

I-710 Corridor Project

LOS ANGELES COUNTY, CALIFORNIA
District 07-LA-710 (PM 5.4/24.5)
249900 / 0700000443

Final Environmental Impact Report/ Environmental Impact Statement and Final Section 4(f) Evaluation

Volume I

**Prepared by:
State of California Department of Transportation
and the
Los Angeles County Metropolitan Transportation Authority**

The environmental review, consultation, and any other actions required by applicable Federal environmental laws for this project are being, or have been, carried out by Caltrans pursuant to 23 U.S.C. 327 and the Memorandum of Understanding dated December 23, 2016, and executed by FHWA and Caltrans.

MARCH 2024

Improve Interstate 710 from Ocean Boulevard in the City of Long Beach to State Route 60 in East Los Angeles.

**Final Environmental Impact Report/
Environmental Impact Statement and
Final Section 4(f) Evaluation**

Submitted Pursuant to: (State) Division 13, California Public Resources Code
(Federal) 42 USC 4332(2)(C) and 49 USC 303

THE STATE OF CALIFORNIA
Department of Transportation

COOPERATING AGENCIES:
United States Army Corps of Engineers
United States Environmental Protection Agency

PARTICIPATING AGENCIES:
National Oceanic and Atmospheric Administration Fisheries; Office of Environmental Policy and Compliance,
United States Department of the Interior; National Park Service, United States Department of the Interior; Los
Angeles Department of Water and Power; Southern California Association of Governments; Los Angeles County
Metropolitan Transportation Authority; Southern California Regional Rail Authority; County of Los Angeles Fire
Department; Los Angeles Department of Public Works, Los Angeles County Department of Regional Planning,
Sanitation Districts of Los Angeles County, City of Lynwood, City of Vernon,
Alameda Corridor Transportation Authority and United States Fish and Wildlife Service

RESPONSIBLE AGENCIES:
Los Angeles County Metropolitan Transportation Authority (Metro), California Department of Fish and Wildlife,
California Public Utilities Commission,
Los Angeles Regional Water Quality Control Board, Los Angeles County Flood Control District
and
County of Los Angeles and affected cities within the I-710 Corridor Project Study Area (Cities of Bell,
Bell Gardens, Carson, Commerce, Compton, Cudahy, Long Beach, Lynwood, Maywood, Paramount,
South Gate, and Vernon)

Abstract: Construct improvements to Interstate 710 from Ocean Boulevard in the City of Long Beach to State Route 60 in East Los Angeles. The proposed project includes two build alternatives and one no build alternative. The build alternatives propose adding lane(s) to the freeway mainline under one build alternative and construction of a separate four-lane freight movement corridor under one build alternative. The build alternatives would improve air quality and public health, improve traffic safety, modernize the freeway design, accommodate projected traffic volumes, and accommodate project growth for population, employment, and economic activities related to goods movement. Key environmental issues of concern include air quality, health risk, residential relocations, business relocations, utility relocations, recreational resources, the Los Angeles River, traffic, noise, aesthetics, and construction impacts. The California Department of Transportation, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration), in cooperation with Los Angeles County Metropolitan Transportation Authority, has identified Alternative 1 (No Build) as the Preferred Alternative.

EXECUTIVE SUMMARY

S.1 NEPA ASSIGNMENT

California participated in the “Surface Transportation Project Delivery Pilot Program” (Pilot Program) pursuant to 23 United States Code (USC) 327, for more than five years, beginning July 1, 2007, and ending September 30, 2012. MAP-21 (P.L. 112-141), signed by President Obama on July 6, 2012, amended 23 USC 327 to establish a permanent Surface Transportation Project Delivery Program. As a result, the Department entered into a Memorandum of Understanding pursuant to 23 USC 327 (the National Environmental Policy Act [NEPA] Assignment MOU) with the Federal Highway Administration (FHWA). The NEPA Assignment MOU became effective October 1, 2012, and was renewed on May 27, 2022, for a term of ten years. In summary, the Department continues to assume FHWA responsibilities under NEPA and other federal environmental laws in the same manner as was assigned under the Pilot Program, with minor changes. With NEPA Assignment, FHWA assigned and the Department assumed all of the United States Department of Transportation (USDOT) Secretary's responsibilities under NEPA. This assignment includes projects on the State Highway System and Local Assistance Projects off of the State Highway System within the State of California, except for certain categorical exclusions that FHWA assigned to the Department under the 23 USC 326 CE Assignment MOU, projects excluded by definition, and specific project exclusions. For the I-710 Corridor Project, Caltrans is the lead agency under both NEPA and the California Environmental Quality Act (CEQA).

S.2 OVERVIEW OF THE PROJECT AREA

The California Department of Transportation (Caltrans), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), the Gateway Cities Council of Governments (Gateway Cities COG), the Southern California Association of Governments (SCAG), the Ports of Los Angeles (POLA) and Long Beach (POLB) (collectively known as the Ports), and the Interstate 5 Joint Powers Authority (I-5 JPA) (collectively referred to as the I-710 Funding Partners), proposes to improve Interstate 710 (I-710, also known as the Long Beach Freeway) in Los Angeles County between Ocean Blvd. and State Route 60 (SR-60). The project is referred to as the I-710 Corridor Project, which includes the No Build Alternative (Alternative 1) and two build alternatives (Alternatives 5C and 7). I-710 is a major north-south interstate freeway connecting the City of Long Beach to central Los Angeles. Within the I-710 Corridor Project Study Area (Study Area), I-710 serves as the principal transportation connection for goods movement between POLA and POLB, located at the southern terminus of I-710 and the Burlington Northern Santa Fe (BNSF Railroad)/Union Pacific Railroad (UP Railroad) rail yards in the Cities of Commerce and Vernon.

The existing I-710 Corridor has elevated levels of health risks related to high levels of diesel particulate emissions, traffic congestion, high truck volumes, high accident rates, and many design features in need of modernization since the original freeway was built in the 1950s and 1960s. The *I-710 Major Corridor Study* (MCS; March 2005), undertaken to address the I-710 Corridor's mobility and safety needs and to explore possible solutions for transportation improvements, was completed in March 2005 and identified a community-based Locally Preferred Strategy consisting of ten general purpose lanes next to four separated freight-movement lanes. Subsequent to the MCS, a Draft Environmental Impact Report/Environmental Impact Statement (EIR/EIS) was circulated for public review in 2012, which analyzed several build alternatives. Based on the feedback received during the 2012 public circulation period, as well as changes in key traffic conditions and traffic modeling assumptions, revised alternatives were developed and analyzed in a Recirculated Draft Environmental Impact Report/Supplemental Draft Environmental Impact Statement (RDEIR/SDEIS) that was released for public review and comment in July 2017, which also included responses to comments on the 2012 Draft EIR/EIS.

The Study Area includes the portion of the I-710 Corridor from Ocean Blvd. in Long Beach to SR-60, a distance of approximately 19 miles. At the freeway-to-freeway interchanges, the Study Area extends east and west of the I-710 mainline for the Interstate 405 (I-405), State Route 91 (SR-91), Interstate 105 (I-105), and I-5 interchanges. This is the general Study Area for the I-710 Corridor Project. Specific study areas have been established for individual environmental analyses (e.g., health risk assessment area of interest or water quality areas).

S.3 PURPOSE AND NEED

S.3.1 PROJECT NEED

The I-710 Corridor is a vital transportation artery, linking the communities along it and the POLA and POLB to southern California and beyond. An essential component of the regional, statewide, and national transportation system, it serves both passenger and goods movement vehicles. As a result of population growth, employment growth, increased demand for goods movement, increasing traffic volumes, and aging infrastructure, the I-710 Corridor experiences serious congestion and safety issues.

S.3.1.1 AIR QUALITY

The U.S. Environmental Protection Agency (EPA) has designated the South Coast Air Basin (Basin), which includes the Study Area, as an extreme ozone non-attainment area and a non-attainment area for small airborne particulate matter less than 10 and 2.5 microns (PM₁₀ and PM_{2.5}). Exposure to ozone, PM₁₀, and PM_{2.5} levels above the Federal health standards is associated with many adverse health effects—including decreased lung function, aggravated asthma, increased lung and heart disease symptoms, and chronic bronchitis. Studies such as

the South Coast Air Quality Management District (SCAQMD) Multiple Air Toxic Exposure Studies (MATES), the latest being MATES IV, have shown that elevated levels of nitrogen dioxide (NO₂) and ultrafine particulates (UFPs) occur very near roadways. Sampling for these MATES has occurred as recently as 2012 and 2013; the highest levels of calculated cancer risk (approximately 1,400 in one million) in 2012 (the study analysis year) occur in the Study Area, particularly near the Ports, the rail yards, and along the I-710 freeway. These studies show that diesel particulate matter (DPM) is the greatest contributor to air-quality-related cancer risk in the Basin and that approximately half of the DPM is emitted by diesel trucks using the freeway and roadway systems.

S.3.1.2 CAPACITY, TRANSPORTATION DEMAND, AND SAFETY

CAPACITY. Many segments of the I-710 mainline currently operate at level of service (LOS) E or F throughout the day, creating chokepoints and causing congestion on other segments of the mainline, as well as on parallel arterial highways. A unique factor affecting the capacity of the I-710 Corridor is the large numbers of heavy-duty trucks that use the I-710 Corridor to travel between POLB, POLA, and the rail freight intermodal yards located near I-5, and to warehousing and cargo distribution points scattered throughout the southern California urban area. In the I-710 Corridor, capacity and congestion at local arterial intersections are also a concern.

TRANSPORTATION DEMAND. Combined port activity in the Study Area is expected to increase from the handling of 14.1 million annual twenty-foot equivalent units (TEUs) in 2012 to approximately 41.4 million annual TEUs in 2035.¹ This forecast is consistent with SCAG's 2012 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) Future Baseline Scenario for 2035. For comparative purposes, SCAG's recent 2016 RTP/SCS Goods Movement Appendix indicates that total container volume for the Ports of Los Angeles and Long Beach is expected to grow to 36 million by 2035. The I-710 Corridor is, and is expected to remain, a primary route for trucks carrying containers to and from the Ports. This indicates that the existing transportation problems on the I-710 mainline and other Study Area roadways will get worse, and which in turn, will have the potential to adversely affect the competitive position of the Los Angeles region in the global economy.

The regional population is forecast to grow by 20 percent and the Study Area population is forecast to grow by 10 percent from 2012 to 2035. Employment will follow a similar pattern, with regional growth of 27 percent and Study Area employment growth of 11 percent. Growth will be lower in the Study Area because it is almost completely developed. Increases in population, employment, and goods movement between now and 2035 will lead to more traffic on the I-710 freeway and on the streets and roadways within the Study Area as a whole.

¹ URS and Cambridge Systematics. 2009. *I-710 Railroad Goods Movement Study*. February.

SAFETY. I-710 experiences elevated accident rates, exceeding the State average for similar facilities in many locations. High traffic volumes, existing freeway design, freeway congestion, and the interaction between cars and the high volume of trucks in the traffic stream on the I-710 mainline may be contributing factors to these existing accident rates. In the Study Area, according to the Caltrans *Traffic Accident Surveillance and Analysis System* (TASAS), truck-related accidents range from 29 to 36 percent of the total number of accidents within the I-710 mainline study segments, which is higher than the State average.

S.3.1.3 ROADWAY DESIGN

The I-710 freeway was designed in the 1950s and 1960s, before the dramatic increase in imports from Asia and the containerization of oceangoing freight increased the cargo traffic at POLA and POLB, and before the extensive population growth in Southern California since 1960. In general, the I-710 freeway has remained relatively unchanged from when it was originally constructed. Due to growth in overall traffic volumes and the high level of truck traffic that has occurred in recent years, many aspects of the freeway design do not operate efficiently due to the heavy truck traffic and the size and relative lack of maneuverability of these trucks.

Design features that are most directly associated with the current operational problems in the I-710 Corridor include outdated local interchange designs, spacing between many of the I-710 mainline interchanges with local streets and nonstandard geometric features of freeway-to-freeway interchanges. On the I-710 freeway mainline, nonstandard weaving distances, narrow or nonexistent shoulders, narrow lane widths, varying number of through lanes, nonuniform ramp metering, and nonstandard pavement all contribute to current operational problems.

S.3.1.4 SOCIAL DEMANDS AND ECONOMIC DEVELOPMENT

Current growth projections recently adopted by SCAG (SCAG 2016 RTP/SCS Growth Forecast, April 2016) indicate continuing growth in the Study Area. The population in Los Angeles County, as a whole, is expected to increase from 10.2 million in 2015 to 11.5 million in 2040, an increase of approximately 13 percent. This regional growth will continue to place demand on the I-710 Corridor.

With regard to economic development, the Gateway Cities Subregion experiences high levels of unemployment and poverty. In September 2016, unemployment rates in the Study Area ranged from 2.8 to 8.1 percent of the workforce within the affected communities, which in some cases is higher than Los Angeles County (5.2 percent) and State (5.5 percent) unemployment rates.

Highway congestion causes delays affecting personal mobility and goods movement and results in increased economic costs. Los Angeles County's goods movement system serves as a gateway for both international and domestic commerce, especially within the Study Area, where POLA, POLB, and the BNSF/UP Railroad intermodal rail yards are located.

S.3.1.5 MODAL INTERRELATIONSHIPS AND SYSTEM LINKAGES

The I-710 Corridor serves regional, statewide, and national needs for both the general traveling public and the goods movement industry. The I-710 Corridor is the principal transportation connection between POLB/POLA and the BNSF/UP Railroad intermodal rail yards located in the Cities of Vernon and Commerce. BNSF and UP Railroads provide freight movement to destinations throughout the United States. Together, POLB/POLA is one of the largest container ports in the world, and port activity is projected to nearly triple in volume by 2035. The I-710 Corridor also provides key interstate commerce connections to east-west freeways (I-405, SR-91, I-105, I-5, SR-60, and Interstate 10 [I-10]). From a system linkage standpoint, no improvements are planned to these facilities except for possible improvements to I-5 (from Interstate 605 [I-605] through the I-710 interchange). Also, the Gerald Desmond Bridge Project has replaced the existing bridge and connects directly to the southern terminus of the I-710 Corridor.

With the existing on-dock rail and intermodal facilities approaching capacity, demand for transport of goods by truck on the I-710 Corridor is expected to increase.

S.3.2 PROJECT PURPOSE

The purpose of the I-710 Corridor Project is as follows:

- Improve air quality and public health
- Improve traffic safety
- Modernize the freeway design
- Accommodate projected traffic volumes
- Address increased traffic volumes resulting from projected growth in population; and employment, and economic activities related to goods movement

The termini of the I-710 Corridor Project build alternatives are logical, extending from the southern terminus of the build alternatives to its connection to SR-60. This 19-mile Study Area is of sufficient length to address environmental matters on a broad scope. Implementation of either of the I-710 Corridor build alternatives would result in improvements to the current traffic conditions within the I-710 Corridor even if no additional transportation improvements are made in the area. As such, the I-710 Corridor Project build alternatives have independent utility, as it does not rely on other projects to address the identified need in the Study Area. Furthermore, the I-710 Corridor Project, including the No Build Alternative, would not restrict consideration of alternatives for other reasonably foreseeable transportation improvements. For the purposes of this document, reasonably foreseeable improvements include any future development for which a General Plan or Specific Plan has been adopted that designates future land uses; projects for

which the applicable jurisdiction has received an application for site development; or infrastructure improvement projects planned by the local jurisdiction or another public agency.

S.4 I-710 CORRIDOR PROJECT

S.4.1 COSTS AND SCHEDULE

Estimated costs for right-of-way acquisition/utility relocation and for construction of the build alternatives are included in Table S-1.

Table S-1: Estimated Costs¹ for the Build Alternatives (in Billion \$)

| Alternative | R/Way/Utilities | Construction | Total |
|---------------------------|-----------------|--------------|-------|
| Alternative 5C | 1. 08 | 3. 59 | 4. 67 |
| Alternative 5C, Option 1A | 1. 04 | 3. 59 | 4. 63 |
| Alternative 5C, Option 2A | 1.09 | 3. 62 | 4.71 |
| Alternative 5C, Option 3A | 1.11 | 3. 69 | 4.80 |
| Alternative 7 | 1. 65 | 6. 32 | 7.97 |
| Alternative 7, Option 1B | 1. 62 | 6. 33 | 7.96 |
| Alternative 7, Option 3B | 1. 68 | 6. 44 | 8.12 |

Source: AECOM. *Draft Project Report* (April 2017).

Note: Unless otherwise stated, estimates are in 2017 dollars and do not include support costs or programmatic elements.

S.4.2 MOTION 22.1

During the 2012 public circulation period, comments received from the public and agencies indicated strong support for the creation and inclusion of another alternative that retained the zero-emission/near zero-emission (ZE/NZE) freight corridor but did not add general purpose lanes on I-710. The Coalition for Environmental Health and Justice (CEHAJ), a coalition of organizations, associations, and community groups working to achieve environmental justice, community health, and overall quality of life in the Study Area, put forth a detailed and comprehensive proposal of an alternative called “Community Alternative 7” (CA-7) as a formal comment on the 2012 Draft EIR/EIS (see Comment No. IP-22 in Appendix S of this Final EIR/EIS). In parallel with the ongoing coordination and communication between CEHAJ and the I-710 Project Team, community members worked with the office of Los Angeles County Supervisor Hilda Solis to continue the effort to include CA-7 in the Final EIR/EIS. As a result, the Metro Board of Directors passed Board Motion 22.1 in October 2015. Also included as part of Motion 22.1 was direction to Metro to examine, in coordination with Caltrans, Gateway Cities COG, and other partner and responsible agencies, the feasibility of several study area elements to occur outside of but in parallel to the I-710 Corridor Project, including, but not limited to, a zero emission truck procurement and operations program, addition of bus stops with access points to bicycle paths, and to work with community groups to develop a Local and Targeted Hiring Policy and Project Labor Agreement for construction jobs and a First Source Hiring Policy

for permanent jobs created by the I-710 Corridor Project build alternatives. Table S-2 lists the elements of Motion 22.1 that are addressed in this Final EIR/EIS and where the discussion can be found.

Table S-2: Motion 22.1 Elements Location of Discussion in Final EIR/EIS

| Motion 22.1 Item | Location of Discussion in Final EIR/EIS |
|--|--|
| A – Geometric design avoidance | Section 3.3.2.3 |
| B – Zero emission trucks | Section 2.3.2.1, Section 3.13 |
| C – New high frequency bus transit | Section 2.3.2.1, Section 3.5 |
| D – Increased existing transit service | Section 2.3.2.1, Section 3.5 |
| E – Traffic control measures/TSM/ITS | Section 2.3.2.1, Section 3.5 |
| F – BACT construction equipment use | Section 3.24, Appendix F |
| J – Upgrades to Los Angeles River Bike Path | On April 27, 2017, the Metro Board amended Motion 22.1 to advance the Los Angeles River Bike Path upgrades sooner and as a separate project; therefore, there is no discussion of this element in this Final EIR/EIS |
| K – Five new bike/pedestrian bridges | Section 2.3.2, Section 3.3, Section 3.5, Section 3.6 |
| L – Complete streets that promote livable neighborhoods | Section 3.3 |
| M – Maximize trees, shrubs, and foliage that are drought resistant and biosequestration/biofiltration | Section 2.3.2, Section 3.6 |
| N – Identify additional BMPs | Section 2.3.2, Section 3.9 |
| O – Avoid/minimize impacts to Los Angeles River, parks, trails, open space, wetlands, and native landscaping | Section 2.2.2, Section 3.3.2.3 |

BACT = Best Available Control Technology

BMPs = Best Management Practices

Final EIR/EIS = Final Environmental Impact Report/Environmental Impact Statement

ITS = Intelligent Transportation Systems

Metro = Los Angeles County Metropolitan Transportation Authority

TSM = Transportation System Management

S.4.3 ALTERNATIVES

This section describes the alternatives based on the MCS that were developed by a multidisciplinary technical team to achieve the I-710 Corridor Project purpose and subsequently were reviewed and concurred upon by the various committees involved in the I-710 Corridor Project community participation framework. Alternative 2 (Transportation Systems Management/Transportation Demand Management [TSM/TDM]), Transit, Intelligent Transportation Systems [ITS] and Enhanced Goods Movement), Alternative 3 (Maximum Goods Movement By Rail/Alternative Technology), and Alternative 4 (Arterial Highway and I-710 Congestion Relief Improvements) were considered but withdrawn from further environmental study as stand-alone alternatives during the process leading to the 2012 Draft EIR/EIS.

Additionally, Alternative 5A (Widening of I-710 to include ten general purpose lanes) and Alternatives 6A, 6B, and 6C (Widening of I-710 to include ten general purpose lanes and the addition of four separated freight movement lanes, with operational variations) were evaluated in detail in the 2012 Draft EIR/EIS. Because of the updates in traffic assumptions and data, resulting in a clearer understanding of the origin and destination of truck traffic within the project area, and the substantial comments received from agencies and the public concerned with

potential right-of-way impacts, potential impacts to health and air quality associated with the addition of general purpose lanes, and other requests, Alternatives 5A, 6A, 6B, and 6C were withdrawn from consideration.

In addition to Alternative 1 (No Build Alternative), Alternative 5C (I-710 Widening and Modernization) and Alternative 7 (I-710 Modernization plus Freight Corridor [Zero-Emission Vehicles]) were evaluated in detail in the 2017 RDEIR/SDEIS. Because of the substantial comments received from agencies and the public concerned with potential right-of-way impacts, potential impacts to health and air quality associated with the addition of general purpose lanes, and other requests (see Section 2.4 for more information), Caltrans, as Lead Agency under CEQA and NEPA (as assigned by the FHWA), in cooperation with Metro has identified the No Build Alternative (Alternative 1) as the Preferred Alternative. Therefore, Alternative 5C and Alternative 7 have been withdrawn from consideration, although the analysis of the impacts related to these build alternatives has been retained for disclosure purposes within this Final EIR/EIS.

S.4.3.1 IDENTIFICATION OF THE PREFERRED ALTERNATIVE

The identification of the Preferred Alternative was based on the environmental technical analysis and the resultant determination of the project's impact on the environment (including the inability to achieve project-level air quality conformity for particulate matter), comments received from the general public and agencies during the public review period of the RDEIR/SDEIS, and input from the Metro Board of Directors.

Although both Alternative 5C and Alternative 7 would meet the Purpose and Need of the project and provide mobility benefits for travel within the I-710 Corridor, the No Build Alternative (Alternative 1) has been identified as the Preferred Alternative for the following reasons:

- Community and public opposition to added lanes on I-710 under Alternatives 5C and 7.
- Inability to achieve project-level conformity for particulate matter.

Section 2.4 of this Final EIR/EIS provides more detail on why the No Build Alternative (Alternative 1) was identified as the Preferred Alternative, and Table 2.3-6 of this Final EIR/EIS, provides a summary comparison of the alternatives.

S.4.3.2 ALTERNATIVE 1: NO BUILD ALTERNATIVE

The No Build Alternative (Alternative 1), which has been identified as the Preferred Alternative, would maintain the current configuration of the existing I-710 Corridor. There would be no capacity-increasing improvements to the I-710 mainline within the Study Area. Within the region, generally only approved and planned projects included in SCAG's 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) Future Baseline Scenario

and 2011 Federal Transportation Improvement Program (FTIP) are considered part of the No Build Alternative (Alternative 1). The No Build Alternative (Alternative 1) provides the basis for comparison of 2035 no build conditions with the 2035 build alternatives.

Alternative 5C: I-710 Widening and Modernization Alternative 5C is a build alternative that would widen the I-710 mainline by adding mixed-flow lanes (one in each direction) between I-405 and I-105, and between I-105 and SR-60. This alternative would also add truck bypass lanes on I-710 through the I-405 interchange. This alternative would modernize the design at the I-405, SR-91, and I-5 interchanges, modernize and reconfigure most local arterial interchanges throughout the I-710 corridor, modify freeway access at various locations, and shift the I-710 centerline at various locations to reduce right-of-way impacts. In addition to improvements to the I-710 mainline and the interchanges, Alternative 5C would also include:

I-710 Clean Truck Program (referred to in the RDEIR/SDEIS as the Zero Emission/Near Zero Emission Truck Technology Deployment Program), which would provide “clean emissions” trucks for operation on I-710 as well as electric charging and hydrogen refueling stations.

Community Health and Benefit Program, which would fund projects targeted towards improving air quality and public health within the Study Area.

I-710 TSM/TDM Congestion Relief Program that would provide funding for traffic signal upgrades and coordination, safety improvements, traffic-calming measures, and intersection improvements on the arterial street system in the Study Area.

Provision of or future provision of ramp metering at all locations and improved arterial signage for access to I-710.

Parking restrictions during peak periods (7:00 a.m.–9:00 a.m. and 4:00 p.m.–7:00 p.m.) on four arterial roadways: Atlantic Blvd. between Pacific Coast Hwy. and SR-60; Cherry Ave./Garfield Ave. between Pacific Coast Hwy. and SR-60; Eastern Ave. between Cherry Ave. and Atlantic Blvd.; and Long Beach Blvd. between San Antonio Dr. and Firestone Blvd.

I-710 Transit Program which would consist of transit improvements such as increased service on all Metro Rapid routes and local bus routes in the Study Area, Blue Line and Green Line light rail service increases, and added express bus routes within the I-710 Corridor area.

ITS improvements which would include updated fiber-optic communications to interconnect traffic signals along major arterial streets to provide for continuous, real-time adjustment of signal timing to improve traffic flow as well as freeway smart corridor strategies from the Los Angeles Gateway Freight Technology program that would deploy dedicated short-range communication units alongside I-710 to manage and control traffic in real time.

Some of the programmatic elements listed above would not be implemented by Caltrans as the Lead Agency under CEQA and NEPA and as the owner/operator of the I-710 freeway, but instead would be implemented by Metro or other public agencies with jurisdiction over a particular element. In addition to the transportation system improvements described above, Alternative 5C would also include:

LANDSCAPING AND IRRIGATION SYSTEMS: Landscaping and irrigation systems would be provided where necessary within the corridor. Features included as part of the design of Alternative 5C would include drought-*tolerant* and native landscaping, plants that change colors with the seasons, and vines where space is limited. New irrigation systems would be designed to use reclaimed water (if available). The number of new trees, shrubs, and foliage within State right-of-way would be maximized, and drought-resistant, with superior biosequestration and biofiltration capabilities. An *Enhanced Water Quality Features Report* (2016) was prepared to identify potential stormwater management solutions in the corridor, along with proposed hardscape and landscape options. Final landscape plans would be developed during later phases of design.

VISUAL/AESTHETIC FEATURES: Texture treatments (for structures, median barriers, etc.), planting, irrigation, opportunities for community identification, and concepts from the I-710 Corridor *Aesthetics Master Plan* (2014) would be incorporated into the design of Alternative 5C to mitigate the visual and community impacts of the increased scale of the improvements.

Following circulation of the RDEIR/SDEIS in late 2017, public input and coordination with stakeholders resulted in the minor modifications to the geometric design of Alternative 5C. These minor revisions include providing room for Class IV bike facilities and adjustments to the curve of the proposed I-710 mainline north of Imperial Hwy. and over the Los Angeles River.

S4.3.3 ALTERNATIVE 7: I-710 MODERNIZATION PLUS FREIGHT CORRIDOR (ZERO/NEAR ZERO-EMISSION VEHICLES)

Alternative 7 would include all the components of Alternative 5C described above, but rather than the addition of mixed-flow through lanes and truck bypass lanes, Alternative 7 would include the addition of two separate truck-only lanes in each direction (a total of four lanes, on a combination of viaduct and/or retaining wall structures and at-grade roadbeds adjacent to, or in the median of, the freeway) between Long Beach and Commerce, adjacent to the freeway, approximately 16 miles in length. This principal feature is referred to as a “Clean-Emission Freight Corridor.” This alternative would restrict the use of the freight corridor to ZE/NZE trucks rather than conventionally powered diesel trucks. The ZE/NZE truck technologies would consist of trucks powered by means other than diesel (e.g., natural gas, hydrogen, and/or electricity), thereby producing zero to near-zero tailpipe emissions while traveling on the freight corridor; however, no specific technology is assumed in the environmental analysis, and the ZE/NZE trucks would not be limited to one particular technology as long as the emissions criteria are met.

Alternative 7 would also include an advanced technology feature that all trucks using the freight corridor would have an automated control system that will steer, brake, and accelerate the trucks under computer control while traveling on the freight corridor. This would safely allow for trucks to travel in “platoons” (e.g., groups of six-to-eight trucks) and increase the capacity of the freight corridor.

As with Alternative 5C, Alternative 7 would include drainage/water quality features as stated above, and additional aesthetic enhancements as follows:

VISUAL/AESTHETIC FEATURES: In addition to the visual/aesthetic features described above for Alternative 5C, specific aesthetic treatments would be developed for the freight corridor, including use of screen walls and masonry treatments on the freight corridor structures (including soundwalls).

S.4.3.4 DESIGN OPTIONS

For both Alternatives 5C and 7, design options were evaluated that are variations to the baseline description of the build alternatives within specific, discrete segments of I-710. In addition, an option that is only applicable to Alternative 7 provides for an operational variation to the freight corridor. These options have been fully analyzed in this Final EIR/. These options are as follows:

DESIGN OPTIONS 1A AND 1B apply to both Alternative 5C (1A) and Alternative 7 (1B) and aims to reduce build alternative impacts to the BNSF operations at the Hobart intermodal rail yard in Commerce, and would shift highway, collector-distributor road, and ramp alignments associated with the build alternatives to achieve this aim without encroaching beyond State rights-of-way. However, local street circulation, highway alignment, and right-of-way requirements would differ between the two alternatives.

DESIGN OPTION 2A applies to Alternative 5C and would restore circulation between Shoreline Dr. and Pacific Coast Hwy. via the I-710 freeway with the addition of two grade-separated ramps to provide connections between the northbound Shoreline Dr. entrance ramp to I-710 and the northbound Pacific Coast Hwy. exit ramp from I-710, and between the southbound Pacific Coast Hwy. entrance ramp to I-710 and the southbound Shoreline Dr. exit ramp from I-710.

DESIGN OPTIONS 3A AND 3B apply to both Alternative 5C (3A) and Alternative 7 (3B) and aim to further improve safety and operation of the freeway by reducing weaving conflicts. In order to achieve the objective, the variation would reconfigure the SR-60, I-5, and Olympic Blvd. interchanges, and alter the freeway and local traffic circulation; however, the design options would vary between Alternative 5C and Alternative 7 in that different right-of-way limits would be required.

OPTION 7ZE is applicable only to Alternative 7 and would restrict use of the freight corridor to exclusively ZE trucks, excluding NZE trucks. This option is operational in nature and would not represent a difference in the geometric design of Alternative 7.

S.5 JOINT CALIFORNIA ENVIRONMENTAL QUALITY ACT/NATIONAL ENVIRONMENTAL POLICY ACT DOCUMENT

The proposed I-710 Corridor Project is a joint project by the California Department of Transportation (Department) and the Federal Highway Administration (FHWA), and is subject to state and federal environmental review requirements. Therefore, environmental documentation has been prepared in compliance with both the California Environmental Quality Act (CEQA) and the National Environmental Policy Act (NEPA). The Department is the Lead Agency under NEPA. The Department is also the Lead Agency under CEQA. In addition, FHWA's responsibility for environmental review, consultation, and any other actions required by applicable Federal environmental laws for this project are being, or have been, carried out by Caltrans pursuant to 23 United States Code Section 327 (23 USC 327) and the Memorandum of Understanding dated December 23, 2016, and executed by FHWA and Caltrans.

Some impacts determined to be significant under CEQA may not lead to a determination of significance under NEPA. Because NEPA is concerned with the significance of the project as a whole, quite often a "lower level" document is prepared for NEPA. One of the most commonly seen joint document types is an Environmental Impact Report/Environmental Impact Statement (EIR/EIS).

In June 2012, a Draft EIR/EIS for the I-710 Corridor Project was released for public circulation.

During the public circulation period (June 27 to September 28, 2012), three public hearings were held, and nearly 3,000 individual comments were received from members of the public, interested groups, organizations, public agencies, and elected officials. Responses to comments received during the 2012 public circulation period are included in Appendix S to this Final EIR/EIS. Among other issues, included in those comments was support for the project team to consider and analyze different alternatives, including a recurring request for an alternative that would add a four-lane ZE/NZE freight corridor with no expansion of general purpose lanes on I-710. In response to concerns raised during public hearings, as well as changes in transportation modeling and the progress of several reasonably foreseeable local projects, new alternatives were developed for the RDEIR/SDEIS, which was released on July 21, 2017. The public comment period for the RDEIR/SDEIS was ultimately extended to Monday, October 23, 2017.

During the 60-day recirculation period for the RDEIR/SDEIS, there was an opportunity for public review and comment. After comments were received from the public and reviewing agencies on the RDEIR/SDEIS, Caltrans undertook additional environmental and/or engineering

refinements. This Final EIR/EIS is available to the public and includes responses to comments received on the RDEIR/SDEIS and identifies the Preferred Alternative. This Final EIR/EIS also contains responses to comments received during the 2012 public circulation period, which are included in Appendix S to this Final EIR/EIS. As required under CEQA, responses to public agency comments will be made available at least ten days prior to Caltrans' approval of the Final EIR. Under NEPA, the Final EIS will be made available for public review at least 30 days prior to approval of the Record of Decision. Following completion of the Final EIR/EIS, a Notice of Determination will be filed with the State Clearinghouse for compliance with CEQA and a Record of Decision will be published in the Federal Register for compliance with NEPA.

S.6 ENVIRONMENTAL CONSEQUENCES

The following sections summarize the impacts documented in the environmental analysis provided in Chapter 3.0 of this Final EIR/EIS. The environmental commitments and measures to minimize harm are listed in each topical section of Chapter 3.0 and the Environmental Commitments Record in Appendix F.

The environmental impacts described below for the build alternatives would not occur under the Preferred Alternative (Alternative 1 - No Build). Specific project benefits such as improved air quality, mobility, and safety would also not occur to the same extent under the Preferred Alternative (Alternative 1 – No Build); however, other projects assumed in the no build condition would provide mobility and air quality benefits over the long term. Unless otherwise stated, the impacts of Alternatives 5C and 7 with the Design Options as outlined below are the same as the “base” alternatives.

S.6.1 LAND USE

S.6.1.1 EXISTING AND FUTURE LAND USE

BUILD ALTERNATIVES. The build alternatives would impact existing commercial and service, industrial, open space and recreation, residential, transportation and utilities, and vacant land uses. Alternative 5C would convert approximately 538 acres of existing land uses (Alternative 5C, Option 1A, would convert approximately 536 acres of existing land uses; Alternative 5C, Option 2A, would convert approximately 545 acres of existing land uses; and Alternative 5C, Option 3A, would convert approximately 541 acres of existing land uses) to transportation land uses. Alternative 7 would convert approximately 748 acres of existing land uses (Alternative 7, Option 1B, would convert approximately 752 acres of existing land uses; and Alternative 7, Option 3B, would convert approximately 751 acres of existing land uses) to transportation land uses. Therefore, Alternative 7, Option 1B, would result in the greatest impact to existing land uses.

S.6.1.2 CONSISTENCY WITH STATE, REGIONAL, AND LOCAL PLANS

BUILD ALTERNATIVES. While adoption of either build alternative would require SCAG, the County of Los Angeles, and several other regional and local agencies to amend their plans to reflect modifications to the I-710 mainline, interchanges, and arterial highways, as well as the elimination of any land uses that may need to be acquired for the build alternatives, the proposed build alternatives are generally consistent with these plans. For any build alternative, Caltrans would need to amend its existing freeway agreements with cities where the build alternatives would add or remove connections to I-710, SR-91, or I-405. FHWA approval would be required for any new connections to an Interstate highway. Additionally, the build alternatives are consistent with the five primary goals of the California Coastal Act.

S.6.1.3 PARKS AND RECREATION FACILITIES

BUILD ALTERNATIVES. The build alternatives would result in permanent direct impacts to parks and recreation facilities, including directly impacting Parque Dos Rios (permanent use of 2.37 acres under Alternative 5C and permanent use of the entire 8.6 acres of park space that would render the park non-functional under Alternative 7, as well as temporary construction easements under both build alternatives) and full acquisition of the Compton Hunting and Fishing Club recreational facilities. Additionally, the build alternatives would result in permanent indirect impacts to Maywood Riverfront Park and to Coolidge Park (low visual impacts). Both build alternatives would require the construction of a wider bridge and resulting aerial easement over the DeForest Market Street Basin of the Deforest Treatment and Dominguez Gap Wetlands; and Alternative 7 would also permanently incorporate 5.4 acres from the Dominguez Gap West Basin. Both build alternatives would impact Cesar E. Chavez Park in the City of Long Beach due to the realignment of Shoreline Dr., and approximately 2.90 acres would be permanently impacted; but with the integration of land previously used for Shoreline Dr., the park would experience a net increase of 2.99 acres. For any build alternative, after construction, there would be a net benefit to the public due to improved accessibility of the park through the consolidation of existing park parcels and because the either build alternative would result in a net increase of park acreage, resulting in a more functional park with a total of 28.38 acres of park area.

The build alternatives would improve regional or local bikeways as well as multi-use trails (hiking, biking, equestrian) with the addition of three pedestrian/bicycle-only overcrossings under both build alternatives, and five total proposed overcrossings under Alternative 5C. Access to the Los Angeles River Trail would be enhanced as a result of modifications to trail entrances at the arterial highways that cross the trail.

S.6.2 GROWTH

S.6.2.1 BUILD ALTERNATIVES

The improved mobility that would be achieved as a result of build alternatives could have a slight influence on demand for residential and nonresidential uses in the cities and communities in the Gateway Cities subregion; however, it would not be expected to be sufficient to result in the need to modify adopted General Plans to allow for greater levels of development (residential and nonresidential). The I-710 build alternatives would accommodate existing, approved, and planned growth in the area, but would not influence the amount, timing, or location of growth in the area. Further, due to lack of vacant or less developed land within the I-710 Corridor, neither build alternative would facilitate new development by opening up access to previously undeveloped or less developed areas.

A key element of the project purpose of the I-710 Corridor Project is to address projected growth in population, employment, and economic activities related to goods movement. The increase in capacity on I-710 under the build alternatives would not influence demand for growth at the Ports nor would growth of port cargo handling capacity at the Ports substantially increase travel demand on I-710. This is because an analysis of the port cargo growth and container movements by truck scenarios showed that the low-growth scenario results in only 11 percent fewer daily port truck trips as compared to the high-growth scenarios, even though the low-growth scenario has 33 percent less containerized cargo throughput compared to the high-growth scenarios.

S.6.3 COMMUNITY IMPACTS

S.6.3.1 COMMUNITY CHARACTER AND COHESION

BUILD ALTERNATIVES. While temporary disruption of community character and cohesion would occur as a result of construction of either build alternative, the mobility improvements provided by the build alternatives would also benefit most of the affected communities by providing an improved connection to other parts of the Study Area (for example, improved bicycle and pedestrian connections across I-710 and the Los Angeles River) and the Gateway Cities Subregion as a whole. Generally, the relocations proposed under Alternative 5C would not represent a substantial adverse impact to the cities and communities within the I-710 Corridor because these relocations would occur along the fringes of the I-710 Corridor, impacting parts of communities rather than whole neighborhoods. However, community cohesion impacts would occur at a localized level within the Cities of Long Beach, Bell, and Commerce due to relocations of existing cohesive communities or vital community facilities under Alternative 7. For any build alternative, mitigation for relocations within these communities would be provided through implementation of Mitigation Measure C-1 described in Section 3.3.2.4. However, as a result of the relocations of the residents in the City of Commerce (specifically located in the Ayers and Sydney Neighborhoods at Washington Blvd. and I-710), businesses, and/or vital

community facilities under Alternative 7, localized areas within the Cities of Long Beach, Bell, and Commerce would experience adverse impacts to community character and cohesion.

Community services within the Study Area, such as fire, police protection, and other emergency responders, would be more readily available under the build alternatives as mobility within the Study Area would improve over existing conditions. Therefore, with the exception of the Cities of Long Beach, Bell, and Commerce, the build alternatives would not result in adverse impacts to community character and cohesion.

The build alternatives have been developed through an extensive community outreach process that involves input from multiple public agencies and stakeholders in order to avoid impacts to human-made and natural environments, including existing and future communities. Community concerns and comments have been expressed throughout the design process and the build alternatives have been refined as much as possible to address the communities' concerns and maintain community character and cohesion. Therefore, with the exceptions noted above under Alternative 7, the character and cohesion of most communities would remain intact with implementation of both the build alternatives.

S.6.3.2 RELOCATIONS AND REAL PROPERTY ACQUISITION

BUILD ALTERNATIVES. The build alternatives would result in the relocation of residential and nonresidential properties. The build alternatives would not result in any relocations in the cities/communities of Boyle Heights, Cudahy, Downey, Lakewood, Maywood, Paramount, Signal Hill, Huntington Park, Wilmington, or San Pedro. Alternative 5C (the base option) would result in a total of 158 nonresidential relocations and 109 residential relocations. Based on an average of four persons per residential unit, Alternatives 5C (not including design options), 5C (Option 1A), and 5C (Option 2A) would each result in the relocation of approximately 436 residents. Alternative 5C, Option 1A, would result in a total of 157 nonresidential relocations and 109 residential relocations. Alternative 5C, Option 2A, would result in 161 nonresidential relocations and 109 residential relocations, and Alternative 5C, Option 3A, would result in 165 nonresidential relocations and 128 residential relocations, resulting in the relocation of approximately 512 residents. Overall, Alternative 5C, Option 3A, impacts a greater number of both residential and nonresidential parcels.

Alternative 7 (not including design options) would result in a total of 206 nonresidential relocations and 121 residential relocations, resulting in the relocation of approximately 484 residents. Alternative 7, Option 1B, would result in a total of 206 nonresidential relocations and 136 residential relocations, resulting in the relocation of approximately 544 residents. Alternative 7, Option 3B, would result in a total of 213 nonresidential relocations and 140 residential relocations, resulting in the relocation of approximately 560 residents.

For the majority of the Study Area, residential displacements resulting from the build alternatives, given the present market conditions, do not indicate a need for the construction of replacement housing, as the construction of replacement housing is only implemented in rare cases. However, for any build alternative, Housing of Last Resort may have to be considered for relocating the affected residential properties such as mobile homes and dwellings in the cities of Cudahy, Vernon, and Commerce, where there is a lack of affordable, comparable replacement housing. For example, five mobile homes at the El Rancho Mobile Home Park in the City of Compton would be proposed to be relocated under both build alternatives. However, adequate relocation resources for mobile homes do not currently exist within the Study Area. This would represent an adverse impact to those displaced residents in the City of Compton, (assuming they preferred to remain in a mobile home). In the cities of Cudahy, Vernon, and Commerce, for any build alternative, the construction of new replacement dwellings under Last Resort Housing may need to be considered as a method of providing comparable replacement housing to displaced persons in areas where replacement housing is unobtainable. For the majority of the residential property impacts resulting from the build alternatives, adequate resources appear to exist at the present time to relocate existing residential occupants to comparable replacement housing, with the exceptions noted previously.

As a result of property acquisitions and relocations, the build alternatives could also result in a loss of sales tax and property tax revenue to the affected cities within the Study Area and also to Metro and the State. It is Caltrans' and Metro's goal that, for any build alternative, all relocations would occur within the affected communities, which would help retain potentially lost tax revenues within those communities. Table S-3 summarizes the residential and nonresidential relocations by the build alternatives.

Table S-3: Relocations by Build Alternatives

| Relocations | Alt. 5C Only | Alt. 5C (Option 1A) | Alt. 5C (Option 2A) | Alt. 5C (Option 3A) | Alt. 7 Only | Alt. 7 (Option 1B) | Alt. 7 (Option 3B) |
|--|--------------------|------------------------------|------------------------------|------------------------------|-------------------|-----------------------------|-----------------------------|
| Residential | 109 | 109 | 109 | 128 | 121 | 136 | 140 |
| Nonresidential | 158 | 157 | 161 | 165 | 206 | 206 | 213 |
| Total Residential and Nonresidential Relocations | 267 | 266 | 270 | 293 | 327 | 342 | 353 |
| Total Estimated Residents Relocated¹ | 436 | 436 | 436 | 512 | 484 | 544 | 560 |

Sources: Epic Land Solutions, Inc. *Draft Relocation Impact Report* (March 2017)

¹ The estimated number of relocated residents is based on the average of four persons per residential unit.

S.6.3.3 ENVIRONMENTAL JUSTICE

BUILD ALTERNATIVES. Overall, the build alternatives would have many beneficial effects on the surrounding communities and I-710 corridor users when compared with current conditions,

including reductions in emissions levels and associated health risk; abatement of freeway noise in most locations; and improved level of service and safety at local interchanges. In addition, programmatic elements of the build alternatives, such as the Community Health Benefit Program, would be of particular benefit to environmental justice communities although the effects cannot be quantified at this time due to the nature of the program (to provide funding for future improvements and/or health-related projects on a case-by-case basis). However, even with the application of these benefits, the environmental justice analysis for the build alternatives has identified potential disproportionately high and adverse impacts on minority and low-income populations in the Study Area, after consideration of mitigation. These disproportionately high and adverse impacts resulting from the build alternatives have been identified for air quality (construction and operation), noise, traffic, community cohesion related to relocations, visual resources, and land use.

Due to the potential for disproportionately high and adverse impacts resulting from the build alternatives, further mitigation would be proposed to reduce impacts to environmental justice communities for any build alternative. This mitigation would fund projects that would improve air quality, public health, aesthetics, and other issues faced by environmental justice populations within the corridor.

S.6.4 UTILITIES AND EMERGENCY SERVICES

S.6.4.1 BUILD ALTERNATIVES

The build alternatives would not result in increased population or demand for public services in the Study Area because they would not construct new housing or businesses. The build alternatives would have both beneficial and adverse effects on fire protection and law enforcement protection service providers within the Study Area. The build alternatives would result in the relocation of City of Vernon Fire Station No. 4. Beneficial effects of the build alternatives include improved emergency response times, as the ability to move fire protection, law enforcement, and emergency service resources from one area to another would be enhanced by the improved transportation network.

Alternatives 5C and 7 would impact cable television, gas, oil, power, sewer, telephone, and water utility lines. These include both distribution and transmission lines that would require either relocation or protection in place. In addition, Alternatives 5C and 7 would result in the relocation of electric and gas transmission facilities owned and operated by Southern California Edison (SCE), the Southern California Gas Company (SCGC), the Los Angeles Department of Water and Power (DWP), and others. Several relocation strategies including undergrounding in areas and protection in place were considered for utilities impacted as a result of the build alternatives. To address the utility relocations resulting from the build alternatives, Metro conducted detailed relocation studies to help shorten the lead time necessary to implement these relocations for any build alternative.

S.6.5 TRAFFIC CIRCULATION, PEDESTRIANS, AND BICYCLISTS

S.6.5.1 BUILD ALTERNATIVES

On the I-710 mainline, the traffic LOS is generally maintained or improved in the morning, midday, and evening peak periods in both directions of I-710 when comparing the 2035 build alternative conditions (Alternatives 5C and 7, all design options) to the 2035 No Build Alternative (Alternative 1) conditions. Although LOS improves under the build alternatives compared to the No Build Alternative, many segments of the I-710 mainline would experience poor LOS in 2035 under Alternative 1 in the morning, midday, and evening peak periods in both the northbound and southbound directions due to increased traffic volumes caused by regional growth in traffic.

There would be degradation in LOS with the project build alternatives at some locations. Several intersections that are projected to experience poor LOS and heavy intersection delay under Alternative 1 conditions are not identified as adversely impacted intersections because they do not have an increase in delay in the build alternative scenario and, therefore, are not impacted by the build alternatives. However, implementation of the I build alternatives is projected to result in adverse impacts to 32 intersections under Alternative 5C and to 30 intersections under Alternative 7, before mitigation. Mitigation in the form of traffic signal upgrades and intersection improvements are proposed for all but two of the impacted intersections under Alternative 5C and all but four of the impacted intersections under Alternative 7. Mitigation is not proposed at these locations due to right-of-way constraints.

The build alternatives include changes to arterial interchanges that may affect sidewalks and bicycle lanes. The build alternatives would provide facilities for bicycles and pedestrians in locations where local streets would be affected by the construction of the build alternatives. Because bicycle and pedestrian facilities would be maintained or improved, the impacts of on pedestrian travel or cycling would not substantially change as a result of the implementation of the build alternatives.

S.6.6 VISUAL/AESTHETICS

S.6.6.1 BUILD ALTERNATIVES

There would be long-term adverse visual and aesthetic impacts with the construction of all build alternatives. The freight corridor component of Alternative 7 would generally result in more visual impacts than those that would occur under Alternative 5C. For any build alternative, some moderately high impacts would require mitigation measures that would need more than five years to take effect, while other areas exhibit lesser levels of negative impacts ranging from moderate to neutral/low or experience a positive visual effect. Aesthetic enhancement of the I-710 Corridor is desired by the affected communities; this would be achieved through implementation of *I-710 Corridor Aesthetics Master Plan* (February 2014) that would define aesthetic and landscaping treatment measures that would be incorporated into the final design

of for any build alternative . The Corridor Master Plan has been developed in a context-sensitive design process in consultation with the affected local agencies and includes involvement of local community members as determined by the local agencies. For any build alternative, texture treatments (for structures, and median barriers, etc.), planting, irrigation, and opportunities for community identification would be incorporated into the design to mitigate the visual and community impacts of the increased scale of the improvements.

In addition to the structural or physical changes that the build alternatives would create, viewers within the Study Area would experience increased night lighting from the addition of traffic lighting on the elevated freight corridor (under Alternative 7). Under Alternative 7, glare from all lanes would be minimized by the construction of screen walls and soundwalls and by the distance of the viewer from traffic lighting and vehicular lights.

S.6.7 CULTURAL RESOURCES

S.6.7.1 BUILD ALTERNATIVES

The build alternatives would impact four historic resources; two UP Railroad segments, Dale's Donuts, and the Boulder Dam-Los Angeles 287.5-kilovolt (kV) Transmission Line. The UP Railroad segments have already been altered and, therefore, do not contribute to the significance of the UP Railroad. The build alternatives would impact a small section of the parking area and sidewalk at Dale's Donuts and would not affect the features that qualify this resource for the National Register of Historic Places (National Register). The impact from the build alternatives to the Boulder Dam-Los Angeles 287.5 kV Transmission Line would not lessen the integrity of the line to render it ineligible for the National Register. Two additional resources, the Drake Park Historic District and Los Angeles River Flood Control Channel, would not be adversely impacted by the build alternatives. Therefore, based on the above discussion, both the build alternatives (Alternative 5C and Alternative 7) result in a finding of No Adverse Effect per 36 Code of Federal Regulations (CFR) 800.5 for these cultural resources. In addition to the evaluation of historic properties, an Archaeological Sensitivity Study was conducted to assess the potential for encountering buried archaeological resources during construction of the build alternatives. Refer to Section 3.24.4.7 for measures to reduce impacts to cultural resources and address human remains discovered during construction.

S.6.8 HYDROLOGY AND FLOODPLAINS

S.6.8.1 BUILD ALTERNATIVES

All build alternatives would result in transverse (i.e., perpendicular to the direction of flow) encroachments at 24 Los Angeles River locations, eight Compton Creek locations, and one Rio Hondo Channel location under Alternative 5C, and would result in encroachments at 34 Los Angeles River locations, four Compton Creek locations, and one Rio Hondo location under Alternative 7. The build alternatives would not change the capacity of the Los Angeles River,

Compton Creek, and/or Rio Hondo Channel to carry water and would not result in a measurable impact to the 100-year floodplain elevation. The proposed encroachments would not result in any adverse impacts on the natural and beneficial floodplain values, would not result in a substantial change in flood risk or damage, and would not have substantial potential to cause interruption or termination of emergency services or emergency routes. Therefore, the build alternatives do not constitute a significant floodplain encroachment as defined in 23 CFR 650.105(q).

S.6.9 WATER QUALITY AND STORMWATER RUNOFF

S.6.9.1 BUILD ALTERNATIVES

Alternatives 5C and 7 would increase impervious surface areas, which would increase runoff volume and pollutant loads. Alternatives 5C and 7 would require replacement or extension of the existing drainage systems such as drainage inlets along the median and shoulders to accommodate the increased project flows. Impacts resulting from the build alternatives to water quality of receiving waters would result from the loading of various constituents typically associated with highway runoff. For any build alternative, these potential operational impacts would be addressed through the incorporation of design development pollution prevention best management practices (BMPs), treatment BMPs, and adherence to the necessary operational maintenance protocols identified in the Caltrans Storm Water Management Plan (SWMP). Potential BMPs would include biofiltration swales, biofiltration strips, infiltration basins, media filters, detention basins, gross solids removal devices, and wet basins. Proposed operational maintenance BMPs would include storm drain cleaning and normal roadway and bridge maintenance, in addition to maintaining all vegetated slopes. The BMPs would treat 74 percent (under Alternative 5C) and 78.3 percent (under Alternative 7) of on-site runoff from the total impervious surface areas within the project area, which would be an improvement over the existing condition. Therefore, for any build alternative, permanent impacts to the water quality of groundwater in the vicinity of the project area would be minimal following the completion of construction because there would not be any increase in the transport of pollutants into the groundwater through infiltration during the operational life of the new structures.

S.6.10 GEOLOGY, SOILS, SEISMIC, AND TOPOGRAPHY

S.6.10.1 BUILD ALTERNATIVES

The roadway, structures, and other features of both build alternatives could be impacted by ground motion and liquefaction and possible ground rupture (deformation), to some degree. Design and construction of the build alternatives to current highway and structure design standards, including applicable seismic standards, would minimize the potential impacts on the build alternatives.

S.6.11 PALEONTOLOGY**S.6.11.1 BUILD ALTERNATIVES**

Permanent impacts from the build alternatives on paleontological resources (fossils) would include destruction of paleontological resources, damage to paleontological resources during grading, destruction of rock units that may contain paleontological resources, loss of contextual data associated with paleontological resources, and loss of associations between paleontological resources. However, for any build alternative, impacts to paleontological resources would be mitigated through monitoring and fossil recovery during construction.

S.6.12 HAZARDOUS WASTE/MATERIALS**S.6.12.1 BUILD ALTERNATIVES**

Hazardous waste risks associated with the build alternatives would be related to property acquisitions, project construction, and project operation. There is potential for hazardous materials, including petroleum products, to exist within the Study Area and be disturbed by full or partial acquisitions or temporary construction easements under the build alternatives. Any contamination encountered during construction and excavation activities related to the build alternatives would be properly handled, removed, remediated, and/or disposed of according to all applicable regulations. If one of the build alternatives is selected for implementation and constructed, each property of environmental concern to be acquired would require testing in order to characterize specific soil and/or groundwater contaminants on the property, and a site-specific hazardous waste remediation plan would be developed for the appropriate removal and disposal of materials. In addition, a remediation plan and site closure plan, if required, would be implemented to clean up the site and provide for any subsequent monitoring to ensure the contamination has been remediated below regulatory thresholds.

Operation and maintenance of the facilities proposed as part of the build alternatives would not introduce new sources of hazardous materials/waste. For any build alternative, routine maintenance activities would be required to follow applicable regulations with respect to handling and disposal of potentially hazardous materials. Under the build alternatives, vehicles traveling on the I-710 mainline would continue to transport hazardous substances that could spill and impact the roadway, adjacent properties, or resources. However, the purpose of the I-710 Corridor Project is to improve traffic safety, which could reduce traffic accidents that could result in hazardous waste spills. Implementation of the build alternatives would not result in a substantial permanent adverse impact related to hazardous waste and materials.

S.6.13 AIR QUALITY

S.6.13.1 BUILD ALTERNATIVES

Table S-4 provides a listing of the air pollutants, their sources, and their adverse effects, which are evaluated in the I-710 air quality analysis.

Table S-4: Summary of Air Pollutants

| Pollutants | Sources | Primary Effects |
|--|--|---|
| Ozone (O ₃) | Atmospheric reaction of organic gases with nitrogen oxides in the presence of sunlight. | <ul style="list-style-type: none"> Aggravation of respiratory and cardiovascular diseases. Irritation of eyes. Impairment of cardiopulmonary function. Plant leaf injury. |
| Nitrogen Dioxide (NO ₂) | Motor vehicle exhaust. High temperature stationary combustion. Atmospheric reactions. | <ul style="list-style-type: none"> Aggravation of respiratory illness. Reduced visibility. Reduced plant growth. Formation of acid rain. |
| Carbon Monoxide (CO) | By-products from incomplete combustion of fuels and other carbon containing substances, such as motor exhaust. Natural events, such as decomposition of organic matter. | <ul style="list-style-type: none"> Reduced tolerance for exercise. Impairment of mental function. Impairment of fetal development. Death at high levels of exposure. Aggravation of some heart diseases (angina). |
| Suspended Particulate Matter (PM _{2.5} and PM ₁₀) | Stationary combustion of solid fuels. Construction activities. Industrial processes. Atmospheric chemical reactions. | <ul style="list-style-type: none"> Reduced lung function. Aggravation of the effects of gaseous pollutants. Aggravation of respiratory and cardiorespiratory diseases. Increased cough and chest discomfort. Soiling. Reduced visibility. |
| Ultrafine Particulates | Both manufactured and naturally occurring. Vehicle exhaust. Combustion reactions. Smoke. | <ul style="list-style-type: none"> Ultrafine particles are deposited in the lungs where they have the ability to penetrate tissue, or to be absorbed directly into the bloodstream. Exposure to ultrafine particulates can induce lung disease and other systemic effects. |
| Sulfur Dioxide (SO ₂) | Combustion of sulfur-containing fossil fuels. Smelting of sulfur-bearing metal ores. Industrial processes. | <ul style="list-style-type: none"> Aggravation of respiratory diseases (asthma, emphysema). Reduced lung function. Irritation of eyes. Reduced visibility. Plant injury. Deterioration of metals, textiles, leather, finishes, coatings, etc. |
| Mobile Source Air Toxics (MSAT) | Vehicle exhaust. Includes acetaldehyde, acrolein, benzene, 1,3-butadiene, diesel particulate matter (DPM), ethyl benzene, and formaldehyde | <ul style="list-style-type: none"> Increased risk of cancer, neurological and reproductive disorders, blood disease, birth defects, developmental damage, kidney and liver damage, and respiratory disease. |
| Greenhouse Gases (GHG) | Fuel combustion. Includes carbon dioxide (CO ₂), methane (CH ₄), and nitrous oxide (N ₂ O). | <ul style="list-style-type: none"> Global climate change (GCC). Alterations in weather features that occur across the Earth as a whole, including temperature, wind patterns, precipitation, and storms. |

S.6.13.2 PROJECT STUDY AREA

Given the size of the I-710 Corridor Project build alternatives and their impact on the region, incremental mobile source (traffic-generated) emission impacts were assessed for the Basin, an Area of Interest (AOI) or sub-region of the Basin that includes cities and communities along the I-710 freeway, and the I-710 freeway itself (see Figure S-1). For the Air Quality/Health Risk Assessment (AQ/HRA) dispersion modeling analyses, the American Meteorological Society/Environmental Protection Agency Regulatory Model (AERMOD) dispersion model and a coarse receptor grid were used to determine a zone of impact of the emissions from the I-710 freeway itself. This modeling zone of impact was generally the size of the general I-710 Study Area (see Figure S-1) and smaller than the AOI.

S.6.13.3 AIR QUALITY/HEALTH RISK ASSESSMENT ALTERNATIVES COMPARISON SUMMARY

Multiple metrics were used to assess the air quality impacts and health risks of the build alternatives. A single metric cannot, and should not, be used to evaluate the full impacts of any build alternative. The results of the different analyses should be considered together to give a fuller and more comprehensive understanding of build alternative air quality and health risk impacts. It should be noted that the specific benefits of the I-710 Corridor Project build alternatives would not occur under Alternative 1, but that the other projects assumed in the no build condition would provide some mobility and air quality benefits. Incremental emissions of criteria pollutants were calculated for each of the criteria pollutants and for the three project study areas (the Basin, the I-710 Study AOI, and I-710, which includes the freight corridor under Alternative 7) and compared to 2012 existing conditions and Alternative 1 (2035 No Build). In summary, the analyses show that:

- **Regional Traffic Emission Impacts:** Except for PM₁₀ criteria, air toxic exhaust emissions are generally lower (sometimes as much as 90 percent lower) in the 2035 alternatives compared to 2012 Baseline emissions. The greatest reductions are in the Basin and I-710 Study AOI. The smallest reductions are along the I-710 freeway.
 - Air toxics are dramatically lower (95 percent or more) for all 2035 build alternatives compared to 2012. Although much of the reduction is from the turnover to diesel trucks that meet the latest EPA standards, ZE/NZE trucks further reduce cancer risk for the build alternatives.
 - Each of the 2035 alternatives would result in lower nitrogen oxides (NO_x), carbon monoxide (CO), PM_{2.5} and volatile organic compound (VOC) emissions for all study areas when compared to 2012 Baseline emissions; only PM₁₀ and sulfur dioxide (under Alternative 7 only) increase for the 2035 build alternatives.

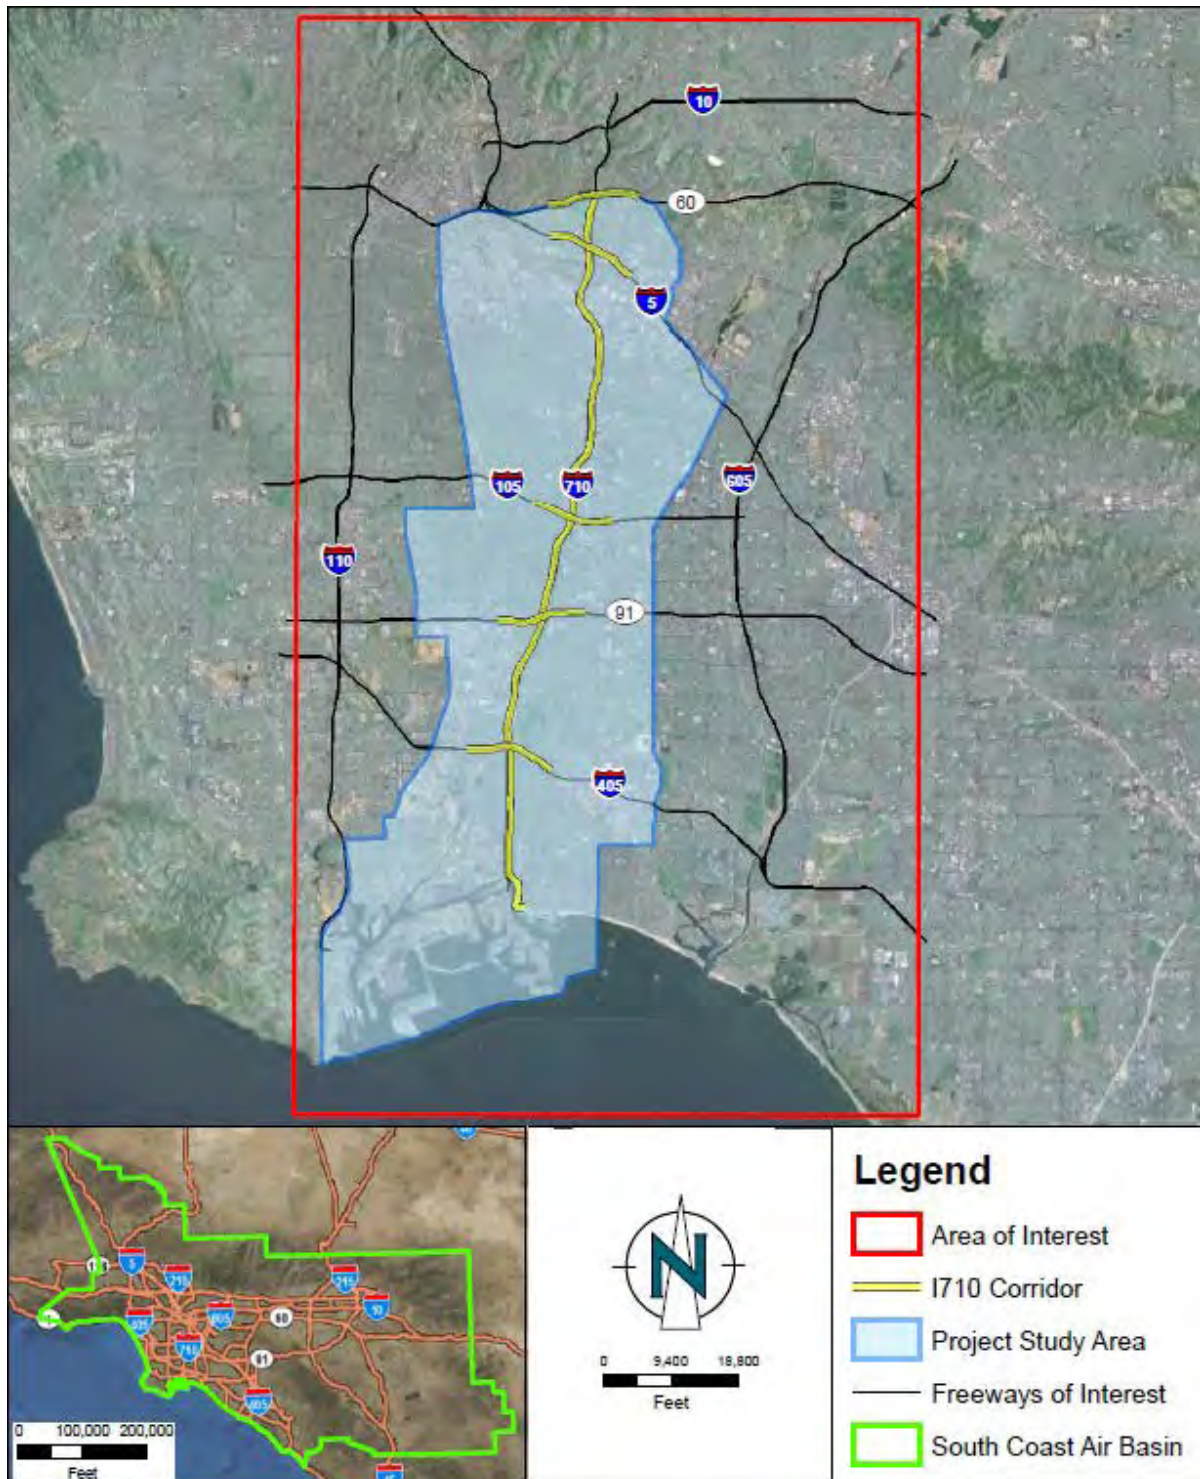

Figure S-1

I-710 Corridor Project

South Coast Air Basin, Air Quality Area of Interest,
General I-710 Project Study Area, and I-710 Freeway

- Each of the 2035 build alternatives would result in lower NO_x emissions, compared to the 2035 No Build Alternative, for all study areas. PM₁₀, PM_{2.5}, CO, and SO₂ would increase, with the greatest increases occurring under Alternative 7. All increases are less than 190 lbs per day for the entirety of the 19-mile long project under Alternative 5C, or less than 640 lbs per day under Alternative 7.
- **PM₁₀ and PM_{2.5} Emissions:** Overall the decrease in exhaust PM_{2.5} emissions for all 2035 alternatives as compared to 2012 Baseline is greater than the sum of the increases in tire wear, brake wear, and entrained road dust emissions. As a result, total PM_{2.5} emissions show decreases for the 2035 alternatives when compared to the 2012 Baseline for all I-710 Corridor Project study areas. In the case of PM₁₀ emissions, the increases in entrained road dust, tire wear and brake wear (which are a direct function of vehicle miles traveled) far outweigh the decrease in exhaust PM₁₀. Therefore, there are increases in total PM₁₀ emissions for all the 2035 alternatives when compared to 2012 Baseline.
- **I-710 Freeway Near-Roadway Impacts:** The 2035 build alternatives show increases in near-roadway 24-hour PM₁₀ impacts for several receptors located along the I-710 freeway as compared to 2035 No Build. The number of impacted receptors is larger in Alternative 7 as compared to Alternative 5C due to increased traffic along the corridor. The 2035 build alternatives show no change to a slight decrease in near roadway short-term PM_{2.5} impacts when compared to 2035 No Build at all modeled receptors for 2035 Alternative 5C and most modeled receptors for 2035 Alternative 7.
- **Greenhouse Gas (GHG) Reductions:** All of the alternatives, when compared to the 2012 Baseline, including the No Build Alternative, would decrease the regional traffic GHG emissions by approximately 13,000,000 metric tons of CO₂e per year (25 percent from 2012 levels). When compared to the No Build conditions, the regional GHG emissions would remain essentially the same for Alternatives 5C and 7.
 - When compared to the 2035 No Build Alternative, Alternative 5C would increase the regional GHG emissions by approximately 10,000 metric tons of CO₂e per year and Alternative 7 would increase the regional GHG emissions by 20,000 metric tons of CO₂e per year. This is less than a 0.1 percent increase compared to the No Build Alternative. The 7ZE Option would reduce regional GHG emissions by 3 percent compared to the No Build Alternative. For the 2012 Baseline, the 2035 No Build, the 2035 Alternative 5C, the 2035 Alternative 7 and 2035 Alternative 7ZE only, GHG emissions are 52.61, 39.68, 39.69, 39.70 and 38.38 million metric tons of CO₂e per year, respectively.

▪ **PM_{2.5} Mortality/Morbidity and Ultrafine Particulates:**

- Special I-710 Corridor Project qualitative analyses were conducted for PM_{2.5} mortality/morbidity and UFPs, using total PM_{2.5} and exhaust PM_{2.5} impacts, respectively, as surrogates.

The exposure of people along I-710 to particulate matter (PM)-related morbidity and mortality health risks should decrease relative to the 2012 Baseline in all parts of the I-710 Study AOI with the exception of some locations near the roadways (particularly for Alternative 7), as shown in the Air Quality/Health Risk Assessment Maps (Figures 4-6 and 19-24 in Appendix Q), of the Final EIR/EIS.

The near-road modeling of total PM_{2.5} emissions also shows that the I-710 near-roadway total PM_{2.5} concentrations of the 2035 No Build Alternative were about the same as both build alternatives, the exception being increases in total PM_{2.5} at receptors near the freight corridor in Alternative 7. Similar to the comparisons to the 2012 Baseline, these very near-roadway increases are predominantly because of increases in entrained roadway dust (related to the assumption of an infinite silt reservoir on the roadways).

The public's exposure to UFPs should decrease for all 2035 build alternatives relative to the 2012 Baseline and 2035 No Build Alternative, even near the I-710 freeway and freight corridor.

▪ **Regional and Project-Level Conformity with the Federal Clean Air Act:**

- A project to reconstruct the I-710 interchanges at I-105, SR-91, I-405, and I-5 as part of the I-710 Corridor Project was included in the SCAG-adopted 2023 FTIP (Project ID No. LA0B952, 100 percent prior years). An update to the description of Alternative 5C was included in SCAG's 2020 Connect SoCal (a.k.a. 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy [RTP/SCS]) Amendment No. 3, adopted by SCAG in September 3, 2020. However, since that time, Alternative 1 (No Build) has been identified as the Preferred Alternative. Moving forward, Metro will continue to work with SCAG to ensure that the future modifications to the RTP and TIP reflect the No Build Alternative (Alternative 1) as opposed to Alternative 5C. A general description of the build alternatives is also included in the Metro Final 2009 Long-Range Transportation Plan (LRTP) as a Funded Freeway Improvement. The LRTP will be amended to remove the build alternatives.

S.6.14 NOISE

S.6.14.1 BUILD ALTERNATIVES

Traffic noise modeling results for the build alternatives compared predicted design-year traffic noise levels with the build conditions to existing conditions and to design-year no build conditions. The comparison to existing conditions was included in the analysis to identify traffic

noise impacts under 23 CFR 772. The comparison to the future no build condition indicates the traffic noise increase resulting from the build alternatives. Traffic noise impacts resulting from the build alternatives are predicted to occur throughout the I-710 Corridor, in addition to areas that already exceed Federal noise abatement criteria. Under Alternative 5C, 125 Category B sensitive land use receptors would be subject to A/E (Approaches/Exceeds) and/or SNI (Substantial Noise Increase) impacts. Under Alternative 7, 139 Category B receptors would be subject to A/E and/or SNI impacts. Under the build alternatives, soundwalls are proposed throughout the length of the build alternative improvements for all sensitive land use categories including residential areas, schools, and parks.

Ground-borne noise and vibration are mostly associated with passenger vehicles and trucks traveling on roads with poor conditions such as potholes, bumps, expansion joints, or other discontinuities in the road surface. Because the build alternatives would provide new asphalt pavement, there would be no discontinuities in the road surface that would generate ground-borne vibration or direct or indirect noise impacts from vehicular traffic on I-710.

S.6.15 ENERGY

S.6.15.1 BUILD ALTERNATIVES

Compared to 2012 Area of Interest existing conditions:

- 2035 No Build (Alternative 1) operational energy consumption would decrease by 23 percent
- 2035 Alternative 5C operational energy consumption would decrease by 23 percent
- 2035 Alternative 7 operational energy consumption would decrease by 26 percent

Compared to 2035 Area of Interest no build conditions (Alternative 1):

- 2035 Alternative 5C operational energy consumption would decrease by 1.0 percent
- 2035 Alternative 7 operational energy consumption would decrease by 5.1 percent

Compared to 2012 Region existing conditions:

- 2035 No Build (Alternative 1) energy consumption would decrease by 11 percent
- 2035 Alternative 5C energy consumption would decrease by 12 percent
- 2035 Alternative 7 energy consumption would decrease by 13 percent

Alternative 5C and 7 improvements would increase average travel speeds during peak hours, remove bottlenecks, and reduce delays. However, vehicle miles traveled (VMT) in the I-710 Corridor Project Study Area would also increase when comparing any of the build alternatives with the 2035 No Build condition (Alternative 1). Alternative 7 includes a Clean-Emission Freight Corridor that would only be utilized by zero emission/near-zero emission (ZE/NZE) heavy-duty trucks.

S.6.16 NATURAL COMMUNITIES

S.6.16.1 BUILD ALTERNATIVES

Permanent direct and indirect impacts to natural communities would be greater under Alternative 7 than under Alternative 5C. A total of 11.23 acres of permanent direct impacts to estuarine habitat and riparian/riverine habitats would occur under Alternative 7, whereas Alternative 5C would permanently and directly impact 2.13 acres of these habitats. Additionally, Alternative 7 would permanently and indirectly impact 42.36 acres of estuarine habitat and riparian/riverine habitats, whereas Alternative 5C would permanently and indirectly impact 36.67 acres of these habitats. Potential hydraulic effects would be associated with bridge modifications under the build alternatives. However, as analyzed in Section 3.8 of this Final EIR/EIS, the proposed modifications under the build alternatives would mimic the existing pier configurations upstream and downstream, and there would not be substantial effects to the water surface elevation, the velocity of flood flows, sedimentation, or scour in the vicinity of the new piers. Because there would not be substantial effects at the location of the modifications under the build alternatives, there would not be substantial effects to downstream locations, including the estuarine habitat.

Because the I-710 Corridor has restricted wildlife movement and resulted in habitat fragmentation for many years, none of the build alternatives would have an adverse effect on wildlife movement. Nonetheless, Alternative 7 would have a greater impact on wildlife corridors/habitat fragmentation than Alternative 5C, due to the larger footprint of the freight corridor associated with Alternative 7.

S.6.17 WETLANDS AND OTHER WATERS OF THE U.S.

S.6.17.1 BUILD ALTERNATIVES

In general, Alternative 7 would result in greater total impacts to jurisdictional waters than Alternative 5C. Based on the concept plans provided in Appendix Q, the worst-case impact scenario associated with Alternative 5C would potentially result in direct permanent impacts to approximately 1.74 acres, and indirect permanent impacts to approximately 26.13 acres of United States Army Corps of Engineers (USACE) jurisdictional areas. In addition, Alternative 5C would potentially result in direct permanent impacts to approximately 2.13 acres and indirect permanent impacts to approximately 36.51 acres of California Department of Fish and Wildlife (CDFW) jurisdictional areas. Furthermore, Alternative 5C would potentially result in direct permanent impacts to approximately 1.74 acres and indirect permanent impacts to approximately 26.29 acres of Regional Water Quality Control Board (RWQCB) jurisdictional areas.

The worst-case impact scenario associated with Alternative 7 would potentially result in direct permanent impacts to approximately 1.54 acres and indirect permanent impacts to

approximately 28.56 acres of USACE jurisdictional areas. In addition, Alternative 7 would potentially result in direct permanent impacts to approximately 1.96 acres and indirect permanent impacts to approximately 42.20 acres of CDFW jurisdiction. Furthermore, Alternative 7 would potentially result in direct permanent impacts to approximately 10.80 acres and indirect permanent impacts to approximately 28.72 acres of RWQCB jurisdictional areas.

Since the No Build Alternative has been identified as the Preferred Alternative, a Least Environmentally Damaging Practicable Alternative (LEDPA) analysis is not warranted.

S.6.18 PLANT SPECIES

S.6.18.1 BUILD ALTERNATIVES

One of the sensitive plant species (southern tarplant) was identified in the Study Area. Alternative 5C would result in direct permanent impacts to two populations of southern tarplant, while Alternative 7 would result in direct permanent impacts to all three populations of southern tarplant, including the largest population near Rosecrans Ave. Also, both Alternatives 5C and 7 would result in indirect impacts to southern tarplant from shading.

S.6.19 ANIMAL SPECIES

S.6.19.1 BUILD ALTERNATIVES

Permanent impacts would be the same for all build alternatives at the location where burrowing owls were observed on two separate occasions in October and December 2009. An individual burrowing owl was also observed at this location on December 7, 2015. No other burrowing owls were found during the 2009 or 2015 surveys. Following refinement of the build alternatives since 2009, the location where burrowing owl individuals were observed is now outside the BSA; therefore, no direct impacts would occur in the area where burrowing owl presence was confirmed.

Permanent impacts would be similar for all build alternatives, since the majority of structures housing or potentially housing bats, including the multiple bridge and culvert structures where roosting bats (including special-status bat species) and/or sign of roosting bats were observed during the focused surveys performed in 2009 and 2015, would be subject to impacts resulting from all build alternatives. However, there are a few notable differences between the build alternatives. Although the project footprint for Alternative 7 is larger than that of Alternative 5C, Alternative 5C would result in impacts to several structures potentially used by bats for roosting that are not part of the Alternative 7 project footprint, including SR-91 over Compton Creek, Artesia Blvd. over Compton Creek, Compton Channel culvert beneath Artesia Blvd., SR-91 Santa Fe Ave. Undercrossing, SR-91 Alameda St. Undercrossing, Slauson Ave. Bridge over the Los Angeles River, I-710 3rd St. Overcrossing, and structures associated with the SR-60/I-710 interchange. Alternative 7 would result in impacts to one structure that is not part of the

Alternative 5C project footprint. This structure, a railroad bridge over the West Basin of the Dominguez Gap Wetlands, has a moderate to high probability of being used by bats for roosting.

The build alternatives would not directly affect any of the other special-status animal species as a result of the avoidance and minimization measures described in Section 3.19.4; however, the build alternatives would have permanent indirect and temporary impacts to these species through the loss of potential habitat. There is no critical habitat for any special-status species within the BSA; therefore, no critical habitat would be impacted by the build alternatives. All of these species are widespread in distribution and are not State or Federally listed as threatened or endangered. New bridge structures or significant changes to existing bridge structures proposed under the build alternatives could result in occasional bird strikes. The potential for bird-vehicle collisions cannot be quantified but is recognized as a potentially adverse effect. For any build alternative, the avoidance and minimization measure described in Section 3.19.4 would address this issue. Permanent impacts to other nonlisted special-status species could occur in the form of direct mortality, habitat loss, and habitat fragmentation.

The build alternatives would include driving pilings in tidal waters across the Los Angeles River at the 7th St., Anaheim St., Pacific Coast Hwy, and Hill St. crossings. The percussive forces generated during pile-driving activities may result in hydroacoustic impacts to animal species in the vicinity, as discussed in Section 3.24.3.19.

S.6.20 THREATENED AND ENDANGERED SPECIES

S.6.20.1 BUILD ALTERNATIVES

Although no green sea turtles were observed in the BSA, any green sea turtles that might visit the area around the mouth of the Los Angeles River could be affected indirectly by changes in water quality originating upstream resulting from the build alternatives. However, for any build alternative, by implementing the avoidance and minimization measures outlined in Section 3.16, Natural Communities, no noticeable changes in water conditions would occur. A “may affect but not likely to adversely affect” determination for the build alternatives was made regarding the green sea turtle, and NMFS concurred on this determination on February 19, 2019.

Similarly, the California least tern could be affected indirectly by changes in water quality resulting from the build alternatives. Additionally, new bridge designs under the build alternatives could result in occasional bird strikes. However, for any build alternative, by following the avoidance and minimization measures outlined in Sections 3.16, Natural Communities and 3.19, Animal Species, no noticeable changes in water conditions or bird strike frequency would occur. A “may affect but not likely to adversely affect” determination for the build alternatives was made regarding the California least tern, and USFWS concurred with this determination on May 2, 2019.

The coastal population of the western snowy plover could be affected indirectly by changes in water quality resulting from the build alternatives. Such changes could involve increased pollution levels, increased turbidity, or impacts on the invertebrates on which they feed. New bridge designs under the build alternatives could result in occasional bird strikes. However, for any build alternative, by following the avoidance and minimization measures outlined in Sections 3.16, Natural Communities, and 3.19, Animal Species, no noticeable changes in water conditions or bird strike frequency would occur. A “may affect but not likely to adversely affect” determination for the build alternatives was made regarding the coastal population of the western snowy plover, and USFWS concurred on this determination on May 2, 2019.

The least Bell’s vireo (LBVI) could be impacted by noise, vibration, lighting, dust, and changes in riparian scrub habitat within the Action Area resulting from the build alternatives. Stressors on LBVI resulting from the build alternatives would consist of indirect effects to potentially suitable habitat areas. In addition, the permanent loss of riparian vegetation in select areas would reduce the available foraging, dispersing, and cover habitat for LBVI in the Action Area. However, existing suitable habitat in the Action Area is fragmented, limited in size, and adjacent to heavily trafficked urban land uses. Stressors associated with the build alternatives would represent limited temporary and permanent impacts to riparian habitats that were not occupied by LBVI during project surveys. Such minor effects would not appreciably diminish the value of suitable LBVI habitats in the Action Area. A “not likely to adversely affect” determination for the build alternatives was made regarding the LBVI, and USFWS concurred on this determination on May 2, 2019 (acreage estimates for LBVI were later amended in a letter dated August 21, 2019).

All build alternatives would include the driving of piers/support structures on four bridges within the lower Los Angeles River that could affect California sea lions. Percussive forces generated during any pile-driving activities may result in injury to California sea lions within and adjacent to the BSA, where estuarine habitat exists. For any build alternative, once the pile driving and bridge construction are completed, bridges associated with the either build alternative would not impede the movement of California sea lions through the channel. Construction and expansion of the four bridges in the lower Los Angeles River under the build alternatives would not alter movement of California sea lions through the channel.

The build alternatives include driving pilings in tidal waters across the Los Angeles River at the 7th St., Anaheim St., Pacific Coast Hwy., and Hill St. crossings. As discussed in Section 3.24.3.19, the percussive forces generated during pile-driving activities may result in injury and/or death to fish, sea turtles, or marine mammals (including species protected under the Federal Endangered Species Act, the Magnuson-Stevens Fishery Conservation and Management Act, and the Marine Mammal Protection Act) within the impact area. However, for any build alternative, through the use of proper equipment, potential adjustment of strikes per day, and attenuation methods (if needed), pile driving for the bridges could be completed within

the acoustic limits established in the *Technical Guidance for Assessment and Mitigation of the Hydroacoustic Effects of Pile Driving on Fish* (Caltrans 2015).

S.6.21 INVASIVE SPECIES

S.6.21.1 BUILD ALTERNATIVES

Construction of the build alternatives have the potential to spread invasive species by the entering and exiting of construction equipment contaminated by invasive species, the inclusion of invasive species in seed mixtures and mulch, and the improper removal and disposal of invasive species so that its seed is spread along the highway. The potential spread of *Caulerpa taxifolia* (a nonnative seaweed) during construction and/or operation of the build alternatives would not occur because the invasive species was not observed in the BSA during the Estuarine Resources Environmental Assessment surveys. Nevertheless, for any build alternative, preventative measures would be taken to prevent the spread of this species in accordance with the National Marine Fisheries Service Control Protocol. Impacts associated with Alternative 7 would be greater than impacts associated with Alternative 5C, given the larger area of disturbance associated with the freight corridor.

S.6.22 CUMULATIVE IMPACTS

Cumulative impacts (both direct and indirect) were identified by considering the impacts of the build alternatives and other current, or proposed actions in the area to establish whether, in the aggregate, they could result in cumulative environmental impacts. The analysis included review of adopted plans and related projects that may, in concert with the build alternatives, have a cumulative adverse effect on sensitive resources in the Study Area and Los Angeles County. The reasonably foreseeable actions used in the cumulative impacts analysis were based on information provided by the Cities of Bell, Bell Gardens, Carson, Commerce, Compton, Cudahy, Downey, Huntington Park, Lakewood, Long Beach, Los Angeles, Lynwood, Maywood, Paramount, Signal Hill, South Gate, and Vernon, which identified and approved pending developments proposed in the proximity of the Study Area. The individual Resource Study Areas (RSA) defined for each environmental topic were used to determine which proposed developments are considered close enough in proximity to the I-710 Corridor Project build alternative improvements to be listed in Section 3.25, Cumulative Analysis. These files were cross-checked against files maintained by the State of California, Office of Planning and Research. Information on future transportation projects was provided by Caltrans, SCAG, Metro, and Gateway Cities COG. In addition, both POLA and POLB identified port improvement projects that should be considered in the cumulative impacts analysis.

The build alternatives, when combined with other cumulative projects, would contribute to cumulative land use, community character and cohesion, traffic (four intersections would remain impacted), visual, air quality (near corridor incremental concentration impacts only), noise,

estuarine and riparian/riverine habitats and species associated with this habitat, southern tarplant populations, green turtle and the California least tern (minor incremental), and relocation impacts. The build alternatives would not contribute to cumulative adverse impacts related to agricultural resources, growth, geology and soils, hazards and hazardous waste, hydrology and water quality, mineral resources, cultural resources, paleontological resources, energy, natural communities, wetlands, invasive species, population and housing, public services, recreation, or utilities and service systems.

S.6.23 SECTION 4(F) PROPERTIES

Potential impacts of the build alternatives to public parks and recreation facilities that qualify for protection under Section 4(f) of the 1966 U.S. Department of Transportation Act include:

- Parque Dos Rios
- Cesar E. Chavez Park and Drake/Chavez Greenbelt
- Los Angeles River and Rio Hondo Trails
- Dominguez Gap and DeForest Treatment Wetlands

At Cesar E. Chavez Park and Drake/Chavez Greenbelt, permanent use of land under both build alternatives would occur; however, consolidation and shift of the Shoreline Dr. corridor would result in a larger, more functional park at Cesar E. Chavez Park. Additionally, temporary closures to public access for portions of the Cesar E. Chavez Park would occur under both build alternatives. Both Alternatives 5C and 7 would result in short-term, temporary closures of the Los Angeles River and Rio Hondo Trails during construction. Finally at the Dominguez Gap and De Forest Treatment Wetlands, Alternatives 5C and 7 would result in an expanded aerial easement. It should be noted that the aerial easement does not constitute a “use” under Section 4(f) under either build alternative. Alternative 7 would also require the permanent incorporation of some acreage of the West Basin of the DeForest Treatment Wetlands. Both build alternatives would require temporary construction easements (TCEs), and Alternative 7 would require the temporary removal of portions of the West Basin of the Dominguez Gap and DeForest Treatment Wetlands during construction.

For Parque Dos Rios, permanent use of land under Alternatives 5C and 7 as well as TCEs for both build alternatives would be required. Alternative 5C would result in the permanent incorporation of 1.68 acres of land from Parque Dos Rios into the transportation facility. Alternative 7 would result in the permanent incorporation of 3.21 acres of land from Parque Dos Rios into the transportation facility. However, the remnant parcel outside the alternative footprint would have limited functionality/accessibility. Therefore, Alternative 7 would result in the permanent use of the entire 8.6-acre park, and Alternative 7 would adversely affect the activities, features, and attributes of the 4(f) resource.

The build alternatives would result in a *de minimis* use of three parks/recreational areas, Cesar E. Chavez Park and Drake/Chavez Greenbelt, the Los Angeles River and Rio Hondo Trails, and the Dominguez Gap and DeForest Treatment Wetlands; and five historic sites, the Union Pacific Railroad Rail Lines, Boulder Dam-Los Angeles Transmission Lines, Dale's Donuts, Drake Park National Register-Eligible Historic District, and Los Angeles River Flood Control Channel.

The RDEIR/SDEIS had previously identified direct impacts resulting from the build alternatives to Bandini Park/Batres Community Center in the City of Commerce. Following circulation of the RDEIR/SDEIS and consultation with the City, revisions to the geometric design of the build alternatives in the area of Bandini Park were undertaken to avoid any additional aerial easement or TCE at the park. Please refer to Section 2.3.2.2 for further details.

S.6.24 CONSTRUCTION IMPACTS

Key findings related to construction impacts of the build alternatives are as follows:

- **Land Use:** Construction of the build alternatives would temporarily affect nearby land uses and would include disruption of local traffic patterns and access to residences and businesses; increased traffic congestion; and increased noise, vibration, and dust. In addition, construction of the build alternatives would result in temporary impacts to equestrian, pedestrian, and bicyclist access points to regional and local multi-use trails and bikeways (including the Los Angeles River Trail), and short-term closures of segments of bikeways in the vicinity of new and/or modified interchanges.
- **Parks and Recreation:** Alternative 5C would require 0.26 acre on the west side of Parque Dos Rios for a TCE during construction; however, no TCEs would be required under Alternative 7 to Parque Dos Rios. During construction of Alternative 5C and Alternative 7, approximately 21.9 acres of Cesar E. Chavez Park would be required for a TCE. The TCE area includes a detour road of 0.41 acre, which would be graded and paved to allow temporary access during construction of realigned Broadway under the build alternatives. Portions of Cesar E. Chavez Park may be temporarily closed to public access to protect the safety of park users and construction workers. Alternative 5C and Alternative 7 would require short-term, temporary closures of segments of the Los Angeles River and the Rio Hondo Trails, and some temporary trail crossings at I-710 and local streets during construction would occur.
- **Community Character and Cohesion:** Construction of the improvements for the build alternatives is anticipated to result in short-term access disruptions related to construction and, therefore, result in a short-term impact to community character and cohesion. For any build alternative, a Transportation Management Plan (TMP) would be implemented during construction in a cost-efficient and timely manner with minimal

interference to the traveling public. In addition, construction jobs would be created by the construction of the build alternatives.

- **Environmental Justice:** Construction activities related to the build alternatives would temporarily affect environmental justice populations. However, construction activities related to the build alternatives would provide jobs, which would benefit local economies that include minority and low-income populations.
- **Utilities and Emergency Services:** Construction activities related to the build alternatives that require closures of travel lanes and ramps could result in traffic delays that could affect the ability of fire, law enforcement, and emergency service providers to meet response time goals within the Study Area. Under all build alternatives, utility relocations would occur prior to construction. For any build alternative, for utilities that would be protected in place, standard construction measures, such as contacting Underground Service Alert, would be used to avoid impacting utilities and to avoid utility service disruptions.
- **Traffic Circulation, Pedestrians, and Bicyclists:** During construction, the build alternatives would result in temporary impacts to traffic circulation due to traffic diversions resulting from temporary closures to local roadways, sidewalks and bikeways, and freeway lanes and ramps. For any build alternative, a detailed TMP would be developed during the design phase with input from stakeholders to address changes in traffic flows and pedestrian and bicycle circulation and provide measures to minimize the adverse effects of construction activities on traffic flows and pedestrian and bicycle travel within the Study Area. It would address traffic safety and control needs and provide details regarding traffic detours, construction timelines, and ramp closures. In addition, construction of the build alternatives would result in temporary impacts to pedestrian and bicyclist access points to regional and local multi-use trails and bikeways (including the Los Angeles River and Rio Hondo Trails), and short-term closures of segments of bikeways in the vicinity of new and/or modified interchanges.
- **Visual/Aesthetics:** Short-term visual impacts under the build alternatives would occur to sensitive viewers, particularly highway neighbors, during the construction period and include views of demolition of existing structures, clearing of existing vegetation, grading of cut-and-fill slopes, construction of the I-710 widening and structures, construction vehicles, and construction staging areas. Construction activities would be temporary, and the adverse visual impacts related to construction activity would cease after completion of construction of either build alternative. The effects of vegetation clearing would gradually improve over time as landscaping for either build alternative matures.
- **Cultural Resources:** There is the potential for direct impacts to buried cultural resources to occur during construction of either build alternative. However, all impacts to

buried cultural resources resulting from the build alternatives are considered to be permanent impacts. Therefore, temporary impacts are not applicable to cultural resources.

- **Hydrology/Floodplains:** Construction equipment would be operated within the Los Angeles River and Compton Creek 100-year floodplains during construction of the bridge and levee improvements under the build alternatives as discussed above under Permanent Impacts. For any build alternative, following the completion of construction activities within the 100-year floodplain, the disturbed area would be returned to the existing condition.
- **Water Quality:** Events such as the accidental discharge of waste products produced during construction of either build alternative are of primary concern. Other concerns, such as disturbed soil and erosion of channel banks; runoff from the construction site; disturbance of existing channel-bottom sediments due to construction over and adjacent to local water bodies; resuspension of fine-grained bottom sediments; and removal and disposal of groundwater are potential issues during construction of the build alternatives. However, for any build alternative, standard construction measures would require the capture and treatment of all runoff from the construction area. The potential for temporary water quality impacts would be greater under Alternative 7 because more improvements are proposed under these alternatives and there would be more disturbed soil area and more work within and adjacent to the water bodies within the project area.
- **Geology, Soils, Seismic, and Topography:** Construction activities related to the build alternatives may temporarily disturb soil outside the facility footprint, yet within the project right-of-way, primarily in the trample zone around work areas, heavy equipment traffic areas, and material laydown areas. Temporary impacts would include soil compaction and increased possibility of soil erosion.
- **Paleontology:** There is the potential for direct impacts to paleontological resources to occur during construction of either build alternative. However, all impacts to paleontological resources resulting from the build alternatives are considered to be permanent impacts. Therefore, temporary impacts are not applicable to paleontological resources.
- **Hazardous Waste:** Alternative 7 would have a greater potential temporary hazardous waste impact prior to and during construction than Alternative 5C due to the larger footprint of the freight corridor associated with Alternative 7. Based on the findings of the records search and the site surveys, elevated concentrations of aerially deposited lead (ADL); asbestos-containing materials (ACMs), polychlorinated biphenyls (PCBs), and/or lead-based paint (LBP); and elevated concentrations of metals such as lead may be encountered during excavation and construction activities for all build alternatives.

Contamination may be encountered during construction and excavation activities at those properties that require additional remediation; residual contamination may be encountered during construction and excavation activities at those properties that have received regulatory agency closure; and waste materials may be encountered during construction and excavation activities at those properties that operated as waste disposal sites. Additionally, contaminated groundwater may be encountered during construction of either build alternative.

- **Air Quality/Greenhouse Gases:** During construction of either build alternative, short-term degradation of air quality may occur due to the release of particulate emissions (airborne dust) generated by excavation, grading, hauling, and other activities related to construction. Emissions from construction equipment would also occur and would include CO, NO_x, VOCs, SO_x, PM₁₀, PM_{2.5}, toxic air contaminants such as DPM, and GHGs. Thirty-year amortized annual average construction GHGs are calculated to be approximately 4,700 or 7,500 metric tons per year of CO₂e for Alternatives 5C and 7, respectively. Although Caltrans has not adopted the SCAQMD significance criteria, when the worst-case construction scenario is assumed (i.e., simultaneous construction across all freeway sections), peak daily criteria air pollutant emission estimates for Alternatives 5C and 7 exceed the SCAQMD thresholds for all pollutants except for oxides of sulfur (SO_x). For a single freeway section, peak daily criteria air pollutant emission estimates for Alternatives 5C and 7 are below SCAQMD thresholds for all pollutants except PM₁₀ and NO_x. An analysis of Best Available Control Technology (BACT) construction equipment shows that NO_x and VOC emissions can be appreciably reduced, although these emissions may still exceed SCAQMD significance criteria.
- **Noise:** During construction of either build alternative, noise from construction activities may occasionally dominate the noise environment in the immediate project area. Construction noise is regulated by Caltrans Standard Specifications, Section 14-8.02, "Noise Control." These requirements state that noise levels generated during construction would be controlled and monitored and not to exceed 86 dBA L_{max} at 50 feet from the job site between the hours of 9:00 p.m. to 6:00 a.m.
- **Energy:** Construction equipment and construction worker vehicles operating during construction of the build alternatives would use fossil fuels. This increased fuel consumption would be temporary, would cease at the end of construction activities, and would not have a residual requirement for additional energy input. The marginal increases in fossil fuel use resulting from construction of the build alternatives would not have appreciable impacts on energy resources. It would take approximately 2.3 years to recover the energy expended for Alternative 5C construction and approximately 0.4 year to recover the energy expended for Alternative 7 construction.

- **Natural Communities:** Temporary impacts to natural communities may occur during construction of all build alternatives where habitats are temporarily disturbed during grading or other activities. In general, Alternative 7 would result in greater temporary impacts than Alternative 5C due to the increased number of structural bridge columns/piers associated with Alternative 7.
- **Wetlands/Other Waters:** Temporary impacts to jurisdictional areas may occur during construction where wetlands or waters are temporarily disturbed during pile-driving activities, construction of abutments, grading, or other activities related to the build alternatives. Alternative 7 would result in greater temporary impacts than Alternative 5C due to the increased number of piles within jurisdictional areas associated with Alternative 7.
- **Plant Species:** Temporary impacts to populations of southern tarplant could result from construction of any of the build alternatives. In general, Alternative 7 would result in greater temporary impacts to the populations of southern tarplant than Alternative 5C.
- **Animal Species:** Both build alternatives could result in temporary impacts to burrows that could be used by the burrowing owls and to roosting bats of various species. Construction and expansion of the four bridges in the lower Los Angeles River would not alter long-term movement of California sea lions or fish protected under the Magnuson-Stevens Fishery Conservation and Management Act through the channel. No permanent effects would occur to essential fish habitat (EFH) except for a minimal permanent loss of channel bottom where the piles would be placed under the build alternatives.
- **Threatened & Endangered Species:** Temporary impacts to California least tern, Western Snowy Plover (coastal population), least Bell's vireo, and green turtle could occur during construction of either build alternative from temporary indirect disturbance (noise, vibration, dust, night lighting, and human encroachment). Construction could temporarily impede movement along the Los Angeles River. California least terns could be affected indirectly by changes in water quality resulting from the build alternatives. Any green turtles that might visit the area around the mouth of the Los Angeles River could be temporarily affected indirectly by changes in water quality originating upstream resulting from the build alternatives.
- **Invasive Species:** Construction of the build alternatives has the potential to spread invasive species through the entering and exiting of construction equipment contaminated by invasives, the inclusion of invasive species in seed mixtures and mulch, and the improper removal and disposal of invasive species so that its seed is spread along the highway.
- **Cumulative Impacts:** Temporary cumulative impacts as a result of the build alternatives, in combination with other past, present and future projects, are not

considered to be adverse. All temporary impacts described in the above sections, as well as impacts for other projects in the Study Area, for any build alternative, would each be minimized or mitigated and would, therefore, not have a cumulative impact to humans or the physical environment. Temporary cumulative impacts to traffic and circulation can also result from the construction of more than one project in a general area. In this case, TMPs for each project would be prepared in the future and, for any build alternative, would be coordinated to ensure adequate circulation in the area, including always maintaining the existing number of mainline freeway lanes.

S.6.25 PUBLIC HEALTH CONSIDERATIONS

Key findings related to the effects of the build alternatives on public health are as follows:

- **Parks and Recreation:** The build alternatives would not result in an adverse impact in access to parks as a result of barriers to walking or biking, changes in pedestrian or bike safety near parks, or in a reduction in park acreage and, therefore, would not have adverse effects on public health related to park access. The expansion and reconfiguration of Cesar E. Chavez Park under the build alternatives would have beneficial effects by increasing opportunities for public use of the park following the completion of construction.
- **Community Character and Cohesion:** Based on the nature of the changes in access in the Study Area, the proximity of these changes to residential and nonresidential properties, and the relocation availability and the Relocation Assistance Program (RAP) provided by Caltrans for the affected properties and considerations toward Last Resort Housing, the build alternatives would not result in isolation and/or segregation of residents without resources to relocate within their existing communities and, therefore, would not result in adverse effects to public health related to community character and cohesion.

While the build alternatives would result in some changes in access, these changes would not result in adverse impacts in access to schools within the Study Area. For any build alternative, once in operation, the build alternatives would not result in adverse impacts to modes of travel for students and would enhance access to schools by reducing traffic congestion. Therefore, the build alternatives would not result in adverse effects to public health related to access to schools.

- **Environmental Justice:** The findings described above for Community Character and Cohesion would also apply to minority and low-income (environmental justice) populations within the I-710 Corridor.
- **Utilities and Emergency Services:** Recognizing both public concern and scientific uncertainty over possible health effects from electromagnetic field (EMF) exposure, the

California Public Utilities Commission (CPUC) adopted a precautionary approach to reduce EMF exposures in 1993 (updated in 2006). While keeping electrical safety and good engineering practice as first priority, investor-owned electric utilities in California utilize design to reduce magnetic fields created by new and rebuilt electric facilities.¹ As the relocation of electrical transmission and distribution lines for the build alternatives would utilize designs to reduce EMFs consistent with the CPUC guidance described above, public health considerations regarding EMFs are not considered a concern.

Regarding emergency response times, other than the above-described effects, (adverse effects during construction and beneficial effects once either of the build alternatives is operational), public health was considered not to be a topic of concern for emergency services.

- **Traffic Circulation, Pedestrians, and Bicyclists:** The build alternatives would improve pedestrian facilities (sidewalks) by replacing the old ones that would be removed. Bike travel under the build alternatives would also be improved by providing new pavement on the arterial bridges that would be replaced over I-710 and the Los Angeles River, as well as new bicycle/pedestrian crossings. In many cases, existing interchanges would be replaced with diverging diamond interchange configuration interchanges. Bicyclists and pedestrians are a consideration in the design of these types of interchanges and appropriate treatments are applied to balance vehicle, bicycle, and pedestrian use. For any build alternative, Caltrans' *Complete Intersections: A Guide to Reconstructing Intersections and Interchanges for Bicyclists and Pedestrians* (Caltrans 2010) would be used during the design process. Because sidewalks would be improved, bikeways and trails would be maintained, appropriate space for bicycle lanes would be provided on overcrossings, and bicycle and pedestrian connectivity would be enhanced, the build alternatives would improve conditions for pedestrian and bicycle travel, thereby resulting in a beneficial effect to public health considerations related to congestion and mobility.

Modernizing the design of I-710 under the build alternatives would reduce the number of total and fatal accidents, resulting in accident rates on I-710 that are more reflective of the statewide average for a similar facility. This reduction in accidents would reduce public health risks related to traffic safety.

- **Water Quality:** Water quality BMPs would be implemented to treat stormwater runoff during construction and operation of the build alternatives. As a result, the build alternatives would not degrade the water quality of the receiving waters. For any build alternative, treatment BMPs would be designed to drain and eliminate standing water;

¹ Southern California Edison (SCE). Website: <http://www.sce.com/Safety/everyone/electric-magnetic-fields.htm> (accessed January 7, 2012).

therefore, vectors (such as mosquitoes) would not be of concern. Therefore, the build alternatives would not pose risks to public health related to hydrology and water quality.

- **Geology, Soils, Seismic, and Topography:** The primary public health consideration related to geology is seismic safety. For any build alternative, all new and modified bridge structures included in the build alternatives would be designed and constructed in accordance with Caltrans' latest seismic design criteria, thus minimizing public health risk concerns associated with structure collapses during an earthquake.
- **Hazardous Waste:** The modern design of the either build alternative would result in reduced risk of traffic accidents, including those that could result in hazardous waste spills. Alternative 7 would further reduce the public health risk of hazardous waste spills by separating truck traffic from automobile traffic as a result of the freight corridor component of the alternative. For these reasons, implementation of the build alternatives would not increase public health risks related to hazardous waste and materials in the short term and would decrease these risks in the long term as a result of the cleanup and remediation of hazardous waste contamination on properties that would be acquired for the build alternatives.
- **Air Quality:** Either build alternative would generally improve air quality and reduce public health risk in the Basin and the I-710 AOI. Along I-710, air quality would be improved and public health risk would be reduced at most locations, but there are a few nearby roadway locations where there would be an increase in certain emissions but no increase in cancer risk compared to 2012. There are no feasible mitigation measures to reduce these localized near-roadway impacts; therefore, these would be unavoidable adverse impacts resulting from the build alternatives.
- **Noise:** The proposed soundwalls to be constructed under either of the build alternatives would reduce noise levels for people living and working in the I-710 Corridor.

S.7 SUMMARY OF SIGNIFICANT IMPACTS UNDER CEQA AFTER MITIGATION

As discussed in detail in Chapter 4.0, CEQA Evaluation, the following impacts of the build alternatives were determined to be significant, adverse, and unavoidable after implementation of the identified avoidance, minimization, and mitigation measures, as well as the design features of the build alternatives:

Permanent Air Quality Impacts: Although most areas would experience improved air quality, some near-roadway sensitive receptors would be exposed to substantial pollutant concentrations that cannot be mitigated.

Permanent Land Use and Planning Impacts: Within the Cities of Commerce, Compton, Bell, and Long Beach Alternative 7 would result in relocations resulting in a significant unavoidable

impact to community character and cohesion. Impacts would also occur under Alternative 5C; however, community character and cohesion would remain intact under this alternative.

Permanent Population and Housing Impacts: Alternative 5C and the Design Options would result in between 109 and 128 residential displacements, and Alternative 7 would result in a total of between 121 and 140 residential relocations, depending on design options. Some of these displaced residences are in areas (mainly the Cities of Commerce and Compton) where there is insufficient replacement housing available. Therefore, for any build alternative, it may not be possible to relocate all displaced residents within their community or an area within reasonable proximity to their community. For this reason, for any build alternative, the construction of replacement housing in these areas may be necessary.

Permanent Traffic and Transportation Impacts: Mitigation measures have not been recommended for four intersections impacted under the build alternatives as mitigation would be infeasible due to right-of-way constraints and potentially severe impacts to adjacent properties within the affected cities. These four intersections would be adversely impacted by the build alternatives and would result in increased delay relative to the future No Build Alternative conditions.

Mandatory Findings of Significance: Although the build alternatives provide benefits in terms of addressing the need and purpose of the I-710 Corridor Project, incremental adverse effects of the build alternatives are considerable when viewed in connection with the effects of past, current, and probable future projects. Additionally, the build alternatives would likely cause substantial adverse effects on human beings, as indicated by discussions of residential displacements associated with the build alternatives.

The remaining impacts of the build alternatives were determined to be either not significant or able to be avoided or reduced to below a level of significance based on implementation of the avoidance, minimization, and mitigation measures and design features of the build alternatives, as described in detail in Chapter 4.0. Table S-5 summarizes the significant impacts of the build alternatives identified during the CEQA evaluation and the relevant mitigation measures applicable for each impact.

S.8 AREAS OF CONTROVERSY AND UNRESOLVED ISSUES

Based on input during the MCS, public scoping, and public outreach efforts, the following areas of public concern have been identified. Some of the issues raised may be considered controversial.

- **Air Quality/Health Risk:** Air quality and health risk continue to be controversial public issues because of the high emissions levels and resulting health risk to populations along the I-710 Corridor due to existing traffic congestion and truck traffic from the Ports.

Table S-5: CEQA Significance Chart

| Resource Area | CEQA Determination | Mitigation Measures | Build Alternatives |
|---|---------------------------------------|--|---|
| Aesthetics | | | |
| Substantially degrade the existing visual character or quality of the site and its surroundings? | Less Than Significant with Mitigation | Measures VIS-1 through VIS-12 provided in Section 3.6.4, Visual/Aesthetics | Alternative 7 would result in greater aesthetic impacts than Alternative 5C. |
| Air Quality | | | |
| Violate any air quality standard or contribute substantially to an existing or projected air quality violation? | Significant and Unavoidable Impact | Measure AQ-1 in Section 3.13, Air Quality | Alternatives 5C and 7 would result in the same impacts. |
| Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)? | Significant and Unavoidable Impact | Measure AQ-1 in Section 3.13, Air Quality | Alternative 7 would result in incremental PM ₁₀ and SO ₂ increases, while Alternative 5C would result in incremental PM ₁₀ and SO ₂ decreases. |
| Expose sensitive receptors to substantial pollutant concentrations? | Significant and Unavoidable Impact | Measures AQ-1 through AQ-3 in Section 3.13, Air Quality | Alternatives 5C and 7 would result in the same impacts. |
| Biological Resources | | | |
| Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service? | Less Than Significant with Mitigation | Measures NC-1 in Section 3.16, Natural Communities; CON-PS-1 in Section 3.24, Construction Impacts; AS-1 in Section 3.19.4, Animal Species; CON-AS-1 through CON-AS-14 in Section 3.24, Construction Impacts; CON-NC-2 through CON-NC-13 in Section 3.24; CON-INV-3 in Section 3.24; CON-TES-1 through CON-TES-4 in Section 3.24 | Impacts vary between Alternatives 5C and 7 with regard to plant species, animal species, and natural communities; however, in general, Alternative 7 may result in greater impacts due to its larger footprint than that of Alternative 5C. |
| Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Wildlife or US Fish and Wildlife Service? | Less Than Significant with Mitigation | Measure NC-1 in Section 3.16, Natural Communities | Generally, Alternative 7 may result in greater impacts due to its larger footprint than that of Alternative 5C. |
| Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means? | Less Than Significant with Mitigation | Measure NC-1 in Section 3.16, Natural Communities | Generally, Alternative 7 may result in greater impacts due to its larger footprint than that of Alternative 5C. |
| Cultural and Paleontological Resources | | | |
| Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature? | Less Than Significant with Mitigation | Measure PAL-1 in Section 3.11, Paleontology | Alternatives 5C and 7 would result in the same impacts. |

I-710 Corridor Project Final EIR/EIS

| Resource Area | CEQA Determination | Mitigation Measures | Build Alternatives |
|---|---------------------------------------|---|---|
| Geology Soils | | | |
| Seismic-related ground failure, including liquefaction? | Less Than Significant with Mitigation | Measures GEO-1 in Section 3.10, Geology and Seismology; CON-GEO-1 in Section 3.24, Construction Impacts | Alternatives 5C and 7 would result in the same impacts. |
| Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse? | Less Than Significant with Mitigation | Measures GEO-1 in Section 3.10, Geology and Seismology; CON-GEO-1 in Section 3.24, Construction Impacts | Alternatives 5C and 7 would result in the same impacts. |
| Hazards and Hazardous Materials | | | |
| Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment? | Less Than Significant with Mitigation | Measures HW-1 through HW-7 listed in Section 3.12, Hazardous Materials, and Measures CON-HW-1 through CON-HW-3 listed in Section 3.24, Construction Impacts | Alternatives 5C and 7 would result in the same impacts. |
| Land Use and Planning | | | |
| Physically divide an established community? | Significant and Unavoidable Impact | None Identified | Alternative 5C and Alternative 7 would result in similar impacts to community cohesion; however, additional impacts to the community would result from the implementation of Alternative 7 due to the increased right of way required for the four-lane freight corridor. |
| Noise | | | |
| Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies? | Less Than Significant with Mitigation | Measure N-1 in Section 3.14, Noise | Receptors within the I-710 Study Area would experience substantial noise increases over existing noise levels for both build alternatives; however, Alternative 7 would result in slightly higher impacts to receptors than Alternative 5C. |
| Exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels? | Less Than Significant with Mitigation | Measure CON-N-1 and CON-N-2 in Section 3.24, Construction Impacts | Alternatives 5C and 7 would result in the same impacts. |
| A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project? | Less Than Significant with Mitigation | Measure N-1 in Section 3.14, Noise | Receptors within the I-710 Study Area would experience substantial noise increases over existing noise levels for both build alternatives; however, Alternative 7 would result in slightly higher impacts to receptors than Alternative 5C. |

| Resource Area | CEQA Determination | Mitigation Measures | Build Alternatives |
|---|---------------------------------------|---|--|
| Population and Housing | | | |
| Displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere? | Significant and Unavoidable Impact | None Identified | Alternative 7 would generally result in greater displacement impacts than those associated with Alternative 5C. |
| Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere? | Significant and Unavoidable Impact | None Identified | Alternative 7 would generally result in greater displacement impacts than those associated with Alternative 5C. |
| Public Services | | | |
| <p>Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services:</p> <p>Fire protection?</p> <p>Police protection?</p> <p>Schools?</p> <p>Parks?</p> <p>Other public facilities?</p> | Less Than Significant with Mitigation | Measures C-1 through C-4 in Section 3.4, Communities; CON-TR-1 in Section 3.24 Construction Impacts | Both build alternatives would result in facility acquisitions; however, Alternative 7 would result in some additional facility acquisitions when compared to Alternative 5C. |
| Parks and Recreation | | | |
| Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated? | Less Than Significant with Mitigation | Measures PR-1 through PR-23 in 3.1, Land Use | Alternatives 5C and 7 would result in the same impacts. |
| Transportation and Traffic | | | |
| Conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit? | Significant and Unavoidable Impact | None Identified | Alternatives 5C and 7 would result in the same impacts. |

I-710 Corridor Project Final EIR/EIS

| Resource Area | CEQA Determination | Mitigation Measures | Build Alternatives |
|---|---------------------------------------|--|---|
| Conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways? | Significant and Unavoidable Impact | None Identified | Alternatives 5C and 7 would result in the same impacts. |
| Utilities and Service Systems | | | |
| Require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects? | Less Than Significant with Mitigation | Measure FP-2 in Section 3.8, Hydrology and Floodplains | Generally, Alternative 5C and Alternative 7 would result in similar impacts; however, the Dominguez Gap Spreading Grounds would only be impacted by the freight corridor in Alternative 7. |
| Mandatory Findings of Significance | | | |
| Does the project have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory? | Less Than Significant with Mitigation | Refer to Section 4.4, Mitigation Measures for Significant Impacts under CEQA | Both of the build alternatives have the potential to degrade the environment as a result of impacts to the following: natural communities, plant communities, and wetlands and other waters. |
| Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)? | Significant and Unavoidable Impact | None Identified | Both build alternatives, when combined with other cumulative projects, would contribute to cumulative impacts related to air quality, land use and planning, noise, population and housing, and lastly, transportation and traffic. |
| Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly? | Significant and Unavoidable Impact | None Identified | Both build alternatives would have direct and indirect adverse impacts on human beings that cannot be mitigated to a level below significance. |

- **USEPA Comments:** The USEPA has raised concerns regarding the analytical methodologies used to evaluate potential impacts of the I-710 Corridor Project build alternatives as well as concerns about potential impacts to low income and minority populations resulting from the build alternatives.
- **Noise:** All of the build alternatives would result in noise impacts to sensitive receptors along the I-710 Corridor. Soundwalls have been proposed under the build alternatives to reduce these impacts.
- **Utility Relocations:** At the time this document was being prepared, the design of the build alternatives was not advanced enough to determine the specific locations of some utility relocations.
- **Acquisition of Private Property/Displacements:** Although the design of the build alternatives was refined to minimize the need to acquire private property, acquisition of property and displacement of existing residences and businesses may be controversial with individual property owners.

S.9 COORDINATION WITH PUBLIC AND OTHER AGENCIES

Early and continuing coordination between the general public and public agencies with the I-710 Corridor Funding Partners (Caltrans, Metro, Gateway Cities COG, POLB, POLA, SCAG, and the I-5 JPA) has been an essential part of the environmental process in order to determine the scope of environmental documentation, the level of analysis, any potential impacts and mitigation measures, and related environmental requirements. Agency consultation and public participation for this project have been accomplished through a variety of formal and informal methods, including an extensive multi-tiered community participation process with numerous public meetings and interagency coordination meetings. Chapter 5.0 summarizes the results of the efforts by Caltrans, Metro, and the I-710 Corridor Project partner agencies to fully identify, address, and resolve project-related issues through early and continuing coordination.

The continuing coordination efforts have resulted in the identification of Cooperating and Participating Agencies. A Cooperating Agency, as defined in NEPA, is any Federal agency, or State or local agency of similar qualification, that has jurisdiction by law or special expertise with respect to any environmental impact involved in a proposed project or project alternative (40 CFR 1508.5). In addition, a Cooperating Agency may adopt, without recirculation of, the environmental impact statement of a lead agency when, after an independent review of the statement, the Cooperating Agency concludes that its comments and suggestions have been satisfied, pursuant to 40 CFR 1506.3. Participating Agencies are those with an interest in the project; therefore, all Cooperating Agencies are also Participating Agencies. However, while the roles and responsibilities of Cooperating and Participating Agencies are similar, the Cooperating Agencies have a higher degree of authority, responsibility, and involvement in the environmental review process. It is at the lead agency's discretion to consider these distinctions in deciding

whether to invite an agency to serve as a Cooperating or Participating Agency or only as a Participating Agency. Under CEQA, a Responsible Agency is any public agency, other than the lead agency, which has the responsibility for any discretionary approvals (e.g., a permit) necessary to implement the project.

S.10 SUMMARY COMPARISON OF ALTERNATIVES

Table S-6 on the following pages provides a summary comparison of the Preferred Alternative (Alternative 1), Alternative 5C, and Alternative 7 for key environmental topics of concern.

Table S-6: Summary Comparison of Alternatives

| Alternatives and Environmental Topics | Alternative 1 No Build | Alternative 5C | Alternative 7 |
|--|---|---|---|
| Alternative Descriptions | No change to I-710 | Widen I-710 in several sections and modernize I-710 geometrics <ul style="list-style-type: none"> Includes a Corridor Aesthetics Master Plan and Programmatic elements (I-710 Clean Truck Program, Community Health Benefit) | Modernize geometrics and add a separated freight corridor (two lanes each direction, four lanes total) <ul style="list-style-type: none"> Includes a Corridor Aesthetic Master Plan and Programmatic elements (I-710 Clean Truck Program, Community Health Benefit) |
| Air Quality/Health Risk Assessment | The improvements proposed as a part of the I-710 Corridor Project build alternatives would not be implemented and the specific benefits of the build alternatives would not occur under Alternative 1. However, the other projects assumed in the no build condition would provide mobility and air quality benefits. | <ul style="list-style-type: none"> Project area particulate matter emissions would increase compared to no project conditions MSAT and criteria pollutant emissions would decrease compared to existing conditions Reduced public health risk at most locations, but at some near-roadway locations emissions would increase | <ul style="list-style-type: none"> Project area particulate matter emissions would increase compared to no project conditions MSAT emissions and criteria pollutant emissions would decrease compared to existing conditions Public health risk would be similar to the health risks associated with Alternative 5C, with slightly higher particulate matter impacts |
| Community Impacts | | | |
| Displacements | No displacements | Between 109 and 128 residential and between 157 and 165 nonresidential displacements (depending on the design option). | Between 121 and 140 residential and between 206 and 213 nonresidential displacements (depending on the design option). |
| Access | No changes to access | <ul style="list-style-type: none"> Improved pedestrian access Alternative routes maintain existing access Five new bicycle/pedestrian-only bridges | <ul style="list-style-type: none"> Improved pedestrian access Alternative routes maintain existing access Addition of a new I-710/Slauson Ave. freight corridor partial interchange Three new bicycle/pedestrian-only bridges |
| Parks & Recreation | No changes to parks and recreation facilities | Impacts to the following facilities: Parque Dos Rios, Compton Hunting and Fishing Club, Maywood Riverfront Park (indirect impacts), Coolidge Park (indirect impacts), Wrigley Greenbelt (temporary construction easement), Cesar E. Chavez Park (access/parking benefit), and Los Angeles River Trail and Rio Hondo Trail (improved access) | Impacts to the following facilities: Parque Dos Rios, Compton Hunting and Fishing Club, Maywood Riverfront Park (indirect impacts) Coolidge Park (indirect impacts), Los Cerritos Park (temporary construction easement), Cressa Park (temporary construction easement), Cesar E. Chavez Park (access/parking benefit), and Los Angeles River Trail and Rio Hondo Trail (improved access) |

| Alternatives and Environmental Topics | Alternative 1 No Build | Alternative 5C | Alternative 7 |
|--|--|--|---|
| Noise | The build alternatives would not be implemented and, therefore, there would be no noise impacts. | 2.2 miles of proposed new soundwalls and 5.3 miles of soundwalls to replace existing. | 2.7 miles of proposed new soundwalls and 6.8 miles of soundwalls to replace existing. |
| Visual | The build alternatives would not be implemented. Therefore, there would be no visual impacts. | Alternative 5C would have less visual impact than Alternative 7 because it would not include the elevated freight corridor. | Greater level of visual impact than Alternative 5C because it would include construction of the elevated freight corridor visible from nearby residential areas. The most substantial adverse visual impacts are in the Cities of Long Beach and South Gate, due to close proximity to freeway-to-freeway interchanges, sound barriers, and the elevated freight corridor. |
| Hazardous Waste | No changes to the existing physical environment and would not result in hazardous waste impacts | There is potential for hazardous materials, including petroleum products, to exist within the Study Area and be disturbed by full or partial acquisitions or temporary construction easements under Alternative 5C. Any contamination encountered during construction and excavation activities for Alternative 5C would be properly handled, removed, remediated, and/or disposed of according to all applicable regulations. If Alternative 5C is selected for implementation, each property of environmental concern to be acquired would require testing in order to characterize specific soil and/or groundwater contaminants on the property, and a site-specific hazardous waste remediation plan would be developed for the appropriate removal and disposal of materials. In addition, a remediation plan and site closure plan, if required, would be implemented to clean up the site and provide for any subsequent monitoring to ensure the contamination has been remediated below regulatory thresholds. | There is potential for hazardous materials, including petroleum products, to exist within the Study Area and be disturbed by full or partial acquisitions or temporary construction easements under Alternative 7. Any contamination encountered during construction and excavation activities for Alternative 7 would be properly handled, removed, remediated, and/or disposed of according to all applicable regulations. If Alternative 7 is selected for implementation, each property of environmental concern to be acquired would require testing in order to characterize specific soil and/or groundwater contaminants on the property, and a site-specific hazardous waste remediation plan would be developed for the appropriate removal and disposal of materials. In addition, a remediation plan and site closure plan, if required, would be implemented to clean up the site and provide for any subsequent monitoring to ensure the contamination has been remediated below regulatory thresholds. An elevated freight corridor would reduce public health risk from hazardous waste spills by separating truck traffic from automobile traffic. |

| Alternatives and Environmental Topics | Alternative 1 No Build | Alternative 5C | Alternative 7 |
|--|---|--|--|
| Traffic | No improvements to I-710, other than those currently planned. Traffic conditions would continue to deteriorate over time due to increased traffic volumes caused by regional growth in traffic. Most segments are projected to operate at LOS F in the 2035 AM peak hour. | Alternative 5C (including the configuration with Design Options 1A and 2A) would have three segments of I-710 that operate at LOS F in the 2035 AM peak hour. | Alternative 7 would have eight segments of I-710 that operate at LOS F in the 2035 AM peak hour. |
| Water Quality | Existing roadway runoff would be treated by the existing BMPs and is undergoing BMP development in accordance with the Stormwater permit. Therefore, the No Build Alternative would result in an improvement to water quality based on these BMPs. | Impervious surface would be increased by 156.4 acres. The BMPs would treat 74 percent of on-site runoff from the total impervious surface areas within the project area, which would be an improvement over the existing condition. | Impervious surface would be increased by 256.9 acres. The BMPs would treat 78.3 percent of on-site runoff from the total impervious surface areas within the project area, which would be an improvement over the existing condition |
| Cultural Resources | The build alternatives would not be implemented. Therefore, there would be no impacts to historic resources. | Impacts to four historic resources: two segments of the UP Railroad, Dale's Donuts, and Boulder Dam-Los Angeles 287.5 kV Transmission Line. It was determined there would be no adverse effects on historic properties. SHPO concurred with this determination on December 20, 2018. | Impacts to four historic resources: two segments of the UP Railroad, Dale's Donuts, Boulder Dam-Los Angeles 287.5 kV Transmission Line. It was determined there would be no adverse effects on historic properties. SHPO concurred with this determination on December 20, 2018. |
| Biology/Natural Resources | The Preferred Alternative (Alternative 1) would not impact estuarine and riparian/riverine habits. | Permanent direct impacts to 2.13 acres of estuarine and riparian/riverine habitats and permanent indirect impacts to 36.67 acres of this habitat. | Permanent direct impacts to 11.23 acres of estuarine and riparian/riverine habitats and permanent indirect impacts to 42.36 acres of this habitat. |

I-710 = Interstate 710

kV = kilovolt

LOS = level of service

MSAT = Mobile source air toxics

UP Railroad = Union Pacific Railroad

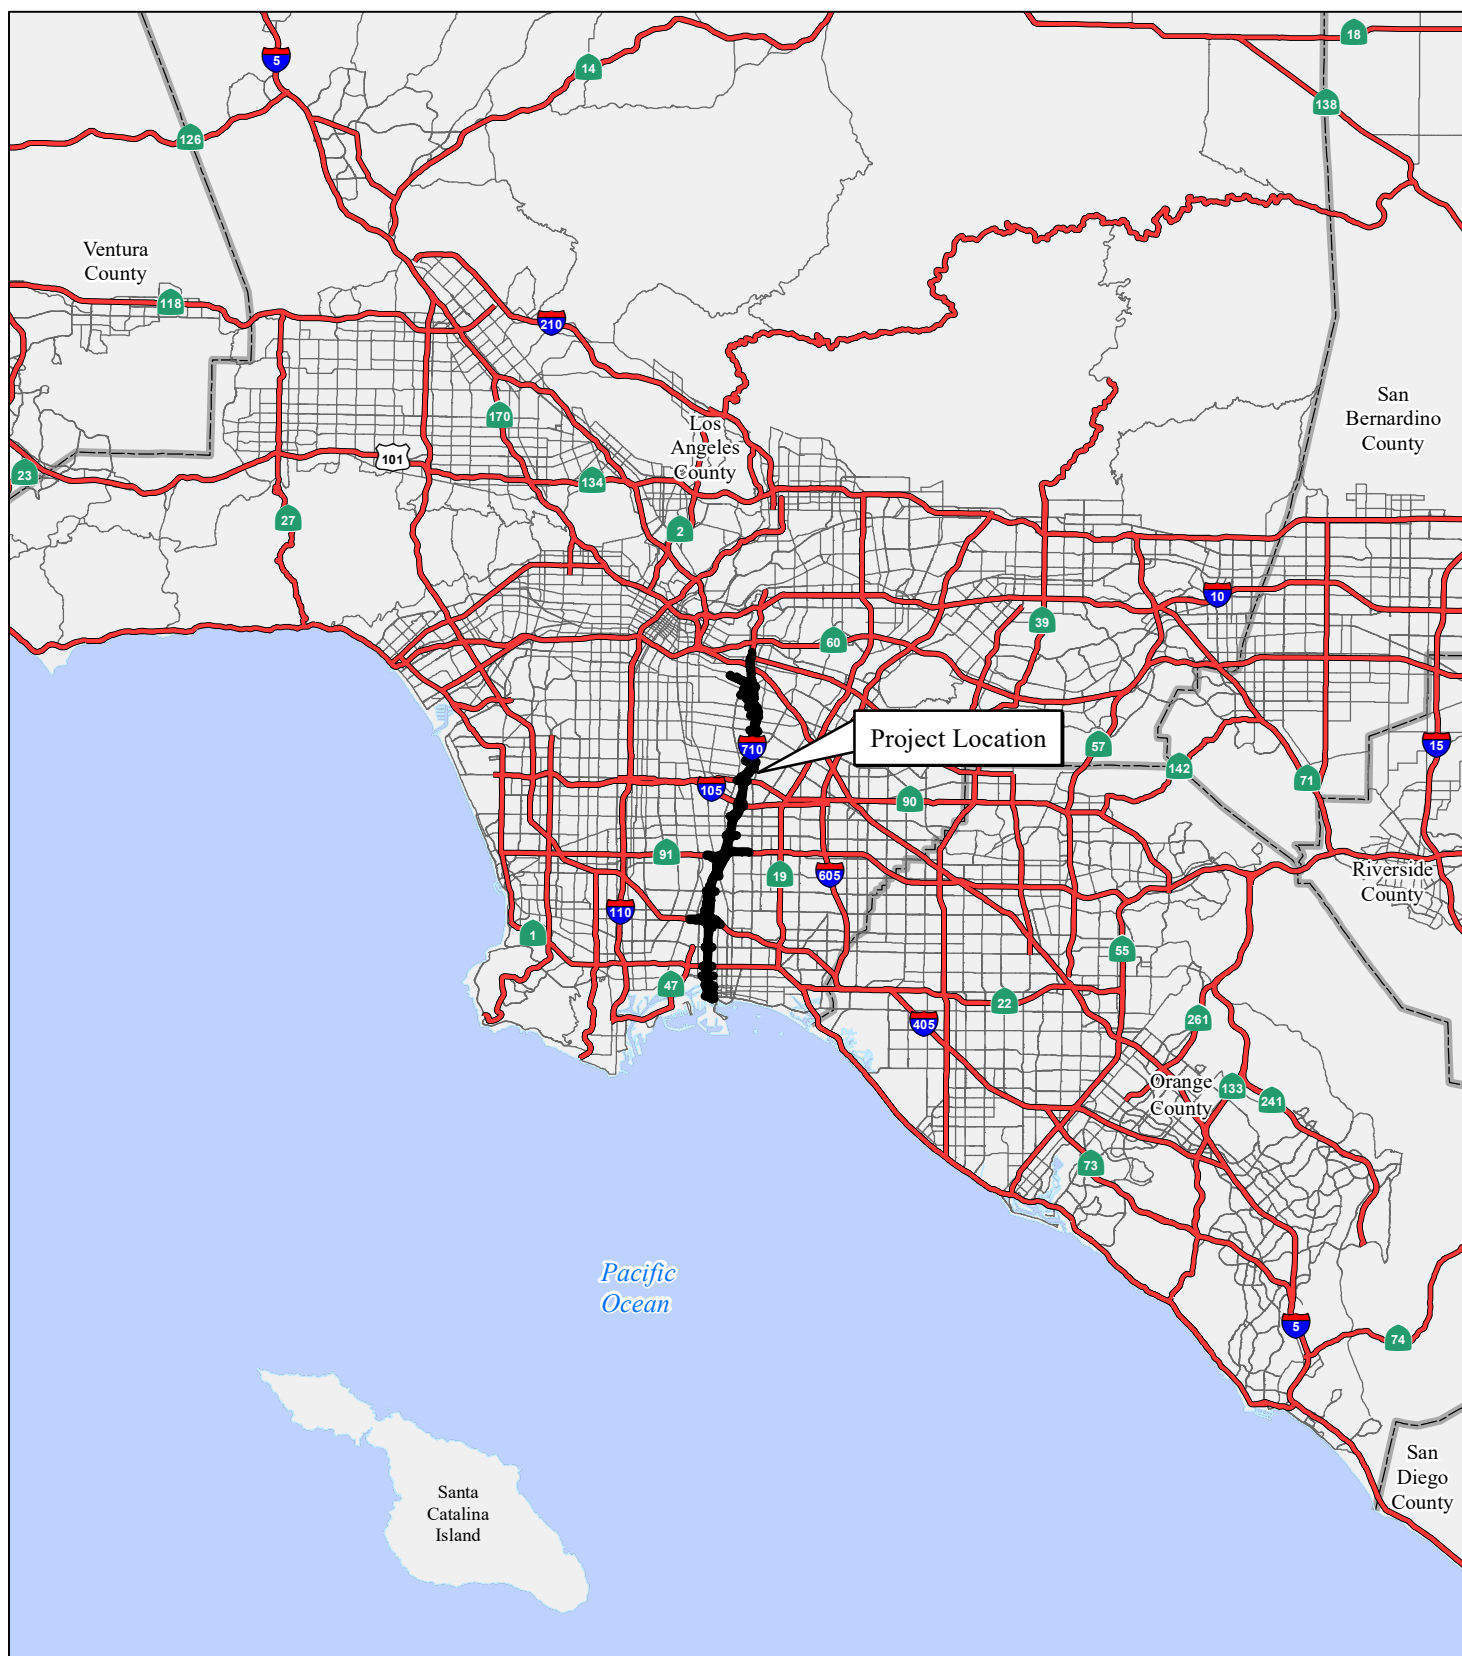

1.0 PROPOSED PROJECT

1.1 INTRODUCTION

The California Department of Transportation (Caltrans), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), the Gateway Cities Council of Governments (Gateway Cities COG), the Southern California Association of Governments (SCAG), the Ports of Los Angeles (POLA) and Long Beach (POLB) (collectively referred to as the Ports), and the Interstate 5 Joint Powers Authority (I-5 JPA) (collectively referred to as the I-710 Funding Partners), proposes to improve Interstate 710 (I-710, also referred to as the Long Beach Freeway) in Los Angeles County between Ocean Blvd. and State Route 60 (SR-60). The proposed project, which includes the No Build (Alternative 1) and two build alternatives (Alternatives 5C and 7) is referred to as the I-710 Corridor Project. I-710 is a major north-south interstate freeway connecting the City of Long Beach to central Los Angeles and beyond. Within the I-710 Corridor Project Study Area (Study Area), I-710 is a significant goods movement artery for the region and serves as the principal transportation connection for goods movement between POLA and POLB, located at the southern terminus of I-710, and the Burlington Northern Santa Fe Railroad (BNSF)/Union Pacific Railroad (UP Railroad) intermodal rail yards in the Cities of Commerce and Vernon, as well as intermodal warehouses along I-710. The I-710 Corridor is part of the Interstate Highway System and is used as a major local and regional truck route. I-710 is listed as a “high priority corridor” on the National Highway System (NHS), serving interregional vehicular traffic in the north-south direction from its terminus in the City of Long Beach to Interstate 10 (I-10). The existing I-710 freeway mainline generally consists of eight general purpose lanes north of Interstate 405 (I-405) and six general purpose lanes south of I-405. As defined by the California Streets and Highways Code Sections 622 and 622.1, Route 710 runs from Route 1 to Route 210 in Pasadena, and Route 710 shall also include that portion of the freeway between Route 1 and the northern end of Harbor Scenic Dr., that portion of Harbor Scenic Dr. to Ocean Blvd., that portion of Ocean Blvd. west of its intersection with Harbor Scenic Dr. to its junction with Seaside Blvd., and that portion of Seaside Blvd. from the junction with Ocean Blvd. to Route 47. Figure 1.1-1 shows the regional location.

The Study Area includes the portion of the I-710 Corridor from Ocean Blvd. in Long Beach to SR-60, a distance of approximately 19 miles and includes all or portions of the Ports, the Cities of Bell, Bell Gardens, Carson, Commerce, Compton, Cudahy, Downey, Huntington Park, Lakewood, Long Beach, Lynwood, Maywood, Paramount, Signal Hill, South Gate, and Vernon, as well as unincorporated areas of Los Angeles County, including the communities of East Los Angeles, Boyle Heights, Wilmington, and San Pedro. At the freeway-to-freeway interchanges, the Study Area extends east and west of the I-710 mainline for the I-405, State Route 91 (SR-91), Interstate 105 (I-105), and I-5 interchanges (see Figure 1.1-2). This is the general Study Area for the I-710 Corridor Project. Specific study areas have been established for individual environmental analyses (e.g., health risk assessment zone of influence and community impact assessment focus area).

The existing I-710 Corridor has elevated levels of traffic congestion, elevated truck volumes, elevated accident rates, and many design features in need of modernization since the original freeway was built in the 1950s and 1960s. Because of this, the *I-710 Major Corridor Study* (MCS; March 2005) was undertaken to address the I-710 Corridor's mobility and safety needs and to explore possible solutions for transportation improvements. This study was completed in March 2005 and identified a community-based Locally Preferred Strategy (LPS) consisting of ten general purpose lanes next to four separated freight movement lanes. In total, three reports have previously been completed on the I-710 Corridor: (1) the *Tier 2 Community Advisory Committee Report* (August 2004); (2) the I-710 MCS (March 2005); and (3) the *I-5/I-710 Interchange Mini-Study* (April 2006). Subsequent to the MCS, the I-710 Funding Partners entered into cooperative agreements with Metro and collectively funded the preparation of preliminary engineering and environmental documentation for the I-710 Corridor Project. A Draft Environmental Impact Report/Environmental Impact Statement (EIR/EIS) for the proposed project was circulated for public review in 2012. In it, several build alternatives were analyzed. Refer to Chapter 2.0, Alternatives, for more information on these alternatives. The feedback and new information received during the public review period prompted further evaluation of the suite of alternatives under analysis for the project. That traffic data indicated different traffic patterns than originally identified, and a clearer understanding of the origins and destinations of truck traffic within and beyond the project area. As a result of this new data and information, the Funding Partners made the decision to develop revised alternatives and prepare a Recirculated Draft EIR/Supplemental Draft EIS (RDEIR/SDEIS). Section 15088.5(c) of the California Environmental Quality Act (CEQA) Guidelines state that "a lead agency is required to recirculate an EIR when significant new information is added to the EIR after public notice is given of the availability of the draft EIR for public review under Section 15087 but before certification." The "significant new information" requiring recirculation can include changes to the environmental setting or the evaluation of a new and different feasible alternative. 23 Code of Federal Regulations (CFR) 771.130 discusses supplemental environmental impact statements and states that "a draft EIS, final EIS, or supplemental EIS may be supplemented at any time", including, but not limited to, when "new information or circumstances relevant to environmental concerns and bearing on the proposed action or its impacts would result in significant environmental impacts not evaluated in the EIS." The project development support, right-of-way, and construction costs for the build alternatives were anticipated to be funded through various local, State, and Federal agencies. Current project development activities were jointly funded by the I-710 Funding Partners using a combination of local, State, and Federal funds.

A project to reconstruct the I-710 interchanges at I-105, SR-91, I-405, and I-5 as part of the I-710 Corridor Project was included in the SCAG-adopted 2019 and 2023 Federal Transportation Improvement Program (FTIP) (Project ID No. LA0B952, 100 percent prior years). An update to the description of Alternative 5C was included in SCAG's 2016 RTP/SCS Amendment No. 3, adopted by SCAG on September 6, 2018 (RTP ID No. 1C0401) and SCAG's 2020 Connect SoCal (2020-2045 Regional Transportation Plan/Sustainable Communities Strategy [RTP/SCS])

Amendment No. 3 adopted by SCAG September 3, 2020 (RTP ID No. LAB952). Alternative 5C is described as “I-710 Corridor capacity enhancement – add 1 mixed flow lane in each direction between Shoreline Dr and SR-91 and between I-105 and SR-60; add 2 truck lanes in each direction between Willow St and Del Amo Blvd; and improve interchanges between Ocean Blvd in Long Beach and SR-60 in East Los Angeles.” However, since that time, Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with Metro, has identified the No Build (Alternative 1) as the Preferred Alternative. Please refer to Section 2.4 of this Final EIR/EIS for more detail. Moving forward, Metro will continue to work with SCAG to ensure that the future modifications to the RTP and FTIP reflect the No Build (Alternative 1) as opposed to Alternative 5C. A general description of the build alternatives is also included in the Metro Final 2009 Long-Range Transportation Plan (LRTP) as a Funded Freeway Improvement.

The 2019 and 2023 FTIP Consistency Amendments #19-12 and #23-03 and amended 2016 and 2020 RTP/SCS project listings noted above are provided in Appendix I of this Final EIR/EIS.

1.2 NEED AND PURPOSE

1.2.1 NEED FOR THE I-710 CORRIDOR PROJECT

The I-710 Corridor is a vital transportation artery not only for the communities along the corridor, but also because it links POLA and POLB to southern California and the rest of the nation via connections to other Interstate and State highways. An essential component of the regional, statewide, and national transportation system, it serves both passenger and goods movement vehicles. As a result of population growth, growth in international cargo being shipped through the Ports, increasing traffic volumes, and aging infrastructure, the I-710 Corridor experiences serious congestion and safety issues. According to the growth projections in the 2012 RTP/SCS, the population in the Study Area is expected to grow from 1,155,000 in 2012 to 1,272,000 in 2035, an increase of approximately 10 percent. These projections have been updated and according to growth projections adopted by SCAG in the 2016 RTP/SCS, the population of Los Angeles County is anticipated to increase from 10.2 million in 2015 to 11.5 million in 2040, an increase of approximately 13 percent. Employment in the Study Area is expected to grow from 470,000 in 2012 to 523,000 in 2035, an increase of approximately 11 percent.¹ Although the RTP/SCS was updated in 2020, there is no substantial difference in the data provided in this section of the Final EIR/EIS. There are no currently funded transportation improvements that will address the projected future transportation demand within the I-710 Corridor. The I-710 Corridor Project build alternatives proposed to address the needs within the I-710 Corridor between the Ports and SR-60 described below in Sections 1.2.1.1 through 1.2.1.5. For purpose statements that

¹ Southern California Association of Governments (SCAG). 2020. *Regional Transportation Plan*.

correspond to each of the needs as listed below, please refer to Section 1.2.2, immediately following the discussion of project needs.

1.2.1.1 AIR QUALITY

The U.S. Environmental Protection Agency (EPA) has designated the South Coast Air Basin, which includes the Study Area, as an extreme ozone non-attainment area and a non-attainment area for small airborne particulate matter less than 2.5 microns (PM_{2.5}). Exposure to ozone and PM_{2.5} levels above the Federal health standards is associated with many adverse health effects—including decreased lung function, aggravated asthma, increased lung and heart diseases symptoms, and chronic bronchitis—that can result in increased morbidity and premature mortality. Studies have shown that elevated levels of nitrogen dioxide (NO₂) and ultrafine particulates (UFPs) occur very near roadways; these elevated levels are also associated with adverse health effects. In addition, the South Coast Air Quality Management District (SCAQMD) has conducted Multiple Air Toxic Exposure Studies (MATES), the latest being MATES IV, sampling for which occurred from 2012 to 2013. The highest levels of calculated cancer risk (approximately 1,400 in one million) in 2012 (the study analysis year) occur in the Study Area, particularly near the Ports, rail yards, and along the I-710 freeway. These studies show that diesel particulate matter (DPM) is the greatest contributor to air-quality-related cancer risk in the South Coast Air Basin and that approximately half of the DPM is emitted by diesel trucks using the freeway and roadway systems.

1.2.1.2 CAPACITY, TRANSPORTATION DEMAND, AND SAFETY

FREEWAY CAPACITY. The need for the I-710 Corridor Project is based on an assessment of the existing and future transportation demand in the Study Area compared to the available capacity. Based on the examination of existing travel conditions and projected future traffic (2035), the I-710 Corridor currently experiences, and will continue to experience, capacity and operational problems due to a number of interrelated factors. With the exception of the I-710/I-105 interchange, no major improvements have been undertaken on I-710 since it was built in the 1950s and 1960s. Extensive population growth occurred after 1960 (see Table 1.2-3 later in this section and the associated discussion in the subsection titled “Transportation Demand”) and before containerization of oceangoing freight and the significant growth in international trade. The increase in regional traffic and heavy-duty truck traffic carrying cargo containers to and from the Ports has contributed to traffic volumes that exceed the existing design capacity of the I-710 Corridor, particularly at the interchanges. Table 1.2-1 shows average daily weekday automobile and heavy-duty truck volumes on I-710.

Table 1.2-1: I-710 Average Daily (Two-Way) Traffic Volumes

| Mainline Segment | | Year 2013 | | | Year 2035 (No Build) | | | % Truck of Total Volume | | 2013–2035 Percent Change in Volume | | |

Current and predicted future freeway operating conditions (traffic flow) within the I-710 Corridor are characterized by level of service (LOS). LOS is based on the comparison of traffic volume to the design capacity of the freeway, which is based on several factors including the number and width of travel lanes, steepness of the grades, and average speeds for which the freeway was designed. LOS is expressed as a range from LOS A (free traffic flow with low volumes and high speeds) to LOS F (traffic volumes that exceed capacity and result in forced-flow operations at low speeds). See Figure 1.2-1 for the LOS illustration for freeway facilities. Increasing traffic on the I-710 Corridor has seriously degraded the freeway LOS, particularly during commuter peak hours (6:00 a.m. to 9:00 a.m. and 3:00 p.m. to 7:00 p.m.).

Figure 1.2-2 shows the existing LOS for the various segments of the I-710 mainline and ramps for the a.m., midday, and p.m. peak hours. As Figure 1.2-2 illustrates, many segments operate at LOS E or F during all three peak hours, creating traffic congestion chokepoints that cause congestion on adjacent segments of I-710. Please see the *I-710 Corridor Project Traffic Operations Analysis Report* (March 2017) for more detail regarding LOS throughout the Study Area.

A specific factor affecting the traffic operational performance of the I-710 Corridor is the large number of heavy-duty trucks that use the I-710 Corridor to travel between the Ports and the rail freight intermodal yards located near I-5, and to warehousing and cargo distribution points throughout the southern California region. Caltrans *2013 Annual Average Daily Truck Traffic on the California State Highway System* (September 2014) indicates that five-axle trucks comprise at least half of all trucks on all segments of I-710, with the greatest concentrations of five-axle trucks (nearly 75 percent of all trucks) occurring at the southern end, near the Ports.

The amount of congestion and traffic delay currently experienced on the I-710 Corridor is not only disruptive to local residents and commuters, but also to port operations that must accommodate “just-in-time” goods delivery and inventory processes, which affects trucking, manufacturing, and other commercial interests within the SCAG region as shipments are delayed while trucks are slowed by traffic congestion.

ARTERIAL-TO-FREEWAY CONNECTIONS. In the I-710 Corridor, congestion at local arterial intersections near the freeway ramps is also a concern. The existing intersection LOS analysis is shown in Table 1.2-2. Fourteen percent of the analyzed intersections are classified as LOS E or F during the AM peak hour, and 19 percent are classified as LOS E or F during the PM peak hour.

This page intentionally left blank

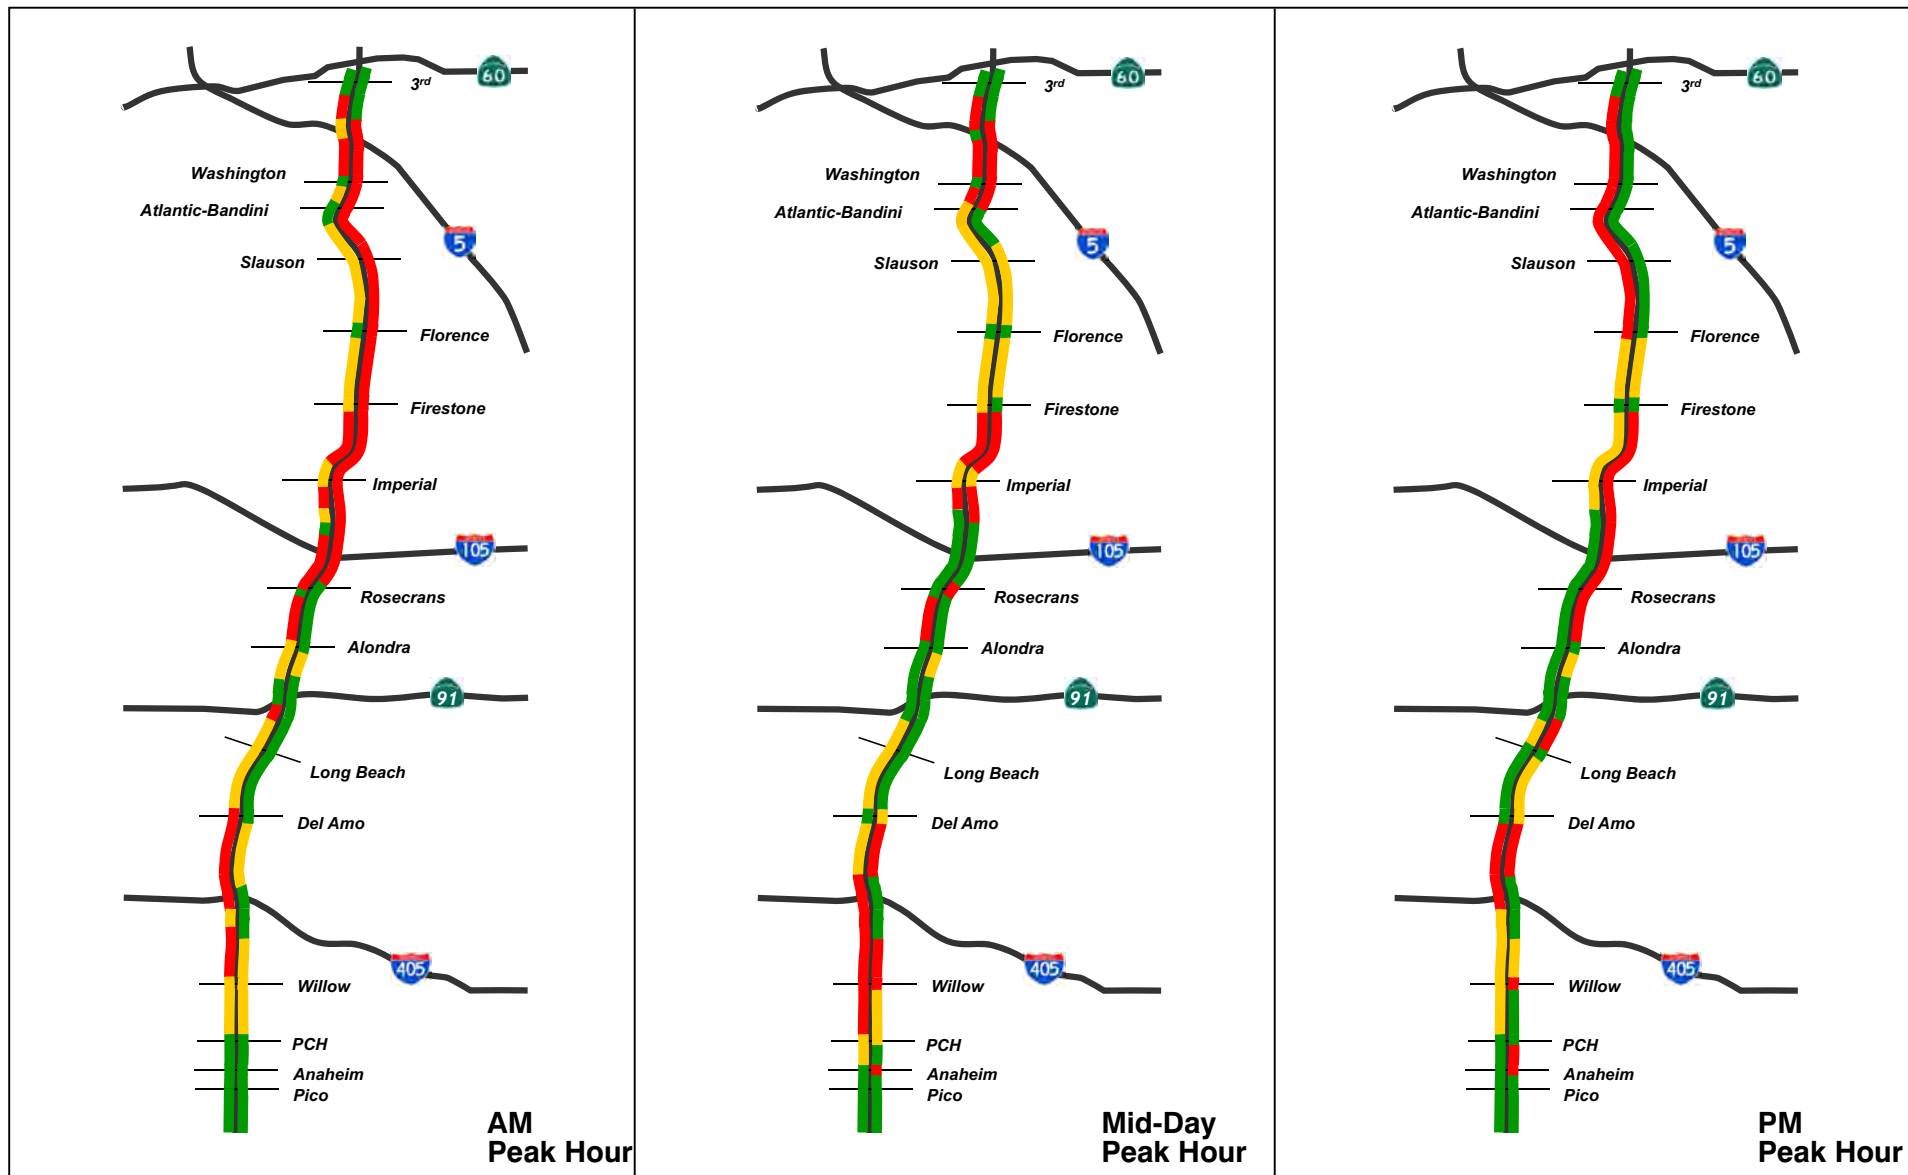

| Level of Service | Flow Conditions | Operating Speed (mph) | Technical Descriptions |
|------------------|---|-----------------------|--|
| A |  | 70 | Highest quality of service. Traffic flows freely with little or no restrictions on speed or maneuverability. No delays |
| B |  | 70 | Traffic is stable and flows freely. The ability to maneuver in traffic is only slightly restricted. No delays |
| C |  | 67 | Few restrictions on speed. Freedom to maneuver is restricted. Drivers must be more careful making lane changes. Minimal delays |
| D |  | 62 | Speeds decline slightly and density increases. Freedom to maneuver is noticeably limited. Minimal delays |
| E |  | 53 | Vehicles are closely spaced, with little room to maneuver. Driver comfort is poor. Significant delays |
| F |  | <53 | Very congested traffic with traffic jams, especially in areas where vehicles have to merge. Considerable delays |

TRANSPORTATION DEMAND. Regional population is forecast to grow by 20 percent and Study Area population is forecast to grow by 10 percent from 2012 to 2035. Employment will follow a similar pattern, with regional growth of 27 percent and Study Area employment growth of 11 percent. Growth is projected to be lower in the Study Area than in the SCAG region because the Study Area is almost completely developed. New growth will be limited to smaller, infill-type developments. Table 1.2-3 summarizes forecasted population and employment growth from the 2012 RTP for the entire SCAG region and for the Study Area. For historical context, the region numbered approximately eight million in 1960.² The 2012 population of the region represents a 130 percent increase in population since 1960. The 2012 RTP growth forecast was the basis for the regional traffic modeling that was performed for the I-710 Corridor Project.

Table 1.2-3: Forecasted Growth in Population and Employment

| | | 2012 | 2035 | Percent Change |
|------------|-----------------------------------|------------|------------|----------------|
| Population | Regional | 18,405,000 | 22,086,000 | 20% |
| | I-710 Corridor Project Study Area | 1,155,000 | 1,272,000 | 10% |
| Employment | Regional | 7,447,000 | 9,435,000 | 27% |
| | I-710 Corridor Project Study Area | 470,000 | 523,000 | 11% |

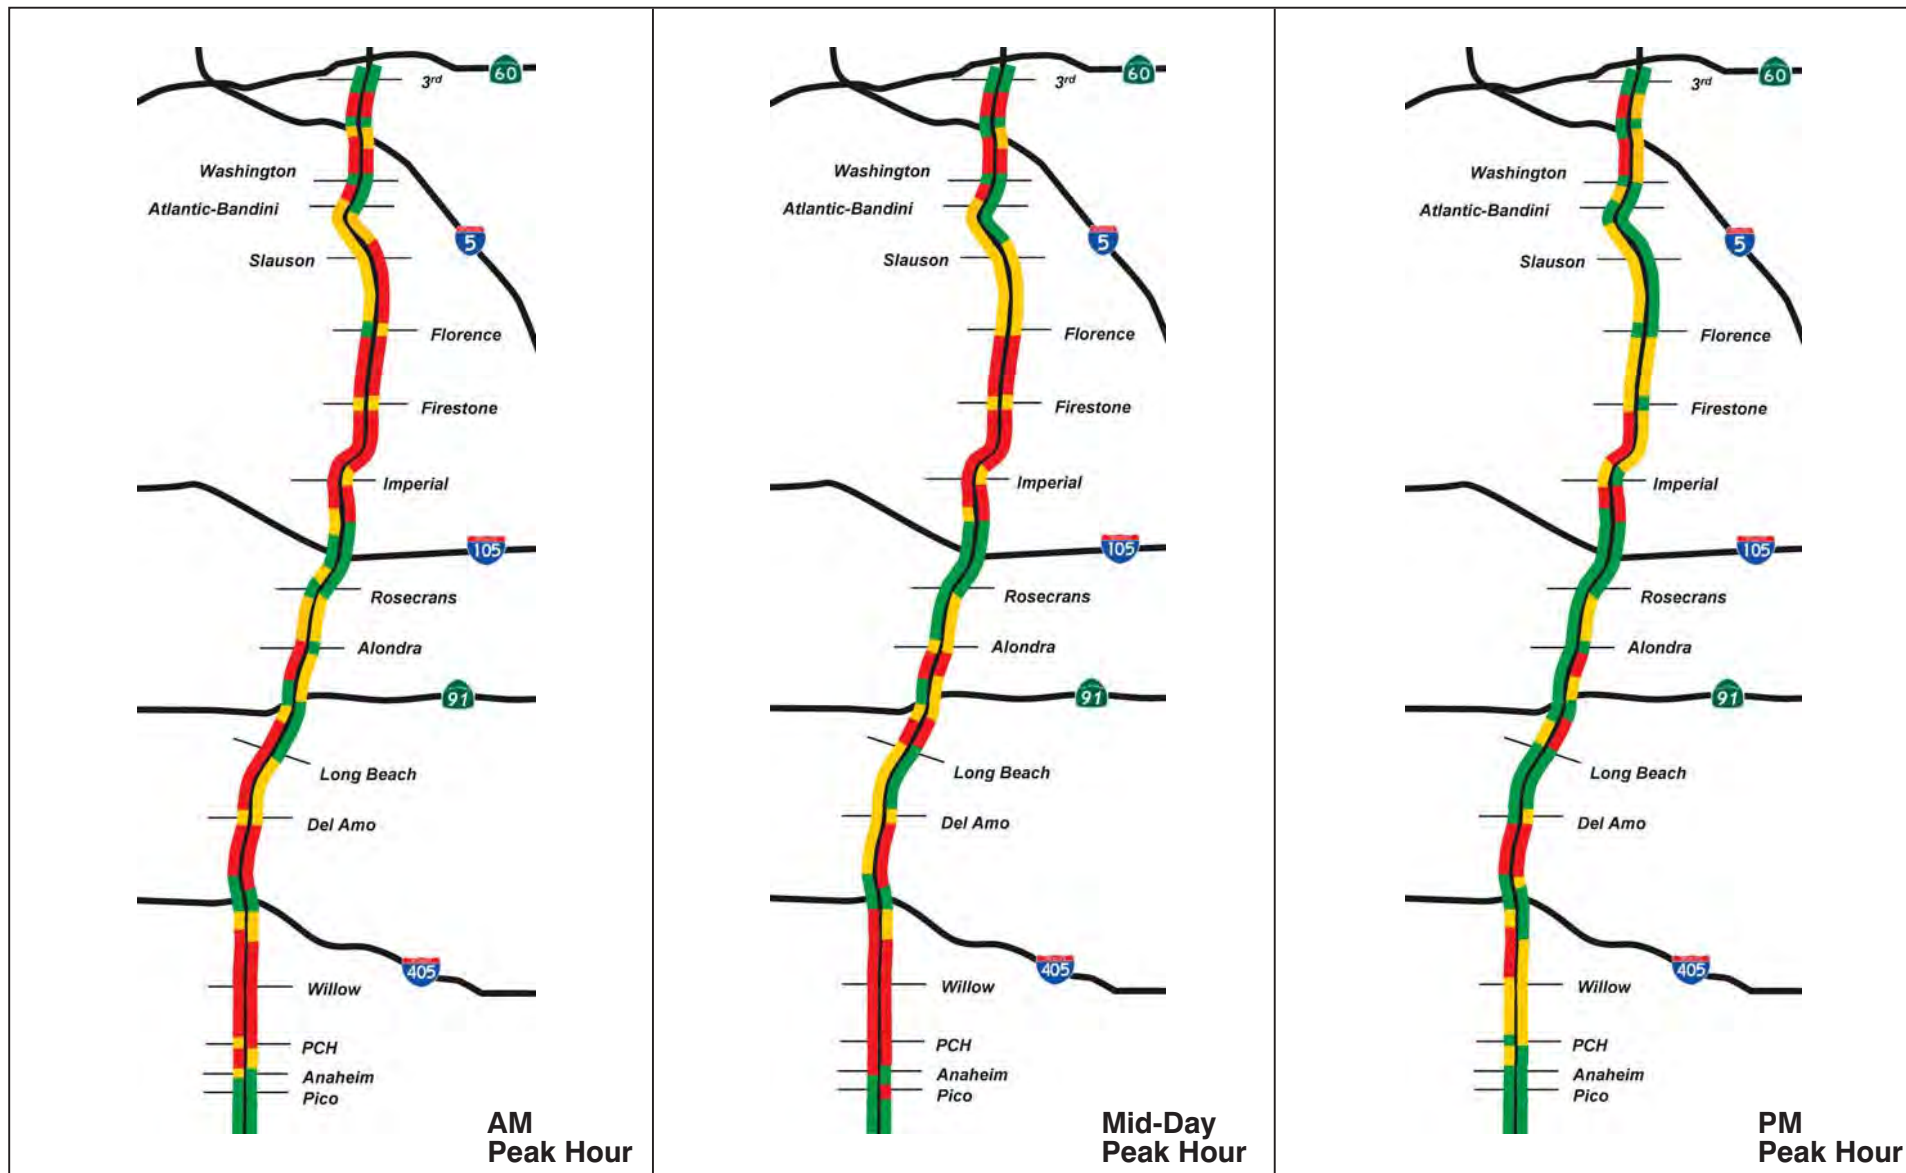

Source: Southern California Association of Governments. 2012 *Regional Transportation Plan*.
I-710 = Interstate 710

For purposes of comparison to the population growth projections in the 2012 RTP/SCS, the 2016 RTP/SCS indicates that population in the SCAG region will grow at a rate of approximately 17.5 percent between 2015 and 2040. The 2020 RTP/SCS indicates that the population in the SCAG region will grow at a rate of approximately 15 percent from 2016 to 2045. For purposes of analyzing future transportation demand, this growth rate is substantially similar to the 2012 RTP/SCS projections.

The Study Area contains several land uses and activity areas related to goods movement and the transport of cargo. The POLA and POLB Ports complex is one of the largest container ports in the world and is located at the southern terminus of the I-710 mainline. Forecasts anticipate growth in demand at the Ports that will increase from the handling of 14.1 million annual TEUs in 2012 reaching 41.4 million twenty-foot equivalent units (TEUs) by 2035 which is capped by planned capacity of the marine terminals.³ The I-710 Corridor is, and is expected to remain, a primary route for trucks carrying containers to and from the Ports. Figure 1.2-3 shows the LOS forecast for 2035 based on this future traffic demand without the I-710 Corridor Project build alternatives.

With regard to future demand for cargo containers to be transported to and from the Ports by rail instead of truck, the *I-710 Railroad Goods Movement Study* (February 2009) found that while railroads have employed a variety of operational strategies to meet increased container demand from the Ports, including longer trains with higher utilization rates, the railroad system will not be able to handle all of the cargo demand, even with the rail system operating at maximum capacity. Therefore, any additional containers would be transported via truck, which increases travel demand by truck on I-710.

TRAFFIC SAFETY. As discussed below, at several locations on I-710, the accident rates exceed the State average for similar highway facilities.

By State law, heavy-duty trucks are restricted to the two right lanes of freeways. Most of the automobile/truck interaction occurs as automobiles maneuver to get on and off the I-710 mainline at the interchanges, therefore, crossing and traveling in these right two lanes. Additionally, trucks are slower to accelerate and slower to stop, which uses up more freeway capacity and also causes merging conflicts among these different vehicle types as automobile drivers weave in and out of traffic to avoid the slower-moving heavy-duty trucks. The difference in mass (weight) between a car and a heavy-duty truck makes an incident between these two vehicle types more consequential for the automobile.

According to data collected and reported by Caltrans over a three-year period (January 1, 2009, to December 31, 2011), the I-710 mainline experiences a fatal accident rate that is above the statewide average for freeways of this type. A specific location that is especially problematic, as it causes increased truck/automobile conflicts, is the northbound segment of the I-710 mainline approaching the I-5 interchange. The connector ramps from northbound I-710 to northbound I-5 are located on the left-hand side of the I-710 mainline. Therefore, at this location, heavy-duty trucks are allowed to use the left lanes of I-710 to access the I-5 northbound ramps, affecting traffic on all lanes of the freeway in that segment.

An analysis of accident data in both the northbound and southbound direction is summarized in Table 1.2-4. The data presented were logically segmented at the locations of major crossing interchanges. Of the five I-710 mainline study segments, one northbound segment and one southbound segment have a higher total accident rate than the State average, and three in the northbound direction and one in the southbound direction have higher fatal accident rates than the State average (ranging 75 to 200 percent higher). The high truck volumes may account for the severity of accidents occurring along the I-710 Corridor. The Traffic Accident Surveillance and Analysis System (TASAS) ramp accident data also show that of the 37 of the 56 Study Area northbound ramp locations and 28 of the 58 southbound ramp locations have higher accident rates compared to the State average. Additionally, SCAG's 2016 and 2020 RTP/SCS identifies I-710 north of I-5 and between I-105 and SR-91 as among the key locations with the highest rates of truck-involved crashes in the region.

**Table 1.2-4: I-710 Mainline Accident Rates

Bolded cells indicate a rate higher than the average.

¹ Accident rates are expressed as the number of accidents per million vehicle miles.

² Average accident rates for similar highway facilities throughout the State.

I-105 = Interstate 105

I-405 = Interstate 405

I-5 = Interstate 5

I-710 = Interstate 710

SR-60 = State Route 60

SR-91 = State Route 91

Accidents, particularly truck-related accidents, form bottlenecks as emergency response personnel temporarily close travel lanes to respond to the accident. As a result, these incidents lead to additional congestion, delay, and occasionally secondary accidents on the I-710 mainline and ramps as approaching vehicles unexpectedly run into the rear ends of other vehicles.

The relatively high incidence of accidents on the I-710 mainline and ramps appears to be the result of three main factors: (1) nonstandard geometrics and design features; (2) high traffic volumes; and (3) the mix of automobiles and heavy-duty trucks.

Nonstandard geometrics and design features exist at many of the I-710 mainline interchanges. In many cases, the curves are too tight on the ramps and the weave distances⁴ between on- and off-ramps are too short. Standardization of these geometrics and features is needed to improve safety on I-710.

The second contributing factor is high traffic volumes. The occurrence of accidents is highest during the peak traffic periods. As traffic volumes increase, so does the propensity for accidents.

The third major factor related to safety concerns is the mix of vehicles using the I-710 mainline and ramps. Refer back to Table 1.2-1, which indicates average annual daily truck traffic on segments along I-710 ranges from 64 percent at the southern end to 7 percent at the northern end. As discussed previously, the truck percentage is expected to increase to over 30 percent of general traffic, depending on the segment of the I-710 mainline. Previous data collection efforts have indicated that during late 2004 to late 2007 a high level of accidents on I-710 (ranging from 29 to 36 percent, depending on the segment) involved trucks⁵ (see Table 1.2-5). Separation of trucks and general traffic would reduce the conflicts between the two and improve safety and operations on I-710.

1.2.1.3 NEED FOR UPDATED ROADWAY DESIGN

The I-710 mainline was designed in the 1950s and 1960s, before the dramatic increase in U.S. imports from Asia and the containerization of oceangoing freight, which have resulted in increased cargo traffic at POLA and POLB, and before the residential, commercial and industrial development in the region occurred over the past several decades leading to an increase in auto trips. In general, the I-710 mainline has remained relatively unchanged from when it was originally constructed. Due to growth in overall traffic volumes and the high level of truck traffic that has occurred in recent years, the I-710 mainline does not have the operational capacity to

⁴ A “weaving” section is where vehicles are entering the freeway in an area where other vehicles are attempting to exit the freeway at the next off-ramp, requiring vehicles to “weave” across each other’s paths.

⁵ AECOM. 2011. *I-710 Corridor Project Traffic Operations Analysis Report*. December.

**Table 1.2-5: I-710 Southbound Mainline Truck Accident Rates
(January 1, 2009, to December 31, 2011)**

| Location (Post Mile) | Description | Statistical Data | | | Actual Accident Rates ¹ | | | Average Accident Rates ¹ | | |
|-------------------------|----------------------------|--------------------|-------|--------|------------------------------------|-------------------|-------------|-------------------------------------|-------------------|-------|
| | | Total Accidents | Fatal | Injury | Fatal | Fatal + Injury | Total | Fatal | Fatal + Injury | Total |
| 4.96–9.410 | Southern terminus to I-405 | 222 | 1 | 64 | 0.003 | 0.21 | 0.72 | 0.004 | 0.28 | 0.90 |

I-5 = Interstate 5

I-710 = Interstate 710

SR-60 = State Route 60

SR-91 = State Route 91

accommodate current or future demand. In addition, many aspects of the freeway design do not operate efficiently due to the heavy truck traffic and the length and relative lack of maneuverability of those trucks.

The design features that are most directly associated with the current operational problems on the I-710 mainline are discussed below.

I-710 FREEWAY MAINLINE. The speed, capacity, and safety of the I-710 mainline are negatively impacted by several existing design features that are discussed below.

NONSTANDARD WEAVING DISTANCES. Weaving distances on the I-710 mainline are substantially constrained by both the spacing of the interchanges and the ramp configurations. This negatively impacts the I-710 mainline's capacity and safety by introducing a substantial number of conflicts in the outer lanes between ramp merge and diverge points.

There is heavy truck traffic in the outer two lanes of the I-710 mainline during the peak traffic periods, as well as throughout the remainder of the day. This intensifies the vehicle conflicts in the weaving sections due to the size of the trucks and density of the truck traffic.

NARROW OR NONEXISTENT SHOULDERS. Along much of the existing I-710 mainline, the shoulders provided are narrow (nonstandard) in width, and in some segments, no shoulders are provided at all. As described in the MCS, because of the lack of shoulders, the current I-710 mainline does not provide sufficient traffic enforcement areas for the California Highway Patrol (CHP), nor does it provide adequate areas for motorists with vehicle breakdowns or minor accidents to safely stop out of the flow of traffic.

NARROW LANE WIDTHS. Several locations along the I-710 northbound contain nonstandard-width lanes (approximately 10.8 feet instead of 12 feet). An example of this is the I-710 bridges over the railroad yards south of I-5. These narrow lanes tend to reduce the motorist's comfort level and speed, thus reducing overall capacity, especially when heavy-duty trucks are present.

THROUGH LANES. The number of through lanes on the I-710 mainline varies throughout the full length of the I-710 mainline. The I-710 mainline is four lanes in each direction between I-405 and SR-60, except for the section between Atlantic Blvd./Bandini Blvd. and I-5, which is five lanes in each direction. South of I-405, the number of through lanes is reduced to three lanes in each direction. This condition leads to bottlenecks on the I-710 mainline, as high volumes of traffic are compressed into fewer lanes. This is particularly evident on the I-710 mainline south of I-405, where long queues of trucks and cars frequently form during the peak traffic periods.

NON-UNIFORM RAMP METERING. Ramp metering is the use of a traffic signal(s) located on an on-ramp to control the rate at which vehicles enter a freeway facility. By controlling the rate at

which vehicles are allowed to enter a freeway, the flow of traffic onto the freeway facility becomes more consistent, smoothing the flow of traffic on the mainline and allowing more efficient use of existing freeway capacity. Approximately half of the existing interchanges along the I-710 mainline have ramp meters at the on-ramps. The benefit of these ramp meters is limited by the fact that they are only in place at some locations; therefore, there is not a coordinated ramp metering plan along the full length of the I-710 mainline. Some of the ramps have limited storage lengths, and if additional ramp meters are installed, the ramps would need to be widened to provide adequate storage capacity.

PAVEMENT. Since 2008, as part of the Long Beach Freeway (I-710) Long Life Pavement Rehabilitation Project, Caltrans has rehabilitated the pavement on I-710 from just north of Pacific Coast Hwy. to Firestone Blvd. The final section of the pavement project is scheduled to be completed in 2022. It should be noted that this component of the project need was identified prior to the preparation of the Draft EIR/EIS in 2012. As indicated, projects have since been initiated to address these elements; they are retained here for consistency with the Draft EIR/EIS.

MEDIAN BARRIERS. Since 2008, as part of the Long Beach Freeway (I-710) Long Life Pavement Rehabilitation Project, Caltrans has replaced the double metal beam barrier with a heightened concrete median barrier (K rail) from just north of Pacific Coast Hwy. to Firestone Blvd. The final section of the pavement project is scheduled to be completed in 2022. It should be noted that this component of the project need was identified prior to the preparation of the Draft EIR/EIS in 2012. As indicated, projects have since been initiated to address these elements; they are retained here for consistency with the Draft EIR/EIS.

INTERCHANGES WITH OTHER FREEWAYS. Within the Study Area, four of the five freeway-to-freeway interchanges have nonstandard geometric features. The major elements needing updated design are shown in Table 1.2-4 and noted in Table 1.2-6. The one exception is the I-710/I-105 interchange, which was opened to traffic in the 1990s. This interchange meets current geometric standards and has no apparent elements associated with an outdated design.

Some of the freeway-to-freeway interchanges provide only low-capacity ramp connections for certain movements. These connector ramps are in a loop configuration, which limits the operating speeds and capacity versus higher-speed “flyover” ramps. For example, three of the connections at the I-710/I-405 interchange are cloverleaf-style loop ramps. See Figure 1.2-4.

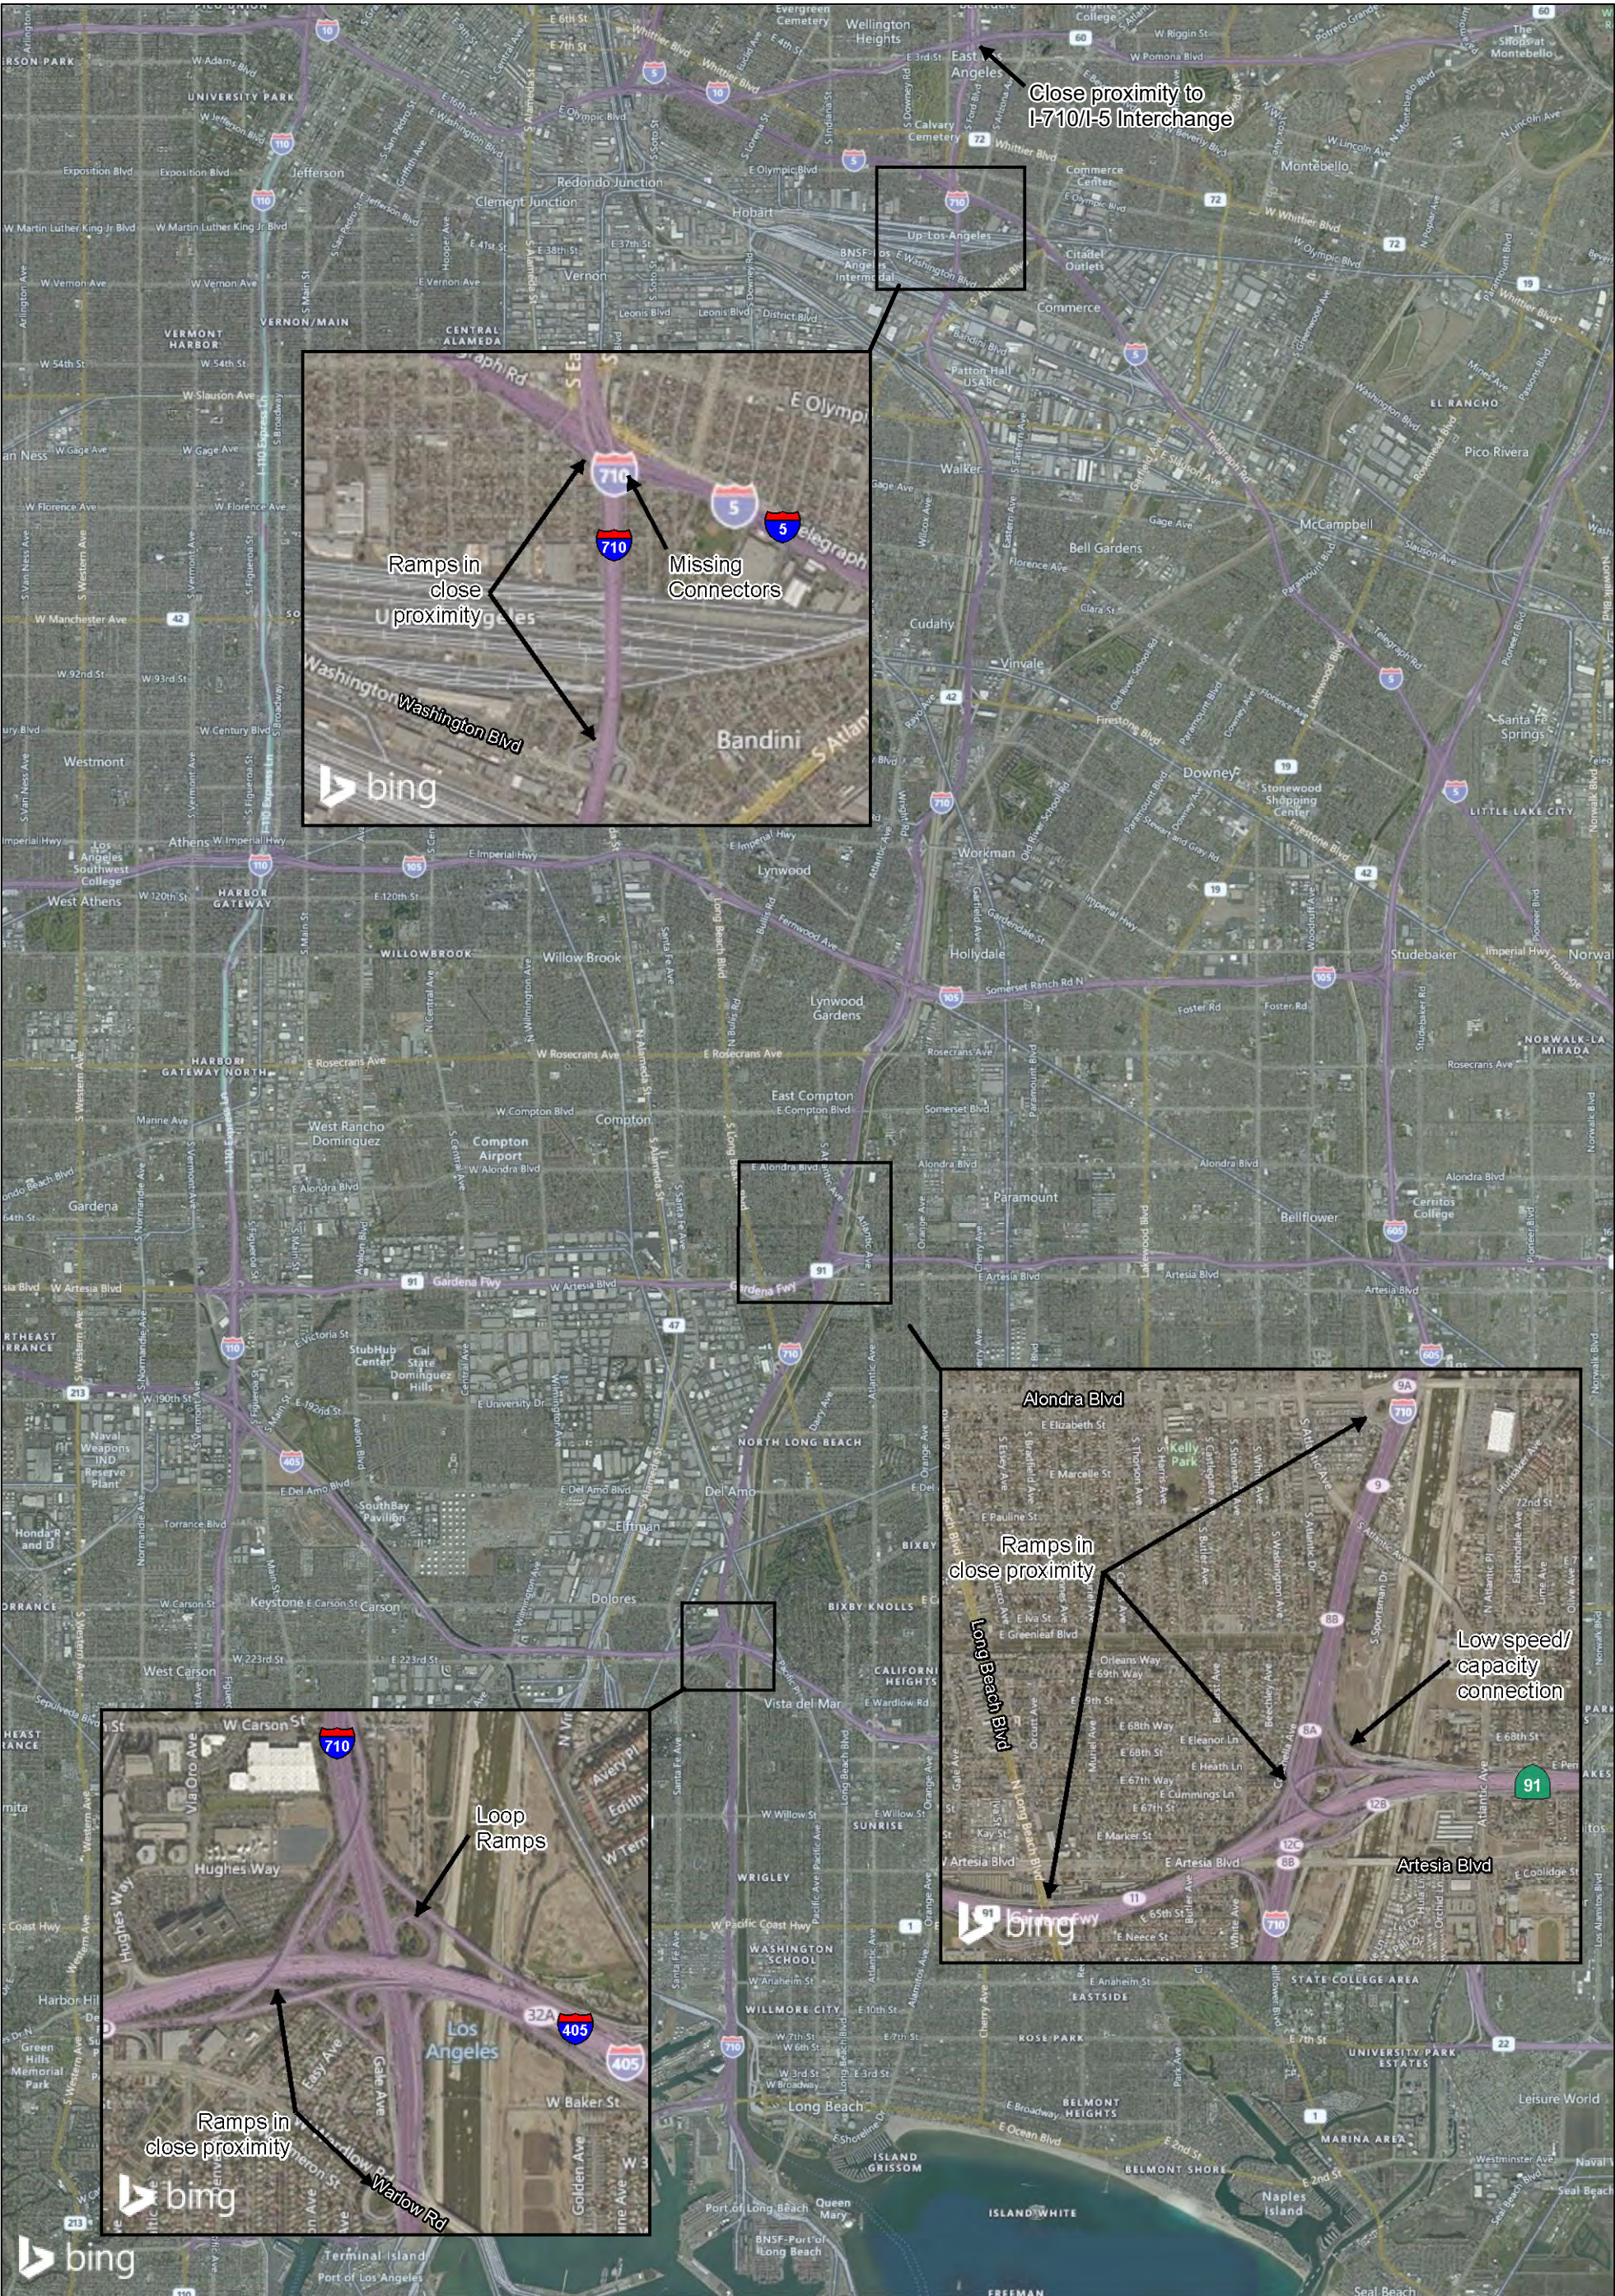

FIGURE 1.2-4

This page intentionally left blank

Table 1.2-6: Freeway-to-Freeway Interchanges: Key Design Concerns

| Cross Freeway | Existing Areas Needing Updated Design |
|---------------|---|
| I-405 | On-/off-ramps for Wardlow Rd. are in close proximity to the interchange. Low speed/capacity connections (loop ramps) for the SB to EB, EB to SB, and NB to WB movements. |
| SR-91 | On-/off-ramps for Atlantic Blvd., Alondra Blvd., and Long Beach Blvd. are located in close proximity to the interchange. Low speed/capacity connections (loop ramp) for the NB to WB movement. |
| I-105 | No elements of outdated design identified. |
| I-5 | Left side exit from NB I-710 to NB I-5. On-/off-ramps to Washington Blvd. are located in close proximity to I-5/I-710 interchange. |
| SR-60 | Local interchange “hook” ramps to 3 rd St. within interchange. May not be a substantial issue provided that volumes remain low. SR-60 ramps merge with I-710 south of SR-60 and are in close proximity to I-5/I-710 interchange. |

INTERCHANGES WITH LOCAL ROADWAYS. The spacing between many of the I-710 mainline interchanges with local roadways is less than current highway design standards, which typically require a minimum of one mile between interchanges. For example, Pico Ave., Anaheim St., and Pacific Coast Hwy. are very closely spaced, with less than 0.5 mile of separation between each interchange. Close spacing of interchanges limits the weaving distance between interchanges. Many of these existing interchanges are cloverleaf configurations (e.g., Anaheim St., Willow St., and Florence Ave.) requiring weaving of traffic over a short distance to accommodate the on- and off-ramp movements. Close spacing of interchanges and cloverleaf ramps both result in nonstandard weaving distances. The necessary weaving distance is based on the total number and type of vehicles weaving; heavy-duty trucks require substantially more weaving distance than automobiles due to their slower acceleration/deceleration rates and overall vehicle length compared to automobiles.

Many of the local street interchange ramps have designs that require modernization based on current Caltrans design standards. Changes to the I-710's interface with local roadway systems would be coordinated with the FHWA. These older designs greatly limit the operational efficiency of the ramps and interchanges as a whole. In some cases, narrow lane widths on the ramps and nonstandard turning radii for trucks at ramp entrances further diminish the operational effectiveness of the ramps. In many cases, the existing ramps have nonstandard acceleration distances and steep climbing grades (e.g., Washington Blvd.), which lead to a degradation of capacity on the ramps entering and exiting the freeway, particularly with truck traffic.

These nonstandard geometric features typically result in automobiles and trucks proceeding through the intersections and ramps at low speeds and trucks taking up more than one lane, which greatly limits the capacity of the interchange as a whole.

There is also a substantial lack of storage on many of the off-ramps throughout the Study Area (e.g., the interchange at Florence Ave.). Ramp storage refers to the amount of cars that can be queued on an on- or off-ramp waiting to enter or exit the freeway. The number of lanes and length of storage areas provided are not adequate in many cases to store the vehicles queuing at the ramp intersection. This often results in traffic on the I-710 off-ramps backing up into the I-710 mainline, which can cause traffic congestion and increase the potential for rear-end collisions.

1.2.1.4 SOCIAL DEMANDS AND ECONOMIC DEVELOPMENT

A review of the growth projections adopted by SCAG (SCAG 2016 RTP/SCS Growth Forecast, April 2016) indicates continuing growth in the Study Area. The population in Los Angeles County, as a whole, is expected to increase from 10.2 million in 2015 to 11.5 million in 2040, an increase of approximately 13 percent. Similar to the 2016 RTP/SCS, the 2020 RTP/SCS (adopted September 2020) indicates the growth rate in Los Angeles County, as a whole, is expected to increase from 10.1 million in 2016 to 11.7 million in 2045, an increase of approximately 15 percent. This regional growth will continue to increase travel demand on the I-710 Corridor. No current regional growth management and/or control ordinances have been identified in the area, although some local general plans do include policies intended to control and manage growth.

The Study Area is located within the Gateway Cities Subregion of Los Angeles County, as defined by SCAG and the Gateway Cities COG. The Subregion consists of 27 area cities, three County Supervisorial Districts, and the POLB. The Gateway Cities Subregion as a whole has experienced population, housing, and employment growth since the early 1900s and is anticipated to continue growth at a slower pace through 2035 (see Table 3.2-1 in Section 3.2). In the 20th century, the regional economy transitioned from an agricultural base to a manufacturing/industrial base, with a heavy emphasis on the aerospace and defense industries in the 1950s through the 1970s. As these industries declined in the 1980s, an expansion in global trade resulted in goods movement becoming an important element of the region's economy. The goods movement industry is a major source of employment in the Gateway Cities Subregion, providing thousands of direct and indirect jobs. By 2030, the goods movement industry is projected to generate 1.6 million jobs in the SCAG region (source: *Multi-County Goods Movement Action Plan*, Metro 2008). As discussed in more detail in Section 3.3, the Study Area experiences somewhat higher levels of unemployment and poverty than Los Angeles County as a whole. As of September 2016, available data show there are approximately 4.8 million persons employed in the civilian labor force in the County of Los Angeles and 268,000 persons (5 percent) are unemployed. The County has a slightly lower unemployment rate than the State (5.9 percent). In the Study Area cities, there are 2,756,800 persons employed in the civilian labor force, and 155,500 persons (approximately

5.6 percent) are unemployed. The Study Area cities have a slightly higher unemployment rate than either the State (5.3 percent) or the County (5 percent).⁶

Today, the POLB and POLA, the railroads, and the trucking industry provide goods movement not just within the Study Area, but also for the SCAG region and the nation as a whole. Growth at the Ports to accommodate increased cargo demand is constrained primarily by the physical capacity of the port facilities, as well as the efficiency with which containers can be unloaded from ships and reloaded onto trucks and/or the railroads in a timely manner for distribution. The POLB and POLA together handled 14 million annual TEUs in 2015 and are projected to grow to handle approximately 41.4 million TEUs by 2035.⁷ The I-710 Corridor Project *Initial Feasibility Analysis* (IFA) was prepared in December 2008 to review factors and indicators forecast as a base assumption in the traffic modeling for the I-710 Corridor Project. The purpose of the IFA was to select a cargo forecast that could be accommodated within the build alternatives under study while still meeting the project's mobility, safety, congestion relief, and other goals. In 2013, the assumptions related to goods movement within the SCAG region were further developed and updated to more closely align with the changed economic conditions, drawing on the Updated Cargo Forecast (2009), the 2012 RTP Travel Demand Forecast Model (2012), the San Pedro Bay Ports estimates of marine terminal capacity (2013), port cargo market shares (2013), and truck trip distribution (2013). The *Model Input Data and Key Assumptions Technical Memorandum for Goods Movement* (May 2013) was then reviewed and discussed by the I-710 Technical Advisory Committee and the Port growth assumptions were approved for use in traffic forecasting performed in support of this Final EIR/EIS. These assumptions include a 2035 total annual cargo container throughput at both ports of 41.4 million TEUs, and the construction and/or implementation of both the BNSF Railroad Southern California International Gateway (SCIG) near-dock intermodal yard and the expansion of the UP Railroad near-dock Intermodal Container Transfer Facility (ICTF). Informed assumptions were also made about the behavior of cargo, including the ratio of inbound to outbound containers, on-dock and off-dock cargo shares, cargo origin and destinations, and cargo transloading (wherein cargo in international containers is transferred to domestic truck trailers at transload centers or warehousing located within the region). For more detail regarding the key assumptions underlying the future forecast of traffic volumes, please refer to the following reports: *I-710 EIR/EIS Initial Feasibility Analysis* (December 2008), the *I-710 Railroad Goods Movement Study Technical Memorandum* (February 2009), the *Data and Key Assumptions Technical Memorandum for Goods Movement* (May 2013), and the *I-710 Corridor Project Travel Demand Modeling Methodology Report* (June 2017). Since the development of these assumptions, a comprehensive long-term unconstrained cargo forecast for the San Pedro Bay Ports was completed in February 2016 (Mercator 2016). This information was

⁶ State of California Employment Development Department. 2016. Labor Market Information Division, Monthly Labor Force Data for Cities and Census-Designated Places (CDPs), September 2016 – Preliminary.

⁷ AECOM. 2017. *I-710 Corridor Project Travel Demand Modeling Report*.

not available in time for incorporation into the technical analyses that informed this Final EIR/EIS (i.e., the travel demand forecasting was completed in 2014-15). The Mercator projection forecasts slower overall growth for the Ports than was forecast in previous studies, with the expected “base case” scenario reaching approximately 34.3 million TEUs by 2035, and 41.1 million TEUs by 2040. However, the difference of 0.3 million TEU between the unconstrained Mercator forecast and the throughput assumption utilized for the I-710 Corridor Project is not anticipated to substantially affect the traffic or other analyses performed for the project, as both scenarios project growth at the Ports beyond their current marine terminal throughput capacity. The analyses contained in this Final EIR/EIS are conservative as they are based on higher marine terminal throughput levels than are now anticipated, and as a result, reflect a greater impact than would occur if the analysis used a different, lower throughput forecast.

Based on the port cargo demand forecasts and how much of that cargo can be handled through maximum utilization of the railroad system (including expanded on-dock rail facilities at the Ports), there is still a high demand for movement of cargo containers by truck on the highway system, specifically I-710.

1.2.1.5 MODAL INTERRELATIONSHIPS AND SYSTEM LINKAGES

Figure 1.2-5 shows how goods are moved within the region. The I-710 Corridor serves regional, statewide, and national needs for both the general traveling public and the goods movement industry. The I-710 Corridor is the principal transportation connection between the POLB and the POLA and the BNSF/UP Railroad intermodal rail yards located in the Cities of Vernon and Commerce and to other warehouse/distribution centers throughout Southern California. The BNSF and UP Railroads provide freight movement to destinations throughout the United States. Together, the POLB and the POLA make up one of the largest container ports in the world, and Port activity is projected to more than double in volume by 2035. Figure 1.2-6 shows the modal interrelationships and system linkages to the I-710 Corridor, and illustrates schematically the various linkages and access between port cargo, near- and off-dock rail facilities, warehousing, and local, State, and national markets. The I-710 Corridor Project build alternatives would interface with the nearby highways, ports, and railroads in a similar manner to the existing conditions, as no major changes in access are proposed at the southern terminus. The build alternatives would also interface with local airports in the same manner as the existing I-710.

HIGHWAYS. The I-710 Corridor also provides key interstate commerce connections to east-west freeways (I-405, SR-91, I-105, SR-60, and I-10) and I-5. From a system linkage standpoint, no improvements are planned to these facilities except for possible improvements to I-5 (from Interstate 605 [I-605] through the I-710 interchange).

This page intentionally left blank

The I-5 Corridor Improvement Project consists of widening I-5 to accommodate high-occupancy vehicle (HOV) lanes and/or general purpose lanes from the I-605 through the I-710/I-5 interchange. Depending on the alternative selected, the project may also include reconstruction of the I-605 and I-710 interchanges. The study is in progress by Caltrans, and a construction schedule is yet to be determined.

The Gerald Desmond Bridge Project replaced the existing five-lane Gerald Desmond Bridge, which connects Terminal Island (POLB) to I-710 with a new six-lane bridge (three lanes in each direction). This project also included construction of the Terminal Island East interchange and replacement of the I-710 southbound off-ramp and northbound on-ramp. A Final EIR/Environmental Assessment (EA) was approved in July 2010,⁸ and project construction was completed in 2020. When improvements in a planned project, such as the build alternatives associated with the I-710 Corridor Project, would or could interface with improvements in approved and/or programmed projects, Caltrans policy is to conduct conceptual engineering and planning for the planned project that would be consistent with and accommodated by the approved/programmed projects. In this case, the conceptual design for the I-710 Corridor Project build alternatives reflects the likely improvements to the Gerald Desmond Bridge and I-5. This ensures that the I-710 improvements under the build alternatives accommodate and are accommodated by those approved and programmed improvements and that minimal modifications to those approved and programmed improvements would be necessary to accommodate the proposed I-710 improvements under the build alternatives.

During design of the I-710 Corridor Project build alternatives, the project team ensured that the build alternatives would be implemented in a manner that is consistent with the programmed and planned improvements described above.

PORTS. As illustrated in Figure 1.2-5, cargo containers at the Ports are transported from ships in one of three ways: (1) to the terminals as property, (2) to on-dock rail facilities, or (3) to trucks that are used either for direct distribution to local and regional warehouses or for movement to near-dock and off-dock rail yards.

The POLB is proposing to expand the existing Pier B Rail Yard located in the North and Northeast Harbor Planning Districts. The On-Dock Rail Support Facility Project would enhance rail operations and the capacity and efficiency of rail facilities at the existing Pier B Rail Yard. This project would realign Pier B St., provide an increase in inbound and outbound freight handling capacity, provide up to 10,000-foot-long staging tracks, accommodate 8,000-foot-to- 10,000-foot

⁸ Port of Long Beach (POLB). Website: <http://www.polb.com/environment/docs.asp> (accessed September 9, 2016).

long container trains, provide storage tracks for empty rail cars, and remove the 9th St. grade crossing or realign 9th St. A Final EIR for the project was certified in March 2018.⁹

RAILROADS. The present rail network in the SCAG region, including the Study Area, is composed of BNSF and UP Railroad rail lines, terminals/yards, and on-dock rail terminals at the Ports. Rail routes include the Alameda Corridor, BNSF Railroad's San Bernardino Subdivision, and UP Railroad's Los Angeles and Alhambra Subdivisions. The *I-710 Railroad Goods Movement Study* (2009) was prepared to assess the available capacity of the Southern California rail network to handle the projected demand in the movement of containerized freight to and from the Ports. One of the fundamental assumptions in developing the 2035 travel demand forecasts for the I-710 Corridor Project build alternatives is that the calculated maximum utilization of the amount of containers moved by rail would be consistent with the rail network (*I-710 Railroad Goods Movement Study*). Taking into consideration the inland origins and destinations of the port cargo and operational characteristics of the railroads, it was assumed that approximately 34.4 percent of the cargo growth (approximately 14.1 million annual TEUs) in 2035 could be moved directly by rail from either on-dock or off-dock intermodal terminals.¹⁰ Key information related to existing and future capacity of the rail system is summarized and cited below.

- As of 2015, the Alameda Corridor was operating 38 trains per day,¹¹ a decrease from previous years, due primarily to longer trains. By 2035, the Alameda Corridor is projected to be operating 108 trains daily. The Alameda Corridor has three tracks and sufficient capacity to handle the projected traffic.
- As of 2010, BNSF Railroad's San Bernardino Subdivision operated up to 99 trains per day (45 freight trains and 54 commuter trains) in its most heavily trafficked segments. By 2035, BNSF's San Bernardino Subdivision is projected to be operating up to 189 trains daily in its most heavily trafficked segments.¹² In most sections, the BNSF Railroad has constructed or has plans to construct three tracks on the San Bernardino Subdivision, sufficient capacity to handle the projected train volumes.
- The UP Railroad operates the Los Angeles and Alhambra Subdivisions as essentially parallel facilities that provide the railroad with routing flexibility. According to the *Regional*

⁹ POLB. Website: <https://www.polb.com/documents#cega-nepa> (accessed December 15, 2020).

¹⁰ Some port cargo is "transloaded", i.e., transferred from marine containers to larger domestic containers, and then moved by rail in these large containers. The transloaded cargo moved by rail is above and beyond the 34.4 percent that is moved directly by rail.

¹¹ Alameda Corridor Transportation Authority. Website: <http://www.acta.org/pdf/CorridorTrainCounts.pdf> (accessed December 28, 2016).

¹² SCAG. 2013. *On The Move: Southern California Delivers the Goods. Comprehensive Regional Goods Movement Plan and Implementation Strategy*, final report. February. Website: <http://www.freightworks.org/DocumentLibrary/CRGMPIS%20-%20Final%20-%20-%20Chapter%204.pdf> (accessed December 28, 2016).

Rail Simulation Update Summary Report prepared for SCAG's November 2011 Comprehensive Regional Goods Movement Plan and Implementation Strategy, 51 through-freight trains operated collectively over the subdivisions in 2010, and this number is forecast to rise to 111 trains by 2035. The Los Angeles Subdivision operated 12 Metrolink passenger trains per day, and this number is also forecast to rise to 20 trains by 2035. The Alhambra subdivision conversely carries very little passenger train traffic (one train per day in 2010, with no forecast increase to 2035).¹³ Through most of its length, the Los Angeles Subdivision will have two tracks but sections that will have only one track are not likely to carry more than 50 trains daily. Thus, this subdivision should have sufficient capacity to carry the projected traffic. East of Pomona (the more heavily trafficked segment), the Alhambra Subdivision is or will be two tracks. Thus, the Alhambra Subdivision, especially given the operating flexibility provided by the Los Angeles Subdivision, will have sufficient capacity to carry the projected traffic.

In addition to the capacity of the rail facilities themselves, there are three types of intermodal facilities that may impact growth for the railroads: on-dock, near-dock, and off-dock. On-dock refers to an intermodal facility that is situated at a port marine terminal. As of 2007, the share of containerized cargo transported by on-dock rail facilities per year was at 23.5 percent. By 2035, it is projected that 30.5 percent of containerized cargo will be transported by on-dock rail facilities, which represents the maximum practical capacity of the existing and planned on-dock rail and supporting facilities at each Port, taking into account the projected total container demand and geographic market destinations of the containers. The capacity of on-dock rail at the Ports is planned to increase from 2.8 million annual container lifts in 2012, to 8.6 million lifts in 2035.

Near-dock refers to an intermodal facility situated within five miles of the POLA or the POLB. The container volume handled at the ICTF as of 2012 was approximately 800,000 containers, and the capacity is projected to rise to 1,500,000 containers by 2035, assuming plans to expand the facility are implemented. Plans to build a new facility (SCIG) are in progress (a Final EIR was certified in 2013, but that approval was vacated by the Contra Costa County Superior Court in 2016. In January 2018, the California Courts of Appeal ruled that the Port of Los Angeles and BNSF were in compliance with the majority of CEQA requirements, with some exceptions, and in April 2018, the California Supreme Court declined to review the Courts of Appeal's January decision). Both of these facilities were assumed to be constructed and operational in the travel demand forecasting conducted for the I-710 Corridor Project.

Off-dock refers to an intermodal facility located more than five miles from POLA and POLB. There are two off-dock facilities in the Study Area: BNSF Railroad Hobart and UP Railroad East Los

¹³ Freight Works. Website: <http://www.freightworks.org/DocumentLibrary/Comprehensive%20Regional%20Goods%20Movement%20Plan%20and%20Implementation%20Strategy%20-%20Regional%20Rail%20Simulation%20Update.pdf> (accessed December 28, 2016).

Angeles. As of 2012, these off-dock facilities were operating below capacity, but they are projected to reach capacity by 2035.¹⁴ No specific expansion plans for the BNSF Railroad Hobart and UP Railroad East Los Angeles facilities have been proposed at the time this document was being prepared. There are also additional off-dock rail yards located further to the east (inland) that are also accessed by trucks from the I-710 Corridor. It is assumed in the *I-710 Corridor Project Travel Demand Modeling Report* (2017) that approximately 20 percent of primary truck trips have destinations that are further than 20 miles from the Ports, with approximately 13 percent destined to the Inland Empire/Orange County, and 7 percent to other locations in the SCAG region (i.e., the San Gabriel Valley, north Los Angeles County, Ventura County, and Imperial County).

TRANSIT. Public transportation service is provided by Metro and various City-operated municipal transit lines (e.g., Long Beach Transit) (see each city discussion in Sections 4.3–4.21 for additional details). Metro operates both local and rapid bus service and light rail service (called Metro Rail) in the Study Area. Metro currently operates five Metro Rapid routes that serve various parts of the Study Area. Metro also operates 13 Local Bus routes that provide predominantly east-to-west service and 10 Local Bus routes that provide predominantly north-to-south service that cover various parts of the Study Area. Metro Rail services are provided via the Blue Line, the Green Line, and the Gold Line, which run through some or most of the Study Area (see Figure 1.2-6). The *I-710 Corridor Project Initial Feasibility Analysis* evaluated expansion of transit services as part of the mobility solution within the I-710 Corridor, and transit enhancement opportunities have been refined and further developed throughout the community engagement process. Chapter 2.0, Project Alternatives, describes transit improvements included in the build alternatives.

1.2.1.6 LEGISLATION

The planning and design of the I-710 Corridor Project build alternatives has been funded by Measures R and M, half-cent sales tax measures for Los Angeles County intended to finance new transportation projects and programs and accelerate those already in progress, passed by County voters and which took effect in July 2009 and January 2017, respectively. There are no other Federal, State, or local legislative mandates regarding the planning and/or implementation of the proposed I-710 Corridor Project build alternatives.

1.2.2 PURPOSE OF THE I-710 CORRIDOR PROJECT

1.2.2.1 PROJECT PURPOSE

The I-710 Corridor Project purposes are specific objectives that Caltrans, Metro, and the I-710 Funding Partners would like to accomplish through implementation of the I-710 Corridor Project. The project purposes are used as the decision factors for comparing alternatives and

¹⁴ AECOM. 2017. *I-710 Corridor Project Travel Demand Modeling Report*.

identifying/selecting the preferred alternative. The purposes defined below respond to the needs within the I-710 Corridor identified in the above sections.

- Improve air quality and public health
- Improve traffic safety
- Modernize freeway design
- Accommodate projected traffic volumes
- Address increased traffic volumes resulting from projected growth in population; and employment, and economic activities related to goods movement

1.2.2.2 INDEPENDENT UTILITY AND LOGICAL TERMINI

Independent utility is generally defined as the ability of a proposed project to be a usable and a reasonable expenditure even if no additional transportation improvements in the area are made; simply put, the ability of the project to be whole, integrated, and to ‘stand alone.’ FHWA defines logical termini as “rational end points for a transportation improvement, and rational end points for a review of the environmental impacts.”¹⁵ Defining transportation improvements with these concepts in mind helps to ensure meaningful evaluation of alternatives and to avoid commitments to transportation improvements before they are fully evaluated. Within the Study Area, I-710 experiences congestion and traffic delays. The I-710 Corridor Project termini are from the southern terminus of the I-710 freeway to its connection to SR-60. Given the needs within the I-710 Corridor and the project’s focus on goods movement as part of the project need, these are logical termini for considering proposed improvements because the southern terminus is an existing terminus already, and SR-60 is one of the major east-west freeways that connects to the I-710 and serves logistics centers in the Inland Empire. Under the No Build (Alternative 1) in 2035, approximately 31 percent of daily traffic transitions to SR-60 at the northern terminus of the I-710 Corridor. Because nearly one-third of the traffic exits I-710 at this location and transportation demand decreases north of SR-60, terminating the project at SR-60 provides a rational endpoint. This 19-mile Study Area is of sufficient length to address environmental matters on a broad scope. The I-710 Corridor Project build alternatives would provide improvements to the current traffic conditions within the I-710 Corridor, even if no additional transportation improvements are made in the area. As such, the I-710 Corridor Project build alternatives are considered to have independent utility as it does not rely on other projects to address the identified need in the Study Area. Furthermore, the I-710 Corridor Project would not restrict consideration of alternatives for other reasonably foreseeable transportation improvements because the build alternatives are being developed in coordination with other transportation improvements in the I-710 Corridor.

1.2.3 EARLY ACTION PROJECTS

Metro tasked the I-710 Technical Advisory Committee to identify and prioritize projects along the I-710 corridor that could be classified as Early Action Projects to be advanced for execution prior to approval of a preferred alternative for the I-710 Corridor Project. Early Action Projects associated with the I-710 Corridor Project are administered by Metro, in collaboration with Caltrans and the Gateway Cities COG, and funded via Measure R.

According to the I-710 Technical Advisory Committee, proposed improvements associated with the I-710 Corridor Project may qualify as Early Action Projects if they: (1) are consistent with the existing freeway and the proposed I-710 Corridor improvements, including all possible project alternatives under consideration in the environmental process; (2) demonstrate independent utility; and (3) require no additional permanent right-of-way to construct, therefore requiring minimal environmental clearance.¹⁶ As such, improvements identified as Early Action Projects, although related to the I-710 Corridor Project, are considered independent projects and are individually subject to CEQA and NEPA and the project development process. Therefore, the Early Action Projects require their own environmental clearances and have been advancing separately through their own CEQA and NEPA processes.

Potential Early Action Projects may include soundwalls, local freeway interchanges, and arterial improvements. For example, the Shoemaker Bridge Replacement Project, the Firestone Boulevard Bridge Widening Project over the Los Angeles River, and the I-710 Early Action Soundwall Program are all designated as Early Action Projects because they meet the criteria described above.

1.2.3.1 SHOEMAKER BRIDGE REPLACEMENT PROJECT

The Shoemaker Bridge Replacement Project is administered by the City of Long Beach, in cooperation with Caltrans, as an Early Action Project of the I-710 Corridor Project and entails the replacement of the Shoemaker Bridge along West Shoreline Dr. crossing the Los Angeles River. The Shoemaker Bridge along West Shoreline Dr. interconnects directly with I-710, indicating it is consistent with the existing freeway, and proposed improvements to the bridge and surrounding circulation network will be consistent with the proposed I-710 Corridor Project build alternatives.¹⁷ Additionally, the Shoemaker Bridge Replacement Project will provide improvements to the current traffic conditions along West Shoreline Dr. crossing the Los Angeles River, even if no additional transportation improvements are made in the area, therefore demonstrating independent utility,

¹⁶ Los Angeles County Metropolitan Transportation Authority (Metro). 2016. I-710 Corridor Project: Early Action Project: Soundwalls Package 3: South of State Route 91. July. Website: http://media.metro.net/board/Items/2014/10_october/20141023_rbmitem47.pdf (accessed January 11, 2017).

¹⁷ City of Long Beach Public Works Department. 2016. *Initial Study for Shoemaker Bridge Replacement Project*. April. Website: http://www.shoemakerprojectlb.com/uploads/docs/IS_Checklist.pdf (accessed January 11, 2017).

as it does not rely on other projects to address the identified need within its project limits.¹⁸ Finally, most of the proposed improvements and construction of the Shoemaker Bridge Replacement Project will occur within existing Caltrans or City of Long Beach right-of-way, but some acquisition of property and easements from the Los Angeles County Flood Control District along the Los Angeles River adjacent to I-710 will be required and were addressed in the project-specific EIR/EA for the proposed Shoemaker Bridge Replacement Project, which was being prepared concurrent with the I-710 Corridor Project RDEIR/SDEIS. The Final EIR/Finding of No Significant Impact was completed in April 2020, and a Notice of Determination for the project was filed with the State Clearinghouse and Los Angeles County Clerk on April 23 and April 24, 2020, respectively.

1.2.3.2 FIRESTONE BOULEVARD BRIDGE WIDENING OVER THE LOS ANGELES RIVER PROJECT

The Firestone Boulevard Bridge Widening over the Los Angeles River Project is administered by the City of South Gate, in cooperation with Caltrans, as an Early Action Project of the I-710 Corridor Project and entails the widening of the Firestone Boulevard Bridge over the Los Angeles River to allow for two new lanes to the southbound on-ramp to I-710. The approximately 60-foot widening will require the extension of the existing pier walls in the river. The existing bridge has three pier walls with debris noses. The Firestone Boulevard Bridge interconnects directly with I-710, indicating it is consistent with the existing freeway, and proposed improvements to the bridge and surrounding circulation network will be consistent with the proposed I-710 Corridor build alternatives.¹⁹ Additionally, the Firestone Boulevard Bridge Widening over the Los Angeles River Project will provide improvements to the current traffic conditions along Firestone Blvd. crossing the Los Angeles River, even if no additional transportation improvements are made in the area, therefore demonstrating independent utility, as it does not rely on other projects to address the identified need within its project limits.²⁰ Finally, most of the proposed improvements and construction of the Firestone Boulevard Bridge Widening over the Los Angeles River Project occur within existing Caltrans or City of South Gate right-of-way, but a temporary construction easement on an adjacent property and partial acquisition of two additional adjacent properties, which include a portion of the Los Angeles County Flood Control District channel along the Los Angeles River and a portion of the Los Angeles Department of Water and Power property, are

required adjacent to the I-710 and were addressed in the project-specific Negative Declaration/Finding of No Significant Impact for the proposed Firestone Boulevard Bridge Widening over the Los Angeles River Project that was initially approved in 1997 and revalidated in 2014. The original scope of the project included modification to the nearby Firestone Blvd./I-710 ramps; those improvements have been since separated from the bridge widening project. Construction of the project commenced in March of 2016 and is currently in progress.

1.2.3.3 I-710 EARLY ACTION SOUNDWALL PROGRAM

Five miles of new soundwalls were identified along I-710, plus an additional seven miles of existing soundwalls that can be aesthetically treated to match the new walls, that are being advanced for earlier delivery. The soundwall locations are consistent with the I-710 Corridor Project build alternatives. Metro awarded three plans, specifications, and estimates (PS&E) contracts for the three soundwall packages in summer 2015, with a PS&E completion date of late 2017. Metro and several partner agencies are working to complete the Early Action Soundwall Program, including Caltrans, the Gateway Cities COG, and the various I-710 corridor cities.²¹

2.0 PROJECT ALTERNATIVES

2.1 PROJECT DESCRIPTION

As described in Chapter 1.0, the Interstate 710 (I-710) Corridor is a vital transportation artery, linking the Ports of Los Angeles and Long Beach (POLA and POLB) to southern California and beyond. An essential component of the regional, statewide, and national transportation system, it serves both passenger and goods movement vehicles. As a result of population growth, cargo container growth, increasing traffic volumes, and aging infrastructure, the I-710 Corridor experiences serious congestion and safety issues. The need for the I-710 Corridor Project is evidenced by the following: high heavy-duty truck volumes resulting in high concentrations of diesel particulate emissions within the I-710 Corridor; high accident rates (particularly truck-related); insufficient weaving lengths and areas in which ramps do not meet current design standards; high volumes of trucks and cars leading to congestion that is projected to increase; and increases in population, employment, and goods movement between now and 2035 that will lead to increased traffic demand on and around I-710. The purpose of the I-710 Corridor Project is to achieve the following: improve air quality and public health; improve traffic safety; provide a modern design for the I-710; address projected traffic volumes; and address projected growth in population, employment, and activities related to goods movement.

This chapter describes the I-710 Corridor Project and the proposed alternatives that were developed to meet the defined purpose(s) while avoiding or minimizing environmental impacts and incorporating feedback from the community. The alternatives evaluated in this Final Environmental Impact Report/Environmental Impact Statement (Final EIR/EIS) are the No Build (Alternative 1), Alternative 5C, I-710 Widening and Modernization; and Alternative 7, I-710 Modernization plus Freight Corridor (Zero-Emission Vehicles). The estimated costs for the Build Alternatives are summarized in Table 2.1-1. The California Department of Transportation (Caltrans), as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), has identified the No Build (Alternative 1) as the Preferred Alternative and discusses this in more detail in Section 2.4, Identification of a Preferred Alternative, below. As the No Build (Alternative 1) does not include construction, there are no estimated construction costs. However, estimated construction costs for Alternative 5C and Alternative 7 have been retained in this Final EIR/EIS for disclosure purposes.

Table 2.1-1: Estimated Costs (Billion \$)

| Alternative | R/W-Utilities | Construction | Total |
|---------------------------|----------------------|---------------------|--------------|
| Alternative 5C | 1.08 | 3.59 | 4.67 |
| Alternative 5C, Option 1A | 1.04 | 3.59 | 4.63 |
| Alternative 5C, Option 2A | 1.09 | 3.62 | 4.71 |
| Alternative 5C, Option 3A | 1.11 | 3.69 | 4.80 |
| Alternative 7 | 1.65 | 6.32 | 7.97 |
| Alternative 7, Option 1B | 1.62 | 6.33 | 7.96 |
| Alternative 7, Option 3B | 1.68 | 6.44 | 8.12 |

Note: Estimates are in 2017 dollars and do not include support costs or programmatic elements.

2.2 I-710 CORRIDOR PROJECT RECIRCULATED DRAFT ENVIRONMENTAL IMPACT REPORT/ SUPPLEMENTAL DRAFT ENVIRONMENTAL IMPACT STATEMENT ALTERNATIVES DEVELOPMENT PROCESS

2.2.1 2012 DRAFT EIR/EIS PUBLIC CIRCULATION AND NEW INFORMATION

In June 2012, the first Draft Environmental Impact Report/Draft Environmental Impact Statement (Draft EIR/EIS) for the I-710 Corridor Project was released for public circulation. This marked a milestone in a four-year effort by the Project Team, stakeholder groups and agencies, and various advisory committees to define project alternatives and analyze the potential impacts of those alternatives. Project development began in 2008 with the issuance of the Notice of Preparation (NOP) and Notice of Initiation (NOI).

During the 2012 public circulation period (June 27 to September 28), three public hearings were held, and nearly 3,000 individual comments were received from members of the public, interested groups, organizations, public agencies, and elected officials. Among other issues, included in those comments was support for the Project Team to consider and analyze different alternatives, including a recurring request for an alternative that would add a four-lane zero emission/near zero emission (ZE/NZE) freight corridor with no expansion of general purpose lanes on I-710.

During or shortly after the close of the 2012 comment period, new information became known as well. The Southern California Association of Governments (SCAG) completed and adopted its 2012 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) and released updated travel demand model forecasts for the SCAG region. Additionally, several transportation improvement projects in the vicinity moved forward in their respective planning stages. The following sections discuss these changes and new information in more detail.

2.2.2 REVISED ALTERNATIVES DEVELOPMENT AND REFINEMENTS

SCAG's 2012 RTP was completed and adopted in April 2012. With the new RTP came updates to the regional traffic model and proposed project list. In order to be programmed for Federal

funding, transportation projects must be included in the RTP project list and modeled in the financially constrained RTP. These updates to the regional traffic model provided a more comprehensive understanding of the traffic patterns and behavior within the study area and beyond, particularly related to goods movement. Several potential shifts in general traffic patterns and demand were identified, resulting from RTP updates as well as changes in the existing condition and reasonably foreseeable projects, particularly in and around the Ports complex, that are detailed in the following discussion.

PORT PROJECTS. Two key port projects that had not been included in the original traffic modeling forecast scenario or in the No Build (Alternative 1) scenario are now considered reasonably foreseeable.¹ The POLA released a Draft EIR for the Southern California International Gateway (SCIG) Rail Yard expansion project in late 2011, and a recirculated Draft EIR in September 2012. The Los Angeles Board of Harbor Commissioners certified the Final EIR in March 2013;² however, that approval was vacated by the Contra Costa County Superior Court in 2016. On January 12, 2018, the California Court of Appeal ruled that the Port of Los Angeles and the Burlington Northern Santa Fe Railroad (BNSF) were in compliance with the majority of the California Environmental Quality Act (CEQA) requirements, with the exception of the air quality analysis of ambient air concentrations and associated cumulative impacts of such pollutant concentrations, and identified ways to resolve the one remaining CEQA issue (i.e., re-analysis of modeled particulate matter [PM] concentrations at a certain location). On April 11, 2018, the California Supreme Court denied a petition to review the Court of Appeal's January decision. As the SCIG project proposes to construct a near-dock intermodal rail facility approximately four miles north of the Ports complex, it would effectively eliminate approximately 95 percent (according to the SCIG Final EIR) of the truck trips that would otherwise use I-710 to access the BNSF Hobart Yard facilities, 26 miles north.

The Intermodal Container Transfer Facility (ICTF) modernization and expansion project proposes to increase the throughput capacity of the existing near-dock ICTF intermodal rail yard, located approximately five miles from the Ports, just south of the Interstate 405 (I-405). An NOP was issued in 2009³ and work on the Draft EIR for this facility is currently underway. By increasing the ability of cargo to off-load at near-dock yards rather than utilize I-710 north to access the BNSF Hobart and Union Pacific Railroad (UP Railroad) intermodal yards, the ICTF and SCIG projects

¹ NEPA and CEQA require consideration of past, present, and reasonably foreseeable future actions in evaluating the impacts of a project.

² Port of Los Angeles (POLA). Final EIR - Southern California International Gateway (SCIG) Project. Website: https://www.portoflosangeles.org/EIR/SCIG/FEIR/feir_scig.asp.

³ POLA. Website: https://www.portoflosangeles.org/nop/ictf/nop-is_011209.pdf.

represent a potential substantial change to the general cargo truck traffic patterns in and around the Ports and on I-710.

CHANGES IN REGIONAL TRUCK TRAVEL PATTERNS SINCE 2008. In addition to the potential effects of the SCIG and ICTF projects on truck travel patterns, more has been learned about port cargo behaviors and their origins and destinations, particularly with regards to cargo transloading.

A substantial portion of port cargo containers are headed to local markets. This includes the true local component, which does not return to off-dock rail yards or leave the region, and the transloading component. Transloading is when cargo in international containers is transferred to domestic containers at transload centers or warehousing located throughout the SCAG region. Once transloaded, cargo within domestic containers is carried by truck to other destinations within the region, or it is carried by truck to intermodal (off-dock) rail yards within the region for transport by freight rail. These secondary trips are more dispersed throughout the region. Sixty-four percent of these transload secondary truck trips are destined to an area within twenty miles of the ports, over 17 percent are headed to the Inland Empire or Orange County, and the remaining 19 percent travel to North Los Angeles County/the San Gabriel Valley, Ventura County, and/or Imperial County. According to both SCAG's 2012, 2016, and 2020 RTP/SCS Goods Movement Appendices, truck patterns will only become more dispersed in the future.

GATEWAY CITIES COUNCIL OF GOVERNMENTS STRATEGIC TRANSPORTATION PLAN. Several other transportation projects and studies in the Gateway Cities subregion (and beyond) have also progressed in their respective planning processes. The Gateway Cities Council of Governments (Gateway Cities COG), in coordination with Metro, developed several studies on Goods Movement, Commuter Rail, and other modes of transportation in the area in order to inform their Strategic Transportation Plan (STP), an integrated transportation plan for the cities of the subregion. The STP is inclusive of freeways, arterial highways, transit, bikeways, pedestrian facilities, technology, and goods movement and provides an integrated, multimodal program of potential projects that move the member cities closer to achieving their goals of improving mobility, accessibility, sustainability, and the increased safety of the subregion's transportation system. The STP also includes a funding and financing plan for implementation purposes. Another important objective of the STP is to increase connectivity of the subregion's bicycle and pedestrian network by connecting gaps in the network and providing more connectivity to transit. Potential multi-jurisdictional bicycle and pedestrian projects are contained in the STP's Active Transportation Plan.⁴

OTHER FREEWAY PROJECTS. Freeway and highway projects in the vicinity have also advanced since the release of the 2012 Draft EIR/EIS. Proposed improvements to I-405 in Orange County

⁴ Gateway Cities Council of Governments (Gateway Cities COG). Website: <http://www.gatewaycog.org/gateway/initiatives-and-projects/strategic-transportation-plan/?cat=Strategic+Transportation+Plan+Resources>.

would add one general purpose lane and two Express Lanes in each direction from I-605 to SR-73, and anywhere from one to two general purpose lanes, and other associated operational improvements, from I-5 to SR-55.⁵ Potential “hot-spot” improvements to congested areas on I-605 within Los Angeles County are also being examined. Metro completed a feasibility study on congestion hot spots within the State Route 91 (SR-91), I-605, and I-405 corridors, and several proposed projects were identified along those routes that would include (but are not limited to) capacity and operational enhancements, ramp and intersection reconfigurations, and safety features. Several of these projects began environmental review in late 2016.⁶

I-710 DESIGN REFINEMENTS. Some changes to the design plans for the two I-710 Corridor build alternatives were also proposed during project development and in consultation with local cities, along with general geometric refinements (particularly between I-105 and SR-60). The proposed Patata (freight corridor only) and Slauson Ave. Interchanges in the Cities of Cudahy and Bell have been removed and revised, respectively, in the proposed design. Also, during the I-710 Corridor Project development process, as studies were developed and coordinated with interested and jurisdictional agencies, several potentially substantive issues or conflicts became evident to the Project Team. One of these conflicts was illustrated in more detail in the completed Utility Studies performed for the project and required a more robust avoidance strategy. Similarly, ongoing coordination with the United States Army Corps of Engineers (USACE) and the Los Angeles County Flood Control District (LACFCD) indicated that substantive changes to the Los Angeles River levee would be infeasible. Therefore, avoidance efforts for the Los Angeles River were undertaken as well.

2.2.2.1 COMMUNITY ALTERNATIVE 7

During the 2012 public circulation period, comments received from the public and agencies indicated strong support for the creation and inclusion of another alternative that retained the ZE/NZE freight corridor but did not add general purpose lanes on I-710. The Coalition for Environmental Health and Justice (CEHAJ), a coalition of organizations, associations, and community groups working to achieve environmental justice, community health, and overall quality of life in the study area, put forth a detailed and comprehensive proposal of an alternative called “Community Alternative 7” (CA-7) as a formal comment on the 2012 Draft EIR/EIS (see Comment No. IP-22 in Appendix S of this Final EIR/EIS). Signatories to the comment letter proposing CA-7 include East Yard Communities for Environmental Justice, Natural Resources Defense Council, Greater Long Beach Interfaith Community Organization, Communities for a Better Environment, Building Healthy Communities – Long Beach, Khmer Parent Association,

⁵ Orange County Transportation Authority (OCTA). Website: <http://www.octa.net/Projects-and-Programs/All-Projects/Freeway-Projects/Overview/> (accessed October 4, 2016).

⁶ Los Angeles County Metropolitan Transportation Authority (Metro). Website: <https://www.metro.net/projects/i-605/> (accessed October 4, 2016).

Westside Christian Church, EndOil/Communities for Clean Ports, Coalition for a Safe Environment, Long Beach Alliance for Children with Asthma, Legal Aid Foundation of Los Angeles, Coalition for Clean Air, Friends of the Los Angeles River, and Physicians for Social Responsibility – Los Angeles.

CA-7 provided a comprehensive and holistic, broad-based solution to transportation issues affecting the I-710 Corridor communities, and placed special emphasis on health, air quality, and active transportation. The seven components of CA-7 included:

- No I-710 widening of general purpose lanes
- Comprehensive public transit element
- Mandatory zero emission freight corridor
- Public-Private Partnership operator of the freight corridor
- Los Angeles River improvements
- Comprehensive pedestrian and bicycle element
- Community benefits

Many comment letters were received in support of CA-7. Similarly, the U.S. Environmental Protection Agency (EPA) indicated in their comment letter a desire to see a “modified Zero-emission Freight Corridor Alternative, with no I-710 widening.”⁷ During the comment period, there was broad support for the evaluation of this type of alternative, as well as providing increased benefits to the impacted communities of the corridor, particularly with regard to health and air quality issues.

Although the CA-7 proposal was comprehensive, the proposed design concept to add a four-lane zero emission freight corridor was to be achieved without widening the I-710 freeway and without requiring any property displacements. However, the geometric design of the highway component of CA-7 provided with CEHAJ’s comment letter on the Draft EIR/EIS dated September 28, 2012, did not adhere to standard engineering practices and/or Caltrans’ requirements. In addition, some elements of the CA-7 alternative are not appropriate for inclusion in a transportation project-level environmental document. The CA-7 alternative is essentially a programmatic effort aimed at implementing multi-jurisdictional projects well beyond the scope of the I-710 Corridor Project. As the approving agency for the I-710 Corridor Project, Caltrans’ jurisdiction is limited to the State highway system. Additionally, some elements of the CA-7 alternative are much smaller in scale than the overall I-710 Corridor Project, and implementation of these elements would be less

⁷ U.S. Environmental Protection Agency (EPA) comment letter on I-710 Corridor Project Draft EIR/EIS, September 28, 2012 (see Comment No. F-5 in Appendix S of the RDEIR/SDEIS).

impactful. Therefore, those elements (such as the construction of bicycle lanes or pedestrian facilities), while still potentially subject to CEQA, would likely not require the preparation of a full EIR, and could be advanced more quickly individually by the agencies with jurisdiction than if they were included in the scope of the I-710 Corridor Project. For these reasons, CA-7 was not carried forward for detailed evaluation as a stand-alone alternative in this Final EIR/EIS. However, the proposal of CA-7, coupled with the general support from the EPA and others for the evaluation of an alternative that added a ZE/NZE freight corridor without expansion of general purpose lanes, was directly responsible for the development of Alternative 7 as a stand-alone project alternative that was evaluated in the Recirculated Draft Environmental Impact Report/Supplemental Draft Environmental Impact Statement (RDEIR/SDEIS). Additionally, in direct response to the issues and requests included in the CA-7 proposal, the Gateway Cities COG developed the "I-710 Livability Initiative," a broader regional framework in which non-transportation elements of CA-7 not carried forward into the I-710 Corridor Project RDEIR/SDEIS would be further explored. A more detailed response to the CEHAJ comment letter is included in Appendix S, Response to Comments, on the 2012 Draft EIR/EIS.

After the close of the public circulation period in September 2012, the Project Team conducted several coordination meetings with agencies and organizations that submitted substantive comments on the project. These meetings were held in order to ensure that the Project Team fully understood the intent and meaning of the comments made and so that they could be properly responded to and, if applicable, responsive changes could be incorporated into the project. In addition to these stakeholder meetings, a series of three detailed workshops were held in December 2014 and January 2015 with representatives from CEHAJ to discuss the specific details of CA-7 and the possibilities for inclusion of some elements into the I-710 Corridor Project, as well as Caltrans' limitations in implementing other programmatic elements. Please see Section 2.6.2 for more information on CA-7. After the workshops, and in parallel with the ongoing coordination and communication between CEHAJ and the Project Team, community members worked with the office of Los Angeles County Supervisor Hilda Solis to continue the effort to include CA-7 in the RDEIR/SDEIS. As a result, the Metro Board of Directors passed Board Motion 22.1 in October 2015 that directed Metro and Caltrans to study the following as a part of the I-710 Corridor Project Description for the build alternatives:⁸

- Develop a geometric design for Alternative 7 that avoids significant impacts and displacement of homes, businesses, and community resources, such as, but not limited to, the Bell Shelter or Senior Centers, and the implications of such a design on commuter

⁸ Metro. Board of Directors, file no. 2015–1656, Attachment D Board Motion 22.1. Website: <https://metro.legistar.com/LegislationDetail.aspx?ID=2551940&GUID=0AE77607-5A13-4551-AFC4-AF2CEA0694B5&Options=&Search=> (accessed November 28, 2016).

and freight traffic demands; where significant impacts are unavoidable, provide documentation of the rationale and constraints.

- An option, under Alternative 7 only, to evaluate the feasibility should technology be available, to operate zero emissions trucks along the freight corridor as part of the project.
- Implementing high-frequency Express Bus Transit service along the main I-710 Corridor and the impact of such a line on commuter and freight traffic demands.
- Adding transit service on the bus and rail lines serving the I-710 project area, including operating Blue and Green Line trains with a minimum of 10-minute headways and a minimum of 25 percent increase in Local Bus, Express Bus, and community shuttles service frequencies.
- Traffic control measures, traffic management, intelligent transportation systems, and operational efficiency improvements, such as highway ramp metering and transit system signal prioritization, to reduce congestion on local roadways and arterials before considering expanding lanes.
- The use of the best available control technology construction equipment as defined by the California Air Resources Board (ARB).
- Upgrades to the existing Los Angeles River Bike Path consisting of safety, landscaping, hardscape, lighting and access enhancements, and fix station including to locations [sic], between Ocean Blvd. (Long Beach) and its northern terminus at Slauson Ave. (Vernon).
- The replacement/enhancement of approximately 28 existing bridges/underpasses and the construction of at least five new pedestrian/bike bridges/underpasses to ensure safe and easily accessible freeway and river crossings to reduce gaps between crossings further than 0.5 mile where demand for increased access exists along the freeway corridor.
- Ensure implementation of Complete Streets treatments that promote sustainable and “livable neighborhoods” for all those arterials, ramp termini, and intersections as part of the proposed I-710 build alternatives. Designs shall be consistent with the principles outlined in Caltrans’ *Main Streets, California: A Guide for Improving Community and Transportation Vitality*.
- Consistent with Caltrans’ policy, maximize the number of new trees, shrubs and foliage within proposed State right-of-way that are drought resistant and have superior biosequestration and biofiltration capabilities, in an effort to surpass the minimum tree removal/replacement ratio.
- Consistent with the Regional Water Quality Control Boards and their Municipal Separate Storm Sewer System permits, identify suitable locations within the proposed State’s right-of-way to implement additional storm water Best Management Practices (BMPs) and enhance the water quality for the Los Angeles River and its tributaries.

- Incorporate into the project design of the build alternatives, avoidance and minimization measures to reduce the level of impacts to the Los Angeles River's riverbanks, trails, pocket parks, open space, wetlands, and native landscaping within the project area.

Also included as part of Motion 22.1 was direction to Metro to examine, in coordination with Caltrans, Gateway Cities COG, and other partner and responsible agencies, the feasibility of several study area elements to occur outside of but in parallel to the I-710 Corridor Project, including, but not limited to, a zero emission truck procurement and operations program, addition of bus stops with access points to bicycle paths, and to work with community groups to develop a Local and Targeted Hiring Policy and Project Labor Agreement for construction jobs and a First Source Hiring Policy for permanent jobs created by the I-710 Corridor Project build alternatives. Table 2.2-1 lists the elements of Motion 22.1 that were addressed in the RDEIR/SDEIS build alternatives and where the discussion can be found.

Table 2.2-1: Motion 22.1 Elements Location of Discussion in Final EIR/EIS

| Motion 22.1 Item | Location of Discussion in Final EIR/EIS |
|--|--|
| A – Geometric design avoidance | Section 3.3.2.3 |
| B – Zero emission trucks | Section 2.3.2.1, Section 3.13 |
| C – New high frequency bus transit | Section 2.3.2.1, Section 3.5 |
| D – Increased existing transit service | Section 2.3.2.1, Section 3.5 |
| E – Traffic control measures/TSM/ITS | Section 2.3.2.1, Section 3.5 |
| F – BACT construction equipment use | Section 3.24, Appendix F |
| J – Upgrades to Los Angeles River Bike Path | On April 27, 2017, the Metro Board amended Motion 22.1 to advance the Los Angeles River Bike Path upgrades sooner and as a separate project; therefore, there is no discussion of this element in the RDEIR/SDEIS. |
| K – Five new bike/pedestrian bridges | Section 2.3.2, Section 3.3, Section 3.5, Section 3.6 |
| L – Complete streets that promote livable neighborhoods | Section 3.3 |
| M – Maximized trees, shrubs, and foliage that are drought resistant and biosequestration/ biofiltration | Section 2.3.2, Section 3.6 |
| N – Identify additional BMPs | Section 2.3.2, Section 3.9 |
| O – Avoid/minimize impacts to Los Angeles River, parks, trails, open space, wetlands, and native landscaping | Section 2.2.2, Section 3.3.2.3 |

BMP = Best Management Practices

ITS = Intelligent Transportation Systems

Metro = Los Angeles County Metropolitan Transportation Authority

Final EIR/EIS = Final Environmental Impact Report/Environmental Impact Statement

TSM = Transportation System Management

2.3 PROJECT ALTERNATIVES

Descriptions of the I-710 Corridor Project alternatives evaluated in this Final EIR/EIS are provided below and include the No Build (Alternative 1) and two build alternatives (Alternatives 5C and 7). Discussion of previous alternatives considered prior to and during the 2012 Draft EIR/EIS development process and public circulation period, but since withdrawn from consideration, are included in Section 2.5. A schematic depiction of each alternative is provided to assist the reader in visualizing the basic components of each alternative. Detailed mapping showing the design features of the revised build alternatives and the locations of those features is provided in Appendix O, Concept Plans.

2.3.1 NO BUILD (ALTERNATIVE 1) - PREFERRED ALTERNATIVE

The No Build (Alternative 1) would maintain the current configuration of the existing I-710 Corridor. There would be no improvements to the I-710 mainline; only approved and planned projects included in SCAG's 2012–2035 Regional Transportation Plan Sustainable Communities Strategy (RTP/SCS) and Federal

Transportation Improvement Program (FTIP) are considered part of the No Build (Alternative 1). The freight rail elements assumed in the No Build (Alternative 1) include the SCIG and ICTF capacity expansion plans in addition to the current plans and projects outlined herein. This alternative also included current plans and projects related to goods movement to and from the Ports, such as maximum utilization of existing and planned railroad capacity, as well as application of advanced technologies and programs to manage transportation systems and travel demand within the I-710 Corridor. See Appendix U for a list of projects assumed to be part of the No Build (Alternative 1). Section 2.4 outlines the reasons that the No Build (Alternative 1) was identified as the Preferred Alternative.

2.3.2 BUILD ALTERNATIVES

2.3.2.1 COMMON FEATURES OF THE BUILD ALTERNATIVES

Although the elements of the build alternatives evaluated in this Final EIR/EIS are not built upon each other as were the alternatives included in the 2012 Draft EIR/EIS, Alternatives 5C and 7 share several common elements between them, including the projects listed as part of the No Build (Alternative 1). This section discusses the common elements of the build alternatives.

MODERNIZATION OF I-710 GEOMETRIC DESIGN. Both Alternatives 5C and 7 involve modernization of I-710 geometric design, particularly at freeway-to-freeway and local interchange locations, in order to address safety, operational, and capacity deficiencies. The locations and scope of modifications to the mainline and freeway-to-freeway interchanges are similar between the alternatives, but not identical, and are listed individually under each build alternative. The I-710 centerline would be shifted at several locations to avoid or minimize right-of-way impacts. Storm

water conveyance and treatment systems and roadside equipment, maintenance, and access features would be replaced, modified, added, and/or removed, in order to accommodate modifications to the freeway. Figure 2.3-1 shows key features common to both build alternatives. Under the no build alternative, this will not be implemented.

Critical infrastructure, including, but not limited to, flood control facilities and major utilities, that crosses proposed freeway modifications would be replaced, modified, and/or relocated. Prominent infrastructure crossings include the Los Angeles River, Compton Creek, Southern California Edison (SCE) transmission lines, and Los Angeles Department of Water and Power (LADWP) transmission lines. Under the no build alternative, this will not be implemented.

Aesthetic enhancements that include thematic surface treatment of structures and paved surfaces, roadside planting, and irrigation systems consistent with a corridor-wide aesthetic master plan (*I-710 Corridor Aesthetics Master Plan* [Caltrans 2014]) are incorporated in the build alternatives.

LOCAL INTERCHANGE MODIFICATIONS. Both build alternatives involve similar modifications to local interchanges, streets, crossings, and frontage roads near I-710 to improve traffic safety, circulation, and access. The improvements common to both alternatives are listed in Table 2.3-1. With respect to “Complete Streets” improvements, inclusion of pedestrian paths (sidewalks, curb ramps, and crosswalks) and sufficient outside shoulder width to accommodate Class II bikeways on local street crossings would be provided as part of these modifications. In addition to the improvements listed in Table 2.3-1, the Leonis St. pedestrian undercrossing in Commerce is proposed to be replaced under both build alternatives. Under the no build alternative, this will not be implemented.

Outside of the freeway features described, modifications to selected local arterial intersections adjacent to I-710 freeway ramp/arterial street intersections would be made in order to reduce traffic delay and improve operations. These modifications consist of lane restriping, median modification, and/or spot widening to provide additional intersection turn lanes, and are the same between both build alternatives. Intersections are listed in Table 2.3-2.

MODIFICATIONS TO RAIL FACILITIES. Roadway or railway grade separation structures would be replaced, widened, added and/or removed in order to accommodate lane additions, modified freeway alignments, and reconfigured interchanges. Some intersecting roadways and railroad crossings entail realignment of local roadways and/or railroads. Railroad crossing locations where modifications are proposed under Alternative 5C, with the exception of the Alameda Corridor, are also proposed under Alternative 7 (albeit with different alignments and impacts). However, Alternative 7 includes additional modifications. Modifications under Alternative 5C include the following:

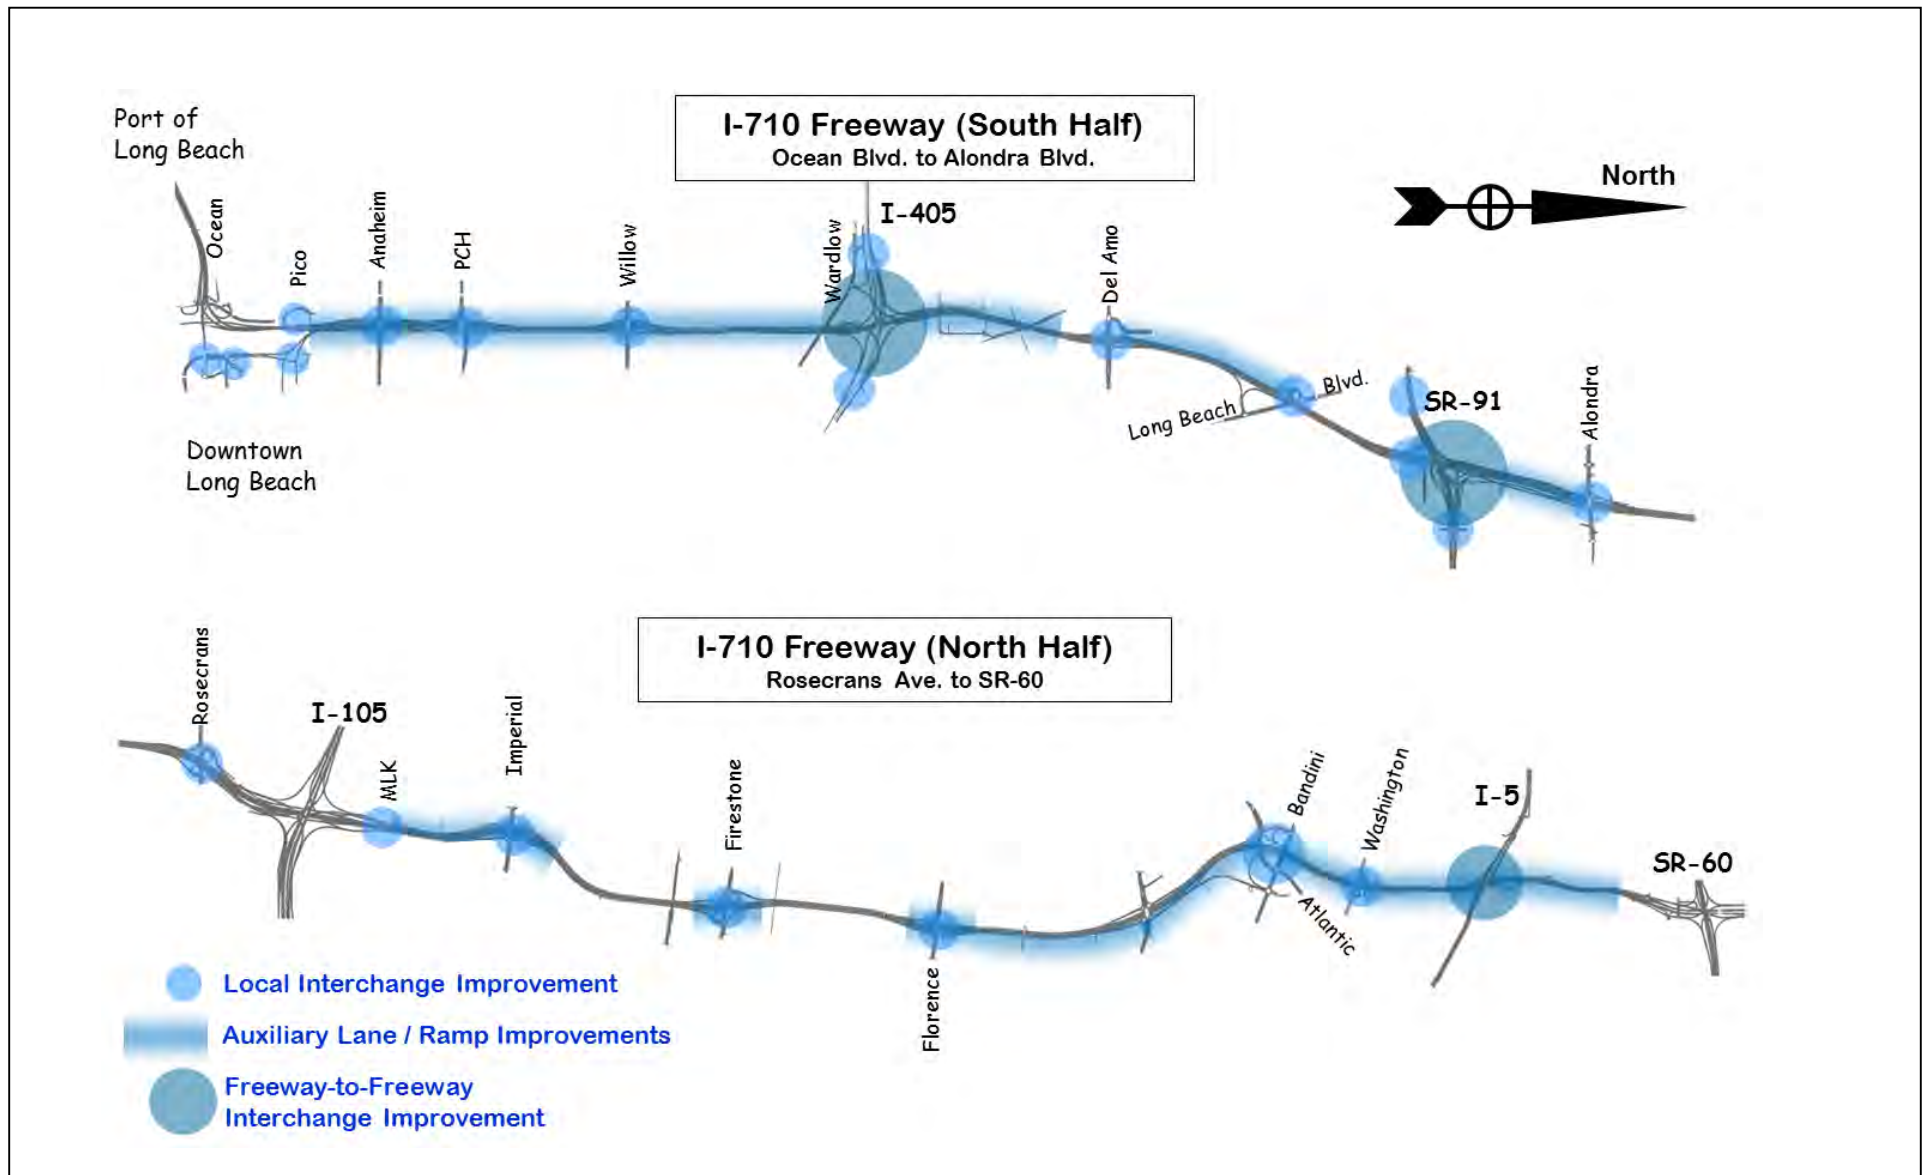

FIGURE 2.3-1

I-710 Corridor Project
Common Key Features of the Build Alternatives

This page intentionally left blank

Table 2.3-1: Local Interchange and Roadway Modifications Common to Both Build Alternatives

| No. | Location | Improvements |
|------|--|---|
| B-1 | Shoreline Dr. (City of Long Beach) | <ul style="list-style-type: none"> • Reconstruction of Shoreline Dr. to consolidate both directions of travel adjacent to the Los Angeles River. • Removal of Shoreline Dr. ramp connections to Broadway and from 3rd St.; replacement with signalized intersection. • Removal of Shoreline Dr. ramp connections to 6th and from 7th St; replacement with signalized intersection. • Removal of Shoreline Dr. ramp connections to and from 9th St. • Replacement of Shoemaker Bridge (Shoreline Dr.) over the Los Angeles River. |
| B-2 | Ocean Blvd. (City of Long Beach) | <ul style="list-style-type: none"> • Reconfiguration of ramp connections. |
| B-3 | Fashion Ave. (City of Long Beach) | <ul style="list-style-type: none"> • Convert to cul-de-sac north and south of Anaheim St. • Convert to cul-de-sac north and south of Willow St. |
| B-4 | 9 th St. (City of Long Beach) | <ul style="list-style-type: none"> • Removal of 9th St. local street crossing. |
| B-5 | 17 th St. (City of Long Beach) | <ul style="list-style-type: none"> • Convert to cul-de-sac east of Fashion Ave. |
| B-6 | Pacific Coast Hwy. (City of Long Beach) | <ul style="list-style-type: none"> • Reconstruction of the Pacific Coast Hwy. interchange, including conversion from cloverleaf interchange to diverging diamond interchange configuration, and braided entrance and exit ramps with those of the Anaheim interchange. • Reconstruction and widening of Pacific Coast Hwy., including freeway overcrossing and bridge over the Los Angeles River, between Caspian Ave. and Golden Ave. |
| B-7 | Hill St. (City of Long Beach) | <ul style="list-style-type: none"> • Addition of a pedestrian and Class I bikeway crossing over the Los Angeles River and I-710 at Hill St. in Long Beach. |
| B-8 | Willow St. (City of Long Beach) | <ul style="list-style-type: none"> • Reconstruction of Willow St. interchange, including conversion from cloverleaf interchange to diverging diamond interchange configuration, and entrance and exit ramps. • Reconstruction and widening of Willow St., including the freeway overcrossing and bridge over the Los Angeles River, between Easy Ave. and Golden Ave. |
| B-9 | Wardlow Rd. (City of Long Beach) | <ul style="list-style-type: none"> • Elimination of the Wardlow Rd. interchange on I-710. • Reconstruction of the Wardlow Rd. overcrossing. |
| B-10 | Via Alcalde Ave. (City of Long Beach) | <ul style="list-style-type: none"> • Realignment of Via Alcalde Ave. between Carson St. and Via Plata St. |
| B-11 | Carson St. (City of Long Beach) | <ul style="list-style-type: none"> • Reconstruction of the Carson St. undercrossing. |
| B-12 | 208 th St. (City of Carson and City of Long Beach) | <ul style="list-style-type: none"> • Reconstruction of the 208th St. overcrossing. |
| B-13 | Santa Fe Ave. (City of Long Beach) | <ul style="list-style-type: none"> • Reconstruction and reconfiguration of Santa Fe Ave. interchange on I-405. |
| B-14 | Pacific Place (City of Long Beach) | <ul style="list-style-type: none"> • Elimination of the Pacific Place interchange on I-405. |

I-710 Corridor Project Final EIR/EIS

| No. | Location | Improvements |
|------|---|---|
| B-15 | Del Amo Blvd. (City of Long Beach) | <ul style="list-style-type: none"> Reconstruction of the Del Amo Blvd. interchange, including conversion from partial cloverleaf interchange to diverging diamond interchange configuration, and entrance and exit ramps. Reconstruction and widening of Del Amo Blvd., including the bridge over Compton Creek, freeway undercrossing, and the bridge over the Los Angeles River, between the Metro Blue Line and Orange Ave. |
| B-16 | Susana Rd. (Community of Rancho Dominguez) | <ul style="list-style-type: none"> Relocation of the Susana Rd./Del Amo Blvd. intersection approximately 500 feet west and realignment of Susana Rd., south of E Pacific Commerce Dr. to join new intersection. |
| B-17 | Long Beach Blvd. (City of Long Beach) | <ul style="list-style-type: none"> Reconstruction of Long Beach Blvd. interchange, including entrance and exit ramps. Reconstruction of Long Beach Blvd., including the freeway overcrossing and bridge over the Los Angeles River, between Allington St. and 56th St. Reconstruction of Long Beach Blvd. from Forhan St. to Artesia Blvd. |
| B-18 | Artesia Blvd. (City of Long Beach) | <ul style="list-style-type: none"> Reconstruction of Artesia Blvd. ramps. Reconstruction of Artesia Blvd., including the freeway overcrossing, from Butler Ave. to the Los Angeles River. |
| B-19 | Cherry Ave. (City of Long Beach) | <ul style="list-style-type: none"> Reconstruction of Cherry Ave. from Artesia Blvd. to 68th St. |
| B-20 | Alondra Blvd. (City of Compton and City of Paramount) | <ul style="list-style-type: none"> Reconstruction of the Alondra Blvd. interchange, including conversion from one-quadrant cloverleaf interchange to diverging diamond interchange configuration, and entrance and exit ramps. Reconstruction of Alondra Blvd., including the freeway overcrossing and bridge over the Los Angeles River, between S White Ave. and Hunsaker Ave. |
| B-21 | Frailey Ave. (City of Compton) | <ul style="list-style-type: none"> Conversion to cul-de-sac north of Alondra Blvd. |
| B-22 | Lime Ave. (City of Compton) | <ul style="list-style-type: none"> Conversion to cul-de-sac north of Alondra Blvd. |
| B-23 | Gibson Ave. (City of Compton) | <ul style="list-style-type: none"> Realignment of Gibson Ave. between E Myrrh St. and Linsley Ave. |
| B-24 | Linsley Ave. (City of Compton and Community of East Compton) | <ul style="list-style-type: none"> Realignment of Linsley Ave. between S Williams Ave. and Gibson Ave. |
| B-25 | Rosecrans Ave. (City of Paramount and Community of East Compton) | <ul style="list-style-type: none"> Modification of Rosecrans Ave. entrance and exit ramps. Widening of Rosecrans Ave., including the freeway overcrossing, between Gibson Ave. and the Los Angeles River. |
| B-26 | Imperial Hwy. (City of South Gate and City of Lynwood) | <ul style="list-style-type: none"> Reconstruction of the Imperial Hwy. interchange, including conversion from cloverleaf interchange to diverging diamond interchange configuration, and the entrance and exit ramps. Reconstruction of Imperial Hwy., including the freeway overcrossing and bridge over the Los Angeles River, between Atlantic Ave. and Leeds St. Construction of a parkway adjacent to the north side of Imperial Hwy. from Atlantic Ave. to east side of the Los Angeles River. Addition of a pedestrian and Class I bikeway crossing over the Los Angeles River and I-710 at Imperial Hwy. in South Gate. |
| B-27 | MLK Jr. Blvd. (City of Lynwood) | <ul style="list-style-type: none"> Reconstruction of the MLK Jr. Blvd. exit ramp. |

| No. | Location | Improvements |
|------|--|--|
| B-28 | Wright Rd. (City of South Gate) | <ul style="list-style-type: none"> Conversion to cul-de-sac north of Imperial Hwy. |
| B-29 | Miller Way (City of South Gate) | <ul style="list-style-type: none"> Replacement of undercrossing to accommodate wider freeway section between East Frontage Rd. and Garfield Ave. |
| B-30 | Firestone Blvd. (City of South Gate) | <ul style="list-style-type: none"> Reconstruction of Firestone Blvd. interchange, including entrance and exit ramps. Reconstruction of Firestone Blvd., including the freeway overcrossing and the bridge over the Los Angeles River, between Rayo Ave. and National Ave. |
| B-31 | Florence Ave. (City of Bell) | <ul style="list-style-type: none"> Reconstruction of Florence Ave. interchange, including conversion from cloverleaf interchange to diverging diamond interchange configuration, and entrance and exit ramps. Reconstruction of Florence Ave., including the freeway overcrossing and bridge over the Los Angeles River, between Walker Ave. and Eastern Ave. |
| B-32 | Clara St. (City of Bell Gardens and City of Cudahy) | <ul style="list-style-type: none"> Reconstruction of the Clara St. overcrossing to accommodate wider freeway section. |
| B-33 | Gage Ave. (City of Bell and City of Bell Gardens) | <ul style="list-style-type: none"> Reconstruction of the Gage Ave. overcrossing to accommodate wider freeway section. |
| B-34 | Southern Ave. (City of South Gate) | <ul style="list-style-type: none"> Construction of Southern Ave., including a freeway overcrossing and bridge over the Los Angeles River, between Salt Lake Ave. and Garfield Ave. Construction of a one-way street couplet reestablishing access between East Frontage Rd. and Southern Ave. |
| B-35 | W Frontage Rd. (City of South Gate) | <ul style="list-style-type: none"> Extension of W Frontage Rd. from current northern terminus to Southern Ave. via a loop ramp. |
| B-36 | Atlantic/Bandini Blvds. (City of Bell and City of Vernon) | <ul style="list-style-type: none"> Reconstruction of the Atlantic/Bandini Blvds. interchange, including: <ul style="list-style-type: none"> Removal of all southbound ramps and replacement with an exit ramp terminating at Bandini Blvd., a one-way street connection between Bandini Blvd. and Atlantic Blvd., and an entrance ramp from Atlantic Blvd. Construction of two southbound ramp termini intersections located at Bandini Blvd. and Atlantic Blvd. Removal of all northbound ramps and replacement with two exit ramps and two entrance ramps. Construction of two northbound ramp termini, one located at Bandini/ Pennington Way, and one located on Atlantic Blvd. north of the Atlantic Blvd./Bandini Blvd. intersection. Reconstruction and realignment of Atlantic Blvd. between the Los Angeles River and the 26th St. overcrossing. Reconstruction of Bandini Blvd. between Ayers Ave. and Pennington Way |
| B-37 | Triggs St. (City of Commerce) | <ul style="list-style-type: none"> Widening of Triggs St. undercrossing. |
| B-38 | Bedessen Ave. (City of Commerce) | <ul style="list-style-type: none"> Conversion to cul-de-sac north of Washington Blvd. |
| B-39 | Connor Ave. (City of Commerce) | <ul style="list-style-type: none"> Conversion to cul-de-sac approximately 340 feet north of Washington Blvd. |

| No. | Location | Improvements |
|------|---|--|
| B-40 | Ransom Ave. (City of Commerce) | <ul style="list-style-type: none"> Conversion to cul-de-sac north of Washington Blvd. |
| B-41 | Olympic Blvd./Eastern Ave. (Community of East Los Angeles) | <ul style="list-style-type: none"> Reconstruction of the entrance and exit ramps at the Olympic Blvd./Eastern Ave. interchange. |
| B-42 | Ford St. (Community of East Los Angeles) | <ul style="list-style-type: none"> Ramp intersection improvements. |

Note: Under the No Build (Alternative 1), these modifications will not be implemented.

Table 2.3-2: Arterial Intersection Improvements Common to Both Build Alternatives

| No. | Location | Improvements |
|------|---|---|
| B-43 | Anaheim St./Harbor Ave. (City of Long Beach) | <ul style="list-style-type: none"> Anaheim St. will be widened to three lanes through the Anaheim St./Harbor Ave. intersections, and the ramp tie-in from I-710 will land further east to increase storage. |
| B-44 | Willow St./Easy Ave. (City of Long Beach) | <ul style="list-style-type: none"> Intersection realignment associated with widening of Willow St. to three lanes to Easy Ave. |
| B-45 | Long Beach Blvd./Victoria St. (City of Long Beach) | <ul style="list-style-type: none"> Intersection modification and reconstruction to accommodate dual-left turn lanes between the Long Beach Blvd. northbound ramp intersection and Victoria St. |
| B-46 | Alondra Blvd./Atlantic Ave. (City of Compton) | <ul style="list-style-type: none"> Intersection will be modified and reconstructed to accommodate the reconstructed Alondra Blvd. interchange improvements. |
| B-47 | Imperial Hwy./Atlantic Ave. (City of Lynwood) | <ul style="list-style-type: none"> Intersection modification and reconstruction to accommodate the realigned Imperial Hwy., with the addition of a pedestrian and bike parkway to the north of the westbound Imperial Hwy. travel lanes. |
| B-48 | Garfield Ave./Miller Way (City of South Gate) | <ul style="list-style-type: none"> Intersection will be relocated approximately 200 feet south and reconstructed in a three-legged T-intersection configuration to accommodate the relocated Imperial Hwy. off-ramp location. |
| B-49 | Florence Ave./Eastern Ave. (City of Bell Gardens) | <ul style="list-style-type: none"> Intersection will be modified to accommodate the reconstructed Florence Ave. interchange. |
| B-50 | Washington Blvd./Ayers Ave. (City of Commerce) | <ul style="list-style-type: none"> Intersection will be modified to accommodate the Washington Blvd. improvements. |
| B-51 | Washington Blvd./Couts Ave. (City of Commerce) | <ul style="list-style-type: none"> Intersection will be modified to accommodate the Washington Blvd. improvements and to handle diverted traffic due to the closure of Ransom St. north of Washington Blvd. |

Note: Under the No Build (Alternative 1), these modifications will not be implemented.

- Union Pacific Railroad (UPRR)

- The UPRR San Pedro Subdivision crosses I-405 3,200 feet north of I-710. Widening of the I-405 Overhead (over UPRR San Pedro Subdivision) is required to accommodate connectors to and from I-710. Special provisions to ensure safeguards around the active rail line during construction would be required.
- The UPRR San Pedro Subdivision crosses I-710 4,500 feet north of I-405. Reconstruction of the rail alignment is required to accommodate widening of the I-710. The limits of reconstruction extend from 700 feet west of the freeway to the Los Angeles River and include replacement of the underpass rail structure crossing over the freeway. The new rail alignment is adjacent to and south of the existing alignment. The permanent “shoofly” alignment allows the existing alignment to remain in service during construction.
- The UPRR San Pedro Subdivision crosses I-710 700 feet north of the Los Angeles River freeway crossing. The railway also crosses Southern Ave. at-grade near the western limits of the Southern Ave. extension. The railway is identified as a future transit line currently known as the Eco-Rapid Transit Line (formerly known as the Orange Line). The roadway and structure widening of the freeway overhead would not require modification of the rail line. Special provisions to ensure safeguards around the active rail line during construction would be required.
- The UPRR Patata Industrial Lead crosses I-710 1,600 feet north of Firestone Blvd. Reconstruction of the rail alignment would be required to accommodate widening of the I-710. The limits of reconstruction extend from 1,500 feet west of the Los Angeles River to 1,500 feet east of the freeway and include replacement of the underpass rail structure crossing over the freeway and the rail bridge over the Los Angeles River. The new rail alignment is adjacent to and south of the existing alignment. The permanent “shoofly” alignment allows the existing alignment to remain in service during construction.
- The UPRR La Habra Subdivision crosses I-710 1,300 feet north of Gage Ave. The railway is situated between Randolph St. west of the Los Angeles River and between Randolph St. and a utility corridor east of the freeway. Reconstruction of the rail alignment would be required to accommodate widening of the I-710. The limits of reconstruction extend from 1,500 feet west of the Los Angeles River to 1,100 feet east of the freeway and include replacement of the underpass rail structure crossing over the freeway and the rail bridge over the Los Angeles River. The new rail alignment is adjacent to and south of the existing alignment. The permanent “shoofly” alignment allows the existing alignment to remain in service during construction.

- UPRR operates its East Los Angeles Intermodal Facility, known as the East LA Yard. The 230-acre yard is located in between Washington Blvd. and Noakes St. The freeway bisects and crosses over the middle of the yard, crossing multiple mainline and strip tracks. Trains are assembled on both the west side and east side of the freeway. The freeway widening, which includes replacement of the freeway overhead and new ramp overheads, increases the total aerial right-of-way width by approximately 80 percent. The widening encroaches into both the west side and east side assembly areas.
- Metro Division 11 (Metro)
 - The Metro Blue Line Yard is situated between I-710 and the Los Angeles River 2,500 feet north of I-405. The yard and rail facilities are not directly affected by the proposed highway modifications under the build alternatives. However, access to the facility would be disrupted during construction. Both 208th St. and Carson St. provide access to the yard and would require closure to reconstruct the street crossings. To ensure at least one access remains in operation, reconstruction of the crossings would be conducted sequentially.
 - The Metro Blue Line crosses I-405 3,100 feet south of I-710. Neither widening of the I-405 Overhead, nor construction of the Los Cerritos Pedestrian Overhead, would require modification to the rail line. Special provisions to ensure safeguards around the active rail line during construction would be required.
 - The Metro Blue Line crosses I-710 4,800 feet north of I-405. Neither widening of the freeway, nor construction of the viaducts supporting the truck bypass lanes, would require modification of the rail line. Special provisions to ensure safeguards around the active rail line during construction would be required.
- Alameda Corridor Transportation Authority
 - The Alameda Corridor crosses SR-91 between Santa Fe Ave. and Alameda St. Widening of SR-91 and reconstruction of the eastbound Alameda St. entrance ramp requires widened and replacement structures over the Alameda Corridor tracks. No modifications are required to the railway. Special provisions to ensure safeguards around the active rail line during construction would be required.
- Los Angeles Junction (LAJ) Railroad
 - The LAJ Laguna Mainline crosses I-710 1,300 feet north of Slauson Ave. The railway is situated between the Los Angeles River and the LADWP transmission corridor west of the freeway. East of the freeway, the railway is situated next to the freeway and crosses Slauson Ave. at-grade. The LAJ Mainline and switching track right-of-way abuts the State right-of-way for 2,800 feet south of the underpass. The railway does not connect to the UPRR La Habra Subdivision.

- Reconstruction and realignment of the mainline and switching tracks would be required to accommodate widening of the I-710. The limits of reconstruction extend 500 feet west of the freeway. East of the freeway, reconstruction extends along the freeway for up to 4,000 feet. Reconstruction would include replacement of the underpass rail structure crossing over the freeway and an at-grade crossing at Slauson Ave. The new rail alignment at the underpass would be adjacent to and north of the existing alignment. The permanent “shoofly” alignment would allow the existing alignment to remain in service during construction. The alignments would not preclude future expansion of the LAJ operation, which could entail a second mainline track over the freeway. Right-of-way requirements for the LAJ reconstruction are part of the right-of-way requirements for the build alternatives. Right-of-way requirements for future LAJ expansion are not.
- An LAJ secondary track crosses I-710 600 feet south of Atlantic Blvd. The secondary track connects to the LAJ mainline at the west wye on the west side of the freeway. East of the freeway, the secondary track connects to the “C” yard and the mainline track at the east wye.
- Reconstruction and realignment of the secondary track and west wye would be required to accommodate the new configuration of the Atlantic Blvd./Bandini Blvd. interchange and its multiple ramps. The new freeway overhead and replacement track would be required to be constructed before the existing tracks are removed. Right-of-way requirements for the LAJ reconstruction are part of the right-of-way requirements for the build alternatives.
- Burlington Northern Santa Fe Railroad (BNSF)
 - BNSF operates its Los Angeles Intermodal Facility, known as the Hobart Yard. The 245-acre yard is located in between Washington Blvd. and Sheila St. The freeway bisects and crosses over the east end of the yard, crossing multiple mainline and strip tracks. All trains are assembled on the west side of the freeway. The freeway widening, which includes replacement of the freeway overhead and new ramp overheads, increases the total aerial right-of-way width by approximately 80 percent. The widening would not encroach into the west side assembly area.

PEDESTRIAN AND BIKE-ONLY BRIDGES. In addition to the widening of existing bridges and overcrossings to accommodate bicycle and pedestrian traffic, three pedestrian and bicycle-only bridges are proposed that would be included under both build alternatives. The bridges would span I-710, and in some cases the Los Angeles River or Metro Rail lines, to provide for improved bicycle and pedestrian connectivity within the corridor. Bridges are proposed at the following locations:

- Humphreys Ave., located in East Los Angeles. This bridge would cross I-710.

- Clara St., located in Bell Gardens/Cudahy. This bridge would cross I-710 and the Los Angeles River.
- Pacific Place, located in Long Beach. This bridge would cross I-405 and the Metro Blue Line.

In order to locate the bicycle and pedestrian bridges at logical and feasible points and enhance connectivity most effectively, an analysis was performed that first identified where gaps in direct access points over the I-710 (and over the Los Angeles River in many cases) occurred, and then evaluated the feasibility of crossings located within those gap areas. In addition to existing crossings, planned crossings that are reasonably foreseeable were also considered. When evaluating the feasibility of proposed crossing locations, several elements were taken into account. Preferred locations were those that provided new connections between bicycle/pedestrian facilities. A crossing was considered infeasible if its construction would impact existing parks or wetlands, or if physical obstructions (e.g., existing and proposed multi-level freeway connector/ramp structures, high-voltage electrical transmission corridors, or railroad facilities) were present that would result in adverse impacts. Under the no build alternative, this will not be implemented. It may be implemented as a separate project.

RETAINING WALLS. Retaining walls would be required under the build alternatives to retain fill or cut slopes to minimize the need to acquire additional right-of-way throughout the I-710 Corridor. Retaining walls would also be required along the outside shoulder of the I-710 freeway to reduce impacts and minimize additional right-of-way requirements. The wall locations for both build alternatives are shown in Appendix O, Concept Plans. The outside shoulder retaining walls heights range from approximately four feet to 30 feet. Under the no build alternative, this will not be implemented.

TSM/TDM, TRANSIT, AND ITS. In addition to improvements to the I-710 mainline and the interchanges, both build alternatives also include TSM/TDM, Transit, and ITS improvements. Although TSM/TDM measures alone could not satisfy the purpose and need of the I-710 Corridor Project, the following TSM/TDM measures were incorporated into both build alternatives for the I-710 Corridor Project. Under the no build alternative, this will not be implemented. It may be implemented as a separate project.

New or updated adaptive ramp metering would be implemented for all I-710 on-ramps between Pico Ave. and Third St. to better manage traffic flows up and down the freeway corridor. Ramp meter improvements are also included for the on-ramps at the local interchanges that access the key crossing freeways (I-405, SR-91, I-105, and I-5) within the project limits.

Improved signage on I-710 would be provided in the form of overhead signs, advanced notification, and changeable message signs.

ITS improvements for the build alternatives, beyond what is already committed and programmed under the No Build (Alternative 1), include the addition of updated fiber-optic communications to interconnect traffic signals along major arterial streets modified under Alternatives 5C and 7 to provide for continuous, real-time adjustment of signal timing to improve traffic flow, as well as other technology improvements, and Transportation Management Center (TMC) upgrades and inter-ties necessary to control and monitor the ITS system.

LANDSCAPING AND IRRIGATION SYSTEMS. Landscaping and irrigation systems would be provided where necessary within the corridor to provide aesthetic treatment, replacement planting, or mitigation planting for the build alternatives. Close coordination among Caltrans, Metro, various I- 710 Corridor committees, and the landscape design consultant on this project has occurred to identify areas available for planting in addition to coordination with Caltrans' Operations and Maintenance Branch to ensure consistency with their objectives and requirements. Features included as part of the project design for the build alternatives would include drought-tolerant and native landscaping, plants that change colors with the seasons, and use of vines where space is limited. New irrigation systems would be designed to use reclaimed water (if available). In an effort to surpass the minimum tree removal-to-replacement ratio, the number of new trees, shrubs and foliage within State right-of-way would be maximized, would be drought-resistant, and would have superior biosequestration and biofiltration capabilities. An *Enhanced Water Quality Features Report* (2016) was prepared to identify potential stormwater management solutions in the corridor, along with hardscape and landscape options. The development of final landscape plans for the build alternatives would occur during later phases of design, and would maximize the number of drought-tolerant trees, shrubs, and foliage and identify additional stormwater BMP locations. In addition, a *I-710 Corridor Aesthetics Master Plan* (2015) was developed to guide the design of hardscape features throughout the corridor for the build alternatives, including highway design elements and themes, lighting, bridge structures, and other components. Under the no build alternative, this will not be implemented.

MAJOR UTILITY RELOCATIONS. Implementation of either build alternative would necessitate substantial relocation of existing utilities, including the relocation of access to oil facilities operated adjacent to the Los Angeles River in the City of Long Beach. The relocation of existing utilities is a component of the alternative descriptions, and the relocated utility infrastructure is included in the footprint/disturbance limits for the build alternatives. The effects of the utility relocation are evaluated in this Final EIR/EIS, including the short-term construction effects of demolition and construction, as well as the long-term effects of operation of the new utility infrastructure.

In the analysis for the build alternatives, utility relocations are grouped into the following categories:

- Protect existing utilities in place;
- Replace utilities with new facilities within existing alignments; and
- Replace utilities with new facilities on new alignments.

Discussion of impacts to utilities is provided in Section 3.4, Utilities and Emergency Services.

PROGRAMMATIC ELEMENTS. Programmatic elements are included in both build alternatives that help the corridor achieve improvements in congestion, air quality and overall community health. These include the I-710 Clean Truck Program (referred to in the RDEIR/SDEIS as the I-710 Corridor Project Zero Emission/Near Zero Emission Truck Technology Deployment Program), the I-710 Corridor Community Health Benefit Program, and the I-710 Corridor Project ITS/TSM/Congestion Relief Program. [Note: Since a build alternative has not been identified as the Preferred Alternative, these programmatic elements as described below will not be implemented by Caltrans as the Lead Agency under CEQA and NEPA and as the owner/operator of the I-710 freeway. The separate process would include new environmental compliance documentation and approval.]

I-710 CLEAN TRUCK PROGRAM. The I-710 Clean Truck Program, also known as the I-710 Corridor Project Zero Emission/Near Zero Emission Truck Technology Deployment Program, is a programmatic component of the build alternatives and would provide funding to individual owner-operators and privately owned truck fleets to subsidize the purchase of heavy-duty (Class 8) ZE/NZE trucks for use within the I-710 corridor. Funding would also be made available to construct up to 20 electric charging stations and up to ten hydrogen refueling stations within the Study Area, in the amounts of \$2 million and \$15 million, respectively. The recharging/refueling stations would be targeted to locations served by heavy-duty vehicles such as intermodal terminals at the Ports and rail yards, warehouses, and distribution centers. Funding preferences would be given to locations near or routes leading directly to I-710. Funding would be provided at different levels for each build alternative. Implementation of Alternative 5C would provide funding for this program in the amount of \$100 million. Implementation of Alternative 7 would provide funding for this program in the amount of \$460 million. Under Design Option 7ZE, this program would be funded in the amount of \$1.050 billion towards only fully zero-emission trucks.

In order to qualify for funding, trucks would need to meet minimum requirements for emissions standards as well as travel within the I-710 corridor. Heavy-duty trucks would meet minimum requirements for ZE/NZE standards by being certified by ARB at or below the optional low-oxides of nitrogen (NO_x) standard of 0.02 grams per brake horsepower-hour of oxides of nitrogen (g/bhp-hr NO_x) and/or meeting ARB and/or South Coast Air Quality Management District (SCAQMD) zero emissions technology definitions. The air quality analysis presumes that no ZE/NZE truck would be diesel-powered.

To be eligible for ZE/NZE truck funding from this program, there would be minimum requirements for travel on I-710 under Alternative 5C or for travel in the proposed freight corridor under Alternative 7. For example, the recipient truck may be required to travel at least 16 miles on the I-710 mainline and/or freight corridor for each of 250 working days per year, which would equal approximately 4,000 vehicle miles traveled (VMT) per year. As with other truck funding programs, compliance could be assessed annually through a global positioning system (GPS)-based Automatic Vehicle Locator (AVL) or similar system that would log mileage within the I-710 Corridor limits. For a period of ten years after the funding is provided, a recipient truck that did not meet the annual minimum VMT requirement would be required to reimburse one-fifth of the program funding, or potentially up to the full program funding. If the recipient truck failed to meet the annual VMT requirement for two years, all program funding would have to be reimbursed. If the truck is sold during the ten-year period after funding is provided, the requirements would remain the same for the purchaser.

The project funding partners would work in partnership with other agencies that may have special expertise and/or previous similar experience in order to identify funding sources and administration responsibilities.

The first annual funding contribution for the truck program would be provided within twelve months after programming/allocation of construction funding, and implementation of the program would occur no sooner than the start of construction of a build alternative. The program is included as a part of both build alternatives and would have received environmental clearance at the time of the Final EIR/EIS and subsequent Record of Decision/Notice of Determination if a build alternative were to be selected.

In 2013, the Gateway Cities COG and Metro developed an “I-710 Project Zero-Emission Truck Commercialization Study” in order to evaluate the ZE truck technologies which might meet the needs of the I-710 Corridor Project and drayage users, and develop a business and commercialization plan. The study concluded that “zero-emission capable drayage trucks can be developed, demonstrated, validated, and moved into production by a 2025 target timeline,”⁹ but there remain core issues to be addressed prior to the successful commercialization of said vehicles. The analysis provided in the RDEIR/SDEIS for the build alternatives did not define or identify a specific vehicle technology to be utilized for the zero- and near-zero emissions trucks. Rather, the analysis assumed that this, more detailed work would occur for the program at a later date as these vehicle technologies continue to evolve.

COMMUNITY HEALTH BENEFIT PROGRAM. The I-710 Corridor Community Health Benefit Program is a programmatic component of the build alternatives and would take the form of a

⁹ Calstart. Website: http://www.calstart.org/Libraries/I-710_Project/I-710_Project_Zero-Emission_Truck_Commercialization_Study_Final_Report.sflb.ashx (accessed December 30, 2016).

grant program structured to provide corridor communities the opportunity to implement projects or outreach activities that would improve air quality and public health related to I-710 travel and goods movement.

As a grant program, the Community Health Benefit Program would make funding available to approved applicants. The guidelines of the program would identify categories of eligible grant recipients, including (but not limited to) corridor cities, the County, school districts, day care centers, community health providers, senior centers, and non-profit organizations geared towards air quality or public health issues.

Under this program, proposed projects would be screened for eligibility and reviewed by an Advisory Committee consisting of area experts, members of participating public agencies, and community representatives. Recommendations of funding awards would be provided in accordance with detailed ranking criteria for each of the three categories of projects, as developed by Metro and the Gateway Cities COG and outlined in more detail below.

Projects falling into three broad categories would be eligible and considered for funding under the program: (1) air quality improvement and/or noise reduction measures at local schools and other sensitive receptors or related sites, (2) air quality improvements at hospitals, medical centers, and senior facilities, as well as health education, outreach, and screening, and (3) greenhouse gas (GHG) reduction through projects such as renewable power, energy efficiency, and tree-planting, etc. Eligible projects could include, but are not limited to, the following:

- Installation of high-efficiency particulate air (HEPA) or other central or portable air filter and heating, ventilation, and air conditioning (HVAC) upgrades in schools, day care facilities, senior centers, clinics, hospitals, etc.
- School bus or senior transport vehicle retrofit or replacement
- Door and window replacement and/or seals
- Community health testing, education, and/or outreach, such as mobile clinics
- Upgrades for parks, added greenbelts, and/or vegetation barriers, buffer parks or open space, landscaping
- Energy efficiency updates and renewable energy projects

Cost-effectiveness would be emphasized, with funding priority given to those proposals that benefit the most people per dollar. The first funding contributions would be provided within twelve months after programming/allocation of construction funding of the build alternative, and implementation of the program would occur no sooner than the start of construction. The program would include yearly funding contributions adjusted for inflation over the ten-year period, commensurate with any phased construction strategy.

The program is included as a programmatic component of both build alternatives and, therefore, would have received environmental clearance as part of the Final EIR/EIS if a build alternative had been selected. In this case, any specific projects funded through a program such as this would likely be ministerial actions or statutorily exempt under CEQA. Grant applicants would, however, be responsible for obtaining project-level environmental clearance if needed.

ITS/TSM/CONGESTION RELIEF PROGRAM. As an element of the build alternatives, the I-710 Corridor Project ITS/TSM/Congestion Relief Program was structured to help address the I-710 Corridor Project goals of improving traffic safety, accommodating projected traffic volumes, and addressing increased traffic volumes resulting from projected growth in population, employment, and economic activities related to goods movement. It is a programmatic component of the build alternatives that would provide funding to local governments to implement projects within the I-710 Corridor Project Study Area that would improve operations at congested intersection locations on the local roadway network. Congested intersections are those intersections in the I-710 Study Area projected to operate at poor levels of service (LOS E or worse) in the future under the 2035 No Build (Alternative 1). Through the No Build (Alternative 1) analysis conducted for the I-710 project, approximately 78 intersections in the Study Area were found to meet this criterion. Currently this project is in the Project Approval/Environmental Documentation (PA/ED) phase.

The types of projects eligible for funding under the program include: traffic signal upgrade, timing, or synchronization; traffic surveillance; traffic signal coordination; safety improvements that reduce incident delay; restriping to add additional turning lanes or storage at the intersection; spot-widening at the intersection to add additional turning lanes or storage; channelization, shoulder work, addition of turn-outs, and installation of two-way turn lanes; curve correction; alignment improvements; and traffic calming measures including signing, striping, access management, or other traffic control measures. Further, any proposed improvements would need to account for the safe movement of bicycles and pedestrians and be consistent with “Complete Streets” principles.

The I-710 ITS/TSM/Congestion Relief Program would be administered by Metro in partnership with the I-710 Corridor Project partner agencies. Eligible recipients for funding provided through the program are the Cities and County of Los Angeles (unincorporated areas) that have local jurisdiction over the arterials and intersections within the I-710 Study Area. While any proposed travel systems management (TSM), intelligent transportation systems (ITS), travel demand management (TDM), and intersection improvements would need to meet criteria and eligibility requirements for funding as defined by Metro; project initiation, project development and project implementation would be subject to local planning and approval processes of the local jurisdictions. In this case, the local jurisdictions would be responsible for obtaining project-level environmental clearance for those projects undertaken under the

I-710 ITS/TSM/Congestion Relief Program. These local, project-level environmental approvals would be achieved following their own processes separate from the I-710 Corridor Project EIR/EIS evaluation process.

The first funding contributions would be provided within twelve months after programming/ allocation of construction funding for a build alternative, and implementation of the program would occur no sooner than the start of construction of a build alternative.

ARTERIAL PARKING RESTRICTION PROGRAM. Under this element of the build alternatives, parking restrictions during peak periods would be implemented on four arterial roadways. These restrictions (e.g., no curb parking permitted) would occur during peak periods (e.g., 6:00 a.m. to 9:00 a.m. and 4:00 p.m. to 7:00 p.m.) to increase traffic capacity by one additional through-lane in each direction at the following locations, as seen in Figure 2.3-2:

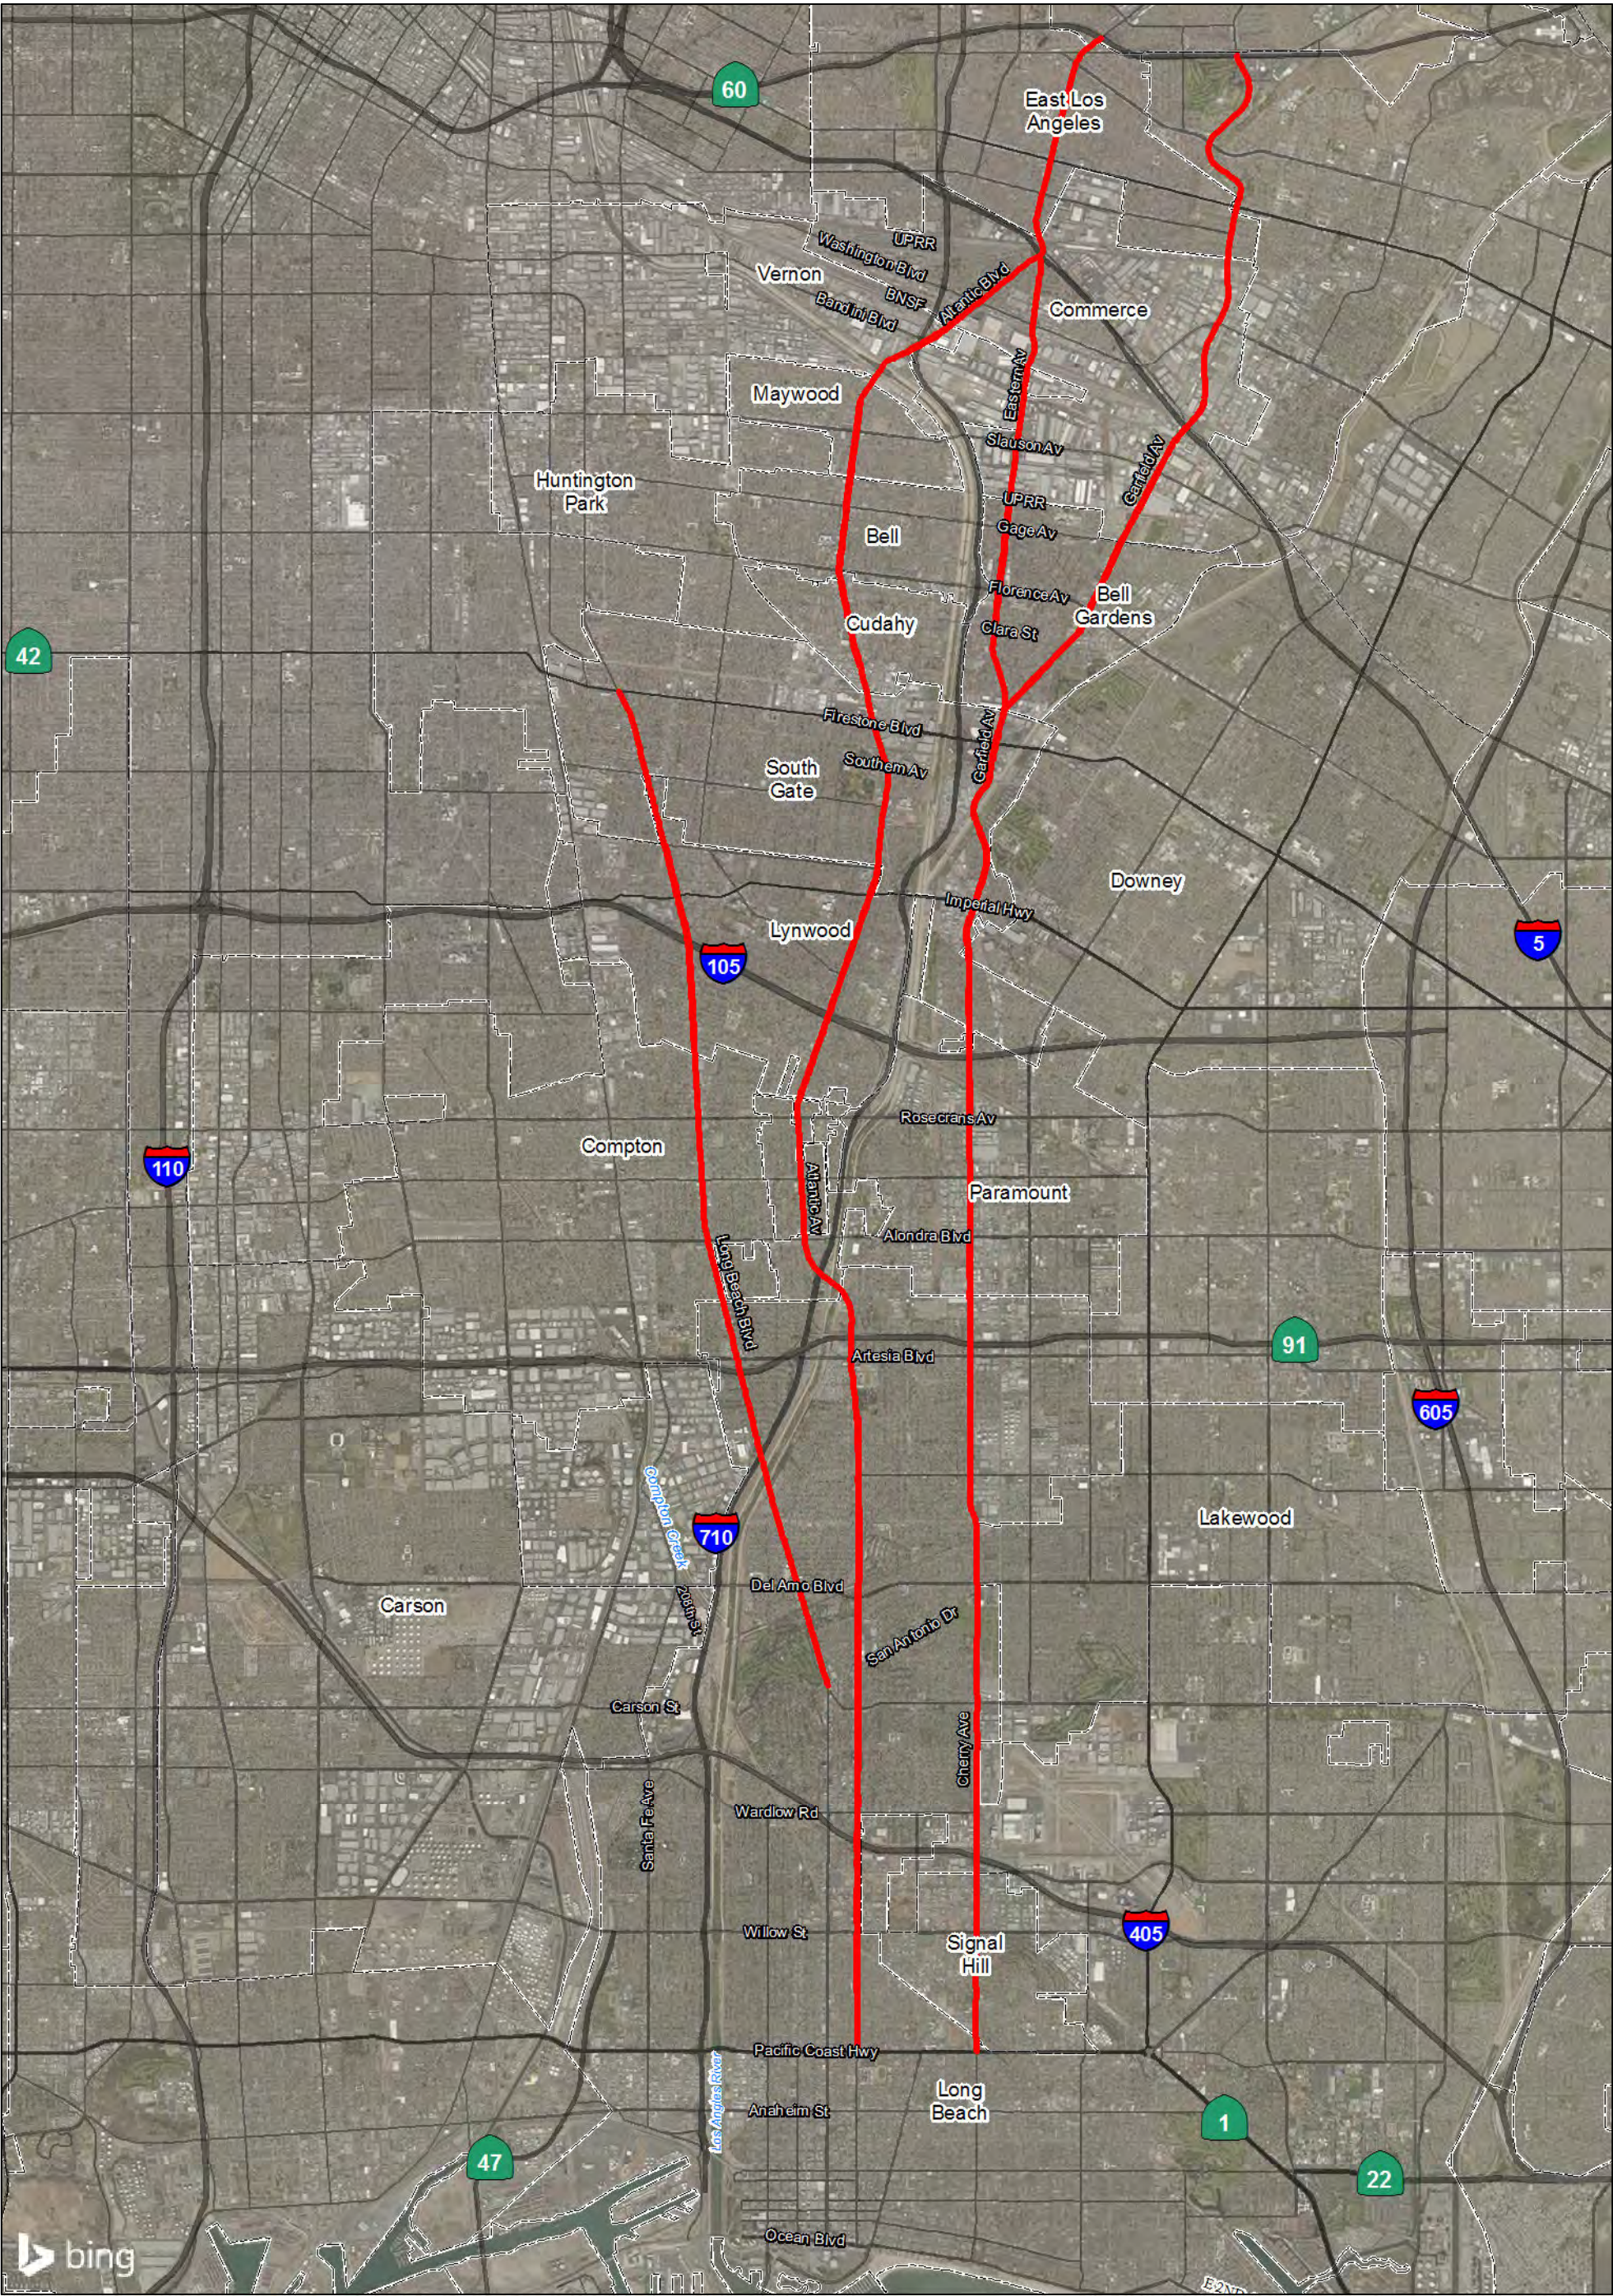

- Atlantic Blvd. between Pacific Coast Hwy. and SR-60
- Cherry Ave./Garfield Ave. between Pacific Coast Hwy. and SR-60
- Eastern Ave. between Cherry Ave. and Atlantic Blvd.
- Long Beach Blvd. between San Antonio Dr. and Firestone Blvd.

As discussed later in Section 2.4, the Arterial Parking Restriction Program was removed from the scope of the Preferred Alternative in response to public comments on the RDEIR/SDEIS and stakeholder input.

TRANSIT PROGRAM. Transit improvements that would be provided as part of the build alternatives for the I-710 Corridor Project include substantially increased service on all Metro Rail and Rapid routes and Local Bus routes in the Study Area. Specific transit improvements are listed in the following paragraphs. Please refer to Figure 2.3-3 for a map of the new transit lines included in Alternatives 5C and 7. It is important to note that the transit operational improvements included in the build alternatives would be phased in incrementally based on available funding as well as transit demand.

- Creation of three new high-frequency Express Bus and Rapid transit routes serving the I-710 Corridor, with the following frequencies and connections:
 - Express Line 51X
 - 20-minute peak headways, 30-minute daytime headways, and 40-minute evening headways.

New Transit Routes

This page intentionally left blank

- Proposed connections at California State University, Long Beach; Long Beach City College; Del Amo Blue Line Station; Bicycle Casino; Maravilla Gold Line Station; and California State University, Los Angeles Silver Line Station.
- Express Line 52X
 - 20-minute peak headways, 30-minute daytime headways, and 40-minute evening headways.
 - Proposed connections at Lakewood Center Mall; Paramount Civic Center; Bicycle Casino; Maravilla Gold Line Station; and California State University, Los Angeles Silver Line Station.
- Rapid Line 7XX
 - 10-minute peak headways, 20-minute daytime headways, and 30-minute evening headways.
 - Proposed connections at California State University, Long Beach; Lakewood Center Mall; Paramount Civic Center; Bicycle Casino; Citadel Outlets; Atlantic Gold Line Station; East Los Angeles College; and California State University, Los Angeles Silver Line Station.
- Increased service on all Metro Rapid route and Local Bus routes in the Study Area including:
 - Express Bus service
 - Increase in corridor Metro Rapid service frequency (annual revenue service hours) by about 33 percent, reducing headways by 50 percent (from ten minutes to five minutes) on all Metro Rapid routes in the Study Area.
 - Local Bus service
 - Increase corridor local bus service (service frequency) by about 68 percent: for bus routes in the Study Area (both Metro and Long Beach Transit), reducing headways greater than 20 minutes by 50 percent and headways less than 20 minutes to ten minutes. This represents an approximate 26 percent increase in annual revenue service hours compared with existing conditions, 20 percent greater than the estimated 5 percent increase under the No Build (Alternative 1).
 - Expansion of existing community bus service (e.g., local circulators Montebello Transit, Compton Renaissance Transit System, and East Los Angeles Shuttle).

- Increased service on all Metro light rail service in the Study Area including:
 - Metro Blue Line
 - An increase in service frequency to decrease peak-period headways to five minutes and off-peak headways to ten minutes during the average weekday, for an estimated increase of 50 trains daily (12 each in the a.m. peak and midday periods, 16 in the p.m. peak period, and ten in the evening hours (7:00 p.m. to midnight)). Service increases beyond this are not feasible due to various system operational restrictions. By 2035, the Regional Connector in downtown Los Angeles will have been completed, along with the extension of the Gold Line as far as Azusa. Under this condition, Blue Line trains will operate continuously between Long Beach and Azusa.
 - Metro Green Line
 - An increase in service frequency to decrease peak-period headways to six minutes and off-peak headways to ten minutes during the average weekday, for an estimated increase of 48 trains daily (six in the a.m. peak period, 24 in the midday period, eight in the p.m. peak period, and ten in the evening period).

LOS ANGELES/GATEWAY FREIGHT TECHNOLOGY PROGRAM. Selected components from the Los Angeles/Gateway Freight Technology Program that are specific to the I-710 Corridor were also included as programmatic elements of Alternatives 5C and 7. These include freeway smart corridor strategies that would deploy dedicated short-range communication roadside units alongside I-710 to manage and control traffic in real time as well as applying operational strategies such as queue warning systems, variable speed limits/speed harmonization, and dynamic corridor ramp metering on I-710. The purpose of these technology applications for the I-710 Corridor would be to manage and control traffic in real time based on prevailing conditions and to make informed, performance-driven decisions regarding traffic management. These strategies are structured to address both recurrent congestion (i.e., morning and evening peak travel hours), as well as non-recurrent congestion due to vehicle breakdowns, lane closures, or traffic incidents in order to reduce delay and improve travel time reliability.

2.3.2.2 ALTERNATIVE 5C: I-710 WIDENING AND MODERNIZATION

Alternative 5C is a build alternative that would widen the I-710 mainline to eight general purpose lanes from Anaheim St. to I-405 and up to ten general purpose lanes north of I-405 (on I-710 northbound and on I-710 southbound) to Olympic Blvd. by adding up to one general purpose lane in each direction. The alternative would also add two truck bypass lanes in each direction around the I-405 freeway to freeway interchange, and a lane buffer in each direction between Pacific Coast Hwy. and Shoreline Dr., to address safety and operational deficiencies. Figure 2.3-4 shows Alternative 5C and its key features.

This alternative would modernize the design at the freeway-to-freeway interchanges at I-405, SR-91, I-105, and I-5 as follows, and as seen on Figure 2.3-5:

- At I-405, modification of the freeway-to-freeway interchange would entail realignment and replacement of all eight of the existing freeway-to-freeway connectors. The local interchanges at Wardlow Rd. at I-710 and Pacific Place at I-405 would be removed, and the local interchange at Santa Fe Ave. and I-405 would be modified.
- The southbound and northbound connectors between SR-91 and I-710 would be reconstructed and extended. The connector ramps on I-710 north of the interchange would be braided with the Alondra Blvd. ramps. The connector ramps on SR-91 west of the interchange would be braided with the Long Beach Blvd., Santa Fe Ave., and Alameda St. ramps. An eastbound auxiliary lane would be constructed on SR-91 from the interchange to Cherry Ave.
- At I-105, the southbound and northbound connectors to I-710 would be reconstructed and extended, and the connector ramps on I-710 north of the interchange would be braided with the Imperial Hwy. ramps.
- At I-5, new collector-distributor roads that service local interchanges at Washington and Bandini Blvds. would be added, and ramp connection points to I-710 would be modified. The existing northbound left-hand side connector from I-710 to I-5 would be removed, as the northbound I-710 to northbound I-5 movement would be made via that collector-distributor, and the southbound connector from I-5 to I-710 would be replaced.
- At SR-60, auxiliary lanes up to and extending from the interchange would be added.

Local interchanges on I-710 would also be modified under Alternative 5C in order to address safety, operational, and capacity deficiencies. Interchange improvements specific to Alternative 5C, that would be implemented in addition to those listed in Section 2.3.2.1, are listed in Table 2.3-3. Local interchanges proposed to be modified under Alternative 5C can be seen in Figure 2.3-6.

Table 2.3-3: Local Interchange and Roadway Modifications Proposed Under Alternative 5C

| No. | Location | Improvements |
|------|----------------------|---|
| 5C-1 | Anaheim St. | <ul style="list-style-type: none"> Reconstruction of Anaheim St. interchange, including braided entrance and exit ramps with that of Pacific Coast Hwy. interchange. Reconstruction and widening of Anaheim St, including freeway overcrossing and bridge over the Los Angeles River, between Canal Ave. and DeForest Ave. |
| 5C-2 | Gaylord St. | <ul style="list-style-type: none"> Convert to cul-de-sac west of Gale Ave. |
| 5C-3 | 16 th St. | <ul style="list-style-type: none"> Convert to cul-de-sac west of Gale Ave. |
| 5C-4 | Atlantic Ave. | <ul style="list-style-type: none"> Reconstruction of Atlantic Ave. from Artesia Blvd. to 68th St. |
| 5C-5 | Bell Gardens Ave. | <ul style="list-style-type: none"> Modifications to Bell Gardens Ave., including a connection to eastbound Clara St. |
| 5C-6 | Slauson Ave. | <ul style="list-style-type: none"> Reconstruction of Slauson Ave., including the freeway overcrossing from the Los Angeles River to approximately 700 feet east of the existing Los Angeles Junction Railway at-grade crossing. |
| 5C-7 | Washington Blvd. | <ul style="list-style-type: none"> Reconstruction of Washington Blvd. interchange, including undercrossing and all entrance and exit ramps, and construction of one-way, access controlled streets between the ramp intersections and Sheila St. Reconstruction of Washington Blvd. from west of Ayers Ave. to west of Atlantic Blvd., including access control on Washington Blvd. between ramp intersections. |

PEDESTRIAN AND BIKE-ONLY BRIDGES. In addition to the widening of existing bridges and overcrossings to accommodate bicycle and pedestrian traffic, two additional pedestrian and bicycle-only bridges would be included under Alternative 5C. The bridges would span I-710 and the Los Angeles River to provide for improved connectivity within the corridor. Bridges are proposed at the following locations:

- Spring St., located in Long Beach. This bridge would cross I-710 and the Los Angeles River.
- Hill St., located in Long Beach. This bridge would cross I-710 and the Los Angeles River.

BRIDGES. Bridges under Alternative 5C that would be widened, replaced, added or removed are shown on Figure 2.3-7.

MAJOR DRAINAGE FACILITIES. Under Alternative 5C, a total of 24 river channel structures (roadway bridges) would be modified, including 22 Los Angeles River locations, one Compton Creek location, and one Rio Hondo location. Construction of new columns or piers and extensions of existing piers would occur at each of these locations, all oriented to the channel flow direction within the existing channels. Additionally, there would be modifications to existing pump stations and new pump stations added; and potential locations for detention basins and biofiltration swales/biofiltration strips.¹⁰ Figure 2.3-8 shows these facilities.

2.3.2.3 ALTERNATIVE 7: I-710 MODERNIZATION PLUS FREIGHT CORRIDOR (ZERO-EMISSION VEHICLES)

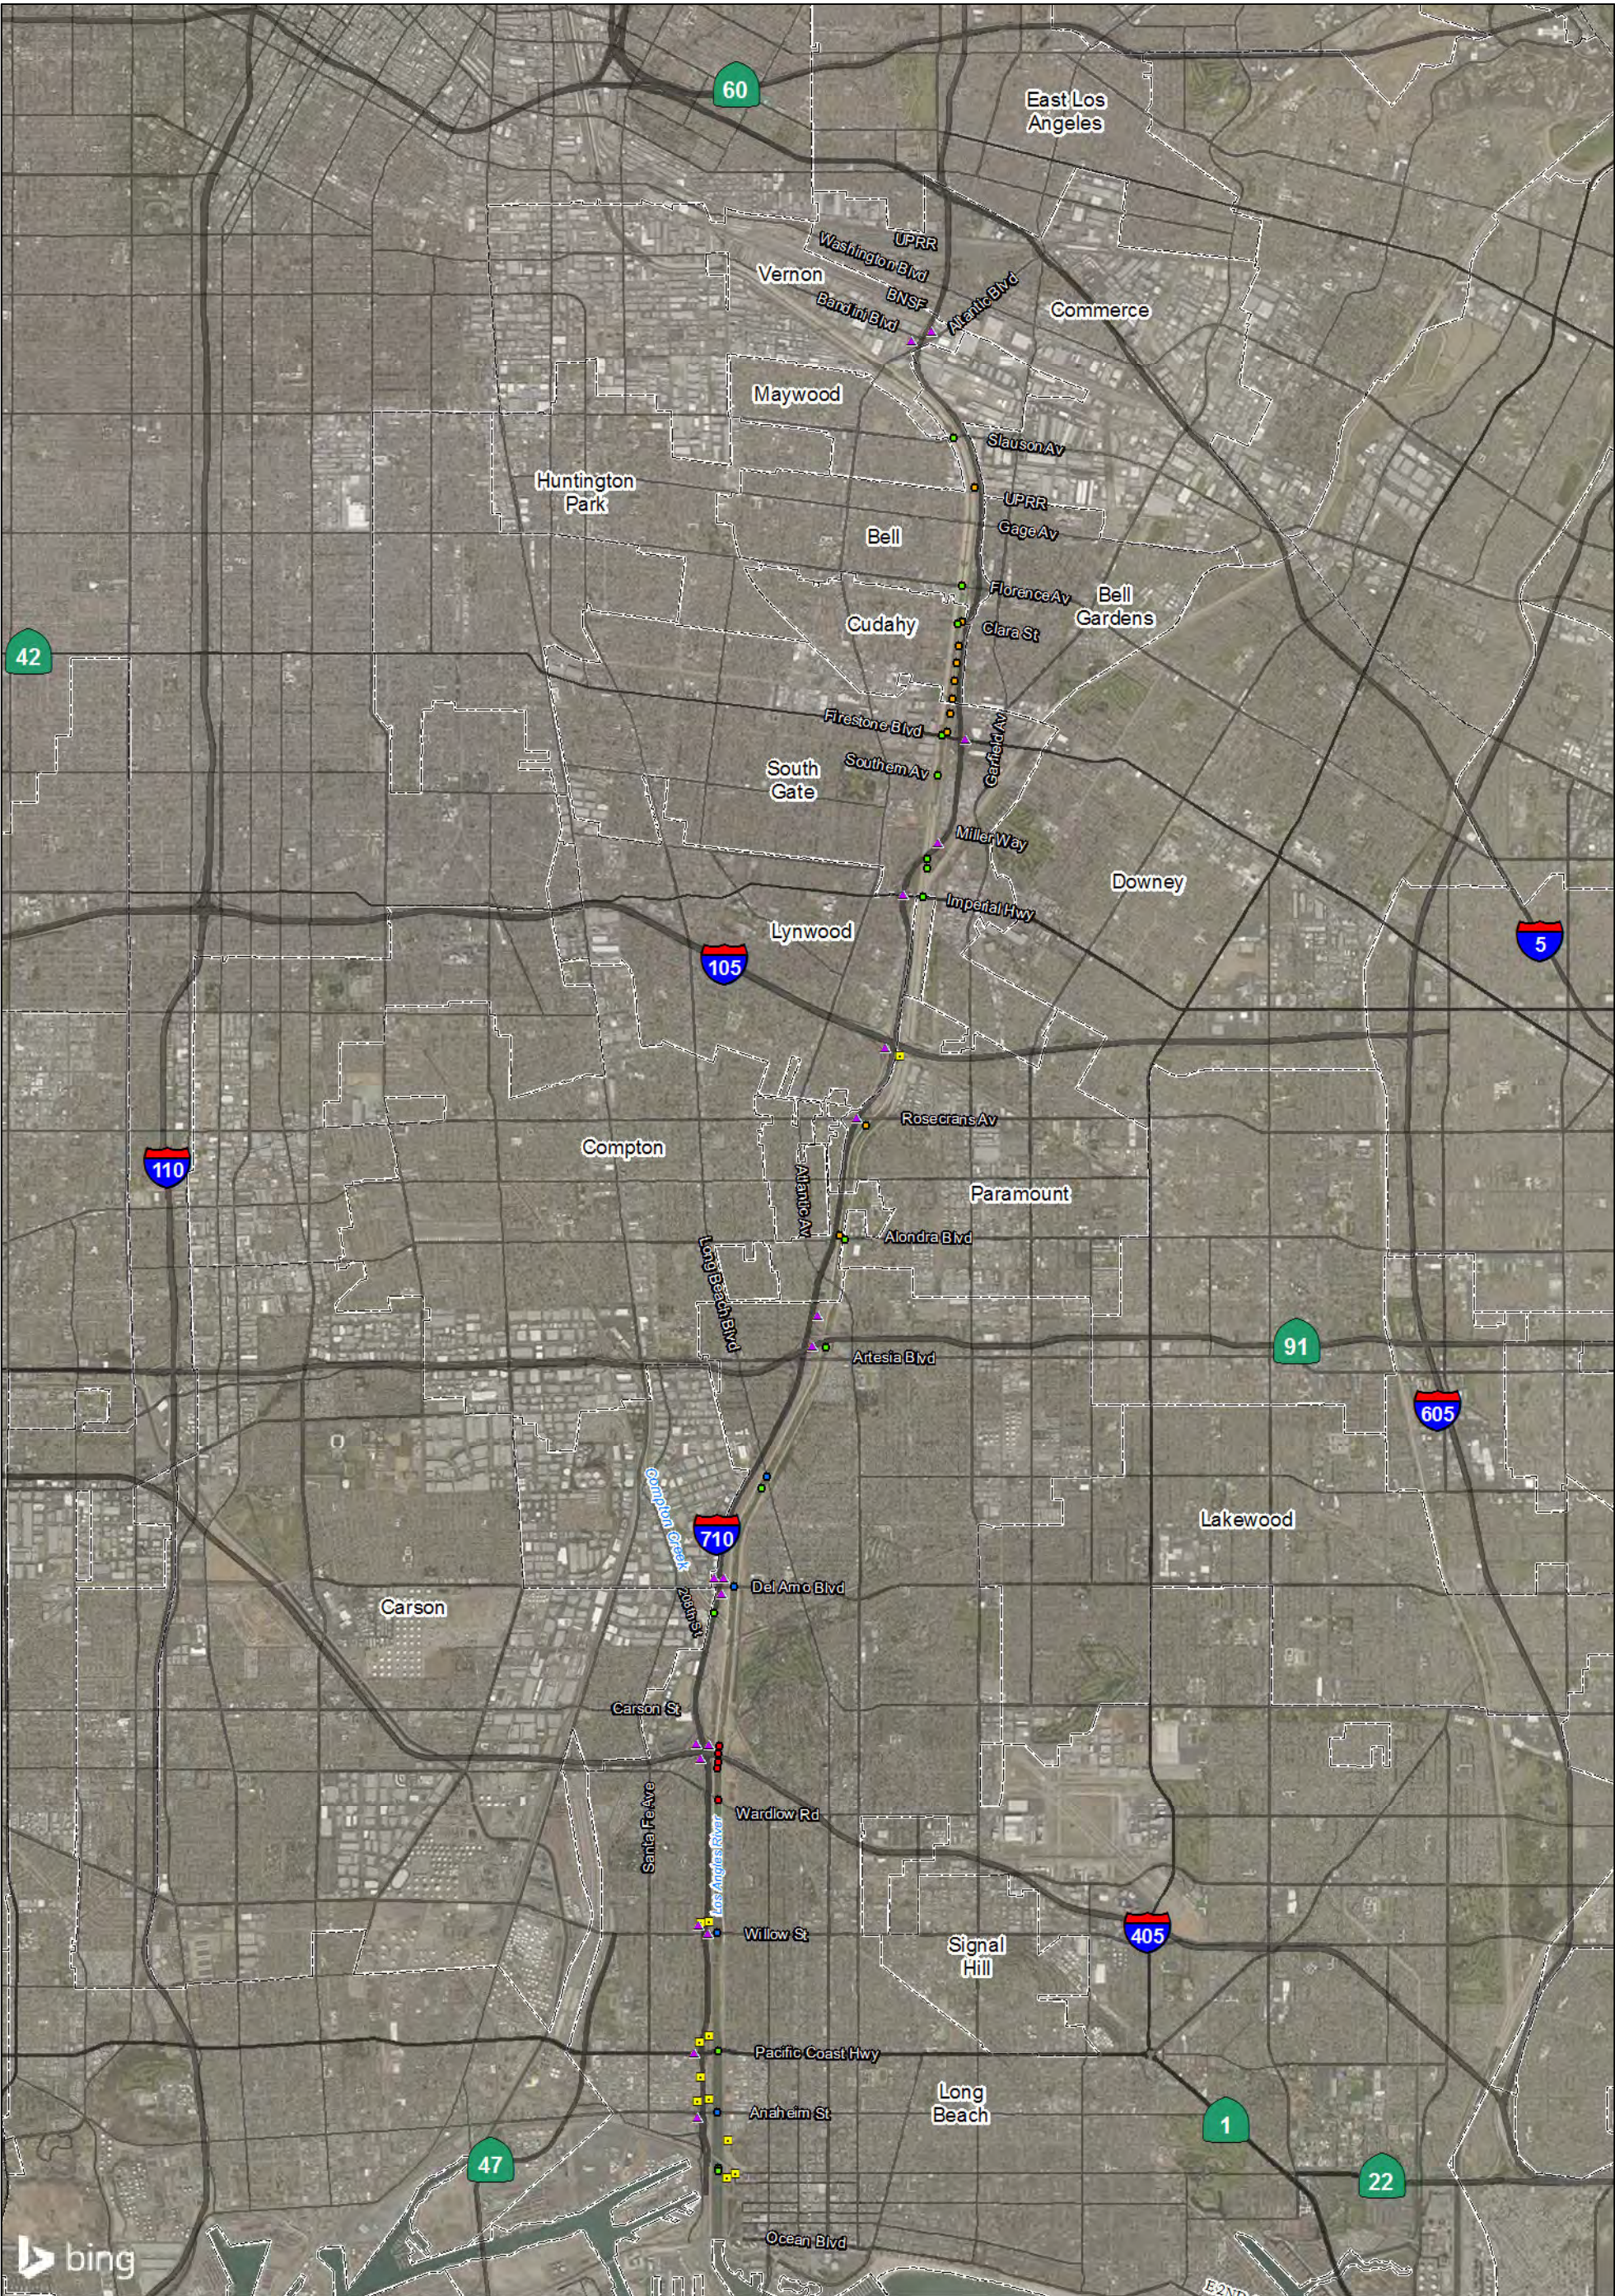

Alternative 7 (also briefly known as Alternative 6D upon its inception) includes all the components of the No Build (Alternative 1) described above, as well as the elements described in Section 2.3.2.1, and would also add two separate truck-only lanes in each direction (total of four lanes) between Long Beach and Commerce, adjacent to the freeway, approximately 16 miles in length. This principal feature is referred to as a “Clean-Emission Freight Corridor.” This alternative would restrict the use of the freight corridor to ZE/NZE trucks rather than conventionally powered diesel trucks. Figure 2.3-9 shows Alternative 7 and its key features. This proposed ZE/NZE truck technology is assumed to consist of trucks powered by technologies other than diesel engines and producing zero to near-zero tailpipe emissions while traveling on the freight corridor.

Feasible options for ZE truck power include electric motors, fuel cell engines, or a combination of the two. These ZE trucks would have zero tailpipe emissions both on and off the freight corridor. Various types of electric motors including linear induction motors, linear synchronous motors, or more prevalent in-vehicle conventional brushless DC motors. The power systems for these electric propulsion trucks could include, but are not limited to, road-connected wayside power (e.g., overhead catenary electric power distribution system), long-range electric battery cells, as well as ZE hybrid power sources such as a fuel-cell/electric battery Range Extender Electric Vehicle (REEV). A pure fuel-cell truck (with auxiliary battery) would also qualify as a ZE truck.

¹⁰ A bioswale is a landscape element designed to remove silt and pollution from surface runoff water.

These types of ZE trucks are currently being demonstrated in California, including at the Ports of Los Angeles and Long Beach, particularly in drayage operations. The freight corridor in Alternative 7 is ZE “technology neutral” in that it could accommodate at least one type of ZE heavy-duty truck that is in commercial mass production before the alternative would complete its final design phase.

The feasible options for NZE power include low-NO_x (0.02g/bhp-hr NO_x, or 90 percent below current truck engine emission standards), which power an internal combustion engine designed to burn natural gas instead of diesel or gasoline. Compressed natural gas (CNG) and liquefied natural gas (LNG) are two different fueling/vehicle storage methods for the natural gas fuel.

Low-NO_x LNG, and CNG heavy-duty trucks will meet ARB’s optional low-NO_x standard of 0.02 g/bhp-hr; an 8.9 L engine already has been certified by the EPA and ARB, and it is anticipated that larger engines currently being tested will be certified in 2017. Heavy-duty trucks with these engines would be commercially available and not require further demonstration. In addition, a natural gas-assisted REEV would also qualify as an NZE. It would be ZE in the electric vehicle mode and low-NO_x in the natural gas mode (when the battery would be recharging). At this time, diesel trucks are being re-engineered to potentially meet lower NO_x standards (0.1 g/bhp-hr or 0.05 g/bhp-hr), but the analysis assumed that 0.02 g/bhp-hr diesel trucks would not be available before the project alternative completes final design.

Alternative 7 also includes the assumption that all trucks using the freight corridor would have an automated vehicle control system that will steer, brake, and accelerate the trucks under computer control while traveling on the freight corridor. This would safely allow for trucks to travel in “platoons” (e.g., groups of 6–8 trucks with short spacing between trucks) and would increase the capacity of the freight corridor from a nominal 2,350 passenger car equivalents per lane per hour (pces/lane/hr) (approximately 1,200 trucks per lane per hour[trucks/lane/hr]) (as would be assumed if the freight corridor were utilized by trucks without automated vehicle technology) to 3,000 pces/lane/hr (1,500 trucks/lane/hr) in Alternative 7.

Alternative 7 would entail the construction of two northbound and two southbound truck lanes on a combination of viaduct and/or retaining wall structures and at-grade roadbeds adjacent to or in the median of the freeway. Freight corridor connector ramps to/from the I-710 general purpose lanes would be provided at three locations on I-710: just south of Anaheim St., just south of Del Amo Blvd., and near Bandini Blvd. Local street access/egress ramps would be provided connecting to the freight corridor at four locations: Pico Ave., Anaheim St., Slauson Ave., and Washington Blvd.

Alternative 7 would also result in modifications to the I-710 alignment. It would maintain the same number of general purpose lanes on I-710, and reconfigure the access points to and from I-710 and its crossing freeways. It would also reconstruct, widen, and realign I-710 to accommodate auxiliary lanes and truck lane viaduct structures.

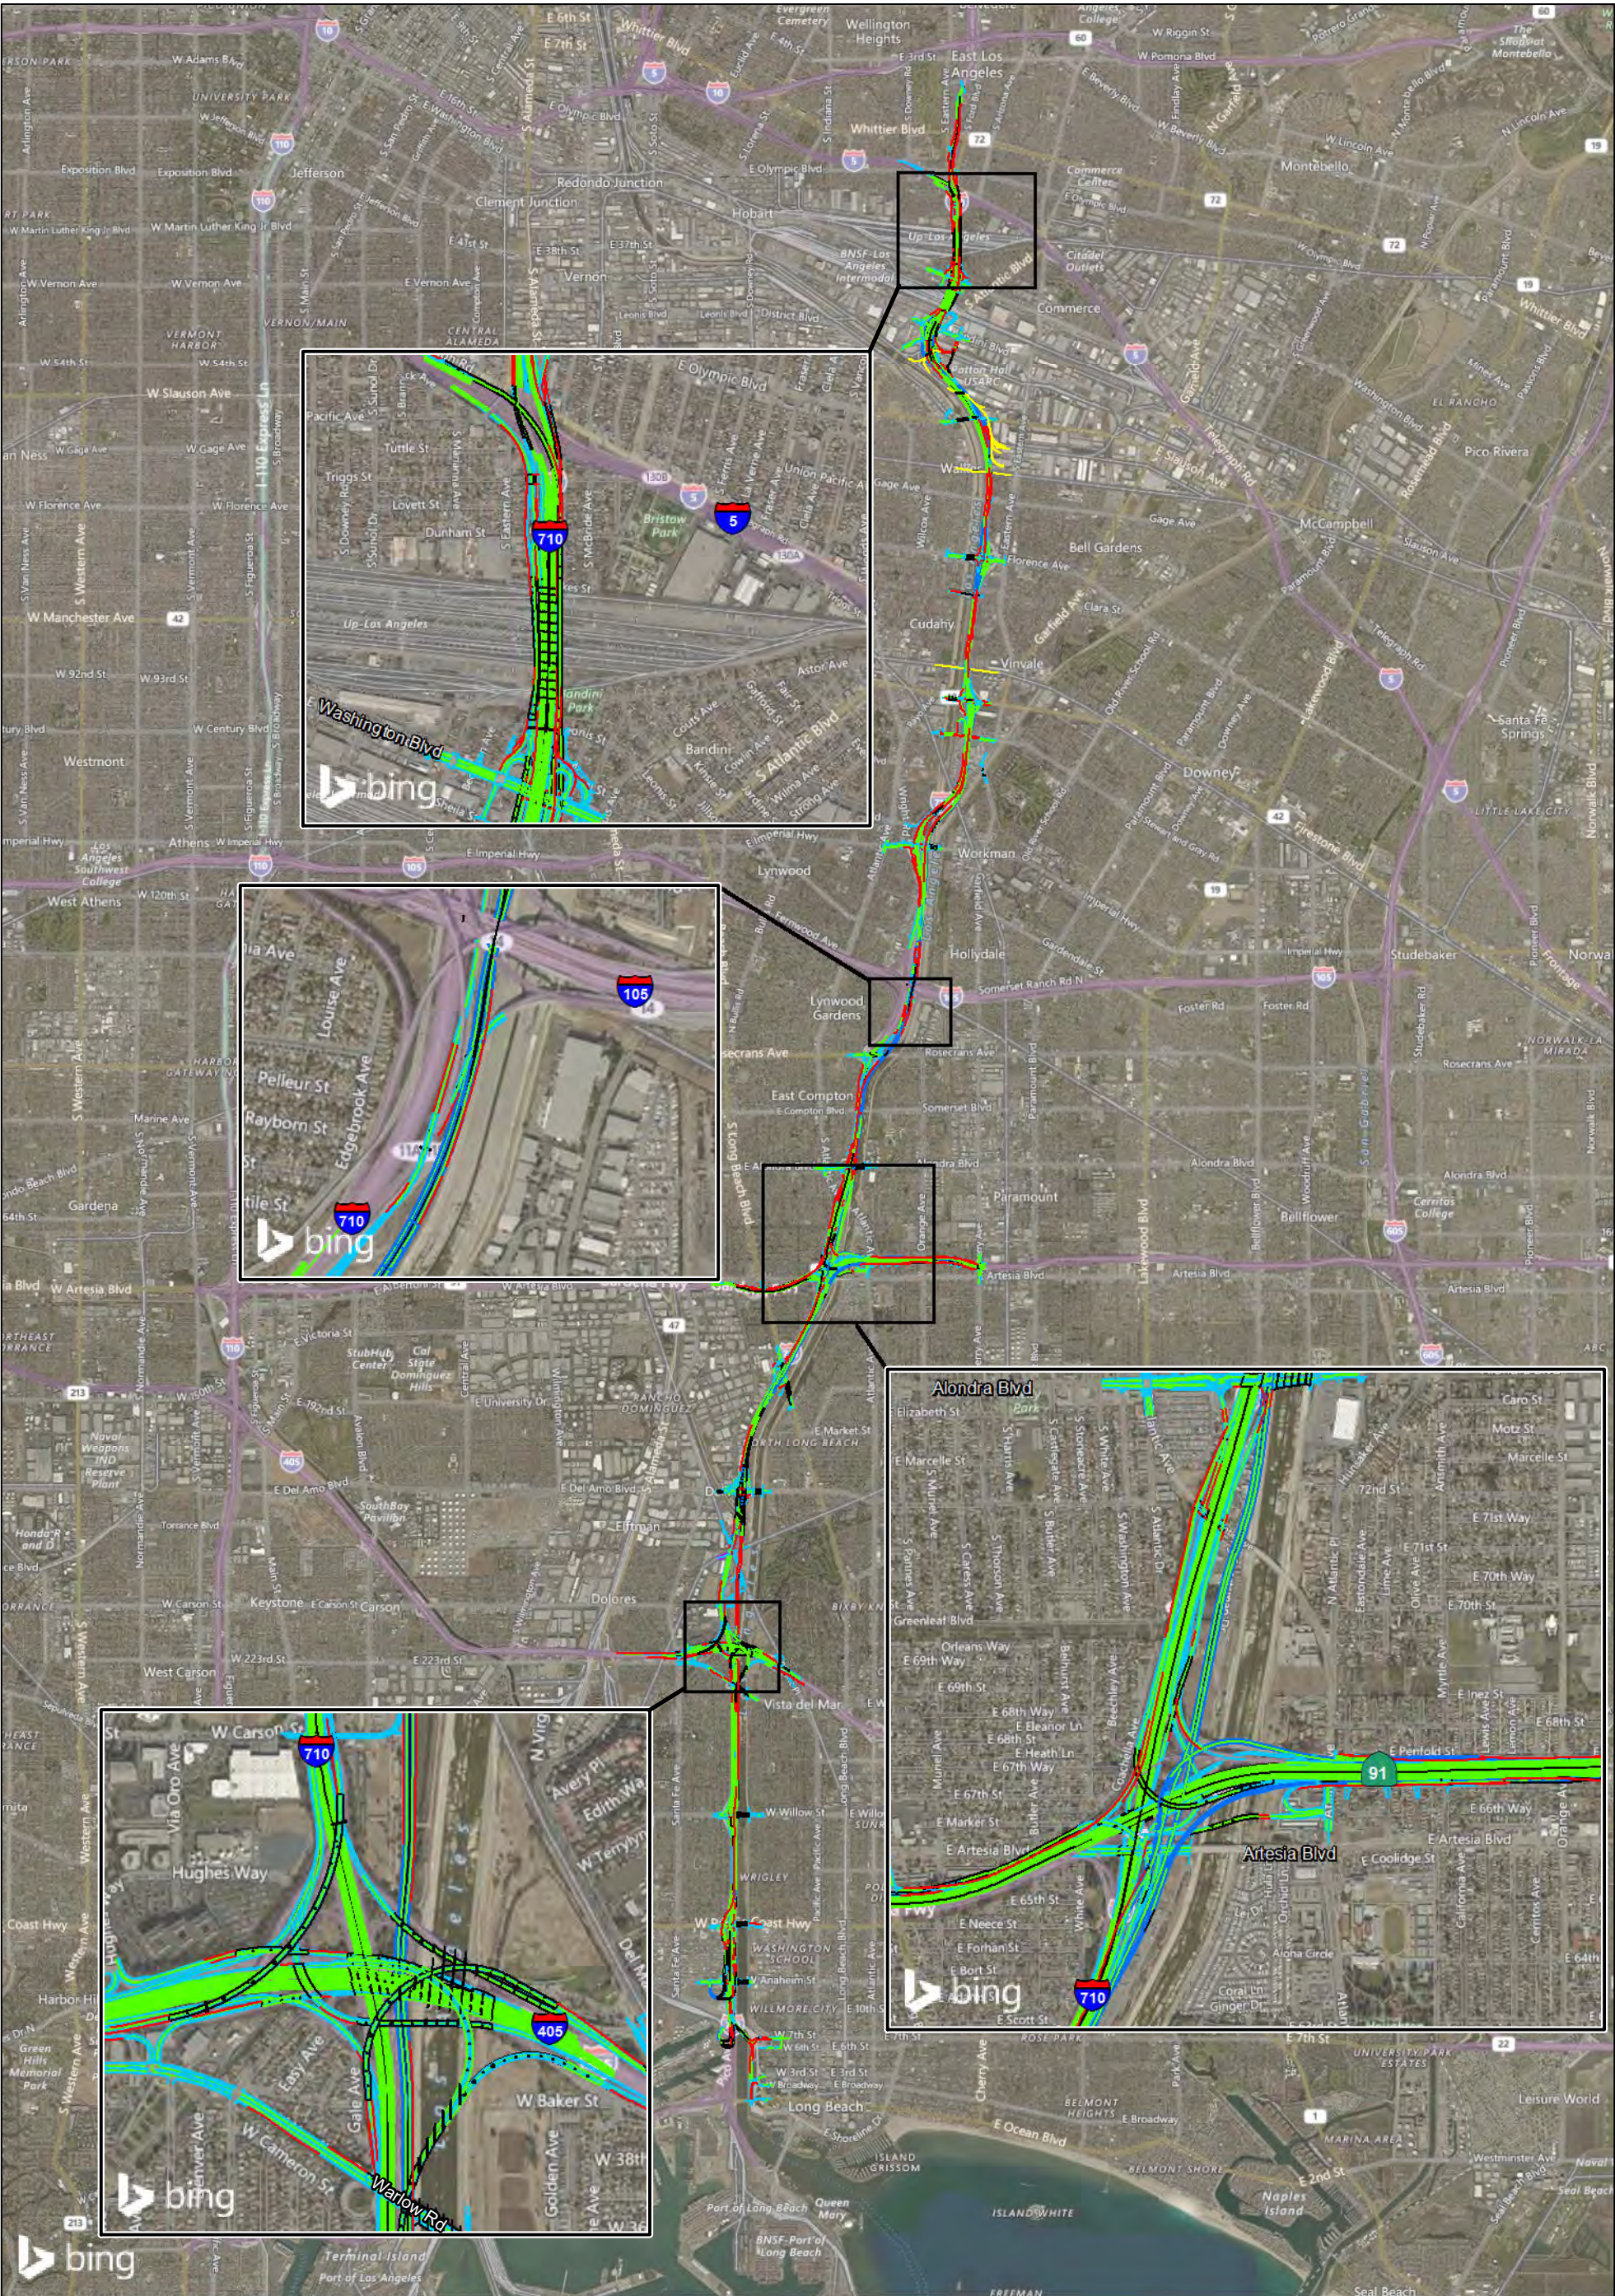

In addition to the freight corridor, this alternative would modernize the design at the freeway-to-freeway interchanges at I-405, SR-91, I-105, and I-5 as follows, and as seen in Figure 2.3-10:

- At I-405, modification of the freeway-to-freeway interchange entails realignment and replacement of all eight of the existing freeway-to-freeway connectors. The local interchanges at Wardlow Rd. at I-710 and Pacific Place at I-405 would be removed, and the local interchange at Santa Fe Ave. and I-405 would be modified.
- The southbound and northbound connectors between SR-91 and I-710 would be reconstructed and extended. The connector ramps on I-710 north of the interchange would be braided with the Alondra Blvd. ramps. The connector ramps on SR-91 west of the interchange would be braided with the Long Beach Blvd. ramps. Connectors from the truck lanes on viaduct structures to and from SR-91 east of I-710 would be constructed. An eastbound auxiliary lane would be constructed on SR-91 from the interchange to Cherry Ave.
- At I-105, the southbound connector to I-710 would be reconstructed and extended, and the southbound connector ramp on I-710 north of the interchange would be braided with the Imperial Hwy. entrance ramp.
- At I-5, new collector-distributor roads that provide connections from I-710, the freight corridor, and Bandini Blvd. to I-5 and Washington Blvd., including a viaduct over the local roadways, and ramp connection points to I-710 would be modified. The existing northbound left-hand side connector from I-710 to I-5 would be removed, and the southbound connector from I-5 to I-710 would be replaced.
- At SR-60, auxiliary lanes up to and extending from the interchange would be added.

Local interchanges on I-710 would also be modified under Alternative 7 in order to address safety, operational, and capacity deficiencies. Interchange improvements specific to Alternative 7, that would be implemented in addition to those listed in Section 2.3.2.1, are listed in Table 2.3-4. Local interchanges proposed to be modified under Alternative 7 can be seen in Figure 2.3-11.

Bridges. Bridges under Alternative 7 that would be widened, replaced, added, or removed are shown on Figure 2.3-12.

Major Drainage Facilities. For Alternative 7, a total of 33 channel structures (roadway bridges) are affected, including 28 Los Angeles River locations, four Compton Creek locations, and one Rio Hondo location. Construction of new columns or piers would occur at these locations, all oriented to the channel flow direction within the existing channels. There are approximately 24,600 square feet of new structures within the floodway. These transverse impacts require localized channel modifications to maintain the existing channel hydraulic capacity. The proposed bridge improvements require designs to minimize impacts to the affected water courses and facilities. Figure 2.3-9 shows these facilities for Alternative 7.

Screen Walls. Screen walls are used to shield sensitive viewers such as residents, park users, etc. from elements of an environment that may seem aesthetically displeasing. These screen walls can use different features such as texture, translucency, and unique design to enhance the visual environment. In the case of Alternative 7, these screen walls would be added to any areas of the freight corridor adjacent to sensitive viewers when a noise barrier is not proposed to be provided.

2.3.3 DESIGN OPTIONS

For both Alternatives 5C and 7, design options were evaluated that are variations to the baseline description of the build alternatives within specific, discrete segments of I-710. In addition, an option that is only applicable to Alternative 7 provides for an operational variation to the freight corridor. These options have been fully analyzed in this Final EIR/EIS. Their locations, purposes, and features are described as follows.

2.3.3.1 DESIGN OPTIONS 1A AND 1B

Design Option 1A applies to Alternative 5C, and Design Option 1B applies to Alternative 7. The objective of these variations is to reduce build impacts to the BNSF operations at the Hobart intermodal rail yard in Commerce. The design option limits are from the Atlantic Blvd./Bandini Blvd. interchange north to the Washington Blvd. interchange, a distance of approximately one mile through the Cities of Bell, Commerce, and Vernon. In order to achieve the objective, highway alignments crossing over the Hobart Yard would shift further to the east and would not encroach beyond the existing State right-of-way on the west side of the freeway over the rail yard. The shifts apply to the proposed freeway, collector-distributor road, and ramp alignments associated with the build alternatives. The new southbound exit ramp to Bandini Blvd. is shifted to the east as well.

Design Option 1A would retain the proposed interchange configuration and local street circulation of Alternative 5C, but the general location of the highway alignment is different. Therefore, the right-of-way requirements of Design Option 1A would differ from those of Alternative 5C. See Appendix O-1, Alternative 5C Concept Plans, sheet 21, for the geometric design of this option.

Design Option 1B would retain the proposed interchange configuration of Alternative 7, but local street circulation, highway alignment, and right-of-way requirements would differ from those of Alternative 7. Alignments would shift generally easterly, the cul-de-sac at Ransom would be removed, the one-way street between the ramp intersection and Sheila St. would be shifted easterly, and portions of Noble St. would be realigned and reconstructed. See Appendix O-1, Alternative 7 Concept Plans, sheets 23 and 24, for the geometric design of this option.

2.3.3.2 DESIGN OPTION 2A

Design Option 2A applies to Alternative 5C. The objective of this variation is to restore circulation between Shoreline Dr. and Pacific Coast Hwy. via the I-710 freeway. The design option limits

extend from the Shoreline Dr. interchange north to the Pacific Coast Hwy. interchange, a distance of approximately one mile through the City of Long Beach. In order to achieve the objective, two grade-separated ramps would be added to provide connections between the northbound Shoreline Dr. entrance ramp to I-710 and the northbound Pacific Coast Hwy. exit ramp from I-710, and between the southbound Pacific Coast Hwy. entrance ramp to I-710 and the southbound Shoreline Dr. exit ramp from I-710.

To accommodate the added ramps, the proposed highway alignment would shift to the west. The shifted alignments include the Shoreline Dr. entrance and exit ramps, the southbound freeway lanes, the southbound Pacific Coast Hwy. entrance ramp, and the southbound Anaheim St. exit ramp. Design Option 2A would retain the interchange configuration types, the Shoreline Dr. ramp alignments on the Shoemaker Bridge over the Los Angeles River, and the local street circulation of Alternative 5C, but the highway alignments, ramp termini locations at Anaheim St. and Pacific Coast Hwy., and associated right-of-way requirements would be different. Compared to Alternative 5C, the right-of-way required would increase between Anaheim St. and Pacific Coast Hwy. west of the freeway facility. See Appendix O-1, Alternative 5C Concept Plans, sheets 1 and 2, for the geometric design of this option.

2.3.3.3 DESIGN OPTIONS 3A AND 3B

Design Option 3A applies to Alternative 5C, and Design Option 3B applies to Alternative 7. The objective of this variation is to further improve safety and operation of the freeway by reducing weaving conflicts. The design option limits extend from the Washington Blvd. interchange north to the SR-60 interchange, a distance of approximately two miles through the City of Commerce and the unincorporated area of East Los Angeles. In order to achieve the objective, the variation would reconfigure the SR-60, I-5, and Olympic Blvd. interchanges, and alter the freeway and local traffic circulation. The specific elements of Design Options 3A and 3B are the same for each option and are described as follows:

- I-710 would be reconstructed and widened to accommodate auxiliary lanes and interchange reconfigurations.
- Southbound entrance and exit ramps terminating at Eastern Ave. would be removed, and replaced with ramps terminating at Whittier Blvd.
- The northbound SR-60 connector would be extended on a viaduct structure adjacent to I-710.
- The northbound entrance and exit ramps terminating at Olympic Blvd. would be reconstructed.
- The Humphreys Ave. overcrossing and southbound exit ramp to 3rd St., terminating at the intersection of Humphreys Ave. and Eagle St., would be replaced.

- Eagle St. would be widened and intersection improvements at Eagle St. and Eastern Ave. would be implemented.
- The intersection of Whittier Ave. and Sydney Dr. would be removed and a cul-de-sac would be implemented at Sydney Dr.

These variations would differ from Alternatives 5C and 7 in that additional right-of-way would be required. See Appendix O-1, Alternative 5C Concept Plans, sheets 22 and 23, and Alternative 7 Concept Plans, sheets 24 and 25, for the respective geometric designs of these options.

2.3.3.4 OPTION 7ZE

Option 7ZE is applicable only to Alternative 7 and provides for the use of the freight corridor exclusively by zero emission trucks, excluding near zero emission trucks. This option is operational in nature and would not represent a difference in the geometric design of Alternative 7.

2.3.4 TEMPORARY PROJECT COMPONENTS (BUILD ALTERNATIVES ONLY)

2.3.4.1 TRANSPORTATION MANAGEMENT PLAN

The Transportation Management Plan (TMP), a standard measure implemented on all Caltrans construction projects, is designed to minimize construction activity-related motorist delays, queuing, and accidents associated with the build alternatives through the effective application of traditional traffic-handling practices and innovative approaches. The purpose of the TMP is to relieve congestion and maintain traffic flow along alternative routes and throughout the surrounding area due to construction activities of the build alternatives within the Study Area. The TMP for the build alternatives would keep all lanes open during construction, with the exception of overnight lane closures. Ramp closures would be limited to potential weekend closures and would not exceed a period of one week. A TMP is typically finalized during final design, but this step may not occur until funding and final staging/phasing is determined at a later date.

The TMP includes traffic mitigation strategies for the duration of construction, addresses lane closure requirements, and seeks to inform the public and motorists regarding the construction schedule, potential detours, and anticipated traffic delays during construction. A preliminary TMP for the build alternatives has been developed and included in the *Draft Project Report* (2017).

2.3.4.2 CONSTRUCTION STAGING

Staging of the construction would be required for all ramp reconstruction, freeway widening, and profile adjustments of the build alternatives. The number of through lanes would be maintained by restriping and shifting traffic on the existing lanes to maintain the existing capacity.

All construction activities would be closely coordinated with other construction projects that are occurring. Existing State facilities such as changeable message signs, traffic cameras, and traffic count stations would also be protected during construction. Close coordination would also be

needed with the Cities within the Study Area, the County of Los Angeles, Caltrans, Metro, and the public to ensure that traffic along I-710 and on surrounding streets remains at an acceptable LOS during construction.

The following procedures have been identified to stage construction of either build alternative:

- Project divided into segments
- Segments divided into major components:
 - Interchanges: New ramps and crossing arterials
 - Freeway: Mainline widening
 - Freight Corridor (Alternative 7)
- The following assumptions have been made regarding construction staging:
 - Utilities relocated in advance
 - Periodic ramp and arterial closures
 - No simultaneous adjacent interchange arterial or ramp closures

Construction staging concepts were developed to identify how the build alternatives may be constructed and what requirements are needed to ensure safe and manageable implementation. It is recognized that there are many possible strategies for staging project alternatives of this size and complexity. Funding, right-of-way certification, maintenance of traffic, and contractor innovation are all variables that drive the timing, priority, and scope of staged improvements. Recognizing that these variables would change over the course of project development of a build alternative, the concepts are used as an initial baseline to approximate construction duration and estimate costs. The concepts also serve to identify potential constructability issues, key maintenance of traffic assumptions, potential construction emissions, and temporary right-of-way impacts.

For each segment of the build alternatives, a sequence of work was developed identifying major elements of the improvements to be constructed by stage. Maintenance of traffic assumptions, including number of lanes maintained, temporary detours, and roadway closures were identified. Stage durations were approximated to provide a range of time expected to construct improvements, within a particular segment; however, this does not mean that construction activities would occur for the entire duration listed at any individual site within a segment.

The approximate construction duration by segment for each of the build alternatives is included in Table 2.3-5. The freight corridor under Alternative 7 could be constructed concurrently with freeway improvements. Where feasible to do so, some soundwalls would be constructed prior to other improvements so as to provide noise and light abatement from construction activities.

Table 2.3-5: Construction Duration

| Segment | Alternative 5C Duration (months) | Alternative 7 Duration (months) |
|---------------------------------------|----------------------------------|---------------------------------|
| 1 (Ocean Blvd. to Willow St.) | 54 | 102 |
| 2 (Wardlow Rd. to Del Amo Blvd.) | 114 | 114 |
| 3 (Long Beach Blvd. to Alondra Blvd.) | 42 | 96 |
| 4 (Rosecrans Ave. to Firestone Blvd.) | 48 | 72 |
| 5 (Florence Ave. to Slauson Ave.) | 48 | 78 |
| 6 (Atlantic Ave. to Washington Blvd.) | 54 | 84 |
| 7 (I-5 to SR-60) | 66 | 108 |

I-5 = Interstate 5

SR-60 = State Route 60

Provided right-of-way certification is obtained, funding and contractor resources are available, and all segments proceed concurrently, the estimated minimum construction duration is approximately ten years for each of the build alternatives.

2.3.4.3 TEMPORARY CONSTRUCTION EASEMENTS

Temporary construction easements are used to facilitate construction during a set period for activities related to the construction of a build alternative, including access or materials/equipment staging, etc. Please refer to Appendix O, Concept Plans, for the location of temporary construction easements for the build alternatives.

2.3.5 COMPARISON OF ALTERNATIVES

The alternatives described in this Final EIR/EIS and the impacts and benefits described herein are presented in order to assist decision-makers to understand how each alternative performs relative to the various objectives, needs, and concerns within the I-710 Corridor. These factors provided the basis for comparing alternatives, including the No Build (Alternative 1) (which may include reasonably foreseeable operational improvements to I-710, including (but not limited to) maintenance activities, repavement or guardrail replacement, or minor ramp modifications). Please see Table 2.3-6 below for a comparison of Alternatives 1, 5C, and 7 for key environmental topics of concern.

After the public circulation period, all comments were considered, and Caltrans has identified a preferred alternative and will make the final determination of the project's effect on the environment. Since the No Build (Alternative 1) has been identified as the Preferred Alternative, under CEQA, Caltrans will certify that the project complies with CEQA. Caltrans will then file a Notice of Determination with the State Clearinghouse. With respect to NEPA, Caltrans, as assigned by the FHWA, will document and explain its decision regarding the selected alternative, project impacts, and mitigation measures in a Record of Decision.

Table 2.3-6: Summary Comparison of Alternatives

| Alternatives and Environmental Topics | No Build (Alternative 1) | Alternative 5C | Alternative 7 |
|--|---|---|---|
| Alternative Descriptions | No change to I-710 | Widen I-710 in several sections and modernize I-710 geometrics <ul style="list-style-type: none"> Includes a Corridor Aesthetics Master Plan and Programmatic elements (I-710 Clean Truck Program, Community Health Benefit) | Modernize geometrics and add a separated freight corridor (two lanes each direction, four lanes total) <ul style="list-style-type: none"> Includes a Corridor Aesthetic Master Plan and Programmatic elements (I-710 Clean Truck Program, Community Health Benefit) |
| Air Quality/Health Risk Assessment | The elements of the build alternatives would not be implemented and the specific benefits of the I-710 Corridor Project build alternatives would not occur under the No Build (Alternative 1). However, the other projects assumed in the no build condition would provide mobility and air quality benefits. | <ul style="list-style-type: none"> Project area particulate matter emissions increase compared to no project conditions MSAT and criteria pollutant emissions would decrease compared to existing conditions Reduced public health risk at most locations, but at some near-roadway locations emissions would increase | <ul style="list-style-type: none"> Project area particulate matter emissions increase compared to no project conditions MSAT emissions and criteria pollutant emissions would decrease compared to existing conditions Public health risk would be similar to the health risks associated with Alternative 5C, with slightly higher particulate matter impacts |
| Community Impacts | | | |
| Displacements | No displacements | Between 109 and 128 residential and between 157 and 165 nonresidential displacements (depending on the design option). Under the Alternative 5C configuration, 109 residential and 160 nonresidential displacements would occur. | Between 121 and 140 residential and between 206 and 213 nonresidential displacements (depending on the design option). |
| Access | No changes to access | <ul style="list-style-type: none"> Improved pedestrian access Alternative routes maintain existing access Five new bicycle/pedestrian-only bridges | <ul style="list-style-type: none"> Improved pedestrian access Alternative routes maintain existing access Addition of a new I-710/Slauson Ave. freight corridor partial interchange Three new bicycle/pedestrian-only bridges |
| Parks & Recreation | No changes to parks and recreation facilities | Impacts to the following facilities: Parque Dos Rios, Compton Hunting and Fishing Club, Maywood Riverfront Park (indirect impacts), Coolidge Park (indirect impacts), Wrigley Greenbelt (temporary construction easement), Cesar E. Chavez Park (access/parking benefit), | Impacts to the following facilities: Parque Dos Rios, Compton Hunting and Fishing Club, Maywood Riverfront Park (indirect impacts), Coolidge Park (indirect impacts), Los Cerritos Park (temporary construction easement), Cressa Park (temporary construction easement), Cesar E. Chavez Park |

| Alternatives and Environmental Topics | No Build (Alternative 1) | Alternative 5C | Alternative 7 |
|---------------------------------------|---|--|---|
| | | and Los Angeles River Trail and Rio Hondo Trail (improved access) | (access/parking benefit), and Los Angeles River Trail and Rio Hondo Trail (improved access) |
| Noise | The build alternatives would not be implemented and, therefore, there would be no noise impacts. | 2.2 miles of proposed new soundwalls and 5.3 miles of soundwalls to replace existing. | 2.7 miles of proposed new soundwalls and 6.8 miles of soundwalls to replace existing. |
| Visual | The build alternatives would not be implemented. Therefore, there would be no visual impacts from the I-710 Corridor Project. | Alternative 5C would have less visual impact than Alternative 7 because it would not include the elevated freight corridor. | Greater level of visual impact than Alternative 5C because it would include construction of the elevated freight corridor visible from nearby residential areas. The most substantial adverse visual impacts are in the Cities of Long Beach and South Gate, due to close proximity to freeway-to-freeway interchanges, sound barriers, and the elevated freight corridor. |
| Hazardous Waste | No changes to the existing physical environment and would not result in hazardous waste impacts | There is potential for hazardous materials, including petroleum products, to exist within the Study Area and be disturbed by full or partial acquisitions or temporary construction easements under Alternative 5C. Any contamination encountered during construction and excavation activities for Alternative 5C would be properly handled, removed, remediated, and/or disposed of according to all applicable regulations. For Alternative 5C, each property of environmental concern to be acquired would require testing in order to characterize specific soil and/or groundwater contaminants on the property, and a site-specific hazardous waste remediation plan would be developed for the appropriate removal and disposal of materials. In addition, a remediation plan and site closure plan, if required, would be implemented to clean up the site and provide for any subsequent monitoring to ensure the contamination has been remediated below regulatory thresholds. | There is potential for hazardous materials, including petroleum products, to exist within the Study Area and be disturbed by full or partial acquisitions or temporary construction easements under Alternative 7. Any contamination encountered during construction and excavation activities for Alternative 7 would be properly handled, removed, remediated, and/or disposed of according to all applicable regulations. For Alternative 7, each property of environmental concern to be acquired would require testing in order to characterize specific soil and/or groundwater contaminants on the property, and a site-specific hazardous waste remediation plan would be developed for the appropriate removal and disposal of materials. In addition, a remediation plan and site closure plan, if required, would be implemented to clean up the site and provide for any subsequent monitoring to ensure the contamination has been remediated below regulatory thresholds. An elevated freight corridor would reduce public health risk from hazardous waste spills by separating truck traffic from automobile traffic. |

| Alternatives and Environmental Topics | No Build (Alternative 1) | Alternative 5C | Alternative 7 |
|--|---|--|--|
| Traffic | No improvements to I-710, other than those currently planned. Traffic conditions would continue to deteriorate over time due to increased traffic volumes caused by regional growth in traffic. Most segments are projected to operate at LOS F in the 2035 AM peak hour. | Alternative 5C has three segments of I-710 that operate at LOS F in the 2035 AM peak hour. | Alternative 7 has eight segments of I-710 that operate at LOS F in the 2035 AM peak hour. |
| Water Quality | Existing roadway runoff would be treated by the existing BMPs and is undergoing BMP development in accordance with the Stormwater permit. Therefore, the No Build (Alternative 1) would result in an improvement to water quality based on these BMPs. | Impervious surface would be increased by 156.4 acres. The BMPs would treat 74 percent of on-site runoff from the total impervious surface areas within the project area, which would be an improvement over the existing condition. | Impervious surface would be increased by 256.9 acres. The BMPs would treat 78.3 percent of on-site runoff from the total impervious surface areas within the project area, which would be an improvement over the existing condition. |
| Cultural Resources | The build alternatives would not be implemented. Therefore, there would be no impacts to historic resources from the No Build (Alternative 1). | Impacts to four historic resources: two segments of the UP Railroad, Dale's Donuts, and Boulder Dam-Los Angeles 287.5 kV Transmission Line. It was determined there would be no adverse effects on historic properties. SHPO concurred with this determination on December 20, 2018. | Impacts to four historic resources: two segments of the UP Railroad, Dale's Donuts, Boulder Dam-Los Angeles 287.5 kV Transmission Line. It was determined there would be no adverse effects on historic properties. SHPO concurred with this determination on December 20, 2018. |
| Biology/Natural Resources | The No Build (Alternative 1) would not impact estuarine and riparian/riverine habits. | Permanent direct impacts to 2.13 acres of estuarine and riparian/riverine habitats and permanent indirect impacts to 36.67 acres of this habitat. | Permanent direct impacts to 11.23 acres of estuarine and riparian/riverine habitats and permanent indirect impacts to 42.36 acres of this habitat. |

I-710 = Interstate 710

kV = kilovolt

LOS = level of service

MSAT = Mobile source air toxics

UP Railroad = Union Pacific Railroad

2.4 IDENTIFICATION OF A PREFERRED ALTERNATIVE

The identification of the Preferred Alternative was based on the environmental technical analysis and the resultant determination of the project's impact on the environment (including the inability to achieve project-level air quality conformity for particulate matter), comments received from the general public and agencies during the public review period of the RDEIR/SDEIS, and input from the Metro Board of Directors, who are the project sponsors.

This Final EIR/EIS was prepared to address all public comments and incorporate a number of corrections or refinements to the description of the alternatives and related impacts in response to public comments.

Although both Alternative 5C and Alternative 7 would meet the Purpose and Need of the project and provide mobility benefits for travel within the I-710 Corridor, the No Build (Alternative 1) has been identified as the Preferred Alternative for the following reasons:

- **Community and Public Opposition to added lanes on I-710 under Alternatives 5C and 7.** Throughout the life of the project, a robust community outreach program was implemented. This included several advisory committees that met on a regular basis, public meetings and hearings, and community briefings. Through this process, the community expressed concern related to following:
 - Number of displacements associated with the build alternatives including residences (specifically in the cities of Commerce and Compton), businesses, homeless shelters (Bell Shelter), the Long Beach Multi-Service Center, and transitional housing.
 - Construction and operational air quality and health risk impacts especially related to asthma and cancer risks to the communities and facilities (such as schools and parks) adjacent to the corridor.
 - Disproportionately high and adverse effect to Environmental Justice populations related to air quality, noise, traffic, parks, construction, and displacements.
 - Impacts to parks and recreational facilities such as the Julia Russ Asmus Park, Coolidge Park, Ralph C. Dills Park, Bandini Park, Maywood Park, Cesar E. Chavez Park, Dominguez Gap and DeForest Treatment Wetlands, and Parque Dos Rios.
 - Impacts related to proposed peak period parking restrictions on arterials, specifically along Atlantic Ave. where businesses are reliant upon on-street parking.
 - Impacts to bicycle and pedestrian facilities specifically related to the safety for pedestrians and bicyclists when crossing diverging diamond interchanges proposed throughout the project limits.

- Impacts related to noise including impacts to park use and enjoyment and impacts to sensitive receptors from heavy trucks and the inadequate mitigation provided.
- **Inability to achieve project-level conformity for particulate matter.** Alternatives 5C and 7 included a zero- and near-zero emissions truck program as a project feature. Alternative 7 also included a zero- and near-zero emissions freight corridor. While project analysis showed that the zero- and near zero emissions truck program would ultimately reduce diesel trucks operating in the I-710 Corridor, extensive discussions with the EPA indicated that Alternatives 5C and 7 must be considered a project of air quality concern due to tire wear, brake wear, and fugitive dust as well as their concerns associated with the enforceability of the zero- and near zero emissions truck program. Therefore, a hotspot analysis was required for air quality conformity determination. Preliminary results of the hotspot analysis indicated that the two build alternatives would not demonstrate project-level conformity requirements for particulate matter and would not successfully satisfy the requirements to demonstrate conformity to the purpose of the State Air Quality Implementation Plan (SIP).

2.5 ALTERNATIVES CONSIDERED BUT ELIMINATED FROM FURTHER DISCUSSION PRIOR TO THE DRAFT EIR/EIS

During the preliminary studies for the I-710 Corridor Project, six alternatives were identified and studied in an *Alternatives Screening Report* (2009). The six alternatives were: No Build (Alternative 1), Alternative 2 (TSM/TDM/Transit/ITS), Alternative 3 (Goods Movement Enhancement by Rail and/or Advanced Technology), Alternative 4 (Arterial Hwy. and I-710 Congestion Relief Improvements), Alternative 5A (Ten General Purpose Lanes), Alternative 5B (Eight General Purpose Lanes plus Two High-Occupancy Vehicle [HOV] Lanes), and Alternative 6 (Alternative 5 with Addition of Four Separated Freight Movement (Truck Only) Lanes). As discussed earlier in this chapter, Alternatives 1, 5A, and Alternatives 6A, 6B, and 6C were evaluated in detail in the 2012 Draft EIR/EIS. Alternatives 2, 3, and 4 were considered for evaluation in Section 2.2.2 of the 2012 Draft EIR/EIS but withdrawn from further environmental study as stand-alone alternatives. Other factors used in considering the alternatives for further evaluation included whether or not the alternatives (1) failed to meet the most basic project objectives, (2) were infeasible (per CEQA Guidelines Section 15126.6(f)(1)), or (3) were unable to avoid significant environmental impacts.

As discussed in more detail in Section 2.2, after the public circulation period for the 2012 Draft EIR/EIS, based on substantive feedback received from agencies, organizations, and the general public, as well as the emergence of new relevant information, Caltrans and the I-710 Funding Partner agencies made the decision to propose a revised set of alternatives and analyze them in an RDEIR/SDEIS. The goal of the revised set of alternatives was to address the requests and input of the impacted communities and involved agencies, while also being responsive to travel demand and meeting project purpose and need.

2.5.1 ORIGINAL ALTERNATIVES DEVELOPMENT

2.5.1.1 MAJOR CORRIDOR STUDY

The *I-710 Major Corridor Study* (MCS) was initiated in January 2001 to analyze the traffic congestion, safety, and mobility problems along the I-710 Corridor and to develop transportation solutions to address these problems, as well as some of the quality of life concerns experienced in communities along the I-710 Corridor.

During the first 24 months of the MCS, existing and future conditions on the I-710 Corridor were assessed, a Purpose and Need Statement was developed, and several transportation alternatives were analyzed. By April 2003, five alternatives had been evaluated in detail and information on their benefits, costs, and impacts was made available to the public (more detail is provided in the *I-710 Major Corridor Study*, November 2004). As a result of the MCS, a Draft Hybrid Design Concept was developed to provide improvements to I-710 focused on improving safety; addressing heavy-duty truck demand as well as general purpose traffic; improving reliability of travel times; and separating automobiles and trucks to the greatest extent possible while limiting right-of-way impacts.

2.5.1.2 ORIGINAL 2012 DRAFT EIR/EIS ALTERNATIVES SCREENING ANALYSIS

Subsequent to the MCS, the project partners for the I-710 Corridor Project were identified. Caltrans, Metro, Gateway Cities COG, POLA, POLB, SCAG and the Interstate 5 Joint Powers Authority (I-5 JPA) entered into a funding agreement for the preparation of preliminary engineering and environmental documentation for the I-710 Corridor Project. In August 2008, a formal public scoping process was initiated for the I-710 Corridor Project. As part of scoping, a set of preliminary alternatives were presented to the public for consideration with various levels of investment, ranging from No Build (Alternative 1) to the Locally Preferred Strategy (LPS) adopted in the I-710 MCS. For more information on the scoping process, please see the *I-710 Corridor Scoping Summary Report* (December 2008), as well as Section 5.2 of the 2012 Draft EIR/EIS.

The initial set of seven proposed alternatives for the I-710 Corridor Project comprised a No Build (Alternative 1) and six build alternatives, one of which (Alternative 6) was based on the LPS identified in the I-710 MCS. A more detailed description of the Initial Set of Alternatives can be found in the *I-710 Corridor Project EIR/EIS Baseline Alternatives Analysis Report* (April 2009).

Following the close of public comment for the 2008 scoping process, an alternatives screening analysis was conducted to determine whether any alternatives should be modified or withdrawn from further consideration. In this screening phase, a conceptual level of analysis was performed on the initial set of seven alternatives to provide comparative information on their relative benefits, costs, and impacts. The measures used to distinguish the differences among these alternatives addressed areas such as improvements to traffic mobility, traffic safety, air quality, and health effects; impacts to environmental resources; right-of-way impacts, and capital costs. This analysis applied screening criteria to distinguish among the relative benefits, impacts, and costs of the

alternatives. These criteria measured the performance of the alternatives relative to the project goals designated in the *Alternatives Screening Report* (2009) and multiple measures were used to provide comparative information.

Based on the screening analysis and on guidance received from the I-710 advisory committees, including the I-710 Technical Advisory Committee (TAC) and the I-710 Community Advisory Committee (CAC), a recommendation was developed that identified certain alternatives (and key features or components) to be carried forward in the technical studies for the 2012 Draft EIR/EIS. The screening evaluation favored those alternatives that best responded to multiple elements of the screening criteria over those initial alternatives that could only respond to a limited number of screening criteria. In most cases, alternatives that were included as a component of other larger alternatives were screened out as stand-alone alternatives, as they did not adequately address the I-710 Corridor Project's defined Purpose and Need. The various I-710 Corridor Project advisory and technical committees, their memberships, and responsibilities are discussed in detail in Section 5.6, Community Participation Process.

The following discussion summarizes the Initial Set of Alternatives evaluated in the 2012 Draft EIR/EIS, including their relative performance and key trade-offs, and the critical factors that led to the technical screening recommendation for each alternative. Refer to the *Final Technical Memorandum - Alternatives Screening Analysis* (2009) for additional details.

NO BUILD (ALTERNATIVE 1):

The No Build (Alternative 1) was carried forward into the 2012 Draft EIR/EIS. The No Build (Alternative 1) is considered to be a viable alternative under the CEQA and NEPA process and because it provides the existing and future environmental baselines against which other alternatives are compared. Please see the discussion in Section 2.3, Project Alternatives, for more detail regarding the No Build (Alternative 1).

ALTERNATIVE 2: TSM/TDM/TRANSIT/ITS

Alternative 2 was not carried forward into the 2012 Draft EIR/EIS as a stand-alone alternative. While Alternative 2 included transit, policy, ITS application, and operational improvements that would have a beneficial effect on mobility in the Study Area, the screening analysis demonstrated that these transportation improvements did not go far enough in resolving the worst of the congestion problems, air quality issues, design elements that need updating, and safety concerns that affect motorists and residents within the overall I-710 Corridor. Alternative 2 also did not update design elements on I-710, nor did it provide the desired separation between trucks and automobile traffic. At best, Alternative 2 provided a 6 to 7 percent improvement in service levels on I-710 and an approximately 5 percent improvement in nitrogen oxide (NO_x) emissions, with a negligible effect in diesel particulate matter (DPM) emissions compared to the No Build (Alternative 1). However, the screening results did confirm that the TSM/TDM, transit, and ITS improvements included in Alternative 2 would provide value to the project. All of Alternative 2 was

included in the reduced set of alternatives as a component of the other alternatives carried forward for more detailed environmental studies.

ALTERNATIVE 3: GOODS MOVEMENT ENHANCEMENT BY RAIL AND/OR ADVANCED TECHNOLOGY

Alternative 3 was not carried forward into the 2012 Draft EIR/EIS as a stand-alone alternative. This alternative was focused on maximum goods movement by rail and goods movement enhancement through an array of advanced “zero emission” technologies, including fixed guideway technologies (e.g., magnetically levitated container transport system [MagLev]), electrified freight rail, and electric-powered trucks. While key features of Alternative 3 demonstrated needed emissions reduction benefits, as well as the ability to markedly reduce heavy-duty truck traffic on the I-710 general purpose lanes as a stand-alone alternative, Alternative 3 did not sufficiently relieve traffic congestion on the I-710 mainline according to several of the mobility measures, nor did it address the existing safety and design elements that need updating on the I-710 compared to other alternatives. Therefore, the electric-powered (zero emission) truck advanced technology component of Alternative 3 was selected for its positive air quality benefits and integrated into another alternative (see the following discussion of Alternative 6B). A technology-screening step was performed in the *Alternatives Goods Movement Technology Study* (January 2009), to select this specific type of zero emission technology. Additionally, at the recommendation of the I-710 TAC, the Enhanced Goods Movement by Rail component was removed from Alternative 3 because these projects and other efforts to maximize the amount of goods movement by rail would not be completed as part of the I-710 Corridor Project.

Alternative 3 focused on maximum goods movement by rail and enhancing goods movement in and out of the Ports by implementing an advanced zero emission container movement technology within the I-710 Corridor. Two families of technology were originally defined: an automated fixed guideway family and a zero emission truck family. During a technical workshop held to evaluate these alternative goods movement technologies, a third technology family of electrified conventional freight rail was added for consideration. This assumption provided the full range of potential benefits and costs of different zero emission technologies and design options.

ALTERNATIVE 4: ARTERIAL HIGHWAY AND I-710 CONGESTION RELIEF IMPROVEMENTS

Alternative 4 was not carried forward into the 2012 environmental process as a stand-alone alternative. Like Alternative 2, Alternative 4 did not provide adequate improvements on its own to fully address the I-710 Corridor Project’s Purpose and Need. This alternative would not accommodate the high future traffic volumes generated by population and employment growth and the forecasted cargo growth. However, the screening analysis found that the arterial highway improvements and the I-710 mainline congestion relief elements of Alternative 4 would be valuable components to include in the alternatives recommended to be carried forward for more detailed environmental analysis.

Alternative 4 focused on arterial highways and specific I-710 congestion relief projects that identify and improve existing freeway and updated design elements of arterial intersections causing the greatest congestion and safety impacts. Additionally, Alternative 4 included the maximum arterial highway improvements that could feasibly be implemented in advance of any I-710 improvements. This would incorporate the major north/south and east/west arterial highways within the Study Area, as well as the Study Area intersections identified for the I-710 Corridor Project. Alternative 4 also addressed congestion relief projects, including early-action projects on I-710, by identifying design elements of the existing freeway that need updating causing bottlenecks, congestion, and safety problems.

ALTERNATIVE 5A: TEN GENERAL PURPOSE LANES

Alternative 5 proposed improving the I-710 mainline by widening I-710 to include ten lanes throughout the length of the corridor (including through the freeway-to-freeway interchanges) and modernizing its design. Included in this alternative were redesigns of the freeway-to-freeway and arterial interchanges. Alternative 5A proposed ten general purpose lanes and Alternative 5B proposed eight general purpose lanes plus two HOV lanes. Alternatives 5A and 5B also included the components in Alternatives 1, 2, 4, and 5A.

Alternative 5A was carried forward in the 2012 environmental studies as a stand-alone alternative. Alternative 5A had the second-best performance on measures of congestion reduction (volume-to-capacity [v/c] ratio) and I-710 mainline travel time. It also ranked second among the screened alternatives in air emission reductions. Alternative 5A also performed well in the screening measures related to traffic safety and right-of-way impacts.

ALTERNATIVE 5B: EIGHT GENERAL PURPOSE LANES PLUS TWO HOV LANES

Alternative 5B was not carried forward into the 2012 environmental process. From a physical standpoint, Alternative 5B closely resembled Alternative 5A except that two of the proposed lanes would operate as HOV lanes rather than general purpose lanes. The screening analysis demonstrated that Alternative 5B had lower benefits compared to Alternative 5A because the HOV lanes under Alternative 5B would not be utilized as much as the proposed general purpose lanes under Alternative 5A, most likely due to the parallel HOV lanes on both I-110 and I-605. However, Alternative 5B contained the drawbacks with regard to potential right-of-way impacts as Alternative 5A, without the corresponding level of mobility benefits. Therefore, Alternative 5A was recommended over Alternative 5B.

ALTERNATIVE 6: ALTERNATIVE 5 WITH ADDITION OF FOUR SEPARATED FREIGHT MOVEMENT LANES

As the highest-performing alternative for mobility and traffic safety measures, Alternative 6 was the only alternative estimated to reduce the peak-period v/c ratio on the I-710 mainline below the level indicating congestion conditions. It also was estimated to generate the lowest percentage of heavy-duty trucks sharing the general purpose lanes with automobiles and to result in the greatest reduction in freeway design elements that need updating, both of which are key indicators of

improved traffic safety. Alternative 6 was included in the Reduced Set of Alternatives because it was the only alternative determined to fully address the mobility problems on the I-710 Corridor and was considered to respond best to the need for improved traffic safety due to its separation of truck and automobile traffic. Alternative 6 had two variations: (1) Alternative 6A (previously labeled Alternative 6), which included ten general purpose lanes and four separated freight movement lanes (freight corridor) for use by all heavy-duty trucks, whether powered by diesel engines or engines with lower or zero emissions; and (2) Alternative 6B, which included ten general purpose lanes and incorporated Alternative 3's advanced technology component by including four separated freight movement lanes. This advanced technology would include, but not be limited to, electric-powered trucks, which could receive electric power from on-board rechargeable batteries by an electric power distribution system employing overhead catenary wires to provide power to conventional electric motors in each vehicle, or embedded in the pavement of the freight movement lanes powering either linear-induction-motor or linear-synchronous-motor systems (or other concepts), or future zero emission technologies to be developed or designed as part of the freight movement corridor. The design of the freight corridor also assumed possible future conversion, or initial construction, as feasible (which may require additional environmental analysis and approval), of a fixed-guideway family of alternative container transport technologies (e.g., Maglev).

Subsequent to the completion of the alternatives screening analysis described above, the I-710 Funding Partners agreed that a tolling option should be added to the freight corridor component of Alternatives 6A and 6B to provide a possible revenue source to fund the improvements. This alternative was known as Alternative 6C. For more detailed information on this Reduced Set of Alternatives, please see Chapter 2.0 of the I-710 Corridor Project 2012 Draft EIR/EIS.

2.5.2 ALTERNATIVES ELIMINATED AFTER 2012 DRAFT EIR/EIS PUBLIC CIRCULATION

2.5.2.1 ALTERNATIVE 5A AND ALTERNATIVES 6A, 6B, AND 6C

In addition to the No Build (Alternative 1), Alternatives 5A (Widening of I-710 to include ten general purpose lanes) and Alternatives 6A, 6B, and 6C (Widening of I-710 to include ten general purpose lanes and addition of four separated freight movement lanes, with operational variations) were evaluated in detail in the 2012 Draft EIR/EIS. Because of the updates in traffic assumptions and data, resulting in a clearer understanding of the origin and destination of truck traffic within the project area, and the substantial comments received from agencies and the public concerned with potential right-of-way impacts, potential impacts to health and air quality associated with the addition of general purpose lanes, and other requests (see Section 2.2.1 for more information), the funding partner agencies decided to continue to build on the available information and move forward with the development of revised alternatives that better responded to public input and updated traffic patterns, while still meeting the project's purpose and need. Therefore, Alternatives 5A and Alternatives 6A, 6B, and 6C have been withdrawn from consideration and were not discussed further in the RDEIR/SDEIS or this Final EIR/EIS.

2.5.3 ALTERNATIVES ELIMINATED AFTER 2017 RECIRCULATED DRAFT EIR/EIS PUBLIC CIRCULATION

2.5.3.1 ALTERNATIVE 5C AND ALTERNATIVE 7

In addition to No Build (Alternative 1), Alternative 5C (I-710 Widening and Modernization) and Alternative 7 (I-710 Modernization plus Freight Corridor [Zero-Emission Vehicles]) were evaluated in detail in the 2012 Draft EIR/EIS and the 2017 RDEIR/SDEIS. Because of the substantial comments received from agencies and the public concerned with potential right-of-way impacts, potential impacts to health and air quality associated with the addition of general purpose lanes, and other requests (see Section 2.4 for more information), Caltrans, as lead agency under CEQA and NEPA (as assigned by the FHWA), in cooperation with Metro has identified the No Build (Alternative 1) as the Preferred Alternative. Therefore, Alternative 5C and Alternative 7 have been withdrawn from consideration, although the analysis of the impacts related to these build alternatives has been retained for disclosure purposes within this Final EIR/EIS.

2.6 NEXT STEPS

The I-710 Task Force was approved by the Metro Board on September 22, 2022, and has been created to re-engage communities and corridor stakeholders to develop a new vision that is multimodal and sensitive to community needs. In addition, any candidate projects originally considered for an Early Action Program will be re-examined as a part of a new I-710 Task Force process that was established to re-envision the I-710 Corridor. Once the I-710 Task Force completes its work, a new set of recommended projects and programs will undergo further refinement, including environmental reviews and approvals following a process separate from this Final EIR/EIS.

2.7 ANTICIPATED PERMITS AND APPROVALS NEEDED

As the No Build (Alternative 1) has been identified as the Preferred Alternative, there are no anticipated permits and approvals needed for the project.

3.0 AFFECTED ENVIRONMENT, ENVIRONMENTAL CONSEQUENCES, AND AVOIDANCE, MINIMIZATION, AND/OR MITIGATION MEASURES

Chapter 3.0 describes the existing affected environment for the Study Area. The affected environment is the base environmental condition on which environmental effects of the build alternatives are evaluated in this Final Environmental Impact Report/Environmental Impact Statement (Final EIR/EIS).

The sections in Chapter 3.0 include the regulatory setting applicable to the environmental topic, the methodology of impact analysis, a description of the affected environment, environmental effects resulting from the build and no build alternatives, a discussion of environmental effects relative to public health considerations, and measures to avoid, minimize, or mitigate adverse impacts of the build alternatives. Photographs, graphic exhibits, and data matrices are included throughout Chapter 3.0 where applicable to support the impact analyses.

The National Environmental Policy Act (NEPA) uses the terms impact, effect, and consequences synonymously. For an action to affect the environment, it must have a causal relationship with the environment. NEPA distinguishes three types of causal impacts: direct, indirect, and cumulative. Cumulative impact is defined and the contribution of the build alternatives to cumulative effects is analyzed in Section 3.25 of this Final EIR/EIS. Direct and indirect effects are defined below and analyzed in Sections 3.1 through 3.24 of this Final EIR/EIS. Sections 3.1 through 3.23 analyze the permanent effects of the build alternatives, and Section 3.24 analyzes the temporary effects of the build alternatives during construction.

- Direct effects are caused by the action and occur at the same time and place (40 Code of Federal Regulations [CFR] 1508.8).
- Indirect effects are caused by the action and occur later in time or farther removed in distance, but are still reasonably foreseeable. Indirect effects may include growth-inducing effects and other effects related to induced changes in the pattern of land use, population density, or growth rate, as well as related effects on air and water and other natural systems, including ecosystems (40 CFR 1508.8).

Unless otherwise specified, the impacts of the build alternatives (Alternatives 5C and 7 with the Design Options) as outlined in Section 2.3.3 of this Final EIR/EIS are the same as the “base” alternatives.

As part of the scoping and environmental analysis conducted for the project, the following environmental resources were considered, but no adverse impacts were identified. As a result, there is no further discussion about these issues in this document:

- **Farmlands and Timberlands:** There are no timberlands or prime, unique, or soils of local significance for farmlands within the Study Area.
- **Wild and Scenic Rivers:** There are no rivers listed in the National Inventory of Wild and Scenic Rivers located in the Study Area.

3.1 LAND USE

The information in this section is based on the following documents:

- *Community Impact Assessment* (July 2017)
- *Section 4(f) and 6(f)* (December 2020)

3.1.1 EXISTING AND FUTURE LAND USES

Land use is addressed in terms of existing and planned land uses. Existing land uses are defined as those uses currently within the Study Area and planned land uses are those that would occur as a result of land use designations and policies contained in various applicable land planning documents.

3.1.1.1 AFFECTED ENVIRONMENT

The Study Area includes 17 cities and parts of unincorporated Los Angeles County, including the unincorporated communities of East Los Angeles, East Rancho Dominguez, and Rancho Dominguez, that are located either directly adjacent to the project in which the direct impacts would occur or where indirect impacts of the project may occur. These cities and communities consist of a mixture of residential, commercial and service, industrial, mixed commercial and industrial, mixed urban, open space and recreation, agricultural, and transportation and utilities uses (refer to Figure 3.1-1).

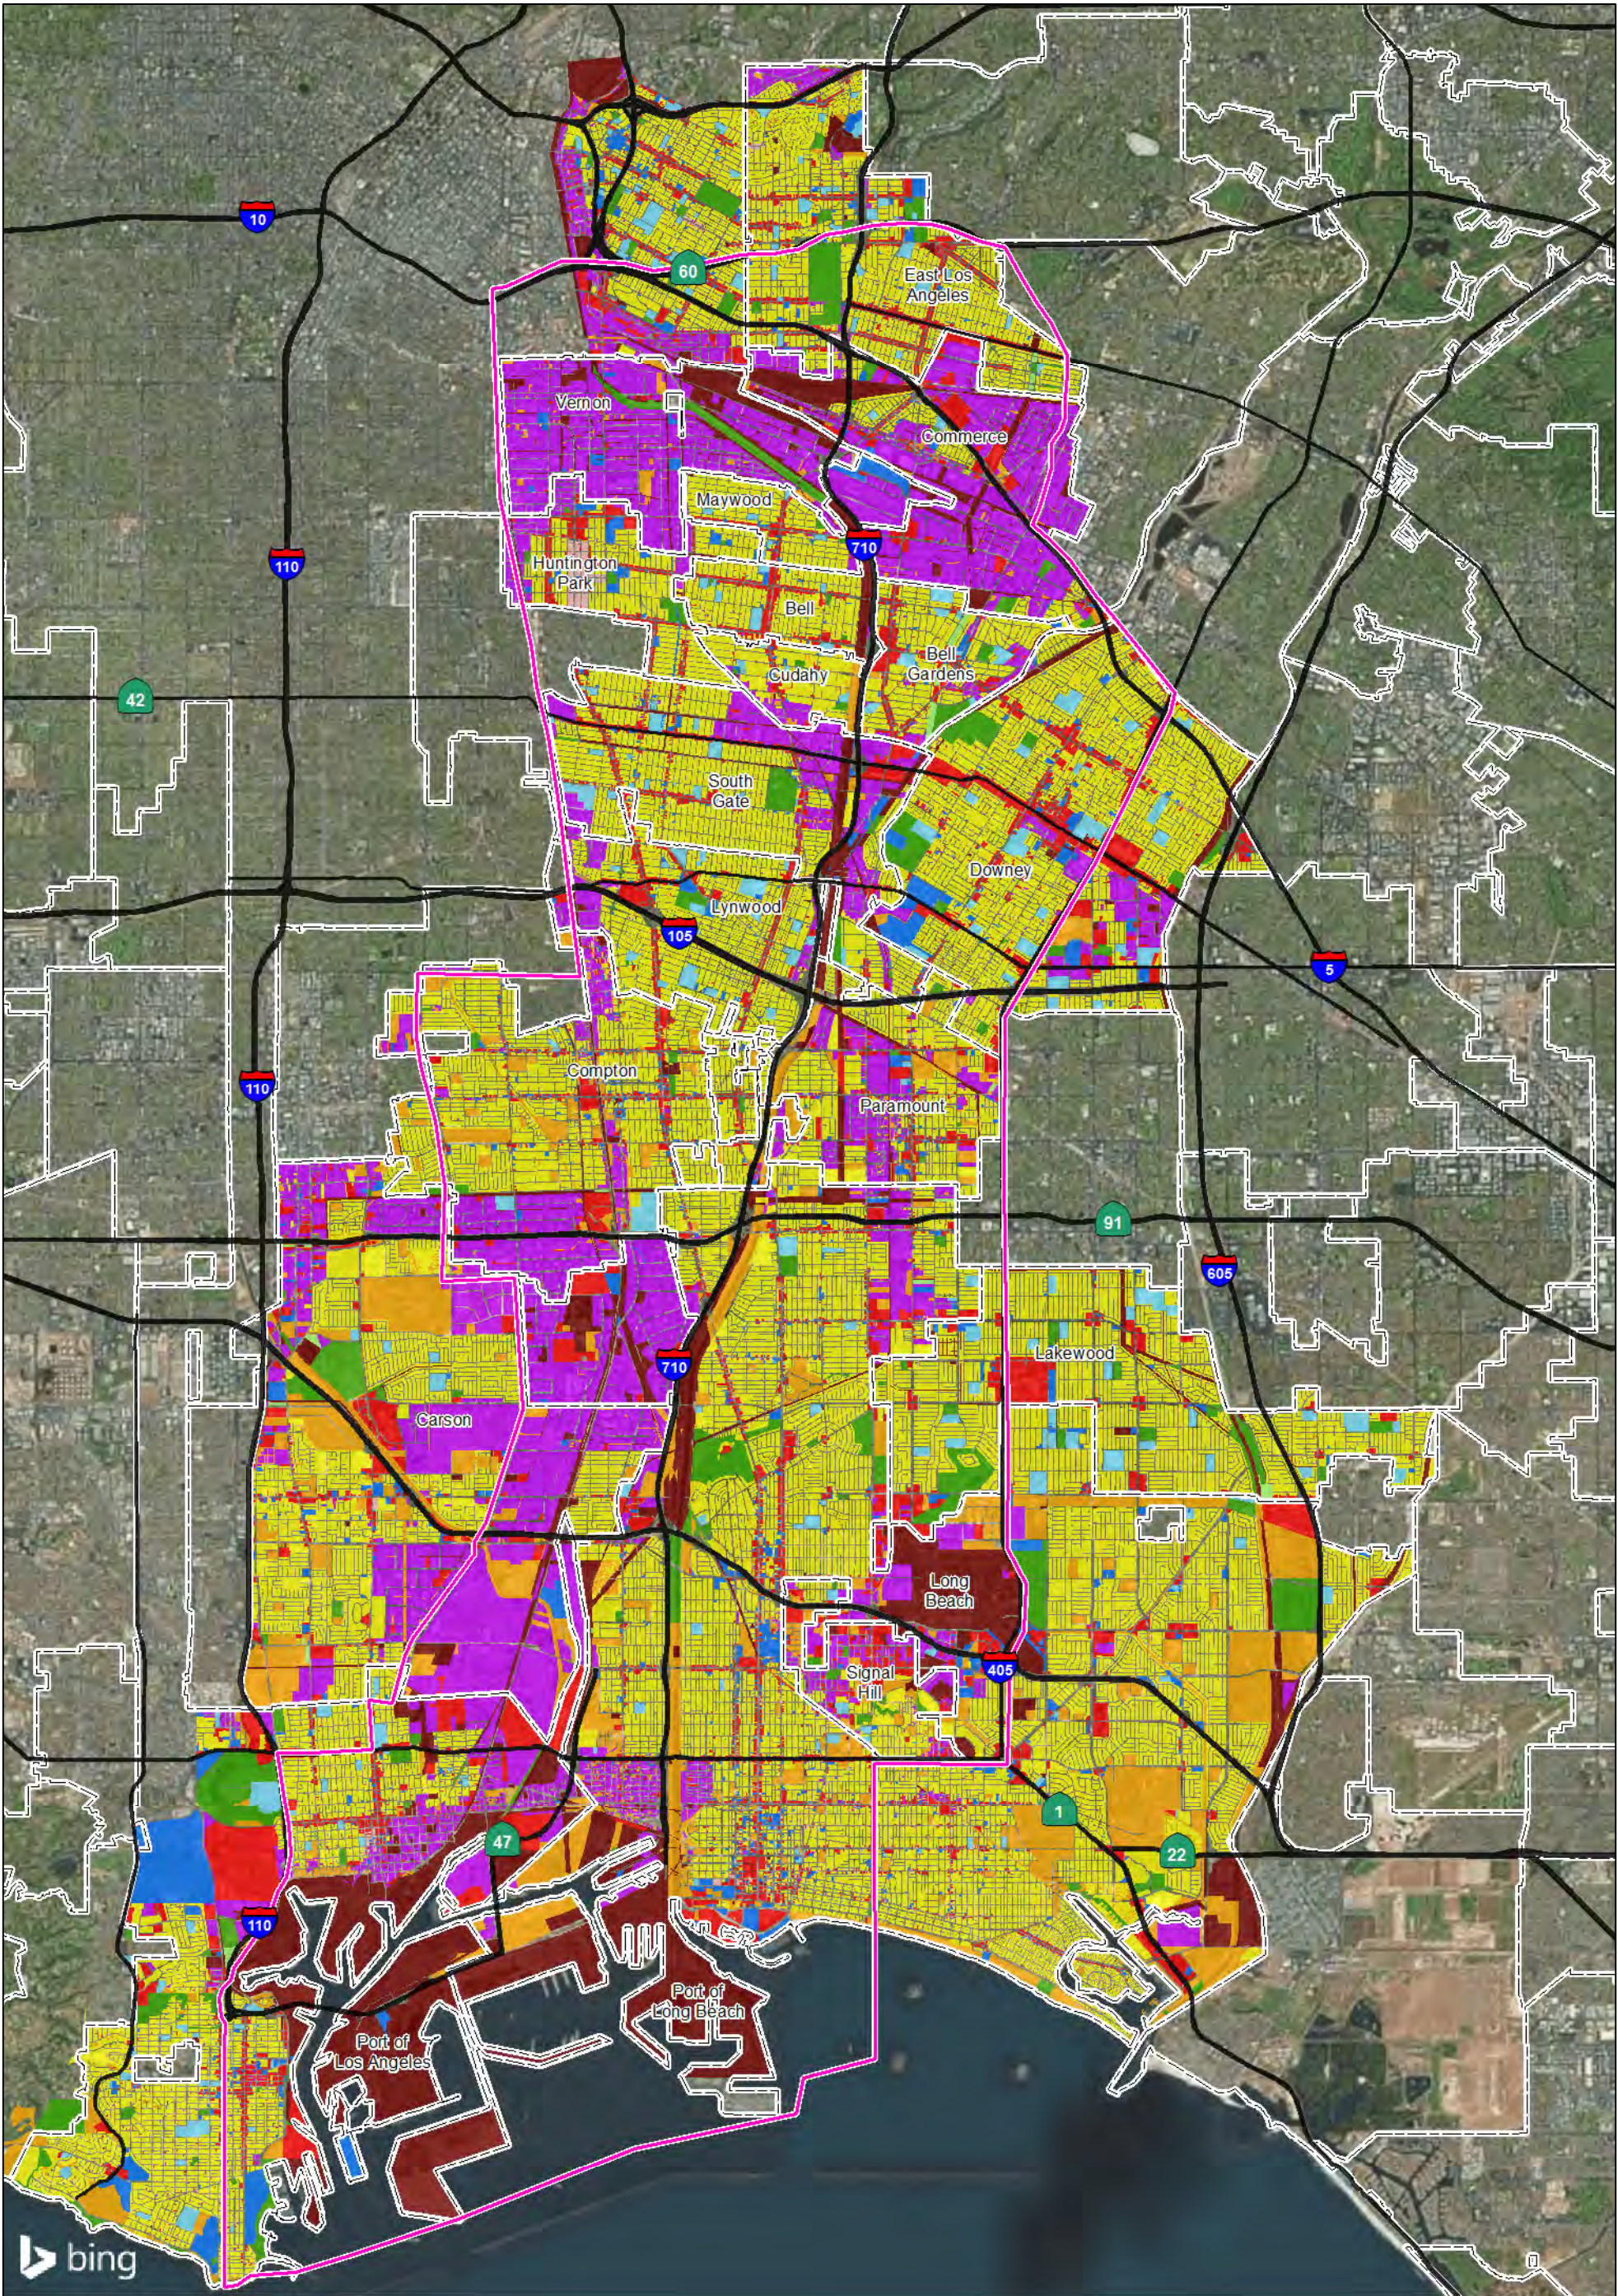

Development trends among these affected cities and communities are generally similar; there is limited vacant land and new development has taken the form of redevelopment and recycling of uses.

The following describes existing land uses and commuting patterns based on the Southern California Association of Governments (SCAG) database (2012) by jurisdiction and geographic/community area.

3.1.1.2 BOYLE HEIGHTS

The community of Boyle Heights is located in the City of Los Angeles where Interstate 5 (I-5) connects to State Route 60 (SR-60), United States Route 101 (US-101), and Interstate 10 (I-10). Existing land uses within Boyle Heights include residential, education, facilities, mixed urban, commercial and services, industrial, open space and recreation, transportation and utilities, and vacant. Boyle Heights consists largely of concentrated residential and industrial uses and the railroad corridor along the western and southern borders of the community.

According to the 2019 Boyle Heights Draft Community Plan¹, vacant land is limited in Boyle Heights and is reserved for parks, bicycle paths, and open spaces. New development is expected to occur through the repurposing of existing land and properties. Within the community of Boyle Heights, approximately 66 percent of workers work within the community and 34 percent work outside it. The mean commute time is 29.6 minutes.

3.1.1.3 CITY OF BELL

The City of Bell is 2.2 square miles in area and is located in the south-central part of Los Angeles County where the Interstate 710 (I-710) mainline meets I-5. Existing land uses within the City of Bell include commercial and services, industrial, open space and recreation, residential, and transportation and utilities. According to the City of Bell 2010 General Plan, industrial land uses account for 24 percent of the total land area, residential uses account for 34 percent, commercial and services uses account for 8 percent, and I-710 accounts for 7 percent. Along I-710, existing land uses include residential, industrial, and commercial and services.

The City of Bell consists of two district areas connected by the Los Angeles River and the I-710. The southern part of the city is known as “Central City” and contains residential and supporting commercial uses. The northern part of the city is developed with industrial uses and is known as the “Cheli Industrial Area.” This area was previously owned by the Federal government but parts have since been sold to the Los Angeles Unified School District (LAUSD) and other agencies for redevelopment. The “military installations” land use shown in Table 3.1-1 is comprised of uses primarily along Bandini Boulevard, which includes a National Guard recruiting office and a heavy vehicle shop. The federally owned parcels north and south of Bandini Boulevard, along I-710, are used for equipment storage, with the warehouses along I-710 leased to private businesses. According to the City’s Land Use Element (2010), very limited vacant land exists in the city (approximately 3 percent of the total city area) and new development is expected to take the form of recycled or redeveloped properties.

Within the City of Bell, approximately 10 percent of workers work within the city and 90 percent work outside the city. The mean commute time is 29.4 minutes.

3.1.1.4 CITY OF BELL GARDENS

The City of Bell Gardens is 2.4 square miles in area and is located in the south-central part of Los Angeles County. Bell Gardens is a dense community with very limited vacant land; undeveloped land is limited to scattered vacant lots. Existing land uses within the City of Bell Gardens include residential, commercial, industrial, open space and recreation, transportation, and agricultural land use designations. According to the City of Bell Garden General Plan (1995), residential land

Source: Los Angeles County Metropolitan Transportation Authority. *Community Impact Assessment* (July 2017).
¹ This total represents the total amount of existing land use acres that would be impacted by the specific Alternative or Design Option.
Notes: Numbers may not add due to rounding.

The Grand Totals for Alternative or Options are not the exact sum of each category total because impacts to water resources, such as the Los Angeles River and the Rio Hondo River (by acre), are not shown in this table. Alternative 5C (including Design Options 1A, 2A and 3A) impacts 26.53 acres of water. Alternative 7 (including Design Option 1B and 3B) impacts 27.40 acres of water. Additionally, Totals by Jurisdiction for Vernon, Long Beach, and Bell are not the exact sum of each category because impacts to water land use (by acre) are not shown. In the City of Vernon, each Alternative and Design Option impacts 0.28 acre of water. In the City of Long Beach, Alternative 5C (including Design Options 1A, 2A, and 3A) impacts 26.25 acres of water, and Alternative 7 (including Design Options 1B and 3B) impacts 27.12 acres of water.

uses account for the majority of land use in Bell Gardens, and the majority of housing stock is over 50 years old. As a result, the City of Bell Gardens strives to preserve the existing residential neighborhoods while promoting new development in the industrial areas to provide employment opportunities. Existing land uses along the I-710 mainline include residential, commercial, and industrial uses.

Within the City of Bell Gardens, approximately 11 percent of workers work within the city and 89 percent work outside the city. The mean commute time is 28.3 minutes.

3.1.1.5 CITY OF CARSON

The City of Carson is approximately 19.2 square miles in area and is located in the southern part of Los Angeles County, just west of the I-710/Interstate 405 (I-405) interchange. Existing land uses within Carson include commercial and services, industrial, open space and recreation, residential, and transportation and utilities. According to the Carson General Plan Land Use Element, approximately 9 percent of the City currently consists of vacant land, of which 8.5 percent is considered underutilized. Along the I-710 mainline, the existing land use is industrial. Nearly 50 percent of Carson's land uses are industrial.

Within the City of Carson, approximately 15 percent of workers work within the city and 85 percent work outside the city. The mean commute time is 26.2 minutes.

3.1.1.6 CITY OF COMMERCE

The City of Commerce is 6.6 square miles in area and is located in the south-central part of Los Angeles County where I-710 meets the I-5. Existing land uses within the City of Commerce include commercial and services, industrial, open space and recreation, residential, and transportation and utilities. Per the City's General Plan, very little vacant land is available for development. Along the I-710 mainline, existing land uses include industrial, open space and recreation, residential, and transportation and utilities. Industrial land uses account for more than 70 percent of the total land area in the city.

The City of Commerce 2020 General Plan (2008) identifies the following nine planning areas that comprise mostly industrial, commercial, and residential uses: Bandini-Rosini, Rosewood, Northwest, Southeast, Ferguson, West, Atlantic/Washington, Commerce Park, and Town Center.

Within the City of Commerce, approximately 14 percent of workers work within the city and 86 percent work outside the city. The mean commute time is 27.3 minutes.

3.1.1.7 CITY OF COMPTON

The City of Compton is approximately 10.5 square miles in area and is located in the south-central part of Los Angeles County where I-710 connects to SR-91. Existing land uses within the City of Compton include residential, commercial and services, industrial, agriculture, open space and

recreation, and transportation and utilities. Along the I-710 mainline, existing land uses include residential, industrial, commercial and services, open space and recreation, and transportation and utilities. The City of Compton is primarily built out and has limited vacant land. According to the City of Compton Land Use Element, open space and vacant land account for approximately 276 acres, or 6 percent, of the City of Compton.

Within the City of Compton, approximately 12 percent of workers work within the city and 88 percent work outside the city. The mean commute time is 28.4 minutes.

3.1.1.8 CITY OF CUDAHY

The City of Cudahy is 1.1 square miles in area and is located in the south-central part of Los Angeles County. Existing land uses within the City of Cudahy include commercial and services, industrial, open space and recreation, residential, and transportation and utilities. According to Table 3-1 in the City of Cudahy General Plan, vacant lands account for approximately 18.3 acres, or 2.7 percent, of the City of Cudahy. Industrial uses are primarily located along the southwestern boundary of the city, adjacent to the railroad and the Cities of Huntington Park and South Gate. The majority of commercial uses are concentrated along Atlantic Ave. Additionally, along the I-710, existing land uses are primarily residential, with some commercial and services, and open space and recreation uses. The City of Cudahy is primarily built out and currently has no sizeable areas of undeveloped land.

Within the City of Cudahy, approximately 5 percent of workers work within the city and 95 percent work outside the city. The mean commute time is 31.7 minutes.

3.1.1.9 CITY OF DOWNEY

The City of Downey is approximately 12.5 square miles in area and is located in the south-central part of Los Angeles County. Existing land uses within the City of Downey include commercial and service, industrial, open space and recreation, residential, agriculture, and transportation and utilities. According to the 2005 Land Use Element, open space and vacant land account for approximately 516 acres, or 8 percent, of the City of Downey. There are no existing land uses along the I-710 mainline because I-710 is not within or adjacent to the City of Downey.

Within the City of Downey, approximately 18 percent of workers work within the city and 82 percent work outside the city. The mean commute time is 28.3 minutes.

3.1.1.10 CITY OF HUNTINGTON PARK

The City of Huntington Park is approximately three square miles in area and is located in the south-central part of Los Angeles County. Existing land uses within the city include commercial and services, industrial, open space and recreation, residential, and transportation and utilities. The city is primarily developed with residential land uses and industrial land uses that are located along its western and northern boundaries. The City of Huntington Park Draft General Plan

identifies approximately 90.4 acres, or 3.6 percent of the City's existing land as vacant. Commercial and service uses are located along major arterials, including Florence Ave., Gage Ave., Slauson Ave., Pacific Blvd., and Santa Fe Ave. The city has no sizeable areas of undeveloped land; therefore, recycling and redevelopment of property is an incremental process that is ongoing. This process includes existing developed areas, otherwise outdated and/or abandoned, being rehabilitated and reconstructed to new and improved uses. There are no existing land uses along the I-710 mainline because I-710 is not within or adjacent to the City of Huntington Park.

Within the City of Huntington Park, approximately 13 percent of workers work within the city and 87 percent work outside the city. The mean commute time is 30.2 minutes.

3.1.1.11 CITY OF LAKEWOOD

The City of Lakewood is 9.5 square miles in area and is located in the southeastern part of Los Angeles County. Existing land uses within the City of Lakewood include commercial and services, industrial, open space and recreation, residential, agriculture, and transportation and utilities. There are no existing land uses along the I-710 mainline because I-710 is not within or adjacent to the City of Lakewood.

The City of Lakewood is primarily a residential community. According to the City of Lakewood General Plan, the city consists of approximately 51 percent residential uses, 13 percent public and quasi-public uses, 24 percent street/highway uses, and 8 percent commercial/industrial/agricultural uses. The city is essentially built out, with only approximately 32 acres of vacant land (0.53 percent of the city's total area).

Within the City of Lakewood, approximately 11 percent of workers work within the city and 89 percent work outside the city. The mean commute time is 27.9 minutes.

3.1.1.12 CITY OF LONG BEACH

The City of Long Beach is approximately 50 square miles in area and is located in the southern part of Los Angeles County. Existing land uses within the City of Long Beach include commercial and services, industrial, open space and recreation, residential, and transportation and utilities. Along the I-710 mainline, existing land uses include commercial and services, industrial, open space and recreation, residential, and transportation and utilities. According to the City's 2019 Land Use Element, vacant land is scarce in the City of Long Beach and will be utilized for infill development and green spaces. New development will occur primarily as a result of land recycling/redevelopment.²

² City of Long Beach 2019 Land Use Element, Improvement #7: Promote Appropriate Infill Development.

Approximately 22 percent of the I-710 Corridor Project Study Area is located in the City of Long Beach, and there are 29 neighborhoods in Long Beach located within 0.5 mile of the I-710 Corridor Project improvements.

Within the City of Long Beach, approximately 34 percent of workers work within the city and 66 percent work outside the city. The mean commute time is 29 minutes.

3.1.1.13 CITY OF LYNWOOD

The City of Lynwood is approximately 4.9 square miles in area and is located in the south-central part of the County where I-710 meets I-105. Existing land uses within Lynwood include commercial and services, industrial, open space and recreation, residential, and transportation and utilities. Along the I-710 mainline, existing land uses include industrial, commercial and services, and transportation and utilities.

According to the City of Lynwood General Plan (2003), 42 percent of the existing land uses within the city are residential and 33.2 percent are streets and highways. As of 2000, there were approximately 128 acres of vacant land in the city, or 4.1 percent of the City of Lynwood's total area (City of Lynwood General Plan).

Within the City of Lynwood, approximately 10 percent of workers work within the city and 90 percent work outside the city. The mean commute time is 29.4 minutes.

3.1.1.14 CITY OF MAYWOOD

The City of Maywood is approximately 1.14 square miles in area and is located in the south-central part of Los Angeles County. Existing land uses within the city include commercial and services, industrial, open space and recreation, residential, mixed commercial and industrial, and transportation and utilities. There are no existing land uses along the I-710 mainline because I-710 is not within or adjacent to the City of Maywood.

According to the City of Maywood General Plan (1993), residential uses account for nearly 60 percent of the land use in Maywood, and the majority of the housing stock is over 50 years old. As a result, the City of Maywood strives to preserve its existing residential neighborhoods while promoting new development in the industrial areas to provide employment opportunities. The City is essentially built out, and there is very little vacant land available for development.

Within the City of Maywood, approximately 8 percent of workers work within the city and 92 percent work outside the city. The mean commute time is 27.9 minutes.

3.1.1.15 CITY OF PARAMOUNT

The City of Paramount is approximately 4.7 square miles in area and is located in the south-central part of the County where I-710 meets the I-105. Existing land uses within the City of Paramount include residential, commercial and services, industrial, open space and recreation,

mixed urban, mixed commercial and industrial, agriculture, and transportation and utilities. Along the I-710 mainline, existing land uses are primarily transportation and utilities.

The City of Paramount General Plan (2007) identifies seven Area Plans for planning purposes for key neighborhoods and districts within the city. These Area Plans include: the Central Business District Area Plan, the Central Industrial District Area Plan, the Clearwater East Area Plan, the Clearwater North and Howe/Orizaba Area Plans, the Clearwater West Area Plan, and the Somerset Area Plan (including the Paramount Place Area Plan and the Downey/Somerset Area Plan). Very little vacant land is available for development in the City of Paramount. Residential uses, industrial uses, commercial uses, streets, and other rights-of-way constitute 100 percent of the City's land uses (City of Paramount 2007 General Plan).

Within the City of Paramount, approximately 16 percent of workers work within the city and 84 percent work outside the city. The mean commute time is 27.1 minutes.

3.1.1.16 CITY OF SIGNAL HILL

The City of Signal Hill is approximately 2.2 square miles in area and is located in the southeastern part of Los Angeles County. Existing land uses within the city include commercial and services, industrial, open space and recreation, residential, and transportation and utilities. According to the City of Signal Hill General Plan (elements with various dates), industrial uses make up 39 percent of the city's land uses, followed by residential uses at 35 percent and commercial and services uses at 21 percent. There are no existing land uses along the I-710 mainline because I-710 is not within or adjacent to the City of Signal Hill.

There are seven neighborhoods in the City of Signal Hill: the Central Neighborhood, the North End Neighborhood, the West Side Neighborhood, the Civic Center Neighborhood, the Hilltop Neighborhood, the Southeast Neighborhood, and the Atlantic/Spring Neighborhood. The City is almost entirely built-out, with very little vacant space, and 24 acres or two percent of the City's area is zoned as Open Space (City of Signal Hill 2001 Land Use Element).

Within the City of Signal Hill, approximately 15 percent of workers work within the city and 85 percent work outside the city. The mean commute time is 26.8 minutes.

3.1.1.17 CITY OF SOUTH GATE

The City of South Gate is approximately 7.4 square miles in area and is located in the south-central part of Los Angeles County where I-710 connects to State Route 42 (SR-42), also known as Firestone Blvd. Existing land uses within the City of South Gate include commercial and services, industrial, open space and recreation, residential, mixed urban, and transportation and utilities. The City of South Gate General Plan 2035 (2009) identifies 41 percent of the city's existing land uses as residential, 20 percent as transportation, and 16 percent as industrial. These existing land uses reflect two historical development trends in the city, as both a residential

community and an industrial center. Vacant lands account for approximately 80 acres, or 1.7 percent, of the land in the City of South Gate. Along the I-710 mainline, existing land uses include industrial, residential, commercial and services, and transportation and utilities. Specifically, residential land uses along the I-710 mainline include the Thunderbird Villa Mobile Home Park, located just west of the I-710 mainline between Southern Ave. and Salt Lake Ave.

The City of South Gate General Plan identifies the following 12 districts in the city: Adrine Industrial, Civic Center, El Paseo/South Gate Towne Center, Firestone Industrial, Gateway, Hollydale Industrial, Imperial, Tweedy Educational, Rayo Industrial, South Gate College, South Gate Triangle, and Southwest Industrial.

Within the City of South Gate, approximately 12 percent of workers work within the city and 88 percent work outside the city. The mean commute time is 29.1 minutes.

3.1.1.18 CITY OF VERNON

The City of Vernon is approximately 5.2 square miles in area and is located in the south-central part of Los Angeles County. Existing land uses within the City of Vernon include commercial and services, industrial, residential, and transportation and utilities. Very little, if any, vacant land exists in the City of Vernon. New development only occurs as a result of land recycling (City of Vernon Land Use Element). Along the I-710 mainline, existing land uses include industrial, and transportation and utilities.

Within the City of Vernon, approximately 19 percent of workers work within the city and 81 percent work outside the city. The mean commute time is 20.2 minutes.

3.1.1.19 UNINCORPORATED EAST LOS ANGELES

The unincorporated community of East Los Angeles is approximately 7.4 square miles in area and is located in the south-central part of Los Angeles County. Existing land uses within East Los Angeles include commercial and services, residential, open space and recreation, industrial, agriculture, mixed commercial and industrial, mixed urban, and transportation and utilities. Along the I-710 mainline, existing land uses include mostly transportation and utilities, residential, commercial and services, and open space and recreation.

Within Los Angeles County, approximately 38 percent of workers work within their City of residence and 61 percent of workers work outside their City of residence (the remaining 1 percent of workers do not live within the County). The mean commute time is 29.6 minutes.

3.1.1.20 WILMINGTON/SAN PEDRO

Existing land uses in Wilmington and San Pedro include residential, commercial and services, industrial, agriculture, open space and recreation, and transportation and utilities. There are no

existing land uses in these communities along the I-710 mainline because I-710 is not within or adjacent to these communities.

Within the City of Los Angeles, in which Wilmington and San Pedro are located, approximately 66 percent of workers work within the city and 34 percent work outside the city. The mean commute time is 29.6 minutes.

3.1.1.21 ENVIRONMENTAL CONSEQUENCES

PERMANENT IMPACTS.

BUILD ALTERNATIVES. As shown in Table 3.1-1, the build alternatives would impact existing, facilities, general office, education, commercial and service, industrial, open space and recreation, residential, transportation and utilities, military installations, and vacant land uses. Alternative 5C would convert approximately 538 acres of existing land uses; Alternative 5C, Option 1A, would convert approximately 536 acres of existing land uses, Alternative 5C, Option 2A, would convert approximately 545 acres of existing land uses, and Alternative 5C, Option 3A, would convert approximately 541 acres of existing land uses to transportation land uses. Table 3.1-1 also shows the number of acres for each land use category that would be acquired by Alternative 5C and its Options, by jurisdiction (city or community).

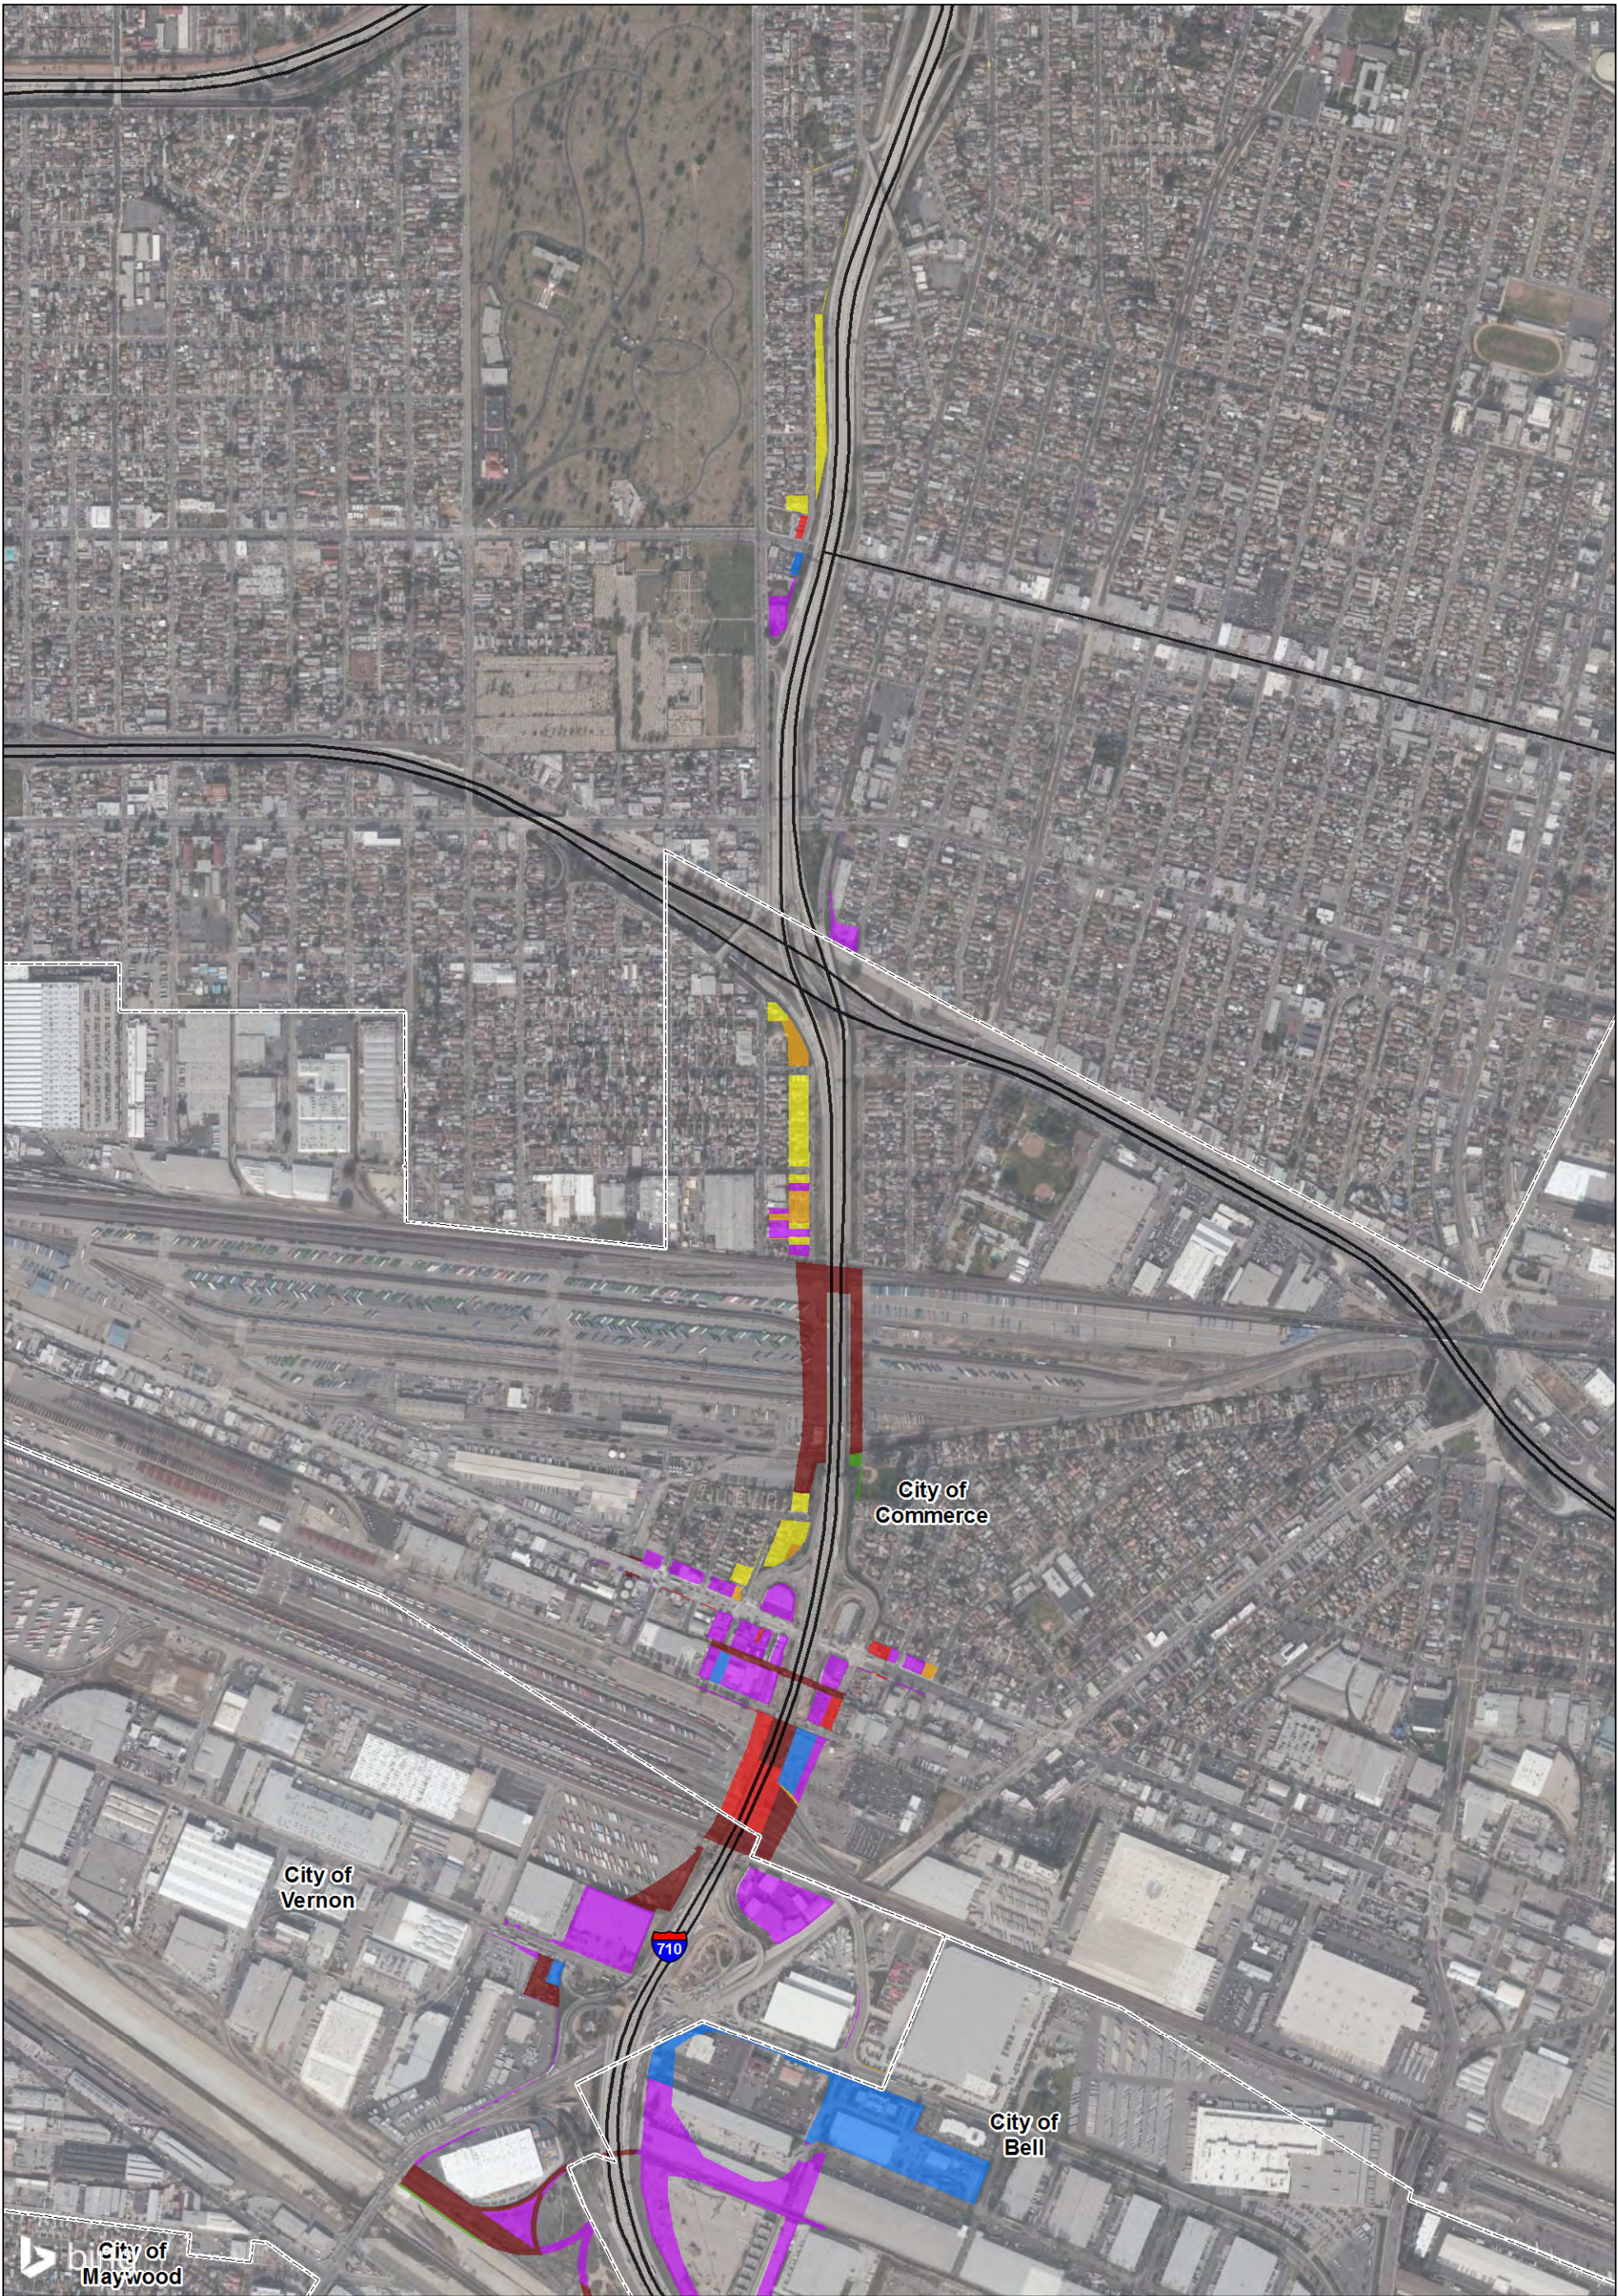

Alternative 7 would convert approximately 748 acres of existing land uses; Alternative 7, Option 1B, would convert approximately 752 acres of existing land uses, and Alternative 7, Option 3B, would convert approximately 751 acres of existing land uses to transportation land uses. Therefore, Alternative 7, Option 1B, would result in the greatest impact to existing land uses. Table 3.1-1 also shows the number of acres for each land use category that would be acquired by Alternative 7 and its Options, by jurisdiction (city or community).

Although the build alternatives would impact 536 to 752 acres of land currently in other uses, because I-710 has been considered in the local General Plans since its construction as a freeway in the 1950s, the build alternatives are generally compatible with adjacent land uses. Generally, approximately 68 percent of the existing rights of way required for Alternatives 5C and 7 consist of existing transportation, utilities, and vacant land uses.

Approximately 3 percent and 20 percent of existing rights of way for the build alternatives consist of existing commercial and services, and industrial uses, respectively.

Additionally, approximately 3 percent of existing rights of way for the build alternatives consists of existing residential uses. Therefore, permanent impacts to land use as a result of Alternative 5C and Alternative 7 are considered minimal in terms of land use conversion. 3.1-2 illustrates the land use impacts to each jurisdiction shown in the above Table 3.1-1 by alternative.

Regarding commuting patterns, the I-710 Corridor Project build alternatives are intended to improve travel time and address projected traffic volumes (refer to Section 3.5, Traffic and Transportation, of this Final Environmental Impact Report/ Environmental Impact Statement (Final EIR/EIS) for additional detail regarding travel delay).

NO BUILD (ALTERNATIVE 1). Under No Build (Alternative 1), the Preferred Alternative, the permanent impacts to existing and future land uses discussed above for the build alternatives would not occur.

PUBLIC HEALTH CONSIDERATIONS. Improvement of air quality and reduction of public health risks are key elements of the project purpose for the I-710 Corridor Project. The transportation/land use relationship is a critical one relative to public health. As discussed in subsequent sections of this Final EIR/EIS, existing sensitive land uses (residences, parks, schools, etc.) directly adjacent to the I-710 are exposed to higher levels of vehicle exhaust emissions and traffic noise than occur within the overall I-710 Corridor. Avoidance, minimization, and mitigation measures were proposed to reduce the impacts resulting from the build alternatives on existing land uses. However, since the No Build (Alternative 1) was identified as the Preferred Alternative, avoidance, minimization, and mitigation measures will not be implemented.

With regard to future land uses, the California Department of Transportation (Caltrans) has no land use approval authority and, therefore, relies on the agencies responsible for land use planning (i.e., the Cities and the County of Los Angeles) to consider the proximity of the I-710 when making future land use decisions within their jurisdictions.

Discussion of public health considerations relative to air quality is provided in Section 3.13, Air Quality, and public health considerations related to noise are discussed in Section 3.14, Noise. This section discusses public health considerations relative to access to parks and schools.

3.1.1.22 AVOIDANCE, MINIMIZATION, AND/OR MITIGATION MEASURES

As previously discussed in this section, the two build alternatives would result in permanent land use impacts. However, with the implementation of Measure LU-1, long-term adverse impacts as a result of the build alternatives would have been reduced as a result of the Cities and County amending their General Plans to reflect a build alternative, should one have been identified as the Preferred Alternative. However, although the No Build (Alternative 1) was identified as the Preferred Alternative and permanent land use impacts would not occur, the adoption of this alternative would still require the amending of any General Plan to reflect the No Build (Alternative 1) as the I-710 Corridor Project is included in the majority of local and regional plans. Avoidance, minimization, and/or mitigation measures pertaining to the two build alternatives are retained in this Final EIR/EIS for disclosure purposes. Please refer to Section 3.1.2.4, Avoidance, Minimization, and Avoidance Measures, for specific language in Measure LU-1.

3.1.2 CONSISTENCY WITH STATE, REGIONAL, AND LOCAL PLANS

3.1.2.1 REGULATORY SETTING

Part of this project is within the coastal zone. The Coastal Zone Management Act of 1972 (CZMA) is the primary Federal law enacted to preserve and protect coastal resources. The CZMA sets up a program under which coastal states are encouraged to develop coastal management programs. States with an approved coastal management plan are able to review Federal permits and activities to determine if they are consistent with the state's management plan.

California has developed a coastal zone management plan and has enacted its own law, the California Coastal Act of 1976, to protect the coastline. The policies established by the California Coastal Act are similar to those for the CZMA; they include the protection and expansion of public access and recreation, the protection, enhancement and restoration of environmentally sensitive areas, protection of agricultural lands, the protection of scenic beauty, and the protection of property and life from coastal hazards. The California Coastal Commission is responsible for implementation and oversight under the California Coastal Act.

Just as the Federal CZMA delegates power to coastal states to develop their own coastal management plans, the California Coastal Act delegates power to local governments (15 coastal counties and 58 cities) to enact their own local coastal programs (LCPs). LCPs determine the short- and long-term use of coastal resources in their jurisdiction consistent with the California Coastal Act goals. A Federal consistency determination may be needed, as well.

3.1.2.2 AFFECTED ENVIRONMENT

REGIONAL AND LOCAL PLANS/POLICIES. The SCAG Regional Comprehensive Plan (RCP) and the Regional Transportation Plan (RTP), the Greater Los Angeles County Integrated Regional Water Management Plan (IRWMP) and the Open Space for Habitat and Recreation Plan (OSHARP), along with the General Plans of the affected cities and communities, were reviewed in order to identify the regional planning goals, land use-related goals, and specific policies of the local jurisdictions that should be considered in evaluating the I-710 Corridor Project.

The following are applicable goals and policies for the I-710 Corridor Project:

SCAG RCP (2008). The RCP is an advisory plan that provides a vision of how southern California can balance resource conservation, economic vitality, and quality of life. The RCP provides an approach to growth and infrastructure challenges in an integrated and comprehensive way. This approach, called the Compass Blueprint and 2 Percent Strategy, would result in substantial land use changes to only 2 percent of the total land area in the region.

Below are principles and goals from the RCP that are applicable to the I-710 Corridor Project.

RCP GUIDING PRINCIPLES.

- Improve mobility for all residents. Improve the efficiency of the transportation system by strategically adding new travel choices to enhance system connectivity in concert with land use decisions and environmental objectives.
- Foster livability in all communities. Foster safe, healthy, walkable communities with diverse services, strong civic participation, affordable housing, and equal distribution of environmental benefits.
- Enable prosperity for all people. Promote economic vitality and new economies by providing housing, education, and job training opportunities for all people.
- Promote sustainability for future generations. Promote a region where quality of life and economic prosperity for future generations are supported by the sustainable use of natural resources.

AIR QUALITY GOALS.

- Reduce emissions of criteria pollutants to attain Federal air quality standards by prescribed dates and State ambient air quality standards as soon as practicable.
- Reverse current trends in greenhouse gas emissions to support sustainability goals for energy, water supply, agriculture, and other resource areas.
- Minimize land uses that increase the risk of adverse air pollution-related health impacts from exposure to toxic air contaminants, particulates (PM₁₀, PM_{2.5}, and ultrafine particulates), and carbon monoxide.
- Expand green building practices to reduce energy-related emissions from developments to increase economic benefits to businesses and residents.

TRANSPORTATION GOALS.

- A more efficient transportation system that reduces and better manages vehicle activity.
- A cleaner transportation system that minimizes air quality impacts and is energy efficient.

SCAG Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) (2012–2035, 2016–2040, and 2020–2045). The 2012–2035, 2016–2040, and 2020–2045 RTP/SCS plans identify the transportation vision for the region through 2035, 2040, and 2045, and provide a long-term investment framework for addressing the region's transportation and

related challenges. The plans have a balanced approach that focuses future investments on the best-performing projects and strategies that seek to preserve, maintain, and optimize the performance of the existing system.

Listed below are goals and policies from the three RTP/SCS plans that are applicable to the I-710 Corridor Project:

GOALS.

- Align the plan investments with improving regional economic development and competitiveness.
- Maximize mobility and accessibility for all people and goods in the region.
- Ensure travel safety and reliability for all people and goods in the region.
- Preserve and ensure a sustainable regional transportation system.
- Maximize the productivity of our transportation system.
- Protect the environment and health for our residents by improving air quality, and encouraging active transportation (non-motorized transportation, such as bicycling and walking).
- Actively encourage and create inventiveness for energy deficiencies, where possible.
- Encourage land use and growth patterns that facilitate transit and non-motorized transportation.
- Maximize the security of the regional transportation system through improved system monitoring, rapid recovery planning, and coordination with other security agencies.
- Encourage regional economic prosperity and global competitiveness.
- Improve mobility, accessibility, reliability, and travel safety for people and goods.
- Enhance the preservation, security, and resilience of the regional transportation system.
- Increase person and goods movement and travel choices within the transportation system.
- Reduce greenhouse gas emissions and improve air quality.
- Support healthy and equitable communities.

- Adapt to a changing climate and support an integrated regional development pattern and transportation network.
- Leverage new transportation technologies and data-driven solutions that result in more efficient travel.
- Encourage development of diverse housing types in areas that are supported by multiple transportation options.

POLICIES.

- Transportation investments shall be based on SCAG's adopted regional Performance Indicators.
- Ensuring safety, adequate maintenance, and efficiency of operations on the existing multimodal transportation system should be the highest RTP/SCS priorities, for any incremental funding in the region.
- RTP land-use and growth strategies in the RTP will respect local input and advance growth initiatives.
- Transportation demand management (TDM) and non-motorized transportation will be focus areas.
- The RTP/SCS will support investments and strategies to reduce non-recurrent congestion and demand for single occupancy vehicle use by leveraging advanced technologies.
- The RTP/SCS will encourage transportation investments that will result in cleaner air, a better environment, a more efficient transportation system, and sustainable outcomes in the long term.
- Monitoring progress on all aspects of the RTP/SCS, including the timely implementation of projects, programs, and strategies, will be an important and integral component of the plans.

The 2012, 2016, and 2020 RTPs also included a Sustainable Communities Strategy (SCS) as a result of Senate Bill (SB) 375. A key goal of the SCS is to identify a vision for future growth in the SCAG region that will decrease per-capita greenhouse gas emissions from automobiles and light trucks. Included in the SCS are TDM and Transportation System Management (TSM) Actions and Strategies, including those listed below applicable to the I-710 Corridor Project:

- Examine major project strategies that reduce congestion and emissions, and optimize the productivity and overall performance of the transportation system.

- Work with relevant State and local transportation authorities to increase the efficiency of the existing transportation system.

SCAG FEDERAL Transportation Improvement Program (FTIP) (ADOPTED 2023). The FTIP is a listing of multi-modal transportation projects proposed over a four-year period (from 2023 [Federal Fiscal Year (FFY) 22/23] to 2027 [FFY 27/28]) for the SCAG region. The projects include highway improvements, transit, rail and bus facilities, high occupancy vehicle lanes, active transportation, signal synchronization, intersection improvements, and freeway ramps, etc. SCAG produces a biennial FTIP update for the region on an even-year cycle.

The FTIP is prepared to implement projects and programs listed in the above-mentioned RTP/SCS and is developed in compliance with State and Federal requirements. The six County Transportation Commissions (Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura) in the SCAG region have the responsibility under State law of proposing their county programs, using current RTP/SCS policies, programs, and projects as a guide, from among submittals by cities and local agencies. The locally prioritized lists of projects are forwarded to SCAG for review. From their lists, SCAG develops the FTIP based on consistency with the current RTP/SCS, inter-county connectivity, financial constraints, and conformity determination.

Below are FTIP policy guidelines:

POLICY GUIDELINES.

- The FTIP is the primary means of implementing the RTP/SCS.
- To ensure consistency with the RTP/SCS, SCAG staff will compare FTIP projects with the first 5 and 10-year implementation schedules of the RTP/SCS.
- Timely implementation of committed Transportation Control Measures (TCMs) projects is required for conformity findings in South Coast Air Basin (Basin) and the Ventura County/South Central Coast Air Basin (VC/SCCAB). TCM projects must be programmed prior to programming other capacity increasing projects.
- Each project in the County Transportation Improvement Program (TIP) submitted to SCAG must be consistent with and reflect investment priorities established in the most recently adopted metropolitan transportation plan, in accordance with the 2015 Fixing America's Surface Transportation Act (Pub L. No 114-95) (FAST Act). Each FTIP project must show consistency with the project's design concept, and timely implementation as reflected in the adopted RTP/SCS.
- The FTIP shall also include projects and programs consistent with the Strategic Highway Safety Plan and other transit safety and security planning and review processes, plans, and programs, as appropriate.

- In accordance with the FAST Act, applicable projects should be designed to promote progress toward achieving federal performance targets established pursuant to rulemaking provided by the U.S. Department of Transportation.
- To ensure successful compliance with Senate Bill 375, SCAG in collaboration with the County Transportation Commissions (CTCs) shall work to achieve full compliance with the approved SCS. The CTCs will ensure that transportation infrastructure investments proposed in the counties' individual Long Range Transportation Plans (LRTP) shall complement strategies identified in SCAG's RTP/SCS.

GREATER LOS ANGELES COUNTY INTEGRATED REGIONAL WATER MANAGEMENT PLAN (IRWMP) (2014). The following is the objective in the Greater County of Los Angeles County IRWMP (2014) that is relevant to the I-710 Corridor Project:

OBJECTIVE

- Enhance open space and recreation through the increase of watershed friendly recreational space for all communities.
 - Plan Year 2035 Targets:
 - Create 38,000 acres of open space.
 - Create 25,000 acres of urban parks.

GREATER LOS ANGELES COUNTY OPEN SPACE FOR HABITAT AND RECREATION PLAN (OSHARP) (2012) AND DRAFT FINAL OPEN SPACE FOR HABITAT AND RECREATION TECHNICAL MEMORANDUM (OSHARTM) (OCTOBER 2013). The following are the objectives in the Greater Los Angeles County OSHARP (2012) and Draft Final Greater Los Angeles County OSHARTM (October 2013), which are included as an appendix to the above-discussed Greater Los Angeles County IRWMP and that are relevant to the I-710 Corridor Project:

OBJECTIVES

- Developed urban parks: Assist in providing developed urban park areas that are accessible to underserved populations (and District Advisory Commission [DAC] communities) based on an average of 4 acres per 1,000 population.
- Passive recreation: Create or assure the preservation of 6 acres of open space lands per 1,000 population that are available for passive recreation. These lands may incorporate: all or a portion of greenways; county, state, or national parks; US Forest Service lands; regional trails routes; and/or dedicated open space areas or any jurisdiction.

- Greenways: Enhance existing and planned greenways and regional trails within open space areas with outdoor recreation and environmental educational opportunities.

2035 COUNTY OF LOS ANGELES GENERAL PLAN (2015). The following are goals and policies in the County of Los Angeles General Plan (October 2015) that are relevant to the I-710 Corridor Project:

GUIDING PRINCIPLES

- Employ Smart Growth: Shape new communities to align housing with jobs and services; and protect and conserve the County's natural and cultural resources, including the character of rural communities.
- Ensure community services and infrastructure are sufficient to accommodate growth: Coordinate an equitable sharing of public and private costs associated with providing appropriate community services and infrastructure to meet growth needs.
- Provide the foundation for a strong and diverse economy: Protect areas that generate employment and promote programs that support a stable and well-educated workforce. This will provide a foundation for a jobs-housing balance and a vital and competitive economy in the unincorporated areas.
- Promote excellence in environmental resource management: Carefully manage the County's natural resources, such as air, water, wildlife habitats, mineral resources, agricultural land, forests, and open space in an integrated way that is both feasible and sustainable.
- Provide healthy, livable and equitable communities: Design communities that incorporate their cultural and historic surroundings, are not overburdened by nuisance and negative environmental factors, and provide reasonable access to food systems. These factors have a measurable effect on public well-being.

LAND USE ELEMENT.

- **Goal LU 1:** A General Plan that serves as the constitution for development, and a Land Use Policy Map that implements the General Plan's Goals, Policies and Guiding Principles.
- **Goal LU-2:** Community-based planning efforts that implement the General Plan and incorporate public input, and regional and community level collaboration.
 - **Policy LU 2.5:** Support and actively participate in inter-jurisdictional and regional planning efforts to help inform community-based planning efforts.

- **Policy LU 2.8:** Coordinate with the Los Angeles County Department of Public Works and other infrastructure providers to analyze and assess infrastructure improvements that are necessary for plan implementation.
- **Goal LU-9:** Land use patterns and community infrastructure that promote health and wellness.

MOBILITY ELEMENT.

- **Goal M-1:** Street designs that incorporate the needs of all users.
 - **Policy M 1.1:** Provide for the accommodation of all users, including pedestrians, motorists, bicyclists, equestrians, users of public transit, seniors, children, and persons with disabilities when requiring or planning for new, or retrofitting existing, transportation corridors/networks whenever appropriate and feasible.
- **Goal M2:** Interconnected and safe bicycle- and pedestrian-friendly streets, sidewalks, paths, and trails that promote active transportation and transit use.
 - **Policy M 2.1:** Provide transportation corridors/networks that accommodate pedestrians, equestrians, and bicyclists, and reduce motor vehicle accidents through a context-sensitive process that addresses the unique characteristics of urban, suburban, and rural communities whenever appropriate and feasible.
- **Goal M6:** The safe and efficient movement of goods.
 - **Policy M 6.1:** Maximize aviation and port system efficiencies for the movement of people, goods, and services.
 - **Policy M 6.4:** Minimize noise and other impacts of goods movement, truck traffic, deliveries, and staging in residential and mixed-use neighborhoods.
 - **Policy M 6.5:** Support infrastructure improvements and the use of emerging technologies that facilitate the clearance, timely movement, and security of trade.
- **Goal M7:** Transportation networks that minimizes negative impacts to the environment and communities.

AIR QUALITY ELEMENT.

- **Goal AQ 1:** Protection from exposure to harmful air pollutants.
 - **Policy AQ 1.3:** Reduce particulate inorganic and biological emissions from construction, grading, excavation, and demolition to the maximum extent feasible.
 - **Policy AQ 1.4:** Work with local air quality management districts to publicize air quality warnings, and to track potential sources of airborne toxics from identified mobile and stationary sources.
- **Goal AQ 2:** The reduction of air pollution and mobile source emissions through coordinated land use, transportation, and air quality planning.
 - **Policy AQ 2.2:** Participate in, and effectively coordinate the development and implementation of community and regional air quality programs.
- **Goal AQ 3:** Implementation of plans and programs to address the impacts of climate change.
 - **Policy AQ 3.4:** Participate in local, regional, and State programs to reduce greenhouse gas emissions.

NOISE ELEMENT.

- **Goal N 1:** The reduction of excessive noise impacts.
 - **Policy N 1.4:** Enhance and promote noise abatement programs in an effort to maintain acceptable levels of noise as defined by the Los Angeles County Exterior Noise Standards and other applicable noise standards.
 - **Policy N 1.6:** Ensure cumulative impacts related to noise do not exceed health-based safety margins.
 - **Policy N 1.7:** Utilize traffic management and noise suppression techniques to minimize noise from traffic and transportation systems.
 - **Policy N 1.8:** Minimize noise impacts to pedestrians and transit-riders in the design of transportation facilities and mobility networks.

COUNTY OF LOS ANGELES BICYCLE MASTER PLAN (2012). This plan is a sub-element of the Transportation Element (also known as the Mobility Element) of the Los Angeles County's General Plan. This plan provides guidance to the County's Bikeway Unit in the implementation of adding 831 miles of new bikeways in the County over the next 20 years. The overarching goal of the Plan is to increase bicycling throughout the County of Los

Angeles through the development and implementation of bicycle friendly policies, programs, and infrastructure. The Plan identified the following goals:

- **Goal 1 - Bikeway System:** Expanded, improved, and interconnected system of County bikeways and bikeway support facilities.
- **Goal 2 - Safety:** Increased safety of roadways for all users.
- **Goal 3 - Education:** Develop education programs that promote safe bicycling.
- **Goal 4 - Encouragement Programs:** Encourage County residents to walk or ride a bike for transportation and recreation.
- **Goal 5 - Community Support:** Community supported bicycle network.
- **Goal 6 - Funding:** Funded Bikeway Plan.

Goals that are specifically related to the I-710 Corridor Project include:

- **Goal IA 1.1.1** - Propose and prioritize bikeways that connect to transit stations, commercial centers, schools, libraries, cultural centers, parks, and other important activity centers within each unincorporated area and promote bicycling to these destinations.
- **Goal IA1.1.2** - Coordinate with adjacent jurisdictions and Metro to implement bicycle facilities that promote connectivity.

CITY OF BELL. The following are goals and policies in the City of Bell 2010 General Plan (1996) that are relevant to the I-710 Corridor Project. The General Plan did not provide any specific goals or policies related to air quality.

CIRCULATION ELEMENT.

- **Policy 1:** Continue to participate in regional transportation planning efforts.
- **Policy 2:** Continue to work with adjacent cities to improve area-wide circulation.
- **Policy 3:** Continue to pursue the construction of a Slauson Ave. interchange at I-710.
- **Policy 4:** Continue to initiate the design and engineering of roadway improvement projects.
- **Policy 5:** Continue to pursue and access State and Federal and County funding sources for improving the circulation system.
- **Policy 7:** Continue to require new development proposals to include design features which will mitigate any adverse impact upon the circulation system.

LAND USE ELEMENT.

- **Policy 1:** Ensure that development activities are consistent with the General Plan.
- **Policy 10:** Expand public facilities to meet community needs and demands.
- **Policy 15:** Evaluate traffic and circulation needs to plan for future capital improvements.
- **Policy 19:** Cooperate closely with agencies responsible for public services and facilities.
- **Policy 22:** Participate in regional planning efforts.

CITY OF BELL GARDENS. The following are issues and policies in the City of Bell Gardens 2010 General Plan that are relevant to the I-710 Corridor Project.

LAND USE ELEMENT. The City of Bell Gardens 2010 General Plan Land Use Element includes policies guided by five major issues to provide a framework for the City's vision for the future: "Pride in the Community/Orgullo en la Comunidad." The five key issues include: property rights, residential development, commercial development, industrial and manufacturing development, and promotion of local businesses and jobs. These issues are addressed in five policies included in the Land Use Element; the policies applicable to the I-710 Corridor Project are provided below.

- **Policy 1:** The City of Bell Gardens decision-makers shall maintain open communication with the community at all times and shall tirelessly seek input from the residents and property owners regarding the future of the City.
- **Policy 3:** The City shall promote compatible commercial development to emphasize commercial identity and to enhance the appearance, potential economic vitality, and revitalization of the commercial areas in the City.

CIRCULATION AND TRANSPORTATION ELEMENT. The Circulation and Transportation Element focuses on key transportation-related issues and identifies roadways, highways, and public utilities that need to be expanded or improved within the city. As identified in the Element, several streets in the city are operating at over-capacity conditions (Florence Ave., west of Eastern Ave. and east of Jaboneria Rd., and Clara St. west of Eastern Ave.), and the City Public Works Department is holding discussions with Caltrans to improve the ramps and signals in the Central Business District area. The Circulation and Transportation Element identifies four policies to address these issues; the policies applicable to the I-710 Corridor Project are provided below.

- **Policy 1:** The City of Bell Gardens shall strive to maintain a well-balanced street system, with special emphasis on circulation problems in the downtown area, and seeking innovative and model solutions to local transportation needs.
- **Policy 2:** The City shall encourage the implementation of new and innovative modes of transportation, while striving to provide for the needs of those who require specialized types of service.
- **Policy 4:** The City shall assist traffic flow along its major streets through improved signalization and other modifications to the City's circulation system.

CITY OF CARSON. The following are goals and policies in the City of Carson's General Plan that are relevant to the I-710 Corridor Project.

TRANSPORTATION ELEMENT.

- **Goal TI-2:** Provide a sustainable, safe, convenient, and cost-effective circulation system to serve the present and future transportation needs of the Carson community.
 - **Policy TI-2.5:** Facilitate cooperation between the City and the transportation agencies serving the region in order to provide adequate regional vehicular traffic volumes and movements on freeways, streets and through intersections.
 - **Policy TI-2.7:** Provide all residential, commercial, and industrial areas with efficient and safe access to major regional transportation facilities.
- **Goal TI-3:** Minimize intrusion of commuter traffic on local streets through residential neighborhoods.
 - **Policy TI-3.3:** Prioritize circulation improvements that enhance through traffic flow on Major and Secondary Highways providing parallel routes to residential streets, in order to reduce through traffic during peak commute periods.
- **Goal TI-6:** Cooperate to the fullest extent possible with Federal, State, County and regional planning agencies responsible for maintaining and implementing circulation standards to ensure orderly and consistent development of the entire South Bay region.
 - **Policy TI-6.1:** Actively participate in various intergovernmental committees and related planning forums associated with County, Regional and State Congestion Management Programs.

- **Policy TI-6.2:** Ensure that the City remains in compliance with County, Regional, and State Congestion Management Programs (CMP) through the development of appropriate City programs and traffic impact analyses of new projects impacting the CMP routes.

LAND USE ELEMENT.

- **Goal LU-6:** A sustainable balance of residential and non-residential development and a balance of traffic circulation throughout the City.
 - **Policy LU-6.2:** Achieve a sustainable land use balance through provision of incentives for desired uses; coordination of land use and circulation patterns; and promotion of a variety of housing types and affordability.
- **Goal LU-14:** Enhance freeway corridors and major arterials which act as gateways into the City of Carson.
 - **Policy LU-14.1:** Work with Caltrans to provide and maintain an attractive freeway environment in Carson, including access ramps.

ECONOMIC DEVELOPMENT ELEMENT.

- **Goal ED-1:** Strengthen existing City services and support systems.
 - **Policy ED-1.4:** Strengthen the physical image of Carson through visual enhancement along freeway corridors, major traffic routes, and areas adjoining residential neighborhoods. To this end:
 - Aggressively pursue code enforcement activities;
 - Develop good design standards; and
 - Establish a City identity.

AIR QUALITY ELEMENT.

- **Goal AQ-1:** Reduce particulate emissions from paved and unpaved surfaces and during building construction.
 - **Policy AQ-1.1:** Continue to enforce ordinances which address dust generation and mandate the use of dust control measures to minimize this nuisance.
 - **Policy AQ-1.2:** Promote the landscaping of undeveloped and abandoned properties to prevent soil erosion and reduce dust generation.

- **Policy AQ-1.3:** Adopt incentives, regulations, and/or procedures to minimize particulate emissions.
- **Goal AQ-2:** Air Quality which meets State and Federal standards.
 - **Policy AQ-2.1:** Coordinate with other agencies in the region, particularly SCAQMD and SCAG, to implement provisions of the regions' Air Quality Management Plans (AQMP), as amended.
 - **Policy AQ-2.3:** Cooperate and participate in regional AQMP, programs and enforcement measures.

CITY OF COMMERCE. The following are goals and policies in the City of Commerce 2020 General Plan (2006) that are relevant to the I-710 Corridor Project.

TRANSPORTATION ELEMENT.

- **Transportation Policy 1.1:** The City of Commerce will continue to implement a comprehensive plan for a coordinated street, circulation system that will provide for the safe and efficient movement of people and goods.
- **Transportation Policy 4.5:** The City of Commerce will initiate discussions with the City of Vernon and Caltrans regarding future freeway improvements.
- **Transportation Policy 4.11:** The City of Commerce will consult with Caltrans in considering the feasibility of constructing a direct ramp connection from the Long Beach Freeway to the adjacent rail yards as a means to reduce truck traffic on local streets.
- **Transportation Policy 6.1:** The City of Commerce will ensure that all future transportation facilities that will provide a regional benefit do not have a significant adverse impact on the community and that any such impacts are mitigated to the fullest extent possible.
- **Transportation Policy 6.2:** The City of Commerce will oppose any regional public transportation improvement that does not first consider the potential impacts of such facilities on the local community in which the facility will be located.
- **Transportation Policy 6.3:** The City of Commerce will take a proactive role in meeting with regional planning agencies to ensure that the local community's voice is heard in the planning for future regional transportation facilities.

One of the key programs that the City will continue to implement or undertake as part of the implementation of the General Plan is the Caltrans Coordination Program.

- **Caltrans Coordination Program:** The City will coordinate efforts with Caltrans to upgrade area freeways. The purpose of this undertaking is to ensure that the City is fully apprised of the improvement efforts in the early stages of planning and design. The City will continue to work with Caltrans and the Metropolitan Transportation Authority (Metro), as appropriate, and will request to be on all notification lists for future projects that may impact the City.

CITY OF COMPTON. The following are goals and policies in the City of Compton General Plan Vision 2010 that are relevant to the I-710 Corridor Project.

Several of the following goals and policies are identified as short-term (S), medium-range (M), or long-range (L) goals. Short-term covers a five-year planning period, medium-range includes a five to ten-year planning period, and long-range indicates goals to be achieved over a 20-year time frame or policies that represent ongoing City policies and programs.

CIRCULATION ELEMENT.

- **Goal 1.0 (L):** Provide a street system that meets current and future City needs and that facilitates the safe and efficient movement of people and goods throughout Compton.
 - **Policy 1.8 (L):** Provide a street system that allows for the safe and efficient movement of traffic.
 - **Policy 1.14 (S):** Minimize the impact of Major and Secondary street “spill over” traffic on residential neighborhoods by installing traffic diverters, restrictive channelization, additional signals, and other features which will discourage through traffic.
- **Goal 4.0 (L):** Use Transportation Demand Management strategies to minimize the number of average daily vehicle trips along City Streets.
 - **Policy 4.7 (S):** Consider enacting an ordinance, which prohibits truck deliveries during peak traffic periods.
- **Goal 5.0 (L):** Balance the use of regional freight routes with the need to protect community welfare.
 - **Policy 5.4 (L):** Continue to enforce the ordinance establishing truck routes and limiting through truck traffic to those routes.

CITY OF CUDAHY. The following are goals and policies in the City of Cudahy General Plan that are relevant to the I-710 Corridor Project.

TRANSPORTATION ELEMENT.

- **Goal 1:** The City of Cudahy will maximize the efficiency, convenience, and safety of the existing transportation system.
- **Goal 3:** The City of Cudahy will encourage the expansion of existing public transportation routes and circulation.
 - **Policy 3.3:** The City of Cudahy will support the continued development of a regional transportation system that will serve area residents.
- **Interagency Coordination:** The City of Cudahy shall continue to work with adjacent cities and other agencies (the Los Angeles County Metropolitan Transportation Authority [Metro]) and the California Department of Transportation [Caltrans]) for the planning of transportation needs of the area. This includes the coordination of public transit programs, congestion management, traffic improvements and other transportation programs. The City will continue to be involved in the development of State and regional transportation plans which may impact the City's circulation system. This includes the County Congestion Management Plan and plans for the Long Beach Freeway.

AIR QUALITY ELEMENT.

- **Goal 4:** The City of Cudahy will reduce Roadway Congestion.
 - **Policy 4.1:** The City of Cudahy will encourage truck operations to divert peak hour travel, whenever feasible, to off peak periods to reduce roadway congestion and associated emissions.
- **Goal 8:** Reduce fugitive dust emissions.
 - **Policy 8.1:** The City of Cudahy will require all feasible fugitive dust reduction techniques to be utilized during construction activities.
 - **Policy 8.3:** The City of Cudahy will require reseeding and maintenance of exposed soil that has been previously disturbed.
 - **Policy 8.4:** The City of Cudahy will encourage landscaping and tree planting which trap pollutants and protect sensitive receptors.
- **Goal 10:** The City of Cudahy will improve preconstruction environmental review to reduce emissions and exposure.
 - **Policy 10.2:** The City of Cudahy will facilitate project review and avoid project delays by adopting regional thresholds of significant air quality impact.

- **Policy 10.3:** The City of Cudahy will provide, to the maximum extent feasible, for the protection of receptors from significant health risks caused by exposure to toxic and hazardous pollutants.
- **Policy 10.4:** The City of Cudahy will reduce the exposure of sensitive receptors to dust and odors to the extent feasible.
- **Goal 11:** The City of Cudahy will maximize the effectiveness of air quality control programs through coordination with other governmental units.
 - **Policy 11.1:** The City of Cudahy will participate in the South Coast Air Quality Management District (SCAQMD) rule development process on regulations which impact the City of Cudahy to insure that city concerns are resolved early in the process.
 - **Policy 11.2:** The City of Cudahy will participate in air quality plan development at the Southern California Association of Governments to insure that issues affecting Cudahy are considered in developing local government measures and that legislation that improves air regional quality and does not adversely impact Cudahy is supported.
- **Goal 13:** The City of Cudahy will reduce directly emitted vehicle emissions through city government actions.
 - **Policy 13.1:** The City of Cudahy will work with surrounding communities to reduce idling emissions by increasing traffic flow on major thoroughfares by synchronizing traffic signals.

NOISE ELEMENT.

- **Goal 1:** The City of Cudahy will prevent any increase in the established acceptable ambient levels of sound in residential areas of the community.
 - **Policy 1.1:** The City of Cudahy will consider the inclusion of noise-impacted areas in redevelopment or other programs, which would permit assistance for the residents with relocation, rehabilitation, or insulation of their structures and properties.
 - **Policy 1.2:** The City of Cudahy will consider steps to correct existing noise problem areas through the establishment of buffers and barriers or through abatement procedures.
 - **Policy 1.3:** The City of Cudahy will discourage the location of unbuffered noise sources near residential areas and schools.

- **Goal 2:** The City of Cudahy will prohibit unnecessary, excessive, and offensive noises, which are detrimental to the public health and welfare and contrary to the public interest.
 - **Policy 2.2:** The City of Cudahy will control at their sources, any sounds, which exceed accepted community noise levels.
 - **Policy 2.3:** The City of Cudahy will limit construction activities to daytime hours to reduce construction noise impacts.

CITY OF DOWNEY. The following are goals and policies in the City of Downey Vision 2025 General Plan (2005) that are relevant to the I-710 Corridor Project.

CIRCULATION ELEMENT.

- **Goal 2.1:** Increase the capacity of the existing street system.
 - **Policy 2.1.1:** Maintain a street system that provides safe and efficient movement of people and goods.
- **Goal 2.4:** Reduce adverse impacts onto city streets from traffic traveling through the region.
 - **Policy 2.4.1:** Discourage the use of city streets as through routes for traffic traveling through the region.
 - **Program 2.4.1.1:** Coordinate with the California Department of Transportation (Caltrans), the Los Angeles County Metropolitan Transportation Authority (Metro), SCAG, Gateway Cities Council of Governments and other agencies to promote multi-modal improvement strategies to improve the regional transportation network.
 - **Program 2.4.1.3:** Support efforts to upgrade the I-710 freeway to address and restrict container truck traffic.

LAND USE ELEMENT.

- **Goal 1.4:** Protect and enhance the residential neighborhoods.

CONSERVATION ELEMENT.

- **Goal 4.5:** Encourage activities that improve air quality.
 - **Policy 4.5.1:** Pursue every available means and opportunities to reduce air particulate and pollutants within the city and region.
 - **Program 4.5.1.1:** Coordinate with other agencies, including school districts, transit agencies, and regional agencies, including South Coast Air Quality Management District and the SCAG, in their efforts to implement the regional Air Quality Management Plan and otherwise improve air quality.
 - **Program 4.5.1.2:** Support regional and subregional efforts in strategically managing goods movements in order to reduce emissions from truck traffic.
 - **Program 4.5.1.3:** Reduce air particulate and other pollutants created by, but not limited to the operation of diesel engine and increased truck traffic from marine and port operations in the Long Beach and Los Angeles ports and City operations, especially along the I-710 freeway corridor.
 - **Program 4.5.1.6:** Promote community participation in developing strategies and projects addressing air quality, such as Tier 2 I-710 corridor citizen advisory committee.
 - **Program 4.5.1.7:** Pursue means to prohibit unnecessary operation of engines.

NOISE ELEMENT.

- **Goal 6.1:** Protect persons from exposure to excessive noise.
 - **Policy 6.1.1:** Minimize noise impacts onto noise-sensitive uses.
 - **Program 6.1.1.1:** Enforce noise standards.
 - **Program 6.1.1.2:** Ensure that new developments within areas with exterior noise at unacceptable levels are designed to maintain interior noise levels at acceptable levels.
 - **Program 6.1.1.3:** Continue to enforce provisions prohibiting construction activities during noise-sensitive hours.
 - **Program 6.1.1.4:** Encourage the use of different construction methods, including insulation, for new developments to reduce noise impacts generated by other land uses and traffic.

- **Program 6.1.1.5:** Discourage the establishment of noise-sensitive land uses within areas where noise cannot be mitigated.
 - **Program 6.1.1.6:** Consider the establishment of a program to retrofit to acceptable noise levels, noise-sensitive land uses within areas with exterior noise are at unacceptable levels.
- **Goal 6.2:** Protect persons from exposure to excessive noise generated by various modes of transportation.
 - **Policy 6.2.1:** Reduce noise generated by vehicular traffic.
 - **Program 6.2.1.1:** Coordinate with and encourage Caltrans to install and maintain freeway sound walls especially providing sound walls for the south side of the I-5 Freeway east of Lakewood Blvd. adjacent to Dennis the Menace Park.
 - **Program 6.1.1.3:** Continue to work with Metro and other transit agencies towards minimizing noise impacts by discouraging the use of local residential streets as transit routes.

CITY OF HUNTINGTON PARK. The following are goals and policies in the City of Huntington Park General Plan that are relevant to the I-710 Corridor Project.

CIRCULATION ELEMENT.

- **Goal 1:** Provide a system of streets that meets the needs of current and future residents and facilitates the safe and efficient movement of people and goods throughout the City.
 - **Policy 1.4:** Coordinate street system improvements and signalization with regional transportation efforts.
- **Goal 2:** Support development of a network of regional roadway facilities which ensure the safe and efficient movement of people and goods from within the City areas outside its boundaries, and which accommodate regional travel demands.
- **Goal 3:** Maximize the efficiency of the circulation system through the use of transportation system management and demand management strategies.

OPEN SPACE AND CONSERVATION ELEMENT.

- **Goal 1.0:** Reduce the air pollution through land use, transportation, and energy use planning.

- **Policy 1.1:** Endorse regional and local air quality and transportation management plans in order to reduce air pollution emissions and vehicular trips.

CITY OF LAKEWOOD. The following are goals and policies in the City of Lakewood General Plan that are relevant to the I-710 Corridor Project.

CIRCULATION ELEMENT.

- **Goal 1:** Maintain a fully developed network of arterial and collector streets which permit the safe and efficient movement of people and goods in harmony with the environment.
 - **Policy 1.4:** Coordinate with other jurisdictions to develop a system of highways and arterials, which meet the demand for regional transportation.

AIR QUALITY ELEMENT.

- **Goal 1:** Effective coordination of air quality improvement efforts in Lakewood and the region.
 - **Policy 1.1:** Recognize that air pollutants are not constrained by political boundaries and that the policies of each community may adversely affect others. That is why strategies to improve air quality must be coordinated among governments.

CITY OF LONG BEACH. The following are goals and policies in the City of Long Beach General Plan (1997) and the Land Use Element (2019) that are relevant to the I-710 Corridor Project.

LAND USE ELEMENT (2019).

- **Goal No. 1:** Implement Sustainable Planning and Development Practices
 - **Strategy No. 1:** Support sustainable urban development patterns.
 - **LU Policy 1-4:** Require sustainable design strategies to be integrated into public and private development projects.
- **Goal No. 7:** Provide Reliable Public Facilities and Infrastructure to Encourage Investment
 - **Strategy No. 17:** Improve public infrastructure to serve new development, established neighborhoods, commercial centers, industry and regional-serving facilities.

- **LU Policy 17-2:** Maintain adequate and sustainable infrastructure systems to protect the health and safety of all Long Beach residents, businesses, institutions, and regional-serving facilities
- **LU Policy 17-3:** Prioritize improvements in underserved neighborhoods to remedy deficiencies in infrastructure, public facilities and services.

MOBILITY ELEMENT (2013).

- **Goal No. 1:** Create an efficient, balanced, multimodal mobility network.
 - **Strategy No. 3:** Strategically improve congested intersections and corridors.
 - **Mobility of People (MOP) Policy 3-1:** Make strategic improvements to intersections and corridors to improve the flow of vehicle traffic.
 - **Strategy No. 5:** Reduce the environmental impacts of the transportation system.
 - **Objective 1:** Maintain traffic and transportation service levels at Level of Service “D” or at the 1987 level of service (LOS) where that LOS was worse than “D.”
 - **Objective 2:** Accommodate reasonable, balanced growth.
 - **Objective 3:** Maintain or enhance our quality of life.
- **Goal No. 2:** Maintain and enhance air, ground, and water transportation capacity.
- **Goal No. 3:** Lead the Region by Example with Innovative and Experimental Practices.
 - **Strategy No. 12:** Be a leading collaborator on transportation issues related to the regional mobility of goods.
 - **Mobility of Goods (MOG) Policy 12-1:** Maintain Long Beach as the hub for regional goods movement and as a gateway to national and international suppliers and markets while mitigating impacts of goods movement on the local community.
 - **MOG Policy 12-2:** Participate in the development and implementation of long-range regional plans. This includes plans

that address regional commercial air carrier capacity to accommodate forecasted air cargo demands. Plans also include the integration of freight trucking connections to the regional aviation system.

- **MOG Policy 12-3:** Coordinate with Caltrans to ensure that regional highway improvements aid in the movement of goods from the Ports of Long Beach and Los Angeles, while also mitigating impacts to Long Beach neighborhoods and the environment.
- **Strategy No. 13:** Develop freight-related improvements consistent with the regional transportation network.
 - **MOG Policy 13-7:** Minimize the effects of truck traffic during peak times of the day on local streets and on the I-710 Freeway.
 - **MOG Policy 13-8:** Support infrastructure improvements and use of emerging technologies that will facilitate the clearance, timely movement, and security of domestic and international trade. This includes facilities for the efficient intermodal transfer of goods between truck, rail, marine, and air transportation modes.
 - **MOG Policy 13-9:** Provide for the efficient circulation of truck and rail traffic within the Port and on the regional transportation network.
- **Strategy No. 14:** Reduce the air quality impacts of freight transportation and Port-related traffic.
 - **MOG Policy 14-1:** Provide for the efficient, clean, and safe movement of goods to support the commerce industry.
 - **MOG Policy 14-3:** Reduce congestion on freeways and designated truck routes.
- **Strategy No. 15:** Mitigate the impacts of increased freight transportation.
 - **MOG Policy 15-1:** Support programs and projects that reduce conflicts between trucks and autos on freeways such as dedicated freight corridors separating heavy trucks from autos.
 - **MOG Policy 15-2:** Minimize conflicts between trucks and other modes, especially bicycles and pedestrians.
 - **MOG Policy 15-10:** Support programs that reduce truck traffic on I-710 during peak commute hours, such as the Port's PierPass Program.

- **MOG Policy 15-11:** Continue to work with Metro on the I-710 Corridor Project to assess the possible impacts and benefits to the City.
- **MOG Policy 15-12:** Vigorously support increased east-west pedestrian and bicycle connectivity related to the I-710 Corridor Project, including streetscape improvements and new pedestrian and bicycle facilities.

AIR QUALITY ELEMENT (1996).

- **Goal 1:** Effective coordination of air quality improvement efforts in the South Coast Air Basin, the Southeast Los Angeles County (SELAC) subregion of SCAG, and other agencies.
 - **Policy 1.2:** Encourage Community Participation.
- **Goal 2:** A diverse and efficient ground transportation system that minimizes air pollutant emissions.
 - **Policy 2.1.1:** Reduce Vehicle Trips.
 - **Policy 2.1.2:** Reduce Vehicle Miles Traveled.
 - **Policy 2.1.3:** Increase cost-effectiveness of transportation and parking systems.
 - **Policy 2.2.1:** Modify Work Schedules.
 - **Policy 2.3.1:** Expand Transit in the City and the Region.
- **Goal 4:** Minimize feasible emissions from the Ports of Long Beach and Los Angeles.
 - **Policy 4.1:** Minimize emissions from ships.
 - **Policy 4.2:** Reduce the impacts of rail-related emissions on Long Beach neighborhoods and the downtown.
 - **Policy 4.3:** Monitor particulate pollution at the Ports and locations downwind, and pursue methods of reducing emissions while accommodating needed growth.
- **Goal 6:** Minimize particulate emissions from the construction and operation of roads and buildings, from mobile sources, and from the transportation, handling, and storage of materials.
 - **Policy 6.1:** Dust Control.

- **Goal 7:** Reduce emissions through reduced energy consumption.
 - **Policy 7.1:** Energy Conservation.
 - **Policy 7.2:** Recycle Wastes.

NOISE ELEMENT (1975).

- **General Noise Goal:** The City desires to attain a healthier and quieter environment for all its citizens while maintaining a reasonable level of economic progress and development.
- **Noise Goal Related to Land Use Planning:** To protect and preserve both the property rights of owners and the right to quietness of the citizenry at large.
 - **Strategy No. 6:** Locate and mitigate noise impacts from highways and freeways on residential land uses and institutional, recreational and school facilities.
- **Goal Related to Noise Environment:** To make the City a quieter, more pleasant place to live.
 - **Strategy No. 3:** To foster and promote cooperation of private organizations and public agencies to upgrade the level of community serenity.
 - **Strategy No. 4:** To apply zoning, noise ordinance and other legislation to prevent an increase of noise levels and occurrences.
 - **Strategy No. 5:** To enact a strong anti-noise ordinance, including limits on transportation, industrial, construction and population noise.
 - **Strategy No. 6:** To describe the noise problem areas which are within local control.
 - **Strategy No. 7:** To continue to take restorative measures to remedy and reduce high noise areas within the City.
- **Goal Related to Transportation Noise:** Diminish the transportation roar that impacts the population.
 - **Strategy No. 1:** Recommending a plan for compatible uses for those portions of Long Beach within transportation noise zones.
 - **Strategy No. 2:** Discouraging within transportation noise zones the development of noise sensitive uses that cannot be sufficiently insulated against externally generated noise at reasonable cost.

- **Strategy No. 3:** Developing a long-range re-allocation of noise sensitive land uses away from transportation noise impact areas.
 - **Strategy No. 4:** Providing standards and criteria for noise emissions from transportation facilities.
 - **Strategy No. 5:** Cooperating with State and the Long Beach Unified School District in the reduction of traffic noise around school grounds.
 - **Strategy No. 8:** Reducing the level of noise exposure from surface transportation in problem areas not pre-empted by State or Federal law.
- **Noise Goal Related to Public Health and Safety:** Attainment of the lowest possible level of harmful effects of noise on the people by the implantation of information, monitoring and advisory programs.
 - **Strategy No. 3:** To continue to reduce excessive traffic noise in problem areas by the construction of sound barriers, further synchronization of traffic lights, and posting of “quiet zone” signs around hospitals and other highly noise sensitive land uses.

THE CITY OF LONG BEACH COMMUNITY LIVABILITY PLAN (2008). The City of Long Beach Public Works developed an initiative to address the quality of life issues for City neighborhoods that are affected by the I-710 freeway. The plan, the *Community Livability Plan: I-710 Corridor Neighborhoods* was approved by the City in February 2008. The City developed the following two primary goals for the Community Livability Plan:

- To work with the I-710 corridor neighborhoods to identify and develop plans to address the impacts they are experiencing from the operation of the I-710 freeway, and
- To develop a series of action strategies and design solutions to improve the physical environment for residents in those neighborhoods.

THE CITY OF LONG BEACH DOWNTOWN & TRANSIT-ORIENTED DEVELOPMENT (TOD) PEDESTRIAN MASTER PLAN (2016). The Long Beach Downtown and TOD Pedestrian Master Plan provides a blueprint for achieving a multi-use vision for streets that provide safe and direct connections to the Metro Blue Line, while at the same time reaching their potential for enhanced community life, recreational opportunities, and ecological benefits. The Downtown and TOD Pedestrian Master Plan identifies high-priority, catalytic infrastructure investments that the City of Long Beach can implement within a planning area adjacent to the Metro Blue Line between I-405 and the waterfront in Downtown Long Beach over the next 15 years, as well as policies, funding strategies, and programs for implementation. The following goal and policies in the Long Beach Pedestrian Master Plan (2016) are relevant to the I-710 Corridor Project.

- **Goal:** Invest in pedestrian infrastructure that is legible, safe, predictable, and allows a broad range of transit users, including commuters, the disabled, youth, and elderly populations, and those who are transit-dependent, to easily access the system. Balance investments throughout the project area and among modes, with consideration given to non-motorized forms of transportation.
 - **Policy E-1:** Focus infrastructure funding in areas of Long Beach that are historically underserved.
 - **Policy E-2:** Invest in all modes of transportation, with a greater emphasis on non-motorized transportation options that promote pedestrian safety, encourage active living, and foster economic activity.
 - **Policy E-4:** Ensure that all public right-of-way improvements are in compliance with the Americans with Disabilities Act and include features such as curb ramps, clear pathways, tactile strips, and audible signals for the blind.

CITY OF LOS ANGELES. The following are goals and policies in the City of Los Angeles General Plan that are relevant to the I-710 Corridor Project.

TRANSPORTATION ELEMENT.

- **Goal A:** Adequate accessibility to work opportunities and essential services, and acceptable levels of mobility for all those who live, work, travel, or move goods in Los Angeles.
 - **Objective 1:** Expand neighborhood transportation services and programs to enhance neighborhood accessibility.
 - **Policy 1.1:** Establish highway and transit accessibility measures to be used in evaluating the transportation needs of the City's communities.
 - **Objective 2:** Mitigate the impacts of traffic growth, reduce congestion, and improve air quality by implementing a comprehensive program of multimodal strategies that encompass physical and operational improvements as well as demand management.
 - **Policy 2.1:** Evaluate the benefits of major transportation projects based on movement of persons and goods, rather than vehicle-movement, and look for opportunities on the arterial system to enhance ridesharing and transit.

- **Policy 2.2:** Cooperate with regional agencies to establish regionwide TDM programs to achieve regional trip reductions and/or increased vehicle occupancy.
- **Policy 2.28:** Establish priority corridors for arterial street capital improvements.
- **Policy 2.29:** Consider highway infrastructure investments primarily along severely congested corridors.

LAND USE ELEMENT.

- **Goal 3A:** A physically balanced distribution of land uses that contributes towards and facilitates the:
 - City's long-term fiscal and economic viability;
 - Revitalization of economically depressed areas;
 - Conservation of existing residential neighborhoods;
 - Equitable distribution of public resources;
 - Conservation of natural resources;
 - Provision of adequate infrastructure and public services;
 - Reduction of traffic congestion and improvement of air quality;
 - Enhancement of recreation and open space opportunities;
 - Assurance of environmental justice and a healthful living environment; and
 - Achievement of the vision for a more livable city.
 - **Policy 3.1.2:** All for the provision of sufficient public infrastructure and services to support the projected needs of the City's population and businesses within the patterns of use established in the community plans as guided by the Framework City wide Long-Range Land Use Diagram.

AIR QUALITY ELEMENT.

- **Goal 1:** Good air quality and mobility in an environment of continued population growth and healthy economic structure.
 - **Objective 1.1:** It is the objective of the City of Los Angeles to reduce air pollutants consistent with the Regional Air Quality Management Plan (AQMP), increase traffic mobility, and sustain economic growth citywide.

- **Policy 1.1.1:** Encourage demonstration projects which involve creative and innovative uses of market incentive mechanisms to achieve air quality objectives.
 - **Objective 1.2:** It is the objective of the City of Los Angeles to demonstrate the City's commitment to air quality improvement through development and revision of the City's General Plan Elements as appropriate, and to work cooperatively with Federal, state, regional, and other local jurisdictions in attaining clean air.
 - **Policy 1.2.2:** Pursue the City's air quality objectives in cooperation with regional and other local jurisdictions.
 - **Objective 1.3:** It is the objective of the City of Los Angeles to reduce particulate air pollutants emanating from unpaved areas, parking lots, and construction sites.
 - **Policy 1.3.1:** Minimize particulate emissions from construction sites.
- **Goal 4:** Minimize impact of existing land use patterns and future land use development on air quality by addressing the relationship between land use, transportation, and air quality.
 - **Objective 4.1:** It is the objective of the City of Los Angeles to include the regional attainment of ambient air quality standards as a primary consideration in land use planning.
 - **Policy 4.1.1:** Coordinate with all appropriate regional agencies the implementation of strategies for the integration of land use, transportation, and air quality policies.

CITY OF LYNWOOD. The following are goals and policies in the City of Lynwood General Plan that are relevant to the I-710 Corridor Project.

CIRCULATION ELEMENT.

- **Goal CIR-1:** Provide a circulation system to serve the internal circulation needs of the City, while also addressing the intercommunity or through travel needs.
- **Goal CIR-3:** Promote a regional transportation system that serves existing and future travel between Lynwood and other population and employment centers within the region.
 - **Policy CIR-3.1:** Regional Transportation Facilities: Interface with appropriate jurisdictions and agencies to encourage the timely

improvement of roadway and transit facilities, which address area wide and regional travel needs.

- **Goal CIR-5:** Manage peak hour traffic flow and demand on the circulation system to reduce traffic congestion where necessary and feasible.
 - **Policy CIR-5.1:** Travel Demand Management Program: Provide for the development and monitoring of TDM programs at locations where trip making is concentrated.

AIR QUALITY ELEMENT.

- **Goal AQ-1:** Improve air quality in conformance with State and Federal standards.
 - **Policy AQ-1.1:** Air Quality Mitigation Measures: The City shall ensure that to the extent practical that air quality mitigation measures are incorporated into residential, commercial, and industrial projects.

CITY OF MAYWOOD. The following are goals and policies in the City of Maywood General Plan that are relevant to the I-710 Corridor Project.

CIRCULATION ELEMENT.

- **Goal 1:** Minimize freeway impacts on the local street system while ensuring convenient access to the Long Beach Freeway (I-710) from Maywood.
 - **Policy 1.1:** Support efforts of Caltrans to improve traffic flow on the freeway system and thereby reduce impacts on the City's arterial roadway network.
 - **Policy 1.2:** Work with Caltrans to provide a full or partial interchange of the Long Beach Freeway at Slauson Ave.
 - **Policy 1.3:** Support efforts of Metro and other transportation agencies to increase use of mass transit and other alternatives to the private automobile as a way to reduce potential traffic loads on the Long Beach Freeway.

CONSERVATION ELEMENT.

- **Goal 2:** Promote cooperation between the City and other agencies and local governments to improve the environment.
 - **Policy 2.1:** Continue cooperation and coordination between jurisdictions pertaining to regional environmental quality.

- **Policy 2.2:** Support all actions and/or programs that will result in the development of a comprehensive regional mass transit system.
- **Goal 3:** Provide for the proper management of natural resources both in the City and region are so that they may be protected for the benefit of present and future residents.
 - **Policy 3.1:** Develop and enforce local criteria of air and water quality so that the City may reduce its share of these regional problems.

CITY OF PARAMOUNT. The following are goals and policies in the City of Paramount General Plan that are relevant to the I-710 Corridor Project.

TRANSPORTATION ELEMENT.

- **Transportation Element Policy 6:** The City of Paramount will continue to support the development and expansion of the region's public and mass transit system.

LAND USE ELEMENT.

- **Land Use Element Policy 9:** The City of Paramount will promote development that capitalizes on its location near the I-105 Freeway, the I-710 Freeway, and State Route 91 (SR-91).

CITY OF SIGNAL HILL. The following are goals and policies in the City of Signal Hill General Plan that are relevant to the I-710 Corridor Project.

CIRCULATION ELEMENT.

- **Goal 2:** Provide a safe and efficient roadway system for all users.
- **Goal 5:** Permit safe and efficient goods movement to support regional commerce and industry, while minimizing undesirable impacts on Signal Hill residents.
 - **Policy 5.a:** Evaluate proposed projects on the I-405 and I-710 freeways to determine if significant impacts from increased truck traffic will affect roadways in Signal Hill.

LAND USE ELEMENT.

- **Goal 2:** Ensure that new development is consistent with the City's circulation system, availability of public facilities, existing development constraints, and the City's unique characteristics and natural resources.

- **Policy 2.1:** Coordinate and monitor the intensity and impact of land uses in Signal Hill and Long Beach on the City's existing transportation and circulation systems so that they are able to provide for the efficient movement of people and goods with the least interference.
- **Goal 3:** Assure a safe, health, and aesthetically pleasing community for residents and businesses.
 - **Policy 3.15:** Improve the image of major highways by use of landscaping, lighting, graphics, and/or other streetscape treatments.

ENVIRONMENTAL RESOURCES ELEMENT.

- **Goal 5:** Ensure minimal degradation to the physical environment from development or operational activities, and require restoration of the environment where degradation has occurred.
 - **Policy 5.1:** Cooperate and participate in regional AQMP, programs, and enforcement measures.

CITY OF SOUTH GATE. The following are goals and policies in the City of South Gate General Plan 2035 that are relevant to the I-710 Corridor Project.

MOBILITY ELEMENT.

- **Goal ME 1:** Provide and maintain an efficient roadway system serving all parts of the City and support multimodal transportation.
 - **Objective ME 1.1:** Balance the roadway system with the planned land uses in the City.
 - **Policy P.1:** The City should provide a safe and efficient street system, to support the City's mobility goals, all transportation modes, and the City's Land Use and Community Design Elements.
 - **Objective ME 1.2:** Fully develop the street system, and maximize its operational efficiency.
 - **Policy P.2:** The City should coordinate with the I-710 Corridor Project to explore I-710 interchange and ramp modifications that improve overall traffic circulation on City streets.
- **Goal ME 3:** Minimize the adverse effects of traffic.
 - **Objective ME 3.1:** Minimize and/or reduce adverse impacts on City streets from regional through traffic.

- **Policy P.1:** The City should coordinate with regional authorities and adjacent jurisdictions for regional highway network improvements, regional multi-modal programs, and signage programs.
- **Policy P.2:** The City should support an I-710 Corridor Project design that minimizes traffic impacts on City streets, and enhances access to the freeway with improved interchanges with City streets.
- **Objective ME 3.2:** Reduce adverse impacts from truck traffic.
 - **Policy P.2:** The City should work closely with the Metro and Caltrans on the I-710 Corridor Improvements process to ensure new truck ramps in the City are suitably located to facilitate truck access to industrial areas of the City, and to ensure that new truck lanes and direct truck ramps do not adversely impact the City and its neighborhoods.
 - **Policy P.4:** The City should coordinate with regional planning agencies, the Ports of Los Angeles and Long Beach, and railroad operators to maximize the use of rail for goods movement in the region and in the I-710 Corridor in particular.
- **Action ME 1:** Implement the following street improvements for general circulation (including transit and other modes).
- **Action ME 1.2:** Garfield Ave.: Work with the I-710 Improvement Project to add truck ramps to I-710 Truck Lanes within the City limits where feasible without adversely impacting key streets or residential neighborhoods.
- **Action ME 1.3:** I-710 Freeway Interchanges: Explore improved ramp connections to City streets as part of the I-710 Project, including the concept of a joint access and frontage road system that would provide freeway access/egress to the new Southern Ave. Extension, Firestone Blvd., and a new easterly extension of Independence Ave/Ardmore Ave.
- **Action ME 1.14:** Imperial Hwy.: Explore and implement improvements to the I-710 interchange as part of the I-710 Corridor Project, including the removal of the existing off ramp at Abbot Rd./Wright Rd. and addition of a substitute ramp directly at Imperial Hwy., as part of the I-710 Improvement Project.

COMMUNITY DESIGN ELEMENT.

- **Goal CD 4:** Preservation and enhancement of existing neighborhoods' quality and character.
 - **Objective CD 4.1:** Preserve the character of existing neighborhoods.

- **Policy P.2:** Existing neighborhoods should be preserved and protected against potential impacts related to development, traffic, noise, air quality, and encroachment of incompatible commercial and industrial activities.

HEALTHY COMMUNITY ELEMENT.

- **Goal HC 7:** High levels of air quality and improved respiratory health throughout the City.
 - **Objective HC 7.2:** Encourage and enable transportation behavior that improves air quality and respiratory health.
 - **Policy P.3:** The City should support Federal, state, and regional agencies in their efforts to reduce exposure to emissions from railroad, truck, and industrial diesel emissions.

CITY OF VERNON. The following are goals and policies in the City of Vernon General Plan (2007) that are relevant to the I-710 Corridor Project.

CIRCULATION ELEMENT.

- **Goal CI-1:** Provide a balanced transportation system for the safe and efficient movement of people, goods and emergency services throughout the City.
 - **Policy CI-1.8:** Continue to work with Caltrans and neighboring jurisdictions to improve the Atlantic Blvd./Bandini Blvd./I-710 intersection and to make improvements to the I-710 Freeway, including direct truck ramps to the rail yards and exploring the potential for adding an interchange at Slauson Ave. to improve access to the City.

LAND USE ELEMENT.

- **Goal LU-1:** Promote and maintain manufacturing and other industrial uses as the primary land use within the City.
 - **Policy LU-1.1:** Designate all properties in Vernon for manufacturing and industrial use, and permit other uses only with a Conditional Use Permit, or other discretionary review process. Permit certain uses only in specified Overlay Districts with Conditional Use Permit or other discretionary review process.

RESOURCE ELEMENT.

- **Goal R-2:** Contribute to the continued (continual and) gradual improvement of air quality in the South Coast Air Basin.
 - **Policy R-2.1:** Coordinate and cooperate with the SCAQMD and SCAG in efforts to implement the regional AQMP.

BOYLE HEIGHTS. The following are goals and policies in the Boyle Heights Community Plan that are relevant to the I-710 Corridor Project.

CIRCULATION ELEMENT.

- **Objective 2:** To minimize the detrimental impact of all existing freeways in the Community.
 - **Policy 2:** That highways and local streets be developed in accordance with standards and criteria contained in the Highways and Freeways Element of the General Plan and the City's Standard Street Dimensions, except where environmental issues and planning practices warrant alternate standards consistent with capacity requirements.

EAST LOS ANGELES. The following are goals and policies in the East Los Angeles Community Plan (1988) that are relevant to the I-710 Corridor Project.

PHYSICAL ENVIRONMENT GOALS.

- To retain the single-family residential life style of the community.
- To improve local transit and circulation.
- To protect the community health, safety and general welfare.

HUMAN RESOURCES GOALS.

- To increase residents' participation in meeting the community's public safety needs.
- To increase the community participation in environmental, human resource and economic development matters.

The following goal in the East Los Angeles Third Street Plan (2014) is relevant to the I-710 Corridor Project.

- **Goal 5:** Improve mobility and transportation choices

LOS ANGELES RIVER MASTER PLAN (JUNE 1996). The plan covers the entire 51-mile length of the river and the nine-mile-long Tujunga Wash, which together flow through 13 cities in Los Angeles County. The plan recommends specific regional and local projects and programs, and coordinates these projects on an ongoing basis. The primary managers of the river right-of-way are the Los Angeles County Department of Public Works and the United States Army Corps of Engineers.

The plan consists of seven major phases that include the following: Phase A, the Outreach Phase; Phase B, the Master Plan Analysis; Phase C, the Master Plan Formulation; Phase D, the Implementation Strategy; Phase E, Environmental Review; Phase F, the Master Plan Adoption; and Phase G, the Master Plan Implementation.

The Los Angeles River Master Plan goals are:

- Ensure flood control and public safety needs are met.
- Improve the appearance of the river and the pride of local communities in it.
- Promote the river as an economic asset to the surrounding communities.
- Preserve, enhance, and restore environmental resources in and along the river.
- Consider stormwater management alternatives.
- Ensure public involvement and coordinate Master Plan development and implementation among jurisdictions.
- Provide a safe environment and a variety of recreational opportunities along the river.
- Ensure safe access to and compatibility between the river and other activity centers.

The Environmental Quality chapter of the plan also provides a goal and objectives for the Environmental Quality of the river; and they are:

- Preserve, enhance and restore environmental resources in and along the river.
- Improve and create natural plant and animal habitats.
- Increase water conservation efforts and provide for the most beneficial use of river water.
- Improve water quality and cleanliness of the river.
- Improve air quality.

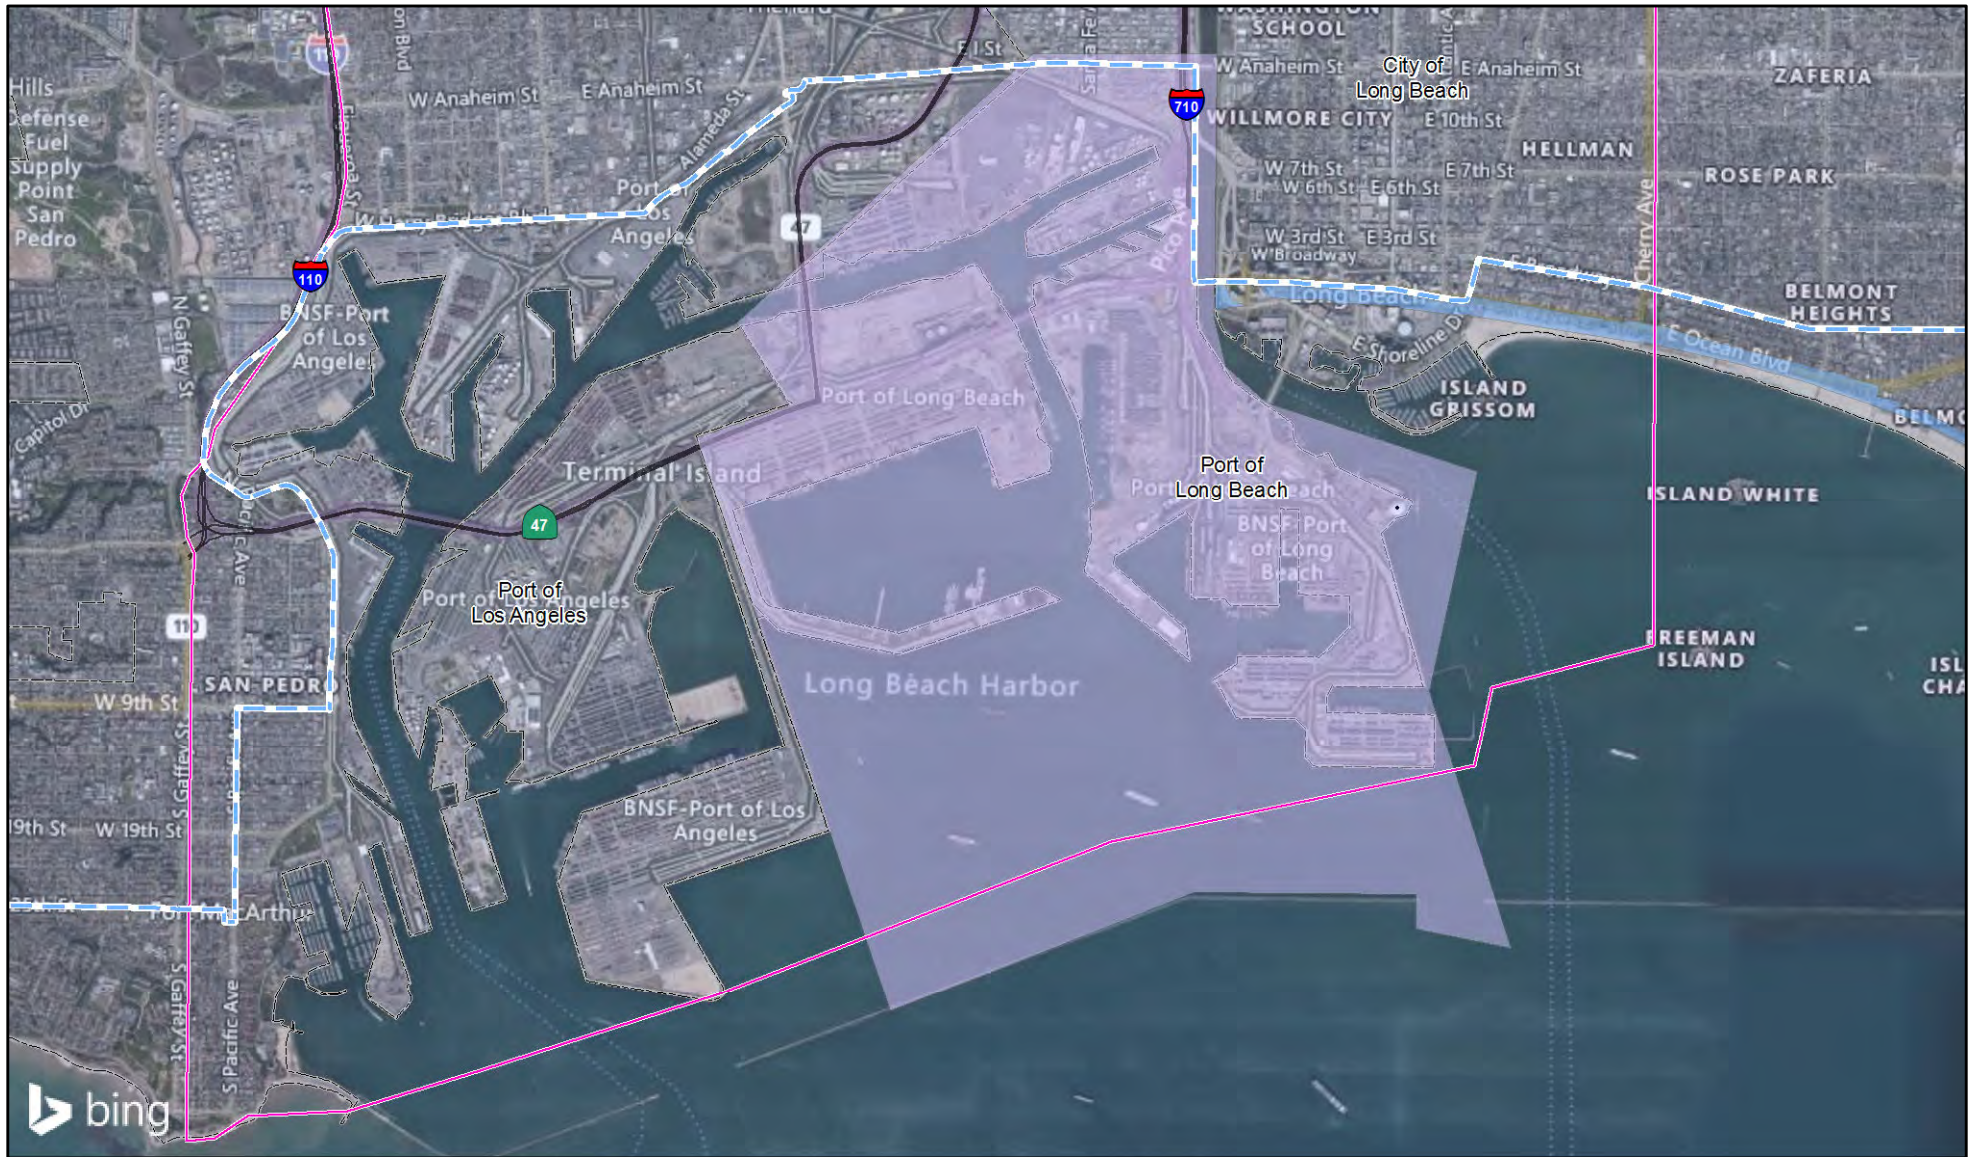

COASTAL ZONE. A part of the Study Area is located within the boundary of the Coastal Zone. The Coastal Zone designation in the Study Area consists of the POLB and the POLA, parts of the City of Long Beach south of Anaheim St. and east of the Los Angeles River, and parts of the City of Long Beach south of Ocean Blvd. and E. Broadway and east of the Los Angeles River. Applicable LCPs in the Study Area include the POLB Master Plan, the POLA Master Plan, and the City of Long Beach LCP; however, the improvements associated with the build alternatives would only occur in the POLB Master Plan and the City of Long Beach LCP jurisdictions (refer to discussion below for details). Figure 3.1-3 shows the official Coastal Zone boundary in the vicinity of the I-710 Corridor Project.

Access to the Coastal Zone in the vicinity of the build alternatives is facilitated by the existing I-710 mainline, State Route 47 (SR-47), and Ocean Blvd. However, public accessibility to the coast is relatively limited because the area is fully developed and the areas west of I-710 are active goods movement areas within the POLB and the POLA. However, the public can gain access to the coast east of I-710 via the public parks and marinas/boat launches located in downtown Long Beach, and south of the build alternatives by foot, vehicle, or bicycle using a network of roads and pathways.

The Coastal Zone environment in the Study Area is built out. Currently, estuarine habitat in the Study Area occurs in earthen-bottom tidal parts of the Los Angeles River along the three miles of the river between Willow St. on the north and the POLB on the south (approximately 7.59 acres). Biological resources located in these habitats are considered high-quality wildlife habitats because they provide protective cover, reproduction, and nesting resources, water, and food for a variety of species. In addition, estuaries such as the lower Los Angeles River serve as nurseries for marine fish and provide sediment traps, erosion control, and natural flood control. Sections 3.16 and 3.17, provided later in this Final EIR/EIS, include additional information on native and nonnative biological resources that occur in the Coastal Zone and Study Area.

POLA MASTER PLAN. The POLA Master Plan was first certified in 1980 by the California Coastal Commission. Since 1980, the POLA Master Plan has been amended and certified an additional 19 times.

The objective of the POLA Master Plan is to establish policies and guidelines to direct the future development of the Port of Los Angeles. The Plan is designed to better promote and safely accommodate the foreign and domestic waterborne commerce, navigation, and fisheries in the national, State, and local public interest. The Plan also provides for additional public recreation facilities within the POLA that are consistent with sound and compatible port planning. The I-710 Corridor Project build alternatives are located adjacent but not within the POLA Master Plan area.

POLB MASTER PLAN. The POLB Master Plan was first certified in 1978 by the California Coastal Commission. The document was updated and certified in 1983 and then again in 1990. Since 1990, the POLB Master Plan has been amended and certified an additional 19 times.

The purpose of the POLB Master Plan is to provide a planning tool to guide future Port development and to ensure that projects and developments in the Harbor District are consistent with the requirements of the California Coastal Act. The POLB Master Plan is divided into ten planning districts, which are geographical areas established to serve functional purposes by consolidating similar land and water uses, maximizing efficient use of facilities, and separating hazardous cargo from other areas of POLB. The build alternatives would be located in District 1, the North Harbor Planning District. The North Harbor Planning District consists of numerous small, independently owned land parcels that are presently devoted to port-related and non-port-related uses.

Anaheim St., the northern boundary of this district, functions as a major route for vehicular traffic entering or leaving the POLB. Existing uses on private land within District 1 remain throughout the northern part of the district but do not need to meet the requirements of the POLB Master Plan; therefore, as these private properties become available, POLB intends to obtain and redevelop them in accordance with the POLB Master Plan.

CITY OF LONG BEACH LCP. The City of Long Beach LCP was certified in 1980 by the California Coastal Commission and amended in 1994. The purpose of the City of Long Beach LCP is to protect and enhance the city's coastal resources. The City of Long Beach LCP is divided into seven planning areas, and a part of the I-710 Corridor Project is located within the Downtown Shoreline planning area. The Coastal Zone of the Downtown Shoreline planning area lies south of Ocean Blvd. and encompasses office and residential buildings, a newly expanded Convention and Entertainment Center, several public uses, and vacant land. The build alternatives are located in the vicinity of existing office uses in the West Beach planning area of the Downtown Shoreline Policy Plan. Within the West Beach area, permitted uses are the existing uses.

3.1.2.3 ENVIRONMENTAL CONSEQUENCES

The following discussion of environmental consequences only describes the permanent impacts of the project. Please refer to Section 3.24 of this document, Construction Impacts, for a discussion of the temporary impacts of the project for each resource area. Specifically, temporary impacts related to land use are located in Section 3.24.3.1.

PERMANENT IMPACTS.

BUILD ALTERNATIVES. While adoption of any one of the build alternatives would require SCAG, the County of Los Angeles, and several other regional and local agencies to amend their plans

and/or land use maps to reflect modifications to the I-710 mainline, interchanges, arterial highways, and arterial intersections, as well as the elimination of any land uses that may need to be acquired for the build alternatives, the build alternatives are generally consistent with these plans. For any build alternative, Caltrans would have needed to amend its existing freeway agreements with cities where the build alternatives would have added or removed connections to I-710 or I-405. For the plans and programs that currently include the build alternatives, Caltrans and the Los Angeles County Metropolitan Transportation Authority (Metro) will continue to work with SCAG and other local and regional agencies to ensure that the future modifications to those plans and programs reflect the No Build (Alternative 1).

LOCAL AND REGIONAL PLANS. The discussions below provide a consistency analysis for the applicable regional and local plans discussed earlier in this section.

SCAG RCP. The 2008 RCP includes several guiding principles and goals that the build alternatives would be consistent with, including improved mobility for residents, improved air quality, and a cleaner transportation system. However, the build alternatives would not provide new housing or education as referenced in the RCP.

SCAG RTP/SCS. The 2020 RTP includes several guiding principles and goals with which the build alternatives would be consistent, including improved mobility for residents, improved air quality, and a cleaner transportation system. The RTP also includes several goals with which the build alternatives would be consistent, including the following: increased mobility and accessibility for all people and all goods in the region; improved safety and reliability for transportation of people and goods in the region; and protection of the environment, including improved air quality. The build alternatives do not provide high-occupancy vehicle (HOV) gap closures or a rideshare program; however, it should not be concluded that the build alternatives would be inconsistent with these policies in the RTP. During the Alternatives Screening Analysis performed in 2009, it was concluded that HOV lanes would not be utilized as much as general purpose lanes, due to parallel HOV facilities on both I-110 and I-605.

SCAG FEDERAL TRANSPORTATION IMPROVEMENT PROGRAM (FTIP) (ADOPTED ON 2023). An update to the description of Alternative 5C was included in SCAG's 2020 Connect SoCal (2020-2045 Regional Transportation Plan/Sustainable Communities Strategy [RTP/SCS]). The RTP/SCS Amendment No. 3 was adopted by SCAG on September 3, 2020, and contained an update to the description for Alternative 5C. However, since that time, Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with Metro, has identified the No Build (Alternative 1) as the Preferred Alternative. Moving forward, Metro will continue to work with SCAG to ensure that the future modifications to the RTP and FTIP reflect the No Build (Alternative 1) as opposed to Alternative 5C.

GREATER LOS ANGELES COUNTY IRWMP. The 2014 Greater Los Angeles County IRWMP includes the objective to enhance open space and recreation through the increase of watershed friendly recreational space for all communities. As shown in Table 3.1-1, the build alternatives would result in impacts to open space and recreation land uses. In the City of Long Beach, Cesar E. Chavez Park is being expanded as a result of the build alternatives by the transfer of land from the Shoreline Dr. right-of-way to the final boundaries of the park. Other enhancements include increased public access, improved landscaping, a bicycle path, and replacement basketball courts. Throughout the project area, for any build alternative, impacted watershed-friendly recreational space would have been replaced in equal or better condition as indicated by the avoidance, minimization, and mitigation measures included in Section 3.1.3.3. Any resulting replacement or other financial burden required by the grant agencies for the acquisition of park property for freeway use would have been mitigated at no cost or impact to the City/County as required under Measures PR-6 and C-1. With implementation of Measures PR-6 and C-1, the build alternatives would have been consistent with this objective of the Greater Los Angeles IRWMP.

GREATER LOS ANGELES COUNTY OSHARP AND DRAFT FINAL OSHARTM. The Greater Los Angeles County OSHARP (2012) and the Draft Final Greater Los Angeles County OSHARTM (October 2013) include objectives with which the build alternatives would be consistent, including enhancement of existing and planned regional trails as the build alternatives would not result in permanent adverse impacts to regional or local multi-use trails or bikeways, and would have beneficial impacts associated with the creation of bike overcrossings that would improve connectivity and access to local parks. Additionally, as described above, although the build alternatives would require the conversion of recreation and open space land uses to transportation land uses, recreational space would be replaced in equal or better condition as indicated by the avoidance, minimization, and mitigation measures for the build alternatives included in Section 3.1.3.3. Any resulting replacement or other financial burden required by the grant agencies for the acquisition of park property for freeway use would be mitigated at no cost or impact to the City/County as required under Measures PR-6 and C-1. With implementation of Measures PR-6 and C-1, the build alternatives would be consistent with this objective of the Greater Los Angeles OSHARP and Draft Final OSHARTM.

2035 COUNTY OF LOS ANGELES GENERAL PLAN. The build alternatives are consistent with the adopted goals and policies in the 2035 County of Los Angeles General Plan because the build alternatives would improve existing transportation facilities instead of building new freeways; would protect sensitive uses, including residential areas; would reduce noise levels; would include the public during the planning process; and would improve the image of major transportation corridors.

COUNTY OF LOS ANGELES BICYCLE MASTER PLAN. The build alternatives would be consistent with the goals of the County of Los Angeles Bicycle Master Plan because the build alternatives would provide bicycle facilities, including bicycle crossings. The bicycle/pedestrian crossing at Humphreys Ave. in East Los Angeles (included under both build alternatives) would be consistent with providing connections to destinations in an unincorporated area of the County, and the bicycle facilities included as part of the build alternatives would also provide connectivity to local parks.

CITY OF BELL GENERAL PLAN. The build alternatives are consistent with the adopted goals and policies in the City of Bell General Plan, because the build alternatives would address existing and planned land uses, including a new I-710 freight corridor interchange at Slauson Ave. under Alternative 7, and would improve circulation within the region. The build alternatives would not expand public facilities in the city; however, Caltrans would work with agencies responsible for public facilities throughout the corridor to potentially mitigate any direct impacts resulting from the build alternatives.

CITY OF BELL GARDENS GENERAL PLAN. The build alternatives are consistent with the adopted goals and policies in the City of Bell Gardens General Plan because the build alternatives include improvements at the I-710/Florence Ave. interchange, including a redesign of the interchange to reduce traffic congestion along Florence Ave., between Eastern Ave. and Jaboneria Rd., which is referenced as a key transportation-related issue in the Circulation Element. The build alternatives would also improve access to the Central Commercial District and would not result in business displacements within the City of Bell Gardens. In addition, Alternative 7 includes a freight corridor for zero-emission and near-zero-emission trucks, which is consistent with the City's policy to encourage new and innovative modes of transportation.

CITY OF CARSON GENERAL PLAN. The build alternatives are consistent with the adopted goals and policies in the City of Carson General Plan because the build alternatives would provide improvements to the circulation system for existing and planned transportation needs; Alternative 7 would provide a dedicated freight corridor; the build alternatives would include an extensive outreach process involving local and regional planning agencies; and the build alternatives would improve local interchanges and arterials, as well as air quality and aesthetics along I-710.

CITY OF COMMERCE GENERAL PLAN. The build alternatives are consistent with the adopted goals and policies in the City of Commerce 2020 General Plan since they address three main components found in many of the General Plan policies: community participation, improved air quality, and reduced traffic congestion. Alternative 7 also includes direct access from I-710 to the rail yards as identified in the General Plan.

CITY OF COMPTON GENERAL PLAN. The build alternatives are consistent with the adopted goals and policies in the City of Compton General Plan because they would improve access to and from businesses and residents within the city, as well as address traffic safety, spillover traffic, reduced congestion, and use of a designated freight route.

CITY OF CUDAHY GENERAL PLAN. The build alternatives are consistent with the adopted goals and policies in the City of Cudahy General Plan because they would improve vehicular circulation and safety, relieve congestion, improve air quality, address increases in noise along the I-710 Corridor near sensitive uses, and incorporate a multi-agency outreach program.

CITY OF DOWNEY GENERAL PLAN. While adoption of a build alternative would not directly impact the City of Downey, the build alternatives are consistent with the adopted goals and policies in the City of Downey General Plan because of the following: the widening and dedicated truck route provided by Alternative 7 would decrease the number of trucks and automobiles accessing local arterials as alternative routes for through trips; the build alternatives would not result in adverse impacts to residential neighborhoods or businesses within the City of Downey; the build alternatives would result in improved air quality; and the build alternatives would not expose persons within the City of Downey to excessive noise.

CITY OF HUNTINGTON PARK GENERAL PLAN. The build alternatives are consistent with the adopted goals and policies in the City of Huntington Park General Plan because they would address existing and future circulation needs including improvements to intersections within the city, improving air quality, and reducing traffic congestion.

CITY OF LAKEWOOD GENERAL PLAN. The build alternatives are consistent with the adopted goals and policies in the City of Lakewood General Plan because the I-710 Corridor Project is a regional project that addresses the main components found in many of the General Plan policies: multi-agency coordination, improved air quality, reduced traffic congestion, and improved safety for drivers. Specifically, the goals and policies of the Circulation Element and Air Quality Element are consistent with the I-710 Corridor Project build alternatives.

CITY OF LONG BEACH GENERAL PLAN. The build alternatives are consistent with the adopted goals and policies in the City of Long Beach General Plan and the 2019 Land Use Element update. The I-710 Corridor Project build alternatives would improve people and goods movement, reduce congestion, improve air quality, and include community and local agency participation. The build alternatives would not expose persons within the City of Long Beach to excessive noise.

CITY OF LONG BEACH COMMUNITY LIVABILITY PLAN. The build alternatives are consistent with the adopted goals in the City of Long Beach Community Livability Plan because they would reduce congestion, improve air quality, and include community and local agency participation. In addition, the build alternatives would not expose persons within the City of Long Beach to excessive noise.

CITY OF LONG BEACH DOWNTOWN & TOD PEDESTRIAN MASTER PLAN. The build alternatives are consistent with the adopted goals and policies in the City of Long Beach Downtown & TOD Pedestrian Master Plan because they would provide substantial funding for active transportation infrastructure, including upgrades to the Los Angeles River Bike Path and the addition of a pedestrian and Class I bikeway crossing over the Los Angeles River and I-710 at Hill Street in West Long Beach, an area which has historically been underserved. Any improvements to the public right-of-way as a result of the build alternatives would comply with the Americans with Disabilities Act, as required.

CITY OF LOS ANGELES GENERAL PLAN. In reference to the communities of Wilmington and San Pedro, the I-710 Corridor Project build alternatives are consistent with the adopted goals and policies in the City of Los Angeles General Plan because they address some of the main components found in many of the General Plan policies: improved accessibility and enhanced transit; improved air quality; reduced traffic congestion; limited impacts to residential neighborhoods; and balanced planning among air quality, transportation, and land use.

CITY OF LYNWOOD GENERAL PLAN. The build alternatives are consistent with the adopted goals and policies in the City of Lynwood General Plan because they would address local and regional circulation for existing and future needs, reduce traffic congestion, consider the community's concerns, provide the necessary infrastructure to promote a balanced community, and improve air quality.

CITY OF MAYWOOD GENERAL PLAN. The build alternatives are consistent with the adopted goals and policies in the City of Maywood General Plan because Alternative 7 includes a partial construction of the I-710 freight corridor interchange at Slauson Ave. that is referenced in the Circulation Element, which would provide convenient access to the I-710 from Maywood for freight and cargo and result in minimal impacts to the local street system. The build alternatives would not directly impact residential or industrial uses within the city. In addition, while the build alternatives would not directly result in new commercial districts or businesses within the city, they would result in increased accessibility to the city along the I-710 Corridor (specifically increased accessibility to the commercial districts located along Slauson Ave. and Atlantic Blvd.) as a result of a new partial local interchange.

CITY OF PARAMOUNT GENERAL PLAN. The build alternatives are consistent with the adopted goals and policies in the City of Paramount General Plan since they would address the region's public and mass transit system and would not adversely impact residences or businesses within the City of Paramount.

CITY OF SIGNAL HILL GENERAL PLAN. The build alternatives are consistent with the adopted goals and policies in the City of Signal Hill General Plan because the I-710 Corridor Project is a regional project that would provide safe, efficient, and balanced circulation to address existing and future land use needs. In addition, Alternative 7 would provide a dedicated freight corridor to reduce traffic on local roadways. The build alternatives would also improve air quality.

CITY OF SOUTH GATE GENERAL PLAN. The build alternatives are consistent with the adopted goals and policies in the City of South Gate General Plan. The build alternatives would reduce traffic congestion, including truck traffic; add a dedicated freight corridor in the city (Alternative 7); include coordination with other local and regional agencies; improve air quality; and preserve residential neighborhoods in the City of South Gate by avoiding residential displacements in the city.

CITY OF VERNON GENERAL PLAN. The I-710 Corridor Project build alternatives are consistent with the adopted goals and policies in the City of Vernon General Plan since they address the need for a balanced transportation network, improvements to the Atlantic Blvd./Bandini Blvd. intersection, new dedicated truck routes and ramps to the rail yards under Alternative 7, improved air quality, and extensive agency coordination.

BOYLE HEIGHTS COMMUNITY PLAN. The I-710 Corridor Project build alternatives are consistent with the adopted goals and policies in the Boyle Heights Community Plan since the build alternatives include features to reduce community impacts, improve air quality, balance land uses, and reduce traffic congestion.

EAST LOS ANGELES COMMUNITY PLAN. The I-710 Corridor Project build alternatives are consistent with the adopted goals and policies in the East Los Angeles Community Plan because they address some of the Community Plan's main components: community participation, improved air quality, reduced traffic congestion, and retaining of residential areas in East Los Angeles.

EAST LOS ANGELES THIRD STREET PLAN. The I-710 Corridor Project build alternatives are consistent with the adopted goals and policies in the East Los Angeles Third Street Plan because they would improve mobility and transportation choices.

LOS ANGELES RIVER MASTER PLAN. The I-710 Corridor Project build alternatives would be consistent with the goals and policies of the Los Angeles River Master Plan, as they would not impact the flood control capacity of the river, would develop stormwater management systems along the corridor, and would involve the public in decision making processes. The build alternatives would improve pedestrian facilities and provide room for bikeways at several I-710 overcrossings where they do not currently exist. In the majority of these overcrossings, the build alternatives improve connectivity with the Los Angeles River multi-use trail by increasing bicycle and pedestrian access to the trail from adjacent roadways (Anaheim St., Pacific Coast Hwy., Willow St., Del Amo Blvd., Long Beach Blvd., Alondra Blvd., Rosecrans Blvd., Imperial Hwy., Firestone Blvd., Florence Ave., and Atlantic Blvd.). The build alternatives are consistent with the adopted objectives of the Los Angeles River Master Plan because they support a multitude of civic activities and addresses some of the Plan's main objectives: provide public access to the Los Angeles River, improve the environment, and improve water resources.

COASTAL ZONE. Table 3.1-2 provides a consistency analysis of the build alternatives relative to the five primary goals of the California Coastal Act.

POLA MASTER PLAN. The build alternatives are not located within the POLA Master Plan Area and would, therefore, not have a direct impact. Nonetheless, the build alternatives are consistent with the POLA Master Plan, as they would improve an existing transportation facility and better promote and safely accommodate goods movement.

POLB MASTER PLAN. The build alternatives are consistent with the POLB Master Plan because they would improve an existing facility and would not introduce new non-port-related uses to the POLB Master Plan District 1 and would not prevent the POLB from redeveloping private properties that become available for port-related uses.

CITY OF LONG BEACH LCP. As discussed above, the build alternatives are located in the vicinity of existing office uses in the West Beach area of the Downtown Shoreline Policy Plan. Within the West Beach area, permitted uses are the existing uses and the plan calls for these to remain. The build alternatives would improve an existing local arterial within the West Beach area; therefore, the build alternatives are a permitted use under the City of Long Beach LCP.

Table 3.1-2: California Coastal Act Consistency

| Goals | Consistency Analysis |
|--|---|
| <p>Goal A: Protect, maintain and, where feasible, enhance and restore the overall quality of the coastal zone environment and its natural and artificial resources.</p> | <p>The build alternatives would improve an existing facility and reduce congestion, which would reduce air emissions in the Coastal Zone. Biological resource surveys conducted for the project indicate that areas potentially impacted by the build alternatives within the Coastal Zone would be limited to developed/ornamental/ruderal areas, and no jurisdictional waters were identified that would be under the jurisdiction of the California Coastal Commission (refer to Sections 3.16 through 3.21 for additional detail). Similarly, cultural resource surveys conducted indicate no known archaeological or historic resources in the Coastal Zone that would be impacted by the build alternatives (refer to Section 3.7 for additional detail). Water quality BMPs are included for the build alternatives and would improve existing water quality conditions (refer to Section 3.9 for additional detail). Therefore, the build alternatives are consistent with Goal A because they would maintain and improve the overall quality of the environment in the Coastal Zone.</p> |
| <p>Goal B: Assure orderly, balanced utilization and conservation of coastal zone resources taking into account the social and economic needs of the people of the state.</p> | <p>The build alternatives would improve an existing facility that is commonly used for goods movement for the local and regional economies, as well as to transport people to and from the Coastal Zone and adjacent cities along the I-710 Corridor. Therefore, the build alternatives are consistent with Goal B because they would improve conditions on an existing facility located in the Coastal Zone used to transport goods and people at a local and regional level and would not result in adverse impacts to Coastal Zone resources.</p> |
| <p>Goal C: Maximize public access to and along the coast and maximize public recreational opportunities in the coastal zone consistent with sound resources conservation principles and constitutionally protected rights of private property owners.</p> | <p>The build alternatives would reduce congestion on the existing I-710 mainline, thereby facilitating vehicular access to the coast, including coastal resources in downtown Long Beach. The build alternatives would not adversely impact existing parks in the Coastal Zone and would not adversely affect public recreation opportunities or sound resource conservation principles in the Coastal Zone. While the build alternatives would require relocation of residences and businesses located in the Study Area, some of which are located in the Coastal Zone near the I-710/Anaheim St. interchange, the build alternatives require that all relocations would comply with the Uniform Act, which would require that relocation services and payments be made available to the eligible residents, businesses, and nonprofit organizations displaced by the build alternatives (refer to Section 3.3.2 for additional detail). Therefore, the build alternatives are consistent with Goal C because they would improve access to the Coastal Zone and would not result in adverse impacts to public recreational opportunities, sound resource conservation, or private property in the Coastal Zone.</p> |

| Goals | Consistency Analysis |
|---|---|
| Goal D: Assure priority for coastal-dependent and coastal-related development over other development on the coast. | The I-710 Corridor Project build alternatives include improvements to an existing transportation facility that serve local residents as well as local and regional goods movement and is not identified as a coastal-dependent or coastal-related development. However, improvements to the I-710 mainline and the freight corridor under Alternative 7 would improve access and reduce congestion for goods movements for adjacent coastal-dependent developments, including the Port of Long Beach and Port of Los Angeles. Therefore, the build alternatives are consistent with Goal D. |
| Goal E: Encourage state and local initiatives and cooperation in preparing procedures to implement coordinated planning and development for mutually beneficial uses, including educational uses, in the coastal zone. | The build alternatives would improve an existing transportation facility that was first constructed as a freeway in the Coastal Zone in the 1950s. The I-710 Corridor Project build alternatives are intended to improve air quality and health, improve traffic safety, address design deficiencies of the I-710 mainline, address projected traffic volumes, and address projected growth in population, employment, and activities related to goods movement. The I-710 Corridor Project includes an extensive community outreach effort, including multiple local and regional agencies, members of the public, and representatives from local groups and organizations to coordinate planning and address the communities' concerns. Therefore, the build alternatives are consistent with Goal E. |

BMPs = Best Management Practices

I-710 = Interstate 710

Uniform Act = Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970

THE CITY OF LONG BEACH COMMUNITY LIVABILITY PLAN. The build alternatives are consistent with the primary goals identified in the City of Long Beach Community Livability Plan. As described in Section 1.2 of this Final EIR/EIS, the project purpose is to address current and future health and traffic related safety impacts to I-710 corridor users and surrounding neighborhoods, as well as provide design solutions to improve the physical environment for residents in the surrounding neighborhoods.

NO BUILD (ALTERNATIVE 1). Under the No Build (Alternative 1), the Preferred, no improvements would be made within the I-710 Corridor other than the projects that are already planned and committed to be constructed by or before 2035. Not improving the I-710 Corridor would be inconsistent with regional plans such as the 2020 RTP and several affected city General Plans that specifically call for improvements to I-710.

PUBLIC HEALTH CONSIDERATIONS. Public health was determined not to be a topic of concern for the consistency analysis of State, regional, and local plans.

3.1.2.4 AVOIDANCE, MINIMIZATION, AND/OR MITIGATION MEASURES

As discussed previously in this section, if approved, the build alternatives would require amendments to the affected cities' General Plans to reflect the final alignment of the I-710 mainline, to reflect modified and/or new interchange locations, and to change the land use designations on properties that would be acquired for the build alternatives to a transportation or public use designation. Measure LU-1 below would be applicable to all build alternatives to ensure consistency with future land use planning. With implementation of Measure LU-1, no residual impact would result relative to future land use impacts and plan consistency. Coordination with local and regional jurisdictions has and would continue to occur during planning of any build alternatives, and it is anticipated that these amendments could occur in the normal course of General Plan updates required in accordance with California law (e.g., a special amendment process specifically to address the I-710 Corridor Project build alternatives would not be necessary). However, as stated previously, since the No Build (Alternative 1) has been identified as the Preferred Alternative, this mitigation measure is included for disclosure purposes only.

LU-1 Following approval of the Final Environmental Impact Report/Environmental Impact Statement (EIR/EIS) for the Interstate 710 (I-710) Corridor Project and filing of a Notice of Determination with the State Clearinghouse, the California Department of Transportation (Caltrans) shall request that the affected Cities and the County to amend their respective General Plans to reflect the final alignment, interchange locations, and modification of land use designations for properties that would be acquired for the project, during the next cycle of amendments to each local jurisdiction's General Plan Circulation and Land Use Elements. The timing of the preparation and processing of such General Plan amendments will be at the discretion of each local jurisdiction. Caltrans will also initiate amendments to existing freeway agreements with cities where the build alternatives would add or remove access to I-710 or Interstate 405 (I-405).

3.1.3 PARKS AND RECREATION FACILITIES

3.1.3.1 AFFECTED ENVIRONMENT

Parks and recreation facilities that meet the definition of Section 4(f) properties are described in detail in the *Section 4(f) and 6(f)* (2020) provided in Appendix B of this Final EIR/EIS. Recreation resources that are not Section 4(f) properties are also discussed in this section and described briefly in the *Draft Section 4(f) and 6(f) Evaluation*.

Table 3.1-3 includes a list of publicly and privately owned parks and recreation facilities in the Study Area within 0.5 mile of the improvements where direct and/or indirect impacts could result from the build alternatives. The parks and recreation resources are listed by city/community and are shown on Figure 3.1-4. There are no parks or recreation facilities within 0.5 mile of the I-710

Table 3.1-3: Existing Parks and Recreation Facilities within 0.5 Mile of the I-710 Corridor Project Build Alternatives

| Resource | Address | Amenities |
|---------------------------------|--|---|
| Veteran's Memorial Park | 6526 Wilcox Ave., City of Bell | Veteran's Memorial Park is an approximately three-acre community park that offers a tot lot, game courts, a picnic area, softball fields, and meeting rooms. |
| Rancho San Antonio Sports Plaza | 7100 Walker Ave., City of Bell | Rancho San Antonio Sports Park is a 2.7-acre neighborhood park that offers a softball field and snack bar. |
| Marlow Park | 6640 Marlow Ave., City of Bell Gardens | Marlow Park is a 0.6-acre mini-park located at the northeast corner of Marlow Ave. and Lubec St. Amenities include two play structures in sand areas, a tetherball pole, concrete walkways, park lighting, benches, picnic tables, barbeque grills, mature shade trees, a multi-use building (Community Center) with restrooms, and a small grass area. |
| Julia Russ Asmus Park | 8321 Jaboneria Rd., City of Bell Gardens | Amenities at this park include playground equipment, a swing set, a basketball court, a picnic shelter, picnic tables, restrooms, and benches. |
| Youth Center | 5658 Ludell St., City of Bell Gardens | The Youth Center is open Monday through Thursday from 2:00 p.m. to 7:00 p.m. and on Friday from 2:00 p.m. to 8:00 p.m. Activities include a variety of programs for youth and adults. |
| Dominguez Park | 21330 Santa Fe Ave., City of Carson | Dominguez Park is a nine-acre neighborhood park that has ball fields, basketball courts, a children's play area, meeting/craft rooms, picnic areas, a snack bar, tennis courts, and a swimming pool. |
| Dominguez Community Center | 21156 Santa Fe Ave., City of Carson | Dominguez Community Center provides a meeting room, a kitchen, and restrooms. |
| Bandini Park | 4725 Astor Ave., City of Commerce | Bandini Park is a 3.1-acre neighborhood park that offers basketball and volleyball courts; athletic fields; picnic shelters; a playground; and a children's wading pool. The Batres Community Center is located at Bandini Park and offers recreational programs and activities for all ages. |
| Bristow Park | 1466 McDonnell Ave., City of Commerce | Bristow Park is an approximately 11-acre neighborhood park that offers outdoor activities such as organized youth sports; picnic shelters; playgrounds; and a children's wading pool. The park has a community center that offers a variety of recreational programs. In addition, a Scout Hut is located at Bristow Park and is used by the various scouting organizations in the City of Commerce and by the Department of Parks and Recreation for youth programs. |
| Kelly Park | 2319 E. Caldwell St., City of Compton | Kelly Park is a 3.8-acre park that offers a community center equipped with a kitchen and stage, meeting rooms, a picnic area with barbeque pits, children's playground equipment, an outdoor basketball court and volleyball court, a junior baseball diamond, and outdoor restrooms. |
| East Rancho Dominguez Park | 15116 S. Atlantic Ave., City of Compton (operated by the County of Los Angeles) | East Rancho Dominguez Park is a five-acre park owned and operated by the County of Los Angeles that offers a gymnasium, a large community building, tennis courts, lighted basketball courts, a picnic area with barbeque grills, and restrooms. |

I-710 Corridor Project Final EIR/EIS

| Resource | Address | Amenities |
|---------------------------------------|--|---|
| Compton Par 3 Golf Course | 6400 E. Compton Blvd., City of Compton | The Compton Par 3 Golf Course has a fully stocked pro shop, a snack bar, and off-street parking. |
| Compton Hunting and Fishing Club | 1625 S. Sportsman Dr., City of Compton | This facility includes an underground firing range and offers meeting rooms for use by various organizations. |
| Compton Homing/Racing Pigeon Club | 1620 S. Sportsman Dr., City of Compton | This facility consists of a meeting building and parking lot. |
| Cudahy Park | 5220 Santa Ana St., City of Cudahy | Amenities at this park include two softball fields, one soccer field, a tennis court, a basketball court, playground equipment, a skate park, City Hall, and the Cudahy Library. |
| River Road Pocket Park | River Rd. | Amenities at this park include benches and a walkway for cyclists that use the Los Angeles River bikeway. |
| Clara Park | 4835 Clara St., City of Cudahy | Amenities at this park include an auditorium and full kitchen, daily activities for seniors, a full-size indoor basketball gym, and meeting rooms available for reservation. |
| Los Amigos Golf Course | 7295 Quill Dr., City of Downey (operated by the County of Los Angeles) | Los Amigos Golf Course is a public 18-hole golf course owned and operated by the County of Los Angeles that features 5,937 yards of golf from the longest tees for a par of 70. The facility includes a clubhouse. |
| Temple Park | 7132 Cole St., City of Downey | Temple Park is a 0.05-acre park with a play area. |
| Crawford Park | 7000 Dinwiddie, City of Downey | This park is a two-acre park with a play area and picnic shelter. |
| 14 th Street Park | 14 th St. and Chestnut Ave., City of Long Beach | This park includes playground equipment. |
| 72nd Street Staging Area ³ | 550 72nd Street, City of Long Beach (operated by the County of Los Angeles) | The 72nd Street Staging area is a 3-acre arena and park with a corral pen and bleacher area, adjacent to the Los Angeles River Trail. This multi-purpose facility includes a two-story announcer building used for viewing and judging of special events. |
| Admiral Kidd Park | 2125 Santa Fe Ave., City of Long Beach | This park provides amenities such as a basketball court, a playground, a soccer field, a picnic area, and restrooms. |
| Baker Street Park | 625 Baker Street and Golden Ave., City of Long Beach | This park is 1.35 acres in size and has picnic and playground areas, and a walking path. |
| Burton W. Chace Park | W. Market St. and Dairy Ave., City of Long Beach | This park is 0.5 acre in size and has a basketball court, playground equipment, and a water play spray feature. |

³ "72nd Street Staging Area" is the nomenclature provided by the County of Los Angeles Department of Parks and Recreation in their comment letter on the RDEIR/SDEIS dated October 23, 2017. However, the County website (parks.lacounty.gov, accessed January 24, 2019) refers to this facility as the 72nd Street Equestrian Park and the 72nd Street Arena.

| Resource | Address | Amenities |
|---|---|--|
| Cesar E. Chavez Park | 401 Golden Ave., City of Long Beach | Cesar E. Chavez Park is approximately 25.5 acres in size and features basketball courts, a community center, a playground, a weight room, restrooms, and picnic areas. The community center is known as The Zone Teen and Senior Center and is located in the east side of park area. |
| Coolidge Park | 352 E. Neece St., City of Long Beach | Facilities at this park include a basketball court, a softball field, a playground, a picnic area, a community center, and restrooms. |
| Cressa Park | Pacific Coast Hwy. and 19 th St., City of Long Beach | Cressa Park is a 0.94-acre park and features native wildflowers and a walking trail. |
| Daisy Avenue Greenbelt | Daisy Ave. and Pacific Coast Hwy., City of Long Beach | The Daisy Ave. Greenbelt is a wide, undeveloped street median with grass and trees. |
| DeForest Nature Trail | 6255 DeForest Ave., City of Long Beach | The DeForest Nature Trail is part of Deforest Park. |
| DeForest Park | 6255 DeForest Ave., City of Long Beach | Facilities at this park include a basketball court, a community center, a nature trail, a playground, a racquetball court, a softball field, a tennis court, a sand volleyball court, recreation classes, and restrooms. |
| DeForest and Dominguez Gap Wetlands | City of Long Beach | The DeForest Wetlands is a publicly owned multipurpose wetland area. The wetland area includes basins that provide for wildlife habitat, water quality improvement, groundwater recharge, passive recreation, and education. This is also a planned Riverlink Park destination site. |
| Drake Park | 951 Maine Ave., City of Long Beach | The facilities at this park include a basketball court, a community center, a handball/racquetball court, a picnic area, a playground, a soccer field, a softball field, a tennis court, a volleyball court, and restrooms. |
| Golden Shore Marine Biological Reserve Park | Golden Ave., City of Long Beach | This park is located near the Golden Shore RV Park. It is a bird and aquatic life sanctuary. |
| Golden Shore RV Park | 101 Golden Ave., City of Long Beach | Golden Shore RV Park is approximately five acres in size. It features 77 spaces with full hookups, 30/50 amp services, large picnic areas with tables, a pool and spa, a recreation/club room with a small kitchen facility, videogames, a sand volleyball court, horseshoes, shuffleboard, a children's playground, hot showers, a laundry room, a convenience store, barbeque pits, a phone hookup, and restrooms. |
| The Fitting Studio Golf Facility | 3701 Pacific Pl., City of Long Beach | This facility features a driving range. It is privately owned and operated. |
| Hudson Park | 2335 Webster Ave., City of Long Beach | This park is 13.1 acres in size and provides two lighted baseball/softball fields, one lighted soccer field, a picnic area, and a playground. |
| Houghton Park | 6301 Myrtle Ave., City of Long Beach | This park provides such amenities as a baseball field, a basketball court, a community center, a picnic area, a playground, a soccer field, softball fields, tennis courts, a volleyball court, and restrooms. |

| Resource | Address | Amenities |
|------------------------------|---|--|
| Lincoln Park | Pacific Ave. and Broadway St., City of Long Beach | Lincoln Park is a total of 5.6 acres in area. It features a picnic area and open space. Lincoln Park has the distinction of being the oldest park in Long Beach. Originally known as Pacific Park, the area was officially designated as a park on the original town site of Long Beach in 1888. |
| Loma Vista Park | 72 nd Pl. and Ocean Blvd., City of Long Beach | Loma Vista Park is 0.23 acre in size and overlooks the scenic Alamitos Bay. Amenities provided include park benches, picnic tables, and play equipment. |
| Los Cerritos Park | 3750 Del Mar Ave., City of Long Beach | Facilities at this park include play equipment, lighted tennis courts, and picnic areas. |
| Long Beach Aquarium | 100 Aquarium Wy., City of Long Beach | This privately owned aquarium features 19 major habitats and 32 focus exhibits and is home to more than 11,000 ocean animals. |
| Public Equestrian Rest Area | Between 31 st St. and Spring St. along the Los Angeles River, City of Long Beach | The Public Equestrian Rest Area is a 1.27-acre planned equestrian recreational facility that would include features such as six round pens, tie rails, horse automatic waterers, drinking fountains, mounting blocks, a multi-use walking path, drainage improvements, and landscaping. |
| Rainbow Harbor Esplanade | Pine Ave. and South Shoreline Dr., City of Long Beach | This park provides open green space for public use and special events. |
| Rancho Los Cerritos | 4600 Virginia Rd., City of Long Beach | Rancho Los Cerritos is a historic site with an adobe house and landscaped grounds. The property is 4.8 acres in size. |
| Rancho Rio Verde Riding Club | 1000 W. Carson St., City of Long Beach | Rancho Rio Verde Riding Club provides horse riding lessons; equestrian, jumping, hunting, and boarding facilities; and transportation. It is privately owned and operated. |
| Seaside Park | City of Long Beach | Seaside Park is a planned park. |
| Shoreline Aquatic Park | Aquarium Wy., City of Long Beach | Shoreline Aquatic Park is located between the Long Beach Aquarium and the Downtown Shoreline Marina. It is a wide, open green area that is used for picnics and special events. |
| Silverado Park | 1545 W. 31 st St., City of Long Beach | Silverado Park provides baseball fields, a basketball court, a Teen and Senior Center, a gym, picnic areas, a playground, a swimming pool, a softball field, tennis courts, volleyball courts, and restrooms. |
| Sleepy Hollow Greenbelt | 47 th Pl. Ave. to Rio Ave. | This greenbelt is 5.4 acres in size and provides an area of open space. |
| South Shore Launch Ramp | 590 Queensway Dr., City of Long Beach | This small boat launch ramp is located near the Queen Mary on Queensway Dr. and is open 24 hours per day. |
| South Street Parkway | South St. and Jaymills Ave., City of Long Beach | South Street Parkway is a 1.4-acre lot of open space. |
| Tanaka Park | 1400 W. Wardlow Rd., City of Long Beach | Tanaka Park provides such amenities as a playground, a picnic area, benches, a walking trail, and a half-court basketball court. |
| Victory Park | Ocean Blvd., City of Long Beach | Victory Park is a total of 4.4 acres in area. It features a grassy area with a scenic ocean view along the south side of Ocean Blvd. between Alamitos Ave. and Magnolia Ave. |
| Virginia Country Club | 4602 N. Virginia Rd., City of Long Beach | Virginia Country Club features 18 holes and 6,505 yards of golf from the longest tees for a par of 71. It is privately owned and operated. |

| Resource | Address | Amenities |
|--------------------------|--|--|
| Wrigley Greenbelt | City of Long Beach | This area provides green open space and a walking trail for residents to enjoy. It is 9.8 acres in size. |
| Wrigley Heights Dog Park | 3401 Golden Ave., City of Long Beach | The Wrigley Heights Dog Park is a 1.9-acre dog park. |
| Wrigley Heights No.1 | City of Long Beach | This is a Riverlink Park destination site. |
| Wrigley Heights No. 2 | City of Long Beach | This is a Riverlink Park destination site. |
| Ruben F. Salazar Park | 3864 Whittier Blvd., County of Los Angeles (unincorporated East Los Angeles) | Ruben F. Salazar Park provides a baseball field, basketball courts, play area, community room, computer center, gymnasium, outdoor fitness station, picnic shelters, senior center, swimming pool, and a tennis court. |
| Eugene A. Obregon Park | 4021 East First St., County of Los Angeles (unincorporated East Los Angeles) | Eugene A. Obregon Park provides basketball courts, ceramic rooms, community room, computer center, fitness zone, gymnasium, multi-purpose field, swimming pool and a walking path. |
| Burke-Ham Park | 11832 Atlantic Ave., City of Lynwood | This ten-acre park includes a baseball and soccer overlay; a basketball court; a tree-covered promenade; a tot lot; a restroom building; picnic and open grass areas; and a walking/jogging path that encircles the park's perimeter, with exercise stations along the route. |
| Maywood Park | 4801 E. 58 th St., City of Maywood | This park is 5.5 acres in size and is located in the eastern part of the city. The facilities located in this park include the Maywood Community Center, a baseball diamond/softball field, picnic facilities, and playground facilities and equipment. |
| Maywood Riverfront Park | 5000 Slauson Ave., City of Maywood | This park is located in the eastern part of the city, along the Los Angeles River. Facilities include grass fields, a basketball court, parking, playground facilities and equipment, picnic facilities, and a walkway. |
| Spane Park | 14400 Gundry Ave., City of Paramount | This park consists of a preschool, a playground, a fishing pond, a learning center (Paramount Education Partnership), a lighted basketball court, a lighted baseball diamond, a picnic area, an outdoor amphitheater, and restrooms. |
| Ralph C. Dills Park | 6500 San Juan St., City of Paramount | This park consists of playgrounds, exercise stations, a nature trail, picnic areas, a walking/jogging path, and restrooms. |
| Orange Ave. Pool | 14618 Orange Ave., City of Paramount | The Orange Ave. Pool is a public pool open to residents of the City of Paramount only during the summer. |
| Circle Park | 10129 Garfield Ave., City of South Gate | Circle Park is a four-acre neighborhood park built in 1956 and renovated in 1976 and 2003. The park is semi developed with a full basketball court, one ball field with a backstop, open turf for soccer, a small parking lot, and a playground. |
| Gardendale Tot Lot | 5480 Gardendale St. | Gardendale Tot Lot is a 0.45-acre mini park that was renovated in 2001. The tot lot is developed with a playground, benches, trash receptacles, street parking, and a path. |
| Hollydale Park | 5400 Monroe Ave., City of South Gate | Hollydale Park is a 56-acre community park built in 1976. The park is partially developed with a playground, lighted tennis courts, handball courts, softball fields with a backstop, an equestrian center, a volleyball court, open turf areas for soccer, one large picnic shelter, a parking lot, stair access to the bike path, and a multi-use trail along Los Angeles River. |

I-710 Corridor Project Final EIR/EIS

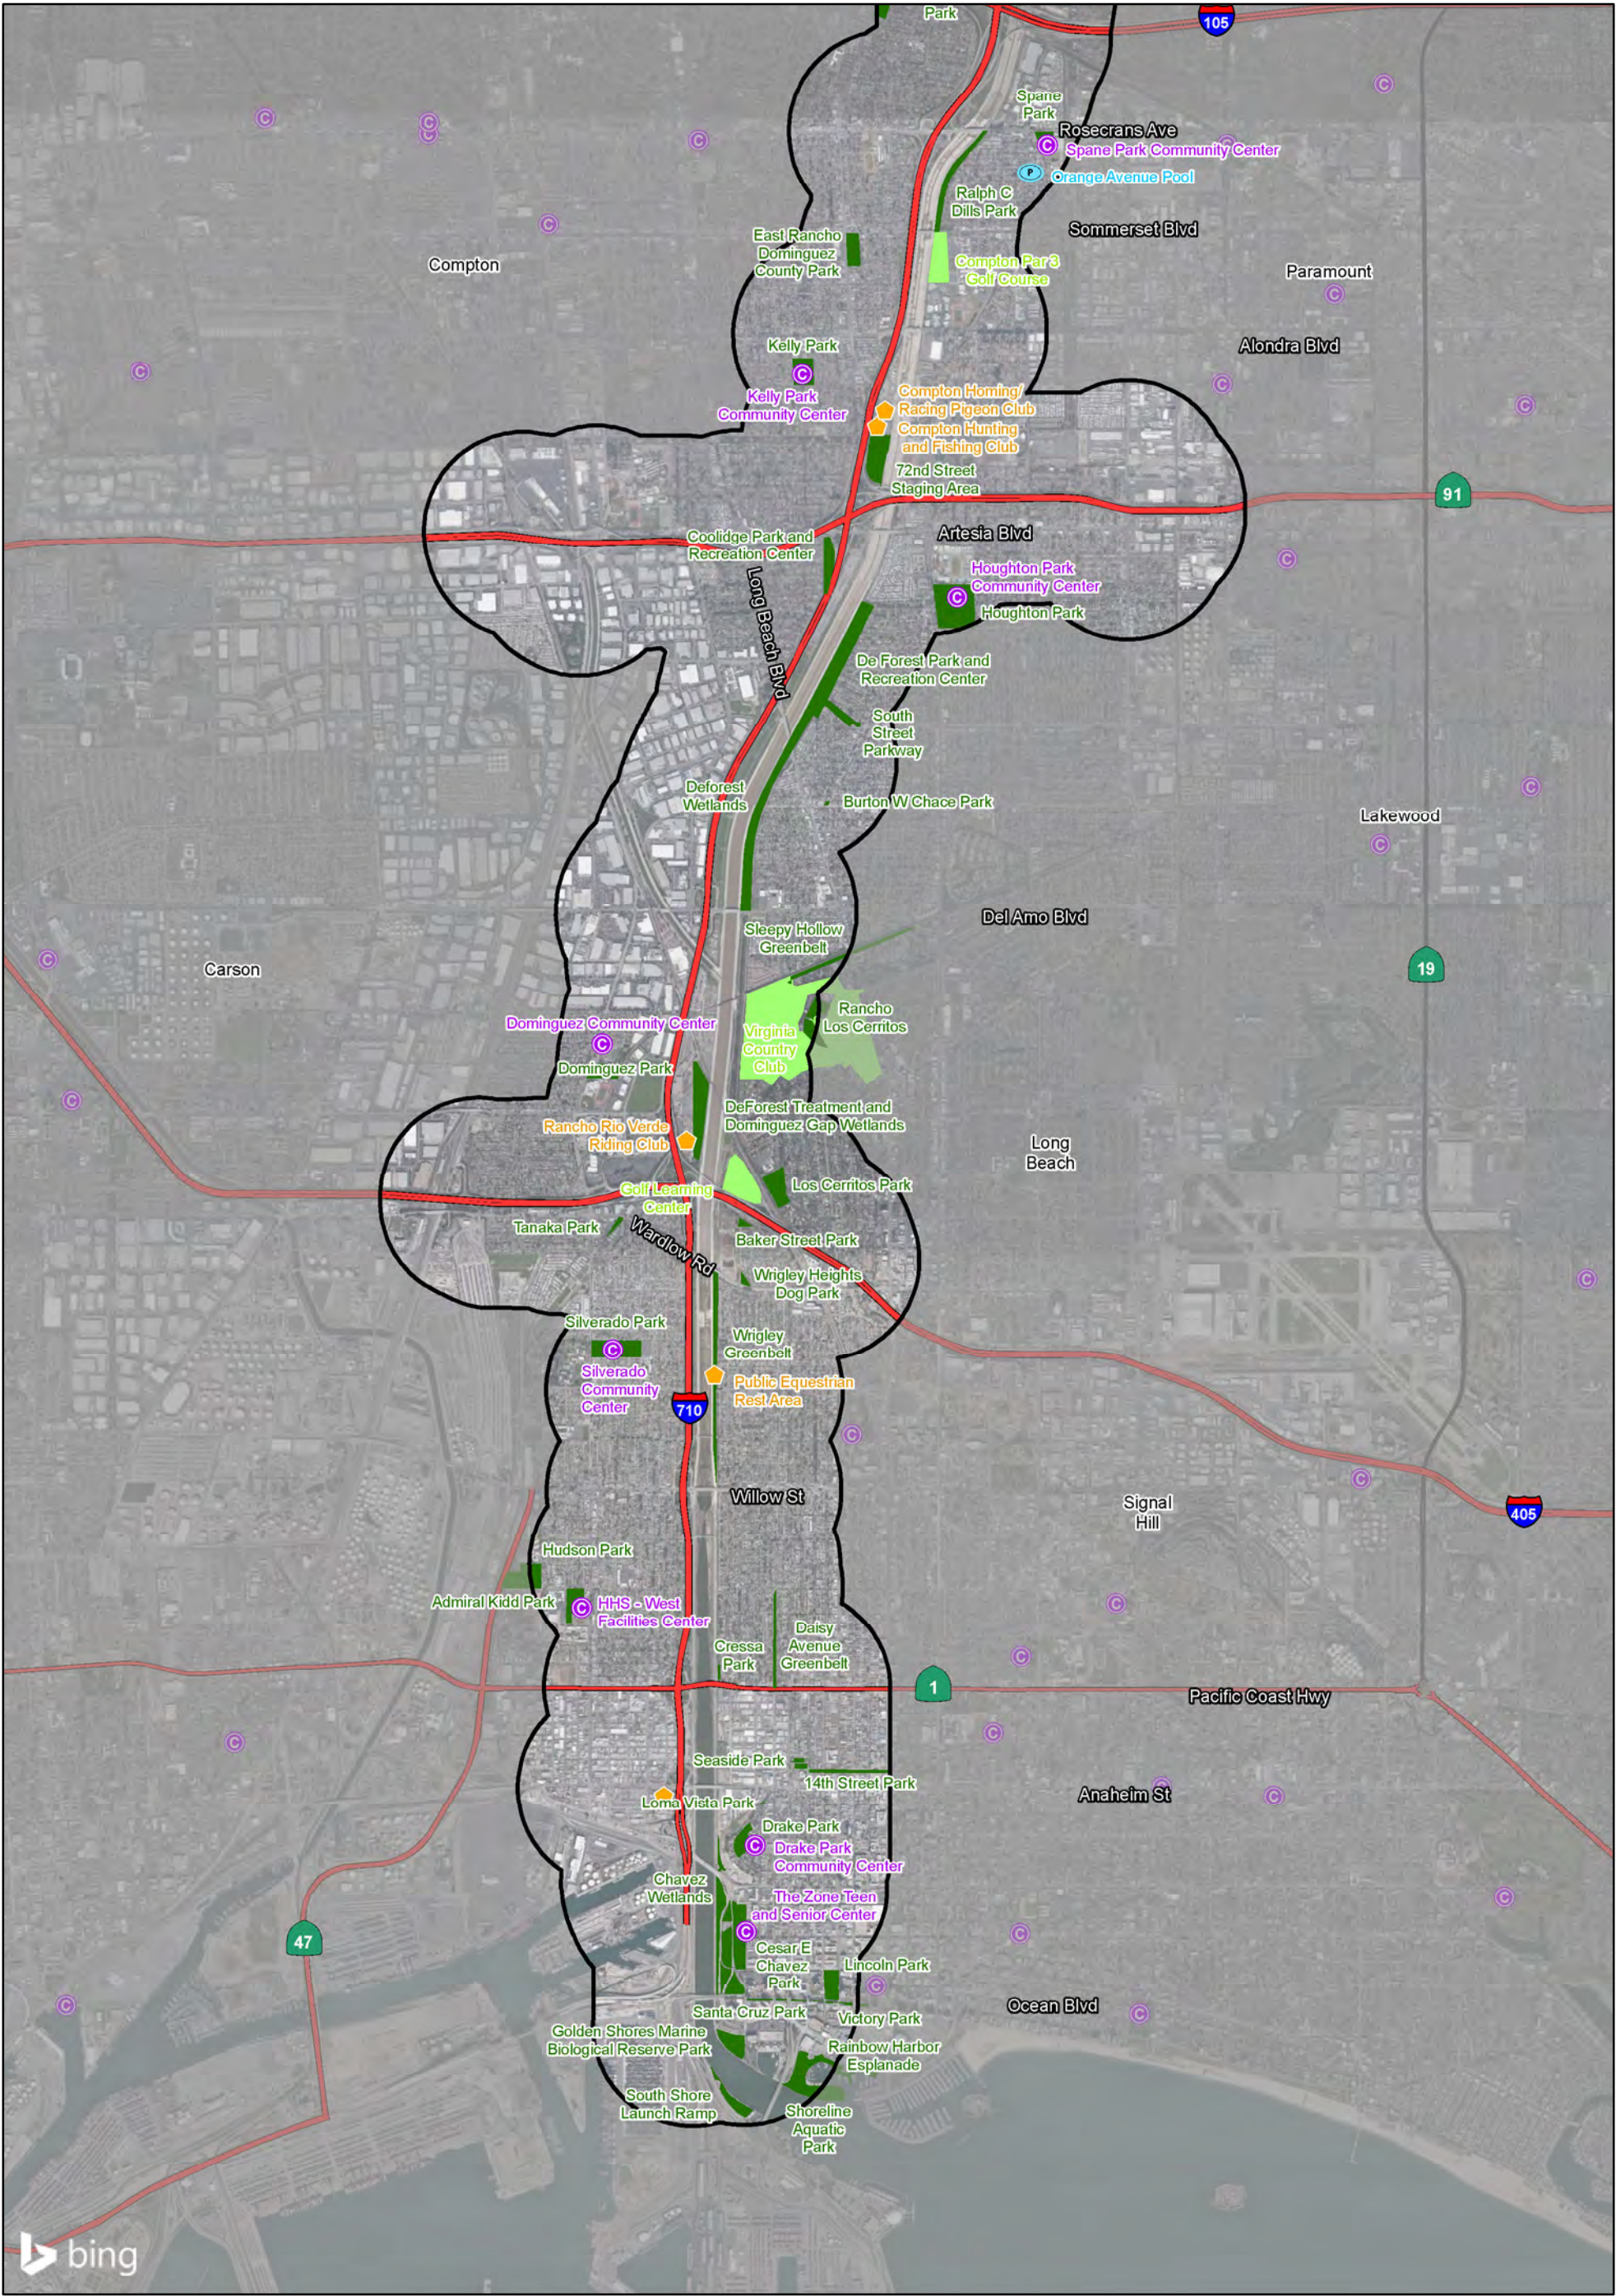

| Resource | Address | Amenities |
|----------------------------------|--|---|
| South Gate Park | 4900 Southern Ave., City of South Gate | South Gate Park is a 96.8-acre community park that was acquired by the City of South Gate in 1936. The park is developed with an auditorium, a sports center with a gym and pool, nine softball fields, one baseball field, soccer fields, tennis courts, a golf course, a junior hockey rink, a skate park, a senior center, an Azalea Memorial Garden, the War Memorial, two playground areas, picnic areas with barbeque grills, basketball courts, handball courts, a sand volleyball court, Boy Scout huts, horseshoe courts, drinking fountains, restrooms, benches, trash containers, and three parking lots. South Gate Park includes the South Gate Girls Clubhouse, the South Gate Sports Complex and Swim Stadium, and South Gate Senior Center. |
| South Gate Municipal Golf Course | 9615 Pinehurst Ave., City of South Gate | South Gate Golf Course is a nine-hole, par-three golf course that includes a snack bar, a driving range, and a pro shop. |
| Triangle Park | Atlantic Ave. and Rayo Ave., City of South Gate | Triangle Park is a 0.3-acre park with a special use area, a trail stop, a pergola, seating, bike racks, a drinking fountain, and parking. |
| Imperial Equestrian Center | 5543 Leeds St., City of South Gate | This privately owned, full-service boarding and training facility features seven round pens and turnouts, a large riding arena with lights, four bathing stalls with lights, and 13 cross-tie stalls. |
| Parque Dos Rios | Imperial Hwy., I-710, City of South Gate | Parque Dos Rios is an 8.5-acre parcel located in the triangle generally formed by the Los Angeles River to the east, Imperial Hwy. to the south, and the I-710 to the west. The Los Angeles River Trail is aligned along the east boundary of the Parque Dos Rios, between the Park and the Los Angeles River. The following recreation facilities and amenities are planned to be provided at Parque Dos Rios when the project is open to the public: overlook decks, seating areas, coastal sage scrub habitat area for birds and animals, shaded area with a picnic table, drinking fountain, bike rack, raptor perches, decorative fencing, and bilingual interpretive signs on the history of the City of South Gate and the Los Angeles and Rio Hondo Rivers. |

Corridor Project build alternatives in the Communities of Boyle Heights, Wilmington, San Pedro, and East Los Angeles, or within the Cities of Huntington Park, Lakewood, and Signal Hill.

LOCAL MULTI-USE TRAILS. The Los Angeles River Trail is a multi-use trail that is approximately 9.57 miles in length. The trail begins where the Rio Hondo River intersects with the Los Angeles River, near Imperial Hwy. and runs along the east side of the Los Angeles River. The trail ends at West Willow Street, in the City of Long Beach. The trail generally runs parallel to the bicycle path along the dirt shoulder. Segments of the trail are separated from the bicycle path by fencing, river bank stabilization devices or by open space. Mountain biking, hiking and equestrian activities are allowed on the multi-use trail.

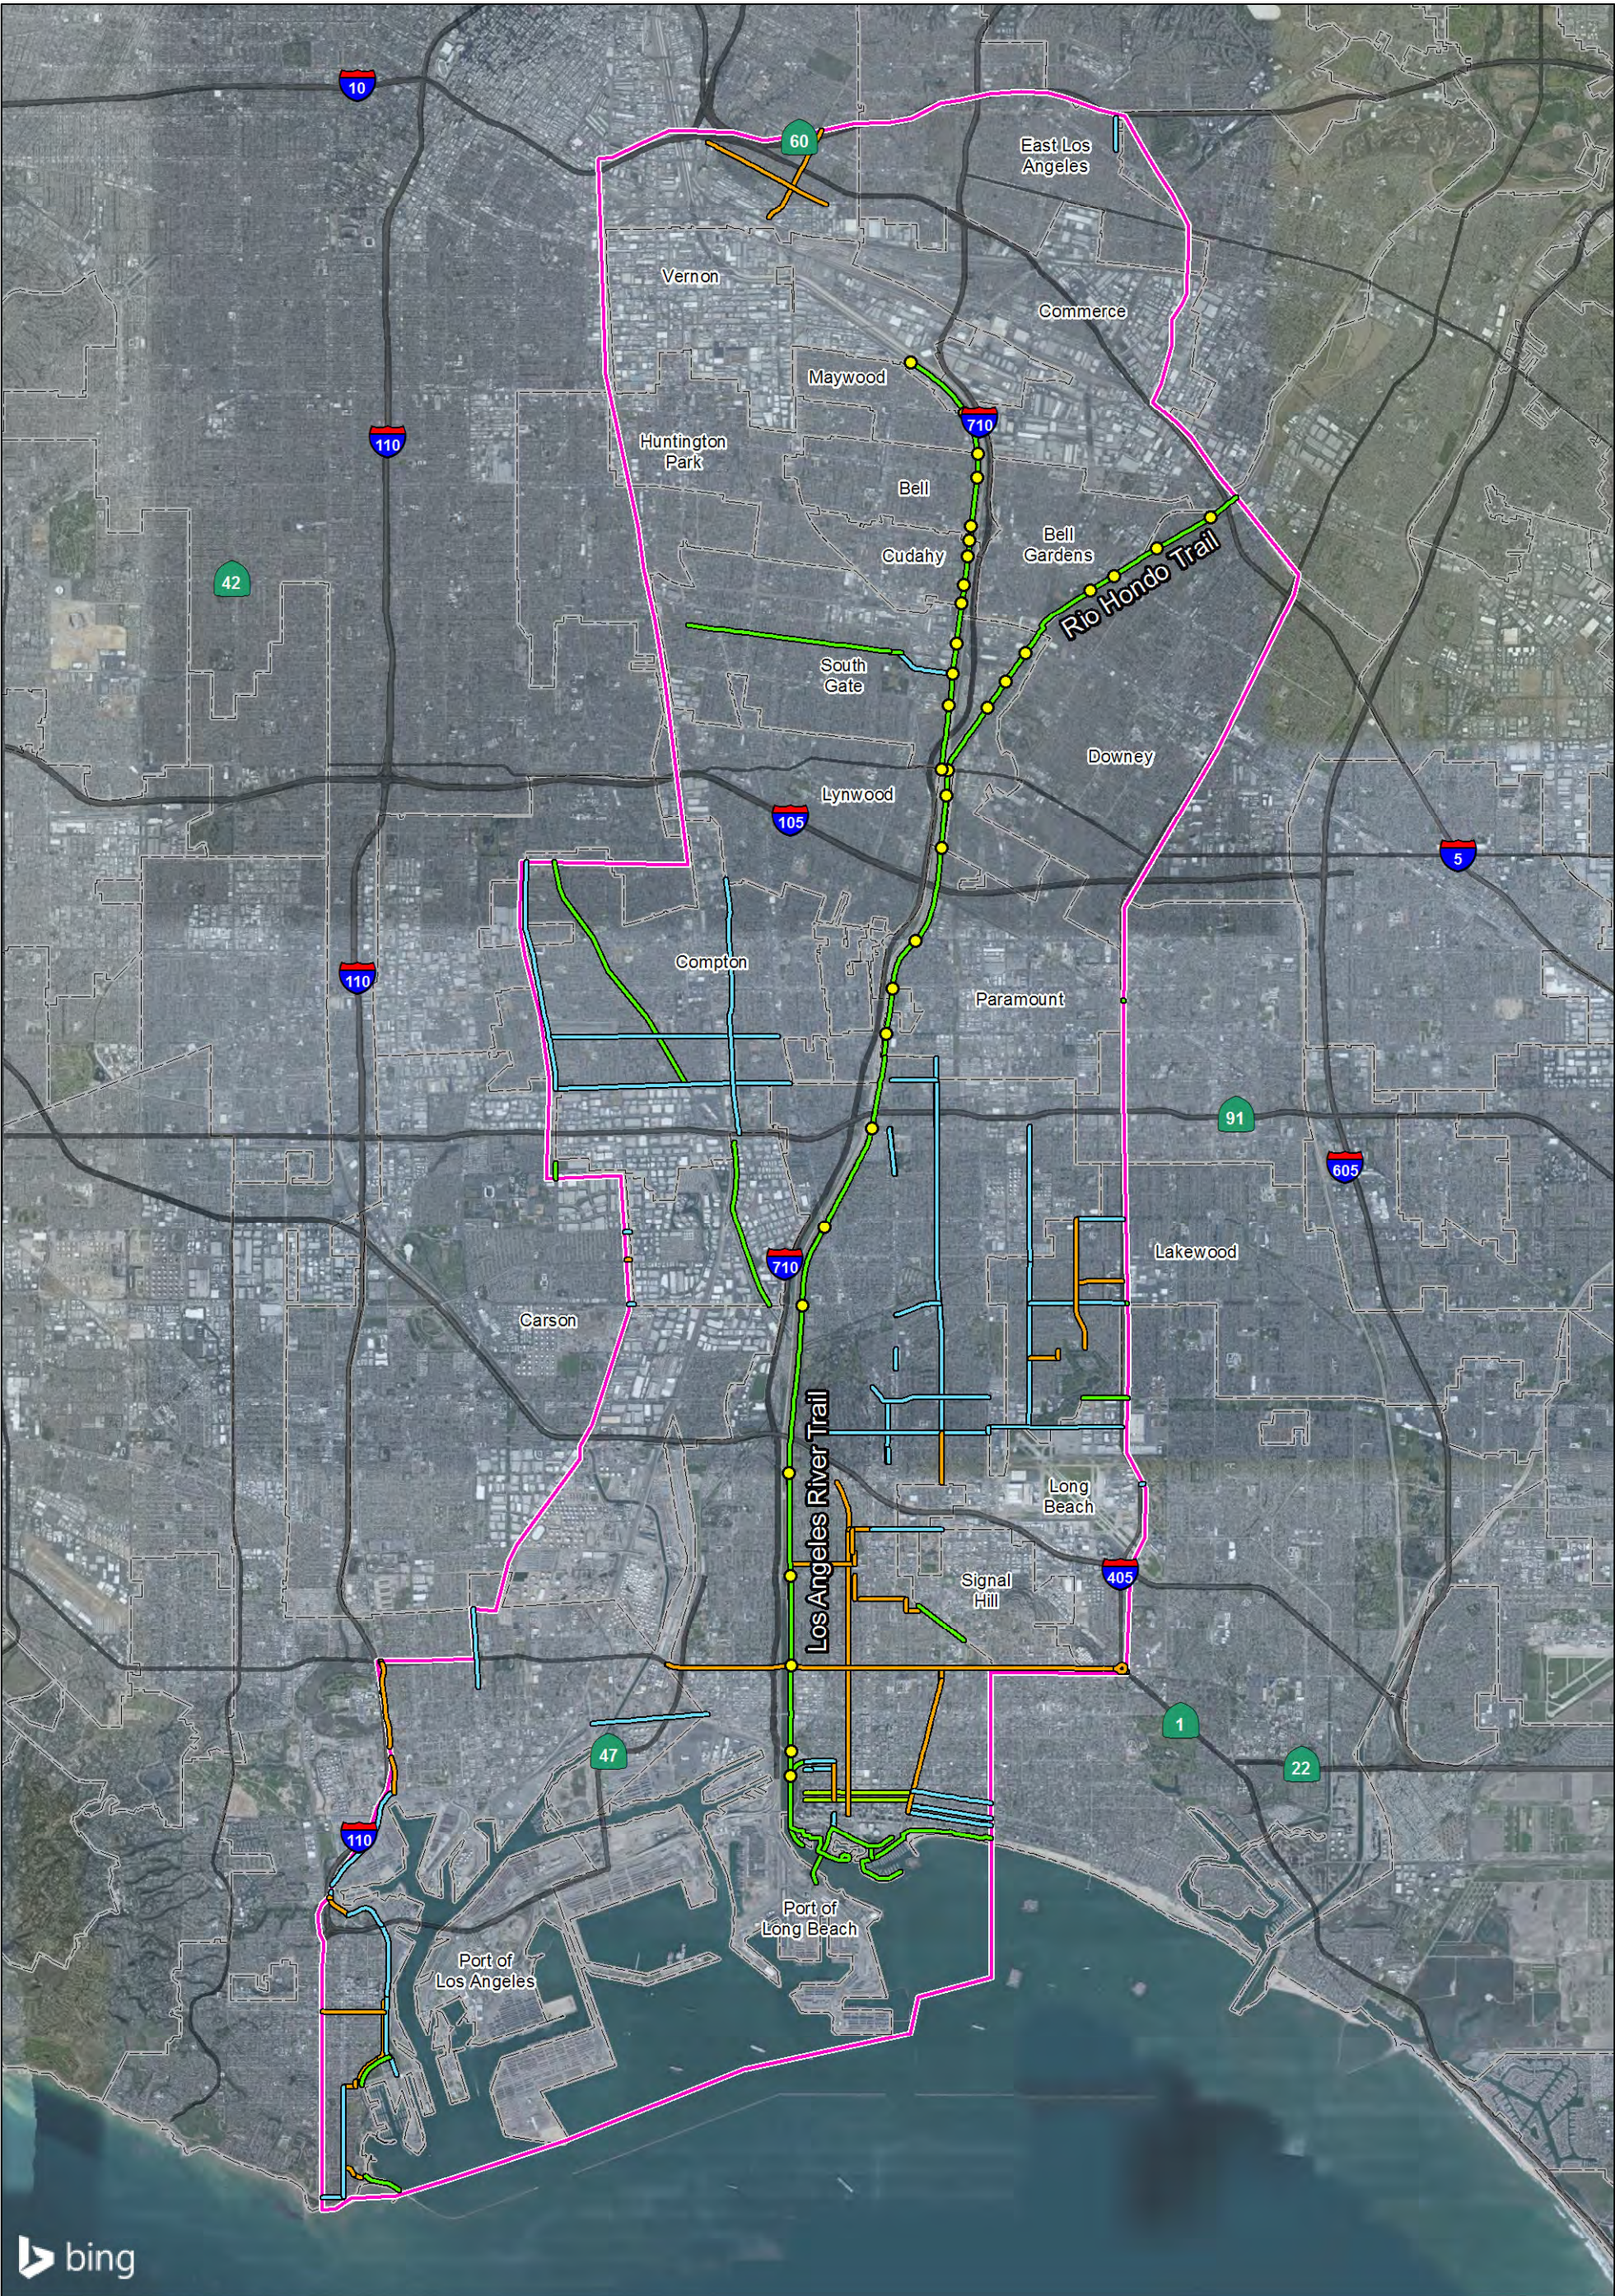

The Rio Hondo River Trail is a multi-use trail that is approximately 15.61 miles in length. The trail begins in North El Monte on Santa Anita Ave. The trail generally runs parallel to the bicycle path on the other side of the river. It crosses under I-10 and SR-60 and connects with the Rio Hondo Bike Path at San Gabriel Blvd. The trail crosses under I-5 and ends at Imperial Hwy., where the Los Angeles River Trail begins. Mountain biking, hiking, and equestrian activities are allowed on the multi-use trail.⁴

REGIONAL BIKEWAYS. Regional bikeways within the Study Area include the Los Angeles River Trail, the Rio Hondo Trail, and the Compton Creek Bike Path. Within the Study Area, the Los Angeles River Trail runs parallel to the I-710 mainline from the City of Long Beach to the City of Vernon, and access points are provided along the Trail near local interchanges, parks, and other trail connections (refer to Figure 3.1-5). The Los Angeles River Trail is a Class 1 Bikeway, meaning the Trail is completely separated from truck and automobile traffic.

The Rio Hondo Trail, a Class 1 Bikeway, is also located within the Study Area (refer to Figure 3.1-5). The southern terminus of the trail is located in the City of South Gate and proceeds in a northeasterly direction toward the City of El Monte. The Compton Creek Bike Path, Class 1 Bikeway, is located within the Study Area along the east bank of Compton Creek. The northern terminus of the trail is located in the City of Compton and proceeds southeasterly through the City of Compton and unincorporated Rancho Dominguez. The trail ends at Del Amo Blvd. near the confluence of Compton Creek and the Los Angeles River in the City of Long Beach, and a connection to the Los Angeles River Trail is provided to the east along Del Amo Blvd.

LOCAL BIKEWAYS. Within the Study Area, there are several Class 1, 2, and 3 Bikeways that provide local bicycle access (refer to Figure 3.1-5). These local bikeways are discussed in Table 3.1-4.

Table 3.1-4: Local Bikeways within the Study Area

| Bikeway Class | Location of Bikeways |
|----------------|--|
| Class 1 | <ul style="list-style-type: none"> ▪ Along Central Ave. from approximately the intersection of Del Amo Blvd. and the I-710 interchange to the south, and just south of East El Segundo Blvd. to the north, near the City of South Gate ▪ Just west of the Port of Los Angeles along Crescent Ave. (adjacent to the 22nd St. Park) and just south of Cabrillo Beach Park ▪ Immediately north-northeast of the Port of Long Beach along South Harbor Scenic Dr., Shoreline Dr., Ocean Blvd., Queens Wy., 3rd St., and Broadway, north-northeast of the Port of Long Beach, and Magnolia St., between Ocean Blvd. and West Shoreline Dr. ▪ Along Compton Creek, north and south of SR-91 ▪ Along Carson St., east of Paramount Ave. and west of Lakewood Blvd. in the City of Long Beach |
| Class 2 | <ul style="list-style-type: none"> ▪ Along Pacific Ave., between West 22nd St. and Shepard St., just west of the Port of Los Angeles ▪ Along North Harbor Blvd./North Front St. from North Pacific Ave. to 6th St., just west of the Port of Los Angeles ▪ Along segments of 1st and 2nd Sts. and 6th and 7th Sts., immediately north- northeast of the Port of Long Beach ▪ Along Cherry Ave. with a northern terminus near Alondra Blvd. in the City of Paramount and a southern terminus at approximately the I-405 and the SR-91 interchange in the City of Long Beach ▪ Along Central Ave., Alondra Blvd., Santa Fe Ave., and Greenleaf Blvd., south of I-105 and north of SR-91 within and adjacent to the City of Compton ▪ Segments of Spring St., Candlewood Ave., Hardwick St., South St., Downey Ave., Del Amo Blvd., Paramount Blvd., Atlantic Ave., E. 70th St., and Orange Ave. in the City of Long Beach |
| Class 3 | <ul style="list-style-type: none"> ▪ Segments along East 8th St. and South Lorena St. in the City of Los Angeles. ▪ Segments along Orange Ave., 45th St., Market St., and South St., in the City of Long Beach ▪ A segment along Pacific Coast Hwy. east of Alameda St. and west of North Lakewood Blvd., located immediately north-northeast of the Port of Long Beach ▪ Pacific Ave. and Alamitos Ave., from Pacific Coast Hwy. to Ocean Blvd., and a small segment of Magnolia Ave., south of 7th St. and north of Broadway, located immediately north-northeast of the Port of Long Beach |

Sources: Various City and County General Plans.

Class 1 Bikeways provide a completely separated right-of-way for the exclusive use of bicycles and pedestrians, with cross-flow by motorists minimized. Class 2 Bikeways provide a striped lane for one-way bike travel on a street or highway. Class 3 Bikeways provide for shared use by pedestrian or motor vehicle traffic.⁵

3.1.3.2 ENVIRONMENTAL CONSEQUENCES

The following discussion of environmental consequences only describes the permanent impacts of the project. Please refer to Section 3.24 of this document, Construction Impacts, for a discussion of the temporary impacts of the project for each resource area. Specifically, temporary impacts related to land use are located in Section 3.24.3.1. However, for consistency with the Section 4(f) evaluation, measures regarding temporary impacts to parks and recreational resources are provided below in Section 3.1.3.3.

PERMANENT IMPACTS.

BUILD ALTERNATIVES. Table 3.1-5 lists the permanent direct and indirect impacts to parks and recreation facilities by the build alternatives. Use impacts were evaluated based on overlaying the footprints/right-of-way limits for the build alternatives on the geographic information system (GIS) mapping of the boundaries of the Section 4(f) properties, including recreational facilities. Locations where the footprints/right-of-way limits for the build alternatives would result in the acquisition of land from these Section 4(f) properties were identified.

Table 3.1-5 also identifies those parks and recreation facilities where the impacts resulting from the build alternatives would constitute use of a Section 4(f) property. *Section 4(f) and 6(f)* (2020), provided in Appendix B, evaluated the identified Section 4(f) and 6(f) properties to assess whether the build alternatives would result in a use of property from those resources.

The build alternatives would not result in permanent adverse impacts to regional or local multi-use trails or bikeways. Beneficial impacts associated with the creation of bike overcrossings would occur due to the creation of connectivity and access to local parks.

NO BUILD (ALTERNATIVE 1). The No Build (Alternative 1), the Preferred Alternative, proposes no improvements to the I-710 Corridor; therefore, it would not result in the direct and indirect permanent impacts to parks and recreation facilities described above.

⁵ California Department of Transportation. 2006. *Highway Design Manual*, Chapter 1000 Bikeway Planning and Design.

Table 3.1-5: Permanent Direct and Indirect Impacts to Parks and Recreation Facilities

| Park | Address | Owner/Operator | Direct or Indirect Impact |
|--------------------------|-------------------------------------|-------------------------|--|
| Julia Russ Asmus Park | 8321 Jaboneria Rd., Bell Gardens | City of Bell Gardens | <p>Improvements to the I-710 mainline and local arterials resulting from the build alternatives would not result in direct impacts to the park.</p> <p>As indicated in the <i>Traffic Noise Study Report</i> (Caltrans 2016) prepared for the project, sound barriers were found to be feasible under the I-710 Corridor Project build alternatives along the east side of I-710 that could provide noise reduction to this park and surrounding land uses.</p> |
| Bandini Park | 1466 McDonnell Ave., Commerce | City of Commerce | <p>The park is located adjacent to the I-710 mainline; however, the build alternatives have been designed to avoid direct impacts to this park. As identified in the RDEIR/SDEIS, Alternatives 5C and 7 would have required an aerial easement, a TCE, and temporary closures to the park. Please refer to Section 2.3.2.2 of this Final EIR/EIS for more detailed information on the redesign in the area of Bandini Park. The need for any additional aerial easement beyond the current Caltrans right-of-way has been avoided. In order to avoid any temporary construction easement within the park, during construction of either of the build alternatives in this area, the construction contractor would be prohibited from accessing Bandini Park or otherwise utilizing the park for staging or construction storage, and construction in this area would be performed from the deck of the overhead structure.</p> <p>As indicated in the <i>Traffic Noise Study Report</i> (Caltrans 2016) prepared for the project, two sound barriers were found to be feasible under Alternative 7 along the east side of I-710 that could provide noise reduction to the park and surrounding land uses. These sound barriers would also have a beneficial visual effect to park users by screening out views of vehicles on the I-710 freeway.</p> |

| Park | Address | Owner/Operator | Direct or Indirect Impact |
|-----------------------------------|--------------------------------|--------------------|--|
| Compton Par 3 Golf Course | 6400 E. Compton Blvd., Compton | City of Compton | <p>The golf course is not located adjacent to the I-710 mainline or along arterials impacted as a result of the I-710 Corridor Project build alternatives (the Los Angeles River separates the I-710 mainline and the golf course); therefore, the build alternatives would not result in direct impacts to this golf course.</p> <p>As indicated in the <i>Traffic Noise Study Report</i> (Caltrans 2016) prepared for the project, for Alternative 7, noise abatement (in the form of a sound barrier) was determined to be acoustically not feasible as it would provide only two dBA in noise reduction.</p> |
| Compton Hunting and Fishing Club | 1625 S. Sportsman Dr., Compton | Private | Alternative 5C would result in a full acquisition of this recreational facility as a result of widening the freeway mainline. Alternative 7 would result in a full acquisition of this recreational facility as a result of the freight corridor. |
| Compton Homing/Racing Pigeon Club | 1620 S. Sportsman Dr., Compton | Private | Alternative 7 would result in direct impacts to this facility. The alternative requires a full acquisition of the parcel of land occupied by this facility. |
| River Park | River Rd., Cudahy | City of Cudahy | During construction, the I-710 Corridor Project build alternatives have the potential to result in temporary impacts to access to the park from Clara St.; however, a TMP that would be prepared to minimize impacts and provide alternative access points, if necessary (refer to Measure CON-TR-1 in Section 3.24, Construction Impacts). These potential impacts would cease once construction was complete. |
| Clara Park | 4835 Clara St., Cudahy | City of Cudahy | During construction, the I-710 Corridor Project build alternatives also have the potential to result in temporary impacts to access the park from Clara St.; however, a TMP that would be prepared to minimize impacts and provide alternative access points, if necessary (refer to Measure CON-TR-1 in Section 3.24, Construction Impacts). These potential impacts would cease once construction was complete. |
| Golden Shore RV Park | 101 Golden Ave., Long Beach | City of Long Beach | As indicated in the <i>Traffic Noise Study Report</i> (Caltrans 2016) prepared for the project, a sound barrier is included under the Early Action Sound Wall project along the south side of Shoreline Dr. that could provide noise reduction to this RV park. |

| Park | Address | Owner/Operator | Direct or Indirect Impact |
|---|-----------------------------------|--------------------|--|
| DeForest Treatment and Dominguez Gap Wetlands | North Long Beach Ave., Long Beach | City of Long Beach | <p>Alternative 5C and Alternative 7 would require the construction of a wider bridge over the DeForest Market Street Basin at North Long Beach Blvd., requiring an expanded bridge and aerial easement that is 0.44 acre wider than the existing bridge and easement.</p> <p>In addition, Alternative 7 would remove the Dominguez Gap West Basin. However, approximately 9.54 acres of the basin would be restored in the same location as the existing basin following construction of either build alternative, and only 5.4 acres from the Dominguez Gap West Basin would be permanently incorporated into the transportation facility. Therefore, Alternative 7 would result in an overall net loss of 3.76 acres from the existing basin area. While the basin would be reduced in size from 13.3 acres to 9.54 acres, the new basin would serve a similar function as the existing basin, and recreational activities would still be available on the property.</p> <p>Because of these uses of this recreation area, this recreation area is addressed further in the <i>Section 4(f) and 6(f)</i> (refer to Appendix B of this Final EIR/EIS).</p> |
| Cesar E. Chavez Park | 401 Golden Ave., Long Beach | City of Long Beach | <p>Shoreline Dr. consists of separated northbound/southbound lanes (one in each direction) routed through Cesar E. Chavez Park. Under the build alternatives, Shoreline Dr. would be combined and reconstructed to two through lanes in each direction along the western edge of the park between Ocean Blvd. and Shoemaker Bridge. Under the build alternatives, the existing lanes would be removed and the available land restored and landscaped to become an accessible part of Cesar E. Chavez Park, therefore resulting in a beneficial impact for the community. This change would improve access to the park, as well as provide for a larger contiguous recreation area (based on design, it is estimated that 2.90 acres would be permanently impacted by the build alternatives but that with the integration of land previously used for Shoreline Dr., the park would experience a net increase of 2.99 acres. Implementation of the build alternatives would result in a larger, more functional park with a total of 28.38 acres of park area. The Teen and Senior Centers would be maintained. A reduction in the amount of land available in the part of the park bounded by North Golden Ave., 3rd St., Shoreline Dr., and Broadway Ave., which is jointly used with Cesar E. Chavez Elementary School and governed by a Joint</p> |

| Park | Address | Owner/Operator | Direct or Indirect Impact |
|---|----------------------------|--------------------|--|
| | | | <p>Use Agreement would occur (2.69 acres under existing conditions to 2.1 acres with the project).</p> <p>Because of these uses of the park, this park is addressed in the <i>Section 4(f) and 6(f)</i> (refer to Appendix B of this Final EIR/EIS).</p> <p>During construction of Alternative 5C and Alternative 7, approximately 21.9 acres of Cesar E. Chavez Park would be required for a TCE (only 19 acres would be exclusively required for the TCE because 2.90 acres of the TCE area would be permanently incorporated), which would include 0.41 acre of land for a detour road within the park during construction and the realignment of Broadway.</p> <p>Also, during construction of either build alternative, parts of Cesar E. Chavez Park would be temporarily closed to public access, to protect the safety of park users and the project construction workers. The closed areas would not be used for any construction activities and would be returned to public use in the same or better condition as when the areas were closed off to public access.</p> <p>Under Alternative 5C and Alternative 7, the removal of the basketball courts west of Cesar E. Chavez Elementary School would be required. However, the basketball courts would be replaced following construction to ensure that the activities, functions, and features of the park would not be adversely affected.</p> |
| Drake Park and the Drake/Chavez Greenbelt (planned) | 951 Maine Ave., Long Beach | City of Long Beach | <p>The City of Long Beach is conducting the planning process for the Drake/Chavez Greenbelt Project, and the Draft Master Plan for the approximately 50-acre proposed greenbelt shows extensive proposed connections among existing Cesar E. Chavez Park, the Los Angeles River Trail, and Loma Vista Park, in addition to a wide range of recreational and other public amenities within the greenbelt.</p> <p>Alternatives 5C and 7 would require permanent incorporation of a portion of the planned linkage between Drake Park and Cesar E. Chavez Park (approximately 2.22 acres). However, the majority of land identified in the Draft Master Plan for the Drake/Chavez Greenbelt is outside the limits of the build alternatives and would not be impacted. A TCE of approximately 2.81 acres on the Drake/Chavez Greenbelt (just south of Anaheim Street and at the Shoemaker Bridge) would be required during</p> |

| Park | Address | Owner/Operator | Direct or Indirect Impact |
|----------------------------------|---------------------------------|--------------------|--|
| | | | construction of either of the build alternatives, but this would be temporary in nature and the land used for the TCE would be returned in equal or better condition. |
| Wrigley Heights No. 2 | Planned in Long Beach | City of Long Beach | During construction, the I-710 Corridor Project build alternatives would have the potential to result in temporary impacts to access along Wardlow Rd.; however, a TMP that would be prepared to minimize impacts and provide detours (refer to Measure CON-TR-1 in Section 3.24, Construction Impacts). These potential impacts would cease once construction was complete. |
| Tanaka Park | 1400 W. Wardlow Rd., Long Beach | City of Long Beach | During construction, the I-710 Corridor Project build alternatives would have the potential to result in temporary impacts to access along Wardlow Rd.; however, the build alternatives would include a TMP that would be prepared to minimize impacts and provide detours (refer to Measure CON-TR-1 in Section 3.24, Construction Impacts). These potential impacts would cease once construction was complete. |
| The Fitting Studio Golf Facility | 3701 Pacific Pl., Long Beach | Private | Improvements to the I-405 and I-710 connectors under the build alternatives would result in impacts to parking; however, the facility would not be relocated. Improvements would also occur at the I-710/Pacific Pl. interchange; therefore, construction of the I-710 Corridor Project build alternatives have the potential to result in temporary impacts to access along N. Pacific Pl. However, the build alternatives would include a TMP that would be prepared to minimize impacts and provide detours (refer to Measure CON-TR-1 in Section 3.24, Construction Impacts). These potential impacts would cease once construction was complete. |
| Rancho Rio Verde Riding Club | 1000 W. Carson St., Long Beach | Private | The build alternative improvements at the I-710/I-405 interchange would not impact this facility; therefore, the I-710 Corridor Project build alternatives would not result in direct impacts to this club. Construction of the I-710 Corridor Project build alternatives would have the potential to result in temporary impacts to access on W. Carson St. However, the build alternatives would include a TMP that would be prepared to minimize impacts and provide detours (refer to Measure CON-TR-1 in Section 3.24, Construction Impacts). These potential impacts would cease once construction was complete. |

| Park | Address | Owner/Operator | Direct or Indirect Impact |
|----------------------------|---------------------------------|-----------------------|--|
| Coolidge Park | 352 E. Neece St., Long Beach | City of Long Beach | <p>Improvements to the I-710 mainline and Artesia Blvd. under the build alternatives would not result in direct impacts to this park; improvements would be made within the existing right-of-way. However, during construction, the I-710 Corridor Project build alternatives would have the potential to result in temporary impacts to access along Artesia Blvd.; however, the build alternatives would include a TMP that would be prepared to minimize impacts and provide detours (refer to Measure CON-TR-1 in Section 3.24, Construction Impacts). These potential impacts would cease once construction was complete.</p> <p>As indicated in the <i>Revised Visual Impact Assessment</i> (2017) prepared for the project, Key View 8 is located at this park. Both build alternatives would result in incremental changes in visual quality ratings, which would result in a low visual impact under Alternative 5C and a moderately low visual impact under Alternative 7.</p> |
| Maywood Riverfront Park | 5000 Slauson Ave., Maywood | City of Maywood | <p>The Los Angeles River separates the park and the I-710 mainline. Interchange improvements at Slauson Ave. under the build alternatives would not directly impact the park. However, as indicated in the <i>Revised Visual Impact Assessment</i> (2017) prepared for the project, Key View 18 is located at this park, facing east toward I-710. The visible changes for Alternatives 5C and 7 would be minimal, and in the distance, there would be very little change in the visual quality. The resulting visual impact for both build alternatives would be low (1.6 and 1.9, respectively).</p> <p>During construction, the I-710 Corridor Project build alternatives would have the potential to result in temporary impacts to access to the park from Slauson Ave.; however, a TMP that would be prepared to minimize impacts and provide alternative access points, if necessary (refer to Measure CON-TR-1 in Section 3.24, Construction Impacts). These potential impacts would cease once construction was complete.</p> |
| Spane Park | 14400 Gundry Ave., Paramount | City of Paramount | <p>The park is not located adjacent to the I-710 mainline. Interchange improvements at Rosecrans Ave. under the build alternatives would not directly impact the park; therefore, the I-710 Corridor Project build alternatives would not result in direct impacts to this park.</p> <p>During construction, the I-710 Corridor Project build alternatives would have the potential to result in temporary impacts to access along Rosecrans Ave; however, the build alternatives would include a TMP</p> |

| Park | Address | Owner/Operator | Direct or Indirect Impact |
|----------------------------|------------------------------|-------------------|---|
| | | | that would be prepared to minimize impacts and provide detours (refer to Measure CON-TR-1 in Section 3.24, Construction Impacts). These potential impacts would cease once construction was complete. |
| Ralph C. Dills Park | 6500 San Juan St., Paramount | City of Paramount | <p>The Los Angeles River separates the park and the I-710 mainline. Interchange improvements at Rosecrans Ave. under the build alternatives would not directly impact the park.</p> <p>During construction, the I-710 Corridor Project build alternatives would have the potential to result in temporary impacts to access along Rosecrans Ave; however, the build alternatives would include a TMP that would be prepared to minimize impacts and provide detours (refer to Measure CON-TR-1 in Section 3.24, Construction Impacts). These potential impacts would cease once construction was complete.</p> <p>As indicated in the <i>Traffic Noise Study Report</i> (Caltrans 2016) prepared for the project, under Alternative 7, there would be a substantial noise increase resulting in noise impacts. Noise abatement was considered in the form of a soundwall along the truck lanes; however, it was determined to be acoustically not feasible.</p> |
| Meadows Park | 15753 Gundry Ave., Paramount | City of Paramount | <p>The park is not located adjacent to the I-710 mainline. Improvements to Alondra Blvd. under the build alternatives would not result in direct impacts to the park.</p> <p>During construction, the I-710 Corridor Project build alternatives would have the potential to result in temporary impacts to access along Alondra Blvd.; however, the build alternatives would include a TMP that would be prepared to minimize impacts and provide detours (refer to Measure CON-TR-1 in Section 3.24, Construction Impacts). These potential impacts would cease once construction was complete.</p> |
| Imperial Equestrian Center | 5543 Leeds St., South Gate | Private | <p>The equestrian center is not located adjacent to the I-710 mainline and improvements to Imperial Hwy. under the build alternatives would not result in direct impacts to the recreational facility.</p> <p>During construction, the I-710 Corridor Project build alternatives would have the potential to result in temporary impacts to access along Imperial Hwy. west of the equestrian center; however, the build alternatives would include a TMP that would be prepared to minimize impacts and provide detours (refer to Measure</p> |

| Park | Address | Owner/Operator | Direct or Indirect Impact |
|-----------------|-------------------------------------|--|---|
| | | | <p>CON-TR-1 in Section 3.24, Construction Impacts). These potential impacts would cease once construction was complete.</p> <p>As indicated in the <i>Revised Visual Impact Assessment</i> (2017) prepared for the project, Key View 12 shows the Lario Trail, next to the Los Angeles County Flood Channel. This Key View is located just southeast of the Equestrian Center. The visual impacts for both Alternative 5C and Alternative 7 would be moderately low.</p> |
| Parque Dos Rios | Imperial Hwy., I-710, South Gate | Watershed Conservation Authority | <p>The build alternatives would result in direct impacts to the planned park. Alternative 5C would result in the permanent use of 2.37 acres of land on the west side of this park. Alternative 7 would result in the permanent incorporation of 3.21 acres of land from Parque Dos Rios into the transportation facility. However, the remnant parcel outside the Alternative 7 footprint would have limited functionality and accessibility. Therefore, Alternative 7 would result in the permanent use of the entire 8.5-acre park. Additionally, Alternative 5C would require the use of 0.26 acre for a TCE, while Alternative 7 would require no TCE use from this park.</p> <p>Because of these park uses, this park is addressed further in the <i>Section 4(f) and 6(f)</i> (refer to Appendix B of this Final EIR/EIS).</p> <p>During construction, the I-710 Corridor Project build alternatives would have the potential to result in temporary impacts to access along Imperial Hwy.; however, the build alternatives would include a TMP that would be prepared to minimize impacts and provide detours (refer to Measure CON-TR-1 in Section 3.24, Construction Impacts). These potential impacts would cease once construction was complete. Under Alternative 5C, the park would have been reduced in size once construction is complete but would remain a functional park. Under Alternative 7, the use of the parkland would limit the functionality of the remaining parkland and, therefore, would require the acquisition of the entirety of the park.</p> |

TMP = Transportation Management Plan

PUBLIC HEALTH CONSIDERATIONS.

PUBLIC HEALTH STATEMENT: Increased access to parks is associated with increases in physical activity, reductions in chronic disease, stress, and obesity; increased opportunities for relaxation, reducing stress; and increased interaction with neighbors, improving social cohesion (P. Simon et al. 2009).

VISUAL IMPACTS. As shown in Table 3.1-4, a low visual impact to Coolidge Park, would result with implementation of the I-710 Corridor Project build alternatives. Similar impacts are anticipated for other parks and recreation facilities located adjacent to or in proximity of the I-710 mainline and freight corridor. The visual impact of the build alternatives would be low at Maywood Riverfront Park, and the visual impact at Bandini Park would be moderately low. Because these parks are within an existing urban environment, these visual impacts as a result of the build alternatives would not reduce the public's use of parks adjacent to I-710.

AIR QUALITY. According to the *Air Quality, Greenhouse Gas, and Health Risk Assessment* (AQ/GHG/HRA) (2017), compared to the 2012 existing Baseline conditions, cancer risk decreases at sensitive receptors, such as parks, under all 2035 project alternatives. Additionally, compared to the 2012 Baseline, vehicle exhaust emissions, including air toxics and inhalable particulate matter, and related impacts, decrease for all 2035 project alternatives. Overall, the greatest reductions generally occur under Alternative 7 due to its zero emissions freight corridor element. Refer to Section 3.13, Air Quality, for a detailed discussion of the AQ/HRA results.

NOISE. The need for noise abatement is also determined according to which areas may experience noise that approaches or exceeds the Federal Noise Abatement Criteria (NAC). The *Traffic Noise Study Report* found that there are areas of the Study Area that will approach or exceed the NAC as a result of the build alternatives. As a result, soundwalls were proposed for the build alternatives at locations throughout the I-710 Corridor. The noise reduction provided by these soundwalls would provide beneficial effects to visitors of these parks and recreational facilities along the Corridor. Refer to Section 3.14, Noise, for a detailed discussion of the Noise Study Report results.

PARK ACCESS. The build alternatives would improve local roadways by constructing new curbs, gutters, and striping as well as new sidewalks and outside shoulders to allow pedestrian and bikeway connections. The build alternatives would also directly impact Cesar E. Chavez Park, Parque Dos Rios, the Compton Hunting and Fishing Club and the Compton Homing/Racing Pigeon Club (directly impacted by Alternative 7 only). The expansion and reconfiguration of Cesar E. Chavez Park would have indirect beneficial public health effects by increasing opportunities for public use of the park following the completion of construction, and by shifting the travel lanes further away from active use area of the park. Additionally,

some parks and surrounding land uses would benefit from sound barriers constructed as part of the build alternatives.

The build alternatives would also add five bicycle/pedestrian-only overcrossings under Alternative 5C and three bicycle/pedestrian-only overcrossings under Alternative 7, three of which are common to both Alternatives 5C and 7. These are located at Humphreys Ave. in East Los Angeles, Clara St. in Bell Gardens and Cudahy, Pacific Place (over I-405 and the Metro Blue Line) in Long Beach, Spring St. in Long Beach (applicable to Alternative 5C only), and Hill St. in Long Beach (also applicable to Alternative 5C only). Parks close to these crossings include Los Cerritos Park, Cudahy Park, Silverado State Park, and Admiral Kidd Park. These pedestrian and bicycle bridges would provide crossings for residents to access local parks and schools which would be a beneficial impact of the build alternatives.

Therefore, the I-710 Corridor Project build alternatives would not result in an adverse impact to access to parks as a result of barriers to walking or biking, changes in pedestrian or bike safety near parks, or a reduction in park acreage and, therefore, would not have adverse effects on public health related to park access.

3.1.3.3 AVOIDANCE, MINIMIZATION, AND/OR MITIGATION MEASURES

As described above, while the build alternatives would include enhancements to Cesar E. Chavez Park in the City of Long Beach, the build alternatives would also have the potential to result in direct and indirect impacts to several parks and recreation facilities, including Parque Dos Rios, the Los Angeles River Trail, and the Rio Hondo Trail.

The build alternatives would result in direct impacts to the Compton Hunting and Fishing Club and the Compton Homing/Racing Pigeon Club. The *Draft Relocation Impact Report* (2017) and *Final Relocation Impact Report* (2019) have identified that the Compton Hunting and Fishing Club would need to be relocated for both build alternatives; the Compton Homing/Racing Pigeon Club would need to be relocated for Alternative 7 only.

Measures to reduce impacts as a result of relocation under the build alternatives are provided in Section 3.3, Community Impacts, in this Final EIR/EIS.

Permanent indirect impacts resulting from the build alternatives would have the potential to occur to several parks, some of which would be visual impacts that would have the potential to occur as a result of widening and/or construction of the freight corridor component of Alternative 7 in an existing viewshed. Measures are provided in Section 3.6, Visual/Aesthetics, of this Final EIR/EIS to further reduce potential indirect visual impacts to parks.

As described above, permanent indirect impacts related to air quality would not occur as a result of Alternative 5C and Alternative 7 to the parks and recreational facilities, and therefore, no avoidance, minimization, and/or mitigation measures are required. Noise abatement in the form

of soundwalls would occur as a result of the build alternatives for some parks and recreational facilities. Refer to Section 3.14, Noise, for a detailed discussion of the proposed preliminary soundwalls that would occur under the build alternatives.

However, as the No Build (Alternative 1) was identified as the Preferred Alternative, temporary and/or permanent impacts to parks and recreation facilities would not occur, and the adoption of this alternative would not require avoidance, minimization, and/or mitigation measures. Avoidance, minimization, and/or mitigation measures pertaining to the two build alternatives are retained in this Final EIR/EIS for disclosure purposes.

Measures to address impacts to Cesar E. Chavez Park and Parque Dos Rios resulting from the build alternatives are provided below. Measures for temporary impacts to the Los Angeles River Trail and the Rio Hondo Trail resulting from the build alternatives are provided in Section 3.24, Construction Impacts. To maintain consistency with the Section 4(f) and 6(f) (Appendix B), this section includes measures for permanent effects as well as temporary effects during construction.

- PR-1 Design Refinements for Alternative 5C at Parque Dos Rios.** If Alternative 5C is selected for implementation, the California Department of Transportation (Caltrans) will require the project design team to identify and incorporate design refinements to minimize the permanent and temporary uses of land from Parque Dos Rios during the final design of Alternative 5C.
- PR-2 Site Plan for the Remaining Area in Parque Dos Rios under Alternative 5C.** If Alternative 5C is selected for implementation, Caltrans will require the project design team to coordinate with the Watershed Conservation Authority (WCA) during final design to develop a plan for recreation facilities and landscaping/native plants on the remaining portion of Parque Dos Rios site, specifically addressing the provision of access to/from the park via the Los Angeles River Trail, the provision of amenities for park users similar to those in the current site plan, and revegetation of the remaining portion of the park with native plant materials similar to those shown in the current site plan.
- PR-3 Identification of Potential Replacement Property/Properties for Parque Dos Rios under Alternative 5C.** Metro will require the project design team to identify potential replacement property for the land used from Parque Dos Rios by Alternative 5C, based on continued coordination and consultation with the WCA throughout the environmental process for the project. Specifically, Metro will identify a property/properties to replace the land permanently used at Parque Dos Rios (2.13 acres under Alternative 5C) from the list of multi-benefit potential project opportunities included in the Lower Los Angeles River Revitalization Plan (Lower Los Angeles River Revitalization Plan Working Group, 2018). The replacement property/properties must provide land and facilities equal to or greater than the

land and facilities used by the selected alternative. Key considerations in identifying replacement property/properties are (1) the acreage of the replacement property/properties compared to the acres used at Parque Dos Rios, (2) whether equivalent or better recreational functionality can be provided on the replacement property/properties, and (3) whether and what connections can be provided to other recreation resources from the replacement property/properties, notably the Los Angeles River Trail and the remaining portion of Parque Dos Rios.

PR-4 Identification of Potential Replacement Property/Properties for Parque Dos Rios under Alternative 7. Metro will require the project design team to identify potential replacement property for the land used from Parque Dos Rios by Alternative 7, based on continued coordination and consultation with the WCA throughout the environmental process for the project. Specifically, Metro will identify a property/properties to replace the land permanently used at Parque Dos Rios (the entire 8.5-acre park under Alternative 7 because of the limited functionality and accessibility of the remnant parcel outside the alternative footprint) from the list of multi-benefit potential project opportunities included in the Lower Los Angeles River Revitalization Plan (Lower Los Angeles River Revitalization Plan Working Group, 2018). The replacement property/properties must provide land and facilities equal to or greater than the land and facilities used by the selected alternative. Key considerations in identifying replacement property/properties are (1) the acreage of the replacement property/properties compared to the acres used at Parque Dos Rios, (2) whether equivalent or better recreational functionality can be provided on the replacement property/properties, and (3) whether and what connections can be provided to other recreational resources from the replacement property/properties, notably the Los Angeles River Trail.

PR-5 Conceptual Site Plans for Potential Replacement Property/Properties for Parque Dos Rios under Alternative 5C and Alternative 7. Metro will require the project design team to develop conceptual site plans for the potential replacement property/properties, in consultation with the WCA, to ensure that the replacement property/properties and facilities are equivalent to or greater than the land and facilities used at Parque Dos Rios by the selected alternative. Those preliminary plans will identify the following:

- The recreation amenities and landscaping/native plant materials to be provided on the replacement property/properties.
- The connections that will be provided between the replacement property/properties and other recreation resources.

- PR-6 Acquisition of Replacement Property/Properties for Parque Dos Rios under Alternative 5C and Alternative 7.** Based on agreement with the WCA on the selected replacement property/properties, Metro will require its Division of Right of Way and Land Surveys to acquire or provide compensation for those selected property/properties.
- PR-7 Final Site Plan and Plan Installation for Parque Dos Rios under Alternative 5C and Alternative 7.** Metro will require the project design team to coordinate with the WCA on the development of the final site plan for the replacement property/properties and on the selection of a contractor to install the recreation facilities and landscaping/native plants as shown on that final site plan.
- PR-8 Transfer of Property Ownership for Parque Dos Rios under Alternative 5C and Alternative 7.** On the completion of the installation of the recreation facilities and landscaping/native plants, and on acceptance of those improvements by the WCA, Metro will deed the replacement property/properties to the WCA for recreation uses in perpetuity, unless compensation is provided to WCA which WCA would use to directly purchase the replacement property/properties.
- PR-9 Temporary Construction Easement at Parque Dos Rios.** At the completion of construction activities that use the TCEs at Parque Dos Rios, Caltrans will require the Construction Contractor to return the area occupied by that TCE to a condition as good as or better than prior to its use for the TCE. The required improvements for the rehabilitation of that area will be determined in consultation among Caltrans, the WCA, and the Construction Contractor and will be coordinated with the plan for the remaining portion of the park, as described in Measure PR-3, above.
- PR-10 Design Refinements at Cesar E. Chavez Park.** If a build alternative is selected, Caltrans will continue to identify and incorporate design refinements to avoid or minimize the permanent incorporation of, permanent easements at, and/or temporary use of land from, Cesar E. Chavez Park in the final design of the build alternatives.
- PR-11 Future Boundaries and Improvements at Cesar E. Chavez Park.** (a) During final design, Caltrans will request that the City of Long Beach define the final boundaries of Cesar E. Chavez Park that will be the basis for the transfer of land from the public street right-of-way for Shoreline Dr. through Cesar E. Chavez Park (currently owned by the City of Long Beach) to within the boundary of the park. This shall be an internal transfer within the City of Long Beach, as the City currently owns the land for both Shoreline Dr. and Cesar E. Chavez Park. Prior to final design, Caltrans will secure approval from the Long Beach Parks and Recreation Commission.

(b) After the City has identified the new boundaries of the park, including the consolidation of the six discontinuous parcels into three larger parcels, Caltrans will coordinate with the City of Long Beach to:

- (b-1) Identify park improvements for the new areas added to the park, including removal of pavement and other materials from Shoreline Dr. the landscaping of those areas, and the provision of sidewalks and bicycle paths, as appropriate, connecting the consolidated parcels;
- (b-2) Develop a landscaping plan and bicycle path plan for the area over the 3rd St. depressed cross section;
- (b-3) Develop a plan for public access to the northwest portion of the park for passive activities such as wildlife viewing and walking.
- (b-4) Develop the plan for replacing the basketball courts in the portion of the park west of Cesar E. Chavez Elementary School.
- (b-5) Ensure consistency with the City of Long Beach Adopted Plans, Codes, Standard Conditions of Approval, Park Development Requirements, the Cesar E. Chavez Park Integration Plan, the Drake/Chavez Greenbelt project, and grant agency requirements, with input from the community, to determine site layout, park amenities, buffers between park and freeway, parking, Americans with Disabilities Act (ADA) access, fencing, signage, neighborhood connections, irrigation improvements, and other park improvements.

(c) Any resulting replacement or other financial burden required by the grant agencies for the acquisition of park property for freeway use shall be mitigated at no cost or impact to the City of Long Beach.

(d) Design refinements will be considered, in consultation with the City of Long Beach, near the planned linkages between Drake Park and Cesar E. Chavez Park to minimize impacts on visibility into areas under overhead Caltrans structures. Any necessary irrigation improvements will be included in the project design and will be provided to the Director of the Department of Parks, Recreation and Marine for review and approval.

PR-12 Replacement of Basketball Courts at Cesar E. Chavez Park. Caltrans will coordinate with the City of Long Beach and LBUSD on the replacement of the basketball courts that will be removed by the build alternatives in a location accessible to Cesar E. Chavez Elementary School and park visitors. Because the basketball courts are in the area used by the school, the replacement courts will be constructed no later than three months after closure of the existing courts.

Construction on portions of the park accessible to Cesar E. Chavez Elementary School would be scheduled during summer months, as feasible, in coordination with LBUSD.

PR-13 Temporary Construction Activities at Cesar E. Chavez Park and Drake/Chavez Greenbelt. (a) Caltrans will require the Construction Contractor to notify the Department of Parks, Recreation and Marine 72 hours prior to the start of construction work. Notification will be directed to the Superintendent of Park Maintenance.

(b) Caltrans will require the Construction Contractor to identify all proposed closures of areas within Cesar E. Chavez Park (including streets), no less than 90 days prior to when each closure would begin.

(c) No less than 90 days prior to when a closure would begin, Caltrans will require the project Construction Contractor to provide the following to the City of Long Beach Parks, Recreation, and Marine Department and LBUSD:

- (c-1) A map of each proposed closure, clearly showing each park area proposed to be closed temporarily, including identification of any street closures.
- (c-2) A plan for providing signage and notifications through other public information outlets to inform the public and park visitors of upcoming closures of areas within the park.
- (c-3) Estimate of the duration of each closure.
- (c-4) Identification of alternative vehicle and trail routes to/through and/or around the park, as appropriate.
- (c-5) Identification of park features that would be unavailable to the public during the closure.

(d) Caltrans will require the Construction Contractor to obtain written approval from the City of Long Beach and LBUSD for each proposed closure in Cesar E. Chavez Park and the Drake/Chavez Greenbelt no less than 45 days prior to when the closure would begin. These approvals are intended to ensure that the project would not disrupt park programs, services, or budgeted revenue.

(e) For Cesar E. Chavez Park and the Drake/Chavez Greenbelt, Caltrans will require the Construction Contractor to provide a construction staging and equipment access plan, and contractor parking and access plan for approval by the Director of Parks, Recreation and Marine prior to the start of construction.

Caltrans will require the Construction Contractor to implement appropriate measures, such as the placement of plywood in all areas of heavy equipment ingress/egress, to prevent damage to underground irrigation infrastructure during construction.

(f) Caltrans will require the Construction Contractor to provide an information telephone number that park visitors can use to contact the Construction Contractor for more information regarding individual closures. The Construction Contractor may also provide an information website. The contact number and website information are to be provided at the construction site, at/around each closed area, and on information signs discussing the individual closures. The Construction Contractor will also be required to provide this information to the City of Long Beach Parks, Recreation, and Marine Department.

(g) Caltrans will require the Construction Contractor to provide irrigation during construction to ensure the health of landscaping, and to install a temporary water meter to be paid for by the Construction Contractor.

(h) Caltrans will require the Construction Contractor to return areas of the park closed temporarily during construction to their original, or better, conditions after completion of construction, and those temporarily closed areas will be returned to the City.

PR-14 Temporary Construction Easement at Cesar E. Chavez Park and Drake/Chavez Greenbelt. (a) At the completion of construction using the TCE at Cesar E. Chavez Park, Caltrans will require the Construction Contractor or will compensate the City to return the area occupied by that TCE to its original condition. This will include, but not be limited to, replacement of plant material, removal of weeds, removal of trash, regrading, and compacting of the TCE area.

(b) Caltrans will also require the Construction Contractor to secure the construction area, monitor the site, repair any damage to the site caused by vandalism, and address homeless clean-up and removal costs as a result of homeless activity at the site.

PR-15 Temporary Closure for Detour Road in Cesar E. Chavez Park. When the temporary detour road in Cesar E. Chavez Park is no longer needed, Caltrans will require the Construction Contractor or will compensate the City to remove the road materials and return the area occupied by the temporary detour road to its original condition and/or incorporate enhancements to the road.

- PR-16 Development of Closures of the Los Angeles River and the Rio Hondo Trails and Bikeways.** Prior to any temporary closures of the Los Angeles River Trail and Bikeway and/or the Rio Hondo Trail and Bikeway, Caltrans will require the Construction Contractor to meet with the Los Angeles County Department of Public Works (LACDPW) and the Los Angeles County Parks and Recreation Department to review the location and need for each closure. Although the trails and bikeways converge at some points, the trails and bikeways are independent of each other and are typically adjacent. Detours for each closure will be developed in consultation with the LACDPW and the Los Angeles County Parks and Recreation Department. In accordance with the Los Angeles County Parks and Recreation Department's requirements, detours will accommodate equestrian users (in addition to pedestrians and bicyclists).
- PR-17 Signing for Detours of the Los Angeles River and Rio Hondo Trails and Bikeways.** Caltrans will require the Construction Contractor to develop signs directing trail users to alternative routes in consultation with the LACDPW, the Los Angeles County Parks and Recreation Department, and the local jurisdictions through which detours would be routed. Appropriate directional and informational signage will be provided by the Construction Contractor prior to each closure and far enough away from the closure, so that trail and bikeway users will not have to backtrack to get to the detour route.
- PR-18 Contact Information during Closures and Detours of the Los Angeles and Rio Hondo Trails and Bikeways.** Caltrans will require the Construction Contractor to provide a contact number and other information to trail and/or bikeway users to contact the Construction Contractor regarding upcoming or active trail and/or bikeway closures. The Construction Contractor will also be required to provide that information to the LACDPW, the Los Angeles County Parks and Recreation Department, and the City Public Works Departments in the jurisdictions where the closures/detours are located.
- PR-19 Restoration of Closed Areas on the Los Angeles and Rio Hondo Trails and Bikeways.** Caltrans will require the Construction Contractor to return trail and/or bikeway segments, which are located at the affected crossings of I-710 and the local streets and that would be closed temporarily during construction, to the LACDPW and the Los Angeles County Parks and Recreation Department in their original, and/or with enhancements incorporated, or better, condition after completion of construction, and the ownership of those temporarily closed areas will remain with the original owner (the LACDPW and the Los Angeles County Parks and Recreation Department).

- PR-20 Temporary Construction Activities on the Dominguez Gap and DeForest Treatment Wetlands.** At the completion of construction activities on the Dominguez Gap and DeForest Treatment Wetlands, Caltrans will require the Construction Contractor to return the area occupied by the construction activities to a condition as good as or better than prior to its use for construction. The required improvements for the rehabilitation of that area will be determined in consultation among Caltrans, the LACDPW, and the Construction Contractor.
- PR-21 Lighting for Pedestrian and Bicyclist Safety.** Lighting would be installed along the portion of the existing Los Angeles River Bicycle Trail that travels under the widened North Long Beach Boulevard bridge structure. Lighting would be developed in consultation with the Los Angeles County Department of Public Works and illuminated in accordance with the Illuminating Engineering Society of North America (IESNA) lighting recommendations for pedestrian and bike paths.
- PR-22 Temporary Construction Activities Adjacent to Coolidge Park, Los Cerritos Park, and Cressa Park.** (a) Prior to project construction, Caltrans will coordinate with the City of Long Beach Parks, Recreation and Marine Department to ensure consistency with the City of Long Beach Standard Conditions of Approval and Park Development Requirements for temporary construction activities adjacent to, Coolidge Park, Los Cerritos Park, and Cressa Park. Caltrans will also coordinate with the City of Long Beach regarding construction activities and impacts, any TCEs adjacent to the parks, timing, and phasing.
- (b) Caltrans will require the Construction Contractor to notify the Department of Parks, Recreation and Marine 72 hours prior to the start of construction work adjacent to Coolidge Park, Los Cerritos Park, or Cressa Park. Notification will be directed to the Superintendent of Park Maintenance.
- (c) Caltrans will require the Construction Contractor to identify all proposed closures of areas adjacent to Coolidge Park, Los Cerritos Park, and Cressa Park, no less than 90 days prior to when each closure would begin.
- (d) No less than 90 days prior to when a closure would begin, Caltrans will require the project Construction Contractor to provide the following to the City of Long Beach Parks, Recreation and Marine Department:
- (d-1) A map of each proposed closure, clearly showing each park area proposed to be closed temporarily, including identification of any street closures.

- (d-2) A plan for providing signage and notifications through other public information outlets to inform the public and park visitors of upcoming closures of areas within the park.
- (d-3) Estimate of the duration of each closure.
- (d-4) Identification of alternative vehicle and trail routes to/through and/or around the park, as appropriate.
- (d-4) Identification of any park features that would be unavailable to the public during the closure.

(e) Caltrans will require the Construction Contractor to provide an information telephone number that park visitors can use to contact the Construction Contractor for more information regarding individual closures. The Construction Contractor may also provide an information website. The contact number and website information are to be provided at the construction site, at/around each closed area, and on information signs discussing the individual closures. The Construction Contractor will also be required to provide this information to the City of Long Beach Parks, Recreation and Marine Department.

(f) At Coolidge Park, Caltrans will require the Construction Contractor to protect the eastern edge of the park from any construction impacts and to provide adequate fencing to separate the park activities from construction activities. The park will not be available for access to the freeway for construction activities, and necessary access will be located elsewhere away from the park.

(g) At Los Cerritos Park, Caltrans will require the Construction Contractor to protect the western edge of the park from any construction impacts and to provide adequate fencing to separate the park activities from construction activities. The park will not be available for access to the freeway for construction activities, and necessary access will be located elsewhere away from the park.

PR-23 Temporary Construction Activities Adjacent to the Wrigley Greenbelt. (a) Prior to project construction, Caltrans will coordinate with the City of Long Beach Parks, Recreation and Marine Department to ensure consistency with the City of Long Beach Standard Conditions of Approval and Park Development Requirements for temporary construction activities adjacent to the Wrigley Greenbelt. Caltrans will also coordinate with the City of Long Beach regarding construction activities and impacts, TCEs, timing, and phasing.

(b) Caltrans will require the construction contractor to notify the Department of Parks, Recreation and Marine 72 hours prior to the start of construction work

adjacent to the Wrigley Greenbelt. Notification will be directed to the Superintendent of Park Maintenance.

(c) Caltrans will require the construction contractor to identify all proposed closures of areas adjacent to the Wrigley Greenbelt no less than 90 days prior to when each closure would begin.

(d) No less than 90 days prior to when a closure would begin, Caltrans will require the project construction contractor to provide the following to the City of Long Beach Parks, Recreation and Marine Department:

- (d-1) A map of each proposed closure, clearly showing each adjacent area proposed to be closed temporarily, including identification of any street closures.
- (d-2) A plan for providing signage and notifications through other public information outlets to inform the public and park visitors of upcoming closures of areas adjacent the park.
- (d-3) Estimate of the duration of each closure.
- (d-4) Identification of alternative vehicle and trail routes to/through and/or around the park, as appropriate.

The proposed closures of areas adjacent to the Wrigley Greenbelt will not disrupt public access to the resource. Existing public access to the Wrigley Greenbelt will be maintained for the duration of construction.

(e) Caltrans will require the construction contractor to obtain written approval from the City of Long Beach for each proposed closure adjacent to the Wrigley Greenbelt no less than 45 days prior to when the closure would begin. These approvals are intended to ensure that the project would not disrupt park programs, services, or budgeted revenue.

(f) Caltrans will require the construction contractor to provide an information telephone number that park visitors can use to contact the construction contractor for more information regarding individual closures. The construction contractor may also provide an information website. The contact number and website information are to be provided at the construction site, at/around each closed area, and on information signs discussing the individual closures. The construction contractor will also be required to provide this information to the City of Long Beach Parks, Recreation and Marine Department.

PR-24 Temporary Construction Activities Adjacent to the Public Equestrian Rest Area (PERA). (a) Prior to project construction, Caltrans will coordinate with LACDPW regarding temporary construction activities adjacent to the PERA facility.

(b) Caltrans will require the construction contractor to notify LACDPW 72 hours prior to the start of construction work adjacent to the PERA facility. Caltrans will require

the construction contractor to identify all proposed closures of areas adjacent to the PERA facility no less than 90 days prior to when each closure would begin. No less than 90 days prior to when a closure would begin, Caltrans will require the project construction contractor to provide the following to LACDPW:

- (b-1) A map of each proposed closure, clearly showing each adjacent area proposed to be closed temporarily, including identification of any street closures.
- (b-2) A plan for providing signage and notifications through other public information outlets to inform the public and facility visitors of upcoming closures of areas adjacent the facility.
- (b-3) Estimate of the duration of each closure.
- (b-4) Identification of alternative vehicle and trail routes to/through and/or around the facility, as appropriate.

(c) Caltrans will require the construction contractor to obtain written approval from LACDPW for each proposed closure adjacent to the PERA facility no less than 45 days prior to when the closure would begin. These approvals are intended to ensure that the project would not disrupt facility programs, services, or budgeted revenue.

(d) Caltrans will require the construction contractor to provide an information telephone number that facility visitors can use to contact the construction contractor for more information regarding individual closures. The construction contractor may also provide an information website. The contact number and website information are to be provided at the construction site, at/around each closed area, and on information signs discussing the individual closures. The construction contractor will also be required to provide this information to LACDPW.

3.2 GROWTH

The information in this section is based on the following documents:

- *Community Impact Assessment (CIA) (July 2017)*
- *I-710 Railroad Goods Movement Study (2009)*
- *Initial Feasibility Analysis (2009)*
- *I-710 Corridor Project RDEIR/SDEIS Travel Demand Modeling Methodology (2017)*

3.2.1 REGULATORY SETTING

The Council on Environmental Quality (CEQ) regulations, which established the steps necessary to comply with the National Environmental Policy Act of 1969, requires evaluation of the potential environmental effects of all proposed federal activities and programs. This provision includes a requirement to examine indirect effects, which may occur in areas beyond the immediate influence of a proposed action and at some time in the future. The CEQ regulations, 40 Code of Federal Regulations (CFR) 1508.8, refer to these consequences as indirect impacts. Indirect impacts may include changes in land use, economic vitality, and population density, which are all elements of growth.

The California Environmental Quality Act (CEQA) also requires the analysis of a project's potential to induce growth. CEQA guidelines, Section 15126.2(d), require that environmental documents "...discuss the ways in which the proposed project could foster economic or population growth, or the construction of additional housing, either directly or indirectly, in the surrounding environment..."

3.2.2 AFFECTED ENVIRONMENT

3.2.1.1 GROWTH TRENDS AND CONSTRAINTS TO POPULATION, HOUSING, AND EMPLOYMENT GROWTH

REGIONAL LEVEL. While much of Los Angeles County is urbanized and close to being built out, especially within the I-710 Corridor Project Study Area, the Southern California Association of Governments (SCAG) anticipates population, housing, and employment growth to occur through 2035 within the Gateway Cities Subregion and Los Angeles County overall. Table 3.2-1 identifies the increases in population, housing, and employment that occurred between 2012 and 2020, and the growth rates projected by SCAG between 2012 and 2035 for Los Angeles County. Impacts related to projected growth in the Study Area have been evaluated in SCAG's

Table 3.2-1: Growth Trends at Regional Levels

| | 2012 | 2020 | 2035 | Percent Change between 2012 and 2035 |
|---------------------------|-----------|------------|------------|--|
| Los Angeles County | | | | |
| Population | 9,992,600 | 10,326,200 | 11,145,100 | +12% |
| Households | 3,257,600 | 3,493,700 | 3,809,300 | +17% |
| Employment | 4,246,600 | 4,662,500 | 6,062,100 | +19% |

Program Environmental Impact Reports (PEIR) for the 2012¹ and 2016² Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) and those documents are hereby incorporated by reference.

Since the time analysis was conducted for this project, SCAG's 2020 Connect SoCal (2020-2045 RTP/SCS) was adopted on September 3, 2020. The data for growth trends for Los Angeles County included in the 2020 RTP/SCS do not differ substantially from the 2012 and 2016 RTP/SCS and do not alter the conclusions in this document.

LOCAL LEVEL. Table 3.2-2 identifies the increases in population, housing, and employment between 2012 and 2020, and the growth rates projected by SCAG between 2012 and 2035 for the affected cities in the Study Area. Because growth trend data is not available at the community level for Boyle Heights, San Pedro, and Wilmington, data for the City of Los Angeles, in which these communities are located, has been provided in Table 3.2-2.

Within the Study Area, there are several physical constraints to growth in population and housing. Most of the cities are close to being built out and have very limited vacant land for new development. Planning efforts by the cities are concentrated on reuse of existing uses to better utilize available land. In the northern part of the Study Area, the railroad yards and tracks also act as a constraint to growth, providing physical boundaries to new developments and expansion of existing land uses. Southern California Edison (SCE) and the Los Angeles Department of Water and Power (DWP) utility corridors within the Study Area are also a physical boundary to growth. These two major utility corridors are located parallel to the Los Angeles River, in addition to other electric transmission corridors within the City of Long Beach and other affected cities within the Study Area. Other existing public infrastructure, such as the Interstate 405 (I-405), State Route 91 (SR-91), Interstate 110 (I-110), and Interstate 5 (I-5), freeways also create physical boundaries that constrain new land development or reuse within the Study Area.

Table 3.25-1 in Section 3.25 (Cumulative Impacts) provides a listing of approved and proposed major public infrastructure, goods movement, and land development/redevelopment projects within the Study Area.

3.2.12 GROWTH TRENDS AND CONSTRAINTS RELATED TO GOODS MOVEMENT

The I-710 Corridor is located within the Gateway Cities Subregion of Los Angeles County. The Gateway Cities Subregion as a whole has experienced population, housing, and employment growth since the early 1900s and is anticipated to continue this growth pattern through 2035 (see Table 3.2-1). In the 20th century, the regional economy transitioned from an agricultural base to a manufacturing/industrial base, with a heavy emphasis on the aerospace and defense industries in the 1950s through the 1970s. As these industries declined in the 1980s, an expansion in global trade, as well as containerization of global freight, resulted in goods movement becoming an important element of the Gateway Cities Subregion's economy. Today, the Port of Long Beach (POLB) and the Port of Los Angeles (POLA) (collectively known as the Ports), the railroads, and

the trucking industry provide goods movement not just within the Study Area, but also for the Gateway Cities Subregion, the SCAG region, and the nation as a whole.

Los Angeles County's goods movement system serves as a gateway for both international and domestic commerce, especially within the Study Area, where the POLB and the POLA, the Burlington Northern Santa Fe Railroad (BNSF Railroad) Hobart rail yard, and the Union Pacific Railroad (UP Railroad) East Los Angeles rail yard, the ICTF, and the Alameda Corridor are located. The Ports, the railroads, and the interstate and State highways all play a critical role related to goods movement within the Study Area. The growth trends and constraints of each of these goods movement system components are discussed below.

PORTS. The POLB and the POLA handle approximately 40 to 45 percent of all of the nation's imported containerized goods. Approximately 25 percent of the imported goods are destined for the local southern California and southwestern U.S. markets, while 75 percent are destined for national distribution to other parts of the U.S. In addition, the goods movement through the Ports provides approximately 1.3 million jobs locally and approximately 4.0 million jobs nationally.

As illustrated in Figure 1.2-5 (Goods Movement) in Chapter 1.0 (Purpose and Need) of this Final Environmental Impact Report/Environmental Impact Statement (Final EIR/EIS), cargo containers at the Ports are transported from ships one of three ways: to the marine terminals as property, to on-dock rail facilities, or to trucks that are used either for direct distribution to local and regional warehouses or for movement to near-dock and off-dock rail yards. As of 2012, the Ports processed approximately 14.1 million twenty-foot-equivalent units (TEUs) annually. Cargo container shipping demand at the Ports is projected to grow to almost 41.4 million TEUs by 2035, which will exceed planned capacity (*I-710 Travel Demand Modeling Report*, 2017).

RAILROADS. The present rail network in the SCAG region, including the Study Area, is composed of BNSF and UP Railroad rail lines, terminals/yards, and on-dock rail terminals at the Ports. Rail routes include the Alameda Corridor, BNSF Railroad's San Bernardino Subdivision, and UP Railroad's Los Angeles and Alhambra Subdivisions. The *I-710 Railroad Goods Movement Study* (2009) was prepared to assess the available capacity of the Southern California rail network to handle the projected demand in the movement of containerized freight to and from the Ports. One of the fundamental assumptions in developing the 2035 travel demand forecasts for the I-710 Corridor Project is that the calculated maximum utilization of the amount of containers moved by rail would be consistent with the rail network (*I-710 Railroad Goods Movement Study*). Taking into consideration the inland origins and destinations of the port cargo and operational characteristics of the railroads, it was assumed that approximately 34.4 percent of the cargo growth (approximately 14.1 million annual TEUs) in 2035 could be moved directly by rail from either on-

dock or off-dock intermodal terminals.³ Key information related to existing and future capacity of the rail system is summarized and cited below.

- As of 2015, the Alameda Corridor was operating 38 trains per day,⁴ a decrease from previous years, due primarily to longer trains. By 2035, the Alameda Corridor is projected to be operating 108 trains daily. The Alameda Corridor has three tracks and sufficient capacity to handle the projected traffic.
- As of 2010, BNSF Railroad's San Bernardino Subdivision operated up to 99 trains per day (45 freight trains and 54 commuter trains) in its most heavily trafficked segments. By 2035, BNSF's San Bernardino Subdivision is projected to be operating up to 189 trains daily in its most heavily trafficked segments.⁵ In most sections, the BNSF Railroad has constructed or has plans to construct three tracks on the San Bernardino Subdivision, sufficient capacity to handle the projected train volumes. The UP Railroad operates the Los Angeles and Alhambra Subdivisions as essentially parallel facilities that provide them with routing flexibility. According to the Regional Rail Simulation Update Summary Report prepared for SCAG's November 2011 Comprehensive Regional Goods Movement Plan and Implementation Strategy, 51 through-freight trains operated collectively over the subdivisions in 2010, and is forecast to rise to 111 trains in 2035. The Los Angeles Subdivision operated 12 Metrolink passenger trains per day, which is also forecast to rise to 20 trains in 2035. The Alhambra subdivision conversely carries very little passenger train traffic (one train per day in 2010, with no forecast increase to 2035)⁶. Through most of its length, the Los Angeles Subdivision will have two tracks but sections that will have only one track are not likely to carry more than 50 trains daily. Thus, this subdivision should have sufficient capacity to carry the projected traffic. East of Pomona (the more heavily trafficked segment), the Alhambra Subdivision is or will be two tracks. Thus, the Alhambra Subdivision, especially given the operating flexibility provided by the Los Angeles Subdivision, would have sufficient capacity to carry the projected traffic.

³ Some port cargo is "transloaded," i.e., transferred from marine containers to larger domestic containers, and then moved by rail in these large containers. The transloaded cargo moved by rail is above and beyond the 34.4 percent that is moved directly by rail.

In addition to the capacity of the rail facilities themselves, there are three types of intermodal facilities that may impact growth for the railroads: on-dock, near-dock, and off-dock. On-dock refers to an intermodal facility that is situated at a port marine terminal. As of 2007, the on-dock rail volume per year was at 23.5 percent of its capacity; however, by 2035, these facilities are projected to reach capacity.

Near-dock refers to an intermodal facility situated within five miles of POLA and POLB. The container volume handled at the Intermodal Container Transfer Facility (ICTF) as of 2012 was approximately 800,000 containers, and the capacity is projected to be 1,500,000 containers by 2035, assuming plans to expand the facility are implemented. Plans to build a new facility (SCIG) are in progress (a Final EIR for the SCIG project was certified in 2013, but that approval was vacated by the Contra Costa County Superior Court in 2016. In January 2018, the California Courts of Appeal ruled that the Port of Los Angeles and BNSF were in compliance with the majority of CEQA requirements, with some exceptions, and in April 2018, the California Supreme Court declined to review the Court of Appeal's January decision. Both of these facilities are assumed to be constructed and operational in the travel demand forecasting conducted for the I-710 Corridor Project.

Off-dock refers to an intermodal facility located more than five miles from POLA and POLB. There are two off-dock facilities in the Study Area: BNSF Railroad's Hobart and UP Railroad's East Los Angeles facilities. As of 2012, these off-dock facilities were operating below capacity, but they are projected to reach capacity by 2035. Additional off-dock rail yards are located further inland to the east of I-710 along with warehouses and distribution centers that are also serviced by trucks carrying goods from POLA and POLB.

HIGHWAYS. According to the *I-710 Travel Demand Modeling Report* (2017), some port cargo movements may be associated with high-density truck flows between origin and destination points, including:

- Primary port truck distributions;
- Transload secondary and true domestic intermodal trips (secondary truck trips associated with transloading of container cargo, as well as pure domestic intermodal trips that are not directly related to port activity); and
- Secondary transload truck trips (cargo in 20- and 40-foot international containers is transferred to 53-foot domestic containers).

The same report noted that about 80 percent of the primary port truck trips are destined to or originated from locations within 20 miles of the Ports.

The Goods Movement Appendix of SCAG's 2012 Regional Transportation Plan (RTP)/Sustainable Communities Strategy (SCS) states that the vast majority of trips leaving the San

Pedro Bay Ports are destined for locations in the southern Gateway Cities, off-dock railyards near downtown Los Angeles, and other locations along the I-710 Corridor. The *I-710 Travel Demand Modeling Report* predicts that regional daily truck vehicle miles traveled (VMT) would increase by approximately 42 percent between 2012 and 2035. Table 1.2-1 (I-710 Daily Traffic Volumes) in Chapter 1.0 (Purpose and Need) of this Final EIR/EIS shows that the percentage increase in truck volumes (both port-related and non-port truck trips) from 2013 to 2035 is much greater than the percentage increase in automobile volumes during the same time period.

The *I-710 EIR/EIS Initial Feasibility Analysis* (2009) provides an analysis of where cargo containers not moved by rail would be distributed onto the regional highway system. The *I-710 EIR/EIS Initial Feasibility Analysis* evaluated what the highway system capacity needs would be (with a focus on the I-710 freeway mainline) given both the growth in cargo container handling demand at the Ports, as well as considering the maximum utilization of the rail system for the movement of containerized freight. One of the objectives of the *I-710 EIR/EIS Initial Feasibility Analysis* was to evaluate the highway system travel demand under three different cargo container demand growth scenarios, as follows:

1. **HIGH PORT CARGO GROWTH SCENARIO WITHOUT NEAR-DOCK INTERMODAL TERMINAL EXPANSION.** This scenario assumed that marine terminal capacity at the Ports would be expanded from 2008 levels, based on existing plans by the two Ports to accommodate growth to approximately 43 million TEUs annually. Along with marine terminal expansion, this scenario assumed that the Ports would expand their existing on-dock rail terminal capacity to allow for 30 percent of total containerized cargo to be loaded onto rail at the Ports. It assumed that the UP and BNSF Railroads would both be unsuccessful in getting their near-dock expansion plans approved. If approved, these plans would expand UP Railroad's ICTF and would build a new BNSF Railroad terminal (SCIG). As a result of not being able to make these near-dock terminal expansions, the railroads would be forced to pursue strategies that would involve a combination of expanded operations at existing downtown yards (mostly through changes in operating practices), expansion of selected existing rail yards where they have available property that they already own, and/or development of new intermodal terminals in locations such as Victorville. It also assumed that the railroads would be able to accommodate this growth in cargo volume on their mainline tracks after completing ongoing capacity expansion projects and by increasing the length of trains. In some locations, additional mainline capacity (third and fourth tracks) would be necessary (*I-710 Railroad Goods Movement Study*, 2009). This was the port cargo growth scenario adopted by the I-710 Corridor Project Committee in April 2009 to provide a conservative basis for the I-710 Corridor Project travel demand forecasting.
2. **HIGH PORT CARGO GROWTH WITH NEAR-DOCK INTERMODAL TERMINAL EXPANSION.** This scenario was the same as the previous scenario, except that it assumed that UP Railroad would expand its existing near-dock intermodal terminal (ICTF), and that BNSF Railroad would build a new near-dock intermodal terminal (SCIG). This scenario would be expected

to reduce truck traffic on I-710 as compared with the high port cargo growth scenario, due to the diversion of truck trips to the near-dock terminals that would have otherwise been destined to the off-dock terminals.

3. **LOW PORT CARGO GROWTH.** This scenario assumed that the Ports would be unable to expand marine terminals beyond their existing terminal footprint, but that they would be able to achieve some improved operating efficiencies. This would result in growth to 28.5 million TEUs processed annually. Because marine terminals would not be expanded, associated new and expanded on-dock rail projects could not be built, thereby limiting the amount of containers that could be loaded on-dock to approximately 5.6 million TEUs. As in the high port cargo growth without near-dock terminal expansion scenario, it was assumed that ICTF would not be expanded and the SCIG would not be built. Both railroads would need to expand their existing intermodal terminal capacity, and they would do so in the same ways as described in the high port cargo growth scenario. In the low port cargo growth scenario, it was further assumed that the large increase in train volume would make it difficult for the railroads to continue the practice of operating longer trains, and that they would have right-of-way constraints that would limit their ability to build new mainline track beyond what is currently under construction.

A summary of these scenarios is presented in Table 3.2-3, below.

Table 3.2-3: Port Cargo Growth Scenarios (in Million Annual TEUs)

| Scenario | Port Cargo Volume Forecast | 40% Direct Rail | Projected On-Dock Terminal Throughput | Projected Near-Dock Terminal Throughput | Remaining Off-Dock Capacity Needed | Container Movements by Truck Likely to Occur on I-710 North of PCH |
|---|----------------------------|-----------------|---------------------------------------|---|------------------------------------|--|
| High port cargo growth without near-dock terminal expansion | 43 | 17.1 | 12.8 | 1.4 | 2.9 | 28.5 |
| High port cargo growth with near-dock terminal expansion | 43 | 17.1 | 12.8 | 4.3 | 0.0 | 25.6 |
| Low port cargo growth | 28.5 | 11.4 | 5.6 | 1.4 | 4.4 | 21.5 |

Source: URS. *I-710 EIR/EIS Initial Feasibility Analysis* (2009).

I-710 = Interstate 710

PCH = Pacific Coast Highway

TEUs = twenty-foot-equivalent units

The analysis of travel demand on the highway system under the three different port cargo growth scenarios tabulated the total volume of auto and truck traffic crossing four different “screenlines” within the I-710 Corridor, which included not just I-710, but also I-405, I-110, Interstate 605 (I-605) and major north-south arterial highways such as Alameda Ave. and Atlantic Blvd. The results of this screenline analysis are shown in Figure 3.2-1. The results, presented in Figure 3.2-1, are presented as the estimated number of lanes required to accommodate total auto and truck travel

demand on I-710. As shown in this figure, even though the three alternative port cargo growth scenarios have different assumptions and there were some differences in traffic volumes on I-710 under each port cargo growth scenario, the number of lanes needed on I-710 is estimated to be the same for all three scenarios at each screenline. This is because the number of lanes estimated in the analysis was rounded up to the nearest whole number, and the traffic volume differences among scenarios are less than a lane's volume of traffic.

As stated in the *I-710 Travel Demand Modeling Methodology Report*, annual Port containerized cargo throughput is projected to increase from 14.1 million twenty foot equivalent units (TEUs) in 2012 to 41.4 million by 2035. This assumption was provided by the Ports of Los Angeles and Long Beach based on their most current estimates of throughput and marine terminal capacity.

Under the prior forecasts used for the I-710 Corridor Project Draft EIR/EIS (2012), the 2035 Port cargo assumption was for 43.2 million annual TEUs. Because the current 2035 port cargo demand forecast of 41.4 million TEUs is only four percent lower than the forecast used for the *Initial Feasibility Analysis* (IFA), the results of the IFA are still considered to be valid for purposes of analyzing the growth-related effects of the I-710 Corridor Project. This projected increase is not substantially different than what was used in the 2009 *Initial Feasibility Analysis*. Therefore, the *Initial Feasibility Analysis* was used for this updated growth analysis.

3.2.3 ENVIRONMENTAL CONSEQUENCES

The following discussion of environmental consequences only describes the permanent impacts of the project. Please refer to Section 3.24 of this document, Construction Impacts, for a discussion of the temporary impacts associated with the build alternatives of the project for each resource area. Specifically, temporary impacts related to growth are located in Section 3.24.3.2.

3.2.3.1 PERMANENT IMPACTS

BUILD ALTERNATIVES/CONSIDERATIONS RELATED TO POPULATION, HOUSING, AND EMPLOYMENT GROWTH. The growth-related effects of the I-710 Corridor Project were assessed using the California Department of Transportation's (Caltrans) *Guidance for Preparers of Growth-Related, Indirect Impact Analyses*. The guidance specifically deals with the subset of indirect effects referred to as "growth-related impacts" associated with highway projects that encourage or facilitate land use or development that changes the location, rate, type, or amount of growth.

FIGURE 3.2-1

I-710 Corridor Project RDEIR/SDEIS
 Screenline Analysis (2035 No Build)

This page intentionally left blank

The potential for the I-710 Corridor Project build alternatives to influence growth was based on consideration of the following questions:

- How, if at all, does the project potentially change accessibility?
- How, if at all, do the project type, project location, and growth pressure potentially influence growth? Some transportation projects may have very little influence on future growth, whereas others may have a great influence. Some geographic locations are more conducive to influencing growth, whereas others are highly constrained. These differences may result from physical constraints, planning and zoning factors, or local political considerations.
- Is project-related growth reasonably foreseeable as defined in the National Environmental Policy Act (NEPA)? Under NEPA, indirect impacts need only be evaluated if they are reasonably foreseeable as opposed to remote or speculative.
- If there will be project-related growth, how, if at all, would resources of concern be impacted?

A discussion regarding each of the above questions/considerations is provided below.

How, if at all, does the project potentially change accessibility?

The build alternatives would improve the vehicle, person, and goods movement travel times within the I-710 Corridor to more effectively serve existing and future travel demand. The build alternatives would also improve intersecting local roads (interchange improvements and ramp modifications) along I-710 to more effectively serve existing and forecast intra-regional travel demand and to reduce the diversion of regional traffic from the I-710 freeway into the surrounding communities. Due to the lack of vacant or less developed land within the I-710 Corridor, the build alternatives would not facilitate new development by opening up access to previously undeveloped or less developed areas. It is important to note that for this analysis, there is no appreciable difference between the build alternatives. The No Build (Alternative 1) would not result in any changes to accessibility, including travel time or roadway improvements.

How, if at all, do the project type, project location, and growth pressure potentially influence growth?

The build alternatives are consistent with the forecasts used for population and employment growth in the 2012 RTP/SCS. The build alternatives are also consistent with growth-related goals and policies of the regional and local agencies within the I-710 Corridor. As discussed earlier in Section 3.1.2.2, Environmental Consequences, the I-710 Corridor Project build alternatives would require the County of Los Angeles and some cities within the I-710 Corridor Project Study Area to amend their General Plan Land Use and Circulation Elements to reflect the adopted project alternative, interchange locations, and redesignation of land acquired for the project to

transportation designations. The existing land uses affected by the I-710 Corridor Project build alternatives that would require redesignation in the local land use plans are shown on Figure 3.1-1 in Section 3.1 (Land Use) of this Final EIR/EIS.

With the exception of the redesignation of land uses for areas incorporated into the transportation uses, the build alternatives would not result in other changes to land uses in the Study Area. This is because at both a regional and local level, communities within the I-710 Corridor have experienced population, housing, and employment growth over the last century, and in particular, after World War II. As shown previously in Table 3.2-1 and Table 3.2-2, Los Angeles County, the Gateway Cities Subregion, and the communities within the Gateway Cities subregion are projected to continue to experience some growth in population and jobs even in the jurisdictions that are relatively constrained by limited land available for development. As documented in the Program EIR for the 2016 RTP/SCS (SCAG 2016; see page 4-11 of the PEIR at <http://scagrtpscscs.net/Pages/DRAFT2016PEIR.aspx>), growth in the SCAG region is expected to occur with or without the projects included in the RTP/SCS, including the I-710 Corridor Project. The improved mobility expected to be achieved as a result of the build alternatives could have a slight influence on demand for residential and nonresidential uses in the cities and communities in the Gateway Cities subregion; however, it would not be expected to be sufficient to result in the need to modify adopted General Plans to allow for greater levels of development (residential and nonresidential). The build alternatives would accommodate existing, approved, and planned land uses in the Study Area but would not influence the amount, timing, or location of growth in the Study Area.

As the No Build (Alternative 1), which has been identified as the Preferred Alternative, does not involve any changes to the existing conditions, it would not have any growth-related impacts and therefore would not influence growth in the project area.

Is project-related growth reasonably foreseeable (as defined by NEPA, i.e., indirect impacts need only be evaluated if they are reasonably foreseeable as opposed to remote and speculative)?

The build alternatives respond to existing and forecasted traffic congestion due to growth, both locally and regionally, that has already occurred or is planned to occur, in accordance with the General Plan Land Use Elements of the County and cities within the Study Area. I-710 was constructed as a six-lane freeway in various segments from 1955 to 1965, with the final segment between I-5 and I-10 completed in 1965. Since that time, the population of Los Angeles County has increased over 60 percent, from approximately 6,039,000 in 1960 to over 9,992,600 in 2012. Although I-710 was later widened to eight lanes between I-405 and I-5, as described in Chapter 1.0, Purpose and Need, the capacity of I-710 is insufficient to handle the existing travel demand that has resulted from the growth in population and employment that has occurred since the freeway was first built. The design of the freeway is also in need of modernization, as the existing

freeway was designed to handle the demands of a smaller population and a different mix of vehicles (i.e., fewer trucks) than exists today.

As shown in Table 3.2-2, most of the cities in the Study Area are projected to continue to experience growth in population and jobs even in jurisdictions relatively constrained by limited land available for development. The build alternatives would not influence the amount, timing, or location of growth in the project area because the build alternatives improve existing transportation infrastructure, the Study Area is already highly developed, and there is limited land available for new development or redevelopment. Likewise, the No Build (Alternative 1) would not influence the amount, timing, or location of growth in the project area. Accordingly, there is no reasonably foreseeable project-related growth that would result from any of the build alternatives or the No Build (Alternative 1).

If there is project-related growth, how, if at all, will that impact resources of concern?

As discussed above, there are no reasonably foreseeable project-related growth impacts under any of the build alternatives or the No Build (Alternative 1); therefore, there would be no impacts to resources of concern.

BUILD ALTERNATIVES/REGIONAL GROWTH CONSIDERATIONS RELATED TO GOODS MOVEMENT. In addition to the questions presented above for evaluating the potential of the build alternatives to result in growth-related effects relative to population, housing, and employment, a focused assessment was conducted to assess the potential of the build alternatives to result in growth-related effects relative to goods movement. In recognition of the I-710 Corridor's function as a major corridor for goods movement, the following questions were considered:

- How would the build alternatives affect the demand for growth of terminal facilities at the Ports, as well as growth in port cargo demand?
- How would growth in port cargo demand affect travel demand on I-710?

A discussion regarding each of these questions is provided below.

How would the build alternatives affect the demand for growth of terminal facilities at the Ports, as well as growth in port cargo demand?

The assessment to address this question is based upon review of published reports⁷ that consider the influence that the availability of landside goods movement infrastructure (i.e., rail and trucks) has on the demand for shippers to use a particular port. Many factors influence the demand for

⁷ Tioga Group. 2007. *San Pedro Bay Cargo Forecast*, December 2007; and *Updated San Pedro Bay Cargo Forecast*, Tioga Group, 2009, *Port Choice Determinants in a Competitive Environment*, Dr. Jose Tongzon, 2002; and I-710 Corridor Project RDEIR/SDEIS *Travel Demand Modeling Methodology*, 2016.

more cargo being handled through the Ports, including global trade demand, availability of alternative port options, capacity of near-dock and off-dock intermodal facilities, and railroad and highway infrastructure capacity. Although the literature on factors determining port selection is limited, it does provide perspective to assess the degree to which roadway infrastructure improvements may influence demand for use of one port over another. The above factors that affect port cargo demand in turn affect the demand for growth of terminal facilities at the Ports. One constraint to the ability to expand terminal facilities at the Ports is the availability of land to construct new or expanded facilities.

The *San Pedro Bay Cargo Forecast* (December 2007) states that the competitiveness of both the POLB and the POLA is based on the following factors:

- The large size of the local Southern California market;
- The region's role as a U.S. distribution hub;
- First-call vessel services that attract service-sensitive intermodal imports; and
- A supply of domestic trailers and containers for transloading.

The *San Pedro Bay Cargo Forecast* (2007) study concludes that the only developments considered likely to alter these basic competitive advantages are the new port at Prince Rupert in northern British Columbia and the improved U.S. rail access to the Lazaro Cardenas Port in Michoacán, Mexico. This is consistent with a more recent report prepared by Mercator International and Oxford Economics in January 2016, the *Executive Summary for San Pedro Bay Long-Term Unconstrained Cargo Forecast*. In assessing demand for cargo handling at all West Coast ports, the study concluded that the currently projected capacity at West Coast ports will eventually be outpaced by cargo growth forecasted in every region.

With regard to potential diversion of cargo to other gateway ports, the *Executive Summary for San Pedro Bay Long-Term Unconstrained Cargo Forecast* (2016) states that local/trans-loads movements via truck are considered to have very little susceptibility to diversion because additional inland costs associated with moving containers into the Ports catchment areas via an alternative gateway port will outweigh any port or terminal cost savings. Additionally, the relatively large population of the Ports' local market in Southern California makes the Ports an essential call for ocean carriers.

Another study conducted for the Port of Singapore (*Port Choice Determinants in a Competitive Environment*, 2002) ranked the factors that determine port selection by freight forwarders; the results are presented in Table 3.2-4. Based on this study, adequate infrastructure ranks third out of seven factors determining port selection. Infrastructure, as defined in the study, includes the number of container berths, cranes, tugs and terminal area, quality and effectiveness of

information systems, availability of intermodal transport (such as roads and railways), the approach channel provided, and the preparedness of the port management.

Table 3.2-4: Ranking of Port Choice Factors: Freight Forwarders' Perspective

| Ranks | Mean | Standard Deviation |
|--|------|--------------------|
| 1. Efficiency | 3.2 | 1.83 |
| 2. Shipping frequency | 4.2 | 2.01 |
| 3. Adequate infrastructure | 4.4 | 2.02 |
| 4. Location | 4.6 | 2.09 |
| 5. Port charges | 5.2 | 2.06 |
| 6. Quick response to port users' needs | 5.4 | 2.24 |
| 7. Reputation for cargo damage | 7.1 | 2.34 |
| N = 47 | | |

Source: Tongzon, Jose. *Port Choice Determinants in a Competitive Environment* (September 2002).

Note: Ranking ranges from 1 (most important) to 7 (least important).

These studies indicate that demand for port growth is primarily driven by the availability and competitiveness of comparable port facilities on the west coast of North America, port efficiency, shipping frequency, and adequacy of infrastructure. Highway infrastructure capacity constitutes one of many infrastructure considerations, as mentioned above. When considered in the context of the many variables that influence growth, particularly international competition, world economic trends, and other infrastructure considerations, improving highway system capacity as a result of the build alternatives would have a very minor influence on increased demand for shippers to use terminal facilities at the POLB and the POLA. Based on the review of these previous studies, the build alternatives would not have a substantial effect on the demand for port cargo growth or expansion of marine terminal facilities at the POLB and the POLA for the following reasons:

- The global economy is the primary driver of cargo demand, which ultimately determines overall world demand for port services.
- The POLB and the POLA benefit from intrinsic competitive advantages, such as the large size of the local Southern California market.
- Local/trans-loads movements via truck are considered to have very little susceptibility to diversion because additional inland costs associated with moving containers into the Ports catchment areas via an alternative gateway port will outweigh any port or terminal cost savings.
- A study of factors that determine port selection by freight forwarders indicated that port efficiency and shipping frequency are more important than adequate cargo servicing infrastructure (e.g., highways).

- Roadway capacity is one of numerous infrastructure considerations that can influence the level of demand for a particular port. Other equally important infrastructure elements are the number of container berths, cranes, tugs and terminal area, the quality and effectiveness of information systems, railway capacity, warehousing facilities, and the capacity of the approach channel.
- Other freeway routes, such as I-110, State Route 103 (SR-103), I-405, and I-605, and parallel surface streets are available to Port trucks to avoid the higher levels of traffic congestion on the I-710 Corridor that would occur under the No Build (Alternative 1).

The No Build (Alternative 1) would have no influence on increased demand for use of POLB and POLA facilities.

How would growth in port cargo demand affect travel demand on I-710?

As discussed above in Section 3.2.2.2, the *I-710 EIR/EIS Initial Feasibility Analysis* (2009) analyzed three port cargo growth scenarios and projected cargo container movements by truck likely to occur on I-710 north of Pacific Coast Highway. The growth scenarios analyzed were based on assumptions about the availability and utilization of on-dock intermodal rail terminal capacity at the marine terminals, the availability of near-dock intermodal terminal capacity, the availability and location of off-dock intermodal terminals, and the availability and limitations of rail system capacity.

At the time the Initial Feasibility Analysis was prepared, In the low-growth scenario where annual port cargo demand is limited to 28.5 million annual TEUs, marine terminals are not expanded beyond the port capacity that already has been approved, and associated on-dock rail projects are not built, thereby limiting the amount of containers that can be loaded on-dock to approximately 5.6 million TEUs annually. The resulting number of *daily* port-related truck trips for each growth scenario is presented in Table 3.2-5.

Table 3.2-5: 2035 Port Cargo Growth and Container Movements by Truck

| Port Cargo Growth Scenario (Year 2035) | Port Volume Cargo Forecast (in Million TEUs) | Container Movements by Truck on I-710 North of PCH (in Million TEUs) | Total Daily Port Truck Trips |
|---|--|---|---------------------------------|
| High port cargo growth without near-dock (rail) terminal expansion | 43.0 | 28.5 | 114,400 |
| High port cargo growth with near- dock (rail) terminal expansion | 43.0 | 25.6 | 114,400 |
| Low port cargo growth | 28.5 | 21.5 | 102,200 |

Source: URS. *I-710 EIR/EIS Initial Feasibility Analysis* (2009).

EIR/EIS = Environmental Impact Report/Environmental Impact Statement

I-710 = Interstate 710

PCH = Pacific Coast Highway

TEUs = twenty-foot-equivalent units

The low-growth scenario results in only 11 percent fewer daily port truck trips as compared to the high-growth scenarios even though the low-growth scenario has 33 percent less containerized cargo throughput compared to the high-growth scenarios. This is because in the low-growth scenario, there is much less on-dock rail capacity than in the high-growth scenarios, as this scenario assumes no further expansion of the Ports' marine terminals and their associated facilities (e.g., on-dock rail). Therefore, there is an increase in the total forecasted number of containers and associated truck trips going to off-dock terminals in the low growth scenario as compared to the high-growth scenarios. As shown previously in Figure 3.2-1, even under the low-growth scenario, the forecasted travel demand by all vehicles on I-710 (automobiles and trucks) would require the same number of lanes on I-710 to serve that demand as under the higher-growth scenarios.

Additionally, according to the Goods Movement Appendix of the SCAG 2012 RTP/SCS, in 2008, the San Pedro Bay Ports were responsible for approximately 50,000 direct daily regional truck trips constituting 3.7 percent of regional truck trips. By 2035, it is anticipated that there will be approximately 120,000 daily regional truck trips, an increase of nearly 150 percent. For informational purposes, truck trip data included in the 2016 RTP/SCS indicated that in 2012, the San Pedro Bay Ports were responsible for approximately 55,000 direct daily regional truck trips (constituting approximately 5 percent of regional truck trips), which were anticipated to grow by 58 percent to approximately 87,000 daily regional truck trips by 2040. Recent data indicates that the vast majority of trips leaving the San Pedro Bay Ports are destined for locations in the southern Gateway Cities, off-dock railyards near downtown Los Angeles, and other locations along the I-710 Corridor. However, this pattern is expected to shift in the future with an increase in the number of daily trucks traveling to warehouses in the San Gabriel Valley and the Inland Empire. For example, in 2008, 0.5 percent and 2.3 percent of all truck trips from the San Pedro Bay Ports moved to eastern San Bernardino Valley and western San Bernardino Valley, respectively. By 2035, it is anticipated that 8.8 percent and seven percent of those truck trips will move to eastern San Bernardino Valley and western San Bernardino Valley, respectively. All key regional highway corridors used to move goods are expected to see an increase in overall truck volumes by 2035. At the corridor level, the highest growth in truck traffic is expected on I-710 as a result of growth in port-related traffic.

The *I-710 Travel Demand Modeling Methodology Report* updated the projected 2035 daily Port truck trips. The Ports combined are estimated to generate about 110,000 daily container related truck trip ends (sum of arrivals and departures at the terminals) in 2035.

BUILD ALTERNATIVES/SUMMARY OF GROWTH CONSIDERATIONS RELATIVE TO PROJECT PURPOSE. A key element of the project purpose of the I-710 Corridor Project is to address projected growth in population, employment, and economic activities related to goods movement. The increase in capacity on I-710 under the build alternatives would not influence demand for growth at the Ports,

based on the review of published reports⁸ on the importance of landside transportation infrastructure (specifically highways) in cargo shipper selection of a particular port. In addition, as shown in Table 3.2-5, growth of port cargo handling capacity at the Ports would not substantially increase travel demand on I-710 (i.e., the high-growth scenario analyzed at the Ports showed an 11 percent increase in total daily port truck trips even with a 50 percent increase in port cargo growth). However, by adding highway system capacity to the goods movement infrastructure in Southern California, all of the build alternatives would have a beneficial effect in accommodating the forecasted growth in the movement of cargo containers via truck within the I-710 Corridor. Furthermore, according to the Goods Movement Appendix of the SCAG 2012 RTP/SCS, the projected increase in freight moving through the region will place greater strain on an already congested transportation system, directly affecting residents and businesses. This would result in the need to expand marine terminal facilities, improve highway connections (particularly those connecting directly to the Ports like I-710), and address on-dock and off-dock intermodal terminal capacities. If port-related rail traffic and commuter demand are to be satisfied, additional mainline capacity improvements would be required. Alternative 7 would have a greater beneficial effect than Alternative 5C by providing dedicated lanes for freight movement within the I-710 Corridor.

NO BUILD (ALTERNATIVE 1). The No Build (Alternative 1), which has been identified as the Preferred Alternative, would not provide capacity increases to accommodate more vehicles and trucks along the I-710 mainline; therefore, the beneficial growth-related effects relative to employment and economic activities associated with goods movement discussed above for the build alternatives would not occur within the I-710 Corridor under the No Build (Alternative 1).

3.2.1.3 PUBLIC HEALTH CONSIDERATIONS

As discussed in Chapter 1.0, Purpose and Need, the growth in population, employment, and goods movement in the I-710 Corridor results in increased travel demand on I-710 by both automobiles and trucks. Although the analysis above concludes that there are no reasonably foreseeable growth-related effects of the build alternatives, the projected growth in travel demand for all alternatives [including the-No Build (Alternative 1)] does result in increased traffic volumes within the I-710 Corridor, which in turn have the potential to affect public health as a result of increases in air pollutant emissions and traffic noise. Please refer to Section 3.13, Air Quality, and Section 3.14, Noise, for a discussion of the public health considerations related to air quality and noise, respectively.

⁸ Tioga Group. 2007. *San Pedro Bay Cargo Forecast*, December 2007, and *Updated San Pedro Bay Cargo Forecast*, 2009; Dr. Jose Tongzon. 2002. *Port Choice Determinants in a Competitive Environment*, and *Executive Summary for San Pedro Bay Long-Term Unconstrained Cargo Forecast*.

3.2.4 AVOIDANCE, MINIMIZATION, AND/OR MITIGATION MEASURES

There are no adverse growth-related effects of the build alternatives; therefore, no measures are required.

This page intentionally left blank

3.3 COMMUNITY IMPACTS

3.3.1 COMMUNITY CHARACTER AND COHESION

The information in this section is based on the following documents:

- *Community Impact Assessment* (CIA) (July 2017)
- *Draft Relocation Impact Report* (DRIR) (March 2017)

Since the No Build (Alternative 1) was identified as the Preferred Alternative, a Final Relocation Impact Report (FRIR) is not required for the project.

3.3.1.1 REGULATORY SETTING

The National Environmental Policy Act (NEPA) of 1969, as amended, established that the federal government use all practicable means to ensure that all Americans have safe, healthful, productive, and aesthetically and culturally pleasing surroundings (42 United States Code [USC] 4331[b][2]). The Federal Highway Administration (FHWA) in its implementation of NEPA (23 USC 109[h]) directs that final decisions on projects are to be made in the best overall public interest. This requires taking into account adverse environmental impacts, such as destruction or disruption of human-made resources, community cohesion, and the availability of public facilities and services.

Under the California Environmental Quality Act (CEQA), an economic or social change by itself is not to be considered a significant effect on the environment. However, if a social or economic change is related to a physical change, then social or economic change may be considered in determining whether the physical change is significant. Since the build alternatives for this project would result in physical change to the environment, it is appropriate to consider changes to community character and cohesion in assessing the significance of the build alternatives' effects.

3.3.1.2 AFFECTED ENVIRONMENT

STUDY AREA COMMUNITIES. The Study Area for the build alternatives includes 17 cities and parts of unincorporated Los Angeles County, including the unincorporated communities of East Los Angeles, East Rancho Dominguez, and Rancho Dominguez, that are located either directly adjacent to the project improvements associated with the build alternatives in which the direct impacts would occur or where the indirect impacts may occur. The following is a discussion of the boundaries and a general description of each of these communities. In addition to the physical constraints described below, citizens within the Interstate 710 (I-710) Corridor communities actively participate in various committees and commissions, including the I-710 Corridor Project Local Advisory Committees (refer to Chapter 5.0, Comments and Coordination, for a full discussion of community participation and public involvement on the I-710 Corridor Project).

BELL. The City of Bell is bordered by the Cities of Maywood and Commerce to the north, the City of Huntington Park to the west, the City of Downey to the east, and the Cities of Cudahy and Bell Gardens to the south. The City of Bell consists of two district areas connected by the Los Angeles River and I-710. The southern part of the City of Bell is known as “Central City” and contains residential and supporting commercial areas. The northern part of the City is developed with industrial areas and is known as the “Cheli Industrial Area.” The City of Bell is directly served by I-710 via interchanges at Atlantic Blvd. and Florence Ave.

Los Angeles County Metropolitan Transportation Authority (Metro) serves the City via the Metro Local lines and Metro Rapid lines. Metro provides service on Atlantic Blvd. and Florence Ave. The Metro service on Wilcox Ave. provides service to nearby cities, including Maywood, Cudahy, Huntington Park, and South Gate. In addition, the City of Bell offers Dial-A-Ride service to senior and disabled residents Monday through Saturday.

Segments of the Los Angeles River Trail are located in the City of Bell. Access points to the trail are provided at Florence Ave., Gage Ave., Randolph St., and Slauson Ave. on the west side of the river.

BELL GARDENS. The City of Bell Gardens is bordered by the City of Downey to the east and south; the Cities of Bell, Cudahy, and South Gate to the west; and the City of Commerce to the north. Residential areas are located throughout the City, and commercial and service areas are concentrated along major local roadways, including Florence Ave., Gage Ave., Garfield Ave. and Eastern Ave. In addition, there is a major retail center located by the I-710 mainline near Florence Ave. and Eastern Ave., and the City identifies this area as the hub of its commercial activity. The City is served by I-710 and Interstate 5 (I-5). I-710 is on the westerly boundary of the City and access within the City to I-710 is provided by a full interchange at Florence Ave. Access to and from I-5 is provided by an interchange at the east end of Gage Ave., just past the City boundary, in the City of Commerce.

The City of Bell Gardens is served by several public transit services and also offers Dial-A-Ride service within the City. Metro has several bus lines that serve the City along Eastern Ave., Gage Ave., and Florence Ave. In addition, the Montebello Bus Line provides service in the City of Bell Gardens along Garfield Ave., toward the City of South Gate, and continues service to the cities of Commerce, Montebello, and other cities in the San Gabriel Valley. The City of Bell Gardens also provides a Fixed-Route Bus called the Town Trolley Bus that operates Monday through Saturday, 6:30 a.m. to 5:30 p.m.

BOYLE HEIGHTS. Boyle Heights is bordered by the communities of Lincoln Heights and El Sereno within the City of Los Angeles to the north; downtown Los Angeles to the west; the City of Vernon to the south; and the unincorporated community of East Los Angeles to the east. Residential areas are located throughout the community, and commercial and service uses are located primarily along major roadways including Whittier Blvd., 1st St., and Cesar

Chavez Ave. The community of Boyle Heights is served directly by I-5, Interstate 10 (I-10), and State Route 60 (SR-60). The I-710 mainline is located east of Boyle Heights, and access is provided by Washington Blvd. and Cesar E. Chavez Ave. in adjacent communities.

Public transportation in Boyle Heights is provided by Metro bus services and light rail services via the Metro Rail Gold Line. Metro provides bus services along major roadways, including 1st St., 4th St., Cesar E. Chavez Ave., Lorena St., Soto St., and Whittier Blvd. Metro Rail Gold Line stations in Boyle Heights include the Soto Station, Mariachi Plaza Station, and Pico/Aliso Station. In addition, the Los Angeles Department of Transportation (LADOT) provides a Dependable, Accessible, Senior and Handicapped (DASH) Transportation bus line that operates the Boyle Heights/East Los Angeles route, with several stops in Boyle Heights, Monday through Saturday.

In addition, there are two Class 3 Bikeways located within Boyle Heights, along Lorena St. and 8th St. Neither of these bikeways is located within 0.5 mile of the improvements associated with the build alternatives.

CARSON. The City of Carson is bordered by parts of unincorporated Los Angeles County to the west; the City of Los Angeles to the west and south; the City of Long Beach to the east; and the City of Compton and the unincorporated community of Rancho Dominguez to the north. Nearly 50 percent of the City of Carson's area is used for industrial purposes, which are primarily located in the eastern part of the City. Residential areas are primarily located in the western part of the City, and main commercial areas include the Carson Mall, located near Interstate 405 (I-405) and Avalon Blvd. The City of Carson is directly served by I-405 via interchanges at Wilmington Ave., Carson St., Avalon Blvd., and Main St., and by I-710 via an interchange at Del Amo Blvd.

Public transportation in Carson is provided primarily by the Carson Circuit. The Carson Circuit provides local transit via eight routes throughout the City. Buses depart from the Transit Center just north of the South Bay Pavilion, and each of the routes operates Monday through Saturday, with service every 40 minutes. The fare is 50 cents; seniors and disabled persons ride for free with a City-issued identification.

Other modes of public transportation in the City of Carson include Torrance Transit, the Metro bus lines, and the Metro Rail Blue Line. Limited public transportation services in the City of Carson are also provided by Long Beach Transit and Gardena Municipal Bus Lines. A north/south shuttle is also provided by the City of Carson. The shuttle connects to the Carson Circuit, Torrance Transit, and Metro bus lines. Dial-A-Ride service is available to seniors and/or disabled citizens 24 hours per day, seven days per week. Service is provided anywhere within the City limits and to specific medical and social service appointments.

Class 1, 2, and 3 Bikeways are also provided in the City of Carson. None of these bikeways are located within 0.5 mile of the improvements associated with the build alternatives.

COMMERCE. The City of Commerce is bordered by the Cities of Vernon and Maywood to the west; the Cities of Bell, Bell Gardens, and Downey to the south; the City of Montebello to the east; and the unincorporated community of East Los Angeles to the north. The city is built up primarily with industrial areas located west of I-710, east of Telegraph Rd., and south of Washington Blvd. Residential areas are primarily located in the north and central areas of the City in the Northwest, Bandini-Rosini, and Rosewood planning areas, as well as additional residential uses in the southern part of the City in the Southeast planning area. In addition, the Ayers neighborhood is located west of I-710, between the mainline and the rail yards in the West planning area. The City of Commerce is directly served by I-5 and I-710 and is located in the center of the Southern California freeway network. Local interchanges for the I-710 mainline that service the City of Commerce include Washington Blvd. and Atlantic Blvd./Bandini Blvd. Local interchanges on I-5 that directly serve the City include Atlantic Ave., Washington Blvd., Garfield Ave., and Slauson Ave. Major roadways in Commerce include Atlantic Blvd., Washington Blvd., Telegraph Rd., Garfield Ave., Eastern Ave., and Slauson Ave.

Public transportation in the City of Commerce is provided by Metro and the City of Commerce. Metro provides bus service along Atlantic Blvd., Eastern Ave., and Telegraph Rd. Metro also provides Metro Rail commuter train service (the Orange County line) and has a station near the intersection of Garfield Ave., I-5, and 26th St. This station also has a park-and-ride facility with approximately 135 parking spaces and offers connecting transit on various other routes.

The City of Commerce has its own municipal bus system that carries approximately 970,000 passengers annually at no charge. The city's transit system consists of five routes that run within the City limits Monday through Saturday. Two routes operate on Sunday, with one stopping at the Commerce Shopping Center on Whittier Blvd./Goodrich Blvd. and the other route stopping at churches located throughout the City.

The City of Commerce also provides a Medi-Ride service for senior and disabled Commerce residents for transportation to and from medical appointments within a 12-mile radius of City Hall.

COMPTON. The City of Compton is bordered by the City of Carson and the unincorporated community of Rancho Dominguez to the south; the City of Long Beach to the south and east; the City of Paramount to the east; the City of Lynwood to the north; and unincorporated areas of Los Angeles County to the north and west. Three pockets of unincorporated Los Angeles County land are located in the City of Compton, including unincorporated East Rancho Dominguez. Residential areas are located throughout the City, and commercial and service uses are concentrated along major roadways including Compton Blvd., Rosecrans Ave., and

Long Beach Blvd. The City of Compton is served by I-710 and State Route 91 (SR-91). Access to I-710 is provided by Alondra Blvd. and Rosecrans Ave.

The City of Compton is served by the Metro Rail Blue Line, with two stations located in the City of Compton: the Compton Station/Martin Luther King Jr. Transit Center and the Artesia Station. The Compton Station/Martin Luther King Jr. Transit Center is located at 275 Willowbrook Ave. and includes a park-and-ride facility and a Greyhound Bus Hub. The Artesia Station is located at 1920 ½ Acacia Ave. and includes a park-and-ride facility that is owned and operated by Metro. The park-and-ride facility has 380 free parking stalls and eight bike racks. Neither transit center is located within 0.5 mile of improvements associated with the build alternatives.

Compton Renaissance Transit also provides transit service within the City. There are five bus routes that operate from the Compton Station/Martin Luther King Jr. Transit Center to various destinations (Compton Airport; El Camino College Compton Center; California State University, Dominguez Hills; Gateway Plaza; and the Renaissance Center) in the City and to the City of Lynwood. The City of Compton also has a Dial-A-Ride program that provides a curb-to-curb, shared ride service for senior citizens 60 years of age or older and eligible handicapped persons, and a bus service that is provided by Metro.

The City of Compton has several bikeways within the City. A Class 1 Bikeway is located along Compton Creek within the City (also known as the Compton Creek Bike Path); it continues into the unincorporated community of Rancho Dominguez and ends in the City of Long Beach at the Los Angeles River. In addition, parts of the Los Angeles River Trail are located in the City of Compton; however, there are no access points to the trail provided in the City of Compton. Class 2 Bikeways are also located along Santa Fe Ave., Alondra Blvd., and Greenleaf Blvd.

CUDAHY. The City of Cudahy is bordered by the City of South Gate to the south; the City of Bell Gardens to the east; the City of Bell to the north; and the City of Huntington Park to the west. The city consists primarily of residential areas. Commercial uses are concentrated along Atlantic Ave. The I-710 mainline is located just east of Cudahy, and access is provided to the north in the City of Bell at Florence Ave. and to the south in the City of South Gate at Firestone Blvd. Major arterials in Cudahy include Atlantic Ave., which runs north-south, and Salt Lake Ave., which follows the curve of the railroad tracks and the City's western boundary.

Public transportation in Cudahy is provided by Metro bus lines that operate on Atlantic Ave. and Wilcox Ave. Metro also provides bus service in the City via Metro Local or Limited lines, the Metro Shuttle line, and the Metro Rapid line. The City of Cudahy also provides a municipal bus system, Cudahy Area Rapid Transit (CART), which provides service within the City. CART operates Monday through Friday from 7:00 a.m. to 5:00 p.m. The City also offers Dial-A-Ride service for the elderly and disabled.

A part of the Los Angeles River Trail is in the City of Cudahy. Access points to the trail are provided within the City of Cudahy at Live Oak St., Clara St., Cudahy Park, and Fostoria St. on the west side of the Los Angeles River.

DOWNEY. The City of Downey is bordered by the Cities of Bellflower and Paramount to the south; the City of South Gate to the west; the Cities of Bell Gardens, Commerce, Montebello, and Pico Rivera to the north; and the Cities of Santa Fe Springs and Norwalk to the east. The City of Downey consists primarily of residential areas located throughout the City and commercial and service areas that are located along major roadways, including Firestone Blvd. and Florence Ave. The City of Downey is directly served by I-5 and Interstate 605 (I-605), and indirectly by I-710. Access to and from I-5 is provided by Paramount Blvd. and Rosemead Blvd. Access to and from I-605 is provided by Florence Ave. I-710 is located one mile west of the City limits, and access to and from I-710 is provided by Florence Ave., Firestone Blvd., and Imperial Hwy.

The City of Downey is served by Metro bus service, which includes lines along Imperial Hwy., Bellflower Blvd., Lakewood Ave., and Clark St. In addition, the Metro Rail Green Line provides light-rail services along Interstate 110 and has one station located along Lakewood Blvd. and I-110. The station has a park-and-ride facility with 414 parking stalls, 22 bike rack spaces, and 12 bike lockers.

The City of Downey also provides DowneyLINK and Dial-A-Ride services. DowneyLINK has four routes operating throughout the City, Monday through Friday, and stops at the Civic Center, the Aquatic Center, schools, and major shopping and entertainment attractions. The Downey Dial-A-Ride provides bus service for seniors and disabled residents of any age. Service is provided to any destination within Downey and to selected medical facilities outside the City. Dial-A-Ride operates seven days per week and registration is required.

EAST LOS ANGELES. The unincorporated community of East Los Angeles is bordered by the City of Commerce to the south; the Cities of Montebello and Monterey Park to the west; and the City of Los Angeles to the north and west. Residential areas are located throughout the City, and commercial and service areas are concentrated along major roadways, including Olympic Blvd., Whittier Blvd., and Atlantic Blvd. East Los Angeles is served directly by I-710, I-5, and SR-60. I-710 and SR-60 bisect East Los Angeles north to south and east to west, respectively. I-5 is located in the southern part of the community. Access to and from I-710 is provided at Eastern Ave. and 3rd St. Access to and from I-5 and SR-60 is provided along Atlantic Blvd.

Metro provides bus and light-rail services throughout the East Los Angeles area. Bus services are provided along major roadways, including Indiana St., Rowan Ave., Ford St., Arizona Ave., and Atlantic Blvd. Service is also provided north to the San Gabriel Valley and south to the Cities of Bell, Bell Gardens, and South Gate. The east-west line also provides service on

Olympic Blvd. to downtown Los Angeles. Light rail services are provided via the Metro Rail Gold Line, and there are four stations located in East Los Angeles (Atlantic, East Los Angeles Civic Center, Maravilla, and Indiana). The Maravilla Station is located within 0.5 mile of the improvements associated with the build alternatives.

Montebello Bus Lines also provides service in East Los Angeles along Beverly Blvd. west to downtown Los Angeles, and east to Montebello and Norwalk. The El Sol Shuttle, provided by the Los Angeles County Department of Public Works, has three lines in East Los Angeles, with stops at the Roybal Health Center; California State University, Los Angeles (CSULA); East LA Community College, and shopping areas on Cesar E. Chavez Ave. and Whittier Blvd. The Children's Court Shuttle connects CSULA, the Sheriff's Headquarters, and Edmond D. Edelman Children's Court.

HUNTINGTON PARK. The City of Huntington Park is bordered by the Cities of Vernon and Maywood to the north; the Cities of Bell and Cudahy to the east; the City of South Gate to the south; and the City of Walnut Park to the south and west. Residential areas are located throughout the City, with the exception of the far western part of the City, which consists of mostly industrial areas. Commercial and service areas are concentrated along major roadways, including Florence Ave., Gage Ave., and Pacific Blvd. Huntington Park is located south of downtown Los Angeles and is not served directly by the regional highway system. The I-710 mainline is located east of the City and access to the freeway is provided in the Cities of Maywood and Bell.

The City is served by the Huntington Park Local Transit Bus (known as the HP Express), which operates every day of the year except major holidays. Stops are located at major intersections, and seniors, disabled, and children under four years of age ride for free. The City also offers Dial-A-Ride service 24 hours per day, seven days per week, including holidays, for residents age 62 or older and disabled individuals. Additional bus service is provided by Metro, which has both Metro Local or Limited Lines and Metro Rapid Lines and stops within the City.

LAKEWOOD. The City of Lakewood is bordered by the City of Long Beach to the south and west; the City of Hawaiian Gardens to the south; the Cities of Bellflower and Cerritos to the north; and the City of Cypress to the east. Residential areas are located throughout the City, and commercial areas include the Lakewood Mall. Lakewood is directly served by I-605 and indirectly served by I-710 and SR-91. Access to and from I-710 is provided by Del Amo Blvd. Major north-south arterials in Lakewood include: Palo Verde Ave., Woodruff Ave., Bellflower Blvd., Lakewood Blvd., and Paramount Blvd. Major east-west arterials in Lakewood include Carson St., Del Amo Blvd., and South St.

Public transportation is provided by three bus systems with local connections: Metro, Long Beach Transit (LBT), and the Orange County Transportation Authority (OCTA). The City of

Lakewood also provides DASH Transportation to seniors and disabled residents for transportation to medical appointments, shopping, and recreational events. The City of Lakewood also subsidizes the use of LBT's Dial-A-Lift service for disabled adult Lakewood residents.

Class 1, 2, and 3 Bikeways are also provided in the City of Lakewood. None of these bikeways are located within 0.5 mile of the improvements associated with the build alternatives.

LONG BEACH. The City of Long Beach is bordered by the Pacific Ocean to the south; the Cities of Los Angeles, Carson, and Compton to the west; the City of Paramount to the north; the Cities of Lakewood and Bellflower to the north and east; and the Cities of Hawaiian Gardens, Los Alamitos, and Seal Beach to the east. Over the years, the City of Long Beach has continued to grow and develop, resulting in distinct neighborhoods throughout the City that are characterized by the schools, parks, and other community resources. A total of 29 neighborhoods are located within 0.5 mile of the mainline and interchange improvements associated with the build alternatives. The City of Long Beach is served directly by I-710, I-405, and SR-91. I-710 is located in the western part of the City of Long Beach and connects with I-405 and SR-91 within the City limits. Access to I-710 is provided by Shoreline Dr., 3rd St., 7th St., Anaheim St., Pacific Coast Hwy., Willow St., Wardlow Rd., Del Amo Blvd., Long Beach Blvd., and Artesia Blvd.

Within the City of Long Beach, public transportation is provided by LBT, the City of Long Beach, and Metro. LBT is the principal provider of public transportation in the City of Long Beach and provides transportation via bus, shuttle, and water taxi (water taxi services are provided between May and September with a limited weekend schedule from September to October). LBT currently operates 34 bus routes, with nearly 2,000 bus stops and offers connections to local rail service and to the neighboring Cities of Carson, Compton, Paramount, Bellflower, Artesia, Cerritos, Hawaiian Gardens, and Norwalk. The Passport Shuttle is a free local bus service that serves various neighborhoods including CSULB and downtown Long Beach/Pine Ave. The City of Long Beach provides Dial-A-Lift service, which offers a curb-to-curb, shared-ride transit service exclusively for the mobility-impaired residing in and traveling throughout the Cities of Long Beach, Lakewood, and Signal Hill.

Metro operates the Blue Line light rail in the City of Long Beach, and there are eight Blue Line stations located in the City. The Wardlow Blue Line Station and the Willow Blue Line Station each have a park-and-ride facility that is owned and operated by Metro. The Wardlow Blue Line Station has 61 parking stalls, paid parking, eight bike racks, and 16 bike lockers. The Willow Blue Line Station has 863 parking stalls (free and paid), most within a parking garage, 16 bike racks, and eight bike lockers. The Transit Mall, Pacific, Wardlow, and Del Amo Stations are located within 0.5 mile of the improvements associated with the build alternatives.

Parts of the Los Angeles River Trail (a Class 1 Bikeway) are located in the City of Long Beach. Access points to the Los Angeles River Trail in the City of Long Beach are provided just north of Shoemaker Bridge near DeForest Ave., on the east side of the river, and on Pacific Coast Hwy., Willow St., Wardlow Rd., Del Amo Blvd., Long Beach Blvd., and Artesia Blvd. In addition, other Class 1, 2, and 3 Bikeways are located throughout the City. In addition, room for Class IV bike facilities would be provided in conformance with the City of Long Beach General Plan for overcrossings located within Long Beach for the build alternatives (see Section 2.3.2.2 of this Final EIR/EIS for further details).

LYNWOOD. The City of Lynwood is bordered by the City of Compton to the south; the City of Paramount to the east; the City of South Gate to the east and north; and unincorporated areas of Los Angeles County and the City of Los Angeles to the west. Residential areas are located throughout the City. Commercial and service areas in the City are concentrated along major roadways and include the Plaza Mexico, Atlantic Crossing, and the Long Beach Pluma shopping centers. The City of Lynwood is directly served by I-710 and I-105. I-710 serves as the eastern boundary of the City and access is provided by Martin Luther King Jr. Blvd. and Imperial Hwy. I-105 bisects the City east-west, and access to and from I-105 is provided by Long Beach Blvd.

The City of Lynwood has several transit options, including bus, trolley, the Metro Rail Green Line, and Dial-a-Ride. The City of Lynwood is served by the Metro Bus service through the Metro Shuttle, Metro Local Lines, Metro Rapid Line, and Municipal Bus line. The Lynwood Trolley serves both residential streets and major boulevards in the City for a nominal fee. The Metro Rail Green Line light rail that runs east-west along the I-105 median has one stop in the City, at Long Beach Blvd. The Green Line Station has a park-and-ride facility that is owned and operated by the California Department of Transportation (Caltrans) and provides 650 parking stalls. The Dial-A-Ride program also serves the transportation needs of Lynwood's seniors and disabled citizens and provides curb-to-curb transportation service to the supermarket, the bank, personal appointments, and medical appointments throughout Lynwood.

The City of Lynwood has one Class 2 Bikeway located in the southern part of the City, along Santa Fe Ave. This bikeway is not located within 0.5 mile of the improvements associated with the build alternatives.

MAYWOOD. The City of Maywood is bordered by the Cities of Huntington Park and Bell to the south; the City of Commerce to the east; and the City of Vernon to the north and west. The city consists primarily of residential areas with commercial and service uses located along Slauson Ave. and Atlantic Blvd. I-710 is located approximately 0.25 mile east of the City of Maywood, and access to and from I-710 is provided by Atlantic Blvd. The major north-south

roadway in the City of Maywood is Atlantic Blvd. and the major east-west roadway is Slauson Ave.

Public transportation is provided by Metro, which provides scheduled bus routes along Slauson Ave. The City of Maywood also offers the Maywood Dial-A-Ride service, which provides free transportation to its senior and disabled residents. The system provides transportation within the City limits for a nominal one-way fee and outside the City to select medical facilities. The service is available seven days per week, from 8:00 a.m. to 5:00 p.m., and registration is required.

An access point to the Los Angeles River Trail (a Class 1 Bikeway) is provided at Slauson Blvd. on the west side of the river, along the City boundary.

PARAMOUNT. The City of Paramount is bordered by the Cities of Compton and Lynwood to the west; the City of Long Beach to the south; the City of Bellflower to the east; and the Cities of Downey and South Gate to the north. Industrial areas are located in the center of the City and include the Central Industrial District. Commercial areas are located east of the industrial areas and include the Central Business District. Residential areas are located throughout the City. The City of Paramount is served by I-710 and I-105. Access to I-710 within the City is provided by a full interchange at Rosecrans Ave. and additional access is provided at the Alondra Blvd. interchange adjacent to the City within the City of Compton. Access to and from I-105 is provided at Garfield Ave. and Paramount Blvd.

The City of Paramount is served by the Metro Bus service, which operates along Alondra Blvd., Rosecrans Ave., Paramount Blvd., and Lakewood Blvd. Local transportation is provided by the Easy Rider Shuttle, Paramount Dial-A-Ride, and Paramount Dial-A-Taxi. For a nominal fee, the Easy Rider Shuttle transports residents along a fixed route throughout town, with stops at major shopping outlets, schools, and City parks. In addition, the Easy Rider Shuttle system was also expanded in 2009 to provide transportation to the Metro Rail Green Line light rail station on Lakewood Blvd. The City of Paramount also contracts for Dial-A-Ride service for senior residents needing assistance and transportation to medical appointments, shopping, errands, etc.

Parts of the Los Angeles River Trail are located in the City of Paramount along the east side of the Los Angeles River. Access points to the trail in the City of Paramount are provided at Rosecrans Ave., Somerset Blvd., and Alondra Blvd.

SIGNAL HILL. The City of Signal Hill is bordered by the City of Long Beach in all directions. Residential areas are primarily located in the southern part of the City, and commercial areas, including the Signal Hill Auto Center, are located primarily in the northern part of the City. The City of Signal Hill is directly served by I-405 and local interchanges are located along Atlantic Ave. and Cherry Ave. Major north-south roadways within the City include Temple Ave., Cherry

Ave., Orange Ave., California Ave., and Atlantic Ave. Major east-west roadways within the City include Pacific Coast Hwy., Willow St., and Spring St.

Public transportation in the City of Signal Hill is provided by the Metro Bus service and Long Beach Transit (LBT) bus service. Metro provides bus service along Long Beach Blvd. from downtown Long Beach to downtown Los Angeles. LBT also provides bus service, with 12 bus routes serving the major streets in Signal Hill, including Pacific Coast Hwy., Willow St., Spring St., Wardlow Rd., Long Beach Blvd., Atlantic Ave., Orange Ave., Cherry Ave., and Redondo Ave. In addition, the LBT connects residents to Metro and Orange County transit opportunities, and provides a Dial-A-Lift service for residents over the age of 18 with ambulatory disabilities. The Dial-A-Lift service is provided to any destination in Signal Hill, Lakewood, and Long Beach and operates six days per week.

Class 2 and 3 Bikeways are also located within the City of Signal Hill. A Class 2 bikeway is located along Spring St. in the Atlantic/Spring neighborhood and a Class 3 Bikeway is located along Pacific Coast Hwy. at the southern border of the City limits. Neither of these bikeways is located within 0.5 of the improvements associated with the build alternatives.

SOUTH GATE. The City of South Gate is bordered by unincorporated areas of Los Angeles County to the north and west; the City of Los Angeles to the west; the Cities of Lynwood and Paramount to the south; the City of Downey to the east; and the Cities of Bell Gardens, Cudahy, and Huntington Park to the north. Residential areas are primarily located west of I-710, and industrial areas are located east of I-710. Commercial areas are located along major roadways and include the El Paseo/South Gate Towne Center, which is located in the northeastern part of the City along Firestone Blvd. The city is served by I-710, and access to I-710 is provided by full interchanges at Firestone Blvd. and Imperial Hwy.

The City of South Gate is served by the Metro Bus system through the Metro Shuttle, Metro Local Lines, and Metro Rapid Line. Locally, the City of South Gate provides transportation services through the Phone-A-Ride program. The Phone-A-Ride program provides residents with limited transportation options, such as senior citizens and the disabled, with reliable and affordable transportation for medical appointments, the grocery store, and other necessary trips within the City limits. Additionally, the City operates a local transit bus called the Get Around Town Express (GATE) that runs on a continuous loop with convenient stops near many popular destinations around the City. Service is offered Monday through Friday, 6:00 a.m.–7:00 p.m., and Saturdays 8:00 a.m.–5:00 p.m.

Parts of the Los Angeles River and Rio Hondo trails are located in the City of South Gate. Access points to the Los Angeles River Trail are provided within the City of South Gate at Firestone Blvd., Southern Ave., Tweedy Blvd., and Imperial Hwy. on the west side of the river. Additional access points are provided on the east side of the Los Angeles River near Borwick Ave. and Hollydale Park. Access points are also provided within the City of South Gate to the

Rio Hondo Trail at Imperial Hwy., Garfield Ave., Southern Ave., and Firestone Blvd. A Class 2 Bikeway is also located along Southern Ave., just west of the Los Angeles River Trail, and this trail turns into a Class 1 Bikeway near South Gate Park as it continues west to Cesar Chavez Park.

VERNON. The City of Vernon is bordered by areas of unincorporated Los Angeles County to the north; the Cities of Maywood and Huntington Park to the south; the City of Commerce to the east; and the City of Los Angeles to the west. The City of Vernon is primarily built up with industrial uses; however, there is a small pocket of residential uses in the western part of the City along Vernon Ave. The City of Vernon is served by I-710. The I-710 mainline crosses through the eastern part of the City, and access to and from I-710 is provided at Atlantic Ave./Bandini Blvd. Public transportation is provided by Metro, which provides scheduled bus routes along various City streets, including Vernon Ave., Solo St., and District Ave. In addition, the Metro Rail Blue Line provides light-rail service and is located west of the City, with the nearest station (Vernon Station) located 0.5 mile west of the City boundary at Vernon Ave.

Parts of the Los Angeles River Trail are located in the City of Vernon. Access points to the trail in the City of Vernon are provided at Atlantic Ave.

WILMINGTON/SAN PEDRO. Wilmington is bordered by Lomita Blvd., the City of Long Beach, the Port of Los Angeles (POLA), Gaffey St., and Normandie Ave. San Pedro is bordered by Taper Ave. to the north; John Gibson Blvd., Harbor Blvd., the West Channel of POLA, and Cabrillo Beach to the east; the Pacific Ocean to the south; and the City of Rancho Palos Verdes to the west. Residential areas are located in the western part of Wilmington and throughout San Pedro. Public transportation in the communities of Wilmington and San Pedro is provided by Metro and the LADOT. Metro provides local bus lines as well as the Metro Express Line, which provides express bus service to downtown Los Angeles via the Harbor Transitway, a high-occupancy vehicle roadway that runs in the median of I-110. LADOT provides DASH Transportation, Commuter Express, and Cityride public transportation services. DASH Transportation provides local bus service around the communities of Wilmington and San Pedro for a nominal fare. Commuter Express provides commuter bus service from the San Pedro and Wilmington areas to the Financial District in downtown Los Angeles and to the City of Long Beach. Commuter Express operates during peak commute times. The Cityride service is a transportation assistance program for residents age 65 and over and individuals with disabilities.

Park-and-ride facilities are also located in Wilmington and San Pedro. Wilmington has one park-and-ride facility located on Pacific Coast Hwy. that is owned and operated by Caltrans. The Wilmington park-and-ride facility has 244 parking stalls available. In San Pedro, there are two park-and-ride facilities for residents to use, the Channel Street Lot and the San Pedro II Lot. The Channel Street Lot is located where Battery St., Gaffey St. and Channel St. converge

and is also owned and operated by Caltrans. The Channel Street Lot has 106 parking stalls available. The San Pedro II Lot is located at the intersection of North Beacon St. and Harbor Blvd. and is owned and operated by Caltrans. The San Pedro II Lot has 280 parking stalls available.

Wilmington and San Pedro also include several Class 1, 2, and 3 Bikeways along major roadways throughout each community. None of these bikeways are located within 0.5 mile of the improvements associated with the build alternatives.

STUDY AREA DEMOGRAPHICS. Community cohesion is the degree to which residents have a sense of belonging to their neighborhood, their level of commitment to the community, or a strong attachment to neighbors, groups, and institutions, usually as a result of continued association over time (*Community Impact Assessment Handbook*, Caltrans, June 1997). The demographic characteristics for the Study Area provided within this assessment were obtained from a combination of sources, including the United States Census Bureau (2010 Census and American Community Survey [ACS] 2010–2014) and the Southern California Association of Governments (SCAG). Since the time these data were collected, the 2020 Census has become available. The 2020 Census data did not differ substantially from the 2010 and 2014 data and the conclusions regarding demographic characteristics provided remain valid.

Elements of community cohesion can be found in demographic data used to profile communities from the United States Census. Typical indicators of community cohesion are described below, followed by a specific discussion of these indicators within the Study Area.

- **AGE:** In general, communities with a high percentage of elderly residents (65 years or older) tend to demonstrate a greater social commitment to their community. This is because the elderly population, which includes retirees, often tends to be more active in the community as they have more time available for volunteering and participating in social organizations.
- **ETHNICITY:** In general, homogeneity of population contributes to higher levels of cohesion. Communities that are ethnically homogenous often speak the same language, hold similar beliefs, and share a common culture and are, therefore, more likely to engage in social interaction on a routine basis.
- **HOUSEHOLD SIZE:** In general, communities with a high percentage of families with children are more cohesive than communities consisting of mainly single people. This appears to occur as children tend to establish friendships with other children in their community. The social networks of children often lead to the establishment of friendships and affiliations among parents in the community. Although the Census Bureau does not provide specific data regarding the number of children present in each household, data regarding the persons per household in Los Angeles County as well as in each city, and community

(including unincorporated areas) in the Study Area that can serve as a proxy for households with children.

- **HOUSING OCCUPANCY:** Communities with a high percentage of owner-occupied residences are typically more cohesive because their population tends to be less mobile. Since they have a financial stake in their community, homeowners often take a greater interest in what is happening in their community than renters do. This means they often have a stronger sense of belonging to their community.
- **HOUSING TENURE:** Communities with a high percentage of long-term residents are typically more cohesive because a greater proportion of the population has had time to establish social networks and develop an identity with the community. For purposes of this analysis, long-term residents are considered those who have lived in their current residence 10 years or more.
- **TRANSIT-DEPENDENT POPULATION:** Communities with a high percentage of residents that are dependent on public transportation typically tend to be more cohesive than communities that are dependent on automobiles for transportation. This is because residents who tend to walk or use public transportation for travel tend to engage in social interaction with each other more frequently than residents who travel by automobile.

AGE. In 2010, the percentage of the population in the Study Area considered transit-dependent (under the age of 19 and over the age of 65) ranged between 0 and 48.2 percent based on the ACS 2010 to 2014 data. Table 3.3-1 provides the median age demographic in 2010 and the transit-dependent populations for the affected cities and communities.

ETHNICITY. Table 3.3-2 shows the ethnic composition of the affected cities and communities in the Study Area in 2010. As shown in that table, the largest racial category for most of the affected cities and communities is Latino (Hispanic).

HOUSEHOLD SIZE. Based on the 2010 census, the average household size within the affected cities and communities in the Study Area ranged between 2.64 and 4.57 persons (refer to Table 3.3-3 for a breakdown of the average household size within each affected city and community). As shown in Table 3.3-3, seven of the affected cities have an average household size greater than four persons.

HOUSING TENURE. Table 3.3-4 provides the housing tenure for the affected cities and communities in the Study Area as documented in the 2010 Census. As shown in that table, approximately 69 percent or more of the households have lived in their unit 10 years or more.

Table 3.3-1: Age of Population in the Study Area

| City | Median Age (Years) | Transit-Dependent Population |
|---|-----------------------|---------------------------------|
| Bell | 28.9 | 10,975 (40.5%) |
| Bell Gardens | 27.3 | 13,179 (42.5%) |
| Carson | 37.6 | 19,792 (26.1%) |
| Commerce | 31.2 | 4,023 (38.8%) |
| Compton | 28 | 27,415 (38.0%) |
| Cudahy | 27 | 7,884 (45.6%) |
| Downey | 33.3 | 22,478 (25.1%) |
| East Los Angeles | 29.1 | 45,168 (42.6%) |
| Huntington Park | 28.9 | 21,194 (48.2%) |
| Lakewood | 37.5 | 10,663 (16.3%) |
| Long Beach | 33.2 | 103,439 (27.6%) |
| City of Los Angeles (includes Boyle Heights, Wilmington, and San Pedro) | 34.1 | 966,131 (31.6%) |
| Lynwood | 27.8 | 20,211 (38.2%) |
| Maywood | 27.9 | 8,835 (44.3%) |
| Paramount | 28.6 | 15,024 (36.6%) |
| Signal Hill | 36 | 1,964 (22.8%) |
| South Gate | 29.4 | 27,498 (37.4%) |
| Vernon | 36.1 | 0 (0.0%) |

COMMUNITY COHESION SUMMARY. Based on the data in Tables 3.3-1 through 3.3-4 and the analysis above, all of the Study Area cities and communities are considered to be highly cohesive based on the factors of median age, ethnic homogeneity, high tenure of residents, above-average household size, high percentage of transit-dependent population, and percentage of elderly residents.

COMMUNITY FACILITIES. In addition to parks and recreation areas discussed in Section 3.1.3 and public safety facilities discussed in Section 3.4 of this Final Environmental Impact Report/Environmental Impact Statement (Final EIR/EIS), other community facilities such as schools, libraries, and places of worship within the Study Area are discussed below.

SCHOOLS. The Study Area is served by several school districts. The following is a list of the school districts and the affected cities in the Study Area served by each district.

- The Los Angeles Unified School District (LAUSD) serves residents for grades Kindergarten to 12 in several of the communities within the Study Area, including the Cities of Bell, Carson, Cudahy, Huntington Park, Maywood, South Gate, and Vernon, as well as parts of East Los Angeles, Boyle Heights, Wilmington, and San Pedro.
- The Montebello Unified School District (MUSD) serves the residents of the Cities of Bell Gardens and Commerce, as well as parts of East Los Angeles, for grades K–12. The Compton Unified School District (CUSD) serves the residents in the City of Compton for grades Kindergarten to 12.
- The Downey Unified School District (DUSD) serves the residents in the City of Downey for grades Kindergarten to 12.
- The Long Beach Unified School District (LBUSD) serves the residents in the City of Long Beach, as well as the City of Signal Hill and parts of the City of Lakewood for grades Kindergarten to 12.
- The Lynwood Unified School District (LUSD) serves the residents in the City of Lynwood for grades Kindergarten to 12.
- The Paramount Unified School District (PUSD) serves the residents in the City of Paramount, as well as parts of the Cities of South Gate and Lakewood for grades Kindergarten to 12.

Table 3.3-5 lists the location, associated school district, and estimated enrollment for schools located within 0.5 mile of the I-710 mainline and interchange improvements associated with the build alternatives. Also, refer to Figure 3.3-1 for the locations of these schools in the Study Area.

Table 3.3-5: Schools Located within 0.5 Mile of the I-710 Mainline and Interchange Improvements Associated with the Build Alternatives

| School | Address | Grades | No. of Students |

In addition, El Camino College Compton Center, in the City of Compton is located on Artesia Blvd. within 0.5 mile of the mainline and interchange improvements associated with the build alternatives.

LIBRARIES. Library services within the Study Area are provided primarily by the County of Los Angeles Public Library System; however, the Cities of Commerce, Downey, Long Beach, Los Angeles, Signal Hill, and Vernon also provide library services for their residents. The following is a list of libraries located within 0.5 mile of the I-710 mainline and interchange improvements associated with the build alternatives (also refer to Figure 3.3-1).

- **Atlantic Library, 2269 S. Atlantic Blvd., Commerce:** Atlantic Library has books, CDs, videos, DVDs, computer software, magazines, newspapers, audiotapes, and books on cassette, available in English or Spanish.
- **Bristow Park Branch Library, 1466 S. McDonnell Ave., Commerce:** Bristow Park Library has a vast variety of materials, including books, CDs, entertainment and educational videos and DVDs, computer software, magazines, newspapers, audiotapes, and books on cassette, available in English and Spanish.
- **Cudahy Library, 5218 Santa Ana St., Cudahy:** Cudahy Library first opened in 1913. After several relocations, the library moved to its current location in 1968. The Cudahy Public Library offers a full range of services, including reference, children's programming (story time, summer reading club, class visits), free internet access, and three online public access catalogs.
- **East Rancho Dominguez Library, 4420 E. Rose St., Compton:** East Rancho Dominguez Library offers adult, children's, and Spanish language materials, reference services, a homework center and public computers with internet access. The library is located within 0.5 mile of the I-710 Corridor Project build alternatives improvements.
- **El Camino Real Library, 4264 E. Whittier Blvd., East Los Angeles:** This library first opened in 1929 and moved to its current location in 1972. The library is approximately 3,000 square feet in size, and the collection contains over 57,000 books in English and Spanish, 3,400 audio recordings, 2,315 video recordings, and 41 magazine and newspaper subscriptions as well as pamphlets.
- **Main Library, 101 Pacific Ave., Long Beach:** The Main Library was built in 1977 and is approximately 145,000 square feet in size. The library serves close to 500,000 residents in Long Beach, as well as six schools.
- **Harte Neighborhood Library, 1595 W. Willow St., Long Beach:** The Harte Library was built in 1957 and is approximately 6,500 square feet in size. The library serves close to 36,000 residents in Long Beach, as well as nine schools.

OTHER COMMUNITY FACILITIES. Within the Study Area, there are numerous places of worship that provide community gathering areas. Table 3.3-6 provides a list of places of worship located within 0.5 mile of the I-710 mainline and interchange improvements associated with the build alternatives (also refer to Figure 3.3-1).

In addition, the Dorothy Kirby Center and Camp School in the City of Commerce is another community facility located within 0.5 mile of the I-710 mainline and interchange improvements associated with the build alternatives, and it provides intensive intervention for minors (ranging in age from 8 to 18) in a residential setting while they await adjudication and disposition of

legal matters. The Girls' and Boys' Town of Compton is located at 15116 S. Gibson Ave. in Compton. This facility provides services to children and youths and is located within 0.5 mile of the I-710 mainline. Within East Los Angeles, the Calvary Mortuary, Home of Peace Memorial Park, Beth Israel, Mount Zion, the Serbian and Chinese cemeteries are located within 0.5 mile of the I-710 mainline and interchange improvements associated with the build alternatives.

HOSPITALS. The following is a list of hospitals located within 0.5 mile of the I-710 mainline and interchange improvements associated with the build alternatives (also refer to Figure 3.3-1).

- **COLLEGE MEDICAL CENTER, SOUTH CAMPUS:** Located at 1725 Pacific Ave., Long Beach
- **LOS ANGELES COMMUNITY HOSPITAL:** Located on Whittier Blvd., East Los Angeles
- **EAST LOS ANGELES DOCTORS HOSPITAL:** Located on East Olympic Blvd., East Los Angeles
- **ROYBAL COMPREHENSIVE HEALTH CENTER:** Located on S. Fetterly Ave., East Los Angeles

HOMELESS FACILITIES. There are several homeless shelters and service providers located in the I-710 Corridor Project Study Area. Facilities that are located within 0.5 mile of the I-710 Corridor Project improvements associated with the build alternatives are:

- Catholic Charities Community Center, located on East 14th St., Long Beach;
- Long Beach Rescue Mission, Lydia House, located on Pacific Ave., Long Beach;
- Long Beach Rescue Mission, located on Pacific Ave., Long Beach;
- Women's Shelter of Long Beach, located on Pacific Ave., Long Beach;
- Christian Outreach in Action Transitional Housing, located on E. 3rd St., Long Beach;
- Long Beach Multi-Service Center, located on W. 12th St., Long Beach;
- East Rancho Dominguez Service Center, located on S. Atlantic Blvd., Compton;
- Salvation Army's Bell Shelter and the John Wesley Community Health (JWCH) Institute, Inc. Medical Center, located on Rickenbacker Rd., Bell;
- S. Mark Taper Foundation Shelter Resource Bank, located on Rickenbacker Rd., Bell; and
- United States Armed Forces Reserve Center, located on Bandini Blvd., Bell.

ECONOMICS.

EMPLOYMENT. Within the Study Area, manufacturing, wholesale trade, retail trade, and educational services, health care and social assistance sectors are generally the highest sectors for number of businesses and employment within the Study Area. In addition, the employment profile for the affected cities in the Study Area is provided in Table 3.3-7. As shown in that table, the unemployment rates in the Study Area range from lower to slightly higher (2.8 percent to 8.1 percent) than Los Angeles County (5.2 percent) and State (5.5 percent) unemployment rates. The City of Vernon has the lowest unemployment rate (2.8 percent), and the City of Compton has the highest unemployment rate (8.1 percent) in the Study Area (as of September 2016).

Table 3.3-7: Employment Profile in the Study Area

| City | Employed Civilian Labor Force | Unemployment Rate (percent) |
|--|-------------------------------|-----------------------------|
| Bell | 14,600 | 7.1 |
| Bell Gardens | 17,600 | 6.0 |
| Carson | 44,600 | 6.7 |
| Commerce | 5,300 | 7.7 |
| Compton | 37,600 | 8.1 |
| Cudahy | 9,800 | 6.6 |
| Downey | 55,900 | 4.6 |
| East Los Angeles | 55,100 | 6.2 |
| Huntington Park | 25,900 | 6.9 |
| Lakewood | 42,000 | 4.0 |
| Long Beach | 231,100 | 5.7 |
| City of Los Angeles (includes Boyle Heights, Wilmington and San Pedro) | 1,950,600 | 5.5 |
| Lynwood | 27,500 | 6.5 |
| Maywood | 12,100 | 5.4 |
| Paramount | 23,900 | 6.1 |
| Signal Hill | 6,000 | 5.7 |
| South Gate | 41,500 | 6.8 |
| Vernon | 100 | 2.8 |
| Los Angeles County | 4,881,700 | 5.2 |
| State of California | 18,278,500 | 5.5 |

I-710 = Interstate 710

For a discussion of commuting patterns within the Study Area, refer to Section 3.1.1.

3.3.1.3 ENVIRONMENTAL CONSEQUENCES

The following discussion of environmental consequences only describes the permanent impacts of the proposed project. Please refer to Section 3.24 of this document, Construction Impacts, for a discussion of the temporary impacts of the proposed project for each resource area. Specifically, temporary impacts related to community impacts are located in Section 3.24.3.3.

PERMANENT IMPACTS.

Build Alternatives. Impacts to community cohesion generally depend on whether a project is likely to create a barrier or disrupt connectivity of a community. Either of these can be a result of disruptions in access or residential and business acquisitions. Direct and indirect impacts to community facilities, as a result of Alternatives 5C and 7, are described in Table 3.3-8. Those community facilities include parks and recreational facilities, and police and fire facilities, which are further discussed in Sections 3.1 (Land Use), and 3.4, (Utilities/Emergency Services), respectively.

Table 3.3-8: Permanent Direct and Indirect Impacts to Schools and Other Community Facilities Associated with the Build Alternatives

| Facility | Address | Owner/ Operator | Direct or Indirect Impact |
|--|-----------------------------|---|--|
| Salvation Army's Bell Shelter, which includes an emergency and community service center and the John Wesley Community Health (JWCH) Institute, Inc. medical center | 5600 Rickenbacker Rd., Bell | Salvation Army and JWCH Institute, Inc. | Alternative 5C would not result in direct impacts to this shelter and medical center. As indicated in the <i>Draft Relocation Impact Report</i> (2017), Alternative 7 would require the partial acquisition of the property and displacement of the transitional housing structures on the property. |
| S. Mark Taper Foundation Shelter Resource Bank | 5600 Rickenbacker Rd., Bell | S. Mark Taper Foundation | Alternative 5C would require a partial acquisition along the western part of the property that may be limited to the area functionally used as loading docks at the far west end of the warehouse. Facility planning would be essential in analyzing the potential for redesign or modification of the structure to accommodate the interrelation of the Resource Bank and Bell Shelter. Improvements to the I-710 mainline under Alternative 7 would result in direct impacts to this resource bank. As indicated in the <i>Draft Relocation Impact Report</i> (2017), Alternative 7 would require the full acquisition of this property and displace this facility. As the operations of this facility are intertwined with those of the Bell Shelter, the relocation of this facility could have indirect impacts to the Bell Shelter. |

| Facility | Address | Owner/ Operator | Direct or Indirect Impact |
|--|---------------------------------|---------------------------------------|--|
| Richard N. Slawson Southeast Occupational Center | 5500 Rickenbacker Rd., Bell | LAUSD | <p>Improvements to the I-710 mainline and local arterials associated with the build alternatives would not result in direct impacts to this occupational center.</p> <p>During construction, the I-710 Corridor Project build alternatives would have the potential to result in temporary impacts to access along Rickenbacker Rd.; however, for any build alternative, a TMP would be prepared to minimize impact and provide detours (refer to Measure CON-TR-1 in Section 3.24, Construction Impacts). These potential impacts would cease once construction of either build alternative was complete.</p> |
| Bell Gardens Elementary School | 5620 Quinn St., Bell Gardens | Montebello Unified School District | <p>Improvements to the I-710 mainline and local arterials associated with the build alternatives would not result in direct impacts to the school.</p> <p>As indicated in the Traffic Noise Study Report (2016), sound barriers were found to be feasible under both I-710 Corridor Project build alternatives along the east side of the I-710 that could provide noise reduction to this school and surrounding land uses.</p> |
| Del Amo Church of Christ | 20411 S. Susana Rd., Carson | Private | This church, located within a commercial/industrial complex, would be displaced under both build alternatives due to the removal of access to Susana Rd. south of Del Amo Blvd. Please refer to Appendix D for nonresidential relocation assistance that would be provided for the build alternatives related to the Uniform Relocation Act. |
| Jesus Is Lord | 20411 S. Susana Rd., Carson | Private | This church, located within a commercial/industrial complex, would be displaced under both build alternatives due to the removal of access to Susana Rd. south of Del Amo Blvd. Please refer to Appendix D for nonresidential relocation assistance that would be provided for the build alternatives related to the Uniform Relocation Act. |

| Facility | Address | Owner/ Operator | Direct or Indirect Impact |
|-----------------------------|----------------------------------|--------------------|--|
| Atlantic Library | 2269 Atlantic Blvd., Commerce | City of Commerce | <p>The library is not located adjacent to the I-710 mainline and build alternatives improvements to Atlantic Blvd. and would not result in direct impacts to this library.</p> <p>During construction, the I-710 Corridor Project build alternatives would have the potential to result in temporary impacts to access along Atlantic Blvd.; however, for any build alternative, a TMP would be prepared to minimize impact and provide detours (refer to Measure CON-TR-1 in Section 3.24, Construction Impacts). These potential impacts would cease once construction of either build alternative was complete.</p> |
| Ellen Ochoa Learning Center | 5027 Live Oak St., Cudahy | LAUSD | <p>The school is not located adjacent to the I-710 mainline. Improvements to Florence Ave. associated with the build alternatives would not result in direct impacts to the school.</p> <p>During construction, the I-710 Corridor Project build alternatives would have the potential to result in temporary impacts to access along Florence Ave; however, for any build alternative, a TMP would be prepared to minimize impacts and provide detours (refer to Measure CON-TR-1 in Section 3.24, Construction Impacts). These potential impacts would cease once construction of either build alternative was complete.</p> |
| Kelly Elementary School | 2320 E. Alondra Blvd., Compton | CUSD | <p>The school is not located adjacent to the I-710 mainline, or along arterials impacted as a result of the I-710 Corridor Project build alternatives; therefore, the I-710 Corridor Project build alternatives would not result in direct impacts to this school.</p> <p>During construction, the I-710 Corridor Project build alternatives would have the potential to result in temporary impacts to access along Alondra Blvd.; however, for any build alternative, a TMP would be prepared to minimize impacts and provide detours (refer to Measure CON-TR-1 in Section 3.24, Construction Impacts). These potential impacts would cease once construction of either build alternative was complete.</p> |

| Facility | Address | Owner/ Operator | Direct or Indirect Impact |
|-----------------------|---------------------------------|--------------------|---|
| Whaley Middle School | 14401 S. Gibson Ave., Compton | CUSD | <p>The school is not located adjacent to the I-710 mainline, and improvements to Rosecrans Ave. associated with the build alternatives would not result in direct impacts to the school.</p> <p>During construction, the I-710 Corridor Project build alternatives would have the potential to result in temporary impacts to access along Rosecrans Ave.; however, for any build alternative, a TMP would be prepared to minimize impacts and provide detours (refer to Measure CON-TR-1 in Section 3.24, Construction Impacts). These potential impacts would cease once construction associated with either build alternative was complete.</p> |
| Walton Middle School | 901 W. Greenleaf Dr., Compton | CUSD | <p>The school is not located adjacent to the I-710 mainline, and improvements associated with the build alternatives to Long Beach Blvd. at the SR-91 interchange would not result in direct impacts to the school.</p> <p>During construction, the I-710 Corridor Project build alternatives would have the potential to result in temporary impacts to access along Long Beach Blvd. at the SR-91 interchange; however, for any build alternative, a TMP would be prepared to minimize impacts and provide detours (refer to Measure CON-TR-1 in Section 3.24, Construction Impacts). These potential impacts would cease once construction of either build alternative was complete.</p> |
| Dominguez High School | 15301 S. San Jose Ave., Compton | CUSD | <p>The school is not located adjacent to the I-710 mainline, and improvements associated with the build alternatives to Alondra Blvd. would not result in direct impacts to the school.</p> <p>During construction, the I-710 Corridor Project build alternatives would have the potential to result in temporary impacts to access along Alondra Blvd.; however, for any build alternative, a TMP would be prepared to minimize impacts and provide detours (refer to Measure CON-TR-1 in Section 3.24, Construction Impacts). These potential impacts would cease once construction of either build alternative was complete.</p> |

| Facility | Address | Owner/ Operator | Direct or Indirect Impact |
|-------------------------------------|-----------------------------------|--|---|
| El Camino College Compton Center | 1111 E. Artesia Blvd., Compton | Compton Community College District | <p>The school is not located adjacent to the I-710 mainline or along arterials impacted as a result of the I-710 Corridor Project build alternatives; therefore, the I-710 Corridor Project build alternatives would not result in direct impacts to this school.</p> <p>During construction, the I-710 Corridor Project build alternatives would have the potential to result in temporary impacts to access along Artesia Blvd.; however, for any build alternative, a TMP would be prepared to minimize impacts and provide detours (refer to Measure CON-TR-1 in Section 3.24, Construction Impacts). These potential impacts would cease once construction of either build alternative was complete.</p> |
| Church of Christ | 2301 E. Alondra Blvd., Compton | Private | <p>The church is not located adjacent to the I-710 mainline, and improvements associated with the build alternatives to Alondra Blvd. would not result in direct impacts to the church.</p> <p>During construction, the I-710 Corridor Project build alternatives would have the potential to result in temporary impacts to access along Alondra Blvd.; however, for any build alternative, a TMP would be prepared to minimize impacts and provide detours (refer to Measure CON-TR-1 in Section 3.24, Construction Impacts). These potential impacts would cease once construction of either build alternative was complete.</p> |
| New Brighter Day Baptist Church | 1911 E. Alondra Blvd., Compton | Private | <p>The church is not located adjacent to the I-710 mainline, and improvements associated with the build alternatives to Alondra Blvd. would not result in direct impacts to the church.</p> <p>During construction, the I-710 Corridor Project build alternatives would have the potential to result in temporary impacts to access along Alondra Blvd.; however, for any build alternative, a TMP would be prepared to minimize impacts and provide detours (refer to Measure CON-TR-1 in Section 3.24, Construction Impacts). These potential impacts would cease once construction of either build alternative was complete.</p> |

| Facility | Address | Owner/ Operator | Direct or Indirect Impact |
|--------------------------------------|-------------------------------|--------------------|--|
| The Girls' and Boys' Town of Compton | 15116 S. Gibson Ave., Compton | Private | <p>This facility is located adjacent to the I-710 mainline, and a TCE for the build alternatives is planned to be located on the parcel of land that is south of this facility. The improvements of the build alternatives would not result in direct impacts to the facility.</p> <p>During construction, the I-710 Corridor Project build alternatives would have the potential to result in temporary impacts to access along Gibson Ave.; however, for any build alternative, a TMP would be prepared to minimize impacts and provide detours (refer to Measure CON-TR-1 in Section 3.24, Construction Impacts). These potential impacts would cease once construction of either build alternative was complete.</p> |
| Cudahy River Park | River Rd., Cudahy | City of Cudahy | <p>The Los Angeles River also separates this park and the I-710 mainline. This park would not be impacted as a result of the I-710 Corridor Project build alternatives. Therefore, the I-710 Corridor Project build alternatives would not result in direct impacts to this park.</p> <p>During construction, the I-710 Corridor Project build alternatives would have the potential to result in temporary impacts to access to the park from Clara St.; however, for any build alternative, a TMP would be prepared to minimize impacts and provide alternative access points, if necessary (refer to Measure CON-TR-1 in Section 3.24, Construction Impacts). These potential impacts would cease once construction of either build alternative was complete.</p> |
| Clara Park | 4835 Clara St., Cudahy | City of Cudahy | <p>The park is not located adjacent to the I-710 mainline or along arterials impacted as a result of the I-710 Corridor Project build alternatives; therefore, the I-710 Corridor Project build alternatives would not result in direct impacts to this park.</p> <p>During construction, the I-710 Corridor Project build alternatives would also have the potential to result in temporary impacts to access to the park from Clara St.; however, for any build alternative, a TMP would be prepared to minimize impacts and provide alternative access points, if necessary (refer to Measure CON-TR-1 in Section 3.24, Construction Impacts). These potential impacts would cease once construction of either build alternative was complete.</p> |

| Facility | Address | Owner/ Operator | Direct or Indirect Impact |
|---------------------|----------------------------------|-----------------------|--|
| Fire Station No. 3 | 1222 Daisy Ave., Long Beach | City of Long Beach | <p>The fire station is not located adjacent to the I-710 mainline, and improvements associated with the build alternatives to Anaheim St. would not result in direct impacts to this fire station.</p> <p>During construction, the I-710 Corridor Project build alternatives would have the potential to result in temporary impacts to access along Anaheim St.; however, for any build alternative, a TMP would be prepared to minimize impacts and provide detours (refer to Measure CON-TR-1 in Section 3.24, Construction Impacts). These potential impacts would cease once construction of either build alternative was complete.</p> |
| Fire Station No. 11 | 160 E. Market St., Long Beach | City of Long Beach | <p>The fire station is not located adjacent to the I-710 mainline, and improvements associated with the build alternatives to Long Beach Blvd. would not result in direct impacts to this fire station.</p> <p>During construction, the I-710 Corridor Project build alternatives would have the potential to result in temporary impacts to access along Long Beach Blvd.; however, for any build alternative, a TMP would be prepared to minimize impacts and provide detours (refer to Measure CON-TR-1 in Section 3.24, Construction Impacts). These potential impacts would cease once construction of either build alternative was complete.</p> |
| Fire Station No. 12 | 6509 Gundry Ave., Long Beach | City of Long Beach | <p>The fire station is not located adjacent to the I-710 mainline, and improvements associated with the build alternatives to Willow St. would not result in direct impacts to this fire station.</p> <p>During construction, the I-710 Corridor Project build alternatives would have the potential to result in temporary impacts to access along Willow St.; however, for any build alternative, a TMP would be prepared to minimize impacts and provide detours (refer to Measure CON-TR-1 in Section 3.24, Construction Impacts). These potential impacts would cease once construction of either build alternative was complete.</p> |

| Facility | Address | Owner/ Operator | Direct or Indirect Impact |
|--|-----------------------------------|-----------------------|--|
| Fire Station No. 13 | 2475 Adriatic Ave., Long Beach | City of Long Beach | <p>This facility is not located adjacent to the I-710 mainline, and improvements associated with the build alternatives to Artesia Blvd. would not result in direct impacts to this fire station.</p> <p>During construction, the I-710 Corridor Project build alternatives would have the potential to result in temporary impacts to access along Artesia Blvd.; however, for any build alternative, a TMP (refer to Measure CON-TR-1 in Section 3.24, Construction Impacts) would be prepared to minimize impacts and provide detours. These potential impacts would cease once construction of either build alternative was complete.</p> |
| Long Beach West Division Police Station | 1835 Santa Fe Ave., Long Beach | City of Long Beach | <p>The police station is not located adjacent to the I-710 mainline, and improvements associated with the build alternatives to Pacific Coast Hwy. would not result in direct impacts to this station.</p> <p>During construction, the I-710 Corridor Project build alternatives would have the potential to result in temporary impacts to access along Pacific Coast Hwy.; however, for any build alternative, a TMP would be prepared to minimize impacts and provide detours (refer to Measure CON-TR-1 in Section 3.24, Construction Impacts). These potential impacts would cease once construction of either build alternative was complete.</p> |
| Cesar Chavez Elementary School | 730 W. 3 rd St. | LBUSD | <p>The school is not located adjacent to the I-710 mainline, and improvements associated with the build alternatives to the downtown area would not result in direct impacts to this school. Under both build alternatives, temporary construction impacts would occur at the adjacent Cesar Chavez Park, with which the elementary school has a joint-use agreement. Additionally, for any build alternative, it may be necessary for the City of Long Beach and the LBUSD to amend the agreement based on the reconfigured park. See Appendix B, Final Section 4(f)/6(f) Evaluation, for more details on impacts at Cesar Chavez Park associated with the build alternatives. For any build alternative, a TMP would be prepared for the build alternatives to minimize impacts at the park that may have indirect impacts on this school (refer to Measure CON-TR-1 in Section 3.24, Construction Impacts).</p> |

| Facility | Address | Owner/ Operator | Direct or Indirect Impact |
|----------------------------|-------------------------------------|--------------------|--|
| Zion Evangelical Church | W. 14 th St., Long Beach | Private | <p>The church is not located adjacent to the I-710 mainline, and improvements associated with the build alternatives to Anaheim St. would not result in direct impacts to this church.</p> <p>During construction, the I-710 Corridor Project build alternatives would have the potential to result in temporary impacts to access along Anaheim St.; however, for any build alternative, a TMP would be prepared to minimize impacts and provide detours (refer to Measure CON-TR-1 in Section 3.24, Construction Impacts). These potential impacts would cease once construction of either build alternative was complete.</p> |
| Foursquare Church | 17 th St., Long Beach | Private | <p>The church is not located adjacent to the I-710 mainline, and improvements associated with the build alternatives to Pacific Coast Hwy. would not result in direct impacts to this church.</p> <p>During construction, the I-710 Corridor Project build alternatives would have the potential to result in temporary impacts to access along Pacific Coast Hwy.; however, for any build alternative, a TMP would be prepared to minimize impacts and provide detours (refer to Measure CON-TR-1 in Section 3.24, Construction Impacts). These potential impacts would cease once construction of either build alternative was complete.</p> |
| Long Beach Bible Institute | 455 E. Artesia Blvd., Long Beach | Private | <p>Alternative 7 would result in a direct impact to this facility due to the construction of the freight corridor; however, the <i>Draft Relocation Impact Report</i> (2017) indicates there are available areas within a five-mile radius of the facility for relocation.</p> <p>During construction, Alternative 5C would have the potential to result in temporary impacts to access along Artesia Blvd.; however, under Alternative 5C, a TMP would be prepared to minimize impacts and provide detours (refer to Measure CON-TR-1 in Section 3.24, Construction Impacts). These potential impacts would cease once construction of Alternative 5C was complete.</p> |

| Facility | Address | Owner/ Operator | Direct or Indirect Impact |
|---------------------------------------|---|--|---|
| Multi-Service Center | 1301 W. 12 th St., Long Beach | City of Long Beach | <p>Alternative 5C would not directly or indirectly impact this facility.</p> <p>Alternative 7 would result in a direct impact to this facility due to construction of the freight corridor ramps at the I-710/Anaheim St. interchange. The <i>Draft Relocation Impact Report</i> (2017), reports there is an available area within a five-mile radius of the facility for relocation. However, under Alternative 7, the relocation of this facility would require a comprehensive relocation plan and include changes to zoning and other issues that would make the move difficult. Early planning for a replacement site would be required, as well as obtaining public input for city planning commission approval for a replacement location.</p> |
| Fire Station No. 3 | 930 S. Eastern Ave., East Los Angeles | Los Angeles County Fire Department | <p>Improvements to the I-710 mainline under the build alternatives would not result in direct impacts to the fire station. In addition, the fire station is not located along arterials impacted as a result of the I-710 Corridor Project build alternatives. Therefore, the I-710 Corridor Project build alternatives would not result in direct impacts to this fire station.</p> <p>During construction, the I-710 Corridor Project build alternatives (Options 3A and 3B) would have the potential to result in temporary impacts to access to Eastern Ave. and Whittier Blvd.; however, for any build alternative, a TMP would be prepared to minimize impacts and provide alternative access points, if necessary (refer to Measure CON-TR-1 in Section 3.24, Construction Impacts). These potential impacts would cease once construction of either build alternative was complete.</p> |
| Humphreys Avenue Elementary School | 500 S. Humphreys Ave., East Los Angeles | LAUSD | <p>Improvements to the I-710 mainline and arterials impacted as a result of the I-710 Corridor Project build alternatives would not result in direct impacts to the school.</p> <p>As indicated in the <i>Traffic Noise Study Report</i> (2017) prepared for the proposed project, there is an existing 12-foot sound wall along northbound I-710 that provides noise reduction to this school. Noise abatement has been considered at this location for the build alternatives; however, it was determined that the extension of the height of the sound wall would not provide the required noise reduction of five dBA.</p> |

| Facility | Address | Owner/ Operator | Direct or Indirect Impact |
|-------------------------------------|-----------------------------|----------------------------|---|
| Lynwood High School | 4050 Imperial Hwy., Lynwood | LUSD | <p>The school is not located adjacent to the I-710 mainline. Improvements associated with the build alternatives to I-710 and Imperial Hwy. would not result in direct impacts to the school.</p> <p>During construction, the I-710 Corridor Project build alternatives would have the potential to result in temporary impacts to access along Imperial Hwy.; however, for any build alternative, a TMP would be prepared to minimize impacts and provide detours (refer to Measure CON-TR-1 in Section 3.24, Construction Impacts). These potential impacts would cease once construction of either build alternative was complete.</p> |
| Lynwood Adult Education School | 4050 Imperial Hwy., Lynwood | LUSD | <p>The school is not located adjacent to the I-710 mainline. Improvements associated with the build alternatives to I-710 and Imperial Hwy. would not result in direct impacts to the school.</p> <p>During construction, the I-710 Corridor Project build alternatives would have the potential to result in temporary impacts to access along Imperial Hwy.; however, for any build alternative, a TMP would be prepared to minimize impacts and provide detours (refer to Measure CON-TR-1 in Section 3.24, Construction Impacts). These potential impacts would cease once construction of either build alternative was complete.</p> |
| Heliotrope Avenue Elementary School | 5911 Woodlawn Ave., Maywood | LAUSD | <p>The school is not located adjacent to the I-710 mainline. Improvements associated with the build alternatives to I-710 and Slauson Ave. would not result in direct impacts to the school.</p> <p>During construction, the I-710 Corridor Project build alternatives would have the potential to result in temporary impacts to access along Slauson Ave.; however, for any build alternative, a TMP would be prepared to minimize impacts and provide detours (refer to Measure CON-TR-1 in Section 3.24, Construction Impacts). These potential impacts would cease once construction of either build alternative was complete.</p> |

| Facility | Address | Owner/ Operator | Direct or Indirect Impact |
|----------------------------|---|--------------------|--|
| Maywood Elementary School | 5200 Cudahy Ave., Maywood | LAUSD | <p>The school is not located adjacent to the I-710 mainline. Improvements associated with the build alternatives to I-710 and Slauson Ave. would not result in direct impacts to the school.</p> <p>During construction, the I-710 Corridor Project build alternatives would have the potential to result in temporary impacts to access along Slauson Ave.; however, for any build alternative, a TMP would be prepared to minimize impacts and provide detours (refer to Measure CON-TR-1 in Section 3.24, Construction Impacts). These potential impacts would cease once construction of either build alternative was complete.</p> |
| Apostolic Christian Church | Located along Alamo Ave., Maywood | Private | <p>The church is not located adjacent to the I-710 mainline. Improvements associated with the build alternatives to I-710 and Slauson Ave. would not result in direct impacts to this facility.</p> <p>During construction, the I-710 Corridor Project build alternatives would have the potential to result in temporary impacts to access along Slauson Ave.; however, for any build alternative, a TMP would be prepared to minimize impacts and provide detours (refer to Measure CON-TR-1 in Section 3.24, Construction Impacts). These potential impacts would cease once construction of either build alternative was complete.</p> |
| Zamboni Middle School | 15733 Orange Ave., Paramount | PUSD | <p>The school is not located adjacent to the I-710 mainline. Improvements associated with the build alternatives to Alondra Blvd. would not result in direct impacts to the school.</p> <p>During construction, the I-710 Corridor Project build alternatives would have the potential to result in temporary impacts to access along Alondra Blvd.; however, for any build alternative, a TMP would be prepared to minimize impacts and provide detours (refer to Measure CON-TR-1 in Section 3.24, Construction Impacts). These potential impacts would cease once construction of either build alternative was complete.</p> |

| Facility | Address | Owner/ Operator | Direct or Indirect Impact |
|----------------------------|---------------------------------|------------------------------------|---|
| Fire Station No. 54 | 4867 Southern Ave., South Gate | Los Angeles County Fire Department | <p>The fire station is not located adjacent to the I-710 mainline, and improvements associated with the build alternatives to Southern Ave. would not result in direct impacts to the fire station.</p> <p>During construction, the I-710 Corridor Project build alternatives would have the potential to result in temporary impacts to access along Firestone Blvd. and Southern Ave., northwest and west of the fire station; however, for any build alternative, a TMP would be prepared to minimize impacts and provide detours (refer to Measure CON-TR-1 in Section 3.24, Construction Impacts). These potential impacts would cease once construction of either build alternative was complete.</p> |
| Fire Station No. 57 | 5720 Gardendale St., South Gate | Los Angeles County Fire Department | <p>The fire station is not located adjacent to the I-710 mainline and improvements associated with the build alternatives to Imperial Hwy. and Garfield Ave. would not result in direct impacts to the fire station.</p> <p>During construction, the I-710 Corridor Project build alternatives would have the potential to result in temporary impacts to access along Imperial Hwy., and Garfield Ave. north of the fire station; however, for any build alternative, a TMP would be prepared to minimize impacts and provide detours (refer to Measure CON-TR-1 in Section 3.24, Construction Impacts). These potential impacts would cease once construction of either build alternative was complete.</p> |
| Hollydale Community Church | 11801 Utah Ave., South Gate | Private | <p>This place of worship is not located adjacent to the I-710 mainline and improvements associated with the build alternatives to Imperial Hwy. would not result in direct impacts to the place of worship.</p> <p>During construction, the I-710 Corridor Project build alternatives would have the potential to result in temporary impacts to access along Imperial Hwy. which is north of this place of worship, and Garfield Ave., which is south of this place of worship; however, for any build alternative, a TMP would be prepared to minimize impacts and provide detours (refer to Measure CON-TR-1 in Section 3.24, Construction Impacts). These potential impacts would cease once construction of either build alternative was complete.</p> |

| Facility | Address | Owner/ Operator | Direct or Indirect Impact |
|------------------------------|-------------------------------|--------------------|---|
| Vernon Fire Station No. 4 | 4530 Bandini Blvd., Vernon | City of Vernon | The build alternatives include improvements to the existing Bandini Blvd./Atlantic Ave. interchange, and as a result of widening and realignment of the existing southbound I-710 off-ramp to Bandini Blvd., acquisition and relocation of the City of Vernon Fire Station No. 4 would be required. While a potential site for relocation has not been identified at this time, for any build alternative, Caltrans would coordinate with the City of Vernon in identifying a new site for relocation within the general vicinity of the existing station so as to maintain the existing response times and service area. In addition, the existing fire station would not be demolished until the new fire station is operational. |

TCE = Temporary Construction Easement

TMP = Transportation Management Plan

The removal of on-street parking on major arterials during peak periods, as listed in Section 2.3.2.1, are described for the build alternatives for each jurisdiction in Table 3.3-9. The number of parking spaces impacted by the build alternatives is conservative as it does not represent the quantity of parking spaces that would be displaced, but indicates a theoretical supply based on linear feet of available curb space. In each jurisdiction, field observations have verified that the observed parking demand could be adequately absorbed in off-street parking areas for uses that generate the demand (e.g., parking lots) as well as in on-street parking areas directly off of these main arterials.

Improvements proposed under both the build alternatives would provide increased connectivity around the Study Area. These would include the construction of pedestrian/ bicycle-only bridges at Pacific Pl., crossing over I-405 and the Blue Line in the City of Long Beach, Clara St., crossing I-710 and the Los Angeles River in Bell Gardens/Cudahy, and Humphreys Ave., crossing I-710 in the Community of East Los Angeles. Under the build alternatives, these elements would improve connectivity for these cities and communities by adding connections that do not currently exist. Additionally, both build alternatives propose to connect Southern Ave. over I-710 and to E. Frontage Rd, which would also provide increased connectivity to the residents of the Thunderbird Villa Mobile Home Park in South Gate.

Table 3.3-9: Parking Impacts Associated with the Build Alternatives by Jurisdiction

| Jurisdiction | Number of Impacted Parking Spaces |
|---------------------------------------|------------------------------------|
| City of Bell | 110 |
| City of Bell Gardens | 285 (304 during peak hour only) |
| Community of Boyle Heights | 0 |
| City of Carson | 0 ¹ |
| City of Commerce | 589 |
| City of Compton | 478 |
| City of Cudahy | 144 |
| City of Downey | 0 |
| City of Huntington Park | 0 |
| City of Lakewood | 0 |
| City of Long Beach | 1,686 |
| Community of East Los Angeles | 329 |
| City of Lynwood | 754 |
| City of Maywood | 119 |
| City of Paramount | 372 |
| City of Signal Hill | 46 |
| City of South Gate | 348 |
| City of Vernon | 0 |
| Communities of Wilmington & San Pedro | 0 |

Source: LSA Associates, Inc. *Community Impact Assessment* (July 2017).

¹ On-street parking is currently not allowed on Santa Fe Ave., Del Amo Blvd., or Carson St. in the vicinity of the I-710 Corridor Project build alternatives and would not be permitted on these streets under any of the build alternatives; therefore, no change to parking would occur as a result of the I-710 Corridor Project build alternatives in the City of Carson.

ALTERNATIVE 5C. Alternative 5C would result in physical changes in the Study Area; however, the existing community character and cohesion for the affected communities would remain intact, with the exception of the City of Commerce as described below. Alternative 5C would include widening of the existing I-710 mainline, as well as improvements to existing interchanges and provision of room for Class IV bicycle lanes in some locations within the City of Long Beach. Existing sidewalks and crosswalks modified as a result of the Alternative 5C improvements would be replaced with new sidewalks and crosswalks to maintain and improve pedestrian access. For any build alternative, all replaced and new sidewalks would comply with the Americans with Disabilities Act (ADA).

While a number of existing routes used to travel from one part of the community to another and that are familiar to residents would be redesigned Alternative 5C to accommodate the widening of I-710 and the modernized design of the freeway interchanges, overall

connectivity within these affected communities would remain intact. Where Alternative 5C would result in changes in access (e.g., due to relocation of a freeway on-ramp or off-ramp), alternative routes would be available nearby to maintain existing residential and business access, as well as access to community facilities.

Property acquisitions for Alternative 5C would result in the relocation of residents, established businesses, and places of employment to other parts of the Study Area; however, any residences or businesses acquired as a result of Alternative 5C would be relocated prior to construction (refer to Section 3.3.3 for additional details). Due to the reconstruction of the I-710/I-5 interchange, a portion of the Sydney Neighborhood within the City of Commerce, along S. Sydney Dr. between Dunham St. and Triggs St. would be displaced. Please refer to Section 3.1.3 (Park and Recreation Facilities) for a description of impacts to park and recreation facilities and to Section 3.4 (Utilities/Emergency Services) for a detailed description of impacts to police and fire protection facilities associated with Alternative 5C. Generally, the relocations proposed under Alternative 5C would not represent a substantial adverse impact to the cities and communities within the I-710 Corridor because these relocations would occur along the fringes of the I-710 Corridor, impacting parts of communities rather than whole neighborhoods. Throughout the Study Area, the construction of Alternative 5C would result in the reconfiguration of local interchanges, generally into a diverging diamond configuration. This reconfiguration would retain the existing access points, but often relocate them, which may require temporary closures. Under Alternative 5C, other temporary impacts regarding those to access, transit service, sidewalks, and nearby trails or bicycle lanes would be minimized to the greatest extent possible via the preparation of a TMP and are discussed in more detail in Section 3.24, Construction Impacts.

Two additional pedestrian/bicycle-only bridges are proposed under Alternative 5C at Spring St. and Hill St., crossing I-710 and the Los Angeles River, in Long Beach. Under Alternative 5C, these elements would represent a connectivity benefit to the City of Long Beach, as they would implement connections that do not currently exist.

ALTERNATIVE 7. Alternative 7 would result in impacts to community cohesion similar to those resulting from Alternative 5C; however, additional impacts to the community would result from implementation of Alternative 7 due to the increased right-of-way required for the four-lane freight corridor. Specifically, Alternative 7 would include two design options for the I-710/Washington Blvd. interchange and the connection into the rail yards in the Cities of Commerce and Vernon. In these cities, Alternative 7 Option 1B would retain the proposed interchange configuration of Alternative 7, but local street circulation, highway alignment, and right-of-way requirements would differ from those of Alternative 7. Alignments would shift generally easterly. The cul-de-sac at Ransom would be removed; the one-way street between the ramp intersection and Sheila St. would be shifted easterly,

and parts of Noble St. would be realigned and reconstructed, resulting in some changes in access within the Cities of Bell, Commerce and Vernon. Similarly, changes in access and reconfiguration of the freeway and arterial connection points (specifically at Eastern Ave. and Whittier Blvd.) are also proposed under Alternative 7 Option 3B, within the City of Commerce and Community of East Los Angeles. Although 12 schools are located near the improvements proposed by the build alternatives, they would not be directly impacted by Alternative 7.

Relocations of residential and non-residential parcels in the City of Commerce are discussed in Section 3.3.2.3, below. As a result of the relocations of the residents, (specifically located in the Ayers Neighborhood at Washington Blvd. and I-710 and the Sydney Neighborhood along S. Sydney Dr. between Dunham St. and Triggs St.), businesses, and/or vital community facilities under Alternative 7, the City of Commerce would experience adverse impacts to community character and cohesion as a result of these relocations. Refer to Measure C-1 in Section 3.3.2.4 for relocation assistance for residents of the Ayers and Sydney Neighborhoods.

While temporary disruption of community character and cohesion would occur as a result of construction of the build alternatives (refer to discussion in Section 3.24, Construction Details), the mobility improvements provided by the I-710 Corridor Project build alternatives would also benefit the affected communities by providing an improved connection to other parts of the Study Area. Community services within the Study Area, such as fire, police protection, and other emergency responders would be more readily available with the build alternatives since mobility within the Study Area would improve over existing conditions. However, the Cities of Commerce, Bell, and Long Beach would experience adverse impacts to community character and cohesion as a result of relocations of residents, businesses, and/or vital community facilities under Alternative 7 as indicated above.

The build alternatives have been developed through an extensive community outreach process that involved input from multiple public agencies and stakeholders in order to avoid impacts to the human and natural environments. Community concerns and comments have been expressed throughout the design process and the build alternatives have been refined as much as possible to address the community's concerns and to maintain community character and cohesion. Therefore, with the exception of the impacts to the cities of Commerce, Bell, and Long Beach under Alternative 7, the community character and cohesion of the communities within the Study Area would remain intact with implementation of the build alternatives, because none of the build alternatives would create a barrier or disrupt the connectivity of the communities.

In summary, the majority of the cities and communities in the Study Area, (which include Bell Gardens, the Boyle Heights Community, Carson, Cudahy, Downey, Huntington Park, Lakewood, the community of East Los Angeles, Lynwood, Maywood, Paramount, Signal Hill, South Gate, Vernon, and the communities of Wilmington and San Pedro) would have no adverse impacts to community character and would remain cohesive and intact with construction and operation of the I-710 Corridor Project build alternatives.

NO BUILD (ALTERNATIVE 1). Under the No Build (Alternative 1), the Preferred Alternative, the impacts (including improved mobility in the Study Area) to community cohesion described above for the build alternatives would not occur.

3.3.1.4 PUBLIC HEALTH CONSIDERATIONS

The following community impact categories are relevant to public health considerations for the I-710 Corridor Project build alternatives: social cohesion, access to schools, and jobs and economic development.

SOCIAL COHESION.

PUBLIC HEALTH STATEMENT. Social cohesion, including increases in social support or strengthening of social networks, is associated with decreased stress; increased assistance in emergencies; increased access to jobs, income, and job benefits; and increased access to other essential resources. Communities that become isolated or segregated lose political power, which is associated with increased exposure to crime and violence, causing both injury and stress and additional impacts to mental health (P. Simon et al. 2009).

Health considerations associated with displacement are generally psychological in nature. For some people, displacement can disturb their psychology of “place” or the connection between individuals and their intimate environments. Individuals are linked to their environment through three psychological processes: attachment, familiarity, and identity. Attachment is the mutual caretaking bond between a person and a beloved place. Familiarity refers to the processes by which people develop detailed cognitive knowledge of their environs. Place identity is concerned with the extraction of a sense of self, based on the places in which one passes one’s life. When each of these processes is threatened by displacement, it potentially results in nostalgia, disorientation, and even alienation (Fullilove, 1996).

If displaced residents are required to relocate outside of their neighborhood, supportive family and community relationships can be lost both for those leaving, as well as for those remaining behind. Neighbors, friends, and family provide material as well as emotional support. Support, either perceived or provided, can buffer stressful situations, prevent damaging feelings of isolation, and contribute to a sense of self-esteem and value. (Guzman and Bhatia, 2005).

Residents have disclosed symptoms of stress, loss, grief, and poorer mental health following housing displacement and relocation. Certain groups, including children, the elderly, the intellectually disabled, and marginalized groups, can be particularly vulnerable to the health effects of housing displacement. (Regional Public Health 2011). Within the I-710 Corridor build alternatives, long-term residents who are elderly may require specialized relocation assistance if displaced or relocated due to construction of the build alternatives.

I-710 CORRIDOR PROJECT BUILD ALTERNATIVES. As discussed earlier in this section, impacts to community cohesion generally depend on whether a project is likely to create a barrier or disrupt connectivity of a community. Either of these can be a result of disruptions in access or residential and nonresidential acquisitions. The build alternatives would result in impacts to access as well as residential and nonresidential property acquisitions.

For residential and nonresidential acquisitions, a DRIR (February 2017) has been prepared for the I-710 Corridor Project build alternatives. This report analyzes the impacts to residential and nonresidential properties within the Study Area as a result of the build alternatives. Several factors were considered in this report to determine whether the I-710 Corridor Project build alternatives would result in direct or indirect relocations, including loss of access or parking that could isolate or segregate a residence or business (refer to Section 3.3.3 for additional details). According to the RIR, comparable replacement areas for purchase or lease, both residential and nonresidential, are located within or adjacent to the potential displacement areas as a result of the I-710 Corridor Project build alternatives.

However, due to the affordability challenges for single-family residences and the limited supply of mobile homes, along with the special needs of impacted businesses, it may be necessary to consider available properties within a larger relocation radius. However, the proximity of these areas would ensure comparable neighborhoods, amenities (e.g., public transportation and close proximity to education), access, facilities, general occupancy characteristics, and demographics.

While adequate comparable replacement housing appeared to exist in neighboring cities at the time this document was prepared, for any build alternative, new replacement dwellings under Last Resort Housing may be considered for these cities as a method of providing comparable replacement housing to displaced persons who reside in areas where the replacement housing is low. For any build alternative, Last Resort Housing would be considered in response to the affected cities' request to keep housing within their cities rather than having the replacement housing be in neighboring cities. Last Resort Housing allows agencies to pay Replacement Housing Payments above the statutory limits of \$5,250 to tenants and \$22,500 to homeowners to make comparable replacement housing affordable.

In addition, for any property (residential or nonresidential) that would be relocated by the build alternatives, Caltrans would be required to adhere to the Relocation Assistance Program

(RAP), which is based on the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970, as amended (Uniform Act) and Title 49 CFR Part 24. The purpose of the RAP is to ensure that persons displaced as a result of a transportation project are treated fairly, consistently, and equitably so that such persons would not suffer disproportionate injuries as a result of projects designed for the benefit of the public as a whole. The RAP also requires that certain relocation services and payments by Caltrans be made available to eligible residents, businesses, and nonprofit organizations displaced by its projects; such payments include moving expenses for the actual reasonable costs. In addition, consideration would be given to commercial and industrial land uses subject to partial acquisitions to reconfigure on site in such a manner as to remain in operation. Refer to Section 3.3.2 of this Final EIR/EIS for additional details and requirements associated with the Federal Uniform Act and Title 49 CFR Part 24 that would be applicable to any build alternative.

Based on the limited extent of access changes in the Study Area as a result of the build alternatives, the proximity of these changes to residential and nonresidential properties, the availability of comparable properties for relocation and consideration of Last Resort Housing, and the comprehensive Relocation Assistance Program that would be provided by Caltrans for those being relocated, the build alternatives would not result in isolation and/or segregation of residents without resources to relocate within their existing communities. Therefore, the build alternatives would not result in adverse effects to public health related to social cohesion.

ACCESS TO SCHOOLS.

PUBLIC HEALTH STATEMENT. Increases in walking and biking are positively associated with improvements in health, including decreased obesity, chronic disease, and stress. Childhood obesity is a particularly important issue that could be addressed through increased student walking or biking to school (P. Simon et al. 2009).

I-710 CORRIDOR PROJECT BUILD ALTERNATIVES. As discussed earlier in this section, the build alternatives would improve local streets by constructing new curbs, gutters, and striping, as well as new sidewalks and outside shoulders to allow pedestrian and bicyclist mobility and safety. While the build alternatives would result in some changes in access, these changes would not result in adverse impacts to access to schools within the Study Area.

During construction, the build alternatives would result in temporary access impacts due to local roadways and interchanges being improved as part of the I-710 Corridor Project build alternatives, and these proposed improvements would have the potential to temporarily impact travel (driving, walking, and/or biking) for students who use these roadways to get to school. There are a total of 12 schools at which students may experience temporary impacts in access from construction of the build alternatives (refer to Table 3.3-8). These schools include: The Ellen Ochoa Learning Center, (LAUSD), Kelly Elementary School (CUSD), Whaley Middle School (CUSD), Walton Middle School (CUSD), Dominguez High School

(CUSD), Compton Community College (CCCD), Humphreys Avenue Elementary School (LAUSD), Lynwood High School (LUSD), Lynwood Adult School (LUSD), Heliotrope Avenue Elementary School (LAUSD), Maywood Elementary School (LAUSD), and Zamboni Middle School (PUSD). As discussed further in Section 3.24, Construction Impacts, for any build alternative, a TMP would be prepared prior to construction to identify strategies for minimizing these impacts and to maintain access and connectivity for travel. Detours would be provided during construction to ensure students' access to the schools in a timely manner. In addition, for any school that has identified Safe Pedestrian Routes (e.g., Dominguez Elementary School), should construction of either build alternative impact any part of an identified Safe Pedestrian Route, the detour identified would include mechanisms for safe crossing of roadways (e.g., crossing guards or stop signs) similar to that provided in the existing Safe Pedestrian Route.

For any students using bus transportation (including that provided by the schools, Metro bus service, and other municipal bus services), should construction of either build alternative impact a local bus stop, the bus stop would be relocated in the vicinity of the existing stop prior to construction of either build alternative to maintain service and student accessibility.

All construction-related activities would cease after completion of construction of either build alternative, and direct access would be returned. Once in operation, the build alternatives would not result in adverse impacts to modes of travel for students and would enhance access to schools by reducing traffic congestion.

Based on the above considerations, the build alternatives would not result in adverse effects to public health related to access to schools.

JOBS AND ECONOMIC DEVELOPMENT.

PUBLIC HEALTH STATEMENT. New jobs, especially higher-paying jobs with adequate benefits such as healthcare and paid time off, are associated with increased ability to afford healthy food, health- and childcare, and adequate housing. This positively benefits all health outcomes, including decreases in obesity and chronic disease. Increases in jobs are associated with increases in local economic activity; higher property values; decreased blight, crime, and stress; and improved mental health (P. Simon et al. 2009).

I-710 CORRIDOR PROJECT BUILD ALTERNATIVES. Construction activities for the build alternatives would occur over an extended time period and would generate direct and indirect jobs. Direct jobs as a result of construction would be the number of construction jobs generated to complete the I-710 Corridor Project build alternatives and are, therefore, considered temporary. The indirect jobs would be the additional employment and business activity that would be generated in the regional economy by the initial construction expenditure for the I-710 Corridor Project build alternatives. It is estimated that anywhere from 99,885 to

179,180 (total direct and indirect) jobs may be generated, depending on the build alternative and option selected.

As shown in Table 3.3-10, based on the preliminary cost estimates, construction of Alternative 5C would generate an estimated 34,238 direct and 65,647 indirect jobs, for a total of 99,885 jobs.

Table 3.3-10: Estimated Construction Employment for the I-710 Corridor Improvement Project Build Alternatives

| Estimated Capital Construction Costs ¹ | | | Estimated Employment Generated ² | | |
|---|-----------|----------------|---|---------------|------------|
| | | | Direct Jobs | Indirect Jobs | Total Jobs |
| Alternative 5C | | \$3.59 billion | 34,238 | 65,647 | 99,885 |
| Alternative 5C | Option 1A | \$3.59 billion | 34,238 | 65,647 | 99,885 |
| | Option 2A | \$3.62 billion | 34,524 | 66,195 | 100,719 |
| | Option 3A | \$3.69 billion | 35,192 | 67,475 | 102,667 |
| Alternative 7 | | \$6.32 billion | 60,274 | 115,568 | 175,842 |
| Alternative 7 | Option 1B | \$6.33 billion | 60,369 | 115,750 | 176,119 |
| | Option 3B | \$6.44 billion | 61,418 | 117,762 | 179,180 |

Source: LSA Associates, Inc. *Community Impact Assessment* (July 2017).

¹ Capital construction costs from AECOM (April 2017). Amount does not include right-of-way or support costs.

² ARTBA estimates every \$1 billion invested in highways supports 27,823 jobs, including 9,537 on-site construction jobs, 4,324 jobs in supplier industries, and 13,962 jobs throughout the rest of the economy.

ARTBA = American Road and Transportation Builders Association

I-710 = Interstate 710

Option 1A of Alternative 5C would generate an estimated 34,238 direct and 65,647 indirect construction jobs, for a total of 99,885 jobs. Option 2A of Alternative 5C would generate an estimated 34,524 direct and 66,195 indirect construction jobs, for a total of 100,719 jobs, and Option 3A of Alternative 5C would generate an estimated 35,192 direct and 67,475 indirect construction jobs, for a total of 102,667 jobs. These construction jobs would generate temporary employment and revenues for both the local and regional economies.

Alternative 7 would generate an estimated 60,274 direct and 115,568 indirect construction jobs, for a total of 175,842 jobs. Option 1B of Alternative 7 would generate an estimated 60,369 direct and 115,750 indirect construction jobs, for a total of 176,119 jobs and Option 3B of Alternative 7 would generate an estimated 61,418 direct and 117,762 indirect construction jobs, for a total of 179,180 jobs. These construction jobs would generate temporary employment and revenues for both the local and regional economies. In addition, the zero-emission/near zero-emission freight corridor component of Alternative 7 would generate

additional indirect employment as the technology would be further developed and eventually maintained within the I-710 Corridor.

The build alternatives would also impact nonresidential parcels and result in possible permanent job loss with relocation of businesses. Section 3.3.2, Relocations and Real Property Acquisition of the RDEIR/SDEIS, provides additional detail regarding relocations. However, the goal of the relocation program for the I-710 Corridor Project build alternatives is that relocations would occur within the affected cities to minimize impacts.

3.3.1.5 MOTION 22.1

As described in Chapter 2.0, Section 2.2.2.1 (Community Alternative 7) of this Final EIR/EIS, the Metro Board of Directors passed Board Motion 22.1 in October 2015 that directed Metro and Caltrans to study a number of additional items as a part of the I-710 Corridor Project Description for the build alternatives. Motion 22.1 includes the following two elements that would promote community cohesion:

- **The replacement/enhancement of approximately 28 existing bridges/underpasses and the construction of at least five new pedestrian/bike bridges/underpasses to ensure safe and easily accessible freeway and river crossings to reduce gaps between crossings further than 0.5 mile where demand for increased access exists along the project corridor.** This measure (particularly the new pedestrian/bike bridges/underpasses) would promote greater community cohesion by providing safer bicycle and pedestrian connectivity within and between affected communities associated with the build alternatives.
- **Ensure implementation of Complete Streets treatments that promote sustainable and “livable neighborhoods” for all those arterials, ramp termini, and intersections as part of the proposed I-710 project. Designs shall be consistent with the principles outlined in Caltrans’ *Main Streets, California: A Guide for Improving Community and Transportation Vitality*.** This measure would also promote greater community cohesion by providing safer bicycle and pedestrian connectivity within and between affected communities associated with the build alternatives.

3.3.1.6 AVOIDANCE, MINIMIZATION, AND/OR MITIGATION MEASURES

As previously discussed in this section, the build alternatives would not result in permanent impacts to community character and cohesion in most communities within the Study Area. Community cohesion impacts associated with the build alternatives would occur at a localized level within Commerce, Bell, and Long Beach due to relocations of existing cohesive communities or vital community facilities. For any build alternative, measures that address relocations for the build alternatives within these communities would be provided through implementation of Measure C-1 described in Section 3.3.2.4. Please refer to Section 3.24.4.3 for measures to

reduce temporary impacts during construction of the build alternatives. Additionally, the build alternatives would result in temporary and permanent opportunities for employment and economic development. Therefore, measures to address jobs and economic development associated with the build alternatives would not be needed.

3.3.2 RELOCATIONS AND REAL PROPERTY ACQUISITION

The information in this section is based on the DRIR. Acquisitions/relocations are based on the design of the build alternatives. As stated previously, a FRIR was not prepared for the project since the No Build (Alternative 1) has been identified as the Preferred Alternative. The footprints of Alternatives 5C and 7 and their options have been developed to minimize the effects of the acquisition of land adjacent to the existing I-710 corridor. Refer to Appendix D of this Final EIR/EIS for additional information on Caltrans Relocation Assistance Program policies and guidelines. Also, refer to Section 3.2.2.2 for a discussion on the public health considerations regarding relocations associated with the build alternatives.

3.3.2.1 REGULATORY SETTING

Caltrans' Relocation Assistance Program (RAP) is based on the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970 (as amended) and Title 49 Code of Federal Regulations (CFR) Part 24. The purpose of the RAP is to ensure that persons displaced as a result of a transportation project are treated fairly, consistently, and equitably so that such persons will not suffer disproportionate injuries as a result of projects designed for the benefit of the public as a whole. Please see Appendix D for a summary of the RAP.

All relocation services and benefits are administered without regard to race, color, national origin, or sex in compliance with Title VI of the Civil Rights Act (42 United States Code [USC] 2000d, et seq.). Please see Appendix C for a copy of the Department's Title VI Policy Statement.

3.3.2.2 AFFECTED ENVIRONMENT

Each of the build alternatives would require the acquisition of property to be incorporated into the project transportation facilities. To minimize the impacts of property acquisition on residents, businesses, and communities (particularly low-income, minority communities), the following steps were conducted:

- The build alternatives limits were carefully evaluated during design and those limits were narrowed or otherwise modified to avoid or minimize the need for acquisition of right-of-way for the build alternatives.
- The traffic analysis carefully considered traffic improvements that would require additional right-of-way and, where those improvements were not necessary for efficient traffic operations, they were not included in the build alternatives.

- The properties that would be affected by full parcel acquisitions resulting from the build alternatives were assessed to determine whether those acquisitions could be reduced to partial acquisitions. Similarly, the properties that would be affected by partial parcel acquisitions resulting from the build alternatives were assessed to determine whether those acquisitions could be further minimized or avoided altogether.

If a build alternative were to be selected for implementation, Caltrans or its authorized agent(s) would continue to evaluate ways to minimize the amount of right-of-way needed for the build alternatives. All of the communities within the Study Area described in Section 3.3.1 could be affected by full acquisitions and partial acquisitions of residential and nonresidential property, including mobile homes. Nonresidential properties include retail trade, finance, insurance, services, government/nonprofit, utilities, and other types of nonresidential property uses.

A full acquisition of a property is defined as an area within which the I-710 Corridor Project build alternatives would require close to full, if not 100 percent, acquisition of the parcel. A partial acquisition is when a small area of a property is acquired. Generally, with partial acquisitions, full use of the property and dwelling structures, including multifamily units, would remain. For example, partial acquisitions could consist of parts of a back, side, or front yard; landscaping; or parking. For areas containing multifamily residences, a project may not affect all units on the parcel. Both full and partial acquisitions could also result in relocations. For example, a project could require acquisition of a small percentage of a parcel that consists of over 100 mobile homes. While the I-710 Corridor Project build alternatives would result in a partial acquisition of the parcel itself, relocation of any mobile homes in that parcel acquisition area would be required. In addition, a project could result in the removal of access or parking for a nonresidential property but have no effect on the building. Relocation could still be required for the partial acquisition because the impact to access and/or parking would result in the business no longer being able to operate due to the loss of access or loss of parking.

The severity of property acquisition impacts varies greatly depending on the population involved. For instance, if a person is highly mobile and has had a history of changing residences frequently, the impact may only be a minor inconvenience. However, if the community is stable and cohesive and residents have been in their homes for many years, many of the displaced persons may have a difficult time adjusting to new homes and neighborhoods because they have a strong attachment to their existing homes and neighborhoods.

3.3.2.3 MOTION 22.1 RIGHT OF WAY AVOIDANCE ANALYSIS

In compliance with Metro Board Motion 22.1, an analysis was undertaken to examine the right-of-way impacts of Alternative 7, identify major impacts to homes, businesses, and/or community resources, and provide documentation of the rationale and constraints that make these impacts unavoidable. The information provided herein is from a memorandum entitled "Avoidance Concepts Applicable to Alternative 7" (AECOM, October 2016). This memorandum detailed

design concepts for the previous freight corridor alternatives (Alternatives 6A, 6B, and 6C) evaluated in the 2012 Draft EIR/EIS in addition to Alternative 7; this summary will focus on Alternative 7. The memorandum is provided in Appendix T of this Final EIR/EIS.

Five areas were identified for closer examination under Alternative 7. These areas are:

- Anaheim St. – Within the City of Long Beach, in the vicinity of the Anaheim St. local interchange and adjacent uses. The Long Beach Multi-Service Center for Homelessness (MSC) is located in this area.
- Alondra Blvd. – Within the Cities of Compton and Paramount as well as unincorporated East Compton, in the vicinity of the Alondra Blvd. local interchange and adjacent uses. The Seasons Senior Apartments (recently completed in 2011, with 84 units to serve the needs of senior citizens with disabilities) and the El Rancho Mobile Home Park are located in this area.
- Slauson Ave. – Within the Cities of Bell, Commerce, and Maywood, in the vicinity of the Slauson Ave. local crossing and adjacent uses. The Salvation Army Bell Shelter and S. Mark Taper Foundation Resource Bank are located in this area.
- Washington Blvd. – Within the City of Commerce, in the vicinity of the Washington Blvd. local interchange and adjacent uses. The Ayers residential neighborhood, part of the City of Commerce's Bandini-Rosini Residential Planning Area, is located in this area.
- I-5 – Within the City of Commerce, in the vicinity of the I-710/I-5 interchange and adjacent uses near both freeways. Of particular focus in this area are the approximately 30 residences located along Sydney Dr., part of the City of Commerce's Northwest Residential Planning Area.

It is inherent in the mission of Caltrans to employ context-sensitive design solutions that consider collaborative, community-sensitive approaches to transportation decision-making. To support these approaches, Caltrans has adopted a number of policies, including the Director's Policy on Context Sensitive Solutions (DP-22)¹, Deputy Directive on Accommodating Non-Motorized Travel (DD-64)², as well as the publication of "*Main Street, California: A Guide for Improving Community and Transportation Vitality*."³ Context-sensitive design solutions are defined as "a collaborative, interdisciplinary approach that involves all stakeholders to develop a transportation facility that fits its physical setting and preserves scenic, aesthetic, historic and environmental resources, while

² Caltrans. Website: http://www.dot.ca.gov/hq/tpp/offices/bike/sites_files/DD-64-R1_Signed.pdf (accessed March 1, 2017).

³ Caltrans. Website: http://www.dot.ca.gov/hq/LandArch/mainstreet/main_street_3rd_edition.pdf (accessed March 1, 2017).

maintaining safety and mobility...an approach that considers the total context within which a transportation improvement project will exist.”⁴

When considering adjacent uses and the overall context of a project’s location, other factors are considered as well. When justified by the context, non-standard design features can be utilized to avoid or minimize adverse environmental or social impacts; however, features that have substantial adverse impacts on the safety and operation of the highway facility would not be utilized.

Avoidance objectives are identified for each location and the specific geometric design elements causing the impacts for Alternative 7 are described. The analysis compares differences in right-of-way impacts, differences in safety and mobility, and differences in capital costs in order to determine the viability of the avoidance concept and inform further project development for the build alternative.

ANAHEIM ST. The main avoidance objective for the Anaheim St. area is to avoid relocation of the Long Beach MSC that would occur due to the placement of the truck-only interchange ramps at Harbor Ave. and Anaheim St. under Alternative 7. Three avoidance concepts were proposed that would achieve the objective and are summarized as follows.

- **M1:** Elimination of the truck ramps at Anaheim St. would achieve the objective and avoid relocation of the MSC. Removal of these ramps would divert truck traffic to the I-710 mixed-flow lanes that are accessible at Anaheim St. The projected amount of truck traffic expected to access the freight corridor at Anaheim St. is 9,800 trucks per day. If the Anaheim St. ramps are eliminated, utilization of the southern four-mile segment of the freight corridor would decrease by up to 25 percent in the peak hours, meaning that up to 70 percent of trucks would be utilizing the mixed-flow freeway lanes rather than the freight corridor. The success of the freight corridor depends upon its ability to remove a substantial majority of diesel trucks from the freeway lanes and deliver travel and air quality benefits relative to its projected cost. The decrease in utilization as noted here would not deliver those benefits relative to cost, and the overall effectiveness of other freeway and local street improvements in this area would also diminish. The performance of Alternative 7 would be substantially reduced. For these reasons, Avoidance Concept M1 is not considered viable.
- **M2:** Termination of the truck ramp at 12th St./Harbor Ave. instead of Anaheim St. was evaluated as a concept that would avoid the relocation of the MSC. In this concept, an access break would effectively occur between Anaheim St. and the truck ramps. Intersections at the ramp terminus and at Anaheim St. would be signalized and synchronized. Virtually all truck traffic exiting the freight corridor at this location would

⁴ Caltrans. Website: <http://www.dot.ca.gov/hq/tpp/offices/ocp/css.html> (accessed March 1, 2017).

continue westbound on Anaheim St., and virtually all truck traffic entering the freight corridor would originate from eastbound Anaheim St., a designated truck route. Long queues would be expected on the access ramps and on eastbound Anaheim St.

Because the Harbor Ave./Anaheim St. intersection would require a long four-phase signal cycle, trucks would stack up between Anaheim St. and 12th St. and on the exit ramp. The short distance (approximately 250 feet) between 12th St. and Anaheim St. and lack of storage would serve to frequently block the intersection and disrupt operations for all users and cause greater congestion. Additionally, the access break between these high-volume entrance and exit ramps is a non-standard design feature and would not conform to access policy standards established by Caltrans and FHWA. As there is not a reasonable justification for this exception to policy and standard, and the resultant condition would not be consistent with the project's purpose and need, this concept is not considered viable.

- **M3:** The termination of the truck ramp at Anaheim St. and Caspian Ave. (another local existing intersection approximately two blocks west of the Anaheim St./Harbor Ave. intersection) would avoid the relocation of the MSC. Additionally, other locations of termination of the truck ramps could occur as far west as Santa Fe Ave./9th St. Although these ramp realignments would avoid the MSC, substantial new impacts would occur and would be larger in area and in number within this dense industrial area. Under Alternative 7, further coordination with the Port of Long Beach would be warranted to determine current and future uses south of Anaheim St. within the Harbor District, as these uses may change with the development of the On-Dock Rail facility at the Pier B Rail Yard. However, at this point, the proposed M3 avoidance concept is not considered viable.

ALONDRA BLVD. The avoidance objective in this area is to avoid residential impacts to the El Rancho Mobile Home Park and continue to avoid impacts to the Seasons Senior Apartments. Three avoidance concepts were proposed for Alternative 7 that would achieve the objective and are summarized as follows.

- **E1:** Elimination of the southbound braided roadway configuration on I-710 approaching SR-91 would avoid the residential impacts at El Rancho Mobile Home Park. The resulting configuration would be similar to existing conditions. This concept would not improve operations or existing freeway deficiencies, and the reconfiguration of the Alondra Blvd. local interchange may actually exacerbate inadequate freeway operations in this area as well. Freeway operations would be substantially affected due to the relatively short weaving area between the Alondra Blvd. entrance ramp and the SR-91 connector, and this bottleneck condition would remain unresolved by the addition of more through-lanes. A longer entrance ramp would shorten the weaving distance further and would add to congestion. This design concept is comparable to existing conditions [No Build (Alternative 1)], remains a viable alternative) but is not a viable concept as part of Alternative 7.

- **E2:** Shifting the freeway, truck lanes, and Alondra Blvd. local interchange easterly would eliminate direct impacts to the El Rancho Mobile Home Park. This realignment of the roadway would not introduce adverse effects on the safety and operation of the freeway and would not require additional property acquisitions as the shift would occur in the area between the freeway and the Los Angeles River. Constructability and staging considerations are also comparable to Alternative 7 and would not introduce significant design challenges. This concept is considered viable.
- **E3:** Elimination of the southbound entrance ramp. As this ramp is the design element that directly affects the El Rancho Mobile Home Park, removal of it would avoid impacts to the resource. However, the Cities of Compton and Paramount depend on full access to the freeway at this location. The businesses and residents of those cities rely on convenient and reliable access to and from I-710. The nearest alternate access points to the southbound I-710 are at Artesia Blvd. and Rosecrans Ave. Each of these are a distance of one mile from Alondra Blvd. From Alondra Blvd.; motorists would use Atlantic Ave. or Hunsaker Ave. and Atlantic Pl. to reach Artesia Blvd. Motorists are less likely to backtrack to Rosecrans Ave. The diverted traffic would increase congestion at multiple intersections along these routes and diminish the safety and mobility performance of the local street network, which would be inconsistent with the I-710 Corridor Project's purpose. Additionally, partial interchanges do not comply with Caltrans standards and FHWA interstate access policy. Less than full access interchanges require substantial justification prior to approval. Because the traffic diversion and congestion issues outlined above associated with the removal of access would have an adverse effect on local street operation, the design concept is not considered viable.

SLAUSON AVE. The avoidance objective in this area is to avoid relocation of or significant modifications to the Salvation Army Bell Shelter and the S. Mark Taper Foundation Resource Bank. Two avoidance concepts for Alternative 7 were proposed as outlined below.

- **S1:** Shifting all of the roadway alignments westerly, while still retaining the functionality of the freight corridor and freight corridor interchange at Slauson Ave. would eliminate direct impacts to the shelter. However, this realignment would necessitate relocation of the Los Angeles Department of Water and Power (LADWP) transmission corridor west of I-710 as well as require major encroachments within the Los Angeles River. Similar alignments were considered as part of Alternatives 6A, 6B, and 6C and dropped from further consideration due to the substantial increase in environmental and right-of-way impacts. Therefore, this concept is not considered viable.
- **S2:** Elimination of the truck interchange at Slauson Ave. Several design elements affect the shelter facilities. The freight corridor ramps at Slauson Ave. would require the alignment of the freight corridor to be situated adjacent to the northbound freeway lanes. The freight corridor lanes and northbound collector-distributor road would directly affect

the shelter facilities, and the realignment of the Los Angeles Junction (LAJ) railroad adjacent to the freight corridor would further impact the shelter facilities as well. Elimination of the freight corridor ramps at Slauson Ave. from the current design would reduce impacts and avoid relocation of the shelter facilities. Because there would be no ramps at Slauson Ave. in this concept, the freight corridor would be positioned in the median of the freeway, supported by a single-column viaduct structure spanning Slauson Ave. This alignment strategy is employed south of Slauson Ave. in the current configuration of Alternative 7. The connectors between the freight corridor and the freeway, north of Slauson Ave., are adjusted to accommodate the new freight corridor alignment. The northbound freeway lanes and northbound collector-distributor road must be shifted east, closer to the shelter facilities, and the LAJ railroad would be relocated adjacent to the northbound lanes. This scenario would not necessitate relocations associated with the shelter facilities.

However, the truck traffic that would have used the Alternative 7 freight corridor and Slauson Ave. would be diverted to other roadways. It was anticipated that virtually all of the diverted traffic would use the mixed-flow freeway lanes instead and access the local area using interchanges at Bandini Blvd. and Florence Ave. as the success of the Alternative 7 freight corridor, and justification of its cost expenditures, would depend on its ability to remove diesel trucks from the freeway lanes. The projected number of truck traffic that would use the Alternative 7 freight corridor at Slauson Ave. is approximately 9,200 per day. As a direct result of this diversion, utilization of the full length of the Alternative 7 freight corridor would decrease and utilization of the adjacent freeway segments would increase. During peak periods, the percentage of trucks in these segments of the Alternative 7 freight corridor would be expected to decrease as much as 15 to 17 percent, meaning that as much as 53 percent of all trucks would be using the mixed flow freeway lanes. This would reduce the distribution below the threshold criteria needed for successful use of the Alternative 7 freight corridor for all segments during most peak periods. Because the Alternative 7 freight corridor would be underutilized, the overall effectiveness of other freeway and local street improvements in this area would diminish markedly. The loss of access is inconsistent with the purpose of the Alternative 7 freight corridor and would substantially reduce the performance of Alternative 7; therefore, this concept is not considered viable.

WASHINGTON BLVD. The avoidance objective in this area is to avoid residential relocations in the Ayers neighborhood in the City of Commerce. Three avoidance concepts for Alternative 7 are outlined below.

- **A1:** The element of the Alternative 7 design directly affecting the Ayers neighborhood is the southbound exit ramp to Washington Blvd. The elimination of the Washington Blvd. exit ramp would avoid most of the residential impacts to the neighborhood. However, the City of Commerce depends upon full access to the freeway at Washington Blvd. The City's businesses and residents rely on convenient and reliable access to and from I-710.

Without the exit ramp, vehicles would use alternate routes to reach destinations in Commerce, the nearest being the Bandini Blvd. exit ramp located 0.5 mile south of Washington Blvd. Vehicles would then backtrack on Atlantic Blvd. to reach Washington Blvd. This diverted traffic would increase congestion at multiple intersections on Bandini Blvd., Atlantic Blvd., and Washington Blvd. The volumes of vehicles exiting at Bandini Blvd. would increase from 1,700 to as much as 2,400 during peak periods, which would exceed the capacity of the ramp intersection. The resultant congestion would diminish the safety and mobility performance of the nearby streets and would be inconsistent with the purpose of the project. Additionally, partial interchanges do not comply with Caltrans standards and FHWA's interstate access policy, and less than full access interchanges require substantial justification prior to approval. Because this traffic diversion has an adverse effect on highway operations, it cannot be justified, and this is not a viable concept.

- **A2:** By retaining the basic ramp configuration of the interchange and shifting the freeway alignment easterly, direct impacts to the Ayers neighborhood under Alternative 7 would be eliminated. In this configuration, the freeway centerline would be moved 120 feet to the east. This freeway alignment would encroach on the Bandini neighborhood. Also, the northbound ramp termini for the freeway entrance and exit would need to be realigned to ensure safe acceleration and deceleration speeds. The local streets of Hepworth Ave. and Noble St. would be realigned and modified to minimize impacts to remaining residents of the neighborhood, and additional businesses fronting Washington Blvd. would be impacted as well. Although this shift would eliminate 1.2 acres impacted and 14 relocations from the Ayers neighborhood, it would add 1.0 acre impacted and 15 relocations from the Bandini neighborhood, 0.2 acre impacted at Bandini Park, including the loss of the baseball diamond and basketball court, and 2.1 acres of impacts (five parcel acquisitions) of the business uses east of the freeway. As item O of Motion 22.1 also instructs that the impacts to parks be minimized, and the right-of-way and relocation impacts would be greater under this avoidance concept for Alternative 7, it is not considered viable.
- **A3:** Realignment of the southbound exit ramp that directly impacts the Ayers neighborhood would serve to avoid most of the residential impacts in this area, the new alignment concept for Alternative 7 would encroach on businesses opposite the neighborhood, between Washington Blvd. and Sheila St. Although this would eliminate 1.2 acres impacted and 14 relocations from the Ayers neighborhood, it would introduce 4.2 acres impacted and seven parcel acquisitions to the business uses south of Washington Blvd. More than three times the area of property acquisition would be required to avoid the residential uses in the Ayers neighborhood, and it would be expected that the property and relocation costs would be substantially greater as compared to Alternative 7. To limit the business impacts, the new ramp would terminate at the intersection of Ayers Ave. and Washington Blvd. Ayers Ave. is the primary access to the Ayers neighborhood,

and this access opposite the ramp termini would be a non-standard highway feature. There would be a potential for vehicles exiting the neighborhood to enter the ramp going in the wrong direction. Because the approval justification of this non-standard feature is insufficient, and also due to the increased right-of-way impacts associated with it, this avoidance concept for Alternative 7 is not considered viable.

I-5. The avoidance objective in this area is to avoid residential and business relocations along Sydney Dr. Two avoidance concepts for Alternative 7 were evaluated and outlined below.

- **W1:** To retain the basic functionality of the southbound braided roadway configuration near I-5 and avoid impacts to Sydney Dr., the freeway alignment for Alternative 7 would be shifted easterly. The centerline would move approximately 120 feet to the east. This new alignment concept for Alternative 7 would encroach on residential property along Duncan Ave., and the northbound freeway and I-5 connector alignments would impact homes directly. As a direct result of the shift, Duncan Ave. would be acquired, along with four acres of residential uses on 27 parcels, displacing 41 households, and 0.2 acre of vacant property on three parcels. Property from UP Railroad would be acquired on one side of the freeway, as well as acquisitions of property and the relocation of residents within the Ayers neighborhood (please see the discussion above of the Washington Blvd. area for more information on avoiding the Ayers neighborhood). More residential acreage and household displacements would occur under the avoidance concept, although property acquisition and relocation costs would be similar to that under Alternative 7. Compared to Alternative 7, this avoidance concept does not avoid or provide a meaningful reduction in property impacts, and therefore is considered not viable.
- **W2:** Again, the southbound braided roadway configuration near I-5 is the specific design element that would impact the residents and businesses along Sydney Dr. The elimination of the braid from the Alternative 7 design would avoid impacts to Sydney Dr., and the resultant configuration would be similar to existing conditions. However, existing freeway deficiencies would be exacerbated, and new traffic impacts would occur. Freeway operations are substantially affected due to the relatively short weaving area between the I-5 connector and the exit ramp to Washington Blvd. and Bandini Blvd. The bottleneck condition would not be resolved by adding additional through-lanes. More vehicles would have to negotiate this weaving area, as the exit ramp carries the combined volume of both Bandini Blvd. and Washington Blvd. exits and would be vital to the operation of the freeway and Alternative 7 freight corridor south of this location. This concept is fundamentally flawed because traffic and safety conditions would actually be made worse than the existing condition at this location under this avoidance concept. Therefore, it is not considered viable for Alternative 7.

3.3.2.4 ENVIRONMENTAL CONSEQUENCES

The following discussion of environmental consequences only describes the permanent impacts of the proposed project. Please refer to Section 3.24 of this document, Construction Impacts, for a discussion of the temporary impacts of the proposed project for each resource area. Specifically, temporary impacts related to community impacts, including relocations, is located in Section 3.24.3.3.

PERMANENT IMPACTS.

BUILD ALTERNATIVES.

RELOCATIONS. The build alternatives would result in the relocation of residential and nonresidential properties. Estimated totals of relocations are tabulated in Table 3.3-11 (also refer to Appendix L⁵ for a detailed table and maps of impacted parcels under each proposed build alternative), and total relocations by city are shown in Table 3.3-12. The build alternatives would not result in any relocations in the cities/ communities of Boyle Heights, Cudahy, Downey, Lakewood, Maywood, Paramount, Signal Hill, Huntington Park, Wilmington, or San Pedro.

The types of businesses that would be relocated by the build alternatives are provided in Table 3.3-13, and the number of employees that would be relocated within the affected cities in the Study Area is provided in Table 3.3-14.

Alternative 5C would result in a total of 158 nonresidential relocations and 109 residential relocations. Based on an average of four persons per residential unit, Alternatives 5C (not including design options), 5C (Option 1A), and 5C (Option 2A) would each result in the relocation of approximately 436 residents. Alternative 5C, Option 1A, would result in a total of 157 nonresidential relocations and 109 residential relocations. Alternative 5C, Option 2A, would result in 161 nonresidential relocations and 109 residential relocations, and Alternative 5C, Option 3A, would result in 165 nonresidential relocations and 128 residential relocations, which would result in the relocation of approximately 512 residents. Overall, Alternative 5C, Option 3A, would impact a greater number of both residential and nonresidential parcels.

⁵ The number of parcels listed in Appendix L may differ from those listed in Section 3.3.2.3. The difference in the number of properties affected may be a result of some parcels being either vacant, or the same business occupies multiple parcels (i.e., only one business would require relocation even though multiple parcels would be acquired for the build alternatives).

Table 3.3-11: Relocations by Build Alternatives

| Relocations | Alternative 5C Only | Alternative 5C (Option 1A) | Alternative 5C (Option 2A) | Alternative 5C (Option 3A) | Alternative 7 Only | Alternative 7 (Option 1B) | Alternative 7 (Option 3B) |

Sources: LSA Associates, Inc. *Community Impact Assessment* (July 2017).

Please note the difference between the total number of residents displaced listed in Table 3.3-11 and the total number of residential relocations listed in this table. Some relocations are parcels that contain multifamily or multiple unit residences and would require multiple displacements.

Please note that billboard and cell tower relocations are counted as relocations, where applicable. A superscript (¹) is used to denote if billboards and/or cell towers are included in the number of relocations for a given city.

There would not be relocations in the Cities of Cudahy, Lakewood, Maywood, Paramount, and Signal Hill or in the communities of Boyle Heights, Wilmington or San Pedro.

Table 3.3-13: Types of Businesses Relocated by the Build Alternatives

¹ Total includes the total number of employees for each potential build alternative scenario.

Alternative 7 (not including design options) would result in a total of 206 nonresidential relocations and 121 residential relocations, which would result in the relocation of approximately 484 residents. Alternative 7, Option 1B, would result in a total of 206 nonresidential relocations and 136 residential relocations, which would result in the relocation of approximately 544 residents. Alternative 7, Option 3B, would result in a total of 213 nonresidential relocations and 140 residential relocations, which would result in the relocation of approximately 560 residents.

Relocations under both Alternatives 5C and 7, and each of their respective design options would result in the displacement of existing residents, businesses, and employees.

The City of Commerce would experience the most residential relocations under both build alternatives. Alternative 5C (including each of the design options) would result in a total of 58 residential relocations. Alternative 7 and Alternative 7, Option 3B, would each result in 58 residential relocations. Alternative 7, Option 1B, would result in 73 residential relocations.

The City of Commerce would experience the most nonresidential relocations under Alternative 5C (including each of the design options) and would result in a total of 39 to 40 nonresidential relocations. The City of Long Beach would experience the most nonresidential relocations under Alternative 7 (including each of the design options) and would result in a total of 62 nonresidential relocations.

Alternative 7 would result in the greatest number of residential and nonresidential relocations and would result in the greatest impact to retail businesses (refer to Table 3.3-13).

In addition, as shown in Table 3.3-14, Alternative 5C could result in a total of between 1,045 and 1,085 employee relocations (depending on the design option), and Alternative 7 could result in a total of between 1,346 and 1,366 employee relocations (depending on the design option) in the Study Area.

For any build alternative, all property acquisition and relocation would be handled in accordance with the Uniform Act of 1970 (Public Law 91-646, 84 Stat. 1894). The Uniform Act mandates that certain relocation services and payments by Caltrans be made available to eligible residents, businesses, and nonprofit organizations displaced by its projects. The Uniform Act provides for uniform and equitable treatment by Federal or Federally assisted programs of persons displaced from their homes, businesses, or farms, and establishes uniform and equitable land acquisition policies. Design refinements to avoid or minimize impacts to existing land uses related to the temporary use and/or permanent acquisition of property would be incorporated in the final design for any build alternative.

Amongst the nonresidential relocations, the DRIR identifies several types of business land uses that may be difficult to relocate as a result of the I-710 Corridor Project build alternatives. These difficulties range from lack of properly zoned replacement land available in a specific market area to specialized architecture required for businesses, such as gas stations, fast food restaurants, liquor stores, churches, oil pumps, industrial storage facilities, car dealerships, and auto-related businesses.

As discussed in the DRIR, for the majority of the Study Area, residential displacements, given the present market conditions, do not indicate a need for the construction of replacement housing for any build alternative. At the time this document was prepared, the housing stock in the Study Area in the City of Commerce contains one single-family residence for sale and one multi-family residence for sale. Section H of this same study discusses the City of Commerce Redevelopment Project, which includes the development of 19 detached single-family residences on a currently vacant parcel located on the northeast corner of Eastern Avenue and Triggs Street. However, as stated above in the discussion of Public Health Considerations, Housing of Last Resort¹ would potentially have to be considered (for any build alternative) for relocating the affected residential properties such as mobile homes and dwellings in the Cities of Cudahy, Vernon, and Commerce, where there is a lack of affordable, comparable replacement housing. In the Cities of Cudahy, Vernon, and Commerce, the construction of new replacement dwellings under Last Resort Housing would potentially need to be considered (for any build alternative) as a method of providing comparable replacement housing to displaced persons in areas where replacement housing is unobtainable. For example, five mobile homes at the El Rancho Mobile Home Park in the City of Compton would be proposed to be relocated under both build alternatives. However, adequate relocation resources for mobile homes in particular do not currently exist within the Study Area. This would represent an adverse impact to those displaced residents in the City of Compton, (assuming they preferred to remain in a mobile home). In the Cities of Cudahy, Vernon, and Commerce, for any build alternative, Caltrans would potentially need to consider construction of new replacement dwellings under Last Resort Housing as a method of providing comparable replacement housing to displaced persons who reside in areas where replacement housing is unobtainable, although it is acknowledged that the

¹ The Urban Redevelopment Authority (URA) requires that comparable decent, safe, and sanitary replacement housing within a person's financial means be made available before that person may be displaced. When such housing cannot be provided by using replacement housing payments, the URA provides for "housing of last resort." Housing of last resort may involve the use of replacement housing payments that exceed the URA maximum amounts. Housing of last resort may also involve the use of other methods of providing comparable decent, safe, and sanitary housing within a person's financial means. Refer to §49 CFR 24.404 and Chapter 3 of the U.S. Housing and Urban Development (HUD) Handbook 1378 for more information. (Website: https://portal.hud.gov/hudportal/HUD?src=/program_offices/comm_planning/affordablehousing/training/web/relocation/lastresort, accessed February 20, 2017.)

construction of replacement housing would only be implemented in rare cases. For the majority of the residential property that would be impacted by the build alternatives, adequate resources appear to exist at the time this document was prepared to relocate existing residential occupants to comparable replacement housing, with the exceptions noted in the previous sentence. For any build alternative, specific locations for relocations would be determined during the right-of-way acquisition phase as Caltrans' right-of-way agents work with each displacee (refer to Appendix D for additional detail on the relocation benefits).

SALES TAX. This analysis estimates the annual sales tax revenue losses to city, county, and State governments as a result of the acquisition of nonresidential parcels for the build alternatives.

The State Board of Equalization (State Board) tabulates sales tax revenues by business and jurisdiction quarterly and annually. The average sales tax rate in the Study Area cities in 2014 was between 9 and 10 percent, of which 6.5 percent was distributed to the State, 1.0 to 1.5 percent was distributed to the local jurisdiction, and 1.5 percent was used for transportation projects in the jurisdiction of Metro. In the Taxable Sales in California (Sales and Use Tax) Report, the State Board tabulates sales tax revenues by business and jurisdictions on a quarterly basis. Due to privacy laws, the State Board does not disclose sales tax revenues generated by individual businesses; therefore, the taxable sales for the individual businesses that would be acquired for each build alternative is not available.

The potential losses in sales tax revenues for the build alternatives were estimated using total taxable sales in county unincorporated areas and the affected cities in the Study Area. Table 3.3-15 summarizes the loss of sales taxes revenue for the cities that would be affected in the Study Area for each of the build alternatives and the design options. Based on the estimates provided in Table 3.3-15, the total estimated annual sales tax revenue losses to the cities that would be affected by Alternative 5C would be between \$918,800 and \$1,016,510, and Alternative 7 would be between \$1,119,461 and \$1,121,603, depending on the design option.

The estimates of sales tax revenue loss represent a worst-case estimate in that it is assumed that, for any build alternative, all businesses would either relocate outside of their existing local jurisdiction or would not relocate at all. One goal of the relocation program for the I-710 Corridor Project build alternatives is that relocations would occur within the affected communities.

No nonresidential acquisitions would be required in the Cities of Cudahy, Lakewood, Maywood, Paramount, and Signal Hill, or in the communities of Boyle Heights, Wilmington, and San Pedro as a result of the build alternatives. Therefore, no sales tax revenues would be lost for these cities as a result of the build alternatives.

PROPERTY TAX. Property taxes in the Study Area are collected by the County of Los Angeles and apportioned to the incorporated cities in Los Angeles County, including the cities that would be affected by the build alternatives in the Study Area. Property taxes are levied on the assessed value of privately owned property (the amount levied is approximately 1 percent of the assessed property value).

The data was provided by the Office of the Los Angeles County Tax Assessor for the property tax paid in fiscal year 2013–2014 for each parcel that would be potentially acquired and relocated in the Study Area cities for the build alternatives. For this analysis, the property tax revenue is the total property tax amount collected by the Los Angeles County Tax Collector for each city before it is distributed to the City and other agencies.

For full property acquisitions for the build alternatives, the total amount paid in property tax was used for this analysis. For partial property acquisitions for the build alternatives, only the percentage of the parcel that would be acquired was used to calculate the loss in property tax revenues. For example, if one of the partial acquisitions that require relocation under the build alternatives would acquire 2 percent of the parcel, the calculated loss of property tax revenues for that parcel would be 2 percent of the total amount paid for the property tax. Table 3.3-16 provides the estimated annual property tax loss for the build alternatives in the affected cities. Based on the estimates provided in Table 3.3-16, the total estimated property tax losses to the affected cities by Alternative 5C would be between \$140,782 and \$173,907, depending on the design option. For Alternative 7, the total estimated property tax losses would be between \$212,644 and \$223,034, depending on the design option.

The above estimates of property tax loss represent a worst-case estimate for the build alternatives in that it is assumed that, for any build alternative, all properties would either relocate outside of their existing local jurisdiction or would not relocate at all. One goal of the relocation program for the I-710 Corridor Project build alternatives is that relocations would occur within the affected communities.

NO BUILD (ALTERNATIVE 1). Under the No Build (Alternative 1), the Preferred Alternative, the property acquisitions and relocations discussed above for the build alternatives would not occur.

PUBLIC HEALTH CONSIDERATIONS. Please refer to Section 3.3.1.5 for a discussion of public health considerations related to social cohesion above, which includes a discussion of anxiety and other mental health symptoms that result from housing displacements and relocations under the build alternatives.

3.3.2.5 AVOIDANCE, MINIMIZATION, AND/OR MITIGATION MEASURES

As described in Chapter 2.0, the No Build (Alternative 1) has been identified as the Preferred Alternative. Mitigation measures would not be required for the No Build (Alternative 1) as no project-related impacts would occur under this alternative. Avoidance, minimization, and/or mitigation measures to address impacts for the two build alternatives are retained in this Final EIR/EIS for disclosure purposes.

The build alternatives would require acquisition of residential and nonresidential parcels, and, for any build alternative, relocation would be required prior to construction of either build alternative. One goal of the relocation program for the I-710 Corridor Project build alternatives is that relocations occur within the affected communities. Measures are provided below.

C-1 The Uniform Relocation Assistance and Real Property Acquisitions Policies Act (Uniform Act) of 1970 (Public Law 91-646, 84 Stat. 1894) mandates that certain relocation services and payments by the California Department of Transportation (Caltrans) be made available to eligible residents, businesses, and nonprofit organizations displaced by its projects (please refer to Appendix D, Summary of Relocation Benefits, for more detail). The Uniform Act provides for uniform and equitable treatment by Federal or Federally assisted programs of persons displaced from their homes, businesses, or farms, and establishes uniform and equitable land acquisition policies. If an Interstate 710 (I-710) Corridor Project build alternative is selected, design refinements to avoid or minimize impacts to existing land uses related to the temporary use and/or permanent acquisition of property would be incorporated in the final design of the selected alternative.

Where acquisition and relocation are unavoidable, Caltrans will follow the provisions of the Uniform Act and the 1987 Amendments as implemented by the Uniform Relocation Assistance and Real Property Acquisition Regulations for Federal and Federally Assisted Programs adopted by Caltrans, dated March 2, 1989, and/or California Government Code Sections 7260-7277. An independent appraisal of the affected property will be obtained, and Caltrans or its authorized agent(s) will offer the full amount for the property (not less than the approved appraisal).

While adequate comparable replacement housing appears to exist presently in neighboring cities, new replacement dwellings under Last Resort Housing may be considered for these cities as a method of providing comparable replacement housing to displaced persons who reside in areas where the replacement housing is low.

Commercial and industrial land uses subject to partial acquisitions shall be evaluated to determine if they can be reconfigured on site in such a manner as to enable them to remain in operation. Caltrans or its authorized agent(s) shall work

directly with property owners and the local jurisdiction to evaluate the feasibility of any such site reconfiguration plans. If a commercial or industrial partial acquisition cannot be reconfigured to allow for continued operation, acquisition of the full property may be required.

Caltrans or its authorized agent(s) shall cooperate with the affected jurisdictions in relocating business and residential uses to land designated for the given land use, preferably within the boundaries of the affected communities.

- C-2** All build alternatives include improvements to the existing Bandini Blvd./Atlantic Ave. interchange, and as a result of widening and realignment of the existing southbound I-710 off-ramp to Bandini Blvd., acquisition and relocation of the City of Vernon Fire Station No. 4 will be required. While a potential site for relocation has not been identified at this time, Caltrans will coordinate with the City of Vernon in identifying a new site for relocation within the general vicinity of the existing station so as to maintain the existing response times and service area. In addition, the existing fire station would not be demolished until the new fire station is operational.
- C-3** During final design, and consistent with the requirements of the Uniform Act, Caltrans or its authorized agent(s) shall negotiate with the City of Long Beach to determine appropriate action and/or identify an alternative location for the Multi-Service Center within the general vicinity of the existing facility so as to maintain the service area and mitigate for the acquisition of this center. The existing center shall not be demolished until the facility has been relocated and is operational.
- C-4** During final design, and consistent with the requirements of the Uniform Act, Caltrans or its authorized agent(s) shall negotiate with the City of Bell to determine appropriate action and/or identify an alternative location for the Bell Shelter/Resource Bank within the general vicinity of the existing facility so as to maintain the service area and its cooperative relationship with the Bell Shelter and mitigate for the acquisition of the center. The existing center shall not be demolished until the facility has been relocated and is operational.
- C-5** Prior to construction, appropriate signage will be developed and displayed by Caltrans to direct both pedestrian and vehicular traffic to businesses via alternate routes.

3.3.3 ENVIRONMENTAL JUSTICE

3.3.3.1 REGULATORY SETTING

All projects involving a federal action (funding, permit, or land) must comply with Executive Order (EO) 12898, *Federal Actions to Address Environmental Justice in Minority Populations and Low-*

Income Populations, signed by President William J. Clinton on February 11, 1994. This EO directs federal agencies to take the appropriate and necessary steps to identify and address disproportionately high and adverse effects of federal projects on the health or environment of minority and low-income populations to the greatest extent practicable and permitted by law. Low income is defined based on the Department of Health and Human Services poverty guidelines. For 2016, this was \$24,300 for a family of four.⁷

All considerations under Title VI of the Civil Rights Act of 1964 and related statutes have also been included in this project. Caltrans commitment to upholding the mandates of Title VI is demonstrated by its Title VI Policy Statement, signed by the Director, which can be found in Appendix C of this document.

3.3.3.2 ANALYSIS METHODS

The FHWA Guidance on Environmental Justice and NEPA, dated December 16, 2011, states: “As per FHWA Order 6640.23, a disproportionately high and adverse effect on a minority or low income population means the adverse effect is predominantly borne by such population or is appreciably more severe or greater in magnitude on the minority or low-income population than the adverse effect suffered by the non-minority or non-low-income population.”

The White House Council on Environmental Quality (CEQ) Environmental Justice Guidance under the National Environmental Policy Act, dated December 10, 1997, states that “Minority populations should be identified where either: (a) the minority population of the affected area exceeds 50 percent or (b) the minority population percentage of the affected area is meaningfully greater than the minority population percentage in the general population or other appropriate unit of geographic analysis.”

While Los Angeles County residents may benefit from the I-710 Corridor Project build alternatives, residents of the Study Area could experience adverse project impacts in addition to project benefits associated with the build alternatives simply due to their proximity to the improvements. As further discussed in Section 3.3.3.3, Affected Environment, the areas around the I-710 Corridor Project are home to a large population of minority and low-income residents. This means the impacts resulting from the build alternatives, as identified through this environmental document, would fall predominantly on these populations. The environmental justice populations analyzed include minority (i.e., all races and ethnicities other than non-Hispanic White, as defined in Federal policy) and low-income (i.e., persons living in households that are below the Federal poverty level).

In this analysis, environmental justice populations were first identified. Census tracts in which minority populations exist in percentages that exceed the Los Angeles County average of 72.2 percent are considered to contain environmental justice populations. This definition is known

⁷ U.S. Department of Health & Human Services. Office of The Assistant Secretary for Planning and Evaluation (ASPE). Website: <https://aspe.hhs.gov/poverty-guidelines>.

as the “meaningfully greater” analysis, wherein meaningfully greater is conservatively defined as simply “greater” than the Reference Community (Los Angeles County). To identify low-income populations, census tracts that contain populations wherein the average income falls below the Federal poverty level at a greater percentage than that of the Reference Community (also Los Angeles County) were considered to contain environmental justice populations.

Information from other technical studies prepared in support of the I-710 Corridor Project has been utilized to determine the potential construction and operational impacts to environmental justice communities associated with the build alternatives. Resource areas in which adverse impacts associated with the build alternatives have been identified, as determined by comparison to the 2035 No Build (Alternative 1) condition, has been discussed in this environmental justice analysis. The impacts to environmental justice populations have been determined based on a comparison of the impacts of each build alternative to the No Build (Alternative 1).

For most resource areas, a spatial analysis has been performed to determine the general proportion of impacts associated with the build alternatives that fall within locations identified as containing environmental justice populations or that would be predominantly borne by environmental justice populations, after mitigation, and balanced with any beneficial effects of the build alternatives.

A qualitative discussion of public health risk, much like discussions contained in each technical study for each resource area, determined if the identified risk pathways associated with the build alternatives would be more predominantly borne by environmental justice communities.

Section 3.3.3.3 below describes the affected environment for the purposes of environmental justice analysis. The demographic characteristics of the Study Area are described and compared with those of the reference population, Los Angeles County. Section 3.3.4.1 presents the analysis of environmental consequences of the I-710 Corridor Project build alternatives with respect to environmental justice, as described above, and Section 3.3.6 presents a summary and conclusions.

3.3.3.3 AFFECTED ENVIRONMENT

The I-710 Corridor is home to a large proportion of minority⁸ and low-income populations. As of the 2010 Census, the I-710 Corridor Project Study Area was 85.6 percent non-White (i.e., composed of individuals other than non-Hispanic Whites). Los Angeles County was 72.2 percent non-White in 2010. The State of California, by contrast, was 59.9 percent non-White according to the 2010 Census. In the I-710 Corridor Project Study Area, according to the 2010-2014 American Community Survey, 22.8 percent of persons live in households that fall below the Federal poverty

⁸ The FHWA and DOT orders define “minority” to mean Black, Hispanic, Asian American, or American Indian/Alaskan Native.

threshold. Within Los Angeles County, that share is 18.7 percent, and in California as a whole, the share is 15.3 percent.

Since the time of analysis for community impacts and environmental justice for the I-710 Corridor Project, the 2020 Census has become available. The 2020 Census data do not differ substantially from the 2010 and 2014 data, and the conclusions regarding potential adverse impacts of the project alternatives to communities and environmental justice populations remain valid.

Residents along the I-710 Corridor are affected by operation of the freeway. The route carries thousands of heavy trucks daily to and from the Ports of Los Angeles (POLA) and Long Beach (POLB), along with other truck and passenger vehicle traffic. The existing traffic congestion, air pollution, and traffic incidents on I-710 directly affect all residents of the area, including the minority and low-income populations that are prevalent in the corridor.

3.3.3.4 DEMOGRAPHIC CHARACTERISTICS OF THE I-710 CORRIDOR PROJECT STUDY AREA

Figure 3.3-2 shows the locations of minority populations in the Study Area, while Figure 3.3-3 shows the locations of low-income populations. In each figure, those tracts exceeding the Los Angeles County average are indicated. Minority populations are concentrated along the corridor and in the northern parts of the Study Area, with particular concentrations in the northwestern parts of the Study Area, in unincorporated East Los Angeles and in the Cities of Commerce, Maywood, Bell, Bell Gardens, Cudahy, South Gate, Lynwood, and Paramount. Tracts with concentrations of low-income residents are distributed in a similar pattern through the Study Area, with a majority of the tracts being located in the northwest and west of the Study Area. Figures 3.3-2 and 3.3-3 include minority and low-income population data, respectively.

3.3.3.5 ENVIRONMENTAL CONSEQUENCES

As described in Section 3.3.3.1, the environmental justice analyses presented in this section discuss the potential adverse impacts of the project alternatives.

In each section, the specific assumptions are explained regarding which impacts were considered in the analysis.

The following discussion of environmental consequences only describes the permanent impacts of the proposed project. Please refer to Section 3.24 of this document, Construction Impacts, for a discussion of the temporary impacts of the proposed project for each resource area. Specifically, temporary impacts related to community impacts, including environmental justice populations, is located in Section 3.24.3.3.

AIR QUALITY/HEALTH RISK ASSESSMENT

The information contained in this section is from the *Air Quality, Greenhouse Gas, and Health Risk Assessment Technical Study* (AQ/GHG/HRA) (2017).⁹ Figures 3.3-4 through 3.3-9 illustrate the change in air pollutant concentrations of both build alternatives as compared to the 2035 No Build (Alternative 1) for particulate matter less than 10 microns in size (PM₁₀), particulate matter less than 2.5 microns in size (PM_{2.5}), and cancer risk.

Within Figure 3.3-4, it can be seen that areas of maximum incremental 24-hour PM₁₀ impact would mostly occur within the Cities and Communities of Long Beach, Rancho Dominguez, Bell, Bell Gardens, Cudahy, South Gate, and Commerce. Notably, within the City of Long Beach, impacts would occur along the east side of the I-710 mainline, both within and outside of the proposed Alternative 5C footprint, from approximately Anaheim St. to I-405 interchange. Along the mainline within these boundaries, areas of maximum incremental 24-hour PM₁₀ impact would occur in areas of minority populations that exceed that of the County, and low-income populations that exceed that of the County in the southern portion of this segment.

Between I-405 and SR-91, areas of 24-hour PM₁₀ impact would occur east of I-710 at I-405, east of I-710 just south of Del Amo Blvd., west of I-710 in the vicinity of Susana Rd., west of I-710 at the Long Beach Blvd. interchange, and east of I-710 between the freeway mainline and the Los Angeles River. Specifically, areas of 24-hour PM₁₀ impact would occur within the Community of Rancho Dominguez to the west of I-710 and occur in areas with both minority and low-income populations that exceed that of the County. Areas of 24-hour PM₁₀ impact that would occur west of the mainline are generally south of Victoria St. and along portions of Susana Rd. Between SR-91 and the northern terminus, areas of 24-hour PM₁₀ impact would occur along the east side of I-710 between Imperial Hwy. and Firestone Blvd., along the west side of I-710 north and south of the Firestone Blvd. interchange, along the west side of I-710 between Clara St. and Gage Ave., and along the east side of I-710 in the vicinity of Gage Ave. Additionally, isolated areas of 24-hour PM₁₀ impact would occur on the east side of the I-710 near the crossing for Atlantic Ave., as well as near Gage St. in the City of Bell Gardens, where at least one adult residential facility has been identified (Inclusion Specialized Programs LLC on Agra St. between I-710 and Specht Ave.), and would be impacted by the build alternatives.

As can be seen on Figure 3.3-4, all of these locations (with the exception of east of I-710, directly north of I-405) fall within areas of minority and/or low-income populations that exceed that of the County.

Figure 3.3-7 illustrates the incremental changes in 24-hour PM_{10} impacts that would occur during operation of Alternative 7. Due to an increase in throughput and associated vehicle miles traveled (VMT), and because the model assumes the silt reservoir is infinite, particulate matter (PM) impacts may be overstated. Nevertheless, the model indicates that incremental 24-hour PM_{10} concentrations would increase substantially over what is demonstrated for Alternative 5C. The incremental 24-hour PM_{10} impacts that would occur under Alternative 7 are more prevalent on the east side of the I-710 mainline and extend further east in many cases. These expanded increase areas are notable in areas of environmental justice populations along I-710 between Del Amo Blvd. and SR-91, and particularly along both sides of I-710 between I-105 and the build alternatives' northern terminus, within the Cities of South Gate, Cudahy, Bell Gardens, Bell, and Commerce, all of which contain minority and low-income populations at higher percentages than that of the County. This impact area encompasses eight sensitive receptors within the Cities of Long Beach, Lynwood, and Bell Gardens and within the community of East Los Angeles.

Specifically, these sensitive receptors that would experience maximum incremental 24-hour PM_{10} impacts would include the YMCA GLB First Friendships State Preschool in the City of Long Beach; Vista High School in the City of Lynwood; Bell Gardens Elementary School, Briarcrest Nursing Center Nursing Home, Bell Gardens Elementary School, Marlow Park Child Development Center, and Inclusion Specialized Programs LLC Residential Facility, all in the City of Bell Gardens; as well as Humphreys Avenue Elementary School, in the community of East Los Angeles.

ANNUAL PM_{10} CONCENTRATIONS. Also identified on Figure 3.3-4 are the areas in which the operation of Alternative 5C would be expected to have an incremental annual PM_{10} impact. The majority of the identified increases would fall within areas very close to, if not the same as, the Alternative 5C 24-hour PM_{10} impact locations identified in the previous discussion. There is also one location identified along I-710 south of Wardlow Rd. at which annual PM_{10} concentrations would incrementally increase up to five micrograms per cubic meter ($\mu\text{g}/\text{m}^3$), a greater increase than any other identified for annual PM_{10} concentrations under Alternative 5C. This location is within a census tract that has been identified as having a greater proportion of minority residents than that of the County; however, the specific location of the identified increase lies within the proposed Alternative 5C footprint where it is adjacent to the Los Angeles River. The increase would not be within an area of residences, schools, or other sensitive receptors, or other frequent human use. However, two sensitive receptors have been identified as being within areas of up to one $\mu\text{g}/\text{m}^3$ increase; those are the Inclusion Specialized Programs LLC Residential Facility and the Marlow Park Child Development Center, both in the City of Bell Gardens.

Additionally, there are also areas in which annual PM_{10} concentrations under Alternative 5C would decrease compared to the 2035 No Build (Alternative 1) condition. These areas would include west of I-710 from the southern terminus to north of Pacific Coast Hwy., west of I-710 in the vicinity of Willow St., east and west of I-710 in the vicinity of Imperial Hwy., east of I-710 at the Florence Ave. interchange, and west of I-710 just south of Atlantic Blvd. With the exception of the area west of I-710 and south of Pacific Coast Hwy., all of these areas wherein a decrease in annual

PM₁₀ concentrations would occur compared to the 2035 No Build (Alternative 1) scenario fall within identified areas of environmental justice populations. No sensitive receptors fall within these areas of decrease.

Figure 3.3-7 also illustrates the locations that would experience a change in annual PM₁₀ concentrations under the operation of Alternative 7 as compared to the 2035 No Build (Alternative 1) condition. The same reasons that are noted in the discussion above regarding 24-hour PM₁₀ concentration (increased throughput and modeled VMT coupled with an infinite silt reservoir) would also be applicable to the increases in annual PM₁₀ concentrations, which appear in generally the same areas in which the Alternative 7 24-hour PM₁₀ incremental impacts would occur. However, in many areas, the increases would not only be larger in size but also more severe due to the greater increase in capacity and VMT for Alternative 7. In several near or on-roadway locations, generally concentrated along the east side of the I-710 Corridor and in the vicinity of major interchange locations, incremental annual impacts of up to five µg/m³ have been identified. These impacts would occur at several locations along the length of the Study Area. Under Alternative 7, several sensitive receptors would fall within areas of increased incremental PM₁₀ annual impacts of up to one µg/m³. These include the RMR Care Facility on De Forest Ave. in the City of Long Beach; St. John's School and YMCA First Friendships State Preschool, both near Orange Ave. in the City of Long Beach; Bell Gardens Elementary School, Briarcrest Nursing Center Nursing Home, Bell Gardens Elementary School, Marlow Park Child Development Center, and Inclusion Specialized Programs LLC Residential Facility, all in the City of Bell Gardens; and Humphreys Avenue Elementary School in the community of East Los Angeles, near the northern terminus of the build alternatives.

Decreases in annual PM₁₀ concentrations would occur at some locations within the I-710 corridor; these areas would be generally smaller than those of the modeled increases, and are generally located west of I-710 between Pacific Coast Hwy. and I-405, and west of I-710 in the vicinity of Imperial Hwy. In nearly all instances, these decreases would fall within areas of identified environmental justice populations. No sensitive receptors have been identified within these areas of decrease.

24-HOUR PM_{2.5} CONCENTRATIONS. Figure 3.3-5 illustrates changes in incremental PM_{2.5} concentrations under Alternative 5C as compared to the 2035 No Build (Alternative 1) condition. Please note that there would not be an appreciable change in incremental 24-hour PM_{2.5} concentrations under Alternative 5C.

Under Alternative 7, a few areas of incremental increases in 24-hour PM_{2.5} concentrations would occur. These areas can be seen on Figure 3.3-8 and are predominantly east of I-710 between Rosecrans Ave. and Firestone Blvd., within areas of identified environmental justice populations. The increases would tend to occur almost entirely within, or directly adjacent to, the Alternative 7 proposed footprint and, therefore, would not be located within areas of frequent human use, residences, or other sensitive receptors.

ANNUAL PM_{2.5} CONCENTRATIONS. There would be some areas of slight incremental annual changes in PM_{2.5} under Alternative 5C. As shown on Figure 3.3-5, increases (up to 0.5 µg/m³) would be concentrated east of I-710 generally between Willow St. and Carson St. in Long Beach and clustered near the Florence Ave. interchange near the Cities of Bell, Bell Gardens, and Cudahy. The areas in which PM_{2.5} concentrations of up to 0.5 µg/m³ would occur within the City of Bell Gardens would occur within areas of identified environmental justice populations near Marlow Ave., though no sensitive receptors would occur in the impact area. Decreases in incremental annual PM_{2.5} concentrations of up to 0.5 µg/m³ also would occur within or close to the prism of the proposed roadway, at the Florence Ave. interchange, west of the I-710 mainline just south of Imperial Hwy., and west of I-710 north and south of Anaheim St. No sensitive receptors are located within these areas of decrease.

Figure 3.3-8 also illustrates the changes in incremental annual PM_{2.5} concentrations that would occur under Alternative 7. These areas of increase would be greater in number than those projected to occur under Alternative 5C, although they would track closely to the proposed footprint for Alternative 7. Generally, areas in which changes in incremental annual PM_{2.5} concentrations of up to one µg/m³ would be located within census tracts in which environmental justice communities reside (with minor exceptions, including a small segment north of I-405). No sensitive receptors have been identified within the incremental annual PM_{2.5} impact areas. Generally, these locations would be along the east side of I-710 between Rosecrans Ave. and Firestone Blvd., and between Willow St. and Del Amo Blvd. Additionally, there would be two very small locations of incremental annual PM_{2.5} concentration decreases, within environmental justice populations, which would likely be attributed to shifting of the roadway alignment.

CANCER RISK. Figures 3.3-6 and 3.3-9 illustrate the changes in cancer risk that would occur under Alternatives 5C and 7, respectively. Under Alternative 5C, much of the area surrounding the I-710 Corridor would experience a decrease in incremental cancer risk of up to one in one million; however, this decrease would become smaller in size as one travels further north up the corridor. Small areas in which decreases in incremental cancer risk of up to ten in one million would occur at various areas within or very close to the roadway, but would include small parts of neighborhoods in the City of Long Beach along the west side of I-710 between Willow St. and I-405 where minority populations at percentages greater than that of the County occur. Nearer to the northern terminus of Alternative 5C in East Los Angeles, there would be some small areas in which incremental cancer risk increases up to one in one million; many of these areas would be within the limits of the proposed roadway, and human exposure would be short-lived and transitory. One sensitive receptor in the community of East Los Angeles, Humphreys Avenue Elementary School, near S. Ford Blvd. and S. Humphreys Ave., would be subject to an increase in cancer risk of up to one in one million under Alternative 5C. However, several sensitive receptors are located within areas of decreased cancer risk of up to one in one million; sensitive receptors that would experience this beneficial effect occur in greatest numbers within the Cities of Bell Gardens, Paramount, and Long Beach. In general, some of these areas of increases and decreases would be a result of the shifting of the roadway alignment. However, most of these areas of increase and decrease would occur within locations of environmental justice populations.

Under Alternative 7, no appreciable increase in cancer risk is modeled for the Study Area. In fact, the areas wherein incremental decreases in cancer risk occur would be far larger than what is anticipated under Alternative 5C. An incremental decrease in cancer risk of up to ten in one million would generally dissipate in the area of the Florence Ave. interchange, and the larger area (in which the decreases of up to one in one million occur) would become gradually smaller until it, too, would dissipate just south of the northern terminus. However, the substantial environmental justice populations in the Study Area would generally benefit from this overall reduced cancer risk.

When compared to the 2012 baseline (also referred to as existing conditions), both build alternatives show an incremental decrease in cancer risk, and the greatest decreases would occur under Alternative 7, mainly due to the decrease in diesel-related mobile source air toxics (MSAT) emissions (specifically diesel particulate matter [DPM], a main driver of cancer risk). All seven priority MSAT emissions show decreases in all of the air quality study areas for both build alternatives when compared to existing conditions. Decreases in DPM were approximately 97 percent in the South Coast Air Basin (Basin), 97 to 98 percent in the Area of Interest (AOI), and 96 to 98 percent along the I-710 freeway. This is due to a larger number of zero emission/near zero emission (ZE/NZE) trucks traveling on the freeway under Alternative 7 that would be funded by the project's programmatic ZE/NZE truck element.

CONCLUSIONS. Overall, air toxics would generally decrease for the build alternatives as compared to the 2035 No Build (Alternative 1). In the South Coast Air Basin, the incremental emissions of the build alternatives compared to the 2035 No Build (Alternative 1) scenario would be essentially zero for all pollutants with the exception of oxides of nitrogen (NO_x), which would decrease under the build alternatives. Along the I-710 freeway, with the exception of NO_x and diesel-related MSAT emissions, exhaust emissions for the build alternatives would generally increase compared to the 2035 No Build (Alternative 1) scenario. The increases in PM_{10} and $\text{PM}_{2.5}$ can be attributed to entrained road dust, rather than exhaust emissions (and the modeled analyses included herein are conservative). Cancer risk would be lower overall, with the exceptions of some near-roadway areas that would fall within the locations of environmental justice populations. Under Alternative 5C, the maximum increase in risk would be approximately three in one million. Under Alternative 7, that maximum increase in risk would be less than one in one million.

When compared to existing conditions, tire wear, brake wear, and entrained road dust PM_{10} and $\text{PM}_{2.5}$ emissions would increase under all of the build alternatives. These emissions are proportional to VMT, which would increase with the rise in vehicle activity in 2035 as compared to existing conditions. However, when compared to existing conditions, exhaust emissions would decrease for all build alternatives with the exception of a slight increase in SO_2 on I-710 under Alternative 7. Cancer risk also would decrease under both build alternatives (more so under Alternative 7) as compared to existing conditions, with focused decreases that would occur in the AOI and along the I-710 freeway, where environmental justice populations are concentrated.

Although there would be air quality benefits associated with the build alternatives (including those associated with the Community Health Benefit Program, a programmatic component of both build alternatives), and these benefits would be experienced by the environmental justice populations that predominantly reside near the I-710 freeway, there would also be near-roadway adverse impacts that would disproportionately burden these populations. Mitigation Measures AQ-2 and AQ-3 described in Section 3.13, Air Quality, of this Final EIR/EIS would reduce exposure of environmental justice to populations to increases in air pollutant concentrations for the build alternatives. However, even when considering these mitigation measures in addition to the beneficial effects of the build alternatives on air quality and public health, both I-710 Corridor Project build alternatives could potentially have an adverse and disproportionate air quality impact to environmental justice populations in localized areas within the I-710 Corridor. Based upon the analysis presented above, Alternative 7 would have a greater impact than Alternative 5C.

Sensitive receptors that have been identified as located within an area of increased pollutants under Alternative 5C include Marlow Park Child Development Center and Inclusion Specialized Programs LLC in the City of Bell Gardens for PM₁₀, and Humphreys Avenue Elementary School in the community of East Los Angeles for increased cancer risk. Under Alternative 7, sensitive receptors that have been identified within areas of increase for both annual and 24-hour PM₁₀ include the RMR Care Facility, St. John's School, and YMCA First Friendships State Preschool all in the City of Long Beach; Bell Gardens Elementary School, Briarcrest Nursing Center Nursing Home, Bell Gardens Elementary School, Marlow Park Child Development Center, and Inclusion Specialized Programs LLC Residential Facility, all in the City of Bell Gardens, and Humphreys Avenue Elementary School in the community of East Los Angeles. These sensitive receptors have been proposed for mitigation measures for the build alternatives. For any build alternative, provision of new or upgraded air filtration and/or heating, ventilation, and air conditioning (HVAC) systems would be funded by the build alternatives as mitigation to reduce exposure to pollutants at these sensitive receptors. Please see Section 3.3.3.7.

CONSTRUCTION EMISSIONS. As part of the AQ/GHG/HRA, a construction emissions analysis was performed (Appendix B of the AQ/GHG/HRA report). The I-710 Construction Emissions Model (CEM) is a modified version of the Sacramento Metropolitan Air Quality Management District (SMAQMD) Road Construction Emissions Model and estimates daily and total criteria air pollutant and greenhouse gas emissions from four categories of construction activity: grubbing/land clearing, grading/excavation, drainage/utilities/sub-grade, and paving. Three major sources of emissions that were evaluated by the I-710 CEM include on-road vehicles, off-road equipment, and fugitive dust.

To assess the full breadth of potential construction-related impacts of the build alternatives, two sets of model runs were performed: one with "No Mitigation" and referred to as the Baseline Compliance Scenario, and one taking into account "Tier 4 Equipment" and referred to as the All Best Available Control Technology (BACT) scenario. The Baseline scenario assumes that, for any build alternative, all construction equipment would be in compliance with California Air Resources Board's (ARB) In-Use Off-Road Diesel-Fueled Fleets Regulation. The BACT scenario

is assuming all construction equipment would meet ARB's Tier 4 Final engine standards for off-road equipment. The I-710 CEM outputs criteria air pollutant emissions in pounds per day per period and tons per period.

For purposes of the construction emissions analysis, emissions from construction activities associated with the build alternatives were analyzed in seven sections that were developed for preliminary engineering of the build alternatives as follows:

- Section 1: Ocean Blvd. to Willow St.
- Section 2: Wardlow Rd. to Del Amo Blvd.
- Section 3: Long Beach Blvd. to Alondra Blvd.
- Section 4: Rosecrans Ave. to Firestone Blvd.
- Section 5: Florence Ave. to Slauson Ave.
- Section 6: Atlantic Blvd. to Washington Blvd.
- Section 7: I-5 to south of SR-60

The construction staging concept is a hypothetical plan that was developed assuming all funding has been programmed and would be available to construct the full build alternative at the start of construction. It is only intended to prove that the proposed build alternatives could physically be constructed, that the freeway facility could continue to operate during construction, and that a logical order of construction could be defined, thereby minimizing the throw-away of built elements. It does not represent a realistic or example emissions scenario and should not characterize impacts as such. However, a qualitative analysis is included here for informational purposes only.

Both emissions scenarios (Baseline and BACT) are presented for the build alternatives for purposes of comparison. See Table 3.3-17, below, for Alternative 5C emissions, and Table 3.3-18 for Alternative 7 emissions. South Coast Air Quality Management District (SCAQMD) significance criteria are also presented. It is important to note that the California Department of Transportation (Caltrans) has not adopted any of SCAQMD's significance thresholds; this information is provided for reference only.

Table 3.3-17: Peak Daily Criteria Air Pollutant Mass Emissions for the Construction of Alternative 5C

| Pollutant | Peak Daily Emission Estimates across All Freeway Sections (lbs/day) | | Peak Daily Emission Estimates for a Single Freeway Section (lbs/day) | | SCAQMD CEQA Significance Criteria ¹ (lbs/day) |

VOC = volatile organic compounds

Depending on the start date and duration of construction activities, for any build alternative, construction periods may overlap. The hypothetical build alternatives construction schedule was used to estimate the maximum daily criteria air pollutant emissions associated with a single freeway section and across the entire build alternatives (all freeway sections). These data are summarized for the Baseline Compliance scenario and the all-BACT scenario for both build alternatives. NO_x and PM exhaust emissions estimates are substantially lower for the all-BACT scenario as compared to the Baseline scenario. It is also noteworthy that in all cases, total PM emissions (both PM₁₀ and PM_{2.5}) are substantially composed of fugitive dust rather than vehicle exhaust.

Although the specific locations of construction emissions impacts cannot be identified, it can be reasonably assumed that construction emissions resulting from the build alternatives would be generally localized and the communities and businesses closest to the location of construction would experience the greatest construction-related air quality impacts. As it has been established that the vast majority of census tracts adjacent to the proposed build alternatives improvements do contain percentages of minority and/or low-income populations at percentages exceeding that of the Reference Community (and have, therefore, been identified as environmental justice communities), it is anticipated that the construction of either of the I-710 Corridor Project build alternatives would have disproportionately high and adverse air-quality related construction emissions impacts on environmental justice communities.

NOISE. Increases in future (2035) worst-hour noise levels, compared to existing levels, were estimated in a *Traffic Noise Study Report* (2016)¹⁰ at over 200 locations for the I-710 Corridor Project build alternatives.

The need for noise abatement is determined according to which areas may experience noise that approaches or exceeds the Federal Noise Abatement Criteria (NAC). The NAC varies depending on the land use activities being evaluated. The *Traffic Noise Study Report* (2016) found that most parts of the Study Area would exceed the NAC. As a result, soundwalls would be proposed at locations throughout the I-710 Corridor for the build alternatives.

For purposes of this analysis, those sound measurement or monitoring locations (receptors) were identified where either build alternative would result in a noise increase that approached or exceeded the NAC, or if a predicted noise level in the design year would substantially exceed the existing noise level (exceeding the existing worst-hour noise level by 12 A-weighted decibels [dBA] or more). The *Traffic Noise Study Report* (2016) identified and recommended acoustically feasible soundwalls. In most cases, the recommended soundwalls would provide adequate noise abatement (defined as five dBA in the Caltrans 2011 *Traffic Noise Analysis Protocol*). Please note that some soundwalls were assumed to be constructed under the Early Action Soundwall Project.

¹⁰ Caltrans. 2016. *Traffic Noise Study Report, I-710 South (Corridor Project/Truck Lane Project)*.

The exceptions would be at locations where soundwalls are not considered acoustically feasible because they do not provide the minimum required five dBA noise abatement. These exceptions are listed as follows:

- Under both Alternatives 5C and 7, along westbound Wardlow Rd. from I-710 to Delta Ave. in the City of Long Beach (designated MSB16A-C), noise abatement in the form of a soundwall (SW-502D) was considered but found to be infeasible as it would only provide a two-to-three dBA noise reduction to the residential area. This area falls within a census tract that exceeds the County percentage for minority residents. At this location, the NAC is 67 dBA. The worst-hour noise level under Alternative 5C would range from 65.8–73.6 dBA. The increases in noise level under Alternative 5C would range from 7.7–9.2 dBA compared to the existing condition, and 3.5–8.4 dBA compared to the No Build (Alternative 1). Under Alternative 7, the future worst-hour noise level at this location would range from 65.8–69.8 dBA. The increases in noise level under Alternative 7 as compared to the existing condition would range from 5.4–8.6 dBA, and the increases in noise level as compared to the No Build (Alternative 1) would range from 3.5–4.6 dBA.
- Under Alternative 5C, along the edge of shoulder at the southbound I-710 off-ramp at Eastern Ave. in East Los Angeles, noise abatement in the form of a soundwall (SW-519) was considered but found to be infeasible as it would not provide the minimum five dBA noise reduction. This area falls within a census tract that exceeds the County percentages for both minority and low-income residents. The impacted location, labeled SB-71M1 in the NSR, has an NAC of 67 dBA and experiences a worst-hour noise level of 68.8 dBA. The noise increase as compared to the existing condition would be approximately 5.4 dBA at this location, and a 2.4 dBA increase under Alternative 5C, as compared to the No Build (Alternative 1), would occur.
- Under Alternative 7, along the northbound freight corridor from SR-91 to Rosecrans Ave. (designated receivers NB-25 through NB-30), noise abatement in the form of a soundwall (SW-708TLN) was considered but found to be infeasible as it would only provide a three dBA noise reduction to the residential area east of the Los Angeles River within the City of Paramount. This residential area falls within census tracts that exceed the County percentages for both minority and low-income residents. At these locations, the NAC is 67 dBA, and the worst-hour noise level under Alternative 7 would range from 63.2–69.0 dBA. The noise increases under Alternative 7, as compared to the existing condition, would range from 6.0–14.3 dBA. When compared to the No Build (Alternative 1), the increase in noise levels would range from 4.7–11.1 dBA.

As these impacts would all be located in census tracts identified as containing minority and/or low-income populations, it can be concluded that with respect to noise, and after consideration of abatement, both I-710 Corridor Project build alternatives would have a disproportionately high and adverse impact to environmental justice populations.

TRAFFIC IMPACTS. This environmental justice analysis is focused on the findings with regard to intersection impacts associated with the build alternatives.

Information on the impacts of the build alternatives on arterial intersections is included in the *Intersection Traffic Impact Analysis Report* (2017).¹¹ According to Table 7-12, “Summary of Impacted Intersections,” impacts are projected to occur at 42 intersections throughout the Study Area. Of these 42, all but four would be lessened if recommended improvements associated with the build alternatives are implemented. At four intersections, improvements are not recommended to be implemented as part of the build alternatives due to right-of-way constraints (i.e., intersection improvements would result in adverse impacts due to displacements of homes, businesses, or other structures). For purposes of this analysis, it was assumed that an unmitigated adverse impact would remain at four intersections in the Study Area for the build alternatives. These impacts are detailed below:

- **Pacific Coast Hwy. and Long Beach Blvd. (Alternative 7):** This intersection, in the City of Long Beach, falls in an area that exceeds the Los Angeles County average minority and low-income percentages.
- **Willow St. and Atlantic Ave. (Alternative 7):** This intersection, in the City of Long Beach, falls in an area that exceeds the Los Angeles County average minority and low-income percentages.
- **37th St. and Santa Fe Ave. (Alternatives 5C and 7):** This intersection, in the City of Vernon, falls in an area that does not exceed the Los Angeles County average minority or low-income percentage.
- **Pacific Coast Hwy. and Harbor Ave. (Alternatives 5C, 5C Option 2A, and 7):** This intersection, in the City of Long Beach, falls in an area that exceeds the Los Angeles County average minority and low-income percentages.

Three of four of these intersections are located in census tracts where minority and/or low-income populations have been identified. Therefore, these traffic intersection impacts would be considered to represent a disproportionately high and adverse impact to environmental justice communities under one or more of the build alternatives.

COMMUNITY COHESION AND RELOCATIONS. Community cohesion and relocations are discussed together, as they are highly interrelated. Impacts to community cohesion could occur as a result of relocations associated with the build alternatives. The *Draft Relocation Impact Report* (DRIR) (2017)¹² and the *Right-of-Way Study* (2017)¹³ identified parcels that would be subject to

¹¹ AECOM. 2017. *Intersection Traffic Impact Analysis Report*. March.

¹² Epic Land Solutions, Inc. 2017. *Draft Relocation Impact Report*. March.

¹³ AECOM. 2017. *Right-of-Way Study*. February.

acquisition and relocation under the I-710 Corridor Project build alternatives. Specific displaced properties for the build alternatives are identified in Appendix B of the RIR.

Given the demographic makeup of the area immediately surrounding the freeway right-of-way, the vast majority of build alternatives' parcel acquisitions and associated relocations would occur in census tracts that exceed the Los Angeles County percentage of minority and low-income residents. The preliminary conclusion of the RIR is that adequate relocation resources exist for all build alternatives and design options, except for residents of five mobile homes in the Alondra sub-area, and in general for renters given the limited supply of affordable rental housing. Housing of Last Resort would be considered where necessary for any build alternative.

A spatial comparison between full parcel acquisitions and census tracts that exceed the Los Angeles County percentage of minority and low-income residents indicates that for each build alternative and design option, the majority of full parcel acquisitions would occur in areas of environmental justice populations. Alternative 5C would displace and require relocations for 109 residential units and 158 nonresidential properties. Alternative 7 would impact 121 residential units and 206 nonresidential properties. The design options would have additional impacts to both residents and businesses. Most acquisitions would occur in areas wherein the percentage of minority and low-income residents exceeds that of the County. Many parcel acquisitions associated with the build alternatives and design options would not directly impact environmental justice communities; vacant land and industrial facility uses are included in these tallies in addition to homes, businesses, and community facilities. However, the demographics of the populations in the immediate vicinity of the I-710 freeway are predominantly minority and low-income. With the application of standard mitigation via the Uniform Act, relocated persons and businesses would be compensated fairly and provided relocation assistance, and therefore, these relocations would not represent a disproportionate adverse impact to environmental justice populations related to the build alternatives. However, the localized impacts to community cohesion would represent a disproportionate adverse impact to environmental justice populations for the build alternatives.

Two social-service locations would be adversely affected by one or both of the project build alternatives: the Bell Shelter, the S. Mark Taper Foundation Shelter Resource Bank, and the Long Beach Multi-Service Center. Under Alternative 5C, the Bell Shelter facility would be avoided, but the Mark Taper Foundation Shelter Resource Bank (a nearby facility at the same street address that is owned by the Shelter Partnership and whose operations are interrelated with those of the Bell Shelter) would be partially acquired. Alternative 7 would require a partial acquisition of the Bell Shelter, and a full acquisition and relocation of both the Resource Bank and the Long Beach Multi-Service Center. In addition, the relocation or disruption of operations at the Resource Bank would also have indirect impacts to the operations of the Bell Shelter. The RIR recognizes that relocation of any of the above facilities would be difficult and does not identify specific locations for the relocation of these facilities under the build alternatives. The Bell Shelter and Resource Center are located in a census tract that exceeds the Los Angeles County average percentage for both minority and low-income, and while the Long Beach Multi-Service Center is not, both

facilities serve minority and low-income residents, as well as other vulnerable and disadvantaged populations. Although these impacts would be predominantly borne by environmental justice populations, with application of standard mitigation via the Uniform Act, these impacts would not represent a disproportionate adverse impact to environmental justice communities for the build alternatives.

VISUAL IMPACTS. According to the *Visual Impact Assessment* (2017),¹⁴ under both build alternatives, long-term visual impacts would occur that would result from the permanent alteration of the visual environment through the reconstruction of the freeway and associated bridges, interchange structures, retaining walls, and soundwalls. Generally, the freight corridor component of Alternative 7 would result in more impacts than those that would occur under Alternative 5C.

At all 25 Key View locations along the corridor, the visual impacts of the proposed build alternatives have been assessed and quantified. In nearly all cases, both build alternatives would result in a visual impact classified as “low” or “moderately low.” The locations at which Alternative 7 would result in a slightly higher visual impact than Alternative 5C are at Key Views 6, 7, 9, and 13. Additionally, at Key View 24 (located at the intersection of Whittier Blvd. and Burger Ave. in East Los Angeles, immediately east of the I-710 mainline), Design Options 3A and 3B would result in a “moderate” visual impact. This Key View is located in a census tract in which both minority and low-income populations have been identified in percentages higher than the County average.

Although measures intended to avoid, minimize, and mitigate visual impacts have been identified (and some are incorporated into the design features of the build alternatives), the I-710 Corridor Project build alternatives would represent a change in the existing viewshed for residents, motorists, and other populations within the I-710 Corridor Project Study Area. As the corridor consists of predominantly environmental justice populations, and the area of the greatest visual impact is also within a census tract identified as an environmental justice population, it can be reasonably concluded that the I-710 Corridor Project build alternatives would have a disproportionate and adverse visual impact to environmental justice communities.

HAZARDOUS WASTE. During the development of the *Initial Site Assessment* (ISA, March 2017),¹⁵ a number of parcels to be acquired in full or in part for construction of either of the two build alternatives, or adjacent to those identified for acquisition, were identified as those of “potential environmental concern” based on a review of online maps, photographs, online databases, windshield surveys, and government records. A number of hazardous materials would be expected to be encountered within the Study Area, including (but not limited to) aerially deposited lead, asbestos, lead-based paint, polychlorinated biphenyls, thermoplastic paint, utility lines, potentially contaminated soils and/or groundwater, landfills, railroads, and treated wood waste.

¹⁴ Tatsumi and Partners, Inc. 2017. *Visual Impact Assessment*.

¹⁵ AECOM. 2017. *Initial Site Assessment*. March.

Generally, operation and maintenance of the proposed facility under either build alternative would not introduce new sources of hazardous materials or waste. Routine maintenance activities would be required to follow applicable regulations with respect to the handling and disposal of potentially hazardous materials. Vehicles traveling on I-710 would continue to transport hazardous substances that could spill and impact the roadway, adjacent properties, or resources for both build alternatives. However, one of the purposes of the I-710 Corridor Project is to improve traffic safety, which could reduce traffic incidents that could result in hazardous waste spills. Additionally, the transport of hazardous materials is subject to strict regulations. Caltrans, the California Highway Patrol, and local police and fire departments are trained in emergency response procedures for safely responding to accidental spills of hazardous substances on public roads, which would further reduce any impacts associated with the build alternatives.

Temporary hazardous waste risks associated with the build alternatives are related to property acquisitions and project construction. Parcels that would be potentially impacted by the proposed right-of-way requirements associated with the build alternatives have been identified in the ISA, and of those, properties with hazardous waste concerns have also been identified. For any build alternative, to ensure that no risk is posed to project construction workers and the general public during construction, any property acquired would require testing and, if necessary, a site-specific remediation plan and closure plan, if required, would be prepared to ensure the property is free of hazardous wastes prior to the start of any construction activities.

Under Alternative 5C, potentially affected parcels were preliminarily assessed and a risk level was assigned. General areas in which high-risk parcels are located include:

- East and west of I-710 between Anaheim St. and 17th St.
- East of I-710 between Wardlow Rd. and Carson St.
- North of I-405 between the Los Angeles River and the Metro Blue Line
- East of I-710 between W. Carson St. and the UP Railroad Overhead
- West of I-710 at Long Beach Blvd.
- East and west of I-710 along Southern Ave.
- East of I-710 at LAJ Railroad
- East of I-710 at Atlantic Blvd./Bandini Blvd.
- East and west of I-710 at Washington Blvd.
- West of I-710 at Eastern Ave. and Noakes St.

Under Alternative 7, potentially affected parcels were preliminarily assessed and a risk level was assigned. General areas in which high-risk parcels are located include:

I-710 Corridor Project Final EIR/EIS

- East and west of I-710 between Pier B St. and 17th St.
- East of I-710 at I-405
- North of I-405 between the Los Angeles River and the Metro Blue Line
- East of I-710 between W. Carson St. and the UP Railroad Overhead
- West of I-710 at Long Beach Blvd.
- East of I-710 at the intersection of Alondra Blvd. and Atlantic Pl.
- East of I-710 at Imperial Hwy.
- East and west of I-710 along Southern Ave.
- East of I-710 at Atlantic Blvd./Bandini Blvd.
- East and west of I-710 at Washington Blvd. (more high-risk parcels are captured under Alternative 7, Option 1B, than under Alternative 7 due to a shift in right-of-way)
- West of I-710 at Eastern Ave. and Noakes St.

Generally, in all of these areas with very few exceptions (such as west of I-710 between Anaheim St. and 17th St.), all of these high-risk parcels are located in areas where environmental justice populations, both minority and low-income, have been identified. In the areas at Washington Blvd. and Noakes St./Eastern Ave., only minority populations exceeding that of the County have been identified.

In addition, a list of all associated parcels for which insufficient information currently exists or is inaccessible for each build alternative is supplied in the ISA. A comparison of the listed locations to the maps of environmental justice communities previously identified indicates that every identified location at which insufficient information is available falls within a census tract that contains minority and/or low-income populations.

However, although many (if not all) of these potential locations of hazardous materials are located within areas of environmental justice populations, standard avoidance and minimization measures would be incorporated into either build alternative that would ensure that the possibility of human exposure or disturbance of hazardous materials would be minimized or avoided to the greatest extent possible, prior to construction activities (refer to Section 3.12.4 for Measures HW-1 through HW-7). In addition, if a build alternative is not selected for construction, there would be no further research into potential contamination at these parcels and no remediation efforts would be undertaken. Therefore, with regards to environmental justice populations, neither of the I-710 Corridor Project build alternatives would have a disproportionate adverse impact after mitigation.

LAND USE. Impacts to land use (specifically, the conversion of various types of land use to transportation use) would occur at various locations up and down the corridor for the build alternatives. Due to the addition of a four-lane freight corridor, Alternative 7 would have a greater impact to land use conversion than Alternative 5C. Generally, the largest areas of land use conversion would occur in the Cities of Bell, Commerce, Long Beach, and South Gate. With the exception of a few areas in Long Beach, each of these cities has substantial minority and/or low-income populations near the I-710 freeway.

PARKS AND RECREATION. The I-710 Corridor Project build alternatives would directly impact some parks, which may result in a net loss in recreational resources. These public parks in which direct impacts would occur are listed as follows.

- Cesar E. Chavez Park, 401 Golden Ave., City of Long Beach: Both I-710 Corridor Project build alternatives would result in direct impacts to this park; however, the reconfiguration/reconstruction of Shoreline Dr. would result in the unification of existing discontinuous parcels that would allow the public to access some parts of the park that are currently inaccessible. Due to the removal and consolidation of the existing Shoreline Dr. lanes, the park would experience a net increase in size of approximately three acres, and the increased access would allow for a functional park size of approximately 28 acres. Some impacts would occur during construction of the build alternatives; however, the build alternatives effects at Cesar E. Chavez Park would have a benefit to the nearby neighborhoods (which include minority and low-income environmental justice communities).
- Parque Dos Rios, Imperial Hwy. and I-710, City of South Gate: Under Alternative 5C, 2.13 acres from the west side of this park would be permanently used. The impacts under Alternative 7 would render the park inaccessible and not functional and, therefore, permanently use the entire 8.5 acres of park space. This park is located in an area wherein the proportion of minority population exceeds that of the County. For any build alternative, mitigation measures are proposed that would relocate the park, but a suitable site has not been identified in this Final EIR/EIS, and it is possible that a replacement site would not be located within the vicinity, resulting in a net loss of park space within this area of environmental justice populations.

Due to the land use conversion and park and recreational resource impacts described above, it can be concluded that with regards to land use and after mitigation, the I-710 Corridor Project build alternatives would have a disproportionately high and adverse impact to environmental justice populations. Alternative 7 would have a greater impact than Alternative 5C.

SUMMARY AND CONCLUSIONS. Overall, the I-710 Corridor Project build alternatives would have many beneficial effects on the surrounding communities and I-710 corridor users when compared with current conditions, including reductions in emissions levels and associated health risk; abatement of freeway noise in most locations; and improved level of service at most intersections. In addition, programmatic elements of the build alternatives, such as the Community Health

Benefit Program, would be of particular benefit to environmental justice communities although the effects cannot be quantified at this time due to the nature of the program (to provide funding for future improvements and/or health-related projects on a case-by-case basis). However, even with the application of these benefits, the environmental justice analysis for the I-710 Corridor Project build alternatives has identified potential disproportionately high and adverse impacts on minority and low-income populations in the Study Area, after consideration of mitigation. These disproportionately high and adverse impacts resulting from the build alternatives have been identified for air quality (construction and operation), noise, traffic, community cohesion, visual resources, and land use.

Due to the potential for disproportionately high and adverse impacts for any build alternative, further mitigation would be provided to reduce impacts to environmental justice populations for the build alternatives. The mitigation for the build alternatives would take the form of additional funding for the Community Health Benefit Program to fund projects that would improve air quality, public health, and other issues faced by environmental justice populations within the corridor. Funding preference would be given to projects benefiting environmental justice populations nearest the I-710 freeway facility. When the environmental justice-specific mitigation measures (described in Section 3.3.3.7, below) are considered in addition to the project benefits associated with the build alternatives to environmental justice populations described above, the build alternatives would not result in disproportionately high and adverse impacts to environmental justice populations.

NO BUILD (ALTERNATIVE 1). Under the Preferred Alternative (Alternative 1 – No Build), the benefits and impacts associated with environmental justice considerations discussed above for the build alternatives would not occur. However, some beneficial effects would also not occur, including improvements to air quality after construction is complete, and the provision of the “Community Health Benefit Program” that is included within each build alternative, and is intended to fund projects that would have a beneficial effect on air quality and public health for communities within the I-710 Corridor.

3.3.3.6 PUBLIC HEALTH CONSIDERATIONS

Please refer to section 3.3.1.5 for a discussion of public health considerations related to environmental justice.

3.3.3.7 AVOIDANCE, MINIMIZATION, AND/OR MITIGATION MEASURES

As described in Chapter 2.0, the No Build (Alternative 1) has been identified as the Preferred Alternative. Mitigation measures would not be required for the No Build (Alternative 1) as no impacts related to the build alternatives would occur under this alternative. Avoidance, minimization, and/or mitigation measures to address impacts for the two build alternatives are retained in this Final EIR/EIS for disclosure purposes.

The environmental justice analysis for the I-710 Corridor Project has identified potential disproportionate adverse impacts on minority and low-income populations in the Study Area under both build alternatives. For any build alternative, Measures C-6 and C-7 provided below would address those impacts, and Measure C-8 would address impacts to sensitive receptors. Also, refer to Sections 3.13, Air Quality, and 3.14, Noise, for the discussion on measures that address impacts related to those topics for the build alternatives.

C-6 To address disproportionate adverse noise impacts to environmental justice populations, interior noise abatement or other similar noise abatement/attenuation measures will be provided for impacted receptors located in areas of environmental justice populations where noise barriers have been deemed acoustically not feasible. The design goal for these abatement measures is to reduce interior noise levels below 52 A-weighted decibels (dBA).

If Alternative 5C is selected as the preferred alternative, the impacted receptors within the following targeted areas would receive interior noise abatement:

- Along westbound Wardlow Rd. from I-710 to Delta Ave.; and
- Along the edge of shoulder along the southbound I-710 off-ramp at Eastern Ave.

If Alternative 7 is selected as the preferred alternative, the following targeted areas would receive interior noise abatement:

- Along westbound Wardlow Rd. from I-710 to Delta Ave.; and
- East of the Los Angeles River, along the northbound freight corridor between State Route 91 (SR-91) to Rosecrans Ave.

C-7 To address disproportionate impacts to environmental justice populations with regards to air quality, traffic, visual impacts, and land use/parks and recreation, funding will be provided to local jurisdictions for targeted improvements that would improve air quality and public health, reduce traffic congestion, provide aesthetic/visual enhancements, and improve parks and recreation. These improvements must be made within the United States Census Bureau census tracts adjacent to the I-710 freeway that have been identified as having a high percentage of minority and/or low income populations compared to the County of Los Angeles. These targeted improvements may include, but are not limited to, air filtration systems installation or upgrade, urban art installations and community events, landscaping, traffic calming measures, pedestrian/bicycle enhancement measures, and development of pocket parks or other park space. Funding for these targeted improvements will be made in the amount of up to 1 percent of the capital construction cost for either of the build alternatives. This funding will be provided through a funding agreement between the Los Angeles County

Metropolitan Transportation Authority (Metro), Caltrans, and the affected local jurisdiction upon the commencement of construction within the limits of that local jurisdiction (in the event of staged construction).

C-8

In order to minimize human exposure to pollutants, upgraded or new filtration or heating, ventilation, and air conditioning (HVAC) systems will be provided for the following sensitive receptors that have been identified as falling within an area of pollutant increase under either of the build alternatives. Coordination with facility owners will occur during the final design process so that the upgraded or new filtration systems can be in place prior to the start of construction in the area.

If Alternative 5C is selected as the preferred alternative, the following facilities would receive upgraded or new filtration or HVAC systems:

- Inclusion Specialized Programs LLC, Agra Ave., Bell Gardens
- Marlow Park Child Development Center, Bell Gardens
- Humphreys Avenue Elementary School, East Los Angeles

If Alternative 7 is selected as the preferred alternative, the following facilities would receive upgraded or new filtration or HVAC systems:

- YMCA GLB First Friendships State Preschool, Long Beach
- St. John's School, Long Beach
- RMR Residential Care Facilities, DeForest Ave., Long Beach
- Vista High School, Wright Rd., Lynwood
- Bell Gardens Elementary School, Bell Gardens
- Briarcrest Nursing Center Nursing Home, Bell Gardens
- Marlow Park Child Development Center, Bell Gardens
- Inclusion Specialized Programs LLC, Agra Ave., Bell Gardens
- Humphreys Avenue Elementary School, East Los Angeles

3.4 UTILITY/EMERGENCY SERVICES

The information in this section is based on the following documents:

- *North Utility Study Final Draft Preliminary Strategies Report* (September 2016)
- *Utility Relocation Strategies Report, Central Segment* (June 2016)
- *South End Utility Study* (November 2016)
- *Community Impact Assessment (CIA)* (July 2017)

3.4.1 AFFECTED ENVIRONMENT

The physical impacts of the build alternatives related to emergency services and utilities would be largely limited to the proposed right-of-way for the Interstate 710 (I-710) Corridor Project build alternatives, the areas adjacent to the proposed improvements, and areas outside the right-of-way to where utilities may be relocated. As a result, discussion of the affected environment focuses on services within 0.5 mile of the proposed improvements under the build alternatives and for utilities within the right-of-way or close enough to the right-of-way to be impacted by the build alternatives. The specific locations of public services and utilities were identified based on information provided by the respective providers. Because services and utilities are generally provided in fairly large geographic areas (a city or service area, for example), this section includes discussion of the larger service areas, as appropriate, to provide an appropriate context for the service providers or utilities, their facilities, and their services.

3.4.1.1 EMERGENCY SERVICES

FIRE PROTECTION. The following fire departments provide fire protection services in the Study Area.

LOS ANGELES COUNTY FIRE DEPARTMENT. The Los Angeles County Fire Department (LACFD) provides fire protection and suppression service for several cities within the Study Area. These cities include Bell, Bell Gardens, Carson, Commerce, Cudahy, Huntington Park, Lakewood, Lynwood, Maywood, Paramount, Signal Hill, and South Gate. In addition, the LACFD provides its services within the Study Area, to the communities of Boyle Heights, East Los Angeles, San Pedro, and Wilmington. These cities and communities are part of LACFD's Consolidated Fire Protection District (CFPD), Battalions 3, 7, 9, 13, and 19.

The CFPD has the primary responsibility for emergency medical service and fire service in a total of 58 cities and the unincorporated areas of the County. Specialized services, such as hazardous materials, air rescue helicopter, air ambulance helicopter, and fire suppression helicopter are provided centrally by the CFPD. The following is a list of LACFD stations within 0.5 mile of the improvements under the build alternatives.

- Fire Station 3, located at 930 S. Eastern Ave., Los Angeles
- Fire Station 54, located at 4867 Southern Ave., South Gate
- Fire Station 57, located at 5720 Gardendale St., South Gate

CITY OF COMPTON FIRE DEPARTMENT. The City of Compton Fire Department provides fire protection and emergency response services to residents and business within the limits of the City of Compton. The fire department ranks among the five busiest fire departments in California, responding to an average of 10,000 emergency calls per year. Within the City of Compton, there are four fire stations. None of these fire stations is located within 0.5 mile of the improvements under the build alternatives.

CITY OF DOWNEY FIRE DEPARTMENT. The City of Downey Fire Department is responsible for fire suppression services, emergency medical service response and basic life support, joint fire communications, fire prevention/arson, and emergency preparedness for the City of Downey. There are four fire stations located within the City of Downey, with approximately 100 staff members. None of these fire stations are located within 0.5 mile of the improvements under the build alternatives.

CITY OF LONG BEACH FIRE DEPARTMENT. The Long Beach Fire Department (LBFD) provides fire and emergency medical response, marine safety and lifeguards, fire prevention, hazardous materials spill response, and hazardous materials regulatory enforcement services within the City of Long Beach. The average citywide emergency response time from dispatch to arrival is less than five minutes. The LBFD's goal for emergency response times is to have the first engine arrive within four minutes of dispatch and the first paramedic rescue team arrive within eight minutes. The following fire stations are located within 0.5 mile of the improvements under the build alternatives:

- **Station 1:** Located at 100 Magnolia Ave.
- **Station 3:** Located at 1222 Daisy Ave.
- **Station 11:** Located at 160 E. Market St.
- **Station 12:** Located at 1199 E. Artesia Blvd.
- **Station 13:** Located at 2475 Adriatic Ave.

CITY OF LOS ANGELES FIRE DEPARTMENT. The Los Angeles Fire Department (LAFD) has a total of 106 fire stations citywide. Services include fire prevention, firefighting, emergency medical care, technical rescue, hazardous materials mitigation, disaster response, public education, and community service. Within the Study Area, the LAFD provides services to the communities of Boyle Heights, Wilmington, and San Pedro; there are no stations located within 0.5 mile of the improvements under the build alternatives.

CITY OF VERNON FIRE DEPARTMENT. The City of Vernon has a Class I Fire Department that provides fire protection and suppression services in the City of Vernon, as well as emergency response. The Vernon Fire Department also has two specialty programs: Urban Search and Rescue and Hazardous Materials Teams. The Vernon Fire Department maintains four fire stations in the city (Fire Station Nos. 1–4). Fire Station No. 4, located at 4530 Bandini Blvd., is the only station located within 0.5 mile of the improvements under the build alternatives.

LAW ENFORCEMENT. The following police departments provide law enforcement and patrol services in the Study Area.

CITY OF BELL POLICE DEPARTMENT. The City of Bell provides its own law enforcement and patrol services through the Bell Police Department. The police station is located at 6326 Pine Ave. and is not within 0.5 mile of the improvements under the build alternatives.

CITY OF BELL GARDENS POLICE DEPARTMENT. The City of Bell Gardens Police Department provides law enforcement services within the City of Bell Gardens. The station is located at 7100 S. Garfield Ave. and is not within 0.5 mile of the improvements under the build alternatives.

CITY OF DOWNEY POLICE DEPARTMENT. The Downey Police Department provides law enforcement services within the City of Downey. The Police Department is located at 11111 Brookshire Ave. and is not located within 0.5 mile of the improvements under the build alternatives.

CITY OF HUNTINGTON PARK POLICE DEPARTMENT. The Huntington Park Police Department provides law enforcement services within the City of Huntington Park. The station is located at 6550 Miles Ave. and is not located within 0.5 mile of the improvements under the build alternatives.

CITY OF LONG BEACH POLICE DEPARTMENT. The City of Long Beach is served by the Long Beach Police Department (LBPD), which is made up of five bureaus: the Investigation Bureau, the Financial Bureau, the Support Bureau, the Patrol Bureau, and the Administration Bureau. There are four stations within the city; the LBPD Public Safety Building, located at 400 W. Broadway St., and the LBPD West Division, located at 1835 Santa Fe Ave., are the only stations located within 0.5 mile of the improvements under the build alternatives.

CITY OF LOS ANGELES POLICE DEPARTMENT. The City of Los Angeles Police Department provides law enforcements services in the communities of Boyle Heights, Wilmington, and San Pedro within the Study Area. There is one station in Boyle Heights and eight stations in Wilmington and San Pedro; none of these stations are located within 0.5 mile of the improvements under the build alternatives.

CITY OF SIGNAL HILL POLICE DEPARTMENT. The Signal Hill Police Department provides law enforcement within the City of Signal Hill. There is one station located at 2745 Walnut Ave., and it is not located within 0.5 mile of the improvements under the build alternatives.

CITY OF SOUTH GATE POLICE DEPARTMENT. The City of South Gate has its own police department that provides law enforcement services within the City of South Gate. The City of South Gate Police Station is located at 8620 California Ave., and is not located within 0.5 mile of the improvements under the build alternatives.

CITY OF VERNON POLICE DEPARTMENT. The Vernon Police Department provides law enforcement services within the City of Vernon. The Vernon Police Department is located at 4305 Santa Fe Ave. and is not located within 0.5 mile of the improvements under the build alternatives.

LOS ANGELES COUNTY SHERIFF'S DEPARTMENT. The Los Angeles County Sheriff's Department is the largest sheriff's department in the world. Within the Study Area, the Los Angeles County Sheriff Department serves the Cities of Carson, Commerce, Compton, East Los Angeles, Lakewood, Lynwood, Maywood, Cudahy, and Paramount. There are no stations located within 0.5 mile of the improvements under the build alternatives.

3.4.1.2 UTILITY COMPANIES AND TYPES OF FACILITIES

Within the Study Area, local utility facilities are critical to municipalities and include power distribution systems, gas transmission pipelines, telephone systems, cable television (CATV) systems, water distribution mains, sanitary sewer mains, and city telecommunication systems. Regional facilities are critical to national and regional interests and include power transmission systems, gas transmission pipelines, petroleum pipelines, water aqueducts, and sewer interceptors. Descriptions and locations of the following utilities have been identified based on collected record data, field reconnaissance, and limited coordination with utility owners. Identification methods, such as potholing or surveying, were not used to verify the location of facilities at this stage of the improvements under the build alternatives.

There are a total of 71 service providers in the Study Area, and they are listed below.

- | | |
|---|--|
| ▪ American Telephone and Telegraph Company (AT&T) – Telephone | ▪ Central Basin Municipal Water District – Water |
| ▪ Beta Offshore – Oil | ▪ Century Link – Fiber Optic |
| ▪ BP Pipelines, Inc. (BP) – Oil | ▪ Charter Communications – Fiber Optic |
| ▪ California Resources Corporation (CRC) – Oil | ▪ Chemoil Refining Corporation – Oil |
| ▪ California Water Service Company - Water | ▪ Chevron Pipeline Co. – Oil |
| | ▪ City of Bell – Sewer |

- City of Carson – Water
- City of Commerce – Sewer
- City of Compton – Sewer
- City of Long Beach – Water, Sewer
- City of Long Beach – City Light & Power, Inc. –Power
- City of Lynwood – Sewer
- City of South Gate – Water, Sewer
- City of Vernon – Gas, Power
- Clear Channel Outdoor – Fiber Optic
- Conoco Phillips – Oil
- Covanta Long Beach Renewable Energy Corp. – Power
- Crimson Pipeline – Oil
- Crown Castle – Fiber Optic
- Defense Logistics Agency (DLA) - Oil
- Equilon Enterprises – Oil
- Exxon Mobile – Oil
- Golden State Water – Water
- Kinder Morgan – Oil
- Level 3 – Fiber Optic
- Long Beach Gas & Oil – Gas, Oil
- Los Angeles County Public Works – Sewer Maintenance Dept. – Sewer
- Los Angeles County Public Works Storm Drain - Sewer
- Los Angeles County Sanitation District (LACSD) – Sewer
- Los Angeles Department of Water and Power (LADWP) – Power
- Los Angeles County Flood Control District (LACFCD) – Water
- Maywood Mutual Water Company – Water
- Metropolitan Water District of Southern California (MWDSC) – Water
- Mobile Pacific Pipeline – Oil
- Oil Operators, Inc. – Oil
- Pacific Energy – Oil
- Pacific Pipeline System – Oil
- Pacific Terminals – Oil
- Paramount Petroleum – Oil
- Park Water Company – Water
- Petro Diamond – Oil
- Plains All American Pipelines – Oil
- Praxair – Oil
- Qwest – Telecom
- Shell Oil Pipeline – Oil
- Southern California Edison (SCE) – Power
- Southern California Gas Company (SCG) – Gas
- Sprint – Fiber Optic
- Sunesys Fiber Systems – Fiber Optic
- Tesoro Logistics – Oil
- Texaco – Oil
- Texaco, Humble, Unocal, Mobile, Shell (THUMS) – Oil
- Tidelands – Oil
- Time Warner Cable – CATV
- Tract 180 Mutual Water Company – Water
- Ultramar Refining – Oil
- United Cable – CATV
- Valero – Oil
- Verizon Business – Fiber Optic
- Verizon Local – Fiber Optic
- Verizon Wireless – Fiber Optic
- World Oil Marketing Company – Oil
- XO Communications – Fiber Optic
- Zayo Fiber Solutions – Fiber Optic

3.4.2 ENVIRONMENTAL CONSEQUENCES

The following discussion of environmental consequences only describes the permanent impacts of the proposed project. Please refer to Section 3.24 of this document, Construction Impacts, for a discussion of the temporary impacts of the proposed project for each resource area. Specifically, temporary impacts related to Utilities and Emergency Services are located in Section 3.24.3.4.

3.4.2.1 EMERGENCY SERVICES

PERMANENT IMPACTS.

ALTERNATIVE 5C. Both beneficial and adverse effects on fire protection and law enforcement protection service providers within the Study Area would occur under Alternative 5C. Beneficial effects include improved emergency response times, as the ability to move fire protection, law enforcement, and emergency service resources from one area to another would be enhanced by the improved transportation network. There are no hospitals or law enforcement facilities located within 0.5 mile of the improvements under Alternative 5C that would be directly or indirectly impacted as a result of the build alternatives. However, Alternative 5C would result in a direct impact to the Vernon Fire Station No. 4, located at 4530 Bandini Blvd. The proposed improvements for the on- and off-ramps at the Atlantic Blvd./Bandini Blvd. local interchange would require additional right-of-way, including the parcel occupied by the fire station, requiring the relocation of the station. In addition, the following changes in access would reduce access options and could increase response times on emergency calls that would otherwise have used these ramps as part of the response route.

- Under all build alternatives, the two ramps and collector distributor roads at the I-710/Wardlow Rd. partial interchange would be removed. Traffic would be redirected one mile east to the Long Beach Blvd. interchange, which provides the closest circulation between Wardlow Rd. and I-710.
- The Pacific Pl. interchange is a partial interchange providing connectivity to both Interstate 405 (I-405) and I-710. Under all build alternatives, direct circulation between I-710 and Pacific Pl. would be eliminated. Traffic would be diverted to adjacent interchanges. Located 0.5 mile south of Pacific Pl., the Long Beach Blvd. interchange provides the closest circulation between Pacific Pl. and I-710.
- Under all build alternatives, access from 9th St. and 10th St. to I-710 in the City of Long Beach would be removed. Traffic would be redirected approximately 1,000 feet north to Anaheim St, which provides the closest circulation.

Alternative 5C, Option 1A, would generally retain the interchange and access configurations that are proposed under Alternative 5C within the Cities of Bell, Commerce, and Vernon and would therefore, not result in additional impacts to emergency services.

Alternative 5C, Option 2A, would also generally retain the interchange and access configurations within the City of Long Beach that are proposed under Alternative 5C and would therefore, not result in additional impacts to emergency services.

Alternative 5C, Option 3A, would reconfigure the interchange and access configurations within the City of Commerce and Community of East Los Angeles. Southbound exit and entrance ramps at Eastern Ave. would be removed and replaced with ramps terminating at Whittier Blvd., and the intersection of Whittier Ave. and Sydney Dr. would be removed. Therefore, the implementation of Option 3A would have additional impacts to emergency services associated with changes in access that reduce access options and potentially increase response times on emergency calls.

ALTERNATIVE 7. The same impacts to emergency services that would occur under Alternative 5C would occur under Alternative 7.

Alternative 7, Option 1B, would generally retain the interchange and access configurations that are proposed under Alternative 7 within the Cities of Bell, Commerce, and Vernon and would therefore, not result in additional impacts to emergency services.

Alternative 7, Option 3B, would reconfigure the interchange and access configurations within the City of Commerce and Community of East Los Angeles in a manner similar to what is described above under Alternative 5C, Option 3A. Therefore, the implementation of Option 3B would have additional impacts to emergency services associated with changes in access that reduce access options and potentially increase response times on emergency calls.

Alternative 7, Option 7ZE, is operational in nature and does not represent a difference in geometric design or access points than what is proposed under Alternative 7, and would therefore, not result in additional impacts to emergency services.

NO BUILD (ALTERNATIVE 1). The No Build (Alternative 1), which is the Preferred Alternative, would not result in the permanent impacts to emergency services described above as a result of the build alternatives. Under the No Build (Alternative 1), emergency services (police, fire and emergency vehicle services) may be delayed as traffic congestion worsens and the level of service (LOS) in the Study Area declines, resulting in adverse impacts to emergency services compared to conditions that would exist under Alternatives 5C and 7.

3.4.2.2 UTILITIES

Utilities in conflict with the build alternatives would either be relocated or protected in place. Further coordination would be required with each owner to confirm the conflict and disposition strategy (i.e., whether they can be protected in place or relocated). Generally, all utility relocations are expected to occupy new or existing fee owned or easement rights-of-way or public rights-of-

way. Listed below are the criteria that was established to generally define “major utilities”, meaning utilities requiring significant effort to relocate in the field or those that need substantial coordination efforts with the utility companies.

- Communication lines containing 12 ducts or more
- Oil pipelines 16 inches or greater
- Water mains 30 inches or greater
- Sewer lines 42 inches or greater
- Power lines with voltages of 50 kilovolts or greater
- Gas pipelines 16 inches or greater

As described in Chapter 2.0 of this Final Environmental Impact Report/ Environmental Impact Statement (Final EIR/EIS), as well as the technical studies listed above, several strategies have been considered for utilities impacted as a result of the build alternatives. These strategies include (1) protect in place, (2) continuous aboveground relocation, and (3) continuous underground relocation. Further coordination with each service owner would be required during final design to confirm the impacts and strategy for relocation.

PERMANENT IMPACTS.

ALTERNATIVE 5C. Impacts to major regional facilities as a result of Alternative 5C are discussed below. Please note that the utility reference numbers (generally a four-digit number preceded by the letter N, C, or S, indicating north, central, or south, respectively) cited throughout this section correspond to those used in the various utility studies referenced in Section 3.4, above.

AT&T. Alternative 5C would result in impacts to several twelve-duct sets of underground AT&T lines that are located at the following locations: along Clara St. at the I-710 crossing, along Florence Ave. at the I-710/Los Angeles River crossing, along Gage Ave. at the I-710 crossing, and an underground duct bank containing 20 inactive ducts along Slauson Ave. at the I-710 crossing. The demolition and reconstruction of these structures would necessitate relocation of these utility lines, and each are proposed to be rerouted underground through a combination of open trenching and directional boring. Relocation of these facilities could result in the installation of permanent vault structures to be constructed east and west of the freeway and/or river to install the new lines within the bored segment. No additional right-of-way would be acquired, but a permanent easement would be needed at the Thunderbird Villa Mobile Home Park community for construction of new lines along Florence Ave. within the property, as well as underground easements from the United States Army Corps of Engineers (USACE) and/or the LACFCD and the LADWP for the segments of the relocated lines within the limits of the Los Angeles River.

Two four-inch polyvinyl chloride (PVC) fiber ducts (C2704) currently cross I-710 at the north side of Artesia Blvd., which is proposed to be replaced under Alternative 5C. To relocate these facilities with no down time, a two-stage strategy is proposed that would construct the south side of the structure first, then relocate the lines to the south side. The existing north conduit would be connected to the east and cross the south side of Alondra Blvd., at which point it would cross I-710 and the Los Angeles River and connect back to the existing conduit on the north side of Alondra Blvd. Various new underground easements and/or encroachment permits would be necessary.

Eighteen four-inch duct trunk lines (C2701) crossing I-710 at Alondra Blvd. within the Cities of Paramount and Compton would be impacted by the proposed reconstruction of the Alondra Blvd. structure under Alternative 5C. The utility would be relocated within the new structure via a two-stage construction strategy. The lines would remain in place on the north side of the structure, and upon the construction of the south side of the structure, would be relocated. The existing north conduit would be connected to the east and cross the south side of Alondra Blvd., where it would cross I-710 and the Los Angeles River and connect back to the existing conduit on the north side of Alondra Blvd. at Atlantic Place.

LACSD. Two major existing LACSD facilities within the City of South Gate would be impacted by Alternative 5C. A 45-inch line crossing the California Department of Transportation (Caltrans) right-of-way south of Southern Ave. and a 45-inch line running along Southern Ave. west of I-710 would both be protected in place.

Utility conflicts C4101, C4102, C4103, and C4104 would all have similar impacts and relocation strategies. The LACSD facility being impacted is a 63-inch reinforced concrete pipe (RCP) crossing I-710 south of Long Beach Blvd. In order to avoid conflicts between the proposed on- and off-ramp locations, the existing pipeline would be relocated to the north, where the proposed profile climbs and a greater amount of cover would be provided. A new easement would be necessary. Additionally, conflict C4105 would impact the 63-inch RCP to the west of I-710, crossing Long Beach Blvd., and the proposed on- and off-ramp location profiles directly impact the facility here as well. Therefore, prior to construction, the sewer would be trenched and buried along the proposed alignment and profile that would not conflict with the proposed geometry at this location. A new easement at this location would be required as well.

There is an LACSD pumping plant/pump station on Gaylord St. Under Alternative 5C, an existing 36-inch overflow pipe to the Los Angeles River would be impacted by the location of proposed ramps, and an existing manhole serving the outflow would require relocation. However, under Alternative 5C, Design Option 2A, the right-of-way line extends further to the west and would require the existing surge tank, manifold structure, and in-flow junction structures to be relocated and reconnected to new and existing facilities. The wet well is

proposed to be eight feet from the southbound Anaheim St. off-ramp. The pump station must be kept operational as a standby facility.

SCE TRANSMISSION. A summary of the conflicts and impacts to SCE transmission lines under Alternative 5C is provided as follows. It should be noted that for all utility relocations, and particularly for systems of 50-kilovolts or greater in accordance with the requirements of General Order 131-D, for any build alternative, if utility relocations result in additional environmental impacts that are currently not known or were otherwise not disclosed in the I-710 Corridor Project EIR/EIS, appropriate environmental re-evaluations would have been undertaken in due course of project development pursuant to 23 CFR 771.129 under NEPA and Sections 15162 and 15164 of the State CEQA Guidelines.

A 66-kilovolt aerial transmission system (S2005) running along the west side of the Los Angeles River from the Pico Substation, south of Ocean Blvd., to Willow St. Conflicts between the transmission lines and the proposed Alternative 5C design would occur at Shoemaker Bridge, from the south side of Anaheim St. through the Tidelands property to Gaylord St., and from 20th St. to Willow St. The relocation strategy proposes that the system follow the same alignment as the existing system. It may be relocated underground in a casing underneath Shoemaker Bridge, and rise up aerially on new poles between the widened I-710 mainline and the Los Angeles River access road or go overhead to clear the spacing requirements. It would continue aerially to cross I-710 at 25th St., and then go west of the proposed southbound ramp to transition back to Willow St. and tie back into the existing system. This relocation would require engineered steel pole replacements of the existing poles, switch, and possible pole replacement, and possible easements, as well as multiple breaker replacements.

Conflict S2008A consists of a 12-kilovolt overhead system north of Pier C St. crossing the Los Angeles River, south of the existing Shoemaker Bridge. The system would be in conflict with the realignment of Shoemaker Bridge. The relocation strategy consists of intercepting the line between I-710 and the Los Angeles River and undergrounding it southerly to the existing utility bridge, wherein it would tie into the bridge and cross the Los Angeles River. Undergrounding SCE subtransmission facilities may require equipment upgrades at local substations. Subtransmission structure height modifications will typically also require modifications to adjacent structures. On the south side of the river, it would remain underground where it would cross under Shoreline Dr. via directional bore, then turn north to tie into the existing overhead lines just north of 6th St.

S2010 consists of a 12-kilovolt aerial system crossing I-710 between 10th St. and 11th St. that would be impacted by the expanded freeway footprint at this location. This system would be removed and back fed from the south.

S2011A is a 12-kilovolt aerial system paralleling Fashion Ave. spanning over Anaheim St., which would be impacted by the widening of Anaheim St. under Alternative 5C. Therefore, an in-line aerial relocation would be necessary in order to span the widened roadway.

Utility conflict S2012 consists of a four-kilovolt and 12-kilovolt underground system in the Anaheim St. bridge structure that crosses I-710 and the Los Angeles River. As the Anaheim St. overcrossing is proposed to be replaced under Alternative 5C, the system would be impacted at this location. It is proposed that the system would be relocated to an aerial crossing over I-710 and the river at Cowles St., approximately 700 feet to the north. East of the Los Angeles River, the system would be relocated to San Francisco Ave., which runs north-south paralleling the river, and proceed south to tie into the existing system at Anaheim St. This relocation would require new poles from Fashion Ave. to San Francisco Ave., with a new pole between I-710 and the Los Angeles River access road. This system would also share poles with utility conflict number S2014 and S2015 (see below). In addition, this system could be moved on an interim basis and then permanently placed in the Anaheim St. overcrossing structure once complete.

Conflicts S2014 and S2015 are 66-kilovolt aerial systems crossing I-710 and the Los Angeles River at Cowles St. As the proposed I-710 mainline widening and northbound on-ramp from Anaheim St. would be in conflict with these systems, they would be adjusted in the same general alignment. The relocation would occur within an area that is primarily comprised of industrial land uses; therefore, the new alignment would not place overhead lines closer to schools or residences. New engineered steel poles would be needed from Fashion Ave. on the west to San Francisco Ave. on the east, and a new pole would be necessary between I-710 and the Los Angeles River access road.

A 12-kilovolt aerial system crosses I-710 and the Los Angeles River at 15th St. (S2017). Under Alternative 5C, the mainline widening and ramps at Pacific Coast Hwy. and Anaheim St. would impact this system. To relocate this system, it would be rerouted north along Fashion Ave. to Gaylord St., where it would then turn east and cross I-710 on a new pole east of the freeway, then cross the Los Angeles River to connect with an existing north-south system on the east side of the river to tie into the existing facility.

The Pacific Coast Hwy. overcrossing widening proposed under Alternative 5C would be in conflict with a 66-kilovolt aerial system (S2021B) that runs parallel to and just north of Pacific Coast Hwy. across I-710 and the Los Angeles River. In order to avoid multiple costly relocations of the system, the south half of the Pacific Coast Hwy. overcrossing structure would be constructed first to allow for an underground relocation in the south half of the bridge, between Harbor Ave. west of the Los Angeles River and Golden Ave. to the east. Alternatively, taller overhead structures may be used for this relocation in the event that undergrounding would conflict with other utilities. On joint poles with S2021A is a

12-kilovolt system (S2022A) that would be impacted and relocated in a similar fashion, but would require an independent bridge cell than that of S2021A within the Pacific Coast Hwy. overcrossing structure. The bridge cell containing S2022A would also contain the relocation of conflict S2022B, a 12-kilovolt underground system that would be impacted and relocated similarly to S2022A.

An aerial service drop (S2024) feeding the LACSD pump station would be impacted by the relocation of the station (see above for further details) and be relocated to tie into the revised location of the pump station. In addition, conflicts S2025 and S2031 are both 12-kilovolt underground systems feeding the pump stations east of 19th St. and east of 27th St., respectively. The pump stations would be removed and/or relocated due to the improvements under Alternative 5C, thereby necessitating the removal of these facilities and the associated conflict.

A 66-kilovolt aerial system crossing I-710 and the Los Angeles River at Spring St. (S2033) would be impacted by the proposed truck bypass lanes under Alternative 5C. The existing pole at the east end of Spring St. would be within the proposed right-of-way. The relocation strategy for this conflict requires a new pole on Spring St. east of Gale Ave. and new conductors between the existing pole west of Gale Ave. and the existing pole east of I-710. On joint poles with this system is one other 66-kilovolt system (S2035) and one 12-kilovolt system (S2034) that share the same impacts and would also share the relocation strategy. The relocation would not bring the system any closer to Birney Elementary School or the residential neighborhoods on the east side of the Los Angeles River.

A four-kilovolt aerial system (S2036) crosses I-710 to feed the Gage Station facility at the Los Angeles River. This system would be impacted by the proposed mainline widening under Alternative 5C and truck bypass lanes. The proposed relocation strategy would require a new pole at the end of 33rd St., as well as a new pole on the east side of I-710 within LACFCD right-of-way.

A 12-kilovolt aerial system (S2037) crosses I-710 and the Los Angeles River at 34th St. and would be impacted by the proposed mainline widening under Alternative 5C. The aerial relocation strategy would be generally in line with the existing alignment and would require two new poles on 34th St. along with a new pole between I-710 and the Los Angeles River.

A 12-kilovolt system (S2040) on joint poles with a dual-circuit 66-kilovolt aerial system (S2042) runs on the north side of Wardlow Rd. just west of I-710. S2040 would need to be relocated away from the edges of the I-710 mainline widening proposed under Alternative 5C, and would require one additional pole from just west of Delta St. to just east of Caspian Ave. S2042 would require four additional poles to relocate.

The 66-kilovolt overhead lines (N2002) crossing I-710 at Southern Ave. would be impacted by Alternative 5C as they would be in direct conflict with the new Southern Ave. overcrossing and the adjacent elevated roadway segments on either side of the bridge. These existing lines would be relocated underground across I-710, the existing LADWP transmission corridor, and the Los Angeles River. The existing lines and their supports would be removed along Southern Ave., from the existing pole on Burtis St. on the west to the existing pole located 250 feet west of Garfield Ave. on the east. A 30-foot easement would be needed from USACE and/or LACFCD for the portion of the line under the Los Angeles River and a 30-foot easement would be needed for the portion of the line under the LADWP transmission corridor. SCE's standard requires a 30-foot easement for underground installation of 66-kilovolt lines. A utility easement or right-of-way corridor between the existing LADWP transmission corridor and the freeway right-of-way would be needed; the vacant land in this area is currently owned by the City of South Gate.

Two 66-kilovolt overhead lines (N2003) crossing I-710 south of the existing Union Pacific Railroad (UP Railroad) West Santa Ana Branch crossing north of Firestone would be impacted by Alternative 5C. The existing lines would be too close to the new railroad bridge structure over I-710 to meet appropriate SCE and UP Railroad horizontal clearance requirements. Therefore, the existing lines would be rerouted over to the north side of the existing tracks and relocated underground along the north side of the existing railroad corridor, using a directional bore under I-710, the LADWP transmission corridor, and the Los Angeles River. Alternatively, overhead routing may be employed in the event that undergrounding was infeasible due to construction constraints. The existing overhead lines and their supports would be removed between the existing pole located at the Rayo Ave. cul-de-sac on the west to the second existing pole east of I-710 on the east. Permanent vault structures and riser poles would serve to transition the lines back overhead. Subtransmission structure height modifications will typically also require modifications to adjacent structures. Additional right-of-way requirements are similar to what is discussed above for the 66-kilovolt overhead lines at Southern Ave., with the addition of a permanent 20-foot-wide easement and a permanent access easement that are needed from the Armstrong World Industries parcel adjacent to the railroad right-of-way, and utility license agreements from the UP Railroad. The relocation would occur in a primarily industrial area and would not bring the system closer to sensitive land uses.

The 66-kilovolt overhead lines (N2006) crossing I-710 north of the Florence Ave. overcrossing would be in direct conflict with the proposed Florence Ave. interchange ramps. These lines would be undergrounded in a similar manner to what is described above, and the supports and lines would be removed along Florence Ave. from the existing riser pole located between Chanslor Ave. and River Dr., on the west, to the existing riser pole located just east of the existing northbound I-710 off-ramp terminus, on the east. Right of way requirements would be similar to those described above, with the

addition of a permanent fee take or easement within the existing IHOP parcel on the northwest corner of Florence Ave./Eastern Ave. to accommodate the proposed vault structure. The vault would be located within the existing parking lot and would not impact the existing building or the business operation.

The circuit 66-kilovolt overhead line (C2014) crossing I-710 at 208th St. would need to be raised over the existing railroad tracks and I-710 in order to provide appropriate clearance for the new railroad bridge structure and freeway alterations. The existing lines would remain in their current alignment with taller poles being installed, replacing the existing poles. No additional right-of-way is required.

Two circuit 66-kilovolt overhead lines (C2015 and C2016) crossing I-710 at Long Beach Blvd. and paralleling the northbound I-710 to Artesia Blvd. and State Route 91 (SR-91) ramp would be in direct conflict with the proposed widening under Alternative 5C. They are proposed to be relocated underground across the freeway right-of-way and within the SCE Transmission Fee parcels via trenching and boring. The existing overhead lines and supports would be removed and undergrounded, including the construction of temporary bore pits, permanent vault structures, and riser poles both west of the I-710 north of Long Beach Blvd. and east of I-710 north of SR-91. Overhead relocation of the lines would not be possible due to the area restriction caused by the I-710 footprint expansion and other existing aerial 220-kilovolt circuits. No additional right-of-way would be required. Subtransmission structure height modifications will typically also require modifications to adjacent structures.

The two circuit 66-kilovolt overhead lines (C2017) crossing I-710 north of SR-91 would be in direct conflict with the proposed widened freeway footprint under Alternative 5C. These lines currently connect to the existing overhead lines within the SCE fee parcels north of SR-91 and east of I-710. New, taller steel poles east and west of I-710 within the existing circuit alignment would be installed. No additional right-of-way is required.

Two circuit 220-kilovolt overhead lines (C2018 and C2019) crossing I-710 north of SR-91 would be in direct conflict with the freeway expansion proposed under Alternative 5C. New foundations, poles, and conductors would be installed, and no additional right-of-way would be required. Subtransmission structure height modifications will typically also require modifications to adjacent structures.

Poles (C2020) supporting the two circuit 66-kilovolt overhead lines crossing I-710 north of SR-91 would be in direct conflict with the expansion proposed under Alternative 5C. New foundations, poles and conductors would be installed, and no additional right-of-way would be required.

Two circuit 66-kilovolt overhead lines (C2021) crossing I-710 south of Alondra Blvd. would be in direct conflict with the proposed freeway footprint under Alternative 5C. New, taller steel poles would be installed in the same alignment as the existing poles, and new conductors would be installed. No additional right-of-way would be required.

Two circuit 66-kilovolt overhead lines (C2022) crossing I-710 at Carson St. would be in direct conflict with the new overcrossing and adjacent elevated roadway segments on either side of the bridge. The lines would be raised across I-710 and installed along the same alignment, not necessitating additional right-of-way. Subtransmission structure height modifications will typically also require modifications to adjacent structures.

LONG BEACH GAS & OIL. Alternative 5C would impact various Long Beach Gas and Oil facilities as follows:

An eight-inch and 12-inch high pressure gas line (C1112) crossing I-710 and running across Long Beach Blvd. would be impacted by the structure replacement proposed under Alternative 5C. Therefore, a two-stage relocation strategy is proposed that would install the eight-inch and 12-inch lines on the north side of the structure once constructed, then tied into the existing lines. A new easement would be required for the relocation of the lines. Another similar conflict (C1113) of an eight-inch and ten-inch line crossing I-710 and running along Artesia Blvd. would be impacted and relocated in the same manner

VERIZON. Some of the facilities that follow were formerly owned by Verizon and are now owned by Frontier Communications, who provides service within parts of the Study Area.

A copper and fiber underground communications system (S2400) on the north of the Anaheim St. overcrossing and bridge over the Los Angeles River would be impacted by the replacement of the Anaheim St. structure under Alternative 5C. The system would be relocated to the south side of the structure between Harbor Ave. and east of San Francisco Ave., utilizing a two-phased construction method.

A small aerial copper line (S2401) currently runs parallel to Anaheim St. and the southbound I-710 on-ramp between Fashion Ave. and Harbor Ave. The existing poles would conflict with the reconfiguration of the interchange and new poles are, therefore, required. The existing copper line can likely be transferred to the new poles.

A copper and fiber aerial communication system (S2402) runs just outside the western edge of the I-710 in the backyards of homes adjacent to the I-710 right-of-way between 19th St. and Burnett St. A short stretch of this line, between 23rd St. and Burnett St., is in conflict with the improvements proposed under Alternative 5C, and would need to be realigned or adjusted accordingly, with one to two poles being relocated just west of their present location.

A copper and fiber system (S2404) on the south half of the Willow St. overcrossing over I-710 and the Los Angeles River would be impacted by the reconstruction of the Willow St. structures and, therefore, relocated to the north side of the structure, utilizing a two-phased construction strategy wherein the north half of the Willow St. structure would be constructed first in order to avoid interim relocations.

A small copper line (S2405) on poles with the S2036 aerial system (see SCE section) crossing the I-710 to feed a facility at the Los Angeles River would be impacted by this alternative. The system would be in conflict with the proposed footprint under Alternative 5C. The relocation would require a new pole at the end of 33rd St. to the west and a new pole on the east side of I-710 opposite 33rd St., generally in line with the existing system.

A large underground communication system (S2410) currently exists in the middle of Wardlow Rd., which would be impacted by the proposed reconstruction of the Wardlow Rd. structure under Alternative 5C. The system is proposed to be relocated into the north half of Wardlow Rd. utilizing a two-phased construction strategy wherein the north side of the structure would be built first. The design and construction of this relocation are highly complex and require significant lead times for both phases, as well as for the placing and splicing of new communication lines.

An aerial service line (S2411) is located on joint poles with S2040 (see SCE discussion) and would be relocated further north between Delta St. and Caspian Ave., as well as pulled back one pole at the northwest quadrant of Wardlow Rd. and I-710 to avoid the proposed Alternative 5C footprint.

A four 4,000-strand fiber-optic cable (C2401) is currently located in the bridge structure at Long Beach Blvd. and I-710. The structure is proposed to be replaced under Alternative 5C; therefore, the lines must be relocated. Construction would be staged so that half of the bridge would be replaced at a given time, and the existing lines would be relocated to the other side of the bridge temporarily so that service is not interrupted. The conduit and fiber-optics can be set in place and connected when the second stage of construction begins. New easements may be needed. Utility conflict number C2402, a four-inch duct with a 480-strand fiber-optic cable located at Del Amo Blvd. and I-710 would be impacted and relocated in a similar fashion.

CHARTER COMMUNICATIONS. Impacts to Charter Communications facilities under Alternative 5C are as follows:

A copper CATV aerial system (S2500) runs just outside the westerly edge of the I-710 right-of-way between 19th St. and Burnett St. A short stretch of this system (between 23rd St. and Burnett St.) is in conflict with proposed improvements under Alternative 5C and would, therefore, relocate one to two poles just west of their present locations.

An aerial fiber line (S2504) located on SCE poles along Wardlow Rd. would be relocated to avoid conflicts with the proposed geometry under Alternative 5C. When that relocation occurs, Charter would need to de- and re-flash their cable to attach to the new poles.

A fiber system (S2505) in the south half of the Willow St. overcrossing and bridge structure crossing I-710 and the Los Angeles River would be impacted due to the reconstruction of the Willow St. structures and interchange under Alternative 5C. The system would ultimately be relocated to the north half of the Willow St. structures utilizing a two-phased construction strategy that would construct the bridge one half at a time and the north half first, thereby avoiding interim relocations.

SOUTHERN CALIFORNIA GAS COMPANY. A 26-inch steel high pressure gas line (C1101) crossing both I-405 and I-710 would be impacted by the proposed connection between southbound I-710 to southbound I-405. Therefore, a new 26-inch encased pipe, perpendicular across I-405 and I-710 would be bored and designed in a sweep configuration to avoid the proposed connector. Easements from Caltrans and private property in the vicinity would be required.

A 26-inch steel high pressure gas line (C1104 and C1106) crossing Del Amo Blvd. east of I-710 and south of Del Amo Blvd. would conflict with the proposed Del Amo Blvd. northbound I-710 on-ramp and widened Del Amo Blvd. at this location. The existing gas line would require the casing extended below the proposed roadway limits. Therefore, the casing to the south would be extended and the alignment would be straightened under the proposed road work on the north side of Del Amo Blvd. No additional right-of-way would be required.

A 26-inch steel high pressure gas line (C1105) crossing under I-710 at the Long Beach Blvd. northbound off-ramp and northbound loop on-ramp would be impacted by the proposed Long Beach Blvd. northbound off-ramp. Therefore, the existing line would be relocated and encased to remove angle points from within Caltrans right-of-way, protecting the line and making it serviceable in the future. New easements would be required at some locations.

A 30-inch steel high pressure gas line (C1109) on the south side of the Del Amo Blvd. undercrossing at I-710 may be impacted by the replacement of the structure over Del Amo Blvd. under Alternative 5C. If the locations of the columns for this structure cannot avoid impacting the line, the line would be relocated to the south, parallel to the existing alignment. Any existing easement would then need to be replaced.

A regulator station for gas facilities (C1110) currently located outside of the roadway, near the back of the sidewalk at Del Amo Blvd. and Susana Rd. would be within the footprint of the improvements proposed by Alternative 5C. The regulator facility would be relocated

outside of the Alternative 5C footprint. A specific location has not yet been determined, and any existing easement would need to be replaced.

A 30-inch underground high-pressure gas line (N1101) crosses I-710 at Quinn St. and is encased within a 36-inch casing within the limits of the freeway right-of-way. Under Alternative 5C, I-710 would be reconstructed and widened at the location of this pipe crossing, and the depth of the existing gas line is assumed to be sufficient to accommodate the freeway reconstruction without impacting the pipe, thereby protecting the facility in place. If the existing pipe is not deep enough to pass under proposed retaining wall footings on either side of the proposed freeway, special wall/footing designs may be required to avoid the pipe.

A 26-inch underground high-pressure gas line (N1102) crosses I-710 at Sheila St., under the proposed I-710 mainline and connector bridges spanning over Hobart Yard. This pipe would be protected in place and proposed column footings adjacent to the pipe would be designed to avoid any physical conflicts with the existing pipe, and the top of the footing elevation would be below the existing pipe to avoid transfer of any bridge loading from column to pipe.

LADWP TRANSMISSION. No major LADWP facilities would be impacted under Alternative 5C. However, the LADWP's transmission line rights-of-way are integral components of its transmission line system, which provides electric power to the City of Los Angeles and other local communities. The use of those rights-of-way is under the jurisdiction of the Federal North American Electric Reliability Corporation (NERC). The safety and protection of the critical transmission facilities are the primary factors used to evaluate secondary land use proposals in the same rights-of-way. The rights-of-way are used by the LADWP for access, construction, maintenance, facility expansion, and emergency operations. As a result, it is possible that the improvements under Alternative 5C within or immediately adjacent to LADWP transmission line rights-of-way could be subject to temporary disruption in the event LADWP needs to access its rights-of-way.

MWDSC. Conflict S3200B is an MWDSC facility north of Wardlow Rd. and south of the I-710/I-405 interchange. An existing 30-inch MWDSC line crosses under the Los Angeles River, continuing in the east-west direction where the discharge structure and air-vac assembly¹ are located both within existing and future Caltrans right-of-way. Under Alternative 5C, the valve would be relocated north of the existing MWDSC line and provide

¹ Air-Vacs, or Air-Vacuum release valves, are devices installed at high points in water pipelines that release accumulated air trapped in the pipeline, to prevent corrosion.

a new outlet to the Los Angeles River. The existing air-vac assembly would be relocated to Gale Ave.

An MWDSC 78-inch pre-stressed concrete second lower feeder pipeline (Conflict C3201), that runs in an east-west direction along Carson St. north of the I-710/I-405 interchange, is located under Alternative 5C. The facility would not be within direct physical conflict with the proposed improvements and would be protected in place. However, it may be necessary to extend the concrete encasement, or install another measure of permanent protection.

An MWDSC 73-inch welded steel middle feeder pipeline (Conflict C3202), that runs in an east-west direction along Greenleaf Blvd. north of the I-710/SR-91 interchange, is located under the proposed Alternative 5C. The facility would not be within direct physical conflict with the proposed improvements under Alternative 5C, and would be protected in place. However, it may be necessary to extend the concrete encasement, or install another measure of permanent protection.

An MWDSC 61-inch welded steel west coast feeder pipeline (Conflict C3203), that runs in an east-west direction underneath the I-710/I-105 interchange, is located under the proposed Alternative 5C. It would not be within direct physical conflict with the proposed improvements under Alternative 5C, and is to be protected in place. It may be necessary to extend the concrete encasement, or install another measure of permanent protection.

An MWDSC 79-inch water line located within the existing electrical transmission corridor, that crosses I-710 south of Firestone Ave. within the City of South Gate, is located under the proposed Alternative 5C footprint. It would not be within direct physical conflict with the proposed improvements, and would be protected in place.

T-MOBILE. A cell tower site (S2600) is located just south of Willow St. and is in conflict with the ramp realignment proposed under Alternative 5C. In addition to the tower structure, the site typically includes electronic switching equipment for numerous carriers and mobile telephone companies. T-Mobile plans indicate that both Nextel and Sprint have facilities within this site location. The site is normally connected to cables for one or more providers which must also be taken into account when relocating the site and structure to the new location. Because of the complexities of this relocation, no specific relocation site has been yet identified based upon the 30 percent level of engineering that has been completed to date. Under Alternative 5C, a specific relocation site would have been defined in the Specific Utility Relocation Plans that would have been prepared under Mitigation Measure U&ES-2 described at the end of this section.

XO COMMUNICATION. One XO Communication facility (C2901) would be impacted under Alternative 5C. An overhead fiber-optic 48- and 144-strand facility along the south side of

Alondra Blvd. would be in direct conflict with the freeway widening at this area. The facility would be relocated as a part of the SCE pole line relocation at this location. No additional right-of-way would be required under this strategy.

KINDER MORGAN. An active 24-inch refined petroleum product pipeline (C6601) located in a 30-inch underground casing crossing I-710 next to the Del Amo Blvd. interchange, and extending southeast across the Los Angeles River, would be impacted under Alternative 5C. The proposed widening of I-710 at this location would necessitate the relocation of the pipeline and block valve located on the west side of the I-710. A new 1,058-foot section of 16-inch pipeline and 921-foot casing would be installed, and the existing pipeline and casing would be removed or abandoned in place. The 24-inch block valve and enclosure to the west would be relocated westerly. A temporary construction easement, encroachment permit, and permanent utility easement would be necessary.

PLAINS ALL-AMERICAN PIPELINE LP. A 16-inch oil line, Plains Line 93 in crude oil service (C6801), runs underground and crosses I-710 south of Del Amo Blvd. on the south side of Compton Creek, within the Cities of Long Beach and Carson. Due to the addition of the Del Amo Blvd. northbound exit and the northbound truck bypass exit at Del Amo Blvd., the pipeline casing would need to be extended to match up to the proposed right-of-way limits under Alternative 5C. Modification of the pipeline is not physically practical, and so a new pipeline and casing under the I-710 would need to be installed. Therefore, a new bypass pipeline would need to be installed measuring 520 feet, encased in 498-foot 20-inch casing and tied into the existing pipeline as close to the freeway right-of-way as possible. Temporary construction and revised utility easements would be needed.

An active 16-inch steel hot oil fuel line (S6800) running in the east-west direction along 28th St., crossing I-710 and the Los Angeles River via an existing utility bridge with vaults located on either side of the river, would be impacted by Alternative 5C. Two vaults are located on the west side, one of which is owned by Plains. This vault would be relocated to within LACFCD right-of-way.

A vault box (S6801), located within BP property on the westerly side of I-710 at the terminus of Burnett St., would also be impacted by Alternative 5C. Incoming and outgoing pipelines may be impacted by the Alternative 5C geometrics, but the vault would remain in place.

CHEVRON. Conflicts S7201 and S7202 are active six-inch welded steel lines running east-west along 28th St. There are a number of utility lines crossing I-710 and the Los Angeles River, running through an existing utility trestle, with vaults located on both the east and west side of the river. Twelve lines exist within the vault owned by five companies. Valves are assigned to each line within the vault on each side of the river at 28th St. The vault on

the west side of the river would be relocated to LACFCD right-of-way towards the existing LACFCD maintenance road running along the western bank of the river.

Utility conflict C7202 is located at the intersection of I-710 and Imperial Hwy. There is one six-inch and one eight-inch underground pipeline that share a trench near the west side of the Los Angeles River that are impacted by the proposed northbound off-ramp to Imperial Hwy. under Alternative 5C. In order to avoid the conflict within this restricted area, the pipelines would be extended north onto private property to Imperial Hwy., where they would be encased and installed in the new Imperial Hwy. overcrossing structure, then reconnected to the existing pipelines north of Imperial Hwy. Two new block valves and a related block valve box would be installed west of the Los Angeles River and north of Imperial Hwy. to complete the connection. An estimated 1,580 feet of additional private right-of-way would be required, along with various construction and utility easements.

CHEMOIL. An idle four-inch pipeline (S6105) runs in the east-west direction along Burnett St., perpendicular to I-710 and the Los Angeles River. An existing valve is located on the east and west sides of the river, part of a shared utility vault consisting of 12 oil lines owned by four different oil companies. Under Alternative 5C, the line on the west of the Los Angeles River would be in conflict with the proposed geometrics and therefore, relocated to LACFCD right-of-way.

An idle eight-inch line (S6106), six-inch line (S6107) and another eight-inch line (S6108) running in the east-west direction along 28th St. perpendicular to I-710 and the Los Angeles River. Each line also contains a valve on both sides of the river and are part of the shared utility vault consisting of 12 lines owned by five different companies. All existing lines on the west side of the river are in conflict with the Alternative 5C improvements and are proposed to be moved to within LACFCD right-of-way.

CRIMSON PIPELINE CO. An active four-inch line (S6203) running on the east side of I-710 and along the westerly bank of the Los Angeles River through the OXY facility would be impacted by the proposed column locations of the Shoemaker Bridge under Alternative 5C. The relocation must be coordinated with the OXY facility currently occupying the property.

An idle eight-inch line (S6204) running along Anaheim St. would be impacted by the replacement of the Anaheim St. structures proposed under Alternative 5C. The line would be relocated within the bridge limits.

An active ten-inch line (S6206), an idle six-inch line (S6207), and an idle six-inch line (S6208) running in the east-west direction within a utility vault containing 12 oil lines owned by five different companies, with valves accompanying the utility vault on both sides of the Los Angeles River at 28th St. The vault on the west side of the river is proposed to be

relocated to LACFCD right-of-way due to conflicts with the proposed Alternative 5C geometrics.

An idle six-inch line (S6209) and an idle ten-inch line (S6210) runs in the east-west direction north of Wardlow Rd. An existing utility bridge would be demolished due to a conflict between it and the proposed I-710/I-405 interchange improvements under Alternative 5C. Three options for rerouting the pipelines have been developed that would avoid this conflict: Option 1 would relocate to Wardlow Rd. (via the Wardlow Bridge), Golden Ave., and Baker St. Option 2 would relocate to Wardlow Rd. (via the Wardlow Bridge), 500 feet west of Golden Ave. to Baker St. Option 3 would involve a 1,500-foot – long directional bore under I-710 and the Los Angeles River along Baker St. New utility easements would be necessary for whichever option is selected.

An existing utility vault (S6211) is located at the terminus of 28th St. on the east side of I-710. It is currently shared between 12 lines and five utility owners. Under the proposed Alternative 5C geometrics, this vault would be relocated.

TIDELANDS FACILITY. Conflict S7025 describes the Tidelands Facility, located west of I-710 between West Cowles St. and West Gaylord St. This facility consists of a total of 21 oil wells that are to be abandoned and relocated from the east side to the west side of I-710, between Cowels St. and Gaylord St. A Tidelands Well Bore Analysis was performed for the site in 2013 that contained a subsurface evaluation, feasibility, and cost analysis for the relocation. Several active production water and water injection lines service the existing facility and any within the proposed right-of-way under Alternative 5C would be removed or abandoned, and services provided from the west would be rerouted to the new Tidelands facility west of I-710, including conflict numbers S7021 (an active 12-inch steel produce water line), S7021A (an active four-inch line), S7022 (a water injection line), S7033 (an active production water line) and S7024 (an active steel oil line).

Associated with the Tidelands Facility are several lines within the facility owned and operated by the City of Lomita. Upon the relocation of the facility, all Lomita connections would be either abandoned or reestablished at the new Tidelands site under Alternative 5C or Alternative 5C, Design Option 2A, as the specific relocation would vary for each alternative but the general connection to the proposed site would be similarly configured.

OIL OPERATORS. An active ten-inch steel water line (S6500D) running in the east-west direction along Burnett St. perpendicular to I-710 and the Los Angeles River would be impacted at the west side of the river by the improvements proposed by Alternative 5C and would be relocated to LACFCD right-of-way, along with a vault containing existing valves.

An active 12-inch high density polyethylene (HDPE) water line (S6500B), an active eight-inch water line (S6500C), an active six-inch oil line (S6701), and an active eight-inch oil line (S6702) would be in conflict with the ramps to and from Pico Ave. under Alternative 5C and relocations would be coordinated with the Port of Long Beach so as to not conflict with other area improvements.

PARAMOUNT PETROLEUM. An active six-inch steel oil line (S6702A), running along Harbor Ave. and Fashion St. and turning 90 degrees west at Willow St., was relocated south of Willow St. into the adjacent alley, avoiding a partial longitudinal encroachment into future Caltrans right-of-way.

An active eight-inch steel oil line (S6703) running longitudinally to I-405 within Wardlow Rd., west of I-710, would require the relocation of a portion of the line under Alternative 5C within the southwest corner of the proposed I-710/I-405 interchange. The line is proposed to be re-routed further east along Wardlow Rd. and Delta Ave., connecting with the existing alignment before the I-405 approach. Encasement of the line within Caltrans right-of-way would also be extended further south.

SHELL OIL. An active 12-inch steel line (S6900) running east-west along 28th St. is one of several utility lines crossing I-710 and the Los Angeles River through an existing utility trestle, with vaults located on both sides of the river, and is one of 12 lines within the vault owned by five different companies. Valves are assigned to each line within the vault on each side of the river at 28th St. The vault on the west side of the river would be relocated to LACFCD right-of-way under Alternative 5C. Additionally, a Shell vault (S6901) located at 28th St. would also be relocated to LACFCD right-of-way and a shared ownership vault is proposed.

OCCIDENTAL PETROLEUM. Oxy's standard lease facility within LACFCD's boundary (S6600) is located along the west bank of the Los Angeles River between Ocean Blvd. and Anaheim St. The facility would be impacted by the proposed alignment of the replaced Shoemaker Bridge under Alternative 5C and four existing oil wells would be impacted and require relocation.

TESORO. The existing Tesoro Manifold meter is located within the vicinity of Burnett St. in Long Beach and, therefore, most of the Tesoro conflicts under Alternative 5C are located in this area. These conflicts include S7507, an active nine-inch welded steel pipe (WSP), S7508, an idle six-inch WSP, S7509, an idle 13-inch WSP, S7513, an idle eight-inch WSP, S7514, an active ten-inch WSP, and S7522, an active 12.75-inch steel line. These all cross the Los Angeles River through the utility trestle located at Burnett St. and utility vaults are located on both sides of the river. The west side vault is in conflict with the Alternative 5C improvements proposed and would be relocated to LACFCD right-of-way.

Idle eight-inch (S7511) and ten-inch (S7512) WSP lines currently run east of I-710 from 11th St. to Burnett St. Under Alternative 5C, the lines would both need to be relocated outside of the proposed Caltrans right-of-way. This relocation is proposed to be located along Fashion Ave. and Gale Ave., connecting to Burnett St.

Two idle 8.625-inch WSP lines (S7516 and S7517) are located on the west side of I-710 and additional casings for the lines may be required with the proposed right-of-way line under Alternative 5C.

ALTERNATIVE 7. Below is a focused discussion of the impacts to major regional facilities and utilities, including LADWP, SCE, Oxy Oil, Long Beach Gas & Oil, and SCG as a result of Alternative 7.

AT&T. Alternative 7 would result in the same impacts to facilities discussed under Alternative 5C; please refer to the previous discussion.

LACSD. The impacts to and relocation strategy of the pump station at Gaylord St. within the City of Long Beach would be similar to what is described above under Alternative 5C, Design Option 2A.

Alternative 7 would result in the same impacts to facilities discussed under Alternative 5C; please refer to the previous discussion. In addition, Alternative 7 would require the relocation of a 45-inch line running along Frontage Rd. East, also located within the City of South Gate, approximately ten feet to the east to avoid conflicts with the proposed freight corridor structure foundations. The relocation would be within the right-of-way of Frontage Rd. East, and no additional right-of-way would be required.

SCE. Alternative 7 would result in impacts to various SCE overhead lines within the Study Area. The following is a description of impacts associated with Alternative 7:

The impacts to facilities S2008A, S2010, S2011A, S2021B, S2022A, S2022B, S2025, S2040, S2042 are the same as under Alternative 5C, outlined above.

An aerial 66-kilovolt system (S2000) runs along the north side of Pico Ave. and is impacted by the proposed Alternative 7 improvements at the ramp to the Gerald Desmond Bridge and ramps to and from Pier B St. At the Gerald Desmond Bridge crossing, two new poles would need to be installed (one on each side of the ramp) to avoid the conflict, in generally the same alignment. The conflict near Pier B St. would require at least three new engineered steel poles, and possibly up to five, placed in line with the existing system. Conflict S2003 is another aerial 66-kilovolt system on joint poles with S2000 that would be impacted and adjusted in the same manner as described above for conflict S2000.

A 66-kilovolt aerial system (S2005) along the west side of the Los Angeles River running from the Pico Substation, south of Ocean Blvd., to Willow St. would be in conflict with the improvements proposed under Alternative 7 in several locations, including the northbound on-ramp from Pier B St., the freight corridor at Shoemaker Bridge, and the freight corridor from the Oxy Oil facility to Willow St. The relocation strategy proposed under Alternative 7 would be to relocate this system currently along the west edge of the Los Angeles River to the east side of the river, and underground from the Harbor Ave./Pacific Coast Hwy. intersection and within the Pacific Coast Hwy. overcrossing/bridge structure across the Los Angeles River east to Magnolia Ave. At Magnolia Ave., the system would return overhead and continue south to 9th St. or Cypress Way, where it would underground again and turn west to Crystal Ct. or Daisy St. and proceed south again to 5th St. or 6th St. where it would connect to a new pole east of Shoreline Dr. and then span to connect to the Seabright Substation from the north. The system would then use existing poles from the Seabright Substation to cross the Los Angeles River to the Pico Substation west of the river. Engineered steel poles would be required of this relocation and new utility easements would be necessary. Subtransmission structure height modifications will typically also require modifications to adjacent structures.

An aerial 12-kilovolt system (S2011B) feeds the pump station between Gaylord St. and 16th St., which would be removed under the Alternative 7 improvements. Therefore, the aerial system would be removed as well.

A four-kilovolt and 12-kilovolt underground system within the Anaheim St. overcrossing/bridge over the I-710 and the Los Angeles River would be impacted by the replacement of Anaheim St. under Alternative 7. Therefore, the system would be relocated underground across I-710 and the river at Cowles St. via directional bore. West of the river, the system would run underground along Harbor Ave. from Anaheim St. to 14th St., and then east to Fashion Ave. also via directional bore starting at Cowles St. East of the river, the system would be relocated within San Francisco Ave. south to Anaheim St. This system would share the underground crossing with conflicts S2014 (a 66-kilovolt aerial system crossing I-710 and the Los Angeles River at Cowles St.), S2015 (a 66-kilovolt aerial system also crossing I-710 and the Los Angeles River at Cowles St.), and S2017 (a 12-kilovolt aerial system crossing I-710 and the Los Angeles River at 15th St.).

A 66-kilovolt system (S2026) crossing I-710 and the Los Angeles River at Hill St. would be impacted by the proposed footprint under Alternative 7. The existing H-frame pole between I-710 and the Los Angeles River access road is impacted by the new right-of-way. West of the river, the system would be undergrounded at Hill St./Fashion Ave. and then cross I-710 and the Los Angeles River via directional bore. East of the river, the system would rise back up on an engineered steel pole at Hill St./San Francisco Ave. to tie back into the existing system. A four-kilovolt system (S2027) on joint poles with S2026

would be similarly impacted, and on the west, would be undergrounded at Hill St. just west of Gale Ave., and use a directional bore with S2028 (see below) to cross I-710 and the Los Angeles River. East of the river, the system would rise back up to a pole on DeForest Ave. just north of Hill St., and tie back into the existing system. S2028 is a 12-kilovolt system also on joint poles with S2027 and S2026 that crosses I-710 and the Los Angeles River at Hill St. West of the river, the system would be undergrounded at Hill St. just west of Gale Ave., use a directional bore under the I-710 and Los Angeles River with S2027, and rise back up on an engineered steel pole on DeForest Ave. just north of Hill St. to tie back into the existing system. Utility easements may be required in support of this work. Because the system is on existing poles along Hill St., the proposed relocation would not move the system any closer to existing sensitive land uses, and would partially underground the lines.

A 66-kilovolt system (S2029) also crossing I-710 and the Los Angeles River at Hill St. jointly with S2026 would be impacted in a similar fashion as is described above. The strategy is as follows: to the west, the system would be undergrounded at Hill St./Fashion Ave. and use a directional bore to cross I-710 and the Los Angeles River. East of the river, the system would rise back on an engineered steel pole at Hill St., just east of DeForest Ave., to tie into the existing system. Because the system is on existing poles along Hill St., the proposed relocation would not move the system any closer to existing sensitive land uses, and would partially underground the lines. Utility easements may be required in support of this work.

Two 66-kilovolt aerial systems (S2033 and S2035) cross I-710 and the Los Angeles River at Spring St. The existing pole at the east end of Spring St. is in conflict with the proposed freight corridor under Alternative 7. The avoidance strategy is to relocate the system underground at Spring St. and cross under the I-710 and the Los Angeles River via directional bore. West of the river, a new pole west of Gale Ave. would be required. East of the river, a new pole between DeForest Ave. and San Francisco Ave. would be required as well. A 12-kilovolt aerial system (S2034) crossing I-710 and the Los Angeles River at the same location as S2033 would be impacted and relocated in a similar manner, but the new pole would be required between San Francisco Ave. and Golden Ave. The relocation would not bring the system appreciably closer to Birney Elementary School or the residential neighborhoods on the east side of the Los Angeles River. Utility easements may be required in support of this work.

A four-kilovolt aerial system (S2036) crossing I-710 to feed the Gage Station facility at the Los Angeles River would be in conflict with the proposed I-710 footprint and freight corridor under Alternative 7. The Gage Station would be relocated to the east side of the Los Angeles River and a new underground four-kilovolt or 12-kilovolt system would be

extended from 34th St. south along DeForest Ave. to the new Gage Station site. A new pole on 34th St. would be required.

A 12-kilovolt aerial system (S2037) crossing I-710 and the Los Angeles River at 34th St. would be directly impacted by the proposed freight corridor under Alternative 7. In order to avoid this conflict, the relocation would require a directional bore to underground the system beneath the I-710 and Los Angeles River. West of the river, a new vault at 34th St. and new pole on 34th St. west of Gale Ave. would be required. East of the river, a new vault and pole at the east edge of the greenbelt would be required. New utility easements would be necessary here.

Two 220-kilovolt circuits (C2003) paralleling the east side of I-710 from Long Beach Blvd. to north of SR-91 would be too close to the new freight corridor structure and the expanded mainline footprint proposed under Alternative 7 to meet appropriate SCE horizontal clearance requirements. The lines would be relocated in order to eliminate overhead encumbrances and facilitate the construction of the new freeway and freight corridor structures. The lines would be relocated easterly within the SCE Fee Parcels, and taller poles would be installed, replacing the existing poles. No additional right-of-way would be required.

Seven 66-kilovolt circuits (C2004) supported on H-frame towers paralleling the east side of the I-710 crossing Artesia Blvd. and SR-91 would be in conflict with the freeway expansion and freight corridor proposed under Alternative 7. Therefore, the existing lines would be undergrounded and support structures removed. The 220-kilovolt closest to the I-710 (see C2208 below) would be relocated to the east to avoid impacting the proposed widening and use the existing H-frame area to accommodate the proposed relocations. Underground agreements with Caltrans within the state right-of-way crossing SR-91 would be required. Subtransmission structure height modifications typically also requires modification to adjacent structures.

Two 220-kilovolt circuits (C2007) paralleling the east side of the I-710 from Long Beach Blvd. to north of SR-91 would be in conflict with the proposed freight corridor and freeway footprint under Alternative 7, and the lines would be relocated in order to eliminate overhead encumbrances to facilitate the construction of the structures. The lines would be relocated easterly of I-710 within the SCE Fee Parcels, with taller poles replacing the existing poles. Additional right-of-way may be required in support of undergrounding the SCE facilities and/or separation from other utilities. Subtransmission structure height modifications typically also requires modifications to adjacent structures.

Two 220-kilovolt circuits (C2008) paralleling the east side of the I-710 from Long Beach Blvd. to north of SR-91 would be too close to the proposed freight corridor and expanded freeway footprint under Alternative 7 to meet appropriate SCE horizontal clearance

requirements. The lines would be relocated easterly in order to eliminate any overhead encumbrances to facilitate the construction of the new structures. The existing poles would be replaced with taller poles. Additional right-of-way would be required of Caltrans at SR-91 to accommodate the proposed steel pole foundation locations. The H-frame (see [C2006] above) would need to be undergrounded prior to this relocation.

Seven 66-kilovolt circuits (C2011 and C2012) supported on H-frame towers paralleling the east side of I-710 crossing Artesia Blvd. and SR-91 would be in conflict with the proposed freight corridor and expanded freeway footprint under Alternative 7. The existing 66-kilovolt lines on H-frame towers would be undergrounded and the existing support structures removed. The 220-kilovolt line closest to the freeway would be relocated easterly to avoid impacting the proposed freeway widening and would use the existing H-frame area to accommodate the proposed relocations. As this relocation would remain between the I-710 mainline and the Los Angeles River, it would not place this system closer to sensitive land uses. Underground agreements with Caltrans within State right-of-way crossing SR-91 would be required.

Two 220-kilovolt circuits (C2013) paralleling the east side of I-710 from Long Beach Blvd. to north of SR-91 would be too close to the proposed freight corridor and expanded freeway footprint under Alternative 7 to meet appropriate SCE horizontal clearance requirements, and would be relocated to eliminate overhead encumbrances to facilitate the construction of the new structures. The lines would be relocated easterly in the SCE Fee Parcels, and the existing poles would be replaced with taller poles. No additional right-of-way would be required.

A 16-inch high pressure gas line (C1111) crossing I-710 north of Long Beach Blvd. may be impacted by freeway widening and a sound wall proposed under Alternative 7 at the west side of the southbound off-ramp. The existing major distribution facility crossing Long Beach Blvd. parallel to Victoria St. would require a casing extension at the location of the I-710 widening, and the sound wall footing should be designed to avoid conflict. The pipe would be protected in place.

The 66-kilovolt overhead lines (N2001) crossing I-710 south of Miller Way would be in both direct and indirect conflict with Alternative 7 improvements. The existing lines would be relocated underground under I-710, and the existing lattice tower located on the east side of I-710 and the overhead lines to the two adjacent towers would be removed. On either end, the underground lines would extend to a set of vaults, and beyond the vaults, riser poles would be installed to transition the lines back overhead and reconnect with the existing lines outside the limits of the relocation. Both east and west of I-710, new right-of-way would be needed in fee or via easement outside the current 25-foot wide SCE-

owned corridor to accommodate the new vault and underground line to be located within the existing private property in the area.

The 66-kilovolt overhead lines (N2002) crossing I-710 at Southern Ave. would be impacted by Alternative 7 as they would be in direct conflict with the new Southern Ave. overcrossing and the adjacent elevated roadway segments on either side of the bridge, and would indirectly conflict with the California Public Utilities Commission (CPUC)-mandated minimum vertical clearance requirement at the crossing of the freight corridor viaduct. The proposed relocation would be identical to that proposed under Alternative 5C; please refer to the previous discussion.

Two 66-kilovolt overhead lines (N2003) crossing I-710 south of existing UP Railroad West Santa Ana Branch crossing north of Firestone Blvd. would be impacted by Alternative 7. The existing lines would be too close to the new railroad bridge structure over I-710 to meet appropriate SCE and UP Railroad horizontal clearance requirements and would indirectly conflict with the CPUC-mandated minimum vertical clearance requirement at the crossing of the freight corridor viaduct. The proposed relocation would be identical to that proposed under Alternative 5C; please refer to the previous discussion.

The 66-kilovolt, 12-kilovolt, and four-kilovolt overhead lines (N2004 and N2005) crossing I-710 south of the proposed Clara St. overcrossing would be in conflict with the CPUC-mandated minimum vertical clearance requirement of 30 feet between the proposed structure deck and existing lines at the crossing of the freight corridor viaduct under Alternative 7. The existing lines would be relocated underground within the freeway right-of-way, the LADWP transmission corridor, and the Los Angeles River. The existing overhead lines and their supports would be removed along Clara St. from the existing pole located on the west side of the River Rd. intersection, on the west, to the existing pole located just east of the residential street intersection, to the east. Permanent vault structure and riser poles would be installed on either side of the freeway. West of the river, the bore pit and vault would be located within River Rd. south of Clara St. A riser pole would be located between River Rd. and Clara St., just west of the new vault, to transition the underground lines back overhead. New overhead lines would be installed along the north side of River Rd. between the new riser pole and the existing pole, located east of the Clara St./River Rd. intersection. East of the freeway, the bore pit and vault would be located within the dead-end residential street located just south of Clara St. A riser pole would be installed along the north side of the street, just west of its intersection with Clara St., to transition the underground lines back overhead. New overhead lines would be installed between the riser pole and the existing pole, north of Clara St., east of the intersection. Additional right-of-way requirements associated with the impacts to this facility would include a new ten-foot wide underground easement from the USACE and/or

LACFCD for the portion under the Los Angeles River and a new 20-foot-wide underground easement for the segment passing under the LADWP transmission corridor.

The 66-kilovolt overhead lines (N2006) crossing I-710 north of the Florence Ave. overcrossing would be in direct conflict with the proposed Florence Ave. interchange ramps under Alternative 7. The impacts and proposed relocation would be identical to what is discussed under Alternative 5C; please refer to that discussion above.

The 66-kilovolt overhead lines (N2007) crossing I-710 south of the existing UP Railroad overcrossing at Randolph St. would be indirectly impacted by the freight corridor viaduct associated with Alternative 7, and the CPUC-mandated minimum vertical clearance requirement of 30 feet between the proposed structure deck and the existing lines cannot be met at the crossing area. Therefore, the existing lines would be relocated underground across the freeway right-of-way, the LADWP transmission corridor, and the Los Angeles River. The existing overhead lines and their supports would be removed between the existing pole located on the south side of Randolph St. just west of Casitas Ave., to the existing lattice tower located within the SCE corridor approximately 560 feet west of Eastern Ave. This would include the removal of three existing lattice towers. On either end, the new underground lines would extend beyond the temporary bore pits to a set of permanent vault structures. West of I-710, the underground line, bore pit, and adjacent vault would be located within Randolph St.; west of the vault, along Randolph St., a riser pole would be constructed within the southerly sidewalk, to transition the lines overhead to reconnect to the existing overhead system. East of I-710, the new underground line, bore pit, and adjacent vault would be located within the existing SCE corridor, and a new riser pole would be installed just east of the vault to transition the lines to reconnect to the existing overhead system. New underground easements (10 feet from USACE and/or LACFCD under the Los Angeles River, and variable widths from LADWP under the transmission corridor) would be needed as well as a new permanent encroachment permit from Caltrans.

Two 66-kilovolt overhead lines (N2008) running along the east levee road of the Los Angeles River, that provide electrical service to the City of Vernon, connect to the 66-kilovolt overhead lines that cross I-710 and the river south of the existing UP Railroad crossing as described above. The undergrounding process of those lines as explained in more detail in the previous paragraph would disrupt this connection and would require restoration under Alternative 7. A separate set of ducts and vaults is involved in this reconnection, and these lines would require extension from the existing connection point on the east side of I-710 through the construction of a separate bored tunnel, located adjacent to the tunnel constructed to house the previous line. From the westerly bore pit, the underground line would be extended to the west to a new vault located within the LADWP transmission corridor and a new riser pole along the river levee in line with the

existing overhead system. From the new riser pole, the lines would transition overhead and extend north, to connect back to the existing system. For the reestablishment of the connection, the poles supporting the existing lines south of the UP Railroad bridge would be removed, and new overhead lines would be strung between the new riser pole, on the south to the nearest existing pole to the north. A new 20-foot-wide underground easement from LADWP would be needed within the transmission corridor, as well as a permanent encroachment permit from Caltrans as described above. Subtransmission structure height modifications will typically also require modifications to adjacent structures.

The 66-kilovolt overhead lines (N2009) crossing I-710, along the south side of Randolph St., adjacent to the existing UP Railroad corridor within the Cities of Commerce and Maywood, would be indirectly impacted by the freight corridor viaduct under Alternative 7, and the CPUC-mandated minimum vertical clearance requirement of 30 feet between the proposed structure deck and the existing lines cannot be met at this crossing. The lines would be relocated underground under the freeway right-of-way, LADWP transmission corridor, and Los Angeles River. The existing overhead lines and their supports would be removed from the existing pole along the south side of Randolph St. North, in line with the project of Home Ave. on the west, to the pole along the south side of Randolph St., located approximately 350 feet east of the cul-de-sac, on the east. Temporary bore pits and permanent vault structures and riser poles would be constructed west of the river and east of I-710. West of I-710, the bore pits and adjacent vaults would be located within Randolph St. North, and west of the vault, along Randolph St., a riser pole would be constructed along the south side of the street within the UP Railroad right-of-way to transition the lines overhead to reconnect to the existing overhead system. East of I-710, the bore pit and vault would be located within the south side of Randolph St. A new riser pole would be installed east of the vault to transition the lines to reconnect to the existing overhead system, within UP Railroad right-of-way. Twenty-foot underground easements would be required from USACE and/or LACFCD for the portion of the line under the Los Angeles River and from LADWP for the portion of the line under the transmission corridor.

The 66-kilovolt overhead lines (N2010) crossing I-710 along the north side of Randolph St. adjacent to the existing UP Railroad corridor would be impacted under Alternative 7 in the same manner as described above for the overhead lines along the south side of Randolph St., and would be undergrounded in the same way. Please refer to the discussion in the previous paragraph. The two sets of lines would share the undergrounding easements from USACE and/or LACFCD and LADWP as described above. Subtransmission structure height modifications will typically also require modifications to adjacent structures.

The 66-kilovolt overhead lines (N2011) located along the east side of I-710 which connect the lines along the north side of Randolph St., as described above, to the customer

substation serving the Newark Pacific Paperboard Cooperation property, would be impacted both directly by the freeway mainline and freight corridor supports and indirectly by the undergrounding of the previously discussed lines along the north side of Randolph St. under Alternative 7. The existing overhead lines would be maintained along the north side of Randolph St. to the existing cul-de-sac to preserve the connection to the substation, and a new pole would be installed at the roadway terminus outside of the new freeway right-of-way. New overhead lines along the east side of the new freeway right-of-way under Alternative 7 to route the lines to a new substation location, which would require new right-of-way to be acquired or dedicated along the north side of 61st St. for accommodation. A potential location for the substation was preliminarily identified between the freeway right-of-way and the relocated Los Angeles Junction (LAJ) tracks. The area needed for in-kind replacement is approximately 60 feet by 100 feet. This relocation would occur in a predominantly industrial area.

Under Alternative 7, the 66-kilovolt overhead lines (N2012) crossing I-710 along the south side of the Slauson Ave. overcrossing would be directly impacted by the proposed freeway mainline and indirectly impacted due to the CPUC-mandated minimum vertical clearance requirement of 30 feet between the proposed structure deck and existing lines which cannot be met at the crossing of the freight corridor viaduct. Subtransmission structure height modifications will typically also require modifications to adjacent structures. Therefore, the existing lines would be relocated underground, under the proposed freight corridor structure. Undergrounding would include construction of temporary bore pits, permanent vault structures, and riser poles both west of the Los Angeles River and east of I-710. West of I-710, the bore pit and adjacent vault would be located within Slauson Ave., on the north side. West of the vault, along Slauson Ave., the line would cross to the south side of the street and a riser pole would be constructed to transition the lines overhead to reconnect to the existing overhead system. East of I-710, the bore pit would be located on private property, north of Slauson Ave., and the adjacent vault would be located within the north side of Slauson Ave. The line would extend from the new vault across to the south side of Slauson Ave., and a new riser pole would be installed along the south side of the road, east of the vault, to transition the lines to reconnect to the existing overhead system. A new ten-foot wide underground easement from USACE and/or LACFCD and a new 20-foot underground easement from LADWP would be needed for the portions of the bored line under the Los Angeles River and transmission corridors, respectively, as well as a new permanent encroachment permit from Caltrans.

The impacts to SCE utility numbers C2014, C2017, C2018, C2019, C2020, and C2021 are the same as described above under Alternative 5C.

SCG. The impacts to utility numbers C1101, C1104, C1105, C1109, C1110 and C1111 are the same under Alternative 7 as they are described above under Alternative 5C.

A 26-inch steel high pressure gas line (C1102) crossing I-710 north of SR-91 would be impacted by the columns and footings of the proposed freight corridor under Alternative 7. Avoidance of the impact is proposed; if relocation is necessary, two bore locations would be required, one on each side of the freeway. The line would be bored across I-710 and open trenched down Coachella Ave., then tie back in with the existing alignment. New easements would be required at proposed locations from Caltrans and from private property owners.

A 26-inch steel high pressure gas line (C1103) crosses 208th St. and the Los Angeles County Metropolitan Transportation Authority (Metro) Blue Line, east of I-710. Under Alternative 7, the freight corridor would be below grade at this location and in direct conflict with this gas line. Therefore, the line would be relocated to the north, and casing would be added to the proposed line where the freight corridor crosses it, and the relocation of the line would be deep enough to avoid any potential impact to the freight corridor here. The proposed relocation would be within SCE and Metro right-of-way and require coordination with those agencies.

The 30-inch underground high-pressure gas line (N1101) crossing I-710 at Quinn St. would be impacted under Alternative 7 in the same manner as it would be under Alternative 5C (see previous discussion). In addition, the proposed freight corridor, at this crossing location, is proposed to be located within the freeway median, which would be used to accommodate a series of single-column supports. Depending on where these columns are spaced/located along the median, the pipe could be impacted. Therefore, the freight corridor supports should be located and spaced as such that the foundations avoid this existing gas line and allow it to be protected in place. Under Alternative 7 this avoidance requirement would be addressed in the Specific Utility Relocation Plans to be prepared under Mitigation Measure U&ES-2 described at the end of this section.

The 26-inch underground high-pressure gas line (N1102) crossing I-710 at Sheila St. would be impacted and protected in place the same way as is described under Alternative 5C (see previous discussion).

LONG BEACH GAS & OIL. Impacts to Long Beach Gas and Oil facilities would be the same as what is described above under Alternative 5C.

VERIZON. The Verizon utility impacts and relocation strategies for conflicts S2400, S2404, S2410, S2411, and C4202 as outlined above under Alternative 5C would remain the same under Alternative 7.

CHARTER COMMUNICATIONS. Many of the impacts to Charter Communications facilities under Alternative 7 are the same as what is described above under Alternative 5C,

including for facilities S2504 and S2505. Impacts to Charter Communications facilities that would occur solely under Alternative 7 are as follows:

An active aerial copper line (S2502) crosses I-710 and the Los Angeles River at 34th St. The avoidance strategy under Alternative 7 has been to underground the facilities at this crossing location in order to avoid conflict with the proposed footprint and freight corridor.

CROWN CASTLE (FORMERLY NEXT G). A fiber system (S2200) on joint poles with SCE conflict S2026 (see discussion above) that crosses I-710 and the Los Angeles River would be impacted by the proposed right-of-way under Alternative 7. This system would be relocated underground via a directional bore crossing of I-710 and the river, but cannot be in the same casing as the SCE transmission facilities that are proposed to be undergrounded at this location.

T-MOBILE. The cell tower site (S2600) located just south of Willow St. conflicts with Alternative 7 improvements in the same manner as that of Alternative 5C. Please refer to the discussion above.

LADWP TRANSMISSION. The 230-kilovolt overhead lines (N2101) crossing the I-710 parallel to the Los Angeles River where the I-710 crosses the river, near the Miller Ave. undercrossing, a set of two circuit 287.5-kilovolt overhead lines (N2102) crossing I-710 just south of Firestone Ave., on the south set of steel lattice towers, and a single circuit 230-kilovolt overhead line (N2103) crossing I-710 south of Firestone Ave., on the north set of steel lattice towers, would be in conflict with the proposed elevated freight corridor under Alternative 7. The lines would all be relocated in place on taller tower structures to provide the required clearance, in a manner in which would avoid or minimize interruptions in service. Under Alternative 7, the relocation of these structures would require continued coordination between SCE and LADWP. No new permanent right-of-way or easements would be required for the reconstruction of these facilities.

MWDSC. Conflict S3200B is an MWDSC facility north of Wardlow Rd. and south of the I-710/I-405 interchange. The impacts to this facility are similar to what is described above under Alternative 5C, but the proposed geometry under Alternative 7 would not provide sufficient room to relocate the discharge valve into LACFCD right-of-way. Therefore, under Alternative 7, the discharge valve would be relocated to the east side of the Los Angeles River, with an outlet to the river and power provided from Baker St. The existing air-vac assembly would be relocated to Gale Ave. in the same manner as under Alternative 5C. Additional right-of-way would potentially be required and appropriate environmental re-evaluations would be undertaken pursuant to 23 CFR 771.129 under NEPA and Sections 15162 and 15164 of the State CEQA Guidelines.

An MWDSC 78-inch pre-stressed concrete second lower feeder pipeline (Conflict C3201), that runs in an east-west direction along Carson St. north of the I-710/I-405 interchange, is located under the proposed Alternative 7. It would not be within direct physical conflict with the proposed improvements, and would be protected in place as it would be under Alternative 5C. As in Alternative 5C, it may be necessary to extend the concrete encasement, or install another measure of permanent protection.

An MWDSC 73-inch welded steel middle feeder pipeline (Conflict C3202), that runs in an east-west direction along Greenleaf Blvd. north of the I-710/SR-91 interchange, is located under the proposed Alternative 7. It would not be within direct physical conflict with the proposed improvements, and would be protected in place as it would be under Alternative 5C. As in Alternative 5C, it may be necessary to extend the concrete encasement, or install another measure of permanent protection.

An MWDSC 61-inch welded steel west coast feeder pipeline (Conflict C3203), that runs in an east-west direction underneath the I-710/I-105 interchange, is located under the proposed Alternative 7. It would not be within direct physical conflict with the proposed improvements, and would be protected in place. As in Alternative 5C, it may be necessary to extend the concrete encasement, or install another measure of permanent protection.

An MWDSC 79-inch water line (N3201) located within the existing electrical transmission corridor, that crosses I-710 south of Firestone Ave., within the City of South Gate, is located under the proposed Alternative 7 footprint. It would not be within direct physical conflict with the proposed improvements, and is to be protected in place as it would be under Alternative 5C. However, under Alternative 7, the concrete encasement would be extended by 110 feet to the east and 20 feet to the west of current limits. No additional permanent right-of-way requirements would be needed for the encasement extension.

XO COMMUNICATION. An active aerial fiber system (S2900) on joint poles with S2026 (see SCE discussion above) would be impacted under the improvements proposed as part of Alternative 7. This facility would need to be relocated underground via directional bore crossing I-710 and the Los Angeles River. This system would not be allowed in the same casing as the SCE transmission facilities proposed to be undergrounded at this location, but would be able to be included in the same trench/casing as the Crown Castle/Next G system at this location (S2200, see above).

The utility conflict and relocation strategy described above for conflict C2901 under Alternative 5C would be the same under Alternative 7.

PARAMOUNT PETROLEUM. An idle eight-inch oil line (S6700), an active six-inch oil line (S6701), and an active eight-inch oil line (S6702) would all be in conflict with Alternative 7 improvements at the ramps to and from Pico Ave., and the relocations would be

coordinated with the Port of Long Beach so as to not conflict with other planned improvements in the vicinity. Conflicts S6702A and S6703 would be impacted and relocated similarly to what is described above under Alternative 5C.

One Paramount Petroleum facility (C6701) would be impacted under Alternative 7. There is an eight-inch underground crude oil line crossing the existing Metro Blue Line/208th street, near the Metro maintenance yard. The freight corridor facility proposed under Alternative 7 would be trenched at this location at a depth of approximately five feet below the existing oil line. The line would be protected via boring/trenching to an appropriate depth and new pipeline would need to be added at either end to connect to the existing pipeline. A new underground easement/permit would be required of Metro and/or Caltrans.

KINDER MORGAN. Utility facility C6601 would be impacted under Alternative 7 the same way as is described above under Alternative 5C. Additionally, utility conflict C6603 consists of a 16-inch refined petroleum pipeline within a 30-inch casing that crosses I-710 near Gordon St., north of Long Beach Blvd., and continues east across the Los Angeles River. The proposed freight corridor under Alternative 7 would effectively extend the State right-of-way line 40 feet to the east, necessitating the extension of the existing 30-inch casing 24 feet to the east. Under Alternative 7, the existing right-of-way agreement between Kinder Morgan and Caltrans would need to be modified to reflect this reconfiguration.

PLAINS ALL-AMERICAN PIPELINE LP. Plains conflict S6800 as described above under Alternative 5C would be impacted by Alternative 7 and relocated in a different configuration. Under Alternative 7, the vault (S6803) would be relocated west of I-710 to the West 28th St. terminus.

Utility conflict C6801 as described above under Alternative 5C would be the same under Alternative 7. In addition, Plains Line 63 (C6802), a 14-inch oil line crossing I-710 adjacent to the Metro Blue Line/208th St., would be impacted in two ways by the I-710 mainline and freight corridor proposed under Alternative 7. The relocation of 208th St. at the Metro Blue Line would impact the right-of-way for the pipeline as it passes under I-710. In addition, the proposed freight corridor would pose a conflict for this pipeline as well. In order to relocate the pipeline to account for the relocation of 208th St., the pipeline would be realigned on the west side of I-710 and run parallel to the freeway outside the freeway right-of-way for approximately 300 feet. A new 20-inch 421-foot-long casing would be installed across the freeway at a 90-degree angle between the edges of the right-of-way. The pipeline would be realigned on the east side of the freeway to connect to the existing line. A pipeline valve and valve box on the east side of the freeway would be repositioned. To address the impacts of the proposed freight corridor on this pipeline, an estimated 100-foot section of the pipeline would be realigned to run parallel to the west side of the

proposed freight corridor and lowered by an estimated 20 feet. A 120-foot section of casing would be installed to the segment of pipeline under the freight corridor. East of the freight corridor, the pipeline would be brought to original grade and reconnected to the existing pipeline. Temporary construction and revised utility easements would be necessary.

CHEVRON. Conflicts S7201 and S7202 described above under Alternative 5C have slightly different configurations under the Alternative 7 geometrics. The utility vault would be relocated west of I-710 to the West 28th St. terminus, rather than within LACFCD right-of-way.

Utility conflict C7202 as described above under Alternative 5C would have the same impacts and relocation strategy under Alternative 7.

CRIMSON PIPELINE CO. Conflicts S6203 and S6204 as described above under Alternative 5C would be similarly impacted and relocated under Alternative 7. However, the vault at 28th St. that contains conflicts S6206, S6207, and S6208 would be configured differently under Alternative 7 and be relocated into City of Long Beach right-of-way to 28th St.

A ten-inch active oil line with an 18-inch RCP casing (C6201) runs underground, parallel and to the north of the Rosecrans Blvd. crossing perpendicular to I-710, within a joint trench shared by Crimson and Chevron, and continues to the east, crossing the Los Angeles River via an existing utility bridge within the City of Paramount. The pipelines within the joint trench would be protected in place, as there is no direct conflict with the freight corridor under Alternative 7, but a one-foot-thick 20- by 200-foot concrete slab would be constructed that would protect the pipelines from any falling debris or surface traffic working under the elevated freight corridor in this location. Under Alternative 7, a temporary Caltrans easement would potentially be needed.

CHEMOIL. An idle four-inch pipeline (S6105) runs in the east-west direction along Burnett St., perpendicular to I-710 and the Los Angeles River. Since the available space under Alternative 7 is more confined than it would be under Alternative 5C, this would necessitate the relocations of the vaults at Burnett St. and 28th St. A directional bore is proposed at Burnett St. to relocate S6105. The existing utility bridge would be protected in place (containing lines S6106, S6107, and S6108).

TIDELANDS FACILITY. Conflict S7025 describes the Tidelands Facility, located west of I-710 between West Cowles St. and West Gaylord St. This facility and the associated pipelines would be impacted similarly to what is described above under Alternative 5C, including conflict numbers S7021A, S7022, S7033, and S7024. In addition, conflict numbers 7004A includes two wells conflicting with proposed improvements under Alternative 7 and would require relocations. Conflicts S7006, S7007, S7008, S7009,

S7010, S7011, S7012, S7013 are all lines of various diameters that would be impacted by proposed improvements within the Pico on- and off-ramp area south of Anaheim St. and would require relocation.

Associated with the Tidelands Facility are several lines within the facility owned and operated by the City of Lomita. Upon the relocation of the facility, all Lomita connections would be either abandoned or reestablished at the new Tidelands site under Alternative 7.

OIL OPERATORS. An active ten-inch steel water line (S6500D) running in the east-west direction along Burnett St. perpendicular to I-710 and the Los Angeles River would be impacted at the west side of the river by the improvements proposed by Alternative 7 and the affected vault would be relocated to the west side of I-710 at the terminus of Burnett St. A directional bore would connect the west and east termini of Burnett St. with the vaults located on both sides.

SHELL OIL. As described above under Alternative 5C, conflicts 6900 and S6901 would be impacted similarly by the improvements under Alternative 7, but the relocation configurations would be different. The utility vault (S6901) would be relocated west of I-710 to the West 28th St. terminus.

OCCIDENTAL PETROLEUM. Oxy's standard lease facility within LACFCD's boundary (S6600) is located along the west bank of the Los Angeles River between Ocean Blvd. and Anaheim St. The facility would be impacted by Alternative 7 in the same way as is described under Alternative 5C, above.

TESORO. Conflicts S7507, S7508, S7509, S7513, S7514, and S7512 described above under Alternative 5C would have similar impacts but the utility vault would be relocated west of I-710 to the West 28th St. terminus under Alternative 7. Conflicts S7511 and S7512 would have the same impacts under Alternative 7 as they would under Alternative 5C. Finally, conflict S7515 is a line requiring relocation under Alternative 7 within the Pico on-ramp/Pier B St. area. Under Alternative 7, relocation would need to be coordinated with the Port of Long Beach to avoid planned improvements in the area.

NO BUILD (ALTERNATIVE 1). The No Build (Alternative 1), which is the Preferred Alternative, does not require construction; therefore, there would be no permanent impacts to utilities.

3.4.2.3 PUBLIC HEALTH CONSIDERATIONS

Electric and magnetic fields (EMFs) are invisible force fields created by both natural and human-made sources. A natural source is the earth's magnetic field. Human-made sources include

household or building wiring, electrical appliances, and electric power transmission and distribution facilities.

The following information regarding EMFs was accessed through several resources on the SCE website.²

“Three decades of research has not established that a human health hazard exists from long-term EMF exposures. Questions remain about whether EMF exposure at home or work is linked to some diseases such as childhood leukemia. While scientific research is continuing, a quick resolution of the remaining scientific uncertainties is not expected. Coordinated international research has resolved many questions about specific diseases. While some health authorities have identified magnetic field exposure as a possible human carcinogen, they acknowledge that additional research would be necessary before a more definitive conclusion can be made.

In its 1999 Report to Congress, the National Institute of Environmental and Health Sciences (NIEHS) stated: “the conclusion of this report is insufficient to warrant aggressive regulatory concern.” Instead, it recommended that: “The power industry should continue its current practice of siting power lines to reduce exposures and continue emphasis on educating both the public and providers of electricity about ways to reduce exposure.”

Recognizing both public concern and scientific uncertainty over possible health effects from EMF exposure, the CPUC adopted a precautionary approach to reduce EMF exposures in 1993 (updated in 2006). While keeping electrical safety and good engineering practice as first priority, investor-owned electric utilities in California utilize designs to reduce magnetic fields created by new and rebuilt electric facilities.”

The relocation of electrical transmission and distribution lines for the I-710 Corridor Project build alternatives would utilize designs to reduce EMFs consistent with the CPUC guidance described above.

3.4.3 AVOIDANCE, MINIMIZATION, AND/OR MITIGATION MEASURES

The build alternatives would result in an adverse impact to Fire Station No. 4 in the City of Vernon, as well as temporary impacts to fire, law enforcement, and emergency service response times as a result of construction. Measure U&ES-1 is provided below to reduce these impacts. Utilities

² Southern California Edison. Website: <https://www.sce.com/emf> (accessed January 5, 2017).

impacted as a result of the build alternatives would be relocated in accordance with specific Utility Relocation Plans described below in Measure U&ES-2.

However, as the No Build (Alternative 1) was identified as the Preferred Alternative, impacts to utilities and emergency services would not occur, and avoidance, minimization, and/or mitigation measures would not be necessary. Avoidance, minimization, and/or mitigation measures pertaining to the two build alternatives are retained in this Final EIR/EIS for disclosure purposes.

U&ES-1 FIRE SERVICES. During final design, and consistent with the requirements of the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970 (Uniform Act), the California Department of Transportation (Caltrans) shall negotiate with the City of Vernon to determine a suitable location for the relocation of Fire Station No. 4. The new location shall be in the general vicinity of the existing fire station location, in order to maintain response times with Fire Station No. 4's service area. The existing Fire Station No. 4 shall not be closed until the new fire station has been constructed and is operational.

U&ES-2 UTILITIES. Utility relocations (classified as both major and minor) would be subject to preparation of Specific Utility Relocation Plans. The Specific Utility Relocation Plans would include the following:

- Description of existing facilities, including facility type, capacity, height, and function, in addition to existing easements and maintenance access.
- Description of proposed changes/demolition of existing facilities.
- Identification of potential conflicts that need to be resolved with the relocation plan, including crossings of flood control, rail, and roadway/freeway infrastructure, existing access tunnels, potential flooding, existing utilities and load distribution, Federal Aviation Administration requirements, drainage and stormwater quality requirements, and temporary roads and staged construction.
- A description of how the potential conflicts were resolved, including how the proposed relocated aboveground facilities are within the disturbance limits established for the project, whether new overhead facilities provide adequate aerial clearances in locations where cranes would be working and near existing and proposed elevated transportation facilities, and whether all aboveground facilities and access points to underground facilities are located outside controlled access lines.
- A description of the proposed facilities, including easements and maintenance access, and a description of vertical and/or horizontal clearance from other utility and public infrastructure.

- A work plan that describes the nature of the construction activity, haul routes, a construction traffic management plan if warranted, hours of construction, construction duration and schedule, planned service interruptions, if any, types of construction activities, and anticipated noise levels.
- A summary of existing and planned Utility Team Coordination Meetings that would include all utility companies and local jurisdictions' Departments of Public Works affected by the project. The meetings should occur during the final design phase (beginning at the 30 percent design stage) and include final design and construction staging. The meeting participants would discuss and plan a workable sequence of utility alterations so that the utility work can be coordinated and, where possible, completed in advance of highway work. Topics to be addressed include sensitive environmental areas, hazardous material sites, erosion controls during construction, and any community events that would be occurring during construction and need to be accommodated.
- A determination whether a community meeting would be held prior to the issuance of demolition and grading permits. Community meetings will be held for major utility relocations that are (1) within 500 feet of residences or schools, and (2) that would require construction duration of 30 days or more. Caltrans shall hold a community preconstruction meeting, in concert with the construction contractor, to provide information regarding the construction schedule and activities. The construction information shall include the location and duration of each construction activity, whether or not and, if applicable, the specific location, days, frequency, and duration of the pile driving that would occur, construction traffic management plans, and any accommodation of community events that would be occurring during the construction period. Notification of this meeting shall be provided to owners and occupants within 500 feet of the utility relocation site.
- The Specific Utility Relocation Plans will also include other applicable mitigation measures described in this Final Environmental Impact Report/ Environmental Impact Statement (Final EIR/EIS), for impacts related to cultural resources, visual resources, hazardous wastes, water quality, and traffic and transportation.

3.5 TRAFFIC AND TRANSPORTATION/PEDESTRIAN AND BICYCLE FACILITIES

The information in this section is based on the following documents:

- *Traffic Operations Analysis Report* (March 2017)
- *Intersection Traffic Impact Analysis Report* (March 2017)
- *I-710 Corridor Project EIR/EIS Travel Demand Modeling Methodology* (June 2017)
- Appendix D of the *Community Impact Assessment* (July 2017)

3.5.1 REGULATORY SETTING

Caltrans, as assigned by the Federal Highway Administration (FHWA), directs that full consideration should be given to the safe accommodation of pedestrians and bicyclists during the development of Federal-aid highway projects (see 23 Code of Federal Regulations [CFR] 652). It further directs that the special needs of the elderly and the disabled must be considered in all Federal-aid projects that include pedestrian facilities. When current or anticipated pedestrian and/or bicycle traffic presents a potential conflict with motor vehicle traffic, every effort must be made to minimize the detrimental effects on all highway users who share the facility.

In July 1999, the U.S. Department of Transportation (USDOT) issued an Accessibility Policy Statement pledging a fully accessible multimodal transportation system. Accessibility in Federally assisted programs is governed by the USDOT regulations (49 CFR part 27) implementing Section 504 of the Rehabilitation Act (29 United States Code [USC] 794). FHWA has enacted regulations for the implementation of the 1990 Americans with Disabilities Act (ADA), including a commitment to build transportation facilities that provide equal access for all persons. These regulations require application of the ADA requirements to Federal-aid projects, including Transportation Enhancement Activities.

3.5.2 AFFECTED ENVIRONMENT

The *Traffic Operations Analysis Report* (2017) and the *Intersection Traffic Impact Analysis Report* (2017) evaluated the effects of the Interstate 710 (I-710) Corridor Project alternatives on freeway segments, freeway ramps, and local intersections within the Study Area. As part of the traffic analysis, portions of the crossing freeways on I-710 within the Study Area were also examined to analyze any potential traffic impact of design changes at the major freeway-to-freeway interchanges associated with the build alternatives.

Traffic operations within the Study Area were evaluated and defined in terms of level of service (LOS), which ranges from LOS A to LOS F. LOS describes the efficiency of traffic flow and how such conditions are perceived by persons traveling in the traffic stream, and accounts for variables such as speed and travel time, freedom to maneuver, traffic interruptions, traveler comfort and convenience, and safety. LOS A indicates free traffic flow with low volumes and high speeds,

resulting in low densities, while LOS F indicates traffic volumes that exceed capacity and result in forced-flow operations at low speeds, resulting in high densities. LOS is categorized for uninterrupted and interrupted traffic flow facilities. Uninterrupted flow facilities (e.g., freeways) do not have fixed elements such as traffic signals that cause interruptions in traffic flow. Interrupted flow facilities (e.g., intersections and arterial roadways) have fixed elements that cause an interruption in the flow of traffic, such as cross streets, stop signs, and traffic signals. Graphical demonstrations of LOS for uninterrupted flow facilities (freeway facilities) and interrupted flow facilities (signalized intersections) are provided on Figures 3.5-1 and 3.5-2, respectively.

To maintain consistency with the date of the socioeconomic data used in the Southern California Association of Governments' (SCAG) 2012–2035 Regional Transportation Plan Sustainable Communities Strategy (RTP/SCS), 2035 is used as the horizon year for analysis of future conditions. The rationale for this is that the geometric design for the build alternatives were prepared and completed between 2013 and 2015, and as such, the SCAG 2012 RTP and associated traffic forecasting model were used, which have a travel forecasting horizon year of 2035. Based on a comparative review of the key model inputs (i.e., demographics, and cargo forecasts), it was determined that the 2012 model and the recently updated 2016 model would not yield substantially different traffic forecasts, nor would they result in substantially different geometric designs. Additionally, utilizing a 20-year horizon from a projected opening year of 2033 would target a 2053 horizon year, which would be both impractical and speculative from an analytical standpoint.¹

3.5.2.1 TRAFFIC ACCIDENT DATA

Traffic accident data was collected from the California Department of Transportation (Caltrans) Traffic Accident Surveillance and Analysis System – Transportation System Network (TASAS - TSN) database for a 36-month period (January 1, 2009, to December 31, 2011). The detailed accident data is provided in the *Traffic Operations Analysis Report* (2017). In addition, traffic collision information is provided in Section 1.2.1.2 as part of the Purpose and Need established for the project. Based on the TASAS - TSN data, the following conclusions can be made regarding safety within the I-710 Corridor:

¹ On June 9, 2017, FHWA and Caltrans Headquarters approved the use of 2035 as the horizon year for the project.

| Level of Service | Flow Conditions | Operating Speed (mph) | Technical Descriptions |
|------------------|--|-----------------------|--|
| A |  | 70 | Highest quality of service. Traffic flows freely with little or no restrictions on speed or maneuverability. No delays |
| B |  | 70 | Traffic is stable and flows freely. The ability to maneuver in traffic is only slightly restricted. No delays |
| C |  | 67 | Few restrictions on speed. Freedom to maneuver is restricted. Drivers must be more careful making lane changes. Minimal delays |
| D |  | 62 | Speeds decline slightly and density increases. Freedom to maneuver is noticeably limited. Minimal delays |
| E |  | 53 | Vehicles are closely spaced, with little room to maneuver. Driver comfort is poor. Significant delays |
| F |  | <53 | Very congested traffic with traffic jams, especially in areas where vehicles have to merge. Considerable delays |

LOS Criteria for Basic Freeway Segments

| LOS | Density (pc/mi/ln) |
|-----|--|
| A | ≤11 |
| B | >11–18 |
| C | >18–26 |
| D | >26–35 |
| E | >35–45 |
| F | Demand exceeds capacity OR density > 45 |

LOS Criteria and Speed-Flow Curves for Basic Freeway Segments

This page intentionally left blank

| Level of Service | Delay per Vehicle (seconds) |
|------------------|---|
| A |  ≤10 |
| B |  11-20 |
| C |  21-35 |
| D |  36-55 |
| E |  56-80 |
| F |  >80 |

Factors Affecting LOS of Signalized Intersections

Traffic Signal Conditions:

- Signal Coordination
- Cycle Length
- Protected left turn
- Timing
- Pre-timed or traffic activated signal
- Etc.

Geometric Conditions:

- Left- and right-turn lanes
- Number of lanes
- Etc.

Traffic Conditions:

- Percent of truck traffic
- Number of pedestrians
- Etc.

EA 249900; EFIS 0700000443

This page intentionally left blank

I-710 NORTHBOUND

- Of the five mainline study segments, one segment (Interstate 105 [I-105] to Interstate 5 [I-5]) has a higher total accident rate than the State average and three segments have higher fatal accident rates than the State average.
- Of the 56 northbound Study Area ramp locations, only two ramps experienced fatal accidents during the 36-month study period. Overall, however, more than half of the ramps (37 out of 56) had accident rates higher than the state average of comparable facilities.
- From I-105 to I-5, the total accident rate is 1.07 (actual), 10 percent higher than the average rate of 0.97. The fatal accident rates are 0.007 (actual) compared to 0.004 (average), which is 75 percent higher.

I-710 SOUTHBOUND

- Of the five mainline study segments, one segment (I-5 to State Route 60 (SR-60)) has a higher accident rate than the State average. The same segment also had a higher fatal accident rate than the State average.
- Of the 58 southbound Study Area ramp locations, about half of the ramps (28 out of 58) had accident rates higher than the state average of comparable facilities.
- From I-5 to SR-60, the total accident rate is 1.61 (actual), 69 percent higher than the average rate of 0.95. The fatal actual accident rate is 0.014, 180 percent higher than the average rate of 0.005.

3.5.2.2 EXISTING AND FUTURE NO BUILD TRAFFIC CONDITIONS

Traffic conditions for existing 2012/2013 Baseline conditions and future 2035 conditions under the No Build (Alternative 1) were evaluated to determine LOS without the build alternatives. The forecasts for the No Build (Alternative 1) include those transportation projects that are already programmed and/or committed to be constructed by or before 2035. The projects included in this alternative are based on SCAG's 2012–2035 RTP/SCS "Future 2035 Baseline Scenario" and 2011 Federal Transportation Improvement Program (FTIP) project list, including freeway, arterial, and transit improvements within the SCAG region. Also see Appendix U for a list of the future transportation projects assumed in the 2035 travel demand forecasting for the No Build (Alternative 1) that is specific to the I-710 Study Area. This alternative also assumes that goods movement to and from the ports make maximum utilization of existing and planned railroad capacity within the I-710 Corridor. For the purpose of the NEPA analysis, the No Build (Alternative 1) conditions are the basis against which the build alternatives for the I-710 Corridor Project were assessed.

The existing I-710 mainline generally consists of eight general purpose lanes north of Interstate 405 (I-405) and six general purpose lanes south of I-405. Existing 2012/2013 and 2035 No Build (Alternative 1) conditions for the Study Area are depicted in Figures 3.5-3 and 3.5-4, respectively, and described below. Please note that the depictions of LOS on figures contained within Section 3.5 show LOS for major geographic stretches (generally, those segments measuring approximately 0.5 mile or more between major interchanges). However, the tables that are included within this section show LOS in more detail, including spot segments where each individual ramp meets the mainline within the interchanges.

FREEWAY SEGMENTS

I-710 MAINLINE SEGMENTS. Existing 2012/2013 and 2035 No Build LOS for I-710 northbound and southbound mainline (basic and weaving²) segments and ramp merge/diverge areas are shown in Table 3.5-1 and Table 3.5-2. The following summary describes the I-710 mainline operations.

In the existing condition:

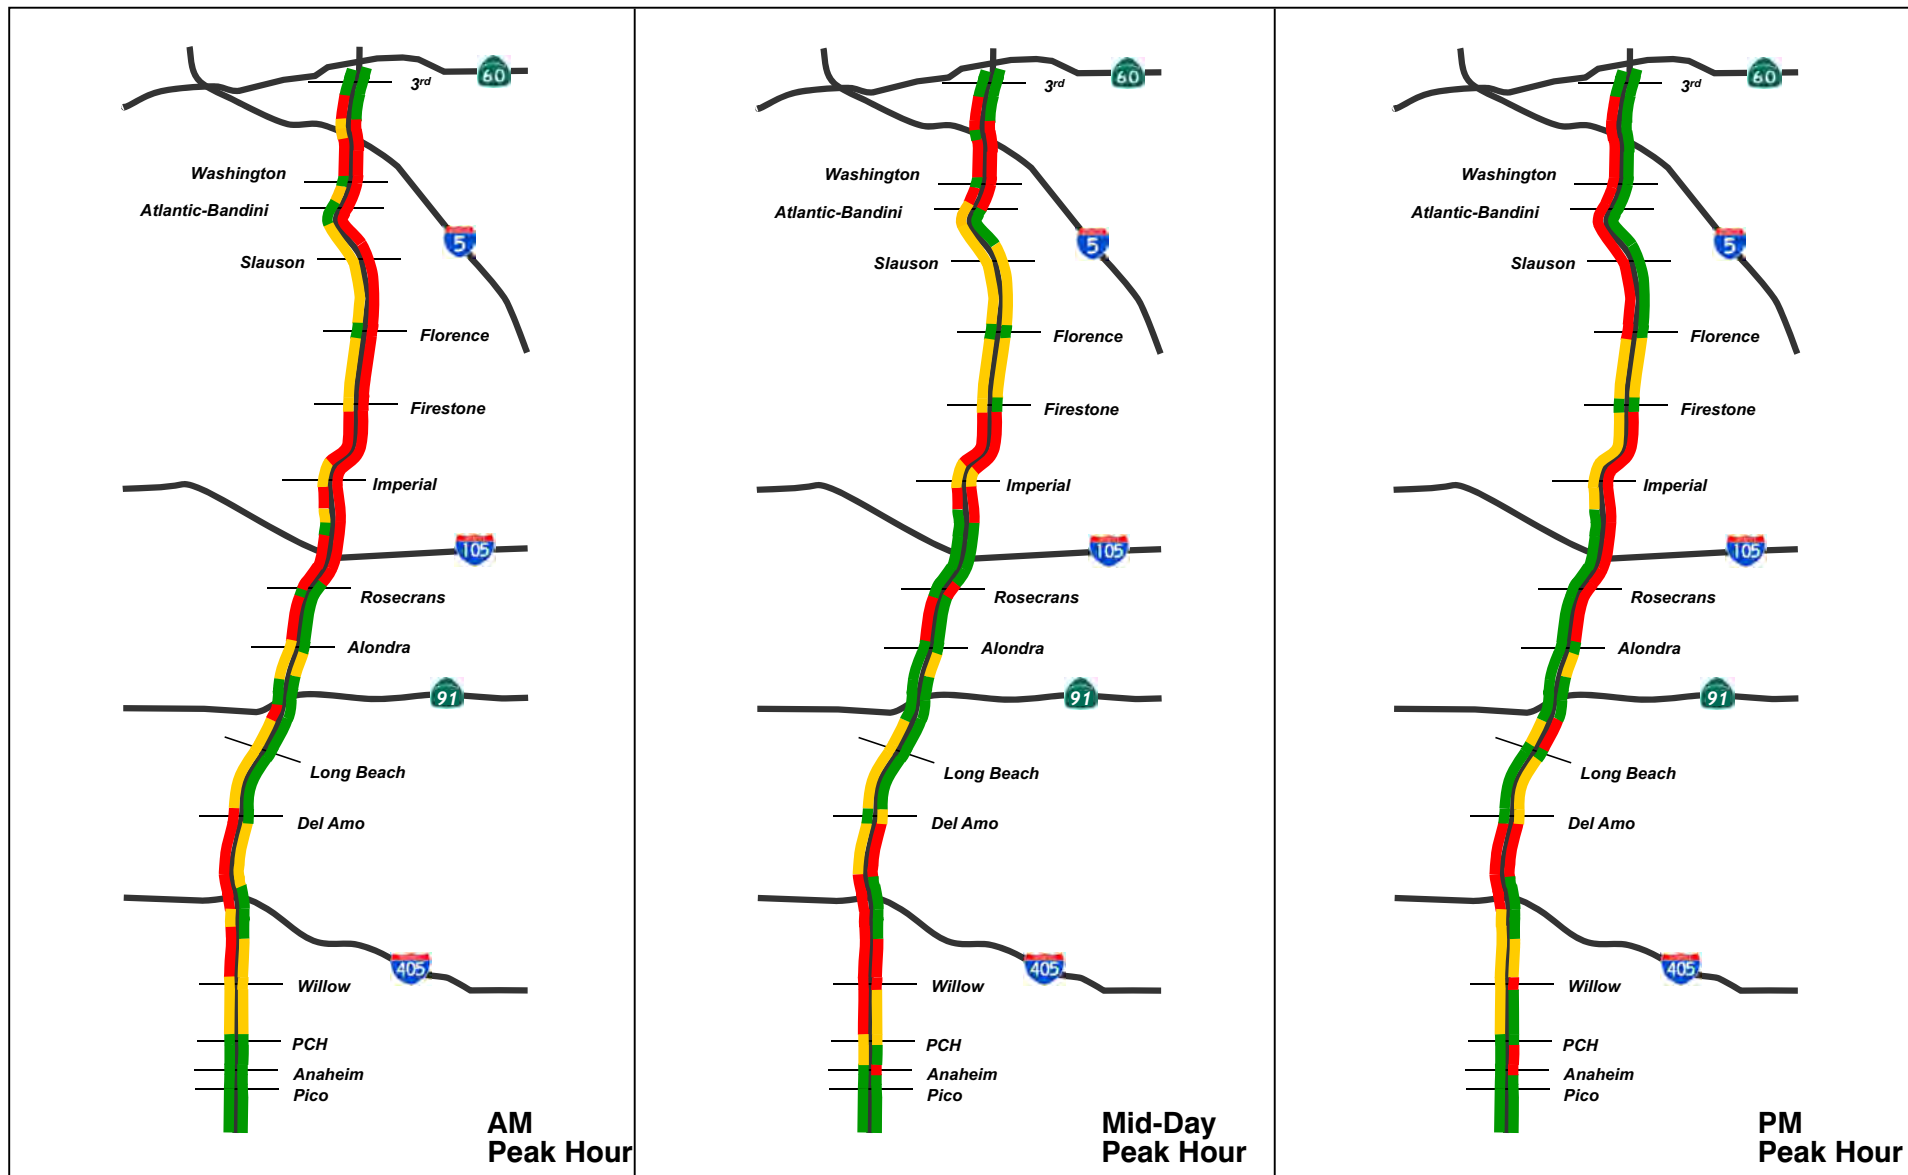

▪ Northbound Direction

- The number of basic freeway segments with poor operating conditions are highest during the morning peak hour (6:00 a.m. to 9:00 a.m.) with nearly half of the segments (19 out of 41) operating at poor LOS (E or F);
- The majority of the merge and diverge areas analyzed operate at acceptable LOS with the exception of 4 (out of 24) merge and diverge areas that operate at poor LOS (E or F) during midday (9:00 a.m. to 3:00 p.m.) and evening peak hours (3:00 p.m. to 7:00 p.m.); and
- Approximately 70 percent of the weave areas (10 out of 14) currently operate at poor LOS (E or F) during the evening peak hour.

▪ Southbound Direction

- Nearly 60 percent (26 out of 45) of the basic freeway segments operate at poor LOS (E or F) during the morning peak hour;
- Poor operating performances (LOS E or F) are currently observed on 21-35 percent of the merge and diverge areas during the three study peak hours; and

² A “weaving” section is where vehicles are entering the freeway in an area where other vehicles are attempting to exit the freeway at the next off-ramp, requiring vehicles to “weave” across each other’s paths.

Source: AECOM. *I-710 Corridor Project Traffic Operations Analysis Report* (2017).

Note: **Bold** text within cells indicates LOS E or F.

* = Demand exceeds capacity, no density is predicted.

LOS and/or density information is not shown for major merge areas, single-lane addition/drop, and merge/diverge operations within a weaving segment. Therefore, this information is listed as not applicable (N/A) in the table.

¹ Density = passenger car/mile/lane; v/c = volume-to-capacity ratio.

² Major merge area; HCM methodology applied for analysis.

³ Major diverge area; HCM methodology applied for analysis.

⁴ Single-lane addition/drop; HCM methodology applied for analysis.

⁵ Weave operation occurs on freeway collector/distributor.

⁶ Observed speed at this location lower than 50 mph; the junction is assumed to be oversaturated.

EB = eastbound

mph = miles per hour

HCM = *Highway Capacity Manual*

N/A = not applicable

I-5 = Interstate 5

NB = northbound

I-105 = Interstate 105

SB = southbound

I-405 = Interstate 405

SR-60 = State Route 60

I-710 = Interstate 710

SR-91 = State Route 91

LOS = level(s) of service

WB = westbound

MD = midday

Source: AECOM. *I-710 Corridor Project Traffic Operations Analysis Report* (2017).

Note: **Bold** text within cells indicates LOS E or F.

* = Demand exceeds capacity, no density is predicted.

LOS and/or density information is not shown for major merge areas, single-lane addition/drop, and merge/diverge operations within a weaving segment. Therefore, this information is listed as not applicable (N/A) in the table.

¹ Density = passenger car/mile/lane; v/c = volume-to-capacity ratio.

² Major merge area; HCM methodology applied for analysis.

³ Major diverge area; HCM methodology applied for analysis.

⁴ Single-lane addition/drop; HCM methodology applied for analysis.

⁵ Weave operation occurs on freeway collector/distributor.

⁶ Observed speed at this location lower than 50 mph; the junction is assumed to be oversaturated.

EB = eastbound

MD = midday

HCM = *Highway Capacity Manual*

mph = miles per hour

I-5 = Interstate 5

N/A = not applicable

I-105 = Interstate 105

NB = northbound

I-405 = Interstate 405

SB = southbound

I-710 = Interstate 710

SR-60 = State Route 60

LOS = level(s) of service

SR-91 = State Route 91

MLK = Martin Luther King Jr. Blvd.

WB = westbound

This page intentionally left blank

- Throughout the analyzed peak hours, at least 70 percent (7 out of 10) of the weaving areas operate at poor LOS (E or worse).

In the 2035 No Build condition:

▪ **Northbound Direction**

- Approximately half of the basic freeway segments are expected to operate at LOS E or F during the morning and midday peak hours, primarily due to the high volume of trucks during those time periods;
- The LOS for the merge and diverge areas are also expected to be poor during the morning and midday peak hours, when approximately half of the merge and diverge areas are expected to operate at LOS E or F; and
- Nearly all of the weaving areas are expected to operate poorly during all analyzed peak hours with the worst conditions occurring during the midday peak hour when 92 percent (12 out of 13) of the weaving areas are projected to operate at LOS E or worse.

▪ **Southbound Direction**

- Approximately 60 percent (26 out of 45) of the basic freeway segments are expected to operate at LOS E or F during the morning peak hour, which is the most congested among the three peak hours analyzed;
- The LOS for the merge and diverge areas is also expected to be poor during the morning peak hour when nearly 60 percent (20 out of 34) of the merge and diverge areas are expected to operate at LOS E or F; and
- Nearly all (9 out of 10) of the weaving areas are expected to operate poorly (LOS E or F) during morning and midday peak hours.

In summary, congestion is prevalent throughout the entire I-710 corridor in both directions for all peak hours. Traffic is slightly worse in the northbound direction during the AM peak hour and in the southbound direction during the PM peak hour. A comparison of LOS results between existing conditions and 2035 No Build conditions demonstrates that operations on I-710 are projected to deteriorate if improvements are not implemented to address capacity deficiencies or to amend geometric deficiencies.

INTERSTATE 405 MAINLINE SEGMENTS. Table 3.5-3 shows the LOS for I-405 in the vicinity of the I-710/I-405 interchange. The following summary describes the existing and No Build I-405 mainline operations.

Source: AECOM. *I-710 Corridor Project Traffic Operations Analysis Report* (2017).

Note: **Bold** text within cells indicates LOS E or F.

* = Demand exceeds capacity, no density is predicted.

LOS and/or density information is not shown for major merge areas, single-lane addition/drop, and merge/diverge operations within a weaving segment. Therefore, this information is listed as not applicable (N/A) in the table.

¹ Density = passenger car/mile/lane; v/c = volume-to-capacity ratio.

² Major merge area; HCM methodology applied for analysis.

³ Major diverge area; HCM methodology applied for analysis.

⁴ Single-lane addition/drop; HCM methodology applied for analysis.

⁵ Weave operation occurs on freeway collector/distributor.

⁶ Observed speed at this location lower than 50 mph; the junction is assumed to be oversaturated.

EB = eastbound

HCM = *Highway Capacity Manual*

I-5 = Interstate 5

I-105 = Interstate 105

I-405 = Interstate 405

I-710 = Interstate 710

LOS = level(s) of service

MD = midday

mph = miles per hour

N/A = not applicable

NB = northbound

SB = southbound

SR-60 = State Route 60

SR-91 = State Route 91

WB = westbound

In the 2012/2013 existing condition:

▪ **Northbound Direction**

- The number of basic freeway segments with poor operating conditions are highest during the morning peak hour with all of the analyzed segments operating at LOS E or F;
- The weaving areas experience heavy densities and operate at poor LOS (E or F) during the morning peak hour; and
- One weave area along the Collector/Distributor (CD) road from I-710 to Santa Fe Ave. currently operates at LOS F during all the three study peak hours.

▪ **Southbound Direction**

- All of the basic freeway segments operate at poor LOS (E or F) during the evening peak hour; and
- The weaving areas experience high vehicle densities during the evening peak hour with all of the weaving areas operating at poor LOS (E or F).

In the 2035 No Build condition:

▪ **Northbound Direction**

- At least half of the freeway segments (two out of four) are forecast to operate at LOS E or worse during the morning peak hour; and
- The weaving areas are expected to experience poor operating conditions during all three peak hours with the worst conditions occurring during the morning and midday peak.

▪ **Southbound Direction**

- Conditions on the basic freeway segments are the worst during PM peak hour when 60 percent (three out of five) of the analyzed segments are projected to operate at LOS E or F;
- The only merge and diverge area is forecast to operate at LOS D or better during all analyzed peak hours; and
- Nearly all of the weaving areas are forecast to operate poorly (LOS E or F) during all analyzed peak hours, with the worst conditions occurring during the evening peak hour.

In summary, northbound I-405 shows heavy congestion during the morning peak hour while southbound I-405 shows heavy congestion during the evening peak hour. Similar to existing conditions, 2035 No Build conditions on northbound and southbound I-405 (weave segments) downstream of the I-710 on- and off-ramps are forecast to break down during all analyzed peak hours. This can be attributed to the high traffic volumes from I-710 and the short length of the weave segments.

SR-91 MAINLINE SEGMENTS. Table 3.5-4 shows the LOS for State Route 91 (SR-91) in the vicinity of the I-710/SR-91 interchange. The following summary describes the 2012/2013 existing and 2035 No Build SR-91 mainline operations.

In the 2012/2013 existing condition:

- **Eastbound Direction**

- Approximately 80 percent (7 out of 9) of the basic freeway segments operate at poor LOS (E or F) during the midday peak hour. All of the nine basic freeway segments operate at poor LOS (E or F) during the evening peak hour;
- All merge and diverge areas operate at an acceptable LOS (D or better), during the three peak analysis hours; and
- All weaving areas operate at poor LOS (E or F) during the midday and evening peak hours.

- **Westbound Direction**

- All of the basic freeway study segments operate at poor LOS (E or F) during the morning peak hour;
- All merge and diverge areas operate at an acceptable LOS (D or better), during the three peak hours analyzed; and
- The weaving areas experience maximum densities during the morning and midday peak hours with all the weaving areas operating at poor LOS (E or F).

In the 2035 No Build condition:

- **Eastbound Direction**

- All but one (eight out of nine) basic freeway segments are projected to operate at LOS D or better during the analyzed peak hours;
- One of the analyzed merge and diverge areas (one out of six) is projected to operate at LOS F during the morning and midday peak hours; and
- All of the weaving areas are projected to perform at acceptable LOS (D or better) during the analyzed peak hours.

Source: AECOM. *I-710 Corridor Project Traffic Operations Analysis Report* (2017).

Note: **Bold** text within cells indicates LOS E or F.

* = Demand exceeds capacity, no density is predicted.

LOS and/or density information is not shown for major merge areas, single-lane addition/drop, and merge/diverge operations within a weaving segment. Therefore, this information is listed as not applicable (N/A) in the table.

¹ Density = passenger car/mile/lane; v/c = volume-to-capacity ratio.

² Major merge area; HCM methodology applied for analysis.

³ Major diverge area; HCM methodology applied for analysis.

⁴ Single-lane addition/drop; HCM methodology applied for analysis.

⁵ Weave operation occurs on freeway collector/distributor.

⁶ Observed speed at this location lower than 50 mph; the junction is assumed to be oversaturated.

EB = eastbound

HCM = *Highway Capacity Manual*

I-5 = Interstate 5

I-105 = Interstate 105

I-405 = Interstate 405

I-710 = Interstate 710

LOS = level(s) of service

MD = midday

mph = miles per hour

N/A = not applicable

NB = northbound

SB = southbound

SR-60 = State Route 60

SR-91 = State Route 91

WB = westbound

▪ **Westbound Direction**

- Approximately 40 percent (three out of eight) of the basic freeway segments are projected to operate at poor LOS (E or F) during the morning peak hour;
- All merge and diverge areas are projected to perform at acceptable LOS (D or better) during the analyzed peak hours; and
- All weave areas are projected to operate at poor LOS (E or F) during the morning peak hour.

In summary, westbound SR-91 shows heavy congestion during the morning peak hour while eastbound SR-91 shows heavy congestion during the evening peak hour. The weaving segment along westbound SR-91, downstream of the ramp from southbound I-710, is projected to operate poorly during all three peak analysis hours under 2035 No Build conditions. This can be attributed to the high traffic volume merging from I-710. Congested conditions are anticipated during all three peak hours along eastbound SR-91 to the east of Cherry Ave. interchange, where the freeway narrows to four mainline lanes.

I-105 MAINLINE SEGMENTS. Table 3.5-5 shows the LOS for I-105 in the vicinity of the I-710/I-105 interchange. The following summary describes the 2012/2013 existing and 2035 No Build I-105 mainline operations.

In the 2012/2013 existing condition:

▪ **Eastbound Direction**

- Over half (four out of seven) of the basic freeway segments currently operate at poor LOS (E or F) during all peak hours; and
- All merge and diverge areas operate at an acceptable LOS (D or better) during all three peak hours.

▪ **Westbound Direction**

- All of the basic freeway segments operate at poor LOS (E or F) during the morning peak hour, with 60 percent (three out of five) of the basic freeway segments experiencing poor operating conditions in the evening and midday peak hour; and
- All merge and diverge areas operate at an acceptable LOS (D or better) during the three peak hours analyzed.

This page intentionally left blank

In the 2035 No Build condition:

- **Eastbound Direction**

- 29 percent (two out of seven) of the basic freeway segments are projected to operate at poor LOS (E or F) during all three analyzed peak hours; and
- All merge and diverge areas are projected to operate at acceptable LOS (D or better) during all three analyzed peak hours.

- **Westbound Direction**

- 40 percent (two out of five) of the basic freeway segments are projected to operate at poor LOS (E or F) during all three analyzed peak hours; and
- One out of four of the merge and diverge areas is projected to operate at poor LOS (E or worse) during the morning and midday peak hours.

Although the HCM analysis under future No Build conditions does not consider upstream or downstream activity as existing conditions have reflected, it is conservative to assume that existing downstream queuing or upstream metering effects would persist under future No Build conditions. A comparison of No Build segment density results to existing conditions indicate that operations on I-105 are projected to deteriorate under future No Build conditions due to increased traffic demand.

I-5 MAINLINE SEGMENTS. Table 3.5-6 shows the LOS for I-5 in the vicinity of the I-710/I-5 interchange. The following summary describes the 2012/2013 existing and 2035 No Build I-5 mainline operations.

In the 2012/2013 existing condition:

- **Northbound Direction**

- All of the basic freeway segments experience poor operating conditions LOS (E or F) during the morning peak hour; and
- Most of the merge and diverge areas operate at acceptable LOS (D or better) during the three peak hours analyzed.

- **Southbound Direction**

- The number of basic freeway segments with poor operating conditions are highest during the midday and evening peak hours with all of the segments operating at poor LOS (E or F);

Source: AECOM. *I-710 Corridor Project Traffic Operations Analysis Report* (2017).
Note: **Bold** text within cells indicates LOS E or F.
* = Demand exceeds capacity, no density is predicted.
LOS and/or density information is not shown for major merge areas, single-lane addition/drop, and merge/diverge operations within a weaving segment. Therefore, this information is listed as not applicable (N/A) in the table.
¹ Density = passenger car/mile/lane; v/c = volume-to-capacity ratio.
² Major merge area; HCM methodology applied for analysis.
³ Major diverge area; HCM methodology applied for analysis.
⁴ Single-lane addition/drop; HCM methodology applied for analysis.
⁵ Weave operation occurs on freeway collector/distributor.
⁶ Observed speed at this location lower than 50 mph; the junction is assumed to be oversaturated.

EB = eastbound
HCM = *Highway Capacity Manual*
I-5 = Interstate 5
I-105 = Interstate 105

I-405 = Interstate 405
I-710 = Interstate 710
LOS = level(s) of service
MD = midday

mph = miles per hour
N/A = not applicable
NB = northbound
SB = southbound

SR-60 = State Route 60
SR-91 = State Route 91
WB = westbound

- At least half of the analyzed merge and diverge areas operate at LOS E or worse during the morning and midday peak hours; and
- The only weave segment operates at poor LOS (E or F) during all the peak hours analyzed.

In the 2035 No Build condition:

▪ **Northbound Direction**

- All of the basic freeway segments are projected to operate at poor LOS (E or F) during the midday peak hour; and
- The number of merge and diverge areas with poor operating conditions are projected to be the highest during midday peak hours with 80 percent (eight out of ten) of the analyzed areas projected to operate at LOS E or worse.

▪ **Southbound Direction**

- All basic freeway segments (eight out of eight) are projected to operate at poor LOS (E or F) during all analyzed peak hours;
- All merge and diverge areas (six out of six) are projected to operate at a poor LOS (E or F) during the morning and midday peak hours; and
- The only weave segment (between the ramp from I-710 southbound and the ramp to Triggs St.) is projected to operate at LOS F during all three analyzed peak hours.

Compared to existing conditions, the analysis of 2035 No Build conditions indicate substantial growth in traffic demand on the I-5 mainline within the Study Area, particularly in the southbound direction. In summary, the northbound lanes are projected to operate poorly during midday peak hour while the southbound lanes show heavy congestion during all three peak analysis hours.

Additionally, existing data on the I-5 demonstrate a system wide capacity deficiency extending beyond the Study Area. It is conservative to assume that the same deficiencies would still be present under future No Build conditions unless additional improvements are implemented beyond those already accounted for in the future No Build network.

ROADWAY SEGMENTS. A total of 177 local arterial roadway segments were included in the Study Area. The analysis of the Study Area roadway segments is provided in the *Intersection Traffic Impact Analysis Report* (2017). The existing and No Build roadway segment operations are summarized below.

Approximately 15 percent (27 of 177) of the roadway segments currently experience volume-to-capacity (V/C) ratios approaching or exceeding the existing capacity. Approximately 21 percent (38 of 177) of the roadway segments are projected to experience V/C ratios approaching (0.90 less than or equal to V/C less than 1.0) or exceeding (V/C greater than or equal to 1.0) the planned future year capacity as depicted in the I-710 traffic model in the No Build condition.

The following summary notes the arterial roadway segments operating with a V/C ratio of 0.90 or greater (indicating LOS E or F) in both the 2012/2013 existing and 2035 No Build conditions (unless noted below).

▪ **North-South Segments:**

- Alameda St. from Sepulveda Blvd./Willow St. to I-405, from Florence Ave. to Slauson Ave., and from Bandini Blvd. to I-10 (2012/2013 Existing Only);
- Alameda St. from Anaheim St. to I-405, from I-105 to Firestone Blvd., from Florence Ave. to Slauson Ave., and from Bandini Blvd. to I-10 (2035 No Build only);
- Atlantic Ave. between Firestone Blvd. and Florence Ave. (2035 No Build only);
- Atlantic Blvd. between Slauson Ave. and Bandini Blvd.;
- Eastern Ave. between Slauson Ave. and Bandini Blvd. (2035 No Build only);
- Cherry Ave. between Anaheim St. and Pacific Coast Hwy. (2035 No Build only);
- Garfield Ave. north of Washington Blvd. to Whittier Blvd. (2035 No Build only);
- Garfield Ave. between Slauson Ave. and Bandini Blvd. (2012/2013 Existing Only); and
- Wilmington Ave. between I-405 and Sepulveda Blvd./Willow St. (2035 No Build only).

▪ **East-West Segments:**

- Anaheim St. between Alameda St. and Santa Fe Ave. (2012/2013 Existing only);
- Anaheim St. west of Alameda St. (2035 No Build only);
- Pacific Coast Hwy. between Santa Fe Ave. and I-710 (2012/2013 Existing Only);
- Pacific Coast Hwy. between Alameda St. and I-710 (2035 No Build only);
- Willow St. west of Alameda St. to I-710;
- Wardlow Rd. between Alameda St. and Santa Fe Ave.;
- Del Amo Blvd. between Santa Fe Ave. and I-710 and between Cherry Ave. and Paramount Blvd.;

- Artesia Blvd. between Alameda St. and Long Beach Blvd. and between Cherry Ave. and Paramount Blvd.;
- Rosecrans Ave. west of Alameda St. (2012/2013 Existing only);
- Rosecrans Ave. from Atlantic Ave. to Garfield Ave. (2035 No Build only);
- Imperial Hwy. between Long Beach Blvd. and Atlantic Ave.;
- Firestone Blvd. between Alameda St. and Long Beach Blvd. (2035 No Build only);
- Firestone Blvd. between Atlantic Ave. and Garfield Ave.;
- Florence Ave. between Alameda St. and Pacific Blvd.;
- Slauson Ave. between Garfield Ave. and Paramount Blvd.;
- Bandini Blvd. west of Alameda St.;
- Washington Blvd. west of Soto St. and between Garfield Ave. and Paramount Blvd.; and
- Whittier Blvd. west of Alameda St. and between Garfield Ave. and Paramount Blvd.

Under the 2035 No Build conditions, major north-south arterials are most congested in the area between I-105 and I-5, as well as between I-405 and Anaheim St. The east-west arterials are most congested near the I-710 interchanges and near the Alameda Corridor. Under 2035 No Build conditions, more arterial roadway segments are projected to operate near or over capacity than under existing conditions. The results are attributed to the overall ambient traffic growth within the Study Area. Increases in roadway volumes are most prominently observed in port truck volumes on all major north-south arterials and on east-west arterials south of Florence Ave. In general, without major improvements to the I-710, the traffic conditions on the arterial highway system will deteriorate further in the future.

INTERSECTIONS. An analysis of the Study Area intersections is provided in the *Intersection Traffic Impact Analysis Report* (2017). See Table 3.5-7 and Figure 3.5-5 for the locations of the intersections analyzed in the Study Area. These intersections were identified in cooperation with the I-710 Technical Advisory Committee and supplemented where needed to inform the conceptual design effort for the build alternatives. The following summary describes the 2012/2013 existing and 2035 No Build intersection operations for the AM, midday, and PM peak hours. It should be noted that not all Study Area intersections contain midday peak hour volumes since these locations were collected through recent projects that only provided AM and PM peak hour turning movement volumes.

Table 3.5-7: Study Intersections

The average intersection delay and operating conditions would get worse under 2035 No Build conditions compared to the 2012/2013 existing conditions. This is attributed to the projected growth in peak-hour traffic volumes within the Study Area. The total number of intersections projected to operate at LOS E or F would increase during all three peak hours analyzed under 2035 No Build conditions compared to the 2012/2013 existing conditions. A total of 43 intersections are currently operating at poor LOS (E or F) considering any of the three peak hours, and 78 intersections are projected to operate at poor LOS E or F during the morning, midday, or evening peak hours under 2035 No Build conditions.

A comparison of the total number of intersections with poor LOS (E or F) between 2035 No Build and existing conditions are shown below:

- **Morning Peak Hour:** 49 of 174 (28 percent) under 2035 No Build compared to 18 of 172 intersections (10 percent) under 2012/2013 existing conditions
- **Midday Peak Hour:** 15 of 160 (9 percent) under 2035 No Build compared to 3 of 158 intersections (2 percent) under 2012/2013 existing conditions
- **Evening Peak Hour:** 60 of 174 (34 percent) under 2035 No Build compared to 36 of 172 intersections (21 percent) under 2012/2013 existing conditions

Similar to 2012/2013 existing conditions, the evening peak hour has the highest number of intersections projected to operate at an unacceptable LOS (E or F) under 2035 No Build conditions. Average intersection delay would increase by approximately 30 percent under 2035 No Build compared to 2012/2013 existing conditions considering average delay for all three peak hours. The same comparison shows an increase in delay of approximately 32 percent over 2012/2013 existing conditions if only the evening peak hour is considered.

It should be noted that a number of intersections along the following streets currently operate or have been projected to operate at a LOS E or F in 2035, which are primarily the east-west arterials in the I-710 Study Area.

- Anaheim St. (2012/2013 Existing only)
- Pacific Coast Hwy.
- Alameda St. (2035 No Build only)
- Willow St.
- Del Amo Blvd.
- Alondra Blvd. (2012/2013 Existing only)
- Rosecrans Ave.
- Imperial Hwy.

- Firestone Blvd.
- Slauson Ave.
- Atlantic Blvd.
- 223rd St. (2012/2013 Existing only)
- Washington Blvd. (2035 No Build only)

BICYCLE AND PEDESTRIAN FACILITIES. Bicycle travel is accommodated in the Study Area through the use of designated bikeways and existing roadways. Class 1 Bikeways provide a completely separated right-of-way for the exclusive use of bicycles and pedestrians, with cross-flow by motorists minimized. Class 2 Bikeways provide a striped lane for one-way bike travel on a street or highway. Class 3 Bikeways provide for shared use by pedestrian or motor vehicle traffic.³

Class 1 Bikeways within the Study Area include the Los Angeles River Bikeway, the Rio Hondo Bikeway, and the Compton Creek Bike Path. Within the Study Area, the Los Angeles River Trail and Bikeway run parallel to the I-710 mainline from the City of Long Beach to the City of Vernon, and access points are provided along the trail near local interchanges, parks, and other trail/bikeway connections. The Rio Hondo Trail is also located within the Study Area. The southern terminus of the trail is located in the City of South Gate and proceeds in a northeasterly direction toward the City of El Monte. The Los Angeles Multi-Use Trail and the Rio Hondo Multi-Use Trail run adjacent to the Bikeways. They converge with the Bikeways at certain points, typically at undercrossings, but are independent of the Bikeways and support different user groups. The Compton Creek Bike Path, Class 1 Bikeway, is located within the Study Area along the east bank of Compton Creek. The northern terminus of the trail is located in the City of Compton and proceeds southeasterly through the City of Compton and unincorporated Rancho Dominguez. The trail ends at Del Amo Blvd. near the confluence of Compton Creek and the Los Angeles River in the City of Long Beach, and a connection to the Los Angeles River Trail is provided to the east along Del Amo Blvd. Figure 3.1-4 in Section 3.1, Land Use, of this Final Environmental Impact Report/Environmental Impact Statement (Final EIR/EIS) provides the locations of local and regional bikeways in the Study Area.

Pedestrian facilities within the Study Area include sidewalks, walkways, and crosswalks. These facilities are located throughout the Study Area. Pedestrian access is also provided via the Los Angeles River Trail and the Rio Hondo Trail.

³ California Department of Transportation. 2006. *Highway Design Manual*, Chapter 1000 Bikeway Planning and Design.

3.5.3 ENVIRONMENTAL CONSEQUENCES

3.5.3.1 PERMANENT IMPACTS

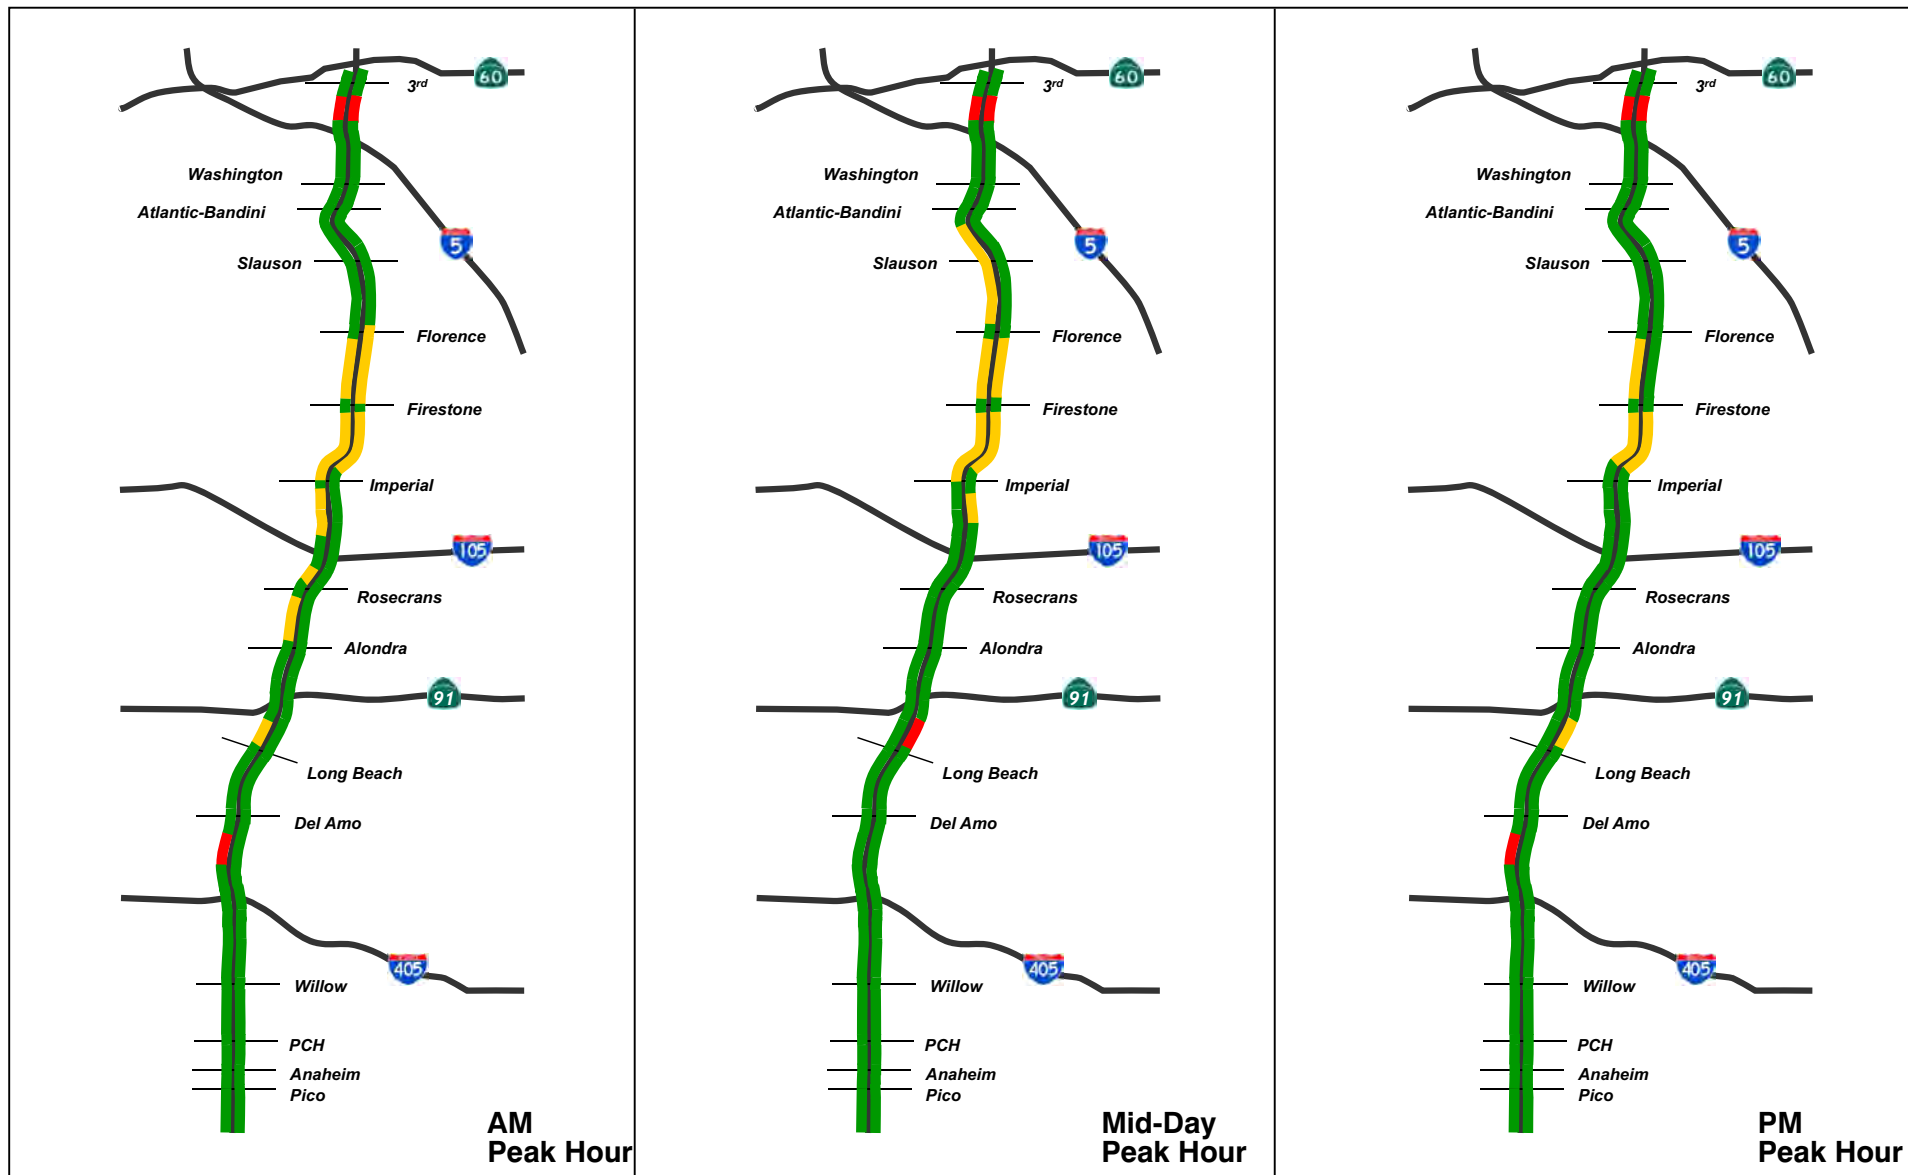

This section discusses the operation of Study Area transportation facilities under the various build alternatives. Alternative 5C and Alternative 7 conditions for the Study Area are depicted in Figures 3.5-6 and 3.5-7, respectively, and described below.

FREEWAYS.

I-710 MAINLINE SEGMENTS. Tables 3.5-8 through 3.5-14 provide a summary of the freeway segment analysis for each I-710 build alternative and applicable design options. Design Options 1A and 1B (applicable to Alternatives 5C and 7, respectively) are not analyzed here as they do not propose changes to the configurations of their respective alternatives and therefore do not affect traffic operations or circulation. As a reference, Tables 3.5-1 through 3.5-2 provide the existing 2012/2013 Baseline and 2035 No Build condition (same as Alternative 1) LOS results for comparison. Generally, these tables show the following results:

- In 2035, under Alternative 5C conditions, traffic operations along the I-710 freeway corridor for both northbound and southbound directions would improve when compared to the traffic operations under existing and the No Build (Alternative 1) conditions. The morning peak hour benefits the most from the Alternative 5C improvements in both directions. However, even with the geometric enhancements, severe congestion still occurs on a few selected segments of the freeway due to high projected future general purpose and truck traffic demand:
 - I-710 southbound (weaving area) between Del Amo Blvd. and I-405 (LOS F, AM/PM)
 - I-710 northbound (weaving area) between Long Beach Blvd. and SR-91 (LOS F, MD)
 - I-710 northbound and southbound (weaving area) between I-5 and SR-60 (LOS F, AM/MD/PM)
- In 2035, under Alternative 7 conditions, traffic operations along the I-710 freeway corridor for both northbound and southbound directions would improve when compared to the traffic operations under existing and the No Build (Alternative 1) conditions. The morning and midday peak hours would benefit the most from the Alternative 7 improvements in both directions. However, even with the geometric enhancements, severe congestion still occurs on some freeway sections due to the high concentration of truck traffic and/or insufficient capacity at those particular locations.

Source: AECOM. *I-710 Corridor Project Traffic Operations Analysis Report* (2017).

Note: **Bold** text within cells indicates LOS E or F.

* = Demand exceeds capacity, no density is predicted.

LOS and/or density information is not shown for major merge areas, single-lane addition/drop, and merge/diverge operations within a weaving segment. Therefore, this information is listed as not applicable (N/A) in the table.

¹ Density = passenger car/mile/lane; v/c = volume-to-capacity ratio.

² Major merge area; HCM methodology applied for analysis.

³ Major diverge area; HCM methodology applied for analysis.

⁴ Single-lane addition/drop; HCM methodology applied for analysis.

⁵ Weave operation occurs on freeway collector/distributor.

⁶ Observed speed at this location lower than 50 mph; the junction is assumed to be oversaturated.

EB = eastbound

mph = miles per hour

HCM = *Highway Capacity Manual*

N/A = not applicable

I-5 = Interstate 5

NB = northbound

I-105 = Interstate 105

SB = southbound

I-405 = Interstate 405

SR-60 = State Route 60

I-710 = Interstate 710

SR-91 = State Route 91

LOS = level(s) of service

WB = westbound

MD = midday

**Table 3.5-9: I-710 2035 Southbound Merge/Diverge Areas Alternative 5C

Note: **Bold** text within cells indicates LOS E or F.

* = Demand exceeds capacity, no density is predicted.

LOS and/or density information is not shown for major merge areas, single-lane addition/drop, and merge/diverge operations within a weaving segment. Therefore, this information is listed as not applicable (N/A) in the table.

¹ Density = passenger car/mile/lane; v/c = volume-to-capacity ratio.

² Major merge area; HCM methodology applied for analysis.

³ Major diverge area; HCM methodology applied for analysis.

⁴ Single-lane addition/drop; HCM methodology applied for analysis.

⁵ Weave operation occurs on freeway collector/distributor.

⁶ Observed speed at this location lower than 50 mph; the junction is assumed to be oversaturated.

Note: **Bold** text within cells indicates LOS E or F.

* = Demand exceeds capacity, no density is predicted.

LOS and/or density information is not shown for major merge areas, single-lane addition/drop, and merge/diverge operations within a weaving segment. Therefore, this information is listed as not applicable (N/A) in the table.

¹ Density = passenger car/mile/lane; v/c = volume-to-capacity ratio.

² Major merge area; HCM methodology applied for analysis.

³ Major diverge area; HCM methodology applied for analysis.

⁴ Single-lane addition/drop; HCM methodology applied for analysis.

⁵ Weave operation occurs on freeway collector/distributor.

⁶ Observed speed at this location lower than 50 mph; the junction is assumed to be oversaturated.

Note: **Bold** text within cells indicates LOS E or F.

* = Demand exceeds capacity, no density is predicted.

LOS and/or density information is not shown for major merge areas, single-lane addition/drop, and merge/diverge operations within a weaving segment. Therefore, this information is listed as not applicable (N/A) in the table.

¹ Density = passenger car/mile/lane; v/c = volume-to-capacity ratio.

² Major merge area; HCM methodology applied for analysis.

³ Major diverge area; HCM methodology applied for analysis.

⁴ Single-lane addition/drop; HCM methodology applied for analysis.

⁵ Weave operation occurs on freeway collector/distributor.

⁶ Observed speed at this location lower than 50 mph; the junction is assumed to be oversaturated.

EB = eastbound

FC = freight corridor

HCM = *Highway Capacity Manual*

I-5 = Interstate 5

I-105 = Interstate 105

I-405 = Interstate 405

I-710 = Interstate 710

LOS = level(s) of service

MD = midday

mph = miles per hour

N/A = not applicable

NB = northbound

SB = southbound

SR-60 = State Route 60

SR-91 = State Route 91

WB = westbound

- I-710 northbound between Imperial Hwy. and Firestone Blvd. (LOS F, MD)
- I-710 northbound between Firestone Ave. and Florence Ave. (LOS F, AM)
- I-710 northbound between Florence Ave. and Slauson Ave. (LOS F, AM)
- I-710 southbound between Firestone Blvd. and Imperial Hwy. (LOS F, AM)
- There are no appreciable differences in the overall LOS results for Alternative 5C and Alternative 7. Both alternatives improve four deficient intersections (LOS E or worse) along I-710 relative to the No Build (Alternative 1). This finding also holds true for the Design Options evaluated in the I-710 Corridor.

I-710 FREIGHT CORRIDOR SEGMENTS. Table 3.5-12 shows the LOS for the various segments of the I-710 freight corridor under Alternative 7. As these tables illustrate, some segments are forecast to operate at LOS E. The following summary describes operations on the I-710 freight corridor under Alternative 7.

In general, capacity on the freight corridor would be sufficient to address demand, with the exception of the freight corridor segments between Del Amo Blvd. and the SR-91 interchange during the midday peak period. An influx of non-port trucks access the freight corridor through the I-710 general purpose ramps to freight corridor near the Del Amo Blvd. interchange, as this is the first opportunity that trucks using I-405 can enter and exit the ZE/NZE freight corridor. However, all freight corridor segments operate at LOS E or better.

I-405 MAINLINE SEGMENTS. Table 3.5-15 and Table 3.5-16 provide a summary of the freeway segment analysis for I-405 under Alternatives 5C and 7. These tables show the following:

- Similar to the No Build (Alternative 1), under Alternatives 5C and 7, northbound I-405 is projected to experience heavy congestion during the morning peak hour while southbound I-405 is projected to experience heavy congestion during the midday and evening peak hour. Existing access between mainline I-405 and Pacific Pl. would be removed under Alternative 5C and 7, thereby eliminating the weave segments associated with existing ramps to and from Pacific Pl. As a result, when compared to the No Build (Alternative 1), the LOS projected under Alternatives 5C and 7 would be improved. While removal of these ramps results in loss of access, the traffic demand impacted due to the changes would be small with alternative accesses available via nearby Wardlow Rd.

SR-91 MAINLINE SEGMENTS. Table 3.5-17 and Table 3.5-18 provide a summary of the freeway segment analysis for SR-91. These tables show the following:

- Similar to the No Build (Alternative 1), under Alternative 5C, westbound SR-91 is projected to be congested near the I-710 interchange during the morning peak hour. The weaving segment along westbound SR-91, downstream of the ramp from southbound I-710 would be eliminated under Alternative 5C with the closing of the off-ramp to Long Beach Blvd. The removal of accesses to and from Long Beach Blvd. and Atlantic Ave. would not adversely affect mainline operations. Eliminating one of the two weaving segments along westbound SR-91 would improve operating conditions through the SR-91/I-710 interchange. Operations within the segment downstream of the ramps from northbound and southbound I-710 are projected to improve to LOS E or better in all three peak analysis hours.

Source: AECOM. *I-710 Corridor Project Traffic Operations Analysis Report* (2017).

Note: **Bold** text within cells indicates LOS E or F.

* = Demand exceeds capacity, no density is predicted.

LOS and/or density information is not shown for major merge areas, single-lane addition/drop, and merge/diverge operations within a weaving segment. Therefore, this information is listed as not applicable (N/A) in the table.

¹ Density = passenger car/mile/lane; v/c = volume-to-capacity ratio.

² Major merge area; HCM methodology applied for analysis.

³ Major diverge area; HCM methodology applied for analysis.

⁴ Single-lane addition/drop; HCM methodology applied for analysis.

⁵ Weave operation occurs on freeway collector/distributor.

⁶ Observed speed at this location lower than 50 mph; the junction is assumed to be oversaturated.

EB = eastbound

I-710 = Interstate 710

NB = northbound

FC = freight corridor

LOS = level(s) of service

SB = southbound

HCM = *Highway Capacity Manual*

MD = midday

SR-60 = State Route 60

I-5 = Interstate 5

mph = miles per hour

SR-91 = State Route 91

I-105 = Interstate 105

N/A = not applicable

WB = westbound

I-405 = Interstate 405

In general, enhancements under Alternative 7 would improve traffic operations through the I-710/SR-91 interchange area. Midday and evening peak operations at the weaving segments along westbound SR-91, downstream of the ramp from southbound I-710 would improve from LOS F under the No Build condition to LOS C under Alternative 7. In the eastbound direction, even though vehicle throughputs are projected to increase under Alternative 7, traffic operating conditions remain similar to that of the No Build condition.

Alternative 7 would provide direct freight corridor connectors from northbound I-710 to eastbound SR-91 and from westbound SR-91 to southbound I-710. This new access point favoring ZE/NZE trucks would facilitate truck movement on SR-91 to points east within the region. The added capacity would attract additional truck traffic to and from east of I-710. Under No Build conditions, traffic demand on eastbound SR-91, to the east of the Cherry Ave. is projected to be nearing capacity. Under Alternative 7 conditions, the facilitated truck movement would further increase the projected traffic demand on eastbound SR-91, causing segments that are outside of the improvement area to experience heavy congestion.

I-105 MAINLINE SEGMENTS. Table 3.5-19 and Table 3.5-20 provide a summary of the freeway segment analysis for I-105. These tables show the following:

- Operations on eastbound and westbound I-105 would not be adversely affected by the improvements on I-710 under Alternative 5C. Similar to the No Build (Alternative 1), under Alternative 5C, operations through the I-105/I-710 interchange area are projected to operate at an acceptable LOS of D or better. Congestion would continue along segments upstream and downstream of the interchange area.
- The improvements on I-710 are projected to have marginal effects on the operations on I-105 under Alternative 7. Overall traffic analysis results indicate that operations under Alternative 7 would not be substantially different compared to 2035 No Build conditions.

I-5 MAINLINE SEGMENTS. Table 3.5-21 and Table 3.5-22 provide a summary of the freeway segment analysis for I-5. These tables show the following:

- Travel conditions would be improved somewhat along I-5 under Alternative 5C conditions when compared to future No Build conditions. While LOS results may improve slightly under Alternative 5C conditions, the projected vehicle throughputs during the morning and evening peak hours would still be constrained by the bottlenecks upstream and queues extending from downstream of the Study Area along I-5.
- A portion of traffic is shifted away from I-5 to I-710 as a result of the improvements included along I-710 under Alternative 7. As a result, travel conditions would be improved somewhat along I-5 under Alternative 7.
- **ADDITIONAL PUBLIC TRANSPORTATION SYSTEM FEATURES.** Transit improvements, including increased revenue vehicle service hours for light rail service (Blue Line/Green Line), Los Angeles County Metropolitan Transportation Authority (Metro) Rapid routes, local bus service, and community bus service within the I-710 Corridor would be included as programmatic elements under both build alternatives in addition to the freeway features described above (*Intersection Traffic Impact Analysis Report*, 2017).
- **ROADWAY SEGMENTS.** The roadway segment analysis is provided in the *Intersection Traffic Impact Analysis Report* (2017). This section provides a summary of the roadway segments that experience V/C ratios approaching or exceeding the available capacity and operating at LOS E or F with the build alternatives.

Source: AECOM. *I-710 Corridor Project Traffic Operations Analysis Report* (2017).

Note: **Bold** text within cells indicates LOS E or F.

* = Demand exceeds capacity, no density is predicted.

LOS and/or density information is not shown for major merge areas, single-lane addition/drop, and merge/diverge operations within a weaving segment. Therefore, this information is listed as not applicable (N/A) in the table.

¹ Density = passenger car/mile/lane; v/c = volume-to-capacity ratio.

² Major merge area; HCM methodology applied for analysis.

³ Major diverge area; HCM methodology applied for analysis.

⁴ Single-lane addition/drop; HCM methodology applied for analysis.

⁵ Weave operation occurs on freeway collector/distributor.

⁶ Observed speed at this location lower than 50 mph; the junction is assumed to be oversaturated.

EB = eastbound

FC = freight corridor

HCM = *Highway Capacity Manual*

I-5 = Interstate 5

I-105 = Interstate 105

I-405 = Interstate 405

I-710 = Interstate 710

LOS = level(s) of service

MD = midday

mph = miles per hour

N/A = not applicable

NB = northbound

SB = southbound

SR-60 = State Route 60

SR-91 = State Route 91

WB = westbound

With the No Build conditions under Alternative 1 (No Build), 38 of the Study Area roadway segments are forecast to operate at LOS E or F in 2035, an increase from 2012/2013 existing conditions wherein 27 roadway segments operate at LOS E or F. Under Alternative 5C, 35 roadway segments would operate at LOS E or F. Under Alternative 7, 35 roadway segments would operate at LOS E or F. As a result, the I-710 Corridor Project build alternatives would improve roadway operations slightly within the Study Area as compared to the No Build conditions. These improvements result in part from not as much I-710 traffic diverting onto local arterials under the I-710 Corridor Project build alternatives as compared to the No Build (Alternative 1).

ON-STREET PARKING. As discussed in Section 2.3.2.1 of this Final EIR/EIS, peak-period parking restrictions were included as part of Alternatives 5C and 7 to improve traffic operations on some of the congested arterial roadway segments within the Study Area. More specifically, parking restrictions during peak periods (6:00 a.m.–9:00 a.m. and 4:00 p.m.–7:00 p.m.) were to be implemented on four arterial roadways shown below:

- Atlantic Blvd., between Pacific Coast Hwy. and State Route 60 (SR-60)
- Cherry Ave./Garfield Ave., between Pacific Coast Hwy. and SR-60
- Eastern Ave., between Cherry Ave. and Atlantic Blvd.
- Long Beach Blvd., between San Antonio Dr. and Firestone Blvd.

Using the standard parallel parking length of 22 feet to calculate parking capacity, at most, approximately 7,300 parking spaces along the northbound and southbound arterial roadways shown above would be removed during the peak period. However, this total is conservative

in that it does not represent the quantity of parking spaces being displaced by the restrictions but rather indicates a theoretical supply based on linear feet of available curb space. Based on field observations, parking demand during the AM peak period is approximately 30 percent of this capacity, and parking demand during the PM peak period is approximately 40 percent of this capacity. Although some drivers may alter their behaviors and schedules to avoid the time-of-day parking restrictions, much of the parking demand would need to be absorbed in off-street parking areas for uses that generate the parking demand and in nearby available on-street parking areas. It is important to note that this programmatic feature – peak period parking restrictions on arterial roadways – is not included for the No Build (Alternative 1), which has been identified as the Preferred Alternative.

INTERSECTIONS. The *Intersection Traffic Impact Analysis Report* (2017) also provides an analysis of the Study Area intersections. The following summary compares the No Build conditions under Alternative 1 (No Build) LOS E or F intersection operations with those of the I-710 Corridor Project build alternatives. In aggregate, Study Area intersection operations would generally improve with Alternative 5C and Alternative 7 compared to the No Build conditions in at least one of the peak hours (AM, MD or PM):

- 78 of the 174 intersections analyzed for the No Build (Alternative 1) operate at LOS E or worse
- 69 of the 185 intersections analyzed for Alternative 5C operate at LOS E or worse
- 70 of the 187 intersections analyzed for Alternative 7 operate at LOS E or worse

To identify intersections that would be impacted by the build alternatives, the operations at each intersection under the 2035 build alternatives/design options were compared to the intersection operations under the 2035 No Build conditions. For the purposes of this analysis, uniform criteria were applied to all intersection locations within the Study Area. These impact criteria were developed collaboratively among Caltrans and Metro in coordination with other major transportation corridor projects currently under environmental review in this subregion of Los Angeles County.

During any of the peak analysis hours, if one or more of the following criteria were met, the intersection was identified as being impacted by the build alternatives:

- If the intersection is projected to operate at LOS E and the increase in delay over 2035 No Build conditions is 5 seconds or more;
- If the intersection is projected to operate at LOS F and the increase in delay over 2035 No Build conditions is 2 seconds or more; and
- If the intersection is projected to operate at LOS D or better the under 2035 No Build and degrades to LOS E or F under the build scenario.

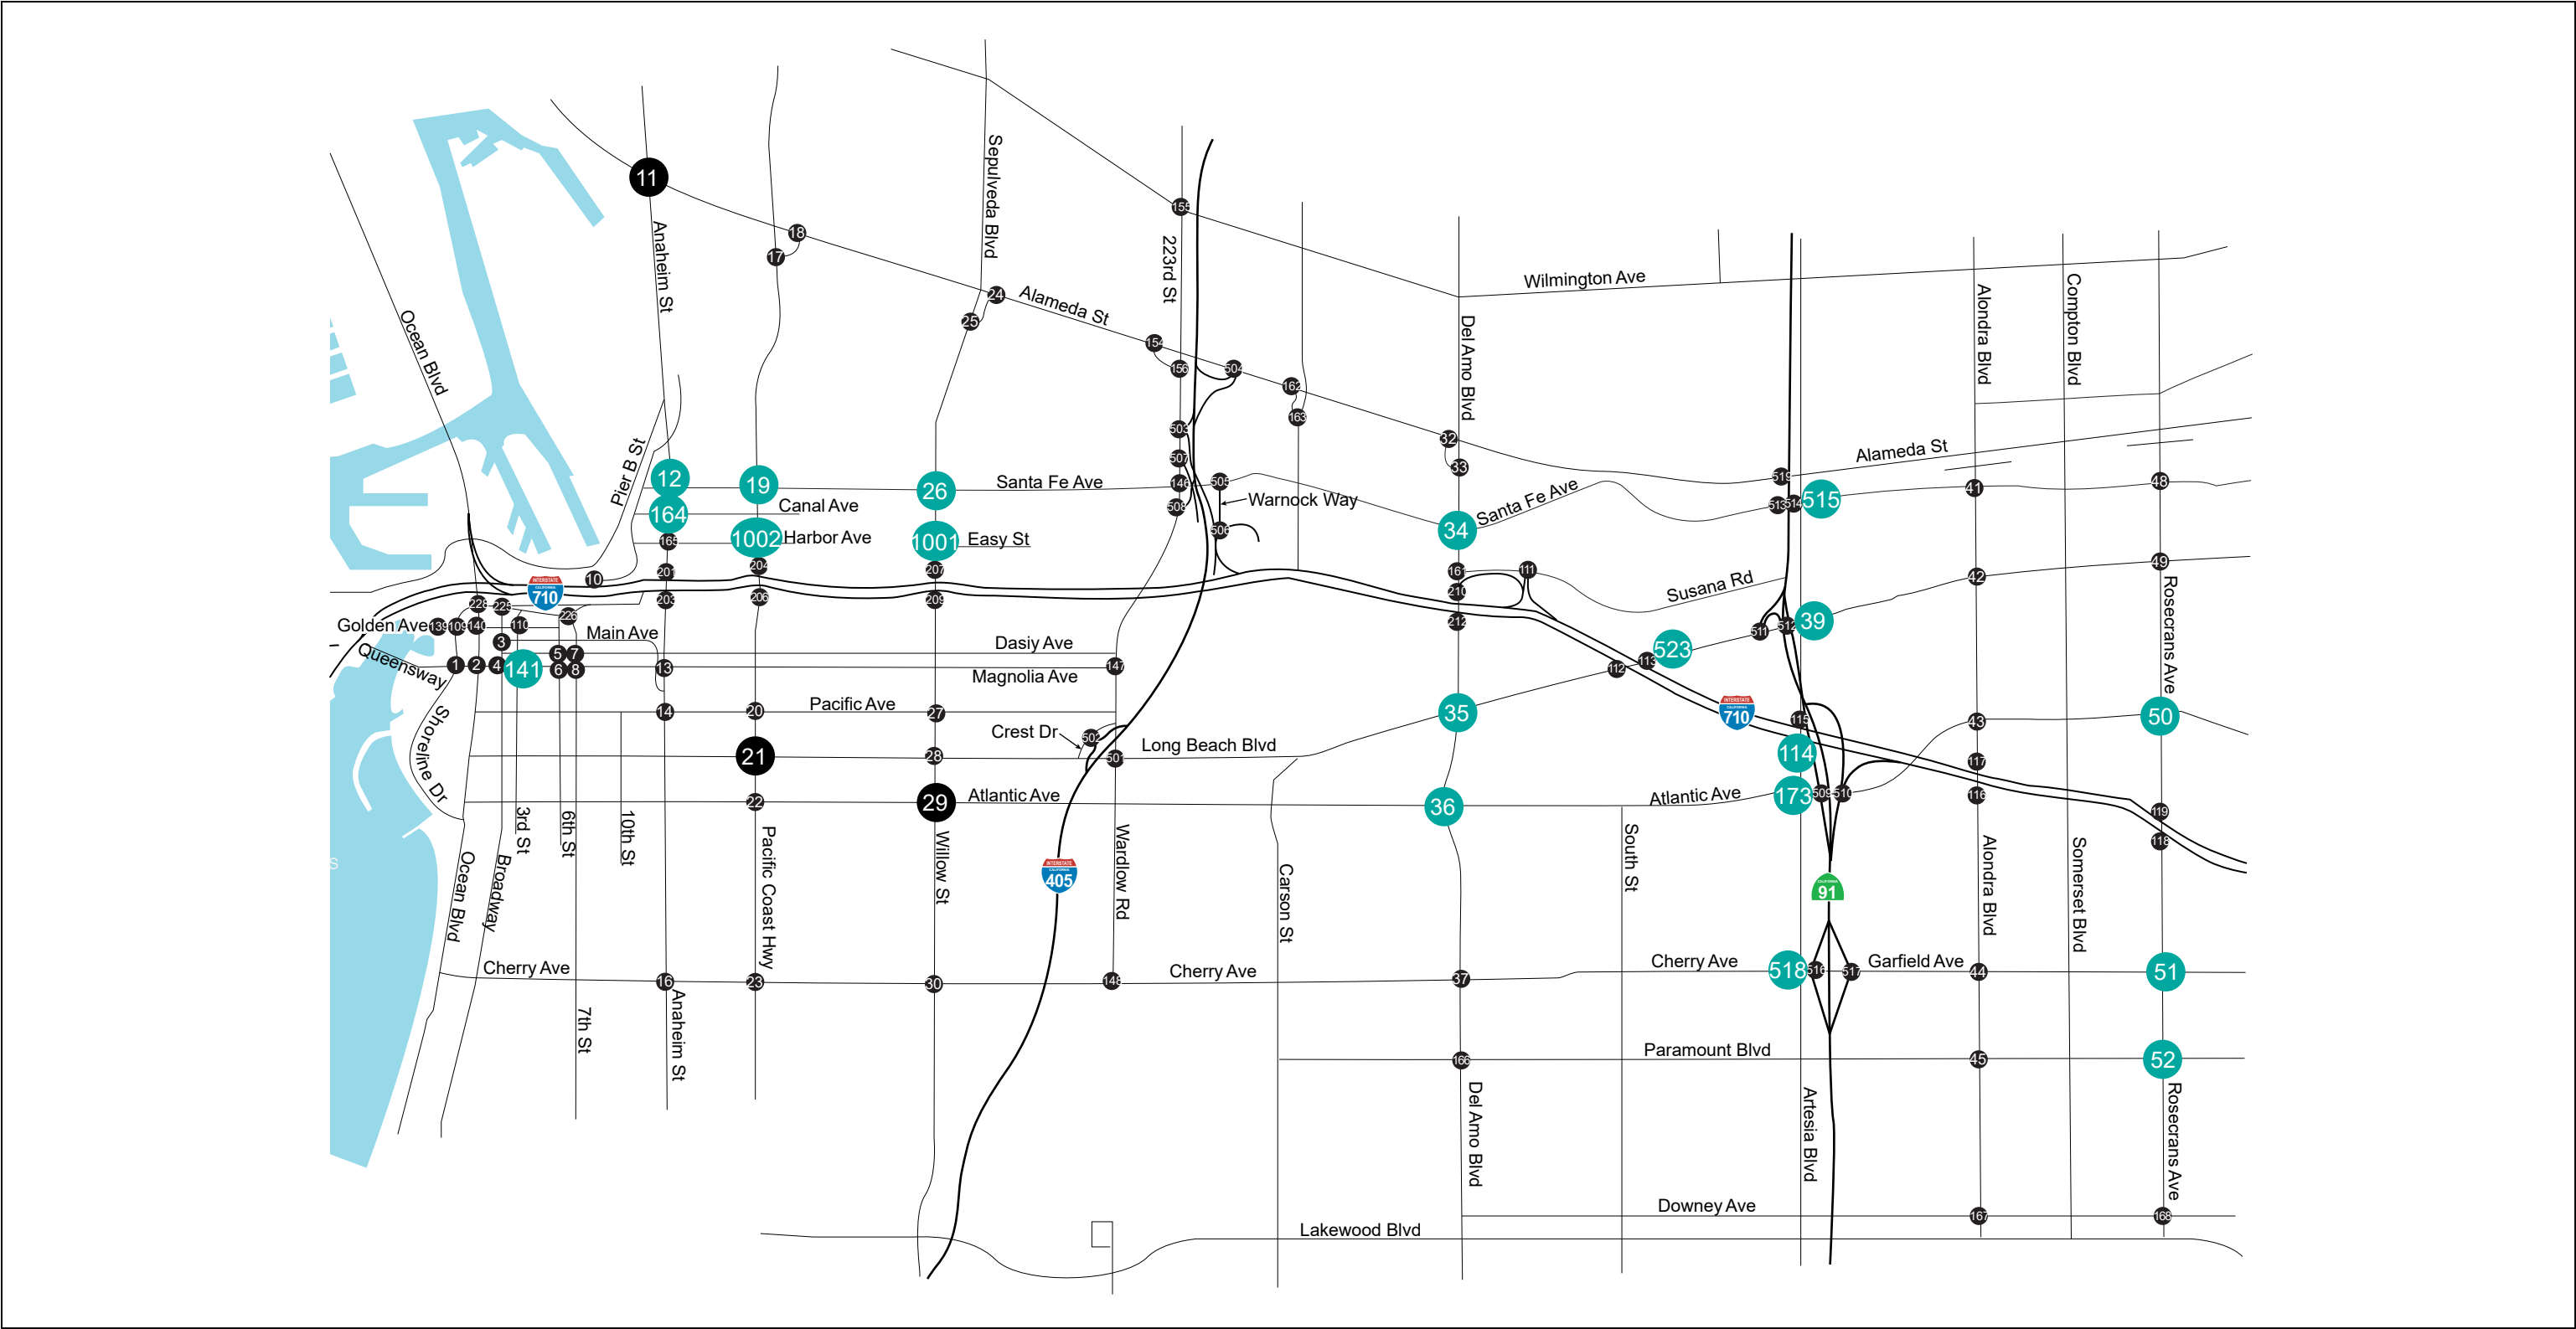

Several intersections that are projected to experience poor LOS and heavy intersection delay under the No Build (Alternative 1) conditions are not identified as adversely impacted intersections because these intersections are also not impacted by any improvements introduced by the build alternatives. For the build alternatives, if there is no significant increase in delay relative to the No Build condition at LOS E or worse, then the intersection is not considered to be impacted.

The LOS and/or intersection delay on the Study Area intersections would generally be maintained or improved during the peak hours in 2035 under the build alternatives compared to No Build (Alternative 1). However, there would be degradation in LOS with the project build alternatives at some locations.

Based on the arterial intersection LOS analysis, 42 Study Area intersections have been identified as adversely impacted by the build alternatives. Of these, 32 intersections are projected to be impacted under Alternative 5C, and 30 intersections are projected to be impacted under Alternative 7. Twenty-two intersections are projected to be impacted by both Alternative 5C and Alternative 7. Under the configuration of Alternative 5C plus Design Options 1A and 2A, 33 intersections would be impacted. These intersections are denoted with the following symbol: † in Table 3.5-23. Intersections impacted by each of the I-710 Corridor Project build alternatives and applicable Design Options are presented in Table 3.5-23 below. Figure 3.5-8 provides a map of all of the intersections in the Study Area that would be impacted by either Alternative 5C or Alternative 7 or one of the Design Options, before mitigation.

Measures that would improve intersection operations and delay to a level equivalent to, or better than, what would occur under the No Build condition have been identified for impacted intersections and have been evaluated for reasonability and feasibility. See Table 3.5-23. Of the 42 intersections impacted by at least one of the build alternatives or Design Options, mitigation improvements for the build alternatives were found to be infeasible at four locations due to right-of-way constraints: Pacific Coast Hwy./Long Beach Blvd. [#21], Willow St./Atlantic Ave. [#29]; 37th St./Santa Fe Ave. [#158]; and Pacific Coast Hwy./Harbor Ave. [#1002]. These four locations are described below.

† Intersection would be signalized under the Build Alternatives and related Design Options.

This page intentionally left blank

Pacific Coast Hwy./Long Beach Blvd. – This intersection is projected to be impacted by Build Alternative 7. One potential improvement to mitigate traffic impacts at this location is to add a separate right-turn lane on the eastbound approach, which would require the full acquisition of the parcel on the southwest quadrant of the intersection.

Therefore, due to this right-of-way constraint, no mitigation improvements are recommended for this intersection.

- Willow St./Atlantic Ave. – This intersection is projected to be impacted by Build Alternative 7. One potential improvement to mitigate traffic impacts at this location is to add a separate right-turn lane on the northbound approach, which would require the full acquisition of the parcel on the southeast quadrant of the intersection. Therefore, due to this right-of-way constraint, no mitigation improvements are recommended for this intersection.
- 37th St./Santa Fe Ave. - This intersection is projected to be impacted by Build Alternatives 5C and 7. One potential improvement to mitigate traffic impacts at this location is to add a separate right-turn lane on the westbound approach. However, due to right-of-way constraints (specifically, the full acquisition of the parcel on the northeast quadrant of the intersection), no mitigation improvements are recommended for this intersection.
- Pacific Coast Hwy./Harbor Ave. - This intersection is projected to be impacted by Build Alternatives 5C, 7, and 5C Design Option 2A. Potential improvements to mitigate traffic impacts at this location include adding an extra through lane on the eastbound approach and converting the westbound right-turn lane to a shared through/right-turn lane, which would require the full acquisition of up to six parcels along the eastbound approach and one parcel in the southwest quadrant of the intersection. Therefore, due to this right-of-way constraint, no mitigation improvements are recommended for this intersection.

VEHICLE MILES TRAVELED/VEHICLE HOURS TRAVELED/VEHICLE HOURS OF DELAY. An analysis of 2035 daily vehicle miles traveled (VMT), vehicle hours traveled (VHT), and vehicle hours of delay (VHD) within the Study Area was prepared for the I-710 Corridor Project. Table 3.5-24 compares the VMT, the VHT, and the VHD for the alternatives.

Table 3.5-24: 2035 Daily Vehicle Miles Traveled, Vehicle Hours Traveled, and Vehicle Hours of Delay Comparison

| Alternative | VMT | VHT | VHD |
|-----------------------------------|------------|---------|---------|
| No Build Alternative 1 | 22,079,000 | 613,900 | 105,800 |
| Alternative 5C | +389,000 | +2,500 | -3,400 |
| Alternative 7 | +604,000 | +400 | -6,400 |

Source: AECOM. *I-710 Corridor EIR/EIS Travel Demand Modeling Methodology* (2017).

VHD = Vehicle Hours of Delay

VHT = Vehicle Hours Traveled

VMT = Vehicle Miles Traveled

As shown in Table 3.5-24, with the I-710 Corridor Project build alternatives, the VMT would increase throughout the Study Area compared to the No Build condition, most likely due to the increased vehicular mobility provided by the I-710 Corridor improvements of the build alternatives. Drivers will travel further if they achieve an overall travel time benefit by choosing a different route (i.e., trading distance for time). In addition, as travel times improve as a result of the build alternatives, additional drivers may choose to opt into the I-710 Corridor from outside the Study Area. It should be noted that although the VMT and VHT would increase, the VHD is forecast to decrease throughout the Study Area compared to the No Build (Alternative 1), which is also likely due to the improvements included as part of Alternatives 5C and 7.

BICYCLE AND PEDESTRIAN FACILITIES. As discussed in Chapter 2.0 of this Final EIR/EIS, the build alternatives include changes to arterial interchanges and intersections which may affect sidewalks and bicycle lanes. The build alternatives would provide facilities for bicycles and pedestrians in locations where local roadways are affected by the construction of the build alternatives. For any build alternative, these facilities would have been designed consistent with the local General Plan Circulation Element and would have complied with ADA requirements. The build alternatives would have improved pedestrian facilities (sidewalks) by replacing the old ones that would have been removed as part of the build alternatives. Bike travel would have also been improved by providing new pavement on the arterial bridges that would have been replaced over I-710 and the Los Angeles River. Existing Class I Bikeways within the Study Area would have been maintained with the build alternatives.

Pedestrian and bicycle-only overcrossings (five additional structures under Alternative 5C, and three under Alternative 7), were included for the build alternatives at locations in which gaps in freeway-crossing opportunities have been identified. These new crossings would also improve pedestrian and bicycle travel within the corridor by introducing new connectivity points traversing the I-710 and the Los Angeles River (and in the case of the Pacific Place overcrossing, the I-405 and Metro Blue Line). These overcrossings would improve pedestrian and bicycle safety compared to the No Build condition.

Many of the arterials crossing I-710 do not have bicycle lanes. Where segments of existing arterials would be replaced under the build alternatives, the cross sectional width of the travel way would be wide enough to allow for Class II bicycle lanes or a combination of Class II and Class IV bicycle lanes. Arterial crossing replacements at Alondra Blvd., Rosecrans Ave., Imperial Hwy., Firestone Blvd., Clara St., Florence Ave., Gage Ave., Bandini Blvd., and Washington Blvd. would have cross sections wide enough for Class II bicycle lanes and delineation. Arterial crossing replacements located in the City of Long Beach include Anaheim St., Pacific Coast Hwy., Willow St., Wardlow Rd., Del Amo Blvd., Long Beach Blvd., and Artesia Blvd. These arterial cross sections would be wide enough for Class IV bicycle lanes and delineation, except at right-turn lane locations. The cross section at right-turn lane locations would be wide enough for Class II bicycle lanes and delineation. These cross sections are consistent with the City of Long Beach's Bicycle Master Plan (a supplement to the Mobility Element included in the City's General Plan Update) (see Section 2.3.2.2 of this Final EIR/EIS for further details). The addition of bicycle lanes on these arterial crossings would improve pedestrian safety as well, by providing greater distance and separation from the flow of vehicular traffic. Furthermore, for any build alternative, the local jurisdictions would have been afforded the flexibility to implement the bicycle lanes, as described, at the time of construction, or later, as part of a broader arterial improvement beyond the project's limits.

Because equestrian, bicycle and pedestrian facilities would generally be maintained or improved, the effect of the build alternatives are that travel by walking, horseback and bicycling would not substantially change as a result of the implementation of the build alternatives. Chapter 5.0 discusses coordination meetings and summarizes outreach with interested parties regarding bicycle and pedestrian facilities.

NO BUILD (ALTERNATIVE 1). The No Build (Alternative 1) would not provide any mobility improvements within the I-710 Corridor. As a result, traffic congestion would continue to increase within the I-710 Corridor and LOS would continue to deteriorate due to forecast increases in traffic volumes between the existing (2012/2013) and Future Year (2035) conditions.

3.5.3.2 PUBLIC HEALTH CONSIDERATIONS – CONGESTION/MOBILITY

PUBLIC HEALTH STATEMENT. Increased access to transit is associated with increased biking and walking as modes of transportation. Increases in congestion and corresponding decreases in bicycle or pedestrian safety are associated with decreased biking and walking. Increases in walking and biking are positively associated with improvements in health, including decreased obesity, chronic disease, and stress (P. Simon et al. 2009).

I-710 CORRIDOR PROJECT ALTERNATIVES. Table 3.5-24 shows the change in VMT, VHT, and VHD associated with the build alternatives relative to the No Build condition. As shown in the table, the VHD are forecast to be less with the build alternatives than under the No Build (Alternative 1). The slight reduction in VHD that would be experienced by residents in the Study

Area would have nominal benefits to public health considerations related to congestion and mobility.

Changes to local interchanges are also included in the project description of the build alternatives. In some cases, these improvements may require modification to local arterial intersections near ramp termini. As part of the interchange design evaluation of the build alternatives at highway access locations, line-of-sight, turning movements, queuing, and signal timing for all modes – pedestrians, bicyclists, and vehicles – were assessed and included in the design for the local interchanges. The improvements to intersections included in the design of the build alternatives were found to provide equal or better safety performance as compared to existing conditions. As an example, for many of the ramp termini that are currently uncontrolled, the new design utilizes traffic signals and phasing to provide for the safe movement of pedestrians and bicycles through the interchanges.

Also, where sidewalks are affected by intersection improvements of the build alternatives, existing sidewalks would be replaced with sidewalks that comply with ADA requirements. Bikeways and multi-use trails along the Los Angeles River would be maintained with the build alternatives.

Because sidewalks would be improved, for any build alternative, bikeways and trails would have been maintained, interchange designs would have been upgraded for all user types, appropriate space for bicycle lanes would have been provided on overcrossings, and new pedestrian and bicycle-only bridges would have been added, the build alternatives would have improved conditions for pedestrian or bicycle travel, thereby resulting in a beneficial effect to public health considerations related to congestion and mobility.

The build alternatives would modernize existing design elements of the I-710 freeway, such as the curves of on- and off-ramps that do not meet current design standards and the weaving sections between interchanges that are of insufficient length. Modernization of the I-710 design under the build alternatives would help improve safety, resulting in accident rates on the I-710 Corridor that are more reflective of the statewide average for a similar facility. This improvement in accident rates would reduce public health risks related to traffic safety.

3.5.3.3 MOTION 22.1

As described in Chapter 2.0, Section 2.2.2.1 (Community Alternative 7) of this Final EIR/EIS, the Metro Board of Directors passed Board Motion 22.1 in October 2015 that directed Metro and Caltrans to study a number of additional items as a part of the I-710 Corridor project description of the build alternatives. For transportation, Motion 22.1 required evaluation of the following measures:

- **Implementing high-frequency Express Bus Transit service along the main I-710 Corridor and the impact of such a line on commuter and freight traffic demands.** Three new routes (Express Line 51X, Express Line 52X, and Rapid Line 7XX) are described in Section 2.3.2.1, Common Features of Build Alternatives. These new routes would provide additional north-south transit service throughout the I-710 Corridor Project Study Area. These new routes would provide additional options for commuters within the Study Area, but would not be expected to have any effect on freight traffic demands.
- **Adding transit service on the bus and rail lines serving the I-710 project area, including operating Blue and Green Line trains with a minimum of 10-minute headways and a minimum of 25 percent increase in Local Bus, Express Bus, and community shuttles service frequencies.** This feature that would expand transit service on existing bus and rail lines in the I-710 Corridor Project Study Area is described in Section 2.3.2.1, Common Features of Build Alternatives. This expanded service would improve mobility by reducing passenger wait times for the next bus or train, as well as reducing crowding on existing buses and trains.
- **Traffic control measures, traffic management, intelligent transportation systems, and operational efficiency improvements, such as highway ramp metering and transit system signal prioritization, to reduce congestion on local roadways and arterials before considering expanding lanes.** These measures are described in Section 2.3.2.1, Common Features of Build Alternatives. For example, new or updated adaptive ramp metering is included in the build alternatives for all I-710 on-ramps between Pico Ave. and Third St. to better manage traffic flows up and down the freeway corridor. These measures would improve existing traffic operations with little or no environmental impact; however, they do not provide enough operational capacity to serve existing or future travel demand within the I-710 Corridor.
- **The replacement/enhancement of approximately 28 existing bridges/underpasses and the construction of at least five new pedestrian/bike bridges/underpasses to ensure safe and easily accessible freeway and river crossings to reduce gaps between crossings further than 0.5 mile where demand for increased access exists along the project corridor.** These measures are described in Section 2.3.2.1, Common Features of Build Alternatives. The improvements to existing bridges/underpasses would occur under Alternatives 5C and 7 as part of the reconstruction of freeway interchanges and existing overcrossings of I-710 and would improve mobility and safety for bicyclists and pedestrians. The five new pedestrian/bicycle overcrossings would further improve mobility by reducing cycling time/walk time for bicyclists and pedestrians seeking to cross the I-710 freeway.

3.5.4 AVOIDANCE, MINIMIZATION, AND/OR MITIGATION MEASURES

The I-710 Corridor Project build alternatives would provide additional capacity and design improvements to address projected traffic volumes, would improve traffic safety by modernizing corridor design, and would provide infrastructure to address projected growth in population, employment, and activities related to goods movement. As discussed previously in this section, the build alternatives would result in improved traffic operations on the I-710 mainline, freight movement corridor, and ramp facilities. However, without mitigation, implementation of the build alternatives would cause permanent adverse impacts at to 32 Study Area intersections under Alternative 5C and 30 Study Area intersections under Alternative 7. Intersection improvements have been identified at each of these locations that would improve intersection operations and delay to a level equivalent to, or better than, what would occur under the No Build condition.

For any build alternative, mitigation for impacts to local intersections by the build alternatives would have been implemented by Caltrans as the lead agency in coordination with the local jurisdiction (if applicable). In this case, Traffic Operations Policy Directive (TOPD) 13-02: Intersection Control Evaluation would have been applied to identify the most effective and comprehensive access strategy, treatment, configuration, and countermeasures(s) at State highway intersections and interchanges. The improvements described below are those that would have improved intersection operations and delay to a level equivalent to or better than what would have occurred under the No Build condition. For any build alternative, the following measure would have addressed these impacts. The mitigation described below for TR-1 would have been applied to both build alternatives unless otherwise noted.

As described in Chapter 2.0, the No Build (Alternative 1) has been identified as the Preferred Alternative. Since a build alternative was not identified as the Preferred Alternative, mitigation measures will not be implemented. Mitigation measures would not be required for the No Build (Alternative 1) as no project-related impacts would occur under this alternative. Avoidance, minimization, and/or mitigation measures to address impacts for the two build alternatives are retained in this Final EIR/EIS for disclosure purposes.

TR-1 The following improvements to address project impacts of Alternatives 5C and 7 to arterial intersections are described as follows:

CITY OF BELL GARDENS.

- **FLORENCE AVE./EASTERN AVE.:** Add an extra left-turn lane on the eastbound (triple-left) approach. Add a separate right-turn lane on the westbound approach. Implement overlap phase for eastbound right-turn movement.

CITY OF BELL GARDENS/CITY OF COMMERCE.

- **GARFIELD AVE./GAGE AVE.:** Add separate right-turn lanes on both the eastbound and westbound approaches.

CITY OF CARSON/COUNTY OF LOS ANGELES.

- **DEL AMO BLVD./SANTA FE AVE.:** Add a separate right-turn lane on the eastbound approach. Add an extra left-turn lane (dual left) on the southbound approach.

CITY OF COMMERCE.

- **SLAUSON AVE./EASTERN AVE.:** Add a separate right-turn lane on the eastbound approach. The improvement at this intersection pertains to Alternative 7 only.
- **SLAUSON AVE./GARFIELD AVE.:** Convert the eastbound right-turn lane to a shared through/right-turn lane. The improvement at this intersection pertains to Alternative 5C only.

CITY OF COMPTON.

- **ROSECRANS AVE./ATLANTIC AVE.:** Add a separate right-turn lane on the westbound approach.
- **ARTESIA BLVD./SANTA FE AVE.:** Convert the eastbound right-turn lane into shared through/right-turn lane. Add an extra right-turn lane on the eastbound approach. The improvement at this intersection pertains to Alternative 5C only.

CITY OF HUNTINGTON PARK.

- **SLAUSON AVE./ALAMEDA ST. (WEST):** Add a separate right-turn lane on the southbound approach. The improvements at this intersection pertain to Alternative 7 only.
- **SLAUSON AVE./SANTA FE AVE.:** Add a separate right-turn lane on the northbound approach. The improvements at this intersection pertain to Alternative 7 only.
- **SLAUSON AVE./BOYLE AVE. (Intersection shared with the City of Vernon):** Add a separate right-turn lane on the eastbound approach.

CITY OF LONG BEACH.

- **ANAHEIM ST./SANTA FE AVE.:** Convert separate southbound right-turn lane to a shared through/right-turn lane. Add an extra left-turn lane to the southbound approach.

- **PACIFIC COAST HWY./SANTA FE AVE.:** Convert westbound right-turn lane to a shared through/right-turn lane. Convert eastbound right-turn lane to a shared through/right-turn lane.
- **WILLOW ST./SANTA FE AVE.:** Add a separate right-turn lane on the westbound approach. The improvement at this intersection pertains to Alternative 5C Design Option 2A only.
- **DEL AMO BLVD./LONG BEACH BLVD.:** Add an extra left-turn lane on both southbound and northbound approaches.
- **DEL AMO BLVD./ATLANTIC AVE.:** Add an extra left-turn lane on northbound approach. The improvement at this intersection pertains to Alternative 5C only.
- **ARTESIA BLVD./LONG BEACH BLVD.:** Add a separate right-turn lane on the southbound approach. The improvement at this intersection pertains to Alternative 5C only.
- **I-710 NORTHBOUND/ARTESIA BLVD. (OFF):** Add an extra right-turn lane on the northbound approach.
- **3RD ST./MAGNOLIA AVE.:** Add a separate right-turn lane on the southbound approach.
- **ANAHEIM ST./CANAL AVE.:** Implement Access Management: prohibit left- and through- movements on both the northbound and southbound approaches during the AM, midday, and PM peak hours.
- **ATLANTIC AVE./ARTESIA BLVD.:** Add a separate left-turn lane on the westbound approach. The improvement at this intersection pertains to Alternative 5C only.
- **ARTESIA BLVD./CHERRY AVE.:** Convert the eastbound right-turn lane into a shared through/right-turn lane. The improvement at this intersection pertains to Alternative 5C only.
- **LONG BEACH BLVD./VICTORIA ST.:** Convert the eastbound shared through/left-turn lane (middle lane) to a shared through/right-turn lane.
- **WILLOW ST./EASY ST.:** Add a separate left-turn lane on the southbound approach. Convert the eastbound right-turn lane to a shared through/right-turn lane.

CITY OF LOS ANGELES (WILMINGTON).

- **ANAHEIM ST./ALAMEDA ST.:** Implement protected phase for eastbound left-turn movement. The improvement at this intersection pertains to Alternative 7 only.

COUNTY OF LOS ANGELES (UNINCORPORATED EAST LOS ANGELES).

- **INDIANA ST./OLYMPIC BLVD.:** Convert both the northbound and southbound approaches to provide a separate left-turn lane and a shared through/right-turn lane.
- **I-710 NORTHBOUND/OLYMPIC BLVD. (OFF):** Add a separate right-turn lane on the northbound approach (Alternative 5C Design Option 3A and Alternative 7 Design Option 3B only).
- **FORD BLVD./WHITTIER BLVD.:** Convert both the northbound and southbound approaches to provide a separate left-turn lane and a shared through/right-turn lane.
- **FORD BLVD./3RD ST.:** Add a separate right-turn lane on the northbound approach. (Alternative 7 and Alternative 5C Design Option 3A only).
- **3RD ST./GAGE AVE.:** Add separate right-turn lanes on both the eastbound and westbound approaches.

CITY OF LYNWOOD.

- **IMPERIAL HWY./ATLANTIC AVE.:** Add an extra left-turn lane on the southbound approach resulting in triple left-turn lanes.

CITY OF PARAMOUNT.

- **ROSECRANS AVE./GARFIELD AVE.:** Add an extra left-turn lane on the eastbound approach. The improvement at this intersection pertains to Alternative 5C only.
- **ROSECRANS AVE./PARAMOUNT BLVD.:** Add an extra left-turn lane on the eastbound approach. The improvement at this intersection pertains to Alternative 5C only.

CITY OF SOUTH GATE.

- **FIRESTONE BLVD./ATLANTIC AVE.:** Add separate right-turn lanes on both the eastbound and westbound approaches.
- **FIRESTONE BLVD./GARFIELD AVE.:** Add an extra left-turn lane on the eastbound approach. The improvement at this intersection pertains to Alternative 5C only.

- **GARFIELD AVE./SOUTHERN AVE.:** Add an extra left-turn lane on the northbound, southbound and eastbound approaches.

CITY OF VERNON.

- **BANDINI BLVD./ATLANTIC BLVD.:** Add an extra right-turn lane on the southbound approach.
- **BANDINI BLVD./PENNINGTON WAY:** Implement overlap phase for northbound right-, southbound right-, and westbound right-turn move-ments. The improvement at this intersection pertains to Alternative 5C only.
- **WASHINGTON BLVD./DOWNEY RD.:** Add an extra left-turn lane on both the northbound and southbound approaches. The improvement at this intersection pertains to Alternative 7 only.

3.6 VISUAL/AESTHETICS

The information in this section is based on the following documents:

- Interstate 710 (I-710) Corridor Project *Revised Draft Visual Impact Assessment* (VIA) (February 2017)
- California Department of Transportation (Caltrans) *I-710 Corridor Aesthetics Master Plan* (February 2014), which was developed and based upon the *Urban Design and Aesthetics Toolbox Report* (February 2012)

3.6.1 REGULATORY SETTING

The National Environmental Policy Act of 1969 (NEPA), as amended, establishes that the Federal government use all practicable means to ensure all Americans safe, healthful, productive, and *aesthetically* (emphasis added) and culturally pleasing surroundings (42 U.S.C. 4331[b][2]). To further emphasize this point, the Federal Highway Administration in its implementation of NEPA (23 U.S.C. 109[h]) directs that final decisions regarding projects are to be made in the best overall public interest taking into account adverse environmental impacts, including among others, the destruction or disruption of aesthetic values.

Likewise, the California Environmental Quality Act (CEQA) establishes that it is the policy of the state to take all action necessary to provide the people of the state “with...enjoyment of *aesthetic*, natural, scenic and historic environmental qualities.” (California Public Resources Code Section 21001[b])

3.6.2 AFFECTED ENVIRONMENT

3.6.2.1 VISUAL ENVIRONMENT STUDY AREA

The Study Area for visual impacts includes or is adjacent to commercial, industrial, residential, parks and recreational land uses, local roads, and major highways/freeways (Interstate 405 [I-405], State Route 91 [SR-91], Interstate 105 [I-105], Interstate 5 [I-5], and State Route 60 [SR-60]). The Study Area does not contain any State, County, or City-designated scenic highways or corridors. The southern portion of the I-710 Corridor Project runs through the City of Long Beach. The Open Space and Recreation Element of the City of Long Beach’s General Plan states that the City’s policy is to “protect and improve the community’s natural resources, amenities and scenic values.” There are no State or locally designated scenic roads within the I-710 Corridor Project’s viewshed; however, the City of Long Beach is working with the California Coastal Conservancy and others to rehabilitate wetland acreage in areas along the Los Angeles River which parallels the I-710 Corridor. The primary viewer groups in the Study Area are residents, motorists, pedestrians, cyclists, park and recreational facility users, employees, and users of commercial and industrial facilities.

3.6.2.2 LANDSCAPE UNITS

A landscape unit is a portion of the regional landscape and can be thought of as an outdoor room that exhibits a distinct visual character. A landscape unit will often correspond to a place or district that is commonly known among local viewers. The following landscape units were defined within the Study Area.

RESIDENTIAL. The residential landscape unit applies solely to residential households. This unit includes views of the I-710 Corridor Project from all residences within the Study Area. This unit includes single-family homes, multifamily homes (such as apartments, townhouses, and condominiums), and mobile homes. Housing styles and residential landscaping may vary substantially between residential areas. Residents along the existing I-710 do not see much of the existing freeway due to the presence of existing walls and fences along the freeway.

RECREATION. The recreation landscape unit applies to parks, bicycle trails, golf courses, and other recreational/leisure-time facilities. Trees such as eucalyptus and liquidambar are prevalent in this unit.

EDUCATION. The education landscape unit is characterized by elementary, middle, and high schools. Although many of these facilities are located within 0.1 mile of the freeway, soundwalls and surrounding buildings contribute to obstruction of the views to I-710.

FREEWAY. The I-710 mainline within the Study Area represents the freeway landscape unit. Most of I-710's route is located parallel to the course of the Los Angeles River and is within several hundred feet from the riverbed. Within the I-710 right-of-way, guardrails, advertisement signs, light poles, and utility lines are found. The freeway landscape unit also contains various types of landscaping.

3.6.2.3 TOPOGRAPHY

The I-710 Corridor Project is situated within the central part of the Los Angeles Basin. The elevation of the Study Area varies from near sea level in the south to approximately 280 feet above mean sea level near SR-60 (United States Geological Survey [USGS] 1994). The lands within the Study Area are generally flat with a slight downward slope toward the Pacific Ocean, located just south of Ocean Blvd. There are no prominent land forms within the Study Area, however, the most prominent landforms near the Study Area are the Dominguez Hills to the southwest of the I-710/SR-91 interchange and Signal Hill to the southeast of the I-710/I-405 interchange.

3.6.2.4 METHODOLOGY

This section summarizes the methodology and terminology used to assess visual impacts of the build alternatives. More details on the methodology are available in the VIA (2017), which was prepared following the methodology prescribed in the publication *Guidelines for the Visual Impact*

Assessment for Highway Projects (Federal Highway Administration [FHWA], January 2015). The following six principal steps were carried out to assess the visual impacts of the build alternatives:

1. Define the project setting and viewshed.
2. Identify Key Views for visual assessment.
3. Analyze existing visual resources and viewer response.
4. Depict the visual appearance of build alternatives.
5. Assess the visual impacts of build alternatives.
6. Propose methods to lessen adverse visual impacts resulting from the build alternatives.

The visual impacts of the build alternatives were determined by assessing the existing visual resources, the visual resource change due to the build alternatives and predicting viewer response to that change.

VISUAL RESOURCE CHANGE. Visual resource change is the combination of the change in visual character and change in visual quality. Determining visual resource change involves assessing the visual compatibility of the build alternatives with existing resources.

Visual character was evaluated using the following FHWA descriptive attributes:

- Form: Visual mass or shape
- Line: Edges or linear definition
- Color: Reflective brightness (light, dark) and hue (red, green)
- Texture: Surface coarseness
- Dominance: Position, size, or contrast
- Scale: Apparent size as it relates to the surroundings
- Diversity: A variety of visual patterns
- Continuity: Uninterrupted flow of form, line, color, or textural pattern

Numeric value ratings were assigned to describe the changes in each visual character attribute (0 = no visual change; 1 = very low; 2 = low; 3 = moderate; 4 = high; 5 = very high). Attribute changes from existing conditions to build alternative conditions were averaged to give an overall Visual Character Change (VCC) rating:

The degree of visual quality in a view was evaluated using the following FHWA descriptive terms:

- **Vividness:** Vividness is the visual power or memorability of landscape components as they combine in striking and distinctive visual patterns (e.g., Niagara Falls is a highly vivid landscape component).
- **Intactness:** Intactness is the visual integrity of the natural and human-built landscape and its freedom from encroaching elements. This factor can be present in well-kept urban and rural landscapes and natural settings.
- **Unity:** Unity is the visual coherence and compositional harmony of the landscape considered as a whole; it frequently attests to the careful design of individual components in the landscape.

A numerical value is assigned to vividness, intactness, and unity using a numeric scale (1.0 = very low; 2.0 = low; 3.0 = moderately low; 4.0 = moderate; 5.0 = moderately high; 6.0 = high; 7.0 = very high). These values are then combined and divided by three to determine an overall visual quality rating.

For these ratings, the common rounding off method is used to determine the level of impact. For example, a value of 3.5-3.9 will round up to 4.0 and a value of 3.1-3.4 will round down to 3.0.

VIEWER RESPONSE. Viewer response is the measure or prediction of the viewer's reaction to changes in the visual environment. Viewer response is assessed through the evaluation of viewer exposure, which is the measure of the viewer's ability to see a particular object (e.g., location, quantity and duration), and viewer sensitivity, which is the measure of the viewer's recognition of a particular object (e.g., activity, awareness and local value). Viewer response numeric scale was established by averaging the viewer exposure and viewer sensitivity to the project (1.0 = very low; 2.0 = low; 3.0 = moderately low; 4.0 = moderate; 5.0 = moderately high; 6.0 = high; 7.0 = very high).

For these ratings, the common rounding off method is used to determine the level of impact. For example, a value of 3.5-3.9 will round up to 4.0 and a value of 3.1-3.4 will round down to 3.0.

VISUAL IMPACT. The levels of visual impact are determined by combining the severity of resource change with the degree to which people are likely to be affected by the change. Resource change and viewer response numerical scores are averaged to give the evaluation for the visual impact. The following ratings describe the levels of the resulting visual impact with the associated level of visual mitigation required:

- Very Low (0.5–1.4): Little to no visual impact resulting from very low viewer response and very low resource change. Mitigation not required. (No Mitigation)
- Low (1.5–2.4): Minor adverse change to the existing visual resource with low viewer response to change in the visual environment. May or may not require mitigation. (Low Mitigation)

- Moderately Low (2.5–3.4): Moderately low adverse change to the existing visual resource with moderately low viewer response. Impact can be mitigated within five years using conventional practices. (Moderate Mitigation)
- Moderate (3.5–4.4): Moderate adverse change to the existing visual resource with moderate viewer response. Impact can be mitigated within five years using conventional practices. (Moderate Mitigation)
- Moderately High (4.5–5.4): Moderately high adverse change to the existing resource with a higher viewer response. Extraordinary mitigation practices may be required. Required landscape treatment will generally take longer than five years to mitigate. (Moderately High Mitigation)
- High (5.4–6.5): Excessive adverse change to the existing resource with a higher level of viewer response to visual changes such that architectural design and landscape treatment cannot mitigate the impacts. An alternative project design may be required to avoid highly adverse impacts. (High Mitigation)

VISUAL SIMULATIONS. Visual simulations were prepared for representative locations along the I-710 Corridor Project. A photographic inventory was taken from each candidate Key View location. All photographs were taken using a digital camera with a 35-millimeter focal length. This specific focal length best simulates the view perspective of the human eye. Twenty-nine preliminary Key Views were assessed and ranked relative to appropriateness and anticipated viewer response. Twenty-five of the top-ranked Key Views were recommended for further study. These 25 Key Views are presented within this section.

To prepare the visual simulations, a photograph of the existing view was taken from each approved Key View location. These existing photographs were used as a baseline from which all other images of the view are compared. Digital models of the scene depicted in the Key View were then created from engineering data of the build alternatives. The resulting image is a “wireframe” view of the completed construction of the build alternatives from the standpoint of the Key View location. Upon completion of the digital modeling, the “wireframe” is “painted” to simulate solid objects. Using materials, textures, and colors obtained from the project engineers, the model is given solid surfaces that simulate the completed construction. This simulation rendering shows the build alternatives as they would look after installation of standard Caltrans landscaping.

I-710 CORRIDOR AESTHETICS MASTER PLAN (CMP). The CMP is a cooperative effort to plan the visual quality of the I-710 Corridor. The *I-710 Corridor Aesthetics Master Plan* was developed with the cooperation and assistance of the following community stakeholders: City of Bell, City of Bell Gardens, City of Commerce, City of Compton, City of Long Beach, City of Lynwood, City of Paramount, City of South Gate, City of Vernon, Los Angeles County, Gateway Cities Council of Governments, and Metro. A committee consisting of Caltrans, local City/County representatives,

Metro, and the Council of Governments was formed to provide background information and community preferences for design, and to develop and approve the aesthetic corridor theme. The committee provided design input for route themes, and Caltrans developed route theme options based on that input. Caltrans then presented theme options to the committee, and the committee either revisited the design input and Caltrans modified design themes, or a consensus was reached and a route theme was approved by the committee and Caltrans. The Corridor Master Plan was finalized in 2014 and, for any build alternative, would guide the development of detailed plans during the final design phase.

3.6.2.5 KEY VIEWS

Key Views form the foundation for the visual impact analysis. Visual impacts are analyzed relative to changes between existing and proposed conditions of the build alternatives from the 25 Key Views selected for analysis. Given that the Study Area is approximately 19 miles in length and goes through a dense urban area composed of many land uses, these Key Views represent typical views within the Study Area from the various landscape units. Figure 3.6-1 shows the location of the Key Views.

KEY VIEW 1. The existing setting photograph for Key View 1 is shown in Figure 3.6-2. This Key View is located at LARIO Trail in the City of Long Beach and looks northwest across the Los Angeles River towards the I-710 Corridor. The landscape unit for Key View 1 is recreational, as pedestrians and cyclists are the primary viewer group of this Key View. The water and vegetation in the Los Angeles River create striking scenery at this location.

The existing vividness of this Key View is high considering the water and vegetation in the Los Angeles River that create a memorable view. The existing intactness is high, as natural landscapes can be seen with minimal encroachment from utility lines in the distance. The existing unity is high because the arrangement of the Los Angeles River, the row of trees in the distance, the row of riprap, and the bike path create strong linear lines. As a result, the existing visual quality of this Key View is high.

KEY VIEW 2. The existing setting photograph for Key View 2 is shown in Figure 3.6-3. This Key View is located on the Willow St. Bridge in the City of Long Beach and overlooks the northbound and southbound lanes of the I-710 Corridor towards the Willow St. northbound off-ramp. There is a large cluster of mature trees to the east of the freeway and a short row of trees along the horizon. The existing landscape unit of Key View 2 is categorized as freeway, as most of the viewers at this location are motorists.

The existing vividness is moderate as the prominent freeway and tree visual elements in this view are not considered memorable. The existing intactness is moderately high since the existing freeway creates visual flow, and the existing unity is moderate, as the view contains both a dominant freeway element along the lower half of the view and vegetation along the top half of the view. As a result, the existing visual quality of this Key View is moderate.

KEY VIEW 3. The existing setting photograph for Key View 3 is shown in Figure 3.6-4. Key View 3 is located on the northbound I-710 between West Willow St. and West Wardlow Rd. in the City of Long Beach. The Key View is comprised of I-710 northbound lanes and barren landscape adjacent to the freeway lanes with small tree groupings on the horizon. The existing view landscape unit is categorized as freeway, as viewers consist entirely of motorists.

The existing vividness is moderately low as it includes unmaintained landscaping and freeway lanes on the lower half of the view, and open sky on the top half of the view, with no dominant or unique visual elements. The existing intactness is moderately high as there is little encroachment from utility poles, billboards, or signs. The existing unity is moderate, due to the consistent lines created by the components in the view. As a result, the existing visual quality of this Key View is moderate.

KEY VIEW 4. The existing setting photograph for Key View 4 is shown in Figure 3.6-5. This Key View is located in a residential area on Fashion Ave. west of the I-710 in the City of Long Beach, and looks towards the southbound lanes of I-710. The view of the freeway is currently screened by a cluster of large trees in the middle of the view. The landscape unit of this Key View is residential.

The existing vividness is low due to the absence of a single dominant visual element. The existing intactness is moderately low due to the strong presence of utility lines. The existing unity is moderately low due to the utility lines that cut across the skyline, creating disharmony with the vertical elements in the residential neighborhood. As a result, the visual quality rating is moderately low.

KEY VIEW 5. The existing setting photograph for Key View 5 is shown in Figure 3.6-6. This Key View is located on the LARIO Trail, east of the I-710 and south of Del Amo Blvd., in the City of Long Beach. This Key View looks northwest toward I-710 interchange at West Del Amo Blvd. and across the Los Angeles River. The landscape unit for this Key View is recreational as cyclists and pedestrian users are the primary viewer group.

The existing vividness is high as the Los Angeles River and bridge are the dominant visual elements in the view with limited landscape vegetation and utility lines in the distance. The existing intactness is moderately high since the utility line encroachments are far in the distance.

The existing unity is moderate because the existing lines, size and design of the elements within the view are harmonious with each other. As a result, the existing visual quality is moderately high.

KEY VIEW 6. The existing setting photograph for Key View 6 is shown in Figure 3.6-7. This Key View is located on the sports field at Colin Powell Elementary School in the City of Long Beach. This Key View looks southeast across the sports field toward the I-710. The view of the freeway is currently screened by a chain-link fence. The landscape unit is education.

The existing vividness is moderately high because, although the green field stands out in this Key View, the presence of a billboard is a prominent and negative visual element in the view. The existing intactness is moderately low due to the billboard, electric lines and freeway encroachments, and the existing unity is low due to the unharmonious arrangement of visual elements within this view. As a result, the existing visual quality is moderately low.

KEY VIEW 7. The existing setting photograph for Key View 7 is shown in Figure 3.6-8. This Key View is located on the southbound I-710, between Artesia Blvd. and Long Beach Blvd. in the City of Long Beach. The Key View consists of current freeway traffic lanes and a narrow strip of landscape adjacent to the traffic lanes with existing power lines and freeway signs in the background. The existing view landscape unit is categorized as freeway, as viewers consist entirely of motorists.

The existing vividness of this Key View is moderately low, as there are no distinct visual elements that stand out in the view. The existing intactness is also moderately low due to the encroachment of utility lines and freeway signs along the top half of the view. The existing unity is moderately low as there is a lack of unifying visual elements within the view. As a result, the existing visual quality is given a rating of moderately low.

KEY VIEW 8. The existing setting photograph for Key View 8 is shown in Figure 3.6-9. Key View 8 is located at Coolidge Park in the City of Long Beach near the I-710 and SR-91 interchange. The Key View is within the park near a baseball field and looks northeast- toward the I-710. The existing wall, fence, and trees divide the park from the I-710. The landscape unit for this Key View is recreational, as park users are the primary viewer group.

The existing vividness is moderate as the horizontal arrangement of the green field, fence, row of trees and skyline draws viewer attention in a vertical manner. The existing intactness is moderately low due to several visual encroachments from utility lines, street lights, and sports field lights, and the existing unity is moderate because these visual encroachments cut into the visual aesthetics of the landscape. As a result, the existing visual quality is moderate.

FIGURE 3.6-9

This page intentionally left blank

KEY VIEW 9. The existing setting photograph for Key View 9 is shown in Figure 3.6-10. This Key View is located on LARIO Trail, northeast of the I-710/SR-91 interchange, in the City of Long Beach. The Key View looks southwest at a bridge across the Los Angeles River, with the bike trail and vegetated concrete barrier in the foreground. The landscape unit for this Key View is recreational as cyclists and pedestrians are the primary viewer group.

The existing vividness is moderately high, as the vegetated concrete barrier is the most prominent visual element in the view and it draws viewer attention toward the bridge. The existing intactness is moderate as the bridge in the distance divides the view in half, and utility lines, freeway signs, and a billboard extend into the skyline in the distance. The existing unity is moderate because the vegetation and lines on the concrete barrier create rhythm, texture, and pattern within the view. As a result, the existing view is considered moderate.

KEY VIEW 10. The existing setting photograph for Key View 10 is shown in Figure 3.6-11. Key View 10 is located on southbound I-710, looking south toward the I-710/SR-91 interchange, in the City of Long Beach. The view consists primarily of freeway lanes with a few trees in the distance. The existing view landscape unit is categorized as freeway, as viewers consist of motorists.

The existing vividness is moderate due to the lack of a distinct major visual element, and the utility pole and freeway elements are evenly spread out in the view. The existing intactness is moderate because of some encroachment by utility lines and freeway signs in the distance. The existing unity is moderately low because the freeway dominates the lower portion of the view, vegetation is spread along the middle of the view, and the skyline dominates the top of the view. As a result, the existing visual quality of this view is moderate.

KEY VIEW 11. The existing setting photograph for Key View 11 is shown in Figure 3.6-12. This Key View is located within a senior apartment complex on Williams Ave. in the City of Compton. The Key View was taken from the recreation area within the senior apartment complex looking east toward the adjacent I-710. The view consists of a well-maintained park and soundwall that separates the complex from the freeway. The landscape unit is residential.

The existing vividness is moderately high with the open sky and large green park area that create a strong landscape aesthetic. The existing intactness is moderate as light posts are the only encroachment within the view. The existing unity of Key View 11 is moderately high due to the strong presence of the sky and horizontal visual flow of the grass, sidewalk, and soundwall. As a result, the existing visual quality of this view is moderately high.

FIGURE 3.6-12

This page intentionally left blank

KEY VIEW 12. The existing setting photograph for Key View 12 is shown in Figure 3.6-13. This Key View is located on LARIO Trail north of the Imperial Hwy. Bridge in the City of South Gate, next to a Los Angeles County Flood Control facility. The Key View looks southwest across the Los Angeles River toward I-710. The view consists of the trail, concrete barrier, and bridge with minimal vegetation enhancements. The landscape unit is recreational, as cyclists and pedestrians are the primary viewer group.

The existing vividness is moderately high, as the concrete barrier between the trail and the Los Angeles River is the dominant feature in the view. This barrier obscures the majority of the view of the river. The existing intactness is moderate, as there are not heavy encroachments in this view and the street lights along the bridge in the distance are uniformly spaced. The existing unity is moderately high because the existing lines, patterns, and colors are harmonious with each other. As a result, the existing visual quality of this Key View is moderately high.

KEY VIEW 13. The existing setting photograph for Key View 13 is shown in Figure 3.6-14. Key View 13 is located on LARIO Trail, north of Imperial Hwy. in the City of South Gate looking southwest toward I-710. The landscape unit is recreational as cyclists and pedestrians are the primary viewer group.

The existing vividness is moderately high, as the vegetation in the foreground, the row of trees in the background, and the open sky are the prominent features in this Key View. The existing intactness is moderate as the trail encompasses half of the view and there are no utility encroachments. The existing unity is moderate due to the contrast between the hard lines of the bike trail and undulating lines of vegetation and row of trees in the background. As a result, Key View 13 has an overall existing visual quality of moderate.

KEY VIEW 14. The existing setting photograph for Key View 14 is shown in Figure 3.6-15. This Key View is taken from the street within the Thunderbird Villa Mobile Home Park in the City of South Gate looking east across Frontage Rd. toward I-710. There are currently large shrubs that partially screen the view of the freeway. The existing landscape unit is residential as the primary viewers are residents within the mobile home park.

The existing vividness is moderately low because the view contains many random features, but none of the features are considered memorable. The existing intactness is moderately low due to numerous encroachments (i.e., utility lines, street signs, fencing, and freeway barrier) that create a disorganized view. The existing unity of Key View 14 is low, as the landscape lacks pattern and rhythm and all visual elements within the view are random, disorganized, and unbalanced. As a result, the existing visual quality is moderately low.

KEY VIEW 15. The existing setting photograph for Key View 15 is shown in Figure 3.6-16. Key View 15 is located at 10001 West Frontage Rd. in the City of North Gate. The Key View is looking north up Frontage Rd. with Thunderbird Villa Mobile Home Park to the west and southbound I-710 to the east. A large billboard and numerous utility poles and lines are the dominant features in this view. The landscape unit is residential as the primary viewers are residents who utilize the road as they leave and return to their homes.

The existing vividness is moderate as the billboard is a dominant element in this view, shared with utility lines and street lights. The existing intactness is moderately low due to the numerous encroachments into the landscape and the unbalanced manner in which the visual elements are arranged. The existing unity is very low as the disorganized visual elements in the view do not relate to each other and lack balance and rhythm. As a result, the existing visual quality is low.

KEY VIEW 16. The existing setting photograph for Key View 16 is shown in Figure 3.6-17. This Key View is located on the northbound I-710 between Firestone Blvd. and Florence Blvd. in the City of Bell Gardens. The Key View faces north towards the mountains in the distance, and there are utility lines on the left and vegetation and billboards on the right of the view. The landscape unit is considered freeway, as motorists are the primary viewers.

The existing vividness of this Key View is moderate, as the view of the mountains to the north is not the prominent feature in this view because it competes with the obstructions of the utility poles and billboard. The existing intactness is moderately low due to the arrangement of the manmade elements in this view make the encroachments more prominent. The existing unity is moderate because, although the freeway itself does create visual flow with the utility lines, the arrangement of elements in this view are random and unbalanced. As a result, the existing visual quality is moderately low.

KEY VIEW 17. The existing setting photograph for Key View 17 is shown in Figure 3.6-18. Key View 17 looks west toward I-710 and is located at 5522 Lanto St. in the City of Bell Gardens. The Key View faces a cul-de-sac within a residential neighborhood. An existing soundwall screens the freeway, and there are two prominent utility poles within the view. The landscape unit is residential.

The existing vividness of this Key View is moderate, as the large utility pole in the center of the view and trees on either side of the street are the most prominent features in the view. The existing intactness is moderately low due to the strong presence of the utility pole encroachments within the view. The unity is low due to the lack of balance, rhythm and overall harmony of visual elements. As a result, the existing visual quality is moderately low.

FIGURE 3.6-18

This page intentionally left blank

KEY VIEW 18. The existing setting photograph for Key View 18 is shown in Figure 3.6-19. This Key View is on LARIO Trail next to Maywood Riverfront Park in the City of Maywood. The Key View looks northeast from the trail toward Slauson Ave. and I-710. The view consists of the trail and chain-link fence in the foreground, the Los Angeles River and bridge in the mid ground, and utility poles and mountains in the background. The landscape unit is recreational, as cyclists and pedestrians are the primary viewer group.

The existing vividness is moderately low, as the Los Angeles River is the dominant feature in the view with the fence in the foreground and mountains in the background. The existing intactness is low due to visual encroachments by many man-made structures. The existing unity of Key View 18 is moderately low, as strong rigid lines comprise the view, with curvilinear lines in the background. As a result, the existing visual quality of this Key View is moderately low.

KEY VIEW 19. The existing setting photograph for Key View 19 is shown in Figure 3.6-20. Key View 19 is located next to the Salvation Army Bell Shelter on K St. in the City of Bell. The Key View looks northwest toward I-710 and is located in the parking lot of the homeless shelter within a residential area. The landscape unit is residential.

The existing vividness is low since there are no dominant visual elements within the view. The existing intactness is also low due to several utility lines encroaching on the view. The existing unity of Key View 19 is moderately low because of the lack of focus, pattern, and rhythm in this view, and the elements within the view are unbalanced. As a result, the existing visual quality is low.

KEY VIEW 20. The existing setting photograph for Key View 20 is shown in Figure 3.6-21. This Key View is located at 4913 Noble St. within a residential neighborhood in the City of Commerce. The Key View looks west toward the I-710 Corridor, which is approximately 400 feet away. The road and sky dominate the view with trees across the middle of the view. The landscape unit is residential.

The existing vividness is moderate low due to the large mass of mature trees in the distance balanced by equal portions of paved road and sky within the view. The existing intactness is moderate due to the visual encroachment by telephone lines and street lights. The existing unity of Key View 20 is moderately low due to lack of focus and balance. However, there is rhythm created by the trees across the view. As a result, the existing visual quality of this Key View is moderately low.

FIGURE 3.6-21

This page intentionally left blank

KEY VIEW 21. The existing setting photograph for Key View 21 is shown in Figure 3.6-22. This Key View is located within an open sports field in Bandini Park in the City of Commerce and looks northwest toward I-710. The park's grass and trees are the most prominent features within the view, with a soundwall and bridge in the background. The landscape unit for this Key View is recreational as park users are the primary viewer group.

The existing vividness is moderate due to the strong visual landscape created by the grass, trees, and sky. The existing intactness is moderately low due to the encroachment of the bridge that cuts across the middle of the view. The existing unity of Key View 21 is moderate due to the harmony created by the grass, trees, and sky. However, the bridge interrupts the balance of the existing natural elements. As a result, the existing visual quality of this Key View is moderate.

KEY VIEW 22. The existing setting photograph for Key View 22 is shown in Figure 3.6-23. This Key View is within a residential neighborhood on Leonis St. in the City of Commerce looking east toward the southbound I-710. The existing view consists of residential landscaping and trees on the left, residential homes on the right, the road in the center, and the existing soundwall is prominent in the background. The landscape unit is residential as residents and passing motorists are the primary viewers.

The existing vividness is moderate due to the cluster of vegetation on the left of the view that stands out as much as the soundwall that cuts across the middle of the view, and neither feature is considered striking. The existing intactness is also moderate due to the telephone line and street sign encroachments. The existing unity of Key View 22 is moderately low due to the lack of pattern rhythm and balance in this view, and although the visual elements are proportionate to each other, there is not visual flow. As a result, the existing visual quality of this Key View is moderately low.

KEY VIEW 23. The existing setting photograph for Key View 23 is shown in Figure 3.6-24. This Key View is located on Dunham St. in a residential community in the City of Commerce that looks east toward I-710. Mature trees on either side of the street are the most prominent features in the view and the existing I-710 soundwall can be seen in the background. The landscape unit is residential.

The existing vividness is moderate due to the mature trees that stand out in the view as they cross the view from the foreground to the background. The existing intactness is moderate due to the encroachment of the utility lines across the view. The existing unity of Key View 23 is moderately low due to pattern and balance created by the placement of the existing trees. As a result, the existing visual quality of this Key View is moderately low.

FIGURE 3.6-24

This page intentionally left blank

KEY VIEW 24. The existing setting photograph for Key View 24 is shown in Figure 3.6-25. This Key View is located at the corner of Whittier Blvd. and Burger Ave. in East Los Angeles. The Key View looks north up Burger Ave. in a residential area, adjacent to the northbound I-710. The landscape unit is residential.

The existing vividness is moderately low due to the prominent tree canopy located between the road and I-710. The existing intactness is moderately low due to the presence of numerous encroachments from utility lines and freeways signage. The existing unity of Key View 24 is moderately low because there is pattern and rhythm from the fence posts and utility poles across the view, as well as visual flow created by the elements in the view. As a result, the existing visual quality of this Key View is moderately low.

KEY VIEW 25. The existing setting photograph for Key View 25 is shown in Figure 3.6-26. This Key View looks south toward I-710 and Whittier Blvd. The Key View is located on Sydney Dr. in East Los Angeles. The view consists of utility lines on the right, residential homes on the left, and the large cypress trees are in the center of the view. The landscape unit is residential.

The existing vividness is moderate due the presence of the cluster of large cypress trees that are the most prominent feature in the view. The existing intactness is moderate due to the prominent presence of utility line encroachments along the right side of the view. The existing unity of Key View 25 is moderately low because sloped landscape harmonizes with the street and sidewalk as they curve into the distance. As a result, the existing visual quality of this Key View is moderately low.

3.6.3 ENVIRONMENTAL CONSEQUENCES

The following discussion of environmental consequences only describes the permanent impacts of the project. Please refer to Section 3.24 of this document, Construction Impacts, for a discussion of the temporary impacts of the project associated with the build alternatives for each resource area. Specifically, temporary impacts of the build alternatives related to visual and aesthetics are located in Section 3.24.3.6.

For both build alternatives, long term visual impacts would result from the permanent alteration of the visual environment through the reconstruction of the freeway and associated bridges, interchange structures, retaining walls, and soundwalls. It should be noted that there are no State or locally designated scenic roadways within the I-710 Corridor Project's viewshed. The freight corridor component of Alternative 7 would generally result in additional visual impacts than those that would occur under Alternative 5C.

Table 3.6-1, Existing and Proposed Visual Quality, provides the visual quality ratings for both build alternatives. The overall visual quality rating (from 1 to 7, or very low to very high) is an average of the three criteria ratings (i.e., vividness, intactness, and unity). The use of these evaluative criteria helps to establish an existing baseline against which to evaluate effects of the build alternatives on visual quality.

The visual impacts of the build alternatives are determined by assessing the existing visual resources, the visual resource change due to the build alternatives, and predicting viewer response to that change.

Visual resource change is the sum of the change in visual character and change in visual quality. Visual resource change is determined by assessing the visual compatibility of the build alternatives with existing resources.

Viewer response to the build alternatives is the sum of viewer exposure and viewer sensitivity to changes in the visual environment. The viewer exposure and viewer sensitivity at each Key View location is determined prior to any changes in the environment. Thus, the overall viewer response at each Key View is the same for all build alternatives and design options at a given location.

The resulting level of visual impact is determined by combining the severity of resource change with the degree to which people are likely to be affected by the change. Resource change and viewer response were assessed for each Key View and were assigned numerical values from 1.0 to 7.0. These numerical scores were averaged to give the evaluation for the visual impact. Based on best-case and worst-case scenarios, the range of possible results for the visual impact occurred on a scale of 0.5 to 6.5. The ratings describe the levels of the resulting visual impacts as well as the associated level of visual mitigation required (0.5 reflecting a very low visual impact with no mitigation required, to 6.5 being a high level of visual impact with a high level of mitigation necessary).

Table 3.6-2, Proposed Visual Character Change, Resource Change, Viewer Response, and Visual Impact Evaluation, provides the anticipated visual character change, resource change, and viewer response ratings for each build alternative, and provides the overall visual impact rating for each build alternative.

This page intentionally left blank

Table 3.6-1: Existing and Proposed Visual Quality

| Key View | Existing Visual Quality | | | | Proposed Visual Quality for Alternative 5C | | | | Proposed Visual Quality for Alternative 7 | | | | Visual Change for Alternative 5C | Visual Change for Alternative 7 |
|----------|-------------------------|-------------------|--------------|--|--|-------------------|--------------|--|---|-------------------|--------------|--|--|------------------------------------|
| | Vividness (V) | Intactness (I) | Unity (U) | Existing Visual Quality (E) ([V=I+U]/3) | Vividness (V) | Intactness (I) | Unity (U) | Proposed Visual Quality ([V=I+U]/3) | Vividness (V) | Intactness (I) | Unity (U) | Proposed Visual Quality ([V=I+U]/3) | | |
| 1 | 5.5 | 5.5 | 5.5 | 5.5 | 5.0 | 4.5 | 4.5 | 4.7 | 5.5 | 5.0 | 5.0 | 5.2 | -0.8 | -0.3 |
| 2 | 3.5 | 4.5 | 3.5 | 3.8 | 5.0 | 2.0 | 5.0 | 4.0 | 6.0 | 3.0 | 6.0 | 5.0 | +0.2 | +1.2 |
| 3 | 3.0 | 5.0 | 4.0 | 4.0 | 4.5 | 3.5 | 4.5 | 4.2 | 4.5 | 4.0 | 4.0 | 4.2 | +0.2 | +0.2 |
| 4 | 2.0 | 3.0 | 2.5 | 2.5 | 4.0 | 4.0 | 3.0 | 3.7 | 4.0 | 4.0 | 3.0 | 3.7 | +1.2 | +1.2 |
| 5 | 5.5 | 5.0 | 4.0 | 4.8 | 6.0 | 5.0 | 4.0 | 5.0 | 5.5 | 4.5 | 4.0 | 4.7 | +0.2 | -0.1 |
| 6 | 4.5 | 2.5 | 2.0 | 3.0 | 4.5 | 2.5 | 2.0 | 3.0 | 5.5 | 2.0 | 4.5 | 4.0 | 0.0 | +1.0 |
| 7 | 3.0 | 3.0 | 2.5 | 2.8 | 3.5 | 2.5 | 3.0 | 3.0 | 5.0 | 2.0 | 4.0 | 3.7 | +0.2 | +0.9 |
| 8 | 4.0 | 3.0 | 3.5 | 3.5 | 4.0 | 3.0 | 4.0 | 3.7 | 4.5 | 2.5 | 4.0 | 3.7 | +0.2 | +0.2 |
| 9 | 5.0 | 3.5 | 4.0 | 4.2 | 5.0 | 4.0 | 4.0 | 4.3 | 6.0 | 3.0 | 3.0 | 4.0 | +0.1 | -0.2 |
| 10 | 3.5 | 4.0 | 3.0 | 3.5 | 3.0 | 3.5 | 2.5 | 3.0 | 4.5 | 3.0 | 2.0 | 3.2 | -0.5 | -0.3 |
| 11 | 5.0 | 4.0 | 5.0 | 4.7 | 5.0 | 4.0 | 5.5 | 4.8 | 5.5 | 3.0 | 6.0 | 4.8 | +0.1 | +0.1 |
| 12 | 5.0 | 4.0 | 4.5 | 4.5 | 4.5 | 4.5 | 5.0 | 4.7 | 5.5 | 4.0 | 4.0 | 4.5 | +0.2 | 0.0 |
| 13 | 4.5 | 3.5 | 3.5 | 3.8 | 4.0 | 3.0 | 3.5 | 3.5 | 6.5 | 1.0 | 1.5 | 3.0 | -0.3 | -0.8 |
| 14 | 3.0 | 2.5 | 2.0 | 2.5 | 4.0 | 4.0 | 4.0 | 4.0 | 4.5 | 3.5 | 4.0 | 4.0 | +1.5 | +1.5 |
| 15 | 3.5 | 2.5 | 1.0 | 2.3 | 5.0 | 3.0 | 5.0 | 4.3 | 5.0 | 3.0 | 5.0 | 4.3 | +2.0 | +2.0 |
| 16 | 3.5 | 3.0 | 3.5 | 3.3 | 4.5 | 3.5 | 4.0 | 4.0 | 6.5 | 2.5 | 6.0 | 5.0 | +0.7 | +1.7 |
| 17 | 4.0 | 2.5 | 2.0 | 2.8 | 4.5 | 3.0 | 2.5 | 3.3 | 4.5 | 3.5 | 3.5 | 3.8 | +0.5 | +1.0 |
| 18 | 3.0 | 2.0 | 3.0 | 2.7 | 3.0 | 2.0 | 3.0 | 2.7 | 3.5 | 2.0 | 3.5 | 3.0 | 0.0 | +0.3 |
| 19 | 2.0 | 2.0 | 3.0 | 2.3 | 2.0 | 2.0 | 3.0 | 2.3 | 4.5 | 4.0 | 5.0 | 4.5 | 0.0 | +2.2 |
| 20* | 3.5 | 3.5 | 2.5 | 3.2 | 4.0 | 4.0 | 3.5 | 3.8 | 4.0 | 3.0 | 2.0 | 3.0 | +0.6 | -0.2 |
| 21 | 4.0 | 3.0 | 3.5 | 3.5 | 3.5 | 2.5 | 3.0 | 3.0 | 3.5 | 2.5 | 3.0 | 3.0 | -0.5 | -0.5 |
| 22 | 3.5 | 3.5 | 3.0 | 3.3 | 4.5 | 3.0 | 4.0 | 3.8 | 4.5 | 3.0 | 4.0 | 3.8 | +0.5 | +0.5 |
| 23 | 3.5 | 3.5 | 2.5 | 3.2 | 4.5 | 3.0 | 3.0 | 3.5 | 4.5 | 3.0 | 3.0 | 3.5 | +0.3 | +0.3 |
| 24* | 3.0 | 2.5 | 2.5 | 2.7 | 4.0 | 3.0 | 3.0 | 3.3 | 5.0 | 3.0 | 4.0 | 4.0 | +0.6 | +1.3 |
| 25* | 3.5 | 3.5 | 3.0 | 3.3 | 3.5 | 3.0 | 3.0 | 3.2 | 5.5 | 3.0 | 4.5 | 4.3 | -0.1 | +1.0 |

Source: AECOM and Tatsumi and Partners, *Revised Draft Visual Impact Assessment* (February 2017).
Rating Scale: 1.0 to 7.0 (1.0 = very low, 2.0 = low, 3.0= moderately low, 4.0 = moderate, 5.0 = moderately high, 6.0 = high, 7.0 = very high)
¹ The proposed visual quality ratings are based on the conceptual ideas of what the views would look like with the project build alternatives. The change in overall visual character at project build out is the difference between the "Existing Visual Quality" rating and the "Proposed Visual Quality" rating. For example, if the overall Existing Visual Quality rating is 6.0 and the Proposed Visual Quality rating is 5.0, then the difference from existing is -1.0. A negative number indicates the potential for lowering the visual impact from the existing visual setting. The greater the negative number, the more substantial the visual impact (e.g., a -1.0 rating would have more visual impact than a -0.4). A positive number represents a potential improvement in the visual setting with the implementation of the particular project alternative. As an industry standard, numerical differences between +1.0 and -1.0 are not considered to be a substantial visual impact
* Note: For Key View 20, Alternatives 5C and 7 have the same Proposed Visual Quality ratings, which are represented in the table under the Alternative 5C columns, and the Proposed Visual Quality ratings for Design Option 1B are represented in this table under the Alternative 7 columns. For Key View 24 and Key View 25, Alternatives 5C and 7 have the same Proposed Visual Quality ratings, which are represented in the table under the Alternative 5C columns, and the Proposed Visual Quality ratings for Design Options 3A and 3B are represented in this table under the Alternative 7 columns.

| 23 | 0.3 | 1.9 | 1.1 | 4.3 | 5.7 | 5.0 | 3.1 | 0.3 | 1.9 | 1.1 | 4.3 | 5.7 | 5.0 | 3.1 |
| 24* | 0.6 | 1.0 | 0.8 | 4.3 | 5.5 | 4.9 | 2.9 | 1.3 | 2.5 | 1.9 | 4.3 | 5.5 | 4.9 | 3.5 |
| 25* | -0.1 | 0.5 | 0.2 | 4.3 | 5.5 | 4.9 | 2.6 | 1.0 | 2.3 | 1.7 | 4.3 | 5.5 | 4.9 | 3.3 |

Source: AECOM and Tatsumi and Partners, *Revised Draft Visual Impact Assessment* (February 2017).

Rating Scale for Visual Character: -3.0 to 3.0 (-3.0 = very poor, -2.0 = poor, -1.0= moderately poor, 0.0 = no notable change, 1.0 = moderately good, 2.0 = good, 3.0 = very good)

Rating Scale for Resource Change: -5.0 to 5.0 (-5.0 = high negative change, 5.0 = high positive change)

Rating Scale for Viewer Exposure and Viewer Sensitivity: 1.0 to 7.0 (1.0 = low, 7.0 = high)

The proposed ratings are based on the conceptual ideas of what the views would look like with the I-710 Corridor Project build alternatives. The overall resource change at project build out is the difference between the “Visual Character” rating and the “Visual Change” rating. The overall Visual Impact Evaluation for each key view is the difference between the “Viewer Response” rating and the “Resource Change” rating.

* Note: For Key View 20, Alternatives 5C and 7 have the same visual impact ratings, which are represented in the table under the Alternative 5C columns, and the visual impact ratings for Design Option 1B are represented in this table under the Alternative 7 columns. For Key View 24 and Key View 25, Alternatives 5C and 7 have the same Proposed Visual Quality ratings, which are represented in the table under the Alternative 5C columns, and the Proposed Visual Quality ratings for Design Options 3A and 3B are represented in this table under the Alternative 7 columns.

3.6.3.1 PERMANENT IMPACTS

BUILD ALTERNATIVES.

KEY VIEW 1. The visual simulation for Key View 1 is shown in Figure 3.6-2. As this Key View is located at a pedestrian/bike trail, the number of viewers is minimal. Trail users would be very aware of their surroundings, and their duration at this location could range from a few minutes to a few hours. The viewer exposure is moderate (4.0). The viewer sensitivity is moderately high (5.0). The view of the Los Angeles River and open sky dominates the view in this area, which would occupy much of the viewer's attention. The overall viewer response to changes at this location would be moderately high (4.5).

Alternative 5C. Under Alternative 5C, a new bicycle/pedestrian bridge would cross over the I-710 and the Los Angeles River. The Los Angeles River would still be a striking view, but the bridge would shorten the view of the river, and the columns of the bridge would be intrusive into the Los Angeles River. Therefore, the proposed vividness would decrease from high (5.5) to moderately high (5.0), and the proposed intactness and unity would each decrease from high (5.5) to moderately high (4.5). This would result in the proposed overall visual quality under Alternative 5C to decrease from high (5.5) to moderately high (4.7). The visual quality change under Alternative 5C compared to the existing condition would be negative (-0.8).

The visual character of Alternative 5C would be compatible with the existing visual character as the new bridge over the Los Angeles River and I-710 curves across the horizon to increase visual flow. The visual character change under Alternative 5C would be very low (1.3).

Given the visual quality change (-0.8) and visual character change (1.3) ratings, the visual resource change would be very low (0.2) for Alternative 5C.

The visual impact for Alternative 5C at Key View 1 would be low (2.4) and the level of visual mitigation required would be low.

Alternative 7. Alternative 7 includes the addition of an elevated freight corridor and soundwall parallel to the Los Angeles River. The elevated freight corridor and soundwall would block the row of trees in the distance, which would shorten the view of vegetation to the mid ground. However, the elevated freight corridor and soundwall would be in the distance, which would make it appear smaller in scale, and runs parallel to the existing freeway. Therefore, the proposed vividness would not change and would remain high (5.5), and the proposed intactness and unity would each decrease from high to moderately high (from 5.5 to 5.0). This would result in the proposed overall visual quality under Alternative 7 to slightly decrease from high to moderately high (from 5.5 to 5.2). The visual

quality change under Alternative 7 compared to the existing condition would be negative (-0.3).

The visual character of Alternative 7 would be compatible with the existing visual character as the elevated freight corridor and soundwalls would reinforce strong linear lines as they would run parallel to the Los Angeles River. The visual character change under Alternative 7 would be considered very low change (0.8).

Given the visual quality change (-0.3) and visual character change (0.8) ratings, the visual resource change would be very low (0.3) for Alternative 7.

The visual impact for Alternative 7 at Key View 1 would be low (2.4), and the level of visual mitigation required would be low.

KEY VIEW 2. The visual simulation for Key View 2 is shown in Figure 3.6-3. As this Key View is located on a roadway bridge, a large number of people pass by this location on a daily basis. The duration a viewer spends at this location can range from a few seconds to several minutes, depending on traffic conditions. The majority of viewers at this location are motorists, with a much smaller portion of pedestrians who utilize the bridge. The viewer exposure is moderately high (4.8). The viewer sensitivity is moderate (3.5). The overall viewer response to changes at this location would be moderate (4.2).

ALTERNATIVE 5C. Under Alternative 5C, a new on-ramp and retaining wall would be on the northbound side of I-710. The existing landscape would be removed, with no available room for replacement. Although the new on-ramp would remove much of the existing vegetation, as well as prevent new vegetation in the midground area, the introduction of strong, linear structures would create prominent visual elements in this Key View. Therefore, the proposed vividness would increase from moderate (3.5) to moderately high (5.0), the proposed intactness would decrease from moderately high (4.5) to low (2.0), and the unity would increase from moderate (3.5) to moderately high (5.0). This would result in the proposed overall visual quality under Alternative 5C to increase slightly but remain moderate (from 3.8 to 4.0). The visual quality change under Alternative 5C compared to the existing condition would be positive (+0.2).

The proposed visual character for Alternative 5C would be compatible with the existing visual character. Under Alternative 5C, the ramp would replace the random cluster of trees, but help highlight the uniform row of tree canopies in the distance. The ramp would also visually run parallel to the existing freeway, which would reinforce the linear lines from the traffic lanes. The visual character change under Alternative 5C would be moderate (2.6).

Given the visual quality change (+0.2) and visual character change (2.6) ratings, the visual resource change would be very low (1.4) for Alternative 5C.

The visual impact for Alternative 5C at Key View 2 would be moderately low (2.8) and the level of visual mitigation required would be moderate.

ALTERNATIVE 7. Under Alternative 7, an elevated freight corridor to the east of northbound I-710 would be included, as well as new landscaping on the northbound side of I-710. Although the elevated freight corridor would encroach into the vertical space of this view, the introduction of new and uniform landscape helps to screen some of the elevated freight corridor. Therefore, the proposed vividness would increase from moderately low (3.5) to high (6.0), the proposed intactness would decrease from moderate (4.5) to moderately low (3.0), and the unity would increase from moderately low (3.5) to high (6.0). This would result in the proposed overall visual quality under Alternative 7 to increase from moderately low (3.8) to moderately high (5.0). The visual quality change under Alternative 7 compared to the existing condition would be positive (+1.2).

The proposed visual character for Alternative 7 would be compatible with the existing visual character. Under Alternative 7, the form of the elevated freight corridor would follow the existing freeway and the columns would increase uniformity. The new landscape area would help soften the structures and visually enhance the view. The visual character change under Alternative 7 would be low (1.9).

Given the visual quality change (+1.2) and visual character change (1.9) ratings, the visual resource change would be low (1.5) for Alternative 7.

The visual impact for Alternative 7 at Key View 2 would be moderately low (2.9) and the level of visual mitigation required would be moderate.

KEY VIEW 3. The visual simulation for Key View 3 is shown in Figure 3.6-4. A large number of people pass through this location on a daily basis as they travel on the freeway. The duration a viewer spends at this location ranges a few seconds to several minutes, depending on traffic conditions. The viewers at this location are made up entirely of motorists on the freeway. There are no dominating features in this view. The viewer exposure is moderate (4.3). The viewer sensitivity is moderately low (3.3). The overall viewer response to changes at this location would be moderate (3.8).

ALTERNATIVE 5C. Under Alternative 5C, both sides of I-710 would be widened and have a barrier between the at-grade truck bypass lanes and other vehicles. Alternative 5C also would include a new soundwall for the freeway widening on the southbound I-710 and a new ramp on the northbound I-710 connecting to I-405. Although, this alternative would remove most of the existing landscape area on the right side of the view, the view on the

right side would be minimally affected visually. The design of this alternative would be an extension of the existing linear form of the freeway. Therefore, the proposed vividness would increase from moderately low (3.0) to moderately high (4.5), the proposed intactness would decrease from moderately high (5.0) to moderate (3.5), and the unity would increase from moderate (4.0) to moderately high (4.5). This would result in the proposed overall visual quality under Alternative 5C to increase slightly, but remain moderate (from 4.0 to 4.2). The visual quality change under Alternative 5C compared to the existing condition would be positive (+0.2).

The proposed visual character for Alternative 5C would be compatible with the existing visual character. Under Alternative 5C, the structures would be within the lower half of the view, consisting of linear forms that match the existing linear forms of the freeway. The visual character change under Alternative 5C would be low (1.8).

Given the visual quality change (+0.2) and visual character change (1.8) ratings, the visual resource change would be very low (1.0) for Alternative 5C.

The visual impact for Alternative 5C at Key View 3 would be low (2.4) and the level of visual mitigation required would be low.

ALTERNATIVE 7. Alternative 7 would include the same structures as Alternative 5C. However, the at-grade truck bypass lanes would only be on the northbound I-710. Alternative 7 would also include a new retaining wall on northbound I-710, which would require cutting into the levee east of I-710. An area of landscaping would be added between the general purpose lanes and the truck bypass lanes. Therefore, the proposed vividness would increase from moderately low (3.0) to moderately high (4.5), the proposed intactness would decrease from moderately high (5.0) to moderate (4.0), and the unity would remain moderate (4.0). This would result in the proposed overall visual quality under Alternative 7 to increase slightly, but remain moderate (from 4.0 to 4.2). The visual quality change under Alternative 7 compared to the existing condition would be positive (+0.2).

The proposed visual character for Alternative 7 would be compatible with the existing visual character. Under Alternative 7, the proposed structures are within the lower half of the view, consisting of linear forms that match the existing linear forms of the freeway. The visual character change under Alternative 7 would be low (1.5).

Given the visual quality change (+0.2) and visual character change (1.5) ratings, the visual resource change would be very low (0.9) for Alternative 7.

The visual impact for Alternative 7 at Key View 3 would be low (2.4) and the level of visual mitigation required would be low.

KEY VIEW 4. The visual simulation for Key View 4 is shown in Figure 3.6-5. Although the view of the build alternatives would be in a residential area, it would be the backdrop of a small street and therefore, not the focus of daily activities. Viewer exposure at this location is moderate (4.3) and viewer sensitivity is moderately high (5.0). The overall viewer response is moderately high (4.7).

ALTERNATIVE 5C. Alternative 5C would introduce a new soundwall and off-ramp from southbound I-710. The structures introduced by Alternative 5C are visible from the residential neighborhood, but the structures are in the background. There are currently no other dominating features in the view aside from the sky, and the existing visual quality is already lowered due to the presence of utility lines. Although this alternative would remove the mature trees in the center of the view, it could be mitigated with the addition of new landscaping. Therefore, the proposed vividness would increase from low (2.0) to moderate (4.0), the proposed intactness would increase from moderately low (3.0) to moderate (4.0), and the unity would increase but remain moderately low (from 2.5 to 3.0). This would result in the proposed overall visual quality under Alternative 5C to increase from moderately low (2.5) to moderate (3.7). The visual quality change under Alternative 5C compared to the existing condition would be positive (+1.2).

The proposed visual character for Alternative 5C would be somewhat compatible with the existing visual character. Under Alternative 5C, the introduction of a solid structure in place of mature trees would create hard linear lines. While the linear lines would match the horizontal utility lines, it would not be compatible with the other elements in this view. Although the view would not be as soft as before, the new soundwall could be mitigated with new landscaping. The visual character change under Alternative 5C would be very low (0.8).

Given the visual quality change (+1.2) and visual character change (0.8) ratings, the visual resource change would be very low (1.0) for Alternative 5C.

The visual impact for Alternative 5C at Key View 4 would be moderately low (2.9) and the level of visual mitigation required would be moderate.

ALTERNATIVE 7. As with Alternative 5C, Alternative 7 would introduce a new soundwall and off-ramp from southbound I-710. Alternative 7 also would include a freight corridor; however, it would not be visible from this location. The soundwall and off-ramp structures introduced by Alternative 7 would be visible from the residential neighborhood, but the structures would be in the background. There are currently no other dominating features in the view aside from the sky, and the existing visual quality is already lowered due to the presence of utility lines. Although this alternative would remove the mature trees in the center of the view, it could be mitigated with the addition of new landscaping. Therefore, the proposed vividness would increase from low (2.0) to moderate (4.0), the proposed

intactness would increase from moderately low (3.0) to moderate (4.0), and the unity would increase but remain moderately low (from 2.5 to 3.0). This would result in the proposed overall visual quality under Alternative 7 to increase from moderately low (2.5) to moderately (3.7). The visual quality change under Alternative 7 compared to the existing condition would be positive (+1.2).

The proposed visual character for Alternative 7 would be somewhat compatible with the existing visual character. Under Alternative 7, the introduction of a solid structure in place of mature trees would create hard linear lines. While the linear lines would match the horizontal utility lines, they would not be compatible with the other elements in this view. Although the view would not be as soft as before, the new soundwall could be mitigated with new landscaping. The visual character change under Alternative 7 would be very low (0.8).

Given the visual quality change (+1.2) and visual character change (0.8) ratings, the visual resource change would be very low (1.0) for Alternative 7.

The visual impact for Alternative 7 at Key View 4 would be moderately low (2.9) and the level of visual mitigation required would be moderate.

KEY VIEW 5. The visual simulation for Key View 5 is shown in Figure 3.6-6. Viewers are primarily people using the bike trail for exercise or recreation. Much of the viewers' attention would be focused on the overall span of the view at this location. Duration of views could range from several minutes to a few hours. Viewer exposure is moderate (3.7) and viewer sensitivity is moderate (4.3). The overall viewer response at this location is moderate (4.0).

ALTERNATIVE 5C. Alternative 5C would widen the I-710 and widen the bridge over the Los Angeles River. The new wall from the freeway widening would have low visibility from this location because it would be in the distance. The widening of the existing bridge would still maintain the same shape. Therefore, the proposed vividness would increase but remain high (from 5.5 to 6.0), the proposed intactness would remain moderately high (5.0), and the unity would remain moderate (4.0). This would result in the proposed overall visual quality under Alternative 5C to slightly increase but remain moderately high (from 4.8 to 5.0). The visual quality change under Alternative 5C compared to the existing condition would be positive (+0.2).

The proposed visual character for Alternative 5C would be compatible with the existing visual character. Alternative 5C would introduce new elements with similar attributes as the existing elements and that would not add any distinct features that would improve or worsen the existing view. The visual character change under Alternative 5C would be very low (0.5).

Given the visual quality change (+0.2) and visual character change (0.5) ratings, the visual resource change would be very low (0.4) for Alternative 5C.

The visual impact for Alternative 5C at Key View 5 would be low (2.2) and the level of visual mitigation required would be low.

ALTERNATIVE 7. Alternative 7 would widen the bridge and add an elevated freight corridor to I-710. The widening of the existing bridge would still maintain the same shape. The elevated freight corridor and flyovers would be in the distance, but would encroach into the vertical space of the view and would block most of the view of the existing trees in the distance. Therefore, the proposed vividness would remain high (5.5), the proposed intactness would decrease but remain moderately high (from 5.0 to 4.5), and the unity would remain moderate (4.0). This would result in the proposed overall visual quality under Alternative 7 to slightly decrease but remain moderately high (from 4.8 to 4.7). The visual quality change under Alternative 7 compared to the existing condition would be negative (-0.1).

The proposed visual character for Alternative 7 would be compatible with the existing visual character. Alternative 7 would introduce new elements that have similar attributes as the existing elements, and do not add any distinct features that improve or worsen the existing view. The visual character change under Alternative 7 would be very low (0.6).

Given the visual quality change (-0.1) and visual character change (0.6) ratings, the visual resource change would be very low (0.3) for Alternative 7.

The visual impact for Alternative 7 at Key View 5 would be low (2.2) and the level of visual mitigation required would be low.

KEY VIEW 6. The visual simulation for Key View 6 is shown in Figure 3.6-7. Viewers consist primarily of people recreating or watching sport events at the school field. The freeway is currently visible from this view as the field lies immediately west of I-710. The number of viewers at this location can reach up into the hundreds during sports games. The duration of the view would vary from less than a minute up to multiple hours, depending on the activity of viewers. Viewer exposure is moderate (3.7) and viewer sensitivity is moderately low (3.3). The overall viewer response at this location is moderate (3.5).

ALTERNATIVE 5C. Alternative 5C would add a soundwall that screens I-710. Under this alternative, the new soundwall moves the visual limits of the I-710 freeway closer to the school's property, but screens some of the view of the I-710. Therefore, the proposed vividness would remain moderately high (4.5), the proposed intactness would remain moderately low (2.5), and the unity would remain low (2.0). This would result in the proposed overall visual quality under Alternative 5C to remain moderately low (3.0). The

visual quality change under Alternative 5C compared to the existing condition would be no change (0.0).

The proposed visual character for Alternative 5C would be compatible with the existing visual character. The visual character change under Alternative 5C would be very little (0.3).

Given the visual quality change (0.0) and visual character change (0.3) ratings, the visual resource change would be very little to no change (0.2) for Alternative 5C.

The visual impact for Alternative 5C at Key View 6 would be low (1.9) and the level of visual mitigation required would be low.

ALTERNATIVE 7. Alternative 7 would add a new soundwall and elevated northbound and southbound freight corridor to the I-710. The freight corridor would be an additional encroachment into the already disorderly view with the existing freeway in the distance. The freight corridor would create a prominent structure in the sky that would encroach vertically into the view at this location. There would be less harmony in the proposed view than the existing view. However, the new elevated freight corridor structure would help reinforce the horizontal lines in gradual layers from the middle towards the top of the view. Therefore, the proposed vividness would increase from moderately high (4.5) to high (5.5), the proposed intactness would decrease from moderately low (2.5) to low (2.0), and the unity would increase from low (2.0) to moderately high (4.5). This would result in the proposed overall visual quality under Alternative 7 to increase from moderately low (3.0) to moderate (4.0). The visual quality change under Alternative 7 compared to the existing condition would be positive (+1.0).

The proposed visual character for Alternative 7 would be compatible with the existing visual character. Under Alternative 7, the elevated freight corridor would introduce strong lines that create a more uniform and balanced visual appeal within this view. The visual character change under Alternative 7 would be low (1.9).

Given the visual quality change (+1.0) and visual character change (1.9) ratings, the visual resource change would be low (1.5) for Alternative 7.

The visual impact for Alternative 7 at Key View 6 would be moderately low (2.5) and the level of visual mitigation required would be moderate.

KEY VIEW 7. The visual simulation for Key View 7 is shown in Figure 3.6-8. Vehicular drivers and motorists make up the viewers at this location. A large number of people pass through this location on a daily basis, with the duration ranging from a few seconds to several minutes, depending on traffic conditions. There are existing utility power lines and freeway signs in the

background, but no dominating features. The viewer exposure is moderate (4.3). The viewer sensitivity is moderately low (3.3). The overall viewer response to changes at this location would be moderate (3.8).

ALTERNATIVE 5C. Alternative 5C would include additional traffic lanes with a new soundwall on northbound I-710. The existing narrow strip of landscape on the shoulder of the freeway would be removed. Under Alternative 5C, the view on the right is altered slightly by additional traffic lanes and a new soundwall. The rest of the view would be visually unaffected. Therefore, the proposed vividness would increase from moderately low (3.0) to moderate (3.5), the proposed intactness would decrease but remain moderately low (from 3.0 to 2.5), and the unity would increase but remain moderately low (from 2.5 to 3.0). This would result in the proposed overall visual quality under Alternative 5C to increase slightly but remain moderately low (from 2.8 to 3.0). The visual quality change under Alternative 5C compared to the existing condition would be positive (+0.2).

The proposed visual character for Alternative 5C would be compatible with the existing visual character. This alternative reinforces the linear lines created by the traffic lanes and freeway edges as they converge in the distance. The design would be uniform and balanced. The visual character change under Alternative 5C would be low (1.8).

Given the visual quality change (+0.2) and visual character change (1.8) ratings, the visual resource change would be very low (1.0) for Alternative 5C.

The visual impact for Alternative 5C at Key View 7 would be low (2.4) and the level of visual mitigation required would be low.

ALTERNATIVE 7. Alternative 7 would include a split elevated freight corridor over the median of I-710 with higher soundwalls than Alternative 5C. The existing narrow strip of landscape would be removed from the shoulder of the freeway. The elevated freight corridor would create a prominent structure in the sky, encroaching into the view vertically and would be visible from the foreground and into the distance. Therefore, the proposed vividness would increase from moderately low (3.0) to moderately high (5.0), the proposed intactness would decrease from moderately low (3.0) to low (2.0), and the unity would increase from moderately low (2.5) to moderate (4.0). This would result in the proposed overall visual quality under Alternative 7 to increase from moderately low (2.8) to moderate (3.7). The visual quality change under Alternative 7 compared to the existing condition would be positive (+0.9).

The proposed visual character for Alternative 7 would be compatible with the existing visual character. Alternative 7 would reinforce the linear lines created by the traffic lanes and freeway edges as they converge in the distance. Although the elevated freight corridor

introduces a massive man-made structure, the design would be uniform and balanced. The visual character change under Alternative 7 would be low (1.8).

Given the visual quality change (+0.9) and visual character change (1.8) ratings, the visual resource change would be very low (1.4) for Alternative 7.

The visual impact for Alternative 7 at Key View 7 would be moderately low (2.6) and the level of visual mitigation required would be moderate.

KEY VIEW 8. The visual simulation for Key View 8 is shown in Figure 3.6-9. The number of viewers could easily reach up into three-digit numbers during high park activity days including weekends and summer periods. The duration of the view ranges from less than a minute up to multiple hours, depending on the activity of viewers. The viewpoint would be approximately 300 feet from the build alternatives. The viewer exposure is moderate (4.0). The viewer sensitivity is moderate (3.8). The overall viewer response to changes at this location would be moderate (3.9).

ALTERNATIVE 5C. Alternative 5C would include a new soundwall and an elevated ramp. The new soundwall would be very similar in size and shape to the existing soundwall. The soundwall would make the view more uniform and balanced, while the elevated ramp would be screened by the existing trees. Under Alternative 5C, there would be no change in visual quality/character with the exception of the connector ramp. Therefore, the proposed vividness would remain moderate (4.0), the proposed intactness would remain moderately low (3.0), and the unity would increase but remain moderate (from 3.5 to 4.0). This would result in the proposed overall visual quality under Alternative 5C to slightly increase, but remain moderate (from 3.5 to 3.7). The visual quality change under Alternative 5C compared to the existing condition would be positive (+0.2).

The proposed visual character for Alternative 5C would be compatible with the existing visual character. The new soundwall would have almost identical characteristics to the existing soundwall, and the new soundwall would appear as an enhancement to the existing view. The visual character change under Alternative 5C would be very little to no change (0.3).

Given the visual quality change (+0.2) and visual character change (0.3) ratings, the visual resource change would be very low (0.2) for Alternative 5C.

The visual impact for Alternative 5C at Key View 8 would be low (2.1) and the level of visual mitigation required would be low.

ALTERNATIVE 7. Alternative 7 would include an elevated freight corridor in addition to a new soundwall at this Key View. The connector ramp and the elevated freight corridor

would be located on the west side of I-710. The new soundwall would be very similar in size and shape to the existing soundwall. The elevated ramp and freight corridor would encroach somewhat into the view at this location; however, they would be mostly screened by the existing trees. The proposed intactness would be lessened due to the new elevated freight corridor, but the proposed unity would remain the same. Therefore, the proposed vividness would increase from moderate (4.0) to moderately high (4.5), the proposed intactness would decrease but remain moderately low (from 3.0 to 2.5), and the unity would increase but remain moderate (from 3.5 to 4.0). This would result in the proposed overall visual quality under Alternative 7 to increase slightly but would remain moderate (from 3.5 to 3.7). The visual quality change under Alternative 7 compared to the existing condition would be positive (+0.2).

The new soundwall would have almost identical characteristics to the existing soundwall, and the new soundwall would appear as an enhancement to the existing view. However, the elevated freight corridor would not be compatible with the existing view because it would encroach behind the trees and into the sky. The visual character change under Alternative 7 would be very low (1.1).

Given the visual quality change (+0.2) and visual character change (1.1) ratings, the visual resource change would be very low (0.6) for Alternative 7.

The visual impact for Alternative 7 at Key View 8 would be low (2.3) and the level of visual mitigation required would be low.

KEY VIEW 9. The visual simulation for Key View 9 is shown in Figure 3.6-10. Viewers are primarily people using the bike trail for exercise or recreation. The number of viewers at this location is relatively low; however, they would be very aware of their surroundings, and their duration at this location can range from a few minutes to a few hours. Viewer exposure is moderate (4.0) and viewer sensitivity is moderately high (5.0). The overall viewer response at this location is moderately high (4.5).

ALTERNATIVE 5C. Alternative 5C would include the demolition of a bridge and addition of new freeway connectors for the I-710 and SR-91 interchange. The bridge closest to the viewer will be removed, but it would not be very noticeable. The view of the new free connectors for the I-710 and SR-91 interchange would be low and in the distance, thus making this view only slightly visible from this location. There would be very little overall change in visual elements. Therefore, the proposed vividness would remain moderately high (5.0), the proposed intactness would increase but remain moderate (from 3.5 to 4.0), and the unity would remain moderate (4.0). This would result in the proposed overall visual quality under Alternative 5C to slightly increase but remain moderate (from 4.2 to 4.3). The visual quality change under Alternative 5C compared to the existing condition would be positive (+0.1).

The proposed visual character for Alternative 5C would be compatible with the existing visual character. There is very minimal to no visible changes within this view. The visual character change under Alternative 5C would be no change (0.0).

Given the visual quality change (+0.1) and visual character change (0.0) ratings, the visual resource change would be very low (0.1) for Alternative 5C.

The visual impact for Alternative 5C at Key View 9 would be low (2.3) and the level of visual mitigation required would be low.

ALTERNATIVE 7. Alternative 7 would include the demolition of one bridge and the addition of a multi-level freight corridor, with one section very prominent across the view. Visually, it would cut across the center of the view, taking dominance over the other elements. Alternative 7 would have a dramatic change to the existing view as the new elevated freight corridor structure takes precedence from the left to the right of the view. Although dominating, its lines and continuity would lessen the harshness of the feature as a whole. It would also replace the existing utility power lines with new and uniform ones. However, the relocated overhead power lines would be larger and closer to the viewer. Therefore, the proposed vividness would increase from moderately high (5.0) to high (6.0), the proposed intactness would decrease from moderate (3.5) to moderately low (from 3.0), and the unity would decrease from moderate (4.0) to moderately low (3.0). This would result in the proposed overall visual quality under Alternative 7 to slightly decrease but remain moderate (from 4.2 to 4.0). The visual quality change under Alternative 7 compared to the existing condition would be negative (-0.2).

The proposed visual character for Alternative 7 would be somewhat compatible with the existing visual character. The design of the elevated freight corridor itself is uniform and curvilinear; however, it is disproportionate to the surrounding visual elements. The visual character change under Alternative 7 would be low (1.9).

Given the visual quality change (-0.2) and visual character change (1.9) ratings, the visual resource change would be very low (0.9) for Alternative 7.

The visual impact for Alternative 7 at Key View 9 would be moderately low (2.7) and the level of visual mitigation required would be moderate.

KEY VIEW 10. The visual simulation for Key View 10 is shown in Figure 3.6-11. Viewers are vehicular drivers and motorists at this location. A large number of people pass through this location on a daily basis, with the duration ranging from a few seconds to several minutes, depending on traffic conditions. The sky and freeway make up the majority of this view, but there are no dominant features that exist. Viewer exposure is moderate (4.3) and viewer

sensitivity is moderately low (3.3). The overall viewer response at this location is moderate (3.8).

ALTERNATIVE 5C. Alternative 5C would include a new ramp and freeway widening, with a new soundwall and landscape buffer. Under Alternative 5C, the existing landscape on the right would be removed and replaced with a new soundwall. The freeway widening encroaches to the edge of the right side of the view, and the elevated ramp encroaches into view on the left. Therefore, the proposed vividness would decrease from moderate (3.5) to moderately low (3.0), the proposed intactness would decrease but remain moderate (from 4.0 to 3.5), and the unity would decrease but remain moderately low (from 3.0 to 2.5). This would result in the proposed overall visual quality under Alternative 5C to decrease from moderate (3.5) to moderately low (3.0). The visual quality change under Alternative 5C compared to the existing condition would be negative (-0.5).

The proposed visual character for Alternative 5C would be compatible with the existing visual character. The visual character will remain very linear despite new encroachments. The visual character change under Alternative 5C would be very little change (0.4).

Given the visual quality change (-0.5) and visual character change (0.4) ratings, the visual resource change would be very low (-0.1) for Alternative 5C.

The visual impact for Alternative 5C at Key View 10 would be low (1.9) and the level of visual mitigation required would be low.

ALTERNATIVE 7. Alternative 7 would include a new ramp and freeway widening, with a new soundwall, as well as addition of multi-level elevated freight corridor connectors at the I-710/SR-91 interchange. Under Alternative 7, the elevated freight corridor would be the dominant visual element, which would alter the view drastically from the existing view since mature trees were visible in the distance. Alternative 7 would block out all the existing mature vegetation in the background. The existing landscape on the right of the view would also be removed and replaced with a new soundwall. Therefore, the proposed vividness would increase from moderate (3.5) to moderately high (4.5), the proposed intactness would decrease from moderate (4.0) to moderately low (3.0), and the unity would decrease from moderately low (3.0) to low (2.0). This would result in the proposed overall visual quality under Alternative 7 to slightly decrease from moderate (3.5) to moderately low (3.2). The visual quality change under Alternative 7 compared to the existing condition would be negative (-0.3).

The proposed visual character for Alternative 7 would be somewhat compatible with the existing visual character. Alternative 7 encroaches into the left of the view by the presence of the elevated freight corridor. The existing visual character was very linear with few encroachments. The visual character change under Alternative 7 would be low (1.5).

Given the visual quality change (-0.3) and visual character change (1.5) ratings, the visual resource change would be very low (0.6) for Alternative 7.

The visual impact for Alternative 7 at Key View 10 would be low (2.2) and the level of visual mitigation required would be low.

KEY VIEW 11. The visual simulation for Key View 11 is shown in Figure 3.6-12. Numerous viewers reside adjacent to I-710. Duration of views would depend upon the activities of viewers and it could range from minutes to hours. Since this view lies within an exercise park area, the duration of viewer exposure is moderate (4.3) and viewer sensitivity is moderately high (5.3). The overall viewer response at this location is moderately high (4.8).

ALTERNATIVE 5C. Alternative 5C would include a new soundwall along the adjacent southbound I-710. It would extend further to the left than the existing soundwall. The soundwall would have very minimal changes to the existing visual quality since it would replace the present soundwall, being just slightly higher than the original. The viewer sensitivity would be somewhat high, but the new soundwall would have a low effect on visual aesthetics. Therefore, the proposed vividness would remain moderately high (5.0), the proposed intactness would remain moderate (4.0), and the proposed unity would increase from moderately high (5.0) to high (5.5). This would result in the proposed overall visual quality under Alternative 5C to slightly increase but remain moderately high (from 4.7 to 4.8). The visual quality change under Alternative 5C compared to the existing condition would be positive (+0.1).

The proposed visual character for Alternative 5C would be compatible with the existing visual character. The strong linear lines would stay intact and be reinforced by the soundwall. The visual character change under Alternative 5C would be very low (0.5).

Given the visual quality change (+0.1) and visual character change (0.5) ratings, the visual resource change would be very low (0.3) for Alternative 5C.

The visual impact for Alternative 5C at Key View 11 would be moderately low (2.6) and the level of visual mitigation required would be low.

ALTERNATIVE 7. Alternative 7 would include a new soundwall in addition to an elevated freight corridor, which would be visible above the soundwall. The soundwall would replace the existing soundwall and be slightly higher and would extend all the way to the left of the view. The elevated freight corridor in would be very prominent and encroach into the sky, but from this view, it would not appear to be higher than the horizon. The elevated freight corridor design characteristics would blend in well with the existing visual characteristics. The viewer sensitivity would be high, but the new structures would be balanced and have a low effect on visual aesthetics. Therefore, the proposed vividness would increase from

moderately high (5.0) to high (5.5), the proposed intactness would decrease from moderate (4.0) to moderately low (3.0), and the proposed unity would increase from moderately high (5.0) to high (6.0). This would result in the proposed overall visual quality under Alternative 7 to slightly increase but remain moderately high (from 4.7 to 4.8). The visual quality change under Alternative 7 compared to the existing condition would be positive (+0.1).

The proposed visual character for Alternative 7 would be compatible with the existing visual character. The strong linear lines would stay intact and be reinforced by the soundwall and the elevated freight corridor. The visual character change under Alternative 7 would be very low (1.4).

Given the visual quality change (+0.1) and visual character change (1.4) ratings, the visual resource change would be very low (0.8) for Alternative 7.

The visual impact for Alternative 7 at Key View 11 would be moderately low (2.8) and the level of visual mitigation required would be moderate.

KEY VIEW 12. The visual simulation for Key View 12 is shown in Figure 3.6-13. The main viewers at this location are pedestrians and cyclists. Although the number of viewers would be relatively low, viewers would be very aware of their surroundings, and their duration at this location can range from a few minutes to a few hours. Viewer exposure is moderate (3.7) and viewer sensitivity is moderately high (5.0). The overall viewer response at this location is moderate (4.3).

ALTERNATIVE 5C. Alternative 5C would widen the Imperial Hwy. Bridge. Alternative 5C would have very minimal resource change from the existing view aside from the new trees in the parkway on the new bridge, which would be uniform across the center of the view, and the bridge widening would visually and physically push the structure closer to the view. The new trees would increase the aesthetic appeal at this location. The bridge widening would have a slightly larger mass than the existing, but the form and lines would stay the same. Therefore, the proposed vividness would decrease but remain moderately high (from 5.0 to 4.5), the proposed intactness would increase from moderate (4.0) to moderately high (4.5), and the proposed unity would increase but remain moderately high (from 4.5 to 5.0). This would result in the proposed overall visual quality under Alternative 5C to slightly increase but remain moderately high (from 4.5 to 4.7). The visual quality change under Alternative 5C compared to the existing condition would be positive (+0.2).

The proposed visual character for Alternative 5C would be compatible with the existing visual character. The forms, lines, and colors from the new structures are very similar to the existing linear forms and colors. The visual character change under Alternative 5C would be very low (0.9).

Given the visual quality change (+0.2) and visual character change (0.9) ratings, the visual resource change would be very low (0.6) for Alternative 5C.

The visual impact for Alternative 5C at Key View 12 would be moderately low (2.5) and the level of visual mitigation required would be moderate.

ALTERNATIVE 7. Alternative 7 would widen the Imperial Hwy. Bridge and would also include an elevated freight corridor that would be visible in the right half of the view. The bridge widening would minimally affect the visual quality at this Key View location because it would be very similar in form to the existing view, only slightly larger in size. The new row of trees across the bridge would enhance the visual aesthetic in this view. The visible elevated freight corridor encroaches into the right center of the view, but the structures have the same visual characteristics as the existing view, which minimizes visual impacts. Therefore, the proposed vividness would increase from moderately high (5.0) to high (5.5), the proposed intactness would remain moderate (4.0), and the proposed unity would decrease from moderately high (4.5) to moderate (4.0). This would result in the proposed overall visual quality under Alternative 7 to remain moderately high (4.5). The visual quality change under Alternative 7 compared to the existing condition would be no change (0.0).

The proposed visual character for Alternative 7 would be compatible with the existing visual character. The forms, lines, and colors from the new structures are very similar to the existing linear forms and colors. The visual character change under Alternative 7 would be very low (1.4).

Given the visual quality change (0.0) and visual character change (1.4) ratings, the visual resource change would be very low (0.7) for Alternative 7.

The visual impact for Alternative 7 at Key View 12 would be moderately low (2.5) and the level of visual mitigation required would be moderate.

KEY VIEW 13. The visual simulation for Key View 13 is shown in Figure 3.6-14. The main viewers at this location are pedestrians and cyclists. Although the number of viewers would be relatively low, viewers would be very aware of their surroundings, and their duration at this location can range from a few minutes to a few hours. Viewer exposure is moderate (3.7) and viewer sensitivity is moderately high (5.0). The overall viewer response at this location is moderate (4.3).

ALTERNATIVE 5C. Alternative 5C would include a new ramp and to widen the Imperial Hwy. Bridge, which is minimally visible in the distance. The new row of trees on the Imperial Hwy. Bridge replacement would go across the view. The visible change for Alternative 5C would be minimal since the new roadway and bridge widening stays low and unobtrusive within this view. The new trees across the center of the view would blend in with the

existing row of trees in the distance. Therefore, the proposed vividness would decrease from moderately high (4.5) to moderate (4.0), the proposed intactness would decrease from moderate (3.5) to moderately low (3.0), and the proposed unity would remain moderate (3.5). This would result in the proposed overall visual quality under Alternative 5C to slightly decrease but remain moderate (from 3.8 to 3.5). The visual quality change under Alternative 5C compared to the existing condition would be negative (-0.3).

As Alternative 5C would have minimal changes, the proposed visual character would be compatible with the existing visual character. The visual character change under Alternative 5C would be very little change (0.4).

Given the visual quality change (-0.3) and visual character change (0.4) ratings, the visual resource change would be very low (0.1) for Alternative 5C.

The visual impact for Alternative 5C at Key View 13 would be low (2.2) and the level of visual mitigation required would be low.

ALTERNATIVE 7. Alternative 7 would widen the Imperial Hwy. Bridge and would also include an elevated freight corridor that would go over the viewer's head. The structure would encroach dramatically into the view. Much of the existing view of the sky would be blocked and the columns of the elevated freight corridor would intrude into the landscape. The elevated freight corridor alters the existing view disproportionately and becomes the dominant feature in this view. Although there would be a high change in visual character under Alternative 7, the viewer response would be considered the same as Alternative 7, thus keeping the score of the resulting visual impact closer to Alternative 7. Therefore, the proposed vividness would increase from moderately high (4.5) to very high (6.5), the proposed intactness would decrease from moderate (3.5) to very low (1.0), and the proposed unity would decrease from moderate (3.5) to low (1.5). This would result in the proposed overall visual quality under Alternative 7 to decrease from moderate (3.8) to moderately low (3.0). The visual quality change under Alternative 7 compared to the existing condition would be negative (-0.8).

The proposed visual character for Alternative 7 would not be compatible at this location due to the elevated freight corridor that dominates the view. The visual character change under Alternative 7 would be low (2.4).

Given the visual quality change (-0.8) and visual character change (2.4) ratings, the visual resource change would be very low (0.8) for Alternative 7.

The visual impact for Alternative 7 at Key View 13 would be moderately low (2.6) and the level of visual mitigation required would be moderate.

KEY VIEW 14. The visual simulation for Key View 14 is shown in Figure 3.6-15. This location is in a residential area and the duration of their view depends on the activity. The distance between the Key View location and the new construction under the build alternatives is estimated to be approximately 100 feet. The viewer exposure is moderate (4.3) and viewer sensitivity is high (5.7). The overall viewer response at this location is moderately high (5.0).

ALTERNATIVE 5C. Alternative 5C would include a new soundwall that would screen the existing freeway uniformly. The new soundwall would be a prominent change, but a positive one as it would screen out marginal sprawling vegetation and views to the existing freeway. The new soundwall would be placed closer to the mobile homes under Alternative 5C, which would be a moderately high visual change in the character for the mobile home park viewers. Due to the anticipated improved appearance of the new soundwall and the new replacement planting, the vividness, intactness and the unity would be increased. Therefore, the proposed vividness would increase from moderately low (3.0) to moderate (4.0), the proposed intactness would increase from moderately low (2.5) to moderate (4.0), and the proposed unity would increase from low (2.0) to moderate (4.0). This would result in the proposed overall visual quality under Alternative 5C to increase from moderately low (2.5) to moderate (4.0). The visual quality change under Alternative 5C compared to the existing condition would be positive (+1.5).

The proposed visual character for Alternative 5C would be compatible with the existing visual character. The strong linear lines from the wall would give the view balance, uniformity, and harmony. It would also help screen out the existing views to the freeway. The visual character change under Alternative 5C would be low (1.6).

Given the visual quality change (+1.5) and visual character change (1.6) ratings, the visual resource change would be low (1.6) for Alternative 5C.

The visual impact for Alternative 5C at Key View 14 would be moderately low (3.3) and the level of visual mitigation required would be moderate.

ALTERNATIVE 7. Alternative 7 would include a new soundwall that would screen the existing freeway uniformly, and would also include an elevated freight corridor that would be seen above the soundwall, but would also be screened by a wall on the freight corridor. The freight corridor would be located on the east side of the I-710 mainline approximately 40 feet over the northbound lanes. The new soundwall would be a prominent change, but a positive one as it would screen out marginal sprawling vegetation and views to the existing freeway. The new soundwall would be placed closer to the mobile homes, which would be a moderately high visual change in the character for the mobile home park viewers. The new soundwall would help organize and beautify the view of the existing area by introducing strong linear forms and minimizing the visual encroachments of the existing view and increasing the view's vividness, and the elevated freight corridor would

further reinforce strong linear forms. Therefore, the proposed vividness would increase from moderately low (3.0) to moderately high (4.5), the proposed intactness would increase from moderately low (2.5) to moderate (3.5), and the proposed unity would increase from low (2.0) to moderate (4.0). This would result in the proposed overall visual quality under Alternative 7 to increase from moderately low (2.5) to moderate (4.0). The visual quality change under Alternative 7 compared to the existing condition would be positive (+1.5).

The proposed visual character for Alternative 7 would be compatible with the existing visual character. The strong linear lines from the wall and elevated freight corridor would give the view balance, uniformity, and harmony. It would also help screen out the existing views to the freeway. The visual character change under Alternative 7 would be low (2.0).

Given the visual quality change (+1.5) and visual character change (2.0) ratings, the visual resource change would be low (1.8) for Alternative 7.

The visual impact for Alternative 7 at Key View 14 would be moderately low (3.4) and the level of visual mitigation required would be moderate.

KEY VIEW 15. The visual simulation for Key View 15 is shown in Figure 3.6-16. Residents would have the potential to see the view multiple times per day as they leave and return to their homes. The duration of the view would depend upon each viewer's activities. The build alternatives would include a new soundwall on the right side of the view that would separate the residential homes from I-710. All travelers would notice the elevated ramp above the existing street. The viewer exposure is moderately high (4.7) and viewer sensitivity is moderately high (4.7). The overall viewer response at this location is moderately high (4.7).

ALTERNATIVES 5C AND 7. Both Alternatives 5C and 7 would include the same structures within this view. Alternatives 5C and 7 both include a new soundwall, Southern Ave. overcrossing, and West Frontage Rd. extension. There would be a strong horizontal structure across the view, and a uniform soundwall to screen out the existing freeway. The new soundwall would remove the existing vegetation on the right, but new landscaping would be planted and would enhance the street. The visual quality and character of this location would be visibly altered from the existing view. A new overcrossing would cut across the view at this location and remove the cluttered look of the existing trees, billboard, and utility lines. A new soundwall with enhanced landscaping would create a more uniform feature on the right side of this view. Therefore, the proposed vividness would increase from moderate (3.5) to moderately high (5.0), the proposed intactness would increase but remain moderately low (from 2.5 to 3.0), and the proposed unity would increase from very low (1.0) to moderately high (5.0). This would result in the proposed overall visual quality under Alternatives 5C and 7 to increase from low (2.3) to moderate

(4.3). The visual quality change under Alternatives 5C and 7 compared to the existing condition would be positive (+2.0).

The proposed visual character for Alternatives 5C and 7 would be compatible with the existing visual character. The new elevated road would clean up the midground and make it more uniform. The strong linear lines from the elevated road and new soundwall would be strong, simple, and create a sense of order that is absent in the existing view. The visual character change under Alternatives 5C and 7 would be low (1.8).

Given the visual quality change (+2.0) and visual character change (1.8) ratings, the visual resource change would be low (1.9) for both Alternatives 5C and 7.

The visual impact for both Alternatives 5C and 7 at Key View 15 would be moderately low (3.3) and the level of visual mitigation required would be moderate.

KEY VIEW 16. The visual simulation for Key View 16 is shown in Figure 3.6-17. Vehicular drivers and motorists make up the viewers at this location. A large number of people pass through this location on a daily basis, with the duration ranging from a few seconds to several minutes, depending on traffic conditions. The sky and freeway make up the majority of this view, but there are no dominant features that exist. The viewer exposure is moderate (4.3) and viewer sensitivity is moderately low (3.3). The overall viewer response at this location is moderate (3.8).

ALTERNATIVE 5C. Alternative 5C would add more traffic lanes by widening the freeway and building a new soundwall. There would be no more landscaping on the side of the freeway, however the mountains would be more visible as Alternative 5C would remove existing encroachments. Therefore, the proposed vividness would increase from moderate (3.5) to moderately high (4.5), the proposed intactness would increase from moderately low (3.0) to moderate (3.5), and the proposed unity would increase but remain moderate (from 3.5 to 4.0). This would result in the proposed overall visual quality under Alternative 5C to increase from moderately low (3.3) to moderate (4.0). The visual quality change under Alternative 5C compared to the existing condition would be positive (+0.7).

The proposed visual character for Alternative 5C would be compatible with the existing visual character. The widening of the freeway and new soundwall would reinforce the existing lines from the traffic lanes as they converge and disappear in the center of the view. The visual character change under Alternative 5C would be very low (1.4).

Given the visual quality change (+0.7) and visual character change (1.4) ratings, the visual resource change would be very low (1.1) for Alternative 5C.

The visual impact for Alternative 5C at Key View 16 would be moderately low (2.5) and the level of visual mitigation required would be moderate.

ALTERNATIVE 7. Alternative 7 would include freeway widening, a new soundwall, and an elevated freight corridor along the median of I-710. There would be no more landscaping on the side of the freeway. The elevated freight corridor would be the dominant feature in this view. Alternative 7 would enclose the space and introduce a dominating large concrete structure overhead. However, Alternative 7 would screen the utility lines and add strong linear lines to the view. There is more harmony within the view due to the widened freeway, new soundwall, and elevated freight corridor, leading to a vanishing point in the center of the view. Therefore, the proposed vividness would increase from moderate (3.5) to very high (6.5), the proposed intactness would decrease but remain moderately low (from 3.0 to 2.5), and the proposed unity would increase from moderate (3.5) to high (6.0). This would result in the proposed overall visual quality under Alternative 7 to increase from moderately low (3.3) to moderately high (5.0). The visual quality change under Alternative 7 compared to the existing condition would be positive (+1.7).

The proposed visual character for Alternative 7 would be somewhat compatible with the existing visual character of this view. The linear forms of the elevated freight corridor would strongly reinforce the existing lines, but the structure itself is disproportionate and overpowering within this view. The visual character change under Alternative 7 would be low (2.3).

Given the visual quality change (+1.7) and visual character change (2.3) ratings, the visual resource change would be low (2.0) for Alternative 7.

The visual impact for Alternative 7 at Key View 16 would be moderately low (2.9) and the level of visual mitigation required would be moderate.

KEY VIEW 17. The visual simulation for Key View 17 is shown in Figure 3.6-18. There are numerous viewers of mostly residents who reside adjacent to I-710 in Key View 17. Duration of the view depends upon the activities of viewers and it may vary from seconds to hours. The Key View is approximately 200 feet from improvements. Due to its residential nature, the viewer exposure is moderately high (4.7) and viewer sensitivity is high (5.7). The overall viewer response at this location is moderately high (5.2).

ALTERNATIVE 5C. Alternative 5C would include a higher soundwall that would screen more of the bottom of the utility pole. The freeway would be widened at this location, but because the widening is at-grade, it would not be seen from this Key View. The new soundwall would have the same characteristics as the existing soundwall; therefore, the new soundwall would help to reinforce the strong linear lines currently going across the center of the view. The new soundwall would visually appear as an enhanced aesthetic design

to the existing soundwall, thus increasing the visual quality. Therefore, the proposed vividness would increase from moderate (4.0) to moderately high (4.5), the proposed intactness would increase but remain moderately low (from 2.5 to 3.0), and the proposed unity would increase from low (2.0) to moderately low (2.5). This would result in the proposed overall visual quality under Alternative 5C to increase but remain moderately low (from 2.8 to 3.3). The visual quality change under Alternative 5C compared to the existing condition would be positive (+0.5).

The proposed visual character for Alternative 5C would be compatible with the existing visual character. The strongest element in this view would be the geometric lines reinforced by the new soundwall. The visual character change under Alternative 5C would be very little change (0.4).

Given the visual quality change (+0.5) and visual character change (0.4) ratings, the visual resource change would be very low (0.5) for Alternative 5C.

The visual impact for Alternative 5C at Key View 17 would be moderately low (2.9) and the level of visual mitigation required would be moderate.

ALTERNATIVE 7. Alternative 7 would include a higher soundwall in addition to an elevated freight corridor. The elevated freight corridor encroaches above the soundwall, but its form and size matches with its surroundings. The new soundwall would visually appear as an enhanced aesthetic design to the existing soundwall. The soundwall and elevated freight corridor would create strong horizontal lines across the view that would harmonize with the utility lines. The improved view from the elimination of a smaller electrical power pole and the relocation of the large electrical tower would be negated by the added structure of the elevated freight corridor and its soundwall. Therefore, the proposed vividness would increase from moderate (4.0) to moderately high (4.5), the proposed intactness would increase from moderately low (2.5) to moderate (3.5), and the proposed unity would increase from low (2.0) to moderate (3.5). This would result in the proposed overall visual quality under Alternative 7 to increase from moderately low (2.8) to moderate (3.8). The visual quality change under Alternative 7 compared to the existing condition would be positive (+1.0).

The proposed visual character for Alternative 7 would be compatible with the existing visual character of this view. The strongest element in this view would be the geometric lines reinforced by the soundwall and elevated freight corridor. The visual character change under Alternative 7 would be very low (1.3).

Given the visual quality change (+1.0) and visual character change (1.3) ratings, the visual resource change would be very low (1.2) for Alternative 7.

The visual impact for Alternative 7 at Key View 17 would be moderately low (3.2) and the level of visual mitigation required would be moderate.

KEY VIEW 18. The visual simulation for Key View 18 is shown in Figure 3.6-19. The main viewers at this location would be pedestrians and cyclists. They would be very aware of their surroundings, and their duration at this location could range from a few minutes to a few hours. The viewer exposure is moderate (3.7) and viewer sensitivity is moderately low (2.7). The overall viewer response at this location is moderately low (3.2).

ALTERNATIVE 5C. Alternative 5C would include a replacement bridge over I-710. It is minimally visible in the distance from the center right of the view. Since the visible changes from Alternatives 5C would be so minimal and in the distance, there would be very little change in the visual quality. Therefore, the proposed vividness would remain moderately low (3.0), the proposed intactness would remain low (2.0), and the proposed unity would remain moderately low (3.0). This would result in the proposed overall visual quality under Alternative 5C to remain moderately low (2.7). The visual quality change under Alternative 5C compared to the existing condition would be no change (0.0).

The proposed visual character for Alternative 5C would be compatible with the existing visual character. The changes would visually be minimal and located in the distance. The visual character change under Alternative 5C would be no change (0.0).

Given the visual quality change (0.0) and visual character change (0.0) ratings, the visual resource change would be no change (0.0) for Alternative 5C.

The visual impact for Alternative 5C at Key View 18 would be low (1.6) and the level of visual mitigation required would be little to no mitigation.

ALTERNATIVE 7. Alternative 7 would include the same new bridge as Alternative 5C and an elevated freight corridor. Alternative 7 would replace and widen the existing Slauson Bridge. In this view, the freight corridor structure is minimally visible in the distance on the right side. The elevated freight corridor would minimally encroach into the view on the right, but it stays low towards the existing elements. The size, location, and form of the elevated freight corridor would blend in with the surrounding view. The overall resource change for Alternative 7 would have very little to no change due to low visibility and vicinity of the new structures. Therefore, the proposed vividness would increase from moderately low (3.0) to moderate (3.5), the proposed intactness would remain low (2.0), and the proposed unity would increase from moderately low (3.0) to moderate (3.5). This would result in the proposed overall visual quality under Alternative 7 to increase slightly but remain moderately low (from 2.7 to 3.0). The visual quality change under Alternative 7 compared to the existing condition would be positive (+0.3).

The proposed visual character for Alternative 7 would be compatible with the existing visual character of this view. The changes would visually be minimal and located in the distance. Alternative 7 would be visible, but its form matches the linear lines of the existing Los Angeles River, bridge, and fence, thus making the visual changes very minimal. The visual character change under Alternative 7 would be very low (0.6).

Given the visual quality change (+0.3) and visual character change (0.6) ratings, the visual resource change would be very low (0.5) for Alternative 7.

The visual impact for Alternative 7 at Key View 18 would be low (1.9) and the level of visual mitigation required would be little to no mitigation.

KEY VIEW 19. The visual simulation for Key View 19 is shown in Figure 3.6-20. This area contains housing, so depending on viewer activity, the duration could range from a few seconds to a few hours. This is also a parking lot for a homeless shelter, which houses up to 350 people. The level of activity is projected to be low, thus lowering the impact of viewer exposure and sensitivity at this location. The viewer exposure is moderately low (3.3) and viewer sensitivity is moderately low (2.8). The overall viewer response at this location is moderately low (3.1).

ALTERNATIVE 5C. Alternative 5C would include a railroad realignment and a replacement of the railroad bridge overcrossing over I-710. Alternative 5C would have very little change in resources because the changes would be in the distance and minimally visible. Therefore, the proposed vividness would remain low (2.0), the proposed intactness would remain low (2.0), and the proposed unity would remain moderately low (3.0). This would result in the proposed overall visual quality under Alternative 5C to remain low (2.3). The visual quality change under Alternative 5C compared to the existing condition would be no change (0.0).

The proposed visual character for Alternative 5C would be compatible with the existing visual character. No visual attributes would be affected by the railroad realignment and railroad overcrossing. The visual character change under Alternative 5C would be very little change (0.4).

Given the visual quality change (0.0) and visual character change (0.4) ratings, the visual resource change would be very low (0.2) for Alternative 5C.

The visual impact for Alternative 5C at Key View 19 would be low (1.7) and the level of visual mitigation required would be little to no mitigation.

ALTERNATIVE 7. Alternative 7 would include the same features as Alternative 5C, in addition to removing the buildings, housing and trees on the left side of the parking lot,

and the addition of an elevated freight corridor. Alternative 7 would include demolition to half of the view to build a new fence and an elevated freight corridor. Alternative 7 would have a much higher change in resources because the left side of the view would be compromised by introduction of the elevated freight corridor. Alternative 7 would make the existing utility lines more prominent, but they would be in balance with the existing telephone lines. The elevated freight corridor would become the dominant feature at this location, introducing strong lines along with the new fence. Therefore, the proposed vividness would increase from low (2.0) to moderately high (4.5), the proposed intactness would increase from low (2.0) to moderate (4.0), and the proposed unity would increase from moderately low (3.0) to moderately high (5.0). This would result in the proposed overall visual quality under Alternative 7 to increase from low (2.3) to moderately high (4.5). The visual quality change under Alternative 7 compared to the existing condition would be positive (+2.2).

The proposed visual character for Alternative 7 would be somewhat compatible with the existing visual character of this view. A large portion of the existing landscape and structures would be demolished to make room for strong linear lines from the new fence and elevated freight corridor. The visual character change under Alternative 7 would be low (1.8).

Given the visual quality change (+2.2) and visual character change (1.8) ratings, the visual resource change would be low (2.0) for Alternative 7.

The visual impact for Alternative 7 at Key View 19 would be moderately low (2.6) and the level of visual mitigation required would be moderate.

KEY VIEW 20. The visual simulation for Key View 20 is shown in Figure 3.6-21. Numerous viewers reside adjacent to I-710. Duration of views would depend upon the activities of the viewers and could vary from seconds to hours. This Key View is approximately 400 feet from the improvements. Due to this view's residential nature, the viewer exposure is moderate (4.3) and viewer sensitivity is moderately high (4.8). The overall viewer response at this location is moderately high (4.6).

ALTERNATIVES 5C AND 7. Alternatives 5C and 7 would include a new soundwall to replace the existing soundwall and an elevated freeway connector to I-5. Under Alternatives 5C and 7, the depth of field would be shortened and the aesthetic view of the existing landscape would be compromised due to the new soundwall from the freeway widening and elevated freight corridor. The soundwall and elevated freight corridor would visually merge as one solid structure to block the row of trees in the background. The texture from the existing trees in the background would be removed and the streetlight and telephone pole would become more present with the new soundwall and elevated road as a backdrop. Therefore, the proposed vividness would increase but remain moderate (from

3.5 to 4.0), the proposed intactness would increase but remain moderate (from 3.5 to 4.0), and the proposed unity would increase from moderately low (2.5) to moderate (3.5). This would result in the proposed overall visual quality under Alternatives 5C and 7 to increase from moderately low (3.2) to moderate (3.8). The visual quality change under Alternatives 5C and 7 compared to the existing condition would be positive (+0.6).

The proposed visual character for Alternatives 5C and 7 would be somewhat compatible with the existing visual character. The strong linear lines from the new soundwall and I-5 connector are in harmony with the street running north and south. However, this new construction would screen out the tree canopies in the distance, leaving the view of the new vegetation unbalanced. The visual character change under Alternatives 5C and 7 would be low (1.5).

Given the visual quality change (+0.6) and visual character change (1.5) ratings, the visual resource change would be very low (1.1) for Alternatives 5C and 7.

The visual impact for Alternatives 5C and 7 at Key View 20 would be moderately low (2.9) and the level of visual mitigation required would be moderate.

ALTERNATIVE 7, DESIGN OPTION 1B. Alternative 7, Design Option 1B would require several homes to be removed to make space for the new street and freeway alignment, soundwall/retaining wall, and elevated connector. Under Alternative 7, Design Option 1B, the new street and freeway alignment would remove almost all of the homes in this view. An elevated connector and soundwall/retaining wall would be constructed across the center of the view, creating a vivid view of strong, linear concrete structures. The elevated connector and new soundwall/retaining wall would be the dominant feature at this location. Therefore, the proposed vividness would increase but remain moderate (from 3.5 to 4.0), the proposed intactness would decrease from moderate (3.5) to moderately low (3.0), and the proposed unity would decrease from moderately low (2.5) to low (2.0). This would result in the proposed overall visual quality under Alternative 7, Design Option 1B, to slightly decrease but remain moderately low (from 3.2 to 3.0). The visual quality change under Alternative 7, Design Option 1B, compared to the existing condition would be negative (-0.2).

The proposed visual character for Alternative 7, Design Option 1B, would not be compatible with the existing visual character of this view. The fluid and complex lines and forms from the existing view would change into linear and geometric forms which would drastically alter the existing visual characteristics in this view. The visual character change under Alternative 7, Design Option 1B, would be moderate (2.9).

Given the visual quality change (-0.2) and visual character change (2.9) ratings, the visual resource change would be very low (1.4) for Alternative 7, Design Option 1B.

The visual impact for Alternative 7, Design Option 1B, at Key View 20 would be moderately low (3.0) and the level of visual mitigation required would be moderate.

KEY VIEW 21. The visual simulation for Key View 21 is shown in Figure 3.6-22. The number of viewers could easily reach into three-digit numbers during high park activity days including weekends and summer periods. The duration of the view would vary from less than a minute up to multiple hours, depending on the activities of the viewers. The viewer exposure is moderate (4.0) and viewer sensitivity is moderately high (5.3). The overall viewer response at this location is moderately high (4.7).

ALTERNATIVES 5C AND 7. Alternatives 5C and 7 would both include a new soundwall and an elevated I-5 connector. The existing trees on the left side of the view would be removed and the elevated freight corridor and new soundwall would visually and physically be closer to the viewer. The grass and existing trees to the right are still prominent, but now they would share the view with the new concrete structures. The aesthetic aspect would be lower in this view. Therefore, the proposed vividness would decrease but remain moderate (from 4.0 to 3.5), the proposed intactness would decrease but remain moderately low (from 3.0 to 2.5), and the proposed unity would decrease from moderate (3.5) to moderately low (3.0). This would result in the proposed overall visual quality under both Alternatives 5C and 7 to decrease from moderate (3.5) to moderately low (3.0). The visual quality change under both Alternatives 5C and 7 compared to the existing condition would be negative (-0.5).

The proposed visual character for both Alternatives 5C and 7 would be somewhat compatible with the existing visual character. The vegetation would be unbalanced due to the removal of the trees on the left side of the view, but the new soundwall would continue the linear lines where the existing soundwall stopped abruptly. It would continue with the bridge to go across the center of the view. The visual character change under both Alternatives 5C and 7 would be low (1.8).

Given the visual quality change (-0.5) and visual character change (1.8) ratings, the visual resource change would be very low (0.7) for both Alternatives 5C and 7.

The visual impact for both Alternatives 5C and 7 at Key View 21 would be moderately low (2.7) and the level of visual mitigation required would be moderate.

KEY VIEW 22. The visual simulation for Key View 22 is shown in Figure 3.6-23. The most impacted viewers at this location are residents and passing motorists. The new soundwall/retaining wall under the build alternatives would be directly in front of the residents' front yards, thus making the new structure very prominent on a daily basis. Residents may have a high level of concern about the views from I-710 into their community. The viewer

exposure is moderate (4.3) and viewer sensitivity is high (5.7). The overall viewer response at this location is moderately high (5.0).

ALTERNATIVES 5C AND 7. Alternatives 5C and 7 would both widen the freeway and the pedestrian tunnel. This would require the removal of a few existing homes and vegetation. The location of the new soundwall would physically and visually move the existing soundwall closer to the viewer. Visually, the design would push the wall closer to the viewer, but the structure would have the same design characteristics as the existing structure. The visual quality of the existing view would be altered by both Alternatives 5C and 7. Vividness increases because the soundwall would now be closer to the viewers. The removal of the nearby homes would also create more focus to the soundwall. Therefore, the proposed vividness would increase from moderate (3.5) to moderately high (4.5), the proposed intactness would decrease from moderate (3.5) to moderately low (3.0), and the proposed unity would increase from moderately low (3.0) to moderate (4.0). This would result in the proposed overall visual quality under both Alternatives 5C and 7 to increase from moderately low (3.3) to moderate (3.8). The visual quality change under both Alternatives 5C and 7 compared to the existing condition would be positive (+0.5).

The proposed visual character for both Alternatives 5C and 7 would be compatible with the existing visual character. The removal of homes takes away some of the texture and diverse elements in this view. However, the original linear lines from the existing soundwall would be reinforced with the new soundwall, and it would create strong forms across the center of the view. The visual character change under both Alternatives 5C and 7 would be low (1.5).

Given the visual quality change (+0.5) and visual character change (1.5) ratings, the visual resource change would be very low (1.0) for both Alternatives 5C and 7.

The visual impact for both Alternatives 5C and 7 at Key View 22 would be moderately low (3.0) and the level of visual mitigation required would be moderate.

KEY VIEW 23. The visual simulation for Key View 23 is shown in Figure 3.6-24. Residents could be seeing the view multiple times per day as they leave and return to their homes. The duration of the view would depend on viewer activity and the duration could span from a couple of seconds to a few hours. The viewer exposure is moderate (4.3) and viewer sensitivity is high (5.7). The overall viewer response at this location is moderately high (5.0).

ALTERNATIVES 5C AND 7. Alternatives 5C and 7 would both include multi-level connectors and a new soundwall. This would require the removal of a few existing homes. Additionally, some vegetation will be lost as the new soundwall is closer to the viewer. The location of the new soundwall would shorten the physical space and depth of field of this area. Landscaping would be an impactful mitigation measure to soften the design and

reintroduce lost vegetation. The visual quality of the existing view would be altered by both Alternatives 5C and 7. Vividness increases because a new soundwall is built across the view, shortening the depth of field and physical space in this area. Intactness and Unity increase slightly because the soundwall introduces strong linear lines to contrast with the varying textures of the existing trees. Therefore, the proposed vividness would increase from moderate (3.5) to moderately high (4.5), the proposed intactness would decrease from moderate (3.5) to moderately low (3.0), and the proposed unity would increase but remain moderately low (from 2.5 to 3.0). This would result in the proposed overall visual quality under both Alternatives 5C and 7 to slightly increase from moderately low (3.2) to moderate (3.5). The visual quality change under both Alternatives 5C and 7 compared to the existing condition would be positive (+0.3).

The proposed visual character for both Alternatives 5C and 7 would be somewhat compatible with the existing visual character. The rigid lines of the new soundwall would replace the textured forms of the group of trees in the background. The visual character change under both Alternatives 5C and 7 would be low (1.9).

Given the visual quality change (+0.3) and visual character change (1.9) ratings, the visual resource change would be very low (1.1) for both Alternatives 5C and 7.

The visual impact for both Alternatives 5C and 7 at Key View 23 would be moderately low (3.1) and the level of visual mitigation required would be moderate.

KEY VIEW 24. The visual simulation for Key View 24 is shown in Figure 3.6-25. The most impacted viewers at this location are residents and passing motorists. Residents could see the view multiple times per day as they leave and return to their homes. The duration could range from a few seconds to a several hours, depending on viewer activity. The viewer exposure is moderate (4.3) and viewer sensitivity is high (5.5). The overall viewer response at this location is moderately high (4.9).

ALTERNATIVES 5C AND 7. Alternatives 5C and 7 would include the widening of I-710 freeway with a new soundwall/retaining wall. The new soundwall/retaining wall would be in closer proximity to the viewers, but it would be very similar form and size to the existing soundwall. The visual quality of the existing view would be slightly altered under Alternatives 5C and 7. Therefore, the proposed vividness would increase from moderately low (3.0) to moderate (4.0), the proposed intactness would increase but remain moderately low (from 2.5 to 3.0), and the proposed unity would increase but remain moderately low (from 2.5 to 3.0). This would result in the proposed overall visual quality under Alternatives 5C and 7 to increase but remain moderately low (from 2.7 to 3.3). The visual quality change under Alternatives 5C and 7 compared to the existing condition would be positive (+0.6).

The proposed visual character for Alternatives 5C and 7 would be compatible with the existing visual character. The new structures would create a strong sense of flow by reinforcing the existing lines created by the sidewalk, road, and landscape edges. The visual character change under Alternatives 5C and 7 would be very low (1.0).

Given the visual quality change (+0.6) and visual character change (1.0) ratings, the visual resource change would be very low (0.8) for Alternatives 5C and 7.

The visual impact for Alternatives 5C and 7 at Key View 24 would be moderately low (2.9) and the level of visual mitigation required would be low.

DESIGN OPTIONS 3A AND 3B. Design Options 3A and 3B would include an elevated connector with a soundwall to the east of I-710. The elevated connector would be a strong linear design overhead that would dominate this view. Design Options 3A and 3B would drastically change the existing view within this area. However, the design and form of the elevated structure blends in with the existing linear form of the street. Therefore, the proposed vividness would increase from moderately low (3.0) to moderately high (5.0), the proposed intactness would increase but remain moderately low (from 2.5 to 3.0), and the proposed unity would increase from moderately low (2.5) to moderate (4.0). This would result in the proposed overall visual quality under Design Options 3A and 3B to increase from moderately low (2.7) to moderate (4.0). The visual quality change under Design Options 3A and 3B compared to the existing condition would be positive (+1.3).

The proposed visual character for Design Options 3A and 3B would be somewhat compatible with the existing visual character. Design Options 3A and 3B would create a strong sense of flow by reinforcing the existing lines created by the sidewalk, road, and landscape edges. It would also introduce a large overhead mass that would be disproportionate to its existing surroundings. The visual character change under Design Options 3A and 3B would be moderate (2.5).

Given the visual quality change (+1.3) and visual character change (2.5) ratings, the visual resource change would be low (1.9) for Design Options 3A and 3B.

The visual impact for Design Options 3A and 3B at Key View 24 would be moderate (3.5) and the level of visual mitigation required would be moderate.

KEY VIEW 25. The visual simulation for Key View 25 is shown in Figure 3.6-26. The most impacted viewers at this location are the residents and passing motorists. The new soundwall/retaining wall included under the build alternatives would be directly in front of the residents' front yards, thus making the new structure very prominent, on a daily basis. Residents may have a high level of concern about the views from I-710 into their community.

The viewer exposure is moderate (4.3) and viewer sensitivity is high (5.5). The overall viewer response at this location is moderately high (4.9).

ALTERNATIVES 5C AND 7. Alternatives 5C and 7 would include freeway and bridge widening with a new soundwall/retaining wall. At this location, the features of Alternatives 5C and 7 would be in the distance. Under Alternatives 5C and 7, the design features would be minimally visible in the distance and resulting visual impact would be minimal. Therefore, the proposed vividness would remain moderate (3.5), the proposed intactness would decrease from moderate (3.5) to moderately low (3.0), and the proposed unity would remain moderately low (3.0). This would result in the proposed overall visual quality under Alternatives 5C and 7 to slightly decrease, but remain moderately low (from 3.3 to 3.2). The visual quality change under Alternatives 5C and 7 compared to the existing condition would be negative (-0.1).

The proposed visual character for Alternatives 5C and 7 would be compatible with the existing visual character. The visual character change under Alternatives 5C and 7 would be very low (0.5).

Given the visual quality change (-0.1) and visual character change (0.5) ratings, the visual resource change would be very low (0.2) for Alternatives 5C and 7.

The visual impact for Alternatives 5C and 7 at Key View 25 would be moderately low (2.6) and the level of visual mitigation required would be moderate.

DESIGN OPTIONS 3A AND 3B. Design Options 3A and 3B would include a new soundwall/retaining wall. Several existing homes would be removed to accommodate the freeway widening. Under Design Options 3A and 3B, the existing landscape on the left side of the view would change from a diverse mix of elements of trees and homes to a simplified linear structure. The removal of existing homes adjacent to the freeway and the introduction of a new soundwall/retaining wall would drastically change the view of this area under Design Options 3A and 3B. However, the design and form of the new soundwall/retaining wall is very uniform, balanced, and proportionate to its surroundings. New landscaping would enhance this view. The visual quality of the existing view will be altered by Design Options 3A and 3B. Therefore, the proposed vividness would increase from moderate (3.5) to high (5.5), the proposed intactness would decrease from moderate (3.5) to moderately low (3.0), and the proposed unity would increase from moderately low (3.0) to moderately high (4.5). This would result in the proposed overall visual quality under Design Options 3A and 3B to increase from moderately low (3.3) to moderate (4.3). The visual quality change under Design Options 3A and 3B compared to the existing condition would be positive (+1.0).

The proposed visual character for Design Options 3A and 3B would be compatible with the existing visual character. Design Options 3A and 3B would contrast sharply with the existing view, but the form and size of the structure would be simple, uniform, and proportionate to its surroundings, thus making it suitable and compatible with its surroundings. The visual character change under Design Options 3A and 3B would be low (2.3).

Given the visual quality change (+1.0) and visual character change (2.3) ratings, the visual resource change would be low (1.7) for Design Options 3A and 3B.

The visual impact for Design Options 3A and 3B at Key View 25 would be moderately low (3.3) and the level of visual mitigation required would be moderate.

OTHER VISUAL IMPACTS – LIGHT, GLARE, SHADE, AND SHADOW. Existing urban land uses within the Study Area would experience an elevated level of night lighting due to the widening of the I-710 mainline under the build alternatives, where traffic light fixtures would be relocated closer to all land uses. Additionally, traffic light fixtures installed onto the freight corridor under Alternative 7 would add increased night lighting to some neighborhoods along Alternative 7. The effects of this new light would be lessened to some degree by utilizing light control appliances on the light fixtures. In addition, there may also be an increase in night lighting for two existing golf courses within the Study Area. However, golfing activity is mainly restricted to daylight hours, and with the distance from the viewer (minimum of 0.20 mile), the build alternatives would have minimal impact to these golf courses from the increased lighting. There may also be increased night lighting along portions of I-710 within the Study Area where it is relatively close to the LARIO Trail. However, because most of the trail use occurs during daylight hours, no impact from the build alternatives is anticipated.

For any build alternative, glare from vehicle headlights in the general-purpose lanes and the elevated portions of the freight corridor would be minimized by the construction of soundwalls and screen walls. Since soundwalls would be installed whenever the improvements related to the build alternatives are adjacent to residential areas, these walls would block the vehicle headlight glare. For views from the opposing side of the Los Angeles River, screen walls would be constructed. However, the distance from the views (minimum of 0.15 mile) across the Los Angeles River to the improvements related to the build alternatives is anticipated to limit any glare.

During hours where the sun is low to the horizon and during the winter solar declination seasons (September through March), the elevated freight corridor under Alternative 7 would create some shade and/or shadows within the I-710 Corridor that do not exist today. The acute angle of the sun relative to the ground plain creates “longer” shadows during these times. The shade/shadows created by the build alternatives would impact the neighborhoods west of the I-710 Corridor from Pacific Coast Hwy. to SR-91, as well as the residents in the Thunderbird Villas Mobile Home Park in the City of South Gate closest to the west side of the I-710 mainline. Using solar declination

calculations (please refer to the VIA [2017]), it was determined that the first row of homes immediately adjacent to Frontage Rd. in South Gate would experience morning shadows between September and March. Late December would result in the longest shadows. These shadows will shorten considerably during the summer months.

NO BUILD (ALTERNATIVE 1). The No Build (Alternative 1), which has been identified as the Preferred Alternative, does not include any improvements within the I-710 Corridor other than those projects that are already funded and/or committed to be constructed by or before the planning horizon year of 2035. Therefore, Alternative 1 would not change the existing visual setting and would, consequently, not result in the visual impacts (both adverse and beneficial) within the I-710 landscape units.

3.6.3.2 PUBLIC HEALTH CONSIDERATIONS

As stated under the “Other Visual Impacts” portion of this section, sensitive viewers adjacent to the improvements related to the build alternatives would experience light and glare effects either where the build alternatives result in new light sources in the existing environment, or when existing light sources are moved closer to sensitive viewers. The health effects of any light and glare effects caused by the build alternatives would be minimal because of the urban nature of the I-710 Corridor, which already has an extensive number of existing sources of light and glare.

BUILD ALTERNATIVES.

ALTERNATIVE 5C. Light and glare from the general-purpose lanes under Alternative 5C would not impact viewers in residences adjacent to I-710. Therefore, Alternative 5C is not anticipated to have an adverse impact to public health with regard to visual impacts.

ALTERNATIVE 7. In addition to the lighting provided under Alternative 5C, Alternative 7 will add traffic lighting and vehicle lights associated with the freight corridor. The effects of this new lighting can be lessened to some degree by utilizing light shielding devices on the safety lighting fixtures.

In addition to the glare discussed above for Alternative 5C, glare related to the freight corridor under Alternative 7 would be minimized by the construction of soundwalls (and potentially screen walls as an aesthetic enhancement) and by the distance of the viewer from the traffic lighting and vehicle lights. For views from the opposing side of the Los Angeles River, no soundwalls will be included, but screen walls may be included as an aesthetic enhancement. However, the distance from the views (minimum of 0.15 mile) across the Los Angeles River to Alternative 7 is anticipated to minimize the glare.

Alternative 7 is not anticipated to have an adverse impact on public health with regard to visual impacts.

3.6.3.3 MOTION 22.1

As described in Chapter 2.0, Section 2.2.2.1 (Community Alternative 7) of this Final EIR/EIS, the Los Angeles County Metropolitan Transportation Authority (Metro) Board of Directors passed Board Motion 22.1 in October 2015 that directed Metro and Caltrans to study a number of additional items as a part of the I-710 Corridor Project Description. All of these measures are described in Section 2.3.2.1, Common Features of Build Alternatives.

The Motion 22.1 measure with the greatest potential for visual impacts in the I-710 Corridor Project Study Area is the provision of five new pedestrian/bicycle bridges over I-710 and the Los Angeles River as part of the build alternatives. These new bridges would have a minimal effect on sensitive viewers during project construction as they would be under construction at the same time as other components of the build alternatives. The permanent impacts resulting from these new bridges are described above under Key View 1. At that location, the visual impact analysis concluded that the Los Angeles River would still be a striking view within the viewshed, but the new bridge under Alternative 5C would shorten the view of the river, and the columns of the bridge would be intrusive to the Los Angeles River. Therefore, the proposed vividness would decrease from high (5.5) to moderately high (5.0), and the proposed intactness and unity would each decrease from high (5.5) to moderately high (4.5). This would result in the proposed overall visual quality under Alternative 5C to decrease from high (5.5) to moderately high (4.7). The visual quality change under Alternative 5C compared to the existing condition would be negative (-0.8). Similar effects would occur as a result of the other new pedestrian/bicycle bridges included under Motion 22.1.

Motion 22.1 also includes a measure which states that, consistent with Caltrans' policy, the build alternatives should maximize the number of new trees, shrubs, and foliage within State right-of-way that are drought resistant and have superior biosequestration and biofiltration capabilities, in an effort to surpass the minimum tree removal/replacement ratio. This Motion 22.1 measure has been incorporated into Mitigation Measure VIS-2, described below in Section 3.6.4, Avoidance, Minimization, and Mitigation Measures.

3.6.4 AVOIDANCE, MINIMIZATION, AND/OR MITIGATION MEASURES

As discussed above, the build alternatives would result in adverse visual impacts due to loss of landscaping, addition of new structures (including soundwalls), widening of existing structures, and the creation of new sources of light and glare. For any build alternative, measures have been identified and are described below to avoid, minimize, or reduce the adverse visual impacts that would result from construction and operation of the I-710 Corridor Project build alternatives. While these measures would reduce the impacts of the I-710 Corridor Project build alternatives, there would still be a residual visual impact due to the introduction of reconstructed freeway-to-freeway connectors, soundwalls, and the freight corridor (Alternative 7) into the visual landscape of the Study Area. These measures would apply to all I-710 Corridor Project build alternatives.

However, as the No Build (Alternative 1) was identified as the Preferred Alternative, adverse visual impacts would not occur, and the adoption of this alternative would not require any avoidance, minimization, and/or mitigation measures. Avoidance, minimization, and/or mitigation measures pertaining to the two build alternatives are retained in this Final EIR/EIS for disclosure purposes.

VIS-1 Elements from the California Department of Transportation (Caltrans) *I-710 Corridor Aesthetics Master Plan* (February 2014) will be incorporated into the final design of the Interstate 710 (I-710) Corridor Project. The *I-710 Corridor Aesthetics Master Plan* defines aesthetic treatment measures to be incorporated into the final design of the Interstate 710 (I-710) Corridor Project. The *I-710 Corridor Aesthetics Master Plan* has been developed in a context-sensitive design process in consultation with the affected local agencies and includes involvement of local community members as determined by the local agencies.

The following are the aesthetic structure design considerations of the *I-710 Corridor Aesthetics Master Plan* (February 2014) that will be incorporated into the design of all structures that are part of the I-710 Corridor Project:

- Provision of visual continuity and a unified experience for the driver, from the coastal City of Long Beach to the community of East Los Angeles to the north.
- Bridge concrete barriers and railing shall contribute to the visual continuity of the travel way.
- Selection of a distinctive light standard design that is compatible with the lines and shapes of the proposed aesthetic theme for structures and that reflects an artistic solution for pole lighting.
- Travel way appurtenances shall exhibit simple design language that unifies various travel way components (e.g., bridge rails, abutments and security fencing).
- The form and surfacing of all vertical elements such as abutments, bridge superstructures, columns, retaining walls, and soundwalls along the travel way, shall exhibit a consistent aesthetic treatment and style.

The *I-710 Corridor Aesthetics Master Plan* determined that the “Modern Theme” will serve as the concept for the I-710 Corridor. Conceptual representations of the “Modern Theme” for all structural elements are portrayed in the *I-710 Corridor Aesthetics Master Plan* (February 2014).

- VIS-2 TREES.** During preparation of plans, specifications, and estimates (PS&E), the Caltrans District 7 Landscape Architect will verify that the design minimizes removal of existing mature trees. If removal of mature trees cannot be avoided, additional landscape improvements will be incorporated into the final design for these areas. The replacement ratio of any trees removed shall be determined by the Caltrans District 7 Landscape Architect. Consistent with Caltrans' policy, the objective of this measure is to maximize the number of new trees, shrubs, and foliage within proposed State right-of-way that are drought resistant and have superior biosequestration and biofiltration capabilities, in an effort to surpass the minimum tree removal/replacement ratio. Depending on the types of trees removed, removal and replacement ratios differ, but will be included in the final landscaping plan. Any trees within the public right of way of local agency jurisdictions that will be removed as part of the proposed project will be replaced in a manner that is consistent with applicable local ordinances.
- VIS-3 HARDSCAPE.** During preparation of PS&E, the Caltrans District 7 Landscape Architect will verify that the project design incorporates attractive walls, medians, and other visually pleasing hardscape in the project design consistent with the *I-710 Corridor Aesthetics Master Plan*. Permeable paving material will be used to reduce surface water runoff.
- VIS-4 SOUNDWALLS.** During preparation of PS&E, Caltrans will include aesthetic enhancements for soundwalls in the final design. The designs of soundwalls require compliance with Caltrans standards for sound attenuation (where walls provide that function), safety requirements, and other pertinent standards. The design of soundwalls requires compliance with the Caltrans *Highway Design Manual* standards, and aesthetic treatments shall be reviewed by the Caltrans District 7 Landscape Architect. The soundwalls shall be developed consistent with the *I-710 Corridor Aesthetics Master Plan* and include the following features:
- Attractive, decorative elements including features that provide an expression of the “sense of place” for the I-710 Corridor communities shall be incorporated into wall designs in order to increase the visual quality of the area.
 - Areas in front of soundwalls shall be landscaped, where landscaping can be accommodated within the public right-of-way, including trees, shrubs, and vines (depending upon the space available) to break the visual monotony, soften the appearance of soundwalls, and deter graffiti.
- VIS-5 RETAINING WALLS.** During preparation of PS&E, Caltrans will include aesthetic enhancements for retaining walls in the project design. Attractive, decorative

elements, including features that provide an expression of the “sense of place” for the I-710 Corridor communities, shall be incorporated into wall designs in order to increase the visual quality of the area. The use of retaining walls along the I-710 freeway mainline or at interchange off- and on-ramps will require compliance with Caltrans’ design standards for safety.

- VIS-6** **SCREEN WALLS.** As discussed in the Project Description, Caltrans will include screen walls along the freight corridor in areas where soundwalls are not provided and where sensitive viewer groups are exposed to the view of the freight corridor. During preparation of PS&E, aesthetic enhancements for screen walls in the project design will include attractive, decorative elements that provide an expression of the “sense of place” for the I-710 Corridor communities.
- VIS-7** **LIGHTING.** During preparation of PS&E, a lighting plan will be prepared by Caltrans. The lighting fixtures will be designed to minimize glare on adjacent properties/environmentally sensitive habitats and into the night sky. Permanent project lighting will be of the lowest illumination necessary for safety and shielded with nonglare hoods and focused within the I-710 Corridor Project right-of-way to reduce the extent of illumination into sensitive habitats.
- VIS-8** **DETENTION BASINS AND BIOSWALES.** During preparation of PS&E, detention basins and bioswales will be addressed as visually integrated elements of the landscape planting. An *Enhanced Water Quality Features Report for the I-710 Corridor Project* (December 2016) has been developed. The proposed Enhanced Water Quality Features will clean the water while simultaneously adding aesthetic features to the area. A common theme will be implemented in the design to help add character, beauty, and unity to the surrounding cities that all share the same responsibility and waterways.
- VIS-9** **LOCAL JURISDICTION REVIEW.** During final design, Caltrans will review with each local jurisdiction the aesthetic features and treatments proposed to be incorporated in the final facility design for freeway components adjacent to each local jurisdiction, in accordance with the *I-710 Corridor Aesthetics Master Plan* described in Measure VIS-1.
- VIS-10** **GRAFFITI REDUCTION, REMOVAL, AND CONTROL.** During final design, Caltrans will include planting plans for vine planting on sound barriers and other vertical structures where feasible, planting plans for trees and shrubs in State right-of-way adjacent to south barriers and other vertical structures, and the use of decorative/surface treatments on sound barriers and other vertical structures in the *I-710 Corridor Aesthetics Master Plan*, to reduce the potential for graffiti and to

soften the appearance of those walls, consistent with the *Highway Design Manual*, Index 902.3(5).

After the construction of each sound barrier or vertical structure where vine planting is shown in the project specifications, Caltrans will require the construction contractor to install the vine planting consistent with the project specifications and the planting requirements in the *I-710 Corridor Aesthetics Master Plan*.

Caltrans has an existing ongoing maintenance program for the control and removal of graffiti from structures and facilities within the State right-of-way for State highways. That program would apply to all new and modified structures in the I-710 Corridor Project build alternatives. The Caltrans program for the control and removal of graffiti is described in Chapter D1, Litter, Debris, and Graffiti, in the Caltrans *Maintenance Manual*, Volume I (July 2014). Key program components applicable to the project features in the I-710 Corridor Project build alternatives include:

- Use of recycled paint for various structures and matching paint used to cover graffiti with the original paint color on the structure.
- Use of physical devices such as rat guards, sign hoods, razor wire, and glare screen patches to limit access to facilities targeted by taggers.
- Replacement of ground-mounted signs with signs that have protective coatings or application of protective coatings to signs.
- Evaluation and use of new products available to aid in control of graffiti, for both preventative and removal of graffiti. Caltrans maintains a list of products that have been tested for safety and effectiveness.
- Multi-Agency Graffiti Intervention Committees (MAGIC) are regional anti-graffiti organizations. They are effective in coordination of regional resources and efforts from local agencies.

Many local jurisdictions along the alignment of I-710 also have graffiti abatement and control programs in their Municipal Codes or other City or County requirements. Those programs apply throughout those jurisdictions and may apply to structures on public and private property. Methods used by local agencies for the removal of graffiti include power washing, gel removers, and painting.

3.7 CULTURAL RESOURCES

The information in this section is based on the following technical reports:

- *Historical Resources Evaluation Report (HRER)* (April 2012)
- *Archaeological Survey Report (ASR), Interstate I-710 between Ocean Boulevard and SR-60* (April 2012)
- *Finding of No Adverse Effect (FNAE)* (July 2012)
- *Supplemental Historic Properties Survey Report (HPSR)* (April 2017)
- *Supplemental HRER* (April 2017)
- *Supplemental ASR (Confidential Report) (Supplemental ASR)* (April 2017)
- *Archaeological Sensitivity Study for the Interstate 710 Corridor Project (Confidential Report) (Archaeological Sensitivity Study)* (February 2017)
- *Second Supplemental HPSR* (September 2018)
- *Supplemental Finding of Effect (FOE)* (October 2018)
- *Project-Level Programmatic Agreement* (June 2019)

3.7.1 REGULATORY SETTING

The term “cultural resources” as used in this document refers to all “built environment” resources (structures, bridges, railroads, water conveyance systems, etc.), culturally important resources, and archaeological resources (both prehistoric and historic), regardless of significance. Under federal and State laws, cultural resources that meet certain criteria of significance are referred to by various terms including “historic properties,” “historic sites,” historical resources,” and “tribal cultural resources.” Laws and regulations dealing with cultural resources include:

The National Historic Preservation Act of 1966 (NHPA), as amended, sets forth national policy and procedures regarding historic properties, defined as districts, sites, buildings, structures, and objects included in or eligible for the National Register of Historic Places (National Register). Section 106 of NHPA requires federal agencies to take into account the effects of their undertakings on such properties and to allow the Advisory Council on Historic Preservation the opportunity to comment on those undertakings, following regulations issued by the Advisory Council on Historic Preservation (36 Code of Federal Regulations [CFR] 800). On January 1, 2014, the First Amended Section 106 Programmatic Agreement (PA) among the Federal Highway Administration (FHWA), the Advisory Council on Historic Preservation (ACHP), the California State Historic Preservation Officer (SHPO), and the California Department of Transportation (Caltrans) (Section 106 PA) went into effect for Caltrans projects, both State and local, with FHWA involvement. The Section 106 PA implements the ACHP’s regulations, 36 CFR 800, streamlining

the Section 106 process and delegating certain responsibilities to Caltrans. The FHWA's responsibilities under the Section 106 PA have been assigned to Caltrans as part of the Surface Transportation Project Delivery Pilot Program (23 United States Code [USC] 327).

Historic properties may also be covered under Section 4(f) of the U.S. Department of Transportation Act, which regulates the "use" of land from historic properties. Refer to Appendix B, of this Final EIR/EIS, Final Section 4(f) Evaluation and Resources Evaluated Relative to the Requirements of Section 4(f), for specific information regarding Section 4(f).

Historical resources are considered under the California Environmental Quality Act (CEQA), as well as California Public Resources Code (PRC) Section 5024.1, which established the California Register of Historical Resources (California Register). California PRC Section 5024 requires State agencies to identify and protect state-owned resources that meet National Register listing criteria. Procedures for compliance with PRC Section 5024 are outlined in a Memorandum of Understanding (MOU)¹ between the Department and SHPO, effective January 1, 2015. For most Federal-aid projects on the State Highway System, compliance with the Section 106 PA will satisfy the requirements of PRC Section 5024. It further specifically requires Caltrans to inventory State-owned structures in its rights-of-way.

3.7.2 AFFECTED ENVIRONMENT

3.7.2.1 CULTURAL RESOURCE SETTING

ENVIRONMENT. The cultural resource setting of the Study Area, which is the more general vicinity of the build alternatives, is based on the underlying assumption that humans and human societies are in continual interaction with the physical environment. Being an integral and major part of the ecological system, humans respond to the limits imposed by the environment through technological and behavioral adaptation and by altering the environment to produce more favorable conditions. In that context, the biotic character and natural environment of the Study Area have been almost completely altered from its natural setting by modern development.

PREHISTORY. Of the many chronological sequences proposed for southern California, two primary regional syntheses are commonly used for the southern California region in the archaeological literature. The first, advanced by Wallace in 1955, defines four cultural horizons, each with characteristic local variations: Early Horizon, Milling Stone, Intermediate, and Late Prehistoric. Employing a more ecological approach, Warren (1968) defined five periods in southern California prehistory: Lake Mojave, Pinto, Gypsum, Saratoga Springs, and Protohistoric. Warren viewed cultural continuity and change in terms of various significant environmental shifts, defining the

¹ The MOU is located on the Caltrans SER website: <https://dot.ca.gov/-/media/dot-media/programs/environmental-analysis/documents/5024mou-15-a11y.pdf> (accessed December 2020).

cultural ecological approach for archaeological research of the California deserts and coast. Many changes in settlement pattern and subsistence focus are viewed as cultural adaptations to a changing environment, beginning with the gradual environmental warming in the late Pleistocene, the desiccation of the desert lakes during the early Holocene, the short return to pluvial conditions during the middle Holocene, and the general warming and drying trend, with periodic reversals, that continues to this day.

ETHNOGRAPHY. Ethnographic studies show that the Study Area was occupied by an Uto-Aztecan-speaking Native American group known as the Gabrielino during the 16th to 19th centuries. The term “Gabrielino” is derived from the association of these Indian peoples with Mission San Gabriel. The Gabrielino practiced a hunter-gatherer lifestyle and lived in permanent communities near the convergence of two or more environmental zones or habitats. Commonly chosen sites included areas near rivers, streams, and inland watercourses; sheltered coastal bays and estuaries; and the transition zone delineating prairies and foothills.

HISTORY. Prior to Spanish exploration and occupation of California in the mid to late 18th Century, trails crisscrossed the Gabrielino lands and were used in trading between inland and coastal native groups. Some of these trails led from the coastal area of present-day San Pedro into the Los Angeles area and through the passes beyond. During the early development of Pueblo de Los Angeles, the plains south and southeast of the pueblo became the center of the hide and tallow trade, with San Pedro being its major embarkation point. A well-rutted road connected Los Angeles with San Pedro and crossed the flat plains, where the only change in landscape was the low rise of the Dominguez Hills.

Los Angeles, San Pedro, and the main dirt road joining them changed little until 1847, when American settlement began. During the early 1850s, the Sepulveda family of nearby Rancho Los Palos Verdes established freight and passenger service between Los Angeles and San Pedro. The route in those early days was known as both the San Pedro Road and Sepulveda’s Stage Road. As the population of Los Angeles grew and the coastal shipping industry developed, with more schooners and steamer traffic arriving at San Pedro, the San Pedro Road became a major artery of travel and the forerunner of later paved roads and highways.

The first transcontinental railroad connection to be constructed in Los Angeles was the Southern Pacific Railroad, and it ushered in an era of population increase and development fostered by the nation-wide networks of passenger and freight railroad systems. Once the railroad line was completed in the 1870s, waves of new settlers began arriving in southern California. Eventually, several major railroads were operating in Southern California during the late 19th and early 20th centuries, including the Southern Pacific Railroad, the Union Pacific Railroad (UP Railroad), and the Santa Fe Railroad.

Throughout the 1920s and 1930s, the City of Los Angeles prospered in unison with the coastal harbors. Imports and exports soon became the driving economy in the Long Beach and Los

Angeles harbors but the railroads were not located within proximity to the harbors. Roads began developing to accommodate trucks that could transport goods into Los Angeles without the access limitations of the railroad tracks.

During the post-World War II period, the construction of freeways that linked with the harbors and the introduction of metal container shipping into the area quickly transformed the shipping industry. This period also saw employment in Los Angeles grow the fastest in the outlying areas of the city. The suburban Cities of Compton, South Gate, and Commerce and other cities lining the present-day Interstate 710 (I-710) Corridor experienced an economic boom due to the manufacturing trade, which altered the traffic patterns within the metropolitan region. With the development of Los Angeles suburbs, the automobile was instrumental in easing the burden on the urban infrastructure. Freeway systems played a major role by linking downtown Los Angeles with the suburbs. The I-710 freeway (also known as the Long Beach Freeway) was constructed in stages between 1951 and 1965 (see Figures 3.7-1 and 3.7-2).

Prior to its construction, a right-of-way was established for the proposed freeway and properties were acquired by the State through eminent domain. A majority of the properties contained single-family residences that were either moved or demolished; most of these residences were once part of housing tracts that were developed primarily during World War II to house people working at local defense industries.

ARCHITECTURE. Within the I-710 Corridor, architecture followed prevailing trends, but also reflected the realities of a working-class population and the gradual development of architectural forms appropriate to the ideals of the California lifestyle. Residential styles transitioned from the Victorian styles of the late 1800s to the Craftsman and Revival styles in the 1910s and 1920s, followed by the California Ranch style, which gained great popularity during the post-World War II period.

The formation of the Interstate System during the post-World War II period created freeway subdivisions. These residential developments were designed with the automobile in mind, and thus, were easily accessible by freeway and major arterial routes. Freeway subdivisions are prevalent throughout the Study Area.

Industrial and commercial architecture was generally more utilitarian and vernacular, with only a few structures having any identifiable style or stylistic influences. One unique style is referred to as Programmatic Architecture, which was a style that first appeared in the early part of the 20th century and flourished during the post-World War II period as the automobile culture grew in unison with the housing boom. The style involved the use of large-scale objects that mimic animals, food products, and household objects as a form of advertising, especially in the form of roadside advertising.

3.7.2.2 AREA OF POTENTIAL EFFECTS

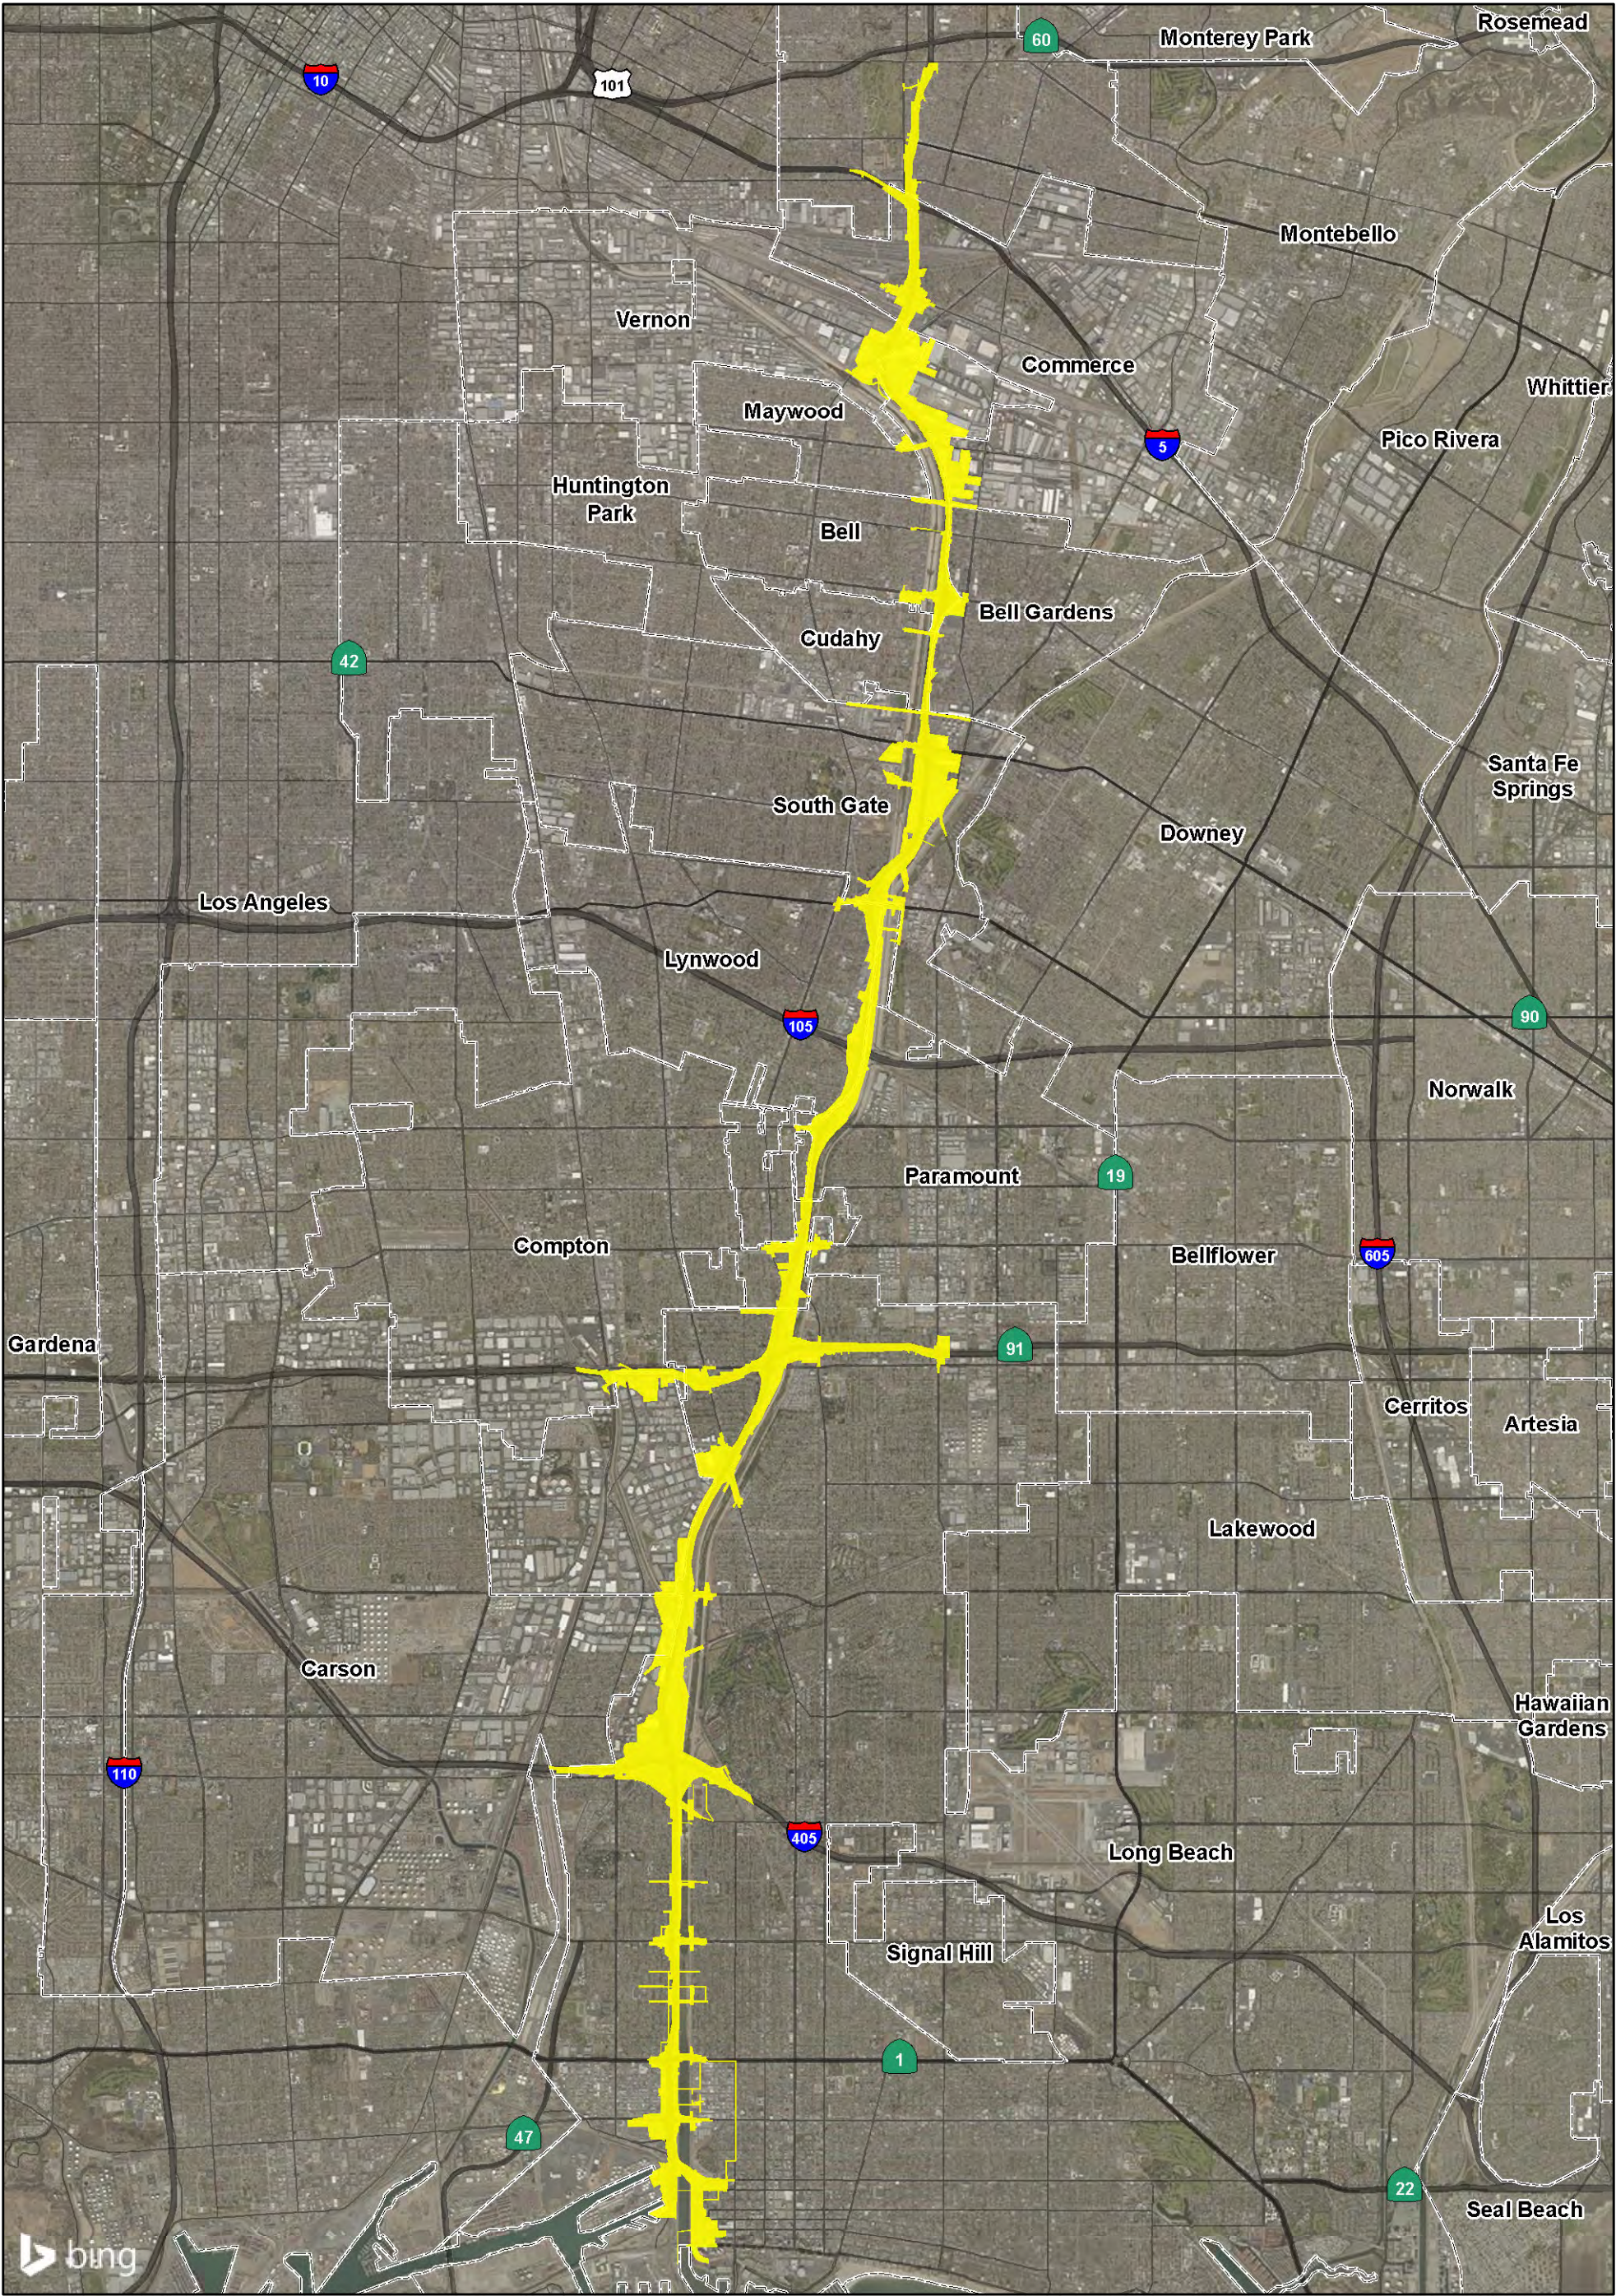

The Area of Potential Effects (APE) for the I-710 Corridor Project defines the geographic area within which the build alternatives have the potential to directly or indirectly affect historic properties, if such properties are present. The original APE for the I-710 Corridor Project build alternatives was finalized and signed on December 20, 2011, and included in the 2012 Draft Environmental Impact Report/Environmental Impact Statement (EIR/EIS). Subsequent to public circulation of the 2012 Draft EIR/EIS and in response to new information and comments received from the public, a revised set of build alternatives was developed. These revised build alternatives extend beyond the limits of the 2011 APE in numerous locations.

The 2011 APE contained approximately 2,558 acres along and adjacent to the I-710 Corridor and along arterial intersections located various distances from I-710; the areas of the new Supplemental APE encompass an additional 509 acres that were not included in the 2011 APE. Also relative to the 2011 APE, the Supplemental APE has been reduced in areas that would no longer be affected by the build alternatives. The Supplemental APE was delineated based on the combined maximum disturbance limits anticipated for both Alternative 5C and Alternative 7. Figure 3.7-3 presents the Supplemental APE boundary.

In general, delineation of the APE is influenced by the scale and nature of a proposed undertaking and may be different for different kinds of effects. The Supplemental APE, signed by Caltrans on April 13, 2017, was delineated to include all resources that could potentially be directly or indirectly affected by the revised set of build alternatives. This includes both built environment resources and archaeological resources, as discussed in both the Supplemental HRER and the Supplemental ASR. The direct area of potential effects (Direct APE) includes the areas where physical impacts would occur from the build alternatives and is based on the horizontal and vertical extents of anticipated ground-disturbing activities, including permanent and temporary impacts associated with the build alternatives. These are generally limited to the proposed and existing right-of-way, as well as areas where utilities would be relocated, and include the horizontal and vertical limits. Under the build alternatives, the vertical APE would range from 0–15 feet in depth for roadway grading and drainage; from 5–25 feet in depth for retaining walls (with piles); from 25–75 feet in depth for freeway structures piles; and from 30–120 feet in depth for freight corridor viaduct piles. As of April 2017, the build alternatives were at 30 percent design and, for any build alternative, the vertical APE would be further defined at a higher level of design completion (i.e., at 65 percent and 95 percent design completion).

The areas of indirect effects related to the build alternatives would extend beyond the Direct APE and would incorporate the area that may be indirectly affected by visual, audible, or atmospheric intrusions, shadow effects, vibrations from construction activities, or changes in access or use. The areas of indirect effects generally include all properties that are adjacent to the proposed right-of-way of the build alternatives unless they are undeveloped.

This page intentionally left blank

In most cases, the Supplemental APE includes only the properties that are adjacent to the proposed right-of-way and/or temporary construction easements (TCEs) of the build alternatives; however, additional parcels have been included where there are proposed new bridges, bridges that are being widened or replaced, or construction of new elevated features such as ramps and the freight corridor in Alternative 7. Exceptions include properties that are buffered by topographic features, large parking and/or landscaped areas, or buildings on other properties. The Supplemental APE extends around the entirety of those parcels where the built environment would be indirectly affected by the build alternatives.

3.7.2.3 RECORDS SEARCH

In May of 2009, in July, September, and October of 2011, and in December 2015, records searches were conducted at the South Central Coastal Information Center (SCCIC) of the California Historical Resources Information System, located at California State University, Fullerton. In addition to reviewing records pertaining to archaeological and historical sites and previously completed cultural resource studies, the following historical resource inventories were reviewed:

- National Register of Historic Places
- California Register of Historical Resources
- California Historic Resources Inventory
- California Points of Historical Interest
- Caltrans Historic Bridge Inventory—State Agency Bridges
- City of Los Angeles Historic-Cultural Monuments

The records searches identified 82 cultural resources studies previously conducted within a 0.125-mile radius of the build alternatives. Of these studies, 32 included portions of the Supplemental APE. These prior investigations were primarily archaeology-related studies. The original and supplemental records searches revealed that there were no archaeological resources in the original 2012 APE, and likewise there are none in the revised boundaries of the 2017 Supplemental APE.

A total of eight built environment resources (Primary Nos. 19-150348, 19-178699, 19-186110/30-176630, 19-186112, 19-186744, 19-186804, 19-187753, and 19-187942) obtained from the records search, and one built resource (Boulder Dam-Los Angeles 287.5-kilovolt Transmission Line, No. 19-188983) obtained from Caltrans District 7 staff, have been recorded within a 0.125-mile radius of the build alternatives. One historic resource, the Drake Park National Register-eligible Historic District, was obtained from the City of Long Beach records. Of these built environment resources, five are located within the Supplemental APE. These five built environment resources include a segment of the UP Railroad in Los Angeles and Orange

Counties (Primary No. 19-186110/30-176630); a segment of the UP Railroad) (Primary No. 19-186112) in Los Angeles, Riverside, and San Bernardino Counties; Boulder Dam-Los Angeles 287.5-kilovolt Transmission Line (Primary No. 19-188983); a segment of the Burlington Northern/Santa Fe (BNSF) Railroad (Primary No. 19-186804); and the Drake Park National Register-eligible Historic District. However, the BNSF Railroad segment has been previously evaluated as ineligible for inclusion on the National Register and thus is not discussed further in this Final EIR/EIS. In addition to the SCCIC records searches, general research was conducted at public libraries and city building departments throughout the Study Area, but research did not identify additional historical built resources or sites. A list of the Caltrans Historic Bridge Inventory highlighting bridges within the Supplemental APE is included as an appendix to the Supplemental HPSR (2017).

To further facilitate the identification of cultural resources, local historical societies and local governments were identified and invited to participate in the Section 106 process in accordance with 36 CFR §800.3(f)(1). Initially, in September 2009, letters were sent to the consulting parties and other individuals and organizations likely to have knowledge of or concerns regarding historic properties in the area. The purpose of the letter was to seek information and identify any issues related to the undertaking's (the build alternatives) potential effects on historic properties as part of the process of identifying historic properties (36 CFR §800.4 (a)(3)). Property-specific research was conducted at a number of Building and Safety Departments for cities within the Supplemental APE on various dates from February through September 2009, and in December 2009, June 2011, July 2011, September 2011, and April 2016. For detailed information on the property-specific research, refer to the Supplemental HPSR (2017).

GOVERNMENT AGENCY/HISTORIC GROUPS CONSULTATION. Supplemental consultation was conducted with the groups and individuals listed below, which were first contacted on September 30, 2009. Comments received regarding the 2009 outreach are summarized in the 2012 I-710 Corridor Project Draft EIR/EIS. On March 4, 2016, a second letter was sent informing the recipients of the preparation of this supplemental analysis, and inviting additional comments (see the Supplemental HPSR [2017], Attachment F: Historical Consultation, for copies of correspondence). No additional comments were received in response to this supplemental consultation. Following is a list of organizations contacted during the supplemental consultation in 2016:

- Clifford Graves, Interim Director, City of Bell, Community Development Department
6330 Pine Ave., Bell, CA 90201
- Carmen Morales, Interim Community Development Director, City of Bell Gardens,
Community Development and Planning Division
7100 Garfield Ave., Bell Gardens, CA 90201

- Saied Naaseh, Planning Manager, City of Carson, Planning Division
701 Carson St., Carson, CA 90745
- Matt Marquez, Deputy Director of Development Services, City of Commerce,
Planning Division
2535 Commerce Way, Commerce, CA 90040
- Jonathan Colin, Director of Development Services, City of Lynwood, Development
Services Department
11330 Bullis Rd., Lynwood, CA 90262
- Michael A. Huntley, Community and Economic Development Director, City of Monterey
Park, Planning Division
320 Newmark Ave., Monterey Park, CA 91754
- Joe Perez, Community Development Director, City of Paramount, Community
Development
16400 Colorado Ave., Paramount, CA 90723
- Alvie Betancourt, Senior Planner, City of South Gate, Planning Division
8650 California Ave., South Gate, CA 90280
- Richard Bruckner, Director of Regional Planning, County of Los Angeles, Regional
Planning Department
320 W. Temple St., 13th Floor, Los Angeles, CA 90012
- Linda Tatum, Planning Bureau Manager, City of Long Beach, Planning Bureau
333 Ocean Blvd., 4th Floor, Long Beach, CA 90802
- Julie Bartolotto, Executive Director, Historical Society of Long Beach
4260 Atlantic Ave., Long Beach, CA 90807
- Historical Society of Monterey Park
781 Orange Ave., Monterey Park, CA 91754
- Mary Kay Nottage, Executive Director, Long Beach Heritage
Post Office Box 92521, Long Beach, CA 90809
- Adrian Scott Fine, Director of Advocacy, Los Angeles Conservancy
523 6th St., Ste. 826, Los Angeles, CA 90014
- Marta Solano, City of Bell Gardens, Cultural Heritage Board
7100 Garfield Ave., Bell Gardens, CA 90201
- Sergio Canales, Planning Assistant, City of Vernon, Community Services Planning
Division
4305 Santa Fe Ave., Vernon, CA 90058

- Robert Delgadillo, Planning Manager, City of Compton, Community Development Department
205 S. Willowbrook Ave., Compton, CA 90220
- Bellflower Heritage Society
16601 Civic Center Dr., Bellflower, CA 90706
- Harry Panagiotis, City of Monterey Park, Historic Heritage Commission
320 W. Newmark Ave., Monterey Park, CA 91754
- Historical Society of Southern California
Post Office Box 93487, Pasadena, CA 91120

On September 13 and 14, 2018, Caprice “Kip” Harper, Caltrans PQS, sent an email to the U.S. Army Corps of Engineers (USACE) to discuss the assumption of eligibility of the Los Angeles River Flood Control Channel and to inquire about the USACE’s level of interest in being a signatory to the project-level PA for the build alternatives. The USACE has been included as a signatory to the project-level PA for the build alternatives.

On October 16, 2018, Ms. Harper and Danielle Storey, USACE Archaeologist (Los Angeles District) discussed the build alternatives via telephone. It was established that Ms. Storey would serve as the USACE contact for the project, and she had previously worked on a USACE proposal to conduct a Feasibility Study to develop a historic context for a portion of the Los Angeles River Flood Control Channel from which to evaluate it for eligibility for listing in the National Register, and to determine the features that would contribute to its significance (if any). The feasibility study is for an 11-mile segment near downtown Los Angeles and is currently not funded. Ms. Storey indicated that USACE considers the river channel and engineering structure as a “living entity” and changes are made to it on an as-needed basis to ensure it remains functional.

On October 19, 2018, Ms. Harper transmitted Ms. Storey the following documents, via email:

- Second Supplemental HPSR (September 2018), which assumes eligibility of the Los Angeles River Flood Control Channel, for the purposes of the build alternatives associated with this project only, pursuant to the Section 106 Programmatic Agreement
- Supplemental FOE (October 2018) and attachments
- Draft Project-level PA for the build alternatives and attachments

On November 1, 2018, Ms. Harper emailed Ms. Storey to schedule a day for discussing the project; however, Ms. Storey indicated that her necessary labor codes were not yet established, and she would reach out when she was able to schedule a date. Ms. Harper sent a revised Project-level Programmatic Agreement for the build alternatives and attachments to Ms. Storey on February 11, 2019. Ms. Harper also indicated that USACE should return comments by

February 25, 2019, and that if no comments were received that Caltrans would assume USACE had no objections to the documentation. No comments from USACE were received.

3.7.2.4 SURVEY METHODS

ARCHITECTURAL SURVEY METHODS. Field visits were conducted to identify buildings and/or structures located within the APE that are older than 45 years of age that would require evaluation for historical significance. The general threshold to require evaluation is 50 years of age; however, in anticipation of buildings or structures turning 50 years of age before completion of the build alternatives (for any build alternative), buildings or structures that were 45 years of age at the time of the survey were considered.

Fieldwork was conducted between December 2008 and January 2012 as part of the original analysis to inform the historical context and identify properties requiring evaluation for historical significance. Additional fieldwork was conducted in March and April 2016, and additionally in January and March 2017, to identify properties in the Supplemental APE that would need to be evaluated for the build alternatives.

Within the 2012 APE, a total of 201 properties were identified that required evaluation as part of the original 2012 HRER, which was reviewed and signed by Caltrans on May 1, 2012, and concurred by the SHPO on June 18, 2012. Photographs and notes were taken for each building identified within the APE. Notes from visual observations were taken in the field, and documentary photographs were later used for developing the State of California Department of Parks and Recreation Series 523 forms (DPRs) for those buildings requiring evaluation.

Additional fieldwork for the supplemental analysis of the build alternatives was conducted using the same methods as the prior effort, described above. The focus of the field visits was to identify properties in the new areas added to the Supplemental APE which would require evaluation and those that were not evaluated in the original 2012 HRER because they were not yet 45 years of age or older. Within the Supplemental APE, a total of 39 additional properties were identified that required evaluation for the build alternatives.

ARCHAEOLOGICAL SURVEY METHODS. An archaeological field survey was conducted for areas within the Supplemental APE that contained possibly intact visible ground surface and were within the maximum limits of direct impacts for all build alternatives. The survey area specific to archaeological resources within the Supplemental APE is approximately 27.6 acres and consists of all areas that are subject to being directly affected by the undertaking (the build alternatives) and that contain possibly intact visible ground surface. This includes utility corridors, road shoulders, parkland, and flood control basins. Between August 2015 and January 2016, these areas of visible ground surface were systematically examined by walking parallel transects at maximum 30-foot intervals. No archaeological resources were identified within or adjacent to the Supplemental APE. The archaeological survey area has been extensively disturbed by

construction of existing freeways and roads, railroads, urban development, and other infrastructure; river channelization; hydrologic events; and agriculture. Areas containing bare ground that could be systematically surveyed were limited to the Southern California Edison (SCE) and the Los Angeles County Department of Water and Power (DWP) power line corridors, the Los Angeles County Flood Control District property adjacent to the Los Angeles River, and a limited number of vacant or minimally developed individual parcels.

Additionally, the Archaeological Sensitivity Study (2017) was conducted to identify areas with a higher potential occurrence of prehistoric and historic archaeological resources within the original and Supplemental APEs. This study incorporated data from pedestrian surveys of accessible, undeveloped portions of the Supplemental APE; a review of historical maps and aerial photos; literature research; and a “proximity analysis.” The proximity analysis was conducted using a Geographic Information System (GIS) and used four data layers: elevation highpoints, the historic alignments of the Los Angeles River, the locations of ethnohistoric villages, and the locations of previously recorded cultural resources identified by SCCIC records searches. Additionally, Sanborn Fire Insurance maps were reviewed. While in no way exhaustive, the comparison of these spatial data sets assisted in identifying areas of potential archaeological sensitivity. Based on these potentially sensitive areas, specific recommendations were made for any build alternative regarding monitoring for archaeological resources within the Supplemental APE. Results of the Archaeological Sensitivity Study (2017) are discussed in further detail in Section 3.7.2.5, Results.

NATIVE AMERICAN CONSULTATION. Consultation with the Native American Heritage Commission and Native American community representatives has been ongoing since 2008. In August 2008, a letter was sent to the Native American Heritage Commission (NAHC) requesting a search of the Sacred Lands File (SLF) in order to identify areas of religious or cultural significance to Native Americans. The NAHC responded on August 5, 2008, to say that the SLF search indicated the presence of Native American cultural resources within the Study Area. Specifically, the NAHC stated that resources are present in the *South Gate, Whittier, and Torrance, California*, United States Geological Survey (USGS) quadrangle areas of the I-710 Corridor Project build alternatives.

After continued consultation between 2009 and 2011, the design of the build alternatives was updated to include arterial intersections that would be modified for the build alternatives, and they were subsequently included in the APE. A new request was sent to the NAHC in July 2011, and a revised SLF search was completed indicating the presence of cultural resources. Both the NAHC and Caltrans suggested appropriate contacts, and as a result, the following 13 Native American representatives were contacted in January 2016:

- City of Los Angeles/County of Los Angeles Native American Indian Community, Ron Andrade, Director

- Gabrielino Tongva Nation, Sam Dunlap, Chairperson
- Ti'At Society/Inter-Tribal Council of Pimu, Cindi Alvitre, Chairwoman-Manisar
- Gabrielino Tongva Indians of California Tribal Council, Robert Dorame, Tribal Chair/Cultural Resources
- Tongva Ancestral Territorial Tribal Nation, John Tommy Rosas, Tribal Administrator
- Gabrielino-Tongva Tribe, Bernie Acuna
- Gabrieleno/Tongva San Gabriel Band of Mission Indians, Anthony Morales, Chairperson
- Gabrielino-Tongva Tribe, Linda Candelaria, Chairwoman
- Gabrieleño Band of Mission Indians Kizh Nation, Andrew Salas, Chairperson
- Gabrieleno/Tongva San Gabriel Band of Mission Indians, Adrian Morales, Cultural Resources Management
- Pechanga Band of Luiseño Indians, Mark Macarro, Chairman
- Pechanga Band of Luiseño Indians, Anna Hoover, Pechanga Cultural Resources Center
- Soboba Band of Luiseño Indians, Joseph Ontiveros, Cultural Resource Director

On January 28, 2016, letters were sent to the Native American contacts describing the build alternatives and requesting comment. As a result of the letters, three initial responses were received.

- John Tommy Rosas, Tongva Ancestral Territorial Tribal Nation, responded by email on January 28, 2016, to say that he would review the information and respond soon. Follow-up emails were sent to Mr. Rosas on February 19 and March 3, 2016. On March 3, 2016, Mr. Rosas requested information regarding the “excavation areas” and “cubic yards.” He also stated that his group would like to monitor regardless. On May 4, 2016, an email was sent to Mr. Rosas stating that the information on excavation areas and cubic yards for the build alternatives was not available at that time. No additional comments have been received.
- Anthony Morales, Gabrieleno/Tongva San Gabriel Band of Mission Indians, responded by telephone on February 18, 2016, to state that areas in the vicinity of the Los Angeles River are very sensitive for cultural resources as there were prehistoric villages present along its banks. He recommends monitoring throughout the construction of either build alternative by a Native American monitor from his group.
- Andrew Salas, Gabrieleño Band of Mission Indians Kizh Nation, responded by letter to state that at one time there were hundreds of prehistoric settlements along the entire route of the build alternatives that have never been documented. The entire route of the build alternatives run directly alongside what was once the main water resource for the Gabrieleño people, as well as a traditional trading route. Based on the map of the build

alternatives provided in the consultation letters, Mr. Salas believes it to be evident that the build alternatives not only run directly alongside the river (Wenot) but run through traditional Gabrieleño villages. This area was highly utilized by his ancestors and is considered highly sensitive. Therefore, he would like to request that one of his Tribal monitors be on site for the build alternatives, as well as archaeological monitors, during all ground disturbance (including, but not limited to, pavement removal, pot-holing or auguring, boring, grading, excavation, and trenching) for any build alternative.

Follow-up emails were sent to the remaining Native American individuals on February 19, 2016, and March 3, 2016, with the exception of Ron Andrade, who defers to Anthony Morales, and Mark Macarro, whose spokesperson for the Pechanga Tribe is Anna Hoover. As a result, three additional responses were received.

- Adrian Morales, Gabrieleno/Tongva San Gabriel Band of Mission Indians, responded by email on March 8, 2016, to request the status of the cultural resources report, and the PA. This information was provided to him on May 5, 2016. No additional comments have been received.
- Anna Hoover, Pechanga Band of Luiseño Indians, stated in an email on March 3, 2016, that the build alternatives are outside the Tribe's traditional territory. They would defer to closer tribes.
- Joseph Ontiveros, Soboba Band of Luiseño Indians, stated in a letter dated February 25, 2016, that while the build alternatives do fall within the bounds of their Tribal Traditional Use Areas, they do not have specific concerns at this time. They request that appropriate consultation continue to take place. In addition, because the build alternatives are in a Traditional Use Area and there is the possibility of encountering cultural resources, they request monitoring by a qualified Native American Monitor during all ground-disturbing activities, for any build alternative, and recommend Gabrieleño Tribal Consultants who are closer to the project area of the build alternatives.

No responses were received from Sam Dunlap, Gabrielino Tongva Nation; Cindi Alvitre, Ti'At Society/Inter-Tribal Council of Pimu; Robert Dorame, Gabrielino Tongva Indians of California Tribal Council; Bernie Acuna, Gabrielino-Tongva Tribe; or Linda Candelaria, Gabrielino-Tongva Tribe.

The following consultation activities took place in 2017:

- Tongva Ancestral Territorial Tribal Nation, John Tommy Rosas, Tribal Administration; Mr. Rosas was provided the Archaeological Survey Report and Archaeological Sensitivity Study in April 2017.

- Gabrielino/Tongva San Gabriel Band of Mission Indians, Anthony Morales, Chairperson; Mr. Morales was provided the Archaeological Survey Report and Archaeological Sensitivity Study in April 2017.
- Gabrielino/Tongva San Gabriel Band of Mission Indians, Adrian Morales, Cultural Resources Management; Mr. Morales was provided the Archaeological Survey Report and Archaeological Sensitivity Study in April 2017.
- Gabrieleño Band of Mission Indians Kizh Nation, Andrew Salas, Chairperson; Mr. Salas was contacted to confirm his continued interest in consultation.

The following consultation activities took place in 2018:

- Tongva Ancestral Territorial Tribal Nation, John Tommy Rosas, Tribal Administration; Mr. Rosas was provided the Draft PA for review on August 13, 2018, and provided his signature on the Draft PA also on August 13, 2018.
- Gabrielino/Tongva San Gabriel Band of Mission Indians, Anthony Morales, Chairperson; Mr. Morales was provided the Draft PA on August 13, 2018.
- Gabrieleño Band of Mission Indians Kizh Nation, Andrew Salas, Chairperson; Mr. Salas was reached via phone following failed email attempts. The Archaeological Survey Report, Archaeological Sensitivity Study, and Draft PA were provided to Mr. Salas for review and comment on August 13, 2018. Additional copies of the Archaeological Survey Report, Archaeological Sensitivity Study, and Draft PA were mailed, per request, on October 8, 2018. Mr. Salas responded via written letter on October 17, 2018, and indicated that he would like to consult on the I-710 Corridor Project and that the Tribe would provide “information, including but not limited to ethnography notes, maps, and oral history.” Also, per Mr. Salas’ request, a telephone meeting was held on November 9, 2018. The telephone conversation confirmed interest in the project by the Gabrieleño Band of Mission Indians; Caltrans staff offered to meet Mr. Salas on site to conduct a field review of the APE. Caltrans provided a hard copy of the PA and copies of the Archaeological Sensitivity Study to Mr. Salas during a field visit for another project on November 13, 2018. On November 14 and 26, 2018, Caltrans staff sent an email reminder to Mr. Salas about scheduling a field review for the I-710 Corridor Project build alternatives. On behalf of Mr. Salas, on November 26, 2018, Ms. Brandy Salas responded that Mr. Salas was not in the office, but she would have him respond as soon as possible. No other response from the Tribe has been received.

The following consultation activities took place in 2019:

- Tongva Ancestral Territorial Tribal Nation, John Tommy Rosas, Tribal Administration; The Cultural Studies Office (CSO)-approved Draft PA with attachments was forwarded to Mr. Rosas on February 21, 2019, for his signature. Mr. Rosas has already received the

documents via email previously, and has signed a previous version of the draft PA. The CSO-approved Draft PA only has minor changes to it from the previous draft PA that was sent to Mr. Rosas.

- Gabrielino/Tongva San Gabriel Band of Mission Indians, Anthony Morales, Chairperson; The CSO-approved Draft PA with attachments was forwarded to Mr. Anthony Morales on February 21, 2019, for his signature. Mr. Anthony Morales has already received hard copies of a previous draft PA. The CSO-approved Draft PA only has minor changes to it from the previous draft PA that was sent to Mr. Anthony Morales.
- Gabrieleño Band of Mission Indians Kizh Nation, Andrew Salas, Chairperson; The CSO-approved Draft PA with attachments was forwarded to Mr. Salas on February 21, 2019, for his signature. He has already previously received draft hard copies of the Draft PA, ASR, and Archaeological Sensitivity Study. The CSO-approved Draft PA only has minor changes to it from the previous draft PA that was sent to Mr. Salas.

Additional details of the Native American consultation, including letters and emails sent and received as part of the consultation process, are summarized in Chapter 5.0, Comments and Coordination, and in the Supplemental ASR (2017). Consultation was ongoing with three individuals/tribes who have expressed interest in the dissemination of the I-710 Corridor Project Supplemental ASR (2017) and the Archaeological Sensitivity Study (2017). However, as the No Build (Alternative 1) has been identified as the Preferred Alternative, Caltrans will no longer continue consultation with the Native American tribes for the I-710 Corridor Project.

3.7.2.5 RESULTS

The intent of the records searches, outreach efforts, and field studies described above was to identify archaeological and built environment cultural resources that may be eligible for listing in the National Register. In total, there were 201 built environment properties over 45 years old within the original APE and an additional 39 built environment properties identified within the Supplemental APE that required evaluations for potential historic significance. However, only five built environment properties were identified as eligible for listing in the National Register within the Supplemental APE. For detailed information on resources found ineligible for inclusion on the National Register, refer to the Supplemental HRER (2017). No prehistoric or historic archaeological resources requiring evaluation were identified through archival research, Native American consultation, or the field survey within the Supplemental APE. Table 3.7-1 lists the eligible historic properties within the Supplemental APE for the I-710 Corridor Project. The SHPO concurred with these determinations of eligibility in a letter dated June 1, 2017.

Table 3.7-1: Known Historic Properties Within the Supplemental APE

| Resource | Status |
|---|---|
| Built environment resource: UP Railroad (formerly Southern Pacific Railroad) Segment in Los Angeles and Orange Counties (Primary No. 19-186110/30-176630). Two portions of this historic property intersect I-710: south of Patata St. and south of Frontage Rd., both in the City of South Gate. | This resource was evaluated as eligible for the National Register under Criteria A and B in 1999, and is therefore, a historic property per Section 106. It is also a historical resource per CEQA. |
| Built environment resource: UP Railroad in Los Angeles, Riverside, and San Bernardino Counties from Los Angeles to Wilmington (Primary No. 19-186112). One portion intersects the I-710: south of Noakes St. in the City of Commerce. | As assigned by FHWA, Caltrans determined this resource is eligible for the National Register under Criteria A and B in 1999, and is, therefore, a historic property per Section 106. It is also a historical resource per CEQA. |
| Built environment resource: Dale's Donuts, Compton | Caltrans evaluated this resource as eligible for the National Register under Criterion C at the local level of significance in 2009, and the SHPO directed Caltrans to assume this property eligible for the purposes of this undertaking only in 2012. This is a historic property per Section 106 and a historical resource per CEQA. |
| Built environment resource: Boulder Dam-Los Angeles 287.5-kilovolt Transmission Line (Primary No. 19-188983) | This resource was evaluated as eligible for the National Register under Criteria A and C by the BLM in 1999, and the SHPO formally concurred in 2000. This is a historic property per Section 106 and a historical resource per CEQA. |
| Built environment resource: Drake Park Historic District | The Drake Park Historic District was determined eligible for the National Register in 1987 under Criteria A and C at the local level. It had been previously designated as a local "historic landmark district" by the City of Long Beach in 1980, and expanded in 1982. In 1998, Long Beach combined the Drake Park Historic Landmark District with nearby Willmore City Historic Landmark District to form a new, larger local district called the Drake Park/Willmore City Historic Landmark District. Only the smaller Drake Park Historic District sub-area within the larger Drake Park/Willmore City local Historic Landmark District is eligible for the National Register. |
| Built environment resource: Los Angeles River Flood Control Channel | This resource is assumed eligible for the National Register for the purposes of the build alternatives for this project only. The portion of the Los Angeles River Flood Control Channel within the APE comprises multiple discontinuous locations between Slauson Ave. in the City of Bell and Ocean Ave. in the City of Long Beach. |

SHPO = State Historic Preservation Officer

UP Railroad = Union Pacific Railroad

Two UP Railroad segments (Primary Nos. 19-186110/30-176630 and 19-186112) were constructed in the 1870s and previously identified as eligible for the National Register under Criteria A and B in 1999. These portions of the UP Railroad are additions to the first transcontinental railroad and were instrumental in the development of Los Angeles and Southern California in general. The UP Railroad is also associated with important historical figures including the “Big Four” railroad tycoons: Mark Hopkins, Collis P. Huntington, Leland Stanford, and Charles Crocker.

Dale’s Donuts was determined by Caltrans to be eligible for listing in the National Register in the context of architecture. Caltrans submitted a letter dated March 1, 2012, to the SHPO transmitting the original Historic Property Survey Report and requesting concurrence on the determinations of eligibility. In a letter dated June 18, 2013, the SHPO concurred with the finding of ineligibility for 200 properties in the APE and directed Caltrans to assume the Dale’s Donuts property eligible for the purposes of this undertaking (the build alternatives) only. Caltrans’ correspondence with the SHPO is provided in Appendix J, Comments and Coordination, of this document, as well as in the 2012 I-710 Corridor Project Draft EIR/EIS. It is significant at the local level under Criterion C as a rare example of Programmatic Architecture. Constructed in 1955, the building was one of ten locations in the now-defunct Big Donut Drive-In chain founded by Russell C. Wendell, a donut machine salesman. He hired architect Henry J. Goodwin to design the prototype for the stores, only four of which are extant. The other remaining buildings are located in Inglewood, Gardena, and Bellflower.

The Boulder Dam-Los Angeles 287.5-kilovolt Transmission Line (Primary No. 19-188983), constructed in 1935-1936, is significant under Criterion A for its association with the construction of Hoover Dam, a National Historic Landmark, and the industrial, economic, and urban development that occurred in metropolitan Los Angeles from the mid-1930s through the 1940s. It is also significant under Criterion C for its unique engineering and structural characteristics within the context of development of point-to-point high voltage power transmission in California. SHPO concurrence was received in 2000.

The Drake Park Historic District was determined eligible for the National Register in 1987 under Criteria A and C at the local level. It had been previously designated as a local “historic landmark district” by the City of Long Beach in 1980, and expanded in 1982. In 1998, Long Beach combined the Drake Park Historic Landmark District with nearby Willmore City Historic Landmark District to form a new, larger local district called the Drake Park/Willmore City Historic Landmark District. Only the smaller Drake Park Historic District sub-area within the larger Drake Park/Willmore City Historic Landmark District is eligible for the National Register.

A second Supplemental HPSR (August 2018) for the revised build alternatives was prepared to document the assumption of eligibility of the Los Angeles River Flood Control Channel for the National Register. The portion of the Los Angeles River Flood Control Channel within the APE comprises multiple discontinuous locations of an approximately 15-mile segment between Slauson Ave. in the City of Bell and Ocean Ave. in the City of Long Beach. The subject segment of the Los Angeles River Flood Control Channel, including its confluences with Rio Hondo and Compton Creek, is presumed eligible for the National Register for the purposes of the build alternatives for this project only as a contributor to a potential district that may be significant under Criterion A, for its association with flood control in the greater Los Angeles region and its role in the development of river-adjacent areas, as well as Criterion C, representing a significant and distinguishable entity whose components may lack individual distinction.

No additional properties that were identified and evaluated within the Supplemental APE for this analysis meet the criteria for inclusion in the National Register and/or the California Register. Therefore, there are five resources in the Supplemental APE eligible for inclusion in the National Register. These five National Register-eligible resources and one assumed eligible resource are also considered historical resources for the purposes of CEQA.

No archaeological resources requiring evaluation were identified in the original APE or Supplemental APE through archival research, Native American consultation, or the field survey. In general, the original APE and the Supplemental APE have been extensively disturbed by construction of the existing freeways and roads, railroads, urban development, and other infrastructure; river channelization; hydrologic events; and agriculture. The area of direct effects (Direct APE) is considered to have very low sensitivity for the presence of buried archaeological resources within existing freeway rights-of-way as any construction activities associated with the build alternatives would likely be limited to within the existing engineered fill. If any deep excavations would occur within the rights-of-way, there would be the potential to encounter undisturbed sediments that may contain archaeological resources.

ARCHAEOLOGICAL SENSITIVITY STUDY. An Archaeological Sensitivity Study (2017) was prepared subsequent to the archaeological survey study. For the Archaeological Sensitivity Study, a proximity analysis was conducted using a Geographic Information System (GIS) and used four data layers: elevation highpoints, the historic alignments of the Los Angeles River, the locations of ethnohistoric villages, and the locations of previously recorded cultural resources identified by SCCIC records searches. Sanborn Fire Insurance Maps were also reviewed. As part of the Archaeological Sensitivity Study, settlement modeling reveals patterned human behavior and the repeated use over time of elevated landforms bordering the lower floodplain. High energy meanderings of the river channel will have erased a great deal of potential archaeological evidence. The Direct APE is considered to have very low sensitivity for the presence of buried archaeological resources within existing freeway rights-of-way (existing I-710 footprint) as any construction activities related to the build alternatives would likely be limited to within the existing

engineered fill. If any excavations were to occur related to the build alternatives within the Direct APE outside the existing freeway footprint (i.e., within the existing rights-of-way) or if deep excavations were to occur within the freeway footprint/existing rights-of-way, there would be the potential to encounter undisturbed sediments that may contain archaeological resources. In other words, excavations within native deposits below and/or outside the existing freeway alignment as part of freeway expansion of the build alternatives would have the potential to encounter archaeological resources. Pile driving and the construction of retaining walls within previously disturbed deposits associated with the build alternatives do not have the potential to encounter archaeological resources. The construction design plans for the build alternatives are currently at a 30 percent level of completion; therefore, specific construction details were unknown at the time this document was prepared. For any build alternative, further construction details would be refined at 65 and 95 percent design review. Once specific areas of impact associated with either build alternative would be defined at a 95 percent design review, areas of potential archaeological sensitivity could be reassessed.

The Archaeological Sensitivity Study categorizes areas within the Supplemental APE that are recommended for monitoring for archaeological resources during construction activities related to the build alternatives. Generally, construction monitoring related to the build alternatives is not recommended for portions of the Supplemental APE that are within the existing freeway alignment, fill deposits, historical marsh environments, or historical river bed settings. However, for any build alternative, construction monitoring would be warranted during ground-disturbing activities within previously undisturbed native deposits. The categorized areas are identified by post-mile markers along the I-710 corridor.

The Archaeological Sensitivity Study (2017) identifies three areas within the Supplemental APE that exhibit the possibility to contain previously unrecorded archaeological resources. For any build alternative, archaeological monitoring would be recommended for 94 acres (3.6 percent) of the Direct APE. Spot checking is recommended for 1,178 acres (45.4 percent) of the Direct APE, and no additional work is recommended for 1,321 acres (50.9 percent) of the Direct APE. The recommendation for spot checking is based on the potential observation of native (previously undisturbed) deposits. Observation during spot checking of previously disturbed and/or fill deposits would negate the continued need for spot checking in those areas. The recommendations are based on review of construction design data for the build alternatives that were at a 30 percent level of completion, as of February 2017. For any build alternative, a re-evaluation would be conducted in the future with availability of a higher level of completion of the construction design data and the vertical APE would be further refined. Caltrans anticipates that the 94 acres recommended for monitoring and the 1,178 acres for spot checking would be further reduced upon review at 65 percent and 95 percent design review. The 65 percent and 95 percent design review requirements are listed in the Environmental Commitment Record and would be added to project plans for the build alternatives.

In a letter dated June 1, 2017, the SHPO concurred with the Supplemental HPSR and found the analysis contained in the Archaeological Sensitivity Study to be sufficient. However, the SHPO concluded that Caltrans cannot fully determine how the undertaking (the build alternatives) may affect unknown historic properties in the Direct APE and advised Caltrans to move forward with a project-level Programmatic Agreement (project-level PA) for this undertaking (for any build alternative) to phase identification, evaluation, and findings of effect of unknown historic properties (pursuant to Stipulation XII.A of the Section 106 PA). Caltrans has developed a project-level PA for the build alternatives. The project-level PA for the build alternatives includes a Historic Properties Treatment Plan (HPTP) as an attachment. Invited signatories include the U.S. Army Corps of Engineers (USACE), Los Angeles District, and concurring parties include the Tongva Ancestral Territorial Tribal Nation, the Gabrielino/Tongva San Gabriel Band of Mission Indians, and the Gabrieleño Band of Mission Indians -Kizh Nation. The project-level PA for the build alternatives was executed between the Caltrans Department of Environmental Analysis (DEA) and SHPO on June 6, 2019.

3.7.3 ENVIRONMENTAL CONSEQUENCES

The following discussion of environmental consequences only describes the permanent impacts of the proposed project. Please refer to Section 3.24 of this document, Construction Impacts, for a discussion of the temporary impacts of the proposed project for each resource area. Specifically, temporary impacts related to cultural resources are located in Section 3.24.3.7.

3.7.3.1 PERMANENT IMPACTS

BUILD ALTERNATIVES. On September 20, 2012, the SHPO concurred on the finding of No Adverse Effect to the I UP Railroad Segments (identified as Primary Nos. 19-186110/30-176630 and 19-186112), Dale's Donuts, and the Boulder Dam-Los Angeles 287.5-kilovolt Transmission Line. There have been no changes to the Project Description for the build alternatives related to these four resources since that time; therefore, SHPO concurrence on the findings for these resources has not changed. However, the Supplemental APE includes two resources, the Drake Park Historic District and the Los Angeles River Channel, that were not discussed in the original 2012 studies. Additionally, a second portion of one of the UP Railroad segments (the segment identified as Primary No. 19-186110/30-176630) is within the Supplemental APE but was not discussed in the original 2012 studies. The build alternatives would have no effect on the additional portion of the UP Railroad Segment, as discussed in the Supplemental FOE (2018). Therefore, the SHPO concurrence on the finding of No Adverse Effect to the UP Railroad Segment has not changed from 2012. The build alternatives would have No Adverse Effect on the Drake Park Historic District and the Los Angeles River Channel. SHPO had no objection with the findings for the Drake Park Historic District and the Los Angeles River Channel on December 20, 2018. Overall, the build alternatives (undertaking) as a whole would have no adverse effect on historic properties under either Alternative 5C or Alternative 7, including Design Options.

ALTERNATIVE 5C. The UP Railroad (formerly Southern Pacific Railroad) Segment (identified as Primary No. 19-186110/30-176630) would be impacted by this alternative. A portion south of Patata St. in the City of South Gate, where the rail line crosses over the Los Angeles River and I-710, would be realigned 70 feet to the south and two bridges would be replaced. However, this segment of rail (including the extant bridge spanning the river) was previously replaced in 1938 due to the Los Angeles River flood. The extant bridge over the I-710 was built in 1957 when I-710 was constructed. Therefore, this segment of the rail line has already been altered and does not contribute to the significance of the UP Railroad. Further, this minor realignment would not impact the overall significance of the UP Railroad. A second portion, south of Frontage Rd. in the City of South Gate, which passes under I-710, would also be impacted by this alternative. The extant overpass, constructed in 1957, would be widened. However, this segment of the rail line was previously realigned between 1936 and 1942. Therefore, this segment of the rail line has been altered and does not contribute to the significance of the UP Railroad. Further, this minor change in setting would not impact the overall significance of the UP Railroad. Therefore, this alternative would not cause an adverse effect on the historical rail line because the rail line would continue to be eligible for the National Register. This alternative would result in a finding of No Adverse Effect per 36 CFR 800.5.

An additional UP Railroad (formerly Southern Pacific Railroad) Segment (identified as Primary No. 19-186112) would also be impacted by Alternative 5C. A portion south of Noakes St. in the City of Commerce passes under I-710. Under this alternative, the extant overpass constructed in 1957, would be widened, and new overpasses would be added. However, this segment of rail was constructed between 1940 and 1948, after the period of significance for the rail line, which is from 1869 to 1926. Therefore, this segment of the rail line is not original and does not contribute to the significance of the UP Railroad. Consequently, this alternative would result in a finding of No Adverse Effect per 36 CFR 800.5 for this resource. SHPO concurred on the findings for both UP Railroad Segments (Primary Nos. 19-186110/30-176630 and 19-186112) in 2012, and this finding has not changed.

Dale's Donuts would only be minimally affected by the arterial intersection improvements associated with Alternative 5C at the Atlantic Ave./Alondra Blvd. intersection. This alternative would incorporate 0.01 acre of land from the property, permanently removing a small section of parking area and sidewalk and moving back the sidewalk eight feet into the parcel. No changes would occur to the structure as a result of Alternative 5C. Therefore, the Programmatic Architectural features that qualify this resource for the National Register would not be affected. Alternative 5C would result in a finding of No Adverse Effect per 36 CFR 800.5 for this resource. SHPO concurred with this finding in 2012, and this finding has not changed.

The Boulder Dam-Los Angeles 287.5-kilovolt Transmission Line (Primary No. 19-188983) would not be impacted by Alternative 5C.

The Drake Park Historic District would not be adversely impacted by Alternative 5C. Under Alternative 5C, a temporary vehicular detour would be routed through the Historic District along Daisy Ave. between 7th and 9th Sts. In addition, 7th St. between Maine and Daisy Aves. would be modified from a one-way to a two-way street utilizing the existing right-of-way. This would require restriping of the roadway, and possibly the replacement of the concrete curb and sidewalk on the north side of the street, within the Historic District boundaries. For Alternative 5C the necessity of replacing the curb and sidewalk would be determined upon further development of construction design plans. If a replacement were needed, it would be in-kind to match the existing scored concrete sidewalk pattern. The vehicular detour would be a temporary condition and would not diminish the integrity of the District's significant historic features. In addition, the in-kind replacement of a segment of curb and sidewalk and restriping of vehicular lanes would not diminish the Historic District's integrity. As such, a finding of No Adverse Effect has been made for this resource per 36 CFR 800.5; SHPO had no objection with this finding in a letter dated December 20, 2018.

The Los Angeles River Flood Control Channel would not be adversely impacted by Alternative 5C. Levee modifications, including demolition and replacement, and new, extended, or replaced bridge bents/pier walls in channel would be part of Alternative 5C, but would not adversely affect the significance, integrity, or eligibility of the channel as a whole. Under Alternative 5C, where replacement is required, it would be in-kind to match the original condition. Therefore, a finding of No Adverse Effect has been made for this resource per 36 CFR 800.5; SHPO had no objection with this finding in a letter dated December 20, 2018.

ARCHAEOLOGICAL RESOURCES. The APE (original and supplemental) has been extensively disturbed by construction of the existing freeways and roads, railroads, urban development, and other infrastructure. Most of this disturbance occurred decades before archaeological sites were routinely and systematically recorded or there were laws and/or regulations to protect cultural resources. No archaeological resources requiring evaluation were identified through archival research, Native American consultation, or the field survey. However, there is the potential (albeit low) to encounter unanticipated archaeological resources during ground-disturbing activity associated with construction of Alternative 5C. Section 3.24, Construction Impacts, discusses impacts related to construction of Alternative 5C, and Measure CON-CUL-1 refers to mitigation measures related to unanticipated cultural resource discoveries during construction activity of the build alternatives. The Archaeological Sensitivity Study (2017) identifies three areas within the Supplemental APE that exhibit the possibility to contain previously unrecorded archaeological resources.

In a letter dated June 1, 2017, the SHPO concurred with the Supplemental HPSR and found the analysis contained in the Archaeological Sensitivity Study to be sufficient. However, the SHPO concluded that Caltrans cannot fully determine how the undertaking (the build alternatives) may affect unknown historic properties in the Direct APE and, for any build

alternative, advised Caltrans to move forward with a project-level PA for this undertaking (the build alternatives) to phase identification, evaluation, and findings of effect of unknown historic properties (pursuant to Stipulation XII.A of the Section 106 PA). Caltrans has developed the project-level PA for the build alternatives. An HPTP has been developed by a qualified archaeologist in consultation with the Caltrans PQS Principal Investigator-Prehistoric Archaeology and PQS Principal Investigator-Historic Archaeology to plan for the identification, evaluation, and treatment of archaeological resources should they be discovered during construction of either build alternative. The draft HPTP has been attached to the project-level PA for the build alternatives. Caltrans continued consultation with the SHPO on the preparation of the project-level PA for the build alternatives and the HPTP following the separate submittal of the Supplemental Finding of Effect (2018). SHPO responded regarding the Supplemental Finding of Effect in a letter dated December 20, 2018, stating the SHPO has no objection to Caltrans' finding that the proposed build alternatives would have no adverse effect on the Drake Park Historic District and the Los Angeles River Flood Control Channel. SHPO further stated that the office looks forward to working with Caltrans on the PA for this undertaking (the build alternatives). The project-level PA for the build alternatives was submitted to SHPO on March 1, 2019; it was executed between the Caltrans Division of Environmental Analysis (DEA) and SHPO on June 6, 2019.

Additionally, no indirect impacts that would alter the eligibility status of archaeological or built environment resources are anticipated as a result of Alternative 5C.

Therefore, overall, the undertaking (Alternative 5C) as a whole would have no adverse effect on historic properties.

ALTERNATIVE 7. The UP Railroad (formerly the Southern Pacific) Segment (identified as Primary No. 19-186110/30-176630) would be impacted by this alternative. Under Alternative 7, a portion south of Patata St. in the City of South Gate, where the rail line crosses over the Los Angeles River and I-710, would be realigned 70 feet to the south, and two bridges would be replaced. However, this segment of rail (including the extant bridge spanning the river) was previously replaced in 1938 due to the Los Angeles River flood. The extant bridge over I-710 was built in 1957 when I-710 was constructed. Therefore, this segment of the rail line has already been altered and does not contribute to the significance of the UP Railroad. Further, this minor realignment would not impact the overall significance of the UP Railroad. A second portion, south of Frontage Rd. in the City of South Gate, which passes under I-710, would be impacted by Alternative 7. A new overpass would be constructed southeast of the I-710 to carry the elevated freight corridor. However, this segment of the rail line was previously realigned between 1936 and 1942. Therefore, this segment of the rail line has been altered and does not contribute to the significance of the UP Railroad. Further, this minor change in setting would not impact the overall significance of the UP Railroad. Therefore, Alternative 7 would not cause an adverse effect on the historic rail line because the rail line would continue to be

eligible for the National Register. This alternative would result in a finding of No Adverse Effect per 36 CFR 800.5 for this resource.

An additional UP Railroad (formerly Southern Pacific Railroad) Segment (identified as Primary No. 19-186112) would also be impacted by the Alternative 7, a portion south of Noakes St. in the City of Commerce that passes under I-710. Under this alternative, the extant overpass, constructed in 1957, would be widened and new overpasses would be added. However, this segment of the rail line was constructed between 1940 and 1948, after the period of significance for the rail line, which is from 1869 to 1926. Therefore, this segment of the rail line is not original and does not contribute to the significance of the UP Railroad. Alternative 7 would result in a finding of No Adverse Effect per 36 CFR 800.5 for this resource. SHPO concurred on the findings for both UP Railroad Segments (identified as Primary Nos. 19-186110/30-176630 and 19-186112) in 2012, and this finding has not changed.

Dale's Donuts would only be minimally affected by the arterial intersection improvements at the Atlantic Ave./Alondra Blvd. intersection under Alternative 7. Alternative 7 would incorporate 0.01 acre of land from the property, which would permanently remove a small section of parking area and sidewalk and would move back the sidewalk eight feet into the parcel. No changes would occur to the structure as a result of Alternative 7. Therefore, the Programmatic Architectural features that qualify this resource for the National Register would not be affected. Alternative 7 would result in a finding of No Adverse Effect per 36 CFR 800.5 for this resource. SHPO concurred with this finding in 2012, and this finding has not changed.

In contrast to Alternative 5C, the Boulder Dam-Los Angeles 287.5-kilovolt Transmission Line (Primary No. 19-188983) would be impacted under Alternative 7 in that the towers on either side of the I-710 would be replaced and the transmission lines heightened by 55 feet to make room for construction of the elevated freight corridor. However, the integrity of the transmission line would not be reduced to the degree that it would no longer be eligible for the National Register. Therefore, Alternative 7 would result in a finding of No Adverse Effect per 36 CFR 800.5 for this resource. SHPO concurred with this finding in 2012, and this finding has not changed.

The Drake Park Historic District would not be adversely impacted by Alternative 7. Under Alternative 7, a temporary vehicular detour would be routed through the Historic District along Daisy Ave. between 7th and 9th Sts. In addition, under Alternative 7, 7th St. between Maine and Daisy Aves. is proposed to be modified from a one-way to a two-way street utilizing the existing right-of-way. This would require restriping of the roadway, and possibly the replacement of the concrete curb and sidewalk on the north side of the street, within the Historic District boundaries. Under Alternative 7, the necessity of replacing the curb and sidewalk would be determined upon further development of construction design plans. If replacement were needed, it would be in-kind to match the existing scored concrete sidewalk

pattern. The vehicular detour would be a temporary condition and would not diminish the integrity of the District's significant historic features. In addition, the in-kind replacement of a segment of curb and sidewalk and restriping of vehicular lanes would not diminish the Historic District's integrity. As such, a finding of No Adverse Effect has been made for this resource per 36 CFR 800.5; SHPO had no objection with this finding in a letter dated December 20, 2018.

The Los Angeles River Flood Control Channel would not be adversely impacted by Alternative 7. Alternative 7 would include levee modifications, including demolition and replacement, and new, extended, or replaced bridge bents/pier walls in channel, but would not adversely affect the significance, integrity, or eligibility of the channel as a whole. Under Alternative 7, where replacement would be required, it would be in-kind to match the original condition. Therefore, a finding of No Adverse Effect has been made for this resource per 36 CFR 800.5; SHPO had no objection with this finding in a letter dated December 20, 2018.

ARCHAEOLOGICAL RESOURCES. The APE (original and supplemental) has been extensively disturbed by construction of the existing freeways and roads, railroads, urban development, and other infrastructure. Most of this disturbance occurred decades before archaeological sites were routinely and systematically recorded or there were laws and/or regulations to protect cultural resources. No archaeological resources requiring evaluation were identified through archival research, Native American consultation, or the field survey. However, there is always the potential (albeit low) to encounter unanticipated archaeological resources during ground-disturbing activity associated with construction of either build alternative. Section 3.24, Construction Impacts, discusses impacts related to construction of this alternative and Measure CON-CUL-1 refers to mitigation measures related to unanticipated cultural resource discoveries during construction activity associated with the build alternatives. The Archaeological Sensitivity Study (2017) identifies three areas within the Supplemental APE that are more likely exhibit the possibility to contain previously unrecorded archaeological resources.

In a letter dated June 1, 2017, the SHPO concurred with the Supplemental HPSR and found the analysis contained in the Archaeological Sensitivity Study to be sufficient. However, the SHPO concluded that Caltrans cannot fully determine how the undertaking (the build alternatives) may affect unknown historic properties in the Direct APE and advised Caltrans to move forward with a project-level PA for this undertaking (the build alternatives), for any build alternative, to phase identification, evaluation, and findings of effect of unknown historic properties (pursuant to Stipulation XII.A of the Section 106 PA). As previously discussed under Alternative 5C, Caltrans has developed a project-level PA for the build alternatives that was submitted to SHPO on March 1, 2019. An HPTP has also been developed and is attached to the PA for the build alternatives. The PA for the build alternatives was executed between Caltrans DEA and SHPO on June 6, 2019.

Additionally, no indirect impacts that would alter the eligibility status of archaeological or built environment resources are anticipated as a result of Alternative 7. Therefore, overall, the undertaking (Alternative 7) as a whole would have no adverse effect on historic properties.

NO BUILD (ALTERNATIVE 1). No I-710 Corridor Project improvements would be constructed under the No Build (Alternative 1), which has been identified as the Preferred Alternative; therefore, no impacts to cultural resources would result from the No Build (Alternative 1).

3.7.3.2 SECTION 4(F) RESOURCES

As discussed earlier, five historic properties have been identified as potentially triggering the requirements for protection under Section 4(f). Please see Appendix B to this Final EIR/EIS for additional details.

UP RAILROAD (PRIMARY NOS. 19-186110/30-176630 AND 19-186112 [ELIGIBLE FOR LISTING IN THE NATIONAL REGISTER]). Alternatives 5C and 7 would require the minor realignment and replacement of two bridges in one segment of the rail line in the portion of Segment 19-186110/30-176630 south of Patata St. in the City of South Gate to accommodate lane additions and the modified freeway realignment. The minor realignment of those tracks would occur entirely within UP Railroad right-of-way, would not result in any change in the number of tracks at this location, and would not result in any modifications to the use of those tracks for rail operations. The extant tracks and bridges at this location are not original. Therefore, the proposed changes associated with the build alternatives would not alter any original features and the rail lines as a whole would continue to be eligible for the National Register. Alternative 5C would result in the widening of an existing overpass, and Alternative 7 would result in the construction of a new overpass in the portion of Segment 19-186110/30-176630 south of Frontage Rd. in the City of South Gate. The tracks at this location were previously altered and are not original. Therefore, the proposed changes associated with the build alternatives would not alter any original features and the rail line as a whole would continue to be eligible for the National Register. Under Alternatives 5C and 7, the extant overpass would be widened and new overpasses would be added in the portion of Segment 19-186112 south of Noakes St. in the City of Commerce. The tracks at this location were previously altered and are not original. Therefore, the proposed changes associated with the build alternatives would not alter any original features, and the rail line as a whole would continue to be eligible for the National Register.

Caltrans, as assigned by FHWA, concluded that the I-710 Corridor Project build alternatives would have No Adverse Effect, under Section 106 of the NHPA and 36 CFR 800.5, on the two UP Railroad Segments (identified as 19-186110/30-176630 and 19-186112). On September 20, 2012, the SHPO concurred on the finding of No Adverse Effect to the UP Railroad. There have been no changes to the Project Description for the build alternatives related to these two segments since the SHPO's previous concurrence. The portion of Segment 19-186110/30-176630 south of Frontage Rd. in the City of South Gate was not included in the prior studies;

however, the build alternatives would have no effect on this non-contributing portion, and the finding of No Adverse Effect to the UP Railroad has not changed. As a result, Caltrans has made a *de minimis* use determination under Section 4(f) for the effects related to the permanent acquisition of land from the UP Railroad Line for the build alternatives. SHPO did not comment on the *de minimis* use determination, and therefore SHPO concurrence is assumed as of May 1, 2019.

DALE’S DONUTS IN COMPTON (ELIGIBLE FOR LISTING IN THE NATIONAL REGISTER). Alternatives 5C and 7 would result in the permanent acquisition of 0.01 acre of land at the property occupied by Dale’s Donuts, but would not require any permanent or temporary easements at, or other temporary uses of, that property. The land needed for the build alternatives would include a curb and some parking, but would not affect the building, which is the feature of this property that qualifies it for the National Register. Therefore, this structure would continue to be eligible for the National Register.

Caltrans, as assigned by FHWA, has concluded that the I-710 Corridor Project build alternatives would have No Adverse Effect, under Section 106 of the NHPA and 36 CFR 800.5, on the National Register-eligible building known as Dale’s Donuts. On September 20, 2012, the SHPO concurred on the finding of No Adverse Effect for Dale’s Donuts. There have been no changes to the Project Description for the build alternatives related to this building since the SHPO’s previous concurrence. Therefore, Caltrans has made a *de minimis* use determination under Section 4(f) for the effects related to the permanent acquisition of land from Dale’s Donuts for the build alternatives. SHPO did not comment on the *de minimis* use determination, and therefore SHPO concurrence is assumed as of May 1, 2019.

BOULDER DAM-LOS ANGELES TRANSMISSION LINES (ELIGIBLE FOR LISTING IN THE NATIONAL REGISTER). Segments of the Boulder Dam-Los Angeles Transmission Lines (two parallel electrical transmission circuits carried on steel lattice towers) cross over I-710 in the Study Area. The transmission lines were constructed in 1935–1936 and were found to be eligible for the National Register in 2000 under Criteria A and C. Therefore, the property is subject to protection under the requirements of Section 4(f).

Alternative 5C would not result in a use of the historic transmission lines. However, Alternative 7 would result in permanent changes at the transmission lines as a result of modifying/replacing one tower on each side of I-710 in order to raise the transmission lines 55 feet at their crossing of I-710. These changes would require modifying one tower on each side of I-710, or replacing the towers with new towers that would be a sufficient height to provide the required clearance between the freeway facility and the transmission lines. The modified or new towers would be entirely within existing City of Los Angeles rights-of-way, and the design and implementation of the modified or new towers would be conducted entirely by the DWP. The modifications to the existing towers, or construction of new towers, would not result in any change in the number of transmission lines.

The proposed modifications would be similar to other structural modifications and replacements previously made along these lines to allow for safe operation of the transmission lines. Therefore, the proposed changes to the transmission lines and towers under Alternative 7 would not substantively affect the resource, and would not reduce the integrity of the historic property to a degree where the property would no longer be eligible for the National Register.

Caltrans, as assigned by FHWA, has concluded that the I-710 Corridor Project build alternatives would have No Adverse Effect, under Section 106 of the NHPA and 36 CFR 800.5, on the Boulder Dam-Los Angeles 287.5-kilovolt Transmission Line. On September 20, 2012, the SHPO concurred on the finding of No Adverse Effect to this resource. There have been no changes to the Project Description for the build alternatives related to the transmission line since the SHPO's previous concurrence. However, as there would be no impact to this resource under the Preferred Alternative (Alternative 1- No Build), no further analysis or discussion under Section 4(f) is needed for this resource.

DRAKE PARK HISTORIC DISTRICT. The Drake Park Historic District was determined eligible for the National Register in 1987 under Criteria A and C at the local level. It had been previously designated as a local "historic landmark district" by the City of Long Beach in 1980, and expanded in 1982. In 1998, Long Beach combined the Drake Park Historic Landmark District with nearby Willmore City Historic Landmark District to form a new, larger local district called the Drake Park/Willmore City Historic Landmark District. Only the smaller Drake Park Historic District sub-area within the larger Drake Park/Willmore City Historic Landmark District is eligible for the National Register. Temporary use of public streets for vehicular detours would be necessary during construction of the build alternatives and, for any build alternative, the in-kind replacement of a small segment of curb and sidewalk would occur; however, these would not adversely affect the significance, integrity, or eligibility of the Historic District as a whole.

Caltrans, as assigned by FHWA, has concluded that the I-710 Corridor Project build alternatives would have No Adverse Effect, under Section 106 of the NHPA and 36 CFR 800.5, on the Drake Park Historic District, and SHPO had no objection with this finding in a letter dated December 20, 2018. Therefore, Caltrans has made a *de minimis* use determination for the effects on this resource resulting from the build alternatives. SHPO made no comment on the *de minimis* use determination, and therefore SHPO concurrence is assumed as of May 1, 2019. The larger Drake Park/Willmore City Historic District, a locally-designated district in the City of Long Beach established in 1998, was determined ineligible for the National Register in 2016. Because it is considered a "CEQA-only" resource, this larger historical resource is discussed in detail within Chapter 4.0 of this document.

LOS ANGELES RIVER FLOOD CONTROL CHANNEL. The Los Angeles River Flood Control Channel was assumed eligible for the National Register for the purposes of the analysis of the build alternatives for this project only. The Los Angeles River Flood Control Channel was assumed

eligible due to the large resource size and limited potential for effects, pursuant to Stipulation VIII.C.4 of the Section 106 PA. The portion of this linear resource within the APE comprises multiple discontinuous locations between Slauson Ave. in the City of Bell and Ocean Ave. in the City of Long Beach. Levee modifications, including demolition and replacement, and new, extended, or replaced bridge bents/pier walls in the channel would be part of construction for the build alternatives; however, these would not adversely affect the significance, integrity, or eligibility of the channel as a whole.

Caltrans, as assigned by FHWA, has concluded that the I-710 Corridor Project build alternatives would have No Adverse Effect, under Section 106 of the NHPA and 36 CFR 800.5, on the Los Angeles River Flood Control Channel. SHPO had no objection with this finding in a letter dated December 20, 2018. Therefore, Caltrans has made a *de minimis* use determination for the effects on this resource resulting from the build alternatives. SHPO made no comment on the *de minimis* use determination, and therefore SHPO concurrence is assumed as of May 1, 2019.

3.7.4 AVOIDANCE, MINIMIZATION, AND/OR MITIGATION MEASURES

As the No Build (Alternative 1) was identified as the Preferred Alternative, no adverse impacts to cultural resources would occur, and the adoption of this alternative would not require any avoidance, minimization, and/or mitigation measures. The following provides a discussion of avoidance, minimization, and/or mitigation measures pertaining to the two build alternatives that are retained in this Final EIR/EIS for disclosure purposes.

As previously discussed in this section, the build alternatives would not adversely affect the qualities of the UP Railroad (P-19-186110/30-176630 and P-19-186112), Dale's Donuts (APN: 7301-017-001), and Boulder Dam-Los Angeles Transmission Lines (P-19-188983), the Drake Park Historic District, or the Los Angeles River Flood Control Channel, and the build alternatives would result in a *de minimis* impact to these Section 4(f) historic properties. Therefore, no avoidance, minimization, and/or mitigation measures are proposed for architectural resources.

In a letter dated June 1, 2017, the SHPO concurred with the Supplemental HPSR and found the analysis contained in the Archaeological Sensitivity Study to be sufficient. However, the SHPO concluded that Caltrans cannot fully determine how the undertaking (the build alternatives) may affect unknown historic properties in the Direct APE and advised Caltrans to move forward with a project-level PA for this undertaking (the build alternatives) to phase identification, evaluation, and findings of effect of unknown historic properties (pursuant to Stipulation XII.A of the Section 106 PA). Caltrans developed the project-level PA for the build alternatives which was submitted to SHPO for review separately from the Supplemental Finding of Effect (2018) document. An HPTP for the build alternatives was developed by a qualified archaeologist in consultation with the Caltrans PQS Principal Investigator-Prehistoric or Historic Archaeology to plan for the identification, evaluation, and treatment of archaeological resources should they be discovered during construction of either build alternative. The draft HPTP was attached to the project-level

PA for the build alternatives. The project-level PA for the build alternatives was executed between the Caltrans DEA and the SHPO on June 6, 2019.

For any build alternative, if previously unidentified cultural materials are discovered during construction of the build alternatives, all earth-moving activity within and around the immediate discovery area would be diverted until a qualified archaeologist can assess the nature and significance of the find. Section 3.24, Construction Impacts, discusses impacts related to construction of the build alternatives and Measures CON-CUL-1, CON-CUL-2, and CON-CUL-3 refer to mitigation measures related to unanticipated cultural resource discoveries during construction activity of the build alternatives. To further minimize potential effects to previously unidentified cultural materials associated with the build alternatives, a qualified archaeologist would monitor construction activities in areas of increased archaeological sensitivity as indicated in the HPTP, which is attached to the project-level PA for the build alternatives, and the Archaeological Sensitivity Study (2017) as well as its updates at 65 and 95 percent design completion for the build alternatives.

For any build alternative, if human remains were to be discovered, State Health and Safety Code Section 7050.5 states that further disturbances and activities shall stop in any area or nearby area suspected to overlie remains, and the County Coroner contacted. Pursuant to California PRC Section 5097.98, if the remains are thought to be Native American, the Coroner would notify the NAHC, which would then notify the Most Likely Descendant (MLD). At this time, the person who discovered the remains would contact the District 7 Cultural Resources Coordinator so that they may work on the respectful treatment and disposition of the remains. Further provisions of California PRC 5097.98 are to be followed as applicable.

Refer to Section 3.24.4.7, Construction Impacts, for measures to reduce impacts to cultural resources and/or human remains that are discovered during project construction of the build alternatives.

3.8 HYDROLOGY AND FLOODPLAIN

3.8.1 REGULATORY SETTING

Executive Order (EO) 11988 (Floodplain Management) directs all Federal agencies to refrain from conducting, supporting, or allowing actions in floodplains unless it is the only practicable alternative. The Federal Highway Administration (FHWA) requirements for compliance are outlined in 23 Code of Federal Regulations (CFR) 650 Subpart A.

In order to comply, the following must be analyzed:

- The practicability of the build alternatives to any longitudinal encroachments
- Risks of the action
- Impacts on natural and beneficial floodplain values
- Support of incompatible floodplain development
- Measures to minimize floodplain impacts and to preserve/restore any beneficial floodplain values affected by the build alternatives

The base floodplain is defined as “the area subject to flooding by the flood or tide having a one percent chance of being exceeded in any given year.” An encroachment is defined as “an action within the limits of the base floodplain.”

3.8.2 AFFECTED ENVIRONMENT

The information in this section is based on the following technical reports:

- *Flood Control Facilities Report (January 2017)*
- *Water Quality Assessment Report (March 2017)*
- *Preliminary On-Site Hydrology Report (December 2016)*

3.8.2.1 FLOODPLAINS

The Federal Emergency Management Agency (FEMA) has prepared Flood Insurance Rate Maps (FIRMs) that delineate flood zones based on estimated flood risk. According to FEMA FIRM Nos. 06037C1810, 06037C1815F (amended May 13, 2014), 06037C1820F (amended most recently on May 13, 2015), 06037C1955F (amended June 11, 2009), 06037C1962F (amended June 3, 2014), and 06037C1964F (September 26, 2008), the Study Area is located within Zone A of the Los Angeles River, Compton Creek, and Rio Hondo Channel 100-year floodplains from the Union Pacific Railroad (UP Railroad) bridge, north of Firestone Blvd. in the City of South Gate, south to the Ocean Blvd. bridge in the City of Long Beach. Zone A is the FEMA designation for areas of 100-year floodplains where base flood elevations and flood hazard factors have not been

determined. The FEMA FIRMs are included in Appendix K of this Final Environmental Impact Report/Environmental Impact Statement (Final EIR/EIS).

A 100-year flood event is mostly contained within the existing levees in the Study Area. However, two 100-year flood areas outside the Los Angeles River channel are located near the Interstate 710 (I-710)/Anaheim St. Interchange in the City of Long Beach. Two other small ponding areas (Zone AH) are located just north of the Interstate 105 (I-105) freeway and west of I-710. Zone AH areas have a one percent annual chance of shallow flooding, usually in the form of a pond, with an average depth ranging from one to three feet. Zone X areas are shown on the FEMA FIRM along the reaches under study. These Zone X areas have either a 0.2 percent annual chance of flood (500-year floodplain) or a one percent annual chance of flood (100-year floodplain) with shallow flooding (less than one foot in depth).

The Los Angeles River parallels the I-710 freeway throughout much of the Study Area and, for the most part, is an unvegetated, concrete- and riprap-lined trapezoidal channel. A small portion of the Los Angeles River, south of Willow St. in Long Beach, has a natural bottom and supports riparian vegetation. The current flow in the river originates from runoff from adjacent commercial, industrial, and residential developments, and groundwater reaching the surface. Water in the Los Angeles River is also fed by Bell Creek and Calabasas Creek, which have headwaters in the Santa Susana and Santa Monica Mountains. Several other feeder creeks flow from the mountains and hills ringing the valley and flow into the Los Angeles River at points throughout the valley. Other major sources of water for the Los Angeles River include the Donald C. Tillman Water Reclamation Plant, which releases recycled wastewater downstream of the Sepulveda Basin, as well as the Tujunga Wash, the Santa Monica Mountains, and the Rio Hondo Channel. Each of these areas carries runoff from areas throughout the watershed and deposits it into the Los Angeles River (The River Project 2011,¹ Tillman Personnel and Multi-use Facility Project IS-MND 2012²). Rio Hondo is an unvegetated, rectangular concrete channel with intermittent flows. Compton Creek is a trapezoidal channel with an earthen bottom and concrete and grouted riprap banks. Compton Creek supports riparian vegetation and perennial flows within the Study Area.

Floodplains and wetlands in their natural or relatively undisturbed state serve water resource values (e.g., natural moderation of floods, water quality maintenance, and groundwater recharge), living resource values (e.g., fish, wildlife, and plant species), and cultural resource values (e.g., open space, archaeological and historical resources, natural beauty, scientific study, outdoor education, and recreation). Beneficial uses of surface waters are identified in the Los Angeles

¹ The River Project. 2011. Website: <http://www.theriverproject.org/learn/know-your-watershed/the-los-angeles-river-watershed/the-valley> (accessed March 22, 2017).

² City of Los Angeles. 2016. Department of Public Works Bureau of Engineering. Website: http://eng.lacity.org/techdocs/emg/docs/dc_water/Public_Draft_IS-MND.pdf.

Region Water Quality Control Plan (Basin Plan). Beneficial uses include the various ways that water can be used for the benefit of people and/or wildlife. The existing, intermittent, and potential beneficial uses are identified in Section 3.9 of this Final EIR/EIS in Table 3.9-1, Beneficial Uses of Inland Surface Waters and Coastal Waters Los Angeles Region Water Quality Control Plan.

3.8.2.2 DRAINAGE CONDITIONS

EXISTING DRAINAGE FACILITIES. The I-710 Corridor contains a complex series of interconnected drainage systems that handle flows from both on-site and off-site drainage areas. There are several drainage outlet scenarios depending on the relative elevation differential to the Los Angeles River levee and other physical constraints presented along the I-710 Corridor. Most drainage areas are handled by pump stations located adjacent to the Los Angeles River. As the terrain and freeway profiles rise relative to the river levee height, more gravity drainage systems handle drainage from the freeway right-of-way and adjacent off-site drainage areas. Existing drainage systems that traverse the Study Area fall into three categories: inflows, outlets, and transfer flows. A brief description of the existing drainage facilities located in the I-710 Corridor near the Los Angeles River is provided below:

- Drainage Area 1 (Pico Ave. to 31st St.) – The terrain in this drainage area is lower than the Los Angeles River levee height and large drainage areas are handled by a series of pump stations situated in the Long Beach Harbor and at the major arterial interchanges including Anaheim St., Pacific Coast Hwy., and Willow St.
- Drainage Area 2 (31st St. to Long Beach Blvd.) – Due to higher terrain, this drainage area contains several gravity-flow drainage systems that outlet to the Los Angeles River. The Dominguez Basin, located north of the I-710/Interstate 405 (I-405) interchange, serves to meter outflow from off-site drainage areas located west of the interchange. A Caltrans pump station located at the Blue Line overcrossing handles drainage from a low point in the freeway profile. There are several existing gravity outlets that enter the Southern California Edison (SCE) right-of-way and Compton Creek in the vicinity of improvements included under the build alternatives.
- Drainage Area 3 (Long Beach Blvd. to Compton Blvd.) – This drainage area includes pump stations located at Long Beach Blvd., the I-710/State Route 91 (SR-91) interchange, and Alondra Blvd. that handle large off-site drainage areas.
- Drainage Area 4 (Compton Blvd. to Clara St.) – This drainage area has several gravity systems that outlet to the Los Angeles River. A Caltrans' pump station is located at the South Gate UP Railroad Crossing. The Bandini Trunk storm drain is a 20-foot by ten-foot concrete drainage channel and is located between the I-710 and the Los Angeles River. This drainage system transfers off-site flows to the Los Angeles River and also receives flows from several smaller drainage pipes.

- Drainage Area 5 (Clara St. to Slauson Ave.) – This drainage area has Caltrans' pump stations located at Clara St., Gage Ave., and Slauson Ave. to handle low points in the freeway profile.
- Drainage Area 6 (Slauson Ave. to Interstate 5 [I-5]) – The freeway is elevated through this drainage area. Smaller, localized drainage systems typically drain to city streets or connect to two major County flood control drains.
- Drainage Area 7 (I-5 to State Route 60 [SR-60]) – In this drainage area, drainages typically drain to city streets or connect to two major County flood control drains. A large portion of the I-5/I-710 interchange depressed area drains to a Caltrans pump station located near the Eastern Ave. bridge over I-5.

ON-SITE DRAINAGE. The on-site drainage areas are defined based on the topography, roadway profiles, and existing drainage systems. These drainage areas may feed multiple drainage systems before reaching an outlet or pump station. The existing on-site drainage systems consist of a complex series of drainage inlets, cross culverts, dikes, over-side drains, concrete and earthen channels, pump stations, and detention basins located within the vicinity of or directly within the I-710 freeway right-of-way. The I-710 lanes and ramps generally drain via sheet flow to the shoulders where drainage collects along curbs before entering into underground pipes or down- drains. In some sections of the I-710 freeway, storm water drains to the median shoulders where drainage inlets convey the runoff to the cross drainage facilities. Underground storm drain systems generally channel flows into larger pipes before entering a pump station or the Los Angeles River. In some cases, the underground systems outlet onto vegetated areas adjacent to the I-710 right-of-way or local roadways.

The Dominguez Gap Spreading Grounds, located in the northeast quadrant of the I-710 to I-405 interchange, serve as recharge facilities and water quality basins. The two basins (east and west of the Los Angeles River) collect runoff from the interchange and off-site areas west of the I-710 Corridor. The basins discharge to a pump station with outlets to the Los Angeles River.

Stormwater runoff at the I-710 to I-5 interchange is conveyed through drainage facilities and one pump station to Los Angeles County facilities. These transport the runoff to outlets in the Los Angeles River before discharging to the Pacific Ocean.

OFF-SITE CONDITIONS. Because of the proximity of I-710 to the Los Angeles River, off-site drainage areas are tributary to the drainage systems located within the Study Area. The off-site areas tributary to the I-710 drainage systems consist mainly of commercial, residential, and vacant land parcels.

3.8.3 ENVIRONMENTAL CONSEQUENCES

The following discussion of environmental consequences only describes the permanent impacts of the project. Please refer to Section 3.24 of this document, Construction Impacts, for a

discussion of the temporary impacts of the project for each resource area. Specifically, temporary impacts associated with the build alternatives related to Hydrology and Floodplains is located in Section 3.24.3.8.

3.8.3.1 PERMANENT IMPACTS

BUILD ALTERNATIVES

ALTERNATIVE 5C.

FLOODPLAIN ENCROACHMENTS. As summarized in Table 3.8-1 and discussed in detail below, transverse (i.e., perpendicular to the direction of flow) encroachments would occur at 24 Los Angeles River locations, and eight Compton Creek and one Rio Hondo channel location under Alternative 5C. At these locations, the encroachments would result from construction of new bridge columns or piers and extension of existing piers. There would be approximately 21,225 square feet (0.487 acre) of new structure placed within the floodplain. In addition, localized channel modifications would be required to maintain the existing channel hydraulic capacity. To calculate level of risk at each crossing a 133-year flood event was used in accordance with United States Army Corps of Engineers (USACE)-authorized design discharge. For Alternative 5C, there would be no longitudinal (i.e., parallel to the direction of flow) encroachments in the Los Angeles River. A total of 52 acres of property acquisition and/or easements would be required from flood control areas. Approximately 66 percent of the acquisitions or easements would consist of aerial easements associated with the widening or creation of bridges.

CROSSINGS IMPACTED BY BOTH ALTERNATIVES 5C AND 7. The following project design feature would result in transverse encroachments of the Los Angeles River 100-year floodplain for both Alternatives 5C and 7. All encroachments are considered low risk by location hydraulic studies performed at 133-year flood levels. Location numbers below identify encroachments from south to north and are used to clarify which encroachments occur at similar locations. These are referenced in Table 3.8-1 and displayed in Figure 3.8-1.

LOCATION NO. 1

- **SHOEMAKER BRIDGE:** The existing multi-span structure over the Los Angeles River consists of seven piers with five piers within the floodway without debris walls. The existing bridge would be replaced with a multi-span bridge, featuring six piers within the floodway approximately 400 feet downstream from the existing structure.

LOCATION NO. 2

- **ANAHEIM ST. BRIDGE:** The existing structure consists of six spans over the Los Angeles River, including five piers that do not have debris walls. The existing bridge would be replaced with a six-span structure with four piers in the floodway in approximately the same location as the existing structure.

Table 3.8-1: Floodway Encroachment Impacts

| Location No. | Floodway Structure | Disposition | Type of Improvement | Existing Floodway Footprint (sf) | Proposed Footprint (sf) | | Net Impact (sf) | |

This page intentionally left blank

LOCATION NO. 3

- **PACIFIC COAST HWY.:** The existing structure consists of seven spans over the Los Angeles River and six piers within the floodway without debris walls. The existing bridge would be removed, and the structure would replace the existing bridge with a multi-span bridge featuring five piers within the floodway.

LOCATION NO. 4

- **WILLOW ST. BRIDGE:** The existing structure over the Los Angeles River is ten spans in length and has nine piers within the floodway. Seven of the piers feature extensions and pier noses. The existing bridge would be replaced with a six-span bridge featuring five piers within the floodway.

LOCATION NO. 5

- **WARDLOW RD. BRIDGE:** The existing structures over the Los Angeles River are seven spans in length and have six piers within the floodway without debris walls. The existing bridges would be replaced with a five-span bridge featuring four piers within the floodway.

LOCATION NO. 6

- **Northbound I-710 to Northbound/Southbound I-405 Connectors (Crossing No. 1):** The northbound I-710 to northbound I-405 connector crosses the Los Angeles River twice in order to avoid impacting existing SCE transmission towers. The connector features a multi-span structure with columns in the floodway at the first crossing and columns on relocated pier walls and an outrigger on a pier wall over the northbound I-405 mainline.
- **SOUTHBOUND I-710 TO SOUTHBOUND I-405 CONNECTOR- SECTION 2:** The southbound I-710 to southbound I-405 connector crosses the Los Angeles River south of the existing interchange with a new multi-span structure with four column bents placed in the floodway.
- **NORTHBOUND I-710 TO NORTHBOUND I-405 CONNECTOR (CROSSING NOS. 1 AND 2):** The northbound I-405 to northbound I-710 connector crosses the Los Angeles River north of the northbound I-710/ southbound I-405 connector. A multi-span structure with four column bents on relocated piers walls within the floodway would replace the existing structure.
- **NORTHBOUND/SOUTHBOUND I-710 TO SOUTHBOUND I-405 CONNECTORS:** The existing northbound and southbound I-710 to the southbound I-405 connector would be removed and the piers supporting the structure would be removed as well.
- **NORTHBOUND SANTA FE OFF-RAMP:** The southernmost portion of the northbound I-405 mainline structure contains an off-ramp for the northbound Santa Fe off-ramp, which

becomes an independent structure as it passes over the Los Angeles River and is supported by the four replaced and relocated piers supporting the mainline I-405.

- **NORTHBOUND/SOUTHBOUND I-405 – SECTION 2:** The bridge structure over the Los Angeles River is supported by four piers within the floodway and carries both northbound and southbound traffic. The existing bridge would be reconstructed as two separate bridges, one for northbound traffic and one for southbound traffic, featuring four replaced and relocated piers within the floodway. The southbound structure also contains the on-ramp section for the southbound Santa Fe on-ramp.
- **NORTHBOUND I-405 TO SOUTHBOUND I-710 CONNECTOR:** The northbound I-405 to the southbound I-710 connector crosses the Los Angeles River north of the existing interchange with a new multi-span structure with four column bents on relocated pier walls and an outrigger on a pier wall over the northbound I-405/ northbound I-710 connector.

LOCATION No. 8

- **DEL AMO BLVD. BRIDGE:** The existing bridge structure features five piers within the floodplain and six spans over the Los Angeles River. The existing bridge would be replaced with a four-span bridge with three piers within the floodway.

LOCATION No. 10

- **LONG BEACH BLVD. BRIDGE:** The Long Beach Blvd. bridge over the Los Angeles River has seven pier walls within the river channel. The bridge would be widened approximately 25 to 53 feet to the east. The widening would require extension of the existing pier walls located in the river.

LOCATION No. 14

- **ALONDRA BLVD. BRIDGE:** The replacement of the Alondra Blvd. bridge would require new abutments and columns in the Los Angeles River, shifted directly south of the existing bridge. The existing bridge has five pier walls with debris noses. The replacement bridge would be widened by 204 to 315 feet and would feature a four-span structure with three piers in the floodway. The piers would be approximately 100 feet longer than the existing piers.

LOCATION No. 15

- **IMPERIAL HWY. BRIDGE:** The existing Imperial Hwy. bridge over the Los Angeles River has four pier walls with debris noses in the river channel. The replacement bridge features a four-span structure with three piers and would be widened by 38 to 100 feet.

LOCATION No. 17

- **I-710 MAINLINE OVER THE LOS ANGELES RIVER:** The replacement of the I-710 bridge over the Los Angeles River would require new abutments and columns in the Los

Angeles River, yet would maintain the existing four-span, three-pier configuration. The replacement bridge would be widened by 150 feet.

LOCATION NO. 19

- **SOUTHERN AVE. BRIDGE:** A new Southern Ave. bridge is included for the Los Angeles River channel. The new bridge would contain three new piers within the existing Los Angeles River channel.

LOCATION NO. 20

- **FIRESTONE BLVD. BRIDGE:** The Firestone Blvd. bridge over the Los Angeles River requires widening to allow for three vehicular travel lanes with one additional eastbound turning lane to the southbound on-ramp to I-710. The approximately 38-foot widening would require extension of the existing pier walls in the river. The existing bridge has three pier walls with debris noses.

LOCATION NO. 21

- **UP RAILROAD CROSSING AT PATATA:** The new UP Railroad bridge would be located north of the existing UP Railroad alignment which has three piers. The new bridge would require the construction of three replacement piers within the existing Los Angeles River channel.

LOCATION NO. 22

- **FLORENCE AVE. BRIDGE:** The Florence Ave. bridge would be replaced and would require three replacement pier walls in the river and abutments at the river's edge. The existing bridge has five piers in the river channel. The widening of the bridge by approximately 70 to 130 feet on each side of the existing bridge would provide a wider median to allow for one additional turning lane approaching I-710 lanes and three lanes on each side.

LOCATION NO. 23

- **UP RAILROAD CROSSING AT LA HABRA SUB:** The existing four span UP Railroad La Habra Sub Bridge would be replaced and would require three replacement pier walls in the floodplain.

The following project design feature would result in transverse encroachments of the Compton Creek 100-year floodplain for both Build Alternatives 5C and 7. The encroachment is considered low risk by the location hydraulic study performed at 133-year flood levels:

LOCATION NO. 9

- **DEL AMO BLVD. BRIDGE:** The existing four-span bridge over Compton Creek has three piers within the floodplain. The structure would widen the bridge by 13 feet in the eastbound direction and seven feet in the westbound direction and would require the

extension of the three piers within the floodplain, including special design considerations that would need to be considered due to the fact that the bridge is currently below the 100-year water surface elevation.

The following project design feature would result in transverse encroachments of the Rio Hondo Channel 100-year floodplain for both Build Alternatives 5C and 7. The encroachment is considered low risk by the location hydraulic study performed at 133-year flood levels:

LOCATION NO. 18

- **GARFIELD AVE. BRIDGE:** The Garfield Ave. bridge over the Rio Hondo Channel would be widened to provide for an additional lane on Garfield Ave. The existing three piers would be lengthened on the downstream side to accommodate the new widened structure.

CROSSINGS EXCLUSIVELY IMPACTED BY ALTERNATIVE 5C. In addition to the improvements discussed above under Impacts Related to Alternatives 5C and 7, the following improvements under only Alternative 5C would result in transverse encroachments of the Los Angeles River 100-year floodplain. All encroachments are considered low risk by location hydraulic studies performed at 133-year flood levels:

LOCATION NO. 3A

- **HILL ST. PEDESTRIAN CROSSING:** Hill St. has been identified as a location that improves local community access by creating a new Los Angeles River pedestrian and bicycle crossing. The new structure width is 16 feet and provides two five-foot pedestrian lanes with two-foot buffers. The conceptual design features a five-span structure with four piers in the floodway.

LOCATION NO. 4A

- **SPRING ST. PEDESTRIAN CROSSING:** Spring St. has been identified as a location that improves local community access by creating a new Los Angeles River pedestrian and bicycle crossing. The new structure width is 16 feet and provides two five-foot pedestrian lanes with two-foot buffers. The conceptual design features a four-span structure with three piers in the floodway.

LOCATION NO. 12

- **ATLANTIC BLVD. OFF-RAMP FROM EASTBOUND SR-91:** The off-ramp from eastbound SR-91 to Atlantic Blvd. would be removed for safety enhancements. The piers would be shortened in this area because the off-ramp would no longer need to be supported.
- **ATLANTIC BLVD. ON-RAMP TO WESTBOUND SR-91:** The on-ramp to westbound SR-91 from Atlantic Blvd. would be removed for safety enhancements. The piers would be shortened in this area because the on-ramp would no longer need to be supported.

- **ATLANTIC BLVD. ON-RAMP TO NORTHBOUND I-710:** The on-ramp to westbound I-710 from Atlantic Blvd. would be removed for safety enhancements. The piers would be shortened in this area because the on-ramp would no longer need to be supported.

In addition to the improvements discussed above under Impacts Related to Alternatives 5C and 7, the following improvements included under only Alternative 5C would result in transverse encroachments of the Compton Creek 100-year floodplain. All encroachments are considered low risk by location hydraulic studies performed at 133-year flood levels:

LOCATION NO. 7

- **DEL AMO BLVD. SOUTHBOUND ENTRANCE RAMP TO TRUCK BYPASS:** The southbound truck bypass on-ramp from Del Amo Blvd. will be a new structure over Compton Creek. This would be west of the southbound truck bypass and would be supported by two new columns with splitter walls.
- **DEL AMO BLVD. NORTHBOUND EXIT RAMP:** The northbound truck bypass off-ramp from Del Amo Blvd. will be a new structure over Compton Creek. This would be east of the I-710 mainline and would be supported by two multi-column bents with splitter walls/pier walls in alignment with the mainline piers.
- **TRUCK BYPASS NORTHBOUND - SECTION 4:** The northbound truck bypass will be a new structure over the northbound off-ramp at Compton Creek. This would be supported by an outrigger off of one of the new pier walls over the northbound off-ramp structure.
- **MAINLINE I-710:** The mainline I-710 bridge over Compton Creek would be replaced with a three-span structure with two piers in the floodplain to match the existing structure.
- **TRUCK BYPASS SOUTHBOUND - SECTION 2:** The new southbound truck bypass structure would be supported by two multi-column pillar bents with splitter aligning with mainline piers. This would cross over the southbound on-ramp at Compton Creek.

LOCATION NO. 11

- **SR-91 MAINLINE:** The existing mainline SR-91 structure is a multi-span structure including two column bents with splitter walls within the floodplain. The widened structure features two additional column bents with splitter walls placed in line with the existing column bents within the floodplain.
- **ALAMEDA ST. ON-RAMP TO EASTBOUND SR-91:** Replacement columns will replace the existing two columns within the floodplain for the Alameda St. on-ramp to eastbound SR-91.

RISKS TO LIFE AND PROPERTY. Construction of the improvements discussed above within the 100-year floodplain is not anticipated to substantially increase the base flood elevation. For

any build alternative, a Conditional Letter of Map Revision (CLOMR) would be required. Since a build alternative was not identified as the Preferred Alternative, no revisions to the FEMA FIRM maps (Letter of Map Revision [LOMR]) are necessary. The build alternatives included Measure FP-1, which includes preparation of a Final Flood Control Facilities Report/Final Location Hydraulic Study during final project design. The *Flood Control Facilities Report* (2017) assesses the risk of the floodplain impacts that would result from the build alternatives. For any build alternative, final reports would be prepared during final design to demonstrate that the design of either build alternative would provide acceptable flood protection. The change in floodplain elevations would be evaluated based on final design plans of the bridges and other structures where they encroach on the 100-year floodplain. The modeling results would be included in the application for a CLOMR and LOMR, if required, which would be processed through the Los Angeles County Flood Control District (LACFCD) and FEMA. Since a build alternative was not identified as the Preferred Alternative, Measure FP-1 will not be implemented.

Alternative 5C would not result in flood-related interruption of emergency services or routes. Alternative 5C would enhance the ability to move fire protection and emergency service resources from one area to another by providing a more reliable freeway network. Operation of Alternative 5C would not result in interruption of emergency services or routes and would improve access throughout the region during a flood event. In addition, Alternative 5C would not increase the risk of flooding because it would not substantially increase the base flood elevation. Therefore, there would be no substantial flood-related risks to life or property associated with implementation of Alternative 5C. Based on the assessment of level of risk in the Location Hydraulics Study Forms provided in the *Flood Control Facilities Report* (2017), the project is considered low-risk.

INCOMPATIBLE FLOODPLAIN DEVELOPMENT. Alternative 5C includes improvements to an existing transportation facility to improve air quality and public health; improve traffic safety; modernize freeway design; address projected traffic volumes; and address projected growth in population, employment, and economic activities related to goods movement. Alternative 5C would reduce congestion by modifying existing facilities and would not promote incompatible floodplain development.

NATURAL AND BENEFICIAL FLOODPLAIN VALUES. Alternative 5C has the potential to impact natural and beneficial water resource values by impacting water quality and jurisdictional waters. As discussed in detail later in Section 3.9, Water Quality and Storm Water Runoff, Alternative 5C would result in a net increase in impervious surfaces and, therefore, an increase in runoff. The runoff from the roadway improvements under Alternative 5C would have the potential to impact water quality in the Los Angeles River, the Rio Hondo Channel, and Compton Creek. However, Treatment Best Management Practices (BMPs) would be implemented during operation of Alternative 5C to reduce impacts to water quality.

Improvements within the 100-year floodplain under Alternative 5C would result in direct, permanent impacts to the Los Angeles River, Rio Hondo and Compton Creek, which are considered potentially jurisdictional to the USACE, the California Department of Fish and Wildlife (CDFW) and the Regional Water Quality Control Board (RWQCB). As discussed in Section 3.17, Wetlands, compensatory mitigation is included as part of Alternative 5C to reduce potential impacts to jurisdictional waters. Therefore, with the measures proposed in Sections 3.9 and 3.17, operation of Alternative 5C would not result in long-term adverse impacts to natural and beneficial floodplain values. However, since a build alternative was not identified as the Preferred Alternative, no mitigation will be required.

SIGNIFICANT FLOODPLAIN ENCROACHMENT. A “significant encroachment,” as defined in 23 CFR 650.105(q), is a highway encroachment that would result in (1) a significant potential for interruption or termination of a transportation facility that is needed for emergency vehicles or provides a community’s only means of evacuation, (2) a significant risk, or (3) a significant adverse impact on natural and beneficial floodplain values. Alternative 5C is a highway improvement project that would require encroachments within the 100-year floodplain in the Los Angeles River, Compton Creek, and the Rio Hondo Channel as part of the bridge and levee improvements discussed above. According to the *Flood Control Facilities Report* (2017), Alternative 5C would not change the capacity of the Los Angeles River, Compton Creek, and the Rio Hondo Channel to carry water. Alternative 5C would not result in a measurable impact to the 100-year floodplain elevation. The encroachment would not result in any adverse impacts on the natural and beneficial floodplain values, would not result in a substantial change in flood risk or damage, and does not have substantial potential to cause interruption or termination of emergency services or emergency routes. Therefore, Alternative 5C does not constitute a significant floodplain encroachment as defined in 23 CFR 650.105(q), and as a result, there is no discussion of the Only Practicable Alternative Finding in this Final EIR/EIS.

ADDITIONAL DISCUSSION: ALTERNATIVE 7

FLOODPLAIN ENCROACHMENTS. Alternative 7 would result in greater permanent impacts to the 100-year floodplain compared to Alternative 5C because more improvements within the 100-year floodplain would occur due to the freight corridor feature. As summarized in Table 3.8-1, transverse encroachments would occur at 34 Los Angeles River locations, four Compton Creek locations, and one Rio Hondo location under Alternative 7. At these locations, the encroachments would result from construction of new columns or piers and extension of existing piers. There would be approximately 43,479 square feet (0.998 acre) of new structure placed within the floodplain. In addition, localized channel modifications would be required to maintain the existing channel hydraulic capacity. Level of risk at each crossing was determined using the 133-year flood event in accordance with the USACE-authorized design discharge. A total of 101 acres of property acquisition and/or easements would be required from flood control areas. Approximately 56 percent of this total acreage

would be utilized for aerial easements associated with the widening and creation of bridges.

CROSSINGS EXCLUSIVELY IMPACTED BY ALTERNATIVE 7. Alternative 7 would result in all of the 100-year floodplain encroachments discussed above under Impacts Related to Alternatives 5C and 7. In addition to the improvements discussed in that section, the following improvements included under Alternative 7 would result in transverse encroachments of the Los Angeles River 100-year floodplain. All encroachments are considered low risk by location hydraulic studies performed at 133-year flood levels:

LOCATION NO. 13

- **ATLANTIC BLVD. ON-RAMP TO NORTHBOUND I-710:** The on-ramp from Atlantic Blvd. to northbound I-710 would be removed to improve safety and traffic operations.
- **NORTHBOUND FREIGHT CORRIDOR TO EASTBOUND SR-91 CONNECTOR:** A new structure would be constructed to the south of the replaced southbound I-710 to the eastbound SR-91 Connector with four columns in the floodway in line with the existing pier walls. This would functionally extend the pier walls through the addition of the columns.
- **SOUTHBOUND I-710 TO EASTBOUND SR-91 CONNECTOR:** A new structure would replace the existing structure. This would rest on the existing bridge piers and would require extension of the piers in the floodway.
- **SR-91 MAINLINE:** The SR-91 mainline would be widened by 18 feet in the westbound direction and 34 to 38 feet in the eastbound direction, which would join with the replaced southbound I-710 to the eastbound SR-91 connector. The existing bridge piers would be replaced within the floodway.
- **WESTBOUND SR-91 TO SOUTHBOUND FREIGHT CORRIDOR CONNECTOR:** A new structure would be constructed that crosses north of the removed northbound I-710 on-ramp from Atlantic Blvd. This would feature four columns in the floodway that would be in line with the existing pier walls, functionally extending them.
- **ATLANTIC BLVD. OFF-RAMP TO EASTBOUND SR-91:** The existing off-ramp would be replaced and relocated south of the existing structure with three new columns in the floodway.

LOCATION NO. 16

- **I-710 FREIGHT CORRIDOR BRIDGE (NORTH OF IMPERIAL HWY.):** A new freight corridor bridge crossing the existing channel to the south would feature a multi-span structure with four column bents on splitter walls in the floodway.

LOCATION NO. 24

- **SLAUSON AVE. BRIDGE:** The existing structure spanning the Los Angeles River at this point consists of a five-span bridge with four piers in the floodway. A replacement crossing would be 37 feet wider and feature four spans and three piers in the floodway.

In addition to the improvements discussed above under Impacts Related to Alternatives 5C and 7, the following project design features for Location No. 20 under Alternative 7 would result in transverse encroachments of the Compton Creek 100-year floodplain. All encroachments are considered low risk by location hydraulic studies performed at 133-year flood levels:

LOCATION NO. 7

- **FREIGHT CORRIDOR (OVER COMPTON CREEK):** A new freight corridor bridge crossing the existing channel would require two multi-column-bents with splitter walls to be placed within the existing channel and in line with the mainline piers.
- **NORTHBOUND I-710 TO NORTHBOUND FREIGHT CORRIDOR CONNECTOR BRIDGE:** Construction of the new northbound freight corridor connector would require two new columns to be built within the existing channel.
- **SOUTHBOUND FREIGHT CORRIDOR TO SOUTHBOUND I-710 CONNECTOR BRIDGE:** Construction of the new southbound freight corridor connector would require two new columns to be built within the existing channel in line with the mainline piers.

The permanent impacts discussed above under Alternative 5C would be applicable to floodplain impacts to the Los Angeles River, Compton Creek, and the Rio Hondo Channel under Alternative 7. Although Alternative 7 would result in more 100-year floodplain encroachments than Alternative 5C, permanent impacts related to emergency response, risks to life and property, incompatible floodplain development, and natural and beneficial floodplain values would be the same as those discussed above under Alternative 5C. Because the new piers would mimic the existing pier configurations upstream and downstream, there would be no substantial effects to the water surface elevation, velocity of flood flows, sedimentation, or scour in the vicinity of the new piers. Because there would be no substantial effects at the location of the modification, there would be no substantial effects to downstream locations. Under Alternative 7, final design of channel modifications and associated hydraulic analysis would have been required for USACE approval. For the same reasons discussed above under Alternative 5C, Alternative 7 does not constitute a significant floodplain encroachment as defined in 23 CFR 650.105(q).

Similar to Alternative 5C, under Alternative 7, a CLOMR would be required. Since a build alternative was not identified as the Preferred Alternative, no revisions to the FEMA FIRM maps are necessary. Under Alternative 7, a Final Flood Control Facilities Report/Final

Location Hydraulic Study would be prepared during final design as specified below in Measure FP-1. The change in floodplain elevations would be evaluated based on final design plans of the bridges and other structures where they encroach on the 100-year floodplain. The modeling results would be included in the application for a CLOMR and LOMR, if required, which would be processed through the LACFCD and FEMA. Since a build alternative was not identified as the Preferred Alternative, Measure FP-1 will not be implemented.

SUMMARY OF FLOODPLAIN IMPACTS FOR BOTH BUILD ALTERNATIVES. Alternatives 5C and 7 consist of highway improvements that would require encroachments within the 100-year floodplain in the Los Angeles River, the Compton Creek, and the Rio Hondo Channel as part of the bridge and levee improvements and utility relocations. According to the *Flood Control Facilities Report* (2017), Alternatives 5C and 7 would not change the capacity of the Los Angeles River, Compton Creek, and the Rio Hondo Channel to carry water or result in a measurable impact to the 100-year floodplain elevation. The encroachments would not result in any adverse impacts on the natural and beneficial floodplain values, would not result in a substantial change in flood risk or damage, and would not have substantial potential to cause interruption or termination of emergency services or emergency routes. Therefore, Alternatives 5C and 7 do not constitute a significant floodplain encroachment as defined in 23 CFR 650.105(q).

LEVEE ENCROACHMENTS FOR BOTH BUILD ALTERNATIVES. The sides of the Los Angeles River Channel are supported by trapezoidal-shaped earthen embankments. Levees would require modifications at several areas due to right-of-way requirements for the construction of walls and columns. The encroachments would consist of simple wall construction, complex wall construction, simple column construction, and complex column construction. Simple encroachments would not require reconstruction of the levees, and complex encroachments would require reconstruction. Encroachments for both build alternatives would be on the dry side of the levee and would not create permanent impacts on the hydraulic performance of the floodplain. The levee encroachments would not result in significant impacts to the performance of levees impacted by the project. For any build alternative, a Section 408 permit for modification to levees would have been required to be obtained from the U.S. Army Corps of Engineers.

DRAINAGE SYSTEM ENCROACHMENTS FOR BOTH BUILD ALTERNATIVES. Most of the I-710 freeway is between existing developed areas and their respective drainage outlets to the various regional flood control facilities. In locations where there are existing pump stations that outlet to the Los Angeles River there are substantial off-site drainage areas that are tributary to each pump station. Off-site tributary areas are collected in underground storm drains and outlet to each pump station. The on-site drainage is collected in a similar manner. On-site drainage systems include inlets, paved channels, and underground storm drain systems. While the freeway improvements under all build alternatives may alter the location of existing pump stations and on-site flow patterns in localized areas, the confluence locations will remain in the general vicinity, and existing Los Angeles River outlets will be utilized whenever possible to minimize

impacts to the river channel. The existing inflow drainage connections would be maintained and accommodated with the on-site drainage systems. Existing drainage patterns on the arterial streets would be maintained by utilizing existing underground drains wherever possible.

Because the existing alignment of the freeway would be shifted horizontally and/or vertically under both build alternatives, most of the freeway pavement would be reconstructed on I-710, which would require reconstruction of most of the drainage systems. As discussed below, this includes both on-site systems and off-site systems within the right-of-way of the build alternatives. There are hundreds of existing drainage systems over the 18-mile length of the I-710 Corridor. For any build alternative, the required drainage system improvements would have been determined during final design. However, impacts to major facilities (outlets and pump stations) have been assessed for the build alternatives and are discussed below.

There are 37 existing drainage outlets impacted by the build alternatives. Of the 37 existing outlets identified, 29 would be protected in place under the build alternatives. This determination was made based on hydraulic sufficiency. The remaining outlets would require removal and reconstruction based on the physical impacts by the build alternatives or based on the need to increase hydraulic capacity of the outlet. The outlets requiring removal and reconstruction are listed in Table 3.8-2 along with their locations and a short description.

Table 3.8-2: Corridor Drainage Outlet Systems Requiring Removal and Reconstruction Under the Build Alternatives

| Location | Description |
|---------------|-----------------------------|
| I-405 Freeway | Caltrans Storm Drain |
| Del Amo Blvd. | Channel Outlet |
| Del Amo Blvd. | Compton Creek Outlet |
| Del Amo Blvd. | Over side Drain |
| Susana Rd. | Over side Drain |
| Fertile St. | Caltrans Storm Drain Outlet |
| Imperial Hwy. | Caltrans Storm Drain Outlet |
| I-710 Freeway | Caltrans Storm Drain |

Caltrans = California Department of Transportation

I-405 = Interstate 405

I-710 = Interstate 710

There are 22 existing pump stations impacted by the build alternatives. Out of the 22 locations, 18 locations would require modification including upgrading facilities to accommodate projected peak flows, relocation due to build alternatives, or reconstruction due to freeway widening and/or profile changes. All pump stations located on the east side of the Los Angeles River would be protected-in-place during construction of either build alternative.

Vehicular access to the Market Street Pump Station via the Los Angeles River eastside maintenance access road between Long Beach Blvd. and Del Amo Blvd. would not be disrupted and would remain accessible at all times. Table 3.8-3 lists the name, location and modifications for each affected pump station.

Table 3.8-3: Corridor Drainage Pump Stations Requiring Upgrading, Relocation, or Reconstruction Under the Build Alternatives

| Name | Cross Street | Disposition |
|-----------------------------------|---|---|
| 6 th St. Pump Station | 6 th St. and 7 th St. | <ul style="list-style-type: none"> Relocate due to conflict with all build alternative alignments. Reconstruct outlet to Los Angeles River. Remove due to conflict with all build alternative alignments. Pump station no longer in use. |
| Cowles Pump Station | Anaheim St. | <ul style="list-style-type: none"> Relocate due to conflict with all build alternative alignments. Upgrade pumping capacity. Reconstruct outlet to Los Angeles River. |
| 19 th St. Pump Station | Pacific Coast Hwy. | <ul style="list-style-type: none"> Relocate due to conflict with all build alternative alignments. Upgrade pumping capacity. Reconstruct outlet to Los Angeles River. |

Caltrans = California Department of Transportation

I-105 = Interstate 105

SR-91 = State Route 91

UP Railroad = Union Pacific Railroad

The build alternatives would require substantial reconstruction of the existing drainage systems including drainage inlets, storm drains, cross culverts, dikes, overside drains, concrete and earthen channels, pump stations, and detention basins. Most of the existing on-site drainage systems would be replaced with new facilities. Some existing facilities may be extended to accommodate the wider freeway. The existing Dominguez Gap Spreading Grounds located in the northeast quadrant of the I-710/I-405 interchange would not be impacted by the I-710 corridor improvements associated with Alternative 5C, as there are no improvements adjacent to the existing basin.

However, in the Alternative 7 improvements, the existing west basin and levees of the Dominguez Spreading Grounds would be impacted by the freight corridor alignment, retaining walls, and slopes which are below the Los Angeles River levee grade in the vicinity of the basin.

The increase in on-site stormwater runoff contributing to the Dominguez Gap Spreading Grounds associated with the improvements is inconsequential in comparison to the amount of stormwater runoff from off-site tributary watersheds and transfer flows from the basins located on the east side of the Los Angeles River.

The west basin would be displaced under Alternative 7 and Caltrans would have had to coordinate with LACFCD to identify an area for relocation or replacement. In addition, the basin relocation would also have the potential to affect plans for pollution remediation in cities along the Los Angeles River. Under Alternative 7, Caltrans would have coordinated with these parties as specified in Measure FP-2. Since a build alternative was not identified as the Preferred Alternative, Measure FP-2 will not be implemented.

Another impact created solely under Alternative 7 would occur at the I-710/I-105 interchange. There are two existing detention basins, also referred to as the Lynwood Retention Basin, located under the I-710/I-105 interchange that retain storm flows from the Los Angeles River during peak flow events. The retention system consists of a primary basin located between the I-710 and the Los Angeles River and a secondary basin located west of the I-710 that are connected together by a series of underground pipes. The freight corridor in Alternative 7 would bisect the primary basin. The capacity and functionality of the primary retention basin would be impacted by the freight corridor alignment, and the basin would need to be reconfigured or relocated elsewhere in the interchange area to remain functional. Under Alternative 7, based on the existing underground piping configuration, one possible location for a new basin would have been in the northwest quadrant of the I-105/I-710 interchange. As specified in Mitigation Measure FP-2, under Alternative 7, Caltrans would have coordinated with the Los Angeles County Department of Public Works to identify a suitable location for replacement of the I-105 retention basin that would provide equal or greater capacity than the basin impacted by the freight corridor. Since a build alternative was not identified as the Preferred Alternative, Measure FP-2 will not be implemented.

In addition, most off-site drainage systems that convey flows from the adjacent neighborhoods, cross the I-710 corridor, and receive on-site flows, would be replaced within the Caltrans right-of-way under Alternative 7. Off-site systems crossing the corridor that do not receive on-site runoff would be protected-in-place where possible. Under Alternative 7, during final design, existing drainage systems would be evaluated for compatibility with Alternative 7. If a drainage facility would not physically conflict with the location and function of the freeway and it provides adequate capacity and service as part of the reconstructed drainage system, it would be protected in place.

As discussed above, the Dominguez Gap Spreading Grounds would be impacted by the freight corridor in Alternative 7. Alternative 7 includes Measure FP-2 below, which would require Caltrans to consult with LACFCD and affected local agencies for the relocation of the Dominguez Gap Spreading Grounds that could be used to mitigate for the loss in recharge areas. Since a build alternative was not identified as the Preferred Alternative, Measure FP-2 will not be implemented.

NO BUILD (ALTERNATIVE 1). The No Build (Alternative 1), which has been identified as the Preferred Alternative, would not result in the construction of any improvements that would affect the Los Angeles River or its tributaries. Therefore, the No Build (Alternative 1) would not result in any adverse impacts related to hydrology and floodplains. Although the No Build (Alternative 1) would not result in adverse impacts, the benefits of stormwater improvements associated with the build alternatives, including those incorporated as enhanced water quality features, would not be realized.

3.8.3.2 PUBLIC HEALTH CONSIDERATIONS

The primary public health considerations related to floodplains and hydrology would be risks to life and property as a result of flooding. As discussed above, construction of the build alternatives is not anticipated to increase the risk of flooding because the build alternatives would not substantially increase the base flood elevations of the Los Angeles River, Compton Creek, or the Rio Hondo Channel. In addition, the build alternatives would not result in flood-related interruption of emergency services or routes. Operation of the build alternatives would not result in interruption of emergency services or routes and would improve access throughout the region during a flood event. Therefore, there would be no substantial flood-related risks to life or property associated with implementation of the build alternatives.

3.8.4 AVOIDANCE, MINIMIZATION, AND/OR MITIGATION MEASURES

Measures to minimize long-term operational impacts of the build alternatives on the natural and beneficial floodplain values related to water quality are discussed in Section 3.9, Water Quality. Measures to minimize permanent impacts of the build alternatives to jurisdictional waters are discussed in Section 3.17, Wetlands and Other Waters of the United States. In addition, the following measures are required for impacts to the 100-year floodplain and impacts to the Lynwood Retention Basin and the Dominguez Gap Spreading Grounds resulting from the build alternatives. However, as the No Build (Alternative 1) was identified as the Preferred Alternative, impacts to hydrology and floodplains would not occur, and the adoption of this alternative would not require any avoidance, minimization, and/or mitigation measures. Avoidance, minimization, and/or mitigation measures pertaining to the two build alternatives are retained in this Final EIR/EIS for disclosure purposes.

FP-1 During final project design, and prior to the issuance of any grading permits, the California Department of Transportation (Caltrans) shall process a Conditional Letter of Map Revision and a Letter of Map Revision, if required, for the floodplain and floodway encroachments through the Los Angeles County Flood Control District (LACFCD) and Federal Emergency Management Agency (FEMA). This shall include submittal of final detailed applications, certification forms, hydraulic analyses (i.e., Final Flood Control Facilities Report, including a Location Hydraulic Study), and fee payment to FEMA to obtain a Conditional Letter of Map Revision and a Letter of Map Revision. The portion of the project within the 100-year

floodplain shall not be constructed until the Letter of Map Revision is approved by the LACFCD and FEMA.

FP-2

Prior to the completion of final design of Alternative 7, Caltrans shall coordinate with the Los Angeles County Department of Public Works and the LACFCD to identify a suitable location for replacement of the Lynwood Retention Basin and the Dominguez Gap Spreading Grounds that will provide equal or greater capacity than the facilities impacted by the freight corridor. Caltrans will consult with the LACFCD and affected local agencies to verify that the basin replacements will continue to meet water quality goals including those established for the Los Angeles River Metals Total Maximum Daily Load.

3.9 WATER QUALITY AND STORMWATER RUNOFF

3.9.1 REGULATORY SETTING

3.9.1.1 FEDERAL REQUIREMENTS: CLEAN WATER ACT

In 1972, Congress amended the Federal Water Pollution Control Act, making the addition of pollutants to the waters of the United States (U.S.), from any point source¹ unlawful unless the discharge is in compliance with a National Pollutant Discharge Elimination System (NPDES) permit. This act and its amendments are known today as the Clean Water Act (CWA); Congress has amended it several times. In the 1987 amendments, Congress directed dischargers of storm water from municipal and industrial/construction point sources to comply with the NPDES permit scheme. The following are important CWA sections:

- Sections 303 and 304 require states to issue water quality standards, criteria, and guidelines.
- Section 401 requires an applicant for a federal license or permit to conduct any activity that may result in a discharge to waters of the U.S., to obtain certification from the state that the discharge will comply with other provisions of the act. This is most frequently required in tandem with a Section 404 permit request (see below).
- Section 402 establishes the NPDES, a permitting system for the discharges (except for dredge or fill material) of any pollutant into waters of the U.S. Regional Water Quality Control Boards (RWQCB) administer this permitting program in California. Section 402(p) requires permits for discharges of storm water from industrial/construction and municipal separate storm sewer systems (MS4s).
- Section 404 establishes a permit program for the discharge of dredge or fill material into waters of the U.S. This permit program is administered by the U.S. Army Corps of Engineers (USACE).

The goal of the CWA is “to restore and maintain the chemical, physical, and biological integrity of the Nation’s waters.”

The USACE issues two types of 404 permits: General and Standard permits. There are two types of General permits: Regional permits and Nationwide permits. Regional permits are issued for a general category of activities when they are similar in nature and cause minimal environmental effect. Nationwide permits are issued to authorize a variety of minor project activities with no more than minimal effects.

¹ A point source is any discrete conveyance such as a pipe or a human-made ditch.

Ordinarily, projects that do not meet the criteria for a Regional or Nationwide Permit may be permitted under one of USACE's Standard permits. There are two types of Standard permits: Individual permits and Letters of Permission. For Standard permits, the USACE decision to approve is based on compliance with the U.S. Environmental Protection Agency's (EPA) Section 404 (b)(1) Guidelines (EPA Code of Federal Regulations [CFR] 40 Part 230), and whether permit approval is in the public interest. The Section 404(b)(1) Guidelines (Guidelines) were developed by the EPA in conjunction with USACE, and allow the discharge of dredged or fill material into the aquatic system (waters of the U.S.) only if there is no practicable alternative which would have less adverse effects. The Guidelines state that USACE may not issue a permit if there is a least environmentally damaging practicable alternative (LEDPA) to the proposed discharge that would have lesser effects on waters of the U.S. and not have any other significant adverse environmental consequences. According to the Guidelines, documentation is needed that ensures a sequence of avoidance, minimization, and compensation measures has been followed, in that order. The Guidelines also restrict permitting activities that violate water quality or toxic effluent² standards, jeopardize the continued existence of listed species, violate marine sanctuary protections, or cause "significant degradation" to waters of the U.S. In addition, every permit from the USACE, even if not subject to the Section 404(b)(1) Guidelines, must meet general requirements. See 33 CFR 320.4. A discussion of the LEDPA determination, if any, for the document is included in the Wetlands and Other Waters section (Section 3.17).

3.9.1.2 STATE REQUIREMENTS: PORTER-COLOGNE WATER QUALITY CONTROL ACT

California's Porter-Cologne Act, enacted in 1969, provides the legal basis for water quality regulation within California. This act requires a "Report of Waste Discharge" for any discharge of waste (liquid, solid, or gaseous) to land or surface waters that may impair beneficial uses for surface and/or groundwater of the state. It predates the CWA and regulates discharges to waters of the state. Waters of the state include more than just waters of the U.S., like groundwater and surface waters not considered waters of the U.S. Additionally, it prohibits discharges of "waste" as defined, and this definition is broader than the CWA definition of "pollutant". Discharges under the Porter-Cologne Act are permitted by Waste Discharge Requirements (WDRs) and may be required even when the discharge is already permitted or exempt under the CWA.

The State Water Resources Control Board (SWRCB) and RWQCBs are responsible for establishing the water quality standards (objectives and beneficial uses) required by the CWA, and regulating discharges to ensure compliance with the water quality standards. Details regarding water quality standards in a project area are contained in the applicable RWQCB Basin Plan. In California, Regional Boards designate beneficial uses for all water body segments in their jurisdictions and then set criteria necessary to protect these uses. As a result, the water quality standards developed for particular water segments are based on the designated use and vary

² The U.S. Environmental Protection Agency (EPA) defines "effluent" as "wastewater, treated or untreated, that flows out of a treatment plant, sewer, or industrial outfall."

depending on that use. In addition, the SWRCB identifies waters failing to meet standards for specific pollutants. These waters are then State- listed in accordance with CWA Section 303(d). If a state determines that waters are impaired for one or more constituents and the standards cannot be met through point source controls (NPDES permits or WDRs), the CWA requires the establishment of Total Maximum Daily Loads (TMDLs). TMDLs specify allowable pollutant loads from all sources (point, non-point, and natural) for a given waterbody.

3.9.1.3 STATE WATER RESOURCES CONTROL BOARD AND REGIONAL WATER QUALITY CONTROL BOARDS

The SWRCB administers water rights, sets water pollution control, issues Water Board orders on matters of statewide application, and oversees water quality functions throughout the State by approving Basin Plans, TMDLs, and NPDES permits. RWCQB's are responsible for protecting beneficial uses of water resources within their regional jurisdiction using planning, permitting, and enforcement authorities to meet this responsibility.

NATIONAL POLLUTION DISCHARGE ELIMINATION SYSTEM (NPDES) PROGRAM.

MUNICIPAL SEPARATE STORM SEWER SYSTEMS (MS4). Section 402(p) of the CWA requires the issuance of NPDES permits for five categories of storm water dischargers, including Municipal Separate Storm Sewer Systems (MS4s). An MS4 is defined as any "conveyance or system of conveyances (roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, human-made channels, and storm drains) owned or operated by a state, city, town, county, or other public body having jurisdiction over storm water, that is designed or used for collecting or conveying storm water." The SWRCB has identified the California Department of Transportation (Caltrans) as an owner/operator of an MS4 under Federal regulations. Caltrans' MS4 permit covers all Caltrans rights-of-way, properties, facilities, and activities in the State. The SWRCB or the RWQCB issues NPDES permits for five years, and permit requirements remain active until a new permit has been adopted.

The Department's MS4 Permit, Order No. 2022-0033-DWQ (adopted on June 22, 2022, and effective on January 1, 2023), has three basic requirements:

1. Caltrans must comply with the requirements of the Construction General Permit (see below);
2. Caltrans must implement a year-round program in all parts of the State to effectively control storm water and non-storm water discharges; and
3. Caltrans storm water discharges must meet water quality standards through implementation of permanent and temporary (construction) Best Management Practices (BMPs) to the Maximum Extent Practicable, and other measures as the SWRCB determines to be necessary to meet the water quality standards.

To comply with the permit, Caltrans developed the Statewide Storm Water Management Plan (SWMP) to address storm water pollution controls related to highway planning, design, construction, and maintenance activities throughout California. The SWMP assigns responsibilities within Caltrans for implementing storm water management procedures and practices as well as training, public education and participation, monitoring and research, program evaluation, and reporting activities. The SWMP describes the minimum procedures and practices Caltrans uses to reduce pollutants in storm water and non-storm water discharges. It outlines procedures and responsibilities for protecting water quality, including the selection and implementation of BMPs.

CONSTRUCTION GENERAL PERMIT. Construction General Permit (NPDES No. CAS000002, SWRCB Order No. 2022-0057-DWQ, adopted on September 8, 2022) became effective on September 1, 2023. The permit regulates storm water discharges from construction sites which result in a Disturbed Soil Area (DSA) of one acre or greater, and/or are smaller sites that are part of a larger common plan of development. By law, all storm water discharges associated with construction activity where clearing, grading, and excavation results in soil disturbance of at least one acre must comply with the provisions of the Construction General Permit. Construction activity that results in soil disturbances of less than one acre is subject to this Construction General Permit if there is potential for significant water quality impairment resulting from the activity as determined by the RWQCB. Operators of regulated construction sites are required to develop storm water pollution prevention plans; to implement sediment, erosion, and pollution prevention control measures; and to obtain coverage under the Construction General Permit.

The Construction General Permit separates projects into Risk Levels 1, 2, or 3. Risk levels are determined during the planning and design phases, and are based on potential erosion and transport to receiving waters. Requirements apply according to the Risk Level determined. For example, a Risk Level 3 (highest risk) project would require compulsory storm water runoff pH and turbidity monitoring, and before construction and after construction aquatic biological assessments during specified seasonal windows. For all projects subject to the permit, applicants are required to develop and implement an effective Storm Water Pollution Prevention Plan (SWPPP). In accordance with the Caltrans' Standard Specifications, a Water Pollution Control Plan (WPCP) is necessary for projects with DSA less than one acre.

SECTION 401 PERMITTING. Under Section 401 of the CWA, any project requiring a Federal license or permit that may result in a discharge to a water of the U.S, must obtain a 401 Certification, which certifies that the project will be in compliance with State water quality standards. The most common Federal permits triggering 401 Certification are CWA Section 404 permits issued by USACE. The 401 permit certifications are obtained from the appropriate RWQCB, dependent on the project location, and are required before USACE issues a 404 permit.

In some cases, the RWQCB may have specific concerns with discharges associated with a project. As a result, the RWQCB may issue a set of requirements known as Waste Discharge Requirements (WDRs) under the State Water Code (Porter-Cologne Act) that define activities, such as the inclusion of specific features, effluent limitations, monitoring, and plan submittals that are to be implemented for protecting or benefiting water quality. WDRs can be issued to address both permanent and temporary discharges of a project.

3.9.2 AFFECTED ENVIRONMENT

This information in this section is based on the following technical reports:

- *Preliminary On-Site Hydrology Report* (December 2016)
- *Storm Water Data Report* (January 2017)
- *Water Quality Assessment Report* (March 2017)
- *Geotechnical Final Report* (January 2010)

3.9.2.1 SURFACE WATER

Surface waters are shown in Figure 3.9-1. The Interstate 710 (I-710) Corridor Project is located within the Los Angeles Basin and discharges to two Los Angeles County watersheds: Dominguez Channel/Los Angeles Harbor and Los Angeles River. In addition, a portion of the I-710 Corridor Project is adjacent to the San Gabriel River Watershed. The primary receiving waters for runoff from the Study Area are the Los Angeles River, Compton Creek, the Rio Hondo Channel, and the Dominguez Channel. The Los Angeles River parallels the I-710 freeway throughout much of the Study Area. Compton Creek and the Rio Hondo Channel are also located within the Study Area and are tributary to the lower portion of the Los Angeles River. The Dominguez Channel flows almost parallel to I-710, approximately one mile west of I-710 between Interstate 405 (I-405) and the Pacific Ocean. Water in the Los Angeles River is fed by Bell Creek and Calabasas Creek which have headwaters in the Santa Susana and Santa Monica Mountains. Several other feeder creeks flow from the mountains and hills ringing the valley and flow into the Los Angeles River at points throughout the valley. Other major sources of water for the Los Angeles River include the Donald C. Tillman Water Reclamation Plant, which releases recycled wastewater downstream of the Sepulveda Basin; as well as the Tujunga Wash, Santa Monica Mountains and Rio Hondo Channel. Each of these areas carries runoff from areas throughout the watershed and deposits it

This page intentionally left blank

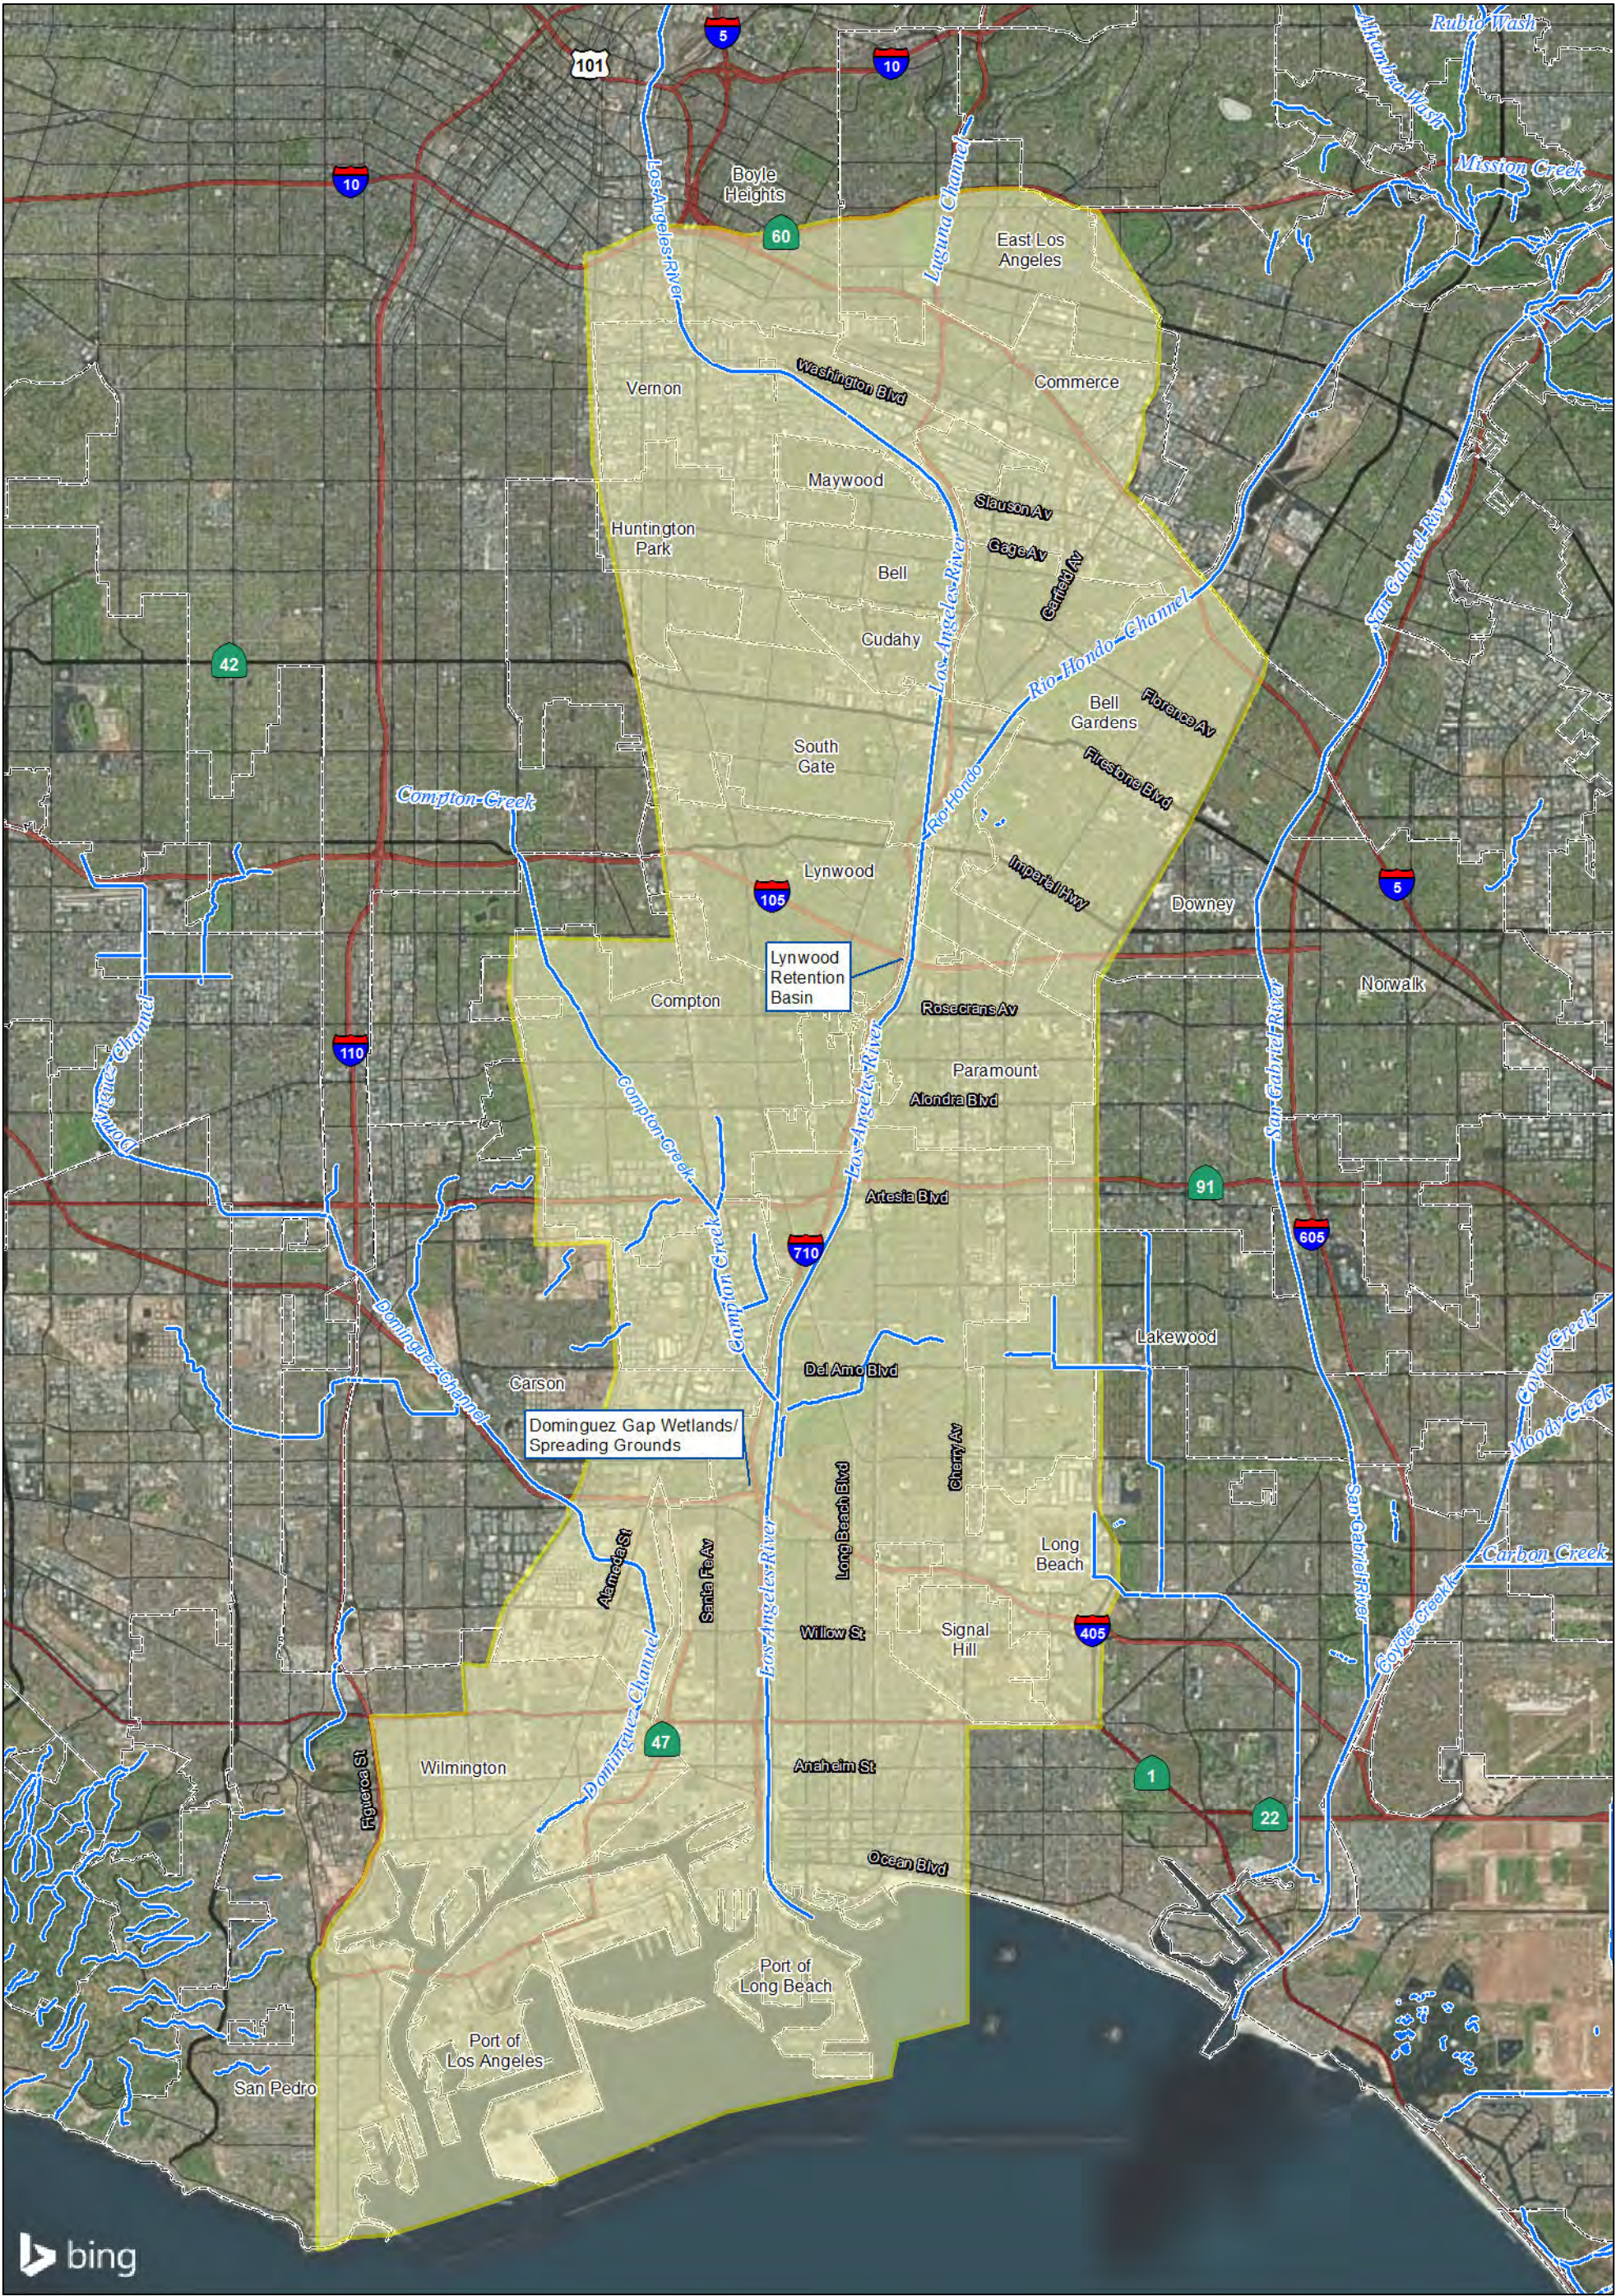

FIGURE 3.9-1

This page intentionally left blank

into the Los Angeles River (The River Project 2011,³ Tillman Personnel and Multi-use Facility Project IS-MND 2012⁴).

LOS ANGELES RIVER. The Los Angeles River begins in Canoga Park in the City of Los Angeles and flows to the Pacific Ocean in the City of Long Beach. The Los Angeles River within the I-710 Corridor Study area is an unvegetated, concrete- and riprap-lined trapezoidal channel. A small portion of the Los Angeles River south of Willow St. in Long Beach has a natural bottom and supports riparian vegetation. The flow in the Los Angeles River varies greatly over the course of the year. During the dry season, most of the water in the river is from wastewater effluent, whereas in the wet season, the river contains runoff from large storms. In addition to variability in seasonal flow, the flow in the channel increases greatly as the river flows toward its mouth on the Pacific Ocean.

COMPTON CREEK. Compton Creek originates at the convergence of several underground storm drains in the City of Los Angeles at Main St. between 107th St. and 108th St. Compton Creek merges with the Los Angeles River just south of the I-710/Del Amo Blvd. interchange. Compton Creek flows generally south through a 5.8-mile channel reach with a concrete bottom and vertical sides. The channel widens just north of State Route 91 (SR-91) in the City of Compton and has a natural earthen bottom and armored trapezoidal sides, which extend approximately 2.7 miles to just above the confluence with the Los Angeles River. In this earthen-bottom portion, vegetation is present in the channel bottom. Flows within Compton Creek are perennial.

RIO HONDO CHANNEL. The Rio Hondo Channel originates in the City of Irwindale and merges with the Los Angeles River just north of the I-710/Imperial Hwy. interchange. Rio Hondo Channel is an unvegetated rectangular concrete channel with intermittent flows.

DOMINGUEZ CHANNEL. The Dominguez Channel extends from the Los Angeles International Airport to the Los Angeles Harbor. It is a human-made channel in the lower reach, which terminates at the Consolidated Slip within the East Basin Channel of Los Angeles Harbor.

INNER LOS ANGELES-LONG BEACH HARBOR. The Los Angeles and Long Beach Harbors are located in the southern portion of the Los Angeles Basin. The harbor is highly disturbed by human activity; however, the inner harbor area supports fairly diverse fish and benthic populations and provides a protected nursery area for juvenile fish. Additionally, the outer harbor, which is less

³ The River Project. 2011. Website: <http://www.theriverproject.org/learn/know-your-watershed/the-los-angeles-river-watershed/the-valley> (accessed January 5, 2017).

⁴ City of Los Angeles. Department of Public Works. Bureau of Engineering. 2016. Website: http://eng.lacity.org/techdocs/emg/docs/dc_water/Public_Draft_IS-MND.pdf (accessed January 6, 2017).

disturbed, supports a large population of fish and receives larger amounts of flushing than the inner harbor (SWRCB, 2008).⁵

I-710 ON-SITE DRAINAGE. The existing on-site drainage systems consist of a series of drainage inlets along the median and shoulders, cross culverts, asphaltic concrete dikes, overside drains, concrete and earthen channels, and pump stations. The northbound and southbound I-710 mainline lanes generally sheet flow to the outside edge of the shoulder, which is then concentrated by inlets into the underground drainage system. In the superelevation portion of the I-710 Corridor Project build alternatives, the stormwater runoff drains to the median, where drainage inlets convey the runoff to the cross drainage facilities.

3.9.2.2 SURFACE WATER BENEFICIAL USES

Beneficial uses form the cornerstone of water quality protection under the Los Angeles RWQCB's *Water Quality Control Plan, Los Angeles Region: Basin Plan for the Coastal Watersheds of Los Angeles and Ventura Counties* (Basin Plan, September 2014).⁶ Appropriate water quality objectives are identified in the Basin Plan in relation to the designated beneficial uses to ensure the protection of these uses. The designated beneficial uses, together with water quality objectives, form the water quality standards. Existing beneficial uses for the Los Angeles River, Compton Creek, the estuarine portion of Dominguez Channel, the Rio Hondo Channel, and the Los Angeles/Long Beach Harbor are presented in Table 3.9-1. To preserve the beneficial uses at their current level, water quality objectives have been developed and published in the basin plans.

3.9.2.3 SURFACE WATER QUALITY

Pollutants in urban runoff from dense clusters of residential, industrial, and other urban activities have impaired water quality in the majority of the Los Angeles River Watershed. Added to this complex mixture of pollutant sources (in particular, pollutants associated with urban and stormwater runoff) is the high number of point source permits. Excessive nutrients (and their effects) and coliform are widespread problems in the watersheds, as well as excessive metals. The majority of the Los Angeles River Watershed is considered impaired due to a variety of point and nonpoint sources. The Los Angeles River, Compton Creek, the Rio Hondo Channel, and the Dominguez Channel are all listed as impaired on the 2012 CWA Section 303(d) List of Water Quality Limited Segments.

Source: Los Angeles Regional Water Quality Control Board. *Basin Plan* (2014).

The Los Angeles River Estuary (Queensway Bay) is listed as impaired for chlordane (sediment), dichlorodiphenyltrichloroethane (DDT) (sediment), polychlorinated biphenyls (PCBs) (sediment), sediment toxicity, and trash. The Los Angeles River Reach 1 (Estuary to Carson St.) is listed as impaired for coliform bacteria, cyanide, cadmium, diazinon, trash, ammonia, dissolved copper, lead, nutrients (algae), pH, and dissolved zinc. The Los Angeles River Reach 2 (Carson St. to Figueroa St.) is listed as impaired for coliform bacteria, copper, nutrients (algae), oil, trash, ammonia, and lead.

Compton Creek is listed as impaired for coliform bacteria, benthic-macroinvertebrate bioassessments, trash, copper, lead, and pH. Rio Hondo Channel (Reach 1 from the confluence with the Los Angeles River to the Santa Ana Freeway) is listed as impaired for coliform bacteria, copper, lead, toxicity, trash, zinc, and pH. Dominguez Channel is listed as impaired for ammonia, benthic community effects, benzo(a)anthracene, benzo(a)pyrene (3,4-Benzopyrene—d), chlordane (tissue), Chrysene (C1-C4), coliform bacteria, DDT (tissue and sediment), dieldrin (tissue), lead (tissue), PCBs, phenanthrene, pyrene, sediment toxicity, and zinc (sediment).

The Los Angeles/Long Beach Inner Harbor is listed as impaired for beach closures, benthic community effects, benzo(a)pyrene, chrysene (C1-C4), copper, DDT, PCBs, sediment toxicity, and zinc.

TMDLs⁷ must be developed for waters listed as impaired on the Section 303(d) List of Water Quality Limited Segments. Table 3.9-2 presents approved TMDLs and TMDLs being developed for water bodies affected by the I-710 Corridor Project build alternatives.

⁷ TMDLs are the total amount of a constituent that can be discharged while meeting water quality objectives and protecting beneficial uses. It is the sum of the individual load allocations for point-source inputs (e.g., an industrial plant), load allocations for nonpoint-source inputs (e.g., runoff from urban areas), and the natural background with a margin of safety included.

Table 3.9-2: Expected and Approved Total Maximum Daily Loads

3.9.2.4 GROUNDWATER

The I-710 Corridor Project is located within the Coastal Plain of the Los Angeles Groundwater Basin and is specifically underlain by the West Coast and Central subbasins. The Coastal Plain of the Los Angeles Groundwater Basin is adjacent to the Santa Monica Mountains and the Puente Hills on the north and east, on the south by the San Joaquin Hills, and on the west by the Pacific Ocean.

Groundwater in the project area migrates southerly, southwesterly, and westerly through the aquifers toward the coast. Shallow, perched aquifers recharged from local surface sources are also present in the Study Area.

The primary source of groundwater in the Study Area is rain and snow melt from the San Gabriel Mountains that travels through washes and creeks into the San Gabriel River and the Rio Hondo

Channel, where some of the water flow is diverted into infiltration (percolation) spreading grounds or basins along those rivers to the northeast of the Study Area.

The west basin of the Dominguez Gap Spreading Grounds, located between the I-710 freeway and the Los Angeles River just north of the I-405 interchange, is one of three interconnected basins used to provide recharge to the local groundwater table. The two remaining basins are located on the east side of the Los Angeles River. The west basin is operated by the County of Los Angeles and infiltrates peak flows from storm events into the ground through a pervious surface layer. The basins also provide habitat for local species.

According to the *Geotechnical Final Report* (January 2010), groundwater has been encountered in many test borings along the project alignment during previous investigations for bridge construction by Caltrans and Los Angeles County. Groundwater encountered in the bridge test borings within the Study Area was on the order of five to 15 feet below the ground surface (bgs) at the south end of the Study Area in the vicinity of Ocean Blvd. north to Pacific Coast Hwy. (State Route 1 [SR-1]). North of this area at Wardlow Rd. and I-405, the depth to groundwater increased to approximately 45 feet bgs. In the area north to the Miller Wy. undercrossing (approximately 1.8 miles north of I-405), groundwater was encountered at all bridge locations at depths ranging from 2.9 feet bgs at the Atlantic Ave. undercrossing to approximately 71 feet bgs at the Compton Blvd. overcrossing. In the area north of this location to the north end of the project alignment, groundwater depths ranged from 2.2 feet bgs at the Gage Ave. bridge to greater than the maximum depth explored of 113 feet bgs at the Cheli Depot overhead. It is likely that some of the depths to groundwater represent local perched water tables, especially some of the shallowest depths.

3.9.2.5 GROUNDWATER BENEFICIAL USES

The following existing beneficial uses are identified in the Basin Plan for the West Coast and Central subbasins of the Coastal Plain of the Los Angeles Groundwater Basin:

West Coast Subbasin:

- Agricultural Supply
- Industrial Process Supply
- Industrial Service Supply

Central Subbasin:

- Municipal and Domestic Supply
- Agricultural Supply
- Industrial Process Supply
- Industrial Service Supply

3.9.2.6 GROUNDWATER QUALITY

The majority of the groundwater in the West Coast and Central subbasins is of high quality and requires little to no treatment before being pumped out of wells and used as potable water for the public. The subbasins' underlying gravel, sand, silt, and clay formations provide for slow fluid movement, which improves groundwater quality through a process known as geopurification.

The most commonly detected groundwater contaminants are, in order of findings: arsenic, perchloroethylene (PCE), trichloroethylene (TCE), total dissolved solids (TDS), manganese, and odor. In addition, seawater intrusion along the lower portions of both subbasins has produced deterioration of water quality over time.

3.9.3 ENVIRONMENTAL CONSEQUENCES

The following discussion of environmental consequences only describes the permanent impacts of the project. Please refer to Section 3.24 of this document, Construction Impacts, for a discussion of the temporary impacts of the project for each resource area. Specifically, temporary impacts related to water quality and stormwater runoff associated with the build alternatives are located in Section 3.24.3.9.

3.9.3.1 PERMANENT IMPACTS

BUILD ALTERNATIVES.

ALTERNATIVE 5C. Alternative 5C would require replacing or extending the existing on-site drainage systems such as drainage inlets along the median and shoulders with new drainage systems that can accommodate the increased flows.

The existing drainage systems that transfer legacy runoff from the adjacent neighborhoods through the I-710 Corridor would be modified to accommodate the improvements included as part of Alternative 5C while still maintaining the existing hydraulic capacity required to accommodate legacy storm flows. Existing Los Angeles River drainage outlets would be maintained in their existing location whenever hydraulically feasible and when not impacted by the improvements under Alternative 5C.

In terms of the long-term effects, Alternative 5C has the potential to impact water quality because it would result in an increase in roadway surface area. The cumulative risk level for Alternative 5C was determined to be Risk Level 2 through the Construction General Permit (CGP) procedure. The increase in impervious area for Alternative 5C is 156.4 acres, which results in a total post-project impervious surface area of 913.1 acres (pre-project area of 756.7 acres). This increase in impervious area brings an increase in runoff volume and pollutant loads that require treatment. Treatment BMPs have been identified and preliminarily sited for both build alternatives. Alternative 5C and all applicable design options would treat 74 percent of the total paved area.

The long-term surface runoff operational effects on water quality stemming from construction of Alternative 5C considers only the continuous impact on contaminant runoff throughout the life of the new facility. This typically includes the following impacts on receiving water quality:

- Incidental drippings from vehicle and accidental spills that introduce contaminant material or waste discharge from the new bridge and its approach structures
- Maintenance activities, such as bridge painting, surface treatments and surface cleaning, substructure repair, joint repair, repairing drainage structures and pavement repair, and repaving

Under Alternative 5C, surface runoff would be designed to flow directly into the closest stormwater channel. Runoff from bridges would be directed to nearby drainage features via drainage inlets on the decks which then flow through the pillars. From an operational standpoint, impacts to water quality may occur from the loading of various constituents typically associated with highway runoff into the channel. These constituents may include the following:

- Particulates from pavement wear and vehicles
- Metals, such as zinc, lead, iron, copper, cadmium, chromium, nickel, and manganese
- Bromide (from leaded gasoline exhaust)
- Diesel fuel
- Tire wear
- Auto body rusting
- Metal plating
- Brake lining wear
- Greases and lubricating oils from automobiles and trucks
- Trash discarded from vehicles and along the roadside
- Pathogenic bacteria (indicators) from soil, litter, bird droppings, and stockyard waste hauled by vehicles on the new bridge

These potential operational impacts resulting from Alternative 5C would be addressed through the incorporation of design pollution prevention BMPs, low impact development (LID) BMPs, treatment BMPs, and adherence to the necessary operational maintenance protocols identified in the Caltrans SWMP. These requirements are specified in Measure WQ-2 in Section 3.9.4.1, below. Under Alternative 5C, selection of operational BMPs would be refined during final design and would include design pollution prevention BMPs, LID BMPs, treatment BMPs, and maintenance BMPs. Design pollution prevention BMPs included under Alternative

5C would include consideration of downstream effects related to potentially increased flow, preservation of existing vegetation, concentrated flow conveyance systems, and slope/surface protection systems. Treatment BMPs would include 40 biofiltration swales, 12 media filters, 32 infiltration/detention basin, and one wet basin, as well as eight gross solids removal devices where feasible. All permanent treatment BMPs would have maintenance requirements associated with their implementation. Operational maintenance BMPs would include storm drain cleaning and normal roadway and bridge maintenance, in addition to maintaining all vegetated slopes. The introduction of treatment BMPs as part of Alternative 5C would represent an improvement when compared to the No Build condition, as there currently are 60 Caltrans-maintained BMPs treating freeway runoff on I-710. Existing BMPs within the project area would be removed as a result of the changing alignment and profile of Alternative 5C.

In addition to the design pollution prevention and treatment BMPs, Alternative 5C would feature LID features throughout the project area. Under Alternative 5C, the final selection of features would be made once drainage, grading, and other design features are determined. Possible LID features would include surface vegetation, soil amendments, subsurface storage, small detention areas, pervious materials, disconnected drainage relying on overland flow, and contour grading. These features would also be integrated as green streets measures to minimize impervious surfaces throughout the project area of the build alternative.

The existing site runoff for a 25-year storm is 3,181 cubic feet per second (cfs) and for a 50-year storm is 3,623 cfs. The increase in peak flow associated with the 25-year storm for Alternative 5C would be 445 cfs, and the largest peak-flow increase for the 50-year storm would be 507 cfs. Therefore, the post-project stormwater runoff would be 3,626 cfs for the 25-year storm and 4,130 cfs for the 50-year storm. Under Alternative 5C, BMPs would be designed to treat low flows from more regular storms. The Caltrans Permit requires that the stormwater runoff water volumes used for sizing BMPs be based on the 85th percentile, 24-hour storm event (Water Quality event). For estimating purposes, this event is roughly equivalent to 74 percent of on-site runoff from the total post-project impervious surface areas within the project area, which would be an improvement over the existing condition. After implementation of BMPs, Alternative 5C is not anticipated to further degrade the water quality of any receiving waters.

Stormwater discharges to Caltrans' MS4 are regulated through the Caltrans MS4 Permit. Although the Caltrans Stormwater Permit does not include a Watershed Management Program (WMP) compliance approach like the Los Angeles and Long Beach MS4 Permits, its TMDL provisions do require cooperation with agencies subject to the same TMDLs. As such, Caltrans' participation is restricted to those sections of the WMP related to TMDL requirements. Caltrans acknowledged their intent to participate for any build alternative.

Permanent impacts to the water quality of groundwater in the vicinity of the improvements under Alternative 5C would be minimal upon completion of the construction because there would not be any increase in the transport of pollutants into the groundwater through infiltration during the operational life of the new structures. The sediment surface of some of the affected channels is impervious, while other locations are natural bottom. Operation of Alternative 5C would not change the nature or extent of these surfaces; therefore, no net gain or loss in infiltration is anticipated from operation of Alternative 5C. Under Alternative 5C, the treatment BMPs selected would provide infiltration opportunities along the alignment, which would be a positive influence on the local hydrogeology.

With the incorporation of the site-specific BMPs during the operational phase of Alternative 5C, along with adherence to BMP and operational maintenance protocols, no adverse impacts to water quality due to operation of the improvements under Alternative 5C are anticipated.

DESIGN OPTION 1A

Design Option 1A would result in similar impacts to Alternative 5C. The increase in impervious surface associated with this design option would be 155.4 acres resulting in a total post-project impervious area of 912.1 acres. The runoff amounts during a 25-year storm event and a 50-year storm event under this design option would be 3,621 cfs (net change of 440 cfs) and 4,124 cfs (net change of 501 cfs), respectively.

DESIGN OPTION 2A

Design Option 1A would result in similar impacts to Alternative 5C. The increase in impervious surface associated with this design option would be 161.7 acres resulting in a total post-project impervious area of 918.4 acres. The runoff amounts during a 25-year storm event and a 50-year storm event under this design option would be 3,640 cfs (net change of 459 cfs) and 4,146 cfs (net change of 523 cfs), respectively.

DESIGN OPTION 3A

Design Option 3A would result in similar impacts to Alternative 5C. The increase in impervious surface associated with this design option would be 161.5 acres, for a total post-project impervious area of 918.2 acres. The runoff amounts during a 25-year storm event and a 50-year storm event under this design option would be 3,635 cfs (net change of 454 cfs) and 4,140 cfs (net change of 517 cfs), respectively.

ALTERNATIVE 7. Permanent water quality impacts during operation of Alternative 7 are similar to those discussed above under Alternative 5C. However, Alternative 7 would result in an increase in impervious area of 256.9 acres, for a total post-project impervious area of 1013.6 acres, which is greater than the increase for Alternative 5C. The increase in impervious surface, and therefore, the increase in runoff and pollutant loading under Alternative 7, would

be greater than under Alternative 5C. Alternative 7 and all applicable design options would treat 78.3 percent of the total paved project area.

Runoff for Alternative 7 would increase by 825 cfs for a 25-year storm and 940 cfs for a 50-year storm, which means that the total peak flow for a 25-year storm would be 4,006 cfs and for a 50-year storm would be 4,563 cfs. Under Alternative 7, treatment BMPs would include 36 bioswales, 30 infiltration basins, 12 media filters, and one wet basin, as well as eight gross solids removal devices where feasible. BMPs for Alternative 7 would be designed to treat low flows from more regular storms. The Caltrans Permit requires that the stormwater runoff water volumes used for sizing BMPs be based on the 85th percentile, 24-hour storm event (Water Quality event). For estimating purposes, this event is roughly equivalent to a two-year peak-flow storm. The Design Pollution Prevention (DPP) and BMPs would treat 78.3 percent of on-site runoff from the total impervious surface areas within the project area, which would be an improvement over the existing condition. After implementation of BMPs, Alternative 7 would not be anticipated to further degrade the water quality of any receiving waters.

In addition, Alternative 7 would include the construction of a freight corridor, which is not included under Alternative 5C. The portion of the freight corridor in the vicinity of the I-710/Interstate 105 (I-105) interchange would be located at-grade and would require relocation of one of two existing retention basins that serve to meter the peak flows of the Los Angeles River channel. The freight corridor construction would also require the relocation of the Dominguez Gap Basin, located just north of the I-710/I-405 interchange. Several parcels have been identified adjacent to I-710 and the Los Angeles River for relocation of the Dominguez Gap Basin. Under Alternative 7, the exact location for relocating the basin would be coordinated between the Los Angeles Department of Water and Power, Gateway Cities Council of Governments, and Caltrans. As specified in Section 3.8 in Mitigation Measure FP-2, under Alternative 7, the relocation and reconstruction of the westerly Dominguez Gap Basin would retain the basin's original recharge capacity, at a minimum. Therefore, the relocation of this basin would not be anticipated to adversely impact groundwater quantity or quality.

DESIGN OPTION 1B

Design Option 1B would result in similar impacts to Alternative 7. The increase in impervious surface associated with this design option would be 256.3, for a total post-project impervious area of 1,013.0 acres. The runoff amounts during a 25-year storm event and a 50-year storm event under this design option would be 4,009 cfs (net change of 828 cfs) and 4,566 cfs (net change of 943 cfs), respectively.

DESIGN OPTION 3B

Design Option 3B would result in similar impacts to Alternative 7. The increase in impervious surface associated with this design option would be 262.2 acres for a total post-project impervious surface area of 1,018.9 acres. The runoff amounts during a 25-year storm event

and a 50-year storm event under this design option would be 4,095 cfs (net change of 835 cfs) and 4,605 cfs (net change of 951 cfs), respectively.

DESIGN OPTION 7ZE

Design Option 7ZE features no variation in geometry from the Alternative 7 configuration and is purely operational in nature. This Design Option would have the same water quality impact as Alternative 7.

SUMMARY. Alternatives 5C and 7 would increase impervious surface areas, which would increase runoff volume and pollutant loads. Alternatives 5C and 7 would require replacement or extension of the existing drainage systems such as drainage inlets along the median and shoulders to accommodate the increased flows. Impacts to water quality of receiving waters may occur from the loading of various constituents typically associated with highway runoff. For any build alternative, these operational impacts would be addressed through the incorporation of design pollution prevention BMPs, treatment BMPs, and adherence to the necessary operational maintenance protocols identified in the Caltrans SWMP. As described in the *Storm Water Data Report* (January 2017), design pollution prevention BMPs include preserving existing vegetation wherever feasible, incorporation of concentrated flow conveyance systems with velocity-reducing outlet structures, and providing slope protection with vegetation. Treatment BMPs would include biofiltration swales, biofiltration strips, infiltration basins, media filters, detention basins, gross solids removal devices, and wet basins. Operational maintenance BMPs would include storm drain cleaning and normal roadway and bridge maintenance, in addition to maintaining all vegetated slopes.

The BMPs utilized for both alternatives would have varying effectiveness when treating certain pollutants. When used together, all pollutants of concern are effectively treated. Infiltration trenches, wet basins, and infiltration basins, which include detention basins, treat all pollutants of concern with high effectiveness. Biofiltration swales treat nutrients trash and bacteria at low effectiveness and all other pollutants at medium effectiveness. Media filters treat nutrients with low effectiveness, bacteria with medium effectiveness, and all other pollutants high effectiveness. Vegetated buffer strips treat sediment, metals, and oil and grease with high effectiveness; trash, organics, and oxygen demand with medium effectiveness; and nutrients and bacteria with low effectiveness. Finally, gross solids removal devices are highly effective at removing trash and debris.⁸ For any build alternative, these BMPs would be integrated into the corridor using enhanced landscape design techniques to draw more attention to them and enhance the aesthetics of stormwater control features.

⁸ California Stormwater Quality Association. 2003. *California Stormwater BMP Handbook*. Website: https://www.casqa.org/sites/default/files/BMPHandbooks/BMP_Municipal_Complete.pdf.

For any build alternative, maintenance of BMPs would be allowed for in the project design, and coordination with and concurrence from the Caltrans Maintenance unit would occur during final design.

With the incorporation of the site-specific BMPs during the operational phase of either build alternative, which would treat up to 75.8 percent of the total surface water runoff under Alternative 7, along with adherence to BMP and operational maintenance protocols, no adverse impacts to water quality due to operation of the build alternatives are anticipated.

Further, the Coordinated Integrated Monitoring Program (CIMP) for the Lower Los Angeles River Watershed Monitoring Group document dated December 21, 2017, was used to confirm the latest monitoring sites pertaining to the Los Angeles River. All of the sampling sites are in the floodway. However, one of the sites includes a “mass emission station.” This is the Los Angeles County Department of Public Works Gaging Station F319-R, which includes an 11-foot x 13-foot stilling well house situated on the western levee, south of Wardlow Rd. The station and supporting infrastructure would be relocated up to 400 feet south of its current location.

NO BUILD (ALTERNATIVE 1). Under the No Build (Alternative 1), which has been identified as the Preferred Alternative, there would not be an increase in impervious areas or changes in land uses in the Study Area. Therefore, the No Build (Alternative 1) would not result in an increase in long-term pollutant loading. The existing roadway runoff in this area would be treated by the existing 60 BMPs and is undergoing BMP development in accordance with the Stormwater permit. As a result, the No Build (Alternative 1) would result in an improvement to water quality based on these BMPs.

3.9.3.2 PUBLIC HEALTH CONSIDERATIONS

Water quality BMPs would be implemented to treat stormwater runoff during construction and operation of the build alternatives. As a result, the build alternatives are not anticipated to degrade the water quality of any receiving waters. For any build alternative, treatment BMPs would be designed to drain and eliminate standing water; therefore, vectors (such as mosquitoes) would not be of concern. Therefore, the build alternatives would not pose risks to public health related to hydrology and water quality. Since a build alternative was not identified at the Preferred Alternative, BMPs will not be implemented.

3.9.3.3 MOTION 22.1

As described in Chapter 2, Section 2.2.2.1 (Community Alternative 7) of this Final EIR/EIS, the Metro Board of Directors passed Board Motion 22.1 in October 2015 that directed Metro and Caltrans to study a number of additional items as a part of the I-710 Corridor Project Description. For water quality, Motion 22.1 requires that the build alternatives, consistent with the Regional Water Quality Control Boards and their Municipal Separate Storm Sewer System permits, identify

suitable locations within the State's right-of-way to implement additional storm water Best Management Practices (BMPs) and enhance the water quality for the Los Angeles River and its tributaries. Storm water BMPs for the build alternatives (both design pollution prevention BMPs for construction and, treatment BMPs for operation) are summarized above in Section 3.9.3, Environmental Consequences (Summary subsection) and described in detail in the *Storm Water Data Report* (January 2017).

3.9.4 AVOIDANCE, MINIMIZATION, AND/OR MITIGATION MEASURES

Compliance with standard requirements and permits listed in Section 3.24.4.9 would minimize short-term, construction-related impacts to water quality resulting from the build alternatives. For any build alternative, floodplain impacts from water quality, including those for relocation of basins, would be minimized by measures in 3.8.4. In addition, for any build alternative, the following measures would be required for long-term impacts to water quality and groundwater recharge.

However, as the No Build (Alternative 1) was identified as the Preferred Alternative, adverse impacts related to water quality would not occur, and the adoption of this alternative would not require any avoidance, minimization, and/or mitigation measures. Avoidance, minimization, and/or mitigation measures pertaining to the two build alternatives are retained in this Final EIR/EIS for disclosure purposes.

WQ-1 The California Department of Transportation (Caltrans) shall comply with provisions identified in the National Pollutant Discharge Elimination System (NPDES) Permit, Statewide Stormwater Permit and Waste Discharge Requirements (WDRs) Order No. 2012-0006-DWQ, NPDES No. CAS000002, or subsequent permit of the Construction General Permit (CGP). An effective Storm Water Pollution Prevention Plan (SWPPP) shall be developed and implemented. During final design, Caltrans will consult with the jurisdictions where discharges of runoff from Interstate 710 (I-710) to local jurisdictions' streets and/or stormwater drainage systems will occur during the project design development, treatment, and operational Best Management Practices (BMPs) in those local jurisdictions.

WQ-2 Caltrans shall follow the procedures outlined in the Caltrans Stormwater Quality Handbooks, Project Planning and Design Guide for implementing design pollution prevention and treatment BMPs including Low Impact Development (LIDs), for the project. Caltrans-approved treatment BMPs shall be implemented to the Maximum Extent Practicable (MEP), consistent with the requirements of the Statewide Storm Water Permit, Order No. 2012-0011-DWQ, NPDES No. CAS000003, and WDRs for Caltrans' properties, facilities, and activities, and any required MS4 Permits. This will include coordination with the Los Angeles Regional Water Quality Control Board (LARWQCB) with respect to feasibility, maintenance, and monitoring of

Treatment BMPs as set forth in the Caltrans Storm Water Management Plan (SWMP).

WQ-3

Caltrans shall require the construction contractor to comply with the provisions of the Waste Discharge Requirements for Discharges of Groundwater from Construction and Project Dewatering to Surface Waters in Coastal Watersheds of Los Angeles and Ventura Counties, Order No. R4-2013-0095, NPDES No. CAG994004, as they relate to discharge of non-stormwater dewatering wastes for the project, including monitoring and reporting requirements.

3.10 GEOLOGY/SOILS/SEISMIC/TOPOGRAPHY

The information in this section is based on the following documents:

- *Geotechnical Final Report* (January 2010)
- *Geotechnical Memorandum* (Department of Transportation Division of Engineering Services, Geotechnical Services [May 2010]), for the northern portion of the Study Area
- *Water Quality Assessment Report* (March 2017)

3.10.1 REGULATORY SETTING

For geologic and topographic features, the key Federal law is the Historic Sites Act of 1935, which establishes a national registry of natural landmarks and protects “outstanding examples of major geological features.” Topographic and geologic features are also protected under the California Environmental Quality Act (CEQA).

This section also discusses geology, soils, and seismic concerns as they relate to public safety and the design of the build alternatives. Earthquakes are prime considerations in the design and retrofit of structures. The California Department of Transportation’s (Caltrans) Office of Earthquake Engineering is responsible for assessing the seismic hazard for Caltrans projects. Structures are designed using the Caltrans Seismic Design Criteria (SDC). The SDC provide the minimum seismic requirements for highway bridges designed in California. A bridge’s category and classification will determine its seismic performance level and which methods are used for estimating the seismic demands and structural capabilities. For more information, please see Caltrans [Division of Engineering Services, Office of Earthquake Engineering, Seismic Design Criteria](#) (SDC).

It should be noted that refinements to seismicity and geological context are regularly updated by Caltrans’ Office of Earthquake Engineering, and the SDC has been updated since preparation of the *Geotechnical Final Report* (2010). Along with site-specific foundation investigations, the SDC would be used during the final design phase of project development to design new or modified structures featured in the build alternatives. Although the Design Seismic Hazards may have changed due to the changes in the SDC, for any build alternative, any impact resulting from changes in the Design Seismic Hazard definition would be addressed during final design using the most current Caltrans design guidelines.

LOCAL PLANS/POLICIES. Standards related to geology were identified in the Los Angeles County General Plan, in addition to the general plans of the affected cities and communities. The following are applicable goals and policies relevant to this Geology/Soils/Seismic/Topography section of this Final Environmental Impact Report/ Environmental Impact Statement (Final EIR/EIS):

COUNTY OF LOS ANGELES GENERAL PLAN (2015).

SAFETY ELEMENT.

- **GOAL S 1:** An effective regulatory system that prevents or minimizes personal injury, loss of life, and property damage due to seismic and geotechnical hazards.
 - **POLICY S 1.1:** Discourage development in Seismic Hazard and Alquist-Priolo Earthquake Fault Zones.

CITY OF CARSON GENERAL PLAN (2004). The following are goals and policies in the City of Carson's General Plan that are relevant to the Geology section of the Interstate 710 (I-710) Corridor Project.

SAFETY ELEMENT.

- **GOAL SAF-1:** Minimize the risk of injury, loss of life, and property damage caused by earthquake hazards.

OPEN SPACE AND CONSERVATION ELEMENT.

- **POLICY OSC-2.2:** Minimize soil erosion and siltation from construction activities through monitoring and regulation.

CITY OF COMMERCE GENERAL PLAN (2008).

SAFETY ELEMENT.

- **SAFETY POLICY 4.1:** The City of Commerce will ensure that appropriate mitigation measures relative to soil contamination and soils characteristics (subsidence, erosion, etc.) are required for development and redevelopment in order to reduce hazards.
- **SAFETY POLICY 8.1:** The City of Commerce will work to minimize hazards to public health, safety, and welfare, and prevent loss of life, bodily injury, and property damage resulting from natural and manmade phenomena.

CITY OF COMPTON DRAFT GENERAL PLAN (2014).

PUBLIC SAFETY ELEMENT.

- **PUBLIC SAFETY POLICY 1.5:** In areas with liquefaction potential, the City of Compton will require the review of soils and geologic conditions, and if-needed, on-site borings, to determine liquefaction susceptibility of the proposed site.

CITY OF CUDAHY GENERAL PLAN (2010).

PUBLIC SAFETY ELEMENT.

- **SAFETY ELEMENT POLICY 1.1:** The City of Cudahy will require geologic studies prior to the construction of critical facilities (hospitals, schools, fire stations, etc.).

CITY OF DOWNEY GENERAL PLAN (2005).

SAFETY ELEMENT.

- **GOAL 5.1:** Protect life and property from disasters and emergencies.
 - **POLICY 5.1.1:** Minimize the level of risk and exposure to disasters.
- **GOAL 5.5:** Address the potential hazards associated with seismic activity.
 - **POLICY 5.5.1:** Minimize damage in the event of a major earthquake.

CITY OF HUNTINGTON PARK GENERAL PLAN (1991).

SAFETY ELEMENT.

- **GOAL 1.0:** Protect the community from seismic hazards.
 - **POLICY 1.4:** In areas with liquefaction potential, require review of soils and geologic conditions, and if necessary, on-site borings, to determine liquefaction susceptibility of the proposed site.

CITY OF LAKEWOOD GENERAL PLAN (1996).

SAFETY ELEMENT.

- **GOAL 1:** To protect the health, welfare, and safety of the City's residents.
- **GOAL 4:** Minimize personal and property damage from earthquakes.
 - **POLICY 1.4:** In areas with liquefaction potential, require review of soils and geologic conditions, and if necessary, on-site borings, to determine liquefaction susceptibility of the proposed site.

CITY OF LONG BEACH GENERAL PLAN.

CONSERVATION ELEMENT.

- **SOIL MANAGEMENT GOAL NO. 3:** To minimize those activities which will have a critical or detrimental effect on geologically unstable areas and soils subject to erosion.

OPEN SPACE AND RECREATION ELEMENT.

- **GOAL/OBJECTIVE:** Provide for and maintain sufficient open space for adequate protection of lives and property against natural and man-made safety hazards.

PUBLIC SAFETY ELEMENT.

- **DEVELOPMENT GOAL 6:** Encourage transportation systems, utilities, industries, and similar uses to locate and operate in a manner consistent with public safety goals.

SEISMIC SAFETY ELEMENT.

- **MANAGEMENT GOAL 1:** Develop implementable mechanisms for a more stringent review of the earthquake potential associated with various projects.
- **DEVELOPMENT GOAL 2:** Provide an urban environment which is as safe as possible from seismic risk.
- **PROTECTION GOAL 1:** Reduce public exposure to seismic risks.

CITY OF LOS ANGELES GENERAL PLAN (2001).

CONSERVATION ELEMENT.

- **MINERAL RESOURCES MANAGEMENT (SAND AND GRAVEL) OBJECTIVE:** Conserve sand and gravel resources and enable appropriate environmentally sensitive extraction of sand and gravel deposits.
 - **POLICY 2:** Continue to encourage the reuse of sand and gravel products, such as concrete, and of alternative materials use in order to reduce the demand for extraction of natural sand and gravel.

SAFETY ELEMENT.

- **GOAL 1:** A City where potential injury, loss of life, property damage and disruption of the social and economic life of the City due to fire, water-related hazard, seismic

event, geologic conditions, or release of hazardous materials disasters is minimized.

- **POLICY 1.1.5:** Risk reduction. Reduce potential risk hazards due to natural disaster to the greatest extent feasible within the resources available, including provision of information and training.
- **POLICY 1.1.6:** State and Federal regulations. Assure compliance with applicable State and Federal planning and development regulations, e.g., Alquist-Priolo Earthquake Fault Zoning Act, State Mapping Act and the Cobey-Alquist Flood Plain Management Act.

CITY OF LYNWOOD GENERAL PLAN (2003).

PUBLIC HEALTH AND SAFETY ELEMENT.

- **GOAL GEO-1:** Protect the public health, safety, and welfare and minimize the damage to structures, property, and infrastructure as a result of seismic activity.
 - **POLICY GEO-1.4:** Ensure that all new construction is designed to meet current safety regulations.

CITY OF MAYWOOD GENERAL PLAN (1993).

PUBLIC SAFETY ELEMENT.

- **GOAL 1:** Protect the lives, health, and property of the residents of the City of Maywood from flooding, fire, and geologic hazards.
 - **POLICY 1.1:** Continue to implement and enforce stringent site and safety criteria for new construction in the City, and require existing structures be brought up to standards.

CITY OF PARAMOUNT GENERAL PLAN (2007).

HEALTH AND SAFETY ELEMENT.

- **HEALTH AND SAFETY ELEMENT POLICY 1:** The City of Paramount will strive to minimize damage to life and property in the event of a major disaster.
- **HEALTH AND SAFETY ELEMENT POLICY 8:** The City of Paramount will strive to prevent serious structural damage to critical facilities and structures, particularly where large numbers of people are apt to congregate.

- **HEALTH AND SAFETY ELEMENT POLICY 12:** The City of Paramount will require special soils and structural investigations for all larger structures or development involving large groups of people pursuant to State requirements.

CITY OF SIGNAL HILL GENERAL PLAN.

SAFETY ELEMENT.

- **GOAL 1:** Strive to prevent man-made disasters and minimize the potential for natural disasters to impact the community.
 - **POLICY 1.D:** Maintain, revise, and enforce appropriate standards and codes to minimize seismic and geologic risks.
 - **POLICY 1.K:** Regulate development in Alquist-Priolo Earthquake Fault Zones consistent with levels of acceptable risk.
 - **POLICY 1.L:** Recognize the need for greater protection and safety of critical use facilities through careful site selection and comprehensive geotechnical evaluation that considers seismic and other geological hazards.

CITY OF VERNON GENERAL PLAN (2007).

SAFETY ELEMENT.

- **GOAL S-1:** Minimize the risk to public health, safety, and welfare associated with the presence of natural and human-caused hazards.
- **GOAL S-4:** Provide a high degree of protection for all workers and residents in the event of any disaster.

EAST LOS ANGELES COMMUNITY PLAN (1988).

PHYSICAL ENVIRONMENT GOALS.

- To protect the community health, safety, and general welfare.

3.10.2 AFFECTED ENVIRONMENT

3.10.2.1 GEOLOGY/TOPOGRAPHY

The Study Area is located at the north end of the Peninsular Ranges physiographic province in the central and south-central coastal plain area of the Los Angeles Basin. The Los Angeles Basin is an alluviated coastal plain of low relief that slopes gradually seaward toward the south, southwest, and west. The basin is bordered on the north by the Santa Monica Mountains, Elysian Repetto, and Puente Hills, and is bordered on the east and southeast by the Santa Ana Mountains

and San Joaquin Hills. The relatively flat surface of the Los Angeles Basin is interrupted by a locally trending northwest alignment of low hills and mesas that extend from Newport Beach on the south to Beverly Hills on the north. With the exception of embankments associated with the existing freeways and the embankments and levees of the Los Angeles River, the Study Area is relatively flat, with elevations ranging from approximately seven feet above mean sea level at the south end, to approximately 165 feet above mean sea level at the north end.

The northern portion of the Study Area will encounter older surficial sediments (Qoa) consisting of remnants of older weakly consolidated alluvial deposits of gravel, sand, and silt.

SURFICIAL AND SUBSURFACE SOILS. The vast majority of the surficial soils in the immediate vicinity of the Study Area consist of sand, sandy and fine-sand loam, silty loam, clay loam, clay, and gravel. The area within the northern portion of the project limits consists mainly of alluvial gravel, sand, and clay deposits with some cobbles.

The area in the vicinity of the Study Area is underlain by sandy alluvial soils containing silts, clays, and gravels deposited by the Los Angeles River, the San Gabriel River, and the Rio Hondo River. The recent deposits overlie older alluvium in some areas and overlie older bedrock in other areas. The depth to bedrock beneath the Study Area ranges from at least 80 feet and ranges to 200 feet or greater.

Artificial fill consisting primarily of fine sand and silt overlies older deposits at the southerly end of the Study Area south of Shoemaker Bridge in the City of Long Beach.

EXPANSIVE AND COLLAPSIBLE SOILS. Expansive soils are fine-grained soils (clay) that can undergo a substantial increase in volume with an increase in water content and a substantial decrease in volume with a decrease in water content. Changes in the water content of an expansive soil can result in severe distress to structures constructed upon the soil. No laboratory data is available regarding the expansion potential of site soils; however, based on review of the existing bridge Logs of Test Borings (LOTBs) for sites within the project area, the soils consist generally of coarse-grained materials that are not highly expansive, but some fine-grained soils susceptible to high degrees of expansion do exist.

Collapsible soils are characterized by having metastable soil structures that are susceptible to collapse upon saturation. Collapse typically occurs in relatively dry granular soils in arid climates or under dry conditions. Naturally occurring unsaturated sandy and silty alluvium and compacted granular fill materials with moisture content below optimum are considered collapsible. Since no laboratory data are available regarding the collapsibility of soils in the area, it is not known if collapsible soils are present; however according to the United States Department of Agriculture (USDA) Soil Map (NRCS 2009), the area is not known to have collapsible soils.

OIL AND GAS RESOURCES. Oil and gas resources can be a concern from a geologic standpoint because of the potential for land subsidence to occur in areas where extraction of these resources occurs. The Study Area traverses four oil fields. The Bandini field is located near the City of Commerce. The Dominguez, Long Beach, and Wilmington fields are located near the City of Long Beach. The Wilmington is the largest oil field in the Los Angeles Basin. Oil is extracted from reservoirs in semi- and unconsolidated Pliocene- and Miocene-age sandstone strata.

There are numerous active, abandoned, and plugged oil wells in the immediate vicinity of the southern part of the Study Area where it crosses the Wilmington field. The majority of these wells are located on the west side of the Los Angeles River, from the south end of the Study Area north to the Shoemaker Bridge in the City of Long Beach. As discussed in Section 3.4, Utilities and Emergency Services, there are two active oil extraction operations (Oxy Oil and Long Beach Gas & Oil) adjacent to Interstate 710 (I-710) in the City of Long Beach. There are only a few scattered wells in the vicinity of the Study Area where it crosses the other three oil fields.

SUBSIDENCE. Land subsidence due to oil extraction in the Wilmington-Long Beach Harbor area of the Wilmington field began in the 1940s. The center of the subsidence area is located approximately one mile west of the southern limits of the Study Area. The center of the subsidence area dropped 29 feet before it was halted by injection water in the oil reservoirs in the 1950s. The south end of the Study Area was also affected, with approximately ten feet of subsidence. Ground surface elevation monitoring and water injection continues today to counteract the effects of oil extraction.

3.10.2.2 WATER

GROUNDWATER. The primary source of groundwater in the Study Area is rain and snow melt from the San Gabriel Mountains, which travels through washes and creeks into the San Gabriel and Rio Hondo Rivers where some of the water flow is diverted by infiltration into spreading ground basins along those rivers to the northeast of the Study Area. The 15-acre west basin of the Dominguez Gap spreading basins is located between the Los Angeles River and the I-710 Corridor, immediately north of the I-710/Interstate 405 (I-405) interchange.

The depth of groundwater in the Study Area ranges from 2.2 feet below the ground surface (bgs) to greater than 113 feet bgs. In general, the groundwater is shallow at the south end of the Study Area and deepens to the north. Groundwater levels in the project vicinity are influenced by seasonal fluctuations. Fluctuations in groundwater levels due to water district practices and long-term climatic conditions may lead to future changes in the water levels.

3.10.2.3 FAULTING AND SEISMICITY

The entire southern California region is seismically active due to the influence of several earthquake fault systems resulting from the interaction between the Pacific and North American crustal plates.

The Study Area is located within a seismically active region that will be subjected to future seismic effects from earthquakes occurring along local or regional faults. Active faults within the Study Area are shown in Figure 3.10-1. The sources listed in Table 3.10-1, and described below, are known primary seismic sources that are capable of producing seismic shaking that could be damaging to bridges and other structures and, therefore, would influence the seismic design of the build alternatives. The distances in Table 3.10-1 are the closest distance from the Study Area to the surface trace of the fault or top of the rupture plane.

The maximum earthquake magnitudes and other fault parameters shown in Table 3.10-1 are those that would be considered for seismic design of the build alternatives.

The Newport-Inglewood Fault Zone extends approximately 41 miles from Newport Mesa in the south to the Baldwin Hills in the north and consists of a series of northwest-trending faults and folds that form an alignment of hills in the western Los Angeles Basin. The Newport-Inglewood Fault Zone consists of several fault segments and branch faults, four of which are in the Study Area: the Cherry Hill, the Pickler, the Northeast Flank, and the Reservoir Hill. The Cherry Hill Fault crosses the Study Area near the I-710/I-405 intersection.

The Puente Hills Fault is a northerly dipping blind thrust fault that extends for more than 25 miles from downtown Los Angeles east to Brea in northern Orange County. The fault consists of three distinct segments: Los Angeles, Santa Fe Springs, and Coyote Hills. An area of the Los Angeles segment trends beneath the Study Area, approximately 3.8 miles north of the I-710/Interstate 105 (I-105) interchange. At its western end, the Santa Fe Springs segment is located approximately 1.8 miles east of the I-710/I-105 interchange.

The Compton Fault extends northwest-southeast for approximately 25 miles along the western edge of the Los Angeles Basin. At its closest point, this fault is less than one mile southwest of the southern end of the project limits.

Table 3.10-1: Potential Seismic Sources

| Fault | Approximate Closest Distance to the Study Area (miles) | Fault Type | Maximum Credible Earthquake Moment Magnitude¹ |
|--|---|-------------------|---|
| Newport-Inglewood (Cherry Hill Fault) | 0 ² | RLSS | 7.5 |
| Puente Hills Blind Thrust | 2.6 ³ | R | 7.3 |
| Compton Blind Thrust | 5.4 ⁴ | R | 6.8 |
| Palos Verdes | 6.9 ² | RLSS | 7.3 |
| Elsinore Fault Zone (Whittier Section) | 10.5 ² | RLSS | 7.6 |
| Upper Elysian Park Blind Thrust | 6.5 ³ | R | 6.4 |

Source: URS. *I-710 Corridor Project Geotechnical Final Report* (January 2010).

Note: As Caltrans' SDC has been updated following completion of the *Geotechnical Final Report*, some faults and terms such as "Maximum Credible Magnitude" have changed. Please refer to the paragraph provided at the end of Section 3.10.2.3 regarding the Elysian Park Blind Thrust.

¹ Maximum moment magnitude earthquake reported by Caltrans (2009 ARS Online Website).

² Distance noted is the closest distance to the surface trace of the fault as measured from Caltrans (2009 ARS Online).

³ This fault is a blind thrust fault that does not rupture the ground surface. The distance noted is the closest distance to the upper limit of the rupture plane in the subsurface calculated using the fault location from Shaw et al. (2002) and the depth to top of rupture plane from Wills et al. (2008).

⁴ This fault is a blind thrust fault that does not rupture the ground surface. The distance noted is the closest distance to the rupture plane in the subsurface calculated using the fault location provided in the Community Fault Model (2004) and the depth to top of rupture plane from Wills et al. (2008).

Caltrans = California Department of Transportation

I-710 = Interstate 710

R = Reverse fault

RLSS = Right Lateral Strike-Slip fault

The Palos Verdes Fault is a northwesterly trending fault that extends from Santa Monica Bay southeasterly across the Palos Verdes Peninsula and then offshore along the coast for approximately 46 miles. At its closest point, the Palos Verdes Fault is approximately four miles southwest of the south end of the Study Area.

The Elysian Park Blind Thrust Fault crosses the alignment of the build alternatives at the intersection of Firestone Boulevard and I-710. However, the CGS has replaced this fault as a seismic source with the Puente Hills thrust fault (CGS, 2003a); therefore, the Elysian Park Blind Thrust Fault is not considered to have an influence on the project area. As shown in Figure 2 of the 2010 *Geotechnical Final Report*, the upper tip line of the Elysian Park Blind Thrust Fault is approximately 2.3 miles north of the north end of the project limits at SR-60 and Caltrans mapped the Elysian Park seismic source at approximately 1.2 miles to the north (Caltrans ARS Online Website). Upper Elysian Park was assigned a maximum moment magnitude earthquake of 6.8.

3.10.2.4 LIQUEFACTION

Soil liquefaction occurs when saturated, loose soils lose their strength due to excess water within the soils. The space between soil particles is completely filled with water, which exerts pressure on the soil particles, influencing how tightly the soil particles are pressed together. Prior to an earthquake, the water pressure is relatively low. However, the shaking caused by an earthquake

can cause the water pressure to increase to the point where the soil particles can readily move with respect to each other. When liquefaction occurs, the strength of the soil decreases and the ability of the soil to support building and bridge foundations are reduced. Liquefied soils also exert pressure on retaining walls, which can cause them to tilt or slide.

The primary factors affecting the possibility of liquefaction in a soil deposit are: (1) intensity and duration of earthquake shaking, (2) soil type and relative density, (3) overburden pressures, and (4) depth to groundwater. Soils most susceptible to liquefaction are clean, loose, uniformly graded, and fine-grained sands and nonplastic silts that are saturated. Silty sands have also been proven to be susceptible to liquefaction.

With the exception of the northernmost 0.8 mile of the Study Area and portions of some on-ramp/off-ramp/transitions under the build alternatives on the east side of the Los Angeles River between Ocean Blvd. and I-405, the entire Study Area is located in an area identified as having the potential for liquefaction. Based on subsurface soil conditions and groundwater elevation, the liquefaction potential in the Study Area ranges from low to high. In the north of the Study Area, low liquefaction potential exists from approximately Hobart Yard, north, until the northern limits of the Study Area (Cities of Vernon and Commerce, including the communities of Boyle Heights and East Los Angeles). Moderate liquefaction potential exists south of Hobart Yard until approximately 1,600 feet south of Florence Ave. (Cities of Maywood, Vernon, Bell, and Bell Gardens); approximately 2,000 feet south of I-710/Martin Luther King exit until I-710/Compton Creek (Cities of South Gate, Lynwood, Paramount, Compton, East Compton, and Long Beach); and east near the N-405/S-710 Connector and N-710/S-405 Connector (East of the Los Angeles River in the City of Long Beach). High liquefaction potential exists approximately 1,600 feet south of Florence Ave. until approximately 2,000 feet south of the I-710/Martin Luther King exit (in the Cities of Bell, Bell Gardens, Cudahy, South Gate, Downey, Lynwood, and Paramount); and from I-710/Compton Creek until the southern limits of the Study Area (the Cities of Long Beach and Carson).

During the last two major earthquakes in the Southern California area, liquefaction did not occur within the limits of the northern portion of the Study Area. In addition, based on a regional study conducted by the United States Geological Survey, the relative liquefaction susceptibility along this portion of the Study Area is considered to be low to very low.

3.10.2.5 LANDSLIDES

Landslides are rock, earth, or debris flows on slopes due to gravity. They can occur on any terrain given the right conditions of soil, moisture, and angle of slope.

3.10.2.6 ENVIRONMENTAL CONSEQUENCES

The following discussion of environmental consequences only describes the permanent impacts of the project alternatives. Please refer to Section 3.24 of this document, Construction Impacts, for a discussion of the temporary impacts of the build alternatives for each resource area.

Specifically, temporary impacts related to Geology/Soils/Seismic/Topography are located in Section 3.24.3.10.

BUILD ALTERNATIVES. The roadway, structures, and other features of the build alternatives could be impacted by ground motion and liquefaction and possible ground rupture (deformation), to some degree. Design and construction of the build alternatives to current highway and structure design standards, including applicable seismic standards, would minimize potential impacts. No natural landmarks and/or landforms have been identified that would be impacted by the build alternatives, given the relative flatness of the Study Area.

The primary geologic and geotechnical constraints affecting the design and construction of the build alternatives include:

- Moderate to high ground accelerations due to the presence of nearby active faults and fault zones, including the Newport-Inglewood (Cherry Hills Fault), Puente Hills, Compton, and Palos Verdes Faults.
- Fault rupture associated with the Cherry Hill segment of the Newport-Inglewood Fault Zone.
- Liquefaction and seismically induced settlement in areas of shallow groundwater and loose alluvial soils. Most of the Study Area is within an area identified as having the potential for liquefaction.
- Earthquake-induced slope instability associated with liquefaction in areas of moderate to high liquefaction potential and near slopes such as the Los Angeles River.

FAULTING/SEISMICITY. Moderate to severe seismic shaking would likely to occur in the Study Area during the life of the I-710 Corridor improvements under all build alternatives. The Study Area is in the seismically active southern California region and within the influence area of several fault systems that are considered active. In general, the build alternatives could be designed to accommodate the expected ground accelerations through compliance with applicable building and seismic codes. As a result, the potential for structural damage can be substantially reduced or avoided through seismic engineering design of the build alternatives.

LIQUEFACTION AND SEISMICALLY INDUCED SETTLEMENT. Under the build alternatives, facilities and structures could not influence and/or increase the severity of liquefaction or seismically induced settlement. However, facilities and structures of the build alternatives could potentially be affected by liquefaction and seismically induced settlement, which could occur where liquefaction potential exists. Section 3.10.2.4 identified locations where there is liquefaction potential in the Study Area. The potential impacts to facilities and structures of the build alternatives could be substantially reduced based on design and construction, consistent with

the recommendations of the detailed geotechnical investigations prepared during final design for any build alternative.

LANDSLIDES. With the exception of the freeway embankment and embankments and levees of the Los Angeles River, the topography in the Study Area is relatively flat with no natural slopes. Earthquake-induced slope instability is not a major factor in the design or operation of the build alternatives, except in areas where there is a potential for liquefaction, as described previously.

NO BUILD (ALTERNATIVE 1). Under the No Build (Alternative 1), which has been identified as the Preferred Alternative, the permanent impacts discussed above for the build alternatives would not occur, but earthquake and seismic safety concerns would be issues that would be analyzed as part of the environmental and engineering studies conducted for the other transportation improvement projects included in the No Build (Alternative 1).

3.10.2.7 PUBLIC HEALTH CONSIDERATIONS

The primary public health consideration related to geology is seismic safety. For any build alternative, all new and modified bridge structures would be designed and constructed in accordance with Caltrans' latest seismic design criteria, thus minimizing public health risk concerns associated with structure collapses during an earthquake.

3.10.3 AVOIDANCE, MINIMIZATION, AND/OR MITIGATION MEASURES

While implementation of standard design would reduce the risk for geologic hazards such as soil erosion and slope instability of the build alternatives, for any build alternative, Measure GEO-1 listed below would also reduce potential impacts to liquefaction, seismic shaking, surface fault rupture, slope instability, and erosion.

However, as the No Build (Alternative 1) was identified as the Preferred Alternative, adverse impacts related to geologic hazards would not occur, and the adoption of this alternative would not require any avoidance, minimization, and/or mitigation measures. Avoidance, minimization, and/or mitigation measures pertaining to the two build alternatives are retained in this Final EIR/EIS for disclosure purposes.

GEO-1 Prior to completion of final design, the California Department of Transportation (Caltrans) will prepare a design-level geotechnical report in accordance with the *Guidelines for Preparing Geotechnical Design Reports* (Caltrans 2006), and/or Caltrans' Geotechnical Manual where applicable, and the most recent Seismic Design Criteria. Design-level geotechnical reports precede development of grading and/or construction plans, and they provide detailed, site-specific design recommendations. Studies at this stage shall provide specific design

recommendations to mitigate geologic hazards as they relate to grading and construction of the project.

Structure foundation reports will be prepared during final design to characterize site geology and subsurface conditions, provide the results of field exploration and laboratory testing, and provide foundation and construction recommendations for each proposed structure, including bridges.

A geotechnical design report will document soil-related constraints and hazards such as slope instability, settlement, liquefaction, or related secondary seismic impacts that may be present. The report shall also include:

- Evaluation of expansive soils and recommendations regarding construction procedures and/or design criteria to minimize the effect of these soils on development of the project.
- Identification of potential liquefiable areas within the project limits and recommendations for mitigation.
- Demonstration that the design of all proposed retaining walls is geotechnically suitable for project area soils.

The Caltrans Project Engineer will incorporate the measures recommended in the design level geotechnical report and structure foundation reports in the final design and project specifications. The Caltrans Resident Engineer will require the construction contractor to implement the measures recommended in the design-level geotechnical report and structure foundation reports as included in the project specifications.

3.11 PALEONTOLOGY

The information in this section is based on the following document:

- *Final Paleontological Identification Report and Paleontological Evaluation Report* (June 2017)

3.11.1 REGULATORY SETTING

Paleontology is a natural science focused on the study of ancient animal and plant life as it is preserved in the geologic record as fossils. A number of Federal statutes specifically address paleontological resources, their treatment, and funding for mitigation as a part of Federally authorized projects. Under 23 United States Code (USC) 305, mitigation of impacts to paleontological resources during development of the project build alternatives may be an eligible Federal project cost provided the necessary documentation is submitted to the Federal Highway Administration (FHWA). Under 23 USC 1.9(a) the use of Federal-aid funds must be in conformity with Federal and State law. As California law addresses paleontological resources, these resources must be properly addressed in order to receive Federal-aid funds.

3.11.2 PALEONTOLOGICAL SENSITIVITY

Paleontological resources (fossils) are defined as any trace of a past life form. While wood, bones, teeth, and shells are the most common fossils, under certain conditions soft tissues, traces, and trails may be preserved as fossils. Fossils are most commonly found in sedimentary rock layers. Generally, scientifically significant paleontological resources are fossils, assemblages of fossils, or fossiliferous deposits that are unique or unusual, are stratigraphically important, and add to the existing body of knowledge in specific areas stratigraphically, taxonomically, or regionally. Those fossils found undisturbed and not subjected to disturbance after their initial burial and fossilization are particularly important as they provide information for interpretation of tectonic events, past climates, the relationship between aquatic and terrestrial species, and evolution in general. In addition to vertebrate fossils, invertebrate and plant fossils, as well as other environmental indicators associated with vertebrate fossils, are also considered significant. Certain invertebrate and plant fossils that are regionally rare or uncommon, or that help to define stratigraphy, age, or taxonomic relationships, are also considered significant.

Paleontological sensitivity is often stated as “potential” because in most cases, decisions about how to manage paleontological resources must be based on the potential to encounter fossils as the actual situation cannot be known until construction excavation for the build alternatives is underway. Paleontological sensitivity may be stated for a particular rock unit, predicated on the research potential of fossils suspected to occur in that unit. The California Department of Transportation (Caltrans) uses the following scale:

- **HIGH POTENTIAL:** Rock units that, based on previous studies, contain or are likely to contain significant vertebrate, significant invertebrate, or significant plant fossils. These units include, but are not limited to: sedimentary formations that contain significant nonrenewable paleontological resources anywhere within their geographical extent and sedimentary rock units temporally or lithologically suitable for the preservation of fossils. These units may also include some volcanic and low-grade metamorphic rock units. Fossiliferous deposits with very limited geographic extent or an uncommon origin (e.g., tar pits and caves) are given special consideration and ranked as highly sensitive. High sensitivity includes the potential for containing: (1) abundant vertebrate fossils; (2) a few significant fossils (large or small vertebrate, invertebrate, or plant fossils) that may provide new and significant taxonomic, phylogenetic, ecologic, and/or stratigraphic data; (3) areas that may contain datable organic remains older than Recent, including *Neotoma* (sp.) middens; and/or (4) areas that may contain unique new vertebrate deposits, traces, and/or trackways. Areas with a high potential for containing significant paleontological resources require monitoring and mitigation.
- **LOW POTENTIAL:** This category includes sedimentary rock units that (1) are potentially fossiliferous but have not yielded significant fossils in the past; (2) have not yet yielded fossils but possess a potential for containing fossil remains; or (3) contain common and/or widespread invertebrate fossils if the taxonomy, phylogeny, and ecology of the species contained in the rock are well understood. Sedimentary rocks expected to contain vertebrate fossils are not placed in this category. Rock units designated as low potential generally do not require mitigation monitoring. However, as excavation for construction gets underway, it is possible that new and unanticipated paleontological resources may be encountered. If this occurs, a Construction Change Order must be prepared in order to have a qualified Principal Paleontologist evaluate the resource. If the resource is determined to be significant, monitoring and mitigation are required.
- **NO POTENTIAL:** Rock units of intrusive igneous origin, most extrusive igneous rocks, and moderately to highly metamorphosed rocks are classified as having no potential for containing significant paleontological resources. For projects encountering only these types of rock units, paleontological resources can generally be eliminated as a concern prior to the environmental document phase and no further action taken.

A formation or geologic unit has paleontological sensitivity if it previously has produced or has characteristics conducive to the preservation of vertebrate fossils or regionally uncommon invertebrate and plant fossils. All sedimentary rocks and certain volcanic and mildly metamorphosed rocks are considered to have sensitivity for paleontological resources.

3.11.3 AFFECTED ENVIRONMENT

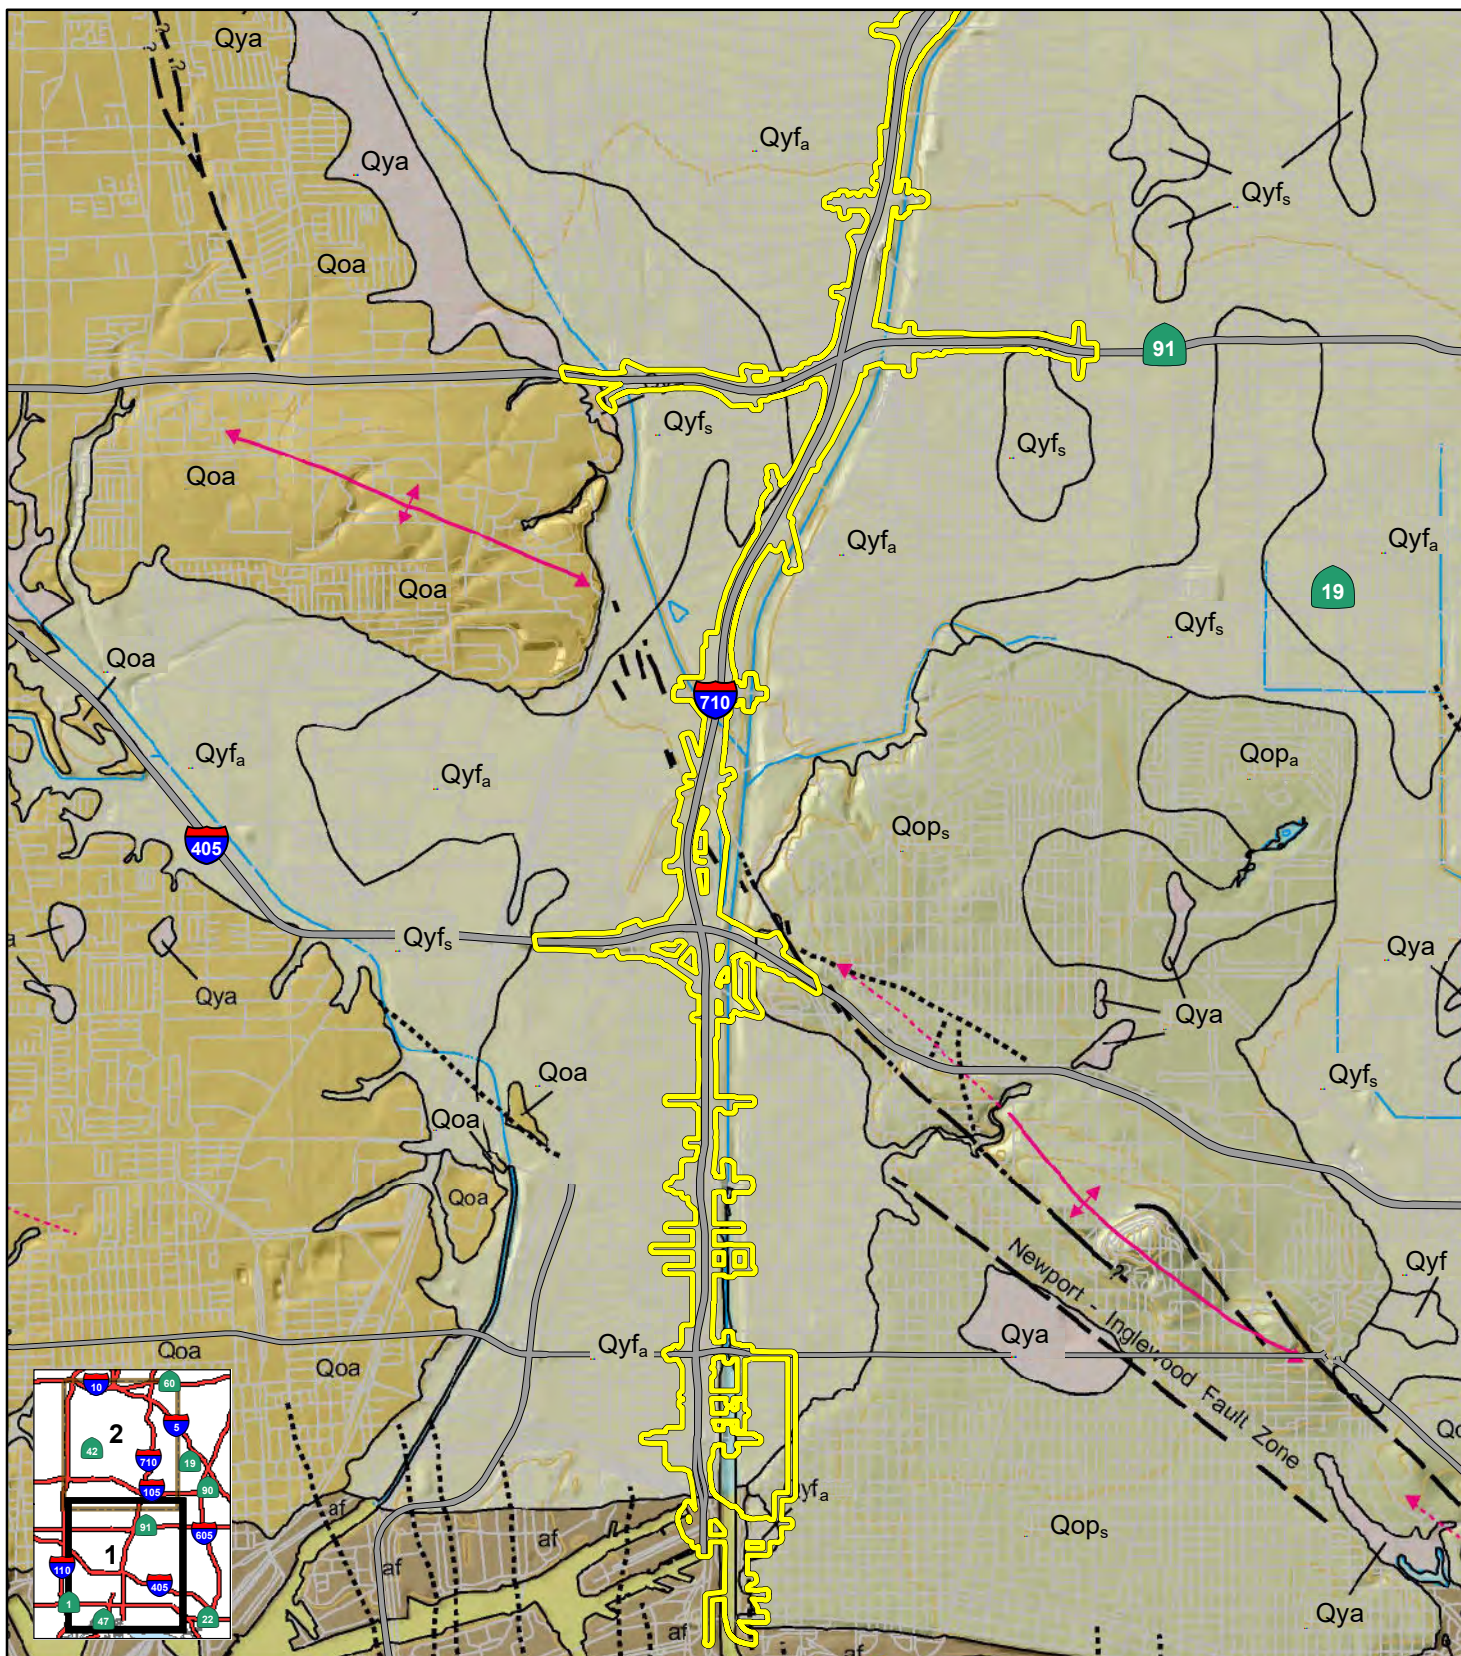

The area studied for paleontological resources is the Area of Potential Disturbance (APD), which included a 100-foot buffer around areas of the I-710 Corridor Project build alternatives, including all areas of proposed and existing right-of-way, utility relocations, lay-down areas, construction staging, and construction easements. In order to determine the geologic units within the APD and their paleontological sensitivities and whether activities related to the build alternatives may affect significant paleontological resources, the following tasks were conducted: (1) a review of pertinent geological and paleontological literature; (2) fossil locality searches through the Natural History Museum of Los Angeles County (LACM); and (3) field surveys of the APD. As geologic formations and units may extend over large geographic areas and contain similar lithologies and fossils, the literature review and fossil locality search include areas well beyond the APD.

The APD is located at the northern end of the Peninsular Ranges Geomorphic Province, a 900-mile-long northwest-southeast-trending structural block that extends from the tip of Baja California to the Transverse Ranges and includes the Los Angeles Basin. The total width of the province is approximately 225 miles, with a maximum landbound width of 65 miles. The province contains extensive pre-Cenozoic (more than 66 million years ago) igneous and metamorphic rocks covered by limited exposures of Cenozoic (less than 66 million years ago) sedimentary deposits. The APD runs along the course of the Los Angeles River, crossing the Los Angeles Basin from north to south. Geologic mapping (Saucedo, et al., 2003; Yerkes and Campbell, 2005) indicates that sediments from the latest Quaternary are mapped within the APD; however, the two maps covering the APD differ slightly (Figure 3.11-1). At the northern end of the APD, Yerkes and Campbell (2005) distinguished between Holocene Alluvial Fan Deposits and Holocene to late Pleistocene Alluvial Fan Deposits. However, over the majority of the APD, Saucedo et al. (2003) grouped the alluvial fan deposits of Holocene to late Pleistocene age into the same unit, called Young Alluvial Fan and Valley Deposits, Undivided. Table 3.11-1 lists the ages for the geologic units mapped within the APD. These units are described below.

3.11.3.1 ARTIFICIAL FILL (AF)

Artificial fill is mapped throughout the APD. This is consistent with the fact that the APD is located in a developed area that has been substantially altered by human activity. Artificial fill consists of sediments that have been removed from one location and transported to another by humans. The transportation distance can range from a few feet to dozens of miles. Composition of artificial fill is dependent on its source. When it is compacted and dense, it is known as “engineered fill,” but it can be unconsolidated and loosely compacted. Artificial fill will sometimes contain modern debris such as asphalt, wood, bricks, concrete, metal, glass, plastic, and even plant material. Depending on the area, thickness can be less than one foot or several hundred feet.

Table 3.11-1: Geologic Units and Ages within the APD

| Geologic Unit | Map Symbol ¹ | Epoch | Age (years) |
|---|-------------------------|------------------------------|-------------------|
| Artificial Fill | af | Holocene | Less than 100 |
| Alluvial Fan Deposits | Qf | Holocene | Less than 11,700 |
| Young Alluvial Fan and Valley Deposits, Undivided | Qyf, Qyfa, Qyfs | Holocene to late Pleistocene | Less than 126,000 |
| Young Alluvial Flood Plain Deposits | Qya | Holocene to late Pleistocene | Less than 126,000 |
| Old Alluvial Fan Deposits, Undivided | Qof | late to middle Pleistocene | 11,700 to 781,000 |
| Old Paralic Deposits, Undivided | Qop | late to middle Pleistocene | 11,700 to 781,000 |

I-710 = Interstate 710

Artificial fill can contain fossils, but these fossils have been removed from their original location and are, therefore, out of context. They are not considered important for scientific study and have no paleontological sensitivity. It should be noted that these deposits can overlie older sediments that do have the potential to contain paleontological resources.

3.11.3.2 ALLUVIAL FAN DEPOSITS (QF)

The Alluvial Fan Deposits mapped at the northern end of the APD consist of unconsolidated mixtures of boulders, cobbles, gravel, sand, and silt (Yerkes and Campbell, 2005). They are found in active and recently active alluvial fans, as well as the upstream portions of some connected channels (Yerkes and Campbell, 2005). These deposits accumulated during the Holocene and are less than 11,700 years old (Yerkes and Campbell, 2005); however, they likely overlie older, Pleistocene (11,700–2.588 million years ago) deposits at undetermined depths and, as such, may be considered to be equivalent to the deposits of Holocene age within the Young Alluvial Fan and Valley Deposits as mapped by Saucedo et al. (2003) over the majority of the APD.

Although Holocene (less than 11,700 years ago) deposits, such as the Alluvial Fan Deposits in the APD, can contain remains of plants and animals, only those from the middle to early Holocene (4,200 to 11,700 years ago; Walker et al., 2012) are considered scientifically important (Society of Vertebrate Paleontology [SVP], 2010). Scientifically important fossils from middle to early Holocene deposits are not very common, and the Natural History Museum of Los Angeles County (LACM) has no records of vertebrate fossil localities from middle to early Holocene deposits within or surrounding the APD.

These Holocene deposits likely overlie older, Pleistocene deposits, which have produced scientifically important fossils elsewhere in the County and the region (Jefferson, 1991a, 1991b; Miller, 1971; Reynolds and Reynolds, 1991; Springer et al., 2009). These older deposits span the end of the Rancholabrean North American Land Mammal Age (NALMA), which dates from 11,000 to 240,000 years ago (Sanders et al., 2009) and was named for the Rancho La Brea fossil site in central Los Angeles. The presence of *Bison* defines the beginning of the Rancholabrean NALMA (Bell et al., 2004), but fossils from this time also include other large and small mammals, reptiles,

fish, invertebrates, and plants (Jefferson, 1991a, 1991b; Miller, 1971; Reynolds and Reynolds, 1991; Springer et al., 2009). These older deposits may be encountered at depths as shallow as 15 feet below the surface (see below). As such, these sediments are assigned a low paleontological sensitivity from the surface to depths of 15 feet and a high paleontological sensitivity once a depth of 15 feet is reached.

3.11.3.3 YOUNG ALLUVIAL FAN AND VALLEY DEPOSITS, UNDIVIDED (QYF, QYFA, QYFS)

The Young Alluvial Fan and Valley Deposits, Undivided, consist of unconsolidated gravel, sand, and silt with occasional cobbles and boulders near mountain fronts (Saucedo et al., 2003; Yerkes and Campbell, 2005). These sediments were deposited by flooding streams and debris flows coming down from higher elevations and generally form a fan or lobe shape at the base of hills and mountains (Yerkes and Campbell, 2005). In some areas, the surfaces can show slight to moderate soil development (Saucedo et al., 2003; Yerkes and Campbell, 2005). These sediments cover the majority of the APD. The Young Alluvial Fan Deposits, Undivided, are Holocene to late Pleistocene in age (less than 126,000 years ago) (Saucedo et al., 2003; Yerkes and Campbell, 2005). In general, the age of these sediments increases with depth; once a depth of approximately 15 feet is reached, the sediments will likely be from the Pleistocene and at least 11,700 years old. The deposits of Holocene age within this geologic unit may be considered equivalent to the Holocene Alluvial Fan Deposits mapped by Yerkes and Campbell (2005) at the northern end of the APD.

The Young Alluvial Fan and Valley Deposits, Undivided, are Holocene and late Pleistocene in age (less than 126,000 years ago). Although Holocene (less than 11,700 years ago) deposits can contain remains of plants and animals, only those from the middle to early Holocene (4,200 to 11,700 years ago; Walker et al., 2012) are considered scientifically important (SVP 2010). As noted above, scientifically important fossils from middle to early Holocene deposits are not very common, and the LACM has no records of vertebrate fossil localities from Holocene deposits within or surrounding the APD. The older, Pleistocene deposits in this geologic unit have produced scientifically important fossils elsewhere in the County and the region (see discussion above on Alluvial Fan Deposits). Although the exact depth of the Holocene/Pleistocene boundary is not known throughout the APD, based on the depths at which Pleistocene fossils were found near the APD, it is inferred that Pleistocene deposits may be encountered beginning at a depth of approximately 15 feet. Therefore, these deposits are assigned low paleontological sensitivity from the surface to a depth of 15 feet and high paleontological sensitivity below that mark.

3.11.3.4 YOUNG ALLUVIAL FLOOD PLAIN DEPOSITS (QYA)

Young Alluvial Flood Plain Deposits are generally found adjacent to stream and river channels and represent deposition by streams and rivers during flood events. They consist of poorly consolidated, poorly sorted, permeable deposits of sand, silt, and clay that accumulated during

the Holocene to late Pleistocene (less than 126,000 years ago) (Saucedo et al., 2003). Within the APD, these deposits are mapped in a small area along SR-91 west of I-710.

The Young Alluvial Flood Plain Deposits are Holocene and late Pleistocene in age (less than 126,000 years ago). Although Holocene (less than 11,700 years ago) deposits can contain remains of plants and animals, only those from the middle to early Holocene (4,200 to 11,700 years ago; Walker et al., 2012) are considered scientifically important (SVP 2010). As noted above, scientifically important fossils from middle to early Holocene deposits are not very common, and the LACM has no records of vertebrate fossil localities from Holocene deposits within or surrounding the APD. The older, Pleistocene deposits in this geologic unit have produced scientifically important fossils elsewhere in the County and the region (see discussion above on Alluvial Fan Deposits). Although the exact depth of the Holocene/Pleistocene boundary is not known throughout the APD, based on the depths at which Pleistocene fossils were found near the APD, it is inferred that Pleistocene deposits may be encountered beginning at a depth of approximately 15 feet. Therefore, these deposits are assigned low paleontological sensitivity from the surface to a depth of 15 feet and high paleontological sensitivity below that mark.

3.11.3.5 OLD ALLUVIAL FAN DEPOSITS, UNDIVIDED (QOF)

The Old Alluvial Fan Deposits, Undivided, are late to middle Pleistocene in age (11,700–781,000 years ago) and consist of unconsolidated silt, sand, and gravel (Yerkes and Campbell, 2005). These sediments were deposited by flooding streams and debris flows coming down from higher elevations and generally form a fan or lobe shape at the base of hills and mountains. In some areas, these deposits are dissected by erosional gullies and have surfaces of moderately to well-developed soils (Yerkes and Campbell, 2005). The Old Alluvial Fan Deposits are found at the northern end of the APD.

The late to middle Pleistocene Old Alluvial Fan Deposits, Undivided, span the latest two NALMAs: the Rancholabrean (11,000 to 240,000 years ago) and the Irvingtonian (240,000 years to approximately 2 million years ago) (Martin et al., 2008; Sanders et al., 2009). Fossils are known from similar Rancholabrean and Irvingtonian deposits from excavations for roads, housing developments, and quarries, as well as scientific investigations in the County and the region (Jefferson, 1991a, 1991b; Miller, 1971; Pajak et al., 1996; Reynolds and Reynolds, 1991; Springer et al., 2009). These fossils include mammoths, mastodons, horses, bison, camels, saber-toothed cats, coyotes, deer, and sloths, as well as smaller animals like rodents, rabbits, birds, reptiles, and bony fish (Barrie et al., 1992; Conkling, 1988, 1997; Jefferson, 1991a, 1991b; Lander, 2000; Miller, 1971; Pajak et al., 1996; Reynolds and Reynolds, 1991; Springer et al., 2009). As such, these deposits are considered to have high paleontological sensitivity.

3.11.3.6 OLD PARALIC DEPOSITS, UNDIVIDED (QOP)

The late to middle Pleistocene (11,700–781,000 years ago) Old Paralic Deposits, Undivided, are composed of marine and non-marine sediments deposited at or near sea level in environments such as deltas, estuaries, tidal flats, beaches, lagoons, and shallow subtidal shelves. As described by Saucedo et al. (2003), they are mostly poorly sorted, moderately permeable, reddish-brown, interfingering strandline, beach, estuarine, and colluvial deposits. These deposits can be composed of siltstone, sandstone, and conglomerate; however, within the project area they are mapped as being primarily silty (Saucedo et al., 2003). The Old Alluvial Deposits, Undivided, are mapped at the southern end of the APD.

The late to middle Pleistocene Old Paralic Deposits, Undivided, span the latest two NALMAs: the Rancholabrean (11,000 to 240,000 years ago) and the Irvingtonian (240,000 years to approximately 2 million years ago) (Martin et al., 2008; Sanders et al., 2009). Fossils are known from similar Rancholabrean and Irvingtonian deposits from excavations for roads, housing developments, and quarries, as well as scientific investigations in the County and the region (Jefferson, 1991a, 1991b; Miller, 1971; Pajak et al., 1996; Reynolds and Reynolds, 1991; Springer et al., 2009). These fossils include mammoths, mastodons, horses, bison, camels, saber-toothed cats, coyotes, deer, and sloths, as well as smaller animals like rodents, rabbits, birds, reptiles, and bony fish (Barrie et al., 1992; Conkling, 1988, 1997; Jefferson, 1991a, 1991b; Lander, 2000; Miller, 1971; Pajak et al., 1996; Reynolds and Reynolds, 1991; Springer et al., 2009). As such, these deposits are considered to have high paleontological sensitivity.

3.11.3.7 FOSSIL LOCALITY SEARCHES

A total of 34 fossil localities were identified within and near the APD during two fossil locality searches conducted at the LACM in 2009 and 2016. Of the 28 localities identified in the 2009 fossil locality search and the 20 localities in the 2016 fossil locality search, only 11 are the same. This discrepancy may be due to new localities appearing since the 2009 results were obtained or may be due to slightly different areas being searched and the overall distance from the fossil localities to the APD. However, the results of both fossil locality searches reinforce the fact that numerous fossil localities have been recovered from sediments similar to those within the APD. The results of both fossil locality searches are included in Appendices A and B of the *Paleontological Identification and Paleontological Evaluation Report* (2017) and summarized below.

The LACM has collections from two vertebrate fossil localities that are present within the boundaries of the current APD. The two localities are LACM 7701–7702, both situated just south of the City of Commerce and north of the Los Angeles River near the intersection of Atlantic Ave. and I-710. These localities contained fossil specimens of threespine stickleback (*Gasterosteus aculeatus*), salamander (*Batrachoseps*), lizard (Lacertilia), snake (Colubridae), rabbit

(*Sylvilagus*), pocket mouse (*Microtus*), harvest mouse (*Reithrodontomys*), and pocket gopher (*Thomomys*), at depths ranging from 11 to 34 feet below grade.

Within approximately 6 miles along the west side of the length of the APD, the LACM has specimens from 19 localities collected from depths of approximately 5 to 30 feet below the surface. These localities include LACM 1157, 1158, 1163, 1165, 1225, 1295, 1344, 1919, 2029, 3260, 3266, 3319, 3365, 3382, 3823, 4129, 4206, 4685, and 6705. Collectively, these localities yielded specimens of pond turtle (*Emys*), puffin (*Mancalla*), turkey (*Parapavo*), ground sloth (*Paramylodon*), mammoth (*Mammuthus*), mastodon (*Mammut americanum*), dire wolf (*Canis dirus*), coyote (*Canis latrans*), rabbit (*Sylvilagus*), squirrel (Sciuridae), ground squirrel (*Spermophilus beecheyi*), deer mouse (*Microtus*), pocket gopher (*Thomomys*), horse (*Equus*), deer (*Cervus*), pronghorn antelope (*Capromeryx minor*), camel (Camelidae), and bison (*Bison*).

To the east, along the length of the APD and within approximately five miles, the LACM has 11 localities recovered from depths of approximately 16 to 100 feet. LACM localities 1005, 1021, 1022, 1144, 3245, 3363, 3550, 3660, 6746, 6802, and 6896 collectively produced specimens of horse (*Equus*), mammoth (*Mammuthus*), camel (*Camelops*), bison (*Bison*), sea lion (*Zalophus*), whale (Cetacea), birds (Aves), speckled sanddab (*Citharichthys stigmaeus*), Pacific sanddab (*C. sordidus*), California halibut (*Paralichthys californicus*), English sole (*Parophrys vetulus*), slender sole (*Lyopsetta exilis*), lanternfish (*Electrona rissoi*), bay gobi (*Lepidogobius lepidus*), and many species of invertebrates.

The LACM also knows of two fossil localities near the APD from other institutions. The first of these localities is from the San Bernardino County Museum (SBCM), which has locality SBCM 9.3.2 that produced sloth (*Paramylodon*), pocket gopher (*Thomomys bottae*), mammoth (*Mammuthus*), horse (*Equus*), and bison (*Bison latifrons*). The second locality is from the San Diego Museum of Natural History (SDMNH), which has locality SDMNH 3246 from the Naval Fuel Reserve Quarry. This locality produced rabbits (*Sylvilagus*, *Lepus*), pocket gopher (*Thomomys*), kangaroo rat (*Dipodomys*), pack rat (*Neotoma*), cat (*Felis*), horse (*Equus*), bison (*Bison*), and deer (*Odocoileus*).

The LACM believes that shallow excavations in the uppermost few feet of the younger Quaternary Alluvium exposed in portions of the APD are not likely to uncover significant fossil vertebrate remains. Any excavations in the older sediments below or within the Alluvial Fan Deposits; Young Alluvial Fan and Valley Deposits, Undivided; Young Alluvial Flood Plain Deposits; Old Alluvial Fan Deposits; or Old Paralic Deposits, Undivided, may encounter significant vertebrate fossils. Therefore, the LACM believes that, except for recent Quaternary Alluvium that is present in the upper several feet across much of the APD, the paleontological sensitivity of the APD is rated high. The LACM believes that any substantial excavations should be closely monitored to quickly and professionally collect any specimens without impeding development. Any fossils recovered

during construction of any project should be deposited in a permanent scientific institution for the benefit of current and future generations.

3.11.3.8 FIELD SURVEYS

The pedestrian surveys noted sediments consistent with much of the geology as it has been mapped by Saucedo et al. (2003) and Yerkes and Campbell (2005). In localized areas, artificial fill has been added and some limited exposures of subsurface bedrock are located within the APD south of State Route 91 (SR-91). Field surveys were conducted from June through August 2009, during May 2011, and on August 17, 2015.

3.11.4 ENVIRONMENTAL CONSEQUENCES

The following discussion of environmental consequences only describes the permanent impacts of the project alternatives as impacts to paleontological resources are considered permanent and not temporary.

3.11.4.1 PERMANENT IMPACTS

BUILD ALTERNATIVES. Fossils and their associated contextual data are significant nonrenewable scientific resources, and the loss of these resources resulting from construction of the build alternatives would be the primary impact on paleontological resources. Earthmoving operations could result in the destruction of fossils and fossiliferous rock units within the construction disturbance limits. It is often not possible to completely eliminate impacts to fossil resources. It is understood that earthmoving activity could, unavoidably, destroy some fossils. These types of impacts can be mitigated by collecting and preserving a representative sample of the entire fossil assemblage and associated geological information in the areas disturbed by construction of either build alternative.

Permanent impacts from the build alternatives on paleontological resources would include:

- Destruction of paleontological resources;
- Damage to paleontological resources during grading;
- Destruction of rock units that may contain paleontological resources;
- Loss of contextual data associated with paleontological resources; and
- Loss of associations between paleontological resources.

Table 3.11-2 summarizes the specific sensitivities for units within the APD. This table uses the Paleontological Sensitivity Scale used by Caltrans. Artificial fill is usually assigned a sensitivity of “None.” The Alluvial Fan Deposits; Young Alluvial Fan and Valley Deposits, Undivided; and Young Alluvial Flood Plain Deposits have a sensitivity of “low” in the uppermost 15 feet as they are likely too young to contain significant paleontological resources. However, once a depth of 15 feet is reached, there is a potential to encounter sediments from the middle Holocene or older, at which point the paleontological sensitivity in that area will change to “high.” The paleontological sensitivity (i.e., potential) for Old Alluvial Fan Deposits, Undivided, and Old Paralic Deposits, Undivided, is high, based on the presence of significant fossil remains that have been recovered from these units in other areas. It is likely that similar significant resources may be encountered if these units are encountered during excavation associated with either of the build alternatives.

Table 3.11-2: Geologic Units and Potential Paleontological Sensitivity within the APD

| Geologic Unit | Paleontological Potential Sensitivity (Caltrans) |
|---|--|
| Artificial Fill | None |
| Alluvial Fan Deposits | Low: Surface to 15 feet High: Below 15 feet |
| Young Alluvial Fan and Valley Deposits, Undivided | Low: Surface to 15 feet High: Below 15 feet |
| Young Alluvial Flood Plain Deposits | Low: Surface to 15 feet High: Below 15 feet |
| Old Alluvial Fan Deposits, Undivided | High |
| Old Paralic Deposits, Undivided | High |

Source: LSA Associates, Inc. *Final Paleontological Identification Report and Paleontological Evaluation Report* (2017).
 Caltrans = California Department of Transportation
 I-710 = Interstate 710

Alternative 7 would involve more bridge construction work, mainly due to the separate freight corridor, than Alternative 5C and therefore would require more excavation. Therefore, Alternative 7 has a greater likelihood of impacting paleontological resources than Alternative 5C. Construction of the build alternatives is not anticipated to impact special paleontological situations that would require redesign of the build alternatives to avoid critical localities or strata. However, because there are areas of high paleontological sensitivity within the APD, for any build alternative, a Paleontological Mitigation Plan (PMP) would be prepared.

NO BUILD (ALTERNATIVE 1). The No Build (Alternative 1) has been identified as the Preferred Alternative. Under this alternative, the permanent impacts to paleontological resources discussed above for the build alternatives would not occur.

3.11.4.2 PUBLIC HEALTH CONSIDERATIONS

No public health considerations were identified relative to impacts of the build alternatives on paleontological resources.

3.11.5 AVOIDANCE, MINIMIZATION, AND/OR MITIGATION MEASURES

For either of the build alternatives, the following mitigation measure, Measure PAL-1, would address impacts to nonrenewable paleontological resources that may be encountered during construction and would have been required. As part of this mitigation measure, concurrently with development of the final design, a PMP would have been prepared to reduce impacts to paleontological resources. The PMP would follow guidelines provided by Caltrans and the SVP and would have been specifically tailored to the resources and sedimentary formations that may be encountered during excavation within the APD. For any of the build alternatives, more project-specific measures may have been needed to be developed during preparation of the PMP to refine these measures during final project design.

However, as the No Build (Alternative 1) was identified as the Preferred Alternative, adverse impacts to paleontological resources would not occur, and the adoption of this alternative would not require any avoidance, minimization, and/or mitigation measures. Avoidance, minimization, and/or mitigation measures pertaining to the two build alternatives are retained in this Final EIR/EIS for disclosure purposes.

PAL-1 Concurrently with development of the final design, a qualified Principal Paleontologist shall prepare a Paleontological Mitigation Plan (PMP) following the guidelines of the California Department of Transportation (Caltrans) and the Society of Vertebrate Paleontology. The PMP will provide a description of the project, describe the geologic units in the project area and their paleontological sensitivities, describe the scope of work, determine decision thresholds, provide cost estimates and schedules, identify and establish a draft curation agreement with an appropriate museum repository, and include the following measures:

- A preconstruction field survey shall be conducted in areas identified as having high paleontological sensitivity after vegetation and paving have been removed, followed by salvage of any observed surface paleontological resources prior to the beginning of additional grading.
- A qualified Principal Paleontologist or representative shall attend the preconstruction meeting. At this meeting, the Principal Paleontologist will explain the likelihood for encountering paleontological resources, what resources may be discovered, and the methods of recovery that will be employed.

- During construction excavation, a qualified vertebrate paleontological monitor shall initially be present on a full-time basis whenever excavation will occur within the sediments that have a high paleontological sensitivity rating and on a spot-check basis for excavation in sediments that have a low sensitivity rating. Monitoring may be reduced to a part-time basis if no resources are being discovered in sediments with a high sensitivity rating (monitoring reductions, when they occur, will be determined by the qualified Principal Paleontologist in consultation with the Caltrans Resident Engineer [RE]). The monitor shall inspect fresh cuts and/or spoils piles to recover paleontological resources. With the RE's approval, the monitor shall temporarily divert construction equipment away from the immediate area of the discovery. The monitor shall be equipped to rapidly stabilize and remove fossils to avoid prolonged delays to construction schedules. If large mammal fossils or large concentrations of fossils are encountered, Caltrans shall consider using heavy equipment on site to assist in the removal and collection of large materials.
- Localized concentrations of small (or micro-) vertebrates may be found in all native sediments. Therefore, these sediments occasionally spot-screened on site through one-eighth- to one-twentieth-inch mesh screens determines whether microfossils are present during monitoring. If microfossils are encountered, sediment samples (up to three cubic yards or 6,000 pounds) shall be collected and processed through one-twentieth-inch mesh screens to recover additional fossils.
- Recovered specimens shall be prepared to the point of identification and permanent preservation. Preparation includes the sorting of any washed mass samples to recover small invertebrate and vertebrate fossils, the removal of surplus sediment from around larger specimens to reduce the volume of storage for the repository and storage cost, and the addition of approved chemical hardeners/stabilizers to fragile specimens.
- Specimens shall be identified to the lowest taxonomic level possible and curated into an institutional repository with retrievable storage. The repository institution usually charges a one-time fee based on volume, so removing surplus sediment is important. The repository institution may be a local museum or university with a curator who can retrieve the specimens on request. Caltrans requires that a draft curation agreement be in place with an approved curation facility prior to the initiation of any paleontological monitoring or mitigation activities.

- A Paleontological Mitigation Report (PMR) documenting completion of the monitoring program for the Lead Agency (Caltrans) shall be prepared and submitted.

3.12 HAZARDOUS WASTE/MATERIALS

The information in this section is based on the *Initial Site Assessment* (ISA) (February 2017). Based on a mutual agreement between the Los Angeles County Metropolitan Transportation Authority (Metro) and the California Department of Transportation (Caltrans), the ISA prepared for the project was not required to identify impacts related to site conditions. The ISA was intended as a prescreening process to identify the potential environmental concerns associated with each alternative.

3.12.1 REGULATORY SETTING

Hazardous materials and hazardous wastes are regulated by many state and Federal laws. These include not only specific statutes governing hazardous waste, but also a variety of laws regulating air and water quality, human health, and land use.

The primary Federal laws regulating hazardous wastes/materials are the Resource Conservation and Recovery Act of 1976 (RCRA) and the Comprehensive Environmental Response, Compensation and Liability Act of 1980 (CERCLA). The purpose of CERCLA, often referred to as Superfund, is to clean up contaminated sites so that public health and welfare are not compromised. RCRA provides for “cradle to grave” regulation of hazardous wastes. Other Federal laws include:

- Community Environmental Response Facilitation Act (CERFA) of 1992
- Clean Water Act
- Clean Air Act
- Safe Drinking Water Act
- Occupational Safety and Health Act (OSHA)
- Atomic Energy Act
- Toxic Substances Control Act (TSCA)
- Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA)
- Hazardous Materials Transportation Act
- Hazardous Materials Transportation Uniform Safety Act of 1990
- Emergency Planning and Community Right-to-Know Act

In addition to the acts listed above, Executive Order (EO) 12088, Federal Compliance with Pollution Control, mandates that necessary actions be taken to prevent and control environmental pollution when Federal activities or Federal facilities are involved.

California regulates hazardous materials, waste, and substances under the authority of the California Health and Safety Code and is also authorized by the Federal government to implement RCRA in the State. California law also addresses specific handling, storage, transportation, disposal, treatment, reduction, cleanup and emergency planning of hazardous waste. The Porter-Cologne Water Quality Control Act (Porter-Cologne Act) also restricts disposal of wastes and requires cleanup of wastes that are below hazardous waste concentrations but could impact ground and surface water quality. California regulations that address waste management and prevention and cleanup of contamination include Title 22, Division 4.5, Environmental Health Standards for the Management of Hazardous Waste, Title 23, Waters, and Title 27, Environmental Protection. The specific acts within the California Code of Regulations (CCR) include:

- Well Safety Devices for Critical Wells (CCR, Title 14, Section 1724.3)
- Gas Monitoring and Control at Active and Closed Disposal Sites (CCR, Title 27, Section 20917)
- Closure and Post-Closure Maintenance of Landfills (CCR, Title 27, Subchapter 5)
- California Public Resources Code (PRC) Section 21151.4
- Hazardous Materials Release Response Plans and Inventory Law (California Health and Safety Code, Section 25500)
- Hazardous Waste Control Act (California Health and Safety Code, Section 25100)
- Safe Drinking Water and Toxic Enforcement Act (Proposition 65, California Health and Safety Code, Section 25249.5)
- Cortese List Statute (California Gov. Code, Section 65962.5)

California Senate Bill (SB) 1082, passed in 1993, created the Unified Hazardous Waste and Hazardous Materials Management Regulatory Program (Unified Program). The California Environmental Protection Agency (Cal-EPA and other state agencies set the standards for their programs, while local governments implement the standards. These local implementing agencies are called Certified Unified Program Agencies (CUPA). CUPAs regulate/and oversee the following:

- Hazardous materials business plans
- California accidental release prevention plans or Federal risk management plans)
- Operation of underground storage tanks and aboveground storage tanks
- Universal waste and hazardous waste generators/handlers
- On-site hazardous waste treatment
- Inspections, permits, and enforcement of facilities generating or transporting hazardous materials and waste

- Proposition 65 reporting
- Emergency response

Worker and public health and safety are key issues when addressing hazardous materials that may affect human health and the environment. Proper management and disposal of hazardous materials is vital if they are encountered, disturbed, or generated during construction of the build alternatives.

3.12.2 AFFECTED ENVIRONMENT

The ISA was prepared to determine whether construction of the build alternatives would be affected by any recorded or visible hazardous waste problems within the I-710 Corridor Project ISA Study Area (ISA Study Area). The ISA Study Area includes the portion of I-710 from Ocean Blvd. in Long Beach to State Route 60 (SR-60), a distance of approximately 19 miles. The ISA Study area extends up to 1.5 miles east and west of the I-710 freeway at the freeway-to-freeway interchanges: Interstate 405 (I-405), State Route 91 (SR-91), Interstate 105 (I-105), and Interstate 5 (I-5).

The ISA included a search of government records to obtain a listing of properties or known incidents from State, Federal, or local regulatory databases for hazardous waste sites within the ISA Study Area, review of reasonably ascertainable historical information sources (aerial photographs, fire insurance maps, oil and gas maps, and topographic maps), and a site survey of the right-of-way for the build alternatives to identify readily visible contamination. Environmental Data Resources, Inc. (EDR) was subcontracted to conduct a search limited to within a one-mile radius (i.e., ASTM International [ASTM] standard) of the I-710 Corridor Project build alternatives for facilities listed by regulatory agencies as potentially having environmental concerns. Due to the amount of properties identified in the records search (over 1,000 properties), no file reviews were conducted at the various State, Federal, or local regulatory agencies. Given the stage of project development, in lieu of file reviews, all full, partial and TCE properties considered to be “high risk” are included in Tables 3.12-1 through 3.12-3, which identify properties of environmental concern (Tables 3.12-1 through 3.12-4 are provided at the end of this section). The RDEIR/EIS stated that if a build alternative were to be selected as the Preferred Alternative, parcel-by-parcel investigations would be necessary for those properties impacted by the Preferred Alternative that were identified as environmental concerns and would have the potential to impact the initial phase of either of the build alternatives. The recommendations for further evaluation of high and medium risk sites include one or more of the following, in this order:

- Review current regulatory status through online databases;
- Conduct file reviews at the oversight regulatory agency, if necessary;
- Parcel specific historical summary using one or more of the following resources: Sanborn maps, historical city directories, chain of title, or building department records;

- Perform a site reconnaissance including on-site interviews with persons knowledgeable about site operations; and
- If warranted, perform a subsurface investigation based on the findings of the previous recommendations or if the findings are inconclusive.

A summary table of all sites identified in the database search is provided in Appendix P of this Final EIR/EIS. Additional readily accessible agency online databases were reviewed, including the California Department of Resources Recycling and Recovery (CalRecycle); Solid Waste Information System (SWIS); the California Department of Toxic Substance Control (DTSC) ENVIROSTOR database; and the State Water Resources Control Board's (SWRCB) GeoTracker database. A visual windshield survey of the majority of the parcels within the ISA Study Area was conducted in May and June 2016, in addition to windshield surveys conducted for the Draft EIR/EIS in 2009 and 2011. Access to the properties within the ISA study area was not permitted; therefore, observations were made from public rights-of-way and/or other publicly accessible areas. During the windshield survey, no visual evidence of spills, accidental releases, or illegal dumping of hazardous materials or hazardous wastes were observed. Land uses commonly affiliated with hazardous releases were observed throughout the I-710 ISA Study Area and include on-site hazardous substance use and storage; on-site hazardous waste disposal; on-site aboveground/underground storage tanks; and on-site pole-mounted transformers. A variety of Federal, State, and local laws, regulations, and orders provide oversight for the management and clean-up of these materials and wastes to minimize risks to facility employees, public health, and the environment.

Because access to the individual properties and parcels was not permitted at the time of the ISA, and given the large amount of parcels potentially impacted under the build alternatives, only a pre-screening and risk assessment for each parcel was completed for inclusion in this Final EIR/EIS.

Based on the ISA, the following hazardous materials are expected to be encountered within the ISA Study Area.

3.12.2.1 AERIALY DEPOSITED LEAD

Aerially deposited lead (ADL) is a byproduct of internal combustion engines burning lead-containing fuels. Aerially deposited lead is deposited on the sides of roads and highways by passing cars and is often found in the soil adjacent to highways and roads. Elevated concentrations of aerially deposited lead may be present along existing roadways throughout the ISA Study Area for the build alternatives.

3.12.2.2 ASBESTOS

The use of asbestos in many building products was banned by the United States Environmental Protection Agency (EPA) by the late 1970s; however, many asbestos-containing product categories not previously banned (prior to 1989) may still be in use today. Asbestos-containing material (ACM) represents a concern when it is subject to damage that results in the release of fibers. Several sites within the ISA Study Area were constructed prior to 1980 and have the potential to contain ACM. In addition, the bridges, overpasses, interchanges, and on- and off-ramps of the I-710 freeway also have the potential to contain ACM.

According to the Los Angeles County Office of the Assessor, several of the parcels within the ISA Study Area were developed prior to 1980 and, therefore, have the potential to contain ACM. The presence of ACM would pose a potential hazardous waste risk if demolition resulting from either of the build alternatives occurs on any parcel of land within the ISA Study Area. In addition, the bridges, overpasses, interchanges, entrance and exit ramps, and other features of I-710 also have the potential to contain ACM, which would also impact demolition activities of either of the build alternatives.

3.12.2.3 LEAD-BASED PAINT

Structures constructed prior to 1978 are presumed to have lead-based paint (LBP). In addition, yellow paints made prior to 1995 may exceed hazardous waste criteria under Title 22, CCR, and require disposal to a Class I disposal site. Several sites within the ISA Study Area were constructed prior to 1980 and have the potential to contain LBP. In addition, the bridges, overpasses, interchanges, and on- and off-ramps of the I-710 freeway also have the potential to contain LBP.

According to the Los Angeles County Office of the Assessor, several of the parcels within the ISA Study Area were developed prior to 1980 and, therefore, have the potential to contain LBP. The presence of LBP would pose a potential hazardous waste risk if demolition of either of the build alternatives occurs on any parcel of land within the ISA Study Area. In addition, the bridges, overpasses, interchanges, entrance and exit ramps, and other features of I-710 also have the potential to contain LBP, which would also impact demolition activities of either of the build alternatives.

3.12.2.4 POLYCHLORINATED BIPHENYLS

Polychlorinated biphenyls (PCBs) are known hazardous materials that are found in coolants or lubricating oils used in some electrical transformers, light ballasts, electrical panels, or other similar equipment prior to 1976. Pole-mounted electrical transformers, which were observed along major thoroughfares within the ISA Study Area, may contain PCBs.

3.12.2.5 THERMOPLASTIC PAINT

Thermoplastic paint and yellow painted traffic stripes/pavement markings contain lead chromate. In addition, yellow traffic paints made prior to 1995 may exceed hazardous waste criteria under Title 22, CCR, and require disposal to a Class I disposal site. Residue produced when yellow thermoplastic and yellow traffic paint are removed may contain heavy metals in concentrations that exceed established thresholds and may produce toxic fumes when heated. Yellow thermoplastic paint has been used for marking within the ISA Study Area, and as such would require special removal, handling, and disposal, for any of the build alternatives.

3.12.2.6 UTILITY LINES

Numerous local and regional underground and aboveground utilities parallel and cross I-710 and the Los Angeles River including power distribution and transmission systems, natural gas distribution and transmission pipelines, petroleum pipelines, telephone systems, cable television (CATV) systems, water distribution mains, water aqueducts, sanitary sewer mains, sewer interceptors, and city telecommunication systems. In addition, two high-voltage electrical transmission corridors (SCE and LADWP) parallel I-710.

3.12.2.7 POTENTIALLY CONTAMINATED SOILS AND/OR GROUNDWATER

Encountering contaminants in soils, groundwater, and surface water can increase worker health and safety requirements, result in project delays, and increase construction costs due to remediation and disposal. These contaminants can indirectly impact nearby residents, workers, and the environment if appropriate steps to mitigate and contain them are not taken. The sites listed in Table 3.12-1 and shown in Appendix P-1 are additional sites that were identified as high risk that would either be disturbed by full and partial acquisitions or by temporary construction easements (TCEs) under Alternative 5C, as identified in the ISA as properties of potential environmental concern. A detailed summary of on-site and off-site hazardous waste listings are included in Appendix P of this environmental document.

The sites listed in Table 3.12-2 and shown in Appendix P-2 are additional sites that were identified as high risk that would either be disturbed by full and partial acquisitions or by TCEs under Alternative 7, as identified in the ISA as properties of potential environmental concern. The sites listed in Table 3.12-1 apply to Alternative 7 as well. A detailed summary of on-site and off-site hazardous waste listings are included in Appendix P of this environmental document.

The sites listed in Table 3.12-3 and shown in Figure 3.12-1 are adjoining properties of potential concern and were identified in the ISA as posing a potential environmental concern to the area within the limits of the build alternatives.

I-710 Corridor Project
Adjoining Properties of Potential Concern

This page intentionally left blank

The findings presented in the ISA relative to the potential for hazardous materials or petroleum products to exist within the ISA Study Area were based upon information derived from various historic mapping sources, site observations made from public right-of-way and other publicly accessible areas in 2009, 2011, and the most recent survey completed in 2016. The conclusions of the ISA are based on the conditions and features of the properties as they existed at the time of the observations from right-of-way, other publicly accessible areas, and reasonably foreseeable conditions. Access to the properties within the ISA Study Area was not permitted; therefore, it is possible that unidentified contamination may currently exist at the properties within the ISA Study Area. Hazardous materials or petroleum products not readily observable during the initial reconnaissance have the potential to become observable at a later date when access onto the properties is permitted (e.g., during property appraisals that would occur prior to right-of-way acquisition, for either of the build alternatives). In addition, due to natural processes or human work on site or on adjacent properties, changes in the conditions to the properties have the potential to occur over time.

Lead in soil along the freeways and interchanges to certain depths may be expected and sampling, analysis, and possibly removal would be required, for the build alternatives. It is Caltrans' standard practice to conduct a soil investigation prior to any soil excavation within a project's footprint. The purpose of such an investigation would be to assess the potential presence of hazardous contaminants and to determine disposal options if necessary for the contaminated soil. The soil investigation would consist of an ADL investigation and investigation for other contaminants of concern due to impacts from adjoining properties.

Each parcel within the buffer zone along the I-710 Corridor was categorized into high, medium, or low based on risk using a conservative approach. The criteria for these risk categorizations were based on land use and conditions that have the potential to produce or cause site contamination and materials that require special handling. The basis for determining each parcel's risk was based upon its use, regulatory status, visual observations, and the example sites for risk analysis.

Sites of Potential Environmental Concern under Alternative 5C are listed in Table 3.12-1, and Sites of Potential Environmental Concern under Alternative 7 are listed in Table 3.12-2, and are generally associated with high risk categorization.

3.12.2.8 LANDFILLS

Based on the information provided from the online CalRecycle SWIS was reviewed to supplement the information provided in the EDR Reports. A review of this database and the EDR Reports identified ten solid waste sites within or potentially within the footprints of the build alternatives. Seven of the sites are considered to have high-risk waste issues, one of the sites needs additional information, and two of the sites are not expected to be of environmental concern.

The sites are listed in Table 3.12-4 and are shown in Figure 3.12-2. Under current regulations, all operating and most closed landfills are required to have landfill gas migration control systems and monitoring programs. Additionally, most active and many closed landfills have landfill gas capture and treatment and destruction systems. Therefore, the likelihood of methane landfill gas affecting an area beyond the landfill property is low.

3.12.2.9 RAILROADS

Soils along the railroad tracks within the disturbance limits of the build alternatives should be assumed to be impacted by polynuclear aromatic hydrocarbons (PNAs). Sources of PNAs include diesel fuel spills from trains, kerosene used to heat rails during rail replacement activities, and wood preservatives used for switch ties. Soils surrounding railroad tracks and ballasts may also be contaminated with ACMs; chlorinated hydrocarbons (e.g., perchloroethylene [PCE] and trichloroethylene) from cargo spills; creosote and pentachlorophenol, which are used as a wood preservative for switch ties; and pesticides and herbicides, which are used around the railroad tracks and ballasts for pest and weed control.

3.12.2.10 TREATED WOOD WASTE

Other treated wood waste materials may be encountered during construction of either of the build alternatives. Any wooden utility poles, railroad ties, or other wood-treated waste material associated with existing roadway structures that would be removed or relocated during construction of either of the build alternatives should be tested for the presence of wood treatments. Contaminants that are usually found in wood waste include creosote, pentachlorophenol, arsenic, copper, and chromium; treatment compounds such as copper azole, alkaline copper quaternary, chromated copper arsenate; and other associated compounds. For either of the build alternatives, soils adjacent to railroad ties should also be tested for the presence of wood treatments/preservatives. All contaminated soil by wood treatments/preservatives would be considered hazardous waste and be removed and properly disposed of at an off-site Class I landfill facility. In addition, all wood-treated material that would be removed and disposed as part of either of the build alternatives would be tested for wood treatments/preservatives. The wood-treated material would be managed in compliance with Alternative Management Standards for Wood Treated Waste in Section 67386.6(a)(2)(B) 3 of the CCR and would be properly disposed at landfills that are identified by the RWQCB as appropriate for the wood treatments/preservatives. All the parcels listed in Alternative 5C are also within the project footprint of Alternative 7. The parcel numbers that are listed below are additional parcels impacted under Alternative 7.

3.12.3 ENVIRONMENTAL CONSEQUENCES

The following discussion of environmental consequences only describes the permanent impacts of the project alternatives. Please refer to Section 3.24 of this document, Construction Impacts, for a discussion of the temporary impacts of the project build alternatives for each resource area. Specifically, temporary impacts related to hazardous waste and materials are located in Section 3.24.3.12.

3.12.3.1 BUILD ALTERNATIVES.

PERMANENT IMPACTS. Operation and maintenance of the facilities included as part of Alternatives 5C and 7 would not introduce new sources of hazardous materials/waste. For either build alternative, routine maintenance activities would be required to follow applicable regulations with respect to handling and disposal of potentially hazardous materials. Vehicles traveling on the I-710 freeway would continue to transport hazardous substances that could spill and impact the roadway, adjacent properties, or resources. However, transport of hazardous materials is subject to strict regulations. Caltrans, the California Hwy. Patrol, and local police and fire departments are trained in emergency response procedures for safely responding to accidental spills of hazardous substances on public roads, which further reduces impacts. For these reasons, implementation of Alternatives 5C and 7 would not result in a substantial permanent adverse impact related to hazardous waste and materials.

TEMPORARY IMPACTS. Hazardous waste risks associated with the build alternatives are related to property acquisitions, construction, and operation. Hazardous waste risks related to construction are discussed in Section 3.24, Construction. Parcels that would be potentially impacted by the right-of-way requirements associated with Alternatives 5C and 7 were identified in the *Draft Right-Of-Way Study Report* (March 2016). As previously indicated, Tables 3.12-1, 3.12-2, 3.12-3, and 3.12-4 list properties with high-risk hazardous waste concerns that would be fully or partially acquired to provide the right-of-way for the build alternatives. To ensure that no risk is posed to construction workers and the general public during construction of either of the build alternatives, any property acquired must be free of hazardous wastes prior to the start of construction. Thus, if a build alternative had been selected for implementation, each property to be acquired would require testing in order to characterize specific soil and/or groundwater contaminants on the property. If contaminated soils and/or groundwater contaminants are identified through site characterization, then a site-specific hazardous waste remediation plan would be developed for the appropriate removal and disposal of contaminated soil and/or groundwater. In addition, a remediation plan and site closure plan, if required, would be implemented to clean up the site and provide for any subsequent monitoring of the site to ensure that the contamination has been remediated below environmental regulatory thresholds. Off-site accidents could also occur during temporary shipment of hazardous materials (e.g. gasoline, diesel, or compressed gases) and waste (e.g. welding materials, containers for fuel, lubricant, including ACM and LBP, solvents, and cement products containing strong basic or acidic chemicals) generated during construction

of either of the build alternatives or the cleanup of existing contaminated sites before construction of either of the build alternatives occurs, thereby exposing individuals, and the environment, to off-site risks.

DESIGN OPTIONS FOR ALTERNATIVE 5C

Additional information is required (i.e., file review) to evaluate potential impacts to Alternative 5C from the remaining ten EDR listings identified associated with the parcels within Alternative 5C.

During the agency database review, 134 EDR listings were identified associated with 248 of the parcels within Alternative 5C Design Options, which are summarized in Appendix P. Subsets of these listings were determined to be common to the three design options applicable to the alternative. Eighteen of these EDR listings are considered to represent an environmental concern to the ISA Study Area. On-line file information was available to review for eight of these 18 EDR listings. Additional information is required (i.e., file review) to evaluate potential impacts to the ISA Study Area from the remaining ten EDR listings identified associated with the parcels within Alternative 5C.

DESIGN OPTIONS FOR ALTERNATIVE 7

Additional information is required (i.e., file review) to evaluate potential impacts to the ISA Study Area from the remaining nine listings identified associated with the parcels within Alternative 7.

During the agency database review, 133 EDR listings were identified associated with 284 of the parcels within Alternative 7 Design Options, which are summarized in Appendix P. Subsets of these listings were determined to be common to the two design options applicable to Alternative 7. A total of 21 of these EDR listings are considered to represent an environmental concern to Alternative 7. Online file information was available to review for 11 of these 21 EDR listings. Additional information is required (i.e., file review) to evaluate potential impacts to the ISA Study Area from the remaining ten EDR listings identified associated with the parcels within Alternative 7.

ADJOINING PROPERTIES AND SOLID WASTE SITES

Additional information is required (i.e., file review) to determine the potential impact from 24 of the adjoining properties of known or potential concern.

The agency database review and online SWIS database identified 24 solid waste sites within or potentially within the ISA Study Area. Waste materials may be encountered during construction and/or excavation activities associated with either of the build alternatives at those properties that operated as waste disposal sites and, therefore, these sites are considered to have high risk issues.

For either build alternative, Measures HW-1 through HW-7 under Section 3.12.4, Avoidance, Minimization, and Mitigation Measures, describe efforts that would be made to avoid, minimize, or mitigate involvement with known or suspected hazardous material contamination sites during construction. With the implementation of Measures HW-1 through HW-7, Alternatives 5C and 7 would not result in a substantial temporary adverse impact related to hazardous waste and materials. Since a build alternative was not identified as the Preferred Alternative, Measure HW-1 through HW-7 will not be implemented.

3.12.3.2 NO BUILD (ALTERNATIVE 1)

The No Build (Alternative 1), which has been identified as the Preferred Alternative, would not change the existing physical environment and therefore would not result in permanent impacts related to hazardous wastes, including permanent acquisition of properties with hazardous waste concerns and the beneficial effect of improved traffic safety. As with the build alternatives, routine maintenance activities would continue and would be required to follow applicable regulations with respect to the handling and disposal of potentially hazardous materials. Vehicles utilizing the I-710 Corridor would continue to transport hazardous substances that could spill and impact the roadway, adjacent properties, or resources.

PUBLIC HEALTH CONSIDERATIONS. The primary public health consideration is human exposure to hazardous materials during either operation or construction of either of the build alternatives. Operation and maintenance of the facilities included as part of the build alternatives would not introduce new sources of hazardous materials/waste. Vehicles utilizing the I-710 Corridor would continue to transport hazardous substances that could spill and impact the roadway, adjacent properties, or resources; however, the modern design of either of the build alternatives would result in reduced risk of traffic accidents, including those that could result in hazardous waste spills. Alternative 7 would further reduce the public health risk of hazardous waste spills by separating truck traffic from automobile traffic as a result of the freight corridor component of the alternative. Any contamination encountered during construction and excavation activities for the build alternatives would be properly handled, removed, remediated, and/or disposed of according to all applicable regulations. For these reasons, implementation of the build alternatives would not increase public health risks related to hazardous waste and materials in the short term and would decrease these risks in the long term as a result of the cleanup and remediation of any hazardous waste contamination on properties that would be acquired for the build alternatives.

3.12.4 AVOIDANCE, MINIMIZATION, AND/OR MITIGATION MEASURES

The measures below would substantially reduce adverse impacts related to hazardous materials and hazardous wastes during construction of the build alternatives. Additional information is required (i.e., file review) to determine the potential impact of parcels within the two build alternatives. Sufficient evidence was not gathered or completed at every parcel to fully

characterize the potential presence of hazardous materials or contaminants, as access was not permitted to conduct thorough investigations.

Should a build alternative have been selected as the Preferred Alternative, depending on which agency is responsible for administration of the construction contract, another party or agency may be identified as the responsible agency for the measures listed below. In this case, these roles and responsibilities would be identified and governed through the execution of a Cooperative Agreement between Metro and Caltrans at the time either of the build alternatives was to be funded.

Should a build alternative have been selected as the Preferred Alternative, additional avoidance, minimization, and/or mitigation measures would be identified following file review and physical investigation of the parcels previously identified. The current property owners would mitigate any hazardous waste/materials present prior to acquisition. If contamination is present at the parcels that cannot be mitigated, the limits of acquisition may be adjusted to avoid the residual contamination. If the limits of acquisition cannot be adjusted, minimization measures may include indemnification, reduction in price, or acquisition as highway easements instead of in fee.

However, as the No Build (Alternative 1) was identified as the Preferred Alternative, adverse impacts related to hazardous materials and waste would not occur beyond what is existing, and the adoption of this alternative would not require any avoidance, minimization, and/or mitigation measures. Avoidance, minimization, and/or mitigation measures pertaining to the two build alternatives are retained in this Final EIR/EIS for disclosure purposes.

- HW-1** Prior to completion of acquisition of any property with existing buildings, a predemolition survey for asbestos-containing material (ACM) and lead-based paint (LBP) will be conducted. If ACMs and/or LBP are detected, a licensed contractor will remove the ACMs and/or LBP materials prior to demolition.
- HW-2** During preparation of Plans, Specifications, and Estimates, utility pole-mounted transformers within the project area will be inspected for leaks. Leaking transformers will be considered a polychlorinated biphenyl (PCB) hazard unless tested and will be handled accordingly.
- HW-3** Prior to soil excavation, a soil investigation for aerially deposited lead (ADL) and other contaminants of concern will be conducted. The analytical results of the soil sampling will assess the potential presence of hazardous contaminants and determine the appropriate handling of the soil and disposal of surplus materials. The soil investigation will consist of an ADL investigation (along Interstate 710 [I-710]) and investigation for other contaminants of concern due to impacts from adjoining properties. Ultimately, soil investigation and soils sampling will be conducted as defined in the Cooperative Agreement between the Los Angeles

County Metropolitan Transportation Authority (Metro) and the California Department of Transportation (Caltrans).

HW-4 During preparation of Plans, Specifications, and Estimates, a groundwater evaluation will be conducted to assess disposal alternatives for groundwater encountered during construction and to comply with the requirements of the National Pollutant Discharge Elimination System (NPDES) permitting process.

HW-5 During preparation of Plans, Specifications, and Estimates, soils within and immediately adjacent to existing railroads that will be disturbed as part of the railroad relocation under the I-710 Corridor Project, will be tested for contaminants commonly found in association with railroads. The soil investigation will include, but not be limited to the following constituents, total petroleum hydrocarbons, lead, and arsenic.

HW-6 During the Plans, Specifications, and Estimates phase, a Construction Contingency Plan (CCP) in accordance with Caltrans' Unknown Hazards Procedures for Construction will be prepared. The CCP will include provisions for emergency response in the event that unidentified underground storage tanks (USTs), hazardous materials, petroleum hydrocarbons, or hazardous or solid wastes are discovered during construction activities. The CCP will address UST decommissioning, field screening, contaminant materials testing methods, mitigation and contaminant management requirements, and health and safety requirements for construction workers.

The CCP is required to be implemented during all construction activities.

During construction, work will cease immediately if an unexpected release of hazardous substances is found in reportable quantities. If an unexpected release of hazardous substances is found in reportable quantities, the National Response Center will be notified by calling 1-800-424-8802. Cleanup of unexpected releases under the appropriate Federal, State, or local agency oversight will be required.

HW-7 A parcel-by-parcel investigation shall be performed for parcels that have been identified as environmental concerns (high- and medium-risk sites) and have the potential to impact the initial phase of the project. Hence, this will better refine the cost of the initial phase for programming and funding. These PSIs may include one or more of the following, in this order:

- Perform a site reconnaissance;
- Perform on-site interviews with persons knowledgeable about site operations; and
- If warranted, perform subsurface investigations based on the findings of the site reconnaissance and on-site interviews.

Table 3.12-1: Sites of Potential Environmental Concern to the ISA Study Area under Alternative 5C

| Appendix P-1 Parcel No. | APN | Address¹ | Acquisition | Site Listing |
|--------------------------------|--------------|----------------------------|--------------------|---|
| 81553 | 622-703-4802 | Rail Ops Cudahy, CA | TCE | The Right-of-Way Impact Report identified Parcel No. 81553 as Railroad Use, owned by SOU PAC CO. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 81553 consists of APN 6227-034-802. Based on a review of online maps and photographs, Parcel No. 81553 consists of a segment of land adjacent to the north of the Southern Pacific Railroad, east of the I-710, and parallel to south of Shull St. See Parcel No. 81552 for an EDR discussion of potential environmental concerns. |
| 81552 | 623-200-2800 | Rail Ops Cudahy, CA | TCE | The Right-of-Way Impact Report identified Parcel No. 81552 as Railroad Use, owned by SOU PAC TRANS CO. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 81552 consists of APN 6232-002-800. Based on a review of online maps and photographs, Parcel No. 81552 consists of a segment of Southern Pacific Railroad, perpendicular to the east of the I-710 and parallel to south of Shull St. An adjacent property at 5614 Shull St. was identified in the EDR Report as Bell Gardens Redevelopment Department (EDR ID No. 837) in the CA HIST UST database; as City of Bell Gardens (Berk Oil) (EDR ID No. 837) in the CA LOS ANGELES CO. HMS, FINDS, and US BROWNFIELDSDS databases; as Berk Oil (EDR ID No. 837) in the CA HIST CORTESE, CA LUST, CA SLIC, and CA ENVIROSTOR databases. According to the online GeoTracker database, Berk Oil is listed as "Open - Site Assessment as of October 19, 2015." The site is currently owned by the City of Bell Garden and resides in one of its redevelopment areas. The site is a 4.33-acre parcel that consisted of two former industrial facilities: Berk Oil and PMC. The Berk Oil facility operated from 1965 through 1989 mainly as an asphalt mixing and oil distribution facility. The PMC was located on the eastern half and operated from 1953 through 1996 as a metal and fabrication facility. Environmental site investigations began in 1985 and included soil borings to a maximum of 80 feet bgs, groundwater sampling using hydropunch and installation of eight monitoring wells. In 1989, six underground storage tanks for asphalt, diesel, and waste oil were removed from the site. Analytical results confirmed that both soil and groundwater are impacted with petroleum hydrocarbons, metals, and volatile organic chemicals (VOCs). During investigations in 2010, groundwater was encountered in two saturated zones at 20 feet and 60 feet bgs. The groundwater flow of the shallower zone was toward the southwest and the deeper zone flows to the south. As of January 2015, due to financial hardship, the City of Bell Garden was still looking for potential developers to handle the investigations and cleanup of the site. No |

I-710 Corridor Project RDEIR/SDEIS

| Appendix P-1 Parcel No. | APN | Address ¹ | Acquisition | Site Listing |
|-------------------------------|--------------|---|-------------|---|
| | | | | further information was available on the GeoTracker database. Therefore, based on the groundwater flow direction and impacts to groundwater and soil, this property presents a potential environmental concern to Alternative 5C. |
| 51518 | 6222-001-801 | Long Beach Fwy and Firestone Blvd. South Gate, CA | TCE | The Right-of-Way Impact Report identified Parcel No. 51518 as Utility Use, owned by SO CALIF EDISON CO. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 51518 consists of APN 6222-001-801. Based on a review of online maps and photographs, Parcel No. 51518 consists of a segment of land east of the Los Angeles River, west of I-710 on-ramp from Firestone Blvd., and north of Southern Ave. According to the online SWIS database, Caltrans South Gate (SWIS No. 19-AA-5067) is located north of Firestone Blvd. between I-710 and the Los Angeles River. However, the database also states that the parcel number for this facility was confirmed in 2014 to be 6222-001-801, which is located south of Firestone Blvd. This facility was not identified in the EDR Report. The online SWIS database reports that this facility is a closed solid waste disposal site (formerly operated by the State of California) and the regulatory status is listed as “pre-regulations.” This land is currently owned by SCE for use as a utility corridor and annual inspections are performed by the County of Los Angeles. The most recent inspection was completed on February 5, 2016, and no violations or area of concern were reported. The inspection report indicates that the site was inaccessible due to perimeter fence and locked gates at the time of the inspection. A 2009 inspection report identifies SWIS No. 19-AA-5067 as “Caltrans, South Gate No. 1” located at 5212 E. Imperial Hwy., southeast of the NB I-710 off-ramp and north of Imperial Hwy.; however, no sites were identified at this location in the mapping feature in the online SWIS database. The 2007 and 2008 inspection reports indicate that Caltrans, South Gate No. 1 was formerly a landfill for street and highway sweepings that operated from 1955 until 1972 and at the time of the inspections was an unpaved dirt land used as a nursery and composting site. No design improvements would be included in this area as it would only be used for a temporary construction easement and therefore, this former solid waste disposal site is not expected to have created an environmental concern to Alternative 5C. |

| Appendix P-1 Parcel No. | APN | Address ¹ | Acquisition | Site Listing |
|-------------------------------|--------------|----------------------|-------------|--|
| 81901 | 5243-013-802 | Commerce, CA | TCE | The Right-of-Way Impact Report identified Parcel No. 81901 as Railroad Use, owned by A T AND S F RY CO. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 81901 consists of APN 5243-013-802. Based on a review of online maps and photographs, Parcel No. 81901 consists of a portion of the BNSF Hobart Yard located adjacent to the west of the I-710 and north of 26 th St. Several listings was identified in the EDR Report as 4650 East 26 th St., Lot 11, Row 11, Spot 420 (EDR ID No. 296) in the CA CHMIRS database; as Agrashell Inc. (EDR ID No. 296) in the CA HIST UST, CA SWEEPS UST, FINDS, and CA EMI databases; and as 4650 E. 26 th St. (EDR ID No. 296) in the ERNS database. Based on the lack of listing in other databases indicating violations and/or a release, this listing is not expected to have created an environmental concern to the ISA Study Area. |
| 81902 | 5243-013-800 | Commerce, CA | TCE | The Right-of-Way Impact Report identified Parcel No. 81902 as Railroad Use, owned by A T&S F RY CO. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 81902 consists of APN 5243-013-800. Based on a review of online maps and photographs, Parcel No. 81902 consists of a segment of railroad adjacent to the west of the I-710 and north of 26 th St. Adjacent to the northwest of this parcel is the BNSF Hobart Yard. See Parcel No. 81901 for a discussion on nearby EDR listings. |
| 81903 | 5243-013-803 | Commerce, CA | TCE | The Right-of-Way Impact Report identified Parcel No. 81903 as Railroad Use, owned by A T&S F RY CO. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 81903 consists of APN 5243-014-803. Based on a review of online maps and photographs, Parcel No. 81903 consists of a segment of railroad adjacent to the west of the I-710 and north of 26 th St. Adjacent to the west of this parcel is the BNSF Hobart Yard. See Parcel No. 81901 for a discussion on nearby EDR listings. |
| 81904 | 5243-013-807 | Commerce, CA | TCE | The Right-of-Way Impact Report identified Parcel No. 81904 as Railroad Use, owned by FORD MOTOR CO. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 81904 consists of APN 5243-014-807. Based on a review of online maps and photographs, Parcel No. 81904 consists of a segment of railroad underneath the I-710 and adjacent to the south of Sheila St. West of this parcel is the BNSF Hobart Yard. See Parcel No. 81901 for a discussion on nearby EDR listings. |

| 40105 | 7271-003-902 | Los Angeles River Long Beach, CA | Partial, TCE | The Right-of-Way Impact Report identifies Parcel No. 40105 as Flood Control Use. A review of the I-710 EIR/EIS Row Exhibit - Alternative 5C Maps revealed that Parcel No. 40105 consists of a portion of APN 7271-003-902. Based on a review of online maps and photographs, Parcel No. 40105 consists of vacant land along the Los Angeles River channel and Anaheim St. Parcel No. 40105 is located adjacent to property occupied by Occidental Petroleum Corporation (Oxy Oil) along the west side of the flood control channel, which contains numerous ASTs and oil wells. Several database listings were identified associated with oil wells operated by Oxy Oil in this area. Based on the use, the adjacent Oxy Oil property is considered to represent an environmental concern to the ISA Study Area and a file review is recommended. |
| 40106 | 7436-004-920 | Long Beach, CA | Full | The Right-of-Way Impact Report identifies Parcel No. 40106 as Flood Control Use. A review of the I-710 EIR/EIS Row Exhibit - Alternative 5C Maps revealed that Parcel No. 40106 consists of APN 7436-004-920. Based on a review of online maps and photographs, Parcel No. 40106 appears to be part of the Oxy Oil facilities, which is leased from the City of Long Beach. Several database listings were identified associated with oil wells operated by Oxy Oil in this area. Based on the use, Parcel No. 40106 is considered to represent an environmental concern to the ISA Study Area and a file review is recommended. |
| 40116 | 7271-002-002 | Long Beach, CA | Partial, TCE | The Right-of-Way Impact Report identifies Parcel No. 40116 as Flood Control Use owned by Kempner, James M and Cynthia A. A review of the I-710 EIR/EIS Row Exhibit - Alternative 5C Maps revealed that Parcel No. 40116 consists of APN 7271-002-002. Based on a review of online maps and photographs, Parcel No. 40116 consists of a strip of land adjacent to the east of the I-710, in between Anaheim St. and Pacific Coast Hwy. The EDR Report identified Public Service Transfer Station No. 1 (EDR ID No. 76-8) in this location, which is listed in the SWF/LF database. This facility is located between the I-710 and the Los Angeles River, north of Anaheim St. and south of Pacific Coast Hwy. According to the online SWIS database (SWIS No. 19-AA-1047), the City of Long Beach operates an active limited volume transfer operation for green materials at this location. The facility permit was issued in October 2001 and it is permitted to handle up to 3,000 tons of green waste per year. The facility is inspected quarterly by the County of Los Angeles and the last inspection was performed on October 7, 2015. No significant violations of State Minimum Standards observed at time of inspection and all records were reported to be in order. The most recent inspection reported that this facility is not open to the public and is currently reserved for street cleaning operations. No enforcement action records were reported in the SWIS database. Based on the use of this property, there is potential for waste materials to exist which |

| Appendix P-1 Parcel No. | APN | Address ¹ | Acquisition | Site Listing |
|-------------------------------|--------------|-----------------------------------|-------------|--|
| | | | | may be encountered during construction and/or excavation activities and therefore, this property is considered to have high risk waste issues. |
| 01419 | 7432-019-049 | 1234 Cowles St. Long Beach, CA | Full | The Right-of-Way Impact Report identifies Parcel No. 01419 as Business Use owned by Exedra Properties LTD (same as Parcel No. 01420). A review of the I-710 EIR/EIS Row Exhibit - Alternative 5C Maps revealed that Parcel No. 01419 consists of a portion of APN 7432-019-023. Based on a review of online maps and photographs, Parcel No. 01419 consists of a southwestern portion of the property occupied by Speedy Fuel (1234 W Cowles St.), see Parcel No. 01420 for EDR listings and information. |
| 01420 | 7432-019-043 | 1234 Cowles St. Long Beach, CA | Full | The Right-of-Way Impact Report identifies Parcel No. 01420 as Business Use, owned by Exedra Properties LTD (same as Parcel No. 01419). This address was identified as MICOR Energy LLC (EDR ID No. S104406362) in the CA LUST database; as MICOR Energy LLC (EDR ID No. S103976836) in the CA HIST CORTESE database; as 1234 WEST COWLES ST. in the HMIRS database; as Jerry and Kathleen Glikesman (EDR ID No. S101587013) in the CA FID UST and CA SWEEPS UST databases; as MICOR Long Beach LLC (EDR ID No. S113076397) in the CA HAZNET database; as MICOR Long Beach (EDR ID No. U003779459) in the CA UST database; as McMullen Oil Inc. (EDR ID No. S112876293) in the CA HAZNET database; and as Delta Auto Service Inc. (EDR ID No. S113113356) in the HAZNET database; as MICOR Energy LLC (EDR ID No. S114650987) in the RGA LUST database; as Speedy Fuel (EDR ID No. U004220378) in the UST database; as Speedy Fuel (EDR No. S113122600) in the CA HAZNET database as 1234 W. COWLES ST. (EDR No. 1015189711) in the EDR Hist Auto database. The status of the MICRO Energy LLC LUST case is listed as "Completed - Case Closed" as of July 1, 2015. The RWQCB is the lead agency on this case. The RWQCB issued a "Direction to Take Corrective Action in Response to Unauthorized Underground Storage Tank Release" in a letter dated March 20, 2009. This letter states that the property was a former gasoline/diesel service station and in 2000, three groundwater monitoring wells were installed at the site. These wells were sampled in 2000 and no petroleum hydrocarbon constituents or oxygenates were detected. The RWQCB stated that in order to evaluate current groundwater quality at the site additional sampling was required. In 2014, the three monitoring wells were sampled and no petroleum hydrocarbon constituents or oxygenates were detected. Based on the regulatory agency closure status, available groundwater data, this listing is not expected to have created an environmental concern to the ISA Study Area. However, there is potential for residual soil contamination to exist which may be encountered during construction and/or excavation activities. |

| 01421 | 7432-020-028 | 1235 Cowles St. Long Beach, CA | Full | The Right-of-Way Impact Report identifies Parcel No. 01421 as Business Use owned by Neill Properties LLC. A review of the I-710 EIR/EIS Row Exhibit - Alternative 5C Maps revealed that Parcel No. 01421 consists of APN 743-202-0028. Based on a review of online maps and photographs, Parcel No. 01421 consists of a property occupied by Neil Aircraft (1235 W Cowles St.), see Parcel No. 01425 for EDR listings and information. |
| 01422 | 7432-020-029 | 1233 Cowles St. Long Beach, CA | Full | The Right-of-Way Impact Report identifies Parcel No. 01422 as Business Use owned by Pogue, Clarence W. and Margit M. A review of the I-710 EIR/EIS Row Exhibit - Alternative 5C Maps revealed that Parcel No. 01422 consists of APN 743-202-0029. Based on a review of online maps and photographs, Parcel No. 01422 consists of a property occupied by an unknown lessee (1233 W Cowles St.). No EDR listings were identified associated with this address. |
| 01423 | 7432-020-030 | 1231 Cowles St. Long Beach, CA | Full | The Right-of-Way Impact Report identifies Parcel No. 01423 as Business Use owned by Neill Properties LLC. A review of the I-710 EIR/EIS Row Exhibit - Alternative 5C Maps revealed that Parcel No. 01423 consists of APN 743-202-0030. Based on a review of online maps and photographs, Parcel No. 01423 consists of a property occupied by a Neill Aircraft Co. (1231 W Cowles St.), see Parcel No. 01425 for EDR listings and information. |
| 01424 | 7432-020-031 | 1229 Cowles St. Long Beach, CA | Full | The Right-of-Way Impact Report identifies Parcel No. 01424 as Business Use owned by Neill Properties LLC. A review of the I-710 EIR/EIS Row Exhibit - Alternative 5C Maps revealed that Parcel No. 01424 consists of APN 743-202-0031. Based on a review of online maps and photographs, Parcel No. 01424 consists of a property occupied by Neil Aircraft (1229 W. Cowles St.), see Parcel No. 01425 for EDR listings and information. |

| Appendix P-1 Parcel No. | APN | Address ¹ | Acquisition | Site Listing |
|-------------------------------|--------------|--|-------------|---|
| 01425 | 7432-020-032 | 1227 Cowles St. Long Beach, CA | Full | The Right-of-Way Impact Report identifies Parcel No. 01425 as Business Use owned by Neill Properties LLC. A review of the I-710 EIR/EIS Row Exhibit - Alternative 5C Maps revealed that Parcel No. 01425 consists of APN 7432-020-032. Based on a review of online maps and photographs, Parcel No. 01425 consists of a property occupied by Neill Aircraft Co. (1227 W Cowles St.) which also occupies the entire block bounded by 15 th St. to the north, Cowles St. to the south, I-710 to the east, and Fashion Ave. to the west. Neill Aircraft was also identified at 1260 W 15 th St. in the UST (EDR ID No. U003660595), RCRA-SQG (EDR ID No. 1000287667), FINDS (EDR No. 1000287667), HAZNET (EDR ID No. S113016249), NPDES (EDR ID No. S108751634) and LUST (EDR No. 1000287667) databases. The LUST status is listed as "Completed - Case Closed" as of July 1, 2015. The RWQCB is the lead agency on this case. The online GeoTracker database indicates that groundwater impacted with gasoline was detected in grab groundwater samples at this property in 1997. The online database indicates that semi-annual groundwater monitoring is required and a "Soil and Groundwater Investigation Report" was prepared in 2009. In 2012, four groundwater monitoring wells were installed and sampled as well as additional soil sampling; high concentrations of TPHg and benzene were detected in both groundwater and soil samples. In September 2013, soil borings were taken to delineate the extent of soil contamination. The most recent groundwater monitoring data from March 2014 showed high concentrations of TPHg and benzene in one of the four monitoring wells while the remaining three wells showed non-detectable concentrations of TPHg, BTEX, MTBE, and TBA. In August 2014, remedial excavation of the former UST area was performed with 214.12 tons of soil removed and transported off-site for disposal. Based on the regulatory agency closure status, available groundwater and soil data, these listings are not expected to have created an environmental concern to the ISA Study Area. However, there is potential for residual soil contamination to exist which may be encountered during construction and/or excavation activities. |
| 01426 | 7432-020-020 | 15 th St. Long Beach, CA | Full | The Right-of-Way Impact Report identifies Parcel No. 01426 as Business Use owned by Neill Properties LLC. A review of the I-710 EIR/EIS Row Exhibit - Alternative 5C Maps revealed that Parcel No. 01426 consists of APN 7432-020-020. Based on a review of online maps and photographs, Parcel No. 01426 consists of a property occupied by Neill Aircraft Co. (W 15 th St.), see Parcel No. 01425 for EDR listings and information. |

| 01434 | 7432-021-008 | 1229 15th St. Long Beach, CA | Full | The Right-of-Way Impact Report identifies Parcel No. 01434 as Business Use owned by Neill Aircraft Company. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 01434 consists of APN 7432-021-008. Based on a review of online maps and photographs, Parcel No. 01434 consists of a property occupied by Neill Aircraft Co. (1229 W. 15th St.), see Parcel No. 01425 for EDR listings and information. |
| 01435 | 7432-021-001 | 1238 Gaylord St. Long Beach, CA | Full | The Right-of-Way Impact Report identifies Parcel No. 01435 as Business Use owned by Neill Aircraft Company. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 01435 consists of APN 7432-021-001. Based on a review of online maps and photographs, Parcel No. 01435 consists of a property occupied by Neill Aircraft Co. (1238 W. Gaylord St.), see Parcel No. 01425 for EDR listings and information. |
| 01436 | 7432-021-002 | Gaylord St. Long Beach, CA | Full | The Right-of-Way Impact Report identifies Parcel No. 01436 as Business Use owned by Neill Aircraft Company. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 01436 consists of APN 7432-021-002, a portion of APN 7432-021-001. Based on a review of online maps and photographs, Parcel No. 01436 consists of a property occupied by Neill Aircraft Co., see Parcel No. 01425 for EDR listings and information. |
| 80417 | 7140-014-936 | E. 208 th St. Long Beach, CA | Partial, TCE | The Right-of-Way Impact Report identified Parcel No. 80417 as Railroad Use. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 80417 consists of APN 7140-014-936. Based on a review of online maps and photographs, Parcel No. 80417 consists of a segment of the Metro Blue Line/ Pacific Electric Railroad track and the Metro Blue Line Yard (4350 208 th St.). Metro Division 11 and Rapid Transit District Metro (EDR ID No. 2484) were identified associated with this address in the RCRA-SQG, FINDS, WDS, NPDES, LUST databases. According to the GeoTracker database, the facility is listed with a status of "completed-case closed" as of September 8, 2010, for a release of "waste oil/motor/hydraulic/lubricating" to soil. No other information was available online or in the EDR Report. Based on the regulatory status, this listing is not expected to have created an |

| | | | | environmental concern to the ISA Study Area. However, there is potential for residual soil contamination to exist which may be encountered during construction and/or excavation activities. |
| 04425 | 7310-016-806 | Long Beach, CA | Partial, TCE | The Right-of-Way Impact Report identified Parcel No. 04425 as Public Use. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 04425 consists of APN 7310-016-806. Based on a review of online maps and photographs, Parcel No. 04425 appears to be occupied by transmission power lines located within the onramp turnaround from I-405 to I-710. No EDR listings were identified in this area. |
| 06101 | 7140-014-019 | Long Beach, CA | Partial, TCE | The Right-of-Way Impact Report identifies Parcel No. 06101 as Business Use, owned by CRG Properties LTD. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps revealed that Parcel No. 06101 consists of APN 7140-014-019. Based on a review of online maps and photographs, Parcel No. 06101 is associated with the former Long Beach Golf Learning Center (3701 & 4021 Pacific Place) property. Long Beach Industrial Park (EDR ID No. 2752, 2767) was identified associated with this address in the VCP, ENVIROSTOR, SLIC, and FINDS databases; as CRG Properties in the HAZNET, UST, database; Petro Resources Inc. in the CERCLIS-NFRAP, FINDS, RGA LUST, and EMI databases. This parcel is associated with an 18-acre site formerly used as a central brine treatment facility from 1926 until the mid-1950s. Former activities consisted of pumping oil brine, drilling mud, and other waste materials generated from nearby oil production into unlined sumps. For the past five years, the site has been used as a golf practice range. Under the DTSC oversight, investigations are being conducted to evaluate the presence and extent of hazardous substances in the subsurface including benzene, benzo(a)pyrene, metals and TPH as gasoline. The case is also identified in the RWQCB's online GeoTracker database as Long Beach Industrial Park at 4021 Pacific Place. According to the GeoTracker and ENVIROSTOR online databases, the DTSC is the lead agency for the case. The cleanup status on the online ENVIROSTOR database is reported as "Inactive – Action Required" as of January 26, 2009; however, the database reports that a Remedial Action Completion Report was due to DTSC on April 30, 2011. Based on the regulatory status and former use, this site is considered to represent an environmental concern to the ISA Study Area and a file review is recommended. It should be noted that soil and groundwater contamination may exist in the area of this property impacted by the right-of-way, which could be encountered during construction and/or excavation activities. |

| 06102 | 7140-014-032 | Long Beach, CA | Partial, TCE | The Right-of-Way Impact Report identifies Parcel No. 06102 as Business Use, owned by CRG Properties LTD. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps revealed that Parcel No. 06102 consists of APN 7140-014-032. Based on a review of online maps and photographs, Parcel No. 06102 is associated with Parcel No. 06101. |
| 06103 | 7140-014-025 | 4021 Amebco Rd. Long Beach, CA | Partial, TCE | The Right-of-Way Impact Report identifies Parcel No. 06103 as Business Use, owned by Tookey, Victor R and Evelyn M. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps revealed that Parcel No. 06103 consists of APN 7140-014-032. Based on a review of online maps and photographs, Parcel No. 06103 is associated with Parcel No. 06101. |
| 06108 | 7140-014-023 | 3916 Amebco Rd Long Beach, CA | Partial, TCE | The Right-of-Way Impact Report identifies Parcel No. 01608 as Business Use, owned by MCDONALD, JOHN B CO TR ET AL. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps revealed that Parcel No. 01608 consists of APN 7140-014-023. Based on a review of online maps and photographs, Parcel No. 01608 is an unpaved strip of land located adjacent to the east of North Pacific Place and adjacent to the west of MTA railroad tracks. No EDR listings were identified in this area. |
| 06206 | 7203-002-001 | 701 Baker St. Long Beach, CA | Partial, TCE | The Right-of-Way Impact Report identified Parcel No. 06206 as Business Use, owned by Oil Operators Inc. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 06206 consists of APN 7203-002-001. Based on a review of online maps and photographs, Parcel No. 06206 is currently vacant land. No EDR listings were identified associated with 701 W Baker St. Oil Operators Inc. was identified at 712 W Baker St. (EDR ID No. 2797) in the UST, SLIC, CERCLIS, CHMIRS, HIST UST, CA FID UST, EMI, and SWEEPS UST databases and at 714 W Baker St. (EDR ID No. 2797) in the ENVIROSTOR database. The ENVIROSTOR database referred the case the RWQCB as of January 1, 2011. The RWQCB remains the lead agency on the case. The ENVIROSTOR database indicates that the US EPA is also involved in cleanup oversight for this case. The online GeoTracker database identifies the case at 712 W Baker St. and lists the facility status as "Open – Site Assessment" as of January 2, 2015. According to the online GeoTracker database, the Oil Operators, Inc. (OOI) property covers 20 acres located east of I-710 and is bounded on the north by the 405 freeway, on the south by Wardlow Rd., and on the east by Golden Ave. Baker St. divides the property into northern and southern parts. The Los Angeles River is located immediately to the west. OOI operated water treatment facilities at this property from 1926 to 1998 to treat production brines and other fluids recovered during oil production. Processed included removal of oil and sediment from the water, recovering low-grade oil for recycling, and disposal |

|-------------------------------|--------------|--|--------------|--|
| | | | | of the treated water off-site. Multiple basins that were used to settle oily solids/sludge and to hold treated water were located on the property. The facilities were decommissioned in phases beginning in 1998 and the property is currently vacant. The primary area of concern is identified as Basin 1, which held untreated oil production fluids for settling of oily solids/sludge. Cleanup criteria have been established for chemicals of concern in Basin 1, including TPH as gasoline, BTEX, and heavy metals. Soil remediation has been underway at the property since March 2010, consisting of in-situ enhanced biodegradation, and quarterly groundwater monitoring is conducted. Based on information reviewed on the online GeoTracker database, it appears that additional investigations and remediation are required at this property. Based on the regulatory status and on-going remedial conditions, this site is considered to represent an environmental concern to the ISA Study Area. |
| 70721 | 7140-014-900 | E 208 th St. Long Beach, CA | Partial, TCE | The Right-of-Way Impact Report identified Parcel No. 70721 as Public Use, owned by the US Government. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 70721 consists of APN 7140-014-900. Based on a review of online maps and photographs, Parcel No. 70721 consists of the northern-most portion of the Metro Blue Line maintenance facility. No EDR listings were identified in this area. |
| 50806 | 7306-022-803 | Southern California Edison (SCE) Corridor Compton, CA | Full | The Right-of-Way Impact Report identifies Parcel No. 50806 as Utility Use, owned by So Calif Edison Co. A review of the I-710 EIR/EIS Right-of-Way Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 50806 consists of APN 7306-022-803. This parcel is located adjacent to the west of I-710 and northeast of the intersection of East Maria St. and South Susana Rd. An EDR listing of potential concern was identified (see Parcel No. 08110). This land parcel is considered high risk. |
| 50807 | 7306-022-802 | SCE Corridor Long Beach, CA | Partial | The Right-of-Way Impact Report identifies Parcel No. 50807 as Utility Use, owned by SO CALIF EDISON CO. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 50807 consists of APN 7306-022-802. This parcel consists of two strips of land located adjacent to the west of the Long Beach Blvd. on-ramp to I-710 South. A nearby EDR listing of potential concern was identified (see Parcel No. 08127). |
| 50808 | 7306-022-801 | SCE Corridor Long Beach, Ca, | Partial | The Right-of-Way Impact Report identifies Parcel No. 50808 as Utility Use, owned by SO CALIF EDISON CO. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 50808 consists of APN 7306-022-801. This parcel consists of a strip of land located adjacent to the west of the Long Beach Blvd. on-ramp to I-710 South. An EDR listing of potential concern was identified (see Parcel No. 08110). |

| 08110 | 7306-022-033 | 88 Victoria St. Long Beach, CA | Partial | The Right-of-Way Impact Report identifies Parcel No. 08110 as Business Use, owned by BELL BUSINESS CENTER LP. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 08110 consists of APN 7306-022-033. This parcel consists of a strip of land adjacent to southwest corner of Victoria St. and Long Beach Blvd. Based on a review of the EDR Report and online maps and photographs, it appears that this parcel is part of a large property (Bell Business Center), which includes APNs 7306-022-055 and 7306-022-054 (adjacent to the west). These two parcels are not impacted by Alternative 5C, but since APN 7306-022-033 is part of this larger property, which was identified in the EDR Report, they are discussed. 100 W. Victoria St. at APN 7306-022-055 was identified as Former Robert Shaw Controls (EDR ID No. 2131) in the ENVIROSTOR, UST, LUST, HIST CORTESE, SLIC, RCRA-SQG, FIND, HAZNET, CA FID UST, HIST UST, EMI, CA WDS, HIST FTTS, VCP, ENF and SWEEPS UST databases; as Bell Business Center in the NPDES and HAZNET database; as Invensys Controls in the FINDS and HAZNET database; and as 100 West Victoria Waste Treatment Area in the CA CHMIRS database. Site investigations began at this property in 1991. Phased site investigations and remediation activities have continued to the present time, to assess and remediate chemical impacts to soils and groundwater from past manufacturing operations. Potential contaminants of concern include chlorinated solvents such as benzene, PCE, TCE, vinyl chloride, and xylenes. A groundwater remediation and monitoring system as well as a soil vapor extraction system are currently being operated at the property. The DTSC referred the case to the RWQCB on February 2, 2009. The online GeoTracker lists the status as "Open – Remediation" as of December 22, 2014. Based on information reviewed in the online GeoTracker database, it appears that additional investigations and remediation are required at this property. Based on the regulatory status and on-going remedial conditions, this site is considered to represent an environmental concern to the ISA Study Area. |
| 08109 | 7306-022-038 | 5951 Long Beach Blvd Long Beach, CA | Partial, TCE | The Right-of-Way Impact Report identifies Parcel No. 08109 as Business Use, owned by 5951 LONG BEACH LLC. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 08109 consists of APN 7306-022-038. This parcel consists of a strip of land adjacent to southwest corner of Victoria St. and Long Beach Blvd. An adjacent EDR listing of potential concern was identified (see Parcel No. 08110). |

| 50814 | 7132-001-808 | SCE Corridor Long Beach, CA | Partial | The Right-of-Way Impact Report identifies Parcel No. 50814 as Utility Use, owned by SO CALIF EDISON CO. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 50814 consists of APN 7132-001-808. This parcel is located adjacent to east of I-710 north off-ramp to Long Beach Blvd and is occupied by high power transmission lines. No EDR listings were identified in this area. |
| 50815 | 7132-001-807 | SCE Corridor Long Beach, CA | Partial, TCE | The Right-of-Way Impact Report identifies Parcel No. 50815 as Utility Use, owned by SO CALIF EDISON CO. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 50815 consists of APN 7132-001-807. This parcel is located adjacent to east of I-710 north off-ramp to Long Beach Blvd and is occupied by high power transmission lines. No EDR listings were identified in this area. |
| 50816 | 7132-001-806 | SCE Corridor Long Beach, CA | Partial, TCE | The Right-of-Way Impact Report identifies Parcel No. 50816 as Utility Use, owned by SO CALIF EDISON CO. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 50816 consists of APN 7132-001-806. This parcel is located adjacent to east of I-710 north off-ramp to Long Beach Blvd and is occupied by high power transmission lines. No EDR listings were identified in this area. |
| 40818 | 7132-004-901 | Los Angeles River Long Beach | Partial, TCE | The Right-of-Way Impact Report identifies Parcel No. 40818 as Flood Control, owned by LA CO FLOOD CONTROL DISTRICT. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 40818 consists of APN 7132-004-901. This parcel consists of a strip of land adjacent to the south of Long Beach Blvd and north of the Los Angeles River and is occupied by high power transmission lines. No EDR listings were identified in this area. |
| 40817 | 7132-004-900 | Los Angeles River Long Beach, CA | Partial, TCE | The Right-of-Way Impact Report identifies Parcel No. 40817 as Flood Control, owned by LA CO FLOOD CONTROL DISTRICT. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 40817 consists of APN 7132-004-900. This parcel consists of a strip of land adjacent to the south of Long Beach Blvd and west of the Los Angeles River and is occupied by high power transmission lines. No EDR listings were identified in this area. |

A review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 50820 consists of APN 7132-037-801. This parcel consists of a strip of land located adjacent to east of I-710, west of the Los Angeles River, and north of Long Beach Blvd. and is occupied by high power transmission lines. No EDR listings were identified in this area. |
| 40819 | 7126-008-902 | Los Angeles River Long Beach, CA | Partial, TCE | The Right-of-Way Impact Report identifies Parcel No. 40819 as Flood Control, owned by LA CO FLOOD CONTROL DISTRICT. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 40819 consists of APN 7126-008-902. This parcel consists of a strip of land adjacent to the north of Long Beach Blvd and south of the Los Angeles River and is occupied by high power transmission lines. No EDR listings were identified in this area. |
| 50902 | 7115-027-800 | SCE Corridor Long Beach, CA | Partial, TCE | The Right-of-Way Impact Report identified Parcel No. 50902 as Utility Use, owned by SCE. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 50902 consists of APN 7115-027-800 and located adjacent to the east of I-710. Based on a review of online maps and photographs, Parcel No. 50902 is occupied by transmission power lines and utilized for storage of power poles and equipment. No EDR listings were identified in this area. |
| 50903 | 7115-027-801 | SCE Corridor Long Beach, CA | Full | The Right-of-Way Impact Report identified Parcel No. 50903 as Utility Use, owned by SCE. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 50903 consists of APN 7115-027-801 and located adjacent to the east of I-710. Based on a review of online maps and photographs, Parcel No. 50903 is occupied by transmission power lines and utilized for storage of power poles and equipment. No EDR listings were identified in this area. |
| 50905 | 7116-018-813 | SCE Corridor Long Beach, CA | Partial, TCE | The Right-of-Way Impact Report identified Parcel No. 50905 as Utility Use, owned by SCE. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 50905 consists of APN 7116-018-813 and located adjacent to the east of I-710. Based on a review of online maps and photographs, Parcel No. 50905 is occupied by transmission power lines. No EDR listings were identified in this area. |

A review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 50906 consists of APN 7116-018-802 and located adjacent to the east of I-710. Based on a review of online maps and photographs, Parcel No. 50906 is occupied by transmission power lines. No EDR listings were identified in this area. |
| 50907 | 7116-018-804 | SCE Corridor Long Beach, CA | Partial, TCE | The Right-of-Way Impact Report identified Parcel No. 50907 as Utility Use, owned by SCE. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 50907 consists of APN 7116-018-804 and located adjacent to the east of I-710. Based on a review of online maps and photographs, Parcel No. 50907 is occupied by transmission power lines. No EDR listings were identified in this area. |
| 50908 | 7116-018-801 | SCE Corridor Long Beach, CA | Partial, TCE | The Right-of-Way Impact Report identified Parcel No. 50908 as Utility Use, owned by SCE. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 50908 consists of APN 7116-018-801 and located adjacent to the east of I-710. Based on a review of online maps and photographs, Parcel No. 50908 is occupied by transmission power lines. This parcel was identified in the EDR Report (S114693651) as Southern California Edison in the LUST database. According to the GeoTracker online database, the status of the site is listed as "Completed-Case closed" as of 10/08/96 for a release of gasoline to an aquifer used for drinking water supply. Based on the regulatory agency closure status, this listing is not expected to have created an environmental concern to the ISA Study Area. However, there is potential for residual contamination to exist which may be encountered during construction and/or excavation activities. |
| 50909 | 7116-018-803 | SCE Corridor Long Beach, CA | Full | The Right-of-Way Impact Report identified Parcel No. 50909 as Utility Use, owned by SCE. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 50909 consists of APN 7116-018-803 and located adjacent to the east of I-710. Based on a review of online maps and photographs, Parcel No. 50909 is occupied by transmission power lines. No EDR listings were identified in this area. |

| 12109 | 7301-003-011 | 2820 Alondra Blvd. Compton, CA | Partial, TCE | The Right-of-Way Impact Report identified Parcel No. 12109 as Business Use (unknown owner). Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 12109 consists of APN 7301-003-011. Based on review of online maps and photographs, Parcel No. 12109 consists of an ARCO gas station (2820 E. Alondra Blvd.), located at the southwest corner of East Alondra Blvd. and Atlantic Ave., west of I-710. This parcel was identified in the EDR Report (EDR ID No.1622) as 7 Days Food Store in the UST, SWEEPS UST, LUST, and Los Angeles County HMS databases; as B&B Petroleum in the Los Angeles County HMS and HAZNET databases; as Alondra AM/PM in the Los Angeles County HMS database; as PMM Alondra Inc. in the HAZNET database; as Hang Yeol Jung Shan in the HAZNET database; and as Mr. Farza Nouri in the HAZNET database. According the GeoTracker database, the status is listed as "open-remediation" as of June 8, 2006, for a release of gasoline to "aquifer used for drinking water supply." According to the third quarter 2015 monitoring report, groundwater is flowing to the southwest. Based on the regulatory status and on-going remediation, this site is considered to represent an environmental concern to the ISA Study Area. |
| 12210 | 7101-015-003 | S Atlantic Ave Compton, CA | Full | The Right-of-Way Impact Report identified Parcel No. 12210 as Business Use owned by Fernando Perez. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 12210 consists of APN 7101-015-003. Based on a review of online maps and photographs, Parcel No. 12210 consists of a portion of the Martin Container Inc. property (1400 Atlantic Ave.), located north of Atlantic Ave. and adjacent to the east of I-710. No EDR listings were identified in this area. |

Based on a review of online maps and photographs, Parcel No. 41432 consists of a vacant strip of land indicative of a subsurface pipeline. This parcel is located between I-710 and the Los Angeles River, north of Imperial Hwy. No EDR listings were identified in this area. |
| 14448 | 6194-002-025 | 5201 Imperial Hwy. South Gate, CA | Full | The Right-of-Way Impact Report identified Parcel No. 14448 as Business Use, owned by Fry's 710 freeway Investment Inc. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 14448 consists of APN 6194-002-025. Based on review of online maps and photographs, Parcel No. 14448 consists of an ARCO gas station (5201 E. Imperial Hwy.) located at the northeast corner of E. Imperial Hwy. and Wright Rd. This parcel was identified in the EDR Report (EDR ID No. 927) as Copper Wash LLC in the Los Angeles County HMS database; as Shell in the LUST, HIST UST, and HAZNET databases; Chang's Shell in the LUST and UST databases; YM Shell in the HAZNET database; Shell Service Station in the ERNS, SWEEPS UST, Los Angeles County HMS, RCRA-SQG, FINDS, and HAZNET databases; SIM Shell in the RCRA-SQG database; and JK Shell in the EDR Historical Auto station database for the years 2001-2003. According to GeoTracker, the following two cases are associated with this parcel: Shell is listed with a status of "completed-case closed" as of October 24, 1996, for a release of gasoline to soil; and Chang's Shell is listed with a status of "completed-case closed" as of July 17, 2013, for a release of gasoline to "an aquifer used for drinking water supply." Additionally, each of the 16 wells located on-site are reportedly being sampled for post-remedial action verification monitoring to evaluate remediation system performance. Based on the post-remedial action sampling that is ongoing at the site, this site is considered to represent an environmental concern to the ISA Study Area and a file review is recommended. Additionally, there is potential for residual soil contamination to exist which may be encountered during construction and/or excavation activities. |

| 15107 | 6222-036-005 | 5310 Southern Ave. South Gate, CA | Partial, TCE | The Right-of-Way Impact Report identified Parcel No. 15107 as Business Use, owned by BORK CORP. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 15107 consists of APN 6222-036-005. Based on a review of online maps and photographs, Parcel No. 15107 consists of a segment of land adjacent to the south of Southern Ave., east of the Los Angeles River, and west of Salt Lake Ave. This parcel was identified in the EDR Report as Southern California Edison Shred Substation (EDR ID No. 944) in the RCRA-SQG, FINDS, CA NPDES, CA WDS, CA LUST, CA HIST UST, CA SWEEPS UST, CA HAZNET, CA EMI, and CA ENVIROSTOR databases; as Bell Foundry Co. (EDR ID No. 944) in the CA LOS ANGELES CO. HMS, CA RGA LUST, FTTS, and HIST FTTS databases. The LUST cleanup status is reported as "Completed – Case Closed" as of September 30, 1999. Based on the regulatory agency closure status, these listings are not expected to have created an environmental concern to the ISA Study Area. However, there is potential for residual soil contamination to exist which may be encountered during construction and/or excavation activities. |
| 71527 | 6232-017-906 | 9830 Miller Way South Gate, CA | Partial | The Right-of-Way Impact Report identified Parcel No. 71527 as Public Use, owned by SOUTH GATE CITY. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 71527 consists of APN 6232-017-906. Based on a review of online maps and photographs, Parcel No. 71527 is located at 9830 Miller Way which consists of a segment of land adjacent to the south of Miller Way and Garfield Ave., and east of I-710. The address was identified as Fiola International (EDR No. 1010) in the CA LOS ANGELES CO. HMS database; and as VACANT (EDR No. 1010) in the CA SWEEPS UST database. Fiola International was also identified at 9850 Frontage Rd. E in the RGA LUST database; at 9858 Miller Way in the CA LUST and CA HIST UST database. The status of the LUST case at 9850 Frontage Rd. E is reported as "Completed – Case Closed" as of 7/23.1996. The status of the LUST case at 9858 Miller Way is reported as "Completed – Case Closed" as of January 29, 2010. According to information available on the online GeoTracker database, this facility was formerly a forklift repair facility and was vacant as of January 2010. In 2006, three 550-gallon hydraulic fluid and waste oil USTs were removed from the site. A fourth UST, a 1,000-gallon tank with unknown contents, was closed in place in 1983. At the time of the 2006 removal, soil impacted with low concentrations of benzene, MTBE, acetone, TBA, and MEK were identified. Groundwater monitoring wells were not required by the RWQCB due to the low concentrations detected, and the case was closed in January 2010. Based on the closed status, this property is not considered an environmental concern for the ISA Study Area. It should be noted that residual soil |

| | | | | contamination and a former UST closed in place may exist in the area of this property impacted by the right-of-way, which could be encountered during construction and/or excavation activities. |
| 15232 | 6232-015-005 | 5730 Southern Ave. South Gate, CA | Partial | The Right-of-Way Impact Report identified Parcel No. 15232 as Business Use, owned by WORLD OIL CORP. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 15232 consists of APN 6232-015-005. Based on a review of online maps and photographs, Parcel No. 15232 consists of a segment of land at 5730 Southern Ave., adjacent to the south of Southern Ave., west of Garfield Ave., and east of I-710. The address was identified as Lunday Thagard Company (EDR No. 969) in the CA HAZNET database and as Pan Pacific Petroleum Co. (EDR No. 969) in the CA WDS database. Parcels No. 15231, 15232, and 15233 were formerly part of a large refinery (see Parcel No. 15233 for EDR discussion). |
| 15231 | 6232-015-004 | 5630 Southern Ave. South Gate, CA | Partial | The Right-of-Way Impact Report identified Parcel No. 15231 as Business Use, owned by WORLD OIL CO. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 15231 consists of APN 6232-015-004. Based on a review of online maps and photographs, Parcel No. 15231 consists of a segment of land at 5630 Southern Ave., adjacent to the south of Southern Ave., west of Garfield Ave., and east of I-710. No EDR listings were identified associated with 5630 Southern Ave. Parcel No. 15231 appears to be associated with Parcel No. 15233 and was identified as Lunday Thagard Company (EDR No. 969) in the CA HAZNET database and as Pan Pacific Petroleum Co. (EDR No. 969) in the CA WDS database. Parcels Nos. 15231, 15232, and 15233 were formerly part of a large refinery (see Parcel No. 15233 for EDR discussion). |
| 15230 | 6232-015-003 | 5532 Southern Ave. South Gate, CA | Partial, TCE | The Right-of-Way Impact Report identified Parcel No. 15230 as Business Use, owned by J B HUNT TRANSPORT INC. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 15230 consists of APN 6232-015-003 Based on a review of online maps and photographs, Parcel No. 15230 consists of a segment of land adjacent to the south of Southern Ave., west of Garfield Ave., and east of I-710. No EDR listings were identified associated with 5440 Southern Ave. |
| 15115 | 6222-001-021 | South Gate, CA | Full | The Right-of-Way Impact Report identified Parcel No. 15115 as Business Use, owned by KUDOCO DIVERSIFIED INC. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 15115 consists of APN 6222-001-021. Based on a review of online maps and photographs, Parcel No. 15115 consists of a segment of vacant land adjacent to the north of the intersection of Southern Ave. and Frontage Rd., and east of I-710. No EDR listings were identified in this area. |

| 15116 | 6222-001-020 | South Gate, CA | Full | The Right-of-Way Impact Report identified Parcel No. 15116 as Business Use, owned by KUDOCO DIVERSIFIED INC. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 15116 consists of APN 6222-001-020. Based on a review of online maps and photographs, Parcel No. 15116 consists of a segment of vacant land north of the intersection of Southern Ave. and Frontage Rd., and east of I-710. No EDR listings were identified in this area. |
| 71514 | 6222-001-916 | South Gate, CA | Full | The Right-of-Way Impact Report identified Parcel No. 71514 as Public Use, owned by COMMUNITY DEV COMMISSION OF. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 71514 consists of APN 6222-001-916. Based on a review of online maps and photographs, Parcel No. 71514 consists of vacant land adjacent to the north of Southern Ave. and east of I-710. No EDR listings were identified in this area. |
| 41513 | 6222-001-904 | Los Angeles River South Gate, CA | Partial, TCE | The Right-of-Way Impact Report identified Parcel No. 41513 as Flood Control Use. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 41513 consists of APN 6222-001-904. Based on a review of online maps and photographs, Parcel No. 41513 consists of a segment of land east of the Los Angeles River and adjacent to the north of Southern Ave. No EDR listings were identified in this area. |
| 61512 | 6222-001-278 | LADWP South Gate, CA | Partial, TCE | The Right-of-Way Impact Report identified Parcel No. 61512 as Utility Use, owned by LA CITY DEPT OF WATER AND POWER. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 61512 consists of APN 6222-001-278. Based on a review of online maps and photographs, Parcel No. 61512 consists of a segment of land east of the Los Angeles River, west of I-710, and north of Southern Ave. No EDR listings were identified in this area. |
| 61517 | 6222-001-276 | LADWP South Gate, CA | TCE | The Right-of-Way Impact Report identified Parcel No. 61517 as Utility Use, owned by LA CITY DEPT OF WATER AND POWER. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 61517 consists of APN 6222-001-276. Based on a review of online maps and photographs, Parcel No. 61517 consists of a segment of land east of the Los Angeles River, west of I-710, and north of Southern Ave. This parcel was part of a former landfill associated with Parcel No. 51518, 61512, and 51518 (see Parcel No. 51518 for EDR discussion). |

| 61522 | 6222-001-277 | LADWP South Gate, CA | Partial, TCE | The Right-of-Way Impact Report identified Parcel No. 61522 as Utility Use, owned by LA CITY DEPT OF WATER AND POWER. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 61522 consists of APN 6222-001-277. Based on a review of online maps and photographs, Parcel No. 61522 consists of a segment of land east of the Los Angeles River, west of I-710, and south of Firestone Blvd. No EDR listings were identified in this area. |
| 15233 | 6232-010-016 | 9301 Garfield Ave. South Gate, CA | Partial | The Right-of-Way Impact Report identified Parcel No. 15233 as Business Use, owned by INNOVATE INC. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 15233 consists of APN 6232-010-016. Based on a review of online maps and photographs, Parcel No. 15233 consists of a segment of land adjacent to the north of Southern Ave. and west of I-710. The parcel was identified in the EDR Report as 9301 Garfield Ave. (EDR ID No. 948) in the ERNS and HMIRS databases; as Lunday-Thagard Refinery (EDR ID No. 948) in the RCRA-LQG, CA NPDES, CA SLIC, CA CHMIRS, CA EMI, TRIS, RMP, CA WDS, CA HIST UST, and CA HAZNET databases; as Asphalt Refinery (EDR ID No. 948) in the CA CHMIRS database; as Herbert Malarkey Roofing Company (EDR ID No. 948) in the CA EMI, FINDS, CA WDS database; as G S Roofing Products Inc. (EDR ID No. 948) in the CA EMI and CA HAZNET databases. The Lundy-Thagard Refinery received violations, which subsequently achieved compliance. According to the SLIC database, a release of fuel oxygenates and gasoline was discovered in 2002 that impacted soil and groundwater. This facility is under the supervision of the RWQCB. The online GeoTracker database reports the cleanup status as "Open – Remediation" as of January 22, 2009. A semi-annual groundwater monitoring program has been implemented at this property and an additional groundwater monitoring well to further investigate down-gradient impacts was installed in October 2010. In 2015, groundwater was reported between 62 and 65 feet bgs and flow direction ranged from south-southeast to southeast. Based on the information reviewed online, it appears that additional remediation and site assessment activities are required at this property and a file review is recommended. Therefore, this property represents an environmental concern to Alternative 5C. It should be noted that soil contamination may exist in the area of this property impacted by the right-of-way, which could be encountered during construction and/or excavation activities. |

| 15234 | 6232-010-008 | 5625 Southern Ave South Gate, CA | Partial, TCE | The Right-of-Way Impact Report identified Parcel No. 15234 as Business Use, owned by SULLY-MILLER CONTRACTING CO. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 15234 consists of APN 6232-010-008. Based on a review of online maps and photographs, Parcel No. 15234 consists of a segment of land adjacent to the north of Southern Ave. and west of I-710. The parcel was identified in the EDR Report Sully Miller Construction (EDR ID No. 969) in the FINDS, CA LOS ANGELES CO. HMS, ERNS, CHMIRS, CA LUST, CA EMI, CA HAZNET, and CA UST databases; as South Gate HMA Plant (EDR ID No. 969) in the CA HIST UST and CA SWEEPS UST databases; and as Blue Diamond Materials (EDR ID No. 969) in the CA HAZNET and CA AST databases. According to the online GeoTracker database, Sully-Miller Contracting Co. is listed in the LUST database with a cleanup status of "Open – Site Assessment" as of November 4, 2009. The RWQCB is the lead agency for the case and contaminants of concern include BTEX, diesel, and fuel oxygenates. No additional information is accessible online. Based on the open case status and lack of data available online, this property represents an environmental concern to Alternative 5C and a file review is recommended. |
| 15235 | 6232-010-011 | 5601 Southern Ave. South Gate, CA | Partial, TCE | The Right-of-Way Impact Report identified Parcel No. 15235 as Business Use, owned by Californian South Gate. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 15234 consists of APN 6232-010-008. Based on a review of online maps and photographs, Parcel No. 15234 consists of a segment of land adjacent to the north of Southern Ave. and west of I-710 and is associated with Parcel ID No.15234. See Parcel ID No. 15234 for EDR listings and information. |
| 15237 | 6232-009-009 | 5700 Firestone Blvd. South Gate, CA | Partial, TCE | The Right-of-Way Impact Report identified Parcel No. 15237 as Business Use, owned by MANN ENTERPRISES INC, currently occupied by Target. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 15237 consists of APN 6232-009-009. Based on a review of online maps and photographs, Parcel No. 15237 consists of two segments of land adjacent to the south of Firestone Blvd. and adjacent to the east of the I-710 off-ramp to Firestone Blvd. The parcel was identified in the EDR Report as Target Store T0190 at 5700 Firestone Blvd. (EDR ID No. 905) in the FINDS, CA HAZNET, and RCRA-SQG databases; and as South Gate Town Center (EDR ID No. 905) in the LA CO. SITE MITIGATION database. A review of the GeoTracker database identified that groundwater underneath Parcel No. 15237 is impacted by the ARCO-Vinvale Tank Farm at 8601 Garfield Ave. |

| | | | | Based on the information available online, this property represents an environmental concern to Alternative 5C. |
| 15339 | 6232-002-005 | 5625 Firestone Blvd. South Gate, CA | Partial, TCE | The Right-of-Way Impact Report identified Parcel No. 15339 as Business Use, owned by ALUM LANDLORD QRS 16 105 INC. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 15339 consists of APN 6232-002-005. Based on a review of online maps and photographs, Parcel No. 15339 consists of a segment of land along the northwest corner of the intersection of National Ave. and Firestone Blvd. International Window Corp was identified at 5625 Firestone Blvd. in this area in the CA UST, CA LUST, CA SLIC, CA HIST UST, CA SWEEPS UST, CA LOS ANGELES CO. HMS MITIGATION, CA ENF, CA HIST CORTESE, and CA HAZNET database. Reportedly, a release was discovered in 1990 that affected the groundwater at the site. The site is under the jurisdiction of the RWQCB. According to the online GeoTracker database, the cleanup status is reported as "Completed – Case Closed" as of August 30, 2001. Based on the regulatory agency closure status, these listings are not expected to have created an environmental concern to the ISA Study Area. However, there is potential for residual soil contamination to exist which may be encountered during construction and/or excavation activities. Groundwater beneath this property has been impacted by the ARCO-Vinvale Tank Farm at 8601 Garfield Ave. |
| 61544 | 6233-001-275 | South Gate, CA | Partial, TCE | The Right-of-Way Impact Report identified Parcel No. 61544 as Utility Use, owned by L A CITY DEPT OF WATER AND POWER. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 61544 consists of APN 6233-001-275. Based on a review of online maps and photographs, Parcel No. 61544 consists of a segment of the Rio Hondo River, bound to the west by the I-710 and to the south by Meadow Rd. This parcel was formerly part of a landfill associated with Parcel No. 41543, No. 15268, No. 61544, No. 41520, and No. 71570 (see Parcel No. 41543 for EDR discussion). |
| 15245 | 6233-002-900 | South Gate, CA | Partial, TCE | The Right-of-Way Impact Report identified Parcel No. 15245 as Business Use, owned by SOUTH GATE CITY. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 15245 consists of APN 6233-002-900. Based on a review of online maps and photographs, Parcel No. 15245 consists of a segment of land east of the Los Angeles River, adjacent to the south of the I-710, and west of the Rio Hondo River. No EDR listings were identified in this area. |

| 16443 | 6315-031-002 | Bell, CA | TCE | The Right-of-Way Impact Report identified Parcel No. 16443 as Utility Use, owned by Chevron USA Inc. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 16443 consists of APN 6315-031-002 and located adjacent to the west of I-710, east of the Los Angeles River. Based on a review of online maps and photographs, Parcel No. 16443 is occupied by a strip of vacant land located adjacent to the west of I-710, bound to the south by E. Gage Ave. and to north by Southern Pacific Railroad. No EDR listings were identified in this area. |
| 16443 | 6315-031-001 | Bell, CA | TCE | The Right-of-Way Impact Report identified Parcel No. 16442 as Utility Use, owned by Chevron USA Inc. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 16442 consists of APN 6315-031-001 and located adjacent to the west of I-710, east of the Los Angeles River. Based on a review of online maps and photographs, Parcel No. 16442 is occupied by a strip of vacant land located adjacent to the west of I-710, bound to the south by E. Gage Ave. and to north by Southern Pacific Railroad. No EDR listings were identified in this area. |
| 17353 | 6332-002-036 | 5600 Rickerbacker Rd Bell, CA | Partial | The Right-of-Way Impact Report identified Parcel No. 17335 as Business Use, owned by The Salvation Army. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 17335 consists of APN 6332-002-036. Review of online maps and photographs, Parcel No. 17335 consists of a large commercial facility (5600 Rickenbacker Rd.) occupied by The Salvation Army Wellness Center located adjacent to the east of I-710. This parcel was identified in the EDR Report (EDR ID No.419) as LAUSD Bell Education and Career Center in the HAZNET, SCH, NPDES, ENVIROSTOR, FINDS, RCRA-LQG databases; as FBI Warehouse in the HAZNET database; as Salvation Army in the HAZNET database; as Jet Propulsion Lab in the HAZNET database; as Bell Federal Building in the HAZNET database; as Shelter Partnership in the HAZNET database; as General Service Administration in the HAZNET database; as Bell Armed Forces Reserve Center in the HAZNET and NPDES databases; and as Federal Service Center in the HIST UST and Los Angeles County HMS databases. The ENVIROSTOR database lists the cleanup status as "Certified as of October 11, 2012." This site comprises over 13 acres and during the PEA, elevated levels of PAHs and arsenic were found in soils to a depth of four feet bgs, which required removal (approximately 1,000 cubic yards were removed). Based on the certified status, this listing is not expected to have created an environmental concern to the ISA Study Area. However, there is potential for |

| | | | | residual soil contamination to exist which may be encountered during construction and/or excavation activities. |
| 61603 | 6226-034-270 | LADWP Bell, CA | Partial, TCE | The Right-of-Way Impact Report identified Parcel No. 61603 as Utility Use, owned by LA City Department of Water and Power (LADWP). A review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 61603 consists of APN 6226-034-270 and located adjacent to the east of the Los Angeles River and west of I-710. Based on a review of online maps and photographs, Parcel No. 61603 is occupied by transmission power lines. No EDR listings were identified in this area. |
| 61640 | 6327-039-270 | LADWP Bell, CA | Partial, TCE | The Right-of-Way Impact Report identified Parcel No. 61640 as Utility Use, owned by LADWP. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 61640 consists of APN 6327-039-270 and located adjacent to the east of the Los Angeles River, west of I-710. Based on a review of online maps and photographs, Parcel No. 61640 is occupied by transmission power lines bound to the south by E. Florence Ave. and to north by E. Gage Ave., west of I-710. No EDR listings were identified in this area. |
| 17206 | 6332-014-025 | 5568 61 st St. City of Commerce, CA | Full | The Right-of-Way Impact Report identified Parcel No. 17206 as Business Use owned by Sheldon Appel Co Trust. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 17206 consists of APN 6332-014-025. Based on review of online maps and photographs, Parcel No. 17206 consists of a large commercial building (5568 E. 61 st St.) occupied by Regal Trading Company (5560 E. 61 st St.) and Ivy Enterprises (5564 E. 61 st St.). This facility is located south of E. 61 st St., east of I-710. This parcel was identified in the EDR Report (EDR ID No. 516) as Henkel Corp in the CHMIRS and EMI databases; and as Cognis Corp in the LUST, RCRA-SQG, EMI, HAZNET, FINDS, DEED, ENVIROSTOR, and Los Angeles County HMS databases. According to the ENVIROSTOR database, from 1938 to 1999, this 11-acre site was occupied by various chemical manufacturing companies and a steel foundry. Some of the former operators included Crayola, Vegetable Oil Company, Emery Industries, Wulff Processing, California Carbonic, National Distillers, and Apex Steel. Henkel, the last facility operator, was an oleochemical manufacturing facility that refined vegetable and animal fats. In 1994, Henkel was granted a Conditional Authorization for the on-site treatment. In 1997, Henkel submitted a Phase I Environmental Assessment Checklist indicating further investigation was needed. DTSC conducted a Phase I Environmental Checklist verification inspection on the site and concurred further investigation was needed. Identified SWMUs included nickel storage, sulfuric acid storage, stormwater impound, wastewater sumps, |

| Appendix P-1 Parcel No. | APN | Address ¹ | Acquisition | Site Listing |
|-------------------------------|--------------|----------------------|-------------|--|
| | | | | wastewater pre-treatment sump, Southland Oil (State Super Fund site) property border, steel foundry, and excavations from Underground Storage Tanks (USTs) formerly containing Acetone, Methanol, Gasoline, Dowtherm A, and Therminol. Cognis Corporation took over Henkel and demolished the above ground structures in the spring 2000. In June 2000, Cognis Corporation entered into a Corrective Action Consent Agreement (CACA) with DTSC to investigate and remediate potential soil and groundwater contamination. During the fiscal year 2004/2005, DTSC oversaw implementation of an interim measure removal of lead contaminated soil in Area 2. Corrective Measures Plan, dated March 29, 2007, for Cognis Facility, was public noticed and approved by DTSC on June 29, 2007. Cognis implemented Soil Vapor Extraction (SVE) and removal of ten cubic yards of contaminated soil with arsenic concentrations above the local background levels in one area (Area 3). In addition, the Corrective Measures Plan would place a cap and additional restriction on the border with Southland Oil Site (Area 6). The restriction prohibits re-development except for the removal of the existing concrete structures and construction of a parking lot. The facility submitted Corrective Measures Completion report in July 2010. A Land Use Covenant was filed with the Los Angeles County Assessor's Office in 2012. The site returned to industrial/commercial use, with "Land use restrictions only" as of May 16, 2012. According the GeoTracker database, the facility is listed with a status of "Completed-case closed" as of February 18, 2009, for a release of gasoline to soil. Based on the regulatory agency closure status, these listings are not expected to have created an environmental concern to the ISA Study Area. However, there is potential for residual soil contamination to exist which may be encountered during construction and/or excavation activities. |
| 17207 | 6332-014-028 | - | Partial | The Right-of-Way Impact Report identified Parcel No. 17207 as Business Use owned by Sheldon Appel Co Trust. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 17207 consists of APN 6332-014-028. Based on review of online maps and photographs, Parcel No. 17207 consists of a segment of E. 61 st St., located east of I-710. No EDR listings were identified in this area. |
| 17208 | 6332-013-015 | - | Partial | The Right-of-Way Impact Report identified Parcel No. 17208 as Business Use owned by Newark Group Industries Inc. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 17208 consists of APN 6332-013-015. Based on review of online maps and photographs, Parcel No. 17208 consists of a strip of land bordering the north side of E. 61 st St., east of I-710. No EDR listings were identified in this area. |

| 17209 | 6332-013-033 | - | Partial, TCE | The Right-of-Way Impact Report identified Parcel No. 17209 as Business Use owned by Newark Group Industries Inc. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 17209 consists of APN 6332-013-033. Based on review of online maps and photographs, Parcel No. 17209 consists of the Golden State Fibers Recycling facility (5585 E. 61 st St.) located north E. 61 st St., east of I-710. This parcel was identified in the EDR Report (EDR ID No. 516) as Baker Castor Oil in the CERCLIS-NFRAP, NPDES, LA County Site Mitigation, Los Angeles County HMS, and ENVIROSTOR databases. According to the ENVIROSTOR database, the facility is listed with a status of "No further action" as of January 17, 1984. Based on the regulatory agency closure status, these listings are not expected to have created an environmental concern to the ISA Study Area. However, there is potential for residual soil contamination to exist which may be encountered during construction and/or excavation activities. |
| 17210 | 6332-013-014 | - | Full | The Right-of-Way Impact Report identified Parcel No. 17210 as Business Use owned by Newark Group Industries Inc. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 17210 consists of APN 6332-013-014. Based on review of online maps and photographs, Parcel No. 17210 consists of a vacant strip of land located the Golden State Fibers Recycling facility (5585 E. 61 st St.) located at the terminus of E. 61 st St., east of I-710. This parcel is associated with Parcel No. 17209, refer for EDR listings and information. |
| 17211 | 6332-013-001 | - | Partial, TCE | The Right-of-Way Impact Report identified Parcel No. 17211 as Business Use owned by Newark Group Industries Inc. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 17211 consists of APN 6332-013-001. Based on review of online maps and photographs, Parcel No. 17211 consists of a portion of Parcel No. 17209, refer for EDR listings and information. |
| 17335 | 6332-002-036 | 5600 Rickenbacker Rd. Bell, CA | Partial | The Right-of-Way Impact Report identified Parcel No. 17335 as Business Use, owned by The Salvation Army. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 17335 consists of APN 6332-002-036. Based on review of online maps and photographs, Parcel No. 17335 consists of a large commercial facility (5600 Rickenbacker Rd.) occupied by The Salvation Army Wellness Center located adjacent to the east of I-710. This parcel was identified in the EDR Report (EDR ID No.419) as LAUSD Bell Education and Career Center in the HAZNET, SCH, NPDES, ENVIROSTOR, FINDS, RCRA-LQG databases; as FBI Warehouse in the HAZNET database; as Salvation Army in the HAZNET |

| | | | | database; as Jet Propulsion Lab in the HAZNET database; as Bell Federal Building in the HAZNET database; as Shelter Partnership in the HAZNET database; as General Service Administration in the HAZNET database; as Bell Armed Forces Reserve Center in the HAZNET and NPDES databases; and as Federal Service Center in the HIST UST and Los Angeles County HMS databases. The ENVIROSTOR database lists the cleanup status as "Certified as of October 11, 2012." This site comprises over 13 acres and during the PEA, elevated levels of PAHs and arsenic were found in soils to a depth of 4-feet bgs, which required removal (approximately 1,000 cubic yards were removed). Based on the certified status, this listing is not expected to have created an environmental concern to the ISA Study Area. However, there is potential for residual soil contamination to exist which may be encountered during construction and/or excavation activities. |
| 18212 | 6332-002-035 | 5600 Rickenbacker Rd. Bell, CA | Partial | The Right-of-Way Impact Report identified Parcel No. 18212 as Business use, owned by Shelter Partnership Inc. (Salvation Army). Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 18212 consists of APN 6332-002-035. Based on review of online maps and photographs, Parcel No. 18212 consists of a large commercial facility (5600 Rickenbacker Rd.) occupied by The Salvation Army Wellness Center located east of I-710. This parcel was identified in the EDR Report (EDR ID No.419) as LAUSD Bell Education and Career Center in the HAZNET, SCH, NPDES, ENVIROSTOR, FINDS, RCRA-LQG databases; as FBI Warehouse in the HAZNET database; as Salvation Army in the HAZNET database; as Jet Propulsion Lab in the HAZNET database; as Bell Federal Building in the HAZNET database; as Shelter Partnership in the HAZNET database; as General Service Administration in the HAZNET database; as Bell Armed Forces Reserve Center in the HAZNET and NPDES databases; Federal Service Center in the HIST UST and Los Angeles County HMS databases. The ENVIROSTOR database lists the cleanup status as "Certified as of October 11, 2012" indicating that the DTSC-approved response action has been completed. This site comprises over 13 acres and during the PEA, in 2009, elevated levels of PAHs and arsenic were found in soils to a depth of 4-feet bgs, which required removal. Approximately 1,000 cubic yards of contaminated soil was subsequently removed and documented in a report dated 2010. Based on the certified status, this listing is not expected to have created an environmental concern to the ISA Study Area. However, there is potential for residual soil contamination to exist which may be encountered during construction and/or excavation activities. |

| 18218 | 6332-002-021 | 5350 Lindbergh Ln. Bell, CA | Full | The Right-of-Way Impact Report identified Parcel No. 18218 as Business use, owned by Cheli Distribution Center Inc. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 18218 consists of APN 6332-002-021. Based on review of online maps and photographs, Parcel No. 18218 consists of a large commercial building occupied by Vernon Sanitary Supply (5350 Lindbergh Lane) and Allied Plastics (5380 Lindbergh Lane) located west of Lindbergh Lane and east of I-710. No EDR listings were identified in this area. This parcel was identified in the EDR Report (EDR ID No.345) as Individual Food Service in the VCP and ENVIROSTOR databases. According to the ENVIROSTOR database, the site is a slab on grade tilt up building comprised of about a 146,000-square-foot structure located on a 255,101-square-foot lot. The building is divided into different suites, used for warehousing and distribution. This Site is located near what was formerly the Cheli Air Force Base. To the west and south are the 710 freeway and the Los Angeles River. The nearest residential land use is on the opposite side of the Los Angeles River, about 0.25 mile from the site. Based on the information available to DTSC and Proponent, the site is or may be contaminated with hazardous substances, including poly-aromatic hydrocarbons (PAHs), volatile organic compounds, and petroleum hydrocarbons. The site is listed with a status of "Certified O&M-Land Use Restrictions Only" as of March 17, 2016. Based on the regulatory agency status, these listings are expected to have created an environmental concern to the ISA Study Area. Additionally, there is potential for soil contamination to exist which may be encountered during construction and/or excavation activities. |

| 18227 | 6332-002-920 | 5300 Bandini Blvd. Bell, CA | Full | The Right-of-Way Impact Report identified Parcel No. 18227 as Business use, owned by US Government (Dept. of the Army). Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 18227 consists of APN 6332-002-920. Based on review of online maps and photographs, Parcel No. 18227 consists of the Department of the Army facility located adjacent to the east of the S. Atlantic Blvd. off-ramp of I-710, south of Bandini Blvd. This parcel was listed in the EDR Report (EDR ID No.322) in the FINDS database; as Office of Adjutant General in the UST database; as US Government in the HIST CORTESE, LUST, SWEEPS UST databases; as CA Army National Guard in the LUST, Los Angeles County HMS; as Bell Organizational Maintenance No. 6 in the CERLIS, HAZNET, and RCRA-LQG databases. According to GeoTracker, three cases are associated with the site. Patton US Army Reserve Center (5340 Bandini Blvd.) is listed with a status of "Completed-case closed" as of November 14, 1999, for a release of diesel to soil. US Government (5300 Bandini Blvd.) is listed with a status of "Completed-case closed" as of February 5, 2009, for a release of gasoline to soil. CA Army National Guard is listed with a status of "Completed-case closed" as of March 3, 2015, for a release of diesel, gasoline, MTBE/TBA/other fuel oxygenates, toluene, waste oil/motor/hydraulic/lubricating, xylenes. Based on the regulatory agency closure status, these listings are not expected to have created an environmental concern to the ISA Study Area. However, there is potential for residual soil contamination to exist which may be encountered during construction and/or excavation activities. |
| 18228 | 6332-002-934 | Bandini Blvd. Bell, CA | Full | The Right-of-Way Impact Report identified Parcel No. 18228 as Business use, owned by US Government. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 18228 consists of APN 6332-002-934. This parcel is the eastern half of Parcel No. 18227. See Parcel No. 18227 for EDR information. |
