Final Environmental Impact Report / Environmental Assessment with Finding of No Significant Impact

Prepared by the
State of California, Department of Transportation

The environmental review, consultation, and any other actions required by applicable Federal environmental laws for this project are being, or have been, carried out by Caltrans pursuant to 23 USC 327 and the Memorandum of Understanding dated December 23, 2016, and executed by Federal Highway Administration and Caltrans.

April 2024

General Information about This Document

What's in this document:

The California Department of Transportation (Caltrans), as assigned by the Federal Highway Administration (FHWA), has prepared this Environmental Impact Report/Complex Environmental Assessment (EIR/EA), which examines the potential environmental impacts of the alternatives being considered for the proposed Yolo 80 Corridor Improvements Project (project) located in Solano, Yolo, and Sacramento Counties, California. Caltrans is the lead agency under the National Environmental Policy Act (NEPA) and the California Environmental Quality Act (CEQA). The document explains why the project is being proposed, what alternatives Caltrans considered for the project, potential effects to the environment resulting from the project, potential impacts of each of the alternatives, and proposed avoidance, minimization, and/or mitigation measures (all measures are listed in Appendix C). The Draft EIR/EA was circulated to the public for 61 days between November 13, 2023, and January 12, 2024. Comments received during this period are included in Chapter 4. Elsewhere throughout this document, a vertical line in the margin indicates a change made since draft document circulation. Minor editorial changes and clarifications have not been so indicated. Additional copies of this document and the related technical studies are available for review at the following locations:

CALIFORNIA DEPARTMENT OF TRANSPORTATION
FINDING OF NO SIGNIFICANT IMPACT (FONSI)

FOR

Yolo 80 Corridor Improvements Project (EA: 03-3H900)

The California Department of Transportation (Caltrans) has determined that Alternative 4b (add a high-occupancy toll lane in each direction for free use by vehicles with three or more riders [HOT 3+] and build an I-80 managed lane direct connector) will have no significant impact on the human environment. This FONSI is based on the attached Environmental Assessment (EA) and associated technical studies which has been independently evaluated by Caltrans and determined to adequately and accurately discuss the need, environmental issues, and impacts of the proposed project and appropriate mitigation measures. It provides sufficient evidence and analysis for determining that an Environmental Impact Statement is not required. Caltrans takes full responsibility for the accuracy, scope, and content of the attached EA and associated technical studies.

The environmental review, consultation, and any other actions required by applicable Federal environmental laws for this project are being, or have been, carried out by Caltrans pursuant to 23 USC 327 and the Memorandum of Understanding dated May 27, 2022, and executed by FHWA and Caltrans.

SUMMARY

NEPA Assignment

California participated in the “Surface Transportation Project Delivery Pilot Program” (Pilot Program) pursuant to 23 USC 327, for more than five years, beginning July 1, 2007, and ending September 30, 2012. MAP-21 (P.L. 112-141), signed by President Obama on July 6, 2012, amended 23 USC 327 to establish a permanent Surface Transportation Project Delivery Program. As a result, the Department entered into a Memorandum of Understanding pursuant to 23 USC 327 (NEPA Assignment MOU) with FHWA. The NEPA Assignment MOU became effective October 1, 2012, and was renewed on May 27, 2022, for a term of ten years. In summary, the Department continues to assume FHWA responsibilities under NEPA and other federal environmental laws in the same manner as was assigned under the Pilot Program, with minor changes. With NEPA Assignment, FHWA assigned, and the Department assumed all of the United States Department of Transportation (USDOT) Secretary's responsibilities under NEPA. This assignment includes projects on the State Highway System and Local Assistance Projects off the State Highway System within the State of California, except for certain categorical exclusions that FHWA assigned to the Department under the 23 USC 326 CE Assignment MOU, projects excluded by definition, and specific project exclusions.

Introduction

The California Department of Transportation (Caltrans or Department), in collaboration with stakeholders, proposes to construct improvements consisting of managed lanes, pedestrian/bicycle facilities, and Intelligent Transportation System (ITS) elements along Interstate 80 (I-80) and U.S. Route 50 (US-50) from Kidwell Road near the eastern Solano County boundary (near Dixon), through Yolo County, and to West El Camino Avenue on I-80 and Interstate 5 (I-5) on US-50 in Sacramento County.

Caltrans, as assigned by the Federal Highway Administration (FHWA), is the lead agency under the National Environmental Policy Act (NEPA) for the Caltrans EA 03-3H900 Yolo 80 Corridor Improvements Project (project). Caltrans is also the lead agency under the California Environmental Quality Act (CEQA).

The project is programmed in the State Transportation Improvement Program (STIP), Regional Surface Transportation Program, and Congestion Management and Air Quality Improvement Program.

Overview of Project Area

CORRIDOR OVERVIEW

The project consists of a stretch of the I-80 corridor that passes through parts of Solano, Yolo, and Sacramento counties. Specifically, the project would extend from Kidwell Road and the Solano/Yolo County line, the Solano/Yolo County line to the Yolo/Sacramento County line, and from the Yolo/Sacramento County line to West El Camino Avenue. In addition, the project

includes a stretch of the US-50 corridor between the I-80/I-50 interchange and the Yolo/Sacramento County line, and between the Yolo/Sacramento County line and the US-50/I-5 interchange. The total project length is approximately 20.8 miles.

Purpose and Need

The purpose of the proposed project is to:

- Ease congestion and improve overall person throughput[1]
- Improve freeway operation on the mainline, ramps, and at system interchanges
- Support reliable transport of goods and services throughout the region
- Improve modality[2] and travel time reliability
- Provide expedited traveler information and monitoring systems.

The proposed project is needed for the following reasons:

- Recurring congestion during the morning and afternoon peak periods exceeds current design capacity limiting person throughput.

- Operational inefficiencies lead to the formation of bottlenecks due to short weaving and merging areas and lane drops.

- Inefficient movement of goods and services impedes regional and interstate economic sustainability.

- The corridor users rely heavily on single-occupancy vehicles with limited multi-modal options such as transit, carpool, bicycle, and pedestrian facilities, resulting in unreliable travel times.

- Lack of real-time traveler information and coordinated traffic communication systems impedes timely response to roadway incidents resulting in secondary collisions and increased non-recurring congestion.

Proposed Action

The project would add managed lanes on I-80 and US-50 by a combination of lane conversion, restriping, and shoulder and median reconstruction with a concrete barrier. Drainage modifications would be required due to median reconstruction in the locations to which sheet flow currently drains. The existing Intelligent Transportation System, (ITS) elements and infrastructure would be expanded and modified and would include ramp meters, fiber-optic conduit and cables, and overhead signs. Utility relocation would also occur as further described below.

[1] Throughput is the number of people moving efficiently through a region.
[2] Modality is the variety in modes of transportation. This includes access and multiple options for the movement of people and goods. Examples include access to transit, carpool, bicycle, and pedestrian facilities.

PROJECT ALTERNATIVES

This section describes alternatives developed to meet the project's purpose and need. The No Build Alternative is Alternative 1. Build Alternatives 2a, 3a, 4a, 5a, and 6a propose the same geometric footprint, but would incorporate different managed lane types. Build Alternatives 2b, 3b, 4b, 5b, and 6b propose the same geometric footprint, include an I-80 managed lane direct connector, but would incorporate different managed lane types. Build Alternatives 7a and 7b would not construct new lanes but would repurpose an existing lane instead; however, Build Alternative 7b would include the I-80 managed lane direct connector.

- Build Alternative 2a: Add a high-occupancy vehicle lane in each direction for use by vehicles with two or more riders (HOV 2+).
- Build Alternative 2b: Add a high-occupancy vehicle lane in each direction for use by vehicles with two or more riders (HOV 2+) and build an I-80 managed lane direct connector.
- Build Alternative 3a: Add a high-occupancy toll lane in each direction for free use by vehicles with two or more riders (HOT 2+). Single-occupied vehicles would pay a fee for lane usage.
- Build Alternative 3b: Add a high-occupancy toll lane in each direction for free use by vehicles with two or more riders (HOT 2+) and build an I-80 managed lane direct connector. Single-occupied vehicles would pay a fee for lane usage.
- Build Alternative 4a: Add a high-occupancy toll lane in each direction for free use by vehicles with three or more riders (HOT 3+). Vehicles with less than three riders would pay a fee for lane usage.
- Build Alternative 4b: Add a high-occupancy toll lane in each direction for free use by vehicles with three or more riders (HOT 3+) and build an I-80 managed lane direct connector. Vehicles with less than three riders would pay a fee for lane usage.
- Build Alternative 5a: Add an express lane in each direction (i.e., everyone would pay a fee to use the lane, regardless of the number of riders).
- Build Alternative 5b: Add an express lane in each direction (i.e., everyone would pay a fee to use the lane, regardless of number of riders), and build an I-80 managed lane direct connector.
- Build Alternative 6a: Add a transit-only lane in each direction.
- Build Alternative 6b: Add a transit-only lane in each direction and build an I-80 managed lane direct connector.
- Build Alternative 7a: Repurpose the current number one general-purpose lane for use by vehicles with two or more riders (HOV 2+); no new lanes would be constructed.

- Build Alternative 7b: Repurpose the current number one general-purpose lane for use by vehicles with two or more riders (HOV 2+); no new lanes would be constructed. Build an I-80 managed lane direct connector.

This project contains several standardized project features, which are employed on most, if not all, Caltrans projects and were not developed in response to any specific environmental impact resulting from the proposed project. These measures are addressed in more detail in the Environmental Consequences sections found in Chapter 2 and included as Appendix E.

Alternatives 2a, 2b, 7a, and 7b include HOV lane alternatives. If a HOT lane alternative is chosen as the preferred alternative (Build Alternatives 3a, 3b, 4a, and 4b), then additional advanced HOT lane signs will need to be placed from I-80/El Camino Avenue to I-80/Truxel Road and between US-50/I-5 and US-50/SR-99 (Sac 80 PM M1.4/3.64 and SAC 50 PM L0.60/R0.20). If necessary, the Environmental Document and the Utility Certification will be revalidated during the PS&E phase.

The Build Alternatives consist of the following three geographic segments:

Segment 1: Segment 1 stretches from Kidwell Road in Eastern Solano County through Davis to the Eastern end of the Yolo Causeway east of Enterprise Boulevard in West Sacramento. Segment 1 consists of three sub-segments:

- *Segment 1a* is from Kidwell Road to Solano County/Yolo County Line.
- *Segment 1b* is from the Solano/Yolo County Line to the west end of the Yolo Causeway.
- *Segment 1c* is from the start of the Yolo Causeway to east of Enterprise Boulevard.

Segment 2: Segment 2 starts just east of Enterprise Boulevard and continues north on I-80 to West El Camino Avenue.

Segment 3: Segment 3 starts at the I-80/US-50 Separation and continues east along US-50 to I-5 near downtown Sacramento. Segment 3 consists of two sub-segments:

- *Segment 3a* is the I-80/US-50 Separation to Jefferson Boulevard Undercrossing.
- *Segment 3b* is the Jefferson Boulevard Undercrossing to just east of I-5.

Identification of a Preferred Alternative

Build Alternative 4B (HOT 3+ with managed lane connector ramp) is the preferred alternative for meeting the project's purpose and need. While Build Alternatives 2–6 offer similar results in terms of impacts on the environment and vehicle miles traveled, Build Alternative 4B provides the highest benefit with respect to revenue generation while still meeting the project's purpose and need to reduce congestion and improve mobility across the corridor. Further, Build Alternative 4B is consistent with local government transportation goals and the project's partner agency's (Yolo Transportation District) declaration of HOT 3+ with connector ramp as their preferred alternative.

Joint California Environmental Quality (CEQA) Act/National Environmental Policy Act (NEPA) Documentation

The proposed project is a joint project by the California Department of Transportation (Department) and the Federal Highway Administration (FHWA) and is subject to state and federal environmental review requirements. Project documentation, therefore, was prepared in compliance with both the California Environmental Quality Act (CEQA) and the National Environmental Policy Act (NEPA). The Department is the lead agency under NEPA. Caltrans is the lead agency under CEQA. In addition, FHWA's responsibility for environmental review, consultation, and any other actions required by applicable Federal environmental laws for this project are being, or have been, carried out by Caltrans pursuant to 23 United States Code Section 327 (23 USC 327) and the Memorandum of Understanding dated May 27, 2022, and executed by FHWA and Caltrans.

Some impacts determined to be significant under CEQA may not lead to a determination of significance under NEPA. Because NEPA is concerned with the significance of the project as a whole, often a "lower level" document is prepared for NEPA. One of the most common joint document types is an Environmental Impact Report/Environmental Assessment (EIR/EA).

After receiving comments from the public and reviewing agencies, this Final EIR/EA was prepared. The Final EIR/EA includes responses to comments received on the Draft EIR/EA and identifies the preferred alternative. If the decision is made to approve the project, a Notice of Determination will be published for compliance with CEQA, and the Department will decide whether to issue a Finding of No Significant Impact (FONSI) or require an Environmental Impact Statement (EIS) for compliance with NEPA. A Notice of Availability (NOA) of the FONSI will be sent to the affected units of federal, state, and local government, and to the State Clearinghouse in compliance with Executive Order 12372.

Potential Environmental Consequences and Avoidance, Minimization, and/or Mitigation Measures

Project impacts would potentially occur in the following resource areas: aesthetics, air quality, biological resources, cultural resources, hazardous materials, energy and greenhouse gases, hydrology and water quality, noise, paleontology, transportation, and utilities and service systems. The project would not contribute to cumulatively considerable effects to the resources analyzed. Project effects under NEPA are discussed fully in Chapter 2, *Affected Environment, Environmental Consequences, and Avoidance, Minimization, and/or Mitigation Measures*. Table S-1 summarizes the impacts of the project under NEPA. Chapter 3, *California Environmental Quality Act Evaluation*, and Table S-2 addresses impacts under CEQA.

Coordination with Other Public Agencies

NOTICE OF PREPARATION

Caltrans filed a Notice of Preparation (NOP) of an EIR with the State Clearinghouse on June 7, 2021. An NOP memorandum was filed with the State Clearinghouse on June 6, 2021, which

was revised on August 17, 2021, to notify that the scoping meeting was rescheduled. Caltrans accepted scoping comments until September 24, 2021. A revised NOP was also distributed on October 17, 2022, that included clarification of the proposed managed lane strategies and Build Alternatives. A copy of the NOP is included in Appendix G.

Agency consultation and public participation for the Yolo 80 Corridor Improvements Project have been accomplished through a variety of formal and informal methods, including project development team meetings, interagency coordination meetings, and correspondence with other interested parties.

Comments from the public that were submitted during the meeting included questions regarding proposed bicycle facilities, project funding, projects in the nearby area, project timing, proposed lane configuration, proposed sound wall locations, and proposed work within the Yolo causeway. In addition, written comment letters included requests to consider potential air quality effects to sensitive receptors, increased flood risks, potential fish passage impacts, Native American Tribal consultation, utility relocation, etc.

PERMITS AND APPROVALS NEEDED

Table S-3 details the permits, licenses, agreements, and certifications required for project construction.

Table S-1 Comparison of Alternatives – Impacts Summary (NEPA)

Impact	No Build Alternative 1	Build Alternatives 2a and 2b	Build Alternatives 3a and 3b	Build Alternatives 4a and 4b	Build Alternatives 5a and 5b	Build Alternatives 6a and 6b	Build Alternatives 7a and 7b	Avoidance, Mitigation, and/or Minimization Measures (AMMs)
Land Use								
Existing and Future Land Use	No effect	Construction and operation of Build Alternatives 2a and 2b would have no effect on existing or future land uses.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	None
Conflict with any land use plan, policy, or regulation	No effect	Consistent or partially consistent.	Consistent or partially consistent.	Consistent or partially consistent.	Consistent or partially consistent, some inconsistent.	Consistent or partially consistent, some inconsistent.	Consistent or partially consistent, some inconsistent.	None
Parks and Recreational Facilities								
Parks and Recreational Facilities	No effect	Construction and operation of Build Alternatives 2a and 2b may result in temporary traffic delays and ramp closures that could cause temporary delays in access to recreational facilities. None of the temporary construction-related impacts would adversely affect the activities, features, or attributes of the park. Build Alternatives 2a and 2b would not require acquisition of a park or recreational facilities.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	None
Farmlands								
Effects on farmland	No effect	Build Alternatives 2a and 2b would occur almost entirely within the Caltrans ROW and would not result in the conversion of any important farmland or Williamson Act land to non-agricultural uses. Therefore, Build Alternatives 2a and 2b would have no effect on farmland or Williamson Act land in the project area.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b	Same as effects described under Build Alternatives 2a and 2b	Same as effects described under Build Alternatives 2a and 2b	Same as effects described under Build Alternatives 2a and 2b	None
Growth								
Growth	No effect	Build Alternatives 2a and 2b would not remove an impediment to growth, provide an entirely new public facility, or provide new access to previously unserved areas. Build Alternatives 2a and 2b would not directly increase development of residential land uses, encourage growth outside of existing growth boundaries, or alter existing access to residential and employment areas; therefore, no adverse effect associated with population growth would be anticipated with implementation of Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Build Alternative 6a and 6b would not improve US-50 corridor traffic performance compared to the No-Build Alternative, so they would not accommodate planned growth. No adverse effects associated with growth would be anticipated.	Build Alternatives 7a and 7b would not improve US-50 corridor traffic performance compared to the No-Build Alternative, so they would not accommodate planned growth. No adverse effects associated with growth would be anticipated.	None

Impact	No Build Alternative 1	Build Alternatives 2a and 2b	Build Alternatives 3a and 3b	Build Alternatives 4a and 4b	Build Alternatives 5a and 5b	Build Alternatives 6a and 6b	Build Alternatives 7a and 7b	Avoidance, Mitigation, and/or Minimization Measures (AMMs)
Community Impacts								
Effects on community character, population, and cohesion	No effect	Build Alternatives 2a and 2b would not alter the zoning, layout, or access within the community. Build Alternatives 2a and 2b would not divide an existing neighborhood or result in additional barriers within the Community Study Area.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	None
Effects on relocation and real property acquisition	No effect	Build Alternatives 2a and 2b would require two permanent right-of-way easements. No displacement of any residences or businesses would be required.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	None
Effects on environmental justice populations	No effect	The expected increases of environmental justice community travel would be like the increases in non-environmental justice community travel and would, therefore, would not cause disproportionately high and adverse direct effects on environmental justice travelers.	Construction effects would be the same as Build Alternatives 2a and 2b. Although the congestion relief and enhanced accessibility would benefit all I-80/US-50 travelers, environmental justice travelers may not realize the equivalent benefit from Build Alternatives 3a and 3b as non-environmental justice travelers due to the tolling.	Construction effects would be the same as described under Build Alternatives 2a and 2b. As Build Alternatives 4a and 4b are toll-based alternatives, effects on environmental justice travelers would be like Build Alternatives 3a and 3b.	Construction effects would be the same as described under Build Alternatives 2a and 2b. Build Alternatives 5a and 5b would involve adding an Express Lane in each direction. As Build Alternatives 5a and 5b are also toll-based alternatives, effects on Environmental Justice Travelers would be like Build Alternatives 3a and 3b, respectively. However, there would be no reduced payment option from carpooling or high vehicle occupancy.	Construction effects would be the same as described under Build Alternatives 2a and 2b. While improved traffic flow and movement of persons on I-80/US-50 within the project limits would benefit a wide range of communities including those defined as environmental justice communities, with a transit-only alternative, the projected increases of environmental justice community travel are less than the projected increases of non-environmental justice community travel	Build Alternatives 7a and 7b would not cause disproportionately high and adverse direct effects on environmental justice communities during construction. There would be an expected increase of environmental justice community travel that is similar the increases in non-environmental justice community travel and would, therefore, not cause disproportionately high and adverse direct effects on environmental justice travelers since the benefits of these alternatives would be equally shared by travelers from all income levels.	Caltrans would implement AMM EJ-1, EJ-2, and EJ-3 for Build Alternatives 3a, 3b, 4a, 4b, 5a, and 5b.
Equity	No effect	Would not substantially affect community character or quality of life in underserved communities in the study area. The Build alternatives would not exacerbate air pollutant conditions and associated health disparities or affect socioeconomic conditions. Residents in these neighborhoods may be initially challenged by the toll-related signage and the process for obtaining toll transponders.	Like effects described under Build Alternatives 2a and 2b. Build Alternatives 3a and 3b may present challenges to linguistically isolated households.	Like effects described under Build Alternatives 2a and 2b. Build Alternatives 4a and 4b may present challenges to linguistically isolated households.	Like effects described under Build Alternatives 2a and 2b. Build Alternatives 5a and 5b may present challenges to linguistically isolated households.	A transit lane would be added in each direction, which would benefit underserved communities using public transit.	Same as effects described under Build Alternatives 2a and 2b.	None

Impact	No Build Alternative 1	Build Alternatives 2a and 2b	Build Alternatives 3a and 3b	Build Alternatives 4a and 4b	Build Alternatives 5a and 5b	Build Alternatives 6a and 6b	Build Alternatives 7a and 7b	Avoidance, Mitigation, and/or Minimization Measures (AMMs)
Utilities/Emergency Services								
Effects on public and private utilities	No effect	Planned or accidental temporary service interruptions during relocation of utilities will occur during construction.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	None
Effects on police, fire, and emergency service providers	No effect	Temporary traffic delays and ramp closures on I-80 and US-50 will occur during construction.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	None
Traffic and Transportation/Pedestrian and Bicycle Facilities								
Existing (2018) operations	No effect	Temporary traffic delays and ramp closures on I-80 and US-50 will occur during construction.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	None, although VMTs are expected to be reduced by implementing the measures in Table 2.1.27.
Opening Year (2029) operations	No effect	Congestion would be eliminated in some areas under Alternatives 2a and 2b. However, congestion in other areas would extend outside the peak period. Alternative 2b (Add HOV with Median Ramps) would have less upstream congestion on I-80 in comparison to Alternative 2a.	Alternative 3a (Add HOT2+) would not perform as well as Alternatives 2a, 4a, and 5a because more vehicles would be eligible for the managed lane than in the alternatives, so congestion would be higher where vehicles are entering and leaving the managed lane. Alternative 3b (Add HOT2+ with Direct Connector) would have less upstream congestion on I-80 in comparison to Alternative 3a.	Alternative 4a (Add HOT3+) would perform well, except for increased VMT. Alternative 4b (Add HOT3+ with Direct Connector) would have less upstream congestion on I-80 in comparison to Alternative 4a.	Same as effects described under Build Alternatives 2a and 2b.	Alternative 6a (Add Transit) would not perform well compared to the other alternatives. Passenger vehicle volume would be constrained by the network capacity resulting in performance like Alternative 1 (No Build) Alternative 6b (Add Transit with Direct Connector) would have less upstream congestion on I-80 in comparison to Alternative 6a.	Alternative 7a would have worse congestion extending into downtown Sacramento on US 50 than the other Build Alternatives. Alternative 7b would have less upstream congestion on I-80 in comparison to Alternative 7a.	None, although VMTs are expected to be reduced by implementing the measures in Table 2.1.27.
Horizon Year (2049) operations	Peak hour demand volume is expected to increase. By horizon year 2049, I-80 and US 50 in the project area would become so congested that travelers would seek longer paths to have a lower travel time.	Under alternatives 2a and 2b, congestion at the Yolo Causeway bottleneck would be lower, but a new bottleneck would form at the lane drop after the US 50 off-ramp. The combined congested area would extend outside the peak period and extend upstream to Harbor Boulevard on US 50. Alternative 2b (Add HOV with Median Ramps) would have the least upstream congestion on both US 50 and I-80 with the additional capacity provided by the median ramp from I-80 and the reduced volume in the weaving section on I-80 between US 50 and West Capitol Avenue.	Alternative 3a (Add HOT2+) would not perform as well as Alternatives 2a, 4a, and 5a because more vehicles would be eligible for the managed lane than in the alternatives, so congestion would be higher where vehicles are entering and leaving the managed lane. Alternative 3b (Add HOT2+ with Direct Connector) would have	Alternative 4a (Add HOT3+) would perform well, except for increased VMT. Alternative 4b (Add HOT3+ with Direct Connector) would have less upstream congestion on US 50 and I-80 in comparison to Alternative 4a.	Same as effects described under Build Alternatives 2a and 2b.	Alternative 6a (Add Transit) would not perform well compared to the other alternatives. Passenger vehicle volume would be constrained by the network capacity resulting in performance similar to Alternative 1 (No Build) Alternative 6b (Add Transit with Direct Connector) would have less upstream congestion on US 50 and	Alternative 7a would have worse congestion extending into downtown Sacramento on US 50 than the other Build Alternatives. Alternative 7b would have less upstream congestion on US 50 and I-80 in comparison to Alternative 7a.	None, although VMTs are expected to be reduced by implementing the measures in Table 2.1.27.

Impact	No Build Alternative 1	Build Alternatives 2a and 2b	Build Alternatives 3a and 3b	Build Alternatives 4a and 4b	Build Alternatives 5a and 5b	Build Alternatives 6a and 6b	Build Alternatives 7a and 7b	Avoidance, Mitigation, and/or Minimization Measures (AMMs)
			less upstream congestion on US 50 and I-80 in comparison to Alternative 3a.			I-80 in comparison to Alternative 6a.		
Visual/Aesthetics								
Effects on scenic resources, visual character, and visual quality	No effect	Overall visual impacts for Build Alternative 2a and 2b would be moderate-low but would range from very low to moderate-high.	Overall visual impacts would be moderate but would range from low to high.	Overall visual impacts would be moderate but would range from low to high.	Overall visual impacts would be moderate but would range from low to high.	Overall visual impacts would be moderate but would range from very low to moderate-high.	Overall visual impacts would be moderate but would range from very low to moderate-high.	AMM AES-1, AMM AES-2, AMM AES-3, AMM AES-4, AMM AES-5
Cultural Resources								
Effects on cultural resources	No effect	Project construction would create subsurface disturbances that could result in damage to or destruction of previously undiscovered subsurface archaeological deposits or unmarked burials.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	None
Water Quality								
Hydrology and floodplain	No effect	Caltrans would need an encroachment permit from the CVFPB and a Section 408 permit from the USACE prior to construction of Build Alternatives 2a and 2b. Build Alternatives 2a and 2b would not promote incompatible development within the floodplain and would not contribute to adverse effects to floodplains. AMM HF-1 will require installation of a detention basin riser to tie into existing storm drains on the upstream side at two locations in the city of Davis—one detention basin rise inlet is proposed at the storm drain crossing on Mace Boulevard south of I-80 and the other will be at the WB I-80 off-ramp to Chiles Road.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Caltrans will implement AMM HF-1 for all Build Alternatives
Water Quality and Stormwater Runoff	No effect	Potential for short-term discharges of sediments, oil, grease, and chemical pollutants into nearby storm drains generated during construction; Potential long-term impacts from increased impervious area, operation, and maintenance activities. Construction and operation would not adversely affect water quality.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	None
Geology/Soils/Seismicity/Topography								
Surface Conditions	No effect	Potential construction and operation effects on erosion, siltation, and runoff would be minimal under Build Alternatives 2a and 2b. Once construction is completed, operation	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Caltrans would implement AMM GEO-1, AMM GEO-2, and AMM GEO-3for all Build Alternatives.

Impact	No Build Alternative 1	Build Alternatives 2a and 2b	Build Alternatives 3a and 3b	Build Alternatives 4a and 4b	Build Alternatives 5a and 5b	Build Alternatives 6a and 6b	Build Alternatives 7a and 7b	Avoidance, Mitigation, and/or Minimization Measures (AMMs)
		of Build Alternatives 2a and 2b would not result in in significant disruptions, displacements, compaction or overcrowding of on-site soils, or change in topography or ground surface features						
Subsurface Conditions and Groundwater	No effect	Groundwater is not anticipated to be encountered during culvert replacement excavation but may be encountered during excavation of footings for the connector ramp under Build Alternative 2b. Build Alternatives 2a and 2b would construct five new culverts and replace or improve 21 existing culverts located beneath the roadway, fill, and embankments at depths unlikely to encounter groundwater.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Caltrans would implement AMM GEO-1, AMM GEO-2, and AMM GEO-3 for all Build Alternatives.
Seismic Hazards	No effect	Liquefaction is expected to be high in the project area due to ground shaking. However, Build Alternatives 2a and 2b would be designed in accordance with Caltrans' Standard Specifications and current Seismic Design Criteria. Construction would have no adverse effect on the geology and soils present at the project site.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Caltrans would implement AMM GEO-1, AMM GEO-2, and AMM GEO-3for all Build Alternatives.
Paleontology								
Damage to paleontological resources	No effect	Build Alternatives 2a and 2b would require excavations greater than 4 feet for installation of retaining, signs, and sound walls. In addition, foundation work for signs, structures, underground utilities, and culvert/drainage installations could also encounter sensitive paleontological resources. Build Alternative 2b proposes pile driving during construction for installation of connector ramp footings to about 40 feet deep. Such activities would be deep enough to reach potentially unknown sensitive paleontological resources.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Caltrans would implement AMM PALEO-1, AMM PALEO-2, and AMM PALEO-3 for all Build Alternatives.
Hazardous Waste and Materials								
Exposure to hazardous materials to humans or the environment	No effect	Build Alternatives 2a and 2b would not affect known hazardous sites. Lead containing paint, asbestos-containing materials, aerially deposited lead, and treated wood waste could be encountered during Project construction. Construction would involve the use and storage of fuels, lubricants, solvents, and other possible contaminants with the potential to spill. No adverse effect would occur.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	None

Impact	No Build Alternative 1	Build Alternatives 2a and 2b	Build Alternatives 3a and 3b	Build Alternatives 4a and 4b	Build Alternatives 5a and 5b	Build Alternatives 6a and 6b	Build Alternatives 7a and 7b	Avoidance, Mitigation, and/or Minimization Measures (AMMs)
Air Quality								
Project-level conformity CO	No effect	Build Alternatives 2a and 2b would have similar effects on conformity	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	None
Project-level conformity PM2.5	No effect	The effects would be like those of Build Alternative 1.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Effects would be slightly less than described under Build Alternatives 2a and 2b,	Effects would be slightly less than described under Build Alternatives 2a and 2b,	Effects would be slightly less than described under Build Alternatives 2a and 2b,	None
Roadway Vehicle Emissions/Criteria Pollutant Emissions	No effect	The effects would be like those of Build Alternative 1.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	None
Noise								
Operational noise and vibration	No effect	The noise level increases from existing conditions are not considered substantial per the Caltrans Noise Analysis Protocol for New Highway Construction	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	None
Construction noise and vibration	No effect	No adverse noise impacts from construction are anticipated for Build Alternative 2a or 2b because construction would be conducted in accordance with Caltrans Standard Specifications Section 14-8.02. Build Alternative 2b alternatives would have greater noise and vibration impacts because of the use of pile drivers for the ramp construction.	Construction effects would be like effects described under Build Alternatives 2a and 2b.	Construction effects would be like effects described under Build Alternatives 2a and 2b.	Construction effects would be like effects described under Build Alternatives 2a and 2b.	Construction effects would be like effects described under Build Alternatives 2a and 2b.	Construction effects would be like effects described under Build Alternatives 2a and 2b.	Caltrans would implement AMM NOI-1 for all Build Alternatives.
Energy								
Energy demands	No effect	Build Alternatives 2a and 2b would consume energy and fuel for construction and would generate new vehicular traffic trips, as it would involve construction of additional managed lanes causing increased vehicle miles traveled (VMT). When balancing energy used during construction and operation against energy saved by relieving congestion and other transportation efficiencies, the project would not have substantial energy effects. Therefore, no adverse permanent effects are anticipated.	Construction effects would be like effects described under Build Alternatives 2a and 2b. Permanent effects would be slightly less than described under Build Alternatives 2a and 2b.	Construction effects would be like effects described under Build Alternatives 2a and 2b. Permanent effects would be slightly less than described under Build Alternatives 2a and 2b.	Construction effects would be like effects described under Build Alternatives 2a and 2b. Permanent effects would be slightly less than described under Build Alternatives 2a and 2b.	Construction effects would be like effects described under Build Alternatives 2a and 2b. Permanent effects would be slightly less than described under Build Alternatives 2a and 2b.	Construction effects would be like effects described under Build Alternatives 2a and 2b. Permanent effects would be slightly less than described under Build Alternatives 2a and 2b.	Caltrans would implement AMM Energy-1 for all Build Alternatives.
Natural Communities								
Natural Communities	No effect	Build Alternatives 2a and 2b would result in the temporary impacts of up to 2.12 acres of riparian habitat. Minimal permanent effects.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Caltrans would implement AMM BIO-1 for all Build Alternatives.

Impact	No Build Alternative 1	Build Alternatives 2a and 2b	Build Alternatives 3a and 3b	Build Alternatives 4a and 4b	Build Alternatives 5a and 5b	Build Alternatives 6a and 6b	Build Alternatives 7a and 7b	Avoidance, Mitigation, and/or Minimization Measures (AMMs)
Wetland and Other Waters								
Effects on Wetlands and Other Waters	No effect	Project construction would result in the temporary disturbance of 0.006 acre (15.70 linear feet) and the permanent impact of 0.079 acre (377.97 linear feet) of jurisdictional waters.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Caltrans would implement AMMs BIO-2 through BIO-4 for all Build Alternatives.
Plant Species								
Effects on Special-Status Plants	No effect	Build Alternatives 2a and 2b may result in the reduction in habitat suitability and quality from the introduction or spread of non-native plant species should Bolander's water-hemlock and wooly rose mallow occur.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	None
Animal Species								
Animal species	No effect	15 non-listed special status wildlife species were identified as potentially occurring in the project region. Project construction could result in the temporary or permanent loss of special status species habitat, displacement of individuals, or disturbance.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Caltrans would implement AMM BIO-5 through BIO-15 for all Build Alternatives.
Effects on Migratory Birds	No effect	Tree and vegetation removal would result in a temporary loss of nesting and foraging habitat for raptors, nesting birds, and migratory birds. Effects would be temporary and minimal.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Caltrans would implement AMM BIO-6 through AMM BIO-11 for all Build Alternatives.
Threatened and Endangered Species								
Effects on threatened and endangered species	No effect	29 threatened or endangered species were identified as potentially occurring in the project region. Project construction could result in the temporary or permanent loss of special status species habitat, displacement of individuals, or disturbance.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Caltrans would implement AMM BIO-6, AMM BIO-16 through BIO-28 for all Build Alternatives.
Invasive Species								
Introduction and spread of invasive plant species	No effect	Build Alternative 2 could contribute to the spread or introduction of invasive species.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	Same as effects described under Build Alternatives 2a and 2b.	None

Table S-2 SUMMARY OF CALIFORNIA ENVIRONMENTAL QUALITY ACT (CEQA) IMPACTS

Environmental Topic	No Build Alternative 1	Build Alternatives 2a and 2b	Build Alternatives 3a and 3b	Build Alternatives 4a and 4b	Build Alternatives 5a and 5b	Build Alternatives 6a and 6b	Build Alternatives 7a and 7b
Aesthetics							
a) Have a substantial adverse effect on a scenic vista.	No Impact	Less than significant impact.	Less than significant impact.	Less than significant impact.	Less than significant impact.	Less than significant impact.	Less than significant impact.
b) Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?	No Impact	No Impact	No Impact	No Impact	No Impact	No Impact	No Impact
c) In non-urbanized areas, would the project substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from a publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?	No Impact	Less than significant impact.	Less than significant impact.	Less than significant impact.	Less than significant impact.	Less than significant impact.	Less than significant impact.
d) Would the project create a new source of substantial light or glare that would adversely affect day or nighttime public views?	No Impact	Less than significant impact.	Less than significant impact.	Less than significant impact.	Less than significant impact.	Less than significant impact.	Less than significant impact.

Environmental Topic	No Build Alternative 1	Build Alternatives 2a and 2b	Build Alternatives 3a and 3b	Build Alternatives 4a and 4b	Build Alternatives 5a and 5b	Build Alternatives 6a and 6b	Build Alternatives 7a and 7b
Agriculture and Forest Resources							
Agriculture and Forest Resources	No Impact	No Impact	No Impact	No Impact	No Impact	No Impact	No Impact
Air Quality							
a) Conflict with or obstruct implementation of the applicable air quality plan?	No Impact	Less than significant impact.	Less than significant impact.	Less than significant impact.	Less than significant impact.	Less than significant impact.	Less than significant impact.
b) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non- attainment under an applicable federal or state ambient air quality standard?	No Impact	Less than significant impact.	Less than significant impact.	Less than significant impact.	Less than significant impact.	Less than significant impact.	Less than significant impact.
c) Expose sensitive receptors to substantial pollutant concentrations?	No Impact	Less than significant impact.	Less than significant impact.	Less than significant impact.	Less than significant impact.	Less than significant impact.	Less than significant impact.
d) Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?	No Impact	Less than significant impact.	Less than significant impact.	Less than significant impact.	Less than significant impact.	Less than significant impact.	Less than significant impact.

Environmental Topic	No Build Alternative 1	Build Alternatives 2a and 2b	Build Alternatives 3a and 3b	Build Alternatives 4a and 4b	Build Alternatives 5a and 5b	Build Alternatives 6a and 6b	Build Alternatives 7a and 7b
Biological Resources							
a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?	No Impact	Less-than-significant impact with mitigation.	Less-than-significant impact with mitigation.	Less-than-significant impact with mitigation.	Less-than-significant impact with mitigation.	Less-than-significant impact with mitigation.	Less-than-significant impact with mitigation.
b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?	No Impact	Less than significant impact.	Less than significant impact.	Less than significant impact.	Less than significant impact.	Less than significant impact.	Less than significant impact.
c) Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?	No Impact	Less than significant impact.	Less than significant impact.	Less than significant impact.	Less than significant impact.	Less than significant impact.	Less than significant impact.

Environmental Topic	No Build Alternative 1	Build Alternatives 2a and 2b	Build Alternatives 3a and 3b	Build Alternatives 4a and 4b	Build Alternatives 5a and 5b	Build Alternatives 6a and 6b	Build Alternatives 7a and 7b
d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?	No Impact	Less-than-significant impact with mitigation.	Less-than-significant impact with mitigation.	Less-than-significant impact with mitigation.	Less-than-significant impact with mitigation.	Less-than-significant impact with mitigation.	Less-than-significant impact with mitigation.
e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?	No Impact	Less than significant impact.	Less than significant impact.	Less than significant impact.	Less than significant impact.	Less than significant impact.	Less than significant impact.
f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?	No Impact	Less-than-significant impact with mitigation.	Less-than-significant impact with mitigation.	Less-than-significant impact with mitigation.	Less-than-significant impact with mitigation.	Less-than-significant impact with mitigation.	Less-than-significant impact with mitigation.
Cultural Resources							
a) Cause a substantial adverse change in the significance of a historical resource pursuant to in §15064.5?	No Impact	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.
b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5? or	No Impact	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.
c) Disturb any human remains, including those interred outside of dedicated cemeteries?	No Impact	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.

Environmental Topic	No Build Alternative 1	Build Alternatives 2a and 2b	Build Alternatives 3a and 3b	Build Alternatives 4a and 4b	Build Alternatives 5a and 5b	Build Alternatives 6a and 6b	Build Alternatives 7a and 7b
Energy							
a) Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?	No Impact	Less-than-significant impact with mitigation.	Less-than-significant impact with mitigation.	Less-than-significant impact with mitigation.	Less-than-significant impact with mitigation.	Less-than-significant impact with mitigation.	Less-than-significant impact with mitigation.
b) Conflict with or obstruct a state or local plan for renewable energy or energy efficiency?	No Impact	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.
Geology and Soils							
a) Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving: i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.	No Impact	No Impact	No Impact	No Impact	No Impact	No Impact	No Impact
ii) Strong seismic ground shaking?	No Impact	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.
iii) Seismic-related ground failure, including liquefaction?	No Impact	Less-than-significant impact with mitigation.	Less-than-significant impact with mitigation.	Less-than-significant impact with mitigation.	Less-than-significant impact with mitigation.	Less-than-significant impact with mitigation.	Less-than-significant impact with mitigation.

Environmental Topic	No Build Alternative 1	Build Alternatives 2a and 2b	Build Alternatives 3a and 3b	Build Alternatives 4a and 4b	Build Alternatives 5a and 5b	Build Alternatives 6a and 6b	Build Alternatives 7a and 7b
iv) Landslides?	No Impact	No Impact	No Impact	No Impact	No Impact	No Impact	No Impact
b) Result in substantial soil erosion or the loss of topsoil?	No Impact	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.
c) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?	No Impact	Less-than-significant impact with mitigation.	Less-than-significant impact with mitigation.	Less-than-significant impact with mitigation.	Less-than-significant impact with mitigation.	Less-than-significant impact with mitigation.	Less-than-significant impact with mitigation.
d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?	No Impact	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.
e) Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?	No Impact	No Impact	No Impact	No Impact	No Impact	No Impact	No Impact
f) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?	No Impact	Less-than-significant impact with mitigation.	Less-than-significant impact with mitigation.	Less-than-significant impact with mitigation.	Less-than-significant impact with mitigation.	Less-than-significant impact with mitigation.	Less-than-significant impact with mitigation.

Environmental Topic	No Build Alternative 1	Build Alternatives 2a and 2b	Build Alternatives 3a and 3b	Build Alternatives 4a and 4b	Build Alternatives 5a and 5b	Build Alternatives 6a and 6b	Build Alternatives 7a and 7b
Greenhouse Gas Emissions							
a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?	No Impact	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.
b) Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?	No Impact	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.
Hazards and Hazardous Materials							
a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?	No Impact	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.
b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?	No Impact	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.
c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?	No Impact	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.

Environmental Topic	No Build Alternative 1	Build Alternatives 2a and 2b	Build Alternatives 3a and 3b	Build Alternatives 4a and 4b	Build Alternatives 5a and 5b	Build Alternatives 6a and 6b	Build Alternatives 7a and 7b
d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?	No Impact	No Impact	No Impact	No Impact	No Impact	No Impact	No Impact
e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?	No Impact	No Impact	No Impact	No Impact	No Impact	No Impact	No Impact
f) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?	No Impact	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.
g) Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires?	No Impact	Less-than-significant impact with mitigation.	Less-than-significant impact with mitigation.	Less-than-significant impact with mitigation.	Less-than-significant impact with mitigation.	Less-than-significant impact with mitigation.	Less-than-significant impact with mitigation.
Hydrology and Water Quality							
a) Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality?	No Impact	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.

Environmental Topic	No Build Alternative 1	Build Alternatives 2a and 2b	Build Alternatives 3a and 3b	Build Alternatives 4a and 4b	Build Alternatives 5a and 5b	Build Alternatives 6a and 6b	Build Alternatives 7a and 7b
b) Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such the project may impede sustainable groundwater management of the basin?	No Impact	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.
c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would: i) result in substantial erosion or siltation on- or off-site; ii) substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site; iii) create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or	No Impact	Less-than-significant impact with mitigation.	Less-than-significant impact with mitigation.	Less-than-significant impact with mitigation.	Less-than-significant impact with mitigation.	Less-than-significant impact with mitigation.	Less-than-significant impact with mitigation.
iv) impede or redirect flood flows?	No Impact	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.
d) In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation?	No Impact	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.

Environmental Topic	No Build Alternative 1	Build Alternatives 2a and 2b	Build Alternatives 3a and 3b	Build Alternatives 4a and 4b	Build Alternatives 5a and 5b	Build Alternatives 6a and 6b	Build Alternatives 7a and 7b
e) Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?	No Impact	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.
Land Use and Planning							
a) Physically divide an established community?	No Impact	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.
b) Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?	No Impact	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.
Mineral Resources							
a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?	No Impact	No Impact	No Impact	No Impact	No Impact	No Impact	No Impact
b) Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?	No Impact	No Impact	No Impact	No Impact	No Impact	No Impact	No Impact

Environmental Topic	No Build Alternative 1	Build Alternatives 2a and 2b	Build Alternatives 3a and 3b	Build Alternatives 4a and 4b	Build Alternatives 5a and 5b	Build Alternatives 6a and 6b	Build Alternatives 7a and 7b
Noise							
a) Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	No Impact	Less-than-significant impact with mitigation	Less-than-significant impact with mitigation	Less-than-significant impact with mitigation	Less-than-significant impact with mitigation	Less-than-significant impact with mitigation	Less-than-significant impact with mitigation.
b) Generation of excessive groundborne vibration or groundborne noise levels?	No Impact	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.
c) For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?	No Impact	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.
Population and Housing							
a) Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?	No Impact	Less than significant impact.	Less than significant impact.	Less than significant impact.	Less than significant impact.	Less than significant impact.	Less than significant impact.

Environmental Topic	No Build Alternative 1	Build Alternatives 2a and 2b	Build Alternatives 3a and 3b	Build Alternatives 4a and 4b	Build Alternatives 5a and 5b	Build Alternatives 6a and 6b	Build Alternatives 7a and 7b
b) Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?	No Impact	No Impact	No Impact	No Impact	No Impact	No Impact	No Impact
Public Services							
a) Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services: Fire protection? Police protection? Schools? Parks? Other public facilities?	No Impact	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.
Recreation							
a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?	No Impact	No Impact	No Impact	No Impact	No Impact	No Impact	No Impact

Environmental Topic	No Build Alternative 1	Build Alternatives 2a and 2b	Build Alternatives 3a and 3b	Build Alternatives 4a and 4b	Build Alternatives 5a and 5b	Build Alternatives 6a and 6b	Build Alternatives 7a and 7b
b) Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?	No Impact	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.
Transportation							
a) Conflict with program, plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities	No Impact	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.
b) Conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b)	No Impact	Significant and unavoidable	Significant and unavoidable	Significant and unavoidable	Significant and unavoidable	Significant and unavoidable	Significant and unavoidable
c) Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)	No Impact	No Impact	No Impact	No Impact	No Impact	No Impact	No Impact
d) Result in inadequate emergency access	No Impact	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.

Environmental Topic	No Build Alternative 1	Build Alternatives 2a and 2b	Build Alternatives 3a and 3b	Build Alternatives 4a and 4b	Build Alternatives 5a and 5b	Build Alternatives 6a and 6b	Build Alternatives 7a and 7b
Tribal Cultural Resources							
Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is: a) Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k),	No Impact	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.
b) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.	No Impact	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.

Environmental Topic	No Build Alternative 1	Build Alternatives 2a and 2b	Build Alternatives 3a and 3b	Build Alternatives 4a and 4b	Build Alternatives 5a and 5b	Build Alternatives 6a and 6b	Build Alternatives 7a and 7b
Utilities and Service Systems							
a) Require or result in the relocation or construction of new or expanded water, wastewater treatment or stormwater drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?	No Impact	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.
b) Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years?	No Impact	No Impact	No Impact	No Impact	No Impact	No Impact	No Impact
c) Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?	No Impact	No Impact	No Impact	No Impact	No Impact	No Impact	No Impact
d) Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?	No Impact	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.
e) Comply with federal, state, and local management and reduction statutes and regulations related to solid waste?	No Impact	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.

Environmental Topic	No Build Alternative 1	Build Alternatives 2a and 2b	Build Alternatives 3a and 3b	Build Alternatives 4a and 4b	Build Alternatives 5a and 5b	Build Alternatives 6a and 6b	Build Alternatives 7a and 7b
Wildfire							
If located in or near state responsibility areas or lands classified as very high fire hazard severity zones, would the project: a) Substantially impair an adopted emergency response plan or emergency evacuation plan?	No Impact	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.
b) Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?	No Impact	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.
c) Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?	No Impact	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.
d) Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?	No Impact	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.

Environmental Topic	No Build Alternative 1	Build Alternatives 2a and 2b	Build Alternatives 3a and 3b	Build Alternatives 4a and 4b	Build Alternatives 5a and 5b	Build Alternatives 6a and 6b	Build Alternatives 7a and 7b
Mandatory Findings of Significance							
a) Does the project have the potential to substantially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?	No Impact	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.
b) Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)? [confirmation pending]	No Impact	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.
c) Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly? [confirmation pending]	No Impact	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.	Less-than-significant impact.

Table S-3. Permits, Reviews, and Approvals Anticipated to be Required for Project Construction

Agency	Permits, Licenses, Agreements, and Certifications	Status
Federal Highway Administration	Air Quality Conformity Determination	Regional will be met by listing in the Regional Transportation Plan and its associated regional emissions analysis.
United States Fish and Wildlife Service	Endangered Species Act, Section 7 Biological Opinion for Valley Elderberry Longhorn Beetle	Issued April 12, 2024
United States Army Corps of Engineers	Clean Water Act Section 404 Permit/408 Permit	Permit application will be submitted if required after the environmental document is approved.
California Department of Fish and Wildlife	1602 Agreement for Streambed Alteration	Permit application and consultation will be submitted and initiated after the environmental document is approved.
	California Endangered Species Act Consultation for Giant Garter Snake	Consultation will be submitted and initiated after the environmental document is approved.
	Incidental Take Permit (ITP) for active Swainson's hawk nest(s)	If needed, an ITP will be obtained prior to initiation of any activities that are likely to result in take.
Central Valley Regional Water Quality Control Board	Clean Water Act Section 401 Water Quality Certification	Permit application will be submitted if required after the environmental document is approved.
	Construction General Permit	Issued during the final design phase
Central Valley Flood Protection Control Board	Encroachment Permit	Issued during the final design phase
Federal Highway Administration	Air Quality Conformity Determination	FHWA determined not a POAQC on October 18, 2021; reaffirmed by IAC 4/26/2024
State Historic Preservation Officer (SHPO)	Concurrence on Eligibility Determinations/Finding of Effect	SHPO concurred with the findings on January 12, 2022. As such, the undertaking would not result in any Section 4(f) use or de minimis finding to any historic properties or historical resources, regardless of alternative.

Yolo 80 Corridor Improvements Project 03-3H900
Final
Environmental Impact Report / Environmental Assessment

General Information about This Document i

Summary Summary-1

NEPA Assignment S-1
Introduction S-1
Overview of Project Area S-1
Corridor Overview S-1
Purpose and Need S-2
Proposed Action S-2
Project Alternatives S-3
Identification of a Preferred Alternative S-4
Joint California Environmental Quality (CEQA) Act/National Environmental Policy Act (NEPA) Documentation S-5
Potential Environmental Consequences and Avoidance, Minimization, and/or Mitigation Measures S-5
Coordination with Other Public Agencies S-5
Notice of Preparation S-5
Permits and Approvals Needed S-6

Chapter 1 Proposed Project 1-1

1.1 Introduction 1-1
1.1.1 Project Background 1-1
1.2 Purpose and Need 1-5
1.2.1 Purpose 1-5
1.2.2 Need 1-5
1.2.3 Independent Utility and Logical Termini 1-6
1.3 Project Description 1-7
1.3.1 Project Alternatives 1-7
1.4 Comparison of Alternatives 1-31
1.4.1 Identification of a Preferred Alternative 1-31
1.5 Alternatives Considered but Eliminated from Further Discussion Prior to Draft EIR/EA 1-31
1.5.1 Alternative 1A 1-31
1.5.2 Alternative 1B 1-32
1.5.3 Alternative 1C 1-32
1.5.4 Alternative 1D 1-32
1.5.5 Alternative 2 1-33
1.5.6 Alternative 4 1-33
1.5.7 Alternative 5 1-33

1.5.8 Alternative 6 1-34
1.6 Permits and Approvals Needed 1-34

Chapter 2 Affected Environment, Environmental Consequences, and Avoidance, Minimization, and/or Mitigation Measures 2-1
2.1 Human Environment 2-1
2.1.1 Existing and Future Land Use 2-1
2.1.2 Consistency with Regional, and Local Plans and Programs 2-16
2.1.3 Parks and Recreational Facilities 2-33
2.1.4 Farmlands 2-42
2.1.5 Growth 2-49
2.1.6 Community Character and Cohesion 2-56
2.1.7 Environmental Justice 2-76
2.1.8 Equity 2-87
2.1.9 Utilities and Emergency Services 2-94
2.1.10 Traffic and Transportation/Pedestrian and Bicycle Facilities 2-98
2.1.11 Visual and Aesthetics 2-129
2.1.12 Cultural Resources 2-142
2.2 Physical Environment 2-148
2.2.1 Hydrology and Floodplain 2-148
2.2.2 Water Quality and Stormwater Runoff 2-155
2.2.3 Geology/Soils/Seismic/Topography 2-164
2.2.4 Paleontology 2-170
2.2.5 Hazardous Waste and Materials 2-175
2.2.6 Air Quality 2-181
2.2.7 Climate Change 2-212
2.2.8 Noise 2-212
2.2.9 Energy 2-268
2.3 Biological Environment 2-277
2.3.1 Natural Communities 2-278
2.3.2 Wetlands and Other Waters 2-301
2.3.3 Plant Species 2-313
2.3.4 Animal Species 2-323
2.3.5 Threatened and Endangered Species 2-336
2.3.6 Invasive Species 2-357
2.4 Cumulative Impacts 2-361
2.4.1 Regulatory Setting 2-361
2.4.2 Methodology 2-362
2.4.3 Resources Excluded from Cumulative Impacts Analysis 2-372
2.4.4 Resources Evaluated for Cumulative Impacts 2-373
2.4.5 Resource Study Area 2-374

Chapter 3 California Environmental Quality Act Evaluation 3-1
3.1 Determining Significance Under CEQA 3-1
3.2 CEQA Environmental Checklist 3-1
3.2.1 Aesthetics 3-2

3.2.2 Agriculture and Forest Resources....3-8
3.2.3 Air Quality....3-9
3.2.4 Biological Resources....3-11
3.2.5 Cultural Resources....3-19
3.2.6 Energy....3-21
3.2.7 Geology and Soils....3-23
3.2.8 Greenhouse Gas Emissions....3-26
3.2.9 Hazards and Hazardous Materials....3-27
3.2.10 Hydrology and Water Quality....3-30
3.2.11 Land Use and Planning....3-34
3.2.12 Mineral Resources....3-36
3.2.13 Noise....3-36
3.2.14 Population and Housing....3-38
3.2.15 Public Services....3-39
3.2.16 Recreation....3-40
3.2.17 Transportation....3-41
3.2.18 Tribal Cultural Resources....3-43
3.2.19 Utilities and Service Systems....3-44
3.2.20 Wildfire....3-45
3.2.21 Mandatory Findings of Significance....3-46
3.3 Wildfire....3-47
3.3.1 Regulatory Setting....3-47
3.3.2 Affected Environment....3-47
3.3.3 Environmental Consequences....3-48
3.3.4 Avoidance, Minimization, and/or Mitigation Measures....3-50
3.4 Climate Change....3-50
3.4.1 Regulatory Setting....3-51
3.4.2 Environmental Setting....3-54
3.4.3 GHG Inventories....3-54
3.4.4 Project Analysis....3-59
3.4.5 CEQA Conclusion....3-63
3.4.6 Greenhouse Gas Reduction Strategies....3-63
3.4.7 Adaptation....3-66

Chapter 4 Comments and Coordination....4-1
4.1 Public Scoping and Participation....4-1
4.1.1 Stakeholder Meetings....4-1
4.1.2 Project Development Team Meetings....4-3
4.1.3 Coordination with Wildlife Professionals....4-3
4.1.4 Public Meetings During Circulation with Public Agencies....4-3
4.2 Consultation and Coordination with Public Agencies....4-4
4.2.1 Federal Agencies....4-4
4.2.2 State Agencies....4-4
4.2.3 Native American Tribal Consultation....4-5
4.2.4 Consultation with Stakeholders for Vehicle Miles Traveled Mitigation....4-6
4.2.5 Stakeholder-Specific Actions – Equitable Outreach....4-10

4.3 Circulation of Draft EIR/EA and Comments Received 4-11
4.3.1 Comments Received 4-11
4.3.2 Responses to Comment 4-15
4.3.3 Agencies 4-28
4.3.4 Organizations 4-158
4.3.5 Individuals 4-1054

Chapter 5 List of Preparers 5-1

Chapter 6 Distribution List 6-1
6.1 Federal Agencies 6-1
6.2 State Agencies 6-1
6.3 Regional and Local Agencies 6-2
6.4 Neighborhood Associations, Organizations, Other 6-3
6.5 Federal Elected Officials 6-6
6.6 State Elected Officials 6-6
6.7 Sacramento County Elected Officials 6-6
6.8 City of Sacramento 6-6
6.9 Tribes 6-7

Chapter 1 Proposed Project

1.1 Introduction

The California Department of Transportation (Caltrans or Department), in collaboration with stakeholders, proposes to construct improvements consisting of managed lanes, pedestrian/bicycle facilities, and intelligent transportation system (ITS) elements along Interstate 80 (I-80) and U.S. Route 50 (US-50) from Kidwell Road near the eastern Solano County boundary (near Dixon), through Yolo County to West El Camino Avenue near the I-80/Interstate 5 (I-5) interchange, and to the US-50/I-5 interchange in Sacramento County (Figure 1.1-1).

Caltrans, as assigned by the Federal Highway Administration (FHWA), is the lead agency under the National Environmental Policy Act (NEPA) for the Caltrans EA 03-3H900 Yolo 80 Corridor Improvements Project (project). Caltrans is also the lead agency under the California Environmental Quality Act (CEQA).

The project is programmed in the State Transportation Improvement Program, Regional Surface Transportation Program, Congestion Management and Air Quality Improvement Program, and California Transportation Commission Trade Corridor Enhancement Program.

1.1.1 Project Background

1.1.1.1 Corridor Overview

The project is in Solano, Yolo, and Sacramento Counties on the I-80 corridor between Kidwell Road and the Solano/Yolo County line, between the Solano/Yolo County line and the Yolo/Sacramento County line, and between the Yolo/Sacramento County line and West El Camino Avenue[1]. In addition, the project is located on the US-50 corridor between the I-80/I-50 interchange and the Yolo/Sacramento County line and between the Yolo/Sacramento County line and the US-50/I-5 interchange. The total project length is approximately 20.8 miles.

Interstate 80

I-80 is a critical link to regional and interregional traffic as the only freeway connection between the San Francisco Bay Area and the Sacramento Metropolitan region. The route also links the Bay Area with recreational destinations in the Sierra Nevada and Northern California via Interstate 505 to I-5 north.

[1] The project is located in Solano, Yolo, and Sacramento counties on the I-80 corridor between PM 40.7 and PM 44.7 in Solano County, between PM 0.00 and PM 11.72 in Yolo County, and between PM 0.00 and PM 1.36 in Sacramento County; and US-50 between PM 0.00 and PM 3.12 in Yolo County and between PM 0.00 and PM 0.617 in Sacramento County.

In Solano County within the project limits, I-80 varies from three to four eastbound and westbound lanes with a standard shoulder, separated by a 20- to 35-foot-wide paved and/or unpaved center median with a guardrail or concrete barrier. In Yolo County within the project limits, I-80 is a six-lane freeway with three lanes in the eastbound and westbound directions.

I-80 has variable 10- to 15-foot-wide outside shoulders in each direction. The corridor travels through the cities of Davis and West Sacramento. County Road (CR) 32A is located north of I-80 and east of the Mace Boulevard interchange and acts as a frontage road to the Yolo Bypass where I-80 becomes a causeway.

In Sacramento County within the project limits, I-80 is a six-lane freeway with three eastbound and three westbound lanes separated by a variable 35- to 60-foot paved center median with concrete and/or guardrail center median barriers. Travel lanes are roughly 12 feet wide, and each direction of travel has variable 10- to 15-foot-wide paved outside shoulders.

Primary providers of bus and rail transit include Amtrak, Fairfield/Suisun Transit, Solano Express Bus, Yolobus, Unitrans, Sacramento Regional Transit, and Greyhound Bus. Bicycle and pedestrian accessibility are provided via the surrounding arterial network.

Within the Sacramento region, I-80 serves local and commute traffic, traffic to and from the Bay Area, recreational traffic to and from the Lake Tahoe Basin, and is a primary corridor for goods movement. Within the corridor, the Yolo Bypass Wildlife Area and floodplain limits east–west linkages, funneling many modes and forms of transportation into the narrow I-80 corridor between the cities of Davis and West Sacramento. I-80/US-50 is also an essential part of the goods movement system, connecting major ports from the Bay Area/Sacramento region to the eastern United States.

I-80 provides direct linkages between agricultural and manufacturing industries in the Central Valley, the Bay Area, and major ports (e.g., Oakland, Richmond, Stockton, West Sacramento). Freight trucks travel through and throughout the region 24 hours a day, seven days a week, transporting large quantities of goods. The tonnage of goods expected to travel via the I-80 corridor is expected to increase over time.

The segment of I-80 within the project limits is a primary access route to the Sacramento International Airport and other large distribution centers.

U.S. Route 50

US-50 serves as a primary connection to I-80 for east–west travel in Solano, Yolo, and Sacramento Counties and provides north–south connections to I-5 and State Route (SR) 99 in Sacramento County.

In Yolo County within the project limits, US-50 is an eight-lane highway between post mile (PM) 0.0 and PM 2.2, where it then reduces to a six-lane highway to approximately the Sacramento County line. Each direction of travel splits the total number of lanes evenly (either three or four) in each direction of travel. The travel directions are separated by an approximately 30-foot-wide

paved center median with a concrete center median barrier. Each travel lane is roughly 12 feet wide in each direction and has an approximately 10-foot-wide outside shoulder.

In Sacramento County, within the project limits, US-50 is an eight-lane highway with four eastbound and four westbound lanes along elevated and separated viaduct structures that cross the Sacramento River and extend east to the end of the project limits.

1.1.1.2 State/Regional Planning

State

Solutions for Congested Corridor Program (SCCP), Congested Corridor Plans (CCPs) represent a cooperative commitment to developing a corridor management vision for state-owned and operated facilities. According to the California Transportation Commission (CTC), the purpose of the SCCP is to provide funding to achieve a balanced set of transportation, environmental, and community access improvements to reduce congestion throughout the state. Accordingly, the I-80 East CCP identifies the future conditions of the corridor as an 8- to 12-lane freeway with high-occupancy vehicle (HOV)/high-occupancy toll (HOT) lanes.

Regional

The Sacramento Area Council of Governments (SACOG) Metropolitan Transportation Improvement Program/Sustainable Communities Strategy (MTIP/SCS) 2020 update prioritizes multiple transportation options to connect people with places. As a result, the plan forecasts less time spent in congestion, cleaner air, fewer greenhouse gas (GHG) emissions per capita, a modernized, more productive transit system, and more ways for residents to choose walking or cycling for some of their daily trips. SACOG considers managed lanes to be a critical component of the regional strategy to raise revenue sufficient to build and maintain the region's transportation system, provide mobility benefits to residents, manage traffic and congestion, and help to achieve the state mandated GHG reduction targets. The full scope of the Yolo County portion of the project is included in the 2020 MTIP/SCS and is identified as requiring capital improvements in the Corridor System Management Plans, the Sacramento Region Managed Lane Network Vision, and the I-5 Transit Corridor Report.

The Solano County portion of the project is in the Solano County Metropolitan Transportation Commission (MTC) area. The 2017 Solano County Regional Transportation Plan (RTP) does not include managed lanes between the Kidwell Road interchange and the Yolo County line. Accordingly, Caltrans continues to coordinate with Caltrans District 4 and Solano County MTC to include the Solano County portion of the project in their RTP update.

1.2 Purpose and Need

1.2.1 Purpose

The purpose of the proposed project is to:

- Ease congestion and improve overall person throughput[2]
- Improve freeway operation on the mainline, ramps, and at system interchanges
- Support reliable transport of goods and services throughout the region
- Improve modality[3] and travel time reliability
- Provide expedited traveler information and monitoring systems

1.2.2 Need

The proposed project is needed for the following reasons:

- Recurring congestion during the morning and afternoon peak periods exceeds current design capacity limiting person throughput.

- Operational inefficiencies lead to the formation of bottlenecks due to short weaving and merging areas and lane drops.

- Inefficient movement of goods and services impedes regional and interstate economic sustainability.

- The corridor users rely heavily on single-occupancy vehicles with limited multi-modal options such as transit, carpool, bicycle, and pedestrian facilities, resulting in unreliable travel times.

- Lack of real-time traveler information and coordinated traffic communication systems impedes timely response to roadway incidents resulting in secondary collisions and increased non-recurring congestion.

1.2.2.1 Roadway Deficiencies

The I-80/US-50 corridor experiences heavy congestion during commute periods due to high vehicular demand. The corridor has infrastructure deficiencies, such as short weaving and merging areas, lane drops that create bottlenecks, incomplete ramp metering and auxiliary lane systems, and inadequate ITS elements. The corridor also experiences heavy recreational traffic, leading to heavy congestion on weekends and holidays.

The Yolo Bypass Causeway is the only direct route connecting the Davis area to West Sacramento and beyond. Heavy congestion and stop-and-go traffic have contributed to increased vehicle emissions, travel costs, emergency response times, and reduced travel time

[2] Throughput is the number of people moving efficiently through a region.
[3] Modality is the variety in modes of transportation. This includes access and multiple options for the movement of people and goods. Examples include access to transit, carpool, bicycle, and pedestrian facilities.

reliability. The congestion has been created by multiple factors, including high traffic volumes, short weaving and merging areas, lane drops, limited sight distances, and incomplete bus and carpool lanes, ramp metering, and auxiliary lane networks.

Motorists traveling on I-80/US-50 experience delays throughout the day, with congestion at its maximum during the afternoon peak period. Data analysis shows that in the eastbound direction, the peak hour occurs during the 4:00 p.m. to 5:00 p.m. hour, with the peak period starting from 3:00 p.m. and lasting to 7:00 p.m. through Davis, and travel being impacted by bottlenecks at Richards Boulevard and Mace Boulevard. Significant morning delays on westbound I-80 occur between 8:00 a.m. to 10:00 a.m., with a severe bottleneck forming at the I-80/US-50 interchange when travel demand volumes are at their peak because of commute-related trips. Westbound US-50 frequently experiences congestion due to queue spillback of traffic at the I-80/US-50 interchange bottleneck. Peak congestion on eastbound US-50 within the project limits occurs during the afternoon peak period, from 4:00 p.m. to 6:00 p.m. The I-80/US-50 corridor primarily operates at Level of Service (LOS)[4] F during the morning and afternoon peak hours within the project limits. The LOS F conditions are anticipated to worsen due to the projected traffic growth in the area.

The existing Yolo 80 bikeway on the north side of the existing Yolo Causeway is underutilized by bicycle riders due to lack of connectivity. Currently, there are three entrance and exit points to the Yolo 80 bikeway. The configuration of the eastern terminus requires that east/west bicycle and pedestrian traffic traverse around the back of two gas stations to avoid several driveways of ingress and egress for automobile and commercial truck traffic. Bicycle and pedestrian traffic must then cross four lanes of traffic to proceed eastbound on West Capitol Avenue.

1.2.3 Independent Utility and Logical Termini

FHWA regulations (23 Code of Federal Regulations [CFR] 771.111 [f]) require that the action evaluated to achieve the following:

- Connect logical termini and be of sufficient length to address environmental matters on a broad scope
- Have independent utility or independent significance (be usable and be a reasonable expenditure even if no additional transportation improvements in the area are made)
- Not restrict consideration of alternatives for other reasonably foreseeable transportation improvements

Logical termini for project development are defined as follows: (1) rational end points for a transportation improvement, and (2) rational end points for a review of the environmental impacts (FHWA 1993). The points at which the project begins and ends are logical in their placement, and environmental impacts studied within and/or adjacent to the project are broad enough to encompass the project. The project limits were proposed to close the gap of HOV lanes on I-80 from the Yolo/Solano County line to the existing HOV lane on I-80 at West El

[4] LOS is a measure used to described quality of motor vehicle traffic service such as delay and congestion.

Camino Avenue, and on US-50 with the existing managed lane project in construction from the US-50/I-5 interchange to US-50 at Watt Avenue (EA 03-0H08U).This project would not require the completion of other projects to be a functioning and a stand-alone project; therefore, the project has independent utility. The project does not conflict with other reasonably foreseeable transportation projects in these segments of I-80 or US-50.

1.3 Project Description

This section describes the proposed action and the project alternatives developed to meet the purpose and need of the project while avoiding or minimizing environmental impacts. Caltrans proposes to make improvements on I-80 and US-50 from Kidwell Road near the eastern Solano County boundary (near Dixon), through Yolo County, and to West El Camino Avenue on I-80 and on US-50 to I-5 in Sacramento County.[5] The project would add managed lanes on I-80 and US-50 by a combination of lane conversion, restriping, and shoulder and median reconstruction with a concrete barrier. Drainage modifications would be required due to median reconstruction in the locations to which sheet flow currently drains. Existing ITS elements and infrastructure would be modified, and new ITS elements would be added, including ramp meters, fiber-optic conduit and cables, and overhead signs.

1.3.1 Project Alternatives

This section describes alternatives developed to meet the project's purpose and need. No Build Alternative 1 is described in Section 1.3.1.6. Build Alternatives 2a, 3a, 4a, 5a, and 6a propose the same geometric footprint, but would incorporate different managed lane types (Figure 1.3-1). Build Alternatives 2b, 3b, 4b, 5b, and 6b propose the same geometric footprint, include an I-80 managed lane direct connector (to provide a direct connection of the HOV 2+ managed lane by flying over US-50 at the I-80/US-50 Interchange) but would incorporate different managed lane types (Figure 1.3-2). Build Alternatives 7a and 7b would not construct new lanes but would repurpose an existing lane instead; however, Build Alternative 7b would include the I-80 managed lane direct connector (Figures 1.3-1 and 1.3-2, respectively, located at the end of this chapter.)

- Build Alternative 2a: Add a high-occupancy vehicle lane in each direction for use by vehicles with two or more riders (HOV 2+).

- Build Alternative 2b: Add a high-occupancy vehicle lane in each direction for use by vehicles with two or more riders (HOV 2+) and build an I-80 managed lane direct connector.

- Build Alternative 3a: Add a high-occupancy toll lane in each direction for free use by vehicles with two or more riders (HOT 2+). Single-occupied vehicles would pay a fee for lane usage.

[5] I-80 corridor between PM 40.7 and PM 44.7 in Solano County, between PM 0.00 and PM 11.72 in Yolo County, and between PM 0.00 and PM 1.36 in Sacramento County; and US-50 between PM 0.00 and PM 3.12 in Yolo County and between PM 0.00 and PM 0.617 in Sacramento County.

- Build Alternative 3b: Add a high-occupancy toll lane in each direction for free use by vehicles with two or more riders (HOT 2+) and build an I-80 managed lane direct connector. Single-occupied vehicles would pay a fee for lane usage.

- Build Alternative 4a: Add a high-occupancy toll lane in each direction for free use by vehicles with three or more riders (HOT 3+). Vehicles with less than three riders would pay a fee for lane usage.

- Build Alternative 4b: Add a high-occupancy toll lane in each direction for free use by vehicles with three or more riders (HOT 3+) and build an I-80 managed lane direct connector. Vehicles with less than three riders would pay a fee for lane usage.

- Build Alternative 5a: Add an express lane in each direction (i.e., everyone would pay a fee to use the lane, regardless of the number of riders).

- Build Alternative 5b: Add an express lane in each direction (i.e., everyone would pay a fee to use the lane, regardless of number of riders), and build an I-80 managed lane direct connector.

- Build Alternative 6a: Add a transit-only lane in each direction.

- Build Alternative 6b: Add a transit-only lane in each direction and build an I-80 managed lane direct connector.

- Build Alternative 7a: Repurpose the current number one general-purpose lane for use by vehicles with two or more riders (HOV 2+); no new lanes would be constructed.

- Build Alternative 7b: Repurpose the current number one general-purpose lane for use by vehicles with two or more riders (HOV 2+); no new lanes would be constructed. Build an I-80 managed lane direct connector.

This project contains several Standard Measures, which are employed on most, if not all, Caltrans projects. They were not developed in response to any specific environmental impact resulting from the project. These measures are addressed in more detail in the Environmental Consequences sections found in Chapter 2 and included as Appendix E.

If a HOT lane alternative is chosen as the preferred alternative (Build Alternatives 4A, 4B. 5A, 5B, 6A, or 6B), then additional advanced HOT lane signs will need to be placed from I-80/El Camino Avenue to I-80/Truxel Road and between US-50/I-5 and US-50/SR-99 (Sac 80 PM M1.4/3.64 and SAC 50 PM L0.60/R0.20).

The Build Alternatives consist of the following three geographic segments:

- **Segment 1:** Segment 1 stretches from Kidwell Road in Eastern Solano County through Davis to the Eastern end of the Yolo Causeway east of Enterprise Boulevard in West Sacramento. Segment 1 consists of three sub-segments:

    - *Segment 1a* is from Kidwell Road to Solano County/Yolo County Line.

- *Segment 1b* is from the Solano/Yolo County Line to the west end of the Yolo Causeway.
- *Segment 1c* is from the start of the Yolo Causeway to east of Enterprise Boulevard.

- **Segment 2:** Segment 2 starts just east of Enterprise Boulevard and continues north on I-80 to West El Camino Avenue.
- **Segment 3:** Segment 3 starts at the I-80/US-50 Separation and continues east along US-50 to I-5 near downtown Sacramento. Segment 3 consists of two sub-segments:
  - *Segment 3a* is the I-80/US-50 Separation to Jefferson Boulevard Undercrossing.
  - *Segment 3b* is the Jefferson Boulevard Undercrossing to just east of I-5.

1.3.1.1 Common Design Features of the Build Alternatives

Common design features and standardized measures are shared among the Build Alternatives.

Managed Lanes

Managed lanes are highway facilities, or a set of lanes, where operational strategies are implemented to manage overall traffic congestion or in response to changing conditions (FHWA 2008). Managed lanes can include pricing, vehicle eligibility, or access control concepts. The lanes have flexibility to be used by different types of vehicles, depending on the need, and can be actively managed to accommodate peak travel demands. Managed lanes would be designated using a striping pattern to distinguish between the mixed-flow lanes as further described in Section 1.3.1.2, Unique Features of the Build Alternatives.

Intelligent Transportation System/Transportation Management Systems

Each of the Build Alternatives would include placement of ramp meters and other ITS/Transportation Management Systems (TMS) such as closed-circuit television (CCTV) and changeable message signs. Several maintenance pullouts are proposed adjacent to I-80 on-ramps to accommodate an electrical cabinet for proposed ramp meters or other ITS/TMS infrastructure.

Table 1.3-1 includes a summary of proposed ITS elements. Proposed ITS elements would be installed on a new pole foundation; some existing ITS infrastructure in these locations would be abandoned or replaced. Accordingly, it is assumed that each ITS pole foundation would have up to a 6-foot radius permanent footprint with up to 10-foot radius temporary area for construction.

Table 1.3-1. Intelligent Transportation System Improvements for All Build Alternatives

No.	Improvement	Freeway	Post Mile	Direction	Location

Structure Modifications

As summarized in Table 1.3-2, Build Alternatives would add improvements to existing structures to accommodate proposed managed lanes. The Yolo Causeway would not be structurally modified.

Table 1.3-2. Structure Modifications

Structure Name	Structure Number	Route	Post Mile	Alternative	Structure Work
South Fork Putah Creek	23-0054 R	Sol 80	42.36	All Build Alternatives	Place fiber-optic conduit
Old Davis Road Undercrossing	23-0155R	Sol 80	R43.5	All Build Alternatives	Place fiber-optic conduit
South Davis Overhead	23-0156R	Sol 80	R43.93	All Build Alternatives	Place fiber-optic conduit
Putah Creek Pedestrian Undercrossing	22-0194	Yol 80	0.01	All Build Alternatives	Place fiber-optic conduit
Richards Boulevard Overcrossing RW NO. 3	TBD	Yol 80	0/0.60	All Build Alternatives	Retaining wall at abutment along eastbound I-80 off-ramp to Richards Boulevard
I-80 Managed Lane Direct Connector	TBD	Yol 80	9.5/10.0	Build Alternatives 2b, 3b, 4b, 5b, 6b, 7b	Proposed managed lane connector retaining wall #1; Proposed managed lane connector retaining wall #2. For Alterative 2B to 7B, The Enterprise Blvd Undercrossing would need to be widened approximately 10 feet on each side due to proposed Director Connect. On the WB, RW #3 would be needed to support roadway widening between Enterprise Blvd Undercrossing and W Capitol loop on-ramp. On the EB, outside roadway widening will need to be supported at east of Enterprise Blvd. RW #4 with SW is proposed to be built at location of existing SW by remove portion of existing SW and replace with new SW on RW# 4.”

Source: Caltrans Draft Project Report (July 2021)

Ramp Modifications

Within Segment 2, eastbound ramp modifications would be constructed at I-80 eastbound on-ramp from Richards Boulevard to accommodate realignment within the right-of-way. In addition,

ramp modifications would occur at the westbound I-80 off-ramp to CR-32A/Chiles Road to accommodate additional bicycle/pedestrian pathway within the right-of-way.

Bicycle/Pedestrian Facilities

The Build Alternatives would replace the existing bicycle pathway pavement behind the gas station located north of West Capitol Avenue from PM 9.15 to PM 9.35. The existing bicycle pathway would be rerouted during repaving activities for up to two months, but repaving activities may occur at nighttime to minimize access disruption. To maintain access, bicycles traveling westbound would be redirected along West Capitol Avenue. Bicycles traveling eastbound would be redirected along a short segment of sidewalk on West Capitol Avenue and use the crosswalk at the West Capitol Avenue/westbound I-80 off-ramp intersection[6]. Bicyclists would then continue eastbound along West Capitol Avenue using the existing bicycle lane. Caltrans would add crosswalk pavement marking across the westbound I-80 off-ramp to West Capitol Avenue and near the existing West Capitol Avenue crosswalk. In addition, Caltrans would add advanced warning signs to alert the motorists traveling on the westbound I-80 off-ramp to West Capitol Avenue before reaching the proposed crosswalk. Caltrans would place signage as part of the traffic management plan to note the access updates and identify the bicycle/pedestrian detours.

The Build Alternatives would also replace the existing bicycle pathway pavement from PM 9.1 to the Yolo Causeway bridge deck approach at approximately PM 8.9. While the existing Class I bicycle pathway is closed, a temporary bicycle pathway with K-rail barrier would be placed along the I-80 westbound on-ramp from West Capitol Avenue. Up to 100 linear feet of existing barrier near PM 8.9 would be removed and realigned to allow bicycles to rejoin the existing Class I bicycle pathway along Yolo Causeway. The existing Class I bicycle pathway along the Yolo Causeway would not require closure during construction activities.

The Build Alternatives would extend the westernmost limit of the existing Class I bicycle pathway from I-80 along Yolo Causeway to connect to CR-32A. The pathway extension would be adjacent to the westbound I-80 off-ramp to CR-32A and about 12 feet wide. The area surrounding the pathway extension would be graded to comply with the Americans with Disabilities Act of 1990 (ADA) regulations. A concrete barrier would separate the pathway extension from westbound off-ramp vehicular traffic. Once construction of the pathway extension along westbound I-80 off-ramp is complete, the Build Alternatives would conduct pavement rehabilitation on the western Yolo Causeway levee, from the Yolo Causeway bridge to from CR-32A to Levee Road. During pavement rehabilitation activities, Levee Road would be closed. Bicycles would be redirected along the newly constructed pathway extension on westbound I-80 off-ramp to access the existing Class I bicycle pathway along Yolo Causeway, which would be built prior to rehabilitation activities on Levee Road. These proposed components are depicted in Figure 1.3-1 and Figure 1.3-2.

[6] City of West Sacramento Municipal Code 10.32.020 states that bicycles are permitted on the public sidewalk but shall yield to any pedestrian.

Park-and-Ride Facility

Within Segment 2 of each build alternative, a Park-and-Ride Facility (also known as a Mobility Hub) would be built on the east side of Enterprise Boulevard in a 4.5-acre lot and would provide about 300 parking spaces. Users of the Park-and-Ride Facility would have the option to park their cars for the day and connect to several county and regional transit services. The facility would be located partially within the existing Caltrans right-of-way and partially outside the existing Caltrans right-of-way. Landscaping and nighttime lighting are proposed at the Park-and-Ride Facility.

Signage

The Build Alternatives would include roadside signs and overhead changeable message signs (CMS) (I.e., symbolic or text messages) that would guide and warn motorists and regulate the flow of traffic. Some of the signs would have hours of operation that restrict certain classes of vehicles during peak periods. Other signs would have information for motorists of the conditions or hazards that they are approaching.

Roadside signs would include regulatory and warning signs, route shields, and guide signs. These signs would be on wood or metal posts. Wood posts would be approximately 6-inches by 6-inches while metal posts would be approximately 2.5-inches by 2.5-inches. Roadside signs would be mounted on the freeway concrete median barrier or placed adjacent to the edge of the travel way up to 30 feet. However, placement of roadway signs would avoid environmentally sensitive areas.

Overhead signs would be mounted on versatile truss structures spanning above the travel lanes. The total height of the overhead sign structure (including the sign) would depend on the type of sign being mounted but would not likely exceed 40 feet in height. Overhead sign structures would have a concrete foundation of up to 6.5 feet diameter and would either be supported on a cast-in-drilled-hole pile foundation or supported by a structure.

Lighting

Street lighting would be added near CR-32A at the proposed bicycle pathway extension adjacent to the westbound off-ramp. Within Segment 2, bridge deck lighting with Type 21 Barrier-Rail-Mounted Lighting Standards would be constructed. Additional street lighting would be added to the Bryte Bend Bridge (I-80 Sacramento River Bridge Overhead), but it may also be added at proposed auxiliary lane locations if determined necessary during the design phase. Nighttime lighting would be installed at the Park-and-Ride Facility. During construction, temporary nighttime lighting would be in used in construction areas. Signage would use reflective lettering.

Road Cut/Fill

Some locations would require full structural section reconstruction, and other locations would require cut or fill of the embankment due to road widening.

Grinding

Cold planing, the process of removing part of the surface of a paved area, would be required throughout the project limits. Cold planing would be required for ramp conforms at all ramps and may be required at other locations along the travel way wherever hot mix asphalt is currently in place. A mill (cold planing) and fill operation may be proposed to repair roadway surface scarring that occurs during temporary restriping associated with some stage construction operations.

Site Preparation

Site preparation would include delineating construction work areas, installing environmentally sensitive area fencing around sensitive habitats and cultural resource areas, installing wildlife exclusion fencing around staging areas, installing best management practices in accordance with the project's Stormwater Pollution Prevention Plan, and removing vegetation, as summarized in Appendix E.

Utilities

Build Alternatives 2a, 3a, 4a, 5a, 6a, and 7a would not result in potential conflicts with existing utilities that are present along the I-80/US-50 corridor utility companies would require verification of facilities and involvement in construction plans. Accordingly, prior to construction, an estimated 15 test hole sites would be drilled at eight separate locations for natural gas lines running transversely underneath I-80, the Yolo Causeway, and West Capitol Avenue in Sacramento where the new managed lane would be constructed with retaining walls and columns. Positive findings would verify whether the gas line would require relocation or how to redesign the project components to avoid conflicts with existing utilities.

Under all Build Alternatives, removal of an existing overhead sign near Westacre Park, within Caltrans right-of-way, would require an overhead electrical distribution line to be temporarily de-energized. Under Build Alternatives 2b, 3b, 4b, 5b, 6b, and 7b, up to four 115-kilovolt overhead utility towers may be relocated or tower height increased near the new I-80 managed lane direct connector at the I-80/US-50 separation in West Sacramento.

Fiber-Optic Cable

The Build Alternatives would install a fiber-optic cable and associated fiber-optic splice boxes within the roadbed at the eastbound outside shoulder of I-80 from west of Kidwell Road in Solano County at PM 40.7 to PM 4.35 in Yolo County. Cut and cover or trenching would be the primary construction method and would require excavation of up to 42 inches deep to install within a 12-foot buffer surrounding the running line. Fiber-optic cable may also be placed via directional borings to avoid conflicts with existing utilities.

Right-of-Way and Temporary Construction Easements

As depicted on Figures 1.3-1 and 1.3-2, the Build Alternatives would require Caltrans to acquire two private fee parcels to construct the proposed Park-and-Ride Facility at Enterprise Boulevard (2.8 acres). Five temporary construction easements (TCEs) would be required along the project

alignment totaling 12.24 acres. No displacement of any residences or businesses would be required.

Staging Areas

As depicted on Figures 1.3-1 and 1.3-2, staging areas would be located at the I-80/West El Camino Avenue interchange, South River Road, I-80/Richards Boulevard interchange, the I-80 and SR-113 interchange, West Capitol Avenue, and along Kidwell Road. These areas total 53.31 acres and would be used for equipment maintenance and storage of equipment, construction materials, fuels, lubricants, solvents, and other possible contaminants during construction.

Traffic Management during Construction

Various Transportation Management Plan (TMP) elements such as portable CMS and the California Highway Patrol Construction Zone Enhanced Enforcement Program would be used to minimize delays for the traveling public. Flaggers would be used to divert traffic. Prior to construction, a detailed TMP would be prepared.

Ramp closures are anticipated at all ramp locations adjacent to proposed widening or proposed mainline paving. Traffic would be detoured to the next interchange. Caltrans would also place signage as part of the TMP to note the access updates and identify the bicycle/pedestrian detours. Caltrans would install a crosswalk at the westbound I-80 off-ramp across right turn movement to West Capitol Avenue and a temporary flashing beacon upstream.

Build Alternatives 2b, 3b, 4b, 5b, 6b, and 7b may require a temporary, full closure on westbound US-50 for construction of the direct connector structure. Full closures would occur during the hours of the lowest volume of traffic (e.g., nighttime), although they could also occur during daytime and/or during a continuous 24- or 48-hour operation, as needed to accommodate construction. The anticipated closure would occur for up to three nights to install falsework and then three additional nights to remove falsework for construction of the direct connector structure. The primary detour for westbound US-50 traffic would be to use northbound I-5 to westbound I-80. Local traffic would use other interchanges in the area.

Vegetation and Tree Removal

Vegetation clearing would be required and would be confined to the area within the project footprint, including construction access routes. Vegetation removal and clearing would be completed with hand tools where possible. Chainsaws, grinders, and excavators would be used for vegetation that cannot be removed by hand. All vegetation would be removed within proposed cut and fill lines as well as within temporary impact lines where ITS components would be constructed. Within areas of temporary impact, vegetation removal would be avoided to the extent possible.

Construction Equipment

The equipment used for the proposed work of the Build Alternatives would be similar among the Build Alternatives. Center median work would use excavators, scrapers, motor graders, loaders,

backhoes, pavers, concrete barrier slip form pavers, truck-mounted cranes, 18-wheel trucks, dump trucks, and water trucks. Reconstruction and modification of ramps/gores/shoulder embankments would use excavators, motor graders, loaders, backhoes, pavers, 18-wheel trucks, dump trucks, and water trucks. Road surfacing work, including placement for sensors in the road surface, would use core drillers, trailers containing and dispersing sealant, and water trucks.

Construction of the I-80 managed lane direct connector under Build Alternatives 2b, 3b, 4b, 5b, 6b, and 7b would require pile driving to install the footings to a depth of up to 40 feet. Equipment would also include a crane (for pile driving), excavator, dozer, loader, manlift, articulated 4x4 forklift, truck, dump truck, trailer unit air compressor, and water truck. This construction equipment would also be used for structural sign mounts along with a truck-mounted crane for all Build Alternatives. A truck-mounted auger would be used for installing roadside signs.

Ground Disturbance

The depth of ground disturbance would vary throughout the project limits. At locations where CMS, sign structures, or piles would be installed, disturbance could be up to 30 feet deep. As described, construction of the I-80 managed lane direct connector under Build Alternatives 2b, 3b, 4b, 5b, 6b, and 7b would require pile driving to install the footings to a depth of up to 40 feet. At locations of culverts, depth of ground disturbance could vary from 3 feet to 10 feet (i.e., the estimated depth to the bottom of a culvert or inlet). At locations of linear electrical facilities such as fiber-optic and conduit installations, the ideal depth is typically 4 feet, assuming 42 inches of cover; however, depth could be increased to avoid conflicts with existing or proposed drainage or existing utilities.

Site Cleanup and Post-Construction Activities

All construction materials and debris would be removed from the construction work areas and recycled or properly disposed of off-site. Caltrans would restore all areas temporarily disturbed by project activities, such as staging areas and access roads, to near or better than preconstruction conditions in accordance with applicable permits and Caltrans requirements.

1.3.1.2 Unique Features of the Build Alternatives

The Build Alternatives are depicted on Figure 1.3-1 and Figure 1.3-2. More detailed engineering figures and detailed maps showing the locations of proposed right-of-way acquisitions are included in Appendix I.

Build Alternatives 2a and 2b: HOV 2+ Managed Lane

Lane Configuration – Build Alternatives 2a and 2b

Build Alternatives 2a and 2b would begin at the Solano/Yolo County Line west of Davis to West El Camino Avenue on I-80 and end at I-5 on US-50 in Sacramento County. Build Alternatives 2a and 2b would include an HOV 2+ managed lane in the eastbound and westbound direction. This would be accomplished by constructing the median from the Solano/Yolo County line to west of

the Yolo Causeway and continuing eastward by restriping to West El Camino Avenue on I-80 and to I-5 on US-50 in Sacramento County.

Build Alternative 2b would involve construction of an I-80 managed lane direct connector and construction activities planned for Build Alternative 2a. The I-80 managed lane direct connector would provide a direct connection of the HOV 2+ managed lane by flying over US-50 at the I-80/US-50 Interchange as depicted in Figure 1.3-2. The connector would include a retaining wall on either side and would travel underneath the existing eastbound connector from I-80 to US-50. The proposed managed lane direct connector would be constructed of columns and include concrete barrier type 842 railings.

Segment 1 (Kidwell Road, Solano County to Enterprise Boulevard, West Sacramento)

Segments 1a, 1b, and 1c would be restriped with 6-inch thermoplastic traffic stripes for three mixed-flow lanes and one managed lane in each direction, westbound and eastbound.

Within Segment 1b, from just west of the Solano/Yolo County Line to the west end of the Yolo Causeway, the project would involve replacement of the existing inside shoulders and construction of the eastbound and westbound median from around Richards Boulevard to 1.5 miles east of Mace Boulevard to accommodate managed lanes in the eastbound and westbound directions. The new shoulders and construction areas would be asphalt concrete material. The median barriers would be upgraded from a metal beam guard rail to a reinforced concrete barrier.

Segment 2 (Enterprise Boulevard to West El Camino Avenue, West Sacramento)

Within Segment 2, the Bryte Bend Bridge would be restriped to accommodate the HOV 2+ managed lane in each direction. Reducing lane and shoulder widths would accommodate a fourth lane on the Bryte Bend Bridge. The bridge striping would change from three lanes (two 12-foot lanes and one 11.5-foot lane) to four lanes (four 11-foot lanes) with 1-foot inside and 2.5-foot outside shoulders.

Segment 3 (I-80/US-50 to Jefferson Boulevard Undercrossing, and Jefferson Boulevard to I-5/US-50 Interchange, West Sacramento)

Within Segment 3a, from I-80/US-50 Separation to Jefferson Boulevard Undercrossing, the pavement would be restriped to convert one mixed-flow lane in each direction to managed lanes.

Within Segment 3b, from the Jefferson Boulevard Undercrossing to just east of I-5, the Jefferson Boulevard Undercrossing (Br. No. 22-0106 L/R), and the Sacramento River viaduct (Br. No. 24-0014 R/L) between Jefferson Boulevard and the I-5/US-50 interchange would be restriped to add an additional managed lane in each direction.

Lane Access – Build Alternatives 2a and 2b

An HOV lane is a type of managed lane that allows qualified users, who meet the minimum number of passengers, to use the managed lane. The number of vehicle occupants required to

qualify can vary depending on location. Under Build Alternatives 2a and 2b, vehicles with two or more occupants would be permitted to access the HOV lane, and all other vehicles would be prohibited from using those lanes. The HOV lanes would be designated using a striping pattern and a diamond marking to distinguish them from mixed-flow lanes and would operate only during peak commute hours.

Signage – Build Alternatives 2a and 2b

Approximately 45 overhead signs would be replaced or proposed within the project area. Several existing overhead signs would be removed and not replaced. In addition, 311 roadside signs would be replaced, and 221 roadside signs are proposed within the median or the shoulder. Proposed signage would be the same for Build Alternatives 2a and 2b. Overhead and roadside signs are described in more detail in Section 1.3.1.1, Common Design Features of the Build Alternatives and shown on Figure 1.3-1 and Figure 1.3-2.

Drainage/Culverts – Build Alternatives 2a and 2b

Anticipated work includes extending existing culverts through existing unpaved medians, extending existing culverts at locations where construction may occur outside the existing edge of pavement lining, and possibly abandoning existing culverts where median construction would occur in crowned sections of the roadway. New drainage inlets and culverts are proposed to be replaced or repaired to accommodate areas where existing shoulders are being narrowed, to accommodate additional runoff due to the increased pavement area, or to perpetuate existing drainage patterns. The linings of one pipe would occur using cast-in-place-pipe lining (CIPP). CIPP is a method to repair pipes without needing to trench by inserting a liner inside the existing culvert pipe.

Build Alternative 2a and Build Alternative 2b would construct 5 new culverts and replace or improve 21 existing culverts. As described, many of the proposed drainage features would be located within the construction footprint of the median for the new HOV 2+ managed lane. In addition, proposed culverts would traverse beneath the freeway to convey drainage to a new outlet. In these instances, the freeway would be trenched using an excavator and the barrel would be installed. Once the barrel is installed, the trench would be backfilled and compacted back to preconstruction conditions. Trenching across the freeway travel lanes would occur in segments during low peak (nighttime) traffic hours to maintain access. Construction of each new or replaced culvert would occur over approximately two nights; however, construction of several culverts could occur concurrently as further described in the construction schedule. It is assumed each of these culvert repair or replacement areas would have a 20-foot by 20-foot temporary construction impact footprint, not to exceed the roadway right-of-way. Proposed drainage features for the I-80 managed lane direct connector, under Build Alternative 2b, would occur within the construction footprint of the I-80 managed lane direct connector.

Construction Schedule – Build Alternatives 2a and 2b

Construction of Build Alternative 2a is anticipated to take approximately 443 construction working days over 22 months. Construction of Build Alternative 2b is anticipated to take approximately 732 construction working days over 36 months. Construction would potentially

commence in Spring 2025. Due to high daytime traffic volumes, nighttime work would be expected. Both daytime and nighttime work should be anticipated throughout the project duration.

Build Alternatives 3a and 3b: HOT 2+ Managed Lane

Build Alternatives 3a and 3b would be the same as Build Alternatives 2a and 2b, respectively, but would include an HOT 2+ managed lane instead of an HOV 2+ lane. Build Alternative 3b would involve construction of the I-80 managed lane direct connector and construction activities planned for Build Alternative 3a.

The HOT managed lane would allow vehicles with a minimum two-person occupancy to use the lane for free, while single-occupied vehicles would pay for the lane usage. All other project components would be the same as Build Alternatives 2a and 2b, respectively, except signage locations.

Approximately 79 overhead signs would be replaced or proposed within the project area. Several existing overhead signs would be removed and not replaced. In addition, 311 roadside signs would be replaced, and 373 roadside signs are proposed within the median or the shoulder. Overhead and roadside signs are described in more detail in Section 1.3.1.1, Common Design Features of the Build Alternatives and shown on Figure 1.3-1 and Figure 1.3-2.

Build Alternatives 4a and 4b: HOT 3+ Managed Lane

Build Alternatives 4a and 4b would be the same as Build Alternatives 2a and 2b, respectively, but would include an HOT 3+ managed lane instead of an HOV 2+ lane. Build Alternative 4b would involve construction of the I-80 managed lane direct connector and construction activities planned for Build Alternative 4a.

The HOT managed lane would allow vehicles with a minimum three-person occupancy to use the lane for free. Vehicles with less than three riders would pay for the lane usage. Vehicles with two passengers may pay reduced or full tolls to travel within the HOT lane. `1 All other project components would be the same as Build Alternatives 2a and 2b, respectively, except signage locations.

Proposed signage for Build Alternatives 4a and 4b would be the same as Build Alternatives 3a and 3b, respectively. Overhead and roadside signs are described in more detail in Section 1.3.1.1, Common Design Features of the Build Alternatives and shown on Figure 1.3-1 and Figure 1.3-2.

Build Alternatives 5a and 5b: Express Managed Lane

Build Alternatives 5a and 5b would be the same as Build Alternatives 2a and 2b, respectively, but would include an express lane instead of an HOV 2+ lane. Build Alternative 5b would involve construction of the I-80 managed lane direct connector in addition to the construction activities planned for Build Alternative 5a. An express lane is a managed lane that allows vehicles of any occupancy to access a dedicated lane once a toll is paid. All other project

components would be the same as Build Alternatives 2a and 2b, respectively, except signage locations.

Proposed signage for Build Alternatives 5a and 5b would be the same as Build Alternatives 3a and 3b, respectively. Overhead and roadside signs are described in more detail in Section 1.3.1.1, Common Design Features of the Build Alternatives and shown on Figure 1.3-1 and Figure 1.3-2.

Build Alternatives 6a and 6b: Transit-Only Managed Lane

Build Alternatives 6a and 6b would be the same as Build Alternatives 2a and 2b, respectively, but would include transit-only managed lanes instead of HOV 2+ lanes. Build Alternative 6b would involve construction of the I-80 managed lane direct connector in addition to the construction activities planned for Build Alternative 6a. A transit-only lane is a managed lane that allows only approved public transit vehicles, such as bus services, to access a dedicated lane. All other project components would be the same as Build Alternatives 2a and 2b, including the proposed signage for Build Alternatives 6a and 6b, respectively. Overhead and roadside signs are described in more detail in Section 1.3.1.1, Common Design Features of the Build Alternatives and shown on Figure 1.3-1 and Figure 1.3-2.

Build Alternatives 7a and 7b: Repurpose Lanes to HOV 2+ Managed Lane

Build Alternatives 7a and 7b would repurpose the current number one general-purpose lanes to HOV 2+ managed lanes. No new lanes would be constructed. Build Alternative 7b would involve construction of the I-80 managed lane direct connector in addition to the construction activities planned for Build Alternative 7a.

Lane Configuration–Build Alternatives 7a and 7b

Build Alternatives 7a and 7b would maintain the existing median pavement delineation, unpaved median, and add an HOV 2+ lane by repurposing an existing mixed-flow lane (lane number one). As a result, Build Alternatives 7a and 7b would not shift the edge of travel way into the median or require barrier beam removal within the median.

Lane Access–Build Alternatives 7a and 7b

Vehicles with two or more occupants would be permitted to access the HOV 2+ lane, and all other vehicles would be prohibited from using them. The HOV 2+ lanes would be designated using a striping pattern and a diamond marking to distinguish them from mixed-flow lanes. HOV 2+ lanes would only operate during peak commute hours.

Signage – Build Alternatives 7a and 7b

Proposed signage for Build Alternatives 7a and 7b would be the same for Build Alternatives 2a and 2b, respectively. Overhead and roadside signs are described in more detail in Section 1.3.1.1, Common Design Features of the Build Alternatives and shown on Figure 1.3-1 and Figure 1.3-2.

Drainage/Culverts – Build Alternatives 7a and 7b

Build Alternatives 7a and 7b would repurpose the current number one general-purpose lanes to HOV 2+ managed lanes. Therefore, culvert construction associated with Build Alternative 7a would only be related to replacements or improvements to 18 existing culverts. Build Alternative 7b would construct 5 new culverts associated with the I-80 managed lane direct connector. Construction methods would be the same as Build Alternative 2a and 2b, respectively. The lining of one pipe would also occur using CIPP. As stated earlier, CIPP is a method to repair pipes without needing to trench by inserting a liner inside the existing culvert pipe.

Construction Schedule – Build Alternatives 7a and 7b

Construction of Build Alternative 7a is anticipated to take approximately 180 construction working days over 10 months. Construction of Build Alternative 7b is anticipated to take 732 construction working days over 36 months to complete. Construction would potentially commence in Spring 2025. Due to high daytime traffic volumes, nighttime work would be expected. Both daytime and nighttime work should be anticipated throughout the project duration.

1.3.1.3 Transportation Demand Management and Transportation System Management Alternatives

System management strategies increase the efficiency of existing facilities; they are actions that increase the number of vehicle trips a facility can carry without increasing the number of through lanes. Examples of Transportation System Management (TSM) strategies include the following: ramp metering, auxiliary lanes, turning lanes, reversible lanes, and traffic signal coordination. TSM also promotes automobile, public, and private transit, ridesharing programs, and bicycle and pedestrian improvements as elements of a unified urban transportation system. Modal alternatives integrate multiple forms of transportation modes, such as pedestrian, bicycle, automobile, rail, and mass transit. Although TSM measures alone could not satisfy the purpose and need of the project, the TSM strategies that have been incorporated into the Build Alternatives include the Park-and-Ride Facility at Enterprise Avenue (all Build Alternatives), the proposed bicycle path improvements (all Build Alternatives), and the ITS elements included in Table 1.3-1.

Transportation Demand Management (TDM) focuses on regional means of reducing the number of vehicle trips and miles traveled and increasing vehicle occupancy. It facilitates higher vehicle occupancy or reduces traffic congestion by expanding the traveler's transportation options in terms of travel method, travel time, travel route, travel costs, and the quality and convenience of the travel experience. A typical activity would be providing funds to regional agencies that are actively promoting ridesharing, maintaining rideshare databases, and providing limited rideshare services to employers and individuals. Increased vehicle occupancy reduces traffic volumes during peak commuting periods; however, without the construction of the improvements described above, successful implementation of a TDM alternative would not substantially improve the safety and operation of the freeway. A TDM alternative by itself would not satisfy the purpose of the project.

1.3.1.4 Reversible Lanes

Effective January 1, 2017, Assembly Bill 2542 amended the California Streets and Highways Code to require that Caltrans or a regional transportation planning agency demonstrate that reversible lanes were considered when submitting a capacity-increasing project or a major street or highway lane realignment project to the CTC for approval (California Streets and Highways Code, Section 100.015). Caltrans considered reversible lanes during project initiation but determined that they would not be compatible with the proposed Build Alternatives.

1.3.1.5 Access to Navigable Rivers

California Streets and Highways Code Section 84.5 states that during the design hearing process relating to state highway projects that include the construction by Caltrans of a new bridge across a navigable river, there shall be included full consideration of and a report on the feasibility of providing a means of public access to the navigable river for public recreational purposes. The project would involve improvements of the existing Bryte Bend Bridge over Sacramento River. The Sacramento River is a navigable river; however, the bridge exists, and the project would not construct a new bridge over the Sacramento River. Public access to the Sacramento River for public recreational purposes is discussed in Section 2.1.3, Parks and Recreational Facilities.

1.3.1.6 No Build Alternative 1

No Build Alternative 1 would maintain the existing conditions, and no work would be conducted to relieve current traffic congestion to improve traffic flow, mobility, and travel time reliability while at the same time reducing vehicle emissions and travel costs. No Build Alternative 1 would not provide a transportation facility that functions for all users, including bicyclists, pedestrians, local transit services, and freight. Recurring travel demand would continue to exceed the highway's current design capacity, resulting in severe traffic congestion and impaired mobility. Additionally, the transportation network would not include adequate facilities for all modes of transportation.

No Build Alternative 1 assumes programmed and planned improvements to the current corridor. While there are numerous planned or programmed transportation projects within the region that can impact future travel patterns, this section focuses only on those future baseline improvements that directly impact the project area. The baseline improvement projects within the project area are listed in Table 1.3-3 and described in further detail in Section 2.4.

Table 1.3-3. List of Reasonably Foreseeable Future Actions

Project ID	Project Name	Jurisdiction	Location	Project Description	Status
Transportation Projects					
T-1	Yolo Pavement Rehabilitation Project 03-4F650	Caltrans District 3	Yolo 80 PM 4.3/R11.4 and Yolo 50 PM 0.0/2.5	This project proposes constructing the median on the I-80 West Capitol Avenue Undercrossing and the I-80 Reed Avenue UC bridges to accommodate stage construction. Additionally, the 03-4F650 project proposes improvements for critical bridge locations within the corridor to upgrade deck surfaces, approach slabs, and slope paving. The proposed median improvement occurs throughout most of the project to accommodate for stage construction. The median concrete barrier will remain in place at other locations, and the median restriped as part of the 3H900 project to provide managed lanes, with one managed lane in each direction. The project proposes new fiber-optic lines throughout, along with some ramp metering and upgrades to other existing roadway features. These fiber-optic lines will improve the ITS monitoring capability within the corridor.	Planned construction March 2023 to December 2027.
T-2	Sac River Bridge Over Head Bryte Bend Bridge Rehabilitation 03-0F250	Caltrans District 3	Yolo 80 PM R11.1/R11.7 and Sac 80 PM M0.0/M0.5: In Yolo and Sacramento Counties and near West Sacramento from 0.1 mile west of Reed Avenue UC to 0.1 mile east of Bryte Bend Bridge.	This project rehabilitated the Sacramento River Bridge and Overhead (BOH), Br.# 22-0026 L/R, on I-80 at the Yolo/Sacramento County Line in West Sacramento about three miles west of I-5. The project included replacing the bridge rail, replacing the deck drain system, building barrier pedestals for future electroliers, and installing conduits.	Construction completed January 2023.
T-3	US-50 ICM Infrastructure 03-3H330	Caltrans District 3	US-50 in El Dorado County from the El Dorado County/ Sacramento County line to Stateline Avenue in the City of South Lake Tahoe.	This project is on US-50 in and near the cities of Sacramento, Rancho Cordova, and Folsom, from the Yolo/Sacramento County line to Folsom Boulevard; and in Yolo County in West Sacramento along US-50, from the I-80/US-50 interchange to the Yolo/Sacramento County line (PM 0.0 to 3.156), and on I-80 from Enterprise Boulevard to US-50 (PM 9.2 to R9.552). Installation of TMS field elements.	Planned construction September 2021 to December 2023.

Project ID	Project Name	Jurisdiction	Location	Project Description	Status
T-4	Sac 50 Design-Build 03-0H08U	Caltrans District 3	Sacramento, Sacramento River bridge, Airport Boulevard, SR-99, I-80, US-50	In Sacramento County on US-50 from PM L0.20 to PM R6.10, from the I-5 Junction to Watt Avenue. The project proposes to construct managed lanes and rehabilitate the pavement.	Construction anticipated to be complete in December 2024.
T-5	Richards Boulevard / Olive Drive Circulation Improvements 03-0H360	City of Davis	Sol 80 PM 44.5/44.7 and Yolo 80 PM 0.0/0.5	Davis, in cooperation with Caltrans, has completed a Project Study Report-Project Development Support and will be circulating Draft Project Report/Environmental Document in Early 2022 that evaluates the safety and operational functions of the interchange at Richards Boulevard and I-80. The Davis project proposes to reconfigure the westbound I-80 on-ramp and off-ramp to a tight diamond; construct additional turn lanes to the eastbound I-80 on-ramp; eliminate the westbound I-80 slip off-ramp to Olive Drive; construct a two-way shared use path on the west side of Richards Boulevard that will pass under the westbound I-80 on-ramp from Richards Boulevard and cross over I-80.	Planned construction December 2023 to June 2025.
T-6	US-50 Metal Beam Guardrail Upgrade 03-1H870	Yolo County	US-50 from PM 0.0 to 3.0 and on I-80 from PM 9.0 to R10.7	The project replaced the guardrail and placed vegetation control.	Construction completed December 2021.
T-7	Sac/Placer 80 Fiber-Optics 03-0H540	Sacramento County	Sac PM M0.3/18.0 & Placer 80 PM 0.0/0.7	Installed fiber-optic conduit, cable and pull boxes, replaced sign panels, transition railing, modified ramp metering systems. limited proposed fiber-optic conduits and pull boxes along the I-80 median and eastbound I-80 outside shoulder, along westbound I-80 diagonal and loop on-ramps from West El Camino Ave, along eastbound I-80 off-ramp to West El Camino Ave and eastbound I-80 loop on-ramp from West El Camino Ave.	Construction completed August 2022.
T-8	Yolo 80 Olive Drive Bike/Ped Connection 03-4H260	City of Davis	PM 0.841/0.851	Bike/Ped structure from Olive Drive to Pole Line Road overcrossing bridge. Closure of eastbound I-80 off-ramp to Olive Drive.	Planned construction January 2021 to June 2023.
T-9	Yolo 80 Davis 80 Rehabilitation Project 03-2J260	City of Davis	PM 0.0/4.40	Remove portion of pavement and replace with RHMA-G and RHMA-O for I-80 mainline and Mace Blvd ramps. Upgrade Mace Blvd drainage facilities, metal beam guard rail, cross walks, ADA ramps, and pedestrian push buttons. Install HOV ramp metering systems at Mace Blvd eastbound on-ramps to I-80. Project Initiation Document was signed December 2022.	Planned construction May 2027 to May 2028.

Project ID	Project Name	Jurisdiction	Location	Project Description	Status
T-10	Sac 5/50 Interchange Painting 03-1H100	City of Sacramento	Sacramento River Viaduct (Pioneer Bridge) to 4th Street; also, on I-5 from 0.2 mile south of Broadway to S Street (PM 22.15 to PM 22.91).	Painting at interchange on Sacramento River Viaduct and on I-5.	Construction was completed February 2023.
T-11	Sycamore Trail Pedestrian Overcrossing 03-3H840	City of West Sacramento	City of West Sacramento	City of West Sacramento plans to construct a trail and pedestrian crossing over US-50 that will extend south from the newly developed pedestrian and bicycle trail at Joseph "Joey" Lopes Park to Westmore Oaks Elementary School. The project site is between Evergreen Avenue and Stone Boulevard along the Sacramento Regional County Sanitation District lower northwest interceptor sewer easement. The width of the overcrossing would be either 16 or 22 feet.	Planned construction March 2023 to April 2024.
T-12	Yolo Rail Relocation	City of Davis, along with City of West Sacramento, City of Woodland and Yolo County	City of Davis, City of West Sacramento, City of Woodland, and Yolo County	The Yolo Rail Realignment Project proposes to relocate the existing rail access from the Union Pacific Railroad mainline current alignment along the eastern edge of West Sacramento to a new location west of the I-80/US-50 split. The project will allow for the West Sacramento riverfront to fully realize its redevelopment potential, alleviate significant traffic impact from the existing freight rail alignment, and provide for the opportunity to expand freight rail service to West Sacramento's industrial areas with minimum community impact. It has been proposed to combine a new railroad overhead under I-80 as part of the combined projects 03-4F650 and 03-3H900 between the Yolo Causeway and Enterprise Boulevard to tie into existing tracks leading to/from the Port of West Sacramento.	Planning phase
T-13	County Road 32A Crossing	Yolo County	CR-32A is located north of I-80 and east of the Mace Boulevard interchange	CR-32A to improve bike path connectivity between CR-105 (just east of Davis) and the western terminus of the proposed new Class I bicycle/pedestrian facility of the Managed Lanes Project (03-3H900) that will connect with CR-32A, just west of the westbound CR-32A Off-Ramp. The County recently completed a Project Study Report and is seeking funding for this project.	Planning Phase

Project ID	Project Name	Jurisdiction	Location	Project Description	Status
T-14	Bridge Preventive Maintenance on Route 505 at Horse Creek Bridge and on Route 80 at McCune Creek Bridge	Caltrans District 4 SHOPP Projects	Vacaville (Solano I-505 and I-80)	In and near Vallejo, Dixon, and Vacaville, at I-80/SR-29 Separation Bridge (No. 23-008), McCune Creek Bridge (No. 23-0084L/R) and Horse Creek Bridge (No. 23-0077L). Bridge preventive maintenance.	Environmental analysis completed in December 2020.
T-15	SOL SR 37, 80 & 780 RRFB 0P760; SOL-Var. 2020 SHOPP	Caltrans District 4 SHOPP Projects	Solano County, Various post markers	Install rectangular rapid flashing beacons in Solano County on various routes (Routes 37, 80, and 780) at various locations.	Construction anticipated to begin in 2022/2023
T-16	SOL-VAR; 2020 SHOPP	Caltrans District 4 SHOPP Projects	Solano County, Various post markers	Install best management practices (stormwater mitigation) at Routes 37, 80, 780, 101, and 121.	Construction anticipated to begin 2023/2024
T-17	I-5 Corridor Improvement Project 03-4H580	Caltrans D3	SAC 5 22.4-34.4	Caltrans proposes to make improvements on I-5 between PM 22.4 and 34.4 in Sacramento County. The proposed action would address mobility on I-5 from the I-5/SR-50 Interchange (south of downtown Sacramento) to the Yolo County line, including Airport Boulevard, providing a vital link to Sacramento International Airport (SMF). This mobility improvement would be accomplished with northbound and southbound managed lane strategies. The project would help relieve current traffic congestion, which would result in improved traffic flow, mobility, travel time, and reliability. In addition, the project would improve transit access and reduce vehicle emissions and travel costs. Ramps, shoulders and gores would be reconstructed at various locations in the project area. Some widening of or replacement of existing structures in the project area would be required. Drainage modifications would be required due to median reconstruction where sheet flow currently drains. Addition of (or modification of existing) intelligent transportation system elements and infrastructure including ramp meters, fiber-optic conduit and cables, and overhead signs would be part of the scope of work. Utility relocation is expected.	Project Approval and Environmental Document Phase, anticipated to be complete late 2023

Project ID	Project Name	Jurisdiction	Location	Project Description	Status
Bicycle and Pedestrian Facility Projects					
BP-1	Mace Boulevard Corridor Project	City of Davis	City of Davis	Addition of green bicycle lane conflict markings where each westbound freeway ramp intersects with Mace Boulevard. Provision of bicycle intersection crossing markings at the signalized intersection of the I-80 westbound ramps and Mace Boulevard and addition of green bike lane conflict markings where each eastbound freeway ramp intersects with Mace Boulevard.	Planning phase; community meeting to be held on January 20, 2022.
BP-3	Jefferson Boulevard interchange area	City of West Sacramento	City of West Sacramento	Addition of Class II bicycle lanes. The pavement on Jefferson under the US-50 interchange structure was not widened for bicycle lanes. The pavement was recently rehabilitated as part of the West Capitol Avenue Safety Enhancement and Road Rehabilitation project.	Project construction complete.
BP-4	S. River Road interchange area	City of West Sacramento	City of West Sacramento	The widening of 5th Street for Class II bicycle lanes through the US-50 interchange area will be constructed as part of the Riverfront Street Extension / Fifth Street Widening project.	Construction to begin soon.
I-80 Corridor Major Developments/General Plans/Specific Plans					
D-1	Olive Drive	City of Davis	City of Davis	The project would develop existing single-family homes into high density multi-family apartments.	Environmental documents approved in November 2019
D-2	University Mall/ University Commons Redevelopment Project	City of Davis	City of Davis	Transit-oriented infill project, commercial.	Final City Council Approval granted on August 25th, 2020
D-3	UC Davis West Village Expansion	UC Davis	City of Davis	200-acre mixed-use neighborhood integrating student, faculty, and staff housing and educational and research facilities, all centered on a civic village square.	Under construction, anticipated completion in fall of 2021
D-4	West Sacramento Corporation Yard Relocation Project	City of West Sacramento	City of West Sacramento	West Sacramento proposes to construct a new Municipal Corporation Yard Facility at 4300 West Capitol Avenue, a parcel which the city anticipates purchasing from the Port of West Sacramento.	Phase I of the project is complete.

Project ID	Project Name	Jurisdiction	Location	Project Description	Status
D-5	West Capitol Avenue–Road Rehabilitation and Safety Enhancement Project	City of West Sacramento	City of West Sacramento	West Capitol Avenue is envisioned as the West Sacramento's downtown: a central core with a vibrant main street that takes advantage of its prime location; providing an attractive setting for a variety of land uses including the Civic Center, Community Center, Transit Hub; and providing residential, commercial, and urban parks that are accessible via multiple modes of transportation. The primary goals are to repair deteriorating pavement; complete scalloped street sections; install drainage improvements, sidewalks, access ramps, signal modifications, separated/buffered bike lanes, street lighting, high-visibility crosswalks for safer pedestrian crossings; and reduce unnecessary vehicular travel lanes.	Construction is complete.
D-6	Upper Westside Specific Plan	Sacramento County	Sacramento County	The project will be a transportation-oriented development due to its location and proximity to transportation infrastructure and major employment regions in the region. It will also incorporate many "complete streets" aspects such as pedestrian- and bicycle-friendly infrastructure, transit services, and some compact housing to encourage alternative modes of transportation within the area. The project area is currently zoned for agricultural use, but a general plan amendment is underway to alter the land use designations for the Upper Westside Plan area.	Application accepted on February 26th, 2019. Environmental analysis in progress.
D-7	The Core Natomas 300-unit Apartments	City of Sacramento	City of Sacramento	This project provides a 300-unit apartment complex with 506 parking spaces (including 203 garage types), two accesses (orchard and via planned cul-de-sac).	Construction completed in 2020.
D-8	River Oaks Phase 2–591 Single Family	City of Sacramento	City of Sacramento	This project provides 591 single family lots on 83.3 acres of vacant land within the River Oaks planned unit development.	Planning phase; environmental documents submitted in 2018.

Project ID	Project Name	Jurisdiction	Location	Project Description	Status
D-9	Bell Avenue Warehouses Project	City of Sacramento	City of Sacramento	The proposed project would include development of the project site with two warehouse structures totaling approximately 339,549 sf as well as various other site improvements related to internal vehicle circulation, stormwater management, and landscaping. The warehouse on the eastern parcel would be about 259,749 sf and contain two depressed loading docks on the western face of the building. The warehouse on the western parcel would be about 79,800 square feet and contain two depressed loading docks on the building's western face. On-site parking would be provided by 277 proposed parking spaces.	Planning phase; environmental documents submitted in February 2020.
D-10	Rivers Oaks Marketplace	City of Sacramento	City of Sacramento	There is a plan amendment for four new commercial structures on a 3.91-acre parcel in the C-2-PUD (General Commercial-Park El Camino) Zone. This requires a Commission-level review for site plan and design review, conditional use permits, a tentative map, and a planned unit development Schematic Plan Amendment.	Project construction would last about 16 months, starting in April 2022 and concluding in July 2022. Construction would proceed in a single phase.
D-11	Parke Bridge Phase 4	City of Sacramento	City of Sacramento	The project proposes to construct 108 new detached, single-unit dwellings with four house plans on approximately 22 acres in the Parke Bridge planned unit development.	Subdivision is currently under development
D-12	Bretton Woods	City of Davis	City of Davis	Davis is annexing land from Yolo County and rezoning land from agricultural intensive to medium density residential, high density residential, residential greenspace overlay, urban agriculture transition area, and mixed-use. This will pave the way for 325 single family homes, 260 of which are for senior citizens, and an additional 150 are affordable senior apartments. The project also includes an approximately 3-acre activity and wellness center. The project is on a site north of Covell Boulevard and west of SR-113, at the intersection of Shasta Drive and West Covell Boulevard.	Currently undergoing planning review of the subdivision phases.

Project ID	Project Name	Jurisdiction	Location	Project Description	Status
D-13	UC Davis Long Range Development Plan	University of California, Davis	Sacramento, located off US-50 near the SR-99/I-80 Business interchange	The 2020 LRDP Update proposes general types of campus development and land uses to support projected campus population growth and enable expanded and new program initiatives. The proposed Aggie Square Phase I project consists of approximately 1,384,500-gross square feet of building space for education, research, residential and commercial uses, and parking structure space.	Planning phase; environmental documents submitted in November 2020.
D-14	Woodland Research & Technology Park Specific Plan	City of Woodland	City of Woodland	Woodland is pursuing a specific plan detailing a commercial mixed-use town center with 2.15 million square feet of non-residential building space for approximately 6,100 employees and 1,600 housing units. The project is in the southern portion of Woodland's planning area, adjacent to the existing city limits, bound by Farmers Central Road to the north, CR-101 to the east, SR-113 to the west, and CR-25A to the south.	Environmental analysis in progress.
D-15	The Promenade - 2023 (Formerly NISHI Housing Site)	City of Davis	City Davis	The City of Davis is processing a planning application for The Promenade, previously known as Nishi Student Apartments. The project creates a new neighborhood adjacent to the UC Davis campus and close to downtown Davis. It is located on 46.9 acres with 2,200 beds across 700 units, with a mix of studio, 2-bedroom and 4-bedroom floorplans ranging in size from 480 to 1,565 square feet.	Planning phase in progress.

Key:
Ave = = Avenue
Blvd = Boulevard
CCTV = closed-circuit television
CMS = changeable message signs
CR = County Road
I-80 = Interstate 80
LRDP = long range development plan
OC = overcrossing
sf = square feet
SHOPP = State Highway Operation and Protection Program
SR = State Route
TCE = temporary construction easement
TMS = transportation management system
UC Davis = University of California, Davis

1.4 Comparison of Alternatives

After the public circulation period, all comments were considered; and Caltrans identified a preferred alternative and made the final determination of the project's effect on the environment.

1.4.1 Identification of a Preferred Alternative

Build Alternative 4B (HOT 3+ with managed lane connector ramp) is the preferred alternative for meeting the project's purpose and need. Alternative 4B would best ease congestion and improve freeway operations to support reliable transport of goods/service throughout the region, improve freeway operation on the mainline ramps and at system interchanges, improve modality and travel time reliability, and lastly provide expediated traveler information and monitoring systems.

While Build Alternatives 2–6 offer similar results in terms of impacts on the environment and vehicle miles traveled, Build Alternative 4B provides the highest benefit with respect to revenue generation while still meeting the project's purpose and need to reduce congestion and improve mobility across the corridor. Further, Build Alternative 4B is consistent with local government transportation goals and the project's partner agency's (Yolo Transportation District) declaration of HOT 3+ with connector ramp as their preferred alternative.

1.5 Alternatives Considered but Eliminated from Further Discussion Prior to Draft EIR/EA

The following alternatives were considered during the Project Initiation Document (PID) phase, documented in the Project Study Report-Project Development Support (PSR-PDS) and were considered and eliminated by the Project Development Team in the Project Approval and Environmental Document phase.

1.5.1 Alternative 1A

This alternative proposed to construct approximately 21 miles of managed lanes in both directions from the Kidwell Road overcrossing in Solano County to the US-50/I-5 and I-80/West El Camino Avenue interchanges in Sacramento County to alleviate bottlenecks and address an increase in travel demand. The managed lanes in Solano County under Alternative 1A would have converted an existing general-purpose lane to a managed lane. This alternative also proposed to construct a new separate bicycle/pedestrian structure adjacent to and north of the existing Yolo Causeway structure. The proposed separate bicycle/pedestrian structure, as proposed in the PID document with a 12-foot width, lacked access in case of emergency and regular maintenance.

The Solano County portion of the project is in the Solano County MTC area and Caltrans District 4. The 2017 Solano County RTP does not include managed lanes between the Kidwell Road interchange and the Yolo County line. Caltrans District 4 has indicated that they will coordinate with these organizations and Solano Transportation Authority to amend the Solano County

bus/carpool lane section of the MTC's Management Transportation Plan (MTP) and possibly add an HOV lane in Solano County on a different and future District 4 project.

The proposed separate Yolo Causeway bike bridge was determined not to be a viable alternative due to a low benefit-to-cost ratio. The current bicycle usage is generally low and environmental studies previously conducted by Caltrans have revealed that there would be impacts to the existing plants and wildlife due to the construction of a separate bicycle bridge. Accordingly, this alternative was also rejected due to the anticipated environmental impacts and environmental mitigation required.

1.5.2 Alternative 1B

This alternative is similar to Alternative 1A except the bicycle and pedestrian access across the Yolo Bypass would have occurred by either widening the existing Yolo Causeway structures or attaching a lightweight structure to them. This option would be more expensive than the structure in Alternative 1A due to the need to seismically retrofit the existing Yolo Causeway. This alternative would have less environmental impact in the Yolo Bypass wetland area and would address the safety, security, and emergency access concerns. Additional earthwork would be needed on the westbound side of I-80 in the berm area within the Yolo Bypass between the two causeway structures, which would impact existing environmental features.

Alternative 1B was rejected because it would require widening each side of the existing Yolo Causeway structures. Seismic upgrades to the existing Yolo Causeway structures would have been more expensive than building a new independent and separate structure.

1.5.3 Alternative 1C

This alternative proposed a managed lane in each direction and a new I-80 HOV connector ramp/bridge at the I-80/US-50 interchange to provide direct connectivity between the proposed managed lanes on I-80. Outside widening was proposed from Yolo I-80 PM 0.0 to the Yolo Causeway, and adjacent to the I-80/US-50 interchange for the I-80 managed lane connector.

This alternative is the same as Alternative 1A except riders would use the existing Yolo Causeway bicycle/pedestrian facility and the Yolo Causeway would be restriped with managed lanes in each direction.

Alternative 1C was rejected for the same reasons as Alternative 1A in that the 2017 Solano County RTP does not include managed lanes between the Kidwell Road interchange and the Yolo County line. In addition, there would be right-of-way costs and environmental impacts with the proposed outside widening of the corridor.

1.5.4 Alternative 1D

This alternative proposed widening into the median in Solano County to add managed lanes. It was different from Alternative 1A in that it proposed converting an existing general-purpose lane into a managed lane.

This was rejected for the same reason as Alternative 1A. It is included in the MTC listing but is not supported by Caltrans District 4 at this time.

1.5.5 Alternative 2

This alternative proposed an interim eastbound reversible lane from just west of the Yolo County line to Enterprise Boulevard. It would convert mixed-flow lanes to managed lanes on US-50 to the I-5 interchange.

Reversible Lanes were evaluated using the 2018 High Occupancy Vehicle Guidelines referenced in section 2 of the Interim Guidance on AB 2542 Reversible Lane Requirement. Section 2.1 of the 2018 High Occupancy Vehicle Guidelines states that:

> *"When a metropolitan area largely consists of a central business district with weekday commuter traffic from outlying areas, often referred to as a "radial" geographical area, the traffic demands on each corridor normally would indicate definite directional peaks during the morning and afternoon commute periods. If traffic in the off-peak direction is light (35 percent or less of the total freeway traffic during the peak periods) and is forecast to remain light during the design life of the project, then a reversible HOV operation may be appropriate."*

The existing and projected "off-peak" directional split of the total freeway transportation is less than 35 percent, with almost equal directional splits in some segments of the project area during the PM peak period. Therefore, based on existing guidance, transportation data, and projected traffic growth, a reversible HOV lane would not be an appropriate alternative to consider for this project.

1.5.6 Alternative 4

This alternative proposed an interim project to stripe managed lanes on the I-80/Bryte Bend bridge. This alternative was rejected because it would not meet the purpose and need of providing adequate operational improvements for the entire corridor.

1.5.7 Alternative 5

This alternative is similar to Alternative 1A, except managed lanes would be exclusively for transit vehicles.

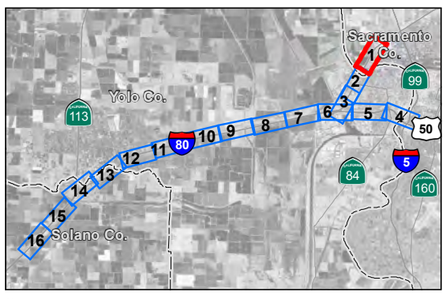
This alternative was rejected due to the anticipated difficult merging required to get from the freeway on-ramps adjacent to the outside shoulders and then transit drivers would have to merge to the median transit lane, then merge to the outside lane again to exit the ramps to bus stops.

This alternative is a modified version of Alternative 6 but has a larger impact area like the Alternative 1A footprint. Alternative 6 is based on the smaller general impact area or similar to Alternative 3 footprint.

It was determined that this alternative was not a viable alternative, but possible Part Time Lane Use or Bus on Shoulder options may be studied further in the design phase.

1.5.8 Alternative 6

This alternative is similar to Alternative 1A except that it proposed to construct two managed lanes in each direction. This is a modified version of Alternative 5, and it was eliminated from further discussion because it would have a bigger environmental footprint and require extensive right-of-way acquisition. This alternative would require replacing or widening all the bridges throughout the I-80 and US-50 Corridor. It is anticipated that there would be merging and weaving issues for traffic merging onto and out of the two managed lanes. This alternative was rejected due to the extensive right-of-way and environmental impacts.



1.6 Permits and Approvals Needed

Table 1.6-1 details the permits, licenses, agreements, and certifications required for project construction.

Table 1.6-1. Permits and Approvals

Agency	Permits, Licenses, Agreements, and Certifications	Status
United States Fish and Wildlife Service	Biological Opinion	Issued April 12, 2024
United States Army Corps of Engineers	Section 404 Permit/Section 408	Issued during the final design phase
California Department of Fish and Wildlife	1602 Agreement for Streambed Alteration	Issued during the final design phase
Central Valley Regional Water Quality Control Board	Section 401 Certification	Issued during the final design phase
Central Valley Regional Water Quality Control Board	Construction General Permit	Issued during the final design phase
California Department of Fish and Wildlife (CDFW)	Incidental Take Permit	If needed, issued during the final design phase
Central Valley Flood Protection Control Board	Encroachment Permit	Issued during the final design phase
Federal Highway Administration	Air Quality Conformity Determination	FHWA determined project not a POAQC on October 18, 2021; reaffirmed by IAC 4/26/2024
State Historic Preservation Officer	Concurrence on Eligibility Determinations/Finding of Effect	SHPO concurred with the findings on January 12, 2022

Chapter 2 Affected Environment, Environmental Consequences, and Avoidance, Minimization, and/or Mitigation Measures

The chapter discusses potential environmental impacts of the Yolo 80 Corridor Improvements Project (project) and recommended avoidance and minimization measures (AMMs), and mitigation measures (MMs). The proposed AMMs and MMs are also summarized in Appendix C. A list of references is available in Appendix D, a list of Standard Measures is included in Appendix E, a list of abbreviations used in this document is available in Appendix F, and the list of technical studies prepared for this project is available in Appendix H. This chapter also addresses issues of concern pursuant to the California Environmental Quality Act (CEQA) and the National Environmental Policy Act (NEPA). Please see Chapter 3 for the CEQA analysis.

Topics Considered but Determined Not to Be Relevant

As part of the scoping and environmental analysis carried out for the project, the following environmental issues were considered, but no adverse impacts were identified. As a result, there is no further discussion about the following issues in this document.

- **Coastal Zone** – The project is not located within the California Coastal Zone. As such, no coastal resources would be affected by construction or operation of the project.
- **Timberlands** – The project area is not located near timberlands. Therefore, the project would not convert timberlands to a non-timberland use or otherwise affect timberlands.
- **Wild and Scenic Rivers** – The project area does not traverse any rivers designated as part of the National Wild and Scenic Rivers System or the California Wild and Scenic Rivers Act. As such, no wild or scenic rivers would be affected by construction or operation of the project.
- **Relocations and Real Property Acquisition –** The project would be constructed primarily within the existing Caltrans right-of-way. No property acquisitions are needed, and no residents or businesses would be relocated.

2.1 Human Environment

2.1.1 Existing and Future Land Use

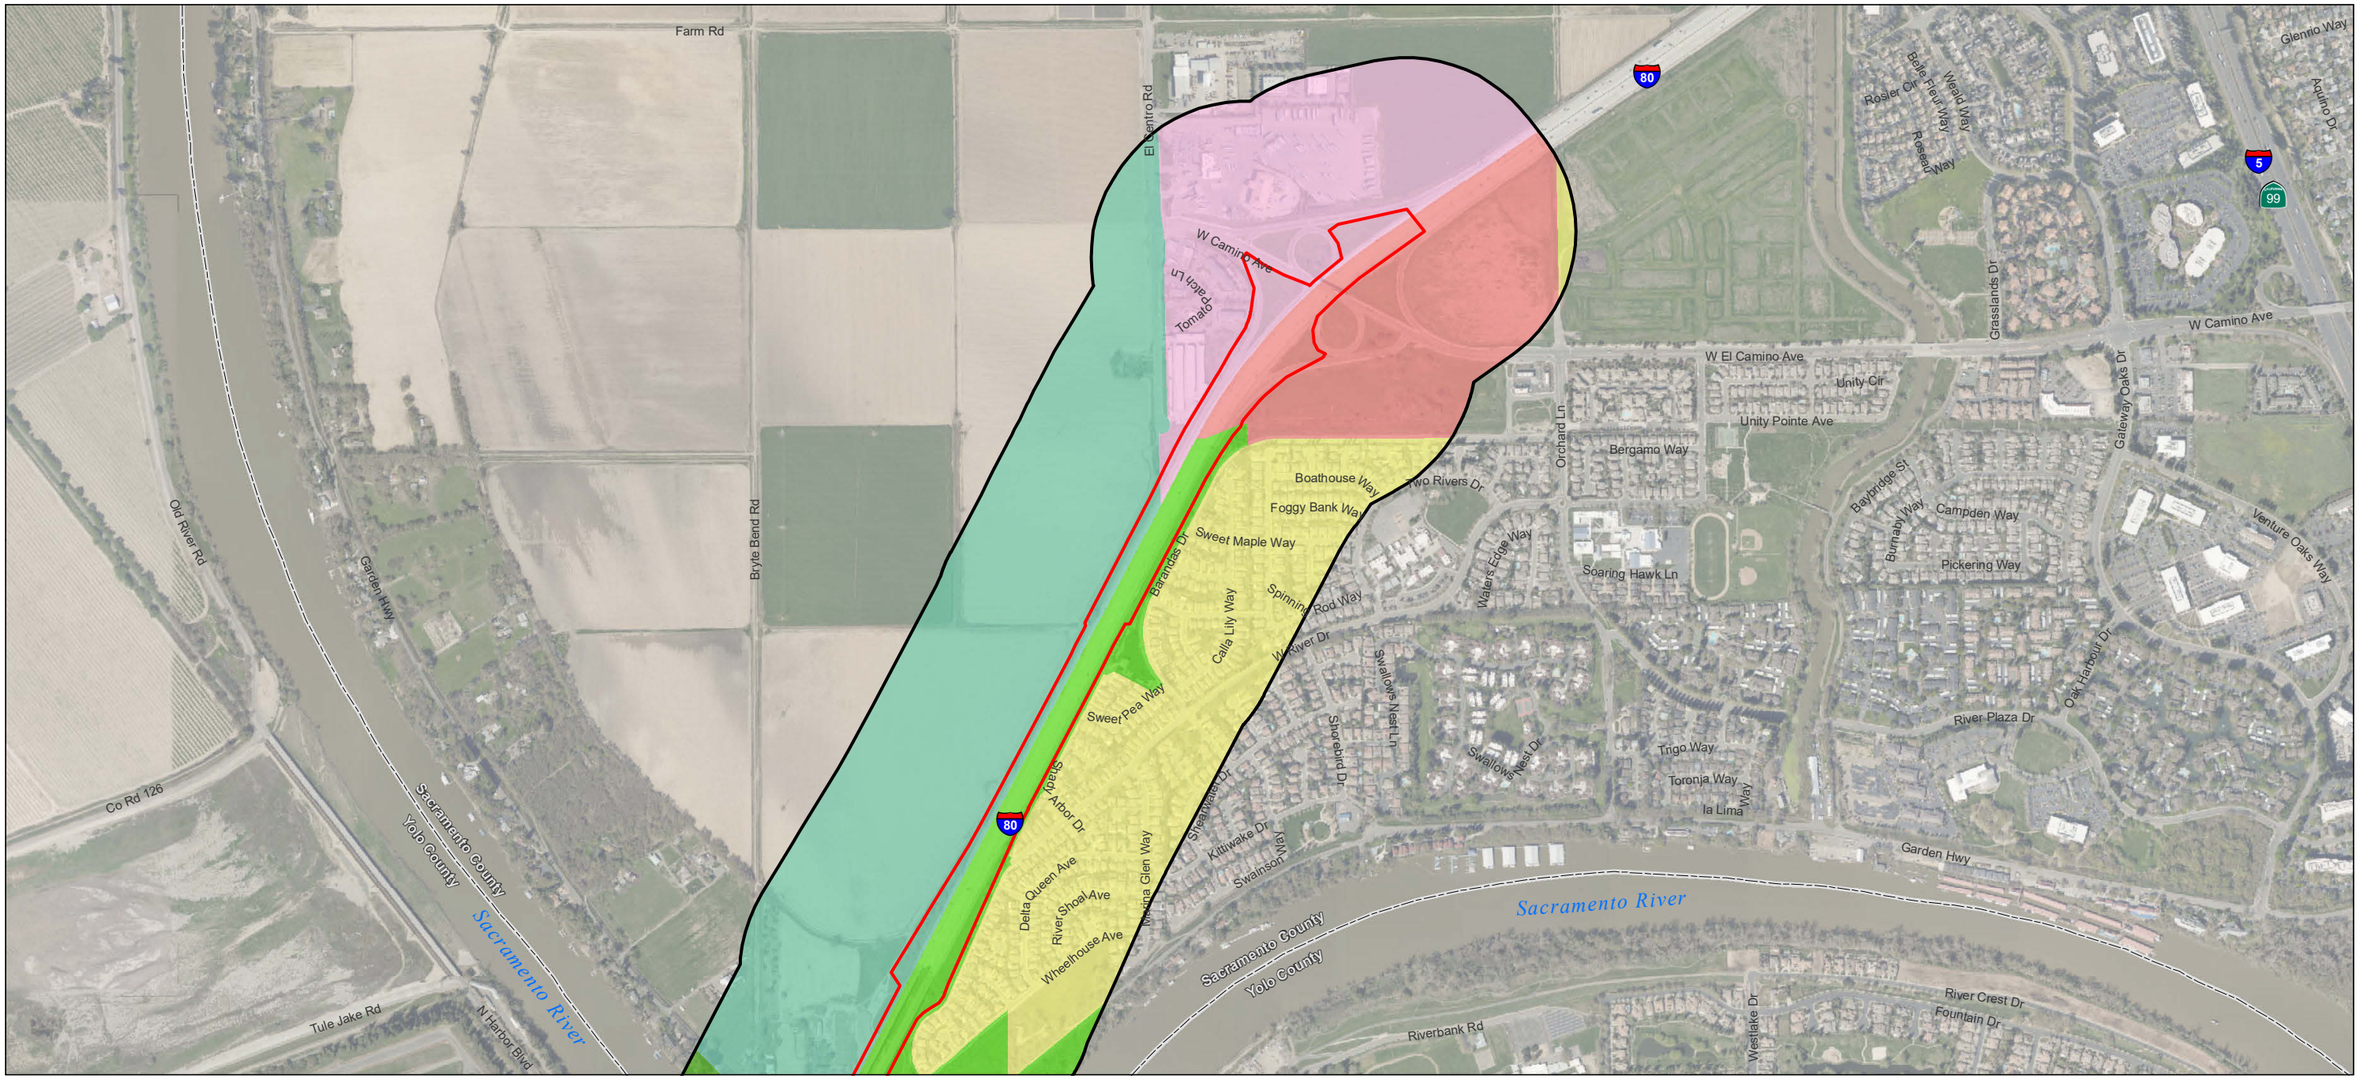
Information in this section is based on the Community Impact Assessment (CIA) prepared for the project (Caltrans 2023a).

The project is in Solano, Yolo, and Sacramento counties on the I-80/US-50 corridor, with a total project length of approximately 20.8 miles. To evaluate effects on land use, the Land Use Study Area is defined as the physical areas directly surrounding I-80/US-50 in the project area that have the potential to experience direct effects associated with the project. The Land Use Study Area includes the project area, plus a 1,000-foot buffer. The Land Use Study Area includes the population most likely to experience direct effects associated with the project's direct physical improvements.

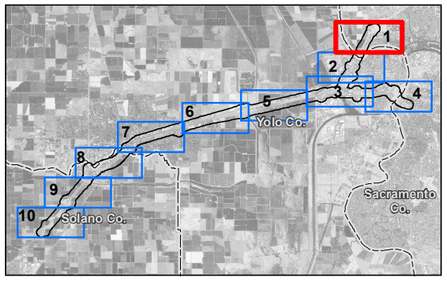
2.1.1.1 Affected Environment

The Land Use Study Area extends through multiple jurisdictions; therefore, there are various plans that guide development, land use, and transportation policies within the Land Use Study Area. Figure 2.1-1 shows designated land uses within the Land Use Study Area.

The western segment of the Land Use Study Area is located within unincorporated Solano County and is surrounded by agricultural and commercial land use designations. These agricultural areas are also mapped by Solano County with an Agricultural Reserve Overlay.



Once I-80 crosses into Yolo County, it is surrounded by the UC Davis campus, with land uses designated as public/quasi-public and agriculture. East of UC Davis, the Land Use Study Area passes through a mix of residential, industrial, open space, parks and recreation, mixed use, and commercial land uses in the city of Davis. It also passes through the City of Davis' Gateway Olive Drive Specific Plan (City of Davis 2018), which guides development in a 165-acre area north of I-80 near the Richards Boulevard Interchange.



East of the city of Davis, I-80 crosses the Yolo Causeway and links the cities of Davis and West Sacramento across the Yolo Bypass floodway. These portions of the Land Use Study Area are designated by Yolo County as agriculture and open space.

In West Sacramento, I-80 passes through mostly commercial and industrial land uses, with some residential and public/quasi-public areas. After I-80 crosses the Sacramento River, the northeastern portion of the Land Use Study Area includes agricultural land uses within unincorporated Sacramento County, and residential, mixed use, and commercial areas within the city of Sacramento.

East of Harbor Boulevard, US-50 passes through residential, commercial, and mixed-use areas in the city of West Sacramento, including the Bridge District Specific Plan area, which provides the framework for mixed-use urban redevelopment areas along the Sacramento River. After crossing the Pioneer Bridge over the Sacramento River, US-50 enters the city of Sacramento, with land uses designated as parks and recreation, commercial/employment, public/quasi-public, and residential.

In addition to existing land uses, there are projects and developments within the existing and future I-80/US-50 travelshed and a large geographic catchment. The baseline transportation and development improvement projects that are planned and proposed for locations within the project area are listed in Chapter 1.

2.1.1.2 Environmental Consequences

Indirect changes to land use can include changes in development patterns, rates, and densities, which may be influenced by changes in traffic patterns and highway capacity. The rate and location of regional growth and land use change can be influenced by travel time and travel cost for residents and workers. Improvements in access, traffic conditions, and lower travel costs can influence the attractiveness of some areas over others for future development.

As mentioned in the Fehr and Peers VMT Mitigation Estimates Technical Memo (Caltrans 2024b), the methodology utilized for calculating VMT reduction for each mitigation measure is based on modeling techniques using two different modeling strategies. The modeling strategies (SACSIM and TDM+) put forth each mitigation measure for analysis on VMT effects. As each mitigation measure was analyzed with a modeling tool, each output was then put towards equations from the California Air Pollution Control Officers Association (CAPCOA) 2021 to calculate VMT reduction. Each mitigation measure's VMT reduction is calculated and listed in the Technical Memo (Caltrans 2024b), as well as the VMT Mitigation Plan (Caltrans 2024a). Further, each mitigation measure was either part of SACOG's MTP/SCS or its own environmental review analysis. SACOG's MTP/SCS has a completed Environmental Impact Report, which incapsulates each project in the mitigation plan that is associated with the MTP/SCS.

The addition of three roundtrip train services on the Capitol Corridor route from Oakland to Sacramento would reduce VMT, as mentioned in the VMT Mitigation Plan (Caltrans 2024a). The calculations and basis for the VMT reduction is based on a Traffic Congestion Relief Program (TCRP) equation, that utilizes a direct effect and indirect effect of train services. In this case, the three additional roundtrips saves 6.3 million passenger miles, which is then multiplied by 2 to obtain the VMT reduction. Hence, the VMT reduction number of 12.6 million is shown in the VMT Mitigation Plan (Caltrans 2024a).

No Build Alternative 1

Construction and Operation

Under No Build Alternative 1, managed lanes and transportation improvements would not be constructed or operated. Therefore, the overall number of lanes in the project area would not change. As such, the No Build Alternative 1, would have no effect on existing and future land uses.

Build Alternatives 2a and 2b

Construction

Build Alternatives 2a and 2b would involve adding an HOV 2+ lane in each direction. Build Alternatives 2a and 2b would replace existing inside shoulders, construct a new median, construct pedestrian/bicycle improvements, install ITS elements, and other improvements. Build Alternative 2b would also install an I-80 connector structure. Most of the project work would occur entirely within the existing Caltrans right-of-way; however, construction would require a

temporary construction easement (TCE) and some staging areas located outside the Caltrans right-of-way. The TCE would be required to accommodate construction activities; however, such activities would not result in conversion of existing land uses adjacent to the project. No impact on existing or future land uses would occur. Therefore, Build Alternatives 2a and 2b would have no effect on existing and future land uses during construction. However, there will be impacts to Vehicle Miles Traveled (VMT), where the build alternatives will induce VMT through the project scope. As part of mitigation, the project will reduce VMT through VMT mitigation efforts.

As mentioned in the Fehr and Peers VMT Mitigation Estimates Technical Memo (Caltrans 2024b), the methodology utilized for calculating VMT reduction for each mitigation measure is based on modeling techniques using two different modeling strategies. The modeling strategies (SACSIM and TDM+) put forth each mitigation measure for analysis on VMT effects. As each mitigation measure was analyzed with a modeling tool, each output was then put towards equations from the California Air Pollution Control Officers Association (CAPCOA) 2021 to calculate VMT reduction. Each mitigation measure's VMT reduction is calculated and listed in the Technical Memo (Caltrans 2024b), as well as the VMT Mitigation Plan (Caltrans 2024a). Further, each mitigation measure was either part of SACOG's MTP/SCS or its own environmental review analysis. SACOG's MTP/SCS has a completed Environmental Impact Report, which incapsulates each project in the mitigation plan that is associated with the MTP/SCS.

The addition of three roundtrip train services on the Capitol Corridor route from Oakland to Sacramento would also reduce VMT, as mentioned in the VMT Mitigation Plan (Caltrans 2024a). The calculations and basis for the VMT reduction is based on a Traffic Congestion Relief Program (TCRP) equation, that utilizes a direct effect and indirect effect of train services. In this case, the three additional roundtrips save 6.3 million passenger miles, which is then multiplied by 2 to obtain the VMT reduction. Hence, the VMT reduction number of 12.6 million is shown in the VMT Mitigation Plan (Caltrans 2024a).

Operation

Build Alternatives 2a and 2b would involve acquisition of one permanent right-of-way easement for the proposed park-and-ride facility. No displacement of residences or businesses would be required.

By increasing freeway capacity and reducing travel costs, Build Alternatives 2a and 2b could change the rate of development expected compared to the No-Build condition. Since I-80 is a key link between the Sacramento and Bay Area, and homes in the Sacramento area are typically more affordable than homes in the Bay Area, the improved travel times on I-80 in the Project corridor could influence more Bay Area residents to move east to the Sacramento area and commute to job centers. However, other bottlenecks on I-80 and other highways into the Bay Area west of the Project (e.g., I-680, I-580, I-880, SR-37, SR-4) may deter commuters from Sacramento and outlying areas to the Bay Area. Within the Community Study Area, planned development at UC Davis and West Sacramento may benefit from the transportation improvement provided under the project, making these areas more attractive and changing the rate at which planned development would occur along the corridor. Improving travel times and capacity along I-80 is not expected to stimulate growth into areas where development is not

planned, as other impediments to growth (e.g., floodplain conditions, long-term wildlife refuge and agricultural preserves, and built-out conditions in city limits), market conditions, and local land use policies are a greater influence on land use change than roadway capacity.

The proposed Park-and-Ride Facility with approximately 300 parking spaces would be located on the east side of Enterprise Boulevard. The facility would total 4.5 acres, located partially within existing Caltrans right-of-way and partially outside the existing Caltrans right-of-way, requiring 2.8 acres of additional permanent easement acquisition. This additional right-of-way would be within an undeveloped area designated by the City of West Sacramento as "Highway-Service Commercial" land use, which provides for restaurants, service stations, hotels and motels, and other retail uses oriented principally to highway and through traffic, public and quasi-public uses, and similar and compatible uses (City of West Sacramento 2016). The construction of a park-and-ride facility is compatible with this land-use designation.

Furthermore, Build Alternatives 2a and 2b propose an extension of the Yolo Causeway Class I bicycle path along Levee Road (option A) or along the westbound off-ramp alignment (option B) to connect with County Road (CR-) 32A. This work would be completed in coordination with Yolo County, would be entirely within the Yolo County right-of-way, and would be performed through an encroachment permit acquired by Caltrans from Yolo County. Therefore, operation of Build Alternatives 2a and 2b would have no effect on existing and future land uses.

Build Alternatives 3a and 3b

Construction and Operation

Build Alternatives 3a and 3b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively. Therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b.

Build Alternatives 4a and 4b

Construction and Operation

Build Alternatives 4a and 4b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively. Therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b.

Build Alternatives 5a and 5b

Construction and Operation

Build Alternatives 5a and 5b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively. Therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b.

Build Alternatives 6a and 6b

Construction and Operation

Build Alternatives 6a and 6b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively. Therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b.

Build Alternatives 7a and 7b

Construction and Operation

Build Alternatives 7a and 7b would involve repurposing the current number 1 general purpose lane to HOV 2+. No new lanes would be constructed. Build Alternatives 7a and 7b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively. Therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b.

2.1.1.3 Avoidance, Minimization, and/or Mitigation Measures

No AMMs or MMs are required.

2.1.2 Consistency with Regional, and Local Plans and Programs

2.1.2.1 Affected Environment

This section identifies state, regional, and local plans and programs, and describes how the project would be consistent with or conform to relevant plan and program elements (Table 2.1-1).

The segments of the I-80/US-50 corridor in the project area extend through multiple jurisdictions and are subject to the policies of several plans and programs that guide development and transportation policies within the Land Use Study Area. Regional and local plans discussed below include the SACOG Metropolitan Transportation Plan (MTP)/Sustainable Communities Strategy (SCS), the Solano County General Plan, City of Davis General Plan, Yolo County Revised Draft 2030 Countywide General Plan, City of West Sacramento General Plan, City of Sacramento 2035 General Plan, and Sacramento County 2030 General Plan.

Sacramento Area Council of Governments (SACOG) 2020 Metropolitan Transportation Plan (MTP)/Sustainable Communities Strategy (SCS)

The 2020 MTP/SCS prepared by SACOG serves as a transportation and land use strategy for the SACOG Planning Area. The overall focus for the 2020 update is to develop strategies to support access to jobs and economic opportunity, transportation options, and affordable housing in a manner that improves air quality, preserves open space, and reduces greenhouse gas (GHG) emissions. SACOG is looking at Caltrans-managed lane projects to lead efforts at transportation revenue and pricing. SACOG sees pricing mechanisms as a critical component of the regional strategy to raise revenue sufficient to build and maintain the region’s transportation

system, provide mobility benefits to residents, manage traffic and congestion, and help to achieve the state-mandated GHG reduction targets (Caltrans 2023a).

Solano County General Plan

A small part of the project area is located within unincorporated Solano County, largely within an area characterized by agricultural land use. The Transportation and Circulation chapter of the Solano County General Plan (Solano County 2008) sets forth the policy framework to shape circulation within Solano County.

The Solano County portion of the project is located within the Solano County Metropolitan Transportation Commission (MTC) area. The 2017 Solano County Regional Transportation Plan (RTP) does not include managed lanes between the Kidwell Road interchange and the Yolo County line. Although the Solano County portion of work for this project is not currently included in MTC's recently initiated RTP update, Caltrans District 4 will discuss this portion of work with the Solano County Transportation Authority. The project's scope of work for tolling facilities within Solano County is limited to advance warning signs, rather than any actual tolling facilities. The only tolling facility relations between this project and Solano County/District 4 would be if District 4 initiated its own tolling/managed lanes project from the end of the Yolo Bypass project's limits further into Solano County on I-80. Accordingly, Caltrans will continue to coordinate with Caltrans District 4, Solano County MTC, and Solano County Transportation Authority to include the Solano County portion of the project in their RTP update.

City of Davis General Plan

The City of Davis General Plan (Amended 2007) includes a transportation element that establishes goals, performance objectives, and policies to guide the evolution and development of the Davis transportation system to year 2035.

University of California, Davis 2018 Long-Range Development Plan

The UC Davis LRDP (2018) provides the growth policies for the main Davis campus and Russell Ranch research lands, totaling about 5,300 acres in Yolo and Solano counties.

Yolo County Revised Draft 2030 Countywide General Plan

Yolo County's Revised Draft 2030 Countywide General Plan (Yolo County 2009) determines land use planning throughout the unincorporated portions of the county and includes a circulation element that focuses on mobility and is correlated with the land uses in the Yolo County General Plan Land Use Element. The goals and policies emphasize multiple modes of travel and encourage non-vehicular trips.

City of West Sacramento General Plan

In 2016, the City of West Sacramento approved their General Plan 2035, which guides how the city should develop over time; specifies locations for various land uses, transportation improvements, new parks and open spaces, and other public infrastructure; and includes a

Mobility Element containing policies for developing a connected, efficient, multi-modal system (City of West Sacramento 2016).

City of Sacramento 2035 General Plan

The City of Sacramento 2035 General Plan identifies the vision, themes, and organization of the City of Sacramento. The Plan's goals, policies, and implementation programs are meant to provide a guide for future development and preservation of resources. Part 2 of the General Plan, *Citywide Goals and Policies*, includes a Mobility Element that describes Sacramento's goals and policies related to transportation.

The City of Sacramento is updating its general plan and anticipates adopting the 2040 General Plan in 2023. On January 19, 2021, the 2040 General Plan Draft Land Use Map, proposed roadway changes, and other key strategies were presented to the Sacramento City Council. The key strategies include substantial policy changes, including permitting a greater variety of housing types in single-unit neighborhoods, such as duplexes, triplexes, and fourplexes. These new policies may allow for greater density development in traditionally single-family residential neighborhoods (City of Sacramento 2022a). The goals and policies for the draft 2040 General Plan are still under review by the community through August 2023 and would be adopted in early 2024, so they are not presented in this consistency evaluation. Nevertheless, the proposed Build Alternatives would not conflict with the new housing and climate change policies proposed in the 2040 General Plan draft.

Sacramento County 2030 General Plan

The Sacramento County 2030 General Plan serves as a guide for growth and development within unincorporated Sacramento County. The plan focuses on economic growth and environmental sustainability, addressing the issues and needs of existing communities and establishing a framework for accommodating the growth of new communities. The Sacramento County General Plan includes a new growth management strategy, a stronger focus on addressing existing communities and revitalizing aging commercial corridors, a new economic development element, and strategies to reduce GHG emissions consistent with state law.

The Circulation Element of the Sacramento County General Plan was amended on October 6, 2020. Sacramento County supports the development of a regional network of Bus/Carpool lanes, including along I-80 and US-50 in the project area.

Table 2.1-1. Consistency with State, Regional and Local Plans and Programs

Policy	No Build Alternative 1	Build Alternatives 2a and 2b	Build Alternatives 3a and 3b	Build Alternatives 4a and 4b	Build Alternatives 5a and 5b	Build Alternatives 6a and 6b	Build Alternatives 7a and 7b
Sacramento Area Council of Governments Metropolitan Transportation Plan/Sustainable Communities Strategy							
Policy 12: Take steps to implement tolling or pricing of specific lanes on major facilities, such as freeways, to improve traffic management, reliability, and operations of those facilities and to help raise funding for the cost of building and maintaining large capital investments.	**Inconsistent.** The No Build Alternative does not involve tolling or pricing strategies.	**Partially Consistent**. Although Build Alternatives 2a and 2b would not implement tolling or pricing strategies, they would take steps to allow future tolling or pricing.	**Consistent.** Build Alternatives 3a and 3b would implement tolling or pricing strategies.	**Consistent.** Same as Build Alternatives 3a and 3b, respectively.	**Consistent.** Same as Build Alternatives 3a and 3b, respectively.	**Partially Consistent.** Build Alternatives 6a and 6b would not include tolling or pricing strategies. Further, due to underuse of the proposed transit lane, these alternatives would not improve traffic operations in the project corridor compared to the No-Build Alternative 1.	**Partially Consistent.** Build Alternatives 7a and 7b would not include tolling or pricing strategies. Further, due to lanes repurposed for HOVs, these alternatives would not improve traffic operations in the project corridor compared to the No-Build Alternative1.
Policy 13: All new major expansion projects on the region's freeways and expressways should be planned for eventual deployment of pricing options to both manage demand and provide a financing mechanism for capital costs. Any pricing strategy pursued should be sensitive to changes in roadway demand during different parts of the day (peak/off-peak) with the objective of managing demand and providing travel choice.	**Inconsistent.** The No Build Alternative does not involve development of a transportation improvement project.	**Partially Consistent**. Although Build Alternatives 2a and 2b would not implement tolling or pricing strategies, they would take steps to allow future tolling or pricing. Managed lanes would be operational during peak demand periods only.	**Consistent.** Build Alternatives 3a and 3b would implement tolling or pricing strategies.	**Consistent.** Same as Build Alternatives 3a and 3b, respectively.	**Consistent.** Same as Build Alternatives 3a and 2b, respectively.	**Inconsistent.** Build Alternatives 6a and 6b would not include tolling or pricing strategies. Further, due to underuse of the proposed transit lane, these alternatives would not improve traffic operations in the project corridor compared to the No-Build Alternative 1. Build Alternatives 6a and 6b would manage lanes for transit during peak hours.	**Inconsistent.** Built Alternatives 7a and 7b would not include tolling or pricing strategies. Further, due to lanes being repurposed for HOVs, these alternatives would not improve traffic operations in the project corridor compared to the No-Build Alternative 1. Build Alternatives 7a and 7b would manage lanes for HOV use during peak hours.
Policy 14: Revenues generated from facility-based pricing should be used to build and maintain a regional network of paid express lanes and, where surplus revenue is available, on strategic transit services (e.g., express buses) or other mobility solutions that can reduce vehicle miles traveled and provide multiple travel options along priced corridors.	**Inconsistent.** The No Build Alternative does not involve development of a transportation improvement project.	**Partially Consistent**. Although Build Alternatives 2a and 2b would not implement tolling or pricing strategies, they would take steps to allow future tolling or pricing.	**Consistent.** Build Alternatives 3a and 3b would implement tolling or pricing strategies.	**Consistent.** Same as Build Alternatives 3a and 2b, respectively.	**Consistent.** Same as Build Alternatives 3a and 3b, respectively.	**Inconsistent.** Build Alternative 6a and 6b would not include tolling or pricing strategies. Further, due to underuse of the proposed transit lane, these alternatives would not improve traffic operations in the project corridor compared to the No-Build Alternative 1.	**Inconsistent.** Build Alternative 7a and 7b would not include tolling or pricing strategies. Further, due to lanes being repurposed for HOVs, these alternatives would not improve traffic operations in the project corridor compared to the No-Build Alternative 1.
Policy 16: When implementing pricing strategies, both paid express lanes and mileage-based fees/PayGo, the region should make every effort to avoid negatively impacting lower-income and rural households. For regional implementation of PayGo, explore innovative options for setting fees, such as including offsetting incentives for non-vehicular travel, offsets to fees for disadvantaged households, and keying fee rates to maintenance and fix-it-first goals.	**Inconsistent.** The No Build Alternative does not involve development of a transportation improvement project.	**Partially consistent.** Build Alternatives 2a and 2b would not implement tolling or pricing strategies and the benefits to all communities would be equal. However, they would take steps to allow future tolling or pricing by adding or repurposing lanes for HOVs.	**Partially consistent.** Build Alternatives 3a and 3b would implement tolling or pricing strategies. It would benefit all travelers using the I-80/US-50 corridor, including environmental justice communities. While they would not negatively affect lower-income or rural households, these alternatives may have proportionally smaller benefits to lower-income and rural households who may be less able to pay fees for the use of managed lanes.	**Partially consistent.** Same as Build Alternatives3a and 3b, respectively.	**Partially consistent.** Same as Build Alternatives 3a and 3b, respectively.	**Partially consistent.** Build Alternatives 6a and 6b would add a transit lane in each direction. Although it would not include tolling or pricing strategies, it could potentially provide proportionally larger benefits to lower-income households using transit.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.

Policy	No Build Alternative 1	Build Alternatives 2a and 2b	Build Alternatives 3a and 3b	Build Alternatives 4a and 4b	Build Alternatives 5a and 5b	Build Alternatives 6a and 6b	Build Alternatives 7a and 7b
Policy 18: System expansion investments that are not directly paid for by new development should be focused on fixing major bottlenecks that exist today, and/or incentivize development opportunities in infill areas.	**Inconsistent.** The No Build Alternative does not involve development of a transportation improvement project.	**Consistent.** Build Alternatives 2a and 2b would address key existing bottleneck locations on I-80/US-50 in the project area.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Inconsistent.** Due to underuse of the proposed transit lane, these alternatives would not improve existing bottlenecks compared to the No-Build Alternative 1.	**Inconsistent.** Due to lanes being repurposed for HOVs, these alternatives would not improve existing bottlenecks compared to the No-Build Alternative 1.
Policy 22: Invest in bicycle and pedestrian infrastructure to encourage healthy, active transportation trips and provide recreational opportunities for residents and visitors.	**Inconsistent.** The No Build Alternative does not involve development of a transportation improvement project.	**Consistent.** Build Alternatives 2a and 2b would extend the westernmost limit of the existing Class I bicycle pathway along I-80 at the Yolo Causeway to connect to CR-32A.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.
Policy 23: Prioritize and incentivize transportation investments that benefit environmental justice communities.	**Inconsistent.** The No Build Alternative does not involve development of a transportation improvement project.	**Partially consistent.** Build Alternatives 2a and 2b would add or repurpose lanes for HOVs. The benefits to all communities would be equal, including environmental justice communities.	**Partially consistent.** Build Alternatives 3a and 3b would benefit all travelers using the I-80/US-50 corridor, including environmental justice communities. However, this alternative may have proportionally smaller benefits to environmental justice communities who may be less able to pay fees for use of HOT or express lanes.	**Partially consistent.** Same as Build Alternatives 3a and 3b, respectively.	**Partially consistent.** Same as Build Alternatives 3a and 3b, respectively.	**Consistent.** Build Alternatives 6a and 6b would add a transit lane in each direction, which could potentially provide proportionally larger benefits to environmental justice communities.	**Partially consistent.** Same as Build Alternatives 2a and 2b.
Policy 24: Invest in transportation improvements that improve access to major economic assets and job centers.	**Inconsistent.** The No Build Alternative does not involve development of a transportation improvement project.	**Consistent.** Build Alternatives 2a and 2b would improve circulation on I-80/US-50 in the project area, which would improve access to major economic assets and job centers.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Inconsistent.** Due to underuse of the proposed transit lane, these alternatives would not improve peak-hour circulation in the project corridor compared to the No-Build Alternative 1.	**Inconsistent.** Due to lanes being repurposed for HOVs, these alternatives would not improve peak-hour circulation in the project corridor compared to the No-Build Alternative 1.
Solano County General Plan							
Policy TC.P-1: Maintain and improve current transportation systems to remedy safety and congestion issues and establish specific actions to address these issues when they occur.	**Inconsistent.** The No Build Alternative does not involve development of a transportation improvement project.	**Consistent.** Build Alternatives 2a and 2b would include managed lanes to improve traffic operations on I-80/US-50 in the project area.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Inconsistent.** Due to underuse of the proposed transit lane, these alternatives would not improve peak-hour circulation in the project corridor compared to the No-Build Alternative 1.	**Inconsistent.** Due to lanes being repurposed for HOVs, these alternatives would not improve peak-hour circulation in the project corridor compared to the No-Build Alternative 1.
Policy TC.P-8: Actively participate with Caltrans, Solano Transportation Authority, cities, and other agencies to plan for any proposed future realignments of current interregional routes.	**Inconsistent.** The No Build Alternative does not involve development of a transportation improvement project.	**Consistent.** Build Alternatives 2a and 2b would include managed lanes to improve traffic operations on I-80/US-50 in the project area and this is being coordinated with other transportation planning agencies.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.

Policy	No Build Alternative 1	Build Alternatives 2a and 2b	Build Alternatives 3a and 3b	Build Alternatives 4a and 4b	Build Alternatives 5a and 5b	Build Alternatives 6a and 6b	Build Alternatives 7a and 7b
Policy TC.P-18: Encourage the development of transit facilities and operations along major corridors to connect the county with surrounding activity centers and regional destinations.	**Inconsistent.** The No Build Alternative does not involve development of a transportation improvement project.	**Consistent.** Build Alternatives 2a and 2b would include managed lanes to improve traffic operations on I-80/US-50 in the project area and development of a new Park-and-Ride Facility.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.
City of Davis General Plan							
Policy 1.2: Transportation access, accommodations, and circulation should contribute to creating a supportive environment for economic development in the downtown for both residents and visitors.	**Inconsistent.** The No Build Alternative does not involve development of a transportation improvement project.	**Consistent.** Build Alternatives 2a and 2b would improve traffic operations on I-80/US-50 in the project area, including around downtown Davis interchanges.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Inconsistent.** Due to underuse of the proposed transit lane, these alternatives would not improve peak-hour circulation in the project corridor compared to the No-Build Alternative 1.	**Inconsistent.** Due to lanes being repurposed for HOVs, these alternatives would not improve peak-hour circulation in the project corridor compared to the No-Build Alternative 1.
Policy 6.3: Address Davis' transportation needs as a major regional destination. Regularly coordinate with SACOG to ensure Davis transportation needs and priorities are appropriately considered. Coordinate with Yolo County, Solano County, and UC Davis to improve multi-modal access and connectivity between major intercity destinations. Coordinate with Yolobus, SACOG, UC Davis, and other relevant entities to provide direct public transportation service from Davis to Sacramento International Airport. Coordinate with Caltrans regarding highway corridor planning for segments that are within or may affect those within the Davis city limits related to: Highway lane widenings HOV lanes HOT lanes Interchange improvements or additions Bicycle connectivity	**Inconsistent.** The No Build Alternative does not involve development of a transportation improvement project.	**Consistent.** Build Alternatives 2a and 2b would improve traffic operations on I-80/US-50 in the project area.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Inconsistent.** Due to underuse of the proposed transit lane, these alternatives would not improve peak-hour circulation in the project corridor compared to the No-Build Alternative 1.	**Inconsistent.** Due to lanes being repurposed for HOVs, these alternatives would not improve peak-hour circulation in the project corridor compared to the No-Build Alternative 1.
UC Davis 2018 Long Range Development Plan							
Provide Land for Remote Parking Facility: Reserve land for a remote 'park n bike' facility west of Old Davis Road, near the exit ramp for I-80; consider additional multi-modal transportation and clean energy features, such as the layering of renewable energy production atop surface parking lots; facilitation of regional transit access and high-speed charging stations for electric vehicles.	**Inconsistent.** The No Build Alternative does not involve development of a transportation improvement project.	**Consistent**. Build Alternatives 2a and 2b would include managed lanes to promote multi-modal transportation options and improve traffic operations on I-80/US-50 in the project area.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.

Policy	No Build Alternative 1	Build Alternatives 2a and 2b	Build Alternatives 3a and 3b	Build Alternatives 4a and 4b	Build Alternatives 5a and 5b	Build Alternatives 6a and 6b	Build Alternatives 7a and 7b
Preserve and Enhance the Bicycle and Pedestrian Infrastructure: Preserve, enhance, and expand bicycle and pedestrian infrastructure; expand bicycle pathways and increase bicycle parking areas throughout the campus; improve bicycle safety through educational programs; reduce bicycle and pedestrian conflicts; provide more designated areas for pedestrians; provide safe and gracious walkways for pedestrians throughout campus.	**Inconsistent.** The No Build Alternative does not involve development of a transportation improvement project.	**Partially consistent.** Build Alternatives 2a and 2b would extend the westernmost limit of the existing Class I bicycle pathway along I-80 at the Yolo Causeway to connect to CR-32A.	**Partially Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Partially Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Partially Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Partially Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Partially Consistent.** Same as Build Alternatives 2a and 2b, respectively.
Foster A Healthier Transportation Ecosystem: Enhance and expand travel services and programs to meet the daily mobility needs of the campus community and create a healthier transportation ecosystem; promote more sustainable travel choices to improve health of the individual, the environment, and the institution.	**Inconsistent.** The No Build Alternative does not involve development of a transportation improvement project.	**Consistent.** Build Alternatives 2a and 2b would include managed lanes to promote multi-modal transportation options and improve traffic operations on I-80/US-50 in the project area.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.
Enhance Transit Service: Preserve and enhance transit service; continue to prioritize and improve transit access to the core campus area; consider improvements to the Hutchison Drive corridor for Unitrans buses and for safely mixing buses, bikes, and pedestrians.	**Inconsistent.** The No Build Alternative does not involve development of a transportation improvement project.	**Consistent.** Build Alternatives 2a and 2b would include managed lanes to promote multi-modal transportation options and improve traffic operations on I-80/US-50 in the project area.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Build Alternatives 6a and 6b would add a transit lane in each direction, which could improve public transit options and reduce SOVs.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.
Invest In Programs Before Parking: Invest in transportation programs before constructing additional parking infrastructure; offer programs and services that promote more sustainable travel choices and minimize impacts to overall parking supply; balance adequate parking supply with the campus objective to reduce GHG emissions.	**Inconsistent.** The No Build Alternative does not involve development of a transportation improvement project.	**Consistent.** Build Alternatives 2a and 2b would include managed lanes to promote multi-modal transportation options and improve traffic operations on I-80/US-50 in the project area.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.
Promote Ride Sharing: Promote carpools and vanpools as viable transportation options that reduce parking demand for the campus community; monitor the utilization of ride-hailing services and proactively manage campus circulation network to promote walking, biking, and busing as preferred travel modes.	**Inconsistent.** The No Build Alternative does not involve development of a transportation improvement project.	**Partially consistent.** The managed lanes under Build Alternatives 2a and 2b would incentivize increased vehicle occupancy, ride sharing, and/or transit use.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Build Alternatives 6a and 6b would add a transit lane in each direction, which could improve public transit options.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.

Policy	No Build Alternative 1	Build Alternatives 2a and 2b	Build Alternatives 3a and 3b	Build Alternatives 4a and 4b	Build Alternatives 5a and 5b	Build Alternatives 6a and 6b	Build Alternatives 7a and 7b
Single Occupancy Vehicle Reduction: Per the University of California Policy on Sustainable Practices, strive to reduce the percentage of employees and students commuting by single occupancy vehicles (SOV) in 2025 by 10 percent relative to 2015-16 SOV commute rate. By 2050, strive to have no more than 40 percent of employees and no more than 30 percent of all employees and students commuting by SOV.	**Inconsistent.** The No Build Alternative does not involve development of a transportation improvement project.	**Partially consistent.** The managed lanes under Build Alternatives 2a and 2b would incentivize increased vehicle occupancy and/or transit use, thereby reducing SOV.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Build Alternatives 6a and 6b would add a transit lane in each direction, which could improve public transit options and reduce SOVs.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.
Yolo County Revised Draft 2030 Countywide General Plan							
Policy CI-1.4: Continue to work with Caltrans, SACOG, cities, and other regional agencies to achieve timely construction of freeway, interchange, highway, and County Road improvements that are consistent with this General Plan. The County shall assist Caltrans in implementing improvements to State Highway facilities that are required due to new growth and are consistent with this General Plan.	**Inconsistent.** The No Build Alternative does not involve development of a transportation improvement project.	**Consistent.** Build Alternatives 2a and 2b would include managed lanes to improve traffic operations on I-80/US-50 in the project area.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.
Policy CI-1.10: Coordinate with appropriate entities to maintain the following as primary routes for emergency evacuation from Yolo County: I-80 – East into Sacramento and west toward Solano County and the San Francisco Bay Area.	**Inconsistent.** The No Build Alternative does not involve development of a transportation improvement project.	**Consistent.** Build Alternatives 2a and 2b would include managed lanes to improve traffic operations on I-80/US-50 in the project area.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.
Policy CI-2.1: When constructing or modifying roadways, plan for use of the roadway space by all users, including automobiles, trucks, alternative energy vehicles, agricultural equipment, transit, bicyclists, and pedestrians, as appropriate to the road classification and surrounding land uses.	**Inconsistent.** The No Build Alternative does not involve development of a transportation improvement project.	**Partially consistent.** Build Alternatives 2a and 2b would incentivize increased vehicle occupancy and/or transit use. They would also extend the westernmost limit of the existing Class I bicycle pathway along I-80 at the Yolo Causeway to connect to CR-32A.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Partially consistent.** Build Alternatives 6a and 6b would add a transit lane in each direction, which could improve the attractiveness of riding transit. It would also extend the westernmost limit of the existing Class I bicycle pathway along I-80 at the Yolo Causeway to connect to CR-32A.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.
Policy CI-2.3: Ensure that, wherever feasible, public transit and alternative mode choices are a viable and attractive alternative to the use of single occupant motor vehicles.	**Inconsistent.** The No Build Alternative does not involve development of a transportation improvement project.	**Partially consistent.** The managed lanes under Build Alternatives 2a and 2b would incentivize increased vehicle occupancy and/or transit use.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Build Alternatives 6a and 6b would add a transit lane in each direction, which could improve public transit options.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.

Policy	No Build Alternative 1	Build Alternatives 2a and 2b	Build Alternatives 3a and 3b	Build Alternatives 4a and 4b	Build Alternatives 5a and 5b	Build Alternatives 6a and 6b	Build Alternatives 7a and 7b
Policy CI-3.1: Maintain Level of Service (LOS) C or better for roadways and intersections in the unincorporated county. In no case shall land use be approved that would either result in worse than LOS C conditions or require additional improvements to maintain the required level of service, except as specified below. The intent of this policy is to consider level of service as a limit on the planned capacity of the County's roadways. I-80 (Davis City Limit to West Sacramento City Limit) – LOS F is acceptable to the County. LOS F is anticipated by Caltrans according to the Interstate 80 and Capital City Freeway Corridor System Management Plan (Caltrans 2009, as cited in Yolo County 2009).	**Inconsistent.** The No Build Alternative does not involve development of a transportation improvement project.	**Consistent.** Build Alternatives 2a and 2b would improve traffic operations on I-80/US-50 in the project area. The "b" alternative would further improve operations by providing a direct connection of the managed lanes by flying over US-50 at the I-80/US-50 interchange.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Inconsistent.** Due to underuse of the proposed transit lane, these alternatives would not improve peak-hour circulation in the project corridor compared to the No-Build Alternative 1.	**Inconsistent.** Due to lanes being repurposed for HOVs, these alternatives would not improve peak-hour circulation in the project corridor compared to the No-Build Alternative 1.
Policy CI-3.3: CEQA review for subsequent projects will analyze project traffic and circulation impacts using both the Yolo County General Plan policies and Caltrans policies as applicable. A. Consider the following objectives, following consultation with Caltrans, when making decisions to expand or modify the State highway system in Yolo County: 1. Minimize impacts to the environment. 2. Minimize increases in GHGs and air pollutants. 3. Minimize increases in VMT. 4. Minimize long-distance commute trips. 5. Fully utilize existing capacity while maintaining stable flows and speeds. 6. Provide facilities for all users including pedestrians, bicyclists, carpool users, and transit riders.	**Inconsistent.** The No Build Alternative does not involve development of a transportation improvement project.	**Partially consistent.** Build Alternatives 2a and 2b would incentivize increased vehicle occupancy and/or transit use, which could minimize increases in VMT and would provide facilities for carpool users and transit riders. Build Alternatives 2a and 2b would also improve an existing facility for bicyclists by extending the westernmost limit of the existing Class I bicycle pathway along I-80 at the Yolo Causeway to connect to CR-32A.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.
Policy CI-1.14: Encourage inter- and intra-regional traffic to use State and federal interstates and highways. The primary role of County Roads is to serve local and agricultural traffic.	**Inconsistent.** The No Build Alternative does not involve development of a transportation improvement project.	**Consistent.** Build Alternatives 2a and 2b would include managed lanes to improve traffic operations on I-80/US-50 in the project area, which could encourage inter- and intra-regional traffic to use these routes, rather than county roads.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.

Policy	No Build Alternative 1	Build Alternatives 2a and 2b	Build Alternatives 3a and 3b	Build Alternatives 4a and 4b	Build Alternatives 5a and 5b	Build Alternatives 6a and 6b	Build Alternatives 7a and 7b
Policy CI-4.3: Reduce dependence upon fossil fuels through: Reduction of vehicle trips and VMT by requiring compact, infill and mixed-use development. Use of alternatives to the drive-alone automobile, including walking, bicycling, and public transit. Promotion of ride sharing and car sharing programs.	**Inconsistent.** The No Build Alternative does not involve development of a transportation improvement project.	**Partially consistent.** Build Alternatives 2a and 2b would incentivize increased vehicle occupancy and/or transit use, which could promote the use of alternatives to the drive-alone automobile. They would also improve an existing facility for bicyclists.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.
City of West Sacramento General Plan							
Policy M-1.1: Connectivity. The City shall strive to develop a comprehensive, safe, and fully integrated multimodal transportation system that connects residents, visitors, and employees to the city and region through all available modes including connected vehicles, car/bikeshare, and autonomous modes.	**Inconsistent.** The No Build Alternative does not involve development of a transportation improvement project.	**Consistent.** Build Alternatives 2a and 2b would improve traffic operations on I-80/US-50 in the project area. The "b" alternative would further improve operations by providing a direct connection of the managed lanes by flying over US-50 at the I-80/US-50 interchange.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Inconsistent.** Due to underuse of the proposed transit lane, these alternatives would not improve peak-hour circulation in the project corridor compared to the No-Build Alternative 1.	**Inconsistent.** Due to lanes being repurposed for HOVs, these alternatives would not improve peak-hour circulation in the project corridor compared to the No-Build Alternative 1.
Policy M-1.2: Multi-modal Corridors. The City shall establish multi-modal corridors and hubs within and between urban centers and along major corridors.	**Inconsistent.** The No Build Alternative does not involve development of a transportation improvement project.	**Consistent.** Build Alternatives 2a and 2b would improve traffic operations and multi-modal opportunities on I-80/US-50 in the project area. The alternatives would include a new Park-and-Ride Facility in West Sacramento.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.
Policy M-1.3: Reduce Vehicle Miles Traveled. The City shall endeavor to reduce VMT and dependence on fossil fuels by continuing to develop a comprehensive multi-modal transportation system and compact, mixed-use development that includes more transit, bicycle, and pedestrian routes.	**Inconsistent.** The No Build Alternative does not involve development of a transportation improvement project.	**Partially consistent**. Build Alternatives 2a and 2b would incentivize increased vehicle occupancy and/or transit use. However, reduction in travel time with these alternatives would induce demand and increase VMT compared to the No-Build Alternative 1. They would also extend the westernmost limit of the existing Class I bicycle pathway along I-80 at the Yolo Causeway to connect to CR-32A.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Partially consistent.** Build Alternatives 6a and 6b would add a transit lane in each direction, which could improve the attractiveness of riding transit. It would also increase VMT compared to the No-Build Alternative 1 and extend the westernmost limit of the existing Class I bicycle pathway along I-80 at the Yolo Causeway to connect to CR-32A.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively. Build Alternative 7 would have the lowest increase in VMT.
Policy M-1.4: Public Involvement. The City shall continue to involve the public, especially those traditionally underserved by transportation services, and seek public input on transportation issues, projects, and processes from the early stage of the planning process.	**Inconsistent.** The No Build Alternative does not involve development of a transportation improvement project.	**Consistent.** Caltrans and other stakeholders have coordinated extensive public feedback on Build Alternatives 2a and 2b.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.

Policy	No Build Alternative 1	Build Alternatives 2a and 2b	Build Alternatives 3a and 3b	Build Alternatives 4a and 4b	Build Alternatives 5a and 5b	Build Alternatives 6a and 6b	Build Alternatives 7a and 7b
Policy M-1.8: Overcoming Barriers to Accessibility. The City shall strive to remove and minimize the effects of natural and manmade barriers, such as the Capital City Freeway, railways, Sacramento River, and the Deep Water Ship Channel, on accessibility between and within existing neighborhoods and districts.	**Inconsistent.** The No Build Alternative does not involve development of a transportation improvement project.	**Consistent.** Build Alternatives 2a and 2b would not change existing barriers or decrease accessibility between and within existing neighborhoods and districts.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.
Policy M-2.2: Connecting and Balance. The City shall preserve and continue to develop a comprehensive, integrated, and connected network of streets that balance walking and bicycling with public transit, automobiles, and trucks.	**Inconsistent.** The No Build Alternative does not involve development of a transportation improvement project.	**Consistent.** Build Alternatives 2a and 2b would improve traffic operations and multi-modal opportunities on I-80/US-50 in the project area.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.
Policy M-2.5: Street Amenities. The City shall require public transit, bicycle, and pedestrian amenities in street design to promote the walking, bicycling, and public transit use and complement the context of nearby centers, corridors, and neighborhoods.	**Inconsistent.** The No Build Alternative does not involve development of a transportation improvement project.	**Partially consistent.** Build Alternatives 2a and 2b would incentivize increased vehicle occupancy and/or transit use. It would also extend the westernmost limit of the existing Class I bicycle pathway along I-80 at the Yolo Causeway to connect to CR-32A.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Partially consistent.** Build Alternatives 6a and 6b would add a transit lane in each direction, which could improve the attractiveness of riding transit. It would also extend the westernmost limit of the existing Class I bicycle pathway along I-80 at the Yolo Causeway to connect to CR-32A.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.
Policy M-3.4: Multi-modal Roadway Level of Service. The City shall develop, maintain, and implement multi-modal LOS roadway standards to measure trade-offs among modes and/or create a more balanced transportation system. The City shall endeavor to achieve levels of service for bikeways, pedestrian ways, and public transit that are at least as efficient as the automobile LOS.	**Inconsistent.** The No Build Alternative does not involve development of a transportation improvement project.	**Partially consistent.** The managed lanes under Build Alternatives 2a and 2b may improve the public transit LOS. They may also improve LOS for bikeways by extending the westernmost limit of the existing Class I bicycle pathway along I-80 at the Yolo Causeway to connect to CR-32A.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Build Alternatives 6a and 6b would add a transit lane in each direction, which would improve the LOS for public transit. It may also improve LOS for bikeways by extending the westernmost limit of the existing Class I bicycle pathway along I-80 at the Yolo Causeway to connect to CR-32A.	**Partially consistent.** Due to underuse of the lanes being repurposed for HOVs, this alternative would not improve peak-hour circulation for transit in the project corridor compared to the No-Build Alternative 1. It may improve LOS for bikeways by extending the westernmost limit of the existing Class I bicycle pathway along I-80 at the Yolo Causeway to connect to CR-32A.
Policy M-3.13: Emergency Service Coordination. The City shall coordinate development and maintenance of all transportation facilities with emergency service providers to ensure continued emergency service operation and service levels.	**Inconsistent.** The No Build Alternative does not involve development of a transportation improvement project.	**Consistent.** Build Alternatives 2a and 2b would implement a TMP during construction to maintain emergency service operations and response times. Improved peak-hour traffic operations on I-80/US-50 in the project area with Build Alternatives 2 through 5 would improve long-term emergency service operation.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.

Policy	No Build Alternative 1	Build Alternatives 2a and 2b	Build Alternatives 3a and 3b	Build Alternatives 4a and 4b	Build Alternatives 5a and 5b	Build Alternatives 6a and 6b	Build Alternatives 7a and 7b
Policy M-4.1: Access to Public Transit. The City shall strive to ensure that all residents have access to adequate and safe public transit options that reduce dependence on fossil fuels and increase physical activity.	**Inconsistent.** The No Build Alternative does not involve development of a transportation improvement project.	**Partially consistent.** The managed lanes under Build Alternatives 2a and 2b would incentivize increased vehicle occupancy and/or transit use.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Build Alternatives 6a and 6b would add a transit lane in each direction, which could improve public transit options.	**Partially consistent.** Same as Build Alternatives 2a and 2b.
Policy M-4.2: Affordable Public Transit. The City shall work with the Yolo County Transit District (Yolobus) to provide adequate and affordable public transit choices, including expanded bus routes and service.	**Inconsistent.** The No Build Alternative does not involve development of a transportation improvement project.	**Partially consistent.** The managed lanes under Build Alternatives 2a and 2b would incentivize increased vehicle occupancy and/or transit use.	**Partially consistent.** Same as Build Alternatives 2a and 2b.	**Partially consistent.** Same as Build Alternatives 2a and 2b.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent**. Build Alternatives 6a and 6b would add a transit lane in each direction, which could improve public transit options.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.
Policy M-4.3: Transit Priority. The City shall consider the use of transit preferential measures, such as signal priority, bypass lanes, and queue jumps, to improve transit service reliability.	**Inconsistent.** The No Build Alternative does not involve development of a transportation improvement project.	**Partially consistent.** The managed lanes under Build Alternatives 2a and 2b could improve transit service reliability.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Build Alternatives 6a and 6b would add a transit lane in each direction, which would improve transit service reliability.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.
Policy M-4.14: Park and Ride. The City shall cooperate with Caltrans and Yolobus in the development of Park-and-Ride facilities near major transportation corridors.	**Inconsistent.** The No Build Alternative does not involve development of a transportation improvement project.	**Consistent.** Build Alternatives 2a and 2b would include construction of a Park-and-Ride Facility in West Sacramento.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.
City of Sacramento 2035 General Plan Policies							
M.1.2.1. The City shall develop an integrated, multimodal transportation system that improves the attractiveness of walking, bicycling, and riding transit over time to increase travel choices and aid in achieving a more balanced transportation system and reducing air pollution and GHG emissions.	**Inconsistent.** The No Build Alternative does not involve development of a transportation improvement project.	**Partially consistent.** Build Alternatives 2a and 2b would incentivize increased vehicle occupancy and/or transit use. They would also extend the westernmost limit of the existing Class I bicycle pathway along I-80 at the Yolo Causeway to connect to CR-32A. The “b” alternative would further improve operations by providing a direct connection of the managed lanes via a managed lane connector ramp over US-50 at the I-80/US-50 interchange.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Build Alternatives 6a and 6b would add a transit lane in each direction, which could improve the attractiveness of riding transit. It would also extend the westernmost limit of the existing Class I bicycle pathway along I-80 at the Yolo Causeway to connect to CR-32A.	**Partially consistent.** Build Alternatives 7a and 7b would repurpose lanes for HOVs, which may incentivize carpool and transit use. However, this alternative would not improve circulation on the project corridor compared to the No-Build Alternative 1.
M.1.3.6. The City shall work with adjacent jurisdictions and SACOG to identify existing and future transportation corridors that should be linked across jurisdictional boundaries to provide desired upstream and downstream traffic operations and to preserve sufficient right-of-way.	**Inconsistent.** The No Build Alternative does not involve development of a transportation improvement project.	**Consistent.** Build Alternatives 2a and 2b would improve traffic operations on I-80/US-50 in the project area. The “b” alternative would further improve operations by providing a direct connection of the managed lanes by flying over US-50 at the I-80/US-50 interchange.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Inconsistent.** Due to the projected underutilization of the managed lanes under Build Alternatives 6 and 7, these alternatives would result in degraded I-80/US 50 corridor performance compared to the No-Build Alternative and would not meet the Project objectives.	**Inconsistent.** Due to lanes being repurposed for HOVs, these alternatives would not improve peak-hour circulation in the project corridor compared to the No-Build Alternative 1.

Policy	No Build Alternative 1	Build Alternatives 2a and 2b	Build Alternatives 3a and 3b	Build Alternatives 4a and 4b	Build Alternatives 5a and 5b	Build Alternatives 6a and 6b	Build Alternatives 7a and 7b
M.1.4.1. The City shall work with a broad range of agencies (e.g., SACOG, SMAQMD, SacRT, Caltrans) to encourage and support programs that increase regional average vehicle occupancy, including the provision of traveler information, shuttles, preferential parking for carpools/vanpools, transit pass subsidies, road and parking pricing, and other methods.	**Inconsistent.** The No Build Alternative does not involve development of a transportation improvement project.	**Consistent.** The types of managed lanes under Build Alternatives 2a and 2b would incentivize increased vehicle occupancy and/or transit use.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Inconsistent.** Build Alternatives 5a and 5b would create an express lane in each direction where all users pay a fee regardless of vehicle occupancy. Therefore, it would not encourage increased vehicle occupancy unless there were discounted fees for carpools.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.
M.1.5.6. The City shall support State highway improvement projects and management plans consistent with the MTP/SCS.	**Inconsistent.** The No Build Alternative does not involve development of a transportation improvement project.	**Consistent.** Build Alternatives 2a and 2b would improve traffic operations on I-80/US-50 in the project area consistent with the MTP/SCS. The "b" alternative would further improve operations by providing a direct connection of the managed lanes by flying over US-50 at the I-80/US-50 interchange.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Inconsistent.** Due to underuse of the proposed transit lane, these alternatives would not improve peak-hour circulation in the project corridor compared to the No-Build Alternative 1. It would be inconsistent with the MTP/SCS.	**Inconsistent.** Due to lanes being repurposed for HOVs, these alternatives would not improve peak-hour circulation in the project corridor compared to the No-Build Alternative 1. They would not be consistent with the MTP/SCS.
Sacramento County General Plan of 2005–2030							
Policy CI-2. Promote continued mobility for individuals whose access to automobile transportation is limited by age, illness, income, desire, or disability.	**Inconsistent.** The No Build Alternative does not involve development of a transportation improvement project.	**Partially consistent.** Although Build Alternatives 2a and 2b do not explicitly include improvements that benefit individuals whose access to automobile transportation is limited by age, illness, income, desire, or disability, Build Alternatives 2a and 2b include ITS, a park and ride facility, and auxiliary lane improvements that would help facilitate circulation between I-80 and the surrounding surface streets, benefiting environmental justice community members using bus and transit service.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.; however, Build Alternatives 6a and 6b add a transit-only lane, which may improve mobility for individuals who can access the existing transit system.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.
Policy CI-3. Travel modes shall be interconnected to form an integrated, coordinated, and balanced multi-modal transportation system, planned and developed consistent with the land uses to be served.	**Inconsistent.** The No Build Alternative does not involve development of a transportation improvement project.	**Partially consistent.** Build Alternatives 2a and 2b would improve operations and safety on I-80/US-50 in the project area, incentivize increased vehicle occupancy and/or transit use, and are consistent with the land uses to be served. These Build Alternatives include bicycle and pedestrian infrastructure improvements that would promote non-motorized travel modes throughout the project area.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.

Policy	No Build Alternative 1	Build Alternatives 2a and 2b	Build Alternatives 3a and 3b	Build Alternatives 4a and 4b	Build Alternatives 5a and 5b	Build Alternatives 6a and 6b	Build Alternatives 7a and 7b
Policy CI-4. Provide multiple transportation choices to link housing, recreational, employment, commercial, educational, and social services.	**Inconsistent.** The No Build Alternative does not involve development of a transportation improvement project.	**Partially consistent.** Build Alternatives 2a and 2b would not provide multiple transportation choices and would incentivize increased vehicle occupancy.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively. They would incentivize increased vehicle occupancy.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively. They would incentivize increased vehicle occupancy.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively; however, Build Alternatives 6a and 6b would incentivize transit use.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively and would incentivize increased vehicle occupancy.
Policy CI-11. To preserve public mobility, freeways and thoroughfares should have limited access and maintain functional characteristics that predominantly accommodate through-traffic.	**Inconsistent.** The No Build Alternative does not involve development of a transportation improvement project.	**Consistent.** Build Alternatives 2a and 2b would improve traffic operations on I-80/US-50 in the project area. The "b" alternative would further improve operations by providing a direct connection of the managed lanes via a managed lane connector ramp over US-50 at the I-80/US-50 interchange.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Inconsistent.** Due to underuse of the proposed transit lane, these alternatives would not improve peak-hour circulation in the project corridor compared to the No-Build Alternative 1.	**Inconsistent.** Due to lanes being repurposed for HOVs, these alternatives would not improve peak-hour circulation in the project corridor compared to the No-Build Alternative 1.
Policy CI-13: Collaborate with regional transportation planning agencies and neighboring jurisdictions to provide cross-jurisdictional mobility.	**Inconsistent.** The No Build Alternative does not involve development of a transportation improvement project.	**Consistent.** Build Alternatives 2a and 2b would improve traffic operations on I-80/US-50 in the project area, improving cross-jurisdictional mobility. The "b" alternative would further improve operations by providing a direct connection of the managed lanes via a managed lane connector ramp over US-50 at the I-80/US-50 interchange.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Inconsistent.** Due to underuse of the proposed transit lane, these alternatives would not improve peak-hour circulation in the project corridor compared to the No-Build Alternative 1.	**Inconsistent.** Due to lanes being repurposed for HOVs, these alternatives would not improve peak-hour circulation in the project corridor compared to the No-Build Alternative 1.
Policy CI-19. Collaborate with transit service providers to provide transit services within the County that are responsive to existing and future transit demand.	**Inconsistent.** The No Build Alternative does not involve development of a transportation improvement project.	**Partially consistent.** Although there would not be an exclusive transit lane under Build Alternatives 2a and 2b, transit use of managed lanes may result in reduced travel times for transit users.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Build Alternatives 6a and 6b would add a transit lane in each direction, which would promote transit services that are responsive to existing and future transit demand.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.
Policy CI-20. Promote transit services in appropriate commercial corridors and where population and employment densities are sufficient or could be increased to support those transit services.	**Inconsistent.** The No Build Alternative does not involve development of a transportation improvement project.	**Partially consistent.** Although there would not be an exclusive transit lane under Build Alternatives 2a and 2b, transit use of managed lanes may result in reduced travel times for transit users.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Build Alternatives 6a and 6b would add a transit lane in each direction, which would promote transit services that are responsive to existing and future transit demand.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.
Policy CI-23. Consider the transit needs of senior, disabled, low-income, and transit-dependent persons in making recommendations regarding transit services.	**Inconsistent.** The No Build Alternative does not involve development of a transportation improvement project.	**Partially consistent.** Although there would not be an exclusive transit lane under Build Alternatives 2a and 2b, transit use of managed lanes may result in reduced travel times for transit users.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Build Alternatives 6a and 6b would add a transit lane in each direction, which would reduce travel times for transit users and thereby may benefit senior, disabled, low-income, and transit-dependent persons.	**Partially consistent.** Same as Build Alternatives 2a and 2b, respectively.

Policy	No Build Alternative 1	Build Alternatives 2a and 2b	Build Alternatives 3a and 3b	Build Alternatives 4a and 4b	Build Alternatives 5a and 5b	Build Alternatives 6a and 6b	Build Alternatives 7a and 7b
Policy CI-41. Consider Transportation System Management programs that increase the average occupancy of vehicles and divert automobile commute trips to transit, walking, and bicycling.	**Inconsistent.** The No Build Alternative does not involve development of a transportation improvement project.	**Consistent.** The types of managed lanes under Build Alternatives 2a and 2b would incentivize increased vehicle occupancy and/or transit use.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Inconsistent.** Build Alternatives 5a and 5b would create an express lane in each direction where all users pay a fee regardless of vehicle occupancy. Therefore, it would not directly encourage increased vehicle occupancy.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.
Policy CI-42. Collaborate with other agencies to develop measures to provide for more efficient traffic flow, reduce vehicular travel demand and meet air quality goals.	**Inconsistent.** The No Build Alternative does not involve development of a transportation improvement project.	**Consistent.** To varying degrees, Build Alternatives 2a and 2b would improve traffic operations on I-80/US-50 in the project area, improving traffic flow. The "b" alternative would further improve operations by providing a direct connection of the managed lanes via a managed lane connector ramp over US-50 at the I-80/US-50 interchange.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Consistent.** Same as Build Alternatives 2a and 2b, respectively.	**Inconsistent.** Due to underuse of the proposed transit lane, these alternatives would not improve peak-hour circulation in the project corridor compared to the No-Build Alternative 1.	**Inconsistent.** Due to lanes being repurposed for HOVs, these alternatives would not improve peak-hour circulation in the project corridor compared to the No-Build Alternative 1.

Key:
CR=County Road; **HOV**=high-occupancy vehicle; **I**=Interstate; **LOS**=level of service; **MTP/SCS**= Metropolitan Transportation Plan (MTP)/Sustainable Communities Strategy (SCS); **SOV**=single-occupancy vehicle; **SR**=State Route; **TMP**=Transportation Management Plan; **VMT**=vehicle miles traveled

2.1.2.2 Environmental Consequences

No Build Alternative 1

Construction and Operation

Under No Build Alternative 1, managed lanes and transportation improvements would not be constructed or operated. As such, the No Build Alternative, as shown in Table 2.1-1, would be inconsistent with regional and local policies.

Build Alternatives 2a and 2b

Construction and Operation

Build Alternatives 2a and 2b would involve adding an HOV 2+ lane in each direction. Build Alternatives 2a and 2b would reduce congestion and improve safety along I-80/US-50 in the project area by incentivizing increased vehicle occupancy and thus reducing vehicular traffic demand. Build Alternatives 2a and 2b would be consistent or partially consistent with local and regional plans and policies related to improved transportation infrastructure. The “b” alternative would further improve operations by providing a direct connection of the managed lanes via a managed lane connector ramp over US-50 at the I-80/US-50 interchange (Table 2.1-1).

There will be impacts to Vehicle Miles Traveled (VMT), where the build alternatives will induce VMT through the project scope. As part of mitigation and to align with all local, regional, and state plans (including climate adaptation plans), the project will reduce VMT through VMT mitigation efforts.

As mentioned in the Fehr and Peers VMT Mitigation Estimates Technical Memo (Caltrans 2024a), the methodology utilized for calculating VMT reduction for each mitigation measure is based on modeling techniques using two different modeling strategies. The modeling strategies (SACSIM and TDM+) put forth each mitigation measure for analysis on VMT effects. As each mitigation measure was analyzed with a modeling tool, each output was then put towards equations from the California Air Pollution Control Officers Association (CAPCOA) 2021 to calculate VMT reduction. Each mitigation measure’s VMT reduction is calculated and listed in the Technical Memo (Caltrans 2024b, as well as the VMT Mitigation Plan (Caltrans 2024a). Further, each mitigation measure was either part of SACOG’s MTP/SCS or its own environmental review analysis. SACOG’s MTP/SCS has a completed Environmental Impact Report, which incapsulates each project in the mitigation plan that is associated with the MTP/SCS.

The addition of three roundtrip train services on the Capitol Corridor route from Oakland to Sacramento would also reduce VMT, as mentioned in the VMT Mitigation Plan (Caltrans 2024a). The calculations and basis for the VMT reduction is based on a Traffic Congestion Relief Program (TCRP) equation, that utilizes a direct effect and indirect effect of train services. In this case, the three additional roundtrips save 6.3 million passenger miles, which is then multiplied by 2 to obtain the VMT reduction. Hence, the VMT reduction number of 12.6 million is shown in the VMT Mitigation Plan (Caltrans 2024a).

Build Alternatives 3a and 3b

Construction and Operation

Build Alternatives 3a and 3b would involve adding an HOT 2+ lane in each direction. As described under Build Alternatives 2a and 2b, Build Alternatives 3a and 3b would reduce congestion and improve safety along I-80/US-50 in the project area by incentivizing increased vehicle occupancy, thus reducing vehicular traffic demand. Tolling strategies would be consistent with SACOG, City, and County goals to provide a funding mechanism for capital costs; however, the fees may make these alternatives less beneficial to environmental justice communities or lower-income households who may be less able to pay fees for use of HOT lanes as further described in Section 2.1.7, Environmental Justice. Although there would not be an exclusive transit lane under Build Alternatives 3a and 3b, transit's use of managed lanes may result in reduced travel times for transit users. As described in the MTP/SCS, to resolve these inconsistencies, alternatives would explore innovative options for setting fees, such as including offsetting incentives for non-vehicular travel, offsets to fees for disadvantaged households, and keying fee rates to maintenance and fix-it-first goals. Accordingly, Build Alternatives 3a and 3b would be consistent or partially consistent with local and regional plans and policies (Table 2.1-1).

Build Alternatives 4a and 4b

Construction and Operation

Build Alternatives 4a and 4b would involve adding an HOT 3+ lane in each direction. Accordingly, Build Alternatives 4a and 4b propose a priced lane and would have similar effects related to consistency with local and regional plans and policies as Build Alternatives 3a and 3b, respectively.

Build Alternatives 5a and 5b

Construction and Operation

Build Alternatives 5a and 5b would be similar to Build Alternatives 3a and 3b, respectively; however, Build Alternative 5a and 5b would create an express lane in each direction where all users pay a fee regardless of vehicle occupancy. It would not encourage increased vehicle occupancy unless there were discounted fees for carpools, and as discussed in Table 2.1-1, Build Alternatives 5a and 5b would be inconsistent with Policy M.1.4.1 and Policy CI-41 from the City of Sacramento 2035 General Plan to encourage increased vehicle occupancy. Inconsistency with land use policies will potentially require Caltrans to work with local agencies to update existing land use plans to achieve consistency. Additionally, Caltrans will implement AMM EJ-1, EJ-2, and EJ-3, and VMT reducing measures (described in Table 2.1-27). Overall, Build Alternatives 5a and 5b are partially consistent with local policies related to improved transportation infrastructure.

Build Alternatives 6a and 6b

Construction and Operation

Build Alternatives 6a and 6b would involve adding a transit-only lane in each direction, which would promote and provide reduced travel times and would be consistent with policies supporting bus rapid transit service to Sacramento International Airport. Build Alternatives 6a and 6b would reduce congestion and improve safety in the project area by incentivizing increased transit and reducing vehicular traffic demand. Although it would not include tolling or pricing strategies, it could potentially provide benefits to lower-income households using transit by reducing travel times for transit users who are generally senior, disabled, low-income, and transit-dependent persons. Build Alternatives 6a and 6b would add a transit lane in each direction which could improve the attractiveness of riding transit. Build Alternatives 6a and 6b would be consistent or partially consistent with a majority of local and regional plans and policies; however, they remain inconsistent with several policies because they would result in degraded functionality in the project corridor compared to the No-Build Alternative 1. (Table 2.1-1). Inconsistency with land use policies will potentially require Caltrans to work with local agencies to update existing land use plans to achieve consistency. Additionally, Caltrans will implement AMM EJ-1, EJ-2, and EJ-3, and VMT reducing measures (described in Table 2.1-27).

Build Alternatives 7a and 7b

Construction and Operation

Build Alternatives 7a and 7b would involve repurposing the current number one general purpose lane to HOV 2+. No new lanes would be constructed. Consistency with local and regional plans would be mostly the same as described under Build Alternatives 2a and 2b, respectively, because Build Alternatives 7a and 7b do not propose a priced lane. However, they are inconsistent with several policies because they would result in degraded functionality in the project corridor compared to the No-Build Alternative 1. Inconsistency with land use policies will potentially require Caltrans to work with local agencies to update existing land use plans to achieve consistency. Additionally, Caltrans will implement AMM EJ-1, EJ-2, and EJ-3, and VMT reducing measures (described in Table 2.1-27).

2.1.2.3 Avoidance, Minimization, and/or Mitigation Measures

No AMMs or MMs are required.

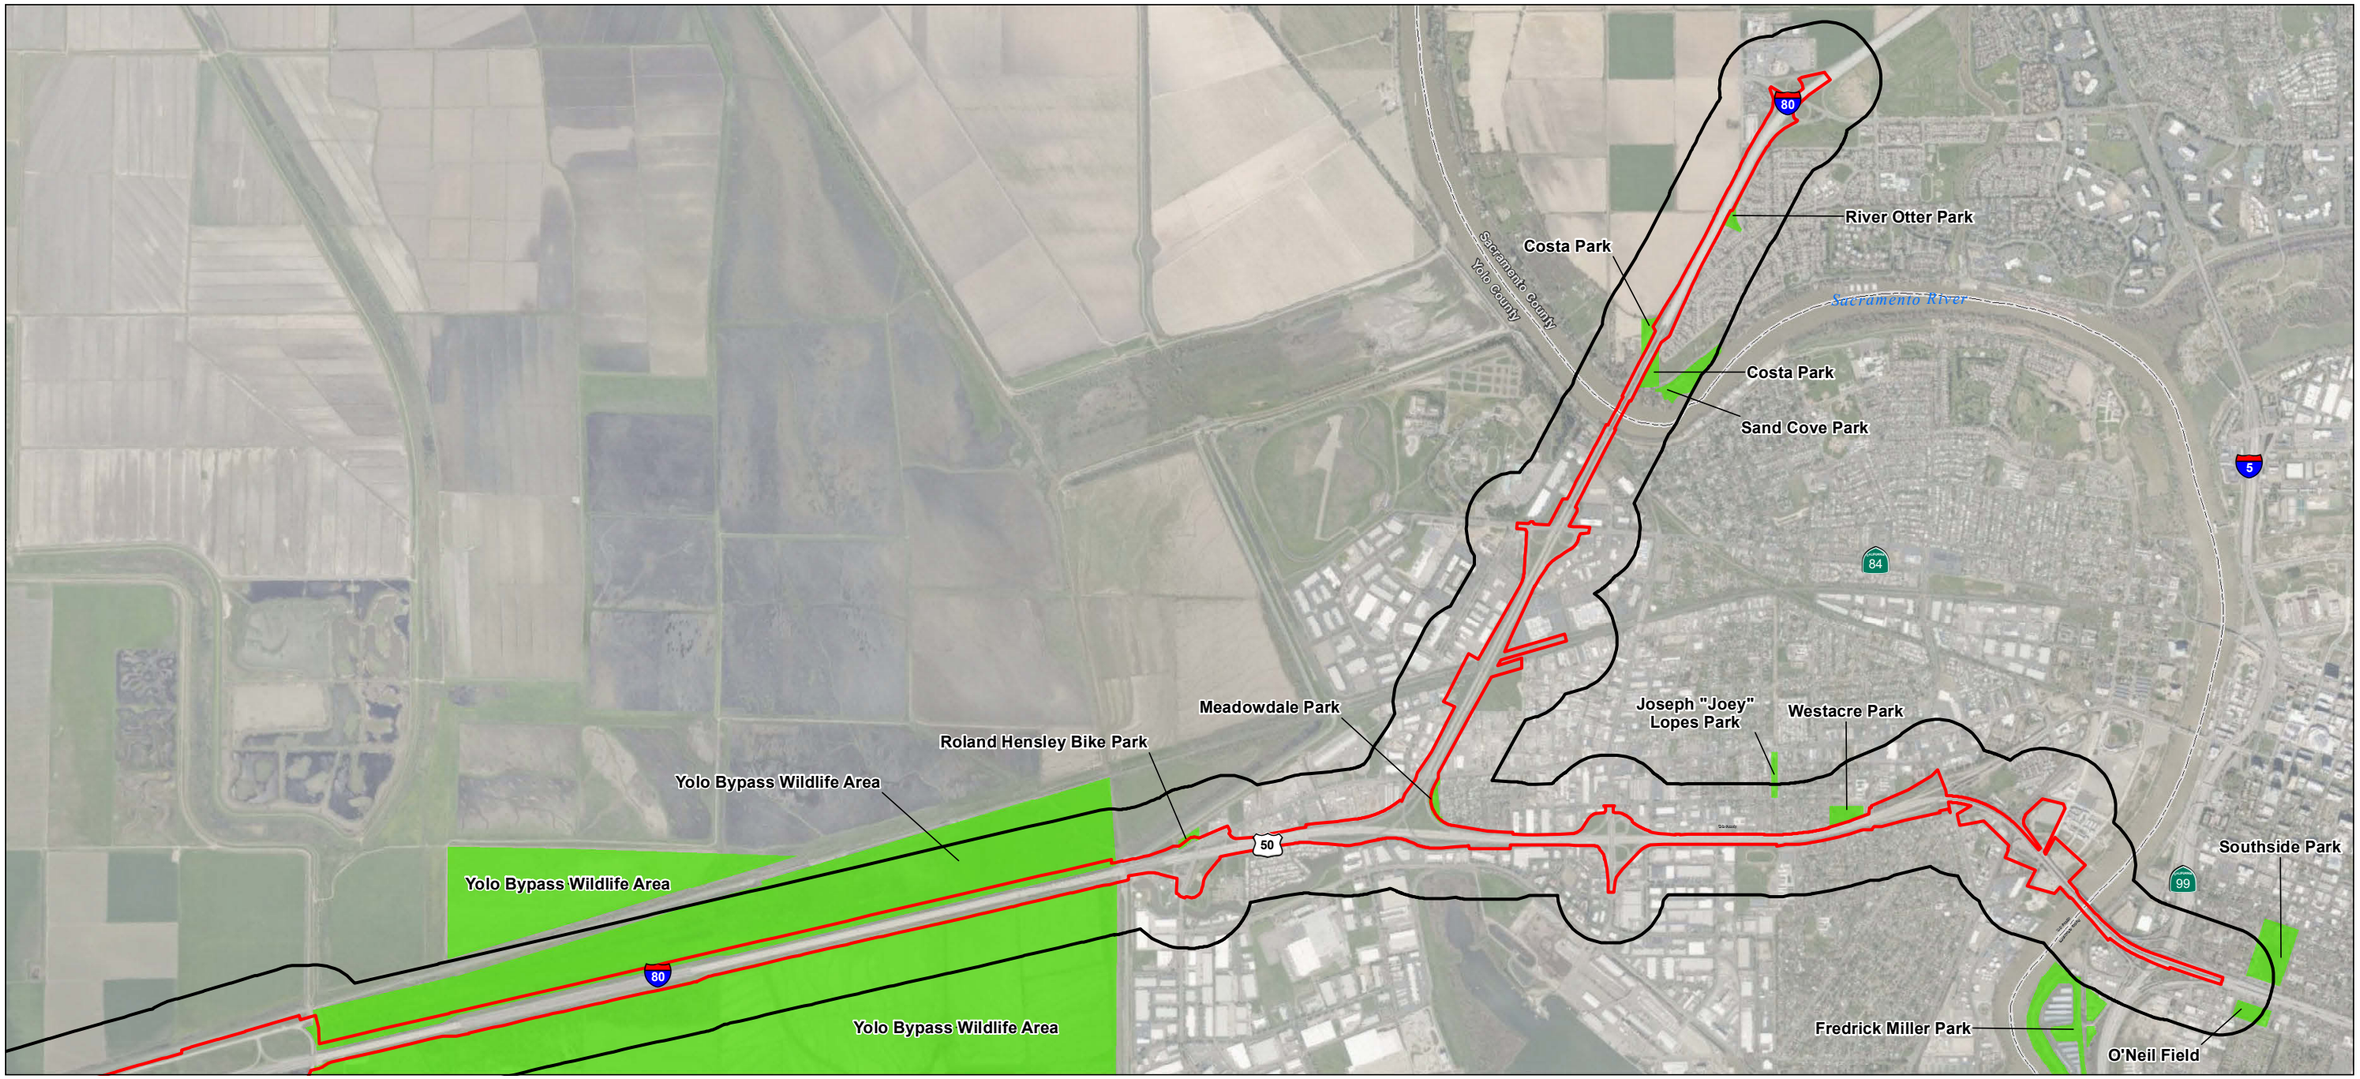
2.1.3 Parks and Recreational Facilities

2.1.3.1 Regulatory Setting

The Park Preservation Act (California Public Resources Code [PRC] Sections 5400-5409) prohibits local and state agencies from acquiring any property which is in use as a public park at the time of acquisition unless the acquiring agency pays sufficient compensation or land, or

both, to enable the operator of the park to replace the park land and any park facilities on that land.

2.1.3.2 Affected Environment



Information in this section is based on the CIA prepared for the project (Caltrans 2023a). Table 2.1-2 and Figure 2.1-2 summarize parks and recreational facilities located within 1,000 feet of the project area and Section 4(f) resources located within 500 feet of the project area.

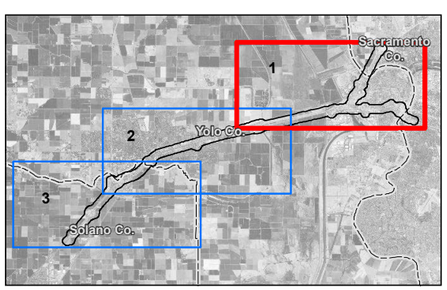


Table 2.1-2. Parks and Recreation Facilities within 1,000 Feet of the Project Area

Park and Recreational Facility Name	Description	Location	Park Operator
University of California, Davis (UC Davis) Arboretum and Public Garden	The UC Davis Arboretum and Public Garden spans the campus' 5,300-plus acres and includes the historic arboretum. It connects with the Putah Creek Riparian Reserve and is open to the public. Access is at various locations, but the visitor center is located on Le Rue Road. Section 4(f) resource – trails/nature area.	1046 Garrod Drive, Davis, CA 95616	UC Davis
Putah Creek Riparian Reserve	The Reserve is a 640-acre natural riparian and grassland ecosystem maintained and operated by the UC Davis Arboretum and Public Garden. Most of the reserve is open to the public. Section 4(f) resource – trails/nature area.	South of the intersection of Levee Road and Brooks Road, west of Highway 113, Davis, CA 95616	UC Davis Arboretum and Public Garden
Toad Hollow Dog Park	Toad Hollow Dog Park is a 2.5-acre, off-leash dog park. Section 4(f) resource – public park.	1919 2nd Street, Davis, CA 95616	City of Davis
Playfields Park	Playfields Park is a City of Davis park, approximately 16 acres, with three baseball/softball fields, a soccer field, batting cages, basketball hoops, and playground equipment. Section 4(f) resource – public park.	2500 Research Drive, Davis, CA 95618	City of Davis
Willow Creek Park	Willow Creek Park is a City of Davis park at 3800 Cowell Boulevard, approximately 5 acres, with play structures, a basketball area, and grassy areas.	3800 Cowell Boulevard, Davis, CA	City of Davis
Pioneer Park	Adjacent to Pioneer Elementary School in Davis, Pioneer Park includes a dog area, tennis courts, play structures, and restrooms.	5035 Swingle Drive, Davis, CA	City of Davis
Yolo Bypass Wildlife Area	The Wildlife Area comprises 17 separate management units covering approximately 16,600 acres. It is protected habitat for fish, waterfowl, migratory birds, raptors, invertebrates, snakes, and turtles. It is open daily to the public for wildlife viewing and fishing and includes self-driving tours along levees. Land also includes Tule Ranch, a working cattle ranch with extensive vernal pool areas and a Class 1 bicycle pathway on Levee Road managed by Yolo County. Section 4(f)/6(f) resource – wildlife area/recreational facility.	45211 CR-32B, Davis, CA 95618	California Department of Fish and Wildlife, Bay Delta Region; Yolo County
Roland Hensley Bike Park	Roland Hensley Bike Park is a 0.5-acre park in West Sacramento that provides a Class I bicycle lane that connects to the east end of the Yolo Causeway Bicycle Path. It includes a picnic area and water fountain. Section 4(f) resource – public park.	4940 West Capitol Avenue, West Sacramento, CA	City of West Sacramento

Park and Recreational Facility Name	Description	Location	Park Operator
Meadowdale Park	Meadowdale Park is a 4-acre park managed by West Sacramento and includes picnic tables, barbeques, a playground, and parking. Section 4(f) resource – public park.	3625 West Capitol Avenue, West Sacramento, CA	City of West Sacramento
Joseph "Joey" Lopes Park	The Joey Lopes Park includes play structures, picnic tables, drinking fountains, and a half-court basketball.	840-878 Sycamore Avenue, West Sacramento, CA	City of West Sacramento
Westacre Park	Westacre Park is a 5-acre park with an enclosed skateboard park, picnic tables, and shade areas. Section 4(f) resource – public park.	1755 Evergreen Avenue, West Sacramento, CA	City of West Sacramento
Jerome D. Barry Park	Jerome D. Barry Park is adjacent to the City's 3-million-gallon water facility and includes small seating areas, multi-use lawns, picnic areas, and play structures.	809 Ballpark Drive, West Sacramento, CA	City of West Sacramento
Garden Park	Garden Park is a 0.5-acre park with raised garden beds, grassy areas, public art, and picnic tables.	564 Garden Street, West Sacramento, CA	City of West Sacramento
Fredrick Miller Regional Park	Fredrick Miller Regional Park is a 40.25-acre park and includes picnic tables, restrooms, river access, a boat ramp, a marina, and a concession bar.	2710 Ramp Way, City of Sacramento, CA	City of Sacramento
O'Neil Park	O'Neil Park consists of a lighted soccer field and a baseball/softball field with restroom facilities and parking. Section 4(f) resource – public park.	715 Broadway, Sacramento, CA	City of Sacramento
Southside Park	Southside Park is a 20-acre park with tennis courts, basketball courts, a wading pool, jogging path, picnic tables, playgrounds, and a community garden. Section 4(f) resource – public park.	2115 6th Street, Sacramento, CA	City of Sacramento
Sand Cove Park	Sand Cove Park is a beach and river access park that spans 9.88 acres with a small parking lot. Section 4(f) resource – public park.	2005 Garden Highway, Sacramento, CA	City of Sacramento
River Otter Park	River Otter Park is a small (1.88-acre) park features a playground, volleyball court, and picnic tables. Section 4(f) resource – public park.	2303 Barandas Drive, Sacramento, CA	City of Sacramento
Two Rivers Park	Two Rivers Park is a 3.03-acre joint-use school and neighborhood park that features a multi-purpose sports field, picnic area, tot lot, and walkways.	3166 Two Rivers Drive, Sacramento, CA	City of Sacramento

2.1.3.3 Environmental Consequences

No Build Alternative 1

Construction and Operation

Under No Build Alternative 1, managed lanes and transportation improvements would not be constructed or operated. As such, the No Build Alternative would have no effect on parks and recreational facilities.

Build Alternatives 2a and 2b

Construction

Build Alternatives 2a and 2b would involve adding an HOV 2+ lane in each direction. Construction of Build Alternatives 2a and 2b would occur almost entirely within the existing Caltrans right-of-way with the exception of a TCE and a staging area that would be located outside the Caltrans right-of-way. Several parks and recreational facilities are located within proximity of the project area and thus, users could be subject to potential air quality and noise impacts during construction. In particular, Build Alternative 2b would have a longer duration of construction than Build Alternative 2a and thus result in longer duration of exposure to potential impacts.

There are parks, recreational facilities, and wildlife areas within the project vicinity that are protected by Section 4(f) of the Department of Transportation Act of 1966. The Section 4(f) technical memorandum prepared for the project concludes that the project would not require the permanent use or constructive use of a Section 4(f) park or recreational facility (Appendix A). There would be a temporary occupancy resulting from construction activities at Roland Hensley Bike Park managed by the City of West Sacramento and the Class 1 bicycle pathway along Levee Road managed by Yolo County located in the Yolo Bypass Wildlife Area, but in both cases exception criteria are met. Concurrence from jurisdictional agencies was received from Yolo County and the City of West Sacramento on April 10 and 15, 2024, respectively, and is provided in Appendix A.

Build Alternatives 2a and 2b would require construction-related activities within Roland Hensley Bike Park and Yolo Bypass Wildlife Area that would result in temporary occupancy of these recreation resources. However, the duration of the occupancy would be temporary, the scope of work would be minor, no adverse impacts on protected activities or access would occur, the property would be restored to same or better condition than existing prior to the project, and the local jurisdictions would be involved (Caltrans 2023b).

Seven of the facilities identified in Table 2.1-2 (i.e., River Otter Park, Meadowdale Park, Westacre Park, Roland Hensley Bike Park, Yolo Bypass Wildlife Area, Putah Creek Riparian Reserve, and UC Davis Arboretum and Public Garden) are located adjacent to the Caltrans I-80 right-of-way and are currently subject to indirect air quality and noise impacts. Build Alternatives 2a and 2b would widen to the outside on the north side of I-80 from post mile 0.1 to post mile 1.0 in Yolo County, bringing traffic slightly closer to the Toad Hollow Dog Park. Noise analysis

determined that changes in long-term noise levels would be 0 - 2 dBA greater than existing conditions, which would be barely perceptible, and the Toad Hollow Dog Park is more than 250 feet from the I-80 travel lanes, with an active railroad line and Second Street between the park and highway. Therefore, no perceptible long-term changes in noise and air quality would occur at this park.

Build Alternatives 2a and 2b would have indirect air quality and noise impacts at these facilities due to proximity to construction activities and changes in long-term traffic volumes. As discussed in Section 2.2.6, Air Quality, Standard Measures would be implemented for air quality. As discussed in Section 2.2.7, Noise, AMM NOI-1 would require noise-generating construction activities to be restricted to 7:00 a.m. to 7:00 p.m. on weekdays, with no construction occurring on weekends or holidays. If work is necessary outside of these hours, a construction noise monitoring program and provide additional noise controls would be implemented. Caltrans Standard Specifications Section 14-8.02 would require that noise levels not to exceed 86 dBA within 50 feet of the job site from the hours of 9:00 p.m. to 6:00 a.m. (Standard Measure NOI-1). Build Alternatives 2a and 2b would also implement Standard Measures NOI-2 through NOI-5 further reducing temporary construction noise levels. Indirect air quality and noise impacts as a result of the proposed project would not be expected to result in substantial impairment to any of the facilities' activities, features, or attributes (Caltrans 2023b).

Build Alternatives 2a and 2b would replace the existing bicycle pathway pavement behind the gas station located north of West Capitol Avenue from PM 9.15 to PM 9.35. The existing bicycle pathway would be rerouted during repaving activities for up to two months, and repaving activities may occur at nighttime to minimize access disruption. To maintain access during daytime hours, bicycles traveling westbound would be redirected along West Capitol Avenue; and bicycles traveling eastbound would be redirected along a short segment of sidewalk on West Capitol Avenue and would use the crosswalk at the West Capitol Avenue/westbound I-80 off-ramp intersection. Bicyclists would then continue eastbound along West Capitol Avenue using the existing bicycle lane. Caltrans would add crosswalk pavement marking across the westbound I-80 off-ramp to West Capitol Avenue and near the existing West Capitol Avenue crosswalk. In addition, Caltrans would add advanced warning signs to alert the motorists traveling on the westbound I-80 off-ramp to West Capitol Avenue before reaching the proposed crosswalk. Caltrans would place signage as part of the TMP to note the access updates and identify the bicycle/pedestrian detours.

Build Alternatives 2a and 2b would also replace the existing bicycle pathway pavement from PM 9.1 to the Yolo Causeway bridge deck approach at approximately PM 8.9. While the existing Class I bicycle pathway is closed, a temporary bicycle pathway with K-rail barriers would be placed along the I-80 westbound on-ramp from West Capitol Avenue. Up to 100 linear feet of existing barrier near PM 8.9 would be removed and realigned to allow bicycles to rejoin the existing Class I Bicycle Pathway along Yolo Causeway. The existing Class I bicycle pathway along the Yolo Causeway would not require closure during construction activities.

Build Alternatives 2a and 2b would extend the westernmost limit of the existing Class I bicycle pathway from I-80 along Yolo Causeway to connect to CR-32A. Once construction of the pathway extension along the westbound I-80 off-ramp is complete, pavement from CR-32A to

Levee Road would be rehabilitated. During pavement rehabilitation activities, Levee Road would be closed. Bicycles would be redirected along the newly constructed pathway extension on the westbound I-80 off-ramp to access the existing Class I bicycle pathway along Yolo Causeway, which would be built prior to rehabilitation activities on Levee Road. Temporarily rerouting the bicycle paths would inconvenience bicycle pathway users.

Construction activities may result in temporary traffic delays and ramp closures on I-80/US-50 that could cause temporary delays in accessing recreation facilities in and near the project area. However, Standard Measure TT-3 would require that a traffic management plan is in place to maintain access. The TMP would plan construction in sections, with no more than one lane closed at a time and no successive ramp closures. The contractor would implement a planned public outreach program to keep area residents, businesses, emergency service providers, and transit operators informed of the project construction schedule as part of Standard Measure COM-1. With these standard practices, no AMMs are required.

None of the temporary construction-related impacts would adversely affect the activities, features, or attributes of the parks and recreation facilities in or near the project area.

Operation

Operation of Build Alternatives 2a and 2b would not require the acquisition of parks or recreational facilities. As a result, operation of Build Alternatives 2a and 2b would have no effect on parks or recreational facilities in or near the project area.

Build Alternatives 3a and 3b

Construction and Operation

Build Alternatives 3a and 3b would involve adding an HOT 2+ lane in each direction. Build Alternatives 3a and 3b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively. Therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b.

Build Alternatives 4a and 4b

Construction and Operation

Build Alternatives 4a and 4b would involve adding an HOT 3+ lane in each direction. Build Alternatives 4a and 4b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively. Therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b.

Build Alternatives 5a and 5b

Construction and Operation

Build Alternatives 5a and 5b would involve adding an Express Lane in each direction. Build Alternatives 5a and 5b propose similar project components within the same project area as

Build Alternatives 2a and 2b, respectively. Therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b.

Build Alternatives 6a and 6b

Construction and Operation

Build Alternatives 6a and 6b would involve adding a transit-only lane in each direction. Build Alternatives 6a and 6b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively. Therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b.

Build Alternatives 7a and 7b

Construction and Operation

Build Alternatives 7a and 7b would involve repurposing the current number 1 general purpose lane to HOV 2+. No new lanes would be constructed. The effect would be similar to effects described under Build Alternatives 2a and 2b, respectively. Additionally, Build Alternatives 7a and 7b would have a shorter construction period than Build Alternatives 2a and 2b, respectively, and may result in fewer delays to park and recreation facilities in and near the project area.

2.1.3.4 Avoidance, Minimization, and/or Mitigation Measures

No AMMs or MMs are required.

2.1.4 Farmlands

2.1.4.1 Regulatory Setting

The National Environmental Policy Act (NEPA) and the Farmland Protection Policy Act (FPPA, 7 United States Code [USC] 4201-4209; and its regulations, 7 Code of Federal Regulations [CFR] Part 658) require federal agencies, such as the Federal Highway Administration (FHWA), to coordinate with the Natural Resources Conservation Service (NRCS) if their activities may irreversibly convert farmland (directly or indirectly) to nonagricultural use. For purposes of the FPPA, farmland includes prime farmland, unique farmland, and land of statewide or local importance.

The California Environmental Quality Act (CEQA) requires the review of projects that would convert Williamson Act contract land to non-agricultural uses. The main purposes of the Williamson Act are to preserve agricultural land and to encourage open space preservation and efficient urban growth. The Williamson Act provides incentives to landowners through reduced property taxes to discourage the early conversion of agricultural and open space lands to other uses.

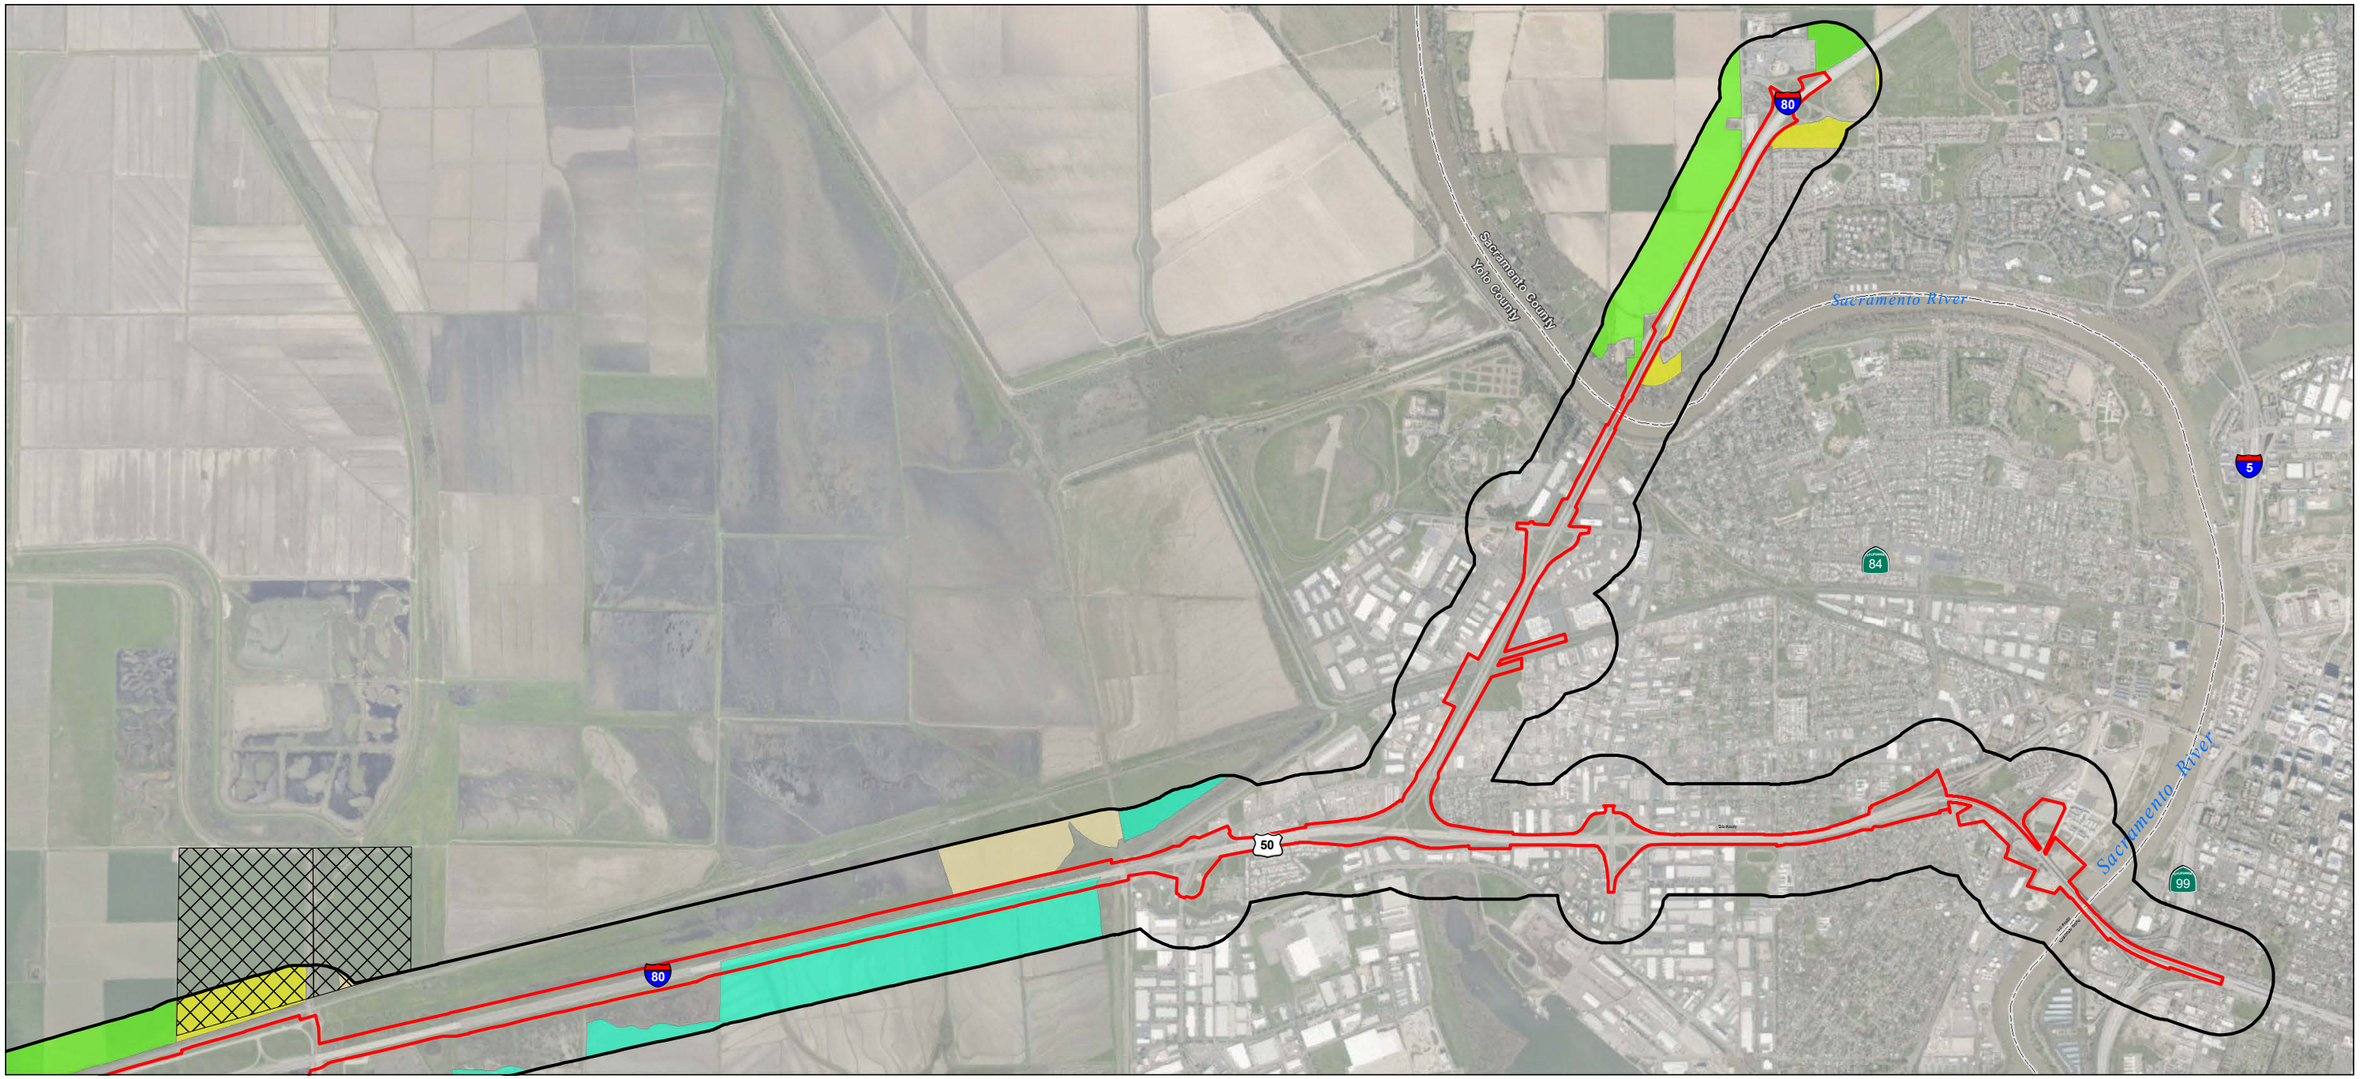
2.1.4.2 Affected Environment

Information in this section is based on the CIA prepared for the project (Caltrans 2023a).

The Department of Conservation Farmland Mapping and Monitoring Program (FMMP) produces maps and statistical data used for analyzing impacts on California agricultural resources. The important farmland category types are classified as:

- **Prime Farmland** – Prime Farmland is land that has the best combination of physical and chemical characteristics for the production of crops. It has the soil quality, growing season, and moisture supply needed to produce sustained high yields of crops when treated and managed, including water management, according to current farming methods. Prime Farmland must have been used for irrigated agricultural production at some time during the 4 years prior to the mapping date. It does not include publicly owned lands for which there is an adopted policy preventing agricultural use.

- **Farmland of Local Importance** – Farmland of Local Importance is either currently producing crops, has the capability of agricultural production, or is used for the production of confined livestock. Farmland of Local Importance is land other than Prime Farmland, Farmland of Statewide Importance, or Unique Farmland. This land may be important to the local economy due to its productivity or value. It does not include publicly owned lands for which there is an adopted policy preventing agricultural use.



- **Unique Farmland** – Unique Farmland is land that does not meet the criteria for Prime Farmland or Farmland of Statewide Importance that has been used for the production of specific high economic value crops at some time during the 4 years prior to the mapping date. It has the special combination of soil quality, location, growing season, and moisture supply needed to produce sustained high quality or high yields of a specific crop when treated and managed according to current farming methods. Examples of such crops may include oranges, olives, avocados, rice, grapes, and cut flowers. It does not include publicly owned lands for which there is an adopted policy preventing agriculture use.

- **Urban and Built-Up Land** – Urban and Built-Up Land is used for residential, industrial, commercial, construction, institutional, public administrative process, railroad yards, cemeteries, airports, golf courses, sanitary landfills, sewage treatment plants, water control structures, and other development purposes. Highways, railroads, and other transportation facilities are mapped as a part of Urban and Built-Up Land if they are a part of the surrounding urban areas.

The Land Use Study Area includes several farmland areas, mostly located within unincorporated portions of Sacramento, Yolo, and Solano counties (Figure 2.1-3). The western segment of the Land Use Study Area in Solano County consists of agricultural lands with areas classified by the FMMP as Prime Farmland and Grazing Land. These areas are also mapped as an “Agricultural Reserve” by Solano County, indicating an area that experiences high development pressure, but where the County encourages voluntary conservation easements to promote the viability of agricultural operations.

East of the city of Davis, in unincorporated Yolo County, agricultural, open space, and wildlife refuge areas border I-80 across the Yolo Causeway, with several areas classified as Prime Farmland, Farmland of Local Importance, Unique Farmland, and Grazing Land, and Farmland

of Local Potential (i.e., areas with soils characterized as being Prime or of Statewide Importance that are not presently irrigated or cultivated). At the northeastern end of the project, the portion of the Land Use Study Area north of I-80 is within unincorporated Sacramento County and contains areas designated as Prime Farmland. In this area, the portion of the Land Use Study Area south of I-80 is within the city of Sacramento and contains several small areas of Farmland of Local Importance.

In Solano County, several of the parcels designated as Prime Farmland are also under Williamson Act Contracts (Figure 2.1-3). There is also a Williamson Act parcel within Yolo County on a parcel along the Yolo Causeway that is classified as Local Potential Farmland.

The other portions of the Land Use Study Area, including the city of Davis, city of West Sacramento, and city of Sacramento are not agricultural and are classified by the FMMP as Urban and Built-up Land, Other Land, or Water.

2.1.4.3 Environmental Consequences

No Build Alternative 1

Construction and Operation

Under No Build Alternative 1, managed lanes and transportation improvements would not be constructed or operated. As such, the No Build Alternative1 would have no effect on farmlands.

Build Alternatives 2a and 2b

Construction

Build Alternatives 2a and 2b would involve adding an HOV 2+ lane in each direction, with Build Alternative 2b providing a direct connection of the managed lanes by flying over US-50 at the I-80/US-50 Interchange. Build Alternatives 2a and 2b would occur almost entirely within the existing Caltrans right-of-way and would not require the acquisition of Important Farmland or Williamson Act land for staging areas, TCEs, or to accommodate construction activities.

Operation

Build Alternatives 2a and 2b would occur almost entirely within the existing Caltrans right-of-way. Build Alternatives 2a and 2b would include a permanent easement for the proposed Park-and-Ride Facility. However, because this area is not designated as agricultural, Build Alternatives 2a and 2b would not result in the conversion of any Important Farmland or Williamson Act land to non-agricultural uses. As a result, Build Alternatives 2a and 2b would have no effect on Important Farmland or Williamson Act land in or near the project area.

Build Alternatives 3a and 3b

Construction and Operation

Build Alternatives 3a and 3b would involve adding an HOT 2+ lane in each direction. Build Alternatives 3a and 3a propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively. Therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b.

Build Alternatives 4a and 4b

Construction and Operation

Build Alternatives 4a and 4b would involve adding an HOT 3+ lane in each direction. Build Alternatives 4a and 4b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively. Therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b.

Build Alternatives 5a and 5b

Construction and Operation

Build Alternatives 5a and 5b would involve adding an Express Lane in each direction. Build Alternatives 5a and 5b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively. Therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b.

Build Alternatives 6a and 6b

Construction and Operation

Build Alternatives 6a and 6b would involve adding a transit-only lane in each direction. Build Alternatives 6a and 6b propose similar project components within the same project area as Build Alternatives 2a and 2b. Therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b.

Build Alternatives 7a and 7b

Construction and Operation

Build Alternatives 7a and 7b would involve repurposing the current number 1 general purpose lane to HOV 2+. No new lanes would be constructed. Build Alternatives 7a and 7b would not change the overall number of lanes in the project area and would have no effect on Important Farmland or Williamson Act land in or near the project area.

2.1.4.4 Avoidance, Minimization, and/or Mitigation Measures

No AMMs or MMs are required.

2.1.5 Growth

2.1.5.1 Regulatory Setting

The Council on Environmental Quality (CEQ) regulations, which established the steps necessary to comply with the National Environmental Policy Act (NEPA) of 1969, require evaluation of the potential environmental effects of all proposed federal activities and programs. This provision includes a requirement to examine indirect effects, which may occur in areas beyond the immediate influence of a proposed action and at some time in the future. The CEQ

regulations (40 Code of Federal Regulations [CFR] 1508.8) refer to these consequences as indirect impacts. Indirect impacts may include changes in land use, economic vitality, and population density, which are all elements of growth.

The California Environmental Quality Act (CEQA) also requires the analysis of a project's potential to induce growth. The CEQA Guidelines (Section 15126.2[d]) require that environmental documents "…discuss the ways in which the proposed project could foster economic or population growth, or the construction of additional housing, either directly or indirectly, in the surrounding environment…"

2.1.5.2 Affected Environment

Information in this section is based on the CIA prepared for the project (Caltrans 2023a).

Growth inducement is defined as the relationship between the proposed transportation project and growth within the project area. It is often defined as the measurable increase in population, housing, and/or employment that can be reasonably attributable to implementation of a given project. The growth inducement assessment examines the relationship of the proposed project to economic and population growth or to the construction of additional housing in the project area. It focuses on the potential for a project to facilitate or accelerate growth beyond planned developments, or influence the location, type, and rate of future growth and development.

This section considers growth trends in the regional study area that include the greater Sacramento area and the surrounding counties of El Dorado, Placer, Sutter, Yolo, and Yuba counties as defined by the MTP/SCS. The MTP/SCS estimates that by 2040, the regional study area will have added 620,000 people, as well as the jobs and housing to support them (Table 2.1-3) (SACOG 2019a). SACOG's estimated growth pattern for the region is built by examining market forces and policy/regulatory influences, and is based on adopted local government general plans, community plans, specific plans, and other local policies and regulations. Based on this analysis, the six-county region's projected housing and employment is expected to grow at a faster rate than the state and national average over the next 30 years (SACOG 2019a). In 2019, the population of the regional study area totaled 2,324,773, representing approximately 6.22 percent of the state's total population. SACOG estimates that between 2016 and 2040, the regional study area will grow by 26 percent for a total population of 2,996,832 by 2040 (SACOG 2019b).

Table 2.1-3. Forecast Growth in the Regional Study Area

Year	Population	Employees	Households	Housing Units
2016	2,376,311	1,060,751	881,799	921,123
2040	2,996,832	1,300,813	1,136,599	1,181,251
Change 2016 to 2040	26%	23%	29%	28%

Source: Sacramento Area Council of Governments Draft Environmental Impact Report for the 2020 Metropolitan Transportation Plan/ Sustainable Communities Strategy (State Clearinghouse #2019049139)

Land use changes in the regional study area over the last 35 years have influenced regional travel patterns. These growth trends have contributed to changes in local traffic on I-80/US-50 in

the project corridor. Additionally, since I-80/US-50 serves a broader area for freight, regional, and statewide traffic, growth in the Bay Area, Sacramento/San Joaquin Valley, and Sierra/Tahoe Region have also modified traffic patterns and volumes on I-80/US-50 in the project area.

Yolo County is the western edge of the Sacramento region, and an important part of the I-80/US-50 corridor linking Sacramento to the Bay Area. Over the last two decades, Yolo County has experienced most of its growth within the incorporated cities; Yolo County had an estimated 2019 population of 220,500, with much of the population residing in the incorporated cities of Davis (69,413), Woodland (60,548), West Sacramento (53,519), and Winters (7,315) (U.S. Census Bureau 2019). Yolo County continues to advocate for the protection of economically important agricultural resources and to direct growth into existing cities and unincorporated towns.

In Sacramento County, development patterns between 1980 and 2005 were typified by low-density, generally suburban development on the edges of established communities. A consequence of these development patterns has been a reliance on automobile travel to serve long-distance trips between residential areas, employment opportunities, and other activity centers. In 2004, the SACOG Board of Directors adopted the Sacramento Region Blueprint, a smart growth vision for the region. The goal of this Blueprint was to integrate land use and transportation planning to curb sprawl and cut down on vehicle emissions and congestion to improve the quality of life for residents of the region. Using smart growth principles, the Blueprint encourages a variety of housing options closer to employment, shopping, and entertainment hubs, which gives options for people to walk, bicycle, or take public transportation to work and play.

The following sections describe growth-related policies and plans from jurisdictions along the I-80/US-50 corridor.

Yolo County

The Yolo County Revised Draft 2030 Countywide General Plan (Yolo County 2009) includes goals and policies that guide land use and development, including the location of uses, population, housing, and job growth. Yolo County maintains a strong focus on protecting agricultural and open space resources and directing growth into existing incorporated cities and towns, as 93 percent of Yolo County remains in farmland and open space despite development pressures from the Sacramento and Bay Area metropolitan areas (Yolo County 2009), with most growth occurring in its incorporated cities and unincorporated towns. Most of the new urban growth allowed under the Yolo County 2030 General Plan would occur within the existing unincorporated communities of Dunnigan, Knights Landing, Madison, Esparto, and Elkhorn. The town of Esparto has most of the new housing potential.

Yolo County has adopted “smart growth” principles in its neighborhood and community design guidelines. The MTP/SCS forecast for unincorporated Yolo County is 3,300 new jobs and 2,800 new housing units, of which 2,500 new jobs and 2,700 new housing units are at the UC Davis campus (SACOG 2019a). Along the I-80 corridor, unincorporated Yolo County land is limited to agricultural, open space, and wildlife refuge designations between the cities of Davis and West

Sacramento. This area would not be subject to future development. Nevertheless, projected growth in Yolo County could contribute to changes in traffic patterns in the regional study area.

City of Davis

The city of Davis is the largest city in Yolo County with a 2019 population of approximately 68,500 persons and 25,800 housing units. The City of Davis has limited new growth areas and has implemented "slow growth" policies since the mid-1980s. The City of Davis General Plan reflects policies intended to manage growth; maintain existing community character as a small, University-oriented town surrounded by farmland, greenbelt, and natural habitat areas; and improve residential, office, and industrial areas (City of Davis 2007, 2017).

The City of Davis adopted a housing/growth resolution in 2008 that establishes an annual 1 percent growth cap (approximately 260 units), not counting affordable housing, accessory dwelling units, and units in mixed-use buildings. The resolution allows the Davis City Council to grant exemptions for projects providing extraordinary community benefits. Consistency with the growth cap is evaluated each year by the Davis City Council. By 2040, the MTP/SCS forecast for Davis includes 1,630 new employees and 3,800 new housing units; most of this growth—61 percent of the employment and 60 percent of the housing—is planned in established communities (SACOG 2019a).

University of California, Davis

Student enrollment at UC Davis increased from 25,315 students in 2000 to 39,629 students in 2019 (City of Davis 2017; UC Davis 2021). The UC Davis LRDP (2018) provides the growth policies for the main Davis campus and Russell Ranch research lands, totaling about 5,300 acres in Yolo and Solano Counties. The LRDP estimates increases in student enrollment, employment (faculty and staff), and campus student housing, and academic building space. The MTP/SCS forecasts 2,500 new jobs and 2,700 new housing units at the UC Davis campus (SACOG 2019a). Planned growth in student enrollment and employment at UC Davis contribute to traffic on I-80/US-50 in the project area.

City of West Sacramento

The City of West Sacramento has been a heavy employment base for the region, centered on the Port of (West) Sacramento and associated industrial and manufacturing uses, since the 1950s (City of West Sacramento 2016). In more recent years, the City of West Sacramento has shifted toward a mix of employment and housing, resulting in considerable residential growth over the last 20 years. The city's population has grown from 31,615 in 2000 to 53,151 in 2019 (U.S. Census Bureau 2019). In the past decade, the pace of residential development in West Sacramento has intensified.

Apart from the riverfront area, much of the northern half of the city is developed, though significant infill opportunity exists. West Sacramento's recent development focus has been mixed-use, high-density projects along the riverfront, including the Bridge District Specific Plan area, the proposed Pioneer Bluff area, and revitalization of the Washington Specific Plan area (SACOG 2019a). Residential growth over the last 20 years has focused on the Southport area.

The MTP/SCS forecast for West Sacramento includes 16,590 new employees and 16,400 new housing units by 2040 (SACOG 2019a). Much of this development would occur in infill and redevelopment opportunities. Due to its location directly across the Sacramento River from Downtown Sacramento, and the type of development planned, West Sacramento is projected to become part of the urban core of the Sacramento region.

City of Sacramento

The city of Sacramento is centrally located within Sacramento County and is the largest city in the SACOG region, with 29 percent of the region's jobs and 21 percent of the region's housing units (SACOG 2019a). The city of Sacramento is projected to increase in population from approximately 513,624 in 2019 (U.S. Census Bureau 2019) to approximately 640,400 in 2035 and will require an additional 68,000 housing units by 2035 (City of Sacramento 2011). To meet forecasted housing needs, the City of Sacramento is trending toward more multifamily infill development instead of the historical trend of single-family residential growth in outlying areas. The MTP/SCS forecast includes 73,510 new housing units and 56,210 new employees by 2040 in the city of Sacramento, with approximately 48,510 new housing units and 32,210 new employees in the central city area through primarily infill and redevelopment projects (SACOG 2019a). Adding significant numbers of new housing developments to the central city area would provide a better jobs-to-housing ratio and help reduce regional VMT (SACOG 2019a). The small portion of the project limits located in the city of Sacramento (US-50 from Sacramento River to the US-50/I-5 interchange) is a developed, urban corridor with limited new growth potential.

2.1.5.3 Environmental Consequences

No Build Alternative 1

Construction and Operation

Under No Build Alternative 1, managed lanes and transportation improvements would not be constructed or operated. As such, the No Build Alternative 1 would have no effect on growth.

Build Alternatives 2a and 2b

Construction

It is anticipated for Build Alternatives 2a and 2b that construction workers would be drawn from either existing Caltrans staff or contractors in the local area who would commute from the neighboring cities. Therefore, the construction workforce would not be required to relocate to the area and thus would not require an increased demand for housing. As a result, construction activities would have no effect on growth.

Operation

Build Alternatives 2a and 2b would add capacity to I-80/US-50 within the project area. The purpose of the project is to improve traffic flow, help reduce congestion, and increase multi-modal opportunities for travel on the highway network. By improving access and highway capacity, Build Alternatives 2a and 2b would accommodate planned growth on a regional level

and could indirectly change development patterns surrounding the project area by changing the rate at which planned development would occur along the corridor. The rate and location of regional growth and land use change may be influenced by travel time and travel cost for residents and workers. Improvements in access, traffic conditions, and lower travel costs can influence the attractiveness of some areas over others for future development. Induced travel assessments need to consider future land use sensitivity to these changing conditions.

However, Build Alternatives 2a and 2b would not remove an impediment to growth, provide an entirely new public facility, or provide new access to previously unserved areas. Build Alternatives 2a and 2b are analyzed to include expected demand and existing conditions that have arisen from past development trends.

The highway capacity enhancements are planned along an existing freeway corridor adjacent to agricultural lands, open space preserve, and within urbanized areas of the cities of Davis, West Sacramento, and Sacramento. By increasing freeway capacity and reducing travel costs, Build Alternatives 2a and 2b could change the rate of development expected compared to the No-Build condition. Since I-80 is a key link between the Sacramento and Bay Area, and homes in the Sacramento area are typically more affordable than homes in the Bay Area, the improved travel times on I-80 in the Project corridor could influence more Bay Area residents to move east to the Sacramento area and commute to job centers. However, other bottlenecks on I-80 and other highways into the Bay Area west of the Project (e.g., I-680, I-580, I-880, SR-37, SR-4) may deter commuters from Sacramento and outlying areas to the Bay Area. Within the Community Study Area, Areas of new residential development adjacent to the I-80 corridor are limited by floodplain conditions, long-term wildlife refuge and agricultural preserves, and built-out conditions in city limits. Improving travel times and capacity along I-80 is not expected to stimulate growth into nearby areas where development is not planned, as other impediments to growth (e.g., floodplain conditions, long-term wildlife refuge and agricultural preserves, and built-out conditions in city limits), market conditions, and local land use policies are a greater influence on land use change than roadway capacity.

However, smart growth policies in these existing communities prioritize infill and redevelopment projects. Additionally, development or redevelopment in these areas would be driven more by market conditions, economics, and local land use policies than the proposed transportation improvements. Accordingly, Build Alternatives 2a and 2b would not directly increase development of residential land uses, encourage growth outside of existing growth boundaries, or alter existing access to residential and employment areas. Therefore, no adverse effects associated with growth would be anticipated.

Build Alternatives 3a and 3b

Construction and Operation

Build Alternatives 3a and 3b would involve adding an HOT 2+ lane in each direction. Build Alternatives 3a and 3b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively. Therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b.

Build Alternatives 4a and 4b

Construction and Operation

Build Alternatives 4a and 4b would involve adding an HOT 3+ lane in each direction. Build Alternatives 4a and 4b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively. Therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b.

Build Alternatives 5a and 5b

Construction and Operation

Build Alternatives 5a and 5b would involve adding an Express Lane in each direction. Build Alternatives 5a and 5b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively. Therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b.

Build Alternatives 6a and 6b

Construction and Operation

Build Alternatives 6a and 6b would involve adding a transit-only lane in each direction and would not increase the afternoon peak hour volume crossing the Yolo Causeway compared to the No Build Alternative. Under Build Alternatives 6a and 6b, considerable congestion would still occur on the Yolo Causeway. However, effects would be similar to Build Alternatives 2a and 2b, respectively; and no adverse effects associated with growth would be anticipated with implementation of Build Alternatives 6a and 6b.

Build Alternatives 7a and 7b

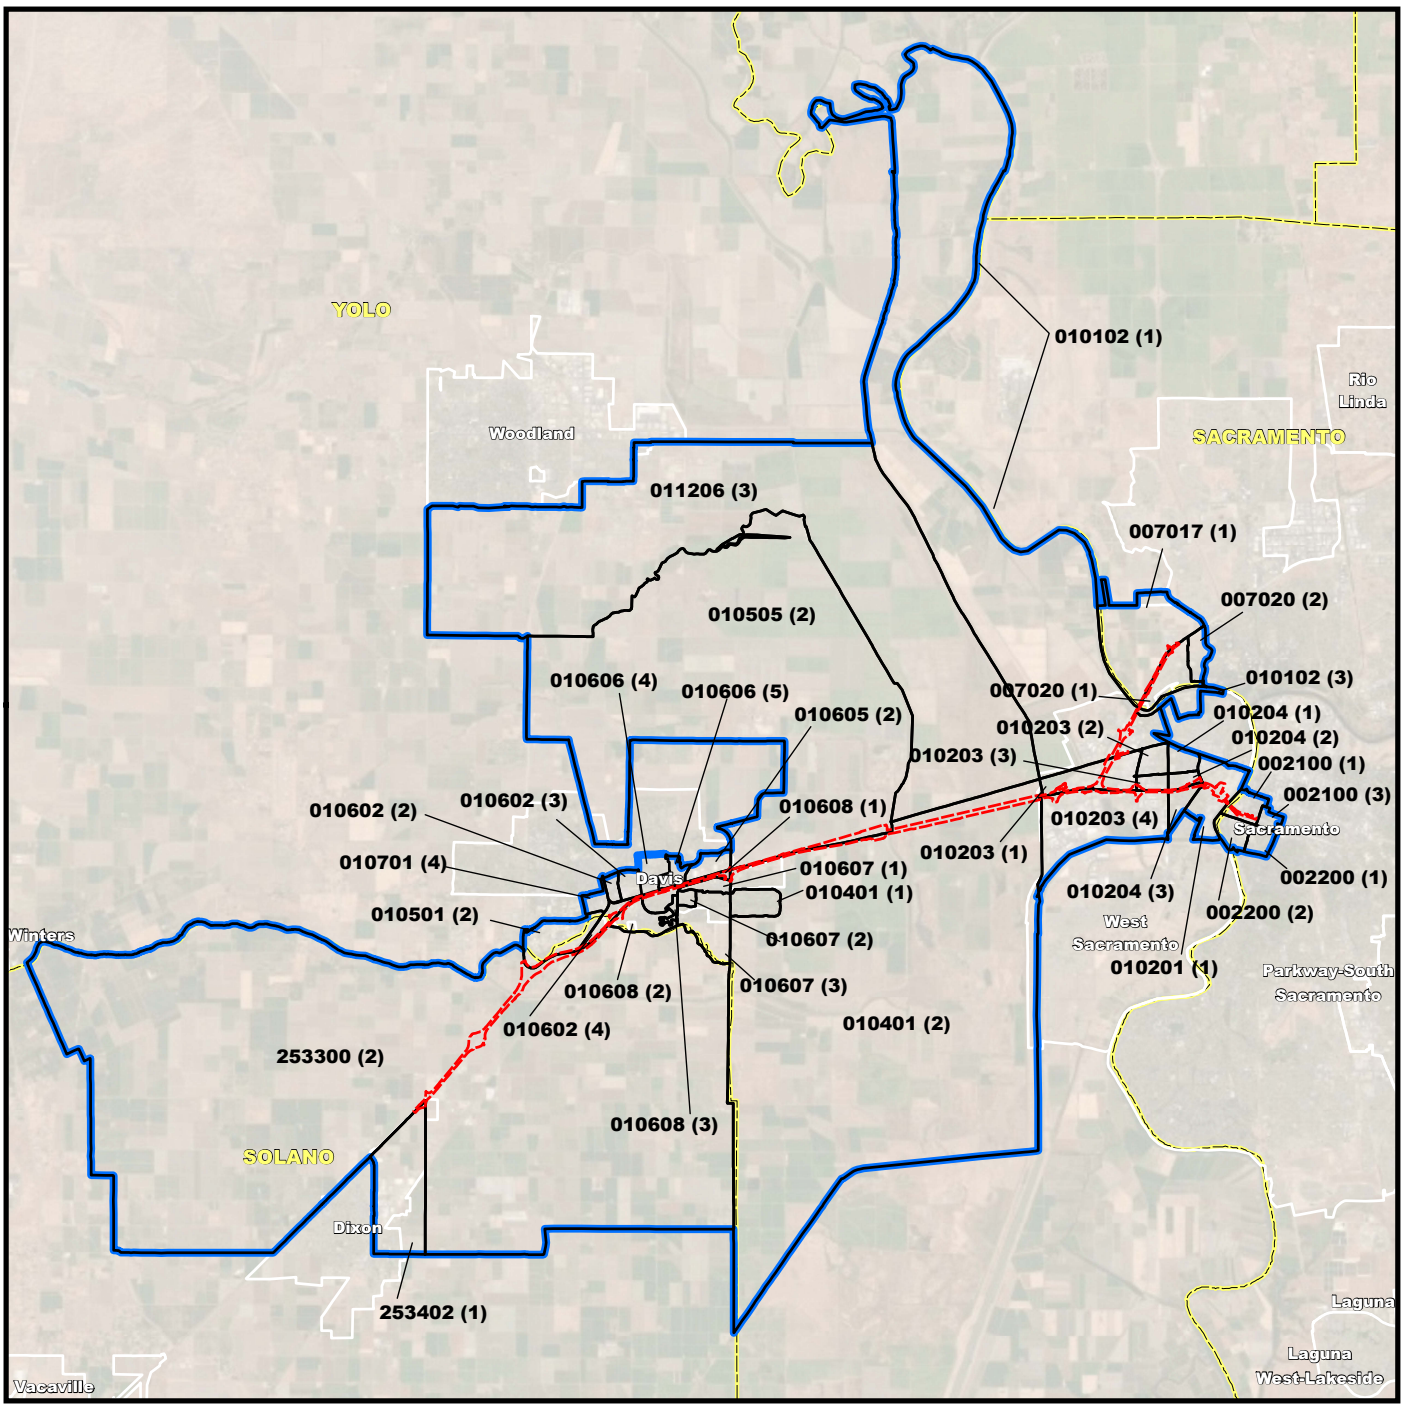
Construction and Operation

Build Alternatives 7a and 7b would involve repurposing the current number 1 general purpose lane to HOV 2+ and would not increase the afternoon peak hour volume crossing the Yolo Causeway compared to the No Build Alternative. Under Build Alternatives 7a and 7b, considerable congestion would still occur on the Yolo Causeway. However, effects would be similar to Build Alternatives 2a and 2b, respectively; and no adverse effects associated with growth would be anticipated with implementation of Build Alternatives 7a and 7b.

2.1.5.4 Avoidance, Minimization, and/or Mitigation Measures

No AMMs or MMs are required.

2.1.6 Community Character and Cohesion



2.1.6.1 Regulatory Setting

The National Environmental Policy Act (NEPA) of 1969, as amended, established that the federal government use all practicable means to ensure for all Americans safe, healthful, productive, and aesthetically and culturally pleasing surroundings (42 United States Code [USC] 4331[b][2]). The Federal Highway Administration (FHWA) in its implementation of NEPA (23 USC 109[h]) directs that final decisions on projects are to be made in the best overall public interest. This requires taking into account adverse environmental impacts, such as destruction or disruption of human-made resources, community cohesion, and the availability of public facilities and services.

Under the California Environmental Quality Act (CEQA), an economic or social change by itself is not to be considered a significant effect on the environment. However, if a social or economic change is related to a physical change, then social or economic change may be considered in determining whether the physical change is significant. Since this project would result in physical change to the environment, it is appropriate to consider changes to community character and cohesion in assessing the significance of the project's effects.

2.1.6.2 Affected Environment

Information in this section is based on the CIA prepared for the project (Caltrans 2023a). The community study area includes all census tracts and block groups immediately adjacent to the project footprint (Figure 2.1-4). Demographic characteristics for the community study area, including population demographics and economic data, were obtained from the US Census for the applicable census tracts and census block groups. The community study area was used to evaluate effects on community character in comparison to the regional study area, as defined under Section 2.1.5, Growth.

Regional Population Characteristics

Table 2.1-4 provides 2019 population for the state, regional study area, and community study area. Information for Yolo County and the cities of Davis, West Sacramento, and Sacramento are also provided for context. In 2019, the population of the regional study area totaled 2,324,773, representing approximately 6.22 percent of the state's total population. The regional study area is estimated to grow by 33 percent for a total population of 3,092,065 by 2045 (SACOG 2019a). The community study area population represents less than 3 percent of the regional study area population.

Table 2.1-4. Current Population (2019)

Area	2019 Population
California	39,283,497
Regional Study Area	2,488,449
Community Study Area	61,065
Yolo County	217,352
City of Davis	68,543
City of West Sacramento	53,151
City of Sacramento	500,930

Source: Source: U.S. Census Bureau 2019, Table B03002

Race and Ethnicity

The racial characteristics of the regional study area and community study area are presented in Table 2.1-5. The regional study area reflects a population that is a majority of white (52.1 percent). The white population accounts for 44.5 percent of the community study area's population, with the Hispanic or Latino population making the next highest majority at 28.4 percent, which is higher than the regional study area (22 percent). The population of Asian descent account for 16 percent of the community study area, which is higher than either the regional study area (13 percent) or state as a whole (14.3 percent). The population with black ethnicity makes up 4.7 percent of the community study area, which is lower than the regional study area (6.5 percent) and the state (5.5 percent). Persons identifying as Native American, Hawaiian or Pacific Islander, and Other Race ethnicities make up a small percentage of the community study area's population, at 0.2, 1.0, and 0.2 percent, respectively.

Table 2.1-5. Racial Distribution of Area Population

Area	Non-Hispanic							Hispanic or Latino
	White	Black or African American	American Indian or Alaska Native	Asian	Native Hawaiian and Other Pacific Islander	Other races	Two or more races	
California	37.2%	5.5%	0.4%	14.3%	0.4%	0.3%	3.0%	39.0%
Regional Study Area	52.1%	6.5%	0.4%	13.0%	0.8%	0.3%	4.8%	22.2%
Community Study Area	44.5%	4.7%	0.2%	16.0%	1.0%	0.2%	5.0%	28.4%
Yolo County	46.7%	2.4%	0.3%	13.9%	0.4%	0.2%	4.5%	31.6%
City of Davis	55.5%	2.1%	0.4%	22.7%	0.3%	0.4%	5.01	13.6%
City of West Sacramento	45.9%	4.6%	0.3%	10.5%	1.0%	0.1%	7.4%	30.1%
City of Sacramento	32.4%	12.7%	0.4%	18.6%	1.7%	0.4%	4.9%	28.9%

Source: U.S. Census Bureau 2019, Table B03002
Note: Percentages are based on the total number of persons in the area. The percentages do not total 100 due to margin of error and rounding.

Homogeneity of the population may contribute to higher levels of cohesion. Communities that are ethnically homogeneous often speak the same language, hold similar beliefs, and share a common culture, and are more likely to engage in social interaction on a routine basis. The community study area is ethnically diverse with 44.5 percent white, 28.4 percent Hispanic or Latino, 16.0 percent Asian, and 4.7 percent black or African American populations.

Age

As shown in Table 2.1-6, the age demographics of the community study area are similar to the regional study area. The community study area reflects a notably lower percentage of people over the age of 65 (10.4 percent) than the regional study area (15.0 percent). Additionally, the percentage of persons under the age of 18 in the community study area (21.7 percent) is slightly lower than the regional study area (23.3 percent). People over 65 and under 18 are considered more susceptible to the negative environmental effects resulting from construction projects (e.g., health impacts, air quality, noise). When compared to the regional study area as a whole, the community study area does not have a disproportionate percentage of people that are over 65 or under 18.

Communities with a higher percentage of residents aged 65 years or older tend to demonstrate a greater social commitment to their communities because they tend to be more active in the community as a result of having more time available for volunteering and participating in social organizations. The community study area has a lower population of people over age 65 (10.4 percent) than the Regional Study Area (15.0 percent).

Table 2.1-6. Age Statistics of Population

Area	Total (Under 18)	Percent of Population (Under 18)	Total (18 to 64)	Percent of Population (18 to 64)	Total (Over 65)	Percent of Population (Over 65)	Percent Under 18 and Over 65	Median Age
California	9,022,146	23.0	24,775,310	63.1	5,486,041	13.96	36.9	36.5
Regional Study Area	579,592	23.3	1,536,730	61.8	372,127	15.0	38.2	37.3
Community Study Area[1]	13,240	21.7	41,478	67.9	6,347	10.4	32.1	34.6
Yolo County	46,026	21.2	144,930	66.7	26,396	12.1	33.3	31.0
City of Davis	10,234	14.9	50,564	73.8	7,745	11.3	26.2	25.5
City of West Sacramento	13,875	26.1	33,183	62.4	6,093	11.5	37.6	34.3
City of Sacramento	115,731	23.1	319,570	63.8	65,629	13.1	36.2	34.5

Source: U.S. Census Bureau 2019., Tables B01001 and B01002
Note: 1 Age data is presented for all census tracts in the community study area.

Neighborhoods/Communities/Community Character

The community study area comprises multiple communities in Yolo and Sacramento counties. Communities are often delineated by physical barriers such as transportation infrastructure, large open spaces, and natural features such as rivers. The community study area is divided from north to south by I-80 and SR-51/I-80 Business/US-50, and from east to west by the Yolo Bypass Floodway, SR-113 in Davis, and the Sacramento River in West Sacramento and Sacramento. Pedestrian and bicycle crossing is limited over the river and over/under freeways and the floodway. The community study area includes portions of the following neighborhoods, described west to east.

Solano County

The western segment of the community study area begins in Solano County (Segment 1a) and consists of agricultural lands with few residents. Approximately 80 percent of the land in Solano County is agricultural or open space. Pockets of industrial properties are located along the I-80 corridor, such as between the Pedrick Road and Kidwell Road exits with facilities such as the CEMEX Dixon Tremont Concrete Plant. Based on the population density being low, community cohesion in unincorporated Solano County within the Project corridor is low.

City of Dixon

Dixon is located in northeastern Solano County and along I-80 within the Community Study Area. Dixon is characterized by its agricultural small-town character and is a community ringed by agricultural and open space lands. Dixon is a hub for grain, alfalfa, and dairy farming and has a long history in the sheep industry. The City hosts an annual sheep festival known as Lamb Town and the annual Dixon May Fair, the oldest state fair in California. The City of Dixon consists of pedestrian-oriented homes and businesses that are no more than three stories tall. I-

80 serves as a prominent gateway to the City of Dixon with a retail and service center geared towards highway travelers consisting of restaurants, gas stations, and motels. Based on the walkability and public space and housing design, social cohesion in the City of Dixon is moderate to high.

UC Davis Campus

I-80 crosses Putah Creek South Fork into the South Campus of UC Davis. Once I-80 crosses into Yolo County (Segment 1b), it is surrounded by the UC Davis 5,300-acre campus and associated agricultural research lands and open space, including the UC Davis Arboretum. The campus infrastructure encourages bicycling and walking with its many bike circles, wide bike lanes, and traffic signals specifically for bikes. Based on the large percentage of rental housing, small average household size, and transient student population, social cohesion at the UC Davis campus is low.

City of Davis

Between the Richards Boulevard and Mace Boulevard interchanges, Davis' south and east neighborhoods include a mix of residential and commercial land uses. Areas immediately adjacent to I-80 in Davis are characterized by multifamily residential, business, office, and commercial uses. Davis has a small-town atmosphere with an emphasis on parks and open spaces. It is a university town, with nearly one-third of all housing units occupied by students (City of Davis 2017). The Davis Farmers Market is held year-round on Wednesdays and Saturdays in Central Park. Davis has a reputation for excellent public schools, is a walkable and bikeable town, and has vibrant arts community influenced by the university offerings. Davis has also been a "slow-growth" city, resulting in housing shortages and high real estate prices. Based on the walkability, public space and housing design, racial diversity, and commute patterns indicating people work where they live, social cohesion in the City of Davis is moderate to high.

Yolo County

The community study area east of Davis (Segment 1c) is located within unincorporated Yolo County. Yolo County is typified by its small communities and rural character with over 93 percent of the county in farmland and open space. This portion of the community study area comprises agricultural and open space, as well as a wildlife refuge that borders the highway across the Yolo Causeway. The Yolo Causeway is a 3.2-mile-long elevated section of I-80 across the Yolo Bypass floodplain linking the cities of Davis and West Sacramento. The Yolo Bypass Wildlife Area is located within the Yolo Bypass, a flood control structure within the historic Yolo Basin floodplain. Based on the population density being low, social cohesion in unincorporated Yolo County within the Project corridor is low.

City of West Sacramento

In West Sacramento, the highway passes through the dominantly commercial and industrial areas along West Capitol Avenue and Industrial Boulevard. North of the I-80/US-50 interchange (Segment 2), I-80 is fronted by industrial, commercial, and business park areas. East of Harbor Boulevard (Segment 3a), US-50 passes adjacent to residential neighborhoods in the West

Sacramento, including Old West Sacramento, which is a hub for deep sea shipping and farming productions with a traditional neighborhood where homes date to the 1900s and show great pride of ownership; Pioneer Bluff which is a proposed mixed-use development area along the Sacramento River; and the Triangle or Bridge District which is a modern mixed-use redevelopment area near Raley Field with townhomes, condominiums, and single family residences. Based on the higher percentage of owner-occupied housing units and higher average household size, social cohesion in the City of West Sacramento within the Project corridor is moderate.

City of Sacramento

After crossing the Pioneer Bridge over the Sacramento River (Segment 3b), US-50 enters Sacramento. At the US-50/I-5 interchange, adjacent neighborhoods include Old Sacramento and the Southside Park neighborhood to the north and the Upper Land Park neighborhood to the south. Old Sacramento consists of historic buildings, wood-plank sidewalks, museums, the Sacramento River, and an ambience from the Gold Rush era. The historic buildings house numerous shops, restaurants, bars, and entertainment venues. This area was separated from downtown Sacramento with the construction of I-5 in the early 1970s. Old Sacramento attracts more than 3 million visitors annually. Southside Park is home to several corner markets and churches, including Our Lady of Guadalupe, which is a large Spanish-speaking church. Many annual celebrations and a Sunday Farmers Market are held throughout the year near Southside Park, a 20-acre park in this neighborhood. Upper Land Park is characterized by traditional neighborhoods, tree-lined streets, distinguished parks, and local shops. Based on the walkability, public space and housing design, and commute patterns indicating people work where they live, social cohesion in the City of Sacramento is moderate.

Housing

Table 2.1-7 and Table 2.1-8 provide data on the housing characteristics in the community study area and regional study area. As shown, in 2019, the community study area had 22,017 housing units, representing approximately 28 percent of Yolo County's total housing stock (77,947 units). Housing characteristics within the community study area vary from the housing characteristics in the regional study area. Fewer vacant housing units are available within the community study area (4.6 percent) compared to the regional study area as a whole (7.9 percent).

In the community study area, about 60 percent of the housing stock consists of single-family homes and 40 percent is multifamily, whereas the regional study area's housing stock in 2019 comprised 74 percent single-family units and 23 percent multifamily. Although subject to debate and dependent on the geographic location and other social factors, areas with a high proportion of single-family homes may be an indicator that a community has a higher degree of cohesion compared to areas with more multifamily housing.

The community study area has a significantly lower percentage of owner-occupied units at 47 percent as compared to the regional study area, and Yolo County has 60 percent and 52 percent, respectively. This difference may be due, in part, to the high percentage of rental units in Davis occupied by students. Communities with a higher percentage of owner-occupied residences are typically more cohesive because their population tends to be less mobile.

Homeowners often take a greater interest in what is happening in their communities than renters do because they have a financial stake in their communities. This often translates to a stronger sense of belonging to their communities.

The median value of homes in the community study area was also more than $134,000 higher than the overall regional study area median home value, and $83,000 more than that in Yolo County (Table 2.1-7).

The Census Bureau reports number of persons per household. This analysis assumes that higher persons per household translates to more families with children and that communities with a high percentage of families with children are more cohesive than communities consisting largely of single people. There are slightly fewer persons per household in the community study area (2.69 persons) than in either Yolo County (2.81 persons) or the regional study area (2.77 persons).

Table 2.1-7. Selected Housing Characteristics

Area	Total Housing Units	Percent Vacant (%)	Percent Single Family Units(%)	Percent multiple Family Units (%)	Percent Owner Occupied (%)	Median Value ($)	Median Rent ($ per month)
California	14,175,976	8.0	64.8	2.95	54.8	505,000	1,503
Regional Study Area	966,189	7.9	74.0	2.77	60.2	374,283	1,236
Community Study Area[1]	22,017	4.6	58.5	2.69	47.3	508,375	1,395
Yolo County	77,947	4.7	66.0	2.81	51.6	424,900	1,324
City of Davis	25,844	4.7	55.8	2.70	43.2	652,300	1,567
City of West Sacramento	19,478	4.6	69.9	2.84	56.9	349,800	1,026
City of Sacramento	196,652	5.8	66.9	2.66	48.5	336,900	1,263

Source: U.S. Census Bureau 2019, Tables B25002, B25003, B25010, B25024, B25064 and B25077
Note: 1. Housing data is presented for all census tracts in the community study area.

The community study area has higher percentages of householders who have lived in their units for shorter periods of time when compared to the regional study area and Yolo County (Table 2.1-8). The community study area comprises 13.5 percent householders who moved into their current housing unit since 2017, compared to 10.8 percent householders in the regional study area, and has only 7.4 percent householders who have lived in their current housing unit since prior to 1989, compared to the 10.2 percent householders in the regional study area. This may indicate that residents of the community study area have lived in the area for fewer years, or maybe a function of newer housing developments in the West Sacramento and Davis area. Communities with a high percentage of long-term residents are typically more cohesive because a greater proportion of the population has had time to establish social networks and develop an identity with the community.

Given the large percentage of rental units, high percentage of multi-family residential, and short average length of occupancy per housing unit, it is reasonable to assume a lower degree of social cohesion exists within the community study area as a whole compared to the regional study area. The City of Davis has the largest percentage of multi-family housing units and the largest percentage of rental units within the Community Study Area, indicating a lower level of cohesion. The City of West Sacramento has the largest percentage of owner-occupied housing and highest average householder size within the Community Study Area, indicating a moderate level of cohesion.

Table 2.1-8. Householder Tenure

Area	Year Householder Moved into Unit by Percentage					
	2017 or Later	2015 to 2016	2010 to 2014	2000 to 2009	1990 to 1999	1989 or Earlier
California	9.7	14.8	27.3	23.8	12.4	12.0
Regional Study Area[1]	10.8	16.6	27.8	23.7	10.9	10.2
Community Study Area[1]	13.5	22.4	27.4	20.9	8.5	7.4
Yolo County	11.9	18.3	26.3	22.4	11.0	10.0
City of Davis	18.3	23.4	21.1	15.6	12.3	9.2
City of West Sacramento	8.9	17.0	31.2	28.4	7.1	7.4
City of Sacramento	12.5	17.4	30.5	20.5	8.7	10.3

Source: U.S. Census Bureau 2019, Table B25038
Note: 1. Housing data is presented for all census tracts in the community study area.

Estimations from the MTP/SCS anticipate approximately 46,400 acres of land will be developed in the regional study area through 2040 to accommodate the projected increase of approximately 620,500 new residents, 260,000 new housing units, and 270,000 new employees (SACOG 2019a). To keep up with the housing demand, SACOG estimates that the region will need to produce 11,000 new homes annually on average (SACOG 2019a). Housing permit data from local building departments show increased demand for more closely situated, denser housing development in 2017 and 2018 (SACOG 2019a). SACOG's planning for future housing aligns with the Sacramento Region Blueprint, which aims to integrate land use and transportation planning to curb sprawl and reduce vehicle emissions and congestion.

Household Income

The average household size in the community study area (2.69 persons per household) was smaller than the regional study area (2.77) and the state as a whole (2.95) (Table 2.1-9). Median household incomes within the community study area ($70,759) were similar to the regional study area ($71,259) and lower than the state ($75,235). Census block groups within the community study area have some of the lowest and highest incomes in the region, with census tract 22, block group 2 (West Broadway in Sacramento) falling within the lowest range ($16,667 median household income) and census tract 106.07, block group 3 (El Macero in

Davis) falling within the highest range ($182,125 median household income). The percentage of families and individuals living below the poverty level within the community study area is higher than the regional study area or state percentage (Table 2.1-9).

Table 2.1-9. Selected Income Characteristics

Area	Population	Average Number of Persons per Household	2Median Household Income[1] ($)	Population Below Poverty Level	Percent of Individuals Below Poverty Level (%)	Percent of Families Below poverty Level[2] (%)
California	38,535,926	2.95	75,235	5,149,742	13.4	9.6
Regional Study Area	2,452,053	2.77	71,259	332,122	13.5	9.4
Community Study Area	101,654	2.69	70,759	21,906	21.5	10.9
Yolo County	209,222	2.81	70,228	39,919	19.1	9.0
City of Davis	66,738	2.70	69,379	19,900	29.8	6.4
City of West Sacramento	52,875	2.84	70,699	8,053	15.2	11.8
City of Sacramento	492,815	2.66	62,335	81,673	16.6	12.1

Community Facilities

Community facilities may contribute to community cohesion by providing health and welfare resources to the local population or a means to interact with other members of the community. Community facilities include schools, libraries, museums, recreation facilities, health providers, emergency services, community centers, and other similar institutions. Facilities that are frequently accessed by the elderly, disabled, low-income, and minority populations are especially important because these groups often have limited mobility and may depend on transit for access.

This section provides a description of community facilities such as community centers, museums, and schools within the Land Use Study Area, which includes the project area plus a 1,000-foot buffer. These physical areas directly surrounding I-80/US-50 in the project area are considered the areas with the potential to experience direct effects on community facilities. Parks and other recreational facilities within the Land Use Study Area are described in Section 2.1.3, Parks and Recreational Facilities.

There are various community facilities in the Land Use Study Area within the city of Davis, including the Mondavi Center for the Arts, Davis Musical Theater Company, the Davis Amtrak Station, numerous bus stops, a US Post office, a Community Housing Facility, a California Department of Forestry and Fire equipment facility, the Yolo Hospice, and Yolo Community Care Continuum (a nonprofit organization serving people with mental illness).

Schools within the Land Use Study Area in Davis include the UC Davis Campus, UC Davis Extension sites, the Mondavi Institute for Wine and Food Studies, Peregrine Elementary School, and Pioneer Elementary School. The Land Use Study Area in Davis also includes an equestrian center, gymnastics center, multiple fitness centers, and numerous other commercial community facilities, such as stores and restaurants.

Within unincorporated areas of Solano County and Yolo County, there are occasional farm stands and other commercial facilities along I-80, as well as the Yolo Basin Foundation headquarters.

Community facilities in the Land Use Study Area in West Sacramento include the West Sacramento Health Education Council, West Sacramento KOA Campground and RV Park, numerous bus stops, DaVita Dialysis Center, California School Boards Association headquarters, a US Post Office, the West Sacramento Chamber of Commerce, River City Dance Academy, Collings West Sacramento Teen Center, Margaret McDowell Manor senior apartment complex, and Veterans of Foreign Wars post 8762.

Churches within the Land Use Study Area in West Sacramento include Community Lutheran Church, Our Lady of Grace Church, Center for Spiritual Awareness (a nondenominational community church), and River City Apostolic Church. Schools within the Land Use Study Area in West Sacramento include Westmore Oak Elementary School, West Sacramento School for Independent Study, Washington Unified School District offices, and James Marshall Nursery School.

In Sacramento, community facilities in the Land Use Study Area include Tenrikyo High Sacramento Church, Muslim Mosque Association, Saint John's Missionary Baptist Church, and the California Automobile Museum.

Regional Economy

The community study area and regional study area have had economic growth and a low unemployment rate that has been supported by substantial growth in the real estate, construction, manufacturing, health care, and retail sectors. Over 2010–2019, Yolo County posted a 36.84 percent net gain in real gross domestic product (GDP), which outpaced the statewide average (36.15 percent). In comparison, Sacramento County and Solano County's GDP grew by approximately 26.45 percent and 23.86 percent, respectively, between 2010 and 2019 (California Regional Economic Analysis Project 2021).

The I-80/US-50 corridor is an important facility for moving freight throughout California. I-80 is a major west-east connector through California, linking the Bay Area with the Sacramento Region and locations across the country. The 203-mile length of I-80 in California between US 101 and the California-Nevada line is designated as a primary link in the National Highway Freight Network by the FHWA (FHWA 2018).

Yolo County's leading economic activity is agriculture and is supported by other industries such as warehousing and distribution, food processing, technology and biotechnology research and development, and higher education at UC Davis. The soils, growing climate, and water supplies

in unincorporated Yolo County support agriculture. Almonds are Yolo County's leading commodity, followed by tomatoes, wine grapes, rice, and organic production. Yolo County is working to become a leader in economic sustainability, focusing on agricultural advancement, emerging green technology expertise, and eco- and agri-tourism opportunities. UC Davis is a leading generator of innovative graduates with expertise in all these industries.

Employment in Yolo County includes government, transportation, warehousing, retail. and agriculture. However, agriculture is on the decline due to increasing mechanization of farming, which reduces labor needs. Job growth is seen in education, healthcare, professional and business services, and leisure and hospitality, largely due to activities at the Cache Creek Casino. UC Davis is the largest employer, followed by Cache Creek Casino, the State of California, and the U.S. Postal Service.

Table 2.1-10 provides information on major employment sectors in the regional study area and community study area. According to the U.S. Census Bureau 2019 American Community Survey, the state had an available labor force of 18,591,241. Comparatively, the regional study area had an available labor force of 1,135,810. At the time of the census, approximately 2.6 to 4.8 percent of the available labor force in the regional study area was unemployed, as compared to 3.8 percent of the state (U.S. Census Bureau 2019). According to the State of California Employment Development Department (CEDD 2022), major employers in Yolo County include:

- Government offices such as the California Procurement Office, Yolo County District Attorney, Yolo County Sheriff's Office, and the City of Davis City Manager's Office
- Hospitals and health care businesses such as Beckman Coulter, Sutter Davis Hospital, Dignity Health Woodland, and the Woodland Healthcare Foundation
- Higher education at UC Davis
- Manufacturing and distribution centers such as Clark Pacific, Nor-Cal Beverage, Pacific Coast Producers, Target, and Rite Aid
- Other private corporations such as Cache Creek Casino Resort, United Parcel Service Customer Center, Tony's Fine Foods, Promega, Mariani Nut, IKEA, Clark Pacific, Capital Express Lines, Walmart, Mcguire & Hester, and Dennis Blazona Construction

Table 2.1-10. Employment Characteristics (2019)

Employment Area	Percentage of Workforce		
	California	Regional Study Area	Community Study Area
Management, business, science, and arts occupations	39.3	40.2	48.5
Service occupations	18.5	18.8	17.0
Sales and office occupations	21.2	22.3	16.8
Natural resources, construction, and maintenance occupations	9.0	8.4	7.9
Production, transportation, and material moving occupations	12.0	10.4	9.9

Source: U.S. Census Bureau 2019

Table 2.1-11 gives employment statistics and labor force composition. The unemployment rate in the community study area at 6.60 percent is slightly higher than the regional study area (6.14 percent) and Yolo County (6.19 percent). The composition of the labor force in the community study area has approximately the same percentage of women workers in the labor force as the regional study area and Yolo County. The labor force of employed persons who are college educated in the community study area (72 percent) is slightly higher than the regional study area (69 percent) and Yolo County (70 percent).

Table 2.1-11. Employment and Labor Force Composition

Area	Number Persons in Labor Force[1]	Number of Persons Employed	Number of Persons Unemployed	Percent Unemployed	Percent Women in Labor Force	Percent Employed and College Educated[2]
California	19,790,474	18,591,241	1,199,233	6.06	46.0	64.5
Regional Study Area	1,210,148	1,135,810	74,338	6.14	47.8	69.2
Community Study Area[3]	51,943	48,514	3,429	6.60	48.8	72.1
Yolo County	105,929	99,367	6,562	6.19	48.4	69.8

Notes:
1 Labor Force: Aged 16 years and older
2 College Educated Population: Aged 25 years and older with more than a high school education.
3 Data is provided on census tract level, not census block group
Source: U.S. Census Bureau 2019, Tables B23001, B24010, and B23006

There are several business centers along the I-80/US-50 corridor in the community study area. The major economic centers include commercial businesses, industrial and manufacturing centers, and office/business parks in Davis and West Sacramento. Major employment centers along the project corridor include UC Davis and the Port of (West) Sacramento.

The California Department of Tax and Fee Administration 2019–2020 Annual Report (CDTFA 2021) reported local sales and use tax revenue distributed for fiscal year 2019-2020 was $4.37 million to Yolo County, $7.33 million to Davis, $19.7 million to West Sacramento, and $85.4 million to the City of Sacramento. Total taxable transactions for the same period in Yolo County

were $4.69 billion, Davis reported $0.55 billion, West Sacramento reported $1.59 billion, and the City of Sacramento reported $6.84 billion (CDTFA 2021).

The COVID-19 pandemic created economic uncertainty in the community study area. The region's economy, like many others throughout the state, was impacted due to the recession induced by the COVID-19 pandemic. This impact was mitigated to a degree by stimulus packages approved by the federal and state governments. In the transition to post-pandemic life, housing demand is higher than supply in the region as Bay Area residents continue to move inland in search of less expensive housing alternatives. Economic recovery from the pandemic is ongoing.

Commute Patterns

The Yolo basin floodway and the Sacramento River present natural physical barriers to traveling within the study area. Limited connectivity across rivers and floodways creates longer trip lengths, greater dependence on automobiles, concentrated vehicle traffic flows on the existing causeway and bridges and their connecting approach roadways, and a barrier to economic activity, social exchanges, recreational opportunities, and access to jobs within the urban core of Sacramento, West Sacramento, and Davis. According to a West Sacramento draft project report for the Broadway Bridge Project, peak morning and afternoon congestion is caused by local intercity commuters using the state highway system as a result of having few local river crossing options (City of West Sacramento 2022).

Table 2.1-12 shows the percentage of workers aged 16 years and older who commute to work using different modes of transportation. Transportation modes to work for workers in the community study area are somewhat consistent with Yolo County, with a slightly higher percentage of workers walking or biking and a slightly lower percentage of workers driving alone. The same differences are more pronounced when comparing the community study area to the regional study area, with a difference of 8.3 percent more workers walking or biking and 10.4 percent fewer workers driving alone. This difference is largely attributable to Davis, where more than 21 percent of the workers walk or bike to work, with two census block groups having 54 and 69 percent of its workers walking or biking to work. These statistics are also provided by census tracts in the table below. One census tract in Davis (census tract 106.08) has a high percentage of workers using public transportation at 18.3 percent, with the next highest at less than 8 percent. One census tract in Davis has a high percentage of workers working from home at 18.4 percent.

Table 2.1-12. Transportation to Work

Area	Total Number Workers[1]	Percent Drove Alone	Percent Carpool	Percent Public Transpor--tation	Percent Other	Percent Walk/Bike	Percent Work from Home

Source: U.S. Census Bureau 2019, Table B08301
Notes: 1. Workers aged 16 years and older.
2. Census Block Groups are shown in parenthesis after the Census Tract numbers.

Table 2.1-13 shows commuting patterns and the location of employment relative to area of residence for workers over the age of 16. The community study area has a lower percentage of people who work within their county of residence (64 percent) than the regional study area (73 percent) and a higher percentage of people who work within their city or census-designated place of residence (38 percent) compared to the regional study area (31 percent). In general, communities with a high percentage of the population that reside and work in the same county or place of residence tend to demonstrate higher levels of involvement and interaction within their communities. The community study area also has a higher percentage of workers with a short commute time of less than 30 minutes (72 percent) compared to the regional study area (61 percent) and the state (56 percent). Communities with a high percentage of the population with shorter travel times to work are generally more cohesive than communities with longer commute times. When people spend less time commuting, they have more time to engage in their local communities and greater cohesion is demonstrated.

Table 2.1-13. Commuting Patterns

Area	Work Inside County of Residence	Work Outside County of Residence	Work Inside Place of Residence[1]	Work Outside Place of Residence	Travel Time to Work[2] <30 Minutes	Travel Time to Work 30 to 60 Minutes	Travel Time to Work >60 Minutes
California	82.4%	17.6%	35.1%	60.2%	56.0%	31.3%	12.7%
Regional Study Area[3]	72.6%	27.4%	30.5%	62.5%	60.5%	31.0%	8.6%
Community Study Area	64.2%	35.8%	38.3%	55.7%	72.1%	22.2%	5.7%
Yolo County	63.1%	36.9%	33.4%	61.3%	69.1%	23.5%	7.4%

Source: U.S. Census Bureau 2019, Tables B08007, B08008, and B08303
Notes:
1. Place of residence is defined as a city or census designated place.
2. Travel Time to Work percentages calculated using total number of workers, excluding those working from home.
3. Population for the regional study area based on the total population within the SACOG area, including El Dorado, Placer, Sacramento, Sutter, Yolo, and Yuba Counties.

The jobs-housing balance is the ratio of jobs to housing in a given area. If the jobs-housing ratio is too high, adequate housing may be unavailable or unaffordable for workers in that area, contributing to traffic congestion. If the jobs-housing balance is too low, this may indicate inadequate job availability for area residents. Table 2.1-14 shows a predicted improvement in the jobs-to-housing ratio for Yolo County and the regional study area through 2040. Providing housing near employment centers reduces commute distances and leads to improvements in traffic and air quality conditions. In regional land use and transportation planning, an improved jobs-to-housing ratio is defined as a ratio that moves toward the regional average. The majority of regional housing and employment growth in the regional study area, approximately 80 percent, is projected to occur in Sacramento County (61 of the total employment growth and 63 percent of the total housing growth) and Placer County (17 percent of the total for both employment and housing growth). Yolo County is projected to have the next highest amount of growth (10 percent of the total employment growth and 9 percent of the total housing growth),

followed by El Dorado, Sutter, and Yuba counties (SACOG 2019). Table 2.1-14 illustrates how jobs-to-housing ratios are projected to change over the next 20 years.

Table 2.1-14. Summary of Jobs to Housing Ratios

Area	2016			2016–2040			2040		
	Dwelling Units	Employ-ees	Jobs to Housing Ratio	New Dwelling Units	New Employ-ees	Jobs to Housing Growth	Dwelling Units	Employ-ees	Jobs to Housing Growth
Yolo County	77,705	104,771	1.3	28,662	30,604	1.0	106,367	135,376	1.2
Regional Study Area[1]	921,123	1,060,751	1.2	260,128	270,060	1.1	1,181,251	1,330,813	1.2

Source: SACOG 2019
Note: 1 Population for the regional study area based on the total population within the SACOG area, including El Dorado, Placer, Sacramento, Sutter, Yolo, and Yuba Counties.

Toll Projects

Travelers do not currently pay tolls on roads or bridges in the community or regional study areas. The 2020 MTP/SCS prepared by SACOG has identified managed lane projects as an option for transportation revenue and pricing. Managed lanes are one tool for modernizing funding methods for transportation infrastructure. Pricing mechanisms can raise revenue to build and maintain the region's transportation system, provide mobility benefits to residents, manage traffic and congestion, and help to achieve the state-mandated greenhouse gas reduction targets (SACOG 2019).

Build Alternatives 3, 4, and 5 all feature managed lanes with tolling options. Each Build Alternative has a distinct tolling structure that defines the Build Alternative as described in Section 1.5 Proposed Project. All tolling option alternatives feature at least one type of tolling exemption for certain occupancy classes of vehicles except Build Alternative 5, which requires that all motorists using the managed lane are subject to the toll regardless of the occupancy classification of the vehicle. The economic impacts of priced lanes must consider the equity of imposing tolls on roadway users, particularly low-income users.

2.1.6.3 Environmental Consequences

No Build Alternative 1

Construction and Operation

Under No Build Alternative 1, managed lanes and transportation improvements would not be constructed or operated. As such, the No Build Alternative 1 would have no effect on neighborhoods, communities, and community character.

Build Alternatives 2a and 2b

Construction

Under Build Alternatives 2a and 2b, construction activities would result in delays for roadway users and potentially affect access to surrounding businesses and community facilities. Build Alternative 2b would result in a longer construction timeline in order to build the I-80 connector structure, thus the effects of construction would be longer than Build Alternative 2a.

For both Build Alternatives 2a and 2b, ramp closures are anticipated at all ramp locations adjacent to proposed widening or proposed mainline paving and would occur for up to 15 days. Traffic would be detoured to the next interchange.

Build Alternative 2b may require a temporary, full closure on westbound US-50 for construction of the I-80 connector structure. Closures would be during night or during a continuous operation (24 or 48 hours). The primary detour for westbound US-50 traffic would be to use northbound I-5 to westbound I-80. Local traffic would use other interchanges in the area. Any full closures would be scheduled to take place during the hours of the lowest volume of traffic to minimize effects on businesses, commuters, and the local community.

A Traffic Management Plan (TMP) (Standard Measure TT-3) would be developed by Caltrans during the design phase. The TMP would include elements such as haul routes, one-way traffic controls to minimize speeds and congestion, flag workers, and phasing, to reduce impacts on local residents as feasible and maintain access for police, fire, and medical services in the local area. Additionally, the contractor would implement a planned public outreach program to keep area residents, businesses, emergency service providers, and transit operators informed of the project construction schedule as part of Standard Measure COM-1.

Furthermore, Build Alternatives 2a and 2b would also implement visual, noise, and air quality standard measures. Therefore, Build Alternatives 2a and 2b would not have substantial effects on the community during construction.

Operation

Build Alternatives 2a and 2b would involve adding an HOV 2+ lane in each direction. As described in Section 2.1.5, Growth, by improving access and highway capacity, Build Alternatives 2a and 2b would help accommodate planned growth on a regional level and could indirectly change development patterns surrounding the project area. A sound wall, mature trees, and vegetation are located between I-80 and residential properties, thus creating a buffer for noise impacts. Noise experienced by nearby residential development would be barely perceptible, which is consistent with existing conditions. Similarly, visual resource effects associated with Build Alternatives 2a and 2b would be compatible with the existing visual character of the corridor since the corridor is already developed as a roadway.

The operational air quality analysis concludes that mobile source air toxic (MSAT) and DPM emissions would decrease in future years compared to existing conditions, reducing pollutant burdens for households neighboring the highway. For Build Alternatives 2a and 2b, significant

operational air quality impacts on nearby sensitive receptors are not expected as air quality is expected to improve in future years. However, fugitive sources of particulate matter, like tire wear, brake wear, and road dust are the largest fraction of particulate matter emissions from traffic, and they increase as VMT increases. Therefore, $PM_{2.5}$ and PM_{10} emissions would continue to increase as VMT in the corridor increases, adding to the pollution burden associated with fugitive particulate matter on communities next to the highway.

Build Alternatives 2a and 2b would occur primarily within the existing Caltrans right-of-way and would not provide new access to previously unserved areas. Build Alternatives 2a and 2b would require acquisition of a vacant parcel to construct a Park-and-Ride lot south of I-80 at Enterprise Boulevard in West Sacramento. However, this acquisition would not result in changes to community character or displacement of any residence, business, or employees.

Build Alternatives 2a and 2b would ultimately improve circulation along I-80/US-50 in the project corridor, which could result in improved access to nearby community facilities. Build Alternatives 2a and 2b would not adversely change the regional economy or locations of employment centers and would be expected to have a beneficial effect on the regional economy when completed, by improving access, travel time, and highway capacity. No businesses would be acquired or relocated and no changes to sales tax revenue or property values are anticipated within the regional study area. Build Alternatives 2a and 2b would not divide an existing neighborhood or result in additional barriers within the community study area, and there would be no adverse effects on community character and cohesion.

Build Alternatives 3a and 3b

Construction and Operation

Build Alternatives 3a and 3b would involve adding an HOT 2+ lane in each direction. While implementation of a tolling structure would result in congestion relief and enhanced accessibility, low-income travelers within the community may not realize the full benefit unless they take advantage of carpooling or high vehicle occupancy, as further described in Section 2.1.7, Environmental Justice. Build Alternatives 3a and 3b offer reduced or no payment options for riders in managed lanes who take advantage of carpooling or high vehicle occupancy. Build Alternatives 3a and 3b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively. Therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b.

Build Alternatives 4a and 4b

Construction and Operation

Build Alternatives 4a and 4b would involve adding an HOT 3+ lane in each direction. While implementation of a tolling structure would result in congestion relief and enhanced accessibility, low-income travelers within the community may not realize the full benefit unless they take advantage of carpooling or high vehicle occupancy, as further described in Section 2.1.7, Environmental Justice. Build Alternatives 4a and 4b offer reduced or no payment options for riders in managed lanes who take advantage of carpooling or high vehicle occupancy. Build

Alternatives 4a and 4b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively. Therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b.

Build Alternatives 5a and 5b

Construction and Operation

Build Alternatives 5a and 5b would involve adding an Express Lane in each direction. While implementation of a tolling structure would result in congestion relief and enhanced accessibility, low-income travelers within the community may not realize the full benefit and there would be no reduced payment option from carpooling or high vehicle occupancy, as further described in Section 2.1.7, Environmental Justice. Build Alternatives 5a and 5b offer no reduction in toll for ridesharing, carpooling, or other high vehicle occupancy and would affect lower-income individuals who cannot afford to pay a toll but would otherwise use the managed lanes for ridesharing and carpooling. Use of tolled lanes constitutes a higher financial burden on low-income travelers who choose to use the managed lanes than on higher-income individuals using the tolled lanes.

Build Alternatives 5a and 5b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively. Therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b.

Build Alternatives 6a and 6b

Construction and Operation

Build Alternatives 6a and 6b would involve adding a transit-only lane in each direction. Build Alternatives 6a and 6b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively. Therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b.

Build Alternatives 7a and 7b

Construction and Operation

Build Alternatives 7a and 7b would involve repurposing the current number one general purpose lane to HOV 2+. No new lanes would be constructed. Because Build Alternatives 7a and 7b would not add new lanes, but would repurpose existing lanes as managed lanes, the Build Alternatives 7a and 7b construction period may have shorter duration resulting in fewer delays than those under Build Alternatives 2a, 2b, 3a, 3b, 4a, 4b, 5a, 5b, 6a, and 6b. Otherwise, Build Alternatives 7a and 7b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively. Therefore, the effect would be similar to the effects described under Build Alternatives 2a and 2b.

2.1.6.4 Avoidance, Minimization, and/or Mitigation Measures

No AMMs or MMs are required.

2.1.7 Environmental Justice

2.1.7.1 Regulatory Setting

All projects involving a federal action (e.g., funding, permit, or land) must comply with Executive Order (EO) 12898, Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations, signed February 11, 1994. This EO directs federal agencies to take the appropriate and necessary steps to identify and address disproportionately high and adverse effects of federal projects on the health or environment of minority and low-income populations to the greatest extent practicable and permitted by law. Low income is defined based on the Department of Health and Human Services poverty guidelines. For 2023, the amount was $30,000 for a family of four (ASPE 2023).

All considerations under Title VI of the Civil Rights Act of 1964, and related statutes, have also been included in this project. Caltrans' commitment to upholding the mandates of Title VI is demonstrated by its Title VI Policy Statement, signed by the Director, which can be found in Appendix B of this document.

2.1.7.2 Affected Environment

Information in this section is based on the CIA prepared for the project (Caltrans 2023a) and Caltrans' Title VI Policy Statement (Appendix B).

The community study area, which includes all census tracts and block groups immediately adjacent to the project footprint, consists of a variety of socioeconomic neighborhoods. The ethnic composition of the community study area, as described in Section 2.1.6 and summarized in Table 2.1-5, is similar in diversity to the regional study area. As described in Section 2.1.6, Community Character and Cohesion, and summarized in Table 2.1-9, median household income in the community study area is $71,216, similar to the regional study area of $71,717. According to the U.S. Census Bureau, which defines poverty thresholds by household income, size of family, and number of children, approximately 10.9 percent of families in the community study area are below the U.S. Census 2019 federal poverty level, which is a higher percentage than the regional study area (9.4 percent).

Environmental Justice Communities

For this analysis, environmental justice communities are defined consistently with the FHWA environmental justice strategy as areas that have concentrated populations of low-income and/or communities of color. The CEQ's Environmental Justice Guidance under NEPA (CEQ 1997) defines low-income populations using the annual poverty thresholds from the Census Bureau and minority populations as areas where the minority population exceeds 50 percent or the minority population percentage is meaningfully greater than the minority population percentage in the general population or other appropriate unit of geographic analysis (CEQ 1997). These guidelines were adopted for use at the national level and do not take into consideration income and population characteristics specific to California. California has a high cost of living, so the federal poverty level does not adequately capture households that experience poverty in California. The minority population has grown to half or more of the

population in Sacramento and Yolo counties, and 45 percent of the region's population (SACOG 2019).

SACOG has defined environmental justice communities for the regional planning area, taking into consideration the differences in income and diversity unique to this region. SACOG has integrated those definitions into the RTP/SCS and the SACSIM traffic model, allowing for a robust analysis of changes in traffic patterns for environmental justice communities.

FHWA definitions for low-income and minority individuals are intended to be consistent with the definitions for EO 12898 that have been issued by CEQ and the EPA, with the following exceptions: FHWA defines low-income individuals using the poverty guidelines from the Department of Health and Human Services (DHHS) rather than U.S. Census Bureau, and the minority category of Native Hawaiian and Other Pacific Islander was added. The primary difference between the U.S. Census Bureau poverty thresholds and the DHHS poverty guidelines is the DHHS have geographic variation to account for the much higher costs of living in Alaska and Hawaii (Institute for Research on Poverty 2023).

To allow for a more dynamic analysis of project effects on environmental justice travelers and to provide consistency with the RTP/SCS and other regional planning documents, Caltrans has used the environmental justice community definitions from SACOG for this analysis.

Environmental justice communities within the regional study area are defined as follows:

- **Low-Income Communities:** Census tracts or block groups where 40 percent or more of the population earns 200 percent or less of the federal poverty level.

- **Minority Communities:** Census tracts or block groups where 70 percent or more of the population are Hispanic or Latino, Native Hawaiian or Other Asian Pacific Islander, Black or African American, American Indian and Alaska Native, or other non-white ethnic groups.

Approximately 39 percent of residents in the community study area (15 of 37 census block groups) live in defined environmental justice communities (SACOG 2019a).

The I-80 corridor is heavily used in Yolo County because it is the only west-east connector that crosses the Yolo Basin, which separates the cities of Davis and West Sacramento. In the larger regional picture, it is also the only west-east connector between the Bay Area and the city of Sacramento. Within the community study area, the percentage of individuals living below the poverty line (approximately 21.5 percent) is higher than the percentage of both the regional study area and California (13.5 and 13.4 percent, respectively).

Within the community study area, low-income, minority, and low-income/minority communities are in portions of downtown and south Davis, along I-80 and US-50 through most of West Sacramento, and near the US-50/I-5 interchange in Sacramento. The percentage of individuals living below the poverty line (approximately 21.5 percent) is higher than the percentage of both the Regional Study Area and California as a whole (13.5 and 13.4 percent, respectively). Table 2.1-9, included in Section 2.1.6, Community Character and Cohesion, identifies census block

groups in the community study area that meet the SACOG income and minority criteria as environmental justice communities.

When evaluating transportation improvement effects on environmental justice communities, it is important to recognize that, on average, residents living in these communities walk, bicycle, and take transit at a higher rate than non-environmental justice households. Within the regional study area, transit use in environmental justice communities is more than twice the rate for non-environmental justice communities, and environmental justice communities have a 65 percent greater rate for walking and bicycling region-wide than non-environmental justice communities (SACOG 2019a). Vehicle availability contributes to this trend. Eleven percent of regional households in environmental justice communities do not have a vehicle compared to 4 percent in non-environmental justice communities. Although vehicle availability in environmental justice communities is less than in non-environmental justice communities, most environmental justice area residents still use personal vehicles for transportation. The existing and future infrastructure support of the transportation needs of these communities is a significant factor in their ability to access jobs, schools, services, and the effects on their overall health and quality of life (SACOG 2019a).

Table 2.1-15 and Table 2.1-16 provide existing daily I-80/US-50 traveler data by income and race/ethnicity for two freeway segments: I-80 at Yolo Causeway and US-50 at Sacramento River. These data are limited to those individuals who reside in the regional study area. As shown in the data, 22.6 to 23.3 percent of daily travelers had yearly incomes of less than $40,000, and minority community members represent between 46.7 and 50.2 percent of travelers using the freeway.

Residents living below the poverty level within the community study area walk, bicycle, and take transit at a higher rate than residents living above the poverty level. Within the regional study area, transit use in low-income communities is more than twice the rate than higher-income communities, and low-income communities have a 65 percent greater rate for walking and bicycling region-wide (SACOG 2019). In the Community Study Area, more workers in the Davis neighborhoods use public transportation or walk or bike to work than workers in other census tracts (Table 2.1-12), so these residents may have more options for public transit and alternative transportation modes than other areas.

Table 2.1-15. Travelers by Household Income in the Regional Study Area

Location	Household Income	Eastbound Travelers	Eastbound Percent of Travelers	Westbound Travelers	Westbound Percent of Travelers
I-80 at Yolo Causeway	$0 to $20,000	3,387	10.5%	3,456	10.3%
	$20,001 to $40,000	3,931	12.2%	4,149	12.3%
	$40,001 to $80,000	8,137	25.3%	8,735	25.9%
	$80,001 to $100,000	3,160	9.8%	3,277	9.7%
	>$100,000	13,583	42.2%	14,103	41.8%
	Total	32,198	100%	33,720	100%
US-50 at Sacramento River	$0 to $20,000	5,897	10.2%	5,611	10.1%
	$20,001 to $40,000	7,469	13.0%	7,334	13.2%
	$40,001 to $80,000	14,948	26.0%	14,587	26.2%
	$80,001 to $100,000	6,110	10.6%	5,807	10.4%
	>$100,000	23,190	40.3%	22,342	40.1%
	Total	57,614	100%	55,681	100%

Source: SACOG Replica model output provided by Caltrans (November 2020). Reported in I-80/ US-50 Travel Pattern Data Memorandum. February 10, 2021 (Fehr & Peers 2021a).
Notes: Number and percent of travelers has been filtered to those who had trips with their origin and destination within the SACOG region. Income values are assumed to be in 2019 dollars to match the model period.

Table 2.1-16. Travelers by Race and Ethnicity in Regional Study Area

Location	Race and Ethnicity	Eastbound Travelers	Eastbound Percent of Travelers	Westbound Travelers	Westbound Percent of Travelers
I-80 at Yolo Causeway	White, Not Hispanic or Latino Origin	17,169	53.3%	17,915	53.1%
	Hispanic or Latino Origin	7,124	22.1%	7,742	23.0%
	Asian, Not Hispanic or Latino Origin	4,569	14.2%	4,722	14.0%
	Black, Not Hispanic or Latino Origin	1,726	5.4%	1,704	5.1%
	Two or More Races, Not Hispanic or Latino Origin	1,179	3.7%	1,201	3.6%
	Native Hawaiian or Pacific Islander, Not Hispanic or Latino Origin	235	0.7%	233	0.7%
	American Indian or Alaskan Native, Not Hispanic or Latino Origin	104	0.3%	114	0.3%
	Some Other Race, Not Hispanic or Latino Origin	92	0.3%	89	0.3%
	Total	**32,198**	**100%**	**33,720**	**100%**
US-50 at Sacramento River	White, Not Hispanic or Latino Origin	28,707	49.8%	27,798	49.9%
	Hispanic or Latino Origin	13,489	23.4%	13,153	23.6%
	Asian, Not Hispanic or Latino Origin	8,390	14.6%	8,043	14.4%
	Black, Not Hispanic or Latino Origin	3,656	6.4%	3,450	6.2%
	Two or More Races, Not Hispanic or Latino Origin	2,318	4.0%	2,236	4.0%
	Native Hawaiian or Pacific Islander, Not Hispanic or Latino Origin	707	1.2%	675	1.2%
	American Indian or Alaskan Native, Not Hispanic or Latino Origin	183	0.3%	175	0.3%
	Some Other Race, Not Hispanic or Latino Origin	164	0.3%	151	0.3%
	Total	**57,614**	**100%**	**55,681**	**100%**

Source: SACOG Replica model output provided by Caltrans (November 2020). Reported in I-80/ US-50 Travel Pattern Data Memorandum. February 10, 2021 (Fehr & Peers 2021a).
Notes: Number and percent of travelers has been filtered to those who had trips with their origin and destination within the SACOG region.

2.1.7.3 Environmental Consequences

The environmental justice analysis in this section examines whether minority and/or low-income populations in the project area would experience disproportionately high and adverse effects and whether the improvements would benefit low-income and minority communities equitably. FHWA Order 6640.23A defines an adverse effect as one that:

- is predominately borne by a minority population and/or a low-income population
- will be suffered by the minority population and/or low-income population and is appreciably more severe or greater in magnitude than the adverse effect that will be suffered by the nonminority population and/or non-low-income population

In determining whether an environmental justice community would experience disproportionately adverse effects or whether impacts are predominantly borne by an environmental justice community, the analysis considers the change in the roadway capacity, traffic, congestion, travel times, travel cost, and facility footprint, and the resulting direct and indirect effects on the human and natural environment, both short-term construction impacts and on-going effects associated with management and operations of the project. This project was analyzed for potential for property acquisitions and relocations in environmental justice communities; effects on environmental justice neighborhood cohesion; and changes in noise, air quality, and visual conditions in environmental justice communities attributable to the construction and operation of that project.

No Build Alternative 1

Construction and Operation

Under No Build Alternative 1, managed lanes and transportation improvements would not be constructed or operated. As such, the No Build Alternative 1 would have no effect on environmental justice communities.

Build Alternatives 2a and 2b

Construction

Build Alternatives 2a and 2b would involve adding an HOV 2+ lane in each direction. Build Alternatives 2a and 2b would occur primarily within the existing Caltrans right-of-way, but it would require one permanent right-of-way easement outside the existing Caltrans right-of-way within census tract 102.03, an environmental justice community. Under all Build Alternatives, Caltrans would acquire right-of-way to construct a Park-and-Ride Facility with approximately 300 parking spaces on the east side of Enterprise Boulevard. The subject parcel is currently vacant, and the new facility would be located partially within and partially outside of the existing Caltrans right-of-way. Surrounding land uses include highway service commercial uses such as restaurants and gas stations. The development of the Park-and-Ride Facility would be consistent with existing land uses and would not displace minority or low-income residents, businesses, or employees. There would be no disruption or adverse effect on existing land uses or community members in the surrounding areas. The Park-and-Ride facility area have been

largely undeveloped. Historical aerial photographs on google earth and historical USGS topographic maps available online show that a road was located on the site from at least 1967 through 2002. The access to I-80 continued across Enterprise Boulevard, across the south-central portion of the site, and connected with Lake Road. The current google maps aerial photo shows the southern portion of the site is being used as a staging area for construction across Lake Road. No other development is identified on the site dating back to 1948 (Google Earth Pro 2023) The Park-and-Ride Facility would not result in changes to land uses, acquisition of residential or commercial property, or displacement of any minority residence, business, or employees.

Since households in environmental justice communities generally have fewer vehicles than households in non-environmental justice communities, the benefits of the Build Alternatives may not be realized by environmental justice community members who do not own a vehicle. However, ITS and auxiliary lane improvements with all Build Alternatives would help facilitate circulation between I-80 and the surrounding surface streets, benefiting environmental justice community members using bus and transit service entering and exiting the highway.

As described in Section 2.1.6, Community Character and Cohesion, project impacts on air quality, noise, and visual resources can affect community character for environmental justice communities and non-environmental justice communities. The severity of these community impacts is a function of proximity to the highway facility. Communities adjacent to highways in the regional study area and community study area are a mix of environmental justice and non-environmental justice neighborhoods.

As discussed in Section 2.2.7, Noise, the noise study completed for the project (Illingworth and Rodkin 2022) concluded that future noise levels along I-80 under the Build Alternatives would increase from 0 to +2 A-weighted decibels (dBA) at all receptors when compared to existing conditions. This modest increase in noise would not substantially affect adjacent communities and would not disproportionately affect community character or quality of life in environmental justice communities compared to non-environmental justice communities, nor would it be predominantly borne by environmental justice communities in the community study area.

Travel lanes would move closer to neighboring properties along some segments and could increase traffic noise. This widening to the outside occurs within an environmental justice community (census tract 106.02 block group 4). Adjacent land uses include a small area of multi-family residential development including a mobile home park, Olive Court (an affordable housing community), and the Arbors (apartment complex). The noise study indicates that future noise levels would increase from 0 to +2 dBA at the sensitive receptors located in this environmental justice community because of this Project by the 2049 horizon year, when compared to existing conditions and also when compared to the No-Build alternative. A sound wall, mature trees, and vegetation are located between I-80 and these residential properties, creating a buffer for noise impacts. This modest increase in noise would not substantially affect community character or quality of life in environmental justice communities compared to non-environmental justice communities.

As noted in Section 2.2.6, Air Quality, the air quality analysis completed for the project (Caltrans 2024c) determined that the Build Alternatives would not substantially change the traffic mix and

future emissions for all pollutants except fugitive particulate matter are expected to be lower than present levels. Fugitive particulate matter emitted is proportional to changes in VMT, so each alternative differs in its relative change in emission levels. Therefore, the Build Alternatives would not increase the pollution burden on neighboring environmental justice communities in the long term.

As noted in Section 2.2.11, Visual and Aesthetics, the visual impact analysis completed for the project (Stantec 2022) concluded that the Build Alternatives would affect the visual environmental of the corridor by removing center median functional plantings, increasing paved surfaces, and adding barriers and fencing, new roadway structures, new overhead and roadside signs, lighting, a Park-and-Ride Facility, and ITS elements, all of which collectively would result in an increasingly urbanized aesthetic. Both environmental justice and non-environmental justice communities that front the highway would be affected by these visual impacts. The resulting effect of these visual changes on community character would be modest. This impact is not appreciably more severe in environmental justice communities than the non-environmental justice communities nor predominantly borne by environmental justice communities in the community study area.

Construction activities would result in delays for roadway users and potentially affect access to surrounding businesses and community facilities. In particular, Build Alternative 2b would result in a longer construction timeline in order to build the I-80 connector structure, thus the effects of construction would be longer than Build Alternative 2a. Construction activities and ground-disturbing activities would result in temporary visual effects; increased noise levels; and increased air pollutants such as dust and particulate matter due to the excavation, grading, hauling, and other construction-related activities. This impact is not appreciably more severe in environmental justice communities than the non-environmental justice communities nor predominantly borne by environmental justice communities in the community study area.

A TMP (Standard Measure TT-3) would be developed by Caltrans during the design phase. Additionally, the contractor would implement a planned public outreach program to keep area residents, businesses, emergency service providers, and transit operators informed of the project construction schedule as part of Standard Measure COM-1. Build Alternatives 2a and 2b would also implement visual, noise, and air quality standard measures. Therefore, Build Alternatives 2a and 2b would not cause disproportionately high and adverse direct effects on environmental justice communities during construction nor create impacts that are predominantly borne by environmental justice communities in the community study area.

Operation

Build Alternatives 2a and 2b would occur primarily within the existing Caltrans right-of-way, but would require one permanent right-of-way easement outside the existing Caltrans right-of-way within census tract 102.03, an environmental justice community. Under Build Alternatives 2a and 2b, Caltrans would acquire 2.8 acres of right-of-way to construct a Park-and-Ride Facility with approximately 300 parking spaces on the east side of Enterprise Boulevard. The subject parcel is currently vacant, and the new facility would be partially outside the existing Caltrans right-of-way. Surrounding land uses include highway service commercial uses such as restaurants and gas stations.

Improved traffic flow and movement of persons on I-80/US-50 within the project limits would benefit a wide range of communities including those defined as environmental justice communities. With the lane addition on I-80 and US-50 under Build Alternative 2a, the volume of vehicles and persons moved through the corridor during peak commute hours would increase compared to Alternative 1 (No Build). Despite the added capacity, congested conditions would still be expected in both directions during peak hours. Under Build Alternatives 2a and 2b, which would add a managed HOV 2+ lane in each direction would not impose tolls on travelers, so the benefits of these alternatives would be equally shared by travelers of all income levels. Additionally, the inclusion of VMT mitigation that includes transit and rail improvements would provide alternative modes of transportation and route flexibility, and transit pass subsidies and reduced fares that would benefit EJ communities.

Build Alternatives 3a and 3b

Construction

Build Alternatives 3a and 3b are within the same project area as Build Alternatives 2a and 2b, respectively and would have the same construction-related effects.

Operation

Build Alternatives 3a and 3b would involve adding an HOT 2+ lane in each direction, which would introduce a toll structure. Since the congestion relief and enhanced accessibility associated with the project would benefit all I-80/US-50 travelers, there is no disproportionate adverse effect on environmental justice travelers for all Build Alternatives. Environmental justice communities may not realize the full benefit from alternatives that include tolling due to cost. Use of toll lanes (Alternatives 3 through 5) by environmental justice (low-income) travelers would cause a higher financial burden that is predominantly borne by environmental justice communities and may be considered a disproportionate impact. Caltrans has adopted AMMs to reduce potential adverse effects on low-income drivers. Caltrans' future-appointed tolling authority would be required to implement a tolling program in alignment with Caltrans Deputy Directive 43-R1. This represents a reduction in the receipt of benefits by low-income groups under tolling alternatives and an inequitable distribution of project benefit. With implementation of AMMs EJ-1, EJ-2, and EJ-3, and VMT mitigation that includes transit and rail improvements, Build Alternatives 3a and 3b would not cause disproportionately high and adverse direct effects on environmental justice communities.

Build Alternatives 4a and 4b

Construction

Build Alternatives 4a and 4b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively. Therefore, the effect on existing environmental justice communities in the surrounding areas would have the same as effects described under Build Alternatives 2a and 2b.

Operation

Build Alternatives 4a and 4b would involve adding an HOT 3+ lane in each direction. As Build Alternatives 4a and 4b are toll-based alternatives; effects on environmental justice travelers would be similar to Build Alternatives 3a and 3b. With implementation of AMMs EJ-1, EJ-2, and EJ-3, Build Alternatives 4a and 4b would not cause disproportionately high and adverse direct effects on environmental justice communities.

Build Alternatives 5a and 5b

Construction

Build Alternatives 5a and 5b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively. Therefore, the effect on environmental justice communities in the surrounding areas would have the same as construction-related effects described under Build Alternatives 2a and 2b.

Operation

Build Alternatives 5a and 5b would involve adding an Express Lane in each direction. As Build Alternatives 5a and 5b are also toll-based alternatives, effects on Environmental Justice Travelers would be similar to Build Alternatives 3a and 3b, respectively. However, there would be no reduced payment option from carpooling or high vehicle occupancy. With implementation of AMMs EJ-1, EJ-2, and EJ-3 Build Alternatives 5a and 5b would not cause disproportionately high and adverse direct effects on environmental justice communities.

Build Alternatives 6a and 6b

Construction

Build Alternatives 6a and 6b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively. Therefore, the effect on environmental justice communities in the surrounding areas would be the same as construction-related effects described under Build Alternatives 2a and 2b.

Operation

Build Alternatives 6a and 6b would add a transit-only lane in each direction. This transit-only alternative would improve traffic flow and movement of persons on I-80/US-50 within the project limits which would benefit a wide range of communities, including those defined as environmental justice communities. Build Alternatives 6a and 6b would not impose tolls on travelers, so the benefits of these alternatives would be equally shared by travelers of all income levels.

Build Alternatives 7a and 7b

Construction

Build Alternatives 7a and 7b would involve repurposing the current number one general purpose lane to HOV 2+. No new lanes would be constructed and proposed work would mostly be limited to restriping. Build Alternative 7b would construct the I-80 managed lane connector structure, providing a direct connection of the managed lanes via a managed lanes connector ramp over US-50 at the I-80/US-50 Interchange. A TMP (Standard Measure TT-3) would be developed by Caltrans during the design phase. Additionally, the contractor would implement a planned public outreach program to keep area residents, businesses, emergency service providers, and transit operators informed of the Project construction schedule as part of Standard Measure COM-1. Further, Build Alternatives 7a and 7b would also implement visual, noise, and air quality standard measures. Therefore, Build Alternatives 7a and 7b would not cause disproportionately high and adverse direct effects on environmental justice communities during construction.

Operation

Build Alternatives 7a and 7b would involve repurposing the current number one general purpose lane to HOV 2+. As a described under Build Alternatives 2a and 2b, with the addition of a managed HOV 2+ lane in each direction that would not impose tolls on travelers, the benefits of these alternatives would be equally shared by travelers of all income levels.

2.1.7.4 Avoidance, Minimization, and/or Mitigation Measures

Based on the above discussion and analysis, the Build Alternatives will not cause disproportionately high and adverse effects on any minority or low-income populations in accordance with the provisions of EO 12898. No further environmental justice analysis is required.

With the inclusion of the following AMMs, the project will not result in adverse impacts: Build Alternatives 3a, 3b, 4a, 4b, 5a, and 5b. If Build Alternative 3a, 3b, 4a, 4b, 5a, or 5b is selected as the preferred alternative, the California Transportation Commission would authorize a tolling authority to operate the toll lanes. In part, the tolling authority's role would be to realize travel benefits from lane pricing to all travelers on I-80/US 50, including environmental justice communities who may not realize the cost-benefit of time savings associated with a tolled lane. The future tolling authority, at the direction of Caltrans, will include a tolling program that offers, but is not limited to, the following strategies to offset the effects of toll lane alternatives on environmental justice travelers.

- **AMM EJ-1 (Build Alternatives 3a, 3b, 4a, 4b, 5a, and 5b)**: Caltrans would establish a variable pricing for express lanes or provide discounted per-mile tolls, credits, rebates and/or exemptions based on income levels and cost of living.

- **AMM EJ-2 (Build Alternatives 3a, 3b, 4a, 4b, 5a, and 5b)**: Caltrans would offset the financial burden of enrolling in electronic tolling program. The toll authority would

improve methods for environmental justice communities and other users to obtain toll tags/transponders. For example, the toll authority would provide that drivers without a credit card or bank account can receive toll tags, waive or redefine the monthly minimum balance requirements for low-income users. and provide translation services to community travelers with Limited English Proficiency (LEP).

- **AMM EJ-3 (Build Alternatives 3a, 3b, 4a, 4b, 5a, and 5b)**: Caltrans would use no less than 50 percent of excess toll revenue to improve multi-modal transit, expand transportation choice, and other transportation improvements that would distribute benefits to environmental justice communities identified in this report.

2.1.8 Equity

2.1.8.1 Regulatory Setting

Equity in transportation seeks fairness in mobility and accessibility to meet the needs of all community members. A central goal of transportation equity is to facilitate social and economic opportunities by providing equitable levels of access to affordable and reliable transportation options based on the needs of the populations being served, particularly populations that are traditionally underserved. It is important to note that transportation equity does not mean equal. An equitable transportation plan considers the circumstances impacting a community's mobility and connectivity needs, and this information is used to determine the measures needed to develop an equitable transportation network (U.S. Department of Transportation 2022a, 2022b).

Equity is related to environmental justice, discussed in the previous section, but is more broadly defined. Recent laws and policies have been adopted regarding equity and the consideration of how past policies and plans have resulted in disparities for underserved and disadvantaged populations.

Executive Order 13985. EO 13985, *Advancing Racial Equity and Support for Underserved Communities Through the Federal Government* (2021), affirms that "the Federal Government should pursue a comprehensive approach to advancing equity for all, including people of color and others who have been historically underserved, marginalized, and adversely affected by persistent poverty and inequality. Affirmatively advancing equity, civil rights, racial justice, and equal opportunity is the responsibility of the whole of our Government." Under EO 13985, the term "equity" means the consistent and systematic fair, just, and impartial treatment of all individuals, including individuals who belong to underserved communities that have been denied such treatment, such as Black, Latino, and Indigenous and Native American persons, Asian Americans and Pacific Islanders and other persons of color; members of religious minorities; lesbian, gay, bisexual, transgender, and queer persons; persons with disabilities; persons who live in rural areas; and persons otherwise adversely affected by persistent poverty or inequality. The term "underserved communities" refers to populations sharing a particular characteristic, as well as geographic communities, that have been systematically denied a full opportunity to participate in aspects of economic, social, and civic life. The EO seeks to advance equity through various efforts, including coordinating across the federal government, identifying methods to assess equity, conducting an equity assessment in federal agencies, allocating

federal resources to advance fairness and opportunity, promoting equitable delivery of government benefits and equitable opportunities, engaging with members of underserved communities, and establishing an Equitable Data Working Group.

USDOT Equity and Access Policy. The U.S. Department of Transportation's March 2021 Equity and Access Policy Statement (USDOT 2021) states that "the Department is committed to promoting equitable delivery of government benefits and opportunities, including advancing meaningful engagement with all communities and ensuring that government contracting and procurement opportunities are available on an equal basis to all eligible providers of goods and services." The policy statement reiterates USDOT's commitment to incorporate environmental justice and equity principles into transportation planning and decision-making processes, including ensuring full and equitable access to programs, activities, and services for persons with limited English proficiency in accordance with Executive Order 13166 *Improving Access to Services for Persons with Limited English Proficiency*.

Caltrans Equity Statement. The Caltrans Equity Statement (December 10, 2020) acknowledges that communities of color and underserved communities have experienced fewer benefits and a greater share of negative impacts associated with our state's transportation system. Some of these disparities reflect a history of transportation decision-making, policy, processes, planning, design, and construction that "quite literally put up barriers, divided communities, and amplified racial inequities, particularly in our Black and Brown neighborhoods."

Local Agency Equity Policies and Programs. Local governments are also addressing equity in their policies and programs. Yolo County established their Inclusion and Diversity Work Group in 2019 with a goal of creating and sustaining an equitable work environment and prioritizing services to underserved communities (Yolo County 2022).The City of West Sacramento recently created a sidewalks and transportation equity program, which will review and prioritize projects with a "lens of equity" by focusing on benefits for disadvantaged communities, seniors, and providing safe routes to schools and parks (City of West Sacramento 2022). The City of Sacramento established their Office of Diversity and Equity in July 2018 with the mission of creating "a more equitable and inclusive City of Sacramento by facilitating the integration of greater representation, fairness, belonging and care into our policies, protocols, practices and work-places" (City of Sacramento 2022). In February 2021, Sacramento County approved a Resolution on Racial Equity and Social Justice, declaring racism a public health crisis (Sacramento County 2021). Solano County's Equity and Diversity Committee is working to improve health services for underserved populations (Solano County 2022).

2.1.8.2 Affected Environment

Information in this section is based on the CIA prepared for the project (Caltrans 2023a).

To help identify communities that are disproportionately burdened by multiple sources of pollution and with population characteristics that make them more sensitive to pollution, the California Office of Environmental Health Hazards Assessment developed the CalEnviroScreen mapping tool. CalEnviroScreen identifies communities facing socioeconomic disadvantages or health disadvantages.

The California Environmental Protection Agency has defined disadvantaged communities as those census tracts that fall in or above the 75th percentile in CalEnviroScreen. Census tracts with the highest CalEnviroScreen score along the I-80/US-50 corridor are concentrated in West Sacramento and near the US-50/I-5 interchange in Sacramento, where the pollution burden percentiles and population characteristic percentiles combine for an overall score of 75 percent or greater. The *I-80/US-50 Travel Pattern Data Memorandum* prepared for the project (Fehr & Peers 2021a) summarizes available data on existing travel patterns for the I-80/US-50 corridor, including use by environmental justice community members.

When identifying underserved and disadvantaged communities in the study area, the CIA for the project considers historic impacts from transportation infrastructure development, existing environmental conditions and pollution burdens, health disparities that make communities more sensitive to pollution, and other socioeconomic factors that correlate with sensitivity to environmental impacts and traditionally underserved communities.

To help identify communities that are disproportionately burdened by multiple sources of pollution and with population characteristics that make them more sensitive to pollution, the California Office of Environmental Health Hazards Assessment developed the CalEnviroScreen mapping tool (OEHHA 2021). The CalEnviroScreen mapping tool identifies communities facing socioeconomic disadvantages or health disadvantages. It uses environmental, health, and socioeconomic data from state and federal government sources to score every census track in California. The scores are generated using statewide indicators in four categories: pollution exposures, environmental effects, sensitive populations, and socioeconomic factors. CalEnviroScreen ranks census tracts (low to high sensitivity) based on their combined pollution burden and population characteristics; a percentile is then calculated from the ordered values.

The California Environmental Protection Agency has defined disadvantaged communities as those census tracts that fall in or above the 75th percentile in CalEnviroScreen, meaning the combined score is higher than 75% of the census tracts in California. Census tracts with the highest CalEnviroScreen score along the I-80/US-50 corridor are concentrated in West Sacramento, where the pollution burden percentiles and population characteristic percentiles combine for an overall score in the 75th percentile when compared to census tracts in the state. This ranking indicates that these tracts are confronted with many burdens and vulnerabilities from environmental pollutants and are defined as disadvantaged communities. Within segment 3 (I-80/US-50 to Jefferson Boulevard and Jefferson Boulevard to I-5), CalEnviroScreen scores fall within the 66th to 96th percentile, indicating that these communities have a high pollution burden and/or high sensitivity.

2.1.8.3 Environmental Consequences

The environmental consequences of the proposed alternatives are evaluated for their potential to adversely affect underserved and disadvantaged communities through changes in the human and natural environment. Project effects on communities can include changes in pollution burdens, modifications to community character, and exacerbation of historical impacts from transportation infrastructure (e.g., divided communities). Section 2.1.7, Environmental Justice, describes localized changes in air quality, noise, and visual resources in underserved

communities; evaluates whether minority and/or low-income populations experience disproportionately adverse effects; and provides conclusions.

No Build Alternative 1

Construction and Operation

The No-Build Alternative 1 would not adversely affect underserved and disadvantaged communities through community disturbance, or tolls. The No-Build Alternative 1 would not provide the travel benefits of the Build Alternatives. As such, the No-Build Alternative 1 would have no effect on equity.

Build Alternatives 2a and 2b

Construction

Construction activities under Build Alternative 2a and 2b would result in short-term changes in access, circulation, light/glare noise, and air quality. Intermittent and temporary ramp and lane closures would inconvenience all roadway users and could require alternative traffic routing. Neighboring residents and businesses may experience short-term noise, fugitive dust, and light/glare from construction activities.

As discussed in Section 2.1.11, temporary sources of light and glare would be added to the project area during the construction phase; however, they would be minimized through use of standard construction equipment, protocols, and appropriate light and glare screening measures, including Standard Measure AR-4 and AMM AES-1, which would limit construction lighting and avoid or minimize glare through selection of materials and finishes, respectively.

However, these construction activities would be short-term and implementation of Standard Measures AR-2, AR-4, GHG-1 through GHG-6, TT-1 through TT-3 (see Appendix E), and AMMs NOI-1 through NOI-6, would help to minimize and reduce potential effects resulting from construction activities. Therefore, Build Alternatives 2a and 2b would not cause disproportionately high and adverse direct effects on underserved and disadvantaged communities through changes in the human and natural environment during construction.

Operation

Build Alternatives 2a and 2b would occur primarily within the existing Caltrans right-of-way. Build Alternatives 2a and 2b would construct a new Park-and-Ride Facility on a vacant parcel south of I-80 at Enterprise Boulevard in West Sacramento, in a traditionally underserved community. The Park-and-Ride Facility would not result in changes to land uses, acquisition of residential or commercial property, or displacement of any minority residence, business, or employees. No residential or business acquisitions in underserved communities would occur. Build Alternatives 2a and 2b would not divide communities. Build Alternatives 2a and 2b would not contribute to the historical division of the West Sacramento area that occurred with the construction of I-80 in the 1970s, but the added lanes within the existing I-80 corridor would not further divide the community nor remedy those historical divisions.

Noise from highway operations can influence community character and burden sensitive populations. Although Build Alternatives 2a and 2b would increase capacity and operational traffic, they would not change the traffic mix nor move major roadways closer to sensitive receptors. As discussed in Sections 2.1.6 and 2.1.7, the noise study for the project concluded that future noise levels along I-80 would increase from 0 to +2 dBA under Build Alternatives 2a and 2b. This modest increase in noise would be barely perceptible and would not substantially affect adjacent communities nor disproportionately affect community character or quality of life in underserved communities in the study area.

Vehicular air pollution and health disparities associated with those air pollutants (including asthma, cardiovascular disease, and low birth weight) are disproportionately borne by residents who live near major highways in California (Union of Concerned Scientists 2019). Traffic is a significant source of air pollution, particularly in urban areas, where more than 50 percent of particulate emissions come from traffic (OEHHA 2021). Exhaust from vehicles also contains toxic chemicals, including nitrogen oxides, carbon monoxide, and benzene. When determining whether the project would affect communities already burdened by air pollution and associated health risks, the analysis of projected air quality conditions was used. Air pollution emissions for eight out of nine toxic chemicals, are predicted to be lower in future years under the Build Alternatives than present levels (Caltrans 2024c). This is primarily a function of improved emission standards and the shift to more electric vehicles in future years rather than changes in traffic operations under the Build Alternatives. Although future emissions would be lower under all alternatives, the amount of fugitive particulate matter emitted with the No-Build and Build Alternatives is proportional to changes in VMT, so each alternative differs in its relative reduction in future emission levels. Build Alternatives 2a and 2b would increase future VMT, but would not significantly exacerbate air pollutant conditions compared to existing conditions and would not significantly exacerbate conditions compared to the future No-Build Alternative for nearby underserved communities and communities with associated health disparities. How changes in air pollutants affect health outcomes for communities that already have high pollutant burdens is difficult to predict. As noted by FHWA (2023), "While much work has been done to assess the overall health risk of air toxics, many questions remain unanswered. In particular, the tools and techniques for assessing project-specific health outcomes as a result of lifetime MSAT exposure remain limited.” Because of the limitations in the methodologies for forecasting health impacts, predicted differences in health impacts between alternatives is likely to be much smaller than the uncertainties associated with predicting the impacts (FHWA 2023).

Additionally, as part of the transportation conformity process for particulate matter, an interagency committee that includes the FHWA, Federal Transit Administration, and USEPA found the Project not to be a project of air quality concern. The Air Quality Report (Caltrans 2024c, Appendix J) concludes that Build Alternative 2a and 2b would not substantially increase the pollution burden on neighboring communities in the long term when compared to the No-Build condition.

Overall, Build Alternatives 2a and 2b would not significantly exacerbate air pollutant conditions for nearby underserved communities and communities with associated health disparities.

Visual changes would also influence community character in adjacent underserved communities. The project proposes to increase the amount of paving within the existing width of the freeway, introduce new overhead signage elements, and remove median plantings and roadside trees that provide visual buffering. These changes would have a notable visual impact that is apparent to both highway users and highway neighbors, including the surrounding community. While visual changes for neighboring communities would be more modest than changes experienced by highway users, Build Alternatives 2a and 2b may increase the dominance of the transportation facility in neighboring viewsheds, further degrading the existing visual condition for disadvantaged communities adjacent to the highway.

Build Alternatives 2a and 2b would improve traffic conditions for highway users, including members of underserved and disadvantaged communities. See Section 2.1.7, Environmental Justice, for an analysis of tolling and low-income populations. Build Alternatives 2a and 2b would not cause disproportionately high and adverse direct effects on underserved and disadvantaged communities through changes in the human and natural environments.

Build Alternatives 3a and 3b

Construction

Build Alternatives 3a and 3b are within the same project area as Build Alternatives 2a and 2b, respectively, and would have the same construction-related effects.

Operation

Build Alternatives 3a and 3b would involve adding an HOT 2+ lane in each direction, which would introduce a toll structure. Tolled lane options would introduce new signage that may present challenges for linguistically isolated households. Only one census block in the community study area in West Sacramento has a high proportion of households where no one over the age of 14 speaks English. Residents in these neighborhoods may be initially challenged by the toll-related signage and the process for obtaining toll transponders. Standard Measure EQ-1 would require If a tolled lane option (Alternatives 3a, 3b, 4a, 4b, 5a, or 5b) is selected as the preferred alternative, Caltrans' future-appointed tolling authority would be required to implement a tolling program in alignment with Caltrans Language Access Plan (2020) and Deputy Directive 91-R2, which would accommodate use of toll lane options by limited English proficiency community members. Caltrans 2020 Language Access Plan lays out reasonable steps to provide limited English proficiency individuals with meaningful access to all Caltrans activities, including the provision of translation and interpretation services to the public. The tolling authority would adhere to these policies. Providing instructions in multiple languages would help offset this burden, and linguistically isolated households are likely to adapt to the new signage and lane operations over time. Build Alternatives 3a and 3b would not cause disproportionately high and adverse direct effects on underserved and disadvantaged communities through changes in the human and natural environments.

Build Alternatives 4a and 4b

Construction

Build Alternatives 4a and 4b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively. Therefore, the effect on existing environmental justice communities in the surrounding areas would be the same as effects described under Build Alternatives 2a and 2b.

Operation

Build Alternatives 4a and 4b would involve adding an HOT 3+ lane in each direction. As discussed in Section 2.1.7, as Build Alternatives 4a and 4b are toll-based alternatives, effects on environmental justice travelers would be similar to Build Alternatives 3a and 3b. Standard Measure EQ-1 would be implemented Build Alternatives 4a and 4b. Build Alternatives 4a and 4b would not cause disproportionately high and adverse direct effects on underserved and disadvantaged communities through changes in the human and natural environments.

Build Alternatives 5a and 5b

Construction

Build Alternatives 5a and 5b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively. Therefore, the effect on environmental justice communities in the surrounding areas would be the same as construction-related effects described under Build Alternatives 2a and 2b.

Operation

Build Alternatives 5a and 5b would involve adding an Express Lane in each direction. As discussed in Section 2.1.7, as Build Alternatives 5a and 5b are also toll-based alternatives, effects on environmental justice travelers would be similar to Build Alternatives 3a and 3b, respectively. Standard Measure EQ-1 would be implemented Build Alternatives 5a and 5b. Build Alternatives 5a and 5b would not cause disproportionately high and adverse direct effects on underserved and disadvantaged communities through changes in the human and natural environments.

Build Alternatives 6a and 6b

Construction

Build Alternatives 6a and 6b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively. Therefore, the effect on environmental justice communities in the surrounding areas would be the same as construction-related effects described under Build Alternatives 2a and 2b.

Operation

Build Alternatives 6a and 6b would add a transit-only lane in each direction, which could benefit underserved communities that use transit at a higher rate than other communities. However, Build Alternative 6a and 6b do not substantially improve overall traffic conditions for all highway users. Refer to Section 2.1.10, Traffic and Transportation, for more information. Standard Measure EQ-1 would be used under Build Alternatives 6a and 6b. Build Alternatives 6a and 6b would not cause disproportionately high and adverse direct effects on underserved and disadvantaged communities through changes in the human and natural environments.

Build Alternatives 7a and 7b

Construction

Build Alternatives 7a and 7b would involve repurposing the current number one general purpose lane to HOV 2+. No new lanes would be constructed, and proposed work would mostly be limited to restriping. Build Alternative 7b would construct the I-80 managed lane connector structure, providing a direct connection of the managed lanes by flying over US-50 at the I-80/US-50 Interchange. A TMP (Standard Measure TT-3) would be developed by Caltrans during the design phase. Additionally, the contractor would implement a planned public outreach program to keep area residents, businesses, emergency service providers, and transit operators informed of the project construction schedule as part of Standard Measure COM-1. Further, Build Alternatives 7a and 7b would also implement visual, noise, and air quality standard measures. Therefore, Build Alternatives 7a and 7b would not cause disproportionately high and adverse direct effects on underserved and disadvantaged communities through changes in the human and natural environments.

Operation

Build Alternatives 7a and 7b would involve repurposing the current number one general purpose lane to HOV 2+. As described under Build Alternatives 2a and 2b, with the addition of a managed HOV 2+ lane in each direction without tolls, impacts would be similar to Build Alternatives 2a and 2b. Standard Measure EQ-1 would be used under Build Alternatives 7a and 7b.

2.1.8.4 Avoidance, Minimization, and/or Mitigation Measures

Based on the above discussion and analysis, the Build Alternatives would not substantially change existing conditions for neighboring underserved and disadvantaged populations. The project would not increase pollution burdens or divide or disrupt existing neighborhoods.

2.1.9 Utilities and Emergency Services

2.1.9.1 Affected Environment

Information in this section is based on the CIA prepared for the project (Caltrans 2023a).

Utilities

There are utility companies with facilities in the project area, including AT&T (fiber-optics/telecommunications provider) and PG&E (electrical and natural gas provider). Additionally, there may be aboveground or underground utilities related to telecommunications, public works, sewer services, water services, and other utility services.

Emergency Services

I-80 and US-50 in the project corridor pass through numerous jurisdictions; therefore, emergency response services are provided by various agencies. In Solano County, emergency services are provided by the County Sheriff's office and Office of Emergency Services (OES). In the city of Davis, the Davis Fire Department provides pre-hospital emergency medical services and responds to fires, hazardous materials incidents, natural disasters, and other emergencies. The Davis Police Department and UC Davis Police Department provide law enforcement. The Yolo County OES is the emergency management agency for Yolo County and coordinates the county government's response to disaster or other large-scale emergencies. The Yolo Emergency Medical Services Agency provides emergency medical care.

The West Sacramento Fire Department serves as emergency management coordinator for the city of West Sacramento and works with other city departments, the Yolo County OES, and surrounding jurisdictions. The West Sacramento Police Department provides law enforcement and emergency services. The Sacramento Fire Department is responsible for the management of fire operations within the city of Sacramento during emergency responses. The Fire Department coordinates all responses through the Sacramento Regional Fire Emergency Communication Center. Fire services also include the provision of emergency medical service and life-saving medical care. The Sacramento Police Department is responsible for law enforcement operations and terrorism prevention within the city.

In addition to its use by emergency responders, US-50 and I-80 are dedicated evacuation routes in Yolo and Sacramento counties. Yolo County's OES and the City of West Sacramento's Emergency Management division have identified evacuation zones and routes for given neighborhoods. The City of Sacramento also has prepared detailed maps showing hypothetical levee breaks at various locations for a 200-year event and recommended flood evacuation routes (City of Sacramento Department of Utilities 2021). I-80 and US-50 are identified evacuation routes on the Yolo County evacuation zone maps and under many levee break scenarios for the city of Sacramento. I-80 is a critical route for the West Sacramento area.

2.1.9.2 Environmental Consequences

No Build Alternative 1

Construction and Operation

Under No Build Alternative 1, managed lanes and transportation improvements would not be constructed or operated. As such, the No Build Alternative would have no effect on emergency services or utilities.

Build Alternatives 2a and 2b

Construction

Utilities

Build Alternatives 2a and 2b would not result in potential conflicts with existing utilities that are present along the I-80/US-50 corridor. Utility companies would require verification of facilities and involvement in construction plans. Accordingly, prior to construction, an estimated 15 test hole sites would be drilled at eight different locations for natural gas lines running transversely underneath I-80, the Yolo Causeway, and West Capitol Avenue in Sacramento, where the new managed lane would be constructed with retaining walls and columns. Positive findings would verify whether the gas line would require relocation or how to redesign to avoid conflicts with existing utilities.

Caltrans would provide verification and notify utilities of proposed construction work in accordance with Standard Measure UE-2. Under Build Alternative 2b, up to four 115-kilovolt overhead utility towers may need to be relocated or the tower height increased near the new I-80 connector structure at the I-80/US-50 separation in West Sacramento. As such, AMM AES-5 would be implemented to minimize the prominence, scale, and mass and avoid the need to raise/relocate adjacent powerline towers.

Build Alternatives 2a and 2b also would include installation of a fiber-optic cable line and associated fiber-optic splice boxes within the roadbed at the eastbound outside shoulder of I-80 from Pedrick Road in Solano County at about Post Mile (PM) 40.7 to PM 4.35 in Yolo County. Fiber-optic cable may also be placed via directional borings and to avoid conflicts with existing utilities.

As described, Standard Measure UE-2 would require coordination of utility conflicts, relocation, and cable protection so disruption of utility service would be minimized. Therefore, Build Alternatives 2a and 2b would not result in an adverse effect on utilities.

Operation

Utilities

Once constructed, there would be no project-related changes to utilities in the project area. Therefore, Build Alternatives 2a and 2b would not result in an adverse effect on utilities.

Construction

Emergency Services

Temporary traffic delays and ramp closures on I-80/US-50 during construction of Build Alternatives 2a and 2b could result in temporary delays in emergency services.

As described in Section 2.1.6, Community Character and Cohesion, to help ensure emergency services are maintained during construction, Standard Measure TT-3, Traffic Management Plan, would be developed by Caltrans consistent with Caltrans' standard procedures to maintain

access for emergency services throughout all phases of construction. The TMP would include elements such as traffic controls to minimize speeds/congestion and other measures to maintain access for police, fire, and medical services along I-80/US-50 in the project area during construction. Additionally, Standard Measure UE-1 would require that all emergency response agencies in the project area would be notified of the project construction schedule and would have access to I-80 and US 50 throughout the construction period.

Operation

Emergency Services

Once constructed, Build Alternatives 2a and 2b would improve circulation and reduce congestion along I-80/US-50 in the project corridor, which would result in improved emergency service access and response times. Therefore, Build Alternatives 2a and 2b would not result in an adverse effect on emergency services.

Build Alternatives 3a and 3b

Construction and Operation

Build Alternatives 3a and 3b would involve adding an HOT 2+ lane in each direction. Build Alternatives 3a and 3b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively. Therefore, the effect would be the same as effects on utilities and emergency services as described under Build Alternatives 2a and 2b.

Build Alternatives 4a and 4b

Construction and Operation

Build Alternatives 4a and 4b would involve adding an HOT 3+ lane in each direction. Build Alternatives 4a and 4b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively. Therefore, the effect would be the same as effects on utilities and emergency services as described under Build Alternatives 2a and 2b.

Build Alternatives 5a and 5b

Construction and Operation

Build Alternatives 5a and 5b would involve adding an Express Lane in each direction. Build Alternatives 5a and 5b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively. Therefore, the effect would be the same as effects on utilities and emergency services as described under Build Alternatives 2a and 2b.

Build Alternatives 6a and 6b

Construction and Operation

Build Alternatives 6a and 6b would involve adding a transit-only lane in each direction. Build Alternatives 6a and 6b propose similar project components within the same project area as

Build Alternatives 2a and 2b, respectively. Therefore, the effect would be the same as effects on utilities and emergency services as described under Build Alternatives 2a and 2b.

Build Alternatives 7a and 7b

Construction and Operation

Utilities

Build Alternatives 7a and 7b would involve repurposing the current number 1 general purpose lane to HOV 2+. No new lanes would be constructed. The effect on utilities would be similar to effects described under Build Alternatives 2a and 2b, respectively.

Emergency Services

Temporary traffic delays and ramp closures on I-80/US-50 during construction of Build Alternatives 7a and 7b could result in temporary delays in emergency services. Because Build Alternatives 7a and 7b would not add new lanes, but would repurpose existing lanes as managed lanes, the Build Alternatives 7a and 7b construction period may have shorter duration and result in fewer delays than those under Build Alternatives 2a and 2b, respectively. As described in Build Alternatives 2a and 2b, to provide that emergency services are maintained during construction, Standard Measure TT-3, Traffic Management Plan, as described in the Traffic and Transportation/Pedestrian and Bicycle Facilities section, would be developed by Caltrans consistent with Caltrans' standard procedures to maintain access for emergency services throughout all phases of construction. The TMP would include elements such as traffic controls to minimize speeds/congestion and other measures to maintain access for police, fire, and medical services along I-80/US-50 in the project area during construction.

Build Alternatives 7a and 7b would ultimately improve circulation and reduce congestion along I-80/US-50 in the project corridor, which would result in improved emergency service access and response times. Therefore, Build Alternatives 7a and 7b would not result in an adverse effect on emergency services.

2.1.9.3 Avoidance, Minimization, and/or Mitigation Measures

No AMMs or MMs are required.

2.1.10 Traffic and Transportation/Pedestrian and Bicycle Facilities

2.1.10.1 Regulatory Setting

Caltrans, as assigned by the Federal Highway Administration (FHWA), directs that full consideration should be given to the safe accommodation of pedestrians and bicyclists during the development of Federal-aid highway projects (see 23 Code of Federal Regulations [CFR] 652). It further directs that the special needs of the elderly and the disabled must be considered in all Federal-aid projects that include pedestrian facilities. When current or anticipated pedestrian and/or bicycle traffic presents a potential conflict with motor vehicle traffic, every

effort must be made to minimize the detrimental effects on all highway users who share the facility.

In July 1999, the U.S. Department of Transportation (USDOT) issued an Accessibility Policy Statement pledging a fully accessible multimodal transportation system. Accessibility in federally assisted programs is governed by the USDOT regulations (49 CFR 27) implementing Section 504 of the Rehabilitation Act (29 United States Code [USC] 794). The FHWA has enacted regulations for the implementation of the 1990 Americans with Disabilities Act (ADA), including a commitment to build transportation facilities that provide equal access for all persons. These regulations require application of the ADA requirements to Federal-aid projects, including Transportation Enhancement Activities.

California Environmental Quality Act - Senate Bill 743 and Vehicle Miles Traveled

SB 743 requires the Governor's Office of Planning and Research (OPR) to identify new metrics for the identification of transportation related impacts within CEQA. On December 28, 2018, regulatory changes to the CEQA Guidelines that implement SB 743 were approved, establishing Vehicle Miles of Travel (VMT) as the new metric for transportation analysis. Thresholds for determining a project's significant transportation impact shall be pursuant to section 15064.3 of the State CEQA Guidelines. Within CEQA, a project's effect on vehicle delay shall not constitute a significant transportation impact (Section 15064.3(a)). OPR released a Technical Advisory that contains recommendations for assessing VMT, thresholds of significance, and mitigation measures. On July 1, 2020, statewide implementation occurred.

In response to the change, Caltrans has prepared guidance in the form of the Transportation Analysis Framework (TAF) and the Transportation Analysis under CEQA: Evaluating Transportation Impacts of State Highway System Projects (TAC), each published in September 2020.

2.1.10.2 Affected Environment

This section describes the existing and planned transportation system within the project area. A Transportation Analysis Report (TAR) (Caltrans 2023d) addresses the project area shown in Figure 2.1-5. Additional documents referenced in this section are listed below. The project study limits consist of I-80 at Pedrick Road in Solano County to the west and I-80 at Northgate Boulevard and US 50 at SR 51/SR 99 in Sacramento to the east.

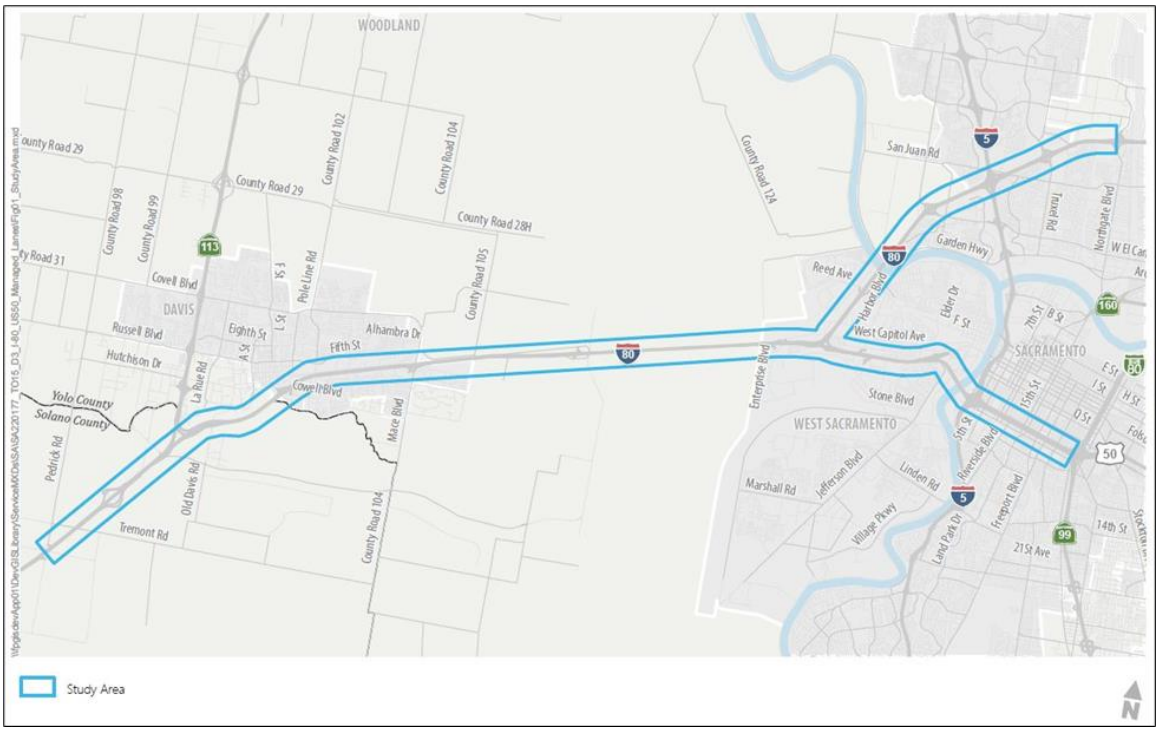

Figure 2.1-5. Transportation Analysis Report Study Area
Source: TAR (Caltrans 2023d)

Documents referenced for this analysis include the following:

- Interstate 80/US Highway 50 Managed Lanes Transportation Analysis Report (Caltrans 2023d)
- Interstate 80/US Highway 50 Managed Lanes Traffic Operations Report (Caltrans 2023e)
- Yolo 80 Managed Lanes Project, Final VMT Mitigation Plan (Caltrans 2024)
- I-80/US 50 Managed Lanes Project, Final VMT Mitigation Estimates (Caltrans 2024)
- I-80/US 50 Managed Lanes: Induced Travel & Truck VMT – Draft (Caltrans 2023h)
- Yolo 80 Corridor Improvements Project Draft Pedestrian and Bicyclist Travel Impact Assessment, (Caltrans 2023i)

2.1.10.3 Collision Data

Table 2.1-17 and Table 2.1-18 summarize the number of collisions and collision rates for the freeway segments of the project area on I-80 and US-50. The existing collisions and collision rates per million vehicle miles are presented for the most recent 5-year period from January 1, 2015, to December 31, 2019, from the Traffic Accident Surveillance and Analysis System (TASAS). The table provides a comparison of the actual collision rates to the average rates for similar facilities throughout California. Total collision rates include all reported fatal collisions, injury, and property damage collisions.

Analysis of the TASAS collision records shows that there was a total of 1,504 collisions (857 eastbound and 647 westbound) that includes 10 fatal collisions (4 eastbound and 6 westbound) for the I-80 segment from the Solano County line to US 50 during the 5-year period mentioned above. The total rate of fatal plus injury-related collisions is higher than the statewide average for the eastbound direction, but the fatal collision rate is lower than average. In the westbound direction, the actual collision rates for fatal, fatal plus injury, and total collisions are all lower than the statewide average.

Table 2.1-17. Freeway Segments— Traffic Accident Surveillance and Analysis System Collisions Summary (January 1, 2015, through December 31, 2019)

Segment		Total No. of Collisions*	Fatal Collisions	Fatal & Injury Collisions
I-80 from Solano Co. Line to US 50 (YOL 0.0 to R9.6)	EB	857	4	325
	WB	647	6	219
I-80 from US 50 to HOV Lane (YOL R9.6 to R11.7, SAC M0.0 to M1.4)	EB	137	1	47
	WB	402	2	138
US 50 from I-80 to I-5 (YOL 0.0 to 3.2, SAC L0.0 to L0.6)	EB	410	4	152
	WB	458	8	195

Source: Caltrans 2023d
Notes:
*Total reported collisions include Property Damage Only collisions
Key: EB = eastbound; WB = westbound

Table 2.1-18. Freeway Segments—Traffic Accident Surveillance and Analysis System Collision Rates (January 1, 2015, through December 31, 2019) per Million Vehicle Miles

Segment		Actual (per Million Vehicle Miles)			Average (per Million Vehicle Miles)		
		Fatal Collisions	Fatal + Injury Collisions	Total*	Fatal Collisions	Fatal + Injury Collisions	Total*
I-80 from Solano Co. Line to US 50 (YOL 0.0 to R9.6)	EB	0.003	**0.27****	**0.70****	0.006	0.22	0.67
	WB	0.005	0.18	0.53	0.006	0.22	0.67
I-80 from US 50 to HOV Lane (YOL R9.6 to R11.7, SAC M0.0 to M1.4)	EB	0.003	0.15	0.44	0.005	0.27	0.81
	WB	**0.006****	**0.44****	**1.29****	0.005	0.27	0.81
US 50 from I-80 to I-5 (YOL 0.0 to 3.2, SAC L0.0 to L0.6)	EB	**0.009****	**0.35****	**0.94****	0.003	0.27	0.84
	WB	**0.018****	**0.45****	**1.05****	0.003	0.27	0.84

Notes:
TASAS = Traffic Accident Surveillance and Analysis System; EB = eastbound; WB = westbound
*Total reported collisions includes Property Damage Only collisions
**(Bold) = actual collision rate greater than statewide average
Source: Caltrans 2023d

There was a total of 539 collisions (137 eastbound and 402 westbound) that included 3 fatal collisions (1 eastbound and 2 westbound) for the I-80 segment from US 50 to the start of the existing HOV lanes. The actual collision rate for all three categories is lower than the statewide average in the eastbound direction but higher for all three categories in the westbound direction.

There was a total of 868 collisions (410 eastbound and 458 westbound) that included 12 fatalities (4 eastbound and 8 westbound) for the segment of US 50 from I-80 to I-5. There was almost the same number of total collisions in each direction. The actual collision rate for all three categories is higher than the statewide average in both the eastbound direction and westbound direction.

Table 2.1-19 summarizes the number of collisions and collision rates at ramps where ramp meters would be installed under the build alternatives, as well as for the connector ramps at I-80/US-50 interchange.

As shown in Table 2.1-19, no collisions were recorded at four of the ramps during the 5-year period. The actual collision rates are higher than the statewide average at the remaining five ramp locations—SR 113 on-ramp to westbound I-80 had a higher than average fatal plus injury collision rate, SR 113 on-ramp to eastbound I-80 had a higher than average fatal collision rate, Richards Boulevard on-ramp to eastbound I-80 had a higher than average fatality plus injury collision rate, westbound I-80 to eastbound US 50 connector ramp had higher than average fatal plus injury collision rates as well as total collision rates, and the westbound US 50 to eastbound I-80 connector ramp has a higher than average total collision rate.

Table 2.1-19. Ramps—Traffic Accident Surveillance and Analysis System Collisions Summary (January 1, 2015 through December 31, 2019)

Ramp	Total No. of Collisions	Fatal Collisions	Fatal and Injury Collisions	Actual (per Million Vehicle Miles)			Average (per Million Vehicle Miles)		
				Fatal Collisions	Fatal + Injury Collisions	Total*	Fatal Collisions	Fatal + Injury Collisions	Total*

2.1.10.4 Roadways

I-80 is a transcontinental highway that extends from San Francisco, CA to New York, NY. In the project area, I-80 serves commuter, freight, and recreational traffic between the San Francisco Bay Area and the Sacramento metropolitan area and provides one of two all-weather connections across the Yolo Bypass. I-80 is a six-lane freeway in most of the project area with an eight-lane portion from Kidwell Road to Old Davis Road in Solano County. System interchanges exist at SR 113, US 50, and I-5. Auxiliary lanes exist in both directions between Kidwell Road and SR 113, between Enterprise Boulevard/West Capitol Avenue and US 50, between West El Camino Avenue and I-5, between I-5 and Truxel Road, and between Truxel Road and Northgate Boulevard.

US-50 is a transcontinental highway that extends from I-80 in West Sacramento to Ocean City, MD. In the project area, US 50 serves commuter, freight, and recreational traffic between Yolo and Sacramento counties. US 50 is a six-lane to eight-lane freeway in the project area. Auxiliary lanes exist in both directions between I-80 and Harbor Boulevard, between Jefferson Boulevard and I-5, between I-5 and 15th Street/16th Street, and between 15th Street/16th Street and SR 51/SR 99. An eastbound auxiliary lane is provided from Harbor Boulevard to Jefferson Boulevard/Tower Bridge Gateway.

I-5 is a north-south freeway that extends from Mexico to Canada along the west coast of the United States. In the project area, I-5 serves regional traffic through the Central Valley and commuter traffic within the Sacramento metropolitan area. I-5 intersects both US 50 and I-80 in the project area. The I-5/US 50 interchange is near downtown Sacramento, and the freeway-to-freeway ramps also provide connections to P Street and Q Street. The I-5/I-80 interchange has a full cloverleaf configuration except that the westbound to southbound movement uses a direct connector ramp.

SR-113 is a north-south highway that runs from SR 12 west of Rio Vista to SR 99 south of Yuba City. In the project area, SR 113 is a four-lane freeway that connects I-80 to I-5 in Woodland. The system interchange ramps at I-80/SR 113 are braided with the adjacent I-80/Old Davis Road interchange.

SR-99 is a north-south highway that runs from I-5 south of Bakersfield to I-5 in Red Bluff. In the project area, SR 99 is an eight-lane freeway that connects US 50 at SR 51 with Elk Grove, Stockton, and the southern Central Valley. SR 99 serves commuters to and from downtown Sacramento.

SR 51 is a north-south eight-lane freeway that connects US 50 at SR 99 in downtown Sacramento to I-80 in northern Sacramento County. SR 51, which is signed as Business Loop 80, serves commuters in the Sacramento area.

Ramp meters operate on many of the ramp entrances to I-80 and US-50 during the morning and afternoon peak periods. Most metering locations operate with a variable metering rate based upon the freeway's mainline flows and on-ramp queue lengths.

Existing condition freeway traffic volumes for the project area was provided in the TAR (Caltrans 2023d). The TAR summarizes data from the PeMS online database to obtain mainline and ramp volumes from October 2019, where available. For locations where PeMS data was not available, the TAR obtained traffic volumes from StreetLight Data. StreetLight Data uses location-based services data and GPS data (anonymized location records from smartphones and navigation devices). The PeMS and StreetLight Data were combined, and the resulting volumes were balanced along the corridor. The October 2019 balanced demand volumes for the morning and afternoon peak -hour within the project area range from approximately 10,000 vehicles per hour in both the EB and WB directions during the morning peak hour to approximately 8,000 and 9,000 vehicles per hour, respectively, in the EB and WB directions during the afternoon peak hour.

The numbers of HOVs, defined as vehicles with two or more occupants, currently using the corridor are summarized in Table 2.1-20 as a percentage of the total flow during the morning and afternoon peak periods for the eastbound and westbound directions. Since the counts were conducted during COVID-19 pandemic, when people were encouraged to work from home and schools were closed, the observed HOV percentages were compared with similar average percentages measured in 2019 on other Sacramento area freeways with HOV lanes (US 50, SR 99, and I-80 east of the project area) to confirm reasonableness for use in this analysis. The vehicle classification counts were collected on one day only.

Table 2.1-20. Average Percentage of HOVs by Time Period – Existing Conditions

Location	Morning Peak Period		Afternoon Peak Period	
	6-8 a.m.	8-10 a.m.	3-5 p.m.	5-7 p.m.
Eastbound	14%	14%	20%	22%
Westbound	20%	20%	20%	22%

Source: Caltrans 2023d
HOV = high-occupancy vehicle

Freeway speed and travel time data were obtained for both directions of travel along I-80 and US 50 within the project area from the INRIX Roadways web-based application for midweek days (Tuesday, Wednesday, and Thursday) in October 2019. Data was collected in 15-minute intervals. The average midweek peak period speeds were calculated to prepare a corridor speed contour plot. Individual day speed contour plots were reviewed to exclude days or areas where non-recurrent congestion occurred. The model speed contour plots for the freeway segments by direction and peak period are presented below in Figure 2.1-6 through Figure 2.1-9

Figure 2.1-6 shows the speed contour plots for the morning and afternoon peak periods for the eastbound corridor from I-80 at Pedrick Road to US 50 at SR 51/SR 99. During the morning peak period, two bottlenecks occur in the eastbound direction: one on I-80 at Mace Boulevard and the other on US 50 in downtown Sacramento. The congestion at Mace Boulevard lasts from about 7:30 to 8:00 a.m. and is limited to the interchange itself. The downtown bottleneck is in the weaving section between I-5 and 15th Street. Congested conditions last from approximately 7:30 to 9:00 a.m. and extend back through the Harbor Boulevard interchange.

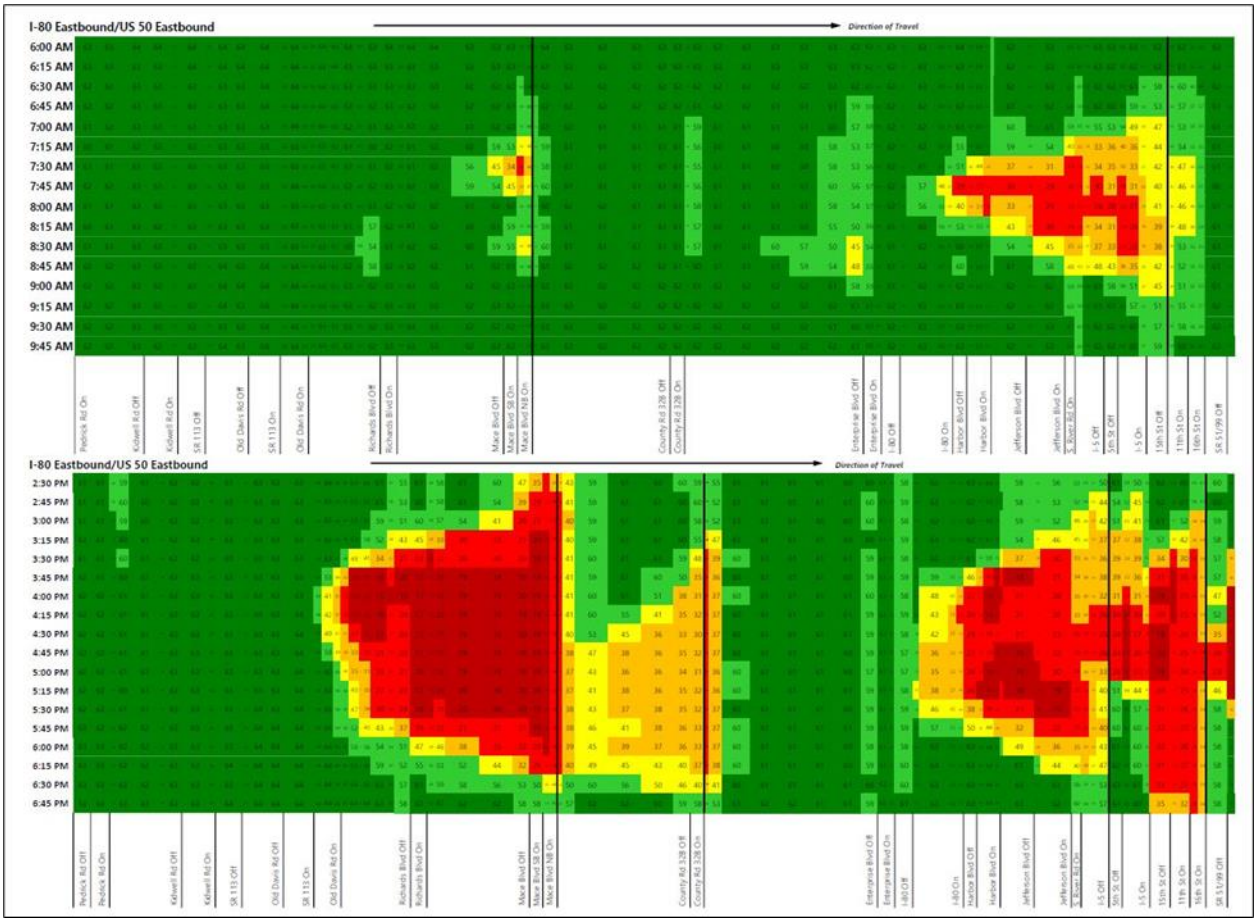

Figure 2.1-6. I-80 and US 50 Eastbound Average 2019 Weekday Speeds
Source: Caltrans 2023e

During the afternoon peak period, the eastbound I-80/US 50 corridor direction has several bottlenecks. The upstream bottleneck at Mace Boulevard lasts the entire peak period and results in congested speeds that extend back to Old Davis Road. The horizontal curve and the Mace Boulevard on-ramps traffic together create the bottleneck, which has a maximum throughput of about 4,800 vehicles per hour (vph) and lasts from approximately 2:30 to 6:30 p.m. Like Mace Boulevard, the secondary bottleneck at County Road 32B forms due to the on-ramp volume although a ramp meter on the on-ramp works to reduce this congestion. The bottleneck is also affected by the vertical curve at the beginning of the Yolo Causeway. The maximum throughput is about 5,320 vph, and congestion lasts from approximately 3:30 to 6:30 p.m. On US 50, the I-5 off-ramp and the weaving section between 16th Street and SR 51/SR 99 are bottlenecks. The first lasts from approximately 3:15 to 6:00 p.m. and the second from approximately 3:00 to 7:00 p.m. Both the SR 51 and SR 99 freeways also have downstream bottlenecks that can affect operations on US 50.

Figure 2.1-6 shows the speed contour plots for the morning and afternoon peak periods for eastbound I-80 from US 50 to Northgate Boulevard. During the morning peak period, eastbound I-80 from US 50 to Northgate Boulevard is not congested. However, two bottlenecks exist during the afternoon peak period. The Reed Avenue on-ramp serves as a bottleneck due to the on-

ramp volume combined with the grade and reduced clear zone at the Bryte Bend bridge. Congested conditions last from approximately 4:15 to 6:15 p.m. and extend back to US 50. Freeway capacity downstream of the Reed Avenue on-ramp is about 5,100 vph. The I-5 to Truxel Road weaving section is also a bottleneck due to the heavy I-5 on-ramp volume entering the freeway. Congestion lasts from approximately 3:45 to 5:45 p.m.. Downstream of the project area, a bottleneck exists at the Steelhead Creek bridge just east of the Northgate Boulevard interchange that causes congestion to extend upstream of the Northgate Boulevard off-ramp.

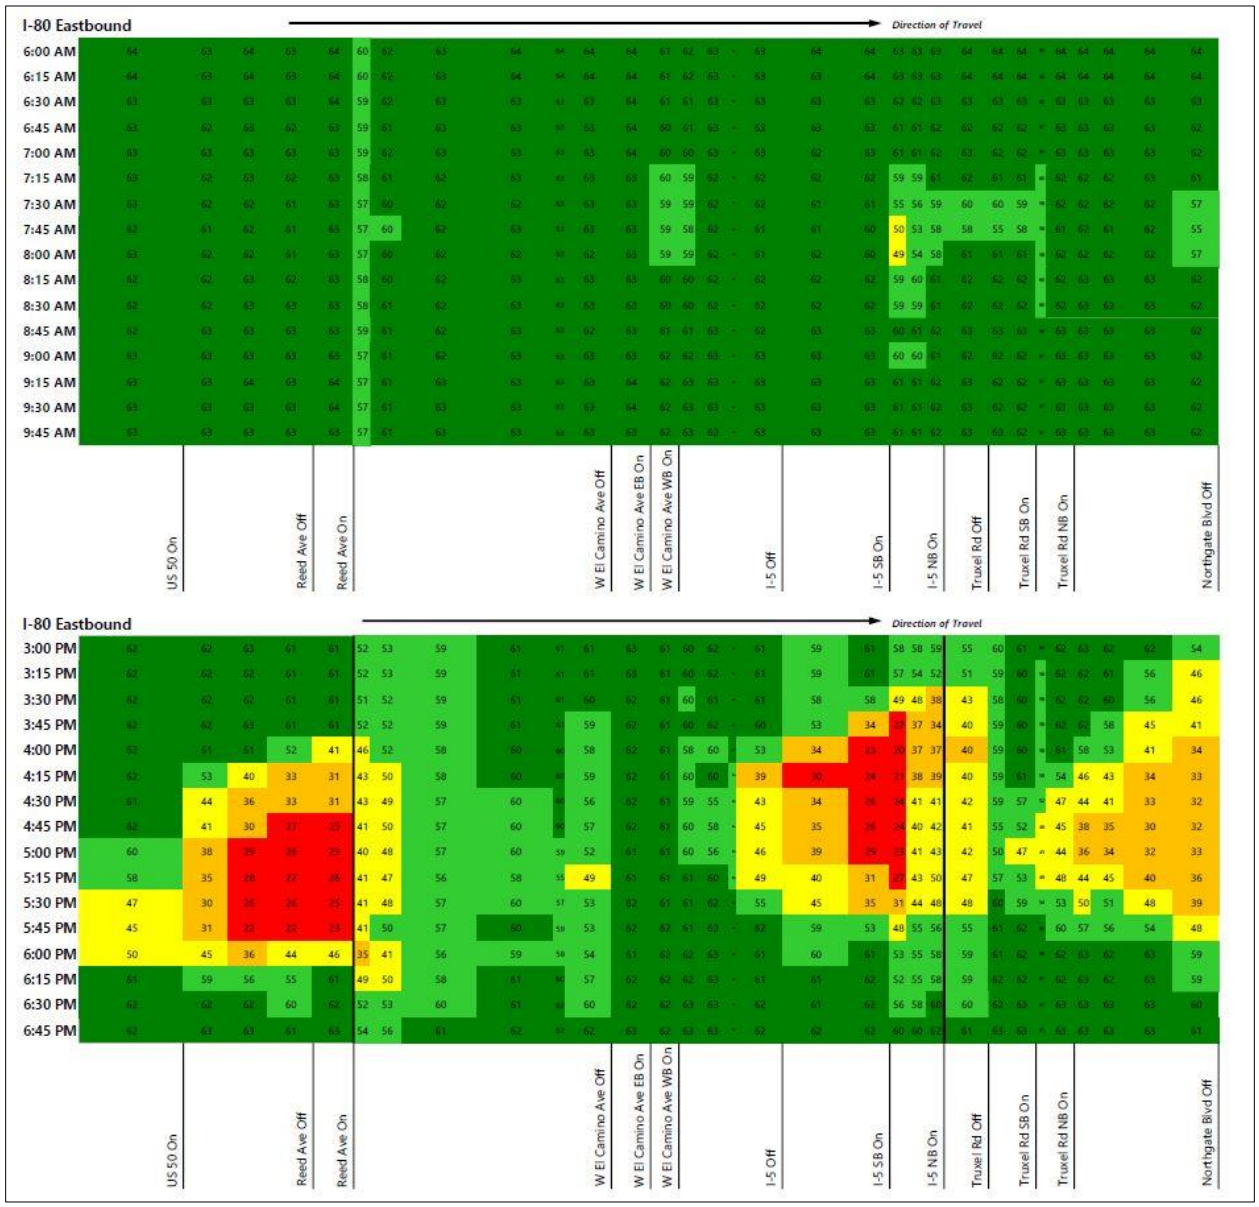

Figure 2.1-7. I-80 Eastbound Average 2019 Weekday Speeds
Source: Caltrans 2023e

Figure 2.1-7 shows the speed contour plots for the morning and afternoon peak periods for the westbound corridor from US 50 at SR 51/SR 99 to I-80 at Pedrick Road. During the morning peak period, the weaving section between the SR 51 on-ramp and the 16th Street off-ramp is a bottleneck from approximately 7:00 a.m. to after 9:00 a.m.. Congestion also occurs at the downstream weaving segment between 15th Street and I-5. At the downstream bottleneck at the Yolo Causeway, congestion begins at approximately 6:30 a.m. and lasts beyond the end of the analysis period at 10:00 a.m. Congestion extends from West Capitol Avenue upstream through the I-80 interchange. The maximum throughput on the Yolo Causeway is about 5,600 vph. During the afternoon peak period, the downtown section of US 50 has overlapping bottlenecks at SR 51 to 16th Street and the I-5 off-ramp. The downstream Jefferson Boulevard off-ramp is also a bottleneck, with a shorter duration of about an hour compared to the three hours of congestion downtown. The lane drop at Jefferson Boulevard requires the I-5 on-ramp traffic to merge over. Additionally, the off-ramp demand volume is greater than 1,500 vph, which suggests that two off-ramp lanes are needed. Like the morning peak period, the Yolo Causeway is also a bottleneck, but the congestion is less severe, only about two and a half hours in duration. The bottleneck throughput is about 4,700 vph.

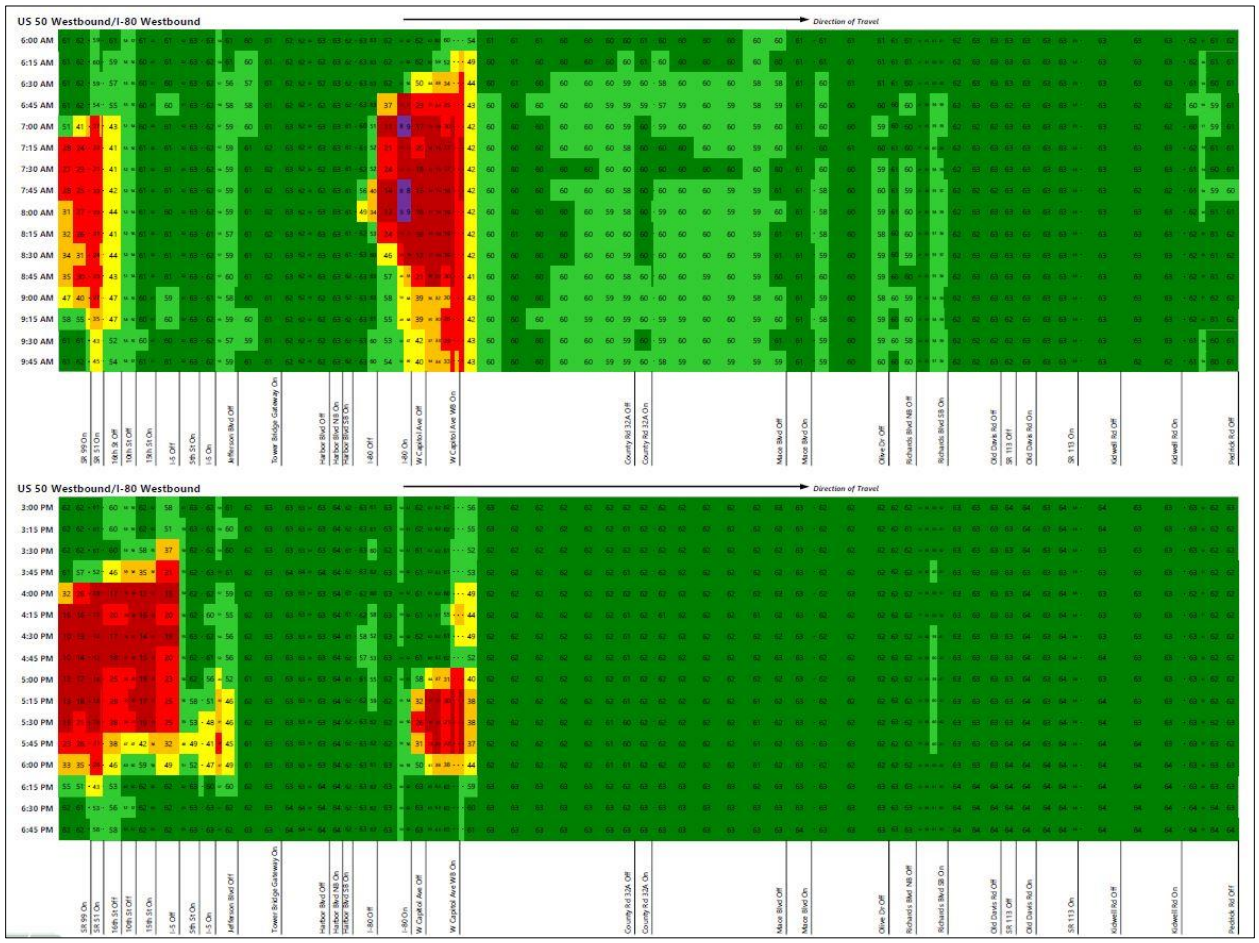

Figure 2.1-8. I-80 and US 50 Westbound Average 2019 Weekday Speeds
Source: Caltrans 2023e

Figure 2.1-8 shows the speed contour plots for the morning and afternoon peak periods for westbound I-80 from Northgate Boulevard to US 50. During the morning peak period, a bottleneck exists on southbound I-5 that extends onto the connector ramp from westbound I-80, which then causes congested conditions on westbound I-80 for about an hour. Congestion also extends from the Yolo Causeway bottleneck onto eastbound I-80 back to Reed Avenue. During the afternoon peak period, this freeway section is mostly uncongested. The only slow speeds occur near US 50 when congestion from the Yolo Causeway bottleneck extends back through this area.

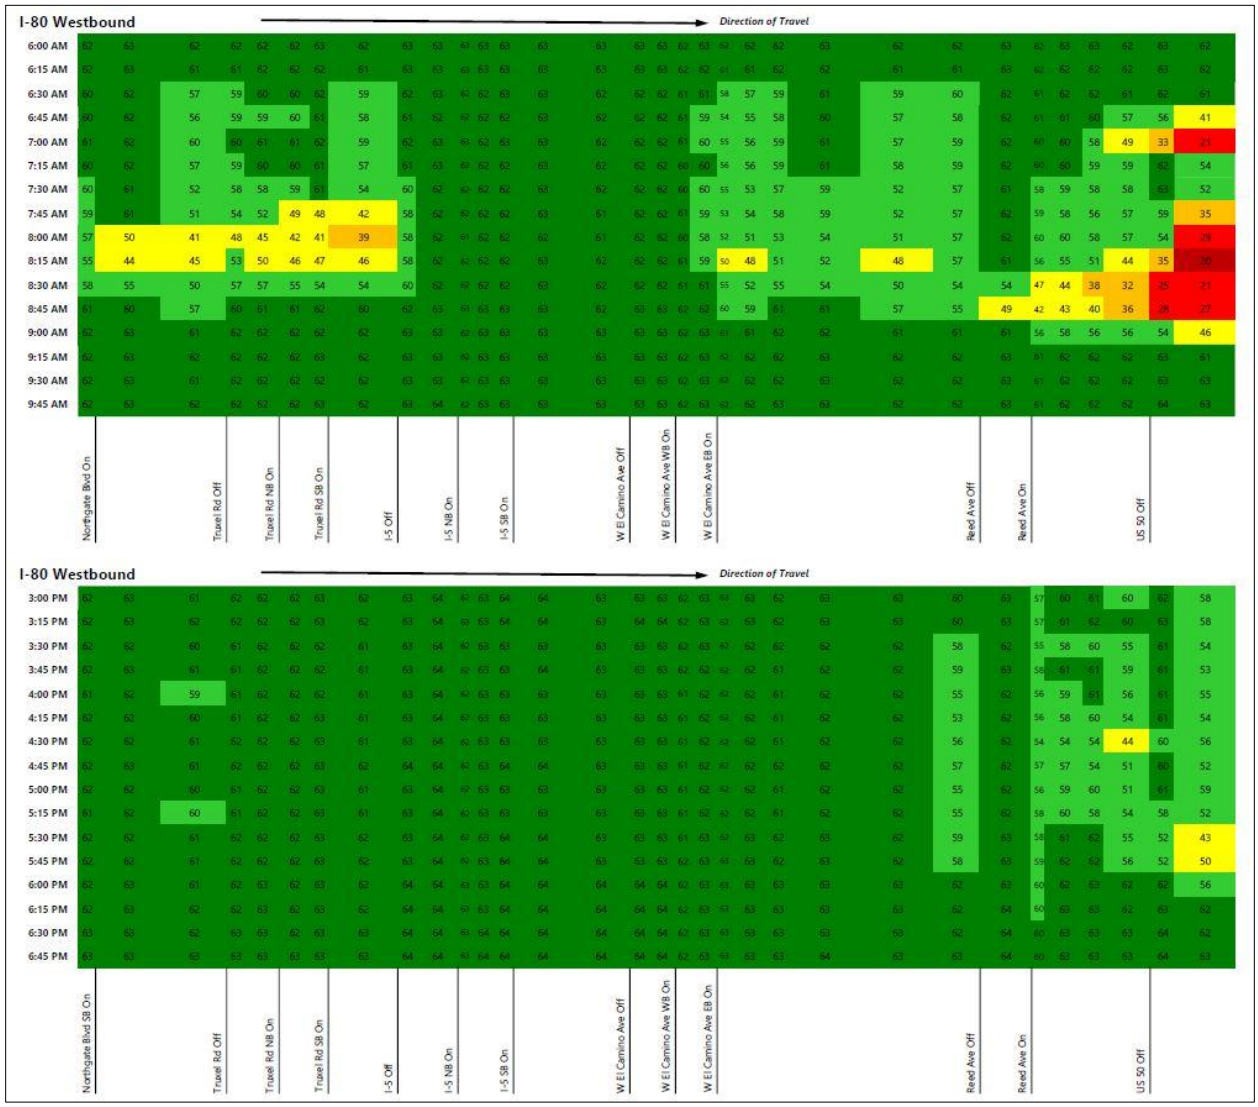

Figure 2.1-9. I-80 Westbound Average 2019 Weekday Speeds
Source: Caltrans 2023e

Peak hour travel times from the freeway traffic operations model is summarized in Table 2.1-21. For comparison purposes, the table also includes the free-flow travel time at the posted speed limit of 65 mph. During the morning peak hour, congested conditions affect eastbound travel times most prominently for eastbound US 50 from I-80 to SR 51/SR 99, which has an average

travel time 46 percent greater, an additional 2.3 minutes (7.3 minutes vs. 5.0 minutes), than the uncongested travel time. For westbound travel times, US 50/I-80 from the I-80 eastbound off-ramp to Kidwell Road has an average travel time 39 percent greater, an additional 4.8 minutes (17.0 minutes vs. 12.2 minutes), than the uncongested travel time.

During the afternoon peak hour, average eastbound travel time is 88 percent greater than free-flow conditions for I-80 from Kidwell Road to US 50 and 142 percent greater than free-flow conditions for US 50 from I-80 to SR 51/SR 99. Westbound travel time experiences the most delay for US 50 from SR 51 to I-80 where the congested travel time is 85 percent greater than free-flow conditions, which equates to approximately 3.5 additional minutes (7.6 minutes vs. 4.1 minutes).

Table 2.1-21. Corridor Travel Times (Minutes) – Existing Conditions (2019)

Path	Free-Flow Conditions	Morning Peak Hour	Afternoon Peak Hour
I-80 Eastbound: Kidwell Rd Off-ramp to US 50 Off-ramp	12.2	13.1 (+7%)	22.9 (+88%)
US 50 Eastbound: I-80 to SR 51/SR 99 Off-ramp	5.0	7.3 (+46%)	12.1 (+142%)
I-80 Eastbound: US 50 Off-ramp to Truxel Rd Off-ramp	5.2	5.5 (+6%)	7.5 (+44%)
US 50/I-80 Westbound: I-80 EB Off-ramp to Kidwell Rd Off-ramp	12.2	17.0 (39%)	12.9 (+6%)
US 50 Westbound: SR 51 On-ramp to I-80 Off-ramp	4.1	4.5 (+10%)	7.6 (+85%)
I-80 Westbound: Truxel Rd SB On-ramp to US 50	5.3	5.8 (+9%)	5.3 (+0%)

Source: Caltrans 2023e
Notes: Travel time is reported in minutes. Free-flow is the travel time at the posted speed of 65 mph. The peak hours are 7:00 to 8:00 a.m. and 4:00 to 5:00 p.m.

Traffic LOS is a measure of traffic operating conditions that is designated A through F with LOS A representing free flow conditions and LOS F representing severe traffic congestion. Table 2.1-22 summarizes the LOS thresholds from HCM Seventh Edition for freeway sections.

Table 2.1-22. Freeway Level of Service Thresholds

LOS	Description	Density (vehicles/mile-lane)	
		Basic	Merge, Diverge and Weave
A	Free-flow speeds prevail. Vehicles are almost completely unimpeded in their ability to maneuver.	≤11	≤10
B	Free-flow speeds are maintained. The ability to maneuver with the traffic stream is only slightly restricted.	>11 to 18	>10 to 20
C	Flow with speeds at or near free-flow speeds. Freedom to maneuver within the traffic stream is noticeably restricted, and lane changes require more care and vigilance on the part of the driver.	>18 to 26	>20 to 28
D	Speeds decline slightly with increasing flows. Freedom to maneuver with the traffic stream is more noticeably limited, and the driver experiences reduced physical and psychological comfort.	>26 to 35	>28 to 35

LOS	Description	Density (vehicles/mile-lane)	
		Basic	Merge, Diverge and Weave
E	Operation at capacity. There are virtually no usable gaps within the traffic stream, leaving little room to maneuver. Any disruption can be expected to produce a breakdown with queuing.	>35 to 45	>35 to 43
F	Represents a breakdown in flow.	>45 or v/c > 1[1]	>43 or v/c > 1[1]

Source: *Highway Capacity Manual, 7th Edition* (Transportation Research Board, 2022)
Note: [1]Volume-to-capacity ratio (v/c) is greater than 1 (exceeds capacity)
Key: LOS = level of service; ≤ means less than or equal to, > means greater than.

Table 2.1-23 and Table 2.1-24 show the peak hour (7:00 to 8:00 a.m. and 4:00 to 5:00 p.m.) level of service (LOS) and average density at select ramp junctions and mainline sections under existing conditions for the eastbound and westbound directions, respectively.

Source: Caltrans 2023e
Notes: *(Bold face) indicates LOS F conditions. The peak hours are 7:00 to 8:00 a.m. and 4:00 to 5:00 p.m.
[1]Density is reported in vehicles per lane per mile.

For the eastbound direction, morning peak hour LOS F congested conditions occur on US 50 from the I-80 on-ramp in West Sacramento to the I-5 on-ramp in Sacramento. LOS F also occurs on I-80 at Mace Boulevard, but the segments on either side of the interchange operate at

LOS D or better. During the afternoon peak hour, LOS F conditions exist on I-80 from Old Davis Road to County Road 32B in Davis, on US 50 from Harbor Boulevard to the I-5 off-ramp, and on US 50 from the I-5 on-ramp past the SR 51/SR 99 off-ramp. LOS F also occurs on I-80 between US 50 and Reed Avenue, at I-5, and from Truxel Road to east of Northgate Boulevard.

For the westbound direction, morning peak hour LOS F congested conditions occur on from the I-80/US 50 interchange through the West Capitol Avenue interchange. During the afternoon peak hour, LOS F conditions exist on US 50 from east of SR 51/SR 99 to the 15th Street on-ramp. The Yolo Causeway bottleneck forms after the peak hour, so LOS F conditions occur after 5 p.m. at this location.

1Density is reported in vehicles per lane per mile.

2.1.10.5 Bicycle and Pedestrian Facilities

A comprehensive Pedestrian and Bicycle Travel Impact Assessment was completed by Caltrans in April 2023 (Caltrans 2023). The assessment evaluated the locations within and adjacent to the project area that consist of facilities and travel origins and destinations commonly used by pedestrians and bicyclists. Changes in traffic patterns resulting from the project that could affect pedestrians and bicyclists, changes to access and configuration of pedestrian and bicyclist

facilities, and the effect of project construction on such facilities was addressed. The Highway Design Manual classifies Bikeway facilities as follows:

- Shared Roadways (No Bikeway Designation) are streets and highways without bikeway designations.
- Class I Bikeways (Bike Path) serve corridors not served by streets and highways. Class I facilities close gaps to bicycle travel caused by construction of freeways or because of the existence of natural barriers (rivers, mountains, etc.).
- Class II Bikeways (Bike Lane) are intended to delineate the right of way assigned to bicyclists and motorists and to provide for more predictable movements by each. To better accommodate bicyclists through corridors where insufficient room exists for side-by-side sharing of existing streets by motorists and bicyclists.
- Class III Bikeways (Bike Route) are shared facilities which serve either to provide continuity to other bicycle facilities (usually Class II bikeways); or designate preferred routes through high demand corridors.
- Class IV Bikeways (Separated Bikeways) is for the exclusive use of bicycles and includes a separation required between the separated bikeway and the through vehicular traffic.

The following describes the existing pedestrian and bicycle infrastructure within the project area.

Near the western limits of the project area, Old Davis Road is configured with Class II bike lanes that use green pavement markings at select locations. Parallel to Old Davis Road is a shared-use path that passes through the I-80 interchange with grade-separated crossings under the freeway ramps, allowing pedestrians and bicyclists to traverse through the interchange fully separated from vehicular traffic.

City of Davis roadways in the vicinity of the Richards Boulevard interchange include on- and off-street bicycle facilities and well-defined pedestrian infrastructure. Class II bike lanes are present on the Richards Boulevard overcrossing with a non-standard configuration in the westbound mixing zone where the path of travel for bicycles crosses the path of travel for vehicles approaching the westbound I-80 loop on-ramp. A sidewalk is present on the south side of the Richards Boulevard overcrossing only, and there are no marked crosswalks for pedestrians at the on- and off-ramps. The Yolo 80 Corridor Improvements Project Draft Pedestrian and Bicyclist Travel Impact Assessment (Caltrans 2023) notes how the Draft Downtown Davis Specific Plan identifies Richards Boulevard as part of its priority network for pedestrians, bicyclists, transit, and vehicular traffic. An off-street shared-use path is located approximately 1,200 feet southwest of the interchange, which allows pedestrians and bicyclists to cross under I-80, connecting the Davis Downtown area with residential areas on the opposite side of I-80.

The Dave Pelz Bike Overcrossing connects neighborhoods and employment centers in areas north and south of I-80. The overcrossing is part of the Davis Bike Loop, an approximately 12-mile-long bikeway used by bicyclists, walkers, and runners. The loop connects various portions

of Davis and UC Davis and is primarily made up of shared-use paths with a few sections on residential streets. Roadways in the vicinity of each overcrossing consist of off-street shared-use paths, Class II bike lanes, and pedestrian facilities. A shared-use path runs along the west side of Pole Line Road connecting the Fifth Street shared-use path with residential areas south of I-80. Class II bike lanes are also present on Pole Line Road, Fifth Street east of Pole Line Road, Cowell Boulevard, and other roadways in the vicinity of Pole Line Road. Multiple shared-use paths are also present throughout the neighborhoods south of I-80, which provide a connection to the Pole Line Road shared-use path. A Class I bicycle path runs parallel to the north side of I-80 and begins at Olive Drive just west of the Pole Line Road overcrossing.

Roadways in the vicinity of the Mace Boulevard interchange include on- and off-street bicycle facilities and pedestrian infrastructure. Class II bike lanes are present on the Mace Boulevard overcrossing, and they connect to Class II bike lanes on Second Street just north of the interchange and to a shared-use path on the east side of Mace Boulevard at Second Street. A sidewalk is present on the east side of the Mace Boulevard overcrossing only. South of I-80, a Class IV cycle track is present on Mace Boulevard from Redbud Drive to Cowell Boulevard, which is configured as a protected intersection. A gap exists where no bike lanes are present on Mace Boulevard between Cowell Boulevard and the I-80 interchange. Connections from Mace Boulevard to the I-80 shared-use path are provided along the northerly edge of the westbound on- and off-ramps.

The roadways in the vicinity of the County Road 32 interchange include limited bicycle infrastructure and generally lack pedestrian infrastructure. A Class I bicycle trail is present along the north side of the Yolo Causeway. The Yolo Causeway Class I bicycle trail terminates at the west end of the causeway, and a connection to local roads is provided by a path between the causeway and CR-32A and CR-32B. CR-32A runs parallel to I-80 on the north side of the freeway and is configured with narrow paved shoulders that are used by bicyclists. No sidewalks are present in the vicinity of the interchange.

The Yolo Causeway bicycle path is located along the northerly edge of the I-80 Yolo Causeway. The west end of the causeway bicycle path connects with CR-32 east of Davis. The east end of the causeway bicycle path connects with West Capitol Avenue in West Sacramento. The Yolo Causeway bicycle path runs parallel to the westbound I-80 vehicle lanes and is separated from vehicular traffic by a concrete barrier with a chain link fence attached to the top of the barrier.

Sidewalks are located on the west side of Enterprise Boulevard and West Capitol Avenue through the I-80 interchange area. Roadways in the vicinity of the interchange include Class II bike lanes on West Capitol Avenue, which begin at the westbound I-80 ramp interchange. There are no marked bicycle facilities within the interchange area or south of the interchange on Enterprise Boulevard. Class II bike lanes are present on Industrial Boulevard south of the interchange. A Class I bicycle path begins on the west side of West Capitol Avenue and connects to the Yolo Causeway bicycle path. The bicycle path can be accessed approximately 350 feet east of the westbound I-80 off-ramp at a location that includes a marked crosswalk with overhead warning beacons. The bicycle path can also be accessed at a location immediately adjacent to the westbound I-80 on-ramp.

Sidewalks are provided on each side of the Harbor Boulevard overcrossing. Class II bike lanes are generally present on Harbor Boulevard through the interchange; however, gaps exist at some locations where bike lane striping is not provided. Marked crosswalks are provided at some locations but are missing at each of the free-flowing ramps. Bike lanes are not provided on Harbor Boulevard immediately north or south of the interchange area. Roadways in the vicinity of the interchange include Class II bike lanes on West Capitol Avenue and on Harbor Boulevard north of West Capitol Avenue. Class II bike lanes are present on Industrial Boulevard south of the interchange except for a gap between Harbor Boulevard and Terminal Street.

Sidewalks are provided on each side of the Jefferson Boulevard undercrossing. Immediately north of the interchange, a small gap in the sidewalk exists on the east side of Jefferson Boulevard. Crosswalks are not provided at the State Route 275 ramp intersections. No bike lanes are present on Jefferson Boulevard through the interchange. Class II bike lanes are provided on Jefferson Boulevard north of West Capitol Avenue and south of Webster Street. Class II bike lanes are also provided on Park Boulevard south of Webster Street and on West Capitol Avenue east of Jefferson Boulevard. Immediately west of Jefferson Boulevard, a Class III bike route is designated on West Capitol Avenue until Poplar Avenue where Class II bike lanes begin.

No sidewalks are provided on either side of South River Road in the area where the road passes underneath I-80. North of Tower Street, a sidewalk is provided on the east side of South River Road only. Class II bicycle lanes are provided on South River Road, north of Tower Street and south of the Caltrans maintenance yard driveway. A sidewalk is provided on the west side of South River Road south of the Caltrans maintenance yard driveway.

Sidewalks are provided on each side of the Reed Avenue undercrossing, and Class II bike lanes are provided through the interchange area and to the west. Class II bike lanes are also provided on Reed Avenue east of the interchange except for a gap between the eastbound ramps and Ikea Court/Riverpoint Drive.

A sidewalk is provided along the north side of West El Camino Avenue through the interchange; however, marked crosswalks are not provided at the ramps. Marked crosswalks are also not provided at the intersection of West El Camino Avenue and El Centro Road near the hotels and truck stop. Class II bike lanes are provided on West El Camino Avenue and on Orchard Lane.

2.1.10.6 Transit

Existing transit service on the corridor is provided by the Amtrak Capitol Corridor regional commuter rail, by Fairfield and Suisun Transit (FAST) express bus service, by Yolo County Transportation District's Yolobus service, and by the Causeway Connection, which is operated by Yolobus and Sacramento Regional Transit. Except where noted, the service descriptions below reflect October 2019 conditions: that is, before service changes associated with the COVID-19 pandemic.

FAST operates the Blue Line express bus that provides weekday service between downtown Sacramento and Walnut Creek with a UC Davis stop in the project area. Effective August 2021, service is provided four times during each of the morning and afternoon peak periods.

The Capitol Corridor operates daily train service between San Jose and Auburn. On weekdays, 11 trains travel between Davis and Sacramento in each direction. Some of the trains terminate in Sacramento or Roseville rather than Auburn. Train service is approximately hourly during the morning and afternoon peak periods with longer headways during the middle of the day. The Sacramento and Davis stations are in the project area. The nearest station to the west is Fairfield-Vacaville and the nearest station to the east is Roseville.

Yolobus operates eight routes on I-80 in the project area. On weekdays, two routes provide intercity service throughout the day, and the other six are commuter routes between Davis and Sacramento. The intercity routes have stops adjacent to the park and ride lots at West Capitol Avenue and Mace Boulevard. The Yolobus routes are as follows:

- Routes 42A and 42B provide intercity service between Davis, Sacramento, and Woodland throughout the day. Route 42A travels in a clockwise direction and Route 42B travels in a counterclockwise direction. In the project area, Route 42A travels westbound along I-80 from West Capitol Avenue to Mace Boulevard and Route 42B travels eastbound from Mace Boulevard to Enterprise Boulevard. Service is provided hourly between 6:00 a.m. and 11:00 p.m.

- Route 43 provides commuter service between UC Davis and downtown Sacramento. Route 43 has five peak direction trips during each peak period (towards Sacramento in the morning and towards Davis in the afternoon). Route 43 travels between I-80 at Mace Boulevard and US 50 at Tower Bridge Gateway.

- Route 43R provides commuter service between UC Davis and downtown Sacramento. Route 43R has one off-peak direction trip during each peak period (towards Davis in the morning and towards Sacramento in the afternoon). Route 43R travels between I-80 at Richards Boulevard and US 50 at 5th Street in Sacramento.

- Routes 230, 231, and 232 provide commuter service between Davis and downtown Sacramento similar to Route 43. Route 230 has three peak direction trips during each peak period (towards Sacramento in the morning and towards Davis in the afternoon) and travels between I-80 at SR 113 and US 50 at Tower Bridge Gateway. Route 232 has one peak direction trip during each peak period (towards Sacramento in the morning and towards Davis in the afternoon) and travels between I-80 at Mace Boulevard and US 50 at Tower Bridge Gateway. Route 231 is an additional route that is scheduled late in the afternoon peak period that picks up passengers that may have missed an earlier Route 230 or 232 bus.

The Causeway Connection (Route 138) provides daily service between UC Davis and the UC Davis Medical Center in Sacramento. On weekdays, 15 buses travel in each direction and hourly service is provided between 6:00 a.m. and 8:00 p.m. In the project area, the route travels between I-80 at Old Davis Road and US 50 at Stockton Boulevard, which is just east of the SR 51/SR 99 interchange.

In addition to these transit services, other organizations provide bus service along I-80. Commercial bus carriers include Greyhound, Megabus, and FlixBus. Recreational tour

companies provide bus service to casinos and other recreational destinations in the Reno and Tahoe region.

2.1.10.7 Environmental Consequences

Caltrans has adopted guidelines in the form of the TAF and the TAC to guide the process of evaluating transportation impacts of State Highway System projects. Through the process of developing the TAF and TAC, Caltrans determined that induced travel demand, which is synonymous with induced VMT, represents the metric most appropriate for determining a transportation project's impact. Induced travel demand generally occurs when the cost for travel is lower after travel constraints, such as congestion, are reduced. In this context, cost can be in the form of travel time, actual financial cost (e.g., fuel and tolling), or a combination of both. Additional driving resulting from a capacity-enhancing highway project may occur due to factors such as a change in travel mode from transit to a single-occupant vehicle or choosing to make a trip that otherwise would not occur.

No-Build Alternative 1

Under the No-Build Alternative, managed lanes and transportation improvements would not be constructed or operated. As such, the No-Build Alternative would have no effect on current or future traffic or transportation conditions.

Build Alternatives 2a through 7b

Construction

Construction activities and ground-disturbing activities associated with the build alternatives would result in temporary traffic delays and ramp closures on I-80 and US 50 that could result in temporary effects on vehicular (including public transportation and emergency vehicles), bicycle, and/or pedestrian access in and near the project area. To maintain access through the project corridor, a transportation management plan (TMP) would be developed by Caltrans consistent with Caltrans standard procedures (Standard Measure TT-3 in Appendix E). The contractor would be required to schedule and conduct work to avoid unnecessary inconvenience to the public and to maintain access to community facilities, including bicycle and pedestrian facilities, within the work zone (Standard Measures TT-1 and TT-2). A TMP would plan construction in sections, with no more than one lane closed at a time and no successive ramp closures. The contractor would implement a planned public outreach program to keep area residents, businesses, community facilities, emergency service providers, and transit operators informed of the project construction schedule as part of the TMP. The TMP would include elements such as traffic controls to minimize speeds/congestion and other measures to maintain access during the construction period.

Operations

Vehicle volume forecasts were prepared for the project's opening year (2029) and a 20-year horizon (2049) for Alternatives 1, 2a, 3a, 4a, 5a, 6a, 7a, and 2b. Peak period conditions for Alternatives 2a and 2b, which are the HOV lane alternatives with and without the managed lane

median ramps at the I-80/US 50 interchange, were modeled using a calibrated traffic simulation model. The changes in traffic conditions between these two alternatives are expected to apply and be similar to Alternatives 3a versus 3b, Alternatives 4a versus 4b, etc., as the only difference between these respective alternatives would be the addition of the managed lane median ramps. Therefore, though individual operational analyses were not conducted for Alternatives 3b through 7b, they were extrapolated from analysis for Alternative 2b. Further detail from the travel demand modeling analysis is provided in the I-80/US 50 Travel Demand Modeling Report (Caltrans 2023h).

Traffic Forecasts

For Alternative 1 (No Build), afternoon peak hour demand volume is expected to increase by 22 percent at the Yolo Causeway by horizon year 2049. For alternatives with an added lane for HOVs and/or toll vehicles (Alternatives 2a through 5a, and 2b), the volume growth from existing conditions would range from 27 to 37 percent. At the Sacramento River bridges on I-80 and US 50, the growth rates would be higher for Alternative 1 (35 and 29 percent), but the added lane alternatives would have similar or higher growth rates.

In addition to preparing traffic volume forecasts, the travel demand model was used to estimate regional and corridor performance measures including VMT, personal miles traveled (PMT), peak hour travel times, vehicle hours of delay, average speeds, and network volumes served. For opening year 2029, the model predicted higher VMT with each of the build alternatives compared to Alternative 1 (No Build), as expected.

By horizon year 2049, I-80 and US 50 in the project area would become so congested that travelers would seek longer paths to have a lower travel time. I-5 between Woodland and Sacramento County would have a higher demand volume under Alternative 1. With the additional capacity provided under the other alternatives, travelers would shift back to I-80.

Since the SACSIM travel demand model does not pass the TAF (Caltrans 2020b) checklist for travel demand models to adequately estimate induced demand, the National Center for Sustainable Transportation (NCST) Induced Travel Calculator was applied as outlined by the TAF procedures. Alternatives 2a through 7b would include some additional capacity and all would increase VMT. VMT cannot be estimated for Alternatives 6a and 6b using the NCST Induced Travel Calculator since Alternatives 6a and 6b restrict the new lane to buses only, which is not a configuration addressed by the methodology. Alternative 7a (Convert HOV) would have the lowest increase in VMT over Alternative 1 (No Build). The increase in VMT under Alternatives 2a through 5a would be the same and would be more than 40 times the VMT increase for Alternative 7a. Alternative 2b would have a slightly higher VMT increase in comparison to Alternative 2a since it would add more lane-miles.

Opening Year 2029 Conditions

For the morning peak period, eastbound I-80 and US 50 would have the same bottleneck locations as existing conditions, and congestion in the project area under Alternative 1 (No Build) would be about the same. Alternatives 2a through 6a, and 2b would eliminate the 45 minutes of congestion otherwise occurring at Mace Boulevard under Alternative 1. Alternative

7a (Convert HOV) would have about two-and-a-half hours of congestion in the general-purpose lanes at Mace Boulevard. Westbound I-80 congestion at the Yolo Causeway would grow under Alternative 1 to extend outside the morning peak period and extend upstream to I-5 on both US 50 and I-80. Alternative 6a (Add Transit) would have conditions similar to Alternative 1, and Alternative 7a would have worse congestion extending into downtown Sacramento on US 50. Congestion under Alternatives 2a through 5a, and 2b would also extend outside the peak period, but the queue would extend upstream only to Harbor Boulevard on US 50. Alternative 2b (Add HOV with Median Ramps) would have less upstream congestion on I-80 in comparison to Alternative 2a.

For the afternoon peak period, congestion at the eastbound I-80 bottlenecks at Mace Boulevard and County Road 32B would expand to outside the afternoon peak period under Alternatives 1 and 6a. Alternatives 2a through 5a, and 2b would have increased throughput at Mace Boulevard and would eliminate the County Road 32B bottleneck. However, the increased throughput would increase downstream congestion on US 50 and I-80 at I-5. Under these alternatives, the congestion at the I-5/I-80 interchange would extend back to Mace Boulevard. Alternative 7a would be congested for the entire peak period due to major bottlenecks at Mace Boulevard, Harbor Boulevard, and I-5. In the westbound direction, additional congestion upstream on US 50 in downtown Sacramento would result in less congestion at the Yolo Causeway under Alternative 1. Except for Alternative 7a, the other alternatives would have similar congestion for an hour or less at the West Capitol Avenue interchange. Alternative 7a would have about two-and-a-half hours of congestion at the Yolo Causeway that would extend back into the I-80/US 50 interchange.

Horizon Year 2049 Conditions

For the morning peak period, eastbound I-80 congestion under Alternative 1 (No Build) at Mace Boulevard would grow to two-and-one-half hours and congestion at the County Road 32B bottleneck would be about one hour. On eastbound US 50, congestion from the I-5 bottleneck would extend back to I-80. Alternative 6a (Add Transit) would have less congestion at Mace Boulevard and County Road 32B (less than an hour at each). Alternatives 2a through 5a, and 2b would have no congestion at Mace Boulevard and County Road 32B, and I-5 congestion would only extend to about Jefferson Boulevard. Alternative 7a would have bottlenecks at Mace Boulevard, County Road 32B, and South River Road that would start around 7:00 a.m. and extend beyond 10:00 a.m.

Westbound I-80 morning peak period congestion at the Yolo Causeway would grow under Alternatives 1 and 6a to extend outside the morning peak period and extend upstream to SR 51/SR 99 on US 50 and merge with a bottleneck at West El Camino Avenue on I-80 to extend upstream beyond Northgate Boulevard. Alternative 7a would have worse congestion upstream on both US 50 and I-80 with speeds lower than 20 mph for most of the morning peak period. Under alternatives 2a through 5a, and 2b, congestion at the Yolo Causeway bottleneck would be lower, but a new bottleneck would form at the lane drop after the US 50 off-ramp. The combined congested area would extend outside the peak period and extend upstream to Harbor Boulevard on US 50. Alternative 2b (Add HOV with Median Ramps) would have the least upstream congestion on both US 50 and I-80 with the additional capacity provided by the

median ramp from I-80 and the reduced volume in the weaving section on I-80 between US 50 and West Capitol Avenue.

For the afternoon peak period, congestion at the eastbound I-80 bottlenecks at Mace Boulevard, County Road 32B, and South River Road would expand to outside the afternoon peak period under Alternatives 1 and 6a. Congestion at Mace Boulevard would extend upstream of Pedrick Road in Solano County by 4:00 p.m. Alternatives 2a through 5a, and 2b would have increased throughput at Mace Boulevard and would delay the congestion at Pedrick Road until 5:00 p.m. Congestion at the County Road 32B and South River Road bottlenecks would be reduced, but the congestion at the I-80/US 50 interchange due to queuing from the I-5/I-80 and/or I-80/Reed Avenue interchanges would be similar to Alternative 1. Alternative 7a would be congested for the entire peak period due to major bottlenecks at Mace Boulevard, Harbor Boulevard, and I-5.

In the westbound direction during the afternoon peak period, a new bottleneck at the Jefferson Boulevard and I-80 off-ramps on US 50 would have one-and-a-half hours of congestion under Alternative 1. Congestion on I-80 at the Yolo Causeway would last more than three hours and extend upstream to US 50. Alternatives 2a, 3a, 6a, 7a, and 2b would also have a bottleneck at the Jefferson Boulevard off-ramp. Alternatives 2a through 4a and 6a, 7a and 2b would also have a bottleneck at the I-80 off-ramp. The Reed Avenue off-ramp would also have high demand volumes leading to congested conditions for the ramp diverge under all project alternatives.

Safety Impacts

Under Alternative 1 (No Build), collision rates would be the same as existing conditions. With the forecasted increase in traffic volumes, congestion and congestion-related collisions would increase. The freeway segments with higher-than-average collision rates would continue to experience the same collision rates. Alternatives 2a through 5a, and 2b would reduce congestion compared to Alternative 1. Alternatives 2a through 6a, and 2b would be expected to lower the collision rate since these alternatives add a lane in most of the project area.

Transit Impacts

Although transit service was not assumed to change among the analysis years, transit ridership will differ based on the travel time performance under the project alternatives. Alternative 6a (Add Transit) would have the highest ridership since only buses would have the travel time savings provided by the managed lanes. Alternatives 2a through 5a, and 2b would have similar transit ridership and an increase over Alternative 1 (No Build). Alternative 7a would have the lowest ridership and a decrease compared to Alternative 1 due to network congestion.

Bicycle and Pedestrian Impacts

Each of the build alternatives would replace the existing bicycle pathway pavement behind the gas station located north of West Capitol Avenue from PM 9.15 to PM 9.35. The existing bicycle pathway would be rerouted during repaving activities for up to two months, but repaving activities may occur at nighttime to minimize access disruption. To maintain access, bicycles traveling westbound would be redirected along West Capitol Avenue. Bicycles traveling

eastbound would be redirected along a short segment of sidewalk on West Capitol Avenue and use the crosswalk at the West Capitol Avenue/westbound I-80 off-ramp intersection[1]. Bicyclists would then continue eastbound along West Capitol Avenue using the existing bicycle lane. Caltrans would add crosswalk pavement marking across the westbound I-80 off-ramp to West Capitol Avenue and near the existing West Capitol Avenue crosswalk. In addition, Caltrans would add advanced warning signs to alert the motorists traveling on the westbound I-80 off-ramp to West Capitol Avenue before reaching the proposed crosswalk. Caltrans would place signage as part of the traffic management plan to note the access updates and identify the bicycle/pedestrian detours.

The build alternatives would also replace the existing bicycle pathway pavement from PM 9.1 to the Yolo Causeway bridge deck approach at approximately PM 8.9. While the existing Class I bicycle pathway is closed, a temporary bicycle pathway with K-rail barrier would be placed along the I-80 westbound on-ramp from West Capitol Avenue. Up to 100 linear feet of existing barrier near PM 8.9 would be removed and realigned to allow bicycles to rejoin the existing Class I Bicycle Pathway along Yolo Causeway. The existing Class I bicycle pathway along the Yolo Causeway would not require closure during construction activities.

Each of the build alternatives would extend the westernmost limit of the existing Class I bicycle pathway from I-80 along Yolo Causeway to connect to County Road (CR) 32A. The pathway extension would be located adjacent to the westbound I-80 off-ramp to CR-32A and would be approximately 12-feet wide. The area surrounding the pathway extension would be graded to comply with the Americans with Disabilities Act of 1990 (ADA) regulations. A concrete barrier would separate the pathway extension from westbound off-ramp vehicular traffic. Once construction of the pathway extension along westbound I-80 off-ramp is complete, the build alternatives would conduct pavement rehabilitation on the western Yolo Causeway levee, from the Yolo Causeway bridge to from CR-32A to Levee Road. During pavement rehabilitation activities, Levee Road would be closed. Bicycles would be redirected along the newly constructed pathway extension on westbound I-80 off-ramp to access the existing Class I bicycle pathway along Yolo Causeway, which would be built prior to rehabilitation activities on Levee Road.

Alternatives Comparison

Table 2.1-25 provides a qualitative assessment of selected performance measures for the horizon year 2049. The alternatives are scored from 1 to 5, with 1 being very good performance and 5 being very poor performance. Peak period conditions for Alternatives 2a and 2b, which are the HOV lane alternatives with and without the managed lane median ramps at the I-80/US 50 interchange, were modeled using a calibrated traffic simulation model. The changes in traffic conditions between these two alternatives are expected to apply and be similar to Alternatives 3a versus 3b, Alternatives 4a versus 4b, etc., as the only difference between these respective alternatives would be the addition of the managed lane median ramps. Therefore, operational

[1] City of West Sacramento Municipal Code 10.32.020 states that bicycles are permitted on the public sidewalk but shall yield to any pedestrian.

analyses were not conducted for Alternatives 3b through 7b, but a qualitative discussion of the expected operations is provided in Section 8.1 of the TAR.

Table 2.1-25. Alternatives Comparison – Horizon Year 2049

Performance Measure	Alt 1	Alt 2a	Alt 3a	Alt 4a	Alt 5a	Alt 6a	Alt 7a	Alt 2b
Regional VMT	5	2	3	2	1	4	2	3
Corridor PMT	5	2	1	3	4	5	5	2
Persons served at bottlenecks	3.5	1	2	2.5	2.5	3.5	5	1
General purpose lane peak hour travel time	3.5	1.5	1.5	2	2	3	5	2
General purpose lane peak hour planning time index	4	2	2	2.5	1.5	3	5	2.5
Managed lane peak hour travel time	4.5	2	1.5	1.5	1.5	3	5	1.5
Vehicle hours of delay	4	2	2.5	2	1.5	2.5	5	1.5
Average speed	4	1.5	2.5	2	2	2.5	5	1
Total vehicles served	3.5	1.5	2	3	3	3	5	1
Total persons served	3	1	2	4	3	2.5	5	1
Deficient segments	5	2.5	2.5	2	1.5	3	4	1.5
Average score	4.1	1.7	2.0	2.4	2.1	3.2	4.6	1.6

Source: Caltrans 2023d
Notes: Comparison is based on a scale of 1 to 5, where 1 represents very good performance and 5 represents very poor performance.
Key: VMT = Vehicle miles traveled; PMT = Personal miles traveled

Alternatives 2a and 2b have the best overall performance, including very good performance in two categories for Alternative 2a and four categories for Alternative 2b. Alternative 2a would have at least good performance for all categories, and Alternative 2b would have neutral performance for only regional VMT. These alternatives would increase freeway capacity in the form of a HOV lane so that faster travel time would be available to vehicles eligible for the HOV lane. These alternatives would increase both vehicle and person throughput at the key bottlenecks: eastbound I-80 at Mace Boulevard and westbound I-80 at the Yolo Bypass. Alternative 2b would perform better than all other alternatives during the morning peak period since the median ramps at I-80/US 50 would provide a travel time advantage to HOVs, but afternoon peak hour travel time would be worse since fewer general purpose lanes would be provided on eastbound I-80 between Enterprise Boulevard and US 50. The morning peak period performance leads Alternative 2b to have the best overall average score.

Alternatives 3a, 4a, and 5a would perform well, although not as high as Alternatives 2a and 2b. For Alternative 3a, performance would be worse because more vehicles would be eligible for the managed lane than in the other alternatives, so congestion would be higher where vehicles are entering and leaving the managed lane. In particular, the transition section from the HOT lane to the existing HOV lane on eastbound I-80 near West El Camino Avenue would have

more turbulence than the other alternatives in a location where the general purpose lanes are congested from a downstream bottleneck at I-5. The additional turbulence would result in longer travel times and lower network average speed. Alternative 4a would also have turbulence at the transition sections. Additionally, Alternative 4a would serve fewer people overall since HOV2s would have to pay to use the managed lane. For Alternative 5a, restricting the managed lane to tolled vehicles would restrict vehicles served and persons served since ridesharing would not provide a travel time savings. However, these alternatives perform better than Alternatives 1 and 7a and offer better travel time reliability in the managed lane than the HOV lane alternatives.

Alternative 6a would not perform well compared to the other alternatives. While person throughput could be improved if additional bus service were provided, the forecasted passenger vehicle volume would be constrained by the network capacity resulting in performance like Alternative 1 for many performance measures. Alternative 7a would also perform poorly. While the HOV lane would provide lower travel time than in the general purpose lanes, congestion in the general purpose lanes would be such that HOVs would be severely delayed entering and exiting the HOV lane.

The TAF provides two approaches to assess the induced VMT attributable to the project; the first being an empirical approach using the NCST Induced Travel Calculator and the second by applying a regional or local area travel demand model. Both the calculator and the travel demand models have strengths and limitations when estimating induced VMT depending on the specific corridor under analysis. Therefore, both the corridor context and analysis limitations are considered when using VMT forecasts from either method. The advantages and disadvantages of these methods are described in the TAR (Caltrans 2023d).

Table 2.1-26 presents the estimated long-term induced travel based on the NCST calculator. The calculator does not estimate the induced VMT for transit-only lane alternatives (Alternatives 6a and 6b). Caltrans has determined that the NCST calculator be used to report VMT for the project alternatives, since the travel demand model does not satisfy all five checks of the TAF's checklist for evaluating adequacy of the travel demand model. These alternatives have the potential to induce VMT, which may constitute a potentially significant impact under the California Environmental Quality Act (CEQA). The induced VMT for Alternatives 6a and 6b, the transit lane alternatives, cannot be calculated by the NCST calculator; however, added transit service generally does not induce auto VMT.

As shown in Table 2.1-26, the NCST calculators induced daily and annual VMT estimates indicate that all the project alternatives would result in substantial increases in VMT, which would represent an adverse effect with respect to induced travel except for No Build Alternative 1 and the transit-only lane Alternatives 6a and 6b[2]. The NCST calculator cannot

[2] The induced VMT of 133 million reported in the Draft EIR was the result of a calculation error. Early in the analysis, the annual VMT estimate from the NCST Induced Travel Calculator was converted to daily VMT using a factor of 300 based on older Performance Measurement System (PeMS) volume data that showed that the average mid-week daily volume was higher than the average volume for all days of the year. PeMS data from 2023 for I-80 in the project area was found to have a conversion factor close to 365. So, the daily VMT was later converted back to annual VMT using this higher value. The corrected value of 110 million removes the artificial increase based on the difference in the daily to annual conversion factors (300 vs. 365).

calculate induced VMT for transit-only lane alternatives (Alternatives 6a and 6b); however, added transit service generally does not induce auto VMT.

Table 2.1-26. Daily and Annual Induced VMT

Project Alternatives	Induced Total Daily VMT	Induced Truck Daily VMT	Induced Total Annual VMT	Induced Auto Annual VMT
Alternative 1 (No Build)	—	—	—	—
Alternative 2a (Add HOV)	+495,300	143,600	148,600,000	105,506,000
Alternative 3a (Add HOT2+)[1]	+495,300	143,600	148,600,000	105,506,000
Alternative 4a (Add HOT3+)[1]	+495,300	143,600	148,600,000	105,506,000
Alternative 5a (Add Toll)[1]	+495,300	143,600	148,600,000	105,506,000
Alternative 6a (Add Transit)	—	—	—	—
Alternative 7a (Convert HOV)	+12,300	3,600	3,700,000	2,627,000
Alternative 2b (Add HOV with Median Ramps)	+516,000	149,600	154,800,000	109,908,000
Alternative 3b (Add HOT2+ with Median Ramps)	n/a	n/a	154,800,000	109,908,000
Alternative 4b (Add HOT3+ with Median Ramps)	n/a	n/a	154,800,000	109,908,000
Alternative 5b (Add Toll with Median Ramps)	n/a	n/a	154,800,000	109,908,000
Alternative 6b (Add Transit with Median Ramps)	—	—	—	—
Alternative 7b (Convert HOV with Median Ramps)	n/a	n/a	9,900,000	7,029,000

2.1.10.8 Avoidance, Minimization, and/or Mitigation Measures

As mentioned in Section 2.2.1.7, Alternative 1 is the no-build Alternative and would not have a negative impact on transportation since it would not induce additional vehicular travel. Similarly, Alternatives 6a and 6b, which add transit-only lanes, are not expected to induce additional automobile VMT.

AMMs have been specified to reduce, avoid, and offset VMT impacts from the project build Alternatives 2a/b through 5a/b, and 7a/b. The following measures to avoid or minimize VMT impacts would be implemented by the project:

- AMM TRANS-1: Reduce the induced VMT effects of the project Alternatives 2a/b through 5a/b, and 7a/b by contributing funding to regional VMT reducing measures. Caltrans will contribute $55 million, roughly 15 percent of the total capital construction cost, to the following eight measures: 1) Voluntary trip reduction program in Yolo County ($20.7 million); 2) Expand Capitol Corridor Frequency between Martinez and Sacramento ($15 million) ; 3) Microtransit in Yolo County ($4.5 million); 4) Expand

YoloBus Route 42 ($6.9 million); 5) Expand causeway connection Route 138 ($2.4 million); 6) Expand Unitrans ($3.5 million); 7) Expand Putah Creek Trail to connect to future Nishi Student Housing Development site ($2 million). Mitigation funding may be supplemented beyond the $55 million with excess net tolling revenue. In addition, Caltrans will initiate a Project Initiation Document (PID) for a new project in July 2025 which will include, but not be limited to, alternatives such as the addition of toll lanes and the conversion of general-purpose lanes.

The annual induced auto VMT from the build alternatives (roughly 106-110 million annual auto VMT for the added-lane alternatives and roughly 2.6-7 million annual auto VMT for the general-purpose lane conversions to HOV) would need to be reduced through the action of VMT reducing measures. Table 2.1-27 summarizes potential measures and the associated VMT reduction to be expected by implementation of the measure as described in the Yolo 80 Managed Lanes Project Final VMT Mitigation Plan (Caltrans 2024). However, as shown the potential total VMT reduction from these measures (approximately 57.1 million annual auto VMT) is not sufficient to offset the induced VMT forecasts of approximately 106-110 million annual VMT for most of the project alternatives. It would be sufficient to fully offset only the alternatives that would convert an existing lane to an HOV-only lane (Alternatives 7a and 7b).

However, full implementation of these VMT-reducing measures is subject to feasibility (see Table 2.1-27) and are not sufficient to fully offset the induced VMT impact of Alternatives 2a/b through 5a/b.

The non-housing mitigation measures are based on 2040 conditions according to the SACSIM model. Some portion of the VMT reduction may not apply if the monthly transit pass subsidies and reduced transit fares are offered. The strategies offer different methods for reducing transit costs but may end up targeting similar people that could dampen the reported effectiveness.

Table 2.1-27. Vehicle Miles Traveled Reducing Measures

Mitigation Measure	Description	Annual VMT Reduced	Cost to Construct or Implement	Yolo 80 Managed Lane Contribution	$/VMT
Voluntary Trip Reduction Program in Yolo County	Part of an approved program provided by Yolo Commute, that include features such as community-based travel planning, ridesharing, transit pass subsidies, and pay-per-mile auto insurance; no physical improvements; payments directly to Yolo Commute.	24.7 million	$1.3 million (annual cost to implement program)	$20.7 million over 15 years (to be supplemented with future toll revenue)	$0.05
Expand Capitol Corridor Frequency between Martinez and Sacramento	Increase Capitol Corridor rail service by three round trip trains between Martinez and Sacramento, on an annual basis, and/or implement buy-down program to reduce fares.	12.6 million	$5 million (annual cost to operate three (3) additional roundtrip train services and/or implement buy-down program)	$15 million over 3 years (to be supplemented with future toll revenue)	$0.40

Mitigation Measure	Description	Annual VMT Reduced	Cost to Construct or Implement	Yolo 80 Managed Lane Contribution	$/VMT
Micro transit in Yolo County	Expand transit service by 25% to add flexible route buses with more frequent service and/or longer service hours.	6.2 million	$1.5 million (annual cost to expand service)	$4.5 million over 3 years (to be supplemented with future toll revenue)	$0.24
Expand YoloBus Route 42	Increase Route 42 A & B services during 30-minute services all day, with the addition of 12 new trips in each direction for both the A and B routes.	3.7 million	$2.3 million (annual cost to expand service)	$6.9 million over 3 years (to be supplemented with future toll revenue)	$0.48
Expand Causeway Connection Route 138	Reduce service headways from 60 minutes all day to 15 minutes for morning and afternoon peak periods and 30 minutes for midday/off-peak periods for Route 138.	5.9 million	$800k (annual cost to expand service)	$2.4 million over 3 years (to be supplemented with future toll revenue)	$0.26
Expand Unitrans	Increase service frequency from 30 to 15 minutes during the morning and afternoon peak periods.	1.2 million	$875k (annual cost to expand service)	$3.5 million over 4 years (to be supplemented with future toll revenue)	$0.75
Expand Putah Creek Trail to Connect to Future Nishi Student Housing Development Site	Expanding the Putah Creek Trail will improve the existing Putah Creek Trail between the Union Pacific Railroad tunnel and Old Davis Road at Hutchison Drive in Davis, and provide direct improvements and access to future Nishi Student Housing Development.	1.4 million	$3.8 million	$2 million	$1.45
Total	—	55.6 million (50% of induced VMT)	--	$55 million

Key: VMT = vehicle miles traveled

The Yolo 80 Managed Lanes Project Final VMT Mitigation Plan (Caltrans 2024a) lists additional VMT reducing measures that were analyzed and rejected as not reasonable or feasible, as shown in Table 2.1-28 below.

Table 2.1-28. Potential VMT Reducing Measures Analyzed and Rejected (Not Reasonable or Feasible)

Mitigation Measure	Description	Annual VMT Reduced	Cost to Construct or Implement /Reason Rejected	Yolo 80 ML Contribution	$/VMT
Increase Parking Costs	Double parking costs at UC Davis and Downtown Sacramento.	64.1 million	N/A Neither agency has a plan to proceed with this program, hence there is no cost and it is deemed unfeasible	N/A	N/A
Build 1,000 Housing Units in Downtown Davis	The Downtown Davis Specific Plan area is bounded by Union Pacific Railroad, 1st, A, and 5th Streets, and includes the G Street corridor. The proposed development would include up to 1000 housing units.	18.3 million	$25 million ($250k per unit to construct) The low financial contribution of $5M for a minimum $25M cost to construct is not feasible to claim full VMT reduction credit.	$5 million	$0.27
Build 700 Housing Units at Nishi Development in City of Davis	Nishi property in Davis is bounded by I-80, Union Pacific Railroad, and Putah Creek. The proposed development would include up to 700 housing units for students at the adjacent UC Davis campus.	14.6 million	$175 million ($250k per unit to construct) The low financial contribution of $5M for a minimum $175M cost to construct is not feasible to claim full VMT reduction credit.	$5 million	$0.34
Expand Sidewalks in Yolo County	Increase sidewalk coverage by 10% throughout Yolo County.	13,6 million	N/A Agency has no plan to proceed with this program, hence there is no cost available and it is deemed infeasible	N/A	N/A
Build 4,442 Housing Units at Bridge District in West Sacramento	The Bridge District Specific Plan area is bounded by the Sacramento River, Tower Bridge Gateway, US 50, South River Road, and 15th Street. The proposed development would include up to 4,442 housing units.	8.4 million	$1.1 billion ($250k per unit to construct) The low financial contribution of $5M for a minimum $1.1B cost to construct is not feasible to claim full VMT reduction credit.	$5 million	$0.59
Green Line LRT Extension: Township 9 to Sac Airport	Extend the Green Line Light Rail Transit from Township 9 Boulevard to the Sacramento International Airport.	7.2 million	$1.2 billion Not feasible or reasonable for cost-to-VMT reduction benefit. Also, in MTP and project funding would only get partial VMT credit.	N/A	$166

Mitigation Measure	Description	Annual VMT Reduced	Cost to Construct or Implement /Reason Rejected	Yolo 80 ML Contribution	$/VMT
Subsidize Monthly Transit Passes in Yolo County	Incentivize transit ridership through subsidizing monthly transit passes for frequent users of Yolobus and Capitol Corridor. This would reduce the cost of monthly passes by 50% on Capitol Corridor and Yolobus transit services for Yolo County residents.	5.6 million	$225K (annual cost to subsidize) Not reasonable or feasible because already subsidizing monthly passes under Mitigation measures Voluntary Trip Reduction Program in Yolo County and Expand Capitol Corridor	$4.5 million over 20 years (to be supplemented with future toll revenue)	$0.04
Downtown Riverfront Streetcar	Construct and operate the proposed Downtown Riverfront Streetcar system.	4.3 million	$259 million Not feasible or reasonable for cost-to-VMT reduction benefit. Also, in MTP and project funding would only get partial VMT credit	N/A	$60
Reduce Transit Fares	Reduce the bus fare for Yolobus and Capitol Corridor users in Yolo County by 50%	3.7 million	$225k (annual cost to reduce fares) Not feasible or reasonable because already subsidizing monthly passes under Mitigation measures Voluntary Trip Reduction Program in Yolo County and Expand Capitol Corridor	$5 million over 20 years (to be supplemented with future revenue)	$0.07
Truxel Road Bridge	Construct a two-lane multimodal bridge at the American River from Garden Highway to Sequoia Pacific Boulevard.	3.7 million	$217 million Not feasible or reasonable for cost-to-VMT reduction benefit. Also, in MTP and project funding would only get partial VMT credit	N/A	$58
Build 400 Housing Units in Downtown Sacramento	The proposed development would include up to 400 housing units in the Downtown Sacramento area bounded by J Street, 16th Steet, N Street, and 7th Street.	3.3 million	$100 million ($250k per unit to construct) The low financial contribution of $5M for a minimum $100M cost to construct is not feasible to claim full VMT reduction credit.	$5 million	$1.51

2.1.11 Visual and Aesthetics

2.1.11.1 Regulatory Setting

The National Environmental Policy Act (NEPA) of 1969, as amended, establishes that the federal government use all practicable means to ensure all Americans safe, healthful, productive, and aesthetically (emphasis added) and culturally pleasing surroundings (42 United States Code [USC] 4331[b][2]). To further emphasize this point, the Federal Highway administration (FHWA), in its implementation of NEPA (23 USC 109[h]), directs that final decisions on projects are to be made in the best overall public interest taking into account adverse environmental impacts, including among others, the destruction or disruption of aesthetic values.

The California Environmental Quality Act (CEQA) establishes that it is the policy of the state to take all action necessary to provide the people of the state "with…enjoyment of aesthetic, natural, scenic and historic environmental qualities" (CA Public Resources Code [PRC] Section 21001[b]).

California Streets and Highways Code Section 92.3 directs Caltrans to use drought resistant landscaping and recycled water when feasible and incorporate native wildflowers and native and climate-appropriate vegetation into the planting design when appropriate.

2.1.11.2 Affected Environment

Information in this section is based on the Visual Impact Assessment (VIA) prepared for the project in October 2021 and revised in March 2023 (Stantec 2023). The purpose of the VIA is to document potential visual impacts caused by the project and to propose measures to lessen impacts that are identified. Visual impacts are demonstrated by identifying visual resources in the project area, measuring the amount of change that would occur as a result of the project, and predicting how the affected public would respond to or perceive those changes.

Visual Resources

The Sacramento River, Sacramento River Corridor, and Yolo Bypass Wildlife Area (YBWA) were identified as areas of scenic value within the project area. The project crosses the Sacramento River on I-80 and US-50, and the river corridor creates one of the primary natural scenic resources in Sacramento. The project crosses the YBWA on the Yolo Causeway which is elevated and provides open views of managed wildlife habitat and seasonal views of flooded riparian waterways.

Visual Character

Visual character includes attributes such as form, line, color, and texture; and they are used to describe, not evaluate. These attributes are neither considered good nor bad. However, a change in visual character can be evaluated when it is compared with the viewer response to that change. Changes in visual character can be quantified by identifying how visually

compatible a project would be with the existing condition by using visual character attributes as an indicator. The following attributes were considered:

- Form: visual mass and shape
- Line: edges or linear definition
- Color: reflective brightness (light, dark) and hue (red, green)
- Texture: surface coarseness
- Dominance: position, size, or contrast
- Scale: apparent size as it relates to the surroundings
- Diversity: a variety of visual patterns
- Continuity: uninterrupted flow of form, line, color, or textural pattern

Visual Quality

Visual quality is evaluated by identifying the vividness, intactness, and unity present in the project corridor. Public attitudes validate the assessed level of quality and predict how changes to the project corridor can affect these attitudes. This process helps identify specific methods for addressing each visual impact that may occur as a result of the project. The three criteria for evaluating visual quality are defined below:

- Vividness: the extent to which the landscape is memorable and is associated with distinctive, contrasting, and diverse visual elements.

- Intactness: the integrity of visual features in the landscape and the extent to which the existing landscape is free from non-typical visual intrusions.

- Unity: the extent to which all visual elements combine to form a coherent, harmonious visual pattern.

Visual Assessment Units

The project corridor was divided into a series of “outdoor rooms” or visual assessment units (VAU). Each VAU has its own visual character and visual quality. It is typically defined by the limits of a particular viewshed which collectively exhibit a similar overall character. For this project, the following four (4) VAUs and their associated key views (KVs) have been identified: Solano County, Davis, Yolo County, and West Sacramento (Figure 2.1-10). KVs represent the viewer groups that have the highest potential to be affected by the project considering exposure and sensitivity based on each Build Alternative. Each VAU is described below. Figure 2.1-10 illustrates the VAUs and respective KVs evaluated for the project.

Solano County Visual Assessment Unit

This VAU is located within the limits of Solano County, west of Davis limits. It extends from the project’s western terminus (PM SOL 40.7) northeast along I-80 to south of the Yolo County/Davis limits (PM YOL 0.0) (see Figure 2.1-10).

This VAU was established based on common attributes which include land use (mostly agricultural), development density (comparatively lower than the adjacent VAUs), regulatory

setting (Solano County), roadway cross section (no center median vegetation), and viewshed (higher frequency of distant views). These attributes combine to create a notably different visual setting than the adjacent VAU.

Davis Visual Assessment Unit

This VAU is located along I-80 from the UC Davis just south and east of the City of Davis boundary (PM YOL 0.0) and extends through the City of Davis to the eastern limits of the city (PM YOL 3.71) (See Figure 2.1-10).

This VAU was established based on common attributes which include land use (mostly suburban), development density (comparatively higher than the adjacent VAUs), regulatory setting (City of Davis), roadway cross section (presence of consistent median vegetation and roadside tree canopy), and viewshed (mostly enclosed roadway corridor with distant views uncommon).

Yolo County Visual Assessment Unit

This VAU is located along I-80 from the eastern limits of the Davis (PM YOL 3.71) spanning the Yolo Bypass to the western limits of West Sacramento (PM YOL 8.80) (See Figure 2.1-10).

This VAU was established based on common attributes which include land use (mostly wildlife preserve), development density (comparatively lower than the adjacent VAUs), regulatory setting (Yolo County), roadway cross section (no median vegetation or roadside tree canopy with an elevated roadway), and viewshed (frequent distant views available). These attributes combine to create a notably different visual setting than the adjacent VAU.

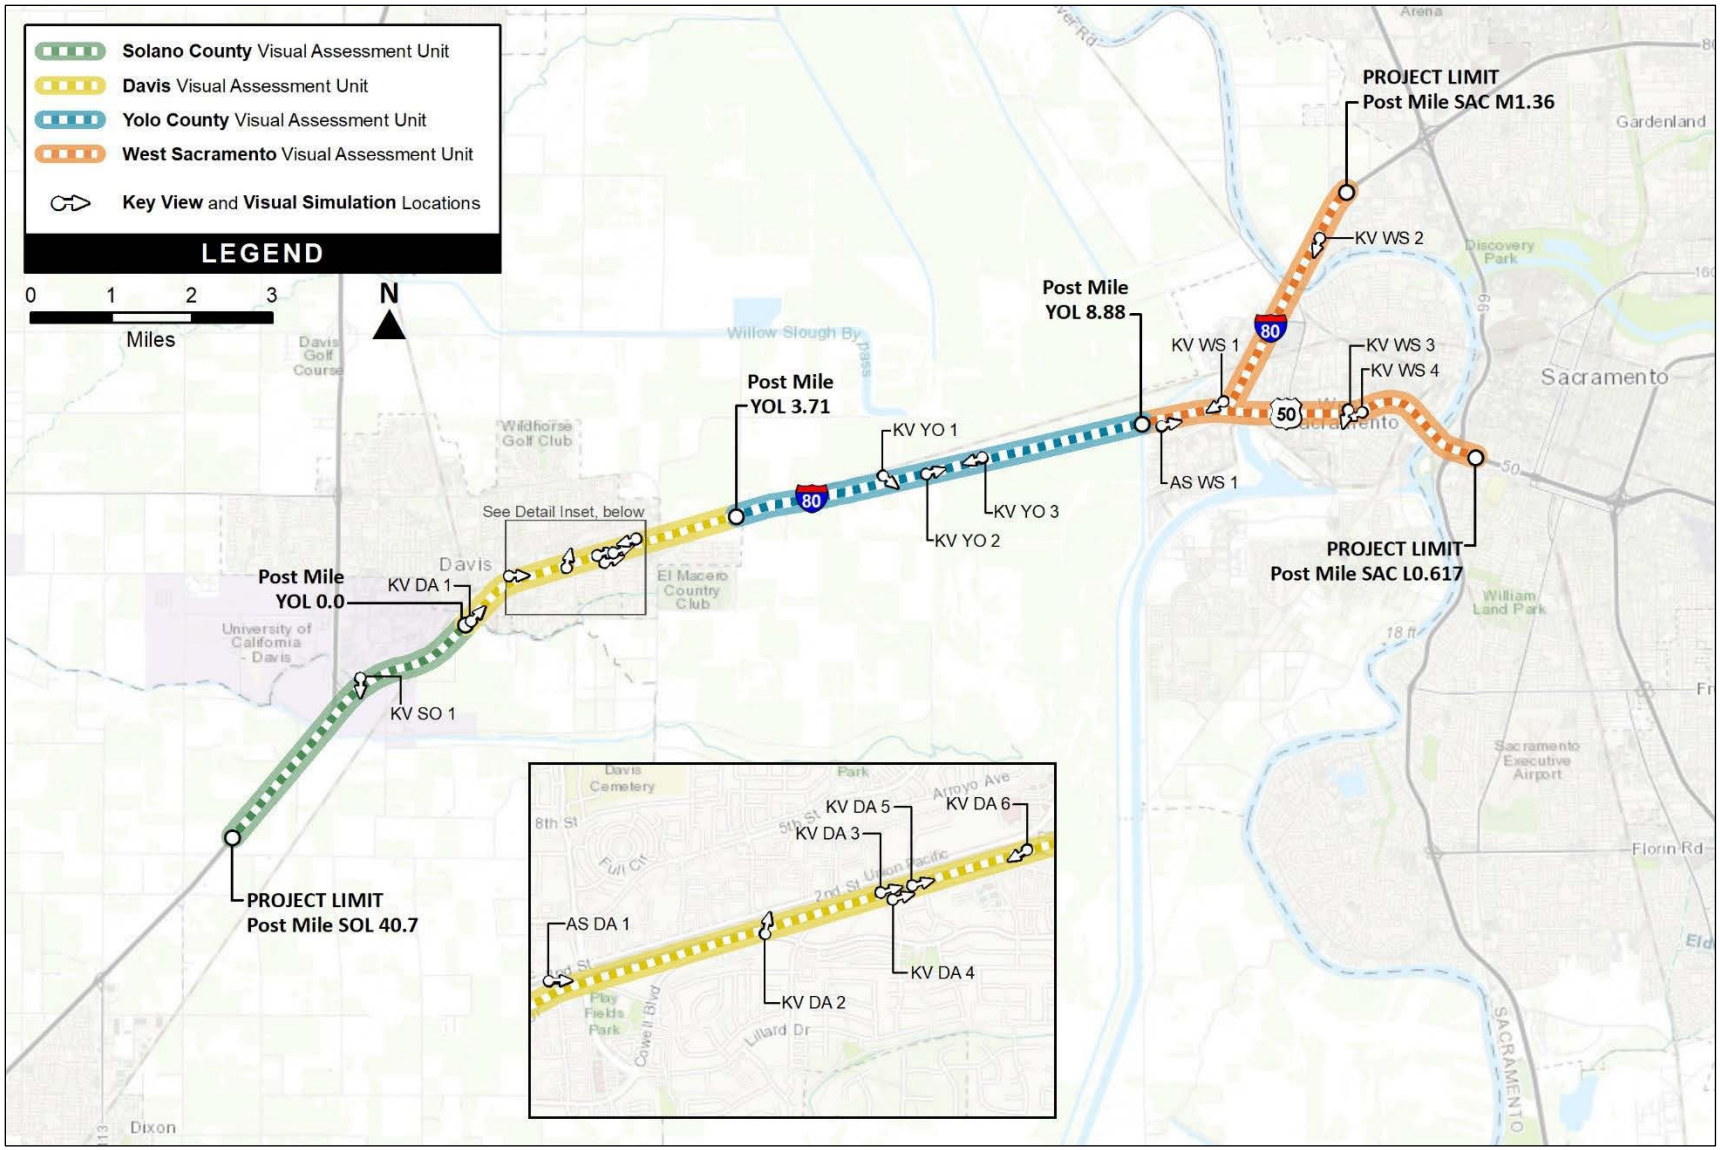

Figure 2.1-10 Visual Assessment Units and Key View Locations

West Sacramento Visual Assessment Unit

This VAU is located along the I-80/US-50 corridor within the city limits of West Sacramento and Sacramento, extending from the west boundary of West Sacramento (PM YOL 8.80) to the project's two eastern termini (PM SAC L0.78 and PM SAC M0.55) (See Figure 2.1-10).

This VAU was established based on common attributes which include land use (mostly suburban), development density (comparatively higher than the adjacent VAU), regulatory setting (West Sacramento and Sacramento), roadway cross section (road is at grade with sound walls more common), and viewshed (comparatively more enclosed roadway corridor with distant views less common). These attributes combine to create a notably different visual setting than the adjacent VAU.

Viewers

Viewer groups identified within the project area include highway neighbors and highway users. In general, highway neighbors have views to the road, and highway users have views from the road. Viewer sensitivity and exposure to proposed resource changes varies for each viewer group based on their level of awareness. As a result, potential visual concerns can be assumed for each viewer group in response to resource change.

Highway Neighbors

Highway neighbors are viewer groups with views to the road. They can be subdivided into different viewer groups by land use. The following highway neighbors were considered:

- Residential/Commercial property viewers
- Pedestrians and bicyclists
- Agricultural viewers
- Amtrak Capitol Corridor Commuters
- Yolo Bypass Wildlife Area viewers
- Industrial/Commercial property viewers

Highway Users

Highway users are viewer groups with views from the road. They can be subdivided into different viewer groups in two different ways—by mode of travel or by reason for travel. The following highway users were considered:

- Commuters
- Truck Drivers
- Recreational travelers (travel is primarily leisure and not related to work or other typical daily tasks)
- Pedestrians and bicyclists (on Yolo Causeway)

Visual Setting

Solano County Visual Assessment Unit

The majority of land directly abutting the highway (i.e., the east and west sides of the highway) is agricultural land, but it also includes views to and from the UC Davis Campus and Arboretum. Generally, views in this VAU include a large open space component with agricultural parcels and undeveloped landscape, with intermittent trees and other vegetation along the roadway partially screening views. Vegetation is most prominent at the UC Davis Arboretum, SR-113 Interchange, and riparian vegetation along Putah Creek. Some existing industrial and agricultural industrial development is present in the westernmost section of the VAU. The UC Davis Campus includes notable built forms that are visible for eastbound and westbound drivers, such as the Mondavi Center for Performing Arts, Mondavi Institute for Wine and Food Science, and the Manetti Shrem Museum of Art. These buildings are separated from the roadway by open space and appear in the middle-ground of the view from highway users. Multiple highway-facing advertising billboards are located along the roadway.

Visual character can be considered moderate, though it varies in this VAU from moderate-low to moderate-high. These ratings are tied to the relationship and comparative density of visual obstructions and vegetation, especially mature trees, which varies within the corridor. Where dense landscaping and/or mature vegetation is present, it softens the appearance, mass, scale, and dominance of visual intrusions, such as highway infrastructure and large built forms. These areas are considered to have moderate to moderate-high visual character. By contrast, visual character declines where dense landscaping and/or mature vegetation is absent, where billboards are present, and/or where the density of highway infrastructure is high within a particular view.

Visual quality in this VAU can be considered moderate, though it varies from moderate-low to moderate-high. Vividness is higher where dense landscaping and/or mature vegetation is present. Intactness and unity are correspondingly higher along these segments, since visibility of visual intrusions such as highway infrastructure and large built forms is limited, resulting in scenes composed of a strong linear element (the freeway) and consistent vegetative screening. This occurs most notably in this VAU at the Pedrick Interchange, at the SR-113/I-80 interchange, and at the UC Davis Arboretum. These areas are considered to have moderate to moderate-high visual quality. By contrast, visual quality declines where dense landscaping and/or mature vegetation is absent (lower vividness), where billboards are present (greater encroachment by features into the roadway corridor and interruption of visibility beyond the roadway corridor), where more industrial agricultural facilities are visible (resulting in a less unified composition) and/or where the density of highway infrastructure is high within a particular view (affecting both the memorability and intactness of views). Portions of the southern segment of this VAU that have one or more of these characteristics, and visual quality is generally lower as a result.

Davis Visual Assessment Unit

Foreground views of highway users are dominated by the paved roadway surface and related infrastructure such as overhead signage and lighting, which are softened by center median

vegetation and a consistent planting of mature trees along both edges of the right-of-way in the corridor, which has a framing effect for highway users. Shoulder vegetation consists of deciduous and evergreen trees lining the highway, shrubs and grasses, and groupings of trees at interchanges. Views under the tree canopies to and from adjacent developments are consistently available since sound walls are uncommon. In the eastbound direction, partially screened views of residential development, commercial buildings and urban development occur where the plantings break. A railroad corridor runs east-to-west, parallel to I-80 from the VAU's eastern terminus to the Pole Line Road overpass. The rail corridor is partially screened by tree and shrub vegetation. Near Richards Boulevard in the westbound direction, there are trees planted in front of a sound wall; and partial views of the tops of residential and commercial buildings can be seen above the wall and trees.

Visual character can be considered moderate, though it varies from moderate-low to moderate-high. These ratings are tied to the relationship and relative density of visual obstructions and vegetation (especially mature trees) to each other, which varies in the corridor. Where dense landscaping and/or mature vegetation is present, it softens the appearance, mass, scale, and dominance of visual intrusions such as highway infrastructure and large built forms. These areas are considered to have moderate to moderate-high visual character. By contrast, visual character declines where dense landscaping and/or mature vegetation is absent, where the center median vegetation is absent or in poor health, and/or where the density of highway infrastructure is high within a particular view.

Visual quality in this VAU can be considered moderate to moderate-high, though it varies from moderate-low to moderate-high. These ratings are tied to the relationship and comparative density of visual obstructions and vegetation (especially center median vegetation and mature trees), which varies within the corridor. Where dense landscaping and/or mature trees and other vegetation are present, views have a higher degree of vividness, along with an intactness and unity that reflect the reduced visibility of other features (infrastructure and other built forms) alongside or just outside of the roadway corridor. When in bloom, the dense median oleander increases the vividness of the corridor as well. These areas are considered to have moderate to moderate-high visual quality depending on the position of the viewer. By contrast, visual quality declines where dense landscaping and/or mature vegetation is absent (allowing for visual intrusion by other elements, reducing intactness and overall unity of views), where the center median vegetation is absent or in poor health (reduced vividness), and/or where the density of highway infrastructure is high within a particular view, reducing the intactness compared with other segments where linear components appear uninterrupted. The westernmost section of this VAU near the Richards Boulevard interchange and a few select gaps where fire has damaged the median planting have lower visual quality because the absence of median planting increases the visibility of highway infrastructure.

Yolo County Visual Assessment Unit

Foreground views of highway users in this VAU are dominated by the paved roadway surface and related infrastructure such as fencing along the bicycle path on the westbound side of the highway. Middle ground views of highway users are dominated by distant views of fields, rural agricultural, and open spaces with some groupings of mature trees. There are views of

overhead utility and transmission lines parallel and crossing above the highway. From CR-32A to West Sacramento, middle ground views of highway users in this VAU are dominated by distant views of the natural landscape, including wet-lands, uplands, floodplains, fields, levees, and riparian habitats, with distant views of urban development and views of the city skyline.

Visual character can be considered moderate, though it varies in this VAU from moderate-low to moderate-high. These ratings are tied to the relationship and relative density of visual obstructions to each other, e.g., signage, fencing, overhead utilities, vegetation (especially mature trees), and open water, which varies within the corridor. Where mature vegetation is present, it softens the appearance, mass, scale, and dominance of visual intrusions such as highway infrastructure and large built forms. These areas are considered to have moderate to moderate-high visual character. This VAU has unique varying and seasonal views of open water when the YBWA is being managed for habitat and/or as a floodway during the rainy season. Visual character declines where the utility and highway infrastructure are present within a particular view.

Visual quality can be considered moderate, though it varies in this VAU from moderate-low to moderate-high. Similar to assessments of visual character, these ratings are tied to the relationship and relative density of visual obstructions to each other, e.g., signage, fencing, overhead utilities, vegetation (especially mature trees), open water, and views of the City skyline, which varies within the corridor. Where dense landscaping, open water views, and/or mature vegetation are present, it adds elements of vividness to the view. Intactness is comparatively higher in such locations as well, where the linear roadway passes through and over generally rectilinear farmland and more natural appearing waterways with little overlap or encroachment observable. This VAU generally lacks mature vegetation, though a large eucalyptus stand and some oak plantings are present. Views of open water to the south are seasonal, and more common in the winter and spring. Views to the City skyline are limited to eastbound traffic and are best in the afternoon and evenings when the sun is behind the viewer. Where one or more of these are present, visual character can be moderate to moderate-high. Visual quality declines where the utility and highway infrastructure are present within a particular view. Overhead utilities and highway signage are relatively infrequent within this VAU; but where they are present, visual quality declines.

West Sacramento Visual Assessment Unit

The segment of I-80 from the interchange to the eastern terminus of the project is elevated or above-grade with three lanes in each direction and paved shoulders in each direction. This segment of I-80 has a continuous paved and unpaved median; there is also a median barrier along the edges of pavement for a majority of the segment. At the elevated crossing over the Sacramento River, the highway splits into separate bridges for each direction of traffic and joins again east of the Sacramento River crossing. From east of the Sacramento River crossing to the project terminus, the center median contains a vertical concrete barrier separating directions of traffic. Roadway lighting is minimal for most of the segment. This segment of I-80 is elevated over West Capitol Avenue, a railroad, Garden Highway, and the Sacramento River. Overhead utility lines cross I-80highway in a few locations and run adjacent to I-80.

The segment of US-50 from the I-80/US-50 to the eastern terminus of the project is generally four lanes in each direction in Yolo County, and it reduces to three lanes in each direction at approximately the Sacramento County line. The road is elevated over Westacre Road, at grade under Harbor Boulevard overpass, elevated and under the SR-275 on-ramp, and elevated over SR-84, Soule Street, and the Sacramento River. The travel directions are separated by a paved center median with a vertical concrete median barrier. Roadway lighting is spaced evenly at approximately 140-foot intervals where present. Sound walls are located on both sides of the highway throughout portions of this segment.

Foreground views of highway users in this VAU are dominated by the paved roadway surface and related infrastructure such as overhead signage, roadway lighting, concrete medians, sound walls, and overhead utility lines. Views in this VAU vary where the highway is elevated or above-grade, such as over train tracks or the Sacramento River. At the I-80/US-50 interchange, views include Prospect Slough, distant views of field and agricultural, and industrial commercial development partially screened by trees and other vegetation. Other views in this VAU include drainages, canals, levees, and the Sacramento River.

Middleground views of highway users in the I-80 section of the VAU consist primarily of the tops of the adjacent commercial and industrial development and large parking lots where the highway is elevated. Sound walls are common adjacent to residential areas which screen views to/from the freeway. Vegetation in this VAU are largely trees, shrubs, and grasses on either side of the corridor. Views in this VAU also contain lighting associated with nearby businesses and residences (including interior and exterior building lighting, overhead lighting within parking lots, and roadway lighting) is minimal to non-existent on the I-80 section of the VAU.

Middleground views of highway users in the US-50 section of this VAU consist primarily of the paved roadway surface and related infrastructure, such as overhead signage, roadway lighting, concrete medians, sound walls, and overhead utility lines. Views are of predominantly low-rise industrial and commercial uses, large parking lots, buildings and signage associated with the adjacent industrial and commercial land uses, and billboards. Sound walls screen development through much of the segment; there the tops of trees and commercial signage visible above the sound walls. Vegetation consists of grasses, trees at grade, or tops of trees above sound walls.

Visual character can be considered moderate, though it varies in this VAU from moderate-low to moderate-high. These ratings are tied to the relationship and relative density of visual obstructions and vegetation (especially mature trees) to each other, which varies in the corridor. Where dense landscaping and/or mature vegetation is present, it softens the appearance, mass, scale and dominance of visual intrusions, such as highway infrastructure, overhead utilities, sound walls, industrial areas, and large built forms. These areas are considered to have moderate to moderate-high visual character. By contrast, visual character declines where dense landscaping and/or mature vegetation is absent, sound walls are present without vines and/or landscaping, and/or where the density of highway or utility infrastructure is high within a particular view.

Visual quality can be considered moderate, though it varies in this VAU from moderate-low to moderate-high. These ratings are tied to the relationship and relative density of visual obstructions and vegetation (especially mature trees) to each other, which varies in the corridor.

Where dense landscaping, river views, Sacramento skyline views and/or mature vegetation are present, they add elements of vividness to the view while also reducing visibility of or drawing attention away from visual intrusions such as highway infrastructure, overhead utilities, sound walls, and industrial areas. The US-50/I-80 interchange has ornamental planting which helps increase the visual quality of the interchange. Where US-50 crosses the Sacramento River, it offers vivid views of the downtown Sacramento skyline and the Sacramento River. Where I-80 crosses the Sacramento River, visual quality is increased by the presence of dense riparian vegetation and river views. View unity is drawn from the experience of traveling a landscaped roadway within an urbanized setting. These areas are considered to have moderate to moderate-high visual quality. By contrast, visual quality declines where dense landscaping and/or mature vegetation is absent, sound walls are present without vines and/or landscaping, large overhead powerlines are present, sound walls have graffiti or patches of graffiti cover-up paint, and/or where the density of highway or utility infrastructure is high within a particular view. Intactness is reduced by the increased visibility of multiple forms within or alongside the roadway corridor, and the unity described above is less present in these segments. Further, many of the sound walls in the US-50 corridor appear to have experienced issues with vandalism. The area between the Yolo Causeway and the US-50/I-80 interchange generally experiences lower visual quality due to dominant freeway infrastructure, presence of overhead utilities, industrial land uses, large sound walls, and the lack of vegetation.

2.1.11.3 Environmental Consequences

No Build Alternative 1

Construction and Operation

Under the No Build Alternative 1, managed lanes and transportation improvements would not be constructed or operated. As such, no change to visual and aesthetics resources would occur.

Build Alternatives 2a and 2b

Construction

For Build Alternatives 2a and 2b, highway users would experience short-term visual impacts as a result of construction. Construction equipment would add visual intrusion and disturbances to the corridor and would reduce the intactness and unity of the visual resources in the study area during the period of construction. Equipment and machinery would be stationed at staging areas within the project limits, and traffic control signage would be used as needed. Temporary sources of light and glare would be added to the project area during the construction phase; however, they would be minimized through use of standard construction equipment, protocols, and appropriate light and glare screening measures, including Standard Measure AR-4 and AMM AES-1, which would limit construction lighting and avoid or minimize glare through selection of materials and finishes, respectively.

Duration of construction is expected to vary by alternative and range from 22 to 36 months. Temporary visual effects from construction would be typical of any major corridor improvement

project and are not considered to be substantial nor significantly contribute to a permanent effect. Measures are proposed to reduce the impacts from temporary construction.

Operation

Resource Changes for Build Alternative 2a include adding managed lanes on I-80 and US-50. New lighting is proposed at the auxiliary lane in the Solano County and Davis VAUs, the Bryte Bend Bridge in the West Sacramento VAU, and the new bike path at the CR-32A exit in the Yolo County VAU. Existing ITS elements and infrastructure would be expanded and modified and would include ramp meters, fiber-optic conduit and cables, and overhead signs. Overall visual impacts for Build Alternative 2a would be moderate-low but would range from very low to moderate-high.

Build Alternatives 2a and 2b would require tree removal or other vegetative clearing to accommodate road widening, work areas, staging, and installation of fiber optic cable. The increase in roadway infrastructure components coupled with the loss of vegetation would alter the character of the corridor toward a more urbanized aesthetic in areas that are currently more naturalized and suburban in overall character.

Visual impacts for Build Alternative 2b would include additional impacts related to the I-80 connector structure in the West Sacramento VAU. Resource changes would occur over the course of approximately 1 mile and include the addition of new walls in the center median of the freeway, a new I-80 connector structure, removal of additional trees, and creation of a new earthen berm at the I-80/US-50 interchange. Visual impacts related to this feature would be moderate-high. The increased impacts associated with this segment would elevate the impacts of each Build Alternative 2a counterpart. Build Alternative 2b impacts would be moderate-high. Implementation of AMM AES-3 would replace highway plantings and vegetation, including oleander. Landscaping and revegetation plans would be prepared to maintain, repair, and expand corridor landscaping and vegetation where proper setbacks exist and where feasible.

The project would implement measures to reduce the potential visual effects of the project by design. Such measures include aesthetic treatment of new structures (Standard Measure AR-1), restoring vegetation and natural contour for temporary access roads, construction easements, and staging areas that were previously vegetated (Standard Measure AR-2), burying guardrail terminals (Standard Measure AR-3), limiting construction lighting (Standard Measure AR-4), and minimizing removal of established trees and vegetation where feasible (Standard Measure AR-5). AMM AES-4 would reduce views of any new overhead signage that may be proposed on the I-80 connector structure. AMM AES-5 would refine the design of the I-80 connector structure to prioritize solutions which reduce visual impacts and limit potential to require powerline relocation.

The rock slope protection strategies proposed primarily in the area of the new bike lane extension of CR-32A have the potential to degrade the existing visual character and quality of public views of the site and its surroundings. However, AMM AES-2 would minimize high-contrast rock slope protection by specifying rock colors and/or stains which match or complement the predominant immediately adjacent landscape color. Alternatively, planted options at this location would be considered.

With implementation of AMM AES-1 through AMM AES-5, Build Alternatives 2a and 2b would not cause disproportionately high and adverse direct effects on visual resources.

Build Alternatives 3a and 3b

Construction and Operation

Build Alternatives 3a and 3b would involve adding an HOT2+ lane in each direction. Build Alternatives 3a and 3b propose similar project components within the same project area as Build Alternatives 2a and 2b; however, they would include additional impacts related to 35 additional overhead pricing signs. The presence of these additional signs would reduce visual quality and character in the vicinity to which they are introduced and would increase the visual impacts of the project. Implementation of AES AMM-4 would reduce the magnitude of these effects by requiring that the location of all new overhead signage and read points be reviewed and that sensitive locations are avoided or screened to the extent possible. Furthermore, read points would be integrated into existing and proposed overhead structures where feasible. Overall visual impacts would be moderate but would range from low to moderate-high. Alternative 3b impacts would be moderate-high to high. With implementation of AMM AES-1 through AMM AES-5, Build Alternatives 3a and 3b would not cause disproportionately high and adverse direct effects on visual resources.

Build Alternatives 4a and 4b

Construction and Operation

Build Alternatives 4a and 4b would involve adding an HOT2+ lane in each direction. Build Alternatives 4a and 4b propose similar project components within the same project area as Build Alternatives 2a and 2b; however, they would include additional impacts related to 35 additional overhead pricing signs. The presence of these additional signs would reduce visual quality and character in the vicinity to which they are introduced and would increase the visual impacts of the project. Overall visual impacts would be moderate but would range from low to moderate-high. Alternative 4b impacts would be moderate-high to high. With implementation of AMM AES-1 through AMM AES-5, Build Alternatives 4a and 4b would not cause disproportionately high and adverse direct effects on visual resources.

Build Alternatives 5a and 5b

Construction and Operation

Build Alternatives 5a and 5b would involve adding an HOT2+ lane in each direction. Build Alternatives 5a and 5b propose similar project components within the same project area as Build Alternatives 2a and 2b; however, they would include additional impacts related to 35 additional overhead pricing signs. The presence of these additional signs would reduce visual quality and character in the vicinity to which they are introduced and would increase the visual impacts of the project. Overall visual impacts would be moderate but would range from low to moderate-high. Alternative 5b impacts would be moderate-high to high. With implementation of AMM AES-1 through AMM AES-5, Build Alternatives 5a and 5b would not cause disproportionately high and adverse direct effects on visual resources.

Build Alternatives 6a and 6b

Construction and Operation

Build Alternatives 6a and 6b propose similar project components within the same project area as Build Alternatives 2a and 2b. Overall visual impacts would be moderate-low but would range from very low to moderate-high. Build Alternative 6b impacts would be moderate-high. With implementation of AMM AES-1 through AMM AES-5, Build Alternatives 6a and 6b would not cause disproportionately high and adverse direct effects on visual resources.

Build Alternatives 7a and 7b

Construction

Construction-related impacts are lowest in Alternative 7a, where reduced impacts occur in the Davis VAU since the center median work would not be performed and the construction schedule would be shortened. However, construction-related impacts are highest in Build Alternative 7b where the I-80 connector structure would be built in the West Sacramento VAU, increasing the schedule to 42 months and including the use of a crane.

Operation

Resource changes for Build Alternative 7a are the same as Build Alternative 2a but would include converting an existing lane into a managed lane on I-80 and US-50 with no shoulder widening or median reconstruction with a concrete barrier. The reduction in impacts would primarily be from highway users in the Davis VAU, where the median plantings would be retained and the vegetation contributions to visual character and quality would be retained. Overall visual impacts of Build Alternative 7a would be low but would range from very low to moderate-high. Build Alternative 7b impacts would be moderate to moderate-high. With implementation of AMM AES-1 through AMM AES-5, Build Alternatives 7a and 7b would not cause disproportionately high and adverse direct effects on visual resources.

2.1.11.4 Avoidance, Minimization, and/or Mitigation Measures

AMMs have been specified to reduce, avoid, and offset visual impacts from the project.

The following would be designed and implemented into the project, with concurrence of the District Landscape Architect, as applicable. The following measures to avoid or minimize visual impacts would be incorporated into the project:

- **AMM AES-1: Avoid or minimize glare through the selection of materials and finishes**. Implement paint finishes that are only matte, satin, or non-glare producing. Concrete colors/finishes would be selected to reduce their potential to become a source of glare.

- **AMM AES-2: Minimize high contrast rock slope protection:** Colors and/or stains that match or complement the predominant immediately adjacent landscape color would be used where stormwater energy dissipation and/or slope stabilization devices are used.

- **AMM AES-3: Account for the loss of plantings and vegetation by providing replacement highway plantings and vegetation.** Plans would be prepared which maintain and repair corridor landscaping and vegetation where proper setbacks exist and where feasible. Plans would help ensure work within any existing classified landscape freeway maintains the status of the landscaped freeway. Appropriate replacement planting would be provided when existing planting (including oleander) is removed to a level considered roughly proportionate, with a target of 100%/1:1 and not less than 60%. Plantings would occur as close to the original impacts as possible. When native, naturally occurring or specimen trees are removed, replacement plantings would reflect the visual importance of the plantings lost.

- **AMM AES-4: Reduce views of new overhead signage and read points from visually sensitive locations.** Where new overhead signage and/or read points are proposed, consider refinements to their final location to avoid or screen direct views from sensitive viewsheds such as those of homeowners and recreationalists. Integrate read points into existing and proposed overhead structures where feasible.

- **AMM AES-5: Minimize I-80 connector structure design profile.** The I-80 connector structure design refinements would be prioritized to minimize its prominence, scale, and mass and avoid the need to raise/relocate adjacent powerline towers.

2.1.12 Cultural Resources

2.1.12.1 Regulatory Setting

The term “cultural resources,” as used in this document, refers to elements that constitute the “built environment” (which comprises buildings; objects, structures such as bridges; and linear features such as railroads, water conveyance systems, etc.), places of traditional or cultural importance, and archaeological sites (both prehistoric and historic), regardless of their significance. Under federal and state laws, cultural resources that meet certain criteria of significance are referred to by various terms including “historic properties,” “historic sites,” “historical resources,” and “tribal cultural resources.” Laws and regulations dealing with cultural resources include:

The National Historic Preservation Act (NHPA) of 1966, as amended, sets forth national policy and procedures for dealing with historic properties, which are defined as districts, sites, buildings, structures, and objects included in or eligible for listing in the National Register of Historic Places (NRHP). Section 106 of the NHPA requires federal agencies to take into account the effects of their undertakings on historic properties and to allow the Advisory Council on Historic Preservation (ACHP) the opportunity to comment on those undertakings, following regulations issued by the ACHP (36 Code of Federal Regulations [CFR] 800). On January 1, 2014, the First Amended Section 106 Programmatic Agreement (PA) among the Federal Highway Administration (FHWA), the ACHP, the California State Historic Preservation Officer (SHPO), and Caltrans went into effect for Caltrans projects, both state and local, with FHWA involvement. The PA implements the ACHP’s regulations, 36 CFR 800, streamlining the Section 106 process and delegating certain responsibilities to Caltrans. The FHWA’s responsibilities

under the PA have been assigned to Caltrans as part of the Surface Transportation Project Delivery Program (23 United States Code [USC] 327).

Historic properties may also be covered under Section 4(f) of the U.S. Department of Transportation Act, which regulates the "use" of land from historic properties (in Section 4(f) terminology—historic sites). See Appendix A for specific information about the applicability of Section 4(f) to historic properties.

CEQA requires the consideration of cultural resources that are historical resources and tribal cultural resources, as well as "unique" archaeological resources. California Public Resources Code (PRC) Section 5024.1 established the California Register of Historical Resources (CRHR) and outlined the necessary criteria for a cultural resource to be eligible for listing in the CRHR and, therefore, to be considered a historical resource. Historical resources are defined in PRC Section 5020.1(j). In 2014, Assembly Bill 52 (AB 52) added the term "tribal cultural resources" to CEQA, and AB 52 is commonly referenced instead of CEQA when discussing the process to identify tribal cultural resources (as well as identifying measures to avoid, preserve, or mitigate adverse effects to them). Defined in PRC Section 21074(a), a tribal cultural resource is a CRHR or local register eligible site, feature, place, cultural landscape, or object which has a cultural value to a California Native American tribe. Tribal cultural resources must also meet the definition of a historical resource. Unique archaeological resources are referenced in PRC Section 21083.2.

PRC Section 5024 requires state agencies to identify and protect state-owned historical resources that meet the NRHP listing criteria. It further requires Caltrans to inventory state-owned historical resources Sections 5024(f) and 5024.5 require state agencies to provide notice to and consult with the SHPO before altering, transferring, relocating, or demolishing state-owned historical resources that are listed on or are eligible for inclusion in the NRHP or are registered or eligible for registration as California Historical Landmarks. Procedures for compliance with PRC Section 5024 are outlined in a Memorandum of Understanding (MOU) between Caltrans and SHPO, effective January 1, 2015. For most Federal-aid projects on the State Highway System, compliance with the PA will satisfy the requirements of PRC Section 5024.

2.1.12.2 Affected Environment

Analysis of the cultural resources for the project was carried out by Caltrans Professionally Qualified Staff (PQS) in a manner consistent with Caltrans regulatory responsibilities under the PA. Methods used to support the studies for the analysis include records searches, field surveys including Phase I pedestrian surveys and Extended Phase I testing, field testing and Native American consultation with tribal entities (Table 2.1-29).

The Native American Heritage Commission (NAHC) was contacted May 14, 2020, to request a search of the Sacred Land Files and request a list of Native American tribes or individuals with potential interests, concerns, and/or knowledge regarding cultural resources or Traditional Cultural Properties that may be affected by the project. Of the 11 tribes originally identified by the NAHC, all responded and requested to continue consultation except for the Ione Band of

Miwok Indians, the Nashville Enterprise Miwok-Maidu-Nishinam Tribe, the Ts'i Akim Maidu, and the Cortina Rancheria-Kletsel Dehe Band of Wintun Indians.

Table 2.1-29. Section 106 Technical Reports

Report Title	Date
Historic Property Survey Report	August 2021
Archaeological Survey Report	March 2021
Historic Resources Evaluation Report	August 2021
Extended Phase I Report	November 2020 and May 2021
Finding of No Adverse Effect	October 2021

Formal consultation began on June 4th, 2020 and was followed up by phone calls and/or emails to the Native American contacts who were identified as having an interest in projects within this area by the NAHC:

- Rhonda Morningstar Pope, Chairperson, Buena Vista Rancheria of Me-Wuk Indians
- Clyde Prout, Chairman, Colfax-Todds Valley Consolidated Tribe
- Sara Dutschke Setchwaelo, Chairperson, Ione Band of Miwok Indians
- Cosme Valdez, Chairperson, Nashville Enterprise Miwok-Maidu-Nishinam Tribe
- Regina Cuellar, Chairperson, Shingle Springs Band of Miwok Indians
- Grayson Coney, Cultural Director, Ts'i Akim Maidu
- Gene Whitehouse, Chairperson, United Auburn Indian Community of the Auburn Rancheria
- Raymond Hitchcock, Chairperson, Wilton Rancheria
- Anthony Roberts, Chairperson, Yocha Dehe Wintun Nation
- Charlie Wright, chairperson, Cortina Rancheria-Kletsel Dehe Band of Wintun Indians
- Marlene Sanchez, Chairperson, Guidiville Indian Rancheria

The Colfax-Todds Valley Consolidated Tribe noted that they would like to defer to a tribe more familiar with the project area. Buena Vista Rancheria of Me-Wuk Indians reviewed the project and did not request additional consultation but requested to be notified if any cultural resources are documented. Guidiville Indian Rancheria had no concerns and requested copies of the reports to add to their records.

Shingle Springs noted areas of concern and asked for continued consultation. United Auburn Indian Community notes areas of concern and requested to monitor testing. The Yocha Dehe Wintun Nation noted areas of concern requested to monitor testing. Wilton Ranchera also noted areas of concern and a desire to continue consultation. A joint meeting was held with concern tribes were project details and areas of concern were discussed. Consultation continued in the form of emails, phone calls, and online meetings with all concerns parties as the project developed.

The Yocha Dehe Wintun Nation provided a monitor for the XPI trenching, and UAIC monitored Geotech work at Bryte Bend bridge. Following the negative results from surveys and

subsurface testing, no additional concerns were raised about the potential to affect historic properties within the project limits.

Responses were not received from the other identified parties.

Area of Potential Effects

The Area of Potential Effects (APE) is the area studied for cultural resources present in the general project area and which may extend beyond the boundary of the project study area. The APE is defined to avoid impacts to cultural resources when feasible, and where avoidance did not conflict with the purpose and need of the proposed project. The APE aligns with the cultural resources study area and project study area and is the same among all project alternatives. It consists of a broad corridor that encompasses existing and proposed new right-of-way as well as lands that may be used during construction but are not included in the final right-of-way. As defined by Caltrans for the project, the project study area comprises the entire APE, totaling 1,475 acres.

Cultural Resources

The Caltrans Office of Cultural Resources Studies conducted research, architectural history surveys, extended phase I studies, and evaluations of cultural resources within the APE in various dates in 2021. Identification and evaluation efforts by Caltrans have resulted in the documentation of one historic property within the APE: Reclamation District 900 (RD 900). Caltrans assumed RD 900 to be eligible for listing in the National Register under Criterion A, for the purposes of this project only, pursuant to Stipulation VIII.C.4 of the PA. On August 9, 2021 Caltrans Cultural Studies Office granted permission to assume the resource's eligibility.

Seven built-environment resources were also identified within the APE (MR1, MR2, MR3, MR4, MR5, MR6, and MR7); however, Caltrans determined all are ineligible for inclusion in the NRHP/CRHR. On September 30, 2021, Caltrans received concurrence from SHPO that the seven built environment resources were ineligible.

In addition, several cultural resources were identified within the APE but were considered to be exempt from evaluation pursuant to Attachment 4 of the Section 106 Programmatic Agreement (Properties Exempt from Evaluation) and as applicable PRC 5024 MOU Stipulation VIII.C.1 and Attachment 4.

Reclamation District 900 (RD 900) will be avoided by the project, and the character defining features for which it is assumed eligible—as a large linear resource associated with historic themes of agriculture/irrigation and land reclamation in the Sacramento Valley—will not be affected. As such, Caltrans, pursuant to PA Stipulation X.B.2, found that there will be no adverse effect. The undertaking will not destroy or alter any contributing feature of RD 900 and will not affect the resource's integrity or ability to convey its historical significance, and the project would have No Adverse Effect without standard conditions.

SHPO concurred with the findings on January 12, 2022. As such, the undertaking would not result in any Section 4(f) use or *de minimis* finding to any historic properties or historical resources, regardless of alternative. The undertaking would have No Adverse Effect overall.

2.1.12.3 Environmental Consequences

No Build Alternative 1

Construction and Operation

Under the No Build Alternative, managed lanes would not be added to the I-80 or US-50 corridors and existing capacity would not increase. No ground disturbing activities would occur. Therefore, there would be no effects related to cultural resources.

Build Alternatives 2a and 2b

Construction

Build Alternatives 2a and 2b would involve adding an HOV 2+ lane in each direction. As described previously, of the cultural resources identified within the APE, and seven cultural resources were evaluated and determined to be ineligible for inclusion to the NRHP/CRHR and one cultural resource, the RD 900 canal, was assumed to be eligible for the purpose of the undertaking.

Project construction would create subsurface disturbances that could result in damage to or destruction of previously undiscovered subsurface archaeological deposits or unmarked burials. Although all the areas of construction and access roads have been subject to the cultural resources survey, the potential remains for previously unidentified archaeological remains to be discovered below the visible ground surface.

If cultural materials are discovered during construction, all earth-moving activity within and around the immediate discovery area would be diverted until a qualified archaeologist can assess the nature and significance of the find as outlined in Standard Measure CR-3 . Standard Measure CR-4 outlines requirements in the event human remains are discovered.

If human remains are discovered, all work within 60 feet of the discovery would halt and Caltrans’ Cultural Resource Studies office would be called. Caltrans' Cultural Resources Studies Office Staff would assess the remains and, if determined human, would contact the County Coroner as per Public Resources Code (PRC) Sections 5097.98, 5097.99, and 7050.5 of the California Health and Safety Code. If the Coroner determines the remains to be Native American, the Coroner will contact the Native American Heritage Commission who would then assign and notify a Most Likely Descendant. Caltrans would consult with the Most Likely Descendant on respectful treatment and reburial of the remains. Further provisions of PRC 5097.98 are to be followed as applicable.

Caltrans, pursuant to Section 106 PA Stipulation X.B.2, found that there would be no adverse effect without standard conditions. The undertaking would not destroy or alter any contributing

feature of RD 900 and would not affect the resource's integrity or ability to convey its historical significance.

Operation

Operation of Build Alternatives 2a and 2b would not require earth-moving activity or ground disturbance. While capacity of the bridge would increase, which could result in increased noise effects, and changes to existing visual character and quality would occur, there would be no adverse effect to cultural resources within the APE.

Build Alternatives 3a and 3b

Construction and Operation

Build Alternatives 3a and 2b would involve adding an HOT 2+ lane in each direction. Because Build Alternatives 3a and 3b would be located in the same project area as Build Alternatives 2a and 2b, respectively, the effect would be the same as the effects described under Build Alternatives 2a and 2b.

Build Alternatives 4a and 4b

Construction and Operation

Build Alternatives 4a and 4b would involve adding an HOT 3+ lane in each direction. Because Build Alternatives 4a and 4b would be located in the same project area as Build Alternatives 2a and 2b, respectively, the effect would be the same as the effects described under Build Alternatives 2a and 2b.

Build Alternatives 5a and 5b

Construction and Operation

Build Alternatives 5a and 5b would involve adding an Express Lane in each direction. Because Build Alternatives 5a and 5b would be located in the same project area as Build Alternatives 2a and 2b, respectively, the effect would be the same as the effects described under Build Alternatives 2a and 2b.

Build Alternatives 6a and 6b

Construction and Operation

Build Alternatives 6a and 6b would involve adding a transit-only lane in each direction. Because Build Alternatives 6a and 6b would be in the same project area as Build Alternative 2a and 2b, respectively, the effect would be the same as the effects described under Build Alternatives 2a and 2b.

Build Alternatives 7a and 7b

Construction and Operation

Build Alternatives 7a and 7b involves repurposing the current number 1 general purpose lane to HOV 2+. No new lanes would be constructed. Because Build Alternatives 7a and 7b involves ground disturbing activities, the effect would be the same as the effects described under Build Alternatives 2a and 2b.

2.1.12.4 Avoidance, Minimization, and/or Mitigation Measures

No AMMs or MMs are required.

2.2 Physical Environment

2.2.1 Hydrology and Floodplain

2.2.1.1 Regulatory Setting

Executive Order (EO) 11988

Executive Order (EO) 11988 (Floodplain Management) directs all federal agencies to refrain from conducting, supporting, or allowing actions in floodplains unless it is the only practicable alternative. The Federal Highway Administration (FHWA) requirements for compliance are outlined in 23 Code of Federal Regulations (CFR) 650 Subpart A.

To comply, the following must be analyzed:

- The practicability of alternatives to any longitudinal encroachments
- Risks of the action
- Impacts on natural and beneficial floodplain values
- Support of incompatible floodplain development
- Measures to minimize floodplain impacts and to preserve/restore any beneficial floodplain values affected by the project

The base floodplain is defined as “the area subject to flooding by the flood or tide having a 1 percent chance of being exceeded in any given year.” An encroachment is defined as “an action within the limits of the base floodplain.”

Section 408

The purpose of a Section 408 Permission is to demonstrate that any proposed work “will not be injurious to the public interest and will not impair the usefulness of the civil works project.” If that can be shown, the project would receive a Section 408 permission from the United States Army Corps of Engineers (USACE) and a Central Valley Flood Protection Board (CVFPB) permit before construction begins.

2.2.1.2 Affected Environment

This section was prepared using the Floodplain Hydraulics Study prepared for this project (Caltrans 2021b).

FEMA Flood Zones

The project is located in areas designated by the Federal Emergency Management Agency (FEMA) as Special Flood Hazard Area (SFHA) Zone A, SFHA Zone AE, and SFHA Zone 99A (Figure 2.2-1). Additionally, the project is also located within areas designated by FEMA as Other Areas of Flood Hazard Zone X (both shaded and unshaded). FEMA uses Zone A to characterize areas subject to inundation by the 1 percent annual chance flood (100-year flood) where no Base Flood Elevations (BFEs) have been determined. FEMA uses Zone AE to characterize areas subject to inundation by the 1 percent annual chance flood (100-year flood) where BFEs have been determined. FEMA uses Zone A99 to characterize areas to be protected from the 1 percent annual chance flood by a Federal flood protection system under construction where no BFEs have been determined. FEMA uses shaded Zone X to characterize areas of 0.2 percent annual chance flood (500-year flood); areas of 1 percent annual chance flood (100-year flood) with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from the 1 percent annual chance flood (100-year flood). FEMA uses unshaded Zone X to characterize areas determined to be outside of the 0.2 percent annual chance flood (500-year flood).

Section 408

Between PM 5.8 and 8.9, I-80 crosses the Yolo Bypass. The west and east levees of the Yolo Bypass, located at PM 5.8 and 8.9 respectively, are State Plan of Flood Control Levees and are part of the Sacramento River Flood Control Project. Consequently, the levees are under the jurisdiction of both the CVFPB and the USACE.

2.2.1.3 Environmental Consequences

No Build Alternative 1

Under No Build Alternative 1, managed lanes would not be added to the I-80 or US-50 corridors, and existing capacity would not increase. No ground-disturbing activities would occur. Therefore, No Build Alternative 1 would not have any new effects related to floodplains.

Build Alternatives 2a and 2b

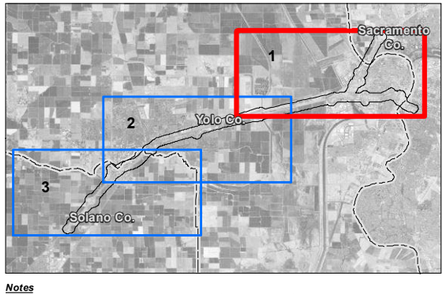
Construction

The proposed bike path extensions for Build Alternatives 2a and 2b, involving rehabilitation of the existing bike path on the crown of the west levee of the Yolo Bypass, classifies the project as falling under the jurisdiction of Section 408. Therefore, Caltrans would need to receive an encroachment permit from the CVFPB and a Section 408 permission from the USACE prior to construction of Build Alternatives 2a and 2b.

New drainage inlets and culverts are proposed to be replaced or repaired to accommodate areas where existing shoulders are being narrowed, to accommodate additional runoff due to the increased pavement area, or to perpetuate existing drainage patterns. Build Alternatives 2a and 2b would construct five new culverts and replace or improve 21 existing culverts. As described, many of the proposed drainage features would be located within the construction footprint of the median for the new HOV 2+ managed lane. In addition, proposed culverts would traverse beneath the freeway to convey drainage to a new outlet. Proposed drainage features for the I-80 managed lane direct connector, under Build Alternative 2b, would occur within the construction footprint of the I-80 managed lane direct connector.

Operations

Build Alternatives 2a and 2b would involve adding an HOV lane in each direction for use by HOV 2+. Most of the project work would occur entirely within the existing Caltrans right-of-way and would not result in any changes to hydrology adjacent to the project area.



The Hydrology Study (Wood Rodgers 2022) determined the magnitude of increased peak flow rates arriving at existing drainage infrastructure caused by the proposed project improvements. Under Build Alternatives 2a and 2b, AMM HF-1 would be used to reduce the potential for adverse impacts resulting from increased peak flow. AMM HF-1 would require installation of a detention basin riser to tie into existing storm drains on the upstream side at two locations in Davis—one detention basin rise inlet is proposed at the storm drain crossing on Mace Boulevard south of I-80 and the other would be at the westbound I-80 off-ramp to Chiles Road.

The bike path extension design option for Build Alternatives 2a and 2b would occur within an SFHA, specifically within Zone A floodplains. This would be a transverse encroachment into the floodplain and would be identical at each bridge location. Accordingly, Build Alternatives 2a and 2b encroach transversely into the floodplains and would not raise or change the profile of any of the highway. It is anticipated that there would be no adverse effects on the FEMA-mapped floodplain in this area.

Build Alternative 2b proposes to construct a concrete median barrier on I-80 in Yolo County from PM 0.21 to PM 4.3 (a median barrier is not proposed under Build Alternative 2a.). At this location, I-80 is located within a Zone A floodplain. Due to the nature of Zone A, no BFEs have been established and the extents of flooding are approximate. A review was made of the FEMA Flood Insurance Study (FIS) for Yolo County to determine how the Zone A floodplain was developed in this area (Wood Rodgers 2022). The FIS states that:

> “Approximate analyses of ‘behind levee’ flooding were conducted for all the levees to indicate the extent of the behind levee floodplains. Along the Sacramento River, Sacramento River Toe Drain, and Yolo Bypass, the area shown on the most recent flood insurance rate map (FIRM) (prior to this current revision) as protected by the levees was assumed to be the area that would be inundated by the 1% annual chance flood if the levees were to fail.”

Stantec has not verified the accuracy and/or completeness of this information and shall not be responsible for any errors or omissions which may be incorporated herein as a result. Stantec assumes no responsibility for data supplied in electronic format, and the recipient accepts full responsibility for verifying the accuracy and completeness of the data.

This location is behind the west levee of the Yolo Bypass, and the floodplain was determined using the above methodology. Flooding at this location is likely due to a failure of the Yolo Bypass, upstream and/or downstream of I-80. Therefore, to determine the depth of flooding on I-80 from PM 0.21 to PM 4.3, the published BFE in the Yolo Bypass adjacent to the project was used. An elevation of 29.5 feet (NAVD 88) was used to determine that this area of I-80 is completely submerged during the 100-year flood event and would continue to be so after the construction of the proposed concrete median under Build Alternative 2b. Thus, Build Alternative 2a or 2b would have no effect on the FEMA-mapped floodplain in this area. The project is located within a 100-year base floodplain but will not result in a significant floodplain encroachment as defined in 23 CFR, Section 650.105.

Per the effective FEMA FIRM for Yolo County (effective date May 16, 2012), the 100-year BFE for the Yolo Bypass at I-80 is approximately at 29.5 feet elevation (NAVD 88). This was determined by interpolating BFEs located upstream and downstream of where I-80 crosses the Yolo Bypass. Although there is a potential for short-term adverse effects on riparian habitat during construction activities, no long-term effects on natural and beneficial floodplain values are anticipated as a result of Build Alternatives 2a and 2b. Build Alternatives 2a and 2b would not promote incompatible development within the floodplain; and with the implementation of AMM HF-1, these alternatives would not contribute to adverse effects on floodplains.

Build Alternatives 3a and 3b

Construction and Operation

Build Alternatives 3a and 3b would involve adding an HOT 2+ lane in each direction, and they propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively. Therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b.

Build Alternatives 4a and 4b

Construction and Operation

Build Alternatives 4a and 4b would involve adding an HOT 3+ lane in each direction, and they propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively. Therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b.

Build Alternatives 5a and 5b

Construction and Operation

Build Alternatives 5a and 5b would create an express lane in each direction where all users pay a fee regardless of vehicle occupancy, and they propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively. Therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b.

Build Alternatives 6a and 6b

Construction and Operation

Build Alternatives 6a and 6b would involve adding a transit-only lane in each direction, and they propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively. Therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b.

Build Alternatives 7a and 7b

Construction and Operation

Build Alternatives 7a and 7b would involve repurposing the current number 1 general purpose lane to HOV 2+. No new lanes would be constructed. Build Alternatives 7a and 7b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively. Therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b.

2.2.1.4 Avoidance, Minimization, and/or Mitigation Measures

Caltrans will use the following avoidance and minimization measure to reduce impacts on the floodplain.

- **AMM HF-1 Detention Basin Risers (Build Alternatives 2a and 2b):** Increased peak flows will be moderated by the use of detention basin risers in existing infrastructure. Caltrans will install detention basin risers to tie into existing storm drains on the upstream side at two locations in the city of Davis—one detention basin rise inlet is proposed at the storm drain crossing on Mace Boulevard south of I-80 and the other will be at the WB I-80 off-ramp to Chiles Road.

2.2.2 Water Quality and Stormwater Runoff

2.2.2.1 Regulatory Setting

Federal Requirements: Clean Water Act

In 1972, Congress amended the Federal Water Pollution Control Act, making the addition of pollutants to the waters of the United States (U.S.) from any point source[3] unlawful unless the discharge is in compliance with a National Pollutant Discharge Elimination System (NPDES) permit. This act and its amendments are known today as the Clean Water Act (CWA). Congress has amended the act several times. In the 1987 amendments, Congress directed dischargers of storm water from municipal and industrial/construction point sources to comply with the NPDES permit scheme. The following are important CWA sections:

[3] A point source is any discrete conveyance such as a pipe or a man-made ditch.

1. Sections 303 and 304 require states to issue water quality standards, criteria, and guidelines.

2. Section 401 requires an applicant for a federal license or permit to conduct any activity that may result in a discharge to waters of the U.S. to obtain certification from the state that the discharge will comply with other provisions of the act. This is most frequently required in tandem with a Section 404 permit request (see below).

3. Section 402 establishes the NPDES, a permitting system for the discharges (except for dredge or fill material) of any pollutant into waters of the U.S. Regional Water Quality Control Boards (RWQCBs) administer this permitting program in California. Section 402(p) requires permits for discharges of storm water from industrial/construction and municipal separate storm sewer systems (MS4s).

4. Section 404 establishes a permit program for the discharge of dredge or fill material into waters of the U.S. This permit program is administered by the U.S. Army Corps of Engineers (USACE).

The goal of the CWA is "to restore and maintain the chemical, physical, and biological integrity of the Nation's waters."

The USACE issues two types of 404 permits: General and Individual. There are two types of General permits: Regional and Nationwide. Regional permits are issued for a general category of activities when they are similar in nature and cause minimal environmental effect. Nationwide permits are issued to allow a variety of minor project activities with no more than minimal effects.

Ordinarily, projects that do not meet the criteria for a Regional or Nationwide Permit may be permitted under one of the USACE's Individual permits. There are two types of Individual permits: Standard permits and Letters of Permission. For Individual permits, the USACE decision to approve is based on compliance with U.S. Environmental Protection Agency's (U.S. EPA) Section 404 (b)(1) Guidelines (40 Code of Federal Regulations [CFR] Part 230), and whether the permit approval is in the public interest. The Section 404(b)(1) Guidelines (Guidelines) were developed by the U.S. EPA in conjunction with the USACE, and allow the discharge of dredged or fill material into the aquatic system (waters of the U.S.) only if there is no practicable alternative which would have less adverse effects. The Guidelines state that the USACE may not issue a permit if there is a least environmentally damaging practicable alternative (LEDPA) to the proposed discharge that would have lesser effects on waters of the U.S. and not have any other significant adverse environmental consequences. According to the Guidelines, documentation is needed that a sequence of avoidance, minimization, and compensation measures has been followed, in that order. The Guidelines also restrict permitting activities that violate water quality or toxic effluent[4] standards, jeopardize the continued existence of listed species, violate marine sanctuary protections, or cause "significant degradation" to waters of the U.S. In addition, every permit from the USACE, even if not subject

[4] The U.S. EPA defines "effluent" as "wastewater, treated or untreated, that flows out of a treatment plant, sewer, or industrial outfall."

to the Section 404(b)(1) Guidelines, must meet general requirements. See 33 CFR 320.4. A discussion of the LEDPA determination, if any, for the document is included in the Wetlands and Other Waters section.

State Requirements: Porter-Cologne Water Quality Control Act

California's Porter-Cologne Act, enacted in 1969, provides the legal basis for water quality regulation within California. This act requires a "Report of Waste Discharge" for any discharge of waste (liquid, solid, or gaseous) to land or surface waters that may impair beneficial uses for surface and/or groundwater of the state. It predates the CWA and regulates discharges to waters of the state. Waters of the State include more than just waters of the U.S., like groundwater and surface waters not considered waters of the U.S. Additionally, it prohibits discharges of "waste" as defined, and this definition is broader than the CWA definition of "pollutant." Discharges under the Porter-Cologne Act are permitted by Waste Discharge Requirements (WDRs) and may be required even when the discharge is already permitted or exempt under the CWA.

The State Water Resources Control Board (SWRCB) and RWQCBs are responsible for establishing the water quality standards (objectives and beneficial uses) required by the CWA and regulating discharges to ensure compliance with the water quality standards. Details about water quality standards in a project area are included in the applicable RWQCB Basin Plan. In California, RWQCBs designate beneficial uses for all water body segments in their jurisdictions and then set criteria necessary to protect those uses. As a result, the water quality standards developed for particular water segments are based on the designated use and vary depending on that use. In addition, the SWRCB identifies waters failing to meet standards for specific pollutants. These waters are then state-listed in accordance with CWA Section 303(d). If a state determines that waters are impaired for one or more constituents and the standards cannot be met through point source or non-point source controls (NPDES permits or WDRs), the CWA requires the establishment of Total Maximum Daily Loads (TMDLs). TMDLs specify allowable pollutant loads from all sources (point, non-point, and natural) for a given watershed.

State Water Resources Control Board and Regional Water Quality Control Boards

The SWRCB administers water rights, sets water pollution control policy, and issues water board orders on matters of statewide application, and oversees water quality functions throughout the state by approving Basin Plans, TMDLs, and NPDES permits. RWCQBs are responsible for protecting beneficial uses of water resources within their regional jurisdiction using planning, permitting, and enforcement authorities to meet this responsibility.

National Pollutant Discharge Elimination System (NPDES) Program

Municipal Separate Storm Sewer Systems (MS4)

Section 402(p) of the CWA requires the issuance of NPDES permits for five categories of storm water discharges, including Municipal Separate Storm Sewer Systems (MS4s). An MS4 is defined as "any conveyance or system of conveyances (roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, human-made channels, and storm drains) owned

or operated by a state, city, town, county, or other public body having jurisdiction over storm water, that is designed or used for collecting or conveying storm water." The SWRCB has identified Caltrans as an owner/operator of an MS4 under federal regulations. The Caltrans MS4 permit covers all Caltrans rights-of-way, properties, facilities, and activities in the state. The SWRCB or the RWQCB issues NPDES permits for five years, and permit requirements remain active until a new permit has been adopted.

The Caltrans MS4 Permit, Order No. 2012-0011-DWQ (adopted on September 19, 2012 and effective on July 1, 2013), as amended by Order No. 2014-0006-EXEC (effective January 17, 2014), Order No. 2014-0077-DWQ (effective May 20, 2014) and Order No. 2015-0036-EXEC (conformed and effective April 7, 2015) has three basic requirements:

1. Caltrans must comply with the requirements of the Construction General Permit (see below);

2. Caltrans must implement a year-round program in all parts of the State to effectively control storm water and non-storm water discharges; and

3. The Caltrans storm water discharges must meet water quality standards through implementation of permanent and temporary (construction) Best Management Practices (BMPs), to the maximum extent practicable, and other measures as the SWRCB determines to be necessary to meet the water quality standards.

To comply with the permit, Caltrans developed the Statewide Storm Water Management Plan (SWMP) to address storm water pollution controls related to highway planning, design, construction, and maintenance activities throughout California. The SWMP assigns responsibilities within Caltrans for implementing storm water management procedures and practices as well as training, public education and participation, monitoring and research, program evaluation, and reporting activities. The SWMP describes the minimum procedures and practices Caltrans uses to reduce pollutants in storm water and non-storm water discharges. It outlines procedures and responsibilities for protecting water quality, including the selection and implementation of BMPs. The proposed project will be programmed to follow the guidelines and procedures outlined in the latest SWMP to address storm water runoff.

Construction General Permit

Construction General Permit, Order No. 2009-0009-DWQ (adopted on September 2, 2009 and effective on July 1, 2010), as amended by Order No. 2010-0014-DWQ (effective February 14, 2011) and Order No. 2012-0006-DWQ (effective on July 17, 2012). The permit regulates storm water discharges from construction sites that result in a Disturbed Soil Area (DSA) of one acre or greater, and/or are smaller sites that are part of a larger common plan of development. By law, all storm water discharges associated with construction activity where clearing, grading, and excavation result in soil disturbance of at least one acre must comply with the provisions of the General Construction Permit. Construction activity that results in soil disturbances of less than one acre is subject to this Construction General Permit if there is potential for significant water quality impairment resulting from the activity as determined by the RWQCB. Operators of regulated construction sites are required to develop Storm Water Pollution Prevention Plans

(SWPPPs); to implement sediment, erosion, and pollution prevention control measures; and to obtain coverage under the Construction General Permit.

The Construction General Permit separates projects into Risk Levels 1, 2, or 3. Risk levels are determined during the planning and design phases, and are based on potential erosion and transport to receiving waters. Requirements apply according to the Risk Level determined. For example, a Risk Level 3 (highest risk) project would require compulsory storm water runoff pH and turbidity monitoring, and before construction and after construction aquatic biological assessments during specified seasonal windows. For all projects subject to the permit, applicants are required to develop and implement an effective SWPPP. In accordance with the Caltrans SWMP and Standard Specifications, a Water Pollution Control Program (WPCP) is necessary for projects with DSA less than one acre.

Section 401 Permitting

Under Section 401 of the CWA, any project requiring a federal license or permit that may result in a discharge to a water of the U.S. must obtain a 401 Certification, which certifies that the project will be in compliance with state water quality standards. The most common federal permits triggering 401 Certification are CWA Section 404 permits issued by the USACE. The 401 permit certifications are obtained from the appropriate RWQCB, dependent on the project location, and are required before the USACE issues a 404 permit.

In some cases, the RWQCB may have specific concerns with discharges associated with a project. As a result, the RWQCB may issue a set of requirements known as WDRs under the State Water Code (Porter-Cologne Act) that define activities, such as the inclusion of specific features, effluent limitations, monitoring, and plan submittals that are to be implemented for protecting or benefiting water quality. WDRs can be issued to address both permanent and temporary discharges of a project.

2.2.2.2 Affected Environment

Caltrans completed a Water Quality Assessment for the project (Caltrans 2022a). This section summarizes the findings of that review.

Regional and Local Hydrology

The project area is located within the Cache Slough Watershed in Solano County, and in the Knights Landing Ridge Cut-Tule Canal Watershed in Yolo and Sacramento counties. Table 2.2-1 summarizes hydrologic units within the project area.

Table 2.2-1. Hydrologic Units

Project Location (PM)	County	Hydrologic Unit	Hydrologic Sub-Area/Number	Latitude/Longitude	Hydrologic Area
40.7-42.392	Solano	Valley Putah-Cache Slough	Undefined/511.10	38.511, -121.7732	Elmira

Source: Caltrans 2021b

Erosion Potential

The project is not in an area where slopes are prone to erosion (Caltrans 2022a).

Receiving Waters and TMDL Compliance

The only portion of the project that lies within a high-risk receiving watershed boundary is located in Sacramento County where the project crosses over the Sacramento River. High-risk receiving watersheds are watersheds that drain to water bodies that are either listed on the CWA 303(d) List for sedimentation/siltation or turbidity, have a USEPA-approved Total Maximum Daily Load Implementation Plan (TDML) for sediment; or have beneficial uses of Cold, Spawn, and Migratory.

The nearest major receiving waters that could potentially be impacted by project activities are Putah Creek, Willow Slough Bypass, Sacramento River, and Delta Waterways as summarized in Table 2.2-2. Under CWA Section 303(d), states, territories, and authorized tribes are required to develop a list of water quality limited segments that do not meet water quality standards. As discussed previously, the CWA requires the establishment of TMDLs, which specify allowable pollutant loads for a given watershed. Putah Creek, Willow Slough Bypass, and the Delta Waterways are listed on the CWA TMDLs and the USEPA's 303(d) List of Water Quality Limited Segments.

Caltrans is a named stakeholder for the methymercury TMDL associated with the Delta Waterways further south of the project area and within specific designated priority reaches.

Table 2.2-2. Major Receiving Waterways

Waterway	County	Total Maximum Daily Loads
Putah Creek	Solano	Mercury
Northern Willow Slough	Yolo	Boron, bacteria, malathion, selenium, conductivity, toxicity, chlorpyrifos, and diuron
Sacramento River (Knights Landing to Delta)	Sacramento	Chlordane, chlorpyrifos, DDT, diazinon, dieldrin, conductivity, Group A Pesticides, invasive species, mercury, PCBs, and toxicity
Delta Waterways, northern portion	Sacramento	Chlordane, chlorpyrifos, DDT, diazinon, dieldrin, conductivity, Group A Pesticides, invasive species, mercury, PCBs, and toxicity

Source: Caltrans 2021b
PCBs = polychlorinated biphenyl; DDT = dichlorodiphenyltrichloroethane

Beneficial Uses

Beneficial uses define resources for aquatic systems and are the basis for water quality objectives. Designated uses are established by the State for each waterbody or water segment. Beneficial uses are critical to water quality management and the protection and enhancement of these beneficial uses are the primary goals of water quality planning. Using the Central Valley Regional Basin Plan and Caltrans' Water Quality Planning Tool, Table 2.2-3 identifies the following beneficial uses:

Table 2.2-3. Beneficial Uses

Hydrologic Sub-Area	Waterbody Name	Beneficial Uses
511.0	Yolo Bypass	AGR, COLD, MIGR, REC1, REC2, SPWN, WARM, WILD
511.20	Sacramento River (Colusa Basin Drain to I Street Bridge	AGR, COLD, MIGR, MUN, REC1, REC2, SPWN, WRM, WILD
510.0	Cosumnes River – Source to Delta	AGR, COLD, MIGR, MUN, REC1, REC2, SPWN, WARM, WILD
510.0	Sacramento San Joaquin Delta (8,9)	AGR, COLD, IND, MIGR, MUN, NAV, REC1, REC2, SPWN, WARM, WILD
510.0	Yolo Bypass	AGR, COLD, MIGR, REC1, REC2, SPWN, WARM, WILD

Source: Caltrans 2021b, California Water Board 2017
Key:
AGR = agricultural supply; COLD = cold freshwater habitat; IND = industrial service supply; MIGR = fish migration; MUN = municipal and domestic supply; NAV = navigation; PROC = industrial process supply; REC1 = water contact recreation; REC2 = noncontact water recreation; SPWN = fish spawning; WARM = warm freshwater habitat; WILD = wildlife habitat

Water Quality Objectives

All inland surface waters within the Sacramento River Basin have water quality objectives that are standard for the following constituents: bacteria, biostimulatory substances, chemical constituents, color, dissolved oxygen, floating material, mercury, methylmercury, oil and grease, pH, pesticides, radioactivity, salinity, sediment, settleable material, suspended material, tastes

and odors, temperature, toxicity, and turbidity. The thresholds and limits for these can be found in the latest Central Valley Regional Basin Plan.

2.2.2.3 Environmental Consequences

No Build Alternative 1

Construction and Operation

Under No Build Alternative 1, managed lanes would not be added to the I-80 nor US-50 corridors and existing capacity would not increase and no ground-disturbing activities would occur. Vehicles traveling on I-80 and US-50 corridors would continue to generate pollutants from tire and brake wear, oil and grease leaks, and exhaust emissions. The release of these pollutants would be similar to existing conditions. Therefore, No Build Alternative 1would not have any new effects related to water quality and stormwater runoff.

Build Alternatives 2a and 2b

Construction

Build Alternatives 2a and 2b would involve adding an HOV2+ lane in each direction. Construction of Build Alternatives 2a and 2b would involve land-disturbing activities, use of construction equipment, clearing and grading, excavation, temporary staging of materials, etc. Ground disturbance would include proposed temporary and permanent impact areas such as staging areas, access roads, sign structures, and roadway widening. Discharge of storm water runoff from construction activities would potentially impact Putah Creek (Solano and Yolo counties), Willow Slough Bypass, Sacramento River, and Delta Waterways.

The discharge of storm water runoff from construction sites has the potential to affect water quality standards, water quality objectives, and beneficial uses. Potential pollutants and sources would include sediment; non-storm water (groundwater, waters from cofferdams, dewatering, water diversions) discharges from vehicle and equipment cleaning agents, fueling, and maintenance; and waste materials from storage activities.

A primary pollutant of concern is sediment and siltation from the disturbed construction areas. As such, Caltrans will implement a SWPPP, in accordance with Standard Measure WQ-1, which would include construction site BMPs during construction activities to avoid and reduce potential water quality effects. The SWPPP would include BMPs to protect sensitive areas and to prevent and minimize stormwater and non-stormwater discharges. Standard Measure WQ-1 requires Caltrans to follow all applicable guidelines and requirements in the 2018 Caltrans Standard Specifications, Section 13, regarding water pollution control and general specifications for preventing, controlling, and abating water pollution to Caltrans-owned storm sewers, streams, waterways, and other bodies of water.

In addition, Caltrans will comply with the NPDES Construction General Permit as part of Standard Measure WQ-2. Standard Measure WQ-3 requires coordination with the Caltrans District NPDES coordination during design to prepare a dewatering and discharge work plan.

If fueling or maintenance of construction vehicles occurs within the project area during construction, there is a risk of accidental spills or releases of fuels, oils, or other potentially toxic materials. An accidental release of materials may adversely affect water quality if contaminants enter storm drains, grassy swales, drainage ditches, or receiving water bodies. The magnitude of the effect from an accidental release depends on the amount and type of material spilled. Caltrans would implement Standard Measure WQ-1, which requires that any spills or leaks from construction equipment (i.e., fuel, oil, hydraulic fluid, and grease) would be cleaned up in accordance with applicable local, state, and/or federal regulations.

With implementation of Standard Measures, construction would not adversely affect water quality.

Operation

Once construction is completed, Build Alternatives 2a and 2b would include 22 acres and 25 acres, respectively, of new impervious surface. Build Alternative 2a would create approximately 16 acres of new impervious surface plus 3 acres of replaced impervious surface, totaling 19 acres of new impervious surface. Build Alternative 2b would create approximately 21 acres of new impervious surface plus 3 acres of replaced impervious surface, totaling 24 acres of new impervious surface. In accordance with the Caltrans MS4 permit, the Build Alternatives 2a and 2b would implement Standard Measure WQ-1 and incorporate post-construction water quality treatment BMPs and low-impact development controls to reduce non-point source pollutants as needed. Additionally, Standard Measure WQ-4 requires preparation of a Stormwater Data Report during the design phase, which would describe whether permanent treatment BMPs should be incorporated.

Operation of Build Alternatives 2a and 2b would have minimal effects on water quality.

Build Alternatives 3a and 3b

Construction and Operation

Build Alternatives 3a and 3b would involve adding an HOT 2+ lane in each direction. Because Build Alternatives 3a and 3b would be located in the same project area as Build Alternatives 2a and 2b and would involve similar ground-disturbing activities and the potential to release similar pollutants, the effects from construction and operation of Build Alternatives 3a and 3b would be the same as those described under Build Alternatives 2a and 2b, respectively.

Build Alternatives 4a and 4b

Construction and Operation

Build Alternatives 4a and 4b would involve adding an HOT 3+ lane in each direction. Because Build Alternatives 4a and 4b would be located in the same project area as Build Alternatives 2a and 2b and would involve similar ground-disturbing activities and the potential to release similar pollutants, the effects from construction and operation of Build Alternatives 4a and 4b would be the same as those described under Build Alternatives 2a and 2b, respectively.

Build Alternatives 5a and 5b

Construction and Operation

Build Alternatives 5a and 5b would create an express lane in each direction where all users pay a fee regardless of vehicle occupancy. Because Build Alternatives 5a and 5b would be located in the same project area as Build Alternatives 2a and 2b and would involve similar ground-disturbing activities and the potential to release similar pollutants, the effects from construction and operation of Build Alternatives 5a and 5b would be the same as those described under Build Alternatives 2a and 2b, respectively.

Build Alternatives 6a and 6b

Construction and Operation

Build Alternatives 6a and 6b would involve adding a transit-only lane in each direction. Because Build Alternatives 6a and 6b would be located in the same project area as Build Alternatives 2a and 2b and would involve similar ground-disturbing activities and the potential to release similar pollutants, the effects from construction and operation of Build Alternatives 6a and 6b would be the same as those described under Build Alternatives 2a and 2b, respectively.

Build Alternatives 7a and 7b

Construction and Operation

Build Alternatives 7a and 7b would involve repurposing the current number 1 general purpose lane to HOV 2+. Because Build Alternatives 7a and 7b would be located in the same project area as Build Alternatives 2a and 2b and would involve similar ground-disturbing activities and the potential to release similar pollutants, the effects from construction and operation of Build Alternatives 7a and 7b would be the same as those described under Build Alternatives 2a and 2b, respectively, with the exception of impervious surface. Build Alternative 7a would create approximately 6 acres of new impervious surface and 10 acres of net new impervious surface. Build Alternative 7b would create approximately 12 acres of new impervious surface and 16 acres of net new impervious surface.

2.2.2.4 Avoidance, Minimization, and/or Mitigation Measures

No AMMs or MMs would be required.

2.2.3 Geology/Soils/Seismic/Topography

2.2.3.1 Regulatory Setting

For geologic and topographic features, the key federal law is the Historic Sites Act of 1935, which establishes a national registry of natural landmarks and protects “outstanding examples of major geological features.” Topographic and geologic features are also protected under CEQA. This section discusses geology, soils, and seismic concerns as they relate to public safety and project design. Earthquakes are prime considerations in the design and retrofit of

structures. Structures are designed using the Caltrans' Seismic Design Criteria (SDC). The SDC provides the minimum seismic requirements for highway bridges designed in California. A bridge's category and classification will determine its seismic performance level and which methods are used for estimating the seismic demands and structural capabilities. For more information, please see Caltrans' Division of Engineering Services, Office of Earthquake Engineering, Seismic Design Criteria.

2.2.3.2 Affected Environment

This section was prepared using the District Preliminary Geotechnical Reports that were prepared for the project (Caltrans 2021d, Caltrans 2021e, Caltrans 2021f). A subsurface investigation was performed in August 2020 of five rotary borings of varying depths from 90 feet to 210 feet. Another subsurface investigation was performed in April 2021 that consisted of 10 rotary borings of varying depths from 31.5 feet to 36.5 feet.

Geology

The project is located within the Sacramento Valley region of the Great Valley Geomorphic Providence. The Great Valley province is an asymmetrical synclinal trough that extends roughly 400 miles north to south and varies up to 50 miles in width separating the Sierra Nevada Mountains on the east from the Coast Range on the west. The surface of the Great Valley consists of up to several thousand feet of Quaternary aged, unconsolidated, marine and non-marine alluvial deposited sediments.

The materials that underlie the project area are mapped as Quaternary aged Alluvium deposits. From west to east, the project area is mapped as: Quaternary Alluvium (Q) between Kidwell road and the western side of the South Fork of Putah Creek; from the South Fork of Putah Creek to approximately Mace Blvd., the project area is mapped as Quaternary aged Levee and Channel Deposits (Qa); and from Mace Blvd. to the Sacramento River as Quaternary aged Basin Deposits (Qb); isolated alluvial deposits associated with the Modesto Riverbank Formation (Qmr) directly north and east of the Kidwell Rd and I-80 intersection; and alluvial deposits associated with the Modesto Formation (Qm), directly north and east of the Mace Blvd and I-80 intersection. Typically, materials associated with basin deposit consists of fine-grained sediments with horizontal stratification deposited by standing or slow-moving water in topography lows. (Caltrans 2021d).

Surface Conditions

The roadway elevation gradually decreases from west to the east, from an approximate maximum of 50 feet above sea level on the west end of the project to approximate low of 10 feet above sea level in the vicinity of the Sacramento River. Within the project area, local drainage generally trends northwest-southeast towards the Yolo Bypass and Sacramento River, which drains north-southwest.

Subsurface Conditions

The subsurface material below the existing roadway is composed of fill material that ranges in thickness from several feet to approximately 25 feet. The fill within the project limits is generally thicker in the areas of the bridge approaches. Below this fill material, the site is predominately composed of alluvial soils typically consisting of mixed layers of clay, silt, sand, and gravels in varying thickness.

Groundwater

The depth of groundwater varies throughout the project area due to variations in ground surface elevations and groundwater conditions. Based on groundwater depths and elevations, depth of groundwater decreases from west to east along the project route. Measured groundwater during the April 2021 and August 2020 subsurface investigation and review of the existing log of test borings (LOTBs) show that the groundwater depth is shallow in the majority of the project area, except the west section where groundwater was measured to be deeper than 25 feet.

Seismic Hazards

There are two main faults located in Yolo County: the Hunting Creek Fault and the Dunnigan Hills Fault (Yolo County 2009). There are three fault zones located in Sacramento County: Cleveland Hills, Sierra Nevada, and San Joaquin Fault.

The only fault in Yolo County that has been identified to be active, or potentially active, and subject to surface rupture is the Hunting Creek Fault (sometimes referred to as the Hunting Creek-Berryessa Fault). The fault is located about 40 miles northwest of the project area. Other major regional faults outside Yolo County in the Coast Ranges and in the Sierra Nevada foothills are capable of producing ground shaking in the county (Yolo County 2009). Additionally, the Coast Range-Sierran Block Boundary, located at the edge of the western side of the lower Sacramento Valley, is recognized as a potential seismic source capable of generating moderate earthquakes that could affect Yolo County (Yolo County 2009).

Fault Rupture

The potential for surface fault rupture within the project area is low since there are no known faults of Holocene or younger age that fall within 1,000 feet of the project limits, or trend towards the project limits, nor do the project limits fall within an Alquist-Priolo Fault Zone.

Liquefaction

Loose, saturated soils pose the greatest threat during episodes of strong ground shaking. Possible hazards that could result from strong ground shaking include unstable soils, liquefaction, and landslides. Liquefaction is a phenomenon in which soils lose all shear strength and essentially turn into liquids. Within the project area, the subsurface soil profile consists of clayey or fill material at the overlaying native interbedded layers of medium dense to dense silts and sands. There are also isolated thin layers of saturated loose granular soils present in the project area. These conditions may lead to the potential for liquefaction.

Mineral Resources

The project area does not contain any known mineral resource zones but does traverse several gas fields near Davis and West Sacramento (Yolo County 2009, Sacramento County 2011).

2.2.3.3 Environmental Consequences

No Build Alternative 1

Construction and Operation

Under No Build Alternative 1, managed lanes would not be added to the I-80 or US-50 corridors and existing capacity would not increase. No ground-disturbing activities would occur and there would be no roadway improvements. Because on-site soils would not be disturbed, no impact related to significant disruptions, displacements, compaction or overcrowding of on-site soils, and/or substantial change in topography or ground surface relief features would occur. Therefore, No Build Alternative 1 would not have any effects related to geology and soils.

Build Alternatives 2a and 2b

Construction

Build Alternatives 2a and 2b would involve adding an HOV2+ lane in each direction. Construction of Build Alternatives 2a and 2b would involve land-disturbing activities such as clearing and grading, excavation, and temporary staging or stockpiling of materials. Build Alternatives 2a and 2b could result in disruptions, displacements, compaction, or overcrowding of on-site soils, and changes in topography or ground surface features that could result in wind or water erosion of onsite or offsite soils.

During construction, Caltrans would implement Standard Measure GS-1 which would include BMPs designed to minimize slope failure, settlement, and erosion. In addition, Caltrans would implement a SWPPP, in accordance with Standard Measure WQ-1, which would include implementation of construction site BMPs to avoid and reduce potential effects related to erosion, siltation, runoff, and discharge of pollutants. The SWPPP would include BMPs to protect sensitive areas. With implementation of Standard Measures GS-1 and WQ-1, potential construction and operation effects on erosion, siltation, and runoff would be minimal.

New embankment fill would be required for the bike pathway extension from I-80 along the Yolo Causeway to connect to CR-32A for Build Alternatives 2a and 2b. The Build Alternative 2b connector structure would include a retaining wall on either side and would travel underneath the existing eastbound connector from US-50 to I-80. Accordingly, the connector structure would require new embankment fill. The underlining clay layer which extends up to 16 to 20 feet below the original ground ranges in consistency from medium stiff to very stiff and is less susceptible to consolidation settlements. However, the proposed large embankment fill consolidation settlement could be considerable. All earthwork on the connector structure would be done in conformance with Section 19 of the 2018 Standard Specifications and would follow the recommendations associated with construction settlement in the geotechnical analyses

(AMM GEO-3). Therefore, the construction of Build Alternative 2b would not have an adverse effect on the slope stability of the proposed embankment.

Build Alternatives 2a and 2b would construct five new culverts and replace or improve 21 existing culverts located beneath the roadway, fill, and embankments at depths unlikely to encounter groundwater. Overhead sign structures would have a concrete foundation of up to 6.5 feet diameter and would either be supported on a cast-in-drilled-hole pile foundation or supported by a structure that could be approximately 30 feet in depth. Build Alternatives 2a and 2b would install a fiber-optic cable and associated fiber-optic splice boxes within the roadbed at the eastbound outside shoulder of I-80 from west of Kidwell Road at PM 40.7 in Solano County to PM 4.35 in Yolo County. Cut and cover or trenching would be the primary construction method and would require excavation of up to 42 inches to install within a 12-foot buffer surrounding the running line. In addition, Build Alternative 2b proposes pile driving during construction for installation of footings of the connector structure to a depth of approximately 40 feet. Groundwater is anticipated to be encountered in excavations as shallow as 1 to 2 feet below ground surface within the Yolo Bypass, and 5 feet below ground surface east of the Yolo Bypass. Groundwater is anticipated to be deeper than 25 feet in the western section of the project. However, groundwater conditions can be expected to fluctuate in response to seasons, storm events, and other factors. Dewatering may be required if encountered during construction of the connector structure. AMM GEO-1 states that during construction, all trenching and earthwork will be performed in accordance with Section 19 of the 2018 Standard Specifications.

According to the Yolo County General Plan EIR, liquefaction is expected to be relatively higher in the Great Valley portion of the county, particularly along the floodplains of streams, where the sediments are generally sandier than other areas (Yolo County 2009). In addition, project-specific geotechnical investigations and review of the LOTBs show that the subsurface profile throughout the project limits consists of clayey or fill material at the overlaying native interbedded layers of medium dense to dense silts and sands with isolated thin layers of saturated loose granular soils.

There is low potential for seismic activity to occur during construction due to the distance from active faults. Seismic shaking creates opportunities for liquefaction. Construction workers could be exposed to seismic hazards during installation of the proposed improvements due to the potential for seismic activity, causing a potentially adverse impact on construction workers' safety. AMM GEO-2 would be implemented to reduce the potential for adverse impacts resulting from seismic activity during construction.

Operation

During project operation, the project area could be affected by ground motion, liquefaction, and possible ground rupture from seismic activity. Without proper engineering, improvements could pose safety issues to people and structures as a result of soil erosion, subsidence, expansive soils, corrosive soils, surface fault rupture, seismic shaking, liquefaction, and landslides. AMM GEO-3 requires that, prior to final design, additional subsurface testing will be conducted so that any new or modified structure will be designed and constructed to current building and seismic standards and includes consideration of liquefaction potential in the design of foundation and retaining systems. Build Alternatives 2a and 2b would be designed and constructed in

accordance with the latest Caltrans design guidelines based on the site-specific field investigations required for the preliminary foundation report during the development of the Final Design (Plans, Specifications, and Estimates). Therefore, operation of the project is not expected to result in substantial effects on resources related to seismicity within the project area.

Build Alternatives 3a and 3b

Construction and Operation

Build Alternatives 3a and 3b would involve adding an HOT 2+ lane in each direction. Build Alternatives 3a and 3b would be located in the same project area and involve similar ground-disturbing activities as Build Alternatives 2a and 2b, respectively. Therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b.

Build Alternatives 4a and 4b

Construction and Operation

Build Alternatives 4a and 4b would involve adding an HOT 3+ lane in each direction. Build Alternatives 4a and 4b would be located in the same project area and involve similar ground-disturbing activities as Build Alternatives 2a and 2b, respectively. Therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b.

Build Alternatives 5a and 5b

Construction and Operation

Build Alternatives 5a and 5b would create an express lane in each direction where all users pay a fee regardless of vehicle occupancy. Build Alternatives 5a and 5b would be located in the same project area and involve similar ground-disturbing activities as Build Alternatives 2a and 2b, respectively. Therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b.

Build Alternatives 6a and 6b

Construction and Operation

Build Alternatives 6a and 6b would involve adding a transit-only lane in each direction. Build Alternatives 6a and 6b would be located in the same project area and involve similar ground-disturbing activities as Build Alternatives 2a and 2b, respectively. Therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b.

Build Alternatives 7a and 7b

Construction and Operation

Build Alternatives 7a and 7b would involve repurposing the current number 1 general purpose lane to HOV 2+. No new lanes would be constructed. Build Alternatives 7a and 7b would be

located in the same project area and involve similar ground-disturbing activities as Build Alternatives 2a and 2b, respectively. Therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b.

2.2.3.4 Avoidance, Minimization, and/or Mitigation Measures

Caltrans would implement the following AMMs to prevent and reduce permanent effects on geology and soils.

- **AMM GEO-1 Earthwork.** During construction, all trenching and earthwork shall be performed in accordance with Section 19 of the 2018 Standard Specifications.

- **AMM GEO-2:** With respect to worker safety during construction, Caltrans' Standard Specifications and California Division of Occupational Safety and Health Administration (Cal OSHA) requires employers to comply with hazard-specific safety and health standards. Pursuant to Section 5(a) (1) of Cal OSHA, employers must provide their employees with a workplace free from recognized hazards likely to cause death or serious physical harm.

- **AMM GEO-3:** As part of the final design phase, Caltrans requires preparation of the geotechnical design reports that incorporate the results of additional subsurface fieldwork and laboratory testing. Site-specific subsurface soil conditions, slope stabilities, and groundwater conditions within the Build Alternative area would be verified during the preparation of these geotechnical design reports. The identification of the site-specific soil conditions within the project limits would be used to determine the appropriate final design for the foundations and footings that would support the proposed Build Alternative improvements. Caltrans' standard design and construction guidelines incorporate engineering standards that address seismic risks. Proposed structures constructed within the project area would consider seismically induced liquefaction and settlement during the final design phase.

2.2.4 Paleontology

2.2.4.1 Regulatory Setting

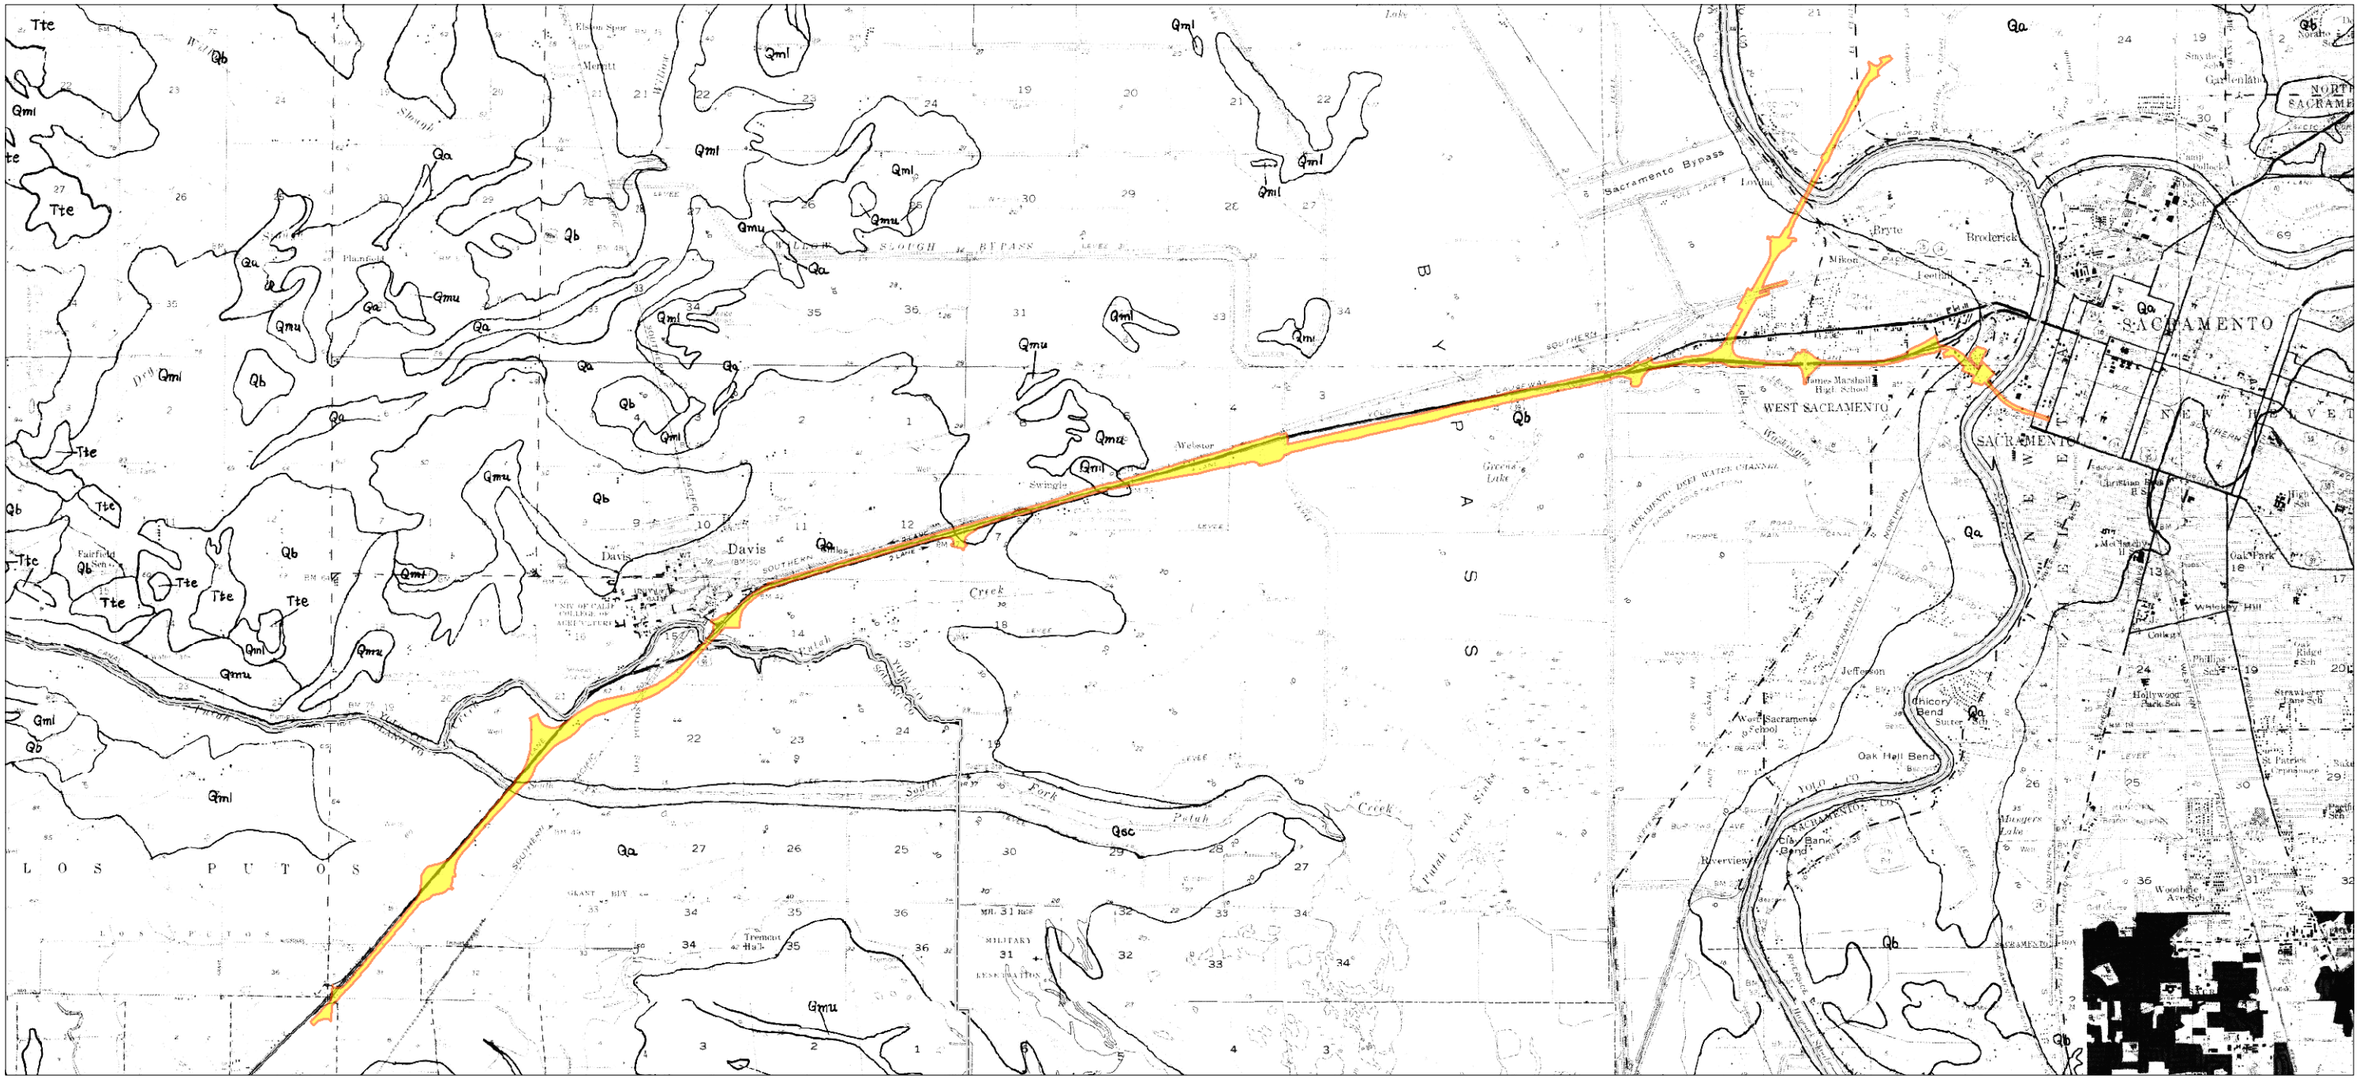
Paleontology is a natural science focused on the study of ancient animal and plant life as it is preserved in the geologic record as fossils. A number of federal statutes specifically address paleontological resources, their treatment, and funding for mitigation as a part of federally authorized projects.

- 16 United States Code (USC) 431-433 (the "Antiquities Act") prohibits appropriating, excavating, injuring, or destroying any object of antiquity situated on federal land without the permission of the Secretary of the Department of Government having jurisdiction over the land. Fossils are considered "objects of antiquity" by the Bureau of Land Management, the National Park Service, the Forest Service, and other federal agencies.

- 23 United States Code (USC) 1.9(a) requires that the use of Federal-aid funds must be in conformity with all federal and state laws.

- 23 United States Code (USC) 305 authorizes the appropriation and use of federal highway funds for paleontological salvage as necessary by the highway department of any state, in compliance with 16 USC 431-433 above and state law.

Under California law, paleontological resources are protected by the California Environmental Quality Act (CEQA).



2.2.4.2 Affected Environment

A Paleontological Identification Report (PIR) was prepared for this report in March 2021 (Caltrans 2021g) and was updated and adapted to the new paleontological template in August 2023. This section is based on the findings of the PIR. The project site is located within the Sacramento Valley region of the Great Valley geomorphic province in California. The Great Valley province is an asymmetrical synclinal trough that extends roughly 400 miles north to south and up to 50 miles in width separating the Sierra Nevada Mountains on the east from the Coast Range on the west. The surface of the Great Valley consists of up to several thousand feet of unconsolidated marine and non-marine sediments.

The project site is generally on flat agricultural and delta terrain. It crosses Putah Creek near its western end and the Sacramento River in two places near its eastern end. The American River meets the Sacramento River between the project forks. Underlying the project are gravel-filled channels laid down during the Pleistocene time by ancestors of the Sacramento River, the American River, and smaller tributaries such as Putah Creek (Figure 2.2-2).

The paleontological potential of the geologic units underlying and near the Project corridor was evaluated. These units include artificial fill (Af), stream channel deposits (Qsc), Holocene alluvial deposits (Qa), Holocene basin deposits (Qb), Modesto Formation (Qmu/Qml), and Riverbank Formation (Qrl) (Figure 2.2-2). The Modesto Formation (Qmu/Qml) and Riverbank Formation (Qrl) date to the late Pleistocene and have the potential to contain scientifically significant vertebrate fossils. Most of the project crosses sediment that is Holocene alluvial deposits (Qa) or Holocene basin deposits (Qb) however the Modesto and Riverbank Formations could be encountered at depth.

Searches of the UC Berkeley Museum of Paleontology and the PaleoBiology databases were performed in January and February 2021 and updated in 2023 as was a literature review. Records of seven vertebrate fossil localities were found within four miles of the project in sediment similar to that of the project site.

2.2.4.3 Environmental Consequences

Caltrans uses a tripartite system to rank the risk of encountering significant fossil resources: no, low, and high risk. If significant fossil resources have been previously discovered within a geologic unit (formation), then that formation in its entirety is considered High risk.

No Build Alternative 1

Construction and Operation

Under No Build Alternative 1, managed lanes would not be added to the I-80 or US-50 corridors and existing capacity would not increase. No ground-disturbing activities would occur. Therefore, No Build Alternative 1 would not have any effects related to paleontological resources.

Build Alternatives 2a and 2b

Construction

Build Alternatives 2a and 2b would involve adding an HOV2+ lane in each direction. Build Alternatives 2a and 2b would require soil disturbance, including installation of signage, road cutting or filling, extending or replacing culverts, utility relocation, and fiber optic line installation. In addition, Build Alternatives 2a and 2b would include excavation for roadbed, and retaining and sound wall installation. Build Alternatives 2a and 2b would install poles for lighting, signs, and Intelligent Transportation Systems (ITS). Foundations for these structures would generally be installed using an auger to drill a hole up to 6.5 feet in diameter and up to 30 feet deep, and a cast-in-drilled-hole concrete foundation would be constructed.

Build Alternative 2b proposes pile driving during construction for installation of footings of the connector structure to a depth of approximately 40 feet. Such activities would be deep enough to reach potentially unknown sensitive paleontological resources. In addition, foundation work for signs, structures, underground utilities, and culvert/drainage installations could also encounter sensitive paleontological resources.

Due to the low sensitivity of the surficial geology directly underneath the project limits, construction activities with shallow disturbances (up to 4 feet) are unlikely to encounter significant fossil resources. In addition, many proposed construction activities would occur within existing disturbed areas of the roadway corridors. Due to the proximity of the project to known high-sensitivity geologic units, excavations greater than 4 feet below the ground surface have an increased potential to encounter sensitive formations and significant fossil resources. Build Alternatives 2a and 2b would require excavations greater than 4 feet for installation of signs, CMS structures, and retaining walls.

Standard Measure GS-2 outlines actions to be taken in the event of a paleontological discovery during construction. If unanticipated paleontological resources are discovered during construction, they would not be disturbed. Work within a 60-foot radius of the discovery would stop; the area would be secured; and the work would not resume until appropriate measures are taken. In addition, AMM PALEO-1 would require preparation of a Paleontological Evaluation

Report (PER) during the design phase to verify if project activities have the potential to impact paleontological resources. Depending on the findings of the PER, AMM PALEO-2 will be implemented, which requires the preparation and execution of a Paleontological Mitigation Plan (PMP) during project construction in areas of high sensitivity. In addition, AMM PALEO-3 would require paleontological construction monitoring in areas with high paleontological sensitivity. With implementation of Standard Measure GS-2 and AMMs PALEO-1 through PALEO-3, Alternatives 2a and 2b would not have substantial adverse effects on paleontological resources.

Operation

No ground disturbance would occur during operation of Build Alternatives 2a and 2b. Therefore, there would be no effects on paleontological resources during operation.

Build Alternatives 3a and 3b

Construction and Operation

Build Alternatives 3a and 3b would involve adding an HOT 2+ lane in each direction. Because Build Alternatives 3a and 3b would be located in the same project area as Build Alternatives 2a and 2b, respectively, and would involve similar ground-disturbing activities, the effects from construction and operation of Build Alternatives 3a and 3b would be the same as those described under Build Alternatives 2a and 2b, respectively.

Build Alternatives 4a and 4b

Construction and Operation

Build Alternatives 4a and 4b would involve adding an HOT 3+ lane in each direction. Build Alternatives 4a and 4b would be located in the same project area and involve similar ground-disturbing activities as Build Alternatives 2a and 2b, respectively. Therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b.

Build Alternatives 5a and 5b

Construction and Operation

Build Alternatives 5a and 5b would create an express lane in each direction where all users pay a fee regardless of vehicle occupancy. Build Alternatives 5a and 5b would be located in the same project area and involve similar ground-disturbing activities as Build Alternatives 2a and 2b, respectively. Therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b.

Build Alternatives 6a and 6b

Construction and Operation

Build Alternatives 6a and 6b would involve adding a transit-only lane in each direction. Build Alternatives 6a and 6b would be located in the same project area and involve similar ground-

disturbing activities as Build Alternatives 2a and 2b, respectively. Therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b.

Build Alternatives 7a and 7b

Construction and Operation

Build Alternatives 7a and 7b would involve repurposing the current number 1 general purpose lane to HOV 2+. No new lanes would be constructed. Build Alternatives 7a and 7b would be located in the same project area and involve similar ground-disturbing activities as Build Alternatives 2a and 2b, respectively. Therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b.

2.2.4.4 Avoidance, Minimization, and/or Mitigation Measures

Caltrans would implement the following AMMs to reduce potential effects on paleontological resources.

- **AMM PALEO-1: Paleontological Evaluation Report**. During the design phase, a qualified paleontologist will prepare a PER. If the PER results in an evaluation that the project does not risk encountering paleontological resources, no further measures are required.

- **AMM PALEO-2: Paleontological Resources Management Plan.** During the design phase, a qualified paleontologist will prepare a PMP. If the PER results in an evaluation that the project does not risk encountering paleontological resources, a PMP would not be required. The PMP would incorporate the results of the PER along with design details to develop a plan for where and when construction activities are at risk of encountering fossils and construction monitoring will occur. The PMP will also include procedures for worker training and actions for construction staff to follow if fossils are encountered. It will also include a curation agreement for the housing and identification of any fossils found.

- **AMM PALEO-3: Paleontological Resources Monitoring.** During construction, areas of high paleontological sensitivity would be monitored by a qualified paleontological monitor. The monitor would spot-check locations where foundation, utility, and/or culvert work extends deeper than 4 feet below ground surface into native soils (not fill material).

2.2.5 Hazardous Waste and Materials

2.2.5.1 Regulatory Setting

Hazardous materials, including hazardous substances and wastes, are regulated by many state and federal laws. Statutes govern the generation, treatment, storage, and disposal of hazardous materials, substances, and waste, and also the investigation and mitigation of waste releases, air and water quality, human health, and land use.

The primary federal laws regulating hazardous wastes/materials are the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) of 1980, and the Resource Conservation and Recovery Act (RCRA) of 1976 (RCRA). The purpose of CERCLA, often referred to as "Superfund," is to identify and cleanup abandoned contaminated sites so that public health and welfare are not compromised. The RCRA provides for "cradle to grave" regulation of hazardous waste generated by operating entities. Other federal laws include:

- Community Environmental Response Facilitation Act (CERFA) of 1992
- Clean Water Act
- Clean Air Act
- Safe Drinking Water Act
- Occupational Safety and Health Act (OSHA)
- Atomic Energy Act
- Toxic Substances Control Act (TSCA)
- Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA)

In addition to the acts listed above, Executive Order (EO) 12088, *Federal Compliance with Pollution Control Standards*, mandates that necessary actions be taken to prevent and control environmental pollution when federal activities or federal facilities are involved.

California regulates hazardous materials, waste, and substances under the authority of the CA Health and Safety Code and is also authorized by the federal government to implement RCRA in the state. California law also addresses specific handling, storage, transportation, disposal, treatment, reduction, cleanup, and emergency planning of hazardous waste. The Porter-Cologne Water Quality Control Act also restricts disposal of wastes and requires cleanup of wastes that are below hazardous waste concentrations but could impact ground and surface water quality. California regulations that address waste management and prevention and cleanup of contamination include Title 22 Division 4.5 Environmental Health Standards for the Management of Hazardous Waste, Title 23 Waters, and Title 27 Environmental Protection.

Worker and public health and safety are key issues when addressing hazardous materials that may affect human health and the environment. Proper management and disposal of hazardous material is vital if it is found, disturbed, or generated during project construction.

2.2.5.2 Affected Environment

An Initial Site Assessment (ISA) was completed for this project in February 2021 (Caltrans 2021h). The ISA included investigations pertaining to naturally occurring asbestos (NOA), hazardous waste sites (Cortese List), aerially deposited lead (ADL), lead-containing paint (LCP) and thermoplastic striping, and treated wood waste (TWW).

A geologic evaluation regarding NOA was conducted within the project limits. This evaluation included a review of geologic maps and reports including data prepared by the California Geological Survey (CGS) and the United States Geological Survey (USGS), and previous studies conducted by Caltrans and their consultants. The evaluation did not indicate the presence of altered ultramafic bedrock, alluvium derived from ultramafic rock, or rock commonly associated with NOA.

ADL also exists along roadways throughout California from the historical use of leaded gasoline. ADL from motor-vehicle exhaust may be present in the soils adjacent to project area roads based on the age of the roadway and the date of the ban (1996) of leaded motor vehicle fuel.

LCP and asbestos containing materials (ACM) have the potential to be present within the project area. Bridges and overpass structures may be coated with LCP and/or ACM in paints, gaskets, caulking, insulation, and tarred surfaces. The likelihood of asbestos being present increases with the age of the bridge, since the use of asbestos-containing building materials began to diminish in the 1980s. Similarly, lead-based paint was commonly used to coat bridge components such as railings and other metal and wood surfaces prior to its being banned in California in 1978. Lead and asbestos are state-recognized carcinogens, and lead is a reproductive toxin.

TWW has the potential to be encountered in the form of posts along metal beam guard railing three-beam barrier, piles, or roadside signs. These wood products are typically treated with preserving chemicals that may be hazardous (e.g., carcinogenic) and could include arsenic, chromium, copper, creosote, or pentachlorophenol. Based upon visual survey of the proposed disposal area by Google Earth Street-View Imagery, TWW may be present within the area (Caltrans 2021h).

The Cortese List is a compilation of contaminated sites identified by the SWRCB; active, closed, and inactive landfills identified by the Integrated Waste Management Board; and potential hazardous waste sites identified by the Department of Toxic Substance Control. This list was reviewed as part of the initial screening for this project. Both the Envirostor and the Geotracker database did not show that the project area contains any hazardous waste/sources.

2.2.5.3 Environmental Consequences

No Build Alternative 1

Construction and Operation

Under No Build Alternative 1, managed lanes would not be added to the I-80 or US-50 corridors and existing capacity would not increase. No ground-disturbing activities would occur. Therefore, No Build Alternative 1 would not have any effects related to hazardous waste and materials.

Construction

Build Alternatives 2a and 2b

Build Alternatives 2a and 2b would involve adding an HOV2+ lane in each direction. Results of the ISA did not indicate the presence of NOA within the footprint of Build Alternatives 2a or 2b; therefore, Build Alternatives 2a or 2b would not have the potential to expose workers or nearby residents to NOA. In addition, Build Alternatives 2a and 2b are not within a Cortese List site boundary and would not impact any site on the Cortese List. Therefore, Build Alternatives 2a and 2b would not affect known hazardous sites.

ACM and LCP have the potential to be encountered during project construction and ground-disturbing activities including grinding/cold planing.

An ACM and LCP survey by a qualified and licensed inspector prior to construction is required for any structure proposed to be demolished or disturbed, including but not limited to, the following structures (AMM HAZ-1):

- Bridge #22-0077 - Richards Blvd OC
- Bridge #22-0043 - Webster UC
- Bridge #22-0044 - Yolo Causeway West
- Bridge #22-0045 - Yolo Causeway East
- Bridge #22-0100 - Enterprise Blvd UC

Standard Measure HW-1 would require Caltrans to prepare a Lead Compliance Plan that would include protocols for environmental and personnel monitoring, requirements for personal protective equipment, and other procedures for handling of lead-impacted soil. In addition, AMM HAZ-2 would require Caltrans to prepare an Asbestos Compliance Plan to outline the procedures to report, handle, store, and dispose of ACM. All ACM or LCP, if found, would be removed by a certified contractor in accordance with local, state, and federal requirements (Standard Measure HW-2 and AMM HAZ-2).

In addition, prior to construction, a demolition notification form and attachments would be prepared by the contractor and submitted to the air district, as required by the National Emission Standards for Hazardous Air Pollutants (AMM HAZ-2).

ADL exists along roadways throughout California due to the historical use of leaded gasoline. There is the likely presence of soils with elevated concentrations of lead as a result of ADL on the state highway system right-of-way within the limits of the project area. Soil determined to contain lead concentrations exceeding stipulated thresholds must be managed under the July 1, 2016, ADL Agreement between Caltrans and the California Department of Toxic Substances Control. This ADL Agreement allows such soils to be safely reused within the project area as long as all requirements of the ADL Agreement are met.

Prior to construction, Caltrans would conduct a PSI for ADL. Based on results of the PSI, special materials handling, worker health and safety training, or regulated soil disposal may be required for construction (AMM HAZ-3).

Construction would involve the use and storage of fuels, lubricants, solvents, and other possible contaminants. In the event hazardous materials are encountered or spilled during construction, Caltrans would implement actions outlined in AMM HAZ-4, Hazardous Materials Incident Contingency Plan, to report, contain, and mitigate roadway spills. The plan will designate a chain of command for notification, evacuation, response, and cleanup of roadway spills.

Based on visual survey of the project area, TWW has the potential to be encountered during construction in the form of posts along metal beam guard railing three-beam barrier, piles, or roadside signs. The Department of Toxic Substance Control requires that TWW either be disposed as a hazardous waste or tested. If not tested, the generator may presume that TWW is

a hazardous waste and must be disposed in an approved TWW facility. If TWW is present, Caltrans will implement Standard Measure HW-3, which outlines specifications for worker training and TWW handling, storage, and disposal requirements.

Standard Measures HW-1, HW-2, HW-3 and AMMs HAZ-1, HAZ-2, HAZ-3, and HAZ-4 would minimize potential effects related to hazards during construction; and no adverse effect would occur.

Operation

Operation of Build Alternatives 2a and 2b would not release hazardous materials; however, vehicles traveling on I-80 or US-50 roadway corridors would continue to generate pollutants from tire and brake wear, oil and grease leaks, and exhaust emissions. The release of these pollutants would be similar to existing conditions; therefore, Build Alternatives 2a and 2b would not result in new adverse effects.

Build Alternatives 3a and 3b

Construction and Operation

Build Alternatives 3a and 3b would involve adding an HOT 2+ lane in each direction. Because Build Alternatives 3a and 3b would be located in the same project area as Build Alternatives 2a and 2b, would involve the use of the same hazardous materials, and/or would encounter the same hazardous waste during construction, the effects from construction and operation of Build Alternatives 3a and 3b would be the same as those described under Build Alternatives 2a and 2b.

Build Alternatives 4a and 4b

Construction and Operation

Build Alternatives 4a and 4b would involve adding an HOT 3+ lane in each direction. Because Build Alternatives 4a and 4b would be located in the same project area as Build Alternatives 2a and 2b, would involve the use of the same hazardous materials, and/or would encounter the same hazardous waste during construction, the effects from construction and operation of Build Alternatives 4a and 4b would be the same as those described under Build Alternatives 2a and 2b.

Build Alternatives 5a and 5b

Construction and Operation

Build Alternatives 5a and 5b would create an express lane in each direction where all users pay a fee regardless of vehicle occupancy. Because Build Alternatives 5a and 5b would be located in the same project area as Build Alternatives 2a and 2b, would involve the use of the same hazardous materials, and/or would encounter the same hazardous waste during construction, the effects from construction and operation of Build Alternatives 5a and 5b would be the same as those described under Build Alternatives 2a and 2b.

Build Alternatives 6a and 6b

Construction and Operation

Build Alternatives 6a and 6b would involve adding a transit-only lane in each direction. Because Build Alternatives 6a and 6b would be located in the same project area as Build Alternatives 2a and 2b, would involve the use of the same hazardous materials, and/or would encounter the same hazardous waste during construction, the effects from construction and operation of Build Alternatives 6a and 6b would be the same as those described under Build Alternatives 2a and 2b.

Build Alternatives 7a and 7b

Construction and Operation

Build Alternatives 7a and 7b would involve repurposing the current number 1 general purpose lane to HOV 2+. Because Build Alternatives 7a and 7b would be located in the same project area as Build Alternatives 2a and 2b, would involve the use of the same hazardous materials, and/or would encounter the same hazardous waste during construction, the effects from construction and operation of Build Alternatives 7a and 7b would be the same as those described under Build Alternatives 2a and 2b.

2.2.5.4 Avoidance, Minimization, and/or Mitigation Measures

Caltrans would implement the following AMMs to reduce potential effects caused by hazardous waste and materials.

- **AMM HAZ-1 Asbestos and Lead-Based Paint Survey.** During the design phase, existing bridge or structures that would be disturbed by the project would be tested for asbestos and lead-based paint by a qualified and licensed inspector prior to construction. All asbestos-containing material or lead-based paint, if found, would be removed by a certified contractor in accordance with local, state, and federal requirements.

- **AMM HAZ-2 National Emission Standards for Hazardous Air Pollutants Notification.** Prior to construction, the contractor will prepare a demolition/renovation/rehabilitation notification/permit form and attachments to be submitted to the Air Pollution Control District (APCD) or Air Quality Management District (AQMD) as required by the National Emission Standards for Hazardous Air Pollutants (NESHAP) at 40 CFR Part 61, Subpart M, and California Health and Safety Code section 39658(b)(1).

- **AMM HAZ-3 Aerially Deposited Lead Preliminary Site Investigation.** Prior to construction, Caltrans would conduct a preliminary site investigation for aerially deposited lead. Soil samples collected to evaluate aerially deposited lead would be analyzed for total lead and soluble lead in accordance with Department of Toxic Substances Control’s requirements to determine appropriate actions that would ensure the protection of construction workers, future site users, and the environment.

- **AMM HAZ-4 Hazardous Materials Incident Contingency Plan**. Prior to construction, the contractor will prepare a hazardous materials incident contingency plan to report, contain, and mitigate roadway spills. The plan would designate a chain of command for notification, evacuation, response, and cleanup of roadway spills. This plan is to be prepared by the contractor.

2.2.6 Air Quality

2.2.6.1 Regulatory Setting

The Federal Clean Air Act (FCAA), as amended, is the primary federal law that governs air quality while the California Clean Air Act is its companion state law. These laws, and related regulations by the United States Environmental Protection Agency (USEPA) and the California Air Resources Board (CARB), set standards for the concentration of pollutants in the air. At the federal level, these standards are called National Ambient Air Quality Standards (NAAQS). NAAQS and state ambient air quality standards have been established for six criteria pollutants that have been linked to potential health concerns: CO, nitrogen dioxide (NO_2), O_3, particulate matter —which is broken down for regulatory purposes into particles of 10 micrometers or smaller (PM_{10}) and particles of 2.5 micrometers and smaller ($PM_{2.5}$), Lead (Pb), and sulfur dioxide (SO_2). In addition, state standards exist for visibility reducing particles, sulfates, hydrogen sulfide (H2S), and vinyl chloride. The NAAQS and state standards are set at levels that protect public health with a margin of safety and are subject to periodic review and revision. Both state and federal regulatory schemes also cover toxic air contaminants (air toxics); some criteria pollutants are also air toxics or may include certain air toxics in their general definition.

Federal air quality standards and regulations provide the basic scheme for project-level air quality analysis under the NEPA. In addition to this environmental analysis, a parallel "Conformity" requirement under the FCAA also applies.

Conformity

The conformity requirement is based on FCAA Section 176(c), which prohibits the USDOT and other federal agencies from funding, authorizing, or approving plans, programs, or projects that do not conform to State Implementation Plan (SIP) for attaining the NAAQS. "Transportation Conformity" applies to highway and transit projects and takes place on two levels: the regional (or planning and programming) level and the project level. The proposed project must conform at both levels to be approved.

Conformity requirements apply only in nonattainment and "maintenance" (former nonattainment) areas for the NAAQS, and only for the specific NAAQS that are or were violated. USEPA regulations at 40 CFR 93 govern the conformity process. Conformity requirements do not apply in unclassifiable/attainment areas for NAAQS and do not apply at all for state standards regardless of the status of the area.

Regional conformity is concerned with how well the regional transportation system supports plans for attaining the NAAQS for CO, NO_2, O, particulate matter (PM_{10} and $PM_{2.5}$), and in some areas (although not in California), SO_2. California has nonattainment or maintenance areas for

all of these transportation-related “criteria pollutants” except SO_2, and also has a nonattainment area for lead (Pb); however, lead is not currently required by the FCAA to be covered in transportation conformity analysis. Regional conformity is based on emission analysis of RTPs and federal transportation improvement programs (FTIPs) that include all transportation projects planned for a region over a period of at least 20 years (for the RTP) and 4 years (for the FTIP). RTP and FTIP conformity uses travel demand and emission models to determine whether or not the implementation of those projects would conform to emission budgets or other tests at various analysis years showing that requirements of the FCAA and the SIP are met. If the conformity analysis is successful, the Metropolitan Planning Organization (MPO), FHWA, and Federal Transit Administration (FTA) make the determinations that the RTP and FTIP are in conformity with the SIP for achieving the goals of the FCAA. Otherwise, the projects in the RTP and/or FTIP must be modified until conformity is attained. If the design concept and scope and the “open-to-traffic” schedule of a proposed transportation project are the same as described in the RTP and FTIP, then the proposed project meets regional conformity requirements for purposes of project-level analysis.

Project-level conformity is achieved by demonstrating that the project comes from a conforming RTP and TIP; the project has a design concept and scope that has not changed significantly from those in the RTP and TIP; project analyses have used the latest planning assumptions and USEPA-approved emissions models; and in particulate matter areas, the project complies with any control measures in the SIP. Furthermore, additional analyses (known as hot-spot analyses) may be required for projects located in CO and particulate matter nonattainment or maintenance areas to examine localized air quality effects.

Local

The US Environmental Protection Agency (USEPA) has delegated responsibility to air districts to establish local rules to protect air quality. Caltrans Standard Specification 14-9.02requires compliance with all applicable air quality laws and regulations including local and air district ordinances and rules.

2020 MTP/SCS

AB 375 requires SACOG to include SCSs in its RTP updates to describe how the GHG emissions reductions set by CARB would be met through land use and transportation planning. In 2015, the SACOG Board adopted the Sacramento Region Transportation Climate Adaptation Plan as part of an update to the 2016 MTP/SCS. The plan provides high-level action and identifies key vulnerabilities to climate change in the region’s transportation infrastructure and provides recommendations for best practices and strategies to meet the state targets for reducing GHG emissions from light-duty vehicles. In 2019, SACOG approved and adopted the 2020 MTP/SCS and accompanying documents. 2020 MTP/SCS is the most recent update to its RTP, which includes implementation of transportation projects and Climate Initiatives Program that, together, would result in emissions from light-duty vehicles that meet the region’s GHG reduction targets, per AB 375. It provides for both priority and timely completion/implementation of the transportation control measures (TCMs) in the applicable SMAQMD air quality plans identified below.

SMAQMD and Yolo-Solano Air Quality Management District SIPs and Redesignation Requests

The SMAQMD and YSAQMD are the designated local authorities responsible for monitoring air pollution within the applicable portion of the Sacramento Valley Air Basin (SVAB) where the project would occur. The SMAQMD and YSAQMD develop and administer plans and programs, including SIPs and redesignation requests, to reduce air pollution levels below the health-based standards established by the state and federal governments.

On January 22, 2009, the SMAQMD adopted the 2009 Sacramento Regional 8-Hour Ozone Attainment and Reasonable Further Progress Plan. This plan set out a strategy for attaining the 1997 O_3 NAAQS and was submitted by CARB to the USEPA on April 17, 2009, as a revision to the California SIP and included revisions to the area's motor vehicle emissions budgets as well as 43 TCMs. The 2016 MTP/SCS included these TCMs and all of them were completed on or before 2018.

In 2010, SMAQMD prepared the particulate matter less than 10 microns in diameter, respirable particulate matter (PM_{10}) Implementation/Maintenance Plan and Redesignation Request for Sacramento County to fulfill the requirements for USEPA to redesignate Sacramento County from nonattainment to attainment/maintenance for the PM_{10} NAAQS. The USEPA approved SMAQMD's request through FR Vol. 78, No. 187 in 2013.

Then, in 2013, SMAQMD prepared the particulate matter less than 2.5 microns in diameter, respirable particulate matter ($PM_{2.5}$) Implementation/Maintenance Plan and Redesignation Request. It was approved by CARB and submitted to the USEPA to fulfill the requirements to redesignate Sacramento County from nonattainment to attainment/maintenance for the $PM_{2.5}$ NAAQS. In January 2017, USEPA recognized Sacramento County as attaining the 2006 $PM_{2.5}$ NAAQS; however, the nonattainment designation is still in effect.

On September 28, 2017, SMAQMD submitted the Sacramento Federal Ozone Nonattainment Area Redesignation Substitution Request for the 1979 1-hour O_3 Standard. This request demonstrated that the Sacramento Federal Ozone Nonattainment Area (SFNA) met the USEPA's requirements, based on ambient air quality monitoring to be redesignated as an attainment area for the revoked 1979 1-hour O_3 NAAQS. The SFNA was designated as a "severe" nonattainment area for the 1-hour standard, that was replaced by the more stringent 1997 8-hour O_3 NAAQS. The USEPA found that the SFNA attained the revoked 1-hour O_3 standard on October 18, 2012 (77 FR 64036). However, the District is still subject to anti-backsliding requirements for the 1-hour standard unless a Redesignation Substitution Request is approved by USEPA. Once approved, the request will redesignate the SFNA to attainment for the revoked 1-hour O_3 standard and remove the obligations associated with it.

The SMAQMD, along with the other air districts within the SFNA, developed and submitted a plan to demonstrate attainment of the 2008 8-hour NAAQS of 75 parts per billion (ppb) by an attainment year of 2024. The Sacramento Regional 2008 NAAQS 8-Hour Ozone Attainment Plan and Reasonable Further Progress Plan were approved by the SMAQMD Board on August 24, 2017, and by CARB on November 16, 2017. This plan sets motor vehicle emissions budgets and demonstrates how it complies with VMT emissions offset requirements. It was then

submitted to the USEPA, along with CARB's 2018 Updates to the California SIP, on December 18, 2017 as a revision to the California SIP. On October 29, 2020, the USEPA published in the Federal Register (85 FR 68533) a proposal to approve all or portions of the submitted plans for the Sacramento Metro nonattainment area. Comments on the proposal were collected through November 30, 2020. Once approved by the USEPA, the plan would meet all the applicable ozone nonattainment area requirements, and the plan's contingency measure requirements would be conditionally approved. The 2023 and 2024 motor vehicle emissions budgets would also be approved.

The Sacramento Regional 2008 NAAQS 8-Hour Ozone Attainment Plan and Reasonable Further Progress Plan includes one TCM that will be in place through 2024. SMAQMD's "Spare the Air" program is a year-round public education program with an episodic ozone reduction element during the summer ozone season and a general awareness during the rest of the year. It is designed to inform people when air quality is unhealthy and achieve voluntary emission reductions by encouraging them to reduce vehicle trips (i.e., VMT).

SMAQMD Rules and Regulations

SMAQMD has adopted rules and regulations applicable to construction projects in the region. These include rules/regulations applicable to visible emissions (Rule 401), fugitive dust emissions (Rule 403) application of architectural coatings (Rule 442), and cutback and emulsified asphalt paving materials (Rule 453).

In addition, SMAQMD has developed a construction mitigation protocol and standard levels. When the levels are exceeded, all feasible mitigation will be applied as required by CEQA. SMAQMD-recommended feasible MMs include enhanced exhaust controls for on-site equipment.

2.2.6.2 Affected Environment

The analysis summarized in this section is based on the Air Quality Report prepared for the project (Caltrans 2024c). The project area is within the city of Sacramento in Sacramento County, Yolo County, and Solano County and is within the SVAB which, in addition to Sacramento County includes Yolo, Yuba, Sutter, Colusa, Glenn, Butte, Tehama, and Shasta counties and parts of Solano and Placer counties. Air quality regulation in the SVAB is administered by nine different air quality management districts: Sacramento Metro, Feather River, Placer, Butte, Shasta, Tehama, Glenn, Colusa, and Yolo-Solano. The Sacramento Metropolitan Air District and the Yolo-Solano Air Quality Management District are responsible for air quality within the project area.

Meteorology (weather) and terrain can influence air quality. Certain weather parameters are highly correlated to air quality, including temperature, the amount of sunlight, and the type of winds at the surface and above the surface. Winds can transport ozone and ozone precursors from one region to another, contributing to air quality problems downwind of source regions. Furthermore, mountains can act as a barrier that prevents ozone from dispersing.

The climate of the SVAB is Mediterranean in character, with mild, rainy winter weather from November through March and warm to hot, dry weather from May through September. Sacramento Valley temperatures range from 20 to 115°F and the average annual rainfall is 20 inches. The topographic features giving shape to the SVAB are the Coast Range to the west, the Sierra Nevada to the east, and the Cascade Range to the north. These mountain ranges channel winds through the SVAB, but also inhibit the dispersion of pollutant emissions.

The predominant annual and summer wind pattern in the Sacramento Valley is the full sea breeze, commonly referred to as Delta breezes. These cool winds originate from the Pacific Ocean and flow through a sea-level gap in the Coast Range called the Carquinez Straits. In the winter (December to February), northerly winds predominate. Wind directions in the Sacramento Valley are influenced by the predominant wind flow pattern associated with each season. During about half the days from July through September, however, a phenomenon called the “Schultz Eddy,” which is a large isotropic vertical-axis eddy on the north side of the Carquinez Straits, prevents the Delta breezes from transporting pollutants north and out of the Sacramento Valley and causes the wind pattern to circle back south, which tends to keep air pollutants in the Sacramento Valley.

Existing Air Quality

The USEPA and CARB designate air basins where ambient air quality standards are exceeded as “nonattainment” areas. If standards are met, the area is designated as an “attainment” area. If there is inadequate or inconclusive data to make a definitive attainment designation, they are considered “unclassified.” National nonattainment areas are further designated as marginal, moderate, serious, severe, or extreme as a function of deviation from standards. Attainment status is based on the NAAQS and the California Ambient Air Quality Standards (CAAQS).

The Clean Air Act (CAA) identifies two types of NAAQS. Primary standards provide public health protection, including protecting the health of sensitive populations such as asthmatics, children, and the elderly. Secondary standards provide public welfare protection, including protection against decreased visibility and damage to animals, crops, vegetation, and buildings (USEPA 2022c). The CAAQS are equal to or more stringent than the NAAQS and include pollutants for which national standards do not exist. Table 2.2-4 presents the applicable NAAQS and CAAQS for the project area.

Table 2.2-4. California and National Ambient Air Quality Standards

Pollutant	Averaging Time	California Standards	National Standards	
		Concentration	Primary	Secondary
Ozone (O_3)	1 hour	0.09 ppm (180 µg/m^3)	—	Same as primary standard
	8 hours	0.070 ppm (137 µg/m^3)	0.070 ppm (137 µg/m^3)	
Respirable Particulate Matter (PM_{10})	24 hours	50 µg/m^3	150 µg/m^3	Same as primary standard
	Annual arithmetic mean	20 µg/m^3	—	
Fine Particulate Matter ($PM_{2.5}$)	24 hours	—	35 µg/m^3	Same as primary standard
	Annual arithmetic mean	12 µg/m^3	9.0 µg/m^3	
Carbon monoxide (CO)	1 hour	20 ppm (23 mg/m^3)	35 ppm (40 mg/m^3)	—
	8 hours	9.0 ppm (10 mg/m^3)	9 ppm (10 mg/m^3)	—
	8 hours (Lake Tahoe)	6 ppm (7 mg/m^3)	—	—
Nitrogen dioxide (NO_2)	1 hour	0.18 ppm (339 µg/m^3)	100 ppb (188 µg/m^3)	—
	Annual arithmetic mean	0.030 ppm (57 µg/m^3)	0.053 ppm (100 µg/m^3)	Same as primary standard
Sulfur dioxide (SO_2)	1 hour	0.25 ppm (655 µg/m^3)	75 ppb (196 µg/m^3)	—
	3 hours	—	—	0.5 ppm (1,300 µg/m^3)
	24 hours	0.04 ppm (105 µg/m^3)	0.14 ppm (for certain areas)	—
	Annual arithmetic mean	—	0.030 ppm (for certain areas)	—
Lead (Pb)	30-day average	1.5 µg/m^3	—	—
	Calendar quarter	—	1.5 µg/m^3	Same as Primary Standard
	Rolling 3-month average	—	0.15 µg/m^3	
Visibility-reducing particles	8 hours	See Footnote [1]	No National Standards	
Sulfates	24 hours	25 µg/m^3		
Hydrogen sulfide	1 hours	0.03 ppm (42 µg/m^3)		
Vinyl chloride	24 hours	0.01 ppm (26 µg/m^3)		

Source: USEPA 2022c

Note: 1. In 1989, CARB converted both the general statewide 10-mile visibility standard and the Lake Tahoe 30-mile visibility standard to instrumental equivalents, which are "extinction of 0.23 per kilometer" and "extinction of 0.07 per kilometer" for the statewide and Lake Tahoe Air Basin standards, respectively.

Key: ppb = parts per billion, µg/m3 =micrograms per liter, PM_{10} = particulate matter less than 10 microns in diameter, $PM_{2.5}$ = particulate matter less than 2.5 microns in diameter, mg/m3 = milligrams per cubic meter

As shown in Table 2.2-5, Yolo and Sacramento Counties are designated Nonattainment (Serious) for the 2015 8-hour O3 NAAQS and Nonattainment (Severe-15) for the 2008 8-hour O3 NAAQS. The Sacramento County and the eastern portion of Yolo County is designated Nonattainment (Moderate) for the 2006 24-hour $PM_{2.5}$ NAAQS. Sacramento County is also designated Maintenance (Moderate) for the 1987 24-hour PM_{10} NAAQS. The counties are Attainment/Unclassified for all other NAAQS. For the more stringent CAAQS, both Sacramento County and Yolo County are designated Nonattainment for O_3 and PM_{10} and are in attainment of all other State standards.

Table 2.2-5. Attainment Status for Sacramento/Yolo Counties

Pollutant	State Status		Federal Status	
	Yolo	Sacramento	Yolo	Sacramento
Ozone (O_3)	Nonattainment – Transitional	Nonattainment	(2015 8-hour) Nonattainment – Serious (2008 8-hour) Nonattainment – Severe 15	(2015 8-hour) Nonattainment – Serious (2008 8-hour) Nonattainment – Severe 15
Particulate Matter (PM10)	Nonattainment	Nonattainment	(1987 24-hour) Attainment – Unclassified	(1987 24-hour) Maintenance – Moderate
Fine Particulate Matter ($PM_{2.5}$)	Unclassified	Attainment	(2012 annual) Attainment – Unclassified (2006 24-hour) Nonattainment – Moderate (2024 24-hour) N/A (designation pending)	(2012 annual) Attainment – Unclassified (2006 24-hour) Nonattainment – Moderate (2024 24-hour) N/A (designation pending)
Carbon Monoxide (CO)	Attainment	Attainment	(1971 1-hour, 8-hour) Unclassifiedble/Attainment	(1971 1-hour, 8-hour) Unclassifed/Attainment
Nitrogen Dioxide (NO_2)	Attainment	Attainment	(1971 1-hour, annual) Unclassified/Attainment	(1971 1-hour, annual) Unclassified/Attainment
Sulfur Dioxide (SO_2)	Attainment	Attainment	(1971, 2010 1-hour, 3-hour, 24-hours, annual) Unclassified/Attainment	(1971, 2010 1-hour, 3-hour, 24-hours, annual) Unclassified/Attainment
Lead	Attainment	Attainment	(1978 30-day, quarter, 3-month) Unclassified/Attainment	(1978 30-day, quarter, 3-month) Unclassified/Attainment
Sulfates	Attainment	Attainment	N/A	N/A
Visibility Reducing Particles	Unclassified	Unclassified	N/A	N/A
Sulfates	Attainment	Attainment	N/A	N/A
Hydrogen Sulfide	Unclassified	Unclassified	N/A	N/A
Vinyl Chloride	N/A	N/A	N/A	N/A

The California Air Resources Board maintains the only monitoring station that collects ambient air quality data in Sacramento County. The nearest monitoring location is found in Sacramento County approximately 0.75-mile northeast of the project location. Data from the monitoring station are shown in Table 2.2-6 and Figure 2.2-3 shows the monitoring station location.

Sensitive receptors are places where people susceptible to air pollution may stay for long periods of time. These locations include land uses such as residential, schools, playgrounds, parks, childcare centers and hospitals. There are several land uses and many residences that are within close vicinity of the project. The project limits are depicted with a map in Appendix I.

Table 2.2-6. Criteria Air Pollutants Data (Sacramento T Street Monitoring Station)

Pollutant	Averaging Time	Applicable Standard	2018	2019	2020	2021	2022
Ozone (O_3)	1-Hour	Maximum Concentration (ppm)	0.097	0.100	0.112	0.091	0.106
		Number of Days State Standard Exceeded	0	0	0	0	1
	8-Hour	Maximum Concentration (ppm)	0.084	0.074	0.076	0.080	0.079
		Number of Days National Standard Exceeded (>0.075ppm)	1	1	3	1	3
		Number of Days State Standard Exceeded (>0.07ppm)	1	1	3	1	3
Particulate Matter 10 Microns or Less (PM_{10})	24-Hour	Maximum Concentration ($\mu g/m^3$)	309.5	179.1	298	132	60.2
		Number of Days National Standard Exceeded	6	1	4	0	0
		Number of Days State Standard Exceeded	22	24	25	59	6
	Annual	State Annual Average (20 $\mu g/m^3$)	29.7	20.7	20.2	31.2	21.0
Particulate Matter 2.5 Microns or Less ($PM_{2.5}$)	24-Hour	Maximum Concentration ($\mu g/m^3$)	263.3	37.1	30.7	26.2	33.1
		Number of Days State Standard Exceeded	0	0	0	0	0
	Annual	National Annual (12.0 $\mu g/m^3$)	11.4	7.7	14.8	8.8	8.5
Carbon Monoxide (CO)*	1-Hour	Maximum Concentration (ppm)	3.2	1.4	4.3	2.2	2.0
		Number of Days National Standard Exceeded	0	0	0	0	0
		Number of Days State Standard Exceeded	0	0	0	0	0

Note: *Carbon monoxide concentrations have not been measured at the T Street station since 2006; the nearest monitoring station is located approximately 1 mile north to the project location at 100 Bercut Drive, Sacramento
Key: µg/m3 =micrograms per cubic meter, ppm = parts per million

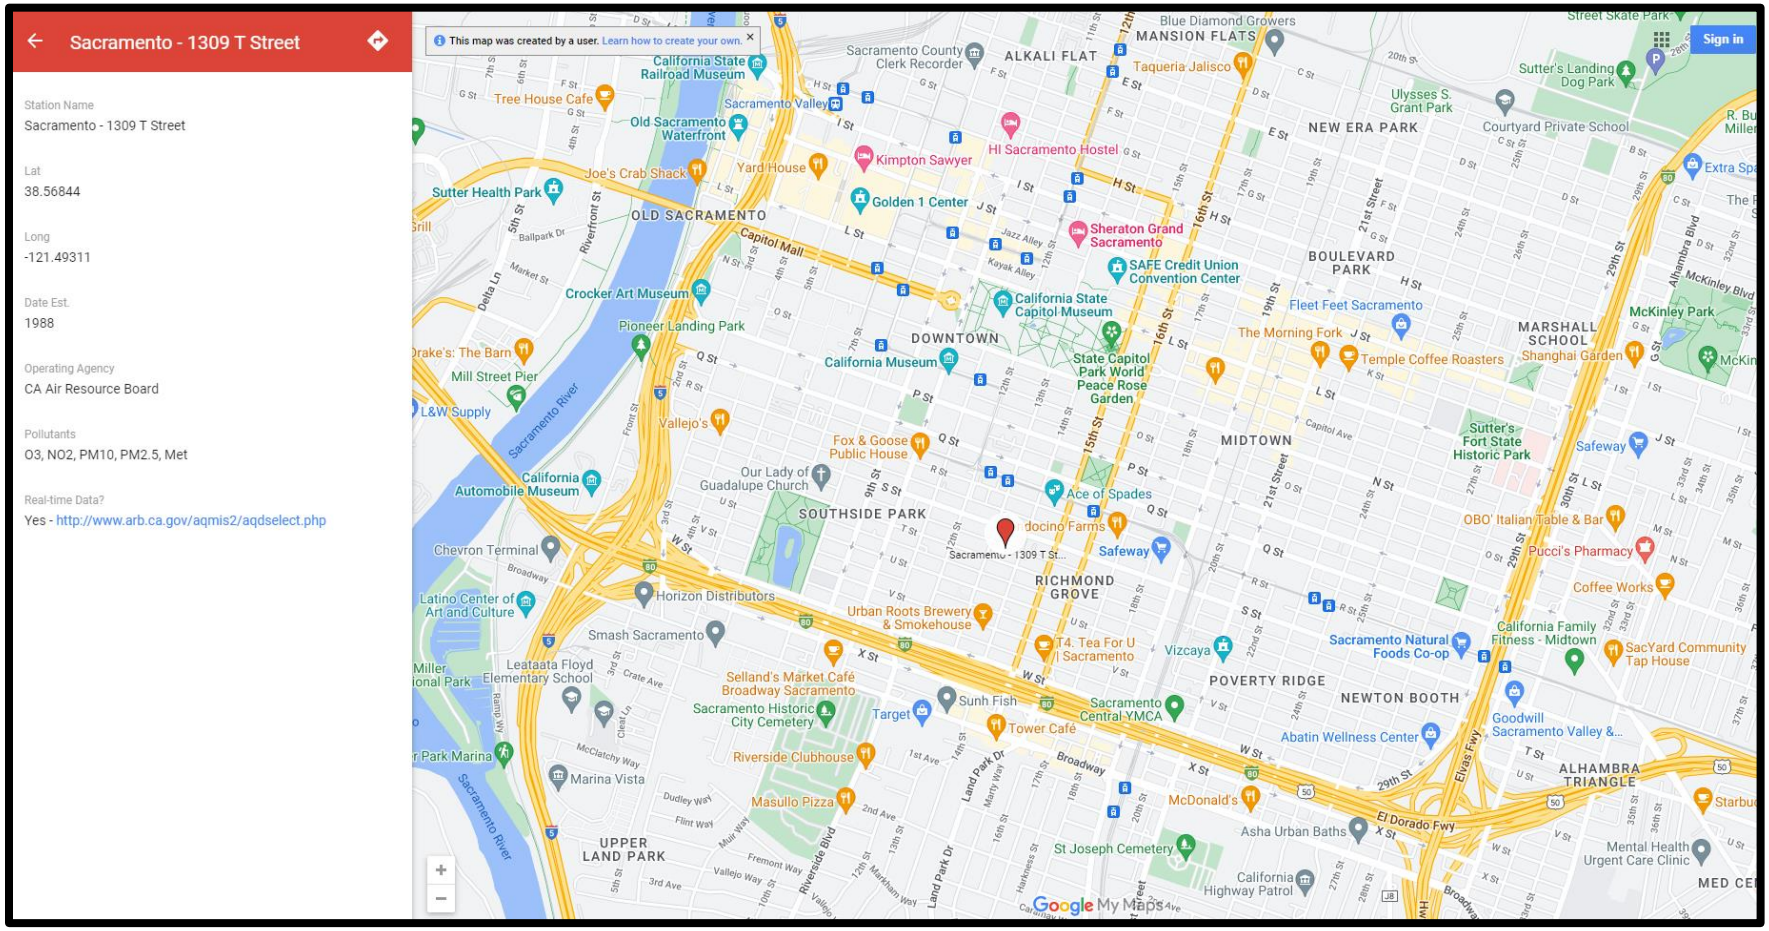

Figure 2.2-3. Air Quality Monitoring Station Located in Downtown Sacramento

Sensitive receptors are places where people susceptible to air pollution may stay for long periods of time. These locations include land uses such as residential, schools, playgrounds, parks, childcare centers and hospitals. There are several land uses and many residences that are within close vicinity of the project. The project limits are depicted with a map in Appendix I. Sensitive receptors within 500 feet of the Project are shown in Table 2.2-7.

Table 2.2-7. Sensitive Receptors Located Within 500 ft of the Project Site.

Mobile Source Air Toxics

In addition to the criteria air pollutants, the US EPA also regulates a list of air toxics (64 FR 38706). Toxic air pollutants or hazardous air pollutants (HAPs) are known to cause or suspected of causing cancer or other serious health ailments. Controlling air toxic emissions became a national priority with the passage of the Clean Air Act Amendments (CAAA) of 1990, whereby Congress mandated that US EPA regulate 188 air toxics, also known as hazardous air pollutants. In 2001, US EPA issued its first Mobile Source Air Toxics Rule, which identified 21 MSAT compounds as being hazardous air pollutants that required regulation. A subset of these MSAT compounds was identified as having the greatest influence on health. EPA issued the second MSAT Rule in 2007, which generally supported the findings of the first rule and provided additional recommendations of compounds having the greatest impact on health. The rule also identified several engine emission certification standards that must be implemented. US EPA has assessed this expansive list in their latest rule on the Control of Hazardous Air Pollutants from Mobile Sources (Federal Register, Vol. 72, No. 37, page 8430, February 26, 2007) and identified a group of 93 compounds emitted from mobile sources that are listed in their Integrated Risk Information System (IRIS).

The 21 HAPs identified by US EPA as MSATs are emitted from highway vehicles and non-road equipment. Some toxic compounds are present in fuel and are emitted to the air when the fuel evaporates or passes through the engine unburned. Other toxics are emitted from the incomplete combustion of fuels or as by-products. Metal air toxics result from engine wear or from impurities in oil or gasoline. US EPA has identified seven compounds with significant contributions from mobile sources that are among the national and regional-scale cancer risk drivers from their 1999 National Air Toxics Assessment (NATA). These are acrolein, benzene, 1,3-butadiene, diesel particulate matter (DPM) that includes diesel exhaust organic gases, formaldehyde, naphthalene, and polycyclic organic matter. While FHWA considers these the priority mobile source air toxics, the list is subject to change and may be adjusted in consideration of future EPA rules.

The US EPA is the lead federal agency responsible for administering the Clean Air Act and has certain responsibilities regarding the health effects of MSATs. In its 2001 rule (66 FR 17229), US EPA examined the impacts of existing and newly promulgated mobile source control programs, including its reformulated gasoline program, national low emission vehicle standards, Tier 2 motor vehicle emissions standards and gasoline sulfur control requirements, and proposed heavy duty engine and vehicle standards and on-highway diesel fuel sulfur control requirements. The agency is preparing another rule under authority of Clean Air Act Section 202(l) that will address these issues and could adjust the full 21 and primary seven MSATs.

FHWA's ongoing work in air toxics includes a research program to better understand and quantify the contribution of mobile sources to air emissions, the establishment of policies for addressing mobile source emissions in environmental reports, and the assessment of scientific literature on health impacts associated with motor vehicle emissions. California's vehicle emission control and fuel standards are more stringent than federal standards and are effective earlier. CARB found that DPM contributes over 70 percent of the known risk from air toxics and poses the greatest cancer risks among all identified air toxics. Diesel trucks contribute more than half of the total diesel combustion sources. In response, CARB adopted a Diesel Risk Reduction Plan with control measures to reduce the overall DPM emissions by about 85 percent from 2000 to 2020. Part of the plan included recently adopted regulation that requires operators of truck and bus fleets in California to retrofit or replace vehicles to meet US EPA NOX and $PM_{2.5}$ emission standards for 2010 model trucks (13 C.C.R. section 2025). Implementation of this regulation begins in 2014. By 2023, nearly all trucks and buses operating in California will need to meet 2010 model year engine emission standards.

Emissions of MSATs are anticipated to decrease substantially in future years. According to an FHWA analysis using EPA's MOVES2010b model combined reduction of 83 percent in the total emissions for the priority MSATs from 2010 to 2050 is projected. This would occur while vehicle-miles travelled (VMT) is assumed to increase by 102 percent. The combined State and federal regulations are expected to result in greater emission reductions, more quickly, than the FHWA analysis indicates.

2.2.6.3 Environmental Consequences

Regional Conformity

Regional conformity requires planned and programmed transportation projects be included in a regional emissions analysis; however, certain types of projects are exempt from conformity requirements. These project types are found by the USEPA to be neutral from an air quality or emissions standpoint and are listed in the Conformity Regulations at 40 CFR 93.126, 40 CFR 92.127, and 40 CFR 92.128. If a project is exempt, it may need little or no conformity analysis and does not need to be individually listed and considered in the regional emissions analysis (i.e., regional conformity modeling).

Each of the Build Alternatives would improve operations, reduce congestion, and increase vehicle occupancy within the travel corridor. Because the proposed alternatives would add lanes, they would add roadway capacity, and would not be considered exempt from either regional or project-level conformity requirements. Therefore, the project requires an individual listing in the RTP (i.e., 2020 MTP/SCS) and their associated regional emissions analyses to demonstrate regional conformity.

The proposed project is listed in the SACOG 2020 MTP/SCS financially constrained Regional Transportation Plan, amendment number 16, which was found to conform by FHWA on November 20, 2019, and FHWA and FTA made a regional conformity determination finding on December 16, 2022. The project is also included in SACOG financially constrained 2023-2026 Metropolitain Transportation Improvement Program. The 2023-2026 Metropolitain Transportation Improvement Program was determined to conform by FHWA and FTA on April 16, 2021. The design concept and scope of the proposed project is consistent with the project description in the 2020 RTP, 2023-2026 MTIP, and the “open to traffic” assumptions of the SACOG regional emissions analysis.

Project-Level Conformity

Project-level conformity requires project sponsors to demonstrate that their transportation project would not cause or contribute to any new localized CO, PM_{10}, and/or $PM_{2.5}$ violations, increase the frequency or severity of any existing CO, PM_{10}, and/or $PM_{2.5}$ violations, or delay timely attainment of any NAAQS or any required interim emission reductions or other SIP milestones. This conformity is demonstrated through a hot-spot analysis where Build and No-Build emissions are modeled, both with and without any MMs committed to in the RTP.

The project area is in an attainment/unclassified area for CO, an attainment/maintenance area for PM_{10}, and a nonattainment area for $PM_{2.5}$. Thus, a project-level conformity analysis applies to the project for both PM_{10} and $PM_{2.5}$ under 40 CFR 93.109. Hot-spot analysis for PM_{10} and $PM_{2.5}$ is only required for projects found to meet the definition of a Project of Air Quality Concern (POAQC) through interagency consultation with the MPO’s the Project Level Conformity Group (PLCG).

The proposed project has undergone Interagency Consultation (IAC) regarding POAQC determination. Interagency Consultation participants concurred that the project is not a POAQC

on October 15, 2021, by EPA, and October 18, 2021, by FHWA. These findings were reaffirmed by IAC on April 26, 2024, after an advertised SACOG meeting. The proposed project is not considered a POAQC because it does not meet the definition as defined in U.S. EPA's Transportation Conformity Guidance for Quantitative Hot-spot Analysis and $PM_{2.5}$ and PM_{10} Nonattainment and Maintenance Areas October 2021 (see Appendix J). Therefore, PM hot-spot analysis is not required. FHWA issued a project-level conformity determination on April 27, 2024 (see Appendix J).

40 CFR 93.123(c)(5) states that: "CO, PM_{10}, and $PM_{2.5}$ hot-spot analyses are not required to consider construction-related activities which cause temporary increases in emissions. Each site which is affected by construction-related activities shall be considered separately, using established 'Guideline' methods. Temporary increases are defined as those which occur only during the construction Phase and last 5 years or less at any individual site." Because construction of the project is expected to last less than 5 years, an evaluation of CO, PM_{10}, and $PM_{2.5}$ emissions during project construction is not required for project-level conformity determination.

No Build Alternative 1

Construction

Under No Build Alternative 1, managed lanes and transportation improvements would not be constructed. There would be no construction emissions.

Operation

Under No Build Alternative 1, the managed lanes and transportation improvements would not be constructed. However, vehicles would continue to travel within the project area contributing to long-term emissions. As shown in Table 2.2-10 and Table 2.2-8, PM_{10} and $PM_{2.5}$ emissions are calculated to increase by up to 22.2 percent by year 2049 under No Build Alternative 1 conditions. The increase is not considered substantial.

Build Alternatives 2a and 2b

Short-Term Construction Impacts

Construction-related emissions are generally short-term in duration but may still cause adverse air quality impacts.

Construction Dust

Dust would be generated during grading and construction operations. The amount of dust generated would be highly variable and is dependent on the size of the area disturbed, amount of activity, soil conditions and meteorological conditions.

Although grading and construction activities would be temporary, they would have the potential to cause both nuisance and health air quality impacts. PM_{10} is the pollutant of greatest concern associated with dust. If uncontrolled, elevated PM_{10} levels could occur downwind of actively

disturbed areas. In addition, dust fall on adjacent properties could be a nuisance. If uncontrolled, dust generated by grading and construction activities would have an adverse effect on air quality. The project would comply with rules and regulations pertaining to the control of fugitive dust and prevention of public nuisance published by the SMAQMD and YSAQMD. In addition, Standard Measures (Appendix E) would include AQ-1 and GHG-1. Therefore, there would be no adverse effect from fugitive dust emissions during the construction of the project.

Construction Equipment Exhaust

Daily Maximum construction emissions were estimated using the latest version of Caltrans' CAL-CET2021 emissions model which uses emission factors from EMFAC2021 developed by CARB. Detailed construction plans were not available at the time of this analysis. Therefore, equipment quantities and construction phases provided by CAL-CET2021 were used along with maximum project durations provided by the Caltrans' design engineering team. Appendix J lists all the construction inputs provided and entered into CAL-CET2021. Inputs to the model included the construction start date, total construction cost, estimated working days, and project length. Table 2.2-8 shows the maximum construction emissions per project phase.

Table 2.2-8. Maximum Construction Emissions

Project Phase	Reactive Organic Gases	Nitrogen Oxides	Particulate Matter 10 Microns or Less	Particulate Matter 2.5 Microns or Less
Grubbing/Land Clearing	10.0 lbs/day	67.4 lbs/day	214.1 lbs/day	25.2 lbs/day
Roadway Excavation/Removal	13.8 lbs/day	107.7 lbs/day	96.0 lbs/day	15.0 lbs/day
Structure Excavation/Removal	10.6 lbs/day	59.2 lbs/day	135.7 lbs/day	16.4 lbs/day
Base/Subbase/Imported Borrow	15.2 lbs/day	129.7 lbs/day	139.6 lbs/day	20.2 lbs/day
Structure Concrete	11.7 lbs/day	67.8 lbs/day	4.3 lbs/day	4.2 lbs/day
Paving	13.7 lbs/day	105.9 lbs/day	5.7 lbs/day	5.5 lbs/day
Drainage/Utilities/Sub-Grade	11.0 lbs/day	48.5 lbs/day	67.8 lbs/day	4.4 lbs/day
Traffic Signalization	17.4 lbs/day	137.3 lbs/day	6.6 lbs/day	6.4 lbs/day
Total (Tons/Construction project)	2.0	13.5	6.1	1.3
SMAQMD Standard Levels	65 lbs/day	85 lbs/day	80 lbs/day	82 lbs/day
YSAQMD Standard Levels	55 lbs/day	55 lbs/day	80 lbs/day	82 lbs/day

Caltrans has statewide jurisdiction on projects within its right-of-way. Since the setting for projects varies extensity across the state, Caltrans has not and will not develop standard levels. Further, because most air district thresholds have not been established by regulation or by delegation from a federal or state agency with regulatory authority over Caltrans, Caltrans is not required to adopt those standard levels in Caltrans' documents. The SMAQMD and YSAQMD standard levels are provided for reference.

Construction equipment and associated heavy-duty truck traffic generate diesel exhaust. Diesel exhaust poses both a health and nuisance impact to nearby receptors. These construction

activities are expected to occur during a relatively short time and therefore would not have an adverse effect.

Long-Term Operational Impacts

The operational emissions analysis compares emissions for existing/baseline conditions to the forecasted conditions for the No-Build and Build alternatives given the project's opening year (2029), RTP horizon year (2040), and design year (2049) with and without an HOV-HOV connector based on the traffic data provided from the Traffic Forecasting from Caltrans (Tables 2.2-9 through 2.2-12). Air pollutant emissions associated with the roadways in the project area were estimated using specific traffic data and conditions provided by the Caltrans District 3 traffic forecasting and the CT-EMFAC2021 emission model.

Carbon Monoxide Analysis

U.S. EPA declared that transportation conformity requirements related to CO in Sacramento ended on June 1, 2018. That date marked 20 years from the redesignation of the areas to attainment and implementation of a maintenance plan. The approved maintenance plan for Sacramento did not extend the maintenance plan period beyond 20 years from redesignation. Consequently, Transportation Conformity requirements for CO ceased to apply after June 1, 2018 (i.e., 20 years after the effective date of the U.S. EPA's approval of the first ten-year maintenance plan and redesignation of the areas to attainment for the CO NAAQS.

$PM_{2.5}$/PM_{10} Analysis

The proposed project has undergone Interagency Consultation (IAC) regarding POAQC determination. Interagency Consultation participants concurred that the project is not a POAQC on October 15, 2021 by EPA and on October 18, 2021 by FHWA. These findings were reaffirmed by IAC on April 26, 2024, after an advertised SACOG meeting. The proposed project is not considered a POAQC because it does not meet the definition as defined in U.S. EPA's Transportation Conformity Guidance. Therefore, PM hot-spot analysis is not required.

The project is located in a particulate matter $PM_{2.5}$ maintenance area and it has been determined that the project is not a project of air quality concern. Project-level hot-spot analysis for particulate matter is therefore not required for a conformity determination.

Table 2.2-13 and Table 2.2-14 show that the total daily PM_{10} and $PM_{2.5}$ emissions for the Build and No Build alternatives in the opening year and the horizon year would be higher than existing conditions. However, the increase of total daily PM_{10} emissions is estimated to be 9. percent, 6.4 percent, and 3.1 percent of PM_{10} for Alternative 2b with opening year 2029, MTP year 2040, and Design year 2049, respectively. This increase is not considered substantial.

$PM_{2.5}$ emissions for Build Alternative 2b are estimated to increase 8.6 percent, 5.6 percent, 1.9 percent with opening year 2029, MTP year 2040, and Design year 2049, respectively. It is anticipated that the decreases of PM_{10} and $PM_{2.5}$ emissions for Build Alternative 2a would be associated with less traffic generated without an HOV-HOV connector. Therefore, the difference between the Build Alternatives and the No Build Alternative 1 would not be significant in terms of PM_{10} and $PM_{2.5}$ in regard to the increase of total AADT between the Build Alternatives and the No Build Alternative 1 with an HOV-HOV connector.

Mobile Source Air Toxics

FHWA released updated guidance in Jan. 18, 2023 for determining when and how to address MSAT impacts in the NEPA process for transportation projects. FHWA identified three levels of analysis:

- No analysis for exempt projects or projects with no potential for meaningful MSAT effects;
- Qualitative analysis for projects with low potential MSAT effects; and
- Quantitative analysis to differentiate alternatives for projects with higher potential MSAT effects.

Projects with no impacts generally include those that a) qualify as a categorical exclusion under 23 CFR 771.117, b) qualify as exempt under the FCAA conformity rule under 40 CFR 93.126, and c) are not exempt, but have no meaningful impacts on traffic volumes or vehicle mix.

Projects that have low potential MSAT effects are those that serve to improve highway, transit, or freight operations or movement without adding substantial new capacity or creating a facility that is likely to substantially increase emissions. The large majority of projects fall into this category.

Projects with high potential MSAT effects include those that:

- Create or significantly alter a major intermodal freight facility that has the potential to concentrate high levels of Diesel Particulate Matter in a single location; or
- Create new or add significant capacity to urban highways such as interstates, urban arterials, or urban collector-distributor routes with traffic volumes where the AADT is projected to be in the range of 140,000 to 150,000, or greater, by the design year; and
- Are proposed to be located in proximity to populated areas or, in rural areas, in proximity to concentrations of vulnerable populations (i.e., schools, nursing homes, hospitals).

The latest version of CT-EMFAC, CT-EMFAC2021, was used to estimate emissions of benzene, 1,3-butadiene, acetaldehyde, formaldehyde, acrolein, ethylbenzene, naphthalene, DPM, and polycyclic organic matter. Please note that Appendix D illustrates the extent of the area considered in the MSAT analysis. Traffic activity data were estimated for each of different periods of a representative day in the baseline, opening 2029, and horizon 2049 years. Emissions were estimated for all MSATs using CT-EMFAC2021, based on EMFAC2021 and speciation factors provided by CARB and U.S. EPA.

As shown in Table 2.2-15, MSAT emission rates are anticipated to decrease substantially, especially for diesel PM, by the opening year of 2029 and even further by the horizon year of 2049. The area surrounding the project is not heavily industrialized and comprises only approximately six percent heavy trucks. The project would not substantially increase the percentage of trucks traveling along I-80 of the project limits, and local truck emissions may in

fact decrease in future analysis years 2029 and 2049 due to penetration of electric heavy duty trucks. In sum, under all Build Alternatives in the opening year and design year it is expected there would be negligible increases in MSAT emissions relative to the No Build Alternative due to the dispersion across the SACOG region and to EPA's MSAT reduction programs.

Moreover, U.S. EPA regulations for vehicle engines and fuels will cause overall MSATs to decline significantly over the next several decades. Based on regulations now in effect, an analysis of national trends with EPA's MOVES3 model forecasts a combined reduction of over 76 percent in the total annual emission rate for the priority MSAT from 2020 to 2060 while vehicle-miles of travel are projected to increase by over 31 percent. This will both reduce the background level of MSAT as well as the possibility of even minor MSAT emissions from this project.

Table 2.2-15. Mobile Source Air Toxic Emission Rates (pounds per day)

In FHWA's view, information is incomplete or unavailable to credibly predict the project-specific health impacts due to changes in mobile source air toxic (MSAT) emissions associated with a

proposed set of highway alternatives. The outcome of such an assessment, adverse or not, would be influenced more by the uncertainty introduced into the process through assumption and speculation rather than any genuine insight into the actual health impacts directly attributable to MSAT exposure associated with a proposed action.

The Environmental Protection Agency (EPA) is responsible for protecting the public health and welfare from any known or anticipated effect of an air pollutant. They are the lead authority for administering the Clean Air Act and its amendments and have specific statutory obligations with respect to hazardous air pollutants and MSAT. The EPA is in the continual process of assessing human health effects, exposures, and risks posed by air pollutants. They maintain the Integrated Risk Information System (IRIS), which is "a compilation of electronic reports on specific substances found in the environment and their potential to cause human health effects" (EPA, https://www.epa.gov/iris/). Each report contains assessments of non-cancerous and cancerous effects for individual compounds and quantitative estimates of risk levels from lifetime oral and inhalation exposures with uncertainty spanning perhaps an order of magnitude.

Other organizations are also active in the research and analyses of the human health effects of MSAT, including the Health Effects Institute (HEI). A number of HEI studies are summarized in Appendix D of FHWA's Updated Interim Guidance on Mobile Source Air Toxic Analysis in NEPA Documents. Among the adverse health effects linked to MSAT compounds at high exposures are: cancer in humans in occupational settings; cancer in animals; and irritation to the respiratory tract, including the exacerbation of asthma. Less obvious is the adverse human health effects of MSAT compounds at current environmental concentrations (HEI Special Report 16, https://www.healtheffects.org/publication/mobile-source-air-toxics-critical-reviewliterature-exposure-and-health-effects) or in the future as vehicle emissions substantially decrease.

The methodologies for forecasting health impacts include emissions modeling; dispersion modeling; exposure modeling; and then final determination of health impacts – each step in the process building on the model predictions obtained in the previous step. All are encumbered by technical shortcomings or uncertain science that prevents a more complete differentiation of the MSAT health impacts among a set of project alternatives. These difficulties are magnified for lifetime (i.e., 70 year) assessments, particularly because unsupportable assumptions would have to be made regarding changes in travel patterns and vehicle technology (which affects emissions rates) over that time frame, since such information is unavailable. It is particularly difficult to reliably forecast 70-year lifetime MSAT concentrations and exposure near roadways; to determine the portion of time that people are actually exposed at a specific location; and to establish the extent attributable to a proposed action, especially given that some of the information needed is unavailable.

There are considerable uncertainties associated with the existing estimates of toxicity of the various MSAT, because of factors such as low-dose extrapolation and translation of occupational exposure data to the general population, a concern expressed by HEI (Special Report 16, https://www.healtheffects.org/publication/mobile-source-air-toxicscritical-review-literature-exposure-and-health-effects). As a result, there is no national consensus on air dose-response values assumed to protect the public health and welfare for MSAT compounds, and in particular for diesel PM. The EPA states that with respect to diesel engine exhaust, "[t]he

absence of adequate data to develop a sufficiently confident dose-response relationship from the epidemiologic studies has prevented the estimation of inhalation carcinogenic risk." (EPA IRIS database, Diesel Engine Exhaust, Section II.C https://iris.epa.gov/static/pdfs/0642_summary.pdf).

There is also the lack of a national consensus on an acceptable level of risk. The current context is the process used by the EPA as provided by the Clean Air Act to determine whether more stringent controls are required in order to provide an ample margin of safety to protect public health or to prevent an adverse environmental effect for industrial sources subject to the maximum achievable control technology standards, such as benzene emissions from refineries. The decision framework is a two-step process. The first step requires EPA to determine an "acceptable" level of risk due to emissions from a source, which is generally no greater than approximately 100 in a million. Additional factors are considered in the second step, the goal of which is to maximize the number of people with risks less than 1 in a million due to emissions from a source. The results of this statutory two-step process do not guarantee that cancer risks from exposure to air toxics are less than 1 in a million; in some cases, the residual risk determination could result in maximum individual cancer risks that are as high as approximately 100 in a million. In a June 2008 decision, the U.S. Court of Appeals for the District of Columbia Circuit upheld EPA's approach to addressing risk in its two-step decision framework. Information is incomplete or unavailable to establish that even the largest of highway projects would result in levels of risk greater than deemed acceptable (https://www.cadc.uscourts.gov/internet/opinions.nsf/284E23FFE079CD5985257800005 0C9DA/$file/07-1053-1120274.pdf).

Because of the limitations in the methodologies for forecasting health impacts described, any predicted difference in health impacts between alternatives is likely to be much smaller than the uncertainties associated with predicting the impacts. Consequently, the results of such assessments would not be useful to decision makers, who would need to weigh this information against project benefits, such as reducing traffic congestion, accident rates, and fatalities plus improved access for emergency response, that are better suited for quantitative analysis.

Build Alternatives 3a and 3b

Construction

Build Alternatives 3a and 3b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively; and construction effects would be similar.

Operation

Build Alternatives 3a and 3b would involve adding an HOT2+ lane in each direction. Permanent effects would be similar to Build Alternatives 2a and 2b; however, PM_{10} and $PM_{2.5}$ emissions would increase slightly under Alterative 3b and would decrease under Alterative 3a compared to the No Build Alternative 1 (Table 2.2-10 and Table 2.2-11). Therefore, the effects would be similar to effects described under Build Alternatives 2a and 2b.

Build Alternatives 4a and 4b

Construction

Build Alternatives 4a and 4b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively; and construction effects would be similar.

Operation

Build Alternatives 4a and 4b would involve adding an HOT3+ lane in each direction. Permanent effects would be similar to Build Alternatives 2a and 2b, respectively; however, PM_{10} and $PM_{2.5}$ emissions would increase slightly under Alterative 4b and would decrease under Alterative 4a compared to the No Build Alternative 1 (Table 2.2-13 and Table 2.2-14). Therefore, the effects would be similar to effects described under Build Alternatives 2a and 2b.

Build Alternatives 5a and 5b

Construction

Build Alternatives 5a and 5b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively; and construction effects would be similar.

Operation

Build Alternatives 5a and 5b would involve adding an Express Lane in each direction. Permanent effects would be similar to Build Alternatives 2a and 2b, respectively; however, PM_{10} and $PM_{2.5}$ emissions would decrease slightly compared to the No Build Alternative 1 in Design Year 2029 (Table 2.2-13 and Table 2.2-14). Therefore, the effects would be slightly less than described under Build Alternatives 2a and 2b, respectively.

Build Alternatives 6a and 6b

Construction

Build Alternatives 6a and 6b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively; and construction effects would be similar.

Operation

Build Alternatives 6a and 6b would involve adding a transit-only lane in each direction. Permanent effects would be similar to Build Alternatives 2a and 2b, respectively; however, however, PM_{10} and $PM_{2.5}$ emissions would decrease slightly compared to the No Build Alternative in Design Year 2029 (Table 2.2-13 and Table 2.2-14). Therefore, the effects would be slightly less than described under Build Alternatives 2a and 2b, respectively.

Build Alternatives 7a and 7b

Construction

Build Alternatives 7a and 7b would involve repurposing an existing general purpose lane to HOV 2+. No new lanes would be constructed. Because Build Alternatives 7a and 7b would not add new lanes but would repurpose existing lanes as managed lanes, the Build Alternatives 7a and 7b construction period may have shorter duration resulting in fewer delays than those under Build Alternatives 2a, 2b, 3a, 3b, 4a, 4b, 5a, 5b, 6a, and 6b and would result in less emissions.

Operation

As no new lanes would be constructed, Build Alternatives 7a and 7b do not increase capacity due to replacing an existing traffic lane with an HOV 2+ lane; therefore, PM_{10} and $PM_{2.5}$ emissions would decrease slightly compared to the No Build Alternative 1 in Design Year 2029 (Table 2.2-13 and Table 2.2-14). Therefore, the effects would be slightly less than described under Build Alternatives 2a and 2b, respectively.

2.2.6.4 Avoidance, Minimization, and/or Mitigation Measures

No AMMs or MMs would be required.

2.2.7 Climate Change

Neither the United States Environmental Protection Agency (U.S. EPA) nor the Federal Highway Administration (FHWA) has issued explicit guidance or methods to conduct project-level greenhouse gas analysis. FHWA emphasizes concepts of resilience and sustainability in highway planning, project development, design, operations, and maintenance. Because there have been requirements set forth in California legislation and executive orders on climate change, the issue is addressed in the California Environmental Quality Act (CEQA) chapter of this document. The CEQA analysis may be used to inform the National Environmental Policy Act (NEPA) determination for the project.

2.2.8 Noise

2.2.8.1 Regulatory Setting

The National Environmental Policy Act (NEPA) of 1969 and the California Environmental Quality Act (CEQA) provide the broad basis for analyzing and abating highway traffic noise effects. The intent of these laws is to promote the general welfare and to foster a healthy environment. The requirements for noise analysis and consideration of noise abatement and/or mitigation, however, differ between NEPA and CEQA.

California Environmental Quality Act

CEQA requires a strictly baseline versus build analysis to assess whether a proposed project will have a noise impact. If a proposed project is determined to have a significant noise impact under CEQA, then CEQA dictates that mitigation measures must be incorporated into the

project unless those measures are not feasible. The rest of this section will focus on the NEPA/Title 23 Part 772 of the Code of Federal Regulations (23 CFR 772) noise analysis; please see Chapter 3 of this document for further information on noise analysis under CEQA.

National Environmental Policy Act and 23 CFR 772

For highway transportation projects with Federal Highway Administration (FHWA) involvement (and Caltrans, as assigned), the Federal-Aid Highway Act of 1970 and its implementing regulations (23 CFR 772) govern the analysis and abatement of traffic noise impacts. The regulations require that potential noise impacts in areas of frequent human use be identified during the planning and design of a highway project. The regulations include noise abatement criteria (NAC) that are used to determine when a noise impact would occur. The NAC differ depending on the type of land use under analysis. For example, the NAC for residences (67 dBA) is lower than the NAC for commercial areas (72 dBA). Table 2.2-13 lists the noise abatement criteria for use in the NEPA/23 CFR 772 analysis.

Table 2.2-16. Noise Abatement Criteria

Activity Category	NAC, Hourly A-Weighted Noise Level, Leq(h)	Description of activity category
A	57 (Exterior)	Lands on which serenity and quiet are of extraordinary significance and serve an important public need and where the preservation of those qualities is essential if the area is to continue to serve its intended purpose.
B[1]	67 (Exterior)	Residential.
C[1]	67 (Exterior)	Active sport areas, amphitheaters, auditoriums, campgrounds, cemeteries, day care centers, hospitals, libraries, medical facilities, parks, picnic areas, places of worship, playgrounds, public meeting rooms, public or nonprofit institutional structures, radio studios, recording studios, recreation areas, Section 4(f) sites, schools, television studios, trails, and trail crossings.
D	52 (Interior)	Auditoriums, day care centers, hospitals, libraries, medical facilities, places of worship, public meeting rooms, public or nonprofit institutional structures, radio studios, recording studios, schools, and television studios.
E	72 (Exterior)	Hotels, motels, offices, restaurants/bars, and other developed lands, properties, or activities not included in A–D or F.
F	No NAC—reporting only	Agriculture, airports, bus yards, emergency services, industrial, logging, maintenance facilities, manufacturing, mining, rail yards, retail facilities, shipyards, utilities (water resources, water treatment, electrical, etc.), and warehousing.
G	No NAC—reporting only	Undeveloped lands that are not permitted.

Notes:
1. Includes undeveloped lands permitted for this activity category.

Figure 2.2-4 lists the noise levels of common activities to enable readers to compare the actual and predicted highway noise levels discussed in this section with common activities.

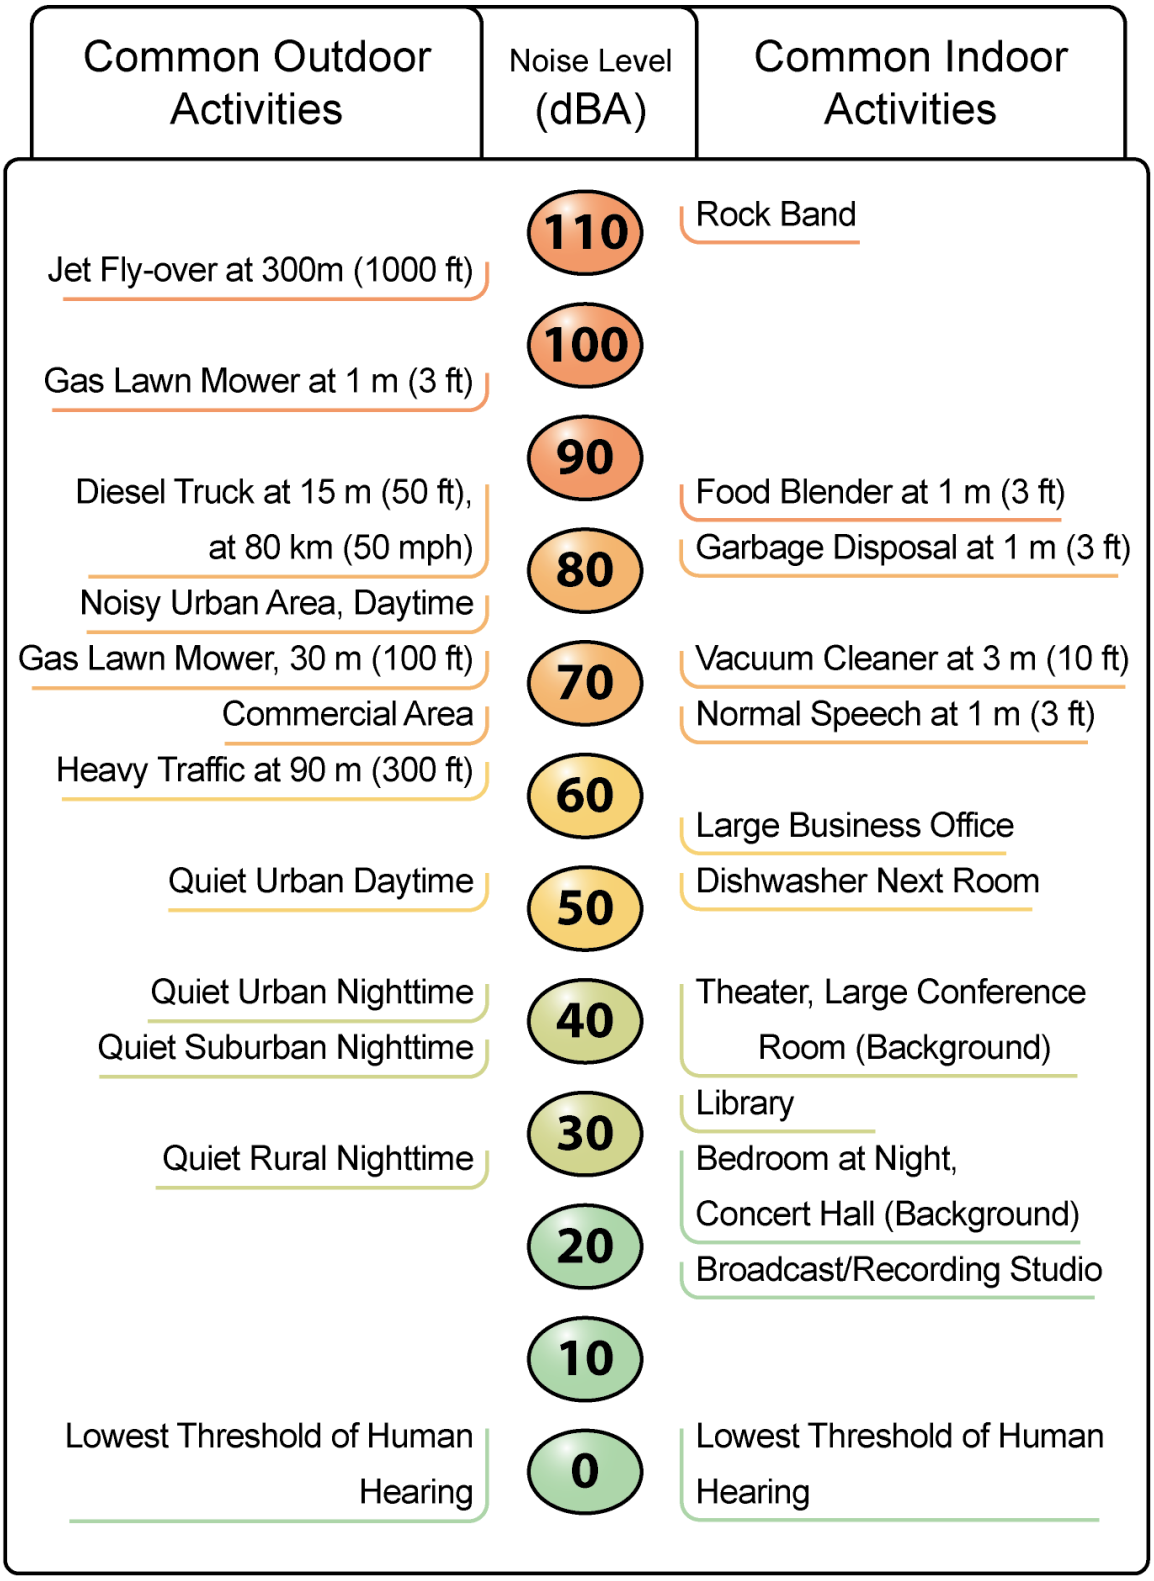

Figure 2.2-4. Noise Levels of Common Activities

According to the Caltrans *Traffic Noise Analysis Protocol for New Highway Construction and Reconstruction Projects, April 2020*, a noise impact occurs when the predicted future noise level with the project substantially exceeds the existing noise level (defined as a 12 dBA or more) or when the future noise level with the project approaches or exceeds the NAC. A noise level is considered to approach the NAC if it is within 1 dBA of the NAC.

If it is determined that the project will have noise impacts, then potential abatement measures must be considered. Noise abatement measures that are determined to be reasonable and feasible at the time of final design are incorporated into the project plans and specifications. This document discusses noise abatement measures that would likely be incorporated in the project.

The Caltrans *Traffic Noise Analysis Protocol* sets forth the criteria for determining when an abatement measure is reasonable and feasible. Feasibility of noise abatement is basically an engineering concern. Noise abatement must be predicted to reduce noise by at least 5 dB at an impacted receptor to be considered feasible from an acoustical perspective. It must also be possible to design and construct the noise abatement measure for it to be considered feasible. Factors that affect the design and constructability of noise abatement include, but are not limited to, safety, barrier height, topography, drainage, access requirements for driveways, presence of local cross streets, underground utilities, other noise sources in the area, and maintenance of the abatement measure. The overall reasonableness of noise abatement is determined by the following three factors: 1) the noise reduction design goal of 7 dB at one or more impacted receptors; 2) the cost of noise abatement; and 3) the viewpoints of benefited receptors (including property owners and residents of the benefited receptors).

2.2.8.2 Affected Environment

The information for the noise analysis was obtained from the Noise Study Report prepared for the project (Caltrans 2022b). The noise study encompasses all developed land uses surrounding the project limits, with a focus on noise-sensitive land uses. Noise-sensitive land uses include areas where serenity and quiet are of extraordinary significance, residential land uses, and other community uses such as hospitals, schools, cemeteries, and parks. Commercial land uses including hotels, motels, and offices are also sensitive to noise.

Receptor Categories

Noise-sensitive land uses in the vicinity of the project limits include Category B (residential), Category C (parks, trails, schools, medical facilities, and active sports areas), Category D (schools, medical facilities, and places of worship), and Category E (hotels and offices). Category F land uses (agriculture, retail facilities, utilities, and warehousing) are also present in the project vicinity.

Segment 1: Kidwell Road to east of Enterprise Boulevard

Segment 1a of the project area is surrounded by agriculture (Activity Category F), University of California Davis (Activity Category C), and single-family residential uses (Activity Category B) and does not have existing sound walls.

Segment 1b of the project area is surrounded by eight multi-family properties (Activity Category B) and three residential subdivisions (Activity Category B) with an existing 6-foot sound barrier located along the I-80 westbound off-ramp at Richards Boulevard. This sound wall is currently shielding a multi-family residential development west of a storage facility. East of the storage facility is another 6-foot sound wall shielding additional multi-family residences. Two medical facilities (Activity Category D), a hotel (Activity Category E), offices (Activity Category E), a sports facility (Activity Category C), and a school (Activity Category D) are also located within the project vicinity. There are no outdoor areas associated with the offices and medical facilities that are considered to be areas of frequent human use.

Segment 1c of the project area is surrounded by agriculture (Activity Category F), undeveloped lands that are not permitted (Activity Category F), and a wildlife trail crossing (Activity Category C).

Segment 2: East of Enterprise Boulevard to West El Camino Avenue

Segment 2 of the project area is surrounded by single-family residential (Activity Category B), a RV Park (Activity Category C), a mobile home park (Activity Category B), and a medical facility (Activity Category D). This area is generally flat. An existing 12-foot sound wall runs parallel to I-80 between the eastbound lanes and Thor Drive, shielding a mobile home park. An existing 12-foot sound wall is located adjacent to I-80 eastbound, just south of West El Camino Avenue and shields the single-family residential housing development. No outdoor areas considered to be areas of frequent human use are associated with the medical facility.

Segment 3: I-80/US-50 Separation to I-5

Segment 3a of the project area is surrounded by three residential subdivisions (Activity Category B), two multi-family properties (Activity Category B), two medical facilities (Activity Category C and D), two hotels (Activity Category E), a school (Activity Category C and D), a park (Activity Category C), and a place of worship (Activity Category D). An existing sound wall, located north of US-50 just east of the I-80/US-50 interchange, is approximately 13.5 feet tall and shields multi-family and single-family developments. Another 12-foot-tall sound wall is located south of the US-50 eastbound lanes at the off-ramp at Harbor Boulevard. This wall is shielding a Motel 6 and Radisson hotel. The Sacramento Valley Charter School, single-family housing area, Westacre Park, and Yolo High School, which are located north of the US-50 westbound lanes west of the Jefferson Boulevard interchange, are shielded by 6- to 12-foot tall sound walls. The single-family houses south of the US-50 eastbound lanes, which are also west of the Jefferson Boulevard interchange, are also currently shielded by 6- to 12-foot tall sound walls.

Segment 3b of the project area is surrounded by Parks (Category C) and residential (Activity Category B) land uses.

Noise Modeling

Short-term and long-term measurements were taken to document the existing noise environment within the project area. Accordingly, 69 short-term noise measurements were

made at land uses in the project vicinity. Ten long-term noise measurements were made to quantify the trend in noise levels and establish the peak traffic noise hour. The existing loudest hour noise levels (L_{eq}[5][h]) ranged from 46 to 85 decibels (dBA) L_{eq} [h] at short-term measurement locations. The existing loudest hour noise levels ranged from 64 to 82 dBA Leq[h] at long-term locations.

In addition to the short-term and long-term measurement locations, there are 152 modeled receptor locations. Receptors are shown in Figure 2.2-5 through Figure 2.2-19.

[5] Leq represents an average of the sound energy occurring over a specified period. In effect, Leq is the steady-state sound level containing the same acoustical energy as the time-varying sound that actually occurs during the same period. The 1-hour A-weighted equivalent sound level (Leq[h]) is the energy average of A-weighted sound levels occurring during a one-hour period and is the basis for NAC used by Caltrans and FHWA.

2.2.8.3 Environmental Consequences

The Code of Federal Regulations (23 CFR 772) "Procedures for Abatement of Highway Traffic Noise" provides procedures for preparing operational and construction noise studies and evaluating noise abatement options. Under 23 CFR 772, projects are categorized as Type I or Type II projects. Type I projects are defined as proposed federal or federal-aid highway improvements for the construction of a highway on new location; or the physical alteration of an existing highway which significantly changes either the horizontal or vertical alignment or increases the number of through-traffic lanes.

The project is a Type I project because it would involve the addition of lanes and would be eligible to receive federal funding from the Federal Highway Administration (FHWA) administered through Caltrans. Therefore, the project requires noise abatement to be considered for impacted receptors.

No Build Alternative 1

Construction

Under No Build Alternative 1, managed lanes and transportation improvements would not be constructed. As such, there would be no construction noise or vibration.

Operation

Under No Build Alternative 1, the managed lanes and transportation improvements would not be constructed; however, vehicles would continue to travel within the project area contributing to long-term noise. Noise levels are calculated to increase by up to 2 dBA by year 2049 under No Build Alternative 1 conditions. The increase is not considered substantial.

Build Alternatives 2a and 2b

Construction

Noise

Construction activities under Build Alternatives 2a and 2b would result in temporary increases to noise and vibration levels at adjacent sensitive receptors. Project construction would occur over a period of approximately 3 years and would include road cut/fill, grinding, grubbing/land cleaning, grading/excavation, drainage/utilities, and paving. Pile driving would be used for the construction of the I-80 connector structure under Build Alternative 2b. Construction noise would primarily result from the operation of heavy construction equipment and the arrival and departure of heavy-duty trucks.

Construction Table 2.2-17 summarizes the typical noise levels by construction phase and indicates that construction noise under Build Alternatives 2a and 2b would not exceed quantitative noise limits established by Caltrans except for nighttime work, which could result in an exceedance.

The construction noise levels in Table 2.2-17 are calculated for each major phase of the project at a distance of 100 feet, based on calculations conducted in FHWA's Roadway Construction Noise Model (RCNM) using project-specific construction information. This construction noise model includes representative sound levels for the most common types of construction equipment. In some instances, maximum instantaneous noise levels are calculated to be slightly lower than hourly average noise levels. This occurs because the model reports the maximum instantaneous noise level generated by the loudest single piece of construction equipment, while reporting the hourly average noise levels resulting from the additive effect of multiple pieces of construction equipment operating simultaneously. Noise generated by construction equipment drops off at a rate of 6 dB per doubling of distance.

Table 2.2-17. Noise Levels by Construction Phase at 100 Feet

Construction Type	Construction Phase	Maximum Noise Level (Lmax, dBA)	Hourly Average Noise Level (Leq[h], dBA)
Roadway Construction	Grubbing/Land Clearing	78	77
	Grading/Excavation	79	83
	Drainage/Utilities	79	82
	Paving	78	78
Bridge/Structures Construction	Grubbing/Land Clearing	78	77
	Grading/Excavation	79	84
	Drainage/Utilities	79	83
	Paving	75	77
Impact Pile Driving	—	95	88

Source: Caltrans 2022b

Although the overall construction schedule would occur over a period of 3 years, roadway construction activities would occur for relatively short periods of time in any specific location as construction proceeds along the project's alignment. Construction noise would mostly be of concern in areas where heavy construction would be concentrated for extended periods of time in areas adjacent to noise-sensitive receptors, where noise levels from individual pieces of equipment are substantially higher than ambient conditions, or when construction activities would occur during noise-sensitive early morning, evening, or nighttime hours.

As indicated through comparison of Table 2.2-17, most construction phases would generate average noise levels that would exceed ambient daytime noise levels at adjacent land uses by 15 to 20 dBA Leq[h]. Receptors shielded by noise barriers would be exposed to a similar increase in noise, albeit at lower overall noise levels because the shielding provided by the existing noise barriers would attenuate construction noise at a similar rate to traffic noise.

Except for possible nighttime construction involving heavy equipment, construction noise levels would not be expected to exceed the quantitative noise limits established by Caltrans. AMM NOI-1 would require noise-generating construction activities to be restricted to 7:00 a.m. to 7:00 p.m. on weekdays, with no construction occurring on weekends or holidays. If work is necessary

outside of these hours, a construction noise monitoring program and provide additional noise controls would be implemented.

Caltrans Standard Specifications Section 14-8.02 would require that noise levels not to exceed 86 dBA within 50 feet of the job site from the hours of 9:00 p.m. to 6:00 a.m. (Standard Measure NOI-1). Build Alternatives 2a and 2b would also implement Standard Measures NOI-2 through NOI-5 further reducing temporary construction noise levels. Therefore, temporary construction noise would have no adverse effects on nearby receptors.

Construction Vibration

Due to the short-term nature of construction, the primary concern is the potential for vibration to damage a structure. Critical factors pertaining to the impact of construction vibration on sensitive receptors include the proximity of the existing structures to the project site, soil conditions, the soundness of the structures, and the methods of construction used.

Caltrans identifies a vibration limit of 0.5 inch/second (in/sec) Peak Particle Velocity (PPV) as the threshold at which there is a potential risk of damage to new residential and modern commercial/industrial structures, 0.3 in/sec PPV for older residential structures, and a conservative limit of 0.25 in/sec PPV for historic and some old buildings (see Table 2.2-18).

Table 2.2-18. Reaction of People and Damage to Buildings from Continuous or Frequent Intermittent Vibration Levels

Velocity Level, PPV (in/sec)	Human Reaction	Effect on Buildings
0.01	Barely perceptible	No effect
0.04	Distinctly perceptible	Vibration unlikely to cause damage of any type to any structure
0.08	Distinctly perceptible to strongly perceptible	Recommended upper level of the vibration to which ruins and ancient monuments should be subjected
0.1	Strongly perceptible	Threshold at which there is a risk of damage to fragile buildings with no risk of damage to most buildings
0.25	Strongly perceptible to severe	Threshold at which there is a risk of damage to historic and some old buildings.
0.3	Strongly perceptible to severe	Threshold at which there is a risk of damage to older residential structures
0.5	Severe (Vibrations considered unpleasant)	Threshold at which there is a risk of damage to new residential and modern commercial/industrial structures

Note: PPV (in/sec) = peak particle velocity (inches per second)

Construction activities with the greatest potential of generating perceptible vibration levels would include the removal of pavement and soil, the dropping of heavy objects, and the movement of heavy tracked equipment. Table 2.2-19 presents typical vibration levels that could be expected from representative construction equipment at a reference distance of 25 feet. Vibration levels are highest close to the source and then attenuate with increasing distance depending on soil conditions.

Table 2.2-19. Vibration Source Levels for Construction Equipment

Equipment	PPV at 25 feet (in/sec)	Nearest Structure Setback 10 feet[1]	Nearest Structure Setback 50 feet[1]	Nearest Structure Setback 100 feet[1]
Impact Pile Driver – Upper Range	1.158	3.173	0.540	0.252
Impact Pile Driver – Typical	0.644	1.764	0.300	0.140
Sonic Pile Driver – Upper Range	0.734	2.011	0.342	0.160
Sonic Pile Driver – Typical	0.17	0.466	0.079	0.037

Notes:
1. Representative of Setbacks of Nearest Structures (in/sec PPV). These levels are calculated assuming normal propagation conditions, using a standard equation of PPVeqmt-PPVref * (25/D) 1.1, from Caltrans, September 2013.
Key: PPV (in/sec) = peak particle velocity (inches per second)

As shown in Table 2.2-20, Caltrans recommends a vibration limit of 0.5 in/sec PPV for new residential and modern commercial/industrial structures, 0.3 in/sec PPV for older residential structures, and 0.25 in/sec PPV for historic and some old buildings. Construction vibration limits would not be exceeded during periods of construction. Therefore, temporary construction vibration would have no adverse effects on nearby receptors.

Table 2.2-20. Distance to Exceedance of Vibration Limit by Structure Type

Structure Type	Threshold	Impact Pile Driving Distance to Exceedance of Threshold (feet)[1]	Heavy Construction Distance to Exceedance of Threshold (feet) [1]
Historic Buildings	0.25 in/sec PPV	100 feet	22 feet
Older Residences	0.3 in/sec PPV	85 feet	18 feet
New Residential and Commercial/Industrial Buildings	0.5 in/sec PPV	55 feet	12 feet

Source: Caltrans 2022b
[1]These levels calculated assuming normal propagation conditions, using a standard equation of *PPVeqmt-PPVref * (25/D) $^{1.1}$*, from Caltrans, September 2013.
Key: PPV (in/sec) = peak particle velocity (inches per second)

Operation

Build Alternatives 2a and 2b would involve adding an HOV2+ lane in each direction while Build Alternative 2b would also include building an I-80 connector structure.

Modeled noise levels under Build Alternative 2a would be the same as Build Alternative 2b with the exception of areas adjacent to the proposed I-80 connector structure (Build Alternative 2b only). Build Alternative 2b, as presented in Table 2.2-21, would increase noise levels by up to 2 dBA over existing conditions and over No Build conditions under future year 2049 conditions, with one residential receptor experiencing up to a 3 dBA. These noise level increases are not considered substantial per the Caltrans Noise Analysis Protocol for New Highway Construction (Caltrans 2020a).

Under Build Alternatives 2a and 2b, traffic noise levels would approach or exceed the Noise Abatement Criteria (NAC) at Category B receptors located north of US-50 westbound travel lanes between Harbor Boulevard and Jefferson Boulevard, south of US-50 eastbound travel lanes between Harbor Boulevard and Jefferson Boulevard, east of the US-50 and I-5 interchange, east of the US-50 westbound ramp onto I-80 eastbound, to the east and west of I-80 at the Sacramento River, and to the east of I-80 eastbound between Sacramento River and West El Camino Avenue. Some of these receptors are located behind existing noise barriers.

Traffic noise levels are predicted to approach or exceed the NAC at Category C receptors located east of the US-50 westbound ramp onto I-80 eastbound and south of US-50 eastbound travel lanes between Harbor Boulevard and Jefferson Boulevard.

Accordingly, noise abatement was considered for impacted receptors as further described in Section 2.2.8.4, Avoidance, Minimization, and/or Mitigation Measures.

Table 2.2-21. Calculated Noise Levels

[1] Impact Type: S = Substantial Increase (12 dBA or more), A/E = Approach or Exceed NAC, None = Increase is less than 12 decibels and noise levels do not approach or exceed the NAC.
[2] As stated in the TeNS, modeling results are rounded to the nearest decibel before comparisons are made.
[3] As stated in the Traffic Noise Protocol (TNAP) April 2020, bike baths that serve primarily as a transportation facility are not evaluated as recreational trails.
[4] As stated in the Traffic Noise Protocol (TNAP) April 2020, recreational trails that primarily involve the use of motorized vehicles are not evaluated as recreational
[5] This location does not include any exterior noise sensitive land uses; exterior noise levels are provided for reference only.
[6]This location is not considered an area of frequent human use where people are exposed to traffic for an extended period of time on a regular basis. Where applicable, additional receivers have been placed in areas of frequent human use.
[7] This location does not include any exterior noise sensitive land uses, so would be considered a Category D land use only. Exterior noise levels are presented in the Table.
Notes: $L_{eq[h]}$ = The 1-hour A-weighted equivalent sound level; dBA = A-weighted decibels; u

Interior Noise

A noise impact would occur if, as a result of a proposed freeway project, noise levels approach or exceed 52 dBA Leq[h] in the interior of auditoriums, day care centers, hospitals, libraries, medical facilities, places of worship, public meeting rooms, public or nonprofit institutional structures, radio studios, recording studios, schools, and television studios. Based on FHWA Guidance, a typical Category D use structure would be anticipated to provide about 10 dBA of noise reduction from exterior noise sources with windows open, and 20 to 30 dBA of noise reduction with windows in the closed position, depending on the window and exterior wall construction. Category D use structures that do not have forced-air mechanical ventilation to allow occupants to keep windows closed to control noise could be anticipated to have interior noise levels approaching or exceeding 52 dBA Leq[h] with exterior exposures of 62 dBA Leq[h] or more. For structures with windows in the closed position, exterior noise levels of 72 to 82 dBA Leq[h] or less, depending on the acoustical construction of the structure, would result in acceptable interior noise levels.

Under Build Alternative 2a and 2b, noise levels at the worst-case exterior façades of Category D land uses that are identified along the alignment range from 56 to 72 dBA Leq[h] by year 2049. Table 2.2-22 lists the calculated loudest-hour interior noise levels within the three Category D land uses.

Four medical facilities were identified in the project area. Davis Urgent Care is located approximately 320 feet north of I-80 and is represented by Receptor R45 (Figure 2.2-8). The 4515 Fermi Place building, of which Davis Urgent Care is an occupant, is a large office building of modern construction and is anticipated to provide about 30 dB of exterior-to-interior noise reduction with windows closed. Concentra Urgent Care is located approximately 350 feet south of I-80 and is represented by Receptor R58 (Figure 2.2-11). The 3680 Industrial Boulevard building, of which Concentra Urgent Care is an occupant, is a large office building of modern construction and is anticipated to provide about 30 dB of exterior-to-interior noise reduction with windows closed. DaVita West Sacramento Dialysis Center is located approximately 280 feet south of US-50 and is represented by Receptor R59 (Figure 2.2-12). The 3450 Industrial Boulevard building, of which DaVita West Sacramento Dialysis Center is an occupant, is a large office building of modern construction and is anticipated to provide about 30 dB of exterior-to-interior noise reduction with windows closed. Noise levels within the 3450 Industrial Boulevard building are not anticipated to approach or exceed 52 dBA Leq[h]. River Bend Nursing Center is located approximately 180 feet north of US-50 and is represented by Receptor R69 (Figure 2.2-13). The 2215 Oakmont Way building, of which River Bend Nursing Center is an occupant, is a large office building of modern construction and is anticipated to provide about 30 dB of exterior-to-interior noise reduction with windows closed. All four office buildings include mechanical ventilation, allowing occupants the option of closing windows to control noise. Therefore, noise levels at all four buildings are not anticipated to approach or exceed 52 dBA Leq.

Table 2.2-22. Calculated Interior Noise Levels for No Build Alternative 1 and Build Alternatives 2a and 2b

Two colleges were identified in the project area. University of California Davis (UC Davis) has multiple building locations throughout the project area. The UC Davis Center of Laboratory Animal Science is located approximately 290 feet south of I-80 and is represented by Receptor ST-8 (). The laboratory building is a large office building of modern construction and is anticipated to provide about 30 dB of exterior-to-interior noise reduction with windows closed. Based on a desktop review, the laboratory building includes mechanical ventilation, allowing occupants the option of closing windows to control noise. Noise levels within the UC Davis Center for Laboratory Animal Science building are not anticipated to approach or exceed 52 dBA Leq[h]. The UC Davis August A. Busch III Brewing and Food Science Laboratory is located approximately 450 feet north of I-80 and is represented by Receptor ST-18 (). The 641 Hilgard Lane building, of which The UC Davis August A. Busch III Brewing and Food Science Laboratory is an occupant, is a large office building of modern construction and is anticipated to provide about 30 dB of exterior-to-interior noise reduction with windows closed. Based on a desktop review, the 641 Hilgard Lane building includes mechanical ventilation, allowing occupants the option of closing windows to control noise. Noise levels within the 641 Hilgard Lane building are not anticipated to approach or exceed 52 dBA Leq[h]. The UC Davis Center for Neuroscience is located approximately 250 feet east of I-80 and is represented by Receptor R5 (Figure 2.2-5). The 1544 Newton Court building, of which the UC Davis Center for

Neuroscience is an occupant, is a large office building of modern construction and is anticipated to provide about 30 dB of exterior-to-interior noise reduction with windows closed. Based on a desktop review, the 1544 Newton Court building includes mechanical ventilation, allowing occupants the option of closing windows to control noise. Noise levels within the 1544 Newton Court building are not anticipated to approach or exceed 52 dBA Leq[h]. The University of California Agriculture and Natural Resources is located approximately 300 feet north of I-80 and is represented by Receptor R30 (Figure 2.2-7). The 2801 2nd Street building, of which the University of California Agriculture and Natural Resources is an occupant, is a large office building of modern construction and is anticipated to provide about 30 dB of exterior-to-interior noise reduction with windows closed. Based on a desktop review, the 2801 2nd Street building includes mechanical ventilation, allowing occupants the option of closing windows to control noise. Noise levels within the 2801 2nd Street building are not anticipated to approach or exceed 52 dBA Leq[h].

Four schools were identified in the project area. Merryhill Preschool is located approximately 320 feet south of I-80 and is represented by Receptor ST-23 (Figure 2.2-8). The 222 La Vida Way building, of which Merryhill Preschool is an occupant, is a medium building of modern construction and is anticipated to provide about 30 dB of exterior-to-interior noise reduction with windows closed. Based on a desktop review, the 222 La Vida Way building includes mechanical ventilation, allowing occupants the option of closing windows to control noise. Noise levels within the 222 La Vida Way building are not anticipated to approach or exceed 52 dBA Leq[h]. Westmore Oaks Elementary School is located approximately 400 feet south of US-50 and is represented by Receptor ST-48 (Figure 2.2-13). The 1514 Fallbrook Street building, of which Westmore Oaks Elementary School is an occupant, is a large building of modern construction and is anticipated to provide about 30 dB of exterior-to-interior noise reduction with windows closed. Based on a desktop review, the 1514 Fallbrook Street building includes mechanical ventilation, allowing occupants the option of closing windows to control noise. Noise levels within the 1514 Fallbrook Street building are not anticipated to approach or exceed 52 dBA Leq[h]. Yolo High School is located approximately 340 feet north of US-50 and is represented by Receptor ST-53 (Figure 2.2-13). The 919 Westacre Road building, of which Yolo High School is an occupant, is a large building of modern construction and is anticipated to provide about 30 dB of exterior-to-interior noise reduction with windows closed. Based on a desktop review, the 919 Westacre Road building includes mechanical ventilation, allowing occupants the option of closing windows to control noise. Noise levels within the 919 Westacre Road building are not anticipated to approach or exceed 52 dBA Leq[h]. Sacramento Valley Charter School is located approximately 125 feet north of US-50 and is represented by Receptor R68 (Figure 2.2-13). The 2399 Sellers Way building, of which Sacramento Valley Charter School is an occupant, is a large building of modern construction and is anticipated to provide about 30 dB of exterior-to-interior noise reduction with windows closed. Based on a desktop review, the 2399 Sellers Way building includes mechanical ventilation, allowing occupants the option of closing windows to control noise. Noise levels within the 2399 Sellers Way building are not anticipated to approach or exceed 52 dBA Leq[h].

One place of worship was identified in the project area. The Center for Spiritual Awareness is located approximately 128 feet south of US-50 and is represented by Receptor ST-43 (Figure 2.2-12). The 1275 Starboard Drive building, of which the Center for Spiritual Awareness is an

occupant, is a large building of modern construction and is anticipated to provide about 30 dB of exterior-to-interior noise reduction with windows closed. Based on a desktop review, the 1275 Starboard Drive building includes mechanical ventilation, allowing occupants the option of closing windows to control noise. Noise levels within the 1275 Starboard Drive building are not anticipated to approach or exceed 52 dBA Leq[h].

Therefore, no adverse effect would occur related to interior noise levels.

Build Alternatives 3a and 3b

Construction

Build Alternatives 3a and 3b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively. Therefore, the effect would be the same as effects described under Build Alternatives 2a and 2b, respectively.

Operation

Build Alternatives 3a and 3b would involve adding an HOT 2+ lane in each direction. Build Alternative 3b would also include building an I-80 connector structure. The 2049 Build Alternative 3a conditions would increase noise levels by up to 2 dBA over existing conditions and over No Build conditions. These noise level increases are not considered substantial per the Protocol. Traffic noise modeling results and predicted traffic noise impacts for existing and design year conditions are shown in Table 2.2-21 for Build Alternative 3a.

Build Alternative 3b was not modeled as part of the analysis but would have similar effects as Build Alternative 2b shown in Table 2.2-21. As discussed under Alternatives 2a and 2b, Build Alternatives 3a and 3b, respectively, are predicted to approach or exceed NAC at Category B and Category C receptors. Some of those receptors are already behind existing barriers. Noise abatement was considered for impacted receptors as further described in Section 2.2.8.4, Avoidance, Minimization, and/or Mitigation Measures.

Build Alternatives 4a and 4b

Construction

Build Alternatives 4a and 4b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively. Therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b.

Operation

Build Alternatives 4a and 4b would involve adding an HOT 3+ lane in each direction. Build Alternative 4b would also include building an I-80 connector structure. Noise increases under Alternatives 4a and 4b would be similar or less than that experienced under Build Alternatives 2b and 3a as shown in Table 2.2-18. Build Alternative 4b was not modeled as part of the analysis but would have similar effects as Build Alternative 2b shown in Table 2.2-21 because it would include the I-80 connector structure. As discussed under Alternatives 2a and 2b, Build

Alternatives 4a and 4b, respectively, are predicted to approach or exceed NAC at Category B and Category C receptors. Some of those receptors are already behind existing barriers. Noise abatement was considered for impacted receptors.

Build Alternatives 5a and 5b

Construction

Build Alternatives 5a and 5b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively. Therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b, respectively.

Operation

Build Alternatives 5a and 5b would create an express lane in each direction where all users pay a fee regardless of vehicle occupancy. Noise increases under Build Alternatives 5a and 5b would be similar or less than that experienced under Alternatives 2b and 3a as shown in Table 2.2-21. Build Alternative 5b was not modeled as part of the analysis but would have similar effects as Build Alternative 2b shown in Table 2.2-21 because it would include the I-80 connector structure. As discussed under Alternatives 2a and 2b, all build conditions are predicted to approach or exceed NAC at Category B and Category C receptors. Some of those receptors are already behind existing barriers. Noise abatement was considered for impacted receptors.

Build Alternatives 6a and 6b

Construction

Build Alternatives 6a and 6b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively. Therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b, respectively.

Operation

Build Alternatives 6a and 6b would involve adding a transit-only lane in each direction. Build Alternative 6b would also include building an I-80 connector structure. Noise increases under Build Alternatives 6a and 6b would be similar or less than that experienced under Alternatives 2b and 3a as shown in Table 2.2-21. Build Alternative 6b was not modeled as part of the analysis, but would have similar effects as Build Alternative 2b shown in Table 2.2-21 because it would include the I-80 connector structure. As discussed under Alternatives 2a and 2b, all build conditions are predicted to approach or exceed NAC at Category B and Category C receptors. Some of those receptors are already behind existing barriers. Noise abatement was considered for impacted receptors.

Build Alternatives 7a and 7b

Construction

Construction phase noise and vibration effects described under Build Alternatives 7a and 7b would be shorter than the effects described under Build Alternatives 2a and 2b, respectively. Build Alternatives 7a and 7b would involve repurposing the current number 1 general purpose lane to HOV 2+ and therefore would have a shorter construction duration than Build Alternatives 2a and 2b through 6a and 6b. AMM NOI-1 would require noise-generating construction activities to be restricted to between 7:00 a.m. and 7:00 p.m. on weekdays, with no construction occurring on weekends or holidays. If work is necessary outside of these hours, a construction noise monitoring program and provide additional noise controls would be implemented.

Caltrans Standard Specifications Section 14-8.02 would require that noise levels not to exceed 86 dBA within 50 feet of the job site from the hours of 9:00 PM to 6:00 AM (Standard Measure NOI-1). Build Alternatives 3a and 3b would also implement Standard Measures NOI-2 through NOI-5 to further reduce temporary construction noise levels. Therefore, temporary construction noise would have no adverse effects on nearby receptors.

The vibration analysis also found that no alternatives would exceed construction vibration limits during construction. Accordingly, under Build Alternatives 7a and 7b, neither construction noise nor vibration would result in an adverse impact.

Operation

Build Alternatives 7a and 7b would involve repurposing the current number 1 general purpose lane to HOV 2+. Build Alternative 7b would also include building an I-80 connector structure. Alternatives 7a and 7b would be similar or less than that experienced under Alternatives 2b and 3a as shown in Table 2.2-21. Build Alternative 7b was not modeled as part of the analysis but would have similar effects as Build Alternative 2b shown in Table 2.2-21 because it would include the I-80 connector structure. As discussed under Alternatives 2a and 2b, all build conditions are predicted to approach or exceed NAC at Category B and Category C receptors. Some of those receptors are already behind existing barriers. Noise abatement was considered for impacted receptors.

2.2.8.4 Avoidance, Minimization, and/or Mitigation Measures

Construction

- **AMM NOI-1:** Noise-generating construction activities will be restricted to between 7:00 a.m. and 7:00 p.m. on weekdays, with no construction occurring on weekends or holidays. If work is necessary outside of these hours, Caltrans will require the contractor to implement a construction noise monitoring program and provide additional noise controls where practical and feasible. Pile driving activities will be limited to daytime hours only.

Operation

Noise abatement was considered where noise impacts were predicted in areas of frequent human use that would benefit from a lowered noise level. Noise abatement must be predicted to provide a minimum of a 5 dB reduction at an impacted receptor to be considered feasible by Caltrans (i.e., the barrier would provide a noticeable noise reduction). Additionally, the Caltrans acoustical design goal states the barrier must achieve a 7 dB noise reduction at one or more benefited receptors.

Noise barriers were the only form of noise abatement considered for exterior land uses in the project area. Each noise barrier was evaluated for feasibility based on achievable noise reduction. As described in the Protocol, Caltrans typically limits noise barrier heights to 16 feet for seismic considerations. For each noise barrier found to be acoustically feasible, reasonable cost allowances were calculated by multiplying the number of benefited receptors by $107,000.

Preliminary noise barriers were evaluated at the most acoustically effective locations within the right-of-way. Where the roadway is at grade, or elevated above receptors, the most acoustically effective location for a barrier is near the edge of the shoulder, either on the structure or at the top of the slope. Where the roadway is located in a cut-section, the most acoustically effective location for a barrier is typically at the right-of-way. Barrier analysis was performed in accordance with the Protocol for instances where noise levels at receptors located behind existing noise barriers approached or exceeded the NAC. If, through a comparison of project noise levels with and without the existing barrier, the existing barrier meets the feasibility and acoustical reasonableness requirements for noise reduction, no modifications to the existing barrier or additional abatement were considered.

Eight new noise barriers were studied as potential noise abatement. In addition, 2049 Build noise levels were calculated to approach or exceed the NAC at locations behind four existing barriers. These existing barriers were assessed for feasibility and reasonableness. If the existing barriers did not meet feasibility and acoustical reasonableness requirements, additional barrier heights were considered.

Barrier 1

The outdoor use area at the residential property located at 9460 W Chiles Road (represented by Receptor R150), has been identified for noise abatement because modeled 2049 Build Alternative 3a noise levels would approach or exceed the NAC.

Evaluated Barrier 1 was modeled along the I-80 eastbound travel lanes, extending approximately 970 feet. Table 2.2-23 shows the 2049 Build noise levels and insertion loss for Evaluated Barrier 1 at various design heights.

Table 2.2-23. Evaluated Barrier 1: 2049 Build Noise Levels and Insertion Loss

Receptor ID	Units Represented	2049 Noise Level w/o Wall	$L_{eq[h]}$ Wall H=6 ft	I.L. Wall H=6 ft	$L_{eq[h]}$ Wall H=8 ft	I.L. Wall H=8 ft	$L_{eq[h]}$ Wall H=10 ft	I.L. Wall H=10 ft	$L_{eq[h]}$ Wall H=12[1] ft	I.L. Wall H=12[1] ft	$L_{eq[h]}$ Wall H=14[1] ft	I.L. Wall H=14[1] ft	$L_{eq[h]}$ Wall H=16[1] ft	I.L. Wall H=16[1] ft
R150	1	72	67	5	66	6	65	7	64	8	64	8	64	8

Note: 1 Barrier breaks line of sight between 11.5-foot-high truck stack and 5-foot-high receptor.
Key: H = Height; Leq[h] = The 1-hour A-weighted equivalent sound level; I.L. = Insertion Loss

As shown in Table 2.2-23, Evaluated Barrier 1 would feasibly abate traffic noise at a minimum height of 6 feet, but would not meet the 7 dB design goal. Evaluated Barrier 1 would feasibly abate traffic noise and meet the 7 dB noise reduction goal at a minimum height of 10 feet.

Barrier 2

The pool area at La Quinta Inn & Suites by Wyndham Davis (represented by Receptor ST-12) has been identified for noise abatement because modeled 2049 Build noise levels would exceed the NAC.

Evaluated Barrier 2 was modeled along the I-80 eastbound travel lanes, extending approximately 560 feet. Table 2.2-24 shows the modeled 2049 Build noise levels and insertion loss for Evaluated Barrier 2 at various design heights.

Table 2.2-24. Evaluated Barrier 2: 2049 Build Noise Levels and Insertion Loss

Receptor ID	Units Represented	2049 Noise Level w/o Wall	$L_{eq[h]}$ Wall H=6 ft	I.L. Wall H=6 ft	$L_{eq[h]}$ Wall H=8 ft	I.L. Wall H=8 ft	$L_{eq[h]}$ Wall H=10 ft	I.L. Wall H=10 ft	$L_{eq[h]}$ Wall H=12[1] ft	I.L. Wall H=12[1] ft	$L_{eq[h]}$ Wall H=14[1] ft	I.L. Wall H=14[1] ft	$L_{eq[h]}$ Wall H=16[1] ft	I.L. Wall H=16[1] ft
ST-12	1	71	70	1	70	1	69	2	69	2	69	2	68	3

Note: 1 Barrier breaks line of sight between 11.5-foot-high truck stack and 5-foot-high receptor.
Key: H = Height; Leq[h] = The 1-hour A-weighted equivalent sound level; I.L. = Insertion Loss

As indicated above in Table 2.2-24, Evaluated Barrier 2 would not feasibly abate traffic noise or meet the 7 dB noise reduction goal, at any impacted receptors, even at a height of 16 feet. Therefore, this barrier is not considered to be feasible and new abatement measures are not recommended. A reasonability analysis was not performed because feasibility was not achieved.

Existing Barriers A.1, A.2, A.3

The private outdoor areas of residences at the homes east of Harbor Boulevard, represented by Receptors R70 and R71, have been identified for noise abatement because 2049 Build noise levels would exceed the NAC. Receptors R70 and R71 are shielded from US-50 by an existing 15- to 16-foot-high noise barrier (Existing Barrier A.1) located along US-50 westbound travel lanes.

The private outdoor areas of residences at the homes east of Harbor Boulevard, represented by Receptors R75, R76, R77, R78, and R79, have been identified for noise abatement because 2049 Build noise levels would exceed the NAC. Receptors R75, R76, R77, R78, and R79 are shielded from US-50 by an existing 11- to 16-foot-high noise barrier (Existing Barrier A.2) located along US-50 westbound travel lanes.

The private outdoor areas of residences at the homes east of Harbor Boulevard, represented by Receptors R80, R81, and ST-49, have been identified for noise abatement because 2049 Build noise levels would exceed the NAC. Receptors R80, R81, and ST-49 are shielded from US-50 by an existing 16- to 11-foot-high noise barrier (Existing Barrier A.3) located along US-50 westbound travel lanes.

As summarized in Table 2.2-25, existing Barriers A.1, A.2 and A.3 were calculated to provide 5 dB of noise reduction at R78, 6 dB of noise reduction at R73, and 7 dB of noise reduction at R76, therefore meeting the noise reduction standard for feasibility. The barrier was calculated to provide noise reduction at other receptors in the area, including 9 dB of noise reduction at R68, 10 dB of noise reduction at R72, 11 dB of noise reduction at R70, 12 dB of noise reduction at R71, 13 dB of noise reduction at R75, 14 dB of noise reduction at R80, and 15 dB noise reduction at R79 and ST-49, therefore meeting the noise reduction design goal. Existing Barriers A.1, A.2, and A.3 meet the noise reduction standard for feasibility and the noise reduction design goal.

Table 2.2-25. Existing Barriers A.1, A.2, and A.3

Receptor ID	Units Represented	Noise Level without Wall	$L_{eq[h]}$ with Existing Wall H=11 to 16 feet	I.L. with Existing Wall H=11 to 16 feet
R68	1	77	68	9
R69	1	65	62	3
R70	6	81	70	11
R71	6	82	70	12
R72	6	77	67	10
R73	12	72	66	6
R74	1	66	63	3
R75	7	82	69	13
R76	8	67	59	7
R77	10	61	58	2
R78	5	65	60	5
R79	5	83	68	15
R80	3	82	68	14
R81	6	64	60	4
ST-49	1	85	70	15

Key: Key: H = Height;Leq[h] = The 1-hour A-weighted equivalent sound level; I.L. = Insertion Loss

As shown above, Existing Barriers A.1, A.2, and A.3 would feasibly abate traffic noise and meet the 7 dB design goal at its existing heights of 11 feet to 16 feet.

Barrier 3

Evaluated Barrier 3 was modeled along the US-50 eastbound travel lanes, extending approximately 970 feet. Table 2.2-26 shows the 2049 Build noise levels and insertion loss for Evaluated Barrier 3 at various design heights.

Table 2.2-26. Evaluated Barrier 3 2049 Build Noise Levels and Insertion Loss

Receptor ID	Units Represented	2049 Noise Level w/o Wall	$L_{eq[h]}$ Wall H=6 ft	I.L. Wall H=6 ft	$L_{eq[h]}$ Wall H=8 ft	I.L. Wall H=8 ft	$L_{eq[h]}$ Wall H=10 ft	I.L. Wall H=10 ft	$L_{eq[h]}$ Wall H=12[1] ft	I.L. Wall H=12[1] ft	$L_{eq[h]}$ Wall H=14[1] ft	I.L. Wall H=14[1] ft	$L_{eq[h]}$ Wall H=16[1] ft	I.L. Wall H=16[1] ft
R151	1	70	66	4	66	4	66	4	64	6	64	6	64	6

Note: 1 Barrier breaks line of sight between 11.5-foot-high truck stack and 5-foot-high receptor.
Key: H = Height; Leq[h] = The 1-hour A-weighted equivalent sound level; I.L. = Insertion Loss

As shown above, Evaluated Barrier 3 would feasibly abate traffic noise at a height of 12 feet but would not meet the 7 dB noise reduction goal, at any impacted receptors, even at a height of 16 feet. Therefore, this barrier is not considered to be feasible and new abatement measures are not recommended. A reasonability analysis was not performed because feasibility was not achieved.

Existing Barriers B.1 and B.2

The private outdoor areas of residences at the homes east of Harbor Boulevard, represented by Receptors R82, R83, R84, R85, R86, R87, R88, R89, R90, R91, and R92, have been identified for noise abatement because 2049 Build noise levels would exceed the NAC. Receptors R82, R83, R84, R85, R86, R87, R88, R89, R90, R91, and R92 are shielded from US-50 by an existing 8- to 13.5-foot-high noise barrier (Existing Barrier B.1) located along US-50 westbound travel lanes.

The private outdoor areas of residences at the homes east of Harbor Boulevard, represented by Receptors R93, R94, R95, R96, and R97, have been identified for noise abatement because 2049 Build noise levels would exceed the NAC. Receptors R93, R94, R95, R96, and R97 are shielded from US-50 by an existing 11.5- to 9-foot-high noise barrier (Existing Barrier B.2) located along US-50 westbound travel lanes.

As shown in Table 2.2-27, existing Barriers B.1 and B.2 were calculated to provide 6 dB of noise reduction at R85, and 7dB of noise reduction at R84, therefore meeting the noise reduction standard for feasibility. The barriers were calculated to provide noise reduction at other receptors in the area, including 8 dB of noise reduction at R83, 9 dB of noise reduction at R82, therefore meeting the noise reduction design goal. Existing Barriers B.1 and B.2 meet the noise reduction standard for feasibility and the noise reduction design goal.

Table 2.2-27. Existing Barriers B.1 and B.2

Receptor ID	Units Represented	Noise Level without Wall	$L_{eq[h]}$ with Existing Wall H=8 to 13.5 feet	I.L. with Existing Wall H=8 to 13.5 feet
R82	6	80	71	9
R83	7	79	71	8
R84	9	78	71	7
R85	2	78	71	6
R86	10	61	72	1
R87	10	62	60	2
R88	13	63	60	1
R89	9	63	62	1
R90	4	63	62	1
R91	8	65	62	1
R92	3	73	64	1
R93	11	66	70	3
R94	5	64	66	0
R95	7	64	64	0
R96	5	66	64	0
R97	4	67	66	0

Key: H = Height;:Leq[h] = The 1-hour A-weighted equivalent sound level; I.L. = Insertion Loss

As shown above, Existing Barriers B.1 and B.2 would feasibly abate traffic noise and meet the 7 dB design goal at its existing heights of 8 feet to 13.5 feet.

Existing Barrier 4.1 and 4.2

The private outdoor areas of residences at the US-50 and I-5 interchange, represented by Receptors ST-60, R99, and R100, have been identified for noise abatement because modeled 2049 Build noise levels would approach or exceed the NAC.

Evaluated Barriers 4.1 and 4.2 were modeled along the US-50 westbound ramp onto the I-5 northbound, extending approximately 700 feet and 760 feet, respectively. Table 2.2-28 shows the 2049 Build noise levels and insertion loss for Evaluated Barriers 4.1 and 4.2 at various design heights.

Table 2.2-28. Evaluated Barriers 4.1 and 4.2 in Segment 3b: 2049 Build Noise Levels and Insertion Loss

Receptor ID	Units Represented	2049 Noise Level w/o Wall	$L_{eq[h]}$ Wall H=6 ft	I.L. Wall H=6 ft	$L_{eq[h]}$ Wall H=8 ft	I.L. Wall H=8 ft	$L_{eq[h]}$ Wall H=10 ft	I.L. R99	9	72	70	2	69	3	69	3	68	4	68	4	67	5
R100	7	65	64	1	64	1	63	2	63	2	63	2	63	2

Note: 1 Barrier breaks line of sight between 11.5-foot-high truck stack and 5-foot-high receptor.
Key: H = Height; Leq[h] = The 1-hour A-weighted equivalent sound level; I.L. = Insertion Loss

As shown above, Evaluated Barriers 4.1 and 4.2 would feasibly abate traffic noise at a height of 16 feet but would not meet the 7 dB noise reduction goal, at any impacted receptors, even at a height of 16 feet. Therefore, this barrier is not considered to be feasible and new abatement measures are not recommended. A reasonability analysis was not performed because feasibility was not achieved.

Existing Barrier C

The private outdoor areas of residences at the I-80 US-50 interchange, represented by Receptors R60, R61, R62, R63, R64, R65, R66, ST-40, and ST-41, have been identified for noise abatement because modeled 2049 Build noise levels would approach or exceed the NAC. Receptors R60, R61, R62, R63, R64, R65, R66, ST-40, and ST-41 are shielded from US-50 by an existing 8- to 13.5-foot-high noise barrier (Existing Barrier C) located along US-50 westbound travel lanes and along the US-50 westbound to I-80 eastbound ramp.

As summarized in Table 2.2-29, existing Barrier C was calculated to provide 5 dB of noise reduction at R64 and 6 dB of noise reduction at R61, therefore meeting the noise reduction standard for feasibility. The barrier was calculated to provide noise reduction at other receptors in the area, including 9 dB of noise reduction at ST-40, 11 dB of noise reduction at ST-41, 14 dB of noise reduction at R65, therefore meeting the noise reduction design goal. Existing Barrier C meets the noise reduction standard for feasibility and the noise reduction design goal.

Table 2.2-29. Existing Barrier C: 2049 Build Noise Levels and Insertion Loss

Receptor ID	Units Represented	Noise Level without Wall	$L_{eq[h]}$ with Existing Wall H=8 to 13.5 feet	I.L. with Existing Wall H=8 to 13.5 feet
R60	8	64	62	2
R61	10	70	64	6
R62	14	63	63	0
R63	11	66	62	4
R64	4	63	58	5
R65	1	80	66	14

Receptor ID	Units Represented	Noise Level without Wall	$L_{eq[h]}$ with Existing Wall H=8 to 13.5 feet	I.L. with Existing Wall H=8 to 13.5 feet
R66	1	58	56	2
ST-40	1	75	66	9
ST-41	1	77	66	11

Key: H = Height;Leq[h] = The 1-hour A-weighted equivalent sound level; I.L. = Insertion Loss

As shown above, Existing Barrier C would feasibly abate traffic noise and meet the 7 dB design goal at its existing heights of 8 feet to 13.5 feet.

Barrier 5

The private outdoor areas of residences at the I-80 US-50 interchange, represented by Receptors R102, R103, R104, R105, R152, R153, R154, and R155, have been identified for noise abatement because modeled 2049 Build noise levels would approach or exceed the NAC. Meadowdale Park, represented by ST-38, has also been identified for noise abatement because 2049 Build noise levels would approach or exceed the NAC.

Evaluated Barrier 5 was modeled along the US-50 westbound ramp onto the I-80 eastbound, extending approximately 1,200 feet. Table 2.2-30 shows the 2049 Build noise levels and insertion loss for Evaluated Barrier 5 at various design heights.

Table 2.2-30. Evaluated Barrier 5: 2049 Build Noise Levels and Insertion Loss

Receptor ID	Units Represented	2049 Noise Level w/o Wall	$L_{eq[h]}$ Wall H=6 ft	I.L. Wall H=6 ft	$L_{eq[h]}$ Wall H=8 ft	I.L. Wall H=8 ft	$L_{eq[h]}$ Wall H=10 ft	I.L. Wall H=10 ft	$L_{eq[h]}$ Wall H=12[1] ft	I.L. Wall H=12[1] ft	$L_{eq[h]}$ Wall H=14[1] ft	I.L. Wall H=14[1] ft	$L_{eq[h]}$ Wall H=16[1] ft	I.L. Wall H=16[1] ft
R102	3	65	63	2	62	3	62	3	61	4	61	4	60	5
R103	11	62	61	1	60	2	60	2	59	3	59	3	59	3
R104	4	65	63	2	63	2	62	3	61	4	61	4	61	4
R105	1	69	67	2	66	3	65	4	65	4	64	5	64	5
R152	2	67	65	2	65	2	64	3	63	4	63	4	63	4
R153	3	66	64	2	63	3	62	4	62	4	62	4	62	4
R154	3	65	63	2	62	3	62	3	61	4	61	4	61	4
R155	2	67	64	3	63	4	63	4	62	5	62	5	62	5
ST-38	1	67	66	1	65	2	65	2	65	2	65	2	64	3

Note: 1 Barrier breaks line of sight between 11.5-foot-high truck stack and 5-foot-high receptor.
Key: H = Height; Leq[h] = The 1-hour A-weighted equivalent sound level; I.L. = Insertion Loss

As indicated above, Evaluated Barrier 5 would feasibly abate traffic noise at a height of 12 feet but would not meet the 7 dB noise reduction goal, at any impacted receptors, even at a height of

16 feet. Therefore, this barrier is not considered to be feasible and new abatement measures are not recommended.

Barrier 6 and 7

The private outdoor areas of residences at the Sacramento River, represented by Receptors ST-62, R106, R107, R108, R109, and R110, have been identified for noise abatement because modeled 2049 Build noise levels would approach or exceed the NAC.

Evaluated Barriers 6 and 7 were modeled along the I-80 eastbound and westbound travel lanes, extending approximately 600 feet and 650 feet, respectively. Table 2.2-31 shows the modeled 2049 Build noise levels and insertion loss for Evaluated Barriers 6 and 7 at various design heights.

Table 2.2-31. Evaluated Barriers 6 and 7: 2049 Build Noise Levels and Insertion Loss

Receptor ID	Units Represented	2049 Noise Level w/o Wall	$L_{eq[h]}$ Wall H=6 ft	I.L. Wall H=6 ft	$L_{eq[h]}$ Wall H=8 ft	I.L. Wall H=8 ft	$L_{eq[h]}$ Wall H=10 ft	I.L. R110	1	66	64	2	64	2	64	2	64	2	64	2	64	2

Note: 1 Barrier breaks line of sight between 11.5-foot-high truck stack and 5-foot-high receptor.
Key: H = Height; Leq[h] = The 1-hour A-weighted equivalent sound level; I.L. = Insertion Loss

As indicated above, Evaluated Barriers 6 and 7 would feasibly abate traffic noise at a height of 12 feet but would not meet the 7 dB noise reduction goal, at any impacted receptors, even at a height of 16 feet. Therefore, this barrier is not considered to be feasible and new abatement measures are not recommended. A reasonability analysis was not performed because feasibility was not achieved.

Barrier 8

The private outdoor areas of residences at the subdivision north of the Sacramento River, represented by Receptors ST-65, ST-66, R111, R112, and R113, have been identified for noise abatement because modeled 2049 Build noise levels would approach or exceed the NAC.

Evaluated Barrier 8 was modeled along the I-80 eastbound lanes, extending approximately 750 feet. Table 2.2-32 shows the modeled 2049 Build noise levels and insertion loss for Evaluated Barrier 8 at various design heights.

Table 2.2-32. Evaluated Barrier 8: 2049 Build Noise Levels and Insertion Loss

Receptor ID	Units Represented	2049 Noise Level w/o Wall	$L_{eq[h]}$ Wall H=6 ft	I.L. Wall H=6 ft	$L_{eq[h]}$ Wall H=8 ft	I.L. Wall H=8 ft	$L_{eq[h]}$ Wall H=10 ft	I.L. R112	4	62	60	2	58	4	58	4	57	5	57	5	57	5
R113	8	67	64	3	63	4	62	5	61	6	61	6	61	6

Note: 1 Barrier breaks line of sight between 11.5-foot-high truck stack and 5-foot-high receptor.
Key: H = Height; Leq[h] = The 1-hour A-weighted equivalent sound level; I.L. = Insertion Loss

As indicated above in Table 2.2-29, Evaluated Barrier 8 would feasibly abate traffic noise at a height of 8 feet but would not meet the 7 dB noise reduction goal, at any impacted receptors, even at a height of 16 feet. Therefore, this barrier is not considered to be feasible and new abatement measures are not recommended. A reasonability analysis was not performed because feasibility was not achieved.

Existing Barrier D

The private outdoor areas of residences north of the Sacramento River to West El Camino Avenue, represented by Receptors ST-68, ST-70, ST-72, ST-73, ST-74, ST-75, R125, R126, R127, R128, R129, R130, R131, R132, R133, R134, R135, R136, R137, R138, R139, R140, R141, R142, R143, and R144, have been identified for noise abatement because modeled 2049 Build noise levels would exceed the NAC. River Otter Park, represented by Receptor ST-71, has been identified for noise abatement because modeled 2049 Build noise levels would exceed the NAC. Receptors ST-68, ST-69, ST-70, ST-71, ST-72, ST-73, ST-74, ST-75, R125, R126, R127, R128, R129, R130, R131, R132, R133, R134, R135, R136, R137, R138, R139, R140, R141, R142, R143, and R144 are shielded from I-80 by an existing 12.5- to 13-foot-high noise barrier (Existing Barrier D) located along I-80 eastbound travel lanes.

As summarized in Table 2.2-33, existing Barrier D was calculated to provide 5 dB of noise reduction at R128, therefore meeting the noise reduction standard for feasibility. The barrier was calculated to provide noise reduction at other receptors in the area, including 7 dB of noise reduction at R139, 8 dB of noise reduction at ST-72 and ST-73, 9 dB of noise reduction at R125 and R126, and 10 dB of noise reduction at ST-70, ST-71, R130, and R141, therefore meeting the noise reduction design goal. Existing Barrier D meets the noise reduction standard for feasibility and the noise reduction design goal.

Table 2.2-33. Existing Barrier D: 2049 Build Noise Levels and Insertion Loss

Receptor ID	Units Represented	Noise Level without Wall	Leq[h] with Existing Wall H=12.5 to 13 feet	I.L. with Existing Wall H=12.5 to 13 feet
ST-68	1	68	66	2
ST-70	1	77	67	10
ST-71	1	75	65	10
ST-72	1	66	58	8
ST-73	1	68	60	8

R139	10	68	61	7
R140	20	56	54	0
R141	7	76	66	10
R142	6	56	55	1
R143	40	53	52	1
R144	7	63	63	0

Key: H = Height;Leq[h] = The 1-hour A-weighted equivalent sound level; I.L. = Insertion Loss

As shown in Table 2.2-33, Existing Barrier D would feasibly abate traffic noise and meet the 7 dB design goal at its existing heights of 12.5 feet to 13 feet.

Noise Abatement Evaluation Summary

The overall reasonableness of noise abatement is determined by the following three factors:

- The noise reduction design goal (a barrier must be predicted to provide at least 7 dB of noise reduction at one or more benefited receptors).
- The cost of noise abatement (reasonable allowance of $107,000 per benefited receptor).
- The viewpoints of benefited receptors (including property owners and residents of the benefited receptors).

For any noise barrier to be considered reasonable from a cost perspective, the estimated cost of the barrier should be equal to or less than the total cost allowance calculated for the barrier. The cost calculations of the noise barrier must include all items appropriate and necessary for construction of the barrier, such as traffic control, drainage modification, retaining walls, landscaping for graffiti abatement, and right-of-way costs. Lastly, all existing sound barriers discussed in this EIR/EA are to be left in place.

Table 2.2-34 lists the reasonableness allowance calculated for all barriers that were calculated to be acoustically feasible and to meet the Caltrans noise reduction design goal. For each noise barrier found to be acoustically feasible, reasonable cost allowances were calculated by multiplying the number of benefited receptors by $107,000.

Table 2.2-34. Summary of Acoustically Feasible and Reasonable Noise Barriers and Replacement Barriers

Barrier ID	Approximate Stationing/ Location[1]	Noise Level without Barrier at Benefited Receptors ($L_{eq[h]}$)	Barrier Height (feet)	Insertion Loss (dBA)	Number of Benefited Receptors	Total Reasonable Monetary Allowance
Evaluated Barrier 1	Along I-80 eastbound from south of Richards Boulevard to north of railroad tracks (970 ft)	72	10	-7	1	$107,000
			12[2]	-8	1	$107,000
			14[2]	-8	1	$107,000
			16[2]	-8	1	$107,000

Notes:
1. Barrier lengths are based on linear approximations used for purposes of noise modeling in TNM 2.5. Actual lengths may differ slightly due to barrier curvature, etc.
2. Barrier breaks line of sight between 11.5-foot-high truck stack and 5-foot-high receptor.
Key: Leq[h] = The 1-hour A-weighted equivalent sound level; dBA = A-weighted decibels

According to the Noise Abatement Decision Report (Caltrans 2022b), the evaluated barriers would cost significantly more than the reasonable monetary allowance that it would be allocated. As such, the evaluated barriers are considered unreasonable and were not recommended and are therefore not considered further. Without noise barriers, interior noise levels are anticipated to increase by a maximum of 2 dBA at sensitive receptors (Table 2.2-21). This change is barely perceivable by the human ear, therefore there would not be an adverse impact.

No new barriers are proposed as part of the project.

2.2.9 Energy

2.2.9.1 Regulatory Setting

The National Environmental Policy Act (NEPA) (42 U.S. Code Part 4332) requires the identification of all potentially significant impacts on the environment, including impacts on energy resources. Guidance for evaluating energy impacts of transportation projects subject to NEPA is outlined in FHWA's Technical Advisory T 6640.8A (Technical Advisory). The Technical Advisory energy analysis requirement applies to projects for which an Environmental Impact Statement (EIS) is prepared. The Technical Advisory indicates that documentation should discuss energy requirements for construction and operation, and the overall conservation potential for each of the project alternatives. The relationship of the project alternatives to applicable state or regional energy plan should also be documented. Additional conservation measures, such as use of high-occupancy vehicle incentives and other measures to improve traffic flow should also be identified.

Other measures to improve energy efficiency in the transportation sector have been implemented at the federal level. In recent years, the United States Environmental Protection Agency (U.S. EPA) and the National Highway Traffic Safety Administration (NHTSA) issued Final Rules governing Corporate Average Fuel Economy (CAFE) standards and other improvements to fuel economy to new vehicles.

On December 28, 2018, the Governor's Office of Planning and Research and the California Natural Resources Agency updated the California Environmental Quality Act (CEQA) Guidelines to require that an environmental document include an analysis of a project's potential for significant environmental effects resulting from wasteful, inefficient, or unnecessary use of energy; or wasteful use of energy resources (Guidelines § 15126.2(b)). The Initial Study/Negative Declaration/Mitigated Negative Declaration (IS/ND/MND) or Environmental Impact Report shall describe feasible measures which could minimize inefficient and unnecessary consumption of energy (Guidelines § 15126.4) and examples of energy conservation measures are provided in the Guidelines Appendix F.

Assembly Bill (AB) 32 codified the 2020 greenhouse gas (GHG) emissions reduction goals outlined in Executive Order (EO) S-3-05. Senate Bill 32 codified the GHG reduction targets established in EO B-30-15 to achieve a mid-range goal of 40 percent below 1990 levels by 2030. The California Air Resources Board (ARB) is required to create a scoping plan and implement rules to achieve “real, quantifiable, cost-effective reductions of greenhouse gases.” The law requires ARB to adopt rules and regulations to achieve the maximum technologically feasible and cost-effective GHG reductions. Energy use and efficiency are important considerations for achieving state goals to reduce greenhouse gas emissions.

2.2.9.2 Affected Environment

The I-80/US-50 corridor experiences heavy congestion during commute periods due to high vehicular demand. The corridor has infrastructure deficiencies, such as short weaving and merging areas, lane drops that create bottlenecks, incomplete ramp metering and auxiliary lane

systems, and inadequate ITS elements. The corridor also experiences recreational traffic, leading to heavy congestion on weekends and holidays.

The Yolo Bypass Causeway is the only direct route connecting the Davis area to West Sacramento and beyond. Heavy congestion and stop-and-go traffic have contributed to increased vehicle emissions, travel costs, emergency response times, and reduced travel time reliability. The congestion has been created by multiple factors, including high traffic volumes, short weaving and merging areas, lane drops, limited sight distances, and incomplete bus and carpool lanes, ramp metering, and auxiliary lane networks.

Motorists traveling on I-80/US-50 experience delays throughout the day, with congestion at its maximum during the afternoon peak period. Data analysis shows that in the eastbound direction, the peak hour occurs during the 4:00 p.m. to 5:00 p.m. hour, with the peak period starting from 3:00 p.m. and lasting to 7:00 p.m. through Davis, and travel being impacted by bottlenecks at Richards Boulevard and Mace Boulevard. Significant morning delays on westbound I-80 occur between 8:00 a.m. to 10:00 a.m., with a severe bottleneck forming at the I-80/US-50 interchange when travel demand volumes are at their peak because of commute-related trips. Westbound US-50 frequently experiences congestion due to queue spillback of traffic at the I-80/US-50 interchange bottleneck. Peak congestion on eastbound US-50 within the project limits occurs during the afternoon peak period, from 4:00 p.m. to 6:00 p.m. The I-80/US-50 corridor primarily operates at Level of Service (LOS) F during the morning and afternoon peak hours within the project limits. The LOS F conditions are anticipated to worsen due to the projected traffic growth in the area.

The existing Yolo 80 bikeway on the north side of the existing Yolo Causeway is underutilized by bicycle riders due to lack of connectivity. Currently, there are three entrance and exit points to the Yolo 80 bikeway. The configuration of the eastern terminus requires that east/west bicycle and pedestrian traffic traverse around the back of two gas stations to avoid several driveways of ingress and egress for automobile and commercial truck traffic. Bicycle and pedestrian traffic must then cross four lanes of traffic to proceed eastbound on West Capitol Avenue.

Transportation energy is generally described in terms of direct and indirect energy. Direct energy is the energy consumed in the actual propulsion (e.g., automobiles, trains, airplanes). This energy consumption is a function of traffic characteristics such as VMT, speed, vehicle mix, and thermal value of the fuel being used. Some projects may also include features such as new or replacement roadway lighting or other features requiring electricity, which is an ongoing and permanent source of direct energy consumption.

Indirect energy is defined as all of the remaining energy consumed to run a transportation system, including maintenance energy, and any substantial impacts on energy consumption related to project-induced land use changes and mode shifts, as well as any substantial changes in energy associated with vehicle operation, manufacturing, or maintenance due to increased automobile use. The one-time energy expenditure involved in constructing a project is also considered indirect energy.

Transportation energy is generally described in terms of direct and indirect energy. Direct energy is the energy consumed in the actual propulsion (e.g., automobiles, trains, airplanes).

This energy consumption is a function of traffic characteristics such as VMT, speed, vehicle mix, and thermal value of the fuel being used. Some projects may also include features such as new or replacement roadway lighting or other features requiring electricity, which is an ongoing and permanent source of direct energy consumption.

Indirect energy is defined as all of the remaining energy consumed to run a transportation system, including maintenance energy, and any substantial impacts on energy consumption related to project-induced land use changes and mode shifts, as well as any substantial changes in energy associated with vehicle operation, manufacturing, or maintenance due to increased automobile use. The one-time energy expenditure involved in constructing a project is also considered indirect energy.

2.2.9.3 Environmental Consequences

This section was prepared using the Energy Evaluation that was prepared for the project (Caltrans 2023j). The basic procedure for analyzing direct energy consumption from mobile sources is to calculate fuel consumption using CT-EMFAC2021. CT-EMFAC2021 is an emission model developed by Caltrans that calculates project-level emissions and fuel consumption using data from the California Air Resources Board's EMFAC model. The fuel consumption can be easily derived from the CT-EMFAC model run prepared for the criteria pollutant and GHG emissions analyses.

The basic procedure for analyzing indirect energy consumption from construction activities is to obtain fuel consumption projections in gallons from the Caltrans Construction Emission Tool (CAL-CET 2021, v1.0).

With regards to VMT, the Project level VMT distribution data and speed bins for the existing, no build, and build alternatives, along with the CT-EMFAC2021 emission rates, were used to calculate the fuel consumptions for the existing 2019, opening 2029, and design 2049 year conditions with (alternative option b) or without (alternative option a) an HOV-HOV connector. Direct Energy

The project fuel consumption during construction is summarized in Table 2.2-35. Fuel consumption projections were determined from the Caltrans Construction Emission Tool (CAL-CET 2020).

Table 2.2-35. Project Level Fuel Consumption During Construction

Construction	Diesel (gallon/project)	Gasoline (gallon/project)	Electricity
Roadway	230,359	140,913	23,883
Bridge/Structures	140,161	23,775	7,661

Source: Caltrans District 3 Yolo Corridor Improvement Project Energy Study (Caltrans 2023j)

VMT data for the existing, No Build, and Build Alternatives, along with the CT-EMFAC2017 emission rates, were used to calculate the fuel consumptions for the existing 2019 and Opening

Year 2029. They are summarized in Table 2.2-36. The fuel consumption for the existing 2029 compared to horizon year 2049 conditions is summarized in Table 2.2-37.

Indirect Energy

Construction indirect energy consumption would result from traffic delays due to construction. The Project's TMP would reduce construction related traffic impacts. The TMP would assist in managing traffic congestion and provide signage to affected residents and businesses in the event temporary closures or detours are warranted during construction activities. Compared with indirect energy use by construction vehicles and equipment, indirect energy use due to construction-related traffic delays would be minimal and would be reduced with implementation of the TMP.

For indirect energy of maintaining the project (permanent impacts) in the long term, it will incorporate the use of energy-efficient lighting, such as LED traffic signals and streetlights, to the extent feasible. LED lights consume 10 percent of the electricity of traditional lights. Furthermore, Intelligent Transportation System (ITS) elements within the project limits would give travelers information about special events such as traffic congestion, accidents, and incidents such as terrorist attacks, AMBER/Silver/Blue Alerts, roadwork zones, or speed limits on a specific highway segment. Such ITS would save energy by notifying vehicles to take alternative routes, limit travel speed, warn of duration and location of the incidents, inform of the traffic conditions, or display public safety messages.

Table 2.2-36. Comparison between Existing, Build Alternatives and No Build Alternative in Fuel Consumption in Opening Year 2029 with Alternative a and Alternative b.

No Build Alternative 1

Construction and Operation

Under No Build Alternative 1, managed lanes and transportation improvements would not be constructed or operated. As such, No Build Alternative 1 would not involve any construction energy effects. Vehicles would continue to consume fuel and energy within the project area.

Build Alternatives 2a and 2b

Construction

Build Alternatives 2a and 2b would result in short-term energy consumption related to the manufacture of construction materials, the use of construction equipment that requires petroleum fuels, and the use of construction workers' motor vehicles as they travel to and from the site. Due to high daytime traffic volumes, night work would be expected. Both day and night work should be anticipated throughout the project duration. Thus, construction-related energy consumption would be finite and limited and would have an incremental impact on area energy supplies.

As indicated above, energy use associated with project construction under Build Alternatives 2a and 2b is conservatively estimated to result in the short-term consumption of 370,520 gallons of combined diesel and gasoline from construction equipment. This represents a small demand on local and regional fuel supplies that would be easily accommodated, and this demand would cease once construction is complete. Moreover, construction-related energy consumption would be temporary and not a permanent new source of energy demand, and demand for fuel would have no noticeable effect on peak or baseline demands for energy.

Construction indirect energy consumption would result from traffic delays due to construction. The project's TMP, as required per Standard Measure TT-3, would reduce construction-related traffic effects. The TMP would assist in managing traffic congestion and provide signage to affected residents and businesses in the event temporary closures or detours are warranted during construction activities. Compared with direct energy use by construction vehicles and equipment, indirect energy use due to construction-related traffic delays would be minimal and would be reduced with implementation of the TMP. Additionally, AMM Energy-1 would be implemented to help conserve energy during the construction period. Therefore, construction of the project would not result in an inefficient, wasteful, and unnecessary consumption of energy.

Operation

Build Alternatives 2a and 2b would involve adding an HOV2+ lane in each direction. Build Alternatives 2a and 2b would increase highway capacity which would result in an increase of traffic using the managed lanes and associated I-5/US-50 interchange and I-80/US-50 connectors. For opening year and horizon year, as shown in Table 2.2-36 and Table 2.2-37, Build Alternatives 2a and 2b would generate new vehicular traffic trips causing increased VMT. Direct energy consumption (i.e., fuel for vehicles) is expected to decrease about 13.2 percent for Build Alternative 2a and increase 1 percent for Build Alternative 2b as compared to No Build Alternative 1.

Although there is a modeled increase in VMT during operation of the project over the long term, newer and more fuel-efficient vehicles and electric vehicles would enter the fleet, resulting in an overall lower potential for an increase in energy consumption. When compared to No Build Alternative 1, Build Alternatives 2a and 2b are expected to result in a 14.5 percent and 0.8 percent, respectively, decrease in energy use in the year 2049 (Table 2.2-37). The project's proposed improvements under Build Alternatives 2a and 2b would improve roadway operations and reduce traffic delay within the project limits. Excess fuel consumption associated with vehicle delay and congestion within the project limits would decrease compared to No Build Alternative 1.

For indirect energy, the project would incorporate the use of energy-efficient lighting, such as LED traffic signals and streetlights, to the extent practicable. LED lights consume 10 percent of the electricity of traditional lights. Furthermore, ITS within the project limits would give travelers information such as traffic congestion, accidents, and other incidents that may cause traffic delays. ITS would save energy by notifying vehicles to take alternate routes, limit travel speed, warn of duration and location of incidents, inform travelers of traffic conditions, or display public safety messages.

When balancing energy used during construction and operation against energy saved by relieving congestion and other transportation efficiencies, the project would not have substantial energy effects. No adverse permanent effects are anticipated.

Build Alternatives 3a and 3b

Construction

Build Alternatives 3a and 3b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively; and construction effects would be similar.

Operation

Build Alternatives 3a and 3b would involve adding an HOT2+ lane in each direction. Permanent effects would be similar to Build Alternatives 2a and 2b; however, fuel consumption would be decreased by 13.9 percent for Build Alternative 3a and increased by 0.5 percent for Build Alternative 3b compared to No Build Alternative 1 in Opening Year 2029 (Table 2.2-36). When compared to No Build Alternative 1 in horizon year 2049, Build Alterative 3a would result in a decrease of 15.4 percent and Build Alternative 3b would result in a decrease of 1.5 percent. The effects would be slightly less than effects described under Build Alternatives 2a and 2b.

Build Alternatives 4a and 4b

Construction

Build Alternatives 4a and 4b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively; and construction effects would be similar.

Operation

Build Alternatives 4a and 4b would involve adding an HOT3+ lane in each direction. Permanent effects would be similar to Build Alternatives 2a and 2b, respectively; however, the fuel consumption would decrease by 15.2 percent under Build Alternative 4a and decreased by 0.8 percent under Build Alternative 4b compared to No Build Alternative 1 in Opening Year 2029 (Table 2.2 36). Fuel consumption would decrease 16.6 percent under Build Alternative 4a and decreased 3.4 percent under Build Alternative 4b compared to No Build Alternative 1 in the horizon year 2049. The effects would be slightly less than effects described under Build Alternatives 2a and 2b, respectively.

Build Alternatives 5a and 5b

Construction

Build Alternatives 5a and 5b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively; and construction effects would be similar.

Operation

Build Alternatives 5a and 5b would involve adding an Express Lane in each direction. Permanent effects would be similar to Build Alternatives 2a and 2b, respectively. The fuel consumption would decrease 16.5 percent under Build Alternative 5a and decrease 2.1 percent under Build Alternative 5b compared to No Build Alternative 1 in Opening Year 2029 (Table 2.2-36). Fuel consumption would decrease 17.5 percent under Build Alternative 5a and decrease 4.3 percent under Build Alternative 5b compared to No Build Alternative 1 in horizon year 2049. The effects would be slightly less than described under Build Alternatives 2a and 2b, respectively.

Build Alternatives 6a and 6b

Construction

Build Alternatives 6a and 6b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively; and construction effects would be similar.

Operation

Build Alternatives 6a and 6b would involve adding a transit-only lane in each direction. Permanent effects would be similar to Build Alternatives 2a and 2b, respectively; however, the fuel consumption would decrease 20.0 percent under Build Alternative 6a and decrease 7.0 percent under Build Alternative 6b compared to No Build Alternative 1 in Opening Year 2029 (Table 2.2-36). Fuel consumption would decrease 17.0 percent under Build Alternative 6a and decrease 3.3 percent under Build Alternative 6b compared to No Build Alternative 1 in horizon year 2049. Therefore, the effects would be slightly less than described under Build Alternatives 2a and 2b, respectively.

Build Alternatives 7a and 7b

Construction

Build Alternatives 7a and 7b would involve repurposing an existing general-purpose lane to HOV 2+. No new lanes would be constructed. Because Build Alternatives 7a and 7b would not add new lanes but would repurpose existing lanes as managed lanes, the Build Alternatives 7a and 7b construction period may have shorter duration resulting in fewer delays than those under Build Alternatives 2a, 2b, 3a, 3b, 4a, 4b, 5a, 5b, 6a, and 6b and would use less gasoline and fuel.

Operation

As no new lanes would be constructed, Build Alternatives 7a and 7b do not increase capacity due to replacing an existing traffic lane with an HOV 2+ lane. The fuel consumption would decrease 17.7 percent under Build Alternative 7a and decrease 4.3 percent under Build Alternative 7b compared to No Build Alternative 1 in Opening Year 2029 (Table 2.2 36). Fuel consumption would decrease 18.2 percent under Build Alternative 7a and decreased 4.7 percent under Build Alternative 7b compared to No Build Alternative 1 in horizon year 2049. The effects would be slightly less than described under Build Alternatives 2a and 2b, respectively.

2.2.9.4 Avoidance, Minimization, and/or Mitigation Measures

Caltrans would implement the following AMMs to reduce construction effects on energy consumption.

- **AMM ENERGY-1: Construction Energy Efficiency Plan**. As part of the Plans, Specifications, and Estimates (PS&E), the Resident Engineer will prepare a Construction Energy Efficiency Plan, which may include the following:
    - Reuse of existing rail, steel, and lumber, wherever possible, such as for falsework, shoring, and other applications during the construction process
    - Recycling of asphalt taken up from roadways, if practicable and cost-effective
    - Use of newer, more energy-efficient equipment, where feasible, and maintenance of older construction equipment to keep in good working order
    - Promoting of scheduling of construction operations to efficiently use construction equipment (i.e., only haul waste when haul trucks are full and combine smaller dozer operations into a single comprehensive operation, where possible)
    - Promotion of construction employee carpooling

2.3 Biological Environment

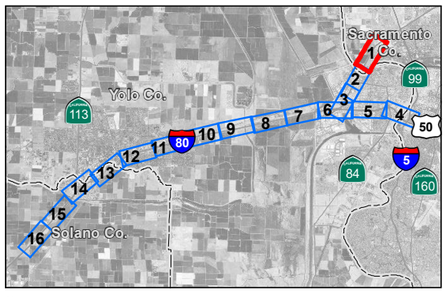
Caltrans prepared a Natural Environment Study (NES) to provide technical information to determine the extent that the project would affect plants, wildlife, and natural communities,

including special-status species, potentially jurisdictional wetlands and waters, and protected plant communities (Caltrans 2023). These biological resources are further detailed in the following sections. As summarized in Appendix E, Standard Measures BIO-1 through BIO-4 are incorporated into the project to avoid potential impacts on biological resources.

The biological study area (BSA) encompasses all currently proposed project improvements and ancillary construction areas (e.g., staging areas, access roads), and totals approximately 1,147.22 acres. For this project, the BSA encompasses the same boundary as the ESL.

2.3.1 Natural Communities

This section of the document discusses natural communities of concern. The focus of this section is on biological communities, not individual plant or animal species. This section also includes information on wildlife corridors and habitat fragmentation. Wildlife corridors are areas of habitat used by wildlife for seasonal or daily migration. Habitat fragmentation involves the potential for dividing sensitive habitat and thereby lessening its biological value.



Habitat areas that have been designated as critical habitat under the Federal Endangered Species Act are discussed below in the Threatened and Endangered Species Section 2.3.8. Wetlands and other waters are also discussed below in Section 2.3.2.

2.3.1.1 Affected Environment

On May 10-14 and 18-20, 2021, and July 14, 2022, a vegetation characterization survey was conducted within the BSA. Habitat types in the BSA were classified based on the California Wildlife Habitat Relationships (CWHR) classification scheme that used vegetation descriptions as developed in *A Guide to Wildlife Habitats of California* (Mayer and Laudenslayer 1988), which were converted (via crosswalk) from the vegetation alliance classification system described in *A Manual of California Vegetation, Second Edition* (MCV) (Sawyer et al. 2009) and the web-based version *Manual of California Vegetation Online* (CNPS 2021). A total of 21 MCV alliances that correspond to 11 CWHR habitat types were identified in the BSA (Figure 2.3-1) (Table 2.3-1). Descriptions of the 11 CHWR habitat types are detailed below.

More than 50 percent (685.29 acres) of the BSA was classified as either developed, or ornamental, with developed accounting for the highest acreage (595.93 acres). There are five natural/semi-natural habitat types that occur in the BSA, of which California Annual and Perennial Grassland accounted for the highest acreage (346.88 acres) comprising predominantly non-native grass species such as rye grass (*Festuca perennis*) and wild oats (*Avena* spp.).

Source: Caltrans District 3 Yolo Corridor Improvement Project Natural Environment Study. (Caltrans. 2023)
Note: BSA – Biological Study Area, CWHR - California Wildlife Habitat Relationships, MCV – Manual of California Vegetation

Developed

Developed areas account for more than half (about 596 acres) of the BSA and include highways, on-ramps, off-ramps, frontage roads, commercial areas, and other urbanized areas. Vegetation is absent on the road surface, although sparse opportunistic grasses and forbs are present on the road shoulders.

Ornamental

Ornamental is the most represented vegetation type in the BSA. Within the BSA, non-native ornamental vegetation has been planted as windbreaks near croplands and as landscaping in urban areas. Stands observed include various eucalyptus (*Eucalyptus* spp.), Lombardy poplar (*Populus nigra*), English walnut (*Juglans regia*), Peruvian pepper tree (*Schinus molle*), and Chinese elm (*Ulmus parvifolia*). The MCV includes ornamental vegetation alliances that do not encompass all species encountered in the BSA. For the purposes of this survey, all ornamental stands have been lumped together in one ornamental category.

Cropland

Croplands are present in the Yolo Bypass, where there are rice fields that are regularly flooded. There is also a large hayfield just to the west of Yolo Bypass and adjacent to CR 32A.

Annual Grassland

Annual Grassland is the second largest habitat type in the BSA. It occurs throughout the BSA, along the highway, off-ramps, and shoulders, where it is regularly mowed and/or treated with herbicide. Within the BSA, this habitat type is dominated (greater than 30 percent relative cover) by one of several non-native grass species such as wild oat, soft chess (*Bromus hordeaceus*), or wall barley (*Hordeum murinum*). Other non-native grasses and forbs including ripgut brome (*Bromus diandrus*), perennial pepper weed (*Lepidium latifolium),* and prickly oxtongue (*Helminthotheca echioides*).

Perennial Grassland

Perennial Grassland occurs adjacent to the highway in the Yolo Bypass and is dominated (greater than 50 percent relative cover) by perennial rye grass. Other non-native grasses and forbs, including ripgut brome, soft chess, perennial pepperweed, and prickly oxtongue, are present as well.

Coast Oak Woodland

Coastal oak woodland occurs within the BSA in small, scattered stands to the north along the highway near Davis. These stands appear to have been planted along the highway as a landscaping tree. Coast live oak is dominant with greater than 50 percent relative cover in the tree stratum in association with other ornamental trees. The herbaceous stratum contains non-native grass species such as wild oats.

Valley Oak Woodland

Valley oak woodland occurs intermittently in the BSA, with most occurrences near Davis and also near the Sacramento River. Many stands associated with I-80 have been planted, while some stands in proximity to riparian corridors, such as Putah Creek, appear to be naturally occurring. Valley oak is dominant with greater than 35 percent relative cover and in association with other oak species (*Quercus* sp.) and English walnut at lower cover. The herbaceous

stratum is typically dominated by non-native grass species such as wild oats and perennial rye grass (*Festuca perennis*).

Interior Live Oak Woodland

Interior live oak woodland was mapped in one planted stand in the BSA, south of Davis, along the interchange to northbound State Route 113. Interior live oak (*Quercus wislizeni*) is dominant with greater than 50 percent relative cover. The herbaceous stratum is dominated by non-native grass species such as wild oats and perennial rye grass.

Valley Foothill Riparian

Valley foothill riparian occurs in small patches in the BSA, and is typically associated with drainages, particularly in the Yolo Bypass, Prospect Slough, and along the Sacramento River. One isolated stand occurs near Sparling Lane south of Davis, and one is associated with a pond. Fremont cottonwood (*Populus fremontii*) is dominant with greater than 50 percent relative cover and in association with various willows (*Salix* spp.) at low cover, and a sparse herbaceous stratum.

Saline Emergent Wetland

Saline emergent wetland occurs in and adjacent to a shallow roadside ditch that runs adjacent to I-80 in Dixon. This alliance is dominated by salt grass (*Distichlis spicata*) at greater than 70 percent relative cover with other non-native grasses and forbs such as harding grass (*Phalaris aquatica*) and bristly ox tongue. Patchy broadleaf cattail (*Typha latifolia*) and bulrush (*Schoenoplectus acutus*) also are present.

Fresh Emergent Wetland

Fresh Emergent Wetland occurs in a ditch that runs adjacent to I-80 near the east side of the Yolo Bypass and is dominated by hardstem bulrush at greater than 50 percent relative cover. Other emergent species in this feature, such as broadleaf cattail and water primrose, are present as well. Another occurrence of fresh emergent wetland occurs in ditches near Yolo Bypass and in a ditch west of Sacramento. It is dominated almost exclusively by invasive water primrose (*Ludwigia peploides*), which floats on top of the water and persists on the ground surface when water levels drop. Mosquito fern (*Azolla microphylla*), a native species, is also present at less than 10 percent relative cover.

Open Water

Open Water is not a vegetation alliance; but for the purposes of this survey, it is included as unvegetated waterbodies. Within the BSA, this includes the Sacramento River, which is crossed twice by the BSA, the South Fork of Putah Creek, Prospect Slough, agricultural ditches, and a pond in the Yolo Bypass.

Habitat Connectivity

Habitat corridors are segments of land that provide linkages between different habitats while also providing cover. On a broader level, corridors also function as avenues along which wide-ranging animals can travel, plants can propagate, genetic interchange can occur, populations can move in response to environmental changes and natural disasters, and threatened species can relocate from other areas. Habitat corridors often consist of riparian areas along streams, rivers, or other natural features. Additionally, the rivers and streams themselves may serve as migration corridors for anadromous fish. The Sacramento River, Putah Creek, the Yolo Bypass, and the adjacent upland forested communities (e.g., riparian corridors along the Sacramento River and Putah Creek) could provide habitat connectivity within the BSA.

Sensitive Natural Communities

California Department of Fish and Wildlife (CDFW) maintains a list of California Sensitive Natural Communities. Sensitive Natural Communities are classified following the technical approach described in the MCV (Sawyer et al. 2009) and the California Native Plants Society (CNPS) web-based version of the manual, *A Manual of California Vegetation Online* (CNPS 2021). The MCV describes common to rare vegetation types in California and is the authority on vegetation classification for large- to fine-scale vegetation mapping efforts in the state. The current list of California Sensitive Natural Communities (CDFW 2021a) was reviewed to determine whether any Sensitive Natural Communities occur in the BSA.

Seven MCV alliances mapped within the BSA are considered Sensitive Natural Communities by CDFW: Oregon ash groves, California sycamore woodlands, Fremont cottonwood forest and woodland, valley oak woodland and forest, Gooding's willow riparian woodland and forest, gum plant patches, and hardstem bulrush marshes. These alliances correspond to the valley foothill riparian, valley foothill woodland, fresh emergent wetland, and annual/perennial grassland CWHR communities described in the Vegetation Communities section above. Table 2.3-2 provides a crosswalk for how these alliances correspond to the CWHR communities.

Table 2.3-2. California Department of Fish and Wildlife Sensitive Natural Community to California Wildlife Habitat Relationships Community Crosswalk

CWHR Community Type	CDFW Sensitive Natural Community
Annual/perennial grassland	Gum plant patches
Fresh emergent wetlands	Hardstem bulrush marshes
Valley foothill riparian	Oregon ash groves California sycamore woodlands Fremont cottonwood forest and woodland Gooding's willow riparian woodland and forest
Valley oak woodland	Valley oak woodland and forest

Source: Caltrans District 3 Yolo Corridor Improvement Project Natural Environment Study. (Caltrans. 2023)
Note: CWHR - California Wildlife Habitat Relationships; CDFW – California Department of Fish and Wildlife

Riparian Habitat

Riparian habitat is considered a sensitive natural community by USACE, Regional Water Quality Control Board (RWQCB), and CDFW, and is present in the BSA. In addition to providing habitat for many wildlife species, riparian areas provide shade, sediment, nutrient or chemical regulation, stream bank stability, and input for large woody debris or organic matter to the channel, which are necessary habitat elements for fish and other aquatic species. Riparian habitat (approximately 15.4 acres) occurs in the vicinity of Putah Creek, Yolo Bypass, and along the Sacramento River at both the I-80 and US-50 crossings in the BSA.

2.3.1.2 Environmental Consequences

No Build Alternative 1

Construction and Operation

No Build Alternative 1 would not result in physical or operational improvements within the BSA. Therefore, No Build Alternative 1 would not affect natural communities of concern.

Build Alternatives 2a and 2b

Construction and Operation

Impacts on CDFW Sensitive Natural Communities would only occur on sensitive natural communities located within the valley foothill riparian and valley foothill woodland CWHR communities. Temporary and permanent impacts, as a result of Build Alternatives 2a and 2b, on CDFW Sensitive Natural Communities and the riparian communities considered sensitive by USACE and RWQCB are summarized in Table 2.3-3. Table 2.3-3 summarizes potential impacts within Sensitive Natural Communities. Standard Measures BIO-1, BIO-3, and BIO-4 (see Appendix E) would be implemented and require contractor briefings, invasive non-native species control, pre-construction surveys for sensitive plant species, etc. Temporary impacts would result from the staging areas, and installation of the fiber optic line. Permanent impacts would result from the permanent footprint of the roadway expansion. In addition, indirect impacts could result from the introduction and spread of non-native invasive plants, which would degrade the quality of habitat or change the vegetation composition and structure. Further, with incorporation of Standard Measures BIO-1, BIO-3, and BIO-4, this impact would not result in adverse impacts to Sensitive Natural Communities. The project is located within the boundaries of the Yolo Habitat Conservation Plan/Natural Community Conservation Plan (HCP/NCCP) and abuts the boundaries of the Natomas Basin Habitat Conservation Plan (NBHCP). With implementation of Standard Measures BIO-1 through BIO-4 and AMMs BIO-1 through BIO-32, construction and operation of the project would not conflict with either HCP/NCCP.

Table 2.3-3. Summary of Sensitive Natural Community Approximate Impacts within the Biological Study Area

CWHR Community Type	CDFW Sensitive Natural Community	Temporary Impact (Acres)	Permanent Impact (Acres)
Valley Foothill Riparian	Oregon ash groves California sycamore woodlands Fremont cottonwood forest and woodland	1.87	-
Valley Oak Woodland	Valley oak woodland and forest	0.51	0.14
Annual/Perennial Grassland	Gum plant patches	0.007	
Total		**2.39**	**0.14**

Source: Caltrans District 3 Yolo Corridor Improvement Project Natural Environment Study. (Caltrans. 2023)
Note: CWHR - California Wildlife Habitat Relationships; CDFW – California Department of Fish and Wildlife

Build Alternatives 3a and 3b

Construction and Operation

Build Alternatives 3a and 3b would involve adding an HOT2+ lane in each direction. Build Alternatives 3a and 3a propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively; therefore, the temporary and permanent effects would be the same as the temporary and permanent effects described under Build Alternatives 2a and 2b.

Build Alternatives 4a and 4b

Construction and Operation

Build Alternatives 4a and 4b would involve adding an HOT3+ lane in each direction. Build Alternatives 4a and 4b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively; therefore, the temporary and permanent effects would be the same as the temporary and permanent effects described under Build Alternatives 2a and 2b.

Build Alternatives 5a and 5b

Construction and Operation

Build Alternatives 4a and 4b would involve adding an HOT3+ lane in each direction. Build Alternatives 4a and 4b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively; therefore, the temporary and permanent effects would be the same as the temporary and permanent effects described under Build Alternatives 2a and 2b.

Build Alternatives 6a and 6b

Construction and Operation

Build Alternatives 6a and 6b would involve adding a transit-only lane in each direction. Build Alternatives 6a and 6b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively; therefore, the effects temporary and permanent would be the same as the temporary and permanent effects described under Build Alternatives 2a and 2b.

Build Alternatives 7a and 7b

Construction and Operation

Build Alternatives 7a and 7b would involve repurposing the current number 1 general purpose lane to HOV 2+. No new lanes would be constructed. Build Alternatives 7a and 7b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively; therefore, the temporary and permanent effects would be the same as the temporary and permanent effects described under Build Alternatives 2a and 2b.

2.3.1.3 Avoidance, Minimization, and/or Mitigation Measures

Caltrans would implement Standard Measures BIO-1, BIO-3, and BIO-4 to reduce impacts on Sensitive Natural Communities. No other avoidance and minimization measures are required.

2.3.2 Wetlands and Other Waters

2.3.2.1 Regulatory Setting

Wetlands and other waters are protected under a number of laws and regulations. At the federal level, the Federal Water Pollution Control Act, more commonly referred to as the Clean Water Act (CWA) (33 United States Code [USC] 1344), is the primary law regulating wetlands and surface waters. One purpose of the CWA is to regulate the discharge of dredged or fill material into waters of the U.S., including wetlands. Waters of the U.S. include navigable waters, interstate waters, territorial seas, and other waters that may be used in interstate or foreign commerce. The lateral limits of jurisdiction over non-tidal water bodies extend to the ordinary high water mark (OHWM), in the absence of adjacent wetlands. When adjacent wetlands are present, CWA jurisdiction extends beyond the OHWM to the limits of the adjacent wetlands. To classify wetlands for the purposes of the CWA, a three-parameter approach is used that includes the presence of hydrophytic (water-loving) vegetation, wetland hydrology, and hydric soils (soils formed during saturation/inundation). All three parameters must be present, under normal circumstances, for an area to be designated as a jurisdictional wetland under the CWA.

Section 404 of the CWA establishes a regulatory program that provides that discharge of dredged or fill material cannot be permitted if a practicable alternative exists that is less damaging to the aquatic environment or if the nation’s waters would be significantly degraded.

The Section 404 permit program is run by the U.S. Army Corps of Engineers (USACE) with oversight by the U.S. Environmental Protection Agency (U.S. EPA).

The USACE issues two types of 404 permits: General and Individual. There are two types of General permits: Regional and Nationwide. Regional permits are issued for a general category of activities when they are similar in nature and cause minimal environmental effect. Nationwide permits are issued to allow a variety of minor project activities with no more than minimal effects.

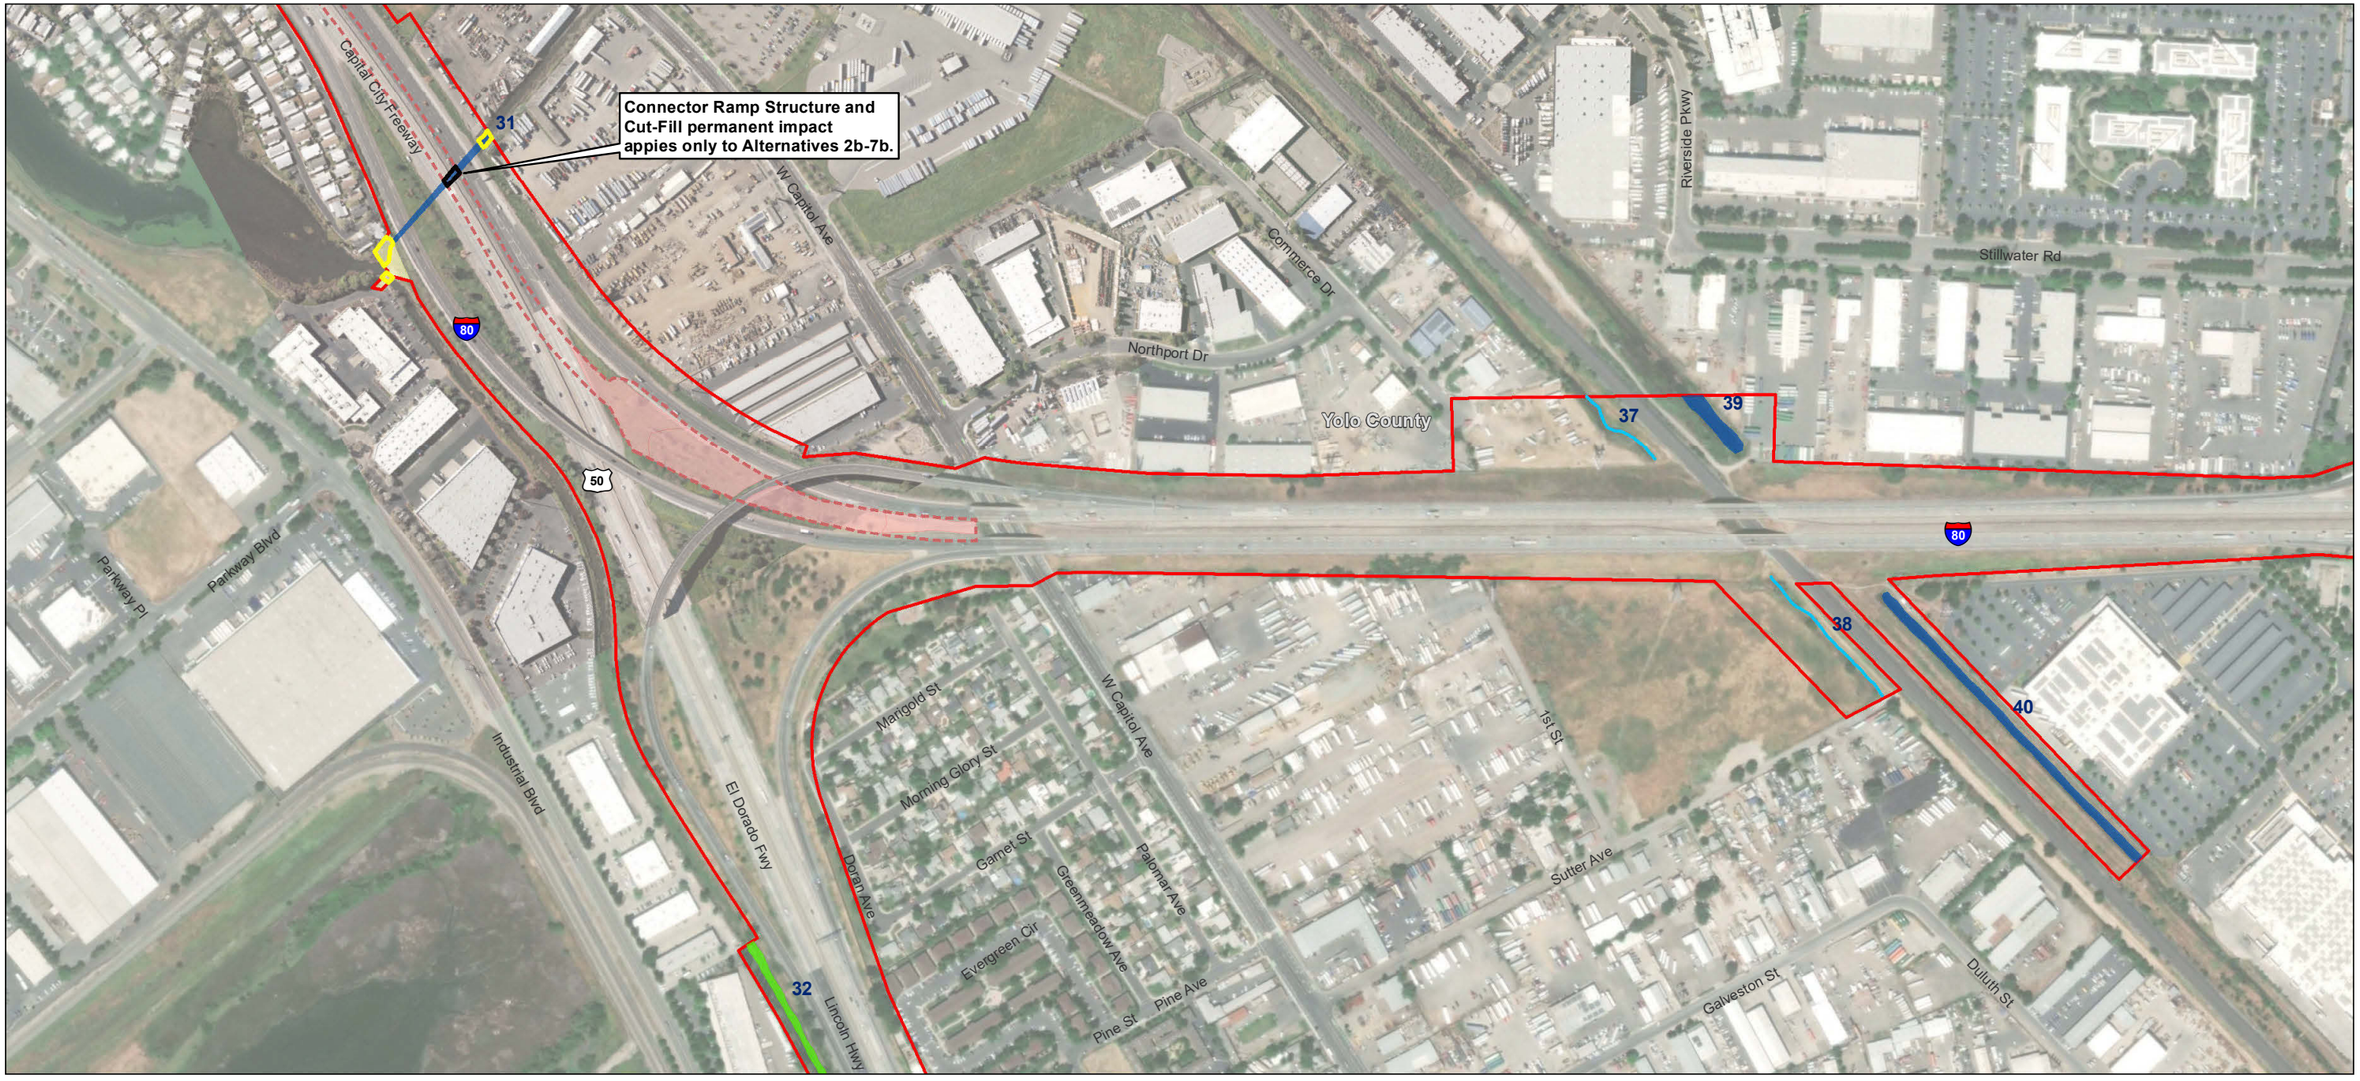
Ordinarily, projects that do not meet the criteria for a Regional or Nationwide Permit may be permitted under one of USACE's Individual permits. There are two types of Individual permits: Standard permits and Letters of Permission. For Individual permits, the USACE decision to approve is based on compliance with U.S. EPA's Section 404(b)(1) Guidelines (40 Code of Federal Regulations [CFR] Part 230), and whether permit approval is in the public interest. The Section 404 (b)(1) Guidelines (Guidelines) were developed by the U.S. EPA in conjunction with the USACE, and allow the discharge of dredged or fill material into the aquatic system (waters of the U.S.) only if there is no practicable alternative which would have less adverse effects. The Guidelines state that the USACE may not issue a permit if there is a "least environmentally damaging practicable alternative" (LEDPA) to the proposed discharge that would have lesser effects on waters of the U.S., and not have any other significant adverse environmental consequences.

The Executive Order for the Protection of Wetlands (EO 11990) also regulates the activities of federal agencies with regard to wetlands. Essentially, EO 11990 states that a federal agency, such as Federal Highway Administration (FHWA) and/or the Department, as assigned, cannot undertake or provide assistance for new construction located in wetlands unless the head of the agency finds: (1) that there is no practicable alternative to the construction and (2) the proposed project includes all practicable measures to minimize harm. A Wetlands Only Practicable Alternative Finding must be made.

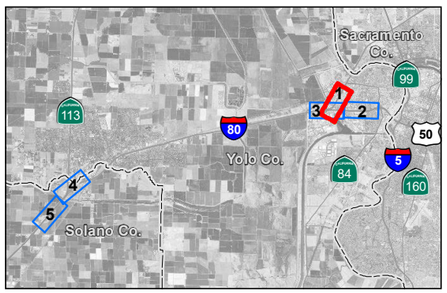
At the state level, wetlands and waters are regulated primarily by the State Water Resources Control Board (SWRCB), the Regional Water Quality Control Boards (RWQCBs) and the California Department of Fish and Wildlife (CDFW). In certain circumstances, the Coastal Commission (or Bay Conservation and Development Commission or the Tahoe Regional Planning Agency) may also be involved. Sections 1600-1607 of the California Fish and Game Code require any agency that proposes a project that will substantially divert or obstruct the natural flow of or substantially change the bed or bank of a river, stream, or lake to notify CDFW before beginning construction. If CDFW determines that the project may substantially and adversely affect fish or wildlife resources, a Lake or Streambed Alteration Agreement will be required. CDFW jurisdictional limits are usually defined by the tops of the stream or lake banks, or the outer edge of riparian vegetation, whichever is wider. Wetlands under jurisdiction of the USACE may or may not be included in the area covered by a Streambed Alteration Agreement obtained from the CDFW.

The RWQCBs were established under the Porter-Cologne Water Quality Control Act to oversee water quality. Discharges under the Porter-Cologne Act are permitted by Waste Discharge Requirements (WDRs) and may be required even when the discharge is already permitted or

exempt under the CWA. In compliance with Section 401 of the CWA, the RWQCBs also issue water quality certifications for activities which may result in a discharge to waters of the U.S. This is most frequently required in tandem with a Section 404 permit request. Please see the Water Quality section for more details.



2.3.2.2 Affected Environment



On December 18, 21, 22, 28, and 29, 2020, February 19 and 20–24, 2021, and July 21, 2022, a delineation of aquatic resources subject to agency jurisdiction (i.e., USACE, RWQCB, CDFW) was conducted. Waters of the United States were delineated according to methodology described in the Corps of Engineers Wetlands Delineation Manual (Environmental Laboratory 1987) and the Regional Supplement to the Corps Wetland Delineation Manual: Arid West Region (USACE 2008). Waters of the state were delineated in accord with the definitions and methods described in the Porter-Cologne Water Quality Control Act and the SWRCB's *Implementation Guidance for the State Wetland Definition and Procedures for Discharges of Dredged or Fill Material to Waters of the State* (SWRCB 2020).

A total of 29.013 acres (8,671.87 linear feet) of aquatic resources potentially subject to agency jurisdiction (i.e., waters of the United States or waters of the state) were identified in the BSA. These features include perennial drainage (5.692 acres; 1,148.01 linear feet), intermittent drainage (0.741 acre; 2,734.89 linear feet), ephemeral drainage (0.461 acre; 1,654.61 linear feet), fresh emergent wetland (0.399 acre), woody riparian wetland (5.058 acres), seasonal wetland (4.002 acres), vegetated ditch (7.553 acres), canal (1.523 acres; 3,134.36 linear feet), and pond (3.584 acres). These features are listed in Table 2.3-4 and shown in Figure 2.3-2.

Stantec has not verified the accuracy and/or completeness of this information and shall not be responsible for any errors or omissions which may be incorporated herein as a result. Stantec assumes no responsibility for data supplied in electronic format, and the recipient accepts full responsibility for verifying the accuracy and completeness of the data.

A total of three fresh emergent marsh wetlands were mapped within the Yolo Bypass portion of the BSA. Vegetation was dominated by obligate perennial species such as water primrose, broad-leaved cattail, and tule (*Schoenoplectus acutus* var. *occidentalis*).

Eleven woody riparian wetlands were mapped intermittently throughout the BSA, particularly in the Yolo Bypass and along the Sacramento River. Woody riparian wetlands exhibit signs of frequent ponding and/or flooding for long duration or very long duration during the growing season and were dominated by woody deciduous shrubs and trees, including dominant species such as Fremont cottonwood, black willow (*Salix goddingii*), and narrow-leaved willow (*Salix exigua*).

Six seasonal wetlands were mapped in the western portion of the BSA, starting in the Yolo Bypass area and intermittently occurring west toward Dixon. The seasonal wetland exhibited positive field indicators of long duration saturation during the growing season and hydrophytic vegetation characteristic of this wetland type. Dominant species observed in seasonal wetlands include umbrella sedge (*Cyperus eragrostis*), dallis grass (*Paspalum dilatatum*), and perennial ryegrass.

Six vegetated ditches were mapped throughout the BSA. Vegetated ditches generally consist of constructed drainage ditches that exhibit positive indicators for all three wetland parameters. Dominant species observed in the vegetated ditches include broad-leaved cattail, tule, and saltgrass.

Two ephemeral drainages and three intermittent drainages were mapped in the BSA. The two ephemeral drainages are both located in the urban sections adjacent to the Sacramento River. Both drainages are subject to flow from rainfall, are seasonally inundated, and are connected through storm drains to the Sacramento River. The three intermittent drainages and drainage segments were mapped in the BSA in the more urban sections of West Sacramento. All three of the drainage/drainage segments are hydrologically connected to the Yolo Bypass Toe Drain, either directly or indirectly, with a culverted connection.

Perennial drainages in the BSA occur as part of the Sacramento River, which intersects the BSA in two locations, at Prospect Slough as part of the Yolo Bypass and one segment of South Putah Creek. The Sacramento River originates outside the BSA and is fed by the intermittent and ephemeral drainages mapped within the BSA before draining into the Sacramento-San Joaquin Delta. South Putah Creek originates at Lake Berryessa outside the BSA, and it flows east until it drains into the Yolo Bypass and, subsequently, the Sacramento River.

Eight segments of canal were mapped within the BSA. Canal segments are man-made drainages that generally have steep sides and move water away from West Sacramento toward croplands for irrigation.

Three ponds with open water were mapped within the BSA. Two ponds are on the north side of the Yolo Bypass and connect via culvert to a vegetated ditch within the Yolo Bypass. The third is connected to a canal on the south side of I-80. These perennial ponds are open water features that are part of the tributary system connected to the Yolo Bypass.

2.3.2.3 Environmental Consequences

No Build Alternative 1

Construction and Operation

No Build Alternative 1 would make no physical or operational improvements within the BSA. Therefore, No Build Alternative 1 would not affect aquatic resources subject to agency jurisdiction (i.e., waters of the U.S. and waters of the state).

Build Alternatives 2a and 2b

Construction and Operation

Build Alternatives 2a and 2b include roadway improvements such as replacing culverts and installing a fiber optic line and vaults. Indirect impacts on aquatic resources could include the reduction in quality and/or function of the aquatic resources as a result of an incidental release of sediments or chemicals into surface waters, or the introduction or spread of non-native species into water features. Build Alternative 2b also includes construction of the connector structure which would result in permanent impacts on Canal 31. Permanent and temporary direct impacts associated with the proposed improvements on aquatic resources are summarized in Table 2.3-5.

Table 2.3-5. Approximate Impacts on Aquatic Resources – Build Alternatives 2a and 2b

Impacts/ Aquatic Resources	Feature ID	Water Feature	Acres		Linear Feet	
			Alt 2a-7a	Alt 2b-7b	Alt 2a-7a	Alt 2b-7b
Permanent Impacts on Other Waters	31	Canal		0.033		62.41
	33	Ephemeral Drainage	0.022	0.022	315.57	315.57

Temporary Impacts on Wetlands	07	Woody Riparian Wetland	0.002	0.002	n/a	n/a
Temporary Impacts on Other Waters	06	Perennial Drainage	0.005	0.005	12.67	12.67
	04	Canal	<0.001	<0.001	3.03	3.03
	31	Canal	0.028	0.028	42.59	42.59
	46	Pond	0.084	0.084	n/a	n/a
Total Temporary Impacts	**—**	**—**	**0.12**	**0.12**	**58.296**	**58.29**

Standard Measures BIO-1, BIO-3 and BIO-4 (see Appendix E) would minimize the potential for indirect impacts on sensitive aquatic resources as a result of construction activities associated with the project. Further, with incorporation of AMMs BIO-1, BIO-2, and BIO-3, impacts on aquatic resources would be minimized; and the project would not result in substantial adverse effects to aquatic resources.

Build Alternatives 3a and 3b

Construction and Operation

Build Alternatives 3a and 3b would involve adding an HOT2+ lane in each direction. Build Alternatives 3a and 3a propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively; therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b.

Build Alternatives 4a and 4b

Construction and Operation

Build Alternatives 4a and 4b would involve adding an HOT3+ lane in each direction. Build Alternatives 4a and 4b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively; therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b.

Build Alternatives 5a and 5b

Construction and Operation

Build Alternatives 4a and 4b would involve adding an HOT3+ lane in each direction. Build Alternatives 4a and 4b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively; therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b.

Build Alternatives 6a and 6b

Construction and Operation

Build Alternatives 6a and 6b would involve adding a transit-only lane in each direction. Build Alternatives 6a and 6b propose similar project components within the same project area as Build Alternatives 2a and 2b; therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b.

Build Alternatives 7a and 7b

Construction and Operation

Build Alternatives 7a and 7b would involve repurposing the current number 1 general purpose lane to HOV 2+. No new lanes would be constructed. Build Alternatives 7a and 7b propose similar project components within the same project area as Build Alternatives 2a and 2b; therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b.

2.3.2.4 Avoidance, Minimization, and/or Mitigation Measures

Caltrans would implement the following AMMs to reduce impacts on wetlands and other waters.

- **AMM BIO-1: USACE and RWQCB Permitting.** Before any discharge of dredge or fill material into waters of the United States or waters of the state, the required permits/authorizations will be obtained from USACE and RWQCB. All terms and conditions of the required permits/authorizations will be implemented.

- **AMM BIO-2: CDFW Permitting.** Before beginning any activities that would obstruct the flow of, or alter the bed, channel, or bank of any feature subject to Fish and Game Code Section 1600, notification of streambed alteration will be submitted to CDFW. If required, a Streambed Alteration Agreement will be obtained from CDFW, and all conditions of the agreement will be implemented.

- **AMM BIO-3: Restoration of Aquatic Resources.** Aquatic resources subject to agency jurisdiction that are temporarily affected by project construction will be restored as close as practicable to their original contour and conditions within 10 days of the completion of construction activities.

2.3.2.5 Wetlands Only Practicable Alternative Finding

The proposed project would temporarily impact wetlands (see Table 2.3-5, above). No permanent effects on wetlands would occur. Executive Order 11990 requires federal agencies, and/or Caltrans, as assigned, to determine and make findings indicating that there is no practicable alternative to construction in wetlands and that the proposed project includes all practicable measures to minimize harm.

Meeting the need and purpose for the proposed project requires modification of infrastructure in close proximity to wetlands. The No-Build Alternative would not affect wetlands but does not meet the need and purpose of the proposed project because it does not address the need to correct operational inefficiencies and recurring congestion. It is, therefore, not a practicable alternative to avoid wetland impacts. Each of the proposed Build Alternatives would have a similar temporary effect on wetlands (0.002 acre temporarily affected).

Practicable measures to minimize harm to wetlands are built into the project design as well as identified above in Section 2.3.2.4. Through review and coordination with resource agencies, the design of the Build Alternatives uses the least footprint possible. The project includes AMM BIO-3, *Restoration of Aquatic Resources*, which requires that all aquatic resources subject to agency jurisdiction (such as wetlands) that are temporarily affected be restored as close as practicable to their original contour and conditions.

Based on the above considerations, it is determined that there is no practicable alternative to the proposed construction in wetlands and that the proposed action includes all practicable measures to minimize harm to wetlands that may result from such use.

2.3.3 Plant Species

2.3.3.1 Regulatory Setting

The U.S. Fish and Wildlife Service (USFWS) and California Department of Fish and Wildlife (CDFW) have regulatory responsibility for the protection of special-status plant species. "Special-status" species are selected for protection because they are rare and/or subject to population and habitat declines. Special-status is a general term for species that are provided varying levels of regulatory protection.

The highest level of protection is given to threatened and endangered species; these are species that are formally listed or proposed for listing as endangered or threatened under the Federal Endangered Species Act (FESA) and/or the California Endangered Species Act (CESA). Please see the Threatened and Endangered Species section 2.3.5 in this document for detailed information about these species.

This section of the document discusses all other special-status plant species, including CDFW species of special concern, USFWS candidate species, and California Native Plant Society (CNPS) rare and endangered plants.

The regulatory requirements for FESA can be found at 16 United States Code (USC) Section 1531, et seq. See also 50 Code of Federal Regulations (CFR) Part 402. The regulatory requirements for CESA can be found at California Fish and Game Code, Section 2050, et seq. Department projects are also subject to the Native Plant Protection Act, found at California Fish and Game Code, Section 1900-1913, and the California Environmental Quality Act (CEQA), found at California Public Resources Code, Sections 21000-21177.

2.3.3.2 Affected Environment

This section addresses the special-status plant species that are documented to have occurred or have the potential to occur in the BSA, based on literature and database searches, and botanical surveys.

A species was determined to have the potential to occur within the BSA if it met at least one of the following criteria:

- Historically occurred within or adjacent to the BSA, as documented in the CDFW Biogeographic Information and Observation System or CNDDB (CDFW 2021b)
- Has a known or expected geographic range within the vicinity of the project area
- Has known or expected habitat present within or near the BSA

Rare Plant Surveys

A protocol-level focused botanical survey and vegetation characterization (see Section 2.3.1 above) was conducted on May 10–14 and 18–20, 2021, and July 14, 2022. The focused

botanical survey was conducted to determine viability and potential presence during blooming period for special-status plants with a potential to occur within the BSA. Surveys were performed within the appropriate bloom periods, but no special-status plants were observed during the focused botanical surveys.

Suitable habitat is present within the BSA for 25 special-status plants. However, these species are presumed to be absent in the BSA because they were not observed during the focused botanical surveys (Table 2.3-6).

Table 2.3-6. Special-Status Plants Potentially Occurring or Known to Occur in the Biological Study Area

Common Name	*Scientific Name*	Status[1] (Fed/State/ CRPR)	General Habitat Description	Potential to Occur within the Biological Study Area[2]
depauperate milk-vetch	*Astragalus pauperculus*	—/—/4.3	Found in chaparral, cismontane woodland, and valley and foothill grassland with vernally mesic, volcanic soil. Blooms: March–June Elevation: 200 to 4,000 feet	None. The BSA is not within elevational range of the species. Vernally mesic, volcanic soils are not present within the BSA. No CNDDB occurrences within 5 miles of the BSA. This species was not observed during the May 2021 botanical surveys and is presumed to be absent from the BSA.
Ferris' milk-vetch	*Astragalus tener* var. *ferrisiae*	—/—/1B.1	Found in valley and foothill grassland (subalkaline flats) and meadows and seeps (vernally mesic). Blooms: April–May Elevation: 5 to 245 feet	None. No suitable subalkaline flats within valley and foothill grassland or meadows and seeps are present within the BSA. The most recent CNDDB occurrence is from 1954 at an unknown location along the Yolo Bypass. This species was not observed during the May 2021 botanical surveys and is presumed to be absent from the BSA.
alkali milk-vetch	*Astragalus tener* var. *tener*	—/—/1B.2	Found in playas, valley and foothill grassland (adobe clay), and vernal pools. Blooms: March–June Elevation: 5 to 200 feet	None. No suitable abode clay or vernal pools are present within the BSA to support the species. No CNDDB occurrences within 5 miles of the BSA. This species was not observed during the May 2021 botanical surveys and is presumed to be absent from the BSA.
heartscale	*Atriplex cordulata* var. *cordulata*	—/—/1B.2	Found in chenopod scrub, meadows and seeps, playas, and valley and foothill grasslands. Alkaline and clay soils. Blooms: April–October Elevation: 1–1,050 feet	Low. Marginal habitat is present within the grasslands, which have limited distribution in the BSA and are dominated by non-native and invasive species. The most recent CNDDB occurrence is from 1952 approximately 1.5 miles northwest of the BSA and is presumed extirpated. However, this species was not observed during the early or late season botanical surveys and is presumed to be absent from the BSA.
brittlescale	*Atriplex depressa*	—/—/1B.2	Found in chenopod scrub, meadows and seeps, playas, and valley and foothill grasslands. Alkaline and clay soils. Blooms: April–October Elevation: 1–1,050 feet	Low. Marginal habitat is present within the grasslands, which have limited distribution in the BSA and are dominated by non-native and invasive species. The most recent CNDDB occurrence is from 1996 approximately 2 miles northwest of the BSA in highly disturbed (plowed) alkali-sink habitat. However, this species was not observed during the early or late season botanical surveys and is presumed to be absent from the BSA.
vernal pool smallscale	*Atriplex persistens*	—/—/1B.2	Found in vernal pools (alkaline). Blooms: June, August–October Elevation: 30-375 feet	None. No suitable vernal pool habitat is present within the BSA. No CNDDB occurrences within 5 miles of the BSA. This species was not observed during the early or late season botanical surveys and is presumed to be absent from the BSA.

Common Name	*Scientific Name*	Status[1] (Fed/State/ CRPR)	General Habitat Description	Potential to Occur within the Biological Study Area[2]
valley brodiaea	*Brodiaea rosea* ssp. *vallicola*	—/—/4.2	Found in swales within valley and foothill grassland and vernal pools on old alluvial terraces with silty, sandy, and gravelly loam. Blooms: April–May (June) Elevation: 30-1,100 feet	None. No suitable alluvial terraces are present within the BSA to support the species. No CNDDB occurrences within 5 miles of the BSA. This species was not observed during May 2021 botanical surveys and is presumed to be absent from the BSA.
bristly sedge	*Carex comosa*	—/—/2B.1	Found in coastal prairie, marshes and swamps (lake margins), and vernal pools. Blooms: May–September Elevation: 0 to 2,050 feet	None. Marginal habitat is present in the fresh emergent marsh wetlands. However, the wetlands within the BSA have altered hydrological regimes. No CNDDB occurrences within 5 miles of the BSA. This species was not observed during the early or late season botanical surveys and is presumed to be absent from the BSA.
pappose tarplant	*Centromadia parryi* ssp. *parryi*	—/—/1B.2	Found in coastal prairie, marshes and swamps (coastal salt), meadows and seeps, chaparral, and valley and foothill grassland (vernally mesic). Blooms: May–November Elevation: 0 to 1,375 feet	Low. Marginal habitat is present in the fresh emergent marsh wetlands within the BSA in the Yolo Bypass area. However, the wetlands within the BSA have altered hydrological regimes. There is also suitable grassland habitat within the BSA. One CNDDB occurrence from 2015 along I-80 and the east side of the Yolo Bypass. However, this species was not observed during the early or late season botanical surveys and is presumed to be absent from the BSA.
Parry's rough tarplant	*Centromadia parryi* ssp. *rudis*	—/—/4.2	Found in valley and foothill grassland and vernal pools in areas that are alkaline, vernally mesic, in seeps, and sometimes roadsides. Blooms: May–October Elevation: 0 to 330 feet	Low. Suitable habitat is present within the BSA along roadsides and habitats. No CNDDB occurrences within 5 miles of the BSA. However, this species was not observed during the early or late season botanical surveys and is presumed to be absent from the BSA.
Bolander's water-hemlock	*Cicuta aculate* var. *bolanderi*	—/—/2B.1	Found in marshes and swamps with coastal, fresh, or brackish water. Blooms: July–September Elevation: 0 to 650 feet	None. Marginal habitat is present in the fresh emergent marsh wetlands. However, the wetlands within the BSA have altered hydrological regimes. No CNDDB occurrences within 5 miles of the BSA. However, this species was not observed during the early or late season botanical surveys and is presumed to be absent from the BSA.
recurved larkspur	*Delphinium recurvatum*	—/—/1B.2	Found in chenopod scrub, valley and foothill grassland, and cismontane woodland. Alkaline soils. Blooms: March–June Elevation:10–2,600 feet	None. No alkaline grasslands are present in the BSA. No CNDDB occurrences within 5 miles of the BSA. This species was not observed during the May 2021 botanical surveys and is presumed to be absent from the BSA.

Common Name	*Scientific Name*	Status[1] (Fed/State/ CRPR)	General Habitat Description	Potential to Occur within the Biological Study Area[2]
dwarf downingia	*Downingia pusilla*	—/—/2B.2	Found in valley and foothill grassland (mesic) and vernal pools. Blooms: March–May Elevation: 3 to 1,460 feet	Low. Marginal habitat is present within the grasslands, which have limited distribution in the BSA and are dominated by non-native and invasive species. No CNDDB occurrences within 5 miles of the BSA. This species was not observed during the early or late season botanical surveys and is presumed to be absent from the BSA.
Jepson's coyote-thistle	*Eryngium jepsonii*	—/—/1B.2	Found in valley and foothill grassland and vernal pools. Blooms: April–August Elevation: 10 to 985 feet	Low. Marginal habitat is present within the grasslands, which have limited distribution in the BSA and are dominated by non-native and invasive species; no vernal pools are present. No CNDDB occurrences within 5 miles of the BSA. This species was not observed during the early or late botanical surveys and is presumed to be absent from the BSA.
San Joaquin spearscale	*Extriplex joaquinana*	—/—/1B.2	Found in chenopod scrub, meadows and seeps, valley and foothill grassland, and playas. Alkaline soils. Blooms: April–October Elevation:2–2,740 feet	None. No grasslands with alkaline soils are present in the BSA. The most recent CNDDB occurrence is from 2001 approximately 4 miles southwest of the BSA. However, this species was not observed during the May 2021 botanical surveys and is presumed to be absent from the BSA.
stinkbells	*Fritillaria agrestis*	—/—/4.2	Found in chaparral, cismontane woodland, pinyon and juniper woodland, and valley and foothill grassland. Clay and sometimes serpentine soils. Blooms: March–June Elevation:30–5,100 feet	Low. Marginal habitat is present within the grasslands, which have limited distribution in the BSA and are dominated by non-native and invasive species. No CNDDB occurrences within 5 miles of the BSA. This species was not observed during the early or late season botanical surveys and is presumed to be absent from the BSA.
fragrant fritillary	*Fritillaria liliacea*	—/—/1B.2	Found in cismontane woodland, coastal prairie, coastal scrub, and valley and foothill grassland. Often serpentine soils. Blooms: February–April Elevation:10–1,350 feet	Low. Marginal habitat is present in the grasslands, which have limited distribution in the BSA and are dominated by non-native and invasive species. No CNDDB occurrences within 5 miles of the BSA. This species was not observed during the early or late season botanical surveys and is presumed to be absent from the BSA.
adobe-lily	*Fritillaria pluriflora*	—/—/1B.2	Found in cismontane woodland, chaparral, and valley and foothill grassland. Often adobe soils. Blooms: February–April Elevation:195–2,310 feet	Low. Marginal habitat is present within the grasslands, which have limited distribution in the BSA and are dominated by non-native and invasive species. However, this species was not observed during the early or late season botanical surveys and is presumed to be absent from the BSA.

Common Name	*Scientific Name*	Status[1] (Fed/State/ CRPR)	General Habitat Description	Potential to Occur within the Biological Study Area[2]
hogwallow starfish	*Hesperevax caulescens*	—/—/4.2	Found in valley and foothill grassland (mesic clay) and shallow vernal pools. Blooms: March–June Elevation: 0 to 1,650 feet	Low. Marginal habitat is present within the grasslands, which have limited distribution in the BSA and are dominated by non-native and invasive species. No CNDDB occurrences within 5 miles of the BSA. This species was not observed during the early or late season botanical surveys and is presumed to be absent from the BSA.
wooly rose-mallow	*Hibiscus lasiocarpos* var. *occidentalis*	—/—/1B.2	Found in marshes and swamps (freshwater). Often in riprap on sides of levees. Blooms: June–September Elevation:0–390 feet	Low. Marginal habitat is present in the fresh emergent marsh wetlands. However, the wetlands within the BSA have altered hydrological regimes. One CNDDB occurrence from 1994 was identified within the BSA in Natomas near the eastbound El Camino Avenue/I-80 on-ramp. However, this species was not observed during the early or late season botanical surveys and is presumed to be absent from the BSA.
Carquinez goldenbush	*Isocoma arguta*	—/—/1B.1	Found in valley and foothill grassland (alkaline). Blooms: August–December Elevation: 3 to 65 feet	None. No alkaline grasslands are present within the BSA. No CNDDB occurrences within 5 miles of the BSA. This species was not observed during the early or late season botanical surveys and is presumed to be absent from the BSA.
alkali-sink goldfields	*Lasthenia chrysantha*	—/—/1B.1	Found in vernal pools and wet saline flats. Blooms: February–April Elevation:0–325 feet	None. No suitable vernal pool habitat is present within the BSA. No CNDDB occurrences within 5 miles of the BSA. This species was not observed during the early or late season botanical surveys and is presumed to be absent from the BSA.
Coulter's goldfields	*Lasthenia glabrata* ssp. *coulteri*	—/—/1B.1	Found in marshes and swamps (coastal salt), playas, and vernal pools. Blooms: February–June Elevation:0–4,000 feet	None. No suitable coastal salt marsh or swamp, playas, or vernal pool habitat is present within the BSA to support the species. No CNDDB occurrences within 5 miles of the BSA. This species was not observed during the May 2021 botanical surveys and is presumed to be absent from the BSA.
Delta tule pea	*Lathyrus jepsonii* var. *jepsonii*	—/—/1B.2	Found in marshes and swamps (freshwater and brackish). Blooms: May–July (August-September) Elevation:0–16 feet	None. Marginal habitat is present in the fresh emergent marsh wetlands. However, the wetlands within the BSA have altered hydrological regimes. No CNDDB occurrences within 5 miles of the BSA. This species was not observed during the early or late season botanical surveys and is presumed to be absent from the BSA.
legenere	*Legenere limosa*	—/—/1B.1	Found in vernal pools. Blooms: April–June Elevation: 3-2,900 feet	None. No suitable vernal pool habitat is present within the BSA. No CNDDB occurrences within 5 miles of the BSA. This species was not observed during the May 2021 botanical surveys and is presumed to be absent from the BSA.

Common Name	*Scientific Name*	Status[1] (Fed/State/ CRPR)	General Habitat Description	Potential to Occur within the Biological Study Area[2]
Heckard's pepper-grass	*Lepidium latipes* var. *heckardii*	—/—/1B.2	Found in valley and foothill grassland (alkaline flats). Blooms: March–May Elevation: 5 to 670 feet	None. No alkaline flats are present within the BSA. The most recent CNDDB occurrence is from 1957 approximately 3 miles northeast of Davis. This species was not observed during the May 2021 botanical surveys and is presumed to be absent from the BSA.
woolly-headed lessingia	*Lessingia hololeuca*	—/—/3	Found in broad-leaved upland forest, coastal scrub, lower montane coniferous forest, and valley and foothill grassland. Clay, serpentine soil. Blooms: June–October Elevation: 50 to 1,000 feet	None. Habitat with suitable clay, serpentine soil is not present within the BSA to support the species. No CNDDB occurrences within 5 miles of the BSA. This species was not observed during the early or late season botanical surveys and is presumed to be absent from the BSA.
Mason's lilaeopsis	*Lilaeopsis masonii*	—/—/1B.1	Found in marshes and swamps (freshwater or brackish) and riparian scrub. Blooms: April–November Elevation:0–33 feet	None. Marginal habitat is present in the fresh emergent marsh wetlands and willow thickets within the BSA. However, the wetlands within the BSA have altered hydrological regimes. No CNDDB occurrences within 5 miles of the BSA. This species was not observed during the early or late season botanical surveys and is presumed to be absent from the BSA.
Delta mudwort	*Limosella australis*	—/—/2B.1	Found in marshes and swamps (freshwater or brackish) and riparian scrub. Usually mud banks Blooms: May–August Elevation:0–10 feet	None. Marginal habitat is present in the fresh emergent marsh wetlands and willow thickets within the BSA. However, the wetlands within the BSA have altered hydrological regimes No CNDDB occurrences within 5 miles of the BSA. This species was not observed during the early or late season botanical surveys and is presumed to be absent from the BSA.
Heller's bush-mallow	*Malacothamnus helleri*	—/—/3.3	Found in chaparral on sandstone and riparian woodland on gravel. Blooms: May–July Elevation:1,000–2,080 feet	None. The BSA is not within elevational range of this species. No CNDDB occurrences within 5 miles of the BSA.
little mousetail	*Myosurus minimus* ssp. *apus*	—/—/3.1	Found in valley and foothill grassland and vernal pools (alkaline). Blooms: March–June Elevation: 65 to 2,100 feet	Low. Marginal habitat is present within the grasslands, which have limited distribution in the BSA and are dominated by non-native and invasive species. No CNDDB occurrences within 5 miles of the BSA. This species was not observed during the early or late season botanical surveys and is presumed to be absent from the BSA.

Common Name	*Scientific Name*	Status[1] (Fed/State/ CRPR)	General Habitat Description	Potential to Occur within the Biological Study Area[2]
Baker's navarretia	*Navarretia leucocephala* ssp*. bakeri*	—/—/1B.1	Found in cismontane woodland, lower montane coniferous forest, meadows and seeps, valley and foothill grassland and vernal pools. Mesic. Blooms: April–July Elevation:15–5,700 feet	Low. Marginal habitat is present within the grasslands and woodlands, which have limited distribution in the BSA and are dominated by non-native and invasive species. No CNDDB occurrences within 5 miles of the BSA. This species was not observed during the early or late season botanical surveys and is presumed to be absent from the BSA.
bearded popcorn flower	*Plagiobothrys hystriculus*	—/—/1B.1	Found in valley and foothill grassland (mesic) and vernal pool margins. Blooms: April–May Elevation: 0 to 900 feet	Low. Marginal habitat is present within the grasslands, which have limited distribution in the BSA and are dominated by non-native and invasive species. No CNDDB occurrences within 5 miles of the BSA. This species was not observed during the May 2021 botanical surveys and is presumed to be absent from the BSA.
California alkali grass	*Puccinellia simplex*	—/—/1B.2	Found in chenopod scrub, meadows and seeps, valley and foothill grassland, and vernal pools. Alkaline, vernally mesic; sinks, flats, and lake margins. Blooms: March–May Elevation: 5–3,050 feet	Low. Marginal habitat is present within the grasslands, which have limited distribution in the BSA and are dominated by non-native and invasive species. The most recent CNDDB occurrence is from 1962 at an unknow location north of Davis and is presumed extirpated. This species was not observed during the May 2021 botanical surveys and is presumed to be absent from the BSA.
Sanford's arrowhead	*Sagittaria sanfordii*	—/—/1B.2	Found in marshes and swamps (assorted shallow freshwater). Blooms: May–October (November) Elevation:0–2,130 feet	Low. Marginal habitat is present in the fresh emergent marsh wetlands within the BSA. However, the wetlands within the BSA have altered hydrological regimes. The most recent CNDDB occurrence is from 1993 approximately 3 miles northeast of the BSA along the American River bike trail. However, this species was not observed during the early or late season botanical surveys and is presumed to be absent from the BSA.
Suisun Marsh aster	*Symphyotrichum lentum*	—/—/1B.2	Found in marshes and swamps (brackish and freshwater). Blooms: (April) May–November Elevation:0–10 feet	None. Marginal habitat is present in the fresh emergent marsh wetlands within the BSA in the Yolo Bypass area. However, the wetlands within the BSA have altered hydrological regimes. A single CNDDB occurrence from 2013 was identified within the Yolo Bypass less than 1 mile south of the BSA. However, this species was not observed during the early or late season botanical surveys.

Common Name	*Scientific Name*	Status[1] (Fed/State/ CRPR)	General Habitat Description	Potential to Occur within the Biological Study Area[2]
saline clover	*Trifolium hydrophilum*	—/—/1B.2	Found in marshes and swamps, valley and foothill grassland (mesic, alkaline), and vernal pools. Blooms: April–June Elevation: 0 to 985 feet	None. Suitable habitat with alkaline soil is not present within the BSA to support the species. No CNDDB occurrences within 5 miles of the BSA. This species was not observed during the May 2021 botanical surveys and is presumed to be absent from the BSA.

[1] CRPR Codes and Extensions:
1A Plants presumed extirpated in California and either rare or extinct elsewhere.
1B Plants rare, threatened, or endangered in California and elsewhere.
2A Plants presumed extirpated in California, but more common elsewhere.
2B Plants rare, threatened, or endangered in California, but more common elsewhere.
3 Review list: Plants about which more information is needed
4 Watch List: Plants of limited distribution
xx.3 Not very endangered in California
xx.2 Fairly endangered in California
xx.1 Seriously endangered in California

[2] Assessment Codes:
Present: The species is known to be present or has been recently observed in the BSA. **High**: The species has been observed and documented within 5 miles of the BSA within the last 5 years and habitat for the species is present in the BSA. **Moderate**: The BSA is located within the range of the species, there are documented occurrences within 5 miles of the BSA, and potential habitat for the species exists in the BSA. **Low**: The BSA is located within the range of the species, but no past documented occurrences have been recorded within 5 miles and only low quality (e.g., small fragmented patches or habitats under the influence of frequent anthropogenic disturbances) are present in the BSA. **None**: Focused surveys determined the species is absent from the BSA, the species is acknowledged to be extirpated locally or the BSA is located outside of the species range, or potential habitat to support the species is not present in the BSA.

2.3.3.3 Environmental Consequences

No Build Alternative 1

Construction and Operation

No Build Alternative 1 would make no physical or operational improvements within the BSA. Therefore, No Build Alternative 1 would not affect special-status plant species.

Build Alternatives 2a and 2b

Construction and Operation

Protocol-level botanical surveys were performed during the blooming period of special-status plants that had potential habitat within the BSA. No special-status plants occur within the BSA; therefore, no adverse effects would occur. However, Standard Measure BIO-4 (see Appendix E) has been incorporated in the project to further reduce the potential for effects to special-status plants outside the BSA to occur as a result of the project, including the spread or introduction of non-native plants within the BSA.

Build Alternatives 3a and 3b

Construction and Operation

Build Alternatives 3a and 3b would involve adding an HOT2+ lane in each direction. Build Alternatives 3a and 3a propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively; therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b.

Build Alternatives 4a and 4b

Construction and Operation

Build Alternatives 4a and 4b would involve adding an HOT3+ lane in each direction. Build Alternatives 4a and 4b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively; therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b.

Build Alternatives 5a and 5b

Construction and Operation

Build Alternatives 4a and 4b would involve adding an HOT3+ lane in each direction. Build Alternatives 4a and 4b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively; therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b.

Build Alternatives 6a and 6b

Construction and Operation

Build Alternatives 6a and 6b would involve adding a transit-only lane in each direction. Build Alternatives 6a and 6b propose similar project components within the same project area as Build Alternatives 2a and 2b; therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b.

Build Alternatives 7a and 7b

Construction and Operation

Build Alternatives 7a and 7b would involve repurposing the current number 1 general purpose lane to HOV 2+. No new lanes would be constructed. Build Alternatives 7a and 7b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively; therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b.

2.3.3.4 Avoidance, Minimization, and/or Mitigation Measures

No AMMs or MMs are required to reduce effects related to special-status plant species.

2.3.4 Animal Species

2.3.4.1 Regulatory Setting

Many state and federal laws regulate impacts to wildlife. The U.S. Fish and Wildlife Service (USFWS), the National Oceanic and Atmospheric Administration's National Marine Fisheries Service (NOAA Fisheries), and the California Department of Fish and Wildlife (CDFW) are responsible for implementing these laws. This section discusses potential impacts and permit requirements associated with animals not listed or proposed for listing under the federal or state Endangered Species Act. Species listed or proposed for listing as threatened or endangered are discussed in the Threatened and Endangered Species Section 2.3.5 below. All other special-status animal species are discussed here, including CDFW fully protected species and species of special concern, and USFWS or NOAA Fisheries candidate species.

Federal laws and regulations relevant to wildlife include the following:

- National Environmental Policy Act
- Migratory Bird Treaty Act
- Fish and Wildlife Coordination Act

State laws and regulations relevant to wildlife include the following:

- California Environmental Quality Act
- Sections 1600 – 1603 of the California Fish and Game Code
- Sections 4150 and 4152 of the California Fish and Game Code

2.3.4.2 Affected Environment

The BSA provides sufficient habitat for various common and special-status wildlife species. This section addresses the regionally occurring special-status wildlife species. The potential for these species to occur within the BSA are presented in Table 2.3-7.

Western Pond Turtle

Western pond turtle (*Emys marmorata*) is proposed for Federal listing as Threatened and is designated as a species of special concern by CDFW. The federal listing status is under review under FESA as of April 10, 2015 (80 FR 192590 19263). This species is found throughout California in a wide range of permanent and intermittent aquatic habitats such as ponds, marshes, rivers, streams, and ephemeral pools with emergent structure for basking and feeding. Western pond turtles also use adjacent upland sites for nesting, often traveling great distances over land to reach suitable nesting sites.

A CNDDB database search and visual assessment to evaluate the potential for western pond turtle to occur within the BSA were conducted. The most recent CNDDB occurrence is from 2001 approximately 0.25 mile north of the BSA documenting 76 individuals, with one hatchling and eight juveniles captured between 1996 to 2001 in a disturbed portion of the UC Davis Arboretum waterway. Aquatic habitat for western pond turtle is present in Putah Creek, the vegetated ditches, and canals identified throughout the BSA. Suitable nesting, upland, and basking habitats (e.g., open banks, exposed logs, rocks) for the species were also identified in the BSA within or immediately adjacent to these features.

Special-Status and Nesting Migratory Raptors and Birds

The federal MBTA (15 USC 703-711), 50 CFR Part 21 and 50 CFR Part 10, and the California Department of Fish and Game Code Sections 3503, 3513, and 3800 protect migratory birds, their occupied nests, and their eggs from disturbance or destruction. “Migratory bird” includes all non-game, wild birds found in the U.S. except the house sparrow (*Passer domesticus*), European starling (*Sturnus vulgaris*), and rock dove (*Columbia livia*). The BSA and adjacent landscape provides foraging and nesting habitat for many species of birds, including those protected by the MBTA and those designated as CDFW species of special concern (SSC) and fully protected (FP) species.

Special-status and migratory raptors that could potentially forage or nest within the vicinity of the BSA during project activities such as burrowing owl (BUOW) (*Athene cunicularia*), white-tailed kite (*Elanus leucurus*), and northern harrier (*Circus hudsonius*). Potential nesting habitat includes larger trees, structures such as bridges, and open fields. Protocol surveys have been conducted within the BSA and surrounding areas for Swainson’s hawk (SWHA) (*Buteo swainsoni*) and BUOW. The results of the SWHA surveys are detailed in Section 2.3.8 and BUOW is discussed in detail below.

Table 2.3-7. Special-Status Wildlife Potentially Occurring or Known to Occur in the Biological Study Area

Common Name	*Scientific Name*	Status[1] (Fed/State)	General Habitat Description	Potential to Occur within the BSA[2]
Sacramento splittail	*Pogonichthys macrolepidotus*	—/SSC	Estuaries and deltas, endemic to California's Central Valley.	None. The BSA does not contain suitable habitat for the species.
Sacramento perch	*Archoplites interruptus*	—/SSC	Warm, turbid reservoirs and ponds.	None. The BSA does not contain suitable habitat for the species.
western spadefoot	*Spea hammondii*	FP/SSC	Breeds and lays eggs in shallow, temporary pools formed by heavy winter rains, often in grasslands. Requires underground refugia, such as mammal burrows, near breeding habitat.	None. The BSA does not contain suitable breeding habitat. The seasonal wetlands within the BSA are heavily vegetated and are not inundated for a sufficient amount of time during the breeding season to support the species. The BSA is within highly disturbed right-of-way and adjacent land use is mostly urban and agriculture with frequent anthropogenic disturbances. No CNDDB occurrences within 5 miles of the BSA.
western pond turtle	*Emys marmorata*	FP/SSC	Slow water aquatic habitat with available basking sites. Hatchlings require shallow water with dense submergent or short emergent vegetation. Requires an upland oviposition site near the aquatic site.	Moderate. The BSA contains suitable aquatic habitat for the species in Putah Creek, vegetated ditches, and canals throughout the BSA. The most recent CNDDB occurrence is from 2001 approximately 0.25 mile north of the BSA documenting 76 individuals (only one hatchling and eight juveniles) captured between 1996 to 2001 in a disturbed portion of the UC Davis Arboretum waterway.
northern harrier	*Circus hudsonius*	—/SSC	Nests on the ground in shrubby vegetation in emergent wetlands, along rivers or lakes, in grasslands, grain fields, or on sagebrush flats.	Present. Species was observed foraging in the Yolo Bypass during the January 12, 2021, survey of the BSA. The most recent CNDDB occurrence is from 2015 approximately 3 miles northwest of the BSA documenting an active nest in a wheat field.

Common Name	*Scientific Name*	Status[1] (Fed/State)	General Habitat Description	Potential to Occur within the BSA[2]
mountain plover	*Charadrius montanus*	—/SSC	Winter resident from September through March inhabiting grasslands and plowed fields in the Central Valley. Does not nest in California.	Moderate. The BSA contains suitable wintering habitat for the species within plowed fields and grassland habitat. No CNDDB occurrences within 5 miles of the BSA.
western burrowing owl	*Athene cunicularia*	—/SSC	Grasslands, agricultural fields, and ruderal habitats with mammal burrows.	Moderate. The BSA contains ruderal areas with suitable nesting and foraging habitats. There are five CNDDB occurrences within approximately 500 feet of the BSA. Species was not observed during protocol level surveys of the project area. In 2021
white-tailed kite	*Elanus leucurus*	—/SFP	Nests in tall shrubs and trees. Forages in grasslands, agricultural fields, and marshes.	Present. White-tailed kite was observed foraging at the eastern end of the BSA during the survey on January 12, 2021. Multiple observations were made within 500 feet of the BSA during the Swainson's hawk surveys in March and April 2021. The most recent CNDDB occurrence is from 1993 approximately 3 miles northwest of the BSA documenting an active nest near Davis.
grasshopper sparrow	*Ammodramus savannarum*	—/SSC	Breeds in dry, dense grasslands with a variety of grasses and tall forbs and scattered shrubs for singing perches.	Moderate. The BSA contains suitable habitat for the species within grassland habitat. No CNDDB occurrences within 5 miles of the BSA.
purple martin	*Progne subis*	—/SSC	Colonial nester in tree cavities, under bridges and culverts, and occasionally nesting boxes. Often nests in tall, old trees near a body of water.	High. The BSA contains suitable habitat within tree cavities, bridges, and culverts. One CNDDB occurrence from 2003 documents 29 pairs observed nesting in weep holes under the I-5 freeway and street overpasses within 1 mile of the BSA.
song sparrow "Modesto population"	*Melospiza melodai*	—/SSC	Extensive wetlands and riparian forests.	High. Habitat is present in the BSA within the Yolo Bypass, Sacramento River, Putah Creek, and agricultural areas. One CNDDB occurrence from 2013 approximately 3.5 miles south of the BSA within the Yolo Bypass.

Common Name	*Scientific Name*	Status[1] (Fed/State)	General Habitat Description	Potential to Occur within the BSA[2]
yellow-headed blackbird	*Xanthocephalus*	—/SSC	Nests in colonies located in dense emergent wetland of cattails, tules, etc., often along the border of the lake or pond.	Low. The BSA contains suitable habitat for the species mostly between the east end of the Yolo Bypass and Davis city limits. No CNDDB occurrences within 5 miles of the BSA.
pallid bat	*Antrozous pallidus*	—/SSC	Day roosts typically include rocky outcrops, cliffs, large-diameter live and snag trees, and crevices. Also roost in caves, mines, bridges, culverts, barns, porches, and bat boxes.	High. Suitable winter hibernation and maternity roost habitat is present in the bridges throughout the BSA. The most recent CNDDB occurrence is from 1964, 1 mile north of the BSA in Davis.
western red bat	*Lasiurus blossevillii*	—/SSC	Typically roost solitarily in dense tree foliage, particularly in willows, cottonwoods, and sycamores. Strongly associated with riparian habitats, particularly mature stands of cottonwood/sycamore.	High. Suitable roost habitat within the BSA located along the Sacramento River, Putah Creek, and South Fork Putah Creek. No recorded CNDDB occurrences within 5 miles of the BSA.
American badger	*Taxidea taxus*	—/SSC	Most abundant in drier open stages of most shrub, forest, and herbaceous habitats, with friable soils. Several hundred undisturbed acres are required for home range.	None. Suitable undisturbed habitat is not present within or adjacent to the BSA. The most recent CNDDB occurrence was approximately 3.5 miles northeast of the BSA documenting a dead badger collected in 1997.

[1] Status Codes: Federal Proposed (FP); State Fully Protected (SFP); CDFW Species of Special Concern (SSC).
[2] Assessment Codes:

Present: The species is known to be present or has been recently observed in the BSA. **High:** The species has been observed and documented within 5 miles of the BSA within the last 5 years and habitat for the species is present in the BSA. **Moderate:** The BSA is located within the range of the species, there are documented occurrences within 5 miles of the BSA, and potential habitat for the species exists in the BSA. **Low:** The BSA is located within the range of the species, but no past documented occurrences have been recorded within 5 miles and only low quality (e.g., small fragmented patches or habitats under the influence of frequent anthropogenic disturbances) are present in the BSA. **None:** Focused surveys determined the species is absent from the BSA, the species is acknowledged to be extirpated locally or the BSA is located outside of the species range, or potential habitat to support the species is not present in the BSA.

Key: BSA – Biological Study Area, CNDDB – California Natural Diversity Database

Bird species observed in the area during site visits include SWHA, bald eagle (*Haliaeetus leucocephalus*), red-tailed hawk (*Buteo jamaicensis*), red-shouldered hawk (*Buteo lineatus*), osprey (*Pandion haliaetus*), American kestrel (*Falco sparverius),* white-tailed kite (*Elanus leucurus*), northern harrier (*Circus hudsonius*), prairie falcon (*Falco mexicanus*), peregrine falcon (*Falco peregrinus*), Cooper's hawk (*Accipiter cooperii*), California scrub jay (*Aphelocoma coerulescens*), northern mockingbird (*Mimus polyglottos*), great egret (*Ardea alba*), turkey vulture (*Cathartes aura*), yellow rumped warbler (*Setophaga coronata*), Nuttall's woodpecker (*Picoides nuttallii*), black phoebe (*Sayornis nigricans*), Brewer's blackbird (*Euphagus cyanocephalus*), red-winged blackbird (*Agelaius phoeniceus*), California towhee (*Pipilo crissalis*), spotted towhee (*Pipilo maculatus*), European starling (*Sturnus vulgaris*), American crow (*Corvus brachyrhynchos*), house finch (*Carpodacus mexicanus*), barn swallow (*Hirundo rustica),* brown-headed cowbird (*Molothrus ater),* Canada goose (*Branta canadensis*), greater white-fronted goose (*Answer albifrons*), killdeer (*Charadrius vociferus*), mallard (*Anas platyrhynchos*), mourning dove (*Zenaida macroura*), northern flicker (*Colaptes auratus*), rock pigeon (*Columba livia*), western meadowlark (*Sturnella neglecta*), white-crowned sparrow (*Zonotrichia leucophrys*), American avocet (*Recurvirostra americana*), common raven (*Corvus corax*), great horned owl (*Bubo virginianus*), American robin (*Turdis migratoriu*s), yellow-billed magpie (Pica nuttalli), American white pelican (*Pelecanus erythrorhynchos*), Anna's hummingbird (*Calypte anna*), western kingbird (*Tyrannus verticalis*), double-crested cormorant (*Phalacrocorax auritus*), and marsh wren (*Cistothorus palustris*).

The following special-status bird species have been identified as having a potential to occur within or adjacent to the BSA.

Northern Harrier

Northern harrier is listed as a species of special concern by CDFW. Northern harrier nests on the ground and forages in and near wet habitats such as freshwater marsh; wet meadows; grasslands; lightly grazed pastures; some croplands; and weedy borders of lakes, rivers, and streams. The northern harrier breeding range extends from sea level in the Central Valley and Sierra Nevada to 5,700 feet. The BSA occurs within the year-round range of northern harrier and the annual grasslands habitat provides potential nesting/foraging habitat for the species. Breeding season is typically from early April to September.

Mountain Plover

Mountain plover (*Charadrius montanus)* is designated as a species of special concern by CDFW. They winter in California's Central Valley from Sutter and Yuba Counties southward and breed from northern Montana and North Dakota south through the Great Plans to southeastern New Mexico and Texas. The BSA is within the winter range (September to March) for the species. Mountain plover prefers habitats with open grassland, plowed fields with little vegetation, and open sagebrush areas. The annual grassland and cropland habitats provide potential foraging habitat for the species from September to March.

Burrowing Owl

BUOW is designated as a species of special concern by CDFW. BUOW is a year-round resident typically wintering in the same locations as their breeding territory. The species nests in dry grassland, desert, and ruderal habitats. They often nest on the banks of canals and levees. They inhabit small mammal burrows or other suitable underground cavities for nesting. Breeding typically takes place from March to August. The BSA occurs within the year-round range of BUOW. There are five CNDDB occurrences within approximately 500 feet of the BSA.

Protocol-level surveys for BUOW were performed according to methodology described in the *Habitat Assessment of the Burrowing Owl Survey Protocol and Mitigation Guidelines* (BUOW Survey Protocol) (The California Burrowing Owl Consortium 1993). Per the BUOW Survey Protocol, the BSA was established with a 150-meter buffer around the BSA to survey for suitable habitat and potential burrows in areas where impacts from factors such as noise and vibration could impact BUOWs. Surveys were performed on February 10, April 16, May 13, May 20, and June 3, 2021, and January 13, 20–21, and 25, 2022. The survey efforts identified grassland and ruderal areas within 150 meters of the BSA that provide suitable nesting and foraging habitat for BUOW. Approximately 10.3 acres of suitable habitat and 0.3 acre of concentrated burrows where BUOW have the potential to nest were identified and mapped during the surveys. Further details of the BUOW surveys can be found in Appendix I of the NES.

White-Tailed Kite

White-tailed kite (*Elanus leucurus)* is fully protected by CDFW. White-tailed kites are found throughout California in coastal and valley lowlands. White-tailed kites typically nest in dense stands of tall shrubs and trees located adjacent to foraging habitat (i.e., undisturbed open grasslands, meadows, farmlands, and emergent wetlands), and are seldom observed more than 0.5 mile from an active nest during the breeding season (Zeiner et al. 1990). The BSA occurs within the year-round range of white-tailed kite. The valley oak woodland, valley foothill riparian, coastal oak woodland, and interior oak woodland habitats all provide nesting habitat for white-tailed kite. The annual grassland and cropland habitats provide potential foraging habitat for the species. Breeding season can take place from early February to October, typically peaking from May to August.

Grasshopper Sparrow

Grasshopper sparrow (*Ammodramus savannarum*) is designated as a species of special concern by CDFW. The breeding range is in the foothills and valley west of the Cascade-Sierra Nevada crest from Mendocino and Trinity Counties south to San Diego County. The winter range is along the southern coast of California. They nest in dense grasslands with thick cover of grasses and forbs. Nests are built in a slight depression in the ground hidden at the base of overhanging vegetation for concealment. Grasshopper sparrow also requires a mix of taller vegetation for singing perches. The annual grassland habitat provides potential nesting and foraging habitat for the species. Breeding season occurs between early April to mid-July, with a peak in May and June.

Purple Martin

Purple martin (*Progne subis*) is designated as a species of special concern by CDFW. Their current breeding range within California includes the coastal mountains, Sierra Nevada, Cascades, and two locations in the Central Valley. The Yolo and Sacramento portions of the BSA is located within one of these breeding ranges. They are a migratory bird typically arriving in their breeding range from South America in late March and departing by late September. They typically nest in old woodpecker cavities and human-made structures such as nesting boxes, under bridges, and culverts. Nests are typically located in open forest or woodland; and foraging over riparian areas and woodland habitats. The bridges and culverts provided potential nesting habitat and the valley foothill riparian habitat provides potential foraging habitat for the species. Breeding season is typically from early April to August.

Song Sparrow "Modesto Population"

The song sparrow "Modesto population" (*Melospiza melodai)* is designated as a species of special concern by CDFW. They are year-round residents of the Sacramento Valley, Sacramento-San Joaquin Delta, and northern San Joaquin Valley. They nest in emergent freshwater marshes, riparian forests, along vegetated irrigation canals and levees, and in recently planted valley oak restoration sites. The fresh emergent wetland and valley foothill riparian habitats provide potential nesting and foraging habitat for the species. Breeding season is typically from early April to July.

Yellow-Headed Blackbird

Yellow-headed blackbird (*Xanthocephalus xanthocephalus*) is designated as a species of special concern by CDFW. In California, the breeding range is in the Central Valley and selected locations in the coast ranges west of the Central Valley. The winter range includes parts of California and Mexico. Yellow-headed blackbird typically forages on insects, spiders, and seeds. The fresh emergent wetland habitat provides potential foraging habitat for the species. Breeding typically occurs from mid-April through July with nests built in dense vegetation such as cattails (*Typha* sp.), tules (*Scirpus* sp.), willow thickets (*Salix* spp.), and blackberry (*Rubus* sp.).

Bat Species

Townsend's big-eared bat (*Corynorhinus townsendii*), pallid bat (*Antrozous pallidus*), and western red bat (*Lasiurus blossevillii*) are all designated as species of special concern by CDFW. Bat species may roost individually or in small groups in tree cavities, in rock crevices, in riparian vegetation, or in man-made structures (e.g., bridges). Townsend's big-eared bat typically roosts in cavities such as caves, tree basal hollows, mines, tunnels, buildings, bridges, or other human-made structures. Pallid bats typically roost in rocky outcrops, cliffs, large-diameter live and snag trees, spacious crevices with access to open habitats for foraging, caves, mines, bridges, barns, porches, tree crevice roosts, bat boxes, and on the ground in stone piles, debris piles, baseboards, and rocks. Western red bats typically roost in dense riparian tree foliage. Although not a special-status species, Mexican free-tailed bat (*Tadarida brasiliensis*) is a species of local importance to the public and communities within/near the BSA

and commonly roosts in caves and rock crevices on cliff faces, abandoned mines and tunnels, highway bridges and large culverts, buildings, and bat houses.

Surveys were performed on December 18, 21, and 22, 2020, to identify suitable roosting habitat for bats within the BSA. Foliage roost habitat for western red bat and human-made structures (i.e., bridges, culverts) that contain suitable roosting habitat for Townsend's big-eared bat and pallid bat are present in the BSA. The BSA contains trees, specifically within the riparian areas along the Sacramento River, Putah Creek, and South Fork Putah Creek, that may contain suitable roosting habitat (e.g., cavities, exfoliating bark) for bats. In addition, the existing bridge over the Yolo Bypass contains one of the largest maternal colonies of Mexican free-tailed bats in the state of California and is well known to the residences and non-governmental agencies in the region. The most recent CNDDB recorded occurrence of pallid bat is from 1964 located 1 mile north of the BSA in Davis. There are no CNDDB occurrences of western red bat or Townsend's big-eared bat within 5 miles of the BSA. Mexican free-tailed bat is not reported in the CNDDB.

2.3.4.3 Environmental Consequences

No Build Alternative 1

Construction and Operation

No Build Alternative 1 would make no physical or operational improvements within the BSA. Therefore, No Build Alternative would not affect special-status animal species.

Build Alternatives 2a and 2b

Construction

Western Pond Turtle

Construction activities are not likely to directly or indirectly impact breeding and nesting activities since construction would occur outside the turtle nesting season; and certain construction activities, such as vegetation removal and soil compaction stemming from grading, would not affect areas where potential nesting habitat is present (e.g., open water and valley foothill riparian habitats along Putah Creek). Standard Measures BIO-1, BIO-2, BIO-3, and BIO-4, listed in Appendix E, would minimize potential impacts to western pond turtle. In addition, AMM BIO-4 would allow for construction to cease until western pond turtles have left the work area, and AMM BIO-5 would require species-specific training for workers.

Burrowing Owl

None of the potential BUOW habitat identified is located within the permanent construction footprint, but approximately 0.03 acre of concentrated burrows is located within the staging area adjacent to Kidwell Road at the west end of the BSA. However, if BUOWs are present within the 500-foot buffer during construction activities, the project could result in temporary displacement of individuals due to the noise and vibration of project activities near potential burrow sites. The area currently has high noise levels from existing heavy traffic conditions; therefore, adverse

effects on BUOW as a result of noise and vibration from construction are anticipated to be minimal. Although no BUOWs were observed during the 2021 nesting season, they have potential to nest in areas mapped as suitable habitat and concentrated burrows, as well as other areas, depending on-site conditions. Standard Measure BIO-1 would require the species to be covered in the Worker Environmental Awareness Training. AMMs BIO-7 through 9 would require pre-construction surveys for BUOW and the implementation of avoidance buffers if active burrows are identified.

Other Special-Status and Migratory Birds and Raptors

Tree and vegetation removal would result in a temporary loss of nesting and foraging habitat for raptors, nesting birds, and migratory birds. Approximately 2.828 acres of nesting habitat would be temporarily impacted and include 0.453 acre of coastal oak woodland, 0.505 acre of valley oak woodland, and 1.87 acres of valley foothill riparian habitat could potentially be impacted. The temporary impact from the loss of nesting and foraging habitat would be minimal given the ample habitat in the vicinity of the BSA. Tree and vegetation removal may also affect foraging success, food sources for herbivorous birds, and reduction in prey density for carnivorous or insectivorous birds. Birds could also abandon nests from noise and construction activities nearby. Following completion of construction, trees would be replanted and the surrounding habitat would be restored. Standard Measure BIO-2 would require pre-construction nesting surveys and the establishment of avoidance buffers for active nests. AMM BIO-2 would require minimizing the amount of riparian vegetation removed. Standard Measure BIO-4 would require replanting, reseeding, and restoration of disturbed areas along with minimizing vegetation removal. AMM BIO-10 would require consultation with CDFW if creating a no disturbance buffer around a white-tailed kite or northern harrier nest is not practicable. AMM BIO-11 would prohibit activities that would result in take of a white-tailed kite nest.

Bat Species

Build Alternatives 2a and 2b would result in temporary displacement of bats and temporary loss of potential bat roosting habitat for locations where culvert removal and tree trimming/removal would occur. If culvert work or tree removal would take place during the reproductive season (early May to August), there is a potential for direct mortality of young bats to occur. Bats typically give birth to young in May but form maternity colonies as early as March. Permanent impacts could occur from bat mortality resulting from the removal of maternity roost habitat. No construction would occur on the existing bridge over the Yolo Bypass, so the maternity colony that roosts under the bridge would not be directly impacted. Temporary impacts on bats would result from construction related noise, lights during night work, and vibration disturbance to bats roosting adjacent to active construction. These impacts have the potential to impact the bats by disturbing their behavior, growth, reproduction, or survival. With the implementation of Standard Measures BIO-1 and BIO-2, adverse effects on special-status bat species would be reduced. In addition, AMM BIO-12 would require trees to be removed after young bats are volant to avoid impacts to maternity colonies, AMM BIO-13 would require pre-construction bat surveys, AMM BIO-14 would require a bat protection plan, and AMM BIO-15 minimizes impacts to bats from structural changes to potential roosting habitat.

Operation

Once construction is completed, Build Alternatives 2a and 2b would carry two more travel lanes than existing conditions. However, the impacts to special-status animal species would not increase from existing conditions.

Build Alternatives 3a and 3b

Construction and Operation

Build Alternatives 3a and 3b would involve adding an HOT2+ lane in each direction. Build Alternatives 3a and 3b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively; therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b.

Build Alternatives 4a and 4b

Construction and Operation

Build Alternatives 4a and 4b would involve adding an HOT3+ lane in each direction. Build Alternatives 4a and 4b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively; therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b.

Build Alternatives 5a and 5b

Construction and Operation

Build Alternatives 5a and 5b would involve adding an express lane in each direction. Build Alternatives 5a and 5b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively; therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b.

Build Alternatives 6a and 6b

Construction and Operation

Build Alternatives 6a and 6b would involve adding a transit-only lane in each direction. Build Alternatives 6a and 6b propose similar project components within the same project area as Build Alternatives 2a and 2b; therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b.

Build Alternatives 7a and 7b

Construction and Operation

Build Alternatives 7a and 7b would involve repurposing the current number 1 general purpose lane to HOV 2+. No new lanes would be constructed. Build Alternatives 7a and 7b propose similar project components within the same project area as Build Alternatives 2a and 2b,

respectively; therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b.

2.3.4.4 Avoidance, Minimization, and/or Mitigation Measures

Caltrans would implement the following AMMs to reduce impacts to special-status animals.

- **AMM BIO-4: Western Pond Turtle.** If western pond turtles are encountered within the BSA during construction, work activity in the immediate vicinity will cease until any turtles have left the work area on their own or a CDFW-approved biologist moves the individual out of harm's way.

- **AMM BIO-5: Worker Training for Western Pond Turtle.** Prior to initiation of construction activities, workers will participate in environmental awareness training provided by a qualified biologist. The training will instruct workers regarding: (1) how to identify the turtle; (2) the habitats used by the turtle; (3) the potential for turtle egg clutches (i.e., nest sites) to be discovered during vegetation clearing; and (4) what to do if a turtle or suspected egg clutch is encountered during construction activities.

- **AMM BIO-6: Pre-Construction Tricolored Blackbird and Yellow-Headed Blackbird Surveys.** Pre-construction surveys for tricolored blackbird and yellow-headed blackbird should be conducted prior to any ground-disturbing activities within 500 feet of mapped potentially suitable habitat. Pre-construction surveys should be conducted in mid-March, mid-April, mid-May, and mid-June given that the dates of nesting in Northern California are not consistent from year to year and given that the species may nest twice in the same nesting season at the same or different locations. The recommendation of a survey every 30 days during the nesting season is based on the potential length of the nesting season in the Sacramento Valley (i.e., mid-March to mid-July) and total time required for incubation and fledging (i.e., 21 to 25 days). Note that the full complement of four survey visits can be reduced accordingly if work starts after mid-March, and surveys can be avoided entirely if work starts between August 1 and March 1 (i.e., outside the nesting season).

- **AMM BIO-7: Pre-Construction BUOW Surveys.** A minimum of one pre-construction survey for occupied BUOW burrows within 500 feet of the BSA in suitable habitat (e.g., grasslands) will be conducted by a qualified biologist within 15 days prior to the initiation of construction activities, regardless of the timing of construction. If any occupied burrows are identified, appropriate conservation measures as determined by a qualified biologist will be implemented. No disturbance will occur within 150 feet of occupied burrows during the nonbreeding season (September 1–January 31) or within 250 feet during the breeding season (February 1–August 31). These measures may also include establishing a construction-free buffer zone around the active nest site in coordination with the CDFW, biological monitoring of the active nest site, and delaying construction activities in the vicinity of the active nest site until the young have fledged.

- **AMM BIO-8: BUOW Exclusion Plan.** If BUOW are detected within the BSA during the nonbreeding season and maintaining a 150-foot no disturbance buffer is not practicable,

a qualified biologist will submit an exclusion plan to CDFW. The exclusion plan will generally follow the guidelines outlined in Appendix E of the *Staff Report on Burrowing Owl Mitigation* (CDFG 2012). The exclusion plan will consist of installing one-way doors in potential burrows, daily monitoring, and collapsing burrows once it is determined that the burrows are unoccupied. Exclusion may only take place during the nonbreeding season (September 1 to January 31) and may be an ongoing effort during this time period. This will allow the owls to exit burrows if they are present, but not return.

- **AMM BIO-9: Burrowing Owl Direct Disturbance.** If occupied burrows are detected during the breeding season and maintaining a 250-foot no disturbance buffer is not practicable, CDFW will be consulted to determine alternative measures to minimize the potential for disturbance to occupied burrows and nesting activities. Measures may include, but are not limited to, continuous biological monitoring by a qualified biologist until it has been determined that the young have fledged and are no longer reliant on the nest for parental care or survival, or the construction is complete. No direct disturbance of burrows with eggs or young can be conducted without written authorization from the CDFW.

- **AMM BIO-10: White-Tailed Kite Consultation.** If an active white-tailed kite nest is observed, CDFW will be consulted to determine alternative measures to minimize the potential for project-related disturbance to the nest site that could result in nest abandonment or other forms of take. Measures may include but are not limited to continuous biological monitoring by a qualified biologist until it has been determined that the young have fledged and are no longer reliant on the nest or parental care for survival or the construction is complete. If the nesting pair shows signs of distress as a result of project-related activities (e.g., adults leaving the nest when eggs or young chicks are present), the monitoring biologist will have authority to stop work until it is determined that the adults have returned and are no longer showing signs of distress.

- **AMM BIO-11: White-Tailed Kite Avoidance.** If consultation with CDFW results in a determination that take of a white-tailed kite nest may not be avoidable, then all activities that are likely to result in such take will be delayed until a qualified biologist has determined that the young have fledged and are no longer reliant on the nest or parental care for survival. White-tailed kites are a fully protected species, and CDFW may provide an Incidental Take Permit for this species if impacts are unavoidable.

- **AMM BIO-12: Tree Removal.** To the extent practicable, removal of large trees with cavities will occur before bat maternity colonies form (i.e., prior to March 1) or after young bats are volant (i.e., after August 31). To the greatest extent practicable, trees would be removed in pieces, rather than felling the entire tree. It is recommended that removal take place late in the day or in the evening (to reduce the likelihood of evicted bats falling prey to diurnal predators) and during warm weather conditions conducive to bat activity.

- **AMM BIO-13:** Pre-construction Bat Surveys. If construction (including the removal of large trees) occurs during the non-volant season (March 1 through August 31), a qualified biologist will conduct a pre-construction survey of the areas identified as high

and moderate maternity roosting potential in the bat habitat assessment for maternity colonies. The pre-construction survey will be performed no more than 14 days prior to the implementation of construction activities, including staging and equipment access. If a lapse in construction activities for 14 days or longer occurs between those dates, another pre-construction survey will be performed. If any maternity colonies are detected, a qualified biologist will determine and implement appropriate conservation measures. These measures may include but are not limited to establishing a construction-free buffer zone around the maternity colony site, biological monitoring of the maternity colony, and delaying construction activities in the vicinity of the maternity site.

- **AMM BIO-14: Bat Protection Plan.** A bat species protection survey plan will be developed. The plan will include items such as having a qualified biologist on-site to conduct monitoring during construction in or near bat roosting habitat.

- **AMM BIO-15: Structural Changes to Bat Roosting Habitat.** To the greatest extent practicable, structural changes may be made to any known roost proposed for removal (as determined by pre-construction surveys) to create conditions in the roost that are undesirable to roosting bats and that will encourage the bats to leave on their own (e.g., open additional portals so that the temperature, wind, light, and precipitation regimes change in the roost). Structural changes to the roost would be performed during the appropriate exclusion timing (listed above) to avoid harming bats.

2.3.5 Threatened and Endangered Species

2.3.5.1 Regulatory Setting

The primary federal law protecting threatened and endangered species is the Federal Endangered Species Act (FESA): 16 United States Code (USC) Section 1531, et seq. See also 50 Code of Federal Regulations (CFR) Part 402. This act and later amendments provide for the conservation of endangered and threatened species and the ecosystems upon which they depend. Under Section 7 of this act, federal agencies, such as the FHWA (and the Department, as assigned), are required to consult with the U.S. Fish and Wildlife Service (USFWS) and the National Oceanic and Atmospheric Administration's National Marine Fisheries Service (NOAA Fisheries) to ensure that they are not undertaking, funding, permitting, or authorizing actions likely to jeopardize the continued existence of listed species or destroy or adversely modify designated critical habitat. Critical habitat is defined as geographic locations critical to the existence of a threatened or endangered species. The outcome of consultation under Section 7 may include a Biological Opinion with an Incidental Take Statement or a Letter of Concurrence. Section 3 of FESA defines take as "harass, harm, pursue, hunt, shoot, wound, kill, trap, capture or collect or any attempt at such conduct."

California has enacted a similar law at the state level, the California Endangered Species Act (CESA), California Fish and Game Code Section 2050, et seq. CESA emphasizes early consultation to avoid potential impacts to rare, endangered, and threatened species and to develop appropriate planning to offset project-caused losses of listed species populations and

their essential habitats. The California Department of Fish and Wildlife (CDFW) is the agency responsible for implementing CESA. Section 2080 of the California Fish and Game Code prohibits “take” of any species determined to be an endangered species or a threatened species. Take is defined in Section 86 of the California Fish and Game Code as “hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill.” CESA allows for take incidental to otherwise lawful development projects; for these actions an incidental take permit is issued by CDFW. For species listed under both FESA and CESA requiring a Biological Opinion under Section 7 of FESA, the CDFW may also authorize impacts to CESA species by issuing a Consistency Determination under Section 2080.1 of the California Fish and Game Code.

Another federal law, the Magnuson-Stevens Fishery Conservation and Management Act of 1976, was established to conserve and manage fishery resources found off the coast, as well as anadromous species and Continental Shelf fishery resources of the United States, by exercising (A) sovereign rights for the purposes of exploring, exploiting, conserving, and managing all fish within the exclusive economic zone established by Presidential Proclamation 5030, dated March 10, 1983, and (B) exclusive fishery management authority beyond the exclusive economic zone over such anadromous species, Continental Shelf fishery resources, and fishery resources in special areas.

2.3.5.2 Affected Environment

The BSA provides sufficient habitat for various state and federally listed plant and wildlife species. This section addresses the regionally occurring listed species. The potential for these listed plant species to occur within the BSA are presented in Table 2.3-8 and the potential for listed wildlife species to occur are presented in Table 2.3-9.

Table 2.3-8. Federal or State Listed Plants Potentially Occurring or Known to Occur in the Biological Study Area

Common Name	*Scientific Name*	Status[1] (Fed/State/ CRPR)	General Habitat Description	Potential to Occur within the BSA[2]
palmate-bracted bird's-beak	*Chlorophyron palmatum*	FT/SE/1B.1	Found in valley and foothill grassland with alkaline soil. Blooms: May–October Elevation: 85 to 90 feet	None. No suitable alkaline soils are present within the BSA to support the species. No CNDDB occurrences within 5 miles of the BSA. This species was not observed during the May 2021 botanical surveys.
Bogg's Lake hedge-hyssop	*Gratiola heterosepala*	—/SE/1B.2	Found in marshes and swamps (lake margins) and vernal pools. Clay soil. Blooms: April–August Elevation: 33 to 7,800 feet	Low. Suitable habitat may be present in the fresh emergent marsh wetlands. No CNDDB occurrences within 5 miles of the BSA. This species was not observed during the early or late season botanical surveys and is presumed to be absent from the BSA.
Colusa grass	*Neostapfia colusana*	FT/SE/1B.1	Found in vernal pools. Blooms: May–August Elevation: 16-656 feet	None. No vernal pool habitat is present within the BSA to support the species. The most recent CNDDB occurrence is from year 2013 approximately 4 miles southwest of the BSA. This species was not observed during the May 2021 botanical surveys.
Keck's checkerbloom	*Sidalcea keckii*	FE/—/1B.1	Found in valley and foothill grassland and cismontane woodland. Serpentinite, clay soil. Blooms: April–May (June) Elevation: 245 to 2,100 feet	Low. Marginal habitat is present within the grasslands, which have limited distribution in the BSA and are dominated by non-native and invasive species. The most recent CNDDB occurrence is from year 2019 approximately 5 miles west of the BSA. This species was not observed during the May 2021 botanical surveys and is presumed to be absent from the BSA.
Crampton's tuctoria or Solano grass	*Tuctoria mucronata*	FE/SE/1B.1	Found in valley and foothill grassland (mesic) and vernal pools. Blooms: April–August Elevation: 15 to 33 feet	Low. Marginal habitat is present within the grasslands, which have limited distribution in the BSA and are dominated by non-native and invasive species. The most recent CNDDB occurrence is from year 2011 approximately 4 miles southwest of the BSA within created vernal pools. However, this species was not observed during the early or late season botanical surveys and is presumed to be absent from the BSA.

1 Status Codes: Federal Endangered (FE); Federal Threatened (FT); State Endangered (SE) / 1 CRPR Codes and Extensions: 1B Plants rare, threatened, or endangered in California and elsewhere; xx.2 Fairly endangered in California; xx.1 Seriously endangered in California

2 Assessment Codes: Present: The species is known to be present or has been recently observed in the BSA. High: The species has been observed and documented within 5 miles of the BSA within the last 5 years and habitat for the species is present in the BSA. Moderate: The BSA is located within the range of the species, there are documented occurrences within 5 miles of the BSA, and potential habitat for the species exists in the BSA. Low: The BSA is located within the range of the species, but no past documented occurrences have been recorded within 5 miles and only low quality (e.g., small fragmented patches or habitats under the influence of frequent anthropogenic disturbances) are present in the BSA. None Focused surveys determined the species is absent from the BSA, the species is acknowledged to be extirpated locally or the BSA is located outside of the species range, or potential habitat to support the species is not present in the BSA.

Key: BSA – biological study area, CNDDB – California Natural Diversity Database

Table 2.3-9. Federal or State Listed Wildlife and Critical Habitat Potentially Occurring or Known to Occur in the Biological Study Area

Common Name	*Scientific Name*	Status[1] (Fed/State)	General Habitat Description	Potential to Occur within the BSA[2]
Invertebrates				
Conservancy fairy shrimp	*Branchinecta conservatio*	FE/—	Large to very large vernal pools with turbid water in grasslands on old alluvial soils underlain by hardpan.	None. Not expected to occur. Species occurs in large vernal pools and are not currently known to occur in any waters or wetlands that intersect the BSA. No suitable habitat is present within the BSA. No CNDDB recorded occurrences within 5 miles of the BSA.
vernal pool fairy shrimp	*Branchinecta lynchi*	FT/—	Vernal and intermittent freshwater pools.	Low. Not expected to occur. Species occurs in large vernal pools and are not currently known to occur in any waters or wetlands that intersect the BSA. No suitable habitat is present within the BSA. The most recent CNDDB occurrence is from year 1995 approximately 5 miles northeast of the BSA documenting 10 adults in a seasonal pond near the Natomas East Main Drainage Canal in Sacramento.
vernal pool tadpole shrimp	*Lepidurus packardi*	FE/—	Vernal and intermittent freshwater pools.	Low. Not expected to occur. Species occurs in vernal pools and are not currently known to occur in any waters or wetlands that intersect the BSA. No suitable habitat is present within the BSA. The most recent CNDDB occurrence is from year 1979 approximately 2 miles northwest of the BSA documenting specimens found in a vernal pool adjacent to agricultural land on the north side of Davis.
valley elderberry longhorn beetle	*Desmocerus californicus dimorphus*	FT/—	Life cycle depends on elderberry shrubs (*Sambucus* spp.), which are typically associated with riparian forests that occur along rivers and streams.	High. Sixty-seven suitable elderberry shrubs were mapped within 165-feet of the BSA; 52 of which are located within the BSA. Three CNDDB occurrences within 2,526 feet of the BSA.

Common Name	*Scientific Name*	Status[1] (Fed/State)	General Habitat Description	Potential to Occur within the BSA[2]
Delta green ground beetle	*Elaphrus viridis*	FT/—	Found in the vicinity of vernal pools within Solano County.	None. Not expected to occur. Species occurs in large vernal pools and are not currently known to occur in any waters or wetlands that intersect the BSA. No suitable habitat is present within the BSA. The most recent CNDDB occurrence is from year 1979 approximately 2 miles northwest of the BSA documenting specimens found in a vernal pool adjacent to agricultural land on the north side of Davis.
Crotch's bumble bee	*Bombus crotchii*	—/CE	Open grasslands and scrub areas in hot and dry climates. Requires underground nesting habitat, abundant flowering plants for foraging, and overwintering habitat (soft, disturbed soil or leaf litter). Crotch's bumble bee has been nearly extirpated from the Central Valley.	None. The BSA is within highly disturbed right-of-way and adjacent land use is mostly urban and agriculture. The floristic resources and underground nesting habitat required for the species are not present within or adjacent to the BSA. In addition, the adjacent agriculture provides competition with managed bees, disease, and pesticides that are detrimental to and have been a factor in the decline of the species. The most recent CNDDB occurrence is from year 1998 approximately 0.5 mile north of the BSA along Putah Creek.
western bumble bee	*Bombus occidentalis*	—/CE	Blooming flowers along streams, meadows, roadsides, and burned or logged areas. Nests found underground in abandoned rodent burrows.	None. The BSA is not within the current range of the species. Most recent CNDDB occurrence is from year 1965 in the general vicinity of Davis.
Fish				
green sturgeon southern DPS	*Acipenser medirostris*	FT/SSC	Spawns in mainstem Sacramento and Feather rivers; juveniles are thought to rear mainly throughout the San Francisco Bay estuary.	Moderate. Suitable spawning habitat is present within the BSA in the Sacramento River. No CNDDB occurrences within 5 miles of the BSA. The BSA is in designated critical habitat.

Common Name	*Scientific Name*	Status[1] (Fed/State)	General Habitat Description	Potential to Occur within the BSA[2]
steelhead- Central Valley DPS	*Oncorhynchus mykiss irideus* pop. 11	FT/—	Spawns and rears in the Sacramento River and its tributaries. Requires cool, swift shallow water; clean, loose gravel for spawning.	High. Suitable habitat is present within the BSA in the Sacramento River and Prospect Slough. The most recent CNDDB documented occurrence is from year 2011 approximately 0.5 mile east of the BSA documenting many migrating and stranded steelhead between 1998-2011 at the eastern edge of the Yolo Bypass; including the toe drain, Sacramento Deep Water Ship Channel, and Sacramento Bypass. The BSA is in designated critical habitat.
Chinook salmon- Central Valley spring-run ESU	*Oncorhynchus tshawytscha* pop. 11	FT/ST	Sacramento and San Joaquin Rivers and tributaries with cool summer water temperatures, deep pools, and suitable spawning substrate.	High. Suitable habitat is present within the BSA in the Sacramento River. The most recent CNDDB documented occurrence is from year 2004 less than 1 mile east of the BSA documenting one adult and 26 juveniles captured in the Sacramento Deep Water Ship Channel in West Sacramento. The BSA is in designated critical habitat.
Chinook salmon- Sacramento River winter-run ESU	*Oncorhynchus tshawytscha* pop. 7	FE/SE	Adults and juveniles occur in the Sacramento River during seasonal migration periods.	High. Suitable habitat is present within the BSA in the Sacramento River. The most recent CNDDB documented occurrence is from year 2004 less than 1 mile east of the BSA documenting 36 adults and 11 juveniles captured in the Sacramento Deep Water Ship Channel in West Sacramento. The BSA is in designated critical habitat.
Delta smelt	*Hypomesus transpacificus*	FT/SE	Estuarine systems in the Sacramento-San Joaquin Delta, in reaches with slow flow.	Moderate. The BSA contains suitable habitat for the species within the Sacramento River. There are no CNDDB occurrences within 5 miles of the BSA. The BSA overlaps designated critical habitat for the species.
longfin smelt	*Spirinchus thaleichthys*	FC/ST	Open water channels and bays in salinities ranging from freshwater to seawater.	High. The BSA contains suitable habitat for the species within the Sacramento River. One CNDDB occurrence was identified in the Sacramento River within the BSA, where a single adult was collected in year 2004.

Common Name	*Scientific Name*	Status[1] (Fed/State)	General Habitat Description	Potential to Occur within the BSA[2]
Amphibians				
California tiger salamander	*Ambystoma californiense*	FT/ST	Breeding habitat consists of vernal or temporary pools in annual grasslands, or open stages of woodlands. Requires underground refugia, such as mammal burrows, within 1 mile of breeding habitat.	None. The BSA does not contain suitable breeding habitat or underground refugia (e.g., small mammal burrows) within annual grassland habitat. The seasonal wetlands within the BSA are not inundated for a sufficient duration to support breeding and development of the species in the features. Further, the BSA is within a highly disturbed right-of-way and adjacent land use is mostly urban and agriculture with frequent anthropogenic disturbances. The most recent CNDDB occurrence is from year 1993 approximately 2.5 miles northwest of the BSA documenting a live individual captured in the parking lot of an apartment complex at the north edge of Davis.
California red-legged frog	*Rana draytonii*	FE/SSC	Requires aquatic habitat for breeding, also uses a variety of other habitat types, including riparian and upland areas. Adults prefer dense, shrubby, or emergent vegetation associated with deep water pools with fringes of cattails and dense stands of overhanging vegetation. This species also breeds in ephemeral ponds that support little or no vegetation.	None. The BSA is not within the current range of the species.
Reptiles				
giant garter snake	*Thamnophis gigas*	FT/ST	Freshwater marshes and low gradient streams with emergent vegetation. Adapted to drainage canals and irrigation ditches with mud substrate.	High. Suitable aquatic and upland habitat is present within the Yolo Bypass, and other areas throughout the BSA. There are five CNDDB occurrences within 5 miles of the BSA.

Common Name	*Scientific Name*	Status[1] (Fed/State)	General Habitat Description	Potential to Occur within the BSA[2]
Birds				
Swainson's hawk	*Buteo swainsoni*	—/ST	Breeds in stands with few trees in juniper-sage flats, riparian areas, and oak savannah; forages in adjacent livestock pasture, grassland, or grain fields.	Present. Protocol-level Swainson's hawk surveys revealed 132 potential nests within 0.5 mile of the BSA; 24 of which were active SWHA nests during the 2021 nesting season. There are 75 CNDDB occurrences within 0.5 mile of the BSA. Tall trees throughout the BSA provide suitable nesting habitat. In addition to nesting, seven observations of overwintering SWHAs were made during the surveys on January 12, and February 17, 2021, in the vicinity of Davis.
bald eagle	*Haliaeetus leucocephalus*	—/SE, FP	Breeds and winters in riparian woodland with large trees, often old-growth or open canopy. Typically nests near large bodies of permanent water or perennially flowing rivers with abundant fish.	Present. One bald eagle was observed flying through the BSA during SWHA surveys. However, no suitable nesting habitat for the species was identified within 0.5 mile of the BSA during the surveys.
California black rail	*Laterallus jamaicensis coturniculus*	—/ST, FP	Resides in saline, brackish, and freshwater wetlands in the San Francisco Bay Area, Sacramento-San Joaquin Delta, coastal Southern California at Morro Bay.	None. The BSA is not within the current range of the species.
western snowy plover	*Charadrius nivosus nivosus*	FT/SSC	Nests in sandy marine and estuarine shores. Inland nesting areas include the Salton Sea, Mono Lake, and at isolated sites on the shores of alkali lakes in northeastern California, in the Central Valley, and the southeastern deserts.	None. No suitable habitat is present for the species.
western yellow-billed cuckoo	*Coccyzus americanus occidentalis*	FT/SE	Requires dense deciduous riparian thickets or woodland with dense, low-level or understory foliage adjacent to slow-moving watercourses, backwaters, or seeps.	Moderate. The BSA is not within the current breeding range of the species. However, migratory stopover habitat is present within the riparian habitat in the BSA. A single CNDDB occurrence documents observances made September 2012 and August 2013 along Putah Creek less than 2 miles west of the BSA.

Common Name	*Scientific Name*	Status[1] (Fed/State)	General Habitat Description	Potential to Occur within the BSA[2]
least Bell's vireo	*Vireo bellii pusillus*	FE/SE	Riparian forest, scrub, or woodland; nests along margins of bushes or twigs projecting; usually willow, mulefat, or mesquite. Requires dense cover within 3-6 feet of the ground for nesting and a dense, stratified canopy for foraging.	Moderate. Although the BSA is within the current breeding range of the species, breeding habitat (i.e., the riparian vegetation lacks the structure and vegetative density required by the species for nesting) is not present within the BSA. The most recent CNDDB occurrence is from year 2011 approximately 3.5 miles south of the BSA in the Yolo Bypass documenting a nesting pair in undisturbed riparian scrub habitat. The species may use riparian habitat within the BSA for foraging or migratory stopover habitat.
bank swallow	*Riparia riparia*	—/ST	Colonial nester on vertical banks or cliffs with fine-textured soils near water.	None. The BSA does not contain suitable habitat for the species. Vertical banks and cliffs are not present within the BSA. The most recent CNDDB occurrence is from year 1986 along the American River approximately 3.5 miles east of the BSA.
tricolored blackbird	*Agelaius tricolor*	—/ST	Breeds in large colonies in freshwater marshes in dense stands of cattails or bulrushes. Forages in open habitats such as farm fields and pastures.	Moderate. Potential habitat for nesting colonies mostly between the east end of the Yolo Bypass and Davis city limits. The most recent CNDDB occurrence is from year 2014 approximately 5 miles south of the BSA in the Yolo Bypass and documents approximately 100 individuals within a nesting colony.

[1] Status Codes: Federal Endangered (**FE**); Federal Threatened (**FT**); State Endangered (**SE**); State Threatened (**ST**); Candidate Endangered (**CE**) State Fully Protected (**FP**); CDFW Species of Special Concern (**SSC**).
[2] Assessment Codes: **Present:** The species is known to be present or has been recently observed in the BSA. **High:** The species has been observed and documented within 5 miles of the BSA within the last 5 years and habitat for the species is present in the BSA. **Moderate:** The BSA is located within the range of the species, there are documented occurrences within 5 miles of the BSA, and potential habitat for the species exists in the BSA. **Low:** The BSA is located within the range of the species, but no past documented occurrences have been recorded within 5 miles and only low quality (e.g., small fragmented patches or habitats under the influence of frequent anthropogenic disturbances) are present in the BSA. **None:** Focused surveys determined the species is absent from the BSA, the species is acknowledged to be extirpated locally or the BSA is located outside of the species range, or potential habitat to support the species is not present in the BSA.
Key: Key: BSA – biological study area, CNDDB – California Natural Diversity Database, DPS – distinct population segment, ESU – evolutionarily significant unit

Valley Elderberry Longhorn Beetle

The valley elderberry longhorn beetle (VELB; *Desmocerus californicus dimorphus*) is federally listed as threatened. VELB is an insect endemic to the Central Valley of California that inhabits riparian and associated upland habitats where elderberry (*Sambucus* spp.), its host plant, grows. Specifically, its range includes the upper Sacramento Valley from the vicinity of Redding to the central San Joaquin Valley, and generally below 500 feet elevation (USFWS 1991). VELB habitat typically consists of riparian forests.

In addition to the field survey, a review of CNDDB records found that there are three occurrences of VELB within 2,526 feet of the BSA. The project falls within the Sacramento River Management Unit and the Putah Creek Management Unit (USFWS 2019). A VELB habitat assessment survey was performed on February 19 and 21–24, 2021, and July 7, 2022, to identify the location of elderberry shrubs within 165 feet of the BSA. Sixty-seven elderberry shrubs were identified within 165 feet of the BSA, of which 53 shrubs were located within the BSA. Of the 53 shrubs observed within the BSA, exit holes were observed in eight shrubs.

Central Valley Distinct Population Segment Steelhead, Central Valley Spring-Run Evolutionarily Significant Unit Chinook Salmon, Sacramento River Winter-Run Evolutionarily Significant Unit Chinook Salmon, and Green Sturgeon

Central Valley distinct population segment (DPS) steelhead (*Oncorhynchus mykiss irideus)* is listed as threatened under FESA. Central Valley steelhead generally leave the ocean from August through April and spawn from December through April in small streams and tributaries of the Sacramento River where cool, well-oxygenated water is available year-round. Timing of upstream migration is correlated with higher flow events, such as freshets or seasonal flow increases, and associated lower water temperatures. Steelhead spawn in gravel and small cobble substrates usually associated with riffle and run habitat types.

Central Valley spring-run evolutionarily significant unit (ESU) Chinook salmon (*Oncorhynchus tshawytscha* pop. 6) is listed as threatened under FESA and CESA. Adult spring-run Chinook salmon migrate upstream from the ocean during the spring, beginning in March, and hold over in deep pools of the mainstem Sacramento River and its large perennial tributaries, where fish can access cold headwaters during the summer months, and then spawn in Mill, Deer, Clear, and Butte creeks and the Feather River from mid-August through mid-October.

Sacramento River winter-run ESU Chinook salmon (*Oncorhynchus tshawytscha* pop. 7) is listed as endangered under FESA and CESA. Adult winter-run Chinook salmon begin their migration from the ocean in December and may spawn from mid-April through mid-August. Spawning primarily occurs in the upper mainstem Sacramento River near Redding. Most of each year's winter-run salmon young migrate downstream and rear in the Delta and portions of the Yolo Bypass before emigrating to the ocean.

Green sturgeon (*Acipenser medirostris)* is listed as threated under FESA and is designated as a species of special concern by CDFW. Adults begin spawning migrations from the ocean in March and typically reach their spawning destinations in the Sacramento River from roughly Colusa to above Red Bluff and in the Feather River near Oroville between March and July

(Heublein et al. 2009; Seeholtz et al. 2015). Spawning takes place between April and June in deep, turbulent pools and fast water, when temperatures range from 46 degrees Fahrenheit (°F) to 60°F (Adams et al. 2002). Following reproduction, some adults promptly migrate downstream back to the estuary and ocean, while others may over-summer and move out of the river during the first fall freshets (Heublein et al. 2009). Juveniles may rear in the river for 1 to 3 years before emigrating downstream to the estuary, primarily during the summer and fall.

Suitable migration habitat is present for all four fish species in the Sacramento River at the eastern end of the BSA and in Prospect Slough within the Yolo Bypass. The following is a summary of the general timing each species is expected to occur in the BSA and the CNDDB documented occurrences within 5 miles.

Central Valley DPS steelhead could be present in the BSA from August to April. The most recent CNDDB documented occurrence is from year 2011 approximately 0.5 mile east of the BSA documenting many migrating and stranded steelhead between 1998–2011 at the eastern edge of the Yolo Bypass, including the toe drain, Sacramento Deep Water Ship Channel, and Sacramento Bypass. The BSA is in designated critical habitat.

Central Valley spring-run ESU Chinook salmon could be present in the BSA between March and April. The most recent CNDDB documented occurrence is from year 2004 less than 1 mile east of the BSA documenting one adult and 26 juveniles captured in the Sacramento Deep Water Ship Channel in West Sacramento. The BSA is in designated critical habitat.

Sacramento River winter-run ESA Chinook could be present in the BSA in December during fall upstream migration and potentially year-round for rearing before returning to the ocean. The most recent CNDDB documented occurrence is from year 2004 less than 1 mile east of the BSA documenting 36 adults and 11 juveniles captured in the Sacramento Deep Water Ship Channel in West Sacramento. The BSA is in designated critical habitat.

Essential Fish Habitat (EFH) for Chinook salmon occurs within the BSA. However, the project does not involve work within or adjacent to EFH. The project would have no effect to EFH. No Magnuson-Stevens Fishery Conservation and Management Act consultation with the NMFS is anticipated to be required.

Green sturgeon could be present in the BSA between March and April and again during the late summer and fall months. No CNDDB occurrences have been documented within 5 miles of the BSA. The BSA is in designated critical habitat.

Delta Smelt and Longfin Smelt

Delta smelt (*Hypomesus transpacificus*) is listed as threatened under FESA. Delta smelt are somewhat anadromous and undergo a spawning migration from brackish water to freshwater annually (Moyle 2002). In early winter, mature Delta smelt migrate from brackish, downstream rearing areas in and around Suisun Bay and the confluence of the Sacramento and San Joaquin rivers upstream to freshwater spawning areas in the Sacramento-San Joaquin Delta. They are found only from Suisun Bay upstream through the Delta in Contra Costa, Sacramento, San Joaquin, and Yolo Counties. Their historic range is thought to have extended from Suisun

Bay upstream to at least Sacramento on the Sacramento River and Mossdale on the San Joaquin River.

Longfin smelt (*Spirinchus thaleichthys*) is listed as a candidate for listing under FESA and threatened under CESA. Longfin smelt reside in the Bay Delta and spawn yearly in the Delta, Suisun Marsh, and Suisun Bay. In dry years, longfin smelt can spawn in the upper Sacramento River and have been observed as far up as Colusa State Park.

Suitable habitat is present for both smelt species in the Sacramento River at the eastern end of the BSA and Prospect Slough within the Yolo Bypass. Prospect Slough may provide suitable spawning habitat for longfin melt. The BSA is within designated critical habitat for Delta smelt.

Giant Garter Snake

The giant garter snake (GGS) (*Thamnophis gigas*) is listed as threatened under FESA and CESA. This species is found in a wide range of aquatic habitats with emergent structure for basking and feeding. GGS also uses adjacent upland sites for nesting and hibernation. The species is generally considered active from May 1 to September 30. The period from October 1 to April 30 is considered the snakes' hibernation period, and they are typically found in underground refugia (e.g., burrows, riprap, debris piles) during this time.

Habitat assessment surveys were performed between December 18 and 30, 2020, and June 12, 2022, to identify the location of potential GGS habitat within 200 feet of the BSA. A total of 101.2 acres of suitable aquatic habitat and 87 acres of marginal aquatic habitat were identified within 200 feet of the BSA (Appendix E of the NES). No GGSs were observed during the surveys.

Swainson's Hawk

SWHA (*Buteo swainsoni*) is listed as threatened under CESA. SWHA nests in stands with few trees in juniper-sage flats, riparian areas, oak savannah, and open agricultural habitats. They require adjacent open fields for foraging, including livestock pastures, grasslands, alfalfa, or grain fields. According to a study performed by Estep (2009) regarding the suitability of vegetation structure on SWHA foraging habitat, different habitats offer either high, moderate, or low suitability for SWHA foraging. Their preferred prey items are voles (*Microtus* sp.), pocket gophers (*Thomomys bottae*), birds, and insects such as grasshoppers (*Caelifera* sp.) (Estep 1989). SWHAs are migratory and typically begin arriving in their breeding territory in the Central Valley in early March to April and immediately begin reconstructing previously used nests or constructing new ones (Estep 2009). They typically begin their southerly migration in early August to mid-September (Estep 2009). The BSA occurs within the current range of SWHA.

Protocol-level SWHA surveys were performed according to the SWHA Survey Protocol described in the Recommended Timing and Methodology for Swainson's Hawk Nesting Surveys in California's Central Valley (Swainson's Hawk Technical Advisory Committee 2000). Per the SWHA Survey Protocol, the BSA was established with a 0.5-mile buffer around the BSA to survey for nesting SWHAs. Initial surveys were performed by Stantec biologists on January 12

and February 17, 2021, to identify suitable nests that could be utilized by SWHAs and other raptor species.

The surveys identified 95 potential nests that SWHAs and other raptor species (e.g., white-tailed kite) could use for nesting within 0.5-mile of the BSA. The survey efforts identified Fremont cottonwoods, valley oaks, and other tall trees within and immediately adjacent to the BSA that provide suitable nest trees for SWHAs and white-tailed kites. The annual grassland, agriculture, and ruderal habitat within the BSA provides potential foraging habitat for the species. Surveys were performed between March 22–26 and 29 and April 5–9 and 12, 2021, to document SWHA activity and identify territories. The SWHA survey identified a total of 24 active SWHA nests and 14 other raptor (i.e., 10 red-tailed hawks, one red-shouldered hawk, two great horned owls, and one osprey) nests within 0.5-mile of the BSA. Post-fledgling surveys conducted on July 7–9, 2021, identified 13 successful fledglings. Further details of the SWHA surveys can be found in Appendix H of the NES.

Bald Eagle

Bald eagles (*Haliaeetus leucocephalus)* are typically found near large bodies of water or free flowing rivers with abundant fish and adjacent snags. They build large nests in large trees in open areas. The BSA occurs within the wintering range of bald eagles. There are no CNDDB recorded occurrences within 5 miles of the BSA. However, one bald eagle was observed soaring over the Yolo Bypass on April 6, 2021, during the SWHA survey. The aquatic habitat within and adjacent to the Yolo Bypass provides potential foraging habitat for migratory bald eagles. Given the potential foraging habitat present in the BSA, no documented occurrences within 5 miles of the BSA, and no eagles or eagle-size nests observed during the 2021 field surveys, there is low potential for this species to nest within or adjacent to the BSA. The species may forage in the vicinity of the BSA or be present in the winter during migration.

Western Yellow-Billed Cuckoo

Western yellow-billed cuckoo (*Coccyzus americanus occidentalis)* is listed as threatened under FESA and endangered under CESA. It is a migratory bird wintering in South America. Within California, breeding populations are rare and scattered through the state, with the closest breeding habitat along the Sacramento River, approximately 40 miles north of the BSA near Colusa. Western yellow-billed cuckoo breeds in dense wooded riparian habitat, typically large, contiguous areas of undisturbed habitat.

The BSA is not within the current breeding range of western yellow-billed cuckoos, and large stands of dense wooded riparian habitat that could provide nesting habitat are absent from the BSA. However, western yellow-billed cuckoos could utilize the riparian habitat surrounding Putah Creek, Sacramento River, and portions of the Yolo Bypass within and adjacent to the BSA as migratory stopover habitat. A single CNDDB recorded occurrence of the species documents observances made in September 2012 and August 2013 along Putah Creek less than 2 miles west of the BSA. As such, based on the reconnaissance-level survey efforts and CNDDB record, the riparian habitats present in the BSA may provide potential foraging and migratory stopover habitat for western yellow-billed cuckoos.

Least Bell's Vireo

Least Bell's vireo (*Vireo bellii pusillus)* is listed as endangered under FESA and CESA. It is a migratory bird wintering in southern Baja California. Within California, breeding populations are mostly in the southern portion of the state with a small breeding habitat in the Yolo Bypass, approximately 3.5 miles south of the BSA. Least Bell's vireo is known to nest in riparian woodlands dominated by willow and Fremont's cottonwood. Suitable willow woodlands are typically dense with well-defined vegetative strata or layers. The most critical structural component of nesting habitat in California is a dense shrub layer 2 to 10 feet above the ground. Ideal least Bell's vireo nesting habitat consists of a riparian corridor at least 800 feet wide. Individuals may forage in adjacent scrub or chaparral habitat; and during winter, they utilize scrub vegetation adjacent to watercourses or riparian gallery forests along the west coast of northern and central Mexico. Foraging typically takes place within riparian habitat but may also extend into adjacent upland vegetation; in particular, elderberry may be important food sources for the species (USFWS 1998).

The BSA is within the current breeding range of least Bell's vireo. However, specific habitat requirements for breeding are not present within the riparian habitat identified within the BSA since the riparian areas lack the vegetative density and cover required by the species for nesting; however, the riparian habitat in the BSA may serve as foraging habitat for the species. The most recent CNDDB recorded occurrence is from year 2011, approximately 3.5 miles south of the BSA in the Yolo Bypass Wildlife Area, documenting a nesting pair in undisturbed riparian scrub habitat. Based on the reconnaissance-level survey efforts and the CNDDB occurrence, the riparian habitats present in the BSA may provide potential foraging and migratory stopover habitat for least Bell's vireo.

Tricolored Blackbird

Tricolored blackbird (*Agelaius tricolor)* is listed as a threatened species under CESA. They are colonial nesters, with tricolored blackbirds forming the largest colonies of any North American passerine bird. Thousands of birds may occur at a single site. Breeding typically occurs from mid-April through July with nests built in dense vegetation such as cattails (*Typha* sp.), tules (*Scirpus* sp.), willow thickets (*Salix* spp.), and blackberry (*Rubus* sp.). The average clutch size is 3 to 4 eggs, and two clutches may be produced per year. Tricolored blackbirds forage on insects, cultivated grains, seeds, and fruits, depending on the season (Beedy and Hamilton 1999).

The most recent CNDDB recorded occurrence of tricolored blackbird is from year 2014, approximately 5 miles south of the BSA in the Yolo Bypass and documents approximately 100 individuals within a nesting colony. Habitat assessment surveys were performed on January 5 and 7, 2021, and July 7, 2022, to identify potential tricolored blackbird nesting habitat within 500 feet of the BSA. A total of 498.7 acres of potentially suitable habitat for tricolored blackbird is within 500 feet of the BSA. Potentially suitable habitat was identified as lands that are planted in alfalfa, natural or semi-natural lands (e.g., grassland, ruderal/grassland, willow scrub, and emergent marsh) on larger parcels (generally greater than approximately 20 acres) that border other open lands. No tricolored blackbirds were observed during the surveys. Further details of the tricolored blackbird habitat assessment can be found in Appendix G of the NES.

2.3.5.3 Environmental Consequences

No Build Alternative 1

Construction and Operation

No Build Alternative 1 would make no physical or operational improvements within the BSA. Therefore, No Build Alternative 1 would not affect state or federally listed plant or animal species.

Build Alternatives 2a and 2b

Construction

Effects determinations for federally listed species and designated critical habitat are listed in Table 2.3-10. A discussion of potential project impacts on both state and federally listed species is also provided below.

Table 2.3-10. Effects on Federally Listed Species – Build Alternatives 2a and 2b

Common Name	Scientific Name	Status	Effect Finding	Effect Finding for Critical Habitat (if applicable)
Plants				
palmate-bracted bird's-beak	*Chlorophyron palmatum*	FT	No Effect	N/A
Colusa grass	*Neostapfia colusana*	FT	No Effect	N/A
Keck's checkerbloom	*Sidalcea keckii*	FE	No Effect	No Effect
Crampton's tuctoria or Solano grass	*Tuctoria mucronate*	FE	No Effect	No Effect
Invertebrates				
conservancy fairy shrimp	*Branchinecta conservatio*	FE	No Effect	N/A
vernal pool fairy shrimp	*Branchinecta lynchi*	FT	No Effect	N/A
vernal pool tadpole shrimp	*Lepidurus packardi*	FE	No Effect	N/A
valley elderberry longhorn beetle	*Desmocerus californicus dimporphus*	FT	May affect, likely to adversely affect	No Effect
Delta green ground beetle	*Elaphrus viridis*	FT	No Effect	N/A
Fish				
green sturgeon southern DPS	*Acipenser medirostris*	FT	No Effect	No Effect
steelhead- Central Valley DPS	*Oncorhynchus mykiss irideus* pop. 11	FT	No Effect	No Effect

Common Name	Scientific Name	Status	Effect Finding	Effect Finding for Critical Habitat (if applicable)
Chinook salmon- Central Valley spring-run ESU	*Oncorhynchus tshawytscha* pop. 11	FT	No Effect	No Effect
Chinook salmon- Central Valley winter-run ESU	*Oncorhynchus tshawytscha* pop. 7	FE	No Effect	No Effect
Delta smelt	*Hypomesus transpacificus*	FT	No Effect	No Effect
longfin smelt	*Spirinchus thaleichthys*	FC	No Effect	No Effect
Amphibians and Reptiles				
California tiger salamander	*Ambystoma californiense*	FT	No Effect	N/A

western yellow-billed cuckoo	*Coccyzus americanus occidentalis*	FT	No Effect	No Effect
least Bell's vireo	*Vireo bellii pusillus*	FE	No Effect	No Effect

Federally listed Plants

Protocol-level botanical surveys were performed during the blooming period of federally listed plants that had potential habitat within the BSA. No federally listed plants occur within the BSA; therefore, no adverse effects would occur. However, Standard Measure BIO-4 (Appendix E) has been incorporated into the project to further reduce the potential for impacts to listed plants outside the BSA to occur as a result of the project, including the spread or introduction of non-native plants within the BSA.

Wildlife

VALLEY ELDERBERRY LONGHORN BEETLE

A total of six elderberry shrubs would be directly affected, and 28 shrubs, located within 165 feet of impact areas, would be indirectly affected by the project. This corresponds with approximately 2.4 acres of temporary impacts and 3.1 acres of permanent impacts to suitable non-riparian (e.g., annual grasslands, ornamental) VELB habitat. Indirect impacts could result from dust,

from removal of terrestrial vegetative cover that could increase microclimate temperatures, increase in hazardous materials, and the potential introduction of invasive plant species by construction equipment. With implementation of Standard Measures BIO-1, BIO-3, and BIO-4, adverse effects on VELB would be avoided/minimized. In addition, the implementation of AMMs BIO-16 through BIO-21 would minimize and mitigate for impacts on VELB and their habitat.

Caltrans initiated formal consultation with USFWS on May 12, 2023, for effects to VELB. The Department received a Biological Opinion for the species on April 12, 2024. The Biological Opinion is in Appendix M.

CENTRAL VALLEY DPS STEELHEAD, CENTRAL VALLEY SPRING-RUN ESU CHINOOK SALMON, SACRAMENTO RIVER WINTER-RUN ESU CHINOOK SALMON, AND GREEN STURGEON

No work is taking place within or near aquatic habitat of listed fish species. Implementation of the project would not result in direct or indirect impacts on Central Valley DPS steelhead, Central Valley spring-run ESU Chinook salmon, Sacramento River winter-run ESU Chinook salmon, or green sturgeon.

DELTA SMELT AND LONGFIN SMELT

No work is taking place within or near aquatic habitat for listed fish species. Implementation of the project would not result in direct or indirect impacts on Delta smelt or longfin smelt.

GIANT GARTER SNAKE

Approximately 4.265 acres of GGS habitat would be permanently impacted. Permanent habitat impacts would result from the bike path improvements. Approximately 3.669 acres of temporary habitat impacts would result from installation of the fiber optic line, bike path improvements, and staging areas. Direct impacts on GGS could result from an increase of hazardous materials, habitat loss, and the crushing of individuals from construction equipment. Indirect impacts could result from removal of terrestrial vegetative cover, which could increase microclimate temperatures and the potential introduction of invasive plant species, which would degrade the quality of potential habitat, by construction equipment and materials.

With implementation of Standard Measures BIO-1, BIO-2, BIO-3, and BIO-4, any adverse effect on GGS would be avoided/minimized. In addition, AMMs BIO-22 through BIO-30 would minimize impacts on GGS.

Caltrans initiated formal consultation with USFWS on May 12, 2023, for effects to GGS. The Department received a Biological Opinion for the species on April 12, 2024. The Biological Opinion is in Appendix M.

SWAINSON'S HAWK

The project could result in a temporary and permanent loss of foraging habitat and displacement of nesting SWHA due to project activities. Direct disturbance from construction activities, such as pile driving, operation of vehicles, heavy equipment operation, and earth-moving operations around active nests could result in stress, injury, or mortality to individuals. The project would

have temporary impacts on foraging habitat through the staging of equipment, temporary construction access, and other construction activities. Permanent loss of foraging habitat would result from the proposed Park and Ride, proposed bike path improvements, connector structure, and other road widening. A total of approximately 10.0 acres of SWHA foraging habitat consisting of grassland and croplands (i.e., hayfield) would be permanently lost. Based on current project designs and the protocol survey results, no trees with active SWHA nests have been slated for removal.

With implementation of Standard Measures BIO-1 and BIO-2, adverse effects on SWHAs would be avoided. In addition, AMMs BIO-31 through BIO-32 would minimize impacts on SWHA.

WESTERN YELLOW-BILLED CUCKOO AND LEAST BELL'S VIREO

The suitable migratory stopover and foraging habitat (i.e., riparian vegetation) for western yellow-billed cuckoo and least Bell's vireo is located within existing Caltrans right-of-way where there are currently frequent anthropogenic disturbances from vehicles and ongoing maintenance activities (e.g., grass mowing, tree trimming, trash pickup). The riparian vegetation within these areas would not be removed, and the activities proposed in the staging areas would be similar to those already occurring in the area (e.g., high volumes of traffic and other disturbances associated with the highway). Therefore, there will be no impact on western yellow-billed cuckoo or least Bell's vireo as a result of project implementation.

Implementation of Standard Measures BIO-1 and BIO-2 would further reduce the potential for impacts on western yellow-billed cuckoo and least Bell's vireo.

TRICOLORED BLACKBIRD

Nesting habitat identified for tricolored blackbirds consists of small isolated patches within and adjacent to the BSA. The species typically nests in more extensive patches of vegetation. With limited habitat available, the likelihood of tricolored blackbirds nesting within or adjacent to the BSA is low. However, if nesting tricolored blackbirds are present within or adjacent to construction areas, they could be disturbed and abandon their nests.

Standard Measures BIO-1 and BIO-2 would avoid/minimize adverse effects on tricolored blackbird. In addition, implementation of AMMs BIO-6 would minimize impacts on tricolored blackbird.

Operation

Once construction is completed, the Build Alternative 2a and 2b would carry two more travel lanes than existing conditions. However, the impacts to federal and state listed animal species would not increase from existing conditions.

Build Alternatives 3a and 3b

Construction and Operation

Build Alternatives 3a and 3b would involve adding an HOT2+ lane in each direction. Build Alternatives 3a and 3a propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively; therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b.

Build Alternatives 4a and 4b

Construction and Operation

Build Alternatives 4a and 4b would involve adding an HOT3+ lane in each direction. Build Alternatives 4a and 4b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively; therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b.

Build Alternatives 5a and 5b

Construction and Operation

Build Alternatives 5a and 5b would involve adding an express lane in each direction. Build Alternatives 5a and 5b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively; therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b.

Build Alternatives 6a and 6b

Construction and Operation

Build Alternatives 6a and 6b would involve adding a transit-only lane in each direction. Build Alternatives 6a and 6b propose similar project components within the same project area as Build Alternatives 2a and 2b; therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b.

Build Alternatives 7a and 7b

Construction and Operation

Build Alternatives 7a and 7b would involve repurposing the current number 1 general purpose lane to HOV 2+. No new lanes would be constructed. Build Alternatives 7a and 7b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively; therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b.

2.3.5.4 Avoidance, Minimization, and/or Mitigation Measures

Caltrans would implement the following AMMs to reduce impacts to threatened and endangered species.

- **AMM BIO-16: VELB Avoidance Area.** Activities that may damage or kill an elderberry shrub (e.g., trenching, paving) may need an avoidance area of at least 6 meters (20 feet) from the drip line, depending on the type of activity.

- **AMM BIO-17: Worker Education for VELB.** Prior to initiation of construction activities, workers will participate in environmental awareness training provided by a qualified biologist. The training will include VELB-specific information to all contractors, work crews, and any on-site personnel on the status of the VELB, its host plant and habitat, the need to avoid damaging the elderberry shrubs, and the possible penalties for noncompliance.

- **AMM BIO-18: VELB Timing.** As much as feasible, all activities that could occur within 50 meters (165 feet) of an elderberry shrub will be conducted outside of the flight season of the VELB (March–July).

- **AMM BIO-19: Erosion Control and Re-Vegetation.** Erosion control will be implemented, and the affected area will be revegetated with appropriate native plants.

- **AMM BIO-20: Elderberry Shrub Transplanting.** If the elderberry shrub cannot be avoided, or if indirect effects will result in the death of stems or the entire shrub, then it should be relocated following the transplanting guidelines:

    - **Monitor.** A qualified biologist will be on-site for the duration of transplanting activities to check for compliance with avoidance and minimization measures and other conservation measures.

    - **Exit Holes.** Exit-hole surveys will be completed immediately before transplanting. The number of exit holes found, GPS location of the plant to be relocated, and the GPS location of where the plant is transplanted will be reported to USFWS and CNDDB.

    - **Timing.** Elderberry shrubs will be transplanted when the shrubs are dormant (November through the first 2 weeks in February) and after they have lost their leaves. Transplanting during the non-growing season will reduce shock to the shrub and increase transplantation success.

    - **Transplanting Procedure.** Transplanting will follow the most current version of the American National Standards Institute A300 (Part 6) guidelines for transplanting (http://www.tcia.org/).

    - **Trimming Procedure.** Trimming will occur between November and February and should minimize the removal of branches or stems that exceed 1 inch in diameter.

- **AMM BIO-21: Compensation for Loss of VELB Habitat.** To mitigate for the removal of elderberry shrubs, Caltrans will purchase credits at a 1:1 ratio at a USFWS-approved conservation bank.

- **AMM BIO-22: GGS Timing.** Construction outside of paved areas will be conducted between May 1 and October 1, which is the active season for GGS, in order to minimize impacts to the species.

- **AMM BIO-23: GGS Exclusionary Fencing.** Where practicable, GGS exclusion fencing will be placed around the BSA before construction during the active period for GGS (May 1–October 1) and will be maintained through the construction period until the project has been completed.

- **AMM BIO-24: Agency Notification for GGS.** Caltrans will notify CDFW and USFWS seven days prior to when construction is scheduled to commence.

- **AMM BIO-25: Worker Education for GGS.** A Worker Environmental Awareness Training Program for construction personnel will be conducted by a USFWS and CDFW-approved biologist for all construction workers, including contractors, prior to the start of construction activities. This training will instruct workers to recognize GGS and their habitats.

- **AMM BIO-26: Pre-construction Survey for GGS.** Twenty-four hours prior to construction activities, the BSA will be surveyed for GGS by a USFWS and CDFW-approved biologist. Surveys of the BSA will be repeated if a 2-week or greater lapse in construction activity occurs. If GGS is encountered during construction, activities will cease until appropriate corrective measures have been completed or it has been determined that the GGS will not be harmed. Any sightings and any incidental take will be reported to USFWS and CDFW immediately by telephone at (916) 414-6600 or (916) 358-2900, respectively, and email or written letter addressed to the Chief, Sacramento Division (USFWS) or North Central Region (CDFW), within 1 working day of the incident.

- **AMM BIO-27: GGS Environmentally Sensitive Area.** The canals and rice fields adjacent to the BSA will be flagged and designated as an environmentally sensitive area during the construction period.

- **AMM BIO-28: GGS Post-Construction Reporting.** Upon completion of the project, all disturbed areas within the BSA will be revegetated using native plant species, and post-monitoring work and pictures will be reported to USFWS and CDFW showing that temporary impacts have been restored to pre-construction conditions.

- **AMM BIO-29: GGS Escape Ramp.** At the end of each workday, Caltrans will place an escape ramp at each end of any open trenches. This will allow any animals that may have been trapped in the trench to climb out overnight. The escape ramp may be constructed of dirt fill, wood planking, or other suitable material and placed at an angle no greater than 30 degrees.

- **AMM BIO-30: Compensation for Loss of GGS Habitat.** Caltrans will mitigate for the permanent loss of GGS habitat through the purchase of GGS mitigation bank credits. These mitigation credits will be purchased from a USFWS- and CDFW-approved GGS mitigation bank possessing a conservation easement in perpetuity with available credits

located in the Sacramento County service area prior to impacts to the species. Caltrans will purchase these credits and provide a bill of sale acceptable and approved by CDFW/USFWS before construction begins. To compensate for the permanent loss of approximately 4.264 acres of GGS habitat, Caltrans will purchase 12.792 acres (a 3:1 ratio) of GGS credits.

- **AMM BIO-31: Pre-construction SWHA Survey.** If construction is to occur between February 1 and September 30, a qualified biologist will conduct pre-construction surveys for nesting SWHA, white-tailed kite, and northern harrier. The pre-construction surveys will include the project footprint and a 0.5-mile buffer for SWHA. The survey will be conducted no more than 15 days prior to the initiation of construction so that no active nests will be disturbed.

- **AMM BIO-32: SWHA Agency Consultation.** If a no disturbance buffer around an active SWHA is not practicable, CDFW will be consulted to determine alternative measures to minimize the potential for project-related disturbance to the nest site that could result in nest abandonment or other forms of take. Measures may include, but are not limited to, continuous biological monitoring by a qualified biologist until it has been determined that the young have fledged and are no longer reliant on the nest or parental care for survival or until the construction is complete. If the nesting pair show signs of distress as a result of project-related activities (e.g., adults leaving the nest when eggs or young chicks are present), the monitoring biologist will have authority to stop work until it is determined that the adults have returned and are no longer showing signs of distress.

2.3.6 Invasive Species

2.3.6.1 Regulatory Setting

On February 3, 1999, President William J. Clinton signed Executive Order (EO) 13112 requiring federal agencies to combat the introduction or spread of invasive species in the United States. The order defines invasive species as “any species, including its seeds, eggs, spores, or other biological material capable of propagating that species, that is not native to that ecosystem whose introduction does or is likely to cause economic or environmental harm or harm to human health.” Federal Highway Administration (FHWA) guidance issued August 10, 1999 directs the use of the State’s invasive species list, maintained by the California Invasive Species Council to define the invasive species that must be considered as part of the National Environmental Policy Act (NEPA) analysis for a proposed project.

2.3.6.2 Affected Environment

The botanical surveys and vegetation characterization conducted on May 10–14 and 18–20, 2021, and July 14, 2022, within the BSA. Eleven distinct vegetation communities were identified within the BSA; these are described in Section 2.3.1, Natural Communities.

Several non-native invasive plant species are present within or adjacent to the BSA, as listed in Table 2.3-11. These species dominate much of the roadway shoulder landscape within the BSA as well as much of the landscape being affected by grading or filling.

Table 2.3-11. Invasive Plant Species Present within the BSA

Cal-IPC Rating[1]	Scientific Name[2]	Common Name[2]
High	*Arundo donax*	giant reed
	Centaurea solstitialis	yellow starthistle
	Hedera helix	English ivy
	Lepidium latifolium	perennial pepperweed
	Ludwigia hexapetala	six petal water primrose
	Rubus armeniacus	Himalayan blackberry
	Tamarix parviflora	tamarisk
Moderate	*Ailanthus altissima*	tree of heaven
	Avena fatua	wildoats
	Brassica nigra	black mustard
	Bromus diandrus	ripgut brome
	Centaurea melitensis	tocalote
	Conium maculatum	poison hemlock
	Cynodon dactylon	Bermuda grass
	Dipsacus fullonum	wild teasel
	Festuca arundinacea	reed fescue
	Festuca myuros	rattail sixweeks grass
	Hirschfeldia incana	mustard
	Hordeum marinum ssp. *gussoneanum*	barley
	Hordeum murinum	foxtail barley
	Lythrum hyssopifolia	hyssop loosestrife
	Mentha pulegium	pennyroyal
	Nicotiana glauca	tree tobacco
	Oxalis pes-caprae	Bermuda buttercup
	Phalaris aquatica	harding grass
	Torilis arvensis	field hedge parsley
	Vinca major	vinca
Limited	*Bromus hordeaceus*	soft chess
	Carduus tenuiflorus	slender flowered thistle
	Dactylis glomerata	orchardgrass
	Erodium cicutarium	coastal heron's bill
	Geranium dissectum	wild geranium
	Hypochaeris glabra	smooth cat’s ear
	Medicago polymorpha	California burclover
	Phoenix canariensis	Canary Island date palm
	Plantago lanceolata	ribwort

Cal-IPC Rating[1]	Scientific Name[2]	Common Name[2]
	Polypogon monspeliensis	annual beard grass
	Raphanus sativus	jointed charlock
	Robinia pseudoacacia	black locust
	Rumex crispus	curly dock
	Salsola tragus	Russian thistle
	Schinus molle	Peruvian pepper tree
	Silybum marianum	milk thistle
	Stipa miliacea var. *miliacea*	smilo grass
	Trifolium hirtum	rose clover

Notes:
1. California Invasive Plant Inventory. Available at https://www.cal-ipc.org/plants/inventory/. Accessed February 28, 2021. (Cal-IPC. 2021)
High: Species has severe ecological impacts on physical processes, plant and animal communities, and vegetation structure. Its reproductive biology and other attributes are conducive to moderate to high rates of dispersal and establishment. Most are widely distributed ecologically. **Moderate**: Species have substantial and apparent, but generally not severe, ecological impacts on physical processes, plant and animal communities, and vegetation structure. Their reproductive biology and other attributes are conducive to moderate to high rates of dispersal, though establishment is generally dependent upon ecological disturbance. Ecological amplitude and distribution may range from limited to widespread. **Limited**: Species are invasive but its ecological impacts are minor on a statewide level or there was not enough information to justify a higher score. The species reproductive biology and other attributes result in low to moderate rates of invasiveness. Ecological amplitude and distribution are generally limited, but these species may be locally persistent and problematic.
2. Taxonomic nomenclature for plant species followed Baldwin, B. G.,D. H. Goldman,R. P. D. J. Keil,T. J. Rosatti, and D. H. Wilken, editors. 2012. *The Jepson Manual: Vascular Plants of California.* Second Edition. University of California Press. Berkeley, California. (Baldwin 2012)

2.3.6.3 Environmental Consequences

No Build Alternative 1

Construction and Operation

No Build Alternative 1 would make no physical or operational improvements within the BSA. Therefore, No Build Alternative 1 would not affect invasive species.

Build Alternatives 2a and 2b

Construction

Build Alternatives 2a and 2b have the potential to contribute to the spread or introduction of invasive species within the BSA from seeds being present on construction equipment and vehicles. The BSA is currently colonized by a relatively large amount of invasive plant species that may be removed or spread around during construction. Overall, the project has the potential to result in the colonization of additional species. Implementation of Standard Measure BIO-3 (see Appendix E) would further avoid the potential for the spread of invasive species in the BSA.

Operation

Once construction is completed, Build Alternatives 2a and 2b would carry two more travel lanes than existing conditions. However, the effects on invasive species would not increase from existing conditions.

Build Alternatives 3a and 3b

Construction and Operation

Build Alternatives 3a and 3b would involve adding an HOT2+ lane in each direction. Build Alternatives 3a and 3a propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively; therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b.

Build Alternatives 4a and 4b

Construction and Operation

Build Alternatives 4a and 4b would involve adding an HOT3+ lane in each direction. Build Alternatives 4a and 4b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively; therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b.

Build Alternatives 5a and 5b

Construction and Operation

Build Alternatives 5a and 5b would involve adding an express lane in each direction. Build Alternatives 5a and 5b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively; therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b.

Build Alternatives 6a and 6b

Construction and Operation

Build Alternatives 6a and 6b would involve adding a transit-only lane in each direction. Build Alternatives 6a and 6b propose similar project components within the same project area as Build Alternatives 2a and 2b; therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b.

Build Alternatives 7a and 7b

Construction and Operation

Build Alternatives 7a and 7b would involve repurposing the current number 1 general purpose lane to HOV 2+. No new lanes would be constructed. Build Alternatives 7a and 7b propose similar project components within the same project area as Build Alternatives 2a and 2b,

respectively; therefore, the effects would be the same as effects described under Build Alternatives 2a and 2b.

2.3.6.4 Avoidance, Minimization, and/or Mitigation Measures

No AMMs or MMs are required to reduce effects related to invasive plant species.

2.4 Cumulative Impacts

The analysis in this section is supported by the Project-specific Cumulative Impact Assessment prepared for the Project (GPA Consulting 2023)

2.4.1 Regulatory Setting

Cumulative impacts are those that result from past, present, and reasonably foreseeable future actions, combined with the potential impacts of the proposed project. A cumulative impact assessment looks at the collective impacts posed by individual land use plans and projects. Cumulative impacts can result from individually minor but collectively substantial impacts taking place over a period of time.

Cumulative impacts to resources in the project area may result from residential, commercial, industrial, and highway development, as well as from agricultural development and the conversion to more intensive agricultural cultivation. These land use activities can degrade habitat and species diversity through consequences such as displacement and fragmentation of habitats and populations, alteration of hydrology, contamination, erosion, sedimentation, disruption of migration corridors, changes in water quality, and introduction or promotion of predators. They can also contribute to potential community impacts identified for the project, such as changes in community character, traffic patterns, housing availability, and employment.

The California Environmental Quality Act (CEQA) Guidelines Section 15130 describes when a cumulative impact analysis is necessary and what elements are necessary for an adequate of cumulative impacts. The definition of cumulative impacts under CEQA can be found in Section 15355 of the CEQA Guidelines. A definition of cumulative impacts under the National Environmental Policy Act (NEPA) can be found in 40 Code of Federal Regulations (CFR) Section 1508.7.

The CEQA definition of cumulative impact refers to two or more individual effects which, when considered together, are considerable or which compound or increase other environmental impacts. The individual effects may be changes resulting from a single project or multiple projects. The cumulative impact from several projects is the change in the environment, which results from the incremental impact of the Project when added to other closely related past, present, and reasonably foreseeable probable future projects. Cumulative impacts can result from individually minor but collectively significant projects taking place over a period of time.

Cumulative impacts were previously defined under the Council on Environmental Quality (CEQ) Regulations for Implementing the Procedural Provisions of the NEPA at Title 40 Code of CFR Section 1508.7. The CEQ is responsible for developing Federal procedures to comply with

NEPA. In July 2020, CEQ comprehensively updated the NEPA regulations, repealing the definition of cumulative impacts. Subsequently, Executive Order 13990, Protecting Public Health and the Environment and Restoring Science to Tackle the Climate Crisis (January 2021) directed all agencies to "immediately review and, as appropriate and consistent with applicable law, take action to address the promulgation of Federal regulations and other actions during the last four years that conflict with these important national objectives" to tackle climate change.

2.4.2 Methodology

The cumulative impact study for the Project was developed by following the eight-step process set forth in the California Department of Transportation's (Caltrans) *Guidance for Preparers of Cumulative Impact Analysis* (Caltrans 2005):

1. Identify resources to consider in the cumulative impact analysis
2. Define the resource study area
3. Describe the current condition and historical context of each resource
4. Identify Project impacts that might contribute to cumulative impacts
5. Identify other reasonably foreseeable future actions that affect each resource
6. Assess potential cumulative impacts
7. Report the results
8. Assess the need for avoidance, minimization, and/or mitigation measures

The cumulative impacts study area (study area) was selected to identify other current or reasonably foreseeable future actions. The study area is generally bounded by the I-80 corridor between PM 40.7 and 44.7 in Solano County, between PMs 0.00 and 11.72 in Yolo County, and between PMs 0.00 and 1.36 in Sacramento County; and US-50 between PMs 0.00 and 3.12 in Yolo County and between PMs 0.00 and 0.617 in Sacramento County. The boundaries of the study area were delineated by reviewing the area within a 2- to 4-mile radius of the Project area, and then adjusting the boundaries based on major roadways and land use/neighborhood boundaries. The current and reasonably foreseeable future actions are listed in Table 2.4-1and shown in Figure 2.4-1 may not be an exhaustive list of every planned project within the study area's cities and communities. The list contains projects that have the possibility of contributing to a cumulative effect because 1) the projects would result in similar permanent impacts within the Project Resource Study Area (RSA) or 2) the projects would be constructed within the same time period as the Project (anticipated to begin in spring 2025 and end in 2028) and may result in temporary impacts at the same time as Project construction. Current and reasonably foreseeable actions include relevant transportation projects that overlap the study area. Minor development projects were not included in this analysis because they are part of overall urban development already planned for the study area and consistent with existing land use plans and policies. Therefore, their contribution to cumulative impacts is not expected to be adverse.

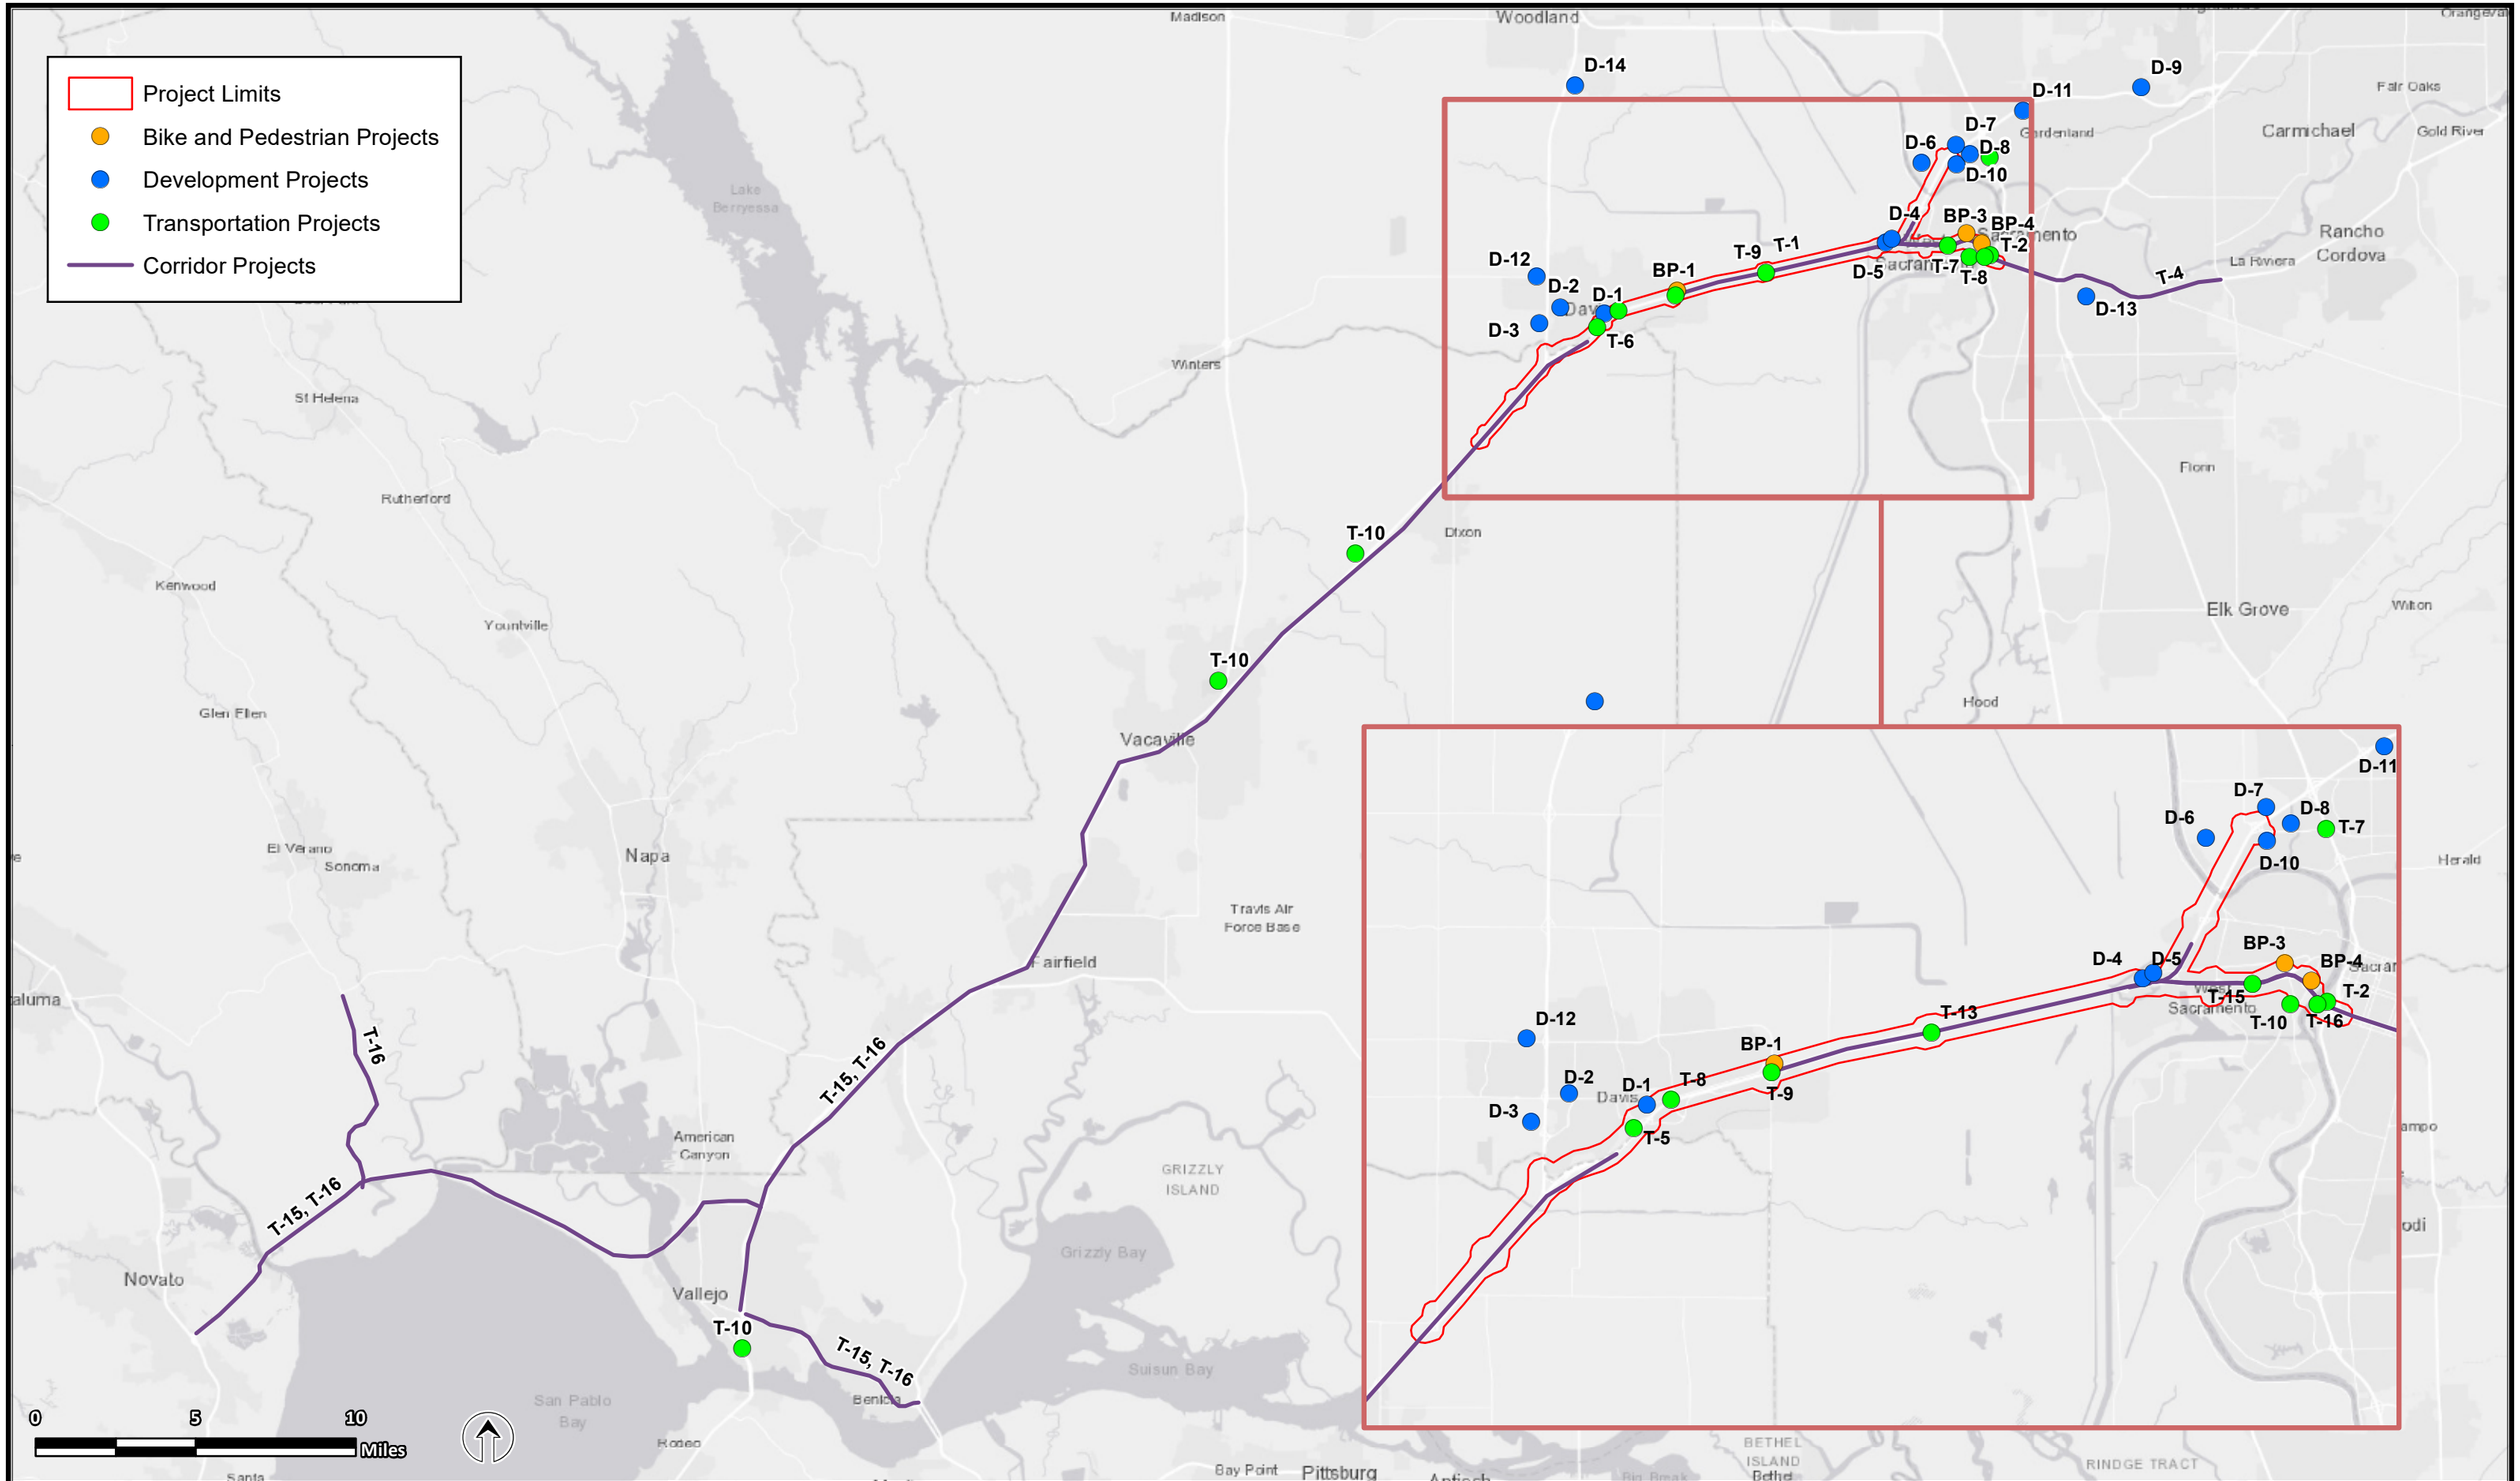
Table 2.4-1. List of Relevant Foreseeable Projects

Project ID	Project Name	Jurisdiction	Location	Project Description	Status
Transportation Projects					
T-1	Yolo Pavement Rehabilitation Project 03-4F650	Caltrans District 3	Yolo 80 PM 4.3/R11.4 and Yolo 50 PM 0.0/2.5	This project proposes constructing the median on the I-80 West Capitol Avenue Under Crossing (UC) and the I-80 Reed Avenue UC bridges to accommodate stage construction. Additionally, the 03-4F650 project proposes improvements for critical bridge locations within the corridor to upgrade deck surfaces, approach slabs, and slope paving. The proposed median improvement occurs throughout most of the project to accommodate for stage construction. The median concrete barrier would remain in place at other locations, and the median restriped as part of the 3H900 project to provide managed lanes, with one managed lane in each direction. The project proposes new fiber-optic lines throughout, along with some ramp metering and upgrades to other existing roadway features. These fiber-optic lines would improve the ITS monitoring capability within the corridor.	Planned construction March 2023 to December 2027.
T-2	Sac River Bridge Over Head Bryte Bend Bridge Rehabilitation 03-0F250	Caltrans District 3	Yol 80 PM R11.1/R11.7 and Sac 80 PM M0.0/M0.5: In Yolo and Sacramento Counties and near West Sacramento from 0.1 mile west of Reed Avenue UC to 0.1 mile east of Bryte Bend Bridge.	This project proposes to rehabilitate the Sacramento River Bridge and Overhead (BOH), Br.# 22-0026 L/R, on I-80 at the Yolo/Sacramento County Line in West Sacramento about three miles west of I-5. The project would rehabilitate the Sacramento River Bridge, OH, including replacing the bridge rail, replacing the deck drain system, building barrier pedestals for future electroliers, and installing conduits.	Construction completed in January 2023.

Project ID	Project Name	Jurisdiction	Location	Project Description	Status
T-3	US 50 ICM Infrastructure 03-3H330	Caltrans District 3	US-50 in El Dorado County from the El Dorado County/ Sacramento County line to Stateline Avenue in South Lake Tahoe	This project is on US-50 in and near the cities of Sacramento, Rancho Cordova, and Folsom, from the Yolo/Sacramento County line to Folsom Boulevard; and in Yolo County in West Sacramento along US-50, from the I-80/US-50 interchange to the Yolo/Sacramento County line (PM 0.0 to 3.156), and on I-80 from Enterprise Boulevard to US-50 (PM 9.2 to R9.552). Installation of TMS field elements.	Planned construction September 2021 to December 2023.
T-4	Sac 50 Design-Build 03-0H08U	Caltrans District 3	Sacramento, Sacramento River bridge, Airport Boulevard, SR-99, I-80, US-50	In Sacramento County on US 50 from PM L0.20 to PM R6.10, from the I-5 Junction to Watt Avenue. The project proposes to construct managed lanes and rehabilitate the pavement.	Construction anticipated to be complete in December 2024.
T-5	Richards Boulevard / Olive Drive Circulation Improvements 03-0H360	City of Davis	Sol 80 PM 44.5/44.7 and Yolo 80 PM 0.0/0.5	Davis, in cooperation with Caltrans, has completed a Project Study Report-Project Development Support and would be circulating Draft Project Report / Environmental Document in Early 2022 that evaluates the safety and operational functions of the interchange at Richards Boulevard and I-80. The Davis project proposes to reconfigure the westbound I-80 off-ramp and westbound I-80 on-ramp to a tight diamond; construct additional turn lanes to the eastbound I-80 on-ramp; eliminate the westbound I-80 slip off-ramp to Olive Drive; construct a two-way shared use path on the west side of Richards Boulevard that would pass under the westbound I-80 on-ramp from Richards Boulevard and cross over I-80.	Planned construction December 2023 to June 2025.
T-6	US 50 Metal Beam Guardrail Upgrade 03-1H870	Yolo County	US 50 from PM 0.0 to 3.0 and on I-80 from PM 9.0 to R10.7	The project would replace the guardrail and place vegetation control.	Construction completed December 2021.
T-7	Sac/Placer 80 Fiber Optics 03-0H540	Sacramento County	Sac PM M0.3/18.0 & Pla 80 PM 0.0/0.7	Install fiber-optic conduit, cable and pull boxes, replace sign panels, transition railing, modify ramp metering systems. limits proposed fiber-optic conduits and pull boxes along the I-80 median and eastbound I-80 outside shoulder, along westbound I-80 diagonal and loop on-ramps from West El Camino Ave, along eastbound I-80 off-ramp to West El Camino Real Ave and eastbound I-80 loop on-ramp from West El Camino Real.	Construction completed August 2022.

Project ID	Project Name	Jurisdiction	Location	Project Description	Status
T-8	Yol 80 Olive Drive Bike/Ped connection 03-4H260	City of Davis	PM 0.841/0.851	Bike/Ped structure from Olive Hill Lane to Pole Line RD OC bridge. Closure of eastbound I-80 off-ramp to Olive Hill Road.	Planned construction January 2021 to June 2023.
T-9	Yol 80 Davis 80 Rehabilitation project 03-2J260	City of Davis	PM 0.0/4.40	Remove portion of pavement and replace with RHMA-G and RHMA-O for I-80 mainline and Mace Blvd ramps. Upgrade Mace Blvd drainage facilities, metal beam guard rail, cross walks, ADA ramps and pedestrian push buttons. Install HOV ramp metering systems at Mace Blvd eastbound on-ramps to I-80. Project Initiation Document was signed December 2022.	Planned construction May 2027 to May 2028.
T-10	Sac 5/50 Interchange Painting 03-1H100	City of Sacramento	Sacramento River Viaduct (Pioneer Bridge) to 4th Street; also, on I-5 from 0.2 mile south of Broadway to S Street (PM 22.15 to PM 22.91)	Proposed painting at interchange on Sacramento River Viaduct and on I-5.	Construction completed February 2023.
T-11	Sycamore Trail Pedestrian Overcrossing 03-3H840	City of West Sacramento	City of West Sacramento	City of West Sacramento plans to construct a trail and pedestrian crossing over US-50 that would extend south from the newly developed pedestrian and bicycle trail at Joseph “Joey” Lopes Park to Westmore Oaks Elementary School. The project site is located between Evergreen Avenue and Stone Boulevard along the Sacramento Regional County Sanitation District lower northwest interceptor sewer easement. The width of the overcrossing would be either 16 or 22 feet.	Planned construction March 2023 to April 2024.

Project ID	Project Name	Jurisdiction	Location	Project Description	Status
T-12	Yolo Rail Relocation	City of Davis, along with City of West Sacramento, City of Woodland and Yolo County	City of Davis, City of West Sacramento, City of Woodland, and Yolo County	The Yolo Rail Realignment Project proposes to relocate the existing rail access from the Union Pacific Railroad mainline current alignment along the eastern edge of West Sacramento to a new location west of the I-80/US-50 split. The project would allow for the West Sacramento riverfront to fully realize its redevelopment potential, alleviate significant traffic impact from the existing freight rail alignment, and provide for the opportunity to expand freight rail service to West Sacramento's industrial areas with minimum community impact. It has been proposed to combine a new railroad overhead under I-80 as part of the combined projects 03-4F650 and 03-3H900 between the Yolo Causeway and Enterprise Boulevard to tie into existing tracks leading to/from the Port of West Sacramento.	Planning phase
T-13	County Road 32A Crossing	Yolo County	CR-32A is located north of I-80 and east of the Mace Boulevard interchange	CR-32A to improve bike path connectivity between CR-105 (just east of Davis) and the western terminus of the proposed new Class I bicycle/pedestrian facility of the Managed Lanes Project (03-3H900) that would connect with CR-32A, just west of the westbound CR-32A Off-Ramp. The County recently completed a Project Study Report and is seeking funding for this project.	Planning Phase
T-14	Bridge Preventive Maintenance on Route 505 at Horse Creek Bridge and on Route 80 at McCune Creek Bridge	Caltrans District 4 SHOPP Projects	Vacaville (Solano I-505 and I-80)	In and near Vallejo, Dixon, and Vacaville, at I-80/SR-29 Separation Bridge (No. 23-008), McCune Creek Bridge (No. 23-0084L/R) and Horse Creek Bridge (No. 23-0077L). Bridge preventive maintenance.	Environmental analysis completed in December 2020.
T-15	SOL SR 37, 80 & 780 RRFB 0P760; SOL-Var. 2020 SHOPP	Caltrans District 4 SHOPP Projects	Solano County, Various post markers	Install rectangular rapid flashing beacons in Solano County on various routes (Routes 37, 80, and 780) at various locations.	Construction anticipated to begin in 2022/2023
T-16	SOL-VAR; 2020 SHOPP	Caltrans District 4 SHOPP Projects	Solano County, Various post markers	Install best management practices (stormwater mitigation) at Routes 37, 80, 780, 101, and 121.	Construction anticipated to begin 2023/2024



Project ID	Project Name	Jurisdiction	Location	Project Description	Status
T-17	I-5 Corridor Improvement Project 03-4H580	Caltrans D3	SAC 5 22.4-34.4	Caltrans proposes to make improvements on I-5 between post miles 22.4 and 34.4 in Sacramento County. The Proposed Action would address mobility on I-5 from the I-5/State Route (SR) 50 Interchange (south of Downtown Sacramento) to the Yolo County line, including Airport Boulevard, providing a vital link to SMF. This mobility improvement would be accomplished with northbound (NB) and southbound (SB) managed lane strategies. The Project would help relieve current traffic congestion, which would result in improved traffic flow, mobility, travel time, and reliability. In addition, the Project would improve transit access and reduce vehicle emissions and travel costs. Ramps, shoulders and gores would be reconstructed at various locations in the Project area. Some widening of or replacement of existing structures in the Project area would be required. Drainage modifications would be required due to median reconstruction where sheet flow currently drains. Addition of (or modification of existing) intelligent transportation system (ITS) elements and infrastructure including ramp meters, fiber-optic conduit and cables, and overhead signs would be part of the scope of work. Utility relocation is expected.	Project Approval and Environmental Document Phase, anticipated to be complete late 2023
T-18	SAC 51 Managed Lanes Project 03-0H931	Caltrans D3	SAC 51, PM 07-4.8	On SR 51, from N Street to 0.5 mile north of El Camino Ave (PM 0.7/4.8): Extend managed lanes, widen the American River Bridge to 10 lanes (4 lanes NB and SB plus managed lane in both directions) and add new Class I bike path on the American River Bridge, new auxiliary lane from Exposition Blvd to E St in both directions, SB auxiliary lane from Arden Way on-ramp to Exposition Blvd off-ramp, replace B St UP, A St OC, and Elvas UP, construct new Capital Corridor 3rd Track UP, widen EB SR 160/SR 51 separation structure, and widen Tribute Rd UC.	Construction planned for Nov 26 through Dec 30
Bicycle and Pedestrian Facility Projects					
BP-1	Mace Boulevard Corridor Project	City of Davis	City of Davis	Addition of green bicycle lane conflict markings where each westbound freeway ramp intersects with Mace Boulevard. Provision of bicycle intersection crossing markings at the signalized intersection of the I-80 westbound ramps and Mace Boulevard and addition of green bike lane conflict markings where each eastbound freeway ramp intersects with Mace Boulevard.	Planning phase; community meeting to be held on January 20, 2022.
BP-3	Jefferson Boulevard interchange area	City of West Sacramento	City of West Sacramento	Addition of Class II bicycle lanes. The pavement on Jefferson under the US 50 interchange structure was not widened for bicycle lanes. The pavement was recently rehabilitated as part of the West Capitol Avenue Safety Enhancement and Road Rehabilitation project.	Project construction complete.

Project ID	Project Name	Jurisdiction	Location	Project Description	Status
BP-4	S. River Road interchange area	City of West Sacramento	City of West Sacramento	The widening of 5th Street for Class II bicycle lanes through the US 50 interchange area would be constructed as part of the Riverfront Street Extension / Fifth Street Widening project.	Construction to begin soon.
I-80 Corridor Major Developments/General Plans/Specific Plans					
D-1	Olive Drive	City of Davis	City of Davis	The project would develop existing single-family homes to high density multifamily apartments.	Environmental documents approved in November 2019
D-2	University Mall/ University Commons Redevelopment Project	City of Davis	City of Davis	Transit-oriented infill project, commercial and residential.	Final City Council Approval granted on August 25th, 2020
D-3	UC Davis West Village Expansion	UC Davis	City of Davis	200-acre mixed use neighborhood integrating student, faculty, and staff housing and educational and research facilities, all centered on a civic village square.	Under construction, anticipated completion in fall of 2021
D-4	West Sacramento Corporation Yard Relocation Project	City of West Sacramento	City of West Sacramento	West Sacramento proposes to construct a new Municipal Corporation Yard Facility at 4300 West Capitol Avenue, a parcel which the city anticipates purchasing from the Port of West Sacramento.	Phase I of the project is complete.
D-5	West Capitol Avenue Road Rehabilitation and Safety Enhancement Project	City of West Sacramento	City of West Sacramento	West Capitol Avenue is envisioned as the West Sacramento‘s downtown: a central core with a vibrant main street that takes advantage of its prime location; providing an attractive setting for a variety of land uses including the Civic Center, Community Center, Transit Hub; and providing residential, commercial and urban parks that are accessible via multiple modes of transportation. The primary goals are to repair deteriorating pavement; complete scalloped street sections; install drainage improvements, sidewalks, access ramps, signal modifications, separated/buffered bike lanes, street lighting, high-visibility crosswalks for safer pedestrian crossings; and reduce unnecessary vehicular travel lanes.	Construction is complete.

Project ID	Project Name	Jurisdiction	Location	Project Description	Status
D-6	Upper Westside Specific Plan	Sacramento County	Sacramento County	The project would be a transportation-oriented development due to its location and proximity to transportation infrastructure and major employment regions in the region. It would also incorporate many "complete streets" aspects such as pedestrian- and bicycle-friendly infrastructure, transit services, and some compact housing to encourage alternative modes of transportation within the area. The project area is currently zoned for agricultural use, but a general plan amendment is underway to alter the land use designations for the Upper Westside Plan area.	Application accepted on February 26th, 2019. Environmental analysis in progress.
D-7	The Core Natomas 300-unit Apartments	City of Sacramento	City of Sacramento	This project provides a 300-unit apartment complex with 506 parking spaces (including 203 garage types), two accesses (orchard and via planned cul-de-sac).	Construction completed in 2020.
D-8	River Oaks Phase 2: 591 Single Family	City of Sacramento	City of Sacramento	This project provides 591 single-family lots on 83.3 acres of vacant land within the River Oaks planned unit development.	Planning phase; environmental documents submitted in 2018.
D-9	Bell Avenue Warehouses Project	City of Sacramento	City of Sacramento	The project would include development of the project site with two warehouse structures totaling approximately 339,549 sf as well as various other site improvements related to internal vehicle circulation, stormwater management, and landscaping. The warehouse situated on the eastern parcel would be approximately 259,749 sf and contain two depressed loading docks on the western face of the building. The warehouse on the western parcel would be approximately 79,800 sf and contain two depressed loading docks on the western face of the building. On-site parking would be provided by 277 proposed parking spaces.	Planning phase; environmental documents submitted in February 2020.
D-10	Rivers Oaks Marketplace	City of Sacramento	City of Sacramento	There is a plan amendment for four new commercial structures on a 3.91-acre parcel in the C-2-PUD (General Commercial-Park El Camino) Zone. This requires a Commission-level review for site plan and design review, conditional use permits, a tentative map, and a planned unit development Schematic Plan Amendment.	Project construction would be anticipated to last approximately 16 months, beginning in April of 2021 and concluding in July of 2022. Construction would proceed in a single phase.
D-11	ParkeBridge Phase 4	City of Sacramento	City of Sacramento	The project proposes to construct 108 new detached, single-unit dwellings with four house plans on approximately 22 acres in the ParkeBridge Panned Unit Development.	Subdivision is currently under development

Project ID	Project Name	Jurisdiction	Location	Project Description	Status
D-12	Bretton Woods	City of Davis	City of Davis	Davis is annexing land from Yolo County and rezoning land from agricultural intensive to medium density residential, high density residential, residential greenspace overlay, urban agriculture transition area, and mixed use. This would pave the way for 325 single-family homes, 260 of which are for senior citizens, and an additional 150 are affordable senior apartments. The project also includes an approximately 3-acre activity and wellness center. The project is on a site north of Covell Boulevard and west of SR-113, at the intersection of Shasta Drive and West Covell Boulevard.	Currently undergoing planning review of the subdivision phases.
D-13	UC Davis Long Range Development Plan	University of California, Davis	Sacramento, located off US-50 near the Highway 99/Business 80 interchange	The 2020 LRDP Update proposes general types of campus development and land uses to support projected campus population growth and enable expanded and new program initiatives. The proposed Aggie Square Phase I project consists of approximately 1,384,500-gross square feet of building space for education, research, residential and commercial uses and parking structure space.	Planning phase; environmental documents submitted in November 2020.
D-14	Woodland Research & Technology Park Specific Plan	City of Woodland	City of Woodland	Woodland is pursuing a specific plan detailing a commercial mixed use town center with 2.15 million square feet of non-residential building space for approximately 6,100 employees and 1,600 housing units. The project is located in the southern portion of Woodland's planning area, adjacent to the existing city limits, in an area bound by Farmers Central Road to the north, CR-101 to the east, SR-113 to the west, and CR-25A to the south.	Environmental analysis in progress.

Notes:
CCTV = closed-circuit television; CMS = changeable message signs; CR = County Road; I-80 = Interstate 80; LRDP = long-range development plan; sf = square feet
SHOPP = State Highway Operation and Protection Program; SR = State Route; TCE = temporary construction easement; TMS = transportation management system
U.C. = University of California; US-50 = U.S. Route 50

Sources: ESRI 2023.

Figure 2.4-1 Map of Reasonably Foreseeable Future Actions
Yolo 80 Corridor Improvement Project

2.4.3 Resources Excluded from Cumulative Impacts Analysis

The following resources have been excluded from the cumulative impacts analysis:

- **Existing and Future Land Uses:** Project improvements would mostly occur within the existing Caltrans right-of-way and would not result in any direct changes to land use adjacent to the Project area. Under all Build Alternatives, there would be some TCEs and staging outside of the Caltrans right-of-way including one small area of permanent right-of-way acquisition under Build Alternatives 2a through 7b. The area of proposed permanent right-of-way acquisition is currently undeveloped, vacant land; and would not result in the displacement of any residences or businesses. Therefore, the Project is not expected to result in cumulatively considerable impacts on land use.

- **Consistency with State, Regional, and Local Plans:** Project-related construction activities would be temporary and would not result in long-term effects that would conflict with state, regional, and local plans. Therefore, the Project would not contribute to temporary cumulative impacts related to consistency with state, regional, and local plans.

- **Farmlands:** Build Alternatives 2a through 7b would include one permanent acquisition right-of-way for construction of a Park-and-Ride Facility; however, the property is currently vacant, undeveloped land that is not categorized as an agricultural or farmland area. The alternatives with additional lanes in each direction would only expand into existing Caltrans right-of-way. Therefore, the Project would not result in cumulatively considerable impacts from the conversion of any important farmland or Williamson Act land to non-agricultural uses.

- **Population and Housing:** Build Alternatives 2a through 6b would accommodate planned regional growth but would not remove any impediments to growth, provide new public facilities, or provide new access to previously unserved areas. Build Alternatives 7a and 7b would repurpose existing lanes as managed lanes and would not add capacity. However, Alternative 7b would include the construction of the I-80 connector ramp, which would add operational capacity. Under all Build Alternatives, no residential property acquisition or relocation would be required. Project-related construction would occur primarily within the existing Caltrans right-of-way and would require acquisition of a vacant parcel to construct a Park-and-Ride Facility. The Project would not affect land uses, residential or commercial property, or any minority residences or businesses. There would be no disruption or effect on the existing community features in the surrounding areas. Therefore, the Project is not expected to result in cumulatively considerable impacts on regional population and housing.

- **Economic Conditions**: All Build Alternatives are anticipated to have a positive impact on the regional economy by improving access, travel time, and highway capacity. There would be no adverse effects on the regional economy, such as acquiring or relocating businesses, changing property or sales tax revenue for the cities or counties involved, or

altering property values. Therefore, the Project is not expected to result in cumulatively considerable impacts on economic conditions.

- **Timberlands:** The Project area does not contain timberlands. Therefore, this resource has been excluded from the cumulative impacts analysis.

- **Coastal Zone:** The Project area is not located in a coastal zone. Therefore, this resource has been excluded from the cumulative impacts analysis (California Coastal Commission 2019).

- **Wild and Scenic Rivers:** The Project area does not cross any rivers designated as part of the National Wild and Scenic Rivers System. The nearest Wild and Scenic River is the Lower American River which is located approximately two miles south of the Project (U.S. Fish and Wildlife Service 2021). Therefore, no wild or scenic rivers would be affected by construction or operation of the Project.

- **Plant Species:** The RSA was determined to have potential habitat for 25 special-status plant species. However, focused botanical surveys conducted in May and August 2021 and July 2022 found no special-status plant species within the RSA. Construction activities associated with the Project would not result in permanent or temporary disturbances of potential habitat for special-status plant species. Therefore, the Project is not expected to result in cumulatively considerable impacts on special-status plants.

- **Invasive Species:** According to the ratings in the California Invasive Plant Inventory produced by California Invasive Plant Council (Cal-IPC), there are currently 45 invasive plant species within the Biological Study Area (BSA) (CAL-IPC 2021). Cal-IPC categorizes non-native invasive plants into three categories of overall negative ecological impact in California: High, Moderate, and Limited. Invasive species found in the RSA with a Cal-IPC rating of “High” include seven species, 20 species with a rating of “Moderate,” and 18 species with a rating of “Limited.” The Project could result in the spread of invasive species during Project construction through ground-disturbing activities, improper disposal of graded and excavated soils on-or off-site, or landscaping with invasive species. To prevent the spread of invasive species, Caltrans Standard Specification 14-6.05A(1) would be included in the contract. Section 14-6.05A(1) includes specifications for preventing the introduction and spread of invasive species to and from the job site. Therefore, the potential for spread of invasive species is very low with implementation of Caltrans Standard Specifications. Therefore, the Project is not expected to result in cumulatively considerable impacts related to invasive species.

2.4.4 Resources Evaluated for Cumulative Impacts

The following resources have been evaluated for cumulative impacts that would result from implementation of the Project:

- Parks and Recreation
- Growth
- Environmental Justice

- Utilities and Emergency Services
- Traffic and Transportation
- Visual and Aesthetics
- Cultural Resources
- Hydrology and Flood Plain
- Water Quality
- Geology/Soils/Seismic/Topography
- Paleontology
- Hazardous Waste or Materials
- Air Quality
- Noise
- Energy
- Natural Communities
- Wetlands and Other Waters
- Animal Species
- Threatened and Endangered Species

2.4.5 Resource Study Area

The study area was selected to identify other current or reasonably foreseeable future actions. The study area is generally bounded by the I-80 corridor between PMs 40.7 and 44.7 in Solano County, between PMs 0.00 and 11.72 in Yolo County, and between PMs 0.00 and 1.36 in Sacramento County; and US-50 between PMs 0.00 and 3.12 in Yolo County and between PMs 0.00 and 0.617 in Sacramento County. The boundaries of the study area were delineated by reviewing the area within a.5- to 4-mile radius of the Project area, and then adjusting the boundaries based on major roadways and land use/neighborhood boundaries.

The geographic boundaries of the RSA for each resource were considered by the Project study area and the study areas delineated by each technical report prepared for the Project. Therefore, a unique RSA was identified for each resource, rather than a single consolidated study area and is defined for each resource in the following sections.

2.4.5.1 Parks and Recreation

The analysis in this section is based on the Community Impact Assessment completed for the Project (Caltrans 2023b) and the Section 4(f) evaluation (Caltrans 2023d).

Resource Study Area

The RSA for Parks and Recreation is consistent with the cumulative study area as described in section 2.4.5, plus a 1,000-foot buffer. The RSA includes the population most likely to experience direct impacts associated with the Project's direct physical improvements.

Cumulative Impacts

Current and reasonably foreseeable future actions could result in land use activities that would result in impacts on parks and recreation during construction and operation. Of the

transportation projects within the RSA, the construction timing for Yolo Pavement Rehabilitation Project (T-1) and Richards Boulevard / Olive Drive Circulation Improvements (T-5) could overlap with the Project. Of the development projects within the RSA, the construction timing for River Oaks Phase (D-8), Bell Avenue Warehouses Project (D-9), and Bretton Woods (D-12), and UC Davis Long Range Development Plan (D-13) could overlap with Project construction. Land use and transportation plans may also include planned and programmed projects that overlap with Project construction.

All Build Alternatives would include improvements to bike infrastructure, which would provide several benefits to the community, including enhancing the safety and accessibility of bicycle travel in the area, potentially reducing traffic congestion, air pollution, and greenhouse gas emissions. The improvements include replacing and extending existing bicycle pathways, improving crosswalks and signage, and constructing a new bike path extension. These benefits would lead to safer and more accessible transportation options, improved public health, and recreational opportunities for the community. Project construction and operation would have positive permanent cumulative effects due to the improvements made to bicycle/pedestrian infrastructure within the RSA.

The Project in conjunction with other projects would contribute to temporary impacts on parks and recreational facilities during construction activities, such as reduced access, loss of parking, local road closures, localized air quality impacts, and increased noise and vibration levels. These temporary impacts could affect public enjoyment of the resources, but standard BMPs, such as temporary detours, would be provided for any closed recreational trails or walkways. Changes in noise levels experienced by park and recreational facility users due to project operation would be barely perceptible and consistent with existing conditions. Similarly, there would be no perceptible long-term changes in air quality at parks and recreational facilities resulting from project operation. Future projects may require right-of-way acquisitions from parks and recreation facilities which may contribute to cumulative impacts; however, the Project does not require additional right-of-way acquisitions from parks and recreation facilities. As a result, the Project, in conjunction with related projects, would not result in cumulatively considerable permanent impacts to parks and recreation.

Human Environment Section 2.1.3 states that no AMMs would be required for parks and recreation and no additional AMMs are required for cumulative impacts.

2.4.5.2 Growth

The analysis in this section is based on the Community Impact Assessment completed for the Project (Caltrans 2023b).

Resource Study Area

The RSA for Growth is consistent with the cumulative study area as described in section 2.4.5, plus a 1,000-foot buffer. The RSA includes the population most likely to experience direct impacts associated with the Project's direct physical improvements.

Cumulative Impacts

Current and reasonably foreseeable future actions could result in land use activities that would result in impacts on growth during construction and operation. Of the transportation projects within the RSA, the construction timing for Yolo Pavement Rehabilitation Project (T-1) and Richards Boulevard / Olive Drive Circulation Improvements (T-5) could overlap with the Project. Of the development projects within the RSA, the construction timing for River Oaks Phase (D-8), Bell Avenue Warehouses Project (D-9), and Bretton Woods (D-12), and UC Davis Long Range Development Plan (D-13) could overlap with Project construction. Land use and transportation plans may also include planned and programmed projects that overlap with Project construction.

The enhancements planned in Build Alternatives 2 through 5 would help accommodate planned growth on a regional level. However, these alternatives are not anticipated to improve opportunities for growth or provide new access to previously unserved areas. New residential development along the I-80 corridor is limited by floodplain conditions, long-term wildlife refuge and agricultural preserves, and built-out conditions in city limits. Improving travel times and capacity along I-80 is not expected to stimulate growth into nearby areas where development is not planned, as other factors such as market conditions and local land use policies have a greater influence on land use change than roadway capacity. Furthermore, new development in the RSA would occur in areas already planned for growth, with smart growth policies prioritizing infill and redevelopment projects. Planned new development in previously undeveloped or agricultural areas is limited by land use policies, agricultural preserves, and floodplains.

Therefore, the Project's contribution to permanent and temporary cumulative impacts on growth would be minimal. The Project's contribution to temporary cumulative impacts would also cease following construction. As a result, the Project, in conjunction with related projects, would not result in cumulatively considerable permanent growth impacts.

Human Environment Section 2.1.5 states that no AMMs would be required for growth and no additional AMMs are required for cumulative impacts.

Community Facilities and Services

The information in this section is based on the Community Impact Assessment completed for the Project (Caltrans 2023b).

Resource Study Area

The RSA for community facilities, utilities, and emergency services includes the Project limits, plus a 1,000-foot buffer. The RSA includes 20.8 miles along the I-80 corridor between Kidwell Road and the Solano/Yolo county line, between the Solano/Yolo county line and the Yolo/Sacramento county line, and between the Yolo/Sacramento county line and West El Camino Avenue; and on the US-50 corridor between the I-80/I-50 interchange and the Yolo/Sacramento county line and between the Yolo/Sacramento county line and the US-50/I-5 interchange.

Cumulative Impacts

Community Facilities

Current and reasonably foreseeable future actions could result in activities that would result in impacts on community facilities during construction and operation. Of the transportation projects within the RSA, the construction timing for Yolo Pavement Rehabilitation Project (T-1) and Richards Boulevard / Olive Drive Circulation Improvements (T-5) could overlap with the Project. Of the development projects within the RSA, the construction timing for River Oaks Phase (D-8), Bell Avenue Warehouses Project (D-9), and Bretton Woods (D-12), and UC Davis Long Range Development Plan (D-13) could overlap with Project construction.

It is anticipated that several of the foreseeable projects may require right-of-way acquisitions, resulting in long-term impacts on community amenities. As a result, these significant transportation projects may lead to cumulative impacts on community facilities that could persist over time. Moreover, the relevant projects planned for construction at the same time as the Project may cause temporary impacts, such as access difficulties, reduced visual aesthetics, air pollution, and noise that could impact community facilities Therefore, the additional projects in conjunction with the Project may contribute to temporary cumulative impacts on community facilities. However, they would not be anticipated to result in cumulatively considerable permanent impacts.

Human Environment Section 2.1.8 states that no AMMs would be required for community facilities and no additional AMMs would be required for cumulative impacts.

Utilities

Current and reasonably foreseeable future actions could result in activities that would result in impacts on utilities during construction and operation. Of the transportation projects within the RSA, the construction timing for Yolo Pavement Rehabilitation Project (T-1) and Richards Boulevard / Olive Drive Circulation Improvements (T-5) could overlap with the Project. Of the development projects within the RSA, the construction timing for River Oaks Phase (D-8), Bell Avenue Warehouses Project (D-9), and Bretton Woods (D-12), and UC Davis Long Range Development Plan (D-13) could overlap with Project construction.

The Project would comply with Caltrans standards and involve coordination with utility providers to minimize temporary construction impacts. In addition, utilities would be restored upon completion of utility relocation activities. The Project would comply with Caltrans standards and coordinate with utility providers; therefore, the Project's contribution to temporary cumulative impacts on utilities would be substantially minimized. In addition, the Project's contribution to temporary cumulative impacts would cease following construction. Each relevant project would be required to consider avoidance, minimization, and/or mitigation measures to reduce impacts on utilities and service systems. Therefore, the Project, in conjunction with related projects, would not result in cumulatively considerable impacts on utilities and service systems.

Human Environment Section 2.1.8 states that no AMMs would be required for utilities and no additional AMMs would be required for cumulative impacts.

Emergency Services

Current and reasonably foreseeable future actions could result in activities that would result in impacts on community facilities during construction and operation. Of the transportation projects within the RSA, the construction timing for Yolo Pavement Rehabilitation Project (T-1) and Richards Boulevard / Olive Drive Circulation Improvements (T-5) could overlap with the Project. Of the development projects within the RSA, the construction timing for River Oaks Phase (D-8), Bell Avenue Warehouses Project (D-9), and Bretton Woods (D-12), and UC Davis Long Range Development Plan (D-13) could overlap with Project construction.

Construction activities of the relevant projects, in conjunction with Project, could result in traffic delays that could affect the ability of fire, law enforcement, and emergency service providers to meet response-time goals. However, construction of the Build Alternatives would include implementation of a TMP and coordination with emergency service providers to minimize temporary construction impacts. The cumulative impacts on emergency services would be temporary and each project would be required to consider avoidance, minimization, and/or mitigation measures to reduce temporary impacts. With implementation of these measures, the Project's contribution to temporary cumulative impacts on emergency services would be substantially minimized. In addition, the Project's contribution to temporary cumulative impacts would cease following construction. Therefore, the Project, in conjunction with related projects, would not result in cumulatively considerable impacts on emergency services.

Human Environment Section 2.1.8 states that no AMMs would be required for emergency services and no additional AMMs would be required for cumulative impacts.

2.4.5.3 Environmental Justice and Equity

The information in this section is based on the Community Impact Assessment completed for the Project (Caltrans 2023b).

Resource Study Area

The RSA for environmental justice consists of 37 census blocks surrounding the Project study area. The SACOG Planning Area is used as a regional comparison.

Cumulative Impacts

Current and reasonably foreseeable future actions could result in activities that would result in impacts on utilities during construction and operation. Of the transportation projects within the RSA, the construction timing for Yolo Pavement Rehabilitation Project (T-1) and Richards Boulevard / Olive Drive Circulation Improvements (T-5) could overlap with the Project. Of the development projects within the RSA, the construction timing for River Oaks Phase (D-8), Bell Avenue Warehouses Project (D-9), and Bretton Woods (D-12), and UC Davis Long Range Development Plan (D-13) could overlap with Project construction.

Several of the relevant projects did not have environmental documents available to determine potential impacts on environmental justice populations in the RSA. There is potential that

relevant projects could result in environmental effects that could result in disproportionately high and adverse effects on minority or low-income populations. The relevant projects, as listed above, that would be constructed within the Project construction period could result in temporary construction impacts related to access, visual/aesthetics, air quality, and noise that could result in disproportionately high and adverse effects on minority or low-income populations. While the Project would also contribute to temporary construction impacts, these impacts would not be disproportionately borne on environmental justice communities and would affect all adjacent communities. The Project's construction impacts would be minimized by adhering to Caltrans' standard specifications and BMPs for noise abatement and fugitive dust control. Each relevant project would also be required to implement measures to minimize temporary impacts on environmental justice and equity. Therefore, the Project would not result in temporary cumulatively considerable impacts on environmental justice and equity.

As discussed above, Build Alternatives 2 through 7 would improve traffic conditions, to varying degrees, on I-80/US-50. Although the congestion relief and enhanced accessibility associated with the Project would benefit all I-80/US-50 travelers, environmental justice travelers may not realize the full benefit from Build Alternatives 3 through 5 because of tolling. Relevant projects have the potential to result in disproportionately high and adverse effects on environmental justice communities. Each relevant project would be subject to approval and be required to consider these impacts and provide measures to avoid or minimize impacts. Therefore, the Project would not result in permanent cumulatively considerable impacts on environmental justice and equity.

The AMMs in Human Environment Section 2.1.7 would be implemented to reduce the direct effects on environmental justice and equity communities, no additional AMMs are required for cumulative impacts.

2.4.5.4 Traffic and Transportation/Pedestrian and Bicycle Facilities

The analysis in this section is based on the Draft Travel Demand Modeling Report (TDMR) (Fehr & Peers 2021), Draft TMP Data Sheet (Caltrans 2021e) and the Draft Pedestrian and Bicyclist Travel Impact Assessment prepared for the Project (Caltrans 2021a).

Resource Study Area

The RSA for traffic, transportation, and pedestrian and bicycle facilities is consistent with the cumulative study area as described in section 2.4.5. The RSA also includes areas required to accommodate construction activities, mobilization, staging, and access, such as city-owned areas where right-of-way acquisition and TCEs would be required. Staging areas would cover approximately 53.3 acres and be located at the I-80/West El Camino Avenue interchange, South River Road, I-80/Richards Boulevard interchange, the I-80 and SR-113 interchange, and the along Kidwell Road.

Cumulative Impacts

Construction of the relevant projects would occur either simultaneously or partially during the construction period of the Project which could increase traffic congestion and delays, potential

lane closures, reduced speed-limits, staging, and detours. However, concurrent construction would be temporary, and projects would be at various stages throughout the 400 working day construction period of the Project. Each transportation project would be required to implement measures as necessary to avoid and minimize traffic impacts.

Based on the above-mentioned travel demand modelling, the Project is anticipated to result in permanent beneficial improvements to the Project area by reducing overall long-term traffic flow and access to highway facilities. The relevant projects are also intended to permanently improve local infrastructure by reducing traffic congestion, increasing access to transit and transportation alternatives within the RSA, and contributing to overall beneficial cumulative impacts on the area. Therefore, the Project, in conjunction with related projects, would not result in cumulatively considerable temporary impacts on traffic and transportation.

The AMMs provided in Human Environment Section 2.1.9 would be implemented to reduce the direct effects of the Build Alternatives on Traffic and Transportation/Pedestrian and Bicycle Facilities. No additional AMMs would be required for cumulative impacts.

2.4.5.5 Visual/Aesthetics

The analysis in the following section is based on the Draft Visual Impact Assessment (VIA) and the supplemental VIA prepared for the Project (Stantec Consulting Services Inc. 2022).

Resource Study Area

The RSA comprises four visual assessment units along the Project corridor as described in the VIA prepared for the Project. Each visual assessment unit (VAU) is typically defined by the limits of a particular viewshed and has its own character and visual quality and is defined as follows:

- Solano County VAU: located within the limits of Solano County from the Project's western terminus northeast along I-80 to south of the Yolo County/Davis city limits
- Davis VAU: located along I-80 from the UC Davis just south and east of the Davis city boundary and extends through Davis to the eastern limits of the city
- Yolo County VAU: located along I-80 from the eastern limits of Davis spanning the Yolo Bypass to the western limits of West Sacramento
- West Sacramento VAU: located along the I-80/US-50 corridor within the city limits of West Sacramento and Sacramento, extending from the west boundary of West Sacramento to the eastern termini of the Project.

Cumulative Impacts

Cumulative impacts are those resulting from past, present, and reasonably foreseeable future actions, combined with the potential visual impacts of this Project. For this Project, it has been determined that the following cumulative visual impacts may occur.

In combination with the Project, the Yolo Pavement Rehabilitation Project (T-1), Sac 50 Design-Build Project (T-4), City of Davis Richards Boulevard Ramps Reconfiguration Project (T-5), the I-5 Auxiliary Lanes Project, and I-5 Managed Lanes Project, would contribute to permanent cumulative visual impacts. These projects would widen highways and structures, remove existing plantings in the center median, reconfigure on/off-ramps, replace guardrails, paint structures, and impact associated vegetation. The transportation projects and proposed development of adjacent parcels would also contribute to an increase in lighting levels and glare in the area by infilling unlit open space areas and adding reflective surfaces. However, the Project would be somewhat compatible with the existing visual environment. Overall Resource Change would vary throughout the corridor, with some areas visually unchanged and other areas that would experience more noticeable visual changes.

The Project under the Build Alternatives would result in permanent visual/aesthetic impacts by making the freeway larger and more dominant in the landscape, changing views for both freeway travelers and adjacent land uses. The combined visual effect of this Project and other development projects planned, recently in construction, or currently in construction would collectively change the visual character of the region. As described in planning documents such as the General Plans for the cities of Davis, Sacramento, and West Sacramento and County RTPs, there is development anticipated within and surrounding the Project area. These plans, once implemented, would improve existing and create new/reconfigured transportation facilities as well as induce development and infill of open space areas and vacant lots within the RSA.

Approximately half of the overall corridor is within municipalities which have identified land development and urban growth patterns adjacent to the Project. Over time, the highway users and highway neighbors may experience the gradual transition of undeveloped lots, the redevelopment of existing developed lots, and the modification of transportation corridors to support these developments within the landscape. As such, the contribution of the Project is minimal in the context or visual impacts through the Project area. Permanent visual impacts would be consistent with the visual environment goals and objectives established by local and regional planning documents and ordinances.

The Project could potentially result in a cumulatively considerable visual impact if multiple projects are constructed concurrently. Nighttime construction lighting, glare, construction equipment, staging areas, demolition, and other construction-related activities from multiple projects may contribute to cumulative visual impacts. However, construction-related visual impacts would be temporary. Furthermore, to minimize potential visual impacts, the Project would implement AMMs that would incorporate aesthetic treatment design considerations to avoid visual resource removal and implement replacement planting as needed. As a result, the Project's contribution to a potential cumulative visual impact would not be cumulatively considerable.

The AMMs provided in Human Environment Section 2.1.10 would be implemented to reduce the direct effects on visual resources. No additional AMMs would be required for cumulative impacts.

2.4.5.6 Cultural Resources

The information in this section is based on the Historic Property Survey Report (Caltrans 2021j) and the Section 4(f) Report (Caltrans 2023d) prepared for the Project.

Resource Study Area

The RSA for cultural resources is defined as the Area of Potential Effects (APE). In accordance with PA Stipulation VIII.A, the APE for the Project was established in consultation with Connor Buitenhuys, Professionally Qualified Staff of Prehistoric and Historical Archaeology, and Jess Avilla, Project Manager on June 30, 2020. Although the APE is almost entirely in Caltrans ROW, five TCEs would be required along the project alignment. The APE occupies approximately 360 acres along the 9.5-mile-long Project.

Cumulative Impacts

Current and reasonably foreseeable future actions could result in land use activities that could result in impacts on cultural resources. Of the transportation projects within the RSA, the construction timing for Yolo Pavement Rehabilitation Project (T-1) and Richards Boulevard / Olive Drive Circulation Improvements (T-5) could overlap with the Project. Of the development projects within the RSA, the construction timing for River Oaks Phase (D-8), Bell Avenue Warehouses Project (D-9), and Bretton Woods (D-12), and UC Davis Long Range Development Plan (D-13) could overlap with Project construction. Land use and transportation plans may also include planned and programmed projects that overlap with Project construction.

Similar to the Project, all projects and plans listed in Table 2.4-1 that would involve ground disturbance could result in damage to or destruction of previously undiscovered subsurface archaeological deposits or unmarked burials. The related projects would be required to conduct applicable surveys and take necessary precautions if determined to be in an area known to have potential for cultural resources. All related projects would also be required to consider avoidance, minimization, and/or mitigation measures. As a result, the Project, in conjunction with related projects, would not result in cumulatively considerable impacts on cultural resources.

The AMMs provided in the Human Environment Section 2.1.11 would be implemented to reduce the direct effects of the Build Alternatives on cultural resources. No additional AMMs would be required for cumulative impacts.

2.4.5.7 Hydrology and Floodplains

The information in this section is based on the Floodplain Hydraulic Study (FHS) prepared for the Project (Wood Rodgers Inc. 2021).

Resource Study Area

The RSA for hydrology and floodplains is consistent with the cumulative study area as described in Section 2.4.5. The RSA also includes the Project area as depicted on the following FEMA FIRM panel numbers:

- 06067C0157J and 06067C0160J for Sacramento County, California and Incorporated Areas dated 06/16/2015.
- 0607280005B for City of West Sacramento, California, Yolo County dated 01/19/1995.
- •06095C0075E and 06095C0100E for Solano County, California and Incorporated Areas dated 05/04/2009.
- 06113C0610G, 06113C0611G, 06113C0620G, and 06113C0630G for Yolo County, California and Incorporated Areas dated 06/18/2010.

Cumulative Impacts

Current and reasonably foreseeable future actions could result in land use activities that could result in impacts on hydrology and floodplains. Of the transportation projects within the RSA, the construction timing for Yolo Pavement Rehabilitation Project (T-1) and Richards Boulevard / Olive Drive Circulation Improvements (T-5) could overlap with the Project. Of the development projects within the RSA, the construction timing for River Oaks Phase (D-8), Bell Avenue Warehouses Project (D-9), and Bretton Woods (D-12), and UC Davis Long Range Development Plan (D-13) could overlap with Project construction. Land use and transportation plans may also include planned and programmed projects that overlap with Project construction.

All relevant projects would be required to determine any potential impacts on the existing floodplain and document any floodplain impacts. Relevant projects would also be required to undergo review by the applicable Lead Agency for compliance with National Pollutant Discharge Elimination System (NPDES) permits for construction, operation, and maintenance activities as well as compliance with local urban stormwater and non-stormwater runoff ordinances for temporary and permanent impacts. Therefore, in conjunction with relevant projects, the Project would not result in a cumulatively considerable impact on hydrology and floodplains.

The AMMs provided in the Physical Environment Section 2.2.1 would be implemented to reduce the direct effects of the Build Alternatives on hydrology and floodplains. No additional AMMs would be required for cumulative impacts.

2.4.5.8 Water Quality and Storm Water Runoff

The analysis in this section is based on the Water Quality Assessment (Caltrans 2022a) and the Floodplain Hydraulics Study (Wood Rodgers Inc. 2021) that were prepared for the Project.

Resource Study Area

The RSA for water quality and storm water runoff includes the entire Solano, Yolo, and Sacramento watersheds. The RSA includes the areas of Project improvements, maintenance access, soundwalls, and other peripheral features owned and maintained by Caltrans, and the cities of Davis, West Sacramento and Sacramento. The RSA also includes areas required to accommodate construction activities, mobilization, staging, and access, such as city-owned right-of-way acquisition and TCEs.

Cumulative Impacts

Development of the Project and the reasonably foreseeable projects within the RSA may have the potential to create sources of short-term and long-term water pollution. Each project would be required to mitigate impacts by providing stormwater pollution prevention measures. Additionally, adverse cumulative water quality impacts to resources in this Project area could result from residential, commercial, agricultural, and highway development. The Project would involve short-term construction activities that would have the potential to degrade water quality in downstream water bodies. While the Project would not change existing land uses in the area, mitigation is proposed that would require implementation of various construction and operational water quality control measures that would prevent the release of pollutants into downstream waterways.

Projects T-1 and T-2 would correct the wash-out and ponding drainage issues that are occurring on both sides of the Bryte Bend Bridge resulting in permanent beneficial impacts on water quality in the Project area (Wood Rodgers Inc. 2021).

It is anticipated that the Project in combination with the projects listed in Table 2.4-1 would contribute to temporary adverse cumulative impacts on water quality. However, each project that disturbs one or more acres would comply with NPDES and install BMPs during construction to minimize potential adverse impacts on water resources.

The AMMs provided in the Physical Environment Section 2.2.2 would be implemented to reduce the direct effects of the Build Alternatives on water quality and stormwater runoff. No additional AMMs would be required for cumulative impacts.

2.4.5.9 Geology/Soils/Seismic/Topography

The information in this section is based on the Structure Preliminary Geotechnical Report for I-80 HOV Connector RW No. 1 & 2 (Caltrans 2021f). Structure Preliminary Geotechnical Report for Richards Blvd. OC RW No. 3 (Caltrans 2021d), and Structure Preliminary Geotechnical Report for I-80 HOV Connector (Caltrans 2020c) prepared for the Project.

Resource Study Area

The RSA for geology/solid/seismic/topography comprises the Project study area which is approximately 20.8 miles on the I-80 corridor between PMs 40.7 and 44.7 in Solano County, between PMs 0.00 and 11.72 in Yolo County, and between PMs 0.00 and 1.36 in Sacramento County; on the US-50 corridor between PMs 0.00 and 3.12 in Yolo County and between PMs 0.00 and 0.617 in Sacramento County.

The RSA includes the areas of Project improvements, construction staging areas, Project-related signage, maintenance access, sound walls, stormwater features, and other peripheral features owned and maintained by Caltrans.

Cumulative Impacts

Current and reasonably foreseeable future actions could result in land use activities that could result in impacts on geology, soils, seismic, and topography. Of the transportation projects within the RSA, the construction timing for Yolo Pavement Rehabilitation Project (T-1) and Richards Boulevard / Olive Drive Circulation Improvements (T-5) could overlap with the Project. Of the development projects within the RSA, the construction timing for River Oaks Phase (D-8), Bell Avenue Warehouses Project (D-9), and Bretton Woods (D-12), and UC Davis Long Range Development Plan (D-13) could overlap with Project construction. Land use and transportation plans may also include planned and programmed projects that overlap with Project construction. Similar to the Project, the relevant projects have the potential to impact water quality temporarily and permanently; however, all projects would be required to implement measures and BMPs to reduce impacts on geology, soils, seismic, and topography.

Each relevant project would be subject to geotechnical analysis and cannot be constructed unless each project is determined to be geotechnically feasible. Similar to the Project, the relevant projects would be designed and built to current standards. Construction activities for the Project would increase the possibility for erosion, slope instability from seismic shaking, and soil expansion/collapse. Similar to the Project, relevant projects would be required to comply with seismic requirements of the California Building Code. The potential for landslides would be considered when planning grading or excavation activities in areas known to be prone to landslides. Relevant projects would also be required to implement measures as necessary if they would result in impacts on geology or soils. Therefore, in conjunction with relevant projects, the Project would not result in a cumulatively considerable impact on geology, soils, seismic, and topography.

The AMMs provided in the Physical Environment Section 2.2.3 would be implemented to reduce the direct effects of the Build Alternatives on Geology/Soils/Seismic/Topography. No additional AMMs would be required for cumulative impacts.

2.4.5.10 Paleontology

This information in this section is based on the PIR prepared for the Project (Caltrans 2021c).

Resource Study Area

The RSA for paleontology comprises the Project study area which is approximately 20.8 miles on the I-80 corridor between PMs 40.7 and 44.7 in Solano County, between PMs 0.00 and 11.72 in Yolo County, and between PMs 0.00 and 1.36 in Sacramento County; on the US-50 corridor between PMs 0.00 and 3.12 in Yolo County and between PMs 0.00 and 0.617 in Sacramento County. The RSA includes the areas of Project improvements, construction staging areas, Project-related signage, maintenance access, sound walls, stormwater features, and other peripheral features owned and maintained by Caltrans.

Cumulative Impacts

Specific impacts on paleontological resources that would result from other relevant projects in the RSA were not readily available for all of the projects. However, the projects listed in Table 2.4-1 would likely require earth-moving activities over a large cumulative surface area with the potential to encounter paleontological resources. Therefore, these relevant projects may contribute to permanent cumulative impacts on paleontological resources. Any impact on paleontological resources would be permanent and irreversible. Consequently, there would be no temporary adverse impact under any of the relevant projects.

As discussed above, the Project has the potential to impact paleontological resources from earth-moving activities greater than 4 feet in depth during Project construction. However, the Project would implement appropriate mitigation measures that would be identified in Paleontological Evaluation Report (PER) for the recovery and treatment of any fossil remains exposed by those earth-moving activities. This report will be prepared during the plans, specifications and estimate (PS&E) development phase when more design details are known.

Any impact on paleontological resources would be permanent and irreversible. With implementation of measures within the PER, the Project's contribution to permanent cumulative impacts on paleontological resources would be substantially minimized.

The AMMs provided in the Physical Environment Section 2.2.4 would be implemented to reduce the direct effects of the Build Alternatives on Paleontological resources. No additional AMMs would be required for cumulative impacts.

2.4.5.11 Hazardous Waste or Materials

The analysis in this section is based on the Hazardous Waste Initial Site Assessment (ISA) prepared for the Project (Caltrans 2021b).

Resource Study Area

The RSA for hazardous waste and materials includes the Project area which is approximately 20.8 miles on the I-80 corridor between PMs 40.7 and 44.7 in Solano County, between PMs 0.00 and 11.72 in Yolo County, and between PMs 0.00 and 1.36 in Sacramento County; on the US-50 corridor between PMs 0.00 and 3.12 in Yolo County and between PMs 0.00 and 0.617 in Sacramento County. The RSA includes the areas of Project improvements, maintenance access, soundwalls, stormwater features, and other peripheral features owned and maintained by Caltrans.

Cumulative Impacts

As mentioned above there are at least 11 relevant projects that could contribute to impacts from hazardous waste and materials. As each of the identified projects are related to transportation, bicycle and pedestrian, or development, it is anticipated that impacts would occur during construction and would be temporary. Hazards may occur from construction materials, fuels, lubricants, solvents, and other possible contaminants during construction. Contaminated soil or

groundwater may also be encountered during Project construction. Construction workers would be required to take appropriate precautions to minimize their exposure, which includes using the appropriate protective clothing and equipment.

With implementation of avoidance and minimization measures listed in the Physical Environment Section 2.2.5, the contribution to temporary adverse cumulative impacts related to hazardous waste or materials would be substantially minimized. In addition, contribution to temporary cumulative impacts would cease following construction.

The operation and maintenance of the relevant projects would not introduce new sources of hazardous wastes or materials.

The AMMs provided in the Physical Environment Section 2.2.5 would be implemented to reduce the direct effects of the Build Alternatives on Hazardous Waste or Materials. No additional AMMs would be required for cumulative impacts.

2.4.5.12 Air Quality

The information in this section is based on the Air Quality Report (Caltrans 2023a) completed for the Project.

Resource Study Area

The RSA for permanent cumulative impacts on air quality includes the Sacramento Valley Air Basin (SVAB), which includes Sacramento, Shasta, Tehama, Butte, Glenn, Colusa, Sutter, Yuba, Yolo, and parts of Solano and Placer counties.

The RSA for temporary cumulative impacts on air quality includes the Project study area, which includes 20.8 miles along the I-80 corridor between Kidwell Road and the Solano/Yolo county line, between the Solano/Yolo county line and the Yolo/Sacramento county line, and between the Yolo/Sacramento county line and West El Camino Avenue; and on the US-50 corridor between the I-80/I-50 interchange and the Yolo/Sacramento county line and between the Yolo/Sacramento county line and the US-50/I-5 interchange. The RSA includes the areas of Project improvements, maintenance access, soundwalls, stormwater features, and other peripheral features owned and maintained by Caltrans.

Cumulative Impacts

Current and reasonably foreseeable future actions could result in land use activities that would result in air quality impacts on adjacent sensitive receptors during construction and operation. Of the transportation projects within the RSA, the construction timing for Yolo Pavement Rehabilitation Project (T-1) and Richards Boulevard / Olive Drive Circulation Improvements (T-5) could overlap with the Project. Of the development projects within the RSA, the construction timing for River Oaks Phase (D-8), Bell Avenue Warehouses Project (D-9), and Bretton Woods (D-12), and UC Davis Long Range Development Plan (D-13) could overlap with Project construction. Land use and transportation plans may also include planned and programmed projects that overlap with Project construction.

During construction of the Project, there would be an increase in localized air quality and GHG impacts due to emissions from generation of dust and equipment exhaust. Control measures would be implemented as specified in Caltrans 2018 Standard Specifications Section 10-5 “Dust Control,” Section 14-9 “Air Quality” and Section 18 “Dust Palliatives.” Similar to the Project, all relevant projects would be required to comply with applicable air quality standards and implement BMPs as necessary to avoid and minimize impacts. Therefore, in conjunction with relevant projects, the Project would not result in a cumulatively considerable impact on temporary air quality and GHG emissions.

Physical Environment Section 2.2.6 states that no AMMs would be required for air quality and no additional AMMs are required for cumulative impacts.

2.4.5.13 Noise and Vibration

The information in this section is based on the Noise Study Report (NSR) completed for the Project (Caltrans 2022).

Resource Study Area

The RSA for noise and vibration consist of the Noise Analysis Areas as described in the NSR prepared for the Project. The analysis focuses on locations with defined outdoor activity areas, such as residential backyards, patios and balconies, common use areas at multifamily residences, outdoor sports and recreation areas, outdoor dining areas of restaurants, and school playgrounds. The RSA includes the areas of Project improvements, maintenance access, sound barriers, stormwater features, and other peripheral features owned and maintained by Caltrans.

Cumulative Impacts

The results of this analysis indicate that past, current, and reasonably foreseeable actions, in combination with the Project, are contributing to adverse cumulative impacts on noise.

Current and reasonably foreseeable future actions could result in land use activities that would increase the typical noise and vibration levels and result in impacts on adjacent sensitive receptors during construction and operation. The Project is anticipated to begin in spring of 2025, the following projects within the RSA may overlap in construction time frame of the Project, the Richards Boulevard / Olive Drive Circulation Improvements 03-0H360 (T-5), and the Yol 80 Davis 80 Rehabilitation Project 03-2J260 (T-9). Project construction of multiple other projects listed in Table 2.4-1 may overlap with the Project, however, the timelines are not yet determined. Land use and transportation plans may also include planned and programmed projects that could potentially overlap with Project construction.

The NSR identified three additional development projects within 500 feet of the Project footprint, the University Research Park development, the Plaza 2555 development, and the 3820 Chiles Road Apartments development. It was determined that the development projects would not contribute cumulatively to noise within the Project area.

The Project would not result in operational noise impacts with implementation of noise mitigation and the installation of the recommended sound barrier. Additionally, vibration levels are not anticipated to increase largely above existing conditions. Therefore, the Project would not contribute to permanent cumulative impacts on noise and vibration.

During construction of the Project, there would be an increase in noise and vibration due to the use of construction equipment. BMPs would be implemented to avoid and/or minimize impacts, which may include the following: providing that equipment is properly maintained and equipped with mufflers, limiting idling, installing temporary noise barriers, and locating staging and queuing areas away from noise-sensitive land uses. All relevant projects would be required to comply with local noise ordinances and implement BMPs as necessary to avoid and minimize temporary impacts on noise. Therefore, in conjunction with relevant projects, the Project would not result in a cumulatively considerable impact on noise and vibration.

The AMMs provided in the Physical Environment Section 2.2.7 would be implemented to reduce the direct effects of the Build Alternatives on noise and vibration. No additional AMMs would be required for cumulative impacts.

2.4.5.14 Energy

The information in this section is based on the Energy Memorandum (Caltrans 2023c) completed for the Project.

Resource Study Area

The RSA for energy is the overall SACOG region. SACOG is a designated Metropolitan Planning Organization that encompasses 28 cities and counties in the Sacramento region. Land use change and the transportation system would influence the demand for future energy development or the location and need for new or additional energy infrastructure across the Sacramento region. The provision of energy can be linked to jurisdictions, but often service providers and their infrastructure cover large areas. Therefore, it is necessary to consider the Sacramento region as a whole and the overall amount of development that would generate additional pressure and demand on energy use and generation facilities.

Cumulative Impacts

Current and reasonably foreseeable future actions could result in land use activities that would result in increased energy consumption during construction and operation. Of the transportation projects within the RSA, the construction timing for Yolo Pavement Rehabilitation Project (T-1) and Richards Boulevard / Olive Drive Circulation Improvements (T-5) could overlap with the Project. Of the development projects within the RSA, the construction timing for River Oaks Phase (D-8), Bell Avenue Warehouses Project (D-9), and Bretton Woods (D-12), and UC Davis Long Range Development Plan (D-13) could overlap with Project construction. Land use and transportation plans may also include planned and programmed projects that overlap with Project construction.

The demands on energy associated with the Project would be temporary and cease with completion of construction-related activities and appropriate BMPs would be implemented to reduce the demand on energy. According to the Energy Memorandum, energy consumption associated with Build Alternatives 2 through 7 represents a small demand on local and regional fuel and supplies that would be accommodated by local energy suppliers (Caltrans 2023c). Development of the projects listed in Table 2.4-1 would be required to assess project-specific impacts related to energy consumption and include design measures consistent with the most recent building code as it relates to energy use. Therefore, in conjunction with relevant projects, the Project would not result in a cumulatively considerable impact on energy.

The AMMs provided in the Physical Environment Section 2.2.7 would be implemented to reduce the direct effects of the Build Alternatives on energy. No additional AMMs would be required for cumulative impacts.

2.4.5.15 Natural Communities

The analysis in this section is based on the Natural Environment Study (NES) prepared for the Project (Caltrans 2023).

Resource Study Area

The RSA for natural communities is consistent with the BSA established for the Project, which is located in the counties of Solano, Yolo, and Sacramento and is approximately 1,137-acres in size. The RSA includes all areas needed for the currently proposed Project improvements and ancillary construction areas (e.g., staging areas, access roads).

Cumulative Impacts

Current and reasonably foreseeable future actions could result in land use activities that could result in impacts on Sensitive Natural Communities. Of the transportation projects within the RSA, the construction timing for Yolo Pavement Rehabilitation Project (T-1) and Richards Boulevard / Olive Drive Circulation Improvements (T-5) could overlap with the Project. Of the development projects within the RSA, the construction timing for River Oaks Phase (D-8), Bell Avenue Warehouses Project (D-9), and Bretton Woods (D-12), and UC Davis Long Range Development Plan (D-13) could overlap with Project construction. Land use and transportation plans may also include planned and programmed projects that overlap with Project construction.

As discussed above, the Project would result in permanent or temporary impacts on Sensitive Natural Communities. The Project would include standard measures to reduce impacts on Sensitive Natural Communities. Information on impacts on Sensitive Natural Communities were not available for several of the current and reasonably foreseeable future actions. However, if these relevant projects result in impacts on the same Sensitive Natural Communities that would be impacted by the Project, there could be a cumulative impact. Similar to the Project, relevant projects that would result in impacts on Sensitive Natural Communities, as defined by CDFW, would be required to conduct biological surveys and evaluation as applicable. If a relevant project would result in impacts on Sensitive Natural Communities, that project would be required to implement measures as required to avoid and minimize impacts. Therefore, in conjunction

with relevant projects, the Project would not result in a cumulatively considerable impact on Sensitive Natural Communities.

The AMMs provided in Biological Section 2.3.1 would be implemented to reduce the direct effects of the Build Alternatives on Sensitive Natural Communities. While the Project would not be expected to have cumulative impacts on Sensitive Natural Communities, implementation of the listed measures would avoid direct impacts on individuals and protect habitat to the extent practicable. No additional AMMs would be required for cumulative impacts.

2.4.5.16 Wetlands and Other Waters

The analysis in this section is based on the NES (Caltrans 2023), Aquatic Resources Survey Report and Preliminary Jurisdictional Assessment (Stantec Consulting Services Inc. 2021), and the Water Quality Assessment (Caltrans 2022a) prepared for the Project.

Resource Study Area

The RSA for wetlands and other waters is consistent with the BSA established for the Project, which is located in the counties of Solano, Yolo, and Sacramento and is approximately 1,137-acres in size. The RSA includes all areas needed for the currently proposed Project improvements and ancillary construction areas (e.g., staging areas, access roads).

Cumulative Impacts

Current and reasonably foreseeable future actions could result in land use activities that could result in impacts on wetlands and other waters. Of the transportation projects within the RSA, the construction timing for Yolo Pavement Rehabilitation Project (T-1) and Richards Boulevard / Olive Drive Circulation Improvements (T-5) could overlap with the Project. Of the development projects within the RSA, the construction timing for River Oaks Phase (D-8), Bell Avenue Warehouses Project (D-9), and Bretton Woods (D-12), and UC Davis Long Range Development Plan (D-13) could overlap with Project construction. Land use and transportation plans may also include planned and programmed projects that overlap with Project construction.

As discussed above, the Project would result in minor temporary impacts on wetlands and other waters. The Project would comply with the requirements of Nationwide Permit No. 14 for Linear Transportation Projects. A preconstruction notification would be required due to the discharge of fill into a wetland. In addition, a Section 401 Water Quality Certification would be obtained from the RWQCB. The Project would include avoidance and minimization measures and would follow all regulatory requirements to reduce impacts on wetlands and other waters. Wetland and aquatic resource delineations were not available for several of the current and reasonably foreseeable future actions. Similar to the Project, all relevant projects would be required to conduct delineations of aquatic resources under the guidance of the USACE, CDFW, and/or the RWQCB, as applicable. If a relevant project would result in impacts on wetlands or other waters, that project would be required to consult with the applicable agencies and implement measures as required to avoid and minimize impacts. Therefore, in conjunction with relevant projects, the Project would not result in a cumulatively considerable impact on wetlands and other waters.

The AMMs provided in the Biological Environment Section 2.3.2 would be implemented to reduce the direct effects of the Build Alternatives on wetlands and other waters. No additional AMMs would be required for cumulative impacts.

2.4.5.17 Animal Species

The analysis in this section is based on the NES prepared for the Project (Caltrans 2023).

Resource Study Area

The RSA for animal species is consistent with the BSA established for the Project, which is located in the counties of Solano, Yolo, and Sacramento and is approximately 1,137-acres in size. The RSA includes all areas needed for the currently proposed Project improvements and ancillary construction areas (e.g., staging areas, access roads).

Cumulative Impacts

Current and reasonably foreseeable future actions could result in land use activities that could result in impacts on animal species. Of the transportation projects within the RSA, the construction timing for Yolo Pavement Rehabilitation Project (T-1) and Richards Boulevard / Olive Drive Circulation Improvements (T-5) could overlap with the Project. Of the development projects within the RSA, the construction timing for River Oaks Phase (D-8), Bell Avenue Warehouses Project (D-9), and Bretton Woods (D-12), and UC Davis Long Range Development Plan (D-13) could overlap with Project construction. Land use and transportation plans may also include planned and programmed projects that overlap with Project construction.

The relevant projects that would be constructed within the Project construction period could result in permanent and temporary impacts on animal species if these projects would require vegetation removal, grubbing and grading, pile driving, operation of vehicles, heavy equipment operation, and earth-moving operations. Each relevant project would be required to implement avoidance, minimization, and mitigation measures as necessary. Therefore, in conjunction with relevant projects, the Project would not result in a cumulatively considerable impact on animal species.

The AMMs provided in the Biological Environment Section 2.3.4 would be implemented to reduce the direct effects of the Build Alternatives on animal species. No additional AMMs would be required for cumulative impacts.

2.4.5.18 Threatened and Endangered Species

The analysis in this section is based on the NES prepared for the Project (Caltrans 2023).

Resource Study Area

The RSA for threatened and endangered species is consistent with the BSA established for the Project, which is located in the counties of Solano, Yolo, and Sacramento and is approximately 1,137-acres in size. The RSA includes all areas needed for the currently proposed Project improvements and ancillary construction areas (e.g., staging areas, access roads).

Cumulative Impacts

Current and reasonably foreseeable future actions could result in land use activities that could result in impacts on threatened and endangered species through degradation of habitat. Of the transportation projects within the RSA, the construction timing for Yolo Pavement Rehabilitation Project (T-1) and Richards Boulevard / Olive Drive Circulation Improvements (T-5) could overlap with the Project. Of the development projects within the RSA, the construction timing for River Oaks Phase (D-8), Bell Avenue Warehouses Project (D-9), and Bretton Woods (D-12), and UC Davis Long Range Development Plan (D-13) could overlap with Project construction. Land use and transportation plans may also include planned and programmed projects that overlap with Project construction.

Detailed biological studies were not available for several of these projects. However, if these relevant projects result in impacts on giant garter snake, valley elderberry longhorn beetle, or Swainson's hawk, there could be a cumulative impact on these species. Similar to the Project, all relevant projects would be required to conduct biological surveys if the project or plan would be developed in an area where sensitive species may occur. If threatened and endangered species or suitable habitat is found within a project site, that project would be required to consult with the applicable agencies and implement measures as required to avoid and minimize impacts. Therefore, in conjunction with relevant projects, the Project would not result in a cumulatively considerable impact on threatened and endangered species.

The AMMs provided in the Biological Environment Section 2.3.5 would be implemented to avoid and minimize impacts on threatened or endangered species. No additional AMMs would be required for cumulative impacts.

Chapter 3 California Environmental Quality Act Evaluation

3.1 Determining Significance Under CEQA

The proposed project is a joint project by the California Department of Transportation (Caltrans) and the Federal Highway Administration (FHWA) and is subject to state and federal environmental review requirements. Project documentation, therefore, has been prepared in compliance with both the California Environmental Quality Act (CEQA) and the National Environmental Policy Act (NEPA). FHWA's responsibility for environmental review, consultation, and any other actions required by applicable Federal environmental laws for this project are being, or have been, carried out by Caltrans pursuant to 23 United States Code Section 327 (23 USC 327) and the Memorandum of Understanding dated December 23, 2016, and executed by FHWA and Caltrans. Caltrans is the lead agency under CEQA and NEPA.

One of the primary differences between NEPA and CEQA is the way significance is determined. Under NEPA, significance is used to determine whether an Environmental Impact Statement (EIS), or a lower level of documentation, will be required. NEPA requires that an EIS be prepared when the proposed federal action (project) *as a whole* has the potential to "significantly affect the quality of the human environment." The determination of significance is based on context and intensity. Some impacts determined to be significant under CEQA may not be of sufficient magnitude to be determined significant under NEPA. Under NEPA, once a decision is made regarding the need for an EIS, it is the magnitude of the impact that is evaluated and no judgment of its individual significance is deemed important for the text. NEPA does not require that a determination of significant impacts be stated in the environmental documents.

CEQA, on the other hand, does require the Department to identify each "significant effect on the environment" resulting from the project and ways to mitigate each significant effect. If the project may have a significant effect on any environmental resource, then an Environmental Impact Report (EIR) must be prepared. Each and every significant effect on the environment must be disclosed in the EIR and mitigated if feasible. In addition, the CEQA Guidelines list a number of "mandatory findings of significance," which also require the preparation of an EIR. There are no types of actions under NEPA that parallel the findings of mandatory significance of CEQA. This chapter discusses the effects of this project and CEQA significance.

3.2 CEQA Environmental Checklist

This checklist identifies physical, biological, social, and economic factors that might be affected by the proposed project. In many cases, background studies performed in connection with the projects will indicate that there are no impacts to a particular resource. A NO IMPACT answer in the last column reflects this determination. The words "significant" and "significance" used throughout the following checklist are related to CEQA, not NEPA, impacts. The questions in

this form are intended to encourage the thoughtful assessment of impacts and do not represent thresholds of significance.

Standard Measures, which can include both design elements of the project, and standardized measures that are applied to all or most Caltrans projects such as Best Management Practices (BMPs) and measures included in the Standard Plans and Specifications or as Standard Special Provisions, are considered to be an integral part of the project and have been considered prior to any significance determinations documented below; see Chapters 1 and 2 for a detailed discussion of these features. All Standard Measures are included in Appendix E. The annotations to this checklist are summaries of information contained in Chapter 2 in order to provide the reader with the rationale for significance determinations; for a more detailed discussion of the nature and extent of impacts, please see Chapter 2. This checklist incorporates by reference the information contained in Chapters 1 and 2.

Where potential impacts are anticipated to be significant, mitigation measures (MMs) will be required, so that impacts may be avoided or reduced to insignificant levels. MMs are included in Appendix C.

3.2.1 Aesthetics

Chapter 2.1.10 provides a comprehensive discussion of the visual/aesthetic resources in the project area. The following is an evaluation of the potential impacts on aesthetics from the Build Alternatives. The No-Build Alternative would not change existing conditions and would not impact aesthetics in the project area and is therefore not discussed further.

a) Have a substantial adverse effect on a scenic vista?

a) Less-than-Significant Impact

Solano County considers views of the Coast Range and nearby hills as scenic vistas. The project does not propose features in Solano County that would substantially impact this vista. No locally or state-designated scenic vistas were identified in Yolo or Sacramento counties from which the project would be visible. Rice Point in the Yolo Bypass Wildlife Area (YWBA) is a wildlife viewing area but is not designated scenic. Some project temporary construction and overhead signage components would have visibility from Rice Point; however, at a distance of 0.5 mile or more, it would not have a substantial effect on views from this location.

The visual impact assessment (VIA) completed for the project (Caltrans 2022a) identified skyline views of downtown Sacramento to be a visual resource for southbound travelers and pedestrians using overpasses within the corridor. The project proposes to introduce new or replaced overhead signage elements that would constitute visual intrusions that could partially obscure the skyline from select vantage points, primarily on the Yolo Causeway and US-50. However, the infrequency of these elements, short duration of visual obstruction, the elevated position of pedestrians and cyclists on bridges above the structures would not result in a substantial visual change on a scenic vista.

The impact on scenic vistas would be less than significant for all Build Alternatives. AMMs 1 through 5 (Appendix C) will be used to avoid or reduce potential project impacts on visual resources and aesthetics associated with the project.

b) Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

b) No Impact

The project corridor is not designated scenic or eligible by Caltrans. For purposes of this analysis, eligible and designated State Scenic Highways, as well as locally designated highways/roadways/corridors near the project were identified and reviewed for potential visual impacts that could result from the project. A summary of each county follows.

3.2.1.1 Solano County

Caltrans has not officially designated any State Scenic Highways in Solano County. However, both I-80 and SR-113 have been designated by the County as local scenic roadways. Temporary construction staging activities are proposed at the I-80/Kidwell Road loop ramp, which is within the County-designated scenic roadway segment of I-80. While tree and vegetation removal would occur as part of the project, it is unlikely that trees would be removed from this staging area since ample staging areas are available within the project corridor; and Caltrans policy is to preserve these resources where feasible.

3.2.1.2 Yolo County

In Yolo County, Caltrans has not officially designated any State Scenic Highways within or near the project limits.

3.2.1.3 Sacramento County

In Sacramento County, the County has designated I-80, I-5 (at US-50), Garden Highway and the Sacramento River as scenic corridors. Sacramento County states that beautifying the freeways makes travel more pleasant and creates a more attractive environment.

As discussed above, the project would have no impact on state-designated or eligible scenic highways.

c) In non-urbanized areas, would the project substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from a publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?

c) Less-than-Significant Impact

The project traverses both non-urbanized and urbanized areas. The Solano County visual assessment unit (VAU) mostly includes agricultural lands uses, and the Yolo County VAU mostly includes wildlife preserve land uses. Therefore, the Solano County VAU and the Yolo County VAU are in non-urbanized areas. The Davis VAU and the West Sacramento VAU mostly include suburban land uses such as residential, commercial, and industrial. Therefore, the Davis VAU and the West Sacramento VAU are in urbanized areas.

Build Alternatives 2a and 2b

Highway users would experience short-term visual impacts due to construction. Short-term impacts would add visual intrusion and disturbances to the corridor and would reduce the intactness and unity of the visual resources in the visual resources study area. Equipment and machinery would be stationed at staging areas within the project limits, and traffic control signage would be used as needed. Temporary visual effects from the construction would be typical of any major corridor improvement.

Build Alternative 2a would expand paving, add managed traffic components, add overhead signage, remove trees, install rock slope treatments, and remove existing median plantings, all of which would degrade the visual character and quality of the site/corridor and its surroundings through the increased urbanized aesthetic change. However, in non-urbanized areas, the project components would be less than in urbanized areas.

Tree and median vegetation removal proposed has the potential to degrade the existing visual character and quality of public views of the site and its surroundings. Trees and bushes would be removed to accommodate off-ramp widening (Davis/Richards Boulevard), bike path extension (at CR 32A in the Yolo VAU), the Park-and-ride facility (east of Harbor Boulevard in West Sacramento), the I-80 connector ramp (West Sacramento), and a drainage facility in West Sacramento. The precise number of trees and bushes proposed to be removed is included in the Natural Environment Study and other documents associated with biological resources prepared for the project.

In the Davis VAU, median oleander vegetation removal would occur over 3.6 miles. Their value as a visual resource is moderate-high, and the visual impacts of their removal would be moderate-high. This value is related to their position within the visual environment and the notable effect they have of breaking down the scale of the roadway for highway users by screening oncoming traffic with a living vegetative visual barrier. They also add a defining element of vegetative character to the VAU and introduce year-long seasonal interest by being evergreen in the winter when most of the vegetation region-wide is deciduous, and by flowering from spring through fall.

Implementation of AMM AES-3 would replace highway plantings and vegetation, including oleander. Landscaping and revegetation plans would be prepared to maintain, repair, and expand corridor landscaping and vegetation where proper setbacks exist and where feasible. Plantings would occur as close to the original impacts as possible. When native, naturally occurring, or specimen trees are removed, replacement plantings would reflect the visual importance of the plantings lost. This measure would reintroduce the lost vegetative character to the corridor which would recover and improve as the plantings mature.

Overhead signage has the potential to degrade the existing visual character and quality of public views of the site and its surroundings. As depicted in several KVs, new overhead signage can reduce the character and quality of a view. The proposed managed traffic components and overhead signage would be consistent with existing similar features in the corridor, but they would also increase the dominance of the freeway in the visual environment of the corridor. However, sensitivity to these additional signs would be moderate for many highway users since they are consistent with expectations of traveling on an interstate, and proposed signage elements are visually comparable with existing signage elements. Implementation of AMM AES-4 would avoid or minimize views of new overhead signage from visually sensitive locations. Where new overhead signage is proposed, refinements to their final location would be considered to avoid or screen direct views from sensitive viewsheds such as those of homeowners and recreationalists.

The rock slope protection strategies proposed have the potential to degrade the existing visual character and quality of public views of the site and its surroundings. However, these impacts would be less than significant. This is primarily in the area of the new bike lane extension at CR-32A that is proposed under Bicycle Option “b” (see KV YO 1). AMM AES-2 would minimize high-contrast rock slope protection by specifying rock colors and/or stains which match or complement the predominant, immediately adjacent landscape color. Alternatively, planted options at this location would be considered.

Many of the project corridor improvements proposed by the project would be largely consistent with the existing visual environment. However, in the Davis VAU (approximately 3.6 miles) the removal of the median vegetation would have the impact of increasing the dominance of the existing highways features. When combined with the increase in signage and paving, the project would alter the character of the roadway. Although the 42-inch-tall concrete median would buffer some of those views, its character is not comparable with the character of the existing vegetation. However, as described previously, implementation of AMMs AES-1 through AES-4 would reduce the magnitude of these effects.

Build Alternative 2b would include the proposed I-80 connector structure in the West Sacramento VAU. The visual condition through this 1-mile segment of the project would be altered by the addition of an elevated, I-80 connector structure which would include significant tree removal (70 trees), grading, new landforms, aerial structures, columns, and walls. Elements on the structure may be visible from adjacent residential areas, though this visibility is expected to be limited by combinations of distance, vegetative screening, and screening of existing built forms such as other homes and existing sound walls. The proposed I-80 connector structure would introduce walls of significant height into the center median of the freeway, which is unprecedented in the VAU, the project corridor, and the broader regional freeway system. This landform and the walls in the center median of the mainline would reduce visual access in segments of the corridor which are currently open. Additionally, existing overhead power lines and structures may need to be relocated or increased in height to maintain required clearances.

Implementation of AMMs would reduce the magnitude of these effects. AMM AES-3 would require replacement trees be planted on the I-80 connector structure’s earthen berm. AMM AES-4 would reduce views of any new overhead signage that may be proposed on the I-80

connector structure. AMM AES-5 would refine the design of the I-80 connector structure to prioritize solutions which reduce visual impacts and limit potential to require power line relocation.

Build Alternatives 3a and 3b

In addition to the impacts noted in Build Alternative 2a, Build Alternative 3a includes the installation of 35 additional overhead signs and read points. These signs would be similar in scale to existing signage; but they would be inconsistent with existing signage color and would result in an increased frequency of signage throughout the corridor. The read points are mounted on poles similar to pole lighting; however, the equipment mounted to them and their pronounced position over the number one lane every 0.5 mile would be a notable and unprecedented visual intrusion. Sensitivity to these additional signs and read points would be moderate for many highway users since they are somewhat consistent with expectations of traveling on an interstate through an urbanized area. For highway neighbors, new overhead signs visible from sensitive locations would degrade the character and quality of the surroundings. Implementation of AMM AES-4 would reduce the magnitude of these effects by requiring that the location of all new overhead signage and read points be reviewed and that sensitive locations are avoided or screened to the extent possible. Furthermore, read points would be integrated into existing and proposed overhead structures where feasible.

Build Alternative 3b would include the proposed I-80 connector structure. Accordingly, with implementation of AMMs AES-3 through AES-5, impacts on visual character and quality in the project area would be reduced. Impacts would be less than significant.

Build Alternatives 4a and 4b

Build Alternatives 4a and 4b propose similar project components within the same project area as Build Alternatives 3a and 3b. Therefore, impacts would be similar to those described for Build Alternatives 3a and 3b.

Build Alternatives 5a and 5b

Build Alternatives 5a and 5b propose similar project components within the same project area as Build Alternatives 3a and 3b. Therefore, impacts would be similar to those described for Build Alternatives 3a and 3b.

Build Alternatives 6a and 6b

Build Alternatives 6a and 6b propose similar project components within the same project area as Build Alternatives 2a and 2b. Therefore, impacts would be similar to those described for Build Alternatives 2a and 2b.

Build Alternatives 7a and 7b

For Build Alternative 7a the visual character and quality of the site and its surroundings would be altered by the project, but to a lesser degree than Build Alternatives 2a–6a since this alternative does not propose impacts on the median vegetation in the Davis VAU nor does it

propose an I-80 connector structure in the West Sacramento VAU (Alternative 7b). Impacts and measures noted above, which Alternative 7a shares with other “a” Alternatives would apply. With implementation of AMMs AES-3 through AES-4, effects would be reduced.

Build Alternative 7b would also include the proposed I-80 connector structure in the West Sacramento VAU. With implementation of AMMs AES-3 through AES-5, effects would be reduced. Impacts would be less than significant.

d) Would the project create a new source of substantial light or glare that would adversely affect day or nighttime public views?

d) Less-than-Significant Impact

For Build Alternatives 2a and 2b through 6a and 6b, temporary sources of light and glare would occur during the construction phase which would include nighttime work. Permanent bridge deck lighting with Type 21 Barrier-Rail-Mounted Lighting Standards would be added to the Bryte Bend Bridge at approximately 150 feet on center along the outside barrier rails. Lighting may also be added at proposed auxiliary lane locations and the new bike lane near CR-32A. The luminary style is set by Caltrans standards for roadway safety and maintenance and has standard features to limit light and glare impacts. In some instances, such as at the Bryte Bend Bridge, new lights may be visible from sensitive public viewing areas, such as residential areas, at angles which bypass standard cut-off and shielding features. This new lighting would introduce views of new sources of light into nighttime public views. These views currently include lights associated with vehicle traffic, though most direct views are shielded by the bridge barrier rail. The level of lighting would not be substantial, and only a few residents would be in proximity to the light.

Where median vegetation is not present, or the current barrier height is being raised by the project, exposure to light and glare from oncoming traffic is anticipated to decrease. However, throughout most of the Davis VAU, the changes proposed by the project to remove center median vegetation would permanently expose users to increased sources of light and glare (except Build Alternatives 7a and 7b). The center median vegetation currently provides a dense evergreen visual buffer through segments of the project corridor. Its removal would create or increase exposure to light and glare associated with vehicles and their headlights. The barrier itself may also become a source of glare on bright sunny days if the concrete color is too light. Glare impacts would occur to highway users during the day and would be primarily associated with sunlight reflecting off vehicles or the barrier rail. Light and glare impacts would also occur in the evening and would primarily be associated with vehicle headlights. Impacts would be variable by time of day, weather conditions, traffic volume, and other factors. Impacts would be experienced primarily and most notably by highway users. The 42-inch center median barrier would provide an effective screen for some highway users where the barrier blocks their line of sight to sources of light and glare. The center median concrete barrier would also provide some screening for lower profile vehicles but less for higher profile vehicles. The barrier would provide reduced screening where variations in any combination of topography, distance, vehicle size, vehicle profile (user position), superelevation, and/or roadway grading create lines of sight greater than its height from the perspective of a given observer. The median vegetation in the Davis VAU is most commonly more than 42 inches, and through some segments of the corridor

exceeds 12 feet; therefore, exposure is anticipated to increase. These conditions would be similar to the immediately adjacent segments of the corridor and are common throughout the interstate system. Although light and glare exposure would increase, the impact would be less than significant. AMM AES-1 would require the concrete color selected reduce glare potential and the impact would remain less than significant.

Build Alternatives 7a and 7b light and glare impacts would be similar to the other Build Alternatives, except that changes to the median are not proposed so impacts in the Davis VAU would be reduced. Impacts would be less than significant.

3.2.2 Agriculture and Forest Resources

Section 2.1.4, Farmlands, provides a comprehensive discussion of the agricultural resources (farmland) in the project area. The project area is not located within areas designated for forest land or timberlands. The following is an evaluation of the potential impacts on agricultural resources from the Build Alternatives. The No-Build Alternative would not change existing conditions and would not impact agricultural resources and is therefore not discussed further.

In determining whether impacts to agricultural resources are significant environmental effects, lead agencies may refer to the California Agricultural Land Evaluation and Site Assessment Model (1997) prepared by the California Department of Conservation as an optional model to use in assessing impacts on agriculture and farmland. In determining whether impacts to forest resources, including timberland, are significant environmental effects, lead agencies may refer to information compiled by the California Department of Forestry and Fire Protection regarding the state's inventory of forest land, including the Forest and Range Assessment Project and the Forest Legacy Assessment Project, and the forest carbon measurement methodology provided in Forest Protocols adopted by the California Air Resources Board.

a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?

b) Conflict with existing zoning for agricultural use, or a Williamson Act contract?

e) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?

a), b), e) No Impact.

As summarized in Section 2.1.3 and shown in Figure 2.1-1, the Land Use Study Area includes several farmland areas, mostly located within unincorporated portions of Sacramento, Yolo, and Solano Counties. Build Alternatives 2a through 7a would occur almost entirely within the Caltrans right-of-way and would include a new permanent easement for construction of a Park-and-Ride Facility. However, because this area is not designated as agricultural, the project would not result in the conversion of any important farmland or Williamson Act land to non-

agricultural uses. Therefore, there would be no impacts on agriculture or forestry using Build Alternatives 2a and b through 7a and b.

c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code Section 12220(g)), timberland (as defined by Public Resources Code Section 4526), or timberland zoned Timberland Production (as defined by Government Code Section 51104(g))?

d) Result in the loss of forest land or conversion of forest land to non-forest use?

c), d) No Impact.

Because the project area is not located within areas designated for forest land or timberlands, there would be no impact on forest land or timberlands resulting from Build Alternatives 2a and 2b through 7a and 7b.

3.2.3 Air Quality

Section 2.6, Air Quality, provides a comprehensive discussion of the air quality in the project area. The following is an evaluation of the potential impacts on air quality from the Build Alternatives. The No-Build Alternative would not change existing conditions and would not impact air quality and is therefore not discussed further.

Where available, the significance criteria established by the applicable air quality management district or air pollution control district may be relied upon to make the following determinations.

a) Conflict with or obstruct implementation of the applicable air quality plan?

a) Less than Significant Impact.

The goal of the project is to improve mobility by implementing managed lane strategies and improving transit access along the corridor, which would reduce traffic congestion, improve traffic flow, reduce travel time, and increase travel time reliability by actively managing recurrent and non-recurrent congestion. Construction associated with the project would result in short-term emissions of criteria pollutants, and long-term operations for Alternatives 2 through 7 are expected to result in increases of criteria pollutants, primarily due to associated increases in VMT.

The project area is in the Sacramento Valley Air Basin (SVAB) and under the jurisdiction of the Sacramento Metro Air Quality Management District (SMAQMD), Yolo-Solano Air Quality Management District (YSAQMD), and Sacramento Area Council of Governments (SACOG). The SMAQMD and YSAQMD are the designated local authorities responsible for monitoring air pollution within the applicable portion of the SVAB, where the project would occur.

Ambient air quality standards have been established at both the state and federal levels. The area meets all federal ambient air quality standards except for ground-level ozone and fine

particulate matter (PM2.5). At the state level, the region meets all ambient air quality standards except those for ground-level ozone and respirable particulate matter (PM10).

The SMAQMD and YSAQMD develop and administer plans and programs, including state implementation plans and redesignation requests, to reduce air pollution levels below the health-based standards established by the state and federal governments. SMAQMD has developed a construction mitigation protocol and standard levels. SMAQMD has also prepared several implementation/maintenance plans and redesignation requests for multiple criteria pollutants. Both the PM2.5 Implementation/ Maintenance Plan and Redesignation Request and the Sacramento Regional 2008 NAAQS 8-Hour Ozone Attainment Plan and Reasonable Further Progress Plan have exhaust and dust control measures for construction-related emissions. The U. S. Environmental Protection Agency (USEPA) and California Air Resources Board (CARB) have adopted rules and emission standards that would reduce diesel particulate matter emissions from on-road and off-road engines for construction equipment.

For project operations, future emissions would generally decrease as older vehicles are replaced by newer vehicles with more stringent emissions and fuel economy standards. Based on the operational period emission data in Table 2.2-9 and Table 2.2-10 in Section 2.2.6 Air Quality, the magnitude of the emissions estimates for each of the Build Alternatives is very similar.

Project implementation will include Standard Measures GHG-1 through GHG-6 (see Appendix E), which would minimize emissions associated with construction activities. As such the project would not conflict with or obstruct implementation of the applicable air quality plan, and impacts would be less than significant.

b) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non- attainment under an applicable federal or state ambient air quality standard?

b) Less-than-Significant Impact

An analysis of the regional emissions that would result from each Build Alternative was conducted using CT-EMFAC 2021 (Version 2) and regional traffic projections, truck percentages, and speeds from the SACOG SACSIM regional travel demand model to compute an emission “burden.” The analysis, presented in in Table 2.2-9 and Table 2.2-10 in Section 2.2, includes the cumulative and indirect travel demand impacts of the project, and shows that the Build Alternatives would have emissions similar to, or lower emissions than those of the No-Build Alternative and lower emissions than the baseline; therefore, impacts would be less than significant.

c) Expose sensitive receptors to substantial pollutant concentrations?

c) Less-than-Significant Impact

The areas adjacent to the project corridor primarily include both single-family and multifamily residential developments, commercial developments (e.g., restaurants, retail spaces, and

offices), and some light industrial uses. Emissions from construction equipment and on-road vehicles powered by gasoline and diesel engines are anticipated. Construction activities in the area may also temporarily increase traffic congestion and slow the speed of traffic, resulting in a temporary increase in on-road emissions. These emissions would be limited to the immediate areas (about 500 feet from the project footprint).

There are a limited number of receptors within 500 feet of the project footprint. Additionally, project construction will include Standard Measures GHG-1 through GHG-6, which would minimize emissions associated with construction activities, and impacts would be less than significant.

While minor alignment shifts in the roadway would occur with implementation of the project, the project would not change the traffic mix. Additionally, all Build Alternatives would improve traffic operations and efficiency, which would help to reduce pollutant emissions, and impacts would be less than significant.

d) Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?

d) Less-than-Significant Impact

The project would not create objectionable odors affecting many people. Minor sources of odors (e.g., diesel engines) would be present during construction of the project. However, because odors would be temporary and would disperse rapidly with distance from the source, construction-generated odors are not anticipated to result in the adverse exposure of receptors to objectionable odorous emissions. Operational odors would be consistent with those under existing conditions, and impacts would be less than significant.

3.2.4 Biological Resources

Chapter 2.3, Biological Environment, provides a comprehensive discussion of the biological resources that occur, or have the potential to occur in the project area. The following is an evaluation of the potential impacts on biological resources from the Build Alternatives.

a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

a) Less-than-significant impact with mitigation.

3.2.4.1 Special-Status Plant Species

As discussed in Chapter 2.3, Biological Environment, during the site surveys conducted in May 2021 and July 2022, none of the 25 special-status plant species that have potential to occur in the project area were observed. Standard Measure BIO-4 has been incorporated into the project

to prevent the potential for the spread or introduction of non-native plants in the biological study area (BSA).

During construction, vegetation would be cleared only where necessary, and grubbing would be minimized to the maximum extent possible as required by Standard Measure BIO-11. Once construction is completed, disturbed areas would be replanted, reseeded, and restored in accordance with Standard Measure BIO-4. As such, impacts on special-status plant species would be less than significant for Build Alternatives 2a and 2b through 7a and 7b.

3.2.4.2 Special-Status Animal Species

During the site surveys conducted throughout 2021, Swainson's hawk, white-tailed kite, and northern harrier were identified in the BSA during the protocol-level Swainson's hawk and burrowing owl surveys. One bald eagle was incidentally observed flying over the BSA during the field surveys. None of the other 20 special-status animal species that have potential to occur in the project area were observed. However, the project area contains suitable habitat for these species; therefore, there is potential for these special-status animal species to occur within the project footprint.

Valley Elderberry Longhorn Beetle

The project would result in direct and indirect impacts on valley elderberry longhorn beetle (VELB). Standard Measures BIO-1, BIO-3, and BIO-4 have been incorporated into the project that would help to avoid adverse effects on VELB; however, impacts could be significant. AMMs BIO-16 through BIO-21 would further minimize impacts on VELB and impacts would be less than significant for Build Alternatives 2a and 2b through 7a and 7b.

Giant Garter Snake

Approximately 4.265 acres of giant garter snake (GGS) habitat would be permanently impacted. Permanent habitat impacts would result from the bike path improvements. Approximately 3.669 acres of temporary habitat impacts would result from installation of the fiber-optic line, GSRD installation, bike path improvements, and staging areas. Direct impacts on GGS could result from the increase in hazardous materials, habitat loss, and the crushing of individuals from construction equipment. Indirect impacts could result from removal of terrestrial vegetative cover, which could increase microclimate temperatures and the potential introduction of invasive plant species by construction equipment, which would reduce potential habitat for the species. Standard Measures BIO-1, BIO-2, BIO-3, and BIO-4 have been incorporated into the project that would help to avoid adverse effects on GGS; however, impacts could be significant. AMMs BIO-22 through BIO-30 would be implemented to further minimize impacts on GGS and impacts on GGS would be reduced to less than significant for Build Alternatives 2a and 2b through 7a and 7b.

Western Pond Turtle

Construction activities are not likely to impact breeding and nesting activities directly or indirectly since construction would occur outside the turtle nesting season; and certain construction

activities, such as vegetation removal and soil compaction stemming from grading, would not affect areas where potential nesting habitat is present (e.g., open water and valley foothill riparian habitats along Putah Creek). Standard Measures BIO-1, BIO-2, BIO-3, and BIO-4, listed in Appendix E, would minimize potential impacts to western pond turtle. In addition, AMM BIO-4 would allow for construction to cease until western pond turtles have left the work area, and AMM BIO-5 would require species-specific training for workers and impacts on western pond turtle would be reduced to less than significant for Build Alternatives 2a and 2b through 7a and 7b.

Burrowing Owl

Suitable burrowing owl habitat was identified during protocol-level surveys. However, no active burrowing owl nests were observed during the nesting season surveys. None of the potential burrowing owl habitat identified is located within the permanent construction footprint and approximately 0.03 acre of concentrated burrows is located within the staging area adjacent to Kidwell Road at the west end of the BSA. However, if burrowing owls are present within the 500-foot buffer during construction activities, the project could result in temporary displacement due to project activities affecting potential burrow sites. Although no burrowing owl were observed during the 2021 nesting season, burrowing owl have a potential to nest in the areas mapped as suitable habitat and concentrated burrows as well as other areas, depending on-site conditions, in the future. Standard Measure BIO-1 requires the species to be covered in the Worker Environmental Awareness Training, which would help to avoid impacts on burrowing owl, but impacts could be significant. AMMs BIO-7 through 9 would be implemented, which require preconstruction surveys for burrowing owl and the implementation of buffers if active burrows are identified. As such, impacts on burrowing owl would be less than significant for Build Alternatives 2a and 2b through 7a and 7b.

Swainson’s Hawk

Twenty-four active Swainson’s hawk nests were observed within 0.5-mile of the BSA during the protocol-level surveys in 2021. The project could result in a temporary and permanent loss of foraging habitat and displacement of nesting Swainson’s hawk (SWHA) due to project activities. Direct disturbance from construction activities, such as pile driving, operation of vehicles, heavy equipment operation, and earth-moving operations around active nests could result in stress, injury, or mortality to individuals. The project would have temporary impacts on foraging habitat through the staging of equipment, temporary construction access, and other construction activities. Permanent loss of foraging habitat would result from the proposed Park-and-Ride Facility, proposed bike path improvements, connector ramp, and other road widening. About 10.0 acres of Swainson’s hawk foraging habitat consisting of grassland and croplands (hayfield) would be permanently lost. Based on current project designs and the protocol survey results, no trees with active Swainson’s hawk nests have been slated for removal. Standard Measures BIO-1 and BIO-2 have been incorporated into the project that would help to avoid adverse effects on Swainson’s hawk; however, impacts could be significant. Implementation of AMMs BIO-31 through BIO-32 would minimize impacts on Swainson’s hawk and as such, impacts on Swainson’s hawk would be less than significant for Build Alternatives 2a and 2b through 7a and 7b.

Western Yellow-Billed Cuckoo and Least Bell's Vireo

Western yellow-billed cuckoo and least Bell's vireo could use the riparian habitat surrounding Putah Creek, Sacramento River, and portions of the Yolo Bypass within and adjacent to the BSA as migratory stopover habitat. The suitable migratory stopover and foraging habitat (i.e., riparian vegetation) for western yellow-billed cuckoo and least Bell's vireo is located within existing Caltrans right-of-way where there are frequent anthropogenic disturbances from vehicles. The riparian vegetation within these areas would not be removed and the activities proposed in the staging areas would be similar to those already occurring in the area (e.g., high volumes of traffic and other disturbances associated with the highway). Therefore, there will be no impact on western yellow-billed cuckoo or least Bell's vireo.

Additionally, Standard Measures BIO-1 and BIO-2 have been incorporated into the project, which will further minimize potential impacts on migratory stopover and foraging habitat for western yellow-billed cuckoo and least Bell's vireo. As such, impacts on western yellow-billed cuckoo and least Bell's vireo would be less than significant for Build Alternatives 2a and 2b through 7a and 7b.

Tricolored Blackbird and Yellow-Headed Blackbird

Nesting habitat identified for tricolored blackbird and yellow-headed blackbird within and adjacent to the BSA is minimal and in small, isolated patches. The most suitable nesting habitat identified during the assessment is the patch of willows, labeled as valley foothill riparian, at the northwest corner of the Kidwell Road interchange at the western end of the BSA. Both species typically nest in more extensive patches of vegetation. With limited habitat available, the likelihood of tricolored blackbird or yellow-headed blackbird nesting within or adjacent to the BSA is low. However, if nesting tricolored blackbird or yellow-headed blackbird are present within or adjacent to construction areas, they could be disturbed and abandon their nests.

Standard Measures BIO-1 and BIO-2 have been incorporated into the project which will help to minimize adverse effects on tricolored blackbird and yellow-headed blackbird; however, impacts could be significant. AMMs BIO-6 would minimize impacts on tricolored blackbird and yellow-headed blackbird, and as such, impacts on tricolored blackbird and yellow-headed blackbird would be reduced to less than significant for Build Alternatives 2a and 2b through 7a and 7b.

Raptors, Other Nesting Birds, and Migratory Birds

Tree and vegetation removal would result in a temporary loss of nesting and foraging habitat for raptors, nesting birds, and migratory birds. Tree and vegetation removal may also affect foraging success, food sources for herbivorous birds, and reduction in prey density for carnivorous or insectivorous birds. Following completion of construction, trees would be replanted, and the surrounding habitat would be restored. Standard Measure BIO-2 would require preconstruction nesting surveys and the establishment of buffers for nesting raptors and all other birds. AMM BIO-2 would require minimizing the amount of riparian vegetation removed. Standard Measure BIO-4 require replanting, reseeding, and restoration of disturbed areas along with minimizing vegetation removal. Standard Measures would minimize the temporary impact from the loss of nesting and foraging habitat; however, impacts on raptors and migratory birds

could potentially be significant. AMM BIO-10 would require consultation with California Department of Fish and Wildlife (CDFW) if creating a no disturbance buffer around a white-tailed kite or northern harrier nest is not practicable. AMM BIO-11 would prohibit activities that would result in take of a white-tailed kite nest. Implementation of Standard Measure BIO-2, Standard Measure BIO-4, AMM BIO-2, AMM BIO-10, and AMM BIO-11 would further reduce impacts and as such, impacts on raptors, other nesting birds, and migratory birds would be less than significant for Build Alternatives 2a and 2b through 7a and 7b.

Special-Status Bat Species

Construction would lead to temporary increases in noise, dust, and human disturbance. The project would result in temporary displacement of bats and temporary loss of bat roosting habitat due to culvert removal and tree removal. Standard Measures BIO-1 and BIO-2 have been incorporated into the project and would reduce impacts on special-status bat species; however, impacts could be potentially significant. Implementation of AMM BIO-12 would require trees to be removed after young bats are volant to avoid impacts to maternity colonies, AMM BIO-13 would require preconstruction bat surveys, AMM BIO-14 would require a bat protection plan, and AMM BIO-15 minimizes impacts to bats from structural changes to potential roosting habitat.

Standard Measure BIO-4 would also be required to further reduce impacts on special-status species. Once construction is completed, all disturbed areas will be restored to the maximum extent feasible. Therefore, impacts on special-status animal species would be less than significant with mitigation incorporated. As such, impacts on special-status bats would be less than significant for Build Alternatives 2a and 2b through 7a and 7b.

b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?

b) Less-than-significant impact.

Impacts on CDFW sensitive natural communities would only occur on those within the valley foothill riparian and valley oak woodland California Wildlife Habitat Relationships (CWHR) communities. Temporary and permanent impacts on CDFW sensitive natural communities and the riparian communities considered sensitive by the U.S. Army Corps of Engineers (USACE) and the Regional Water Quality Control Board (RWQCB) are summarized in Table 3.2-1. Impacts are expected to be similar between all build alternatives. Impacts on riparian habitat and sensitive natural communities would be minimal and would therefore be less than significant for Build Alternatives 2a and 2b through 7a and 7b.

Table 3.2-1. Summary of Sensitive Natural Community Approximate Impacts within the Biological Study Area

CWHR Community Type	CDFW Sensitive Natural Community	Temporary Impact (Acres)	Permanent Impact (Acres)
Valley Foothill Riparian	Oregon ash groves California sycamore woodlands Fremont cottonwood forest and woodland	1.87	—
Valley Oak Woodland	Valley oak woodland and forest	0.51	0.14
Annual/Perennial Grassland	Gum plant patches	0.007	—
Total	—	**2.39**	**0.14**

c) Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

c) Less-than-significant impact.

The project includes roadway improvements such as replacing culverts and installing a fiber-optic line and vaults. As discussed in Section 2.3.2, Wetlands and Other Waters, 0.12 acre (58.296 linear feet) of jurisdictional waters is estimated to be temporarily affected, and approximately 0.055 acre (377.98 linear feet) is estimated to be permanently affected by the project. Prior to construction, Caltrans would obtain a Section 404 permit from the USACE, a Section 401 Water Quality Certification from the RWQCB, which would require the purchase of compensatory mitigation for the permanent loss of waters. Caltrans would also obtain a Section 1602 Lake and Streambed Alteration Agreement from CDFW.

Also, Standard Measures BIO-1, BIO-3, and BIO-4 have been incorporated into the project, including measures to minimize water quality and erosion during construction, as such impacts would be less than significant. Further, with incorporation of AMMs BIO-1, BIO-2, and BIO-3, impacts on aquatic resources would be minimized; and the project would not result in substantial adverse effects to aquatic resources.

d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

d) Less-than-significant impact with mitigation.

The project is located in areas with high levels of anthropogenic disturbances within and near the Caltrans right-of-way. The project would not remove a substantial amount of habitat. The project would not interfere with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors or impede the use of native wildlife nursery sites and impacts would be less than significant.

Further, bat maternity roosts are located within the project area. With implementation of Standard Measures BIO-1 and BIO-2 as well as AMM BIO-12 through BIO-15, the project would not result in substantial adverse effects to bat maternity roosts.

e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

e) Less-than-significant impact

Tree ordinances and policies protecting trees are in place in the City of Sacramento, City of West Sacramento, City of Davis, and Sacramento County. Caltrans will comply with local tree ordinances.

f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

f) Less-than-significant impact with mitigation.

The project is located within the boundaries of the Yolo Habitat Conservation Plan/Natural Community Conservation Plan (HCP/NCCP) and abuts the boundaries of the Natomas Basin Habitat Conservation Plan (NBHCP). With implementation of Standard Measures BIO-1 through BIO-4 and AMMs BIO-1 through BIO-32, construction and operation of the project would not conflict with either HCP/NCCP or other approved local, regional, or state habitat conservation plans, and there would be no impact under these criteria.

The following goals and policies under the Yolo HCP/NCCP Conservation and Open Space Policies would be applicable to the project:

City of Davis

Goal HAB 1: Identify, protect, restore, enhance, and create natural habitats. Protect and improve biodiversity consistent with the natural biodiversity of the region.

- **Policy HAB 1.1.** Protect existing natural habitat areas, including designated Natural Habitat Areas.

City of West Sacramento

Goal NRC-2: To protect sensitive native vegetation and wildlife communities and habitats in West Sacramento.

- **NRC-2.7 Rare, Threatened, & Endangered Species Protection.** The City shall preserve rare, threatened, and endangered species by ensuring that development does not adversely affect such species or by fully mitigating adverse effects. For developments where adverse impacts cannot be mitigated, the City shall not approve the project.

- **NCR-2.9 No Net Loss.** The City shall require new development to ensure no net loss of State and Federally regulated wetlands, other waters of the United States (including creeks, rivers, ponds, marshes, vernal pools, and other seasonal wetlands), and associated functions and values by regulating development in and near these habitats and promoting projects that avoid sensitive areas. Where habitat loss is unavoidable, the City shall require replacement consistent with State and Federal regulations protecting wetland resources.

- **NCR-2.10 Wetland and Riparian Habitat Protection.** The City shall seek to minimize the loss or degradation of wetland and riparian habitats at the following sites: Lake Washington and associated wetlands, Bee's Lake and associated riparian woodlands, riparian woodlands along the Sacramento River north of the I Street Bridge and south of the barge canal, and riparian woodlands along the Deep Water Ship Channel and the Yolo Bypass.

County of Yolo

Goal CO-2. Biological Resources. Protect and enhance biological resources through the conservation, maintenance, and restoration of key habitat areas and corresponding connections that represent the diverse geography, topography, biological communities, and ecological integrity of the landscape.

- **Policy CO-2.1.** Consider and maintain the ecological function of landscapes, connecting features, watersheds, and wildlife movement corridors.

- **Policy CO-2.3.** Preserve and enhance those biological communities that contribute to the county's rich biodiversity including blue oak and mixed oak woodlands, native grassland prairies, wetlands, riparian areas, aquatic habitat, agricultural lands, heritage valley oak trees, remnant valley oak groves, and roadside tree rows.

- **Policy CO-2.9.** Protect riparian areas to maintain and balance wildlife values.

- **Policy CO-2.10.** Encourage the restoration of native habitat.

- **Policy CO-2.13.** Promote the use of oak woodlands conservation banks to mitigate for losses due to development impacts and to provide carbon sequestration for greenhouse gas emissions under applicable State programs.

- **Policy CO-2.14.** Ensure no net loss of oak woodlands, alkali sinks, rare soils, vernal pools or geological substrates that support rare endemic species, with the following exception. The limited loss of blue oak woodland and grasslands may be acceptable, where the fragmentation of large forests exceeding 10 acres is avoided, and where losses are mitigated.

- **Policy CO-2.16.** Existing native vegetation shall be conserved where possible and integrated into new development if appropriate.

- **Policy CO-2.30.** Protect and enhance streams, channels, seasonal and permanent marshland, wetlands, sloughs, riparian habitat and vernal pools in land planning and community design.

- **Policy CO-2.31.** Protect wetland ecosystems by minimizing erosion and pollution from grading, especially during grading and construction projects.

- **Policy CO-2.34.** Recognize, protect, and enhance the habitat value and role of wildlife migration corridors for the Sacramento River, Putah Creek, Willow Slough, the Blue Ridge, the Capay Hills, the Dunnigan Hills and Cache Creek.

- **Policy CO-2.37.** Where applicable in riparian areas, ensure that required State and Federal permits/approvals are secured prior to development of approved projects.

- **Policy CO-2.41.** Require that impacts to species listed under the State or Federal Endangered Species Acts, or species identified as special-status by the resource agencies, be avoided to the greatest feasible extent. If avoidance is not possible, fully mitigate impacts consistent with applicable local, State, and Federal requirements.

- **Policy CO-2.42.** Projects that would impact Swainson's hawk foraging habitat shall participate in the Agreement Regarding Mitigation for Impacts to Swainson's Hawk Foraging Habitat in Yolo County entered into by the CDFG and the Yolo County subsequent adopted mitigation requirements consistent with applicable local, State, and federal requirements.

3.2.5 Cultural Resources

Section 2.1.11, Cultural Resources, provides a comprehensive discussion of the cultural resources in the project area. The following is an evaluation of the potential impacts on cultural resources from the Build Alternatives. The No-Build Alternative would not change existing conditions and would not impact cultural resources and is therefore not discussed further.

a) Cause a substantial adverse change in the significance of a historical resource pursuant to in §15064.5?

a) Less-than-significant impact.

A Reclamation District (RD) 900 canal was identified within the area of potential effect (APE) and was assumed eligible for inclusion in the National Register of Historic Places (NRHP) for the purpose of this undertaking, under Criterion A, as a large linear resource associated with historic themes of agriculture/irrigation and land reclamation in the Sacramento Valley.

Construction would result in temporary visual impacts, increased noise levels, and increased air pollutants such as dust and particulate matter due to excavation, grading, hauling, and other ground-disturbing activities. In addition, all "B" Build Alternatives would include pile driving for construction of the I-80 connector structure, which would be undertaken for installation of footings. Each cast-in-place drilled footing would be excavated to a depth of up to 40 feet.

However, Caltrans determined that construction of the project, regardless of alternative would not adversely effect the RD 900. The Finding of No Adverse Effect Document was submitted to the State Historic Preservation Officer (SHPO) in November 2021. The SHPO Determination of Eligibility and Finding of No Adverse Effect concurrence were received September 30, 2021 and January 12, 2022, respectively (Appendix K).

Caltrans, pursuant to Section 106 PA Stipulation X.B.2, found that there will be no adverse effect. The undertaking will not destroy or alter any contributing feature of RD 900 and will not affect the resource's integrity or ability to convey its historical significance.

The overall impact for the project, regardless of alternative, was determined to be less than significant.

b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5? or

c) Disturb any human remains, including those interred outside of dedicated cemeteries?

b), c) Less-than-significant impact.

Seven built environment resources were identified within the APE: MR1, MR2, MR3, MR4, MR5, MR6, and MR7. Caltrans PQS evaluated the built environment resources and determined that they were not eligible for inclusion in the NRHP/CRHR. On September 30, 2021, Caltrans received concurrence from SHPO that the seven built environment resources were ineligible (Appendix K).

Project construction would create subsurface disturbances that could result in damage to or destruction of previously undiscovered subsurface archaeological deposits or unmarked burials. Although all the areas of construction and access roads have been subject to the cultural resources survey, the potential remains for previously unidentified archaeological remains to be discovered below the visible ground surface. If cultural materials are discovered during construction, all earth-moving activity within and around the immediate discovery area would be diverted until a qualified archaeologist can assess the nature and significance of the find as outlined in Standard Measure CR-3. Standard Measure CR-4 outlines requirements in the event human remains are discovered. If human remains are discovered, all work within 60 feet of the discovery would halt and Caltrans' Cultural Resource Studies office would be called. Caltrans' Cultural Resources Studies Office Staff would assess the remains and, if determined human, would contact the County Coroner as per Public Resources Code (PRC) Sections 5097.98, 5097.99, and 7050.5 of the California Health and Safety Code. If the Coroner determines the remains to be Native American, the Coroner will contact the Native American Heritage Commission who would then assign and notify a Most Likely Descendant. Caltrans would consult with the Most Likely Descendant on respectful treatment and reburial of the remains. Further provisions of PRC 5097.98 are to be followed as applicable.

With the implementation of Standard Measure CR-3 and CR-4, Build Alternatives 2a and 2b through 7a and 7b would have a less-than-significant impact.

AB52 consultation was initiated in 2020 with California Native American tribes included on the Native American Heritage Commission's (NAHC) list of groups and individuals that may have a traditional or cultural affiliation with the geographic area of the project. Tribes that have requested that they be included on the NAHC list were sent written notification of the project on June 4, 2020. The record of correspondence, including a consultation log are presented in Appendix L.

3.2.6 Energy

Section 2.2.8, Energy provides a comprehensive discussion of energy resources. The following is an evaluation of the potential impacts on energy from the Build Alternatives. The No-Build Alternative would not change existing conditions and would not impact energy and is therefore not discussed further.

a) Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?

a) Less-than-significant impact with mitigation.

The project would result in short-term energy consumption related to related to manufacturing of construction materials, the use of construction equipment that requires petroleum fuels, and the use of construction workers' motor vehicles as they travel to and from the site. Construction is anticipated to take approximately 24 to 42 months to complete, depending on the Build Alternative. Thus, construction-related energy consumption would be finite and limited and would have an incremental impact on area energy supplies. As indicated above, energy use associated with project construction under Build Alternatives is conservatively estimated to result in the short-term consumption of 370,520 gallons of diesel and 164,688 gallons of gasoline from construction equipment. This represents a small demand on local and regional fuel supplies that would be easily accommodated, and this demand would cease once construction is complete. Moreover, construction-related energy consumption would be temporary and not a permanent new source of energy demand, and demand for fuel would have no noticeable effect on peak or baseline demands for energy.

Indirect energy consumption would result from traffic delays due to construction. The project's Transportation Management Plan (TMP), as required per Standard Measure TT-1, would reduce construction-related traffic impacts. The TMP would help manage traffic congestion and provide signage to affected residents and businesses if temporary closures or detours are warranted during construction. Compared with direct energy use by construction vehicles and equipment, indirect energy use due to construction-related traffic delays would be minimal and would be reduced with implementation of the TMP. Additionally, AMM Energy-1 would be implemented to help conserve energy during construction, which would further reduce impacts. For indirect energy, the project would incorporate the use of energy efficient lighting, such as LED traffic signals and streetlights, to the extent feasible. LED lights consume 10 percent of the electricity of traditional lights.

The project would increase capacity, and thus add more traffic using the managed lanes and associated I-5/US 50 interchange and I-80/US 50 connectors, so a net increase in energy consumption is anticipated for Build Alternatives 2a and 2b through 6a and 6b. No new lanes would be constructed as part of Build Alternatives 7a and 7b and thus there would be no increase in capacity. Furthermore, intelligent transportation system (ITS) elements within the project limits would give travelers information about special events such as traffic congestion, accidents, and other incidents that may impact traffic flow on a specific highway segment. Such ITS would save energy by notifying vehicles to take alternative routes, limit travel speed, warn of duration and location of the incidents, or inform of the traffic conditions. Therefore, the project would not result in an inefficient, wasteful, and unnecessary consumption of energy and impacts would be less than significant with mitigation incorporated.

b) Conflict with or obstruct a state or local plan for renewable energy or energy efficiency?

b) Less-than-significant impact.

The project is within the jurisdiction of the SACOG, which is the Regional Transportation Planning Agency for Sacramento, Sutter, Yolo, and Yuba Counties. The 2020 MTP identifies a path for improving air quality, preserving open space and natural resources, and helping California achieve its goal to reduce GHG emissions that contribute to climate change (SACOG 2019). The regional reduction target for passenger vehicle GHG emissions per person from 2005 levels for SACOG is 19 percent by 2035 (ARB 2019c). The project is included in the SACOG MTP/SCS 2020.

Estimates of energy consumption indicated that the Build Alternatives 2 and 3 result in a minimal increase less than 1 percent in energy consumption and Build Alternatives 4-7 would result in a nominal decrease ranging between 0.8 to 7 percent in energy consumption in opening year 2029. Although there is a modeled increase in VMT identified in Section 2.2.8, Energy, during operation of the project over the long-term, newer and more fuel-efficient vehicles and electric vehicles would enter the fleet, resulting in an overall lower potential for an increase in energy consumption due to vehicle traffic. Additionally, as noted above, the project would incorporate energy efficient lighting, to the extent feasible, and ITS elements that would save energy. The project would implement managed lanes to manage traffic congestion, accommodate travel demands, and improve modality and travel time reliability. By helping to provide a continuous managed lane system, the project, combined with other in-progress and proposed managed lane projects, would provide reliable travel times, and help contribute to the completion of the regional transportation network envisioned in the SACOG MTP/SCS. Energy consumption during project construction would be temporary and minimized to the maximum extent practicable. Operation of the project would not conflict with a state or local plan for renewable energy or energy efficiency. Project construction would not conflict with a state or local plan for renewable energy or energy efficiency.

3.2.7 Geology and Soils

Section 2.2.3, Geology, Soils, Seismic, Topography, provides a comprehensive discussion of geology and soil resources. In addition, the section provides a comprehensive discussion of the paleontological resources that occur in the project area. The following is an evaluation of the potential impacts on geology and soils and paleontological resources from the Build Alternatives. The No-Build Alternative would not change existing conditions and would not impact geology and soils and is therefore not discussed further.

a) Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.

a)i) No Impact.

The potential for surface fault rupture at the site is absent since there are no known faults of Holocene or younger age that fall within 1,000 feet of the project limits, or trend toward the project limits, nor does the project limits fall within an Alquist-Priolo Fault Zone. Therefore, there would be no impact under these criteria for Build Alternatives 2a and 2b through 7a and 7b.

ii) Strong seismic ground shaking?

a)ii) Less-than-significant impact.

The project is not located within an Alquist-Priolo Fault Zone. Construction of the project would be designed, engineered, and built in accordance with applicable standards and within the recommended ground motion parameters for each section described in the Geotechnical Report. With implementation of these design, engineering, and building standards, impacts related to ground shaking would be less than significant for Build Alternatives 2a and 2b through 7a and 7b.

iii) Seismic-related ground failure, including liquefaction?

a)iii) Less-than-significant impact with mitigation.

Soil liquefaction can occur when saturated, loose to semi-compact, granular soils, or specifically defined cohesive soils are subjected to ground shaking sufficient to increase pore pressures to trigger liquefaction. In general, liquefaction hazard is most severe within the upper 50 feet of the ground surface.

The depth of groundwater varies throughout the project area due to variations in ground surface elevations and groundwater conditions. Based on groundwater depths and elevations, depth of groundwater decreases from west to east along the project route. Measured groundwater during

the April 2021 and August 2020 subsurface investigation and review of the existing log of test borings show that the groundwater depth is shallow in most of the project area, except the west section where groundwater was measured to be deeper than 25 feet.

The groundwater depth is shallow in most of the project area, and the soil throughout comprises clayey or fill material with layers of medium dense to dense silts and sands. There are also isolated thin layers of saturated, loose, granular soils present. Combined, these factors indicate the potential for liquefaction. There is low potential for seismic activity to occur during construction due to the distance from active faults. Seismic shaking creates opportunities for liquefaction, which could impact construction workers during construction, or result in safety issues to people and structures because of soil erosion, subsidence, expansive soils, corrosive soils, surface fault rupture, seismic shaking, liquefaction, and landslides.

Standard Measures GS-1 and WQ-1 through WQ-3 have been incorporated into the project and would be implemented during construction to minimize soil erosion or the loss of topsoil. Additionally, AMM GEO-2 would reduce potential impacts from construction-related to worker safety and AMM GEO-3 would help ensure any new or modified structure is designed and constructed to current standards, including seismic design standards, and includes consideration of liquefaction potential in the design of foundation and retaining systems. With implementation of these Standard Measures and AMMs, impacts related to liquefaction are less than significant for all Build Alternatives.

iv) Landslides?

a)iv) No Impact.

The project is not located in an area that has historically been prone to landslides. All earthwork will be in conformance with Section 19 of the Caltrans 2018 Standard Specifications, which reduces the potential for impacts related to landslides for all Build Alternatives.

b) Result in substantial soil erosion or the loss of topsoil?

b) Less-than-significant impact.

Construction of Build Alternatives 2a and 2b through 7a and 7b would involve land-disturbing activities such as clearing and grading, excavation, and temporary staging or stockpiling of materials. Build Alternatives 2a and 2b through 7a and 7b could result in disruptions, displacements, compaction, or overcrowding of on-site soils, and changes in topography or ground surface features that could result in wind or water erosion of on-site or off-site soils.

In accordance with Standard Measure WQ-1, Caltrans would implement a Stormwater Pollution Prevention Plan (SWPPP) during construction which would include implementation of site BMPs to avoid and reduce potential impacts related to erosion or siltation. The SWPPP would include BMPs to protect sensitive areas. With implementation of Standard Measure WQ-1, potential construction and operational impacts on erosion, siltation, and runoff would be minimal and impacts under Build Alternatives 2a and 2b through 7a and 7b would be less than significant.

c) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse?

c) Less-than-significant impact with mitigation.

The project is not in an Alquist-Priolo Fault Zone or in an area that has historically been prone to landslides, lateral spreading, or subsidence. However, soil characteristics and shallow groundwater within the project area contribute to the potential for liquefaction. AMM GEO-3 would help ensure any new or modified structure is designed and constructed to current standards, including seismic design standards, and includes consideration of liquefaction potential in the design of foundation and retaining systems. With implementation of these design, engineering, and building standards, impacts related to liquefaction would be less than significant for Build Alternatives 2a and 2b through 7a and 7b.

d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?

d) Less-than-significant impact.

Expansive soils are not present within the project area. New embankment fill would be required for the bike pathway extension from I-80 along the Yolo Causeway to connect to CR-32A for Build Alternatives 2a and 2b. The Build Alternative 2b connector structure would include a retaining wall on either side and would travel underneath the existing eastbound connector from US-50 to I-80. Accordingly, the connector structure would require new embankment fill. The underlining clay layer which extends up to 16 to 20 feet below the original ground ranges in consistency from medium stiff to very stiff and is less susceptible to consolidation settlements. However, the proposed large embankment fill consolidation settlement could be considerable. All earthwork on the connector structure would be done in conformance with Section 19 of the 2018 Standard Specifications and would follow the recommendations associated with construction settlement in the geotechnical analyses (AMM GEO-3). With implementation of these design and building specifications, impacts related to expansive soil would be less than significant for all Build Alternatives.

e) Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?

e) No Impact.

No on-site wastewater treatment systems are proposed. There would be no impacts to waste water disposal systems for Build Alternatives 2a and 2b through 7a and 7b.

f) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

f) Less-than-significant impact with mitigation.

Caltrans uses a tripartite system to rank the risk of encountering significant fossil resources: no, low, and high risk. If significant fossil resources have been previously discovered within a geologic unit (formation), then that formation in its entirety is considered high risk. Searches of the University of California, Berkeley, Museum of Paleontology, and the PaleoBiology databases were performed and returned records of numerous fossil collections from the vicinity of the project in both Solano and Yolo Counties. In the immediate vicinity of the project boundary, significant fossil discoveries have occurred in formations. While the discoveries were not found at the surface directly beneath the project activities, the depth of excavation required for structures work increases the risk of encountering these formations.

Build Alternative 2b proposes pile driving during construction for installation of connector ramp footings to about 40 feet deep. Such activities would be deep enough to reach potentially unknown sensitive paleontological resources. In addition, foundation work for signs, structures, underground utilities, and culvert/drainage installations deeper than 4 feet could also encounter sensitive paleontological resources. Standard Measures GS-2, Unanticipated Discovery of Paleontological Resources, has been incorporated into the project that outlines actions to be taken in the event of a paleontological discovery during construction. If unanticipated paleontological resources are discovered during construction, they would not be disturbed. Work within a 60-foot radius of the discovery would stop; the area would be secured; and the work would not resume until appropriate measures are taken. However, the inadvertent discovery of a unique paleontological resource during construction could be significant.

AMM PALEO-1 would require preparation of a Paleontological Evaluation Report (PER) during the design phase and AMM PALEO-2 would require that a Paleontological Mitigation Plan be prepared and executed during project construction in areas of high sensitivity. In addition, paleontological construction monitoring would be required in areas with high paleontological sensitivity with implementation of AMM PALEO-3. With implementation of AMMs PALEO-1 through PALEO-3, construction of Build Alternatives 2a and 2b would not have significant impact on paleontological resources.

3.2.8 Greenhouse Gas Emissions

Chapter 3.4, Climate Change, provides a comprehensive discussion of greenhouse gas. The following is an evaluation of the potential impacts on greenhouse gas emissions from the Build Alternatives. The No-Build Alternative would not change existing conditions and would not impact greenhouse gas and is therefore not discussed further.

a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

a) Less-than-significant impact.

A quantitative analysis of daily CO_2 emissions was performed using the Caltrans CT-EMFAC2021. GHG emissions and VMT comparisons were calculated for the Build Alternatives the existing year (2019), in opening year (2029), and design year (2049). As anticipated with new fleet and electric vehicles penetration, in design year 2049, GHG emissions of the Build Alternatives were assessed to be less, with the greatest reduction being Build Alternative 7a

with 6.3 percent difference and the least reduction being Build Alternative 2a with 2.6 percent difference. Operational emissions would be less than significant.

GHG emissions would be generated during construction and this impact would be less than significant due to implementation of standard measures. As discussed in Section 2.2.9, Energy, the project would implement measures to reduce construction emissions, such as using newer, more energy efficient equipment, where feasible, and promotion of employee carpooling. As noted in Section 2.2.9, Energy, a TMP would be required to reduce construction-related traffic impacts and manage traffic congestion. GHG emissions impacts would be less than significant with the implementation of the Standard Measures (Appendix E) already incorporated into the project. GHG Standard Measures would include GHG-1: Comply with local regulations, GHG-2: Idling restrictions, GHG-3: Comply with CARB regulations, GHG-4: Use of a TMP, GHG-5: Revegetation, GHG-6: Maintain pedestrian and bicycle access.

b) Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

b) Less-than-significant impact.

Section 3.2.8 question “a” and Section 3.2.6, describes the various plans, policies, and regulations adopted for the purpose of reducing the emissions of greenhouse gases that are applicable to the project and describes how the project would be consistent. By helping to provide a continuous managed lane system, the project, combined with other in-progress and proposed managed lane projects, would provide reliable travel times, and help contribute to the completion of the regional transportation network envisioned in the SACOG MTP/SCS and would be consistent with it. GHG emissions for the Build Alternatives would be lower for design year 2049 compared to existing year (see Table 3.4-2); therefore, the project would align with policies to keep the state on a trajectory for progress toward the Executive Order (EO) S-3-05 2050 emission reduction target. Additionally, Caltrans is involved on the Governor’s Climate Action Team as the ARB works to implement EOs S-3-05 and S-01-07 and help achieve the targets set forth in AB 32. EO B-30-15, issued in April 2015, and SB 32 (2016), set an interim target to cut GHG emissions to 40 percent below 1990 levels by 2030. The project would not conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases and there would be no impact.

3.2.9 Hazards and Hazardous Materials

Section 2.2.5, Hazardous Waste and Materials, provides a comprehensive discussion of the hazards and hazardous materials in the project area. The following is an evaluation of the potential impacts on hazards and hazardous materials from the Build Alternatives. The No-Build Alternative would not change existing conditions and would not impact hazards and hazardous materials and is therefore not discussed further.

a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

a and b) Less-than-significant impact.

Initial Site Assessment was completed for this project in February 2021 (Caltrans 2021h). The Initial Site Assessment included assessments pertaining to naturally occurring asbestos (NOA), aerially deposited lead (ADL), Lead-Containing Paint (LCP) and thermoplastic traffic striping and pavement markings, and treated wood waste (TWW). A geologic evaluation did not indicate the presence of altered ultramafic bedrock, alluvium derived from ultramafic rock, or rock commonly associated with NOA. ADL also exists along roadways throughout California from the historical use of leaded gasoline and has the potential to be encountered during project construction. LCP and asbestos-containing materials have the potential to be encountered during project construction. TWW has the potential to be encountered during construction in the form of posts associated with metal beam guard railing three-beam barrier, and roadside signs. Construction would also involve the use and storage of fuels, lubricants, solvents, and other possible contaminants.

Standard Measures HW-1, HW-2 and HW-3 and AMM HAZ-1, AMM HAZ-2, AMM HAZ-3, and AMM HAZ-4 have been incorporated into the project that minimizes potential impacts related to hazards during construction of Alternatives 2a and 2b through 7a and 7b, and impacts would be less than significant.

c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

c) Less-than-significant impact.

Standard Measures HW-1, HW-2 and HW-3 and AMM HAZ-1, AMM HAZ-2, AMM HAZ-3, and AMM HAZ-4 have been incorporated into the project that minimizes potential impacts related to hazards during construction of Alternatives 2a and 2b through 7a and 7b, and impacts would be less than significant.

d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

d) No Impact.

The Cortese List was reviewed as part of the Initial Site Assessment (see Section 2.2.5, Hazardous Waste and Materials). Neither Envirostor and Geotracker databases returned hazardous waste/sources within the project footprint, therefore, there would be no impact.

e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?

e) No Impact.

The project is not located within an airport land use plan or within 2 miles of a public airport therefore, there would be no impact.

f) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

f) Less-than-significant impact.

Yolo County's office of emergency services and the City of West Sacramento's Emergency Management division have identified evacuation zones and routes for given neighborhoods. US-50 and I-80 are dedicated evacuation routes in Yolo and Sacramento Counties. City of Sacramento has detailed maps showing hypothetical levee breaks at various locations for a 200-year flood event[1] and the recommended flood evacuation routes (Caltrans 2021a). I-80 and US-50 are identified evacuation routes on the Yolo County evacuation zone maps and under many levee break scenarios for the City of Sacramento. I-80 is a critical route for the West Sacramento area.

Temporary traffic delays and ramp closures on I-80/US-50 during construction of all Build Alternatives could result in temporary delays in emergency services or evacuations. Because Build Alternatives 7a and 7b would not add new lanes, but would rather repurpose existing lanes as managed lanes, the Build Alternatives 7a and 7b construction period may have shorter duration and therefore result in fewer delays than those under than those under Build Alternatives 2a and 2b, respectively. Since Build Alternative 2b, 3b, 4b, 5b, and 6b would construct the elevated I-80 connector structure, the construction period would have a longer duration and require additional lane closures than Build Alternatives 2a, 3a, 4a, 5a, and 6a. All Build Alternatives would improve circulation and reduce congestion along I-80/US-50 in the project corridor, which could result in improved efficiency for evacuations and emergency services.

Standard Measures TT-3 has been incorporated as part of the project, which requires that a traffic management plan be developed by Caltrans consistent with Caltrans' standard procedures to maintain access for emergency services throughout all phases of construction. The TMP would include elements such as traffic controls to minimize speeds/congestion and other measures to maintain access for police, fire, and medical services along I-80/US-50 in the project area during construction, and as such impacts from all Build Alternatives would be less than significant. Standard Measure UE-3 would require that all emergency response agencies in

[1] A 200-year flood event is the probability of a flood level or peak that has a one in two hundred, or 0.5 percent, chance of being equaled or exceeded in any year.

the project area would be notified of the project construction schedule and would have access to I-80 and US 50 throughout the construction period.

g) Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires?

g) Less-than-significant impact with mitigation.

The project area is surrounded by mostly developed areas near the City of Davis and City of West Sacramento, but traverses natural open space, vegetation, and agricultural lands within unincorporated Solano County near the City of Dixon as well as the near the Yolo Causeway. The project is not located within a very high fire hazard severity zone and would be entirely within a local responsibility area (LRA).

As discussed in Section 3.3, Wildfire, the project may be located near and around vegetated areas and would involve the use of flammable materials including fuels such as gasoline or diesel, hydraulic oils, paints, solvents, or other industrial chemicals necessary for maintaining vehicles and equipment. The risk of fire associated with these materials is generally related to improper use or storage which could increase the potential for wildfire ignition. During construction, Build Alternatives 2a and 2b through 7a and 7b would incorporate fire prevention practices during construction (AMM WF-1) to reduce wildfire impacts. The project would not expose people or structures to post-fire instability or change drainage patterns and would comply with Caltrans Standard Specifications for electrical systems (Section 87) for installation and operation.

Additionally, Standard Measure TT-3 has been incorporated as part of the project, which would maintain emergency access during construction. Build Alternatives 2a and 2b through 7a and 7b also propose a Park-and-Ride Facility that could provide areas for emergency vehicle staging during wildfires or other emergencies. Standard Measure UE-3 would require the contractor to submit a jobsite fire prevention plan as required by Cal OSHA before starting job site activities. In the event of an emergency or wildfire, the contractor would cooperate with fire prevention authorities. Build Alternatives 2a and 2b would also implement bioswales and other drainage features that could potentially provide firebreaks during a wildfire event. Therefore, operation of the project would not exacerbate wildfire risks or result in temporary or ongoing impacts to the environment. Once project construction is completed, the roadway corridor would continue to serve the same use as existing conditions and would not create a new roadway alignment within a high fire severity zone. Therefore, impacts related to wildfire would be less than significant for Build Alternatives 2a and 2b through 7a and 7b.

3.2.10 Hydrology and Water Quality

Section 2.2.1, Hydrology and Floodplain, provides a comprehensive discussion of hydrology and Section 2.2.2 provides a comprehensive discussion of water quality in the project area. The following is an evaluation of the potential impacts on hydrology and water quality from the Build Alternatives. The No-Build Alternative would not change existing conditions and would not impact hydrology and water quality and is therefore not discussed further.

a) Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality?

or

e) Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?

a), e) Less-than-significant impact.

The discharge of storm water runoff from construction sites can affect water quality standards and degrade surface or ground water quality. Potential pollutants and sources would include sediment; non-storm water (groundwater, waters from cofferdams, dewatering, water diversions) discharges from vehicle and equipment cleaning agents, fueling, and maintenance; and waste materials from storage activities.

The primary pollutant of concern is sediment and siltation from the disturbed construction areas. Standard Measure WQ-1 has been incorporated as part of the project, which requires the preparation of a SWPPP that includes construction site BMPs to avoid potential water quality impacts. The SWPPP would include BMPs to protect sensitive areas and to prevent and minimize stormwater and non-stormwater discharges. Standard Measure WQ-1 requires that Caltrans follows all applicable guidelines and requirements in the 2018 Caltrans Standard Specifications (2018 CSS), Section 13, regarding water pollution control and general specifications for preventing, controlling, and abating water pollution to Caltrans-owned storm sewers, streams, waterways, and other bodies of water.

In addition, as required by Standard Measure WQ-2, Caltrans would comply with the National Pollutant Discharge Elimination System (NPDES) Construction General Permit. Standard Measure WQ-3 requires the coordination with the Caltrans District NPDES coordinator during design to prepare a dewatering and discharge work plan if dewatering is anticipated as a construction activity.

All Build Alternatives would result in an increase of impervious surfaces, as described in Section 2.2.2, Water Quality and Stormwater Runoff. In accordance with the Caltrans MS4 permit, Standard Measure WQ-1 incorporates post-construction water quality treatment BMPs and low-impact development controls to reduce non-point source pollutants as needed. Additionally, Standard Measure WQ-4 has been incorporated into the project and requires the preparation of a Stormwater Data Report (SWDR) during the design phase to describe whether permanent treatment BMPs will be considered.

Temporary construction impacts related to water quality would be less than significant for Build Alternatives 2a and 2b through 7a and 7b.

b) Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such the project may impede sustainable groundwater management of the basin?

b) Less-than-significant impact.

The depth of groundwater varies throughout the project limits due to variations in ground surface elevations and groundwater conditions. Based on groundwater depths and elevations, depth of groundwater decreases from west to east along the project route.

Groundwater is anticipated to be encountered in excavations as shallow as 1 to 2 feet below ground surface within the Yolo Bypass, and 5 feet below ground surface east of the Yolo Bypass. Groundwater is expected to be deeper than 25 feet in the project's western section. However, groundwater conditions can be expected to fluctuate in response to seasons, storm events, and other factors. Dewatering may be required if encountered during construction of the connector structure. AMM GEO-1 states that during construction, all trenching and earthwork will be performed in accordance with Section 19 of the 2018 Standard Specifications.

None of the Build Alternatives would substantially decrease groundwater supplies since groundwater extraction would only be conducted during excavation and would cease once construction is complete and impacts would be less than significant.

All Build Alternatives would result in an increase of impervious surfaces, as described in Section 2.2.2, Water Quality and Stormwater Runoff, and would slightly reduce the total permeable area for groundwater recharge. The amount of new, impermeable surfaces Build Alternatives 2a and 2b through 7a and 7b would add is negligible. In accordance with the Caltrans MS4 permit, the Build Alternatives would implement Standard Measure WQ-1 and incorporate post-construction water quality treatment BMPs and low-impact development controls to reduce non-point source pollutants as needed. Additionally, Standard Measure WQ-4 requires preparation of a Stormwater Data Report during the design phase, which would describe whether permanent treatment BMPs should be incorporated. Therefore, construction and operation of the project would not substantially decrease groundwater supplies or interfere substantially with groundwater recharge such the project may impede sustainable groundwater management of the basin, and impacts would be less than significant.

c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:

i) result in substantial erosion or siltation on- or off-site;

ii) substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site;

iii) create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or

c)i), ii), iii) Less-than-significant impact with mitigation.

Construction of all Build Alternatives would involve land-disturbing activities, use of construction equipment, clearing and grading, excavation, and temporary staging of materials. As a result, during construction, all Build Alternatives would potentially result in changes in topography or ground surface features; an increase in wind or water erosion of on-site or off-site soils, resulting in changes to soil deposition and/or erosion; and the discharge of storm water runoff and pollutants which have the potential to affect water quality in Putah Creek, Willow Slough Bypass, Sacramento River, and Delta Waterways.

In addition, Build Alternatives 2a and 2b through 7a and 7b All Build Alternatives would result in an increase of impervious surfaces, as described in Section 2.2.2, Water Quality and Stormwater Runoff. During construction, the Build Alternatives would require full structural reconstruction and cut/fill of embankments. New culverts or culvert replacements would be installed to accommodate additional runoff due to the increased pavement area. Construction activities related to culvert replacement may contribute to soil instability. As previously described, Standard Measures WQ-1 through WQ-4 have been incorporated into the project, which would minimize construction-related erosion and siltation. Additionally, AMM GEO-1 (monitoring during culvert replacement) will be implemented to reduce adverse effects related to erosion, siltation, and runoff for all Build Alternatives. Potential construction and operational impacts related to erosion, siltation, and runoff would be less than significant.

iv) Impede or redirect flood flows?

c)iv) Less-than-significant impact.

The project is in areas designated by the Federal Emergency Management Agency (FEMA) as Special Flood Hazard Area (SFHA) Zone A, SFHA Zone AE, and SFHA Zone 99A. Additionally, the project limits are also located within areas designated by FEMA as Other Areas of Flood Hazard Zone X (both shaded and unshaded). The shoulder widening planned for the bike path for Alternative 2 will occur within a SFHA, specifically within Zone A floodplains. This encroachment into the floodplain will be identical at each bridge location. The current scope of the project encroaches transversely into the floodplain and will not raise or change the profile of any of the highway, thus it is anticipated that there would be no negative impacts on the FEMA mapped floodplain in this area.

The Hydrology Study (Wood Rodgers 2022) determined the magnitude of increased peak flow rates arriving at existing drainage infrastructure caused by the project improvements. Under Build Alternatives 2a and 2b, AMM HF-1 would be used to reduce the potential for adverse impacts resulting from increased peak flow. AMM HF-1 would require installation of a detention basin riser to tie into existing storm drains on the upstream side at two locations in Davis—one detention basin rise inlet is proposed at the storm drain crossing on Mace Boulevard south of I-80 and the other will be at the westbound I-80 off-ramp to Chiles Road.

All “B” Build Alternatives propose to construct a concrete median barrier on I-80 in Yolo County from PM 0.21 to PM 4.3. (A median barrier is not proposed under Build Alternative 2a.) At this location, I-80 is in a Zone A floodplain. This location is behind the west levee of the Yolo Bypass, and the floodplain was determined using the above methodology. Flooding at this location is likely due to a failure of the Yolo Bypass, upstream and/or downstream of I-80.

Therefore, to determine the depth of flooding on I-80 from PM 0.21 to PM 4.3, the published base flood elevation (BFE) in the Yolo Bypass adjacent to the project was used. An elevation of 29.5 feet (NAVD 88) was used to determine that this area of I-80 is completely submerged during the 100-year flood event and would continue to be so after the construction of the proposed concrete median under “B” Build Alternatives. Thus, Build Alternative 2a or 2b would have no effect on the FEMA mapped floodplain in this area. The project does not constitute a significant floodplain encroachment as defined in 23 CFR, Section 650.105.

Although there is a potential for short-term adverse effects to riparian habitat during construction activities, no long-term effects to natural and beneficial floodplain values are anticipated as a result of the Build Alternatives. The bike path extension would involve rehabilitation of the existing bike path on the crown of the west levee of the Yolo Bypass, which classifies the project as falling under the jurisdiction of Section 408. Therefore, Caltrans would get an encroachment permit from Central Valley Flood Protection Board (CVFPB) and Section 408 permission from USACE before the project's construction.

Potential construction and operational impacts related to flooding would be minimal for all Build Alternatives and impacts would be less than significant.

d) In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation?

d) Less-than-significant impact.

The project is not in an area that could be inundated by seiche, tsunami, or mudflow. Project limits are in areas designated by the FEMA as SFHA Zone A, SFHA Zone AE, and SFHA Zone 99A, and SFHA Zone X, which FEMA characterizes as areas subject to inundation by the 100-year flood event. Though unlikely to occur, inundation of the project area during construction or operations could result in the release of sediment, non-storm water (groundwater, waters from cofferdams, dewatering, water diversions) discharges, and pollutants (fuels, lubricants, solvents, and other possible contaminants) and waste materials (construction debris). Standard Measures WQ-1 through WQ-4 and HAZ-5 have been incorporated as part of the project to reduce the potential for erosion and pollutant discharge during construction. Following construction, all construction-related sediment, wastes, and pollutants would be removed from the project area, leaving no risk of discharge in the event of inundation during operations. As a result, the project would not increase the risk of the release of pollutants due to inundation and impacts would be less than significant for all Build Alternatives.

3.2.11 Land Use and Planning

Section 2.1.1, Existing and Future Land Use, provides a comprehensive discussion of land use in the project area. The following is an evaluation of the potential impacts on land use and planning from the Build Alternatives. The No-Build Alternative would not change existing conditions and would not impact land use or planning and is therefore not discussed further.

a) Physically divide an established community?

a) Less-than-significant impact.

As discussed in Section 2.1, Human Environment, the project would not physically divide an established community. Under Build Alternatives 2a and 2b through 7a and 7b, there would be minimal changes to the community character or neighborhoods present. Build Alternatives 2a and 2b through 7a and 7b would occur almost entirely within the existing Caltrans right-of-way and would not result in access changes.

Since all "b" Build Alternatives would construct the elevated I-80 connector, the construction period for Build Alternatives 2b, 3b, 4b, 5b, and 6b would have a longer duration and require additional lane closures than "a" Build Alternatives. With "a" Build Alternatives, a temporary full closure may be needed on westbound US-50; the primary detour for westbound US-50 traffic would be to use northbound I-5 to westbound I-80. With a planned public outreach program to keep the area residents, businesses, emergency service providers, and transit operators informed of the project construction schedule (Standard Measure COM-1), impacts would be less than significant.

b) Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?

b) Less-than-significant impact.

As discussed in Section 2.1, Human Environment, Build Alternatives 2a and 2b, 3a and 3b, 4a and 4b would be consistent or partially consistent with local and regional plans and policies.

Overall, Build Alternatives 5a and 5b are partially consistent with local policies related to improved transportation infrastructure. Build Alternatives 5a and 5b would create an express lane in each direction where all users pay a fee regardless of vehicle occupancy. Therefore, it would not encourage increased vehicle occupancy unless there were discounted fees for carpools and would be inconsistent with the City of Sacramento 2035 General Plan policies to encourage increased vehicle occupancy. Build Alternatives 6a and 6b would add a transit lane in each direction which could improve the attractiveness of riding transit. Build Alternatives 6a and 6b would be consistent or partially consistent with a majority of local and regional plans and policies; however, they remain inconsistent with several policies because they would result in degraded functionality in the project corridor compared to the No-Build Alternative 1. For Build Alternatives 7a and 7b, consistency with local and regional plans would be mostly the same as described under Build Alternatives 2a and 2b, respectively, because Build Alternatives 7a and 7b do not propose a priced lane. However, they are inconsistent with several policies because they would result in degraded functionality in the project corridor compared to the No-Build Alternative 1. If inconsistency with land use policies will require Caltrans to work with local agencies to update existing land use plans to achieve consistency. With implementation of AMM EJ-1, EJ-2, and EJ-3, and VMT reducing measures, impacts would be less than significant.

3.2.12 Mineral Resources

The following is an evaluation of the potential impacts on mineral resources from the Build Alternatives. The No-Build Alternative would not change existing conditions and would not impact mineral resources and is therefore not discussed further.

a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?

b) Result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?

a), b) No Impact.

The project area does not contain any known mineral resource zones but does traverse several gas fields near the Cities of Davis and West Sacramento (Yolo County 2009, Sacramento County 2011). Implementation of Build Alternatives 2a or 2b through 7a or 7b would not change or convert existing land uses resulting in new development activity that would potentially disrupt continued management of mineral resources. Accordingly, Build Alternatives 2a or 2b through 7a or 7b would not conflict with a resource recovery plan and would not result in the loss of availability of a locally important mineral resource recovery site. There would be no impact.

3.2.13 Noise

Noise Section 2.2.8, Noise, provides a comprehensive discussion of noise in the project area. The No-Build Alternative would not change existing conditions and would not impact noise and is therefore not discussed further.

Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

a) Less-than-significant impact with mitigation.

Construction activities would result in temporary increases to noise levels at adjacent sensitive receptors. Project construction would include road cut/fill, grinding, grubbing/land cleaning, grading/excavation, drainage/utilities, and paving. Pile driving would be planned to be used for the construction of I-80 connector structure under Build Alternatives 2b, 3b, 4b, 5b, 6b, and 7b. Construction noise would result from heavy construction equipment and the arrival and departure of heavy-duty trucks. Noise levels would not exceed quantitative noise limits established by Caltrans except for nighttime work, which could result in an exceedance.

Except for possible nighttime construction involving heavy equipment, construction noise levels would not be expected to exceed the quantitative noise limits established by Caltrans. AMM NOI-1 would require noise-generating construction activities to be restricted to between 7:00 a.m. and 7:00 p.m. on weekdays, with no construction occurring on weekends or holidays, reducing the potentially significant impact to a less-than-significant level. If work is necessary

outside of these hours, a construction noise monitoring program and additional noise controls would be implemented.

Caltrans Standard Specifications Section 14-8.02 would require that noise levels not exceed 86 dBA within 50 feet of the job site from the hours of 9:00 p.m. to 6:00 a.m. (Standard Measure NOI-1). Build Alternatives 2a and 2b would also implement Standard Measures NOI-2 through NOI-5 to further reduce temporary construction noise levels. Therefore, temporary construction noise would have a less-than-significant impact on nearby receptors for Build Alternatives 2a and 2b through 7a and 7b.

As discussed in Section 2.2.8, Noise, under CEQA a noise impact is assessed using increase over baseline conditions, while under NEPA, noise impacts are measured against noise levels for land uses.

Modeled noise levels under Build Alternatives 2a and 2b through 7a and 7b would result in noise level increases of up to 2 dBA over existing conditions and over No Build conditions under future year 2049 conditions, with one residential receptor experiencing up to a 3 dBA. These noise level increases are barely perceptible and therefore would be less than significant.

Under Build Alternatives 2a and 2b through 7a and 7b, traffic noise levels would approach or exceed the Noise Abatement Criteria (NAC) at Category B receptors located north of US-50 westbound travel lanes between Harbor Boulevard and Jefferson Boulevard, south of US-50 eastbound travel lanes between Harbor Boulevard and Jefferson Boulevard, east of the US-50 and I-5 interchange, east of the US-50 westbound ramp onto I-80 eastbound, to the east and west of I-80 at the Sacramento River, and to the east of I-80 eastbound between Sacramento River and West El Camino Avenue. Some of these receptors are behind existing noise barriers. Traffic noise levels are predicted to approach or exceed the NAC at Category C receptors located east of the US-50 westbound ramp onto I-80 eastbound and south of US-50 eastbound travel lanes between Harbor Boulevard and Jefferson Boulevard. For context, these are the Federal, or NEPA, standards that are contained herein as “other agency.”

Build Alternatives 2b, 3b, 4b, 5b, 6b, and 7b propose the I-80 connector structure. Accordingly, these Build Alternatives would have a slight increase in noise levels in comparison to Build Alternatives 2a, 3a, 4a, 5a, 6a, and 7a as further described in Section 2.2.8. Noise. Accordingly, noise abatement was considered for impacted receptors. Noise barriers are the only form of noise abatement considered for exterior land uses in the project area (Caltrans 2022b).

Generation of excessive groundborne vibration or groundborne noise levels?

b) Less-than-significant impact.

Due to the short-term nature of construction, the primary concern is the potential for vibration to damage a structure. Critical factors pertaining to the impact of construction vibration on sensitive receptors include the proximity of the existing structures to the project site, soil conditions, the soundness of the structures, and the methods of construction used.

Construction activities with the greatest potential of generating perceptible vibration levels would include the removal of pavement and soil, the dropping of heavy objects, and the movement of heavy tracked equipment. As further described in Section 2.2.8, Noise, construction vibration limits would not be exceeded during periods of construction. Therefore, temporary construction vibration would have a less-than-significant impact on nearby receptors for Build Alternatives 2a and 2b through 7a and 7b.

For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

c) Less-than-significant impact.

The project is in the Sacramento International Airport Land Use Compatibility Plan area (SACOG 2013). However, the project would not result in a conversion of land uses as the project area would continue to serve as a transportation corridor. As described under a) and b), Build Alternatives 2a and 2b through 7a and 7b would not expose people residing or working in the project area to excessive noise levels during construction or during the operation phase. Therefore, the impact would be less than significant.

3.2.14 Population and Housing

Section 2.1.5, Growth, provides a comprehensive discussion of growth related to population and housing in the project area. The following is an evaluation of the potential impacts on population and housing from the Build Alternatives. The No-Build Alternative would not change existing conditions and would not impact population and housing and is therefore not discussed further.

a) Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?

a) Less-than-significant impact.

It is anticipated that, for Build Alternatives 2a and 2b through Build Alternatives 7a and 7b, construction workers would be drawn from either existing Caltrans staff or contractors in the local area who would commute from the neighboring cities. Therefore, the construction workforce would relocate to the area and thus would not result in an increased demand for housing. As discussed in Section 2.1, although implementing Build Alternatives 2a and 2b through 6a and 6b would increase freeway capacity, it would not alter planned regional development or growth trends. Build Alternatives 7a and 7b would repurpose an existing lane to HOV but would not increase capacity.

By improving access and highway capacity, Build Alternatives 2a and 2b through 7a and 7b would accommodate planned growth on a regional level and could indirectly change development patterns surrounding the project area by changing the rate at which planned development would occur along the corridor. However, Build Alternatives 2a and 2b through 7a

and 7b would not directly increase development of residential land uses, encourage growth outside of existing growth boundaries, or alter existing access to residential and employment areas; therefore, associated with population growth would be less than significant for Alternatives 2a and 2b through 7a and 7b.

b) Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?

b) No Impact.

As discussed in Section 2.1, construction of Build Alternatives 2a and 2b through 7a and 7b would occur mostly within existing Caltrans right-of-way, with one permanent right-of-way easement and five temporary construction easements. No displacement of any residences would be required. There would be no impact.

3.2.15 Public Services

Section 2.1.8, Utilities and Emergency Services, provides a comprehensive discussion of the public services, including emergency services, in the project area. The following is an evaluation of the potential impacts on public services from the Build Alternatives. The No-Build Alternative would not change existing conditions and would not impact public services and is therefore not discussed further.

a) Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services:

Fire protection?

Police protection?

Schools?

Parks?

Other public facilities?

a) Less-than-significant impact.

Temporary traffic delays and ramp closures on I-80/US-50 during construction of Build Alternatives 2a and 2b through 7a and 7b could result in temporary delays in emergency services. As described in Section 2.1.6, Community Character and Cohesion, Standard Measure TT-3 has been incorporated into the project that would require preparation of a TMP which would maintain access for emergency services throughout all phases of construction. The TMP would include elements such as traffic controls to minimize speeds/congestion and other

measures to maintain access for police, fire, and medical services along I-80/US-50 in the project area during construction. Standard Measure COM-1 would require a planned public outreach program to keep the area residents, businesses, emergency service providers, and transit operators informed of the project construction schedule.

The project would help accommodate planned growth on a regional level. However, Build Alternatives 2a and 2b through 7a and 7b would not result in a use that would directly induce population and employment growth in Sacramento, Yolo, or Solano Counties. Therefore, the project would not result in the need for new or physically altered schools, parks, or other public facilities. Impacts on fire and police protection services would be less than significant for Build Alternatives 2a and 2b through 7a and 7b.

3.2.16 Recreation

Section 2.1.3, Parks and Recreational Facilities, provides a comprehensive discussion of parks and recreational facilities in the project area. The following is an evaluation of the potential impacts on recreation from the Build Alternatives. The No-Build Alternative would not change existing conditions and would not impact recreation and is therefore not discussed further.

a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

a) No Impact.

The project would help accommodate planned growth on a regional level. However, the project would not increase demand or use of surrounding recreational facilities. There would be no impact for any of the Build Alternatives.

b) Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?

b) Less-than-significant impact.

The project does not involve the construction or expansion of recreational facilities. The project would occur almost entirely within the existing Caltrans right-of-way; however, several parks and recreational facilities are located within proximity of the project area and thus, users could be subject to potential air quality and noise impacts during construction. Build Alternatives 2b, 3b, 4b, 5b, and 6b would have a longer duration of construction than Build Alternative 2a, 3a, 4a, 5a, and 6a and thus result in longer duration of exposure to potential impacts. All Build Alternatives would also implement visual (Standard Measures AR-1, AR-2, and AR-3, and AMM AES-4), noise (Standard Measure NOI-1, AMM NOI-1), and air quality (Standard Measure GHG-1) Standard Measures and AMMs during construction.

Construction activities may result in temporary traffic delays and ramp closures on I-80/US-50 that could cause temporary delays in accessing recreation facilities in and near the project area.

However, Standard Measure TT-3 would require a traffic management plan to maintain access. The TMP would plan construction in sections, with no more than one lane closed at a time and no successive ramp closures. The contractor would implement a planned public outreach program to keep area residents, businesses, emergency service providers, and transit operators informed of the project construction schedule as part of Standard Measure COM-1. With these standard practices, no AMMs are required.

As a result, potential impacts to recreational facilities would be less than significant for Build Alternatives 2a and 2b through 7a and 7b.

3.2.17 Transportation

Section 2.1.9, Traffic and Transportation, provides a comprehensive discussion of transportation in the project area. The following is an evaluation of the potential impacts on transportation from the Build Alternatives. The No-Build Alternative would not change existing conditions and would not impact transportation and is therefore not discussed further.

a) Conflict with program, plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities

a) Less-than-Significant Impact

The project area is surrounded by rural and urban areas in Yolo, Sacramento, and Solano County. While Yolo, Sacramento and Solano County have plans and policies regarding local circulation; I-80, and US 50 are part of the California State Highway System and under Caltrans Jurisdiction. The segment of the I-80 and US 50 corridor within the project limits are identified as requiring capital improvements in the SACOGMTP/SCS.

Build Alternatives 2a through 7b would add capacity to I-80, US 50 within the project area. The purpose of the project is to improve traffic flow and help relieve congestion on the highway network; therefore, the project would not conflict with a program, plan, ordinance, or policy related to transportation, and impacts would be less than significant.

b) Conflict or be inconsistent with CEQA Guidelines Section 15064.3, subdivision (b)

b) Significant and Unavoidable Impact

SB 743 (2013) requires the Office of Planning and Research (OPR) to identify new metrics for identifying and mitigating transportation impacts under CEQA. Under SB 743, CEQA Guidelines Section 15064.3(b) was revised to identify VMT as the most appropriate measure of assessing transportation impacts.

Based on the estimates in the project Traffic Analysis Report (TAR), although Build Alternatives 2a through 7b would result in improved vehicular operational conditions that would result in reduced vehicular delays and congestion within the project corridor; however, these alternatives, with the exception of Alternatives 6a and 6b (which add a transit-only lane), would result in induced VMT (Section 2.2.10.7 Table 2.1-26), which would represent a significant

impact. The annual induced auto vehicle miles traveled (VMT) from the build alternatives (roughly 106-110 million annual auto VMT for the added-lane alternatives and roughly 2.6-7 million annual auto VMT for the general-purpose lane conversions to HOV) would need to be reduced through the action of VMT reducing measures. Caltrans has identified the following approaches to reduce regional VMT.

- Implement a Voluntary Trip Reduction Program in Yolo County
- Expand Capitol Corridor Frequency between Martinez and Sacramento
- Implement Microtransit in Yolo County
- Expand YoloBus Route 42
- Expand Causeway Connection Route 138
- Expand Unitrans
- Expand Putah Creek Trail to connect to Future Nishi Student Housing Development Site

Caltrans proposes to work with the California Department of Housing and Community Development, the City of Sacramento Housing Trust, and the City of Davis Housing Trust by providing various amounts of funding to help facilitate the measures mentioned above. If the measures are completed as expected, regional VMT would be reduced by approximately 57.1 million annual auto VMT. Caltrans is making a commitment to the above-mentioned agencies to contribute $55 million toward the indicated measures. However, full implementation of these VMT reducing measures is outside the regulatory authority of Caltrans and is not sufficient to fully offset the induced VMT impact of Alternatives 2a/b through 5a/b. It would be sufficient to fully offset only the alternatives that would convert an existing lane to an HOV-only lane (Alternatives 7a and 7b).

AMMs TRANS-1 will be used to avoid or reduce potential project impacts on transportation associated with the project. Caltrans also actively encourages smart growth principles through its Local Development-Intergovernmental Review processes with the local agencies responsible for such actions, and Caltrans facilitates improvements in transit service by providing facilities that improve transit headways, such as the managed lanes that are a part of some project alternatives. However, none of the above strategies and measures are certain to occur. As such, Build Alternatives 2a/b through 5a/b would conflict or be inconsistent with CEQA Guidelines Section 15064.3, subdivision (b), and impacts would be significant and unavoidable.

c) Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)

c) No Impact

Although the Build Alternatives would involve adding a lane and/or connecting ramps, the alignment of I-80 and US 50 would not change. The project would not increase hazards due to design features, and there would be no impact.

d) Result in inadequate emergency access

d) Less-than-Significant Impact

See Impact Discussion 3.2.9 (f).

3.2.18 Tribal Cultural Resources

Section 2.1.12, Cultural Resources, provides a comprehensive discussion of the tribal resources that occur, or have the potential to occur, in the project area. Chapter 2.1.12 also includes a discussion of AB 52 consultation efforts for the project. The following is an evaluation of the potential impacts on tribal resources from the Build Alternatives. The No-Build Alternative would not change existing conditions and would not impact tribal resources and is therefore not discussed further.

Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code Section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:

a) Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code Section 5020.1(k),

b) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.

a), b) Less-than-significant impact.

Consultation efforts with Native Americans who were identified as having an interest in projects within this area by the Native American Heritage Commission (NAHC) did not reveal any known tribal cultural resources that occur within the project area. However, subsurface construction activities associated with the project could potentially damage or destroy previously undiscovered unique tribal cultural resources. Standard Measure CR-3 and CR-4 have been incorporated as part of the project that would prevent previously undiscovered tribal cultural resources from being impacted during construction. Standard Measure CR-3 and CR-4 require that all construction activities be completed within and around the immediate discovery area. If human remains are discovered within the project site, Caltrans Cultural Resources Studies Office Staff would assess the remains and contact the County Coroner per PRC Sections 5097.98, 5097.99, and 7050.5 of the California Health and Safety Code. If the Coroner determines the remains to be Native American, the Coroner will contact the NAHC, who will then assign and notify the most likely descendant (MLD). Caltrans would consult with the MLD on respectful treatment and reburial of the remains. Further provisions of PRC 5097.98 would be followed as applicable. Therefore, the impact would be less than significant for all Build Alternatives.

3.2.19 Utilities and Service Systems

Chapter 2.1.8 provides a comprehensive discussion of the utilities in the project area. The following is an evaluation of the potential impacts on utilities from the Build Alternatives. The No-Build Alternative would not change existing conditions and would not impact utilities and is therefore not discussed further.

a) Require or result in the relocation or construction of new or expanded water, wastewater treatment or stormwater drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?

a) Less-than-significant impact.

Build Alternatives 2a and 2b through 7a and 7b would result in conflicts with existing utilities present along the I-80/US-50 corridor. Caltrans would provide verification and notify utilities of proposed construction work in accordance with Standard Measure UE-2. Under Build Alternative 2b, 3b, 4b, 5b, 6b, and 7b, overhead lines near the new managed lane connector at the I80/US-50 separation in West Sacramento may have to be relocated. Under all Build Alternatives, utility verification would be coordinated with all applicable utility providers, as required under Standard Measure UE-2.

Additionally, all Build Alternatives would result in an increase of impervious surfaces, as described in Section 2.2.2, Water Quality and Stormwater Runoff. In accordance with the Caltrans MS4 permit, Standard Measure WQ-1 incorporates post-construction water quality treatment BMPs and low-impact development controls to reduce non-point source pollutants as needed. Additionally, Standard Measure WQ-4 has been incorporated into the project and requires the preparation of a Stormwater Data Report (SWDR) during the design phase to describe whether permanent treatment BMPs will be considered. New culverts or culvert replacements would be installed to accommodate additional runoff due to the increased pavement area. AMM PALEO-3 (monitoring during culvert replacement) will be implemented to reduce adverse effects related to culvert replacement for all Build Alternatives. As such, impacts would be less than significant for Build Alternatives 2a and 2b through 7a and 7b.

b) Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years?

c) Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?

b), c) No Impact.

The project would not directly increase the number of residents in the area because residential land uses are not proposed. By improving access and highway capacity, Build Alternatives 2a and 2b through 7a and 7b would accommodate planned growth on a regional level; however, the project would not increase the demand for additional water or wastewater treatment beyond

existing planned growth in surrounding development areas. There would be no impact for Build Alternatives 2a and 2b through 7a and 7b.

d) Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?

e) Comply with federal, state, and local management and reduction statutes and regulations related to solid waste?

d), e) Less-than-significant impact.

The project would not generate excessive solid waste and would comply with all management and reduction statutes and regulations. Standard Measure UE-2 has been incorporated into the project that requires solid waste generated during construction be collected and transported to an appropriate recycling, disposal, or processing facility that is properly equipped and capable of handling solid waste materials. The impact would be less than significant for Build Alternatives 2a and 2b through 7a and 7b.

3.2.20 Wildfire

Chapter 3.3 provides a comprehensive discussion of wildfire in the project area. The following is an evaluation of the potential impacts on wildfire from the Build Alternatives. The No-Build Alternative would not change existing conditions and would not impact wildfire and is therefore not discussed further.

If located in or near state responsibility areas or lands classified as very high fire hazard severity zones, would the project:

a) Substantially impair an adopted emergency response plan or emergency evacuation plan?

b) Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?

c) Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?

and

d) Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?

a), b), c), d) Less-than-significant impact.

The project area is surrounded by mostly developed areas near the City of Davis and City of West Sacramento, but traverses natural open space, vegetation, and agricultural lands within unincorporated Solano County near the City of Dixon as well as the near the Yolo Causeway. The project is not located within a very high fire hazard severity zone and would be entirely within a LRA.

Portions of the project are located near and around vegetated areas and would involve the use of flammable materials including fuels such as gasoline or diesel, hydraulic oils, paints, solvents, or other industrial chemicals necessary for maintaining vehicles and equipment. The risk of fire associated with these materials is related to improper use or storage, which could increase the potential for wildfire ignition. During construction, Build Alternatives 2a and 2b through 7a and 7b would incorporate fire prevention practices during construction (AMM WF-1) to reduce wildfire impacts. The project would not expose people or structures to post-fire instability or change drainage patterns and would comply with Caltrans Standard Specifications for electrical systems (Section 87) for installation and operation.

Additionally, Standard Measure TT-3-has been incorporated into that project that will maintain emergency access and communications with emergency service providers during construction. Build Alternatives 2a and 2b through 7a and 7b also include a Park-and-Ride Facility that could provide areas for emergency vehicle staging during wildfires or other emergencies. Therefore, operation of the project would not exacerbate wildfire risks or result in temporary or ongoing impacts on the environment. Once construction of the project is completed, the roadway corridor would continue to serve the same use as existing conditions. Therefore, impacts related to wildfire would be less than significant for Build Alternatives 2a and 2b through 7a and 7b.

3.2.21 Mandatory Findings of Significance

a) Does the project have the potential to substantially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?

a) Less-than-significant impact.

The project area contains suitable habitat for special-status plant and wildlife species and nesting birds, CDFW Sensitive Natural Communities, and federally protected wetlands. Project construction would create subsurface disturbances that could result in damage to or destruction of previously undiscovered subsurface archaeological deposits or unmarked burials. With implementation of Standard Measures and AMMs, impacts to these resources would be less than significant for all Build Alternatives.

b) Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?

b) Less-than-significant impact.

As discussed in Chapter 2.4, Cumulative Impacts, the project would not have a cumulatively significant impact on any impacted resources. All potential impacts would be minimized through the Standard Measures and AMMs. Therefore, this impact would be less than significant.

c) Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?

c) Less-than-significant impact.

Construction activities would temporarily increase criteria pollutant emissions and ambient noise levels. These impacts would be temporary, and the project would incorporate Standard Measures and AMMs to minimize potentially adverse effects to humans resulting from construction activities. Therefore, the project would not have a substantial direct or indirect impact on the human environment, and impacts would be less than significant for all Build Alternatives.

3.3 Wildfire

3.3.1 Regulatory Setting

Senate Bill 1241 required the Office of Planning and Research, the Natural Resources Agency, and the California Department of Forestry and Fire Protection to develop amendments to the "CEQA Checklist" for the inclusion of questions related to fire hazard impacts for projects located on lands classified as very high fire hazard severity zones. The 2018 updates to the CEQA Guidelines expanded this to include projects "near" these very high fire hazard severity zones.

3.3.2 Affected Environment

Climate and landscape characteristics are among the most important factors influencing hazard levels. Weather characteristics such as wind, temperature, humidity, and fuel moisture content affect the potential for fire. A fire typically burns faster and with more intensity when the air temperature is high, relative humidity is low, and winds are strong. Accordingly, urban and rural fires have the potential to cause damage, injury, or harm (Solano County 2008).

The project area is surrounded by mostly developed areas near the City of Davis and City of West Sacramento, but traverses natural open space, vegetation, and agricultural lands within unincorporated Solano County near the City of Dixon as well as the near the Yolo Causeway.

Wildland fire protection in California is the responsibility of either the State, local government, or the federal government. LRA fire protection is typically provided by city fire departments, fire protection districts, counties, and by CAL FIRE under contract to local government. According to the California Department of Forestry and Fire Protection, the project is not located within a very high fire hazard severity zone and would be located entirely within an LRA. However, several

areas along the Sacramento River are mapped as moderately hazardous for wildland fires (CAL FIRE 2021).

3.3.3 Environmental Consequences

3.3.3.1 No-Build Alternative 1

Construction and Operation

Under the No-Build Alternative, managed lanes would not be added to the I-80 or US-50 corridors and existing capacity would not increase. I-80 and US-50 would continue to serve the same use as existing conditions, which is not located within a very high fire severity zone and there would be no effects related to wildfire.

3.3.3.2 Build Alternatives 2a and 2b

Construction

Build Alternatives 2a and 2b would involve adding an HOV lane in each direction for use by HOV 2+. Construction of the project would require use of heavy and light equipment to modify ramps, widen roadway shoulders, install fiber-optic cable and electrical conduit, etc. The project is located along an existing transportation right-of-way that is maintained, creating an intrinsic fuel break. Equipment usage during construction would be temporary. However, such activities may be located near and around vegetated areas and would involve the use of flammable materials including fuels such as gasoline or diesel, hydraulic oils, paints, solvents, or other industrial chemicals necessary for maintaining vehicles and equipment. The risk of fire associated with these materials is related to improper use or storage which could increase the potential for wildfire ignition. During construction, Caltrans would implement a TMP (Standard Measure TT-3) to maintain emergency access during construction. Therefore, project construction activities would not impair an adopted emergency response plan or emergency evacuation plan. Standard Measure UE-3 would require the contractor to submit a jobsite fire prevention plan as required by California Division of Occupational Safety and Health Administration (Cal OSHA) before starting job site activities. In an emergency or wildfire, the contractor would cooperate with fire prevention authorities. Additionally, Standard Measure COM-1 would require a planned public outreach program to keep the area residents, businesses, emergency service providers, and transit operators informed of the project construction schedule; however, even with implementation of these Standard Measure TT-3, impacts from wildfire could still be significant. Therefore, during construction of Build Alternatives 2a and 2b, AMM WF-1 would be implemented that includes fire prevention practices to reduce the potential for wildfires to occur in the project area.

Operation

Caltrans would restore the project area to preconstruction conditions in accordance with applicable permits and Caltrans requirements. The project would involve the installation of fiber-optic and electrical conduit within existing transportation right-of-way. Once in operation, electrical components would be underground and tie-in to existing distribution lines. In addition,

Caltrans would comply with Caltrans Standard Specifications for electrical systems (Section 87) for installation and operation. While Build Alternatives 2a and 2b would add capacity to the I-80 and US-50 corridors and would increase the edge of pavement through shoulder widening, operation of Build Alternatives 2a and 2b would continue to serve the same use as existing conditions and would not create a new roadway alignment within a very high fire severity zone.

In addition, Build Alternatives 2a and 2b proposes a Park-and-Ride Facility with approximately 300 parking spaces that could provide areas for emergency vehicle staging during wildfires or other emergencies. Build Alternatives 2a and 2b would implement drainage features that could potentially provide firebreaks during a wildfire event. The project would not exacerbate wildfire risks or result in temporary or ongoing impacts to the environment, and impacts would be less than significant from project operations.

Impacts from Build Alternatives 2a and 2b would be less than significant with mitigation.

3.3.3.3 Build Alternatives 3a and 3b

Construction and Operation

Build Alternatives 3a and 3b would involve adding a HOT lane in each direction for use by HOT 2+ and Build Alternatives 3a and 3b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively; therefore, the impact would be the same as impacts described under Build Alternatives 2a and 2b.

3.3.3.4 Build Alternatives 4a and 4b

Construction and Operation

Build Alternatives 4a and 4b would involve adding an HOT lane in each direction for use by vehicles with three or more riders (HOT 3+). Build Alternatives 4a and 4b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively; therefore, the impact would be the same as impacts described under Build Alternatives 2a and 2b.

3.3.3.5 Build Alternatives 5a and 5b

Construction and Operation

Build Alternatives 5a and 5b would create an express lane in each direction where all users pay a fee regardless of vehicle occupancy. Build Alternatives 5a and 5b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively; therefore, the impact would be the same as impacts described under Build Alternatives 2a and 2b.

3.3.3.6 Build Alternatives 6a and 6b

Construction and Operation

Build Alternatives 6a and 6b would involve adding a transit-only lane in each direction. Build Alternatives 6a and 6b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively; therefore, the impact would be the same as impacts described under Build Alternatives 2a and 2b.

3.3.3.7 Build Alternatives 7a and 7b

Construction and Operation

Build Alternatives 7a and 7b would involve repurposing the current #1 general purpose lane to HOV 2+. No new lanes would be constructed. Build Alternatives 7a and 7b propose similar project components within the same project area as Build Alternatives 2a and 2b, respectively; therefore, the impact would be the same as impacts described under Build Alternatives 2a and 2b.

3.3.4 Avoidance, Minimization, and/or Mitigation Measures

AMM WF-1: **Implement Fire Prevention Practices During Construction**. During the construction, Caltrans would implement the following fire prevention practices to reduce the potential for wildfire.

- Prepare names and emergency telephone numbers of the nearest fire suppression agencies before the start of job site activities and post at a prominent place at the job site.
- Prepare a fire prevention plan required by the California Division of Occupational Safety and Health before the start of job site activities.
- Cooperate with fire prevention authorities in performance of the work.
- Immediately report fires occurring within and near the project limits by dialing 911 and to the nearest fire suppression agency by using the emergency phone numbers retained at the job site.
- Prevent project personnel from setting open fires that are not part of the work.
- Prevent the escape of and extinguish fires caused directly or indirectly by job site activities.

3.4 Climate Change

Climate change refers to long-term changes in temperature, precipitation, wind patterns, and other elements of the Earth's climate system. The Intergovernmental Panel on Climate Change, established by the United Nations and World Meteorological Organization in 1988, is devoted to

greenhouse gas (GHG) emissions reduction and climate change research and policy. Climate change in the past has generally occurred gradually over millennia, or more suddenly in response to cataclysmic natural disruptions. The research of the Intergovernmental Panel on Climate Change and other scientists over recent decades, however, has unequivocally attributed an accelerated rate of climatological changes over the past 150 years to GHG emissions generated from the production and use of fossil fuels.

Human activities generate GHGs consisting primarily of carbon dioxide (CO2), methane (CH4), nitrous oxide (N2O), tetrafluoromethane, hexafluoroethane, sulfur hexafluoride (SF6), and various hydrofluorocarbons (HFCs). CO2 is the most abundant GHG; while it is a naturally occurring and necessary component of Earth's atmosphere, fossil fuel combustion is the main source of additional, human-generated CO2 that is the main driver of climate change. In the U.S. and in California, transportation is the largest source of GHG emissions, mostly CO2.

The impacts of climate change are already being observed in the form of sea level rise, drought, more intense heat, extended and severe fire seasons, and historic flooding from changing storm patterns. Both mitigation and adaptation strategies are necessary to address these impacts. The most important mitigation strategy is to reduce GHG emissions. In the context of climate change (as distinct from CEQA and NEPA), "mitigation" involves actions to reduce GHG emissions or to enhance the "sinks" that store them (such as forests and soils) to lessen adverse impacts. "Adaptation" is planning for and responding to impacts to reduce vulnerability to harm, such as by adjusting transportation design standards to withstand more intense storms, heat, and higher sea levels. This analysis will include a discussion of both in the context of this transportation project.

3.4.1 Regulatory Setting

This section outlines federal and state efforts to comprehensively reduce GHG emissions from transportation sources.

3.4.1.1 Federal

To date, no national standards have been established for nationwide mobile source GHG reduction targets, nor have any regulations or legislation been enacted specifically to address climate change and GHG emissions reduction at the project level.

The National Environmental Policy Act (NEPA) (42 United States Code [USC] Part 4332) requires federal agencies to assess the environmental effects of their proposed actions prior to making a decision on the action or project.

The Federal Highway Administration (FHWA) recognizes the threats that extreme weather, sea level change, and other changes in environmental conditions pose to valuable transportation infrastructure and those who depend on it. FHWA therefore supports a sustainability approach that assesses vulnerability to climate risks and incorporates resilience into planning, asset management, project development and design, and operations and maintenance practices (FHWA 2022). This approach encourages planning for sustainable highways by addressing climate risks while balancing environmental, economic, and social values— "the triple bottom

line of sustainability" (FHWA n.d.). Program and project elements that foster sustainability and resilience also support economic vitality and global efficiency, increase safety and mobility, enhance the environment, promote energy conservation, and improve the quality of life.

The federal government has taken steps to improve fuel economy and energy efficiency to address climate change and its associated effects. The most important of these was the Energy Policy and Conservation Act of 1975 (42 USC Section 6201) as amended by the Energy Independence and Security Act (EISA) of 2007; and Corporate Average Fuel Economy (CAFE) Standards. This act established fuel economy standards for on-road motor vehicles sold in the United States. The U.S. Department of Transportation's National Highway Traffic and Safety Administration (NHTSA) sets and enforces the CAFE standards based on each manufacturer's average fuel economy for the portion of its vehicles produced for sale in the United States. The Environmental Protection Agency (U.S. EPA) calculates average fuel economy levels for manufacturers, and also sets related GHG emissions standards under the Clean Air Act. Raising CAFE standards leads automakers to create a more fuel-efficient fleet, which improves our nation's energy security, saves consumers money at the pump, and reduces GHG emissions (U.S. DOT 2014).

U.S. EPA published a final rulemaking on December 30, 2021, that raised federal GHG emissions standards for passenger cars and light trucks for model years 2023 through 2026, increasing in stringency each year. The updated GHG emissions standards will avoid more than three billion tons of GHG emissions through 2050. In April 2022, NHTSA announced corresponding new fuel economy standards for model years 2024 through 2026, which will reduce fuel use by more than 200 billion gallons through 2050 compared to the old standards and reduce fuel costs for drivers (U.S. EPA 2022a; NHTSA 2022).

3.4.1.2 State

California has been innovative and proactive in addressing GHG emissions and climate change by passing multiple Senate and Assembly bills and executive orders (EOs) including, but not limited to, the following:

EO S-3-05 (June 1, 2005): The goal of this EO is to reduce California's GHG emissions to: (1) year 2000 levels by 2010, (2) year 1990 levels by 2020, and (3) 80 percent below year 1990 levels by 2050. This goal was further reinforced with the passage of Assembly Bill (AB) 32 in 2006 and Senate Bill (SB) 32 in 2016.

Assembly Bill (AB) 32, Chapter 488, 2006, Núñez and Pavley, The Global Warming Solutions Act of 2006: AB 32 codified the 2020 GHG emissions reduction goals outlined in EO S-3-05, while further mandating that the California Air Resources Board (CARB) create a scoping plan and implement rules to achieve "real, quantifiable, cost-effective reductions of greenhouse gases." The Legislature also intended that the statewide GHG emissions limit continue in existence and be used to maintain and continue reductions in emissions of GHGs beyond 2020 (Health and Safety Code [H&SC] Section 38551(b)). The law requires ARB to adopt rules and regulations in an open public process to achieve the maximum technologically feasible and cost-effective GHG reductions.

Senate Bill (SB) 375, Chapter 728, 2008, Sustainable Communities and Climate Protection: This bill requires ARB to set regional emissions reduction targets for passenger vehicles. The Metropolitan Planning Organization (MPO) for each region must then develop a "Sustainable Communities Strategy" (SCS) that integrates transportation, land use, and housing policies to plan how it will achieve the emissions target for its region.

EO B-30-15 (April 2015) establishes an interim statewide GHG emission reduction target of 40 percent below 1990 levels by 2030 to ensure California meets its target of reducing GHG emissions to 80 percent below 1990 levels by 2050. It further orders all state agencies with jurisdiction over sources of GHG emissions to implement measures, pursuant to statutory authority, to achieve reductions of GHG emissions to meet the 2030 and 2050 GHG emissions reductions targets. It also directs ARB to update the Climate Change Scoping Plan to express the 2030 target in terms of million metric tons of carbon dioxide equivalent (MMTCO2e). [GHGs differ in how much heat each traps in the atmosphere, called global warming potential, or GWP. CO2 is the most important GHG, so amounts of other gases are expressed relative to CO2, using a metric called “carbon dioxide equivalent,” or CO2e. The global warming potential of CO2 is assigned a value of 1, and the GWP of other gases is assessed as multiples of CO2.] Finally, it requires the Natural Resources Agency to update the state’s climate adaptation strategy, Safeguarding California, every 3 years, and to ensure that its provisions are fully implemented.

SB 32, Chapter 249, 2016, codifies the GHG reduction targets established in EO B-30-15 to achieve a mid-range goal of 40 percent below 1990 levels by 2030.

SB 1386, Chapter 545, 2016, declared “it to be the policy of the state that the protection and management of natural and working lands … is an important strategy in meeting the state’s greenhouse gas reduction goals, and would require all state agencies, departments, boards, and commissions to consider this policy when revising, adopting, or establishing policies, regulations, expenditures, or grant criteria relating to the protection and management of natural and working lands.”

SB 743, Chapter 386 (September 2013): This bill changes the metric of consideration for transportation impacts pursuant to CEQA from a focus on automobile delay to alternative methods focused on vehicle miles traveled, to promote the state’s goals of reducing greenhouse gas emissions and traffic related air pollution and promoting multimodal transportation while balancing the needs of congestion management and safety.

SB 150, Chapter 150, 2017, Regional Transportation Plans: This bill requires ARB to prepare a report that assesses progress made by each metropolitan planning organization in meeting their established regional greenhouse gas emission reduction targets.

EO B-55-18 (September 2018) sets a new statewide goal to achieve and maintain carbon neutrality no later than 2045. This goal is in addition to existing statewide targets of reducing GHG emissions.

AB 1279, Chapter 337, 2022, The California Climate Crisis Act: This bill mandates carbon neutrality by 2045 and establishes an emissions reduction target of 85% below 1990 level as part of that goal. This bill solidifies a goal included in EO B-55-18. It requires ARB to work with

relevant state agencies to ensure that updates to the scoping plan identify and recommend measures to achieve these policy goals and to identify and implement a variety of policies and strategies that enable carbon dioxide removal solutions and carbon capture, utilization, and storage technologies in California, as specified.

3.4.2 Environmental Setting

The project area is surrounded by mostly developed areas near the City of Davis and City of West Sacramento, but traverses natural open space, vegetation, and agricultural lands within unincorporated Solano County near the City of Dixon as well as the near the Yolo Causeway. County. The I-80/US-50 corridor experiences heavy congestion during commute periods due to high vehicular demand. Traffic congestion during peak hours is common in the project area.

The SACOG Metropolitan Transportation Plan/Sustainable Communities Strategy (MTP/SCS) 2020 update prioritizes multiple transportation options to connect people with places. As a result, the plan forecasts less time spent in congestion, cleaner air, fewer GHG emissions per capita, a modernized, more productive transit system, and more ways for residents to choose walking or cycling for some of their daily trips. SACOG sees managed lanes as a critical component of the regional strategy to raise revenue sufficient to build and maintain the region's transportation system, provide mobility benefits to residents, manage traffic and congestion, and help to achieve the state mandated GHG reduction targets. The full scope of the Yolo County section of the project is included in the 2020 MTP/SCS and is identified as requiring capital improvements in the Corridor System Management Plans, the Sacramento Region Managed Lane Network Vision, and the I-5 Transit Corridor Report. The Solano County portion of the project is in the Solano County Metropolitan Transportation Commission area.

3.4.3 GHG Inventories

A GHG emissions inventory estimates the amount of GHGs discharged into the atmosphere by specific sources over a period of time. Tracking annual GHG emissions allows countries, states, and smaller jurisdictions to understand how emissions are changing and what actions may be needed to attain emission reduction goals. U.S. EPA is responsible for documenting GHG emissions nationwide, and the ARB does so for the state, as required by H&SC Section 39607.4. Cities and other local jurisdictions may also conduct local GHG inventories to inform their GHG reduction or climate action plans.

3.4.3.1 National GHG Inventory

The annual GHG inventory submitted by the U.S. EPA to the United Nations provides a comprehensive accounting of all human-produced sources of GHGs in the United States. The 1990-2019 inventory found that overall GHG emissions were 6,558 million metric tons (MMT) in 2019, down 1.7 percent from 2018 but up 1.8% from 1990 levels. Of these, 80 percent were CO2, 10 percent were CH4, and 7 percent were N2O; the balance consisted of fluorinated gases. CO2 emissions in 2019 were 2.2 percent less than in 2018, but 2.8 percent more than in 1990. As shown on Figure 3.4-1, the transportation sector accounted for 29 percent of U.S. GHG emissions in 2019 (U.S. EPA 2021b, 2021c).

The annual GHG inventory submitted by the U.S. EPA to the United Nations provides a comprehensive accounting of all human-produced sources of GHGs in the United States. Total GHG emissions from all sectors in 2020 were 5,222 million metric tons (MMT), factoring in deductions for carbon sequestration in the land sector. Of these, 79 percent were CO2, 11 percent were CH4, and 7 percent were N2O; the balance consisted of fluorinated gases. Total GHGs in 2020 decreased by 21% from 2005 levels and 11% from 2019. The change from 2019 resulted primarily from less demand in the transportation sector during the COVID-19 pandemic. The transportation sector was responsible for 27 percent of total U.S. GHG emissions in 2020, more than any other sector (Figure 3.4-1, and for 36% of all CO2 emissions from fossil fuel combustion. Transportation CO2 emissions for 2020 decreased 13 percent from 2019 to 2020, but were 7 percent higher than transportation CO2 emissions in 1990 (Figure 3.4-1) (U.S. EPA 2022b).

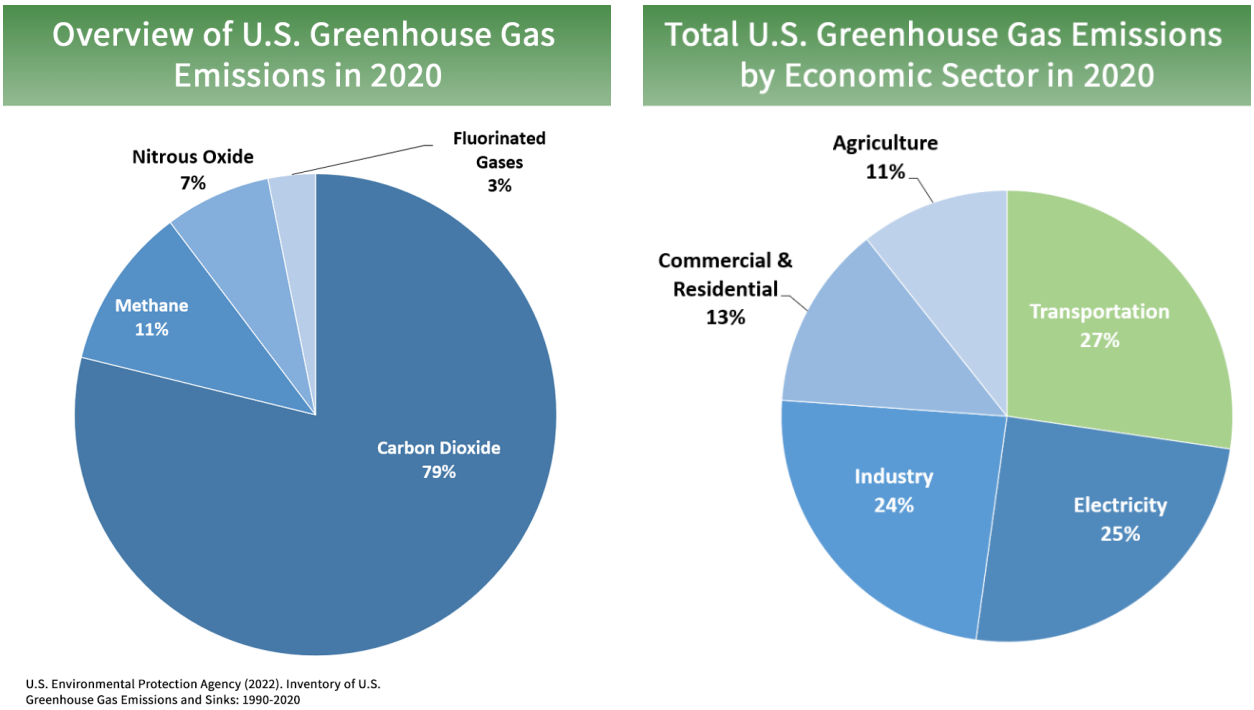


Figure 3.4-1. U.S. 2020 Greenhouse Gas Emissions (Source: U.S. EPA 2022d)

3.4.3.2 State GHG Inventory

ARB collects GHG emissions data for transportation, electricity, commercial/residential, industrial, agricultural, and waste management sectors each year. It then summarizes and highlights major annual changes and trends to demonstrate the state's progress in meeting its GHG reduction goals. The 2022 edition of the GHG emissions inventory reported emissions trends from 2000 to 2020. Total California GHG emissions in 2020 were 369.2 MMTCO2e, a reduction of 35.3 MMTCO2e from 2019 and 61.8 MMTCO2e below the 2020 statewide limit of 431 MMTCO2e. Much of the decrease from 2019 to 2020, however, is likely due to the effects of the COVID-19 pandemic on the transportation sector, during which vehicle miles traveled declined under stay-at-home orders and reductions in goods movement. Nevertheless, transportation remained the largest source of GHG emissions, accounting for 37 percent of

statewide emissions (Figure 3.4-2). (Including upstream emissions from oil extraction, petroleum refining, and oil pipelines in California, transportation was responsible for about 47 percent of statewide emissions in 2020; however, those emissions are accounted for in the industrial sector.) California's gross domestic product (GDP) and GHG intensity (GHG emissions per unit of GDP) both declined from 2019 to 2020 (Figure 3.4-3). It is expected that total GHG emissions will increase as the economy recovers over the next few years (ARB 2022a).

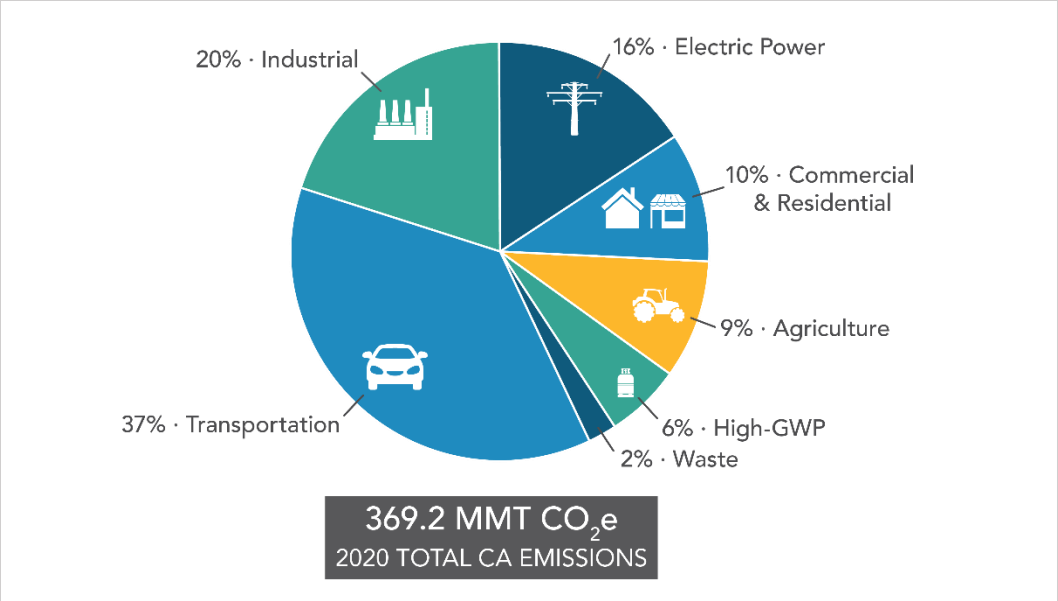

Figure 3.4-2. California 2019 Greenhouse Gas Emissions by Scoping Plan Category (Source: ARB 2022a)

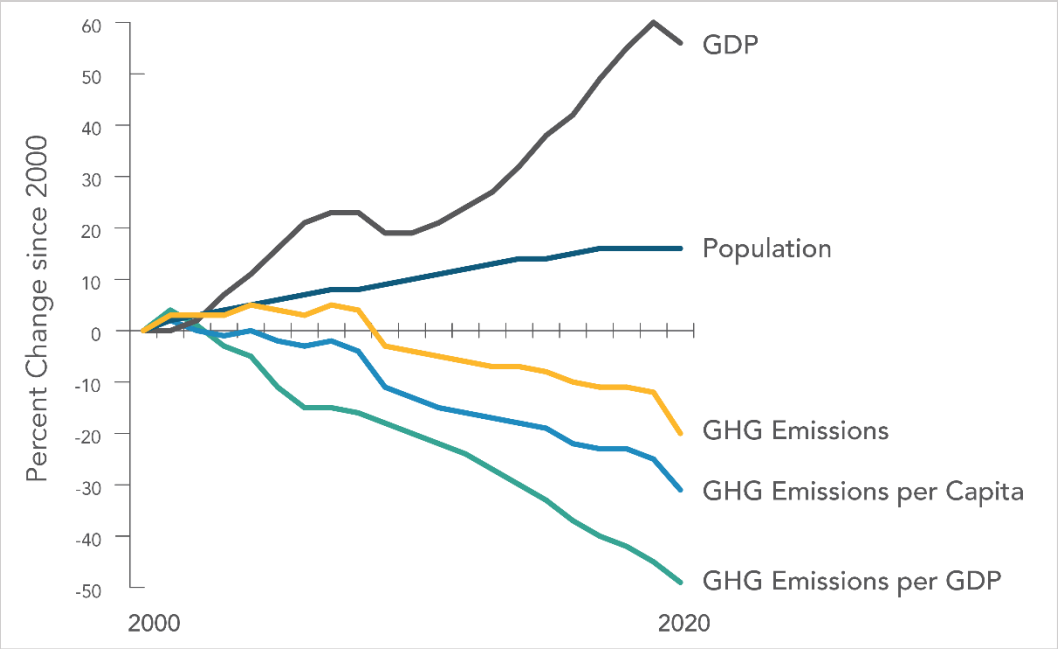

Figure 3.4-3. Change in California GDP, Population, and GHG Emissions since 2000 (Source: ARB 2021a)

AB 32 required ARB to develop a Scoping Plan that describes the approach California will take to achieve the goal of reducing GHG emissions to 1990 levels by 2020, and to update it every 5 years. ARB adopted the first scoping plan in 2008. The second updated plan, California's 2017 Climate Change Scoping Plan, adopted on December 14, 2017, reflects the 2030 target established in EO B-30-15 and SB 32. The draft 2022 Scoping Plan Update additionally lays out a path to achieving carbon neutrality by 2045 (ARB 2022b).

3.4.3.3 Regional Plans

ARB sets regional GHG reduction targets for California's 18 metropolitan planning organizations (MPOs) to achieve through planning future projects that will cumulatively achieve those goals, and reporting how they will be met in the Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS). Targets are set at a percent reduction of passenger vehicle GHG emissions per person from 2005 levels. SACOG MTP/SCS 2020. The regional reduction target for SACOG is 19 percent by 2035 (ARB 2022b).

The project is within the jurisdiction of the SACOG, which is the Regional Transportation Planning Agency (RTPA) for Sacramento, Sutter, Yolo, and Yuba Counties. The 2020 MTP identifies a path for improving air quality, preserving open space and natural resources, and helping California achieve its goal to reduce GHG emissions that contribute to climate change (SACOG 2019) (Table 3.4-1).

Table 3.4-1. Regional and Local Greenhouse Gas Reduction Plans

Title	GHG Reduction Policies or Strategies
SACOG 2020 Metropolitan Transportation Plan/Sustainable Communities Strategy	• Policy 3: Implement pilot projects aimed at making microtransit and micromobility (such as bike and scooter share) work for urban, suburban, rural, and low-income areas of the region. • Policy 4: Pursue flexibility in state and federal funding sources to enable testing and implementation of innovative mobility solutions that are affordable, accessible, and reduce greenhouse gas emissions. • Policy 5: Support innovative education and transportation demand management programs covering all parts of the region, to offer a variety of alternatives to driving alone. • Policy 6: Pursue new funding and planning opportunities to support electric vehicle infrastructure and programs for both private vehicles and public transit fleets. • Policy 7: Support transit agencies and local governments looking to secure funds to improve the frequency, hours of service, and coverage of productive bus service (including bus rapid transit, express bus, and more frequent fixed-route service). • Policy 8: Support more seamless travel through better traveler information for trip planning, reliable service and coordination between operators for transit, shared mobility and other first/last mile connections. • Policy 9: Pursue new and reformed transportation funding methods and sources to implement the MTP/SCS that are stable, predictable, flexible, and adequate to operate, maintain, and expand the transportation system. Mileage-based fees/PayGo should replace, not be on top of, existing state fuel taxes. • Policy 11: Initiate a leadership role in testing and piloting roadway pricing mechanisms, such as facility-based tolling and mileage-based fees, in partnership with the state, federal, and local agencies and private sector organizations. • Policy 12: Take steps to implement tolling or pricing of specific lanes on major facilities, such as freeways, to improve traffic management, reliability, and operations of those facilities and to help raise funding for the cost of building and maintaining large capital investments. • Policy 13: All new major expansion projects on the region's freeways and expressways should be planned for eventual deployment of pricing options to both manage demand and provide a financing mechanism for capital costs. Any pricing strategy pursued should be sensitive to changes in roadway demand during different parts of the day (peak/off-peak) with the objective of managing demand and providing travel choice. • Policy 14: Revenues generated from facility-based pricing should be used to build and maintain a regional network of paid express lanes and, where surplus revenue is available, on strategic transit services (e.g., express buses) or other mobility solutions that can reduce vehicle miles traveled and provide multiple travel options along priced corridors. • Policy 15: New taxes and fees, including mileage-based fees, intended to raise additional funding for transportation purposes should prioritize closing the gap for system maintenance and state-of-good repair needs before investing in system expansion. • Policy 16: When implementing pricing strategies, both paid express lanes and mileage-based fees/PayGo, the region should make every effort to avoid negatively impacting lower income and rural households. For regional implementation of PayGo, explore innovative options for setting fees, such as including off-setting incentives for non-vehicular travel, off-sets to fees for disadvantaged households, and keying fee rates to maintenance and fix-if-first goals. • Policy 22: Invest in bicycle and pedestrian infrastructure to encourage healthy, active transportation trips and provide recreational opportunities for residents and visitors. • Policy 25: Prioritize investments in transportation improvements that reduce greenhouse gas emissions and vehicle miles traveled.

Title	GHG Reduction Policies or Strategies
Yolo County Climate Action Plan	• Increase vehicle fuel efficiency. • Reduce carbon content. • Reducing number of vehicles miles traveled. • Optimizes vehicle operations and driver behavior, including strategies such as speed management, ecodriving, and vehicle maintenance.
Sacramento County Climate Action Plan	• Increase the average fuel efficiency of County-owned vehicles powered by gasoline and diesel and encourage increased fuel efficiency in community vehicles. • Increase use of alternative and lower carbon fuels in the County vehicle fleet and facilitate their use in the community. • Reduce total vehicle miles traveled per capita in the community and the region.
Solano County Climate Action Plan	• TC-1: Solano County will work with STA to enhance countywide rideshare infrastructure and services. • TC-3: Work with cities and STA to improve bicycle and pedestrian connectivity in the county. • TC-4: Educate residents and businesses about options to reduce motor vehicle emissions.

3.4.4 Project Analysis

GHG emissions from transportation projects can be divided into those produced during operation and use of the State Highway System (SHS) (operational emissions) and those produced during construction. The primary GHGs produced by the transportation sector are CO2, CH4, N2O, and HFCs. CO2 emissions are a product of burning gasoline or diesel fuel in internal combustion engines, along with relatively small amounts of CH4 and N2O. A small amount of HFC emissions related to refrigeration is also included in the transportation sector.

The CEQA Guidelines generally address greenhouse gas emissions as a cumulative impact due to the global nature of climate change (Pub. Resources Code, § 21083(b)(2)). As the California Supreme Court explained, “because of the global scale of climate change, any one project's contribution is unlikely to be significant by itself.” (Cleveland National Forest Foundation v. San Diego Assn. of Governments (2017) 3 Cal.5th 497, 512.) In assessing cumulative impacts, it must be determined whether a project’s incremental effect is “cumulatively considerable” (CEQA Guidelines Sections 15064(h)(1) and 15130).

To make this determination, the incremental impacts of the project must be compared with the effects of past, current, and probable future projects. Although climate change is ultimately a cumulative impact, not every individual project that emits greenhouse gases must necessarily be found to contribute to a significant cumulative impact on the environment.

3.4.4.1 Operational Emissions

CO2 from fossil fuel combustion is the largest component of U.S. GHG emissions, and transportation is the largest contributor of CO2. The largest emitters of transportation CO2 emissions in 2020 were passenger cars (38.5 percent), freight trucks (26.3 percent), and light-duty trucks (18.9 percent). The remainder came from other modes of transportation, including aircraft, ships, boats, and trains, as well as pipelines and lubricants (U.S. EPA 2022b). Because

CO2 emissions represent the greatest percentage of GHG emissions, it has been selected as a proxy for the following analysis of potential climate change impacts.

The highest levels of CO_2 from mobile sources such as automobiles occur at stop-and-go speeds (0–25 miles per hour) and speeds over 55 miles per hour; the most severe emissions occur from 0–25 miles per hour (see Figure 3-4-4). To the extent that a project enhances operational efficiency and improves travel times in high-congestion travel corridors, GHG emissions, particularly CO_2, may be reduced, provided that improved travel times do not induce additional VMT.

Four primary strategies can reduce GHG emissions from transportation sources: (1) improving the transportation system and operational efficiencies, (2) reducing travel activity (e.g., vehicle miles traveled), (3) transitioning to lower GHG emitting fuels, and (4) improving vehicle technologies and efficiency. To be most effective, all four strategies should be pursued concurrently.

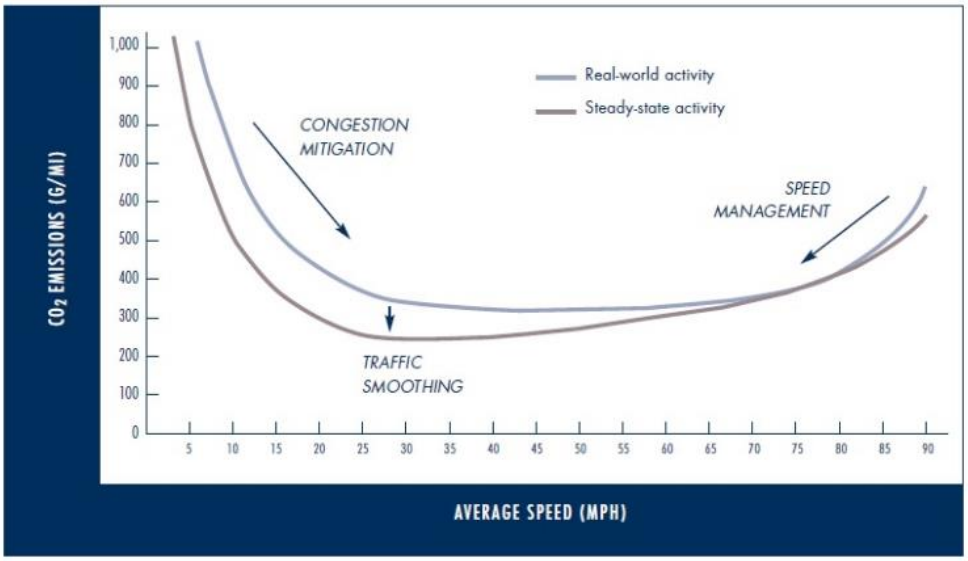

Figure 3.4-4. Possible Use of Traffic Operation Strategies in Reducing On-road CO_2 Emissions

Source: Real-World Carbon Dioxide Impacts of Traffic Congestion. Berkeley, CA: University of California Transportation Center. UCTC-FR-2010-11. Available: https://www.researchgate.net/publication/46438207. (Barth and Boriboonsomsin 2010)

The project is within the jurisdiction of the SACOG, which is the RTPA for Sacramento, Sutter, Yolo, and Yuba Counties. The 2020 MTP identifies a path for improving air quality, preserving open space and natural resources, and helping California achieve its goal to reduce GHG emissions that contribute to climate change (SACOG 2019). The regional reduction target for passenger vehicle GHG emissions per person from 2005 levels for SACOG is 19 percent by 2035 (ARB 2019c). The project is included in the SACOG MTP/SCS 2020.

The Build Alternatives would implement managed lanes to manage traffic congestion, accommodate travel demands, and improve modality and travel time reliability. By helping to provide a continuous managed lane system, the project, combined with other in-progress and

proposed managed lane projects, would provide reliable travel times, and help contribute to the completion of the regional transportation network envisioned in the SACOG MTP/SCS.

3.4.4.2 Quantitative Analysis

A quantitative analysis of daily GHG emissions was performed using the Caltrans CT-EMFAC2021. CT-EMFAC2021 is an emission model developed by Caltrans that calculates project-level emissions using data from the California Air Resources Board's EMFAC 2021 model. GHG emissions were calculated for the Build Alternatives under existing (2019), opening (2029), and design (2049) year conditions. As shown in Table 3.4-2, GHG emissions for some alternatives would increase (up to 11.0 percent) under opening year conditions. However, under long-term design year conditions, GHG emissions improve with the project and all alternatives would achieve an emissions reduction (up to 16.9 percent) (Table 3.4-2).

ARB developed the EMission FACtors (EMFAC) model to facilitate preparation of statewide and regional mobile source emissions inventories. The model generates emissions rates that can be multiplied by vehicle activity data from all motor vehicles, including passenger cars to heavy-duty trucks, operating on highways, freeways, and local roads in California. EMFAC has a rigorous scientific foundation, has been approved by U.S. EPA, and has been vetted through multiple stakeholder reviews. Caltrans developed CT-EMFAC to apply project-specific factors to ARB's model.

EMFAC's GHG emission rates are based on tailpipe emissions test data and the model does not account for factors such as the rate of acceleration and vehicle aerodynamics, which influence the amount of emissions generated by a vehicle. GHG emissions quantified using CT-EMFAC are therefore estimates and may not reflect actual on-road emissions. Furthermore, the model does not account for induced travel. Modeling GHG estimates with EMFAC or CT-EMFAC nevertheless remains the most precise means of estimating future greenhouse gas emissions. While CT-EMFAC is currently the best available tool for calculating GHG emissions from mobile sources, it is important to note that the GHG results are only useful for a comparison of alternatives. Federal CAFE and GHG emissions standards continue to evolve, and models will be updated to account for regulatory changes.

Table 3.4-2. Modeled Annual Carbon Dioxide Equivalent (CO_2e) Emissions by Alternative

Year	CO_2e Emissions	Baseline (Existing Yr 2019)	Alt 1 (No Build)	Alt 2a	Alt 2b	Alt 3a	Alt 3b	Alt 4a	Alt 4b	Alt 5a	Alt 5b	Alt 6a	Alt 6b	Alt 7a	Alt 7b

Notes:
CO_2 = carbon dioxide
CO_2e = carbon dioxide equivalent
carbon dioxide (CO_2), nitrous oxide (N_2O), methane (CH_4): all GHGs included in the model's calculation of CO_2e
N/A = not available

3.4.4.3 Construction Emissions

Construction GHG emissions would result from material processing and transportation, on-site construction equipment, and traffic delays due to construction. These emissions will be produced at different levels throughout the construction phase; their frequency and occurrence can be reduced through innovations in plans and specifications and by implementing better traffic management during construction phases.

Use of long-life pavement, improved traffic management plans, and changes in materials can also help offset GHG emissions produced during construction by allowing longer intervals between maintenance and rehabilitation activities.

GHG emissions from project construction were estimated using CAL-CET2020 version 1.0.1. There will be about 5,532 tons of CO2 generated over the entire construction project.

All construction contracts include Caltrans Standard Specifications related to air quality. Section 7-1.02A and 7 1.02C, Emissions Reduction, requires contractors to comply with all laws applicable to the project and to certify they are aware of and will comply with all ARB emission reduction regulations. Section 14-9.02, Air Pollution Control, requires contractors to comply with all air pollution control rules, regulations, ordinances, and statutes. Certain common regulations, such as equipment idling restrictions, that reduce construction vehicle emissions also help reduce GHG emissions.

3.4.5 CEQA Conclusion

The Build Alternatives would result in GHG emissions during construction. In addition, the Build Alternatives would result in additional vehicle capacity that would result in an increase of VMTs. Therefore, long-term operational GHG emissions would potentially increase from existing conditions under 2029 opening year assumptions. However, as projected under the 20-year horizon design assumptions (2049), although VMTs were estimated to increase, GHG emissions were estimated to decrease for the Build Alternatives as compared to conditions under 2029, which is attributed to newer more fuel-efficient fleets and the increase in electric vehicles by the year 2049. The project does not conflict with any applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs. With the implementation of construction GHG reduction mitigation measures, the impact would be less than significant.

Caltrans is firmly committed to implementing measures to help reduce GHG emissions. These measures are outlined in the following section.

3.4.6 Greenhouse Gas Reduction Strategies

3.4.6.1 Statewide Efforts

In response to AB 32, California is implementing measures to achieve emission reductions of GHGs that cause climate change. Climate change programs in California are effectively reducing GHG emissions from all sectors of the economy. These programs include regulations, market programs, and incentives that will transform transportation, industry, fuels, and other

sectors, to take California into a sustainable, low-carbon and cleaner future, while maintaining a robust economy (ARB 2022d).

Major sectors of the California economy, including transportation, will need to reduce emissions to meet 2030 and 2050 GHG emissions targets. The Governor's Office of Planning and Research identified five sustainability pillars in a 2015 report: (1) increasing the share of renewable energy in the State's energy mix to at least 50 percent by 2030; (2) reducing petroleum use by up to 50 percent by 2030; (3) increasing the energy efficiency of existing buildings by 50 percent by 2030; (4) reducing emissions of short-lived climate pollutants; and (5) stewarding natural resources, including forests, working lands, and wetlands, to ensure that they store carbon, are resilient, and enhance other environmental benefits (OPR 2015). OPR later added strategies related to achieving statewide carbon neutrality by 2045 in accordance with EO B-55-18 and AB 1279 (OPR 2022).

The transportation sector is integral to the people and economy of California. To achieve GHG emission reduction goals, it is vital that the state build on past successes in reducing criteria and toxic air pollutants from transportation and goods movement. GHG emission reductions will come from cleaner vehicle technologies, lower carbon fuels, and reduction of vehicle miles traveled (VMT). Reducing today's petroleum use in cars and trucks by 50% is a key state goal for reducing greenhouse gas emissions by 2030 (California Environmental Protection Agency 2015).

In addition, SB 1386 (Wolk 2016) established as state policy the protection and management of natural and working lands and requires state agencies to consider that policy in their own decision-making. Trees and vegetation on forests, rangelands, farms, and wetlands remove carbon dioxide from the atmosphere through biological processes and sequester the carbon in above- and below-ground matter.

Subsequently, Governor Gavin Newsom issued Executive Order N-82-20 to combat the crises in climate change and biodiversity. It instructs state agencies to use existing authorities and resources to identify and implement near- and long-term actions to accelerate natural removal of carbon and build climate resilience in our forests, wetlands, urban greenspaces, agricultural soils, and land conservation activities in ways that serve all communities and in particular low-income, disadvantaged, and vulnerable communities. To support this order, the California Natural Resources Agency (2022a) released Natural and Working Lands Climate Smart Strategy, with a focus on nature-based solutions.

Caltrans Activities

Caltrans continues to be involved on the Governor's Climate Action Team as the ARB works to implement EOs S-3-05 and S-01-07 and help achieve the targets set forth in AB 32. EO B-30-15, issued in April 2015, and SB 32 (2016), set an interim target to cut GHG emissions to 40 percent below 1990 levels by 2030. The following major initiatives are underway at Caltrans to help meet these targets.

California Action Plan for Transportation Infrastructure

The California Action Plan for Transportation Infrastructure (CAPTI) builds on executive orders signed by Governor Newsom in 2019 and 2020 targeted at reducing GHG emissions in transportation, which account for more than 40 percent of all polluting emissions, to reach the state's climate goals. Under CAPTI, where feasible and within existing funding program structures, the state will invest discretionary transportation funds in sustainable infrastructure projects that align with its climate, health, and social equity goals (California State Transportation Agency 2021).

California Action Plan for Transportation Infrastructure

The California Transportation Plan (CTP) is a statewide, long-range transportation plan to meet our future mobility needs and reduce GHG emissions. It serves as an umbrella document for all the other statewide transportation planning documents. The CTP 2050 presents a vision of a safe, resilient, and universally accessible transportation system that supports vibrant communities, advances racial and economic justice, and improves public and environmental health. The plan's climate goal is to achieve statewide GHG emissions reduction targets and increase resilience to climate change. It demonstrates how GHG emissions from the transportation sector can be reduced through advancements in clean fuel technologies; continued shifts toward active travel, transit, and shared mobility; more efficient land use and development practices; and continued shifts to telework (Caltrans 2021a).

Caltrans Strategic Plan

The Caltrans 2020–2024 Strategic Plan includes goals of stewardship, climate action, and equity. Climate action strategies include developing and implementing a Caltrans Climate Action Plan; a robust program of climate action education, training, and outreach; partnership and collaboration; a VMT monitoring and reduction program; and engaging with the most vulnerable communities in developing and implementing Caltrans climate action activities (Caltrans 2021b).

Caltrans Policy Directives and Other Initiatives

Caltrans Director's Policy 30 (DP-30) Climate Change (June 22, 2012) established a Department policy to ensure coordinated efforts to incorporate climate change into Departmental decisions and activities. Caltrans Greenhouse Gas Emissions and Mitigation Report (Caltrans 2020) provides a comprehensive overview of Caltrans' emissions. The report documents and evaluates current Caltrans procedures and activities that track and reduce GHG emissions and identifies additional opportunities for further reducing GHG emissions from Department-controlled emission sources, in support of Departmental and State goals.

3.4.6.2 Project-Level GHG Reduction Strategies

The following measures will also be implemented in the project to reduce GHG emissions and potential climate change impacts from the project.

The following measures would be implemented to reduce GHG emissions and potential climate change impacts from the project.

Construction contractors will comply with Caltrans Standard Specifications Section 7-1.02A and 71.02C, Emissions Reduction, and Section 14-9.02, Air Pollution Control, which requires contractors to comply with all air pollution control rules, regulations, ordinances, and statutes. As outlined in Appendix E, the project would implement Standard Measures GHG-1 through GHG-6 to reduce GHG emissions. GHG-6 would require Caltrans to maintain access for bicycle and pedestrians throughout construction. GHG-5 commits Caltrans to revegetating disturbed areas to offset any potential CO2 emissions increase through carbon sequestration.

3.4.7 Adaptation

Reducing GHG emissions is only one part of an approach to addressing climate change. Caltrans must plan for the effects of climate change on the state's transportation infrastructure and strengthen or protect the facilities from damage. Climate change is expected to produce increased variability in precipitation, rising temperatures, rising sea levels, variability in storm surges and their intensity, and in the frequency and intensity of wildfires. Flooding and erosion can damage or wash out roads; longer periods of intense heat can buckle pavement and railroad tracks; storm surges combined with a rising sea level can inundate highways. Wildfire can directly burn facilities and indirectly cause damage when rain falls on denuded slopes that landslide after a fire. Effects will vary by location and may, in the most extreme cases, require that a facility be relocated or redesigned. Accordingly, Caltrans must consider these types of climate stressors in how highways are planned, designed, built, operated, and maintained.

3.4.7.1 Federal Efforts

Under NEPA Assignment, Caltrans is obligated to comply with all applicable federal environmental laws and FHWA NEPA regulations, policies, and guidance.

The Fourth National Climate Assessment, published in 2018, presents the foundational science and the "human welfare, societal, and environmental elements of climate change and variability for 10 regions and 18 national topics, with particular attention paid to observed and projected risks, impacts, consideration of risk reduction, and implications under different mitigation pathways."

The U.S. DOT Policy Statement on Climate Adaptation in June 2011 committed the federal Department of Transportation to "integrate consideration of climate change impacts and adaptation into the planning, operations, policies, and programs of DOT in order to ensure that taxpayer resources are invested wisely, and that transportation infrastructure, services and operations remain effective in current and future climate conditions" (U.S. DOT 2011).

FHWA order 5520 (Transportation System Preparedness and Resilience to Climate Change and Extreme Weather Events, December 15, 2014) established FHWA policy to strive to identify the risks of climate change and extreme weather events to current and planned transportation systems. FHWA has developed guidance and tools for transportation planning that foster resilience to climate effects and sustainability at the federal, state, and local levels (FHWA 2019).

Under NEPA Assignment, Caltrans is obligated to comply with all applicable federal environmental laws and FHWA NEPA regulations, policies, and guidance.

The Fourth National Climate Assessment, published in 2018, presents the foundational science and the "human welfare, societal, and environmental elements of climate change and variability for 10 regions and 18 national topics, with particular attention paid to observed and projected risks, impacts, consideration of risk reduction, and implications under different mitigation pathways."

The U.S. DOT Policy Statement on Climate Adaptation in June 2011 committed the federal Department of Transportation to "integrate consideration of climate change impacts and adaptation into the planning, operations, policies, and programs of DOT in order to ensure that taxpayer resources are invested wisely, and that transportation infrastructure, services and operations remain effective in current and future climate conditions" (U.S. DOT 2011). The U.S. DOT Climate Action Plan of August 2021 followed up with a statement of policy to "accelerate reductions in greenhouse gas emissions from the transportation sector and make our transportation infrastructure more climate change resilient now and in the future," following this set of guiding principles (U.S. DOT 2021):

- Use best available science
- Prioritize the most vulnerable
- Preserve ecosystems
- Build community relationships
- Engage globally

U.S. DOT developed its climate action plan pursuant to the federal EO 14008, Tackling the Climate Crisis at Home and Abroad (January 27, 2021). EO 14008 recognized the threats of climate change to national security and ordered federal government agencies to prioritize actions on climate adaptation and resilience in their programs and investments (White House 2021).

FHWA order 5520 (Transportation System Preparedness and Resilience to Climate Change and Extreme Weather Events, December 15, 2014) established FHWA policy to strive to identify the risks of climate change and extreme weather events to current and planned transportation systems. FHWA has developed guidance and tools for transportation planning that foster resilience to climate effects and sustainability at the federal, state, and local levels (FHWA 2019).

3.4.7.2 State Efforts

Climate change adaptation for transportation infrastructure involves long-term planning and risk management to address vulnerabilities in the transportation system. A number of state policies and tools have been developed to guide adaptation efforts.

California's Fourth Climate Change Assessment (Fourth Assessment) (2018) is the state's effort to "translate the state of climate science into useful information for action." It provides information that will help decision makers across sectors and at state, regional, and local scales

protect and build the resilience of the state's people, infrastructure, natural systems, working lands, and waters. The State's approach recognizes that the consequences of climate change occur at the intersections of people, nature, and infrastructure. The Fourth Assessment reports that if no measures are taken to reduce GHG emissions by 2021 or sooner, the state is projected to experience a 2.7 to 8.8 degrees Fahrenheit increase in average annual maximum daily temperatures, with impacts on agriculture, energy demand, natural systems, and public health; a two-thirds decline in water supply from snowpack and water shortages that will impact agricultural production; a 77% increase in average area burned by wildfire, with consequences for forest health and communities; and large-scale erosion of up to 67% of Southern California beaches and inundation of billions of dollars' worth of residential and commercial buildings due to sea level rise (State of California 2018).

Sea level rise is a particular concern for transportation infrastructure in the coastal zone. Major urban airports will be at risk of flooding from sea level rise combined with storm surge as early as 2040; San Francisco airport is already at risk. Miles of coastal highways vulnerable to flooding in a 100-year storm event will triple to 370 by 2100, and 3,750 miles will be exposed to temporary flooding. The Fourth Assessment's findings highlight the need for proactive action to address these current and future impacts of climate change.

In 2008, then-governor Arnold Schwarzenegger recognized the need when he issued EO S-13-08, focused on sea level rise. Technical reports on the latest sea level rise science were first published in 2010 and updated in 2013 and 2017. The 2017 projections of sea level rise and new understanding of processes and potential impacts in California were incorporated into the State of California Sea Level Rise Guidance Update in 2018. This EO also gave rise to the California Climate Adaptation Strategy (2009), updated in 2014 as Safeguarding California: Reducing Climate Risk (Safeguarding California Plan), which addressed the full range of climate change impacts and recommended adaptation strategies. The Safeguarding California Plan was updated in 2018 and again in 2021 as the California Climate Adaptation Strategy, incorporating key elements of the latest sector-specific plans such as the Natural and Working Lands Climate Smart Strategy, Wildfire and Forest Resilience Action Plan, Water Resilience Portfolio, and the CAPTI (described above). Priorities in the 2021 California Climate Adaptation Strategy include acting in partnership with California Native American Tribes, strengthening protections for climate-vulnerable communities that lack capacity and resources, nature-based climate solutions, use of best available climate science, and partnering and collaboration to best leverage resources (California Natural Resources Agency 2022b).

EO B-30-15, signed in April 2015, requires state agencies to factor climate change into all planning and investment decisions. This EO recognizes that effects of climate change in addition to sea level rise also threaten California's infrastructure. At the direction of EO B-30-15, the Office of Planning and Research published Planning and Investing for a Resilient California: A Guidebook for State Agencies in 2017, to encourage a uniform and systematic approach.

AB 2800 (Quirk 2016) created the multidisciplinary Climate-Safe Infrastructure Working Group to help actors throughout the state address the findings of California's Fourth Climate Change Assessment. It released its report, Paying it Forward: The Path Toward Climate-Safe Infrastructure in California, in 2018. The report provides guidance to agencies on how to

address the challenges of assessing risk in the face of inherent uncertainties still posed by the best available science on climate change. It also examines how state agencies can use infrastructure planning, design, and implementation processes to address the observed and anticipated climate change impacts (Climate Change Infrastructure Working Group 2018).

3.4.7.3 Caltrans Adaptation Efforts

Caltrans Vulnerability Assessments

Caltrans completed climate change vulnerability assessments to identify segments of the State Highway System vulnerable to climate change effects of precipitation, temperature, wildfire, storm surge, and sea level rise.

The climate change data in the assessments were developed in coordination with climate change scientists and experts at federal, state, and regional organizations at the forefront of climate science. The findings of the vulnerability assessments guide analysis of at-risk assets and development of Adaptation Priority Reports as a method to make capital programming decisions to address identified risks.

3.4.7.4 Project Adaptation Analysis

Sea Level Rise

The project is outside the coastal zone and not in an area subject to sea level rise. Therefore, direct impacts to the project due to projected sea level rise are not expected. However, according to the Caltrans District 3 Climate Change Vulnerability Assessment Map (2021), the Yolo Causeway would be vulnerable to sea level rise if exposed to a scenario of sea level rise of 2 meters or up, see Figure 3.4-5.

Precipitation and Flooding

The District 3 Climate Change Vulnerability Assessment indicates the potential for a 0-4.9 percent increase in 100-year storm precipitation depth in the project vicinity by 2025 and through 2085 (Caltrans 2019). Many local geomorphic variables affect how a given precipitation event would affect streamflow, making it difficult to assess potential impacts at a particular location. The current scope of the project will not raise or change the profile of any of the highways within Segment 1, and it is anticipated that there will be no negative impacts to the FEMA mapped floodplain in this area. Therefore, the project is not likely to be affected by future changes in storm precipitation, and risk of interrupting traffic flow or emergency vehicles or access on I-80 is low.

Wildfire

The project is not in a high fire hazard severity zone. The Caltrans Climate Change Vulnerability Assessment for District 3 evaluated roads at risk for future wildfire. Mapping of wildfire risk shows a portion of the project area is in an area of wildfire concern and was not characterized as exposed roadway through 2085. As described in Section 3.3, Wildfire, the project would serve the same use as the existing use and would not exacerbate wildfire risks. Caltrans would

implement AMM WF-1 to reduce the potential wildfire risks during construction. Accordingly, the project is not likely to be subject to effects of wildfire that could occur under climate change.

Temperature

The District Climate Change Vulnerability Assessment does not indicate temperature changes during the project's design life that would require adaptive changes in pavement design or maintenance practices.

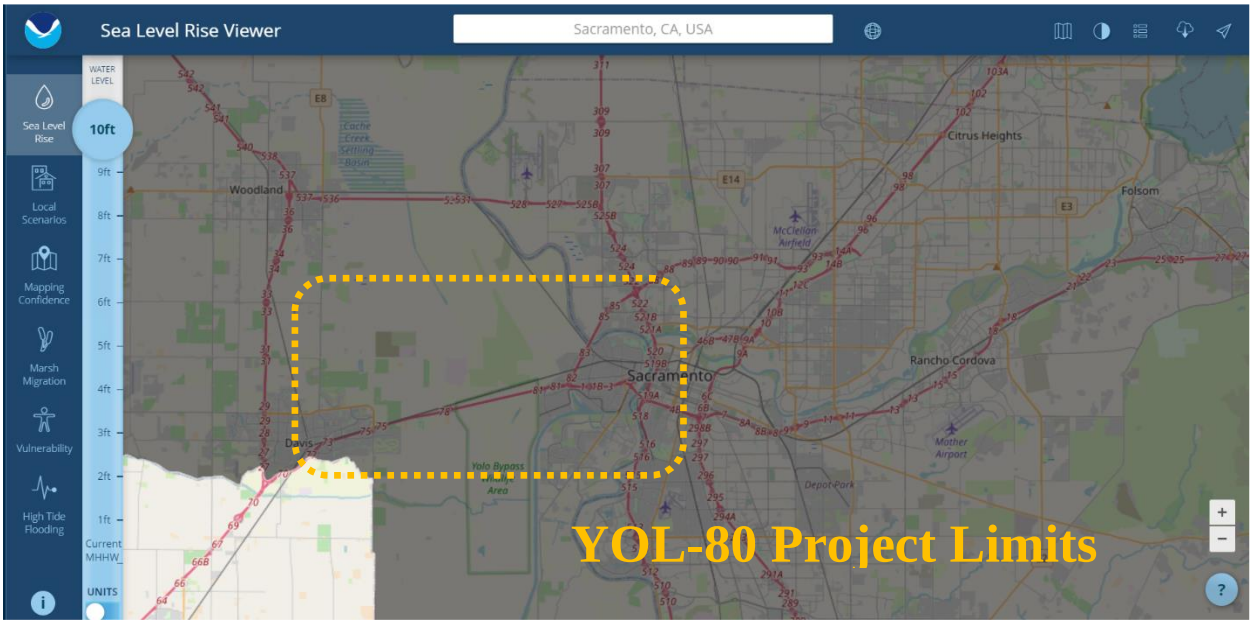

Figure 3.4-5. Project Limits with Sea Level Rise

Chapter 4 Comments and Coordination

Early and continuing coordination with the general public and appropriate public agencies is an essential part of the environmental process to determine the scope of environmental documentation, the level of analysis, potential impacts and mitigation measures, and related environmental requirements. Agency consultation and public participation for the Yolo 80 Corridor Improvements Project have been accomplished through a variety of formal and informal methods, including project development team meetings, interagency coordination meetings, and correspondence with other interested parties. This chapter summarizes the results of Caltrans' efforts to fully identify, address, and resolve project-related issues through early and continuing coordination.

4.1 Public Scoping and Participation

A Notice of Preparation (NOP) memorandum was filed with the State Clearinghouse on June 6, 2021, which was revised on August 17, 2021, to notify that the scoping meeting was rescheduled. Caltrans accepted scoping comments until September 24, 2021. A revised NOP was also distributed on October 17, 2022, that included clarification of the proposed managed lane strategies and Build Alternatives. A copy of the NOP is included in Appendix G.

Scoping was noticed through newspaper advertisements that ran in the *Davis Enterprise* on August 18, 2021, and the *Sacramento Bee* on August 23, 2021, and via Facebook, Twitter (now X), and Caltrans' project website. In addition, Caltrans notified members of the community and media through email.

Two public scoping meetings were held virtually through WebEx on August 25, 2021, at 6:00 p.m. and at 7:00 p.m. The purpose of these meetings was to discuss the scope of the EIR/EA and the potential effects of the project. Each meeting included a brief presentation on the project and the environmental review process. Attendees were encouraged to submit comments during the meeting or to Caltrans staff via mail or email.

Comments from the public that were submitted during the meeting included questions regarding proposed bicycle facilities, project funding, projects in the nearby area, project timing, proposed lane configuration, proposed sound wall locations, and proposed work within the Yolo causeway. In addition, written comment letters included requests to consider potential air quality effects to sensitive receptors, increased flood risks, potential fish passage impacts, Native American Tribal consultation, utility relocation, etc.

Additional public outreach took place during the circulation period of the Draft EIR/EA.

4.1.1 Stakeholder Meetings

In addition to the public scoping, Caltrans established a steering committee for the project that included local stakeholders, such as the Cities of Davis and West Sacramento, Yolo County,

Sacramento Area Council of Governments (SACOG), Yolo Transportation District (YoloTD), University of California (UC) Davis, Bicycle Coalition, etc. The steering committee held several public meetings within the Cities of Davis, Sacramento, and West Sacramento to discuss the project and receive input from the community. The meetings occurred as follows:

- June 6, 2018, Davis Senior Center, 646 A Street, Davis, CA 95616, 6:00 p.m.–7:30 p.m.
- June 14, 2018, West Sacramento City Hall, 1110 West Capitol Avenue, West Sacramento, CA 95691, 6:00 p.m.–7:30 p.m.
- June 21, 2018, Sacramento City Hall, 915 I Street, Sacramento, CA 95814, 6 p.m.–7:30 p.m.
- November 21, 2019, Mary L. Stephens Davis Library Blanchard Room, 315 East 14th Street, Davis, CA 95616, 6:30 p.m.–7:30 p.m.
- February 27, 2020, West Sacramento City Hall, 1110 West Capitol Ave, West Sacramento, CA 95691, 6:30 p.m.–7:30 p.m.
- August 25, 2021, Virtual (via WebEx), 6:00 p.m. and 7:00 p.m.
- Weekly meetings with YoloTD, SACOG, and CTC.
- December 1, 2023, YoloTD Board presentation preparation.
- December 7, 2023, SACOG Transportation Committee Meeting.
- December 7, 2023, YoloTD Board presentation preparation.
- December 11, 2023, SACOG Board meeting.
- December 11, 2023, YoloTD Board meeting.
- December 13, 2023, Yolo County annual coordination meeting with cities and counties surrounding Yolo County (Yolo County, City of Davis, City of West Sacramento, City of Winters, Yocha Dehe Wintun Nation tribe).
- December 18, 2023, Sacramento Transportation Authority Board meeting.
- January 8, 2024, City of Davis project coordination.

The purpose of these meetings was to discuss potential project activities and answer questions. Comments received from the public included bicycle improvements, potential toll lane pricing, sound wall locations, design alternatives, construction impacts to bat species, and other questions regarding project design elements.

4.1.2 Project Development Team Meetings

Project Development Team (PDT) meetings provided the forum for coordination, issue resolution, and information feedback between Caltrans, Sacramento Council of Governments, West Sacramento, Davis, Yolo County, UC Davis, and YoloTD.

PDT meetings have occurred monthly since October 3, 2017, and will continue to occur throughout the remainder of the environmental and project approval process. The PDT represents various fields of expertise including design, environmental review, traffic operations, right-of-way, and project management. Accordingly, the PDT convenes to review the project status, address issues as they arise, and provide overall direction throughout the project development process.

4.1.3 Coordination with Wildlife Professionals

Caltrans conducted outreach to Corky Quirk and Dave Johnston about the bat population on the causeway during July of 2020. Caltrans conducted outreach to Eric Hansen to discuss habitat suitability for giant garter snake during June of 2023.

4.1.4 Public Meetings During Circulation of Draft EIR/EA

Caltrans held two public outreach/open house gatherings during the comment period for the Draft EIR/EA. A news release announcing the meetings was posted to social media feeds on Facebook and X (previously Twitter) with a link to the news release. A copy of the release announcing the meetings was sent to the Sacramento television stations listed below. The public notice about the meetings also ran in the Davis Enterprise newspaper. Additionally, a Caltrans Spanish interpreter was available during the public gatherings.

Local television stations to which news releases were sent.

KCRA Channel 3 - NBC
KUVS Channel 19 – Spanish
KMAX Channel 31
KOVR Channel 13 - CBS
KTXL Channel 40 – Fox

The first outreach/open house meeting was on November 28, 2023, from 5:30 p.m. to 7:30 p.m. in West Sacramento at the Arthur F. Turner Community Library (1212 Merkley Ave, West Sacramento, CA). Thirty-four attendees signed the registration sheet at the meeting. The second was on December 13, 2023, from 5:30 p.m. to 7:30 p.m. in the City of Davis at the Mary L. Stephens Davis Branch Library (315 E 14th St, Davis, CA). Forty-three attendees signed the registration sheet. Additional people attended both meetings without signing in. Each meeting was an open house style gathering with information boards placed about the room depicting various aspects of the project. Technical experts were on hand to respond to questions from attendees. Comment forms were available for attendees to complete during the meeting and provide to Caltrans staff or to complete afterward and submit via mail. The forms also allowed commenters to indicate their preferred alternative. At or after the November meeting, 7

comment forms were returned, and at or after the December meeting, 17 forms were returned. The forms are included with other public comment letters in Section 4.3.1, *Comments Received*.

4.2 Consultation and Coordination with Public Agencies

4.2.1 Federal Agencies

On January 28, 2021, a list of federal listed anadromous fish species with the potential to occur in the Sacramento West, Davis, Merritt, and Dixon, California USGS 7.5- minute topographic quadrangles was obtained from the National Marine Fisheries Services (NMFS). Early correspondence with U.S. Fish and Wildlife Service (USFWS) via email was done during June and July of 2021. On July 27, 2021, Adam Stewart, a biologist with the USFWS Sacramento Office, met with Caltrans staff to conduct a site visit and review of key habitat areas in the project footprint, and to discuss potential effects and avoidance measures for each species.

On October 19, 2022, a list of federally listed species with the potential to occur in the Biological Study Area (BSA) was obtained from the Sacramento USFWS Office. An updated species list was obtained on March 27, 2023.

A Biological Assessment (BA) was prepared for Section 7 consultation under the ESA. Caltrans sent a letter and the BA to USFWS on May 12, 2023, to initiate formal consultation.

Email correspondence with USFWS regarding the content and details of the BA between May and August of 2023. Email correspondence with USFWS regarding questions about species habitat and construction during January and February of 2024. Email correspondence with USFWS regarding status of the Biological Opinion and conservation measures occurred in February of 2024.

USFWS issued their Biological Opinion on April 12, 2024.

4.2.2 State Agencies

Early correspondence with California Department of Fish and Wildlife (CDFW) occurred via email during June and July of 2021. A field visit was conducted with CDFW staff on July 27, 2021, to discuss potentially sensitive areas and gather information from CDFW based on their recommended course of action for project planning. Many Caltrans staff and the project consultant were in attendance. Caltrans is in ongoing coordination with CDFW to explore the options for obtaining a consistency determination (CD) for the Project. If a CD is deemed inappropriate for this Project, Caltrans would proceed in obtaining an incidental take permit (ITP) for giant garter snake (GGS) as further discussed in Section 2.3.

As further described in Section 2.1, Caltrans evaluated the built environment resources and determined that they were not eligible for inclusion in the National Register of Historic Places (NRHP)/California Register of Historic Resources (CRHR). On September 30, 2021, Caltrans received concurrence from State Historic Preservation Officer (SHPO) that the seven built environment resources were ineligible.

Caltrans held weekly meetings with the California Transportation Commission and project partner agencies YoloTD and SACOG.

4.2.3 Native American Tribal Consultation

As further described in Section 2.1.7, Cultural Resources, the Native American Heritage Commission (NAHC) was contacted May 14, 2020, to request a search of the Sacred Land Files and request a list of Native American tribes or individuals with potential interests, concerns, and/or knowledge regarding cultural resources or traditional cultural properties that may be affected by the project. Of the 11 tribes originally identified by the NAHC, all responded and requested to continue consultation except for the Ione Band of Miwok Indians, the Nashville Enterprise Miwok-Maidu-Nishinam Tribe, the Ts'i Akim Maidu, and the Cortina Rancheria-Kletsel Dehe Band of Wintun Indians.

Formal consultation began on June 4th, 2020, and was followed up by phone calls and/or emails to the Native American contacts who were identified as having an interest in projects within this area by the NAHC:

- Rhonda Morningstar Pope, Chairperson, Buena Vista Rancheria of Me-Wuk Indians
- Clyde Prout, Chairman, Colfax-Todds Valley Consolidated Tribe
- Sara Dutschke Setchwaelo, Chairperson, Ione Band of Miwok Indians
- Cosme Valdez, Chairperson, Nashville Enterprise Miwok-Maidu-Nishinam Tribe
- Regina Cuellar, Chairperson, Shingle Springs Band of Miwok Indians
- Grayson Coney, Cultural Director, Ts'i Akim Maidu
- Gene Whitehouse, Chairperson, United Auburn Indian Community of the Auburn Rancheria
- Raymond Hitchcock, Chairperson, Wilton Rancheria
- Anthony Roberts, Chairperson, Yocha Dehe Wintun Nation
- Charlie Wright, chairperson, Cortina Rancheria-Kletsel Dehe Band of Wintun Indians
- Marlene Sanchez, Chairperson, Guidiville Indian Rancheria

The Colfax-Todds Valley Consolidated Tribe noted that they would like to defer to a tribe more familiar with the project area. Buena Vista Rancheria of Me-Wuk Indians reviewed the project and did not request additional consultation but requested to be notified if any cultural resources are documented. Guidiville Indian Rancheria had no concerns and requested copies of the reports to add to their records.

Shingle Springs noted areas of concern and asked for continued consultation. United Auburn Indian Community (UAIC) notes areas of concern and requested to monitor testing. The Yocha Dehe Wintun Nation noted areas of concern and requested to monitor testing. Wilton Ranchera also noted areas of concern and a desire to continue consultation. A joint meeting was held with concerned tribes; and project details and areas of concern were discussed. Consultation continued in the form of emails, phone calls, and online meetings with all concerned parties as the project developed.

The Yocha Dehe Wintun Nation provided a monitor for the XPI trenching, and UAIC monitored the geotechnical work at Bryte Bend bridge. Following the negative results from surveys and

subsurface testing, no additional concerns were raised about the potential to affect tribal cultural resources within the project limits.

4.2.4 Consultation with Stakeholders for Vehicle Miles Traveled Mitigation

According to the Caltrans VMT Program Bulletin 21-01: VMT Mitigation Funding Status & Additionality (2021), Caltrans strategy seeks to minimize any induces traffic that would generate vehicle miles traveled (VMT), which would reduce or eliminate the need for mitigation. However, when state highway system projects do generate VMT, mitigation strategies must be employed per CEQA. According to Bulletin 21-01, projects or programs must be able to demonstrate a negative effect on VMT and be relatively likely to come to fruition to qualify as feasible mitigation.

Consultation occurred during circulation of the Draft EIR/EA to ensure strict timelines for the final document could be met. Consultation continued after Draft EIR/EA circulation in response to public comments to finalize VMT mitigation for the Final EIR/EA. Consultation was accomplished through written communications and virtual meetings.

A summary of VMT mitigation correspondences, meetings, and other notable discussions with stakeholders to-date is provided as Table 4.2-1.

Table 4.2-1. Yolo 80 Managed Lanes VMT Mitigation Correspondences, Meetings, Good Faith Efforts

Date	Type	People/Agencies	Discussion Topics
12/20/2022	PDT - Project Wide Discussion	Caltrans Staff, YCTD, Stantec (Env consultant), City of West Sacramento, Yolo County, Wood Rodgers, City of Davis, UC Davis, SACOG	Project overview, VMT Mitigation Plan, Draft environmental document Schedule.
12/28/2022	Environmental Status	Caltrans Staff (P.M., Environmental)	Environmental schedule, risks, target dates.
1/5/2023	Consultant Task Order Review	Caltrans Staff (PM, Traffic Ops), Fehr & Peers	VMT Mitigation Plan, mitigation measures, schedule for F&P to complete updated Mitigation Memo.
1/9/2023	Discussion of HQ Sustainability Mitigation Memo Response	Caltrans Staff (PM, Environmental, Traffic Ops), Fehr & Peers, DKS Associates	Page-by-page overview of HQ Sustainability's Dec 28th response/comments of Draft Mitigation Memo submitted on Dec 16th.
1/10/2023	PDT - Project Wide Discussion	Caltrans Staff	Project overview, VMT Mitigation Plan.
1/10/2023	Monthly Managed Lanes Status Update for Executives	Caltrans Executive Staff	Project overview, VMT Mitigation Plan, Draft environmental document Schedule.

Date	Type	People/Agencies	Discussion Topics
1/12/2023	VMT Mitigation Plan Discussion	Caltrans Executive Level Staff (PM, Traffic Ops, Planning Forecasting)	Discuss Mitigation Plan and how to move forward, and what direction to provide to consultants (F&P). Outcome was list of 12 transit-related projects for F&P to analyze for VMT reduction, based on highest percentage available of VMT reducing projects and past precedent from D6 Managed Lanes project using transit-oriented projects over a 20-year period for their mitigation plan.
1/12/2023	Managed Lane Brainstorm prior to Consultant Meeting	Caltrans Staff (PM, Traffic Ops, Environmental, Planning Forecasting)	Discuss Mitigation Plan and how to move forward, and what direction to provide to consultants (F&P). Outcome was list of 12 transit-related projects for F&P to analyze for VMT reduction, based on highest percentage available of VMT reducing projects and past precedent from D6 Managed Lanes project using transit-oriented projects over a 20-year period for their mitigation plan.
1/12/2023	Consultant Task Order Review	Caltrans Staff (PM, Traffic Ops), Fehr & Peers	Provide F&P with mitigation strategy and direction on 12 projects to analyze for VMT reduction and give schedule of return of Draft Mitigation Memo by 2/16/23.
1/18/2023	VMT Mitigation Plan Discussion with HQ Sustainability	Caltrans Staff (PM, Traffic Ops, Environmental, HQ Sustainability), Fehr & Peers	Discuss and seek guidance on HQ Sustainability's comments from Dec 28th response letter, provide updates for the mitigation plan, and discuss feasibility of mitigation measures being presented.
1/24/2023	Yolo 80 Managed Lanes Update with partner agency, YoloTD (Brian Abbanat)	Caltrans (PM) & YoloTD	Provide update to partner agency, YoloTD, on project schedule, risks, and deficiencies with public outreach.
1/25/2023	March California Transportation Commission Meeting Reception	Caltrans Staff (PM) & CTC Commissioners/Staff	Discuss Managed Lanes projects with CTC Staff and specifically Yolo 80 project with Commissioner Joe Lyou for input, opinion, and feedback.
1/30/2023	Housing for VMT Mitigation	Caltrans Staff (PM, Environmental) and Affordable Housing Consultant (Brian Bulaga from Thurmond Consulting)	Obtain information on affordable housing opportunities within Sac and Yolo Counties, based on Brian's City of Woodland affordable housing project using Housing and Community Development Homekey grant funds. Discussed Sac-5 and Yol-80 Managed Lanes projects and VMT mitigation requirements, and desire to obtain more information for potentially adding low-income infill housing as a VMT mitigation measure.
1/30/2023	DED/DPR Schedule Focus Meeting	Caltrans Staff (P.M., Environmental, Design, Traffic Ops, Planning Forecasting)	Team discussion to update the DED/DPR schedule and reconcile different alternative descriptions.

Date	Type	People/Agencies	Discussion Topics
2/2/2023	Consultant Task Order Review	Caltrans Staff (P.M., Traffic Ops), Fehr & Peers	Review VMT Mitigation plan and memo status. Still on track for 2/16/23 delivery by F&P.
2/6/2023	Draft environmental document Schedule Meeting	Caltrans Staff (P.M. and Environmental)	Status update on Environmental delivery for DED and schedule impacts with VMT memo on mitigation measures anticipated for 2/16/23.
2/9/2023	Draft environmental document Status Update	Caltrans Staff (P.M., Environmental, Traffic Ops), Stantec, Fehr & Peers	Discuss Stantec's status on Draft environmental document and outstanding issues/needs for them to complete studies. Also discussed DED schedule and need to push Admin Draft environmental document circulation back from 2/13/23 to 4/14/23.
2/13/2023	PDT - Project Wide Discussion	Caltrans Staff	Project overview, VMT Mitigation Plan.
2/14/2023	Housing for VMT Mitigation	Caltrans Staff (P.M., Environmental) and Department of Housing and Community Development (HCD)	Obtain information on HCD grant funding and partnering opportunities for Caltrans to help implement affordable housing with Sac-5 and Yol-80 region as a VMT mitigation measure.
2/14/2023	Monthly Managed Lanes Status Update for Executives	Caltrans Executive Staff	Project overview, VMT Mitigation Plan, DED Schedule.
3/1/2023	Mitigation Plan Discussion	Caltrans Staff (P.M. and Environmental)	Updated Fehr & Peers Mitigation Memo with VMT reduction numbers provided for the mitigation measures identified. And also, how the mitigation plan fits into the DED schedule.
3/6/2023	City of Davis, YoloTD, Caltrans Partnering	City of Davis, YoloTD, Caltrans Staff (P.M. and Environmental)	Partnering opportunities from a financial contribution perspective for the 3 City of Davis mitigation measures identified in the project plan. Also discussed timeline for needing the partnership to be documented in the project environmental document, and mechanism for solidifying partnership (i.e., MOU to start but actionable plan with City Council recommendation and approval).
3/6/2023	Mitigation Plan Discussion	YoloTD, Caltrans Staff (P.M. and Environmental)	Analyzed each mitigation measure and effectiveness, feasibility, reasonableness for the plan.
3/7/2023	VMT Mitigation Discussion with D4	Caltrans Staff (P.M., Planning, D4 Planning)	D4's situations and discussions for their managed lanes projects and VMT mitigation measures, and how they juxtapose with D3's proposed mitigation plans (for I-5 and Yol-80).

Date	Type	People/Agencies	Discussion Topics
3/8/2023	Caltrans, Housing and Community Development (HCD), DGS Partnering	HCD, DGS, Caltrans Staff (District P.M., HQ Sustainability, HQ 743 Team)	Partnering opportunities from a financial contribution perspective for housing projects that HCD and DGS provide funding programs for. Also discussed timeline for needing the partnership to be documented in project environmental document, and mechanism for solidifying partnership (i.e., MOU to start but actionable plan with financial contributions obligated by certain dates).
3/9/2023	Mitigation Plan Discussion	Fehr & Peers, YoloTD, Caltrans Staff (P.M., Environmental, Traffic Ops)	Analyzed each mitigation measure and effectiveness, feasibility, reasonableness for the plan, including the additional measures identified by YoloTD.
3/10/2023	Sacramento Regional Transit (SacRT), YoloTD, Caltrans Partnering	SacRT, YoloTD, Caltrans Staff (P.M. and Environmental)	Partnering opportunities from a financial contribution perspective for the Causeway Connection expansion program mitigation measure identified in the project plan. Also discussed timeline for needing the partnership to be documented in project environmental document, and mechanism for solidifying partnership (i.e., MOU to start but actionable plan with City Council recommendation and approval).
3/13/2023	City of West Sacramento, YoloTD, Caltrans Partnering	City of West Sacramento and YoloTD (Caltrans Staff unavailable)	
11/29/2023	Coordination	Caltrans staff (P.M. and Environmental), YoloTD	VMT mitigation final documentation
12/1/2023	Coordination	Caltrans staff (P.M. and Environmental), YoloTD and SacRT	VMT mitigation final documentation
12/4/2023	Coordination	Caltrans staff (P.M. and Environmental), UC Davis	VMT mitigation final documentation
12/6/2023	Coordination	Caltrans staff (P.M. and Environmental), Capital Corridor Joint Powers Authority (CCJPA)	VMT mitigation final documentation
12/11/2023	Coordination	Caltrans staff (P.M. and Environmental), YoloTD and SacRT	VMT mitigation calculations and assumptions
12/14/2023	Coordination	Caltrans staff (P.M. and Environmental), CCJPA	VMT mitigation calculations and assumptions
12/18/2023	Coordination	Caltrans staff (P.M. and Environmental), UC Davis and City of Davis	VMT mitigation calculations and assumptions

Date	Type	People/Agencies	Discussion Topics
12/18/2023	Coordination	Caltrans staff (P.M. and Environmental), YoloTD	VMT mitigation calculations and assumptions
1/3/2024	Coordination	Caltrans staff (P.M. and Environmental), YoloTD and SacRT	VMT mitigation calculations and assumptions
2/22/2024	Coordination	Caltrans staff (P.M. and Environmental), YoloTD	VMT mitigation calculations and assumptions
2/29/2024	Coordination	Caltrans staff (P.M. and Environmental), YoloTD	VMT mitigation calculations and assumptions
3/4/2024	Coordination	Caltrans staff (P.M. and Environmental), YoloTD	VMT mitigation calculations and assumptions

4.2.5 Stakeholder-Specific Actions – Equitable Outreach

Caltrans is committed to meaningfully engage communities most impacted by structural racism in the creation and implementation of the programs and projects that impact their daily lives by creating more transparent, inclusive, and ongoing consultation and collaboration processes. Equity will achieve this through an engagement process where everyone is treated with dignity and justice. Based on public input, Caltrans considered changes to the project to avoid harm to frontline and vulnerable communities. Caltrans prioritizes projects that improve access for and provide meaningful benefits to underserved communities. The proposed project will reduce GHG emissions, which in turn will promote greater environmental health factors for frontline and vulnerable communities. In addition to the environmental health improvements economically, a fare reduction program will be arranged, as noted in the project's VMT mitigation measures in Section 3.2.17 *Transportation.*

Accordingly, Caltrans took the following actions to increase public interest and participation in the outreach process, particularly to seek input on the equity of the managed lanes systems alternatives presented in this document during the public circulation phase of the Draft EIR/EA.

1. Caltrans used public service announcements and publication notifications of Draft EIR/EA availability by posting alerts on social media (i.e., Facebook and X [previously Twitter]), and used local news outlets such as local news television, radio stations, and newspapers to target communities of color and underserved communities most likely to be affected by changes to I-80 and Hwy 50 in the project area.

2. Caltrans held two public outreach/open house gatherings during the comment period for the Draft EIR/EA. A news release announcing the meetings was posted to social media feeds on Facebook and X (previously Twitter) with a link to the news release. A copy of the release announcing the meetings was sent to the Sacramento television stations listed below. The public notice about the meetings also ran in the Davis Enterprise newspaper. Additionally, a Caltrans Spanish interpreter was available during the public gatherings. Notices for the public gatherings that Caltrans conducted, were made

available via the Caltrans project website and by social media posts (i.e., Instagram and Facebook). During the gatherings subject matter experts from Caltrans were available to verbally answer questions from participants. Caltrans displayed project renderings and exhibits. Additionally, all participants were given the opportunity to provide comments and questions in writing. The questions and comments are part of the Final Environmental Document.

4.3 Circulation of Draft EIR/EA and Comments Received

A Notice of Completion form and copies of the Draft EIR/EA were submitted to the State Clearinghouse on November 13, 2023. A notice of the availability of the Draft EIR/EA and of the public meetings was published in the Davis Enterprise and mailed to the distribution list of agencies, organizations and individuals identified in Chapter 6, Distribution List.

The Draft EIR/EA was available for public review starting November 13, 2023, with the initial comment period ending January 5, 2024, a 53-day review period. On December 1, 2023, Caltrans extended the public circulation and comment period to January 12, 2024, for a total review period of 60 days. A printed copy and flash drive copy were provided at the Mary L. Stephens Davis Branch Library in Davis on December 5, 2023 and the Arthur F. Turner Community Library in West Sacramento on December 6, 2023. On December 22, 2023, a news release about the extended comment period was circulated to local news outlets and emails were sent to those entities who had already provided comments on the Draft EIR/A via email.

4.3.1 Comments Received

Table 4.3-1 contains a list of the individuals, organizations, and agencies that submitted comments on the Draft EIR/EA during the public comment period.

4.3.2 Responses to Comment

On the following pages are copies of the comments and responses to each. The comment letters are included in the order shown in Table 4.3-1.

Master responses were prepared to address similar comment issues raised by multiple commenters. When an individual comment raises an issue discussed in a master response, the response to that individual comment will cross reference to the appropriate master response (e.g., “see Master Response A”).

The Master Responses address the following topics.

- Master Response A: Induced Travel Demand and VMT Mitigation
- Master Response B: Alternatives Considered
- Master Response C: Segmentation and Piecemealing Concerns
- Master Response D: Transportation Modeling Methodology (Static versus Dynamic Traffic Assignment)
- Master Response E: Environmental Justice and Equity of Toll Lanes
- Master Response F: Additional Improvements to Existing Bicycle/Pedestrian Path
- Master Response G: Mobility Hub
- Master Response H: Improved Traffic Flow and Weaving with the Addition of Intelligent Transportation Systems Elements, Auxiliary Lanes, and Ramp Metering
- Master Response I: Traffic Data Used for Impact Analyses

4.3.2.1 Master Responses

Master Response A: Induced Travel Demand and VMT Mitigation

Vehicle Miles Traveled (VMT) is an essential traffic metric that calculates vehicle travel within a certain area. Tracking, forecasting, and mitigating VMT are critical components in reducing VMT. This master response addresses comments on induced travel demand and VMT.

Induced VMT Analysis Tools and Methodology:

Several commenters provided feedback, questions, and opinions related to the Induced VMT calculation methodologies and tools used to evaluate project alternatives. The induced travel impacts of the project were analyzed using travel forecasting and modeling techniques conforming to existing standards, guidance, policies, and best practices. Caltrans used the National Center for Sustainable Transportation (NCST) Induced Travel Calculator to analyze long-term induced vehicle travel effects on VMT. This calculator is used to "estimate the VMT induced annually as a result of adding general-purpose lane miles, high-occupancy vehicle (HOV) lane miles, or high-occupancy toll (HOT) lane miles…"[1]

The use of the NCST Induced VMT tool (calculator) is consistent with the Transportation Analysis under CEQA (TAC) and the Transportation Analysis Framework (TAF), as referenced in the Draft EIR/EA (Section 2.1.10, *Traffic and Transportation*). The TAC and TAF documents are the product of a collaborative effort among State government partners, including the Governor's Office of Planning and Research (OPR), the California State Transportation Agency, and the California Air Resources Board.

The literature used to develop the NCST calculator estimates the induced VMT to be realized in about 3 to 10 years after the project is built. As the population increases (by the horizon year 2049), the magnitude of induced VMT is expected to be marginalized, ensuring the projections account for the evolving demographic landscape. Impacts on VMT due to land use changes are also incorporated into this calculator.

The NCST estimates and the exclusion of truck VMT from those estimates were limited to induced VMT impact analysis and mitigation targets, which are consistent with CEQA Guidelines Section 15064.3 and the OPR Technical Advisory which note that "automobile" refers to cars and light trucks for the purposes of estimating induced travel attributed to transportation projects. The NCST Calculator does not automatically exclude heavy duty trucks from the induced travel estimates. Therefore, the Caltrans Hot Topic entitled "NCST Calculator Truck Adjustment" further details reduction adjustments to NCST-generated elasticity values for Class 1 facilities by 29%, and Class 2 and 3 facilities by 22% as per the research supporting the NCST tool.

SACSIM19 activity-based travel demand model VMT (including truck VMT) was used to assess the project's environmental impacts as the NCST tool does not provide the level of detail

[1] National Center for Sustainable Transportation. 2024. Induced Travel Calculator. Available: https://ncst.ucdavis.edu/research-product/induced-travel-calculator. Accessed: February 22, 2024.

required for the environmental impact analysis. The Draft EIR/EA transportation analysis used the approved SACOG Metropolitan Transportation Plan/Sustainable Communities Strategy (MTP/SCS) fiscally constrained SACSIM model. The use of the model is consistent with current modeling standards, guidelines, and practices and was approved for use by SACOG as detailed in the Transportation Analysis Report prepared for the project, as summarized in Draft EIR/EA Section 2.1.10, *Traffic and Transportation*, and Section 3.2.17 *Transportation.* The TAR is available on the project website with the Final EIR/EA (https://dot.ca.gov/caltrans-near-me/district-3/d3-projects/d3-i80-corridor-improvements).There is a difference in the VMT data utilized for environmental impact analysis of operational impacts from induced VMT such as air quality and noise, and for the induced VMT analysis to determine consistency with CEQA Guidelines Section 15064.3. As noted in Section 2.1.10, *Traffic and Transportation,* since the SACSIM model was identified as not passing the checklist for travel demand model adequacy, the NCST tool is utilized per Caltrans policy to remain consistent with the TAC and TAF.

The Draft EIR/EA induced VMT amount of roughly 188 million assumed a 300-day conversion factor, based on outdated Performance Measurement System data, to convert from NCST annual induced VMT to daily VMT. Then the daily induced value used a factor of 365 to convert again to annual in the Draft EIR/EA. Hence, the annual induced VMT was artificially inflated by a factor of 365 divided by 300.

VMT mitigation measure financial contribution amounts and timelines differ from the Draft EIR/EA due to a redistribution of funding for some measures and the removal of other measures completely from the proposed plan. These changes were the product of multiple outreach meetings with each partner agency proposed to receive financial contribution to implement or construct their respective programs.

Induced VMT Mitigation:

Mitigating for induced VMT is an important part of the project. Caltrans has ensured that the resources available to mitigate VMT were maximized and help promote carpooling, transit, and other modes of travel that help reduce reliance on single occupancy vehicles. Prior to analyzing the mitigation measures listed in Tables 2.1-27 and 2.1-28 of the Draft EIR/EA (and 1 and 2 of the VMT Mitigation Plan Executive Summary), a solicitation effort was conducted by Caltrans with all local agencies and stakeholders to identify VMT reducing measures that were deemed feasible and implementable. Following the solicitation process, the list was evaluated for highest VMT reduction, and further analyzed for feasibility and implementation ability. When analyzing proposed and rejected mitigation measures regarding induced VMT and mitigation, the feasibility of mitigation measures must be considered. Feasibility factors included reasonable cost-to-VMT benefit ratios, specific measures included in a local agency planning document, whether the measure is within the realm of responsibility of another public agency or jurisdiction, inclusion in SACOG's MTP/SCS, (which would rule out the ability to claim VMT reduction credit), or whether the project's proposed financial contribution would be sufficient enough to make a reasonable and feasible claim for full VMT credit. The proposed VMT mitigation measures were determined after a solicitation process with local partner agencies and stakeholders prior to circulation of the Draft EIR/EA. The results of the solicitation yielded the measures listed in Tables 2.1-27 and 2.1-28 of the Draft EIR/EA. Conversations with local

agencies and stakeholders have been ongoing and Tables 2.1-27 and 2.1-28 have been revised in the Final EIR/EA to show refinements to the VMT mitigation.

The mitigation funding contribution is 14–15% due to a funding limitation on the project as a whole. The grant funding available and provided for the project is enough to build the project plus the proposed amount of VMT mitigation funding. The total project cost is the reason for providing the 14–15% VMT funding contribution.

No changes to the Draft EIR/EA are necessary to address induced travel or VMT mitigation.

Master Response B: Alternatives Considered

A Notice of Preparation (NOP) was filed with the State Clearinghouse on June 6, 2021, which was revised on August 17, 2021, to notify that the scoping meeting was rescheduled. Caltrans accepted scoping comments until September 24, 2021. A revised NOP was also distributed on October 17, 2022, that included clarification of the proposed managed lane strategies and Build Alternatives. A copy of the NOPs are included in Appendix G of the Draft EIR/EA.

Notice of project scoping was noticed through newspaper advertisements that ran in the Davis Enterprise on August 18, 2021, and the Sacramento Bee on August 23, 2021, and via Facebook, Twitter, and Caltrans' project website. In addition, Caltrans notified members of the community and media through email.

Two public scoping meetings were held virtually through WebEx on August 25, 2021, at 6:00 p.m. and at 7:00 p.m. The purpose of these meetings was to discuss the scope of the EIR/EA and the potential effects of the project. Each meeting included a brief presentation on the project and the environmental review process. Attendees were encouraged to submit comments during the meeting or to Caltrans staff via mail or email.

The outcome of the discussions and feedback gained from the public and all state and local partner agencies, including SACOG and YoloTD, yielded the alternatives that were listed in the Draft EIR/EA. Alternatives such as converting existing capacity to priced lanes and pricing all lanes were not part of NOP comments received from partner agencies and the public. The alternatives included in the Draft EIR/EA were deemed feasible for analysis, from a legal and implementational perspective at the time of the NOP process.

Section 1.5 of the Draft EIR/EA discusses alternatives that were considered but eliminated from further consideration during earlier phases of the project development process. The alternatives considered different footprints and types of managed lanes, including a transit only lane.

The following section presents alternatives not considered in the Draft EIR/EA but suggested by multiple agencies and members of the public in formal, written comments on the Draft EIR/EA. Additional information as to why these alternatives may not be feasible is also provided. Additional alternatives mentioned in single comments have been responded to on an individual basis. Multiple comments included various suggestions for improvements to the bicycle facilities along the project corridor. Please refer to Master Response F for more information on bicycle facility improvements.

Suggested Alternative: Tolling All Lanes

Converting all existing capacity to priced lanes would cause diversion to non-priced routes, potentially increasing trip length and VMT, and impairing mobility of people and freight on other routes. This alternative would not meet the purpose and need of the project, as noted in the Summary Section of the Draft EIR/EA "*Support reliable transport of goods and services throughout the region*." There are project alternatives in the Draft EIR/EA that meet the project's purpose and need and are feasible for implementation. Additionally, pricing all lanes raises equity and environmental justice issues that would involve challenging inter-governmental coordination and monitoring. For more information on equity, please see Master Response E. More information is provided below regarding the feasibility of these types of alternatives.

Suggested Alternative: Toll Two Lanes in Each Direction

This suggested alternative proposes to construct a new toll lane in each direction, and converting the #1 general-purpose lane (i.e., the leftmost general-purpose lane) to a toll lane. Many commenters noted that this alternative is consistent with the SACOG MTP/SCS. It should be noted that the Draft EIR/EA transportation analysis used the approved SACOG MTP/SCS fiscally constrained SACSIM model. The use of the model is consistent with current modeling standards, guidelines, and practices and was approved for use by SACOG as detailed in the Transportation Analysis (TAR) and Appendices for the project, as summarized in Section 3.2.17, *Transportation*. The TAR is available on the project website with the Final EIR/EA (https://dot.ca.gov/caltrans-near-me/district-3/d3-projects/d3-i80-corridor-improvements).

However, as mentioned above, Caltrans conducted an NOP outreach process to discuss potential alternatives. The feedback gained from the public and all State and local partner agencies, including SACOG and YoloTD, yielded the alternatives that were included in the Draft EIR/EA. Further, this alternative was considered infeasible for the following reasons:

1. This alternative would likely result in many of the diversion, VMT, equity, and environmental justice issues that would result from the Tolling All Lanes alternative, but perhaps to a lesser degree. These issues would result because existing general-purpose capacity would require a fee for use if this alternative were implemented. (For more information on environmental justice and equity, please see Master Response E).

2. This alternative would potentially negatively impact heavy freight vehicle movement through the region. The conversion of the #1 general-purpose lane to a toll lane would lead to more demand and less reliability on the existing #2 and #3 general-purpose lanes, which would impair the mobility of freight and lead to unreliable travel times. Due to these impacts on freight, the purpose and need of the project would not be met.

3. Current State and Federal regulations currently prohibit conversion of a general-purpose lane to a tolled lane. Section 64112, Toll Facilities, of Assembly Bill (AB) 798: California Transportation Financing Authority, states:

> *(b) Each highway project for which tolls are imposed shall have non-tolled alternative lanes available for public use in the same corridor as the proposed toll project. Nothing*

> *in this division shall allow the conversion of any existing non-tolled or non-user fee lanes into tolled or user-fee lanes, except for the conversion of high-occupancy vehicle lanes into high-occupancy toll lanes, consistent with the authorizations in Sections 149.1, 149.4, 149.5, 149.6, and 149.7 of the Streets and Highways Code.*

In addition, Section 129 of Title 23 of the US Code restricts tolling to initial construction or reconstruction of a toll highway, bridge or tunnel, of one or more lanes or other improvements that increase capacity of a highway, bridge, or tunnel.

Suggested Alternative: Add a General-Purpose Lane in Each Direction

This alternative conflicts with the purpose and need of the project. The project aims to improve modality (i.e., the variety of modes of transportation). The alternatives considered in the Draft EIR/EA that add vehicular capacity to the corridor include minimum occupancy requirements in an effort to promote carpooling and transit use.

Suggested Alternative: Improved Rail Service or Local Mass Transit

Alternatives to improve rail and bus service would reduce VMT and increase person throughput, but railroads, light rail, and bus services are not within the jurisdiction of Caltrans and therefore, they cannot be feasible alternatives. Mitigation Measure TRANS-1 in the Draft EIR/EA does include Caltrans contributions to Capitol Corridor Railway and local bus transit organizations such as the City of West Sacramento, Yolobus, SacRT, and other transit operators that traverse the corridor. The purpose of these contributions is to facilitate more ridership and increase the frequency of transit services.

Project alternatives were analyzed specifically in relation to existing conditions using the tools available with the requirement of meeting the purpose and need of the project for this particular segment of highway. As outlined above, the suite of proposed alternatives may result in equity and environmental justice issues, are unable to be constructed due to current legislation, may not meet the purpose and need of the project, or are outside of Caltrans jurisdiction. However, these alternatives may still be viable for other projects in the future as the corridor is developed.

Master Response C: Segmentation and Piecemealing Concerns

Some commenters expressed concerns regarding the perception of piecemealing or segmenting the Yolo 80 Corridor Improvements Project. It appears that these commenters are associating this managed lane project with other projects currently in construction. Projects currently under construction are separate projects with independent scope, purpose, and need that were evaluated for environmental impacts under CEQA and NEPA. Caltrans does not segment projects or scopes of work between two separate projects. For instance, the pavement rehabilitation project that is currently under construction (from east of Mace Boulevard to the I-80/US 50 split, and on I-80 to Reed Avenue and on US 50 to Jefferson Boulevard) is its own scope of work that will install continuously reinforced concrete pavement and asphalt concrete. It is different from this project, the Yolo 80 Corridor Improvements Project, that proposes to add a managed lane. The Yolo 80 Corridor Improvement Project is not dependent upon the pavement rehabilitation project and could have been constructed without it. The environmental

impacts of adding a managed lane have been fully assessed in the Draft EIR/EA. These two projects are independent of each other and offer their own independent utility. This project is one of many outlined in the Sustainable Communities Strategy as referenced in Section 1.1.1.2 State/Regional Planning of the Draft EIR/EA that may also be in construction.

No changes are necessary to the Draft EIR/EA to address segmenting, piecemealing.

Master Response D: Transportation Modeling Methodology (Static versus Dynamic Traffic Assignment)

Multiple commenters suggested an alternate transportation modeling methodology to evaluate project alternatives. The travel forecasting and modeling techniques used in the analysis conform to existing standards, guidance, policies, and best practices. The SACSIM19 model is an activity-based model that was developed by SACOG and covers the six-county SACOG region and was used to conduct travel demand modeling for the project. This model performs static traffic assignment (STA), instead of dynamic assignment (DTA). The SACSIM19 model was also tested for sensitivity to land use variables, fuel prices and auto operating costs, added highway capacity, and transit fares.

There are no travel demand models with DTA for this region. While the SACSIM19 model performs static assignment, instead of dynamic assignment, the model was calibrated on both a static and dynamic basis. In order to conduct an analysis using DTA, a new tool or significant additions to SACSIM 19 would be needed, which was outside the scope of this project. The travel forecasting and modeling techniques used in the analysis conform to existing standards, guidance, policies, and best practices.

Additionally, the DTA has limited benefits when estimating daily VMT changes. While the assumption is that the DTA has larger implications in the future No-Build Alternative due to drivers changing the time of departure rather than taking a lengthy route to avoid a jammed facility, many trips cannot shift the time of travel on weekday peak conditions due to work/school times, delivery schedule, etc., thereby limiting any potential benefit of employing a DTA. Any change in departure time and related VMT effect is captured in the daily VMT, which is used to assess other environmental impacts of the project (i.e. air quality and GHG impacts), further limiting any potential benefit of employing a DTA.

As there is no dynamic assignment travel demand model for the region, the methodology used for impact analysis was deemed appropriate by SACOG and Caltrans headquarters rather than developing such a model/tool or performing mesoscopic modeling.

No changes to the Draft EIR/EA are necessary to address traffic modeling methodology.

Master Response E: Environmental Justice and Equity of Toll Lanes

Addition of Toll Lanes

Some commenters suggested the addition of toll lanes may not be equitable for all users, specifically those of lower-income communities.

Sections 2.1.7 and Section 2.1.8 of the Draft EIR/EA discusses Environmental Justice and Equity, respectively. Adding a toll lane gives members of the traveling public choices for navigating the corridor. The toll lane will provide benefits to transit, freight trucks, carpools, vanpools, and single-occupancy vehicles through the reduction of congestion and increased travel time reliability. Reducing congestion and increasing travel time reliability across the corridor provides members of lower-income communities with the option to utilize transit and arrive to their daily commuting destination in a timely manner. By adding a toll lane, these benefits are realized by both toll lane and general-purpose lane users. Utilizing carpools and vanpools are further encouraged with the addition of the toll lane, where vehicles that meet the minimum occupancy requirements can utilize the lane free-of-charge. The addition of the toll lane provides benefits for all users, in that it provides all users with the freedom to make their own transportation choices and still arrive at their destinations in a safe and timely manner. As stated in Section 2.1.7.4, *Avoidance, Minimization, and/or Mitigation Measures* and shown in Table 2.1-27, Caltrans plans to use a portion of future excess toll revenue to fund multi-modal transportation improvements that distribute benefits more equitably among communities (applicable to Build Alternatives 3a, 3b, 4a, 4b, 5a, and 5b that involve tolling). Section 2.1.7.4 of the Draft EIR/EA lists additional measures that have been included in the project to minimize impacts to minority or low-income populations. Standard measure EQ-1 would be included in the project if the alternative with the toll lane is selected as the preferred alternative. This measure would accommodate use of toll lane options by limited English proficiency community members.

Pricing All Lanes

Some commenters suggested pricing, or tolling, all lanes. Pricing all lanes raises equity and environmental justice issues, as it limits the traveling public with choices for how to navigate the corridor. Pricing all lanes would require the traveling public to pay a toll to use the facility, which may be a financial burden on them, and which some commuters may not be able to afford. As a result, some travelers may choose not to make the trip, which may limit their job and housing prospects and opportunities.

Additionally, tolling all lanes would cause diversion to non-priced routes, potentially increasing trip length and VMT, and impairing mobility on other routes, potentially affecting priority communities. Therefore, lower-income communities would be negatively affected by the reduction of efficient and cost-effective transportation choices if all lanes required a toll. This alternative would also not meet the purpose and need of the project: "*Support reliable transport of goods and services throughout the region*".

Master Response F: Additional Improvements to Existing Bicycle/Pedestrian Path

Some commenters suggested deficiencies in the existing bicycle/pedestrian facility across the corridor, and further suggested the project would not provide sufficient improvements to address these concerns. Four bicycle and pedestrian related studies were conducted by Caltrans to assess bicycle and pedestrian routes and the number of bicyclists that traveled the Yolo Causeway on a regular basis to determine if a Class IV bike path was needed parallel to the existing Yolo Causeway. The results of the study did not support providing a Class IV facility. The results of the studies are discussed in Sections 1.3.1.1 and 2.1.10.7 of the Draft EIR/EA.

However, the project proposes to add an additional bicycle/pedestrian path along the westbound I-80 off-ramp to Chiles Road/County Road (CR) 32A and will connect to the existing Yolo Causeway bridge bicycle/pedestrian path. The construction of the bicycle/pedestrian path along westbound I-80 off-ramp to Chiles Road/CR 32A will allow bicyclists traveling eastbound from the City of Davis to access the Yolo Causeway bridge bicycle/pedestrian path without crossing the Chiles Road/CR 32A traveled way. Bicyclists traveling westbound on the existing Yolo Causeway bridge bicycle/pedestrian path will find that if they travel on the existing western Yolo Causeway levee bike path, they will not have to cross the Chiles Road/CR 32A traveled way to get to the City of Davis. The project would also construct an Americans with Disabilities Act (ADA) ramp with a curb ramp detectable surface, as well as additional lighting at the CR 32A/I-80 westbound off-ramp intersection. Rectangular rapid flashing beacons are being considered at this location in coordination with Yolo County.

The project also proposes to replace existing Hot Mix Asphalt pavement and provide additional bike path signs at both entry points of the Yolo Causeway bicycle/pedestrian path, enhancing surface rideability and safety for all users.

Widening of the path within the City of West Sacramento jurisdiction and connecting West Capitol Avenue to the Yolo Causeway were determined to be unnecessary because the existing bike path currently meets the maximum American Association of State Highway and Transportation Officials (AASHTO) standards. The shared path width is 12 feet.

The pavement rehabilitation project that is currently under construction proposes to remove and replace the existing concrete pedestrian rail and fencing between the bicycle/pedestrian path and westbound Yolo Causeway traffic lanes. Additionally, the Hot Mix Asphalt pavement of the path will be removed and replaced.

No changes to the Draft EIR/EA are necessary to address bicycle/pedestrian path improvements.

Master Response G: Mobility Hub

Some commenters suggested that there are deficiencies in the multi-modal transfer system along the corridor. The project proposes to construct a Mobility Hub south of I-80 and east of Enterprise Boulevard. This Mobility Hub (described in Section 1.3.1.1 as a Park-in-Ride Facility in the Draft EIR/EA) would provide an opportunity for bicyclists and carpoolers to connect with their preferred transit option at the bus transfer station. Further design enhancements are under consideration and discussion with the City of West Sacramento, Yolobus, SacRT, and other transit operators that traverse the corridor. Design enhancements under consideration are electric vehicle charging stations, electric bus charging stations, bike lockers and racks, and potentially shade covers for transferring transit users.

No changes to the Draft EIR/EA are necessary to address mobility hub features or multi-modal transfer options.

Master Response H: Improved Traffic Flow and Weaving with the Addition of Intelligent Transportation Systems Elements, Auxiliary Lanes, and Ramp Metering

Several commenters referenced existing system operational deficiencies, such as lane drops and a lack of Intelligent Transportation Systems (ITS) elements in the project area. The proposed toll lane will improve traffic flow and the mobility of people and freight through the project area, in addition to auxiliary lanes and ramp meters. One specific area of concern on Eastbound I-80 are the several lane drops associated with existing acceleration and general-purpose lanes. The project would add an eastbound auxiliary lane on I-80 between Old Davis Road and Richards Boulevard and standardize acceleration lanes to help improve weaving/merging along the corridor, improving person and freight mobility, in addition to providing safety benefits. Further, a westbound auxiliary lane is proposed on US 50 between Harbor Boulevard and Jefferson Boulevard.

Additionally, the project would add several ramp meters to help regulate traffic flow on I-80. These ramp meters would help facilitate safer and easier merging while reducing bottleneck intensity and duration. Other ITS improvements, including the addition of changeable message signs (CMS) and closed-circuit television (CCTV) cameras, would help reduce non-recurrent congestion by expediting traveler information and reducing incident identification, response, and clearance time. No changes to the Draft EIR/EA are necessary to address ITS/operational improvement elements.

Master Response I: Traffic Data Used for Impact Analyses

Caltrans analyzed impacts of the proposed project using traffic data provided from Caltrans District 3 Traffic Forecasting. The National Center for Sustainable Transportation (NCST) Induced Travel Calculator was also applied to estimate induced demand. In addition, the CT-EMFAC2021 emission model, developed by Caltrans, calculates project-level emissions using data from the California Air Resources Board's EMFAC 2021 model. The Draft EIR/EA also included 2020 SACOG MTP/SCS land use projections in which the project is included in the future year network, to estimate induced traffic and growth.

Air

Air pollutant emissions associated with the roadways in the project area were estimated using specific traffic data and conditions provided by the Caltrans District 3 traffic forecasting and the CT-EMFAC2021 emission tool.

The operational emissions analysis compares emissions for existing/baseline conditions to the forecasted conditions for the No Build alternative given the project's opening year (2029), RTP horizon year (2040), and design year (2049). The increase of air pollutants compared to baseline year and year 2049 regarding the No Build alternative are not considered to be substantial in all the alternatives. Table 2.2-10 in Section 2.2.6.3 of the Draft EIR/EA lists the change in emissions for each alternative. Alternative 3 has the highest change in emissions at 26.9%. This change (26.9% by 2049, over 30 years) is a less than 1% change per year. Less than 1% increase per year is not considered to be substantial.

Caltrans determined “less than significant” air quality impacts for all other project alternatives as each of the Build alternatives would improve operations, reduce congestion, and increase vehicle occupancy within the travel corridor as compared to the No Build alternative.

GHG

The Draft EIR/EA analyzed the impacts of the proposed project on GHG emissions by comparing the Build Alternatives at the existing year (2019) to the No Build alternative. Generally, HOV and HOT lanes build alternative emissions are lower than No Build emissions due to a reduction in congestion (i.e., higher travel speeds throughout the modeled region) and an estimated future reduction in truck traffic percentages. In addition, California's transportation energy consumption has become increasingly efficient due to technological growth, environmental policies, and innovation. Gasoline and diesel represent the largest fraction of fuel consumed by the transportation sector in California. To meet stringent emission standards, equipment and vehicle manufacturers install emission control systems to reduce emissions in addition to increasing engine efficiency. However, it is anticipated that Corporate Average Fuel Economy (CAFE) regulations, Low Carbon Fuel Standard regulation, and zero-emission vehicle regulations will gradually displace gasoline and diesel engines in favor of more energy-efficient systems with lower GHG emissions[2].

The Draft EIR/EA analysis of GHG emissions used Caltrans CT-EMFAC which is based on CARB’s EMFAC, the only model approved by the U.S. Environmental Protection Agency (EPA) for use by California and local governments to meet CAA requirements. As discussed in the Draft EIR/EA Section 3.4.4.2 *Quantitative Analysis*, “GHG emissions quantified using CT-EMFAC… CT-EMFAC is currently the best available tool for calculating GHG emissions from mobile sources.”

As stated in the Draft EIR/EA, Section 3.4.5 *CEQA Conclusion*, "Long-term operational GHG emissions would potentially increase from existing conditions under 2029 opening year assumptions. However, as projected under the 20-year horizon design assumptions (2049), although VMTs were estimated to increase, GHG emissions were estimated to decrease for the Build Alternatives as compared to conditions under 2029, which is attributed to newer more fuel-efficient fleets and the increase in electric vehicles by the year 2049.” GHG emissions were estimated to decrease for the Build Alternatives as compared to existing conditions by opening year 2049. The project does not conflict with any applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs.

GHG emissions of the project related to vehicle travel are not underestimated. Caltrans determined that GHG increases are “less than significant” as the proposed project will improve traffic flow and reduce congestion.

[2] California Department of Transportation. 2024. Highway Performance Monitoring System (HPMS) Data. Available: https://dot.ca.gov/programs/research-innovation-system-information/highway-performance-monitoring-system. Accessed: February 23, 2024.

Energy

Energy impacts were analyzed in Section 2.2.9 of the Draft EIR/EA. Energy consumption from mobile sources were analyzed by calculating fuel consumption using CT-EMFAC in conjunction with Caltrans Construction Emission Tool (CAL-CET). Fuel consumption can be derived from running the model prepared for the criteria pollutant and GHG emissions analyses. The procedure for analyzing direct energy consumption from construction activities is to obtain fuel consumption projections in gallons from the CAL-CET. Construction-related energy consumption would be temporary and not a permanent new source of energy demand and the demand for fuel would have no noticeable effect on peak or baseline demands for energy.

The VMT data for the existing, no build, and build alternatives, along with the CT-EMFAC emission rates, were used to calculate the fuel consumptions for the existing 2019, opening 2029, and horizon 2049 conditions. With the construction of additional managed lanes, an increase in VMT is expected causing an initial increase in fuel consumption. However, at year 2049, fuel consumption would decrease due to the fleet turnover (more fuel-efficient vehicles) and electric vehicle increases.

Noise

Field investigations and measurements were conducted between March and July of 2021, to identify land uses that could be subject to project related construction and traffic noise impacts. Existing land uses in a project area were categorized by land use type and activity category, and the extent of frequent human use areas were also documented. Noise receptor locations in the project area were identified through a review of project mapping, aerial photos, and field reconnaissance.

All land uses are evaluated, but the focus is on locations of frequent human use that would benefit from a lowered noise level. The noise impact analysis focused on locations with defined outdoor activity areas, including residential backyards, common use areas at multi-family residences, common use areas at hotels and motels, places of worship, schools, parks, restaurants, offices, and retail.

The roadway geometry of the project relative to nearby existing and planned land uses is also identified. Long-term measurement sites are selected to capture the daily traffic noise level pattern in the project area. Short-term measurement locations were selected to serve as model validation points for existing highway conditions and representative modeling locations. Additional non-measurement locations are selected as modeling locations as required by 23CFR772.

Field noise measurements were conducted in accordance with recommended procedures in Caltrans Traffic Noise Analysis Protocol, For New Highway Construction, Reconstruction, and Retrofit Barrier Projects, dated April 2020 and Caltrans Technical Noise Supplement, dated September 2013. Noise measurements were made with sound level meters calibrated before and after each of the measurements. The response of the sound level meter is checked before and after each measurement session to ensure the response is within 0.2 dBA. All

instrumentation used during a noise survey meet the requirements of the American National Standards Institute (ANSI) SI 4-1983 for Type 1 or 2 use.

Traffic noise levels are predicted using the mandated Federal Highway Administration (FHWA) Traffic Noise Model (TNM) 2.5 software. As per 23CFR772, analysis must use the FHWA Traffic Noise Model, which is described in “FHWA Traffic Noise Model” Report No. FHWA-PD-96-010, including Revision No. 1, dated April 14, 2004.

Due to the reliability constraints of TNM 2.5 to accurately calculate noise levels at great distances from the roadway, Caltrans limits noise assessments to approximately 500 feet of the roadway source.

TNM 2.5 calculates traffic noise levels based on the roadway geometry of the sites, which includes the positioning of travel lanes, receptors, barriers, terrain, ground type, buildings, etc. The noise source is the traffic flow, as defined by the user, in terms of hourly volumes of automobiles, medium-duty trucks, heavy-duty trucks, buses, and motorcycles. Existing traffic and Design Year peak hour traffic volume data and speed estimates are used as model inputs for local roads and ramps.

To summarize, the Noise analysis was conducted consistent with current modeling standards, guidelines, and practices for FHWA, and Caltrans Traffic Noise Analysis Protocol for New Highway Construction, Reconstruction, and Retrofit Barrier Projects (Protocol) as summarized in EIR/EA, Section 3.2.13, *Noise*. The Noise Study is available on the project website with the Final EIR/EA (https://dot.ca.gov/caltrans-near-me/district-3/d3-projects/d3-i80-corridor-improvements).

4.3.3 Agencies

20231113, California Air Resources Board

From: Ganson, Chris@ARB <Christopher.Ganson@arb.ca.gov>
Sent: Monday, November 13, 2023 4:48 PM
To: Bhattal, Gurtej@DOT; Patwary, Masum@DOT; Keaton, Dennis L@DOT
Cc: Sundquist, Eric@DOT; Ketchum, Jeremiah S@DOT
Subject: Request for Yolo 80 technical appendixes

EXTERNAL EMAIL. Links/attachments may not be safe.

Hello Gurtej, Masum, Dennis,

Chris Ganson here. I will be reviewing the Yolo 80 DEIR for the California Air Resources Board. I'm writing to request you email me electronic copies of all transportation technical appendixes for this project, including:

- Transportation Analysis Report
- VMT Mitigation Estimates – Executive Summary
- VMT Mitigation Plan
- Fehr and Peers. 2022. I-80/US 50 Managed Lanes – Phase B Forecasts and Performance Measures
- Managed Lanes Traffic Forecasts Memorandum
- Managed Lanes Traffic Data Memorandum
- Managed Lanes Travel Demand Modeling Report
- Travel Pattern Data Memorandum
- Origin destination report
- Traffic forecasting report
- Traffic and revenue forecasting report

1

Because of CARB's internal review requirements, I will need to review these documents and draft our comments within the next seven business days. So, I am requesting they be sent ASAP, and am hoping you will be able to provide them today or tomorrow.

Many thanks!
Chris

Response to Comment 1 in 20231113, California Air Resources Board

The commenter requests copies of transportation-related technical studies. During an email exchange over the subsequent days after this email, the commenter's list of unavailable appendices and studies were delivered to the commenter by Caltrans. No changes to the Draft EIR/EA are necessary.

20231121, City of Davis

November 21, 2023

Gurtej Bhattal
Project Manager
Caltrans, District 3
703 B Street
Marysville, CA 95901

Subject: Request to extend the comment period for the Yolo 80 Corridor Improvements Project draft EIR

Dear Mr. Bhattal;

Thank you for the opportunity to review and provide feedback on the Draft EIR for the I-80 Corridor Improvements Project. The City of Davis respectfully requests that the comment period for the Yolo 80 Corridor Improvements Project draft EIR be extended to at least January 10, 2024. The request is being made for two key reasons, as articulated below:

1) As of the date of this letter Caltrans has not posted the Technical Studies listed in Appendix H to the DEIR. While Caltrans staff has provided City staff with the requested materials, the City feels that it is crucial for full disclosure and transparency that all of the Technical Studies that are used or referenced in the draft EIR be available to the public in the same manner that the draft EIR is, both on the project website and as hard copies where the draft EIR have been made available to the public. As of today it has also come to our attention that old documents (prior drafts) have been posted to the Caltrans project web page, which required changes to correct the documents. Transparency and accuracy of the posted information is especially important for the traffic studies given the interest from the City and from members of the public to review and understand the methodologies used in the Vehicle Miles Traveled (VMT) CEQA analysis. Posting the Technical Studies by no later than November 25, 2023 AND providing a review period extension to at least January 10, 2024 will ensure that the Draft EIR AND the Technical Studies have been available for a full minimum 45-day review period. A modest five-day extension can remedy this concern. 1

2) An extension of the comment period to January 10, 2024 will allow for the City Council to review and approve the City of Davis DEIR comment letter at the regularly scheduled January 9th City Council meeting. Should the Caltrans comment period not be extended past the current January 5, 2024 deadline, the City Council will need to schedule a

530-757-5602 | @CityofDavis
City Manager's Office
23 Russell Boulevard, Davis, CA 95616

CITYOFDAVIS.ORG

special meeting the week of January 1st to review and approve the City comment letter. To do so will necessitate posting of the City Council meeting agenda and report during the holiday closure. The review schedule necessitated by the current Caltrans comment deadline is not ideal in terms of public transparency and access, especially in the midst of holidays. Again, a modest five-day extension to January 10, 2024 can remedy this concern.

1 cont.

We understand that the overall project schedule is important to Caltrans and is likely the impetus for the current January 5th comment deadline. However, the positive gesture to extend the comment period to January 10th we believe is very reasonable and in the best interest of public transparency of process, and document accessibility. Thank you for your consideration of this and please feel free to reach out to me or to Ryan Chapman on our team if you have any questions. I can be reached at mwebb@cityofdavis.org and Ryan can be reached at rchapman@cityofdsavis.org

Sincerely,

Mike Webb
City Manager

Ryan Chapman, Assistant Director, Public Works Engineering & Transportation

Response to Comment 1 in 20231121, City of Davis

This comment requests an extension of the Draft EIR/EA comment period to January 10, 2024, and requests technical studies listed in Appendix H be posted to the project website. The technical studies requested in this comment were provided to the commenter and a response to this comment was provided in a letter dated December 7, 2023, in which the extension of the comment period was addressed.

The original end date of the 45-day review period would have been December 27, 2023. However, when the Draft EIR/EA was released for public review, Caltrans ended the initial comment period on January 5, 2024, to account for the holiday season. Caltrans subsequently extended the public circulation and comment period to January 12, 2024. No changes to the Draft EIR/EA are necessary.

20231208, California Air Resources Board

From: Gress, Jennifer@ARB
To: Benipal, Amarjeet S@DOT
Cc: Yolo80Corridor@DOT; Bhattal, Gurtej@DOT; Patwary, Masum@DOT
Subject: Yolo 80 Corridor DEIR – Request for Public Comment Period Extension
Date: Friday, December 8, 2023 11:03:05 AM

EXTERNAL EMAIL. Links/attachments may not be safe.

Dear Mr. Benipal,

We are reviewing the Draft Environmental Impact Report (DEIR) for the Yolo 80 Corridor Improvements Project. We appreciate you making the DEIR publicly available on your website and sharing the technical appendices with us by email. We noticed, however, that many of the appendices have not been posted publicly. Specifically, we see that these appendices have not been posted:

- Interstate 80/US Highway 50 Managed Lanes Transportation Analysis Report
- Interstate 80/US Highway 50 Managed Lanes Transportation Analysis Report Appendix
- Interstate 80/U.S. Highway 50 Managed Lanes Traffic and Revenue Report
- I-80/US 50 Managed Lanes – Phase B Forecasts and Performance Measures
- I-80/US 50 Managed Lanes – Phase B Forecasts and Performance Measures Appendix
- Interstate 80/U.S. Highway 50 Managed Lanes Travel Demand Modeling Report
- Interstate 80/U.S. Highway 50 Managed Lanes Travel Demand Modeling Report Appendix
- Air Quality Report, Yolo 80 Corridor Improvements Project
- Environmental Impact Evaluation – Energy
- I-80/US 50 Origin-Destination Study: Additional Data Needs
- I-80/US 50 Managed Lanes Traffic Data
- I-80/US 50 Managed Lanes – Traffic Forecasts
- I-80/US 50 Travel Pattern Data

1

We are concerned that the public does not have adequate information to evaluate and comment on the DEIR. In addition, given that a number of major holidays fall within the comment period, we are further concerned that the public will not have sufficient time to review and comment as CEQA allows.

With these concerns in mind, we request that Caltrans post all appendices and extend the public review and comment period to at least 45 days from the date when the last appendix is posted.

As you are aware, the DEIR and associated comment period is the only time when the public has opportunity to provide written comments and when the public agency must provide a response to those comments. Failing to provide full public disclosure of the appendices for an adequate amount of time undercuts the public's ability to engage on a major project of regionwide significance. 1 cont.

Thank you for your consideration.

Sincerely,

Jennifer Gress, Ph.D., Chief
Sustainable Transportation and Communities Division
California Air Resources Board

Response to Comment 1 in 20231208, California Air Resources Board

Caltrans submitted the Draft EIR/EA to the State Clearinghouse on November 13, 2023, through CEQANet. The Draft EIR/EA was published on the same day and simultaneously made available on the Caltrans Website. The original end date of the 45-day review period would have been December 27, 2023. However, when the Draft EIR/EA was released for public review, Caltrans ended the initial comment period on January 5, 2024, to account for the holiday season. Caltrans subsequently extended the public circulation and comment period again to January 12, 2024.

Appendices to the Draft EIR/EA were available on the Caltrans website and on the State Clearinghouse website. Additionally, hard copies of the Draft EIR/EA were delivered to the Yolo County Library on December 5, 2023, and the West Sacramento Library on December 6, 2023.

The commenter's list of unavailable "appendices" are studies listed in Appendix H. These studies were available upon request as indicated on the Caltrans website. Caltrans provided the Air Quality and Energy evaluation reports, sent via email, on December 8, 2024. Requested traffic studies were sent via an online file transfer link.

Yolo 80 Managed Lanes Alternatives

Dear Mr. Benipal,

On December 11, 2023 the YoloTD Board received a presentation from District 3 on the Yolo 80 Managed Lanes Draft Environmental Document (DED). An outcome of that meeting was the YoloTD Board directed us to advise Caltrans that Alternative #4 (HOT 3+ Lane) is YoloTD's preferred alternative for the Yolo 80 Managed Lanes project.

Consistent with the October 5, 2022 Memorandum of Understanding (MOU) between YoloTD and District 3, YoloTD firmly believes that, of the alternatives analyzed in the Environmental Impact Report (EIR), a tolled managed lane (in this case, HOT 3+) offers the best combination of operational improvements, improved transportation access, environmental and sustainability outcomes, improved transportation access, and equity considerations. 1

Subject: EPA comments for the Yolo 80 Corridor Improvements Project Draft Environmental Assessment, Yolo, Solano and Sacramento Counties, California

Dear Masum Patwary:

The U.S. Environmental Protection Agency has reviewed the above-referenced document pursuant to the National Environmental Policy Act, Council on Environmental Quality regulations (40 CFR Parts 1500-1508), and our NEPA review authority under Section 309 of the Clean Air Act.

The Draft EA includes 12 build alternatives to ease traffic congestion across 20.8 miles of the Interstate 80/US-50 corridor from Kidwell Road on the Solano/Yolo County line to West El Camino Avenue on the Yolo/Sacramento County line by adding managed lanes through a combination of converting general purpose lanes, restriping, and reconstructing shoulders and medians with concrete barriers. Sheet flow drainage modifications for repurposed medians were analyzed, and lane management would be accomplished through expanded use of Intelligent Transportation System, ramp meters, overhead signs, high-occupancy lanes, and possibly dynamically-priced high-occupancy tolls lanes, and transit-only lanes. 1

We acknowledge that the EPA and the Federal Highways Administration concurred that the project was found not to be a Project of Air Quality Concern on October 15 and 18, 2021, based on information that concluded that the estimated percentage of diesel truck traffic resulting from the project, both with and without HOV-HOV connectors, would be estimated to remain under an 8% threshold of significance. We also note Caltrans environmental justice and equity analysis in the project area, the commitment to BMPs to reduce noise and dust impacts during construction, and to exploring fee-setting options including offsetting incentives and keying fee rates for disadvantaged households disproportionately and adversely impacted by tolling build alternatives. Given potential outstanding issues for disadvantaged households, including possible inequitable tolling costs, we continue to 2

encourage Caltrans to meaningfully engage impacted communities to materially address concerns as the project design is finalized.

Thank you for the opportunity to review this combined Draft Environmental Impact Report/Environmental Assessment. Please coordinate with EPA should Caltrans determine that further environmental analysis is warranted to assess additional design considerations and further refine the 12 build alternatives. We would appreciate receiving an electronic copy of the final environmental document once it is publicly available. If you have any questions, please contact me at 415-947-4167, or contact Zac Appleton, the lead reviewer for this project, at 415-972-3321 or appleton.zac@epa.gov.

Sincerely,

Response to Comment 1 in 20240104, Environmental Protection Agency Region 9

Thank you for your comment on the Draft EIR/EA. This introductory comment summarizes the authority of the EPA's review and the build alternatives being considered. The comment does not discuss the adequacy of the EIR/EA. No changes to the Draft EIR/EA are necessary.

Response to Comment 2 in 20240104, Environmental Protection Agency Region 9

This comment encourages Caltrans to consider continuing to have meaningful engagement with impacted communities, within the project area, to address concerns as the project is finalized. Caltrans will take into consideration the possibility of continuing engagement with impacted communities as project design is finalized. Sections 2.1.7 and Section 2.1.8 of the Draft EIR/EA discusses Environmental Justice and Equity, respectively. Please refer to Master Response E for responses related to environmental justice and equity. No changes to the Draft EIR/EA are necessary.

January 10, 2024

Tony Tavares
Director
California Department of Transportation (Caltrans)
1120 N St
Sacramento, CA 95814
Tony.Tavares@dot.ca.gov

Dear Director Tavares,

Thank you for the opportunity to provide comments on the Draft Environmental Impact Report (DEIR) for the Yolo 80 Corridor Improvements Project (Yolo 80, or project). We appreciate the opportunities that we have had to collaborate with Caltrans to support the success of California's *2022 Scoping Plan for Achieving Carbon Neutrality*. As the agency entrusted with environmental review of our largest transportation infrastructure investments, Caltrans' decisions carry unparalleled weight. The need to improve travel through the Yolo 80 Corridor presents an opportunity to advance the State's climate, air quality, and equity goals, and be a model for effectively managing the state highway system.

CARB staff have identified that the Yolo 80 proposal adds substantial new roadway capacity. This can increase vehicle miles traveled (VMT) and greenhouse gas (GHG) emissions. The DEIR omits project alternatives that could better meet the project's objectives with less environmental impact. Specifically, it only examines alternatives that add lanes and no project alternatives that convert existing lanes to priced lanes, even though converting an existing lane is in the Sacramento region's current sustainable communities strategy for achieving its GHG reduction target. In addition, the DEIR uses a traffic assessment approach that is expected to underestimate the project's impacts and exaggerate its benefits. This could lead to inaccurate DEIR significance determinations on GHG emissions, air quality, energy, noise, and safety, as well as influence whether the project achieves its objectives. Finally, the DEIR's proposal to mitigate less than half of its induced travel impact is inadequate, when additional mitigation is feasible. 1

Taken as a whole, the project would substantially increase VMT and GHGs, more so than the DEIR discloses, hampering achievement of the State's climate and air quality goals. Several State documents, including the Scoping Plan, CARB's *Progress Report on Implementation of the Sustainable Communities and Climate Protection Act*, and the *Climate Action Plan for Transportation Infrastructure*, call for reimagining or deprioritizing roadway projects that increase VMT to create a more sustainable transportation system. Reducing VMT also benefits health, traffic safety, equity, and the environment. By expanding capacity while

arb.ca.gov 1001 I Street • P.O. Box 2815 • Sacramento, California 95812 (800) 242-4450

improperly assessing and insufficiently mitigating impacts, the Yolo I-80 project is inconsistent with these State plans.

Procedurally, CARB had previously requested that Caltrans extend the public review period for this DEIR due to the current comment period being effectively truncated by several major holidays and because Caltrans has not posted the technical appendices to its website or otherwise made them available through the full comment period. I appreciate that Caltrans extended the deadline by one week. You may wish to consider further extension to mitigate concerns we are hearing from some stakeholders. Specifically, while Caltrans has committed to making the technical appendices available upon request, we are aware that these documents were not made immediately available to some members of the public who had requested them, leaving members of the public without adequate information and without the full time to evaluate and comment on the DEIR.

1 cont.

Thank you for the opportunity to comment. The attachment to this letter describes our comments in more detail and offers recommendations on how to address the DEIR's inadequacies. We would welcome the opportunity to work together to strengthen the project in ways that achieve its intended purpose while also addressing our shared climate and air quality goals.

If you have any questions, please feel free to contact me or Dr. Jennifer Gress, Chief of the Sustainable Transportation and Communities Division, at (916) 764-0747 or *jennifer.gress@arb.ca.gov*.

Sincerely,

Steven S. Cliff, Ph.D., Executive Officer

Attachment: CARB's detailed comments on the Yolo 80 Corridor Improvements Project

Background

The 2022 Scoping Plan[1] charts a path to achieving carbon neutrality by 2045 and describes why significant vehicle miles travelled (VMT) reduction is needed to achieve the State's greenhouse gas (GHG) emissions reduction targets. California's infrastructure investment choices play a central role in achieving those reductions.[2] Adding highway capacity leads to substantial increases in VMT, generally in proportion to the amount of capacity added,[3,4,5,6] moving California in the opposite direction from its climate and air quality goals. The induced VMT caused by highway expansion also has serious impacts on human health[7] and the natural environment.[8] Further, such investments lead to dispersed land use patterns, which move destinations further apart and exclude non-drivers (including people who are too old or young to drive, who cannot afford a car, or who are not physically able to drive) from economic and social opportunities. Exacerbating such land use and transportation patterns by expanding roadways rather than better managing the existing system and

investing public funds to provide more housing and transportation options that reduce the need to drive moves us further away from building an equitable and just society.

Meanwhile, pricing alone, without expansion, can relieve congestion while improving equity,[9] with less induced travel and reduced impact on the environment. Congestion often reduces vehicle flows by a third to a half, and congestion pricing can relieve congestion and return facilities to their full capacity flow. For this reason, pricing can obviate the need for expansion.

Several State documents, including the Scoping Plan, CARB's Progress Report on implementation of the Sustainable Communities and Climate Protection Act,[10] and the Climate Action Plan for Transportation Infrastructure,[11] call for reimagining or deprioritizing roadway projects that increase VMT to create a more sustainable transportation system. Most of the DEIR's proposed alternatives are out of alignment with these State goals, but that is obscured by issues with the analysis. Continuing on this path will not achieve our GHG emissions reduction targets. 2 cont.

This attachment provides CARB's comments on the proposed project in greater detail and offers recommendations for resolving the issues identified in those comments.

I. DEIR omits key project alternatives

The DEIR omits key alternatives that could better address congestion, have less impact on the environment, and in some cases cost less to build.

The SACOG 2020 Metropolitan Transportation Plan / Sustainable Communities Strategy (MTP/SCS), the region's blueprint for transportation infrastructure investment, is designed to achieve the region's transportation GHG emissions reduction goals. It specifies two express lanes for the corridor, one added and the other converted from an existing lane. In the travel demand model SACOG used to assess passenger vehicle GHG per capita reduction in its regional plan, the corridor was specified as follows: 3

[9] **Pricing can improve access to opportunity for low-income populations by funding improved transit (and, with income-based pricing, improved auto-mobility), and it can reduce environmental, health, and safety burdens by reducing traffic volumes and relieving congestion in neighborhoods near major roadways. See** *Pricing Roads, Advancing Equity*. **Transform, 2019. Available at: https://drive.google.com/file/d/1cnuJVoDfiKa04l9PhxjktOt4Er03RMuf/view**

[10] *2022 Progress Report: California's Sustainable Communities and Climate Protection Act*, available at https://ww2.arb.ca.gov/sites/default/files/2023-05/2022-SB150-MainReport-FINAL-ADA.pdf

[11] *Climate Action Plan for Transportation Infrastructure*, available at https://calsta.ca.gov/-/media/calsta-media/documents/capti-july-2021-a11y.pdf

Dual express lane each direction. SOVs tolled. One lane added, one converted from GP lane during peak hours (7am-10am and 3pm-6pm).

The Yolo County Transportation District also requested that Caltrans evaluate this configuration, showing further regional support for this alternative.

However, Caltrans declined to include this configuration in the DEIR as an alternative. None of the alternatives Caltrans included in the DEIR feature pricing of more than a single lane. Without the revenue a second priced lane would generate, the DEIR claims funds are unavailable to fully mitigate VMT impacts. Without that mitigation, the project would undermine the region's VMT and GHG emissions reduction efforts. Also, pricing only a single lane reduces congestion substantially less, and would therefore be less effective in achieving the project's purpose (as stated on DEIR page summary-2) to:

1. Ease congestion and improve overall person throughput
2. Improve freeway operation on the mainline, ramps, and at system interchanges
3. Support reliable transport of goods and services throughout the region
4. Improve modality and travel time reliability
5. Provide expedited traveler information and monitoring systems

3 cont.

The DEIR could focus on alternatives that achieve more greenhouse gas emissions reduction and cause less environmental impact while achieving the project's objectives. For example, Caltrans could study an alternative that adds congestion pricing on existing lanes. Pricing all three existing lanes in each direction without adding a lane could address traffic congestion and improve vehicle throughput to a similar extent as building a new priced lane,[12] cause less impact to the environment, greatly reduce cost, and generate more revenue to fully mitigate the harms of the project and provide additional benefits to the region. All-lane tolling has been considered elsewhere in California, including recently in District 4 for Highway 37, is feasible given the features of the corridor, and should be considered and studied as an alternative here, too.

Furthermore, consideration of additional project alternatives is likely needed, given that the DEIR's traffic assessment fails to assess travel patterns resulting from the project with reasonable accuracy (as discussed in the next section) throwing into doubt whether the

[12] Congestion typically reduces vehicle flows to 1000-1400 vehicles per hour per lane. A lane operating at free flow lane can carry 1700-1900 vehicles per hour. Therefore, addressing congestion with pricing can adjust vehicle flows during peak periods by roughly +600 vehicles per lane. Because relieving congestion with pricing can increase vehicle flows by 600 vehicles per hour per lane, adding congestion pricing to two congested lanes can add as much to flow as adding one lane that congests (+600 vehicles per hour per lane x 2 lanes = +1200 vehicles per hour). Adding congestion pricing to three congested lanes can add as much to vehicle flow as a lane priced to maintain free flow travel (+600 vehicles per hour per lane x 3 lanes = +1800 vehicles per hour).

project alternatives presented would achieve the project's stated purpose and need. Before building a project of this expense and impact, Caltrans should have better evidence that the project will accomplish what is intended. 3 cont.

II. DEIR uses a traffic assessment that underestimates impacts

A. Caltrans chose to assess traffic impacts using a travel demand modeling approach that does not accurately capture the impacts of this project

Despite having reportedly been advised to do so,[13] Caltrans did not apply a modeling approach that would more accurately capture the impacts of this project. As a result, the DEIR's traffic assessment likely underestimates the project's impact on VMT. Induced VMT generally manifests over the five years after delivery of a highway expansion project,[14] but the travel demand model Caltrans used for this project shows a different trajectory. On opening year (2029), the model predicts a high amount of induced VMT (about four times what the induced travel studies would predict over the long run), increasing VMT of the entire region approximately 3%. But in the long run, the model predicts the effect of the project would be to *reduce* VMT by approximately 3.5%. 4

The DEIR's technical appendixes note that static traffic assignment travel demand models, like the one used in the Yolo 80 DEIR, have difficulty with assessment in congested conditions:

> Another limitation of the SACSIM19 model is the use of static assignment rather than dynamic assignment of vehicle trips. With congested conditions, static assignment can result in volumes that exceed capacity for the analysis period. With dynamic assignment, trips are rerouted or shifted in time so that capacity is met. If dynamic assignment were used, VMT could be lower if trips are shifted in time to more direct routes or if trips are shifted to different destinations due to congested conditions. VMT could also be higher if longer routes must be used to avoid congested links. (Transportation Analysis Report, Interstate 80/US Highway 50 Managed Lanes, November 2023, page 78)

[13] *The Policy and Politics of Highway Expansions*, Amy Lee, 2023, Page 279. Available at: https://escholarship.org/uc/item/13x3n8zr

[14] *If you build it, they will drive: Measuring induced demand for vehicle travel in urban areas*. **Hymel, 2019. Available at: https://www.sciencedirect.com/science/article/abs/pii/S0967070X18301720**

Another technical appendix corroborates the concerns raised in the Transportation Analysis Report, acknowledging that static modeling is likely to exaggerate future year traffic volumes on the facility:

> Based on the static validation and knowledge that the model relies on static assignment of vehicle trips instead of dynamic traffic assignment, the model's peak period (and peak hour) forecasts may be higher than would occur. (Interstate 80/U.S. Highway 50 Managed Lanes Travel Demand Modeling Report, p. 27)

Other appendixes raise additional issues that may be compounding the problem:

> "[The model] has a limitation from its use of static traffic assignment instead of dynamic traffic assignment (DTA). For example, the model completes all origin-destination (OD) trips during peak hours even if the congested travel time would require longer than one hour to complete the trip (see Appendix A). This is not realistic and would not occur with a DTA. Instead, trips would only travel as far as congested speeds would allow within one hour. This type of limitation may overestimate peak hour demand." (Interstate 80/U.S. Highway 50 Managed Lanes Traffic and Revenue Report, p. 8)

4 cont.

Assessed with a travel demand model, induced travel is the difference between VMT assessed with the project and VMT assessed without the project. Research shows that static traffic assignment modeling approaches can over-predict future congestion in congested conditions.[15] The approach used here does not model the likelihood that drivers may vary departure time in the face of existing congestion, so in the horizon year, without the project it shows drivers piling onto and jamming the congested facility. The model then shows the jammed facility pushing subsequent drivers to take a lengthy route around the project corridor (in this case, via Woodland and I-5 about 10 miles to the north), adding substantial VMT to those trips. In the horizon year with the project, the model shows the facility accommodating that traffic. Comparing scenarios with and without the project, then, building the project appears to reduce VMT.

Dynamic traffic assignment modeling approaches, meanwhile, aim to better reflect the reality that many drivers would change their departure to a less congested time and forego the longer route. As a result, they would not generate the intensity of the congestion shown in the static traffic assignment modeling approach used for the project assessment. Without that intensity of congestion, and with the ability to change departure time, less traffic would re-route around the facility, so the VMT in the no-project scenario would be lower and the

[15] *Forecasting the impossible: The status quo of estimating traffic flows with static traffic assignment and the future of dynamic traffic assignment*. **Marshall, 2018. Available at: https://www.sciencedirect.com/science/article/pii/S2210539517301232?via%3Dihub**

comparison between VMT in the project and no project scenarios–the induced VMT–would be more accurate.

Meanwhile, other states are bringing dynamic traffic assignment modeling techniques into use for complex projects and projects that, like Yolo 80, have congested traffic conditions and parallel routes. The Colorado Department of Transportation offers the following guidance, which would appear to apply to a project like Yolo 80:

> DTA is useful when the analyst's study area includes a congested transportation facility as well as its parallel facilities (or parallel capacity). …[I]t may inform how much traffic redistribution to expect from one facility to another. DTA's assignment methods is more sophisticated than a traditional travel demand model as it accounts for bottlenecks. DTA also allows for temporal spreading (peak-hour spreading)[16] [i.e., changing of departure times to avoid congestion].

Caltrans did not apply a dynamic traffic assignment modeling approach that would more accurately capture the effect of the project on travel behavior and its impacts on the environment, and to have nevertheless opted for static modeling. *The Policy and Politics of Highway Expansions*[17] describes an interview with a transportation expert with knowledge of the modeling for the project: 4 cont.

> …a transportation expert also discussed the travel modeling analysis of HOT lanes on I-80. They discussed the various modeling approaches and scenarios that had been used to analyze the project, including scenarios to estimate long-term changes in VMT that included land use changes and used dynamic traffic assignment. Caltrans rejected these scenarios that showed long-term increases in VMT in favor of scenarios that used static traffic assignment, which showed that VMT would decrease with the highway expansion project because people would re-route off of a longer, parallel route through Woodland and back onto I-80. Caltrans 'liked' the model run using static assignment because it gave quantitative support for the expansion project. Comparisons of dynamic versus static assignment are well-documented in academic literature – generally, static assignment fails to account for the tendency of people to change their departure time as a result of travel time. But in reality, "way more people would change their departure time before they would go all the way around through Woodland." (p. 279, emphasis added)

---

[16] *Traffic Analysis and Forecasting Guidelines, Colorado Department of Transportation*, 2023, Pages 129-131. Available at: https://www.codot.gov/safety/traffic-safety/assets/traffic_analysis_forecasting_guidelines/traffic_analysis_forecasting_guidelines

[17] *The Policy and Politics of Highway Expansions*, Amy Lee, 2023, available at: https://escholarship.org/uc/item/13x3n8zr

This account seems to document three important points:

1. For this project, the static trip assignment modeling approach showed exaggerated traffic congestion and VMT in the no-project scenario.
2. Applying static trip assignment modeling in this way helped justify the project and reduce the appearance of environmental impacts associated with the project's induced VMT.
3. Caltrans reportedly considered and rejected dynamic traffic assignment modeling approaches because those would have revealed the environmental impacts of the project and because static trip assignment modeling exaggerated the need for a project it preferred to build (see underlined portion of *Lee 2023* excerpt above).

4 cont.

For this project, using static trip assignment modeling in this way causes crucial information about the intensity of the impact to be omitted; that omitted information is necessary for an informed understanding of the project's impacts.

In addition to the limitations of this static trip assignment approach, the model used for this project appears not to be validated to meet the standard of current practice. For example, in Table 5 of the *Interstate 80/U.S. Highway 50 Managed Lanes Travel Demand Modeling Report*, the Sacramento River screen line does not meet the minimum expectation of "percent within Caltrans maximum deviation" established in the RTP Guidelines. This adds to concerns with the quality of the forecast. Further, there is no speed validation at the corridor level.

B. Caltrans omits the effects of project-caused land use changes in its assessment of the project's effect on travel patterns

Ample research has documented highway expansion changes on land use development patterns,[18] and those changes comprise a substantial portion of the overall induced travel effect of highway projects.[19] This is well understood, and Caltrans' own guidance on assessing induced travel requires that land use development effects be assessed.[20] Guidance from the Governor's Office of Planning and Research also establishes the need to assess land use effects of highway capacity projects.[21]

5

[18] *Highway-Induced Development: Research Results for Metropolitan Areas.* Ewing 2008.
[19] Many induced travel studies distinguish short-term effects, generally caused by change in destination, mode, route, or number of trips, from long-term effects, generally caused by changes in land use patterns, and find the long-term component adds substantially to the short-term component.
[20] *Caltrans Transportation Analysis Framework*. 2020. Page 21. Available at: https://dot.ca.gov/-/media/dot-media/programs/transportation-planning/documents/sb-743/2020-09-10-1st-edition-taf-fnl-a11y.pdf.
[21] *Technical Advisory on Evaluating Transportation Impacts in CEQA*, Governor's Office of Planning and Research, 2018, pages 33-34. Available at: https://opr.ca.gov/docs/20190122-743_Technical_Advisory.pdf

However, in its traffic analysis, Caltrans district staff excluded the land use effects of this project, applying the same land use scenario with and without the project:

> Caltrans district staff directed that the model land uses be maintained without changes from the MTP/SCS versions for all alternatives, including the no build alternative. (*Interstate 80/US Highway 50 Managed Lanes Transportation Analysis Report,* p. 26)

When modeling a project, applying the same land use scenario with and without the project omits the project's effect on land use from the analysis entirely. Omitting the land use effect of the project would likely lead to a substantial underestimate of the amount of induced vehicle travel, as it is generally among the largest of the components of the induced travel effect, as is stated in the Traffic and Revenue Report for the DEIR:

> The development of the SACSIM19 model to represent 2029 and 2049 conditions is documented in the I-80/US 50 Managed Lanes – Forecasts Methodology Memorandum (November 23, 2020) and the I-80/US 50 Managed Lanes – Travel Demand Modeling Report (September 2021). Reviewers should note that the model inputs for land use growth have the largest effect on future travel demand. (Interstate 80/U.S. Highway 50 Managed Lanes Traffic and Revenue Report, p. 10)

5 cont.

Despite its importance to the analysis, Caltrans maintained the same land use scenario across all alternatives, including no-build:

> Land use inputs were not developed for each individual alternative. Instead, the SACOG 2020 MTP/SCS land use forecasts associated with specific model years 2016, 2027, and 2040 were used without modification. Then the resulting vehicle trip tables from the SACSIM19 model were factored to produce 2029 and 2049 vehicle trip tables that were used in the final assignment. This approach limits the sensitivity of the traffic and revenue forecasts to any unique land use effects associated with each alternative. (Interstate 80/U.S. Highway 50 Managed Lanes Traffic and Revenue Report, p. 10)

Excluding land use effects resulted in the exclusion of a major source of additional vehicle travel in the assessment. Omitting land use changes from the project, and the extra vehicle travel they would cause, exaggerates the transportation benefits of the project by showing that it improves traffic more and over a longer period of time than it actually will.

Omitting land use changes also leads to understating the environmental impacts of the project related to vehicle travel. Underestimating VMT will lead to an underestimate of GHG emissions, air pollutant emissions, energy, and noise, likely mischaracterizing the directionality, magnitude, and significance of impacts.

C. Caltrans applies differing values for induced truck VMT in different parts of the DEIR in ways that minimize appearance of environmental impacts

Caltrans claims differing amounts of induced truck travel in different impact analyses in the DEIR. For VMT impacts, it discounts a large amount of induced truck travel from its assessment of induced auto travel, making that impact appear substantially smaller. Assessing other impacts, it assumes less additional truck travel, making those impacts, too, appear substantially smaller. Using truck VMT inconsistently in the manner that Caltrans does minimizes the appearance of environmental impacts of the project.

For VMT assessment under SB 743, truck travel may be either included or excluded.[22] In its VMT analysis, Caltrans chooses to exclude truck travel from induced VMT. To establish the amount of truck travel to omit, the DEIR references the Caltrans advisory *NCST Calculator Truck Adjustment*.[23] That guidance references Duranton & Turner (2011): "…we estimate that trucks account for between 19 and 29 percent of the total increase in interstate VKT [vehicle kilometers travelled],"[24] and suggests applying the maximum value in that range to reduce the amount of induced auto VMT it reports as a transportation impact. 6

When assessing impacts other than VMT, truck travel must be included. However, the traffic analyses feeding into these assessments report much less induced truck travel.[25] We analyzed the discrepancy between induced truck VMT, as reported in the Transportation Analysis Report for the project[26], and found it ranged from 201% and 565% across the capacity-adding alternatives (see table below).

In sum, Caltrans applies lower estimates feeding into assessment of project impacts such as GHG emissions, air pollutant emissions, energy, and noise, making those impacts appear smaller. Meanwhile, it applies higher estimates where those estimates are subtracted from

---

[22] *Technical Advisory on Evaluating Transportation Impacts under CEQA*. **Governor's Office of Planning and Research, 2020, pages 4-5. Available at: https://opr.ca.gov/docs/20190122-743_Technical_Advisory.pdf**

[23] *NCST Calculator Truck Adjustment: Method for adjusting NCST Calculator results to account for heavy-duty trucks*. **Available at: https://dot.ca.gov/programs/esta/sb-743/resources/ncst-truck-adjustment**

[24] **Page 2644**

[25] Further, the technical appendixes make conflicting claims about discussing air quality impacts, the DEIR states, "The project would not change the traffic mix" (p. 3-11). In its assessment of air quality, the share of trucks listed for the no build and build alternatives is the same, indicating that none of the project alternatives would affect truck volumes compared to the no-build (Table 2.2-9, Pages 2-194 – 2-195). It is not possible that 29 percent of the project's induced travel is truck travel, and also that the project does not affect the share of truck travel.

[26] (Interstate 80/US Highway 50 Managed Lanes Transportation Analysis Report, November 2023, Table 31 and Table 32, pages 81-82)

the total induced VMT, making those impacts also appear smaller. The table below shows the magnitude of the discrepancy for each alternative.

Alternative	Long-Term Induced Truck VMT (used to calculate GHG, Air Quality, Energy, and Noise Impacts) (Transportation Analysis Report, Nov. 2023, Table 35, p. 83)	Long-Term Induced Truck VMT (subtracted from VMT impacts)* (Transportation Analysis Report Nov 2023, Table 32, p. 82.)	Difference
1 (No Build)	0	-	-
2 (Add HOV)	67,500	143,600	213%
3 (Add HOT2+)	41,600	143,600	345%
4 (Add HOT3+)	25,400	143,600	565%
5 (Add Toll)	29,200	143,600	492%
6 (Add Transit)	1,200	-	-
7 (Convert HOV)	6,500	3,600	55%
8 (Add HOV with Median Ramps)	61,000	149,600	245%
9 (Add HOV without Enterprise Crossing)	71,400	143,600	201%

Induced truck travel for each alternative used to assess different impacts. (*Caltrans NCST Calculator Truck Adjustment Guidance (available at https://dot.ca.gov/programs/esta/sb-743/resources/ncst-truck-adjustment))

CEQA requires factual conclusions reached in an EIR to be supported by substantial evidence.[27] Here, using different amounts of truck travel in different sections of the document is internally inconsistent, and can therefore inaccurately – and improperly – reduce the appearance of environmental impacts. Substantial evidence under CEQA is that which includes "facts, reasonable assumptions predicated upon facts, and expert opinion supported by facts."[28] The CEQA statute goes on to state that substantial evidence does not include unsubstantiated opinion or narrative, or evidence which is clearly inaccurate or erroneous.[29] Given the EIR is internally inconsistent in support for its key determinations regarding truck-related VMT, these determinations lack substantial evidence. Furthermore, if impacts are underestimated, they will be under-mitigated, and the environment will not be protected as the law envisions.

6 cont.

[27] See Cal. Pub. Resources Code § 21168.5.
[28] Cal. Pub. Resources Code § 21082.2(c).
[29] See *id.*

III. DEIR relies on the traffic assessment for its impact assessment and significance determinations, including the GHG emissions assessment

The DEIR's assessment of GHG emissions, air quality, energy, and noise are all based on the traffic assessment discussed earlier. Therefore, these impacts are likely underestimated, calling the DEIR's significance determinations into question.

CARB staff found this to be the case with the DEIR's assessment of GHG emissions. Table 8 in the Air Quality Report (August 2023) (pages 30 and 31) provides GHG emissions that it claims would result from each alternative. The DEIR's claim on p. 3-26 – 3-27 that "GHG emissions of the Build Alternatives were assessed to be less" than the no-build appears to be based on data from that table. However, data from the table appear to be based upon the output of the static trip assignment modeling approach of comparing scenarios without land use variations, discussed above.

Furthermore, the DEIR GHG assessment appears to incorrectly factor in emissions reductions from vehicle efficiency improvements to justify the project's effect on GHG emissions, stating: 7

> A quantitative analysis of daily CO2 emissions was performed using the Caltrans CTEMFAC2021. GHG emissions and VMT comparisons were calculated for the Build Alternatives the existing year (2019), in opening year (2029), and design year (2049). As anticipated with new fleet and electric vehicles penetration, in design year 2049, GHG emissions of the Build Alternatives were assessed to be less.

However, the decarbonization of the vehicle fleet is not what this DEIR is supposed to analyze. The DEIR is supposed to analyze the effects *of the project*,[30] which must be determined by comparing emissions with and without the project using the same year.[31] Caltrans' own guidance on assessing transportation projects under CEQA articulates the importance of focusing on the impacts of the project by comparing impacts with and without the project in the same year:

> Transportation projects are typically built years after the CEQA analysis is completed, and comparing to existing conditions would combine the project's VMT effects with other effects…in effect misleading the public and decision-makers by obscuring the impacts of the project itself. When comparing future build conditions to future no-

[30] See CEQA Guidelines § 15126.2(a).
[31] See *id*; see also § 15125(a).

build conditions, the difference is the addition of the project itself and associated changes that may occur to land use and travel behavior.[32]

7 cont.

For these reasons, the DEIR's claim that adding a lane will decrease GHG emissions is not supported by substantial evidence and is likely incorrect.

IV. Amount of VMT mitigation in the DEIR is inadequate

CEQA requires significant impacts to be fully mitigated where feasible. However, while the project as proposed will induce substantial amounts of new VMT, the DEIR proposes to mitigate only 43% of it.[33] Inadequate mitigation of VMT makes it harder to achieve the State's climate goals, which depend on VMT reduction.

Cost is the only reason cited for offering incomplete mitigation, but neither the DEIR nor its appendixes offer reasoning or substantial evidence for setting the ceiling of mitigation funds at 14-15% of construction cost. Also, because the DEIR omits consideration of viable, key pricing alternatives (discussed earlier) the cost of VMT mitigation should not be allowed as justification for less than full mitigation. Considering conversion of existing lanes to priced lanes would bring in more revenue that could be invested to mitigate the impacts of the project and provide additional benefits to the public, including investment in additional low-VMT housing[34] and/or capacity reduction elsewhere on the system (e.g., via road diet or conversion to transit-only lanes).

8

V. Recommendations

Flowing from the comments on the DEIR presented above, CARB staff have the following recommendations:

Alternatives. Pricing, not expansion, can address congestion and achieve the objectives set forth in the DEIR for this project. Pricing also generates less impact to the environment than expansion. Therefore, Caltrans should study conversions of existing lanes to priced lanes, at a minimum including:

9

- the configuration specified in the MTP/SCS (i.e., an addition of one express lane plus the conversion of one existing general-purpose lane to an express lane),

[32] *See Caltrans Transportation Analysis Under CEQA*, page 17, available at https://dot.ca.gov/-/media/dot-media/programs/transportation-planning/documents/sb-743/2020-09-10-1st-edition-tac-fnl-a11y.pdf
[33] Yolo 80 Managed Lanes Project Draft VMT Mitigation Plan, October 25, 2023, p. 8.
[34] **Housing generating less than 85 percent of regional average household VMT, per** *Technical Advisory on Evaluating Transportation Impacts under CEQA*, **Governor's Office of Planning and Research, 2020. Available at: https://opr.ca.gov/docs/20190122-743_Technical_Advisory.pdf**

- pricing existing lanes without any lane expansion.

Caltrans should revisit the question of whether each alternative achieves the stated objectives for the project (i.e., the purpose and need).

Redo the traffic assessment. Given the three major flaws identified in the traffic assessment and given the importance of accuracy in that assessment to impact assessments and significance determinations, we recommend the travel modeling for the project be redone using a modeling approach that is more appropriate for this analysis with the project's effects on land use included, and taking care to use consistent assumptions on induced truck VMT. 9 cont.

Reassess impacts and significance determinations. Redoing the traffic assessment is likely to show different traffic outcomes both with and without the project than the traffic assessment currently in the DEIR. Therefore, GHG, air quality, energy, safety, and noise impact assessments and significance determinations need to be revisited. When revising the impact assessment and significance determination for GHG emissions, please only compare emissions with and without the project, removing the impact of vehicle efficiency improvements.

Provide full mitigation for induced VMT. VMT impacts of the project should be fully mitigated. Pricing of existing lanes can serve both as mitigation itself and to finance other mitigation strategies to achieve full mitigation.

Response to Comment 1 in 20240110, California Air Resources Board

This comment generally summarizes issues that are presented in the detailed comments attached to the letter and are addressed below.

The Draft EIR/EA was circulated for the required length of time (45 days), plus an additional 11 days to accommodate the holiday season. Due to multiple requests during the circulation process for additional review time, the Draft EIR/EA was further extended an additional 7 days to January 12, 2024, for a total of 62 days.

Response to Comment 2 in 20240110, California Air Resources Board

This comment provides background information and summarizes CARB's comments on the Draft EIR/EA. These comments are responded to in greater detail in Response to Comments 3-9 below. No changes to the Draft EIR/EA are necessary.

Please refer to Master Responses A, B, and E for responses related to induced travel, project alternatives considered, and equity, respectively.

Response to Comment 3 in 20240110, California Air Resources Board

The commenter recommended that Caltrans consider other alternatives that could reduce VMT and generate additional funds to mitigate VMT impacts, such as adding one express lane plus convert an existing general-purpose lane to an express lane, or pricing existing lanes without any lane expansion, and provided calculations of this at footnote 12.

The theoretical calculation provided by the commenter on footnote 12 is an inaccurate estimation of the impact to vehicular flow per lane by pricing existing capacity. While ideal capacity of a priced lane may be 1,700-1,900 vehicles per hour, the calculation ignored the impacts to vehicular flow due to friction between general purpose and priced lanes, turbulence caused by ingress/egress, and congestion caused by downstream bottlenecks. As the priced lanes in the example provided would not operate in a vacuum, the factors listed above, along with other factors, would reduce the vehicular throughput impacts due to pricing stated by the commenter.

Regarding the project's circulated and preferred alternative(s), Caltrans offers the following:

The Project's alternatives were developed by Caltrans and its partners. In 2018, Caltrans established a steering committee for the project that included local stakeholders, such as the Cities of Davis and West Sacramento, Yolo County, Sacramento Area Council of Governments (SACOG), Yolo Transportation District (YoloTD), University of California (UC) Davis, Bicycle Coalition, etc. The steering committee held over 14 public meetings within the Cities of Davis, Sacramento, and West Sacramento to discuss the project and receive input from the community.

Additionally, the Project Development Team (PDT) conducted meetings that provided the forum for coordination, issue resolution, and information feedback between Caltrans, Sacramento Council of Governments, West Sacramento, Davis, Yolo County, UC Davis, and YoloTD. PDT

meetings occurred monthly, starting on October 3, 2017, and continued well into the remainder of the environmental and project approval process, ending in Spring of 2024. Table 4-2.1, Chapter 4, Final EIR/EA captures notable meetings from 2023-24. Given the project's 6-year development period, about 60 PDT meetings were conducted with participation from Agency partners.

A Notice of Preparation (NOP) memorandum was filed with the State Clearinghouse on June 6, 2021, which was revised on August 17, 2021, to notify that the scoping meeting was rescheduled. Caltrans accepted scoping comments until September 24, 2021. A revised NOP was also distributed on October 17, 2022, that included clarification of the proposed managed lane strategies and Build Alternatives.

Project alternatives were analyzed specifically in relation to existing conditions using the tools available with the requirement of meeting the purpose and need of the project for this segment of highway. Additionally, the suite of proposed alternatives may not meet the purpose and need of the project. However, these alternatives may still be viable for other projects in the future. As new projects are developed in the Yolo 80 corridor, Caltrans will ensure these projects are consistent with the SACOG Sustainable Communities Strategy.

Please refer to Master Response B for responses related to project alternatives considered. No changes to the Draft EIR/EA are necessary.

Response to Comment 4 in 20240110, California Air Resources Board

The commenter recommended Caltrans use a dynamic assignment modeling approach, instead of the SACSIM19, a static assignment, asserting that it underreports environmental impacts. Please refer to Master Response D for responses related to modeling methodologies.

Response to Comment 5 in 20240110, California Air Resources Board

The commenter stated that Caltrans failed to consider project-caused land use changes in assessing the project's effects on travel patterns, thereby understating the project's impacts. This is inaccurate. Caltrans used the NCST's California Induced Travel Calculator to analyze long-term induced vehicle travel effects on VMT, in which the impact to VMT due to land use changes is implied. The use of the calculator is consistent with the TAC and TAF.

The land use information used in the project analysis is indicative of Build conditions as the 2020 SACOG MTP/SCS land use projections include the project in the future year network. Therefore, the environmental impacts of the project related to vehicle travel are not understated. No changes to the Draft EIR/EA are necessary.

Please refer to Master Response A for additional responses related to induced travel and VMT calculation methodologies.

Response to Comment 6 in 20240110, California Air Resources Board

The commenter stated Caltrans used truck VMT in an inconsistent manner which minimized the appearance of the project's environmental impacts.

Caltrans VMT analysis of automobile travel attributable to the project legally complied with CEQA Guideline Section 15064.3. Please refer to Master Response A for responses related to induced travel and VMT calculation methodologies and Master Response I for responses related to the use of traffic data in analyses of impacts related to other resource areas.

Response to Comment 7 in 20240110, California Air Resources Board

The commenter stated the Draft EIR/EA's GHG assessment was incorrect because it factored in emission reductions from vehicle efficiency improvements.

California Environmental Protection Agency and CARB have noted in addition to reducing VMT, other appropriate measures to reduce GHG emissions include improved fuel standards for cars, trucks, and buses, and adopting state regulations for zero emission vehicles (ZEV). (California EPA/Air Resources Board Technical Advisory: Strategies to Reduce Air Pollution, April 2017, pp. 3, 5, 9.) Technological innovations to reduce air pollution and GHG emissions are consistent with laws to improve air quality and ensuring net zero greenhouse gas emissions. (42 U.S.C. § § 7404(a)(1), 7534. Health & Safety Code § 38500, et. seq. Health & Safety Code §§ 38562.2(c), 38566.) Thus, the Draft EIR/EA's consideration of the vehicle efficiency improvements as a factor in the analysis of GHG emission reduction is appropriate.

The land use information used in the project analysis is indicative of build conditions as the 2020 SACOG MTP/SCS land use projections include the project in the future year network. Therefore, GHG emissions of the project related to vehicle travel are not underestimated.

Please refer to Master Response I for response related to GHG analysis methods.

Response to Comment 8 in 20240110, California Air Resources Board

The commenter states the Draft EIR/EA, which proposes to mitigate 43% of the VMT in inadequate. The commenter also states the mitigation funding which is 14-15% of the project is inadequate and insufficient.

Please refer to Master Response A for responses related to VMT mitigation.

Conversion of existing lanes to priced lanes was already discussed in Comment 3, above and in Master Response B.

Response to Comment 9 in 20240110, California Air Resources Board

This commenter offers recommendations on alternatives, requests new traffic assessments, new impact/significance determinations, and asks for full mitigation for induced VMT. Please refer to Master Responses A, B, and D for responses related to induced travel, VMT mitigation, project alternatives considered, and modeling, respectively. Caltrans deems the Draft EIR/EA to contain adequate analyses regarding traffic and related resources issues and appropriate mitigation for VMT impacts.

20240110, City of West Sacramento

CITY OF WEST SACRAMENTO

January 10, 2024

Masum A Patwary, Environmental Scientist C
California Department of Transportation, District 3
703 B Street
Marysville, CA 95901
VIA Email: Yolo80Corridor@dot.ca.gov

Subject: Yolo 80 Corridor Improvements Project: Draft Environmental Impact Report/Environmental Assessment (DEIR/EA)

Dear Mr. Patwary,

The City of West Sacramento has had an opportunity to review the Draft Environmental Impact Report/ Environmental Assessment (DEIR/EA) for the Yolo 80 Corridor Improvement Project. Please see staff's comments below:

City of West Sacramento Comments:

1. Has there been a consideration of Bus Rapid Transit (BRT) to minimize traffic impacts between I-80 Yolo Causeway between Davis and West Sacramento. 1
2. Will there be an increase in the frequency of public transit (i.e., more buses) to serve commuters using these connectors. 2
3. Are the managed lanes intended to be active seven days a week or limited to weekdays only? There is major traffic build up along this corridor on weekends also. 3
4. In section 3.2.17 (Transportation) (b), what measures would be taken to implement a voluntary trip reduction program in Yolo County? How involved will Yolo County be in potentially implementing this program along with the other stakeholders? 4
5. On Pages 2-51 and 2-52 the document states that the Southport area of West Sacramento is "nearly built out." This is incorrect as there are more than 6,500 dwelling units yet to be built in addition to the Port of West Sacramento's Seaway and Stone Lock properties, which will be developed with a mix of uses. The analysis must account for this growth. 5
6. On Page 2-83 the document states that use of toll lanes (Alternatives 3-5) would cause a higher financial burden on low-income travelers and "is a disproportional impact." Despite AMMS there would be a "reduction in benefits by low-income groups... and inequitable distribution of project benefit." How can this be remedied so that the disadvantaged residents of West Sacramento, which make up the majority of disadvantaged residents in the project area, are not ever further disproportionately impacted by the project. 6
7. On Page 2-119 the document states that "alternatives 2a, 3a, 6a, 7a, and 2b would also have a bottleneck at the Jefferson Boulevard off-ramp. Alternatives 2a through 4a and 6a, 7a and 2b would also have a bottleneck at the I-80 off-ramp. The Reed Avenue off-ramp would also have high demand volumes 7

leading to congested conditions for the ramp diverge under all project alternatives." How can these impacts be mitigated sufficiently? 7 cont.

8. On Page 2-44 the document states that a "total of approximately 10.0 acres of SWHA foraging habitat consisting of grassland and croplands (i.e., hayfield) would be permanently lost." Why is there no mention of mitigation through the Yolo Habitat Conservancy? 8
9. On Pages 3-20 and 3-43, please add the requirement to contact West Sacramento police and Community Development if human remains of Native American origin are found in West Sacramento. 9
10. On Page 3-36, the document is unclear if West Sacramento sensitive receptors (Valhalla, Meadowdale, Sikh Temple school, etc.) would be impacted. 10
11. On Page 3-39, include more detail on emergency access per the West Sacramento Fire Dept. 11
12. The document should discuss all potential locations for stockpiles, construction staging, batch plants, and traffic associated with construction on local roadways, and identify potential impacts from these activities on local streets, residents, air quality, traffic, noise, etc. Local land use and construction permitting may be required, and if this Project DEIR does not adequately address the impacts of construction-related activities on the local community, the City of West Sacramento may determine that such activities are considered "projects" under CEQA and require environmental review and a determination as part of the construction-related project's analysis and evaluation. 12
13. On Page 3-4, the document includes a reference to a "drainage facility in West Sacramento. Please identify the drainage facility, indicate who is responsible for it, and if there would any upstream or downstream impacts. 13
14. The City of West Sacramento has met on two occasions with Caltrans pertaining to the proposed Park and Ride lot at the northeast corner of Lake Road and Enterprise Boulevard and the existing Park and Ride lot at the corner of Enterprise Blvd./West Capitol Avenue. The preliminary design of the new Park and Ride facility proposed by Caltrans on Lake Road was not supported as it did not meet a significant number of landscape, security, pedestrian safety, EV charging, and mobility requirements as dictated by the West Sacramento Parking Area Design Standards and the West Sacramento Mobility Action Plan. At the most recent meeting between the City of West Sacramento, Yolo County Transportation District (YTD), Sacramento Area Council of Governments (SACOG), and Caltrans, the city made it clear that a park and ride was not meeting local expectations for supporting transit, mobility, and active transportation goals. The City provided design recommendations including, but not limited to the following: 14
    a) Parking lot design must conform with Chapter 17.27.090 of the Municipal Code. Construction of this facility is only compatible with the current land use designation when designed in accordance with city standards.
    b) Proposed 300 parking spaces must be shaded by canopy trees to reduce the urban heat island effect, and landscaping must be proposed in accordance with the Landscape Development Guidelines of the City of West Sacramento.
    c) Parking lot design must include efficient lighting for public safety.
    d) Pedestrian circulation and access must be planned to accommodate those with disabilities.

1110 West Capitol Avenue
West Sacramento, CA 95691
(916) 617-4500
www.cityofwestsacramento.org

e) EV charging must be provided at a minimum standard of 1 Level 2 (L2) EV charge port for every 5 parking spaces by code. The City is amenable to discussing a swap of Direct Current Fast Chargers (DCFC) in place of the L2 ports required in the amount of 1 DCFC port for every 50 parking spaces minimum in exchange for the required 60 Level 2 Chargers with approval of the Community Development Director. At least one DCFC port must be accessible for transit vehicles (pull through space) to support regional electric bus and local electric micro-transit service.

f) As supported by SACOG and as policy dictated in the City's Mobility Action Plan, this park and ride facility must include transit, pedestrian, and bicycle access and support amenities consistent with a Regional Mobility Hub designed to promote transit use, support active transportation, and reduce VMT/GHG. Mobility hub amenities include the following:

   i. Secure Bicycle lockers (1 per 10 spaces)
   ii. Bus Shelter(s)
   iii. Bike/Scooter Share Racks supporting regional micro-mobility
   iv. Passenger Pickup and Waiting Areas
   v. Transit Vehicle Turn Out
   vi. EV Charging
   vii. Real Time passenger information systems
   viii. CCTV Security Cameras

The City provided an electronic mark-up of the initial design submitted by Caltrans to city staff showing how the City's requirements can be met without reducing the number of spaces available. No follow-up for discussion was scheduled by Caltrans.

14 cont.

15. In 2018, early in the community engagement process for this project, the City of West Sacramento communicated the need to connect bicycle facilities on Enterprise Boulevard with West Capitol Avenue where I-80 currently prohibits bicycle connectivity. There are no bicycle lanes under I-80 on Enterprise Blvd., and sidewalk exists only on the north side. Caltrans expressed a firm commitment to improving bicycle and pedestrian connectivity north and south of the state highway which the City proposed evaluating three options at the community workshop:

    a. Connect the existing bike path under Yolo Causeway by way of Tule Jake Road, under I-80 adjacent to Prospect Slough to Lake Road.
    b. Widen the Enterprise Blvd. underpass to provide NB and SB bike lanes.
    c. Provide a single multiuse path (tunnel) from under I-80 on the east side of Enterprise.

    The last option would have the benefit of connecting Caltrans' north park and ride facility with that proposed on the south. The City reminded Caltrans of this important issue multiple times, including to the Project Manager months prior to the release of the EIR/EA, which does not address this issue or evaluate any options expressed. This is concerning because Caltrans' own study completed February 2023 (Yolo 80 Corridor Improvements Project Draft Pedestrian and Bicyclist Travel Impact Assessment) recommends the following to be implemented with this project:

15

1110 West Capitol Avenue
West Sacramento, CA 95691
(916) 617-4500
www.cityofwestsacramento.org

"At the Enterprise Boulevard/West Capitol Boulevard interchange area where traffic volume changes are less substantial, but where the interchange represents a significant gap in pedestrian and bicycle infrastructure that significantly limits access to the Yolo Causeway bicycle path, the following recommendations were identified to close the current pedestrian and bicycle infrastructure gap:

• At eastbound ramp intersection: reconstruct pedestrian ramps to current ADA standards. (A pedestrian ramp upgrade is planned as part of the 03-4F650 project to be completed prior to construction of this project.)

• At westbound direct on-ramp: enhance the marked crosswalk with rapid rectangular flashing beacons; reconstruct pedestrian ramps to current ADA standards.

• At westbound ramp intersection: provide marked crosswalks and pedestrian crossing warning signs for free-flowing right-turns; reconstruct pedestrian ramps to current ADA standards. (A pedestrian ramp upgrade is planned as part of the 03-4F650 project to be completed prior to construction of this project).

• On Enterprise Boulevard/West Capitol Avenue: restripe roadway between the westbound ramps and Lake Road within project work area to provide Class II bike lanes in accordance with current CA MUTCD standards. Outcomes could be enhanced in future planning efforts by coordinating with West Sacramento to provide bicycle facilities between Lake Road and the existing bike lanes at the intersection of Industrial Boulevard and/or the potential future bridge crossing over the existing shipping channel."

15 cont.

The proposed resurfacing of the existing bike path north of West Capitol Avenue does not address a mobility deficiency, contribute to reducing VMT/GHG, nor does it address a serious safety concern created by the state highway system. We request that the options proposed by the City be evaluated and considered with this project, and at minimum, Caltrans' own recommendations be implemented with this project to protect the safety, health and welfare of West Sacramento residents.

16. Travel Forecasts and VMT evaluated for the project that are included in the Travel Demand Modeling Report do not appear to include the Enterprise Crossing in the future condition. The Enterprise Crossing is a planned 2 to 4-lane multi-modal bridge crossing connecting Enterprise Boulevard with Southport Parkway over the existing Deep-Water Ship Channel serving the Port of West Sacramento. The project is identified in the Metropolitan Transportation Plan-Sustainable Communities Strategy (MTP-SCS) as YOL19434 – Enterprise Crossing with a completion timing of 2026-2030. The project has also been included in the West Sacramento General Plan since the 1990s. The Project Approvals and Environmental Document (PA&ED) Project Development Phase has been initiated with contract approval anticipated January 2024. Traffic analysis for the bridge was evaluated by the Port of West Sacramento in April 2022 (Mott MacDonald) which showed an opening day of 7,700 AADT with a Year 2040+ of 16,000 AADT. Enterprise Boulevard from Channel Drive to I-80/US 50 interchange at Enterprise to grow from the existing 18,400 AADT to 33,000 AADT in Cumulative year 2040+. For years the General Plan has anticipated an estimated 20,000 to 40,000 daily trips to the I-80/US 50 corridor at Enterprise/West Capitol Avenue on/off ramps, including a shift in truck trips from Harbor Blvd to Enterprise as this new bridge would reduce VMT for trips to Southport Industrial Park. 16

1110 West Capitol Avenue
West Sacramento, CA 95691
(916) 617-4500
www.cityofwestsacramento.org

This projected travel data does not appear to correspond with the data provided in the travel forecasting information for the Managed Lane Project prepared by Fehr and Peers. There is very little difference between the 2019 Existing Condition and the 2029 No Build Alternative, amounting to a difference of only 5,487 trips. For 2040 the volumes only increase 100 trips, and in some alternatives, they actually drop below 2029 levels. Although the City of West Sacramento on multiple occasions informed Caltrans of the Enterprise Bridge Project, and although it is identified in the Forecasts report, it does not appear that the EIR considers the Enterprise Bridge Project. Please confirm that the Enterprise Crossing project and the estimated AADT has been included in the Traffic analysis for the EIR. 16 cont.

If you have any questions, please contact me at (916) 617-4645 or via email at: andreao@cityofwestsacramento.org.

Response to Comment 1 in 20240110, City of West Sacramento

The commenter asks if Bus Rapid Transit has been considered to minimize traffic impacts. While Bus Rapid Transit was not specifically considered, increased transit service and Capital Corridor Rail frequency have been included as part of the VMT mitigation plan which is summarized in AMM TRANS-1 in Section 2.1.10 and Section 3.2.17 of the Draft EIR/EA. Subsequent coordination with local agencies and stakeholders have resulted in a contribution to expand YoloBus Route 42 has been added to measures to reduce VMT in Table 2.1-27 of the Final EIR/EA.

Response to Comment 2 in 20240110, City of West Sacramento

The commenter asks if there will be an increase in the frequency of public transit. Yes, increased service frequency for multiple public transit routes, including the Causeway Connection Route 138, Capitol Corridor, and Unitrans services, are included in AMM TRANS-1 which is described in Section 2.1.10 and Section 3.2.17 of the Draft EIR/EA. Measures have been updated in the Final EIR/EA to reflect refinement that has occurred through coordination with local agencies and stakeholders.

Response to Comment 3 in 20240110, City of West Sacramento

The commenter asks if managed lanes will be active all week. A Concept of Operations for the corridor is currently being developed to help identify potential hours of operations for the managed lane alternatives. However, if a toll lane alternative is selected, 7 days a week operation would be a serious consideration due to the traffic impacts mentioned by the commenter. The transportation analysis for the project was conducted using typical weekday traffic data in order to capture the peak travel periods of the corridor, as the magnitude of weekday traffic is much higher than weekends. Further analysis will be conducted to evaluate the potential for weekend managed lane hours of operation. No changes to the Draft EIR/EA are necessary.

Response to Comment 4 in 20240110, City of West Sacramento

The commenter asks what measures would be taken to implement a Voluntary Trip Reduction Program in Yolo County. As part of mitigation measures TRANS-1, Caltrans would contribute to the Voluntary Trip Reduction Program, which would help fund the current approved program implemented by Yolo Commute, the Yolo County transportation management association. As indicated in Table 2.1-27 of the Draft EIR/EA, the program includes features such as community-based travel planning, ridesharing, transit pass subsidies, and pay-per-mile auto insurance. Yolo County would not be the implementing agency for this program, as Yolo Commute is the implementing agency for the Voluntary Trip Reduction Program. However, Yolo Commute coordinates with all its local stakeholders and constituents when performing outreach and implementing the program.

Response to Comment 5 in 20240110, City of West Sacramento

The commenter is correct that the Southport area is not built out. The referenced sentence in Section 2.1.5.1 of the Draft EIR/EA was revised for clarity by removing the statement "and is now nearly built out."

The growth analysis includes the assumptions for growth contained in the City of West Sacramento 2035 General Plan and associated Specific Plans. As noted in the City of West Sacramento 2035 General Plan Policy Document: "*The city is at a major crossroads as the new 2035 General Plan focuses the city's future growth within the existing city limits. The pace of future growth is not likely to slow. As remaining development capacity in the Southport villages continues to be absorbed, new development and redevelopment will also begin in the city's waterfront mixed-use districts.*"[3] As noted in the Draft EIR/EA, the growth analysis and SACOG forecast model include assumed growth in West Sacramento consistent with the General Plan and Specific Plans for residential and mixed-use development, including development plans in Southport and the Port of West Sacramento areas.

Response to Comment 6 in 20240110, City of West Sacramento

Please refer to Master Response E for responses related to equity.

Response to Comment 7 in 20240110, City of West Sacramento

The bottleneck at US 50/Jefferson Boulevard is a result of the short weave distance between the US 50/I-5 and US 50/Jefferson Boulevard interchanges. Furthermore, there is heavy traffic demand that enters US 50 from I-5. This congestion could be reduced by interchange reconfiguration and/or improvements that are not within the scope of this project.

The bottlenecks at US 50/I-80 and I-80/Reed Avenue are also due to high demand (i.e., large traffic volume) for both the US 50 WB to I-80 EB connector and I-80 WB to Reed Avenue off-ramp. These bottlenecks improve with multiple project alternatives; however, the congestion could also be further alleviated with interchange reconfiguration and/or improvements that are not within the scope of this project.

Response to Comment 8 in 20240110, City of West Sacramento

The commenter asks about mitigation for Swainson's hawk foraging habitat. Draft EIR/EA Section 3.2.4, *Swainson's Hawk* summarizes the technical findings of Caltrans environmental analysis on potential impacts to Swainson's hawk. Based on technical review, foraging habitat that would be impacted is already degraded by proximity to roadways and other forms of anthropogenic disturbance. Caltrans has proposed two species-specific measures (AMM BIO-31 and Mitigation Measure BIO-32) that are expected to reduce impacts to below the level of

[3] City of West Sacramento. 2016. City of West Sacramento 2035 General Plan Policy Document. November. Updated January 2024. Available: https://www.cityofwestsacramento.org/home/showpublisheddocument/18212/638421374385370000. Accessed: February 22, 2024.

significance. Based on this finding, Caltrans has determined that compensatory mitigation for the loss of foraging habitat is not required.

Additionally, please see Response to Comment 16 in 20240112, California Department of Fish and Wildlife, regarding Caltrans participation in habitat conservation plans (HCPs). No changes to the Draft EIR/EA are necessary.

Response to Comment 9 in 20240110, City of West Sacramento

Caltrans standard protocol if human remains are found during construction activities is provided in Standard Measure CR-4 which is listed in Appendix E of the Draft EIR/EA. This measure conforms with the State Health and Safety Code and the Native American Graves Protection Act. This measure is referenced and summarized in Section 2.1.12 of the Draft EIR/EA. No changes to the Draft EIR/EA are necessary.

Response to Comment 10 in 20240110, City of West Sacramento

The commenter states that Chapter 3 of the document is unclear if West Sacramento sensitive receptors (Valhalla, Meadowdale, Sikh Temple school, etc.) would be impacted. Chapter 3 summarizes analysis from Chapter 2 and provides impact conclusions under CEQA, as indicated in the introductory text to Section 3.2.13 directing the reader to the Noise Section in Chapter 2. This was misnumbered as 2.2.7, rather than 2.2.8, in the Draft EIR/EA. That typographical error is revised in the Final EIR/EA.

Valhalla, Meadowdale, and the Sikh Temple school are included in the noise analysis as Category 3, noise-sensitive land uses. Section 2.2.8 provides greater detail about the analysis and impacts related to noise. The locations the commenter refers to specifically are illustrated in Figures 2.2-13 and 2.2-14 in the Draft EIR/EA. Noise modelling results are provided in Table 2.2-18 of the Draft EIR/EA. The table indicates no noise increase at Valhalla (ST-34), an increase of 1dBA under Alternative 2A and no increase under other alternatives at Meadowdale Park (ST-38), and minimal noise increase under all alternatives except Alternative 7A at the school near the Sikh Temple (R-69). The impact is less than significant.

Response to Comment 11 in 20240110, City of West Sacramento

The commenter states that more detail should be included on emergency access per the West Sacramento Fire Department. Standard measures have been incorporated into the project to maintain access for emergency services and are listed in Appendix E of the Draft EIR/EA.Standard Measure TT-3 would require the preparation of a TMP to maintain access for emergency services throughout all phases of construction. The TMP is prepared before construction to plan for maintaining access for police, fire, and medical services along I-80/US-50 in the project area during construction.

Standard Measure COM-1 has also been implemented into the project and would require a planned public outreach program to keep the area emergency service providers, including the West Sac Fire Department, informed of the project construction schedule.

Response to Comment 12 in 20240110, City of West Sacramento

Construction-related impacts were evaluated in the Draft EIR/EA. Temporary Construction Easements (TCE) and staging areas were identified in Section 1.3.1.1, Common Design Features of the Build Alternatives (Right of Way and Temporary Construction Easements and Staging). As these locations were identified, they were included in Caltrans' review for environmental impacts. No changes to the Draft EIR/EA are necessary.

Response to Comment 13 in 20240110, City of West Sacramento

The commenter states in Section 3.2.1.3, Build Alternatives 2a and 2b, of the Draft EIR/EA that a drainage facility in West Sacramento is mentioned. The commenter asks to identify the drainage facility, indicate who is responsible for it, and if there would be any upstream or downstream impacts.

Please refer to the Draft EIR/EA Chapter 1, Figure 1.3-1, sheet 3 of 16 indicates a temporary construction easement (TCE) on the north and the south side of Yolo 80, just west of the 50/80 interchange, which are located on the upstream and downstream sides of an existing 8-feet by 6-feet Reinforced Concrete Box (RCB) culvert. The culvert work, as included in the Environmental Study Limit (ESL) and environmentally reviewed in the Draft EIR/EA, will allow for future maintenance of the RCB by the City of West Sacramento or Caltrans. On the same Figure 1.3-1, sheet 6 of 16, a construction easement south of I-80 near Lake Road, is for cleaning the downstream end of an existing storm drain culvert. Upstream or downstream impacts from the culverts are not expected.

Response to Comment 14 in 20240110, City of West Sacramento

Caltrans will take the design elements and constraints presented by the commenter into consideration as the design of the Mobility Hub progresses. Caltrans will implement all or as many design features listed as possible, within sound engineering reasoning and within existing constraints. Caltrans will coordinate with the City as design progresses to ensure all parties are satisfied with the Mobility Hub design and features. In addition, please refer to Master Response G for responses related to mobility hub Improvements.

Response to Comment 15 in 20240110, City of West Sacramento

Caltrans will evaluate the potential active transportation enhancement options presented by the commenter, to fit within sound engineering reasoning and existing constraints, as design progresses. Caltrans will also be sure to have coordination meetings with the City to ensure all parties are satisfied with improvements proposed for the project. Also, please refer to Master Response F for responses related to improvements to the existing Bicycle/Pedestrian Path.

Response to Comment 16 in 20240110, City of West Sacramento

Forecasted volumes were prepared using the SACSIM travel demand model. Opening year 2029 forecasts were prepared using a linear interpolation of final vehicle trip matrices between each alternative-specific 2027 and 2040 scenario, accounting for 2 out of 13 years of growth. Interpolated growth between 2029 and 2040 vehicle trip matrices was calculated on the matrix

total and then applied to each origin and destination Traffic Analysis Zone (TAZ) pair in the study area. Trip assignment of the final 2029 vehicle trip matrices was then run on each project-specific 2029 network. Similarly, the horizon year 2049 forecasts were developed using extrapolation of final vehicle trip matrices beyond the refined 2040 scenario. The growth rate between the base year 2016 and future year 2040 might not follow a linear growth pattern within the study area. Therefore, the vehicle trip matrices among the available SACSIM model years (2027, 2035, and 2040) were reviewed to compare growth rates. Based on this review, the growth rate between 2035 and 2040 was selected to extrapolate to 2049.

The numbers cited in the comment cannot be verified as the comment does not provide the source of these numbers.

In Section 2.1.10, *Traffic and Transportation*, and Section 3.2.17, *Transportation,* of the Draft EIR/EA include a summary of analysis of Alternative 2 (addition of an HOV2 lane with the Enterprise Crossing) and Alternative 9 (addition of an HOV2 lane without the Enterprise Crossing). Forecasts, including project ADT, for each alternative are included in the appendix of the Traffic Analysis Report (TAR). The TAR is available on the project website with the Final EIR/EA (https://dot.ca.gov/caltrans-near-me/district-3/d3-projects/d3-i80-corridor-improvements).

No changes to the Draft EIR/EA are necessary.

Subject: YOLO 80 CORRIDOR IMPROVEMENTS PROJECT
DRAFT ENVIRONMENTAL IMPACT REPORT (DEIR)
SCH No. 2021060117

Dear Mike Bartlett:

The California Department of Fish and Wildlife (CDFW) received and reviewed the Notice of Availability of a DEIR from the State of California Department of Transportation (Caltrans) for the Yolo 80 Corridor Improvements Project (Project) pursuant the California Environmental Quality Act (CEQA) statute and guidelines.[1]

Thank you for the opportunity to provide comments and recommendations regarding those activities involved in the Project that may affect California fish, wildlife, native plants, and their habitat. Likewise, we appreciate the opportunity to provide comments regarding those aspects of the Project that CDFW, by law, may need to exercise its own regulatory authority under the Fish and Game Code (Fish & G. Code).

CDFW ROLE 1

CDFW is California's Trustee Agency for fish and wildlife resources and holds those resources in trust by statute for all the people of the State (Fish & G. Code, §§ 711.7, subd. (a) & 1802; Pub. Resources Code, § 21070; CEQA Guidelines § 15386, subd. (a)). CDFW, in its trustee capacity, has jurisdiction over the conservation, protection, and management of fish, wildlife, native plants, and habitat necessary for biologically sustainable populations of those species. (Fish & G. Code, § 1802.) Similarly for purposes of CEQA, CDFW provides, as available, biological expertise during public agency environmental review efforts, focusing specifically on projects and related activities that have the potential to adversely affect fish and wildlife resources.

[1] CEQA is codified in the California Public Resources Code in section 21000 et seq. The "CEQA Guidelines" are found in Title 14 of the California Code of Regulations, commencing with section 15000.

DocuSign Envelope ID: 94DCB4A6-CB82-4B26-8FF7-D2E8E06EB355

CDFW may also act as a Responsible Agency under CEQA. (Pub. Resources Code, § 21069; CEQA Guidelines, § 15381.) CDFW expects that it may need to exercise regulatory authority as provided by the Fish and Game Code. As proposed, for example, the Project may be subject to CDFW's lake and streambed alteration regulatory authority. (Fish & G. Code, § 1600 et seq.) Likewise, to the extent implementation of the Project as proposed may result in "take" as defined by State law of any species protected under the California Endangered Species Act (CESA) (Fish & G. Code, § 2050 et seq.), the project proponent may seek related take authorization as provided by the Fish and Game Code.

PROJECT DESCRIPTION SUMMARY

The Project site is located along Interstate 80 (I-80) and U.S. Route 50 (US-50) from Kidwell Road near the eastern Solano County boundary (near Dixon), through Yolo County, and to West El Camino Avenue on I-80 and Interstate 5 (I-5) on US-50 in Sacramento County. 1 cont.

The Project consists of constructing improvements consisting of managed lanes, pedestrian/bicycle facilities, and an Intelligent Transportation System (ITS) element. The project would add managed lanes on I-80 and US-50 by a combination of lane conversion, restriping, and shoulder and median reconstruction with a concrete barrier. Drainage modifications would be required due to median reconstruction in the locations to which sheet flow currently drains. The existing ITS elements and infrastructure would be expanded and modified and would include ramp meters, fiber-optic conduit and cables, and overhead signs. Utility relocation would also occur.

COMMENTS AND RECOMMENDATIONS

CDFW offers the comments and recommendations below to assist Caltrans in adequately identifying and, where appropriate, mitigating the Project's significant, or potentially significant, direct and indirect impacts on fish and wildlife (biological) resources. Based on the potential for the Project to have a significant impact on biological resources, CDFW concludes that an Environmental Impact Report is appropriate for the Project.

COMMENT 1: Chapter 2: Bat Species, page 2-324.

Issue: Bats are considered non-game mammals and are protected by state law from take and/or harassment (Fish and Game Code §4150, CCR §251.1). Impacts may be considered potentially significant unless adequate mitigation is incorporated. The Bat Species section acknowledges the presence of the known bat maternity colony within the Yolo Causeway bridge structure and states that, "No construction would occur on the existing bridge over the Yolo Causeway, so the maternity colony that roosts under the bridge would not be directly impacted." However, the proximity of the project to the colony would likely cause disturbance to the colony if effective avoidance measures are 2

DocuSign Envelope ID: 94DCB4A6-CB82-4B26-8FF7-D2E8E06EB355

not included in the EIR. Disturbance of roost sites during the maternity and hibernation seasons are considered primary factors that may negatively impact bats and have the potential to result in take. During the hibernation period, bats are very slow to respond to disturbance and can lose fat stores needed to survive the winter while pups in the maternity colony may not have the ability to fly. The EIR does not have sufficient and enforceable avoidance measures to reduce impacts to the colony to a less than significant level. For mitigation measures to be effective, they must be specific, enforceable, and feasible actions that will reduce the environmental impacts from the project to a less than significant level. 2 cont.

Recommendation: CDFW recommends the EIR include a fully enforceable avoidance measure restricting all construction activities within 500 feet of the Yolo Causeway bridge structure from March 1 through August 31 annually. CDFW does not support eviction of bats during the maternity or hibernation periods (March 1 through August 31 annually). Construction activities and/or installation of bat exclusion devices on the Yolo Causeway structure between March 1 and August 31 annually is considered a significant impact.

COMMENT 2: Chapter 1: Table S-2 Biological Resources Summary, page 17.

Issue: The Biological Resources section, environmental topic (d) of Table S-2 Summary of California Environmental Quality Act (CEQA) Impacts reads, "[will the Project] interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors or impede the use of native wildlife nursery sites." All alternatives are listed as having "No Impact." The maternity colony in the Yolo Causeway bridge is considered a native wildlife nursery site. Proposed temporary disturbances from construction, cumulative impacts from past, on-going, and reasonably foreseeable projects, as well as long-term impacts from maintenance and light pollution have the potential to impact this nursery site.

Recommendation: CDFW recommends the EIR include a scientifically supported discussion of potential direct, indirect, and cumulative impacts to nursery sites from lighting, noise, human activity, and wildlife-human interactions created by Project activities. The EIR should define the threshold of significance for each impact and describe the criteria used to determine whether the impacts are significant (CEQA Guidelines, § 15064, subd. (f)). The EIR must demonstrate that the significant environmental impacts of the Project were adequately investigated and discussed, and it must permit the significant effects of the Project to be considered in the full environmental context. 3

The EIR should include scientifically supported appropriate and adequate avoidance, minimization, and/or mitigation measures for all direct, indirect, and cumulative impacts that are expected to occur as a result of construction and long-term operation and maintenance of the Project. Mitigation must be roughly proportional to the level of

DocuSign Envelope ID: 94DCB4A6-CB82-4B26-8FF7-D2E8E06EB355

impacts, including cumulative impacts, in accordance with the provisions of CEQA (Guidelines § § 15126.4(a)(4)(B), 15064, 15065, and 16355). 3 cont.

COMMENT 3: Chapter 2: Section 2.4.5.17, Animal Species, Cumulative Impacts, page 2-384.

Issue: This section acknowledges current and reasonably foreseeable future actions that could result in land use activities and impacts on animal species. It goes on to state that the relevant projects that would be constructed within the Project construction period could result in permanent and temporary impacts on animal species if vegetation removal, grubbing and grading, pile driving, operation of vehicles, heavy equipment operation, and earth-moving operations are required. It concludes that because "…each relevant project would be required to implement avoidance, minimization, and mitigation measures as necessary, the Project would not result in a cumulatively considerable impact on animal species. Thus, this section does not recommend additional avoidance and minimization measures for cumulative impacts to animal species."

The EIR's cumulative impacts analysis describes increased noise and vibration levels to parks and recreation facilities and also states that nighttime construction lighting, glare, construction equipment, staging areas, demolition, and other construction-related activities from multiple projects may contribute to cumulative visual impacts. However, the EIR does not analyze the impact of construction related noise, vibration, or lighting on animal species including but not limited to day roosting bats and purple martin. 4

Bats
For roosting bats, on-going construction related noise, light, and vibration impacts from the Yolo Pavement Rehabilitation Project (EA 03-4F650) are of particular concern. The Yolo Pavement Rehabilitation Project is in active construction on the Yolo Causeway bridge deck. Construction activities were continuous through the 2023 maternity season. Routine monitoring of the Yolo Causeway bridge maternity colony by local bat researchers resulted in the anecdotal observation of abnormal and unpredictable colony egress pathways in areas where active construction was taking place on the bridge deck (Quirk, Mary Jean of the Yolo Basin Foundation. Interview. Conducted by Melissa Stanfield. Jan. 3, 2024). This change in behavior was previously undocumented at the Yolo Causeway bridge. Although a change in egress pathways cannot be definitively linked to construction activities, behavioral changes as a response to construction should be analyzed as potential impacts. Additionally, it is well documented that construction related disturbance has the potential to impact day roosting bats (Johnston et. al 2004, Johnston et. al 2019).

Disturbance caused by project implementation that results in post-construction roost abandonment is considered a permanent impact (Johnston et. al, 2019). The most common type of permanent, post-construction disturbance is from light pollution. Any direct or indirect artificial lighting has the potential to degrade or eliminate roosts or potential roosting habitat (Johnston et. al, 2019). Noise disturbance and displacement of

DocuSign Envelope ID: 94DCB4A6-CB82-4B26-8FF7-D2E8E06EB355

bats from roosts or important foraging areas can potentially result in reduced survivability of individuals from increased susceptibility to predation, reduced quality of thermal and social environments, and decreased foraging efficiencies (Johnston et. al, 2019).

Purple Martin
The EIR should also analyze cumulative impacts to the Sacramento population of purple martins regarding the US-50 Multimodal Corridor Enhancement and Rehabilitation Project, I-5 Corridor Improvement Project (FixSac5), and I Street Bridge Replacement. During this analysis, Caltrans should discuss when the Project's incremental effect is cumulatively considerable and examine impacts that are created as a result of the combination of the project evaluated in the EIR together with other projects that may cause or have already caused related impacts. There are multiple colonies throughout the Sacramento area that nest in highway overpasses and elevated freeway sections and have been subject to transportation related construction activity during the nesting season (i.e., 35th Street, S Street, 29th and R Streets, and Redding Avenue colonies). This project and the FixSac5 project could further subject local colonies (i.e., 19th Street/Freeport Boulevard) to continued disturbance during the nesting season. The I Street Bridge replacement project will result in the permanent removal of a known nesting colony. Protection of colonies from construction disturbance is a critical component to a longer-term conservation program for the species (Airola 2020). Caltrans District 3 is familiar with the impacts associated with colonies that were disturbed during the US-50 Multimodal Corridor Enhancement and Rehabilitation Project and has coordinated with CDFW and local experts on purple martins in the past. 4 cont.

Recommendation: The EIR should analyze the impact of construction related noise, vibration, or lighting on animal species including but not limited to day roosting bats and purple martin.

Bats
CDFW recommends the EIR provide scientifically supported discussions regarding adequate analysis, and avoidance, minimization, and/or mitigation measures to address the Project's significant impacts upon any resident or maternity colonies within the biological study area (BSA). The cumulative effects of construction noise on bats, the frequency of noise generated and the hearing sensitivity of the bat species at risk should be evaluated in the EIR and mitigated to a less than significant level. Mitigation must be roughly proportional to the level of impacts, in accordance with the provisions of CEQA (Guidelines § § 15126.4(a)(4)(B), 15064, 15065, and 16355). In order for mitigation measures to be effective, they must be specific, enforceable, and feasible actions.

Purple Martin
CDFW recommends the EIR provide scientifically supported discussions regarding adequate analysis, avoidance, and/or mitigation measures to address the Project's significant impacts upon purple martin. Nest exclusion can cause declines and

DocuSign Envelope ID: 94DCB4A6-CB82-4B26-8FF7-D2E8E06EB355

permanent abandonment of colony sites (Airola and Grantham 2003) and should not be prescribed as a mitigation measure without first consulting with CDFW and local species experts. In addition, if the Project has the potential to impact nests or colonies, the installation of nest boxes as a form of compensatory mitigation should not be considered as they have shown to be ineffective in the Sacramento Valley (Airola, Dan. Interview. Conducted by Melissa Stanfield. Feb. 16, 2023). CDFW recommends continued coordination occur for this and other upcoming projects to identify and implement additional conservation efforts for the species that at a minimum should include full avoidance of known nest sites and funding purple martin research. 4 cont.

COMMENT 4: Chapter 2, Section 2.3.4.4 Avoidance, Minimization, and/or Mitigation Measures. AMM BIO-13 Pre-construction Bat Surveys, page 2-327.

Issue: As currently written, the pre-construction bat survey appears to apply only to maternity colonies and areas identified as moderate or high presence potential for maternity colonies; however, all bats are considered non-game mammals and are afforded protection by state law from take and/or harassment, not just maternity colonies (Fish & G. Code, § 4150; Cal. Code of Regs, § 251.1). The purpose of pre-construction surveys should be to confirm the presence or absence of colonies and/or individuals within the entirety of the Project footprint. Given the size of the Project footprint, one pre-construction survey prior to the start of construction activities may not be sufficient to detect occupied roosts. Furthermore, the measure states "if any maternal colonies are detected, a qualified biologist will determine and implement appropriate conservation measures." This measure is not enforceable as it defers development of conservation measures to a future time, when it is known that a maternal colony is present. 5

Recommendation: CDFW recommends AMM BIO-13 be revised to phase pre-construction surveys and ensure they are conducted prior to the start of construction activities in all previously undisturbed areas or areas where no construction has occurred for 14 days or longer. In addition, pre-construction survey methods consistent with *Caltrans Bat Mitigation: A Guide to Developing Feasible and Effective Solutions (Johnston et. al, 2019)* should be included in BIO-13. The qualified biologists performing pre-construction surveys should be approved by CDFW prior to initiating surveys. Survey results including personnel, timing, methods, and results should be provided to CDFW no later than 10 days following the survey and prior to the start of construction. If an occupied roost site is detected, construction should not commence until CDFW has been consulted and provided written concurrence that construction may commence. The EIR should include fully enforceable measures to mitigate potentially significant impacts and should not defer these measures to a future time (CEQA Guidelines § 15126.4).

DocuSign Envelope ID: 94DCB4A6-CB82-4B26-8FF7-D2E8E06EB355

COMMENT 5: Chapter 2, Section 2.3.4.4 Avoidance, Minimization, and/or Mitigation Measures. AMM BIO-14 Bat Protection Plan, page 2-328.

Issue: The EIR should include fully enforceable measures to mitigate potentially significant impacts and should not defer these measures to a future time (CEQA Guidelines § 15126.4). As currently written, the measure does not outline or set minimum standards of what should be included in the Bat Protection Plan (plan). The measure does not identify when the plan would be prepared, or who would be responsible for preparing, reviewing, or implementing it. The measure also does not define the plan area or establish criteria for plan success or contingency measures if implementation fails or cannot be completed. Without specific Bat Protection Plan goals, content, and enforceability, this measure does not mitigate project impacts to a less than significant level. 6

Recommendation: CDFW recommends BIO-14 be reworded as follows:
A bat species protection survey plan will be developed by a qualified biologist and submitted to CDFW for review and approval no later than 60 days prior to the start of construction activities. The plan shall include but not be limited to a description of the plan area, survey methods, surveyor qualifications, recommended protective buffers, construction monitoring, and post-construction monitoring consistent with *Caltrans Bat Mitigation: A Guide to Developing Feasible and Effective Solutions (Johnston et. al, 2019).*

COMMENT 6: Chapter 2, Section 2.3.4.4 Avoidance, Minimization, and/or Mitigation Measures. AMM BIO-15 Structural Changes to Bat Roosting Habitat, page 2-328.

Issue: As BIO-15 is currently written, it is unclear when structural changes to bat roosting habitat would be warranted, who will be performing those activities, what materials are proposed for use, and whether impacts from those activities will require need to be mitigated. Temporary or permanent exclusion efforts may lead to an increase in localized human-wildlife conflict as the bats attempt to find alternative roosting sites; therefore, compensatory mitigation in the form of replacement roost habitat is necessary to mitigate impacts to a less than significant level. 7

Recommendation: CDFW recommends BIO-15 be revised to include a Bat Exclusion Plan be prepared and provided to CDFW for review and approval no later than 10 days prior to the exclusion of any bat roost. Exclusion should only occur when absolutely necessary, be installed by a CDFW-approved qualified biologist, and should never occur during the maternity season (i.e. March 1 – August 31).

COMMENT 7: Potential for Project Activities to Result in Injured Wildlife

Issue: The Project does not describe how bats or other wildlife incidentally injured as a result of construction activities will be addressed. 8

DocuSign Envelope ID: 94DCB4A6-CB82-4B26-8FF7-D2E8E06EB355

Recommendation: CDFW recommends that the cost of reasonable, licensed rehabilitation efforts for any injured bats or other wildlife taken to wildlife care facilities from the Project area should be assumed in full by Caltrans. 8 cont.

COMMENT 8: Lighting Impacts on Biological Resources

Issue: All build alternatives appear to propose new temporary and permanent lighting. Temporary nighttime lighting would occur during nighttime construction work activities. Both temporary and permanent signage throughout the Project would use reflective lettering. Permanent street lighting would be added near CR-32A at the proposed bicycle pathway extension adjacent to the westbound off-ramp. Within Segment 2, bridge deck lighting with Type 21 Barrier-Rail-Mounted Lighting Standards would be constructed. Additional street lighting would be added to the Bryte Bend Bridge (I-80 Sacramento River Bridge Overhead), but it may also be added at proposed auxiliary lane locations if determined necessary during the design phase. Existing ITS elements to be installed also include a minimum of 42 overhead signs including changeable message signs. The EIR does not analyze impacts to biological resources resulting from temporary and permanent light pollution.

New lighting, especially in areas where no lighting or low levels of lighting currently exist, has potential for significant impacts to occur that could result in a finding of significance. Artificial light spillage beyond the prism of the roadway into natural areas may result in a potentially significant impact through substantial degradation of the quality of the environment. Artificial light pollution also has the potential to significantly and adversely affect biological resources and the habitat that supports them. Unlike the natural brightness created by the monthly cycle of the moon, the permanent and continuously powered lighting fixtures create an unnatural light regime that produces a constant light output. Continuous light output for 365 days a year can also have cumulatively significant impacts on fish and wildlife populations. 9

Artificial night lighting can disrupt the circadian rhythms of many wildlife species. Many species use photoperiod cues for communication (e.g., bird song), determining when to begin foraging (Stone et al. 2009), behavior thermoregulation (Beiswenger 1977), and migration (Longcore and Rich 2004). Artificial night lighting has also been found to impact juvenile salmonid overwintering success by delaying the emergence of salmonids from benthic refugia and reducing their ability to feed during the winter (Contor and Griffith 1995). For nocturnally migrating birds, direct mortality resulting from collisions with anthropogenic structures due to attraction to light (Gauthreux, 2006) is another direct effect of artificial light pollution. There are also more subtle effects, such as disrupted orientation (Poot et al. 2008) and changes in habitat selection (McLaren et al. 2018). There is also growing evidence that light pollution alters behavior at regional scales, with migrants occupying urban centers at higher-than-expected rates as a function of urban illumination (La Sorte et al. 2021). While artificial light pollution can act as an attractant at both regional (La Sorte et al. 2021) and local (Van Doren et al. 2017)

DocuSign Envelope ID: 94DCB4A6-CB82-4B26-8FF7-D2E8E06EB355

scales, there is also evidence of migrating birds avoiding strongly lit areas when selecting critical resting sites needed to rebuild energy stores (McLaren et al. 2018).

Recommendation: Due to the high potential for songbirds, marsh-birds, migratory birds, salmonids and nocturnally active State listed and special status species, CDFW strongly recommends that no new or replacement artificial lighting is installed as a result of Project completion. If the installation of artificial lighting is unavoidable, CDFW recommends the following mitigation measures be incorporated into the EIR:

Recommended Mitigation Measure 1 – Light Output Analysis: Isolux Diagrams that note current light levels present during pre-Project conditions and the predicted Project light levels that will be created upon completion of the Project shall be included in the EIR. If an increase in light output from current levels to the projected future levels is evident, additional avoidance, minimization or mitigation measures shall be developed in coordination with the natural resource agencies to offset indirect impacts to special status species. Within 60 days of Project completion, the lead agency shall conduct a ground survey that compares projected future light levels with actual light levels achieved upon completion of the Project through comparison of Isolux diagrams. If an increase from the projected levels to the actual levels is discovered, additional avoidance, minimization or mitigation measures may also be required in coordination with the natural resource agencies. This analysis should be conducted across all potential alternatives and compared in table and map format.

Recommended Mitigation Measure 2 – Light Output Limits: All LED's or bulbs installed as a result of the Project shall be rated to emit or produce light at or under 2700 kelvin that results in the output of a warm white color spectrum.

Recommended Mitigation Measure 3 – Reflective Signs and Road Striping: Retro-reflectivity of signs and road striping should be implemented throughout the Project to reduce the need for electrical lighting. 9 cont.

Recommended Mitigation Measure 4 – Light Pole Modifications and Shielding: All new or replacement light poles or sources of illumination shall be installed with the appropriate shielding to avoid excessive light pollution into natural landscapes or aquatic habitat within the Project corridor in coordination with CDFW. In addition, the light pole arm length and mast heights should be modified to site specific conditions to reduce excessive light spillage into natural landscapes or aquatic habitat within the Project corridor. In areas with sensitive natural landscapes, aquatic habitat, or within 500 feet of any bat roost, Caltrans should also analyze and determine if placing the light poles at non-standard intervals has the potential to further reduce the potential for excessive light pollution caused by decreasing the number of light output sources in sensitive areas.

DocuSign Envelope ID: 94DCB4A6-CB82-4B26-8FF7-D2E8E06EB355

COMMENT 9: Chapter 2: Section 2.3 Biological Environment. Valley Oak Woodland and Forest Impacts

Issue: The EIR does not sufficiently disclose or adequately analyze the potentially significant impacts to fish and wildlife resources that may occur from the removal, limbing or trimming of valley oak woodland and forest. Figures 2.3-1 indicates that all build alternatives will result in 0.51 acre of temporary impacts and 0.14 acre of permanent impacts to valley oak woodland and forest. The removal, limbing or trimming of trees may have a potentially significant impact to fish and wildlife resources by reducing and degrading the quality of habitat for nesting birds, reptiles, amphibians and invertebrates. Red-shouldered hawks, red-tail and white-tailed kites (State Fully Protected) are known to inhabit the Project vicinity, and removal of tree stands could potentially impact nests, nesting behavior and foraging habitat.

Furthermore, the EIR does not define temporary impacts to valley oak woodland. Given the temporal loss of habitat and its impact on wildlife species, removal and/or significant trimming of trees within valley oak woodland and forest habitats should be considered permanent and significant impacts. The EIR proposes removal of trees without significant preservation or replacement of trees on- or off-site.

Proposed mitigation for impacts to both valley oak woodland and valley riparian forest is implementation of BIO-2. BIO-2 commits Caltrans to notifying for and obtaining a Streambed Alteration Agreement prior to the start of construction activities. Not only does this measure defer mitigation based on future approvals through a Streambed Alteration Agreement, but maps presented in the EIR show impacts to valley oak woodland and forest are activities that may occur outside the bed, bank, or channel of streams; therefore, these activities would likely be omitted from the Streambed Alteration Notification. 10

Recommendation: CDFW recommends incorporating the following mitigation measures into the EIR.

Recommended BIO-Measure 1: Off-Site Conservation of Valley Oak Woodland and Forest: If impacts cannot be avoided to valley oak woodland and forest; Caltrans shall permanently preserve valley oak woodland and forest at an off-site location. The off-site location may be lands with habitats that may be rehabilitated, restored, or preserved and maintained to fully mitigate for the potentially significant impacts. The lands must be protected through fee title, transfer or conservation easement to an appropriate conservation entity to ensure long term preservation and successful implementation of the mitigation. The fish and wildlife resources or environments replaced or substituted for those impacted must be maintained in perpetuity.

Recommended BIO-Measure 2: Valley Oak Woodland and Forest On-Site and Off-Site Restoration Plan: CEQA Guidelines §15126.4 (a) requires lead agencies to consider feasible mitigation measures to avoid or substantially reduce a project's significant

DocuSign Envelope ID: 94DCB4A6-CB82-4B26-8FF7-D2E8E06EB355

environmental impacts. Caltrans shall develop a more in-depth restoration plan in consultation with the natural resource agencies. Caltrans shall incorporate details that (1) commits itself to the mitigation, (2) adopts specific performance standards that the mitigation will achieve, and (3) identifies the type(s) of potential action(s) that can feasibly achieve that performance standard. Caltrans shall specifically discuss permanent land protection in perpetuity, mitigation/restoration bank credit purchase and requirements in regard to valley oak woodland and forest. Additional actions should be included in the EIR, such as installation of artificial wood rat boxes and bat boxes to reduce potentially significant impacts to fish and wildlife resources. 10 cont.

COMMENT 10: Appendix C, Biological Resources. AMM BIO-19: Erosion Control and Re-Vegetation, page 54

Issue: Monofilament materials found in some erosion control products have been demonstrated to result in snaring and entrapment of snakes, lizards, and small mammals.

Recommendation: CDFW recommends AMM BIO-19 be revised to state the following: 11

Erosion control materials shall be monitored daily and repaired if necessary to ensure maximum erosion and sediment control. All fiber rolls, straw wattles, and/or hay bales utilized within and adjacent to the project site shall be free of non-native plant materials. Fiber rolls or erosion control mesh shall be made of loose-weave mesh that is not fused at the intersections of the weave, such as jute, or coconut (coir) fiber, or other products without welded weaves. Products with plastic monofilament or cross joints in the netting that are bound/stitched (such as found in straw wattles/fiber rolls and some erosion control blankets), which may cause entrapment of wildlife, shall not be allowed. All temporary erosion control and any related material shall be removed upon completion of project activities.

COMMENT 11: Chapter 2: Section 2.3.5.4 Avoidance, Minimization, and/or Mitigation Measures. AMM BIO-31: Pre-construction SWHA Survey, page 2-348.

Issue: This measure states that the qualified biologist will conduct pre-construction surveys if construction is to occur between February 1 and August 31. However, Swainson's Hawk (SWHA) nesting season is March 1 through September 30. The measure also states that pre-construction surveys will be conducted up to 15 days prior to construction. These methods are inconsistent with the Swainson's Hawk Technical Advisory Committee's (TAC) *Recommended Timing and Methodology for Swainson's Hawk Nesting Surveys in California's Central Valley* (2000) and insufficient to avoid impacts to SWHA. 12

Recommendation: CDFW recommends BIO-31 be revised to read:

DocuSign Envelope ID: 94DCB4A6-CB82-4B26-8FF7-D2E8E06EB355

"Prior to the initiation of construction activities, the Project proponent have a qualified biologist conduct surveys for Swainson's hawk in accordance with the Swainson's Hawk Technical Advisory Committee's (TAC) *Recommended Timing and Methodology for Swainson's Hawk Nesting Surveys in California's Central Valley* (2000), available on CDFW's webpage at https://wildlife.ca.gov/Conservation/Survey-Protocols#377281284-birds. Survey methods should be closely followed by starting early in the nesting season to maximize the likelihood of detecting an active nest (nests, adults, and chicks are more difficult to detect later in the growing season because trees become less transparent as vegetation increases). Surveys should be conducted within a minimum 0.25-mile radius of the Project area or a larger area, if necessary, to identify potentially impacted active nests. Surveys should occur annually for the duration of the Project. The qualified biologist should have a minimum of two years of experience implementing the TAC survey methodology. If an active nest is identified, a 0.25-mile protective buffer should be maintained around the nest until the young fledge. The protective buffer should be clearly marked and be an area where no project-related activities or personnel are allowed while in place. If the 0.25-mile buffer must be reduced or take of Swainson's hawk cannot be avoided, the Project proponent should be required to obtain an Incidental Take Permit (ITP) as a condition of Project approval." 12 cont.

Issue: The Project area includes a portion of the Swainson's Hawk Zone (SHZ), which the Natomas Basin Habitat Conservation Plan (NBHCP) describes as the area within one mile of the Sacramento River in the Natomas Basin. The SHZ was derived from the high density of Swainson's hawk nests within this area and scientific evidence for the value of the habitat (NBHCP 2003). The NBHCP recognizes the importance of the SHZ to this species and the viability of their plan which resulted in substantial effort from the City of Sacramento and Sutter County to replan development outside of this area. Although Caltrans is not party to the NBHCP, the EIR must consider the Project's 1) biological impact in an ecologically valuable area and 2) the effect that Project development in the SHZ will have on the continued implementation and viability of the NBHCP.

COMMENT 12: Chapter 2: Biological Resources – Swainson's Hawk, page 2-344.

Issue: The EIR states that, "A total of approximately 10.0 acres of SWHA foraging habitat consisting of grassland and croplands (i.e., hayfield) would be permanently lost;" however, compensatory mitigation for the permanent loss of foraging habitat is not included. The primary threat to the Swainson's Hawk population in California continues to be habitat loss, especially the loss of suitable foraging habitat (California Department of Fish and Game 2016). Unmitigated loss of foraging habitat for a CESA listed threatened species is a significant impact. 13

Recommendation: CDFW recommends the following mitigation measure be added to the EIR:

DocuSign Envelope ID: 94DCB4A6-CB82-4B26-8FF7-D2E8E06EB355

Compensatory Mitigation for Permanent Impacts to SWHA Foraging Habitat: To mitigate impacts from the permanent loss of 10.0 acres of Swainson's hawk foraging habitat to a less than significant level, CDFW recommends Caltrans either purchase 30.0 acres of SWHA foraging habitat credits from a CDFW-approved conservation bank OR provide for both the permanent protection and management of 30.0 acres of Habitat Management (HM) lands including calculation and deposit of management funds as approved by CDFW. Prior to transfer of SWHA foraging credits, Caltrans shall obtain CDFW approval to ensure the conservation bank is appropriate to compensate for the impacts of the Project. Caltrans shall submit to CDFW a copy of the executed Credit Transfer Agreement prior to initiating construction activities. 13 cont.

COMMENT 13: Chapter 2: Biological Resource - Tricolored Blackbird, page 2-341.

Issue: The EIR acknowledges a total of 498.7 acres of potentially suitable habitat for tricolored blackbird within 500 feet of the BSA. Potentially suitable habitat was identified as lands that are planted in alfalfa, natural or semi-natural lands (e.g., grassland, ruderal/grassland, willow scrub, and emergent marsh) on larger parcels (generally greater than approximately 20 acres) that border other open lands. However, the EIR does not quantify temporary or permanent Project impacts to tricolored blackbird foraging or nesting habitat. The EIR also does not provide appropriate and adequate compensatory mitigation for all direct, indirect, and cumulative impacts to tricolored blackbird foraging and nesting habitat that are expected to occur as a result of construction and long-term operation and maintenance of the Project.

Destruction of the tricolored blackbirds' marsh and grassland homes has reduced its populations to a small fraction of their former enormity. Further loss, conversion, and disturbance, either temporary or permanent, to foraging and nesting habitat is a significant impact. 14

Recommendation: To help mitigate Project impacts to a less than significant level, CDFW recommends the EIR: 1) quantify permanent direct, indirect, and cumulative impacts to tricolored blackbird foraging and nesting habitat, and 2) include an enforceable mitigation measure requiring Caltrans to either purchase tricolored foraging and nesting habitat credits from a CDFW-approved conservation bank OR provide for both the permanent protection and management of Habitat Management (HM) lands including calculation and deposit of management funds as approved by CDFW. Prior to transfer of tricolored blackbird credits, Caltrans shall obtain CDFW approval to ensure the conservation bank is appropriate to compensate for the impacts of the Project. Caltrans shall submit to CDFW a copy of the executed Credit Transfer Agreement prior to initiating construction activities. The number of credits purchased shall be at a ratio appropriate to fully mitigate permanent habitat impacts.

DocuSign Envelope ID: 94DCB4A6-CB82-4B26-8FF7-D2E8E06EB355

COMMENT 14: Fish Passage Analysis Senate Bill 857

Issue: The Draft EIR, as it is currently written, does not address many of the locations noted in the CALFISH Database that occur within the Project limits as it pertains to Senate Bill 857 (SB-857), which amended Fish and Game Code 5901 and added section 156 to the Streets and Highways Code states in section 156.3, "For any project using state or federal transportation funds programmed after January 1, 2006, Caltrans shall insure that, if the project affects a stream crossing on a stream where anadromous fish are, or historically were, found, an assessment of potential barriers to fish passage is done prior to commencing project design. Caltrans shall submit the assessment to the CDFW and add it to the CALFISH database. If any structural barrier to passage exists, remediation of the problem shall be designed into the project by the implementing agency. New projects shall be constructed so that they do not present a barrier to fish passage. When barriers to fish passage are being addressed, plans and projects shall be developed in consultation with CDFW."

Recommendation: The Biological Resources section of the EIR should address the following locations noted in the CALFISH Database that occur within the Project limits as it pertains to SB- 857. 15

- Location 1, South Fork Putah Creek (I-80; PM 41.3, Solano County), Fish Passage Assessment Database ID# 761347, fish barrier status: temporal;
- Location 2, Unnamed tributary to Toe Drain (I-80; PM 9.4, Yolo County), Fish Passage Assessment Database ID# 764517, fish barrier status: unassessed; and
- Location 3, Unnamed tributary to Toe Drain (I-80; PM 10.62, Yolo County), Fish Passage Assessment Database ID# 764482, fish barrier status: unassessed.

The EIR should include a fish passage discussion section to address potentially significant impacts. CDFW recommends that the fish passage section, at a minimum, discuss the current status of the crossing locations noted in the California Fish Passage Assessment Database, conduct first pass and or second pass fish assessments, as necessary, as well as provide images of the upstream and downstream ends of water conveyance structures.

COMMENT 15: 2.1.2 Consistency with Regional, and Local Plans and Programs

Issue: CEQA Guidelines section 15125(d) states that EIRs must discuss any inconsistencies between projects and applicable plans (including habitat conservation plans/natural community conservation plans). Portions of the Project are within the boundaries of the Yolo Habitat Conservation Plan/Natural Community Conservation Plan (Yolo Plan) and the Natomas Basin Habitat Conservation Plan (NBHCP). 16

DocuSign Envelope ID: 94DCB4A6-CB82-4B26-8FF7-D2E8E06EB355

Recommendation: Because the Yolo Plan and NBHCP are currently being implemented, the EIR must include a discussion on the consistency of each project alternative with the respective plans and how Caltrans will ensure that implementation of the project alternatives do not impede either plan's ability to meet its biological goals and objectives. Furthermore, CDFW recommends that Caltrans coordinate with the implementing agency/plan operators (Yolo Habitat Conservancy/Yolo County and the Natomas Basin Conservancy) of each respective plan to ensure significant environmental impacts assessed in the EIR are adequately investigated. Particular focus in the EIR's analysis should be directed to:

- Analysis of all Yolo Plan and NBHCP Covered Species,
- Assessment of habitat types identified in the Yolo Plan and NBHCP,
- Identification of applicable Yolo Plan and NBHCP avoidance, minimization, or mitigation measures; and
- Analysis of any impacts to land commitments of the Yolo Plan and NBHCP.

16 cont.

CEQA Guidelines section 15125(e) requires the analysis examine both the existing physical conditions at the time of the EIR and the potential future conditions discussed in the adopted plans.

The Project area includes a portion of the Swainson's Hawk Zone (SHZ), which the NBHCP describes as the area within one mile of the Sacramento River in the Natomas Basin. The SHZ was derived from the high density of Swainson's hawk nests within this area and scientific evidence for the value of the habitat (NBHCP 2003). The NBHCP recognizes the importance of the SHZ to this species and the viability of their plan which resulted in substantial effort from the City of Sacramento and Sutter County to replan development outside of this area. Although Caltrans is not party to the NBHCP, the EIR must consider the Project's 1) biological impact in an ecologically valuable area and 2) the effect that Project development in the SHZ will have on the continued implementation and viability of the NBHCP.

COMMENT 16: Throughout EIR.

Issue: Generally, much of the language used to describe avoidance, minimization, and mitigation actions within the EIR use the term "would."

Recommendation: To ensure mitigation measures are both quantifiable and enforceable, CDFW recommends replacing instances of "would" with "shall" within all avoidance, minimization, and mitigation measures.

17

DocuSign Envelope ID: 94DCB4A6-CB82-4B26-8FF7-D2E8E06EB355

ENVIRONMENTAL DATA

CEQA requires that information developed in environmental impact reports and negative declarations be incorporated into a database which may be used to make subsequent or supplemental environmental determinations (Pub. Resources Code, § 21003, subd. (e)). Accordingly, please report any special-status species and natural communities detected during Project surveys to the California Natural Diversity Database (CNDDB). The CNNDB field survey form can be found at the following link: https://www.wildlife.ca.gov/Data/CNDDB/Submitting-Data. The completed form can be submitted online or mailed electronically to CNDDB at the following email address: CNDDB@wildlife.ca.gov.

FILING FEES

The Project, as proposed, would have an impact on fish and/or wildlife, and assessment of filing fees is necessary. Fees are payable upon filing of the Notice of Determination by the Lead Agency and serve to help defray the cost of environmental review by CDFW. Payment of the fee is required in order for the underlying project approval to be operative, vested, and final. (Cal. Code Regs, tit. 14, § 753.5; Fish & G. Code, § 711.4; Pub. Resources Code, § 21089.) 18

CONCLUSION

Pursuant to Public Resources Code § 21092 and § 21092.2, CDFW requests written notification of proposed actions and pending decisions regarding the proposed project. Written notifications shall be directed to: California Department of Fish and Wildlife North Central Region, 1701 Nimbus Road, Rancho Cordova, CA 95670 or emailed to R2CEQA@wildlife.ca.gov.

CDFW appreciates the opportunity to comment on the DEIR for the Yolo 80 Corridor Improvements to assist Caltrans in identifying and mitigating Project impacts on biological resources. CDFW personnel are available for consultation regarding biological resources and strategies to minimize and/or mitigate impacts. Questions regarding this letter or further coordination should be directed to Irina Lopatin, Environmental Scientist at (916) 880-8324 or irina.lopatin@wildlife.ca.gov; or Melissa Stanfield, Senior Environmental Scientist (Supervisory), at (916) 597-6417 or melissa.stanfield@wildlife.ca.gov.

Sincerely,

DocuSigned by:

Response to Comment 1 in 20240112, California Department of Fish and Wildlife

This introductory comment provides the role of the California Department of Fish and Wildlife, provides a summary of the proposed project, and provides a summary of the more detailed comments provided in the letter. This comment does not discuss the adequacy of the EIR/EA. No changes to the Draft EIR/EA are necessary.

Response to Comment 2 in 20240112, California Department of Fish and Wildlife

The only construction activity proposed for the project within 500 feet of the bat maternity colony associated with the Yolo Causeway bridge structure is lane restriping. The Draft EIR/EA specifically states that no structural modification of the Yolo Causeway is proposed (Draft EIR/EA Chapter 1, “The Yolo Causeway would not be structurally modified.”). Based on the type of work activity proposed and in consideration of AMM BIO-12 through AMM BIO-15, no construction activities having the potential to generate impacts to the bat maternity colony are expected to take place within 500 feet of the maternity colony during the maternity period (March 1 to August 31). The proposed measures are considered by Caltrans to be specific, enforceable and feasible. Other potential roosting colonies or individual bats that may be encountered in other portions of the project footprint are expected to be protected by these measures as well. No changes to the Draft EIR/EA are necessary.

Response to Comment 3 in 20240112, California Department of Fish and Wildlife

Caltrans deems that the analysis of direct, indirect, and cumulative impacts presented in the Draft EIR/EA represents a scientifically supported analysis of the potential effects of construction and operational project activities on bats and other sensitive wildlife. Furthermore, Caltrans asserts that the Draft EIR/EA demonstrates that significant environmental impacts were adequately investigated and discussed. Per the response to Comment 2 above, Caltrans deems the Draft EIR/EA to include fully enforceable avoidance, minimization, and mitigation measures. Caltrans concludes that no project-related activities are expected to generate significant direct, indirect, or cumulative impacts on the bat maternity colony or to any other roosting colonies or individual bats that may be encountered within the project footprint. Caltrans is not proposing any direct modification of the Yolo Bypass bridge structure or its attendant facilities, including lighting or signage that would generate excess light within 500 feet of the bat maternity colony.

Additionally, lighting, noise, human activity, and wildlife-human interactions created by project activities are expected to be of a short duration, limited in extent, and taking place in discrete locations within the overall project footprint over a 3-year construction period. Analysis of Noise and Vibration cumulative impacts indicates that with implementation of proposed mitigation measures, impacts from noise and vibration would not be cumulatively considerable (Draft EIR/EA Chapter 2, Section 2.4.5.13: “All relevant projects would be required to comply with local noise ordinances and implement BMPs as necessary to avoid and minimize temporary impacts on noise. Therefore, in conjunction with relevant projects, the Project would not result in a cumulatively considerable impact on noise and vibration.”). Impacts from construction lighting, human activity, and wildlife-human interactions are similarly expected to also not be cumulatively considerable.

No changes to the Draft EIR/EA are necessary.

Response to Comment 4 in 20240112, California Department of Fish and Wildlife

Cumulative impacts associated with Yolo 80, FixSac5, I Street Bridge Replacement, and other transport projects will be distributed both in time and across a broad geographic area, would be limited in duration and typically occur at discrete locations within their respective project footprints. Therefore, cumulative impacts associated with construction related noise, vibration, or lighting are not expected to rise to the level of significance for bats and purple martin.

Per the response to Comment 2 and 3 above, Caltrans asserts that the Draft EIR/EA includes fully enforceable avoidance measures and concludes that project related activities are not expected to generate significant impacts (direct or cumulative) on the known bat maternity colony or to any other roosting colonies or individual bats that may be encountered within the project footprint. Proposed avoidance and minimization measures are expected to reduce direct impacts to below significance and avoid contributing to cumulative impacts.

Caltrans acknowledges the need for ongoing coordination with CDFW on the Yolo 80 and other interrelated projects to identify and implement additional conservation efforts for purple martin.

No changes to the Draft EIR/EA are necessary.

Response to Comment 5 in 20240112, California Department of Fish and Wildlife

Caltrans deems that implementation of AMM BIO-13 (Draft EIR/EA, Chapter 2, Section 2.3.4, and Chapter 3, Section 3.2.4) is adequate to avoid or minimize project effects on sensitive bat species. AMM BIO-13 was written in adherence to the Caltrans Bat Mitigation: A Guide to Developing Feasible and Effective Solutions and conforms with Caltrans standard practice.[4] The project would not be implemented as an intentional act to disrupt normal behavioral patterns to wildlife. No changes to the Draft EIR/EA are necessary.

Response to Comment 6 in 20240112, California Department of Fish and Wildlife

Caltrans deems that implementation of AMM BIO-14 (Draft EIR/EA, Chapter 2, Section 2.3.4, and Chapter 3, Section 3.2.4) is adequate to avoid or minimize project effects on sensitive bat species. AMM BIO-14 was written in adherence to the Caltrans Bat Mitigation: A Guide to Developing Feasible and Effective Solutions and conforms with Caltrans standard practice.[5] No changes to the Draft EIR/EA are necessary.

Response to Comment 7 in 20240112, California Department of Fish and Wildlife

Caltrans does not anticipate needing to exclude bats from built structures because the project does not include impacts to structures with known or expected bat roost occupancy. Caltrans

[4] Johnston, D. and K. Briones. 2019. Final Caltrans Bat Mitigation: A Guide to Developing Feasible and Effective Solutions, Section 5.
[5] Johnston, D. and K. Briones. 2019. Final Caltrans Bat Mitigation: A Guide to Developing Feasible and Effective Solutions, Section 5.

deems that implementation of AMM BIO-13 through 15 (Draft EIR/EA, Chapter 2, Section 2.3.4, and Chapter 3, Section 3.2.4) are adequate to avoid or minimize project effects on sensitive bat species. No changes to the Draft EIR/EA are necessary.

Response to Comment 8 in 20240112, California Department of Fish and Wildlife

Caltrans deems that with implementation of AMM BIO-4 through 32 (Draft EIR/EA, Chapter 2, Section 2.3, and Chapter 3, Section 3.2.4) project activities are not expected to result in injuries to bats or other wildlife. Regardless, any unforeseen human-animal interactions generated by Caltrans contractors related to project-related activities that result in injury to wildlife and necessitating rehabilitation are expected to be covered by the contractor in coordination with Caltrans and CDFW staff. No changes to the Draft EIR/EA are necessary.

Response to Comment 9 in 20240112, California Department of Fish and Wildlife

Regarding the recommended Mitigation Measure 1 - Light Output Analysis: Caltrans has designed the Yolo 80 project to minimize the amount of new lighting being installed when not in conflict with Caltrans design guidelines or public safety standards for roadways. Because of this, Caltrans disagrees that a Light Output Analysis is necessary to avoid incidental impacts to light-sensitive wildlife.

Regarding the recommended Mitigation Measure 2 – Light Output Limits: When practicable, Caltrans plans to use LED’s or bulbs rated to emit or produce light of a warm white color spectrum in areas where impacts to light sensitive natural resources may occur.

Regarding the recommended Mitigation Measure 3 – Reflective Signs and Road Striping: When practicable, Caltrans plans to use retroreflective signs and road striping throughout the project to reduce the need for electrical lighting.

Regarding the recommended Mitigation Measure 4 – Light Pole Modifications and Shielding: When practicable and when not in conflict with public safety standards for roadways, Caltrans will install new or replacement light poles or sources of illumination with the appropriate shielding to avoid excessive light pollution into natural landscapes or aquatic habitat within the project corridor. Commenter recommendations regarding light pole arm length and mast heights are likely to conflict with public safety standards but will be considered when practicable. In areas with sensitive natural landscapes, aquatic habitat, or within 500 feet of any bat roost, Caltrans will determine if placing the light poles at non-standard intervals has the potential to further reduce the potential for excessive light pollution caused by decreasing the number of light output sources in sensitive areas.

No changes to the Draft EIR/EA are necessary.

Response to Comment 10 in 20240112, California Department of Fish and Wildlife

In response to commenter’s recommended BIO-Measure 1: Caltrans intends to minimize impacts to sensitive natural communities, including Valley Oak Woodland, to the maximum extent practicable and Standard Measure BIO-4 in Appendix E of the Draft EIR/EA- details the measures Caltrans will implement as part of the project. Compensatory mitigation for Valley Oak

Woodland is not expected to be necessary given the acreage of permanent impacts (i.e., less than 0.2 acre) within already disturbed areas (i.e., along existing road shoulders within Caltrans right-of-way).

In response to commenter's recommended BIO-Measure 2: Valley Oak Woodland and Forest On-Site and Off-Site Restoration Plan. Standard Measure BIO-4, which is part of the project, states that Caltrans will develop a restoration plan to address impacts to sensitive natural habitats. Based on the conclusions of the environmental analysis in the Draft EIR/EA indicating a less-than-significant impact, Caltrans does not intend to purchase offsite mitigation/restoration bank credits for the expected temporary and permanent impacts to Valley Oak Woodland proposed in the project. Caltrans acknowledges the need for ongoing coordination with CDFW to identify and implement additional conservation efforts for wildlife, including installation of artificial wood rat boxes and bat boxes to reduce impacts to fish and wildlife resources.

No changes to the Draft EIR/EA are necessary.

Response to Comment 11 in 20240112, California Department of Fish and Wildlife

Per the Draft EIR/EA, Section 2.3.5, AMM BIO-19: Erosion Control and Re-Vegetation states the following: "Erosion control will be implemented, and the affected area will be revegetated with appropriate native plants." Contractors will comply with Caltrans standard specification for materials used in erosion control measures. The contractor must submit a certificate of compliance showing their materials conform to Caltrans specifications. Specifically, fiber rolls and mesh are to be made of natural/biodegradable materials and will not use plastic monofilament or cross joints. In the Draft EIR/EA Appendix E, Project Features, Standard Measure BIO-4 includes language stipulating that construction related material shall be removed upon completion of project activities. No changes to the Draft EIR/EA are necessary.

Response to Comment 12 in 20240112, California Department of Fish and Wildlife

The commenter says the pre-construction survey dates are not consistent with the Swainson's Hawk nesting season. BIO-31 has been revised to include the dates between February 1 and September 30 to reflect Caltrans standard nesting bird window. As revised, Caltrans anticipates that implementation of AMM BIO-31 and 32 (Draft EIR/EA, Chapter 2, Section 2.3.5, and Chapter 3, Section 3.2.4) are adequate to avoid or minimize project effects on Swainson's hawk or otherwise already address the recommendations of the commenter. Caltrans intends to implement surveys and buffers in an appropriate fashion and with CDFW consultation. No other changes to the Draft EIR/EA are necessary.

Potential effects of the project on the Swainson's Hawk Zone and conservation lands of the Natomas Basin Habitat Conservation Plan are included twice in the CDFW comment letter. This issue is not addressed here but is addressed in Response to Comment 16 in 20240112, California Department of Fish and Wildlife. No changes to the Draft EIR/EA are necessary.

Response to Comment 13 in 20240112, California Department of Fish and Wildlife

Draft EIR/EA Chapter 3, Section 3.2.4 summarizes the technical findings of Caltrans environmental analysis on potential impacts to Swainson's hawk. Based on technical review, foraging habitat that would be impacted is already degraded by proximity to roadways and other forms of anthropogenic disturbance. Caltrans has proposed two species specific measures (AMM BIO-31 and BIO-32) that are expected to reduce impacts to below the level of significance. Based on this finding, Caltrans has determined that compensatory mitigation for the loss of foraging habitat is not necessary. No changes to the Draft EIR/EA are necessary.

Response to Comment 14 in 20240112, California Department of Fish and Wildlife

Caltrans deems that implementation of AMM BIO-6 (Draft EIR/EA, Chapter 2, Sections 2.3.4 and 2.3.5, and Chapter 3, Section 3.2.4) is adequate to avoid or minimize project effects on tricolored blackbird. Caltrans intends to implement surveys and buffers in an appropriate fashion and with CDFW consultation. No changes to the Draft EIR/EA are necessary.

Response to Comment 15 in 20240112, California Department of Fish and Wildlife

Regarding Location 1, South Fork Putah Creek: Caltrans is not proposing to modify the existing bridge structure crossing Putah Creek at this location. As detailed in the Draft EIR/EA Chapter 1, Proposed Project, work activities at this location are limited to the placement of fiber-optic cable. Because there will be no substantive modification of the existing structure, Caltrans declines to include this location in the requested fish passage analysis on the basis that the project will have no effect on fish passage characteristics.

Regarding Location 2, Unnamed tributary to Toe Drain: Staff familiar with the fish passage characteristics of this location (PAD ID# 764517) indicate that it has extremely low-quality habitat constituents, possesses a low probability for anadromy, and are highly managed and maintained. Though the location has been identified as potential barrier locations in the Fish Passage Assessment Database, further assessments are not justifiable due to the poor quality of habitat present and lack of any extensive fish bearing habitat upstream. Because of the lack of appropriate habitat at or above these crossings, Caltrans declines to include this location in the requested fish passage analysis. No changes to the Draft EIR/EA are necessary.

Regarding Location 3, Unnamed tributary to Toe Drain: According to the California Fish Passage Assessment Database, this location (PAD ID# 764482) was assessed in 2022 and is not considered a barrier as there is no suitable upstream habitat (historic or current) for salmon or steelhead. Because of the 2022 assessment indicating the location is not a barrier, Caltrans declines to include this location in the requested fish passage analysis. No changes to the Draft EIR/EA are necessary.

Response to Comment 16 in 20240112, California Department of Fish and Wildlife

As indicated in the comment, portions of the project are within the Yolo Habitat Conservation Plan/Natural Community Conservation Plan (Yolo Plan) and abuts the boundaries of the Natomas Basin Habitat Conservation Plan (NBHCP). The Swainson's Hawk Zone (SHZ), which

the NBHCP defines as within 1 mile east of the toe of the inside levee of the Sacramento River and extending from the Natomas Cross Canal on the north and I-80 on the south, also abuts the project area. However, Caltrans right-of-way (ROW) only abuts these areas and does not extend into or overlap significantly with them.

Because of the limited overlap and because project effects are not expected to propagate to any significant degree beyond the ROW or significantly alter potential future conditions, with mitigation, analysis of impacts to HCP lands or coordination with agency/plan operators is not considered necessary to fulfil the requirement to discuss consistency of project alternatives with the respective plans. Furthermore, Caltrans is not a signatory to either the Yolo Plan or the NBHCP and does not typically participate in habitat conservation planning at the municipal level. The project would not affect the implementation or viability of the Yolo Plan or NBHCP and SHZ with implementation of Caltrans Standard Measures BIO-1 through BIO-4 and project-specific AMMs and mitigation measures (Draft EIR/EA, Appendix E and Chapter 2, Section 2.3, AMM BIO-1 through BIO 32).

Also see Draft EIR/EA, Chapter 3, Section 3.2.4.2. Special Status Animal Species, for analysis of potential effects to local HCP/NCCPs. For clarity, conclusions from this section have been amended and added to the EIR/EA, Chapter 2, Section 2.3.1.2, Natural Communities: Environmental Consequences.

Response to Comment 17 in 20240112, California Department of Fish and Wildlife

This comment requests a change from the word “would” to “shall” in avoidance, minimization, and mitigation measures. This comment does not discuss the adequacy of the EIR/EA. The word “would” is commonly used in an EIR/EA. No changes to the Draft EIR/EA are necessary.

Response to Comment 18 in 20240112, California Department of Fish and Wildlife

This conclusory comment provides information about uploading species data and payment of filing fees and includes a request for written notification about project decisions. This comment does not discuss the adequacy of the EIR/EA. No changes to the Draft EIR/EA are necessary.

20240112, City of Davis

Masum Patwary
Environmental Scientist
Caltrans District 3
703 B Street,
Marysville, CA 95901

Dear Mr. Patwary:

Thank you for the opportunity to review the Draft Environmental Impact Report ("DEIR") for the Yolo 80 Corridor Improvements Project ("Project"). The City of Davis ("Davis") respectfully submits these comments to help Caltrans to ensure that the Environmental Impact Report complies with the California Environmental Quality Act ("CEQA"). Public Resources Code sections 21000-21889, CEQA Guidelines sections 15000-15387. 1

The City's concerns fall into the following general categories:

Project Description 2

An inaccurate or incomplete project description may render the analysis of significant environmental impacts inherently unreliable. While extensive detail is not necessary, the law mandates that EIRs should describe proposed projects with sufficient detail and accuracy to permit informed decision-making. (CEQA Guidelines section 15124).

1) Chapter 1.3.1.1 does not discuss the phasing of the project. Our understanding of the project is that there is insufficient funding to complete the entire project in one phase so construction will have to be phased. If this is correct, a discussion of project phasing should be included in the project description and is necessary to fully inform the public about the construction timing and project schedule. 3

2) Chapter 1.5 of the DEIR addresses alternatives considered but rejected. The City requests Caltrans include and analyze a project alternative that converts existing general-purpose lanes to a tolling lane or HOT lane. Caltrans should explain why the alternative of converting an existing lane to HOV was considered but the option of toll lanes, which could generate revenue for transit improvements, was not considered. 4
3) The DEIR assumes under Project Alternative 6 (transit-only managed lane) that there will be no increase in transit supply. Davis requests that Caltrans conduct an analysis of Project Alternative 6 (transit-only managed lane) that assumes an increase in transit supply. 5

530-757-5602 | @CityofDavis

23 Russell Boulevard, Davis, CA 95616

CITYOFDAVIS.ORG

Climate Change, Local Plan Consistency

The DEIR determines that the impacts on climate change, including air quality and greenhouse gas emissions ("GHG") will be less than significant after implementation of standard mitigation measures as described in Exhibit E to the DEIR.

4) Chapter 3.4.3.3 describes the applicable Regional Plans that address Greenhouse Gas Emissions ("GHG") reduction policies or strategies. The City of Davis adopted its Climate Action and Adaptation Plan on April 18, 2023 and requests that it be included in the analysis of consistency with local plans. The City understands that Caltrans is not required to include the Davis CAAP in the DEIR analysis as it was adopted after Caltrans released the Notice of Preparation for the Project DEIR. The City recommends that Caltrans do so, however, given that the CAAP represents the City's most recent policy document related to GHG. Specifically, the CAAP includes three climate action goals relevant to the project – (1) expand public transit (TR6), (2) develop Transportation Demand Management (TR9), and (3) strengthen regional transit (TR7). A copy of the CAAP is attached for your convenience. 6

Traffic and Transportation

VMT Mitigation Measures

Vehicles Miles Traveled measures the amount of travel for all vehicles in a geographic region over a given period of time, typically a one-year period. It is calculated as the sum of the number of miles traveled by a vehicle. CEQA requires that an EIR identify "all feasible measures which could minimize significant adverse impacts." CEQA Guidelines Section 15126.4(a)(1). The City submits the following comments related to Caltrans' mitigation measures related to Transportation/VMT impacts. 7

5) The DEIR concludes that the impacts of the project on vehicles miles traveled will be significant and unavoidable even after the implementation of mitigation. The DEIR identifies eight "VMT Reduction Measures." The City notes that these reduction matters are not included in the table of mitigations in Exhibit C, however, and it is unclear if Caltrans intends to adopt them as formal mitigation measures under CEQA. Caltrans is obligated to identify all feasible VMT mitigation measures, even if they will not result in mitigation of VMT impacts to a "less than significant" level. CEQA Guidelines Section 15126.4(a)(1).

6) The DEIR states that Caltrans is making a commitment to contribute $55 million toward the measures. However, full implementation of these VMT-reducing will require substantial additional financial investment. The specific process by which this additional funding will be obtained is not specified in detail, and the DEIR appears to assume the additional funding will come from tolls. CEQA requires that mitigation measures be "fully enforceable through permit conditions, agreements, or other legally binding instruments." CEQA Guidelines Section 15126.4(a)(2). The DEIR's 8

"Mitigation Reduction Measures" fail to meet this requirement, as long-term funding for the mitigation measures is not currently available, and the DEIR fails to propose a legally binding pathway to funding them. The City notes that Caltrans could improve the enforceability of the VMT mitigation measures by seeking to enter binding agreements with the affected agencies who will establish a tolling authority, and developing an agreed upon methodology for establishing toll amounts that would fully fund the ongoing mitigation measures. Finally, it would be important for the tolling agencies to agree to divert revenue towards the mitigation measures. If this is not feasible, then Caltrans could commit to funding the mitigation measures until tolls are established and the mitigation measures could be funded through binding and legally enforceable agreements. 8 cont.

7) Similarly, the City notes that full implementation of the VMT mitigation measures is largely outside the legal jurisdiction of Caltrans as ongoing funding will depend on the intervening actions of multiple other public agencies. While the City understands that Caltrans cannot control the discretionary actions of other public agencies, as noted above, Caltrans could either seek agreement from the affected agencies, or agree to fund the mitigation measures itself until such time as tolling agencies are able to fully fund them. The DEIR does not look at this option or analyze its feasibility. 9

8) In addition to lacking legal enforceability, the proposed VMT Reduction Measures appear to defer mitigation of ongoing VMT impacts to a later date without meeting the requirements of CEQA Guidelines Section 15126.4(a)(1)(B), including the identification of specific performance standards that the mitigation measure should achieve and identifying potential actions that could attain that result. 10

9) Finally, even if the VMT Reduction Measures are fully implemented and funded over the long term, they would not be sufficient to offset the VMT impacts of Build Alternatives 2-5. In addition to revising the 8 VMT Reduction measures to meet CEQA requirements for enforceability and specificity, the City requests that Caltrans review options to further reduce the VMT impacts of the Project. The DEIR does not include any analysis of other potential mitigation measures besides the eight proposed measures, and does not provide a basis for concluding that these are the only feasible mitigation measures to address VMT for the Project. 11

10) Table 2.1-28 states that the cost to increase Route 42A and 42B services for 15-minute headways during morning and afternoon peak hours would be $16 million annually. The City asks that Caltrans reexamine this cost estimate. The City notes that the expansion of the Causeway Connection was estimated to cost less than $1 million per year. It is not clear to the City that expanding the routes of two 42 bus routes would cost 16 times more than the Causeway Connection. If those numbers are correct, the City asks that Caltrans look at expanding other bus routes (e.g. 43, 43R, 230) instead of discarding the measure completely. 12

11) Section 2.1.10.8 includes subsidizing transit passes and/or eliminating fares as a potential VMT reduction measure. Caltrans's methodology for estimating the VMT reduction due to a voluntary trip reduction plan should be more fully described and analyzed. Since the analysis time frame uses 2019 traffic data through both the NCST calculator and SACSIM more analysis should be done to make sure that any mitigation measures that restore transit service to 2019 levels are not double counting or over estimating the VMT benefits that they would provide. 13

12) With respect to Tables 2.1.27 and 2.1.28 related to VMT Reducing Measures, the City requests Caltrans to consider that commuters travel I-80 from Dixon to Davis and Sacramento. Although there is Solano Express bus service between Dixon and Davis, expansion of this service on the blue line to Sacramento with improved frequencies, especially between Dixon and Davis would likely have a beneficial impact on VMT. Another option to consider would be a Capitol Corridor train stop in Dixon. The Yolobus 42 routes cover long distances. Shorter, more frequent routes (particularly during commute times) between Woodland and Davis should also be considered. While the City acknowledges that this latter option would not substantially change the VMT on I-80, it could mitigate some of the I-80 GHG impacts. 14

13) Table 2.1.28 rejected a mitigation calling for increases to parking costs at UC Davis and Downtown Sacramento since currently there are no plans to proceed with this program. The VMT reduction estimate from this measure is significant and the City request that Caltrans consider working with the affected agencies to increase parking costs by a lesser amount in order to provide some VMT mitigation. 15

Induced Demand Analysis

14) The City notes that the DEIR contains contradictory information about whether commercial or truck traffic is considered in the analysis of induced demand and elasticity. The Fehr and Peers memorandum of November 16, 2023 states that increases to commercial traffic would be 19-29% based on induced demand, but later states that "With commercial driving excluded, the automobile daily induced VMT has an elasticity of 0.71." Additional explanation of why commercial traffic should be excluded from this analysis would be helpful in terms of understanding the agency's induced demand methodology. 16

Safety Concerns

15) Section 2.1.10.3 "Collision Data" summarizes the number of collisions and collision rates for the freeway segments of the Project Area. The Project proposes reducing the inner shoulder width in order to create the managed lane through the City of Davis and onto the Causeway. The reduction or elimination of the inner shoulder should be analyzed to determine if this will increase the likelihood of collisions and to 17

evaluate impacts on local first responders, such as police, fire and emergency services. 17 cont.

16) Along the same lines, the DEIR should analyze to the increased risk of collisions during the construction period. The City understands that staged traffic control, such as narrower lanes, no (or minimal) shoulders, and lane shifts have had an impact on collision rates during the current work on I-80 across the Causeway and in West Sacramento. The increased number of collisions has also had an impact on the City of Davis due to the increase in emergency calls for service to assist with incidents on the Causeway. For example, the Davis Fire Department saw an increase in calls to the Causeway between October 12th and November 22nd . The City received calls for service for 9 incidents in that same time frame in 2022, but this figure nearly doubled to 17 incidents in 2023. 18

Air Quality

17) Section 3.4.4.1 "Operation Emissions" as well as Table 3.4.2, analyzes CO2 emissions from fossil fuel combustion and its impact on GHG emissions. But the model used for this calculation does not account for "induced travel." A project that reduces travel time can lead to changes in traveler behavior that can increase the overall amount of travel, and therefore the Project may result in "induced travel." The DEIR needs to either explain how induced travel impacts were evaluated for GHG and air quality impacts or provide a full analysis these impacts. 19

18) Section 3.4.5 CEQA Conclusion determines that the Build Alternative will result in additional vehicle capacity that will result in an increase of impacts from VMT. The Project's very modest decrease in projected GHG emissions in 2049 are attributed to newer more fuel-efficient fleets and the increase in electric vehicles. The City requests a more detailed analysis of the Project's consistency with the State of California's goals of a 40% reduction (below 1990 levels) by 2030 and 85% reduction by 2050 (2022 Scoping Plan, ARB). 20

19) Section 3.4.6.1 (p. 3-64) describes a Governor's Office of Planning and Research report (2015) that identified a 50% reduction in petroleum use in cars and trucks by 2030 as a "key state goal" for reducing greenhouse gas emissions. Here again, the Project should be fully evaluated for consistency with State goals, even where they are not legally binding. 21

Miscellaneous/Non-CEQA Comments

20) The City notes that the public circulation period for the DEIR has been marked by noticing flaws, with incorrect documents loaded to the website at various points, supporting information on the VMT analysis posted later than the rest of the DEIR, 22

and repeated reports that physical copies of the documents were not available for significant periods of time at the Mary L. Stephens Davis Library. For all of these reasons, as well as the additional time it affords for review, the City appreciates the extension of the public comment period to January 12, 2024. However, one may argue that the extension provided may not be sufficient to account for these noticing deficiencies and we continue to have concerns about the adequacy of the availability of documents as noted above, particularly as it pertains to the document access to interested members of the community who may wish to participate in the DEIR review and comment process. 22 cont.

21) Section 2.1.10.7 Environmental Consequences proposes adding Class II bike lanes to County Road 32A, at the intersection of 32A/105 and the Class I bikeway that parallels I-80. When this is designed, the City requests that a safe crossing to access to the Class I bikeway be developed for westbound cyclists to use. 23

22) We note that Project T-8 in Table 1.3-3 incorrectly refers to “Olive Hill Lane” and “Olive Hill Road” instead of “Olive Drive.” 24

In addition, the city received comments from two City commissions: the Bicycling, Transportation, and Street Safety Commission (BTSSC) and the Natural Resources Commission (NRC). Their comments have been attached for your consideration as well. 25

If any of the requested analysis or comments noted above would trigger a recirculation of the DEIR, please recirculate the DEIR as required by CEQA. 26

Thank you again for the opportunity to comment on this DEIR. Please feel free to contact Ryan D. Chapman, P.E., T.E., Assistant Director of Public Works Engineering and Transportation if you have any questions. He can be reached at rchapman@cityofdavis.org.

Sincerely,

Mike Webb
City Manager

BTSSC Comments

NRC Discussion: Caltrans I-80 Yolo Widening Draft Environmental Impact Report November 27, 2023

NRC Motion

At the regular meeting of the Natural Resources Commission on November 27, 2023, the following motion was approved unanimously (Johnston, Blough, 5-0):

"The NRC recommends that all comments from individual Commissioner review of the Caltrans I-80 Yolo Widening Draft Environmental Impact Report (DEIR), as presented and discussed at the NRC meeting, be compiled and sent to Ryan Chapman, Assistant Director, Public Works Engineering and Transportation, and Mike Webb, City Manager. Further, the NRC requests that the comments in full should be provided to the Bicycling, Transportation and Street Safety Commission in advance of their December 14, 2023 meeting, and that they be appended in full to the BTSSC recommendations to City Council."

27

NRC Comments

The following are the compiled NRC comments, both sent in advance of the NRC meeting, and also discussed by all Commissioners during the meeting. Commissioners' review "assignments" in advance of the NRC meeting were as follows:

K Tuso : 2.2.2 Water Quality and Stormwater Runoff
J Byrne: 2.2.6 Air Quality, and 3.4.6 Greenhouse Gas Reduction Strategies
J Blough: 2.2.8 Noise
J Johnston -Transportation/Vehicle Miles Traveled (VMT) Mitigation Measures: 2.1.10 Traffic and Transportation/Pedestrian and Bicycle Facilities; and 3.2.8 Greenhouse Gas Emissions; and 3.4.4 Project Analysis

Comments from Keara Tuso: Stormwater (highlighting included as submitted)

- Under section 2.2.2.3, Environmental Consequences, sections discuss various building options and their impacts on stormwater
  - No Build Alternative 1 would have no changes or impacts to stormwater
  - Build Alternatives 2a and 2b
    - Caltrans will implement a SWPPP, in accordance with Standard Measure WQ-1, which would include construction site BMPs during construction activities to avoid and reduce potential water quality effects. The SWPPP would include BMPs to protect sensitive areas and to prevent and minimize stormwater and non-stormwater discharges. Standard Measure WQ-1 requires Caltrans to follow all applicable guidelines and requirements in the 2018 Caltrans Standard Specifications, Section 13, regarding water pollution control and general specifications for preventing, controlling, and abating water pollution to Caltrans-owned storm sewers, streams, waterways, and other bodies of water.

28

NRC Discussion of I-80 Yolo Widening Draft EIR
November 27, 2023

        - Standard Measure WQ-4 requires preparation of a Stormwater Data Report during the design phase, which would describe whether permanent treatment BMPs should be incorporated. Operation of Build Alternatives 2a and 2b would have minimal effects on water quality.
    - All other Build Alternatives would have the similar stormwater impacts as noted for Build Alternatives 2a and 2b
- Under section 2.4.5.8, Water Quality and Storm Water Runoff, it is anticipated that the Project in combination with the projects listed in Table 2.4-1 would contribute to temporary adverse cumulative impacts on water quality. However, each project that disturbs one or more acres would comply with NPDES and install BMPs during construction to minimize potential adverse impacts on water resources. 28 cont.
- CEQA section:
    - All Build Alternatives would result in an increase of impervious surfaces, as described in Section 2.2.2, Water Quality and Stormwater Runoff. In accordance with the Caltrans MS4 permit, Standard Measure WQ-1 incorporates post-construction water quality treatment BMPs and low impact development controls to reduce non-point source pollutants as needed. Additionally, Standard Measure WQ-4 has been incorporated into the project and requires the preparation of a Stormwater Data Report (SWDR) during the design phase to describe whether permanent treatment BMPs will be considered. Temporary construction impacts related to water quality would be less than significant for Build Alternatives 2a and 2b through 7a and 7b.

Overall comment from Keara: Stormwater impacts are less than significant and would not require additional comment from the NRC.

Comments from Jacob Byrne: Air Quality and GHG

- Construction emissions would exceed Yolo and Sacramento air quality standards, but neither district has jurisdiction over Caltrans; a construction project in a local jurisdiction would otherwise be required to reduce emissions through mitigation 29
- Alternatives do result in changes to operational emissions, generally the managed lane direct connector appears to increase emissions, but this may not be true in every case 30
- The no build scenario results in increased emissions; this relates to assumed continued growth in congestion 31
- Vehicle emissions reductions will reduce emissions overtime in opposition to the increase in VMT 32
- page 3-61 states "Furthermore, the model does not account for induced travel." Does this statement mean the induced VMT from the project is not considered in the GHG emissions analysis? If the induced VMT is not being considered, in the GHG analysis, what VMT is used as the basis of this analysis? Is induced VMT 33

NRC Discussion of I-80 Yolo Widening Draft EIR
November 27, 2023

also omitted from the air quality analysis? On page 2-116 it is noted that 'Caltrans determined that induced travel demand, which is synonymous with induced VMT, represents the metric most appropriate for determining a transportation project's impact.' This seems to create a contradiction with the approach taken in the GHG analysis if this induced VMT is not considered. This would similarly be true for the air quality analysis if induced VMT is not used to calculate emissions. In both cases exclusion of induced VMT would lead to lower estimated emissions from build alternatives. 33 cont.

Clerical: Project T-8 in Table 1.3-3 refers to 'Olive Hill Lane' and 'Olive Hill Road' instead of 'Olive Drive'. 34

Comments from Jordan Blough: Noise
As expected, the noise chapters in the EIR are not particularly groundbreaking. The analysis seems adequate, and the potential issues with this project are not related to noise. No major comments from me. 35

Comments from John Johnston: VMT, GHG, and Energy

General

Project Description and Setting:

The relationship between this project and its role in the I-80 Comprehensive Multimodal Corridor Plan needs to be described. The goals are to assure the public that this project is consistent with the recommendations in the CMCP, that it is a necessary part of the CMCP, and that the mitigation measures and strategies proposed in the CMCP are adequately considered in the design of this project. 36

Environmentally Superior Alternative:

CEQA requires that the environmentally superior alternative be identified, and if it is not the preferred alternative, justifications should be included for why the preferred alternative is chosen over the environmentally superior one. These considerations do not appear to be in the subject DEIR. 37

VMT and GHG Comments

Explanatory information for Commissions (next 2 paragraphs).

Completing the Project will cause a 0-12% increase in VMT by induced traffic. Alternative 6 (transit only) is not projected to induce any new traffic; Alternative 7 (conversion of existing lanes) induces about 1%, and all the other alternatives induce about 12% more VMT. For these alternatives, the induced VMT is about 180 million miles/yr total and 128 million mi/yr autos only over existing traffic. That the DEIR would 38

classify this as a *Less-than-significant impact with mitigation* (Sec 3.2.8) probably doesn't ring true to most casual readers and requires some explanation.
While VMT does increase over time, three factors mitigate the GHG effect. One is a VMT reduction program (AMM TRANS-1, Section 2.1.10.8). This is the "mitigation" referred to above (more comments on this below). The second factor is more efficient driving resulting from Project. The third, and most important, is the changing nature of the vehicle fleet toward more electric vehicles. The claim is that GHG emissions are expected to decrease slightly as a result of these changes (Table 3.4-2). Depending on the alternative, changes in GHG emissions compared with the No Build alternative range from –13 to +11% in 2029. The corresponding numbers in 2049 are -16 to -2% (all negative because the fleet has more completely transformed over time). 38 cont.

What follows are comments on the DEIR regarding VMT and GHG.

1. Underestimation of GHG estimates.

In Section 3.4.4.2, it is stated that the AQ model does <u>not</u> account for induced travel. Consequently, the GHG estimates in Table 3.4-2 may be underestimated by an unknown but not negligible amount. Most alternatives result in about 12% greater VMT, which is similar to or greater than percentage reductions in GHG. Consequently, including the induced traffic in the GHG calculation may change the project from one of reducing GHG to one that increases GHG. The GHG emissions should be recalculated to reflect all VMT. 39

2. Significance of GHG emissions.

The DEIR argues that there is no applicable threshold of significance for GHGs, and that Caltrans is not violating any policies (Sec 3.4.4). Why the numerous state laws and executive orders (some of which are described in Sec 3.4.1.2) don't constitute "policy" needs to be justified. Even if they are not state policy according to a technical definition of such, these executive orders, etc. clearly express the intent of the state government over multiple administrations and legislatures (e.g., AB1279). The project's very modest decreases in GHG in 2029 and 2049 contrast sharply with state goals of a 40% reduction (below 1990 levels) by 2030 and 85% reduction by 2050 (2022 Scoping Plan, ARB). <u>The significant inconsistency between the project impacts and state goals should be highlighted for decision-makers</u> and the public. Decision-makers should be properly informed that this particular project will not advance the state toward its stated climate goals. 40

In a similar vein, the DEIR (p 3-64) describes, a Governor's Office of Planning and Research (2015 report) that identified a 50% reduction in petroleum use in cars and trucks by 2030 as a "key state goal" for reducing greenhouse gas emissions. Depending on the alternative, gasoline use by vehicles ranges from -13 to +11% in 2029 and -21 to +0.4% in 2049. Here again, the inconsistency between the project impacts and the state goals should be highlighted, even if they are not legally binding. 41

NRC Discussion of I-80 Yolo Widening Draft EIR
November 27, 2023

Issues with the VMT reduction package

1. Trip reduction plan methodology and double counting.

As noted in the VMT mitigation memo, a subsidizing transit passes and/or eliminating fares may be part of a voluntary trip reduction plan. If so, then the VMT reductions due to these three actions are being double-counted. The methodology for estimating the VMT reduction due to a voluntary trip reduction plan needs to be described. If it is not well enough defined at this point to know whether transit fare changes are included, one wonders how a five significant figure estimate of VMT reductions can be calculated or relied on. These three measures should be examined more closely and the VMT reductions revised accordingly, especially if they overlap. 42

2. Expansion of Yolobus Route 42.

The cost estimate associated with this measure should be reexamined. This measure was rejected because of costs, which were estimated to be $16M/yr. In contrast, the expansion of the Causeway Connection was estimated to cost less than $1M/yr. It is not apparent why expanding the routes of two 42 bus routes should cost 16 times more than the Causeway Connection. Is there a calculation error? If it turns out that the numbers are correct, consider expanding other bus routes (e.g. 43, 43R, 230) instead of discarding the measure completely. 43

3. Promote regional transit service.

Commuters travel I-80 from Dixon to Davis and to Sacramento. Although there is SolanoExpress bus service between Dixon and Davis, consider expanding this service on the blue line to Sacramento and improving frequencies, especially between Dixon and Davis. UCD has data on where its employees live and the potential ridership. Adding a Capitol Corridor train stop in Dixon would be another way to provide this service. The Yolobus 42 routes cover long distances. Shorter, more frequent routes (particularly during commuter times) between Woodland and Davis should also be considered. While this would not change the VMT on I-80, it could mitigate some of the I-80 GHG emissions. All of these ideas are consistent with Davis CAAP climate measures TR6 (expand public transit) and TR7 (strengthen regional transit). 44

4. Nishi overpass accounting.

In the VMT mitigation plan, Caltrans proposes to contribute $5M to the Nishi overpass and in return, takes credit for 14M VMT reduction due to the Nishi project ($0.34/VMT) However, Caltrans does not have control over this project. The Caltrans contribution is only 2.5% of the total project cost (250Kper unit x 700 units + 18M for the overpass). That contribution is not very large, and its presence will not guarantee that the project 45

will be constructed. Accordingly, Caltrans should not claim VMT reduction credit for it. There are other measures that would definitely result in VMT reductions were they to receive the same monetary contribution. Alternatively, Caltrans could propose a substitute measure of equivalent size that would be funded if the Nishi project is not executed within a certain timeframe. 45 cont.

5. Parking price increases.

The proposed measure to increase parking costs was rejected because there were no plans at hand. The VMT reduction estimate from this measure is immense (multiple times larger than other measures proposed). Because of this potential, its feasibility should be reconsidered, even if only a part of the original scope is achieved. 46

6. Criteria for deciding whether the VMT reduction package is adequate.

The proposed VMT reduction package covers only 43% of the induced automobile VMT. It is not explained why the total induced VMT is the basis for comparison. In addition, there is no information in the DEIR to put this into a regulatory context and the criteria for deciding that 43% is good enough is not described. It is stated in the document that the available mitigation funds total roughly 14-15% of the project's capital costs. If cost the limiting factor, or if there are limits on the kinds of projects that can be included in a VMT mitigation package, the regulatory and/or statutory authorities should be clearly stated. If not, the justification for providing only 43% VMT mitigation as opposed to a higher value should be provided. 47

<u>Miscellaneous Davis Issues</u>

1. Consistency with local plans (Table 2.1-1).

The 2023 Davis CAAP was not included in the analysis of consistency with local plans. The 2007 General Plan was considered, but the CAAP is the latest and current thinking on GHG issues. The CAAP has 3 climate actions relevant to the project – expand public transit (TR6), Transportation Demand Management (TR9) and strengthen regional transit (TR7). Add the CAAP to Table 2.1-1 and elsewhere consistency with local plans is discussed. 48

2. Davis cut-through traffic impacts.

Davis "cut-through" traffic (i.e., drivers seeking to avoid congestion by cutting through town) was not addressed. This is a significant problem which the project may or may not alleviate. It turns out that because of induced traffic, the project will improve but not eliminate congestion. Traffic conditions after the project is built are discussed in Section 2.1.10.7. The environmental effects of this side flow and how it might improve or get worse should be included in the EIR. 49

Draft Minutes
City of Davis
Bicycling, Transportation, and Street Safety Commission (BTSSC)
Davis Senior Center Activity Room, 646 A Street, Davis, CA 95616
Thursday, December 14, 2023
5:30 p.m.

Commissioners:	Brook Ostrom (Chair), Andy Furillo, Fei Ma, Nick Bates, Schuyler Campbell. NRC Commissioner John Johnston.
Council Liaisons:	Donna Neville
Staff:	Ryan Chapman, PWET Assistant Director/City Traffic Engineer Jennifer Donofrio, City of Davis
Absent:	Brett Lee

1. Call to Order & Roll Call
   Meeting called to order at 5:34 p.m.

2. Approval of Agenda

   Motion (Bates, Campbell)

   Motion carries: 5-0

3. Brief Announcements from Staff and Liaisons
   A. Council Announcements

      Councilmember Donna Neville arrived after brief announcements.

   B. Staff Announcements

      Jennifer Donofrio shared that the agenda and staff reports are in a binder.

4. Public Comment

   Hiram Jackson stated he was on the school board and informed the commissioners about the school board parcel tax. He shared the importance of this tax and that it funds are used for school programs, electives, athletics, the library, counselors and more. The proposed new tax will be on the ballot and with no sunset date.

   Alan Hirsch thanked Donna Neville for attending the teach-in discussion about I-80 managed lanes EIR. He also spoke about a YoloTD meeting on Monday night

50

where they selected their preferred alternative in advance of the EIR being approved.

5. Consent Calendar

   A. Commission Minutes from September 14, 2023
   Motion (Bates, Furillo):
   Motion carries: 4-0-1.
   Abstain (Commissioner Campbell did not attend at the September meeting)

   B. Commission Minutes from October 12, 2023
   Motion (Furillo, Campbell):
   Motion carries: 4-0-1.
   Abstain (Commissioner Ma, did not attend the October meeting)

6. Regular Items

   A. Review I80 Widening Draft EIR

   Ryan Chapman provided an overview of the draft EIR and highlighted that the comments heard tonight and the Natural Resource Commission's letter will be provided to City Council. He explained what types of comments the City is looking for and what comments belong in the City's comment letter. He shared that the EIR is a disclosure document that looks at alternatives. He stated that if there is an environmental impact, then their needs to be a mitigation measure to respond to that impact.

   Clarifying Questions
   Commissioner Ma asked about the goal for this discussion. Ryan Chapman shared it is letting us know what was deficint or missed in the EIR to include in the letter.

   Councilmember Neville shared that City Council requested an extension of the EIR's due date, but it was denied by Caltrans. She also read what the CEQA laws is and recommended that the commission focus on three areas for EIR comments. The three areas of focus are, (1) sufficient disclosure and analysis, (2) is the Mitigation Adequate and (3) do you want to new or modified alternatives.

   Commissioner Ostrom asked Ryan Chapman about his thoughts about the EIR. Ryan Chapman noted there were challenges with accessing the EIR documents. He pointed out that the an older EIR draft was posted originally on the Caltrans website and at the libraries. He also noted how Caltrans removed the incorrect draft EIR from library and there was a period where the new EIR was not at the library during the comment period. He shared issues with mitigation measures and the project timeline. He noted issues with bicycle facilities during and after construction. He shared that the EIR needs

50 cont.

to included project phasing and how that was not included. He also stated that he did not see how this project would be funded. Finally, he stated that cut through traffic was not analyzed in the EIR and it needs to be included to understand the project impacts on City streets.

NRC Commissioner Johnston asked about how the NRC letter and BTSSC comments will be moved forward. Ryan Chapman shared that the comments will be reviewed by the City Manager's Office and then go to City Council. 50 cont.

Commissioner Furillo asked about how YoloTD voted on a preferred alternative ahead of the EIR approval and asked if this practice is unusual? Ryan Chapman shared that he has seen this before.

Commissioner Johnston asked about a superior alternative. City Councilmember Donna Neville shared that she is looking into this.

Public Comment
Alan Hirsch shared his issues with the EIR including that it was not available at the library, how challenging it was to access the technical reports. He noted that Caltrans did not provide a complete EIR, because they did not provide all the technical reports to the libraries. He recommended that the BTSSC request Caltrans to recirculate the EIR. 51

Commissioner Discussion

Commissioner Campbell shared that more needs to be done to improve transit. He noted that the Capitol Corridor trains are packed and there are not enough train cars. Commissioner Furillo stated that there are two alternatives that highlight transit, but these alternatives are not along transit corridors. He noted at the primary alternative, states there is transit on a portion of the project area. However, there is a 5-mile stretch between 80/50 split and I-5, which has no transit and there are no plans to add transit. The same issue exists with Alternative 6B, which states there is transit, but I-80 has no transit.

Commissioner Bates asked if there is not transit today, how are the models evaluating transit? Ryan Chapman shared information about the models. The UC Davis research model uses induced demand and land use patterns to model transportation. The SACSIM model created by SACOG, evaluates land use and models trips in the region using trip data. We see few people in the region using transit as a result, the model is not showing transit use. The SACOG model does not look at changes in land uses. 52

Commissioner Campbell shared that we have a weak transit system in the Sacramento region and unless we build a strong transit system, we will not see it in the model.

DRAFT

Commissioner Furillo shared that when transit is available along geographical pinch points, there are examples where transit systems can have high transit use.

NRC Commissioner Johnston stated that transit agencies have methods to create models and we should be asking them for this information. Ryan Chapman stated that he is seeing the shift towards transit in the mitigation measures. NRC Commissioner Johnston noted that there was limited information in the EIR about what models that used Caltrans used and what information was included in setting up the model.

Commissioner Ostrom and Commissioner Furillo shared their concerns about the mitigation measure to expand Yolo Bus Route 42A was rejected, because the annual cost would the $16 million. This comment was also picked up by NRC. There was discussion that commissioners believe this is an error with decimal places.

Commissioner Ostrom highlighted how the project area is part of an important east west corridor, however the EIR does not consider impacts to the whole corridor. He also noted that there was no discussion about impacts to local roadways, including Mace and Cowell. He believes that these impacts are being completely ignored. He thinks that the EIR should include mitigation measures from Caltrans to address impacts to our City and County streets. 52 cont.

Commissioner Furillo asked if adding an additional lane in the project area has any impacts on the choke point, where I-80 goes from 8 lanes to 4 lanes. We wants to understand if adding a lane in the project area make a difference with delay?

Commissioner Ma asked about VMT mitigations and how do we know if these mitigation measures will happen in the future. Ryan Chapman shared that Caltrans is entering into MOUs with other agencies to manage the VMT mitigation measures. Commissioner Bates stated that these mitigation measures are good ideas and asked if these ideas would be good to have in place without this project. He also asked about the connection between the mitigation measures and revenue. Ryan Chapman stated that Caltrans will provide money for these mitigation measures to the agencies implementing the measures. He also noted that if they create a tolling authority, then they will also use this revenue to pay for mitigation measures. Ryan Chapman shared that he wants to understand if there is no tolling, then how are the mitigation measures going to be funded.

Commissioner Furillo stated that in order to increase transit service, you need to create a car lane.

DRAFT

NRC Commissioner Johnston asked why in the mitigation measures VMT reduction stopped at 43%, when the threshold is 0%. He would like clarification on where this number came from? Ryan Chapman suggested that the BTSSC include in their comments that the mitigation measures do not go far enough.

Commissioner Ostrom asked about collisions on the causeway and will this project reduce or keep the collision rates the same. Ryan Chapman shared that there is a paragraph in the EIR that the collision rate will not increase, but he stated that he would like Caltrans to better explain this determination with their plan to add an additional lane and limit the shoulder area. He would also like Caltrans to consider collision impacts during both construction and the build out. Commissioner Furillo shared he wants to consider the safety of the bike path. He has seen fence pieces, bumpers, along the pathway. He also noted areas where the path is currently narrowed due to construction. He noted that there is no viable alternative route for bicyclists and the construction is impacting the pathway. 52 cont.

Commissioner Bates shared that most alternatives include adding a travel lane and a toll lane, but asked why there was no option for not adding a travel lane and adding a toll lane.

The BTSSC completed their general comments about the EIR and then created a BTSSC EIR Comment List, see below. The purpose of this list was to share this list with City Council to help draft a letter to Caltrans. Commissioners provided comments on three topic areas in bold.

<u>BTSSC EIR Comment List</u>

Did the EIR have sufficient disclosure and analysis? 53

1. The EIR did not analyze diversion traffic and cut-through traffic. This needs to be included.

2. The National Center for Sustainable transportation calculator was used to model the toll lane alternative, but the calculator guidelines say not to use this calculator for toll lanes. 54

3. Did Caltrans consider choke points and people using cut-through routes? 55

Was the mitigation adequate? 56

1. The mitigation was not adequate related to transit improvements. The proposed mitigation just restores transit services to pre-pandemic levels. Is Caltrans double counting VMT reduction?

DRAFT

2. There are no identified mitigation measures for the bike path during construction. The roadway shoulder is being eliminated during construction, which means that there will be construction impacts adjacent to the pathway. 57

3. The VMT mitigation should be zero or close to zero in accordance with California Air Resource Board. A project of this scope should not be moving forward without VMT mitigation compliance. 58

Do you want to new or modified alternatives?

1. The EIR is insufficient in explaining the primary alternative and alternative 6B with regards to transit. The BTSSC suggests adding a transit connector from Mace to I-80 instead of at I-80/US 50. The transit lane that is proposed on I-80 between I-5 and 80/50 split does not carry buses and there are no proposals for buses on this route. 59

2. There should be an alternative with one lane being a toll lane and no additional lanes being added. 60

Motion (Bates, Furillo): The BTSSC recommends that City Council consider the list of EIR comments and also include the NRC letter with their letter to Caltrans.

Motion carries: 5-0

7. Subcommittee and Liaison Assignment Updates. This item is for brief updates on subcommittee work or reports from commission liaison(s) on meetings attended, if any.

   Commissioner Furillo shared that there was a YoloTD meeting in November and they are considering a new transit center in downtown Woodland. They also discussed detours to Yolo Bus during events, like Kings games and how closing stops and roads is causing significant impacts. YoloTD will be bringing this up with Sacramento City Manager's office. YoloTD also has three openings on their committee. 61

8. Long Range Calendar: Upcoming Meeting Dates and/or Potential Agenda Items

Commissioner Bates requested staff provide the BTSSC with an update on the downtown parking plan. He would like to understand what moved forward since the plan was adopted and what has stalled. Ryan Chapman shared that this item could be added in a couple of months.

Commissioner Ma asked for an update on the G Street Corridor. Jennifer Donofrio provided a short updated that staff will be bringing an item to City Council in January

sharing the results of the survey and asking them to provide recommendations list of infrastructure improvements and parking.

Commissioner Ostrom asked about an update on Spin. Staff will add this request to the calendar.

Public Comment
Two audience members from Yolo County shared that they are working on a taskforce and might bring something to the BTSSC about this work. They provided their contact information to Jennifer Donofrio to follow-up.

61 cont.

Discussion

9. Adjournment.

Motion (Campbell, Furillo): Adjourned at 7:35 p.m. Motion carries, 5-0.

DRAFT

Below Caltrans responds to the 22 comments of City of Davis, and the additional comments included from BTSSC and NRC for consideration.

Response to Comment 1 in 20240112, City of Davis

Thank you for commenting on the Draft EIR/EA. This introductory comment does not discuss the adequacy of the Draft EIR/EA. No changes to the Draft EIR/EA are necessary.

Response to Comment 2 in 20240112, City of Davis

The commenter states that an inaccurate or incomplete project description may render the analysis of significant environmental impacts inherently unreliable. The project description in the Draft EIR/EA provides sufficient detail of the project to allow for a complete environmental review as it includes important information such as the project location, the scope of work, and methodologies for construction of the project. The inclusion of this information in the project description allows for informed decision-making.

Response to Comment 3 in 20240112, City of Davis

The commenter points out that Chapter 1.3.1.1 does not discuss the phasing of the project, and questions whether there is sufficient funding to complete the entire project in one phase. The Draft EIR/EA discloses and analyzes the entirety of the project that would be constructed, as required by CEQA and NEPA. It is not yet known with certainty if or how construction phasing would occur. No changes to the Draft EIR/EA are necessary.

Response to Comment 4 in 20240112, City of Davis

The commenter asks why Caltrans did not analyze as an alternative converting existing general-purpose lanes to a tolling lane or HOT lane. Current State and Federal regulations currently prohibit conversion of a general-purpose lane to a tolled lane. Please refer to Master Response B for information related to project alternatives considered.

Response to Comment 5 in 20240112, City of Davis

The commenter requested Caltrans to conduct an analysis of Project Alternative 6 (transit-only managed lanes) that assumes an increase in transit supply. The transit assumptions used for future year alternative analysis are provided in the TAR, prepared for the project and summarized in the Draft EIR/EA Section 3.2.17, *Transportation*.

TAR section 3.2.1, Future Year Model Development, notes that the roadway network and transit projects included in the SACSIM19 future year scenarios were reviewed within the project study area. The MTP/SCS provides a range for the implementation timing (typically, a five-year range). Based on the project list, a set of projects to be in place by the opening year of 2029 and the horizon year of 2049 was developed. Key roadway network and transit projects included in the future year models are listed in the TAR.

For more details on the existing transit system and ridership forecasts, see the TAR sections 4.5.1, 5.5.1, and 7.4.1. The TAR was prepared for the project and summarized in the Draft

EIR/EA Section 3.2.17, *Transportation*, and was available upon request. The TAR is available on the project website with the Final EIR/EA (https://dot.ca.gov/caltrans-near-me/district-3/d3-projects/d3-i80-corridor-improvements).

Response to Comment 6 in 20240112, City of Davis

Commenter requests the Climate Action and Adaptation (CAAP) of the City of Davis be included in the analysis of consistency with local plans. Caltrans is not required to include the CAAP in the Draft EIR/EA analysis due to the timing of the Davis CAAP adoption (April 2023) and preparation of the project NOP (October 2022). However, since the project is already proposing expanding public transit, developing Transportation Demand Management (TDM), and strengthening regional transit, certain CAAP goals and policies are met. These project measures, summarized in Section 3.2.17 of the Draft EIR/EA, are found in the VMT Mitigation Plan, which proposes to provide financial contributions to such measures as expanding Unitrans and Yolobus Microtransit frequency, enhancing the YoloCommute TDM program to incentivize and educate the public on the benefits of transit, and expanding Causeway Connection Route 138 (and potentially Yolobus Route 42A/B currently under discussion) frequency.

Response to Comment 7 in 20240112, City of Davis

The commenter asks if Caltrans intends to adopt the VMT Reduction Measures as formal mitigation measures and notes they were not included in the table of mitigations in Exhibit. Caltrans will adopt AMM TRANS-1 (the VMT mitigation measures) presented in Section 2.1.10 of the Draft EIR/EA as formal mitigation measures to comply with CEQA regulations. AMM TRANS-1 was inadvertently left out of Appendix C and has been added to Appendix C in the Final EIR/EA and is included in the Environmental Commitment Record. Please refer to Master Response A for responses related to VMT mitigation.

Response to Comment 8 in 20240112, City of Davis

The commenter questions the long-term funding of the VMT mitigation measures. The proposed VMT mitigation measures are fully enforceable and will be legally binding through the execution of Cooperative Agreements with each partner agency receiving financial contributions. The Cooperative Agreements will be executed only upon receipt of sufficient funding, which is anticipated in the Summer of 2024.

Caltrans will enter into Cooperative Agreements with the Joint Powers Authority (JPA) that will be in charge of the tolling facility and toll revenue collection/expenditure. It will be the decision of the JPA to determine the expenditure plan, but a proposed option is to provide any net excess toll revenue (after initial Operation and Maintenance costs are used from toll revenue) towards transit programs within the region and across the corridor.

Finally, Caltrans will adopt a Statement of Overriding Considerations to comply with CEQA requirements, as the project will not be able to feasibly and reasonably mitigate the fully 100% induced VMT. However, as documented in the VMT Mitigation Plan and summarized in Section 4.2.4, *Consultation with Stakeholders for Vehicle Miles Traveled Mitigation* of the Draft EIR/EA, a good faith effort was put forward to mitigate as much as feasibly and reasonably as possible,

to comply with CEQA requirements. Please refer to Master Response A for further responses related to VMT mitigation. Also, please see Response to Comment 11 in 20240112, City of Davis for a more detailed discussion of this topic.

Response to Comment 9 in 20240112, City of Davis

The commenter questions the feasibility of the VMT mitigation since its implementation requires actions of other public agencies. The toll revenue mentioned in the VMT Mitigation Plan and referenced in Table 2.1-27 of the Draft EIR/EA, as ongoing contributions provided for each mitigation measure would not fully mitigate the induced demand. The projected revenue would not be enough to fully mitigate the induced demand, nor would providing funding for the infeasible and rejected mitigation measures from the VMT Mitigation Plan listed in Table 2.1-28 of the Draft EIR/EA.

As mentioned above in Response to Comment 8 in 20240112, City of Davis, the JPA will make the final decision as to where net excess toll revenue will be expended, but the projected figures do not provide sufficient revenue to fully mitigate the entirety of the induced demand to less-than-significant levels. Hence, a Statement of Overriding Considerations will be adopted to comply with CEQA. However, Caltrans is likely to also have a voting seat on the JPA to help determine where net excess toll revenue is expended. Also, please refer to Master Response A for responses related to VMT mitigation.

Response to Comment 10 in 20240112, City of Davis

The commenter asserts the VMT Reduction Measures will be deferred to a later date and not meet CEQA Guideline Section 15126.4. This assertion is inaccurate. There is no plan to defer mitigation or any indication that mitigation will be deferred. As has been discussed with each partner agency receiving mitigation funding, partner agencies will receive the funds and implement the specific measures by completion of project construction and the opening of the project to traffic, fully complying with CEQA requirements. The financial contributions will be provided through a legal binding agreement, in the form of a Cooperative Agreement. The Cooperative Agreement will outline total amount of funding contributed, annual funding contributed, number of years to provide the funding, and specific activities/programs for which the funding will be used. Additionally, the Draft EIR/EA acknowledges that AMM TRANS-1 would not fully mitigate the VMT impacts of the project and that this impact is significant and unavoidable, and Caltrans will adopt a Statement of Overriding Considerations as part of the project approval process. Also, please refer to Master Response A for responses related to VMT mitigation.

Response to Comment 11 in 20240112, City of Davis

The commenter is concerned about the VMT Reduction Measures are insufficient and requests Caltrans review options to further reduce VMT impacts from the project. As previously mentioned in Response to Comment 8 in 20240112, City of Davis, the project will not fully mitigate the induced VMT. Caltrans will adopt a Statement of Overriding Considerations as part of the project approval process.

The Draft EIR/EA includes Table 2.1-28, a table documenting mitigation measures that were analyzed but rejected, with reasoning provided for each measure. Examples of reasons to reject those measures are that there is no plan in a local agency's General Plan to implement such measures, or the cost to implement/construct a measure is infeasible for this project to implement.

Both the chosen mitigation measures and rejected measures were the product of a region-wide solicitation process from August – December 2022, in which Caltrans requested all potential partner agencies in the Yolo-Sacramento region provide projects that are part of their agency General Plan or part of SACOG's 2020 MTP/SCS. Once a list of measures was established from this public outreach, each measure was discussed with Caltrans' traffic engineering consultant, Fehr and Peers, to determine which measures provided the highest VMT reduction at the most feasible and reasonable cost. Also, please refer to Master Response A for responses related to VMT mitigation.

Response to Comment 12 in 20240112, City of Davis

The commenter asks Caltrans to reexamine cost estimates for the Route 42A and 42B. The cost estimate to expand Route 42 A/B has been examined with YoloTD and is revised to a more realistic annual cost to implement the program. Route 42 A/B expansion is included in the updated VMT Mitigation Plan and to AMM TRANS-1 in the Final EIR/EA. Also, please refer to Master Response A for responses related to VMT mitigation.

Response to Comment 13 in 20240112, City of Davis

The commenter requests more detail on the VMT reduction estimates from voluntary trip reduction. After further consultation with partner agencies, the mitigation measures labeled "Subsidize Monthly Transit Passes in Yolo County" and "Reduce Transit Fares" are removed from the Updated VMT mitigation plan and AMM TRANS-1 in the Final EIR/EA. The mitigation measures labeled "Voluntary Trip Reduction Program in Yolo County" and "Expand Capitol Corridor Frequency between Oakland and Sacramento" encompass bus and train fare subsidies, respectively. Therefore, the effectiveness of each fare subsidy is built into the VMT reduction assumptions for the two remaining measures.

Also, please refer to Master Response A for responses related to VMT mitigation.

Response to Comment 14 in 20240112, City of Davis

The commenter proposes consideration of additional bus services from Dixon to Davis and Sacramento. While the Solano Express bus service traverses across Yolo County, it is not a Yolo County focused transit service. The VMT mitigation in the Draft EIR/EA focuses on the project limits pertaining to the induced VMT when analyzing VMT reduction strategies and where to contribute financial investments. Therefore, transit services operated by Yolobus and SacRT were identified as priority services offering VMT reduction within the project limits. Further, the shorter routes between Woodland and Davis is considered as part of the mitigation measure labeled "Microtransit in Yolo County". And as the commenter notes, measures that do not offer substantial VMT mitigation were rejected as one of the analysis factors, hence the

suggestion of the City's latter option would not yield a successful measure. Also, please refer to Master Response A for responses related to VMT mitigation.

Response to Comment 15 in 20240112, City of Davis

The commenter requests Caltrans to reconsider increases to parking as part of mitigation measures. As previously mentioned in Response to Comment 11 in 20240112, City of Davis, Caltrans cannot partner with agencies on projects that are not currently in an approved General Plan or SACOG's 2020 MTP/SCS. Projects must be in an approved local agency plan to prove it is reasonable, feasible, and enforceable to comply with CEQA requirements. Also, please refer to Master Response A for responses related to VMT mitigation.

Response to Comment 16 in 20240112, City of Davis

The commenter requests additional explanation to understand Caltrans' induced demand methodology. Please refer to Master Response A for responses related to induced travel and VMT calculation methodologies.

Response to Comment 17 in 20240112, City of Davis

The commenter requests an evaluation of whether reducing or eliminating the inner shoulder will increase collisions and impacts on local first responders. A Design Standard Decision Document (DSDD) has been signed for the project to document all non-standard features that are included in the project, including less-than-standard shoulders for certain portions of the project where physical limitations exist. Non-standard features documented in a DSDD are included in most transportation projects where physical limitations and existing footprint constraints exist. The DSDD is reviewed by Caltrans Traffic Safety, Traffic Operations, and signed by executive Design staff. Each non-standard feature is taken seriously to ensure the traveling public is not hindered in safety and operations.

Emergency services and first responders will have priority to utilize the managed lane without meeting occupancy requirements, hence providing a freer-flowing option than the general-purpose lanes. Additionally, the project will maintain standard outside shoulders throughout the project limits.

The project design complies with all state and federal guidance, and it is not anticipated to produce adverse safety impacts for travelers on the corridor and will improve overall safety along the corridor. For the alternatives that reduce congestion, Highway Safety Manual (AASHTO, 2014) equations that predict the safety performance of freeways show that reducing congestion is associated with lower collision frequency per lane for the most frequent collision types within the project limits. As a result, these alternatives would be expected to lower the collision rate.

In addition, the build alternatives make several improvements which will lead to increased safety outcomes, including adding ramp meters, auxiliary lanes, ITS elements that improve incident response time, improved concrete median barrier, and added CCTVs and changeable message signs. Ramp meters will facilitate safer and easier merging and can reduce collisions by 14%,

while auxiliary lanes improve weaving conflicts and can reduce collisions by 21%. ITS elements like CCTVs and CMS's assist in incident monitoring, identification, verification, and provide important traveler information, all of which help reduce incident response and clearance time while reducing secondary collisions.

Response to Comment 18 in 20240112, City of Davis

The commenter requests analysis of increased collision risks during construction. The Draft EIR/EA does not analyze stage construction methodology, as stage construction is determined after completion of the Final EIR/EA and during the design phase. However, the project team will evaluate this incident response data and take appropriate measures during the stage construction design development. As described in Standard Measure TT-3, *Transportation Management Plan*, in the Draft EIR/EA, coordination with local agencies and emergency services will take place for any planned closures that reduce mobility longer than typical construction closures.

Response to Comment 19 in 20240112, City of Davis

The commenter questions whether induced travel impacts were fully analyzed for GHG and air quality impacts. The commenter incorrectly states that the GHG analysis does not account for induced VMT. As discussed in Master Response D, the SACSIM19 model was used to conduct travel demand modeling. SACSIM19 accounts for any changes in departure time and related VMT effects resulting from implementation of the project and future transportation investments in the six-county SACOG region. Thus, the VMT used to support the GHG analysis is not underestimated and was developed using travel forecasting and modeling techniques conforming to existing standards, guidance, policies, and best practices. See also Master Response A, Induced Travel and VMT calculation methodologies.

Response to Comment 20 in 20240112, City of Davis

The commenter requests more detail on the project's consistency with California's reduction goals of GHG of 40% (below 1990 levels) by 2030, and of 85% by 2050 (2022 Scoping Plan, ARB). Caltrans' criteria for determining significance of GHG emissions is whether or not the project *contributes* to overall state reduction goals. A project that results in less GHG emissions compared to existing can be considered to have a less than significant impact. Consistency with the 2022 Scoping Plan and other plans and policies for the reduction of GHG emissions is assessed in Section 3.2.8, *Greenhouse Gases*. Importantly, no single project is expected to achieve the same percent reduction as the goals stated in various policies. As noted in the impact analysis, GHG emissions for the Build Alternatives would be lower for design year 2049 compared to existing year (see Table 3.4-2). Therefore, the project supports the state's long-term climate change goals and plans, including the 2022 Scoping Plan.

Please refer to Master Response I for response related to air quality and GHG analysis methods.

Response to Comment 21 in 20240112, City of Davis

The commenter requests Caltrans to consider OPR's 2015 report identifying a 50% reduction in petroleum in cars and trucks by 2030 as a key goal to reduce GHG. Caltrans strives to ensure that projects contribute to statewide GHG reduction goals to the extent feasible while meeting project purpose and need. The project is not inconsistent between project impacts and state goals as the project contributes to overall state reduction goals by reducing GHG emissions. As stated in the Draft EIR/EA (3.4.5 *CEQA Conclusion*), "…as projected under the 20-year horizon design assumptions (2049), GHG emissions were estimated to decrease for the Build Alternatives as compared to conditions under 2029."

Response to Comment 22 in 20240112, City of Davis

The commenter expressed appreciation that due to technical snafus providing VMT analysis on the website, the public comment period was extended. As the commenter states, Caltrans extended the review period an additional 7 days from the previously announced 53-day review period. The review period was initially given an extra 8 days from the CEQA required 45-day review period due to the holiday season. Due to multiple requests to extend the review period from 53 days, Caltrans extended to 60 days, which is 15 days more than required by law. Further, the project website stated that technical documents were available upon request.

Response to Comment 23 in 20240112, City of Davis

The commenter states in Section 2.1.10.7 there is a proposal for adding Class II bike lanes to County Road 32A. When this is designed the commenter requests that a safe crossing to access Class I bikeway be developed for cyclists to use.

The Class II bike path on County Road (CR) 32A is no longer included as part of the project and was incorrectly included in the Draft EIR/EA. There is no bike path work or shoulder widening proposed on or adjacent to CR 32A. Section 2.1.10.7 of the Draft EIR/EA discusses extending the existing Class I bicycle pathway along the Causeway to connect at the westbound CR 32A offramp.

Further bicycle facility discussions can be had with local agencies and stakeholders as design progresses or as separate, locally-lead projects. Also, please refer to Master Response F for responses related to bicycle and pedestrian improvements.

Response to Comment 24 in 20240112, City of Davis

The commenter notes that Table 1.3-3 refers to "Olive Hill Lane" and "Olive Hill Road" instead of Olive Drive. This typographical error is corrected in the Final EIR/EA.

Response to Comment 25 in 20240112, City of Davis

The commenter states that comments from the Bicycling, Transportation, and Street Safety Commission (BTSSC) and the Natural Resources Commission were included as an attachment. Comments from these commissions were addressed in Responses to Comments 27-49 in 20240112, City of Davis.

Response to Comment 26 in 20240112, City of Davis

The commenter states that if any requested analysis or comments noted from the City of Davis trigger a recirculation of the Draft EIR/EA, that the document would be recirculated as required by CEQA.

Comments from the City of Davis have been addressed, please see Response to Comments 1-25 in 20240112, City of Davis.

Response to Comment 27 in 20240112, City of Davis

The commenter shares the Commission's unanimous motion to recommend all comments at the NRC meeting to the City Council. Caltrans acknowledges said motion.

Response to Comment 28 in 20240112, City of Davis

This is a statement regarding stormwater impacts, acknowledging that they would not be significant, and noting that additional comments are not required from the NRC.

Response to Comment 29 in 20240112, City of Davis

Commenter notes construction emissions would exceed Yolo and Sacramento air quality standards, but that neither district has jurisdiction over Caltrans. As most air district thresholds have not been established by regulation or by delegation from a federal or state agency with regulatory authority over Caltrans, Caltrans is not required to adopt those standard levels in Caltrans' documents. (CEQA Guidelines Sections 15064(b)(2), 15064.7(b).) Thus, the SMAQMD and YSAQMD standard levels are provided for reference only.

Construction-related air quality impacts are discussed in Chapter 6 of the Air Quality Report located in Appendix J of the Draft EIR/EA. Construction impacts on air quality are evaluated based on existing/baseline conditions and include compliance with control measures. Caltrans considers projects that do not implement Caltrans Standard Specifications may result in short-term air quality impacts. Emissions from construction-related activities are considered temporary as defined in 40 CFR 93.123(c)(5).Section 2.2.6 *Air Quality* of the Draft EIR/EA discusses compliance with SMAQMD rules and regulations.

Appendix E of the Draft EIR/EA also lists air quality and GHG Standard Measures that will be implemented as part of the project. Caltrans special provisions and standard specifications include the requirement to minimize or eliminate dust through application of water or dust palliatives. The construction dust and equipment exhaust emissions measures will be implemented when practical, during all phases of construction work:

Response to Comment 30 in 20240112, City of Davis

The commenter states that "alternatives do result in changes to operational emissions and that the managed lane direct connector appears to increase emissions, but this may not be true in every case." Operational emissions are discussed in Section 2.2.6 *Air Quality*. Based on the operational period emission data in Table 2.2-10 in Section 2.2.6 Air Quality, the magnitude of

the emissions estimates for each of the Build Alternatives is very similar (i.e., within 10%). Project implementation will include Standard Measures GHG-1 through GHG-6 (listed in Appendix E), which would minimize emissions associated with construction activities.

Response to Comment 31 in 20240112, City of Davis

The commenter states that the no build scenario will increase emissions. This is documented in the Draft EIR/EA, Section 2.2.6.3, *Environmental Consequences*. The commenter does not discuss the adequacy of the Draft EIR/EA.

Response to Comment 32 in 20240112, City of Davis

The commenter claims the GHG reductions presented in the EIR/EA are in opposition to the VMT findings for the project. An increase in project-level VMT thus does not immediately constitute a significant GHG impact, as suggested by the commenter.

Please refer to Response to Comment 7 in 20240110, California Air Resources Board and *Response to Comment 12 in 20240111, Center for Biological Diversity* for additional discussion.

Response to Comment 33 in 20240112, City of Davis

The commenter asks if the air quality and GHG analyses account for induced VMT. As discussed in Master Response D, the SACSIM19 model was used to conduct travel demand modeling, and this model accounts for changes in departure time and related VMT effects resulting from implementation of the project and future transportation investments in the six-county SACOG region. The quoted text from the commenter is in relation to the CT-EMFAC model, which is an emissions forecasting tool. Please refer to Response to Comment 5 in 20240112, John Johntson for additional discussion. See also Master Response A for information related to induced travel and VMT calculation methodologies.

Response to Comment 34 in 20240112, City of Davis

As in Comment 24 above, the commenter notes that Table 1.3-3 refers to "Olive Hill Lane" and “Olive Hill Road” instead of Olive Drive. This typographical error is corrected in the Final EIR/EA.

Response to Comment 35 in 20240112, City of Davis

The commenter states that the Noise analysis in the Draft EIR/EA is adequate and has no comment. No changes to the Draft EIR/EA are necessary.

Response to Comment 36 in 20240112, City of Davis

The commentor states the relationship between the project and its role in the I-80 Comprehensive Multimodal Corridor Plan (CMCP) needs to be described as the goals to assure the public this project is consistent with CMCP.

The proposed managed lane work on I-80 for this project is discussed in the "Solano/Yolo/Sacramento I-80 Comprehensive Multimodal Corridor Plan" (CMCP, dated January 2023) as one of over two hundred I-80 corridor improvement projects proposed to improve corridor operations, increase travel choices, and close gaps in the existing multimodal transportation system. CMCP includes these segments within our project limits: Segment 6: I-80 from Sol/Yolo County Line to US 50; Segment 7: I-80 from 50/80 Split to West El Camino; and Segment 9: US 50/I-80 Interchange to I-5/ US 50 Interchange. This project will also meet some of the CMCP goals to improve freeway travel time reliability, help close the gaps in Transportation Operation Systems (TOS) elements, by adding Ramp Metering, Vehicle Detection Sites, Closed-Circuit Television Cameras and Changeable Message Signs. The Mobility Hub proposed on this project is also mentioned in the CMCP and that it will help improve access and connections to existing and future multimodal (bus, bike and pedestrian) transportation or Mobility Hubs. *Solano/Yolo/Sacramento I-80 Comprehensive Multimodal Corridor Plan" (CMCP, January 2023)*

Consistency with regional and local plans and programs is discussed in Section 2.1.2 of the Draft EIR/EA.

Response to Comment 37 in 20240112, City of Davis

Commenter questions whether environmentally superior alternative was identified, and if not, why the preferred alternative was chosen over the environmentally superior one. Table S-1 Comparison of Alternatives-Impacts Summary (NEPA) and Table S-2 Summary of CEQA Impacts, located in the Summary section of the Draft EIR/EA, compared project alternatives and their impacts. All the alternatives presented have similar impacts and a particular alternative does not stand out as the environmentally superior alternative. However, Alternative 4b. would involve adding a high-occupancy toll lane in each direction for free use by vehicles with three or more riders (HOT 3+) and would build an I-80 managed lane direct connector. Vehicles with less than three riders would pay a fee for lane usage. As Alternative 4b. would encourage carpooling and transit use, the environmentally superior alternative would be identified as Alternative 4b.

Response to Comment 38 in 20240112, City of Davis

The commenter paraphrases information from the Draft EIR/EA related to the project VMT and GHG analyses. The statements do not discuss the adequacy of the EIR/EA.

Response to Comment 39 in 20240112, City of Davis

The commenter claims the GHG analysis does not account for induced VMT. This is incorrect. Please see Response to Comment 33 in 20240112, City of Davis and Response to Comment 5 in 20240112, John Johntson for additional discussion. See also Master Response A for responses related to induced travel and VMT calculation methodologies

Response to Comment 40 in 20240112, City of Davis

The commenter questions why state laws and executive orders, described in Section 3.4.1.2 are not policies applicable to the project. No single project is expected to achieve the same percent reduction as the goals stated in various policies. Caltrans' criteria for determining significance of greenhouse gas emissions is whether or not the project *contributes* to overall state reduction goals. A project that results in less GHG emissions compared to existing can be considered to have a less than significant impact. Please refer Response to Comment 20 in 20240112, City of Davis for additional discussion.

See also Master Response I for response related to air quality and GHG analysis methods.

Response to Comment 41 in 20240112, City of Davis

The commenter asserts that there is inconsistency between the OPR's goals and the project's impacts, and questions why this was not highlighted in the Draft EIR/EA even if the OPR goals are not legally binding. The Draft EIR/EA's argument that there is no applicable threshold of significance for GHGs is based on the current regulatory framework. While state laws and executive orders express the intent of the state government, they do not necessarily constitute a "policy" in the technical sense that can be enforced on individual projects.

The project's GHG reductions, while modest, are in line with the overall trend of decreasing emissions. It's important to note that achieving state goals is a collective effort that involves numerous projects and initiatives, not just a single project.

The Draft EIR/EA does acknowledge the state's goal of a 50% reduction in petroleum use in cars and trucks by 2030, and that the projected gasoline use by vehicles associated with this project is within the range of -13 to +11% in 2029 and -21 to +0.4% in 2049, depending on the alternative. This range reflects the uncertainty inherent in such long-term projections and the influence of factors beyond the control of this project and beyond the control of Caltrans.

Assembly Bill 1279 (AB 1279) establishes the policy of the State to achieve carbon neutrality as soon as possible, but no later than 2045, and maintain net negative greenhouse gas emissions thereafter. The California Air Resources Board's (CARB) 2022 Scoping Plan lays out a path to achieve these targets.

While these are significant steps towards addressing climate change, they represent broad state-level goals and are not directly enforceable on individual projects. The Draft EIR/EA acknowledges these goals and incorporates them into its analysis where applicable. However, it's important to remember that the achievement of these goals requires a collective effort from all sectors of the economy, not just individual projects.

As stated in the Draft EIR/EA (3.4.5 *CEQA Conclusion*), "…as projected under the 20-year horizon design assumptions (2049), GHG emissions were estimated to decrease for the Build Alternatives as compared to conditions under 2029." As GHG emissions are expected to decrease over the long-term operational use, the project complies with state goals. Standard measures that help reduce project GHG emissions are listed in Appendix E of the Draft EIR/EA.

Response to Comment 42 in 20240112, City of Davis

The commenter asserts three actions are double-counted for mitigation reduction. After further consultation with partner agencies, the mitigation measures labeled “Subsidize Monthly Transit Passes in Yolo County” and “Reduce Transit Fares” are removed from Mitigation Measure TRANS-1 and Table 2.1-27 in the Final EIR/EA and in the updated VMT mitigation plan. The measures labeled “Voluntary Trip Reduction Program in Yolo County” and “Expand Capitol Corridor Frequency between Oakland and Sacramento” encompass bus and train fare subsidies, respectively. Therefore, the effectiveness of each fare subsidy is built into the VMT reduction assumptions for the two remaining measures. Please refer to Master Response A for responses related to VMT mitigation.

Response to Comment 43 in 20240112, City of Davis

The commenter asks for reexamination of expanding Yolobus Route 42. Please refer to Master Response A for responses related to VMT mitigation and Response to Comment 12 in 20240112, City of Davis.

Response to Comment 44 in 20240112, City of Davis

Commenter suggests promoting more regional transit services from Dixon to Davis to Sacramento. Please refer to Master Response A for responses related to VMT mitigation and Response to Comment 14 in 20240112, City of Davis.

Response to Comment 45 in 20240112, City of Davis

The commenter asserts Caltrans is claiming the Nishi overpass as mitigation. The Nishi overpass has been removed as a measure for VMT mitigation after further consultation with the partner agencies involved. Rather, Caltrans will contribute to a bike path project that offers VMT reduction. This revision is shown in changes to Measure Measures TRANS-1 in the Final EIR/EA and in the Final VMT mitigation plan. Please refer to Master Response A for responses related to VMT mitigation.

Response to Comment 46 in 20240112, City of Davis

As the commenter states, parking prices increases would reduce VMT, however this option remains infeasible. Please refer to Master Response A for responses related to VMT mitigation.

Response to Comment 47 in 20240112, City of Davis

The commenter questions whether the VMT reduction package is adequate. Please refer to Master Response A for responses related to VMT mitigation.

Response to Comment 48 in 20240112, City of Davis

The commenter questions the project’s consistency with local plans. Please refer to response to comment 6 in 20240112, City of Davis.

Response to Comment 49 in 20240112, City of Davis

The commenter suggested that the Draft EIR/EA include a specific analysis on “cut-through” traffic in the City of Davis. This was addressed in a separate analysis but is outside the scope of the analysis of the Draft EIR/EA. The analysis found that conditions at local interchanges often used as a part of typical cut-through routes improve with the add-a-lane alternative of the project on an overall basis.

The project aims to reduce cut-through traffic within the City of Davis by providing a more reliable, direct route between Davis and West Sacramento. Encouraging drivers of regional trips to remain on the freeway will leave surface streets available to those making local trips in the modes available to them. Drivers using off-ramps in Davis will be using them to access land uses in Davis, instead of accessing local roads to avoid congestion on I-80. No changes to the Draft EIR/EA are necessary.

Response to Comment 50 in 20240112, City of Davis

Comment numbers 50 to 61 are from the City of Davis meeting minutes and not direct comments on the Draft EIR/EA. The meeting minutes include their discussion on the proposed project and how to proceed with commenting on the Draft EIR/EA.

The discussion included time extension request, issues accessing the documents, availability of the documents, sufficient disclosure and analysis, adequate mitigation, proposed alternatives, preferred alternative selection, phasing, funding, local traffic impacts and bicycle facilities during and after construction (see City of Davis response to comment 57).

Caltrans extended the initial comment period beyond the holidays to January 5, 2024. Caltrans subsequently extended the public circulation and comment period again to January 12, 2024.

Response to Comment 51 in 20240112, City of Davis

This is a public comment by Alan Hirsch recommending a recirculation of the Draft EIR/EA due to the EIR/EA not being available at the library and it being challenging to access the technical studies. Technical studies listed in Appendix H to the Draft EIR/EA were made available upon request as indicated on the Caltrans website. Draft EIR/EA appendices were available for download on the State Clearinghouse website. Additionally, hard copies of the Draft EIR/EA were delivered to the Yolo County Library on December 5th, 2023, and the West Sacramento Library on December 6, 2023. CEQA does not require that all technical studies be available at public libraries during the public comment period. There is no need to recirculate the EIR/EA.

Response to Comment 52 in 20240112, City of Davis

Commissioners discussed that more be done to improve transit and questioned the VMT mitigation measures. Please refer to Master Response A and Master Response H for responses related to induced travel, VMT calculation methodologies, VMT mitigation, and auxiliary lane improvements. Also, see Response to Comment 17 in 20240112, City of Davis for information related to this comment.

The commenter suggested an alternative in which an existing lane would be converted to toll. Master Reponses B addresses this potential alternative's potential impacts related to diversion, freight mobility, implementation feasibility, and trip length. Due to these factors, this alternative would not meet the project's purpose and need. No changes to the Draft EIR/EA are necessary.

Response to Comment 53 in 20240112, City of Davis

This comment asked for analysis of diversion traffic and cut-through traffic. Please refer to Response to Comment 49 in 20240112, City of Davis for information regarding cut-through traffic analysis.

Response to Comment 54 in 20240112, City of Davis

This comment noted the NCST calculator guidelines do not address toll lanes. Please refer to Master Response A for responses related to induced travel and VMT calculation methodologies.

Response to Comment 55 in 20240112, City of Davis

This comment asked whether Caltrans considered choke points and people using cut-through routes. Please refer to Response to Comment 49 in 20240112, City of Davis for information regarding cut-through traffic analysis.

Response to Comment 56 in 20240112, City of Davis

This comment questioned the adequacy of the mitigation related to transit improvements. Please refer to Master Response A for responses related to VMT mitigation.

Response to Comment 57 in 20240112, City of Davis

The commenter references impacts to the existing bike lane during construction. Stage construction plans have not been developed for the project. Once plans have been developed, notifications of potential long-term closures will be sent to allied agencies and the traveling public. Standard measure TT-1 has been incorporated into the project and is listed in Appendix E of the Draft EIR/EA. Standard measure TT-1 requires pedestrian and bicycle access to be maintained during construction. No changes to the Draft EIR/EA are necessary.

Response to Comment 58 in 20240112, City of Davis

This comment asserted under CARB the VMT mitigation should be zero or close to zero. Please refer to Master Response A for responses related to VMT mitigation.

Response to Comment 59 in 20240112, City of Davis

The commenter suggests an alternative that would add a transit connector to Mace Boulevard in lieu of adding a connector at the I-80/US 50 interchange. The proposed connector at the I-80/US 50 interchange provides significant regional benefits including improving freight mobility and enhancing operations by improving weaving. The I-80/US 50 interchange connector would be a critical part of meeting the project's purpose and the proposed alternative would eliminate

that scope. The proposed alternative would not meet the project's purpose and need. For more information on alternatives please see Master Response B. No changes to the Draft EIR/EA are necessary.

Response to Comment 60 in 20240112, City of Davis

This comment asserted there should be an alternative with one lane being toll lane and no additional lanes added. Please see Response to Comment 52 in 20240112, City of Davis for information related to this comment.

Response to Comment 61 in 20240112, City of Davis

This comment documents the City Council's unanimous decision to submit comments to and attach the NRC letter. The comment also includes closing meeting minutes and agenda items for their next meeting.

20240112, Sacramento Metropolitan Air Quality Management District

SACRAMENTO METROPOLITAN AIR QUALITY MANAGEMENT DISTRICT

January 12, 2024

Masum Patwary, Environmental Planner
Caltrans, 703 B Street, Marysville, CA 95901
Yolo80Corridor@dot.ca.gov

Subject: **I-80 Corridor Improvement Project Draft Environmental Impact Report**
State Clearinghouse # 2021060117

Dear Masum Patwary:

Thank you for providing the Sacramento Metropolitan Air Quality Management District (Sac Metro Air District) with the opportunity to review the Draft Environmental Impact Report (EIR) under the California Environmental Quality Act (CEQA) for the proposed I-80 Corridor Improvement Project. This project consists of roadway improvements including managed lanes, pedestrian and bicycle facilities, and Intelligent Transportation System elements along Interstate 80 (I-80) and United States Route 50 (US-50) in the counties of Sacramento, Yolo, and Solano. Please accept our comments on air quality and climate considerations for CEQA review, consistent with methods recommended in our Guide to Air Quality Assessment in Sacramento County (CEQA Guide), available on our website. 1

Air Quality
We were unable to find the following elements of CEQA air quality analysis in the Draft EIR: (1) quantification of operational emissions of reactive organic gases (ROG) or oxides of nitrogen (NOx); (2) evaluation of construction emissions against a threshold of significance; (3) air quality modeling runs with clear, consistent numeric correspondence to the emissions tables in the Draft EIR text. As an example of the third point, the Draft EIR text cites Caltrans' CAL-CET2021 as the source of construction emissions projections in Table 2.2-8; however, the construction emissions model run in the appendix is for the Road Construction Emissions Model, a model that is not referenced in the Draft EIR text. 2

- Sac Metro Air District recommends that the Final EIR include a quantification of ROG, NOx, and Particulate Matter (PM) emissions for project operations and a quantification of NOx and PM emissions for project construction, and evaluate all project emissions against the applicable air quality management district threshold of significance. We recommend that a final EIR support these emissions projections with air quality modeling runs that are cited clearly in the Draft EIR text's quantification tables, and have clear, consistent numeric correspondence to the projections.

- Sac Metro Air District recommends use of the CalEEMod linear construction module to quantify construction emissions. 3

AirQuality.org

- Sac Metro Air District recommends that the Final EIR include our Basic Construction Emission Control Practices (BCECP), available on our website, as mitigation for construction emissions. Please note that all projects undergoing CEQA review must implement the BCECP to use our non-zero PM CEQA thresholds of significance. Without incorporating the BCECP, any project construction PM emissions will have significant environmental impacts in Sacramento County. 3 cont.

- We maintain the recommendation, from our comments on the EIR Notice of Preparation, that the EIR include an analysis of health effects that may result from project emissions, pursuant to the "Friant Ranch" decision. In December 2018 the California Supreme Court issued a decision in the Sierra Club v. County of Fresno case regarding the "Friant Ranch" project ((2018) 6 Cal. 5th 502). The Court determined that CEQA air quality analysis must include a reasonable effort to connect a project's air quality impacts to likely health consequences or explain in meaningful detail why it is not feasible to do so. To analyze health effects pursuant to the Friant Ranch decision, consult Sac Metro Air District's Guidance to Address the Friant Ranch Ruling for CEQA Projects in the Sac Metro Air District. 4

Public Exposure to Substantial Pollutant Concentrations

The Draft EIR claims that the project's exposure of sensitive receptors to substantial pollutant concentrations will be less than significant because "There are a limited number of receptors within 500 feet of the project footprint," and "The project would not change the traffic mix and would not move major roadways closer to sensitive receptors. Additionally, all Build Alternatives would improve traffic operations and efficiency, which would help to reduce pollutant emissions."

5

Please note that Draft EIR Figure 1.3-1 (above) shows project boundaries near dozens of homes in Sacramento County, and one of the project mitigation measures is to build an overcrossing at the Nishi

Student Housing Development site which is adjacent to the project in Yolo County. These are examples of sensitive receptors within 500 feet of the project footprint. Moreover, the project uses shoulder space at the outer edge of the existing roadway area to accommodate proposed managed lanes, thereby decreasing space between emitting motor vehicles and sensitive receptors such as residences. 5 cont.

Project analysis indicates that "The project would not substantially increase the percentage of trucks traveling along I-80 of the project limits, and local truck emissions may in fact decrease in future analysis years 2029 and 2049 due to penetration of electric heavy duty trucks." The project will induce truck trips, for example according to Table 2.1-26. Further, electric truck penetration is not a basis of comparison between no-build and build alternatives because it applies regardless of whether the project is built. 6

Draft EIR Table 2.2-12 shows operational emissions of Deisel PM, a Toxic Air Contaminant, that are greatly reduced from existing conditions, but with some increases over the "No Build" alternative. However, Table 2.2-12 is not labeled for units of measurement, and no corresponding model run is provided. We could not find quantification for construction emissions specific to Deisel PM.

- Sac Metro Air District recommends that the Final EIR include a quantification of Deisel PM emissions and associated concentrations for both project construction and operations, with units of measurement clearly labeled, and supplement this quantification with model runs and clearly defined assumptions about electric truck penetration. We further recommend use of Office of Environmental Health Hazard Assessment guidance to quantify the health risk that these emissions pose to nearby sensitive receptors, and a determination of the significance of health risk impacts. 7

Greenhouse Gas Emissions

The Draft EIR claims that project operational greenhouse gas (GHG) emission impacts will be less than significant because "GHG emissions were estimated to decrease for the Build Alternatives as compared to conditions under 2029, which is attributed to newer more fuel-efficient fleets and the increase in electric vehicles by the year 2049. The project does not conflict with any applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs." 8

The Draft EIR's operational emissions quantifications are not consistent, and no model run is provided. Numbers in Table 3.4-2 of the Draft EIR text do not correspond with Table 7 of the Air Quality Report in the appendices. Operational emissions are not evaluated against a threshold of significance. We could not find a quantification of construction emissions in the Draft EIR text.

This project induces motor vehicle miles traveled (VMT) as noted in the Draft EIR transportation analysis, and as such does not support GHG reduction targets established for the California Global Warming Solutions Acts of 2006 and 2016 (AB 32 and SB 32). As discussed in the "Transportation and Vehicle Miles Traveled" section herein, emissions reduction plans for AB 32 and SB 32 stipulate VMT reductions, because fuel and vehicle efficiencies alone cannot achieve the targets under necessary timelines. The Draft EIR text does not clarify why the project is consistent with applicable plans despite inducing VMT. 9

- Sac Metro Air District recommends that the Final EIR include a quantification of GHG emissions for project construction and operations, and evaluate all emissions projections against a

threshold of significance. This threshold should consider California GHG reduction targets pursuant to Global Warming Solutions Acts. We recommend that a final EIR support these projections with air quality modeling runs that are cited clearly in tables in Draft EIR text, and that have clear, consistent numeric correspondence to the projections. 9 cont.

- We recommend that the Final EIR clearly explain why the project is consistent with the California Global Warming Solutions Acts despite inducing VMT, mitigating GHG emissions accordingly if there is no clear basis for this claim of consistency.

The Draft EIR references mitigation measures for GHG emissions impacts including "GHG-1: Comply with local regulations, GHG-2: Idling restrictions, GHG-3: Comply with CARB regulations, GHG-4: Use of a TMP, GHG-5: Revegetation, GHG-6: Maintain pedestrian and bicycle access." Please note that compliance with existing regulations is not a mitigation measure; it is a legal requirement. Further, measures such as "idling restrictions" and "pedestrian and bicycle access" are not specifically defined and quantified, and there is no implementation responsibility assigned to them. 10

- Sac Metro Air District recommends that the Final EIR include specific, clearly enforceable GHG mitigation, with quantified emissions reductions to the full extent possible, that does not overlap with existing regulations, and is generally consistent with CEQA Statute and Guidelines.

Transportation and Vehicle Miles Traveled

Proper analysis of project vehicle miles traveled (VMT), including induced VMT, is critical to proper assessment of project GHG emissions impacts. The California Global Warming Solutions Acts of 2006 and 2016 ultimately aim to reduce GHG emissions to 40% below the 1990 levels by 2030, and California's Mobile Source Strategy sets VMT reduction goals to meet this aim. Fuel and vehicle efficiencies alone cannot achieve the reduction targets under the necessary timelines, and VMT reductions are necessary. The 2020 Mobile Source Strategy sets a goal "to reduce light-duty VMT by 15 percent by 2050 compared to business as usual."

Table 2.1-26 in the Draft EIR text indicates that induced VMT is the same for the all the add-a-lane project alternatives except the alternative to add a transit lane; it indicates that the "Express Lanes" alternative (Alternative 5) would induce as much VMT as high occupancy vehicle (HOV) and high occupancy toll (HOT) lanes. The Draft EIR text indicates that these projections come from the California Induced Travel Calculator from the National Center for Sustainable Transportation (NCST). 11

The NCST calculator website indicates that "The Calculator is limited to use for capacity expansions (lane additions, roadway lengthening, and new facility construction)," although Table 2.1-26 (and corresponding Table 1 in the project consultant's November 16, 2023 VMT mitigation memo) indicates that the project alternative to *convert* an existing general purpose lane to HOV (Alternative 7), rather than add a HOV lane, would induce VMT. No source is cited for this calculation outside of the NCST calculator.

Further, the NCST calculator website also indicates that the calculator "should not be used to estimate induced VMT from additions of pure toll lanes without supplemental analysis." It is therefore unclear why the Express Lanes alternative is listed as having the same amount of VMT as the HOV and HOT add-a-lane alternatives, without evident supplemental analysis documented. The NCST calculator website

further indicates that "available empirical evidence suggests that new HOV and HOT lanes might have similar induced travel effects as general-purpose lane expansions."

It is important to note that, according to the Draft EIR text, among common design features of the project alternatives that add managed lanes, "The lanes have flexibility to be used by different types of vehicles, depending on the need, and can be actively managed to accommodate peak travel demands." Further, the project alternative allowing two or more users in a HOV lane (HOV 2+) (Alternative 2) would "operate only during peak commute hours." Outside of peak hours, presumably these lanes would be added general purpose lanes.

- Sac Metro Air District recommends added documentation for the induced VMT projections in the Draft EIR text, including supplemental analysis for the Express Lane alternative (Alternative 5) and the source of information for induced VMT in the lane conversion alternative (Alternative 7).

11 cont.

Table 2.1-25 evaluates project alternatives according to criteria including "Regional VMT." It gives the highest rating for Regional VMT to the Express Lane alternative (Alternative 5), and the second highest rating to the lane conversion alternative (Alternative 7). According to Table 2.1-26, Alternative 5 induces more VMT than Alternative 7. The Table 2.1-25 evaluation criteria are not clearly described in the Draft EIR text.

- Sac Metro Air District recommends added information on the Table 2.1-25 evaluation criteria, for example the definition of "Regional VMT" that seemingly excludes induced VMT, and an exact definition of "Corridor PMT."

12

The Draft EIR text repeatedly claims that "reduced travel time" and "improved traffic flow" are a benefit of added roadway capacity (added lanes and roadway widening), without discussing the negating effect of induced VMT on the travel time and flow. Due to induced VMT associated with added roadway capacity, travel time reductions and improved flow may ultimately be counteracted by added VMT, creating possible incentive to add more capacity, a potentially on-going and unsustainable accommodation.

- Sac Metro Air District recommends that the Final EIR provide clear public disclosure of the impacts of induced VMT on travel times and traffic flow, and clarify that the benefits of added roadway capacity may be temporary due to induced VMT. We recommend clarifying that adding roadway capacity to improve travel times and traffic flow has strong potential to create further congestion in the future.

13

TRANS-1, the VMT mitigation measure, only mitigates 43% of induced VMT. Other mitigation is not found to be reasonable or feasible, and the remaining induced VMT is found to be a significant, unavoidable environmental impact. The project alternatives assumed in the determination that TRANS-1 mitigates only 43% of induced VMT were Alternatives 2 through 5. According to the Draft EIR, TRANS-1 "would be sufficient to fully offset only the alternatives that would convert an existing lane to an HOV-only lane (Alternatives 7a and 7b)."

- Sac Metro Air District contends that if the project alternatives with the lowest VMT (for example Alternative 7 and Alternative 5 pending further analysis and information) are not selected for implementation, then a final EIR should explain why they are not selected and therefore why

14

most of the project's induced VMT is an unavoidable impact. It should clearly delineate why rejected alternatives do not meet project objectives. If they are not selected due to factors such as travel time and traffic flow, then the explanation should document projections of how each alternative would accommodate improved travel times and traffic flow over time, given the impacts of induced VMT. 14 cont.

Alternatives Analysis
CEQA review must include a reasonable range of alternatives to a proposed project that could feasibly attain most of the basic project objectives, and would avoid or substantially lessen any of the proposed project's significant effects. Evidence suggests that HOT lanes operating in tandem have strong potential to maximize managed lane use and alleviate motor vehicle congestion. Further, the Sacramento Area Council of Governments submitted a proposal to the California Air Resources Board to maintain its requirements under California's Sustainable Communities and Climate Protection Act (SB 375), which includes a designation for "Multilane Express Lane during Peak Periods" in the project area. 15

- Sac Metro Air District recommends analysis of the following project alternatives in the Final EIR:
  - Consistent with our letter on the first Notice of Preparation for the EIR, an alternative with two HOT lanes in each direction, including one that uses an existing lane.
  - An alternative with a multilane express lane during peak periods.

Pedestrian / Bicycle Facilities
Sac Metro Air District has contracted with staff from Sacramento's Civic Thread for recommendations on project active transportation facilities. Their recommendations address safety and comfort concerns about the existing multi-modal path in the project area and are attached. 16

The referenced November 16, 2023 VMT mitigation memo indicates that "The enhancement of the existing [bicycle and pedestrian] connection may encourage additional bicycle and pedestrian trips. However, VMT reduction has been found only for new bicycle and pedestrian connections, not for simply enhancement of existing connections." The California Climate Investments report Quantifying Reductions in Vehicle Miles Traveled from New Bike Paths, Lanes, and Cycle Tracks, prepared by scholars at the University of California at Davis's Institute of Transportation Studies, summarizes outcomes from a literature review on emerging data and methods for estimating VMT from new bicycle facilities. While it assesses new facilities rather than enhancements to existing facilities, it does suggest substitution rates for determining what percent of bicycle trips on a given facility are not simply added bicycle trips but instead replace motor vehicle trips.

If the current bicycle facilities are not being fully utilized because they are unpleasant and perceived as unsafe, for example due to confusing or incomplete connections with a history of damaging bicycle accidents as noted in the attached Civic Thread report, then their ability to divert motor vehicle trips to bicycle trips is compromised. The project's induced VMT will further exacerbate this situation with added speeding motor vehicles in proximity to bicyclists. 17

Moreover, major Caltrans improvement projects affecting Sacramento have resulted in increased collisions and congestion during the construction period, as reported by the Sacramento Bee for US 50[1] 18

[1] Lange, Ariane and Reese, Phillip. *More death, more traffic. How Highway 50 construction in Sacramento went horribly wrong.* Sacramento Bee. November 3, 2023. https://www.sacbee.com/news/local/article280083809.html

and by KCRA3 for the Yolo Causeway.[2] Increased collisions and congestion may cause motorists to seek nearby parallel routes, which also serve as the bicycle corridors between Davis and Sacramento. Per CEQA Appendix G, Caltrans must determine if the project would "Conflict with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities, or otherwise decrease the performance or safety of such facilities." Currently, there is no consistent protected bikeway between Davis and Sacramento and this project may impact bicycle safety along the project area. 18 cont.

As a reminder, CEQA requires projects with significant and unavoidable impacts to implement all feasible mitigation. Mitigation that is not fully quantified may achieve emissions reductions and co-benefits on their own or may enhance the ability of quantified measures to attain reductions and co-benefits. The Sacramento region has had success in upgrading Class II bicycle lanes to protected Class IV lanes, and with increased eBike ownership and access, protected inter-city bicycle routes have definite potential to increase sustainable miles traveled that replace motor vehicle miles traveled.

- Sac Metro Air District recommends that a final EIR incorporate the attached pedestrian / bicycle facility recommendations into project construction as mitigation where applicable. We also recommend that the Final EIR include analysis of project impacts on pedestrian and bicycle safety. Further, while the VMT-reducing potential of improvements to the existing multi-modal path may currently primarily qualitative due to the modeling that is available to Caltrans, it is incumbent upon Caltrans to apply all feasible project mitigation to supplement the current 43% of induced VMT mitigated. 19

Conclusion
As a reminder, all projects are subject to Sac Metro Air District rules and regulations at the time of construction. Please visit our website to find a list of the most common rules that apply at the construction phase of projects. Thank you for your attention to our comments. If you have questions about them, please contact me at mwright@airquality.org or (279) 207-1157. 20

Sincerely,

Molly Wright

Response to Comment 1 in 20240112, Sacramento Metropolitan Air Quality Management District

This introductory comment briefly summarizes the proposed project and does not discuss the adequacy of the EIR/EA. No changes to the Draft EIR/EA are necessary.

Response to Comment 2 in 20240112, Sacramento Metropolitan Air Quality Management District

The comment requests quantification of operational ROG and NOx emissions and an evaluation of project-generated criteria pollutants against local air district thresholds. The comment also requests air quality modeling runs be appended to the Final EIR/EA and seeks clarification on the model used to quantify construction emissions. Construction related emissions including ROG and NOx are shown in Table 2.2-8 Maximum Construction Emissions. The tables below show operational emissions estimates and will be included in the Final EIR/EA.

The Draft EIR/EA discussed air quality impacts in Section 2.2.6.2 *Affected Environment* and 2.2.6.3 *Environmental Consequences*. Operational emissions associated with the roadways in the project area were estimated using specific traffic data and conditions provided by the Caltrans District 3 traffic forecasting and the CT-EMFAC2021 emission tool. Operational PM10 and PM2.5 emissions are specifically presented in Tables 2.2-10 and 2.2-11. Emissions results for additional pollutants, including ROG and NOx, are included in Appendix G of the Air Quality Technical Report. Tables 2 through 4 below summarize the additional operational emissions results for Opening 2029, MTIP 2040, and Design 2049.

As shown in Table 2, to compare air pollutants between Opening Year 2029 and Baseline 2019, PM2.5 is expected to decrease by approximately 0.5% to 8.4%; PM10 would increase by approximately 3.5% to 13%; NOx reduction is estimated to be 59.3% to 63.8%; ROG reduction is estimated to be 27% to 36.9%; Diesel PM reduction is estimated to be 64.8% to 70.2%.

As shown in Table 4, to compare air pollutants between Design Year 2049 and Baseline 2019, PM2.5 is estimated to decrease by 1.9% to increase by 6.7%; PM10 would increase by 16.1% to 26.9%; NOx reduction is estimated to be 73.3% to 79.5%; ROG reduction is estimated to be 38.1% to 53.8%; Diesel PM reduction is estimated to be 76.8% to 81.3%.

Table 3. Estimate of Air Pollutants by the Project Operations for MTIP Year 2040

MTIP Year 2040		Baseline (Existing Year 2019)	Alt 1 (No Build)	Alt 2 (HOV)	Alt 3 (HOT)	Alt 4 (HOT 3+)	Alt 5 (Express Lane)	Alt 6 (Transit)	Alt 7 (Take-A-Lane)
PM2.5 (lbs/day)		139.25	128.18	135.35	135.03	132.52	131.39	128.21	124.76

As discussed in Section 2.2.6.2, *Affected Environment, "...*most air district thresholds have not been established by regulation or by delegation from a federal or state agency with regulatory authority over Caltrans, Caltrans is not required to adopt those standard levels in Caltrans' documents." (CEQA Guidelines §§ 15064(b)(2), 15064.7(b).) Caltrans does not evaluate impacts based on thresholds of significance.

Construction-related air quality impacts are discussed in Chapter 6 of the Air Quality Report located in Appendix J of the Draft EIR/EA. Construction impacts on air quality are evaluated based on existing/baseline conditions and include compliance with control measures. Caltrans considers projects that do not implement Caltrans Standard Specifications may result in short-term air quality impacts. Emissions from construction-related activities are considered temporary as defined in 40 CFR 93.123(c)(5).

Operational impacts on air quality are assessed based on the project's contribution to regional emissions and potential to contribute to localized emissions hot-spots. Caltrans determined less than significant air quality impacts as each of the Build Alternatives would improve operations, reduce congestion, and increase vehicle occupancy within the travel corridor as compared to the No Build alternative. The Build Alternatives were also found not to contribute to localized emissions hot-spots.

The Draft EIR/EA summarizes the air quality technical analysis prepared for the project. Quantification methods and model outputs are provided in the Air Quality Report. Construction emissions were quantified using Caltrans' CAL-CET2021. While Appendix E of the Air Quality Report is generally titled "Road Construction Emission Model," the included model output is from CAL-CET2021. This is the same model cited in the Draft EIR/EA text for construction emissions projections in Table 2.2-8.

Response to Comment 3 in 20240112, Sacramento Metropolitan Air Quality Management District

The comment requests construction emissions be quantified using CalEEMod and recommends the project implement best management practices to reduce construction generated emissions. As requested, the CalEEMOD was used to quantify construction emissions and is included in the Final EIR/EA.

As noted in Response to Comment 2 in 20240112, Sacramento Metropolitan Air Quality Management District, construction emissions were quantified using CAL-CET2021. Caltrans acknowledges that there are many tools available for the quantification of construction emissions. Caltrans developed the CAL-CET to analyze construction emissions for various types of highway improvement projects that Caltrans administers annually statewide. The methodology and assumptions are based on Caltrans-specific data and construction practices, knowledge, and experiences. Thus, it is Caltrans' position that CAL-CET2021 is the most appropriate and accurate tool for the quantification of construction emissions generated by highway improvement projects.

Caltrans will comply with the local Air Quality Management District rules and implement Basic Construction Emissions Control Practices (BCECP). Please see Table 1 above and Table 2.2-8 in Section 2.2.6.3 *Environmental Consequences* for the projected construction emissions. The project would comply with rules and regulations pertaining to the control of fugitive dust and prevention of public nuisance published by the SMAQMD and YSAQMD.

Appendix E of the Draft EIR/EA lists specific air quality and GHG standard measures that will be implemented as part of the project. Caltrans special provisions and standard specifications include the requirement to minimize or eliminate dust through application of water or dust palliatives.

As discussed in Response to Comment 2 in 20240112, Sacramento Metropolitan Air Quality Management District, Caltrans does not evaluate impacts based on local thresholds of significance. Thus, SMAQMD's non-zero PM threshold is not applicable to the project analysis.

Response to Comment 4 in 20240112, Sacramento Metropolitan Air Quality Management District

The comment requests that the Final EIR/EA include an analysis of health effects that may result from project emissions, pursuant to the “Friant Ranch” Decision.

Friant Ranch clarifies that an EIR is required to adequately discuss health and safety problems due to a project’s adverse air impacts, or state why it is not currently feasible at the time of drafting the EIR to provide such an analysis. Caltrans consulted SMAQMD’s guidance to address the Friant Ranch Ruling for this project and utilized the Strategic Area Project Health Screening Tool to adhere to the Friant Ranch Decision. The tables for Opening Year 2029 and Year 2049 are included in the Final EIR/EA.

Criteria pollutants were discussed in Section 2.3 of the Air Quality Report, Appendix J of the Draft EIR/EA. These pollutants include Ozone, Nitrogen dioxide (NO2), PM2.5/10, Carbon monoxide, Sulphur dioxide, and Lead. Ozone and NO2 are discussed in Sections 2.3.1 and 2.3.2 of the Air Quality Report. The Draft EIR/EA included an analysis of health effects that may result from project emissions in Section 2.2.6.3. *Environmental Consequences*, *Mobile Source Air Toxics (MSAT)*.

Some part of PM2.5 is associated with MSAT. In FHWA’s view, information is incomplete or unavailable to credibly predict the project-specific health impacts due to changes in MSAT emissions associated with a proposed set of highway alternatives. The outcome of such an assessment, adverse or not, would be influenced more by the uncertainty introduced into the process through assumption and speculation rather than any genuine insight into the actual health impacts directly attributable to MSAT exposure associated with a proposed action.

Caltrans did consult the SMAQMD’s guidance to address the Friant Ranch Ruling for CEQA projects and determined that the guidance does not apply to mobile sources such as highways. The reasoning is provided in the paragraph above. Currently, there are no readily available models that estimate the health effects of NOX, PM2.5, ROG, SO2, and CO from mobile sources. Hence, at present it is not feasible to provide additional analysis on how human health will be adversely affected by the project’s air impacts.

Response to Comment 5 in 20240112, Sacramento Metropolitan Air Quality Management District

The commenter summarizes conclusions of the Draft EIR/EA and identifies examples of sensitive receptors within 500 feet of the proposed alignment.

The Draft EIR/EA identified sensitive receptors within 500 feet of the project site in Section 2.2.6.2 *Affected Environment* (Table 2.2.7 Sensitive Receptors Located Within 500 feet of the Project Site). These areas were included in the Environmental Study Limit (ESL) and evaluated during environmental review. The project would widen portions of the road to accommodate proposed managed lanes. The maximum width added to the existing outer edge of the road would be between 6 to 10 feet. Only minor alignment shifts (e.g., about 6 to 15 feet) are proposed, and it was determined that a less than significant impact would occur. The Draft

EIR/EA has been updated to clarify that only minor alignment shifts in the roadway would occur with implementation of the project.

Response to Comment 6 in 20240112, Sacramento Metropolitan Air Quality Management District

The commenter expresses concern with the following statements in the Draft EIR/EA: 1) that the project will not substantially increase the percentage of trucks traveling along I-80 of the project limits and 2) that emissions from trucks may decrease in future years due to increased penetration of electric heavy-duty trucks. The Draft EIR/EA acknowledges that implementation of the project will induce truck trips (see Table 2.1-26). However, as shown in Table 2.2-9, implementation of the project will not change the percentage of trucks among the No Build and Build Alternatives. Thus, truck AADT is relatively similar for all alternatives compared to the No Build Alternative. Hence, the statement, “There would be negligible increases in MSAT emissions relative to the No Build Alternative.” The discussion of future electric trucks is not made to justify differences in emissions among the build and no build conditions. Rather, the statement supports the general conclusion that MSAT emission rates are expected to decrease over time.

Response to Comment 7 in 20240112, Sacramento Metropolitan Air Quality Management District

The commenter requests clarity on the units of measurement for Table 2.2-12 and that model outputs be provided. The commenter also requests a heatlh risk assessment be performed to assess receptor exposure to diesel particulate matter (DPM).

Table 2.2-12 has been updated to identify the units of measurement as pounds per day. Quantification methods and model outputs are provided in the Air Quality Report, which is identified in Appendix J to the Draft EIR/EA.

The Draft EIR/EA included an analysis of health effects that may result from project MSATs, including DPM, in Section 2.2.6.3. *Environmental Consequences*. The analysis was conducted consistent with FHWA’s Jan. 18, 2023 guidance for determining when and how to address MSAT impacts in the NEPA process for transportation projects. DPM emissions from construction are assessed in Section 3.2.3, *Air Quality*. The analysis qualitatively evaluates the potential for project construction to expose receptors to substantial DPM concentrations. Given the proximity of receptors and temporary nature of construction, coupled with implementation of best management practices, which would minimize emissions associated with construction activities, impacts would be less than significant.

Response to Comment 8 in 20240112, Sacramento Metropolitan Air Quality Management District

The commenter states that operational GHG emissions results presented in the Draft EIR/EA are not consistent with the Air Quality Report and that no model outputs were provided. The commenter also claims that construction GHG emissions were not quantified and that GHG emissions were not evaluated against a threshold of significance.

Operational GHG emissions are presented in Table 3.4-2 in Section 3.4, *Climate Change* and includes alternatives with (a) and (b). Model outputs are provided in the Air Quality Report.

The claim that construction GHG emissions were not quantified is not consistent with the information presented in the Draft EIR/EA. Table 2.2-8 shows the maximum construction emissions per project phase. In addition, total construction generated GHG emissions are disclosed in Section 3.4.4.3, *Construction Emissions*.

The claim that GHG emissions were not evaluated against a threshold of significance is not correct. Caltrans' criteria for determining significance of GHG emissions is whether or not the project contributes to overall state reduction goals. Please see Response to Comment 41 in 20240112, City of Davis for additional discussion.

Response to Comment 9 in 20240112, Sacramento Metropolitan Air Quality Management District

The commenter requests construction and operational GHG emissions be quantified and compared to a threshold of significance. The commenter also requests project consistency with GHG reduction plans be further explained.

GHG reduction does not require the use of a numerical threshold, but rather consistency with A.B. 32's statewide goals. (*Center for Biological Diversity v. Dept. of Fish & Wildlife* (2015) 62 Cal.4th 204, 221.)

As discussed in Response to Comment 8 in 20240112, Sacramento Metropolitan Air Quality Management District, construction and operational GHG emissions were fully quantified and disclosed in the Draft EIR/EA. Construction emissions were quantified using CAL-CET2021 and are presented in Table 2.2-8 and discussed in Section 3.4.4.3, *Construction Emissions*. Operational GHG emissions were quantified using CT-EMFAC and are presented in Table 3.4-2. The models used to quantify emissions are described in the Draft EIR/EA and the document cites the Air Quality Report as the source for additional information and analysis.

Please see Response to Comment 41 in 20240112, City of Davis for discussion on GHG thresholds. As noted in that response and in Response to Comment 8 in 20240112, Sacramento Metropolitan Air Quality Management District, the Draft EIR/EA GHG threshold considers state GHG reduction targets, consistent with the commenter's suggestion. Caltrans recognizes that AB 1279 establishes the policy of the State to achieve carbon neutrality as soon as possible, but no later than 2045, and maintain net negative GHG emissions thereafter. As GHG emissions are expected to decrease over the long-term operational use, the project directly supports the state's long-term target of carbon neutrality by 2045, as outlined in the 2022 Scoping Plan and pursuant to AB 1279.

Consistency with the Global Warming Solutions Act, SACOG MTP/SCS, and other plans and policies for the reduction of GHG emissions is assessed in Section 3.2.8, *Greenhouse Gases*. Caltrans has determined that by helping to provide a continuous managed lane system, the project, combined with other in-progress and proposed managed lane projects, would provide reliable travel times, and help contribute to the completion of the regional transportation network

envisioned in the SACOG MTP/SCS. The long-term GHG reductions achieved by the project would support the state's climate reduction trajectory established under Global Warming Solutions Act and strengthened by AB 1279.

Response to Comment 10 in 20240112, Sacramento Metropolitan Air Quality Management District

The commenter identifies Standard Measures GHG-1 through GHG-6 as mitigation measures and expresses concern with their implementation and enforcement. The commenter also recommends the Final EIR/EA include additional GHG mitigation.

Section 3.2.8, *Greenhouse Gas Emissions* of the Draft EIR/EA is incorrect in the significance determination. The CEQA determination should list that the project would have a less than significant impact regarding the generation of GHG emissions (a). Mitigation is not proposed for this project as this project is not expected to generate significant levels of GHG emissions.

As discussed in Chapter 1, *Proposed Project,* the project contains several Standard Measures, which are employed on most, if not all, Caltrans projects. The measures were not developed in response to any specific environmental impact resulting from the project. Thus, the Standard Measures are not mitigation. They are required as part of the project design and will be implemented and enforced by Caltrans. The commenter is correct that some components of Standard Measures GHG-1 through GHG-6 included compliance with existing regulations. However, because the measures are part of the project design and not mitigation, reductions achieved through regulatory compliance are not relied upon in making the final determination of significance.

Response to Comment 11 in 20240112, Sacramento Metropolitan Air Quality Management District

Commenter recommended additional documentation and analysis for induced VMT projections relating to alternatives 5 and 7.

Alternative 7 includes induced VMT due to widening needed to transition lanes at the ends of the project. Alternative 7 would add 0.7 lane miles, which would therefore generate induced VMT according to the California Induced Travel Calculator. This addition of lane miles is found in the revised VMT Mitigation Memo and summarized in the Final EIR/EA.

Further, Alternative 7 mainly would convert an existing general-purpose lane to an HOV lane, it includes additional improvements such as construction of auxiliary lanes and, in the case of Alternative 7B, direct connector ramps that are considered added lane-miles. Therefore, induced VMT would result, as per the NCST calculator.

Traffic modeling consultant, Fehr and Peers, habitually participates in industry-updating panels to share their expertise and speak further on pressing induced demand topics. One such topic discussed at a recent expert panel yielded the preliminary conclusion that there is insufficient evidence to support treating fully tolled lanes any differently than general purpose, HOV, or HOT lanes.

Also, as the commenter notes, the NCST calculator website indicates that induced demand would be similar for HOV, HOT, and general-purpose expansion alternatives. This is accurate and evidenced by Alternative 10 in the Induced Demand table found within the Fehr and Peers authored Transportation Analysis Report. The TAR was prepared for the project, as summarized in Draft EIR/EA Section 2.1.10, *Traffic and Transportation*, and Section 3.2.17, *Transportation*. The TAR is available on the project website https://dot.ca.gov/caltrans-near-me/district-3/d3-projects/d3-i80-corridor-improvements).

Response to Comment 12 in 20240112, Sacramento Metropolitan Air Quality Management District

The commenter requested additional information on Table 2.1-25, namely for Caltrans to define "Regional VMT" and "Corridor PMT".

The scoring in Table 2.1-25 is based on the regional VMT estimated by SACSIM19 as a part of the Transportation Analysis Report (TAR), which informed much of the Draft EIR/EA analysis. "Regional VMT" is vehicle miles traveled on a regional scale and "Corridor PMT" is personal miles traveled for the corridor. Both of these are used as performance measures, specifically PMT is a performance measure of mobility that combines both the number and length of trips. These terms are further defined in the TAR. No changes to the Draft EIR/EA are necessary.

Response to Comment 13 in 20240112, Sacramento Metropolitan Air Quality Management District

For more information on induced VMT, please see Master Response A. For more information on forecasting methodologies, please see Master Response D. No changes to the Draft EIR/EA are necessary.

Response to Comment 14 in 20240112, Sacramento Metropolitan Air Quality Management District

The commenter notes some project alternatives (Alternatives 5 and 7) have lower VMTs and recommends if these are not selected for the Final EIR to explain why they were not selected. The project alternatives, including Alternatives 5 and 7, were evaluated on multiple criteria. This evaluation includes regional VMT, Annual Average Daily Traffic (AADT), and truck AADT. For more information on alternatives not considered in this analysis, please refer to Master Response B. No changes to the Draft EIR/EA are necessary.

Response to Comment 15 in 20240112, Sacramento Metropolitan Air Quality Management District

The commenter recommended further analysis addressing their letter on the first Notice of Preparation for the EIR, namely an alternative with two HOT lanes in each direction, including one that uses an existing lane, and an alternative with a multilane express lane during peak periods. For more information on alternatives not considered in this analysis, please refer to Master Response B. No changes to the Draft EIR/EA are necessary.

Response to Comment 16 in 20240112, Sacramento Metropolitan Air Quality Management District

Please refer to Master Response F for more information on improvements to pedestrian/bicycle facilities on the corridor. No changes to the Draft EIR/EA are necessary.

Response to Comment 17 in 20240112, Sacramento Metropolitan Air Quality Management District

The commenter proposes that a plausible argument could be made that enhancing existing bicycle facilities could be considered a VMT reduction. Additionally, the commenter states bicycle facilities may not be fully utilized if unsafe or incomplete, hence reducing their ability to divert motor vehicle trips.

Please refer to Master Response F for more information on the bicycle/pedestrian facilities on the corridor. These improvements, as well as the bicycle/pedestrian-related improvements included in the VMT mitigation plan aim to improve conditions for these system users and complete the bicycle/pedestrian network. No changes to the Draft EIR/EA are necessary.

Response to Comment 18 in 20240112, Sacramento Metropolitan Air Quality Management District

The commenter notes increased collisions and congestions during construction period, and there being no consistent protected bikeway between Davis and Sacramento and questioned the project's impact to bicycle safety.

Please see response to comment 17. Additionally, the project aims to improve conditions on the freeway so there is less diversion to local facilities, which would allow for safer travel on those local facilities for cyclists. No changes to the Draft EIR/EA are necessary.

Response to Comment 19 in 20240112, Sacramento Metropolitan Air Quality Management District

The commenter recommended additional consideration of pedestrian/bicycle facility upgrades and improvements as additional VMT mitigation where applicable.

Please refer to Master Response A for more information on induced VMT mitigation. No changes to the Draft EIR/EA are necessary.

Response to Comment 20 in 20240112, Sacramento Metropolitan Air Quality Management District

This closing comment provides a link to the rules and regulations applicable to project construction and provides commenter contact information. This information is so noted. This comment does not discuss the adequacy of the EIR/EA. No changes to the Draft EIR/EA are necessary.

Subject: Yolo 80 CORRIDOR IMPROVEMENT PROJECT, SCH NO. 2021060117

Dear Mr. Patwary:

The City of Sacramento (City) has reviewed the Draft Environmental Impact Report (EIR)/Environmental Assessment (EA) for the Yolo 80 Corridor Improvements Project (Project) located in Sacramento, Solano, and Yolo counties. The EIR public review period concluded on January 5, 2024, however, on December 18, 2023 we requested a 30-day extension of time to complete our review due to the holidays and late notification that we received. Caltrans has granted a one-week extension of time to January 12, 2024. 1

The Project consists of improvements that directly affect multiple areas of the City of Sacramento. The following provides our comments and recommendations to Caltrans for consideration.

COMMENTS AND RECOMMENDATIONS

Project Alternatives:

The EIR should have considered an alternative that provides the opportunity to toll the existing bridge over the Yolo Causeway and enhance transit parallel to the corridor. 2

Chapter 2: 2.1.6-9 figure labels and paragraph descriptions are off. 2.1.6 is used twice. 3

On the Alternatives Comparison Table 2.1-25, Alt 5a scores the best on Regional VMT even though its increase is 40x that of Alt 7 (1 versus 2). This brings into question the validity of the qualitative scoring methodology.

Table 2.1-25 gives equal weight to all the qualitative scoring criteria to produce the average score which is misleading. The average score should be removed.

Table 2.1-25 has a managed lane peak hour travel time score for Alt 1which does not have managed lanes. This score should be removed.

4

All of the alternatives except for 6a and 6b (assumed 0), 7a (4.5 million) and 7b (12 million) induce 128-133 million annual auto VMT that cannot be fully mitigated. These alternatives have a detrimental effect on the Sacramento region's attempts to reduce VMT in order to meet SB 32, SB 375, and EO-S-3-05 goals for GHG emissions. Projects on the State Highway System should be held to the same standard as local projects if we hope to ever meet our GHG reduction goals.

5

The project seeks to respond to traffic congestion by increasing roadway capacity via building new roadways or adding lanes to existing facilities. Studies examining that approach indicate it is only a temporary fix. The studies consistently show that adding roadway capacity actually increases network-wide vehicle miles traveled (VMT) by a nearly equivalent proportion within a few years, reducing or negating any initial congestion relief. That increase in VMT is called "induced travel." (National Center for Sustainable Transportation)

Caltrans has adopted guidelines in the form of the Transportation Analysis Framework (TAF) and the Transportation Analysis under CEQA (TAC) to guide the process of evaluating transportation impacts of State Highway System projects. Through the process of developing the TAF and TAC, Caltrans determined that induced travel demand, which is synonymous with induced VMT, represents the metric most appropriate for determining a transportation project's impact. The DEIR should clarify that the threshold of significance for induced VMT is any amount greater than zero (0).

6

The Draft EIR/EA indicates that by the horizon year 2049, I-80 and US 50 in the project area would become so congested that travelers would seek longer paths to have a lower travel time. I-5 between Woodland and Sacramento County would have a higher demand volume under Alternative 1. With the additional capacity provided under the other alternatives, travelers would shift back to I-80. The Draft EIR/EA does not make it clear if the higher demand on I-5 between Woodland and the City of Sacramento would lead to demand exceeding capacity under Alternative 1. If it does not then this could be an acceptable outcome even though access to Sacramento International Airport would also need to be considered.

7

January 12, 2024
Page 3

VMT Mitigation:

The Draft EIR/EA indicates that following measures would be implemented by the project to avoid or minimize VMT impacts:

> *AMM TRANS-1: Reduce the induced VMT effects of the project Alternatives 2a/b through 5a/b, and 7a/b by contributing funding to regional VMT reducing measures. Caltrans will contribute $55 million, roughly 15 percent of the total capital construction cost, to the following eight measures:*
>
> *1) Voluntary trip reduction program in Yolo County ($10 million)*
> *2) Expand Capitol Corridor Frequency between Oakland and Sacramento ($15 million)*
> *3) Microtransit in Yolo County ($7.5 million)*
> *4) Subsidize monthly transit passes in Yolo County ($5 million)*
> *5) Reduce transit fares ($5 million)*
> *6) Expand causeway connection Route 138 ($4 million)*
> *7) Expand Unitrans ($3.5 million)*
> *8) Build overcrossing at future Nishi Student Housing Development site.*

8

We note that most of the mitigations are to support transit in Yolo County. We request that mitigations address anticipated areas where additional trips will be induced based on an analysis of origin/destinations of the additional trips. We expect a substantial portion is in the City of Sacramento, yet the primary measure to address VMT that might directly affect Sacramento residents and visitors is to expand Capital Corridor frequency. While we support this measure, it will only be most effective if it also includes support to subsidize trip costs to make it a feasible alternative to driving for those with lower incomes.

The City of Sacramento has been implementing projects to reduce VMT and GHG emissions, including lane reductions, adding more protected bike facilities, adding publicly available EV chargers, and eliminating parking requirements on development. Once vehicles exit the freeway system, they will be entering local streets. Inducing additional vehicle trips on streets designed to accommodate fewer vehicles without mitigating these impacts will offset the benefits of the City's efforts, increase congestion and increase air pollutants and GHG emissions. We would request that the EIR address impacts on local City streets and include appropriate mitigations, including support of increased frequency of transit in Sacramento, to address the increased VMT inducement for trips in the City.

9

All the recommended mitigation measures except for the Nishi Bridge contribution include future funding from tolling but alternatives 1, 2a, 2b, 6a, 6b, 7a, and 7b will not generate toll revenue. The Draft EIR/EA does not address how these mitigation measures be funded if a tolling alternative is not selected.

10

The project would pay $5 million in mitigation towards the $18 million Nishi project without quantifying any VMT benefits. Unless some quantifiable VMT benefit can be attributed to the Nishi project, it should not be considered as a mitigation measure. 11

The Draft EIR/EA does not make it clear whether transit would be allowed on the toll lane options 5a and 5b. This clarification is critical since the bulk of the mitigation measures proposed are to increase transit ridership. 12

Only 43% of the estimated 128-133 million induced VMT would be mitigated by the proposed mitigation contributions. If overridden, the balance would significantly compromise regional efforts to meet statewide GHG reduction goals. Instead, Caltrans should establish and contribute to a mitigation bank that would fund projects calculated to achieve the remaining 57% of their impact. $55 million is the proposed contribution to mitigate 57,130,000 of the induced VMT. Therefore, $72,906,977 should be deposited into a regional mitigation bank for additional projects to mitigate the remaining induced VMT balance. For comparison, Caltrans District 12 is making a one-time payment of $441 million in VMT mitigation in Orange County as well as ongoing contributions to mitigate 22.3 million annual VMT (26.2%). 13

We also note that mitigation measures such as doubling parking fees in Downtown Sacramento were analyzed and rejected without any known coordination with the City of Sacramento. Without understanding the level to which parking demand is anticipated to be increased in Sacramento because of this project, it is difficult for the City to assess whether higher parking fees would provide any mitigation. 14

Electric Vehicle Charging Infrastructure (T-13) is one example of a mitigation measure identified in the CAPCOA Handbook (https://www.caleemod.com/handbook/index.html) that does not appear to have been analyzed despite having VMT reduction co-benefit as well as providing support for achieving California GHG and EV adoption goals. Another CAPCOA mitigation strategy not considered is Providing Real-Time Transit Information (T-41). 15

On-going toll revenue would be necessary to maintain the proposed mitigation measures and the resulting VMT reductions. The Draft EIR/EA does not include toll revenue analysis to suggest that sufficient funding would be generated to continue these mitigation measures beyond the initial contribution. 16

None of the mitigation funds are intended to support affordable housing in the City of Sacramento despite direct VMT impacts to the City. It is unclear why the Draft EIR/EA indicates working with City of Sacramento Housing Trust Fund, as this program is not funded at a level to address these additional VMT impacts. 17

January 12, 2024
Page 5

VMT Memorandum:

The Downtown/Riverfront Streetcar project description is incorrect. The current version of the project does not go into Midtown and it will not run on Broadway. 18

The Truxel Bridge, the Green Line to the Airport, and the Downtown/Riverfront Streetcar should have already been assumed in 2045 SACSIM model runs. Credit towards mitigation would only be applicable if these projects were built ahead of schedule and then only for those additional years. 19

Habitat Conservation Plan:

Portions of the project are within the boundaries of the Yolo Habitat Conservation Plan/Natural Community Conservation Plan (Yolo Plan) and the Natomas Basin Habitat Conservation Plan (NBHCP). For over 25 years, the City of Sacramento has been committed to the success of the NBHCP. It has come to our attention that the California Department of Fish and Wildlife (CDFW) who is a signatory party to the City's NBHCP provided Caltrans with a comment letter dated November 21, 2022 in response to the Notice of Preparation for the subject project. The CDFW letter raised specific issues that have not been adequately addressed in the Draft EIR/EA. Specifically, the prior comments provided to Caltrans state the following:

> *"Because the Yolo Plan and NBHCP are currently being implemented, the EIR must include a discussion on the consistency of each project alternative with the respective plans and how Caltrans will ensure that implementation of the project alternatives do not impede either plan's ability to meet its biological goals and objectives. Furthermore, CDFW recommends that Caltrans coordinate with the implementing agency/plan operators (Yolo Habitat Conservancy/Yolo County and the Natomas Basin Conservancy) of each respective plan to ensure significant environmental impacts assessed in the EIR are adequately investigated. Particular focus in the EIR's analysis should be directed to:*
>
> - *Analysis of all Yolo Plan and NBHCP Covered Species,*
> - *Assessment of habitat types identified in the Yolo Plan and NBHCP,*
> - *Identification of applicable Yolo Plan and NBHCP avoidance, minimization, or mitigation measures; and*
> - *Analysis of any impacts to land commitments of the Yolo Plan and NBHCP.*
>
> *CEQA Guidelines section 15125(e) requires the analysis examine both the existing physical conditions at the time of the NOP and the potential future conditions discussed in the adopted plans."*

20

CDFW recommended that Caltrans coordinate with the implementing agency/plan operators of each respective plan to ensure that the environmental impacts were adequately assessed in the Draft EIR. City staff works very closely with The Natomas

Basin Conservancy (TNBC) who is the operator for the City's NBHCP. It is our understanding that as of January 9, 2024 Caltrans did not coordinate with TNBC staff as recommended by CDFW. We are requesting that Caltrans coordinate with TNBC per CDFW's November 21, 2022 comment letter and that the Biological Resources evaluation and mitigation be revised to address the issues in the CDFW letter.

20 cont.

Parks:

The Draft EIR/EA indicates per the following table that the project is closest to River Otter Park which is adjacent to the Caltrans project site:

Table 2. Public Parks and Wildlife Areas within 500 Feet of the Proposed Project, Listed Generally East to West.

Park Name	Facility Type	Distance/Relationship to Project
River Otter Park	Public Park	Adjacent
Sand Cove Park	Public Park	400 feet
Meadowdale Park	Public Park	Adjacent
Southside Park	Public Park	500 feet
O'Neil Park	Public Park	500 feet
Westacre Park	Public Park	Adjacent
Roland Hensley Bike Park	Public Bike Park	Adjacent
Yolo Bypass Wildlife Area*	Wildlife Area	Adjacent and Underneath
Playfields Park*	Public Park	50 feet
Toad Hallow Dog Park	Public Dog Park	400 feet
Putah Creek Riparian Reserve	Trails/Nature Area	Adjacent
U.C. Davis Arboretum	Trails/ Nature Area	Adjacent

*These resources received funds form the LWCF Act and are therefore also 6(f) resources

21

As stated in the Draft EIR/EA, there would be no acquisition of park property, and therefore no direct use of the park. No construction activities or project components are proposed within River Otter Park. Access to park facilities would not be disrupted, and park users would not be impacted. Standard measures would further reduce potential noise or air quality impacts during construction along the I-80 corridor. However, River Otter park is located adjacent to the Caltrans I-80 right-of-way and is currently subject to indirect air quality and noise impacts.

On p. 3-39 of Chapter 3 CEQA Evaluation, it states: Temporary traffic delays and ramp closures on I-80/US-50 during construction of Build Alternatives 2a and 2b through 7a and 7b could result in temporary delays in emergency services. As described in Section 2.1.6, Community Character and Cohesion, Standard Measure TT-3 has been incorporated into the project that would require preparation of a TMP which would maintain access for emergency services throughout all phases of construction. The TMP would include elements such as traffic controls to minimize speeds/congestion and other measures to maintain access for police, fire, and medical services along I-80/US-50 in the project area during construction. Standard Measure COM-1 would require a

22

planned public outreach program to keep the area residents, businesses, emergency service providers, and transit operators informed of the project construction schedule.

We would like to make sure that TT-3 and TMP include COM-1 which would inform the community of the indirect air quality and noise impacts.

22 cont.

Thank you for the opportunity to review the Draft EIR/EA. If you have follow-up questions, please contact me at 916-808-5971 or at chodge@cityofsacramento.org.

Sincerely,

Response to Comment 1 in 20240112, City of Sacramento

This introductory comment summarizes the public review period for the Draft EIR/EA and Caltrans' extension of that period. No changes to the Draft EIR/EA are necessary.

Response to Comment 2 in 20240112, City of Sacramento

The commenter suggested an alternative that would toll traffic on the existing Yolo Causeway bridge and enhance transit parallel to the corridor. Please refer to Master Response B for responses related to project alternatives considered. Significant enhancements to transit have been identified as part of the mitigation measure TRANS-1 included in the Draft EIR/EA, including increasing transit and rail frequency. However, a toll plus enhanced transit alternative would not meet the project's purpose and need as a standalone project. No changes to the Draft EIR/EA are necessary.

Response to Comment 3 in 20240112, City of Sacramento

The commenter notes typographical errors in Figure 2.1.6-9. No such figure exists in the Draft EIR/EA. The comment is unclear and no change to the Draft EIR/EA is necessary.

Response to Comment 4 in 20240112, City of Sacramento

The commenter questions the validity of the qualitative scoring methodology for the Regional VMT. The alternative scoring criteria in Table 2.1-25 was based on the Regional Daily VMT as calculated by the SACSIM 19 model, which yielded the lowest estimate for Build Alternative 5a. Therefore, this alternative was assigned a "1" in the Alternative Comparison Table.

The purpose and need of this project are multi-faceted, so multiple criteria were used to determine the alternative scoring.

Where a managed lane does not exist, the general-purpose travel time was used. Otherwise, the managed lane travel time for Build Alternative 1 would represent the same distance as the travel times for general-purpose lanes and the travel times for the other alternatives.

No changes to the Draft EIR/EA are necessary.

Response to Comment 5 in 20240112, City of Sacramento

The commenter noted most of the alternatives have detrimental effects on GHG emissions and that the VMT cannot be fully mitigated. Caltrans strives to ensure that projects contribute to statewide GHG reduction goals to the extent feasible while meeting project purpose and need. The project is not inconsistent with state goals as the project contributes to overall state reduction goals by reducing GHG emissions. As stated in the Draft EIR/EA (3.4.5 CEQA Conclusion), "…as projected under the 20-year horizon design assumptions (2049), GHG emissions were estimated to decrease for the Build Alternatives as compared to conditions under 2029."

Please refer to Master Response A for VMT and mitigation and Master Response I for Air Quality and GHG analysis. See also Response to Comment 12 in 20240111, Center for Biological Diversity.

Response to Comment 6 in 20240112, City of Sacramento

The commenter advised that the Draft EIR/EA should clarify that the threshold of significance for induced VMT is any amount greater than zero. Please refer to Master Response A for responses related to induced travel and VMT calculation methodologies. The threshold for significant for induced VMT is any amount greater than zero per Senate Bill 743.

Response to Comment 7 in 20240112, City of Sacramento

The commenter raises concerns about future conditions on I-5 between Woodland and Sacramento. Operational-level analysis and study of these facilities were beyond the scope of this project. Additionally, the cut-through traffic is not only limited to SR 113 and I-5. Cut-through routes include local roads through the cities of Dixon and Davis, which results in increased congestion and vehicular emissions on these facilities, as well as greater regional VMT as these routes are more circuitous than I-80, which provides a direct connection across the Yolo Bypass and Sacramento River.

Response to Comment 8 in 20240112, City of Sacramento

The commenter states most of the mitigations support Yolo County transit. Please refer to Master Response A for responses related to VMT mitigation. In addition to Master Response A, the majority of the project falls within Yolo County limits and the origin-destination analysis shows that AM and PM peak volumes traverse the corridor to enter and exit Yolo County. Therefore, VMT mitigation measures to enhance Yolo County transit was prioritized. Further, Route 138 Causeway Connection is partly operated by Sacramento Regional Transit District (SacRT), which provides for transit in Sacramento County.

Response to Comment 9 in 20240112, City of Sacramento

The commenter requests that the EIR/EA address impacts to local city streets, and appropriate mitigations to address increased VMT inducement for trips in the city. Please refer to Master Response A for responses related to induced travel and VMT calculation methodologies. Caltrans deems the Draft EIR/EA to contain adequate analyses and mitigation for the project's various Build Alternatives impacts and that the document complies with CEQA and NEPA. No changes to the Draft EIR/EA are necessary.

The project aims to improve conditions on the freeway so there is less diversion to local facilities. Encouraging drivers of regional trips to remain on the freeway by providing a more reliable, direct route, will leave surface streets available to those making local trips in the modes available to them.

Response to Comment 10 in 20240112, City of Sacramento

The commenter questions how funding will be generated for the alternatives that do not have funding from tolling. Please refer to Master Response A for responses related to VMT mitigation. In addition to Master Response A, the upfront payment of the VMT mitigation plan (total of $55M) is the amount that will mitigate for 43% of the induced VMT (per Draft EIR/EA), regardless of selected alternative. Future potential toll revenue, if a toll lane is the selected alternative, would continue to provide ongoing mitigation beyond the proposed 43%.

Response to Comment 11 in 20240112, City of Sacramento

The commenter questions why the project did not quantify VMT mitigation benefits from the $5 million for the Nishi overpass. Please refer to Master Response A for responses related to VMT mitigation. In addition to Master Response A, the Draft EIR/EA $5M contribution towards the proposed Nishi Overcrossing provides an added active transportation benefit, regardless of VMT reduction. Please refer to note at bottom of Table 1 in VMT Mitigation Executive Summary attached to Draft EIR/EA. This has since been updated after further consultation with the partner agencies involved, and the overcrossing will no longer be invested in. Rather, a bike path project will be invested in that offers VMT reduction.

Response to Comment 12 in 20240112, City of Sacramento

The commenter requests clarification on whether transit would be allowed on toll lanes in options 5a and 5b. Transit would be allowed to use Express Lanes (Alternative 5) toll free. No changes to the Draft EIR/EA are necessary.

Response to Comment 13 in 20240112, City of Sacramento

The commenter notes that only 43% of induced VMT will be mitigated and recommends Caltrans to contribute $72,906,977 to a mitigation bank for the remaining 57% unmitigated VMT. Commenter states Caltrans has mitigated 26.2% of its VMT in District 12, by paying $441 million into a regional mitigation bank in Orange County. Please refer to Master Response A for responses related to VMT mitigation. In addition to Master Response A, the VMT dollar contributions are not a linear amount for VMT reduction that can yield to full 100% achieved reduction based on the comment. The 43% proposed in the Draft EIR/EA is the amount that can reasonably and feasibly be implemented by each implementing agency. Simply providing a linear dollar amount and asking implementing agencies to utilize these dollars to expand their services is not reasonable or feasible because each agency has individual constraints on service expansion. Further Caltrans District 12 is a different project with different constraints and VMT reduction needs than this project.

Response to Comment 14 in 20240112, City of Sacramento

The commenter states mitigation measures such as double-parking fees in Downtown Sacramento were analyzed and rejected without any known coordination with the City of Sacramento. This option was found to be infeasible. Please refer to Master Response A for responses related to VMT mitigation.

Response to Comment 15 in 20240112, City of Sacramento

The commenter asks if electric vehicle charging infrastructure or providing real-time transit information were considered as mitigation measures. Electric vehicle charging infrastructure alone is not a VMT mitigating measure per CAPCOA guidance. The improved messaging boards across the corridor that are included as part of the project, will provide real-time traffic information for all vehicles, including transit. Please refer to Master Response A for responses related to VMT mitigation. Please refer to Master Response G for electric charging stations.

Response to Comment 16 in 20240112, City of Sacramento

The commenter questions whether a tolling revenue analysis was done. Preliminary revenue analysis was conducted and provided high level estimates of potential net revenue. These estimates do suggest that there would be sufficient net revenue to fund mitigation beyond the initial contribution, depending on alternative. However, more detailed revenue analysis will need to be conducted in the future to determine the level of contribution. No changes to the Draft EIR/EA are necessary.

Response to Comment 17 in 20240112, City of Sacramento

The commenter questions why the Draft EIR/EA indicated it was working with the City of Sacramento Housing Trust Fund, and notes that none of the mitigation funds were used to support affordable housing in the City of Sacramento despite direct VMT impacts to the city. Caltrans coordinated with the California Housing and Community Development (HCD) to aid in potential outreach efforts with local housing trust funds. The outreach was regarding feasibility of providing funds for affordable housing as mitigation, which was not supported by the project contributing a small amount of the total housing costs and claiming full VMT reduction credit. Please refer to Master Response A for responses related to VMT mitigation.

Response to Comment 18 in 20240112, City of Sacramento

The commenter noted an inaccuracy in the Draft EIR/EA description of the Downtown/Riverfront Streetcar project description. The project description of the Downtown/Riverfront Streetcar project has been corrected.

Response to Comment 19 in 20240112, City of Sacramento

The commenter questions the mitigation credits from the Truxel Bridge, the Green Line to the Airport, and the Downtown/Riverfront Streetcar. Please refer to Master Response A for responses related to VMT mitigation. The Truxel Bridge, the Green Line to the Airport, and the Downtown/Riverfront Streetcar projects were evaluated for potential VMT reducing measures. These measures were found to be not reasonable or feasible. (Table 2.1-28. Potential VMT Reducing Measures Analyzed and Rejected).

Response to Comment 20 in 20240112, City of Sacramento

The commenter notes the California Department of Fish and Wildlife had concerns about the potential effects to habitat conservation plans. Please refer to Response to Comment 16 in

20240112, California Department of Fish and Wildlife regarding analysis of potential effects of the Project on HCP lands. No changes to the Draft EIR/EA are necessary.

Response to Comment 21 in 20240112, City of Sacramento

The commenter discusses the project being adjacent to River Otter Park, and that it is currently subject to indirect air quality and noise impacts because it is adjacent to Caltrans right-of-way. Section 2.1.3.2. of the Draft EIR/EA, Table 2.1-2 lists, River Otter Park as a facility that would have indirect air quality and noise impacts due to its proximity to construction activities and changes in long-term traffic volumes. As discussed in Section 2.2.6, *Air Quality*, Standard Measures GHG-1, GHG-2, GHG-3, GHG-4, and GHG-5 would be implemented for air quality. As discussed in Section 2.2.7, *Noise*, AMM NOI-1 would require noise-generating construction activities to be restricted to 7:00 a.m. to 7:00 p.m. on weekdays, with no construction occurring on weekends or holidays. If work is necessary outside of these hours, a construction noise monitoring program and provide additional noise controls would be implemented. Caltrans Standard Specifications Section 14-8.02 would require that noise levels not to exceed 86 dBA within 50 feet of the job site from the hours of 9:00 p.m. to 6:00 a.m. (Standard Measure NOI-1). Standard Measures NOI-2 through NOI-5 would also be implemented to further reduce temporary construction noise levels. Indirect air quality and noise impacts from the proposed project would not result in substantial impairment to any of the facilities' activities, features, or attributes.

Response to Comment 22 in 20240112, City of Sacramento

The commenter questions how Caltrans will address traffic delays, emergency services, and public outreach about the project during construction. The requirements listed in Standard Measure COM-1 will be incorporated in the project via Caltrans Public Information Office communication. A planned public outreach program to keep the area residents, businesses, emergency service providers, and transit operators informed of the project construction schedule does not include direct communication regarding air quality or noise impacts.

Subject: Technical Appendices for I-80
Date: Friday, December 1, 2023 2:11:11 PM

EXTERNAL EMAIL. Links/attachments may not be safe.

Good afternoon,

It has come to our attention that there are technical appendices for the I-80 corridor project 03-3H900 that were not published with the rest of the DEIR materials made available to the public.

We request access to these appendices, and would further request that they be made openly available to the public as soon as is possible.

1

Thank you,
Matt

RE: Request to Extend Deadline for Public Comment on Yolo 80 Corridor Improvements Project DEIR

Dear Director Benipal:

On behalf of Natural Resources Defense Council (NRDC), I'm writing to request an extension of the deadline for public comment on the Draft Environmental Impact Report (DEIR) for the Yolo 80 Corridor Improvements Project.

Caltrans District 3 has not yet provided necessary information about the project and is not in compliance with the Guidelines for Implementation of the California Environmental Quality Act (CEQA Guidelines). Cal. Code Regs. tit. 14, § 15000 *et seq.* First, Caltrans has not yet made available the technical studies referenced in DEIR Appendix H for public review. In the CEQA Guidelines, Section 15147 requires that technical information "shall be readily available for public examination and shall be submitted to all clearinghouses which assist in public review." These technical studies are not available at either the CEQANET clearinghouse or the Yolo 80 Corridor Improvements Project webpage. NRDC emailed yolo80corridor@dot.ca.gov and the District 3 Chief Public Information Officer on November 16 and November 27 to request copies of the technical studies listed in Appendix H and has not received a response. 1

Second, the DEIR indicates that hard copies of the DEIR will be made available at respective libraries in Davis and Sacramento. NRDC called those libraries on December 6, 2023, and was told that the Davis library had only received the hard copy DEIR that week, and the Sacramento library had not yet received the hard copy. This has deprived the public of the minimum 30-day public review time.

Finally, the public comment period contains the Thanksgiving, Christmas and New Years Day holidays, which shortens an already compressed review period.

Given the complexity of the project and the heightened public interest in this project due to the whistleblower complaints about use of transportation funds along this corridor, NRDC requests that Caltrans extend the deadline for public comment to 45 days from when the full technical studies are published for public review and hard

NATURAL RESOURCES DEFENSE COUNCIL
1314 2ND STREET | SANTA MONICA, CA | 90401 | T 310.434.2300 | F 310.434.2399 | NRDC.ORG

copies are available at the locations indicated in the DEIR. 1 cont.

Sincerely,

Carter Rubin
Senior Transportation Lead, NRDC

Cc:

Toks Omishakin, Secretary of Transportation
Tony Tavares, Director of the California Department of Transportation
James Hacker, Deputy Cabinet Secretary, Office of Governor Gavin Newsom

Response to Comment 1 in 20231208, Natural Resources Defense Council

The commenter requested an extension of the public review period. Caltrans submitted the Draft EIR/EA to the State Clearinghouse through CEQANet and posted it on the Caltrans Website on November 13, 2023. The original end date of the 45-day review period required by CEQA would have been December 27, 2023. However, when the Draft EIR/EA was released for public review, Caltrans ended the initial comment period on January 5, 2024, to account for the holiday season. Caltrans subsequently extended the public circulation and comment period to January 12, 2024.

Technical studies listed in Appendix H were available upon request as indicated on the Caltrans website. The commenter requested studies and Caltrans provided them on December 13, 2023. Hard copies of the Draft EIR/EA were delivered to the Yolo County Library on December 5, 2023, and the West Sacramento Library on December 6, 2023. The commenter's list of unavailable appendices and studies were delivered upon request to the commenter by Caltrans.

No changes to the Draft EIR/EA are necessary.

COMMENTS The Nishi Housing Project has been approved & awaiting to begin Construction. You have stated that an Overpass is needed to connect students to the UC Davis campus. I submit that no overpass at $18 million is needed. It is so close to UCD that students living here already have access to UCD through a path running from Nishi to the campus. Check it out! 1

Do you have a preferred alternative? No Overpass needed!

SLOW FOR THE CONE ZONE CALTRANS

Completing and signing this document is voluntary. The Department of Transportation may use this information for statistical purposes, to notify you of any future hearings, or to assist in providing you with further information. This document is a public record and may be subject to inspection and copying by other members of the public.

Response to Comment 1 in 20231213, Davis Democratic Club and Davis Oddfellows #169

This comment provides the commenters opinion that no overpass is needed at the Nishi housing project to connect to the UC Davis campus. After further consultation with the partner agencies involved, the Nishi overpass was removed as a measure for VMT mitigation. This revision is made in Tables 2.1-27 and 2.1-28 in the Final EIR/EA.

RE: Request to Extend Deadline for Public Comment on Yolo 80 Corridor Improvements Project

Dear Director Benipal:

On behalf of Planning and Conservation League (PCL), I'm writing to request an extension of the deadline for public comment on the Draft Environmental Impact Report (DEIR) for the Yolo 80 Corridor Improvements Project.

As noted in the Natural Resources Defense Council (NRDC) letter dated December 8th 2023, PCL also believes that Caltrans District 3 has violated CEQA, by not complying with its obligations to make relevant documents readily available to the public for the required amount of time.

Despite multiple requests, Caltrans District 3 has not yet provided necessary information about the project and is not in compliance with the California Code of Regulations, Title 14 - Natural Resources, Division 6 - Resources Agency, Chapter 3 - Guidelines for Implementation of the California Environmental Quality Act.

1

Caltrans has not published the technical studies referenced in DIER Appendix H for public review. CEQA Guidelines, Article 10, Section 15147 states:

> The information contained in an EIR shall include summarized technical data, maps, plot plans, diagrams, and similar relevant information sufficient to permit full assessment of significant environmental impacts by reviewing agencies and members of the public. Placement of highly technical and specialized analysis and data in the body of an EIR should be avoided through inclusion of supporting information and analyses as appendices to the main body of the EIR. Appendices to the EIR may be prepared in volumes separate from the basic EIR document, but shall be readily available for public examination and shall be submitted to all clearinghouses which assist in public review.

These technical studies are not available at either the CEQANET clearinghouse or the Yolo 80 Corridor Improvements Project webpage. PCL emailed yolo80corridor@dot.ca.gov on December 1st requesting access to these technical studies and have not received a response. We are aware NRDC made this

request multiple times before this without response as well.

Further, the DEIR indicates that hard copies of the DEIR will be made available at libraries in Davis and Sacramento. NRDC called those libraries on December 6, 2023, and was told that the Davis library had only received the hard copy DEIR that week, and the Sacramento library had not yet received the hard copy as of that date. This has deprived the public of the minimum 30-day public review time, compounded by the comment period's overlap with multiple holidays. 1 cont.

PCL requests along with NRDC that Caltrans extend the deadline for public comment to 45 days from the date the full technical studies are published for public review, and hard copies are available at the locations indicated in the DEIR.

Sincerely,

Matthew Baker, Policy Director
Planning and Conservation League

Response to Comment 1 in 20231215, Planning & Conservation League

The commenter requests an extension of the public review period. Caltrans submitted the Draft EIR/EA to the State Clearinghouse through CEQANet and posted it on the Caltrans Website on November 13, 2023. The original end date of the 45-day review period required by CEQA would have been December 27, 2023. However, when the Draft EIR/EA was released for public review, Caltrans ended the initial comment period on January 5, 2024 to account for the holiday season. Caltrans subsequently extended the public circulation and comment period to January 12, 2024. No changes to the Draft EIR/EA are necessary.

The commenter also follows up with a request for technical studies listed in Appendix H (20231201, Planning & Conservation League). Caltrans provided these studies. Hard copies of the Draft EIR/EA were delivered to the Yolo County Library on December 5, 2023, and the West Sacramento Library on December 6, 2023 and were available for the entire circulation period. The public notice included that the document would be available at these locations for public review.

The commenter provides language from the CEQA Guidelines stating that appendices shall be available for public review and shall be submitted to the Clearinghouse and states that they believe that Caltrans has violated CEQA. All appendices to the Draft EIR/EA were posted on the Caltrans and Clearinghouse websites for review on November 13, 2023. The technical studies listed in Appendix H are not appendices, but technical studies, containing highly technical and specialized analysis. The studies were summarized in the Draft EIR/EA as required and were available upon request. This approach complies with CEQA.

20231221, Center for Biological Diversity

December 21, 2023

Masum.Patwary@dot.ca.gov

Re: Request for 31-Day Comment Deadline Extension on the Draft Environmental Impact Report for the Yolo 80 Corridor Improvements Project

Dear Dr. Patwary,

The Center for Biological Diversity respectfully requests an extension of the comment period for the Draft Environmental Impact Report (DEIR) for the Yolo 80 Corridor Improvements Project (SCH # 2021060117). The current deadline of January 5, 2024 is inadequate to allow full review of the Draft EIR, which covers complex issues in its 596 pages plus almost another 600 pages of appendices. As the DEIR was circulated on November 13, 2023, much of the comment period overlaps with holiday season, which limits the public's ability to adequately review the DEIR. 1

It is simply not possible for the public to meaningfully review and comment on these documents in such a short timeframe. Due to the volume and complexity of the materials, we believe an additional 31 days is required. Extending the deadline to February 5, 2024 would allow for a more comprehensive review and more useful comments. We therefore respectfully request that you consider extending the comment period an additional 31 days.

Thank you for your attention to this matter.

Sincerely,

Tiffany Yap, D.Env/PhD
Senior Scientist
Center for Biological Diversity
tyap@biologicaldiversity.org

Response to Comment 1 in 20231221, Center for Biological Diversity

The commenter requests that the public comment be extended to February 5, 2024. The Draft EIR/EA was posted on the Caltrans website and CEQANet on November 13, 2023. A 45-day review period would have ended on December 27. However, in consideration of the holidays, Caltrans set the end of the initial comment period beyond the holidays to January 5, 2024. Caltrans subsequently extended the public circulation and comment period again to January 12, 2024.

No change to the Draft EIR/EA is necessary.

20240108, Sierra Club Yolano Group

SIERRA CLUB
YOLANO GROUP

Masum A Patwary
Environmental Scientist C
California Department of Transportation
District 3 703 B Street
Marysville, CA 95901

Dear Dr. Patwary:

This letter provides detailed comments on the Yolo 80 Draft Environmental Impact Report (DEIR) on behalf of the Yolano Group of the Motherlode Chapter of the Sierra Club.

I have prepared these comments as an unpaid Technical Advisor to the Yolano Group. In my professional life I am a Professor of Urban Planning and Design in the Department of Human Ecology at the University of California, Davis, and Chair of the UC Davis Community Development Graduate Group. I have studied urban and regional planning topics for more than 35 years, including interactions between transportation systems and regional land use patterns, and was formerly chair of the City of Berkeley Transportation Commission and cofounder of the Bay Area's regional transportation-land use-housing advocacy organization Transform. I am the author of urban planning textbooks used in universities worldwide, including *The Sustainable Urban Development Reader* (Fourth Edition, 2023), *Planning for Sustainability* (Third Edition to be published in late 2024), and *Reimagining Sustainable Cities* (2021). My awards in this field include the Dale Prize for Excellence in Urban and Regional Planning. 1

Let me say first that it's very unfortunate that the Yolo 80 project has proceeded this far without better alternatives being considered. As has been widely known for decades, widening freeways does not fix congestion problems; it just defers them for a few years while increasing overall motor vehicle use, greenhouse gas (GHG) emissions, local air pollution, suburban sprawl, and related problems. The climate crisis gives particular urgency to the need to stop increasing road capacity and vehicle use. Although California is making progress in many sectors towards reducing its GHG emissions, transportation is one area in which it is not. Transportation is also the single largest source of the state's GHG emissions, accounting for 38 percent of the total. 2

In order to meet California's GHG reduction goals, the state has adopted policies that discourage road expansion and its concomitant VMT increases. SB 743, passed in 2013, required agencies to use VMT as a metric for analyzing transportation impacts of new projects after July 1, 2020 instead of Level of Service (LOS). Put another way, this bill made reducing overall motor vehicle use the goal of state policy rather than short-term reductions in road congestion. The California State Transportation Agency (CalSTA)'s Climate Action Plan for Transportation Infrastructure (CAPTI), adopted in 2021, establishes policy that "projects should generally aim to reduce vehicle miles traveled" and counsels agencies that "when addressing congestion, consider alternatives to highway capacity expansion such as providing multimodal options in the corridor, employing pricing strategies, and using technology to optimize operations." However, Caltrans appears to be disregarding the state's new policy framework with multiple projects including Yolo 80. 2 cont.

A certain amount of congestion isn't bad in that it puts realistic constraints on the public's behavior. However, if congestion is deemed to be a problem beyond that point, the academic and professional literature shows that pricing, better land use planning, and other demand management solutions (e.g. working with large employers to promote vanpools and transit use) are the best strategies. But Caltrans never considered those alternatives in the Yolo 80 case. It clearly wanted to widen the freeway from the start, and indeed appears to have illegally begun widening I-80 east of the Mace intersection and west of the I-50 split in early Fall 2023 well before the current environmental review was completed. This action shows a high level of disregard for CEQA/NEPA processes, and we ask Caltrans to suspend construction activities on Yolo 80 until environmental review is completed and the environmental document certified. 3

The Yolo 80 DEIR has a great many deficiencies which require revising and recirculating the document. These include the following:

1. **<u>The environmental review studied an overly narrow range of alternatives</u>**. Almost all alternatives considered in this document add a lane to the freeway, thereby increasing road capacity and likely future VMT associated with Yolo 80. Other realistic alternatives that could address the main rationale for the project (congestion) at far lower cost without widening the freeway and increasing capacity weren't considered.

   The DEIR studies 7 alternatives, with (a) and (b) options listed for most of these depending on whether median ramps and a flyover lane at the eastern end are included. Alternative 1 is the required No Build alternative. Alternatives 2-6 add a lane with various configurations of High Occupancy Vehicle (HOV), High Occupancy Toll (HOT), and transit use on the new lane. Alternative 7 takes an existing lane for HOV use (informed observers know that this is highly unlikely to be chosen since Caltrans has always constructed a new lane for HOVs in the past). 4

   The most obvious alternative not included in the DEIR would be to price all lanes of the existing freeway. Pricing is widely acknowledged to be an effective means to discourage single-occupant vehicle travel (e.g. Small and Gomez-Ibanez, 2005; Clements, Kockelman, and Alexander, 2021). It can be easily implemented in California using FastTrak technology, with either a flat charge or variable congestion tolls, and is currently in use in northern California on the Bay Area bridges. Many other states nationally also use tolls to raise revenue or reduce congestion. Caltrans recently

created an example of the sort of facility that could be built for Yolo 80 when it constructed a new automated toll facility in Martinez for the east-bound I-680 bridge. Equity impacts of pricing can be decreased by direct rebates to low-income vehicle owners and/or by using toll revenue for public transit or other services benefitting low-income communities.

Pricing is also the most cost-effective alternative. Instead of costing up to $465 million, pricing the existing I-80 Yolo causeway would generate in excess of $300 million annually (~150,000 vehicles/day x an $8 toll = $1.2M/day x 365 days/year = $438M). In addition to equity rebates, this money could be used for transit and affordable housing near jobs in the corridor, further reducing traffic.

Pricing strategies are recommended by CalSTA's CAPTI framework as mentioned above as well as by the Sacramento Area Council of Governments (SACOG)'s 2020 Metropolitan Transportation Plan/Sustainable Community Strategy. Policy 11 of the latter document calls for the region to "Initiate a leadership role in testing and piloting roadway pricing mechanisms, such as facility-based tolling and mileage-based fees." That document also states (p. 73) "The roadway pricing mechanisms in the MTP/SCS are a critical component of the regional strategy to raise enough revenue to fund our transportation infrastructure, provide mobility benefits to residents, manage traffic, and help to achieve the region's SB 375 greenhouse gas reduction target." 4 cont.

Pricing alternatives would also have the benefit of improving transit performance. With tolls reducing overall traffic volume, buses would no longer be sitting in congestion. (A managed lane for both HOVs and transit, as proposed under several of the DEIR's alternatives, could easily become congested as HOVs move into it from other lanes.) Pricing itself is not a panacea, and would likely result in a modest increase in VMT over the current situation since free-flowing lanes carry more vehicles than congested lanes. However, such an increase would be far less than that caused by widening the freeway.

A second main alternative would be constructing a dual express lane in each direction with single occupant vehicles tolled (one lane would be added, one existing lane converted). This alternative is used in SACOG's travel demand model as part of its regional planning strategy, which Caltrans should have known about. It was also requested by the Yolo County Transportation District in its letter of May 4, 2022 to Caltrans, asking that "The Project Description...be written broadly enough to consider, and provide environmental clearance for, a multi-laned facility." Tolling two lanes in this way would be more effective at meeting the project's main goal of reducing congestion, and would have the additional advantage of generating additional revenue to mitigate VMT impacts.

A third potential alternative would be "using technology to optimize operations" as suggested by CAPTI. This approach is also a priority of SACOG's Intelligent Transportation Systems (ITS) program, which seeks to use tools such as freeway ramp meters, dynamic message signs, closed-circuit cameras, and real-time information for the public to manage traffic. Congestion on I-80 could conceivably be kept manageable if all entrances featured ramp meters, with transit vehicles and HOVs allowed to bypass ramp queues. Incentives would then be strong for drivers to carpool or take transit, thus reducing VMT and congestion. 5

A fourth category of alternatives in the I-80 corridor would focus on dramatically better public transit. These alternatives might include better and more frequent bus service, better and more frequent rail service, and better feeder bus and van service in local communities connecting to trains and long-distance express buses. 6

A fifth category of alternatives would consist of regional Transportation Demand Management (TDM) programs. Air quality management districts in California have historically implemented these in order to address local air quality programs in locations such as the Bay Area and Los Angeles basin. Such initiatives typically include agreements with large employers to implement carpool and vanpool programs, to subsidize employee transit usage, and to charge employees for parking. They also include public education and informational strategies to decrease drive-alone commuting. To be most effective in the I-80 corridor, TDM programs should be combined with regional and local land use planning to create a better balance of jobs, housing, and services in local communities. Since 2008 California state policy pursuant to SB 375 has encouraged such planning, for example requiring regional planning agencies to prepare Sustainable Community Strategies. 7

Studying all of these alternatives is certainly not necessary for a robust DEIR, and the fourth and fifth would involve challenging inter-governmental coordination. But given the increasingly strong state policy framework against road capacity expansion and VMT increases, we request that the technically simple and cost-effective alternative of pricing all existing lanes be included in a recirculated environmental document.

2. **The DEIR fails to adequately consider induced traffic**. The Yolo 80 DEIR has a major flaw: its analysis fails to consider long-term increases in traffic volume stemming from widening the road, increasing capacity, and in turn influencing land use and behavior patterns. Again, the project would increase road capacity regardless of whether the new lane is an HOV lane, toll lane, or free-flow lane.

   Road widening induces additional traffic in two main ways: 1) by changing short-term behavior, in particular as individuals see reduced congestion and choose to drive rather than using other alternatives such as carpooling, taking transit, or telecommuting; and 2) by changing long-term land-use patterns and behavior, in particular as individuals and businesses perceive that easy availability of commuting makes it possible to locate in certain places rather than others. Induced traffic is a well-established concept in the research literature dating back at least 50 years (e.g. Downs, 1962, Handy and Bournet, 2014; Hymel, 2019; Volker, Lee, and Handy, 2020). Many decades of experience in California also demonstrates the reality of this phenomenon, for example through the rapid growth of communities such as Vacaville, Dixon, and Fairfield which are almost entirely dependent on I-80 for long-distance motor vehicle travel. 8

   Caltrans appears to have employed an identical future land use scenario for all DEIR alternatives. Agency materials state that "Land use inputs were not developed for each individual alternative. Instead, the SACOG 2020 MTP/SCS land use forecasts associated with specific model years 2016, 2027, and 2040 were used without modification....This approach limits the sensitivity of the traffic and revenue forecasts to any unique land use effects associated with each alternative." (Caltrans, 2023b, 10).

Consequently Caltrans' DEIR analysis appears to incorporate the first form of induced traffic but not the second. The DEIR shows a substantial increase in traffic at the 2029 opening, but only modest increases long-term. Table 2.2-9 (pp. 2-194-105) shows an immediate 9.2% increase in VMT for Alternative 2 compared with the No Build alternative, but a 2049 increase of only 4.2%. The corresponding figures for Alternative 3 are 9.2% and 4.3%. If induced traffic due to changing land use and lifestyle patterns were fully taken into account, these long-term figures would likely be significantly higher. Indeed, if NCST induced traffic figures of 495,400 VMT/day were simply added to the No Project alternative for these years, Alternatives 2 and 3 would have had increases of 11% in 2049. Actual increases would certainly be higher, since the DEIR shows the No Project alternative to be highly congested, reducing VMT, whereas alternatives would have greater throughput. 8 cont.

The DEIR flatly states (p. 3-38) that the project would have "less than significant impact" on population growth either directly or indirectly. This is particularly surprising given that the document previously includes the NCST data mentioned above showing more than 495,000 additional VMT/day for most alternatives. Here as in other locations the DEIR appears not to have incorporated the NCST data into analyses.

For this DEIR Caltrans District 3 relied on analysis procedures not compatible with more recent Caltrans Headquarters standards that require induced traffic be considered. Caltrans' 2020 CEQA guidance states that

> "[C]apacity-increasing projects generally need to be evaluated for their potential induced travel. The mechanisms by which induced travel occur include:

- Route changes (may increase or decrease overall VMT)
- Mode shift to automobile use (increases overall VMT)
- Longer trips (increases overall VMT)
- More trips (increases overall VMT)
  - Location and land use changes (increases overall VMT)" (Caltrans, 2020a, 18)

Caltrans HQ adopted the NCST induced travel calculator in 2020 as an official tool, and the agency's *Transportation Analysis Framework* document provides extensive guidance on how it is to be applied (Caltrans, 2020a). Table 2 on page 17 of this document specifically says that the NCST calculator is to be applied to Yolo County. But the DEIR fails to integrate NCST numbers for induced traffic into its analysis of long-term impacts of the project, thus understating VMT and GHG emissions while overstating congestion relief.

3. **The DEIR fails to adequately take into account changing driver behavior**. A second modelling inadequacy of the DEIR is that it uses a simplistic static trip assignment model rather than a more sophisticated dynamic traffic assignment model. The latter type of model takes into account a variety of feedback loops resulting from traffic congestion, including drivers changing the time of their trips so as to avoid congestion. Use of a static trip assignment model can have the effect of understating the increase in VMT. A related problem is that the model wrongly assumes that additional traffic would be routed off the congested highway up through Woodland, which is unlikely given the distance and likely congestion of that alternative route. Again, this points to a 9

model with major inadequacies. Interviews conducted as part of Dr. Amy Lee's dissertation *The Policy and Politics of Highway Expansions* show that Caltrans rejected better models (dynamic traffic assignment) because they would have shown increased VMT (Lee, 2023). The DEIR's own technical appendices acknowledge limitations of the static assignment model:

> "Another limitation of the SACSIM19 model is the use of static assignment rather than dynamic assignment of vehicle trips. With congested conditions, static assignment can result in volumes that exceed capacity for the analysis period. With dynamic assignment, trips are rerouted or shifted in time so that capacity is met." (Transportation Analysis Report, I 80/US 50 Managed Lanes, November 2023, 78).

9 cont.

Dynamic travel assignment models are increasingly used elsewhere in the country for projects in urban areas with congested conditions. For example, Colorado's Department of Transportation has concluded that

> "DTA is useful when the analyst's study area includes a congested transportation facility as well as its parallel facilities (or parallel capacity)....DTA's assignment methods is more sophisticated than a traditional travel demand model as it accounts for bottlenecks. DTA also allows for temporal spreading (peak-hour spreading)." (Colorado Department of Transportation, 2023)

4. **The DEIR relies on inadequate mitigations**. The DEIR assumes that VMT/GHG increases can be mitigated if Caltrans funds projects in local cities. But its project list covers only 43% of its estimated VMT increase (which is likely low in that it appears not to include truck traffic), and it's doubtful that such mitigations would be additional and verifiable. These mitigations would have to be implemented by other entities over which Caltrans has no control, and mitigation funding is questionable, with Caltrans committing to funding only 12.5% of the cost of trip reduction programs, for example. The mitigations therefore do not meet the "fully enforceable" standard required by CEQA.

   At least one mitigation,"Build overcrossing at future Nishi Student Housing Development site" is a project that has long been planned by the developer of the Nishi student housing project and approved by the Davis City Council. This "mitigation" is not an additional GHG reduction and would simply give public funds to a private developer. Many other mitigations focus on increasing use of long-distance express bus services. Such services can have their own traffic-inducing impacts, for example if they encourage households to move to outlying suburban communities thinking that they can use long-distance express buses to commute to jobs in Sacramento. Such households then use their motor vehicles for many other types of trips, increasing VMT in the region. For such reasons Caltrans must identify fully enforceable and fully funded mitigations to offset the full amount of likely VMT and GHG increases in the DEIR.

10

5. **The document falsely concludes no or less-than-significant impact for important topics.** For NEPA and CEQA purposes the DEIR (Tables S-1 and S-2) wrongly states that the alternatives studied would have "no impact" on urban growth and population, air pollutants, and energy demand, and "less than significant" impacts on GHGs and state climate policy. These statements are not true and

11

should be revised based on additional analysis and up-to-date modeling practices within a recirculated document.

A) Urban growth and population: The DEIR states (Summary-7) "Build Alternatives 2a and 2b **would not remove an impediment to growth**, provide an entirely new public facility, or provide new access to previously unserved areas. Build Alternatives 2a and 2b would not directly increase development of residential land uses, encourage growth outside of existing growth boundaries, **or alter existing access to residential and employment areas**; therefore, no adverse effect associated with population growth would be anticipated with implementation of Alternatives 2a and 2b." (Emphasis added. Text for alternatives 3a and b, 4a and b, and 5a and b says "Same as effects described under Build Alternatives 2a and 2b.")

This is not true. Common sense tells us that since no alternative through-route exists congestion on I-80 is a prime determiner of urban growth in the corridor. If the project reduced congestion upon opening, access to residential and employment areas along the corridor would be greatly altered. It could take, for example, 25 minutes rather than 1 hour to get from Vacaville to Sacramento in the morning rush hour. Such a time difference would have a large impact on people's travel and residency decisions, fueling urban growth and population increase in some locations rather than others. 11 cont.

These "no impact" conclusions, like many other DEIR conclusions discussed below, arise in part because Caltrans did not consider induced traffic within its model. However, this is a well-established concept in the research literature, much of which is summarized by Volker, Lee, and Handy, 2020. The DEIR itself acknowledges the induced traffic concept by including data from the National Center for Sustainable Transportation (NCST) showing an additional 495,000 vehicle miles travelled (VMT) for most alternatives (Table 2-1-26). If induced traffic had been considered, the DEIR's conclusions about no effect on urban growth and population would not have been supported.

B) Air pollutants: Sacramento and Yolo counties are state non-attainment areas for 8-hour ozone and PM 2.5 air pollutants. In terms of pollutant increase, the DEIR (Summary-16) finds "no impact" for the No Build alternative. This is unlikely to be true and shows deficiencies in the underlying analysis. Indeed, Table 2-2-34 shows a 19.9% increase in congestion for the No Project alternative in 2049 (idling cars usually increase pollution), and Table 5 In Appendix J shows increases of 3.5% and 22.2% respectively for PM10 in the years 2029 and 2049 versus the baseline year of 2019, and an increase of 4.5% for PM2.5 in 2049. (That appendix does not show results for other pollutants such as carbon monoxide and ozone. The increases for particulate matter are dismissed with the following statement: "the difference between Build and No Build would be not significant in terms of PM10 and PM2.5 in regards to the increase of total AADT [Average Annual Daily Traffic] between Build and No Build with a HOV-HOV connector.") 12

The DEIR also finds "less than significant" air quality impacts for all other project alternatives. This is also unlikely to be true. Table 5 in Appendix J shows increases of between 2.9% and 13.0% for PM10 in the opening year of 2029 for alternatives 2-7b compared with the 2019 baseline. For 2049 it shows PM10 increases of 0.5% to 9.5% for alternatives 2-7a and 6.1% to

26.9% for alternatives 207b. For PM2.5, the increases range from -1.9% to 6.7% for the "b" alternatives. It is hard to see how these increases can be called "less than significant." Such figures also do not take into account induced traffic and likely increases in congestion resulting from that well-documented phenomenon, which would likely increase air pollution further. 12 cont.

C) Energy demand: The DEIR states (Summary-12) "When balancing energy used during construction and operation against energy saved by relieving congestion and other transportation efficiencies, the project would not have substantial energy effects. Therefore, no adverse permanent effects are anticipated."

This statement is likely false, since it assumes congestion would actually be relieved in the long-term which is inconsistent with the literature on induced traffic (much of which is summarized in Volker, Lee, and Handy, 2020), and the historical experience of freeway-building in California.

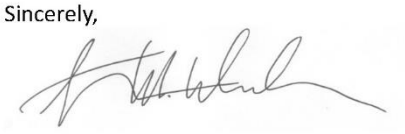
Even without considering induced traffic stemming from secondary land use change and population/employment location decisions, the DEIR's modeling shows sizeable traffic increases from roadway dynamics alone (less congested lanes attracting more drivers). These VMT increases are in turn likely to require additional energy, making a finding of "no adverse impacts" inappropriate. (The form of energy will of course shift as vehicles electrify, though electric vehicles will still have impacts.) 13

The exact traffic increases from existing conditions under DEIR modeling are difficult to calculate since the DEIR fails to provide existing traffic volume (measured as Average Annual Daily Traffic) anywhere. SACOG gives this figure as 136,700 vehicles in 2017 at the Yolo/Solano county border (https://vitalsigns.mtc.ca.gov/indicators/traffic-volumes-at-gateways). Taking this as the baseline and using Table 4 in Appendix J figures for future AADT, 2029 traffic increases from roadway dynamics compared to the recent baseline would range from 15.0% for the No Project alternative to 14.5%-27.1% for the various alternatives. 2049 traffic increases would range from 31.9% for the No Project alternative to 27.3% to 39.6% for the various alternatives. Again, it is hard to see how such large increases in traffic would produce "no adverse impacts" in terms of energy.

D) GHGs: **The DEIR itself shows that CO2 emissions would increase by between 2.2% and 10.9% for the various project alternatives in the 2029 opening year** (Table 7, Appendix J). That is a substantial amount; it is hard to see how this can be called "less than significant." In the year 2049 the document shows all alternatives reducing GHG emissions versus existing and No Build conditions, but in many cases these reductions are small. For the "b" alternatives, for example, they range between -1.4% and -4.9%. **Most importantly, these modelled GHG emissions reductions do not take into account induced traffic.** 14

If induced traffic is taken into account, the GHG increase would be large. The DEIR itself includes data from NCST modeling showing likely increases of 495,300 vehicle miles traveled daily from most project alternatives (Table 2-1-26). Based on these NCST figures and average GHG emissions figures for passenger motor vehicles, **widening I-80 in Yolo County would add at least 79,545 tons of CO2e emissions annually (218 tons/day)—equivalent to increasing Davis**

citywide emissions by at least 14%, or unincorporated Yolo County emissions by at least 7.3%. (This figure would be higher still if the higher-emitting truck percentage of up to 29% of vehicles were included.) Building on Table 7, **the increase in GHG emissions produced by the I-80 project in 2049 would then range between 15.4% and 29.5% for alternatives 2-5 (those that add a lane) compared with the No Project alternative**. This is a very large amount for a future date when the state plans to be carbon-neutral, and hardly "less than significant." 14 cont.



The DEIR analysis of greenhouse gas emissions is thus highly inadequate. Caltrans should bring its model up-to-date by including induced travel from freeway projects, and should revise and recirculate this document based on a more accurate model taking this phenomenon into account.

E) State climate policy: Under its 2022 Scoping Plan, California has a state climate planning goal of achieving carbon neutrality by 2045, which means cutting GHG emissions 85% compared with 1990 as well as sequestering large amounts of emissions in natural landscapes and below-ground. In contrast, the I-80 project is likely to produce sizeable increases in GHGs both in the short-term (2029) and the long-term (2049), as shown above. Thus this project, like other freeway widening projects that Caltrans continues to pursue, cannot be said to have "less than significant" impacts on state climate policy. 15

For the above reasons, the Yolo 80 DEIR should be revised and recirculated.

Thank you very much for your attention.

Sincerely,

Stephen M. Wheeler, Ph.D.
On behalf of the Yolano Group of the Motherlode Chapter of the Sierra Club

Response to Comment 1 in 20240108, Sierra Club Yolano Group

This introductory comment provides the qualifications of the letter author and does not discuss the adequacy of the EIR/EA. No changes to the Draft EIR/EA are necessary.

Response to Comment 2 in 20240108, Sierra Club Yolano Group

The commenter recommends alternatives to congestion other than widening the freeway, and states the project disregards the state's new policy of considering alternatives to highway capacity expansion which increase GHG and VMT.

Please refer to Master Response B for information related to project alternatives. Additionally, the environmental analysis for the project alternatives conforms to existing standards, guidance, policies, and best practices. No changes to the Draft EIR/EA are necessary.Please refer to Response to Comment 41 in 20240112, City of Davis for more information relating to compliance with state GHG emissions reduction goals.

Response to Comment 3 in 20240108, Sierra Club Yolano Group

Please refer to Master Response C for information related to this comment.

Response to Comment 4 in 20240108, Sierra Club Yolano Group

Please refer to Master Response B for information related to project alternatives.

Response to Comment 5 in 20240108, Sierra Club Yolano Group

As discusses in Section 1.3, *Project Description*, of the Draft EIR/EA, the project proposes to construct the ITS elements listed by the commenter as well as implement other technology to help improve safety and reliability by increasing system monitoring capabilities, actively managing traffic, providing real-time information to the traveling public, and optimizing incident response. Elements such as ramp meters, changeable message signs, closed-circuit television (CCTV), and high-speed fiber-optic communication will be constructed as part of the project. Additionally, new technology will be utilized, including off-pavement detection, high-resolution color changeable message signs, and high mast lowerable CCTV poles, which can house multiple CCTVs on a single pole. Table 1.3-1 of the Draft EIR/EA provides types and locations of proposed ITS improvements for all build alternatives.

No changes to the Draft EIR/EA are necessary.

Response to Comment 6 in 20240108, Sierra Club Yolano Group

The Draft EIR/EA considers a transit-only lane as Alternative 6. This alternative incorporated the expansion of transit services included in the MTP/SCS. Additionally, Mitigation Measure TRANS-1 would require contributions to increase bus and passenger rail service frequency along the corridor, as well as provide fare reductions as part of VMT mitigation for the project. No changes to the Draft EIR/EA are necessary.

Response to Comment 7 in 20240108, Sierra Club Yolano Group

Transporation Demand Management (TDM) strategies are discussed in Section 1.3.1.3 of the Draft EIR/EA. TDM strategies, including voluntary trip reduction programs, are also included in Section 2.1.10, *Traffic and Transportation/Pedestrian and Bicycle Facilities*, of the Draft EIR/EA (see AMM TRANS-1). As discussed in the Draft EIR/EA Section 1.3.1.3, TDM programs on their own would not meet the purpose and need of the project. No changes to the Draft EIR/EA are necessary.

Response to Comment 8 in 20240108, Sierra Club Yolano Group

Please refer to Master Response A for information related to induced travel and VMT mitigation.

The commenter is also skeptical that the project would have a less than significant impact on population growth based on the additional VMT. Section 2.1.5 of the Draft EIR/EA discusses population growth. Also see response to comment 11 below. No changes to the Draft EIR/EA are necessary.

Response to Comment 9 in 20240108, Sierra Club Yolano Group

Please refer to Master Response D for information related to modeling methodologies.

Response to Comment 10 in 20240108, Sierra Club Yolano Group

Please refer to Master Response A for information related to VMT mitigation. Also, see Response to Comment 10 in 20240112, City of Davis relating to funding.

Response to Comment 11 in 20240108, Sierra Club Yolano Group

The growth assessment in the Draft EIR/EA acknowledges the potential influence the Build Alternatives would have on population growth. As stated in the Draft EIR/EA Section 2.1.5.3, “The rate and location of regional growth and land use change may be influenced by travel time and travel cost for residents and workers. Improvements in access, traffic conditions, and lower travel costs can influence the attractiveness of some areas over others for future development.” The Draft EIR/EA concludes that by increasing freeway capacity and reducing travel costs, the Build Alternatives may change the rate of development expected compared to the No Build condition, and because I-80 is a key link between the Sacramento and Bay Area, and homes in the Sacramento area are typically more affordable than homes in the Bay Area, the improved travel times on I-80 in the project corridor could influence more Bay Area residents to move east to the Sacramento area and commute to job centers. The Draft EIR/EA, therefore, discloses potential direct and indirect growth attributable to induced traffic and changes in travel time and cost.

The Draft EIR/EA concludes that the Build Alternatives would influence the pace of planned growth in the region by improving travel times and capacity along I-80. Growth in areas where development is not planned is limited by other impediments (e.g., floodplain conditions, long-term wildlife refuge and agricultural preserves, and built-out conditions in city limits) and local land use policies, which control regional land use changes. The Build Alternatives’ impact on

unplanned population growth is determined to be less than significant. Refer to Sections 2.1.5.3 and 3.2.14 of the Draft EIR/EA. Additionally, please refer to Master Response A for information related to induced demand. No changes to the Draft EIR/EA are necessary.

Response to Comment 12 in 20240108, Sierra Club Yolano Group

Caltrans' no impact determination for the No Build Alternative was based on traffic data provided from Caltrans' traffic forecasting. Air pollutant emissions associated with the roadways in the project area were estimated using specific traffic data and conditions provided by the Caltrans District 3 traffic forecasting and the CT-EMFAC2021 emission model. Operational PM10 and PM2.5 emissions are specifically presented in Tables 2.2-10 and 2.2-11. Emissions results for additional pollutants, including ROG and NOx, are included in Appendix G of the Air Quality Technical Report. See also Response to Comment 2 in 20240112, Sacramento Metropolitan Air Quality Management District for a summary of operational emissions modeling and an analysis of emissions trends among the modeled conditions (i.e., Opening 2029, MTIP 2040, and Design 2049).

Air pollutants in California are closely linked to the state's transportation energy consumption, which has improved due to technological advancements, environmental policies, and innovation. Gasoline and diesel remain the dominant fuels used by the transportation sector. To meet strict emission standards, manufacturers install emission control systems in vehicles, enhancing engine efficiency. However, regulations such as the Low Carbon Fuel Standard, and zero-emission vehicle rules are expected to gradually replace gasoline and diesel engines with more energy-efficient systems, resulting in lower greenhouse gas emissions. Additionally, the anticipated increase in vehicle miles traveled (VMT) once a project is open to the public may not be substantial, as recent estimates show only a modest 1.4 percent rise in statewide VMT compared to the previous year.

Notably, High Occupancy Vehicle (HOV) and High-Occupancy Toll (HOT) lanes with zero emission vehicle penetration are expected to have lower emissions than the No Build scenario, resulting in reduced congestion and projected decreases in truck traffic. This reduction is attributed to reduced congestion (resulting in higher travel speeds across the modeled region) and an anticipated decrease in truck traffic percentages. Overall, this project is expected to reduce greenhouse gas emissions, enhance mobility, and provide traffic relief.

The project is included in the SACOG Metropolitan Transportation Plan/Sustainable Communities Strategy (MTP/SCS), which incorporates air quality standards, including ozone attainment goals, into project planning. SACOG must comply with National Ambient Air Quality Standards (NAAQS).

Caltrans determined less than significant air quality impacts for all other project alternatives as each of the Build Alternatives would improve operations, reduce congestion, and increase vehicle occupancy within the travel corridor as compared to the No Build Alternative.

Please refer to Master Response A for information related to induced travel, including the use of the MTP/SCS SACSIM model. Please refer to Master Response I which includes information related to GHG emissions.

No changes to the Draft EIR/EA are necessary.

Response to Comment 13 in 20240108, Sierra Club Yolano Group

Please refer to Master Response A for information related to induced travel and VMT mitigation and Master Response I for information related to data and modeling used for impacts analyses. The commenter also states that existing traffic volume data is not provided. Traffic data is summarized in Section 2.1.10 *Affected Environment* of the Draft EIR/EA, specifically Section 2.1.10.4 *Roadways* discusses traffic volumes. However, Appendix A of the TAR prepared for the project provides AADT information for existing conditions. The TAR is available on the project website with the Final EIR/EA (https://dot.ca.gov/caltrans-near-me/district-3/d3-projects/d3-i80-corridor-improvements).In terms of emissions, High Occupancy Vehicle (HOV) and High-Occupancy Toll (HOT) lanes with the anticipated non-growth of VMT, the projected emissions are lower than the No Build scenario. This reduction is attributed to reduced congestion (resulting in higher travel speeds across the modeled region) and an anticipated decrease in truck traffic percentages. Overall, this project is expected to reduce greenhouse gas emissions, enhance mobility, and provide traffic relief.

Response to Comment 14 in 20240108, Sierra Club Yolano Group

The commenter questions the accuracy of the Draft EIR/EA's finding of less than significant relating to GHG, in part because CO2 emissions would increase by between 2.2% and 10.9% for the various project alternatives in 2029, and the modelled GHG emission reductions do not take into account induced traffic.

The Draft EIR/EA analysis of GHG emissions was based on CT-EMFAC2021, an emission tool that calculates project-level emissions using data from CARB's EMFAC 2021 model. As discussed in the Draft EIR/EA (Section 3.4.4.2, *Quantitative Analysis*) "GHG emissions quantified using CT-EMFAC are therefore estimates and may not reflect actual on-road emissions. Furthermore, the model does account for induced travel. Modeling GHG estimates with EMFAC or CT-EMFAC nevertheless remains the most precise means of estimating future greenhouse gas emissions. While CT-EMFAC is currently the best available tool for calculating GHG emissions from mobile sources, it is important to note that the GHG results are only useful for a comparison of alternatives. Federal CAFE and GHG emissions standards continue to evolve, and models will be updated to account for regulatory changes."

The NCST Induced Travel Calculator was applied as outlined by the TAF procedures to adequately estimate induced demand. In addition, the Draft EIR/EA included 2020 SACOG MTP/SCS land use projections in which the project is included in the future year network, to estimate induced traffic and growth. Therefore, GHG emissions of the project related to vehicle travel are not underestimated. Caltrans determined that GHG increases are less than significant as the project is expected to improve traffic flow and reduce congestion.

Please also refer to Response to Comment 2 in 20240112, Sacramento Area Bicycle Advocates. No changes to the Draft EIR/EA are necessary.

Response to Comment 15 in 20240108, Sierra Club Yolano Group

As discussed in Section 3.2.8 *Greenhouse Gas Emissions*, “GHG emissions for the Build Alternatives would be lower for design year 2049 compared to existing year (see Table 3.4-2).” Therefore, the project directly supports the state’s long-term target of carbon neutrality by 2045, as outlined in the 2022 Scoping Plan and pursuant to Assembly Bill 1279.

Please refer to Response to Comment 41 in 20240112, City of Davis for more information relating to compliance with state GHG emissions reduction goals.

Re: **Comments on I-80 Corridor Improvement Project EIR/EIS**

Dear Mr. Bhattal, Mr Patwary and Mr. Keaton:

I am writing on behalf of the Yolo Basin Foundation Board of Directors. Yolo Basin Foundation works in partnership with CA Department of Fish and Wildlife (CDFW) to provide educational and public access programs at the Yolo Bypass Wildlife Area (Wildlife Area). The Wildlife Area is a 16,800-acre mosaic of managed wetland habitat and farm and range land located in the Yolo Bypass. The Wildlife Area is located on both sides of the Interstate 80 Causeway.

Yolo Basin Foundation staff and board members participated in two of the public scoping meetings for the proposed project. On October 2, 2023, Foundation staff met with Mr. Bhattal and others in the field to discuss the elements of the improvements related to the Yolo Causeway. We appreciate the opportunity to speak with Caltrans personnel directly involved in the planning and implementation of the proposed project. 1

There are at least three species of bat that live under the Yolo Causeway in the expansion joints and the decking. The majority of these are a large maternal colony of Mexican free-tailed bats.The estimated size of this colony, at its peak, is 250,000. The bat population increases in the spring and spends the summer and early fall at this important roost. In June to early July the bats give birth to their young which become volant in mid-August. This colony is widely known throughout the Sacramento Region and beyond. It may be the largest colony in California. There are many of these bats that reside in the bridge all year and others that leave in the fall.

For over 20 years Yolo Basin Foundation has provided a program called Bat Talk and Walks four to five evenings a week from early June through September. Expert Yolo Basin Foundation staff provide a lecture at the Yolo Bypass Wildlife Area headquarters on County Road 32B and then lead groups of up to 70 individuals in carpools out to view the evening bat emergence of the tens of thousands of Mexican free-tailed bats. We had 4,433 attendees at the events in 2023. For many people it is their first experience viewing a bat emergence and they are truly inspired. 2

During the summer of 2023, as the current construction improvements were being conducted, the bat behavior was very unpredictable from night to night. Normally, during the summer, the bats exit the bridge in the same numbers at the same locations. This past summer, from night to night, they frequently changed the exit location and the number of bats exiting any given location varied substantially.

Yolo Basin Foundation – comment letter
January 9, 2024

We were pleased to read that "No construction would occur on the existing bridge over the Yolo Bypass, so the maternity colony that roosts under the bridge would not be directly impacted." We assume that this means that the Causeway will not be widened and that activities will be limited to lane realignment and installation of toll lanes and signs. 2 cont.

Yolo Basin Foundation does have several concerns regarding the I-80 improvement project since it will involve noisy activities.

1. Conservation of this important bat roost is a high-priority, and we encourage you to consider this during the life of the I-80 improvement project. Monitoring of the bat colony population during the construction phase is important. 3

   Timing of improvements to the Causeway will be key to avoid disturbing the summer roosting and birthing season.

   We request that improvement activities during the summer be limited to daytime hours only. Additionally, we request that activity cease during the months of April through August to protect the maternity colony.

2. The entrance to the Wildlife Area is at the West levee just south of the beginning of the Causeway. Access for management of the Wildlife Area by CDFW personnel at that entrance is crucial. This is the only access road for public uses including: 1) Yolo Basin Foundation's Bat Talk and Walk; 2) YBF's Discover the Flyway school field trip program which brings 3,200 K-12 students from throughout the Sacramento Region. School buses or parent carpools use this entrance Monday through Friday from September through the end of May; 3) This the access for hunters from October through early February; and finally, 4) this is only entrance for other public use of the area for wildlife viewing all year. It is estimated that 30,000 people use this entrance every year to enjoy the multiple values of the Yolo Bypass Wildlife Area. 4

   It is important that the entrance to the Wildlife Area at the East Chiles Exit on County Road 32A be kept open and accessible during all phases of construction on the Causeway.

3. We support improvements to the east and west bike lane entrances. If lighting is installed at the bikeway entrances or along the route, we request that low impact bulbs be used that shine downward. Any additional lighting on the Causeway could disrupt the bats , especially during nursing season when bats return during the night to feed their young. 5

Thank you for the opportunity to make comments on the I-80 Improvement Project EIR/EIS. Please contact Martha Diepenbrock if you have any questions at martha.diepenbrock@gmail.com.

Sincerely,

Martha Diepenbrock, Executive Director

2

Response to Comment 1 in 20240109, Yolo Basin Foundation

This introductory comment provides background on the role of the foundation, information on the Yolo Bypass Wildlife Area, and indicates the participation at a field meeting to discuss elements of the project. This comment does not discuss the adequacy of the Draft EIR/EA. No changes to the Draft EIR/EA are necessary.

Response to Comment 2 in 20240109, Yolo Basin Foundation

The commenter expressed concern about the effects to the bat populations during construction.

The only construction activity proposed for the project within 500 feet of the bat maternity colony associated with the Yolo Causeway bridge structure is lane restriping. The Draft EIR/EA specifically states that no structural modification of the Yolo Causeway is proposed (Chapter 1, "The Yolo Causeway would not be structurally modified."). Based on the type of work activity proposed and in consideration of AMM BIO-12 through AMM BIO-15, no construction activities having the potential to generate impacts to the bat maternity colony are expected to take place within 500 feet of the colony within the maternity period (March 1 to August 31). No changes to the Draft EIR/EA are necessary.

Response to Comment 3 in 20240109, Yolo Basin Foundation

Yolo Basin Foundation's concerns regarding timing and effect of construction activities for this project are addressed by the Draft EIR/EA's conservation measures for bats (AMM BIO-12 through AMM BIO-15). No changes to the Draft EIR/EA are necessary.

Response to Comment 4 in 20240109, Yolo Basin Foundation

The commenter questions the public's ability to have access to the Wildlife Area at the East Chiles Exit on County Road 32A during all phases of construction on the Causeway.

The entrance to the Wildlife Area for westbound travelers will be affected during one (1) weekend for a 55-hour ramp closure at the I-80 westbound offramp to Chiles Road/CR 32A. Westbound drivers will be directed to a detour to Mace Boulevard if they wish to access CR 32A and the Wildlife Area entrance during this one weekend closure. The Wildlife Area entrance from eastbound and westbound directions will be open during all other construction activities. No changes to the Draft EIR/EA are necessary.

Response to Comment 5 in 20240109, Yolo Basin Foundation

The commenter requests low impact light bulbs should lighting be installed at the east and west bikeway entrances on the Causeway.

No new lighting is proposed for the Yolo Causeway. When needed, Caltrans plans to use LED's or bulbs rated to emit or produce light output of a warm white color spectrum in areas where impacts to light sensitive natural resources may occur. No changes to the Draft EIR/EA are necessary.

Re: Comments on Draft Environmental Impact Report (DEIR) for the Yolo 80 Corridor Improvements Project (SCH # 2021060117)

Dear Mr. Patwary,

These comments are submitted on behalf of the Center for Biological Diversity (Center) regarding the Draft Environmental Impact Report (DEIR) for the Yolo 80 Corridor Improvements Project (SCH # 2021060117). The Center has reviewed the DEIR for the Project and is concerned that the DEIR fails to adequately assess and mitigate the Project's impacts to special-status species, sensitive habitats, wildlife movement, greenhouse gas emissions and climate change, public resources, and existing communities. Adding more lanes to roadways will not reduce vehicular travel nor meet the state's air quality goals. Doing so will only worsen traffic and emissions while harming sensitive wildlife and habitats. The Center strongly urges Caltrans to implement Build Alternative 7a, which would repurpose a general-purpose lane for an HOV 2+ lane and no new lanes would be constructed. A revised DEIR for public review that provides adequate analyses and mitigation for the Project's various build alternatives' impacts and complies with CEQA is required. 1

The Center is a non-profit, public interest environmental organization dedicated to the protection of native species and their habitats through science, policy, and environmental law. The Center has over 1.7 million members and online activists throughout California and the United States. The Center has worked for many years to protect imperiled plants and wildlife, open space, air and water quality, and overall quality of life for people in California.

I. The DEIR Fails to Adequately Assess and Mitigate the Project's Impacts to Biological Resources.

The California Environmental Quality Act (CEQA) requires an EIR to provide decision-making bodies and the public with detailed information about the effect a proposed project is likely to have on the environment, to list ways in which the significant effects of a project might be minimized, and to indicate alternatives to the project. (Pub. Res. Code § 21061.) CEQA further requires a lead agency to mitigate to the extent feasible significant impacts. (CEQA Guidelines § 15064.4.) The DEIR fails to provide sufficient analyses and mitigation for the Project's potential impacts to biological resources and therefore fails to comply with CEQA.

The DEIR fails to adequately assess and mitigate the Project's impacts to biological resources. The Project includes potentially widening portions of and subsequently increasing traffic on approximately 20 miles of roadway that slices through the Yolo Bypass Wildlife Area, the Sacramento River (in two locations), and the Putah Creek. Any new construction in or near the Caltrans right-of-way will impact more than just its footprint. 2

The Project must be considered in context of the landscape it is located in and surrounded by. Limiting the analyses to just the Project footprint undermines the rich biodiversity and connectivity value of the area, which includes the road as it exists now as well as nearby habitats. The area supports a wide variety of special-status species and sensitive habitats that will be significantly impacted by a larger road with more vehicles and traffic and therefore more noise, light, carbon emissions, and runoff pollution. Instead of worsening the road's impacts on the environment, Caltrans has an opportunity to follow the science about induced growth and instead of widening the road to encourage more drivers, traffic, and emissions, the Project should restore degraded habitats and enhance wildlife connectivity at their existing infrastructure to make the landscape and its inhabitants more climate resilient. In fact, doing so is required by Assembly Bill 2344 (AB 2344) (see below for more information). The DEIR fails to adequately assess and mitigate the Project's impacts to wildlife connectivity, special-status species, and sensitive habitats.

A. The DEIR fails to adequately disclose and analyze the Project's impacts to wildlife movement and habitat connectivity.

The DEIR erroneously states the Project's impacts to wildlife movement are less than significant with mitigation without providing substantial evidence to support such claims. Although the DEIR mentions that the Sacramento River, Putah Creek, Yolo Bypass, and adjacent upland forested communities "could provide habitat connectivity within the BSA" (DEIR at 2-291), the DEIR fails to provide a sufficient description of the area's baseline conditions and its importance for wildlife movement and connectivity. Instead, it states that the project is located "in areas with high levels of anthropogenic disturbances within and near the Caltrans right-of-way" (DEIR at 3-16), dismissing the biodiversity and connectivity value of the area. It is also misleading. Although there is an existing road there, the area still provides important habitat and connectivity for numerous special-status animals and plants. Widening the road and increasing traffic will fortify existing barrier effects and significantly affect north-south movement in the Sacramento River and Yolo Bypass Wildlife Area and east-west movement in Putah Creek. The 3

DEIR fails to adequately assess and mitigate the Project's impacts to local, regional, and global wildlife movement and habitat connectivity and is therefore insufficient and fails to comply with CEQA.

Contrary to the DEIR's statements, the California Department of Fish and Wildlife (CDFW) identifies much of the Project area as "ACE Rank 3 – Connections with implementation flexibility" (Figure 1), which are defined as "areas that have been identified as having connectivity importance, but have not been identified as channelized areas, species corridors, or habitat linkages at this time. This may change with future changes in surrounding land use or regional specific information" (CDFW, 2019). It is immediately adjacent to areas identified as "ACE Rank 4 – Conservation Planning Linkages" (Figure 1), which are areas that "represent the best connections between core natural areas to maintain habitat connectivity" (CDFW, 2019). Importantly, CDFW also defines the area as having the highest ecoregion biodiversity ranking (Figure 1), which makes wildlife movement and habitat connectivity critical to protect the area's existing biodiversity. Yet the DEIR fails to adequately disclose, assess, and mitigate the Project's impacts to wildlife movement and habitat connectivity in and near the Project area.

3 cont.

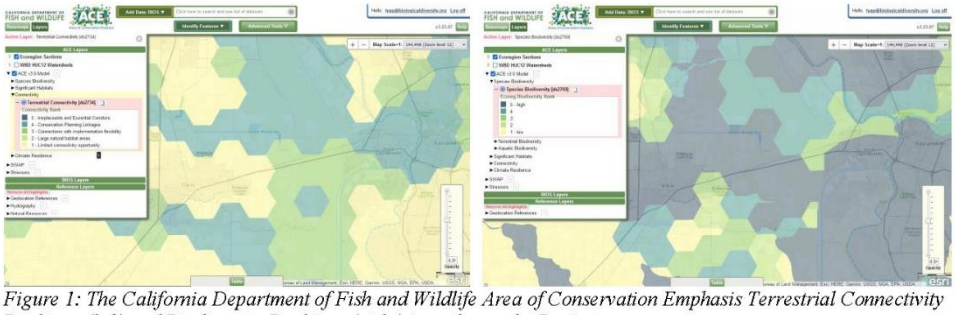

Figure 1: The California Department of Fish and Wildlife Area of Conservation Emphasis Terrestrial Connectivity Rankings (left) and Biodiversity Rankings (right) in and near the Project area.
Source: https://apps.wildlife.ca.gov/ace/. Accessed December 26, 2023.

The DEIR also fails to mention that the Project bisects a Global Priority Important Bird Area (IBA) that has other IBAs nearby (Figure 2). Networks of IBAs are critical for regional, state, and global connectivity particularly for migratory birds that require habitat along their migratory path to find food, shelter, and nesting habitat. Of particular importance are the riparian areas and wetlands in and immediately adjacent to the Project area that likely provide critical nesting and feeding habitat for both resident and migratory birds, including the federally- and state-endangered least Bell's vireo, the state-threatened tricolored blackbird, and state-threatened California black rail, all species that were recorded in the vicinity of the Project area in the California Natural Diversity Database (CNDDB) (see Exhibit A).

3

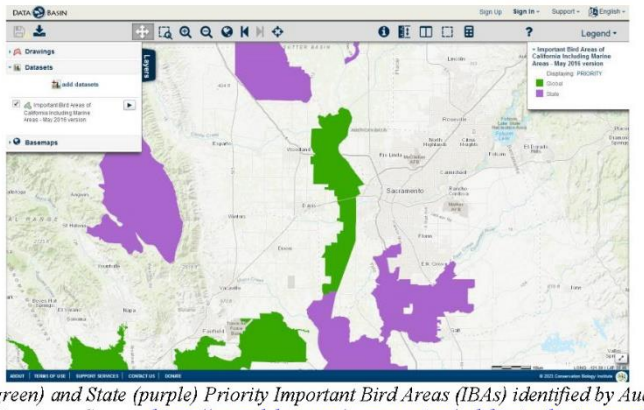

Figure 2: Global (green) and State (purple) Priority Important Bird Areas (IBAs) identified by Audubon California in and near the Project area. Source: https://ca.audubon.org/conservation/california-iba-interactive-site-map and https://databasin.org/maps/new/#datasets=a2a77df9c31c4689b2373fb25d81d9bb. Accessed December 26, 2023.

The DEIR fails to adequately assess and mitigate the Project's impacts to wildlife. As detailed in a 2021 Center Report (Yap et al., 2021), roads and development create barriers that lead to habitat loss and fragmentation, which harms native wildlife, plants, and people. As barriers to wildlife movement, poorly-planned development and roads can affect an animal's behavior, movement patterns, reproductive success, and physiological state, which can lead to significant impacts on individual wildlife, populations, communities, landscapes, and ecosystem function (Brehme et al., 2013; Ceia-Hasse et al., 2018; Haddad et al., 2015; Marsh & Jaeger, 2015; Mitsch & Wilson, 1996; Trombulak & Frissell, 2000; van der Ree et al., 2011). For example, habitat fragmentation from roads and development has been shown to cause mortalities and harmful genetic isolation in mountain lions in southern California (Ernest et al., 2014; Riley et al., 2014; Vickers et al., 2015), increase local extinction risk in amphibians and reptiles (Brehme et al., 2018; Cushman, 2006), cause high levels of avoidance behavior and mortality in birds and insects (Benítez-López et al., 2010; Kantola et al., 2019; Loss et al., 2014), and alter pollinator behavior and degrade habitats (Aguilar et al., 2008; Goverde et al., 2002; Trombulak & Frissell, 2000). 3 cont.

Habitat loss and fragmentation also severely impacts plant communities. An 18-year study found that reconnected landscapes had nearly 14% more plant species compared to fragmented habitats, and that number is likely to continue to rise as time passes (Damschen et al., 2019). The authors conclude that efforts to preserve and enhance connectivity will pay off over the long-term (Damschen et al., 2019). In addition, connectivity is important to allow for range shifts and species migrations as climate changes (Cushman et al., 2013; Heller & Zavaleta, 2009; Krosby et al., 2018). Loss of wildlife connectivity decreases biodiversity and degrades ecosystems. It also prevents the reestablishment of native species, like bald eagles, vernal pool fairy shrimp, and valley elderberry longhorn beetles that may occur in or near the Project area.

Edge effects like noise and light from Project construction and operation will have impacts on wildlife and wildlife movement, particularly next to open space like the IBA as well as the designated critical habitat for numerous fish species, including the federally threatened North American green sturgeon (southern DPS), federally-threatened delta smelt, federally-and 4

4

state-threatened Chinook salmon (Central Valley spring run ESU), federally- and state-endangered Chinook salmon (Sacramento winter run ESU), and federally-threatened steelhead (Central Valley DPS).

Negative edge effects from human activity, traffic, lighting, noise, domestic pets, pollutants, and invasive weeds have been found to be biologically significant up to 300 meters (~1000 feet) away from anthropogenic features in terrestrial systems (Environmental Law Institute, 2003). This is important to consider when open space is immediately adjacent to the Project area, as birds and other wildlife have been found to be sensitive to edge effects. For example, field observations and controlled laboratory experiments have shown that traffic noise can significantly degrade habitat value for migrating songbirds (Ware et al., 2015). Subjects exposed to 55 and 61 dBA (simulated traffic noise) exhibited decreased feeding behavior and duration, as well as increased vigilance behavior (Ware et al. 2015). Such behavioral shifts increase the risk of starvation, thus decreasing survival rates. Another study found a 28% decrease in bird abundance in areas when traffic noise was present compared to when there was no traffic noise (McClure et al., 2013). Negative edge effects of roads and development have been documented in wide-ranging predators, such as mountain lions and bobcats (Crooks, 2002; Delaney et al., 2010; Lee et al., 2012; Riley et al., 2006; Smith et al., 2015, 2017; Vickers et al., 2015; Wang et al., 2017), as well as smaller species with poor dispersal abilities, such as song birds, small mammals, and herpetofauna (Benítez-López et al., 2010; Cushman, 2006; Kociolek et al., 2011; Slabbekoorn & Ripmeester, 2008). The Project will result in increased traffic and an increase in associated noise and light. The DEIR fails to analyze these impacts and should be revised to determine the Project's impacts to wildlife connectivity and provide appropriate mitigation. 4 cont.

B. The DEIR fails to adequately mitigate the Project's impacts to wildlife movement and habitat connectivity.

The DEIR concludes that impacts to wildlife movement would be less than significant with mitigation without providing substantial evidence to support such conclusions. The DEIR's proposed mitigation offers only standard measures BIO-1 and BIO-2 and avoidance and minimization measure (AMM) BIO-12 through BIO 15 (DEIR at 3-17), which are vague, inadequate, and improperly deferred mitigation. For example, Standard Measure BIO-1 would have a Caltrans biologist meet with contractors to brief them on environmental permit conditions and requirements, with no information as to what such conditions or requirements might be. Standard Measure BIO-2 includes the preparation of an Aquatic Giant Garter Snake Habitat Dewatering Plan that would include "appropriate measures" for when the contractor dewaters suitable habitat; though the amount and location of dewatered suitable habitat and what those appropriate measures might be are not provided. There is no clear, realistic, and guaranteed plan for accurately documenting the impacts and mitigating damages. 5

AMM BIO-12 through BIO 15 pertain to only bats even though many non-bat species movement will also be affected. These measures are also vague and include an improperly differed bat species protection survey plan. In addition, AMM BIO-15 proposes "to the greatest extent practicable, structural changes may be made" to remove bat roosts without describing what the structural changes would be or providing alternative places for them to roost. This 6

5

AMM seems to be an additional impact on bats that keep insect populations in control and help protect crops. According to a 2019 report prepared for Caltrans, providing bat boxes or panels have been shown to be effective bat mitigation (H.T. Harvey and Associates & HDR, Inc., 2019). The DEIR's vague, inadequate mitigation is deferred and unsupported by evidence that it will reduce the relevant impacts to less than significant, and therefore violates CEQA. 6 cont.

The DEIR provides insufficient detail for the public and decision makers to ascertain whether such measures would adequately mitigate the Project's impacts to wildlife movement and habitat connectivity *before* the Project is approved. (See *San Joaquin Raptor Rescue Center v. County of Merced* (2007) 149 Cal.App.4th 645, 670 [EIR inadequate where the success or failure of mitigation efforts "may largely depend upon management plans that have not yet been formulated, and have not been subject to analysis and review within the EIR"]). In the limited circumstances in which deferred mitigation is appropriate, the agency must meet all of the following elements: (1) practical considerations prevented the formulation of mitigation measures during the planning process; (2) the agency committed itself to developing mitigation measures in the future; (3) the agency adopted specific performance criteria prior to project approval; and (4) the EIR lists the mitigation measures to be considered, analyzed, and possibly incorporated into the mitigation plan. (See *POET, LLC v. State Air Resources Bd.* (2013) 218 Cal.App.4th 681, 736-37 [review denied].) The DEIR's proposed mitigation for the Project's impacts to wildlife movement and habitat connectivity fails to meet these criteria. 7

The proposed Project includes the construction of five new culverts and the replacement or improvement of 21 existing culverts underneath the roadway. This is where the Project's impacts to wildlife movement and habitat connectivity could potentially be mitigated. Instead of constructing new culverts or replacing/improving existing culverts only for drainage, the Project could include constructing undercrossings and retrofitting existing culverts to be more wildlife friendly to address drainage issues as well as facilitate wildlife movement. Retrofitting existing culverts could include upsizing them to encourage larger animals or a larger variety of animals to use them, replacing them with undercrossings with restored habitat on both sides, adding ramps and critter shelves for small animals to be able to cross through culverts/underpasses when they are filled with water, or other innovative ways based on the best available science. In addition, placing exclusion/directional fencing that guides wildlife to crossings would help facilitate safe wildlife movement under the road. The Project should incorporate wildlife-friendly measures in its design to mitigate the Project's impacts to wildlife movement and habitat connectivity. Without doing so, the DEIR fails to adequately mitigate the Project's impacts to wildlife connectivity. 8

C. The DEIR fails to comply with AB 2344.

With Assembly Bill 2344 (AB 2344)—The Safe Roads and Wildlife Protection Act—being passed and signed into law in 2022, Caltrans is required to seriously consider and restore wildlife connectivity when there is new construction and/or when improvements are being made to existing transportation infrastructure. The bill specifically states: 9

> It is therefore the policy of the state to protect, restore, and enhance the functioning of fish, wildlife, and habitat connectivity in connection with the planning, construction, and

6

improvement of transportation infrastructure throughout the state and, where feasible, the operation and maintenance of transportation infrastructure throughout the state. (AB 2344 Section 1(b)).

9 cont.

Despite this language and the area's high wildlife biodiversity and the applicability of this bill to the proposed Project that will add/improve drainage culverts and, with the exception of Build Alternatives 1, 7a, and 7b, widen freeways by adding new lanes (one in each direction) on I-80 and US-50, the DEIR fails to comply with AB 2344 and fails to adequately assess and mitigate the Project's impacts to wildlife connectivity.

D. The DEIR fails to adequately analyze and mitigate the Project's impacts to special-status species and sensitive habitats.

The DEIR fails to adequately assess and mitigate the Project's impacts to special-status species and sensitive habitats, that occur, have the potential to occur, or historically occurred in and near the Project area. As mentioned previously, the Project area is located within an area that CDFW defines as having the highest ecoregion biodiversity ranking (Figure 1). It is also designated as a global priority IBA (Figure 2). Therefore, it is critical to provide a comprehensive analysis of the species that may be impacted by the proposed Project. Although the DEIR mentions numerous special-status species that are known or have potential to occur in the area, the list is not comprehensive.

Exhibit A provides a list of the species recorded in the CNDDB from a 9-quad query centered around the quad "Sacramento West." Although this is informative, it must be acknowledged that CNDDB is not a comprehensive list. Other databases, like iNaturalist and eBird as well as on-the-ground surveys following the appropriate USFWS- and/or CDFW-approved protocols and guidelines are required to adequately assess the presence or potential presence of special-status species in or near the Project area. For example, the state-threatened greater sandhill crane was documented within the CNDDB 9-quad query (Exhibit A), and on iNaturalist there are many documented observations of sandhill cranes in and near the Project area.[1] This suggests that the Project area is located within potentially suitable habitat for greater sandhill cranes and they, along with the many other birds that may use the IBA, will be significantly affected by the Project. Scientists estimated that up to 340 million birds are killed by car strikes every year in the U.S. (Loss et al., 2014) and North American bird populations have declined by 30% since 1970 (Rosenberg et al., 2019). Widening roads and increasing traffic in and near this IBA could increase the number of birds killed by vehicles as well as reduce suitable habitat due to noise and chemical pollution. The DEIR fails to adequately disclose, assess, and mitigate the Project's impacts to special-status birds.

10

Although there are several proposed standard measures and AMMs to minimize the Project's impacts to sensitive bird species, they are insufficient. Most include preconstruction surveys and marking no-disturbance buffers from nests (e.g., AMM BIO-6, AMM BIO-7, AMM BIO-31), though additional AMMs allow for working within those no-disturbance buffers if it "is not practicable" to avoid them (e.g., AMM BIO-9, AMM BIO-10, AMM BIO-32). Although the

[1] iNaturalist Observations of Sandhill Crane: https://www.inaturalist.org/observations?place_id=any&subview=map&taxon_id=508048

7

latter requires consultation with CDFW, they generally render the former AMMs meaningless. And despite the Project resulting in more cars and traffic that will lead to more vehicle strikes, noise, and chemical pollution, the DEIR fails to provide mitigation for the resident and migratory species that rely on the IBA. The DEIR fails to adequately mitigate the Project's impacts to special-status birds and other wildlife in and near the Project area. 10 cont.

The DEIR also fails to adequately assess the Project's impacts to special-status fish and other wildlife. Although the DEIR acknowledges that the Project area is located in designated critical habitat for the federally threatened North American green sturgeon (southern DPS), federally-threatened delta smelt, federally-and state-threatened Chinook salmon (Central Valley spring run ESU), federally- and state-endangered Chinook salmon (Sacramento winter run ESU), and federally-threatened steelhead (Central Valley DPS) and that these species have a moderate to high potential to occur in the Project area (DEIR Table 2.3-9), the DEIR argues that "no work is taking place within or near aquatic habitat of listed fish species" and therefore concludes that the Project "would not result in direct or indirect impacts" to these species (DEIR at 2-344). However, the DEIR fails to conduct analyses or provide substantial evidence to support such conclusions.

The DEIR does not take into account that wider freeways with more vehicles and traffic will lead to increased pollution in nearby waterways and wetlands in which these special-status fish species may occur for all or part of their lives. Storm-related runoff containing the chemical 6PPD-quinone from tire dust has led to mass die-offs of Pacific coho salmon in urban areas (Tian et al., 2021). This chemical rubs off of car tires through normal wear and tear. Such pollution from increasing cars and traffic on wider roads could lead to increased pollution in runoff that may be deadly to these closely related special-status fish species that occur in and near the Project area. The increase in this chemical, in addition to microplastics and heavy metal pollution from increased vehicles and traffic, could also harm many of the other sensitive and special-status species that occur in the area, including but not limited to the federally-endangered vernal pool tadpole shrimp, federally- and state-threatened giant garter snake, and state-threatened tricolored blackbird. The DEIR fails to adequately assess and mitigate the Project's impacts to special-status species, including North American green sturgeon (southern DPS), delta smelt, Chinook salmon (Central Valley spring run ESU), Chinook salmon (Sacramento winter run ESU), and steelhead (Central Valley DPS) and their designated critical habitat. 11

II. The Project Would Increase Greenhouse Gas Emissions, Harming State Climate Goals.

A strong, international scientific consensus has established that human-caused climate change is causing widespread harms to human society and natural systems, and climate change threats are becoming increasingly dangerous. In a 2018 *Special Report on Global Warming of1.5°C* from the Intergovernmental Panel on Climate Change (IPCC), the leading international scientific body for the assessment of climate change describes the devastating harms that would occur at 2°C warming, highlighting the necessity of limiting warming to 1.5°C to avoid catastrophic impacts to people and life on Earth. The report provides overwhelming evidence that climate hazards are more urgent and more severe than previously thought, and that aggressive reductions in emissions within the next decade are essential to avoid the most devastating climate change harms. 12

8

The impacts of climate change will be felt by humans and wildlife. In California, climate change will transform our climate, resulting in such impacts as increased temperatures and wildfires, and a reduction in snowpack and precipitation levels and water availability. In light of inadequate action on the national level, California has taken steps through legislation and regulation to fight climate change and reduce statewide GHG emissions. (Health & Saf. Code § 38550; *see also* Executive Order B-30-15 (2015); Executive Order S-3-05 (2005); Executive Order B-55-18 (2018).) The Legislature has also passed S.B. 100 which requires renewables to account for 60 percent of electricity sales in 2030. Enforcement and compliance with these state-level actions are essential to help stabilize the climate and avoid catastrophic impacts to our environment.

In a 2022 report, the California Air Resources Board concluded that California is currently not on track to meet its greenhouse gas reduction targets, primarily due to GHG emissions from the transportation sector (CARB, 2022). The DEIR fails to adequately assess and mitigate the Project's impacts to GHGs and climate change. While the DEIR concludes that because of "new fleet and electric vehicles penetration, in design year 2049, GHG emissions of the Build Alternatives were assessed to be less" (DEIR, page 3-26), this simply does not align with the conclusion that "implementing Build Alternatives 2a and 2b through 6a and 6b would increase freeway capacity" (DEIR, page 3-38). 12 cont.

To claim that the Project would increase freeway capacity and vehicle miles traveled (VMT) (DEIR, page 3-41) but somehow *reduce* the region's GHG emissions is unsubstantiated and a misrepresentation of the Project's impacts. Adding new lanes to the roadway would increase the number of single occupancy vehicles on the road. To assert that the project would result in reduced GHG emissions because of State standards on vehicles at the time of the project implementation should not be a relevant factor because it is not something the project has control over. Increasing VMT increases GHG emissions. The DEIR's conclusions are in direct contradiction to one another (U.S. Environmental Protection Agency, 2022).

Projects that increase capacity on existing roads have the potential to widen the gap between where California needs to be to tackle the climate crisis and where it is headed. The DEIR fails to adequately assess and mitigate the Project's impacts to GHGs and climate change.

III. The Project Would Increase Single Occupancy Vehicle Use, Harming Community Health and Wellbeing and Divesting from Sustainable Transportation Methods.

Providing alternatives to single occupancy vehicle travel is essential to building an efficient, sustainable and equitable transportation system. Unfortunately, we have a long way to go if we are going to achieve this vision in the U.S. In 2013, it was reported that of all the U.S. daily commutes to work, 76.4% are of people driving alone (McKenzie, 2015). According to the Inventory of U.S. Greenhouse Gas Emissions and Sinks: 1990-2015, our collective daily transportation in the U.S. constitutes about 27% of the total greenhouse gasses released (U.S. Environmental Protection Agency, 2017). California's annual average emissions associated with 13

passenger vehicles between 2000 and 2020 was approximately 110 million metric tons of CO2e. The Project's build alternatives that include widening the roadway will increase such emissions.

Increasing a region's VMTs isn't just bad planning, it also undermines community health. Increased VMT increases emissions of air pollutants such as nitrogen oxides (NO_x), volatile organic compounds (VOCs), carbon monoxide, heavy metals, carbon dioxide and respirable particulate matter ($PM_{2.5}$). Increased VMT also leads to more ozone (O_3) production through the photochemical reactions of NO_x and VOCs emitted by vehicles.[2] Short- and long-term exposure to several of these pollutants has been linked to premature mortality, compromised birth outcomes, heart disease and a host of respiratory illnesses.[3]

Another serious direct impact of increasing the number of cars on roads, like the Project would do, is automobile crashes, which are the leading cause of death among young people (15 to 19 years old) in the United States.[4] An estimated 42,915 people in the U.S. died in car crashes in 2021 alone and 3.4 million people are injured each year, which costs an estimated $473.2 billion annually as measured by wage and productivity losses, medical expenses, motor-vehicle damage, and employers' uninsured costs (Frumkin et al., 2004; U.S. Department of Transportation, 2022).[5]

Beyond the direct impacts, increased VMT has long term impacts on commuters. In 2019, the duration of the average daily commute in the United States increased to a new high of 55.2 minutes, and a record 9.8 percent of commuters reported daily commutes of at least 2 hours (Burd et al., 2021). These long commutes reduce time available to spend with family, friends, and community, and reduce opportunities for healthy recreation. The increase in inactivity and isolation can also lead to long-term health complications such as pre-diabetes, diabetes, obesity, asthma, isolation, stress and depression (Ewing et al., 2003; Leyden, 2003). 13 cont.

To change these trends, government agencies like Caltrans need to invest in alternative modes of transportation to not only make them cheaper to use, but more efficient than driving. Best practices for transportation options should include providing free public transit services for future residents and workers; implementing bus only lanes; optimizing bus routes to minimize overlap and ensure coverage across the city in line with demand; and providing high-frequency, reliable services with regular bus stops for easy access.

Studies indicate that free public transit services typically result in ridership increase from 20% to 60% in a matter of just a few months (Studenmund and Connor, 1982).[6] Similarly, bus lanes that reduce total transit door-to-door travel times by 5%-15% will increase urban peak

ridership 2%-9% (UCLA Institute of Transportation Studies, 2019). Lastly, ensuring accessibility and convenience is essential to increasing ridership. Providing more bus stops decreases the distance residents have to travel to access such services.

However, the DEIR simply acknowledges that "the project would result in induced VMT, which would represent a significant impact" (DEIR, page 3-41), but that "full implementation of the suggested VMT reducing measures is outside the regulatory authority of Caltrans and is not sufficient to fully offset the induced VMT impact" (DEIR, page 3-41). This is woefully insufficient when you consider all the mental and physical harms increased VMT has on residents. 13 cont.

It should be a priority of Caltrans to reduce VMTs with every new project, but instead this Project's build alternatives that include adding additional lanes to the roadways would steer the region in the opposite direction, eroding community and environmental health to build more single-occupancy vehicle infrastructure. The DEIR fails to adequately assess and mitigate the Project's impacts on GHGs, air pollution, and public health and safety due to increased cars on the road and VMT.

IV. The Project Would Not Achieve Its Stated Objective of Reducing Traffic Congestion

The central goal of the project is "to improve mobility by implementing managed lane strategies and improving transit access along the corridor, which would reduce traffic congestion, improve traffic flow, reduce travel time, and increase travel time reliability by actively managing recurrent and non-recurrent congestion" (DEIR, page 3-9). However, conducting business-as-usual and simply adding more lanes to an already congested freeway ignores the science that clearly documents the concept of "induced travel demand." It is widely accepted that building more lanes only creates more traffic long term, despite short term reductions in congestion (Angarita-Zapata et al., 2016). Put simply, increasing lane miles may cause an immediate reduction in traffic density in the region because of the initial feeling of less congestion and decreased average travel times. However, because the cost of travel (in terms of time spent) is initially reduced, more people are inclined to drive, which puts more cars on the road. As traffic volumes rise, travel times start to increase and congestion again becomes prevalent. Eventually there is a new equilibrium met with a higher volume of network traffic than prior to the capacity expansion. Depending on the extent of induced demand, undesirable consequences of road use such as congestion, pollution, and accidents worsen (Hymel, 2019).[7] 14

Thus, not only does the proposed Project's build alternatives that add more lanes go against the State's climate goals that aim to reduce single-occupancy vehicle use, but the Project would not even achieve its stated objective of reducing traffic congestion long term. The Project should be altered to ensure no additional lanes are built and instead, current infrastructure should be adjusted to promote high occupancy vehicle and public transit alternatives that are proven to reduce a region's GHGs, improve air quality and decrease traffic congestion.

The Center urges Caltrans to implement Build Alternative 7a, which would reduce the region's GHG emissions, as well as the associated air quality impacts, by simply re-classifying existing lanes to high occupancy only lanes. 14 cont.

V. Conclusion

Thank you for the opportunity to submit comments on the DEIR for the Yolo 80 Corridor Improvements Project. Due to the shortcomings described above, the Center urges Caltrans to make corrections to the EIR and Project—including properly assessing and mitigating the Project's impacts to special-status species, wildlife connectivity, GHGs, and public health and safety—and recirculate a revised and legally adequate EIR for public review and comment. The Center strongly urges Caltrans to choose Build Alternative 7a as the preferred alternative, which would repurpose a general-purpose lane for an HOV 2+ lane and no new lanes would be constructed. 15

Please include the Center on your notice list for all future updates to the Project and do not hesitate to contact us with any questions at the emails listed below.

Sincerely,

Tiffany Yap, D.Env/PhD, Senior Scientist

Exhibit A

List of California Natural Diversity Database (CNDDB) records of sensitive plant and animal species in and near the Project area. This is not a comprehensive list of sensitive species that occur, potentially occur, or historically occurred in and/or near the Project area.

Type	Scientific Name	Common Name
Animals - Birds	*Accipiter cooperii*	Coopers hawk
Animals - Birds	*Buteo swainsoni*	Swainsons hawk
Animals - Birds	*Elanus leucurus*	white-tailed kite
Animals - Birds	*Haliaeetus leucocephalus*	bald eagle
Animals - Birds	*Ardea alba*	great egret
Animals - Birds	*Ardea herodias*	great blue heron
Animals - Birds	*Egretta thula*	snowy egret
Animals - Birds	*Ixobrychus exilis*	least bittern
Animals - Birds	*Nycticorax nycticorax*	black-crowned night heron
Animals - Birds	*Charadrius montanus*	mountain plover
Animals - Birds	*Pica nuttalli*	yellow-billed magpie
Animals - Birds	*Coccyzus americanus occidentalis*	western yellow-billed cuckoo
Animals - Birds	*Falco mexicanus*	prairie falcon
Animals - Birds	*Falco peregrinus anatum*	American peregrine falcon
Animals - Birds	*Progne subis*	purple martin
Animals - Birds	*Riparia riparia*	bank swallow
Animals - Birds	*Agelaius tricolor*	tricolored blackbird
Animals - Birds	*Pandion haliaetus*	osprey
Animals - Birds	*Setophaga petechia*	yellow warbler
Animals - Birds	*Ammodramus savannarum*	grasshopper sparrow
Animals - Birds	*Melospiza melodia pop. 1*	song sparrow (Modesto population)
Animals - Birds	*Spizella breweri*	Brewers sparrow
Animals - Birds	*Nannopterum auritum*	double-crested cormorant
Animals - Birds	*Laterallus jamaicensis coturniculus*	California black rail
Animals - Birds	*Athene cunicularia*	burrowing owl
Animals - Birds	*Plegadis chihi*	white-faced ibis
Animals - Birds	*Vireo bellii pusillus*	least Bells vireo
Animals - Crustaceans	*Branchinecta lynchi*	vernal pool fairy shrimp
Animals - Crustaceans	*Linderiella occidentalis*	California linderiella
Animals - Crustaceans	*Lepidurus packardi*	vernal pool tadpole shrimp
Animals - Fish	*Acipenser medirostris pop. 1*	green sturgeon - southern DPS
Animals - Fish	*Acipenser transmontanus*	white sturgeon
Animals - Fish	*Archoplites interruptus*	Sacramento perch
Animals - Fish	*Lavinia exilicauda exilicauda*	Sacramento hitch
Animals - Fish	*Mylopharodon conocephalus*	hardhead

Animals - Fish	*Pogonichthys macrolepidotus*	Sacramento splittail
Animals - Fish	*Hysterocarpus traskii traskii*	Sacramento-San Joaquin tule perch
Animals - Fish	*Hysterocarpus traskii traskii*	Sacramento-San Joaquin tule perch
Animals - Fish	*Hypomesus transpacificus*	Delta smelt
Animals - Fish	*Spirinchus thaleichthys*	longfin smelt
Animals - Fish	*Entosphenus tridentatus*	Pacific lamprey
Animals - Fish	*Lampetra ayresii*	western river lamprey
Animals - Fish	*Oncorhynchus mykiss irideus pop. 11*	steelhead - Central Valley DPS
Animals - Fish	*Oncorhynchus tshawytscha pop. 13*	chinook salmon - Central Valley fall / late fall-run ESU
Animals - Fish	*Oncorhynchus tshawytscha pop. 7*	chinook salmon - Sacramento River winter-run ESU
Animals - Insects	*Bombus pensylvanicus*	American bumble bee
Animals - Insects	*Cicindela hirticollis abrupta*	Sacramento Valley tiger beetle
Animals - Insects	*Desmocerus californicus dimorphus*	valley elderberry longhorn beetle
Animals - Mammals	*Taxidea taxus*	American badger
Animals - Mammals	*Bassariscus astutus raptor*	northern California ringtail
Animals - Mammals	*Lasiurus cinereus*	hoary bat
Animals - Mollusks	*Margaritifera falcata*	western pearlshell
Animals - Mollusks	*Gonidea angulata*	western ridged mussel
Animals - Reptiles	*Emys marmorata*	western pond turtle
Animals - Reptiles	*Thamnophis gigas*	giant gartersnake
Animals - Reptiles	*Phrynosoma blainvillii*	coast horned lizard
Community - Terrestrial	*Elderberry Savanna*	Elderberry Savanna
Community - Terrestrial	*Great Valley Cottonwood Riparian Forest*	Great Valley Cottonwood Riparian Forest
Plants - Vascular	*Sagittaria sanfordii*	Sanfords arrowhead
Plants - Vascular	*Centromadia parryi ssp. rudis*	Parrys rough tarplant
Plants - Vascular	*Symphyotrichum lentum*	Suisun Marsh aster
Plants - Vascular	*Astragalus tener var. ferrisiae*	Ferris milk-vetch
Plants - Vascular	*Fritillaria agrestis*	stinkbells
Plants - Vascular	*Hibiscus lasiocarpos var. occidentalis*	woolly rose-mallow
Plants - Vascular	*Brodiaea rosea ssp. vallicola*	valley brodiaea

Response to Comment 1 in 20240111, Center for Biological Diversity

This introductory comment provides the role of the Center for Biological Diversity, a summary of the proposed project, and a summary of the more detailed comments provided in the letter. This comment discusses the inadequacy of the Draft EIR/EA in broad terms, indicating that the Draft EIR/EA fails to adequately assess and mitigate the project's impacts to special-status species, sensitive habitats, wildlife movement, GHG emissions and climate change, public resources, and existing communities. The commenter also expresses a preference for Build Alternative 7a.

Caltrans deems the Draft EIR/EA to contain adequate analyses and mitigation for the project's various Build Alternatives and their impacts and that the document complies with CEQA and NEPA. No changes to the Draft EIR/EA are necessary.

Response to Comment 2 in 20240111, Center for Biological Diversity

The commenter states under AB 2344, projects are required to restore degraded habitats and enhance wildlife connectivity at their existing infrastructure to make landscape and its inhabitants more climate resilient, that the Draft EIR/EA failed to do so. The project's initiation date was January 30, 2018. Assembly Bill 2344, codified within Streets & Highways Code, Section 158 et seq., applies to projects, whose initiation phase begins on or after July 1, 2025. (Sts. & Hy. Code, § 158.1(a)(1).)

Caltrans deems the Draft EIR/EA to contain adequate analyses respective to fish and wildlife connectivity and mitigation for the project's Build Alternatives and their impacts and that the document complies with CEQA and NEPA, including determining potential impacts to sensitive natural resources including wildlife connectivity, special-status species, and sensitive habitats. No changes to the Draft EIR/EA are necessary.

Response to Comment 3 in 20240111, Center for Biological Diversity

The commenter states that widening the road and increasing traffic will fortify existing barrier effects and significantly affect north-south movement in the Sacramento River and Yolo Bypass Wildlife Area and east-west movement in Putah Creek, and that the Draft EIR/EA fails to adequately assess and mitigate the Project's impacts to local, regional, and global wildlife movement and habitat connectivity.

Please see Response to Comment 2 in 20240111, Center for Biological Diversity above. No changes to the Draft EIR/EA are necessary.

Response to Comment 4 in 20240111, Center for Biological Diversity

The commenter states the Draft EIR/EA has not complied with CEQA as it fails to address edge effects like noise and light from the Project construction and operation and its impacts on wildlife and wildlife movement.

Lighting and noise created by project activities are expected to be of a short duration, limited in extent, and taking place in discrete locations within the overall project footprint over a 3-year construction period. Analysis of noise and vibration cumulative impacts indicates that with

implementation of proposed mitigation measures, impacts from noise and vibration would not be cumulatively considerable (Draft EIR/EA Chapter 2, “All relevant projects would be required to comply with local noise ordinances and implement BMPs as necessary to avoid and minimize temporary impacts on noise. Therefore, in conjunction with relevant projects, the Project would not result in a cumulatively considerable impact on noise and vibration.”) Impacts from construction lighting, human activity, and wildlife-human interactions are similarly expected to also not be cumulatively considerable. No changes to the Draft EIR/EA are necessary.

Response to Comment 5 in 20240111, Center for Biological Diversity

The commenter states that the Draft EIR/EA fails to adequately mitigate the project’s impacts to wildlife movement and habitat connectivity, and that there is no clear, realistic, and guaranteed plan for accurately documenting the impacts and mitigating damages.

Please see Response to Comment 2 in 20240111, Center for Biological Diversity above. No changes to the Draft EIR/EA are necessary.

Response to Comment 6 in 20240111, Center for Biological Diversity

The commenter states that mitigation measures concerning bats are inadequate and unsupported by evidence that it will reduce the relevant impacts to less than significant.

Caltrans deems the Draft EIR/EA to contain adequate analyses and mitigation for the project’s Build Alternatives and their impacts and that the document complies with CEQA and NEPA, including determining potential impacts to sensitive natural resources including wildlife connectivity, special-status species, and sensitive habitats. In addition, see Response to Comments 5, 6 and 7 in 20240112, California Department of Fish and Wildlife, for details regarding Caltrans standard protocols for handling bats. Also see Response to Comment 2 in 20240109, Yolo Basin Foundation, regarding Caltrans conclusion that construction activities will not have a significant impact on bat roosts. Caltrans does not expect to encounter and exclude bat roosts on built structures within the project footprint and therefore does not expect Avoidance and Minimization Measure (AMM) BIO-15 to generate “additional impacts” to bats. If bat exclusion takes place, Caltrans and its contractors will follow *Caltrans Bat Mitigation: A Guide to Developing Feasible and Effective Solutions* recommendations for implementing bat exclusion which are expected to reduce impacts to below significance.[6] No changes to the Draft EIR/EA are necessary.

Response to Comment 7 in 20240111, Center for Biological Diversity

The commenter states that the Draft EIR/EA does not provide sufficient detail for the public or decision makers to ascertain *before* the project is approved whether the mitigation measures on wildlife movement and habitat connectivity are sufficient.

[6] Johnston, D. and K. Briones. 2019. Final Caltrans Bat Mitigation: A Guide to Developing Feasible and Effective Solutions, Section 5.

Please see Response to Comment 2 in 20240111, Center for Biological Diversity above. No changes to the Draft EIR/EA are necessary.

Response to Comment 8 in 20240111, Center for Biological Diversity

The commenter states that the proposed project includes the construction of five new culverts and the replacement or improvement of 21 existing culverts underneath the roadway, and suggests instead of constructing new culverts or replacing/improving existing culverts only for drainage, the project could include constructing undercrossings and retrofitting existing culverts to be more wildlife friendly to address drainage issues as well as facilitate wildlife movement.

The commenter is proposing that Caltrans implement design changes outside Caltrans standard measures and practices. Caltrans may only consider deviation from standard practice when significant impacts to resources are expected to occur as a result of the considered action, and not as a result of prior actions. Additionally, fill heights along I-80, from Richards Boulevard to Mace Boulevard are not adequate to increase cross culvert sizes to provide for animal crossings. In the absence of analysis indicating significant impacts to wildlife movement as a result of the proposed action and design constraints limiting alternatives, Caltrans declines to consider these proposed design changes.

Caltrans deems the Draft EIR/EA to contain adequate analyses and mitigation for the project's build alternatives and their impacts and that the document complies with CEQA and NEPA, including determining potential impacts to sensitive natural resources including wildlife connectivity, special-status species, and sensitive habitats. No changes to the Draft EIR/EA are necessary.

Response to Comment 9 in 20240111, Center for Biological Diversity

The commenter has proposed that Caltrans comply with Assembly Bill (AB) 2344. Caltrans assesses that this project does not qualify for consideration of implementation of the design criteria specified by AB 2344.

Also please see Response to Comment 2 and 8 in 20240111, Center for Biological Diversity. No changes to the Draft EIR/EA are necessary.

Response to Comment 10 in 20240111, Center for Biological Diversity

The commenter states that the Draft EIR/EA fails to adequately assess and mitigate the project's impacts to special-status species and sensitive habitats, that occur, have the potential to occur, or historically occurred in and near the project area, and fails to provide a comprehensive analysis of the species that may be impacted by the proposed project.

Draft EIR/EA Chapter 3, Section 3.2.4.2, summarizes the technical findings of Caltrans environmental analysis on potential impacts to special-status species. Based on technical review, habitat that would be impacted is already degraded by proximity to roadways and other forms of anthropogenic disturbance. Caltrans has proposed AMM and standard measures (Draft EIR/EA Appendix E, Chapter 2, AMM BIO-1 through BIO-32) that are expected to reduce impacts to special-status species and sensitive habitats to below the level of significance. Based

on this finding, Caltrans deems that impacts to all special status species potentially affected by the project have been adequately analyzed. No changes to the Draft EIR/EA are necessary.

Response to Comment 11 in 20240111, Center for Biological Diversity

The commenter states that the Draft EIR/EA fails to adequately assess the project's impacts to special-status fish and other wildlife, does not take into account that wider freeways increase traffic and pollution in nearby waterways and wetlands where these special-status fish species are found. The commenter also states a concern regarding Storm-related runoff containing the chemical 6PPD-quinone from tire dust.

Draft EIR/EA Chapter 3, Section 3.2.4.2, summarizes the technical findings of Caltrans environmental analysis on potential impacts to special-status species. Based on technical review, impacts to aquatic species would either not occur or occur but at less than significant levels with the incorporated standard measures. In addition, Draft EIR/EA Chapter 3.2.10, states the following:

> "Standard Measure WQ-1 has been incorporated as part of the project, which requires the preparation of a SWPPP that includes construction site BMPs to avoid potential water quality impacts. The SWPPP would include BMPs to protect sensitive areas and to prevent and minimize stormwater and non-stormwater discharges. Standard Measure WQ-1 requires that Caltrans follows all applicable guidelines and requirements in the 2018 Caltrans Standard Specifications (2018 CSS), Section 13, regarding water pollution control and general specifications for preventing, controlling, and abating water pollution to Caltrans-owned storm sewers, streams, waterways, and other bodies of water.
>
> In addition, as required by Standard Measure WQ-2, Caltrans would comply with the National Pollutant Discharge Elimination System (NPDES) Construction General Permit…"

Additionally, the project includes standard measures (Draft EIR/EA Appendix E, Chapter 2, AMM BIO-1 through BIO-32) that are expected to reduce impacts to special-status species and sensitive habitats to below the level of significance. Based on this finding, Caltrans asserts that it has adequately analyzed impacts to all special status species having the potential to be affected by the project. No changes to the Draft EIR/EA are necessary.

Response to Comment 12 in 20240111, Center for Biological Diversity

The commenter questions the legitimacy of Caltrans use and analysis of the GHG reductions resulting from legislation and regulations, and the accuracy of the Draft EIR/EA's finding that the project would result in reduced GHG emissions, when the roadway capacity is increased.

GHG emissions associated with the roadways in the project area were estimated using specific traffic data and conditions provided by the Caltrans District 3 traffic forecasting and the CT-EMFAC2021 emission tool. CT-EMFAC2021 incorporates emission factors from EMFAC. The EMFAC emissions model is developed and used by CARB to assess emissions from on-road

vehicles for regulatory compliance and long-range planning, including the 2022 Climate Change Scoping Plan. EMFAC incorporates all the most recently adopted on-road mobile source regulations. These regulations will reduce the emissions intensity of vehicles, including those using the transportation improvements proposed by the project.

CARB's 2022 Scoping Plan identifies improvement in vehicle technology, low-carbon fuels, and VMT reduction as critical for achieving the state's long-term climate change goals. While reducing statewide VMT is part of the solution, the 2022 Scoping Plan VMT reduction targets are not regulatory requirements nor does the plan assume zero VMT growth in further compliance pathways. An increase in project-level VMT thus does not immediately constitute a significant GHG impact or conflict with statewide GHG reduction policy, as suggested by the commenter. In the context of GHG planning, VMT cannot be analyzed in insolation. It must be considered alongside all variables that influence emissions generation, including vehicle technologies and low-carbon fuels. As discussed in Section 3.2.8 *Greenhouse Gas Emissions*, the emissions modeling performed for the project confirms that while VMT is expected to slightly increase, "GHG emissions for the Build Alternatives would be lower for design year 2049 compared to existing year (see Table 3.4-2)." Therefore, the project directly supports the state's long-term target of carbon neutrality by 2045, as outlined in the 2022 Scoping Plan and pursuant to Assembly Bill 1279.

See also Response to Comment 7 in 20240110, California Air Resources Board and Master Response I for additional discussion of GHG emissions.

Response to Comment 13 in 20240111, Center for Biological Diversity

Consistent with the commenter's suggestion, Caltrans will be investing in alternative transportation with this project. The Draft EIR/EA considers alternatives that would construct a transit-only lane (Build Alternatives 6A and 6B). Moreover, many alternatives improve conditions for transit as well, since transit vehicles would have free access to the managed lane under all alternatives that include a managed lane. The Build Alternatives of the project also include improvements to the pedestrian/bicycle facility adjacent to the Yolo Causeway. These bicycle/pedestrian-related improvements aim to complete the bicycle/pedestrian network and reduce VMT. Please refer to Master Response F for more information about the improvements to the bicycle/pedestrian path. Please refer to Master Response A for more information on VMT and VMT mitigation.

The Draft EIR/EA discussed air quality impacts including an analysis of health effects that may result from project emissions in Section 2.2.6.3 *Environmental Consequences, Mobile Source Air Toxics (MSAT)*. The project is included in the SACOG Metropolitan Transportation Plan/Sustainable Communities Strategy (MTP/SCS), which incorporates air quality standards, including ozone attainment goals, into project planning.

This project proposes to rehabilitate pavement to bring it to a state of long-life pavement and provide other safety benefits such as standard median concrete barrier and additional lighting throughout the project limits. Please refer to Master Response F for more information on how the project proposes to enhance safety and surface rideability.

Response to Comment 14 in 20240111, Center for Biological Diversity

Commenters state that building more lanes creates more traffic long term, despite short term reductions in congestion, and that though the cost of travel (in terms of time spent) is initially reduced, more people are inclined to drive, which puts more cars on the road.

Please refer to Master Responses A and B for responses related to induced travel and project alternatives considered, respectively. Please note that the project alternatives were analyzed using methodologies and techniques conforming to existing standards, guidance, policies, and best practices. Several project alternatives meet the purpose and need of the project, including increasing modality along the corridor.

Response to Comment 15 in 20240111, Center for Biological Diversity

This conclusory comment indicates a preference for Build Alternative 7a and suggests, as a summary to the preceding comments, that the Draft EIR/EA is inadequate. Please see Response to Comments 1 through 14, above. No changes to the Draft EIR/EA are necessary.

Masum A. Patwary
Environmental Scientist C
California Department of Transportation, District 3
703 B Street
Marysville, CA 95901

Dear Dr. Patwary:

This letter provides comments on the Yolo 80 Draft Environmental Impact Report (DEIR) on behalf of the Environmental Council of Sacramento (ECOS), of which I chair its Climate Committee. I also serve on the board of Breathe California-Sacramento Region. I have graduate degrees in chemistry and environmental health. I am a retired chemistry professor, having taught at UC Davis. I am also a retired Air Pollution Research Specialist from the California Air Resources Board (CARB), where I managed research conducted by the University of California on health effects of near-road air pollutants. This includes a 2017 UCLA study (Effectiveness of Sound Wall-Vegetation Combination Barriers as Near-Roadway Pollutant Mitigation Strategies) that concluded "Traffic-related air pollutants are a significant public health concern near freeways." 1

Stephen Wheeler is correct in his January 8, 2024 letter on behalf of Sierra Club's Yolano Group, where he stated that while "California is making progress in many sectors towards reducing its GHG emissions, transportation is one area in which it is not." This is due to increased vehicle-miles traveled (VMT), which the alternatives presented in the DEIR would further exacerbate.

The DEIR fails to consider reasonably feasible alternatives which could avoid or mitigate potential significant environmental impacts. Alternatives which Caltrans should consider are: 2

a) Toll all vehicles using all lanes in each direction (existing freeway and any additional lanes), with accrued revenue to be directed to an independent agency that would assign funds to projects that would reduce VMT. These projects should include funding public transit, such as additional bus and train service, as well as incentives for higher-density housing near transit. It could also include rebates to low-income vehicle owners and/or other services benefiting low-income communities. These projects should be analyzed to determine if they can fully mitigate the emissions from all VMT that would be generated by the additional lanes.
b) Toll all vehicles on two lanes in each direction (existing freeway and any additional lanes), with accrued revenue to be directed … [same as in a) above].
c) Toll single occupant vehicles on two lanes in each direction (existing freeway and any additional lanes), with accrued revenue to be directed … [same as in a) above], as requested by the Yolo County Transportation District in its May 4, 2022 letter to Caltrans.

One or more of these alternatives could provide VMT limitation that is necessary for the Sacramento Area Council of Governments (SACOG) to demonstrate achievement of the State's 19% GHG reduction target pursuant to SB 375. 2 cont.

The DEIR fails to adequately evaluate induced travel. The DEIR shows a substantial increase in travel at the 2029 opening, and smaller increases long-term. Table 2.2-9 shows an immediate 9.2% increase in VMT for Alternative 2 compared with the No Build alternative, but a 2049 increase of only 4.2%. The corresponding figures for Alternative 3 are 9.2% and 4.3%. If induced travel due to changing land use and lifestyle patterns were fully taken into account, these long-term figures would likely be much higher. Caltrans should identify enforceable and funded mitigations to fully offset the likely VMT and GHG increases in the DEIR. The document's data does not support its conclusion of no or less-than-significant impacts. The DEIR states that the alternatives studied would have "no impact" on urban growth and population, air pollutants, and energy demand, and "less than significant" impacts on GHGs and state climate policy. These statements should be revised based on additional analysis and modeling practices that consider induced travel, a recirculated document. 3
