| 19113 | 5243-029-019 | 4646 Washington Blvd. Commerce, CA | Full | The Right-of-Way Impact Report identified Parcel No. 19113 as Business Use, owned by Kenneth W Busch Trust. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 19113 consists of APN 5243-029-019. Based on review of online maps and photographs, Parcel No. 19113 consists of Rodger's Trucking & Equipment Repair (4646 E. Washington Blvd.) located south of E. Washington Blvd. and west of I-710. This parcel was identified in the EDR Report (EDR ID No.214) as Rodger's Trucking and Equipment in the Los Angeles County HMS database. Based on the lack of violations and/or listing in other databases indicating a release, this listing is not expected to have created an environmental concern to the ISA Study Area. See Parcel No. 19116 for a discussion on nearby EDR listings of potential environmental concern. |
| 19114 | 5243-029-002 | 4642 Washington Blvd. Commerce, CA | Full | The Right-of-Way Impact Report identified Parcel No. 19114 as Business Use, owned by Larry Patapoff. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 19114 consists of APN 5243-029-002 located south of E. Washington Blvd. and west of I-710. Based on review of online maps and photographs, Parcel No. 19114 composes the western portion of Parcel No. 19113. See Parcel No. 19113 for EDR information. See Parcel No. 19116 for a discussion on nearby EDR listings of potential environmental concern. |
| 19115 | 5243-029-003 | 4638 Washington Blvd. Commerce, CA | Full | The Right-of-Way Impact Report identified Parcel No. 19115 as Business Use, owned by Kenneth W Busch Trust. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 19115 consists of APN 5243-029-003. Based on review of online maps and photographs, Parcel No. 19115 consists of RDD USA (4638 E. Washington Blvd.) located south of E. Washington Blvd. and west of I-710. This parcel was identified in the EDR Report (EDR ID No.214) as KW Busch Electric in the HAZNET database. Based on the lack of violations and/or listing in other databases indicating a release, this listing is not expected to have created an environmental concern to the ISA Study Area. See Parcel No. 19116 for a discussion on nearby EDR listings of potential environmental concern. |
| 19116 | 5243-029-020 | 2414 Connor Ave. Commerce, CA | Full | The Right-of-Way Impact Report identified Parcel No. 19116 as Business Use, owned by David M Throgmorton. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 19116 consists of APN 5243-029-003. Based on review of online maps and photographs, Parcel No. 19116 consists of Throgmorton's Frame Clinic (2414 Conner Ave.) located east of Conner Ave., south of E. Washington Blvd., west of I-710. This parcel was identified in the EDR Report (EDR ID No.214) as Certified Coatings Prod Co in |

I-710 Corridor Project RDEIR/SDEIS

| Appendix P-1 Parcel No. | APN | Address ¹ | Acquisition | Site Listing |
|-------------------------------|--------------|---------------------------------------|-------------|---|
| | | | | the RCRA-SQG, FINDS, Los Angeles County HMS, EMI, CA FID UST, SLIC, LUST, UST, HIST UST, HIST CORETESE, and SWEEPS UST databases; and as Throgmortons Frame Clinic in the Los Angeles County HMS and HAZNET databases. According to the GeoTracker database, two cases are associated with this parcel. Certified Coatings Products is listed with a status of "Completed-case closed" as of June 27, 1991, for a release of acetone to soil. Throgmorton's Frame Clinic is listed with a status of "open-inactive" as of January 29, 2015. A Phase II Environmental Assessment Report dated May 2008 indicated that fifteen (15) soil borings were advanced on-site to delineate the extent of soil contamination resulting from existing USTs. The report concluded that petroleum hydrocarbon and VOC contamination is generally located between 20 and 105 feet bgs. The consultant then recommended that all existing USTs be removed, and all residual contamination be treated by vapor extraction. No additional information was available on the GeoTracker website. Based on the regulatory status, this listing has the potential to create an environmental concern to the ISA Study Area and a file review is recommended. |
| 19117 | 5243-029-004 | 4630 Washington Blvd. Commerce, CA | Full | The Right-of-Way Impact Report identified Parcel No. 19117 as Business Use, owned by Kenneth W Busch Trust. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 19117 consists of APN 5243-029-004. Based on review of online maps and photographs, Parcel No. 19117 consists of a commercial property (4630 E. Washington Blvd.) located at the southeast corner of Connor Ave. and E. Washington Blvd., west of I-710. No EDR listings were identified associated with this address. See Parcel No. 19116 for a discussion on nearby EDR listings of potential environmental concern. |
| 19118 | 5243-029-021 | 2415 Conner Ave. Commerce, CA | Full | The Right-of-Way Impact Report identified Parcel No. 19118 as Business Use, owned by Criterion Enterprises. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 19118 consists of APN 5243-029-021. Based on review of online maps and photographs, Parcel No. 19118 consists of a vacant commercial property (2415 Connor Ave.) located west of Connor Ave. and south of E. Washington Blvd., west of I-710. No EDR listings were identified associated with this address. See Parcel No. 19116 for a discussion on nearby EDR listings of potential environmental concern. |

| 19119 | 5243-029-007 | 4614 Washington Blvd. Commerce, CA | Full | The Right-of-Way Impact Report identified Parcel No. 19119 as Business Use, owned by Criterion Enterprises. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 19119 consists of APN 5243-029-007. Based on review of online maps and photographs, Parcel No. 19119 consists of Pacific Signs & Supplies (4618 E. Washington Blvd.) located at the southwest corner of the intersection of E. Washington Blvd. and Connor Ave., west of I-710. This parcel was identified in the EDR Report (EDR ID No.214) as Criterion Gates and Mfg Co in the Los Angeles HMS database. Based on the lack of violations and/or listing in other databases indicating a release, this listing is not expected to have created an environmental concern to the ISA Study Area. |
| 19120 | 5243-029-008 | 4614 Washington Blvd. Commerce, CA | Full | The Right-of-Way Impact Report identified Parcel No. 19120 as Business Use, owned by Criterion Enterprises. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 19120 consists of APN 5243-029-007. Based on review of online maps and photographs, Parcel No. 19120 consists of Universal Neon Plus (4614 E. Washington Blvd.) located south of E. Washington Blvd., west of I-710. This parcel was identified in the EDR Report (EDR ID No.214) as Criterion Gate in the UST database; as Criterion Products Inc. in the HAZNET, EMI, and FINDS databases. Based on the lack of violations and/or listing in other databases indicating a release, these listings are not expected to have created an environmental concern to the ISA Study Area. |
| 19121 | 5243-029-009 | 4600 Washington Blvd. Commerce, CA | Partial | The Right-of-Way Impact Report identified Parcel No. 19121 as Business Use, owned by 4600 Washington LLC. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 19121 consists of APN 5243-029-009. Based on review of online maps and photographs, Parcel No. 19121 consists of J R's Tire Service (4600 E. Washington Blvd.) located south of E. Washington Blvd., west of I-710. This parcel was identified in the EDR Report (EDR ID No.214) as 4600 Super Service in the SWEEPS UST, CA FID UST, Los Angeles County HMS, LUST, HIST CORTESE, HIST UST databases; as 1xHarrison Gas & Oil in the HAZNET database. According to the GeoTracker database, this site is listed with a status of "Completed-case closed" as of October 21, 2009, for a release of gasoline to an aquifer used for drinking water supply. Based on the regulatory agency closure status, these listings are not expected to have created an environmental concern to the ISA Study Area. However, there is potential for residual soil contamination to exist which may be encountered during construction and/or excavation activities. |

Eastern Ave. Parcel No. 19495 is located west of S. Sydney Dr., west of I-710. No EDR listings were identified in this area. |
| 19496 | 5241-030-018 | 1517 Sydney Dr. Commerce, CA | Full | The Right-of-Way Impact Report identified Parcel No. 19496 as Business Use, owned by Marvin A and Ricki C Ring Trust. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 19496 consists of APN 5241-030-018. Based on a review of online maps and photographs, Parcel No. 19496 is used for storage associated with the California Charcoal & Firewood business located at 1518 S. Eastern Ave. Parcel No. 19496 is located west of S. Sydney Dr., west of I-710. No EDR listings were identified in this area. |
| 19497 | 5241-030-025 | Sydney Dr. Commerce, CA | Full | The Right-of-Way Impact Report identified Parcel No. 19497 as Business Use, owned by Marvin A and Ricki C Ring Trust. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 19497 consists of APN 5241-030-025. Based on a review of online maps and photographs, Parcel No. 19497 is used for storage associated with the California Charcoal & Firewood business located at 1518 S. Eastern Ave. Parcel No. 19497 is located west of S. Sydney Dr., west of I-710. No EDR listings were identified in this area. |
| 19498 | 5241-030-026 | 1511 Sydney Dr. Commerce, CA | Full | The Right-of-Way Impact Report identified Parcel No. 19498 as Business Use, owned by Marvin A and Ricki C Ring Trust. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 19498 consists of APN 5241-030-026. Based on a review of online maps and photographs, Parcel No. 19498 is used for storage associated with the California Charcoal & Firewood business located at 1518 S. Eastern Ave. Parcel No. 19498 is located west of S. Sydney Dr., west of I-710. No EDR listings were identified in this area. |

|-------------------------------|--------------|-----------------------------------|-------------|--|
| 19499 | 5241-030-021 | 1507 Sydney Dr. Commerce, CA | Full | The Right-of-Way Impact Report identified Parcel No. 19499 as Business Use, owned by Marvin A and Ricki C Ring Trust. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 19499 consists of APN 5241-030-021. Based on a review of online maps and photographs, Parcel No. 19499 is used for storage associated with the California Charcoal & Firewood business located at 1518 S. Eastern Ave. Parcel No. 19499 is located west of S. Sydney Dr., west of I-710. No EDR listings were identified in this area. |
| 19501 | 5241-030-006 | 1528 Eastern Ave. Commerce, CA | Full | The Right-of-Way Impact Report identified Parcel No. 19501 as Business Use, owned by Marvin A and Ricki C Ring Trust. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 19501 consists of APN 5241-030-021. Based on a review of online maps and photographs, Parcel No. 19501 is used for storage associated with the California Charcoal & Firewood business located at 1518 S. Eastern Ave. Parcel No. 19501 is located east of S. Eastern Ave., west of I-710. No EDR listings were identified in this area. |
| 19502 | 5241-030-005 | 1522 Eastern Ave. Commerce, CA | Full | The Right-of-Way Impact Report identified Parcel No. 19502 as Business Use, owned by Marvin A and Ricki C Ring Trust. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 19502 consists of APN 5241-030-005. Based on a review of online maps and photographs, Parcel No. 19502 is developed with a residential structure associated with the California Charcoal & Firewood business located at 1518 S. Eastern Ave. Parcel No. 19502 is located east of S. Eastern Ave., west of I-710. No EDR listings were identified associated with this address. |
| 19516 | 5241-013-018 | 45 Triggs St. Commerce, CA | Full | The Right-of-Way Impact Report identifies Parcel No. 19503 as Residential Use (1459 S. Sydney Dr.). A review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps revealed that Parcel No. 09503 consists of APN 5241-029-001. Based on a review of online maps and photographs, Parcel No. 09503 consists of a residential structure located west of S. Sydney Dr., west of I-710. No EDR listings were identified associated with this address. |
| 19517 | 5241-013-019 | 1350 Eastern Ave. Commerce, CA | Partial | The Right-of-Way Impact Report identified Parcel No. 19517 as Business Use, owned by LOS JARDINES LLC. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 19517 consists of APN 5241-013-019. Based on review of online maps and photographs, Parcel No. 19517 consists of a strip of vacant land (1350 S. Eastern Ave.) located adjacent to the south of the I-5 and I-710 interchange and a portion of the I-5 South to I-710 South ramp. A review of the EDR Report identified Specific Plating Co. Inc. (1350 S. Eastern Ave.) (EDR ID No. 161) in the RCRA-SQG, CA HIST UST, CA VCP, CA |

I-710 Corridor Project RDEIR/SDEIS

|-------------------------------|--------------|--|-------------|--|
| | | | | ENVIROSTOR, CA UST, CA SWEEPS UST, CA LOS ANGELES CO. HMS, and CA EMI databases. According the online GeoTracker database, the CA VCP status is listed as "ACTIVE AS OF December 12, 2013." The site was occupied by Specific Plating, an electroplating company from the 1960s. In February 2012, DTSC conducted soil and soil gas sampling at the site as part of a discovery project. Sampling data indicated elevated levels of volatile organic compounds (PCE and TCE). DTSC determined that additional sampling and remediation is required at this Site. The site is undergoing litigation currently to identify the legal owner, causing a delay in evaluation and cleanup of the site. Based on the active regulatory status and on-going investigations, this site is considered to represent an environmental concern to Alternative 5C. |
| 19520 | - | Read Site Listing | Full | The Right-of-Way Impact Report identified Parcel No. 19520 as Business Use, owned by STATE OF CALIFORNIA. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 19520 consists of unknown APN. Based on review of online maps and photographs, Parcel No. 19520 consists of land currently occupied by multiple businesses (4711-4727 E. Washington Blvd.) located south of Hepworth Ave. and adjacent to the east of I-710. No EDR listings were identified in this area. See Parcel No. 19517 for an EDR discussion of nearby potential environmental concerns. |
| 18106 | 6304-030-002 | Los Angeles, CA | Partial | The Right-of-Way Impact Report identified Parcel No. 18106 as Business use, owned by FedEx National LTL INC. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 18106 consists of APN 6304-030-002. Based on review of online maps and photographs, Parcel No. 18106 composes the western portion of the FedEx Freight facility (Parcel No. 18107-4500 Bandini Blvd.). EDR listings associated with this parcel are discussed in Parcel No. 18107. |
| 18107 | 6304-030-001 | 3939 S Atlantic Blvd. Los Angeles, CA | Partial | The Right-of-Way Impact Report identified Parcel No. 18107 as Business use, owned by FedEx National LTL INC. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 18106 consists of APN 6304-030-002. Based on review of online maps and photographs, Parcel No. 18107 consists of the FedEx Freight facility (4500 Bandini Blvd.) located north of S. Atlantic Blvd., west of I-710. This parcel was identified in the EDR Report (EDR ID No. 311) as 4500 Bandini Blvd. in the CHMIRS database; as FedEx Freight Inc. in the RCRA-SQG, WDS, SWEEPS UST, NPDES, HIST CORTESE, and LUST databases; as Watkins Motor Lines, Inc. in the LUST and FINDS databases. According to GeoTracker, the facility is listed with a status of "Completed-case closed" as of September 1, 1999, for a release of gasoline to soil. Based on the regulatory agency closure status, these |

| Appendix P-1 Parcel No. | APN | Address ¹ | Acquisition | Site Listing |
|-------------------------------|--------------|---|--------------|--|
| | | | | listings are not expected to have created an environmental concern to the ISA Study Area. However, there is potential for residual soil contamination to exist which may be encountered during construction and/or excavation activities. |
| 01310 | 7271-007-004 | - | Partial, TCE | The Right-of-Way Impact Report identifies Parcel No. 01310 as Business Use. A review of the I-710 EIR/EIS ROW Exhibit – Alternative 5C Maps revealed that Parcel No. 01310 consists of a portion of APN 7271-007-005 along Anaheim St. Based on a review of online maps and photographs, APN 7271-007-005 is occupied by Petros Tubular Services Inc. (929 W. Anaheim St.) for use as a storage yard. The 929 W. Anaheim St. address was not identified in the EDR Report. The online GeoTracker database indicates that the address 901 W. Anaheim St. is also associated with parcel, which is identified as Long Beach City Tow Yard (EDR ID No. 3265) in the LUST database with a Closed Case status as of July 6, 2011. Based on the closed case status, available soil and groundwater data, removal of the source (UST), location of the release on the property (north end), and groundwater flow direction (ESE), this release is not expected to represent an environmental concern to the ISA Study Area. |
| 01438 | 7432-020-033 | 1243 W Cowles St. Long Beach, CA | Full | The Right-of-Way Impact Report identified Parcel No. 01438 as Business use owned by Neill Properties LLC. Review of the I-710 EIR/EIS ROW Exhibit – Alternative 5C Maps and County Assessor website revealed that Parcel No. 01438 consists of APN 7432-020-033. Based on a review of online maps and photographs, Parcel No. 01438 consists of a property occupied by a Neill Aircraft Co. (1243 W. Cowles St.) located west of I-710. This parcel was identified in the EDR Report (EDR ID No. 3141) as Speedy Fuel Inc. and Delta Auto Service Inc. in the Historical Auto Stations database for the years 2004-2012; as Micor Energy LLC in the HIST CORTESE and UST databases; as Delta Auto Service Inc. in the HAZNET database; as Speedy Fuel in the HAZNET database. Based on the lack of violations and/or listing in other databases indicating a release, these listings are not expected to have created an environmental concern to the ISA Study Area. |
| 01440 | 7432-020-025 | 1248 W 15 th St. Long Beach, CA | Full | The Right-of-Way Impact Report identifies Parcel No. 01440 as Business Use owned by Neill Properties LLC. A review of the I-710 EIR/EIS Row Exhibit - Alternative 5C Maps revealed that Parcel No. 01440 consists of APN 7432-020-025. Based on a review of online maps and photographs, Parcel No. 01440 consists of consists of a property occupied by Neill Aircraft Co. (1248 W 15 th St.). No EDR listings were identified associated with this portion of the Neill Aircraft property. |

| 01439 | 7432-020-026 | 1260 15 th St. Long Beach, CA | Full | The Right-of-Way Impact Report identifies Parcel No. 01439 as Business Use owned by Neill Properties LLC. A review of the I-710 EIR/EIS Row Exhibit - Alternative 5C Maps revealed that Parcel No. 01439 consists of APN 7432-020-026. Based on a review of online maps and photographs, Parcel No. 01439 consists of a property occupied by Neill Aircraft Co. (1260 W 15 th St.). No EDR listings were identified associated with this address. |
| 01441 | 7432-021-004 | 1241 15 th St. Long Beach, CA | Full | The Right-of-Way Impact Report identifies Parcel No. 01441 as Business Use owned by Neill Properties LLC. A review of the I-710 EIR/EIS Row Exhibit - Alternative 5C Maps revealed that Parcel No. 01441 consists of APN 7432-021-004. Based on a review of online maps and photographs, Parcel No. 01441 consists of a property occupied by Neill Aircraft Co. (1241 W 15 th St.). No EDR listings were identified associated with this portion of the Neill Aircraft property. |
| 70149 | - | - | Full | The Right-of-Way Impact Report identifies Parcel No. 70149 as Business Use owned by Tidelands Oil Production Company. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 70149 consists of approximately 6.7112 acres of land within the existing right-of-way (no APN is associated with this area), east of I-710 between Anaheim St. and PCH. According to a review of online database, multiple active oil wells and petroleum pipelines are located in this area. This area was identified in the EDR Report as Public Service Transfer Station No. 1 (EDR ID No. 30-3240) in the CA SWF/LF database, which is discussed in detail. Reportedly, the City of Long Beach has an active limited volume transfer operation for green materials at this location. Based on the materials processed, frequent inspections and lack of reported violations or listing in other databases indicating a release, this listing is not expected to have created an environmental concern to the ISA Study Area. However, the oil production use and petroleum pipelines on this parcel of land are considered to represent an environmental concern to the ISA Study Area. |
| 40415 | 7203-001-901 | Los Angeles River Long Beach, CA | Partial, TCE | The Right-of-Way Impact Report identified Parcel No. 40415 as Flood Control Use. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 40415 consists of APN 7203-001-900. Based on a review of online maps and photographs, Parcel No. 40415 consists of a segment of the Los Angeles River, adjacent to the east of I-710, between W. 34 th St. to the south and I-405 to the north. No EDR listings were identified in this area. |

|-------------------------------|--------------|-------------------------------------|--------------|---|
| 41434 | 6233-028-026 | Los Angeles River South Gate, CA | Full | The Right-of-Way Impact Report identified Parcel No. 41434 as Flood Control Use owned by the State of California. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 41434 consists of APN 6233-028-026. Based on a review of online maps and photographs, Parcel No. 41434 consists of a vacant strip of land indicative of a subsurface pipeline. This parcel is located between I-710 and the Los Angeles River, north of Imperial Hwy. No EDR listings were identified in this area. |
| 15110 | 6222-001-013 | South Gate, CA | Partial, TCE | The Right-of-Way Impact Report identified Parcel No. 15110 as Business Use, owned by CHEVRON USA INC. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 15110 consists of APN 6222-001-013. Based on a review of online maps and photographs, Parcel No. 15110 consists of a segment of land adjacent to the north of Southern Ave., west of the Los Angeles River, and east of Burtis St. No EDR listings were identified in this area. |
| 16105 | 6226-005-011 | Florence Ave. Bell, CA | Partial, TCE | The Right-of-Way Impact Report identified Parcel No. 16105 as Residential Use, owned by Chevron USA Inc. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 16105 consists of APN 6226-005-011. Based on a review of online maps and photographs, Parcel No. 16105 consists of a portion of a road located within the Florence Village Mobile Home Park, adjacent to the west of the Los Angeles River, West of I-710. No EDR listings were identified in this area. |
| 18329 | 6332-002-078 | 5553 Bandini Blvd. Bell, CA | Partial | The Right-of-Way Impact Report identified Parcel No. 18329 as Business use, owned by Bandini XC LLC. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 18329 consists of APN 6332-002-078. Based on review of online maps and photographs, Parcel No. 18329 consists of a paved parking area associated with the California Post office (27 Yeager Way) located east of I-710 and north of Bandini Blvd. This parcel was identified in the EDR Report (EDR ID No.364) as US Postal Service LA East Bell in the NPDES and WDS databases; as US Postal Service East Garage in the UST, HAZNET, and Los Angeles County HMS databases. Based on the lack of violations and/or listing in other databases indicating a release, these listings are not expected to have created an environmental concern to the ISA Study Area. |

Table 3.12-2: Sites of Potential Environmental Concern to the ISA Study Area under Alternative 7

| Appendix P-2 Parcel No. | APN | Address¹ | Acquisition | Site Listing |
|------------------------------------|--------------|----------------------------|--------------------|---|
| 81553 | 622-703-4802 | Rail Ops Cudahy, CA | TCE | The Right-of-Way Impact Report identified Parcel No. 81553 as Railroad Use, owned by SOU PAC CO. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps and County Assessor website revealed that Parcel No. 81553 consists of APN 6227-034-802. Based on a review of online maps and photographs, Parcel No. 81553 consists of a segment of land adjacent to the north of the Southern Pacific Railroad, east of the I-710, and parallel to south of Shull St. See Parcel No. 81552 for an EDR discussion of potential environmental concerns. |
| 81552 | 623-200-2800 | Rail Ops Cudahy, CA | TCE | The Right-of-Way Impact Report identified Parcel No. 81552 as Railroad Use, owned by SOU PAC TRANS CO. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps and County Assessor website revealed that Parcel No. 81552 consists of APN 6232-002-800. Based on a review of online maps and photographs, Parcel No. 81552 consists of a segment of Southern Pacific Railroad, perpendicular to the east of the I-710 and parallel to south of Shull St. An adjacent property at 5614 Shull St. was identified in the EDR Report as Bell Gardens Redevelopment Department (EDR ID No. 837) in the CA HIST UST database; as City of Bell Gardens (Berk Oil) (EDR ID No. 837) in the CA LOS ANGELES CO. HMS, FINDS, and US BROWNFIELDS databases; as Berk Oil (EDR ID No. 837) in the CA HIST CORTESE, CA LUST, CA SLIC, and CA ENVIROSTOR databases. According to the online GeoTracker database, Berk Oil is listed as "Open - Site Assessment as of October 19, 2015." The site is currently owned by the City of Bell Garden and resides in one their redevelopment areas. The site is a 4.33-acre parcel that consisted of two former industrial facilities: Berk Oil and PMC. The Berk Oil facility which operated from 1965 through 1989 mainly as an asphalt mixing and oil distribution facility. The PMC was located on the eastern half and operated from 1953 through 1996 as a metal and fabrication facility. Environmental site investigations began in 1985 and included soil borings to a maximum of 80 feet bgs, groundwater sampling using hydropunch and installation of eight monitoring wells. In 1989, six underground storage tanks for asphalt, diesel, and waste oil were removed from the site. Analytical results confirmed that both soil and groundwater are impacted with petroleum hydrocarbons, metals, |

| Appendix P-2 Parcel No. | APN | Address ¹ | Acquisition | Site Listing |
|----------------------------|--------------|---|-------------|--|
| | | | | and volatile organic chemicals (VOCs). During investigations in 2010, groundwater was encountered in two saturated zones at 20 feet and 60 feet bgs. The groundwater flow of the shallower zone was toward the southwest and the deeper zone flows to the south. As of January 2015, due to financial hardship, the City of Bell Garden is still looking for potential developers to handle the investigations and cleanup of the site. No further information was available on the GeoTracker database. Therefore, based on the groundwater flow direction and impacts to groundwater and soil, this property presents a potential environmental concern to Alternative 7. |
| 51518 | 6222-001-801 | Long Beach Fwy and Firestone Blvd. South Gate, CA | TCE | The Right-of-Way Impact Report identified Parcel No. 51518 as Utility Use, owned by SO CALIF EDISON CO. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps and County Assessor website revealed that Parcel No. 51518 consists of APN 6222-001-801. Based on a review of online maps and photographs, Parcel No. 51518 consists of a segment of land east of the Los Angeles River, west of I-710 on-ramp from Firestone Blvd., and north of Southern Ave. According to the online SWIS database, Caltrans South Gate (SWIS No. 19-AA-5067) is located north of Firestone Blvd. between I-710 and the Los Angeles River. However, the database also states that the parcel number for this facility was confirmed in 2014 to be 6222-001-801 which is located south of Firestone Blvd. This facility was not identified in the EDR Report. The online SWIS database reports that this facility is a closed solid waste disposal site (formerly operated by the State of California) and the regulatory status is listed as “pre-regulations.” This land is currently owned by SCE for use as a utility corridor and annual inspections are performed by the County of Los Angeles. The most recent inspection was completed on February 5, 2016, and no violations or area of concern were reported. The inspection report indicates that the site was inaccessible due to perimeter fence and locked gates at the time of the inspection. A 2009 inspection report identifies SWIS No. 19-AA-5067 as “Caltrans, South Gate No. 1” located at 5212 E. Imperial Hwy., southeast of the NB I-710 off-ramp and north of Imperial Hwy; however, no sites were identified at this location in the mapping feature in the online SWIS database. The 2007 and 2008 inspection reports indicate that Caltrans, South Gate No. 1 was a formerly a landfill for street and highway sweepings that operated from 1955 until 1972 and at the time of the inspections was an unpaved dirt land used as a nursery and composting site. No design improvements would be |

I-710 Corridor Project RDEIR/SDEIS

| Appendix P-2 Parcel No. | APN | Address ¹ | Acquisition | Site Listing |
|----------------------------|--------------|----------------------|-------------|--|
| | | | | included in this area as it would only be used for a temporary construction easement and therefore this former solid waste disposal site is not expected to have created an environmental concern to Alternative 7. |
| 81901 | 5243-013-802 | Commerce, CA | TCE | The Right-of-Way Impact Report identified Parcel No. 81901 as Railroad Use, owned by A T AND S F RY CO. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps and County Assessor website revealed that Parcel No. 81901 consists of APN 5243-013-802. Based on a review of online maps and photographs, Parcel No. 81901 consists of a portion of the BNSF Hobart Yard located adjacent to the west of the I-710 and north of 26 th St. Several listings was identified in the EDR Report as 4650 East 26 th S., Lot 11, Row 11, Spot 420 (EDR ID No. 296) in the CA CHMIRS database; as Agrashell Inc. (EDR ID No. 296) in the CA HIST UST, CA SWEEPS UST, FINDS, and CA EMI databases; and as 4650 E. 26 th St. (EDR ID No. 296) in the ERNS database. Based on the lack of listing in other databases indicating violations and/or a release, this listing is not expected to have created an environmental concern to the ISA Study Area. |
| 81902 | 5243-013-800 | Commerce, CA | TCE | The Right-of-Way Impact Report identified Parcel No. 81902 as Railroad Use, owned by A T&S F RY CO. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps and County Assessor website revealed that Parcel No. 81902 consists of APN 5243-013-800. Based on a review of online maps and photographs, Parcel No. 81902 consists of a segment of railroad adjacent to the west of the I-710 and north of 26 th St. Adjacent to the northwest of this parcel is the BNSF Hobart Yard. See Parcel No. 81901 for a discussion on nearby EDR listings. |
| 81903 | 5243-013-803 | Commerce, CA | TCE | The Right-of-Way Impact Report identified Parcel No. 81903 as Railroad Use, owned by A T&S F RY CO. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps and County Assessor website revealed that Parcel No. 81903 consists of APN 5243-014-803. Based on a review of online maps and photographs, Parcel No. 81903 consists of a segment of railroad adjacent to the west of the I-710 and north of 26 th St. Adjacent to the west of this parcel is the BNSF Hobart Yard. See Parcel No. 81901 for a discussion on nearby EDR listings. |

| 19113 | 5243-029-019 | 4646 Washington Blvd. Commerce, CA | Full | The Right-of-Way Impact Report identified Parcel No. 19113 as Business Use, owned by Kenneth W Busch Trust. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps and County Assessor website revealed that Parcel No. 19113 consists of APN 5243-029-019. Review of online maps and photographs, Parcel No. 19113 consists of Rodger's Trucking & Equipment Repair (4646 E. Washington Blvd.) located south of E. Washington Blvd. and west of I-710. This parcel was identified in the EDR Report (EDR ID No.214) as Rodger's Trucking and Equipment in the Los Angeles County HMS database. Based on the lack of violations and/or listing in other databases indicating a release, this listing is not expected to have created an environmental concern to the ISA Study Area. See Parcel No. 19116 for a discussion on nearby EDR listings of potential environmental concern. |
| 19114 | 5243-029-002 | 4642 Washington Blvd. Commerce, CA | Full | The Right-of-Way Impact Report identified Parcel No. 19114 as Business Use, owned by Larry Patapoff. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 19114 consists of APN 5243-029-002 located south of E. Washington Blvd. and west of I-710. Based on review of online maps and photographs, Parcel No. 19114 composes the western portion of Parcel No. 19113. See Parcel No. 19113 for EDR information. See Parcel No. 19116 for a discussion on nearby EDR listings of potential environmental concern. |
| 19115 | 5243-029-003 | 4638 Washington Blvd. Commerce, CA | Full | The Right-of-Way Impact Report identified Parcel No. 19115 as Business Use, owned by Kenneth W Busch Trust. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps and County Assessor website revealed that Parcel No. 19115 consists of APN 5243-029-003. Based on review of online maps and photographs, Parcel No. 19115 consists of RDD USA (4638 E. Washington Blvd.) located south of E. Washington Blvd. and west of I-710. This parcel was identified in the EDR Report (EDR ID No.214) as KW Busch Electric in the HAZNET database. Based on the lack of violations and/or listing in other databases indicating a release, this listing is not expected to have |

| | | | | created an environmental concern to the ISA Study Area. See Parcel No. 19116 for a discussion on nearby EDR listings of potential environmental concern. |
| 19116 | 5243-029-020 | 2414 Connor Ave. Commerce, CA | Full | The Right-of-Way Impact Report identified Parcel No. 19116 as Business Use, owned by David M Throgmorton. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps and County Assessor website revealed that Parcel No. 19116 consists of APN 5243-029-003. Based on review of online maps and photographs, Parcel No. 19116 consists of Throgmorton's Frame Clinic (2414 Conner Ave.) located east of Conner Ave., south of E. Washington Blvd., west of I-710. This parcel was identified in the EDR Report (EDR ID No.214) as Certified Coatings Prod Co in the RCRA-SQG, FINDS, Los Angeles County HMS, EMI, CA FID UST, SLIC, LUST, UST, HIST UST, HIST CORETESE, and SWEEPS UST databases; and as Throgmortons Frame Clinic in the Los Angeles County HMS and HAZNET databases. According to the GeoTracker database, two cases are associated with this parcel. Certified Coatings Products is listed with a status of "Completed-case closed" as of Jun3 27, 1991 for a release of acetone to soil. Throgmorton's Frame Clinic is listed with a status of "open-inactive" as of January 29, 2015. A Phase II Environmental Assessment Report dated May 2008 indicated that fifteen (15) soil borings were advanced on-site to delineate the extent of soil contamination resulting from existing USTs. The report concluded that petroleum hydrocarbon and VOC contamination is generally located between 20 and 105 feet bgs. The consultant then recommended that all existing USTs be removed, and all residual contamination be treated by vapor extraction. No additional information was available on the GeoTracker website. Based on the regulatory status, this listing has the potential to create an environmental concern to the ISA Study Area and a file review is recommended. |
| 19117 | 5243-029-004 | 4630 Washington Blvd. Commerce, CA | Full | The Right-of-Way Impact Report identified Parcel No. 19117 as Business Use, owned by Kenneth W Busch Trust. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps and County Assessor website revealed that Parcel No. 19117 consists of APN 5243-029-004. Based on review of online maps and photographs, Parcel No. 19117 consists of a commercial property (4630 E. Washington Blvd.) located at the southeast corner of Connor Ave. and E. Washington Blvd., west of I-710. No EDR listings were identified associated with this address. See Parcel No. 19116 for a discussion on nearby EDR listings of potential environmental concern. |

| 19118 | 5243-029-021 | 2415 Conner Ave. Commerce, CA | Full | The Right-of-Way Impact Report identified Parcel No. 19118 as Business Use, owned by Criterion Enterprises. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps and County Assessor website revealed that Parcel No. 19118 consists of APN 5243-029-021. Based on review of online maps and photographs, Parcel No. 19118 consists of a vacant commercial property (2415 Connor Ave.) located west of Connor Ave. and south of E. Washington Blvd., west of I-710. No EDR listings were identified associated with this address. See Parcel No. 19116 for a discussion on nearby EDR listings of potential environmental concern. |
| 19119 | 5243-029-007 | 4614 Washington Blvd. Commerce, CA | Full | The Right-of-Way Impact Report identified Parcel No. 19119 as Business Use, owned by Criterion Enterprises. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps and County Assessor website revealed that Parcel No. 19119 consists of APN 5243-029-007. Based on review of online maps and photographs, Parcel No. 19119 consists of Pacific Signs & Supplies (4618 E. Washington Blvd.) located at the southwest corner of the intersection of E. Washington Blvd. and Connor Ave., west of I-710. This parcel was identified in the EDR Report (EDR ID No.214) as Criterion Gates and Mfg Co in the Los Angeles HMS database. Based on the lack of violations and/or listing in other databases indicating a release, this listing is not expected to have created an environmental concern to the ISA Study Area. |
| 19120 | 5243-029-008 | 4614 Washington Blvd. Commerce, CA | Full | The Right-of-Way Impact Report identified Parcel No. 19120 as Business Use, owned by Criterion Enterprises. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps and County Assessor website revealed that Parcel No. 19120 consists of APN 5243-029-007. Based on review of online maps and photographs, Parcel No. 19120 consists of Universal Neon Plus (4614 E. Washington Blvd.) located south of E. Washington Blvd., west of I-710. This parcel was identified in the EDR Report (EDR ID No.214) as Criterion Gate in the UST database; as Criterion Products Inc. in the HAZNET, EMI, and FINDS databases. Based on the lack of violations and/or listing in other databases indicating a release, these listings are not expected to have created an environmental concern to the ISA Study Area. |

| 19121 | 5243-029-009 | 4600 Washington Blvd. Commerce, CA | Partial | The Right-of-Way Impact Report identified Parcel No. 19121 as Business Use, owned by 4600 Washington LLC. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps and County Assessor website revealed that Parcel No. 19121 consists of APN 5243-029-009. Based on review of online maps and photographs, Parcel No. 19121 consists of J R's Tire Service (4600 E. Washington Blvd.) located south of E. Washington Blvd., west of I-710. This parcel was identified in the EDR Report (EDR ID No. 214) as 4600 Super Service in the SWEEPS UST, CA FID UST, Los Angeles County HMS, LUST, HIST CORTESE, HIST UST databases; as 1x Harrison Gas & Oil in the HAZNET database. According to the GeoTracker database, this site is listed with a status of "Completed-case closed" as of October 21, 2009, for a release of gasoline to an aquifer used for drinking water supply. Based on the regulatory agency closure status, these listings are not expected to have created an environmental concern to the ISA Study Area. However, there is potential for residual soil contamination to exist which may be encountered during construction and/or excavation activities. |
| 19122 | 5243-026-024 | 4560 Washington Blvd. Commerce, CA | Partial, TCE | The Right-of-Way Impact Report identified Parcel No. 19122 as Business Use, owned by Ron M Sarake Et Al Lessee. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps and County Assessor website revealed that Parcel No. 19122 consists of APN 5243-026-024. Based on review of online maps and photographs, Parcel No. 19122 consists of Commerce Truck Stop (4650 E. Washington Blvd.) located south of E. Washington Blvd., east of Ayers Ave., west of I-710. This parcel was identified in the EDR Report (EDR ID No. 214) as Commerce Truck Stop in the Los Angeles County HMS, LUST, UST, and HAZNET databases. According to the GeoTracker database, this site is listed with a status of "Completed-case closed" as of February 6, 2012, for a release of gasoline to other groundwater. Based on the regulatory agency closure status, these listings are not expected to have created an environmental concern to the ISA Study Area. However, there is potential for residual soil contamination to exist which may be encountered during construction and/or excavation activities. |

|----------------------------|-----|----------------------|-------------|--|
| | | | | <p>in the CA HAZNET database; as George C Mitchell (EDR ID No. 3141) in the CA HAZNET database; as Technochem (EDR ID No. 3141) in the CA UST database; and as Harrison Property (EDR ID No. 3141) in the CA HIST CORTESE and CA LUST databases. A review of the GeoTracker online database lists the address as a LUST Cleanup site with a regulatory status of "Open - Site Assessment" as of October 29, 2007. The site maintained a 1,000 gallon gasoline UST and 7,500 gallon diesel UST from the 1960s to 1980s. The USTs were reportedly removed in 1984 when a gasoline release was discovered that impacted groundwater. The RWQCB is lead cleanup oversight agency for this case. A Preliminary assessment was completed in 1999 and a pollution characterization was completed in 2003. Semi-annual groundwater monitoring is required at this property. The latest groundwater monitoring report from November 2015 shows groundwater was encountered at approximately eight feet bgs with a flow direction to the west. Analytical results identified high levels of TPHg, benzene, and TBA in groundwater on the west-central portion of the property. In addition, soil samples were taken along the south and southwestern portion of the property. Relatively high concentrations of TPHg and BTEX were identified in soil borings on the southwestern portion of the property. Based on the cumulative results, the extent of impacted soil and groundwater has not been adequately defined in the area south and west of the site. Based on the regulatory status and on-going remedial conditions, this site is considered to represent an environmental concern to the ISA Study Area. It should be noted that soil and groundwater contamination may exist in the area of this property impacted by the right-of-way, which could be encountered during construction and/or excavation activities.</p> |

| 01187 | 7436-004-036 | 1336 W 12 th St Long Beach, CA | Full | The Right-of-Way Impact Report identifies Parcel No. 01187 as Business Use, owned by STAPLETON, RICHARD CO TR. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps and County Assessor website revealed that Parcel No. 01187 consists of a portion of APN 7436-004-036. Based on a review of online maps and photographs, Parcel No. 01187 is a part of the address 1336 W. 12 th St. and consists of land west of I-710, bounded to the south by 11 th St., to the west by Harbor Ave., and to the north by W. 12 th St. See Parcel No. 01186 for a discussion on EDR listings of potential concern. |
| 40105 | 7271-003-902 | Los Angeles River Long Beach, CA | Partial, TCE | The Right-of-Way Impact Report identifies Parcel No. 40105 as Flood Control Use. A review of the I-710 EIR/EIS Row Exhibit - Alternative 7 Maps revealed that Parcel No. 40105 consists of a portion of APN 7271-003-902. Based on a review of online maps and photographs, Parcel No. 40105 consists of vacant land along the Los Angeles River channel and Anaheim St. Parcel No. 40105 is located adjacent to property occupied by Occidental Petroleum Corporation (Oxy Oil) along the west side of the flood control channel, which contains numerous ASTs and oil wells. Several database listings were identified associated with oil wells operated by Oxy Oil in this area. Based on the use, the adjacent Oxy Oil property is considered to represent an environmental concern to the ISA Study Area and a file review is recommended. |
| 40106 | 7436-004-920 | Long Beach, CA | Full | The Right-of-Way Impact Report identifies Parcel No. 40106 as Flood Control Use. A review of the I-710 EIR/EIS Row Exhibit - Alternative 7 Maps revealed that Parcel No. 40106 consists of APN 7436-004-920. Based on a review of online maps and photographs, Parcel No. 40106 appears to be part of the Oxy Oil facilities, which is leased from the City of Long Beach. Several database listings were identified associated with oil wells operated by Oxy Oil in this area. Based on the use, Parcel No. 40106 is considered to represent an environmental concern to the ISA Study Area and a file review is recommended. |

| 40116 | 7271-002-002 | Long Beach, CA | Full | The Right-of-Way Impact Report identifies Parcel No. 40116 as Flood Control Use owned by Kempner, James M and Cynthia A. A review of the I-710 EIR/EIS Row Exhibit - Alternative 7 Maps revealed that Parcel No. 40116 consists of APN 7271-002-002. Based on a review of online maps and photographs, Parcel No. 40116 consists of a strip of land adjacent to the east of the I-710, in between Anaheim St. and Pacific Coast Hwy. The EDR Report identified Public Service Transfer Station No. 1 (EDR ID No. 76-8) in this location, which is listed in the SWF/LF database. This facility is located between the I-710 and the Los Angeles River, north of Anaheim St. and south of Pacific Coast Hwy. According to the online SWIS database (SWIS No. 19-AA-1047), the City of Long Beach operates an active limited volume transfer operation for green materials at this location. The facility permit was issued in October 2001 and it is permitted to handle up to 3,000 tons of green waste per year. The facility is inspected quarterly by the County of Los Angeles and the last inspection was performed on October 7, 2015. No significant violations of State Minimum Standards observed at time of inspection and all records were reported to be in order. The most recent inspection reported that this facility is not open to the public and is currently reserved for street cleaning operations. No enforcement action records were reported in the SWIS database. Based on the use of this property, there is potential for waste materials to exist which may be encountered during construction and/or excavation activities and therefore, this property is considered to have high risk waste issues. |
| 01419 | 7432-019-049 | 1234 Cowles St. Long Beach, CA | Full | The Right-of-Way Impact Report identifies Parcel No. 01419 as Business Use owned by Exedra Properties LTD (same as Parcel No. 01420). A review of the I-710 EIR/EIS Row Exhibit - Alternative 7 Maps revealed that Parcel No. 01419 consists of a portion of APN 7432-019-023. Based on a review of online maps and photographs, Parcel No. 01419 consists of a southwestern portion of the property occupied by Speedy Fuel (1234 W Cowles St.), see Parcel No. 01420 for EDR listings and information. |

| 19105 | 5243-029-023 | 4651 Sheila St. Commerce, CA | Full | The Right-of-Way Impact Report identified Parcel No. 19105 as Business Use, owned by Lyman H Johnson Et Al. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps and County Assessor website revealed that Parcel No. 19106 consists of APN 5243-029-023. Based on a review of online maps and photographs, Parcel No. 19105 consists of the Ceramic Decorating Company (4651 Sheila St.) located north of Sheila St. and adjacent to the west of I-710. This parcel was identified in the EDR Report (EDR ID No.214) as Ceramic Decorating Co Inc. in the Los Angeles County HMS, FINDS, HAZNET, and HIST UST databases. Based on the lack of violations and/or listing in other databases indicating a release, these listings are not expected to have created an environmental concern to the ISA Study Area. See Parcel No. 19116 for a discussion on nearby EDR listings of potential environmental concern. |
| 19106 | 5243-029-024 | 4635 Sheila St. Commerce, CA | Full | The Right-of-Way Impact Report identified Parcel No. 19106 as Business Use, owned by PARKER, JOSEPH AND BERNICE TRS. Review of the I-710 EIR/EIS ROW Exhibit – Alternative 7 Maps and County Assessor website revealed that Parcel No. 19106 consists of APN 5243-029-024. Based on a review of online maps and photographs, Parcel No. 19106 consists of land currently occupied by American Allied Trucking at 4635 Sheila St., adjacent to the north of Sheila St. and west of the I-710. See Parcel No. 19116 for a discussion on nearby EDR listings of potential environmental concern. |
| 81907 | 5243-029-816 | 4621 Sheila St. Commerce, CA | Full | The Right-of-Way Impact Report identified Parcel No. 81907 as Railroad Use, owned by BNSF RAILWAY COMPANY. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps and County Assessor website revealed that Parcel No. 81907 consists of APN 5243-029-816. Based on a review of online maps and photographs, Parcel No. 81907 consists of paved vacant parking lot at 4621 Sheila St., adjacent to the north of Sheila St. and west of the I-710. See Parcel No. 19116 for a discussion on nearby EDR listings of potential environmental concern. |

| 81911 | 5243-029-812 | Rail OPS Commerce, CA | Partial | The Right-of-Way Impact Report identified Parcel No. 81911 as Railroad Use and owned by UNION PACIFIC RR CO. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps and County Assessor website revealed that Parcel No. 81911 consists of APN 5243-029-812. Based on a review of online maps and photographs, Parcel No. 81911 consists of a strip of land occupied by several businesses that runs parallel in between Sheila St. and Washington Blvd., west of the I-710, and east Ayers Ave. See Parcel No. 19116 for a discussion on nearby EDR listings of potential environmental concern. |
| 01420 | 7432-019-043 | 1234 Cowles St. Long Beach, CA | Full | The Right-of-Way Impact Report identifies Parcel No. 01420 as Business Use, owned by Exedra Properties LTD (same as Parcel No. 01419). This address was identified as MICOR Energy LLC (EDR ID No. S104406362) in the CA LUST database; as MICOR Energy LLC (EDR ID No. S103976836) in the CA HIST CORTESE database; as 1234 WEST COWLES ST. in the HMIRS database; as Jerry and Kathleen Glikesman (EDR ID No. S101587013) in the CA FID UST and CA SWEEPS UST databases; as MICOR Long Beach LLC (EDR ID No. S113076397) in the CA HAZNET database; as MICOR Long Beach (EDR ID No. U003779459) in the CA UST database; as McMullen Oil Inc. (EDR ID No. S112876293) in the CA HAZNET database; and as Delta Auto Service Inc. (EDR ID No. S113113356) in the HAZNET database; as MICOR Energy LLC (EDR ID No. S114650987) in the RGA LUST database; as Speedy Fuel (EDR ID No. U004220378) in the UST database; as Speedy Fuel (EDR No. S113122600) in the CA HAZNET database as 1234 W. COWLES ST. (EDR No. 1015189711) in the EDR Hist Auto database. The status of the MICRO Energy LLC LUST case is listed as "Completed - Case Closed" as of July 1, 2015. The RWQCB is the lead agency on this case. The RWQCB issued a "Direction to Take Corrective Action in Response to Unauthorized Underground Storage Tank Release" in a letter dated March 20, 2009. This letter states that the property was a former gasoline/diesel service station and in 2000 three groundwater monitoring wells were installed at the site. These wells were sampled in 2000 and no petroleum hydrocarbon constituents or oxygenates were detected. The RWQCB stated that in order to evaluate current groundwater quality at the site additional sampling was required. In 2014, the three monitoring wells were sampled and no petroleum hydrocarbon constituents or oxygenates were detected. Based on the |

| | | | | regulatory agency closure status, available groundwater data, this listing is not expected to have created an environmental concern to the ISA Study Area. However, there is potential for residual soil contamination to exist which may be encountered during construction and/or excavation activities. |
| 01438 | 7432-020-033 | 1243 W Cowles St. Long Beach, CA | Full | The Right-of-Way Impact Report identified Parcel No. 01438 as Business use owned by Neil Properties LLC. Review of the I-710 EIR/EIS ROW Exhibit – Alternative 7 Maps and County Assessor website revealed that Parcel No. 01438 consists of APN 7432-020-033. Based on a review of online maps and photographs, Parcel No. 01438 consists of a property occupied by a Neill Aircraft Co. (1243 W. Cowles St.) located west of I-710. This parcel was identified in the EDR Report (EDR ID No. 3141) as Speedy Fuel Inc. and Delta Auto Service Inc. in the Historical Auto Stations database for the years 2004-2012; as Micor Energy LLC in the HIST CORTESE and UST databases; as Delta Auto Service Inc. in the HAZNET database; as Speedy Fuel in the HAZNET database. Based on the lack of violations and/or listing in other databases indicating a release, these listings are not expected to have created an environmental concern to the ISA Study Area. |
| 12109 | 7301-003-011 | 2820 Alondra Blvd. Compton, CA | Partial, TCE | The Right-of-Way Impact Report identified Parcel No. 12109 as Business Use (unknown owner). Review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps and County Assessor website revealed that Parcel No. 12109 consists of APN 7301-003-011. Based on review of online maps and photographs, Parcel No. 12109 consists of an ARCO gas station (2820 E. Alondra Blvd.), located at the southwest corner of East Alondra Blvd. and Atlantic Ave., west of I-710. This parcel was identified in the EDR Report (EDR ID No.1622) as 7 Days Food Store in the UST, SWEEPS UST, LUST, and Los Angeles County HMS databases; as B&B Petroleum in the Los Angeles County HMS and HAZNET databases; as Alondra AM/PM in the Los Angeles County HMS database; as PMM Alondra Inc. in the HAZNET database; as Hang Yeol Jung Shan in the HAZNET database; and as Mr. Farza Nouri in the HAZNET database. According the GeoTracker database, the status is listed as “open-remediation” as of June 8, 2006, for a release of gasoline to “aquifer used for drinking water supply.” According to the third quarter 2015 monitoring report, groundwater is flowing to the southwest. Based on the regulatory status and on-going remediation, this site is considered to represent an environmental concern to the ISA Study Area. |

| Appendix P-2 Parcel No. | APN | Address ¹ | Acquisition | Site Listing |
|----------------------------|--------------|-----------------------------------|-------------|---|
| 01425 | 7432-020-032 | 1227 Cowles St. Long Beach, CA | Full | <p>The Right-of-Way Impact Report identifies Parcel No. 01425 as Business Use owned by Neill Properties LLC. A review of the I-710 EIR/EIS Row Exhibit - Alternative 7 Maps revealed that Parcel No. 01425 consists of APN 7432-020-032. Based on a review of online maps and photographs, Parcel No. 01425 consists of a property occupied by Neill Aircraft Co. (1227 W Cowles St.) which also occupies the entire block bounded by 15th St. to the north, Cowles St. to the south, I-710 to the east, and Fashion Ave. to the west. Neill Aircraft was also identified at 1260 W 15th St. in the UST (EDR ID No. U003660595), RCRA-SQG (EDR ID No. 1000287667), FINDS (EDR No. 1000287667), HAZNET (EDR ID No. S113016249), NPDES (EDR ID No. S108751634) and LUST (EDR No. 1000287667) databases. The LUST status is listed as "Completed - Case Closed" as of July 1, 2015. The RWQCB is the lead agency on this case. The online GeoTracker database indicates that groundwater impacted with gasoline was detected in grab groundwater samples at this property in 1997. The online database indicates that semi-annual groundwater monitoring is required and a "Soil and Groundwater Investigation Report" was prepared in 2009. In 2012, four groundwater monitoring wells were installed and sampled as well as additional soil sampling; high concentrations of TPHg and benzene were detected in both groundwater and soil samples. In September 2013, soil borings were taken to delineate the extent of soil contamination. The most recent groundwater monitoring data from March 2014 showed high concentrations of TPHg and benzene in one of the four monitoring wells while the remaining three wells showed non-detectable concentrations of TPHg, BTEX, MTBE, and TBA. In August 2014, remedial excavation of the former UST area was performed with 214.12 tons of soil removed and transported off site for disposal. Based on the regulatory agency closure status, available groundwater and soil data, these listings are not expected to have created an environmental concern to the ISA Study Area. However, there is potential for residual soil contamination to exist which may be encountered during construction and/or excavation activities.</p> |

| 80417 | 7140-014-936 | E. 208 th St. Long Beach, CA | Partial, TCE | The Right-of-Way Impact Report identified Parcel No. 80417 as Railroad Use. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps and County Assessor website revealed that Parcel No. 80417 consists of APN 7140-014-936. Based on a review of online maps and photographs, Parcel No. 80417 consists of a segment of the Metro Blue Line/ Pacific Electric Railroad track and the Metro Blue Line Yard (4350 208 th St.). Metro Division 11 and Rapid Transit District Metro (EDR ID No. 2484) were identified associated with this address in the RCRA-SQG, FINDS, WDS, NPDES, LUST databases. According to the GeoTracker database, the facility is listed with a status of "completed-case closed" as of September 8, 2010, for a release of "waste oil/motor/hydraulic/lubricating" to soil. No other information was available online or in the EDR Report. Based on the regulatory status, this listing is not expected to have created an environmental concern to the ISA Study Area. However, there is potential for residual soil contamination to exist which may be encountered during construction and/or excavation activities. |
| 06101 | 7140-014-019 | Long Beach, CA | Partial, TCE | The Right-of-Way Impact Report identifies Parcel No. 06101 as Business Use, owned by CRG Properties LTD. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps revealed that Parcel No. 06101 consists of APN 7140-014-019. Based on a review of online maps and photographs, Parcel No. 06101 is associated with the former Long Beach Golf Learning Center (3701 & 4021 Pacific Place) property. Long Beach Industrial Park (EDR ID No. 2752, 2767) was identified associated with this address in the VCP, ENVIROSTOR, SLIC, and FINDS databases; as CRG Properties in the HAZNET, UST, database; Petro Resources Inc. in the CERCLIS-NFRAP, FINDS, RGA LUST, and EMI databases. This parcel is associated with an 18-acre site formerly used as a central brine treatment facility from 1926 until the mid-1950s. Former activities consisted of pumping oil brine, drilling mud, and other waste materials generated from nearby oil production into unlined sumps. For the past five |

| Appendix P-2 Parcel No. | APN | Address ¹ | Acquisition | Site Listing |
|----------------------------|--------------|-----------------------------------|--------------|--|
| | | | | years, the site has been used as a golf practice range. Under the DTSC oversight, investigations are being conducted to evaluate the presence and extent of hazardous substances in the subsurface including benzene, benzo(a)pyrene, metals and TPH as gasoline. The case is also identified in the RWQCB's online GeoTracker database as Long Beach Industrial Park at 4021 Pacific Place. According to the GeoTracker and ENVIROSTOR online databases, the DTSC is the lead agency for the case. The cleanup status on the online ENVIROSTOR database is reported as "Inactive – Action Required" as of January 26, 2009; however, the database reports that a Remedial Action Completion Report was due to DTSC on April 30, 2011. Based on the regulatory status and former use, this site is considered to represent an environmental concern to the ISA Study Area and a file review is recommended. It should be noted that soil and groundwater contamination may exist in the area of this property impacted by the right-of-way, which could be encountered during construction and/or excavation activities. |
| 06102 | 7140-014-032 | Long Beach, CA | Partial, TCE | The Right-of-Way Impact Report identifies Parcel No. 06102 as Business Use, owned by CRG Properties LTD. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps revealed that Parcel No. 06102 consists of APN 7140-014-032. Based on a review of online maps and photographs, Parcel No. 06102 is associated with Parcel No. 06101. |
| 06103 | 7140-014-025 | 4021 Amebco Rd. Long Beach, CA | Partial, TCE | The Right-of-Way Impact Report identifies Parcel No. 06103 as Business Use, owned by Tookey, Victor R and Evelyn M. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps revealed that Parcel No. 06103 consists of APN 7140-014-032. Based on a review of online maps and photographs, Parcel No. 06103 is associated with Parcel No. 06101. |
| 06108 | 7140-014-023 | 3916 Amebco Rd. Long Beach, CA | Partial, TCE | The Right-of-Way Impact Report identifies Parcel No. 01608 as Business Use, owned by MCDONALD, JOHN B CO TR ET AL. A review of the I-710 EIR/EIS ROW Exhibit – Alternative 7 Maps revealed that Parcel No. 01608 consists of APN 7140-014-023. Based on a review of online maps and photographs, Parcel No. 01608 is an unpaved strip of land located adjacent to the east of North Pacific Place and adjacent to the west of MTA railroad tracks. No EDR listings were identified in this area. |

| Appendix P-2 Parcel No. | APN | Address ¹ | Acquisition | Site Listing |
|----------------------------|--------------|---------------------------------|--------------|---|
| 06206 | 7203-002-001 | 701 Baker St. Long Beach, CA | Partial, TCE | <p>The Right-of-Way Impact Report identified Parcel No. 06206 as Business Use, owned by Oil Operators Inc. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps and County Assessor website revealed that Parcel No. 06206 consists of APN 7203-002-001. Based on a review of online maps and photographs, Parcel No. 06206 is currently vacant land. No EDR listings were identified associated with 701 W Baker St. Oil Operators Inc. was identified at 712 W Baker St. (EDR ID No. 2797) in the UST, SLIC, CERCLIS, CHMIRS, HIST UST, CA FID UST, EMI, and SWEEPS UST databases and at 714 W Baker St. (EDR ID No.2797) in the ENVIROSTOR database. The ENVIROSTOR database referred the case the RWQCB as of January 1, 2011. The RWQCB remains the lead agency on the case. The ENVIROSTOR database indicates that the US EPA is also involved in cleanup oversight for this case. The online GeoTracker database identifies the case at 712 W Baker St. and lists the facility status as "Open – Site Assessment" as of January 2, 2015. According to the online GeoTracker database, the Oil Operators, Inc. (OOI) property covers 20 acres located east of I-710 and is bounded on the north by the 405 freeway, on the south by Wardlow Rd., and on the east by Golden Ave. Baker St. divides the property into northern and southern parts. The Los Angeles River is located immediately to the west. OOI operated water treatment facilities at this property from 1926 to 1998 to treat production brines and other fluids recovered during oil production. Processed included removal of oil and sediment from the water, recovering low-grade oil for recycling, and disposal of the treated water off-site. Multiple basins that were used to settle oily solids/sludge and to hold treated water were located on the property. The facilities were decommissioned in phases beginning in 1998 and the property is currently vacant. The primary area of concern is identified as Basin 1, which held untreated oil production fluids for settling of oily solids/sludge. Cleanup criteria have been established for chemicals of concern in Basin 1, including TPH as gasoline, BTEX, and heavy metals. Soil remediation has been underway at the property since March 2010, consisting of in-situ enhanced biodegradation, and quarterly groundwater monitoring is conducted. Based on information reviewed on the online GeoTracker database, it appears that additional investigations and remediation are required at this property. Based on the regulatory status and on-going remedial conditions, this site is considered to represent an environmental concern to the ISA</p> |

|----------------------------|--------------|-----------------------------------|-------------|--|
| | | | | Study Area. It should be noted that soil and groundwater contamination may exist in the area of this property impacted by the right-of-way, which could be encountered during construction and/or excavation activities. |
| 50807 | 7306-022-802 | SCE Corridor Long Beach, CA | Partial | The Right-of-Way Impact Report identifies Parcel No. 50807 as Utility Use, owned by SO CALIF EDISON CO. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps and County Assessor website revealed that Parcel No. 50807 consists of APN 7306-022-802. This parcel consists of two strips of land located adjacent to the west of the Long Beach Blvd. on-ramp to I-710 South. A nearby EDR listing of potential concern was identified (see Parcel No. 08127). |
| 50808 | 7306-022-801 | SCE Corridor Long Beach, Ca, | Partial | The Right-of-Way Impact Report identifies Parcel No. 50808 as Utility Use, owned by SO CALIF EDISON CO. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps and County Assessor website revealed that Parcel No. 50808 consists of APN 7306-022-801. This parcel consists of a strip of land located adjacent to the west of the Long Beach Blvd. on-ramp to I-710 South. An EDR listing of potential concern was identified (see Parcel No. 08110). |
| 08110 | 7306-022-033 | 88 Victoria St. Long Beach, CA | Partial | The Right-of-Way Impact Report identifies Parcel No. 08110 as Business Use, owned by BELL BUSINESS CENTER LP. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps and County Assessor website revealed that Parcel No. 08110 consists of APN 7306-022-033. This parcel consists of a strip of land adjacent to southwest corner of Victoria St. and Long Beach Blvd. Based on a review of the EDR Report and online maps and photographs, it appears that this parcel is part of a large property (Bell Business Center), which includes APNs 7306-022-055 and 7306-022-054 (adjacent to the west). These two parcels are not impacted by Alternative 7, but since APN 7306-022-033 is part of this larger property, which was identified in the EDR Report, they are discussed. 100 W. Victoria St. at APN 7306-022-055 was identified as Former Robert Shaw Controls (EDR ID No. 2131) in the ENVIROSTOR, UST, LUST, HIST CORTESE, SLIC, RCRA-SQG, FIND, HAZNET, CA FID UST, HIST UST, EMI, CA WDS, HIST FTTS, VCP, ENF and SWEEPS UST databases; as Bell Business Center in the NPDES and HAZNET database; as Invensys Controls in the FINDS and HAZNET database; and as 100 West Victoria Waste Treatment Area in the CA CHMIRS database. Site investigations began at this property in 1991. Phased site investigations and remediation activities have continued to the present |

|----------------------------|--------------|--|--------------|--|
| | | | | time, to assess and remediate chemical impacts to soils and groundwater from past manufacturing operations. Potential contaminants of concern include chlorinated solvents such as benzene, PCE, TCE, vinyl chloride, and xylenes. A groundwater remediation and monitoring system as well as a soil vapor extraction system are currently being operated at the property. The DTSC referred the case to the RWQCB on February 2, 2009. The online GeoTracker lists the status as "Open – Remediation" as of December 22, 2014. Based on information reviewed in the online GeoTracker database, it appears that additional investigations and remediation are required at this property. Based on the regulatory status and on-going remedial conditions, this site is considered to represent an environmental concern to the ISA Study Area. |
| 08109 | 7306-022-038 | 5951 Long Beach Blvd Long Beach, CA | Partial, TCE | The Right-of-Way Impact Report identifies Parcel No. 08109 as Business Use, owned by 5951 LONG BEACH LLC. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps and County Assessor website revealed that Parcel No. 08109 consists of APN 7306-022-038. This parcel consists of a strip of land adjacent to southwest corner of Victoria St. and Long Beach Blvd. An adjacent EDR listing of potential concern was identified (see Parcel No. 08110). |
| 14115 | 6194-004-037 | 11000 Atlantic Ave. Lynwood, CA | Partial | The Right-of-Way Impact Report identified Parcel No. 14115 as Business use, owned by Northwest Dealerco Holdings LLC. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps and County Assessor website revealed that Parcel No. 14115 consists of APN 6194-004-037. Based on review of online maps and photographs, Parcel No. 14115 consists of a 76 gas station (11000 Atlantic Ave.) located in the southeast corner of the intersection of E. Imperial Hwy. and Atlantic Ave., west of I-710. This parcel was identified in the EDR report (EDR ID No.927) as Lees Union 76 Service in the EDR Historical Auto Station database for the years 2001, 2003-2005, and 2011; as Lynwood 76 in the FINDS database; Lees Unocal Service Station in the HAZNET database; Tosco Corporation Station No. 30442 in the HAZNET database; Conoco Phillips No. 252474 in the HAZNET database; Western Fuel Group in the HAZNET database; 76 Products Station No. 2474 in the Hist Cortese, ENF, HAZNET, and Los Angeles County HMS databases; Union Oil Service Station No. 2474 in the HIST UST database; Unocal Corp SS 2474 in the SWEEPS UST and Los Angeles County HMS databases; Tosco 76 Station 2474 in the LUST, UST, and HIST UST databases. According to GeoTracker, the site is listed with a status of "completed- |

| Appendix P-2 Parcel No. | APN | Address ¹ | Acquisition | Site Listing |
|----------------------------|--------------|--------------------------------------|--------------|--|
| | | | | case closed" as of January 22, 2015, for a release gasoline to "aquifer used for drinking water supply." Based on the regulatory agency closure status, these listings are not expected to have created an environmental concern to the ISA Study Area. However, there is potential for residual soil contamination to exist which may be encountered during construction and/or excavation activities. |
| 41421 | 6234-012-002 | Los Angeles River Lynwood, CA | Partial, TCE | The Right-of-Way Impact Report identified Parcel No. 41421 as Flood Control Use owned by Chevron USA Inc. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps and County Assessor website revealed that Parcel No. 41421 consists of APN 6234-012-002. Based on a review of online maps and photographs, Parcel No. 41421 consists of a vacant strip of land indicative of a subsurface pipeline. This parcel is located between I-710 and the Los Angeles River, south of Imperial Hwy. No EDR listings were identified in this area. |
| 41432 | 6233-032-010 | Los Angeles River South Gate, CA | Partial, TCE | The Right-of-Way Impact Report identified Parcel No. 41432 as Flood Control Use owned by the State of California. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps and County Assessor website revealed that Parcel No. 41432 consists of APN 6233-032-010. Based on a review of online maps and photographs, Parcel No. 41432 consists of a vacant strip of land indicative of a subsurface pipeline. This parcel is located between I-710 and the Los Angeles River, north of Imperial Hwy. No EDR listings were identified in this area. |
| 14448 | 6194-002-025 | 5201 Imperial Hwy. South Gate, CA | Full | The Right-of-Way Impact Report identified Parcel No. 14448 as Business Use, owned by Frys 710 freeway Investment Inc. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps and County Assessor website revealed that Parcel No. 14448 consists of APN 6194-002-025. Based on review of online maps and photographs, Parcel No. 14448 consists of an ARCO gas station (5201 E. Imperial Hwy.) located at the northeast corner of E. Imperial Hwy. and Wright Rd. This parcel was identified in the EDR Report (EDR ID No. 927) as Copper Wash LLC in the Los Angeles County HMS database; as Shell in the LUST, HIST UST, and HAZNET databases; Chang's Shell in the LUST and UST databases; YM Shell in the HAZNET database; Shell Service Station in the ERNS, SWEEPS UST, Los Angeles County HMS, RCRA-SQG, FINDS, and HAZNET databases; SIM Shell in the RCRA-SQG database; and JK Shell in the EDR Historical Auto station database for the years 2001-2003. According to GeoTracker, the following two cases are associated with this parcel: Shell is listed |

I-710 Corridor Project RDEIR/SDEIS

| Appendix P-2 Parcel No. | APN | Address ¹ | Acquisition | Site Listing |
|----------------------------|--------------|-------------------------------------|--------------|---|
| | | | | with a status of “completed-case closed” as of October 24, 1996, for a release of gasoline to soil; and Chang’s Shell is listed with a status of “completed-case closed” as of July 17, 2013, for a release of gasoline to “an aquifer used for drinking water supply.” Additionally, each of the 16 wells located on site are reportedly being sampled for post-remedial action verification monitoring to evaluate remediation system performance. Based on the post-remedial action sampling that is ongoing at the site, this site is considered to represent an environmental concern to the ISA Study Area and a file review is recommended. Additionally, there is potential for residual soil contamination to exist which may be encountered during construction and/or excavation activities. |
| 15105 | 6222-036-002 | Southern Ave. NA | Partial, TCE | The Right-of-Way Impact Report identified Parcel No. 15105 as Business Use, owned by CHEVRON USA INC. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps and County Assessor website revealed that Parcel No. 15105 consists of APN 6222-036-003. Based on a review of online maps and photographs, Parcel No. 15105 consists of a segment of land adjacent to the south of Southern Ave., east of the Los Angeles River, and west of Salt Lake Ave. No EDR listings were identified in this area. |
| 15106 | 6222-036-004 | 5310 Southern Ave South Gate, CA | TCE | The Right-of-Way Impact Report identified Parcel No. 15106 as Business Use, owned by BORK CORP. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 15106 consists of APN 6222-036-004. Based on a review of online maps and photographs, Parcel No. 15106 consists of a segment of land adjacent to the south of Southern Ave., east of the Los Angeles River, and west of Salt Lake Ave. No EDR listings were identified in this area. |
| 19502 | 5241-030-005 | 1522 Eastern Ave. Commerce, CA | Full | The Right-of-Way Impact Report identified Parcel No. 19502 as Business Use, owned by Marvin A and Ricki C Ring Trust. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps and County Assessor website revealed that Parcel No. 19502 consists of APN 5241-030-005. Based on a review of online maps and photographs, Parcel No. 19502 is developed with a residential structure associated with the California Charcoal & Firewood business located at 1518 S. Eastern Ave. Parcel No. 19502 is located east of S. Eastern Ave., west of I-710. No EDR listings were identified associated with this address. |

|----------------------------|--------------|--|--------------|--|
| 15107 | 6222-036-005 | 5310 Southern Ave. South Gate, CA | Partial, TCE | The Right-of-Way Impact Report identified Parcel No. 15107 as Business Use, owned by BORK CORP. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps and County Assessor website revealed that Parcel No. 15107 consists of APN 6222-036-005. Based on a review of online maps and photographs, Parcel No. 15107 consists of a segment of land adjacent to the south of Southern Ave., east of the Los Angeles River, and west of Salt Lake Ave. This parcel was identified in the EDR Report as Southern California Edison Shred Substation (EDR ID No. 944) in the RCRA-SQG, FINDS, CA NPDES, CA WDS, CA LUST, CA HIST UST, CA SWEEPS UST, CA HAZNET, CA EMI, and CA ENVIROSTOR databases; as Bell Foundry Co. (EDR ID No. 944) in the CA LOS ANGELES CO. HMS, CA RGA LUST, FTTS, and HIST FTTS databases. The LUST cleanup status is reported as "Completed – Case Closed" as of September 30, 1999. Based on the regulatory agency closure status, these listings are not expected to have created an environmental concern to the ISA Study Area. However, there is potential for residual soil contamination to exist which may be encountered during construction and/or excavation activities. |
| 15110 | 6222-001-013 | South Gate, CA | Partial, TCE | The Right-of-Way Impact Report identified Parcel No. 15110 as Business Use, owned by CHEVRON USA INC. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps and County Assessor website revealed that Parcel No. 15110 consists of APN 6222-001-013. Based on a review of online maps and photographs, Parcel No. 15110 consists of a segment of land adjacent to the north of Southern Ave., west of the Los Angeles River, and east of Burtis St. No EDR listings were identified in this area. |
| 15339 | 6232-002-005 | 5625 Firestone Blvd. South Gate, CA | Partial, TCE | The Right-of-Way Impact Report identified Parcel No. 15339 as Business Use, owned by ALUM LANDLORD QRS 16 105 INC. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps and County Assessor website revealed that Parcel No. 15339 consists of APN 6232-002-005. Based on a review of online maps and photographs, Parcel No. 15339 consists of a segment of land along the northwest corner of the intersection of National Ave. and Firestone Blvd. International Window Corp was identified at 5625 Firestone Blvd. in this area in the CA UST, CA LUST, CA SLIC, CA HIST UST, CA SWEEPS UST, CA LOS ANGELES CO. HMS MITIGATION, CA ENF, CA HIST CORTESE, and CA HAZNET database. Reportedly, a release was discovered in 1990 that affected the groundwater at the site. The site is under the jurisdiction of the RWQCB. According to the online GeoTracker database, the cleanup |

| Appendix P-2 Parcel No. | APN | Address ¹ | Acquisition | Site Listing |
|----------------------------|--------------|-------------------------------------|-------------|--|
| | | | | status is reported as “Completed – Case Closed” as of August 30, 2001. Based on the regulatory agency closure status, these listings are not expected to have created an environmental concern to the ISA Study Area. However, there is potential for residual soil contamination to exist which may be encountered during construction and/or excavation activities. Groundwater beneath this property has been impacted by the ARCO-Vinvale Tank Farm at 8601 Garfield Ave. |
| 15356 | 6232-002-002 | 8601 Garfield Ave South Gate, CA | TCE | The Right-of-Way Impact Report identified Parcel No. 15365 as Business Use, owned by BP WEST COAST PRODUCTS LLC. Review of the I-710 EIR/EIS ROW Exhibit – Alternative 7 Maps and County Assessor website revealed that Parcel No. 15365 consists of APN 6232-002-002. Based on a review of online maps and photographs, Parcel No. 15365 consists of the Tesoro Vinvale Terminal 6 facility (ARCO-Vinvale) located adjacent to the east of the I-710., and west of Garfield Ave. (8601 Garfield Ave.). This address was identified in the EDR Report (EDR ID No.656) in the FINDS, EMI, LUST, HAZNET, TRIS, NPDES, SLIC, SWEEPS UST, Los Angeles County HMS, CHMIRS, UST, EDR Historical Auto station, AST, and ENVIROSTOR databases. According to the GeoTracker database, this site is listed with a cleanup status of “Open-Site Remediation” since June 30, 2001. GeoTracker states that the site is an approximately 35-acre fuel terminal currently used for storage and loading of gasoline and diesel fuel products for delivery by tanker trucks to various local retail outlets in the Los Angeles metropolitan area since 1977. Approximately 34 million gallons of fuel are stored and processed at the facility. The site previously operated as a refinery from approximately 1923 to 1957 under the ownership of Rio Grande Oil Company. In 1957, all the refining equipment was removed to accommodate the construction of the 710 freeway. The site operated as a storage and distribution facility for Richfield’s Watson Refinery until 1977. The site lies within the Central Basin Pressure Area and is underlain by three major water-bearing zones: shallow hydrostratigraphic zone (SHZ): 50-90 feet bgs); middle hydrostratigraphic zone (MHZ): 100-175 feet bgs; and deep hydrostratigraphic zone (DHZ): 270-320 feet bgs. In addition, upper and lower subzones have been identified and reported in the SHZ and MHZ. Localized perched zones also occur within the shallow unsaturated zone (SUZ), which extends from the surface to approximately 50 feet bgs. The SHZ is the shallowest continuously saturated water-bearing zone and occurs as extensive |

| Appendix P-2 Parcel No. | APN | Address ¹ | Acquisition | Site Listing |
|----------------------------|-----|----------------------|-------------|---|
| | | | | <p>lenses of sandy and/or gravelly fine-grained material within the Bellflower aquitard. The confined MHZ and DHZ correspond with the Exposition and Hollydale aquifers, respectively. These water-bearing zones are separated by low-permeability zones. All three water-bearing zones are monitored quarterly for dissolved-phase petroleum hydrocarbons in groundwater. In addition, the SHZ is monitored quarterly for light non-aqueous phase liquids (LNAPL), herein referred to as separate phase hydrocarbons (SPH) for consistency with the workplan and prior reports. SPH thickness is measured quarterly and SPH transmissivities are calculated from select recovery wells. No SPH has been detected within the MHZ or DHZ. Stantec is currently conducting SPH recovery from a series of groundwater remediation wells specifically designed for fluid and product recovery. From July 28 to 31, 2014, Stantec provided field oversight for the advancement of 15 CPT-UVOST borings (CPT-UV43 through CPT-UV57). The CPT-UVOST borings were drilled to approximately 88 feet bgs to obtain additional lithologic and qualitative hydrocarbon distribution data to determine optimum locations and construction specifications for the additional remediation wells. Borings CPT-UV43 to CPT-UV46 were installed in the former diesel AST area and previously addressed in the workplan addendum. Remaining borings CPT-UV47 to CPT-UV57 were installed within the four target remediation areas on-site and off-site. Data from these borings were evaluated along with those of prior CPT-UVOST borings, historical product recovery data, the distribution of existing remedial wells and their estimated radius of influence, and the approximate current extent of SPH to identify optimum locations for additional remediation wells. Based on these criteria, additional remedial wells would be included to fill observed gaps within the remediation well network and increase the effectiveness of SPH recovery across the site. From January through March 2015, Stantec installed 15 additional remediation wells in select areas on-site and off-site to expand the remediation well network and enhance the conceptual site model. The additional remedial wells were installed as a phased approach. Further expansion of the well network may be necessary once their effectiveness has been determined. Based on regulatory status, this property presents an environmental concern to Alternative 7.</p> |

| 61544 | 6233-001-275 | South Gate, CA | Partial, TCE | The Right-of-Way Impact Report identified Parcel No. 61544 as Utility Use, owned by L A CITY DEPT OF WATER AND POWER. Review of the I-710 EIR/EIS ROW Exhibit – Alternative 7 Maps and County Assessor website revealed that Parcel No. 61544 consists of APN 6233-001-275. Based on a review of online maps and photographs, Parcel No. 61544 consists of a segment of the Rio Hondo River, bound to the west by the I-710 and to the south by Meadow Rd. This parcel was formerly part of a landfill associated with Parcel No. 41543, No. 15268, No. 61544, No. 41520, and No. 71570 (see Parcel No. 41543 for EDR discussion). |
| 15245 | 6233-002-900 | South Gate, CA | Partial, TCE | The Right-of-Way Impact Report identified Parcel No. 15245 as Business Use, owned by SOUTH GATE CITY. Review of the I-710 EIR/EIS ROW Exhibit – Alternative 7 Maps and County Assessor website revealed that Parcel No. 15245 consists of APN 6233-002-900. Based on a review of online maps and photographs, Parcel No. 15245 consists of a segment of land east of the Los Angeles River, adjacent to the south of the I-710, and west of the Rio Hondo River. No EDR listings were identified in this area. |
| 16443 | 6315-031-002 | Bell, CA | TCE | The Right-of-Way Impact Report identified Parcel No. 16443 as Utility Use, owned by Chevron USA Inc. A review of the I-710 EIR/EIS ROW Exhibit – Alternative 7 Maps and County Assessor website revealed that Parcel No. 16443 consists of APN 6315-031-002 and located adjacent to the west of I-710, east of the Los Angeles River. Based on a review of online maps and photographs, Parcel No. 16443 is occupied by a strip of vacant land located adjacent to the west of I-710, bound to the south by E. Gage Ave. and to north by Southern Pacific Railroad. No EDR listings were identified in this area. |
| 16443 | 6315-031-001 | Bell, CA | TCE | The Right-of-Way Impact Report identified Parcel No. 16442 as Utility Use, owned by Chevron USA Inc. A review of the I-710 EIR/EIS ROW Exhibit – Alternative 7 Maps and County Assessor website revealed that Parcel No. 16442 consists of APN 6315-031-001 and located adjacent to the west of I-710, east of the Los Angeles River. Based on a review of online maps and photographs, Parcel No. 16442 is occupied by a strip of vacant land located adjacent to the west of I-710, bound to the south by E. Gage Ave. and to north by Southern Pacific Railroad. No EDR listings were identified in this area. |

| 17353 | 6332-002-036 | 5600 Rickerbacker Rd Bell, CA | Partial | The Right-of-Way Impact Report identified Parcel No. 17335 as Business Use, owned by The Salvation Army. Review of the I-710 EIR/EIS ROW Exhibit – Alternative 7 Maps and County Assessor website revealed that Parcel No. 17335 consists of APN 6332-002-036. Based on review of online maps and photographs, Parcel No. 17335 consists of a large commercial facility (5600 Rickenbacker Rd.) occupied by The Salvation Army Wellness Center located adjacent to the east of I-710. This parcel was identified in the EDR Report (EDR ID No.419) as LAUSD Bell Education and Career Center in the HAZNET, SCH, NPDES, ENVIROSTOR, FINDS, RCRA-LQG databases; as FBI Warehouse in the HAZNET database; as Salvation Army in the HAZNET database; as Jet Propulsion Lab in the HAZNET database; as Bell Federal Building in the HAZNET database; as Shelter Partnership in the HAZNET database; as General Service Administration in the HAZNET database; as Bell Armed Forces Reserve Center in the HAZNET and NPDES databases; and as Federal Service Center in the HIST UST and Los Angeles County HMS databases. The ENVIROSTOR database lists the cleanup status as “Certified as of October 11, 2012.” This site comprises over 13 acres and during the PEA, elevated levels of PAHs and arsenic were found in soils to a depth of 4-feet bgs, which required removal (approximately 1,000 cubic yards were removed). Based on the certified status, this listing is not expected to have created an environmental concern to the ISA Study Area. However, there is potential for residual soil contamination to exist which may be encountered during construction and/or excavation activities. |
| 15230 | 6232-015-003 | 5532 Southern Ave. South Gate, CA | Partial, TCE | The Right-of-Way Impact Report identified Parcel No. 15230 as Business Use, owned by J B HUNT TRANSPORT INC. Review of the I-710 EIR/EIS ROW Exhibit – Alternative 7 Maps and County Assessor website revealed that Parcel No. 15230 consists of APN 6232-015-003 Based on a review of online maps and photographs, Parcel No. 15230 consists of a segment of land adjacent to the south of Southern Ave., west of Garfield Ave., and east of I-710. No EDR listings were identified associated with 5440 Southern Ave. |

|----------------------------|--------------|--------------------------------------|-------------|---|
| 15231 | 6232-015-004 | 5630 Southern Ave. South Gate, CA | Partial | The Right-of-Way Impact Report identified Parcel No. 15231 as Business Use, owned by WORLD OIL CO. Review of the I-710 EIR/EIS ROW Exhibit – Alternative 7 Maps and County Assessor website revealed that Parcel No. 15231 consists of APN 6232-015-004. Based on a review of online maps and photographs, Parcel No. 15231 consists of a segment of land at 5630 Southern Ave., adjacent to the south of Southern Ave., west of Garfield Ave., and east of I-710. No EDR listings were identified associated with 5630 Southern Ave. Parcel No. 15231 appears to be associated with Parcel No. 15233 and was identified as Lunday Thagard Company (EDR No. 969) in the CA HAZNET database and as Pan Pacific Petroleum Co. (EDR No. 969) in the CA WDS database. Parcels No. 15231, 15232, and 15233 were formerly part of a large refinery (see Parcel No. 15233 for EDR discussion). |
| 15232 | 6232-015-005 | 5730 Southern Ave. South Gate, CA | Partial | The Right-of-Way Impact Report identified Parcel No. 15232 as Business Use, owned by WORLD OIL CORP. Review of the I-710 EIR/EIS ROW Exhibit – Alternative 7 Maps and County Assessor website revealed that Parcel No. 15232 consists of APN 6232-015-005. Based on a review of online maps and photographs, Parcel No. 15232 consists of a segment of land at 5730 Southern Ave., adjacent to the south of Southern Ave., west of Garfield Ave., and east of I-710. The address was identified as Lunday Thagard Company (EDR No. 969) in the CA HAZNET database and as Pan Pacific Petroleum Co. (EDR No. 969) in the CA WDS database. Parcels No. 15231, 15232, and 15233 were formerly part of a large refinery (see Parcel No. 15233 for EDR discussion). |

|----------------------------|--------------|--------------------------------------|-------------|--|
| 15233 | 6232-010-016 | 9301 Garfield Ave. South Gate, CA | Partial | <p>The Right-of-Way Impact Report identified Parcel No. 15233 as Business Use, owned by INNOVATE INC. Review of the I-710 EIR/EIS ROW Exhibit – Alternative 7 Maps and County Assessor website revealed that Parcel No. 15233 consists of APN 6232-010-016. Based on a review of online maps and photographs, Parcel No. 15233 consists of a segment of land adjacent to the north of Southern Ave. and west of I-710. The parcel was identified in the EDR Report as 9301 Garfield Ave. (EDR ID No. 948) in the ERNS and HMIRS databases; as Lunday-Thagard Refinery (EDR ID No. 948) in the RCRA-LQG, CA NPDES, CA SLIC, CA CHMIRS, CA EMI, TRIS, RMP, CA WDS, CA HIST UST, and CA HAZNET databases; as Asphalt Refinery (EDR ID No. 948) in the CA CHMIRS database; as Herbert Malarkey Roofing Company (EDR ID No. 948) in the CA EMI, FINDS, CA WDS database; as G S Roofing Products Inc. (EDR ID No. 948) in the CA EMI and CA HAZNET databases. The Lundy-Thagard Refinery received violations, which subsequently achieved compliance. According to the SLIC database, a release of fuel oxygenates and gasoline was discovered in 2002 that impacted soil and groundwater. This facility is under the supervision of the RWQCB. The online GeoTracker database reports the cleanup status as “Open – Remediation” as of January 22, 2009. A semi-annual groundwater monitoring program has been implemented at this property and an additional groundwater monitoring well to further investigate down-gradient impacts was installed in October 2010. In 2015, groundwater was reported between 62 and 65 feet bgs and flow direction ranged from south-southeast to southeast. Based on the information reviewed online, it appears that additional remediation and site assessment activities are required at this property and a file review is recommended. Therefore, this property represents an environmental concern to Alternative 7. It should be noted that soil contamination may exist in the area of this property impacted by the right-of-way, which could be encountered during construction and/or excavation activities.</p> |

| 15234 | 6232-010-008 | 5625 Southern Ave South Gate, CA | Partial, TCE | The Right-of-Way Impact Report identified Parcel No. 15234 as Business Use, owned by SULLY-MILLER CONTRACTING CO. Review of the I-710 EIR/EIS ROW Exhibit – Alternative 7 Maps and County Assessor website revealed that Parcel No. 15234 consists of APN 6232-010-008. Based on a review of online maps and photographs, Parcel No. 15234 consists of a segment of land adjacent to the north of Southern Ave. and west of I-710. The parcel was identified in the EDR Report Sully Miller Construction (EDR ID No. 969) in the FINDS, CA LOS ANGELES CO. HMS, ERNS, CHMIRS, CA LUST, CA EMI, CA HAZNET, and CA UST databases; as South Gate HMA Plant (EDR ID No. 969) in the CA HIST UST and CA SWEEPS UST databases; and as Blue Diamond Materials (EDR ID No. 969) in the CA HAZNET and CA AST databases. According to the online GeoTracker database, Sully-Miller Contracting Co. is listed in the LUST database with a cleanup status of “Open – Site Assessment” as of November 4, 2009. The RWQCB is the lead agency for the case and contaminants of concern include BTEX, diesel, and fuel oxygenates. No additional information is accessible online. Based on the open case status and lack of data available online, this property represents an environmental concern to Alternative 7 and a file review is recommended. |
| 15235 | 6232-010-011 | 5601 Southern Ave. South Gate, CA | Partial, TCE | The Right-of-Way Impact Report identified Parcel No. 15235 as Business Use, owned by Californian South Gate Review of the I-710 EIR/EIS ROW Exhibit – Alternative 7 Maps and County Assessor website revealed that Parcel No. 15234 consists of APN 6232-010-008. Based on a review of online maps and photographs, Parcel No. 15234 consists of a segment of land adjacent to the north of Southern Ave. and west of I-710 and is associated with Parcel ID No.15234. See Parcel ID No. 15234 for EDR listings and information. |

| 15237 | 6232-009-009 | 5700 Firestone Blvd. South Gate, CA | Partial, TCE | The Right-of-Way Impact Report identified Parcel No. 15237 as Business Use, owned by MANN ENTERPRISES INC, currently occupied by Target. Review of the I-710 EIR/EIS ROW Exhibit – Alternative 7 Maps and County Assessor website revealed that Parcel No. 15237 consists of APN 6232-009-009. Based on a review of online maps and photographs, Parcel No. 15237 consists of two segments of land adjacent to the south of Firestone Blvd. and adjacent to the east of the I-710 off-ramp to Firestone Blvd. The parcel was identified in the EDR Report as Target Store T0190 at 5700 Firestone Blvd. (EDR ID No. 905) in the FINDS, CA HAZNET, and RCRA-SQG databases; and as South Gate Town Center (EDR ID No. 905) in the LA CO. SITE MITIGATION database. A review of the GeoTracker database identified that groundwater underneath Parcel No. 15237 is impacted by the ARCO-Vinvale Tank Farm at 8601 Garfield Ave. Based on the information available online, this property represents an environmental concern to Alternative 7. |
| 15439 | 6232-002-005 | 5625 Firestone Blvd. South Gate, CA | Partial, TCE | <p>The Right-of-Way Impact Report identified Parcel No. 15339 as Business Use, owned by ALUM LANDLORD QRS 16 105 INC. Review of the I-710 EIR/EIS ROW Exhibit – Alternative 7 Maps and County Assessor website revealed that Parcel No. 15339 consists of APN 6232-002-005. Based on a review of online maps and photographs, Parcel No. 15339 consists of a segment of land along the northwest corner of the intersection of National Ave. and Firestone Blvd. International Window Corp was identified at 5625 Firestone Blvd. in this area in the CA UST, CA LUST, CA SLIC, CA HIST UST, CA SWEEPS UST, CA LOS ANGELES CO. HMS MITIGATION, CA ENF, CA HIST CORTESE, and CA HAZNET database. Reportedly, a release was discovered in 1990 that affected the groundwater at the site. The site is under the jurisdiction of the RWQCB. According to the online GeoTracker database, the cleanup status is reported as “Completed – Case Closed” as of August 30, 2001. Based on the regulatory agency closure status, these listings are not expected to have created an environmental concern to the ISA Study Area.</p> <p>However, there is potential for residual soil contamination to exist which may be encountered during construction and/or excavation activities. Groundwater beneath this property has been impacted by the ARCO-Vinvale Tank Farm at 8601 Garfield Ave. (see Parcel No. 15365).</p> |

| 16105 | 6226-005-011 | Florence Ave. Bell, CA | Partial, TCE | The Right-of-Way Impact Report identified Parcel No. 16105 as Residential Use, owned by Chevron USA Inc. Review of the I-710 EIR/EIS ROW Exhibit – Alternative 7 Maps and County Assessor website revealed that Parcel No. 16105 consists of APN 6226-005-011. Based on a review of online maps and photographs, Parcel No. 16105 consists of a portion of a road located within the Florence Village Mobile Home Park, adjacent to the west of the Los Angeles River, West of I-710. No EDR listings were identified in this area. |
| 18106 | 6304-030-002 | Los Angeles, CA | Partial | The Right-of-Way Impact Report identified Parcel No. 18106 as Business use, owned by FedEx National LTL INC. Review of the I-710 EIR/EIS ROW Exhibit – Alternative 7 Maps and County Assessor website revealed that Parcel No. 18106 consists of APN 6304-030-002. Based on review of online maps and photographs, Parcel No. 18106 composes the western portion of the FedEx Freight facility (Parcel No. 18107-4500 Bandini Blvd.). EDR listings associated with this parcel are discussed in Parcel No. 18107. |
| 18107 | 6304-030-001 | 3939 S Atlantic Blvd. Los Angeles, CA | Partial | The Right-of-Way Impact Report identified Parcel No. 18107 as Business use, owned by FedEx National LTL INC. Review of the I-710 EIR/EIS ROW Exhibit – Alternative 7 Maps and County Assessor website revealed that Parcel No. 18106 consists of APN 6304-030-002. Based on review of online maps and photographs, Parcel No. 18107 consists of the FedEx Freight facility (4500 Bandini Blvd.) located north of S. Atlantic Blvd., west of I-710. This parcel was identified in the EDR Report (EDR ID No. 311) as 4500 Bandini Blvd. in the CHMIRS database; as FedEx Freight Inc. in the RCRA-SQG, WDS, SWEEPS UST, NPDES, HIST CORTESE, and LUST databases; as Watkins Motor Lines, Inc. in the LUST and FINDS databases. According to GeoTracker, the facility is listed with a status of “Completed-case closed” as of September 1, 1999, for a release of gasoline to soil. Based on the regulatory agency closure status, these listings are not expected to have created an environmental concern to the ISA Study Area. However, there is potential for residual soil contamination to exist which may be encountered during construction and/or excavation activities. |

| 18212 | 6332-002-035 | 5600 Rickenbacker Rd. Bell, CA | Partial | The Right-of-Way Impact Report identified Parcel No. 18212 as Business use, owned by Shelter Partnership Inc. (Salvation Army). Review of the I-710 EIR/EIS ROW Exhibit – Alternative 7 Maps and County Assessor website revealed that Parcel No. 18212 consists of APN 6332-002-035. Based on review of online maps and photographs, Parcel No. 18212 consists of a large commercial facility (5600 Rickenbacker Rd.) occupied by The Salvation Army Wellness Center located east of I-710. This parcel was identified in the EDR Report (EDR ID No.419) as LAUSD Bell Education and Career Center in the HAZNET, SCH, NPDES, ENVIROSTOR, FINDS, RCRA-LQG databases; as FBI Warehouse in the HAZNET database; as Salvation Army in the HAZNET database; as Jet Propulsion Lab in the HAZNET database; as Bell Federal Building in the HAZNET database; as Shelter Partnership in the HAZNET database; as General Service Administration in the HAZNET database; as Bell Armed Forces Reserve Center in the HAZNET and NPDES databases; Federal Service Center in the HIST UST and Los Angeles County HMS databases. The ENVIROSTOR database lists the cleanup status as “Certified as of October 11, 2012” indicating that the DTSC-approved response action has been completed. This site comprises over 13 acres and during the PEA, in 2009, elevated levels of PAHs and arsenic were found in soils to a depth of 4-feet bgs, which required removal. Approximately 1,000 cubic yards of contaminated soil was subsequently removed and documented in a report dated 2010. Based on the certified status, this listing is not expected to have created an environmental concern to the ISA Study Area. However, there is potential for residual soil contamination to exist which may be encountered during construction and/or excavation activities. |
| 19516 | 5241-013-018 | 45 Triggs St. Commerce, CA | Full | The Right-of-Way Impact Report identifies Parcel No. 19503 as Residential Use (1459 S. Sydney Dr.). A review of the I-710 EIR/EIS ROW Exhibit – Alternative 7 Maps revealed that Parcel No. 09503 consists of APN 5241-029-001. Based on a review of online maps and photographs, Parcel No. 09503 consists of a residential structure located west of S. Sydney Dr., west of I-710. No EDR listings were identified associated with this address. |

| Appendix P-2 Parcel No. | APN | Address ¹ | Acquisition | Site Listing |
|----------------------------|--------------|-----------------------------------|-------------|---|
| 19517 | 5241-013-019 | 1350 Eastern Ave. Commerce, CA | Partial | The Right-of-Way Impact Report identified Parcel No. 19517 as Business Use, owned by LOS JARDINES LLC. Review of the I-710 EIR/EIS ROW Exhibit – Alternative 7 Maps and County Assessor website revealed that Parcel No. 19517 consists of APN 5241-013-019. Based on review of online maps and photographs, Parcel No. 19517 consists of a strip of vacant land (1350 S. Eastern Ave.) located adjacent to the south of the I-5 and I-710 interchange and a portion of the I-5 South to I-710 South ramp. A review of the EDR Report identified Specific Plating Co. Inc. (1350 S. Eastern Ave.) (EDR ID No. 161) in the RCRA-SQG, CA HIST UST, CA VCP, CA ENVIROSTOR, CA UST, CA SWEEPS UST, CA LOS ANGELES CO. HMS, and CA EMI databases. According the online GeoTracker database, the CA VCP status is listed as “ACTIVE AS OF December 12, 2013.” The site was occupied by Specific Plating, an electroplating company from the 1960s. In February 2012, DTSC conducted soil and soil gas sampling at the site as part of a discovery project. Sampling data indicated elevated levels of volatile organic compounds (PCE and TCE). DTSC determined that additional sampling and remediation is required at this Site. The site is undergoing litigation currently to identify the legal owner, causing a delay in evaluation and cleanup of the site. Based on the active regulatory status and on-going investigations, this site is considered to represent an environmental concern to Alternative 7. |
| 18218 | 6332-002-021 | 5350 Lindbergh Ln. Bell, CA | Full | The Right-of-Way Impact Report identified Parcel No. 18218 as Business use, owned by Cheli Distribution Center Inc. Review of the I-710 EIR/EIS ROW Exhibit – Alternative 7 Maps and County Assessor website revealed that Parcel No. 18218 consists of APN 6332-002-021. Based on review of online maps and photographs, Parcel No. 18218 consists of a large commercial building occupied by Vernon Sanitary Supply (5350 Lindbergh Lane) and Allied Plastics (5380 Lindbergh Lane) located west of Lindbergh Lane and east of I-710. No EDR listings were identified in this area. This parcel was identified in the EDR Report (EDR ID No.345) as Individual Food Service in the VCP and ENVIROSTOR databases. According to the ENVIROSTOR database, the site is a slab on grade tilt up building comprised of about a 146,000-square-foot structure located on a 255,101-square-foot lot. The building is divided into different suites, used for warehousing and distribution. This Site is located near what was formerly the Cheli Air Force Base. To the west and south are the 710 freeway and the Los Angeles River. The nearest residential land use is on the |

| Appendix P-2 Parcel No. | APN | Address ¹ | Acquisition | Site Listing |
|----------------------------|--------------|--------------------------------|-------------|---|
| | | | | opposite side of the Los Angeles River, about 0.25 mile from the site. Based on the information available to DTSC and Proponent, the site is or may be contaminated with hazardous substances, including poly-aromatic hydrocarbons (PAHs), volatile organic compounds, and petroleum hydrocarbons. The site is listed with a status of "Certified O&M-Land Use Restrictions Only" as of March 17, 2016. Based on the regulatory agency status, these listings are expected to have created an environmental concern to the ISA Study Area. Additionally, there is potential for soil contamination to exist which may be encountered during construction and/or excavation activities. |
| 19520 | - | Read Site Listing | Full | The Right-of-Way Impact Report identified Parcel No. 19520 as Business Use, owned by STATE OF CALIFORNIA. Review of the I-710 EIR/EIS ROW Exhibit – Alternative 7 Maps and County Assessor website revealed that Parcel No. 19520 consists of unknown APN. Based on review of online maps and photographs, Parcel No. 19520 consists of land currently occupied by multiple businesses (4711-4727 E. Washington Blvd.) located south of Hepworth Ave. and adjacent to the east of I-710. No EDR listings were identified in this area. See Parcel No. 19517 for an EDR discussion of nearby potential environmental concerns. |

| 18227 | 6332-002-920 | 5300 Bandini Blvd. Bell, CA | Full | The Right-of-Way Impact Report identified Parcel No. 18227 as Business use, owned by US Government (Dept. of the Army). Review of the I-710 EIR/EIS ROW Exhibit – Alternative 5C Maps and County Assessor website revealed that Parcel No. 18227 consists of APN 6332-002-920. Based on review of online maps and photographs, Parcel No. 18227 consists of the Department of the Army facility located adjacent to the east of the S. Atlantic Blvd. off-ramp of I-710, south of Bandini Blvd. This parcel was listed in the EDR Report (EDR ID No.322) in the FINDS database; as Office of Adjutant General in the UST database; as US Government in the HIST CORTESE, LUST, SWEEPS UST databases; as CA Army National Guard in the LUST, Los Angeles County HMS; as Bell Organizational Maintenance No. 6 in the CERLIS, HAZNET, and RCRA-LQG databases. According to GeoTracker, three cases are associated with the site. Patton US Army Reserve Center (5340 Bandini Blvd.) is listed with a status of “Completed-case closed” as of November 14, 1999, for a release of diesel to soil. US Government (5300 Bandini Blvd.) is listed with a status of “Completed-case closed” as of February 5, 2009, for a release of gasoline to soil. CA Army National Guard is listed with a status of “Completed-case closed” as of March 3, 2015, for a release of diesel, gasoline, MTBE/TBA/other fuel oxygenates, toluene, waste oil/motor/hydraulic/lubricating, xylenes. Based on the regulatory agency closure status, these listings are not expected to have created an environmental concern to the ISA Study Area. However, there is potential for residual soil contamination to exist which may be encountered during construction and/or excavation activities. |

| 40416 | 7140-014-940 | Los Angeles River Long Beach, CA | Partial, TCE | The Right-of-Way Impact Report identified Parcel No. 40416 as Flood Control Use. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps and County Assessor website revealed that Parcel No. 40416 consists of APN 7140-014-940. Based on a review of online maps and photographs, Parcel No. 40416 consists of a segment of the Los Angeles River, adjacent to the east of I-710, located northeast of the I-405 onramp to I-710. This parcel is located within an area identified in the EDR Report Orphan Summary (ID Nos. S114725879 and S114725880) as Caltrans Long Beach, and West Los Angeles River No. 2 in the RGA LF database. According to the online SWIS database, the exact location of Caltrans Long Beach, West Los Angeles River No. 2 (SWIS No. 19-AK-5002) is unknown, but it is located between the I-710 and the Los Angeles River at the end of W. Carson St. This location is a closed solid waste disposal site that was operated by Caltrans and the regulatory status is reported as "unpermitted." It is inspected annually by the County of Los Angeles and the most recent inspection was performed on January 28, 2016. The inspection report notes |

| Appendix P-2 Parcel No. | APN | Address ¹ | Acquisition | Site Listing |
|----------------------------|--------------|-------------------------------------|--------------|---|
| | | | | that the exact location is unknown and no new information has been obtained, but no significant land use changes were noted in the area since the last inspection. No significant violations were noted at the time of the inspection. Based on the use of this area, there is potential for waste materials to exist which may be encountered during construction and/or excavation activities. |
| 50440 | 7140-014-808 | SCE Corridor Long Beach, CA | Partial, TCE | The Right-of-Way Impact Report identified Parcel No. 50440 as Utility Use, owned by Southern California Edison Co Ltd. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps and County Assessor website revealed that Parcel No. 50440 consists of APN 7140-014-808 and located adjacent to the east of I-710. Based on a review of online maps and photographs, Parcel No. 50440 is a strip of land that is occupied by transmission power lines and stables associated with the Rancho Rio Verde Riding Club (1000 W. Carson St.). No EDR listings were identified in this area. This parcel is located within an area identified in the EDR Report Orphan Summary (ID Nos. S114725879 and S114725880) as Caltrans Long Beach, and West Los Angeles River No. 2 in the RGA LF database, see Parcel No. 40416 for EDR listing information. |
| 40441 | 7140-014-939 | Los Angeles River Long Beach, CA | Partial, TCE | The Right-of-Way Impact Report identified Parcel No. 40441 as Flood Control Use, owned by LA Flood Control District. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps and County Assessor website revealed that Parcel No. 40441 consists of APN 7140-014-939. Based on a review of online maps and photographs, Parcel No. 40441 consists of the Dominguez Basin, a segment of the Los Angeles River, and a strip of vacant land located adjacent to the east of the Los Angeles River. This parcel was located within an area identified in the EDR Report Orphan Summary (ID Nos. S114725879 and S114725880) as Caltrans Long Beach, and West Los Angeles River No. 2 in the RGA LF database, see Parcel No. 40416 for EDR listing information. |

| 40445 | 7140-014-942 | Rail OPS Long Beach, CA | Partial, TCE | The Right-of-Way Impact Report identified Parcel No. 40445 as Flood Control Use, owned by LA County Metro Tans. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps and County Assessor website revealed that Parcel No. 40445 consists of APN 7140-014-942. Based on a review of online maps and photographs, Parcel No. 40445 consists of the northern portion of the Dominguez Basin. This parcel is located within an area identified in the EDR Report Orphan Summary (ID Nos. S114725879 and S114725880) as Caltrans Long Beach, and West Los Angeles River No. 2 in the RGA LF database, see Parcel No. 40416 for EDR listing information. |
| 40447 | 7140-014-910 | Los Angeles River Long Beach, CA | Partial | The Right-of-Way Impact Report identified Parcel No. 40447 as Flood Control Use, owned by LA County Flood Control District. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps and County Assessor website revealed that Parcel No. 40447 consists of APN 7140-014-910. Based on a review of online maps and photographs, Parcel No. 40447 consists of a storage yard (leasee unknown) located adjacent to the west of the Los Angeles River. This parcel is located within an area identified in the EDR Report Orphan Summary (ID Nos. S114725879 and S114725880) as Caltrans Long Beach, and West Los Angeles River No. 2 in the RGA LF database, see Parcel No. 40416 for EDR listing information. |
| 40449 | 7140-014-909 | Los Angeles River Long Beach, CA | Partial | The Right-of-Way Impact Report identified Parcel No. 40449 as Flood Control Use, owned by LA County Flood Control District. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps and County Assessor website revealed that Parcel No. 40449 consists of APN 7140-014-909. Based on a review of online maps and photographs, Parcel No. 40449 consists of a segment of the Los Angeles River and the Dominguez Gap Wetlands located south of Dominguez St. This parcel is located within an area identified in the EDR Report Orphan Summary (ID Nos. S114725879 and S114725880) as Caltrans Long Beach, and West Los Angeles River No. 2 in the RGA LF database, see Parcel No. 40416 for EDR listing information. |

| 80450 | 7140-014-943 | Rail OPS Long Beach, CA | Partial, TCE | The Right-of-Way Impact Report identified Parcel No. 80450 as Railroad Use, owned by LA Co Metro Trans. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps and County Assessor website revealed that Parcel No. 80450 consists of APN 7140-014-943. Based on a review of online maps and photographs, Parcel No. 80450 consists of a paved lot used for parking and storage associated with the adjoining Metro facility. This parcel is located within an area identified in the EDR Report Orphan Summary (ID Nos. S114725879 and S114725880) as Caltrans Long Beach, and West Los Angeles River No. 2 in the RGA LF database, see Parcel No. 40416 for EDR listing information. |
| 04351 | 7140-014-028 | Long Beach, CA | Partial, TCE | The Right-of-Way Impact Report identified Parcel No. 04351 as Business Use, owned by Harbor Land Company LLC. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps and County Assessor website revealed that Parcel No. 04351 consists of APN 7140-014-028. Based on a review of online maps and photographs, Parcel No. 04351 consists of a segment of the Metro Blue Line/ Pacific Electric Railroad tracks. This parcel is located within an area identified in the EDR Report Orphan Summary (ID Nos. S114725879 and S114725880) as Caltrans Long Beach, and West Los Angeles River No. 2 in the RGA LF database, see Parcel No. 40416 for EDR listing information. |
| 50452 | 7140-014-804 | SCE Corridor Long Beach, CA | Partial, TCE | The Right-of-Way Impact Report identified Parcel No. 50452 as Utility Use, owned by SCE. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps and County Assessor website revealed that Parcel No. 50452 consists of APN 7140-014-804. Based on a review of online maps and photographs, Parcel No. 50452 is a storage yard (leasee unknown) located adjacent to the west of the Los Angeles River. This parcel is located within an area identified in the EDR Report Orphan Summary (ID Nos. S114725879 and S114725880) as Caltrans Long Beach, and West Los Angeles River No. 2 in the RGA LF database, see Parcel No. 40416 for EDR listing information. |

| 08122 | 7306-022-043 | 129 Victoria St. Long Beach, CA | Partial | The Right-of-Way Impact Report identifies Parcel No. 08122 as Business Use, owned by 5951 LONG BEACH LLC. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps and County Assessor website revealed that Parcel No. 08122 consists of APN 7306-022-043. This parcel consists of a strip of land located adjacent to the west of the Long Beach Blvd. on-ramp to I-710 South. An EDR listing of potential concern was identified (see Parcel No. 08110). |
| 08111 | 7307-008-051 | 6001 Long Beach Blvd. Long Beach, CA | Partial | The Right-of-Way Impact Report identifies Parcel No. 08111 as Business Use, owned by WMC INC and currently occupied by an ARCO gasoline station. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps and County Assessor website revealed that Parcel No. 08111 consists of APN 7307-008-051. This parcel consists of a strip of land at 6001 Long Beach Blvd., adjacent to northwest corner of Victoria St. and Long Beach Blvd. This address was identified as 81956 ARCO AM/PM (EDR ID No. 2092) in the HAZNET database; as ABZ. INC. (ARCO AM/PM) (EDR ID No. 2092) in the CA UST database It appears that historically the address 6015 Long Beach Blvd. was also associated with this parcel, which was identified as 92497 (EDR ID No. 2092) in the HIST UST database; as J.W. Ridell Chevron (EDR ID No. 2092) in the UST database; and as Chevron U.S.A. Inc. (EDR ID No. 2092) in the CA FID UST, SWEEPS UST, CA HIST UST databases; as Strong Roy Chevron (EDR ID No. 2092) in the EDR Hist Auto database. Based on the lack of listing in other databases indicating violations and/or a release, these listings are not expected to have created an environmental concern to the ISA Study Area. An adjacent EDR listing of potential concern was identified (see Parcel No. 08110). |
| 14101 | 6194-031-008 | 5447 Marti Luther King Jr Blvd. Lynwood, CA | Partial, TCE | The Right-of-Way Impact Report identified Parcel No. 14101 as Business use, owned by ERMM Corp. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps and County Assessor website revealed that Parcel No. 14101 consists of APN 6194-031-008. Based on review of online maps and photographs, Parcel No. 14101 consists of three commercial structures occupied by Kirk's Diesel (5447 Martin Luther King Blvd.), located north of Martin Luther King Jr. Blvd. and west of I-710. This parcel was identified in the EDR Report (EDR ID No. 1274) as Diesel Mobile Service in the HAZNET database. Based on the lack of violations and/or listing in other databases indicating a release, this listing is not expected to have created an environmental concern to the ISA Study Area. |

| Appendix P-2 Parcel No. | APN | Address ¹ | Acquisition | Site Listing |
|----------------------------|--------------|---|-------------|--|
| 17206 | 6332-014-025 | 5568 61 st St. City of Commerce, CA | Full | <p>The Right-of-Way Impact Report identified Parcel No. 17206 as Business Use owned by Sheldon Appel Co Trust. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps and County Assessor website revealed that Parcel No. 17206 consists of APN 6332-014-025. Based on review of online maps and photographs, Parcel No. 17206 consists of a large commercial building (5568 E. 61st St.) occupied by Regal Trading Company (5560 E. 61st St.) and Ivy Enterprises (5564 E. 61st St.). This facility is located south of E. 61st St., east of I-710. This parcel was identified in the EDR Report (EDR ID No. 516) as Henkel Corp in the CHMIRS and EMI databases; and as Cognis Corp in the LUST, RCRA-SQG, EMI, HAZNET, FINDS, DEED, ENVIROSTOR, and Los Angeles County HMS databases. According to the ENVIROSTOR database, from 1938 to 1999, this 11-acre site was occupied by various chemical manufacturing companies and a steel foundry. Some of the former operators included Crayola, Vegetable Oil Company, Emery Industries, Wulff Processing, California Carbonic, National Distillers, and Apex Steel. Henkel, the last facility operator, was an oleochemical manufacturing facility that refined vegetable and animal fats. In 1994, Henkel was granted a Conditional Authorization for the on-site treatment. In 1997, Henkel submitted a Phase I Environmental Assessment Checklist indicating further investigation was needed. DTSC conducted a Phase I Environmental Checklist verification inspection on the site and concurred further investigation was needed. Identified SWMUs included nickel storage, sulfuric acid storage, stormwater impound, wastewater sumps, wastewater pre-treatment sump, Southland Oil (State Super Fund site) property border, steel foundry, and excavations from Underground Storage Tanks (USTs) formerly containing Acetone, Methanol, Gasoline, Dowtherm A, and Therminol. Cognis Corporation took over Henkel and demolished the above ground structures in the spring 2000. In June 2000, Cognis Corporation entered into a Corrective Action Consent Agreement (CACA) with DTSC to investigate and remediate potential soil and groundwater contamination. During the fiscal year 2004/2005, DTSC oversaw implementation of an interim measure removal of lead contaminated soil in Area 2. Corrective Measures Plan, dated March 29, 2007, for Cognis Facility, was public noticed and approved by DTSC on June 29, 2007. Cognis implemented Soil Vapor Extraction (SVE) and removal of ten cubic yards of contaminated soil with arsenic concentrations above the local background levels in</p> |

| Appendix P-2 Parcel No. | APN | Address ¹ | Acquisition | Site Listing |
|----------------------------|--------------|---------------------------------|-------------|---|
| | | | | <p>one area (Area 3). In addition, the Corrective Measures Plan would place a cap and additional restriction on the border with Southland Oil Site (Area 6). The restriction prohibits re-development except for the removal of the existing concrete structures and construction of a parking lot. The facility submitted Corrective Measures Completion report in July 2010. A Land Use Covenant was filed with the Los Angeles County Assessor's Office in 2012. The site returned to industrial/commercial use, with "Land use restrictions only" as of March 16, 2012. According the GeoTracker database, the facility is listed with a status of "Completed-case closed" as of February 18, 2009, for a release of gasoline to soil. Based on the regulatory agency closure status, these listings are not expected to have created an environmental concern to the ISA Study Area. However, there is potential for residual soil contamination to exist which may be encountered during construction and/or excavation activities.</p> |
| 19489 | 5241-030-011 | 1549 Sydney Dr. Commerce, CA | Full | <p>The Right-of-Way Impact Report identified Parcel No. 19489 as Business Use, owned by Emigdio Gamboa Trust. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 19489 consists of APN 5241-030-011. Based on a review of online maps and photographs, Parcel No. 19489 consists of the Universal Lift Gate Service (1549 S. Sydney Dr.) located west of S. Sydney Dr., west of I-710. This parcel was identified in the EDR Report (EDR ID No. 170) as Yaky Welding Shop in the EMI database; as Universal Liftgate Service in the HAZNET database. Based on the lack of violations and/or listings in other databases indicating a release, these listings are not expected to have created an environmental concern to the ISA Study Area.</p> |

| 19490 | 5241-030-012 | 1545 Sydney Dr. Commerce, CA | Full | The Right-of-Way Impact Report identified Parcel No. 19490 as Business Use, owned by Jesus C and Blanca L Barraza. A review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 19490 consists of APN 5241-030-012. Based on a review of online maps and photographs, Parcel No. 19490 consists of Barraza & Sons (1545 S. Sydney Dr.) located west of S. Sydney Dr., west of I-710. This parcel was identified in the EDR Report (EDR ID No. 170) as Barraza & Sons Inc. in the HAZNET, HAULERS, and FINDS databases. Based on the lack of violations and/or listings in other databases indicating a release, these listings are not expected to have created an environmental concern to the ISA Study Area. |
| 17209 | 6332-013-033 | - | Partial, TCE | The Right-of-Way Impact Report identified Parcel No. 17209 as Business Use owned by Newark Group Industries Inc. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps and County Assessor website revealed that Parcel No. 17209 consists of APN 6332-013-033. Based on review of online maps and photographs, Parcel No. 17209 consists of the Golden State Fibers Recycling facility (5585 E. 61 st St.) located north E. 61 st St., east of I-710. This parcel was identified in the EDR Report (EDR ID No. 516) as Baker Castor Oil in the CERCLIS-NFRAP, NPDES, LA County Site Mitigation, Los Angeles County HMS, and ENVIROSTOR databases. According to the ENVIROSTOR database, the facility is listed with a status of "No further action" as of January 17, 1984. Based on the regulatory agency closure status, these listings are not expected to have created an environmental concern to the ISA Study Area. However, there is potential for residual soil contamination to exist which may be encountered during construction and/or excavation activities. |
| 17210 | 6332-013-014 | - | Full | The Right-of-Way Impact Report identified Parcel No. 17210 as Business Use owned by Newark Group Industries Inc. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps and County Assessor website revealed that Parcel No. 17210 consists of APN 6332-013-014. Based on review of online maps and photographs, Parcel No. 17210 consists of a vacant strip of land located the Golden State Fibers Recycling facility (5585 E. 61 st St.) located at the terminus of E. 61 st St., east of I-710. This parcel is associated with Parcel No. 17209, refer for EDR listings and information. |

| 17211 | 6332-013-001 | - | Partial, TCE | The Right-of-Way Impact Report identified Parcel No. 17211 as Business Use owned by Newark Group Industries Inc. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps and County Assessor website revealed that Parcel No. 17211 consists of APN 6332-013-001. Based on review of online maps and photographs, Parcel No. 17211 consists of a portion of Parcel No. 17209, refer for EDR listings and information. |
| 19115 | 5243-029-003 | 4638 Washington Blvd. Commerce, CA | Full | The Right-of-Way Impact Report identified Parcel No. 19115 as Business Use, owned by Kenneth W Busch Trust. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps and County Assessor website revealed that Parcel No. 19115 consists of APN 5243-029-003. Based on review of online maps and photographs, Parcel No. 19115 consists of RDD USA (4638 E. Washington Blvd.) located south of E. Washington Blvd. and west of I-710. This parcel was identified in the EDR Report (EDR ID No. 214) as KW Busch Electric in the HAZNET database. Based on the lack of violations and/or listing in other databases indicating a release, this listing is not expected to have created an environmental concern to the ISA Study Area. See Parcel No. 19116 for a discussion on nearby EDR listings of potential environmental concern. |
| 19116 | 5243-029-020 | 2414 Connor Ave. Commerce, CA | Full | The Right-of-Way Impact Report identified Parcel No. 19116 as Business Use, owned by David M Throgmorton. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps and County Assessor website revealed that Parcel No. 19116 consists of APN 5243-029-003. Based on review of online maps and photographs, Parcel No. 19116 consists of Throgmorton's Frame Clinic (2414 Conner Ave.) located east of Conner Ave., south of E. Washington Blvd., west of I-710. This parcel was identified in the EDR Report (EDR ID No. 214) as Certified Coatings Prod Co in the RCRA-SQG, FINDS, Los Angeles County HMS, EMI, CA FID UST, SLIC, LUST, UST, HIST UST, HIST CORETESE, and SWEEPS UST databases; and as Throgmortons Frame Clinic in the Los Angeles County HMS and HAZNET databases. According to the GeoTracker database, two cases are associated with this parcel. Certified Coatings Products is listed with a status of "Completed-case closed" as of June 27, 1991, for a release of acetone to soil. Throgmorton's Frame Clinic is listed with a status of "open-inactive" as of January 19, 2015. A Phase II Environmental Assessment Report dated May 2008 indicated that 15 soil borings were advanced on-site to delineate the extent of soil contamination resulting from existing USTs. The report concluded that |

| Appendix P-2 Parcel No. | APN | Address ¹ | Acquisition | Site Listing |
|----------------------------|--------------|---------------------------------------|-------------|---|
| | | | | petroleum hydrocarbon and VOC contamination is generally located between 20 and 105 feet bgs. The consultant then recommended that all existing USTs be removed, and all residual contamination be treated by vapor extraction. No additional information was available on the GeoTracker website. Based on the regulatory status, this listing has the potential to create an environmental concern to the ISA Study Area and a file review is recommended. |
| 19117 | 5243-029-004 | 4630 Washington Blvd. Commerce, CA | Full | The Right-of-Way Impact Report identified Parcel No. 19117 as Business Use, owned by Kenneth W Busch Trust. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps and County Assessor website revealed that Parcel No. 19117 consists of APN 5243-029-004. Based on review of online maps and photographs, Parcel No. 19117 consists of a commercial property (4630 E. Washington Blvd.) located at the southeast corner of Connor Ave. and E. Washington Blvd., west of I-710. No EDR listings were identified associated with this address. See Parcel No. 19116 for a discussion on nearby EDR listings of potential environmental concern. |
| 19118 | 5243-029-021 | 2415 Conner Ave. Commerce, CA | Full | The Right-of-Way Impact Report identified Parcel No. 19118 as Business Use, owned by Criterion Enterprises. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps and County Assessor website revealed that Parcel No. 19118 consists of APN 5243-029-021. Based on review of online maps and photographs, Parcel No. 19118 consists of a vacant commercial property (2415 Connor Ave.) located west of Connor Ave. and south of E. Washington Blvd., west of I-710. No EDR listings were identified associated with this address. See Parcel No. 19116 for a discussion on nearby EDR listings of potential environmental concern. |
| 19119 | 5243-029-007 | 4614 Washington Blvd. Commerce, CA | Full | The Right-of-Way Impact Report identified Parcel No. 19119 as Business Use, owned by Criterion Enterprises. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps and County Assessor website revealed that Parcel No. 19119 consists of APN 5243-029-007. Based on review of online maps and photographs, Parcel No. 19119 consists of Pacific Signs & Supplies (4618 E. Washington Blvd.) located at the southwest corner of the intersection of E. Washington Blvd. and Connor Ave., west of I-710. This parcel was identified in the EDR Report (EDR ID No. 214) as Criterion Gates and Mfg Co in the Los Angeles HMS database. Based on the lack of violations and/or listing in other databases indicating a release, this listing is not expected to have created an environmental concern to the ISA Study Area. |

|----------------------------|--------------|-------------------------------------|--------------|---|
| | | | | HMS and LUST databases. According to the GeoTracker online database, the site is listed with a status of "Open-Site Assessment" as of June 3, 2009, for a release of diesel. Groundwater monitoring is ongoing at this property. Based on the regulatory status, this listing has potentially created an environmental concern to the ISA Study Area. In addition, there is potential for contamination to exist which may be encountered during construction and/or excavation activities. |
| 15277 | 6232-014-025 | 9925 Miller Way South Gate, CA | Partial, TCE | The Right-of-Way Impact Report identified Parcel No. 15277 as Business Use, owned by Fiola International. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps and County Assessor website revealed that Parcel No. 15277 consists of APN 6232-014-025. Based on a review of online maps and photographs, Parcel No. 15277 consists of the Cal State Express Inc. facility (9850 Miller Way) located west of Miller Way, south of Frontage Rd., and adjacent to the east of I-710. This parcel was identified in the EDR Report (EDR ID No. 1010) as Fiola International in the Los Angeles County HMS and LUST databases; as LA Express Assembly and Dist. Inc. in the FINDS and CERCLIS databases; as Vacant in the HIST CORTESE and SWEEPS UST databases. According to the GeoTracker online database, the site is listed with a status of "Completed-Case closed" as of July 23, 1996, for a release of other solvents or non-petroleum hydrocarbon to soil. Based on the regulatory agency closure status, this listing is not expected to have created an environmental concern to the ISA Study Area. However, there is potential for residual contamination to exist which may be encountered during construction and/or excavation activities. |
| 15229 | 6232-015-009 | 5440 Southern Ave South Gate, CA | Partial | The Right-of-Way Impact Report identified Parcel No. 15229 as Business Use, owned by J B Hunt Transport Inc. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 7 Maps and County Assessor website revealed that Parcel No. 15229 consists of APN 6232-015-009. Based on a review of online maps and photographs, Parcel No. 15229 is associated with Parcel No. 15230, occupied by J B Hunt Transportation (5730 Southern Ave.), located south of Southern Ave. and east of I-710. See Parcel No. 15230 for EDR information. |

I-710 Corridor Project RDEIR/SDEIS

|----------------------------|--------------|----------------------|--------------|--|
| 15268 | 6233-002-901 | South Gate, CA | Partial, TCE | The Right-of-Way Impact Report identified Parcel No. 15268 as Business Use, owned by SOUTH GATE CITY. Review of the I-710 EIR/EIS ROW Exhibit - Alternative 5C Maps and County Assessor website revealed that Parcel No. 15268 consists of APN 6233-002-901. Based on a review of online maps and photographs, Parcel No. 15268 consists of a segment of land bounded to the northwest by I-710, northeast by the Union Pacific Railroad, southeast by the Rio Hondo Channel, and southwest by the Los Angeles River. This parcel is currently leased to GWS, Inc. for use as an active composting operation for green waste. and used to be associated with a former landfill. This parcel was formerly part of a landfill associated with Parcel Nos. 41543, 15268, 61544, 41520, and 71570 (see Parcel No. 41543 for EDR discussion). |

Table 3.12-3: Adjoining Properties of Potential Concern Under Alternatives 5C and 7

| Location | Impact | | Sub-Area | Description |
|---|--|--|------------------------------|---|
| | Alternative 5C | Alternative 7 | | |
| Adjacent to the east of the study area, northeast of the intersection of 6 th St. and San Francisco Ave. | Nearby Parcel No. 70024, 70018 | Nearby Parcel No. 70024, 70018 | 00-SHORELINE-7 th | This address was identified in the EDR Report as City of Long Beach Redevelopment Agency (EDR ID No. 2988) in the CA RGA LUST database. This address (EDR ID No. 2998) was also identified in the UST database. Additional information was not available in the EDR Report. According to the online GeoTracker database, this site formerly maintained two 3,000-gallon USTs, which were permitted for removal in 1974; however, it was unclear whether they were removed at that time or if soil testing was conducted. In 2007, a subsurface investigation was performed in the area of the former USTs and a total of 18 soil samples were collected and analyzed for fuel constituents (EPA Methods 8015M and 8260B. Maximum concentrations of 122 mg/kg total petroleum hydrocarbons (TPHg), 20.3 mg/kg total petroleum hydrocarbons as motor oil, 0.57 mg/kg benzene, 1.01 mg/kg ethylbenzene, 0.0027J toluene, 0.27 mg/kg xylenes were detected in the soil samples. Fuel oxygenates were not detected. In a letter dated November 25, 2014, the RWQCB stated that the residual concentrations of fuel constituents posed a low threat to human health, and soil and groundwater beneath the site. Therefore, no further action was required to pursue any further soil and/or groundwater investigation at the site. Based on the no further action status, these listings are not expected to have created an environmental concern to the ISA Study Area. |
| Adjacent to northeast of study area, near intersection of 7 th St. and I-710 | Nearby Parcel No. 70023, 70025, 40026, 40027 | Nearby Parcel No. 70023, 70025, 40026, 40027 | 00-SHORELINE-7 th | This address was identified as MTA Div. 12 (EDR ID No. 3292) in the RCRA-NonGen/NLR, CA LUST, CA FID UST, SWEEPS UST, HIST UST, CA NPDES, and UST databases; and as LA County Metropolitan Transit Authority (EDR No. 3292) in the FINDS, CA WDS, CA SLIC, CA EMI, CA HAZNET, and CA UST databases. This site was used as the MTA Bus Division 12 bus maintenance and fueling facility and included multiple gasoline and diesel USTs, and associated product piping and dispensers. Reportedly, a gasoline release that impacted soil was discovered in 2002. The LUST cleanup status is reported as "Open – Site Assessment" as of |

| Location | Impact | | Sub-Area | Description |
|--|--|--|------------------------------|---|
| | Alternative 5C | Alternative 7 | | |
| | | | | October 28, 2015. The RWQCB is lead regulatory oversight agency. No groundwater data is available on the online GeoTracker database; however, a soil and groundwater investigation report appears to have been completed in 2010 and groundwater monitoring is ongoing (documents not available online). Based on the open case status, a file review is recommended. |
| Adjacent to the northeast of the study area, east of Los Angeles River, north of 7 th St. | Near Parcel No. 40105, 40106, 40107, 40108 | Near Parcel No. 40105, 40106, 40107, 40108 | 00-SHORELINE-7 th | This address was identified as the Former Bulk Terminal (EDR ID No. 3292) in the FINDS, RCRA-SQG, CA HAZNET, CA RGA LUST, ERNS, CA EMI, CA UST, SLIC, CA HIST CORTESE, and LUST databases; as Union Pacific Railroad in the CA HAZNET database; and as 960 DEFOREST AVE. LONG BEACH SITE in the CERCLIS-NFRAP and RCRA-LQG database. The GeoTracker database reports that prior to 1965, the site was owned and operated by Pacific Electric Railroad Company and used for electric railroad repair, maintenance, and inspection. Southern Pacific Transportation Company acquired the site in 1965 and leased it to various entities, whose primary operations were bulk transfer and storage of liquid petroleum and chemical products. Union Pacific Railroad Company (UPRR) acquired the site in 1966, in a merger of Southern Pacific Transportation Company. Subsequently, the City of Long Beach acquired the site from the UPRR in May 2007. All structures have been removed from the property. The site is contaminated with heavy metals, petroleum distillates, volatile organic compounds (VOCs), and poly aromatic hydrocarbons (PAHs). Depth to groundwater is as shallow as 11 feet bgs and has also been impacted by some of these compounds. Soil remediation using soil vapor extraction (SVE) was completed between 2003 and 2007; when the system was decommissioned. Remaining impacted soils were approved for removal in 2008; however, based on the information available it is unclear whether this work was completed or what assessment work and/or remediation was completed to address the impacts to groundwater. The LUST cleanup status is listed as "Open - Site Assessment as of February 28, 2016." Based on the open-case regulatory status, this site is considered to represent an environmental concern to the ISA Study Area and a file review is recommended. Based on the proximity to the ISA Study Area, contamination |

| | Alternative 5C | Alternative 7 | | |
| | | | | may exist and be encountered near this property during construction and/or excavation activities. |
| East of study area, south side of Anaheim St. | East of Parcel No. 01209 | East of Parcel No. 01209 | 01 PICO-ANAHEIM | <p>This address was identified as West Coast Choppers (EDR ID No. 2998) in the CA ENF and CA LUST database; as Douglas Robinson Property (EDR ID No. 2998) in the HIST CORTESE database; and as Ellis Family Trust (EDR ID No. 2998) in the SLIC database. Reportedly, a release of "naphtha distillate" was discovered in 1995 impacting groundwater. This property was formerly occupied by Ellis Paint Company. The RWQCB is the lead agency for this case. The online GeoTracker database lists the cleanup status as "Completed - Case Closed as of July 30, 2012." Prior to 1995, the USTs were used to store mineral spirits, lacquer thinner and toluene. Since 1995, it was used as a motorcycle retail sale store. In 1995, three underground storage tanks (USTs) and one clarifier were removed from the site. Total petroleum hydrocarbons as gasoline (TPHg) and total petroleum hydrocarbons as diesel (TPHd) were detected up to 1,539 mg/kg, and 9,553 mg/kg respectively. Subsurface soil and groundwater contamination was detected during investigations conducted in 1996. In 1996, seven soil borings and four hand-auger borings were advanced on-site to maximum depth of ten feet bgs. Grab groundwater samples were collected from the boreholes. Benzene was detected up to 19 ug/L. In 2006, five temporary wells TW1 through TW5 were installed on-site. Groundwater analytical data showed the TPHg and benzene were detected up to 77,000 ug/L, respectively. MTBE and TBA were not detected. On December 2, 2011, three soil borings were advanced to evaluate the current soil and groundwater condition. Three soil borings were completed. Approximately 1.5 inches of free product was detected in boring B1. On December 21, 2011, the RP conducted a remedial excavation in the boring B1 area (six feet by six feet by 11.5 feet deep). The free product was removed and contaminated soil (17 cubic yards) excavated and disposed off-site. A soil sample was collected after excavation and a 12-inch diameter groundwater monitoring well W1 was installed in the excavation. TPHg, TPHd and benzene were detected up to 420 mg/kg, 2,100 mg/kg and 0.15 mg/kg, respectively in the soil sample. On January 9, 2012, groundwater samples</p> |

| Location | Impact | | Sub-Area | Description |
|---|--------------------------|--------------------------|-----------------|--|
| | Alternative 5C | Alternative 7 | | |
| | | | | were analyzed from the three existing wells (two are temporary wells). The groundwater flow direction was identified as flowing to the northwest and was detected between six and nine feet bgs. No free produced was detected in well W1. TPHg and benzene were detected up to 24,000 ug/L and 250 ug/L, respectively. MTBE was not detected. The results show at least 50 percent reduction in contaminant from 2006 data. The highest contamination is centered in well W1 area. RWQCB granted a No Further Action- Closure letter on July 30, 2012. Based on the regulatory agency closure status, these listings are not expected to have created an environmental concern to the ISA Study Area. |
| East of study area, south side of Anaheim St. | East of Parcel No. 01209 | East of Parcel No. 01209 | 01 PICO-ANAHEIM | This address was identified as in the EDR Report as Aratex Services (Aramark Uniform and Career Apparel) (EDR ID No. 2998) in the RCRA-LQG, HIST CORTESE, CA LUST, CA SLIC, CA FID UST, CA LOS ANGELES CO. HMS, and HAZNET databases; as Soft Water Laundry & Dry Cleaning Company (EDR ID No. 2998) in the EDR Hist Cleaner database; and as American Buffalo Inc in the CA UST database. Reportedly, a release of solvents impacting an aquifer used for drinking water supply was discovered in 1988. The LUST cleanup status is reported as "Open – Remediation" as of August 16, 2013. The RWQCB is lead regulatory oversight agency. The property is occupied by two buildings. Historically, the main laundry facility was located on the west and the auxiliary building was on the east. The area between the two buildings is covered by asphalt pavement. Adjacent to the main building on the west, there is a sump. The past operations and uses of the sump are unknown. Three underground storage tanks (USTs) and one above-ground storage tank (AST) were present at the site prior to ARAMARK's purchase in 1986. USTs included a 6,000-gallon diesel, a 550-gallon gasoline, and a Stoddard solvent UST of unknown size. The AST contained tetrachloroethylene (PCE) and had a capacity of 1,000 gallons. In 1982, the diesel and gasoline USTs and PCE AST were removed. Later, the Stoddard solvent UST was filled with concrete and pea gravel and abandoned in-place. The exact date of the Stoddard solvent UST abandonment is |

|----------|----------------|---------------|----------|--|
| | Alternative 5C | Alternative 7 | | |
| | | | | <p>unknown but occurred prior to 1986. Several soil and groundwater investigations have been conducted at the site since 1987. Soil and groundwater have been impacted with chlorinated volatile organic compounds, petroleum hydrocarbons, benzene, toluene, ethylbenzene and xylenes (BTEX). Highest historical soil concentrations include 28,000 micrograms per kilogram (ug/kg) of PCE, 1,200 ug/kg of cis-1,2-dichloroethylene (c-1,2-DCE), 2,300 ug/kg of benzene, and 12,000 ug/kg of total petroleum hydrocarbons. Initial groundwater investigations in 1988 detected concentrations of benzene, trans-1,2-DCE, and PCE up to 1,600, 7,240, and 8,350 micrograms per liter (ug/L), respectively. A groundwater pump and treat system operated at the site from 1994 to 2002, pumping groundwater through a shallow tray air stripper and two granular activated carbon units prior to discharge at the storm drain, under the National Pollutant Discharge Elimination System (NPDES) permit No. CA0063045. Groundwater monitoring has been conducted since 1987. In general, concentrations of chlorinated volatile organic compounds in groundwater have decreased due to the operation of remediation system, except for vinyl chloride. Maximum groundwater concentrations in the second quarter of 2008 include PCE at 450 ug/L, TCE at 120 ug/L, cis-1,2-DCE at 59 ug/L, vinyl chloride at 600 ug/L, benzene at 33 ug/L, and chlorobenzene at 47 ug/L. There are currently seven groundwater monitoring wells on the property. Four groundwater monitoring wells are scattered around the property, across Orange Ave., and across West Anaheim St. The groundwater monitoring wells are screened differently based on when they were installed. A soil vapor extraction system is operating at the site since 2011. Amendments were injected in groundwater for cleanup in 2013-2014. Groundwater monitoring is on-going. Based on the open-case regulatory status, this site is considered to represent an environmental concern to the ISA Study Area and a file review is recommended. Based on the proximity to the ISA Study Area, contamination may exist and be encountered near this property during construction and/or excavation activities.</p> |

| | Alternative 5C | Alternative 7 | | |
| West of the study area, southeast corner of 17 th St. and Harbor Ave | West of Parcel Nos. 01448, 01447, 01446 | West of Parcel Nos. 01448, 01447, 01446 | 01 PICO-ANAHEIM | <p>This address was identified as Marine Hardware (EDR ID No. 3141) in the LUST database; as Hydro Services Co (EDR ID No. 3141) RCRA-SQG, FINDS, CA HIST CORTESE and UST databases; and as Press Tech Inc (EDR ID No. 3141) in the RCRA-NonGen and FINDS databases. Reportedly, a release of other solvents or non-petroleum hydrocarbons impacting an aquifer used for drinking water supply was discovered in 1989. The LUST cleanup status is reported as "Completed - Case Closed as of October 8, 2013." The RWQCB is lead regulatory oversight agency. The site is a former marine hardware company and is now a truck maintenance facility. The case was referred to the Regional Board in November 1991 by the City of Long Beach. In November 1989, an 8,000-gallon diesel UST and a 1,000-gallon waste oil/gasoline UST was removed from the site. Hydrocarbon contamination was detected in soil samples collected from the bottom of the USTs. TPHg was detected up to 13,700 mg/kg in 1989. In September 1990, four soil borings were advanced to 30 feet bgs and the borings were converted to four groundwater monitoring wells (MW1 through MW4). TPHg and benzene were detected up to 270 mg/kg and 1.2 mg/kg, respectively, in soil samples. In July 2002, two groundwater monitoring wells (MW-5 and MW-6) were installed. TPHg was detected up to 5,800 mg/kg. Benzene, MTBE, and TBA were not detected in soil samples. Groundwater monitoring began in 2002. The depth to groundwater ranges from approximately seven to 14 feet bgs. The groundwater flow direction is north. The latest groundwater monitoring data collected in June 2013 showed that TPHg and benzene were detected up to 600 ug/L, and 1.5 ug/L, respectively. MTBE and TBA were non-detectable in all six wells. The RWQCB granted a No Further Action-Closure letter on October 8, 2013. Based on the regulatory agency closure status, these listings are not expected to have created an environmental concern to the ISA Study Area.</p> |

| Adjacent to the west of the study area at the southwest corner of Harbor Ave. and W. Pacific Coast Hwy. | Southwest of Parcel No. 02419 | Southwest of Parcel No. 02419 | 02 PCH | <p>This address was identified in the EDR Report as Tosco 76 Station No. 3568 (EDR ID No. 3141) in the CA HIST CORTESE and CA LUST database; as Conoco Philips No. 253568 (EDR ID No. 3141) in the CA HAZNET database; as Pacific 76 (EDR ID No. 3141) in the CA HAZNET and CA UST database; as UNOCAL Service Station No. 3568 (EDR ID No. 3141) in the CA HAZNET database; as Service Station 3568 (EDR ID No. 3141) in the CA HIST UST database; as Tosco Corporation Station No. 30519 (EDR ID No. 3141) in the CA HAZNET database; and as Union Oil Service Station (EDR ID No. 3141) in the CA HIST UST database. According to the LUST database, in 1993, a gasoline release affected groundwater at this site. The LUST case status is listed as "Completed - Case Closed as of July 3, 2015." According to the October 2013 groundwater monitoring report, groundwater samples detected TPHg of 9,400 ug/L, benzene of 1,900 ug/L, toluene of 23 ug/L, ethylbenzene of 310 ug/L, xylenes of 28 ug/L, TBA of 2,400 ug/L and MTBE of 280 ug/L. Groundwater samples were non-detect when analyzed for VOCs in 2013. The depth to groundwater was approximately encountered at seven feet bgs with a flow direction to the northwest. According to the Low-Threat Closure report dated November 2013, the following remedial actions were conducted at the site: In May 1993, approximately 80 tons of soil were removed during the tank removal and replacement activities at the site. In March 2000, during a one day dual-phase extraction (DPE) pilot test at the site, approximately 110 pounds of vapor phase hydrocarbons were removed from the site. Groundwater volume extracted from the site during this event was not documented. In November 2008, another one-day DPE pilot test was conducted at the site using the same groundwater monitoring wells (MW-1, MW-2, and MW-4) in addition to BC-2. Approximately 4.26 pounds of vapor phase hydrocarbons and 5,000 gallons of groundwater were removed during this event. Benzene concentrations has decreased since March 1993 from 11,000 ug/L to 1,900 ug/L in October 2013. Two down-gradient wells (MW-8 and BC-4) reported non-detect for benzene. Benzene plume appeared to have stabilized. MTBE has also decreased since February 1999 from 120,000 ug/L to 280 ug/L in October 2013 in well MW-4, and from 48,000 ug/L to 130 ug/L in well MW-2.</p> |

| Location | Impact | | Sub-Area | Description |
|---|--|--|--------------------|--|
| | Alternative 5C | Alternative 7 | | |
| | | | | Both MW-2 and MW-4 are source wells. Additionally, downgradient wells MW-1, MW-9 and MW-11 detected low concentrations or non-detect for MTBE (22 ug/L, 11 ug/L, and ND, respectively). MTBE plume appeared to have stabilized. TBA has decreased since July 2002 from 390,000 ug/L to 2,400 ug/L in October 2013 in well MW-4, and from 850,000 ug/L to 900 ug/L in well MW-1 (MW-1 and MW-4 are source wells) Downgradient well MW-11 was non-detect for TBA. TBA Plume appeared to have stabilized. Based on the regulatory agency closure status, these listings are not expected to have created an environmental concern to the ISA Study Area. |
| Adjacent to the west of the study area just southeast of the intersection of Susana Rd. and Reyes Ave | West of Parcel No. 80741 | West of Parcel No. 80741 | 07 DEL AMO | This address was identified as Flo-Kem Products (EDR ID No. 2258) in the CA Los Angeles Co. HMS, CA EMI, SSTS, RCRA-SQG, CA HIST UST, CA ENVIROSTOR, TRIS, FTTS, HIST FTTS, RMP, CA ID UST, CA SWEEPS UST, FINDS, CA HAZNET, CA NPDES, CA SLIC, CA RGA LUST, CA LUST and CA HIST CORTESE databases. According to the LUST database, a release of aviation fuel affected soil at this site in 1985. The LUST status is listed as "Open – Inactive" as of January 29, 2015, and "leak being confirmed." No additional information was available on the GeoTracker database. The lead agency is listed as the County of Los Angeles. Based on the lack of data available online, a file review is recommended. |
| Adjacent to the study area on the northeast corner of Victoria St. and Long Beach Blvd. | Near Parcel Nos. 08421, 08109, 08111, 08110, and 50808 | Near Parcel Nos. 08421, 08109, 08111, 08110, and 50808 | 08 LONG BEACH BLVD | This address was identified in the EDR Report as 6020 Long Beach Blvd (EDR ID No. 2092) in the ERNS database; as Fernandes Joe Texaco Station (EDR ID No. 2092) in the EDR Hist Auto database; as Paul Abrahms Living Trust (EDR ID No. 2092) in the CA HAZNET database; as Bravoil Truckstops LLC (EDR ID No. 2092) in the CA HAZNET database; as Luxavin, Inc. (EDR ID No. 2092) in the CA UST database; as Luxavia Gas Station (EDR ID No. 2092) was identified in the HAZNET, UST, and LUST databases. The LUST cleanup status is reported as "Completed - Case Closed" as of March 8, 2016. According to the UST Case Closure from the RWQCB, the release at the site was discovered in February 1999, when petroleum constituents were detected in confirmation soil samples during the removal office underground storage tanks (USTs). In April and May 2006, a Phase II investigation |

| Location | Impact | | Sub-Area | Description |
|--|----------------------------------|---------------|------------|--|
| | Alternative 5C | Alternative 7 | | |
| | | | | identified petroleum constituents between five and 45 feet bgs. The borings were constructed near the locations of former USTs and dispensers at the site. Skimming and hand bailing removed 65 gallons of free product from groundwater between February 2007 and October 2011. Measurable free product has not been reported at the site since October 2011. A SVE system was operated at the site between August 2008 and July 2014. The SVE system had removed 29,992 pounds of vapor phase hydrocarbons as of July 2014. Air sparging has been used in conjunction with SVE since January 2009. The site is an active fueling facility. Groundwater was most recently measured at 45 feet bgs. The contaminant plume that exceeds water quality objectives (WQOs) is less than 250 feet in length and has been stable or decreasing since 2011. The nearest existing public supply well is located greater than 1,000 feet west of the defined plume boundary. Additional corrective action would not likely change the conceptual site model. Residual petroleum constituents pose a low risk to human health, safety, and the environment. The GeoTracker database reports that a total of 13 groundwater monitoring wells are associated with this property. Groundwater is present at approximately 43 to 46 feet bgs and flows to the south (would intersect the ISA Study Area). Based on the regulatory agency closure status, these listings are not expected to have created an environmental concern to the ISA Study Area. |
| Adjacent to the west of the study area, south of SR-91 and on the northwest corner of Stanley St. and Marville St. | West of Parcel Nos. 41007, 41008 | None | 10 91 WEST | This address was identified in the EDR Report as Boeing – Parcel 3 (EDR ID No. 1998) in the CA WDS and SLIC database; as Stanley Properties Pres Special (EDR ID No. 1998) in the CA HAZNET database; as Cylinder Clinic (EDR ID No. 1998) in the CA LOS ANGELES CO HMS database; as Estate of Albert Levinson (EDR ID No. 1998) in the CA HAZNET database; and as Chemtainer Industries Inc (EDR ID No. 1998) in the FINDS database. According to the SLIC database, groundwater was affected at this site by chlorinated hydrocarbons. The SLIC status is listed as “Open – Remediation” as of March 8, 2011. The GeoTracker database reports that a total of 52 groundwater monitoring wells are associated with this property and |

| Location | Impact | | Sub-Area | Description |
|--|----------------|---------------|--------------|---|
| | Alternative 5C | Alternative 7 | | |
| | | | | groundwater is present at approximately 60 to 75 feet bgs. VOCs have been found in groundwater at concentrations exceeding their MCLs. Shallow soil remediation was completed at the site in 2003. As of 2006 deep soil and groundwater remediation activities were ongoing at this property; however, additional off-site assessment was necessary to define the lateral extent of the groundwater plume. No additional (or more recent) information was available on the GeoTracker database. Based on the open-case regulatory status, this site is considered to represent an environmental concern to the ISA Study Area and a file review is recommended. |
| West of the study area, north of I-105, west of I-710. | None | None | 13 ROSECRANS | This address was identified in the EDR Report as Caltrans-Wilco Dumpsite (EDR ID No. 1380) in the CA LOS ANGELES CO. HMS database; as Willco Landfill in the CA SWEEPS UST, CA LDS, LA Co. Site Mitigation, CA RESPONSE, FINDS, CA HIST Cal-Sites, and CA ENVIROSTOR database; as Willco Disposal Company Inc. in the CA WMUDS/SWAT and CA RGA LF database. Reportedly, the landfill was bounded by the Long Beach freeway on the east, Wright Rd. on the west, a Southern Pacific Railroad right-of-way on the south, and a retaining wall along the north. Prior to 1950, the site was used as a sand quarry and excavated to a minimum elevation of 62 feet above mean sea level in the central portion of the site. From 1950 to 1956, the area was used as a dump site, and from 1956 to 1978, the site was a transfer station for Class II and Class III landfill material. Caltrans acquired the site in 1974 for the location of the Long Beach freeway and the proposed Century freeway (105). In 1983, excavation of approximately two thirds of the landfill material was completed, removing approximately 200,000 cubic yards from the western and eastern ends of the site. During the excavation of the central area soil samples indicated the presence of metals and solvents near USTs. The online ENVIROSTOR database states that the site was issued a clean-up status of "Certified" as of February 19, 1988. The online GeoTracker database lists the cleanup status as "Completed - Case Closed" as of June 3, 2013. The potential contaminants of concern are listed as acetone, lead, petroleum, and VOCs, with potential to impact "other groundwater (uses other |

|---|---|---|--------------|--|
| | Alternative 5C | Alternative 7 | | |
| | | | | than drinking water) and soil.” Based on the proximity to the ISA Study Area, contamination may exist and be encountered near this property during construction and/or excavation activities. |
| Adjacent to the east of the study area, at the southeast corner of Garfield Ave. and Southern Ave | East of Parcel Nos. 15232, 71528, 71527 | East of Parcel Nos. 15232, 71528, 71527 | 15 FIRESTONE | This address was identified in the EDR Report as Greater LA County Vector Control District (GLAVCD) (EDR ID No. 969) in the CA HAZNET, CA LOS ANGELES CO. HMS, LUST database; and as District HQ (EDR ID No. 969) in the CA HIST UST and CA SWEEPS UST database. According to the LUST database, a gasoline release affected soil at this site in 2000. The LUST case status is listed as “Completed - Case Closed” as of July 17, 2013. The GeoTracker database reports that 116 tons of soil was excavated on February 29, 2000. The RWQCB granted a Closure/No Further Action letter on July 17, 2013, but the closure package available online is for the incorrect address. Although the regulatory status is considered closed, based on the lack of information available online, a file is required to evaluate potential impacts from this property. |
| Adjacent to the east of the study area, at the southeast corner of Garfield Ave. and Southern Ave | East of Parcel Nos. 15232, 71528, 71527 | East of Parcel Nos. 15232, 71528, 71527 | 15 FIRESTONE | This address was identified in the EDR Report as LA CO SAN DIST: SOUTH GATE (EDR ID No. 969) in the CA UST, FINDS, CA LOS ANGELES CO. HMS, CA AST, CA WDS, CA NPDES, CA HIST UST, CA CDL, CA HAZNET, CA SWEEPS UST, LUST and SWF/LF databases. The SWF/LF database reports that this property is a permitted large volume transfer/processing facility that accepts construction/demolition, industrial, inert, and mixed municipal wastes. The facility is inspected monthly by the County of Los Angeles. According to the CalRecycle Solid Waste Information System (SWIS) database online, the most recent inspection was performed on March 30, 2016, and no violations or areas of concern were reported. The LUST database reports that a diesel release affected this site in 1998. The potential media affected is “under investigation.” The cleanup status is listed as “Completed-Case Closed” as of January 7, 2015. The lead agency is the SWRCB. According to the UST Case Closure letter on the online GeoTracker database. The site is an active fueling facility. The release at the site was discovered during a subsurface soil investigation in May 1998. Petroleum |

| Location | Impact | | Sub-Area | Description |
|---|--------------------------|--------------------------|--------------|--|
| | Alternative 5C | Alternative 7 | | |
| | | | | constituents were detected in the vicinity of the diesel dispenser at three feet bgs. During subsurface investigation at the site in October 1998, ten soil borings were advanced to depths between five and 50 feet bgs. Petroleum constituents were detected between two and four feet bgs. Groundwater was encountered in one boring at 43 feet bgs. One groundwater grab sample was analyzed and indicated that groundwater at the site had not been affected by the release. In July 1999, the diesel dispenser and three underground storage tanks (USTs) were removed from the site, and two of the USTs were replaced. Petroleum constituents detected in the vicinity of the USTs were very low, below Policy criteria. The nearest public supply well is greater than 1,000 feet from the site. A concrete-lined channel is located less than 250 feet from the site. Additional corrective action would not likely change the conceptual site model. Any remaining petroleum constituents pose a low risk to human health, safety, and the environment. The site received a site closure letter of No Further Action on January 7, 2015. Based on the regulatory agency closure status, these listings are not expected to have created an environmental concern to the ISA Study Area. |
| Adjacent to the west of the Union Pacific Railroad (UPRR) tracks, north of Southern Ave., and east of Rayo Ave. | East of Parcel No. 15108 | East of Parcel No. 15108 | 15 FIRESTONE | This address was identified in the EDR Report as Best Tape Inc DBA Seam Master Ind (EDR ID No. 944) in the CA HAZNET database; as Seam Master Industries (EDR ID No. 944) in the FINDS, CA LOS ANGELES CO. HMS, CA WDS, CA NPDES, CA Cortese, CA HAZNET, and CA ENVIROSTOR databases; as Southern Ave. Industrial Area (EDR ID No. 944) in the NPL and CERCLIS database. The CERCLIS database reports that a "Combined Preliminary Assessment/Site Inspection" was completed on January 17, 2006, and as a result the property was assigned a "higher priority for further assessment." The ENVIROSTOR database indicate that this property is in the Voluntary Cleanup Program and the status is "active" as of September 13, 2014. The lead agency is the US EPA. The online ENVIRSTOR database reports that a screw manufacturer operated on the site prior to 1972 and since 1972, the site has been used for the manufacture of hot-melt adhesive tape used for carpets. Observed releases of TCE and cis-1,2-DCE to groundwater |

| Location | Impact | | Sub-Area | Description |
|----------|----------------|---------------|----------|--|
| | Alternative 5C | Alternative 7 | | |
| | | | | <p>and soils has been documented. Three main Areas of Concern (AOCs) at this property include concrete liners in the northwest corner of the property, a sump in the southeast corner of the property, and a UST in the southeastern corner of the property. Since 1986, several notices of violations (NOVs) have been issued by LA County Health Services mostly for improper storage/management of hazardous waste, leaky hazardous waste containers, ponding of cutting oil on the ground, and not disposing of retrograde and unusable oils and solvents. Several environmental investigations conducted at the site included groundwater, drum, and soil sampling. In groundwater, TCE and cis-1,2-DCE were detected in groundwater at concentrations up to 16,000 ug/L and 17,000 ug/L, respectively. Drum and floor samples from a storage shed indicated the presence of several metals (cadmium up to ten milligrams per kilogram (mg/kg); total chromium up to 2,800 mg/kg; copper up to 7,000 mg/kg; lead up to 1,500 mg/kg, and zinc up to 8,400 mg/kg). Soil samples indicated the presence of 20 VOCs. The highest soil concentrations were detected in samples collected immediately down-gradient of the sump. Depth to groundwater and flow direction were not available online. A Consent Order with the DTSC was completed on January 24, 2010. On January 18, 2011, the DTSC referred the US EPA to assume lead oversight responsibilities. A Remedial Investigation Report is due in 2016; no information was available for review. Therefore, a file review is required to evaluate potential impacts from this property. Based on the proximity to the ISA Study Area, contamination may exist and be encountered near this property during construction and/or excavation activities.</p> |

| Adjacent to the study area, northwest of the intersection of Firestone Blvd. and Garfield Ave. | South of Parcel No. 81522 | Included in the design for Alt. 7 (Parcel No. 15356) | 15 FIRESTONE | <p>This address was identified in the EDR Report as COX Petroleum Transport (EDR ID No. 656) in the CA EMI database; as the Distribution Terminal (EDR ID No. 656) in the CA CHMIRS database; as ARCO Vinvale Terminal (EDR ID No. 656) in the FINDS, CA EMI, CA LUST, CA HAZNET, CA ENF, CA WDS, CA UST, CA SLIC, and CA HIST CORTESE database; as Tesoro Vinvale Terminal (EDR ID No. 656) in the TRIS, CA NPDES, CA SLIC, CA SWEEPS UST, CA LOS ANGELES CO. HMS, and CA EMI database; and as BP West Coast Products, ARCO Vinvale (EDR ID No. 656) in the CA EMI database. According to the CERCLIS database, this facility is not listed on the NPL list and, on December 21, 1988, no further remedial action was planned (NFRAP) for the facility. RCRA violations were issued to the facility in 2007, which subsequently achieved compliance. The lead agency for the SLIC and LUST cases is the RWQCB. The online GeoTracker database reports the 35-acre site operated as a refinery under the ownership of Rio Grande Oil Company from approximately 1923 to 1957. In 1957, all of the refining equipment was removed to accommodate the construction of I-710 freeway. The site was operated as a storage and distribution facility for Richfield's Watson Refinery until 1977. In 1977, the facility was upgraded to its current configuration and has operated as a fuel storage and distribution terminal since then. The SLIC cleanup status is reported as "Open – Remediation as of June 30, 2002." Subsurface investigations at the site began in 1987. Over 160 groundwater monitoring wells have been installed at this site and in the surrounding area. Ongoing quarterly groundwater monitoring and remediation is being performed including SVE and fluid recovery of separate-phase hydrocarbon (SPH) under the supervision of the RWQCB. Since the inception of remediation in May 1994, an estimated 1,568,347 gallons of petroleum hydrocarbons have been removed from beneath the site. Based on the information reviewed online, it appears that additional remediation and site assessment activities are required at this property. Therefore, this property represents an environmental concern to the ISA Study Area. Based on the proximity to the ISA Study Area,</p> |

|---|---|---|--------------|--|
| | Alternative 5C | Alternative 7 | | |
| | | | | contamination may exist and be encountered near this property during construction and/or excavation activities. |
| Adjacent to the west of the study area at the northeast corner of Firestone Blvd. and Rayo Ave. | West of Parcel No. 41540, North of Parcel No. 15124 | West of Parcel No. 41540, North of Parcel No. 15124 | 15 FIRESTONE | <p>This address was identified as Shultz Steel Company (EDR ID No. 693) in the RCRA-SQG, CA WDS, CA NPDES, CA HIST UST, CA UST, TRIS, FINDS, CA HAZNET, US AIRS, CA RGA LUST, CA SWEEPS UST, CA LOS ANGELES. HMS, CA EMI, CA ENVIROSTOR, and CA LUST database. According to the LUST database, a gasoline release affected soil at this property in 1999. The LUST cleanup status is listed as "Completed - Case Closed" as of September 7, 2011. The GeoTracker database reports that the Shultz Steel Company is an operating steel and machine products business that process aluminum, stainless steel, titanium and nickel-based alloys. The site encompasses several addresses with a total of seven buildings on 23 acres of land. The site formerly contained one 10,000-gallon gasoline and one 10,000-gallon diesel underground storage tanks and two fuel dispensers which were removed in 1998. The gasoline UST was relocated to a new location on the property. In 2000, one 10,000-gallon gasoline UST located at the southeastern portion of the parking lot was removed. In 2004, one 10,000-gallon diesel UST located at the eastern end of the Resiner Way cul-de-sac was removed. In 1998, soil sampling was reportedly conducted during the UST removal. Soil samples collected to a maximum of 30 feet bgs indicated maximum concentrations of 80 mg/kg TPHg (15 feet bgs), 0.015 mg/kg benzene (15 feet bgs) and 4.2 mg/kg MTBE (15 feet bgs). In April 2000, additional soil borings were taken near the former UST. Soil samples collected indicated that maximum concentrations of 400 mg/kg TPH (10 feet bgs) and 0.41 mg/kg MTBE (20 feet bgs). In December 2000, one 10,000-gallon gasoline UST and associated piping were excavated. Additional soil samples were taken from the excavation area to a maximum depth of 16.5 feet bgs. soil samples collected indicated maximum concentrations of 5,000 mg/kg TPHg (3 feet bgs), 26 mg/kg benzene (3 feet bgs) and 77 mg/kg MTBE (5 feet bgs). The excavation was backfilled with previously excavated sandy and clayey soil along with clean imported soil. Approximately 320 tons of fuel</p> |

| Location | Impact | | Sub-Area | Description |
|--|---------------------------|---------------------------|------------|---|
| | Alternative 5C | Alternative 7 | | |
| | | | | contaminated soil was removed from site. In April 2004, the 10,000-gallon diesel UST was excavated and soil samples were taken at the excavation area to a maximum depth of 15 feet bgs. Soil samples collected indicated maximum concentrations of 1,200 mg/kg of TRPH and 280 mg/kg TPHd. Between November and December 2009, soil borings were drilled in all former UST areas between 31.5 and 96.5 feet bgs. Soil samples were collected to a maximum depth of 71.5 feet bgs. Six of the soil borings were converted to monitoring wells. During the December 2009 site assessment, analysis of groundwater samples identified up to 17 ug/L of 1,1 DCA, and 13 ug/L of 1,1 DCE. TPHg, BTEX, MTBE and TBA were not detected in the groundwater. Depth to groundwater was measured at about 50 feet bgs and flow direction varied toward the southwest, northeast, and southeast. The residual VOC plume is currently under the investigation by the DTSC. The RWQCB granted a closure letter of "No Further Action" on September 7, 2011. Based on the regulatory agency closure status, these listings are not expected to have created an environmental concern to the ISA Study Area. |
| North of the study area, north of UPRR and Randolph St., east of I-710 | North of Parcel No. 81635 | North of Parcel No. 81635 | 17 SLAUSON | This address was identified in the EDR Report as Southland Oil, Inc. (EDR ID No. 522) in the CA BOND EXP. PLAN, CA CORTESE, CA DEED CA RESPONSE, CA ENVIROSTOR, FINDS, CA ENF, CERCLIS-NFRAP, RCRA-SQG, CA LOS ANGELES CO. HMS, CA WDS, CA HIST Cal-Sites, and CA HAZNET databases; and as A. Ellison Co. (EDR ID No. 522 in the HIST UST database. This property is a former refinery and waste oil recycling facility. Contaminants of concern include heavy petroleum hydrocarbons, PCBs, metals (lead), halogenated hydrocarbons, aromatic and semi volatile compounds. According to the EDR Report, the use of this property has been restricted to commercial/industrial use (deed restriction) and the engineered asphalt/concrete cap and operating SVE system cannot be disturbed without approval. The ENVIROSTOR cleanup status is listed as "Certified - Operations and Maintenance as of August 16, 2002," which appears to be ongoing. The online ENVIROSTOR database reports that in 2015, the SVE system was deactivated to collect soil, soil vapor and groundwater samples, |

| Location | Impact | | Sub-Area | Description |
|---|----------------|---------------------------|------------|--|
| | Alternative 5C | Alternative 7 | | |
| | | | | update site conditions, and investigate the source of certain oily liquid detected in one SVE well. Field operations will restart in Spring 2016. Based on the site's active remediation status, this property represents an environmental concern to the ISA Study Area. Based on the deed restriction in place for this property, approval from the DTSC would be required prior to any construction and/or excavation activities on this parcel. |
| West of the flood control channel at the northwest corner of Alamo Ave. and 59 th Pl., currently part of Maywood Riverfront Park | None | South of Parcel No. 17452 | 17 SLAUSON | This address was identified as W.W. Henry (EDR ID No. NPL REGION) in the SLIC, LUST and Cortese databases. According to the LUST database, a solvents release affected groundwater at this site in 1997 and the case was deferred to SLIC. The GeoTracker database reports that the W.W. Henry site was an industrial site with a long history of manufacturing activities on about two acres and it is adjacent to the larger and more extensively contaminated site, Pemaco (see above), which is under US EPA oversight through its Superfund authority. Both sites, which have been vacant for several years, have been undergoing site assessments to delineate the extents of soil, soil vapor, and groundwater contamination, and are being cleaned up for redevelopment as the Maywood Riverfront Park. The Park has been opened for use by the community since 2005 and was found to be maintained in good condition during a site visit by the RWQCB on June 19, 2008. During construction of the park, engineering controls were used including placing a layer of geo-textile liner over the site and covering the entire property with a foot of certified clean soil. A dual phase extraction (DPE) system (both soil vapor and groundwater) has been operating at the property since 2001. As of March 23, 2010, the dual phase extraction continued to operate and remediate the soils in the vadose zone and contaminated groundwater in the perched zone. The cleanup status is listed as "Open – Remediation as of October 15, 2014." Based on the semi-annual groundwater monitoring report from October 2015, the groundwater flow direction beneath the eastern portion of the site is inferred to be generally toward the south-southwest and was encountered between 105 to 114 feet above mean sea level (amsl) to 115 feet amsl. Chlorinated hydrocarbons, including 1,1-DCE, cis-1,2-DCE, |

| Location | Impact | | Sub-Area | Description |
|---|----------------|---------------------------|------------|--|
| | Alternative 5C | Alternative 7 | | |
| | | | | trans-1,2-DCE, and VC, were detected in a number of perched zone monitoring wells across the site. On the eastern portion of the site, chlorinated hydrocarbons were detected in two wells. Chlorinated compounds detected at these well locations likely represent off-site contamination from the Pemaco Superfund site migrating onto the former W.W. Henry property. On the western portion of the site, chlorinated hydrocarbons were detected in wells two wells. The DPE system is shut down and equipment removal from the site is pending RWQCB approval. Based on the on-going remediation activities and south-southwestern flow of groundwater, this site is not expected to create an environmental concern to the ISA Study Area. |
| West of the flood control channel, south of Slauson Ave. and north of 59 th Pl., currently part of Maywood Riverfront Park | None | South of Parcel No. 17452 | 17 SLAUSON | This address was identified as Pemaco Inc./Pemaco Former Chemical Corporation (EDR ID No. 452) in the FINDS, ICIS, CA UST, CA SWEEPS UST, NPL, CERCIS, US ENG CONTROLS, US INST CONTROL, ROD, CA LOS ANGELES CO. HMS, CA EMI, PRP, CA HIST CAL-SITES, CA CORTESE, CA ENVIROSTOR, CA HIST CORTESE, and CA LUST databases. Based on a drive-by of this property, it is currently occupied by a City park (Maywood Riverfront Park) and an active remediation system was observed within a fenced enclosure in the southern portion of the property. Pemaco is a former chemical mixing facility located in a light industrial and residential area. It is believed that Pemaco began on-site operations in the late 1940s and ended operations at the site on June 21, 1991. Hazardous substances are known to have been used at the facility, including chlorinated solvents, aromatic solvents, and flammable liquids. The site is currently undergoing cleanup of soil vapor and groundwater under the oversight of the EPA. The groundwater treatment system has been operating since April 2007; the vapor portion of the system has been operating since May 2007. According to EPA fact sheets, contaminated groundwater is reportedly located between 25 and 100 feet below surface. At the time the Maywood Riverfront Park was constructed in 2005, a layer of geo-textile liner was placed over the site and a foot of certified clean soil was used to cover the entire property (engineering control). The "source area" with the highest |

| Location | Impact | | Sub-Area | Description |
|--|---|---|-----------------------------------|--|
| | Alternative 5C | Alternative 7 | | |
| | | | | contamination has been fenced off while it is being remediated in the southern portion of the site. Based on the engineering control in place for this property, approval from the EPA would be required prior to any construction and/or excavation activities on this parcel. |
| Adjacent to the east of the study area and I-710, northwest of the intersection of Eastern and Bandini Blvd. | East of Parcel No. 18227, 18228, 18239, 18330 | East of Parcel No. 18227, 18228, 18239, 18330 | 18 ATLANTIC-BANDINI, OPT1A/OPT 1B | Based on a review of the EDR Report and online maps and photographs, it appears that this parcel consists of a large U.S. Government-owned property, which was identified as US Postal Service East Garage (EDR ID No. 364) at 5553 Bandini Blvd in the CA NPDES, CA WDS, CA UST, CA LOS ANGELES CO. HMS, and CA HAZNET databases; and as US Postal Service Bulk Mail (EDR ID No. 364) at 5555 Bandini Blvd in the CA HAZNET, CA RGA LUST, CA HIST UST, FINDS, CA CHMIRS, LUST, CA HIST CORTESE, CA FID UST, and SWEEPS UST databases. The online GeoTracker database reports the LUST status for the US Postal Service Bulk Mail facility at 5555 Bandini Blvd. as "Completed – Case Closed" as of October 19, 1998. The online GeoTracker database reports that the LUST status for the US Postal Service East Garage is "Completed - Case closed as of January 16, 2015." Based on the SWRCB Closure Order from October 2014, The release at the site was discovered when four underground storage tanks (USTs), dispenser, and associated product piping were removed from the site in January 2005. Analytical results indicated concentrations of total petroleum hydrocarbons at 930 milligrams per kilogram in soil at three feet bgs near the former dispenser. A remedial excavation was conducted and impacted soil was excavated and disposed of off-Site. Another sample was collected at four feet bgs and analytical results indicated no significant level of petroleum constituents in the soil. The site is currently operated as a U.S. Postal Service (USPS) sorting facility. Groundwater was not encountered during soil sampling to the maximum depth explored (14 feet bgs). In the area of the site, depth to water is approximately 90 feet bgs. There are not sufficient mobile constituents at the site (leachate, vapors, or light non-aqueous phase liquids [LNAPL]) to cause groundwater to exceed the groundwater criteria for the Policy. The nearest public supply well and surface water body are greater than 1,000 feet |

| | Alternative 5C | Alternative 7 | | |
| West of the study area, southwest corner of Washington Blvd. and Indiana St. | None | None | 18 WASHINGTON, OPT1A/OPT 1B | <p>This address was identified in the EDR Report as Laidlaw Waste Systems (EDR ID No. 199) in the CA HIST CORTESE and CA LUST database; as Sinclair Paint Co (EDR ID No. 199) in the CERCLIS, CORRACTS, RCRA-TSDF, RCRA-SQG, CA HIST UST, CA SWEEPS UST, CA LOS ANGELES CO. HMS, CA ENVIROSTOR, and CA HWP. This property was formerly owned by Sinclair Paint Co. from the late 1940s until 1987 and used as a paint manufacturing facility. In 1987, the property was sold to Laidlaw Waste Systems, Inc. (Laidlaw) for use as a solid waste transfer station until 1997 when all buildings, aboveground tanks (27 total), underground storage tanks (39 total), and piping were removed from the property and it was paved with asphalt. In 1997, Laidlaw changed their name to Allied Waste Systems, Inc., who was acquired by Republic Services (responsible party) in 2008. The property is currently leased by Burlington Northern Santa Fe Company for intermodal container trailer parking. There are currently 14 on-site and six off-site groundwater monitoring wells associated with this property. Three of the groundwater monitoring wells were installed in a deeper saturated zone where depth to water has been gauged at approximately 130 to 137 feet bgs. Groundwater flow in the deep zone is generally to the south. The deep zone groundwater monitoring wells are sampled annually. The remaining groundwater monitoring wells are screened within the shallow saturated zone where depth to water has been gauged between approximately 60 to 90 feet bgs. Groundwater flow in the shallow zone is generally in two directions; from the south end of the site the flow is north, and from the north end the groundwater flows south. The shallow groundwater monitoring wells are gauged and sampled on a semi-annual basis. The primary contaminants of concern (COCs) in soil and shallow groundwater include acetone, benzene, ethylbenzene, isopropyl alcohol, methyl ethyl ketone, toluene, xylenes, and total petroleum hydrocarbons (TPH). In the deep groundwater monitoring wells, COCs include carbon tetrachloride, chloroform, TCE, and TPH. Free product is routinely detected in several of the on-site shallow groundwater monitoring wells and recovered from these wells on a weekly basis. An SVE/biovent system was installed in 1997 and continues to operate.</p> |

|---|---|---|------------|--|
| | Alternative 5C | Alternative 7 | | |
| | | | | According to the online GeoTracker database, the cleanup status is listed as "Open - Assessment & Interim Remedial Action as of May 1, 2015." Based on the site's active remediation status, this property represents an environmental concern to the ISA Study Area. |
| Adjacent to the west of the study area, northwest corner of Eastern Ave. and Triggs St. | Parcel No. 19515, 19517, 19519, 19519 | Parcel No. 19515, 19517, 19519, 19519 | 20 I5-SR60 | This address was identified as National Lighting Supply (EDR ID No. 161) in the RCRA-SQG, FINDS, and CA ENVIROSTOR databases. According to the ENVIROSTOR database, this property was referred to the DTSC by the County of Los Angeles Fire Department on August 3, 1994. The site is contaminated with PCE (100 ppm), PCBs (range to 1-81 ppm), and petroleum hydrocarbons (6400 ppm). The contaminated area is capped; however, there is a potential for groundwater contamination exists at the site because the depth to groundwater is approximately 70 feet bgs. Due the evidence of contamination at the site, the DTSC recommended a PEA. It is unclear whether a PEA was performed. The ENVIRSTOR database lists the site type as "Historical" and the cleanup status as "Inactive – Needs Evaluation as of June 20, 1995." No additional information was available on the ENVIROSTOR database. Based on the lack of information available in the EDR Report and online, a file review is required to evaluate potential impacts from this property. |

Table 3.12-4: Solid Waste Disposal Sites of Potential Concern Under Alternatives 5C and 7

| Parcel ID No. | APN | Location | Acquisition | Site Listing |
|--|--|--|-------------------------------------|--|
| N/A | N/A | Between the I-710 and the Los Angeles River between Anaheim St. to the south and Pacific Coast Hwy. to the north | Full (Within Existing right-of-way) | Public Service Transfer Station No. 1 (EDR ID No. 30-3240) is listed in the CA SWF/LF database. This facility is located between the I-710 and the Los Angeles River, north of Anaheim St. and south of Pacific Coast Hwy. The facility is located on City of Long Beach-owned property and is not associated with an APN because it is within the existing right-of-way. Project parcels are located adjacent to the east of this location. Reportedly, the City of Long Beach has an active limited volume transfer operation for green materials at this location. According to the online California Department of Resources Recycling and Recovery (CalRecycle), Solid Waste Information System (SWIS) database (SWIS No. 19-AA-1047), the facility permit was issued in October 2001 and it is permitted to handle 3,000 tons of green waste per year. The facility is inspected quarterly by the County of Los Angeles and the last inspection was performed on January 28, 2016. No violations or areas of concerns were observed at time of inspection. Past inspection records reported that this facility is not open to the public and is reserved for street cleaning operations. No enforcement action records were reported in the SWIS database. Based on the materials processed, frequent inspections and lack of reported violations or listing in other databases indicating a release, this listing is not expected to have created an environmental concern to the ISA Study Area. |
| 40416 40441 50443 50442 40445 80450 50444 40447 40449 50452 04351 50440 | 7140-014-940 7140-014-939 7140-014-803 7140-014-806 7140-014-942 7140-014-943 7140-014-805 7140-014-910 7140-014-909 7140-014-804 7140-014-028 7140-014-808 | Between the I-710 and the Los Angeles River at the end of W. Carson St. | Partial, TCE | According to the online SWIS database, the exact location of Caltrans Long Beach, West Los Angeles River No. 2 (SWIS No. 19-AK-5002) is unknown, but it is located between the I-710 and the Los Angeles River at the end of W. Carson St. This facility was not identified in the EDR Report. This location is a closed solid waste disposal site that was operated by Caltrans and the regulatory status is reported as "unpermitted." It is inspected annually by the County of Los Angeles and most recent inspection was performed on January 28, 2016. The inspection report notes that the exact location is unknown and no new information has been obtained, but that the general surveyed area appeared to be maintained in satisfactory condition. No violations or areas of concern were noted at the time of the inspection. Based on the former use of this area, there is potential for waste materials to exist which may be encountered during construction and/or excavation activities and therefore, this area is considered to have high risk waste issues. |

| Parcel ID No. | APN | Location | Acquisition | Site Listing |
|----------------|------------------------------|---|---------------------------------|--|
| 12220 12221 | 7101-013-037 7101-013-041 | 6300 Alondra Blvd. Paramount, CA | TCE | J. Ruillo (EDR ID No. 20-1748) is listed in the SWF/LF database. According to the online SWIS database, J. Ruillo (SWIS No. 19-AA-5203) consisted of three parcels located east of the I-710 and the Los Angeles River, south of Alondra Blvd. This closed municipal solid waste disposal site ceased operations on July 25, 1969, and the regulatory status is reported as "pre-regulations." This former landfill has been redeveloped with a Home Depot retail store (6400 Alondra Blvd.). It is inspected annually by the County of Los Angeles and most recent inspection report available online was dated April 28, 2015. This report states "Site is currently an operating Home Depot. There are asphalted parking lot areas all around the store with occasional planter strips throughout. No signs of vegetative distress were observed. All parking lot and sidewalk areas were clean and in good repair. No signs of differential settlement were observed. No Solid Waste code violations were observed at the time of inspection." No enforcement action records were reported in the SWIS database. No further information was available in the SWIS database. No project improvements would be included in this area as it would only be used for a temporary construction easement and therefore this former solid waste disposal site is not expected to have created an environmental concern to Alternatives 5C and 7. |
| N/A | N/A | West side of I-710 at the end of San Carlos St. | Adjacent | San Carlos Dump (EDR ID No. 196-10, 13) was identified in the SWF/LF database. According to the online SWIS database, the San Carlos Dump (SWIS No. 19-AA-5340) is located on the west side of I-710 at the end of San Carlos St. The regulatory status of this closed solid waste disposal site is reported as "pre-regulations." It is inspected annually by the County of Los Angeles and the most recent inspection report available online was dated December 14, 2009. The inspection report states "cul-de-sac clean & in good order. No litter, differential settlement, nor distressed vegetation observed on/along freeway on ramp." No solid waste code violations were noted at the time of the inspection. No enforcement action records were reported in the SWIS database. No project improvements would be included in this area and therefore this former solid waste disposal site is not expected to have created an environmental concern to Alternatives 5C and 7. |
| N/A | N/A | East end Courtland Ave. at I-710 Lynwood, CA | Within Existing right-of-way | Courtland Ave. Dump (EDR ID No. 16-1274) was identified in the SWF/LF database. This property is located at the end of Courtland Ave, adjacent to the west of I-710. This property is State-owned and it does not appear to be associated with an APN because it is within the existing right-of-way. According to the SWF/LF database, the owner is Caltrans and the operator's status is listed as "closed." This property is a closed solid waste disposal site and the regulatory status is listed as "pre-regulations." According to the online SWIS database, this property (SWIS No. 19-AA-5291) was inspected in 2006-2009. The September 24, 2009, inspection report notes that the property was being used as a construction yard and what appeared to be large piles of asphaltic debris that was being actively ground/crushed were observed on-site. A concern was noted that ground material was drifting against, and in places partially burying, the support pillars for the transition ramps between the southbound I-710 and the westbound I-105. The most recent inspection report available |

I-710 Corridor Project RDEIR/SDEIS

| Parcel ID No. | APN | Location | Acquisition | Site Listing |
|--|--|--|--------------|---|
| | | | | online was dated December 10, 2015, and noted that "... currently an empty site underneath and adjacent to the southeast quadrant of the interchange between the I-710 and 105 freeways...few piles of dirt still left from previous use as a contractor laydown yard." No solid waste code violations were noted at the time of inspection. No project improvements would be included in this area and therefore this former solid waste disposal site is not expected to have created an environmental concern to Alternatives 5C and 7. |
| 41430 41431 41432 41433 41434 41435 41436 41439 41440 41441 | 6233-032-902 6233-032-901 6233-032-010 6233-037-901 6233-028-026 6233-028-019 6233-028-005 6233-028-900 6233-037-900 6233-001-011 | Long Beach Fwy at Los Angeles River South Gate, CA | Partial, TCE | According to the online SWIS database, Caltrans – South Gate No. 2 (SWIS No. 19-AA-5068) is located north of Imperial Hwy. and east of the north bound I-710 freeway entrance. The area is a vacant lot, undeveloped and fenced off. The Rio Hondo River bike trail is located adjacent to the east. The project parcels in this area include Parcel Nos. 41430 through 41436 and 41439 through 41441. This facility was not identified in the EDR Report. The site was used as a landfill from the 1950s to receive street and highway sweepings, cardboard, wood and paper totaling 31,000 cubic yards of materials. The landfill stopped receiving waste in 1972. The regulatory status of this closed solid waste disposal site is reported as "permitted." It is inspected annually by the County of Los Angeles and the most recent inspection report available online was dated November 10, 2014. The inspection report states "routine inspection for 2014 was conducted. No changes in land use were observed. No significant differential settlement was observed at the time of inspection." No enforcement action records were reported in the SWIS database. Based on the former use of this area, there is potential for waste materials to exist which may be encountered during construction and/or excavation activities and therefore, this area is considered to have high risk waste issues. |
| 15245 15268 | 6233-002-900 6233-002-901 | 10200 Miller Way South Gate, CA | Partial, TCE | South Gate Solid Fill (EDR ID No. 16-1032) was identified in the SWF/LF database at 10200 Miller Way. The project parcels in this area include Parcel Nos. 15245 and 15268. South Gate Solid Fill (SWIS No. 19-AA-0042) is a closed solid waste disposal site owned by the City of South Gate. Reportedly, this property was a former inert waste disposal site. Regulatory status of the former disposal facility is reported as "to be determined." The facility is inspected annually by the County of Los Angeles and the most recent inspection report available online was dated March 30, 2015. The following observations were reported "Permission to inspect granted by George Garrido, the owner of GWS Composting (the business operating on top of this closed landfill). No areas of differential settlement were observed. No evidence of vegetative distress seen. Watering protocols for the composting operation were conservative enough not to result in excess water ponding or infiltrating the cap of the landfill. No Solid Waste code violations were observed at the time of inspection." Based on the former use of this area, there is potential for waste materials to exist which may be encountered during construction and/or excavation activities and therefore, this area is considered to have high risk waste issues. |

| Parcel ID No. | APN | Location | Acquisition | Site Listing |
|-------------------------|--|---|--------------|---|
| 15245 15268 | 6233-002-900 6233-002-901 | 10120 Miller Way South Gate, CA | Partial, TCE | GWS, Inc. (EDR ID No. 16-1032) was identified in the SWF/LF database. This address was also identified as Miller Way Solid Landfill (EDR ID No. 16-1032) in the CA WDS database for a general water discharge permit of storm water runoff. The project parcels in this area include Parcel Nos. 15245 and 15268. These parcels are owned by the City of South Gate and leased to GWS, Inc. for use as an active composting operation for green waste. According to the online SWIS database (SWIS No. 19-AA-1064), the facility permit was issued in August 2004 and it is permitted to handle a maximum of 12,500 cubic yards of green waste per year or 200 tons per day. The facility is inspected quarterly by the County of Los Angeles and the last inspection was performed on July 22, 2015. No Solid Waste code violations were observed at the time of inspection. No enforcement action records were reported in the SWIS database. Based on the use of this area, there is potential for waste materials to exist which may be encountered during construction and/or excavation activities and therefore, this area is considered to have high risk waste issues. |
| 71514 15116 15115 | 6222-001-916 6222-001-020 6222-001-021 | 5466 Southern Ave. South Gate, CA | Full | Southeastern Disposal and By-Products (EDR ID No. 11-969) was identified at 5466 Southern Ave. in the SWF/LF and WMDUS/SWAT databases. According to the online SWIS database (SWIS No. 19-AA-5545), the former landfill is enclosed by a locked gate and bounded on the east by I-710, on the north and west by utility rights-of-way and the south by a mobile home park. It is also noted that the present use of the former landfill is "partly freeway, partly vacant land," and that it is possibly the location of the former AV Hohn Dump (database states "see A.V. Hohn [AA-19-5103] for which there is no listing). According to the EDR Report, the address was identified as Hohn, A.V. (EDR ID No. 11-969) in the WMDUS/SWAT database. The owner of the property is the City of South Gate and the operator's status is listed as "closed." The regulatory status of this a former solid waste disposal site is reported as "unpermitted" and it reportedly ceased operations in December 1949. Cleanup of the former landfill and contaminated soils was completed in 1984, which effectively mitigated waste constituents, and was approved by the State Department of Health Services. DHS concluded in a February 1986 Preliminary Assessment Summary that this site would remain active in status until a 1990 assessment report of surface and groundwater characteristics was completed. It is unknown if this report was completed (this site is not listed on GeoTracker or ENVIROSTOR). Annual inspections of this parcel are performed by the County of Los Angeles. The most recent inspection report available online was dated December 14, 2015, and no violations or areas of concern were reported. This inspection report states, "ground cover is dirt and native vegetation. There is no activity on the site which could be observed in plain view through the fence." Based on the former landfill use of this property, there is potential for waste materials to exist which may be encountered during construction and/or excavation activities and therefore this parcel is considered to have high risk waste issues. |

I-710 Corridor Project RDEIR/SDEIS

| Parcel ID No. | APN | Location | Acquisition | Site Listing |
|---------------|--------------|--|-------------|--|
| 51518 | 6222-001-801 | Long Beach Fwy and Firestone Blvd. South Gate, CA | TCE | According to the online SWIS database, Caltrans South Gate (SWIS No. 19-AA-5067) is located north of Firestone Blvd. between I-710 and the Los Angeles River. However, the database also states that the parcel number for this facility was confirmed in 2014 to be 6222-001-801 which is located south of Firestone Blvd. This facility was not identified in the EDR Report. The online SWIS database reports that this facility is a closed solid waste disposal site (formerly operated by the State of California) and the regulatory status is listed as "pre-regulations." This land is currently owned by SCE for use as a utility corridor, and annual inspections are performed by the County of Los Angeles. The most recent inspection was completed on February 5, 2016, and no violations or area of concern were reported. The inspection report indicates that the site was inaccessible due to perimeter fence and locked gates at the time of the inspection. A 2009 inspection report identifies SWIS No. 19-AA-5067 as "Caltrans, South Gate No. 1" located at 5212 E. Imperial Hwy., southeast of the northbound I-710 off-ramp and north of Imperial Hwy.; however, no sites were identified at this location in the mapping feature in the online SWIS database. The 2007 and 2008 inspection reports indicate that Caltrans, South Gate No. 1 was a formerly a landfill for street and highway sweepings that operated from 1955 until 1972 and at the time of the inspections was an unpaved dirt land used as a nursery and composting site. No project improvements would be included in this area as it would only be used for a temporary construction easement and therefore this former solid waste disposal site is not expected to have created an environmental concern to Alternatives 5C and 7. |

3.13 AIR QUALITY

The information in this section is based on the following document:

- *Air Quality, Greenhouse Gas, and Health Risk Assessment* (AQ/GHG/HRA) Technical Study (June 2017)
- *Addendum to the Air Quality, Greenhouse Gas, and Health Risk Assessment Technical Study* (December 2020)

Given the existing air quality/health risk concerns in the Interstate 710 (I-710) Corridor (see discussion of the project need in Chapter 1.0), the Los Angeles County Metropolitan Transportation Authority (Metro), the California Department of Transportation (Caltrans), and the I-710 Funding Partners conducted special analyses beyond the standard Caltrans analyses typically done for roadway/freeway projects (as described in Caltrans' *Standard Environmental Reference* at www.dot.ca.gov/ser/vol1/sec3/physical/ch11air/chap11.htm). These additional special project analyses over and above the standard analyses done for freeway projects were conducted because of the unique goods movement component of the build alternatives and the air quality purpose of the project.

The I-710 Corridor Project's effects on air quality were evaluated for three different geographic areas: (1) the South Coast Air Basin (Basin), (2) the I-710 "Area of Interest" (AOI), which is a sub-region of the Basin that includes cities and communities along the I-710 freeway, and (3) the I-710 freeway corridor, which may include a freight corridor and related ramps, depending on the project alternative.

3.13.1 REGULATORY SETTING

The Federal Clean Air Act (FCAA) of 1970 (42 United States Code [USC] 7401 et seq.), as amended, is the primary Federal law that governs air quality while the California Clean Air Act is its companion State law. These laws, and related regulations by the U.S. Environmental Protection Agency (EPA) and California Air Resources Board (ARB), set standards for the concentration of pollutants in the air. At the Federal level, these standards are called National Ambient Air Quality Standards (NAAQS). NAAQS and State ambient air quality standards have been established for six transportation-related criteria pollutants that have been linked to potential health concerns: carbon monoxide (CO), nitrogen dioxide (NO₂), ozone (O₃), particulate matter (PM) which is broken down for regulatory purposes into particles of 10 micrometers or smaller (PM₁₀) and particles of 2.5 micrometers and smaller (PM_{2.5}), and sulfur dioxide (SO₂). In addition, national and State standards exist for lead (Pb), and State standards exist for visibility-reducing particles, sulfates, hydrogen sulfide (H₂S), and vinyl chloride. The NAAQS and State standards are set at levels that protect public health with a margin of safety and are subject to periodic review and revision. Both State and Federal regulatory schemes also cover toxic air contaminants (air

toxics); some criteria pollutants are also air toxics or may include certain air toxics in their general definition.

Federal air quality standards and regulations provide the basic scheme for project-level air quality analysis under the National Environmental Policy Act (NEPA). In addition to this environmental analysis, a parallel “Conformity” requirement under the FCAA also applies.

3.13.1.1 CONFORMITY

The conformity requirement is based on FCAA Section 176(c), which prohibits the U.S. Department of Transportation (USDOT) and other Federal agencies from funding, authorizing, or approving plans, programs, or projects that do not conform to the State Implementation Plan (SIP) for attaining the NAAQS. “Transportation Conformity” applies to highway and transit projects and takes place on two levels: the regional—or planning and programming—level and the project level. The proposed project must conform at both levels to be approved.

Conformity requirements apply only in nonattainment and “maintenance” (former nonattainment) areas for the NAAQS, and only for the specific NAAQS that are or were violated. EPA regulations at 40 Code of Federal Regulations (CFR) 93 govern the conformity process. Conformity requirements do not apply in unclassifiable/attainment areas for NAAQS and do not apply at all for State standards regardless of the status of the area.

Regional conformity is concerned with how well the regional transportation system supports plans for attaining the NAAQS for CO, NO₂, O₃, particulate matter (PM₁₀ and PM_{2.5}), and in some areas (although not in California), SO₂. California has nonattainment or maintenance areas for all of these transportation-related “criteria pollutants” except SO₂, and also has a nonattainment area for Pb; however, Pb is not currently required by the FCAA to be covered in transportation conformity analysis. Regional conformity is based on emission analysis of Regional Transportation Plans (RTPs) and Federal Transportation Improvement Programs (FTIPs) that include all transportation projects planned for a region over a period of at least 20 years (for the RTP), and 4 years (for the FTIP). RTP and FTIP conformity uses travel demand and emission models to determine whether or not the implementation of those projects would conform to emission budgets or other tests at various analysis years showing that requirements of the Clean Air Act and the SIP are met. If the conformity analysis is successful, the Metropolitan Planning Organization (MPO), the Federal Highway Administration (FHWA), and the Federal Transit Administration (FTA), make determinations that the RTP and FTIP are in conformity with the SIP for achieving the goals of the FCAA. Otherwise, the projects in the RTP and/or FTIP must be modified until conformity is attained. If the design concept and scope and the “open-to-traffic” schedule of a proposed transportation project are the same as described in the RTP and FTIP, then the proposed project meets regional conformity requirements for purposes of project-level analysis.

Project-level conformity is achieved by demonstrating that the project comes from a conforming RTP and FTIP; the project has a design concept and scope¹ that has not changed significantly from those in the RTP and FTIP; project analyses have used the latest planning assumptions and EPA-approved emissions models; and in PM areas, the project complies with any control measures in the SIP. Furthermore, additional analyses (known as hot-spot analyses) may be required for projects located in CO and PM nonattainment or maintenance areas to examine localized air quality impacts.

3.13.2 AFFECTED ENVIRONMENT

3.13.2.1 CLIMATIC CONDITIONS

The project site is in Los Angeles County, an area within the South Coast Air Basin (Basin), which includes Orange County and the non-desert parts of Los Angeles, Riverside, and San Bernardino Counties. Air quality regulation in the Basin is administered by the South Coast Air Quality Management District (SCAQMD).

The Basin climate is determined by its terrain and geographical location. The Basin is a coastal plain with connecting broad valleys and low hills. The Pacific Ocean forms the southwestern boundary of the Basin, and high mountains surround the rest of the Basin. The region lies in the semi-permanent high-pressure zone of the eastern Pacific Ocean. The resulting climate is mild and tempered by cool ocean breezes. This climatological pattern is rarely interrupted. However, periods of extremely hot weather, winter storms, and Santa Ana wind conditions do occur in the Basin.

In this area, the period of May through October is warm to hot and dry with average high temperatures of 74–84°F and lows of 58–66°F; however, temperatures frequently exceed 90°F and occasionally reach 100°F in inland areas (away from the moderating effect of the ocean). The period of November through April is mild and somewhat rainy with average high temperatures of 68–73°F and lows of 48–53°F; however, temperatures can occasionally drop to the low 40s or be as high as 80°F for a few days during the winter. The area averages 15 inches of precipitation annually, which mainly occurs during the winter and spring (November through April) with generally light rain showers, but sometimes as heavy rainfall and thunderstorms. The coast gets slightly less rainfall, while the mountains get slightly more.

¹ "Design concept" means the type of facility that is proposed, such as a freeway or arterial highway. "Design scope" refers to those aspects of the project that would clearly affect capacity and thus any regional emissions analysis, such as the number of lanes and the length of the project.

The Basin experiences a persistent temperature inversion (increasing temperature with increasing altitude) as a result of the Pacific high. This inversion limits the vertical dispersion of air contaminants, holding them relatively near the ground. As the sun warms the ground and the lower air layer, the temperature of the lower air layer approaches the temperature of the base of the inversion (upper) layer until the inversion layer finally breaks, allowing vertical mixing with the lower layer. This phenomenon is observed from mid-afternoon to late afternoon on hot summer days, when the smog appears to clear up suddenly. Winter inversions frequently break by midmorning.

Winds in the vicinity of the Study Area blow predominantly from the west, south, and southwest, with wind speeds ranging from 0.5 to 8.8 miles per hour (mph). Low average wind speeds together with a persistent temperature inversion limit the vertical dispersion of air pollutants throughout the Basin. Strong, dry, northerly, or northeasterly winds, known as Santa Ana winds, occur during the fall and winter months, dispersing air contaminants. Santa Ana conditions tend to last for several days at a time.

Inversion layers have a substantial role in determining O₃ formation. Ozone and its precursors will mix and react to produce higher concentrations under an inversion. The inversion will also simultaneously trap and hold directly emitted pollutants such as CO. PM₁₀ is both directly emitted and created indirectly in the atmosphere as a result of chemical reactions. Concentration levels are directly related to inversion layers due to the limitation of mixing space.

Surface or radiation inversions are formed when the ground surface becomes cooler than the air above it during the night. The earth's surface goes through a radiative process on clear nights when heat energy is transferred from the ground to a cooler night sky. As the earth's surface cools during the evening hours, the air directly above it also cools, while air higher up remains relatively warm. The inversion is destroyed when heat from the sun warms the ground, which in turn heats the lower layers of air; this heating stimulates the ground-level air to float up through the inversion layer.

The combination of stagnant wind conditions and low inversions produces the greatest concentration of pollutants. On days of no inversion or high wind speeds, ambient air pollutant concentrations are the lowest. During periods of low inversions and low wind speeds, air pollutants generated in urbanized areas are transported predominantly onshore into Riverside and San Bernardino Counties. In the winter, the greatest pollution problems are CO and nitrogen oxide (NO_x) because of extremely low inversions and air stagnation during the night and early morning hours. In the summer, the longer daylight hours and the brighter sunshine combine to cause a reaction between hydrocarbons and NO_x to form photochemical smog.

3.13.2.2 MONITORED AIR QUALITY

The I-710 Corridor Project is in the jurisdiction of the SCAQMD. As shown in Figure 3.13-1, the SCAQMD maintains ambient air quality monitoring stations throughout the Basin. The I-710 Corridor Project Study Area was divided into four representative meteorological zones, each with a representative meteorological station. The closest monitoring stations to the Study Area are the SCAQMD Long Beach North, Long Beach Hudson, Long Beach Signal Hill, Compton, and Los Angeles North Main Street Stations. Table 3.13-1 and Table 3.13-2 provide monitoring data from these stations for 2018, 2019, 2020, 2021, and 2022.

From the ambient air quality data provided in Tables 3.13-1 and 3.13-2, it can be seen that CO, annual NO₂, and SO₂ levels are below the relevant State and Federal standards. Values listed in Tables 3.13-1 and 3.13-2 that are equal to or exceed the NAAQS for the various pollutants are highlighted in bold text. One-hour O₃ levels exceeded the State standard at the Long Beach Signal Hill (2020 and 2022), Compton (2019, 2020, and 2022) and Los Angeles North Main Street (2018, 2020, 2021, and 2022) Stations. Eight-hour O₃ levels exceeded the State and Federal standards at the Long Beach Signal Hill (2020 and 2022), Compton (2019, 2020, 2021, and 2022), and Los Angeles North Main Street (2018, 2019, 2020, 2021, and 2022) Stations. The Federal 24-hour PM_{2.5} standard was exceeded in each of the past five years at the Compton and Los Angeles North Main Street (with the exception of 2022) Stations. The Federal 24-hour PM_{2.5} standard was exceeded at the Long Beach Hudson station in 2018, 2020, and 2021. The State and Federal annual PM_{2.5} standards were also exceeded at the Compton (2018, 2020, 2021, and 2022) and Los Angeles North Main Street (2018, 2020, and 2021) Stations. It should be noted that exceedance of a standard is not necessarily a violation, especially for many Federal standards.

3.13.2.3 CRITERIA POLLUTANT ATTAINMENT/NONATTAINMENT STATUS

The national and California ambient air quality standards (AAQS) for the criteria pollutants are summarized in Table 3.13-3.

Air quality monitoring stations are located throughout the nation and maintained by the local air districts and State air quality regulating agencies. Data collected at permanent monitoring stations are used by the EPA to identify regions as “attainment,” “nonattainment,” or “maintenance,” depending on whether the regions meet the requirements stated in the primary NAAQS. Nonattainment areas are imposed with additional restrictions as required by the EPA. In addition, different classifications of nonattainment, such as marginal, moderate, serious, severe, and extreme, are used to classify each air basin in the State on a pollutant-by-pollutant basis. The classifications are used as a foundation to create air quality management strategies to improve air quality and comply with the NAAQS. Attainment status for each of the criteria pollutants in the Basin is listed in Table 3.13-3.

Note: **Bold text** indicates an exceedance of the Federal standard level (see Table 3.13-3 for full discussion of Federal and State standards).

Note: *Italic text* indicates that data are incomplete due to an insufficient number of days in the data. 90 percent data completeness is required. Invalid data include lost data due to calibrations or other quality assurance procedures. United States Environmental Protection Agency, EPA-454/R-99-005. February 2000. Meteorological Monitoring Guidance for Regulatory Modeling Applications. Website: <https://www3.epa.gov/scram001/guidance/met/mmgrma.pdf> (accessed December 2020).

¹ Data obtained from SCAQMD Historical Data by Year, station numbers 087/AQS ID: 060371103 (Los Angeles North Main Street), 033 (Long Beach Hudson), and 112/AQS ID: 060371302 (Compton). Available at: <https://www.aqmd.gov/home/air-quality/historical-air-quality-data/historical-data-by-year>. January 2024.

² 2018 and 2019 ozone, PM₁₀, and SO₂ concentration data are obtained from Long Beach Hudson air monitoring station. Since this station does not monitor PM_{2.5}, PM_{2.5} data were taken from the South Long Beach Station for 2018 through 2022. The Long Beach Hudson station closed in 2020 due to "unexpected lease terminations and circumstances beyond control of South Coast AQMD". Therefore 2020 through 2022 ozone and SO₂ data are obtained from Long Beach Signal Hill.

³ The Compton Station does not monitor PM₁₀ and SO₂.

µg/m³ = micrograms per cubic meter

EPA = United States Environmental Protection Agency

I-710 = Interstate 710

O₃ = ozone

PM = particulate matter

PM_{2.5} = particulate matter less than 2.5 microns in size

PM₁₀ = particulate matter less than 10 microns in size

ppm = parts per million

SCAQMD = South Coast Air Quality Management District

SO₂ = sulfur dioxide

Table 3.13-3: State and Federal Criteria Air Pollutant Standards, Effects, and Sources

| Pollutant | Averaging Period | California Standard ¹ | Federal Standard ² | Basin Attainment Status ³ | | Principal Health and Atmospheric Effects | Typical Sources |
|---|------------------|------------------------------------|------------------------------------|--------------------------------------|----------------------------------|---|---|
| | | | | California Standard | Federal Standard | | |
| Ozone (O ₃) | 1-hour | 0.09 ppm (180 µg/m ³) | Revoked | Non-Attainment | --- | High concentrations irritate lungs. Long-term exposure may cause lung tissue damage and cancer. Long-term exposure damages plant materials and reduces crop productivity. Precursor organic compounds include many known toxic air contaminants. Biogenic VOC may also contribute. | Low-altitude ozone is almost entirely formed from ROG or VOC and NO _x in the presence of sunlight and heat. Major sources include motor vehicles and other mobile sources, solvent evaporation, and industrial and other combustion processes. |
| | 8-hour | 0.070 ppm (137 µg/m ³) | 0.070 ppm (137 µg/m ³) | Non-Attainment | Designation Pending ⁴ | | |
| Respirable Particulate Matter (PM ₁₀) | 24-hour | 50 µg/m ³ | 150 µg/m ³ | Non-Attainment | Attainment / Maintenance | Irritates eyes and respiratory tract. Decreases lung capacity. Associated with increased cancer and mortality. Contributes to haze and reduced visibility. Includes some toxic air contaminants. Many aerosol and solid compounds are part of PM ₁₀ . | Dust- and fume-producing industrial and agricultural operations; combustion smoke; atmospheric chemical reactions; construction and other dust-producing activities; unpaved road dust and re-entrained paved road dust; natural sources (wind-blown dust, ocean spray). |
| | Annual | 20 µg/m ³ | Revoked | Non-Attainment | --- | | |
| Fine Particulate Matter (PM _{2.5}) | 24-hour | --- | 35 µg/m ³ | --- | Non-Attainment (Serious) | Increases respiratory disease, lung damage, cancer, and premature death. Reduces visibility and produces surface soiling. Most diesel exhaust particulate matter – a toxic air contaminant – is in the PM _{2.5} size range. Many aerosol and solid compounds are part of PM _{2.5} . | Combustion including motor vehicles, other mobile sources, and industrial activities; residential and agricultural burning; also formed through atmospheric chemical (including photochemical) reactions involving other pollutants including NO _x , SO _x , ammonia, and ROG. |
| | Annual | 12 µg/m ³ | 12.0 µg/m ³ | Non-Attainment | Non-Attainment (Serious) | | |
| Carbon Monoxide (CO) | 1-hour | 20 ppm (23 mg/m ³) | 35 ppm (40 mg/m ³) | Attainment | Attainment / Maintenance | CO interferes with the transfer of oxygen to the blood and deprives sensitive tissues of oxygen. CO also is a minor precursor for photochemical O ₃ . | Combustion sources, especially gasoline-powered engines and motor vehicles. CO is the traditional signature pollutant for on-road mobile sources at the local and neighborhood scale. |
| | 8-hour | 9.0 ppm (10 mg/m ³) | 9 ppm (10 mg/m ³) | Attainment | Attainment / Maintenance | | |

| Pollutant | Averaging Period | California Standard ¹ | Federal Standard ² | Basin Attainment Status ³ | | Principal Health and Atmospheric Effects | Typical Sources |
|-------------------------------------|--------------------------------------|-----------------------------------|------------------------------------|--------------------------------------|---------------------------------------|---|--|
| | | | | California Standard | Federal Standard | | |
| Nitrogen Dioxide (NO ₂) | 1-hour | 0.18 ppm (339 µg/m ³) | 0.100 ppm (188 µg/m ³) | Attainment | Unclassifiable / Attainment | Irritating to eyes and respiratory tract. Colors atmosphere reddish-brown. Contributes to acid rain. Part of the "NO _x " group of O ₃ precursors. | Motor vehicles and other mobile sources; refineries; industrial operations. |
| | Annual | 0.030 ppm (57 µg/m ³) | 0.053 ppm (100 µg/m ³) | Attainment | Attainment / Maintenance | | |
| Lead (Pb) | 30-day average | 1.5 µg/m ³ | --- | Attainment ⁵ | --- | Disturbs gastrointestinal system. Causes anemia, kidney disease, and neuromuscular and neurological dysfunction. Also a toxic air contaminant and water pollutant. | Lead-based industrial processes like battery production and smelters. Lead paint, leaded gasoline. Aerially deposited lead from gasoline may exist in soils along major roads. |
| | Rolling 3-month average ⁶ | --- | 0.15 µg/m ³ | --- | Non-Attainment (Partial) ⁷ | | |
| Sulfur Dioxide (SO ₂) | 1-hour | 0.25 ppm (655 µg/m ³) | 0.075 ppm (196 µg/m ³) | Attainment ⁵ | Designation Pending ⁸ | Irritates respiratory tract; injures lung tissue. Can yellow plant leaves. Destructive to marble, iron, steel. Contributes to acid rain. Limits visibility. | Fuel combustion (especially coal and high-sulfur oil), chemical plants, sulfur recovery plants, metal processing; some natural sources like active volcanoes. Limited contribution possible from heavy-duty diesel vehicles if ultra-low sulfur fuel not used. |
| | 3-hour ⁹ | --- | 0.5 ppm (1,300 µg/m ³) | --- | Designation Pending ⁸ | | |
| | 24-hour | 0.04 ppm (105 µg/m ³) | 0.14 ppm | Attainment ⁵ | Undesignated | | |
| Hydrogen Sulfide (H ₂ S) | 1-hour | 0.03 ppm (42 µg/m ³) | --- | Attainment | --- | Colorless, flammable, poisonous. Respiratory irritant. Neurological damage and premature death. Headache, nausea. | Industrial processes such as: refineries and oil fields, asphalt plants, livestock operations, sewage treatment plants, and mines. Some natural sources like volcanic areas and hot springs. |
| Vinyl Chloride | 24-hour | 0.01 ppm (26 µg/m ³) | --- | Attainment | --- | Neurological effects, liver damage, cancer. Also considered a toxic air contaminant. | Industrial processes |

| Pollutant | Averaging Period | California Standard ¹ | Federal Standard ² | Basin Attainment Status ³ | | Principal Health and Atmospheric Effects | Typical Sources |
|-------------------------------|------------------|---|-------------------------------|--------------------------------------|------------------|--|--|
| | | | | California Standard | Federal Standard | | |
| Sulfates | 24-hour | 25 µg/m ³ | --- | Attainment | --- | Premature mortality and respiratory effects. Contributes to acid rain. Some toxic air contaminants attach to sulfate aerosol particles. | Industrial processes, refineries and oil fields, mines, natural sources like volcanic areas, salt-covered dry lakes, and large sulfide rock areas. |
| Visibility-Reducing Particles | --- | Extinction coefficient of 0.23 per kilometer (visibility of ten miles or more due to particles when relative humidity is less than 70%) | --- | Unclassified ⁵ | --- | Reduces visibility. Produces haze. Note: not related to the Regional Haze program under the Federal Clean Air Act, which is oriented primarily toward visibility issues in National Parks and other "Class I" areas. | See particulate matter above. |

Sources: Ramboll-Environ. *I-710 Corridor Air Quality, Greenhouse Gas, and Health Risk Assessment Technical Study* (June 2017); *Addendum to the Air Quality, Greenhouse Gas, and Health Risk Assessment Technical Study* (December 2020).

¹ California standard levels obtained from ARB CAAQS webpage. Website: <http://www.arb.ca.gov/research/aaqs/caaqs/caaqs.htm> (accessed February 2017).

² Federal standard levels obtained from the EPA NAAQS Table. Note that some Federal standards include a level (such as the concentrations shown in the Table) and a form (often a statistical form or based on excluding a certain number of exceedances of the standard level over a given number of years). Exceedances of the standard level are not necessarily violations or exceedances of the standard. Website: <https://www.epa.gov/criteria-air-pollutants/naaqs-table> (accessed February 2017).

³ Attainment status obtained from SCAQMD NAAQS and CAAQS Attainment Status for the South Coast Air Basin. Website: <http://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/naaqs-caaqs-feb2016.pdf?sfvrsn=2> (accessed February 2017).

⁴ The Los Angeles-South Coast nonattainment area was designated as Non-Attainment (Extreme) on June 4, 2018.

⁵ Attainment status obtained from ARB Area Designation Maps. Website: <http://www.arb.ca.gov/desig/adm/adm.htm> (accessed February 2017).

⁶ Final rule signed October 15, 2008. The 1978 lead standard (1.5 µg/m³ as a quarterly average) remains in effect until one year after an area is designated for the 2008 standard, except that in areas designated nonattainment for the 1978, the 1978 standard remains in effect until implementation plans to attain or maintain the 2008 standard are approved.

⁷ According to the ARB website, the Los Angeles County portion of the South Coast Air Basin is designated "Nonattainment" only for near-source monitors. Expect to remain in attainment based on current monitoring data.

⁸ Designation is pending; Unclassifiable/Attainment classification is expected.

⁹ This is a secondary standard. Not to be exceeded more than once per year.

µg/m³ = micrograms per cubic meter

ARB = California Air Resources Board

Basin = South Coast Air Basin

CAAQS = California Ambient Air Quality Standards

EPA = United States Environmental Protection Agency

mg/m³ = milligrams per cubic meter

NAAQS = National Ambient Air Quality Standards

NO_x = oxides of nitrogen

ppm = parts per million

ROG = reactive organic gases

SCAQMD = South Coast Air Quality Management District

SO_x = oxides of sulfur

VOC = volatile organic compounds

3.13.3 ENVIRONMENTAL CONSEQUENCES

The following discussion of environmental consequences only describes the permanent impacts of the project alternatives. Please refer to Section 3.24 of this document, Construction Impacts, for a discussion of the temporary impacts of the build alternatives for each resource area. Specifically, temporary impacts related to air quality are located in Section 3.24.3.13.

3.13.3.1 REGIONAL AIR QUALITY CONFORMITY

A project to reconstruct the I-710 interchanges at Interstate 105 (I-105), State Route 91 (SR-91), Interstate 405 (I-405), and Interstate 5 (I-5) as part of the I-710 Corridor Project was included in the Southern California Association of Governments' (SCAG)-adopted 2023 Federal Transportation Improvement Program (FTIP) (Project ID No. LA0B952, 100 percent prior years). An update to the description of Alternative 5C was included in SCAG's 2020 Connect SoCal (a.k.a. 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy [RTP/SCS]) Amendment No. 3, adopted by SCAG on September 3, 2020. Alternative 5C (RTP ID No. LA0B952) is described as "I-710 Corridor capacity enhancement – add 1 mixed flow lane in each direction between Shoreline Dr. and SR-91 and between I-105 and SR-60; add 2 truck lanes in each direction between Willow St. and Del Amo Blvd.; and improve interchanges between Ocean Blvd. in Long Beach and SR-60 in East Los Angeles." However, since that time, Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), has identified the No Build (Alternative 1) as the Preferred Alternative. Please refer to Section 2.4 of this Final EIR/EIS for more detail. Moving forward, Metro will continue to work with SCAG to ensure that the future modifications to the RTP and FTIP reflect the No Build (Alternative 1) as opposed to Alternative 5C. A general description of the build alternatives is also included in the Metro Final 2009 Long-Range Transportation Plan (LRTP) as a Funded Freeway Improvement.

3.13.3.2 PROJECT LEVEL AIR QUALITY CONFORMITY

Because the I-710 Corridor Study Area is within an attainment/maintenance area for CO and PM₁₀, and a nonattainment area for Federal PM_{2.5} standards, local hot-spot analyses for CO, PM_{2.5}, and PM₁₀ are required for conformity purposes for the build alternatives. The results of the project-level CO analysis are presented in Section 3.13.3.3, Permanent Impacts. A CO hot-spot analysis was provided in Section 3.13.3.3 of the RDEIR/SDEIS, which showed that both build alternatives conform to the State Implementation Plan for attaining the NAAQS and meet project-level CO conformity requirements.

Extensive coordination occurred between Caltrans, Metro, and EPA staff related to the protocol for the particulate matter hot-spot analysis, a component of that project-level conformity analysis. Prior to circulation of the 2012 Draft EIR/EIS, the I-710 Corridor Project was determined to be a Project of Air Quality Concern (POAQC) requiring a PM hot-spot analysis because it was

considered to be: (i) a new or expanded highway project that had a significant number of or significant increase in diesel vehicles, and (ii) a project affecting intersections that are at level of service (LOS) D, E or F with a significant number of diesel vehicles, or those that will change to LOS D, E or F because of increased traffic volumes from a significant number of diesel vehicles related to the build alternatives. This was described in Section 3.13.3.1 of the 2012 Draft EIR/EIS. Some of the build alternatives analyzed in the 2012 Draft EIR/EIS assumed that zero emission/ near zero emission (ZE/NZE) trucks would be commercially deployed and therefore in use in the corridor at the time a build alternative would be constructed; however, at that point in project development, the I-710 Corridor Project did not include a ZE/NZE truck program as a programmatic element. The assumption that the project was a POAQC was carried forward in the RDEIR/SDEIS even considering that the subsidy and deployment of ZE/NZE trucks was included as a programmatic element of Alternatives 5C and 7, which serves as a commitment that ZE/NZE trucks would be deployed in the corridor should a build alternative have been approved and constructed. Because the build alternatives analyzed in the RDEIR/SDEIS included ZE/NZE truck deployment strategies and funding commitments approved by the Metro Board of Directors, it can be reasonably concluded that “a significant number of or significant increase in diesel vehicles” would not occur as a result of the build alternatives. Rather, it can be demonstrated that the number of diesel vehicles operating in the corridor would actually decrease as a direct result of either Alternative 5C or 7. Figure 3.13-2 shows a comparison of diesel truck trips on I-710 in 2035 between the No Build (Alternative 1) and Alternative 5C.

However, since a build alternative has not been identified as the Preferred Alternative, programmatic elements such as I-710 Clean Truck Program will not be implemented by Caltrans as the Lead Agency under CEQA and NEPA and as the owner/operator of the I-710 freeway. Prior to selection of the No Build (Alternative 1) as the Preferred Alternative, the I-710 Clean Truck Program was being further defined to include a proposed governance structure, roles, and responsibilities for program oversight, and provisions related to program enforceability (for more information, see Section 2.3.2.1, Common Features of the Build Alternatives, and Appendix W of this Final EIR/EIS).

3.13.3.3 PERMANENT IMPACTS

CARBON MONOXIDE (CO). The Caltrans *Transportation Project-Level Carbon Monoxide Protocol* (December 1997) (CO Protocol) was used to assess the project’s impact on local CO concentrations. However, through the interagency consultation process², the approach suggested

² The AQ/GHG/HRA protocol, which includes the protocol for CO hotspot analysis, was submitted to the Air Agency Technical Working Group (AATWG), which includes the EPA, on October 12, 2015. Comments were received from the EPA on November 13, 2015.

in the CO Protocol was modified slightly to incorporate the use of the EPA-approved mobile source dispersion model, CAL3QHC, to model representative worst-case congested intersections throughout the project's AOI.

The hot-spot analysis assessed the potential for localized CO impacts due to the project and whether the project alternatives would either cause violation of the CO ambient air quality standards or exacerbate the air quality conditions to delay the progress of meeting attainment of the standard. The one-hour and eight-hour NAAQS for CO are 35 parts per million (ppm) and nine ppm, respectively. The results of the analysis as shown in Table 3.13-4 show that the maximum predicted CO concentrations,³ representative of worst-case conditions, would be below the corresponding NAAQS for all modeled intersections for the 2012 Baseline and all future alternatives. Hence, project-related CO emissions at local intersections would not cause or contribute to any new violations of the NAAQS. Therefore, pursuant to the Federal transportation conformity rule (CFR Chapter 40 Parts 51 and 93), the project alternatives conform to the SIP for attaining the NAAQS and meets project-level CO conformity requirements.

PARTICULATE MATTER (PM_{2.5} AND PM₁₀).

ANALYSIS METHOD. For the RDEIR/SDEIS, a qualitative analysis for PM₁₀ and PM_{2.5} was conducted for the project alternatives, which is not a project-level conformity analysis. This qualitative analysis serves as the PM discussion under NEPA.

For this PM discussion, future localized PM_{2.5} and PM₁₀ pollutant emissions were calculated and 2012/2016 Air Quality Management Plan (AQMP) projections are presented. Additionally, the impacts of the build alternatives on the regional PM_{2.5} and PM₁₀ emissions and incremental PM_{2.5} and PM₁₀ levels [compared to the 2012 Baseline and 2035 No Build (Alternative 1)] are discussed in the Additional Analyses section. Impacts were calculated using EMFAC2014, ARB's methodology for entrained road dust, the projected vehicle trip distribution, and/or dispersion modeling.

TYPES OF EMISSIONS CONSIDERED. Some aspects of the NEPA analysis (not for conformity purposes) were performed according to the EPA's guidance for quantitative PM hot-spot analyses. In accordance with 2015 EPA guidance,⁴ the analysis includes PM exhaust, tire wear, brake wear, and re-entrained road dust emissions. Exhaust, tire wear, and brake wear emissions from on-road vehicles are always included in a project's PM_{2.5} and PM₁₀ analyses.

³ Equal to the highest-modeled concentration plus background.

Notes:

¹ The values in the table are the sum of the highest predicted CO concentrations and background concentration.

² The background values used in the analysis are the highest ambient CO concentrations recorded in the latest three years (2013 to 2015) of monitoring data from local air quality stations and are equal to 5.8 ppm and 3.8 ppm, respectively, for the 1-hour and 8-hour CO averaging periods.

³ Alternative 1 is the Future No Build Alternative.

⁴ Alternative 5C includes a funding program for ZE/NZE heavy-heavy duty trucks that meet certain minimum requirements for travel on the I-710 freeway.

⁵ Alternative 7 requires all trucks on the Freight Corridor to be ZE/NZE

⁶ NAAQS obtained from Environmental Protection Agency NAAQS table. Available at: <https://www.epa.gov/criteria-air-pollutants/naaqs-table>. Accessed: November 2016.

CO = carbon monoxide

I-710 = Interstate 710

N/A = not applicable

NAAQS = National Ambient Air Quality Standards

NZE = near zero emission

ppm = parts per million

SB = southbound

ZE = zero emission

Re-entrained road dust must be included in all PM₁₀ hot-spot analyses. For PM_{2.5}, re-entrained road dust emissions are included only if EPA or the State agency has made a finding that such emissions are a significant contributor to the PM_{2.5} air quality problem.^{5, 6} SCAQMD has identified re-entrained road dust as a significant contributor to the area's PM_{2.5} problem in the Final 2012 AQMP⁷ as well as the Final 2016 AQMP;⁸ therefore, re-entrained PM_{2.5} was included in this analysis.

Secondary particles formed through PM_{2.5} and PM₁₀ precursor emissions from a transportation project take several hours to form in the atmosphere, giving emissions time to disperse beyond the immediate project area of concern for localized analyses. Therefore, PM_{2.5} and PM₁₀ precursors are not considered in PM hot-spot analyses.

DATA CONSIDERED. The closest air monitoring stations to the Study Area are the South Long Beach, Long Beach Hudson, Long Beach North, Compton, and Los Angeles North Main Street Stations. These monitoring stations are located in Los Angeles County within the project's Study Area. Therefore, the air quality concentrations monitored at these stations are representative of the conditions within the Study Area. The locations of the air monitoring stations relative to the project area are shown in Figure 3.13-1.

TRENDS IN BASELINE PM_{2.5} CONCENTRATIONS. The monitored PM_{2.5} concentrations at the North Long Beach, South Long Beach, Compton, and Los Angeles North Main Street Stations are shown in Table 3.13-5. These data show that the Federal 24-hour PM_{2.5} AAQS (35 micrograms per cubic meter [µg/m³]) has been exceeded at the Los Angeles North Main Street Station three times out of the six-year period evaluated (2018, 2020, 2021), Compton Station three times (2017, 2020, and 2021) out of the evaluated six years, the South Long Beach Station one time out of the evaluated six years (2020), and Long Beach North Station one time out of the evaluated six years (2020). In addition, the annual

µg/m³ = micrograms per cubic meter

EPA = United States Environmental Protection Agency

I-710 = Interstate 710

PM = particulate matter

average PM_{2.5} AAQS (12 µg/m³) has been exceeded at the Los Angeles North Main Street Station five times in the evaluated six years (2017, 2018, 2020, 2021, and 2022), five out of the evaluated six years at the Compton Station (2017, 2018, 2020, 2021, and 2022), three out of the evaluated six years at the Long Beach South Station (2020, 2021, and 2022), and once out of the evaluated six years (2020) at Long Beach North Station.

PROJECTED 24-HOUR CONCENTRATIONS. The monitored PM_{2.5} concentrations at the Los Angeles North Main Street, Compton, South Long Beach, and Long Beach North Stations are shown in Table 3.13-5. In the year 2019 and 2022, no stations show exceedances of the 24-hour PM_{2.5} NAAQS. In each 2017 and 2018, only one station shows an exceedance of the 24-hour PM_{2.5} NAAQS (Compton and Los Angeles North Main Street, respectively).

Using various methodologies, the 2012 AQMP estimated the 2015 24-hour $PM_{2.5}$ concentrations. Table V-5-23 in the 2012 AQMP estimates that the 24-hour $PM_{2.5}$ concentration in 2030 will be $26.2 \mu\text{g}/\text{m}^3$ at South Long Beach, $30.3 \mu\text{g}/\text{m}^3$ at Long Beach North, and $31.0 \mu\text{g}/\text{m}^3$ at Los Angeles North Main Street. These estimates predict an 18 percent decrease in 2030 as compared to the 2017-2022 average at South Long Beach, a 0.50 percent increase at Long Beach North, and a 14 percent decrease at Los Angeles North Main Street. All 2030 predictions are below the 24-hour $PM_{2.5}$ NAAQS of $35 \mu\text{g}/\text{m}^3$. The Final 2016 AQMP does not have any predictions for future 24-hour $PM_{2.5}$ concentrations beyond 2019 because it was anticipated that the 24-hour $PM_{2.5}$ standard would be met by the 2019 attainment year with no additional reductions needed beyond already adopted measures. The South Coast Air Basin narrowly failed to attain this standard by December 2019 and approved a $PM_{2.5}$ Plan for the 2006 $PM_{2.5}$ Standard on December 4, 2020.⁹ However, the South Coast Air Basin met the 2006 and 1997 24-Hour $PM_{2.5}$ standards based on ambient monitoring data from 2018-2020 (subject to the U.S. EPA's approval for removal of a 2020 wildfire exceptional event).

The "Final 2021 Redesignation Request and Maintenance Plan for the 2006 and 1997 24-Hour $PM_{2.5}$ Standards for South Coast Air Basin" was adopted on November 5, 2021.¹⁰ As discussed above, this PM analysis is provided for informational purposes, as a quantitative $PM_{10}/PM_{2.5}$ project-level conformity analysis is not required for the No Build (Alternative 1).

PROJECTED ANNUAL CONCENTRATIONS. As seen in Table 3.13-5, the annual $PM_{2.5}$ NAAQS of $12 \mu\text{g}/\text{m}^3$ was exceeded at the Los Angeles North Main Street and Compton Stations in all years except 2019. The annual $PM_{2.5}$ NAAQS was only exceeded in 2020 at the Long Beach North monitoring station and in 2020, 2021, and 2022 the South Long Beach monitoring station.

Table V-6-7 of the 2012 AQMP estimates that in 2030, the annual $PM_{2.5}$ concentration will be $9.5 \mu\text{g}/\text{m}^3$ in South Long Beach, $10.2 \mu\text{g}/\text{m}^3$ in Long Beach North, and $11.4 \mu\text{g}/\text{m}^3$ in Los Angeles North Main Street. Table 5-5 in the Final 2016 AQMP predicts that the annual $PM_{2.5}$ concentrations at Los Angeles North Main Street will be between 10.4 and 10.8

⁹ SCAQMD. 2020. Final Attainment Plan for 2006 24-hour $PM_{2.5}$ Standard. December. Website: <http://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/2022-air-quality-management-plan/2-final-attainment-plan-for-2006-24-hour-pm2-5-standard-for-the-south-coast-air-basin.pdf?sfvrsn=6> (accessed November 16, 2022).

¹⁰ SCAQMD. 2021. Final 2021 Redesignation Request and Maintenance Plan for the 2006 and 1997 24-Hour $PM_{2.5}$ Standards for South Coast Air Basin. October. Website: <http://www.aqmd.gov/docs/default-source/2021-PM-2.5-Redesignation-Request-Maintenance-Plan/2-final-pm2-5-redesignation-request-and-maintenance-plan.pdf?sfvrsn=6> (accessed November 16, 2022).

$\mu\text{g}/\text{m}^3$ in 2025; this value is lower than the prediction of $11.4 \mu\text{g}/\text{m}^3$ in the 2012 AQMP for calendar years 2023 and 2030. The photochemical modeling results in the 2012 AQMP indicate a 23 percent decrease in 2030 from the 2017-2022 average at South Long Beach, a 5.3 percent decrease at Long Beach North, and a 8.4 percent decrease at Los Angeles North Main Street. The Final 2016 AQMP predicts a 15 percent reduction in annual $\text{PM}_{2.5}$ concentrations in 2025 as compared to the 2017-2022 average at Los Angeles North Main Street. All future predictions in the 2012 AQMP and the Final 2016 AQMP are below the NAAQS of $12 \mu\text{g}/\text{m}^3$.

TRENDS IN BASELINE PM_{10} CONCENTRATIONS. The PM_{10} concentrations monitored at the South Long Beach, Long Beach North, Long Beach Hudson, and Los Angeles North Main Street Stations are shown in Table 3.13-6. The 24-hour PM_{10} NAAQS were not exceeded between 2017 and 2022 at any of these stations, with the exception of one exceedance at Long Beach Hudson in 2019. Averages of the first highest PM_{10} concentration measured at the Long Beach Hudson, South Long Beach and the Los Angeles North Main Street Stations across the last six years (2017 to 2022) were $101 \mu\text{g}/\text{m}^3$, $60 \mu\text{g}/\text{m}^3$, and $67 \mu\text{g}/\text{m}^3$, respectively, which are well below the 24-hour PM_{10} NAAQS of $150 \mu\text{g}/\text{m}^3$.

The 2012 AQMP and Final 2016 AQMP do not predict future concentrations of PM_{10} . However, it is expected that PM_{10} concentrations will continue to decrease as $\text{PM}_{2.5}$ emissions are a fraction of PM_{10} .

TRANSPORTATION AND TRAFFIC CONDITIONS. Existing and future (2035) No Build average daily traffic (ADT) volumes and average daily truck volumes for I-710 in the project area are shown in Table 3.13-7. The table indicates that I-710 experiences about 4,000 to 18,000 trucks annual average daily traffic (AADT) in the base year 2012.

TRAFFIC CHANGES DUE TO THE BUILD ALTERNATIVES. The build alternatives are considered a highway expansion. Based on the *Freeway Traffic Operations Analysis Report* (March 2017) and the *Intersection Traffic Impact Analysis Report* (March 2017), the build alternatives would increase the traffic volumes along I-710. The future traffic volumes along I-710 for each of the build alternatives are shown in Table 3.13-8. As shown, the build alternatives would increase the total traffic volume and the number of trucks using I-710.

Table 3.13-9 shows the LOS and delay in the project area for the a.m. and p.m. peak hours at the top ten affected intersections for the 2035 No Build (Alternative 1) and build alternatives (5C and 7). As shown, the I-710 project build alternatives would improve the LOS and reduce the delay at some intersections in the project area while worsening the LOS and increasing the delay at other intersections within the project area.

¹ Alternative 1 is the future No Build Alternative.

² Alternative 5C includes a funding program for 4,000 ZE/NZE heavy-heavy duty trucks that meet certain minimum requirements for travel on the I-710 freeway. 2035 Alternative 5C includes traffic volumes on truck lanes, where applicable.

³ Alternative 7 requires all trucks on the freight corridor to be ZE/NZE. 2035 Alternative 7 includes traffic volumes on the freight corridor, where applicable.

I-405 = Interstate 405

LOS = level of service

SB = southbound

Sec = seconds

DAILY VEHICLE EMISSION CHANGES DUE TO THE PROJECT. The PM_{2.5} and PM₁₀ emissions for the project are presented in Table 3.13-10 and Table 3.13-11, respectively. These emissions were calculated using the I-710 Traffic Model and post-processed traffic data (which incorporates recent traffic count information).

Total PM₁₀ and PM_{2.5} emissions consist of vehicle exhaust emissions, tire wear, brake wear, and entrained road dust emissions. The exhaust portion of PM emissions for all 2035 alternatives decrease as compared to the 2012 Baseline. These reductions are primarily driven by cleaner heavy-duty trucks in 2035 as compared to 2012 resulting from the implementation of ARB's Truck and Bus Regulation¹¹ and the Ports' Clean Trucks Program.^{12, 13} Tire wear and brake wear emission estimates are proportional to vehicle miles traveled (VMT); as a result they increase with increased vehicle activity in 2035 as compared to 2012. As described earlier, entrained road dust emissions were calculated using ARB's emission factors (based on EPA's Compilation of Air Pollution Emission Factors [AP-42]) for entrained road dust from paved roads. This methodology assumes that roadways have an infinite silt reservoir and entrained road dust emissions are directly proportional to VMT. As a result, there is a 21 percent to 77 percent increase in entrained road dust emissions for the 2035 alternatives as compared to the 2012 Baseline. The increase in entrained road dust emissions associated with the modeled I-710 freeway for Alternative 7 as compared to the 2012 Baseline is around 1.9 times greater than that for Alternative 5C as compared to the 2012 Baseline and 2.5 times greater than that for the No Build (Alternative 1) as compared to the 2012 Baseline because of additional ZE/NZE truck traffic associated with the freight corridor in Alternative 7.

Overall, the decrease in exhaust PM_{2.5} emissions for all 2035 alternatives as compared to the 2012 Baseline is greater than the sum of the increases in tire wear, brake wear, and entrained road dust emissions. As a result, total PM_{2.5} emissions show decreases for the 2035 alternatives when compared to the 2012 Baseline for all I-710 Corridor Project study areas (Table 3.13-10). In the case of PM₁₀ emissions, the increases in entrained road dust, tire wear, and brake wear far outweigh the decrease in exhaust PM₁₀. Therefore, total PM₁₀ emissions increase for all the 2035 alternatives when compared to the 2012 Baseline (Table 3.13-11).

¹ Emissions based on the I-710 Traffic Model output. The I-710 Traffic Model is a refined version of the SCAG Regional Transportation Plan Travel Demand Model.

² Alternative 1 is the future No Build Alternative.

³ Alternative 5C includes a funding program for ZE/NZE heavy-heavy duty trucks that meet certain minimum requirements for travel on the I- 710 freeway.

⁴ Alternative 7 requires all trucks on the freight corridor to be ZE/NZE.

⁵ Emissions based on the post-processed traffic data. The post-processed traffic data were developed by adjusting and/or calibrating the I-710 Traffic Model results using actual traffic counts at specific locations on the I-710 to provide more accurate traffic volumes.

I-710 = Interstate 710

lbs/day = pounds per day

PM₁₀ = particulate matter less than 10 microns in diameter

SCAG = Southern California Association of Governments

ZE/NZE = zero emission/near zero emission

As seen in Table 3.13-10 and Table 3.13-11, the incremental $PM_{2.5}$ and PM_{10} emissions of the 2035 build alternatives compared to the 2035 No Build (Alternative 1) are essentially zero (approximately 1 percent different or less) in the Basin and AOI study areas. However, the planned increases in the mobility and capacity of the freeway result in increases in PM emissions along the I-710 freeway. Increases in emissions for Alternative 7 are generally greater than for Alternative 5C, primarily due to the greater increase in capacity (and VMT) for Alternative 7 and the linear VMT-dependence of entrained road dust and brake/tire wear emissions.

ZE Design Option. Implementing the ZE design option for Alternative 7 would slightly decrease the I-710 emissions for Alternative 7 (effect of ZE/NZE truck exhaust emissions), but would not appreciably change the 30 percent increase in I-710 PM_{10} and $PM_{2.5}$ emissions for Alternative 7/ZE compared to the 2035 No Build (Alternative 1) condition.

| Differences (in lbs/day along the I-710) as compared to the No Build (Alternative 1) | PM_{10} | $PM_{2.5}$ | DPM |
|--|-----------|------------|------|
| Alternative 5C | 160 | 36 | -1.7 |
| Alternative 7 | 640 | 130 | -5.2 |
| Alternative 7ZE | 630 | 120 | -5.2 |

DPM = diesel particulate matter

lbs/day = pounds per day

PM_{10} = particulate matter less than 10 microns in size

$PM_{2.5}$ = particulate matter less than 2.5 microns in size

ZE = zero emission/near zero emission

CONCLUSION. Transportation conformity is required under Section 176(c) of the Clean Air Act (CAA) to ensure that Federally supported highway and transit project activities are consistent with the purpose of the SIP. Conformity for the purpose of the SIP means that transportation activities will not cause new air quality violations, worsen existing violations, or delay timely attainment of the relevant AAQS.

The following paragraphs discuss the results of the qualitative $PM_{2.5}$ and PM_{10} analysis for analysis purposes under NEPA.

- Ambient PM₁₀ concentrations in the project vicinity are more than 50 percent below the 24-hour PM₁₀ NAAQS.
- Alternative 5C would increase the PM₁₀ emissions along the I-710 freeway corridor by up to 18 percent¹⁴ to 24 percent¹⁵ in 2035 when compared to existing conditions. This increase is lower than the percent difference between the current PM₁₀ ambient concentrations and the PM₁₀ standard.
- Alternative 7 would increase the PM₁₀ emissions along the I-710 freeway corridor by up to 45 percent to 51 percent in 2035 when compared to existing conditions. This increase is around the same value as the percent difference between the current PM₁₀ ambient concentrations and the PM₁₀ standard. Per the Final 2016 AQMP, the future 24-hour PM₁₀ background concentrations are expected to be lower than the current background.
- Based on the local monitoring data and the 2012 AQMP,¹⁶ the 24-hour PM_{2.5} concentrations within the project area would decrease by 14 to 18 percent in the year 2030 as compared to current background concentrations. Overall, the 2030 background concentrations will be around 4.0 µg/m³ to 8.8 µg/m³ lower than the 24-hour PM_{2.5} NAAQS of 35 µg/m³ and would require a 13 to 34 percent increase to exceed the 24-hour PM_{2.5} NAAQS.
 - Based on the data in Table 3.13-10, PM_{2.5} emissions are expected to increase by 8 percent to 9 percent along the I-710 freeway for Alternative 5C in 2035 when compared to the 2035 No Build (Alternative 1). Since the 2035 No Build (Alternative 1) contributes to only a portion of the future PM_{2.5} ambient background concentration and changes in localized ambient PM_{2.5} concentrations are generally a direct function of changes in primary PM_{2.5} emissions, it is reasonable to assume that Alternative 5C would likely not increase the future 24-hour PM_{2.5} ambient background concentration by more than 8 to 9 percent.

¹⁴ Emissions are based on traffic data from the I-710 Traffic Model combined with emission rate data from EMFAC2014. The I-710 Traffic Model is a modified version of the SCAG Regional Transportation Plan Travel Demand Model.

¹⁵ Emissions are based on post-processed traffic data combined with emission rate data from EMFAC2014. The post-processed traffic data were developed by adjusting and/or calibrating the I-710 Traffic Model results using actual traffic counts at specific locations on the I-710 to provide more accurate traffic volumes.

¹⁶ SCAQMD. 2013. Final 2012 AQMP Appendix V. February. Website: [http://www.agmd.gov/docs/defaultsource/clean-air-plans/air-quality-management-plans/2012-air-quality-management-plan/final-2012-aqmp-\(february-2013\)/appendix-v-final-2012.pdf](http://www.agmd.gov/docs/defaultsource/clean-air-plans/air-quality-management-plans/2012-air-quality-management-plan/final-2012-aqmp-(february-2013)/appendix-v-final-2012.pdf) (accessed August 2016).

- Based on the data in Table 3.13-10, Alternative 7 is expected to increase the PM_{2.5} emissions from the I-710 freeway by 30 percent to 31 percent in 2035 when compared to the 2035 No Build condition.
- Based on the local monitoring data and modeling in 2012 AQMP, the annual average PM_{2.5} concentrations within the project area would reduce by 5.3 percent to 23 percent below the current background concentrations in the year 2030. Overall, the 2030 background concentrations will be 0.6 µg/m³ to 2.5 µg/m³ below the annual PM_{2.5} NAAQS and would require a 5 to 26 percent increase to exceed the annual PM_{2.5} NAAQS. The Final 2016 AQMP¹⁷ predicts an even greater reduction in annual average PM_{2.5} concentration of 15 percent in 2025 as compared to the 2017-2022 conditions.
 - As described above, there is projected to be an 8 percent to 9 percent increase in PM_{2.5} emissions along the I-710 freeway for 2035 Alternative 5C as compared to the 2035 No Build condition.
 - Based on the data in Table 3.13-10, Alternative 7 is expected to increase the PM_{2.5} emissions from the I-710 freeway by 30 percent to 31 percent in 2035 when compared to the 2035 No Build condition.
- The emissions analysis does show that Alternative 7 incremental near-freeway emissions along the I-710 are at least three times greater than Alternative 5C when compared to the 2035 No Build (Alternative 1).

PROJECT-LEVEL MOBILE SOURCE AIR TOXICS (MSAT). In addition to the criteria air pollutants for which there are NAAQS, the EPA also regulates air toxics. Most air toxics originate from human-made sources, including on-road mobile sources, other mobile sources (e.g., airplanes), area sources (e.g., dry cleaners), and stationary sources (e.g., factories or refineries).

Controlling air toxic emissions became a national priority with the passage of the CAA Amendments of 1990, whereby Congress mandated that the EPA regulate 188 air toxics, also known as hazardous air pollutants. The EPA assessed this expansive list in its rule on the Control of Hazardous Air Pollutants from Mobile Sources (Federal Register, Volume 72, No. 37, page 8,430, February 26, 2007), and identified a group of 93 compounds emitted from mobile sources that are part of EPA's Integrated Risk Information System (IRIS).¹⁸ In addition, the EPA identified nine compounds with significant contributions from mobile sources that are among the national and regional-scale cancer risk drivers or contributors and non-cancer hazard contributors from

¹⁷ SCAQMD. 2017. Final 2016 AQMP. March. Website: <http://www.aqmd.gov/home/library/clean-air-plans/air-quality-mgt-plan/final-2016-aqmp> (accessed March 20, 2017).

¹⁸ EPA. Website: <https://www.epa.gov/iris>.

the 2011 National Air Toxics Assessment (NATA).¹⁹ These are 1,3-butadiene, acetaldehyde, acrolein, benzene, diesel particulate matter (DPM), ethylbenzene, formaldehyde, naphthalene, and polycyclic organic matter (POM). While FHWA considers these the priority MSAT, the list is subject to change and may be adjusted in consideration of future EPA rules.

The 2007 EPA rule mentioned above requires controls that will dramatically decrease MSAT emissions through cleaner fuels and cleaner engines. According to an FHWA analysis using EPA's MOVES2014a model, even if VMT increases by 45 percent from 2010 to 2050 as forecast, a combined reduction of 91 percent in the total annual emissions for the priority MSATs is projected for the same time period, as shown in Figure 3.13-3. The projected reduction in MSAT emissions would be slightly different in California due to the use of the EMFAC2014 emission model in place of the MOVES model. Among other things, EMFAC2014 improved estimates of particulate matter emissions from the latest model year diesel trucks, dramatically lowering DPM emissions in 2035. The impact of these new model trucks as the result of the ARB Truck and Bus Rule and the San Pedro Bay Ports Clean Truck Programs, as well as improved emission factors, reduces fleet emissions faster than VMT is expected to increase. In addition, although traffic emissions are generally proportional to vehicle miles traveled, the emission factor is also a function of vehicle distribution, weight, speed, etc., such that improvements in mobility (i.e., less congestion) will also reduce emissions.

Air toxics analysis is a continuing area of research. While much work has been done to assess the overall health risk of air toxics, many questions remain unanswered. In particular, the tools and techniques for assessing project-specific health outcomes as a result of lifetime MSAT exposure remain limited. These limitations impede the ability to evaluate how the potential health risks posed by MSAT exposure should be factored into project-level decision-making within the context of NEPA.

In October 2016, FHWA issued a memorandum titled *Updated Interim Guidance on Mobile Source Air Toxic Analysis in NEPA Documents*²⁰ to advise FHWA division offices as to when and how to analyze MSATs in the NEPA process for highways. This document is an update to the previous guidance released in December 2012. The guidance is described as interim because MSAT science is still evolving. As the science progresses, FHWA will update the guidance. This analysis follows the FHWA guidance.

Figure 3.13-3: National MSAT Emission Trends

MSAT ANALYSIS METHODOLOGY. Depending on the specific project circumstances, FHWA has identified three levels of analysis.

- **Projects with No Meaningful Potential MSAT Effects, or Exempt Projects:** For projects qualifying as categorical exclusions under 23 CFR 771.117 or that are exempt from CAA conformity under 40 CFR 93.126, no analysis or discussion of MSAT is necessary.
- **Projects with Low Potential MSAT Effects:** These projects are those that serve to improve operations of highway, transit, or freight without adding substantial new capacity or without creating a facility that is likely to meaningfully increase MSAT emissions, including minor widening projects, new interchanges, replacement of a signalized intersection on a surface street, and projects where design year traffic is projected to be

less than 140,000 to 150,000 per. For these projects, a qualitative assessment of emissions projections should be conducted.

- **Projects with Higher Potential MSAT Effects:** These projects typically are those that create or substantially alter a major intermodal freight facility that has the potential to concentrate high levels of diesel particulate matter in a single location, involving a substantial number of diesel vehicles for new projects or accommodating with a substantial increase in the number of diesel vehicles for expansion projects, create new capacity or add substantial capacity to urban highways such as interstates, urban arterials, or urban collector-distributor routes with traffic volumes where the AADT is projected to be in the range of 140,000 to 150,000 by the design year, and also be proposed to be located in proximity to populated areas. The approach to assessing impacts for these types of projects would include a quantitative analysis to forecast local-specific emission trends of the priority MSAT for each alternative, as well as addressing the potential for cumulative impacts, where appropriate, based on local conditions.

The build alternatives include the expansion of an existing highway that has average annual daily trips exceeding 140,000 per day and a high percentage of diesel vehicles. Therefore, the build alternatives qualify as having higher potential MSAT effects. This analysis focuses on seven of the nine²¹ MSAT pollutants identified by the EPA as being the highest priority MSATs: acrolein, benzene, 1,3-butadiene, DPM, formaldehyde, naphthalene, and polycyclic organic matter (POM). Following circulation of the RDEIR/SDEIS, an assessment was performed of the cancer risk contribution of two additional priority MSAT, acetaldehyde and ethyl benzene, which were not identified in the 2012 interim guidance that was used when the analysis commenced. MSAT emission inventories for all project alternatives and baselines were developed for the I-710 Corridor Project study areas using the emission factors of non-criteria air pollutants in the Basin, I-710 Traffic Model data, and ARB/EPA speciation profiles for reactive organic gases (ROG), total organic gases (TOG), and PM_{2.5}. MSAT emission inventories for the I-710 freeway were also developed for the project alternatives and baselines using the emission factors of non-criteria pollutants in Los Angeles County, post-processed traffic data, and ARB/EPA speciation profiles. MSAT tools and analysis can be used to illuminate, for both the public and decision makers, the health risks associated with different project alternatives.

²¹ This HRA analysis is based on the 2012 FHWA guidance for MSAT analysis that included only seven priority MSAT. After the completion of this analysis, on October 18, 2016, FHWA released an updated guidance that includes two additional MSAT: acetaldehyde and ethyl benzene. As a result, these two MSAT are not included in this analysis; however, following circulation of the RDEIR/SDEIS in 2017, a qualitative assessment of the contribution of these two additional priority MSAT was undertaken.

MSAT ANALYSIS RESULTS. Table 3.13-12 presents an analysis of MSAT incremental emissions for each of the project alternatives compared with the 2012 existing conditions (baseline) for all study areas. Table 3.13-13 presents a similar comparative analysis of incremental emissions of each of the 2035 build alternatives compared to the No Build (Alternative 1).

In every instance (all project alternatives, and all study areas [the Basin, the I-710 AOI, and I-710]), decreases in incremental MSAT emissions compared to 2012 were calculated. Reductions in DPM (the main risk driver) were approximately 97 percent (Basin), 97 percent to 98 percent (AOI), and 96 percent to 98 percent along I-710. Compared to 2012, reductions from Alternative 7 were approximately 1 percent greater than reductions with Alternative 5C.

In 2035, compared to the No Build (Alternative 1), DPM emissions (the main health risk concern) decreased for Alternatives 5C and 7 in all study areas, with the greatest decreases in Alternative 7.

ZE Design Option. Both ZE/NZE trucks for Alternative 7 and ZE trucks only in the ZE Design Option for Alternative 7 are assumed to be non-diesel vehicles based on an analysis of truck technologies that would meet a low-NO_x (0.02 g NO_x / bhp-hr) standard or lower. As a result, MSAT emissions estimates of diesel-fueled vehicles for these two alternatives are identical. Figures F-5 and F-6 in Appendix Q provide a comparison of the spatial distribution of the incremental DPM emissions associated with 2035 Alternative 7 and 2035 Alternative 7ZE as compared to project baselines. These results are identical. Note that MSATs associated with natural gas combustion are included in Alternative 7 ZE/NZE emission estimates.

A review of the SCAQMD's Multiple Air Toxics Exposure Study IV (MATES IV)²² was conducted to understand the contribution of acetaldehyde and ethyl benzene to basin-wide cancer risk associated with on-road mobile sources and to evaluate if inclusion of these two MSAT would result in any substantive changes to the analysis provided herein. Based on a cancer-potency weighted contribution of individual toxic air contaminants (TACs) to the TAC inventory published in MATES IV, the contribution of acetaldehyde to cancer risk associated with mobile sources in 2012 was approximately 0.14 percent. The contribution of ethyl benzene to cancer risk is less than 0.01 percent. The total contribution of these two MSAT to cancer risk is less than 1 percent and as such, does not meaningfully change the MSAT analysis provided herein.

ADDITIONAL ANALYSES. The I-710 Corridor Project is a cooperative venture of several agencies responsible for both transportation and goods movement in the greater Los Angeles area. Therefore, additional analyses, including multiarea criteria pollutant traffic emissions, criteria pollutant concentration impacts along the I-710, and air toxic health risk impacts (i.e., cancer risk, and acute and chronic hazard indices) were conducted because of the unique goods movement component of the build alternatives and the stated purpose of the project to improve air quality.

CRITERIA POLLUTANT TRAFFIC EMISSIONS. Mass emissions of criteria pollutants and/or their precursors (NO_x, volatile organic compounds [VOC], PM₁₀, PM_{2.5}, CO, SO₂) from traffic were calculated for the I-710 mainline to determine the impact of the alternatives on the surrounding area. In addition, the Basin mass emissions and mass emissions for the AOI were also evaluated to determine the impact of the alternatives on a regional scale. The AQ/GHG/HRA Protocol describes the methodology for calculating traffic-related mass emissions. The method for calculating regional emissions impacts from the project alternatives is summarized below.

REGIONAL EMISSION IMPACT METHODOLOGY. The vehicle activity data was obtained from I-710 Traffic Model, which is based on the SCAG regional traffic model. Four different peak time periods were evaluated in the model: AM (6:00 a.m.–9:00 a.m.), Midday (9:00 a.m.–3:00 p.m.), PM (3:00 p.m.–7:00 p.m.) and Night (7:00 p.m.–6:00 a.m.). The I-710 Traffic Model assigns one-directional traffic flows for traffic links (sections of roadways) that represent freeways, ramps, and one-way streets. All other traffic links are assigned bi-directional vehicle flow. The output of the I-710 Traffic Model provides several parameters including a unique identifier for each traffic link in the SCAG network (Link ID), a description of each link (road name, route name, and road type), link lengths, and average vehicle speeds and traffic volumes for each traffic link during four different time periods (AM, mid-day, PM, and night-time).²³ This model output data is hereinafter referred to as “The I-710 Traffic model data.”

The I-710 Traffic Model data was then further adjusted and/or calibrated using actual traffic counts at specific locations on I-710 to provide more accurate traffic volumes (referred to as “post-processed traffic data” hereinafter) for the I-710 freeway (includes freight corridor for certain alternatives) and related ramps/freeway-to-freeway connectors.

To maintain consistency with the date of the socioeconomic data used in the SCAG 2012 RTP, 2035 is used as the horizon year for analysis of future conditions. The horizon year of 2035 is consistent with SCAG's 2012 RTP, the base year used for the I-710 Traffic Model.

²³ Note that the I-710 traffic model is based on the 2012 (latest) RTP model but combines two time periods in the RTP model (evening 7:00 to 9:00 p.m. and night 9:00 p.m. to 6:00 a.m.) and calls it night period (from 7:00 p.m. to 6:00 a.m.).

EMFAC2014 was used to develop emission factors for the various criteria pollutants. The EMFAC model was run for both baseline year 2012 and build-out year 2035. (Details of how EMFAC was used are included in the Air Quality/Greenhouse Gas/ Health Risk Assessment [AQ/GHG/HRA] Protocol and AQ/GHG/HRA Technical Study [June 2017].) EMFAC2014 does not account for rules and regulations enacted by the ARB after 2014.

Both build alternatives include ZE/NZE trucks (4,000 for Alternative 5C and 18,350 for Alternative 7). As a result, ZE/NZE trucks account for approximately 25 percent of the heavy-duty truck VMT along the I-710 in Alternative 5C, and all trucks traveling along the freight corridor in Alternative 7 are ZE/NZE (approximately 67 percent of heavy-duty truck VMT along the I-710 main line and freight corridor).

SUMMARY OF REGIONAL TRAFFIC EMISSION IMPACTS. The incremental emissions of criteria pollutants for Basin, AOI, and I-710 as compared to 2012 existing conditions and 2035 No Build (Alternative 1) are presented in Table 3.13-14 and Table 3.13-15, respectively.

These comparisons are performed for each of the criteria pollutants and for the three project study areas (Basin, I-710 Study AOI, and I-710, which includes the freight corridor under Alternative 7). Each of the alternatives would result in lower NO_x, CO, PM_{2.5} and VOC emissions for all study areas when compared to 2012.

Incremental SO₂ emissions decreased for each of the project alternatives in each study area, compared to 2012, with the exception of Alternative 7 in the I-710 Study Area which increased by one pound per day.

Total traffic-related PM emissions consist of exhaust emissions, direct brake and tire wear, and entrained road dust emissions (particulate matter from roadways lifted into the air by vehicle motion). The entrained road dust emissions were calculated using ARB's emission factors (based on EPA's Compilation of Air Pollution Emission Factors [AP-42]²⁴) for entrained road dust from paved roads. This methodology conservatively assumes that roadways have an infinite silt reservoir, even for heavily traveled freeways and major arterials. This methodology increases entrained emissions as a direct function of VMT. Thus, each of the 2035 alternatives shows an increase (approximately 21 to 77 percent) in entrained PM emissions compared to 2012. For PM_{2.5}, exhaust emission decreases are great enough that total PM_{2.5} emissions still decrease for all study areas (except for Alternative 7 along I-710).

⁴ Alternative 5C includes a funding program for ZE/NZE heavy-heavy duty trucks that meet certain minimum requirements for travel on the I- 710 freeway.

⁵ Alternative 7 requires all trucks on the freight corridor to be ZE/NZE.

AOI = Area of Interest

Basin = South Coast Air Basin

CO = carbon monoxide

I-710 = Interstate 710

lbs/day = pounds per day

NO_x = oxides of nitrogen

PM₁₀ = particulate matter less than 10 microns in diameter

PM_{2.5} - particulate matter less than 2.5 microns in diameter

SCAG = Southern California Association of Governments

SO₂ = sulfur dioxide

TWBW = tire wear and brake wear

VOC = volatile organic compound

ZE/NZE = zero emission/near zero emission

For PM₁₀, calculated increases in entrained and brake/tire wear emissions are much greater than exhaust PM₁₀ reductions, resulting in large calculated increases in PM₁₀ emissions in all study areas for all 2035 alternatives compared to 2012.

Overall, the decrease in exhaust PM_{2.5} emissions for all 2035 alternatives as compared to 2012 Baseline is greater than the sum of the increases in tire wear, brake wear, and entrained road dust emissions. As a result, total PM_{2.5} emissions show decreases for the 2035 alternatives when compared to the 2012 Baseline for all I-710 Corridor Project study areas. In the case of PM₁₀ emissions, the increases in entrained road dust, tire wear and brake wear far outweigh the decrease in exhaust PM₁₀. Therefore, there are increases in total PM₁₀ emissions for all the 2035 alternatives when compared to 2012 Baseline.

It should be noted that after the I-710 Corridor Project emission calculations were completed, ARB revised the silt loading factor for freeways to a lower value (approximately 25 percent lower). Initial analyses indicate that this reduces freeway entrained PM_{2.5} and PM₁₀ incremental emissions for all project alternatives as compared to California Environmental Quality Act (CEQA)/National Environmental Policy Act (NEPA) baselines. These reductions are not expected to alter the conclusions of this analysis and the analyses presented can be considered as conservative.

There is no significant change (less than 5 percent) in VMT across the 2035 alternatives for the AOI and the Basin. Emissions associated with on-road vehicles is generally a function of the VMT. Since there is no significant change (less than 5 percent) in VMT across the 2035 alternatives for the AOI and the Basin, emission estimates in Table 3.13-14 for various criteria air pollutants for the 2035 alternatives as compared to the 2012 Baseline are similar. Furthermore, the apparent lack of variation can be partially attributed to the rounding of the emission estimates to two significant digits.

The comparison of the build alternatives to the No Build (Alternative 1) for 2035 conditions is presented in Table 3.13-15. In this comparison, the impacts of general VMT increases from 2012 are eliminated, although smaller VMT differences among the project alternatives remain.

With the exception of CO emissions under Alternative 5C, each of the alternatives would result in lower NO_x, CO, and VOC emissions for the Basin and AOI study areas when compared to the No Build (Alternative 1).

Incremental SO₂ emissions, PM_{2.5} exhaust, and PM₁₀ exhaust increased for each of the build alternatives in each study area, compared to the No Build (Alternative 1) (with the exception of PM_{2.5} and PM₁₀ at the Basin level, where there are decreases for each alternative).

ZE Design Option. Although NO_x levels are marginally lower for the ZE design option, no substantial change is seen between the incremental impacts of 2035 Alternative 7 and 2035 Alternative 7ZE as compared to the 2012 Baseline for all project study areas, except for SO₂ from the I-710 freeway. Incremental impacts of 2035 Alternative 7 and 2035 Alternative 7ZE in the Basin and the AOI as compared to 2035 No Build (Alternative 1) are similar.

CRITERIA POLLUTANT TRAFFIC EMISSION CONCENTRATIONS. Emissions released from traffic are mixed and diluted in ambient air and ultimately transported away from the traffic. The simulation of the release and transport of emissions from traffic in order to estimate the concentrations of the criteria pollutants at specified locations (called receptors) is conducted through air dispersion modeling.

Modeling of the quantities and effects of project traffic-related air pollution was performed using emissions data calculated for the I-710 mainline (and freight corridor for Alternative 7), using post-processed traffic data.²⁵ The modeling results do not, therefore, reflect changes in emissions on the other nearby freeways, local arterials, and other local roadways. Based on the emissions analysis of the build alternatives, emissions of criteria pollutants generally decrease on these nearby freeways, arterials, and roadways as traffic shifts to the I-710. The detailed modeling methodology and results are presented in the AQ/GHG/HRA (2017). The modeling results presented are conservative in that they account for impacts from increased traffic on the I-710 for the build alternatives but do not account for any decreases in ambient concentrations related to reduced traffic on nearby freeways, arterials, and roadways for the build alternatives as mobility improves on I-710.

For this study, the EPA's AERMOD dispersion model was used to model the criteria pollutant concentrations that would result from traffic-related emissions on I-710. It is important to note that the air dispersion modeling was performed using only the emissions data calculated for the I-710 mainline (and freight corridor for Alternative 7). Freeway traffic emissions were represented in AERMOD as a series of volume sources. The I-710 freeway near-roadway AERMOD modeling uses up to 29,000 adjacent volume sources per model run. In response to comments on the Draft EIR/EIS, grid receptors now "follow" the freeway and begin closer to the freeway (approximately 150 feet away from the edge of the roadway). Air quality and health risk impacts were calculated at over 10,000 model grid points²⁶ and 748 "sensitive"

²⁵ Post-processed traffic data were developed by adjusting and/or calibrating the I-710 Traffic Model results using actual traffic counts at specific locations on I-710 to provide more accurate traffic volumes.

²⁶ Fine grid receptors were placed at distances of 50 meters (m), 100 m, 150 m, 200 m, and 250 m from the edge of the Alternative 5C mainline footprint with a spacing of 50 m along the length of the mainline. Coarse grid receptors were placed at distances of 500 m to 3,000 m from the edge of the Alternative 5C mainline footprint with a spacing of 250 m by 250 m, perpendicular to and along the mainline. The Alternative 5C mainline footprint was used as the basis for creating this freeway-following grid because this alternative has the smaller footprint of the two project

receptors (e.g., schools, senior centers, and daycare centers, etc.) were specifically analyzed. Figures 3.3-4 through 3.3-9 in Section 3.3, Community Impacts, which illustrate the change in air pollutant concentrations of both build alternatives as compared to the 2035 No Build (Alternative 1) for various pollutants, also show the locations of the sensitive receptors utilized in this analysis.

Hourly-resolution meteorological surface data, such as wind speed and direction, and upper air data must be provided as inputs for air dispersion modeling. A unique aspect of the I-710 Corridor Project is that the freeway is 18 miles in length, and the meteorology over that 18-mile stretch may change along different lengths of the freeway. For purposes of air dispersion modeling, a sphere of influence analysis was performed to identify the most appropriate meteorological stations to use to represent the meteorological conditions encountered along the I-710 freeway. Ultimately, the I-710 Corridor Project Study Area was divided into four representative meteorological zones, each with a representative meteorological station. Meteorological data for a station in each zone was processed using AERMET, the EPA meteorological preprocessor program for AERMOD.

As guidance to lead agencies, the SCAQMD has established CEQA significance criteria for concentration impacts for NO₂ (one-hour and annual average), CO (one-hour and eight-hour), PM₁₀ (24-hour and annual average), and PM_{2.5} (24-hour average). Therefore, the concentration impacts for only these criteria pollutants and corresponding averaging periods were calculated and reported. In this section SCAQMD's CEQA significance criteria are presented for information purposes only; the air quality analysis for CEQA is provided in Chapter 4.0, California Environmental Quality Act Evaluation, of this Final EIR/EIS.

Tables 3.13-16, 3.13-17 and 3.13-18 provide the calculated maximum incremental concentration impacts for the project alternatives as compared to 2012 for CO, NO₂, PM₁₀, PM_{2.5}, and exhaust only emissions of PM₁₀ and PM_{2.5} (for analysis of other public health considerations). The annual NO₂ incremental impacts decrease for all project alternatives as compared to 2012.

build alternatives. Only a few receptors on the roadways and related right-of-way were excluded from the criteria pollutant analyses.

The gridded and sensitive receptors were placed as described in the AQ/HRA Protocol. A quantitative PM₁₀/PM_{2.5} project-level conformity analysis would be conducted should a build alternative have been selected as the Preferred Alternative according to EPA guidelines for project-level conformity analyses, with receptors as close as approximately 15 feet from the edge of the roadway. Since a build alternative was not identified as the Preferred Alternative, a project-level conformity analysis will not be conducted.

³ Alternative 1 is the future No Build Alternative.

⁴ Alternative 5C includes a funding program for ZE/NZE heavy-heavy duty trucks that meet certain minimum requirements for travel on the I-710 freeway.

⁵ Alternative 7 requires all trucks on the freight corridor to be ZE/NZE.

µg/m³ = micrograms per cubic meter

AERMOD = AMS/EPA Regulatory Model

CEQA = California Environmental Quality Act

I-710 = Interstate-710

PM₁₀ = particulate matter less than 10 microns in diameter

PM_{2.5} = particulate matter less than 2.5 microns in diameter

SCAQMD = South Coast Air Quality Management District

ZE/NZE = zero emission/near zero emission

The 2035 ambient concentration levels calculated by adding the incremental impacts to existing background concentrations of CO and NO₂ were found to be below the California Ambient Air Quality Standards (CAAQS) and the NAAQS for most alternatives. The annual PM₁₀ and PM_{2.5} incremental impacts increase for all project alternatives as compared to 2012. The 2035 ambient concentration levels calculated by adding the incremental impacts to existing background concentrations of PM₁₀ and PM_{2.5} were found to be above the SCAQMD significance criteria, with the exception of 24-Hour PM_{2.5} under Alternatives 1 and 5C.

Figures 4-2a through 4-2c, from the AQ/GHG/HRA (2017), and provided in Appendix Q of this EIR/EIS, show the change in NO_x emissions for build alternatives as compared to the 2012 Baseline and No Build (Alternative 1). These gridded mass emission figures have been plotted by adding the NO_x emissions from links or part of links present in a grid size of 0.25 mile by 0.25 mile. The NO_x emissions for all 2035 alternatives as compared to the 2012 Baseline, decrease on the freeways, arterials, and roadways in the AOI in spite of the increase in the VMT. This occurs due to the improvement in vehicle technology driven by State and local programs/regulations. The only areas where increases occur are in the locations of the Southern California International Gateway (SCIG) Project in the Port area and the SR-710 North Project (a portion of SR-710 north of Interstate 10 [I-10]). These two projects were included in the future background conditions of the 2035 I-710 Traffic Model and SCAG's regional traffic model for Year 2035.

Figures 4-1a to 4-1c in Appendix Q of this Final EIR/EIS, present gridded mass emission plots for total PM_{2.5} and total PM₁₀ (insets) for the 2035 alternatives as compared to the 2012 Baseline (left side of the Figures) and the 2035 build alternatives as compared to the 2035 No Build (Alternative 1) (right side of the Figures). These gridded mass emission figures have been plotted by adding the PM emissions from links or part of links present in a grid size of 0.25 mile by 0.25 mile.

Total PM_{2.5} emissions, which consist of vehicle exhaust emissions, tire wear, brake wear, and entrained road dust emissions, show mostly decreases on the freeways, arterials, and roadways in the AOI for the 2035 alternatives as compared to the 2012 Baseline (Figures 4-1a to 4-1c, left side). The only increases seen in these charts occur in the Port areas where a proposed SCIG Project would be located in 2035 and a portion of SR-710 north of I-10 where the SR-710 North Study project would be located in 2035.

Total PM₁₀ emissions for all I-710 Corridor Project 2035 alternatives as compared to the 2012 Baseline (Figures 4-1a to 4-1c, left side insets) increase along the I-710 freeway as well as on portions of I-10, I-5, I-110, and I-405 (and SR-60 for Alternative 7). Increases in total PM₁₀ emissions are also observed in the Port areas where the SCIG Project would be located.

There is no change in total $PM_{2.5}$ emissions for 2035 Alternative 5C (Figure 4-1b, right side) compared to 2035 No Build (Alternative 1) except at a couple of grid cells at the intersection of I-710 and I-405. For 2035 Alternative 7 compared to the 2035 No Build (Alternative 1) (Figure 4-1c, right side) increases in total $PM_{2.5}$ emissions occur along the I-710 freeway due to the increase in tire wear, brake wear, and entrained road dust associated with the truck traffic on the freight corridor.

Total PM_{10} emissions for the build alternatives compared to the 2035 No Build (Alternative 1) (Figures 4-1b and 4-1c, right side insets) show an increase in emissions on the I-710 freeway. This is due to the increased mobility and capacity of the freeway, which results in increased entrained road dust emissions. For Alternative 7 (Figure 4-1c, inset), decreases in emissions are observed on sections of nearby freeways (particularly I-605) due to the shifting of truck activity to the I-710 with the introduction of the freight corridor. However, this shift in activity also results in increases in emissions on sections of I-405 and SR-60 as trucks make their way to and from the freight corridor.

Figures 4-3a through 4-3f (Appendix Q) present annual PM isopleths for the 2035 alternatives as compared to the 2012 Baseline (left side of the Figures) and the 2035 build alternatives as compared to the 2035 No Build (Alternative 1) (right side of the Figures). These isopleths show that total PM_{10} impacts (Figures 4-3a to 4-3c) are generally higher than $PM_{2.5}$ impacts (Figures 4-3d to 4-3f) for all project alternatives. The PM_{10} isopleths that show comparisons of the 2035 alternatives to the 2012 Baseline present the locations of areas along the I-710 freeway where the annual incremental impacts were estimated to be above the SCAQMD significance criteria of 1 microgram per cubic meter ($\mu g/m^3$). These areas are larger for 2035 Alternative 7 as compared to other 2035 alternatives due to the increase in entrained road dust, tire wear, and brake wear associated with the ZE/NZE trucks traveling on the Freight Corridor.

Figures 4-4a through 4-4f (Appendix Q) present 24-hour PM “bubble” plots²⁷ for the 2035 alternatives as compared to the 2012 Baseline and the 2035 build alternatives as compared to the 2035 No Build (Alternative 1). The bubble plots present the maximum incremental 24-hour PM concentration at each modeled receptor over the modeling period (modeling period refers to calendar year 2009, as meteorological data for this calendar year was used in the analyses). It is important to note that the maximum incremental 24-hour concentration at one modeled receptor may not occur on the same day as the maximum incremental concentration at another modeled receptor. These figures may include some receptors located within areas restricted from public access such as the Los Angeles River and the right-of-way on arterial and local roadways.

²⁷ “Bubble” plots are a way of presenting maximum incremental changes in 24-hour PM_{10} and $PM_{2.5}$ concentrations. Each “bubble” in a plot represents a modeled receptor.

All 2035 alternatives have maximum 24-hour PM_{10} incremental impacts above the SCAQMD significance criteria when compared to the 2012 Baseline (Figures 4-4a to 4-4c, left side), with Alternative 7 showing approximately three times the number of receptors above the significance criteria as Alternative 5C. As discussed previously, these exceedances are primarily driven by the conservative calculations for entrained dust. In regards to $PM_{2.5}$, the 2035 alternatives have far fewer receptors with maximum incremental 24-hour impacts above SCAQMD significance criteria when compared to the 2012 Baseline (Figures 4-4d to 4-4f, left side). Specifically, the No Build (Alternative 1) and Alternative 5C do not have any receptors with maximum incremental 24-hour $PM_{2.5}$ impacts above SCAQMD significance criteria. For Alternative 7 (Figure 4-4f, left side), there are 52 receptors with maximum incremental 24-hour $PM_{2.5}$ impacts above SCAQMD significance criteria. These receptors are located along the freight corridor immediately north of I-405 and at the intersection of I-105 and I-710.

The 2035 build alternatives show increases in near roadway 24-hour PM_{10} impacts for several receptors located within of the I-710 freeway as compared to the 2035 No Build (Alternative 1) (Figures 4-4b and 4-4c, right side). The number of impacted receptors is larger in Alternative 7 as compared to Alternative 5C due to increased truck traffic associated with the freight corridor. The 2035 build alternatives show an equivalent amount to a slight decrease in near roadway short-term $PM_{2.5}$ impacts when compared to the 2035 No Build (Alternative 1) (Figures 4-4e and 4-4f, right side) at all modeled receptors for 2035 Alternative 5C and most modeled receptors for 2035 Alternative 7.

ZE Design Option. In general, the air quality impacts are relatively similar for 2035 Alternative 7-ZE as compared to 2035 Alternative 7, with no appreciable changes in maximum incremental impacts observed. Impacts related to PM emissions for both 2035 Alternative 7-ZE and 2035 Alternative 7 are dominated by contributions from entrained road dust emissions (because of the assumption of an infinite silt reservoir on the roadways) and brake/tire wear, which are identical in both alternative options.

3.13.3.4 PUBLIC HEALTH CONSIDERATIONS

PM MORTALITY AND MORBIDITY. Respirable particulate matter (RPM) is a public health concern as it is known to impact both the respiratory and cardiovascular systems. RPM deposition in the lungs and penetration into the bloodstream (for the smallest particles) triggers a range of inflammation responses and exacerbates health problems such as asthma and chronic bronchitis. Individuals susceptible to higher health risks from exposure to airborne PM include children, the elderly, smokers, and people of all ages with low pulmonary/cardiovascular function. Information about the biological mechanisms by which exposure to ambient particles adversely affects the

respiratory and cardiovascular systems may be found in an ARB 2002 review²⁸ and a 2009 EPA Integrated Science Assessment.²⁹

The PM Integrated Science Assessment reviewed numerous epidemiological studies and concluded that the relationship between long-term PM_{2.5} exposures and mortality/morbidity is causal. During its periodic review of the NAAQS, the EPA released the “Quantitative Health Risk Assessment for Particulate Matter,” which provided national estimates of premature mortality associated with PM_{2.5} nationwide and in 15 urban areas, including Los Angeles.³⁰ ARB conducted a thorough review and evaluation of the EPA’s analysis along with past EPA health risk assessments and developed an application of these methods for use in California, wherein ARB attempted to quantify the non-toxic health effects (i.e., mortality and morbidity) of PM exposure through concentration-response functions.^{31, 32, 33} These models used by the ARB, the EPA, and others include formulas showing that the PM-related mortality and morbidity are a function of the annual death rate per person from all causes (typically county-level information for a given age range), a co-efficient from a health study or studies relating health risk to PM concentrations, the population affected (for the age range of all-causes death), and the change in PM concentration.

Although the ARB model has been used to quantitatively assess project-specific incremental levels of public mortality and morbidity (see for example Chapter 3.2 of the Port of Long Beach (POLB) Middle Harbor Redevelopment Project³⁴), such calculations are subject to significant uncertainty in the input data. Sources of uncertainty include emission estimates, representativeness of the meteorological data, air dispersion modeling algorithms, toxicity factors,

population exposure estimates, concentration-response functions,³⁵ baseline rates of mortality and morbidity (which are typically countywide, not for the specific PM impact area) that are entered into concentration response functions, and occurrence of additional not-quantified adverse health effects. It should be noted that the nature of PM as a complex mixture of various pollutants, as well as the confounding health effects of pollutants such as SO₂, NO₂, CO, and O₃ that tend to co-occur with PM in ambient air, greatly increase the complexity of deriving accurate PM concentration-response functions. Health risk estimates derived in the presence of significant uncertainty tend to rely on very conservative assumptions that may greatly overestimate the potential adverse health effects. According to the Gateway Cities Air Quality Action Plan, uncertainty can be assessed by comparison to other studies.³⁶ As stated by ARB in a 2006 study of DPM exposure from ports and goods movement in California:³⁷ "Risk assessment has various uncertainties in the methodology and is therefore deliberately designed so that risks are not under predicted. Risk assessment is thus best understood as a tool for comparing risks from various sources, usually for purposes of prioritizing risk reduction, and not as literal prediction of the community incidence of disease from exposure."³⁸

The analysis of PM mortality and morbidity for this project is a qualitative assessment based on comparative analysis of total PM_{2.5} emissions for the various alternatives, given that other components of the model equations should be similar for the different project alternatives and are subject to the uncertainties listed above.

The near-roadway modeling of total PM_{2.5} emissions (sum of running exhaust, tire wear, brake wear, and entrained road dust) indicates that the exposure of people along I-710 to PM-related morbidity and mortality health risks should decrease relative to the 2012 Baseline with the exception of some locations near the roadways (particularly for Alternative 7). To the extent that increases in entrained road dust in the 2035 alternatives may be overestimated, the exposure would be even lower for those very near to the roadways (see discussion of ultrafine particulates below, which uses exhaust PM_{2.5} [rather than total PM_{2.5}] as a surrogate).

³⁵ Concentration-response functions may be location-specific, since the composition of particulate matter varies significantly by region, and not all types of particulate matter are expected to have the same health effects. Therefore, the application of concentration-response functions obtained from epidemiologic studies conducted e.g., outside of California may introduce significant errors in estimating impacts in the South Coast Air Basin.

³⁷ ARB. 2006. Diesel Particulate Matter Exposure Assessment Study for the Ports of Los Angeles and Long Beach – Final Report. Website: <http://www.arb.ca.gov/ports/marineveess/documents/portstudy0406.pdf> (accessed July 2016).

³⁸ Additional discussion and explanation of the sources and level of uncertainty in health risk assessments are provided in Cal/EPA guidance (Cal/EPA 2015).

Total PM_{2.5} emissions can also be used as a potential surrogate for localized primary PM exposure. Calculations show that, in general, total I-710 PM_{2.5} emissions are expected to be lower for each of 2035 Alternatives (1, 5C, and 7) than 2012 Baseline emissions. The same is true for total PM_{2.5} emissions within the Basin and the AOI. Consequently, the public's exposure within the AOI to PM-related morbidity and mortality health risks should decrease relative to the 2012 Baseline, although spatial variations (where there are localized increases in emissions) may occur. These very near-roadway increases are predominantly because of increases in entrained roadway dust (related to the assumption of an infinite silt reservoir on the roadways) from the 2012 Baseline. The near-road modelling of total PM_{2.5} emissions also shows that the I-710 near-roadway total PM_{2.5} concentrations of the 2035 No Build (Alternative 1) were about the same as both build alternatives, the exception being increases in total PM_{2.5} at receptors near the freight corridor in Alternative 7. Similar to the comparisons to the 2012 Baseline, these very near-roadway increases are predominantly because of increases in entrained roadway dust (related to the assumption of an infinite silt reservoir on the roadways).

ULTRAFINE PARTICULATES – QUALITATIVE ANALYSIS. As scientific studies and environmental regulations are expanding, their focus on the smaller particles in ambient air (total suspended particulate to PM₁₀ to PM_{2.5}) has grown. An increasing interest in particles of size less than 0.1 microns, referred to as ultrafine particulate matter or ultrafine particulates (UFP or UFPs) is also developing. Although UFPs generally contribute to a small mass fraction of ambient PM, they are orders of magnitude more numerous than PM₁₀ and PM_{2.5} particles. Their number concentrations range from 10 to 40×10³ UFPs/cm³ in urban air and 40 to 1000×10³ UFPs/cm³ near highways. UFPs are not currently regulated in the U.S. However, the SCAQMD recommended in its 2007 AQMP that UFPs be specifically addressed in PM and air toxics control strategies.

Fuel combustion in motor vehicles is a major source of UFP, and consequently UFP emissions are concentrated near highways and other roadways. Studies have shown that UFP number concentrations decrease sharply with distance from emission sources as a result of particle growth and accumulation processes; for instance Zhu et al. (Zhu 2002) reported that UFP concentration measurements were equal to background concentrations 300 meters downwind of I-405 near the Los Angeles National Cemetery. Thus, high ambient UFP levels are very localized and exhibit large geographical and temporal variations. Concerns about public exposure to UFPs (especially in areas near freeways) are due to the fact that UFPs and the contaminants they contain are relatively easily transported into the body. This is because (i) smaller particles can be inhaled and deposited deeper into the lungs than larger particles, and (ii) the high surface area/mass ratio of UFPs can facilitate adsorption and result in higher content of trace metals and other toxic organic compounds.

There has been increasing interest among the scientific community in roadway impacts to air quality specific to I-710 (Kozawa et al. 2009, Arhami et al. 2009, Moore et al. 2009). SCAQMD also conducted a series of near roadway ambient air monitoring studies, which examined traffic

impacts on concentrations of a host of pollutants, including UFPs.^{39,40} In April 2012, SCAQMD reported findings of a study conducted along I-710 in two one-month intensive campaigns (February–March 2009 and July–August 2009). Samples were collected from one background location upwind of the freeway and two locations downwind of the freeway at 15 meters and 80 meters. Air pollutant species measured included UFP count, black carbon, PM₁₀, PM_{2.5}, NO_x, CO, tri-sodium phosphate (TSP) lead, and volatile organic compounds (VOCs). Results indicate that ambient air near I-710 (at 15 meters) was enriched in UFP. Similar to the results published by Zhu et al., UFP counts were substantially higher at the monitoring site closest (at 15 meters) to the roadway and dropped off with distance (at 80 meters). Concentrations at both downwind monitoring sites were higher than those at the upwind background measurement site. There was no substantial difference in UFP count during winter versus summer.

Information on UFP is limited at this time and is an area of active research. For example, physical transient behaviors, such as particle growth and accumulation, complicate the task of elucidating UFP concentration-response functions. Also, the existing state of knowledge does not yet support the derivation of reliable UFP emission models that account for the particulate growth and accumulation phases. Dispersion modeling of UFPs would also require additional information on the rate of UFP coagulation and absorption so that concentrations can be calculated. Given the lack of information to quantify emissions, dispersion, exposure, and health response to exposure, UFP emissions could not be quantified from the project build alternatives. However, a qualitative analysis has been conducted by using PM_{2.5} exhaust emissions, and exposure as a surrogate for UFP exposure⁴¹ to assess the incremental impacts of the project alternatives as compared to the baselines. Calculations show that I-710 PM_{2.5} exhaust emissions are expected to be more than 90 percent lower for each of the 2035 alternatives as compared to the 2012 Baseline emissions. The same is true for exhaust PM_{2.5} emissions in the Basin and AOI. Consequently, the public's exposure to UFP in 2035 would decrease relative to the 2012 Baseline. Near-roadway modeling (Figures 4-8a through 4-9c of Appendix Q) confirms the conclusion of the emissions analyses, which is that the implementation of either of the build alternatives would decrease the public's health risk due to UFP relative to the 2012 Baseline and the 2035 No Build (Alternative 1), even near the I-710 freeway and freight corridor.

CANCER RISK. The following discussion is included for informational purposes only. For more information on impacts to environmental justice communities as a result of the project, please

³⁹ SCAQMD. Ospital, J, "Health Studies & Near Roadway Issues," December 2009.

⁴⁰ SCAQMD. 2012. Ambient Concentrations of Criteria and Air Toxic Pollutants in Close Proximity to a Freeway with Heavy Duty Diesel Traffic. April. Website: <http://www.aqmd.gov/docs/default-source/air-quality/air-quality-monitoring-studies/near-roadway-study.pdf?sfvrsn=2> (accessed June 2015).

⁴¹ The rationale for this choice is that both UFP and PM_{2.5} emissions are primarily the result of internal combustion processes.

refer to Section 3.3, Community Impacts. The *Gateway Cities Air Quality Action Plan (AQAP)* (Gateway Cities Council of Governments, 2013) assessed the extent to which air pollution health risk falls disproportionately on disadvantaged populations in the Gateway Cities. The Gateway Cities population was divided into quarters according to risk. Several demographic indicators were utilized to identify potentially disadvantaged populations. The air pollution cancer risk among the Gateway Cities population for the 2009 and projected 2035 scenarios was estimated and distributed among the risk quartiles. Results indicated that within each risk quartile, the proportion of the population in each demographic category was similar, suggesting that there is little evidence of disproportionate cancer risk for disadvantaged populations in either the present (2009) or future (2035) scenario.

3.13.3.5 MOTION 22.1

As described in Chapter 2.0, Section 2.2.2.1 (Community Alternative 7) of this Final EIR/EIS, the Metro Board of Directors passed Board Motion 22.1 in October 2015 that directed Metro and Caltrans to study a number of additional items as a part of the I-710 Corridor Project build alternatives. All of these measures are described in Section 2.3.2.1, Common Features of Build Alternatives.

The Motion 22.1 measure applicable to air quality is, under Alternative 7 only, to evaluate the feasibility (should technology be available) to operate only zero emissions trucks along the Freight Corridor as part of the build alternatives. A full analysis of the Alternative 7 Zero Emission Design Option (ZE Design Option) is provided in Appendix F of the AQ/GHG/HRA Technical Report (June 2017). Results of the ZE Design Option analysis have been incorporated into the text and tables above within this section of the Final EIR/EIS.

The ZE Design Option has the same design and traffic activity as Alternative 7. The only difference between these two alternatives is that ZE/NZE trucks in Alternative 7 are replaced with ZE trucks in the ZE Design Option.

No significant changes in incremental mass emissions were seen between the ZE Design Option and Alternative 7 as compared to the project baselines in the South Coast Air Basin and the AOI. On I-710, some decreases in exhaust emission estimates of criteria air pollutants and greenhouse gas (GHG) were observed for the ZE Design Option as compared to Alternative 7. There are, however, no changes in emissions of the main components of particulate matter (PM) (entrained road dust, tire wear, or brake wear emissions). As a result, total PM₁₀ and PM_{2.5} emissions for these two alternatives are similar.

Although there were some decreases seen in exhaust fractions of criteria air pollutants, near-roadway incremental impacts of criteria air pollutants for Alternative 7 and the ZE Design Option were found to be similar.

Differences in Mobile Source Air Toxics (MSAT) emissions between Alternative 7 and the ZE Design Option are minimal, as both the ZE/NZE vehicles in Alternative 7 and ZE vehicles in the

ZE Design Option are assumed to be non-diesel. This also translates to similar incremental health risk impacts for the ZE Design Option and 2035 Alternative 7.

3.13.3.6 AVOIDANCE, MINIMIZATION, AND/OR MITIGATION MEASURES

As discussed above, and as shown in the maps and plots provided in Appendix Q of this Final EIR/EIS, the build alternatives would improve air quality and reduce public health risk in the Basin and the I-710 AOI. Should a build alternative have been selected, along I-710, air quality would be improved and public health risk would be reduced at most locations, but there are some near-roadway locations where there would be an increase in emissions. Alternative 5C has the fewest areas with these near-roadway impacts. The near-roadway impacts are generated by the on-road vehicles, the emissions of which are controlled by ARB and EPA. Programmatic features to fund ZE/NZE trucks and provide a grant program to fund projects that would improve air quality and public health in the corridor are included in both build alternatives. Additionally, the build alternatives would include measures (AQ-2 and AQ-3) to minimize exposure to air emissions are provided below. These measures are based upon the ARB technical advisory *Strategies to Reduce Air Pollution Exposure Near High Volume Roadways* (California Environmental Protection Agency/Air Resources Board, April 2017). According to the EPA⁴², the installation of high-efficiency particulate air (HEPA) filters rated at MERV 12 or better would reduce indoor particulate matter, including DPM, by at least 90 percent.

In addition, the build alternatives would include Measure AQ-1, which would provide funding for four new air quality monitoring stations within the I-710 Corridor. Although this measure would not serve to reduce either exposure or concentrations, it would serve to provide increased and better air quality data within the I-710 Corridor area so that the effects of projects and resultant mitigation measures can be better quantified. However, since the No Build (Alternative 1) has been identified as the Preferred Alternative, Measures AQ-1, AQ-2, and AQ-3 will not be implemented but are included below for disclosure purposes.

AQ-1 Within two years of the approval of a Record of Decision for an Interstate 710 (I-710) Corridor Project build alternative, a funding contribution shall be made to the South Coast Air Quality Management District (SCAQMD) to provide funding for the design and construction of four new air quality monitoring stations within the I-710 Corridor. The new stations will provide for monitoring meteorology (temperature, relative humidity, pressure, wind speed and direction, and rain) and monitoring the following pollutants: ozone (O₃), nitrogen oxide (NO), nitrogen dioxide (NO₂), particulate matter less than 2.5 microns in diameter (PM_{2.5}),

⁴² EPA. 2009. *Residential Air Cleaners (Second Edition): A Summary of Available Information*. Website: 19january2017snapshot.epa.gov/sites/production/files/2014-08/documents/residential_air_cleaning_devices.pdf (accessed December 2018).

particulate matter less than 10 microns in diameter (PM₁₀), and carbon monoxide (CO).

AQ-2

To further reduce exposure of children and other people to near roadway emissions associated with implementation of a build alternative, air filtration systems shall be provided for any of the following schools within 0.25 mile of I-710 that currently lack adequate air filtration systems. As stated in the California Air Resources Board (ARB) *Technical Advisory* (April 2017), high-efficiency filters in ventilation systems can remove from 50 to 99 percent of the particles in the air. Determination of adequate air filtration systems will be addressed during coordination with the respective school districts or administrations and based on current building codes as well as guidelines set forth by the United States Environmental Protection Agency (EPA) and the SCAQMD. Coordination with facility owners will occur during the final design process of the build alternative so that the upgraded or new filtration systems can be in place prior to the start of construction in the area.

AQ-3

Traffic Emission Dispersion Measures. During final design of a build alternative, the feasibility of two measures (individually or in combination) will be evaluated by a qualified biologist/arborist and an air quality specialist familiar with air dispersion/ computational field dynamics modelling characteristics and pollutant transport, and implemented where deemed feasible and effective throughout the corridor to increase dispersion of vehicular emissions and particulate matter:

- Provide solid barriers (walls) in areas where soundwalls do not exist or are not currently proposed. As stated in the ARB *Technical Advisory* (April 2017), studies have found that because of the vertical dispersion provided by such barriers, pollutant concentrations downwind of barriers are reduced by 10 to 50 percent compared to locations without barriers. Locations of solid barriers would be determined in consultation with a noise specialist to ensure no secondary effects would occur.
- Provide vegetation for pollution dispersion for the build alternatives. As stated in the ARB *Technical Advisory* (April 2017), some studies have shown that densely planted vegetation can reduce pollutant concentrations up to 20 percent on the leeward side of a line of trees. In order to achieve these types of air quality benefits, the following factors should be considered to reach the desired pollutant dispersion effects:
 - Vegetation density;

- Increase in air turbulence from the placement of vegetation; and
- Avoidance of species that produce VOCs that can lead to ozone formation.
- Where it has been determined that pollution dispersion vegetation placement would be effective, the landscaping plan for the build alternatives shall identify the necessary criteria for species to be installed.

The ARB *Technical Advisory*, EPA's "Recommendations for Construction Roadside Vegetation Barriers to Improve Near-Road Air Quality" (July 2016), and other relevant technical publications and research information will be utilized in the planning and implementation of solid and vegetation barriers for the build alternatives, in accordance with the site-specific conditions that must be taken into consideration when evaluating the effectiveness of barriers.

3.13.4 CLIMATE CHANGE

Neither the United States Environmental Protection Agency (U.S. EPA) nor the Federal Highway Administration (FHWA) has issued explicit guidance or methods to conduct project-level greenhouse gas analysis. FHWA emphasizes concepts of resilience and sustainability in highway planning, project development, design, operations, and maintenance. Because there have been requirements set forth in California legislation and executive orders on climate change, the issue is addressed in a separate California Environmental Quality Act (CEQA) discussion in Chapter 4.0. The CEQA analysis may be used to inform the National Environmental Policy Act (NEPA) determination for the project.

3.14 NOISE

The information in this section is based on the following documents:

- *Traffic Noise Study Report* (May 2016)
- *Supplemental Traffic Noise Study Report* (May 2018)
- *Noise Abatement Decision Report* (updated May 2018)

3.14.1 REGULATORY SETTING

The National Environmental Policy Act (NEPA) of 1969 and the California Environmental Quality Act (CEQA) provide the broad basis for analyzing and abating highway traffic noise effects. The intent of these laws is to promote the general welfare and to foster a healthy environment. The requirements for noise analysis and consideration of noise abatement and/or mitigation, however, differ between NEPA and CEQA.

3.14.1.1 CALIFORNIA ENVIRONMENTAL QUALITY ACT

CEQA requires a strictly baseline versus build analysis to assess whether a proposed project will have a noise impact. If a proposed project is determined to have a significant noise impact under CEQA, then CEQA dictates that mitigation measures must be incorporated into the project unless those measures are not feasible. The rest of this section will focus on the NEPA/23 Code of Federal Regulations (CFR) 772 noise analysis; please see Chapter 4.0 of this document for further information on noise analysis under CEQA.

3.14.1.2 NATIONAL ENVIRONMENTAL POLICY ACT AND 23 CFR 772

For highway transportation projects with Federal Highway Administration (FHWA) (and [Caltrans], as assigned) involvement, the federal-Aid Highway Act of 1970 and its implementing regulations (23 CFR 772) govern the analysis and abatement of traffic noise impacts. The regulations require that potential noise impacts in areas of frequent human use be identified during the planning and design of a highway project. The regulations include noise abatement criteria (NAC) that are used to determine when a noise impact would occur. The NAC differ depending on the type of land use under analysis. For example, the NAC for residences (67 A-weighted decibels [dBA]) is lower than the NAC for commercial areas (72 dBA). The following Table 3.14-1 lists the NAC for use in the NEPA/23 CFR 772 analysis.

Figure 3.14-1 lists the noise levels of common activities to enable readers to compare the actual and predicted highway noise levels discussed in this section with common activities.

Table 3.14-1: Noise Abatement Criteria

| Activity Category | NAC, Hourly A- Weighted Noise Level, $L_{eq}[h]$¹ | Description of Activities |
|--------------------------|--|---|
| A | 57 (Exterior) | Lands on which serenity and quiet are of extraordinary significance and serve an important public need and where the preservation of those qualities is essential if the area is to continue to serve its intended purpose. |
| B ² | 67 (Exterior) | Residential |
| C ² | 67 (Exterior) | Active sport areas, amphitheaters, auditoriums, campgrounds, cemeteries, day care centers, hospitals, libraries, medical facilities, parks, picnic areas, places of worship, playgrounds, public meeting rooms, public or nonprofit institutional structures, radio studios, recording studios, recreation areas, Section 4(f) sites, schools, television studios, trails, and trail crossings. |
| D | 52 (Interior) | Auditoriums, day care centers, hospitals, libraries, medical facilities, places of worship, public meeting rooms, public or nonprofit institutional structures, radio studios, recording studios, schools, and television studios. |
| E | 72 (Exterior) | Hotels, motels, offices, restaurants/bars, and other developed lands, properties, or activities not included in Categories A through D or F. |
| F | No NAC—reporting only | Agriculture, airports, bus yards, emergency services, industrial, logging, maintenance facilities, manufacturing, mining, rail yards, retail facilities, shipyards, utilities (water resources, water treatment, electrical), and warehousing. |
| G | No NAC—reporting only | Undeveloped lands that are not permitted. |

Source: California Department of Transportation. *Traffic Noise Analysis Protocol for New Highway Construction, Reconstruction, and Retrofit Barrier Projects* (May 2011).

¹ The $L_{eq}(h)$ activity criteria values are for impact determination only and are not design standards for noise abatement measures. All values are A-weighted decibels (dBA).

² Includes undeveloped lands permitted for this activity category.

$L_{eq}(h)$ = equivalent continuous sound level per hour

NAC = Noise Abatement Criteria

Figure 3.14-1: Noise Levels of Common Activities

| Common Outdoor Activities | Noise Level (dBA) | Common Indoor Activities |
|--|-------------------|--|
| Jet Fly-over at 300m (1000 ft) | 110 | Rock Band |
| Gas Lawn Mower at 1 m (3 ft) | 100 | |
| Diesel Truck at 15 m (50 ft), at 80 km (50 mph) | 90 | Food Blender at 1 m (3 ft) |
| Noisy Urban Area, Daytime | 80 | Garbage Disposal at 1 m (3 ft) |
| Gas Lawn Mower, 30 m (100 ft) | 70 | Vacuum Cleaner at 3 m (10 ft) |
| Commercial Area | | Normal Speech at 1 m (3 ft) |
| Heavy Traffic at 90 m (300 ft) | 60 | Large Business Office |
| Quiet Urban Daytime | 50 | Dishwasher Next Room |
| Quiet Urban Nighttime | 40 | Theater, Large Conference Room (Background) |
| Quiet Suburban Nighttime | 30 | Library |

| | 10 | Broadcast/Recording Studio |
| Lowest Threshold of Human Hearing | 0 | Lowest Threshold of Human Hearing |

Source : California Department of Transportation. *Traffic Noise Analysis Protocol for New Highway Construction, Reconstruction, and Retrofit Barrier Projects* (May 2011).

According to Caltrans' *Traffic Noise Analysis Protocol for New Highway Construction and Reconstruction Projects* (Traffic Noise Analysis Protocol) (May 2011), a noise impact occurs when the future noise level with the project substantially exceeds the existing noise level (defined as a 12 dBA or more increase) or when the future noise level with the project approaches or exceeds the NAC. Approaching the NAC is defined as coming within one dBA of the NAC.

If it is determined that a build alternative will have noise impacts, then potential abatement measures must be considered. Noise abatement measures that are determined to be reasonable and feasible at the time of final design of a build alternative are incorporated into the project plans and specifications. This document discusses the noise abatement measures that would likely be incorporated in the project build alternatives.

The Caltrans Traffic Noise Analysis Protocol (2011) sets forth the criteria for determining when an abatement measure is reasonable and feasible. Feasibility of noise abatement is basically an engineering concern. A minimum five-dBA reduction in the future noise level must be achieved for an abatement measure to be considered feasible. Other considerations include topography, access requirements, other noise sources, and safety considerations. Additionally, a noise reduction of seven dBA must be achieved at one or more benefited receptors for an abatement measure to be considered reasonable. The reasonableness determination is basically a cost-benefit analysis. Factors used in determining whether a proposed noise abatement measure is reasonable include residents' acceptance and the cost per benefited residence.

3.14.2 AFFECTED ENVIRONMENT

3.14.2.1 SURROUNDING LAND USES AND SENSITIVE RECEPTORS

Land use within the Study Area was determined by a number of field visits and review of aerial maps of the Study Area. Land uses within the Study Area vary and include residential, commercial, industrial, parks, recreation areas, and undeveloped land. Schools and medical facilities are located throughout the Study Area. The Interstate 710 (I-710) freeway mainline is on the west side of the Los Angeles River, from Ocean Blvd. in the City of Long Beach to Imperial Hwy. in the City of South Gate, and on the east side of the Los Angeles River, from Imperial Hwy. in the City of South Gate to State Route 60 (SR-60) in East Los Angeles. A total of 238 noise measurement sites were evaluated within the Study Area. The locations of these sites are shown on Figures 3.14-2 and 3.14-3 for Alternatives 5C and 7, respectively. Figures 3.14-2 and 3.14-3 are provided following the last page of text in this section to minimize disruptions in the text for the reader.

In response to comments received during the RDEIR/SDEIS public circulation period, a Supplemental Noise Study Report was prepared to update the original noise study report to consider noise abatement and impacts from the build alternatives at the Salvation Army Bell Shelter and to neighborhoods on the west side of the Los Angeles River in the City of Bell. The transitional housing units that are part of the Bell Shelter property are considered to be a noise-sensitive land use under Activity Category B (residential). The locations of these new sites have been included as sheets 36 and 37 of Figure 3.14-2 under Alternative 5C, and sheets 34 and 35 of Figure 3.14-3 under Alternative 7.

3.14.2.2 EXISTING NOISE ENVIRONMENT

The existing noise environment in the Study Area was determined by performing both short-term (ten-minute) and long-term (24-hour) noise readings. A few of the short-term noise level measurements were performed for 15 minutes. These short-term noise level measurements were used to calibrate the noise model. A total of 125 short-term monitoring locations were performed using MetroSonics Model dB-3080 Type 2 sound level meters within the Study Area. The results of the short-term noise monitoring are provided in Tables 6-1-1 through 6-1-10 in the *Traffic Noise Study Report* (May 2016) for the project alternatives.

Community background noise readings for a duration of ten minutes were taken at 17 locations within the limits of the build alternatives. They ranged between 50 and 61 dBA one-hour A-weighted equivalent continuous sound level ($L_{eq}[h]$). Background noise is the total of all noise generated within a community and is measured away from the freeway where freeway traffic noise does not contribute to the total noise level. Background noise levels are typically measured to determine the acoustical feasibility (noise reducibility of five dBA) of noise abatement and to ensure that noise reduction goals can be achieved.

Long-term monitoring was conducted at 24 locations using MetroSonics Model dB-3080 Type 2 sound level meters. The purpose of these measurements was to capture variations in traffic noise levels throughout the day, rather than absolute noise levels at a specific receptor of concern. The long-term sound level data was collected over 144 consecutive ten-minute intervals over a 24-hour period. The long-term 24-hour monitoring locations were used to determine the worst-hour within the limits of the build alternatives and adjust each noise measurement site to the worst-hour. The typical worst-hour noise occurs in the early morning hours just before traffic begins to slow due to congestion, usually around 5:30 a.m.–6:30 a.m. The worst noise hour is affected by many factors, and it varies depending on the day of the week, the type of area (urban vs. rural), and the percentage of heavy trucks, accidents, and other factors. There is no single worst noise hour. The worst noise hours were determined by placing a 24-hour noise meter in the backyards of homes adjacent to the freeway. Then, six consecutive ten-minute noise levels were taken that were the highest levels within the 24-hour noise test. These six noise levels were then averaged logarithmically to come up with a single noise level representing the highest noise level at that location. These noise level measurements were used to calibrate the noise model. The results of the long-term 24-hour noise monitoring were provided in Tables 6-3-1 through 6-3-4 in the *Traffic Noise Study Report* (May 2016) for the project alternatives.

In addition to performing noise level measurements, the existing noise levels were determined at 89 modeled locations, which were acoustically representative of the entire Study Area. The existing worst-hour noise levels are shown in Table 3.14-2. All noise monitoring and modeled locations are shown on Figure 3.14-2 and Figure 3.14-3.

Notes: All noise levels are in dBA L_{eq}(h).

Land Use: R=Residential; S=School; P=Park & Recreation; G=Golf Course; K=Cemetery; H=Hotel/Motel

Impact Type: N=No Impact; A=Approaches; E=Exceeds; SNI=Substantial Noise Increase

¹ Assumes the construction of Early Action Soundwalls

² Nearby site NB-42 was used as a proxy to determine existing worst-hour noise levels as well as the future no build noise level. Site NB-42 is located within the same interchange, and the surrounding topography is similar in both areas, with the freeway in a cut section; hence, the same calibration factor was used as well.

³ Nearby site NB-40 was used as a proxy to determine existing worst-hour noise levels as well as the future no build noise level. Site NB-40 is located within the same interchange, and the surrounding topography is similar in both areas, with the freeway in a cut section; hence, the same calibration factor was used as well.

⁴ Address is approximate.

* Predicted noise levels exclude noise contribution from Artesia Blvd.

** Local street traffic is the predominant noise source.

[24] = 24-hour noise measurement site.

dBA = A-weighted decibels

I-105 = Interstate 105

I-405 = Interstate 405

I-710 = Interstate 710

L_{eq}(h) = one-hour A-weighted equivalent continuous sound level

SR-91 = State Route 91

This page intentionally left blank

3.14.2.3 PUBLIC HEALTH CONSIDERATIONS

There are several types of public health considerations that have been studied over the years related to traffic noise. Although permanent hearing loss is not predicted, since most traffic sound level exposures would remain below 85 decibels (dB) over an eight-hour period, there are potential stress-induced health factors that should be considered:

- **Annoyance:** The expression of negative feelings resulting from interference with an individual's activities including disruption of one's peace of mind.
- **Sleep Disturbance:** Noise exposure lessening of the quality and duration of sleep. Particularly vulnerable groups include night workers, mothers with babies, elderly persons, persons vulnerable to physical and mental disorders, and persons with sleep disorders.
- **Immune Effects:** Noise disturbance of sleep stages resulting in immunosuppressive effects.
- **Ergonomics:** Disruption in attention resulting in decreased quality of work.
- **Psychology:** Increased stress resulting in psychic tension.
- **Cardiovascular Disease:** Specifically increased blood pressure and hypertension associated with prolonged noise exposure near roadways above 70 dBA (Bodin et al., 2009).

3.14.3 ENVIRONMENTAL CONSEQUENCES

Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), has identified the No Build (Alternative 1) as the Preferred Alternative. Therefore, no permanent or temporary noise impacts associated with the No Build (Alternative 1) will occur. Please refer to Section 2.4 of this Final EIR/EIS for more detail.

The build alternatives are considered a Type I Project under 23 CFR 772 because one or both build alternatives involve the addition of through-traffic lane(s), the addition of auxiliary lanes, and/or the addition or relocation of interchange lanes or ramps added to a quadrant to complete an existing partial interchange.

The following discussion of environmental consequences only describes the permanent impacts of the build alternatives. Please refer to Section 3.24 of this document, Construction Impacts, for a discussion of the temporary impacts of the build alternatives for each resource area. Specifically, temporary impacts related to noise are located in Section 3.24.3.14.

3.14.3.1 PERMANENT IMPACTS

GROUNDBORNE NOISE AND VIBRATION IMPACTS. When on-road vehicles cause effects, such as the rattling of windows, the source can be attributed to airborne noise if the thickness and area of

glass is in resonance with a frequency generated by a nearby vehicle. Depending on the qualities of a given window, rattling is caused by both airborne and groundborne noise and vibration. On poor quality windows where rattling is often an issue, the cause can usually be attributed to airborne noise and vibration. Groundborne vibrations are mostly associated with passenger vehicles and trucks traveling on poor roadway conditions such as potholes, bumps, expansion joints, or other discontinuities in the road surface. Smoothing the bump or filling the pothole will usually solve the problem. As the build alternatives would use new asphalt pavement followed with proper maintenance, there would be no potholes, bumps, expansion joints, or other discontinuities in the road surface that would generate groundborne vibration or direct or indirect noise impacts from vehicular traffic traveling on I-710.

TRAFFIC NOISE IMPACTS. Future noise levels were predicted using traffic characteristics that would yield the worst hourly traffic noise impact on a regular basis. The design-year (2035) peak-hour traffic volumes, vehicle classification percentages, and traffic speeds were provided by the project engineer and used as the future traffic for areas between Ocean Blvd. and SR-60.

Table 3.14-2 summarizes the traffic noise modeling results for the design-year conditions with and without the project for each build alternative. Predicted design-year traffic noise levels with the project build alternatives are compared to existing conditions and to design-year no-build conditions. The comparison to existing conditions is included in the analysis to identify traffic noise impacts related to substantial increase under 23 CFR 772. The comparison to the future no build condition indicates the traffic noise increase resulting from the build alternatives. Traffic noise impacts are predicted to occur with the build alternatives at Activity Category B, C, D, and E land uses within the Study Area, and noise abatement for the build alternatives has been considered at all noise receptors where such impacts were predicted.

3.14.4 NOISE ABATEMENT CONSIDERATION

In accordance with the Noise Control Act of 1972 and 23 CFR 772, noise abatement was considered where noise impacts were predicted in areas of frequent human use that would benefit from a lowered noise level. Potential noise abatement measures identified in the Traffic Noise Analysis Protocol (2011) for the build alternatives include the following:

- Avoiding the impact by using design alternatives, such as altering the horizontal and vertical alignment of the project;
- Constructing noise barriers;
- Acquiring property to serve as a buffer zone;
- Using traffic management measures to regulate types of vehicles and speeds; and
- Acoustically insulating public-use or nonprofit institutional structures.

All of these abatement options have been considered. However, because of the configuration and location of the build alternatives, abatement in the form of soundwalls, including Early Action Soundwalls, are the only types of abatement that are considered feasible. As part of the Early Action Soundwall Project, the Los Angeles County Metropolitan Transportation Authority (Metro) identified five miles of new soundwalls along I-710, plus an additional seven miles of existing soundwalls that can be aesthetically treated to match the new soundwalls. It is important to note that the No Build scenario for the purpose of this project analysis assumes that the Early Action Soundwall Project will have been completed. Early Action Soundwalls have been identified as those that could be constructed at the ultimate right-of-way in advance of the I-710 Corridor Project build alternatives and its associated widening.

The following is a discussion of noise abatement considered for each Activity Category and evaluation area for which traffic noise impacts resulting from the build alternatives are predicted. Generally, soundwalls have been identified according to the alternative under which they are included; the 500 series naming convention identifies soundwalls analyzed under Alternative 5C and the 700 series naming convention identifies soundwalls analyzed under Alternative 7. Soundwalls analyzed that are not along the I-710 mainline are similar for both build alternatives and identified by the freeway on which they are included (for example, SW-405A is located along I-405, and SW-91 is located along SR-91).

3.14.4.1 ACTIVITY CATEGORY A

There are no noise-sensitive receptors under this activity category.

3.14.4.2 ACTIVITY CATEGORY B

Most of the noise-sensitive land uses are residences along the I-710 between Ocean Blvd. and SR-60. Traffic noise impacts are considered to occur at receptor locations where predicted design-year noise levels are at least 12 dBA greater than existing noise levels (substantial noise increase), or where predicted design-year noise levels approach (within one dBA) or exceed the 67 dBA $L_{eq}(h)$ NAC. All impacted residential areas within the limits of the build alternatives have been considered for noise abatement, and acoustically feasible soundwalls have been provided in the *Traffic Noise Study Report* for the build alternatives. Table 3.14-2 shows all the impacted sites for which noise abatement has been considered. There are impacted residential areas where, due to the presence of an existing noise barrier, raising the height of the barrier did not achieve the minimum required five dBA noise attenuation and at least seven-dBA noise reduction at one or more benefited receptors. Under Alternative 5C, 125 Category B receptors would be subject to A/E (Approaches/Exceeds) and/or SNI (Substantial Noise Increase) impacts. Under Alternative 7, 139 Category B receptors would be subject to A/E and/or SNI impacts. The noise reduction charts are provided in Appendix B of the *Traffic Noise Study Report*.

3.14.4.3 ACTIVITY CATEGORY C

This activity category includes parks and recreational areas, golf courses, a medical facility, places of worship, schools, and cemeteries.

1. Golden Shore Recreational Vehicle (RV) Park (represented by noise barrier Site Nos. NB-A and NB.-B) is located south of Shoreline Dr. and east of the Los Angeles River. Noise measurements were conducted at a swimming pool and modeled at a nearby RV in order to determine noise impacts. Noise impacts are predicted to occur at the RV Park for both Alternatives 5C and 7, and noise abatement in the form of soundwalls has been considered.
2. Cesar E Chavez Park is located on the southeast corner of Shoreline Dr. and 6th St. east of the Los Angeles River in the City of Long Beach and is represented by Site Nos. NB-1 and NB-2. No noise impacts were identified at the park for both Alternatives 5C and 7, and no noise abatement has been considered.
3. Virginia Country Club is located between Interstate 405 (I-405) and Del Amo Blvd. along northbound I-710 in the City of Long Beach. Site No. NB-13 represents an outdoor golf course area. No impacts were identified at the golf course for either build alternative, and no noise abatement has been considered.
4. The City of Compton Golf Course is located between Alondra Blvd. and Compton/ Somerset Blvds. along northbound I-710 in the City of Compton. This golf course is represented by Site No. NB-27. Based on the noise analysis, noise impacts have been predicted to occur at this golf course for Alternative 7. Therefore, noise abatement in the form of a sound barrier was considered.
5. Ralph C. Dills Park is located between Somerset Blvd. and Rosecrans Ave. along northbound I-710 in the City of Paramount and is represented by Site No. NB-30. No noise impacts have been identified for this park under Alternative 5C. However, noise impacts were identified at this park because a substantial noise increase of 12 dB or more is predicted under Alternative 7. Noise abatement has been considered in the form of a soundwall along the freight corridor included in Alternative 7.
6. Hollydale Park is located between Century Blvd. and Gardendale St. along northbound I-710 east of the Los Angeles River in the City of South Gate. This park is represented by Site No. NB-34. No noise impacts were identified at this park under both Alternatives 5C and 7, and no noise abatement was considered.
7. Julia Russ Asmus Park (represented by modeled Site No. NB-36B) is located at 8321 Jaboneria Rd. in the City of Bell Gardens. Traffic noise impacts have been predicted to occur at this park under both Alternatives 5C and 7. Noise abatement in the form of a soundwall was considered.

8. Bandini Park (Site No. NB-44M2) is located between Washington Blvd. and the rail yard to the north in the City of Commerce. Freeway traffic noise impacts have been predicted to occur under both Alternatives 5C and 7 at this park. Noise abatement in the form of a soundwall was considered for this area.
9. The Kingdom Hall (place of worship) is located along the I-710 southbound off-ramp at Willow St. in the City of Long Beach; however, there is no exterior area of frequent human use that would benefit from a lowered noise level. Iglesia Bautista (a place of worship) is located on the southwest corner of I-710 and Interstate 5 (I-5) and has no exterior area of frequent human use that would benefit from a lowered noise level.
10. Cesar E Chavez Elementary School is located between Broadway and 3rd St. along northbound I-710 in the City of Long Beach. This school is represented by Site Nos. NB-1A (inside classroom) and NB-1B (outside area of frequent human use). Based on the noise analysis, no traffic noise impacts were predicted to occur at this school for either of the build alternatives, and no noise abatement was considered.
11. Edison Elementary School is located between 6th St. and 7th St. along the northbound side of I-710 in the City of Long Beach. This school is represented by Site No. NB-3 (exterior). Based on the noise analysis, no noise impacts were predicted to occur at this school for either of the build alternatives, and no noise abatement was considered.
12. Perry Lindsey Academy is located at the northwestern corner of Del Amo Blvd. and Long Beach Blvd. along northbound I-710 in the City of Long Beach. This school is represented by Site No. NB-15 (exterior). No noise impacts were predicted to occur at this school for either build alternative, and no noise abatement was considered.
13. Colin Powell Academy is located between Long Beach Blvd. and Artesia Blvd./State Route 91 (SR-91) along southbound I-710 in the City of Long Beach. This school is represented by Site No. SB-19 (exterior). Based on the noise analysis, no noise impacts are predicted to occur at this school under either of the build alternatives, and no noise abatement was considered.
14. The Girls and Boys Town of Compton is located between Alondra Blvd. and Compton Blvd. along southbound I-710 in an unincorporated area of Los Angeles County, Rancho Dominguez. Site No. SB-34B (exterior) acoustically represents this residential, educational, and assessment center. The exterior noise levels at this facility exceeded the NAC under Alternative 7. Noise abatement in the form of a soundwall was considered.
15. Marco Antonio Firebaugh High School is located between I-105 and Martin Luther King Jr. Blvd. along southbound I-710 in the City of Lynwood. This school is represented by Site No. SB-50 (exterior). Site No. SB-50 has been used to calibrate the noise model even though there are no frequent human use areas that would benefit from a lowered noise level. Other locations on the playground were modeled, but no noise impacts were identified.

16. Vista High School is located between Martin Luther King Jr. Blvd. and Imperial Hwy. along southbound I-710 in the City of Lynwood. Site No. SB-53 was used to calibrate this site although there is no exterior area of frequent human use identified at this school. Based on the noise analysis, no noise impacts are predicted to occur at this school under either of the build alternatives, and no noise abatement was considered.
17. William Jefferson Clinton Elementary School is located between Alondra Blvd. and Somerset Blvd. along northbound I-710 to the east of the Los Angeles River in the City of Compton. This school is represented by Site No. NB-27C (exterior). The noise analysis indicates that there would be no freeway traffic noise impacts under either build alternative for this school. Therefore, no noise abatement has been considered.
18. Dominguez High School is also located between Alondra Blvd. and Somerset Blvd. along northbound I-710 to the east of the Los Angeles River in the City of Compton. This school is represented by Site No. NB-27B (exterior). Based on the analysis, traffic noise impacts have been predicted to occur at this school for exterior areas under Alternative 7 only. However, based on Traffic Noise Model (TNM) modeling, noise barriers on the mainline I-710, as well as on the truck lanes, would not provide the minimum required five-dBA noise level. Therefore, no barriers have been included for this school.
19. Hollydale School is located between Century Blvd. and McKinley Ave. along northbound I-710 in the City of South Gate. The school is represented by Site No. MNB-32 (exterior). Based on the noise analysis, no traffic noise impacts were predicted to occur at this school under either build alternative, and no noise abatement was considered.
20. Bell Gardens Elementary School is located at 5620 Quinn St. in the City of Bell Gardens. The measured and predicted noise levels at Site Nos. NB-36 and NB-37 represent the exterior noise levels for this school. The playing field near the freeway is generally not considered an area of frequent human use that would benefit from a lowered noise level. However, since noise levels have been predicted to occur at representative sites for this school, sound barriers have been considered under both Alternatives 5C and 7.
21. Humphreys Avenue Elementary School is located at 500 South Humphreys Ave. in the City of Los Angeles. There are existing 12-foot-high soundwalls along the northbound I-710 that provide noise reduction to this school. The measured and predicted noise levels at Site No. NB-53 (a nearby residential site) are representative of the school area. Noise abatement has been considered since freeway traffic noise impacts have been predicted for this area under both build alternatives. However, based on the noise analysis, increasing the height of the existing 12-foot-high soundwall to 16 feet would only provide a noise level reduction of one to two dB. Therefore, a higher soundwall would not provide the minimum required noise reduction of five dB for acoustical feasibility and seven dB noise reduction to at least one receptor for reasonableness.

22. The Los Angeles County Fire Station (which may contain housing for firefighters) is located near the southwest corner of I-710 and Whittier Blvd. This fire station is represented by Site No. SB-71M1. Because noise impacts have been identified under both Alternatives 5C and 7, noise abatement was considered in the form of a soundwall.
23. There are four cemeteries located within the limits of the build alternatives and all of them are situated west of I-710 and north of I-5. They include Mt. Zion Cemetery, Beth Israel Cemetery, Home of Peace Memorial Park, and Calvary Cemetery. While cemeteries are considered noise-sensitive land uses according to the Protocol, they must contain an area or facility for formalized memorial gathering. Individual grave sites, access ways, and informal activity areas are not considered individually sensitive receptors. None of these cemeteries has a formalized gathering area facing the freeway, and, therefore, no noise impacts have been identified.

3.14.4.4 ACTIVITY CATEGORY D

While there are several schools where interior noise measurements were conducted, none of the school interior classroom noise levels approached or exceeded the NAC of 52 dBA- $L_{eq}(h)$. Also, there are two places of worship (discussed in Section 3.14.5.3 – Item Nos. 9 and 10) adjacent to the I-710, where the predicted worst-hour interior noise level would not approach or exceed the NAC of 52 dBA- $L_{eq}(h)$.

3.14.4.5 ACTIVITY CATEGORY E

Noise-sensitive land uses under this activity category include a hotel, a motel, and a restaurant. The NAC under this category is 72 dBA- $L_{eq}(h)$.

1. The Hilton Hotel, Long Beach (Site No. NB-C), is located on the northeast corner of Ocean Blvd. and Golden Ave., east of the Los Angeles River in the City of Long Beach. The swimming pool is located approximately 25 to 30 feet above ground in elevation. No traffic noise impacts are predicted to occur at the swimming pool area under either build alternative.
2. The Luxury Inn Motel is located just north of Long Beach Blvd. along southbound I-710. The outdoor frequent human use area (spa) associated with the motel is represented by Site No. SB-20. Noise impacts have been predicted to occur at this location under Alternative 7.
3. A McDonald's Restaurant is located at the southwest corner of Olympic Blvd. and Eastern Ave. in the City of Los Angeles. The outdoor seating area associated with the fast-food restaurant is represented by Site No. SB-70M4. Noise impacts have been predicted to occur at this restaurant for both Alternatives 5C and 7. Noise abatement in the form of a soundwall was considered.

3.14.4.6 ACTIVITY CATEGORY F

There are many industrial buildings, maintenance facilities, manufacturing, retail facilities, and warehousing units located within the limits of the build alternatives. Additionally, there is a logging facility, a bus yard, and several rail yards identified along the I-710 within the limits of the build alternatives. However, since no areas of frequent human use were identified in this category, noise abatement was not necessary to consider.

3.14.4.7 FEASIBILITY

Caltrans' *Traffic Noise Analysis Protocol* (Noise Protocol) sets forth the criteria for determining when an abatement measure is reasonable and feasible. Feasibility of noise abatement is basically an engineering concern. A minimum five-dBA (for projects using the 2011 Noise Protocol) in the future noise level must be achieved for an abatement measure to be considered feasible. Other considerations include topography, access requirements, other noise sources, and safety considerations. Each soundwall was evaluated for feasibility based on achievable noise reduction. For each sound barrier found to be acoustically feasible, the reasonable cost allowances were calculated. The following is a description of the acoustic feasibility of sound barriers for the build alternatives. The locations of acoustically feasible soundwalls for the build alternatives are shown on Figures 3.14-2 and 3.14-3 (these figures are located at the end of this section in order to not break up the text for the reader). Soundwalls that may not be considered feasible in this analysis but are identified to be constructed as part of the Early Action Soundwall Program would be funded with local funds and not subject to federal reimbursement.

ALTERNATIVE 5C

- Soundwall SW-500 would benefit the Golden Shore RV Park located on the southwest corner of Shoreline Dr. and Golden Shore Dr. in the City of Long Beach. SW-500 (a range of eight to 16 feet) would provide noise reduction in the range of seven-to-11-dBA to the park residents. SW-500 has been recommended for construction at a height of ten feet as part of the Early Action Soundwall Project. The location of this soundwall is shown on Figure 3.14-2 (sheet 2).
- Soundwalls SW-501A+B+C would benefit the residential area consisting of single-family homes located between Pacific Coast Hwy. and Willow St. along southbound I-710 in the City of Long Beach. SW-501 would replace the entire existing ten-to-12-foot-high soundwall in this area to accommodate the widening along I-710 under Alternative 5C. SW-501A+B+C would provide a five-to-15-dBA noise reduction to up to 185 receptors. As part of the Early Action Soundwall Project, SW-501 (Segments 1 through 7) has been recommended for construction at a height of 16 feet from Pacific Coast Hwy. to W. 25th St. and a height of 12 feet from W. 25th St. to Willow St. The location of this soundwall is shown on Figure 3.14-2 (sheets 4 and 5).

- Soundwall SW-501D would be included for Alternative 5C construction along Pacific Coast Hwy. in the City of Long Beach to benefit the residential area consisting of mostly single-family homes located immediately east of the Los Angeles River. SW-501D would benefit (five-to-eight dBA) approximately ten homes in this area with acoustically feasible wall heights of ten-to-16 feet. The location of this soundwall is shown on Figure 3.14-2 (sheet 4).
- Soundwall SW-502 would benefit the residential area consisting of mainly single-family homes located between Willow St. and Wardlow Rd. along southbound I-710 in the City of Long Beach. SW-502 would completely remove and replace the existing ten-foot-high soundwall in this area to accommodate widening along I-710 under Alternative 5C. The current loop off-ramp at Wardlow Rd. on southbound I-710 would be closed. SW-502 is predicted to provide a ten-to-15-dBA noise reduction to about 78 to 218 residences in this area. As part of the Early Action Soundwall Project, SW-502 (Segments 1 through 4) has been recommended for construction at a height of 12 feet from Willow St. to W. 27th St. and a height of 16 feet from W. 27th St. to Wardlow Rd. The location of this soundwall is shown on Figure 3.14-2 (sheets 5 and 6).
- Soundwall SW-502A would benefit the residential area located north of Wardlow Rd. to Baker St. along southbound I-710 in the City of Long Beach. SW-502A would remove and replace the existing ten -foot-high soundwall and would be constructed on the edge of shoulder of the truck bypass lanes. SW-502A would provide a six-to-nine-dBA noise reduction to about three to eight homes in this area just south of the I-710/I-405 interchange. The location of this soundwall is shown on Figure 3.14-2 (sheet 6).
- Soundwall SW-502B would benefit the residential area consisting of mostly single-family homes located between Baker St. and I-405 along the southbound I-405 to the southbound I-710 connector in the City of Long Beach. SW-502B would provide acoustic benefit in the range of seven-to-11-dBA to four to 18 homes in this area. As part of the Early Action Soundwall Project, SW-502B (labeled as SW-502—Segments 6 and 7) has been recommended for construction at a height of 16 feet along the State right-of-way line. The location of this soundwall is shown on Figure 3.14-2 (sheets 6 and 9).
- Soundwall SW-502C would benefit the impacted residential area along eastbound Wardlow Rd. just west of the I-710 in the City of Long Beach. SW-502C would benefit about seven homes along Wardlow Rd. that do not have property walls in their backyards. For the homes that do have the five-foot-high property walls, a noise barrier is not able to achieve the minimum required five-dBA noise reduction. It is important to note that this sound barrier has been included outside of the Caltrans' right-of-way and onto the City of Long Beach right-of-way. Therefore, before finalizing the design of this barrier for Alternative 5C, input from all affected homeowners and the City of Long Beach would need to be considered. The location of this soundwall is shown on Figure 3.14-2 (sheets 6 and 8).

Since noise impacts were identified on westbound Wardlow Rd. (represented by Sites #MSB16A-C), just west of the I-710, noise abatement was considered. However, the sound barrier provided only a two-to-three-dBA noise reduction, and therefore, did not meet the acoustical feasibility requirement.

- Soundwall SW-405A1 would be included for Alternative 5C construction on the edge of shoulder along northbound I-405 between Salmon Ave. and Santa Fe Ave., west of the I-710 in the City of Long Beach. SW-405A1 would remove and replace the existing sound barrier and would provide a five-to-eight-dBA noise reduction for about eight to 37 homes along 221st Place. The location of this soundwall is shown on Figure 3.14-2 (sheets 7 and 8).
- Soundwall SW-405A2 would be included for Alternative 5C construction on the edge of shoulder along southbound I-405 between S. McHelen Ave. and Santa Fe Ave. west of the I-710 in the City of Long Beach. SW-405A2 is a new wall that would connect the existing sound barrier immediately to the west. This barrier is predicted to provide a five-to-six-dBA noise reduction to one to three homes located south of Wardlow Rd. The location of this soundwall is shown on Figure 3.14-2 (sheets 7 and 8).
- Soundwall SW-405B would be included for Alternative 5C construction on the edge of shoulder along the northbound I-710 to the southbound I-405 connector and then transition onto the southbound I-405 mainline in the City of Long Beach. This soundwall would remove and replace the existing soundwalls, close the barrier gap over Pacific PI./Metro Blue Line Bridge, and connect to the existing sound barrier at Cedar Ave. in Long Beach. SW-405B at a height of 16 feet is predicted to provide a five-dBA noise reduction to about nine homes in this area. The location of this soundwall is shown on Figure 3.14-2 (sheet 10).
- Soundwall SW-405C1 has been recommended (as part of the Early Action Soundwall Project – SW-405C Segment 1) for construction at a height of 16 feet (1,239 feet long) and would be located on the City of Long Beach right-of-way along Del Mar Ave. near the Metro Blue Line tracks. There are no freeway noise impacts identified in this area as part of the Alternative 5C in order to improve the I-710. Also, this barrier is considered acoustically not feasible as it does not provide the minimum required noise level of five dBA. The location of this soundwall is shown on Figure 3.14-2 (sheet 10).
- Soundwall SW-405C2 also has been recommended (as part of the Early Action Soundwall Project – SW-405C Segment 2) for construction at a height of 16 feet (1,007 feet long) and located on the edge of shoulder along the northbound I-405 to northbound I-710 connector in the City of Long Beach. This residential area would likewise not be impacted by the freeway traffic noise from Alternative 5C. Similarly, this barrier would also be considered not acoustically feasible as it would provide only a three-dBA noise reduction. The location of this soundwall is shown on Figure 3.14-2 (sheet 10).

- Soundwall SW-405C3 too has been recommended (under the Early Action Soundwall Project – SW-405C Segments 4 through 6) for construction at a height of 16 feet and 740 feet in length. It would be located on the State right-of-way along the northbound I-405 off-ramp at Long Beach Blvd in the City of Long Beach. This residential area, although outside the limits for Alternative 5C, has been identified for noise impacts based on predicted noise levels. This 16-foot-high wall is also considered acoustically feasible, providing an eight-dBA noise reduction to four receivers. The location of this soundwall is shown on Figure 3.14-2 (sheet 11).
- Soundwall SW-503A+B would benefit the residential area consisting of mostly single-family homes located between Long Beach Blvd. and Artesia Blvd. along southbound I-710 in the City of Long Beach. Both soundwalls would completely remove and replace the existing eight-foot-high soundwalls to accommodate widening. These walls combined provide a seven-to-12-dBA noise reduction to approximately 39 to 49 receptors in this area. SW-503A has been recommended for construction at a height of 16 feet as part of the Early Action Soundwall Project (labeled as SW-503A – Segment 1 and SW-503B – Segment 1). SW-503B has been recommended for construction at a height of 16 feet as part of the Early Action Soundwall Project (labeled as SW-503B – Segments 2, 3, and 4). The location of this soundwall is shown on Figure 3.14-2 (sheets 14 and 17).
- Soundwall SW-91A would be included for construction on the edge of shoulder along the southbound SR-91 off-ramp at Long Beach Blvd in the City of Long Beach. SW-91A would remove and replace the existing ten-foot-high sound barrier to accommodate the widening of this realigned off-ramp under Alternative 5C. This wall provides only a one-dBA noise reduction at the maximum height of 16 feet due to the new retaining wall providing additional shielding to this area.
- Soundwall SW-91B+C would combine to provide a six-to-nine-dBA noise reduction to about 55 to 64 residences along E. 67th St. on the eastbound SR-91 in the City of Long Beach. SW-91B would be included for construction on the edge of shoulder along the northbound I-710 to the eastbound SR-91 connector transitioning onto the mainline eastbound SR-91 and up to Lime Ave. SW-91C would be constructed on the edge of shoulder along eastbound SR-91 from Atlantic Ave. to Cherry Ave. in Long Beach. It must be noted that both of these walls would need to be constructed under Alternative 5C because of the widening of SR-91 that would remove the existing ten-to-12-foot-high soundwall in this area. The location of this soundwall is shown on Figure 3.14-2 (sheets 17, 18, and 19).
- Soundwall SW-504 would be included for construction on the edge of shoulder along the southbound I-710 from Greenleaf Blvd. to Alondra Blvd. in the City of Compton. This soundwall would remove and replace the existing eight-to-12-foot-high soundwall to accommodate widening of the I-710 under Alternative 5C. It would join the existing eight-foot-high sound barrier near the power lines at Greenleaf Blvd. SW-504 is predicted to

provide an eight-to-12-dBA noise reduction to approximately 30 to 60 homes in this area. The location of this soundwall is shown on Figure 3.14-2 (sheet 20).

- Soundwall SW-505 would be included for construction on the edge of shoulder along the southbound I-710 off-ramp at Alondra Blvd. in the City of Compton. This soundwall would remove and replace the existing 12-foot-high soundwall along State right-of-way protecting the residential area along Gibson Ave. and a newly constructed developer's sound barrier (eight-feet high) that is providing noise attenuation for Seasons (a senior apartment complex) to accommodate widening of the I-710 under Alternative 5C. SW-505 would provide a six-to-eight-dBA noise reduction to approximately six to 17 homes in this area, including a small park, for the aforementioned apartment complex. Also, this barrier would join SW-506. The location of this soundwall is shown on Figure 3.14-2 (sheet 20).
- Soundwall SW-506 would be included for Alternative 5C construction on the State right-of-way (and would also join SW-505) along the southbound I-710 between Myrrh St. and Compton Blvd. in the City of Compton. It would provide a five-to-eight-dBA noise reduction to 15 to 25 receptors to this residential area. It would also remove and replace a 12-foot-high soundwall for the Girls and Boys Town facility located at the southwest corner of the I-710 and Compton Blvd. SW-506 has been recommended for construction at a height of 16 feet as part of the Early Action Soundwall Project (labeled as SW-507 – Segment 2). The location of this soundwall is shown on Figure 3.14-2 (sheets 20 and 21).
- Soundwall SW-507 would be included for construction on top of a retaining wall along the southbound I-710 off-ramp at Rosecrans Ave. in the City of Lynwood. Although this area is considered barely impacted by the Alternative 5C, the noise abatement is not acoustically feasible as it provides only a four-dBA noise reduction. However, SW-507 has been recommended for construction at a height of 14 feet as part of the Early Action Soundwall Project (labeled as SW-614 – Segments 1 and 2). The location of this soundwall is shown on Figure 3.14-2 (sheets 21 and 22).
- Soundwall SW-508 would be included for Alternative 5C construction on the edge of shoulder along eastbound Imperial Hwy. (SR-90) transitioning onto the southbound I-710 on-ramp in the City of Lynwood. SW-508 is predicted to provide a five-dBA noise reduction to about seven homes in this area. The location of this soundwall is shown on Figure 3.14-2 (sheets 23 and 24).
- Soundwall SW-509 would be included for Alternative 5C construction on the edge of shoulder along the southbound I-710 off-ramp at Imperial Hwy. (SR-90) in the City of South Gate. This barrier would need to be extended over the Los Angeles River Bridge in order to provide the required noise reduction to the impacted homes along Blumont Rd. SW-509 is predicted to provide a six-to-eight-dBA noise reduction to 27 to 30 homes in this area. The location of this soundwall is shown on Figure 3.14-2 (sheet 24).

- Soundwalls SW-510A+B+C would be included for Alternative 5C construction to provide noise reduction to the Thunderbird Villa Mobile Home Park located along southbound I-710 between Miller Way and Southern Ave. SW-510A and SW-510B would be located along the frontage road on the City of South Gate right-of-way. SW-510C would be located along the freeway edge of shoulder within the State right-of-way. SW-510A+B+C have been recommended as part of the Early Action Soundwall Project (marked as SW-509—Segments 1 through 4) at a height of 16 feet and totaling 1,948 feet in length. These barriers would provide up to a ten-dBA noise reduction for up to 65 mobile homes at Thunderbird Villa. The location of this soundwall is shown on Figure 3.14-2 (sheets 24 and 25).
- Soundwalls SW-511A+B would be included for Alternative 5C construction on the right-of-way between Shull St. and Cecilia St. along northbound I-710 in the Cities of Cudahy and Bell Gardens. These walls are separated by a channel that connects to the Los Angeles River to the west. It must be noted that SW-511A+B have been recommended as part of the Early Action Soundwall Project (marked as SW-510 – Segments 1 and 2) at a height of 16 feet and totaling 1,333 feet in length. These barriers would provide an eight-to-12-dBA noise reduction to about 20 homes in this area as well as to Julia Russ Asmus Park. The location of this soundwall is shown on Figure 3.14-2 (sheet 26).
- Soundwall SW-511C would be included for Alternative 5C construction on the edge of shoulder along the northbound I-710 from Cecilia St. (joining SW-511B) to Clara St. in the Cities of Cudahy and Bell Gardens. This sound barrier would completely remove and replace the existing ten-to-12-foot-high soundwall to accommodate widening of the I-710 under Alternative 5C. SW-511C is predicted to provide a five-to-11-dBA noise reduction to approximately ten to 27 homes in this area including the Bell Gardens Elementary School. The location of this soundwall is shown on Figure 3.14-2 (sheet 26).
- Soundwall SW-511D would be constructed on top of the retaining wall along the new Alternative 5C northbound I-710 off-ramp to Atlantic Blvd./Bandini Blvd. within the City of Bell, and would be 721 feet in length. SW-511D is predicted to provide an eight-to-10-dBA noise reduction to the modular transitional housing units at the Salvation Army Bell Shelter. The location of this soundwall is provided on Figure 3.14-2 (sheet 37).
- Soundwalls SW-512A+B have been predicted to provide a five-to-six-dBA noise reduction to the residential area and Bandini Park located along northbound I-710 at the Washington Blvd. on-ramp in the City of Commerce. SW-512A would be located on the on-ramp while SW-512B would be located on the Alternative 5C connector from northbound I-710 to northbound I-5. SW-512A would completely remove and replace an existing 15-foot-high soundwall to accommodate the new on-ramp configuration under Alternative 5C. Both SW-512A and SW-512B (parallel to each other) have been predicted to benefit 12 to 25 receptors in this area. The location of this soundwall is shown on Figure 3.14-2 (sheets 30 and 31).

- Soundwalls SW-513A+B have been predicted to provide a five-to-nine-dBA noise reduction to the residential area located along southbound I-710 at the Washington Blvd. off-ramp in the City of Commerce. SW-513A would be located on the off-ramp while SW-513B would be located on the mainline southbound I-710. SW-513A would completely remove and replace an existing 15-foot-high sound barrier to allow for new off-ramp configuration under Alternative 5C. Both SW-513A and SW-513B (parallel to each other) have been predicted to benefit four to 16 receptors in this area. The location of this soundwall is shown on Figure 3.14-2 (sheets 30 and 31).
- Soundwalls SW-514A+B have been predicted to provide a six-to-nine-dBA noise reduction to the residential area located along northbound I-710 between Noakes St. and Olympic Blvd. in the City of Commerce and the community of East Los Angeles. SW-514A would be located on the mainline northbound I-710 while SW-514B would be located on the new connector from northbound I-710 to northbound I-5 under Alternative 5C. SW-514A would completely remove and replace an existing 12-foot-high sound barrier that is located on the northbound I-710 mainline and would continue over the I-5 interchange to the Olympic Blvd. off-ramp. Both SW-514A and SW-514B (parallel to each other) have been predicted to benefit 21 to 53 receptors in this area. The location of this soundwall is shown on Figure 3.14-2 (sheets 30, 31, 32, and 33).
- Soundwall SW-515 would be included for construction on the edge of shoulder along southbound I-5 to the southbound I-710 connector in the City of Commerce and the community of East Los Angeles, removing and replacing the existing 12-foot-high sound barrier to allow for shifting of the mainline and ramps in this interchange area under Alternative 5C. Based on TNM modeling, although SW-515 does not provide the minimum required noise reduction to this residential area, it would be constructed in order to replace the existing sound barrier. The location of this soundwall is shown on Figure 3.14-2 (sheets 30, 31, 32 and 33).
- Soundwalls SW-516+SW-517 have been predicted to provide a five-to-ten-dBA noise reduction to about 14 to 62 single and multifamily residential units between Olympic Blvd. and Humphreys Ave. in the community of East Los Angeles. SW-516 would be included for construction for Alternative 5C on the edge of shoulder along the mainline northbound I-710 over the Olympic Blvd. Bridge. SW-517 would begin on the on-ramp from Olympic Blvd. onto the mainline northbound I-710 and overlap with an existing 12-foot-high barrier near Humphreys Ave. Both of these barriers would remove and replace the existing 12-foot-high barriers within the limits. The location of this soundwall is shown on Figure 3.14-2 (sheets 32, 33, 34, and 35).
- Soundwall SW-518 would be included for construction on the edge of shoulder along southbound I-710 over the Olympic Blvd. Bridge in the community of East Los Angeles. SW-518 has been predicted to provide a five-to six- dBA noise reduction to one residence (immediately south of the cemetery) along Eastern Ave. and an outside frequent human

use area at McDonald's. If this wall were to be constructed, it would obstruct the view of many commercial properties to/from the freeway. Before finalizing the design/construction of this wall, a concurrence from all affected property owners would be necessary for Alternative 5C to obtain their input. Home of the Peace Park, a cemetery in this area, does not have a formalized gathering area that would benefit from a lowered noise level, and therefore, was not analyzed for noise impacts. The location of this soundwall is shown on Figure 3.14-2 (sheets 32 and 33).

ALTERNATIVE 7

- Soundwall SW-700 would benefit the Golden Shore RV Park located on the southwest corner of Shoreline Dr. and Golden Shore Dr. in the City of Long Beach. SW-700 (a range of eight to 16 feet) and would provide noise reduction in the range of seven-to-11-dBA to the park residents. SW-700 has been recommended for construction at a height of ten feet as part of the Early Action Soundwall Project as SW-500. The location of this soundwall is shown on Figure 3.14-3 (sheet 2).
- Soundwalls SW-701A+B+C would benefit the residential area consisting of single-family homes located between Pacific Coast Hwy. and Willow St. along southbound I-710 in the City of Long Beach. SW-501 would replace the entire existing ten-to-12-foot-high soundwall in this area to accommodate the widening along I-710 under Alternative 7. SW-701A+B+C would provide a five-to- 14-dBA noise reduction to about 21 to 77 receptors. In addition, a sound barrier (SW-701TL) has been analyzed along the edge of shoulder of the elevated truck lanes from south of Pacific Coast Hwy. to just north of Willow St. However, SW-701TL in combination with SW-701A+B+C provides noise reduction to eight additional residences. This sound barrier (SW-701A+B+C) has been recommended for construction under the Early Action Soundwall Project as SW-501 (Segments 1 through 7) at a height of 16 feet from Pacific Coast Hwy. to W. 25th St. and a height of 12 feet from W. 25th St. to Willow St. The location of this soundwall is shown on Figure 3.14-3 (sheets 4 and 5).
- Soundwall SW-701D would be included for construction for Alternative 5C along the Pacific Coast Hwy. to benefit the residential area consisting of mostly single-family homes located immediately east of the Los Angeles River in the City of Long Beach. SW-701D would benefit (five-to-eight-dBA) approximately ten homes in this area with acoustically feasible wall heights of ten-to-16 feet. The location of this soundwall is shown on Figure 3.14-3 (sheet 4).
- Soundwall SW-702 would benefit the residential area consisting of mainly single-family homes located between Willow St. and Wardlow Rd. along southbound I-710 in the City of Long Beach. SW-702 would completely remove and replace the existing ten-foot-high soundwall in this area to accommodate widening along I-710 under Alternative 7. The current loop off-ramp at Wardlow Rd. on southbound I-710 would be closed under

Alternative 7. SW-702 is predicted to provide ten-to-15-dBA noise reduction to about 76 to 185 residences in this area. This soundwall (SW-702) under the Early Action Soundwall Project, has been recommended for construction as SW-502 (Segments 1–4) at a height of 12 feet from Willow St. to W. 27th St. and a height of 16 feet from W. 27th St. to Wardlow Rd. The location of this soundwall is shown on Figure 3.14-3 (sheets 5 and 6).

- Soundwall SW-702A would remove and replace the existing ten-foot-high soundwall and would be included for construction on the edge of shoulder of the northbound I-405 to southbound I-710 connector in the City of Long Beach. Although SW-702A would not provide the minimum required noise abatement to the residential area located north of Wardlow Rd. to Baker St. along southbound I-710, would to be constructed under Alternative 7 to replace the existing sound barrier that would be removed to accommodate widening. The location of this soundwall is shown on Figure 3.14-3 (sheet 6).
- Soundwall SW-702B would benefit the residential area consisting of mostly single-family homes located between Baker St. and I-405 along the southbound I-405 to southbound I-710 connector in the City of Long Beach. SW-702B would provide acoustic benefit in the range of seven-to-11-dBA to four to 12 homes in this area. As part of the Early Action Soundwall Project, this sound barrier, SW-702B (labeled as SW-502 – Segments 6 and 7) has been recommended for construction at a height of 16 feet along the State right-of-way line. The location of this soundwall is shown on Figure 3.14-3 (sheets 6 and 9).
- Soundwall SW-702C would benefit the impacted residential area along eastbound Wardlow Rd. just west of the I-710 in the City of Long Beach. SW-702C would benefit about seven homes along Wardlow Rd. that do not have property walls in their backyards. For the homes that do have the five-foot-high property walls, a noise barrier is not able to achieve the minimum required five-dBA noise reduction. This sound barrier has been included outside of the Caltrans' right-of-way and onto the City of Long Beach right-of-way. Therefore, before finalizing the design of this barrier under Alternative 7, input from all affected homeowners and the City of Long Beach would have to be considered. Since noise impacts were identified on westbound Wardlow Rd. (represented by Site Nos. MSB16A-C), just west of the I-710, noise abatement was considered. However, the sound barrier provided only a two-to-three-dBA noise reduction, and therefore, did not meet the acoustical feasibility requirement. The location of this soundwall is shown on Figure 3.14-3 (sheets 6 and 8).
- Soundwall SW-405A1 would be included for construction on the edge of shoulder along northbound I-405 between Salmon Ave. and Santa Fe Ave. west of the I-710 in the City of Long Beach under Alternative 7. SW-405A1 would remove and replace the existing sound barrier and would provide a five-to-eight-dBA noise reduction for about eight to 37 homes along 221st Place. The location of this soundwall is shown on Figure 3.14-3 (sheets 7 and 8).

- Soundwall SW-405A2 would be included for construction on the edge of shoulder along southbound I-405 between S. McHelen Ave. and Santa Fe Ave., west of the I-710 in the City of Long Beach. SW-405A2 is a new wall that would connect the existing sound barrier immediately to the west. This barrier is predicted to provide a five-to-six-dBA noise reduction to one to three homes located south of Wardlow Rd. The location of this soundwall for Alternative 7 is shown on Figure 3.14-3 (sheets 7 and 8).
- Soundwall SW-405B would be included for construction on the edge of shoulder along the northbound I-710 to the southbound I-405 connector and then transition onto the southbound I-405 mainline in the City of Long Beach. This soundwall would remove and replace the existing soundwalls, close the barrier gap over Pacific PI./Metro Blue Line Bridge, and connect to the existing sound barrier at Cedar Ave. in Long Beach. SW-405B at a height of 16 feet is predicted to provide a five-dBA noise reduction to about nine homes in this area. The location of this soundwall for Alternative 7 is shown on Figure 3.14-3 (sheet 10).
- Soundwall SW-405C1 has been recommended (as part of the Early Action Soundwall Project – SW-405C Segment 1) for construction at a height of 16 feet (1,239 feet long) and would be located on the City of Long Beach right-of-way along Del Mar Ave. near the Metro Blue Line tracks. It must be noted that there are no freeway noise impacts identified in this area as a result of Alternative 7. Also, this barrier is considered acoustically not feasible as it does not provide the minimum required noise level of five dBA. The location of this soundwall is shown on Figure 3.14-3 (sheet 10).
- Soundwall SW-405C2 also has been recommended (as part of the Early Action Soundwall Project – SW-405C Segment 2) for construction at a height of 16 feet (1,007 feet long) and located on the edge of shoulder along the northbound I-405 to northbound I-710 connector in the City of Long Beach. This residential area is likewise not impacted by the freeway traffic noise as a result of Alternative 7. Similarly, this barrier is also not acoustically feasible as it provides only a three-dBA noise reduction. The location of this soundwall is shown on Figure 3.14-3 (sheet 10).
- Soundwall SW-405C3 too has been recommended (under the Early Action Soundwall Project – SW-405C Segments 4 through 6) for construction at a height of 16 feet and 740 feet in length. It would be located on the State right-of-way along the northbound I-405 off-ramp at Long Beach Blvd. in the City of Long Beach. This residential area, although outside the limits for Alternative 7, has been identified for noise impacts based on predicted noise levels. This 16-foot-high wall is also considered acoustically feasible, providing an eight-dBA noise reduction to four receivers. The location of this soundwall is shown on Figure 3.14-3 (sheet 11).
- Soundwalls SW-703A+B would benefit the residential area consisting of mostly single-family homes located between Long Beach Blvd. and Artesia Blvd. along southbound I-710 in the City of Long Beach. Both soundwalls would completely remove and replace

the existing eight-foot-high soundwalls to accommodate widening under Alternative 7. Because of the freight corridor, these walls would provide only a five-dBA noise reduction to approximately ten receptors in this area. Therefore, SW-703TL has also been analyzed along the truck lanes from Long Beach Blvd. to Artesia Blvd. The combination of these walls would provide about a seven-to-nine-dBA noise reduction to approximately 12 to 23 homes. SW-703A has been recommended for construction at a height of 16 feet as part of the Early Action Soundwall Project (labeled as SW-503A – Segment 1 and SW-503B – Segment 1). SW-703B has been recommended for construction at a height of 16 feet as part of the Early Action Soundwall Project (labeled as SW-503B – Segments 2, 3, and 4). The location of this soundwall is shown on Figure 3.14-3 (sheets 14 and 17).

- Soundwalls SW-91A+B would combine to provide five-to seven-dBA noise reduction to about 14 to 26 residences along E. 67th St. on eastbound SR-91 in the City of Long Beach under Alternative 7. SW-91A would be included for construction on the edge of shoulder along the northbound I-710 to eastbound SR-91 connector up to Lewis Ave. SW-91B would be constructed on the edge of shoulder along the mainline eastbound SR-91 from Lewis Ave. to Cherry Ave. (transitioning onto the off-ramp at Cherry Ave.) in Long Beach. Both of these walls would need to be constructed for Alternative 7 because of the widening of the SR-91 that would remove the existing ten to 12-foot-high soundwall in this area under Alternative 7. The location of this soundwall is shown on Figure 3.14-3 (sheets 18 and 19).
- Under Alternative 7, Soundwalls SW-91C+D would combine to provide a six-to-nine-dBA noise reduction to about 21 to 32 residences along E. Eleanor St. and E. Penfold St. (between Atlantic Ave. and Cherry Ave.) on the westbound SR-91 in the City of Long Beach. SW-91C would be included for construction on the edge of shoulder along the westbound SR-91 mainline from Cherry Ave. and Lewis Ave. SW-91D would be constructed on the edge of shoulder along the mainline westbound SR-91 from Lewis Ave. to Atlantic Ave. (transitioning onto the off-ramp at Atlantic Ave.) in Long Beach. It must be noted that, both of these walls would need to be constructed for Alternative 7 because of the widening of SR-91 that would remove the existing ten-to-12-foot-high soundwall in this area under Alternative 7. The location of this soundwall is shown on Figure 3.14-3 (sheets 18 and 19).
- Soundwalls SW-91E+F would remove and replace a good portion of the existing eight- to- 12-foot-high soundwall along the edge of shoulder of the southbound I-710 to westbound SR-91 connector in the City of Long Beach. Although these walls would not provide the minimum required noise abatement to the adjacent residential area under Alternative 7, they would need to be constructed to replace the existing sound barriers that would be removed to accommodate widening under Alternative 7. The location of this soundwall or Alternative 7 is shown on Figure 3.14-3 (sheets 16 and 17).

- Soundwall SW-704 would be included for construction for Alternative 7 on the edge of shoulder along the southbound I-710 from Greenleaf Blvd. to Alondra Blvd. in the City of Compton. This soundwall would remove and replace the existing eight-to-12-foot-high soundwall to accommodate widening of the I-710 under Alternative 7. It would join the existing eight-foot-high sound barrier near the power lines at Greenleaf Blvd. SW-704 is predicted to provide an eight-to-11-dBA noise reduction to approximately 30 to 45 homes in this area. The location of this soundwall is shown on Figure 3.14-3 (sheet 20).
- Soundwall SW-705 would be included for construction for Alternative 7 on the edge of shoulder along the southbound I-710 off-ramp at Alondra Blvd. in the City of Compton. This soundwall would remove and replace the existing 12-foot-high soundwall along State right-of-way protecting the residential area along Gibson Ave. and a newly constructed developer's sound barrier (eight-foot-high) that is providing noise attenuation for Seasons (a senior apartment complex) to accommodate widening of the I-710 under Alternative 7. SW-705 would provide a five-dBA noise reduction to three receptors in this area including a small park for the aforementioned apartment complex. Also, this barrier would join SW-706. Another barrier, SW-705TL, was analyzed on top of the freight corridor (southbound). Both of these walls combined would provide up to a seven-dBA noise reduction to the same number of receptors (three). The location of this soundwall is shown on Figure 3.14-3 (sheets 20 and 21).
- Soundwall SW-706 would be included for construction for Alternative 7 on the State right-of-way (would also join SW-705) along the southbound I-710 between Myrrh St. and Compton Blvd. in the City of Compton. Based on the analysis, due to the noise contribution from the freight corridor, SW-706 would not provide the minimum required noise reduction (five dBA) to this residential area. Additional analysis revealed that even by placing a barrier on top of the truck lanes, substantial noise reduction is not achieved. SW-706 would also remove and replace a 12-foot-high soundwall for the Girls and Boys Town facility located at the southwest corner of the I-710 and Compton Blvd. SW-706 has been recommended for construction at a height of 16 feet as part of the Early Action Soundwall Project (labeled as SW-507 – Segment 2). The location of this soundwall is shown on Figure 3.14-3 (sheets 20 and 21).
- Soundwall SW-706A would be included for construction for Alternative 7 on the State right-of-way along the southbound I-710 between Compton Blvd. and Rosecrans Ave. in the City of Compton. There is an existing 12-foot-high soundwall here whose height would need to be raised to 16 feet. This vertical extension of this existing barrier provides five-to-six-dBA noise reduction to about 50 residences in this area. And additionally, a sound barrier (SW-705TL) analyzed along the elevated truck lanes would provide a seven-dBA noise reduction to about 70 residences. The location of this soundwall is shown on Figure 3.14-3 (sheet 21).

- Soundwall SW-707 would be included for construction for Alternative 7 on top of a retaining wall along the southbound I-710 off-ramp at Rosecrans Ave. in the City of Lynwood. SW-707 constructed at a height of 16 feet would provide a five-dBA noise reduction to this area. Also, SW-707 has been recommended for construction at a height of 14 feet as part of the Early Action Soundwall Project (labeled as SW-614 – Segments 1 and 2). The location of this soundwall is shown on Figure 3.14-3 (sheets 21 and 22).
- Soundwall SW-708 would be included for construction for Alternative 7 on the edge of shoulder along eastbound Imperial Hwy. (SR-90) transitioning onto the southbound I-710 on-ramp in the City of Lynwood. SW-708 (only at a height of 14 to 16 feet) is predicted to provide a five-dBA noise reduction to about seven homes in this area. Additional barrier SW-708TL along the freight corridor in the City of South Gate would not provide further acoustic benefit to any more residences in this area. The location of this soundwall is shown on Figure 3.14-3 (sheets 23 and 24).
- Soundwall SW-709 would be included for construction for Alternative 7 on the edge of shoulder along the southbound I-710 off-ramp at Imperial Hwy. (SR-90) in the City of South Gate. This barrier would need to be extended over the Los Angeles River Bridge in order to provide the required noise reduction to the impacted homes along Blumont Rd. SW-709 is predicted to provide a five-to-six-dBA noise reduction to ten to 30 homes in this area. Additional barrier SW-708TL along the freight corridor would not provide any more acoustic benefit to any more residences in this area. The location of this soundwall is shown on Figure 3.14-3 (sheet 24).
- Soundwalls SW-710A+B+C would be included for construction for Alternative 7 to provide noise reduction to the Thunderbird Villa Mobile Home Park located along southbound I-710 between Miller Way and Southern Ave. in the City of South Gate. SW-710A and SW-710B would be located along the frontage road on the City of South Gate right-of-way. SW-710C would be located along the freeway edge of shoulder within the State right-of-way. Based on the analysis, however, due to the addition of the freight corridor, none of these walls would provide the minimum required noise reduction to the Thunderbird Villa homes. Therefore, SW-710TL on top of the freight corridor has been analyzed, and based on the analysis, this wall (combined with SW-710A+B+C) would provide 11-to-14-dBA noise reduction to about 47 mobile homes. SW-710A+B+C have been recommended as part of the Early Action Soundwall Project (marked as SW-509 – Segments 1 through 4) at a height of 16 feet and totaling 1,948 feet in length. The location of this soundwall is shown on Figure 3.14-3 (sheets 24 and 25).
- Soundwalls SW-711A+B would be included for construction for Alternative 7 on the right-of-way between Shull St. and Cecilia St. along northbound I-710 in the Cities of Cudahy and Bell Gardens. These walls are separated by a channel that connects to the Los Angeles River to the west. SW-711A+B have been analyzed to provide about five-to-seven-dBA noise reduction to about nine to ten homes in this area. Additionally, since the

freight corridor runs right on top of the mainline I-710 in this area, SW-711TL has also been analyzed on top of the truck lanes. Combination of all these walls would provide a five-to-11-dBA noise reduction to about nine to 21 homes. It must be noted that SW-711A+B have been recommended as part of the Early Action Soundwall Project (marked as SW-510 – Segments 1 and 2) at a height of 16 feet and totaling 1,333 feet in length. The location of this soundwall is shown on Figure 3.14-3 (sheet 26).

- Soundwall SW-711C would be included for construction for Alternative 7 on the edge of shoulder along the northbound I-710 from Cecilia St. (joining SW-711B) to Clara St. in the Cities of Cudahy and Bell Gardens. This sound barrier would completely remove and replace the existing ten-to-12-foot-high soundwall to accommodate widening of the I-710 under Alternative 7. SW-711C is predicted to provide a five-dBA noise reduction to approximately 12 homes in this area including the Bell Gardens Elementary School. Additionally, a barrier (SW-711TL) has been analyzed that would provide greater acoustic benefit to this impacted area. SW-711C in combination with SW-711TL would provide about a nine-to-11-dBA noise reduction to up to 27 homes. The location of this soundwall is shown on Figure 3.14-3 (sheet 26).
- Soundwall SW-711D is a short (240 feet in length) sound barrier for Alternative 7 that would remove and replace the existing 12-foot-high sound barrier. This portion would be included for construction just south of the Gage Ave. Bridge along northbound I-710 in the Cities of Bell and Bell Gardens. Another sound barrier on top of the freight corridor (SW-712TL) has been analyzed in combination with SW-711D. Both of these walls combine to provide a five-dBA noise reduction to six receptors in this area. The location of this soundwall is shown on Figure 3.14-3 (sheet 27).
- Soundwall SW-711E would be included for construction for Alternative 7 on the new retaining wall between Gage Ave. and the UP Railroad Bridge in the Cities of Bell and Bell Gardens. SW-711E would remove and replace the existing eight-to-ten-foot-high sound barrier to accommodate widening under Alternative 7. This barrier would provide a six-to-ten-dBA noise reduction to approximately seven to 14 residences in this area. Another barrier, SW-712TL has also been analyzed on top of the freight corridor. Both SW-711E and SW-712TL would combine to provide ten-dBA noise reduction to 20 homes at a height of 16 feet. SW-712TL does not provide any more noise reduction than SW-711E. SW-712TL, however, does provide benefit to additional receptors. The location of this soundwall is shown on Figure 3.14-3 (sheets 27 and 28).
- Soundwalls SW-712A+B have been predicted to provide a five-to-six-dBA noise reduction to the residential area and Bandini Park, located along northbound I-710 at the Washington Blvd. on-ramp in the City of Commerce. SW-712A would be located on the on-ramp while SW-712B would be located on the included connector from northbound I-710 to northbound I-5 under Alternative 7. SW-712A would completely remove and replace an existing 15-foot-high soundwall to accommodate the new on-ramp

configuration under Alternative 7. Both SW-712A and SW-712B (parallel to each other) have been predicted to benefit 12 to 25 receptors in this area. The location of this soundwall is shown on Figure 3.14-3 (sheets 30 and 31).

- Soundwalls SW-713A+B have been predicted to provide a six-to-eight-dBA noise reduction to the residential area located along southbound I-710 at the Washington Blvd. off-ramp in the City of Commerce. SW-713A would be located on the off-ramp while SW-713B would be located on the mainline southbound I-710. SW-713A would completely remove and replace an existing 15-foot-high sound barrier to allow for new off-ramp configuration under Alternative 7. Both SW-713A and SW-713B (parallel to each other) have been predicted to benefit six to 16 receptors in this area. The location of this soundwall is shown on Figure 3.14-3 (sheets 30 and 31).
- Soundwalls SW-714A+B have been predicted to provide six-to-nine-dBA noise reduction to the residential area located along northbound I-710 between Noakes St. and Olympic Blvd. in the City of Commerce and the community of East Los Angeles. SW-714A would be located on the mainline northbound I-710 while SW-714B would be located on the included connector from northbound I-710 to northbound I-5 under Alternative 7. SW-714A would completely remove and replace an existing 12-foot-high sound barrier that is located on the northbound I-710 mainline and would continue over the I-5 interchange to the Olympic Blvd. off-ramp. Both SW-714A and SW-714B (parallel to each other) have been predicted to benefit 21 to 53 receptors in this area. It is important to note that if this wall were to be constructed, it would obstruct the view of some commercial properties (near the off-ramp at Olympic Blvd.) to/from the freeway. Before finalizing a decision to design/construct this wall for Alternative 7, a concurrence from all affected property owners would have been necessary to obtain their input. The location of this soundwall is shown on Figure 3.14-3 (sheets 30, 31 and 32).
- Soundwall SW-715 would be included for construction for Alternative 7 on the edge of shoulder along southbound I-5 to the southbound I-710 connector in the City of Commerce and the community of East Los Angeles, removing and replacing the existing 12-foot-high sound barrier to allow for shifting of the mainline and ramps/connectors in this interchange area under Alternative 7. Based on TNM modeling, although SW-715 does not provide the minimum required noise reduction to this residential area, it would need to be constructed for Alternative 7 in order to replace the existing sound barrier. The location of this soundwall is shown on Figure 3.14-3 (sheets 30, 31 and 32).
- Soundwalls SW-716+SW-717 have been predicted to provide five-to-nine-dBA noise reduction to about 14 to 64 single and multifamily residential units between Olympic Blvd. and Humphreys Ave. in the community of East Los Angeles. SW-716 would be constructed on the edge of shoulder along the mainline northbound I-710 over the Olympic Blvd. Bridge. SW-717 would begin on the on-ramp from Olympic Blvd. onto the mainline northbound I-710 and overlap with an existing 12-foot-high barrier near Humphreys Ave.

Both of these barriers would remove and replace the existing 12-foot-high barriers within the limits of Alternative 7. The location of this soundwall is shown on Figure 3.14-3 (sheets 32 and 33).

- Soundwall SW-718 would be included for construction for Alternative 7 on the edge of shoulder along southbound I-710 over the Olympic Blvd. Bridge in the community of East Los Angeles. SW-718 has been predicted to provide a six-dBA- noise reduction to one residence (immediately south of the cemetery) along Eastern Ave. and an outside frequent human use area at McDonald's. If this wall were to be constructed, it would obstruct the view of many commercial properties to/from the freeway. Before finalizing the design/ construction of this wall for Alternative 7, a concurrence from all affected property owners would have been necessary to obtain their input. Home of the Peace Park, a cemetery in this area, does not have a formalized gathering area that would benefit from a lowered noise level, and therefore, is not analyzed for noise impacts. The location of this soundwall is shown on Figure 3.14-3 (sheet 32).
- Soundwall SW-719 would be included for construction for Alternative 7 on the edge of shoulder along the southbound I-710 off-ramp at Eastern Ave. in the community of East Los Angeles, joining the existing 12-foot-high sound barrier. This short barrier has been analyzed to provide a five-dBA noise reduction to the Los Angeles County Fire Department's building where sleeping quarters for the firefighters may be impacted under Alternative 7. The location of this soundwall is shown on Figure 3.14-3 (sheet 32).

3.14.4.8 REASONABLENESS

The reasonableness of a soundwall is determined by comparing the estimated cost of the soundwall construction against the total reasonable allowance. The total reasonable allowance is determined based on the number of benefited residences multiplied by the reasonable allowance per residence. Additionally, in accordance with the Caltrans Traffic Noise Analysis Protocol (2011), each sound barrier must provide at least seven dBA of noise reduction at one or more benefited receiver(s) to be considered reasonable. Therefore, if the estimated sound barrier construction cost exceeds the total reasonable allowance or was not predicted to provide at least seven dBA of noise reduction at one or more benefited receiver, the sound barrier is determined to be not reasonable. However, if the estimated sound barrier construction cost is within the total reasonable allowance and is predicted to provide at least seven dBA of noise reduction at one or more benefited receiver, the sound barrier is determined to be reasonable.

The estimated construction cost was prepared based on escalated Caltrans 2015 Contract Cost Data. The unit costs for material used in the estimate are based on masonry construction, with a variety of foundation types applicable to site conditions. For the build alternatives, some sections of soundwalls would have been built on top of retaining walls and bridge structures. The cost of constructing the retaining walls or bridge structures was not included in the estimate for the soundwalls because the retaining walls and bridge structures are to be built under the build

alternatives regardless of the placement of the soundwalls. Therefore, the cost to construct retaining walls or bridge structures is included as part of the overall project for the build alternatives, not noise abatement. The viewpoints of benefited receptors (including those of property owners and residents of the benefited receptors) would also be taken into account prior to making a final decision on noise abatement. Since a build alternative was not selected as the Preferred Alternative, soundwalls and noise abatement will not be implemented.

Table 3.14-3 lists the acoustically feasible soundwalls for Alternatives 5C and 7 along with the design-year (2035) noise levels, the height, approximate length, the noise attenuation, number of benefited receptors, the reasonable allowance per benefited residence, the total reasonable allowances per barrier, the estimated soundwall construction cost, and whether the soundwall is reasonable. It should be noted that the base allowance for benefited receptors was increased in 2018; however, none of the conclusions regarding reasonability for walls included under the build alternatives have changed as a result of this increase.

3.14.4.9 NON-ACOUSTICAL FACTORS RELATING TO FEASIBILITY

Factors not relating to acoustics that must be considered for sound barriers include: geometric standards, safety, maintenance, security, and utility relocations, geotechnical considerations, and visual impacts. Additional factors to consider include opinions of affected residents and input from the public and public agencies. Social, economic, legal, and technological factors also must be taken into consideration.

Non-acoustic feasibility issues associated with the walls for the build alternatives are not anticipated. Non-standard features (sight distance, etc.) for both alternatives have been identified. There are non-standard locations with sight obstructions (barrier and/or soundwall).

3.14.4.10 PRELIMINARY DECISION ON SOUNDWALLS

For any build alternative, Caltrans would incorporate noise abatement in the form of barriers shown in Table 3.14-3, depending on the build alternative. The following presents the preliminary noise abatement decision for each build alternative pertaining to each of the soundwalls evaluated under Alternatives 5C and 7. Some of these barriers would be required because they would replace existing soundwalls that would be removed by the build alternatives. Calculations based on preliminary design data show that the barriers would reduce noise levels by at least 5 dBA for the residences listed in Table 3.14-3. Please note that the final decision on noise abatement for the build alternatives would typically occur following the completion of the project design for either of the respective build alternatives.

However, since the No Build (Alternative 1) has been identified as the Preferred Alternative, soundwalls will not be constructed as a part of this project. The following discussion includes the preliminary decision on noise abatement for Alternatives 5C and Alternative 7, which is presented for disclosure purposes.

Table 3.14-3: Summary of Feasibility and Reasonableness Data for Soundwalls

| Alternative | Sound Wall No. | City | Height (feet) | Approximate Length (feet) | Noise Attenuation (dBA) | Acoustically Feasible? | Number of Benefited Receptors | Acoustical Design Goal (7 dBA to one receptor) met? | Reasonable Allowance per Benefited Receptor | Total Reasonable Allowance per Barrier | Estimated Soundwall Construction Cost | Cost Less Than Allowance? |

¹ It would be required that this soundwall be constructed as a replacement of the existing soundwall to accommodate the widening of the build alternative.

² Although not reasonable, it would be required that this soundwall be provided as a replacement of the existing soundwall impacted by the build alternatives.

³ Sound barrier that is to be constructed as part of the Early Action Soundwall Project (EA-298000)

dBA = A-weighted decibels

I-710 = Interstate 710

L_{eq}(h) = one-hour A-weighted equivalent continuous sound level

RDEIR/SDEIS = Recirculated Draft Environmental Impact Report/Supplemental Draft Environmental Impact Statement

This page intentionally left blank

ALTERNATIVE 5C

- Soundwall SW-500 would benefit the Golden Shore RV Park located on the southwest corner of Shoreline Dr. and Golden Shore St. SW-500 would provide up to an 11-dBA noise reduction to 25 receptors at the Golden Shore RV Park. However, please note that SW-500 has been rejected by the City of Long Beach and as such, was not recommended for construction as part of the Early Action Soundwall Project or the I-710 Corridor Project.
- Soundwalls SW-501A+B+C would benefit the residential area consisting of single-family homes located between Pacific Coast Hwy. and Willow St. along southbound I-710. SW-501 would replace the entire existing ten-to-12-foot-high soundwall in this area to accommodate the widening along I-710 under Alternative 5C. SW-501A+B+C have been recommended to be constructed at 16 feet in height, which would provide up to a 15-dBA noise reduction to 178 residences. Please note that as part of the Early Action Soundwall Project, SW-501 (Segments 1 through 7) has been recommended for construction at a 16-foot height from Pacific Coast Hwy. to W. 25th St. and at 12 feet in height from W. 25th St. to Willow St. SW-501A+B+C covers all segments (Segments 1 through 7) of the Early Action Soundwall Project.
- Soundwall SW-501D would be constructed along Pacific Coast Hwy. to benefit the residential area consisting of mostly single-family homes located immediately east of the Los Angeles River. SW-501D has been recommended for construction at 12 feet in height providing up to a seven-dBA noise reduction to eight receptors.
- Soundwall SW-502 would benefit the residential area consisting of mainly single-family homes located between Willow St. and Wardlow Rd. along southbound I-710. SW-502 would completely remove and replace the existing ten-foot-high soundwall in this area to accommodate widening along I-710 under Alternative 5C. The current loop off-ramp at Wardlow Rd. on southbound I-710 would be closed. SW-502 is recommended for construction at 16 feet in height and it would provide up to a 15-dBA noise reduction to 218 residences in this area. Please note that as part of the Early Action Soundwall Project, SW-502 (Segments 1 through 4) has been recommended for construction at a 12-foot height from Willow St. to W. 27th St. and at 16 feet in height from W. 27th St. to Wardlow Rd.
- Soundwall SW-502A would benefit the residential area located north of Wardlow Rd. to Baker St. along southbound I-710. SW-502A would remove and replace the existing ten-foot-high soundwall and would be constructed on the edge of shoulder of the truck bypass lanes. SW-502A has been recommended at 16 feet in height and would provide up to a nine-dBA noise reduction to eight homes in this area just south of the I-710/I-405 interchange. SW-502A is identified as SW-502 (Segment 5) that could not be constructed because of the required widening.

- Soundwall SW-502B would benefit the residential area consisting of mostly single-family homes located between Baker St. and I-405 along the southbound I-405 to the southbound I-710 connector. SW-502B has been recommended to be constructed at 16 feet in height and would provide acoustic benefit of up to an 11-dBA noise reduction to 18 homes in this area. Please note that as part of the Early Action Soundwall Project, SW-502B (labeled as SW-502 – Segments 6 and 7) has been recommended for construction at a 16 feet height along the State right-of-way line.
- Soundwall SW-502C would benefit the impacted residential area along eastbound Wardlow Rd. just west of the I-710 in Long Beach. SW-502C, recommended to be constructed at 16 feet in height, would benefit seven homes along Wardlow Rd. that do not have property walls in their backyards. For the homes that do have the five-foot-high property walls, a noise barrier is not able to achieve the minimum required five-dBA noise reduction. It is important to note that this sound barrier for Alternative 5C has been included outside of the Caltrans' right-of-way and onto the City of Long Beach right-of-way. Therefore, before finalizing the design of this barrier for Alternative 5C, input from all affected homeowners and the City of Long Beach would need to be considered.
- Soundwall SW-405A1 would be constructed on the edge of shoulder along northbound I-405 between Salmon Ave. and Santa Fe Ave. west of the I-710 in the City of Long Beach. SW-405A1 would remove and replace the existing sound barrier and would be constructed at 16 feet in height to provide up to an eight-dBA noise reduction for 37 homes along 221st Place.
- Soundwall SW-405A2 was analyzed on the edge of shoulder along southbound I-405 between S. McHelen Ave. and Santa Fe Ave. west of the I-710 in Long Beach. SW-405A2 would be a new wall that would connect the existing sound barrier immediately to the west. This barrier is predicted to provide a five-to-six-dBA noise reduction for only one-to-three homes located south of Wardlow Rd. Because the construction cost of this barrier exceeds the reasonable allowance by two times, it has not been recommended for construction.
- Soundwall SW-405B would be constructed on the edge of shoulder along the northbound I-710 to southbound I-405 connector and then transition onto the southbound I-405 mainline. This soundwall would remove and replace the existing soundwalls, close the barrier gap over the Pacific Place/Metro Blue Line Bridge, and connect to the existing sound barrier at Cedar Ave. in the City of Long Beach. SW-405B at 16 feet height is predicted to provide a five-dBA noise reduction to nine homes in this area. Although this barrier does not meet the seven-dBA noise reduction goal to be determined reasonable, it would need to be constructed for Alternative 5C in order to replace an existing soundwall that would be removed to accommodate freeway widening. If the wall were to not be constructed, the community would be exposed to a noise level of 69 dBA, a five-dBA increase over existing noise levels.

- Soundwall SW-405C1, located in the City of Long Beach right-of-way along Del Mar Ave. near the Metro Blue Line tracks, has not been recommended as there are no freeway noise impacts identified in this area as part of Alternative 5C and the barrier is considered acoustically not feasible as it does not provide the minimum required noise reduction of five dBA.
- Soundwall SW-405C2 located on the edge of shoulder along the northbound I-405 to the northbound I-710 connector in the City of Long Beach is likewise not recommended for construction as this residential area is also not impacted by the freeway traffic noise resulting from Alternative 5C. Similarly, this barrier is also not acoustically feasible as it provides only a three-dBA noise reduction.
- Soundwall SW-405C3 would be located on the State right-of-way along the northbound I-405 off-ramp at Long Beach Blvd. This residential area, although outside the limits of Alternative 5C, has been identified for noise impacts based on predicted noise levels. SW-405C3 has been recommended to be constructed at 16 feet in height as it would provide up to an eight-dBA noise reduction to four receivers. Also, SW-405C3 has been recommended (under the Early Action Soundwall Project – SW-405C [Segments 4 through 6]) for construction at 16 feet in height and 740 feet in length.
- Soundwall SW-503A+B would benefit the residential area consisting of mostly single-family homes located between Long Beach Blvd. and Artesia Blvd. along southbound I-710. Both soundwalls would completely remove and replace the existing eight-foot-high soundwalls to accommodate widening under Alternative 5C. SW-503A and SW-503B have been recommended to be constructed at 16 feet in height, benefiting 49 homes with up to a 12-dBA noise reduction. Please note that SW-503A has been recommended for construction at a 16-foot height as part of the Early Action Soundwall Project (labeled as SW-503A–Segment 1 and SW-503B–Segment 1). In addition, SW-503B has been recommended for construction at 16 feet in height as part of the Early Action Soundwall Project (labeled as SW-503B–Segments 2, 3, and 4).
- Soundwall SW-91A would be constructed on the edge of shoulder along southbound SR-91 off-ramp at Long Beach Blvd. SW-91A would remove and replace the existing ten-foot-high sound barrier to accommodate the widening of this realigned off-ramp under Alternative 5C. Although SW-91A provides only a one-dBA noise reduction (due to the new retaining wall providing additional shielding to this area), it was still recommended at ten feet to replace the existing sound barrier that would be removed to accommodate freeway widening under Alternative 5C, although it is not considered feasible or reasonable.
- Soundwall SW-91B+C have been recommended for construction at 14 feet in height. These walls would combine to provide up to a nine-dBA noise reduction to 63 residences along E. 67th St. on the eastbound SR-91 in the City of Long Beach. SW-91B would be constructed on the edge of shoulder along the northbound I-710 to eastbound SR-91

connector transitioning onto the mainline eastbound SR-91 and up to Lime Ave. SW-91C would be constructed on the edge of shoulder along eastbound SR-91 from Atlantic Ave. to Cherry Ave. in Long Beach. It must be noted that both of these walls would need to be constructed for Alternative 5C because of the widening of the SR-91 that would remove the existing ten-to-12-foot-high soundwalls in this area.

- Soundwall SW-504 has been recommended for construction at 14 feet in height and would be constructed on the edge of shoulder along the southbound I-710 from Greenleaf Blvd. to Alondra Blvd. This soundwall would remove and replace the existing eight-to-12-foot-high soundwall to accommodate widening of the I-710 under Alternative 5C. It would join the existing eight-foot-high sound barrier near the power lines at Greenleaf Blvd. SW-504 is predicted to provide up to an 11-dBA noise reduction to 60 homes in this area.
- Soundwall SW-505 would be constructed on the edge of shoulder along the southbound I-710 off-ramp at Alondra Blvd. This soundwall would remove and replace the existing 12-foot-high soundwall along the State right-of-way protecting the residential area along Gibson Ave. and a newly constructed developer's sound barrier (eight feet high) that protects Seasons (a senior apartment complex) to accommodate widening of the I-710 under Alternative 5C. SW-505 has been recommended for construction at 16 feet in height and would provide up to an eight-dBA noise reduction to 17 homes in this area including a small park for the aforementioned apartment complex. Also, this barrier would join SW-506.
- Soundwall SW-506 would be constructed on the State right-of-way (would also join SW-505) along the southbound I-710 between Myrrh St. and Compton Blvd. SW-506 has been recommended at 16 feet in height. It would provide up to a seven-dBA noise reduction to 25 receptors to this residential area. It would also remove and replace a 12-foot-high soundwall for the Girls and Boys Town facility located at the southwest corner of the I-710 and Compton Blvd. Please note that SW-506 has been recommended for construction at 16 feet in height as part of the Early Action Soundwall Project (labeled as SW-507–Segment 2).
- Soundwall SW-507/614 has not been recommended for construction along the southbound I-710 off-ramp at Rosecrans Ave. Although this area is considered barely impacted by Alternative 5C, the noise abatement is not acoustically feasible as it provides only a four-dBA noise reduction.
- Soundwall SW-508 has not been recommended for construction as the noise abatement does not meet the seven-dBA acoustical design goal and is therefore not considered reasonable. The new retaining walls that would be constructed under Alternative 5C from the eastbound Imperial Hwy. (SR-90) transitioning onto the southbound I-710 on-ramp would block much of the noise to the adjacent residential area. This retaining wall is actually predicted to provide a noise reduction of up to seven dBA from future worst-hour

noise levels. Also, based on its current location, constructing SW-508 would have serious safety sight-distance issues.

- Soundwall SW-509 has been recommended for construction at 14 feet in height. It would be constructed on the edge of shoulder along the southbound I-710 off-ramp at Imperial Hwy. (SR-90). This barrier would need to be extended over the Los Angeles River Bridge in order to provide the required noise reduction to the impacted homes along Blumont Rd. SW-509 is predicted to provide up to a seven-dBA noise reduction to 28 homes in this area.
- Soundwall SW-510A+B+C have been recommended for construction for Alternative 5C at 16 feet in height. Combined, these barriers would provide up to a ten-dBA noise reduction to 65 residences of the Thunderbird Villa Mobile Home Park located along southbound I-710 between Miller Way and Southern Ave. SW-510A and SW-510B would be located along the frontage road on the City of South Gate right-of-way. Since these two walls are outside of the State right-of-way, an agreement with the residents and the City of South Gate would need to be made to the construction and maintenance of both barriers SW-510A and SW-510B under Alternative 5C. SW-510C would be located along the freeway edge of shoulder within the State right-of-way. Please note that SW-510A+B+C have been recommended as part of the Early Action Soundwall Project (marked as SW-509 – Segments 1 through 4) at 16 feet in height and totaling 1,948 feet in length. These barriers would provide up to a ten-dBA noise reduction for 65 mobile homes of the Thunderbird Villa Mobile Home Park.
- Soundwall SW-511A+B have been recommended for construction at 16 feet in height. They would be constructed on the right-of-way between Shull St. and Cecilia St. along northbound I-710. These walls are separated by a channel that connects to the Los Angeles River to the west. Both SW-511A and SW-511B combine to provide up to 12 dBA noise reduction to ten homes in this area. It must be noted that SW-511A+B have been recommended as part of the Early Action Soundwall Project (marked as SW-510 – Segments 1 and 2) at 16 feet in height and totaling 1,333 feet in length. These barriers would provide an eight-to-12-dBA noise reduction to ten residences in this area.
- Soundwall SW-511C would be constructed on the edge of shoulder along the northbound I-710 from Cecilia St. (joining SW-511B) to Clara St. This sound barrier would completely remove and replace the existing ten-to-12-foot-high soundwall to accommodate widening of the I-710 under Alternative 5C. SW-511C has been recommended at 16 feet in height and is predicted to provide up to an 11-dBA noise reduction to 27 homes in this area including the Bell Gardens Elementary School.
- Soundwall SW-511D would be constructed on top of the retaining wall along the new northbound I-710 off-ramp to Atlantic Blvd./Bandini Blvd. under Alternative 5C. SW-511D has been recommended at 16 feet in height and is predicted to provide up to an eight-dBA noise reduction to the ten residential units at the Salvation Army Bell Shelter.

- Soundwall SW-512A+B have been predicted to provide up to a six-dBA noise reduction to the residential area and Bandini Park located along northbound I-710 at the Washington Blvd. on-ramp. SW-512A would be located on the on-ramp while SW-512B would be located on the new connector under Alternative 5C from northbound I-710 to northbound I-5. SW-512A would completely remove and replace an existing 15-foot-high soundwall to accommodate the new on-ramp configuration under Alternative 5C. SW-512A has been recommended for construction at 16 feet in height with SW-512B at 14 feet in height. Both walls combined would provide acoustic benefit to 25 residences and the park in this area. Although these barriers do not meet the seven-dBA noise reduction goal to be considered reasonable, they would need to be constructed to replace the existing soundwall that would have been removed to accommodate freeway widening under Alternative 5C. If the replacement walls were to not be constructed for Alternative 5C, the community in this area would be exposed to a noise level of 74 dBA, a six-dBA increase over existing noise levels.
- Soundwall SW-513A+B have been predicted to provide up to a nine-dBA noise reduction to the residential area located along southbound I-710 at the Washington Blvd. off-ramp. SW-513A would be located on the off-ramp while SW-513B would be located on the mainline southbound I-710. SW-513A would completely remove and replace an existing 15-foot-high sound barrier to allow for the new off-ramp configuration under Alternative 5C. SW-513A has been recommended for construction at 16 feet in height with SW-513B at 14 feet in height. Both SW-513A and SW-513B have been predicted to benefit 16 homes in this area.
- Soundwall SW-514A+B have been predicted to provide up to a nine-dBA noise reduction to 47 homes located along northbound I-710 between Noakes St. and Olympic Blvd. SW-514A has been recommended for construction at 14 feet and would be located on the mainline northbound I-710 while SW-514B has also been recommended at 14 feet in height and would be located on the new connector under Alternative 5C from northbound I-710 to northbound I-5. SW-514A would completely remove and replace an existing 12-foot-high sound barrier that is located on the northbound I-710 mainline and would continue over the I-5 interchange to the Olympic Blvd. off-ramp. Both SW-514A and SW-514B have been predicted to benefit 47 residences in this area.
- Soundwall SW-515 would be constructed on the edge of shoulder along new realigned southbound I-5 to the southbound I-710 connector, removing and replacing the existing 12-foot-high sound barrier to allow for shifting of the mainline and ramps in this interchange area under Alternative 5C. Based on TNM modeling, although SW-515 does not provide the minimum required noise reduction to this residential area, it would need to be constructed for Alternative 5C in order to replace the existing sound barrier. SW-515 has been recommended for construction at 14 feet in height. Although this barrier is not considered acoustically feasible or reasonable, it would need to be constructed to replace

the existing barrier that would be removed to accommodate freeway widening under Alternative 5C. If the replacement wall was not constructed, the community in the area would be exposed to a noise level of 70 dBA, a three-dBA increase over existing levels.

- Soundwall SW-516+SW-517 have been recommended for construction at 16 feet in height. Both of these walls would provide up to a ten-dBA noise reduction to 62 single and multifamily residential units between Olympic Blvd. and Humphreys Ave. SW-516 would be constructed on the edge of shoulder along the mainline northbound I-710 over the Olympic Blvd. Bridge. SW-517 would begin on the on-ramp from Olympic Blvd. onto the mainline northbound I-710 and overlap with an existing 12-foot-high barrier near Humphreys Ave. Both of these barriers would remove and replace the existing 12-foot-high barriers in this area.
- Soundwall SW-518 has not been recommended for construction as the construction cost is double the reasonable allowance for this barrier. SW-518 would provide up to a six-dBA noise reduction to only one residence (immediately south of the cemetery) along Eastern Ave. and an outside frequent human use area at McDonald's. The construction cost of \$332,856 exceeds the reasonable allowance of \$160,000, and therefore, is considered to be not reasonable from a cost perspective.

DESIGN OPTION 3A

- Soundwall SW-514A+B have been predicted to provide up to a nine-dBA noise reduction to 47 homes located along northbound I-710 between Noakes St. and Olympic Blvd. SW-514A has been recommended for construction at 14 feet and would be located on the mainline northbound I-710 while SW-514B has also been recommended at 14 feet in height and would be located on the new connector under Design Option 3A from northbound I-710 to northbound I-5. SW-514A would completely remove and replace an existing 12-foot-high sound barrier that is located on the northbound I-710 mainline and would continue over the I-5 interchange to the Olympic Blvd. off-ramp. Both SW-514A and SW-514B have been predicted to benefit 47 homes in this area.
- Soundwall SW-515 would be constructed on the edge of shoulder along new realigned southbound I-5 to the southbound I-710 connector, removing and replacing the existing 12-foot-high sound barrier to allow for shifting of the mainline and ramps in this interchange area under Design Option 3A. Based on TNM modeling, although SW-515 does not provide the minimum required noise reduction to this residential area, it would need to be constructed for Design Option 3A in order to replace the existing sound barrier. SW-515 has been recommended for construction at 14 feet in height. Although not acoustically feasible or reasonable, this barrier would need to be constructed for Design Option 3A to replace the existing barrier that would be removed to accommodate freeway widening. If the replacement wall were not constructed, the

community in this area would be exposed to a 70 dBA noise level, a three-dBA increase over existing levels.

- Soundwalls SW-516+SW-516A+SW-516B+SW-517 have all been recommended for construction at 14 feet in height. All of these walls together would provide up to a nine-dBA noise reduction to 142 single and multifamily residential units between Olympic Blvd. and Humphreys Ave. along the northbound I-710. SW-516 (from south of Olympic Blvd. to Verona St.) would be constructed along the edge of shoulder of the new direct connector under Design Option 3A from Slauson Ave. to SR-60. SW-516A would be constructed on the edge of shoulder along the mainline northbound I-710 over the Olympic Blvd. Bridge. SW-516B would be constructed on the mainline I-710 (northbound) from Whittier Blvd. to Humphrey Ave. SW-517 would begin on the on-ramp from Olympic Blvd. onto the new direct connector to SR-60 until Humphrey Ave. under Design Option 3A. All of these barriers would remove and replace the existing 12-foot-high barriers in this area.
- Soundwall SW-518 has been recommended for construction at 16 feet in height along the on-ramp at Olympic Blvd. and then onto the southbound I-710 mainline. SW-518 would provide a five-dBA noise reduction to 12 residences (immediately south of the cemetery) along Eastern Ave. and an outside frequent human use area at McDonald's. It should be noted that since this barrier does not meet the acoustical design goal of a seven-dBA reduction to one benefited receptor, it is not eligible for Federal funding.
- Soundwalls SW-519 and SW-520 have been recommended for construction at 14 feet in height along the southbound I-710 at Whittier Blvd. and would replace the existing 12-foot high walls, as well as partially remove and replace an existing ten-foot sound barrier located on the State right-of-way between Humphrey Ave. and the Whittier Blvd. off-ramp. An eight-dBA noise reduction would be provided to 27 homes in this area.

ALTERNATIVE 7

- Soundwall SW-700 would benefit the Golden Shore RV Park located on the southwest corner of Shoreline Dr. and Golden Shore St. SW-700 would provide up to an 11-dBA noise reduction to 25 receptors at the Golden Shore RV Park. However, please note that SW-700 has been rejected by the City of Long Beach and as such, has not been recommended for construction under the Early Action Soundwall Project or Alternative 7.
- Soundwalls SW-701A+B+C + SW-701TL would benefit the residential area consisting of single-family homes located between Pacific Coast Hwy. and Willow St. along southbound I-710. SW-701 would replace the entire existing ten-to-12-foot-high soundwall in this area to accommodate the widening along I-710 under Alternative 7. SW-701A+B+C have been recommended at 16 feet in height along the State right-of-way. In addition, a sound barrier (SW-701TL) has also been recommended at eight feet in height along the

edge of shoulder of the elevated truck lanes from south of the Pacific Coast Hwy. to just north of Willow St. All of these sound barriers combined would provide up to 15 dBA noise reduction to 85 homes. Please note that sound barriers SW-701A+B+C have been recommended for construction under the Early Action Soundwall Project as SW-501 (Segments 1 through 7) at 16 feet in height from Pacific Coast Hwy. to W. 25th St. and at 12 feet in height from W. 25th St. to Willow St.

- Soundwall SW-701D would be constructed along the Pacific Coast Hwy. to benefit the residential area consisting of mostly single-family homes located immediately east of the Los Angeles River. SW-701D has been recommended for construction at 12 feet in height and would benefit (up to a seven-dBA noise reduction) eight homes in this area.
- Soundwall SW-702 would benefit the residential area consisting of mainly single-family homes located between Willow St. and Wardlow Rd. along southbound I-710. SW-702 would completely remove and replace the existing ten-foot-high soundwall in this area to accommodate widening along I-710 under Alternative 7. The current loop off-ramp at Wardlow Rd. on southbound I-710 would be closed. SW-702 is recommended for construction at 16 feet in height and is predicted to provide up to a 15-dBA noise reduction to 185 residences in this area. Please note that this soundwall (SW-702) has been recommended for construction under the Early Action Soundwall Project as SW-502 (Segments 1 through 4) at 12 feet in height from Willow St. to W. 27th St. and at 16 feet in height from W. 27th St. to Wardlow Rd.
- Soundwall SW-702A would remove and replace the existing ten-foot-high soundwall and would be constructed on the edge of shoulder of the northbound I-405 to southbound I-710 connector. Although SW-702A would not provide the minimum required noise abatement to the residential area located north of Wardlow Rd. to Baker St. along southbound I-710, it would need to be constructed for Alternative 7 to replace the existing sound barrier that would be removed to accommodate widening under Alternative 7. SW-702A has been recommended for construction at 16 feet in height. Although not acoustically feasible or reasonable, this barrier would be constructed for Alternative 7 to replace the existing soundwall that would be removed to accommodate freeway widening. If the wall was not constructed, the community in this area would be exposed to a 70 dBA noise level, a six-dBA increase over existing levels.
- Soundwall SW-702B would benefit the residential area consisting of mostly single-family homes located between Baker St. and I-405 along the southbound I-405 to southbound I-710 connector. SW-702B has been recommended for construction at 16 feet in height and would provide acoustic benefit of up to 11 dBA to 12 homes in this area. Please note that as part of the Early Action Soundwall Project, this sound barrier, SW-702B (labeled as SW-502–Segments 6 and 7) has been recommended for construction at 16 feet in height along the State right-of-way line.

- Soundwall SW-702C would benefit the impacted residential area along eastbound Wardlow Rd. just west of the I-710 in the City of Long Beach. SW-702C, recommended at 16 feet in height, would benefit seven homes along Wardlow Rd. that do not have property walls in their backyards. For the homes that do have the five-foot-high property walls, a noise barrier is not able to achieve the minimum required five-dBA noise reduction. It is important to note that this sound barrier has been included outside of the Caltrans' right-of-way and onto the City of Long Beach right-of-way. Therefore, before finalizing the design of this barrier for Alternative 7, input from all affected homeowners and the City of Long Beach would need to be considered.
- Soundwall SW-405A1 has been recommended to be constructed at 16 feet in height on the edge of shoulder along northbound I-405 between Salmon Ave. and Santa Fe Ave. west of the I-710 in the City of Long Beach. SW-405A1 would remove and replace the existing sound barrier and would provide up to an eight-dBA noise reduction for 37 homes along 221st Place.
- Soundwall SW-405A2 was analyzed on the edge of shoulder along southbound I-405 between S. McHelen Ave. and Santa Fe Ave. west of the I-710 in the City of Long Beach. SW-405A2 is a new wall that would connect the existing sound barrier immediately to the west. This barrier is predicted to provide five-to-six-dBA noise reduction to only one to three homes located south of Wardlow Rd. Because the construction cost of this barrier exceeded the reasonable allowance by two times, it has not been recommended for construction.
- Soundwall SW-405B would be constructed on the edge of shoulder along the northbound I-710 to the southbound I-405 connector and then transition onto the southbound I-405 mainline. This soundwall would remove and replace the existing soundwalls, close the barrier gap over the Pacific Place/Metro Blue Line Bridge, and connect to the existing sound barrier at Cedar Ave. in the City of Long Beach. SW-405B, at 16 feet in height, is predicted to provide a five-dBA noise reduction at up to nine homes in this area. Although this barrier does not meet the seven-dBA noise reduction goal to be considered reasonable, it would need to be constructed for Alternative 7 to replace the existing wall that would be removed to accommodate freeway widening. If the wall was not constructed, the community in the area would be exposed to a noise level of 70 dBA, a six-dBA increase over existing levels.
- Soundwall SW-405C1 located on the City of Long Beach right-of-way along Del Mar Ave. near the Metro Blue Line tracks in Long Beach has not been recommended as there are no freeway noise impacts identified in this area as part of Alternative 7, and the barrier is considered acoustically not feasible as it does not provide the minimum required noise reduction of five dBA.
- Soundwall SW-405C2 located on the edge of shoulder along the northbound I-405 to the northbound I-710 connector in Long Beach is likewise not recommended for construction

as this residential area is also not impacted by the freeway traffic noise by Alternative 7. Similarly, this barrier is also not acoustically feasible as it provides only a three-dBA noise reduction.

- Soundwall SW-405C3 would be located on the State right-of-way along the northbound I-405 off-ramp at Long Beach Blvd. This residential area, although outside the limits for Alternative 7, has been identified for noise impacts based on predicted noise levels. SW-405C3 has been recommended at 16 feet in height as it would provide up to an eight-dBA noise reduction to four receivers. Also, SW-405C3 has been recommended (under the Early Action Soundwall Project – SW-405C [Segments 4 through 6]) for construction at 16 feet in height and 740 feet in length.
- Soundwall SW-703A+B + SW-703TL would benefit the residential area consisting of mostly single-family homes located between Long Beach Blvd. and Artesia Blvd. along southbound I-710. Both soundwalls would completely remove and replace the existing eight-foot-high soundwalls to accommodate widening under Alternative 7. Because of the freight corridor, these walls would provide only a five-dBA noise reduction to ten receptors in this area. Therefore, SW-703TL has also been analyzed along the truck lanes from Long Beach Blvd. to Artesia Blvd. SW-703TL has been recommended at 10 feet in height along the truck lane structure as it provides (in association with SW-703A+B) an eight-dBA reduction to 21 receptors in the area. It should be noted that while SW-703TL is acoustically feasible and meets the seven-dBA acoustical design goal, it is not considered cost-reasonable, and it is not eligible for Federal funding. SW-703A and SW-703B have been recommended at 16 feet in height. Please note that SW-703A has been recommended for construction at 16 feet in height as part of the Early Action Soundwall Project (labeled as SW-503A–Segment 1 and SW-503B–Segment 1). And SW-703B has been recommended for construction at 16 feet in height as part of the Early Action Soundwall Project (labeled as SW-503B–Segments 2, 3, and 4).
- Soundwall SW-91A+B have been recommended for construction at 16 feet in height, and they would combine to provide up to a seven-dBA noise reduction to 26 residences along E. 67th St. on the eastbound SR-91 in the City of Long Beach. SW-91A would be constructed on the edge of shoulder along the northbound I-710 to eastbound SR-91 connector up to Lewis Ave. SW-91B would be constructed on the edge of shoulder along the mainline eastbound SR-91 from Lewis Ave. to Cherry Ave. (transitioning onto the off-ramp at Cherry Ave.) in the City of Long Beach. It must be noted that both of these walls would need to be constructed for Alternative 7 because of the widening of the SR-91 under Alternative 7 that would remove the existing ten-to-12-foot-high soundwall in this area.
- Soundwall SW-91C+D have been recommended for construction at 14 feet in height and they would combine to provide up to an eight-dBA noise reduction to 30 residences along E. Eleanor St. and E. Penfold St. (between Atlantic Ave. and Cherry Ave.) on the westbound SR-91 in the City of Long Beach. SW-91C would be constructed on the edge

of shoulder along the westbound SR-91 mainline from Cherry Ave. and Lewis Ave. SW-91D would be constructed on the edge of shoulder along the mainline westbound SR-91 from Lewis Ave. to Atlantic Ave. (transitioning onto the off-ramp at Atlantic Ave.) in the City of Long Beach. It must be noted that both of these walls would need to be constructed for Alternative 7 because of the widening of the SR-91 that would remove the existing ten-to-12-foot high soundwall in this area.

- Soundwall SW-91E+F would remove and replace a good portion of the existing eight- to-12-foot-high soundwall along the edge of shoulder of the southbound I-710 to the westbound SR-91 connector. Although these walls would not provide the minimum required noise abatement to the adjacent residential area, they would need to be constructed for Alternative 7 to replace the existing sound barriers that would be removed to accommodate widening. Both SW-91E and SW-91F have been recommended for construction at 14 feet in height. Although these barriers are not considered acoustically feasible or cost-reasonable, they it would need to be constructed under Alternative 7 to replace the existing soundwall that would be removed in order to accommodate freeway widening. If the walls were not constructed, the community in this area would be exposed to a noise level of 72 dBA, an eight-dBA increase over existing noise levels.
- Soundwall SW-704 would be constructed on the edge of shoulder along the southbound I-710 from Greenleaf Blvd. to Alondra Blvd. This soundwall would remove and replace the existing eight-to-12-foot-high soundwall to accommodate widening of the I-710 under Alternative 7. It would join the existing eight-foot-high sound barrier near the power lines at Greenleaf Blvd. SW-704 is recommended for construction at 14 feet in height and would provide up to an 11-dBA noise reduction to 45 homes in this area.
- Soundwall SW-705 + SW-705TL: SW-705 has been recommended at 16 feet in height and would be constructed on the edge of shoulder along the southbound I-710 off-ramp at Alondra Blvd. This soundwall would remove and replace the existing 12-foot-high soundwall along the State right-of-way protecting the residential area along Gibson Ave. and a newly constructed developer's sound barrier (eight-foot-high) that protects Seasons (a senior apartment complex) to accommodate widening of the I-710 under Alternative 7. SW-705 would provide a five-dBA noise reduction to only three receptors in this area, including a small park for the aforementioned apartment complex. Also, this barrier would join SW-706. Another barrier, SW-705TL, was analyzed on top of the freight corridor (southbound). SW-705TL has been recommended for construction at eight feet in height. Both of these walls combined would provide up to a seven-dBA noise reduction to the same number of receptors (three) in this area. While a combination of these recommended barriers is acoustically feasible but not cost effective, SW-705TL would combine with other walls (see below) to provide acoustic benefit to 70 receptors in this community and is cost-reasonable and, therefore, was recommended for construction.

- Soundwall SW-706 + SW-705TL: SW-706 would be constructed at 16 feet in height on the State right-of-way (and would also join SW-705) along southbound I-710 between Myrrh St. and Compton Blvd. Based on the analysis, due to the noise contribution from the freight corridor, SW-706 would not provide the minimum required noise reduction (five dBA) to this residential area. SW-705TL has been recommended for construction at eight feet in height. Both walls together would provide a three-dBA noise reduction. SW-706 would also remove and replace a 12-foot-high soundwall for the Girls and Boys Town facility located at the southwest corner of the I-710 and Compton Blvd. Please note that SW-706 has been recommended for construction at 16 feet in height as part of the Early Action Soundwall Project (labeled as SW-507–Segment 2).
- Soundwall SW-706A + SW-705TL: SW-706A has been recommended to be constructed at 16 feet in height on the State right-of-way along southbound I-710 between Compton Blvd. and Rosecrans Ave. There is an existing 12-foot-high soundwall here whose height would need to be raised to 16 feet. The vertical extension of this existing barrier provides up to a six-dBA noise reduction to 50 residences in this area. And additionally, a sound barrier (SW-705TL) analyzed along the elevated truck lanes would provide up to a seven-dBA noise reduction to 70 residences. SW-705TL has been recommended for construction at eight feet in height.
- Soundwall SW-707/614 has not been recommended for construction along the southbound I-710 off-ramp at Rosecrans Ave. Although this area is considered barely impacted by Alternative 7, the noise abatement is not acoustically feasible as it provides only a four-dBA noise reduction. This barrier is not included for construction as it does not provide the minimum required noise reduction.
- Soundwall SW-708 has not been recommended for construction on the edge of shoulder along eastbound Imperial Hwy. (SR-90) transitioning onto the southbound I-710 on-ramp. SW-708 would not achieve a seven-dBA reduction to at least one impacted receptor, and would be located along a tight curve causing sight distance issues. Additional barrier SW-708TL along the freight corridor would not provide any more acoustic benefit to any more residences in this area, and therefore, has also not been recommended.
- Soundwall SW-709 has been recommended for construction at 16 feet in height and would be constructed on the edge of shoulder along the southbound I-710 off-ramp at Imperial Hwy. (SR-90). This barrier would need to be extended over the Los Angeles River Bridge in order to provide the required noise reduction to the impacted homes along Blumont Rd. SW-709 is predicted to provide a six-dBA noise reduction to 30 homes in this area. Additional barrier SW-708TL along the freight corridor would not provide any more acoustic benefit to any more residences in this area, and therefore, has not been recommended. It should be noted that since SW-709 does not meet the acoustical design goal of a seven-dBA reduction to one impacted receptor, it is not eligible for Federal funding.

- Soundwall SW-710A+B+C + SW-710TL: SW-710A+B+C have been recommended to be constructed at 16 feet in height to provide noise reduction to the Thunderbird Villa Mobile Home Park located along southbound I-710 between Miller Way and Southern Ave. SW-710A and SW-710B would be located along the frontage road on the City of South Gate right-of-way. SW-710C would be located along the freeway edge of shoulder within the State right-of-way. Based on the analysis, however, due to the addition of the freight corridor, none of these walls would provide the minimum required noise reduction to the Thunderbird Villa Mobile homes. Therefore, SW-710TL on top of the freight corridor has been recommended for construction at eight feet in height. The combination of SW-710A+B+C and SW-710TL would provide up to an 11-dBA noise reduction to 47 mobile homes. Please note that SW-710A+B+C have been recommended as part of the Early Action Soundwall Project (marked as SW-509—Segments 1 through 4) at 16 feet in height and totaling 1,948 feet in length.
- Soundwall SW-711A+B + SW-711TL: SW-711A+B have been recommended for construction at 16 feet in height on the right-of-way between Shull St. and Cecilia St. along northbound I-710. These walls are separated by a channel that connects to the Los Angeles River to the west. Additionally, since the freight corridor runs directly on top of the mainline I-710 in this area, SW-711TL, at eight feet in height, has also been recommended for construction on top of the truck lanes. The combination of all these walls would provide up to a ten-dBA noise reduction to about 16 homes. It must be noted that SW-711A+B have been recommended as part of the Early Action Soundwall Project (marked as SW-510—Segments 1 and 2) at 16 feet in height and totaling 1,333 feet in length.
- Soundwall SW-711C + SW-711TL: SW-711C has been recommended for construction at 16 feet height on the State right-of-way along the northbound I-710 from Cecilia St. (joining SW-711B) to Clara St. This sound barrier would completely remove and replace the existing ten-to-12-foot-high soundwall to accommodate widening of the I-710 under Alternative 7. Additionally, a barrier (SW-711TL) on top of the truck lanes has been recommended at eight feet in height that would provide greater acoustic benefit to this impacted area. SW-711C in combination with SW-711TL would provide up to a nine-dBA noise reduction to 25 homes and the Bell Gardens Elementary School. Although these barriers are not considered reasonable, they would need to be constructed for Alternative 7 to replace the existing soundwall that would be removed to accommodate freeway widening. If the walls were not constructed, the community and school in this area would be exposed to a 78 dBA noise level, a ten-dBA increase over existing levels.
- Soundwall SW-711D + SW-712TL: SW-711D is a short (240-foot in length) sound barrier that has been recommended for construction at 16 feet in height. This barrier would replace the existing 12-foot-high sound barrier to accommodate widening of the I-710 mainline under Alternative 7. This portion of the wall would be constructed on a retaining wall just south of the Gage Ave. Bridge along northbound I-710. Another sound barrier on

top of the freight corridor (SW-712TL) has also been recommended at eight feet in height. Both SW-711D and SW-712TL would combine to provide a five-dBA noise reduction to six receptors in this area. Although SW-711D does not meet the acoustical design goal of a seven-dBA reduction to one impacted receptor to be considered reasonable, it would need to be constructed for Alternative 7 to replace the existing wall that would be removed to accommodate freeway widening. If this wall was not constructed, the community in this area would be exposed to a 70 dBA noise level, two dBA over existing levels.

- Soundwall SW-711E + SW-712TL: SW-711E has been recommended for Alternative 7 for construction at 16 feet in height on the new retaining wall between Gage Ave. and the Union Pacific Railroad Bridge. SW-711E would remove and replace the existing eight-to-ten-foot sound barrier to accommodate widening under Alternative 7. Another barrier, SW-712TL has also been recommended at an eight-foot height on top of the freight corridor. Both SW-711E and SW-712TL would combine to provide a ten-dBA noise reduction to 20 homes in this area.
- Soundwall SW-712A+B have been recommended at heights of 16 feet and 14 feet, respectively. They have been predicted to provide up to a six-dBA noise reduction to the residential area and Bandini Park located along northbound I-710 at the Washington Blvd. on-ramp. SW-712A would be located on the on-ramp while SW-712B would be located on the new connector from northbound I-710 to northbound I-5 under Alternative 7. SW-712A would completely remove and replace an existing 15-foot-high soundwall to accommodate the new on-ramp configuration under Alternative 7. Both SW-712A and SW-712B (parallel to each other) have been predicted to benefit 25 residences in this area. Although these barriers are not considered reasonable as they do not meet the acoustical design goal of a seven-dBA reduction to one impacted receptor, they would need to be constructed under Alternative 7 to replace the existing wall that would be removed to accommodate freeway widening. If the walls were not constructed, the community in the area would be exposed to a 75 dBA noise level, a seven-dBA increase over existing levels.
- Soundwall SW-713A+B have been recommended at heights of 16 feet and 14 feet, respectively. They would provide up to an eight-dBA noise reduction to the residential area located along southbound I-710 at the Washington Blvd. off-ramp. SW-713A would be located on the off-ramp while SW-713B would be located on the mainline southbound I-710. SW-713A would completely remove and replace an existing 15-foot-high sound barrier to allow for the new off-ramp configuration under Alternative 7. Both SW-713A and SW-713B (parallel to each other) have been predicted to benefit 16 homes in this area.
- Soundwall SW-714A+B have been recommended at heights of 14 feet. They have been predicted to provide up to a nine-dBA noise reduction to the residential area located along northbound I-710 between Noakes St. and Olympic Blvd. SW-714A would be located on the mainline northbound I-710 while SW-714B would be located on the new connector from northbound I-710 to northbound I-5 under Alternative 7. SW-714A would completely

remove and replace an existing 12-foot-high sound barrier that is located on the northbound I-710 mainline and would continue over the I-5 interchange to the Olympic Blvd. off-ramp. Both SW-714A and SW-714B (parallel to each other) have been predicted to benefit 47 homes in this area. It is important to note that if SW-714A were to be constructed, it would obstruct the view of some commercial properties (near the off-ramp at Olympic Blvd.) to/from the freeway. Before finalizing a decision to design/construct this wall for Alternative 7, a concurrence from all affected property owners would have been necessary to obtain their input.

- Soundwall SW-715 has been recommended for construction at 14 feet in height on the edge of shoulder along southbound I-5 to the southbound I-710 connector, removing and replacing the existing 12-foot-high sound barrier to allow for shifting of the mainline and ramps/connectors in this interchange area under Alternative 7. Based on TNM modeling, although SW-715 does not provide the minimum required noise reduction to this residential area and is not considered acoustically feasible or reasonable, it would need to be constructed for Alternative 7 in order to replace the existing sound barrier that would be removed to accommodate freeway widening. If the wall was not constructed, the community in the area would be exposed to a 72 dBA noise level, a five-dBA increase over existing levels.
- Soundwall SW-716+SW-717 have been recommended for construction at 16 feet in height. They are predicted to provide up to a nine-dBA noise reduction to 64 single- and multifamily residential units between Olympic Blvd. and Humphreys Ave. SW-716 would be constructed on the edge of shoulder along the mainline northbound I-710 over the Olympic Blvd. Bridge. SW-717 would begin on the on-ramp from Olympic Blvd. onto the mainline northbound I-710 and overlap with an existing 12-foot-high barrier near Humphreys Ave. The new barriers would replace the existing 12-foot-high barriers within the limits of Alternative 7. It is important to note that if SW-716 were to be constructed, it would obstruct the view of some commercial properties (near the on/off-ramp at Olympic Blvd.) to/from the freeway. Before finalizing a decision to design/construct this wall for Alternative 7, a concurrence from all affected property owners would have been necessary to obtain their input.
- Soundwall SW-718 has not been recommended for construction on the edge of shoulder along southbound I-710 over the Olympic Blvd. Bridge. Although SW-718 has been predicted to provide a six-dBA noise reduction to only one residence (immediately south of the cemetery) along Eastern Ave. and an outside frequent human use area at McDonald's, the construction cost estimate of this barrier is two times the reasonable allowance. Also, if this wall were to be constructed, it would obstruct the view of many commercial properties to/from the freeway.
- Soundwall SW-719 analyzed on the edge of shoulder along the southbound I-710 off-ramp at Eastern Ave., joining the existing 12-foot-high sound barrier, has not been

recommended. This short barrier had been analyzed to determine acoustical feasibility to the Los Angeles County Fire Department's building in which sleeping quarters for the firefighters may be impacted. Although SW-719 provides a five-dBA noise reduction, it is considered not cost-effective as the construction cost would be two times the reasonable allowance for this barrier.

3.14.5 AVOIDANCE, MINIMIZATION, AND/OR ABATEMENT MEASURES

Should a build alternative have been selected as the Preferred Alternative, the following measure would be required to provide abatement for traffic noise impacts associated with the build alternatives in accordance with 23 CFR 772.

However, as the No Build (Alternative 1) was identified as the Preferred Alternative, adverse noise impacts would not occur, and the adoption of this alternative would not require any avoidance, minimization, and/or mitigation measures. Avoidance, minimization, and/or mitigation measures pertaining to the two build alternatives are retained in this Final EIR/EIS for disclosure purposes.

N-1 Based on the studies completed to date, the California Department of Transportation (Caltrans) intends to incorporate noise abatement in the form of soundwalls listed as reasonable in Table 3.14-3, depending on the selected alternative. During final design, Caltrans will make the final decision on noise abatement to be included in the selected build alternative, based on the final design of the proposed project and the public involvement process. If during final design, conditions have substantially changed, noise abatement at some of the locations noted above may not be necessary. Caltrans will incorporate the final noise abatement in the final project design and specifications.

3.15 ENERGY

The information in this section is based on the following document:

- *Interstate 710 (I-710) Corridor Project Revised Final Energy Technical Report* (December 2020)

Following public review of the RDEIR/SDEIS, a Near-Zero Emission (NZE) energy calculation technique was published in the Low Carbon Fuel Standard (LCFS) Methodology,¹ which necessitated updates to the technical study. The study was also updated to refine input data in order to fully capture travel speeds, vehicle miles traveled, and vehicle hours traveled for zero- and non-zero emissions vehicles, by vehicle class, on the roadway network within the region and within the I-710 Area of Interest.

3.15.1 REGULATORY SETTING

The National Environmental Policy Act (NEPA) (42 United States Code [USC] Part 4332) requires the identification of all potentially significant impacts to the environment, including energy impacts.

The California Environmental Quality Act (CEQA) Guidelines Section 15126.2(b) and Appendix F, Energy Conservation, require an analysis of a project's energy use to determine if the project may result in significant environmental effects due to wasteful, inefficient, or unnecessary use of energy, or wasteful use of energy resources.

3.15.2 AFFECTED ENVIRONMENT

Energy impacts were estimated using the traffic modeling data for the following study areas:

- Region: South Coast Air Basin (Basin);
- Area of Interest: a sub-region of the Basin that includes cities and communities along the I-710 freeway as well as major roadways that lead to and run parallel to the I-710 freeway.

Energy is currently consumed within the Study Area for the construction of public and private projects; operation of automobiles, trucks, and marine vessels; and operation of existing land uses. Automobile and truck fueling stations are located throughout the Study Area.

California is rich in conventional and renewable energy resources. It has large crude oil and substantial natural gas deposits in six geological basins, located in the Central Valley and along the Pacific coast. Most of those reserves are concentrated in the southern San Joaquin Basin.

¹ California Air Resources Board (CARB). 2018. *Low Carbon Fuel Standard* (17 Cal. Code of Regs. 95480. et seq.), Website: <https://www.arb.ca.gov/regact/2018/lcfs18/lcfs18.htm> (accessed August 2018).

More than a dozen of the nation's 100 largest oil fields are located in California, including the Belridge South oil field, the second-largest oil field in the contiguous United States. In addition, Federal assessments indicate that large undiscovered deposits of recoverable oil and gas lie offshore in the Federally administered Outer Continental Shelf.

Excluding federal offshore areas, California's total energy consumption ranks among the highest in the nation, but in 2015, the State's per capita energy consumption ranked 49th, due in part to its mild climate and its energy efficiency programs. In 2016, California ranked third in the nation in conventional hydroelectric generation, second in net electricity generation from all other renewable energy resources combined, and first as a producer of electricity from solar, geothermal, and biomass resources. California leads the nation in solar thermal electricity capacity and generation.

PETROLEUM. California was the third-largest producer of petroleum among the 50 states in 2016, after Texas and North Dakota, and, as of January 2017, third in oil refining capacity, with a combined capacity of almost 2 million barrels per calendar day at the State's 18 operable refineries.

A network of crude oil pipelines connects production areas to refining centers in the Los Angeles area, the San Francisco Bay area, and the Central Valley. California refiners also process large volumes of Alaskan and foreign crude oil received at ports in Los Angeles, Long Beach, and the Bay Area. Crude oil production in California and Alaska is in decline, and California refineries have become increasingly dependent on foreign imports. Led by Saudi Arabia and Ecuador, foreign suppliers now provide more than two-fifths of the crude oil refined in California; however, California's dependence on foreign oil remains less than the national average.

California ranks third in the United States in petroleum refining capacity and accounts for more than one-tenth of total U.S. capacity. California's largest refineries are highly sophisticated; they are capable of processing a wide variety of crude oil types and are designed to yield a high percentage of light products like motor gasoline. To meet strict Federal and State environmental regulations, California refineries are configured to produce cleaner fuels, including reformulated motor gasoline and low-sulfur diesel.

Most California motorists are required to use a special motor gasoline blend called California Clean Burning Gasoline (CA CBG). In the ozone non-attainment areas of Imperial County and the Los Angeles metropolitan area, motorists are required to use California Oxygenated Clean Burning Gasoline, and the Los Angeles area is also required to use oxygenated motor gasoline during the winter months. By 2004, California completed a transition from methyl tertiary butylether (MTBE) to ethanol as a gasoline oxygenate additive, making California the largest ethanol fuel market in the United States. Four ethanol production plants are located in central and southern California, but most of California's ethanol supply is transported by rail from corn-based producers in the Midwest. Some supply is also imported from abroad.

NATURAL GAS. California natural gas production typically accounts for less than 2 percent of total annual U.S. production and satisfies less than one-fifth of State demand. Production takes place in basins located in northern and southern California, as well as offshore in the Pacific Ocean. California receives most of its natural gas by pipeline from production regions in the Rocky Mountains, the Southwest, and western Canada. As with crude oil production, California natural gas production is in decline. However, State supply has remained relatively stable due to increasing amounts of natural gas shipped from the Rocky Mountains. California markets are served by two key natural gas trading centers—the Golden Gate Center in northern California and the California Energy Hub in southern California, and the State has nearly a dozen natural gas storage facilities that help stabilize supply. In part to help meet California's demand for natural gas, several companies have proposed building liquefied natural gas (LNG) import terminals in southern California.

COAL, ELECTRICITY, AND RENEWABLES. Natural gas-fired power plants provide the largest portion of the in-state electricity generation, although it has declined in recent years while solar and wind have increased. California is one of the largest hydroelectric power producers in the United States, and with adequate rainfall, hydroelectric power typically accounts for close to one-fifth of State electricity generation. Due to strict emission laws, only a few small coal-fired power plants operate in California, producing less than 1 percent of the total electricity generation in California.

California leads the nation in electricity generation from nonhydroelectric renewable energy sources. In 2016, California had 73 percent of the nation's capacity and produced 71 percent of the nation's utility-scale electricity generation from solar thermal resources. While most of the fuel-type categories had little change over the past year, utility-scale solar photovoltaic (PV) capacity increased by 2,538 megawatts (MW) to 8,618 MW in 2016. This increase included capacity expansions of approximately 268 MW to existing solar PV plants, as well as 2,270 MW of new solar PV facilities that went on-line in 2016. Capacity expansions included McCoy Solar (104 MW added) in Riverside County and Desert Stateline Solar (113 MW added) in San Bernardino County. New solar PV installations for 2016 were most prevalent in Kern County with 855 MW of new capacity from 16 projects. Following Kern County, Los Angeles County added 337 MW from 19 projects while Fresno County followed up in third with 265 MW from two projects. Riverside, Kings, Imperial, and Tulare Counties rounded out the listings of counties with 100 MW or more of new installations with 240 MW, 224 MW, 189 MW, and 109 MW, respectively. Total in-state wind generation increased by 11 percent to 13,500 gigawatt hours (GWh) in 2016, up 1,324 GWh from 2015. Overall, renewables in California accounted for 27.9 percent of the total in-state electric generation in 2016, an increase of 3.3 percent from 2015.

Due to high electricity demand, California imports more electricity than any other State in the country. States in the Pacific Northwest deliver power to California markets primarily from hydroelectric sources, while states in the Desert Southwest deliver power primarily from coal- and natural gas-fired sources. Hydroelectric power comes to California primarily through the Western

USA interconnection, which runs from northern Oregon to southern California. The system, also known as the Pacific Intertie, is the largest single electricity transmission program in the United States. Although the Pacific Intertie was originally designed to transmit electricity south during California's peak summer demand season, flow is sometimes reversed overnight and has occasionally been reversed during periods of reduced hydroelectric generation in the Northwest. California restricts the use of coal-fired generation within its boundaries; however, the Los Angeles Department of Water and Power (LADWP) operates the coal-fired Intermountain power plant in Utah, which delivers three-fourths of its output to LADWP and other California municipal utilities. A recent California law forbids utilities from entering into long-term contracts with conventional coal-fired power producers. Intermountain's existing contracts with southern California cities are set to expire in 2027.

3.15.2.1 ENERGY CONSUMPTION IN CALIFORNIA/LOS ANGELES COUNTY

The following statistics have been provided by the California Energy Commission (CEC) and are current through 2016.

ELECTRICITY. Fueled by population growth, the demand for electricity in California is increasing. At the same time, the mandate to decrease greenhouse gas emissions will only increase in the future. California's electricity mix is generated by natural gas (33.4 percent); coal (0.15 percent); large hydroelectric (22.0 percent); nuclear (10.6 percent); and renewable (33.8 percent) sources.

In 2016, California produced 68 percent of the electricity it used; the rest was imported from the Pacific Northwest (15 percent) and the United States Desert Southwest (17 percent). Natural gas is the main source for electricity, contributing 34 percent of the total system power. According to the United States Department of Energy (DOE), Energy Information Administration (EIA) *Annual Electric Power Industry Report*, Californians spent almost \$39 billion for their electricity in 2016. Table 3.15-1 shows the total electricity consumed in Los Angeles County for 2016.

Table 3.15-1: Annual Electric Consumption in Los Angeles County (2016)

| Type of Consumer | Millions of Kilowatt-Hours ¹ |
|------------------|---|
| Residential | 20,856 |
| Non-Residential | 48,759 |
| TOTAL | 69,614 |

Source: California Energy Commission. Energy Consumption Data Management System (2018).

¹ A kilowatt-hour is a unit of power equal to 1,000 watts of electricity consumed in one hour.

NATURAL GAS. Electricity generation is the largest user of natural gas, using approximately half of all natural gas in the State. The residential sector uses 38 percent of the available natural gas. Of that amount, 88 percent is used for space and water heating. Table 3.15-2 shows the total natural gas consumption in Los Angeles County for 2009.

Table 3.15-2: Natural Gas Consumption in Los Angeles County (2016) in Millions of Therms

| Land Use | Millions of Therms ¹ |
|-----------------|---------------------------------|
| Residential | 1,111 |
| Non-Residential | 1,758 |
| TOTAL | 2,869 |

Source: California Energy Commission. Energy Consumption Data Management System (2018).

¹ A therm is a unit of heat containing 100,000 British thermal units (BTU).

LIQUID PETROLEUM GAS (PROPANE). Liquefied petroleum gas (LPG) is a mixture of gaseous hydrocarbons, mainly propane and butane that change into liquid form under moderate pressure. LPG (usually called propane) is commonly used as a fuel for rural homes for space and water heating, as a fuel for barbecues and recreational vehicles, and as a transportation fuel. It is normally created as a by-product of petroleum refining and from natural gas production.

LPG is generally an unregulated fuel in California (except for storage and safety issues, which are regulated). Because it is an unregulated commodity, the State does not collect data on LPG sales or usage. The statistics for LPG in the Alternatives to Traditional Transportation Fuels section below were provided by the DOE, EIA, Office of Coal, Nuclear, Electric, and Alternate Fuels. As such, statistics are unavailable for LPG as a fuel for rural homes, for space and water heating, or for barbecues, and none are contained in the body of this section.

TRADITIONAL TRANSPORTATION FUELS (FOSSIL FUELS). Fossil fuels are energy resources that come from the remains of plants and animals that are millions of years old. The three fossil fuels—petroleum oil, natural gas, and coal—are overwhelmingly responsible for providing the energy that powers our lifestyles and economy, and fuels our transportation systems. They are the bedrock we base our energy mix on, but they are a limited resource. Once they are consumed, they will no longer be part of our energy mix.

A public concern with fossil fuels is that, in addition to their unsustainability as a non-renewable source of energy, there is a negative environmental impact in the use of fossil fuels. The burning of fossil fuels is responsible for emissions that contribute to global climate change, acid rain, ozone problems, and unhealthy air. As such, the development of alternatives to traditional transportation fuels is desirable to improve sustainability and reduce impacts of fossil fuel consumption.

ALTERNATIVES TO TRADITIONAL TRANSPORTATION FUELS. Alternatives to traditional transportation fuels are being developed and introduced into the consumer marketplace. Alternative fuels currently in use in the United States include:

- Compressed natural gas
- Electric (EVC)
- Ethanol, 85 percent (E85)
- Hydrogen (HYD)
- LNG
- LPG

The following information was prepared by the EIA, the independent statistical and analytical agency within the DOE. Each year, the EIA collects data on the number of alternative fuel vehicles (AFVs) supplied, and for a limited set of fleet user groups, the number of AFVs in use and the amount of alternative transportation fuel consumed. The user groups surveyed are Federal and State governments, alternative fuel providers, and transit companies.

ALTERNATIVE FUEL VEHICLES IN USE. An estimated 431,545 alternative fuel vehicles were in use in the United States in 2016, with 45,208 in use in California. See Table 3.15-3, below.

Table 3.15-3: Alternative Fuel Vehicles In Use by Fuel Type (2016)

| Fuel Type | United States | California |
|-------------------------------|----------------|---------------|
| Compressed Natural Gas (CNG) | 25,539 | 8,164 |
| Electric | 10,180 | 3,761 |
| Ethanol, 85% (E85) | 388,432 | 31,862 |
| Hydrogen | 49 | 46 |
| Liquefied Natural Gas (LNG) | 379 | 324 |
| Liquefied Petroleum Gas (LPG) | 6,966 | 1,051 |
| TOTAL | 431,545 | 45,208 |

Source: Energy Information Administration. Alternative Fuels Data Center. Website: <http://www.eia.gov/renewable/afv/users.cfm?fs=a> (accessed August 2018).

ALTERNATIVE FUEL CONSUMPTION. The estimated consumption of alternative fuels (in thousand gasoline-equivalent gallons) in California during 2016 is shown in Table 3.15-4.

Table 3.15-4: Estimated Consumption of Alternative Fuels in California by Fuel Type (2016) (thousand gasoline-equivalent gallons)

| CNG | Electric | E85 | Hydrogen | LNG | LPG | Total |
|--------|----------|-------|----------|-------|-------|--------|
| 71,990 | 231 | 1,528 | 121 | 3,422 | 1,341 | 78,633 |

Source: Energy Information Administration. Alternative Fuels Data Center. Website: <http://www.eia.gov/renewable/afv/users.cfm?fs=a> (accessed August 2018).

CNG = compressed natural gas
E85 = Ethanol, 85%

LNG = liquefied natural gas
LPG = liquefied petroleum gas

3.15.3 ENVIRONMENTAL CONSEQUENCES

The following discussion of environmental consequences describes both the direct and indirect energy impacts of the project alternatives, including the build alternatives that include construction. Please refer to Section 3.24 of this document, Construction Impacts, for further discussion of the temporary impacts of the build alternatives related to energy. Specifically, temporary impacts related to energy are located in Section 3.24.3.15.

3.15.3.1 DIRECT IMPACTS

BUILD ALTERNATIVES. Local energy demand for transportation projects typically is dominated by vehicle fuel usage. Operational energy consumption was estimated for the vehicles (autos and light-, medium-, and heavy-duty trucks powered by diesel, ZE, and NZE technologies) traveling within the I-710 Corridor Project Area of Interest and for those same vehicles traveling throughout the region. Energy calculations are based on the vehicle miles traveled (VMT) (numbers of vehicles, distance traveled) and vehicle hours traveled (VHT) (hours of travel) and diesel or ZE/NZE truck type on an average weekday (Table 3.15-5 and Table 3.15-6) for the 2012 base year and for each of the year 2035 project alternatives, including the No Build (Alternative 1). California Air Resources Board's (CARB) LCFS regulations include two factors (Energy Economy Ratio (EER) and Energy Density) to describe the relative energy consumption of electrically-powered trucks compared to diesel and gasoline powered.

Table 3.15-5: I-710 Corridor Project Operational Daily VMT and VHT – Area of Interest

| Scenario | Daily (Average Weekday) Region Area of Interest VMT & VHT (millions) | | | | | | | |
|-------------------------------|--|------|--------------|-------|---------------|-------|--------------|------|

I-710 = Interstate 710

VHT = vehicle hours traveled

VMT = vehicle miles traveled

As described in the *Air Quality, Greenhouse Gas, and Health Risk Assessment Technical Study* (Ramboll-Environ, 2017), *Appendix C, Operational Emissions*, both build alternatives include air quality improvement measures that provide funding for ZE/NZE trucks. As a result, ZE/NZE trucks account for approximately 22 percent of the heavy-duty truck VMT along the I-710 for Alternative 5C, and approximately 67 percent of the heavy-duty truck VMT along the I-710 for Alternative 7 (where only trucks traveling on the freight corridor are ZE/NZE).

In addition to VMT, VHT, and ZE/NZE truck percentage, travel conditions within the Study Area also influence fuel consumption rates. Without the capacity improvements included in the build alternatives, congested traffic conditions would be more prevalent throughout the Study Area and to a lesser extent, the region. These conditions contribute to a higher energy consumption rate because vehicles use energy less efficiently while idling in stop-and-go traffic or moving at slow speeds through congested roadways.

An important additional consideration for this project is the effect of ZE/NZE trucks on overall energy use. CARB's LCFS regulations include two factors (EER and Energy Density) to describe the relative energy consumption of electrically-powered trucks compared to diesel and gasoline powered. CARB released revised draft LCFS regulations asserting higher EER figures for battery electric vehicles relative to conventional diesel in the heavy duty sector (CARB 2018). From the revised draft LCFS regulation: "The vehicle EER is about 3.5 at highway speeds and 5 to 7 times the efficiency of conventional diesel vehicles when operated at lower speed duty cycles where idling and coasting losses from conventional engines are highest. These results show that the expected efficiency gains from electrification of trucks and buses are better than previously estimated, especially for low speed duty cycles." For this analysis, the LCFS Energy Economy Ratio (EER) for the ZE/NZE trucks of 3.5 (meaning that ZE/NZE trucks use energy 3.5 times more efficiently than diesel trucks) was applied to develop a representative diesel fuel consumption rate that approximates the energy used by the ZE/NZE trucks.

The VMT and VHT data from Table 3.15-5 and Table 3.15-6 were combined with vehicle miles-per-gallon data and gasoline and diesel vehicle percentages from EMFAC2014 by vehicle category to estimate the vehicle fuel consumption for each of the scenarios in Table 3.15-7 and Table 3.15-8. The equivalent miles-per-gallon (mpge) for the ZE/NZE trucks were derived by using the ZE/NZE speed averages and the EMFAC2014 diesel mpg multiplied by the EER factor of 3.5. For example, while a diesel heavy truck would get 8.72 mpg, an otherwise similar ZE/NZE heavy truck would get 30.52 (8.72×3.5) mpge. The mpg/mpge values shown in Tables 3.15-7 and 3.15-8 are not precisely different by the 3.5 EER because the diesel and ZE/NZE trucks have different average speeds. In order to better distinguish between the project scenarios, the miles per gallon (mpg) data from EMFAC2014 that were published in only five mile per hour (mph) increments were interpolated to provide mpg data in one mph increments.

Table 3.15-9 and Table 3.15-10 convert the fuel consumption rates shown in Table 3.15-7 and Table 3.15-8 into British thermal units (BTUs) in order to provide a uniform metric to represent energy consumption for the build alternatives, which is then compared against existing year (2012) and 2035 No Build (Alternative 1) in the Area of Interest and the region, respectively. Alternative 5C and 7 improvements would include ZE/NZE heavy trucks, increase average travel speeds during peak hours, remove bottlenecks, and reduce delays.

While the energy used by roadway lighting and traffic signals is very small compared to the energy used by the vehicles operating on the project roadway, it is expected that the build alternatives would place energy efficient lighting fixtures for roadway lighting. These lighting fixture improvements would reduce the energy used by the build alternatives.

Compared to 2012 Area of Interest existing conditions:

- 2035 No Build (Alternative 1) operational energy consumption decreases by 23 percent
- 2035 Alternative 5C operational energy consumption decreases by 23 percent
- 2035 Alternative 7 operational energy consumption decreases by 26 percent

Compared to 2035 Area of Interest No Build (Alternative 1) conditions:

- 2035 Alternative 5C operational energy consumption decreases by 1.0 percent
- 2035 Alternative 7 operational energy consumption decreases by 5.1 percent

Compared to 2012 Region existing conditions:

- 2035 No Build (Alternative 1) energy consumption decreases by 11 percent
- 2035 Alternative 5C energy consumption decreases by 12 percent
- 2035 Alternative 7 energy consumption decreases by 13 percent

Table 3.15-7: I-710 Corridor Project Daily Energy Consumption - Area of Interest

| 2035 Alternative 5C | 1,521 | -12% | -1.0% |
| 2035 Alternative 7 | 1,499 | -13% | -2.4% |

¹ Assumes an energy content of 130,500 BTUs per gallon of diesel fuel and 115,000 BTUs per gallon of gasoline.

BTUs = British thermal units

Region = Southern California Association of Governments Region

Compared to 2035 Region No Build (Alternative 1) conditions:

- 2035 Alternative 5C operational energy consumption decreases by 1.0 percent
- 2035 Alternative 7 operational energy consumption decreases by 2.4 percent

The difference between actual and potential transportation has been given careful consideration. The potential service of a vehicle refers to the maximum-rated capacity for passengers or cargo, and the actual service is the real number it does carry. The implications of this concept are vital to comparisons between different transportation modes. For example, a commuter bus may be filled to capacity in one direction while taking people to work or shopping, but it may return nearly empty to complete the loop of its route. It has the potential to carry a full passenger load on the return trip, but this is, practically speaking, impossible. Thus, although it consumes fuel for the complete loop, it actually provides transportation for less than the maximum rates of passenger-miles. The same holds true for a delivery truck that leaves a warehouse full and returns empty. The ratio of actual service rendered versus potential service is called the “load factor” and must be used in connection with an energy analysis.

Load factors also apply to private vehicles. For example, a passenger car rated for six seats and carrying only the driver has a load factor of $1/6^{\text{th}}$, whereas motorcycles, which are usually considered to be single-seaters in spite of their extra-long seat and foot pegs for a passenger, may actually be given a load factor of 2 when a passenger is carried.

The purpose of the build alternatives is to effectively and efficiently accommodate regional and local north-south travel demands in the Study Area. Making this accommodation would not alter the ratio of the actual transportation service versus the potential transportation service within the project region; thus, the build alternatives would have no effect on service parameters.

NO BUILD (ALTERNATIVE 1). Under the No Build (Alternative 1), the effects on energy consumption discussed above for the build alternatives would not occur.

3.15.3.2 INDIRECT IMPACTS

BUILD ALTERNATIVES. Indirect energy impacts consist principally of the ongoing, nonrecoverable energy costs associated with the manufacture and maintenance of vehicles. Indirect manufacturing energy effects involve the one-time, nonrecoverable energy costs associated with the manufacture of vehicles. Indirect construction energy effects involve the one-time, nonrecoverable energy costs associated with construction of roads and structures. Indirect roadway maintenance energy effects involve the ongoing nonrecoverable energy costs associated with maintaining the roads and structures. As described in the *Interstate 710 (I-710) Corridor Project Revised Final Energy Technical Report* (December 2020), this analysis was conducted using the Input-Output Method. This method converts VMT, construction, and maintenance costs into energy consumption based on existing data from other road improvement projects in the United States using conversions listed in the California Department of Transportation (Caltrans) *Energy and Transportation Systems Handbook* (July 1983). It was assumed that the energy requirements for manufacturing and maintaining vehicles have not changed from those listed in this handbook. Thus, the per-vehicle indirect energy impacts for the build alternatives would be the same and would not change from the existing condition.

Based on the roadway construction energy consumption factor of 27,500 BTU per 1977 construction dollar and the estimated costs to construct the build alternatives (rolled back to 1977 equivalent), it would take approximately 19.9 trillion BTUs to construct Alternative 5C and 39.9 trillion BTUs to construct Alternative 7. This energy consumption is factored over the study period of 30 years.

Based on the annual urban roadway maintenance energy data in the Caltrans *Energy and Transportation Systems* handbook Table C:14 of 1.634×10^8 BTU per lane-mile for Portland cement concrete pavement and 1.776×10^8 BTU per lane-mile for asphalt concrete pavement, and assuming that the build alternatives would have approximately equal amounts of each over the 20 miles of the project area, the roadway maintenance energy would be as shown in Table 3.15-11.

Table 3.15-11: I-710 Indirect Energy Comparison – Area of Interest

| Description | Area of Interest Energy Used (Billion BTUs/year) | | |

Alt = Alternative

BTU = British thermal units

I-710 = Interstate 710

N/A = not applicable

Using the annual VMT data shown in Table 3.15-5 and Table 3.15-6, and considering that the VMT increases in the Area of Interest would be due to a combination of factors, including increases in population in the region as well as the improvements under the build alternatives, Table 3.15-11 shows that the build alternatives would result in increases in indirect energy consumption in the Area of Interest compared to the 2035 No Build (Alternative 1) condition, ranging from 300 to 600 percent. Table 3.15-12 shows that for the region, the build alternatives would result in an increase in manufacturer- and maintenance-related energy consumption from the 2035 No Build (Alternative 1) ranging from 5 to 11 percent.

NO BUILD (ALTERNATIVE 1). Under the No Build (Alternative 1), the indirect effects on energy consumption discussed above for the build alternatives would not occur. Generally, construction energy can be compared to increased roadway maintenance energy if a project is not built. However, there is insufficient information to quantify this energy savings.

Table 3.15-11 shows that all the build alternatives would have a substantial increase to total indirect energy consumption in the Area of Interest, ranging from 300 percent for Alternative 5C to 600 percent for Alternative 7. Table 3.15-12 shows that including the indirect energy used for road maintenance throughout the region, the indirect energy increases for the build alternatives are only 5 percent and 11 percent, respectively.

Table 3.15-12: I-710 Indirect Energy Comparison - Region

| Description | Region Energy Used (Billion BTUs/year) | | |

Alt = Alternative

BTU = British thermal units

N/A = not applicable

Region = Southern California Association of Governments Region

Thus, of the three analysis elements (i.e., direct and indirect energy consumption and service parameters), direct energy consumption would be substantially lower for either of the build alternatives compared to both the 2012 existing conditions and the 2035 No Build (Alternative 1); however, indirect energy consumption and service parameters would not be substantially impacted by either of the build alternatives.

3.15.3.3 TOTAL ENERGY IMPACTS

The combination of the direct and indirect energy impacts are summarized in Table 3.15-13 and Table 3.15-14. An important criterion in any energy impact analysis is if or when the energy savings a project would achieve would offset the energy cost to construct the project. If the energy savings would offset the energy costs, the project would have a payback period defined as the period of time taken to do so. As shown in Table 3.15-13, the estimated costs to construct the various build alternatives would range from approximately 684 billion to 1.4 trillion BTUs.

Table 3.15-13: I-710 Corridor Total Energy Comparison - Area of Interest

| Description | Energy Used (Billion BTU/year) | | |
|--------------------------------|--------------------------------|---------------|---------------|
| | 2035 No Build (Alt 1) | 2035 Alt 5C | 2035 Alt 7 |
| Non-Construction Energy | | | |
| Direct Energy | 96,528 | 95,564 | 91,597 |
| Indirect Energy | 209 | 210 | 210 |
| Construction Energy | 20 | 684 | 1,357 |
| Total Energy | 96,758 | 96,458 | 93,165 |
| Percentage Change | | -0.31% | -3.71% |
| Payback Period (Years) | | 2.3 | 0.4 |

Note: Daily direct energy converted to annual by multiplying by 365 assuming daily rate is consistent throughout the year. Indirect Non-Construction energy is the sum of Auto and Truck Manufacturing combined with Auto and Truck Maintenance energy rates. Construction Energy is the combination of Project Construction and Road Maintenance energy rates.

Alt = Alternative

BTU = British thermal units

Table 3.15-14: I-710 Corridor Total Energy Comparison - Region

| Description | Energy Used (Billion BTU/year) | | |
|--------------------------------|--------------------------------|----------------|----------------|
| | 2035 No Build (Alt 1) | 2035 Alt 5C | 2035 Alt 7 |
| Non-Construction Energy | | | |
| Direct Energy | 560,349 | 555,019 | 547,107 |
| Indirect Energy | 1,234 | 1,234 | 1,234 |
| Construction Energy | 12,100 | 12,764 | 13,430 |
| Total Energy | 573,683 | 569,017 | 561,771 |
| Percentage Change | | -0.81% | -2.08% |
| Payback Period (Years) | | 2.7 | 1.1 |

Note: Daily direct energy converted to annual by multiplying by 365 assuming daily rate is consistent throughout the year. Indirect Non-Construction energy is the sum of Auto and Truck Manufacturing combined with Auto and Truck Maintenance energy rates. Construction Energy is the combination of Project Construction and Road Maintenance energy rates.

Alt = Alternative

BTU = British thermal units

Region = Southern California Association of Governments Region

As shown in Table 3.15-13 for the Area of Interest, the indirect and construction energy impacts are much less than the direct energy impacts. The total energy consumption for Alternative 5C would be 0.31 percent less than the No Build (Alternative 1) and for Alternative 7 would be 3.71 percent lower. With these Area of Interest energy savings, it would take approximately 2.3 years to recover the energy expended for Alternative 5C construction and approximately 0.4 year to recover the energy expended for Alternative 7 construction.

As shown in Table 3.15-14 for the Region, the total energy consumption for Alternative 5C would be 0.81 percent less than the No Build (Alternative 1) and for Alternative 7 would be 2.08 percent lower. With these regional energy savings, it would take approximately 2.7 years to recover the energy expended for Alternative 5C construction and approximately 1.1 years to recover the energy expended for Alternative 7 construction. These savings do show that the impact of the build alternatives to regional energy supplies would be minor.

Thus, for the region, none of the three energy analysis elements (direct and indirect energy consumption and service parameters) would be substantially impacted by either of the build alternatives. Therefore, no avoidance, minimization, or mitigation measures would be required.

3.15.4 CONSISTENCY WITH ENERGY CONSERVATION PLANS

The CEC, the California Public Utilities Commission (CPUC), and the Consumer Power and Conservation Financing Authority (previously called the CPA but which is now defunct) approved the final State of California Energy Action Plan in 2003, which was proposed by a subcommittee of these three agencies. The Plan established shared goals and specific actions to ensure that adequate, reliable, and reasonably priced electrical power and natural gas supplies are achieved and provided through policies, strategies, and actions that are cost-effective and environmentally sound for California's consumers and taxpayers.

The CEC adopted the *2015 Integrated Energy Policy Report* on February 10, 2016. The *2015 Integrated Energy Policy Report* provides the results of the CEC's assessment of a variety of issues, including: ensuring that the State has sufficient, reliable, and safe energy infrastructure to meet current and future energy demands; monitoring publicly owned utilities' progress toward achieving 10-year energy efficiency targets; defining and including zero-net-energy goals in State building standards; overcoming challenges to increased use of geothermal heat pump/ground loop technologies and procurement of biomethane; using demand response to meet California's energy needs and integrate renewable technologies; removing barriers to bioenergy development; planning for California's electricity infrastructure needs given potential retirement of power plants; estimating new generation costs for utility-scale renewable and fossil-fueled generation; planning for new or upgraded transmission infrastructure; monitoring utilities' progress in implementing past recommendations related to nuclear power plants; tracking natural gas market trends; implementing the Alternative and Renewable Fuel and Vehicle Technology Program; addressing the vulnerability of California's energy supply and demand infrastructure to the effects of climate change; and planning for potential electricity system needs in 2030.

As described in Sections 3.15.3.2 and 3.15.3.3, the total indirect energy impacts of the build alternatives would be negligible at the regional level. Because California's energy conservation planning actions are conducted at a regional level, and because the build alternatives' total impact to regional energy supplies would be minor, neither of the build alternatives would conflict with

California's energy conservation plans as described in the CEC's *2015 Integrated Energy Policy Report*.

Thus, as shown, the build alternatives would avoid or reduce the inefficient, wasteful, and unnecessary consumption of energy and not result in any irreversible or irretrievable commitments of energy.

3.15.5 AVOIDANCE, MINIMIZATION, AND MITIGATION MEASURES

Since the No Build (Alternative 1) has been identified as the Preferred Alternative, no avoidance, minimization, and/or mitigation measures are necessary. However, avoidance, minimization, and/or mitigation measures pertaining to the two build alternatives are retained in this Final EIR/EIS for disclosure purposes.

3.15.5.1 CONSTRUCTION MINIMIZATION MEASURES

Construction of any of the build alternatives would not result in adverse impacts related to energy consumption in the Area of Interest or in the region compared to the No Build (Alternative 1). No measures to address impacts would be required. However, in the interest of promoting energy efficiency, the following measure would be implemented as part of the construction of Alternatives 5C and 7.

E-1 Prior to the completion of final design, the California Department of Transportation (Caltrans) shall prepare and implement a construction efficiency plan, which will be incorporated into the project Plans, Specifications, and Estimates package where applicable. This construction efficiency plan will include the following:

- Select disposal sites as close as practicable to the Interstate 710 (I-710) construction area to minimize haul distances and excavation-related fuel consumption
- Reuse existing rail, steel, and lumber wherever possible, such as for falsework, shoring, and other applications during the construction process
- Recycle asphalt taken up from roadways, if practicable and cost-effective
- Use newer, more energy-efficient equipment and maintain older construction equipment in good working order
- Schedule construction operations to result in the most efficient use of construction equipment possible
- Promoting employee carpooling

3.15.5.2 MAINTENANCE MINIMIZATION MEASURES

Maintenance of any of the build alternatives would not result in adverse impacts related to energy consumption in the Area of Interest or in the region compared to the No Build (Alternative 1). No measures would be required. However, in the interest of promoting energy efficiency, the following measure would be implemented as part of Alternatives 5C and 7.

E-2 Prior to the completion of project construction, Caltrans shall prepare and implement a maintenance efficiency plan which will be incorporated into the project Plans, Specifications, and Estimates package if applicable. This maintenance efficiency plan will include the following:

- Maintain maintenance equipment in good working order
- Schedule maintenance operations to result in the most efficient use of maintenance equipment possible

3.15.5.3 OPERATIONAL MINIMIZATION MEASURES

Operation of any of the build alternatives would not result in adverse impacts related to energy consumption in the Area of Interest or in the region compared to the No Build (Alternative 1). No measures would be required. However, in the interest of promoting energy efficiency, the following measure would be implemented as part of Alternatives 5C and 7.

E-3 Prior to completion of final design, Caltrans shall prepare and implement an area lighting plan which will be incorporated into the project Plans, Specifications, and Estimates package where applicable. This area lighting plan will identify lighting fixtures that are energy efficient and identify placement of individual lighting fixtures used for roadway lighting that will provide safety lights for pedestrians and motorists.

3.16 NATURAL COMMUNITIES

This section analyzes the anticipated impacts of the Interstate 710 (I-710) Corridor Project on natural communities and is based on the following documents:

- *I-710 Corridor Project Natural Environment Study* (NES) (June 2017)
- *I-710 Corridor Project Jurisdictional Delineation Report* (May 2012; Appendix E of the NES)
- *Memorandum Update to the I-710 Corridor Project Jurisdictional Delineation Report* (Memorandum Update) (January 2017)

3.16.1 REGULATORY SETTING

The U.S. Fish and Wildlife Coordination Act (16 United States Code [USC] 661) requires that federal agencies consult with the U.S. Fish and Wildlife Service (USFWS), the National Marine Fisheries Service (NMFS), and State wildlife agencies for activities that affect, control or modify waters of any stream or bodies of water, in order to minimize the adverse impacts of such actions on fish and wildlife resources and habitat. This consultation is generally incorporated into the process of complying with Section 404 of the Clean Water Act, National Environmental Policy Act (NEPA) or other federal permit, license or review requirements.¹

This section of the document discusses natural communities of concern. The focus of this section is biological communities, not individual plant or animal species. This section focuses on the ecological function of natural communities within the I-710 Corridor Project Study Area. This section also includes information on wildlife corridors and habitat fragmentation. Wildlife corridors are areas of habitat used by wildlife for seasonal or daily movement. Habitat fragmentation is a process by which an area of habitat becomes isolated from other areas of habitat, often by transportation infrastructure and other human development, thereby lessening its biological value.

The Coastal Pelagic Species Fishery Management Plan (CPS FMP) has been adopted within the I-710 Corridor Project Study Area and covers six species: the northern anchovy, market squid, pacific sardine, pacific (chub) mackerel, jack mackerel, and krill. The goal of the CPS FMP is to promote efficiency and profitability in the fisheries, including the sustainability of catch, while providing adequate forage for potential predators (NOAA Fisheries, 2018). There are no other adopted or proposed Habitat Conservation Plans or Natural Communities Conservation Plans within the I-710 Corridor Project Study Area.

¹ National Oceanic and Atmospheric Administration. Damage Assessment, Remediation, and Restoration Program. Website: <https://darrp.noaa.gov/fish-and-wildlife-coordination-act> (accessed March 22, 2017).

Habitat areas that have been designated as critical habitat under the Federal Endangered Species Act are discussed in Section 3.20, Threatened and Endangered Species. Wetlands and other waters are discussed in Section 3.17.

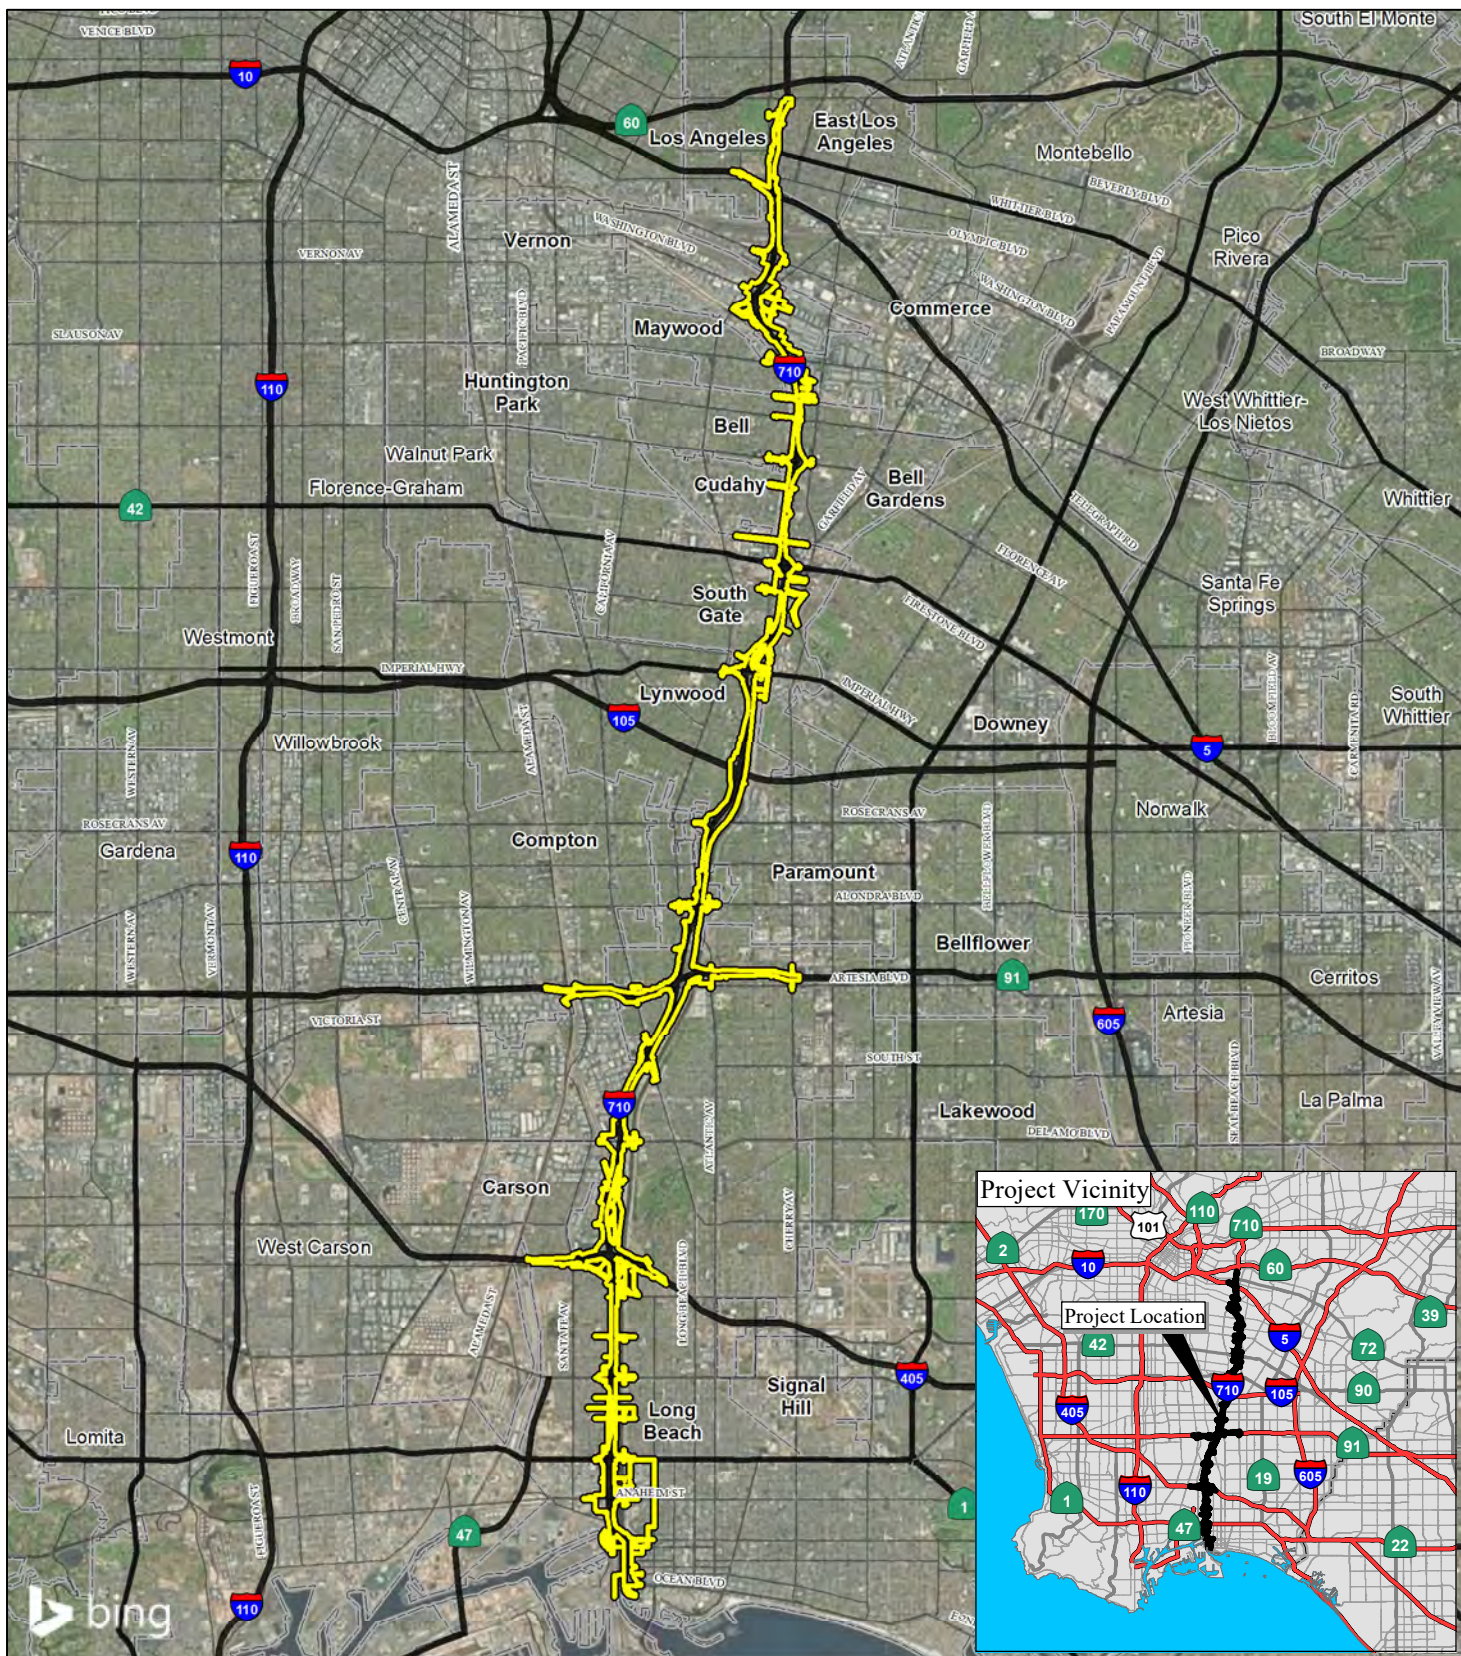

3.16.2 AFFECTED ENVIRONMENT

3.16.2.1 BIOLOGICAL STUDY AREA

The “Biological Study Area” (BSA) is the area assessed for biological resources. The BSA is approximately 19 linear miles along the I-710 Corridor, from Ocean Blvd. to State Route 60 (SR-60). The BSA also includes a portion of major transportation corridors connecting to I-710, including Interstate 405 (I-405), State Route 91 (SR-91), Interstate 105 (I-105), and Interstate 5 (I-5), to accommodate the interchange improvements under the build alternatives. The BSA encompasses approximately 1,950 acres and is shown in Figure 3.16-1.

3.16.2.2 LAND COVER DESIGNATIONS

Land cover or habitat types located within the BSA are mostly developed (developed/ornamental/ruderal) but also include aquatic resources. Riparian scrub was the only natural plant community that is addressed in Preliminary Descriptions of the Terrestrial Natural Communities of California (Holland 1986). Waters of the Los Angeles River have been identified and described based on freshwater and intertidal characteristics. Fragments of riparian scrub and freshwater emergent marsh habitats have been identified within the BSA within the Los Angeles River itself, within native habitat restoration areas established in the vicinity of the Los Angeles River, or within tributary drainages. Two general natural community groups of special concern were identified within the BSA: estuarine habitat associated with tidal waters of the lower three miles of the Los Angeles River, and riparian/riverine habitats. Habitats are considered to be of special concern based on (1) Federal, State, or local laws regulating their development; (2) limited distributions; and/or (3) the habitat requirements of special-status plants or animals occurring within the BSA. Consulting biologists identified two primary plant communities that are considered important by State and/or local agencies: Estuarine and Riparian/Riverine Habitats. These communities occur with varied abundance within the BSA and are associated with water features that may be considered jurisdictional by the United States Army Corps of Engineers (USACE), the California Department of Fish and Wildlife (CDFW), and/or the Regional Water Quality Control Board (RWQCB). All of the areas identified as a natural community of concern were disturbed from regular flood control maintenance, human encroachment (e.g., homeless encampments), and intrusion by nonnative species. Table 3.16-1 lists the acreage of each of the vegetation communities present within the BSA.

Note: The Dominguez Gap and DeForest Treatment Wetlands contain 9.51 acres of developed/ornamental/ruderal, freshwater emergent marsh, riparian scrub, and open water land cover or habitat types. These treatment wetlands are associated with Drainage Boxes 3, 23, and 24.

BSA = biological study area

Vegetation communities and associated drainage boxes² identified within the BSA are illustrated in the maps provided within Appendix R of this Final EIR/EIS.

DEVELOPED/ORNAMENTAL/RUDERAL. This land cover or vegetation community consists of developed areas such as existing buildings, paved roads, ornamental vegetation, commercial and residential properties, and disturbed areas where invasive plant species are dominant. These upland disturbed areas are grouped together in the land cover mapping because of their generally low habitat value for native plant and wildlife species.

Human-made roadside drainage ditches (concrete v-ditches with absent or marginal ordinary high water mark (OHWMs), isolated freeway drainages, and isolated earthen swales/erosional features) are constructed in upland areas and are likely not USACE jurisdictional. For a complete analysis of all of the drainage features, see Section 3.17, Wetlands.

Some of the areas mapped under this vegetation community consisted predominantly of unmaintained or escaped ornamental vegetation. Dozens of ornamental and fruit trees occur in yards and landscaping. Plant species within this habitat type are typically nonnative, invasive species and include Mexican fan palm (*Washingtonia robusta*), eucalyptus (*Eucalyptus* sp.),

² The delineation of drainage boxes identifies the locations of drainage features on the figures. Numbering of drainage boxes was initiated during preparation of the Jurisdictional Delineation. The Los Angeles River and some areas with riparian scrub habitat were not assigned a drainage box number.

Hottentot-fig (*Carpobrotus edulis*), and Bermuda grass (*Cynodon dactylon*). Although these areas contain little to no native vegetation, bat species may roost within various existing buildings or ornamental trees mapped as part of this vegetation community.

Portions of the developed areas that were not paved or landscaped contained naturalized nonnative vegetation dominated by ruderal invasive species. Some of the invasive species most often encountered included Russian thistle (*Salsola tragus*), ripgut brome (*Bromus diandrus*), Bermuda grass, common wild oat (*Avena fatua*), foxtail chess (*Bromus madritensis* ssp. *rubens*), black mustard (*Brassica nigra*), shortpod mustard (*Hirschfeldia incana*), London rocket (*Sisymbrium irio*), musky stork's bill (*Erodium moschatum*), tocalote (*Centaurea melitensis*), bull thistle (*Cirsium vulgare*), and perennial sow-thistle (*Sonchus arvensis*). Many of these areas had been mowed prior to the surveys in 2009 and 2015. Botta's pocket gopher (*Thomomys bottae*) and California ground squirrel (*Otospermophilus beecheyi*) burrows were occasionally observed within ruderal grassland areas. The locations of burrows suitable to provide habitat for burrowing owl (*Athene cunicularia*; BUOW) are shown on Figure 2 of the 2015 Phase I and Phase II *Burrowing Owl Survey Report* (2015), which is provided in Appendix C of the NES.

EARTHEN-BOTTOM TIDAL WATERS OF THE LOS ANGELES RIVER. Tidal influence on the Los Angeles River extends north from Queensway Bay to the Willow St. Bridge over the Los Angeles River (MBC Applied Environmental Sciences 1994). Intertidal portions of the shoreline extend from the extreme low to the extreme high water mark, while subtidal areas lie below the extreme low tide zone and are never exposed. The Los Angeles River estuary at this location consists of a natural soft bottom composed of sands and muds. Between Anaheim St. and the 7th St. Bridge, protective riprap cover lines the margins of the river. The halophytic (salt-loving) vegetation found in the estuarine wetland provides a valuable function to the overall wetland ecosystem by anchoring soils and controlling erosion. During surveys conducted in October 2009, intertidal areas of riprap consisted of relatively low species diversity and included barnacles (*Balanus amphitrite* and *B. glandula*), mussels (*Mytilus galloprovincialis* and *Geukensia demissa*), a green algae (*Ulva* sp.), and a filamentous red algae turf. Barnacles exist at the bridge abutments. No rooted eelgrass or kelp forests were observed in the BSA.

Human-made structures (dikes and weirs) and boulders provide roosting habitat for shorebirds, seabirds, and waterfowl during low-flow periods. The rocky tidal portion of the BSA is not considered a sensitive habitat because of the highly variable salinity and temperature regimes and the presence of river-borne sediments that silt over the low-lying riprap. The *Estuarine Resources Environmental Assessment* completed for the I-710 Corridor Project further describes habitat characteristics and lists additional species observed in the tidal waters of the Los Angeles River (Appendix F of the NES) (2009b).

FRESHWATER EMERGENT MARSH. This habitat has been highly affected by the human environment, much like the riparian scrub habitat described below. Freshwater marsh habitat has

been identified along narrow margins of the lower Los Angeles River and in the bed of Compton Creek (identified as Drainage Boxes 6 and 22 in the 2017 Jurisdictional Delineation Memorandum Update). Within the BSA, Compton Creek is a trapezoidal channel with an earthen bottom and concrete and grouted riprap banks, and supports riparian vegetation and perennial flows that create wetland conditions. Freshwater marsh habitat has also been identified in an area surrounded by riparian scrub habitat associated with the Dominguez Gap and DeForest Treatment Wetlands (identified as Drainage Boxes 3 and 23 in the Jurisdictional Delineation). Regular maintenance associated with flood control generally prevents the vegetation from becoming mature. Dominant species found in freshwater marsh habitat include California bulrush (*Schoenoplectus californicus*), cattails (*Typha* sp.), primrose-willow (*Ludwigia* sp.), and nonnative swamp smartweed (*Persicaria hydropiperoides*).

RIPARIAN SCRUB. Riparian scrub habitat is sporadic within the BSA and is located along the margins of Compton Creek (Drainage Boxes 6 and 22), within vegetated areas of the Los Angeles River margins south of Willow St., and within the native habitat restoration areas associated with the Dominguez Gap and Deforest Treatment Wetlands Project (identified as Drainage Boxes 3 and 23 in the Jurisdictional Delineation). Riparian scrub lines the Los Angeles River shoreline primarily between Willow St. and Pacific Coast Hwy. Between Anaheim St. and 7th St., the riparian margins of the river decrease, and protective riprap lines the margins of the river. At the time of the biological surveys, this habitat was disturbed by litter and human intrusion and was cleared annually (at a minimum) for flood control purposes. Dominant species in riparian scrub include mulefat (*Baccharis salicifolia*), Goodding's willow (*Salix gooddingii*), narrowleaf willow (*Salix exigua*), western goldenrod (*Euthamia occidentalis*), and Fremont's cottonwood (*Populus fremontii*). Occasionally, small stands of marsh species such as California bulrush and cattails are interspersed with riparian scrub. Nonnative and/or weedy species commonly observed included giant reed (*Arundo donax*), poison hemlock (*Conium maculatum*), broad-leaved peppergrass (*Lepidium latifolium*), and common sunflower (*Helianthus annuus*).

CONCRETE-LINED FRESHWATER WATERS OF THE LOS ANGELES RIVER AND ASSOCIATED DRAINAGES. These human-made jurisdictional areas were identified within the Los Angeles River north of the Willow St. crossing and within unvegetated channels adjacent to the Los Angeles River. These areas typically were unvegetated due to the concrete lining. Islands of sand, rock, or silt are occasionally found upstream of Willow St. and can be colonized by riparian plants that are covered during flood periods. These islands either shift position or are washed away during high flow events. The Los Angeles River and its tributaries connect with a navigable water (the Pacific Ocean) and are, therefore, considered jurisdictional. Along with the freshwater portion of the Los Angeles River, the areas identified as Drainage Boxes 1, 2, 4, 12, 13, and 21 in Appendix H are included in this designation. Following refinement of the build alternatives, Drainage Box 20 is no longer within the BSA.

OPEN WATER. The Dominguez Gap Treatment Wetland (identified as Drainage Box 3 in the Jurisdictional Delineation) contains open water habitat, where fresh water ponds for extended periods of time during the groundwater recharge process and prevents the growth of vegetation.

3.16.2.3 WILDLIFE CORRIDORS/HABITAT FRAGMENTATION

Many wildlife species require large areas of habitat to forage for food, find burrowing/denning or nesting sites, and breed. Corridors linking areas of suitable habitat are important because they allow movement of wildlife from one area of habitat to another. Corridors are often used by juveniles dispersing to new territories. This avoids intraspecific competition in existing habitats and allows the recolonization of areas from which animals have become extirpated. Wildlife movement and habitat fragmentation are greatly affected by roads.

Wildlife crossings are generally structural passages beneath or above roadways. "Wildlife crossing" is the umbrella term encompassing underpasses, overpasses, and culverts. All of these structures provide seminatural corridors above or below roads, and in some cases adjacent to roads, so that animals can safely cross without endangering themselves and motorists. Species of primary interest in this wildlife corridor assessment are medium-sized mammals such as coyote (*Canis latrans*) and bobcat (*Lynx rufus*).

The adverse impacts of I-710 to wildlife movement have long been in place since the construction of the freeway in the late 1950s and 1960s. Wildlife movement across I-710 in the BSA has been substantially constrained for many years by human-made barriers (lack of suitable vegetative cover, existing roadways, storm water conveyance structures, and fencing, along with the associated commercial, industrial, and residential development). The urban setting of the BSA provides limited opportunities for habitat continuity. Nevertheless, the Los Angeles River and adjacent parks, wetlands, and vacant lands do provide a long, linear stretch of area suitable for wildlife, including many species of waterbirds and medium-sized, adaptable mammals such as coyotes.

3.16.3 ENVIRONMENTAL CONSEQUENCES

The following discussion of environmental consequences only describes the permanent impacts of the project alternatives. Please refer to Section 3.24, Construction Impacts, of this document for a discussion of the temporary impacts of the project build alternatives for each resource area. Specifically, descriptions of temporary impacts related to natural communities are located in Section 3.24.3.16, Natural Communities, in the Construction Impacts section. For either of the build alternatives, any direct or indirect impacts (other than the existing indirect impacts of the existing facility) to natural communities or biological resources that would have the potential to occur beyond the BSA (such as water quality impacts) resulting from the build alternatives would be avoided or minimized by implementing the avoidance and minimization measures outlined in this section, Section 3.16, Natural Communities, through Section 3.21, Invasive Species, as well

as in Section 3.24. There would be no impacts, direct or indirect, beyond existing indirect effects of the facility, anticipated to occur beyond the right-of-way of the build alternatives. Since a build alternative was not selected as the Preferred Alternative, avoidance and minimization measures will not be implemented.

3.16.3.1 PERMANENT IMPACTS

For the purposes of impact analysis, a conservative right-of-way footprint was established for each build alternative based on preliminary engineering plans that includes areas of cut and fill; staging areas for construction vehicles, equipment, and materials; haul routes; and water quality treatment features. While some portions of this right-of-way footprint would only be temporarily disturbed during construction of either of the build alternatives and would be revegetated, this revegetation may not fully restore the functions and values of the impacted habitat.

Where the concept plans (see Appendix O of this Final EIR/EIS) showed the placement of columns/piers or other roadway features under the build alternatives, a direct permanent impact was assumed. Indirect permanent impacts were assumed in areas where shading from a bridge or the elevated freight corridor in Alternative 7 was identified. Therefore, the analysis of impacts conservatively estimates a worst-case impact scenario. In general, Alternative 7 would have greater impacts to natural communities of concern than Alternative 5C because of its larger footprint.

BUILD ALTERNATIVES. Permanent direct and indirect impacts to land cover or habitat types of concern by build alternative are provided in Table 3.16-2 and discussed in more detail below.

ESTUARINE HABITAT. As shown in Table 3.16-2, Alternatives 5C and 7 are expected to result in direct permanent impacts to 0.18 acre or 0.11 acre, respectively, of estuarine habitat (earthen-bottom intertidal portions of the Los Angeles River) due to the construction of abutments and driving of piles, and a reduction in soft-bottom habitat as a consequence of the placement of piers and abutments. Percussive forces generated during pile-driving activities may result in hydroacoustic impacts to animal species, as discussed in Section 3.24.3.20, within this habitat.

In addition to direct permanent impacts, Alternatives 5C and 7 would result in indirect permanent effects to 5.09 acres or 5.02 acres, respectively, of estuarine habitat. Indirect permanent effects would result from permanent shading associated with bridges or elevated roadways. In addition, construction may indirectly affect estuarine habitats permanently through enhancing the germination and proliferation of nonnative invasive plant species. Potential hydraulic effects are associated with bridge modifications and the relocation of a segment of electrical transmission lines along the edge of the river, upstream.

Table 3.16-2: Impacts of the Build Alternatives to Land Cover or Habitat Types Occurring Within the Biological Study Area

| Impacts | Land Cover or Habitat Type | | | | | | | Total (acres) |
|---|---|---|----------------|--|---------------|----------------------------------|--------------------------------|----------------|
| | Estuarine Habitat ¹ | Riparian/Riverine Habitats ¹ | | | | | | |
| | Earthen-Bottom Intertidal Portions of Los Angeles River | Marsh | Riparian Scrub | Concrete-Lined Freshwater Portions of the Los Angeles River and Associated Drainages | Open Water | Total Riparian/Riverine Habitats | Developed/Ornamental / Ruderal | |
| Total Acres Within the BSA | 14.27 | 1.86 | 8.54 | 48.22 | 5.34 | 63.96 | 1869.43 | 1947.66 |
| Alternative 5C | | | | | | | | |
| Permanent (Direct) Impacts | 0.18 | 0.01 | 0.15 | 1.39 | | 1.55 | 0.40 | 2.13 |
| Permanent (Indirect) Impacts | 5.09 | 0.77 | 2.22 | 18.02 | | 21.02 | 10.56 | 36.67 |
| Temporary Impacts | 8.34 | 0.67 | 1.93 | 19.34 | | 21.93 | 25.54 | 55.82 |
| Total Acreage Impacted | 13.61 | 1.45 | 4.30 | 38.75 | | 44.50 | 36.50 | 94.62 |
| % of Total Acreage in BSA Impacted | 95.4% | 78.0% | 50.3% | 80.4% | 0.0% | 69.6% | 2.0% | 4.9% |
| Alternative 7 | | | | | | | | |
| Permanent (Direct) Impacts | 0.11 | 0.17 | 3.90 | 1.28 | 5.34 | 10.69 | 0.43 | 11.23 |
| Permanent (Indirect) Impacts | 5.02 | 0.65 | 1.74 | 21.14 | | 23.53 | 13.81 | 42.36 |
| Temporary Impacts | 8.19 | 0.66 | 1.41 | 23.51 | | 25.59 | 37.96 | 71.74 |
| Total Acreage Impacted | 13.33 | 1.49 | 7.05 | 45.93 | 5.34 | 59.81 | 52.19 | 125.33 |
| % of Total Acreage in BSA Impacted | 93.4% | 79.8% | 82.5% | 95.3% | 100.0% | 93.5% | 2.8% | 6.4% |

¹ Habitats of special concern

Notes: The Design Options have the same habitat impacts as their associated build alternative. The Dominguez Gap and DeForest Treatment Wetlands contain marsh, riparian scrub, open water, and developed/ornamental/ruderal land cover or habitat types, which are accounted for in the acreages shown.

Numbers totaled may not comport with values presented in the table due to rounding.

BSA = Biological Study Area

However, as analyzed in Section 3.8 of this Final EIR/EIS, the modifications under the build alternatives would mimic the existing pier configurations upstream and downstream, and there would not be substantial effects to the water surface elevation, velocity of flood flows, sedimentation, or scour in the vicinity of the new piers. Because there are no substantial effects at the location of the modifications, there are no substantial effects to downstream locations, including the estuarine habitat.

RIPARIAN/RIVERINE HABITATS. This category includes freshwater emergent marsh, riparian scrub, concrete-lined freshwater waters of the Los Angeles River and associated tributaries, and open water. The Dominguez Gap and DeForest Treatment Wetlands contain these riparian habitat types, except for concrete-lined. The build alternatives would result in direct and indirect permanent impacts to riparian/riverine natural communities through disturbance and/or removal of existing vegetation. Furthermore, construction may indirectly affect riparian/riverine habitats permanently through shading of the areas below bridges or elevated roads and enhancing the germination and proliferation of nonnative invasive plant species, as described in more detail in Section 3.21.

Permanent impacts to riparian/riverine habitats would be greater under Alternative 7 than under Alternative 5C. As shown in Table 3.16-2, Alternative 7 is expected to result in direct permanent effects to 10.69 acres and indirect permanent effects to 23.53 acres of riparian/riverine habitats. Alternative 5C would result in permanent direct impacts to 1.55 acres and permanent indirect impacts to 21.02 acres of riparian/riverine habitats. The figures in Appendices I and J of the NES illustrate the locations where riparian/riverine habitats would be impacted by Alternatives 5C and 7, respectively.

Both build alternatives would result in an impact to the Los Angeles River and Compton Creek due to the structural modifications, relocation, and/or replacement of crossing structures at 22 locations (with multiple structures at some locations).

Existing or proposed wetland restoration areas identified in the BSA may be affected by the build alternatives. The Los Angeles County Department of Public Works identified the boundaries of County restoration areas (Rivera [December 30, 2009] and Su [January 11, 2009], personal communication). Two areas were found to overlap the limits of the BSA. Impacts resulting from the build alternatives to the Dominguez Gap and DeForest Treatment Wetlands are accounted for in Table 3.16-2 above. Alternative 5C would result in approximately 0.08 acre of temporary impacts to the Dominguez Gap and DeForest Treatment Wetlands and Alternative 7 would result in approximately 9.26 acres of direct permanent impacts and 0.08 acre of temporary impacts to the Dominguez Gap and DeForest Treatment Wetlands.

WILDLIFE CORRIDORS/HABITAT FRAGMENTATION. Wildlife movement across I-710 in the BSA has been substantially constrained for many years by the urbanized nature of the area as well

as by human-made barriers (lack of suitable vegetative cover, existing roadways, stormwater conveyance structures, and fencing). The urban setting of the BSA provides limited opportunities for habitat continuity. The BSA also does not contain any critical habitat linkage areas identified in the South Coast Missing Linkages Project³ or any Essential Connectivity Areas identified in the California Essential Habitat Connectivity Project⁴. Nevertheless, the Los Angeles River and adjacent parks, wetlands, and vacant lands do provide a long linear stretch of habitat suitable for wildlife, including many species of water birds and medium-sized adaptable mammals such as coyotes.

The build alternatives would result in some loss of vacant land but would not increase habitat fragmentation or impede the movement of wildlife in the area. Habitat within the Los Angeles River channel and movement opportunities therein would not be affected by implementation of either build alternative because they essentially modify an existing transportation facility.

Because the I-710 Corridor has restricted wildlife movement and resulted in habitat fragmentation for many years, none of the build alternatives are expected to have an adverse effect on wildlife movement.

NO BUILD (ALTERNATIVE 1). Under the No Build (Alternative 1), which has been identified as the Preferred Alternative, the improvements under the build alternatives would not be constructed. There would be no permanent direct or indirect impacts to natural communities from the No Build (Alternative 1).

3.16.3.2 PUBLIC HEALTH CONSIDERATIONS

No public health considerations were identified relative to impacts from the build alternatives on natural communities, wildlife corridors, or habitat fragmentation.

3.16.4 AVOIDANCE, MINIMIZATION, AND/OR MITIGATION MEASURES

Measures to address permanent impacts to natural communities of concern resulting from the build alternatives are described below. Related measures are also provided in Sections 3.6, 3.19 through 3.21, and 3.24 (Measures CON-NC-1 through CON-NC-16).

The majority of existing estuarine and riparian/riverine communities within the BSA fall under the regulatory jurisdiction of the USACE (pursuant to Section 10 of the RHA and Section 404 of the CWA), the CDFW (pursuant to Section 1602 of the California Fish and Game Code), and the

³ South Coast Wildlands. 2008. *South Coast Missing Linkages: A Wildland Network for the South Coast Ecoregion*. Website: <http://www.scwildlands.org/reports/SCMLRegionalReport.pdf> (accessed March 22, 2017).

⁴ California Department of Fish and Wildlife. California Essential Habitat Connectivity Project. Website: <http://www.scwildlands.org/reports/SCMLRegionalReport.pdf> (accessed March 22, 2017).

RWQCB (pursuant to Section 401 of the CWA). For any of the build alternatives, compensatory mitigation for these communities would be required to comply with Section 404 of the CWA. Compensatory mitigation would be developed in accordance with the Final Rule on Compensatory Mitigation for Losses of Aquatic Resources (33 CFR Part 325 and 332, and 40 CFR Part 200). At minimum, these habitats subject to regulatory jurisdiction would have been mitigated at a minimum mitigation-to-impact ratio of 2:1 for permanent impacts and 1:1 for temporary impacts for either build alternative. Compensatory mitigation may have been in the form of habitat restoration and/or enhancement in on- or off-site areas where similar habitat exists. Since a build alternative was not selected as the Preferred Alternative, compensatory mitigation will not be required.

For any build alternative, final details for compensatory mitigation would have been evaluated through coordination between Caltrans and the resource agencies. Areas within or directly adjacent to the BSA would offer potential mitigation options. Online research (The River Project 2009; Los Angeles County 2009) and communication with agency representatives (L. Torres [Rivers and Mountains Conservancy], J. Casanova [Los Angeles River and San Gabriel Rivers Watershed Council], and D. Rivera [LACDPW], personal communication, December 30, 2009) revealed that a number of restoration opportunities, some still in progress, exist in the vicinity. Portions of the Joint Dominguez Gap and DeForest Treatment Wetlands Project lie within the BSA. Among other potential options, compensation for the impacts of the build alternatives to tidal waters may have been provided through additional funding for the Golden Shore Marine Preserve (Long Beach Natural Areas 2009). The final report has been submitted for the Compton Creek Improvement Project, which may have provided a compensatory mitigation opportunity for riparian scrub and/or freshwater emergent marsh for any build alternative. The Rivers and Mountains Conservancy is looking for potential projects for implementation in the Compton Creek Watershed, as well as in the Los Angeles River. For either build alternative, these potential opportunities would be investigated in coordination with the resource agencies, the Los Angeles County Department of Public Works (LACDPW), and the Santa Monica Mountains Recreation and Conservation Authority (SMMRCA) throughout the planning phase, final design, and the permitting process.

However, as the No Build (Alternative 1) was identified as the Preferred Alternative, adverse impacts to natural communities would not occur, and the adoption of this No Build (Alternative 1) would not require any avoidance, minimization, and/or mitigation measures. Avoidance, minimization, and/or mitigation measures pertaining to the two build alternatives are retained in this Final EIR/EIS for disclosure purposes.

The following measure shall apply to all build alternatives:

NC-1 The California Department of Transportation (Caltrans) shall prepare a Habitat Mitigation Monitoring Plan (HMMP) during final design to be reviewed and approved by the relevant resource agencies that shall comply with all terms and conditions set forth in the permits and opinions issued by the resource agencies and shall include the following provisions:

- Permanent impacts to estuarine and riparian/riverine habitat shall be replaced on or off site at a minimum 2:1 ratio with in-kind habitat, and a 3:1 ratio for permanent impacts to suitable least Bell's vireo riparian habitat. Temporary impacts to estuarine and riparian/riverine habitat shall be replaced at a minimum 1:1 ratio with in-kind native habitat restored in place within the Biological Study Area (BSA). Temporary impact areas shall be planted as soon as possible following completion of construction activities to prevent encroachment by nonnative plants. If off-site restoration is conducted, it shall be done within the same watershed as the Interstate 710 (I-710) Corridor Project.
- The HMMP shall identify a success criterion of at least 80 percent cover of native riparian vegetation or composition structure similar to that of an appropriate reference site. The reference site shall be determined based on the type of habitat being impacted and the hydrology and surrounding habitat at the proposed mitigation area. The HMMP will include a minimum 5-year plant establishment period and quantitative performance criteria that will be achieved for the restoration to be approved by the resource agencies. Further criteria specified in the HMMP shall include an establishment period for the replacement habitat, regular trash removal, and regular maintenance and monitoring activities to ensure the success of the mitigation plan. After construction, annual summary reports of the biological monitoring shall be provided to the United States Army Corps of Engineers (USACE), the California Department of Fish and Wildlife (CDFW), the Regional Water Quality Control Board (RWQCB), and the United States Fish and Wildlife Service (USFWS) documenting the monitoring effort. The duration of the monitoring and reporting shall be established by resource agency permit conditions.

3.17 WETLANDS

This section is based on the following documents:

- *I-710 Corridor Project Natural Environment Study (NES)* (June 2017)
- *I-710 Corridor Project Jurisdictional Delineation Report* (May 2012; Appendix E of the NES)
- *Memorandum Update to the I-710 Corridor Project Jurisdictional Delineation Report* (January 2017)

Detailed discussions and maps of identified jurisdictional features are provided in the Jurisdictional Delineation Report (May 2012). Portions of this section contain updated discussions based on new regulatory definitions that were adopted after the technical reports listed above were prepared. Specifically, this section includes discussions and impact analyses pertaining to the *State Wetland Definition and Procedures for Discharges of Dredged or Fill Material to Waters of the State*, which became effective on May 28, 2020.

3.17.1 REGULATORY SETTING

Wetlands and other waters are protected under a number of laws and regulations. At the Federal level, the Federal Water Pollution Control Act, more commonly referred to as the Clean Water Act (CWA) (33 USC 1251 et seq.), is the primary law regulating wetlands and surface waters. One purpose of the CWA is to regulate the discharge of dredged or fill material into waters of the United States (U.S.), including wetlands. Waters of the U.S. include navigable waters, interstate waters, territorial seas and other waters that may be used in interstate or foreign commerce. To classify wetlands for the purposes of the CWA, a three-parameter approach is used that includes the presence of hydrophytic (water-loving) vegetation, wetland hydrology, and hydric soils (soils formed during saturation/inundation). All three parameters must be present, under normal circumstances, for an area to be designated as a jurisdictional wetland under the CWA.

Section 404 of the CWA establishes a regulatory program that provides that discharge of dredged or fill material cannot be permitted if a practicable alternative exists that is less damaging to the aquatic environment or if the nation's waters would be significantly degraded. The Section 404 permit program is run by the U.S. Army Corps of Engineers (USACE) with oversight by the U.S. Environmental Protection Agency (EPA).

The USACE issues two types of 404 permits: General and Standard permits. There are two types of General permits: Regional permits and Nationwide permits. Regional permits are issued for a general category of activities when they are similar in nature and cause minimal environmental effect. Nationwide permits are issued to allow a variety of minor project activities with no more than minimal effects.

Ordinarily, projects that do not meet the criteria for a Nationwide Permit may be permitted under one of USACE's Standard permits. There are two types of Standard permits: Individual permits and Letters of Permission. For Standard permits, the USACE decision to approve is based on compliance with EPA's Section 404(b)(1) Guidelines (EPA 40 Code of Federal Regulations [CFR] Part 230), and whether permit approval is in the public interest. The Section 404 (b)(1) Guidelines (Guidelines) were developed by the EPA in conjunction with the USACE, and allow the discharge of dredged or fill material into the aquatic system (waters of the U.S.) only if there were no practicable alternative which would have less adverse effects. The Guidelines state that the USACE may not issue a permit if there is a least environmentally damaging practical alternative (LEDPA) to the proposed discharge that would have lesser effects on waters of the U.S., and not have any other significant adverse environmental consequences.

The Executive Order for the Protection of Wetlands (EO 11990) also regulates the activities of Federal agencies with regard to wetlands. Essentially, EO 11990 states that a Federal agency, such as FHWA and/or Caltrans, as assigned, cannot undertake or provide assistance for new construction located in wetlands unless the head of the agency finds: (1) that there is no practicable alternative to the construction, and (2) the proposed project includes all practicable measures to minimize harm. A Wetlands Only Practicable Alternative Finding must be made.

At the state level, wetlands and waters are regulated primarily by the State Water Resources Control Board (SWRCB), the Regional Water Quality Control Boards (RWQCB), and the California Department of Fish and Wildlife (CDFW). In certain circumstances, the Coastal Commission (or Bay Conservation and Development Commission or the Tahoe Regional Planning Agency) may also be involved. Sections 1600-1607 of the California Fish and Game Code require any agency that proposes a project that will substantially divert or obstruct the natural flow of or substantially change the bed or bank of a river, stream, or lake to notify CDFW before beginning construction. If CDFW determines that the project may substantially and adversely affect fish or wildlife resources, a Lake or Streambed Alteration Agreement will be required. CDFW jurisdictional limits are usually defined by the tops of the stream or lake banks, or the outer edge of riparian vegetation, whichever is wider. Wetlands under jurisdiction of the USACE may or may not be included in the area covered by a Streambed Alteration Agreement obtained from the CDFW.

The RWQCBs were established under the Porter-Cologne Water Quality Control Act (Porter-Cologne Act) to oversee water quality. Discharges under the Porter-Cologne Act are permitted by Waste Discharge Requirements (WDRs) and may be required even when the discharge is already permitted or exempt under the CWA. In compliance with Section 401 of the CWA, the RWQCBs also issue water quality certifications for activities which may result in a discharge to waters of the U.S. This is most frequently required in tandem with a Section 404 permit request. Please see Section 3.9, Water Quality, for additional details.

3.17.2 AFFECTED ENVIRONMENT

3.17.2.1 USACE, RWQCB AND CDFW JURISDICTION

Areas under the jurisdiction of the USACE and RWQCB typically differ from those under the jurisdiction of CDFW; therefore, the following text describes the basis of USACE and CDFW jurisdiction over various waters.

USACE (waters of the U.S.) jurisdiction extends laterally to the ordinary high water mark (OHWM) or beyond the OHWM to the limit of any adjacent wetlands, if present. The OHWM is defined as “that line on the shore established by the fluctuations of water and indicated by physical characteristics such as clear natural line impressed on the bank, shelving, changes in the character of soil, destruction of terrestrial vegetation, the presence of litter and debris, or other appropriate means that consider the characteristics of the surrounding area.”

In this section, USACE jurisdictional areas are described as either wetland or nonwetland areas. The USACE defines wetlands as “those areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted to life in saturated soil conditions.” In order to satisfy the USACE wetland definition, an area must possess three wetland characteristics: (1) hydrophytic vegetation,¹ (2) hydric soils,² and (3) wetland hydrology.³ Generally, nonwetland waters are those within the OHWM that are not wetlands.

The definition of waters under the jurisdiction of the State of California is broad and includes any surface water or groundwater, including saline waters within the boundaries of the State. Waters that meet the definition of waters of the U.S. are also considered waters of the State, but the jurisdictional limits of waters of the State may extend beyond the limits of waters of the United States. Isolated waters that may not be subject to regulations under federal law are considered to be waters of the State and regulated accordingly.

While there is no formal statewide guidance for the delineation of non-wetland waters of the State, jurisdiction generally corresponds to the surface area of aquatic features that are at least seasonally inundated, and areas within the banks of defined rivers, streams, washes, and channels, including associated riparian vegetation. Currently, each RWQCB reserves the right to establish criteria for the regulation of non-wetland waters of the State, and in many cases, these

¹ Plant life that grows, and is typically adapted for life, in permanently or periodically saturated soils.

² Soils that formed under conditions of saturation, flooding, or ponding long enough during the growing season to develop anaerobic conditions (i.e., absence of oxygen) in the upper part.

³ Areas with wetland hydrology are those where the presence of water has an overriding influence on vegetation and soil characteristics due to anaerobic and reducing conditions, respectively.

areas correspond with USACE jurisdictional non-wetland waters. As discussed above, wetland waters of the State must contain hydric soils and wetland hydrology.

On August 28, 2019, the California Office of Administrative Law approved the SWRCB-proposed *State Wetland Definition and Procedures for Discharges of Dredged or Fill Material to Waters of the State* (Procedures). The Procedures, effective on May 28, 2020, apply to discharges of dredged or fill material to waters of the State.⁴ The Procedures consist of four major elements: (1) a wetland definition; (2) a framework for determining whether a feature that meets the wetland definition is a water of the State; (3) wetland delineation procedures; and (4) procedures for the submittal, review and approval of applications for Water Quality Certifications and Waste Discharge Requirements for dredge or fill activities.

The Water Boards define a wetland as:

An area is wetland if, under normal circumstances, (1) the area has continuous or recurrent saturation of the upper substrate caused by groundwater, or shallow surface water, or both; (2) the duration of such saturation is sufficient to cause anaerobic conditions in the upper substrate; and (3) the area's vegetation is dominated by hydrophytes or the area lacks vegetation.

The Water Board will rely on the final aquatic resource report verified by the USACE for determining the extent of wetland waters of the U.S. The Procedures rely on the USACE 1987 Manual and Regional Supplements to determine whether the area meets the State definition of a wetland. As described in the 1987 Manual and Supplements, an area “lacks vegetation” if it has less than 5 percent areal coverage of plants at the peak of the growing season. The methods shall be modified only to allow for the fact that the lack of vegetation does not prevent the determination of such an area that meets the State definition of wetland.

The CDFW regulates streams and rivers, which are defined by the presence of a channel, bed, and banks. CDFW regulates wetland areas only to the extent that those wetlands are part of a river, stream, or lake as defined by the CDFW, which has not defined wetlands for jurisdictional purposes. CDFW generally includes, within the jurisdictional limits of streams and lakes, any riparian habitat present. Riparian habitat includes willows, alders, and other vegetation typically associated with the banks of a stream or lake shoreline. In most situations, wetlands associated with a stream or lake would fall within the limits of riparian habitat. Thus, defining the limits of

⁴ On January 26, 2021, the Superior Court in *San Joaquin Tributaries Authority v. California State Water Resources Control Board* issued a judgment and writ enjoining the SWRCB from applying the Procedures to waters other than those for which water quality standards are required by the federal CWA. The SWRCB has proposed a draft resolution to adopt the Procedures as state policy for water quality control under Water Code section 13140. The public comment period for the draft resolution ends on March 8, 2021.

CDFW jurisdiction based on riparian habitat will automatically include any wetland areas. Wetlands not associated with a lake, stream, or other regulated area are generally not subject to CDFW jurisdiction.

3.17.2.2 CALIFORNIA COASTAL COMMISSION JURISDICTION

A portion of the biological study area (BSA) for the I-710 Corridor Project is located within the Long Beach Local Coastal Program (LCP). However, there are no California Coast Commission (CCC) jurisdictional wetlands within the portion of the BSA located in the Coastal Zone. Areas within the Coastal Zone satisfying the USACE jurisdictional criteria for wetlands would also be subject to CCC jurisdiction as wetlands pursuant to the California Coastal Act. However, there are no USACE wetlands in the Coastal Zone portion of the BSA. Drainage Feature 19 (shown on sheet 1 of 20 in Appendix R of this Final Environmental Impact Report/ Environmental Impact Statement (Final EIR/EIS) is a concrete-lined drainage potentially jurisdictional by the USACE within the Coastal Zone, but it does not satisfy USACE or CCC wetland criteria and is no longer within the BSA. Additionally, there are no other areas where hydrophytic vegetation or hydric soils indicators or wetland hydrology occur in the Coastal Zone. Therefore, there are no CCC jurisdictional wetlands within the BSA.

3.17.2.3 JURISDICTIONAL AREAS IN THE I-710 CORRIDOR BIOLOGICAL STUDY AREA

The BSA is approximately 19 linear miles along the Interstate 710 (I-710) corridor, from Ocean Blvd. to State Route 60 (SR-60). The BSA also includes a portion of Interstate 405 (I-405), State Route 91 (SR-91), Interstate 105 (I-105), and Interstate 5 (I-5), to accommodate for interchange improvements under the build alternatives. The entire I-710 Corridor Project BSA is located within the Los Angeles River Hydrologic Unit, which drains a watershed of approximately 530,000 acres (824 square miles). The upper portion of the watershed is covered by forest or open space, while the remaining watershed, including the BSA, is highly developed with commercial, industrial, or residential uses. The confluences of two of the eight major tributaries to the Los Angeles River, the Rio Hondo, and Compton Creek occur within the BSA. The Rio Hondo joins the Los Angeles River in the city of South Gate from the east, and Compton Creek joins the Los Angeles River in the city of Long Beach from the northwest. The 2.5 miles of Compton Creek closest to its confluence with the Los Angeles River are soft-bottom. South of Compton Creek, the Los Angeles River flows within a concrete or rock-lined channel into the estuary in Long Beach. The last three miles of the Los Angeles River are soft-bottom, and sides are lined with rock riprap. The Los Angeles River has a relatively permanent (at least three months) flow during the year and has been designated as a traditional navigable water (TNW), under the Clean Water Act (CWA). Some of the tributary drainages have relatively permanent (at least three months) flow during the year and are, therefore, considered jurisdictional by the USACE. The lower reach of the Los Angeles River between an area just south of Willow St. and the Pacific Ocean is subject to daily tidal influences and is, therefore, considered a navigable water of the United States under Section 10 of the Rivers and Harbors Act.

As described in the Jurisdictional Delineation Report (2012) and in the 2017 *Memorandum Update to the I-710 Corridor Project Jurisdictional Delineation Report* (Appendix E of the NES), there are several drainages within the BSA (including Compton Creek) that connect directly or indirectly to the Los Angeles River. Numbering of “drainage boxes” was used during preparation of the Jurisdictional Delineation to identify the locations of drainage features on maps. The Los Angeles River was not assigned a drainage box number.

The BSA contains a total of 58.77 acres of Section 404 jurisdictional nonwetland waters, 10.16 acres of Section 404 wetland waters, and 14.42 acres of Section 10 jurisdictional waters within the Section 404 waters (Table 3.17-1). There are a total of 122.36 acres of streambed and associated riparian habitat within the BSA subject to the jurisdiction of CDFW under Section 1600 of the California Fish and Game Code. RWQCB jurisdiction was determined based on the presence of Section 404 jurisdiction, with one exception; the Joint Dominguez Gap and Deforest Treatment Wetlands are not considered USACE jurisdictional, but are likely to be considered jurisdictional by RWQCB. There are a total of 78.54 acres within the BSA under the likely jurisdiction of the RWQCB.

RWQCB jurisdiction was determined based on delineated USACE wetlands (three-parameter) and guidance pertaining to SWRCB Procedures. Wetlands included under delineated wetland waters of the State include the Joint Dominguez Gap and Deforest Treatment Wetlands, which are not considered jurisdictional by the USACE. The RWQCB asserts jurisdiction over roadside drainage ditches on a case-by-case basis and may extend jurisdiction beyond the OHWM, but jurisdiction over such ditches is presumed to coincide for purposes of this analysis. Therefore, the jurisdictional status determinations listed in Table 3.17-1 are subject to agency verification during the respective permitting processes.

All of the areas satisfying the USACE jurisdictional criteria for waters of the U.S. and adjacent wetlands, as described above, are also subject to CDFW jurisdiction pursuant to Section 1602 of the California Fish and Game Code. In addition, streambed banks and adjacent riparian areas extending beyond the limits of the USACE jurisdiction are considered subject to CDFW jurisdiction. These areas failed to meet wetland criteria.

On February 8, 2011, a letter was sent to the USACE with a copy of the draft jurisdictional delineation report, requesting a determination on the jurisdictional status of waters in the BSA. The findings and conclusions regarding the location and extent of wetlands and other waters subject to regulatory jurisdiction represent the professional opinion of the consulting biologists. After requesting supplemental information on several drainages, and revisions to the draft jurisdictional delineation, the USACE provided the Approved Jurisdictional Determination (AJD) on June 8, 2012. The AJD covered Drainage Features 1 through 20. The preliminary findings provided in this section regarding Drainage Features 21, 22, 23, and 24 will need to be verified

Table 3.17-1: Summary of Jurisdictional Waters within the I-710 Corridor Project Biological Study Area

¹ Total Section 10 Area (acres) is inclusive of Total Section 404 Area (acres).

² Total may not reflect sum of individual drainages, due to rounding.

BSA = Biological Study Area

CDFW = California Department of Fish and Wildlife

I-710 = Interstate 710

N/A = not applicable

OHWM = ordinary high water mark

RWQCB = Regional Water Quality Control Board

USACE = United States Army Corps of Engineers

by the USACE, CDFW, and RWQCB, but not by the CCC because they are not located in the Coastal Zone. For any build alternative, a request for an AJD for Drainage Features 21, 22, 23, and 24 would be submitted and secured prior to the application for a Section 404 permit. As of June 22, 2020, the effective definition of the term “waters of the United States” has been revised, and some and some of the concrete-lined channels and ephemeral drainages that were identified for potential jurisdiction may be excluded. On June 22, 2020, the final Navigable Waters Protection Rule became effective, which revised the definition of “waters of the United States” to include four simple categories of jurisdictional waters, providing clear exclusions for many water features that traditionally have not been regulated, and defining terms in the regulatory text that have never been defined before.⁵

In addition, substantial changes in the operable definition of “Waters of the U.S.” have occurred and may continue to occur considering changes in administrations, proposed regulatory revisions, and potential court actions.⁶ Appendix R of this Final EIR/EIS depicts the waters of the U.S. within the BSA relative to the build alternatives under consideration.

The average annual rainfall for the lower Los Angeles watershed area is 9.9 inches.⁷ During the 2013–2014 rainy season, the area received approximately 4.11 inches of rainfall.⁸ Prior to 1960, 80 percent of the rain water in the Los Angeles River percolated into the ground. Today, that figure is closer to eight percent, with the rest draining into the ocean (The River Project 2009).

3.17.2.4 FUNCTIONS AND VALUES

The functions and values of the identified wetlands and other waters within the BSA of the I-710 Corridor were qualitatively assessed in the Jurisdictional Delineation and the *Memorandum Update to the I-710 Corridor Project Jurisdictional Delineation Report* (January 2017). All wetlands and other waters have some degree of functionality, and no single wetland or other water can perform all of the functions considered below. The following functions are analyzed at low, moderate, or high value levels. Each drainage box is analyzed in Table 3.17-2 based on the criteria outlined below.

* The Los Angeles River exhibits higher functions and values south of Willow St., where the channel has a natural bottom that allows development of wetlands, shorebird habitat, and high recreational opportunities.

I-710 = Interstate 710

N/A = not applicable

HYDROLOGIC REGIME. This function is the ability of a wetland or stream to absorb and store water below ground. The degree of this saturation is dependent on the soil composition and is affected by prior flooding events. For example, clay soils possess more pore space than sandy soils. However, the smaller pore size slows the rate at which water is absorbed and released, and therefore, clay soil has a lower capacity to store water than sandy soils. The storage of water below ground allows for the fluctuation between anaerobic and aerobic conditions that benefit environmental conditions necessary for microbial cycling.

Drainage Features 3, 6, and 22 have a moderate capacity to absorb and store water. Drainage Feature 3, part of the Joint Dominguez Gap and DeForest Treatment Wetlands system, acts to retain, clean, and infiltrate runoff into the groundwater system. Water in the East Basin (mostly outside the BSA) is transferred to the West Basin (within the BSA) only to the extent that it can infiltrate into the groundwater. Drainage Features 23 and 24 are part of the East Basin. Excess water from the East Basin is conveyed into the Los Angeles River. The West Basin (Drainage Feature 3) has deep soils with a high capacity to absorb and store water, but water is not discharged from the West Basin into the Los Angeles River. Drainage Features 6 and 22, Compton Creek, for the most part is earthen-bottomed within the BSA. It is a narrow channel that contains sufficient sediment to hold water for a long enough period of time to support wetland vegetation.

FLOOD STORAGE AND FLOOD FLOW MODIFICATION. This function is determined based on the ability of a wetland or stream at which the peak flow in a watershed can be attenuated during major storm events and during peak domestic flows to take in surface water that may otherwise cause flooding. This is dependent on the size of the wetland or stream, the amount of water it can hold, and its location in the watershed. For instance, larger wetlands or streams that have a greater capacity to receive waters have a greater ability to reduce flooding. In addition, areas high in the watershed may have more ability to reduce flooding in downstream areas, but areas lower in the watershed may have greater benefits to a specific area. Vegetation, shape, and the configuration of the wetland or stream may also affect flood storage by dissipating the energy of flows during flood events.

Several of the drainages within the BSA were created or modified in order to provide increased flood storage capacity during storm events within the project vicinity. As a result, many of the drainages function at a moderate or high level with regards to flood storage and flood flow modification. The Los Angeles River, as well as Drainage Features 3 (Dominguez Gap Wetlands), 6 (Compton Creek), 12 (Rio Hondo Creek), and 13, function at a high level due to their large size and/or presence of vegetation or other modifications, which would serve to dissipate flood flows downstream. Drainage Features 4, 16, 22, 23, and 24 all function at a moderate level, as they are not as large as the drainages identified above, but provide flood storage and/or flow modification for large areas and have the capacity to receive moderate amounts of flood water. For the most part, flood waters within these drainages are held for only a short time prior to conveyance into the Los Angeles River.

SEDIMENT RETENTION. Removal of sediment is the process that keeps sediments from migrating downstream. This is accomplished through the natural process of sediment retention and entrapment. This function is dependent on the sediment load being delivered by runoff into the watershed. Similar to above, the vegetation, shape, and configuration of a wetland will also affect sediment retention if water is detained for long durations, as would be the case with dense vegetation, a bowl-shaped watershed, or slow-moving water. This function would be

demonstrated (i.e., high) if the turbidity of the incoming water is greater than that of the outgoing water.

The majority of the drainages within the BSA have a low ability to remove or trap sediment as they are concrete-lined and unvegetated. Drainage Features 3, 6, 22, 23, and 24 have a moderate or high capacity to trap and retain sediment. Drainage Features 3, 23, and 24 (Joint Dominguez Gap and DeForest Treatment Wetlands) have the ability to retain a substantial amount of sediment as they contain vegetated basins with large capacities. Drainage Features 6 and 22 (Compton Creek), are earthen-bottomed within the BSA. Compton Creek is a narrow channel that contains sufficient sediment and vegetation to trap a moderate amount of sediment prior to conveyance into the Los Angeles River.

NUTRIENT RETENTION AND TRANSFORMATION. Nutrient cycling consists of two variables: uptake of nutrients by plants and detritus turnover, in which nutrients are released for uptake by plants downstream. Wetland systems in general are much more productive with regard to nutrients than upland habitats. The regular availability of water associated with the wetland or stream may cause the growth of plants (nutrient uptake) and associated detritivores and generate nutrients that may be utilized by a variety of aquatic and terrestrial wildlife downstream.

The majority of the drainages within the BSA function at a low level with regards to nutrient retention and transformation. Since most of the drainages are concrete-lined and unvegetated, they do not contribute at all to this function. Earthen-bottomed portions of the Los Angeles River, Compton Creek (Drainage Features 6 and 22), and the Joint Dominguez Gap and DeForest Treatment Wetlands (Drainage Features 3, 23, and 24) have a moderate or high capacity in regard to nutrient retention and transformation.

The earthen-bottomed portions of the Los Angeles River, south of Willow St., contain islands of vegetation that have grown in sediment that was retained during prior storm events. Since waters from this section of the Los Angeles River are almost immediately conveyed into the Pacific Ocean, this drainage does not provide nutrients for downstream vegetation. However, it does function to remove excess nutrients from water prior to conveyance into the Pacific Ocean. The Joint Dominguez Gap and DeForest Treatment Wetlands (Drainage Features 3, 23, and 24) have the ability to retain a moderate to high amount of nutrients as they contain (or will contain, in the case of Drainage Feature 24), significant amounts of wetland vegetation. Compton Creek (Drainage Features 6 and 22) contains a small amount of wetland vegetation that is capable of retaining a moderate amount of nutrients prior to conveyance into the Los Angeles River.

TOXICANT TRAPPING. The major processes by which wetlands remove nutrients and toxicants are as follows: (1) by trapping sediments rich in nutrients and toxicants, (2) by absorption to soils high in clay content or organic matter, and (3) through nitrification and denitrification in alternating oxic and anoxic conditions. Removal of nutrients and toxicants is closely tied to the processes that provide for sediment removal.

The majority of the drainages within the BSA function at a low level in regard to toxicant trapping. Since most of the drainages are concrete-lined and unvegetated, they do not contribute at all to this function. Compton Creek (Drainage Features 6 and 22) and the Joint Dominguez Gap and DeForest Treatment Wetlands (Drainage Features 3, 23, and 24) have a moderate or high capacity in regard to toxicant trapping for the same reasons, as they provide for nutrient retention.

Drainage Features 3, 23, and 24 (Joint Dominguez Gap and DeForest Treatment Wetlands) provide a high level of toxicant trapping, as they contain a large amount of vegetation and sediment.

SOCIAL SIGNIFICANCE. This is a measure of probability that a wetland or stream will be utilized by the public because of its natural features, economic value, official status, and/or location. This includes its being utilized by the public for recreational uses, such as boating, fishing, birding, walking, and other passive recreational activities. In addition, a wetland or stream that is utilized as an outdoor classroom, is a location for scientific study, or is near a nature center would have a higher social significance standing.

The majority of the drainages within the BSA are small concrete-lined drainages adjacent to I-710 or nearby surface streets. Since most of the drainages are flood control structures, public access is generally not permitted. Therefore, most of the drainages do not provide any social significance, as they are not utilized by the public.

The Los Angeles River provides for recreational uses including biking, jogging, and walking, as well as birding and other passive recreational activities. There is a multi-use recreational trail along the top of the east bank of the Los Angeles River channel throughout the BSA. Wetland areas located at Willow St. are also known birdwatching areas. The Joint Dominguez Gap and DeForest Treatment Wetlands (Drainage Features 3, 23, and 24) also provide public recreational opportunities. Compton Creek (Drainage Features 6 and 22) contains wetland habitat and may provide some opportunity for passive recreation, such as birding, though access to the creek is somewhat restricted.

WILDLIFE HABITAT. General habitat suitability is the ability of a wetland to provide habitat for a wide range of wildlife. Vegetation is a large component of wildlife habitat. As plant community diversity increases along with connectivity with other habitats so does potential wildlife diversity. In addition, a variety of open water, intermittent ponding, and perennial ponding is also an important habitat element for wildlife.

The majority of the drainages within the BSA function at a low level in regard to wildlife habitat. Since most of the drainages are concrete-lined and unvegetated, they contribute only minimally to this function. Earthen-bottomed portions of the Los Angeles River, as well as Drainage Features 3, 6, 22, 23, and 24, have a moderate or high value in regard to wildlife habitat. The earthen-bottomed portions of the Los Angeles River contain wetland areas that attract many avian

species. Wetland and riparian habitat within Drainage Features 3, 23, and 24 (Joint Dominguez Gap and DeForest Treatment Wetlands) provide wildlife habitat for mainly avian species. The small amount of wetland vegetation within Drainage Features 6 and 22 (Compton Creek) provides a moderate amount of habitat for aquatic species.

AQUATIC HABITAT. The ability of a wetland or stream to support aquatic species requires that there be ample food supply, pool and riffle complexes, and sufficient soil substrate. Food supply is typically in the form of aquatic invertebrates and detrital matter from nearby vegetation. Pool and riffle complexes provide a variety of habitats for species diversity as well as habitat for breeding and rearing activities. Species diversity is directly related to the complexity of the habitat structure.

The majority of the drainages within the BSA function at a low level in regard to aquatic habitat. Since most of the drainages are concrete-lined and unvegetated, they contribute only minimally to this function.

The earthen-bottomed portions of the Los Angeles River contain wetland areas with sufficient sediment and vegetation to support aquatic invertebrates and provide detrital matter. The water is shallow within this area but is sufficient to provide a moderate amount of habitat for aquatic species. Wetland and riparian habitat within Drainage Features 3, 23, and 24 (Joint Dominguez Gap and DeForest Treatment Wetlands) provide aquatic habitat due to the presence of water, sediment and vegetation. The small amount of wetland vegetation within Drainage Features 6 and 22 (Compton Creek) provide a moderate amount of habitat for aquatic species.

3.17.3 ENVIRONMENTAL CONSEQUENCES

The following discussion of environmental consequences only describes the permanent impacts of the project alternatives. Please refer to Section 3.24 of this document, Construction Impacts, for a discussion of the temporary impacts of the project build alternatives for each resource area. Specifically, the descriptions of temporary impacts related to wetlands and other waters of the United States are located in Section 3.24.3.17, Wetlands and Other Waters of the United States.

3.17.3.1 PERMANENT IMPACTS

BUILD ALTERNATIVES. For the purposes of this impact analysis, a conservative right-of-way footprint was established for each build alternative that includes areas of cut and fill, staging areas for construction vehicles, equipment and materials, haul routes, and water quality treatment features. While some portions of this right-of-way footprint would only be temporarily disturbed during construction and would be revegetated with native plant species, it is not expected that this revegetation would fully restore the functions and values of the impacted habitat in some cases.

Table 3.17-3 shows the extent to which each build alternative would affect USACE, RWQCB, and CDFW jurisdictional waters. In addition, Appendix R of this Final EIR/EIS depicts the waters of the U.S. in the BSA relative to the build alternatives under consideration. In general, Alternative 7 would cause greater impacts to jurisdictional waters than Alternative 5C.

Table 3.17-3: Impacts of the Build Alternatives to Potentially Jurisdictional Areas

| Jurisdictional Areas | Permanent (acres) ¹ | | Temporary (acres) |
|--|--------------------------------|----------|-------------------|
| | Direct | Indirect | |
| USACE Jurisdictional Areas | | | |
| Alternative 5C | 1.74 | 26.13 | 30.21 |
| Alternative 7 | 1.54 | 28.56 | 33.70 |
| CDFW Jurisdictional Areas | | | |
| Alternative 5C | 2.13 | 36.51 | 55.73 |
| Alternative 7 | 1.96 | 42.20 | 71.66 |
| RWQCB Jurisdictional Areas | | | |
| Alternative 5C | 1.74 | 26.29 | 30.29 |
| Alternative 7 | 10.80 | 28.72 | 33.79 |
| RWQCB-only Jurisdictional Areas ² | | | |
| Alternative 5C | 0.00 | 0.15 | 0.08 |
| Alternative 7 | 9.26 | 0.16 | 0.08 |

Note: Jurisdictional impacts for all Design Options (5C-1A, 2A, or 3A, and 7-1B or 3B) are the same as for their corresponding build alternatives.

¹ For purposes of full disclosure pursuant to CEQA and NEPA, permanent impacts of the build alternatives are calculated where new structures will occur, regardless of habitat. However, for USACE permitting purposes, changes to jurisdictional areas that are already concrete-lined are considered temporary impacts.

² These areas are likely to be only RWQCB jurisdictional.

CDFW = California Department of Fish and Wildlife

RWQCB = Regional Water Quality Control Board

USACE = United States Army Corps of Engineers

The permanent impacts shown in Table 3.17-3 are based on preliminary engineering plans for the build alternatives. Where the concept plans for the build alternatives (see Appendix O of this Final EIR/EIS) showed the placement of piles or other roadway features, a direct permanent impact was assumed. Indirect permanent impacts of the build alternatives were assumed in areas where shading from a bridge or the elevated freight corridor was identified. Therefore, the analysis of impacts conservatively estimates a worst-case impact scenario wherein all areas within the right-of-way footprint are calculated as permanent impacts, with the exception of shaded areas spanned by bridges (indirect).

Table 3.17-3 also shows the impacts resulting from the build alternatives to the Joint Dominguez Gap and Deforest Treatment Wetlands Project areas (Drainage Features 3, 23, and 24) that are likely to be considered jurisdictional only by the RWQCB.

Based on the concept plans provided in Appendix O, the worst-case impact scenario associated with Alternative 5C would potentially result in direct permanent impacts to approximately 1.74 acres and, indirect permanent impacts to approximately 26.13 acres of USACE jurisdictional areas. In addition, Alternative 5C would potentially result in direct permanent impacts to approximately 2.13 acres and indirect permanent impacts to approximately 36.51 acres of CDFW jurisdictional areas. Furthermore, Alternative 5C would potentially result in direct permanent impacts to approximately 1.74 acres and indirect permanent impacts to approximately 26.29 acres of RWQCB jurisdictional areas.

The worst-case impact scenario associated with Alternative 7 would potentially result in direct permanent impacts to approximately 1.54 acres and indirect permanent impacts to approximately 28.56 acres of USACE jurisdictional areas. In addition, Alternative 7 would potentially result in direct permanent impacts to approximately 1.96 acres and indirect permanent impacts to approximately 42.20 acres of CDFW jurisdiction. Furthermore, Alternative 7 would potentially result in direct permanent impacts to approximately 10.80 acres and indirect permanent impacts to approximately 28.72 acres of RWQCB jurisdictional areas.

The following describes permanent impacts to the functions and values of wetlands and other waters in the BSA resulting from the build alternatives:

HYDROLOGIC REGIME. The majority of the drainages within the BSA have a low ability to absorb and store water as they are concrete-lined. Impacts resulting from the build alternatives within the Los Angeles River include expanded bridge footings with a small footprint that would not substantially affect the existing hydrologic regime. Alternative 5C would not result in any permanent impacts within Drainage Feature 3 (Dominguez Gap Wetlands). Alternatives 7 would result in permanent impacts to Drainage Feature 3. Due to the permanent removal of a large amount of the basins within Drainage Feature 3, the permanent impacts would substantially alter the hydrologic regime of this drainage. Impacts resulting from the build alternatives within Compton Creek (Drainage Features 6 and 22) include expanded bridge footings with a small footprint that would not substantially affect the existing hydrologic regime. Following implementation of either of the build alternatives, with the exception of Drainage Feature 3, all drainages within the BSA would continue to function at the existing level with regard to hydrologic regime.

FLOOD STORAGE AND FLOOD FLOW MODIFICATION. Impacts within the Los Angeles River, as well as Drainage Features 6 and 22 (Compton Creek), 12 (Rio Hondo Creek), 13, and 21 for Alternative 5C would not substantially alter flood storage or flood flow modification. Impacts within Drainage Feature 3 (Dominguez Gap Wetlands) for Alternative 7 would result in the loss of the basins west of the Los Angeles River, thereby diminishing flood storage capacity.

SEDIMENT RETENTION. The majority of the drainages within the BSA have a low ability to remove or trap sediment as they are concrete-lined and unvegetated. Therefore, impacts to

most of the drainages under the build alternatives would not affect sediment retention. Impacts within the Los Angeles River resulting from the build alternatives include expanded bridge footings with a small footprint that would not substantially affect the existing sediment retention capabilities of this drainage. Impacts to Drainage Feature 3 under Alternative 7 would substantially affect the sediment retention. Impacts for Alternatives 5C and 7 within Drainage Features 6 and 22 (Compton Creek) are minimal and would not substantially affect the existing hydrologic regime.

NUTRIENT RETENTION AND TRANSFORMATION. Impacts within the Los Angeles River associated with Alternatives 5C and 7 are relatively small and would not substantially affect the existing level of nutrient retention capabilities of this drainage. There are no permanent impacts within Drainage Feature 3 associated with Alternative 5C. Impacts associated with Alternatives 7 would result in the loss of the basins west of the Los Angeles River (Drainage Feature 3) and would substantially reduce its value related to nutrient retention and transformation. Impacts within Drainage Features 6 and 22 (Compton Creek) under Alternatives 5C and 7 are minimal and would not substantially affect nutrient retention or transformation.

TOXICANT TRAPPING. Impacts within the Los Angeles River associated with Alternatives 5C and 7 are relatively small and would not substantially affect the existing low level of toxicant trapping capabilities of this drainage. There are no permanent impacts within Drainage Feature 3 associated with Alternative 5C. Impacts associated with Alternative 7 would result in the loss of Drainage Feature 3 and would substantially reduce its value related to toxicant trapping. Impacts within Drainage Features 6 and 22 (Compton Creek) for Alternatives 5C and 7 are minimal and would not substantially affect toxicant trapping.

SOCIAL SIGNIFICANCE. Impacts within the Los Angeles River associated with Alternatives 5C and 7 are relatively small and all social uses would be retained or improved. There are no permanent impacts within Drainage Feature 3 associated with Alternative 5C. Impacts associated with Alternative 7 would result in the loss of Drainage Feature 3 and would substantially reduce the social significance of this drainage because its potential for public use would be eliminated.

WILDLIFE HABITAT. Impacts to wildlife habitat within the Los Angeles River associated with Alternatives 5C and 7 are relatively small and would not substantially alter wildlife habitat values of this drainage. There are no permanent impacts within Drainage Feature 3 associated with Alternative 5C. Impacts associated with Alternative 7 would result in the loss of the wildlife habitat within Drainage Feature 3 and would eliminate its function as wildlife habitat. Impacts within Drainage Features 6 and 22 (Compton Creek) for Alternatives 5C and 7 would not result in the loss of a substantial amount of wildlife habitat.

AQUATIC HABITAT. Impacts within the Los Angeles River associated with Alternatives 5C and 7 are relatively small and would not substantially affect the existing aquatic habitat values of

this drainage. There are no permanent impacts within Drainage Feature 3 associated with Alternative 5C. Impacts associated with Alternative 7 would result in the loss of aquatic habitat within this drainage and would eliminate its function as aquatic habitat. Impacts within Drainage Features 6 and 22 (Compton Creek) for Alternatives 5C and 7 are minimal and would not result in the loss of a substantial amount of aquatic habitat.

NO BUILD (ALTERNATIVE 1). Under the No Build (Alternative 1), which has been identified as the Preferred Alternative, the build alternatives would not be constructed. No permanent (direct or indirect) impacts to jurisdictional waters would result from the No Build (Alternative 1).

LEAST ENVIRONMENTALLY DAMAGING PRACTICABLE ALTERNATIVE.

REGULATORY REQUIREMENTS. CWA Section 404(b)(1) guidelines specify that a permit can be issued for a discharge of dredged or fill material to waters of the U.S. only if that discharge is determined to be the least environmentally damaging practicable alternative (LEDPA) (40 CFR 230.10 [a]). When a proposed project requires an individual permit for filling waters of the U.S., an analysis of alternatives must be completed. Likewise, the SWRCB Procedures and RWQCBs have similar policies for alternative analyses for impacts on waters of the State. The LEDPA analysis is required for non-water dependent projects (which include essentially all surface transportation projects) that require filling of wetlands or other special aquatic sites. Special aquatic sites are areas possessing special or ecological characteristics of productivity, habitat, wildlife protection, or other important and easily disrupted ecological values. These areas are generally recognized as significantly influencing or positively contributing to the general overall environmental health or vitality of the entire ecosystem of a region.

No discharge of dredged or fill material shall be permitted if it: (a) causes or contributes to violations of any applicable State water quality standard; (b) jeopardizes the continued existence of species listed as endangered or threatened under the Federal Endangered Species Act of 1973 (FESA), as amended, or results in the likelihood of the destruction or adverse modification of a habitat which is determined to be a critical habitat under FESA; or (c) violates any requirement imposed to protect any maritime sanctuary. The LEDPA is generally the practicable alternative that either avoids waters of the U.S. or impacts the smallest area of waters.

The evaluation of alternatives must consider a reasonable range of options that could fulfill the project purpose and need with focus on projects that avoid or minimize fill. An Alternative is practicable "if it is available and capable of being done after taking into consideration cost, existing technology, and logistics in light of overall project purposes" (40 CFR 230.10 [a][2]). For projects that include fill of wetlands or other special aquatic sites, it is presumed that practicable alternatives that do not involve special aquatic sites are available, unless clearly demonstrated otherwise. An alternative with fewer impacts to aquatic resources than the Preferred Alternative may be eliminated by demonstrating that it has other overriding severe environmental impacts, is not practicable, or does not meet the project purpose and need.

IDENTIFICATION OF THE LEDPA. Because a Section 404 permit can only be issued for the LEDPA, Section 404 compliance usually requires a more detailed and specific analysis of the aquatic impacts of each build alternative. This analysis is referred to as a Section 404(b)(1) Alternative Analysis. To the extent necessary, i.e., if an Individual Permit is required, the Section 404(b)(1) specific analyses would be finalized in separate documentation as part of the project permitting process, in compliance with the law, for any build alternative.

It should be noted that the No Build (Alternative 1) has been identified as the Preferred Alternative. This alternative does not entail any construction, nor does it have an operational phase, and therefore would not have direct impacts to wetlands and other waters of the U.S. Therefore, the LEDPA analysis is not warranted.

3.17.3.2 PUBLIC HEALTH CONSIDERATIONS

No public health considerations exist with regard to project impacts on jurisdictional areas.

3.17.4 AVOIDANCE, MINIMIZATION AND/OR MITIGATION MEASURES

The majority of the jurisdictional aquatic resources within Los Angeles County fall under the regulatory jurisdiction of the USACE (pursuant to Section 404 of the CWA) and the CDFW (pursuant to Section 1600 of the California Fish and Game Code). Compensatory mitigation for impacts to jurisdictional aquatic resources would be required in order to obtain permits from the USACE and CDFW. For any build alternative, compensatory mitigation would developed in accordance with the Final Rule on Compensatory Mitigation for Losses of Aquatic Resources (33 CFR Parts 325 and 332, and 40 CFR Part 200). Typically, aquatic resources subject to USACE and CDFW jurisdiction are mitigated at a minimum mitigation-to-impact ratio of 2:1 for permanent impacts and 1:1 for temporary impacts, which is consistent with USACE and CDFW policies for no net loss of aquatic habitat (e.g., wetlands) standards. Compensatory mitigation may have been in the form of habitat restoration and/or enhancement in on- or off-site areas where similar aquatic habitat exists, or a monetary contribution toward an in-lieu fee program, as acceptable by the regulatory agencies. Mitigation bank credits may also have been an option, although further research would be needed to determine feasibility. For any build alternative, final details for compensatory mitigation would have been evaluated through coordination between Caltrans and the resource agencies. Areas within or directly adjacent to the BSA of the build alternatives may have offered potential mitigation options. Online research (The River Project 2009; Los Angeles County 2009) and communication with agency representatives (L. Torres [Rivers and Mountains Conservancy], J. Casanova [Los Angeles River and San Gabriel Rivers Watershed Council], and D. Rivera [LACDPW], personal communication, December 30, 2009) revealed that a number of restoration opportunities, some still in progress, exist in the vicinity. Portions of the Joint Dominguez Gap and DeForest Treatment Wetlands Project lie within the BSA. Among other potential options, compensation for the impacts of the build alternatives to tidal waters may have been provided through additional funding for the Golden Shore Marine Preserve (Long Beach Natural Areas 2009). The final report has been submitted for the Compton Creek Improvement

Project, which may provide a compensatory mitigation opportunity for riparian scrub and/or freshwater emergent marsh. The Rivers and Mountains Conservancy is looking for potential projects for implementation in the Compton Creek Watershed, as well as in the Los Angeles River. For any build alternative, these potential opportunities would have been investigated in coordination with the resource agencies, the Los Angeles County Department of Public Works (LACDPW), and the Santa Monica Mountains Recreation and Conservation Authority (SMMRCA) throughout the planning phase, final design, and the permitting process. Since a build alternative was not identified as the Preferred Alternative, compensatory and other mitigation will not be implemented.

For any build alternative, Measure NC-1, described in Section 3.16, Natural Communities, would be implemented to address impacts to jurisdictional areas. Additional applicable measures for the build alternatives are provided in Section 3.24.4.17 (Measures CON-WET-1 through CON-WET-3). As previously mentioned, since a build alternative has not been identified as the Preferred Alternative, avoidance, minimization and/or mitigation measures will not be implemented.

3.17.5 WETLANDS ONLY PRACTICABLE ALTERNATIVE FINDING.

3.17.5.1 PURSUANT TO EXECUTIVE ORDER 11990 – PROTECTION OF WETLANDS

The Los Angeles River and 24 additional mapped drainage features occur within the BSA. These features are identified in Table 3.17-1, Summary of Jurisdictional Waters within the I-710 Corridor Project Biological Study Area. Because the build alternatives would widen an existing roadway, it is not possible to completely avoid impacts to wetlands alongside and under the existing roadway. Table 3.17-3, Impacts of the Build Alternatives to Potentially Jurisdictional Areas, compares the direct, indirect, and temporary impacts of Alternative 5C and Alternative 7 to the wetlands in the BSA. The implementation of either Alternative 5C or Alternative 7 would have both direct and indirect impacts to wetlands. As shown in Table 3.17-3, Alternative 5C directly impacts 0.23 acre of wetlands and 1.74 total acres of jurisdictional waters (inclusive of nonwetlands) and Alternative 7 directly impacts 0.19 acre of wetlands and 1.54 total acres of jurisdictional waters (inclusive of nonwetlands).” Therefore, of the two build alternatives, Alternative 5C would result in slightly more permanent impact to wetlands.

Potential alternatives to the actions that would be carried out under Alternatives 5C and 7 are not possible within reasonable, natural, social, and economic constraints. In addition, all measures to minimize potential harm within the floodplain resulting from the build alternatives, consistent with regulations issued under Section 2(d) of Executive Order (EO) 11988, have been taken. The build alternatives would include mitigation measures CON-WET-1, CON-WET-2, and CON-WET-3 (see Section 3.24, Construction Impacts) which would be implemented for permanent and temporary (construction phase) impacts of either build alternative to ensure (the minimum amount possible) loss of wetlands. For any build alternative, all wetland areas temporarily disturbed by construction would be fully restored following construction activities. Based on the above considerations, it is determined that there is no practicable alternative to the build alternatives in wetlands and that the build alternatives include all practicable measures to minimize harm to wetlands that may result from such use. However, the No Build (Alternative 1) has been identified as the Preferred Alternative in light of newly adopted policies regarding freeway widening and shifting focus to transit solutions, and concern about community displacement along the I-710 Corridor. Refer to Chapter 2.0, Alternatives, for further discussion on the ultimate incompatibility of Alternatives 5C and 7 with current transportation policies. As such, although no practicable alternative to the proposed action exists (23 CFR 650, Subpart A), adoption of the Preferred Alternative will not result in any actions that would result in potential harm within the floodplain.

3.18 PLANT SPECIES

The analysis of impacts on plant species is based on the following document:

- *I-710 Corridor Project Natural Environment Study (NES)* (June 2017)

3.18.1 REGULATORY SETTING

The U.S. Fish and Wildlife Service (USFWS) and California Department of Fish and Wildlife (CDFW) share regulatory responsibility for the protection of special-status plant species. “Special-status” species are selected for protection because they are rare and/or subject to population and habitat declines. Special-status is a general term for species that are afforded varying levels of regulatory protection. The highest level of protection is given to threatened and endangered species; these are species that are formally listed or proposed for listing as endangered or threatened under the Federal Endangered Species Act (FESA) and/or the California Endangered Species Act (CESA). Please see the Threatened and Endangered Species Section 3.20, in this document for detailed information regarding these species.

This section of the document discusses all the other special-status plant species, including CDFW species of special concern, USFWS candidate species, and California Native Plant Society (CNPS) rare and endangered plants.

The regulatory requirements for FESA can be found at 16 United States Code (USC), Section 1531, et seq. See also 50 Code of Federal Regulations (CFR) Part 402. The regulatory requirements for CESA can be found at California Fish and Game Code, Section 2050, et seq. Caltrans projects are also subject to the Native Plant Protection Act, found at Fish and Game Code, Section 1900–1913, and the California Environmental Quality Act, California Public Resources Code, Sections 2100-21177.

3.18.2 AFFECTED ENVIRONMENT

Prior to conducting the field surveys, existing documentation relevant to the Biological Study Area (BSA) was reviewed. Database records and websites reviewed included:

- California Natural Diversity Database (CNDDDB) information (RareFind Version 5.1.1), which is administered by the CDFW (this database covers sensitive plant and animal species as well as sensitive natural communities that occur within California) (2009 and 2015)
- California Native Plant Society Electronic Inventory (CNPSEI, Version 8), California Native Plant Society (CNPS) Rare Plant Program (2009 and 2015)
- Calflora website (Calflora 2009 and 2015)
- CalPhotos website (CalPhotos 2009 and 2015)

- Consortium of California Herbaria website (Consortium of California Herbaria 2008)
- USFWS Official Species List (provided by Carlsbad Fish and Wildlife Office June 6, 2017; Appendix A)

Searches of these databases were conducted for the quadrangles containing and surrounding the BSA (i.e., the *San Pedro, Torrance, Inglewood, Hollywood, Los Alamitos, Seal Beach, Burbank, Pasadena, Mount Wilson, El Monte, Whittier, South Gate, Long Beach, and Los Angeles, California* United States Geological Survey [USGS] 7.5-minute quadrangles). Other sensitive species known to occur in the general area were also considered.

The special-status species lists obtained from the CNDDDB, the CNPS, and the USFWS were reviewed to determine which species could occur in the vicinity of the BSA. From these lists, comprehensive site-specific lists were compiled based on known ranges of species as well as species occurrence records within several miles of the BSA; these were further refined based on the availability of suitable habitat within the species' known ranges in the BSA. Most special-status species identified in the lists provided by the above agencies and organizations are not likely to be present within the BSA because species-specific habitat requirements are not present within the BSA, some species are rare and transient and would only occur in the area during migration, and some species are not tolerant of the level or proximity of human-related disturbance that currently characterizes the BSA.

The natural communities in the BSA include a variety of plant species considered sensitive by USFWS, CDFW, and CNPS. The literature review described above resulted in a list of 58 special-status plant species that may occur in or within the vicinity of the BSA. Fourteen of these special-status plant species are Federally and/or State-listed as endangered, threatened, candidate, or fully protected species and are discussed in more detail in Section 3.20. However, suitable habitat for all 14 of these species is absent within the BSA.

Further information on special-status plant species, including status, habitat requirements, and potential for occurrence, is summarized in Table 3.18-1.

3.18.2.1 SPECIAL-STATUS PLANT SPECIES REQUIRING SURVEYS

Southern tarplant (*Centromadia parryi* ssp. *australis*), previously known as *Hemizonia parryi* ssp. *Australis*, is a yellow-orange flowered plant that occurs in seasonally wet saline or alkaline soils of the southern California coast and into northern Baja California. Southern tarplant is listed by the CNPS as a rare, threatened, or endangered species in California and elsewhere (CNPS 1B). This native annual plant is typically found in sunny areas where competition from other plants is limited by alkalinity, seasonal soil saturation, or the impacts of human disturbance. Numbers of individuals can vary widely at a given location from year to year, depending on recent disturbance and seasonal precipitation. Populations are expected to be larger in years of average or above average rainfall.

Table 3.18-1: Special-Status Plant Species Potentially Occurring or Known to Occur in the Biological Study Area

| Common Name | Scientific Name | Status Federal/State/CNPS Status | General Habitat Description | Habitat Present or Absent/ Species Observed | Rationale |
|-----------------------|---|--|--|---|--|
| Aphanisma | <i>Aphanisma blitoides</i> | –/–/1B.2 | Sandy or clay soils on slopes or bluffs near the ocean, usually in coastal bluff scrub, coastal dunes, or coastal scrub, below 1,000 feet elevation. Known in California from Ventura, Santa Barbara, Los Angeles, Orange, and San Diego Counties. Also occurs in Mexico. Blooms March–June. | A | No sandy or clay soils occur within the BSA. |
| San Gabriel manzanita | <i>Arctostaphylos glandulosa</i> ssp. <i>gabrielensis</i> | –/–/1B.2 | Rocky areas in chaparral from 1,950 to 5,000 feet elevation. Known only from Los Angeles, Santa Barbara, and San Bernardino Counties, California. Blooms March (evergreen shrub). | A | No chaparral or rocky outcrop in the BSA. BSA is not within the species' range. |
| Coulter's saltbush | <i>Atriplex coulteri</i> | –/–/1B.2 | Alkaline or clay soils in ocean bluffs and ridgetops and alkaline low places in coastal bluff scrub, coastal dunes, coastal sage scrub, and valley and foothill grasslands below 1,500 feet elevation. In California, known only from Los Angeles, Orange, Santa Barbara, San Bernardino, San Luis Obispo, Ventura, and San Diego Counties. Also occurs in Mexico. Species has been documented northeast of the I-710/I-405 interchange. Blooms March–October. | A | No alkaline or clay soils or suitable habitat occur within the BSA. Not observed during surveys of area nearest to suitable habitat. |
| South Coast saltscale | <i>Atriplex pacifica</i> | –/–/1B.2 | Alkali soils in coastal sage scrub, playas, coastal bluff scrub, coastal dunes, and chenopod scrub below 600 feet elevation, and perhaps formerly up to about 1,400 feet in Los Angeles County. In California, known from the Channel Islands and mainland Los Angeles, San Diego, and Orange Counties. Also occurs in Mexico. Believed extirpated from Ventura County. Blooms March–October. | A | No alkaline soils or other suitable habitat occur within the BSA. Not observed during surveys of area nearest to suitable habitat. |

| Common Name | Scientific Name | Status Federal/State/CNPS Status | General Habitat Description | Habitat Present or Absent/ Species Observed | Rationale |
|-------------------------|--|--|---|---|--|
| Parish's brittlescale | <i>Atriplex parishii</i> | —/—/1B.1 | Alkali meadows, vernal pools, chenopod scrub, and playas. Usually on drying alkali flats with fine soils. In California, known from Riverside, San Diego, and Orange Counties. Also occurs in Mexico. Believed extirpated from Los Angeles and San Bernardino Counties. This species has been documented northeast of the I-710/I-405 interchange. Blooms June–October. | A | No alkaline soils or other suitable habitat occur within the BSA. Not observed during surveys of area nearest to suitable habitat. |
| Davidson's saltscale | <i>Atriplex serenana</i> var. <i>davidsonii</i> | —/—/1B.2 | Alkaline soils in scrub and herbaceous communities from 30 to 1,500 feet elevation. In California, known only from Los Angeles, Orange, Riverside, San Diego, San Luis Obispo, and Ventura Counties. Believed extirpated from Santa Barbara and perhaps Los Angeles Counties. Also occurs in Mexico. Blooms April–October. | A | No alkaline soils or other suitable habitat occur within the BSA. Not observed during surveys of area nearest to suitable habitat. |
| Round-leaved filaree | <i>California macrophylla</i> | —/—/CBR *Considered but rejected | Clay soils in woodland, scrub, and grassland communities from 50 to 4,000 feet elevation. Known from central and south coastal areas and the Central Valley in California. Also occurs in Oregon and Mexico. Blooms March–May. | A | No clay soils occur within the BSA. |
| Slender mariposa lily | <i>Calochortus clavatus</i> var. <i>gracilis</i> | —/—/1B.2 | Shaded foothill canyons in areas of chaparral; typically 1,200 to 3,300 feet elevation; known only from San Gabriel Mountains of Los Angeles and San Bernardino Counties. Blooms March. | A | No chaparral or foothill canyons within the BSA. BSA is outside the species' range. |
| Plummer's mariposa-lily | <i>Calochortus plummerae</i> | —/—/4.2 | Sandy or rocky sites of (usually) granitic or alluvial material in valley and foothill grassland, coastal scrub, chaparral, cismontane woodland, and lower montane coniferous forest at 300 to 5,600 feet elevation. Known from Santa Monica Mountains to San Jacinto Mountains in Riverside, San Bernardino, Orange, Los Angeles, and Ventura Counties. Blooms May–July. | A | No sandy or rocky soils occur within the BSA. |

| Common Name | Scientific Name | Status Federal/State/CNPS Status | General Habitat Description | Habitat Present or Absent/ Species Observed | Rationale |
|-----------------------------|--|--|---|---|---|
| Intermediate mariposa lily | <i>Calochortus weedii</i> var. <i>intermedius</i> | —/—1B.2 | Generally rocky areas in hills with annual grassland and coastal sage scrub; typically 600 to 2,800 feet elevation. Los Angeles, Orange, and Riverside Counties. Blooms June–July. | A | No rocky, hilly areas within the BSA. BSA is outside the species' elevational and geographic range. |
| Lucky morning-glory | <i>Calystegia felix</i> | —/—1B.1 | Wetland and marshy areas, sometimes alkaline, sometimes artificially watered, from 100 to 700 feet elevation. All of the known extant occurrences are associated with well-watered landscaping on recently completed industrial, commercial, and residential developments in the City of Chino within a historical area of artesian springs. Older collections are from areas that are now heavily urbanized (including one from South Los Angeles and another from Pico Rivera in Los Angeles County). Known to occur only in western San Bernardino County. Presumed extirpated from Riverside and Los Angeles Counties. Blooms March–September (annual or perennial rhizomatous herb). | A | Believed extirpated from Los Angeles County. Areas where it was observed in the County (last in 1902) are now highly urbanized. |
| Santa Barbara morning-glory | <i>Calystegia sepium</i> ssp. <i>binghamiae</i> | —/—1A, * (presumed extinct in CA) | Coastal marshes below 80 feet elevation. Probably extinct. Formerly known from Los Angeles, Orange, Ventura, and Santa Barbara Counties. Blooms April–May. | A | Believed extirpated from Los Angeles County. Known only from historical records. Not observed during surveys of marsh habitat within the BSA. |

| Common Name | Scientific Name | Status Federal/State/CNPS Status | General Habitat Description | Habitat Present or Absent/ Species Observed | Rationale |
|--------------------------|---|--|---|---|--|
| Lewis's evening primrose | <i>Camissoniopsis lewisii</i> (<i>Camissonia lewisii</i>) | —/—/3 | Sandy or clay areas in coastal scrub, grassland, and woodland below 1,000 feet elevation. In California, known only from Los Angeles and San Diego Counties. Believed extirpated from Orange County. Also occurs in Mexico. | A | No sandy or clay habitat occurs within the BSA. |
| Southern tarplant | <i>Centromadia parryi</i> <i>ssp. australis</i> | —/—/1B.1 | In vernal wet areas such as edges of marshes and vernal pools, at edges of roads and trails, and in other areas of compacted, poorly drained, or alkaline soils where competition from other plants is limited, often due to disturbance, below 1,400 feet elevation. In California, known only from Santa Barbara, Ventura, Los Angeles, Orange, and San Diego Counties. Also occurs in Mexico. Blooms May–November. | P, O | Observed in three locations during 2009 surveys. Largest population was approximately 9,000 plants near the I-710/Rosecrans interchange. |
| Parry's spineflower | <i>Chorizanthe parryi</i> var. <i>parryi</i> | —/—/1B.1 | Sandy or rocky soils in chaparral, coastal scrub, or woodlands at 100 to 5,600 feet elevation. Known only from Los Angeles, Riverside, and San Bernardino Counties. Blooms April–June (annual herb). | A | No sandy or rocky soils within the BSA. No chaparral, coastal scrub, or woodlands within the BSA. |
| California saw-grass | <i>Cladium californicum</i> | —/—/2B.2 | Marshes and seeps below 2,000 feet elevation. In California, known from Inyo, Riverside, Santa Barbara, San Bernardino, and San Luis Obispo Counties. Believed to be extirpated from Los Angeles and perhaps San Bernardino Counties. Also occurs in Arizona, New Mexico, Nevada, Texas, Utah, and Mexico. Blooms June–September. | A | BSA is outside the species' known range (believed extirpated from Los Angeles County). Not observed during the surveys of most likely habitat. |
| Catalina crossosoma | <i>Crossosoma californicum</i> | —/—/1B.2 | On rocky sea bluffs, in wooded canyons, and on dry, open sunny spots on rocky clay, below 1,600 feet elevation. Known only from Channel Islands and mainland Los Angeles County. Blooms February–May. | A | No rocky bluffs, canyons, or clay habitats occur within the BSA. |

| Common Name | Scientific Name | Status Federal/State/CNPS Status | General Habitat Description | Habitat Present or Absent/ Species Observed | Rationale |
|-----------------------|--|--|--|---|--|
| Peruvian dodder | <i>Cuscuta obtusifolia</i> <i>var. glandulosa</i> | –/–/2B.2 | May be extirpated in California. Formerly found sporadically in freshwater marsh on herbs such as <i>Alternanthera</i> , <i>Dalea</i> , <i>Lythrum</i> , <i>Polygonum</i> , and <i>Xanthium</i> below about 1,600 feet elevation. Reported in California from Los Angeles, San Bernardino, Sonoma, Sutter, Butte, Sacramento, and Merced Counties. Also known from the eastern and southern United States, West Indies, and Mexico. Blooms July–October (annual parasitic vine). | A | Likely extirpated from Southern California. Last documented occurrence in Southern California was 1890 in San Bernardino County. The only other record in Southern California is an undated record for “El Monte.” |
| Many-stemmed dudleya | <i>Dudleya multicaulis</i> | –/–/1B.2 | Heavy, often clay soils or around granitic outcrops in chaparral, coastal sage scrub, and grassland below 2,600 feet elevation. Known only from Los Angeles, Orange, Riverside, San Bernardino, and San Diego Counties. Blooms April–July. | A | No clay, granitic outcrops, or similar habitat occur within the BSA. |
| Island green dudleya | <i>Dudleya virens</i> ssp. <i>insularis</i> | –/–/1B.2 | Rocky areas in coastal scrub and coastal bluff scrub below 1,000 feet elevation. Known only from Channel Islands and mainland Los Angeles and Ventura Counties. Blooms April–June. | A | No rocky habitat occurs within the BSA. |
| San Gabriel bedstraw | <i>Galium grande</i> | –/–/1B.2 | Rocky slopes in chaparral, woodland, and forest at 1,400 to 4,900 feet elevation. Known only from Los Angeles County. Blooms January–July (deciduous shrub). | A | No rocky slopes, chaparral, woodland, or forest within the BSA. BSA is outside the species’ range. |
| Los Angeles sunflower | <i>Helianthus nuttallii</i> ssp. <i>parishii</i> | –/–/1A, * (presumed extinct in CA) | Marshes and swamps (coastal salt and freshwater) at 30 to 1,600 feet elevation. Species is historically known from Los Angeles, Orange, and San Bernardino Counties, California. Last seen in 1937. Presumed extinct. Plants found in 2002 at Castaic Spring along the Santa Clara River in Los Angeles County were initially reported as | A | Believed extirpated from Los Angeles County. Known only from historical records. Not observed during surveys of marsh |

| Common Name | Scientific Name | Status Federal/State/CNPS Status | General Habitat Description | Habitat Present or Absent/ Species Observed | Rationale |
|----------------------|--|--|--|---|--|
| | | | possibly this taxon, but instead appear to be hybrids or evolutionary intermediates between <i>H. nuttallii</i> and <i>H. californicus</i> , based on chromosome counts and pollen morphology (<i>A Quantitative Analysis of Pollen Variation in Two Southern California Perennial Helianthus</i> [<i>Heliantheae: Asteraceae</i>], J.M. Porter and N. Fraga, 2004). Blooms August–October. | | habitat within the BSA. |
| Vernal barley | <i>Hordeum intercedens</i> | –/–/3.2 | Vernal pools and saline flats and depressions below 3,300 feet elevation. Known from many California counties. Also occurs in Mexico. | A | No vernal pools, saline flats, or depressions occur within the BSA. Not observed in nearest to suitable habitat. |
| Mesa horkelia | <i>Horkelia cuneata</i> ssp. <i>puberula</i> | –/–/1B.1 | Sandy or gravelly soils in chaparral, or rarely in cismontane woodland or coastal scrub at 200 to 2,700 feet elevation. Occurs in San Luis Obispo, Santa Barbara, Ventura, Los Angeles, Orange, and San Bernardino Counties. Believed extirpated from Riverside and San Diego Counties. Blooms February–July (September). | A | No gravelly or sandy habitat occurs within the BSA. |
| Coulter's goldfields | <i>Lasthenia glabrata</i> ssp. <i>coulteri</i> | –/–/1B.1 | Usually alkaline soils in marshes, playas, vernal pools, and valley and foothill grassland below 4,600 feet elevation. Known from Colusa, Merced, Tulare, Orange, Riverside, Santa Barbara, San Diego, San Luis Obispo, and Ventura Counties. Believed extirpated from Kern, Los Angeles, and San Bernardino Counties. Also occurs in Mexico. Blooms February–June. | A | Believed extirpated from Los Angeles County. No alkaline soils or other suitable habitat occur within the BSA. Not observed in habitats that are most nearly suitable. |

| Common Name | Scientific Name | Status Federal/State/CNPS Status | General Habitat Description | Habitat Present or Absent/ Species Observed | Rationale |
|------------------------------------|--|--|---|---|---|
| Robinson's pepper-grass | <i>Lepidium virginicum</i> <i>var. robinsonii</i> | —/—/4.3 | Dry soils in coastal sage scrub and chaparral, typically below 1,600 feet elevation. In California, known only from Los Angeles, Orange, Riverside, Santa Barbara, San Bernardino, and San Diego Counties. Blooms January–July. | A | No coastal scrub or chaparral within the BSA. |
| San Gabriel linanthus | <i>Linanthus concinnus</i> | —/—/1B.2 | Lower and upper montane coniferous forest; found on dry rocky slopes, often in Jeffrey pine/canyon oak forest; 5,500 to 9,200 feet elevation; known only from Los Angeles and San Bernardino Counties. Blooms May–July (annual herb). | A | No coniferous forest within the BSA. BSA is outside the species' range. |
| Orcutt's linanthus | <i>Linanthus orcuttii</i> | —/—/1B.3 | Openings (often gravelly) in chaparral, pinyon and juniper woodland, and coniferous forest at 3,000 to 7,000 feet elevation. In California, known only from Los Angeles (believed extirpated), Riverside, San Bernardino, and San Diego Counties. Also occurs in Mexico. Blooms May–July. | A | No chaparral or coniferous habitats occur within the BSA. |
| Santa Catalina Island desert-thorn | <i>Lycium brevipes</i> var. <i>hassei</i> | —/—/3.1 | Deciduous shrub of coastal bluffs and slopes in coastal bluff scrub and coastal scrub at 30 to 1,000 feet elevation. Known only from Channel Islands (extirpated), one location on Palos Verdes Peninsula in Los Angeles County, and one location in Orange County. Blooms June. | A | No coastal bluff or coastal sage scrub occur within the BSA. |
| Davidson's bush-mallow | <i>Malacothanmus</i> <i>davidsonii</i> | —/—/1B.2 | Sandy washes in coastal scrub, riparian woodland, and chaparral at 600 to 2,800 feet elevation. Known only from Los Angeles, Monterey, Santa Clara, San Luis Obispo, and San Mateo Counties, California. Blooms June–January (deciduous shrub). | A | No sandy washes, coastal scrub, or chaparral within the BSA. Although marginal riparian habitat is present within the BSA, the BSA is outside the species' known elevation range. |

| Common Name | Scientific Name | Status Federal/State/CNPS Status | General Habitat Description | Habitat Present or Absent/ Species Observed | Rationale |
|----------------------------------|---------------------------------|--|--|---|--|
| California muhly | <i>Muhlenbergia californica</i> | —/—/4.3 | Stream banks, canyons, and other moist sites in chaparral, coastal sage scrub, coniferous forest, and meadows at 300 to 6,600 feet elevation. Known only from the San Gabriel, San Bernardino, and San Jacinto Mountains of Los Angeles, San Bernardino, and Riverside Counties, California. Blooms July–September. | A | No chaparral, coastal sage scrub, coniferous forest, or meadows within the BSA. Although marginal riparian habitat is present within the BSA, the BSA is outside the species' known elevation range. |
| Mud nama | <i>Nama stenocarpum</i> | —/—/2B.2 | Lake shores, riverbanks, and similar intermittently wet areas at 20 to 1,600 feet elevation. Known in California from San Diego, Orange, and Riverside Counties and from San Clemente Island. Believed extirpated from Los Angeles and Imperial Counties. Known also from Baja California and Arizona. Blooms January–July. | A | Believed extirpated from Los Angeles County. Not observed in wet areas within the BSA during special-status plant surveys. |
| Prostrate vernal pool navarretia | <i>Navarretia prostrata</i> | —/—/1B.1 | Vernal pools, usually alkaline, from 50 to 2,300 feet elevation. Known only from Alameda, Los Angeles, Merced, Los Angeles, Orange, Riverside, San Benito, San Diego, San Luis Obispo, and possibly San Bernardino Counties. Species has been documented from approximately one to two miles east of the right-of-way for the build alternatives in Downey, approximately one to two miles west of the right-of-way near Compton, and approximately two miles west of the right-of-way north of United States Naval Station Long Beach. Blooms April–June. | A | No vernal pools or other suitable habitat occurs within the BSA. |

| Common Name | Scientific Name | Status Federal/State/CNPS Status | General Habitat Description | Habitat Present or Absent/ Species Observed | Rationale |
|----------------------|--|--|---|---|--|
| Coast woolly-heads | <i>Nemacaulis denudata</i> <i>var. denudata</i> | —/—/1B.2 | Sandy places such as coastal dunes below 300 feet elevation. Known in California from Orange, Los Angeles, and San Diego Counties. Believed extirpated from Santa Catalina Island. Also occurs in Mexico. Species has been documented from approximately one to two miles east of the right-of-way for the build alternatives north of the Long Beach Harbor. Blooms April–September. | A | No sandy soils occur within the BSA. |
| White rabbit-tobacco | <i>Pseudognaphalium leucocephalum</i> | —/—/2B.2 | Sand and gravel at the edges of washes or mouths of steep canyons at zero to 7,000 feet elevation. In California, known from Los Angeles, Orange, Riverside, Santa Barbara, San Diego, San Luis Obispo, and Ventura Counties. Also occurs in Arizona, New Mexico, Texas, and Mexico. Blooms (July) August–November (December). | A | No sandy/gravelly wash habitat occurs within the BSA. |
| Parish's gooseberry | <i>Ribes divaricatum</i> var. <i>parishii</i> | —/—/1A | Deciduous shrub of willow swales in riparian habitats at 200 to 1,000 feet elevation. Believed to be extinct. Historical collections from Los Angeles and San Bernardino Counties. Blooms February–April. | A | Believed to be extinct. Not observed in riparian habitats. |
| Sanford's arrowhead | <i>Sagittaria sanfordii</i> | —/—/1B.2 | Marshes and swamps below 2,100 feet elevation. Occurs in standing or slow-moving fresh water (ponds, marshes, and ditches). Known only from Butte, Del Norte, El Dorado, Fresno, Merced, Mariposa, Placer, Sacramento, Shasta, San Joaquin, and Tehama Counties. Believed extirpated from Southern California. | A | Not known from Los Angeles County. Believed extirpated from Southern California. |

| Common Name | Scientific Name | Status Federal/State/CNPS Status | General Habitat Description | Habitat Present or Absent/ Species Observed | Rationale |
|-----------------------------|---|--|---|---|--|
| Southern mountains skullcap | <i>Scutellaria bolanderi</i> <i>ssp. austromontana</i> | —/—/1B.2 | Gravelly soils of streambanks or in mesic sites in oak or pine woodland at 1,400 to 6,600 feet elevation. Known from Riverside and San Diego Counties. Believed extirpated from San Bernardino County and perhaps Los Angeles County. Blooms June–August. | A | Site is outside the species' elevation range. |
| Salt Spring checkerbloom | <i>Sidalcea neomexicana</i> | —/—/2B.2 | Alkaline springs and brackish marshes below 5,000 feet elevation. In California, known only from Kern, Orange, Riverside, San Bernardino, San Diego, and Ventura Counties. Believed extirpated from Los Angeles County. Also known from Arizona, New Mexico, Nevada, Utah, and Mexico. Blooms March–June. | A | No alkali springs or brackish marsh within the BSA. Believed extirpated from Los Angeles County. Also, not observed in marsh habitats. |
| Estuary seablite | <i>Suaeda esteroa</i> | —/—/1B.2 | Coastal salt marshes below 15 feet elevation. Occurs along the immediate coast from Santa Barbara County to Baja California. Species has been documented from approximately one to two miles east of the right-of-way north of the Long Beach Harbor. Blooms January–October. | A | No salt marsh within the BSA. |
| San Bernardino aster | <i>Symphyotrichum defoliatum</i> | —/—/1B.2 | Vernally wet sites (such as ditches, streams, and springs) in many plant communities below 6,700 feet elevation. In California, known from Ventura, Kern, San Bernardino, Los Angeles, Orange, Riverside, and San Diego Counties. May also occur in San Luis Obispo County. Blooms July–November. | P | Not observed during focused surveys of vernal wet sites during the 2009 blooming period. Also, not observed during 2015 surveys. |
| Greata's aster | <i>Symphyotrichum greatae</i> | —/—/1B.3 | Chaparral and woodland habitats in mesic canyons from 1,000 to 6,600 feet elevation. Known only from Los Angeles, San Bernardino, and Ventura Counties. Blooms July–November. | A | No canyons or similar habitats occur within the BSA. BSA is outside of species' known elevation range. |

I-710 Corridor Project Final EIR/EIS

| Common Name | Scientific Name | Status Federal/State/CNPS Status | General Habitat Description | Habitat Present or Absent/ Species Observed | Rationale |
|---------------------|---|--|---|---|--|
| Sonoran maiden fern | <i>Thelypteris puberula</i> var. <i>sonorensis</i> | –/–/2B.2 | Seeps along streams in meadows at 170 to 2,000 feet elevation. Known from western Riverside, southwestern San Bernardino, Santa Barbara, and Los Angeles Counties. Blooms January–September (perennial herb). | A | No seep or meadow habitat within the BSA. Not observed during surveys of most likely habitat. |
| Eelgrass | <i>Zostera marina</i> | HAPC/– | Widespread in Northern Hemisphere estuaries and bays, zero to seven feet below mean low tide. Provides habitat and structure for benthic invertebrates and many other organisms. | A | Currently not known to occur in the Los Angeles River system, although present elsewhere along the Long Beach shoreline. |

Source: LSA Associates, Inc. *I-710 Corridor Project Natural Environment Study* (June 2017).

Habitat Present/Absent: Absent (A) - no habitat present and no further work needed. Habitat Present (P) – habitat is, or may be present. Species observed during surveys (O) – Based on the literature review the species has been observed within the area of the BSA. Critical Habitat (CH) – Project footprint is located within designated critical habitat unit, but does not necessarily mean that appropriate habitat is present.

Status: Federal Endangered (FE); Federal Threatened (FT); Federal Proposed (FP, FPE, FPT); Federal Candidate (FC); Federal Habitat Area of Particular Concern (HAPC) United States Fish and Wildlife Service Birds of Conservation Concern (BCC); California Endangered (CE); California Threatened (CT); Fully Protected Species (CFP); California Species of Special Concern (CSC); California Special Plant (CSP), California Special Animal (CSA), California Native Plant Society (CNPS); 1A, Plants presumed extinct in California; 1B, Plants considered by CNPS to be rare, threatened, or endangered in California and elsewhere, 2, Plants considered by CNPS to be rare, threatened, or endangered in California, but more common elsewhere; 3, Plants about which more information is needed – a CNPS review list; CNPS threat categories: 0.1-Seriously threatened in California (high degree/immediacy of threat); 0.2-Fairly threatened in California (moderate degree/immediacy of threat); 0.3-Not very threatened in California (low degree/immediacy of threats or no current threats known)

BSA = Biological Study Area
CNPS = California Native Plant Society
I-405 = Interstate 405
I-710 = Interstate 710

Southern tarplant was observed in three locations within the BSA during the 2009 botanical surveys conducted during the blooming period for this species (May through November). No additional locations were observed during the 2011 or 2015 surveys. The largest population consisted of approximately 9,000 plants just north of the Interstate 710 (I-710)/Rosecrans Ave. interchange on the east side of I-710. Approximately 90 plants were found in sunny areas near the I-710/Atlantic Blvd. interchange, and six plants were found southeast of the I-710/Interstate 405 (I-405) interchange. There is no critical habitat for this species within the BSA.

3.18.3 ENVIRONMENTAL CONSEQUENCES

The following discussion of environmental consequences only describes the permanent impacts of the project alternatives. Please refer to Section 3.24 of this document, Construction Impacts, for a discussion of the temporary impacts of the project build alternatives for each resource area. Specifically, descriptions of temporary impacts related to plant species are located in Section 3.24.3.18, Plant Species.

3.18.3.1 PERMANENT IMPACTS

BUILD ALTERNATIVES. Alternative 5C, including the Design Options, would result in direct permanent impacts to two populations of southern tarplant. Alternative 7, including its Design Options, would result in direct permanent impacts to all three populations of southern tarplant, including the largest population near Rosecrans Ave. Table 3.18-2 indicates the type of impacts and quantifies the total square footage of southern tarplant that would be impacted by each build alternative.

Table 3.18-2: Impacts to Southern Tarplant by Build Alternative

| Alternative | Direct Permanent Impacts (square feet) | Temporary Impacts (square feet) |
|----------------|---|------------------------------------|
| Alternative 5C | 22,667 | 5 |
| Alternative 7 | 27,704 | 26 |

Source: LSA Associates, Inc. *I-710 Corridor Project Natural Environment Study* (June 2017).

The elevated freight corridor structure would span over the populations, creating some degree of permanent shade where sunny conditions currently exist. Since the southern tarplant is a sun-loving species, shading is anticipated to result in an adverse impact to the portions of the populations lying below the elevated structures. Alternatives 5C and 7 would result in direct permanent impacts to southern tarplant from shading. The build alternatives are not expected to result in permanent direct impacts to southern tarplant due to emissions, climate or micro-climate change, or fugitive dust beyond the existing conditions. Anticipated impacts to the populations of southern tarplant from Alternatives 5C and 7 are shown in Figures 3.18-1, 3.18-2, and 3.18-3.

Permanent impacts to this species cannot be avoided by the build alternatives. As shown in Table 3.18-3, Alternative 5C would result in the loss of the two smaller populations of southern tarplant, and Alternative 7 would result in the loss of all three populations, including the largest population near the I-710/Rosecrans Ave. interchange. Although the listing status of the southern tarplant (CNPS 1B) does not offer it legal protection under CESA, the species is rare and declining in population and is, therefore, considered to be special-status. The populations of southern tarplant found within the BSA are located in areas where the CNPS had either presumed the species to be extirpated or the species' occurrence was unknown. Despite the overall quality of the habitat in the BSA being poor, given the fact that I-710 and other urban development surrounds the population boundaries, these tarplant populations have persisted while the majority of the historic populations in the vicinity of I-710 have been removed by urban development.

Table 3.18-3: Build Alternative and Design Option Impacts to Southern Tarplant Populations

| Location of Population (from south to north) | Number of Individual Plants in Population | Square Footage of Population | Alternative 5C (1A, 2A, or 3A) | Alternative 7 (1B or 3B) |
|---|---|---------------------------------|-----------------------------------|-----------------------------|
| Southeast of I-710/I-405 Interchange | 6 | 1,028 | X | X |
| I-710/Rosecrans Ave. Interchange | 8,800 | 5,063 | | X |
| Atlantic Blvd./Bandini Blvd. Interchange | 90 | 21,640 | X | X |
| Total | 8,896 | 27,731 | -- | -- |

I-405 = Interstate 405

I-710 = Interstate 710

Temporary impacts from the build alternatives may occur in staging, access, and equipment laydown areas during construction. As stated above, temporary impacts to plant species are discussed further in Section 3.24.3.18, Plant Species.

NO BUILD (ALTERNATIVE 1). Under the No Build (Alternative 1), which has been identified as the Preferred Alternative, the I-710 Corridor Project would not be constructed. Therefore, there would be no permanent impacts to special-status plant species from the No Build (Alternative 1).

3.18.3.2 PUBLIC HEALTH CONSIDERATIONS

No public health considerations were noted in regard to project impacts on plants.

3.18.4 AVOIDANCE, MINIMIZATION, AND/OR MITIGATION MEASURES

Minimization efforts are warranted to minimize disturbance to larger portions of the populations than is necessary to improve the I-710 Corridor under the build alternatives. The avoidance and

minimization measures outlined in Section 3.16, Natural Communities and Section 3.24, Construction Impacts (particularly Measures CON-NC-2, CON-INV-1, CON-NC-8, CON-NC-10, CON-NC-14, CON-NC-15, CON-NC-16, CON-PS-1, and CON-INV-3), would be implemented to avoid and minimize impacts to southern tarplant, under the build alternatives. However, as the No Build (Alternative 1) was identified as the Preferred Alternative, adverse impacts to southern tarplant would not occur, and the adoption of this alternative would not require any avoidance, minimization, and/or mitigation measures. Avoidance, minimization, and/or mitigation measures pertaining to the two build alternatives are retained in this Final EIR/EIS for disclosure purposes.

PS-1 In order to mitigate for impacts to southern tarplant, the affected southern tarplant populations will be relocated under the supervision of the District Biologist from within the BSA to nearby protected open space areas in order to maintain these few remaining populations within the vicinity of the I-710 Corridor. Otherwise, to compensate for the loss of these populations, collection and scattering of seed in sunny areas with suitable soil and hydrologic conditions in the region, such as in areas adjacent to existing and remaining populations, shall occur under the supervision of the District Biologist during the appropriate time of year to improve the potential for populations of this species to remain stable in future years. Consultation with the CDFW would be completed prior to any relocation or restoration effort.

PS-2 To the maximum extent practicable, native coastal sage scrub species such as California sagebrush (*Artemisia californica*), black sage (*Salvia mellifera*), white sage (*Salvia apiana*), California buckwheat (*Eriogonum fasciculatum*), and coast brittle-bush (*Encelia californica*) will be incorporated into revegetation plans for the proposed project and shown on landscaping plans through coordination with the Caltrans Biologist and Caltrans Landscape Architect. An effort will be made to build upon coastal sage scrub restoration efforts already underway within the vicinity of the biological study area.

3.19 ANIMAL SPECIES

The analysis of impacts on animal species is based on the following document:

- *I-710 Corridor Project Natural Environment Study (NES) (June 2017)*

3.19.1 REGULATORY SETTING

Many State and Federal laws regulate impacts to wildlife. The U.S. Fish and Wildlife Service (USFWS), the National Oceanic and Atmospheric Administration's National Marine Fisheries Service (NOAA Fisheries Service), and the California Department of Fish and Wildlife (CDFW) are responsible for implementing these laws. This section discusses potential impacts and permit requirements associated with wildlife not listed or proposed for listing under the federal or state Endangered Species Act. Species listed or proposed for listing as threatened or endangered are discussed in Section 3.20. All other special-status animal species are discussed here, including CDFW fully protected species and species of special concern.

Federal laws and regulations relevant to wildlife include the following:

- National Environmental Policy Act
- Migratory Bird Treaty Act (MBTA) (16 United States Code [USC] 715-715s)
- Fish and Wildlife Coordination Act

State laws and regulations relevant to wildlife include the following:

- California Environmental Quality Act
- Sections 1600 – 1603 of the California Fish and Game Code
- Section 4150 and 4152 of the California Fish and Game Code

3.19.2 AFFECTED ENVIRONMENT

Prior to conducting the field surveys, existing documentation relevant to the Interstate 710 (I-710) Corridor Project Biological Study Area (BSA) was reviewed. Database records and websites reviewed included:

- California Natural Diversity Database (CNDDDB) information (RareFind Version 5.1.1), which is administered by the CDFW (this database covers sensitive plant and animal species as well as sensitive natural communities that occur within California) (2009 and 2015)
- CalPhotos website (CalPhotos 2009 and 2015)
- CalHerps website (CalHerps 2009 and 2015)

- Cornell All About Birds website (Cornell 2009 and 2015)
- Mammal Society website (Mammal Society 2009 and 2015)
- USFWS Official Species List (provided by Carlsbad Fish and Wildlife Office June 6, 2017; Appendix A)
- NMFS Official Species List (updated June 12, 2017; Appendix A)

Searches of these databases were conducted for the quadrangles containing and surrounding the BSA (i.e., the *San Pedro, Torrance, Inglewood, Hollywood, Los Alamitos, Seal Beach, Burbank, Pasadena, Mount Wilson, El Monte, Whittier, South Gate, Long Beach, and Los Angeles, California* United States Geological Survey [USGS] 7.5-minute quadrangles). Other sensitive species known to occur in the general area were also considered.

The special-status species lists obtained from the CNDDDB, the USFWS, and the NMFS were reviewed to determine which species could occur in the vicinity of the BSA. From these lists, comprehensive site-specific lists were compiled based on known ranges of species as well as species occurrence records within several miles of the BSA; these were further refined based on the availability of suitable habitat within the species' known ranges in the BSA. Most special-status species identified in the lists provided by the above agencies and organizations are not likely to be present within the BSA because species-specific habitat requirements are not present within the BSA, some species are rare and transient and would only occur in the area during migration, and some species are not tolerant of the level or proximity of human-related disturbance that currently characterizes the BSA.

The BSA supports suitable habitat for a variety of special-status wildlife species. Areas along the Los Angeles River south of the I-710/Willow St. interchange provide the most valuable habitat for shorebirds in the BSA. After a thorough literature review as described above, it was determined that 116 special-status wildlife species that are not Federally and/or State-listed as Threatened or Endangered have the potential to occur within the vicinity of the BSA. Further information on these species, including their status, habitat requirements, and potential for occurrence, is summarized in Table 3.19-1. Federally and/or State-listed, candidate, or proposed endangered or threatened species, or those that are considered California Fully Protected (CFP) species by the State, are discussed in Section 3.20, Threatened and Endangered Species. Locations of selected special-status animal species observed within the vicinity of the BSA are shown on Figure 3.19-1.

Table 3.19-1: Special-Status Animal Species Potentially Occurring or Known to Occur in the Biological Study Area

| Common Name | Scientific Name | Status Federal/ State | General Habitat Description | Habitat Present or Absent/ Species Observed | Rationale |
|--|--------------------------------------|-----------------------------|--|---|--|
| INVERTEBRATES | | | | | |
| Mimic tryonia (California brackish water snail) | <i>Tryonia imitator</i> | –/CSA | Inhabits coastal lagoons, estuaries, and salt marshes from Sonoma County to San Diego County. Found only in permanently submerged areas in a variety of sediment types; able to withstand a wide range of salinities. | A | Formerly occurred in Long Beach; now apparently extirpated from the Los Angeles River. |
| Busck's gallmoth | <i>Eugnosta busckana</i> | –/CSA | Known occurrences in Loma Linda in San Bernardino County, Beverly Terrace and El Segundo in Los Angeles County, and west Riverside in Riverside County. Known to inhabit coastal bluff vegetation and sand dune habitat. | A | Suitable coastal dune or coastal scrub habitat not present within the BSA. |
| Monarch butterfly (overwintering concentrations) | <i>Danaus plexippus</i> | –/CSA | Winter roost sites extend along the coast from northern Mendocino County to Baja California. Roosts located in wind-protected tree groves (eucalyptus, pine, and cypress), with nectar and water sources nearby. | P | Suitable winter roost sites may be present in developed areas within and adjacent to the BSA. |
| Wandering skipper | <i>Panoquina errans</i> | –/CSA | Southern California coastal salt marshes. Requires moist salt grass for larval development. There are occurrences of this species east-southeast of the BSA from 1989. | A | Probably occurred formerly, but there appears to be no suitable habitat remaining in the BSA. |
| Western tidal-flat tiger beetle | <i>Cicindela gabbii</i> | –/CSA | Dark-colored mud of estuaries and mudflats along the coast of Southern California and northern Baja California. | A | Formerly occurred in Wilmington and Long Beach but now apparently extirpated from Los Angeles County. |
| Sandy beach tiger beetle | <i>Cicindela hirticollis gravida</i> | –/CSA | Inhabits clean, dry sand along the sea coast from the San Francisco Bay area to Baja California. | A | Formerly occurred at Terminal Island and Long Beach but now apparently extirpated from Los Angeles County. |

| Common Name | Scientific Name | Status Federal/ State | General Habitat Description | Habitat Present or Absent/ Species Observed | Rationale |
|----------------------------------|--|-----------------------|--|---|--|
| Western beach tiger beetle | <i>Cicindela latesignata latesignata</i> | –/CSA | Beaches and mudflats from Los Angeles County to northern Baja California. | A | Formerly occurred in San Pedro and Long Beach but now apparently extirpated from Los Angeles County. |
| Senile tiger beetle | <i>Cicindela senilis frosti</i> | –/CSA | Known from dark-colored mud and dry saltpan in central and Southern California. | A | Formerly occurred in Long Beach but now apparently extirpated from Los Angeles County. |
| Globose dune beetle | <i>Coelus globosus</i> | –/CSA | Sand dunes along the Pacific Coast from Mendocino County to northern Baja California. | A | Suitable habitat is not present within the BSA. |
| Dorothy's El Segundo Dune weevil | <i>Trigonoscuta dorothea dorothea</i> | –/CSA | Associated with coastal and desert dune habitat where it feeds on various plants. Coastal species are sometimes common among the roots of beach grass. Known to occur in Los Angeles and Orange County. | A | Suitable habitat is not present within the BSA. |
| Crotch bumble bee | <i>Bombus crotchii</i> | –/CSA | Inhabits open grassland and scrub habitats primarily in California. | A | Suitable habitat is not present within the BSA. |
| FISH | | | | | |
| Arroyo chub | <i>Gila orcuttii</i> | –/CSC | Perennial streams or intermittent streams with permanent pools; slow-water sections of streams with mud or sand substrates; spawning occurs in pools. Native to the Los Angeles, San Gabriel, San Luis Rey, Santa Ana, and Santa Margarita River systems; introduced in the Santa Ynez, Santa Maria, Cuyama, and Mojave River systems and smaller coastal streams. | A | Still occurs in upper reaches of the Los Angeles River but is apparently extirpated downstream. |
| Santa Ana speckled dace | <i>Rhinichthys osculus</i> ssp. 3 | –/CSC | Primarily clear, well-oxygenated moving water (especially shallow, rocky riffles and runs) in the headwaters of the Los Angeles, San Gabriel, and Santa Ana Rivers. | A | Still occurs in upper reaches of the Los Angeles River but is apparently extirpated downstream. |

| Common Name | Scientific Name | Status Federal/ State | General Habitat Description | Habitat Present or Absent/ Species Observed | Rationale |
|--|--|-----------------------------|--|---|---|
| AMPHIBIANS | | | | | |
| Coast Range newt (Los Angeles County south) | <i>Taricha torosa torosa</i> | –/CSC | Southern populations are found on the coastal slope from Los Angeles to near the Mexican border. They generally inhabit mesic habitats such as oak woodland and require streams or pools for breeding. | A | Historical records from Long Beach and Palos Verdes Peninsula; now extirpated from the Los Angeles Basin. |
| Western spadefoot | <i>Spea hammondi</i> | –/CSC | Grasslands and other relatively open habitats; requires pools (persisting for at least three weeks) for breeding; burrows in loose soils during the dry season. Found in the Central Valley and foothills, coast ranges, and inland valleys to northwestern Baja California. | A | Occurred historically, but now extirpated from the Los Angeles Basin. |
| REPTILES | | | | | |
| Western pond turtle | <i>Emys marmorata</i> | –/CSC | Inhabits permanent or nearly permanent water below 6,000 feet from the San Francisco Bay area south to northern Baja California. Absent from desert regions, except in the Mojave Desert along the Mojave River and its tributaries. Requires basing sites such as partially submerged logs, rocks, or open mud banks. | A | Occurred formerly but is now extirpated from the lower Los Angeles River. |
| Blaineville's horned lizard (coast horned lizard) | <i>Phrynosoma blainvillii</i> (<i>Phrynosoma coronatum blainvillii</i>) | –/CSC | Wide variety of habitats, including CSS, grassland, and riparian woodland; typically on or near loose sandy soils; coastal and inland areas from Ventura County to Baja California. | A | Previously known from the area, but now apparently extirpated from the lower Los Angeles River. |

| Common Name | Scientific Name | Status Federal/ State | General Habitat Description | Habitat Present or Absent/ Species Observed | Rationale |
|----------------------------------|---------------------------------------|-----------------------|---|---|---|
| Coastal western whiptail | <i>Aspidoscelis tigris stejnegeri</i> | –/CSC | Wide variety of habitats, including CSS, sparse grassland, and riparian woodland; coastal and inland valleys and foothills; Ventura County to Baja California. | P | Apparently never documented along the lower Los Angeles River and unlikely to be found within the BSA. |
| Silvery legless lizard | <i>Anniella pulchra pulchra</i> | –/CSA | Fossorial. Inhabits loose soil and humus from Central California to northern Baja California. | P | May persist along the lower Los Angeles River but is unlikely to be found within the BSA. |
| Rosy boa | <i>Charina trivirgata</i> | –/CSA | Inhabits rock outcrops and rocky shrublands from southwestern California to northern Baja California. | A | Presumably extirpated from the lower Los Angeles River. |
| San Bernardino ring-necked snake | <i>Diadophis punctatus modestus</i> | –/CSA | Along drainage courses, in mesic chaparral and oak and walnut woodland communities. Moist habitats of southwestern California from approximately Ventura to Orange Counties. | P | Probably persists along the lower Los Angeles River but is unlikely to be found within the BSA, although potential habitat is present. |
| Coast patch-nosed snake | <i>Salvadora hexalepis virgultea</i> | –/CSC | Coastal chaparral, washes, sandy flats, and rocky areas from San Luis Obispo County to northwestern Baja California. | A | Presumably extirpated from the lower Los Angeles River. |
| South coast garter snake | <i>Thamnophis sirtalis</i> ssp. | –/CSC | Occurs in marsh and upland habitats near permanent water with riparian vegetation; coastal slope from Ventura to San Diego Counties. | A | Occurred in the area historically but is now apparently extirpated from Los Angeles County. |
| Two-striped garter snake | <i>Thamnophis hammondi</i> | –/CSC | Highly aquatic. Only in or near permanent sources of water. Streams with rocky beds supporting willows or other riparian vegetation. From Los Angeles County to northwestern Baja California. | P | Apparently never documented along the lower Los Angeles River and unlikely to be found within the BSA, although potential habitat is present. |

| Common Name | Scientific Name | Status Federal/ State | General Habitat Description | Habitat Present or Absent/ Species Observed | Rationale |
|-------------------------|--------------------------------------|-----------------------------|--|---|---|
| BIRDS | | | | | |
| Fulvous whistling-duck | <i>Dendrocygna bicolor</i> | –/CSC (nesting) | Fresh and brackish shallow water and cultivated fields, primarily in tropical and subtropical regions around the world. | A | Probably nested formerly within the BSA but is now essentially extirpated from California. |
| Aleutian cackling goose | <i>Branta hutchinsii leucopareia</i> | FD/CSA (wintering) | Nests on the Aleutian Islands and winters primarily in cultivated fields in California. | P | Probably occurred regularly within the BSA in the past and has been recorded within the BSA since 2014. |
| Brant | <i>Branta bernicla</i> | –/CSC (wintering) | Cosmopolitan. Nests in arctic tundra and winters primarily in coastal estuaries and lagoons in the temperate zone. | P | Probably a regular visitor within the BSA historically, but now a very rare visitor to the lower Los Angeles River channel. Has been occasionally recorded within the BSA since 2014. |
| Redhead | <i>Aythya americana</i> | –/CSC (nesting) | Freshwater marshes for nesting; also estuaries, bays, and lakes in winter. Breeds from Canada to Mexico and winters south to Central America. | P | Probably nested formerly within the BSA, but never confirmed. Now a rare visitor on the lower Los Angeles River and off-channel ponds. |
| Pink-footed shearwater | <i>Puffinus creatopus</i> | BCC/– | Pelagic. Nests on islands off the coast of Chile and ranges at sea north to Alaska. | A | No oceanic waters within the BSA. |
| Black-vented shearwater | <i>Puffinus opisthomelas</i> | BCC/- | Pelagic. Nests on islands off the west coast of Mexico and ranges at sea north to California and occasionally beyond. | A | No oceanic waters within the BSA. |
| Ashy storm-petrel | <i>Oceanodroma homochroa</i> | BCC/CSC (nesting) | Pelagic. Nests on islands off the coasts of California and Baja California, and generally ranges at sea in the vicinity. | A | No oceanic waters within the BSA. |
| Magnificent frigatebird | <i>Fregata magnificens</i> | BCC/– | Primarily inhabits coastal waters. Nests on tropical American islands and the Cape Verde Islands off west Africa. Ranges at sea into subtropical waters and occasionally beyond. | A | Extremely rare in California, with no known records within the BSA. |

| Common Name | Scientific Name | Status Federal/ State | General Habitat Description | Habitat Present or Absent/ Species Observed | Rationale |
|--------------------------|--|--------------------------------|--|---|--|
| California brown pelican | <i>Pelecanus occidentalis californicus</i> | FD/CD, CFP (nesting, roosting) | Nests on islands off Southern California and western Mexico, and ranges along the immediate coast and varying distances at sea to Canada and southern Mexico. | P, O | Forages regularly in estuarine portions of the Los Angeles River. One along the river in Paramount in July 2008 was exceptionally far upriver. Observed during biological surveys in 2009 (Appendix B of the NES). |
| American bittern | <i>Botaurus lentiginosus</i> | –/CSA | Nests in freshwater and brackish marshes across much of North America; winters south to Central America. | P | Formerly an uncommon nesting species within the BSA; now a scarce nonbreeding visitor. |
| Least bittern | <i>Ixobrychus exilis</i> | BCC/CSC (nesting) | Occurs locally in freshwater marshes across much of southern North America and northern South America. | P | Probably nested within the BSA formerly; now a rare visitor at best. |
| Great blue heron | <i>Ardea herodias</i> | –/CSA (rookery site) | Rookeries consist of a colony of breeding animals. Usually nests in trees, but also on large bushes, poles, reed beds, and even the ground. Frequents a wide range of wetland habitats at other times of year. Widespread in North America; winters to northern South America. | P, O | Probably nested within the BSA historically but is not known to do so currently. There are small rookeries along the San Gabriel River and in urban park lakes (such as Echo Park near downtown Los Angeles) in habitats similar to those found along the lower Los Angeles River. Observed during biological surveys in 2009 (Appendix B of the NES). |
| Great egret | <i>Ardea alba</i> | –/CSA (rookery site) | Occurs in a wide range of wetland habitats in much of the temperate and tropical zones worldwide. Nests primarily in trees. | P, O | Probably nested within the BSA historically but is not known to do so currently. There are small rookeries along the San Gabriel River in habitats similar to those found along the lower Los Angeles River. Observed during biological surveys in 2009 (Appendix B of the NES). |
| Snowy egret | <i>Egretta thula</i> | –/CSA (rookery site) | Occurs in a wide range of wetland habitats throughout much of the Americas. Nests primarily in trees. | P, O | Probably nested within the BSA historically but is not known to do so currently. There are small rookeries along the San Gabriel River in habitats similar to those found along the lower Los Angeles River. Observed during biological surveys in 2009 (Appendix B of the NES). |

| Common Name | Scientific Name | Status Federal/ State | General Habitat Description | Habitat Present or Absent/ Species Observed | Rationale |
|---------------------------|------------------------------|-----------------------|--|---|---|
| Black-crowned night-heron | <i>Nycticorax nycticorax</i> | –/CSA (rookery site) | Occurs in a wide range of wetland habitats in much of the temperate and tropical zones worldwide. Nests primarily in trees, sometimes in urban habitats. | P, O | Probably nested within the BSA historically but is not known to do so currently. Rookeries are known from urban residential areas near the lower San Gabriel River, and such rookeries could exist somewhere along the lower Los Angeles River. Observed during biological surveys in 2009 (Appendix B of the NES). |
| White-faced ibis | <i>Plegadis chihi</i> | –/CSA (rookery site) | Freshwater wetlands in temperate and tropical North and South America. Usually nests in emergent vegetation or low trees and shrubs over shallow water. | P, O | Probably nested formerly within the BSA, but never confirmed. Now a regular nonbreeding visitor, primarily in the fall. Observed during biological surveys in 2009 (Appendix B of the NES). |
| Wood stork | <i>Mycteria americana</i> | –/CSC | Freshwater and brackish wetlands in southern North America and much of South America. | P | Formerly an occasional visitor from Mexico, where populations have declined so much that future occurrences are unlikely. |
| Osprey | <i>Pandion haliaetus</i> | –/CSA (nesting) | Estuaries, rivers, lakes, and marshes in much of the temperate and tropical world. Nests primarily on trees and other structures. | P, O | Not known to have nested within the BSA but is increasing as a breeder in coastal Southern California. Observed during biological surveys in 2009 (Appendix B of the NES). |
| White-tailed kite | <i>Elanus leucurus</i> | –/CFP (nesting) | Open country in South America and southern North America. Nests in trees. | P | Probably nested within the BSA formerly but is now only a scarce visitor. |
| Northern harrier | <i>Circus cyaneus</i> | –/CSC (nesting) | Open country in the northern Temperate Zone worldwide. New World birds winter south to Central America. | P | Probably nested within the BSA formerly but is now only an uncommon visitor. |
| Cooper's hawk | <i>Accipiter cooperii</i> | –/CSA (nesting) | Primarily forests and woodlands throughout North America. Nests in trees. | P, O | Seen regularly along entire Los Angeles River channel and may nest within the BSA. Is now a rather common and widespread breeder in urban areas through the Los Angeles Basin. Populations of this and other urban raptor species may be checked in part by large-scale trapping and shooting by roller pigeon fanciers (documented by USFWS and CDFW). |

| Common Name | Scientific Name | Status Federal/ State | General Habitat Description | Habitat Present or Absent/ Species Observed | Rationale |
|---------------------------|-----------------------------------|-----------------------------|---|---|--|
| Ferruginous hawk | <i>Buteo regalis</i> | BCC/CSA (wintering) | Open country in western North America; north to Canada in summer and south to Mexico in winter. | A | Probably occurred regularly historically and occasional visitors may still occur, but no suitable habitat for long-term presence. |
| Golden eagle | <i>Aquila chrysaetos</i> | BCC/CFP nesting, wintering) | Generally open country of the Temperate Zone worldwide. Uncommon resident in southwestern California. | A | Probably occurred regularly within the BSA historically, but now only very rarely. |
| Merlin | <i>Falco columbarius</i> | –/CSA (wintering) | Open fields; breeds in the Holarctic Region and winters south to the tropics. Uncommon fall migrant and winter visitor to southwestern California. | P | Regularly forages within the BSA. Has increased greatly as a wintering species in the Los Angeles Basin and regularly forages along the length of the Los Angeles River. |
| American peregrine falcon | <i>Falco peregrinus anatum</i> | FD,BCC/ CD,CFP (nesting) | Widespread, but scarce and local throughout North America. Nests on buildings and bridges in the Los Angeles Basin. | P, O | Nests in the Port of Los Angeles and regularly forages within the BSA. Observed during biological surveys in 2009 (Appendix B of the NES). |
| Lesser sandhill crane | <i>Grus canadensis canadensis</i> | –/CSC (wintering) | Nests in low-lying tundra and marshy areas from northeastern Siberia across northern North America. Winters primarily in agricultural fields and wet prairie in the southern United States and northern Mexico. | A | May have occurred historically, but habitat is now unsuitable within the BSA. |
| Black oystercatcher | <i>Haematopus bachmani</i> | BCC/CSA (nesting) | Primarily rocky areas along the immediate coastline from Alaska to Baja California. | P | Numerous records from rocky areas at the mouth of the Los Angeles River. |
| Mountain plover | <i>Charadrius montanus</i> | BCC/CSC (wintering) | Nests in dry, open prairies and grasslands in central North America; winters in the southwestern United States and northern Mexico. | A | Probably a regular winter visitor historically, but no suitable remains within the BSA. |
| Lesser yellowlegs | <i>Tringa flavipes</i> | BCC/– | Nests on tundra and in woodlands in northern North America and winters from the coastal and southern United States to South America; widespread migrant elsewhere. | P | Uncommon transient along the lower Los Angeles River. |

| Common Name | Scientific Name | Status Federal/ State | General Habitat Description | Habitat Present or Absent/ Species Observed | Rationale |
|------------------------|-----------------------------------|-----------------------------|--|---|---|
| Whimbrel | <i>Numenius phaeopus</i> | BCC/– | Circumpolar: nests in arctic and subarctic tundra and migrates for the rest of the year to fields and a wide range of wetland habitats in temperate and tropical areas around the world. | P | Uncommon transient along the lower Los Angeles River. |
| Long-billed curlew | <i>Numenius americanus</i> | BCC/CSA (nesting) | Primarily nests on prairies and grassy meadows, near water, in interior western North America. Winters primarily along the Pacific and Gulf of Mexico coasts from the southern United States to Central America. | P, O | Scarce transient along the lower Los Angeles River. Observed during biological surveys in 2009 (Appendix B of the NES). |
| Marbled godwit | <i>Limosa fedoa</i> | BCC/– | Nests primarily on grasslands, marshes, and ponds in south-central Canada; winters on both coasts from the United States to Central America. | P, O | Uncommon transient along the lower Los Angeles River. Observed during biological surveys in 2009 (Appendix B of the NES). |
| Roselaar's red knot | <i>Calidris canutus roselaari</i> | BCC/– | Nests on barren tundra on Wrangle Island and in northwestern Alaska. Winter range and migratory routes poorly known, but may include the Pacific coast of Southern California. | P | Species is rare but probably annual as a fall transient (remaining into early winter as conditions allow) along the lower Los Angeles River; however, there is no information on the subspecies of knots in Los Angeles County. |
| Short-billed dowitcher | <i>Limnodromus griseus</i> | BCC/– | Nests on muskegs, wet meadows, and marshy coastal tundra from southern Alaska across North America to Labrador. Winters along both coasts from temperate North America to tropical South America. | P | Fairly common fall transient (mainly early July to mid-September) along the lower Los Angeles River. |
| Cassin's auklet | <i>Ptychoramphus aleuticus</i> | BCC/CSC (nesting) | Pelagic. Nests on islands off the coast from Alaska to west Mexico, and generally ranges at sea in the vicinity. | A | No oceanic waters within the BSA. |
| Caspian tern | <i>Hydroprogne caspia</i> | BCC/CSA (nesting) | Seacoast, bays, estuaries, lakes, marshes, and rivers around much of the world. | P | Nests at Terminal Island in Los Angeles Harbor and forages regularly in estuarine portions of the Los Angeles River and occasionally farther upstream. |

| Common Name | Scientific Name | Status Federal/ State | General Habitat Description | Habitat Present or Absent/ Species Observed | Rationale |
|-----------------|---|-----------------------------|--|---|---|
| Forster's tern | <i>Sterna forsteri</i> | –/CSA (nesting) | Nests in freshwater and salt marshes locally across temperate North America; winters from the coastal and southern United States through Central America. | P, O | Species is not documented as breeding in Los Angeles County, although small numbers occurred throughout the spring and summer at Willow St. in some years in the 1990s and early 2000s. Up to 140 birds, including begging juveniles, were along the Los Angeles River at Willow St. in late July 2000, but these were likely dispersing family groups from the nearest breeding colonies in Orange County. Observed during biological surveys in 2009 (Appendix B of the NES). |
| Elegant tern | <i>Thalasseus elegans</i> | –/CSA (nesting) | Strictly coastal; nests in Southern California and western Mexico and winters south to Chile. | P, O | Nests at Terminal Island in Los Angeles Harbor and forages regularly in estuarine portions of the Los Angeles River. Observed during biological surveys in 2009 (Appendix B of the NES). |
| Black skimmer | <i>Rynchops niger</i> | BCC/CSC (nesting) | Nests primarily on sandy beaches, shell banks, and small islands in coastal areas locally from the southern United States to South America; more widespread otherwise, extending to bays, lagoons, and mudflats. | P | Nests at Terminal Island in Los Angeles Harbor and forages regularly in estuarine portions of the Los Angeles River. Birds were seen well upstream in Paramount (around Rosecrans Ave.) in July 2002 and July 2006. |
| Flammulated owl | <i>Otus flammeolus</i> (<i>Psilosops flammeolus</i>) | BCC/CSA | Nests in pine and oak woodland in interior western North America and winters in southern Mexico and Central America. | A | No suitable habitat within the BSA. |

| Common Name | Scientific Name | Status Federal/ State | General Habitat Description | Habitat Present or Absent/ Species Observed | Rationale |
|---------------------|---------------------------|---|---|---|---|
| Burrowing owl | <i>Athene cunicularia</i> | BCC/CSC (burrow and some wintering sites) | Open country in much of North and South America. | P, O | Former resident (e.g., in open fields at California State University, Dominguez Hills until the early 1980s). Occasional migrants and wintering birds still occur, but species is believed to be extirpated as a nesting species within the BSA. Individual owls were observed south of the Compton Creek channel on three separate occasions (October and December 2009; December 2015) (Burrowing Owl Survey Reports, Appendix C of the NES). |
| Long-eared owl | <i>Asio otus</i> | –/CSC (nesting) | Scarce and local in forests and woodlands throughout much of the Northern Hemisphere. Sensitive to human disturbance on nesting grounds. | A | Former resident in willow woodlands along the Los Angeles River; no suitable habitat remains within the BSA. |
| Short-eared owl | <i>Asio flammeus</i> | –/CSC (nesting) | Open country, usually with tall grass, in scattered regions around the Northern Hemisphere. | A | Former winter visitor but not known to have nested in the Los Angeles Basin; now even rare as a nonbreeding visitor. |
| Black swift | <i>Cypseloides niger</i> | BCC/CSC (nesting) | Nests at scattered locations through western North America and the Caribbean south to Central America; montane in Southern California. Presumably winters in South America. | A | Rare migrant in the Los Angeles Basin, including the lower Los Angeles River. |
| Costa's hummingbird | <i>Calypte costae</i> | BCC (nesting) | Primarily deserts, arid brushy foothills, and chaparral in the southwestern United States and northwestern Mexico. | P | Probably occurs in small numbers as a transient and winter visitor (nearly year-round), but natural arid scrub breeding habitat is absent. May occasionally breed where the right mix of exotic flowering sages and other plants grow; flowering sages have been used extensively in landscaping along the banks of the lower Los Angeles River. |

| Common Name | Scientific Name | Status Federal/ State | General Habitat Description | Habitat Present or Absent/ Species Observed | Rationale |
|------------------------|-----------------------------------|-----------------------|--|---|---|
| Allen's hummingbird | <i>Selasphorus sasin</i> | BCC/CSA (nesting) | Chaparral, open oak woodland, riparian woodland, and residential areas on the breeding grounds from southwestern Oregon to southwestern California; primarily montane woodland on the wintering grounds in central Mexico. | P, O | Fairly common resident within the BSA. Species is abundant, adaptable, and increasing throughout urban Southern California and is expected anywhere there is a mix of exotic flowering trees and shrubs. Observed during biological surveys in 2009 (Appendix B of the NES). |
| Lewis's woodpecker | <i>Melanerpes lewis</i> | BCC/CSA (nesting) | Nests in open forest and woodlands in interior western North America and winters slightly to the south and west. | A | A rare migrant in the Los Angeles Basin, with no known records within the BSA. |
| Nuttall's woodpecker | <i>Picoides nuttallii</i> | BCC/CSA (nesting) | Oak, pine-oak, and riparian woodland in California and northwestern Baja California. | A | Occasional visitors may occur, but suitable habitat for nesting appears to be absent within the BSA. Generally scarce to uncommon in wooded parks and residential areas in the lower Los Angeles Basin. |
| Olive-sided flycatcher | <i>Contopus cooperi</i> | BCC/CSC (nesting) | Nests in coniferous forests in northern and western North America and winters in South America. | A | Uncommon transient within the BSA. |
| Loggerhead shrike | <i>Lanius ludovicianus</i> | BCC/CSC (nesting) | Open country in much of North America, but declining in many areas, including southwestern California. | P, O | Nested along the lower Los Angeles River in Long Beach and Cudahy as recently as 2002 and 2004, but now probably extirpated as a nesting species. Has greatly declined as a wintering species in the area as well, but one was seen by the consulting biologist south of East Florence Ave. in December 2009 (Appendix B of the NES). |
| California horned lark | <i>Eremophila alpestris actia</i> | -/CSA (nesting) | Open grasslands and fields, agricultural areas from northern coastal California to northwestern Baja California. | P | Probably bred as recently as the mid-1980s in open areas around Carson, but perhaps no longer breeds in coastal Los Angeles County. Now only a rare nonbreeding visitor. |
| Purple martin | <i>Progne subis</i> | -/CSC (nesting) | Breeds locally in a wide range of habitats across much of North America; nests in cavities. Winters primarily in South America. | A | Nested historically in the Los Angeles Basin, but now believed to be extirpated as a nesting species in Los Angeles County. Occasional transient on the Los Angeles River in recent years. |
| Oak titmouse | <i>Baeolophus inornatus</i> | BCC/CSA (nesting) | Primarily oak woodland from southern Oregon to southern Baja California Sur. | A | Occasional visitors may occur, but suitable habitat for nesting is absent within the BSA. |

I-710 Corridor Project Final EIR/EIS

| Common Name | Scientific Name | Status Federal/ State | General Habitat Description | Habitat Present or Absent/ Species Observed | Rationale |
|-------------------------------|--|-----------------------|--|---|---|
| Coastal cactus wren | <i>Campylorhynchus brunneicapillus</i> | BCC/CSA, CSC | Primarily lowland arid scrub with cactus in Mexico and the southwestern United States. | A | May have occurred within the BSA historically, but no suitable habitat is present now. The nearest known populations are on the Palos Verdes Peninsula near San Pedro and in the Montebello Hills. |
| Clark's marsh wren | <i>Cistothorus palustris clarkae</i> | –/CSC | Local resident in freshwater marshes on the coastal slope from Los Angeles County to northwestern Baja California. | P | Perhaps a rare resident within the BSA; observed in the off-channel marsh south of the Del Amo St. crossing of the Los Angeles River in 2008. |
| Yellow warbler | <i>Setophaga petechia (Dendroica petechia)</i> | BCC/CSC (nesting) | Nests in riparian woodland in the western United States and northwestern Baja California; more widespread in brushy areas and woodlands during migration and winter, when occurring from western Mexico to northern South America. | P, O | Formerly nested along much of the lower Los Angeles River (and still does so fairly commonly along the soft-bottom reach from the Griffith Park area downstream through the Glendale Narrows), but only marginally suitable nesting habitat remains within the BSA. Common migrant and rare winter visitor in the area. Observed during biological surveys in 2009 (Appendix B of the NES). |
| Saltmarsh common yellowthroat | <i>Geothlypis trichas sinuosa</i> | BCC/CSC | Nests primarily in brackish and freshwater marshes in the San Francisco Bay area and disperses, at least formerly, along the California coast as far as Humboldt Bay and San Diego. | P | Recorded historically in the Los Angeles Basin, but may no longer occur as frequently as it once did. |
| Yellow-breasted chat | <i>Icteria virens</i> | –/CSC (nesting) | Riparian thickets of willows and brushy tangles near watercourses. Nests in riparian woodland throughout much of western North America. Winters in Central America. | A | Nested formerly along the lower Los Angeles River, but suitable nesting habitat is now absent. Currently a scarce transient in the area. |
| Green-tailed towhee | <i>Pipilo chlorurus</i> | BCC/– | Nests in chaparral and other brushy habitats primarily in the interior western United States; winters in brushy habitats primarily in Mexico and the southwestern United States. | A | Rare migrant and winter visitor within the BSA. |

| Common Name | Scientific Name | Status Federal/ State | General Habitat Description | Habitat Present or Absent/ Species Observed | Rationale |
|--|--|-----------------------|--|---|---|
| Southern California rufous-crowned sparrow | <i>Aimophila ruficeps canescens</i> | –/CSA | Steep, rocky CSS and open chaparral habitats, particularly scrubby areas mixed with grasslands. From Santa Barbara County to northwest Baja California. | A | Probably never common along the lower Los Angeles River, and now all suitable habitat is gone. |
| Brewer's sparrow | <i>Spizella breweri</i> | BCC/CSA (nesting) | Nests in brushland, especially sagebrush, in the interior western United States; winters in brushy areas in the southwestern United States and northwest Mexico. | A | Rare migrant and winter visitor within the BSA. |
| Lark sparrow | <i>Chondestes grammacus</i> | –/CSA (nesting) | Open situations with scattered bushes or trees. Breeds throughout much of western North America and winters from the southern United States to southern Mexico. | A | Occasional visitors may occur, but suitable nesting habitat is now absent within the BSA. |
| Large-billed Savannah sparrow | <i>Passerculus sandwichensis rostratus</i> | –/CSC (wintering) | Nests in brackish marshes in the northern Gulf of California and disperses widely to littoral habitats from Southern California to western Mexico. | P | Once occurred commonly at the mouth of the Los Angeles River, but there are apparently no recent records. Given several recent records from the Los Angeles Harbor to Playa del Rey, the occasional sighting near the mouth of the river is to be expected. |
| Grasshopper sparrow | <i>Ammodramus savannarum</i> | –/CSC (nesting) | Grasslands of North America and northern South America. | A | Historically a regular nesting species in the vicinity of the BSA, but no suitable habitat remains. |
| Oregon vesper sparrow | <i>Pooecetes gramineus affinis</i> | BCC/CSC (wintering) | Nests in lower valleys and plains in western Washington, western Oregon, and extreme northwestern California. Winters almost exclusively in low-elevation grasslands in central and Southern California. | A | Probably once a regular winter visitor in the vicinity of the BSA, but no suitable habitat remains. |
| Fox sparrow | <i>Passerella iliaca</i> | –/– | Nests in various brushy habitats across northern and western North America; winters in coastal and southern United States. | P | Uncommon winter visitor within the BSA. |

| Common Name | Scientific Name | Status Federal/ State | General Habitat Description | Habitat Present or Absent/ Species Observed | Rationale |
|-------------------------------------|---|-----------------------------|---|---|--|
| Yellow-headed blackbird | <i>Xanthocephalus xanthocephalus</i> | –/CSC (nesting) | Nests in freshwater marshes in central-western North America and disperses to open, cultivated land and marshes as far as southern Mexico. | A | Formerly nested in the vicinity of the BSA but has not been known to do so for many years. Still occurs as a nonbreeding visitor in the area (e.g., birds seen along the Los Angeles River at Del Amo St. in September 2008 and September 2009). |
| Lawrence's goldfinch | <i>Spinus lawrencei</i> (<i>Carduelis lawrencei</i>) | BCC/CSA (nesting) | Oak woodland chaparral, riparian woodland, and other habitats in arid regions, but usually near water; from northern California to northern Baja California, but periodically wandering throughout much of western North America. | A | Occasional visitors may occur, but suitable habitat for nesting is absent within the BSA. |
| MAMMALS | | | | | |
| South coast marsh vole | <i>Microtus californicus stephensi</i> | –/CSC | Tidal marshes in Los Angeles, Orange, and southern Ventura Counties. | A | Probably occurred in the vicinity of the BSA historically, but there appears to be an insufficient amount of habitat at this time. However, it is unknown to what extent this subspecies might range into other coastal habitats. |
| San Diego desert woodrat | <i>Neotoma lepida intermedia</i> | –/CSC | Frequents poorly vegetated arid lands and is especially associated with cactus patches. Occurs along the Pacific slope from about San Luis Obispo County to northwest Baja California. | A | Probably occurred within the BSA historically, but no suitable habitat remains. |
| Southern grasshopper mouse | <i>Onychomys torridus ramona</i> | –/CSC | Primarily open scrub habitats of southwestern California and northwestern Baja California. | A | Probably occurred within the BSA historically, but no suitable habitat remains. |
| San Diego black-tailed jackrabbit | <i>Lepus californicus bennettii</i> | –/CSC | Open country of coastal Southern California and northern Baja California. | A | Occurred within the BSA historically but has been extirpated from most of the Los Angeles Basin. |
| Southern California saltmarsh shrew | <i>Sorex ornatus salicornicus</i> | –/CSC | Coastal marshes in Los Angeles, Orange, and Ventura Counties. Requires dense vegetation and woody debris for cover. | A | May have occurred within the BSA historically, but no suitable habitat remains. |

| Common Name | Scientific Name | Status Federal/ State | General Habitat Description | Habitat Present or Absent/ Species Observed | Rationale |
|---------------------------|------------------------------------|-----------------------------|--|---|---|
| California leaf-nosed bat | <i>Macrotus californicus</i> | –/CSC | Western United States and northwestern Mexico. In California, primarily occupies low-lying desert areas, roosting in caves, mines, and old buildings with warm, stable temperatures. Rarely uses bridges for roosting. Historic records extend west to near Chatsworth, Los Angeles County, but most populations from the California coastal basins are believed to be extirpated. | A | May have occurred within the BSA historically, but no suitable roosting habitat is present in the vicinity of the BSA, and coastal California populations in general are presumed extirpated. |
| Mexican long-tongued bat | <i>Choeronycteris mexicana</i> | –/CSC | Uses a variety of habitats from the southwestern United States through Central America. In California, this species has been observed in San Diego County, likely as a seasonal migrant. Feeds on nectar and pollen of night-blooming succulents; may visit hummingbird feeders. Roosts in caves, mines, and occasionally buildings. Not known to use bridges for roosting. | A | Foraging and roosting habitat is not present within the BSA. There are no known records in the vicinity of the BSA. |
| Western mastiff bat | <i>Eumops perotis californicus</i> | –/CSC | Ranged historically throughout much of the southwestern United States and northwestern Mexico. In California, most records are from rocky areas at low elevations. Occurs in many open, semi-arid to arid habitats, including conifer and deciduous woodlands, coastal scrub, grasslands, chaparral, etc.; roosts in crevices in vertical cliff faces, high buildings, trees, and tunnels throughout southwestern California. May roost in tall bridges. | P | Although only marginally suitable roosting habitat is present in the BSA, numerous historic roosting areas exist in the Los Angeles Basin. In addition, foraging habitat is present along the Los Angeles River, and this species is known to forage over large distances from roost sites. |

| Common Name | Scientific Name | Status Federal/ State | General Habitat Description | Habitat Present or Absent/ Species Observed | Rationale |
|--------------------------|---------------------------------|-----------------------|---|---|---|
| Pocketed free-tailed bat | <i>Nyctinomops femorosaccus</i> | –/CSC | Varied habitats, but usually associated with high cliffs or rocky areas. Spotty distribution, ranging from Southern California and southwestern Arizona through central Mexico. Roosts primarily in cliffs and rock crevices; may use buildings for roosting. Rarely roosts in bridges. | P | Although roosting is unlikely within the BSA, foraging habitat is present along the Los Angeles River, and this species is known to forage over large distances from roost sites. Recorded from Harbor City and Inglewood. |
| Big free-tailed bat | <i>Nyctinomops macrotis</i> | –/CSC | Mainly inhabits rugged, rocky habitats in arid southwestern North America. Feeds principally on large moths. Roosts primarily in cliffs and rock crevices, and rarely in buildings, caves, and tree cavities. Not known to use bridges for roosting. | P | Although roosting is unlikely within the BSA, foraging habitat is present along the Los Angeles River, and this species is known to forage over large distances from a roost site. Recorded from Long Beach and Los Angeles. |
| Western red bat | <i>Lasiurus blossevillei</i> | –/CSC | Ranges from southwestern Canada through the western United States and Middle America to South America. Forages over a wide range of habitats but is often associated with intact riparian habitat, particularly with willows, cottonwoods, and sycamores. Typically solitary, roosting in the foliage of trees or shrubs. Day roosts are commonly in edge habitats adjacent to streams or open fields, in orchards, and sometimes in urban areas. | P | Not known to use bridges for roosting but may roost in large-leaved trees along portions of the Los Angeles River and adjacent residential areas. Foraging habitat is present along the Los Angeles River. |
| Hoary bat | <i>Lasiurus cinereus</i> | –/CSA | Widespread in North America (and Hawaii). Forages over a wide range of habitats but prefers open habitats with access to water and trees for roosting. Typically solitary, roosting in the foliage of shrubs or coniferous and deciduous trees. Roosts are usually near the edge of a clearing. | P | Not known to use bridges for roosting but may roost in trees along portions of the Los Angeles River or in adjacent residential areas. Foraging habitat is present along the river. Recorded throughout the Los Angeles area. |

| Common Name | Scientific Name | Status Federal/ State | General Habitat Description | Habitat Present or Absent/ Species Observed | Rationale |
|--------------------------|--------------------------------|-----------------------------|--|---|---|
| Western yellow bat | <i>Lasiurus xanthinus</i> | –/CSC | Varied habitats from the southwestern United States to southern Mexico; often associated with palms and desert riparian habitats. In Southern California, occurs in palm oases and in residential areas with untrimmed palm trees. Roosts primarily in trees, especially the dead fronds of palm trees, although it has also been documented to roost under the leaves of deciduous trees such as cottonwoods. | P | Not known to use bridges for roosting but may roost in palms along portions of the Los Angeles River and adjacent residential areas. Foraging habitat is present along the Los Angeles River. Recorded from Garden Grove. |
| Townsend's big-eared bat | <i>Corynorhinus townsendii</i> | –/CSC | Ranges from southwestern Canada through the western United States to southern Mexico. Requires caves, mines, tunnels, buildings, or other similar structures for roosting. Occasionally roosts in hollow spaces of bridges or buildings. Will occasionally roost in hollow trees. Highly sensitive to disturbance. | A | Known to occasionally roost in the hollow spaces of bridges. Marginally suitable foraging habitat is present along the Los Angeles River. However, this species is not expected within the BSA due to its extremely low tolerance for urbanization and disturbance, and lack of historic records in the area. |
| Spotted bat | <i>Euderma maculatum</i> | –/CSC | Found in widely scattered localities in western North America from southern British Columbia to central Mexico. Occurs in a range of habitats, from arid, low desert habitats to high-elevation conifer forests. Roosts in crevices and caves, usually high in fractured cliff/rock faces; not known to use bridges or buildings for roosting. Can forage over wide distances. | P | No known records and no roosting habitat in the vicinity of the BSA, but the species can travel widely when foraging. |

| Common Name | Scientific Name | Status Federal/ State | General Habitat Description | Habitat Present or Absent/ Species Observed | Rationale |
|-----------------------------|----------------------------------|-----------------------------|--|---|---|
| Pallid bat | <i>Antrozous pallidus</i> | –/CSC | Varied habitats in western North America, including grasslands, shrublands, woodlands, deserts, and forests. Primarily day roosts in bridges, hollows or crevices of trees, or buildings. Occasionally roosts in mines, caves, and cliff/rock crevices. Night roosts may be more open sites, such as porches, open buildings, and bridges. | P | Known to frequently roost in bridges. Foraging habitat is present along the Los Angeles River. Recorded throughout the Los Angeles area, including Long Beach. |
| Silver-haired bat | <i>Lasionycteris noctivagans</i> | –/CSA | Primarily associated with north temperate-zone conifer and mixed conifer/hardwood forests across southern Canada and most of the United States. May be found in the winter and during seasonal migration in lower, xeric habitats. Roosts mainly in hollows or crevices of trees, but may also roost in rock crevices, mines, or caves. May forage a considerable distance from its roosting area. | P | Rarely uses bridges for roosting, but may roost in trees within the BSA and forage along the Los Angeles River. Recorded from Bellflower and Long Beach. May be present at one bridge location within the BSA, but data collected during nighttime emergence and acoustic surveys was inconclusive (Appendix D of the NES). |
| Western small-footed myotis | <i>Myotis ciliolabrum</i> | –/CSA | Found across much of North America, primarily in relatively arid wooded and brushy uplands near water. Individuals are known to roost singly or in small groups in cliff and rock crevices, buildings, concrete overpasses, caves, and mines. | P | Known to occasionally roost in bridges. Foraging habitat is present along the Los Angeles River. |

| Common Name | Scientific Name | Status Federal/ State | General Habitat Description | Habitat Present or Absent/ Species Observed | Rationale |
|--------------------|--------------------------|-----------------------------|---|---|---|
| Long-eared myotis | <i>Myotis evotis</i> | –/CSA | Found throughout much of North America, in semi-arid shrublands, chaparral, and agricultural areas, but is usually associated with coniferous forests. Roosts under exfoliating tree bark and in hollow trees, caves, mines, and crevices in cliffs/rocks. Sometimes roosts in buildings and bridges. | P | Known to occasionally roost in bridges. Foraging habitat is present along the Los Angeles River, and the species has been recorded as close as Arroyo Seco. |
| Fringed myotis | <i>Myotis thysanodes</i> | –/CSA | Range is patchy in western North America from sea level to 9,350 feet; most common at middle elevations. Appears to be most common in drier woodlands but is found in a wide variety of habitats, including desert scrub, mesic coniferous forest, grassland, and sage-grass steppe. Roosts primarily in large trees and snags, as well as in caves and mines. Also roosts in buildings, rock crevices, cliff faces, and bridges. | A | May have occurred within the BSA historically, but no suitable habitat remains. No known records from the vicinity of the BSA. |
| Long-legged myotis | <i>Myotis volans</i> | –/CSA | Widespread in western North America, primarily in coniferous forests, but also occurs seasonally in riparian and desert habitats. Utilizes abandoned buildings, cracks in the ground, cliff crevices, exfoliating tree bark, and hollows within snags as summer day roosts; caves and mine tunnels are used as hibernacula. Commonly forages in and around the forest canopy. | A | May have occurred within the BSA historically, but no suitable habitat remains. No known records from the vicinity of the BSA. |

I-710 Corridor Project Final EIR/EIS

| Common Name | Scientific Name | Status Federal/ State | General Habitat Description | Habitat Present or Absent/ Species Observed | Rationale |
|-----------------|----------------------------|-----------------------|---|---|--|
| Yuma myotis | <i>Myotis yumanensis</i> | –/CSA | Occurs in a variety of habitats in western North America, including riparian habitats, arid scrublands and deserts, and forests. Optimal habitats are open forests and woodlands with sources of water over which to feed. Roosts in buildings, mines, caves or crevices, and under bridges. May occasionally roost in swallow nests. | P, O | Known to frequently roost in bridges. Observed roosting and foraging along the Los Angeles River from SR-91 to Willow St. during 2009 surveys. Was confirmed to be day roosting at two bridge locations and was observed foraging at another location during nighttime emergence and acoustic surveys. |
| American badger | <i>Taxidea taxus</i> | –/CSC | Occurs throughout much of North America. Primary habitat requirements seem to be sufficient food and friable soils in relatively open uncultivated ground in grasslands, woodlands, and desert. | A | Probably occurred within the BSA historically, but no suitable habitat remains. |
| Ringtail | <i>Bassariscus astutus</i> | –/CFP | Woody and rocky areas of the southwestern United States and most of Mexico. | A | May have occurred within the BSA historically, but no suitable habitat remains. |

Source: LSA Associates, Inc. *I-710 Corridor Project Natural Environment Study* (June 2017).

Habitat Present/Absent: Absent (A) - no habitat present and no further work needed. Habitat Present (P) – habitat is, or may be present. (O) – Based on the literature review and field surveys, the species has been observed within the BSA. Critical Habitat (CH) – Project footprint is located within designated critical habitat unit, but does not necessarily mean that appropriate habitat is present.

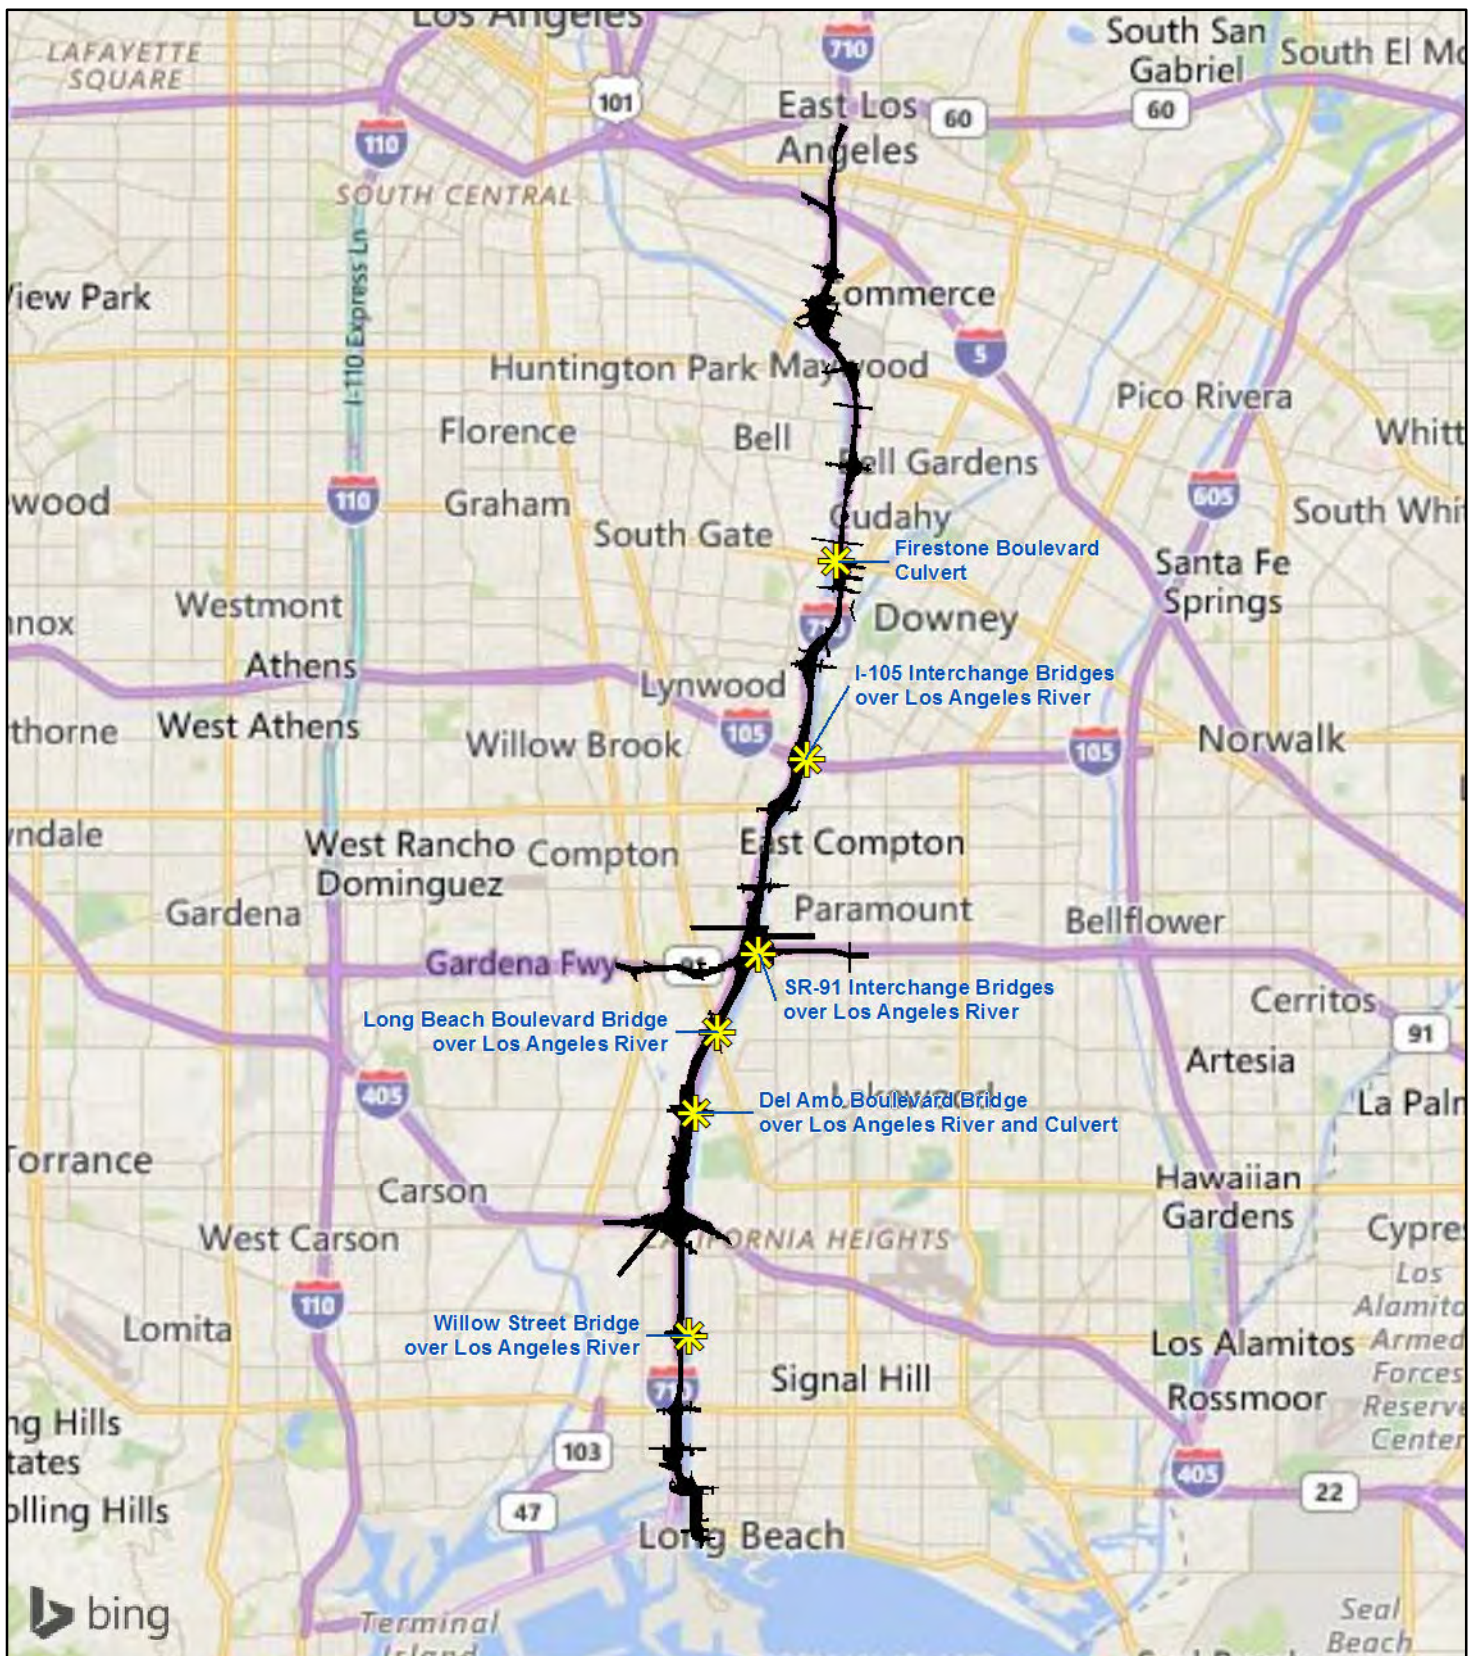

Status: Federal Endangered (FE); Federal Threatened (FT); Federal Proposed (FP, FPE, FPT); Federal Candidate (FC); Federally Delisted (FD); United States Fish and Wildlife Service Birds of Conservation Concern (BCC); California Endangered (CE); California Threatened (CT); California Delisted (CD), California Fully Protected Species (CFP); California Species of Special Concern (CSC); California Special Animal (CSA)

BSA = biological study area
 CDFW = California Department of Fish and Wildlife

 SR-91 = State Route 91
 USFWS = United States Fish and Wildlife Service

3.19.2.1 SPECIAL-STATUS ANIMAL SPECIES REQUIRING SURVEYS

Focused surveys were conducted in 2009 and 2015 for burrowing owl (*Athene cunicularia*) and special-status bat species. Survey results were as follows:

- **Burrowing Owl:** Phase I, Phase II, and Phase III protocol surveys conducted for burrowing owl are described in Attachment C of the NES. The vacant parcel south of the confluence of the Compton Creek and the Los Angeles River was the only area where a burrowing owl was identified. Individual owls were observed south of the Compton Creek channel in this area on two separate occasions (October and December 2009) using burrows approximately 150 feet from one another in an area with numerous burrows, south of the mouth of Compton Creek (see Figure 3.19-1). It could not be determined whether or not these were the same burrowing owl (BUOW) that were observed on two separate occasions. Although no pairs were observed, the area is large enough to support a pair. An individual BUOW was also observed at this location on December 7, 2015. No other burrowing owls were found during the 2009 or 2015 surveys. The vacant parcel (on which these surveys were conducted) has since been developed by the landowner. Suitable habitat for this species is now absent from the BSA.
- **Special-Status Bat Species:** Daytime bat habitat assessments and nighttime emergence surveys performed for bat species are described in Appendix D of the NES. During the 2009 and 2015 bat habitat suitability assessments, suitable roosting habitat for bats was observed in various bridge and culvert structures throughout the BSA, including the Del Amo Blvd. bridge and its adjacent culvert, the SR-91 bridge over the Los Angeles River, the SR-91 bridge over Compton Creek, I-105 over the Los Angeles River, the Firestone Blvd. culvert, the Long Beach Blvd. bridge, and the Willow St. bridge, and bats and/or bat sign confirming bat presence were observed in several of these structures (see Figure 3.19-2). Nighttime surveys were performed in 2009, and at a small portion of suitable roost sites observed during the assessments. Buildings situated within the BSA may also provide potential bat-roosting habitat; however, no buildings were examined during the surveys due to lack of access. Some of the mature trees (including palm trees) within the BSA may be used as roosts by foliage-roosting special-status bat species such as western red bat (*Lasiurus blossevillei*), western yellow bat (*Lasiurus xanthinus*), and hoary bat (*Lasiurus cinereus*). In addition, some bat species including Yuma myotis (*Myotis yumanensis*) are known to roost in swallow mud nests such as those found throughout the BSA. Yuma myotis and silver-haired bat (*Lasionycteris noctivagans*) were the only bat species with special-status that were observed during these surveys; however, since nighttime surveys were performed in a small portion of the BSA, it is possible that other special-status bat species also occur within the BSA. Other common species of bats visually and acoustically detected within the BSA during nighttime emergence and acoustic surveys in 2009 included big brown bat (*Eptesicus fuscus*) and

Mexican free-tailed bat. In addition, inconclusive acoustic data from the 2009 surveys suggest the potential presence of California myotis.

No sign or indication of a large group of bats, such as a large maternity colony, was observed during the daytime or nighttime surveys; however, smaller maternity colonies were observed at some structures during the focused surveys. Maternity colonies may also be present in other structures within the BSA, particularly those situated along the Los Angeles River. No bats were directly observed at the sites surveyed during the 2015 daytime habitat assessment. There is no critical habitat for any bat species within the BSA.

3.19.2.2 OTHER SPECIAL-STATUS ANIMAL SPECIES NOT REQUIRING SURVEYS

Of the special-status species mentioned above and included in Table 3.19-1, those that occur in Natural Habitats and that were observed within the BSA during the 2009 surveys include great blue heron, great egret, snowy egret, black-crowned night heron, white-faced ibis (*Plegadis chihi*), osprey, long-billed curlew, marbled godwit, Forster's tern (*Sterna forsteri*), elegant tern (*Thalasseus elegans*), and yellow warbler. Of the special-status species mentioned above and included in Table 3.19-1, those that occur in Developed/Ornamental/Ruderal Habitats and that were observed within the BSA during the 2009 surveys include Cooper's hawk, Allen's hummingbird, and loggerhead shrike. Several monarch butterfly individuals were observed at Santa Cruz Park within the southern portion of the BSA during the 2015 surveys. Although the remaining special-status species were not observed during the surveys, the surveys were not focused on these species. In addition, it is possible for them to move onto the site prior to construction. While much of the habitat within the BSA is disturbed, developed, or degraded by the presence of nonnative species, some suitable habitat exists within the BSA. There is no critical habitat for any special-status species within the BSA.

3.19.3 ENVIRONMENTAL CONSEQUENCES

The following discussion of environmental consequences only describes the permanent impacts of the project alternatives. Please refer to Section 3.24 of this document, Construction Impacts, for a discussion of the temporary impacts of the project build alternatives for each resource area. Specifically, descriptions of temporary impacts related to animal species are located in Section 3.24.3.19, Animal Species.

3.19.3.1 PERMANENT IMPACTS

BUILD ALTERNATIVES.

BURROWING OWL. At this time, the BUOW(s) found in the fall/winter of 2009 and 2015 are best considered wintering individual(s) likely to leave the BSA in the spring because the vast majority of BUOWs in coastal Southern California are only wintering owls. Following refinement of the build alternatives since 2009, the location where BUOW individuals were

observed is now outside the BSA; therefore, no direct impacts by either Alternative 5C or Alternative 7 would occur in the area where BUOW presence was confirmed. However, BUOW presence in 2009 and 2015 demonstrates that open areas within the BSA and its vicinity do still provide habitat for BUOW despite the species' much-reduced presence within the Los Angeles Basin. Therefore, there would be potential for BUOW to be present at the time of construction for the build alternatives, and preconstruction surveys would be recommended for any build alternative, including protocol breeding season surveys in areas containing suitable habitat and burrows.

Due to its larger footprint, Alternative 7 may have a greater impact on the potential BUOW habitat areas within the BSA than Alternative 5C. Impacts to these habitat areas are discussed in Section 3.16, Natural Communities. There is no critical habitat for this species within the BSA; therefore, no critical habitat would be impacted by the build alternatives. Potential construction-related impacts from the build alternatives to BUOW are discussed in Section 3.24, Construction. Measures described in Section 3.19.4, Avoidance, Minimization, and/or Mitigation Measures; Section 3.16, Natural Communities; and Section 3.24, Construction Impacts, would be implemented for any build alternative to address impacts to this special-status animal species. Following implementation of these measures, impacts to BUOW from either build alternative would be reduced or avoided. Since the No Build (Alternative 1) was not identified as the Preferred Alternative, avoidance, minimization and/or mitigation measures will not be implemented.

SPECIAL-STATUS BAT SPECIES. Permanent impacts would be similar for either Alternative 5C or Alternative 7, since the vast majority of structures housing or potentially housing bats, including the multiple bridge and culvert structures where roosting bats (including special-status bat species) and/or sign of roosting bats were observed during the focused surveys performed in 2009 and 2015, would be subject to impacts in both build alternatives. For example, Willow St. Bridge is a confirmed bat-roosting site that would be widened for both build alternatives. However, there are a few notable differences between the build alternatives. Although the project footprint for Alternative 7 is larger than that of Alternative 5C, Alternative 5C would result in impacts to several structures potentially used by bats for roosting that are not part of the Alternative 7 project footprint, including SR-91 over Compton Creek, Artesia Blvd. over Compton Creek, the Compton Channel culvert beneath Artesia Blvd., the SR-91 Santa Fe Ave. Undercrossing, the SR-91 Alameda St. Undercrossing, the Slauson Ave. bridge over the Los Angeles River, the I-710 3rd St. Overcrossing, and structures associated with the SR-60/I-710 interchange. Alternative 7 would result in impacts to one structure that is not part of the Alternative 5C project footprint. This structure, a railroad bridge over the West Basin of the Dominguez Gap Wetlands, has a moderate-to-high probability of being used by bats for roosting.

Indirect permanent issues associated with human encroachment, such as the introduction of nonnative species and trash, from either Build Alternative 5C or 7 would permanently contribute to the degradation of foraging habitat (e.g., riparian/riverine vegetation) and, therefore, result in permanent impacts to special-status bat species.

Impacts from either Build Alternative 5C or 7 may also include direct mortality to bats; however, direct mortality of bats can be avoided or minimized by having a qualified bat biologist humanely evict and/or exclude bats from areas where direct impacts from the build alternatives could occur. In addition, construction could temporarily impede access to roost sites (existing and future) in the crevices or cavities of bridges, culverts, and other structures, or result in the permanent loss of an existing roost site. Only a portion of roosting habitat (existing and future) may be permanently altered by the I-710 Corridor build alternatives, and provision of alternative roosting habitat would serve to minimize or mitigate these impacts by providing alternate roost sites during construction and avoiding net loss of roosting habitat. Contingent upon design of either build alternative, the widening and modification of bridge and culvert structures may have increased future potential roosting habitat. The build alternatives are not expected to substantially affect long-term use of the structures by bats because humanely excluding bats from areas where they may have been subject to direct impacts during construction of either build alternative would minimize the likelihood of direct mortality, and because there would be no net loss of bat-roosting habitat if alternate roosting habitat is installed at a 1:1 ratio where permanent impacts to bat-roosting habitat do occur. There is no critical habitat for any bat species within the BSA; therefore, no critical habitat would be impacted by the build alternatives.

For any build alternative, specific measures described in Section 3.19.4, Avoidance, Minimization, and/or Mitigation Measures; Section 3.16, Natural Communities; and Section 3.24, Construction Impacts, (specifically, Measures CON-AS-6, CON-AS-7, CON-AS-8, CON-AS-9, CON-AS-10, and CON-AS-12) would be implemented to avoid and minimize impacts to special-status bat species. Following implementation of these measures, impacts to special-status bat species from either build alternative would be reduced or avoided.

OTHER SPECIAL-STATUS ANIMAL SPECIES NOT REQUIRING SURVEYS. The build alternatives are not expected to directly affect any of these species as a result of the avoidance and minimization measures described below in Section 3.19.4; however, the build alternatives are expected to have permanent indirect and temporary impacts to these species through the loss of potential habitat. As stated above, temporary impacts related to animal species are discussed in Section 3.24.4.18, Animal Species. There is no critical habitat for any special-status species within the BSA; therefore, no critical habitat would be impacted by the build alternatives. As discussed under Section 3.19.2.2, the following species were observed within the BSA: great blue heron, great egret, snowy egret, black-crowned night heron, white-faced ibis (*Plegadis chihi*), osprey, long-billed curlew, marbled godwit, Forster's tern (*Sterna*

forsteri), elegant tern (*Thalasseus elegans*), and yellow warbler in natural habitats, and Cooper's hawk, Allen's hummingbird, loggerhead shrike, and monarch butterfly in developed/ornamental/ruderal habitats.

All of these species are widespread in distribution and are not State or federally listed as threatened or endangered. Due to its larger footprint, Alternative 7 may have a greater impact on the habitats within the BSA that are utilized by these species than Alternative 5C. Impacts to these habitats are discussed in Section 3.16, Natural Communities. Measures described in Section 3.16, Natural Communities, and Section 3.24, Construction Impacts, would be implemented to avoid and minimize impacts to special-status animal species for any build alternative. Following implementation of these measures, impacts to special-status animal species from the build alternatives would be avoided or minimized.

MIGRATORY BIRDS. New bridge structures, or significant changes to existing bridge structures, under the build alternatives, could result in occasional bird strikes. The potential for bird-vehicle collisions cannot be quantified but is recognized as a potentially significant effect of the build alternatives. In general, changes to the flow of traffic parallel to the Los Angeles River in what is already a heavily used traffic corridor (and transmission corridor) are not expected to result in an increase in bird-vehicle collisions. The free movement of birds up and down the river is of critical importance, however, so special attention must be paid to any changes to existing bridges or to the addition of new bridges over the river. For this reason, the avoidance and minimization measure described in Section 3.19.4 is expected to address this issue for the build alternatives. The measure states that new and renovated bridges would be designed to ensure the safety of birds flying up and down the Los Angeles River. Suitable fencing or other structural features on the sides of bridges would direct flying birds up and out of the way of traffic, as well as restrict litter and debris from falling into the Los Angeles River during regular operation. Additionally, specific bridge designs would only be adopted after consultation with the USFWS and CDFW. Because much of the habitat that may be suitable for these species is already fragmented or otherwise affected by human disturbance in the BSA and because suitable habitat is located in relatively small areas within the BSA, permanent impacts to these species with regard to habitat loss and habitat fragmentation are expected to be extremely minimal under the build alternatives, if at all. Similarly, hydraulic changes to the Los Angeles River resulting from the build alternatives could alter the value of the habitat in the lower portion of the river. Potential hydraulic effects are associated with bridge modifications and the relocation of a segment of electrical transmission lines along the edge of the river. However, the modifications included under the build alternatives would mimic the existing pier configurations upstream and downstream, and there would be no substantial effects to the water surface elevation, velocity of flood flows, sedimentation, or scour in the vicinity of the new piers. Because there are no substantial effects at the location of the modifications, there are no substantial effects to downstream locations. For any build

alternative, final design of channel modifications and associated hydraulic analysis would require USACE approval.

Due to its larger footprint, Alternative 7 may have a greater impact on the habitats within the BSA utilized by migratory birds than Alternative 5C. Impacts to these habitats are discussed in Section 3.16, Natural Communities. For any build alternative, measures described in Section 3.16, Natural Communities, and Section 3.24, Construction Impacts, would be implemented by Caltrans to avoid and minimize impacts to migratory birds. Following implementation of these measures, impacts to migratory birds from either of the build alternatives would be avoided or minimized.

NO BUILD (ALTERNATIVE 1). Under the No Build (Alternative 1), which has been identified as the Preferred Alternative, the I-710 Corridor Project would not be constructed. There would be no permanent impacts to animals from the No Build (Alternative 1).

3.19.3.2 PUBLIC HEALTH CONSIDERATIONS

No public health considerations were identified with regard to project impacts on animals.

3.19.4 AVOIDANCE, MINIMIZATION, AND/OR MITIGATION MEASURES

In addition to measures described in Section 3.16, Natural Communities; Section 3.20, Threatened and Endangered Species, and Section 3.24, Construction Impacts (particularly Measures CON-AS-1 through CON-AS-14), for any build alternative, the following measure would be implemented by Caltrans to avoid and minimize impacts to special-status animal species.

However, as the No Build (Alternative 1) was identified as the Preferred Alternative, adverse impacts to animal species would not occur, and the adoption of this alternative would not require any avoidance, minimization, and/or mitigation measures. Avoidance, minimization, and/or mitigation measures pertaining to the two build alternatives are retained in this Final EIR/EIS for disclosure purposes.

AS-1 New, replacement, and renovated bridges will be designed to ensure the safety of birds flying up and down the Los Angeles River, including the least Bell's vireo, western snowy plover, and California least tern. Suitable fencing or other structural features on the sides of bridges would direct flying birds up and out of the way of traffic, at the same time not serving as dangers themselves, as well as restrict litter and debris from falling into the Los Angeles River during regular operation. Other design measures will be considered if they accomplish the same results. In addition to review and certification by the bridge design and the California Department of Transportation (Caltrans) District Non-Standard Special Provisions (NSSP) team, final bridge design will be reviewed and approved by the Caltrans District 7 biologist, in consultation with the United States Fish and Wildlife Service (USFWS) and the California Department of Fish and Wildlife (CDFW).

This page intentionally left blank

3.20 THREATENED AND ENDANGERED SPECIES

The analysis of impacts of the project alternatives on threatened and endangered species is based on the following documents:

- *I-710 Corridor Project Natural Environment Study* (NES) (June 2017)
- *Biological Assessment* (BA) (November 2018)

3.20.1 REGULATORY SETTING

The primary Federal law protecting threatened and endangered species is the Federal Endangered Species Act (FESA): 16 United States Code (USC), Section 1531, et seq. See also 50 Code of Federal Regulations (CFR) Part 402. This act and later amendments provide for the conservation of endangered and threatened species and the ecosystems upon which they depend. Under Section 7 of this act, Federal agencies, such as the Federal Highway Administration (FHWA), are required to consult with the U.S. Fish and Wildlife Service (USFWS) and the National Oceanic and Atmospheric Administration's National Marine Fisheries Service (NMFS) to ensure that they are not undertaking, funding, permitting, or authorizing actions likely to jeopardize the continued existence of listed species or destroy or adversely modify designated critical habitat. Critical habitat is defined as geographic locations critical to the existence of a threatened or endangered species. The outcome of consultation under Section 7 may include a Biological Opinion with an Incidental Take statement, a Letter of Concurrence and/or documentation of a No Effect finding. Section 3 of FESA defines take as "harass, harm, pursue, hunt, shoot, wound, kill, trap, capture or collect or any attempt at such conduct."

California has enacted a similar law at the state level, the California Endangered Species Act (CESA), California Fish and Game Code, Section 2050, et seq. CESA emphasizes early consultation to avoid potential impacts to rare, endangered, and threatened species and to develop appropriate planning to offset project-caused losses of listed species populations and their essential habitats. The California Department of Fish and Wildlife (CDFW) is the agency responsible for implementing CESA. Section 2081 of the Fish and Game Code prohibits "take" of any species determined to be an endangered species or a threatened species. Take is defined in Section 86 of the Fish and Game Code as "hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill." CESA allows for take incidental to otherwise lawful development projects; for these actions, an incidental take permit is issued by CDFW. For species listed under both the FESA and CESA requiring a Biological Opinion under Section 7 of the FESA, the CDFW may also authorize impacts to CESA species by issuing a Consistency Determination under Section 2080.1 of the Fish and Game Code.

Another Federal law, the Magnuson-Stevens Fishery Conservation and Management Act (MSA) of 1976, was established to conserve and manage fishery resources found off the coast, as well as anadromous species and Continental Shelf fishery resources of the United States, by

exercising (A) sovereign rights for the purposes of exploring, exploiting, conserving, and managing all fish within the exclusive economic zone established by Presidential Proclamation 5030, dated March 10, 1983, and (B) exclusive fishery management authority beyond the exclusive economic zone over such anadromous species, Continental Shelf fishery resources, and fishery resources in special areas. Additional Federal laws include the Marine Life Protection Act, the Marine Mammal Protection Act (MMPA), and the U.S. Fish and Wildlife Coordination Act (16 USC 661).

3.20.2 AFFECTED ENVIRONMENT

Prior to conducting the field surveys, existing documentation relevant to the Biological Study Area (BSA) was reviewed. Database records and websites reviewed included:

- California Natural Diversity Database (CNDDDB) information (RareFind Version 5.1.1), which is administered by the CDFW (this database covers sensitive plant and animal species as well as sensitive natural communities that occur within California) (2009 and 2015)
- California Native Plant Society Electronic Inventory (CNPSEI, Version 8), California Native Plant Society (CNPS) Rare Plant Program (2009 and 2015)
- Calflora website (Calflora 2009 and 2015)
- CalPhotos website (CalPhotos 2009 and 2015)
- Consortium of California Herbaria website (Consortium of California Herbaria 2008)
- CalHerps website (CalHerps 2009 and 2015)
- Cornell All About Birds website (Cornell 2009 and 2015)
- Mammal Society website (Mammal Society 2009 and 2015)
- USFWS Official Species List (provided by Carlsbad Fish and Wildlife Office, January 25, 2021; Appendix J of this Final EIR/EIS)
- NMFS Official Species List (updated January 27, 2021; Appendix J of this Final EIR/EIS)

Searches of these databases were conducted for the quadrangles containing and surrounding the BSA (i.e., the *San Pedro, Torrance, Inglewood, Hollywood, Los Alamitos, Seal Beach, Burbank, Pasadena, Mount Wilson, El Monte, Whittier, South Gate, Long Beach, and Los Angeles, California* United States Geological Survey [USGS] 7.5-minute quadrangles). Other sensitive species known to occur in the general area were also considered.

The special-status species lists obtained from the CNDDDB, the CNPS, the USFWS, and the NMFS were reviewed to determine which species could occur in the vicinity of the BSA. From these lists, comprehensive site-specific lists were compiled based on known ranges of species as well as species occurrence records within several miles of the BSA; these were further refined based on

the availability of suitable habitat within the species' known ranges in the BSA. Most special-status species identified in the lists provided by the above agencies and organizations are not likely to be present within the BSA because species-specific habitat requirements are not present within the BSA, some species are rare and transient and would only occur in the area during migration, and some species are not tolerant of the level or proximity of human-related disturbance that currently characterizes the BSA.

On April 16, 2009, May 23, 2012, June 12, 2017, and again on January 25, 2021, the USFWS provided a list of Federally listed as endangered, threatened, proposed, and candidate species that may occur in the vicinity of the Interstate 710 (I-710) Corridor Project. In addition, the NMFS provided a similar list on December 13, 2016, June 12, 2017, and January 27, 2021. These lists are included in Appendix J of this Final Environmental Impact Report/Environmental Impact Statement (Final EIR/EIS). Other consultation to date between the California Department of Transportation (Caltrans), as assigned by FHWA pursuant to the FESA, with the USFWS and the NMFS is summarized below.

On September 29, 2008, the USFWS issued a response letter to the *Notice of Preparation (NOP) to Prepare a Draft Environmental Impact Report for the I-710 Corridor Project, Los Angeles County, California – FWS-LA-08B0786-08TA0998*. The letter discussed USFWS concerns regarding the I-710 Corridor Project build alternatives' potential impacts to migratory birds, least Bell's vireo, habitat creation areas, and four Federally listed or candidate plant species.

On September 29, 2008, the USFWS declined Caltrans' invitation to become a cooperating agency for the I-710 Corridor Project due to workload constraints. The USFWS agreed to provide technical assistance as a participating agency.

On April 16, 2009, the USFWS provided a list of Federally listed as endangered, threatened, proposed, and candidate species that may occur in the vicinity of the I-710 Corridor Project (NES, Appendix A) (USFWS 2009). On September 24, 2009, the consulting biologist had a phone discussion with Sally Brown (Biologist) of the USFWS Carlsbad office regarding concerns related to the I-710 Corridor Project build alternatives. USFWS concerns included the potential for the build alternatives to stir up contaminated sediments that would occur during pile driving and bridge demolition, and potentially cause contamination of aquatic resources with lead-based paint during bridge demolition, and to result in bird strikes from the new bridges.

On December 14 and 15, 2009, the consulting biologist discussed impacts of the build alternatives on essential fish habitat (EFH) and marine mammals with NMFS biologists Bryant Chesney and Monica Deangeles.

On March 24, 2011, the consulting biologist had an informal consultation phone call with Sally Brown (Biologist) of the USFWS Carlsbad office regarding the Biological Assessment (BA) and surveys for the Brand's star phacelia.

On August 22, 2012, the USFWS submitted a comment letter on the Draft EIR/EIS.

On June 6, 2017, the USFWS provided an official list of Federally listed endangered, threatened, proposed, and candidate species that may occur in the vicinity of the I-710 Corridor Project.

On June 12, 2017, Caltrans coordinated with Penny Ruvelas (Long Beach Office Branch Chief - Protected Resources Division of NMFS) regarding an updated list of Federally listed endangered, threatened, proposed, and candidate species that may occur in the vicinity of the I-710 Corridor Project (NES, Appendix A) (NMFS 2017). Ms. Ruvelas provided further direction regarding species likelihood to occur in the BSA, listing status changes, and inclusion of additional species.

On June 12, 2017, Caltrans coordinated with Jay Ogawa of NMFS regarding informal consultation for EFH, marine mammals, and steelhead.

The Biological Assessment was submitted to USFWS and NMFS on November 19, 2018. Following the receipt of the Biological Assessment, Colleen Draguesku of USFWS contacted Sean Herron, Caltrans biologist, with questions regarding the response to comments USFWS had provided on the RDEIR/SDEIS during public circulation, and how bridges associated with the build alternatives would be designed to protect migrating birds. Caltrans provided responses to those questions on December 19, 2018. Ms. Draguesku posed follow-up questions regarding potential impacts of the build alternatives to riparian habitat in the area of the De Forest Park Restoration effort (specifically, potential impacts to least Bell's vireo) on February 14, 2019. Mr. Herron provided a response with supplemental aerial footprint information and photographs on February 19, 2019. On December 14, 2018, Sean Herron of Caltrans and Dan Lawson of NMFS held a teleconference regarding clarification of water depths in the area where bridge replacements associated with the build alternatives would occur, bridge pile information, and other details regarding bridge construction and how it may impact species protected under the MMPA and the FESA. Caltrans followed up on questions resulting from that teleconference on December 26, 2018. Mr. Lawson provided further questions in an email to Mr. Herron dated January 29, 2019. Anthony Spina of the NMFS sent a concurrence letter dated February 19, 2019, to Paul Caron of Caltrans stating that the proposed action of the build alternatives is not likely to adversely affect endangered Southern California steelhead or threatened East Pacific green turtle and designated critical habitat for these species. On May 2, 2019, Jonathan Snyder of USFWS sent a concurrence letter to Paul Caron stating that the build alternatives are not likely to adversely affect least Bell's vireo, Western snowy plover, and California least tern. Following further coordination with Ms. Draguesku, an amended letter of concurrence was received from USFWS on August 21, 2019, which revised the acreage estimate for least Bell's vireo.

In January 2021, updated species lists from the USFWS and NOAA Fisheries were obtained.

3.20.2.1 PLANT SPECIES

After the thorough literature review as described above, it was determined that 14 plant species that are Federally and/or State-listed, candidate, or proposed endangered or threatened have the potential to occur within the vicinity of the BSA. However, for all of these plant species, either suitable habitat does not exist within the BSA or the species was not observed during field surveys; therefore, they are not discussed further in this section. Further information on these species is summarized in Table 3.20-1, including status, habitat requirements, and potential for occurrence.

3.20.2.1 ANIMAL SPECIES

After the thorough literature review as described above, it was determined that 47 animal species or habitats that are Federally and/or State-listed, candidate, or proposed endangered or threatened, or regulated by the NMFS have the potential to occur within the vicinity of the BSA. Suitable habitat does not exist within the BSA for 43 of these animal species. With the exception of the Southern California steelhead Distinct Population Segment (DPS), green sea turtle, western snowy plover, California least tern (CLT), California sea lion, and EFH, all other animal species that lack suitable habitat in the BSA or that would not be affected by the build alternatives (e.g., abalones or whales) are not discussed further in this section. Steelhead, green sea turtle, CLT, California sea lion, and EFH are exceptions because they may occur within the BSA, and downstream effects to these species warrant consideration. The USFWS specifically requested full consideration of the western snowy plover. Further information on each of these species is summarized in Table 3.20-2, including status, habitat requirements, and potential for occurrence.

SOUTHERN CALIFORNIA STEELHEAD DPS. The Southern California steelhead DPS is Federally listed as an endangered species. This DPS includes potential populations from rivers and smaller streams from Santa Barbara County to the Mexican border. This steelhead DPS is a winter run species and typically moves upstream towards its spawning areas when winter rains increase river flows. Steelhead occur in the coastal marine waters off the southern California coast, but based on available data, it appears to be extirpated from the Los Angeles River (Friends of the Los Angeles River 2008). If steelhead does occur in the Los Angeles River, it is likely to be only as an occasional stray near the mouth of the river.

GREEN SEA TURTLE. The green sea turtle is Federally listed as a threatened species. The green sea turtle is most widely distributed in tropical ocean waters, but has been found in areas of southern California, including artificially warm water in south San Diego Bay and at the mouth of the San Gabriel River. Green sea turtles have been observed in the Long Beach area (particularly in the vicinity of the San Gabriel River mouth), but not within the I-710 Corridor Project BSA.

Table 3.20-1: Threatened and Endangered Plant Species Potentially Occurring or Known to Occur in the Biological Study Area

| Common Name | Scientific Name | Status Federal/ State/ CNPS Status | General Habitat Description | Habitat Present or Absent/ Species Observed | Rationale | Finding of Effect |
|--------------------------|--|------------------------------------|---|---|--|--|
| Marsh sandwort | <i>Arenaria paludicola</i> | FE/CE/ 1B.1 | Found in freshwater marshes from ten to 560 feet elevation, where it grows up through dense mats of <i>Typha</i> , <i>Juncus</i> , <i>Scirpus</i> , etc. Presently known to occur only in San Luis Obispo County. Believed extirpated from Los Angeles, San Francisco, Santa Cruz, Riverside, and San Bernardino Counties, and from the State of Washington. Last known record of this species in Riverside, San Bernardino, or Los Angeles Counties is from 1900. Blooms May–August. | A | Believed extirpated in Los Angeles County. Last record is from 1900. Not observed in marsh habitat within the BSA during special-status plant surveys in 2009. | The build alternatives would have no effect on this species. There is no designated critical habitat for this species. |
| Braunton's milk-vetch | <i>Astragalus brauntonii</i> | FE/–/1B.1 | Considered a limestone endemic and dependent on fire. Usually on sandstone with carbonate layers following fire, but may follow other disturbance and occur on stiff gravelly clay soils over granite. Typically associated with the fire-dependent chaparral habitat on limestone and on downwash sites below 2,100 feet elevation. Known only from Los Angeles, Orange, Riverside, and Ventura Counties. Blooms January–August. | A | No carbonates, stiff gravelly clay, or chaparral occur within the BSA. | The build alternatives would have no effect on this species or on the designated critical habitat for the species. |
| Ventura marsh-milk vetch | <i>Astragalus pycnostachyus</i> var. <i>lanosissimus</i> | FE/CE/ 1B.1 | Coastal salt marsh within reach of high tide or protected by barrier beaches, or more rarely near seeps on sandy bluffs, below 120 feet elevation. Known only from Santa Barbara and Ventura Counties. Believed extirpated from Los Angeles and Orange Counties. Blooms August–October. | A | No salt marsh or suitable habitat occur within the BSA. | The build alternatives would have no effect on this species or on the designated critical habitat for the species. |

| Common Name | Scientific Name | Status Federal/ State/ CNPS Status | General Habitat Description | Habitat Present or Absent/ Species Observed | Rationale | Finding of Effect |
|---------------------------------|---|------------------------------------|--|---|---|--|
| Coastal dunes milk-vetch | <i>Astragalus tener</i> var. <i>titi</i> | FE/CE/ 1B.1 | Moist, sandy depressions of coastal dunes and bluffs, or clay terraces, below 160 feet elevation. Known to occur only in Los Angeles County. Believed extirpated from Los Angeles County. May also be extirpated from San Diego County. Blooms March–May. | A | No coastal dunes, bluffs, or clay terraces occur within the BSA. Believed extirpated in Los Angeles County. | The build alternatives would have no effect on this species. There is no designated critical habitat for this species. |
| Nevin's barberry | <i>Berberis nevinii</i> | FE/CE/ 1B.1 | Gravelly wash margins in alluvial scrub, or coarse soils and rocky slopes in chaparral; typically 900 to 2,700 feet elevation; Los Angeles, San Bernardino, Riverside, and San Diego Counties. Blooms March–June (evergreen shrub, survey year-round). | A | No alluvial scrub or chaparral within the BSA. BSA is outside the species' expected range. | The build alternatives would have no effect on this species or on the designated critical habitat for the species. |
| San Fernando Valley spineflower | <i>Chorizanthe parryi</i> var. <i>fernandina</i> | FC/CE/ 1B.1 | Sandy soils in coastal scrub, primarily in northeastern Western Transverse Ranges and San Gabriel Mountains at ten to 4,000 feet elevation. Known only from Los Angeles and Ventura Counties. Presumed extirpated from Orange County and the Los Angeles Basin. Blooms April–June (annual herb). | A | No sandy areas or coastal scrub within the BSA. Presumed extirpated from the Los Angeles Basin. | The build alternatives would have no effect on this species. There is no designated critical habitat for this species. |
| Salt marsh bird's-beak | <i>Chloropyron</i> (<i>Cordylanthus</i>) <i>maritimum</i> spp. <i>maritimum</i> | FE/CE/ 1B.2 | Coastal dunes and salt marshes below 100 feet elevation. In California, known from Los Angeles, Orange, Santa Barbara, San Diego, San Luis Obispo, and Ventura Counties. Historical collections referred to this taxon from alkaline meadow in vicinity of San Bernardino Valley are intermediate to <i>C. maritimum</i> ssp. <i>canescens</i> . Species has been documented from approximately two miles west and east of the right-of-way north of Long Beach Harbor. Also occurs in Mexico. Blooms May–October (annual herb). | A | No dunes or salt marshes occur within the BSA. | The build alternatives would have no effect on this species. There is no designated critical habitat for this species. |

| Common Name | Scientific Name | Status Federal/ State/ CNPS Status | General Habitat Description | Habitat Present or Absent/ Species Observed | Rationale | Finding of Effect |
|----------------------------|--|------------------------------------|---|---|--|--|
| Slender-horned spineflower | <i>Dodecahema leptoceras</i> | FE/CE/ 1B.1 | In the Vail Lake area, occurs in gravel soils of Temecula arkose deposits in openings in chamise chaparral. In other areas, occurs in sandy cobbly riverbed alluvium in alluvial fan sage scrub (usually late seral stage), on floodplain terraces and benches that receive infrequent overbank deposits from generally large washes or rivers. Most often found in shallow, silty depressions dominated by leather spineflower (<i>Lastarriaea coriacea</i>) and other native annual species, and often associated with cryptogamic soil crusts composed of bryophytes, algae and/or lichens. Occurs at 600 to 2,500 feet elevation. Known only from Los Angeles, Riverside, and San Bernardino Counties, California. Blooms April–June (annual herb). | A | No chaparral or alluvial fan sage scrub within the BSA. BSA is not within the species' range. | The build alternatives would have no effect on this species. There is no designated critical habitat for this species. |
| San Diego button-celery | <i>Eryngium aristulatum</i> var. <i>parishii</i> | FE/CE/ 1B.1 | Vernal pools and similar mesic habitats in coastal scrub and grassland at 50 to 2,000 feet elevation. In California, known only from Los Angeles, Orange, Riverside and San Diego Counties. In Riverside County, known only from the Santa Rosa Plateau. Also occurs in Mexico. Blooms April–June (annual or perennial herb). | A | No vernal pools or similar habitats within the BSA. No records from Los Angeles County in over 100 years. | The build alternatives would have no effect on this species. There is no designated critical habitat for this species. |
| Gambel's water cress | <i>Nasturtium gambelii</i> | FE/CT/ 1B.1 | Marshes and swamps from 20 to 1,100 feet elevation. Currently believed to occur in California only in Santa Barbara and San Luis Obispo Counties. There are historical records from Los Angeles, Orange, San Diego, and San Bernardino Counties, although the San Diego County records may be based on misidentification of another species. Also occurs in Baja California. Blooms April–October. | A | Believed extirpated from Los Angeles County. Not observed in wet areas within the BSA during special-status plant surveys. | The build alternatives would have no effect on this species. There is no designated critical habitat for this species. |

| Common Name | Scientific Name | Status Federal/ State/ CNPS Status | General Habitat Description | Habitat Present or Absent/ Species Observed | Rationale | Finding of Effect |
|-------------------------|-----------------------------|------------------------------------|---|---|--|--|
| Moran's navarretia | <i>Navarretia fossalis</i> | FT/-/1B.1 | In vernal pools, playas, shallow freshwater marshes, and similar sites at 100 to 4,300 feet elevation. In California, known only from Los Angeles, San Luis Obispo, Riverside, and San Diego Counties. Also occurs in Mexico. Blooms April–June. | A | No vernal pools or other suitable habitat occur within the BSA. | The build alternatives would have no effect on this species or on the designated critical habitat for the species. |
| California orcutt grass | <i>Orcuttia californica</i> | FE/CE/ 1B.1 | Vernal pools from 50 to 2,200 feet elevation. In California, known from Los Angeles, Ventura, Riverside, and San Diego Counties. Also occurs in Mexico. Species has been documented from approximately one to two miles east of the right-of-way of the build alternatives in Downey. Blooms April–August. | A | No vernal pools occur within the BSA. Not observed in wet areas during the special-status plant surveys. | The build alternatives would have no effect on this species. There is no designated critical habitat for this species. |
| Lyon's pentachaeta | <i>Pentachaeta lyonii</i> | FE/CE/ 1B.1 | Clay soils in edges of openings in fire-adapted coastal sage scrub and chaparral on saddles between hills, on the tops of small knolls, or in flat areas at the base of slopes, particularly where soil crust results in less competition from annual grasses, from 100 to 2,100 feet elevation. Occurs only in the Santa Monica Mountains in eastern Ventura and western Los Angeles Counties and in the western Simi Hills in Ventura County. Based on historical records, it once occurred on the Palos Verdes Peninsula and on Santa Catalina Island, but has not been seen at these locations since 1910 and 1855, respectively, and is assumed to be extirpated from those areas. Species has been documented from approximately two miles west of the right-of-way north of United States Naval Station Long Beach. Blooms March–August. | A | No clay habitats occur within the BSA. Believed to be extirpated from the area. | The build alternatives would have no effect on this species or on the designated critical habitat for the species. |

| Common Name | Scientific Name | Status Federal/ State/ CNPS Status | General Habitat Description | Habitat Present or Absent/ Species Observed | Rationale | Finding of Effect |
|-----------------------|---------------------------|------------------------------------|---|---|--|--|
| Brand's star phacelia | <i>Phacelia stellaris</i> | –/–/1B.1 | Sandy openings, sandy benches, dunes, sandy washes, or river floodplains in coastal sage scrub at 20 to 1,300 feet elevation. In western Riverside County, species appears to be restricted to sandy washes and benches in alluvial floodplains. In California, known only from Los Angeles (believed extirpated), Riverside, and San Diego Counties. Species has been documented from approximately one to two miles east of the right-of-way for the build alternatives in Downey. Blooms March–June. | A | No sandy soils or other suitable habitat occur within the BSA. | The build alternatives would have no effect on this species. There is no designated critical habitat for this species. |

Source: LSA Associates, Inc. I-710 Corridor Project Natural Environment Study (June 2017).

Habitat Present/Absent: Absent (A) - no habitat present and no further work needed. Habitat Present (P) – habitat is, or may be present. Species observed during surveys (O) – Based on the literature review the species has been observed within the area of the BSA.

Status: Federal Endangered (FE); Federal Threatened (FT); Federal Candidate (FC); California Endangered (CE); California Threatened (CT); California Special Animal (CSA), California Native Plant Society (CNPS); 1B, Plants considered by CNPS to be rare, threatened, or endangered in California and elsewhere; CNPS threat category: 0.1-Seriously threatened in California (high degree/immediacy of threat)

Table 3.20-2: Threatened and Endangered Animal Species and NMFS-Regulated Resources Potentially Occurring or Known to Occur in the Biological Study Area

| Common Name | Scientific Name | Status Federal/ State | General Habitat Description | Habitat Present or Absent/ Species Observed | Rationale | Finding of Effect |
|-----------------------------|---|-----------------------|--|---|---|--|
| INVERTEBRATES | | | | | | |
| Black abalone | <i>Haliotis cracherodii</i> | FE/- | Crevices, cracks, and holes of intertidal and shallow subtidal rocks generally in areas of moderate to high surf. Considered locally extinct in most locations south of Point Conception, California. | A | Included on the NMFS species list for the project alternatives (NES, Appendix A). No suitable habitat within the BSA. | The build alternatives would have no effect on this species or on the designated critical habitat for the species. |
| White abalone | <i>Haliotis sorenseni</i> | FE/- | Open low and high relief rock or boulder habitat that is interspersed with sand channels. Usually found at depths of 80-100 feet. Occur more frequently at the offshore islands of southern California. | A | Included on the NMFS species list for the project alternatives (NES, Appendix A). No suitable habitat within the BSA. | The build alternatives would have no effect on this species or on the designated critical habitat for the species. |
| Riverside fairy shrimp | <i>Streptocephalus woottoni</i> | FE/CSA | Inhabits vernal pools or other seasonal pools at least 12 inches in depth. Feeds on microscopic organisms such as bacteria and protozoa. Dried eggs will survive in the soil through the dry seasons until pools are formed by rainwater. Native to southern California and Baja California. | A | Suitable habitat not present within the BSA. | The build alternatives would have no effect on this species or on the designated critical habitat for the species. |
| Palos Verdes blue butterfly | <i>Glaucopsyche lygdamus palosverdesensis</i> | FE/CSA | Restricted to the cool, fog-shrouded, seaward side of the Palos Verdes Hills in Los Angeles County. Dependent on host plant <i>Astragalus trichopodus</i> var. <i>lonchus</i> . | A | Outside the subspecies' known range. | The build alternatives would have no effect on this species or on the designated critical habitat for the species. |

| Common Name | Scientific Name | Status Federal/ State | General Habitat Description | Habitat Present or Absent/ Species Observed | Rationale | Finding of Effect |
|--|---|-----------------------------|--|---|--|--|
| FISH and ESSENTIAL FISH HABITAT | | | | | | |
| Essential Fish Habitat (Groundfish, Coastal Pelagic Species, and Highly Migratory Species) | | -/- protected under the MSA | Waters and substrates necessary to fish for spawning, breeding, feeding, or growth to maturity. | P | Included on the NMFS species list for the project alternatives (NES, Appendix A). The southernmost extent of the project is located within the lower reaches of the Los Angeles River in an area designated as EFH by NMFS, though it is unlikely that any species included in the Management Plans would occur within the BSA. | The build alternatives may affect but are not likely to adversely affect this habitat with the implementation of the avoidance, minimization, and mitigation measures. |
| Mohave tui chub | <i>Siphateles bicolor mohavensis</i> (<i>Gila bicolor mohavensis</i>) | FE/CE, CFP | Endemic to the Mojave River basin and adapted to alkaline, mineralized waters. Needs deep pools, ponds, or slough-like areas. Needs vegetation for spawning. Now extirpated from the botanic garden in Palos Verdes where it was transplanted in 1970. | A | BSA is outside the species' range. | The build alternatives would have no effect on this species. There is no designated critical habitat for this species. |
| Giant manta ray | <i>Manta birostris</i> | FT/-- | Circumglobal species typically found in tropical and subtropical waters, but can also be found in temperate waters. Has been documented as far north as southern California. | A | Directed to include this species in the biological analysis per Caltrans correspondence with NMFS. BSA represents the northern Extent of Occurrence and Area of Occupancy for this species and there are no records of this species occurring within or near the BSA, which does not provide suitable habitat. This species is not expected to occur within the BSA. | The build alternatives would have no effect on this species or on the designated critical habitat for the species. |

| Common Name | Scientific Name | Status Federal/ State | General Habitat Description | Habitat Present or Absent/ Species Observed | Rationale | Finding of Effect |
|--|------------------------------|-----------------------|---|---|---|--|
| Green sturgeon (southern DPS) | <i>Acipenser medirostris</i> | FT/CSC | Near shore marine waters, bays and estuaries, spawns in rivers in deep fast water over large cobbles, but also clean sand to bedrock. Southern most spawning population in the Sacramento River. | A | Included on the NMFS species list for the project alternatives (NES, Appendix A). No recent records of this species occurring within or near the BSA. The estuarine habitats within the BSA do not provide suitable habitat. This species is not expected to occur within the BSA. | The build alternatives would have no effect on this species or on the designated critical habitat for the species. |
| Santa Ana sucker | <i>Catostomus santaanae</i> | FT/- | Historic range includes the Los Angeles, San Gabriel, and Santa Ana River drainage systems in Southern California. An introduced population also occurs in the Santa Clara River drainage system in Southern California. Found in shallow, cool, running water. | A | Still occurs in upper reaches of the Los Angeles River but is apparently extirpated downstream. | The build alternatives would have no effect on this species or on the designated critical habitat for the species. |
| Scalloped hammerhead shark - Eastern Pacific DPS | <i>Sphyrna lewini</i> | FE/-- | Circumglobal species that lives in coastal warm temperate and tropical seas. It occurs over continental and insular shelves, as well as adjacent deep waters, but is seldom found in waters cooler than 22° C. It ranges from the intertidal and surface to depths of up to 450-512m with occasional dives to even deeper waters. | A | Directed to include this species in the biological analysis per Caltrans correspondence with NMFS. Species may occur in nearby waters during periods of warmer water (e.g., El Nino conditions). However, there are no records of this species occurring within or near the BSA, and the BSA does not provide suitable habitat. This species is not expected to occur within the BSA. | The build alternatives would have no effect on this species. There is no designated critical habitat for this species. |

| Common Name | Scientific Name | Status Federal/ State | General Habitat Description | Habitat Present or Absent/ Species Observed | Rationale | Finding of Effect |
|--|------------------------------------|-----------------------|--|---|---|---|
| Steelhead - Southern California DPS | <i>Oncorhynchus mykiss irideus</i> | FE/CSC | This anadromous species requires small, low-flowing streams with gravel beds with protective cover and adequate food to complete its lifecycle. Historically occurred in larger coastal drainages from Point Conception to northern Baja California. The southernmost populations now appear to be in Malibu and San Mateo Creeks. | A | Included on the NMFS species list for the project alternatives (NES, Appendix A), but this species appears to be extirpated from the BSA. | The build alternatives may affect but are not likely to adversely affect this species or the designated critical habitat for the species. |
| Southern steelhead (Southern California ESU) | <i>Oncorhynchus mykiss irideus</i> | FE/CSC | This anadromous species requires small, low-flowing streams with gravel beds with protective cover and adequate food to complete its lifecycle. Historically occurred in larger coastal drainages from Point Conception to northern Baja California. The southernmost populations now appear to be in Malibu and San Mateo Creeks. | A | BSA is outside the species' current range. | The build alternatives may affect but are not likely to adversely affect this species or the designated critical habitat for the species. |
| Tidewater goby | <i>Eucyclogobius newberryi</i> | FE/CSC | Found in shallow lagoons up to 15 feet in depth and lower stream reaches; needs fairly still but not stagnant water and high oxygen levels. Brackish water habitats along the California coast from the Agua Hedionda Lagoon in San Diego County to the mouth of the Smith River, in shallow lagoons and lower stream reaches. | A | Formerly occurred in Ballona Creek estuary; now apparently extirpated from Los Angeles County. | The build alternatives would have no effect on this species or on the designated critical habitat for the species. |

| Common Name | Scientific Name | Status Federal/ State | General Habitat Description | Habitat Present or Absent/ Species Observed | Rationale | Finding of Effect |
|--------------------------------------|------------------------------|-----------------------|--|---|--|--|
| AMPHIBIANS | | | | | | |
| Arroyo toad | <i>Anaxyrus californicus</i> | FE/CSC | Washes and arroyos with open water; sand or gravel beds, for breeding, pools with sparse overstory vegetation. Coastal streams and a few desert streams from Los Angeles County to Baja California. | A | Occurs in headwaters of the Los Angeles River, but apparently never recorded on the river proper. | The build alternatives would have no effect on this species or on the designated critical habitat for the species. |
| California red-legged frog | <i>Rana draytonii</i> | FT/CSC | Streams with slow-moving water and deep pools; dense, shrubby riparian vegetation at pool edges. Coastal streams from Marin County to northwestern Baja California, but extirpated from most of southwestern California. | A | May have occurred historically but is now extirpated from the Los Angeles Basin. | The build alternatives would have no effect on this species or on the designated critical habitat for the species. |
| Southern mountain yellow-legged frog | <i>Rana muscosa</i> | FE/CE, | Inhabits ponds, tarns, lakes, and streams at moderate to high elevations in the Transverse Ranges of Southern California, but is possibly on the verge of extinction. | A | Outside known range of the species. | The build alternatives would have no effect on this species or on the designated critical habitat for the species. |
| REPTILES | | | | | | |
| Olive Ridley sea turtle | <i>Lepidochelys olivacea</i> | FT/– | Worldwide in warm marine waters. Mainly a pelagic sea turtle, but has been known to inhabit coastal areas, including bays and estuaries. Nests on sandy beaches along tropical coasts, but within the United States. | A | Included on the NMFS species list for the project alternatives (NES, Appendix A). May occasionally occur in offshore waters from the BSA, but is not expected to occur within the BSA. | The build alternatives would have no effect on this species. There is no designated critical habitat for this species. |

| Common Name | Scientific Name | Status Federal/ State | General Habitat Description | Habitat Present or Absent/ Species Observed | Rationale | Finding of Effect |
|-------------------------------------|-----------------------------|-----------------------|--|---|---|--|
| Leatherback sea turtle | <i>Dermochelys coriacea</i> | FE/- | The most migratory and wide ranging of sea turtle species. Nests on sandy beaches along tropical coasts, but can forage in temperate coastal waters. | A | Included on the NMFS species list for the project alternatives (NES, Appendix A). May occasionally occur in offshore waters from the BSA, but is not expected to occur within the BSA. | The build alternatives would have no effect on this species or on the designated critical habitat for the species. |
| North Pacific loggerhead sea turtle | <i>Caretta caretta</i> | FE/- | Worldwide in tropical and temperate marine waters. Forages in lagoons and bays. Nests on coarse-grained beaches along tropical coasts. Only known nesting areas in North Pacific are in southern Japan. Most records in California are of juveniles off the coast. | A | Included on the NMFS species list for the project alternatives (NES, Appendix A). May occasionally occur in offshore waters from the BSA, but is not expected to occur within the BSA. | The build alternatives would have no effect on this species or on the designated critical habitat for the species. |
| Green sea turtle | <i>Chelonia mydas</i> | FT/- | Worldwide in warm marine waters near shorelines such as lagoons and bays with beds of eelgrass, seaweeds, or mangroves; open ocean during dispersal and/or migration. Nests on sandy beaches along tropical coasts. In Southern California, aggregations occur in areas with artificially warm water from power plant outfalls in the south San Diego Bay and at the mouth of the San Gabriel River. | P | Not expected to occur due to lack of suitable foraging habitat (e.g., eelgrass beds) and source of warm water. May occasionally occur downstream from the BSA, in the vicinity of the mouth of the Los Angeles River. | The build alternatives may affect but are not likely to adversely affect this species with the implementation of the avoidance, minimization, and mitigation measures. There is no designated critical habitat for this species. |

| Common Name | Scientific Name | Status Federal/ State | General Habitat Description | Habitat Present or Absent/ Species Observed | Rationale | Finding of Effect |
|---------------------------|--|---------------------------------|--|---|---|--|
| BIRDS | | | | | | |
| Bald eagle | <i>Haliaeetus leucocephalus</i> | FD, BCC/CE (nesting, wintering) | Primarily near seacoasts, rivers, swamps, and large lakes throughout much of North America. | A | Probably never common within the BSA and now only a rare visitor (e.g., one observed along the Los Angeles River in Long Beach in November 2004); some birds found in coastal Los Angeles County in recent years originated as released birds on the Channel Islands. | The build alternatives would have no effect on this species. There is no designated critical habitat for this species. |
| Swainson's hawk | <i>Buteo swainsoni</i> | BCC/CT (nesting) | Nests in open country throughout much of interior western North America and winters primarily in South America. | A | Does not nest on the coastal slope of Southern California but migrates through the entire region (less commonly along the coast). Has been observed in the vicinity of the BSA. | The build alternatives would have no effect on this species. There is no designated critical habitat for this species. |
| California black rail | <i>Laterallus jamaicensis coturniculus</i> | BCC/CT, CFP | Shallow margins of fresh and saltwater marshes from Central California to northern Baja California; very local in occurrence. | A | Probably occurred historically, but never confirmed within the BSA. | The build alternatives would have no effect on this species. There is no designated critical habitat for this species. |
| Light-footed clapper rail | <i>Rallus longirostris levipes</i> | FE/CE, CFP | Coastal salt marshes from Santa Barbara County to northern Baja California. | A | Former resident in the mouth of the Los Angeles River but now extirpated from Los Angeles County. | The build alternatives would have no effect on this species. There is no designated critical habitat for this species. |
| Greater sandhill crane | <i>Grus canadensis tabida</i> | –/CT, CFP (nesting, wintering) | Nests in marshy areas across southern Canada and the northern United States. Winters primarily in agricultural fields and wet prairie in the southern United States and northern Mexico. | A | May have occurred historically, but habitat is now unsuitable within the BSA. | The build alternatives would have no effect on this species. There is no designated critical habitat for this species. |

| Common Name | Scientific Name | Status Federal/ State | General Habitat Description | Habitat Present or Absent/ Species Observed | Rationale | Finding of Effect |
|---|---|-----------------------|---|---|---|---|
| Western snowy plover (coastal population) | <i>Charadrius alexandrinus nivosus</i> | FT, BCC/CSC (nesting) | Sandy beaches and dry mud or salt flats, Washington to western Mexico. After being extirpated from Los Angeles County for more than 60 years, breeding was recently documented on protected beaches of Santa Monica Bay. | A | No nesting habitat remains within the BSA, but occasional visitors are seen along the lower Los Angeles River. | The build alternatives would have no effect on this species or on the designated critical habitat for the species. |
| Scripp's murrelet | <i>Synthliboramphus scrippsi</i> | FC, BCC/CT (nesting) | Pelagic. Nests on islands off the coasts of Southern California and northwest Mexico, and generally ranges at sea in the vicinity. | A | No oceanic waters within the BSA. | The build alternatives would have no effect on this species or on the designated critical habitat for the species. |
| California least tern | <i>Sternula antillarum browni</i> | FE/CE, CFP (nesting) | Nests along the coast from San Francisco Bay to northern Baja California. Colonial breeder on bare or sparsely vegetated, flat substrates. Winters primarily off the Pacific coast of northern South America. | P | Nests at Terminal Island in Los Angeles Harbor and forages regularly in estuarine portions of the Los Angeles River. Recent sightings upstream have included juveniles and/or family groups foraging at Willow St., I-405, and off-channel ponds at the Dominguez Gap Wetlands. | The build alternatives may affect, but are not likely to adversely affect this species with implementation of the avoidance, minimization, and mitigation measures. There is no designated critical habitat for this species. |
| Western yellow-billed cuckoo | <i>Coccyzus americanus occidentalis</i> | FT, BCC/CE | Breeds and nests in extensive stands of dense cottonwood and willow riparian forest along broad, lower flood bottoms of larger river systems. Widespread but local in western North America; very rare and local in California. Winters in South America. | A | Formerly a fairly common nesting species within the BSA, but no suitable habitat remains. | The build alternatives would have no effect on this species. There is no designated critical habitat for this species. |

| Common Name | Scientific Name | Status Federal/ State | General Habitat Description | Habitat Present or Absent/ Species Observed | Rationale | Finding of Effect |
|--------------------|------------------------------|-----------------------|--|---|---|---|
| Willow flycatcher | <i>Empidonax traillii</i> | BCC/CE (nesting) | Breeds primarily in moist, brushy thickets and riparian woodland (especially with willow) across much of temperate North America; winters in Central and South America. The southwestern willow flycatcher (<i>E. t. extimus</i>) is a rare and local breeder in the southwestern United States and northwestern Mexico. | A | The southwestern willow flycatcher was once a common nesting species along the lower Los Angeles River, but the population is much reduced and suitable habitat for nesting now appears to be absent within the BSA. The subspecies <i>E. t. brewsteri</i> is an uncommon migrant along the lower Los Angeles River. | The build alternatives would have no effect on this species. There is no designated critical habitat for this species. |
| Least Bell's vireo | <i>Vireo bellii pusillus</i> | FE/CE (nesting) | Formerly occurred in well-established riparian areas from north-central California to Baja California. Now absent from northern portions of its range, but populations in Southern California are growing in response to intense management efforts. Winters primarily in western Mexico. | A | Formerly common along the lower Los Angeles River, but recent habitat restoration projects adjacent to the river have resulted in the establishment of more suitable nesting habitat for least Bell's vireo. Has recently been recorded at DeForest Park and the ponds south of Del Amo St. in Long Beach in the winter and spring. Although there are currently no available records of least Bell's vireo nesting in the area, suitable habitat is expanding and improving, and it is reasonable to expect that the species may begin nesting within or adjacent to the project area for the build alternatives in the near future. | The build alternatives may affect, but are not likely to adversely affect this species with implementation of the avoidance, minimization, and mitigation measures. There is no designated critical habitat for this species. |
| Bank swallow | <i>Riparia riparia</i> | -/CT (nesting) | Nests locally in near-vertical river banks, primarily in temperate regions around the northern hemisphere; winters primarily in the tropics. | A | Nested historically in the Los Angeles Basin, but now believed to be extirpated as a nesting species in Los Angeles County. Scarce transient in recent years, mainly in the late summer and early fall. | The build alternatives would have no effect on this species. There is no designated critical habitat for this species. |

| Common Name | Scientific Name | Status Federal/ State | General Habitat Description | Habitat Present or Absent/ Species Observed | Rationale | Finding of Effect |
|--------------------------------|--|-----------------------|--|---|--|--|
| Coastal California gnatcatcher | <i>Poliophtila californica californica</i> | FT/CSC | Inhabits CSS in low-lying foothills and valleys in cismontane southwestern California and northwestern Baja California. | A | Recorded three times in recent years along the lower Los Angeles River, but suitable CSS habitat is no longer present within the BSA. | The build alternatives would have no effect on this species or on the designated critical habitat for the species. |
| Belding's Savannah sparrow | <i>Passerculus sandwichensis beldingi</i> | -/CE | Coastal salt marshes from Santa Barbara County to northern Baja California. | A | Nested historically within the lower reaches of the Los Angeles River, but suitable nesting habitat is now absent. | The build alternatives would have no effect on this species. There is no designated critical habitat for this species. |
| Tricolored blackbird | <i>Agelaius tricolor</i> | BCC/CT | Open country in western Oregon, California, and northwestern Baja California. Nests primarily in freshwater marshes. | A | Formerly nested in the vicinity of the BSA but has not been known to do so for many years. Still occurs as a nonbreeding visitor in the area (e.g., one was observed along the lower Los Angeles River on August 8, 2008). | The build alternatives would have no effect on this species or on the designated critical habitat for the species. |
| MAMMALS | | | | | | |
| Pacific pocket mouse | <i>Perognathus longimembris pacificus</i> | FE/CSC | Historically occupied open habitats on sandy soils along the coast from Los Angeles to the Mexican border. Now known from only four sites in Orange and San Diego Counties. | A | Collected from Wilmington in 1865 and probably occurred in the vicinity of the BSA at that time. Not recorded on the shores of San Pedro Bay since. | The build alternatives would have no effect on this species. There is no designated critical habitat for this species. |
| Lesser long-nosed bat | <i>Leptonycteris yerbabuenae</i> | FD/CSA | Occurs in Sonoran desert scrub, semi-desert grasslands, and lower oak woodlands from Arizona and New Mexico to El Salvador, and has been recorded in southwestern California. Frugivorous and nectivorous; highly associated with plants such as agave, saguaro, and ocotillo as a source of food. Roosts in caves and mines; not known to use | A | Foraging and roosting habitat is not present within the BSA. There are no known records in the vicinity of the BSA. | The build alternatives would have no effect on this species or on the designated critical habitat for the species. |

| Common Name | Scientific Name | Status Federal/ State | General Habitat Description | Habitat Present or Absent/ Species Observed | Rationale | Finding of Effect |
|---------------------------------------|--------------------------------|-------------------------------------|--|---|--|---|
| | | | bridges for roosting. Capable of migrating long distances. | | | |
| California sea lion | <i>Zalophus californianus</i> | -/- protected under the MMPA | Occurs in Pacific coastal marine waters from Vancouver Island to the Galapagos Islands. | P, O | Rare in the BSA but occasionally forages downstream in estuarine portions of the Los Angeles River. An individual was seen in September 2009 during wildlife surveys north of Pacific Coast Hwy. | Due to the infrequent presence of this species in the BSA, the build alternatives may affect but are not likely to adversely affect this species. |
| Guadalupe fur seal | <i>Arctocephalus townsendi</i> | FT/CT, CFP protected under the MMPA | Tropical waters of the Southern California/ Mexico region. Non-migratory and their breeding grounds (rocky habitats and caves) are almost entirely on Guadalupe Island, Mexico. Small populations off of Southern California at San Miguel Island. | A | Included on the NMFS species list for the project alternatives (NES, Appendix A). Highly unlikely to occur within the BSA or in offshore waters. | The build alternatives would have no effect on this species or on the designated critical habitat for the species. |
| Blue whale | <i>Balaenoptera musculus</i> | FE/- protected under the MMPA | Worldwide, from sub-polar to sub-tropical latitudes. Found in coastal waters, but are thought to occur generally more offshore than other whales. Forages off California coast in summer. | A | Included on the NMFS species list for the project alternatives (NES, Appendix A). May occasionally occur in offshore waters from the BSA, but is not expected to occur within the BSA. | The build alternatives would have no effect on this species. There is no designated critical habitat for this species. |
| Fin whale | <i>Balaenoptera physalus</i> | FE/- protected under the MMPA | Deep, offshore waters of all major oceans, primarily in temperate to polar latitudes, and less commonly in the tropics. | A | Included on the NMFS species list for the project alternatives (NES, Appendix A). May occasionally occur in offshore waters from the BSA, but is not expected to occur within the BSA. | The build alternatives would have no effect on this species. There is no designated critical habitat for this species. |
| Humpback whale - Central American DPS | <i>Megaptera novaeangliae</i> | FE/- protected under the MMPA | Uses the waters (Pacific Ocean) of Central America for the purpose of breeding and reproduction, but migrates off the coast of California in summer/fall to feeding areas. | A | Included on the NMFS species list for the project alternatives (NES, Appendix A). May occasionally occur in offshore waters from the BSA, but is not expected to occur within the BSA. | The build alternatives would have no effect on this species or on the designated critical habitat for the species. |

| Common Name | Scientific Name | Status Federal/ State | General Habitat Description | Habitat Present or Absent/ Species Observed | Rationale | Finding of Effect |
|--------------------------------|-------------------------------|-------------------------------|--|---|---|--|
| Humpback whale - Mexico DPS | <i>Megaptera novaeangliae</i> | FT/- protected under the MMPA | Uses the waters (Pacific Ocean) of Mexico for the purpose of breeding and reproduction, but migrates off the coast of California in summer/fall to feeding areas. | A | Included on the NMFS species list for the project alternatives (NES, Appendix A). May occasionally occur in offshore waters from the BSA, but is not expected to occur within the BSA. | The build alternatives would have no effect on this species or on the designated critical habitat for the species. |
| Southern resident killer whale | <i>Orcinus orca</i> | FE/- protected under the MMPA | Most abundant in colder waters, but also occur, though at lower densities, in tropical, subtropical, and offshore waters. | A | Included on the NMFS species list for the project alternatives (NES, Appendix A). Per Caltrans correspondence with NMFS, this species is extremely unlikely to occur as far south as the BSA. This species is not expected to occur within the BSA. | The build alternatives would have no effect on this species or on the designated critical habitat for the species. |
| North Pacific right whale | <i>Eubalaena japonica</i> | FE/- protected under the MMPA | Primarily polar and sub-polar regions of the Pacific Ocean, though sightings have been reported as far south as central Baja California in the eastern North Pacific. They primarily occur in coastal or shelf waters, although movements over deep waters are known. Migratory patterns of the North Pacific right whale are unknown, although it is thought the whales spend the summer on high-latitude feeding grounds and migrate to more temperate waters during the winter. | A | Included on the NMFS species list for the project alternatives (NES, Appendix A). May occasionally occur in offshore waters from the BSA, but is not expected to occur within the BSA. | The build alternatives would have no effect on this species. There is no designated critical habitat for this species. |

I-710 Corridor Project Final EIR/EIS

| Common Name | Scientific Name | Status Federal/ State | General Habitat Description | Habitat Present or Absent/ Species Observed | Rationale | Finding of Effect |
|-------------|-------------------------------|-------------------------------|---|---|--|--|
| Sei whale | <i>Balaenoptera borealis</i> | FE/- protected under the MMPA | Prefer subtropical to subpolar waters on the continental shelf edge and slope worldwide. Usually observed in deeper waters of oceanic areas far from the coastline. | A | Included on the NMFS species list for the project alternatives (NES, Appendix A). May occasionally occur in offshore waters from the BSA, but is not expected to occur within the BSA. | The build alternatives would have no effect on this species. There is no designated critical habitat for this species. |
| Sperm whale | <i>Physeter macrocephalus</i> | FE/- protected under the MMPA | Temperate to tropical waters in deep waters typically far from land. | A | Included on the NMFS species list for the project alternatives (NES, Appendix A). May occasionally occur in offshore waters from the BSA, but is not expected to occur within the BSA. | The build alternatives would have no effect on this species or on the designated critical habitat for the species. |

Source: LSA Associates, Inc. *I-710 Corridor Project Natural Environment Study* (June 2017).

Habitat Present/Absent: Absent (A) - no habitat present and no further work needed. Habitat Present (P) – habitat is, or may be present. (O) – Based on the literature review and field surveys, the species has been observed within the BSA.

Status: Federal Endangered (FE); Federal Threatened (FT); Federal Proposed Threatened (FPT); Federal Candidate (FC); Federally Delisted (FD); United States Fish and Wildlife Service Birds of Conservation Concern (BCC); California Endangered (CE); California Threatened (CT); California Delisted (CD), California Fully Protected Species (CFP); California Species of Special Concern (CSC); California Special Animal (CSA)

BSA = biological study area

CSS = coastal sage scrub

DPS = Distinct Population Segment

EFH = Essential Fish Habitat

ESU = Evolutionarily Significant Unit

I-405 = Interstate 405

MMPA = Marine Mammal Protection Act

MSA = Magnuson-Stevens Fishery Conservation and Management Act

NES = Natural Environment Study

NMFS = National Marine Fisheries Service

The potential for this species to occur in the Los Angeles River is considered very low. No critical habitat has been designated for the green sea turtle outside of the Caribbean Basin.

WESTERN SNOWY PLOVER (COASTAL POPULATION)

The coastal population of the western snowy plover is Federally listed as a threatened species and is a California Species of Special Concern. The coastal population of western snowy plover nests along the coast from Washington to northwestern Mexico. Snowy plovers nested on the coast of Los Angeles County through at least 1949 but were then extirpated. Successful nesting was first documented again in 2017. Occasional non-breeding visitors are seen along the lower Los Angeles River. Critical habitat was designated in 2012. The closest areas so designated are at Hermosa State Beach and Bolsa Chica State Beach.

LEAST BELL'S VIREO

Least Bell's vireo (LBVI) is Federally listed as an endangered species. LBVI formerly occurred in well-established riparian areas from north-central California to Baja California, but is now absent from northern portions of its range. Populations in southern California are growing in response to intense management efforts. LBVI is highly migratory and virtually all LBVI leave California for the winter and are absent from California from October through mid-March. From March through August, the species is found from northern California to northern Baja California Sur. Most of the population winters in southern Baja California Sur. In California, LBVI is generally found in lowland areas west of the mountains and deserts. LBVI is closely associated with lowland riparian habitats during the breeding season but shows somewhat more habitat flexibility on the wintering grounds.

CALIFORNIA LEAST TERN

California Least Tern (CLT) is Federally listed as an endangered species and is State listed as an endangered species. Nesting CLT is also listed as a California Fully Protected species. CLT is a colonial breeder that nests along the coast from San Francisco Bay to Baja California. CLT nests at Terminal Island in the Port of Los Angeles (POLA). Foraging birds regularly visit the Los Angeles River mouth below the Queensway Bridge and occasionally upstream. CLT are rare away from the estuarine portions of the Los Angeles River but have been recorded north to Interstate 5 and in off-channel ponds east of the river. CLT are typically present in California from the first week of April to the first week of September. No critical habitat has been designated for CLT.

3.20.2.2 SPECIES PROTECTED UNDER THE MARINE MAMMAL PROTECTION ACT

The California sea lion (*Zalophus californianus*) is one of the most common and widespread marine mammals along the California coast. The California sea lion is not a Federally listed species or California species of special concern; however, it is protected under the Marine Mammal Protection Act (MMPA) and, therefore, is addressed in regard to potential effects from the I-710 Corridor Project build alternatives.

The California sea lion is occasionally found within the BSA in the lower reaches of the Los Angeles River, primarily south of Ocean Blvd. Individuals occasionally stray upstream as far north as Willow St. (e.g., one was seen by a survey team north of Pacific Coast Hwy. on September 4, 2009), although the generally shallow depth and the lack of haul-out sites (low-lying docks, piers, platforms, or sandy shoreline beaches) limit their occurrence. Haul-out sites are necessary for seals for mating and giving birth, but not all haul-out sites are for reproduction. Other benefits of haul-out sites may include predator avoidance, thermal regulation, social activity, parasite reduction, and rest. There is no critical habitat for this species within the BSA.

3.20.2.3 FISHERIES PROTECTED UNDER THE MAGNUSON-STEVENSON FISHERY CONSERVATION AND MANAGEMENT ACT

Despite the relatively disturbed nature of the Los Angeles River, portions of this river within the BSA still provide habitat for a number of fish species. These fish inhabit Queensway Bay and may occasionally move upstream to tidal and freshwater portions of the Los Angeles River. As explained in more detail in the *Estuarine Resources Environmental Assessment* (Appendix F of the NES), ichthyoplankton (fish eggs and larvae) in the Lower Los Angeles River varies both spatially and seasonally. Species occurring in greatest abundance include gobies (Gobiidae family), northern anchovy (*Engraulis mordax*), slough anchovy (*Anchoa delicatissima*), and white croakers (*Genyonemus lineatus*). Other eggs and larvae occurring in the river include spotted turbot (*Pleuronichthys ritteri*), hornyhead turbot (*Pleuronichthys verticalis*), California lizard fish (*Synodus lucioceps*), and California tonguefish (*Symphurus atricaudus*). Overall, ichthyoplankton species richness and density is higher in the Los Angeles River during the winter, primarily due to an increase in the number of cheekspot goby. There is no critical habitat for any fish species within the BSA.

3.20.2.4 ESSENTIAL FISH HABITAT

Essential Fish Habitat (EFH) includes those waters and substrates necessary to fish for spawning, breeding, feeding, or growth to maturity. For the purpose of interpreting the definition of EFH, “waters” includes aquatic areas and their associated physical, chemical, and biological properties that are used by fish and may include aquatic areas historically used by fish where appropriate; “substrate” includes sediment, hard bottom, structures underlying the waters, and associated biological communities; “necessary” refers to the habitat required to support a sustainable fishery and the managed species contribution to a healthy ecosystem; and “spawning, breeding, feeding, or growth to maturity” covers a species’ full life cycle.

The southernmost extent of the BSA is located within the lower reaches of the Los Angeles River in an area designated as EFH by the NMFS (Erlandson, personal communication, December 14, 2009) for Groundfish, Coastal Pelagic Species, and Highly Migratory Species. An *Estuarine Resources Environmental Assessment* (January 2010) was prepared for the I-710 Corridor Project and can be found in Appendix F of the NES. Previous studies were examined as well.

As a nursery site for numerous fish species, Queensway Bay provides EFH for Coastal Pelagic Species (northern anchovy, Pacific sardine [*Sardinops sagax*], Pacific mackerel [*Scomber japonicus*], and jack mackerel [*Trachurus symmetricus*]) and Pacific Coast Groundfish (leopard shark [*Triakis semifasciata*], spiny dog fish shark [*Squalus acanthias*], and California sculpin [*Clinocottus recalvus*]). These species occasionally use Queensway Bay for reproduction and development and are included in the Pacific Coast Groundfish, Coastal Pelagic Species and Highly Migratory Species Fisheries Management Plans. However, the only one of these species that would be expected to occur within the lower reaches of the Los Angeles River is the northern anchovy. The majority of the anchovy population is expected to occur outside of the BSA in Queensway Bay and San Pedro Bay at depths greater than 12 feet.

3.20.3 ENVIRONMENTAL CONSEQUENCES

The following discussion of environmental consequences only describes the permanent impacts of the project alternatives. Please refer to Section 3.24 of this document, Construction Impacts, for a discussion of the temporary impacts of the project build alternatives for each resource area. Specifically, descriptions of temporary impacts related to threatened and endangered species are located in Section 3.24.3.20, Threatened and Endangered Species.

3.20.3.1 PERMANENT IMPACTS

BUILD ALTERNATIVES

SOUTHERN CALIFORNIA STEELHEAD DPS. Based on available data, steelhead appear to be extirpated from the BSA. Steelhead are large, highly mobile fish and would likely move out of the area if disturbed by construction activities (e.g., pile-driving) related to the build alternatives. Nonetheless, in the unlikely event that steelhead are present in the BSA, implementation of the measures outlined for fish in general should avoid and minimize potential impacts to this species for any build alternative. Alternative 5C may have a greater impact on the habitat (estuarine) within the BSA that could potentially be utilized by this species than Alternative 7. The riverine habitat upstream of the estuarine habitat within the BSA is primarily concrete-lined and does not provide suitable habitat for steelhead. Impacts to estuarine habitat are discussed in Section 3.16, Natural Communities.

GREEN SEA TURTLE. Although no green sea turtles were observed in the BSA, any green sea turtles that might visit the area around the mouth of the Los Angeles River could be affected indirectly by the build alternatives resulting from changes in water quality originating upstream. Such changes could involve increased pollution levels, increased turbidity, or impacts on the sea grasses and algae on which green sea turtles feed. However, by implementing the measures outlined in Section 3.16, Natural Communities, for any build alternative, no noticeable changes in water conditions would occur. There is no critical habitat for this species within the BSA; therefore, no critical habitat would be impacted by the build alternatives.

Alternative 5C may have a greater impact on the habitat (estuarine) within the BSA that could potentially be utilized by this species than Alternative 7. Impacts to estuarine habitat are discussed in Section 3.16, Natural Communities.

Concurrence from the NMFS has occurred through informal consultation with Caltrans as assigned by FHWA pursuant to FESA. As stated in Chapter 5.0, Comments and Coordination, Anthony Spina of the NMFS sent a concurrence letter, dated February 19, 2019, to Paul Caron of Caltrans concurring on Caltrans' determination that the proposed action of the build alternatives may affect, but is not likely to adversely affect endangered Southern California steelhead or threatened East Pacific green turtle and designated critical habitat for these species.

WESTERN SNOWY PLOVER (COASTAL POPULATION). The coastal population of the western snowy plover could be affected indirectly by project-generated changes in water quality associated with the build alternatives. Such changes could involve increased pollution levels, increased turbidity, or impacts on the invertebrates on which they feed. New bridge designs could result in occasional bird strikes. However, by following the measures outlined in Sections 3.16, Natural Communities, and 3.19, Animal Species for any build alternative, no noticeable changes in water conditions or bird strike frequency would occur. There is no critical habitat for this species within the BSA; therefore, no critical habitat would be impacted by the build alternatives.

Due to its larger footprint, Alternative 7 may have a greater impact on habitats within the BSA that are utilized by this species than Alternative 5C. Impacts to these habitats are discussed in Section 3.16, Natural Communities.

As stated in Chapter 5.0, Comments and Coordination, on May 2, 2019, USFWS concurred with Caltrans' determination that the build alternatives are "not likely to adversely affect" the Western snowy plover.

LEAST BELL'S VIREO. LBVI could be impacted by the build alternatives by project-generated noise, vibration, lighting, dust, and changes in riparian scrub habitat within the BSA. Permanent indirect impacts to suitable LBVI habitat could occur to 0.86 acre of riparian scrub. Further, the areas of riparian scrub habitat within the footprint of Alternative 5C (totaling 4.3 acres) are not expected to be occupied by the species as part of a breeding territory due to the fragmented and limited size of such areas, and the locations of these habitat areas adjacent to heavily trafficked urban land uses. Therefore, project-related stressors associated with the build alternatives on LBVI would consist of indirect effects to potentially suitable habitat areas, which would be limited to distinct portions of the BSA that support riparian scrub habitat (e.g., Dominguez Gap and DeForest Park Wetlands, and sparse riparian scrub within the Los Angeles River channel and Compton Creek). The permanent loss of riparian vegetation in certain areas (totaling 0.15 acre) would reduce the available foraging,

dispersing, and cover habitat for LBVI in the BSA; however, riparian habitats within the direct disturbance limits of the build alternatives experience regular disturbance associated with existing traffic and urban land uses, and there are additional areas within the BSA that provide for more suitable, less disturbed habitat.

Stressors associated with Alternative 5C would represent limited temporary and permanent impacts to riparian habitats that were not occupied by LBVI during project surveys. Such minor effects would not appreciably diminish the value of suitable LBVI habitats in the BSA. As stated in Chapter 5.0, Comments and Coordination, on May 2, 2019, USFWS concurred with Caltrans' determination that the build alternatives are not likely to adversely affect LBVI based on the permanent and temporary impacts of the build alternatives being offset by restoration and conservation of habitat approved by the CDFW, which would contribute to the survival and recovery of LBVI. The acreage estimates for LBVI were revised in an amendment to the letter of concurrence, received on August 21, 2019, following further coordination with USFWS staff. Although the acreage estimate was revised, the letter of concurrence did not reduce the impact ratio for LBVI under the build alternatives. As such, for any build alternative, compensatory mitigation would be warranted to reduce adverse effects to LBVI. Since the No Build (Alternative 1) was identified as the Preferred Alternative, compensatory or other mitigation will not be implanted.

CALIFORNIA LEAST TERN. CLT could be affected indirectly by project-generated changes in water quality associated with the build alternatives. Such changes could involve increased pollution levels, increased turbidity, or impacts on the fish on which they feed due to shading. New and heightened bridge structures and increased traffic levels under the build alternatives may result in an increase in bird strikes. However, by following the measures outlined in Sections 3.16, Natural Communities, and 3.19, Animal Species, and any additional measures identified during USFWS consultation, no noticeable changes in water conditions or bird strike frequency would occur for any build alternative. This species is absent from California for more than half of the year. Other than potential long-term impacts on fish populations (CLT's food source), there would be no potential impacts related to the build alternatives when the species is absent. There is no critical habitat for this species within the BSA; therefore, no critical habitat would be impacted by the build alternatives.

Due to its larger footprint, Alternative 7 may have a greater impact on habitats within the BSA that are utilized by this species than Alternative 5C. Impacts to these habitats are discussed in Section 3.16, Natural Communities.

As stated in Chapter 5.0, Comments and Coordination, on May 2, 2019, USFWS concurred with Caltrans' determination that the build alternatives are "not likely to adversely affect" CLT.

SPECIES PROTECTED UNDER THE MARINE MAMMAL PROTECTION ACT. All build alternatives would include the driving of piers/support structures on the following bridges within the lower

Los Angeles River that could affect California sea lions: 7th St. bridge, Anaheim St. bridge, Pacific Coast Hwy. bridge, Hill St. bridge, and Willow St. bridge. A new bridge would be constructed over the lower Los Angeles River at 7th St. and a pedestrian bridge would be added at Hill St., while Anaheim St., Pacific Coast Hwy., and Willow St. would be expanded. Additional details regarding the methods and materials for pile driving (e.g., alignment, size, and height of the elevated structure; duration of construction; use of steel or concrete casings) were unknown at the time the NES was prepared. Typically, design details such as these would not be known for a build alternative until it advances to the final design phase. Nonetheless, the percussive forces generated during any pile-driving activities may result in injury to California sea lions within and adjacent to the BSA where estuarine habitat exists.

The I-710 Corridor Project build alternatives may be able to drive the piles at a sound level less than the threshold that has been identified as harmful to marine mammals such as California sea lions. A sound level below 190 decibels (dB) re 1 micro-Pascal (microPa) root mean square (rms) would not result in a Level A harassment of pinnipeds and the onset of temporary threshold shifts (TTS) in pinniped hearing (NMFS 2003). The driving of the steel piles could exceed the Level A harassment levels if no attenuation methods are implemented. Use of appropriate attenuation methods during pile driving, such as bubble curtains or blocks, is expected to reduce the sound pressure levels below the harassment level.

Construction and expansion of the four bridges in the lower Los Angeles River under the build alternatives would also bring construction personnel and equipment into the area where California sea lions may occur. Although there would be an incremental increase in activity due to bridge construction, the Los Angeles River typically draws large numbers of people engaged in recreational and commercial activities. The temporary presence of construction personnel is not expected to adversely impact sea lions.

Construction and expansion of the four bridges in the lower Los Angeles River under the build alternatives would not alter movement of California sea lions through the channel. While dewatering of the entire Los Angeles River would not occur, some minimal isolation of work (e.g., an air bubble curtain system or air-filled isolation casings around bridge support structures) may be required during bridge construction; this impact would be temporary during the period of pile driving and bridge deck construction. Once the pile driving and bridge construction would be completed for the build alternatives, the bridges would not impede the movement of California sea lions through the channel.

Activity related to the build alternatives on dry land is not expected to impact California sea lions, provided that sediments and construction materials are retained on land and measures are implemented to prevent the movement of soil, concrete, and other construction materials into the Los Angeles River channel. There is no critical habitat for this species within the BSA; therefore, no critical habitat would be impacted by the build alternatives.

Alternative 5C may have a greater impact on the habitat (estuarine) within the BSA that could potentially be utilized by this species than Alternative 7. Impacts to estuarine habitat are discussed in Section 3.16, Natural Communities.

FISHERIES PROTECTED UNDER THE MAGNUSON-STEVENS FISHERY CONSERVATION AND MANAGEMENT ACT. Alternatives 5C and 7 would include driving of piers/support structures in tidal waters across the Los Angeles River at the 7th St., Anaheim St., Pacific Coast Hwy., Hill St., and Willow St. crossings. Furthermore, numerous pilings would be required upstream of tidal waters in the freshwater areas of the Los Angeles River to accommodate improvements to other crossing structures. Relevant information for pile driving, such as alignment, number, size, methods, materials, or duration, could not be determined at the time the NES was prepared. Typically, design details such as these would not be known for a build alternative until it advances to the final design phase. Nonetheless, the percussive forces generated during pile-driving activities may result in injury and death to fish within the impact area. The following analysis is based on the *Technical Guidance for Assessment and Mitigation of the Hydroacoustic Effects of Pile Driving on Fish*, prepared for Caltrans in November 2015. Both the peak sound pressure level and the sound exposure level may result in damage to the auditory tissue of fishes or their temporary hearing loss. Temporary hearing loss occurs at lower levels than auditory tissue damage and is dependent on the size of the fish, with smaller fish being affected at lower levels than larger fish. In addition to the direct impacts of hearing loss and auditory tissue damage, sound levels from pile driving may also result in indirect impacts under the build alternatives, such as the inability to avoid predators or to detect prey and the inability to communicate or detect the environment.

In addition to auditory tissue damage and temporary hearing loss, increased sound levels associated with pile driving under the build alternatives may also affect fish by causing physiological and anatomical damage. Nonauditory tissue damage may include capillary rupture in skin, neurotrauma, eye hemorrhage, swim bladder rupture, and death of individual fish. Such impacts may be the result of single or repeated exposure to elevated sound levels.

Construction of the bridges under the build alternatives may also alter movement of fish through the mouth of the Los Angeles River. While dewatering of the entire Los Angeles River would not occur, some minimal isolation of work (e.g., an air bubble curtain system or air-filled isolation casings around bridge support structures) may be required during bridge construction; this impact would be temporary during the period of pile driving and bridge deck construction. Once the pile driving and bridge construction would be completed for the build alternatives, the bridges would not impede the movement of fish through the channel.

Construction of the I-710 Corridor Project build alternatives on dry land is not expected to impact fish, provided that sediments and construction materials are retained on land and measures are implemented to prevent the movement of soil, concrete, and other construction

materials into the river channel. There is no critical habitat for any fish species within the BSA; therefore, no critical habitat would be impacted by the build alternatives.

Alternative 5C may have a greater impact on the habitat (estuarine) within the BSA that could potentially be utilized by this species than Alternative 7. Impacts to estuarine habitat are discussed in Section 3.16, Natural Communities.

ESSENTIAL FISH HABITAT. The I-710 Corridor Project build alternatives would have a temporary adverse impact on Coastal Pelagic and Groundfish Management Plan Species. The I-710 Corridor Project build alternatives would not permanently impede movement of fish into and out of the Los Angeles River corridor. Construction would have a temporary impact on fish that inhabit the river during pile-driving operations and potential isolated dewatering activities. In addition to the injury and mortality that may result from pile driving and dewatering, pile driving and dewatering would likely make the channel bottom in the vicinity of the bridges unsuitable for fish during these operations. This would be a temporary loss of habitat, and no permanent impacts would occur to the habitat except for a minimal loss of channel bottom where the piles would be placed. In addition, no permanent impacts would occur from dewatering activities, as dewatering materials would be removed upon completion of bridge construction of the build alternatives.

Alternative 5C may have a greater impact on the habitat (estuarine) within the BSA that could potentially be utilized by this species than Alternative 7. Impacts to estuarine habitat are discussed in Section 3.16, Natural Communities.

3.20.3.2 NO BUILD (ALTERNATIVE 1)

Under the No Build (Alternative 1), which has been identified as the Preferred Alternative, the I-710 Corridor Project would not be constructed. There would be no permanent impacts to threatened or endangered species from the No Build (Alternative 1).

3.20.3.3 PUBLIC HEALTH CONSIDERATIONS

No public health considerations were identified with regard to impacts on threatened or endangered species associated with the build alternatives.

3.20.4 AVOIDANCE, MINIMIZATION, AND/OR MITIGATION MEASURES

For any build alternative, the measures described in Section 3.9, Water Quality (WQ-1 through WQ-3); Section 3.16, Natural Communities (NC-1); Section 3.19, Animal Species (AS-1); and Section 3.24, Construction Impacts (specifically, Measures CON-TES-1 through CON-TES-10 in Section 3.24.4.20), would ensure that effects to Southern California steelhead, green sea turtle, the coastal population of western snowy plover, least Bell's vireo, California least tern, California sea lion, and Essential Fish Habitat are absent or minimal from implementation of any of the build alternatives. Per the USFWS, specific compensatory mitigation for the build alternatives would be

warranted and may have been in the form of habitat restoration and/or enhancement in on- or off-site areas where similar habitat exists, or equivalent contribution to a mitigation bank or in-lieu fee program, as stated in Measure CON-TES-10 in Section 3.24.4.21 of this Final EIR/EIS. Because a marine mammal monitor would be on site to stop construction if a marine mammal enters the vicinity of the build alternatives as outlined in Measure CON-TES-2 in Section 3.24, no Incidental Harassment Authorization (IHA) or Letter of Authorization (LOA) would be needed.

However, as the No Build (Alternative 1) was identified as the Preferred Alternative, adverse impacts to threatened and endangered species would not occur, and the adoption of this alternative would not require any avoidance, minimization, and/or mitigation measures.

3.21 INVASIVE SPECIES

This section discusses impacts on the spread of invasive species and is based on the *I-710 Corridor Project Natural Environment Study* (NES) (June 2017).

3.21.1 REGULATORY SETTING

On February 3, 1999, President William J. Clinton signed Executive Order EO 13112 requiring Federal agencies to combat the introduction or spread of invasive species in the United States. The order defines invasive species as “any species, including its seeds, eggs, spores, or other biological material capable of propagating that species, which is not native to that ecosystem whose introduction does or is likely to cause economic or environmental harm or harm to human health.” Federal Highway Administration guidance issued on August 10, 1999, directs the use of the State’s invasive species list currently maintained by the California Invasive Species Council to define the invasive plants that must be considered as part of the National Environmental Policy Act (NEPA) analysis for a proposed project.

3.21.2 AFFECTED ENVIRONMENT

The California Invasive Plant Council (Cal-IPC) 2006 Invasive Plant Inventory is based on information submitted by members, land managers, botanists, and researchers throughout the state as well as published sources. The inventory highlights nonnative plants that are serious problems in wildlands (natural areas that support native ecosystems, including national, state, and local parks, ecological reserves, wildlife areas, national forests, Bureau of Land Management [BLM] lands, etc.). The inventory categorizes plants as High, Moderate, or Limited based on the species’ negative ecological impact in California. Plants categorized as “High” have severe ecological impacts. Plants categorized as “Moderate” have substantial and apparent, but not severe, ecological impacts. Plants categorized as “Limited” are invasive, but their ecological impacts are minor on a statewide level.

A total of 31 exotic plant species occurring on the Cal-IPC Inventory were identified within the Biological Study Area (BSA). Of these species, there are three listed with a High rating, including Hottentot-fig (*Carpobrotus edulis*), giant reed (*Arundo donax*), and pampas grass (*Cortaderia* sp.). Sixteen of the species are listed with a Moderate rating, including poison hemlock (*Conium maculatum*), sticky eupatorium (*Ageratina adenophora*), bull thistle (*Cirsium vulgare*), black mustard (*Brassica nigra*), shortpod mustard (*Hirschfeldia incana*), London rocket (*Sisymbrium irio*), edible fig (*Ficus carica*), tree of heaven (*Ailanthus altissima*), tree tobacco (*Nicotiana glauca*), Mexican fan palm (*Washingtonia robusta*), ripgut brome (*Bromus diandrus*), Bermuda grass (*Cynodon dactylon*), tall fescue (*Festuca arundinacea*), foxtail barley (*Hordeum murinum*), Italian ryegrass (*Lolium multiflorum*), and African fountain grass (*Pennisetum setaceum*). Twelve of the species are listed with a Limited rating, including African brass-buttons (*Cotula coronopifolia*), bristly ox-tongue (*Picris echioides*), wild radish (*Raphanus sativus*), five-hook bassia (*Bassia*

hyssopifolia), Russian thistle (*Salsola tragus*), castor bean (*Ricinus communis*), black locust (*Robinia pseudoacacia*), American pokeweed (*Phytolacca americana*), English plantain (*Plantago lanceolata*), kikuyugrass (*Pennisetum clandestinum*), smilo grass (*Piptatherum miliaceum*), and rabbitfoot grass (*Polypogon monspeliensis*).

3.21.3 ENVIRONMENTAL CONSEQUENCES

The following discussion of environmental consequences only describes the permanent impacts of the project alternatives. Please refer to Section 3.24 of this document, Construction Impacts, for a discussion of the temporary impacts of the project build alternatives for each resource area. Specifically, descriptions of temporary impacts related to invasive species are located in Section 3.24.3.21, Invasive Species.

3.21.3.1 PERMANENT IMPACTS

BUILD ALTERNATIVES. Construction of the I-710 Corridor Project build alternatives would have the potential to spread invasive species by the entering and exiting of construction equipment contaminated by invasives, the inclusion of invasive species in seed mixtures and mulch, and the improper removal and disposal of invasive species so that its seed is spread along the highway. The potential spread of *Caulerpa taxifolia* (a nonnative seaweed) during construction and/or operation of the build alternatives would not be expected because the invasive species was not observed in the BSA during the Estuarine Resources Environmental Assessment surveys. Nevertheless, preventative measures would be taken for the build alternatives to prevent the spread of this species in accordance with the National Marine Fisheries Service (NMFS) Control Protocol. Impacts associated with Alternative 7 would be greater than impacts associated with Alternative 5C, given the larger area of disturbance associated with the freight corridor.

NO BUILD (ALTERNATIVE 1). The No Build (Alternative 1), which has been identified as the Preferred Alternative, would have no effect on the spread of invasive species.

3.21.3.2 PUBLIC HEALTH CONSIDERATIONS

No public health considerations were identified with regard to impacts from the spread of invasive species resulting from the build alternatives.

3.21.4 AVOIDANCE, MINIMIZATION AND/OR MITIGATION MEASURES

Measures CON-INV-1 through CON-INV-3 in Section 3.24.2.1 of this Final EIR/EIS would address invasive species concerns immediately prior to and during construction of the build alternatives. In compliance with EO 13112, the California Department of Transportation (Caltrans) would implement the following measures to address invasive species following completion of construction of any build alternative. However, as the No Build (Alternative 1) was identified as the Preferred Alternative, adverse impacts related to invasive species would not occur, and the

adoption of this alternative would not require any avoidance, minimization, and/or mitigation measures. Avoidance, minimization, and/or mitigation measures pertaining to the two build alternatives are retained in this Final EIR/EIS for disclosure purposes.

IS-1 A weed abatement program would be developed to minimize the importation of nonnative plant material after construction. Eradication strategies would be employed should an increase in invasive plants occur.

At a minimum, this program would include:

- Eradication procedures (e.g., spraying and/or hand weeding) would be outlined should an infestation occur; the use of herbicides would be prohibited within and adjacent to native vegetation, except as specifically authorized and monitored by the Caltrans District Biologist.
- Weed abatement would be targeted for areas that do not contain ruderal native vegetative species such as milkweed.

IS-2 After construction, affected areas adjacent to native vegetation would be revegetated with plant species approved by the California Department of Transportation (Caltrans) District Biologist that are native to the vicinity. Landscape plans prepared by the Caltrans Landscape Architect shall depict plants species and locations proposed for areas to be revegetated, which shall be approved by the District Biologist. All revegetated areas would avoid the use of species listed in the California Invasive Plant Council's (Cal-IPC) California Invasive Plant Inventory that have a high or moderate rating, specifically all variations of ice plants. All revegetated areas would be replanted consistent with the Los Angeles River Master Plan Landscaping Guidelines and Plant Palettes (January 2004) or otherwise consist of the native riparian and upland plants historically present along the Los Angeles River.

This page intentionally left blank

3.22 RELATIONSHIP BETWEEN LOCAL SHORT-TERM-USES OF THE HUMAN ENVIRONMENT AND THE MAINTENANCE AND ENHANCEMENT OF LONG-TERM PRODUCTIVITY

3.22.1 INTRODUCTION

Implementation of the Interstate 710 (I-710) Corridor Project build alternatives would result in attainment of short-term and long-term transportation objectives at the expense of some short-term economic impacts and some long-term social, aesthetic, and land use impacts. The I-710 Corridor Project build alternatives are based on State, regional, and local comprehensive-based planning efforts that consider the need for present and future traffic requirements within the context of present and future transportation and goods movement needs. As an important corridor for goods movement, the I-710 Corridor Project build alternatives would fulfill an integral component of the long-range planning for Los Angeles County and the southern California region.

3.22.2 ENVIRONMENTAL CONSEQUENCES

3.22.2.1 BUILD ALTERNATIVES

Both build alternatives would have similar impacts unless otherwise stated.

Short-term losses and impacts of the I-710 Corridor Project build alternatives would include:

- Economic losses experienced by businesses from relocations or traffic detours.
- Temporary construction impacts to residents and visitors such as increased noise, impaired air quality from dust and debris, increased nighttime light, blocked viewsheds, and motorized and nonmotorized traffic delays or detours.
- Temporary loss of productivity on and near sites used as the temporary construction staging areas.
- Temporary construction impacts to utility services, such as service interruptions or accidental damage to facilities.
- Disruption of recreational activities at Cesar E. Chavez Park due to the reconfiguration of the park to accommodate the improvements under all build alternatives. Disruption of recreational activities at Parque Dos Rios due to partial acquisition and a temporary construction easement (TCE) under Alternative 5C and full acquisition under Alternative 7. Disruption of activities at the Compton Hunting and Fishing Club due to relocation of this property under all build alternatives. Disruption of activities at the Compton Homing Pigeon Club due to relocation of this property under Alternative 7.

Short-term benefits of the I-710 Corridor Project build alternatives would include:

- Increased jobs and revenue generated during construction.

Long-term losses resulting from the I-710 Corridor Project build alternatives would include:

- Permanent impacts to wetlands and natural communities.
- Permanent increase in some air pollutant concentrations at a few locations near the I-710 Corridor.
- Permanent impacts to residents and visitors in some locations as a result of increased noise levels, increased nighttime light, and altered viewsheds.
- Permanent increase in noise levels near the I-710 Corridor.
- Permanent consumption of materials and energy during construction.
- Permanent removal of residential and nonresidential uses and possible permanent loss of those uses in the I-710 Corridor communities if they are not relocated within their existing communities.

Long-term gains of the I-710 Corridor Project build alternatives would include:

- An improvement of the regional transportation network in this part of Los Angeles County.
- Improvement of vehicle, person, and goods movement travel times in the I-710 corridor to more effectively serve existing and future travel demand between the Ports of Los Angeles and Long Beach [Ports] and freeways (Interstate I-405, State Route 91 [SR-91], Interstate 105 [I-105], Interstate 5 [I-5], State Route 60 [SR-60], and Interstate 10 [I-10]), intermodal rail yards, warehouses, and cargo distribution points.
- Improvement to air quality and reduction of public health risk.
- Improvement to motorist, bicyclist, and pedestrian safety as congestion-related accidents would be reduced, sidewalks would be improved, roadway shoulders on arterial overcrossings of I-710 would be improved, and access to bikeways and trails would be maintained.
- Improvements to access and congestion relief on local roadways and highways.
- Economic benefits associated with accommodating future growth in goods movement.
- Improvement to water resources and storm water management facilities due to treatment of surface water runoff that is currently untreated, including surface water and flood plains.
- Provision of abandoned highway rights of way for use at Cesar E. Chavez Park that result in a larger, contiguous park.
- Provision of programmatic funding to area communities for projects intended to improve community health.

3.22.2.2 NO BUILD (ALTERNATIVE 1)

As stated previously in Chapter 2.0 of this Final EIR/EIS, the No Build (Alternative 1), the Preferred Alternative, includes other transportation improvements that are already programmed and/or committed to be constructed by 2035. These programmed and/or committed transportation improvements would provide the benefits of reduced travel times and improved efficiency for the movement of vehicles, people, and goods; however, they would also result in the irreversible/irretrievable commitment of resources. The No Build (Alternative 1) would not result in the construction of the improvements under the I-710 Corridor Project build alternatives. Therefore, the No Build (Alternative 1) would not provide the benefits of the reduced travel times and improved efficiency for the movement of vehicles, people, and goods that would result from implementation of either of the I-710 Corridor Project build alternatives.

3.22.3 CONCLUSIONS

Implementation of the I-710 Corridor Project build alternatives would result in trade-offs between addressing transportation needs and goals (short- and long-term) and adverse environmental impacts (short- and long-term).

The I-710 Corridor Project build alternatives would provide a safer, more efficient, and less congested route for the transportation of people and goods in an area anticipated to experience major goods movement growth. The I-710 Corridor Project build alternatives would provide increased capacity and a separated freight movement corridor (under Alternative 7) to accommodate this growth and provide roadway geometrics to meet State highway design standards.

As discussed in Section 3.5, Traffic and Transportation, the existing roads and intersections in the Study Area will operate at unacceptable levels of service into 2035 without implementation of the I-710 Corridor Project build alternatives. The I-710 Corridor Project build alternatives would serve to improve traffic conditions in the region. The long-term benefits to the community (through transportation improvements) would be weighed against the short-term and long-term environmental impacts of the I-710 Corridor Project build alternatives.

However, as stated above, although the No Build (Alternative 1) would not provide the benefits of the reduced travel times and improved efficiency for the movement of vehicles, people, and goods that would result from implementation of the build alternatives, the No Build (Alternative 1), which has been identified as the Preferred Alternative, does include other transportation improvements that are already programmed and/or committed to be constructed by 2035. These programmed and/or committed transportation improvements would provide some benefits of reduced travel times and improved efficiency for the movement of vehicles, people, and goods; however, they would also result in the irreversible/irretrievable commitment of resources.

This page intentionally left blank

3.23 IRREVERSIBLE AND IRRETRIEVABLE COMMITMENTS OF RESOURCES THAT WOULD BE INVOLVED IN THE PROPOSED PROJECT

3.23.1 BUILD ALTERNATIVES

Construction of the build alternatives involves a commitment of a range of natural, physical, human, and fiscal resources. Land used in the construction of the Interstate 710 (I-710) Corridor Project build alternatives is considered an irreversible commitment during the time period that the land is used for the highway facility. However, if a greater need arises for use of the land or if the highway facility is no longer needed, the land could be converted to another use. There is no reason to believe such a conversion would ever be necessary or desirable for the foreseeable future.

The following irreversible and irretrievable commitments of resources from the physical and natural environment would occur as a result of the build alternatives:

- **Paleontological Resources.** Excavation associated with construction of the build alternatives could encounter paleontological resources. That excavation could result in permanent irretrievable adverse impacts to paleontological resources in the following Holocene to Pleistocene deposits: Young Alluvial Fan and Valley Deposits, Undivided; Young Alluvial Flood Plain Deposits; Old Alluvial Fan Deposits, Undivided; and Old Paralic Deposits, Undivided.
- **Archaeological Resources.** No archaeological resources requiring evaluation were identified through archival research, Native American consultation, or the field survey. However, excavation associated with construction of the build alternatives could encounter archeological resources. That excavation could result in permanent irretrievable adverse impacts to archeological resources. The *Archaeological Sensitivity Study* (February 2017) identifies areas that are more likely to have the potential for previously unrecorded archaeological resources.
- **Estuarine Habitat.** The build alternatives include improvements to bridges that are located within tidal waters which are the same for Alternatives 5C and 7. Alternatives 5C and 7 would result in direct permanent impacts to 0.18 acre and 0.11 acre, respectively, of estuarine habitat (earthen-bottom intertidal portions of the Los Angeles River) due to the construction of abutments and driving of piles, and a reduction in soft-bottom habitat as a consequence of the placement of piers and abutments. In addition to direct permanent impacts, Alternatives 5C and 7 would result in indirect permanent effects to 5.09 acres or 5.02 acres, respectively, of estuarine habitat. Indirect permanent effects would result from permanent shading associated with bridges or elevated roadways. In addition, construction may indirectly affect estuarine habitats permanently through enhancing the germination and proliferation of nonnative invasive plant species.

- **Riparian/Riverine Habitat.** Permanent impacts to riparian/riverine habitats would be greater under Alternative 7 than under Alternative 5C. Alternative 7 would result in direct permanent effects to 10.69 acres and indirect permanent effects to 23.53 acres of riparian/riverine natural communities. Alternative 5C would result in permanent direct impacts to 1.55 acres and permanent indirect impacts to 21.01 acres of riparian/riverine habitats. Therefore, the build alternatives would result in permanent irretrievable adverse impacts to riparian/riverine habitats, although mitigation would be provided to replace this loss.
- **Jurisdictional Waters.** The build alternatives would result in direct and indirect permanent impacts to United States Army Corps of Engineers (USACE)/ Regional Water Quality Control Board (RWQCB) and California Department of Fish and Wildlife (CDFW) jurisdictional waters. Therefore, the build alternatives would result in permanent irretrievable adverse impacts to USACE/RWQCB and CDFW jurisdictional waters, although mitigation would be provided to replace this loss for any of the build alternatives.
- **Construction.** In addition to the commitments of resources from the physical and natural environments, considerable amounts of fossil fuels, labor, public capital, and highway construction materials such as cement, aggregate, bituminous material, and steel would be expended and not retrievable following construction of either build alternative. Additionally, large amounts of labor and natural resources are used in the making of construction materials, and these are generally not retrievable. However, they are not in short supply, and their use would not have an adverse effect upon continued availability of these resources. Construction of the build alternatives would also require a substantial one-time expenditure of public (and possibly private) funds, which would not be retrievable. Savings in travel time, improved transportation system efficiency, and improved public health and safety would offset this use of materials, labor, resources, and funds. In addition to the costs of construction and right-of-way would be the ongoing costs for roadway maintenance, including pavement, roadside litter/sweeping, signs and markers, structural, electrical, and storm maintenance.

The commitment of these resources to the build alternatives enables residents, workers, travelers, and others in the immediate area, region, and state to benefit from the improved quality of the transportation system in Los Angeles County. These benefits would consist of improved air quality, efficiency of goods movement, accessibility, travel time, and safety, the benefits of which would outweigh the commitment of these resources.

3.23.2 NO BUILD (ALTERNATIVE 1)

The No Build (Alternative 1), which has been identified as the Preferred Alternative, would not result in the construction of the improvements under the I-710 Corridor Project build alternatives. Therefore, the No Build (Alternative 1) would not result in the irretrievable commitment of the resources required to construct either build alternative. The No Build (Alternative 1) would also

not provide the benefits of the reduced travel times and improved efficiency for the movement of vehicles, people, and goods that would result from implementation of the build alternatives.

As stated previously in Chapter 2.0 of this Final Environmental Impact Report/Environmental Impact Statement (Final EIR/EIS), the No Build (Alternative 1) includes additional transportation improvements that are already funded and/or committed to be constructed by or before the planning horizon year of 2035. Therefore, there would be irretrievable commitments of resources resulting from these other transportation improvements, but not as a result of the I-710 Corridor build alternatives.

This page intentionally left blank

3.24 CONSTRUCTION IMPACTS

This section describes the construction methods and related types of impacts considered for the build alternatives. Construction methods are the basis for assessing and qualifying the potential environmental impact from construction activities. For any build alternative, these construction methods would be used to prepare, construct, and implement the typical highway and freight corridor improvements that make up the build alternatives.

3.24.1 CONSTRUCTION METHOD APPROACH

This section identifies the types of construction associated with the build alternatives, describes the typical sequence and methods for each type of construction (mainline/interchanges and freight corridor), and discusses potential construction-related impacts.

3.24.1.1 HIGHWAY IMPROVEMENT PROCESS

CONSTRUCTION WORKSITE CHARACTERISTICS. The worksite for a highway capacity improvement project is the existing highway right-of-way and additional right-of-way (including any temporary construction easements) that has been acquired for the improvements. The defining characteristic of this worksite is the need to maintain traffic on the existing highway during construction of the improvement. For any build alternative, during construction, traffic would first be shifted to one side of the existing roadway while the opposite side is improved (e.g., new retaining walls and pavement installed to widen the roadway, barriers installed or replaced), then traffic would be shifted back onto the newly improved portion while the other side is improved. Operational issues associated with construction would require coordination between the Construction Contractors and responsible agencies.

TYPICAL CONSTRUCTION SEQUENCE. The typical construction sequence would be the following:

- Pre-construction activities
- Mobilization and site preparation—Clear any remaining buildings or other improvements from any new right-of-way.
- Initial traffic control phase—Implement a plan for the temporary protection and direction of traffic. The initial traffic control plan phase may include construction of new sound walls along the new edge of the right-of-way.
- Repeat for each traffic control phase—Remove the portions of existing structures; construct the portions of new structures and bridges, existing structure widening, and existing embankment widening or excavations; and widen pavement and install temporary pavement markings. Repeat for the next phase of the traffic control plan.

- Final traffic control plan phase—Construct new wearing surface across entire width of each direction of roadway and install final pavement markings.
- Finishes—Construct elements such as signage and landscaping (this phase may start prior to the final traffic control phase).

PRE-CONSTRUCTION ACTIVITIES. Pre-construction activities would include the following:

- Coordination with affected Interstate 710 (I-710) Corridor cities.
- Develop project aesthetics plan within public participation framework.
- Coordination with utility providers and appropriate potholing and other activities to locate and clearly mark the types and locations of all utility facilities in the disturbance limits.
- Coordination with utility providers on protection in place, relocation, and/or removal of utility facilities in the disturbance limits.
- Execution of detailed soils and geotechnical testing.
- Execution of hazardous waste contamination testing and site remediation, as needed.

MOBILIZATION AND SITE PREPARATION. The key mobilization activity would be to develop a traffic control plan for the temporary protection and direction of traffic. As part of this, coordination with emergency service providers regarding detours and other traffic conditions would be ongoing.

The build alternatives would be expanding the highway right-of-way; therefore, site preparation would include the following:

- Installation of fencing around construction and staging areas.
- Delineation of disturbance limits and any environmentally sensitive areas or other areas to be avoided.
- Clearing, grading, and preparation of the field office location(s) and staging areas.
- Moving construction equipment to the staging areas and around the construction areas.
- Clearing the new right-of-way of conflicting structures, obstructions, and utilities.

The build alternatives would include replacing existing structures and pavement; therefore, an aggregate (pavement) crushing plant to recycle used pavement into new aggregate may be established. The crushing plant would not be mobilized until sufficient material has been removed to allow several months of continuous operation. (If the build alternatives do not

require recycling, the Construction Contractor would dispose of the waste material, either as embankment material or at a disposal site.)

Best management practices (BMPs) would be implemented on an ongoing basis, consistent with the needs for each construction activity.

INITIAL TRAFFIC CONTROL PHASE. Each traffic control phase would shift traffic away from that phase's work zone and would install temporary barriers to protect workers in the work zone from traffic. The shift can use some combination of closed lanes, narrowed lanes, and the pavement shoulder for through traffic.

EARTHWORK. The Construction Contractor would construct the required retaining walls, embankments, and excavations. The design would attempt to balance cut and fill requirements, but severe terrain or urban conditions may require imported fill or exported cut material. If the overall schedule permits, the embankments would be allowed to consolidate for a year or two before pavement is placed on them. The Construction Contractor would route any existing drainage that crosses the alignment through new and extended pipes or box culverts. The Construction Contractor would install inlets and pipes, detention basins, and outfalls for roadway drainage.

STRUCTURES. The Construction Contractor would construct grade separation, drainage, and other bridges or concrete boxes as required.

PAVEMENT. The Construction Contractor would finish grading the new roadbed, install subbase, base rock, and bridge approach slabs, and may pave the new roadway. Any new pavement would drain to the inlets previously constructed. The Construction Contractor would construct any transition sections required. The Construction Contractor would install pavement markings on the completed roadway.

REPEAT FOR EACH TRAFFIC CONTROL PHASE. Subsequent traffic control phases would shift traffic onto the completed portion of the work to create a new work zone. The Construction Contractor would construct/reconstruct the portion of the pavement and structures in the new work zone, then shift the traffic to a new traffic control phase until all new pavement and structures are complete.

FINAL TRAFFIC CONTROL PLAN PHASE. For some roadway widening, when the temporary barrier is removed, the Construction Contractor would overlay a new pavement wearing surface across the entire roadway width. This paving could be done at night, when traffic volumes are reduced, and may take several nights. The Construction Contractor would install temporary pavement markings as the new top layer is installed. The Construction Contractor would install permanent markings after the new pavement has aged for a week.

FINISHES. Construction of the new pavement wearing course and markings may complete the project, or construction may continue with shoulder barriers, signage, and landscaping.

3.24.2 TYPICAL CONSTRUCTION IMPACTS

This section describes construction impacts that are typical to all build alternatives. Temporary impacts to affected resources are described in Section 3.24.3.

- Traffic plan lane closures and lane narrowing would divert more traffic demand than would be added as a result of construction traffic.
- The existing roadway drainage would be disrupted during construction. The Construction Contractor would use silt fences, hay bales, and other measures to control runoff and erosion.
- Roadway widening would generate waste pavement and waste structural concrete that would either be recycled or placed in landfills.
- Most roadway widening activities would not increase the ambient highway noise level. Demolition and pile driving are inherently noisy and would be audible at nearby land uses, but these activities and their associated noise would also be of comparatively short duration compared to the paving activities.
- Much of the work involved in setting up the traffic control phases, demolishing existing structures, and final paving would take place at night, when traffic volumes are less. The night worksites would be illuminated, and the illumination may have an impact on adjacent land uses.
- Roadway projects would generate short-term pollutant noise increases and air emissions (fugitive dust emissions, mobile source emissions and asbestos) (see Section 3.24.3.13 for more detail regarding temporary impacts to air quality¹).

3.24.3 CONSTRUCTION IMPACTS OF THE BUILD ALTERNATIVES ON SPECIFIC RESOURCES

3.24.3.1 LAND USE

The information in this section is based on the following documents:

- *Community Impact Assessment (CIA)* (July 2017)
- *Section 4(f) Evaluation* (July 2017)

¹ Caltrans has not adopted the SCAQMD thresholds for air quality analyses.

Construction of the build alternatives would temporarily affect nearby land uses. Temporary construction impacts would include disruption of local traffic patterns and access to residences and businesses; increased traffic congestion; and increased noise, vibration, and dust. Although some businesses could close or relocate during a prolonged construction period, this impact would be localized and would not likely result in long-term changes in land use.

Table 3.24-1 lists the temporary direct and indirect impacts to parks and recreation facilities by the build alternatives.

Table 3.24-1: Temporary Direct and Indirect Impacts of the Build Alternatives to Park and Recreational Facilities

| Park | Address | Owner/ Operator | Direct or Indirect Impact |
|---------------------------------|---|--------------------|--|
| Cesar E. Chavez Park | 401 Golden Ave. | City of Long Beach | <p>During construction of the build alternatives, parts of Cesar E. Chavez Park may be temporarily closed to public access, to protect the safety of park users and the construction workers. The closed areas would not be used for any construction activities and would be returned to public use in the same or better condition as when the areas were closed off to public access.</p> <p>Also during construction of Alternative 5C and Alternative 7, approximately 21.9 acres of Cesar E. Chavez Park would be required for a TCE (only 19 acres would be exclusively required for the TCE because 2.90 acres of the TCE area would be permanently incorporated), which includes 0.41 acre of land for a detour road in the park during construction of realigned Broadway.</p> <p>Under Alternative 5C and Alternative 7, the removal of the basketball courts west of Cesar E. Chavez Elementary School would be required. However, the basketball courts would be replaced following construction.</p> |
| Wrigley Heights South (Planned) | Along Los Angeles River between Wardlow Rd. and I-405 | City of Long Beach | <p>During construction, the build alternatives would result in temporary impacts to access along Wardlow Rd.; however, for any build alternative, a TMP (see CON-TR-1) would be prepared to minimize access impacts and provide detours and alternate access points. These impacts would cease once construction was complete.</p> |
| Tanaka Park | 1400 W. Wardlow Rd. | City of Long Beach | <p>During construction, the build alternatives would result in temporary impacts to access along Wardlow Rd.; however, for any build alternative, a TMP (see CON-TR-1) would be prepared to minimize access impacts and provide detours and alternate access points. These impacts would cease once construction was complete.</p> |

| Park | Address | Owner/ Operator | Direct or Indirect Impact |
|----------------------------------|--------------------|----------------------------|---|
| The Fitting Studio Golf Facility | 3701 Pacific Pl. | Private | During construction, the build alternatives would result in temporary impacts to access along Pacific Pl.; however, for any build alternative, a TMP (see CON-TR-1) would be prepared to minimize access impacts and provide detours and alternate access points. These impacts would cease once construction was complete. |
| Rancho Rio Verde Riding Club | 1000 W. Carson St. | Private | During construction, the build alternatives have the potential to result in temporary impacts to access on W. Carson St. However, for any build alternative, a TMP (see CON-TR-1) would be prepared to minimize impacts and provide detours. These potential impacts would cease once construction was complete. |
| Coolidge Park | 352 E. Neece St. | City of Long Beach | During construction, the build alternatives would result in temporary impacts to access along Artesia Blvd.; however, for any build alternative, a TMP (see CON-TR-1) would be prepared to minimize access impacts and provide detours and alternate access points. These impacts would cease once construction was complete. |
| Maywood River Park | 5000 Slauson Ave. | City of Maywood | During construction, the build alternatives would result in temporary impacts to access to the park from Slauson Ave.; however, for any build alternative, a TMP (see CON-TR-1) would be prepared to minimize access impacts and provide alternate access points, if necessary. These impacts would cease once construction was complete. |
| Spane Park | 14400 Gundry Ave. | City of Paramount | During construction, the build alternatives would result in temporary impacts to access along Rosecrans Ave.; however, for any build alternative, a TMP (see CON-TR-1) would be prepared to minimize access impacts and provide detours and alternate access points. These impacts would cease once construction was complete. |
| Ralph C. Dills Park | 6500 San Juan St. | City of Paramount | During construction, the build alternatives would result in temporary impacts to access along Rosecrans Ave.; however, for any build alternative, a TMP (see CON-TR-1) would be prepared to minimize access impacts and provide detours and alternate access points. These impacts would cease once construction was complete. |
| Meadows Park | 15753 Gundry Ave. | City of Paramount | During construction, the build alternatives have the potential to result in temporary impacts to access along Alondra Blvd.; however, for any build alternative, a TMP (see CON-TR-1) would be prepared to minimize impacts and provide detours. These potential impacts would cease once construction was complete. |

| Park | Address | Owner/ Operator | Direct or Indirect Impact |
|----------------------------|--|----------------------------------|--|
| Imperial Equestrian Center | 5543 Leeds St., South Gate | Private | During construction, the build alternatives have the potential to result in temporary impacts to access along Imperial Hwy. west of the equestrian center; however, for any build alternative, a TMP (see CON-TR-1) would be prepared to minimize impacts and provide detours. These potential impacts would cease once construction was complete. |
| Parque Dos Rios | Adjacent to Los Angeles River, north of Imperial Hwy., and east of I-710 | Watershed Conservation Authority | During construction, Alternative 5C would require the use of 0.23 acre from this park for a TCE. Also, both build alternatives have the potential to result in temporary impacts to access along Imperial Hwy.; however, for any build alternative, a TMP (see CON-TR-1) would be prepared to minimize impacts and provide detours. These potential impacts would cease once construction was complete. See Appendix B, Section 4(f)/6(f) Evaluation, for more details on impacts at Parque Dos Rios. |
| Bandini Park | 4725 Astor Ave. | City of Commerce | The RDEIR/SDEIS identified a temporary impact to Bandini Park due to an 0.11-acre TCE and temporary closures to the park during construction of either build alternative. Following circulation of the RDEIR/SDEIS and consultation with the City of Commerce, the geometric design of the I-710 mainline in this area was shifted to fit within the right-of-way limits of an aerial easement over Bandini Park that Caltrans had previously acquired. Therefore, the need for any additional aerial easement beyond the existing Caltrans right-of-way was avoided. In order to avoid any TCE within the park, for any build alternative, the Construction Contractor would be prohibited from accessing or otherwise utilizing Bandini Park for staging or construction storage. Construction in this area would be performed from the deck of the overhead structure. Therefore, the build alternatives would no longer result in a direct temporary impact to Bandini Park. This Final EIR/EIS reflects the changes as a result of the redesign, which is included in more detail in Section 2.3.2.2. |
| River Park | River Rd. | City of Cudahy | During construction, both Alternative 5C and Alternative 7 have the potential to result in temporary impacts to access to the park from Clara St.; however, for any build alternative, a TMP (see CON-TR-1) would be prepared to minimize impacts and provide alternative access points, if necessary. These potential impacts would cease once construction was complete. |

| Park | Address | Owner/ Operator | Direct or Indirect Impact |
|------------|----------------|--------------------|--|
| Clara Park | 4835 Clara St. | City of Cudahy | During construction, both Alternative 5C and Alternative 7 have the potential to result in temporary impacts to access to the park from Clara St.; however, for any build alternative, a TMP (see CON-TR-1) would be prepared to minimize impacts and provide alternative access points, if necessary. These potential impacts would cease once construction was complete. |

Source: LSA Associates, Inc. *Community Impact Assessment* (July 2017).

I-710 = Interstate 710

TCE = Temporary Construction Easement

TMP = Transportation Management Plan

The construction of the build alternatives would also result in temporary effects related to access at/around 17 parks and recreational facilities, which would be addressed in the Transportation Management Plan (TMP) and may include detours.

In addition, construction of either of the build alternatives would result in temporary impacts to equestrian, pedestrian and bicyclist access points to regional and local trails and bikeways (including the Los Angeles River Trail and the Rio Hondo Trail), as well as short-term closures of portions of the bikeways located in the vicinity of new and/or modified interchanges where construction activities would occur. Closures would be temporary and could range from a few days to several months in duration, depending on the construction activities at a given trail crossing. Alternative/detour routes for the trails would be provided whenever a closure is needed. While these impacts would cease after completion of construction, measures are provided in Section 3.24.4.1 to minimize impacts and maintain connectivity and access for pedestrians and bicyclists during construction of either of the build alternatives.

3.24.3.2 GROWTH

The information in this section is based on the following documents:

- *Community Impact Assessment* (CIA) (July 2017)
- *I-710 Railroad Goods Movement Study* (2009)
- *Model Input Data and Key Assumptions Technical Memorandum for Goods Movement* (2013)
- *I-710 Travel Demand Modeling Methodology Report* (2017)
- *I-710 EIR/EIS Initial Feasibility Analysis* (2009)

Construction activities related to the build alternatives would occur over an extended time period, and construction of the build alternatives would result in an increase in construction-related (direct and indirect) jobs (see Section 3.3.1 for additional detail). These direct and indirect employee

needs would likely be accommodated by the existing labor pool within the Study Area since the unemployment rate in the Study Area currently ranges from 2.8 percent to 8.1 percent.

While construction of the build alternatives would result in new short-term construction-related employment, it is not likely to result in a temporary influx of people living in the Study Area because the unemployed population within Los Angeles County is anticipated to fill these jobs. The increase in jobs is not substantial enough to be an attractive force to draw workers to the region because the existing construction work force would adequately absorb this job growth, and the induced jobs during the construction period would primarily be met by the supply of unemployed and workers with matching skills in construction and manufacturing that already reside in the Study Area. For purposes of this analysis, it was anticipated that specially-skilled workers may come to the area to work for short periods, but long-term relocation of workers and their families in large numbers was not anticipated. Workers who travel to the area for short periods of time would likely stay in hotels, motels, or other temporary living quarters. Therefore, because of the availability of workers in the local communities, construction of the build alternatives would not increase demand for population or housing in the Study Area and would not result in additional growth-related effects related to population and housing growth.

3.24.3.3 COMMUNITY IMPACTS

The information in this section is based on the following document:

- *Community Impact Assessment (CIA) (July 2017)*

BUILD ALTERNATIVES. Construction of the improvements for the build alternatives is anticipated to result in short-term access disruptions related to construction and therefore result in a short-term impact to community character and cohesion. Table 3.24-2 lists the short-term access disruptions to community facilities by the build alternatives.

In addition, temporary jobs would be created by the construction of the build alternatives. As shown in Table 3.24-3, construction employment has two components, direct and indirect.

The direct component is the number of construction jobs that would be created to complete either of the build alternatives. The indirect component is the additional employment and business activity that would be generated in the regional economy by the initial construction expenditure for either build alternative. Alternative 5C and its options would generate between 34,238 and 35,192 direct and between 65,647 and 67,475 indirect construction jobs, for a total of between 99,855 and 102,667 construction jobs. These construction jobs would generate temporary employment and revenues for both the local and regional economies. Alternative 7 and its options would generate the highest number of temporary jobs, for a total of between 175,842 and 179,180 construction jobs.

Table 3.24-2: Temporary Direct and Indirect Impacts of the Build Alternatives to Community Facilities

| Facility | Address | Owner/ Operator | Direct or Indirect Impact |
|--|-----------------------------|------------------------------------|---|
| Richard N. Slawson Southeast Occupational Center | 5500 Rickenbacker Rd., Bell | LAUSD | During construction, the I-710 Corridor Project build alternatives have the potential to result in temporary impacts to access along Rickenbacker Rd.; however, for any build alternative, a TMP (see CON-TR-1) would be prepared to minimize impact and provide detours. These potential impacts would cease once construction was complete. |
| Atlantic Library | 2269 Atlantic Blvd. | City of Commerce | During construction, the I-710 Corridor Project build alternatives have the potential to result in temporary impacts to access along Atlantic Blvd.; however, for any build alternative, a TMP (see CON-TR-1) would be prepared to minimize impact and provide detours. These potential impacts would cease once construction was complete. |
| Whaley Middle School | 14401 S. Gibson Ave. | Compton Unified School District | During construction, the I-710 Corridor Project build alternatives have the potential to result in temporary impacts to access along Rosecrans Ave.; however, for any build alternative, a TMP (see CON-TR-1) would be prepared to minimize impacts and provide detours. These potential impacts would cease once construction was complete. |
| Dominguez High School | 15301 S. San Jose Ave. | Compton Unified School District | During construction, the I-710 Corridor Project build alternatives have the potential to result in temporary impacts to access along Alondra Blvd.; however, for any build alternative, a TMP (see CON-TR-1) would be prepared to minimize impacts and provide detours. These potential impacts would cease once construction was complete. |
| Kelly Elementary School | 2320 E. Alondra Blvd. | Compton Unified School District | During construction, the I-710 Corridor Project build alternatives have the potential to result in temporary impacts to access along Alondra Blvd.; however, for any build alternative, a TMP (see CON-TR-1) would be prepared to minimize impacts and provide detours. These potential impacts would cease once construction was complete. |
| Walton Middle School | 901 W. Greenleaf Dr. | Compton Unified School District | During construction, the I-710 Corridor Project build alternatives have the potential to result in temporary impacts to access along Greenleaf Dr.; however, for any build alternative, a TMP (see CON-TR-1) would be prepared to minimize impacts and provide detours. These potential impacts would cease once construction was complete. |
| El Camino College Compton Center | 1111 E. Artesia Blvd. | Compton Community College District | During construction, the I-710 Corridor Project build alternatives have the potential to result in temporary impacts to access along Artesia Blvd.; however, for any build alternative, a TMP (see CON-TR-1) would be prepared to minimize impacts and provide detours. These potential impacts would cease once construction was complete. |

| Facility | Address | Owner/ Operator | Direct or Indirect Impact |
|--------------------------------------|--------------------------------|--------------------|--|
| Church of Christ | 2301 E. Alondra Blvd., Compton | Private | During construction, the I-710 Corridor Project build alternatives have the potential to result in temporary impacts to access along Alondra Blvd.; however, for any build alternative, a TMP (see CON-TR-1) would be prepared to minimize impacts and provide detours. These potential impacts would cease once construction was complete. |
| New Brighter Day Baptist Church | 1911 E. Alondra Blvd., Compton | Private | During construction, the I-710 Corridor Project build alternatives have the potential to result in temporary impacts to access along Alondra Blvd.; however, for any build alternative, a TMP (see CON-TR-1) would be prepared to minimize impacts and provide detours. These potential impacts would cease once construction was complete. |
| The Girls' and Boys' Town of Compton | 15116 S. Gibson Ave., Compton | Private | During construction, the I-710 Corridor Project build alternatives have the potential to result in temporary impacts to access along Gibson Ave.; however, for any build alternative, a TMP (see CON-TR-1) would be prepared to minimize impacts and provide detours. These potential impacts would cease once construction was complete. |
| Ellen Ochoa Learning Center | 5027 Live Oak St. | LAUSD | During construction, the I-710 Corridor Project build alternatives have the potential to result in temporary impacts to access along Florence Ave; however, for any build alternative, a TMP (see CON-TR-1) would be prepared to minimize impacts and provide detours. These potential impacts would cease once construction was complete. |
| Fire Station No. 3 | 1222 Daisy Ave. | City of Long Beach | During construction, the build alternatives have the potential to result in temporary impacts to access along Anaheim St.; however, for any build alternative, a TMP (see CON-TR-1) would be prepared to minimize impacts and provide detours. These potential impacts would cease once construction was complete. |
| Fire Station No. 11 | 160 E. Market St. | City of Long Beach | During construction, the I-710 Corridor Project build alternatives have the potential to result in temporary impacts to access along Long Beach Blvd.; however, for any build alternative, a TMP (see CON-TR-1) would be prepared to minimize impacts and provide detours. These potential impacts would cease once construction was complete. |
| Fire Station No. 12 | 6509 Gundry Ave. | City of Long Beach | During construction, the build alternatives have the potential to result in temporary impacts to access along Willow St.; however, for any build alternative, a TMP (see CON-TR-1) would be prepared to minimize impacts and provide detours. These potential impacts would cease once construction was complete. |

| Facility | Address | Owner/ Operator | Direct or Indirect Impact |
|---|----------------------------------|--------------------|--|
| Fire Station No. 13 | 2475 Adriatic Ave. | City of Long Beach | During construction, build alternatives have the potential to result in temporary impacts to access along Artesia Blvd.; however, for any build alternative, a TMP (see CON-TR-1) would be prepared to minimize impacts and provide detours. These potential impacts would cease once construction was complete. |
| Long Beach West Division Police Station | 1835 Santa Fe Ave. | City of Long Beach | During construction, the build alternatives have the potential to result in temporary impacts to access along Pacific Coast Hwy.; however, for any build alternative, a TMP (see CON-TR-1) would be prepared to minimize impacts and provide detours. These potential impacts would cease once construction was complete. |
| Cesar Chavez Elementary School | 730 W. 3 rd St. | LBUSD | The school is not located adjacent to the I-710 mainline, and improvements to the downtown area would not result in direct impacts to this school. Under both build alternatives, temporary construction impacts would occur at the adjacent Cesar Chavez Park, with which the elementary school has a joint use agreement. Additionally, for any build alternative, depending on the details of the joint use agreement, it may be necessary for the City of Long Beach and the LBUSD to amend the agreement based on the reconfigured park. See Appendix B, Section 4(f)/6(f) Evaluation, for more details on impacts at Cesar Chavez Park. for any build alternative, a TMP (see CON-TR-1) would be prepared to minimize impacts at the park that may have indirect impacts on this school. |
| Zion Evangelical Church | W. 14 th St. | Private | During construction, the build alternatives have the potential to result in temporary impacts to access along Anaheim St.; however, for any build alternative, a TMP (see CON-TR-1) would be prepared to minimize impacts and provide detours. These potential impacts would cease once construction was complete. |
| Foursquare Church | 17 th St. | Private | During construction, the build alternatives have the potential to result in temporary impacts to access along Pacific Coast Hwy.; however, for any build alternative, a TMP (see CON-TR-1) would be prepared to minimize impacts and provide detours. These potential impacts would cease once construction was complete. |
| Long Beach Bible Institute | 455 E. Artesia Blvd., Long Beach | Private | During construction, Alternative 5C would have the potential to result in temporary impacts to access along Artesia Blvd.; however, for any build alternative, a TMP (see CON-TR-1) would be prepared to minimize impacts and provide detours. These potential impacts would cease once construction was complete. |

I-710 Corridor Project Final EIR/EIS

| Facility | Address | Owner/ Operator | Direct or Indirect Impact |
|-------------------------------------|--------------------------|------------------------------------|---|
| Fire Station No. 3 | 930 S. Eastern Ave. | Los Angeles County Fire Department | During construction, the I-710 Corridor Project build alternatives (Options 3A and 3B), have the potential to result in temporary impacts to access to Eastern Ave. and Whittier Blvd.; however, for any build alternative, a TMP (see CON-TR-1) would be prepared to minimize impacts and provide alternative access points, if necessary. These potential impacts would cease once construction was complete. |
| Lynwood High School | 4050 Imperial Hwy. | LUSD | During construction, the build alternatives have the potential to result in temporary impacts to access along Imperial Hwy.; however, for any build alternative, a TMP (see CON-TR-1) would be prepared to minimize impacts and provide detours. These potential impacts would cease once construction was complete. |
| Lynwood Adult Education School | 4050 Imperial Hwy. | LUSD | During construction, the build alternatives have the potential to result in temporary impacts to access along Imperial Hwy.; however, for any build alternative, a TMP (see CON-TR-1) would be prepared to minimize impacts and provide detours. These potential impacts would cease once construction was complete. |
| Heliotrope Avenue Elementary School | 5911 Woodlawn Ave. | LAUSD | During construction, the build alternatives have the potential to result in temporary impacts to access along Slauson Ave.; however, for any build alternative, a TMP (see CON-TR-1) would be prepared to minimize impacts and provide detours. These potential impacts would cease once construction was complete. |
| Maywood Elementary School | 5200 Cudahy Ave. | LAUSD | During construction, the build alternatives have the potential to result in temporary impacts to access along Slauson Ave.; however, for any build alternative, a TMP (see CON-TR-1) would be prepared to minimize impacts and provide detours. These potential impacts would cease once construction was complete. |
| Apostolic Christian Church | Located along Alamo Ave. | Private | During construction, the build alternatives have the potential to result in temporary impacts to access along Slauson Ave.; however, for any build alternative, a TMP (see CON-TR-1) would be prepared to minimize impacts and provide detours. These potential impacts would cease once construction was complete. |
| Zamboni Middle School | 15733 Orange Ave. | PUSD | During construction, the build alternatives have the potential to result in temporary impacts to access along Alondra Blvd.; however, for any build alternative, a TMP (see CON-TR-1) would be prepared to minimize impacts and provide detours. These potential impacts would cease once construction was complete. |

| Facility | Address | Owner/ Operator | Direct or Indirect Impact |
|----------------------------|---------------------|------------------------------------|---|
| Fire Station 54 | 4867 Southern Ave. | Los Angeles County Fire Department | During construction, the build alternatives have the potential to result in temporary impacts to access along Firestone Blvd. and Southern Ave., northwest and west of the fire station; however, for any build alternative, a TMP (see CON-TR-1) would be prepared to minimize impacts and provide detours. These potential impacts would cease once construction is complete. |
| Fire Station 57 | 5720 Gardendale St. | Los Angeles County Fire Department | During construction, the I-710 Corridor Project build alternatives have the potential to result in temporary impacts to access along Imperial Hwy., and Garfield Ave. north of the fire station; however, for any build alternative, a TMP (see CON-TR-1) would be prepared to minimize impacts and provide detours. These potential impacts would cease once construction was complete. |
| Hollydale Community Church | 11801 Utah Ave. | Private | During construction, the I-710 Corridor Project build alternatives have the potential to result in temporary impacts to access along Imperial Hwy. which is north of this place of worship, and Garfield Ave., which is south of this place of worship; however, for any build alternative, a TMP (see CON-TR-1) would be prepared to minimize impacts and provide detours. These potential impacts would cease once construction was complete. |

¹ Capital construction costs from AECOM (Draft Project Report, April 2017). Amount does not include right-of-way or support costs.

² ARTBA estimates every \$1 billion invested in highways supports 27,823 jobs, including 9,537 on-site construction jobs, 4,324 jobs in supplier industries, and 13,962 jobs throughout the rest of the economy.

ARTBA = American Road and Transportation Builders Association

I-710 = Interstate 710

For any build alternative, a TMP, as described in Chapter 2.0 and Section 3.24.4.5, would also be implemented for either build alternative in a cost-efficient and timely manner with minimal interference to the traveling public. The TMP would minimize construction-related traffic delay by the effective application of traditional traffic mitigation strategies and innovative combinations of public and motorist information, demand management, incident management, system management, alternative route strategies, construction strategies, and other strategies.

Additionally, temporary construction impacts would occur under each build alternative and would occur for property owners whose properties are fully acquired and require relocation. These property owners would be temporarily impacted during the relocation process. Relocated individuals and businesses would be temporarily impacted by the act of moving. Although eligible moving expenses would be reimbursed, the physical act of moving would be an inconvenience for residents and employees. Tasks associated with moving include the physical act of packing, unpacking, and setting up in a new residence or business, transferring of utilities and change-of-address tasks, and the act of getting accustomed and acclimated to a new neighborhood (in the event residents and/or businesses must be relocated outside of their existing neighborhoods).

Relocated business owners would likely have several additional administrative-related duties with regard to the act of relocation, as well as non-monetary effects like short-term potential loss of goodwill. These may include notification to the Franchise Tax Board, Internal Revenue Service, Employment Development Department, clients, and banks of the business' changed address,

updating of letterheads and/or business cards, coordination of the transport of specialized equipment, and other similar items.

Lastly, construction activities would temporarily affect environmental justice populations. Temporary construction impacts would include disruption of local traffic patterns and access to residences and businesses, increased traffic congestion, and increased noise, vibration and dust. However, construction activities would provide jobs, which would benefit local economies that include minority and low-income populations.

3.24.3.4 UTILITIES/EMERGENCY SERVICES

The information in this section is based on the following documents:

- *Utility Impacts Report* (November 2011)
- *North Utility Study Final Draft Preliminary Strategies Report* (September 2016)
- *Utility Relocation Strategies Report, Central Segment* (June 2016)
- *South End Utility Study* (November 2016)
- *Community Impact Assessment (CIA)* (July 2017)

BUILD ALTERNATIVES. Regarding emergency services, some adverse effects on fire protection and law enforcement protection service providers within the Study Area would occur under construction phases of either Alternative 5C or Alternative 7. There are nine fire stations and two police stations that are located within 0.5 mile of the build alternative improvements. The fire stations, which are within 0.5 mile of the build alternative improvements, include five stations in the City of Long Beach, one station in the community of East Los Angeles, two stations in the City of South Gate, and one station in the City of Vernon. The police stations, which are within 0.5 mile of the build alternative improvements, include two stations in the City of Long Beach.

The following describes impacts associated with both of the build alternatives (Alternative 5C and Alternative 7) relating to fire stations and police stations located within 0.5 mile of the build alternative improvements.

CITY OF LONG BEACH

- **FIRE STATION NO. 1 (100 MAGNOLIA AVE.)** – This fire station is not located adjacent to the I-710 mainline, and the build alternatives would not result in direct or indirect impacts to this fire station.
- **FIRE STATION NO. 3 (1222 DAISY AVE.)** – This fire station is not located adjacent to the I-710 mainline, and improvements to Anaheim St. under either build alternative would not result in direct impacts to this fire station. During construction, the I-710 Corridor build alternatives have the potential to result in temporary impacts to access along Anaheim

St.; however, for any build alternative, a TMP would be prepared to minimize impacts and provide detours. These impacts would occur only during construction.

- **FIRE STATION NO. 11 (160 E. MARKET ST.)** – This fire station is not located adjacent to the I-710 mainline, and improvements to Long Beach Blvd. under either build alternative would not result in direct impacts to this fire station. However, during construction, the I-710 Corridor build alternatives have the potential to result in temporary impacts to access along Long Beach Blvd. For any build alternative, a TMP would be prepared to minimize impacts and provide detours. These impacts would occur only during construction.
- **FIRE STATION NO. 12 (6509 GUNDRY AVE.)** – This fire station is not located adjacent to the I-710 mainline, and improvements to Willow St. under either build alternative would not result in direct impacts to this fire station. During construction, the I-710 Corridor build alternatives have the potential to result in temporary impacts to access along Willow St.; however, for any build alternative, a TMP would be prepared to minimize impacts and provide detours. These impacts would occur only during construction.
- **FIRE STATION NO. 13 (2475 ADRIATIC AVE.)** – This fire station is not located adjacent to the I-710 mainline, and improvements to Artesia Blvd. under either build alternative would not result in direct impacts to this fire station. During construction, the I-710 Corridor build alternatives have the potential to result in temporary impacts to access along Artesia Blvd.; however, for any build alternative, a TMP would be prepared to minimize impacts and provide detours. These impacts would occur only during construction.
- **LONG BEACH SOUTH DIVISION – POLICE STATION (400 W. BROADWAY ST.)** – This police station is not located adjacent to the I-710 mainline, and build alternative improvements would not result in direct or indirect impacts to this fire station.
- **LONG BEACH WEST DIVISION – POLICE STATION (1835 SANTA FE AVE.)** – This police station is not located adjacent to the I-710 mainline, and improvements to Pacific Coast Hwy. under either build alternative would not result in direct impacts to this station. During construction, the I-710 Corridor build alternatives have the potential to result in temporary impacts to access along Pacific Coast Hwy.; however, for any build alternative, a TMP would be prepared to minimize impacts and provide detours. These impacts would occur only during construction.

COMMUNITY OF EAST LOS ANGELES

- **FIRE STATION NO. 3 (930 S. EASTERN AVE.)** – Improvements to the I-710 mainline under the build alternatives would not result in direct impacts to this fire station. In addition, this fire station is not located along arterials impacted as a result of the I-710 Corridor Project build alternatives. Therefore, the I-710 Corridor Project build alternatives would not result in direct impacts to this fire station. During construction, the I-710 Corridor build alternatives have the potential to result in temporary impacts to Eastern Ave. and Whittier Blvd., however, for any build alternative, a TMP would be prepared to minimize impacts

and provide alternative access points, if necessary. These potential impacts would occur only during construction.

CITY OF SOUTH GATE

- **FIRE STATION NO. 54 (4867 SOUTHERN AVE.)** – This fire station is not located adjacent to the I-710 mainline, and improvements to Southern Ave. under either build alternative would not result in direct impacts to this fire station. During construction, the I-710 Corridor build alternatives have the potential to result in temporary impacts to access along Firestone Blvd. and Southern Ave.; however, for any build alternative, a TMP would be prepared to minimize impacts and provide detours. These impacts would occur only during construction.
- **FIRE STATION NO. 57 (5720 GARDENDALE ST.)** – This fire station is not located adjacent to the I-710 mainline, and improvements to Imperial Hwy. and Garfield Ave. under either build alternative would not result in direct impacts to this fire station. During construction, the I-710 Corridor build alternatives have the potential to result in temporary impacts to access along Imperial Hwy. and Garfield Ave.; however, for any build alternative, a TMP would be prepared to minimize impacts and provide detours. These impacts would occur only during construction.

Regarding utilities, both Alternatives 5C and 7 would result in indirect and temporary impacts to a number of utility providers. There are a total of 71 service providers in the Study Area. These providers include, but are not limited to: Southern California Edison (SCE) and their 220-kilovolt and 66-kilovolt distribution and transmission lines; Verizon Business and Time Warner fiber optic and cable utility lines; twelve-duct sets of underground AT&T lines; as well as several other utility types and providers. The build alternatives would require various relocations of utility alignments. Impacts associated with these relocations would include traffic disruption during construction, the need for construction staging areas and temporary construction easements, the reconstruction of city streets from trenching, and the presence of construction equipment and dump trucks during construction. For any build alternative, these impacts would be minimized with implementation of the TMP discussed below in Measure CON-TR-1 in Section 3.24.4.

- **ALTERNATIVE 5C.** Construction activities that require closures of travel lanes and ramps under Alternative 5C could generally result in traffic delays that could affect the ability of fire, law enforcement, and emergency service providers to meet response time goals within the Study Area. Because specific construction staging plans had not been developed at the time this document was prepared, details regarding the location of or duration of traffic delays due to lane closures or ramp closures beyond those discussed above are not available.

- **ALTERNATIVE 7.** Construction activities that require closures of travel lanes and ramps would also occur under Alternative 7. Therefore, the implementation of Alternative 7 could also result in traffic delays that could affect the ability of fire, law enforcement, and emergency service providers to meet response time goals within the Study Area. Because specific construction staging plans had not been developed at the time this document was prepared, details regarding the location of or duration of traffic delays due to lane closures or ramp closures beyond those discussed above are not available.

3.24.3.5 TRAFFIC AND TRANSPORTATION/PEDESTRIAN AND BICYCLE FACILITIES

The information in this section is based on the following documents:

- *Freeway Traffic Operations Analysis Report* (March 2017)
- *Intersection Traffic Impact Analysis Report* (March 2017)

During construction, the build alternatives would result in temporary impacts to traffic circulation due to traffic diversions resulting from temporary closures to local roadways, sidewalks and bikeways, and freeway lanes and ramps. As is typical with major highway improvements, many of the details of the construction process would be determined during the design phase. An analysis of the potential impacts as a result of the build alternatives to traffic and transportation, including to pedestrian and bicycle facilities, is included in the *Intersection Traffic Impact Analysis Report* (March 2017). The analysis discusses the levels of service that would occur during construction and provides a general description of anticipated ramp closures during construction.

Additionally, an evaluation of damage to the pavement surface on local roadways that could occur due to construction traffic related to the build alternatives would be completed. Increased vehicle trip and the movement of heavy equipment along existing roadways would likely result in increased wear-and-tear to pavement surfaces in the vicinity of the construction area. For any build alternative, new pavement would be provided on local arterials that connect to or cross over (or under) I-710 where such roadways would be directly affected by construction. For those roadways that could be used as temporary detour routes during construction, there was insufficient design and construction information at the time this document was prepared to identify the routing or duration of any such detours.

For any build alternative, a detailed TMP would be developed during the design phase with input from stakeholders and would be implemented to construct the project in a cost-efficient and timely manner with minimal interference to the traveling public. It would address traffic safety and control needs throughout the work zone and define strategies to minimize effects of constructing either of the build alternatives. Further detail, including traffic detours, approximate timelines for construction activities, and specifics related to ramp closures during construction would be included. The TMP would also address changes in pedestrian and bicycle circulation and provide

measures to minimize the adverse effects of construction activities on pedestrian and bicycle travel within the Study Area.

3.24.3.6 VISUAL/AESTHETICS

The information in this section is based on the following documents:

- *I-710 Corridor Project Visual Impact Assessment (VIA) (February 2017)*
- *I-710 Corridor Aesthetics Master Plan (February 2014)*

ALTERNATIVE 5C. Short-term visual impacts under Alternative 5C would occur to sensitive viewers during the construction period and would include views of demolition of existing structures, clearing of existing vegetation, grading of cut-and-fill slopes, construction of the I-710 widening and structures, construction vehicles, and construction staging areas. Types of viewers considered to have a more sensitive viewer response to highway projects include highway neighbors. This viewer group involves a large number of viewers that varies from residents, students, travelers on local streets, users on bicycle trails and other recreational facilities, and employees and visitors in commercial, industrial, and transportation businesses. Sensitive viewers adjacent to construction activity would experience elevated visual impacts, including light and glare effects if artificial lighting is used during construction. Construction activities are temporary, and the adverse visual impacts related to construction activity would cease after completion of construction. The effects of vegetation clearing would gradually improve over time as landscaping for the matures.

ALTERNATIVE 7. Short-term visual impacts under Alternative 7 would include similar effects as described above under Alternative 5C, but would also include construction of the freight corridor. As the freight corridor would be an elevated structure for the majority of the corridor, visual impacts would be greater during construction than those of Alternative 5C due to the more extensive amount of construction activities and a longer duration of construction.

3.24.3.7 CULTURAL RESOURCES

The information in this section is based on the following technical reports:

- *Supplemental Historic Property Survey Report (April 2017)*
- *Supplemental Historical Resources Evaluation Report (April 2017)*
- *Supplemental Archaeological Survey Report (February 2017)*

Impacts to cultural resources may result from construction of any of the build alternatives. Impacts to cultural resources are considered permanent, not temporary, as discussed in Section 3.7 and in Chapter 4.0, CEQA.

3.24.3.8 HYDROLOGY AND FLOODPLAIN

This section is based on the following documents:

- *Flood Control Facilities Report* (January 2017)
- *Water Quality Assessment Report for the Interstate 710 Corridor Project* (March 2017)
- *Preliminary On-Site Hydrology Report* (December 2016)

ALTERNATIVE 5C. Construction equipment would be operated within the Los Angeles River and Compton Creek 100-year floodplains during construction of the bridge and levee improvements under Alternative 5C as discussed under permanent impacts in Section 3.8. Under this build alternative, following the completion of construction activities within the 100-year floodplain, the disturbed area would be returned to the existing condition.

Construction activities related to Alternative 5C would have the potential to impact the natural and beneficial values of the Los Angeles River and Compton Creek by impacting water quality and jurisdictional waters. As discussed in Section 3.24.3.9, potential impacts to water quality could occur during construction of Alternative 5C due to increased erosion or accidental spills. However, for any build alternative, BMPs, including erosion control measures, would be implemented during the construction of Alternative 5C to reduce impacts to water quality. In addition, as discussed in Section 3.24.3.17, prior to clearing or construction, highly visible barriers (such as orange construction fencing, stakes, or flags) would be installed around riparian/riverine vegetation to be preserved that would minimize impacts to jurisdictional waters during construction. Therefore, with the measures presented in Sections 3.24.4.9 and 3.24.4.17, construction of Alternative 5C would not result in short-term adverse impacts to natural and beneficial floodplain values.

ALTERNATIVE 7. The temporary impacts discussed above under Alternative 5C would be applicable to floodplain impacts to the Los Angeles River, Compton Creek, and the Rio Hondo Channel under Alternative 7. However, because more improvements within the 100-year floodplain are proposed under Alternative 7 than under Alternative 5C, a greater area of the floodplain would be temporarily impacted for a longer duration under Alternative 7. Temporary construction impacts that are unique to Alternative 7 would occur to the Atlantic Blvd. on-ramp to northbound I-710 within the Los Angeles River floodway. Under Alternative 7, erosion control measures and BMPs similar to those described above for Alternative 5C would reduce impacts to water quality in similar ways when implemented under Alternative 7.

3.24.3.9 WATER QUALITY AND STORMWATER RUNOFF

This section is based on the following document:

- *Water Quality Assessment Report* (March 2017)

ALTERNATIVE 5C. Evaluation of construction impacts focus on the effects to existing water quality associated with stormwater runoff from the construction site. This construction work involves the removal of the existing structures and construction of the new highway alignments and related improvements. The construction phase of Alternative 5C has the potential to impact the present and future water quality of the receiving waters through the transport of pollutants and mobilization of construction equipment within waterways. The primary impact locations having the greatest risk to water quality are areas at or adjacent to the highway and stormwater discharge points. This includes working on structures that are located within the Los Angeles River channel.

Events such as the accidental discharge of waste products produced during construction are of primary concern. Pollutants can range from trash left on the structures to petroleum hydrocarbons that have spilled in active construction areas and construction staging areas. Equipment that is operated in the vicinity of the channels within the construction area may leak petroleum compounds and contaminate areas of the work site. In addition, staging areas utilized for the fueling of equipment also are subject to this risk. Other concerns for discharge of hazardous materials that might degrade water quality include areas set aside for the cleaning of equipment over the course of the construction period. Elevated levels of pH as well as suspended and dissolved solids are water quality parameters of concern.

Construction sites tend to disturb soil and promote erosion of channel banks. The maximum total disturbed soil area for Alternative 5C would be 1,424 acres. Under Design Options 1A, 2A, and 3A, the disturbed soil area would consist of 1,524.2 acres, 1,518.6 acres, and 1,521.8 acres, respectively. At some locations, the beds and banks of the affected channel structures would be modified during construction of replacement bridges. Additionally, although the Los Angeles River and related channels are currently concrete-lined, soil erosion from nearby areas could allow for the transport of solid material through surface runoff into the channels, increasing total suspended solid (TSS) levels.

Alternative 5C would require the partial removal and demolition of some existing structures. Alternative 5C would have some construction over and adjacent to the local water bodies and would disturb existing channel bottom sediments. Any construction work within the channel areas would likely result in sediment resuspension and dispersal into the water column of the channels. However, under Alternative 5C, work within any channels would be limited to non-flood season as much as practicable. Additionally, coordination with the National Weather Service and the USACE regarding storm and flood events would occur. A safety plan for flood events would be in place, including plans for evacuation of personnel and equipment in the event of storm flows or an anticipated storm event.

For the entire length of the Alternative 5C improvements, two primary levels of construction would occur: heavy construction that would disturb sediment (such as excavation of the channel bottom or foundation demolition) and light construction with minimal resuspension effects (e.g., pile

driving for the erection of false work). Regardless of the type of construction activities, some resuspension of fine-grained bottom sediments would occur.

Under Alternative 5C, construction activities within the Los Angeles River channel would include the following:

- Excavation of existing channel levees
- Demolition of existing bridge structures
- Installation of cofferdams and/or shoring
- Pile driving within the existing channel or tidal waters
- Securing of floating work platforms to the existing channel bottom
- Erection of construction forms
- Placement of structural concrete
- Finishing of bridge structures, including painting, sandblasting, and cleanup

As required by the Construction General Permit, a Risk Level Determination of 2 was developed for each segment or subsegment. The sediment risk was calculated to be *medium* and the receiving water risk level was determined to be *low* for the Los Angeles River Reach 2 and *high* for the Los Angeles River Reach 1, the Los Angeles River Estuary, and Dominguez Channel based on the information regarding TMDL and beneficial uses in the Caltrans Water Quality Planning Tool. The Risk Determination Spreadsheet was used to calculate the combined risk level for each segment and subsegment of Alternative 5C using the found information. Therefore, the combined risk level for Alternative 5C was determined to be Risk Level 2. The construction activity under Alternative 5C that has the greatest potential to impact groundwater would involve the removal and disposal of groundwater during the excavation required for the structural I-710 foundations. Under Alternative 5C, the construction of support structures may require the use of either the cast-in-drilled-hole (CIDH) or cast-in-steel-shell (CISS) methods. In the CIDH method, a hole would be drilled, filled with slurry to prevent cave-ins, and then pumped with concrete (which displaces the slurry and is reused). In areas of high groundwater, the hole would passively fill with groundwater, which would be removed prior to filling the hole with slurry and concrete (i.e., dewatering). The removed groundwater would then be disposed of according to the selected method. This construction activity would not affect groundwater movement because of the use of slurry to prevent caving and groundwater movement. The amount of dewatering necessary would be determined by the Construction Contractor's method of construction and relative groundwater elevation.

Under Alternative 5C, applicable construction site BMPs would be incorporated into the construction documents, including temporary soil stabilization, sediment and tracking control, and waste management. Groundwater removed during dewatering operations would be disposed of

off-site at approved locations or treated on site and incorporated into the grading operations. These requirements are specified in the measures provided in Section 3.24.4.9, below.

With the incorporation of the proposed site-specific BMPs during the construction phase of Alternative 5C, no adverse impacts to water quality due to construction would occur.

ALTERNATIVE 7. Water quality impacts during construction of Alternative 7 would be similar to those discussed above under Alternative 5C. However, temporary water quality impacts would be greater because more improvements are proposed under Alternative 7; therefore, there would be more disturbed soil area and more work within and adjacent to the water bodies within the corridor. The disturbed area under Alternative 7 would consist of 1,640.7 acres, and under Design Options 1B and 3B, the disturbed soil area would consist of 1,730.2 acres and 1,738.7 acres, respectively. Design Option 7ZE would not change construction practices and, therefore, would feature the same disturbed soil area as Alternative 7.

3.24.3.10 GEOLOGY/SOILS/SEISMIC/TOPOGRAPHY

The information in this section is based on the following documents:

- *Geotechnical Final Report* (January 2010)
- *Geotechnical Memorandum* (Department of Transportation Division of Engineering Services, Geotechnical Service, May 2010) (for the northern portion of the Study Area)
- *Water Quality Assessment Report* (WQAR) (March 2017) (referenced for evaluating temporary erosion-related impacts)

BUILD ALTERNATIVES. Temporary impacts are related to construction activities. Each of the build alternatives would alter existing landforms due to grading and construction activities. Construction activities may also temporarily disturb soil outside the facility footprint, but within the right-of-way for the build alternatives, primarily in the trample zone around work areas, heavy equipment traffic areas, and material laydown areas. Temporary impacts would include soil compaction and increased possibility of soil erosion.

During construction of either build alternative, excavated soil would be exposed, and there would be an increased potential for soil erosion compared to existing conditions. Additionally, during a storm event, soil erosion could occur at an accelerated rate. For any build alternative, worker safety hazards resulting from erosion during construction activities would be minimized with implementation of the requirements outlined in the General Construction Permit and the erosion and sediment control BMPs identified in the Storm Water Pollution Prevention Plan (SWPPP). Either build alternative would be required to adhere to the requirements of the General Construction Permit and implement erosion and sediment control BMPs specifically identified in a project SWPPP in order to keep sediment from moving off site into receiving waters. Refer to

Section 3.24.3.9 for additional information regarding construction-related water quality issues and mitigation.

Construction activities for the build alternatives could be impacted by ground motion from seismic activities if an earthquake were to occur during construction. Additionally, in the event of a seismic event, liquefaction could occur as a result of shallow groundwater mixing with surface soils. For any build alternative, implementation of safe construction practices and compliance with California Department of Transportation (Caltrans) and California Division of Occupational Safety and Health Administration (Cal-OSHA) requirements would minimize any impacts to worker safety during construction activities.

These temporary impacts would occur for both of the build alternatives, but would be greater under Alternative 7 due to the freight corridor component of that alternative.

3.24.3.11 PALEONTOLOGY

The information in this section is based on the following document:

- *Paleontological Resources Identification and Evaluation Report* (June 2017)

BUILD ALTERNATIVES. Direct impacts to paleontological resources would result from construction of any of the build alternatives but not from operation of the facility itself. Impacts to paleontological resources are considered permanent, not temporary, as discussed in Section 3.11 of this Final Environmental Impact Report/Environmental Impact Statement (Final EIR/EIS).

3.24.3.12 HAZARDOUS WASTE/MATERIALS

The information in this section is based on the following document:

- *Initial Site Assessment (ISA)* (March 2017)

BUILD ALTERNATIVES. Hazardous materials may be encountered during excavation and construction activities for both Alternative 5C and Alternative 7. Any contamination encountered during construction and excavation activities for the build alternatives would be properly handled, removed, remediated, and/or disposed of according to all applicable regulations. For these reasons, implementation of the build alternatives would not increase public health risks related to hazardous waste and materials in the short term and would decrease these risks in the long term as a result of the cleanup and remediation of any hazardous waste contamination on properties that would be acquired for the build alternatives.

To ensure that no risk is posed to construction workers and the general public during construction, any property acquired would be free of hazardous wastes prior to the start of construction for either build alternative. Thus, for any build alternative, each property acquired would require

testing in order to characterize specific soil and/or groundwater contaminants on the property. If contaminated soils and/or groundwater contaminants are identified through site characterization, then a site-specific hazardous waste remediation plan would be developed for the appropriate removal and disposal of contaminated soil and/or groundwater. In addition, a remediation plan and site closure plan, if required, would be implemented to clean up the site and provide for any subsequent monitoring of the site to ensure that the contamination has been remediated below environmental regulatory thresholds.

Contamination may be encountered during construction and excavation activities at those properties that require additional remediation; residual contamination may be encountered during construction and excavation activities at those properties that have received regulatory agency closure; and waste materials may be encountered during construction and excavation activities at those properties that operated as waste disposal sites. Specifically, relocation of several railroad lines near Washington Blvd. would be required as part of both build alternatives. For any build alternative, sampling for contaminants commonly found in association with railroads would be conducted as total petroleum hydrocarbons, lead, and arsenic are likely to be present at levels that would require action once the soil is encountered or moved. During grading or excavation within the railroad right-of-way, hazardous concentrations of the contaminants listed above could be released into the environment and affect construction workers.

For any build alternative, a soil investigation would be conducted prior to any soil excavation. The purpose of the investigation would be to assess the potential presence of hazardous contaminants and to determine disposal options if necessary for the contaminated soil. The soil investigation would consist of an aerially deposited lead (ADL) investigation (along I-710) and investigation for other contaminants of concern due to impacts from adjoining properties. Considering the history and nature of activities conducted at some of the sites located within the ISA study area, contaminated groundwater may be encountered during construction. Dewatering of contaminated groundwater during construction of both Alternatives 5C and 7 could impair adjacent surface waters. For any build alternative, a groundwater evaluation would be conducted to determine the location of any groundwater contamination.

Site investigations would be undertaken on all hazardous materials sites within the right-of-way for either of the build alternatives to determine whether hazardous materials are present on site. Hazardous material spills associated with any acquired property would be removed and remediated prior to construction of either of the build alternatives.

Elevated concentrations of ADL may be present along existing roadways that would be modified by either of the build alternatives. During grading activities, there would be a possibility that hazardous concentrations of ADL could be released into the environment and affect construction workers. For any build alternative, a soil investigation would be conducted to determine the extent of ADL-contaminated soils adjacent to I-710.

Structures that would be removed or modified as part of either of the build alternatives could contain asbestos-containing materials (ACM), polychlorinated biphenyls (PCBs), and/or lead-based paint (LBP), which could be released into the environment if not properly handled and removed for disposal. For any build alternative, a predemolition survey for ACM and LBP would be conducted to determine the presence of ACM and LBP materials within structures to be demolished.

Preliminary findings regarding utilities that may be potentially impacted by the build alternatives including their relocation strategies can be found in the various utility studies and Section 3.4 of this Final EIR/EIS. These utilities include petroleum pipelines that would require relocation and/or would be exposed during construction of either build alternative. Based on the presence and contents of these pipelines, it is likely that during relocation and/or construction, impacts to the subsurface could be encountered. Impacts to the subsurface encountered from these pipelines would be the responsibility of the pipeline owner.

Any transformers that would be removed or relocated during construction of either of the build alternatives would be considered PCB-containing unless labeled or tested otherwise. Leaking transformers that impact adjacent soils would be a concern during construction because they could affect construction workers and the environment.

Yellow traffic stripe and pavement-marking materials (paint, thermoplastic, permanent tape, and temporary tape) that would be removed as part of either build alternative could contain elevated concentrations of metals such as lead. Removal of these materials during construction could affect construction workers and the surrounding environment. For any build alternative, yellow tape and paint would be tested for metals, such as lead, prior to removal and disposal.

California Government Code 4216 requires that any operator or excavator call Underground Services Alert of California ("DigAlert") two working days before any planned excavation by dialing 811. Delineation of the proposed excavation area is mandatory. The area to be excavated should be marked with water soluble or chalk-based white paint on paved surfaces or with other suitable markings such as flags or stakes on unpaved areas prior to calling DigAlert.

After Alternative 5C was initially identified as the Preferred Alternative, prior to identification of the No Build (Alternative 1) as the Preferred Alternative, and Alternative 5C's subsequent elimination from consideration after the 2017 Recirculated Draft EIR/EIS public circulation (refer to Chapter 2.0, Alternatives, for additional details), supplemental file reviews for ten parcels within the right-of-way to be acquired for the build alternatives, and nine adjacent parcels, were conducted to assess the presence of hazardous materials from the past and present site operations and remedial actions. The file reviews were documented in the *Preliminary Initial Site Assessment Supplemental File Review* (February 2019). Further evaluation of the high- and medium-risk sites identified in this supplemental report is recommended (conducting of a Preliminary Site Investigation [PSI]). For any build alternative, a Parcel Specific ISA including

detailed site reconnaissance¹, interviews, and a subsequent Phase II parcel-specific site investigation would be conducted prior to the completion of the right-of-way acquisition phase for either of the build alternatives.

Previously unknown contaminants could be encountered at the properties to be acquired as part either of the build alternatives due to poor housekeeping, improperly stored chemicals, or past spills. If not handled properly, these contaminants could affect construction workers and the surrounding environment.

ALTERNATIVE 5C. Hazardous materials may be encountered during excavation and construction activities for Alternative 5C.

The database review identified 118 site listings associated with the parcels within Alternative 5C, 17 of which would pose a potential environmental concern during construction of Alternative 5C. Seven of these sites had on-line file information available for review; the remaining ten listings identified for Alternative 5C required additional information (i.e., file review) to evaluate potential impacts to Alternative 5C, due to the lack of information available in the agency database reports.

During the file review, the following listings were found to be sites of significant concern/high environmental risk:

- Parcels #06101, #06102, #06103
- Parcels #15233, #15231, and #15232
- Parcels #18218–#18226 and #18243–#18268
- Parcel #19116

During the file review, the following listings were found to be sites of medium environmental risk:

- Parcels #12220 and #12221
- Parcel #14448
- Parcel #15234
- Parcel #40105

¹ As part of the ISA, in May and June 2016, a visual windshield survey of the majority of the parcels within the ISA Study Area was conducted along the I-710 Corridor. Access to the properties was not permitted; therefore, observations were made from public rights-of-way and/or other publicly accessible areas. However, since observations were made from rights-of-way and/or other publicly accessible areas, conditions have the potential to exist on the site that were not visible at the time of the windshield survey.

- Parcel #40106
- Parcel #15235

During the database review, ten solid waste sites were identified within or potentially within the proposed Alternative 5C disturbance limits. These sites are previously discussed in Table 3.12-5 in Section 3.12, Hazardous Waste/Materials. Waste materials may be encountered during construction and/or excavation activities at those properties that operated as waste disposal sites and therefore, these sites are considered to be sites of potential environmental concern.

ALTERNATIVE 7. Temporary impacts during construction of Alternative 7 would be similar to those discussed above for Alternative 5C. However, different database sites of potential environmental concern would be encountered during construction of Alternative 7. During the database review, 126 listings were identified that were associated with the parcels within Alternative 7. Of these listings, 19 sites were identified and considered to represent an environmental concern to the disturbance limits during construction under Alternative 7. However, online agency file review information was only available for ten of the 19 sites. Additional review of information in agency files was required to evaluate potential impacts to Alternative 7 from the remaining nine sites.

During the file review, the following listings were found to be sites of significant concern/high environmental risk:

- Parcels #06101, #06102, and #06103.
- Parcels #15233, #15231, and #15232
- Parcel #19116
- Parcel #18218
- Parcels #18218, #18219–#18226, and #18243–#18266

During the file review, the following listings were found to be sites of medium environmental risk:

- Parcels #12220 and #12221
- Parcel #14448
- Parcel #15234
- Parcel #15235

A total of 32 adjoining properties of known or potential concern were identified during the agency database review, and could be impacted during construction of either of the build alternatives. Information is available in on-line databases for 15 of these 32 listed sites. The remaining 17 adjoining properties identified during the agency database review are also considered to have the potential to create an environmental concern to either of the build alternatives. For any build

alternative, additional information would be required (i.e., file review) to determine the potential impact from these 17 adjoining properties, which include the following:

- 970 Chester Pl., Long Beach
- 620 San Francisco Ave., Long Beach
- 1250 West 7th St., Long Beach
- 929 West Anaheim St., Long Beach
- 702 West Anaheim St., Long Beach
- 960 De Forest Ave., Long Beach
- 100 West Victoria St., Long Beach
- 1500 Hughes Way, Long Beach
- 19402 Susana Rd., Compton
- 157 East Stanley St., Compton
- 2820 East Alondra Blvd., Compton
- 6300 Alondra Blvd., Paramount
- 5211 Southern Ave., South Gate
- 9510 Garfield Ave., South Gate
- 4000 East Washington Blvd., City of Commerce
- 4400 Washington Blvd., City of Commerce
- 1365 South Eastern Ave., City of Commerce

3.24.3.13 AIR QUALITY

CONSTRUCTION IMPACTS. The information in this section is based on the following document:

- *Air Quality, Greenhouse Gas, and Health Risk Assessment Technical Study (AQ/GHG/HRA Technical Study) (June 2017)*

During construction of either build alternative, short-term degradation of air quality may occur due to the release of particulate emissions (airborne dust) generated by excavation, grading, hauling, and other activities related to construction. Emissions from construction equipment would also occur and would include carbon monoxide (CO), nitrogen oxide (NO_x), volatile organic compounds (VOCs), particulate matter less than ten microns in diameter (PM₁₀), particulate matter less than 2.5 microns in diameter (PM_{2.5}), and toxic air contaminants such as diesel particulate matter (DPM). Ozone is a regional pollutant that is derived from NO_x and VOCs in the presence of sunlight and heat.

Site preparation and roadway construction of either build alternative would involve clearing, cut-and-fill activities, grading, removing or improving existing roadways, and paving roadway surfaces. Construction-related effects on air quality from most highway projects would be greatest during the site preparation phase because most engine emissions are associated with the excavation, handling, and transport of soils to and from the site. If not properly controlled, these activities would temporarily generate PM₁₀, PM_{2.5}, and small amounts of CO, sulfur dioxide (SO₂), NO_x, and VOCs. Sources of fugitive dust would include disturbed soils at the construction site and trucks carrying uncovered loads of soils. Unless properly controlled, vehicles leaving the site would deposit mud on local roadways, which could be an additional source of airborne dust after it dries. PM₁₀ emissions would vary from day to day, depending on the nature and magnitude of construction activity and local weather conditions. PM₁₀ emissions would depend on soil moisture, silt content of soil, wind speed, and the amount of equipment operating. Larger dust particles would settle near the source, while fine particles would be dispersed over greater distances from the construction site.

According to the conceptual construction schedule used to develop the construction emissions analysis for the build alternatives, some of the conceptual construction phases would take more than five years to complete. However, construction of either build alternative would not occur at any one location for more than five years. Therefore, construction-related emissions may be considered temporary; subsequently, any construction-related PM_{2.5} and PM₁₀ emissions due to the build alternatives were not included in the hot-spot analysis. Either of the build alternatives would comply with the South Coast Air Quality Management District (SCAQMD) Fugitive Dust Rule for fugitive dust during construction. In addition, per the Transportation Conformity Rule, either build alternative would be required to comply with any PM_{2.5} and PM₁₀ control measures in the State Implementation Plan. Therefore, excavation, transportation, placement, and handling of excavated soils would result in no visible dust migration. In addition, for any build alternative, a water truck or tank would be available within the project limits at all times to suppress and control the migration of fugitive dust from earthwork operations.

Construction activities for large development projects are estimated by the United States Environmental Protection Agency (EPA) to add 1.2 tons of fugitive dust per acre of soil disturbed per month of activity. If water or other soil stabilizers are used to control dust, the emissions can be reduced by up to 50 percent. The Caltrans Standard Specifications (Section 18) pertaining to dust minimization requirements require use of water or dust palliative compounds and would reduce potential fugitive dust emissions during construction for any build alternative.

In addition to dust-related PM₁₀ emissions, heavy trucks and construction equipment powered by gasoline and diesel engines would generate CO, SO₂, NO_x, VOCs, and some soot particulate (PM₁₀ and PM_{2.5}) in exhaust emissions. If construction activities were to increase traffic congestion in the area, CO and other emissions from traffic would increase slightly while those vehicles are

delayed. These emissions would be temporary and limited to the immediate area surrounding the construction site.

SO₂ is generated by oxidation during combustion of organic sulfur compounds contained in diesel fuel. Off-road diesel fuel meeting Federal standards can contain up to 5,000 parts per million (ppm) of sulfur, whereas on-road diesel is restricted to less than 15 ppm of sulfur. However, under California law and California Air Resources Board (ARB) regulations (Title 13, California Code of Regulations, [CCR] Sections 2281-2285), off-road diesel fuel used in California must meet the same sulfur and other standards as on-road diesel fuel, so SO₂ related issues due to diesel exhaust resulting from either build alternative would be minimal.

ODORS. Some phases of construction of either build alternative, particularly asphalt paving, would result in short-term odors in the immediate area of paving sites. Such odors would be quickly dispersed below detectable thresholds as distance from the sites increases.

NATURALLY OCCURRING ASBESTOS. The build alternatives are located in Los Angeles County, which is among the counties listed as containing serpentine and ultramafic rock. However, the build alternatives are not located within the region of the County known to contain serpentine or ultramafic rock. Therefore, the impact from naturally occurring asbestos during construction of either build alternative would be minimal to none.

CONSTRUCTION EMISSIONS. As analyzed in the AQ/GHG/HRA Technical Study (2017), the emissions of criteria air pollutants and greenhouse gases from construction activities related to the build alternatives were estimated using a modified version of the Road Construction Emissions Model (Version 8.1.0), developed by Sacramento Metropolitan Air Quality Management District (SMAQMD) (hereafter referred to as the “modified SMAQMD Model”). The model can be used to estimate both vehicle/equipment exhaust and fugitive dust. The methodology used for estimating fugitive dust emissions is a simplified method that is based on the maximum area disturbed per day. The vehicle exhaust emissions are estimated using the equipment activity data and emission factors derived from the ARB OFFROAD and EMFAC2014 model runs. Emission factors for on-road vehicles used in the SMAQMD Model are specific to the Sacramento area. Therefore, these were replaced with emission factors specific to Los Angeles County. Further, the SMAQMD Model stops at calendar year 2025. For any construction years beyond 2025, appropriate emission factors from ARB were incorporated as discussed in Appendix B of the AQ/GHG/HRA Technical Study (2017).

The construction of the build alternatives was analyzed for seven segments (created for preliminary engineering of the build alternatives) along the 18-mile length of the build alternatives. For any build alternative, construction may or may not occur on different segments (or parts of these segments) over the same time interval. However, to have a conservative estimate of maximum daily emissions, construction emissions were calculated for a “worst-case” scenario that assumed, among other things, that construction would occur simultaneously in the seven

segments. Details about the assumptions, method, and results of this “worst-case” construction scenario may be found in Appendix B of the AQ/GHG/HRA Technical Study (2017).

Table 3.24-4 summarize the peak-day emissions of criteria pollutants for both build alternatives for the “worst-case” construction scenario. These emissions would not occur in one location, but would be spread out along the I-710 Corridor among the seven segments. It should be noted that it would be extremely unlikely that the worst-case construction scenario could occur.

Table 3.24-4: Criteria Pollutant Mass Emissions for Construction of the Build Alternatives

| Pollutant | Peak Day (all segments total) (lbs/day) | | Peak Day (maximum single segment) (lbs/day) | | SCAQMD CEQA Threshold (lbs/day) |
|-----------------------------------|---|---------------|---|---------------|--|
| | Alternative 5C | Alternative 7 | Alternative 5C | Alternative 7 | |
| NO _x | 1,200 | 1,200 | 280 | 240 | 100 |
| CO | 1,100 | 1,100 | 220 | 200 | 550 |
| PM ₁₀ (Total) | 680 | 800 | 190 | 240 | 150 |
| PM ₁₀ (Exhaust) | 49 | 47 | 3.8 | 3.6 | - |
| PM ₁₀ (Fugitive Dust) | 630 | 750 | 180 | 240 | - |
| PM _{2.5} (Total) | 180 | 200 | 42 | 53 | 55 |
| PM _{2.5} (Exhaust) | 45 | 42 | 3.4 | 3.3 | - |
| PM _{2.5} (Fugitive Dust) | 130 | 160 | 38 | 50 | - |
| VOC | 120 | 130 | 27 | 25 | 75 |
| SO _x | 2.9 | 2.9 | 0.50 | 0.49 | 150 |

Source: Ramboll-Environ. *Air Quality, Greenhouse Gas, and Health Risk Assessment Technical Study, Appendix B* (June 2017).

Notes: Emissions are from construction equipment/activities related to the build alternatives. Emissions estimates are conservative in that they do not assume use of green construction equipment. Values for exhaust and fugitive dust are not peak values, but represent the constituents of PM₁₀ and PM_{2.5} on the peak day. This analysis conservatively assumed that all seven segments are constructed simultaneously with a maximum single-segment construction duration of 114 months or 10 years). All numbers are rounded to two significant digits.

CEQA = California Environmental Quality Act

CO = carbon monoxide

I-710 = Interstate 710

lbs/day = pounds per day

NO_x = nitrogen oxides

PM_{2.5} = particulate matter less than 2.5 microns in diameter

PM₁₀ = particulate matter less than ten microns in diameter

SCAQMD = South Coast Air Quality Management District

SO_x = sulfur oxides

VOC = volatile organic compound

The single-segment peak-day emissions may be spread out along the entire length of that segment (1.1 to 5.9 miles). Construction phasing and additional mitigation measures, if feasible, would reduce peak-day emissions. Construction minimization measures are discussed in Section 3.24.4.13.

3.24.3.14 NOISE

The information in this section is based on the following documents:

- *Traffic Noise Study Report* (May 2016)
- *Noise Abatement Decision Report* (June 2017)

CONSTRUCTION VIBRATION. Vibration generated by construction equipment can result in varying degrees of ground vibration, depending on the equipment. The operation of construction equipment causes ground vibrations that spread through the ground and diminish in strength with distance. Buildings situated on soil near the active construction area respond to these vibrations, which range from imperceptible to low rumbling sounds with perceptible vibrations and slight damage at the highest vibration levels. Typically, construction-related vibrations do not reach vibration levels that would result in damage to nearby structures. However, old and fragile structures would require special consideration to avoid damage.

The Caltrans *Transportation- and Construction-Induced Vibration Guidance Manual* (Caltrans, September 2013) shows that the vibration damage threshold for continuous/frequent intermittent sources is 0.25 peak particle velocity (PPV) (inches per second [in/sec]) for historic and sensitive buildings, 0.3 PPV (in/sec) for old residential structures, and 0.5 PPV (in/sec) for new residential structures. The same manual shows the vibration annoyance potential criteria to be barely perceptible at 0.01 PPV (in/sec), distinctly perceptible at 0.04 PPV (in/sec), strongly perceptible at 0.1 PPV (in/sec), and severe at 0.4 PPV (in/sec). Both sets of thresholds were used to evaluate short-term, construction-related ground-borne vibration.

For any build alternative, the build alternatives may require the use of pile drivers and other heavy-tracked construction equipment for construction. The Federal Transit Administration (FTA), in its *Transit Noise and Vibration Assessment* (FTA 2006), shows that a typical-impact pile driver would generate approximately 0.644 PPV (in/sec) when measured at 25 feet. It also shows that typical heavy-tracked construction equipment would generate approximately 0.003 to 0.089 PPV (in/sec) when measured at 25 feet.

Potential pile driving activities related to the build alternatives would be located within existing channel or tidal waters and approximately 50 feet from the closest residence. Therefore, for any build alternative, residences located 50 feet from pile driving activities would be subject to a vibration level of 0.3 PPV. This vibration level would be considered to be strongly perceptible and would have the potential to damage the residential structure because the structure would be considered old. Other construction equipment and activities would generate vibration levels much lower than those of pile driving and would therefore result in lower vibration levels at adjacent receiver locations. Residences located further than 50 feet from these activities would experience decreasing vibration levels the further away from the pile driving activities in which residences are located. No adverse temporary groundborne vibration impacts resulting from the build alternatives would be anticipated as a result of pile driving with implementation of avoidance and minimization measures described in Section 3.24.4.14, to conduct pre- and post-construction surveys and alternatives to pile driving, respectively, for residential structures that are located 200 feet or closer from pile driving activities.

CONSTRUCTION NOISE. During construction of the build alternatives, noise from construction activities may occasionally dominate the noise environment in the immediate improvement area. Construction noise is regulated by Caltrans Standard Specifications, Section 14-8.02, "Noise Control." These requirements state that noise levels generated during construction would be controlled and monitored and not to exceed 86 dBA L_{\max} at 50 feet from the job site between the hours of 9:00 p.m. to 6:00 a.m.

Figure 3.24-1 summarizes noise levels produced by construction equipment that would be commonly used on roadway construction projects. As indicated, equipment involved in construction would be expected to generate noise levels ranging from 70 to 90 A-weighted decibels (dBA) at a distance of 50 feet. Noise produced by construction equipment would reduce over distance at a rate of about six dBA per doubling of distance. Normally, construction noise levels should not exceed 86 dBA maximum instantaneous noise level (L_{\max}) at a distance of 50 feet.

Figure 3.24-1: Construction Equipment Noise Levels

No adverse noise impacts from construction of either build alternative would occur because, for any build alternative, construction would be conducted in accordance with the Caltrans standard specifications and would be short-term, intermittent, and dominated by local traffic noise.

3.24.3.15 ENERGY

The information in this section is based on the following document:

- *I-710 Corridor Project Energy Technical Report* (June 2017)

Indirect construction energy effects involve the one-time, nonrecoverable energy costs associated with construction of roads, structures, and vehicles. Based on the roadway construction energy consumption factor of 27,500 BTU per 1977 construction dollar and the estimated costs to construct the build alternatives (rolled back to the 1977 equivalent), it would take approximately 20 trillion British thermal units (BTUs) to construct Alternative 5C and approximately 40 trillion BTUs to construct Alternative 7. Similar to other completed major infrastructure construction projects in Southern California, because the construction energy consumed would be such a small fraction of regional energy consumption, the construction of any of the build alternatives would not be likely to create a noticeable impact on short-term energy demand during construction. As shown in Table 3.15-13, for the Area of Interest, the construction energy impacts would be much less than the direct energy impacts. It would take approximately 2.3 years to recover the energy expended for construction of Alternative 5C, and approximately 0.4 year to recover the energy expended for construction of Alternative 7.

3.24.3.16 NATURAL COMMUNITIES

This section is based on the following documents:

- *Natural Environment Study* (NES) (June 2017)
- *Jurisdictional Delineation Report* (May 2012)
- *Memorandum Update to the I-710 Corridor Project Jurisdictional Delineation Report* (January 2017)

Temporary impacts to natural communities may occur during construction of the build alternatives where habitats are temporarily disturbed during grading or other activities, as shown in Section 3.16, Natural Communities. In general, Alternative 7 would result in greater temporary impacts than Alternative 5C due to the increased number of structural columns/piers associated with Alternative 7.

For any build alternative, implementation of the measures described in Section 3.24.4.16, Natural Communities, 3.24.4.19, Animal Species, and 3.24.4.21, Invasive Species would ensure that temporary impacts to natural communities are avoided or minimized.

BUILD ALTERNATIVES.

ESTUARINE HABITAT. Temporary effects resulting from the build alternatives would include construction-related effects such as dust, potential fuel spills from construction equipment, and unauthorized activities of equipment or personnel outside designated construction areas, as well as operational effects such as effects on adjacent habitats caused by stormwater runoff, traffic, and litter. Temporary effects would also result in areas chosen for staging, areas directly adjacent to the placement of abutments and piers during construction, and areas beneath bridges to be demolished and removed. These construction-related effects could cause temporary water quality impacts to the Los Angeles River, which could then affect the estuarine habitat present. Temporary impacts would also result in areas chosen for staging, in areas directly adjacent to the placement of abutments and piers during construction and dewatering activities, and in the areas beneath bridges to be demolished and removed. While dewatering of the entire Los Angeles River would not occur, for any build alternative, some minimal isolation of work may be required to minimize downstream impacts such as turbidity (e.g., an air bubble curtain system or air-filled isolation casings around the bridge support structures). Temporary impacts to estuarine habitat would be the same for both the build alternatives because the proposed improvements to the four bridges (7th St., Anaheim St., Pacific Coast Hwy., and Willow St. within the City of Long Beach) that are located within tidal waters are the same for Alternative 5C and Alternative 7. As shown in Section 3.16, Natural Communities, Alternative 5C would result in temporary effects to approximately 8.34 acres of estuarine habitat while Alternative 7 would result in 8.19 acres of estuarine habitat. The figures in Appendices I and J of the NES (June 2017) illustrate the locations where estuarine habitat would be impacted by Alternative 5C and Alternative 7, respectively.

RIPARIAN/RIVERINE HABITATS. Temporary effects are anticipated from the placement of staging areas, construction of piers and abutments, and demolition and removal of existing bridges under the build alternatives. Additional temporary indirect effects would include construction-related effects such as dust, potential fuel spills from construction equipment, possible night lighting during construction, and activities of equipment or personnel outside designated construction areas, as well as operational issues such as effects on adjacent habitats caused by stormwater runoff, traffic, and litter. Temporary effects would also result in areas chosen for staging, areas directly adjacent to the placement of abutments and piers during construction, and areas beneath bridges to be demolished and removed. While dewatering of the entire Los Angeles River would not occur, for any build alternative, some minimal isolation of work may be required to minimize downstream impacts such as turbidity (e.g., an air bubble curtain system or air-filled isolation casings around bridge support structures). These construction-related effects could cause temporary water quality impacts to the Los Angeles River, which could then affect riparian/riverine habitat present.

Temporary impacts to riparian/riverine habitats would be greater from Alternative 7 than from Alternative 5C, due to its slightly larger footprint associated with the freight-corridor. As shown

in Section 3.16, Natural Communities, Alternative 5C would potentially result in temporary impacts to 21.93 acres of riparian/riverine natural communities overall, 19.34 acres of which would be concrete-lined freshwater portions of the Los Angeles River and associated drainages. Alternative 7 would potentially result in temporary impacts to 25.59 acres of riparian/riverine natural communities, and 23.51 acres of which would be concrete-lined freshwater areas. Further, Alternative 5C would result in approximately 0.08 acre of temporary impacts to the Dominguez Gap and DeForest Treatment Wetlands, and Alternative 7 would result in approximately 9.26 acres of direct permanent impacts and 0.08 acre of temporary impacts to the Dominguez Gap and DeForest Treatment Wetlands, which are proposed and/or existing Los Angeles County Department of Public Works (LACDPW) restoration areas. The figures in Appendix R of this Final EIR/EIS illustrate the locations in which riparian/riverine habitats would be impacted by Alternative 5C and Alternative 7, respectively.

WILDLIFE CORRIDORS/HABITAT FRAGMENTATION. Temporary impacts during pile-driving activities resulting from the build alternatives could have an effect on marine mammals (California sea lion [*Zalophus californianus*]), migratory birds, and fisheries. The percussive forces generated during any pile-driving activities associated with the build alternatives on the four southernmost bridges may result in injury to California sea lions swimming in the estuarine portion of the Los Angeles River within and adjacent to the Biological Study Area (BSA). Migratory birds could be affected during pile-driving activities and other types of construction along the length of the corridor.

Both build alternatives would include construction or expansion of a number of piers on the following four bridges over the lower Los Angeles River that could affect California sea lions and estuarine fisheries: the 7th St. bridge, the Anaheim St. bridge, the Pacific Coast Hwy. bridge, and the Willow St. bridge. For any build alternative, a new bridge would be constructed over the lower Los Angeles River at 7th St., while the Anaheim St., Pacific Coast Hwy., and Willow St. bridges would be expanded. Construction and expansion of the bridges in the lower Los Angeles River would not alter the movement of California sea lions through the channel. Under Alternative 5C only, a pedestrian bridge would be added at Hill St. However, some minimal isolation of work areas (e.g., air bubble curtain system or air-filled isolation casings) in the Los Angeles River would potentially be required to minimize indirect impacts (e.g., turbidity). These isolated work areas would be unavailable for use by wildlife. This unavailability would be temporary while work is taking place on and around bridge support structures. Once the work was completed, the bridges would not impede the movement of California sea lions through the channel.

As discussed in Section 3.24.3.19, Animal Species, portions of the Los Angeles River within the BSA provide habitat for a number of fish and bird species. Fish inhabiting Queensway Bay may occasionally move upstream to tidal and freshwater portions of the Los Angeles River. Fish and birds moving in the river could be affected by bridge construction under the build

alternatives, particularly during pile-driving activities. Construction of the bridges could also alter the movement of fish and birds through the mouth of the Los Angeles River. This impact would be temporary during the period of pile driving and bridge deck construction. Once the pile driving was completed, the bridges would not impede the movement of fish or birds through the channel.

3.24.3.17 WETLANDS AND OTHER WATERS

This section is based on the following documents:

- *Natural Environment Study* (June 2017)
- *Jurisdictional Delineation Report* (May 2012)
- *Memorandum Update to the I-710 Corridor Project Jurisdictional Delineation Report* (January 2017)

As shown in Section 3.17, Wetlands and Other Waters of the United States, the build alternatives may result in temporary effects through the degradation of jurisdictional areas as a result of placement of staging areas, construction of piles and abutments, and demolition and removal of existing bridges. Additional temporary indirect effects would include construction-related effects such as dust, potential fuel spills from construction equipment, and activities of equipment or personnel outside designated construction areas, as well as operational effects such as effects on adjacent habitats caused by stormwater runoff, traffic, and litter. For any build alternative, temporary effects would also result in areas chosen for staging, in areas directly adjacent to placement of abutments and piles during construction, and in areas beneath bridges to be demolished and removed.

Temporary impacts to jurisdictional areas would be greater from Alternative 7 than from Alternative 5C. There would be 30.21 acres of United States Army Corps of Engineers (USACE) jurisdictional areas that would be temporarily impacted under Alternative 5C, whereas 33.70 acres would be temporarily impacted under Alternative 7. Alternative 5C would result in temporary impacts to 30.29 acres of Regional Water Quality Control Board (RWQCB) jurisdictional areas, whereas Alternative 7 would temporarily impact 33.79 acres of RWQCB jurisdictional areas. Under both Alternatives 5C and 7, 0.08 acre of RWQCB-only jurisdictional area would be temporarily impacted. However, Alternative 5C would result in 55.73 acres of temporary impacts to California Department of Fish and Wildlife (CDFW) jurisdictional areas, and Alternative 7 would temporarily impact 71.66 acres of CDFW jurisdictional areas. For more information on these temporary impacts to jurisdictional areas, refer to Table 3.17-3 in Section 3.17, Wetlands. Additionally, Alternative 7 would result in temporary impacts to the three additional areas noted in Section 3.17.3.1 in the discussion of permanent impacts.

For any build alternative, implementation of the measures described in Section 3.24.4.16, Natural Communities, and Section 3.24.4.17, Wetlands and Other Waters, would ensure that temporary impacts to wetlands and other waters are avoided or minimized.

3.24.3.18 PLANT SPECIES

This section is based on the following document:

- *Natural Environment Study* (June 2017)

Temporary impacts to populations of southern tarplant could result from implementation of any of the build alternatives. During construction, grading, staging, or other construction-related activities could disrupt populations located below the elevated corridor to be constructed as part of Alternative 7. In general, Alternative 7 would result in greater temporary impacts to the populations of southern tarplant than Alternative 5C though both alternatives would result in some impacts to populations of southern tarplant. For any build alternative, implementation of the measures described in Section 3.24.4.16, Natural Communities, and Section 3.24.4.18, Plant Species, would ensure that temporary and indirect impacts to southern tarplant are avoided or minimized.

3.24.3.19 ANIMAL SPECIES

This section is based on the following document:

- *Natural Environment Study* (June 2017)

BURROWING OWL. Temporary impacts to burrows that could be used by the owls (BUOW) may result from all build alternatives. Construction activities may cause potential direct impacts from equipment, noise, light, and vibration resulting in, for example, direct mortality, crushing of burrows, and nest abandonment, and may cause potential indirect effects, such as habitat alteration and behavior modification. Should burrows be permanently impacted, burrowing owls would likely disperse to adjoining areas and construct new burrows in place of those that were destroyed from implementation of either build alternative. For any build alternative, implementation of the measures described in Section 3.24.4.16, Natural Communities, and Section 3.24.4.19, Animal Species, would ensure that temporary impacts to burrowing owl are absent or minimal.

SPECIAL-STATUS BAT SPECIES. All build alternatives could result in temporary impacts to roosting bats during construction, including impeded access to day- and/or night-roosting sites in the crevices or cavities of bridges, culverts, and other structures. Day roosts where female bats congregate to give birth and rear young (maternity roosts) are considered vital to the survival of local populations, whereas when a night roost (a structure in which bats roost during the evening between foraging bouts) is eliminated, the energy required for bats to successfully utilize the surrounding foraging area may be negatively affected. Although a day roost may double during

the evening as a night roost if it is close to a foraging area, night roosts are used only in the evening.

Effects to special-status bat species (including but not limited to Yuma myotis and silver-haired bat, and foliage-roosting species such as western red bat, western yellow bat, and hoary bat) resulting from the build alternatives would also include temporary indirect disturbance (such as noise, vibration, dust, night lighting, and human encroachment) from construction. In addition, construction could temporarily impede access to roost sites (existing and future) in the crevices of bridges, culverts, and overhead structures. Although none of the structures identified as day and/or night roosts appear to be utilized by large numbers of bats, if several structures in a given area would be impacted at one time, there may be an impact with regard to the availability of suitable crevices for roosting. For any build alternative, the avoidance and minimization measures described in Section 3.24.4.19 would ensure that temporary effects to bat species are absent or minimal from implementation of either of the build alternatives.

OTHER SPECIAL-STATUS ANIMAL SPECIES NOT REQUIRING SURVEYS. Temporary impacts to all animal species would be greater from implementation of Alternative 7 than from Alternative 5C, given the greater amount of habitats that would be affected by the larger footprint of Alternative 7.

Temporary impacts to other nonlisted special-status species could occur during construction from temporary indirect disturbance (noise, vibration, dust, night lighting, and human encroachment) resulting from the build alternatives. Construction of either build alternative could temporarily impede movement along the Los Angeles River. These special-status animal species could be affected indirectly by changes in water quality generated by the build alternatives. Such changes could involve increased pollution levels, increased turbidity, or impacts on the fish on which they feed. However, for any build alternative, by following the avoidance and minimization measures described in Section 3.24.4.19, temporary impacts to other special-status animal species would not be substantial.

3.24.3.20 THREATENED AND ENDANGERED SPECIES

This section includes animal species and habitat that are Federally and/or State-listed, candidates, or proposed endangered or threatened or regulated by National Marine Fisheries Service (NMFS) and is based on the following document:

- *Natural Environment Study* (June 2017)

SOUTHERN CALIFORNIA STEELHEAD DPS. Based on available data, steelhead appear to be extirpated from the BSA. Steelhead are large highly mobile fish and would likely move out of the area if disturbed by construction activities (e.g., pile-driving). Nonetheless, for any build alternative, in the unlikely event that steelhead are present in the BSA, the mitigation measures outlined for fish in general in Section 3.24.4.9, Water Quality; Section 3.24.4.16, Natural

Communities; Section 3.24.4.19, Animal Species; and Section 3.24.4.20, Threatened and Endangered Species, should avoid and minimize potential impacts to this species. In February 2019, NMFS consultation under Section 7 of the Federal Endangered Species Act concluded with concurrence on mitigation measures outlined for fish in general as described above. For any build alternative, before in-water construction would begin, further consultation with the NMFS under Section 7 of the Federal Endangered Species Act would be required at later points in development of the build alternative, such as during the preparation of Advance Planning Studies, prior to construction.

GREEN SEA TURTLE. All build alternatives proposed for the I-710 Corridor Project would include driving pilings in tidal waters across the Los Angeles River at the 7th St., Anaheim St., and Pacific Coast Hwy. crossings. Under Alternative 5C, a total of 24 river channel structures (roadway bridges) would be modified, including 22 Los Angeles River locations, one Compton Creek location, and one Rio Hondo location; with Alternative 7, a total of 33 channel structures would be affected, including 28 Los Angeles River locations, four Compton Creek locations, and one Rio Hondo location. Construction of new columns or piers and extension of existing piers would occur at each of these locations. A greater number of pilings would be required upstream of tidal waters in freshwater areas of the Los Angeles River to accommodate improvements to various bridges.

Any green turtles that might visit the area around the mouth of the Los Angeles River (outside of the BSA) could be temporarily affected indirectly under the build alternatives by changes in water quality originating upstream. Such changes could involve increased pollution levels, increased turbidity, or impacts on sea grasses and algae on which green turtles feed. Although green sea turtles would not be affected by the build alternatives, for any build alternative, the avoidance and minimization measures described in Section 3.24.4.9, Water Quality; Section 3.24.4.16, Natural Communities; Section 3.24.4.19, Animal Species; and Section 3.24.4.20, Threatened and Endangered Species, would avoid and minimize impacts to green sea turtle, if present.

WESTERN SNOWY PLOVER (COASTAL POPULATION). Temporary impacts to the coastal population of western snowy plover could occur during construction of either build alternative from temporary indirect disturbance (noise, vibration, dust, night lighting, and human encroachment). Construction of the build alternatives could temporarily impede movement along the Los Angeles River. Furthermore, western snowy plover could be temporarily affected indirectly by changes in water quality generated by the build alternatives. Such changes could involve increased pollution levels, increased turbidity, or impacts on the fish on which they feed. For any build alternative, by following the avoidance and minimization measures outlined in Section 3.24.4.9, Water Quality; Section 3.24.4.16, Natural Communities; Section 3.24.4.19, Animal Species; and Section 3.24.4.20, Threatened and Endangered Species, no noticeable changes in water conditions would occur.

LEAST BELL'S VIREO. Temporary impacts to least Bell's vireo (LBVI) could occur during construction of the build alternatives from temporary indirect disturbance (noise, vibration, dust, night lighting, and human encroachment). Temporary impacts resulting from the build alternatives could occur to 1.93 acres of riparian scrub suitable for LBVI habitat. Construction could temporarily impede movement along the Los Angeles River. Furthermore, least Bell's vireo could be temporarily affected indirectly by changes in water quality generated by the build alternatives. Such changes could involve increased pollution levels, increased turbidity, or impacts on the fish on which they feed. For any build alternative, by following the avoidance and minimization measures outlined in Section 3.24.4.9, Water Quality; Section 3.24.16, Natural Communities; Section 3.24.4.19, Animal Species; and Section 3.24.4.20, Threatened and Endangered Species, no noticeable changes in water conditions would occur. Least Bell's vireo is highly mobile and not expected to occur year-round within the areas directly and indirectly affected by the build alternatives, and as such, for any build alternative, these effects would be very limited both temporarily and spatially.

CALIFORNIA LEAST TERN. Temporary impacts to California least tern could occur during construction of the build alternatives from temporary indirect disturbance (noise, vibration, dust, night lighting, and human encroachment). Construction of the build alternatives could temporarily impede movement along the Los Angeles River. Furthermore, California least terns could be temporarily affected indirectly by changes in water quality generated by the build alternatives. Such changes could involve increased pollution levels, increased turbidity, or impacts on the fish on which they feed. For any build alternative, by following the avoidance and minimization measures outlined in Section 3.24.4.9, Water Quality; Section 3.24.4.16, Natural Communities; Section 3.24.4.19, Animal Species; and Section 3.24.4.20, Threatened and Endangered Species, no noticeable changes in water conditions would occur.

SPECIES PROTECTED UNDER THE MARINE MAMMAL PROTECTION ACT. Temporary impacts to marine mammals (California sea lion) would be the same from implementation of any of the build alternatives. Construction and expansion of four bridges in the lower Los Angeles River would bring construction personnel and equipment into the area where California sea lions may occur. Although there would be an incremental increase in activity due to bridge construction, the Los Angeles River typically draws large numbers of people engaged in recreational and commercial activities. Therefore, for any build alternative, the temporary presence of construction personnel is not expected to adversely impact sea lions.

For any build alternative, it is anticipated that most California sea lions would avoid the BSA, but it is possible that some individuals could be present in the work area at various times during construction activity. Measures proposed in the Fisheries Management Plan that may be prepared, for any build alternative, and as determined in consultation with NMFS (if necessary), would provide avoidance and minimization measures that would be suitable for California sea lions, should they be present in the lower Los Angeles River during construction. Therefore, an

Incidental Harassment Authorization and associated Marine Mammal Monitoring Plan issued under the authority of Section 101 (a) (5) (D) of the Marine Mammal Protection Act would not be required, although changes in NMFS personnel could potentially result in a different conclusion.¹ In a letter dated February 19, 2019, the NMFS concurred with Caltrans' proposed avoidance and minimization measures as they relate to marine mammals. For any build alternative, further coordination with the NMFS would be conducted as necessary prior to construction if construction were to disturb marine mammals.

The percussive forces generated during any pile-driving activities associated with the build alternatives may result in injury to California sea lions within and adjacent to the BSA, where estuarine habitat exists. Prior studies have shown that loud underwater sounds, such as those produced by in-water pile driving, can have detrimental effects on marine mammals. However, for any build alternative, some minimal isolation of work areas (e.g., air bubble curtain system or air-filled isolation casings) in the Los Angeles River may be required to minimize indirect impacts (e.g., turbidity). These isolated work areas would be unavailable for use by wildlife. This unavailability impact would be temporary while work is taking place on and around bridge support structures. Additionally, for any build alternative, implementation of avoidance and minimization measures described for water quality in Section 3.9, for estuarine/open water and riparian/riverine natural communities in Section 3.16 and for construction in Section 3.24 (Section 3.24.4.9, Water Quality; Section 3.24.4.16, Natural Communities; Section 3.24.4.19, Animal Species; and Section 3.24.4.20, Threatened and Endangered Species) would ensure that temporary effects to marine mammals and other aquatic species would be minimal.

Construction activity on dry land would not impact California sea lions, provided that sediments and construction materials are retained on land and measures are implemented to prevent the movement of soil, concrete, and other construction materials into the Los Angeles River channel.

FISHERIES PROTECTED UNDER THE MAGNUSON-STEVENSON FISHERY CONSERVATION AND MANAGEMENT ACT. Fish moving through the river may be directly affected by bridge construction associated with the build alternatives, particularly during the pile-driving activities. As previously noted, all build alternatives would include driving pilings in tidal waters across the Los Angeles River at the 7th St., Anaheim St., and Pacific Coast Hwy. crossings. The percussive forces generated during pile-driving activities may result in injury and death to fish within the impact area. Injury would include damage to the auditory tissue of fishes or temporary hearing loss (THL). Temporary hearing loss occurs at lower levels than auditory tissue damage and would be dependent on the size of the fish, with smaller fish being affected at lower levels than larger fish. In addition to the direct effect of hearing loss or auditory tissue damage, sound levels from pile driving may also result in indirect effects such as inability to avoid predators or detect prey and

¹ National Marine Fisheries Service. DeAngelo, personal communication (December 15, 2009).

inability to communicate or detect the environment (Caltrans' *Technical Guidance for Assessment and Mitigation of the Hydroacoustic Effects of Pile Driving on Fish* [Guidance for Effects of Pile Driving on Fish], November 2015).

In addition to auditory tissue damage and temporary hearing loss, increased sound levels associated with pile driving resulting from the build alternatives may also affect fish by causing permanent physiological and anatomical damage. Nonauditory tissue damage may include capillary rupture in skin, neurotrauma, eye hemorrhage, swim bladder rupture, and death of individual fish (Caltrans' *Guidance for Effects of Pile Driving on Fish* [2015]). Such impacts may be the result of single or repeated exposure to elevated sound levels.

The acoustic impact area for the build alternatives is estimated to extend from bank to bank and upstream and downstream 1,000 meters from each crossing. This area is estimated using calculations in the Caltrans' *Guidance for Effects of Pile Driving on Fish* (2015).

Pile driving can be accomplished with sound levels that are below the peak and cumulative single event noise level for fish. For any build alternative, through the use of proper equipment and attenuation methods (if needed), pile driving for the bridge would be completed within the acoustic limits established in the Caltrans' *Guidance for Effects of Pile Driving on Fish* (2015). This technical guidance has been adopted by the National Oceanographic and Atmospheric Administration (NOAA) Fisheries, the United States Fish and Wildlife Service (USFWS), Caltrans, the CDFW, and the Oregon Department of Transportation.

Construction of the bridges under the build alternatives may also alter movement of fish through the mouth of the Los Angeles River. However, for any build alternative, some minimal isolation of work areas (e.g., air bubble curtain system or air-filled isolation casings) in the Los Angeles River may be required to minimize indirect impacts (e.g., turbidity). These isolated work areas would be unavailable for use by wildlife. This unavailability impact would be temporary while work is taking place on and around bridge support structures. Once the work is completed, the bridges would not impede the movement of fish through the channel. Additionally, for any build alternative, implementation of avoidance and minimization measures listed in Section 3.24.4.9, Water Quality; Section 3.24.4.16, Natural Communities; Section 3.24.4.19, Animal Species; and Section 3.24.4.20, Threatened and Endangered Species, is expected to ensure that temporary effects to fish would be minimal.

The Biological Assessment (BA) combined consultation under the Magnuson-Stevens Act and Essential Fish Habitat with the ESA Section 7 consultation. The NMFS concurred with the determinations in the Caltrans' BA on February 19, 2019, and agreed that the avoidance and minimization measures discussed above are sufficient for any build alternative.

Construction of the build alternatives on dry land would not impact fish, provided that sediments and construction materials are retained on land and measures are implemented to prevent the movement of soil, concrete, and other construction materials into the river channel.

ESSENTIAL FISH HABITAT. The build alternatives would have a temporary adverse effect on Coastal Pelagic Management Plan Species. The build alternatives would not impede movement of fish into and out of the Los Angeles River corridor, as no coffer dams or dewatering are proposed. Construction of either build alternative would have a temporary effect on fish that inhabit the river during pile-driving operations, as described above. In addition to the injury and mortality that may result from pile driving, pile driving would likely make the channel bottom in the vicinity of the bridges unsuitable for fish during pile-driving operations. However, for any build alternative, implementation of avoidance and minimization measures listed in Section 3.24.4.9, Water Quality; Section 3.24.4.16, Natural Communities; Section 3.24.4.19, Animal Species; and Section 3.24.4.20, Threatened and Endangered Species, would ensure that temporary effects to fish would be minimal.

Informal consultation with the NMFS regarding impacts to EFH in the lower reaches of the Los Angeles River for potential impacts to northern anchovy was completed in February 2019. The NMFS concurred on February 19, 2019, that the avoidance and minimization measures described in Sections 3.9, 3.16, and 3.24 would avoid and minimize impacts to EFH for any build alternative.

3.24.3.21 INVASIVE SPECIES

Impacts related to invasive species resulting from the build alternatives are considered permanent impacts because the introduction of invasive species into previously undisturbed areas would permanently affect the habitat. Therefore, impacts related to invasive species are described in Section 3.21, Invasive Species under permanent impacts. However, for any build alternative, implementation of avoidance and minimization measures listed in Section 3.24.4.16, Natural Communities, and Section 3.24.4.21, Invasive Species, would ensure that impacts are avoided or minimized.

3.24.3.22 CUMULATIVE IMPACTS

Temporary cumulative impacts as a result of the build alternatives, in combination with other past, present and future projects, are anticipated to occur if projects are under construction concurrently (see Table 3.25-2 in Section 3.25, Cumulative Impacts, which lists the planned construction schedule for major projects in the Study Area), but are not considered to be adverse. For any build alternative, all temporary impacts described in the above sections, as well as impacts for other projects in the Study Area, would each be minimized or mitigated and would, therefore, not have an adverse cumulative impact on humans or the physical environment. Additionally, it is possible that, if more than one project would be constructed in the same general area, there could be a cumulative effect on consumption of local resources such as fuel, energy, construction

materials, etc. Temporary cumulative impacts to traffic and circulation could also result from the construction of more than one project in a general area. In this case, for any build alternative, TMPs for each project would be coordinated to ensure adequate circulation in the area.

3.24.4 AVOIDANCE, MINIMIZATION, AND/OR MITIGATION MEASURES

For any build alternative, the following avoidance, minimization, and/or mitigation measures would reduce the construction impacts of either build alternative.

However, as the No Build (Alternative 1) was identified as the Preferred Alternative, adverse impacts from the I-710 Corridor Project build alternatives in combination with other projects to natural communities would not occur, and the adoption of this Preferred Alternative would not require any avoidance, minimization, and/or mitigation measures. Avoidance, minimization, and/or mitigation measures pertaining to the two build alternatives are retained in this Final EIR/EIS for disclosure purposes.

Unless otherwise noted, the following measures apply to both Alternative 5C and Alternative 7.

3.24.4.1 LAND USE

As previously discussed in this section, the build alternatives would result in temporary land use impacts from construction. As noted above, the No Build (Alternative 1) was identified as the Preferred Alternative, and therefore, adverse impacts from the I-710 Corridor Project build alternatives in combination with other projects to land use would not occur, and the adoption of this Preferred Alternative would not require any avoidance, minimization, and/or mitigation measures. The following avoidance, minimization, and/or mitigation measures are retained in this Final EIR/EIS for disclosure purposes. In addition, as part of the TMP specified in Mitigation Measure CON-TR-1, a plan to maintain business access would also be provided. Avoidance, minimization, and mitigation measures to reduce construction impacts to parks and recreational trails are described in Section 3.1.3.3 of this Final EIR/EIS.

CON-LU-1

During construction, the California Department of Transportation (Caltrans) will require the Construction Contractor to maintain vehicular, bicycle, and pedestrian access to businesses within the construction area throughout the construction period. If existing access points are disrupted, alternative access will be provided. Appropriate signage and temporary sidewalks will be provided as needed throughout construction, and the Construction Contractor will provide and maintain appropriate signage to direct pedestrian, bicycle, and vehicular traffic to businesses via alternate routes. Disabled access will also be maintained during construction.

CON-LU-2

During construction, Caltrans will require establishment of one or more public information field office(s) near the construction site(s). The field office(s) will serve the following purposes:

- Provide the community and businesses with a physical location where information pertaining to construction can be obtained in both English and Spanish, including information on lane, street, and ramp closures, including pedestrian and bicycle facility closures and applicable detours.
- Enable Caltrans staff to facilitate communication between Caltrans staff and residents and business operators.
- Notify property owners, residences, and businesses of major construction activities (e.g., utility relocation/disruption, rerouting of delivery trucks) at least 14 days prior to the disruption.
- Respond to phone inquiries.
- Coordinate business outreach programs, specifically to increase participation in the planning, construction, operation, and maintenance of the project by small businesses, minority-owned businesses, and women-owned businesses in the Study Area.
- Conduct periodic informational meetings regarding upcoming construction to provide a forum for interested parties to voice concerns about the construction process.

CON-PR-1

DEVELOPMENT OF CLOSURES OF THE LOS ANGELES RIVER AND RIO HONDO TRAILS AND BIKEWAYS. Prior to any temporary closures of the Los Angeles River Trail and Bikeway and/or the Rio Hondo Trail and Bikeway, Caltrans will require the Construction Contractor to meet with the Los Angeles County Department of Public Works (LACDPW) to review the location and need for each closure. Although the trails and bikeways converge at some points, the trails and bikeways are independent of each other and are typically adjacent. Detours for each closure will be developed in consultation with the LACDPW.

CON-PR-2

SIGNING FOR DETOURS OF THE LOS ANGELES RIVER AND RIO HONDO TRAILS AND BIKEWAYS. Caltrans will require the Construction Contractor to develop signs directing trail users to alternative routes in consultation with LACDPW and the local jurisdictions through which detours will be routed. Appropriate directional and informational signage will be provided by the Construction Contractor prior to each closure and far enough away from the closure, so

that trail and bikeway users will not have to backtrack to get to the detour route.

CON-PR-3

CONTACT INFORMATION DURING CLOSURES AND DETOURS OF THE LOS ANGELES RIVER AND RIO HONDO TRAILS AND BIKEWAYS. Caltrans will require the Construction Contractor to provide a contact number and other information to trail and/or bikeway users to contact the Construction Contractor regarding upcoming or active trail and/or bikeway closures. The Construction Contractor will also be required to provide that information to the LACDPW and the City Public Works Departments in the jurisdictions where the closures/detours are located.

CON-PR-4

RESTORATION OF CLOSED AREAS ON THE LOS ANGELES AND RIO HONDO TRAILS AND BIKEWAYS. Caltrans will require the Construction Contractor to return trail and/or bikeway segments closed temporarily during construction to the LACDPW in their original, or better, condition after completion of construction, and the ownership of those temporarily closed areas will remain with the original owner (the LACDPW).

3.24.4.2 GROWTH

There are no temporary adverse growth-related effects of the build alternatives; therefore, no avoidance, minimization, and/or mitigation measures are required.

3.24.4.3 COMMUNITY IMPACTS

The build alternatives have the potential to result in temporary impacts to access, potentially resulting in a short-term impact to community character and cohesion. A minimization measure is included in Section 3.24.4.5 of this Final EIR/EIS to further reduce potential temporary impacts to access as a result of construction of the build alternatives.

3.24.4.4 UTILITIES/EMERGENCY SERVICES

The build alternatives would result in temporary impacts to fire, law enforcement, and emergency service response times as a result of construction. However, as noted above, the No Build (Alternative 1) was identified as the Preferred Alternative, and therefore, adverse impacts from the I-710 Corridor Project build alternatives in combination with other projects to utilities and emergency services would not occur, and the adoption of this Preferred Alternative would not require any avoidance, minimization, and/or mitigation measures. The following avoidance, minimization, and/or mitigation measures are retained in this Final EIR/EIS for disclosure purposes.

CON-U&ES-1**FIRE, LAW ENFORCEMENT, EMERGENCY SERVICES AND SCHOOL DISTRICTS.**

Prior to and during construction, Caltrans and the Construction Contractor will coordinate all temporary ramp closures and detour plans with fire, emergency medical, and law enforcement providers, as well as with local jurisdictions' Departments of Public Works, to minimize temporary delays in emergency response times as part of the Transportation Management Plan (TMP), including the identification of alternative routes and routes across the construction areas for emergency vehicles, developed in coordination with the affected agencies.

In addition, as part of the TMP, prior to and during construction, Caltrans and the Construction Contractor will coordinate all temporary ramp closures and detour plans with local school districts and individual schools as identified by the school districts to minimize temporary delays to school bus services and to minimize effects on students who walk to school, including ensuring that pedestrian detours are safe for student use. This coordination will include the identification of alternative bus and pedestrian travel routes including routes to and around construction areas to and from individual schools.

CON-U&ES-2

UTILITIES. Major utility relocations will be subject to preparation of Specific Utility Relocation Plans. For temporary impacts, the Specific Utility Relocation Plans will include (Specific Utility Relocation Plan elements for permanent impacts are included in Section 3.4, Utilities and Emergency Services):

- Description of proposed changes/demolition of existing facilities.
- Identification of potential conflicts that need to be resolved with the relocation plan, including temporary roads and staged construction.
- A work plan that describes the nature of the construction activity, haul routes, a construction transportation management plan if warranted, hours of construction, construction duration and schedule, planned service interruptions, if any, types of construction activities, and anticipated noise level.
- A summary of existing and planned Utility Team Coordination Meetings that will include all utility companies and local jurisdictions' Departments of Public Works affected by the project. The meetings will occur during the final design phase and include final design and construction staging. The meeting participants will discuss and plan a workable sequence of utility alterations so that the utility work can

be coordinated and, where possible, completed in advance of highway work. Topics to be addressed include sensitive environmental areas, hazardous material sites, erosion controls during construction, and any community events that will be occurring during construction and need to be accommodated.

- A determination if a community meeting will be held prior to the issuance of demolition and grading permits. Community meetings will be held for major utility relocations that are (1) within 500 feet of residences or schools, and (2) that will require construction duration of 30 days or more. Caltrans will hold a community pre-construction meeting, in concert with the Construction Contractor, to provide information regarding the construction schedule and activities. The construction information will include the location and duration of each construction activity, whether or not and, if applicable, the specific location, days, frequency, and duration of the pile driving that will occur, construction transportation management plans, and any accommodation of community events that will be occurring during the construction period. Notification of this meeting will be provided to owners and occupants within 500 feet of the utility relocation site.

CON-U&ES-3

Prior to grading activities, Caltrans will require the Construction Contractor to notify Underground Service Alert at least two days prior to excavation by calling 811 to require that all utility owners within the project disturbance limits identify the locations of underground transmission lines and facilities.

3.24.4.5 TRAFFIC AND TRANSPORTATION/PEDESTRIAN AND BICYCLE FACILITIES

Implementation of the build alternatives would cause temporary impacts during the construction phase. During construction, temporary impacts and traffic delays to transit service may occur along those routes designated as detour or alternative routes to I-710. As noted above, the No Build (Alternative 1) was identified as the Preferred Alternative, and therefore, adverse impacts from the I-710 Corridor Project build alternatives in combination with other projects to traffic and transportation, and pedestrian and bicycle facilities would not occur, and the adoption of this Preferred Alternative would not require any avoidance, minimization, and/or mitigation measures. The following avoidance, minimization, and/or mitigation measures are retained in this Final EIR/EIS for disclosure purposes.

CON-TR-1

TRANSPORTATION MANAGEMENT PLAN. Prior to construction, Caltrans will prepare a TMP to address short-term traffic impacts during construction of the Interstate 710 (I-710) Corridor Project. The objectives of the TMP are to:

- Maintain traffic safety during construction
- Maintain an acceptable level of traffic flow throughout the transportation system during construction
- Minimize traffic delays and facilitate reduction in the overall duration of construction activities
- Minimize detours and impacts to, and maintain connectivity for equestrians, pedestrians, and bicyclists
- Foster public awareness of the project and construction-related impacts

The TMP will include the elements recommended in the Caltrans TMP Guidelines (November 2015), including:

- Public Information and Outreach
- Traveler Information Strategies
- Incident Management
- Construction Strategies
- Demand Management
- Alternate Route Strategies

Also, to be consistent with the Caltrans *Complete Intersections Guide: A Guide to Reconstructing Intersections and Interchanges for Bicycles and Pedestrians* (2010), the TMP will consider the short-term project effects on all travel modes including pedestrians, bicyclists, and transit users to minimize closures and the effects of temporary detours on those travelers. The TMP will include public outreach, including information on current and upcoming project construction activities, lane and other closures, detours, and other information to assist residents, students, visitors, and business patrons to more effectively travel around and in the vicinity of active construction areas. Further, if full ramp closures (lasting 10 days or longer) are found to be necessary during future phases of the project, a Ramp Closure Study will be performed to evaluate any potential impacts. The TMP will be coordinated with the affected jurisdictions.

CON-TR-2 Prior to construction, an evaluation of damage to the pavement surface on local roadways that may occur due to project-related construction traffic will be completed. New pavement will be provided on local arterials that connect to or cross over (or under) I-710 where such roadways will be directly affected by project construction, which includes detours, after project completion in the vicinity of each arterial.

CON-TR-3 To minimize travel time delays on I-710 during project construction, Caltrans and Metro will work with area transit operators to implement a Transit Subsidy Program that will provide discounted transit fares in areas impacted by construction as well as performing outreach and marketing to incentivize use of transit during construction periods.

3.24.4.6 VISUAL/AESTHETICS

Visual impacts associated with construction of the build alternatives would be experienced by viewers in the area; however, visual impacts related to construction would be temporary. As noted above, the No Build (Alternative 1) was identified as the Preferred Alternative, and therefore, adverse impacts from the I-710 Corridor Project build alternatives in combination with other projects to visual/aesthetics would not occur, and the adoption of this Preferred Alternative would not require any avoidance, minimization, and/or mitigation measures. The following avoidance, minimization, and/or mitigation measures are retained in this Final EIR/EIS for disclosure purposes.

Measures to avoid, minimize, or reduce the adverse visual impacts that may result from construction of the build alternatives would be achieved by requiring the Construction Contractor to construct either build alternative in accordance with the Caltrans Standard Construction Specifications, which would include appropriate measures to address visual impacts during construction.

CON-VIS-1 Wherever possible and feasible, during final design, the placement of construction staging areas and routes to and from construction areas will be considered so that the view of these sites and routes is shielded from sensitive resources, including residential neighborhoods.

3.24.4.7 CULTURAL RESOURCES

The cultural resource studies for the I-710 Corridor Project identified three historic properties that would be impacted by all of the build alternatives; however, the features that qualify the resources as a historic property and/or a historical resource would not be impacted. The Archaeological Sensitivity Study (2017) identified three areas within the Supplemental APE that exhibit the possibility to contain previously unrecorded archaeological resources. As noted above, the No

Build (Alternative 1) was identified as the Preferred Alternative, and therefore, adverse impacts from the I-710 Corridor Project build alternatives in combination with other projects to cultural resources would not occur, and the adoption of this Preferred Alternative would not require any avoidance, minimization, and/or mitigation measures. However, the following avoidance, minimization, and/or mitigation measures are retained in this Final EIR/EIS for disclosure purposes.

The following measures would be implemented to address the discovery of cultural resources or human remains during project construction:

- CON-CUL-1** If cultural materials are discovered during construction, all earth-moving activity within and around the immediate discovery area will be diverted until a qualified archaeologist can assess the nature and significance of the find.
- CON-CUL-2** If human remains are discovered, State Health and Safety Code Section 7050.5 states that further disturbances and activities will cease in any area or nearby area suspected to overlie remains, and the County of Los Angeles (County) Coroner will be contacted. Pursuant to Public Resources Code (PRC) Section 5097.98, if the remains are thought to be Native American, the Coroner will notify the Native American Heritage Commission, which will then notify the Most Likely Descendant (MLD). At that time, the District 7 Environmental Branch Chief or the District 7 Native American Coordinator will be contacted so that he/she may work with the MLD on the respectful treatment and disposition of the remains. Further provisions of PRC 5097.98 are to be followed as applicable.
- CON-CUL-3** Caltrans has developed a project-level Programmatic Agreement (PA) following submittal of the Supplemental Finding of Effect document. Also, an Historic Properties Treatment Plan (HPTP) has been developed by a qualified archaeologist in consultation with Caltrans PQS Principal Investigator-Prehistoric or Historic Archaeology to plan for the identification, evaluation, and treatment of archaeological resources should they be discovered during construction. The HPTP was attached to the project-level PA. Caltrans Division of Environmental Analysis (DEA) and the State Historic Preservation Officer (SHPO) executed the project-level PA on June 6, 2019. The provisions outlined in the PA and HPTP will be followed during construction.

3.24.4.8 HYDROLOGY AND FLOODPLAIN

As noted above, the No Build (Alternative 1) was identified as the Preferred Alternative, and therefore, adverse impacts from the I-710 Corridor Project build alternatives in combination with other projects to hydrology and floodplains would not occur, and the adoption of this Preferred Alternative would not require any avoidance, minimization, and/or mitigation measures. However, measures to minimize temporary construction impacts on the natural and beneficial floodplain values related to water quality are discussed in Section 3.24.4.9, measures to minimize temporary construction impacts to jurisdictional waters are discussed in Section 3.24.4.17, and the measures provided below are included for disclosure purposes.

3.24.4.9 WATER QUALITY

CON-WQ-1

Caltrans will require the Construction Contractor to comply with the provisions of the National Pollutant Discharge Elimination System (NPDES) General Permit for Stormwater Discharges Associated with Construction and Land Disturbance Activities (Order No. 2012-0006--DWQ, NPDES No. CAS000002) and any subsequent permit as they relate to construction activities for the project. This will include submission of the Permit Registration Documents, including a Notice of Intent (NOI), risk assessment, site map, Storm Water Pollution Prevention Plan (SWPPP), annual fee, and signed certification statement to the State Water Quality Control Board (SWRCB) at least 14 days prior to the start of construction. The SWPPP will meet the requirements of the Construction General Permit and will identify pollutant sources associated with construction activities; identify non-stormwater discharges; develop a water quality monitoring and sampling plan; and identify, implement, and maintain Best Management Practices (BMPs) to reduce or eliminate pollutants associated with the construction site. The BMPs identified in the SWPPP will be implemented during project construction. A Notice of Termination will be submitted to the SWRCB upon completion of construction and the stabilization of the site.

CON-WQ-2

Caltrans will require the Construction Contractor to comply with the provisions of the Waste Discharge Requirements for Discharges of Groundwater from Construction and Project Dewatering to Surface Waters in Coastal Watersheds of Los Angeles and Ventura Counties, Order No. R4-2013-0095, NPDES No. CAG994004, as they relate to discharge of non-stormwater dewatering wastes for the project, including monitoring and reporting requirements. This includes complying with the prescribed Monitoring and Reporting Program and submitting to the Los Angeles Regional Water Quality Control Board (RWQCB) a NOI at least 45 days prior to the start of non-stormwater dewatering discharge. In addition, a

Notice of Termination will be submitted upon completion of dewatering discharge.

3.24.4.10 GEOLOGY/SOILS/SEISMIC/TOPOGRAPHY

As noted above, the No Build (Alternative 1) was identified as the Preferred Alternative, and therefore, adverse impacts from the I-710 Corridor Project build alternatives in combination with other projects from geologic hazards would not occur, and the adoption of this Preferred Alternative would not require any avoidance, minimization, and/or mitigation measures. However, the following avoidance, minimization, and/or mitigation measure is retained in this Final EIR/EIS for disclosure purposes.

CON-GEO-1

Caltrans will prepare a quality assurance/quality control plan that will be maintained during construction. The plan will include observing, monitoring, and testing by a geotechnical engineer and/or geologist during construction to confirm that geotechnical/geologic recommendations are fulfilled, or if different site conditions are encountered, appropriate changes are made to accommodate such issues. The geotechnical engineer will prepare weekly reports while grading excavation and construction activities are underway.

3.24.4.11 PALEONTOLOGY

As noted above, the No Build (Alternative 1) was identified as the Preferred Alternative, and therefore, adverse impacts from the I-710 Corridor Project build alternatives in combination with other projects to paleontological resources would not occur, and the adoption of this Preferred Alternative would not require any avoidance, minimization, and/or mitigation measures. However, the following avoidance, minimization, and/or mitigation measures are retained in this Final EIR/EIS for disclosure purposes.

It should be noted that impacts to paleontological resources are considered permanent, not temporary. However, for any build alternative, permanent impacts to paleontological resources would likely be limited to construction phases of the project. Therefore, the following avoidance and minimization measures would be proposed.

CON-PAL-1

In accordance with the Paleontological Mitigation Plan (refer to PAL-1 in Section 3.11), a pre-construction field survey shall be conducted in areas identified as having high paleontological sensitivity after vegetation and paving have been removed, followed by salvage of any observed surface paleontological resources prior to the beginning of additional grading.

CON-PAL-2

During construction excavation, a qualified vertebrate paleontological monitor shall initially be present on a full-time basis whenever excavation will occur within the sediments that have a high paleontological sensitivity rating and on a spot-check basis for excavation in sediments that have a low sensitivity rating. Monitoring may be reduced to a part-time basis if no resources are being discovered in sediments with a high sensitivity rating (monitoring reductions, when they occur, will be determined by the qualified Principal Paleontologist in consultation with the Caltrans Resident Engineer [RE]). The monitor shall inspect fresh cuts and/or spoils piles to recover paleontological resources. With the RE's approval, the monitor shall temporarily divert construction equipment away from the immediate area of the discovery. The monitor shall be equipped to rapidly stabilize and remove fossils to avoid prolonged delays to construction schedules. If large mammal fossils or large concentrations of fossils are encountered, Caltrans shall consider using heavy equipment on site to assist in the removal and collection of large materials.

3.24.4.12 HAZARDOUS WASTE/MATERIALS

As noted above, the No Build (Alternative 1) was identified as the Preferred Alternative, and therefore, adverse impacts from the I-710 Corridor Project build alternatives in combination with other projects related to hazardous waste/materials would not occur, and the adoption of this Preferred Alternative would not require any avoidance, minimization, and/or mitigation measures. However, the following avoidance, minimization, and/or mitigation measures are retained in this Final EIR/EIS for disclosure purposes.

CON-HW-1

During construction, the Construction Contractor will test and remove yellow traffic stripes and pavement marking material in accordance with Standard Special Provision 14-11.12.

CON-HW-2

If suspect hazardous waste or underground tanks are encountered during construction, the Construction Contractor will stop work and follow the procedures outlined in Appendix E of the Caltrans' *Unknown Hazards Procedures for Construction*.

CON-HW-3

During preparation of Plans, Specifications, and Estimates, Metro's contractor (with oversight from Caltrans) will conduct a groundwater evaluation to assess disposal alternatives for groundwater encountered during construction and to comply with the requirements of the NPDES permitting process. If contaminated groundwater is detected during the evaluations, proper agencies will be alerted, and action will be taken to contain the contamination.

CON-HW-4

During final design, prior to any ground disturbance, all treated wood waste will be properly disposed of, in accordance with Alternative Management Standards for Treated Wood Waste in Section 67386.6(a)(2)(B) 3 of the California Code of Regulations (CCR). In addition, any personnel who come in contact with treated wood waste or contaminated soils will be required to follow all applicable requirements under Section 67386.6(a)(2)(B) 3 of the CCR and be trained in the proper identification, disposal, and safe handling of treated wood waste and contaminated soils.

CON-HW-5

The specifications related to air pollution control during demolition or renovation of a structure or bridge will be included during the Plans, Specifications, and Estimates phase and implemented prior to demolition or renovation of a structure or bridge. SCAQMD notification and submittal of any required fees or documentation will be completed at least ten days prior to proceeding with demolition work per SCAQMD Rule 1403. The requirements of SCAQMD Rule 1403 will be adhered to during demolition/renovation activities. The sampling, handling, treatment, and disposal of hazardous waste will be conducted in accordance with applicable local, State, and federal regulations and requirements, prior to and during construction of the project.

3.24.4.13 AIR QUALITY

Construction of the I-710 Corridor Project build alternatives would result in temporary adverse impacts related to fugitive dust and construction equipment and vehicle emissions. Particularly sensitive populations, such as children and seniors. For any build alternative, places where sensitive populations congregate, such as daycare facilities, hospitals and clinics, would be identified and where possible, strategies and technologies would be used in combination to reduce the impacts of air pollution as identified by the *Gateway Cities Air Quality Action Plan Final Report* (Gateway Cities Council of Governments 2013). The standard conditions and SCAQMD Rule 403 (fugitive dust) would substantially reduce potential adverse short-term air quality impacts during construction of either build alternative as described below, although Caltrans has not formally adopted the SCAQMD thresholds. In addition, for any build alternative, dependent upon the agency that would administer the construction contract, all applicable measures from the SCAG RTP/SCS enforceable at a project level intended to reduce GHG emissions would be included in the Plans, Specifications, and Estimates package prepared for either build alternative (formalized as Measure CON-AQ-17, below). In particular, Measure CON-AQ-15 below would implement the provision of Metro Board Motion 22.1 to implement best available control technology construction equipment as defined by the California Air Resources Board.

However, as noted above, the No Build (Alternative 1) was identified as the Preferred Alternative, and therefore, adverse impacts from the I-710 Corridor Project build alternatives in combination with other projects to air quality would not occur, and the adoption of this Preferred Alternative would not require any avoidance, minimization, and/or mitigation measures. However, the following avoidance, minimization, and/or mitigation measures are retained in this Final EIR/EIS for disclosure purposes.

CON-AQ-1 The Construction Contractor will comply with Caltrans Standard Specifications.

- Section 7, “Legal Regulations and Responsibility to the Public,” addresses the Construction Contractor’s responsibility on many items of concern, such as compliance by the Construction Contractor with laws and regulations and responsibilities for public safety and convenience. Section 7-1.03 specifically requires application of a dust palliative for the prevention or alleviation of dust nuisance, and Section 7-1.04, “Public Safety,” specifically states “Control dust resulting from the work, inside and outside the right-of-way.”
- Section 13 is directed at water pollution control and specifically, Section 13-5 discusses temporary soil stabilization.
- Section 14, “Environmental Stewardship,” includes specifications relating to environmental compliance and environmental resource management. Specifically, Section 14-9 includes specifications relating to air quality, including 14-9.02, Air Pollution Control, which directs the Construction Contractor to comply with applicable air pollution control rules, regulations, ordinances, and statutes.

CON-AQ-2 The Construction Contractor will apply water or dust-palliative per Caltrans Standard Specifications Section 18 or applicable air district regulations, whichever are more stringent for air quality, to the site and equipment as frequently as necessary to control fugitive dust emissions. South Coast Air Quality Management District (SCAQMD) Rule 403 will also be followed.

CON-AQ-3 The Construction Contractor will spread soil binder on any unpaved roads used during construction and all project construction parking areas, consistent with storm water pollution control requirements (Caltrans Standard Specifications Section 13-5).

- CON-AQ-4** Section 13 of the Caltrans Standard Specifications discusses Water Pollution Control. Specifically, Section 13-5, "Temporary Soil Stabilization," directs the Construction Contractor to utilize various methods to control and minimize wind erosion, among other occurrences, that will also alleviate instances of fugitive dust.
- CON-AQ-5** The Construction Contractor will properly tune and maintain construction equipment and vehicles. The Construction Contractor will use low-sulfur fuel in all construction equipment as provided in California Code of Regulations (CCR) Title 17, Section 93114.
- CON-AQ-6** The Construction Contractor will develop and implement a dust control plan documenting sprinkling, temporary paving, speed limits, and expedited revegetation of disturbed slopes as needed to minimize construction fugitive dust impacts to adjacent land uses.
- CON-AQ-7** The Construction Contractor will locate equipment and materials storage sites as far away from adjacent residential and park uses as practical. The Construction Contractor will keep construction areas clean and orderly.
- CON-AQ-8** The Construction Contractor will establish Environmentally Sensitive Areas (ESAs) for sensitive air receptors within which construction activities involving extended idling of diesel equipment will be prohibited to the extent feasible. In addition, a strong anti-idling policy will be implemented at all construction sites as part of an air quality impact training program that will include education on potential health risks to nearby receptors and ways to reduce emissions, including no idling, use of PM filters, use of alternative fuels, etc.
- CON-AQ-9** The Construction Contractor will use track-out reduction measures such as gravel pads at project access points to minimize dust and mud deposits on off-site roads used by construction traffic, consistent with storm water pollution control requirements (Caltrans Standard Specifications Section 13-7).
- CON-AQ-10** The Construction Contractor will cover all loads of soils and wet materials prior to transport, or provide adequate freeboard (space from the top of the material to the top of the truck) to reduce particulate matter less than ten microns in size (PM10) and the deposition of particulate matter during transportation.

- CON-AQ-11** The Construction Contractor will remove dust and mud deposited on paved public roads due to construction activity and traffic to decrease particulate matter, consistent with storm water pollution control requirements (Caltrans Standard Specifications Section 13-7).
- CON-AQ-12** The Construction Contractor will route and schedule construction traffic to avoid peak travel times as much as possible and to reduce congestion and related air quality impacts caused by idling vehicles along local roads.
- CON-AQ-13** The Construction Contractor will install mulch or plant vegetation as soon as practical after grading to reduce windblown particulates in the area.
- CON-AQ-14** During clearing, grading, earthmoving, or excavation operations, excessive fugitive dust emissions will be controlled by regular watering or other dust preventive measures using the following procedures, as specified in the SCAQMD Rule 403. All material excavated or graded will be sufficiently watered to prevent excessive amounts of dust. Watering will occur at least twice daily with complete coverage, preferably in the late morning and after work is done for the day. All material transported on site or off site will be either sufficiently watered or securely covered to prevent excessive amounts of dust. The area disturbed by clearing, grading, earth moving, or excavation operations will be minimized so as to prevent excessive amounts of dust. These control techniques will be indicated in project specifications. Visible dust beyond the property line emanating from the project will be prevented to the maximum extent feasible.
- CON-AQ-15** Construction equipment used during project construction will meet equivalent emissions performance to that of United States Environmental Protection Agency (EPA) Tier 4 standards and California Air Resources Board (ARB) requirements for non-road engines, depending on the responsible agency that administers the construction contract and the availability of construction equipment compliant with these standards. If Metro administers the construction contract, then Metro's Green Construction Policy would be utilized.
- CON-AQ-16** Caltrans will instruct the Construction Contractor to comply with ARB's anti-idling rule, which prohibit diesel truck idling in excess of five minutes.
- CON-AQ-17** The following measures from Appendix G of the 2012 SCAG RTP/SCS Programmatic Environmental Impact Report and the 2016 SCAG RTP/SCS will be implemented during construction:

- Excavating and grading activities will cease during second stage smog alerts and periods of high winds (25 miles per hour or more; defined as a “strong breeze” on the Beaufort scale¹).
- Construction roads that carry traffic anticipated during construction should be engineered using the pavement standards and procedures for new construction, except where noted otherwise, in accordance with the Caltrans *Highway Design Manual* Section 603.6, Temporary Pavements and Detours.
- Traffic speeds on all unpaved surfaces will not exceed 25 miles per hour.
- To the extent possible, construction activity should utilize electricity from on-site power poles rather than diesel and/or gasoline powered generators.
- A person or persons will be appointed to monitor the dust control program and to order increased watering, as necessary, to prevent transport of dust off site. Their duties should include holidays and weekend periods when work may not be in progress. The name and telephone number of such persons should be provided to the local air district prior to the start of construction as well as posted on site over the duration of construction.
- Appropriate wind-breaks will be installed at the construction site to minimize windblown dust.
- Land disturbance will be minimized where possible, consistent with SCAQMD Rule 403.
- The contractor will be required to assemble a comprehensive inventory list of all heavy-duty off-road equipment that could be used an aggregate of 40 or more hours for the project.
- Portable engines and portable engine-driven equipment units used at the project work site, with the exception of on-road and off-road motor vehicles, will be required to obtain ARB Portable Equipment Registration with the State or a local district permit. Appropriate consultations with the ARB or the SCAQMD will occur to determine

¹ National Weather Service. Beaufort Wind Scale. Website: <https://www.weather.gov/mfl/beaufort> (accessed September 11, 2018).

registration and permitting requirements prior to equipment operation at the site.

- If cranes are required for construction, they shall be rated at 200 hp or greater and equipped with Tier 4 or equivalent engines, if commercially available.
- All off-road and portable diesel-powered equipment will be fueled with ARB-certified motor vehicle diesel fuel (non-taxed version suitable for use off-road).
- Electric fleet or alternative-fueled vehicles will be used where commercially available and feasible including methanol, propane, and compressed natural gas. Where alternative fuels are used, alternative diesel fuels, such as Clean Fuels Technology (water emulsified diesel fuel) or O₂ diesel ethanol-diesel fuel (O₂ Diesel) in existing engines, will be used if commercially available and feasible.
- On-road, heavy-duty trucks that meet the ARB's 2007 or cleaner certification standards for on-road diesel engines, and compliance with State on-road regulations, will be used.
- Idle reduction technology, defined as a device that is installed on the vehicle that automatically reduces main engine idling and/or is designed to provide services, e.g., heat, air conditioning, and/or electricity to the vehicle or equipment that would otherwise require the operation of the main drive engine while the vehicle or equipment is temporarily parked or is stationary, will be used.
- Minimize idling time either by shutting off equipment when not in use or limit idling time to five minutes, in accordance with ARB's anti-idling rule. Signs shall be posted in the designated queuing areas and/or job sites to remind drivers and operators of the five-minute idling limit. The Construction Contractor shall maintain a written idling policy and distribute it to all employees and subcontractors. The on-site construction manager or Resident Engineer shall enforce this limit.
- The number of construction equipment in operation simultaneously shall be minimized through efficient management practices to ensure that the smallest practical number is operating at any one time.
- Catalytic converters shall be installed on gasoline-powered equipment.

- Signs shall be posted in designated queuing areas and job sites to remind drivers and operators of the idling limit.
- Construction worker trips shall be minimized by providing options for carpooling and by providing for lunch on site.
- Use of low-rolling resistance tires on long haul class 8 tractor-trailers.
- Install an ARB-verified, Level 3 emission control device, e.g., diesel particulate filters, on all diesel engines.

3.24.4.14 NOISE

As noted above, the No Build (Alternative 1) was identified as the Preferred Alternative, and therefore, adverse impacts from the I-710 Corridor Project build alternatives in combination with other projects related to noise would not occur, and the adoption of this Preferred Alternative would not require any avoidance, minimization, and/or mitigation measures. However, the following avoidance, minimization, and/or mitigation measures are retained in this Final EIR/EIS for disclosure purposes.

- | | |
|----------------|---|
| CON-N-1 | Equipment noise control will be utilized and applied to revising old equipment and designing new equipment to meet specified noise levels during construction of the proposed project. |
| CON-N-2 | The Construction Contractor will utilize in-use noise control where existing equipment is not permitted to produce noise levels in excess of specified limits. |
| CON-N-3 | The Construction Contractor will implement site restrictions during construction activity in an attempt to achieve noise reduction through modifying the time, place, or method of operation of a particular source. |
| CON-N-4 | The Construction Contractor will implement personal training of operators and supervisors to become more aware of the construction site noise problems. |
| CON-N-5 | The Construction Contractor will implement equipment noise control that is needed to reduce the noise emissions from construction sites by mandating specified noise levels for the design of new equipment and updating old equipment with new noise control devices and techniques, as described below: |

- Mufflers are very effective devices, which reduce the noise emanating from the intake or exhaust of an engine, compressor, or pump. The fitting of effective mufflers on all new equipment and the retrofitting of mufflers on existing equipment will be necessary to yield an immediate noise reduction at all types of road construction sites.
- Sealed and lubricated tracks for crawler-mounted equipment will lessen the sound radiated from the track assembly resulting from metal-to-soil and metal-to-metal contact. Contractors, site engineers, and inspectors will ensure that the tracks are kept in excellent condition by periodic maintenance and lubrication.
- Lowering exhaust pipe exit heights closer to the ground can result in an off-site noise reduction. Barriers are more effective in attenuating noise when the noise source is closer to ground level.
- General noise control technology can have substantially quieter construction equipment when manufacturers apply state-of-the-art technology to new equipment or repair old equipment to maintain original equipment noise levels.

CON-N-6

The Construction Contractor will implement in-use site noise control measures that are necessary to prevent existing equipment from producing noise levels in excess of specified limits. Any equipment that produces noise levels less than the specified limits will not be affected. However, those exceeding the limit will be required to meet compliance by repair, retrofit, or replacement. New equipment with the latest noise-sensitive components and noise control devices are generally quieter than older equipment, if properly maintained and inspected regularly. It will be repaired or replaced if necessary to maintain the in-use noise limit. All equipment applying the in-use noise limit will achieve an immediate noise reduction if properly enforced.

CON-N-7

The Construction Contractor will apply site restrictions to achieve noise reduction through different methods, resulting in an immediate reduction of noise emitted to the community without requiring any modification to the source noise emissions. The methods include shielding with barriers for equipment and site, truck rerouting and traffic control, time scheduling, and equipment relocation. The effectiveness of each method depends on the type of construction involved and the site characteristics.

- Shielding with barriers will be implemented at an early stage of a project to reduce construction equipment noise. The placement of barriers must be carefully considered to reduce limitation of site access. Barriers may be natural or man-made, such as excess land fill used as a temporary berm strategically placed to act as a barrier. They may also include the construction of soundwalls as the first order of work, if their construction will not be precluded by other construction activities, so that the walls may help to abate construction noise.
- Efficient rerouting of trucks and control of traffic activity on construction sites will reduce noise due to vehicle idling, gear shifting, and accelerating under load. Planning proper traffic control will result in efficient workflow and reduce noise levels. In addition, rerouting trucks does not reduce noise levels but transfers noise to other areas that are less sensitive to noise.
- Time scheduling of activities will be implemented to minimize noise impacts on exposed areas. Local activity patterns and surrounding land uses must be considered in establishing site curfews. However, limiting working hours can decrease productivity. Sequencing the use of equipment with relatively low noise levels versus equipment with relatively high noise levels during noise-sensitive periods will be an effective noise control measure.
- Equipment location will be as far from noise-sensitive land use areas as possible. The Construction Contractor will substitute quieter equipment or use quieter construction processes at or near noise-sensitive areas.

CON-N-8

The Construction Contractor(s) and their employees will be educated via a training program to be sensitive to noise impact problems and noise control methods. This may be one of the most cost-effective ways to help operators and supervisors become more aware of the construction site noise problem and to implement the various methods of improving the conditions. The Construction Contractor will conduct a training program for equipment operators to instruct them in methods of operating their equipment to minimize environmental noise. Many training programs are presently given on the subject of job safety. This can be extended to include the impacts due to noise and methods of abatement.

- CON-N-9** A pre- and post-construction survey will be conducted for residential structures located within 200 feet of pile driving locations to determine whether any new cracks or other damage have occurred. Should damage occur to structures resulting from project construction, operations will cease and the construction methods and/or equipment will be re-evaluated. Measures in the Caltrans *Transportation and Construction Vibration Guidance Manual* (September 2013) will be implemented as necessary.
- CON-N-10** The Construction Contractor will be required to utilize alternatives to pile driving such as pre-drilling and cast-in-place will be required, where feasible, to limit vibration generation to a negligible amount.
- CON-N-11** During the final design phase of the proposed project, a Noise Monitoring Plan and Noise Control Plan shall be prepared. The Noise Monitoring Plan and Noise Control Plan shall identify additional noise abatement measures that are required to effectively provide the necessary level of noise attenuation to adjacent sensitive receptors. The Construction Contractor will be required to implement the necessary additional noise abatement measures detailed in the Noise Monitoring Plan and Noise Control Plan to ensure that potential project-related noise impacts to affected sensitive sites adjacent to the freeway are minimized and avoided to the greatest extent possible.

3.24.4.15 ENERGY

Construction of any of the build alternatives would not result in adverse direct or indirect impacts related to energy consumption in the Study Area nor in the South Coast Air Basin (Basin) compared to the No Build conditions under Alternative 1. As noted above, the No Build (Alternative 1) was identified as the Preferred Alternative, and therefore, adverse impacts from the I-710 Corridor Project build alternatives in combination with other projects to energy would not occur, and the adoption of this Preferred Alternative would not require any avoidance, minimization, and/or mitigation measures. However, the following avoidance, minimization, and/or mitigation measures are retained in this Final EIR/EIS for disclosure purposes. Additional measures are provided in Section 3.15.5 of the Energy section (Section 3.15) of this Final EIR/EIS in the interest of promoting energy efficiency.

- CON-E-1** Prior to the completion of final design, Caltrans shall prepare and implement a construction efficiency plan, which will include the following:
- Select disposal sites as close as practicable to the I-710 construction area to minimize haul distances and excavation-related fuel consumption.

- Reuse existing rail, steel, and lumber wherever possible, such as for falsework, shoring, and other applications during the construction process.
- Recycle asphalt taken up from roadways, if practicable and cost-effective.
- Using newer, more energy-efficient equipment and maintain older construction equipment in good working order.
- Schedule construction operations to result in the most efficient use of construction equipment possible.
- Promoting employee carpooling.

CON-E-2

Prior to the completion of project construction, Caltrans shall prepare and implement a maintenance efficiency plan which will include the following:

- Maintain maintenance equipment in good working order.
- Schedule maintenance operations to result in the most efficient use of maintenance equipment possible.

3.24.4.16 NATURAL COMMUNITIES

As noted above, the No Build (Alternative 1) was identified as the Preferred Alternative, and therefore, adverse impacts from the I-710 Corridor Project build alternatives in combination with other projects to natural communities would not occur, and the adoption of this Preferred Alternative would not require any avoidance, minimization, and/or mitigation measures. However, the following avoidance, minimization, and/or mitigation measures are retained in this Final EIR/EIS for disclosure purposes. In addition, related measures are also provided in Section 3.24.4.9, Water Quality, and Sections 3.24.4.17 through 3.24.4.21.

CON-NC-1

Prior to clearing or construction, highly visible barriers (such as orange construction fencing) will be installed around sensitive habitats adjacent to the project footprint under the guidance of a biological monitor to designate ESAs to be preserved. No grading or fill activity of any type will be permitted within these Environmentally Sensitive Areas (ESAs). In addition, no construction activities, materials, or equipment will be allowed within the ESAs. All construction equipment will be operated in a manner so as to prevent accidental damage to nearby preserved areas. No structure of any kind, or incidental storage of equipment or supplies, will be allowed within the ESAs. Silt fence barriers will be installed at ESA boundaries to prevent accidental deposition of fill material in areas where the ESA is immediately adjacent to planned grading activities. The fencing will be inspected by the

Resident Engineer on a regular basis and will be maintained throughout the construction period. Damaged portions of the fence will be repaired in a timely manner from the construction side of the fence.

CON-NC-2 A biologist will monitor construction within the vicinity of estuarine and riparian/riverine habitats for the duration of the project to ensure that vegetation removal, BMPs, ESAs, and all avoidance and minimization measures are properly implemented.

CON-NC-3 A biological monitor will be present during all vegetation clearing to flush any wildlife species present prior to construction.

CON-NC-4 An employee education program for all construction personnel will be developed and implemented by the biological monitor prior to construction. At a minimum, the program will include the following topics: (1) responsibilities of the biological monitor; (2) delineation and installation of visible barriers of Environmentally Sensitive Areas (ESAs); (3) limitations on all movement of those employed on site, including ingress and egress of equipment and personnel, to designated construction zones (personnel shall not be allowed access to ESAs); (4) on-site pet prohibitions; (5) use of trash containers for disposal and removal of trash; (6) project features designed to reduce the impacts to listed species and habitat and promote continued successful occupation of adjacent habitat areas; (7) identification and information regarding special-status species (e.g., least Bell's vireo, burrowing owl, southern tarplant, eelgrass) and measures to be implemented; and (8) identification and information regarding invasive species (e.g., *Caulerpa taxifolia*). A record of information presented and all personnel trained will be maintained.

CON-NC-5 Potential exists for eelgrass to occur within a portion of the project limits, specifically at bridges over the tidally-influenced reaches of the Los Angeles River. Protocol eelgrass presence/absence surveys shall be conducted at these bridges within one year prior to commencement of construction. If eelgrass presence is confirmed, areas with eelgrass shall be mapped, impact analysis shall be performed, and mitigation measures shall be determined in coordination with the National Marine Fisheries Service.

CON-NC-6 The use of rodenticides, herbicides, insecticides, or other chemicals that could potentially harm sensitive plant and wildlife species, including state and federally listed species, shall be prohibited in and adjacent to suitable habitat for these species. Use of rodenticides, herbicides, insecticides, or

other chemicals in other areas will be monitored by a qualified biologist to ensure no accidental effects in sensitive habitats.

- CON-NC-7** A Habitat Mitigation and Monitoring Plan (HMMP) that is acceptable by the USACE, the CDFW, and the RWQCB is expected to be required as a condition of the permit approvals required from each agency. If required, the HMMP will be developed and submitted to the applicable resource agencies for approval as part of the regulatory permit application.
- CON-NC-8** A construction SWPPP and soil erosion and sedimentation plan will be developed by the Construction Contractor to minimize erosion and identify specific pollution prevention measures that will eliminate or control potential point and nonpoint pollution sources on site during and following the project's construction phase. The SWPPP will identify specific BMPs to be implemented during project construction so as not to cause or contribute to an exceedance of any water quality standard. A Storm Preparation and Evacuation Plan shall be prepared as part of the SWPPP prepared for the project. The plan shall include a requirement that no work shall occur within drainages during storm events. In addition, the SWPPP will contain provisions for changes to the plan such as alternative mechanisms, if necessary, during project design and/or construction to achieve the stated goals and performance standards.
- CON-NC-9** All avoidance, minimization, and mitigation measures identified in the Habitat Mitigation Monitoring Plan (HMMP), the Fisheries Management Plan (if required), and the SWPPP will be followed.
- CON-NC-10** BMPs will be included in the Fisheries Management Plan (if required) and/or SWPPP to limit the resuspension of sediment and to manage resuspended sediment during construction in and adjacent to the Los Angeles River, particularly to limit the spread of contaminated sediment. These BMPs may include cofferdams, silt or turbidity curtains, or other watertight barricades surrounding the work areas that will contain resuspended sediment in the work area until it settles.
- CON-NC-11** All equipment maintenance, staging, and dispensing of fuel, oil, or any other such activities will occur in developed or designated nonsensitive upland habitat areas. The designated upland areas will be located in such a manner as to prevent runoff from any spills from entering sensitive habitats and waters of the United States.

- CON-NC-12** In addition to specific BMPs identified in the SWPPP, project construction shall be carried out under standard BMPs (e.g., no staging or vehicle repair in sensitive areas, implementation of erosion control measures, and fuel spill cleanup). During project construction, the proper use and disposal of oil, gasoline, diesel fuel, antifreeze, lead paint, and other toxic substances shall be enforced. No construction materials, equipment, debris, or waste shall be placed or stored where it may be subject to tidal erosion and dispersion. Construction materials shall not be stored in direct contact with the soil anywhere along the project alignment.
- CON-NC-13** Measures to contain all contaminated soils and material, including contaminated topsoil and lead-based paint from demolished bridges, shall be in place prior to and during soil moving (e.g., grading) and demolition activities. All contaminated soils and material shall be removed from the BSA and disposed of at an approved disposal site.
- CON-NC-14** Construction techniques utilized within and adjacent to the Los Angeles River channel will be designed to minimize effects on downstream conditions (e.g., flow rate or turbidity). During low flow, there will be no substantial contribution to or disruption of normal processes downstream. However, some minimal isolation of work may be required to minimize turbidity (e.g., air bubble curtain system or air-filled isolation casings around bridge support structures). Any potential disruption during storm events will be inconsequential amid typical high-volume flows.
- CON-NC-15** All debris generated during bridge construction and deconstruction will be prevented from settling into the Los Angeles River. When work is taking place over the Los Angeles River, floating booms (and/or other acceptable equipment) shall be used to contain debris. All construction-related debris shall be removed no later than the end of each day. Floating booms and/or other acceptable equipment shall be in place prior to commencement of construction over the Los Angeles River, and shall remain in place for the duration of construction activities over water.
- CON-NC-16** Construction and operation of equipment in waterways, including the Los Angeles River, shall be limited to the maximum extent feasible during the wet season (wet season is typically defined by the Regional Water Quality Control Board as November 1 to March 31). If such work is to occur, weather forecasts and storm predictions shall be closely monitored, and construction activities shall cease and equipment/materials that could be

affected by storms or other high-flow events shall be removed from the waterway prior to such events.

3.24.4.17 WETLANDS AND OTHER WATERS OF THE UNITED STATES

As noted above, the No Build (Alternative 1) was identified as the Preferred Alternative, and therefore, adverse impacts from the I-710 Corridor Project build alternatives in combination with other projects to wetlands and other waters of the United States would not occur, and the adoption of this Preferred Alternative would not require any avoidance, minimization, and/or mitigation measures. However, in addition to the above measures for natural communities, the following avoidance, minimization, and/or mitigation measures are retained in this Final EIR/EIS for disclosure purposes.

CON-WET-1 Prior to the start of construction, Caltrans shall apply for and obtain an appropriate permit from the U.S. Army Corps of Engineers (USACE) for placement of fill in jurisdictional wetlands or waters pursuant to Section 404 of the Clean Water Act (CWA) and Section 10 of the Rivers and Harbors Act, respectively.

CON-WET-2 Prior to the start of construction, Caltrans shall apply for and obtain a Lake or Streambed Alteration Agreement (SAA) from the California Department of Fish and Wildlife (CDFW) for impacts to riparian and streambed areas under the jurisdiction of Section 1602 of the Fish and Game Code.

CON-WET-3 Prior to the start of construction, Caltrans shall apply for and obtain a Water Quality Certification from the Regional Water Quality Control Board (RWQCB) for effects to jurisdictional wetlands pursuant to Section 401 of the CWA.

3.24.4.18 PLANT SPECIES

As noted above, the No Build (Alternative 1) was identified as the Preferred Alternative, and therefore, adverse impacts from the I-710 Corridor Project build alternatives in combination with other projects to plant species would not occur, and the adoption of this Preferred Alternative would not require any avoidance, minimization, and/or mitigation measures. However, in addition to the above measures for natural communities, the following avoidance, minimization, and/or mitigation measures are retained in this Final EIR/EIS for disclosure purposes.

CON-PS-1 During construction, Caltrans shall ensure that a qualified biologist will monitor construction within the vicinity of southern tarplant populations for the duration of the project to ensure that vegetation removal, BMPs, ESAs, and all avoidance and minimization measures are properly implemented.

3.24.4.19 ANIMAL SPECIES

As noted above, the No Build (Alternative 1) was identified as the Preferred Alternative, and therefore, adverse impacts from the I-710 Corridor Project build alternatives in combination with other projects to animal species would not occur, and the adoption of this Preferred Alternative would not require any avoidance, minimization, and/or mitigation measures. However, in addition to the above measures for natural communities, the following avoidance, minimization, and/or mitigation measures are retained in this Final EIR/EIS for disclosure purposes.

CON-AS-1 A biologist will monitor construction within the vicinity of burrowing owl (BUOW) locations (if present) for the duration of the project to ensure that vegetation removal, BMPs, ESAs, and all avoidance and minimization measures are properly implemented.

CON-AS-2 Construction within suitable habitat for nesting birds shall be limited to the extent necessary to complete construction activities. If any work, including vegetation removal, is to occur during the bird nesting season (which is February 1st through September 1st), the District Biologist shall be notified two weeks prior to the start of construction to determine if nesting birds could be present so that preconstruction surveys may be conducted and exclusionary devices and methods may be discussed. If work has not commenced within 72 hours after the bird nesting survey, the bird nesting survey shall be repeated. No work shall commence until vegetation to be removed has been surveyed for nesting birds and cleared by the District Biologist. In the event that nesting birds are observed, the Resident Engineer (RE) shall pause work until a qualified biologist has determined that fledglings have left the nest. If this is not possible, the RE shall coordinate with the District Biologist to minimize the risk of violating the Migratory Bird Treaty Act (MBTA). Most likely, the District Biologist will recommend a buffer of 150 ft. for songbirds and a buffer of 500 ft. for raptors during all phases of construction. Nesting birds are protected under the MBTA and cannot be impacted by construction activities, including but not limited to noise, dust pollution, and habitat disturbance.

CON-AS-3 On-site pets and the deliberate feeding of wildlife shall be prohibited.

CON-AS-4 Within 30 days prior to any phase of construction, pre-construction surveys will be conducted in areas with suitable burrowing owl (BUOW) habitat to ensure that any BUOW that may occupy the site are not affected by construction activities. These pre-construction surveys are also required in order to demonstrate compliance with the Migratory Bird Treaty Act (MBTA) and the California Fish and Game Code. If any of the pre-construction

surveys determine that BUOW are present, mitigation measures may be required. The specifics of the required measures shall be coordinated between Caltrans District Biologist and the resource agencies.

CON-AS-5

If any of the pre-construction surveys determine that burrowing owls (BUOW) are present, one or more of the following measures may be required: (1) avoidance of active nests and surrounding buffer area during construction activities; (2) passive relocation of individual owls; (3) active relocation of individual owls; and (4) preservation of on-site habitat with long-term conservation value for the owl. The specifics of the required measures shall be coordinated between the Caltrans District Biologist and the resource agencies.

CON-AS-6

In June or July at least one year prior to construction, a qualified bat biologist shall survey structures that may be subject to impacts from the project to assess their potential for use as maternity roosts, since maternity colonies are generally formed in late spring. The qualified bat biologist shall also perform pre-construction surveys at these structures during the fall or winter season, since bat roosts can change seasonally and bats may over-winter at some locations where they are not present during the summer months. The maternity season and pre-construction surveys shall include a combination of structure inspection, exit counts, and acoustic surveys, and shall also include a component to determine whether night-roosting bats are present. If a maternity roost is found, no work will take place on that structure until the end of the maternity season and exclusion devices are installed by a qualified bat biologist. All bat preconstruction survey methods shall be coordinated between the Caltrans District Biologist and the CDFW.

CON-AS-7

In order to prevent effects to bridge- and crevice-roosting bats (including bat maternity colonies), existing bridges with potential habitat identified during the pre-construction surveys shall have bat exclusion devices installed between September 1 and November 30 (with consideration of weather conditions) to exclude bats from directly affected work areas and avoid potential direct mortality. Exclusions are not always appropriate, and the decision of whether or not to implement a humane eviction/exclusion of bats shall be made on a case-by-case basis in consultation with a qualified bat biologist, and the complete eviction of roosting bats from a structure shall be avoided unless deemed necessary to avoid direct impacts to bats. Installation of the exclusion devices shall be conducted under the guidance of a qualified bat biologist and will be limited

if weather conditions are such that they will be harmful to evicted species (e.g., cold temperatures, high winds). Such exclusion efforts must be continued to keep the directly affected work area(s) of direct impacts free of bats until the completion of construction, or until a qualified bat biologist determines that project activities will not result in negative impacts to bats. In conjunction with the humane eviction/exclusion, alternative bat-roosting habitat shall be installed to minimize temporary or permanent impacts to bat-roosting habitat. All exclusion techniques shall be coordinated between the Caltrans District Biologist and the CDFW.

CON-AS-8

To minimize direct impacts to bats from the temporary loss of roosting habitat during a humane eviction or exclusion, alternate bat-roosting habitat structures shall be installed prior to the eviction/exclusion of bats from that structure. The design, numbers, and locations of these roost structures should be determined in consultation with a qualified bat biologist. If permanent, direct impacts to bat-roosting habitat are anticipated, alternate roosting habitat shall be provided at a 1:1 ratio to ensure no net loss of bat roosting habitat. All bat-roosting habitat mitigation shall be coordinated between the Caltrans District Biologist and the CDFW.

CON-AS-9

In order to avoid impacts to maternity-roosting bats and nonvolant (flightless) juvenile bats, tree removal or trimming (particularly of palm and eucalyptus trees) activities will occur outside of the bat maternity season (April 1–August 31); this time period coincides with the clearing and grubbing restrictions typically associated with the bird nesting season. If tree trimming or removal of large trees or palm trees cannot be avoided during the bat maternity season, these trees should be surveyed by a qualified bat biologist prior to removal and/or monitored during removal to ensure that no roosting bats are present.

CON-AS-10

In order to prevent effects to bridge- and crevice-nesting birds (e.g., swifts and swallows), bird exclusion devices shall be installed between September 1 and December 31 (with consideration of weather conditions) at existing bridges where potential habitat is identified during the pre-construction surveys. Installation of the exclusion devices will be conducted under the guidance of a qualified biologist (in coordination with a qualified bat biologist to ensure no impacts to bats such as incidental entrapment occur) and will be limited if weather conditions are such that they will be harmful to evicted species (e.g., cold temperatures). Such exclusion efforts must be continued to keep the structures free of birds until the completion

of construction. All exclusion techniques shall be coordinated between the Caltrans District Biologist and the resource agencies.

CON-AS-11

In order to prevent project effects to bridge-nesting birds (i.e., swallows), all unoccupied bird nests from previous nesting seasons shall be removed prior to construction from existing bridges where work will be conducted between February 1 and September 1. Nests from previous nesting seasons shall be removed under the guidance and observation of a qualified biologist prior to February 1 of that year, before the swallow colony returns to the nesting site. Removal of swallow nests that are under construction shall only occur under the supervision of a qualified biologist with approval from the California Department of Fish and Wildlife and, if approved, will be repeated as frequently as necessary to prevent nest completion or until a nest exclusion device is installed (such as netting, plastic sheeting, or a similar mechanism that keeps birds from building nests) is installed. Nest removal and exclusion device installation shall be monitored by a qualified biologist. Such exclusion efforts must be continued to keep the structures free of swallows until September 1 or completion of construction. All nest exclusion techniques will be coordinated between the Caltrans District Biologist and the resource agencies.

CON-AS-12

Some species of bat, including Yuma myotis, are known to roost within swallow nests. Although swallow nests will be removed outside of the swallow nesting season, bats may roost in these mud nests at any time of the year. Therefore, if swallow nests are removed to prevent swallows from nesting within the project area during construction activities, they should be removed in a manner that ensures they do not fall to the ground. To the greatest extent possible, mud nests should be removed by scraping them from the attachment surface and keeping the nest intact until it is examined and determined unoccupied by a qualified bat biologist. This examination should occur concurrently or immediately following the removal of each mud nest.

CON-AS-13

Construction work in the vicinity of the Los Angeles River, adjacent parks, wetlands, and vacant lands will be limited to daylight hours to minimize disturbance to wildlife movement to the best extent feasible. However, this may be difficult to achieve since most highway construction in the region is conducted at night to avoid impacting commuter traffic. If work must be done at night, noise and lighting will be selectively placed and directed away from the Los Angeles River, adjacent parks, wetlands, and vacant lands. Construction lighting will be of the lowest illumination necessary for

safety and will be directed toward the road and away from sensitive habitats. Light glare shields will be used to reduce the extent of illumination into sensitive habitats.

CON-AS-14 The Los Angeles River corridor will be kept clear of all equipment or structures that could potentially serve as barriers to wildlife passage.

3.24.4.20 THREATENED AND ENDANGERED SPECIES

As noted above, the No Build (Alternative 1) was identified as the Preferred Alternative, and therefore, adverse impacts from the I-710 Corridor Project build alternatives in combination with other projects to threatened and endangered species would not occur, and the adoption of this Preferred Alternative would not require any avoidance, minimization, and/or mitigation measures. However, in addition to the avoidance and minimization measures described in Section 3.24.4.9, Water Quality, and Section 3.24.4.16, Natural Communities, the following avoidance, minimization, and/or mitigation measures are retained in this Final EIR/EIS for disclosure purposes. Some of these measures were refined following circulation of the RDEIR/SDEIS during development of the Biological Assessment and consultation and coordination with NMFS and USFWS.

CON-TES-1 Informal Section 7 consultation with the National Marine Fisheries Service (NMFS) was completed in February 2019 and found that a Fisheries Management Plan is not required for the action as currently proposed. However, should re-initiation of consultation with NMFS be necessary during construction of the project, and should NMFS determine that a Fisheries Management Plan be required at that time, such a plan will be developed and submitted to the NMFS, the United States Army Corps of Engineers (USACE), the Regional Water Quality Control Board (RWQCB), and the California Department of Fish and Wildlife (CDFW), as necessary, for information and permit condition compliance. The Fisheries Management Plan would contain provisions for changes to the plan such as alternative mechanisms, if necessary, during project design and/or construction to achieve the stated goals and performance standards.

CON-TES-2 A biological monitor will be on site during pile-driving activities in the Los Angeles River to monitor fish that may become injured or killed during the pile driving, as well as for green sea turtles and marine mammals. All pile driving and bridge construction will take place during daylight hours. If native fish are observed to be injured or killed, or if sea turtles or marine mammals are observed during pile driving activities, pile driving will cease, and the California Department of Fish and Wildlife (CDFW) and National Marine Fisheries Service (NMFS) will be contacted to determine

appropriate steps to avoid additional effects to the fish. The results of the pile-driving monitoring will be reported to Caltrans within two weeks following the completion of pile-driving activities at each location. During pile-driving activities in the tidally influenced reaches of the Los Angeles River, the designated biological monitor will be on site to record the presence or behavior of any sea turtles or marine mammals that approach the project area, and to initiate the shutdown of activities as necessary if sea turtles or marine mammals are observed entering the “shutdown zone”. For all pile-driving activities, the “shutdown zone” will be matched to the type of pile and pile driving activity being conducted, and designed around an area that defines an expected acoustic zone of influence that meets the acoustic guidance for Level B harassment for marine mammals under the Marine Mammal Protection Act for that specific pile-driving activity and pile type. Following completion of the Advance Planning Studies by Caltrans (tentatively scheduled for fall 2019; subject to change) that are necessary to provide information on the expected acoustic impacts from the specific pile-driving activity that will be conducted in the tidally influenced reaches of the Los Angeles River, Caltrans will develop and submit a marine mammal and sea turtle monitoring and avoidance plan to NMFS for review prior to initiating construction of the proposed project.

CON-TES-3 To minimize impacts of pile driving in the Los Angeles River, minimal impact construction equipment and methods (e.g., a vibrating driver, crane, vibratory hammer, or hydraulic press) will be used during construction.

CON-TES-4 To minimize impacts of pile driving in the Los Angeles River, sound levels will be monitored during pile-driving activities in the Los Angeles River to ensure that peak sound levels do not exceed the threshold for injury to fish, including steelhead trout (206 maximum or peak measured decibel level [dB_{peak}] or 183 dB sound exposure level [SEL]). If sound levels exceed threshold, additional mitigation measures (e.g., work when the current is reduced, using a hydraulic hammer, the smallest hammer needed to advance the pile, air bubble curtain system, or air-filled isolation casings) will be developed in consultation with the resource agencies.

The following measures were developed during preparation of the Biological Assessment for purposes of Section 7 consultation:

CON-TES-5 To avoid potential adverse indirect impacts on nesting least Bell’s vireo (LBVI), protocol surveys for the species during the breeding season (March 15 to September 1) will be conducted within 1 year prior to any construction

activities that may occur during the vireo nesting season (mid-March through early August) within 500 feet of potentially suitable nesting habitat, including the Dominguez Gap and DeForest Park Treatment Wetlands riparian scrub habitat areas. Pre-construction surveys shall also be conducted by a qualified Biologist within portions of the construction area containing suitable habitat for LBVI and within a 500-foot radius of this area if construction will occur during the LBVI breeding season (March 15 to September 1). Pre-construction surveys shall be conducted no more than 72 hours prior to initiating construction activities and will be repeated if construction activities are suspended for five (5) days or more. Should any areas be found to be occupied by an LBVI breeding territory during protocol or pre-construction surveys within 500 feet of the project impact area, no work shall occur within 500 feet of the habitat and the USFWS Carlsbad office shall be notified to determine if it is necessary to reinitiate consultation to address potential effects to this species. Biological monitoring will be conducted to ensure that construction-related noise and other effects generated within 500 feet of LBVI habitat areas do not result in disturbance to the active nest(s) or nesting behaviors. The project biologist for this measure must be a trained ornithologist with at least 40 hours of independent LBVI observation in the field.

CON-TES-6

Operation of equipment and stockpiling of materials in storm channels, including the Los Angeles River, must be avoided during times of high flow. If such work is occurring, weather forecasts and storm predictions shall be closely monitored, and equipment and materials that could be affected by storms or other high-flow events shall be removed from the channel prior to such events.

CON-TES-7

If feasible, drive piles when the current is reduced (i.e., centered around slack current) in areas of strong current, to minimize the number of fish exposed to adverse levels of underwater sound.

CON-TES-8

If any listed wildlife species are discovered within 500 feet of construction activities and have potential to be adversely affected by the project (as determined by the project biologist), re-initiation of consultation with the United States Fish and Wildlife Service (USFWS), NOAA Fisheries, and/or the CDFW, as applicable, will occur to address unanticipated adverse effects to such species. The biologist shall have the authority to stop work activities in the area until the proper resource agencies have approved the project to proceed.

CON-TES-9

Permanent impacts to suitable vireo habitat will be offset at a 3:1 ratio, and temporary impacts will be offset at a 1:1 ratio, onsite or at a mitigation bank or other site as approved by the Service prior to construction. If vireo are detected within the direct project footprint, impacts to occupied habitat will be offset at a location that is occupied by vireo. If temporary impacts are restored onsite, Caltrans will submit a restoration plan to USFWS for review and approval prior to construction. The restoration plan will include a minimum 5-year plant establishment period and quantitative performance criteria that will be achieved for the restoration to be approved as successful by USFWS. Temporary impact areas will be planted as soon as possible following re-grading after completion of construction to prevent encroachment by non-native plants. Methods for offsetting permanent and temporary impacts will be approved by the USFWS prior to project construction or vegetation clearing.

CON-TES-10

Estuarine/open water and riparian/riverine communities will be offset at a minimum ratio of 2:1 for permanent impacts and 1:1 for temporary impacts (except for suitable vireo habitat as described in CON-TES-9, which will be offset at a 3:1 ratio). Compensatory mitigation may be in the form of habitat restoration and/or enhancement in on- or offsite areas where similar habitat exists, or equivalent contribution to a mitigation bank or in-lieu fee program. A Habitat Mitigation and Monitoring Plan (HMMP) will be reviewed and approved by USFWS prior to construction to offset impacts to suitable habitat for the plover and least tern.

3.24.4.21 INVASIVE SPECIES

As noted above, the No Build (Alternative 1) was identified as the Preferred Alternative, and therefore, adverse impacts from the I-710 Corridor Project build alternatives in combination with other projects to invasive species would not occur, and the adoption of this Preferred Alternative would not require any avoidance, minimization, and/or mitigation measures. However, the following avoidance, minimization, and/or mitigation measures are retained in this Final EIR/EIS for disclosure purposes.

CON-INV-1

Prior to construction, a *Caulerpa taxifolia* (nonnative seaweed/algae) survey will be conducted in tidally-influenced portions of the project limits within the Los Angeles River according to the National Marine Fisheries Service (NMFS) Control Protocol. If this species is found, then protocols for the eradication of *Caulerpa* will be implemented to remove this species from the I-710 Corridor Project Study Area. The 2008 *Caulerpa* Control Protocol will be followed, which requires survey results to be submitted to the NMFS and the California Department of Fish and Wildlife (CDFW)

within 15 days of completion. This protocol also requires that the National Oceanic and Atmospheric Administration (NOAA) and CDFW be notified within 24 hours if *Caulerpa* is identified at a permitted project site.

CON-INV-2

Prior to the use of equipment in aquatic situations, the equipment will be thoroughly cleaned and inspected to prevent the introduction of nonnative aquatic species, especially mollusks, in accordance with CDFW Aquatic Invasive Species Decontamination Protocol.

CON-INV-3

A weed abatement program will be developed to minimize the importation of nonnative plant material during and after construction. Eradication strategies will be employed should an increase in invasive plants occur.

At a minimum, this program would include:

- During construction, the Construction Contractor shall inspect and clean construction equipment at the beginning and end of each day and prior to transporting equipment from one project location to another.
- During construction, soil and vegetation disturbance will be minimized to the greatest extent feasible.
- During construction, the Construction Contractor shall ensure that all active portions of the construction site are watered a minimum of twice daily or more often when needed due to dry or windy conditions to prevent excessive amounts of dust.
- During construction, the Construction Contractor shall ensure that all material stockpiled is sufficiently watered or covered to prevent excessive amounts of dust.
- During construction, soil/gravel/rock will be obtained from weed-free sources.
- Only certified weed-free straw, mulch, and/or fiber rolls will be used for erosion control.
- After construction, affected areas adjacent to native vegetation will be revegetated with plant species approved by the Caltrans District Biologist that are native to the vicinity.
- After construction, all revegetated areas will avoid the use of species listed in California Invasive Plant Council's (Cal-IPC) California Invasive Plant Inventory that have a high or moderate rating.

- Eradication procedures (e.g., spraying and/or hand weeding) will be outlined should an infestation occur; the use of herbicides will be prohibited within and adjacent to native vegetation, except as specifically authorized and monitored by the Caltrans District Biologist.

3.24.4.22 CUMULATIVE

For any build alternative, and should all or part of the any build alternative be under construction at the same time as any of the major projects listed in Table 3.25-2 in Section 3.25, Cumulative Impacts, of this Final EIR/EIS, the following measure would be implemented:

CON-CUM-1 Prior to completion of Plans, Specifications, and Estimates for construction, Caltrans shall consult with the lead agencies of other major projects within two miles of the I-710 Corridor Project to ensure that the construction plans are coordinated and do not result in conflicts regarding construction staging areas, roadway closures, detour routes, or commitments to reduce cumulative air quality impacts.

3.25 CUMULATIVE IMPACTS

This section discusses the cumulative impacts of the Interstate 710 (I-710) Corridor Project. Construction and operation of either of the two build alternatives evaluated in this Final Environmental Impact Report/Environmental Impact Statement (Final EIR/EIS) could result in direct and/or indirect impacts that, when combined with other projects, would contribute to cumulative impacts to resources of concern.

3.25.1 REGULATORY SETTING

Cumulative impacts are those that result from past, present, and reasonably foreseeable future actions, combined with the potential impacts of the I-710 Corridor Project build alternatives. A cumulative effect assessment looks at the collective impacts posed by individual land use plans and projects. Cumulative impacts can result from individually minor, but collectively substantial impacts taking place over a period of time.

Cumulative impacts to resources in the Study Area may result from residential, commercial, industrial, and highway development, as well as from agricultural development and the conversion to more intensive types of agricultural cultivation. These land use activities can degrade habitat and species diversity through consequences such as displacement and fragmentation of habitats and populations, alteration of hydrology, contamination, erosion, sedimentation, disruption of migration corridors, changes in water quality, and introduction or promotion of predators. They can also contribute to potential community impacts identified for these projects, such as changes in community character, traffic patterns, housing availability, and employment.

California Environmental Quality Act (CEQA) Guidelines, Section 15130, describe when a cumulative impact analysis is warranted and what elements are necessary for an adequate discussion of cumulative impacts. The definition of cumulative impacts, under CEQA, can be found in Section 15355 of the CEQA Guidelines. A definition of cumulative impacts, under National Environmental Policy Act (NEPA), can be found in 40 Code of Federal Regulations (CFR), Section 1508.7 of the Council on Environmental Quality (CEQ) Regulations.

3.25.2 METHODOLOGY

The cumulative impacts analysis for the I-710 Corridor Project was developed by following the eight-step process as set forth in the *Guidelines for Preparers of Cumulative Impact Analysis* (California Department of Transportation [Caltrans, June 2005]), posted on the Caltrans Standard Environmental Reference (SER) website (http://www.dot.ca.gov/ser/cumulative_guidance/purpose.htm). The eight-step process is as follows:

1. Identify the resources to consider in the cumulative impacts analysis by gathering input from knowledgeable individuals and reliable information sources. This process is initiated during project scoping and continues throughout the NEPA/CEQA analysis.
2. Define the geographic boundary or Resource Study Area (RSA) for each resource to be addressed in the cumulative impacts analysis.
3. Describe the current health and historical context of each resource.
4. Identify the direct and indirect impacts of the proposed project that might contribute to a cumulative impact on the identified resources.
5. Identify a set of other current and reasonably foreseeable future actions or projects and their associated environmental impacts to include in the cumulative impacts analysis.
6. Assess cumulative impacts.
7. Report the results of the cumulative impacts analysis.
8. Assess the need for mitigation and/or recommendations for actions by other agencies to address a cumulative impact.

As specified in the Caltrans guidance, if the proposed project would not result in a direct or indirect impact to a resource, it would not contribute to a cumulative impact on that resource. This cumulative impacts analysis includes resources that would be substantially impacted by the build alternatives, as well as resources that are currently in poor or declining health or that would be at risk even if impacts resulting from the build alternatives were not substantial.

Examples of reasonably foreseeable actions include: future development for which a General Plan or Specific Plan has been adopted that designates future land uses; projects for which the applicable jurisdiction has received an application for site development; or infrastructure improvement projects planned by the local jurisdiction or another public agency. The reasonably foreseeable actions used in this cumulative impacts analysis were based on information provided by the Cities of Bell, Bell Gardens, Carson, Commerce, Compton, Cudahy, Downey, Huntington Park, Lakewood, Long Beach, Los Angeles, Lynwood, Maywood, Paramount, Signal Hill, South Gate, and Vernon, which identified approved and pending developments proposed in proximity to the Study Area. For the purposes of this cumulative impacts analysis, *proximity to the Study Area* is encompassed by the RSA defined for each environmental topic listed below in accordance with the *Guidelines for Preparers of Cumulative Impact Analysis* (Caltrans, June 2005). These files were cross-checked against files maintained by the State of California, Office of Planning and Research. Information on future transportation projects was provided by Caltrans, Southern California Association of Governments (SCAG), Los Angeles County Metropolitan Transportation Authority (Metro), and the Gateway Cities Council of Governments (Gateway Cities COG). The Port of Los Angeles (POLA) and the Port of Long Beach (POLB)

(collectively known as the Ports) also identified Port improvement projects that should be considered in the cumulative impacts analysis. The reasonably foreseeable actions are listed in Table 3.25-1 and shown on Figure 3.25-1. Although all of the projects listed in Table 3.25-1 have the potential to result in cumulative impacts together with the I-710 Corridor Project build alternatives, a subset of major projects expected to have a greater potential for adverse impacts on the environment were researched and analyzed in greater depth for purposes of this cumulative analysis. These projects and their anticipated construction schedules are listed in Table 3.25-2 and are discussed in the Environmental Consequences section.

3.25.3 RESOURCES EXCLUDED FROM CUMULATIVE IMPACTS ANALYSIS

The I-710 Corridor Project build alternatives would involve improving an existing freeway in order to improve air quality and reduce public health risk, improve mobility, reduce delay, improve safety features, and address projected growth in population, employment, and economic activities related to goods movement. Based on the scope of the build alternatives, the affected environment of the Study Area, and the technical studies prepared for this Final EIR/EIS, the following resources would not be substantially impacted by the build alternatives and are not at risk:

- **Farmlands and Timberlands:** There are no timberlands or prime, unique, or soils of local significance for farmlands within the general Study Area. Therefore, there are no recognized environmental concerns related to farmlands and timberlands for any of the build alternatives.
- **Hazardous Waste and Materials:** As discussed in Section 3.12 of the Final EIR/EIS, operation and maintenance of the facilities proposed as part of Alternatives 5C and 7 would not introduce new sources of hazardous waste and materials, but would continue existing exposure to the transport of hazardous waste and materials associated with vehicles currently utilizing the I-710 Corridor. The build alternatives would improve safety for vehicles transporting hazardous materials. For any build alternative, routine maintenance activities would be required to follow applicable regulations with respect to handling and disposal of potentially hazardous materials. No new permanent hazardous waste/materials impacts beyond existing conditions related to hazardous materials are anticipated as a result of the build alternatives; therefore, there would be no adverse cumulative effects related to hazardous waste and materials.

3.25.4 RESOURCES EVALUATED FOR CUMULATIVE IMPACTS

Given the level of effect identified in the technical studies and the analysis throughout this Final EIR/EIS, potential cumulative effects related to the following resources and environmental topics may result from implementation of the build alternatives. Each of these topics is discussed below.

This page intentionally left blank

Table 3.25-1: Past, Present and Foreseeable Future Projects in the I-710 Corridor Study Area

| Project ID No. | Project Title | Major Project | Lead Agency | Project Description | Project Status | Relevant Cumulative Environmental Factors |
|--------------------------------|---|---------------|---|--|--|---|
| Transportation Projects | | | | | | |
| T-1 | I-710 Long Life Pavement Rehabilitation Project (Atlantic Ave. to I-10) | No | California Department of Transportation (Caltrans) | <ul style="list-style-type: none">The project would rehabilitate this segment of the route by overlaying the existing mainline pavement with asphalt concrete (AC), upgrading the median barrier, and constructing maintenance pullouts along the route to enhance safety for maintenance crews. Project will widen shoulders and structures to current standards. Project will also install fiber optic lines for Closed Circuit Television (CCTV), Changeable Message Signs (CMS), Ramp Metering System (RMS), and Traffic Monitoring System (TMS) for traffic management during construction and for future use. The Atlantic Blvd. undercrossing and the Compton Creek Bridge will be widened. | <p>The project began with the I-710 segment from Pacific Coast Hwy. to I-405 and was completed in November 2003. Construction of the I-710 segment from I-405 to Firestone Blvd. (with widening of structures from I-405 to Atlantic Ave.) began construction in summer 2007. Construction of the I-710 segment from Imperial Hwy. to Firestone Blvd. began in October 2008 and was completed in 2012. Construction of the I-710 segment from Firestone Blvd. to Slauson Ave. began in October 2009 and construction of the I-710 segment from Slauson Ave. to I-10 (with widening of structures from the Los Angeles River bridge to I-10) is under construction. The majority of the mainline roadway pavement work has been completed. The entirety of the project is anticipated to be complete by 2022.</p> <p>(Source: Caltrans Website, www.dot.ca.gov/dist07)</p> | Noise barriers were originally planned to be included with this project but were withdrawn from the project scope due to the lack of funding. |
| T-2 | SR-710 North Project (previously identified as the SR-710 Project in the 2012 I-710 Corridor Draft EIR/EIS) | Yes | Caltrans/Los Angeles County Metropolitan Transportation Authority (Metro) | <ul style="list-style-type: none">The proposed project is intended to close a gap in the freeway system between the northerly terminus of I-710 and I-210. The new project will consider a full range of alternatives and, depending on the results of a thorough environmental analysis of all possible transportation improvements during the NEPA/CEQA process, may include, but not be limited to: surface and subsurface highway/freeway construction, heavy rail and bus/light rail systems, local street upgrades, traffic management systems and a no build alternative. | <p>A Final EIR/EIS was publicly circulated in November 2018. The Final EIR/EIS identifies the Transportation System Management/Transportation Demand Management (TSM/TDM) Alternative as the Preferred Alternative. Metro is currently working with cities in the San Gabriel Valley to implement the TSM/TDM projects identified in the Final EIR/EIS. No construction schedule has been established yet.</p> <p>(Sources: http://www.metro.net/projects_studies/route_710/; https://www.metro.net/projects/sr-710-conversations/, accessed January 22, 2019, https://www.metro.net/projects/sr-710-mobility-improvements/, accessed August 14, 2023)</p> | <p>Land Use Community Impacts Utilities Traffic Visual Hydrology and Floodplains Water Quality and Storm Water Runoff Geology, Soils, Seismic, and Topography Hazardous Waste and Materials Air Quality Noise Energy Natural Communities</p> <p>Soundwalls, relocation assistance, construction impact management and other mitigation measures will be incorporated into the proposed project.</p> |
| T-3 | Firestone Blvd. Bridge Widening over Los Angeles River Project | No | City of South Gate/ Caltrans District 7 | <ul style="list-style-type: none">The project would widen Firestone Blvd. on the south side, add a traffic lane in the eastbound direction, modify the southbound on-ramp to I-710, and retrofit the bridge for compliance with the latest seismic standards. This project is an Early Action Project of the I-710 Corridor Project. | <p>A Draft EIR for the project was prepared in July 2007.</p> <p>Construction of the project commenced in March 2016 and the first phase of the project has been completed, which included widening of the Firestone Boulevard Bridge over the Los Angeles River on the south side of the street. The I-710/ Firestone Southbound On-Ramp Modification Project is the second phase of the project, and is currently in the design and environmental phase. Design phase is planned for completion in December of 2023.</p> <p>(Sources: City of South Gate CIP list August 2007; Daniel Gruezo Assistant Engineer; and http://www.cityofsouthgate.org/506/Capital-Improvement-Program-CIP, https://www.cityofsouthgate.org/Government/Departments/Public-Works/Capital-Improvement-Program-Projects/I-710-Firestone-Bridge-Southbound-On-Ramp, accessed August 14, 2023)</p> | The EIR concluded that the project would not adversely contribute to cumulative effects in conjunction with other projects. |

| Project ID No. | Project Title | Major Project | Lead Agency | Project Description | Project Status | Relevant Cumulative Environmental Factors |
|----------------|---|---------------|-------------|--|--|--|
| T-4 | I-5 Widening and HOV Lane (Orange County Line to I-605) | Yes | Caltrans | <ul style="list-style-type: none"> The project would widen I-5 with a high-occupancy vehicle (HOV) Lane and Mixed Flow lane in each direction (widen from three to five lanes in each direction). The Valley View Ave. interchange would be reconstructed to a tight-diamond interchange. | <p>A Final Environmental Impact Report/Environmental Impact Statement (EIR/EIS) was prepared for this project by Caltrans in June 2007. The project is under construction and will be completed by 2021.</p> <p>(Sources: http://www.dot.ca.gov/dist07/resources/envdocs/docs/I-5_CIP_Final_EIR-EIS_VI.pdf, accessed December 23, 2009; http://my51a.com/i-5-south/, accessed January 22, 2019)</p> | <p>Land Use Community Impacts Utilities Visual Noise Biological</p> <p>Short-term transportation, water quality, hazardous waste, and energy</p> |
| T-5 | I-5 Corridor Improvement Project (I-605 to I-710) | Yes | Caltrans | <ul style="list-style-type: none"> The project would widen I-5 from I-605 to I-710 (a total of eight miles). An alternative may include modifications to the I-605 and I-710 interchanges. | <p>The Draft EIR/EIS document does not currently have a scheduled circulation date.</p> <p>(Source: Caltrans)</p> | <p>Environmental impacts have not been determined at this time. Information will be added, if the Draft EIR/EIS becomes available during the environmental process for the I-710 Corridor Project. Expected issues of concern are traffic, residential and business relocations, noise, air quality, utility relocations, and historic properties.</p> |
| T-6 | I-5 at Carmenita Rd. Interchange Improvement Project | No | Caltrans | <ul style="list-style-type: none"> The project would replace the Carmenita Rd. interchange by removing the existing two-lane structure and constructing a new interchange with tight diamond ramps; construct a grade separation for the railroad crossing south of the freeway. The frontage roads would be realigned. I-5 would be widened from Alondra Blvd. to Shoemaker Ave. | <p>An Initial Study/Environmental Assessment (IS/EA) and Final Negative Declaration/Finding of No Significant Impact (ND/FONSI) was prepared for this project in March 2002. Construction began on the project in August 2008 and was completed in 2018.</p> <p>(Sources: Caltrans Website, www.dot.ca.gov/dist07; http://my51a.com/i-5-south/, accessed January 22, 2019)</p> | <p>The ND/FONSI determined that the project would not contribute to cumulative effects in the project area.</p> |
| T-7 | I-10/I-605 Direct Connector Project | No | Caltrans | <ul style="list-style-type: none"> The project would construct a direct connector from southbound I-605 to eastbound I-10. | <p>A Mitigated Negative Declaration/Finding of No Significant Impact (MND/FONSI) was prepared for this project in January 2009.</p> <p>Construction began in October 2012 and was completed in November 2015.</p> <p>(Sources: Caltrans Website, www.dot.ca.gov/dist07; http://www.dot.ca.gov/d7/projects/10/10-hov.html, accessed January 22, 2019)</p> | <p>The MND/FONSI determined that the project's contribution to cumulative impacts would be less than cumulatively considerable, and no additional mitigation measures were required.</p> |
| T-8 | San Bernardino Freeway (Interstate 10) add one HOV Lane from I-605 to State Routes 57/71 and Interstate 210 | No | Caltrans | <ul style="list-style-type: none"> The project would construct one HOV lane in each direction on I-10 between I-605 and SR-57/SR-71/I-210 interchange. | <p>An IS/EA MND was prepared for this project in October 2002. Construction on the first phase began in November 2009. Construction of Phase 2 began in 2013, with completion anticipated in 2019. Construction of Phase 3 began in April 2016, with completion anticipated for 2021.</p> <p>(Source: Caltrans Website, www.dot.ca.gov/dist07)</p> | <p>The IS/EA MND determined that the project would not contribute to a substantial cumulative adverse impact on the environment.</p> |
| T-9 | I-10 (San Bernardino Freeway/El Monte Busway) High Occupancy Toll Lanes Project (from Alameda St. to I-605) (Union Station) | No | Caltrans | <ul style="list-style-type: none"> The project would convert the existing HOV lanes to High Occupancy Toll (HOT) lanes and restripe the existing facility to add an additional HOT lane by utilizing the wide buffer areas and median shoulders and mixed flow lanes on the I-10 from Alameda St./Union Station to I-605. | <p>A Final EIR/EA FONSI (April 2010) was prepared for this project. Construction began in 2011 and the Express lanes are currently operational.</p> <p>(Sources: www.dot.ca.gov/dist07/resources/envdocs/alldocs.php; and SCAG RTIP List, Caltrans District 7)</p> | <p>If the I-10 Restoration project construction activities overlap with construction of the I-10 HOT lanes project, there may be temporary cumulative construction-related impacts, including noise, dust and impacts to access routes in the project area.</p> |
| T-10 | I-10 (I-605 to Puente Ave.) | No | Caltrans | <ul style="list-style-type: none"> Widen by one HOV lane in each direction. | <p>Construction was completed in 2013.</p> <p>(Source: San Bernardino Freeway (I-10) High Occupancy Vehicle Lane Project, http://www.dot.ca.gov/d7/projects/docs/10/10HOV%20Info%20FAQ.pdf – accessed December 27, 2016)</p> | <p>The project is completed; no cumulative factors would contribute to a substantial cumulative adverse impact on the environment.</p> |

| Project ID No. | Project Title | Major Project | Lead Agency | Project Description | Project Status | Relevant Cumulative Environmental Factors |
|----------------|---|---------------|-----------------------------|--|--|---|
| T-11 | I-10 (Puente Ave. to Citrus) | No | Caltrans | <ul style="list-style-type: none">Widen by one HOV lane in each direction. | Construction began in Summer 2014 and is anticipated to be complete in 2019. (Sources: San Bernardino Freeway (I-10) High Occupancy Vehicle Lane Project, http://www.dot.ca.gov/d7/projects/docs/10/10HOV%20Info%20FAQ.pdf – accessed December 27, 2016; and Final Environmental Impact Report for Add One High Occupancy Vehicle Lane in Each Direction on the San Bernardino Freeway (Interstate 10) from Puente Avenue to State Routes 57/71 in Los Angeles County, June 2012, http://www.dot.ca.gov/d7/env-docs/docs/I-10_HOV_FEIR_062512.pdf - accessed December 27, 2016) | Simultaneous construction activities of other projects near I-10 have the potential to result in temporary cumulative traffic impacts during construction. Cumulatively beneficial traffic and air quality impacts during operation. |
| T-12 | I-10 (Citrus to Route 57/71) | No | Caltrans | <ul style="list-style-type: none">Widen by one HOV lane in each direction. | Construction began in April 2016 is anticipated to be complete in Summer of 2021. (Sources: San Bernardino Freeway (I-10) High Occupancy Vehicle Lane Project, http://www.dot.ca.gov/d7/projects/docs/10/10HOV%20Info%20FAQ.pdf – accessed December 27, 2016; and Final Environmental Impact Report for Add One High Occupancy Vehicle Lane in Each Direction on the San Bernardino Freeway (Interstate 10) from Puente Avenue to State Routes 57/71 in Los Angeles County, June 2012, http://www.dot.ca.gov/d7/env-docs/docs/I-10_HOV_FEIR_062512.pdf - accessed December 27, 2016) | Simultaneous construction activities of other projects near I-10 have the potential to result in temporary cumulative traffic impacts during construction. Cumulatively beneficial traffic and air quality impacts during operation. |
| T-13 | The I-110 (Harbor Freeway)/Transitway High-Occupancy Toll Lanes Project (182 nd St. to Adams Blvd.) and on I-105 from Crenshaw Blvd. to Compton Ave. | No | Caltrans | <ul style="list-style-type: none">The project would build a flyover structure from the northbound I-110 HOV off-ramp directly to Figueroa St. and on I-110 from 182nd St./Artesia Transit Center to Adams Blvd. | A Final EIR/EA FONSI (April 2010) was prepared for this project. Construction began in 2010 and was completed in November 2012. (Sources: www.dot.ca.gov/dist07/resources/envdocs/doc , and SCAG RTIP List, Caltrans District 7) | The Final EIR/EA FONSI concluded that there are no cumulative impacts anticipated for this project. |
| T-14 | I-110 Freeway Access Ramp SR-47 and I-110 Northbound Connector Widening (John S. Gibson Blvd. Interchange) | No | Port of Los Angeles (POLA) | <ul style="list-style-type: none">The project would extend the existing off-ramp at John S. Gibson Blvd.Modify to a two-lane exit and restripe to accommodate one shared through and left-turn lane and one exclusive right lane.Create an additional left-turn lane on southbound John S. Gibson Blvd. for traffic destined to Port terminals.Enhance the operation and safety of the I-110/SR-47/Harbor Blvd. interchange connector. | A Draft MND/FONSI was publicly circulated in August 2011. Construction began September 2011 and was completed June 2016. (Source: http://www.portoflosangeles.org/MND/Gibson/IS-EA_Text+Appendices_June%202011.pdf) | Traffic Noise |
| T-15 | I-405 (Wilmington Ave./223 rd St.) | No | Caltrans and City of Carson | <ul style="list-style-type: none">The project would widen the existing southbound on- and off-ramps of the I-405/Wilmington Ave. interchange (widen from two to three lanes).Add a new two-lane northbound on-ramp from southbound Wilmington Ave.Widen Wilmington Ave. in the northbound direction from 223rd St. to I-405 northbound off-ramp (widen from three to four lanes). | An IS/EA with MND/FONSI was prepared for this project in November 2008. Construction of the project began in November 2013 and was completed in early 2017. (Sources: Caltrans Website, www.dot.ca.gov/dist07 and http://i405wilmington.com/wp/wp-content/uploads/2013/10/I-405-Wilmington-Ave.-FAQs-2-2-16.pdf) | Simultaneous construction activities of other projects near the I-405 have the potential to result in temporary cumulative impacts during construction. |
| T-16 | I-405 Interchange Improvements at Avalon Blvd. | No | Caltrans and City of Carson | <ul style="list-style-type: none">The project would add one lane in the northbound direction on Avalon Blvd. under I-405 (widen from three to four lanes).Construct a new two-lane on-ramp to southbound I-405.Add two lanes to northbound off-ramp (widen from one to three lanes), two lanes to southbound off-ramp (widen from one to three lanes).Construct five-lane connector road from southbound off-ramp to Avalon Blvd. (widening from two to three lanes within existing Caltrans right-of-way). | An IS/EA with ND/FONSI was prepared for this project in March 2009. Construction of the project was completed in 2012. (Sources: 710 Alts Doc and IS/MND for project; and http://ci.carson.ca.us/content/files/pdfs/latestnews/trafficAlert_fall2011.pdf) | The IS/EA with ND/FONSI concluded that there are no cumulative impacts anticipated for this project. |

| Project ID No. | Project Title | Major Project | Lead Agency | Project Description | Project Status | Relevant Cumulative Environmental Factors |
|----------------|--|---------------|--|---|--|---|
| T-17 | I-405 (Euclid Ave. to I-605) | No | Caltrans | <ul style="list-style-type: none"> Add one general purpose lane in each direction. | <p>A Final EIR was completed for this project in March 2015. The project was approved by Caltrans in March 2015 and the Orange County Transportation Authority in September 2015. Construction of this project began in 2018 and is anticipated to be completed in mid-2023.</p> <p>(Source: Caltrans District 12 Website, http://www.dot.ca.gov/dist12/DEA/405/index.php#DEIS; https://www.octa.net/Projects-and-Programs/Under-Construction/I-405-Improvement-Project/?frm=7135, accessed August 14, 2023)</p> | None |
| T-18 | SR-60 Freeway Improvement Project | No | Caltrans | <ul style="list-style-type: none"> The project would construct HOV lanes in both directions on SR-60 between SR-57 and I-605. A total of 11.5 miles of new carpool lanes are being constructed in each direction. The project includes bridge and lane widening, reconstruction of the median barrier, and the realignment of four on-ramps. | <p>An IS/ND was prepared for this project. Construction began in April 2007 and was completed in 2011.</p> <p>(Source: Caltrans Website, www.dot.ca.gov/dist07)</p> | The ND concluded that the project would not have a significant effect on the environment and would not have cumulative effects. |
| T-19 | SR-22 West County Connectors Project | No | Orange County Transportation Authority (OCTA), Caltrans and FHWA | <ul style="list-style-type: none"> The project would include additional carpool lanes on the I-405 between SR-22 and I-605 in both directions. HOV direct connectors between SR-22/I-405/I-605 freeways. Reconstruction of Valley View St. and Seal Beach Blvd. bridges. | <p>A Final EIR/EIS was prepared for this project and approved in March 2003. Construction of the project began in 2010 and was completed in February 2015.</p> <p>(Sources: OCTA Website, Caltrans District 12 website, http://www.dot.ca.gov/dist12/files/sr22EIR/, and http://www.dot.ca.gov/hq/paffairs/news/pressrel/2015/15pr014.htm)</p> | <p>Potential construction noise issues if combined with other simultaneous construction projects near the project area.</p> <p>Visual impacts (loss of trees).</p> |
| T-20 | SR-22 (SR-55 to I-405) | No | Orange County Transportation Authority (OCTA) | <ul style="list-style-type: none"> Add one HOV lane in each direction. | This project has been completed. | None |
| T-21 | SR-47 Expressway Project (Schuyler Heim Bridge Replacement and construct Expressway and Flyover) | Yes | Caltrans and Alameda Corridor Transportation Authority (ACTA) | <ul style="list-style-type: none"> The project would replace the Schuyler Heim Bridge over Cerritos Channel with a fixed span bridge connecting to a new limited-access four-lane elevated highway that parallels Henry Ford Ave. and that merges with Alameda St. Construct new two-lane flyover to divert eastbound Ocean Blvd. traffic directly to northbound SR-47 and across the new bridge. | <p>A Final EIS/EIR was prepared for this project, dated May 2009. A Record of Decision was prepared for the project in August 2009. The Schuyler Heim Bridge Replacement was completed in 2017; expressway construction is postponed indefinitely pending further evaluation of demand, benefits, costs and funding.</p> <p>(Source: Caltrans Website, http://www.dot.ca.gov/dist07/resources/envdocs/docs/SR-47_FEIS-FEIR_full_5-09.pdf - accessed August 14, 2023)</p> | <p>Community impacts</p> <p>Parking</p> <p>Visual</p> <p>Cultural</p> <p>Geology</p> <p>Air quality</p> <p>Noise</p> <p>Biological</p> <p>Short-term transportation, water quality, hazardous waste, air quality, and noise impacts during construction activities.</p> |
| T-22 | ACTA Track Realignment, West Basin Rail Yard–Rail Enhancement Project | No | Various Agencies | <ul style="list-style-type: none"> The project would install a Track Realignment south of the Thenard Junction (ACTA). West Basin Rail Yard (part of Ports Rail Enhancement). | <p>Phase I of the Thenard Junction track connection was completed in July 2008. Construction of Phases II and III began in 2013 and were completed in 2014. An EIS/SEIR document is to be prepared for the West Basin Phase II and III projects.</p> <p>(Source: POLA website www.portoflosangeles.org/)</p> | Environmental impacts have not been determined at this time. |
| T-23 | Terminal Island Wye Track Realignment–Rail Enhancement Project | No | Port of Long Beach (POLB) | <ul style="list-style-type: none"> The project would install the Terminal Island Wye Track Realignment. | <p>An EIR was prepared for this project. Construction of the project was originally anticipated to begin in March 2019, but had not begun as of December 2022.</p> <p>(Source: POLB CIP, Department of Transportation website, www.dot.ca.gov/hq/transprog/ctcbooks/2009/1209/062_4.2.pdf)</p> | Environmental impacts have not been determined at this time. |
| T-24 | Grade Separation at Reeves Crossing and Navy Mole Storage Yard–Rail Enhancement Project | No | POLA/POLB | <ul style="list-style-type: none"> The project would include the closure of the Reeves At-Grade Crossing. Construction of the Navy Mole Rd. Storage Rail Yard. |----------------|---|---------------|--|--|--|---|
| P-14 | SSA Outer Harbor Fruit Facility Relocation | No | City of Los Angeles Harbor Department (POLA) | <ul style="list-style-type: none">The project would relocate the existing fruit import facility at 22nd and Miner to Berth 153. | <p>An EIR was to be prepared for this project. The project is on hold.</p> <p>(Source: SR-47 Cumulative List, POLB website, included in the Schuyler Heim Bridge Replacement and SR-47 Expressway Project Final EIS/Final EIR and Section 4(f) Evaluation posted at http://www.dot.ca.gov/dist07/resources/envdocs/; www.polb.com/civica/filebank/blobdload.asp?BlobID=7107)</p> | <p>Transportation impacts</p> <p>Air quality impacts</p> |
| P-15 | ILWU Local 13 Dispatch Hall Project | No | Los Angeles Harbor Department | <ul style="list-style-type: none">The project site is located at 1500 E. Anaheim St., in Los Angeles. The project would construct a two-story, 32,565 square-foot Dispatch Hall that would provide a meeting space and administrative offices for dispatching longshore workers within the Ports of Los Angeles and Long Beach.The project includes an 812-space dedicated on-site parking lot. | <p>A Final IS/MND (May 12, 2011) was prepared for this project. A Mitigated Negative Declaration was approved in 2016, along with an Addendum to the Final Project.</p> <p>Construction began in July 2012 and its grant opening was held in late 2018.</p> <p>(Source: www.portoflosangeles.org/MND/ILWU/mnd_ilwu.asp, https://ilwu46.com/video-grand-opening-of-the-ilwu-local-13-dispatch-hall/, accessed August 15, 2023)</p> | <p>With the proposed mitigation for the project, the Draft IS/MND concluded that the project would not have any individually limited or cumulatively considerable impacts. The 2016 Addendum to the Final IS/MND identifies a 2.75-acre location immediately south of the project site to accommodate 256 additional parking spaces. The addition requires minor physical improvements but does not generate any new significant environmental impacts.</p> |
| P-16 | City Dock No. 1 Marine Research Center Project | No | Los Angeles Harbor Department | <ul style="list-style-type: none">The project is located within the San Pedro Waterfront Plan area, which is approximately 400 acres, along the west side of the Los Angeles Harbor's Main Channel.The Port of Los Angeles and the Southern California Marine Institute (SCMI) have been working together to create marine research center.The project would develop a research center in the Port of Los Angeles, at Berths 56-60 and 70-71.The center would provide world-class facilities including laboratories, offices, classrooms, a lecture hall/auditorium and storage space to conduct marine research. The berths would provide a docking area for research vessels, from small vessels to large 250-to-300-foot vessels.The facility would include the world's largest wave tank using seawater for research activities. | <p>An EIR was prepared in 2012 and certified in 2013.</p> <p>The center's design was unveiled in 2016, and bidding for development began in 2019. In 2022, West campus renovation began, and in 2023, construction began for the Center of Innovation. The facility is expected to open in 2023.</p> <p>(Source: https://www.portoflosangeles.org/pola/pdf/eir/citydock/feir/citydock_feir_september2012.pdf, https://altasea.org/first-look-altasea-port-las-huge-marine-research-center-2/#:~:text=The%20Science%20Hub%20should%20be,science%2C%20math%2C%20and%20tech. Accessed August 15, 2023)</p> | <p>The checklist analysis concluded that the project would potentially result in significant impacts to biological resources, historic and archaeological resources, and would result in a cumulatively considerable contribution to greenhouse gas emissions, during construction. The Final EIR found that effects to air quality during construction would be less than significant with mitigation.</p> |
| P-17 | Al Larson Boat Shop Improvement Project | No | Los Angeles Harbor Department | <ul style="list-style-type: none">The project is located at 1046 Seaside Ave., Terminal Island.The project would redevelop the existing boat shop to modernize the facility, comply with National Pollution Discharge Elimination System permit and Water Discharge Requirement and to improve the shop's ability to build and repair ships and vessels.Improvements would include maintenance dredging to ensure access of vessels to the site, reuse of dredging material to construct two confined disposable facilities that would add approximately one acre of new land to the facility.The project will be constructed in three phases to minimize operational impacts to the facility. | <p>An NOP for a Draft EIR was prepared in September 2010 for the project. Operation of the project would occur under a new 30-year lease and is now complete.</p> <p>(Source: www.portoflosangeles.org/NOP/Al_Larson/NOP_Final.pdf)</p> | <p>No information regarding environmental impacts has been found at this time.</p> |
| P-18 | Berths 302-306 [APL] Container Terminal Project | No | Los Angeles Harbor Department and U.S. Army Corps of Engineers | <ul style="list-style-type: none">The project is located on Terminal Island and would redevelop and expand a container terminal at Berths 302-306 in the Port of Los Angeles.The project includes extending the existing concrete wharf by 1,250 linear feet to add Berth 306, add new cranes to Berths 302-306 and expand the existing terminal with an additional 56 acres. | <p>The Draft EIS for this project was completed in February 2012. The project's scope was decreased and a new EIR Addendum was certified in May 2021.</p> <p>(Source : www.portoflosangeles.org/EIR/APL/DEIR/APL_Final_EIS_EIR_May%202012.pdf, accessed June 2012) https://ceqanet.opr.ca.gov/2009071031/5 accessed August 15, 2023)</p> | <p>The Draft EIS concluded that there would be unavoidable significant impacts to air quality, GHG, and biological resources.</p> <p>There would be less than significant impacts with mitigation to traffic and noise.</p> |

|----------------|--|---------------|---|---|---|--|
| P-19 | Middle Harbor Redevelopment Project | Yes | City of Long Beach Board of Harbor Commissioners (POLB) | <ul style="list-style-type: none">The project would redevelop, expand, and modernize the existing waterfront property that is part of the Middle Harbor area of the POLB and Port lands to accommodate a portion of the forecasted increases in containerized cargo throughput volumes. | <p>The Final EIR/EIS was prepared in April 2009. Construction started in May 2011 and was completed in 2022.</p> <p>(Source: http://www.polb.com/civica/filebank/blobdload.asp?BlobID=6227 – accessed May 2012, https://p2sinc.com/projects/port-of-long-beach-middle-harbor-redevelopment accessed August 15, 2023).</p> | <p>Community impacts Emergency response times Utilities Transportation (impacts to I-710 highway segment between Willow St. and Pacific Coast Hwy.) Cultural Air quality Biological</p> <p>Short-term transportation, water quality, hazardous waste, air quality, and noise impacts during construction activities.</p> |
| P-20 | Gerald Desmond Bridge Replacement | Yes | POLB, Caltrans, Federal Highway Administration (FHWA) | <ul style="list-style-type: none">The project would replace the existing four-lane Gerald Desmond Bridge with new six-lane bridge (three lanes in each direction)Construct the Terminal Island East Interchange and I-710 connector ramps. | <p>A revised Final EIR/EA FONSI was prepared for this project in July 2010. Construction started in 2013 and was opened to traffic in 2020.</p> <p>(Source: https://www.polb.com/port-info/projects#gerald-desmond-bridge-replacement-project – accessed December 18, 2020)</p> | <p>Growth Utilities Transportation Visual (benefit) Geology Air quality Biological</p> <p>Short-term transportation, water quality, hazardous waste, air quality, and noise impacts during construction activities.</p> |
| P-21 | Piers G and J Terminal Redevelopment Project | No | City of Long Beach Board of Harbor Commissioners (POLB) | <ul style="list-style-type: none">The project would redevelop two existing marine container terminals into one terminal. The Piers G and J Redevelopment Project is in the Southeast Harbor Planning District area of the POLB. The project will develop a marine terminal up to 315 acres by consolidating two existing terminals on Piers G and J and several surrounding parcels. Construction will occur in four phases; it will include approximately 53 acres of landfills, dredging, concrete wharves, rock dikes, and road and railway improvements. | <p>An EIR was prepared for the project, and the project has been approved. Pier G redevelopment includes up to 16 separate construction phases. Most of the project elements under this program were completed by 2014. Some of the program elements are on hold (e.g., South Rail yard, South Slip fill, and Berth G236 extension).</p> <p>(Source: <i>SR-47 Cumulative List, included in the Schuyler Heim Bridge Replacement and SR-47 Expressway Project Final EIS/Final EIR and Section 4(f) Evaluation posted at http://www.dot.ca.gov/dist07/resources/envdocs/</i>)</p> | <p>Groundwater and soil impacts</p> <p>Air quality impacts</p> |
| P-22 | Pier A East and West Expansion Project | Yes | City of Long Beach Board of Harbor Commissioners (POLB) | <ul style="list-style-type: none">The Pier A expansion project would be located north of Cerritos Channel on both sides of Terminal Island Freeway. The project consists of the development of approximately 90 acres of oil production land. Additionally, an underpass linking the existing Pier A site to the expansion site would need to be constructed under the Terminal Island Freeway just north of the Schuyler Heim Bridge.Pier A East would redevelop 32 acres of the existing auto storage area into container terminal backlands.Pier A West would remove and dispose the contaminated soil from 19 sumps off site including oil wells, filling and paving. | <p>An EIR document was prepared for the Pier A West Project and was completed in 2009. This project is on hold.</p> <p>(Source: <i>SR-47 Cumulative List, included in the Schuyler Heim Bridge Replacement and SR-47 Expressway Project Final EIS/Final EIR and Section 4(f) Evaluation posted at http://www.dot.ca.gov/dist07/resources/envdocs/</i>)</p> | <p>Utilities Hazardous waste Air quality Noise</p> <p>Short-term transportation, water quality, hazardous waste, air quality, and noise impacts during construction activities.</p> |
| P-23 | Pier S Marine Terminal | Yes | City of Long Beach Board of Harbor Commissioners (POLB) | <ul style="list-style-type: none">The project would develop a 150-acre container terminal on Terminal Island. The Pier S site encompasses approximately 17 acres of former oil production land, which is currently undergoing remedial action. Following remediation and stabilization, the site will be brought up to grade and paved. The project calls for an existing riprap dike along Cerritos Channel to be realigned and a concrete, pile-supported wharf to be built. Additionally, terminal buildings, utilities, and a rail yard will be constructed. | <p>A Draft EIR/EIS was prepared for the project in September 2011. This project is currently in the conceptual design phase and construction is expected to start in February 2024.</p> <p>(Source: http://www.polb.com/environment/docs.asp – accessed May 2012, https://www.constructionjournal.com/projects/details/49793fe36de1439a99a5d8dfdb9d5827.html accessed August 15, 2023)</p> | <p>Emergency services Utilities Transportation Hydrology Water quality Geology Hazardous waste Air quality Noise Biological</p> <p>Short-term transportation, water quality, hazardous waste, air quality, and noise impacts during construction activities.</p> |

| Project ID No. | Project Title | Major Project | Lead Agency | Project Description | Project Status | Relevant Cumulative Environmental Factors |
|----------------|---|---------------|---|---|--|---|
| P-24 | Intermodal Container Transfer Facility (ICTF) | Yes | ICTF Joint Powers Authority (JPA) | <ul style="list-style-type: none"> The project would reconfigure the existing rail yard facility and add new train tracks within the ICTF. This facility transfers containers to and from trains. Replace the existing diesel-fueled rubber-tired gantry cranes with electric-powered wide-span gantry cranes. Improve the existing gate facilities and add parking. Increase the number of containers handled at the ICTF from the current annual average of 725,000 to an estimated 1.5 million annual average. | <p>An NOP/IS was released in January 2009. The construction start date is unknown, but the project is expected to take three to four years to complete.</p> <p>(Source: ICTF NOP, ICTF website, www.ictf-jpa.org/)</p> | <p>Utilities Visual Water quality Hazardous waste Air quality Noise</p> <p>Short-term transportation, water quality, hazardous waste, air quality, and noise impacts during construction activities.</p> |
| P-25 | Advanced Transportation Management Information System (ATMIS) | No | POLA, POLB and ACTA | <ul style="list-style-type: none"> The project would implement the Advanced Transportation Management and Information System (ATMIS) and Advanced Traveler Information System (ATIS) to improve traffic flow for both POLA and POLB and the adjacent regional transportation system. | <p>The project began in 2006 and was completed in late 2012. The ATMIS has been identified in the Caltrans Statewide Goods Movement Intelligent Transportation Systems Action Plan and is contained in the Caltrans Global Gateways Development Program.</p> <p>(Source: Baseline Alternatives Analysis, Port of Los Angeles Draft Portwide Rail Synopsis Report, July 2004)</p> | <p>This is a major component in the overall ITS program for the I-710 Corridor/Gerald Desmond Bridge Gateway Program. The ITS program would help to avoid and minimize potential cumulative impacts of the I-710 Corridor Project build alternatives.</p> |
| P-26 | POLB Administration Building | No | POLB | <ul style="list-style-type: none"> The project would construct a new administration building and maintenance facility along with public open space amenities on approximately 17 acres. | <p>An EIR for this project was completed in 2009. Subsequently, the POLB Administration Building site moved to Downtown Long Beach. However, construction of the POLB Maintenance Building, as initially proposed, was completed in 2013.</p> <p>(Source: POLB website, www.polb.com)</p> | <p>Transportation</p> <p>Temporary cumulative air quality impacts during construction activities.</p> <p>Cumulative contribution to short-term construction noise impacts.</p> |
| P-27 | Chemoil Tank Farm Modification Project | No | City of Long Beach, Board of Harbor Commissioners | <ul style="list-style-type: none"> The project would modify the existing Chemoil facility currently situated on 3.4 acres on Pier F by expanding to the west onto 0.7 acre of the existing Morton Salt lease area for a new total Chemoil site acreage of 4.1 acres and installing two additional petroleum storage tanks. | <p>An NOP has been prepared for this project. Construction of the project was expected to occur over a 26-month period. However, this project is currently on hold.</p> <p>(Source: POLB website, www.polb.com)</p> | <p>No information regarding environmental impacts has been found at this time.</p> |
| P-28 | Mitsubishi Cement Corporation Facility Modifications | No | Port of Long Beach | <ul style="list-style-type: none"> The project would expand the Mitsubishi Cement Corporation facility at Berth F208 into the adjacent property, install an emission control system (Dockside Catalytic Control System [DoCCS]), construct four additional cement storage silos, and upgrade ship unloading equipment. The additional cement storage silos and truck loading equipment would be constructed in the location formerly used as the warehouse for Pacific Banana operations. Upon completion of new silos, a new ship unloader would be added, the larger existing unloader would be upgraded, and the smaller existing unloader would be decommissioned. The existing and new cement storage silos would be connected to the existing and new ship unloaders via new piping. The current 4.21-acre terminal site would be increased to 5.92 acres. Silo construction would occur in two or more phases depending on the sequence in which silos are constructed. | <p>A Final EIR was published in October 2014. The project was approved by the Long Beach Board of Harbor Commissioners in 2015.</p> <p>(Source: www.polb.com/civica/filebank/blobdload.asp?BlobID=8645)</p> | <p>Potentially significant impacts include biological resources, GHG emissions, transportation/traffic, hazardous materials, air quality, hydrology/water quality, and noise.</p> |
| P-29 | Cemera Long Beach Aggregate Terminal | No | Port of Long Beach | <ul style="list-style-type: none"> The project consists of the construction and operation of a sand, gravel, and granite aggregate, receiving, storage and distribution terminal, and a ready-mix concrete plant at Pier B. The project would include two enclosed aggregate storage structures, each measuring 460 feet by 217 feet, a ready-mix concrete plant occupying approximately 1.6 acres of structures and pavement, an administrative office building, covered truck load-out stations, and paved internal access roads. The site is currently a designated brownfield through DTSC. The project would include soil and groundwater remediation. | <p>A Notice of Preparation was circulated for this project in June 2009. This project was moved to a different site on Pier D Street (project P-46). Project P-44 was constructed on the site.</p> <p>(Source: Office of Planning and Research, CEQAnet Database – accessed December 27, 2016)</p> | <p>None</p> |

| LD-33 | Tesoro Los Angeles Refinery Integration Project | No | South Coast Air Quality Management District; in the City of Carson | <ul style="list-style-type: none"> The project includes improvements to the refinery, including: (1) the Wilmington Operations located at 2101 East Pacific Coast Hwy. in the Wilmington District of the City of Los Angeles; and (2) the Carson Operations, which is the former BP Carson Refinery located at 2350 East 223rd St. in the City of Carson. The project is located at 223rd St. and Alameda St. | <p>A Draft EIR was circulated for this project in March 2016. The Final EIR was prepared in May 2017. The project was approved in June 2017. The project was challenged in court but the challenge was rejected in 2020. The challenge delayed the project and it has not begun construction yet.</p> <p><i>(Sources: Office of Planning and Research, CEQAnet Database – accessed December 12, 2016) and http://www.aqmd.gov/home/library/documents-support-material/lead-agency-permit-projects, Website accessed January 22, 2019. https://news.bloomberglaw.com/environment-and-energy/tesoro-oil-refinery-project-withstands-environmental-challenge accessed August 16, 2023</i></p> | The Final EIR concluded the project would not have a significant permanent impact on air quality but would make a cumulatively considerable impact to air quality during construction. Construction of the project would cause significant but temporary emission increases and require mitigation of these impacts by requiring use of trucks and construction equipment meeting the cleanest emission standards. |
| LD-34 | Shell Oil Products U.S. Carson Revitalization Project (CRP) Specific Plan (CRPSP) | No | City of Carson | <ul style="list-style-type: none"> The project includes adoption and implementation of a Specific Plan. CRP proposes up to an additional 1,663,000 square feet of buildings for a total of (existing and proposed) 1,823,000 square feet of mixed industrial and business park uses. Plan includes stormwater basins and water quality areas, buffer areas, a railroad yard, public access road easements, and open storage for equipment and materials. The project is located at 20945 S. Wilmington Ave. | <p>A Draft EIR was circulated for this project in February 2014. The Specific Plan has been adopted.</p> <p><i>(Source: Office of Planning and Research, CEQAnet Database – accessed December 12, 2016)</i></p> | No information regarding environmental impacts has been identified at this time. |
| LD-35 | Phillips 66 Los Angeles Refinery Carson Plant – Crude Oil Storage Capacity Project | No | South Coast Air Quality Management District; in the City of Carson | <ul style="list-style-type: none"> The project would increase storage capacity at its Los Angeles Refinery Carson Plant by installing one new 615,000-barrel crude oil storage tank with a geodesic dome, increasing the annual permit throughput limit of two existing 320,000-barrel crude oil storage tanks. Two new feed/transfer pumps and one 14,000-barrel water draw surge tank with associated pumps and pipelines would also be installed. Tie-ins to the Pier “T” crude oil delivery pipeline from Berth 121 would be installed and one new electrical power substation would be constructed. The project is located at Sepulveda Blvd. and Alameda St. | <p>A Negative Declaration was circulated for this project in September 2013.</p> <p><i>(Source: Office of Planning and Research, CEQAnet Database – accessed December 12, 2016)</i></p> | The Negative Declaration determined that the project would not contribute to a substantial cumulative adverse impact on the environment. |
| LD-36 | Rainbow Transport Tank Cleaners – Old Wash Rack Groundwater Interim Measure | No | Department of Toxic Substances Control | <ul style="list-style-type: none"> The project involves approval of a groundwater interim measure work plan to begin cleanup of contaminated groundwater resulting from historical operations at the site. The project is located at Wilmington Ave. and Water St. | <p>A Negative Declaration was circulated for this project in August 2013.</p> <p><i>(Source: Office of Planning and Research, CEQAnet Database – accessed December 12, 2016)</i></p> | The Negative Declaration determined that the project would not contribute to a substantial cumulative adverse impact on the environment. |

|--|--|---------------|--|--|---|--|
| LD-88 | Long Beach Main Pumping Plant (LBMPP) Upgrades | No | City of Long Beach | <ul style="list-style-type: none">Due to the age of the facility, it is necessary to upgrade and expand the LBMPP. The configuration and size of both the inlet gravity sewers and force mains requires that the LBMPP Replacement Project be sited on the property located adjacent to and west of the existing pumping plant. | <p>As of July 2018, the LBMPP was partially constructed, with plans for two more replacement pumps to increase the overall pumping capacity.</p> <p>(Source: County Sanitation District No. 2, Meeting Minutes, July 25, 2018).</p> | The City of Long Beach General Plan EIR identified no cumulatively considerable effects to the environment as it relates to utilities or land use through full build out. The City of Long Beach General Plan Land Use Element establishes PlaceTypes, each subject to unique design guidelines in accordance with the City's Urban Design Element. As such, the LBMPP Upgrades Project was subject to its own General Plan consistency analysis and was reviewed for consistency with adopted land use plans and policies. No cumulatively considerable effects on the environment were identified. |
| LD-89 | Long Beach Municipal Urban Stormwater Treatment (LB MUST) Facility | Yes | City of Long Beach | <ul style="list-style-type: none">The project would be designed to treat diverted runoff water that would otherwise discharge into the Los Angeles River. Stormwater that enters the Los Angeles River has historically carried pollutants containing trash, bacteria, metals and hydrocarbons that have contaminated our beaches and waterways. By diverting this stormwater before it enters recreational waters, LB MUST has the potential to improve Long Beach's recreational water quality. | <p>The project was approved by the Long Beach City Council in January 2018. Construction began in 2021 but as of April 2023 had slowed due to weather. Therefore, the project is still under construction.</p> <p>(Sources: Office of Planning and Research, CEQAnet Database – accessed January 16, 2019; https://lbmust.com/wp-content/uploads/2016/11/LB-MUST-Schedule-170104-e1495134120509.jpg)</p> | The LB MUST project would result in the following impacts: Water quality improvements providing a cumulatively beneficial effect Short-term impacts to emergency service providers due to temporary lane closures during construction Utility relocations Short-term light and glare and visual impacts during construction Increased open space/public recreational area along the I-710 corridor |
| LD-90 | South Gate Urban Orchard | No | City of South Gate | <ul style="list-style-type: none">The project would transform 18.7 acres of land to green space in a disadvantaged community in South Gate. The project would include an urban orchard and community garden that would be irrigated with storm water captured from an adjacent storm water drain. A walking/biking path and parking area would be installed using permeable surfaces. This LID project would include BMPs, and would provide multiple benefits including: 1) improved water quality by infiltrating storm water, 2) increased water supply reliability; and 3) new public open space. The project is located adjacent to the Thunderbird Villa Mobile Home Park and is generally bound by the Los Angeles River, I-710, and Firestone Boulevard. | <p>A feasibility study exploring the possibility of daylighting the section of the Bandini Channel that runs through the site is being prepared. A conceptual design has been prepared for the project; however, some refinements may be necessary. The project has been awarded a Proposition 1 Storm Water Implementation Grant by the State Water Resources Control Board. A notice of exemption was granted in July 2018. The project is currently under construction.</p> <p>(Sources: State Water Resources Control Board Media Release – accessed May 26, 2017; http://www.waterboards.ca.gov/press_room/press_releases/2016/pr120516_prop1_stormwater.pdf; CEQAnet Database – accessed January 2019)</p> | No information regarding environmental impacts has been identified at this time. |

This page intentionally left blank

Reasonably foreseeable actions within the Study Area are listed in Table 3.25-1; however, a subset of major projects (large projects related to transportation and goods movement that would be located in the vicinity to the build alternatives) with a potential for adverse environmental effects, listed in Table 3.25-2, are discussed in the analysis below.

For each environmental topic, relevant projects are listed along with the project identification number shown on Figure 3.25-1. The source documents for the environmental impact information for these major projects are provided in Table 3.25-1. For each environmental topic listed below, the RSA is described.

3.25.4.1 LAND USE

The information in this section is based on Sections 3.1 and 3.24.3.1 of this Final EIR/EIS and the *Community Impact Assessment* (2017) prepared for the I-710 Corridor Project.

RESOURCE STUDY AREA. The Study Area includes the portion of I-710 from Ocean Blvd. in Long Beach to SR-60, a distance of approximately 18 miles. At the freeway-to-freeway interchanges, the Study Area extends one mile east and west of I-710 for the I-405, SR-91, I-105, and Interstate 5 (I-5) interchanges. The I-710 Corridor Project build alternatives also includes the major north-south arterials from Wilmington Ave. to the west to Lakewood Blvd. to the east. For the purpose of this analysis, the RSA for land use is the Study Area, which includes parts of the Cities of Bell, Bell Gardens, Carson, Commerce, Compton, Cudahy, Downey, Huntington Park, Lakewood, Long Beach, Los Angeles, Lynwood, Maywood, Paramount, Signal Hill, South Gate, and Vernon, as well as parts of unincorporated Los Angeles County.

HEALTH AND HISTORICAL CONTEXT. The Study Area is located in a largely urbanized area. Within the Study Area, the I-710 mainline serves as the principal transportation connection for goods movement between POLA and POLB, located at the southern terminus of the freeway, and the Burlington Northern Santa Fe (BNSF)/Union Pacific Railroad (UP Railroad) rail yards in the Cities of Commerce and Vernon. A variety of land uses exist within and adjacent to the RSA, including transportation, residential, commercial, industrial, infrastructure, education, recreation, undeveloped, and water-related land uses. There are hundreds of parks and recreation facilities within the Study Area that are both publicly and privately owned.

IMPACTS FROM THE I-710 CORRIDOR PROJECT BUILD ALTERNATIVES.

FUTURE AND EXISTING LAND USES. Table 3.25-3 provides the impacts to particular land use designations by each build alternative within the Study Area. Alternative 7 would directly impact more area than Alternative 5C. Because I-710 has been considered in local General Plans since its construction as a freeway in the 1950s, the build alternatives are generally compatible with adjacent land uses.

Table 3.25-3: Existing Land Use Impacts by Build Alternative (acres)

| | Facilities | General Office | Education | Commercial and Services | Industrial | Open Space and Recreation | Residential | Transportation and Utilities | Military Installations | Vacant | Total |
|---------------------------|-------------------|-----------------------|------------------|--------------------------------|-------------------|----------------------------------|--------------------|-------------------------------------|-------------------------------|---------------|--------------|
| Alternative 5C | 12.38 | 3.41 | 0.11 | 19.64 | 96.71 | 1.61 | 14.62 | 135.18 | 11.64 | 216.79 | 538.63 |
| Alternative 5C, Option 1A | 12.38 | 3.41 | 0.11 | 18.93 | 96.96 | 1.61 | 14.48 | 134.33 | 11.64 | 216.80 | 537.20 |
| Alternative 5C, Option 2A | 12.38 | 3.63 | 0.11 | 19.63 | 102.15 | 1.61 | 14.62 | 135.19 | 11.64 | 217.90 | 545.42 |
| Alternative 5C, Option 3A | 12.55 | 3.57 | 0.11 | 19.63 | 98.02 | 1.61 | 16.30 | 135.18 | 11.64 | 216.79 | 541.96 |
| Alternative 7 | 15.39 | 3.26 | 0.07 | 29.50 | 150.20 | 1.64 | 16.67 | 237.88 | 11.88 | 253.83 | 747.72 |
| Alternative 7, Option 1B | 15.39 | 3.42 | 0.07 | 29.40 | 151.83 | 1.67 | 18.43 | 237.99 | 11.88 | 253.98 | 751.50 |
| Alternative 7, Option 3B | 15.56 | 3.42 | 0.08 | 29.49 | 151.51 | 1.64 | 18.35 | 233.87 | 11.88 | 253.78 | 751.04 |

Source: Compiled by LSA Associates, Inc.

CONSISTENCY WITH STATE, REGIONAL, AND LOCAL PLANS. With regard to overall General Plan consistency, adoption of a build alternative would require several cities to amend their General Plan Land Use and Circulation Elements to reflect modifications to arterials, interchange modifications, and elimination of any land uses that may need to be acquired for either build alternative. However, the I-710 Corridor Project build alternatives are generally consistent with the adopted goals and policies in the General Plans since they would address the main components found in many of the General Plan policies: community participation, improved air quality, and reduced traffic congestion. The build alternatives are not located within the POLA Master Plan area and would, therefore, not have a direct impact. Nonetheless, the build alternatives are consistent with the POLA Master Plan, as they would improve existing facilities. The build alternatives are consistent with the POLB Master Plan because they would improve an existing facility and would not introduce new non-port-related uses to the POLB Master Plan District 1.

PARKS AND RECREATION. The build alternatives would include modifications to Cesar E. Chavez Park in the City of Long Beach. Both build alternatives would result in direct impacts to the planned Parque Dos Rios Park in the City of South Gate. Alternative 5C would result in the permanent use of 2.37 acres of land on the west side of this park. Alternative 7 would result in the permanent use of the entire park. Additionally, both build alternatives would require the relocation of the Compton Hunting and Fishing Club. Alternative 7 would require the relocation of the Compton Homing/Racing Pigeon Club. In addition, indirect impacts resulting from the build alternatives may occur to several parks and recreation facilities, including temporary access impacts that may occur during construction and/or visual impacts that may occur with widening and/or construction of the freight corridor component of Alternative 7.

REASONABLY FORESEEABLE ACTIONS. The reasonably foreseeable actions would occur in the areas that are planned for development or redevelopment, which are located throughout the Study Area. Reasonably foreseeable actions that may contribute to a cumulative land use impact include:

- I-5 Widening and High-Occupancy Lane (HOV) Lane Project
- I-5 Corridor Improvement Project
- SR-710 North Project
- California High Speed Rail Project

CUMULATIVE IMPACTS.

FUTURE AND EXISTING LAND USES. The I-710 Corridor Project build alternatives are generally consistent with existing land uses and the applicable goals and policies in the affected cities'

General Plans. As stated in the environmental document for the I-5 Corridor Improvement Project, the Preferred Alternative (Alternative 4B) would be consistent with future and existing land uses. According to the Draft EIR/EIS prepared for the SR-710 North Project (formerly referred to as SR-710 Project in the 2012 I-710 Corridor Project Draft EIR/EIS), all four of the SR-710 North Project Build Alternatives, including the Freeway Tunnel Alternative, would have direct, construction-related impacts on existing land uses and would require the acquisition and conversion of land currently planned for nontransportation uses into transportation uses. None of the land use impacts associated with the SR-710 North Project Build Alternatives would affect the same cities as the I-710 Corridor Project build alternatives. Although environmental documents are not available for the other listed projects, in the case that these projects would have an impact on future and existing land uses, implementation of avoidance, minimization, and/or mitigation measures would be required to comply with CEQA and/or NEPA. Therefore, the I-710 Corridor Project build alternatives would not contribute to cumulative adverse impacts related to land use.

CONSISTENCY WITH STATE, REGIONAL, AND LOCAL PLANS. With regard to overall General Plan consistency, adoption of a build alternative for the I-710 Corridor Project would require several cities to amend their General Plan Land Use and Circulation Elements to reflect modifications to arterials, interchange modifications, and elimination of any land uses that may need to be acquired for the I-710 Corridor Project build alternatives. Other projects within the RSA for cumulative land use impacts may also require modification of some cities' General Plan Land Use and Circulation Elements. Each city would individually evaluate any General Plan amendment request for a reasonably foreseeable action within its jurisdiction. As stated in Section 3.1, Land Use, with regard to overall General Plan consistency, adoption of a build alternative would require several cities to amend their General Plan Land Use and Circulation Elements to reflect modifications to arterials, interchange modifications, and elimination of any land uses that may need to be acquired for either build alternative. However, the build alternatives are generally consistent with the adopted goals and policies in the General Plans since they address the main components found in many of the General Plan policies: community participation, improved air quality, and reduced traffic congestion. As stated in the environmental document for the I-5 Corridor Improvement Project, the Preferred Alternative (Alternative 4B) would be consistent with State, regional, and local plans. While each of the four build alternatives analyzed in the Draft EIR/EIS prepared for the SR-710 North Project would be inconsistent with the 2012 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) and/or individual policies, objectives, and program goals in local plans, those inconsistencies would be addressed through implementation of avoidance, minimization, and/or mitigation measures. Further, none of those inconsistencies specifically involve the I-710 Corridor Project build alternatives. Although environmental documents are not available for the other listed projects, in the case that these projects would have an impact on State, regional, and/or local plans, implementation of avoidance, minimization, and/or mitigation measures would be required to

comply with CEQA and/or NEPA. Therefore, the I-710 Corridor Project build alternatives would not substantially contribute to a cumulative effect related to consistency with State, regional, and local plans because they are generally consistent with area General Plan goals and policies, and because each General Plan amendment associated with any of the cumulative impacts would be evaluated by the city with jurisdiction over the proposed change.

PARKS AND RECREATION. None of the cumulative projects identified within the RSA would impact the facilities that could be affected by the I-710 Corridor build alternatives. Future parks are planned as part of some of the affected cities' General Plans (e.g., City of Long Beach); therefore, build out of the future land uses in the RSA would not result in adverse impacts to parks and recreation facilities. As stated in the environmental document for the I-5 Corridor Improvement Project, the Preferred Alternative (Alternative 4B) would not impact any park or recreation facilities. According to the Draft EIR/EIS prepared for the SR-710 North Project, all four of the SR-710 North Project Build Alternatives, including the Freeway Tunnel Alternative, would result in noise effects on parks and recreation resources, and the Bus Rapid Transit (BRT) Alternative would require the acquisition of a small portion of Cascades Park in Monterey Park. Avoidance, minimization, and/or mitigation measures described in the EIR/EIS would avoid, reduce, or minimize those effects. In addition, none of the parks and recreation resources affected by the SR-710 North Project would be affected by the I-710 Corridor Project build alternatives. Although environmental documents are not available for the other listed projects, in the case that these projects would have an impact on park and recreation facilities, implementation of avoidance, minimization, and/or mitigation measures would be required to comply with CEQA and/or NEPA. Further, most of the cumulative transportation projects consist of improvements to existing roadways and freeways, which would limit potential impacts to only those parks and recreation facilities that are immediately adjacent to the existing roadways and freeways. Therefore, the I-710 Corridor Project build alternatives would not contribute to cumulative adverse impacts related to parks and recreation.

AVOIDANCE, MINIMIZATION, AND MITIGATION MEASURES. As discussed above, the I-710 Corridor Project build alternatives would result in the modification of Cesar E. Chavez Park and the relocation of the Compton Hunting and Fishing Club. Alternative 5C would result in the permanent use of part of the planned Parque Dos Rios Park, while Alternative 7 would result in the permanent use of the entire park. Alternative 7 would require the relocation of the Compton Homing/Racing Pigeon Club. See Sections 3.25.4.2 and 3.25.4.6 for measures to reduce these direct effects. For any build alternative, the I-710 Corridor Project build alternatives would also include the following design enhancements within the Study Area:

- **Cesar E. Chavez Park:** Within the City of Long Beach, Shoreline Dr. consists of separated northbound/southbound lanes (one in each direction) routed through Cesar E.

Chavez Park. Under all I-710 Corridor Project build alternatives, Shoreline Dr. would be combined and reconstructed to two through lanes in each direction along the western edge of the Park between Ocean Blvd. and Shoemaker Bridge. The existing lanes would be removed and the available land restored and landscaped to become part of Cesar E. Chavez Park. This change would improve access to the park, as well as provide for a larger contiguous recreation area.

3.25.4.2 GROWTH

The analysis in this section is based on Sections 3.2, Growth, and 3.24.3.2 of this Final EIR/EIS and on the *Community Impact Assessment* (2017), the *I-710 Railroad Goods Movement Study* (Metro, 2009), and the *I-710 EIR/EIS Initial Feasibility Analysis* (Metro, 2009).

RESOURCE STUDY AREA. The Study Area includes the portion of I-710 from Ocean Blvd. in Long Beach to SR-60, a distance of approximately 18 miles. At the freeway-to-freeway interchanges, the Study Area extends one mile east and west of I-710 for the I-405, SR-91, I-105, and I-5 interchanges. The I-710 Corridor Project build alternatives also includes the major north-south arterials from Wilmington Ave. to the west, to Lakewood Blvd. to the east. For the purpose of this analysis, the RSA for land use is the Study Area, which includes parts of the Cities of Bell, Bell Gardens, Carson, Commerce, Compton, Cudahy, Downey, Huntington Park, Lakewood, Long Beach, Los Angeles, Lynwood, Maywood, Paramount, Signal Hill, South Gate, and Vernon, as well as parts of unincorporated Los Angeles County.

HEALTH AND HISTORICAL CONTEXT. At the regional level, much of Los Angeles County is built out and urbanized, especially within the Study Area. However, SCAG anticipates population, housing, and employment growth to occur through 2035 within the Gateway Cities Subregion and Los Angeles County overall.¹ At the local level, SCAG anticipates low population, housing, and employment growth for the affected cities generally located in the northern portion of the Study Area (e.g., the Cities of Bell, Commerce, and Maywood), with the exceptions of the cities of Cudahy and South Gate. In addition, SCAG anticipates moderate population and housing growth for the affected cities generally located in the southern portion of the Study Area (e.g., the Cities of Carson, Long Beach, and Signal Hill).

Within the Study Area, there are several physical constraints to growth in population and housing. Most of the cities are currently built out and have very limited vacant land for new development. Planning efforts by the cities are concentrated on redevelopment and the recycling of existing uses to better utilize available land. In the northern part of the Study Area, the railroad yards and tracks also act as a constraint to growth, providing physical boundaries to new developments and expansion of existing land uses. The Southern California Edison (SCE)

¹ 2012 RTP/SCS Growth Forecast Appendix, April 2012.

and Los Angeles Department of Water and Power (DWP) utility corridors within the Study Area also create a physical boundary to growth. These two major utility corridors are located parallel to the Los Angeles River, in addition to other electric transmission corridors within the City of Long Beach and other affected cities within the Study Area. Other existing public infrastructure, such as the I-405, SR-91, I-110, and I-5, freeways also create physical boundaries that constrain land development or redevelopment within the Study Area.

The Study Area is located within the Gateway Cities Subregion of Los Angeles County. The Gateway Cities Subregion as a whole has experienced population, housing, and employment growth since the early 1900s and is anticipated to continue this growth pattern through 2035 (see Table 3.2-2 in Section 3.2.2). In the 20th century, the regional economy transitioned from an agricultural base to a manufacturing/industrial base, with a heavy emphasis on the aerospace and defense industries in the 1950s through the 1970s. As these industries declined in the 1980s, an expansion in global trade, as well as containerization of global freight, resulted in goods movement becoming an important element of the Gateway Cities Subregion's economy. Today, the POLB and POLA, the railroads, and the trucking industry provide goods movement not just within the Study Area, but also for the Gateway Cities Subregion, the SCAG region, and the nation as a whole.²

Los Angeles County's goods movement system serves as a gateway for both international and domestic commerce, especially within the Study Area, where the POLB and POLA, the Burlington Northern Santa Fe (BNSF) Hobart rail yard, and the UP Railroad East Los Angeles rail yard, the Intermodal Container Transfer Facility (ICTF), and the Alameda Corridor are located. The Ports, railroads, and interstate and State highways all play a critical role related to goods movement within the Study Area.

IMPACTS FROM THE I-710 CORRIDOR PROJECT BUILD ALTERNATIVES. The I-710 Corridor Project build alternatives would affect accessibility by improving the vehicle, person, and goods movement travel times within the I-710 Corridor to more effectively serve existing and future travel demand. The I-710 Corridor Project build alternatives would also improve intersecting local roads (interchange improvements and ramp modifications) along I-710 to more effectively serve existing and projected intra-regional travel demand and to reduce the diversion of regional traffic from the I-710 freeway into the surrounding communities. Due to the lack of vacant or less developed land within the I-710 Corridor, the build alternatives would not facilitate new development by opening up access to previously undeveloped or less developed areas.

Los Angeles County, the Gateway Cities Subregion, and the communities within the Gateway Cities Subregion are projected to continue to experience some growth in population and jobs even in the jurisdictions that are relatively constrained by limited land available for development.

² 2016 RTP/SCS Goods Movement Appendix, April 2016.

Growth in the Southern California Association of Governments (SCAG) region is expected to occur with or without the projects included in the RTP, including the I-710 Corridor Project build alternatives. Improved travel times as a result of the I-710 Corridor Project build alternatives would not be sufficient to result in the need to modify adopted General Plans to allow for greater levels of development (residential and nonresidential). The I-710 Corridor Project build alternatives are expected to accommodate existing, approved, and planned growth in the area, but are not expected to influence the amount, timing, or location of growth in the area.

A key element of the project purpose of the I-710 Corridor Project is to address projected growth in population, employment, and economic activities related to goods movement. The increase in capacity on I-710 under the I-710 Corridor Project build alternatives would not influence demand for growth at the Ports nor would growth of port cargo handling capacity at the Ports substantially increase travel demand on I-710. However, for any build alternative, by adding highway system capacity to the goods movement infrastructure in Southern California, both of the I-710 Corridor Project build alternatives would have a beneficial effect in accommodating the forecasted growth in the movement of cargo containers via truck within the I-710 Corridor. Alternative 7 would have a greater beneficial effect than Alternative 5C by providing dedicated lanes for freight movement within the I-710 Corridor.

REASONABLY FORESEEABLE ACTIONS. Reasonably foreseeable actions would occur in the areas that are planned for development or redevelopment, which include areas adjacent to the I-710 Corridor Project build alternatives. Projects with the potential to contribute to cumulative growth-related effects in the RSA include:

- Pier A East and West Expansion Project
- Pier B On-Dock Rail Support Facility
- Gerald Desmond Bridge Project
- Los Angeles River Master Plan
- SR-710 North Project
- California High Speed Rail Project

CUMULATIVE IMPACTS. In addition to the I-710 Corridor Project build alternatives, the Gerald Desmond Bridge Project would provide landside highway infrastructure that would help accommodate the existing and future demand for goods movement in southern California. The SR-710 North Project Build Alternatives and the California High Speed Rail Project would also enhance mobility and circulation in the region to accommodate existing and future population growth. The Pier A East and West Expansion Project and the Pier B On-Dock Rail Support Facility would provide marine terminal facilities within POLA and POLB, respectively, to accommodate existing and future demand for goods movement. Although the Los Angeles

River Master Plan's programmatic environmental document states that the project has the potential to induce growth by providing a more attractive area to live and work, this impact is anticipated to be low and to be a positive contribution to the area. Therefore, the I-710 Corridor Project build alternatives would not contribute to cumulative adverse impacts related to growth.

AVOIDANCE, MINIMIZATION, AND MITIGATION MEASURES. There are no adverse growth-related effects of the I-710 Corridor Project build alternatives; therefore, no avoidance, minimization, and/or mitigation measures are required.

3.25.4.3 COMMUNITY IMPACTS

The information in this section is based on Sections 3.3 and 3.24.3.3 of this Final EIR/EIS, the *Community Impact Assessment* (2017), and the *Draft Relocation Impact Report* (RIR) (March 2017) prepared for the project.

RESOURCE STUDY AREA. For the purpose of this analysis, the RSA for community impacts is the Study Area, which includes parts of the Cities of Bell, Bell Gardens, Carson, Commerce, Compton, Cudahy, Downey, Huntington Park, Lakewood, Long Beach, Los Angeles, Lynwood, Maywood, Paramount, Signal Hill, South Gate, and Vernon, as well as parts of unincorporated Los Angeles County.

HEALTH AND HISTORICAL CONTEXT. The cumulative impacts Study Area is located in a largely urbanized area. The health of this resource changes as land or infrastructure development results in property acquisitions and relocations. Relocations occur when development, redevelopment, or infrastructure projects are located in areas where residential, commercial, or community facilities currently exist. There are numerous community facilities located within each of the affected cities in the Study Area. Community facilities include schools, libraries, fire stations, police stations, and places of worship, and provide community gathering areas for the public. Relocations may also affect community character and cohesion. Community cohesion is the degree to which residents have a sense of belonging to their neighborhood, a high level of commitment to the community, or a strong attachment to neighbors, groups, and institutions, usually as a result of continued association over time. According to several indicators of community cohesion, the Study Area consists of many cohesive and intact communities within the affected cities.

Many of the cities in the Study Area originally developed as "streetcar suburbs" of Los Angeles in the 1920s along the Pacific Electric inter-city commuter railroad line that connected downtown Los Angeles with downtown Long Beach. Due to their good rail access, the Cities of Commerce and Vernon were developed primarily with industrial uses. Following World War II, most of the remaining undeveloped areas in the Study Area, with the exception of some parts of Rancho Dominguez, which were developed later, were developed to accommodate a large influx of new residents in the region. Regional transportation in the Study Area changed considerably in the

1950s and 1960s as Southern California's regional freeway network was built and the Pacific Electric system was closed and replaced with bus service. In the early 1990s, passenger rail service returned to the Study Area as Metro's Blue Line light rail project was opened along the same right-of-way that was used by the Pacific Electric and the Green Line was opened in the median of I-105. Although I-710 was built along the Los Angeles River and SR-91 was built in a largely undeveloped area on the south side of Compton, the construction of I-105 resulted in the displacement of several hundred housing units in Lynwood, Paramount, South Gate, and Downey. The construction of I-105 physically divided the communities along its alignment and resulted in the displacement of thousands of residents. As discussed above, most of the cities in the Study Area were built along existing railroad corridors and many of the Study Area freeways, with the exception of I-105, were built along existing natural community boundaries. Therefore, for the most part, the Study Area communities have grown up with the regional transportation network.

Historically, many of the cities in the Study Area consisted of working-class families that first settled in the area in the 1920s. Racial segregation was prominent in the Study Area cities. Some cities had substantial African-American populations, while others were almost exclusively White. Demographics in the Study Area changed substantially in the 1980s and 1990s as immigrants from Asia and Latin America replaced the White populations that moved to newer suburbs elsewhere in the region. As described in Section 3.3, Community Impacts, the Study Area is home to a large proportion of minority and low-income populations. As of the 2010 Census, the Study Area was 85.6 percent non-White (i.e., composed of individuals other than non-Hispanic Whites). By contrast, Los Angeles County was 72.2 percent non-White in 2010. According to the 2010-2014 American Community Survey, 22.8 percent of persons in the Study Area live in households that fall below the Federal poverty threshold. Within Los Angeles County, that share is 18.7 percent.

Residents in the Study Area are affected by operation of I-710 and other transportation facilities in the area. I-710 carries thousands of heavy trucks daily to and from the Ports of Los Angeles (POLA) and Long Beach (POLB), along with other truck and passenger vehicle traffic. I-105, I-405, and SR-91 also carry thousands of trucks and vehicles per day. The existing traffic congestion, air pollution, and traffic incidents on I-710 and the other freeways in the area directly affect all residents of the area, including the minority and low-income populations that are prevalent in the corridor.

IMPACTS FROM THE I-710 CORRIDOR PROJECT BUILD ALTERNATIVES.

COMMUNITY CHARACTER AND COHESION. With the exception of residential relocations in the City of Commerce, which are discussed below, the I-710 Corridor Project build alternatives would not result in adverse impacts to community character and cohesion. The I-710 Corridor Project build alternatives were developed through an extensive community

outreach process that involved input from multiple public agencies and stakeholders in order to avoid impacts to the human, physical, and natural environments, including existing and future communities. Due to extensive community outreach, which included advisory committee input on the design plans, the extent of adverse impacts throughout the Study Area have been minimized. This was accomplished through refining the I-710 Corridor Project build alternatives as much as possible to address community concerns and maintain community character and cohesion. Within the City of Commerce, Alternative 7 would result in unavoidable adverse impacts to community character and cohesion as a result of residential relocations. Therefore, Alternative 7 would contribute to cumulative adverse impacts related to community character and cohesion within Commerce.

ENVIRONMENTAL JUSTICE. Overall, the I-710 Corridor Project build alternatives would have many beneficial effects on the surrounding communities and I-710 corridor users when compared with current conditions, including reductions in emissions levels and associated health risk; abatement of freeway noise in most locations; and improved level of service at most intersections. In addition, programmatic elements of the build alternatives, such as the Community Health Benefit Program, would be of particular benefit to environmental justice communities although the effects could not be quantified at the time this document was prepared due to the nature of the program (to provide funding for future improvements and/or health-related projects on a case-by-case basis). However, even with the application of these benefits, the environmental justice analysis for the I-710 Corridor Project build alternatives would have potential disproportionately high and adverse impacts on minority and low-income populations in the Study Area, after consideration of mitigation. These disproportionately high and adverse impacts have been identified for air quality (construction and operation), noise, traffic, community cohesion/relocations, visual resources, and land use. However, the No Build (Alternative 1) has been identified as the Preferred Alternative; hence programmatic elements of the build alternatives, such as the Community Health Benefit Program, will not be implemented by Caltrans as the Lead Agency under CEQA and NEPA and as the owner/operator of the I-710 freeway.

Due to the potential for disproportionately high and adverse impacts, for any build alternative, further mitigation would be proposed to help alleviate impacts to environmental justice communities resulting from the build alternatives. Please see Measures C-6 through C-8 in Section 3.3, Community Impacts.

RELOCATION. Within the Study Area, Alternative 5C and the design options would result in a total of between 109 and 128 residential relocations and between 157 and 165 nonresidential relocations. Alternative 7 and the design options would result in a total of between 121 and 140 residential and between 206 and 213 nonresidential relocations. These acquisitions would result in the relocation of existing residents, businesses, and employees. Most residential displacements in the Study Area, given present market

conditions, do not indicate a need for the construction of replacement housing for any build alternative .

Within the City of Commerce, current market conditions, at the time this report was prepared, indicated the lack of comparable replacement housing. While adequate comparable replacement housing appeared to exist in neighboring cities, new replacement dwellings under Last Resort Housing, for any build alternative, may be considered for this city as a method of providing comparable replacement housing to displaced persons who reside in areas where replacement housing is low. However, there were sufficient relocation properties available within the Study Area to relocate the majority of affected residents and businesses (*Relocation Impact Report*, March 2017), with the exception of those noted above. As stated in the discussion of Public Health Considerations, there are residential property impacts for some design options of Alternative 7 in the City of Commerce where Housing of Last Resort³ may have to be considered for relocating the affected residential properties for any build alternative.

Within the City of Compton, five mobile homes at the El Rancho Mobile Home Park would be proposed to be relocated under both build alternatives. Adequate relocation resources for mobile homes did not exist within the Study Area at the time this report was prepared, and this lack of resource would represent an adverse impact to displaced mobile home residents (assuming they preferred to remain in a mobile home). For the majority of residential property impacts, adequate resources appeared to exist to relocate existing residential occupants to comparable replacement housing, with the exception of mobile home housing as stated above. For any build alternative, specific locations for relocations would be determined during the right-of-way acquisition phase as Caltrans' right-of-way agents negotiate with each displacee (refer to Appendix D for additional detail on the relocation benefits).

COMMUNITY FACILITIES. The I-710 Corridor Project build alternatives would result in direct impacts to community facilities in the Study Area, including the Long Beach Bible Institute, in the City of Long Beach, and Fire Station No. 4 in the City of Vernon. In addition, Alternative 7 would result in direct impacts to the Salvation Army's Bell Shelter in the City of Bell, the

³ The Uniform Relocation Act (URA) requires that comparable decent, safe, and sanitary replacement housing within a person's financial means be made available before that person may be displaced. When such housing cannot be provided by using replacement housing payments, the URA provides for "housing of last resort." Housing of last resort may involve the use of replacement housing payments that exceed the URA maximum amounts. Housing of last resort may also involve the use of other methods of providing comparable decent, safe, and sanitary housing within a person's financial means. Refer to §49 CFR 24.404 and Chapter 3 of the U.S. Housing and Urban Development (HUD) Handbook 1378 for more information. Website: https://portal.hud.gov/hudportal/HUD?src=/program_offices/comm_planning/affordablehousing/training/web/relocation/last_resort (accessed February 20, 2017).

Mark Taper Foundation Shelter Resource Bank in the City of Bell, and the Multi-Service Center in the City of Long Beach. Relocation would be required for these community facilities prior to construction of either build alternative. In addition, indirect impacts resulting from the build alternatives may occur to several other community facilities, some of which would be temporary access impacts that may occur during construction and/or visual impacts that may occur with widening and/or construction of the freight corridor in an existing viewshed.

REASONABLY FORESEEABLE ACTIONS. The reasonably foreseeable actions would occur in the areas that are planned for development or redevelopment, which are located throughout the Study Area. Projects with particular relevance to community impacts include all projects that would divide an existing neighborhood or change the character and cohesion of the neighborhood and are as follows:

- Shoemaker Bridge Replacement Project
- State Route 47 (SR-47) Expressway Project
- Middle Harbor Redevelopment Project
- Gerald Desmond Bridge Project
- Southern California International Gateway (SCIG) Project
- Los Angeles River Master Plan
- RiverLink Plan
- I-5 Widening and HOV Lane Project
- I-5 Corridor Improvement Project
- SR-710 North Project
- California High Speed Rail Project
- Long Beach MUST Facility

CUMULATIVE IMPACTS.

COMMUNITY CHARACTER AND COHESION. As stated above, Alternative 7 would contribute to cumulative adverse impacts related to community character and cohesion in Commerce. Additionally, as stated in the environmental document for the I-5 Corridor Improvement Project, the project would disrupt neighborhoods, further separate resident children from schools, and fragment edges of cohesive groups of people, thereby adversely affecting how a community or neighborhood functions. As this project's northern terminus is at the I-5/I-605 interchange and is not located near the Cities of Commerce, Compton, or Bell Gardens, this impact to community character and cohesion is not considered a cumulative impact.

As stated in the SR-710 North Project Final EIR/EIS, all four of the SR-710 North Project Build Alternatives, including the Freeway Tunnel Alternative, would have varying impacts to community character and cohesion, including temporary lane restrictions, delays, and detours during construction, as well as temporary and permanent air quality, noise, traffic/access, and/or parking effects on community facilities. Although most of the impacts to community character and cohesion caused by the SR-710 North Project Build Alternatives would not occur in the same cities that would be affected by the I-710 Corridor Project build alternatives, the Light Rail Transit (LRT) Alternative described in the SR-710 North Project Final EIR/EIS would result in significant and unavoidable impacts to community cohesion in East Los Angeles related to the displacement of 15 neighborhood-oriented businesses. This would contribute to a cumulative impact to the northern portion of the RSA. However, the SR-710 North Project Final EIR/EIS identifies the TSM/TDM Alternative as the Preferred Alternative, which does not result in any cumulative impacts to East Los Angeles. A Final Notice of Determination and Record of Decision for the SR-710 North Project was issued in February 2019.

The environmental documents available for the State Route 47 (SR-47) Expressway Project, the Middle Harbor Redevelopment Project, the Gerald Desmond Bridge Project, and the SCIG Project conclude that these projects would not have impacts on community character and cohesion. The environmental document available for the Long Beach MUST Facility concluded that the project would result in increased open space/public recreational area along the southern end of the I-710 corridor. The Shoemaker Bridge Replacement Project would also result in minor changes to existing visual character in that area. Impacts from the I-5 Widening and HOV Lane Project and the California High Speed Rail Project to community character and cohesion could occur that would contribute to a cumulative impact to the northern portion of the RSA. Therefore, Alternative 7 could contribute to cumulative adverse impacts related to community character and cohesion in Commerce.

ENVIRONMENTAL JUSTICE. As a result of the I-710 Corridor Project build alternatives, there would be some disproportionate adverse impacts related to air quality, noise, traffic, and relocations, while in other areas, there would be no disproportionate adverse effects. These adverse effects identified have the potential to be mitigated. The I-5 Corridor Improvement Project would result in residential acquisitions that may affect a disproportionately high number of Hispanic and low-income populations in the Cities of Norwalk and Downey and may affect a disproportionately high number of persons living in poverty. As this project's northern terminus is at the I-5/I-605 interchange and is not located near the areas in which environmental justice impacts would occur as a result of the I-710 Corridor Project build alternatives, this impact to environmental justice communities would not be considered a cumulative impact. The environmental documents available for the SR-47 Expressway Project, the Middle Harbor Redevelopment Project, the SR-710 North Project, and the

Gerald Desmond Bridge Project conclude that these projects would not have impacts on environmental justice communities.

The SCIG Project would result in disproportionate effects on minority and low-income populations as a result of significant unavoidable impacts related to aesthetics, cultural resources, and noise. Impacts related to air quality, biology, greenhouse gases, land use, public services, and water resources would be reduced through avoidance, minimization, and/or mitigation measures. This project may result in cumulative impacts in the RSA. Impacts related to the I-5 Widening and HOV Lane Project and the California High Speed Rail Project to environmental justice communities could occur that would contribute to a cumulative impact.

As shown in Table 3.25-2, construction activities of some phases of the I-710 Corridor Project build alternatives, the SR-47 Expressway Project, the Los Angeles River Master Plan, the Middle Harbor Redevelopment Project, the I-5 Widening and HOV Lane Project, and the California High Speed Rail Project are anticipated to overlap and would temporarily affect environmental justice populations. Temporary construction impacts would include disruption of local traffic patterns and access to residences and businesses, increased traffic congestions, and increased noise, vibration and dust. However, construction activities and operation of the projects would provide direct and indirect jobs, which would benefit local economies that include minority and low-income populations.

Measures C-6 through C-8 stipulated in Section 3.3.3, Community Impacts, and avoidance, minimization, and/or mitigation measures in other sections of this Final EIR/EIS would reduce impacts to affected populations, including environmental justice populations, with the exception of those who are located very near I-710 and experience noise, air quality, traffic, and relocation impacts that cannot be fully mitigated and/or abated. Therefore, the I-710 Corridor Project build alternatives could contribute to cumulative adverse impacts on environmental justice populations.

RELOCATION. Other planned projects such as the SR-47 Expressway Project, the Gerald Desmond Bridge Project, the SCIG Project, the SR-710 North Project, and the I-5 Corridor Improvement Project may require property acquisitions and subsequent relocation of both residents and businesses.

- SR-47 Expressway Project – six business acquisitions in the County of Los Angeles near POLA
- Gerald Desmond Bridge Project – 19 business acquisitions mostly owned and administered by POLB
- SCIG Project – POLA tenant relocations

- SR-710 North Project – the number of relocations varies, depending upon which alternative is selected for implementation; however, none of the build alternatives would require residential relocations (the Preferred Alternative, or the Transportation Systems Management/Transportation Demand Management [TSM/TDM] and BRT Alternatives would not displace any businesses; the LRT Alternative would displace 73 businesses in Alhambra, East Los Angeles, Los Angeles, Monterey Park, Pasadena, and South Pasadena; and the Freeway Tunnel Alternative would displace two businesses in Los Angeles)
- I-5 Corridor Improvement Project – 108 residential acquisitions (approximately 400 people) and 42 commercial acquisitions located in the Cities of Cerritos, Downey, La Mirada, Norwalk, and Santa Fe Springs

The I-5 Widening and HOV Lane Project and the California High Speed Rail Project could require acquisition and relocation of residential and nonresidential properties. According to the SR-710 North Project Final EIR/EIS, the LRT Alternative would require the relocation of 17 businesses in East Los Angeles. None of the other relocations associated with the SR-710 North Project Build Alternatives would occur in the same cities affected by the I-710 Corridor Project build alternatives. Residential and nonresidential acquisitions are anticipated to occur in the City of Commerce and in the community of East Los Angeles as a result of the California High Speed Rail Project and the I-5 Widening and HOV Lane Project. In combination with the I-710 Corridor Project build alternatives, this would have a cumulative impact in these areas. However, any property acquisitions and subsequent relocations would require compliance with the provisions of the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970 (Uniform Act) and its 1987 Amendments, as implemented by the Uniform Relocation Assistance and Real Property Acquisition Regulations for Federal and Federally Assisted Programs, adopted by the United States Department of Transportation on March 2, 1989. Consistency with the Uniform Act and its 1987 Amendments would substantially reduce any cumulative adverse effects related to relocation.

Last Resort Housing may be required for relocation of residents in the City of Commerce for the I-710 Corridor Project build alternatives. Therefore, the I-710 Corridor Project build alternatives may contribute to adverse cumulative impacts related to the relocation of displaced residents within the RSA.

COMMUNITY FACILITIES. Both I-710 Corridor Project build alternatives would result in direct impacts to community facilities in the Study Area, including Fire Station No. 4 in the City of Vernon. In addition, Alternative 7 would result in direct impacts to the Salvation Army's Bell Shelter in the City of Bell, the Mark Taper Foundation Shelter Resource Bank in the City of Bell, the Multi-Service Center in the City of Long Beach, and the Long Beach Bible Institute. For any build alternative, relocation would be required prior to construction; however, as

discussed in the DRIR for the I-710 Corridor Project, sufficient relocation properties were available within the Study Area at the time the report was prepared. Therefore, the I-710 Corridor Project build alternatives would not contribute to cumulative adverse impacts related to community facilities. Relocation of community facilities would also occur as a result of the I-5 Corridor Improvement Project. As with the I-710 Corridor Project build alternatives, sufficient relocation properties are available within the Study Area for this project. Therefore, the I-5 Corridor Improvement Project would not contribute to cumulative adverse impacts related to community facilities. As stated in the SR-710 North Project EIR/EIS, none of the SR-710 North Project Build Alternatives would require relocation of any community facilities. Impacts from the I-5 Widening and HOV Lane Project and the California High Speed Rail Project could include acquisition and relocation of community facilities. The relocations would be mitigated according to the Uniform Act and would, therefore, not result in an adverse impact.

The SR-47 Expressway Project, the Middle Harbor Redevelopment Project, the Gerald Desmond Bridge Project, the SCIG Project, the Los Angeles River Master Plan, and the RiverLink Plan would not require relocation of any community facilities.

Therefore, the I-710 Corridor Project build alternatives would not contribute to cumulative adverse impacts related to community facilities.

AVOIDANCE, MINIMIZATION, AND MITIGATION MEASURES. The I-710 Corridor Project build alternatives would require acquisition of residential and nonresidential parcels, and relocation would be required prior to construction. Measures are provided in Section 3.3 of this Final EIR/EIS to mitigate and/or minimize these effects for any build alternative. In addition, the build alternatives would require acquisition of several community facilities in the Study Area. Relocation would also be required for both of these community facilities prior to construction. Cumulative projects with similar relocation impacts would also be required to comply with the Uniform Act (Public Law 91-646, 84 Stat. 1894).

3.25.4.4 UTILITY/EMERGENCY SERVICES

The information in this section is based on Sections 3.4 and 3.24.3.4 of the Final EIR/EIS, the *North Utility Study Final Draft Preliminary Strategies Report* (September 2016), the *Utility Relocation Strategies Report, Central Segment* (June 2016), the *South End Utility Study* (November 2016), and the *Community Impact Assessment* (July 2017).

RESOURCE STUDY AREA. The direct physical impacts of the I-710 Corridor Project build alternatives related to emergency services and utilities would be largely limited to the proposed right-of-way and the areas adjacent to the proposed improvements. The specific locations of public services and utilities were identified based on information provided by the respective providers. As a result, the discussion of the affected environment focuses on utilities within the

right-of-way or close enough to the right-of-way to be impacted by the build alternatives. Services such as fire and police protection are, however, generally provided to fairly large geographic areas (a city or service area, for example), and for this reason, the cumulative RSA for emergency services would correspond to the geographic area serviced by the given service provider. Emergency service providers in the Study Area include the Los Angeles County Fire Department, the City of Compton Fire Department, the City of Downey Fire Department, the City of Los Angeles Fire Department, the City of Vernon Fire Department, the Los Angeles County Sheriff's Department, the City of Bell Gardens Police Department, the City of Bell Police Department, the City of Los Angeles Police Department, the City of Maywood-Cudahy Police Department, the City of Downey Police Department, the City of Huntington Park Police Department, the City of Long Beach Police Department, the City of Signal Hill Police Department, the City of South Gate Police Department, and the City of Vernon Police Department. In addition, 71 different utility owners were identified that operate facilities within the Study Area. Two high-voltage electrical transmission corridors owned by DWP and SCE would be affected by Alternative 7.

HEALTH AND HISTORICAL CONTEXT. The Study Area is located in the largest population concentration on the Pacific Coast. Large-scale urban growth has and will continue to put pressure on emergency services and require prudent land use, hazard abatement, and risk management programs. Intensification of land uses throughout an urban area also requires a coordinated emergency response network like the one that exists throughout Los Angeles County.

Regional utility facilities critical to national and regional interests are located throughout the Study Area. These regional facilities are proprietary in nature and are regulated under State and Federal jurisdictions. Those identified within the Study Area include power transmission systems, petroleum transmission pipelines, gas transmission pipelines, water aqueducts, sewer interceptor trunk lines, and telecommunication systems. Historically, utility corridors have been engineered for the purpose of accommodating sewer, water, and other utility lines and providing access for their maintenance.

IMPACTS FROM THE I-710 CORRIDOR PROJECT BUILD ALTERNATIVES.

EMERGENCY SERVICES. The I-710 Corridor Project build alternatives would have both beneficial and adverse effects on the agencies that provide fire protection and law enforcement within the Study Area. Beneficial effects would include improved emergency response times, as the ability to move fire protection, law enforcement, and emergency service resources from one area to another would be enhanced by the improved transportation network. However, the build alternatives also have the potential to result in a direct adverse impact to Vernon Fire Station No. 4, located along Bandini Blvd., where additional right-of-way requirements would require acquisition of the fire station. In addition,

closure of the I-710/Wardlow Rd. partial interchange, closure of the I-710/Pacific Pl. partial interchange connecting Pacific Pl. to both I-405 and I-710, the removal of access from 9th St. and 10th St. to I-710 in the City of Long Beach, and, within the City of Commerce and Community of East Los Angeles, the replacement of Southbound exit ramps terminating at Whittier Blvd. and removal of the intersection of Whittier Ave. and Sydney Dr. (Alternative 5C, Option 3A, and Alternative 7, Option 3B only) would reduce access options and would nominally increase response times on emergency calls (to residents and workers within these service areas) that would otherwise have used these access routes as part of their response route. Overall, the same impacts to emergency services that would occur under Alternative 5C would occur under Alternative 7. Under Option 3A for Alternative 5C and Option 3B for Alternative 7, the proposed reconfiguring of the interchange and access configurations within the City of Commerce and the Community of East Los Angeles would have additional impacts to emergency services associated with changes in access that reduce access options and potentially increase response times on emergency calls.

UTILITIES. There would be long-term adverse impacts with the construction of both build alternatives for the I-710 Corridor Project. Impacts to major regional facilities as a result of the build alternatives are discussed below:

AT&T. The I-710 Corridor Project build alternatives would result in impacts to several 12-duct sets of underground AT&T lines, two four-inch polyvinyl chloride (PVC) fiber ducts, and 18 four-inch duct trunk lines, which would require utility relocations. Both alternatives would result in the same impacts to AT&T facilities.

LACSD. Two major 45-inch lines within the City of South Gate would be impacted by the build alternatives. In addition, a 63-inch reinforced concrete pipe (RCP) would be impacted in two primary locations. LACSD facilities associated with a pumping plant/pump station on Gaylord Street that would be impacted include a 36-inch overflow pipe to the Los Angeles River and an existing manhole serving the outflow. Under Alternative 5C, Design Option 2A, and Alternative 7, Design Option 2B, the existing surge tank, manifold structure, and in-flow junction structures would need to be relocated and reconnected to new and existing facilities, and the existing pump station would be kept operational as a standby facility. Although both build alternatives would result in largely the same impacts to Sanitation Districts of Los Angeles County (LACSD) facilities, Alternative 7 would impact an additional facility (45-inch line).

SCE TRANSMISSION. The I-710 Corridor Project build alternatives would result in impacts to SCE Transmission facilities such as 66-kilovolt overhead lines, circuit-kilovolt overhead lines, 66-kilovolt aerial transmission systems, an aerial service drop feeding the LACSD pump station, 12-kilovolt aerial systems, a four-kilovolt and 12-kilovolt aerial system, a four-kilovolt and 12-kilovolt underground system, and two 220-kilovolt aerial transmission

systems. While Alternatives 5C and 7 would have the same impact on a number of the same SCE Transmission facilities, the nature of the impact, type of the impact, and/or specific facilities impacted for any additional impacted facilities vary between the two alternatives. For any build alternative, several of the impacted systems would be relocated underground (unless infeasible), which may require equipment upgrades at local substations. Subtransmission structure height modifications would typically also require modifications to adjacent structures. Should utility relocations result in additional environmental impacts that are not currently known, appropriate environmental re-evaluations would be undertaken in due course of development of either build alternative pursuant to 23 CFR 771.129 under NEPA and Sections 15162 and 15164 of the *State CEQA Guidelines*.

LONG BEACH GAS & OIL. The I-710 Corridor Project build alternatives would result in impacts to an eight-inch and 12-inch high-pressure gas line crossing I-710 and running across Long Beach Blvd. Both build alternatives would result in the same impacts to Long Beach Gas & Oil facilities.

VERIZON. The I-710 Corridor Project build alternatives would result in impacts to three copper and fiber underground communications systems, two small aerial copper lines, a large underground communication system, an aerial service line, and a four 4000-strand fiber-optic cable. Both alternatives would result in the same impacts to Verizon facilities.

CHARTER COMMUNICATIONS. The I-710 Corridor Project build alternatives would result in impacts to a copper CATV aerial system, an aerial fiber line, and a fiber system. In addition to the above impacts, Alternative 7 would impact an active aerial copper line.

CROWN CASTLE (FORMERLY NEXT G). Alternative 7 would result in impacts to a fiber system on joint poles with SCE facilities.

SOUTHERN CALIFORNIA GAS COMPANY. The I-710 Corridor Project build alternatives would result in impacts to Southern California Gas Company facilities such as 26-inch high pressure gas lines, 30-inch high-pressure gas lines, and a regulator station for gas facilities. While Alternatives 5C and 7 would have the same impact on a number of the same Southern California Gas Company facilities, the nature of the impact, type of the impact, and/or specific facilities impacted for any additional impacted facilities vary between the two build alternatives.

LOS ANGELES DEPARTMENT OF WATER AND POWER (LADWP). Alternative 5C would not result in impacts to major LADWP facilities. Alternative 7 would impact a set of two circuit 230-kilovolt overhead lines.

METROPOLITAN WATER DISTRICT OF SOUTHERN CALIFORNIA (MWDSC). Alternative 5C would impact the 30-inch MWDSC line that crosses under the Los Angeles River south of the

I-710/I-405 interchange and would require the relocation of the valve north of the existing MWDSC line and provide a new outlet to the Los Angeles River. The existing air-vac assembly would be relocated to Gale Avenue. An MWD 79-inch water line located within the existing electrical transmission corridor that crosses I-710 south of Firestone Ave. in the City of South Gate, a 78-inch prestressed concrete second lower feeder pipeline that runs along Carson Street north of the I-710/I-405 interchange, and a 73-inch welded steel middle feeder pipeline that runs along Greenleaf Boulevard north of the I-710/SR-91 interchange are all located under the proposed Alternative 5C footprint. These conflicts are not in direct physical conflict with the proposed improvements, and would be protected in place for any build alternative. The impacts to these facilities are similar for both alternatives; however, the proposed geometry under Alternative 7 would not provide sufficient room to relocate the discharge valves into LACFCD right-of-way. Therefore, the relocation conflict and relocation strategy would differ for both alternatives.

T-MOBILE. The I-710 Corridor Project build alternatives would result in impacts to a cell tower site, which includes electronic switching equipment for numerous carriers and mobile telephone companies. T-Mobile plans indicate that both Nextel and Sprint have facilities within this site location. This facility is also normally connected to cables for one or more providers. Both build alternatives would result in the same impacts to T-Mobile facilities.

XO COMMUNICATION. The I-710 Corridor Project build alternatives would result in impacts to an overhead fiber-optic 48- and 144-strand facility.

KINDER MORGAN. The I-710 Corridor Project build alternatives would result in impacts to one facility – an active 24-inch refined petroleum product pipeline and associated block valve located in a 30-inch underground casing. The impacts to this facility are similar for both build alternatives; however, the proposed geometry under Alternative 7 would necessitate the extension of the existing 30-inch casing 24 feet to the east. Therefore, the relocation conflict and relocation strategy would differ for both build alternatives.

PLAINS ALL-AMERICAN PIPELINE LP. The I-710 Corridor Project build alternatives would result in impacts to an active 16-inch steel hot oil fuel line and associated vault, a vault box, and a 16-inch crude oil services line, and may have potential impacts to incoming and outgoing pipelines. The impacts to Plains All-American Pipeline LP facilities are similar for both build alternatives; however, the relocation conflict and relocation strategy would differ for both build alternatives.

CHEVRON. The I-710 Corridor Project build alternatives would result in impacts to a vault on the west side of the river, which contains twelve lines owned by five companies, including Chevron. The build alternatives would impact two active six-inch welded steel lines that run through this vault. In addition, the build alternatives would impact one six-inch and one eight-inch underground pipeline that share a trench near the west side of the Los Angeles

River. The impacts to Chevron facilities are similar for both build alternatives; however, due to slightly different configurations, the relocation conflict and relocation strategy would differ for both build alternatives.

CHEMOIL. The I-710 Corridor Project build alternatives would result in impacts to a vault on the west side of the river, which contains twelve lines owned by five companies, including Chemoil. The build alternatives would impact an idle four-inch line, an idle eight-inch line, a six-inch line, and another eight-inch line that run through this vault. The impacts to Chemoil facilities are similar for both build alternatives; however, due to slightly different configurations, the relocation conflict and relocation strategy for an idle four-inch pipeline would differ for both build alternatives.

CRIMSON PIPELINE CO. The I-710 Corridor Project build alternatives would result in impacts to a vault on the west side of the river, which contains twelve lines owned by five companies, including Crimson Pipeline Co. The build alternatives would impact an active ten-inch line and two idle six-inch lines that run through this vault. In addition, the build alternatives would impact an active four-inch line, an idle eight-inch line, an idle six-inch line, and an idle ten-inch line. The impacts to Crimson Pipeline Co. facilities are similar for both build alternatives; however, due to different configurations for the vault, the relocation conflict and relocation strategy for the vault would differ for both build alternatives.

TIDELANDS FACILITY. The I-710 Corridor Project build alternatives would result in impacts to 21 oil wells at the Tidelands Facility as well as several lines associated with the Tidelands Facility that are owned and operated by Lomita. While Alternatives 5C and 7 would have the same impact on a number of the same Southern California Gas Company facilities, the nature of the impact, type of the impact, and/or specific facilities impacted for any additional impacted facilities vary between the two build alternatives. Alternative 7 would result in additional impacts to two wells and several lines of various diameters.

OIL OPERATORS. The I-710 Corridor Project build alternatives would result in impacts to an active ten-inch steel water line, along with a vault containing existing valves for this line. In addition, Alternative 5C would impact an active 12-inch high density polyethylene (HDPE) oil line, two active eight-inch water lines, and an active six-inch oil line.

PARAMOUNT PETROLEUM. Alternative 5C would impact an active six-inch steel oil line and an active eight-inch steel oil line. Alternative 7 would impact an idle eight-inch oil line, an active six-inch oil line, and an active eight-inch oil line, as well as an eight-inch underground crude oil line.

SHELL OIL. The I-710 Corridor Project build alternatives would result in impacts to a vault on the west side of the river, which contains twelve lines owned by five companies, Shell Oil. The build alternatives would impact an active 12-inch steel line that runs through this vault.

The impacts to Shell Oil facilities are similar for both build alternatives; however, due to slightly different configurations, the relocation conflict and relocation strategy for two utility conflicts would differ for both build alternatives.

OCCIDENTAL PETROLEUM. The I-710 Corridor Project build alternatives would result in impacts to a standard lease facility within LACFCD's boundary along the west bank of the Los Angeles River. Both build alternatives would result in the same impacts.

TESORO. The existing Tesoro Manifold meter is located within the vicinity of Burnett St. in Long Beach and, therefore, most of the impacts to Tesoro conflicts resulting from the build alternatives are located in this area. Impacted facilities include an active nine-inch welded steel pipe (WSP), an idle six-in WSP, an idle 13-inch WSP, an idle eight-inch WSP, an idle ten-inch WSP, and an active 12.75-inch steel line that cross the Los Angeles River through the utility trestle located at Burnett St. and utility vaults located on both sides of the river. The build alternatives would also impact an idle eight-inch WSP line, an idle ten-inch WSP line, and two idle 8.63-inch WSP lines.

The impacts to Tesoro facilities are similar for both build alternatives; however, due to slightly different configurations, the relocation conflict and relocation strategy would differ under both build alternatives for six utility conflicts. Alternative 7 would impact an additional Tesoro facility.

Overall, the relocation of the impacted facilities outlined above may require additional construction (i.e., open trenching and directional boring for underground rerouting), and/or additional right-of-way or easements. The nature of each impact and associated relocation is discussed in more detail in Section 3.4.

REASONABLY FORESEEABLE ACTIONS. The reasonably foreseeable actions would occur in areas where there could be additional impacts to the utilities and emergency services impacted by the build alternatives. Projects with particular relevance to utilities and emergency services include:

- SR-47 Expressway Project – Relocation of approximately 25 electrical lines, six natural gas lines, three sets of phone lines, six water line segments, and seven wastewater line segments.
- Pier B On-Dock Rail Support Facility – Temporary rerouting, street closures, and closure or removal of ramps could cause temporary interruptions or delays for emergency service providers (i.e., police, fire, and emergency service responders); removal and relocation of fire hydrants, water supply trunk lines, and distribution mains and construction activities would affect fire protection facilities.
- Shoemaker Bridge Replacement Project – Short-term impacts to emergency responders during construction activities and long-term impacts to emergency responders during

operation may occur because the project may result in the permanent closure of the 9th and 10th Street ramp connections to downtown Long Beach.

- Gerald Desmond Bridge Project – Relocation of SCE high-voltage transmission towers and lines that cross the Cerritos Channel between Piers S and A; construction of new SCE towers adjacent to the existing towers on Piers S and A; relocation of NRG Energy Inc., utilities; relocation of several gas, water, sewer and telephone lines; replacement of storm drain facilities; relocation or protection of approximately 23 oil wells and several oil lines.
- Pier S Marine Terminal Project – Relocation of oil facilities and utilities (completed in 2001); provision of water, sewer, storm drain, electrical (above and below ground distribution, as well as substations), telecommunications and security, and natural gas.
- Middle Harbor Redevelopment Project – Construction of new underground utility mains and lines; relocation of water distribution system; replacement or extension of sewer lines; removal and replacement of storm drain system; relocation of oil lines; construction of new gas lines; construction of a new 66/12-kilovolt (Pier E substation) on site; possible construction by SCE of up to 6.5 circuit miles of new subtransmission conductor that would carry 66 kilovolts from the SCE Hinson Substation.
- ICTF – Modification of existing storm drain system; construction of new drinking water lines, fire suppression utilities (pipes, valves, hydrants, etc.), and sewer lines that would link to existing infrastructure; removal of over 60 mounted light poles and installation of approximately 60 poles.
- SCIG Project – Removal and relocation of fire hydrants, water supply trunk and distribution pipelines; modification of existing water supply line network; modification of off-site sewer lines; reconfiguration of existing storm drain system; relocation of above-ground DWP and SCE electric power lines.
- I-5 Widening and HOV Lane Project – Relocation of several public and private utilities.
- SR-710 North Project – Temporary utility relocation and emergency services delays during construction.
- California High Speed Rail Project - High likelihood for relocation of water, gas, and electric utilities.
- Long Beach MUST Facility – Short-term impacts to emergency service providers would occur due to temporary lane closures during construction.

These projects would include measures to avoid, minimize, or mitigate impacts to utilities and emergency services.

CUMULATIVE IMPACTS. Indirect impacts as a result of the utility relocations for the I-710 Corridor Project build alternatives and the cumulative projects listed above would include traffic disruption during construction, the need for construction staging areas and temporary construction easements, the reconstruction of city streets from trenching, the presence of construction equipment and dump trucks during construction, and exacerbated impacts on emergency access due to potentially concurrent construction schedules. Construction activities of the I-710 Corridor Project build alternatives, would temporarily affect water and power services. Temporary construction impacts would include minimal interruptions in service. For any build alternative, these impacts would be minimized with the implementation of the transportation management plan discussed in Measure CON-TR-1 in Section 3.24.4.5. Similar minimization measures are included in the environmental documents for the SR-47 Expressway Project, the Gerald Desmond Bridge Project, the Pier S Marine Terminal Project, the Middle Harbor Redevelopment Project, the ICTF, the SCIG Project, the SR-710 North Project, and the Long Beach MUST Facility. The I-5 Widening and HOV Lane Project, the California High Speed Rail Project, and the Shoemaker Bridge Replacement Project, would include similar measures to be implemented to comply with CEQA and/or NEPA. Therefore, the cumulative impacts to utilities would be reduced.

Additional indirect impacts from the I-710 Corridor Project build alternatives as a result of relocations would be related to undergrounding utilities. By undergrounding utilities, there would be a potential to encounter hazardous waste during excavation, subsurface cultural and paleontological resources, the need for dewatering, additional storm water considerations, and the relocation of existing utilities, such as storm drains, sewers or other underground facilities. For any build alternative, these indirect impacts would be minimized with the implementation of avoidance, minimization, and mitigation measures described in Sections 3.24.4.7 and 3.24.4.9, and the measures provided later in Section 3.25.3, Avoidance, Minimization, and Mitigation Measures.

For the cumulative projects listed above, utility relocations would occur prior to highway construction; therefore, no temporary impacts to utilities would occur during construction. For utilities that would be protected in place, standard construction measures, such as contacting Underground Service Alert, would be used to avoid impacting utilities and utility service disruptions. Therefore, the I-710 Corridor Project build alternatives would not contribute to cumulative adverse impacts related to utilities and emergency services.

AVOIDANCE, MINIMIZATION, AND MITIGATION MEASURES. The build alternatives would result in an adverse impact to Fire Station No. 4 in the City of Vernon, as well as temporary impacts to fire, law enforcement, and emergency service response times as a result of construction. For any build alternative, Measures U&ES-1 and CON-U&ES-1 would reduce these impacts to ensure minimal interruption in emergency services. For any build alternative, utilities impacted as a result of the build alternatives would be relocated in accordance with specific Utility Relocation

Plans described in Measure U&ES-2 in Section 3.4.3 and Measure CON-U&ES-1 in Section 3.24.4. In addition, prior to grading activities, the Construction Contractor would notify Underground Service Alert at least two days prior to excavation by calling 811 to require that all utility owners within the disturbance limits identify the locations of underground transmission lines and facilities (Measure CON-U&ES-3). Similar minimization and mitigation measures are included in the environmental documents for the SR-47 Expressway Project, the Gerald Desmond Bridge Project, the Pier S Marine Terminal Project, the Middle Harbor Redevelopment Project, the ICTF, the SCIG Project, and the Long Beach MUST Facility. No minimization or mitigation measures are required for the SR-710 North Project Build Alternatives. For the I-5 Widening and HOV Lane Project, the California High Speed Rail Project, and the Shoemaker Bridge Replacement Project, similar measures will be implemented to comply with CEQA and/or NEPA.

3.25.4.5 TRAFFIC AND TRANSPORTATION

The analysis in this section is based on Sections 3.5 and 3.24.3.5 of this Final EIR/EIS and the *I-710 Corridor Project Traffic Operations Analysis Report* (2017), the *Intersection Traffic Impact Analysis Report* (2017), the *I-710 Corridor Project EIR/EIS Travel Demand Modeling Methodology* (2017), and Appendix D of the *Community Impact Assessment* (2017).

RESOURCE STUDY AREA. The Study Area for the I-710 Corridor Project encompasses 16 cities and unincorporated areas in Los Angeles County, including the community of East Los Angeles, within or adjacent to the freeway corridor. It extends one mile east and west of I-710 and includes freeway-to-freeway interchanges at I-405, SR-91, I-105, and I-5. Additionally, the RSA for transportation concerns includes intersections and roadway segments of key north-south and east-west arterials from Wilmington Ave. in the west to Lakewood Blvd. in the east.

HEALTH AND HISTORICAL CONTEXT. The I-710 Corridor is the principal transportation connection between East Los Angeles and POLA/POLB. It plays a vital role in the regional, statewide, and national transportation system, serving both people and goods movement needs. The POLA/POLB complex is the fifth largest container port in the world, and projections show a substantial increase in the volume of port activity within the Study Area through 2035.⁴ As a result of port activity levels, a high volume of heavy-duty truck traffic uses the I-710 mainline, which was built prior to the containerization of ocean-going freight. In conjunction with the large growth in population and employment along the corridor, these heavy-duty truck volumes have strained the facility's capacity, rendering it unable to accommodate current or future traffic demands. The congestion problem is compounded by the freeway's outdated design and the potential for accidents created by the co-mingling of heavy-duty trucks and cars.

⁴ 2016 RTP/SCS Goods Movement Appendix, April 2016.

IMPACTS FROM THE I-710 CORRIDOR PROJECT BUILD ALTERNATIVES. The I-710 mainline segments and weaving areas currently experience severe congestion throughout the I-710 Corridor in both directions for the AM, midday, and PM peak periods, with many freeway mainline segments, ramps, weaving areas, and nearby intersections operating at level of service (LOS) E or F in the peak periods. Traffic is slightly worse in the northbound direction during the AM peak hour and in the southbound direction during the PM peak hour. The results of the freeway-based analysis show that without the improvements related to the I-710 Corridor Project build alternatives, the I-710 Corridor would experience worsening traffic conditions in the future 2035 No Build scenario. In general, the build alternatives would have a beneficial effect by improving mobility on the I-710 mainline and improving the LOS for intersections impacted by the build alternatives. However, even with the proposed geometric enhancements under the build alternatives, severe congestion would still occur on some freeway sections due to the high concentration of truck traffic and/or insufficient capacity at those particular locations. There are no appreciable differences in the overall LOS results for Alternative 5C and Alternative 7. Both alternatives would improve the total number of deficient intersections (LOS E or worse) along I-710 relative to the No Build (Alternative 1) at comparable levels. This finding also holds true for each of the evaluated design options.

REASONABLY FORESEEABLE ACTIONS. The analysis of future traffic conditions is based on a cumulative traffic model system. The traffic model system used in the analysis for the build alternatives is based on the 2012 SCAG RTP model and includes detailed port cargo forecasts within the Port's subarea. Because the analysis is based on a cumulative traffic model that includes planned land uses and transportation improvement projects, individual projects listed in 3.25-1 are accounted for in the model. Projects of particular interest are:

- I-5 Corridor Improvement Project – Anticipated improvements to local and regional circulation
- I-5 Widening and HOV Lane Project – Anticipated improvements to local and regional circulation
- SR-47 Expressway Project – Diversion of POLA and POLB trucks from State Route 103 (SR-103); operates at a satisfactory LOS
- Middle Harbor Redevelopment Project – Adverse impacts to I-710, I-405, and SR-91 until which time Caltrans makes improvements to these facilities
- California High Speed Rail Project – Anticipated improvements to regional circulation
- SR-710 North Project – Anticipated improvements to local and regional circulation

CUMULATIVE IMPACTS. Implementation of any of the cumulative projects would have the potential to result in short-term effects to neighborhood circulation and access as a result of construction activities. These activities include grading and excavation, road detouring, and utility

construction/relocation. Specifically, the northern portion of the Study Area (the Cities of Commerce and Vernon, and the community of East Los Angeles) may experience these short-term impacts due to the potential concurrent construction of the California High Speed Rail Project and the SR-710 North Project. Therefore, the north end of the Study Area around the I-710/Washington Blvd. interchange may experience a temporary cumulative impact related to neighborhood circulation. Permanent neighborhood circulation disruption would not occur as a result of the cumulative projects since the development is generally consistent with the future land use plans of the local jurisdictions. Site-specific effects related to circulation and access has been or would be addressed through the local project review, and appropriate minimization and/or mitigation measures have been or would be identified in order to comply with CEQA and/or NEPA.

The analysis of future traffic conditions in the 2035 design year is a cumulative analysis in that it considers traffic generated by future planned land uses and the effect of future planned transportation improvements. Therefore, the cumulative project effects would be similar to the effects discussed above as they were already assumed in the traffic model used to predict future Study Area traffic volumes and travel patterns. Because the LOS at the intersections discussed above under Impacts from the I-710 Corridor Project Build Alternatives would remain at LOS E or F in the post project condition, the I-710 Corridor Project build alternatives would contribute to adverse cumulative impacts related to traffic at these locations within the RSA.

AVOIDANCE, MINIMIZATION, AND MITIGATION MEASURES. Implementation of the I-710 Corridor Project build alternatives would result in adverse impacts to 32 intersections in the Study Area under Alternative 5C and 30 Study Area intersections under Alternative 7. For any build alternative, the LOS and average intersection delay for the remaining impacted study intersections would improve back to the projected No Build (Alternative 1) operating conditions or better with implementation of the recommended mitigation measures, with exceptions at areas where excessive right-of-way requirements make the mitigation measures infeasible. To mitigate the impact of the build alternatives on these intersections, Mitigation Measure TR-1 would be implemented in partnership with the affected local jurisdiction.

During construction, the build alternatives would result in temporary impacts to traffic circulation due to traffic diversions resulting from temporary closures to local roadways, sidewalks and bikeways, and freeway lanes and ramps. A Transportation Management Plan (TMP) (Measure CON-TR-1) would be implemented for either build alternative, in order to construct either build alternative in a cost-efficient and timely manner with minimal interference to the traveling public. The TMP would also address changes in pedestrian and bicycle circulation and provide measures to minimize the adverse effects of construction activities on pedestrian and bicycle travel within the Study Area. The TMP would be coordinated with TMPs for other projects in the Study Area to ensure that any detours or road closures for the I-710 Corridor Project build alternatives would conflict with detours and road closures for other projects.

3.25.4.6 VISUAL/AESTHETICS

The analysis in this section is based on Sections 3.6 and 3.24.3.6 of this Final EIR/EIS, the Interstate 710 (I-710) Corridor Project *Visual Impact Assessment* (VIA) (February 2017) and the California Department of Transportation (Caltrans) *I-710 Corridor Aesthetics Master Plan* (2014), which was developed based upon the *Urban Design and Aesthetics Toolbox Report* (February 2012).

RESOURCE STUDY AREA. The regional landscape establishes the general visual environment of the I-710 Corridor Project Study Area. The specific visual environment upon which the *Visual Impact Assessment* was based was determined by defining landscape units and the project viewshed. Landscape units within the Study Area include Residential, Recreation, Education, and Freeway units. The I-710 Corridor Project Study Area is located south of the Verdugo Mountains, west of the Los Angeles Basin, east of the San Gabriel Mountains, and southeast of the Santa Ana Mountains. For the purpose of this analysis, the RSA for visual resources and aesthetics is the Study Area, which includes parts of the Cities of Bell, Bell Gardens, Carson, Commerce, Compton, Cudahy, Downey, Huntington Park, Lakewood, Long Beach, Los Angeles, Lynwood, Maywood, Paramount, Signal Hill, South Gate, and Vernon, as well as parts of unincorporated Los Angeles County, including the community of East Los Angeles.

HEALTH AND HISTORICAL CONTEXT. As stated above, landscape units within the Study Area include Residential, Recreation, Education, and Freeway units. Based on the analysis completed for the I-710 Corridor Project Visual Impact Assessment, the overall visual quality of the Residential and Freeway landscape units is moderately low. The overall visual quality of the Recreation landscape unit is moderate. The overall visual quality of the Education landscape units is low. There are no State or locally designated scenic roads within the I-710 Corridor Project's viewshed.⁵ Local policies relevant to the proposed project are found in the General Plans of cities within the Study Area. For example, the City of Carson has adopted the beautification of views along its roads as one of its objectives and the City of Lynwood has adopted policies requiring that "new construction and renovations of existing structures achieve a high level of architectural and site design quality" and that street median landscape standards be developed to enhance the streetscape. In addition, the City of Long Beach is working with the California Coastal Conservancy and others to rehabilitate wetland acreage in areas along the Los Angeles River, which parallels the I-710 Corridor.

IMPACTS FROM THE I-710 CORRIDOR PROJECT BUILD ALTERNATIVES. The I-710 Corridor Project build alternatives would result in adverse impacts at some locations to key viewers within the various Landscape Units defined within the I-710 Corridor. Adverse impacts include the

⁵ California Department of Transportation. Website: http://www.dot.ca.gov/hq/LandArch/scenic_highways/index.htm.

introduction of new structures and other features of the build alternatives that would contribute to degradation of existing visual quality at some locations in the Study Area, as well as potential impacts from light, glare, shade, and shadows.

In addition to the structural or physical changes that the I-710 Corridor Project build alternatives would create, viewers along the Study Area would experience increased night lighting due to the widening of the mainline where traffic light fixtures would be relocated closer to all land uses. Additionally, under Alternative 7, traffic light fixtures installed in the areas of the elevated freight corridor would add increased night lighting to residences in some neighborhoods. During hours when the sun is low on the horizon and during the winter solar declination (September through March), the elevated freight corridor would create some shade and/or shadows within the Study Area. The shade/shadows created by the build alternatives would impact the neighborhoods west of the RSA from Pacific Coast Hwy. to SR-91, as well as the residents in Thunderbird Villas Mobile Home Park in the City of South Gate closest to the west side of the I-710 mainline. The acute angle of the sun relative to the ground plane creates “longer” shadows during these times.

REASONABLY FORESEEABLE ACTIONS. The reasonably foreseeable actions would occur in the areas that are planned for development or redevelopment, which are located throughout the Los Angeles River Basin. Projects with particular relevance to visual resources and aesthetics include:

- Shoemaker Bridge Replacement Project – changes to existing visual character during construction and operation
- Gerald Desmond Bridge Project (a new cable-stayed bridge with 200 feet of vertical clearance)
- SR-47 improvements and a new viaduct from Ocean Ave. to I-405
- ICTF – light and glare impacts
- Los Angeles River Master Plan – beneficial visual impact
- I-5 Corridor Improvement Project – elevated highway structures
- California High Speed Rail Project – elevated rail structures
- SR-710 North Project – varying visual impacts, depending upon which alternative is selected for implementation
- Long Beach MUST Facility – short-term light and glare and visual impacts during construction, would provide increased open space/public recreational area along the I-710 Corridor

CUMULATIVE IMPACTS. The many physical changes resulting from the I-710 Corridor Project build alternatives would create adverse visual impacts due to the number of new structures at grade and above grade, including new interchanges, a new bridge, an elevated freight corridor, and several bridge modifications.

There is a concern that the visual impacts of the I-710 Corridor Project build alternatives, when combined with other major projects, would create an adverse visual change in the I-710 Corridor. For example, the Gerald Desmond Bridge replacement would be the most visible project in proximity to the RSA at the south end of the Study Area. It is anticipated to be over 200 feet in height and completed by 2019. However, the EIR/Environmental Assessment (EA) for the project concludes that the visual impact on the area would be beneficial due to the modern design of the new facility. Additional visual impacts may occur in the south end of the Study Area from the SR-47 Project that will include a new bridge, flyover, and/or expressway. The expanded ICTF facility in the south end of the Study Area would add potential light and glare impacts and also views of tall cranes and other port cargo-related equipment. The Shoemaker Bridge Replacement would replace an existing bridge over the Los Angeles River (and potentially add a bridge if the existing structure is retained for recreational/open space purposes), and the Long Beach MUST Facility would result in beneficial visual impacts by increasing the open space/public recreational area along the I-710 corridor.

Although aesthetics in the north end of the Study Area would not be adversely impacted by the I-710 Corridor Project build alternatives, the California High Speed Rail Project and the I-5 Corridor Improvement Project would create an adverse visual change in the I-710 Corridor. Both of these projects would add elevated structure elements. In addition, as described in the Final EIR/EIS prepared for the SR-710 North Project, all four SR-710 North Project Build Alternatives would have varying degrees of temporary and permanent visual impacts; however, most of those impacts would not occur in the same cities that would be affected by the I-710 Corridor Project build alternatives. The TSM/TDM Alternative (Preferred Alternative for the SR-710 North Project) mainly involves minor improvements to existing roads and intersections without substantive changes in the physical facilities or views; as a result, there would only be minor visible temporary impacts to the environment under the TSM/TDM Alternative. The LRT Alternative described in the SR-710 North Project Draft EIR/EIS would result in visual impacts in East Los Angeles; however, the SR-710 North Project Final EIR/EIS contains avoidance, minimization, and/or mitigation measures to lessen those impacts. Further, none of those impacts would occur in the same area of East Los Angeles that would experience impacts under the I-710 Corridor Project build alternatives.

Beneficial visual impacts may occur in the RSA due to the Gerald Desmond Bridge Project (described above), the Los Angeles River Master Plan and the City of Long Beach RiverLink Plan, as they would add landscaping and open space recreational opportunities throughout the Study Area adjacent to the Los Angeles River. These effects, when combined with the

avoidance, minimization, mitigation, and/or enhancement measures for other projects in the area would lessen the adverse cumulative impacts in the Study Area.

Construction activities of some phases of the I-710 Corridor Project build alternatives and the Middle Harbor Redevelopment Project are anticipated to overlap and would temporarily affect the visual quality in the south end of the Study Area. Therefore, the I-710 Corridor Project build alternatives could contribute to cumulative adverse impacts related to visual resources and aesthetics.

AVOIDANCE, MINIMIZATION, AND MITIGATION MEASURES. As discussed in Section 3.6 of this Final EIR/EIS, the *I-710 Corridor Aesthetics Master Plan*, which was developed in a context-sensitive design process in consultation with the affected local agencies and includes involvement of local community members as determined by the local agencies. The *I-710 Corridor Aesthetics Master Plan* defines aesthetic treatment measures to be incorporated into the final design of the I-710 Corridor Project, for any build alternative. Additionally, measures such as visually pleasing hardscape such as attractive walls and medians, as well as landscaping, have been committed to in the environmental documents for the projects listed above. For any build alternative, project-specific measures such as local jurisdiction review, the preparation of a lighting plan, and screen and retaining walls would be implemented. Similar measures would be required to minimize or avoid impacts of cumulative projects on visual resources and aesthetics.

3.25.4.7 CULTURAL RESOURCES

The analysis in this section is based on Sections 3.7 and 3.24.3.7 of this Final EIR/EIS and the *Supplemental Historic Property Survey Report* (HPSR) (April 2017), *Supplemental Historic Resources Evaluation Report* (April 2017), *Supplemental Archaeological Survey Report* (confidential report) (Supplemental ASR) (April 2017), *Archaeological Sensitivity Study for the Interstate 710 Corridor Project* (Confidential Report) (Archaeological Sensitivity Study) (February 2017), and *Archaeological Survey Report, Interstate I-710 between Ocean Boulevard and SR-60* (April 2012).

RESOURCE STUDY AREA. The original 2011 APE for the I-710 Corridor Project encompassed 2,532 acres, the majority of which is developed with built environment and has been disturbed by the construction of I-710, other roads, railroads, other infrastructure, and residential, commercial, and industrial properties; river channelization; hydrologic events; and agriculture. The areas of the new Supplemental APE encompass an additional 509 acres that were not included in the 2011 APE. Also relative to the 2011 APE, the Supplemental APE has been reduced in areas that are no longer affected by the projects. The Supplemental APE includes the limits of the proposed construction and staging areas for both build alternatives and arterial intersections, as well as all resources that may be subject to indirect effects (Supplemental HPSR Attachment A, Map 3). For the purposes of cumulative impacts analysis, the RSA would correspond to the Supplemental APE for the I-710 Corridor Project.

HEALTH AND HISTORICAL CONTEXT. Today, the I-710 Corridor encompasses a large area that passes through urban settings consisting of residential, industrial warehouse, and commercial business uses. In the 16th to 19th centuries, the Study Area was occupied by an Uto-Aztecan-speaking Native American group known as the Gabrielino. Spanish colonization in the late 1800s eventually resulted in the destruction of native culture and society. The I-710 Freeway (also known as the Long Beach Freeway) was constructed in stages between 1951 and 1965, although the idea for a highway heading south from Los Angeles and roughly following the contours of the Los Angeles River and existing railroad routes was considered by the County as early as 1911. The first railroad to be constructed in Los Angeles was the Southern Pacific Railroad, which, after completion in the 1870s, ushered in an era of population increase and development fostered by the nation-wide networks of passenger and freight railroad systems.

No archaeological resources requiring evaluation were identified through archival research, consultation, or the field survey. However, there is always a potential to encounter unanticipated archaeological resources during ground-disturbing activity associated with construction of the build alternatives. The *Archaeological Sensitivity Study* (February 2017) identifies areas that are more likely to encompass previously unrecorded archaeological resources. Additionally, no indirect impacts that would alter the eligibility status of archaeological or built environment resources are anticipated as a result of the build alternatives. There are five historic properties within the Supplemental APE for the I-710 Corridor Project: two railroad segments of the UP Railroad (Resource Numbers 19-186110/30-176630 and 19-186112); Dale's Donuts, located at 4502 East Alondra Blvd. in Compton; the Boulder Dam-Los Angeles 287.5-kilovolt Transmission Line; and the Drake Park Historic District in Long Beach.

The UP (formerly Southern Pacific) Railroad Segment (Primary No. 19-186110/30-176630) would be impacted by the build alternatives. Under the build alternatives, a segment south of Patata St. in the City of South Gate would be realigned 70 feet to the south and two bridges would be replaced. However, this segment of the rail line has already been altered and does not contribute to the significance of the UP Railroad. A portion of the UP Railroad Segment south of Frontage Rd. in the City of South Gate would be impacted by the build alternatives. However, this portion of the segment of rail line has also been altered and does not contribute to the significance of the UP Railroad. Further, this minor realignment would not impact the overall significance of the UP Railroad. Therefore, the I-710 Corridor Project build alternatives would not cause an adverse effect on the historical rail line because the rail line would continue to be eligible for the National Register. The second UP Railroad Segment (Resource No. 19-186112) south of Noakes St. includes an area in the City of Commerce that passes under the I-710 that would be impacted by the build alternatives. However, this segment of rail line is not original and does not contribute to the significance of the UP Railroad. SHPO concurred on the findings of No Adverse Effect per 36 CFR 800.5 for the Patata Segment, including the Frontage St. portion of this segment (Primary No. 19-186110/30-176630) and Noakes Segment (Primary No. 19-186112) in 2012, and no update to this concurrence has been received. Dale's Donuts would

only be minimally affected by the arterial intersection improvements under both build alternatives as well as the reconstructed interchange under Alternative 5C at the Atlantic Ave./Alondra Blvd. intersection. The build alternatives would incorporate 0.01 acre of land from the property, permanently removing a small section of parking area and sidewalk only. Therefore, the Programmatic Architectural features that qualify this resource for the National Register would not be affected. Therefore, the I-710 Corridor Project build alternatives would result in a finding of No Adverse Effect per 36 CFR 800.5. SHPO concurred with this finding in 2012.

The Boulder Dam-Los Angeles 287.5-kilovolt Transmission Line would be impacted by Alternative 7 in that the towers on either side of I-710 would be heightened by 55 feet to make room for construction of the freight corridor. However, the integrity of the Transmission Line would not be reduced to the degree that it would no longer be eligible for the National Register. Therefore, the build alternatives would result in a finding of No Adverse Effect per 36 CFR 800.5. Because this resource would not be impacted by the Preferred Alternative (Alternative 1 – No Build), SHPO concurrence for this resource was not requested.

A temporary vehicular detour would be routed through the Drake Park Historic District along Daisy Avenue between 7th and 9th Sts. Under both build alternatives. In addition, 7th St. between Maine and Daisy Aves. is proposed to be modified from a one-way to a two-way street utilizing the existing right-of-way. This would require restriping of the roadway, and possibly the replacement of the concrete curb and scored concrete sidewalk on the north side of the street, within the district boundaries. The temporary vehicular detour would affect the district by altering traffic patterns within the district; however, this temporary condition would not diminish the integrity of the district's significant historic features. In addition, the in-kind replacement of a segment of curb and sidewalk and restriping of vehicular lanes would not diminish the district's integrity. Therefore, this alternative would result in a finding of No Adverse Effect per 36 CFR 800.5 for this resource; SHPO concurred with this finding in a letter dated December 20, 2018.

REASONABLY FORESEEABLE ACTIONS. Reasonably foreseeable actions would occur in the areas that are planned for development or redevelopment, which include areas adjacent to the APE for the I-710 Corridor Project. Projects with particular relevance to cultural resources and aesthetics include:

- SR-47 Expressway Project – demolition of historic Schuyler Heim bridge
- Middle Harbor Redevelopment Project – adverse impact to two historic smoke houses/offices
- SCIG Project – demolition of historic Sepulveda Blvd. Railroad Bridge
- Los Angeles River Master Plan – potential impacts to previously undocumented cultural materials or human remains

- California High Speed Rail Project – potential indirect visual, noise, and vibration impacts to historic architectural resources
- SR-710 North Project – potential impacts to previously undocumented cultural materials or human remains

CUMULATIVE IMPACTS. As described above under the Impacts from the I-710 Corridor Project Build Alternatives section, Dale's Donuts, UP Railroad Segments (Resource No. 19-186110/30-176630 and P-19-18611), the Drake Park Historic District, and the Boulder Dam-Los Angeles 287.5-kilovolt Transmission Line (Alternative 7 only) would be minimally impacted by the build alternatives, but not adversely affected, resulting in a finding of No Adverse Effect per 36 CFR 800.5, pending SHPO concurrence.

According to the Final EIR/EIS for the SR-47 Expressway Project, that project would result in adverse effects on cultural resources related to the demolition and replacement of the historic Schuyler Heim Bridge. The SR-47 Expressway Project could also result in the destruction of previously undiscovered archaeological resources during construction. The Final EIR/EIS for the Middle Harbor Redevelopment Project indicates that project could result in potentially significant impacts on two historic smoke houses/offices and damage previously undiscovered archaeological resources during construction. According to the Final EIR for the SCIG Project, that project would result in a significant impact to cultural resources related to the demolition of the historic Sepulveda Boulevard Railroad Bridge and could damage previously undiscovered archaeological resources during construction. In addition, the environmental documents for the Los Angeles River Master Plan and the SR-710 North Project indicate those projects could result in the destruction of previously undiscovered archaeological resources during construction.

The California High Speed Rail Project could result in potential indirect visual, noise, and vibration impacts to historic architectural resources that could contribute to a cumulative impact on cultural resources in the northern portion of the RSA.

All future transportation and development projects in the Study Area would be required to comply with CEQA and Federally funded projects would be required to comply with the requirements of the National Historic Preservation Act of 1966, as amended, and the Section 106 Programmatic Agreement (PA) between the Advisory Council, the Federal Highway Administration (FHWA), the State Historic Preservation Officer (SHPO), and Caltrans.

Therefore, based on the above, the I-710 Corridor Project build alternatives would not contribute to cumulative adverse impacts related to cultural resources.

AVOIDANCE, MINIMIZATION, AND MITIGATION MEASURES. Avoidance, minimization, and mitigation measures for cultural resources impacted by the I-710 Corridor Project build alternatives are

presented in Section 3.24.4.7 of this Final EIR/EIS. Similar measures, including the halting of construction activities if archaeological material or human remains are found, would be required for any of the reasonably foreseeable actions that would also impact cultural resources. Additional measures such as the removal and relocation of historic architectural resources, placement of informative plaques on places of historic interest, and storage of artifacts in local museums are proposed in the environmental documents for the cumulative projects listed above under Section 3.25.4.7.

3.25.4.8 HYDROLOGY AND FLOODPLAINS

The analysis in this section is based on Sections 3.8 and 3.24.3.8 of this Final EIR/EIS and on the *Flood Control Facilities Report* (January 2017), the *Memorandum Update to the I-710 Corridor Project Jurisdictional Delineation Report* (January 2017), the *Preliminary On-Site Hydrology Report* (December 2016) and the *Water Quality Assessment Report* (March 2017) for the I-710 Corridor Project.

RESOURCE STUDY AREA. The I-710 Corridor contains a complex series of interconnected drainage systems that handle flows from both on-site and off-site drainage areas and flow into the Los Angeles River, Compton Creek, Rio Hondo Channel, and Dominguez Channel. Therefore, the RSA for this resource is beyond the Study Area of the I-710 Corridor Project and includes the entire Los Angeles River Watershed and the Dominguez Channel/Los Angeles Harbor watershed.

HEALTH AND HISTORICAL CONTEXT. Historically, the Los Angeles River provided an easily accessible supply of irrigation water for early human populations in the area that today is the City of Los Angeles. The river and its tributaries supported native peoples for centuries before the arrival of the first Europeans. Within 100 years after the founding of the Pueblo Los Angeles, the population and its use of water had outgrown the flows in the river. Eventually the river's natural flooding patterns became too much of a threat to the developing land uses and the river was viewed as something that had to be controlled in order for the City of Los Angeles to continue to grow. In the early 1900s, development began to encroach into more flood-prone areas. Development resulted in impervious areas, such as parking lots, roads and buildings, which resulted in increased runoff. There were two major floods in the 1930s that resulted in loss of life and a great deal of property damage. In response to the explosive population growth and pressure for more development, flood protection was demanded by the public. In response, the USACE and the County of Los Angeles constructed numerous flood control basins, channels, and other flood control facilities. In the 1950s and 1960s, the Federal government straightened, deepened, and reinforced the river with concrete. The concrete structures prevented loss of life and property damage, but had a negative impact on the aesthetics of the river.

The USACE operates and maintains five major flood control reservoirs with the Los Angeles River system. The Los Angeles County Department of Public Works operates and maintains 15 dams, about 143 sediment entrapment basins and 29 spreading grounds. The County Flood Control, Caltrans, cities, and homeowner associations maintain numerous storm drains and pump stations through the Los Angeles River basin.

In recent years, various community and governmental groups have been working together to revitalize the Los Angeles River through cooperative planning efforts such as the Los Angeles River Master Plan and the Los Angeles River Revitalization Master Plan.

IMPACTS FROM THE I-710 CORRIDOR PROJECT BUILD ALTERNATIVES. Both build alternatives would result in the same 26 transverse (i.e., perpendicular to the direction of flow) encroachments. 24 of these transverse encroachments would occur at 16 Los Angeles River locations. The Compton Creek and Rio Hondo channel would each be affected by one transverse encroachment. Alternative 5C would result in three additional transverse encroachments of the Los Angeles River channel in one location, and 7 additional transverse encroachments of the Compton Creek channel in two locations. Alternative 7 would result in eight additional transverse encroachments of the Los Angeles River channel in four locations, and three additional transverse encroachments of the Compton Creek channel in one location. All encroachments are considered low risk by location hydraulic studies performed at 133-year flood levels. Neither build alternative would change the capacity of the Los Angeles River, Compton Creek, and the Rio Hondo Channel to carry water or result in a measurable impact to the 100-year floodplain elevation. The proposed encroachments would not result in any adverse impacts on the natural and beneficial floodplain values, would not result in a substantial change in flood risk or damage, and would not have substantial potential to cause interruption or termination of emergency services or emergency routes. The I-710 Corridor Project build alternatives would result in encroachments to the existing basin and levees. However, the increase in on-site storm water runoff contributing to the Dominguez Basin associated with the proposed improvements of the build alternatives is inconsequential in comparison to the amount of storm water runoff from off-site tributary watersheds and transfer flows from the basins located on the east side of the Los Angeles River.

Alternative 7 would require relocation of the Dominguez Gap Basin and the reconfiguration or relocation of a basin near the I-710/I-105 interchange. As discussed in Section 3.9, Water Quality and Stormwater Runoff, several parcels have been identified adjacent to I-710 and the Los Angeles River for relocation of the Dominguez Gap Basin under Alternative 7. The affected basin near the I-710/I-105 interchange basin could be relocated in the northwest quadrant of the I-105/I-710 interchange. The replacement basins for both the I-105 and Dominguez Gap Basin would provide equal or greater capacity than the basins impacted by the freight corridor under Alternative 7.

REASONABLY FORESEEABLE ACTIONS. Reasonably foreseeable actions would occur in the areas that are planned for development or redevelopment, which include areas adjacent to the I-710 Corridor Project. Projects with particular relevance to hydrology and floodplains include:

- Gerald Desmond Bridge Project – placement of structures in the base floodplain
- Pier S Marine Terminal Project – dredge and fill activities that would affect water circulation in the Back Channel and Cerritos Channel
- Los Angeles River Master Plan – revitalization and maintenance of the Los Angeles River
- SR-710 North Project – the Freeway Tunnel Alternative could result in erosion from clearing of land and vegetation.

CUMULATIVE IMPACTS. The Gerald Desmond Bridge Project would add new bridge structures within the base floodplain but would not redirect flood flows. The dredge and fill activities associated with the Pier S Marine Terminal Project would not significantly alter harbor-wide water circulation or flushing conditions. According to the Final EIR/EIS prepared for the SR-710 North Project, the Freeway Tunnel Alternative could result in temporary construction impacts and the potential for erosion from clearing of land and vegetation, but there would be no permanent impacts on floodplain values. None of the other SR-710 North Project Build Alternatives, including the Preferred Alternative (TSM/TDM) would encroach upon floodplains. As the I-710 Corridor build alternatives, Pier S Marine Terminal Project, and the Gerald Desmond Bridge Project would not have adverse impacts to hydrology and floodplain, cumulative impacts would not be adverse. Additionally, through adoption of the Los Angeles River Master Plan, the City of Los Angeles is working with other jurisdictions and agencies to revitalize and maintain the Los Angeles River. As discussed above, neither of the I-710 Corridor Project build alternatives would affect the capacity of the Los Angeles River, Compton Creek, and the Rio Hondo Channel to carry water or result in a measurable impact to the 100-year floodplain elevation. Therefore, the I-710 Corridor Project build alternatives would not contribute to cumulative adverse impacts related to hydrology and floodplains.

AVOIDANCE, MINIMIZATION, AND MITIGATION MEASURES. Measures to minimize long-term operational impacts of the I-710 Corridor Project build alternatives on the natural and beneficial floodplain values related to water quality are discussed in Section 3.24.4.9. Measures to minimize permanent impacts of the I-710 Corridor Project build alternatives to jurisdictional waters are discussed in Section 3.17, Wetlands and Other Waters of the United States. In addition, for any build alternative, Measures FP-1 and FP-2 would minimize and mitigate impacts of the I-710 Corridor Project build alternatives to the 100-year floodplain and impacts to the retention basin near the I-105/I-710 interchange and the Dominguez Gap Basin under Alternative 7.

3.25.4.9 WATER QUALITY AND STORM WATER RUNOFF

This section is based on Sections 3.9 and 3.24.3.9 of this Final EIR/EIS and the *Water Quality Assessment Report* (March 2017) prepared for the proposed project.

RESOURCE STUDY AREA.

SURFACE WATER. The I-710 Corridor Project is located within the Los Angeles Basin and discharges to two Los Angeles County watersheds: the Dominguez Channel/Los Angeles Harbor and the Los Angeles River. In addition, a portion of the Study Area is adjacent to the San Gabriel River Watershed. The primary receiving waters for runoff from the Study Area are the Los Angeles River, Compton Creek, the Rio Hondo Channel, and the Dominguez Channel. These watersheds and receiving waters constitute the RSA for assessing cumulative impacts on surface waters.

GROUNDWATER. The I-710 Corridor Project is located within the Coastal Plain of the Los Angeles Groundwater Basin and is specifically underlain by the West Coast and Central Sub-basins. The Coastal Plain of the Los Angeles Groundwater Basin is adjacent to the Santa Monica Mountains and the Puente Hills on the north and east, on the south by the San Joaquin Hills, and on the west by the Pacific Ocean. These groundwater basins constitute the RSA for assessing cumulative impacts on groundwater.

HEALTH AND HISTORICAL CONTEXT. Pollutants in urban runoff from dense clusters of residential, industrial, and other urban activities have impaired surface water quality in the majority of the Los Angeles River Watershed. The Los Angeles River, Compton Creek, the Rio Hondo Channel, and the Dominguez Channel are all listed as impaired on the 2008 Clean Water Act (CWA) Section 303(d) List of Water Quality Limited Segments. The majority of the groundwater in the West Coast and Central Sub-basins is of high quality and requires little to no treatment before being pumped out of wells and used as potable water for the public.

IMPACTS FROM THE I-710 CORRIDOR BUILD ALTERNATIVES. The I-710 Corridor Project build alternatives would add new impervious surfaces, thereby increasing the amount of storm water runoff within the limits of the build alternatives, and introducing additional water pollutant loads into the runoff in the area. Alternative 7 would result in a greater amount of impervious surface area compared to Alternative 5C. The increase in impervious surface area, and therefore the increase in runoff and pollutant loading, under Alternative 7 would be greater than under Alternative 5C. The typical roadway pollutants would be washed off impervious surface areas by storm water flows and then discharged to the local receiving water bodies. As described in Section 3.9, Water Quality, the introduction of additional treatment BMPs as part of the build alternatives would represent an improvement when compared to the No Build (Alternative 1) condition, as there currently are only 18 Caltrans-maintained BMPs treating freeway runoff on I-710.

Additionally, as discussed previously in 3.25.4.8, Alternative 7 would require the relocation of the Dominguez Gap West Basin. However, for any build alternative, several parcels have been identified adjacent to I-710 and the Los Angeles River for relocation of the Dominguez Gap Basin. The exact location for relocating the basin would be coordinated with DWP. In addition, Alternative 7 would require reconfiguration or relocation of one of two existing retention basins near the I-710/I-105 interchange that serve to meter the peak flows of the Los Angeles River channel. As specified in Measure FP-2 in Section 3.8, the relocation and reconstruction of the Westerly Dominguez Gap Basin and the basin near the I-710/I-105 interchange would retain each basin's original recharge capacity at a minimum. Therefore, the relocation of these basins would not adversely affect groundwater quantity or quality.

REASONABLY FORESEEABLE ACTIONS. The reasonably foreseeable actions that could affect water quality and storm water runoff would occur in the areas that are planned for development or redevelopment, which are located throughout the Los Angeles River Basin. The reasonably foreseeable actions are listed in Table 3.25-2.

CUMULATIVE IMPACTS. With the exception of the Los Angeles River Master Plan and the Pier B On-Dock Rail Support Facility, all of the projects listed in Table 3.25-2 would increase impervious surfaces, thereby increasing the amount of storm water runoff and introducing additional water pollutant loads. The I-710 Corridor Project build alternatives and cumulative projects would include BMPs to target constituents of concern, which would include any pollutants causing downstream impairments. These measures are identified in the environmental documents for the projects listed in Table 3.25-2 for which the CEQA and/or NEPA process has been completed or is in progress. In the case that environmental documents are not available for the projects listed in Table 3.25-2, similar measures would be required to comply with CEQA and/or NEPA. The cumulative projects include BMPs to address pollutants of concern from roadways; therefore, incremental contribution for impairments resulting from pollutants of concern from roadways would not be cumulatively considerable. For impairments resulting from pollutants that are not related to roadways, the cumulative projects would not contribute these pollutants to the impaired waters because roadways are not a source for these pollutants.

The Long Beach MUST Facility would result in beneficial impacts pertaining to water quality, since it would divert and treat urban runoff from that would otherwise discharge directly into the Los Angeles River. The Long Beach MUST Facility would provide a solution to meeting clean water mandates, as required under the NPDES Permits, as well as under the Los Angeles River Total Maximum Daily Load (TMDL) requirements, which are overseen by the Los Angeles RWQCB, SWRCB, and the U.S. Environmental Protection Agency (EPA) under the Clean Water Act. All first flush and dry weather urban runoff directly from the Long Beach MUST Facility would be contained on site and directed through the project's treatment system, prior to discharge to the Los Angeles River.

Construction activities of some phases of the I-710 Corridor Project build alternatives, the SR-47 Expressway Project, the SR-710 North Project, and the Middle Harbor Redevelopment Project may overlap and would temporarily adversely affect water quality. However, for any build alternative, the appropriate permits, approvals, and BMPs would be obtained/implemented to reduce any potential temporary impact to water quality. Therefore, the I-710 Corridor Project build alternatives would not contribute to cumulative adverse impacts related to water quality and storm water runoff.

AVOIDANCE, MINIMIZATION, AND MITIGATION MEASURES. In addition to the relocation of the Dominguez Gap Basin and the basin near the I-710/I-105 interchange (Measure FP-2 in Section 3.8.4), Section 3.24.4.9 of this Final EIR/EIS, outlines that the I-710 Corridor Project build alternatives would be required to comply with National Pollutant Discharge Elimination System (NPDES) requirements and would implement water quality Design Pollution Prevention and Treatment BMPs at the time of development. Cumulative land use and transportation projects would be required to comply with NPDES requirements and to implement water quality Design Pollution Prevention and Treatment BMPs at the time of development as projects subject to NEPA and/or CEQA would require BMPs as part of construction. As all these projects are required to comply with these measures, any adverse impacts to water quality would not be adverse. Therefore, they would not contribute to a cumulative adverse effect to water quality.

3.25.4.10 GEOLOGY/SOILS/SEISMIC/TOPOGRAPHY

This section is based on Sections 3.10 and 3.24.3.10 of this Final EIR/EIS and the *Geotechnical Final Report* (January 2010) prepared for the project.

RESOURCE STUDY AREA. The Study Area is located at the north end of the Peninsular Ranges physiographic province, in the central and south-central Coastal Plain area of the Los Angeles Basin. The Study Area constitutes the RSA for assessing cumulative impacts related to geology. The Los Angeles Basin is a coastal plain that is bordered on the north by the Santa Monica Mountains and on the east and southeast by the Santa Ana Mountains and the San Joaquin Hills. The relatively flat surface of the Los Angeles Basin is interrupted by a locally trending northwest alignment of low hills and mesas that extends from Newport Beach to Beverly Hills. With the exception of embankments associated with the existing freeways and the embankments and levees of the Los Angeles River, the Study Area is relatively flat, with elevations ranging from about seven feet above mean sea level at the south end to about 16 feet above mean sea level at the north end. The Study Area is a seismically active area, and with the exception of the northernmost 0.8 mile of the Study Area and portions of some proposed on-ramp/off-ramp transitions on the east side of the Los Angeles River between Ocean Blvd. and I-405 proposed under the build alternatives, the entire area is located in an area identified as having the potential for liquefaction.

HEALTH AND HISTORICAL CONTEXT. Reasonably well-established historical records of earthquakes in California have been compiled for approximately the past 200 years. More accurate instrumental measurements have been available since 1933. As demonstrated by historical seismicity, earthquakes generated by displacement along nearby regional faults are considered capable of generating ground shaking of engineering significance within the Study Area. Ground or seismic shaking is typically considered to have the greatest potential for damage associated with earthquakes. Seismic shaking can also result in secondary effects like liquefaction.

IMPACTS FROM THE I-710 CORRIDOR PROJECT BUILD ALTERNATIVES. The roadway, structures, and other features of the build alternatives could be impacted by soil disturbance (during construction), ground motion and liquefaction, and possible ground rupture (deformation). Design and construction of the build alternatives to current highway and structure design standards, including applicable seismic standards, would minimize the potential impacts of the build alternatives related to geological and seismic hazards.

REASONABLY FORESEEABLE ACTIONS. The reasonably foreseeable actions would occur in the areas that are planned for development or redevelopment, which are located throughout the Study Area. Projects of particular interest related to geology are:

- SR-47 Expressway Project – potential for permanent ground displacement
- Gerald Desmond Bridge Project – potential for liquefaction
- Pier B On-Dock Rail Support Facility – potential for seismic-related ground failure, including liquefaction
- Pier S Marine Terminal Project – potential for seismic-related ground failure, including liquefaction; potential for future subsidence
- SCIG Project – subject to seismic activity, soil settlement and subsidence, and expansive soils and erosion
- Los Angeles River Master Plan – liquefaction and erosion
- California High Speed Rail Project – aerial foundation issues
- SR-710 North Project – potential for seismic-related ground failure, including liquefaction and landslides

CUMULATIVE IMPACTS. While other projects may impact the geology at their project sites, the geological impacts would be localized and would not impact regional geology. Therefore, the I-710 Corridor Project build alternatives would not contribute to cumulative adverse impacts related to geological and seismic hazards.

AVOIDANCE, MINIMIZATION, AND MITIGATION MEASURES. Implementation of standard design and construction practices would reduce the risk for geologic hazards such as soil erosion and slope instability to affect the I-710 Corridor Project build alternatives. Although the reasonably foreseeable actions would not result in cumulative impacts related to geology, similar measures would be required for the SR-47 Expressway Project, the Gerald Desmond Bridge Project, the Pier B On-Dock Rail Support Facility, the Pier S Marine Terminal Project, the SR-710 North Project, and the SCIG Project that result in the construction of new structures to comply with CEQA and NEPA. For those projects in the Study Area in which environmental documents are not yet available, similar measures would be required to comply with CEQA and/or NEPA.

3.25.4.11 PALEONTOLOGICAL RESOURCES

The analysis in this section is based on Sections 3.11 and 3.24.3.11 of this Final EIR/EIS and the *Paleontological Resources Identification and Evaluation Report* (June 2017) prepared for the project.

RESOURCE STUDY AREA. The I-710 Corridor Project is located at the northern end of the Peninsular Ranges geomorphic province, a 900-mile-long, northwest-southeast-trending structural block that extends from the tip of Baja California to the Transverse Ranges and includes the Los Angeles Basin. Specifically, the I-710 Corridor Project runs along the course of the Los Angeles River, crossing the Los Angeles Basin from north to south in an area typified by a low-lying topography with slight hills or mesas rising above the basin floor. For the purposes of this cumulative impacts analysis, the RSA is defined as the Los Angeles River Basin from the southern terminus of the I-710 Corridor Project at Ocean Blvd. to its northern terminus at SR-60.

HEALTH AND HISTORICAL CONTEXT. The I-710 Corridor encompasses a large area that passes through urban settings consisting of residential, industrial warehouse, and commercial business uses. Across the Los Angeles Basin, a veneer of Holocene sediments often overlies older, Pleistocene sediments. The locality search and literature review conducted for the I-710 Corridor Project identified numerous Pleistocene fossil localities from the immediate vicinity of the I-710 Corridor Project that were found during excavation into sediments that underlie these surficial Holocene deposits. Therefore, some sediments in the RSA have the potential to contain important paleontological resources.

IMPACTS FROM THE I-710 CORRIDOR PROJECT BUILD ALTERNATIVES. The area affected by the build alternatives contain seven types of sediments at the surface. Five of these, because of their young age (less than 10,000 years), do not have the potential to contain paleontological resources. Two sediments from the Quaternary Period (1.8 million to 10,000 years ago) have the potential to contain paleontological remains. The I-710 Corridor Project build alternatives would involve potential excavation that could extend into deeper Pleistocene deposits, which have high potential and high sensitivity for the presence of nonrenewable paleontological

resources. Therefore, paleontological localities may be encountered during the excavation phase of construction of either build alternative within these sediments.

REASONABLY FORESEEABLE ACTIONS. The reasonably foreseeable actions would occur in the areas that are planned for development or redevelopment, which are located throughout the Los Angeles River Basin. Those projects with specific relevance to paleontological resources include all projects that require deep excavation into sediments with sensitivity for paleontological resources (Pleistocene alluvium). Relevant projects are:

- I-5 Corridor Improvement Project
- I-5 Widening and HOV Project
- SCIG Project
- California High Speed Rail Project
- Pier B On-Dock Rail Support Facility
- SR-710 North Project

CUMULATIVE IMPACTS. Past projects within the RSA have resulted in discoveries of paleontological resources. These are described in Section 3.11.3.7, Fossil Locality Searches, of this Final EIR/EIS. All reasonably foreseeable projects involving deep excavation into Pleistocene alluvium would have the potential to result in adverse impacts to paleontological resources. These cumulative projects are or would be required to implement a Paleontological Mitigation Plan (PMP) that includes monitoring and recovery of paleontological resources that may be found during construction. Because these cumulative projects include this requirement, the cumulative projects' contribution to cumulative paleontological impacts would not be considerable.

AVOIDANCE, MINIMIZATION, AND MITIGATION MEASURES. Each cumulative project would be subject to the requirements of Federal and/or State environmental laws for protection of paleontological resources. In addition, Caltrans has developed a set of guidelines similar those of the Society of Vertebrate Paleontology to prepare a PMP to reduce impacts to paleontological resources for any build alternative. For the cumulative projects, a PMP would be required for every project with high-sensitivity sediments that is subject to Caltrans oversight.

The SCIG Project Draft EIR revealed no vertebrate fossil localities have been recorded directly within the SCIG Project footprint, but fossil localities exist near the SCIG Project footprint in sedimentary deposits identical or similar to those encountered underlying the [SCIG] Project

footprint.⁶ The Pier B On-Dock Rail Support Facility Draft EIR revealed paleontological resources could be encountered during project construction, but implementation of mitigation measures consisting of a project-specific paleontological monitoring program and temporary halting of construction work to properly evaluate any fossiliferous materials would ensure no cumulatively considerable contributions to significant cumulative impacts on paleontological resources would occur.⁷ The SR-710 North Project did not reveal previously recorded fossil localities within the project area boundaries for any of the alternatives, but fossil localities are known to exist in the vicinity of the SR-710 North Project area.⁸ As stated in the environmental documents for the SCIG Project, the Pier B On-Dock Rail Support Facility, and the SR-710 North Project, implementation and adherence to project-specific Paleontological Resources Mitigation Programs would be required to minimize impacts to resources within high-sensitivity sediments. For those projects in the RSA in which environmental documents are not available, similar measures would be required to comply with CEQA and/or NEPA. Through implementation of the project-specific Paleontological Resources Mitigation Programs, impacts and effects to nonrenewable paleontological resources would be reduced to below levels of significance or adversity, respectively, and no cumulatively considerable contributions to significant cumulative impacts on paleontological resources would occur. Therefore, the I-710 Corridor Project build alternatives would not contribute to cumulative adverse impacts related to paleontological resources.

3.25.4.12 AIR QUALITY

This section is based on Sections 3.13 and 3.24.3.13 of this Final EIR/EIS, *Air Quality, Greenhouse Gas, and Health Risk Assessment Technical Study* (June 2017).

RESOURCE STUDY AREA. The I-710 Corridor Project's effects on air quality were evaluated for three different geographic Study Areas: (1) the South Coast Air Basin (Basin); (2) the I-710 "Area of Interest" (AOI), which is a sub-region of the Basin that includes cities and communities along the I-710 freeway; and (3) the area within and immediately adjacent to the I-710 Corridor itself (I-710 Area). For the purpose of this analysis, the RSA for air quality is the area

⁶ Section 3.4 - Cultural Resources. *Southern California International Gateway Draft Environmental Impact Report*. Page 3.4-13. September 2011. Website: <https://www.portoflosangeles.org/EIR/SCIG/DEIR/03.04. Cultural Resources.pdf> (accessed February 28, 2017).

⁸ *Paleontological Identification and Evaluation Report for State Route 710 North Project*. Page 6-33. March 14, 2014. Website: http://www.dot.ca.gov/dist07/resources/envdocs/docs/710study/draft_eir-eis/Paleo%20Identification%20Evaluation%20Report/SR%20710%20Paleo%20Identification%20Evaluation%20Report.pdf (accessed February 28, 2017).

immediately adjacent to the I-710 Corridor that would be directly affected by construction emissions and vehicle emissions from operation of the completed build alternatives. The I-710 AOI includes portions of the Cities of Bell, Bell Gardens, Carson, Commerce, Compton, Cudahy, Downey, Huntington Park, Lakewood, Long Beach, Los Angeles, Lynwood, Maywood, Paramount, Signal Hill, South Gate, and Vernon, as well as parts of unincorporated Los Angeles County, including the community of East Los Angeles, which are located adjacent to the Study Area. The Basin, the I-710 AOI, the I-710 Area and the other past, present, and future projects considered in the analysis in Section 3.13, Air Quality, are located at least partially in Los Angeles County.

A single RSA for each type of air quality impact would not effectively consider the appropriate areas for potential short-term air quality impacts during construction of the build alternatives. Short-term air quality impacts can result from equipment operations as well as dust generated during grading or travel on unpaved surfaces. An RSA for short-term air quality impacts would focus on a specific area under construction at the time, the roads and intersections in the vicinity of the construction zone, and other projects under construction at the same time in the same area. As a result, an RSA for short-term air quality impacts focuses on areas in proximity to active construction areas for the proposed I-710 Corridor Project build alternatives and other nearby cumulative projects under construction at the same time.

HEALTH AND HISTORICAL CONTEXT. The RSA is located in a largely urbanized area. The health of the resource changes with emissions levels in the area surrounding the build alternatives. Over time, the air quality in the Basin has been substantially degraded by short- and long-term emissions of pollutants and dust generated by a wide variety of land uses, including agricultural, urban, industrial, and manufacturing uses.

The I-710 Corridor Project is under the jurisdiction of the South Coast Air Quality Management District (SCAQMD). The SCAQMD maintains ambient air quality monitoring stations throughout the Basin. The closest monitoring stations to the project area are the SCAQMD Long Beach North (decommissioned in 2013), Long Beach Hudson, Compton, and Los Angeles North Main Street Stations. Tables 3.13-1 and 3.13-2 in Section 3.13, Air Quality, provide monitoring data from these stations for 2015, 2016, 2017, 2018, and 2019.

From the ambient air quality data provided in Tables 3.13-1 and 3.13-2, it can be seen that CO, annual NO₂, and SO₂ levels are below the relevant State and Federal standards. Values listed in Tables 3.13-1 and 3.13-2 that are equal to or exceed the NAAQS for the various pollutants are highlighted in bold text. One-hour NO₂ levels exceeded the Federal standards at the Long Beach Hudson (2015) Station. One-hour O₃ levels exceeded the State standard at the Compton (2015, 2016, 2017 and 2019) and Los Angeles North Main Street (2015, 2016, 2017, and 2018) Stations. Eight-hour O₃ levels exceeded the State and Federal standards at the Compton (2015, 2016, 2017, and 2019), and Los Angeles North Main Street (2015, 2016, 2017, 2018, and 2019)

Stations. The Federal 24-hour $PM_{2.5}$ standard was exceeded in each of the past five years at the South Long Beach/Long Beach Hudson (with the exception of 2016 and 2019), Compton, and Los Angeles North Main Street Stations. The State and Federal annual $PM_{2.5}$ standards were also exceeded at the Compton (2017 and 2018) and Los Angeles North Main Street (2015 and 2018) Stations. It should be noted that exceedance of a standard is not necessarily a violation, especially for many Federal standards.

Following circulation of the RDEIR/SDEIS in 2017, extensive coordination occurred between Caltrans, Metro, and EPA staff related to the protocol for the particulate matter hot-spot analysis, a component of that project-level conformity analysis. Prior to circulation of the 2012 Draft EIR/EIS, the I-710 Corridor Project was determined to be a Project of Air Quality Concern (POAQC) requiring a PM hot-spot analysis because it was considered to be: (i) a new or expanded highway project that had a significant number of or significant increase in diesel vehicles, and (ii) a project affecting intersections that are at level of service (LOS) D, E, or F with a significant number of diesel vehicles, or those that will change to LOS D, E, or F because of increased traffic volumes from a significant number of diesel vehicles related to the build alternatives. This was described in Section 3.13.3.1 of the 2012 Draft EIR/EIS. Some of the build alternatives analyzed in the 2012 Draft EIR/EIS assumed that zero emission/near zero emission (ZE/NZE) trucks would be commercially deployed and therefore in use in the corridor at the time a build alternative would be constructed; however, at that point in project development, the I-710 Corridor Project did not include a ZE/NZE truck program as a programmatic element. The assumption that the project was a POAQC was carried forward in the RDEIR/SDEIS even considering that the subsidy and deployment of ZE/NZE trucks was included as a programmatic element of Alternatives 5C and 7, which serves as a commitment that ZE/NZE trucks would be deployed in the corridor should a build alternative be approved and constructed. Because the build alternatives analyzed in the RDEIR/SDEIS included ZE/NZE truck deployment strategies and funding commitments approved by the Metro Board of Directors, it can be reasonably concluded that “a significant number of or significant increase in diesel vehicles” would not occur as a result of the build alternatives. Rather, it can be demonstrated that the number of diesel vehicles operating in the corridor would actually decrease as a direct result of either Alternative 5C or 7. Figure 3.13-2 shows a comparison of diesel truck trips on I-710 in 2035 between the No Build (Alternative 1) and Alternative 5C.

IMPACTS FROM THE I-710 CORRIDOR PROJECT BUILD ALTERNATIVES. The air quality impacts of the I-710 Corridor Project build alternatives are different for each of the build alternatives. With the exception of Total PM_{10} emissions, 2035 criteria and air toxic exhaust emissions would be generally lower for the build alternatives when compared to Baseline (2012) emissions. Despite a projected reduction of PM from vehicle exhaust due to the use of cleaner heavy-duty trucks, total PM_{10} emissions would increase for all the 2035 alternatives when compared to the 2012 Baseline due to increased vehicle activity and related tire and brake wear emissions. Total PM_{10} emissions from Alternative 5C would increase by 0.1 percent in the Basin, 0.6 percent in the

AOI, and 8.2 to 9.2 percent in the I-710 Area (depending on modelled and traffic data, respectively) when compared to the No Build (Alternative 1). Total PM₁₀ emissions from Alternative 7 would increase by 0.2 percent in the Basin, 1.4 percent in the AOI, and 32.7 to 33.3 percent in the I-710 Area (depending on modelled and traffic data, respectively) when compared to the No Build (Alternative 1).

Total PM_{2.5} and exhaust emissions are used as surrogates for PM and Ultrafine Particulates (UFP) exposure, respectively. Both total I-710 PM_{2.5} and exhaust emissions are expected to be lower for each of the alternatives [including the No Build (Alternative 1)] in 2035 as compared to the 2012 Baseline emissions. The same is true for total PM_{2.5} and exhaust emissions in the Basin and AOI. The public's exposure along I-710 to PM-related morbidity and mortality health risks would decrease relative to the 2012 Baseline with the exception of some locations near the roadways (particularly for Alternative 7). To the extent that increases in entrained road dust in the 2035 alternatives may be overestimated, the exposure would be even lower for those very near to the roadways. Implementation of either of the build alternatives would decrease the public's health risk due to UFP relative to the 2012 Baseline and the 2035 No Build (Alternative 1), even near the I-710 freeway and freight corridor.

REASONABLY FORESEEABLE ACTIONS. The reasonably foreseeable actions would occur in the areas where cumulative projects would be constructed that are located throughout the Study Area. Projects with particular relevance to air quality impacts are shown in Table 3.25-2 and include construction projects, projects that would result in an increase in vehicle trips and traffic congestion, and projects that would result in additional stationary source emissions.

Due to the scale and duration of the construction for the build alternatives, it is likely that the construction of other projects would overlap with the construction of either of the build alternatives. These projects include:

- SR-47 Expressway Project
- Middle Harbor Redevelopment Project
- I-5 Widening and HOV Project
- I-5 Corridor Improvement Project
- California High Speed Rail Project
- SR-710 North Project

Construction activities of some phases of the I-710 Corridor Project build alternatives, the SR-47 Expressway Project, the SR-710 North Project, and the Middle Harbor Redevelopment Project may overlap and would result in short-term air quality impacts associated with fugitive dust and construction equipment emissions. The quantity and severity of those impacts would be related to the amount of soil disturbed, the types and numbers of pieces of construction equipment,

weather conditions, and other factors specific to each project. However, all construction projects in southern California are required to comply with some or all of the applicable SCAQMD rules as well as local jurisdictions' requirements for dust and emission controls during construction. In addition, all projects on State highways are required to comply with Caltrans Standard Construction Specifications for dust control and asphalt concrete plant emissions. All construction material hauling is required to comply with California Vehicle Code requirements for avoiding material spills on public roads.

Many of the cumulative projects and programs, such as the Port's Clean Air Action Plan, would have a beneficial effect on air quality and reducing health risk. The cumulative benefit of these types of projects is reflected in the reduction in criteria pollutant concentrations discussed in Section 3.13.

CUMULATIVE IMPACTS. For any build alternative, if the construction of the build alternative and some of the other cumulative projects occur concurrently and in proximity to each other, there would be a potential for cumulative impacts related to short-term fugitive dust and construction equipment emissions in the RSA. The cumulative short-term air quality impacts could be substantial, depending on the number of projects under construction concurrently, their proximity to each other, weather and climatic conditions, and other factors. Therefore, the build alternatives would have potential to contribute to cumulative short-term air quality impacts in the RSA during construction, even with mitigation. The build alternatives and their design variations would result in near-roadway incremental concentration impacts at some receptors within the RSA. Therefore, the I-710 Corridor Project build alternatives would contribute to long-term near corridor cumulative air quality impacts.

AVOIDANCE, MINIMIZATION, AND MITIGATION MEASURES. The build alternatives include substantial measures to address short-term dust and equipment emissions. These types of measures are typically required of most major construction projects in the Basin by the SCAQMD and/or the local jurisdictions. As a result, it is anticipated that potential short-term cumulative air quality impacts of the build alternatives and the other cumulative projects would be substantially reduced based on compliance with SCAQMD regulations. However, if a large number of projects, including the any build alternative for the I-710 Corridor Project, are under construction at the same time, it is possible that the short-term air quality impacts of those cumulative projects in the RSA could exceed the applicable SCAQMD standards, even with mitigation.

As discussed in Section 3.13, the build alternatives would result in localized adverse long-term air quality impacts to a small number of near-roadway receptors, with Alternative 7 resulting in a slightly higher number of near-roadway emission impacts. For any build alternative, Measure AQ-1 would provide funding for four additional air quality monitoring stations within the I-710 Corridor. Additional measures to further reduce air quality impacts would include the provision of air filtration systems for schools within 0.25 mile of I-710 (AQ-2) and the provision of solid

barriers (walls) and vegetation to increase dispersion of vehicular emissions and particulate matter (AQ-3). However, construction of either build alternative may result in adverse impacts related to fugitive dust, construction equipment, and vehicle emissions. Therefore, in Section 3.24.4.13, the build alternatives include standard conditions and conditions for implementing the requirements of SCAQMD Rule 403 that would substantially reduce potential adverse short-term air quality impacts during project construction, for either build alternative.

3.25.4.13 NOISE

This section is based on Sections 3.14 and 3.24.3.14 of this Final EIR/EIS, the *Traffic Noise Study Report* (May 2016), the *Supplemental Traffic Noise Study Report* (May 2018), and the *Noise Abatement Decision Report* (updated May 2018).

RESOURCE STUDY AREA. For the purpose of this analysis, the RSA for noise impacts includes all areas adjacent to the Study Area where there are sensitive land uses that would be affected by construction noise and traffic noise generated by the operation of the completed build alternatives. The Study Area focuses on those areas in the vicinity of I-710 with potentially noise-sensitive uses, including residential uses, parks, and open space uses, or areas of frequent human activity. The RSA includes parts of the Cities of Bell, Bell Gardens, Carson, Commerce, Compton, Cudahy, Downey, Huntington Park, Lakewood, Long Beach, Los Angeles, Lynwood, Maywood, Paramount, Signal Hill, South Gate, and Vernon, as well as parts of unincorporated Los Angeles County, including the community of East Los Angeles, which are located adjacent to the Study Area.

HEALTH AND HISTORICAL CONTEXT. The cumulative impacts Study Area is located in a largely urbanized area. Noise in this area is generated by traffic on the freeways and area roads, equipment operations, urban uses, aircraft, and other noise sources typical in urban and developed areas. The health of the resource is affected by noise from I-710, local arterial roadways and surrounding noise-generating land uses such as the ports of Los Angeles and Long Beach. As the Study Area has become more densely developed over time and traffic volumes on the I-710 have increased, the background levels of noise in much of the RSA have increased and, in some areas, already exceed the applicable noise standards. Existing background traffic noise levels in the RSA are provided in Table 3.14-2 in Section 3.14, Noise.

IMPACTS FROM THE I-710 CORRIDOR PROJECT BUILD ALTERNATIVES. During construction of either build alternative, noise from construction activities may occasionally dominate the noise environment in the immediate project area. Equipment involved in construction generally generates noise levels ranging from 70 to 90 A-weighted decibels (dBA) at a distance of 50 feet. Normally, construction noise levels should not exceed 86 dBA maximum instantaneous noise level (L_{max}) at a distance of 50 feet. No adverse noise impacts from construction of the build alternatives are anticipated because construction would be conducted in accordance with

Caltrans Standard Specifications and would be short-term, intermittent, and dominated by local traffic noise.

The comparison of build alternative noise impacts to the future No Build condition and existing Baseline conditions indicates that traffic noise would increase as a result of either build alternative. Traffic noise impacts would occur at noise-sensitive land uses within the Study Area, and noise abatement has been considered, for either build alternative. There are some areas where the build alternatives would result in substantial increases in noise from existing levels without the build alternatives, where sound barriers would not reduce traffic noise levels to future No Build levels. Because not all noise increases may be able to be abated, this noise impact would be an unavoidable adverse impact of the build alternatives.

REASONABLY FORESEEABLE ACTIONS. The reasonably foreseeable actions would occur in the areas where cumulative projects would be constructed, which are located throughout the Study Area. Projects with particular relevance to noise impacts include all construction projects and projects that would result in an increase in traffic noise levels. These projects include all projects listed in Table 3.25-2 with the exception of the Middle Harbor Redevelopment Project, the Gerald Desmond Bridge Project, the Los Angeles River Master Plan, and the RiverLink Plan.

CUMULATIVE IMPACTS. As shown in Table 3.25-2, a large number of transportation projects are proposed in the RSA within the Study Area. Similar to the I-710 Corridor Project build alternatives, some of those projects would result in increases in the ambient noise levels in the long term that would not be able to be avoided or substantially mitigated.

The build alternatives would result in increased noise levels in the Study Area compared to existing Baseline conditions and future No Build conditions, and some of those increases would not be able to be feasibly abated. Also, many of the other cumulative transportation and land use projects in the area would also result in increases in long-term noise levels in the RSA, some of which may also not be substantially or feasibly abated. Therefore, the I-710 Corridor Project build alternatives may contribute to long-term cumulative adverse noise impacts.

AVOIDANCE, MINIMIZATION, AND MITIGATION MEASURES. The build alternatives include some new soundwalls, as well as increases in heights in existing soundwalls along the I-710 corridor and would result in only a minor increase in ambient noise levels. According to the environmental documents for the I-5 Corridor Improvement Project, the SR-47 Expressway, the Pier B On-Dock Rail Support Facility, the Washington Blvd. Improvement Project, the SR-710 North Project, the SCIG Project, the Pier A East and West Expansion, the Pier S Marine Terminal, and the ICTF, these projects also include appropriate noise abatement for long-term impacts on sensitive receptors, which could include new soundwalls, increases in heights of existing soundwalls, other buffers, and/or structural features (sound proofing, double-paned windows, etc.), as appropriate for each project. For those projects listed in Table 3.25-2 in which environmental documents are not available, it is anticipated that similar noise abatement

measures would be provided to comply with CEQA and/or NEPA. However, it is not expected that all the increases in noise levels in the RSA associated with those projects can be abated to levels equivalent to those under no project conditions. As a result, the other cumulative projects are anticipated to contribute to a long-term increase in ambient noise levels in the RSA with the likelihood that some of those effects cannot be substantially abated. Because traffic noise from a freeway in an urban area (where other manmade noise sources are part of ambient background noise) becomes less audible with increasing distance from the freeway, the potential for cumulative noise impacts is limited to those receivers that are within the noise exposure area from more than one freeway widening project. Based on the list of cumulative projects in Table 3.25-1, only areas in the City of Commerce and the community of East Los Angeles that are within the noise exposure area of both the I-710 Corridor Project build alternatives and the I-5 Widening and HOV Lane Project would experience cumulative noise impacts during construction or operation for any build alternative.

Construction activities of some phases of the I-710 Corridor Project build alternatives, the SR-47 Expressway Project, and the Middle Harbor Redevelopment Project may overlap and would temporarily affect ambient noise levels in the southern portion of the Study Area. Temporary impacts related to noise would be reduced by complying with Caltrans standard practices and local noise ordinances. In some cases, temporary noise barriers would be constructed.

3.25.4.14 ENERGY

This section is based on Sections 3.15 and 3.24.3.15 of this Final EIR/EIS and the *Revised Final Energy Technical Report* (December 2020) prepared for the project.

RESOURCE STUDY AREA. The Study Area consists of approximately 19 linear miles along the I-710 Corridor, from Ocean Blvd. to SR-60. The Study Area also includes a portion of the interchanges with I-405, SR-91, I-105, I-5, and SR-60 to accommodate for proposed interchange improvements under the build alternatives. The project area spans the Cities of Bell, Bell Gardens, Carson, Commerce, Compton, Cudahy, Downey, Huntington Park, Lakewood, Long Beach, Los Angeles, Lynwood, Maywood, Paramount, Signal Hill, South Gate, and Vernon, and parts of unincorporated Los Angeles County, including the community of East Los Angeles. Because energy consumption is typically tracked on a regional or State level, consideration of cumulative effects related to energy consumption is considered in the context of the SCAG planning region.

HEALTH AND HISTORICAL CONTEXT. Driven by high demand from California's many motorists, major airports, and military bases, the transportation sector is the State's largest energy consumer. California's electricity mix is generated by natural gas (33.4 percent); coal (0.15 percent); large hydroelectric (22.0 percent); nuclear (10.6 percent); and renewable (33.8 percent) sources. In 2016, California produced 68 percent of the electricity it used; the rest was imported from the Pacific Northwest (15 percent) and the Desert Southwest (17 percent).

IMPACTS FROM THE I-710 CORRIDOR PROJECT BUILD ALTERNATIVES. Direct energy consumption during construction of either build alternative would involve energy used by the construction equipment, work trucks, haul trucks, and worker commutes. Permanent impacts as a result of increased capacity and use may occur as a result of implementation of either build alternative; however, the Study Area would show improvements as a result of the build alternatives. Alternatives 5C and 7 improvements would increase average travel speeds during peak hours, remove bottlenecks, and reduce delays. This alleviating of stop-and-go conditions, which requires the use of more energy, decreases the amount of energy used in the Study Area. However, VMT in the I-710 Corridor Project Study Area would also increase when comparing any of the build alternatives with the 2035 No Build (Alternative 1) condition.

Alternatives 5C and 7 would both fund up to 4,000 zero emission/near zero emission (ZE/NZE) heavy-duty trucks. Alternative 7 would restrict the freight corridor to ZE/NZE trucks but allow any truck type on the mainline. Alternatives 5C and 7 would reduce the vehicle hours traveled (VHT) by diesel heavy trucks and increase the VHT by ZE/NZE trucks when compared with the 2035 No Build condition, resulting in operational energy use decreasing by 13 percent in the Study Area for Alternative 5C and by 25 percent in the Study Area for Alternative 7.

REASONABLY FORESEEABLE ACTIONS. The reasonably foreseeable actions would be those related to energy use associated with traffic generated by future planned land uses and the effects of other future planned transportation improvements on regional energy consumption. The reasonably foreseeable actions include:

- SR-47 Expressway Project
- SCIG Project
- Middle Harbor Redevelopment Project
- California High Speed Rail Project
- SR-710 North Project

CUMULATIVE IMPACTS. The build alternatives would not result in or substantially contribute to adverse cumulative energy effects. Increases in energy use would be limited to those occurring during construction of either I-710 Corridor Project build alternative, and energy use would return to normal levels following completion of construction. There is the potential for increased energy use during construction of all of the cumulative projects; however, this increase would be temporary and would not have the potential to result in substantial permanent impacts once the project has been completed. Construction activities of some phases of the I-710 Corridor Project build alternatives, the SCIG Project, the California High Speed Rail Project, the SR-47 Expressway Project, the SR-710 North Project, and the Middle Harbor Redevelopment Project may overlap and would temporarily increase energy usage in the Study Area. The I-710 Corridor Project build alternatives and the California High Speed Rail Project would not have

substantial energy impacts contributing toward cumulative energy consumption because the energy saved by relieving congestion and by using other transportation efficiencies from the region over its design life would be substantially greater than the energy consumed to construct it. Therefore, the I-710 Corridor Project build alternatives would not contribute to cumulative adverse impacts related to energy.

AVOIDANCE, MINIMIZATION, AND MITIGATION MEASURES. In order to reduce potential temporary construction effects and permanent operational increases in energy consumption, for any build alternative, measures that improve siting, construction procedures, and traffic operations to minimize energy consumption and reduce peak energy demand, and that incorporate the use of alternative fuels, would be incorporated during the design phase. Similar measures would also be required for any reasonably foreseeable actions to comply with CEQA and/or NEPA.

3.25.4.15 NATURAL COMMUNITIES

The analysis in this section is based on Sections 3.16 and 3.24.3.16 of this Final EIR/EIS and the *Natural Environment Study* (June 2017) prepared for the project.

RESOURCE STUDY AREA. The RSA for natural communities is consistent with the biological Study Area (BSA) established for the I-710 Corridor Project. The BSA is approximately 19 linear miles along the I-710 Corridor, from Ocean Blvd. to SR-60. The BSA also includes a portion of major transportation corridors connecting to I-710, including Interstate 405 (I-405), State Route 91 (SR-91), Interstate 105 (I-105), and Interstate 5 (I-5), to accommodate the proposed interchange improvements. Additionally, the BSA includes improvements to surrounding local arterial intersections that would improve intersection operations. The build alternatives pass through mostly urban settings consisting of residential areas, industrial warehouses, and commercial businesses. The entire BSA is located within the Los Angeles River Watershed.

HEALTH AND HISTORICAL CONTEXT. Land uses/vegetation communities located within the BSA are mostly developed (developed/ornamental/ruderal). Table 3.25-4 lists the acreage of each of the vegetation communities present within the BSA.

Habitats are considered to be of special concern based on (1) Federal, State, or local laws regulating their development; (2) limited distributions; and/or (3) the habitat requirements of special-status plants or animals occurring within the BSA. Within the BSA, there are two primary plant communities that are considered important by State and/or local agencies. These two natural community groups are estuarine habitat associated with the tidal waters of the lower three miles of the Los Angeles River, and riparian/riverine habitats. Sensitive habitats are located primarily in the southern portion of the BSA, where the Los Angeles River and associated wetlands have retained a more natural state.

Table 3.25-4: Acreages of Land Cover or Habitat Types within the Biological Study Area

| Vegetation Community | Acreage |
|--|-----------------|
| Developed/Ornamental/Ruderal | 1,869.43 |
| Concrete-Lined Freshwater Waters of the Los Angeles River and Associated Drainages | 48.22 |
| Earthen-Bottom Tidal Waters of the Los Angeles River | 14.27 |
| Riparian Scrub | 8.54 |
| Open Water | 5.34 |
| Freshwater Emergent Marsh | 1.86 |
| Total | 1,947.66 |

Source: LSA Associates, Inc. *I-710 Corridor Project Jurisdictional Delineation Report* (2012);
Memorandum Update to the I-710 Corridor Project Jurisdictional Delineation Report (2017)

ESTUARINE HABITAT. Approximately 91 percent of California's coastal wetlands have been lost to development. Estuarine wetland habitats, such as those associated with the lower Los Angeles River, were formerly more abundant in the semi-enclosed coastal waters of California's south coast and included the estuaries of Wilmington Lagoon, Alamitos Bay, Anaheim Bay, Santa Ana River Marsh, and Newport Bay. These tidal wetlands of coastal southern California are now much reduced due to urban diversion, channelization, and other human developments that have altered or eliminated a once-viable system. These habitats are considered high-quality wildlife habitats because they provide protective cover, reproduction and nesting sites, water, and food for a variety of species.

RIPARIAN/RIVERINE HABITATS. Riparian/riverine habitats, such as those within the BSA, were formerly abundant along the major rivers of coastal southern California but have been substantially reduced by urban expansion, flood control, and channel "improvements" (Holland 1986). These habitats are considered high-quality wildlife habitats because they provide protective cover, water, and food for a variety of species.

IMPACTS FROM THE I-710 CORRIDOR PROJECT BUILD ALTERNATIVES. Table 3.25-5 shows the impacts to natural communities calculated for each build alternative.

REASONABLY FORESEEABLE ACTIONS. The reasonably foreseeable actions would occur in the areas that are planned for development or redevelopment, which are located throughout the Los Angeles River Basin. Projects with specific relevance to natural communities include those projects that would impact natural communities' resources through degradation and removal, and include:

- SR-47 Expressway Project – potential impacts to aquatic communities and habitat associated with the burrowing owl and peregrine falcon

Table 3.25-5: Impacts from the Build Alternatives to Natural Communities of Special Concern Occurring within the Biological Study Area

| Vegetation Community | Total Acres within BSA | Permanent (Direct) | | Permanent (Indirect) | | Temporary | | Total | |
|--|------------------------|--------------------|-------|----------------------|-------|-----------|-------|--------|-------|
| | | Alt 5C | Alt 7 | Alt 5C | Alt 7 | Alt 5C | Alt 7 | Alt 5C | Alt 7 |
| Estuarine Habitat | | | | | | | | | |
| Earthen-bottom Intertidal portions of the Los Angeles River | 14.27 | 0.18 | 0.11 | 5.09 | 5.02 | 8.34 | 8.19 | 13.61 | 13.33 |
| Riparian/Riverine Habitats | | | | | | | | | |
| Open Water | 5.34 | 0.00 | 5.34 | 0.00 | 0.00 | 0.00 | 0.00 | 0.00 | 5.34 |
| Concrete-lined Freshwater portions of the Los Angeles River and Associated Drainages | 48.22 | 1.39 | 1.28 | 18.02 | 21.14 | 19.34 | 23.51 | 38.75 | 45.93 |
| Marsh | 1.86 | 0.01 | 0.17 | 0.77 | 0.65 | 0.67 | 0.66 | 1.45 | 1.49 |
| Riparian Scrub | 8.54 | 0.15 | 3.90 | 2.22 | 1.74 | 1.93 | 1.41 | 4.30 | 7.05 |
| Total Riparian/Riverine Habitats | 63.96 | 1.55 | 10.69 | 21.02 | 23.53 | 21.93 | 25.59 | 44.50 | 59.81 |

Source: LSA Associates, Inc. *Natural Environment Study* (June 2017).

Note: Alternative 5C Design Options (1A, 2A, and 3A) have the same habitat impacts as Alternative 5C, and Alternative 7 Design Options (1B and 3B) have the same habitat impacts as Alternative 7.

Alt = Alternative

BSA = Biological Study Area

- SCIG Project – affects aquatic and bat and bird roosting habitat
- I-5 Corridor Improvement Project – loss of nesting habitat and minor loss of aquatic habitat
- I-5 Widening and HOV Lane Project – potential for loss of roosting and nesting habitat
- California High Speed Rail – potential for loss of roosting and nesting habitat
- SR-710 North Project – permanent loss of wetlands complex and temporary impacts to nearby riparian habitat (Freeway Tunnel Alternative only)
- Los Angeles River Master Plan – beneficial impact
- RiverLink Plan – beneficial impact

CUMULATIVE IMPACTS. Most of the lands surrounding the BSA are highly urbanized and have already been developed. Those areas not already developed have generally been preserved as city parks or restored areas. Probable future projects in the vicinity (both transportation-related and nontransportation-related) were reviewed as part of this analysis. The cumulative effects of the I-710 Corridor Project build alternatives, in combination with the SR-47 Expressway Project and the SCIG Project, may incrementally cause further effects to estuarine and riparian/riverine habitats.

Temporary impacts to natural communities may occur during construction where habitats are temporarily disturbed during grading or other activities. The I-710 Corridor Project build alternatives, the SR-47 Expressway Project, and the SCIG Project would impact riparian/riverine and estuarine habitats. Under the I-710 Corridor Project the Dominguez Gap Wetlands restoration area would be impacted by the freight corridor proposed in Alternative 7. Construction within the Dominguez Gap Wetlands restoration areas would have permanent, temporary, and indirect effects. The cumulative projects would result in some loss of vacant land but would not increase habitat fragmentation or impede the movement of wildlife in the area. Habitat within the Los Angeles River channel and movement opportunities therein would not be affected by implementation of the I-710 Corridor Project build alternatives because the build alternatives essentially modify an existing transportation facility. According to the Final EIR/EIS prepared for the SR-710 North Project, the Freeway Tunnel Alternative could result in the permanent loss of wetlands complex and temporary impacts to nearby riparian habitat. None of the other SR-710 North Project Build Alternatives, including the Preferred Alternative (TSM/TDM) would have temporary or permanent impacts on sensitive natural communities. Permanent benefits to natural communities would occur through implementation of the Los Angeles River Master Plan and the RiverLink Plan. This would offset some of the cumulative impacts as a result of the projects discussed above. With implementation of the avoidance, minimization, and mitigation measures discussed below, the I-710 Corridor Project build alternatives would not contribute to cumulative adverse impacts related to natural communities.

AVOIDANCE, MINIMIZATION, AND MITIGATION MEASURES. A combination of avoidance, minimization, and mitigation measures would reduce the overall adverse effects of the I-710 Corridor Project build alternatives to sensitive natural communities. Avoidance and minimization measures include but are not limited to avoidance of designated sensitive habitat boundaries to be demarcated by a visible barrier, employee education, and an invasive seaweed abatement program to minimize the importation and spread of nonnative plants. For any build alternative, a biologist would monitor construction within the vicinity of estuarine habitat for the duration of construction to flush any wildlife species present prior to construction and to ensure that vegetation removal guidelines, BMPs, ESA boundaries, and all avoidance and minimization measures are properly constructed and observed.

For any build alternative, compensatory mitigation for estuarine communities would be required to comply with Section 404 of the Clean Water Act (CWA) and Section 1600 of the California Fish and Game Code. Typically, estuarine habitat subject to USACE jurisdiction is mitigated at a minimum mitigation-to-effect ratio of 2:1 for permanent effects and 1:1 for temporary effects, which would be consistent with the USACE policy of no net loss of estuarine habitat (e.g., wetlands). Compensatory mitigation for riparian/riverine communities would be required for USACE Section 404 and CDFW Section 1600 permitting. Typically, riparian/riverine habitats subject to USACE and CDFW jurisdiction are mitigated at a minimum mitigation-to-effect ratio of

2:1 for permanent effects and 1:1 for temporary effects, which is consistent with the USACE and CDFW policies for no net loss of riparian/riverine habitats (e.g., wetlands).

As stated in the environmental documents for the SR-47 Expressway Project, the SR-710 North Project, the SCIG Project, and the I-5 Corridor Improvement Project, similar measures would be required for reasonably foreseeable actions that impact estuarine or riparian/riverine resources. For those projects in which environmental documents are not available, similar measures would be required to comply with CEQA and/or NEPA.

3.25.4.16 WETLANDS AND OTHER WATERS

The analysis in this section is based on Sections 3.17 and 3.24.3.17 of this Final EIR/EIS and the *Natural Environment Study* (June 2017) prepared for the project.

RESOURCE STUDY AREA. The RSA for wetlands and other waters is consistent with the BSA. The BSA is approximately 19 linear miles along the I-710 Corridor, from Ocean Blvd. to SR-60. The BSA also includes a portion of major transportation corridors connecting to I-710, including I-405, SR-91, I-105, and I-5, to accommodate for proposed interchange improvements under the I-710 Corridor Project build alternatives. From south to north, the BSA is located on the United States Geological Survey (USGS) *Long Beach, South Gate, and Los Angeles, California* 7.5-minute series topographical quadrangles. The BSA spans the Cities of Bell, Bell Gardens, Carson, Commerce, Compton, Cudahy, Downey, Huntington Park, Lakewood, Long Beach, Los Angeles, Lynwood, Maywood, Paramount, Signal Hill, South Gate, and Vernon, and parts of unincorporated Los Angeles County, including the community of East Los Angeles. The build alternatives pass through mostly urban settings consisting of residential areas, industrial warehouses, and commercial businesses. The entire BSA is located within the Los Angeles River Watershed.

The Los Angeles River, which flows into the Pacific Ocean, runs parallel to I-710 throughout the BSA. Several drainages within the BSA are tributary to the Los Angeles River and are a mixture of man-made channels with natural earthen bottoms, concrete v-ditches, and concrete-lined channels. In addition, there are numerous roadside drainage ditches within the BSA that are not believed to convey flows at the present time or that are not tributary to the Los Angeles River.

The Los Angeles River channel contains several sections where sufficient sediment has accumulated to support potential wetland waters of the United States. Other potential wetland waters of the United States occur within Compton Creek and in isolated detention basins and/or man-made wetland areas.

A variety of land uses exist adjacent to the BSA, including transportation, residential, commercial, industrial, infrastructure, recreational, undeveloped, and water-related land uses. Some of the restoration areas in the vicinity of the BSA include the Golden Shore Marine

Preserve, the Dominguez Gap Wetlands Project, the DeForest Park Restoration Project, Compton Creek Improvement Project, and South Gate Riparian Habitat Restoration Project.

HEALTH AND HISTORICAL CONTEXT. The upper portion of the Los Angeles River Watershed is covered by forest or open space, while the remaining watershed, including the BSA, is highly developed with commercial, industrial, or residential uses. The Los Angeles River is the heart of an 834-square-mile watershed that encompasses the Santa Susanna Mountains to the west, the San Gabriel Mountains to the north and east, and the Santa Monica Mountains and Los Angeles Coastal Plain to the south. Channelization started in 1914 as an effort to control the devastating floods that periodically swept through the City of Los Angeles. Subsequent lining of the channel with concrete removed most of the river's vegetation, wetland, wildlife, and ecological richness. Prior to 1960, 80 percent of the rainwater in the Los Angeles River Watershed would percolate into the ground. Today, that figure is estimated to be 8 percent, with the remainder draining out into the ocean.⁹ Of the 51 miles of the Los Angeles River, 13 miles retain the natural riverbed. The only portion of the Los Angeles River with a natural bottom adjacent to the BSA is the southernmost three miles of the river.

Riparian/riverine habitats, such as those within the BSA, were formerly abundant along the major rivers of coastal Southern California but have been substantially reduced by urban expansion, flood control, and channel "improvements" (Holland 1986). The typical association of riparian/riverine habitat types with drainages indicates that they are "protected" under the Fish and Game Code and, to certain extent, by the CWA. These habitats are considered high-quality wildlife habitats because they provide protective cover, water, and food for a variety of species.

In addition, approximately 91 percent of California's coastal wetlands have been lost to development.¹⁰ Estuarine wetland habitats, such as those associated with the lower Los Angeles River, were formerly more abundant in the semi-enclosed coastal waters of California's south coast and included the estuaries of Wilmington Lagoon, Alamitos Bay, Anaheim Bay, Santa Ana River Marsh, and Newport Bay. These tidal wetlands of coastal southern California are now much reduced due to urban diversion, channelization, and other human developments that altered or eliminated a once-viable system. These habitats are considered high-quality wildlife habitats because they provide protective cover, reproduction, nesting, water, and food for a variety of species. Many animal species are estuarine wetland habitat obligates. Estuaries such as the lower Los Angeles River serve as nurseries for marine fish and provide sediment traps, erosion control, and natural flood control.

¹⁰ California Department of Fish and Game. 2001. *Coastal Wetlands - Emergent Marshes. California's Living Marine Resources: A Status Report*. December. Website: <https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentID=34250> (accessed February 24, 2017).

IMPACTS FROM THE I-710 CORRIDOR PROJECT BUILD ALTERNATIVES. There were 24 drainages identified during surveys of the BSA. Most of these drainages connect to the Los Angeles River either directly or through the storm drain system.

A formal Jurisdictional Delineation survey determined that there are jurisdictional features within the BSA, including wetland areas, that are subject to the jurisdiction of the USACE, CDFW, and the Regional Water Quality Control Board (RWQCB). Because of this, for any build alternative, permits would be required from regulatory agencies, including the USACE (pursuant to Section 404 of the CWA), the CDFW (pursuant to Section 1602 of the California Fish and Game Code), and the RWQCB (pursuant to Section 401 of the CWA).

Table 3.25-6 shows that based on the information currently available, the worst-case impact scenario associated with Alternative 5C would result in direct permanent impacts to approximately 1.74 acres and indirect permanent impacts to approximately 26.13 acres of USACE jurisdictional areas. Alternative 5C would result in direct permanent impacts to 2.13 acres and indirect permanent impacts to approximately 36.51 acres of CDFW jurisdictional areas.

Table 3.25-6: Impacts of the Build Alternatives to Potentially Jurisdictional and Nonjurisdictional Areas

| Jurisdictional Areas | Permanent (acres) | | Temporary (acres) |
|---------------------------------|-------------------|----------|-------------------|
| | Direct | Indirect | |
| USACE Jurisdictional Areas | | | |
| Alternative 5C | 1.74 | 26.13 | 30.21 |

| Alternative 7 | 9.26 | 0.16 | 0.08 |

Source: LSA Associates, Inc. *Natural Environment Study* (June 2017).

Note: Impacts for all Design Options (Alternative 5C - 1A, 2A, or 3A and Alternative 7 - 1B or 3B) are the same as for their corresponding build alternatives.

CDFW = California Department of Fish and Wildlife
I-710 = Interstate 710

RWQCB = Regional Water Quality Control Board
USACE = United States Army Corps of Engineers

The worst-case impact scenario associated with Alternative 7 would result in direct permanent impacts to approximately 1.54 acres and indirect permanent impacts to approximately 28.56 acres of USACE jurisdictional areas. Alternative 7 would result in direct permanent impacts to 10.80 acres and indirect permanent impacts to approximately 28.72 acres of RWQCB

jurisdictional areas. Alternative 7 would result in direct permanent impacts to 1.96 acres and indirect permanent impacts to approximately 42.20 acres of CDFW jurisdictional areas.

REASONABLY FORESEEABLE ACTIONS. Most of the lands surrounding the BSA are highly urbanized and have already been developed. Those areas not already developed have generally been preserved as city parks or restored areas. The reasonably foreseeable actions would generally occur in areas with minimal or no wetlands and other waters of the United States. Reasonably foreseeable actions with particular relevance to wetlands and other waters include roadway, freeway, bridge and development projects that would impact those resources. Those projects are:

- I-5 Corridor Improvement Project – potential for loss of wetlands or other waters of the U.S.
- SR-710 North Project – potential for temporary and permanent impacts to non-wetland waters (Freeway Tunnel Alternative only)
- Los Angeles River Master Plan – beneficial impact
- RiverLink Plan – beneficial impact

CUMULATIVE IMPACTS. The cumulative effects of the I-710 Corridor Project build alternatives, in combination with reasonably foreseeable projects listed above, would incrementally cause further effects to riparian/riverine habitats and estuarine wetland habitats. These impacts would also extend to potential future wetland habitat along the Los Angeles River within the BSA. Impacts to riparian/riverine habitats would result in direct and indirect permanent effects through disturbance and/or removal of existing vegetation. Furthermore, construction would indirectly affect riparian/riverine habitats permanently through shading of the areas below bridges or elevated roads and enhancing the germination and proliferation of nonnative invasive plant species. Permanent impacts to estuarine habitat, including a reduction in soft-bottom habitat, would result from the construction of abutments and driving of piles. In addition to direct permanent effects, indirect permanent effects would result from permanent shading associated with bridges or elevated roadways. In addition, construction would indirectly affect estuarine habitats permanently through enhancing the germination and proliferation of nonnative invasive plant species. Permanent benefits to wetlands and other waters of the U.S. would occur through implementation of the Los Angeles River Master Plan and the RiverLink Plan. This would offset some of the cumulative impacts as a result of the projects discussed above. With implementation of the avoidance, minimization, and mitigation measures discussed below, the I-710 Corridor Project build alternatives would not contribute to cumulative adverse impacts related to wetlands.

AVOIDANCE, MINIMIZATION, AND MITIGATION MEASURES. For any build alternative, a combination of avoidance, minimization, and mitigation measures would reduce the overall adverse effects of

the I-710 Corridor Project build alternatives to wetlands and other waters. To offset effects to jurisdictional areas, a compensatory mitigation program would be developed. Typically, habitat subject to USACE and CDFW jurisdiction is mitigated at a minimum mitigation-to-effect ratio of 2:1 for permanent effects and 1:1 for temporary effects, which is consistent with USACE and CDFW policies for no net loss of riparian/riverine habitat (e.g., wetlands). Compensatory mitigation may be in the form of habitat restoration and/or enhancement in on- or off-site areas where similar riparian/riverine habitats exist, or a monetary contribution toward an in-lieu fee program, as acceptable by the regulatory agencies. The final compensatory mitigation program would fully offset project-related jurisdictional effects by providing “no net loss” of estuarine and riparian/riverine habitats. Because each cumulative project would be required to comply with CEQA and/or NEPA and replace impacted wetlands and other waters, additional mitigation for the cumulative effects of the proposed I-710 Corridor Project build alternatives is not warranted.

3.25.4.17 PLANT SPECIES

The analysis in this section is based on Sections 3.18 and 3.24.3.18 of this Final EIR/EIS and the *Natural Environment Study* (June 2017) prepared for the project.

RESOURCE STUDY AREA. The RSA for plant species is consistent with the BSA for the I-710 Corridor Project. The BSA is approximately 19 linear miles along the I-710 Corridor, from Ocean Blvd. to SR-60. The BSA also includes a portion of the major transportation corridors connecting to I-710, including I-405, SR-91, I-105, and I-5, to accommodate for the proposed interchange improvements under the I-710 Corridor Project build alternatives. The build alternatives pass through mostly urban settings consisting of residential areas, industrial warehouses, and commercial businesses. The entire BSA is located within the Los Angeles River Watershed.

HEALTH AND HISTORICAL CONTEXT. Because the BSA is mostly developed (1,869.43 acres), very little suitable habitat for sensitive plant species (78.23 acres or 4.2 percent) exists within the BSA.

IMPACTS FROM THE I-710 CORRIDOR PROJECT BUILD ALTERNATIVES. Direct impacts would result from implementation of the I-710 Corridor Project build alternatives. Alternative 5C, including the design options, would result in direct permanent impacts to two populations of southern tarplant identified within the BSA, comprising approximately 96 plants. Alternative 7, including its design options, would result in direct permanent impacts to all three populations of southern tarplant, comprising approximately 8,896 plants and including the largest population near Rosecrans Ave. Alternatives 5C and 7 would result in indirect permanent impacts to southern tarplant from shading.

REASONABLY FORESEEABLE ACTIONS. The reasonably foreseeable actions would occur in the areas that are planned for development or redevelopment, which are located throughout the BSA. The reasonably foreseeable actions relevant to impacts to plant species include those

transportation and development projects that would result in vegetation removal and degradation of existing plant populations. Those projects are:

- I-5 Corridor Improvement Project – Potential for loss of sensitive plant species
- SR-710 North Project – Removal of trees protected by local ordinances (BRT, LRT, and Freeway Tunnel Alternatives) and potential for loss of sensitive plant species (LRT and Freeway Tunnel Alternatives)
- Los Angeles River Master Plan – Beneficial impact
- RiverLink Plan – Beneficial impact

CUMULATIVE IMPACTS. The cumulative effects of the I-710 Corridor Project build alternatives, in combination with reasonably foreseeable development in the vicinity, may incrementally cause further effects to plants as follows: Impacts to plants from the I-710 Corridor Project build alternatives would be limited to direct impacts to southern tarplant populations as a result of drilling or driving piles required to construct bridge columns and shading effects of elevated structures. Therefore, cumulative impacts to plants could only result from the build alternatives impacts, in combination with other past, present and reasonably foreseeable projects, such as roadway, freeway, and bridge projects that would result in impacts to southern tarplant. With implementation of the avoidance, minimization, and mitigation measures discussed below, the I-710 Corridor Project build alternatives would not contribute to cumulative adverse impacts on plant species.

AVOIDANCE, MINIMIZATION, AND MITIGATION MEASURES. In order to mitigate for permanent impacts to southern tarplant populations, for any build alternative, the affected southern tarplant populations would be relocated from within the BSA to nearby protected open space areas in order to maintain these few remaining populations within the vicinity of the I-710 Corridor. Otherwise, to compensate for the loss of these populations, collection and scattering of seed in sunny areas with suitable soil and hydrologic conditions in the region, such as in areas adjacent to existing and remaining populations, during the appropriate time of year may improve the potential for populations of this species to remain stable in future years. Consultation with the CDFW would be completed prior to the restoration effort. This measure is outlined in Section 3.18, Plant Species (Measure PS-1). The avoidance and minimization measures outlined in Section 3.16, Natural Communities, and Section 3.24, Construction Impacts, would be implemented to avoid and minimize impacts to southern tarplant for any build alternative.

In order to comply with CEQA and/or NEPA, the I-5 Corridor Improvement Project would include similar avoidance and minimization measures to mitigate for impacts to southern tarplant. Additionally, the Los Angeles River Master Plan and the RiverLink Plan would enhance the natural environment in the Study Area, which may result in habitat suitable for sensitive species such as southern tarplant. The I-5 Corridor Improvement project would remove a large amount

of vegetation and mature trees and result in a minor loss of aquatic vegetation, but avoidance measures, such as keeping disturbed areas to a minimum and new landscaping, would potentially mitigate for loss. It does not contain suitable southern tarplant habitat. Therefore, cumulative impacts to southern tarplant as a result of the I-710 Corridor Project build alternatives in combination with other reasonably foreseeable projects are not anticipated.

3.25.4.18 ANIMAL SPECIES

The analysis in this section is based on Sections 3.19 and 3.24.3.19 of this Final EIR/EIS and the *Natural Environment Study* (June 2017) prepared for the project.

RESOURCE STUDY AREA. The RSA for animal species is consistent with the BSA. The BSA is approximately 19 linear miles along the I-710 Corridor, from Ocean Blvd. to SR-60. The BSA also includes a portion of the major transportation corridors connecting to I-710, including I-405, SR-91, I-105, and I-5, to accommodate for the proposed interchange improvements under the I-710 Corridor Project build alternatives. The build alternatives pass through mostly urban settings consisting of residential areas, industrial warehouses, and commercial businesses. The entire BSA is located within the Los Angeles River Watershed.

HEALTH AND HISTORICAL CONTEXT. Although most of the BSA is developed and urbanized, the BSA still supports suitable habitat for a variety of special-status wildlife species. Areas along the Los Angeles River, south of the I-710/Willow St. interchange, provide the most valuable habitat for shorebirds in the BSA. Bridge structures within the BSA provide habitat for various bat species. After a thorough literature review, it was determined that 159 special-status wildlife species have the potential to occur within the vicinity of the BSA.

IMPACTS FROM THE I-710 CORRIDOR PROJECT BUILD ALTERNATIVES.

BURROWING OWLS. Burrowing owls were detected in two locations during surveys of the BSA. No direct impacts from the build alternatives would occur in the area where burrowing owl presence was confirmed. However, open areas within the BSA and its vicinity would still provide habitat for the species.

SPECIAL-STATUS SPECIES ASSOCIATED WITH RIPARIAN/RIVERINE AND AQUATIC HABITATS. The build alternatives would not directly affect any additional animal species as a result of the avoidance and minimization measures described below; however, the I-710 Corridor Project build alternatives would have indirect and temporary effects on animal species through the loss of potential habitat.

Hydraulic changes to the Los Angeles River could alter the value of the habitat in the lower portion of the river. Potential hydraulic effects from the build alternatives would be associated with bridge modifications and the relocation of a segment of electrical

transmission lines along the edge of the river. However, as analyzed in Section 3.8, the proposed modifications under the build alternatives would mimic the existing pier configurations upstream and downstream, and there would be no substantial effects to the water surface elevation, velocity of flood flows, sedimentation, or scour in the vicinity of the new piers. Because there are no substantial effects at the location of the modifications, there are no substantial effects to downstream locations resulting from the build alternatives.

SPECIAL-STATUS SPECIES ASSOCIATED WITH BRIDGES AND CREVICES. Effects of the build alternatives to special-status bridge- and crevice-dwelling animal species would include temporary indirect disturbance (such as noise, vibration, dust, night lighting, and human encroachment) from construction. Indirect permanent issues associated with human encroachment, such as the introduction of nonnative species and trash, would permanently contribute to the degradation of foraging habitat (e.g., riparian/riverine vegetation) in the vicinity. There is a small potential for bat mortality, which could be a permanent impact resulting from the build alternatives.

In addition, construction of either build alternative could temporarily impede access to roost sites (existing and future) in the crevices of bridges, culverts, and overhead structures. Only a small portion of roosting habitat (existing and future) may be permanently altered by the I-710 Corridor Project build alternatives. However, the widening and modification of bridge, culvert, and overhead structures would more likely increase future potential roosting habitat.

REASONABLY FORESEEABLE ACTIONS. The reasonably foreseeable actions would occur in the areas that are planned for development or redevelopment that are located throughout the BSA. These projects relevant to consideration of impacts to animal species include transportation and development projects that could impact potential habitat for animal species or that may result in direct impacts, such as harassment or take during construction or roadkill during operation of the completed project. Those projects are:

- SR-47 Expressway Project – Potential impacts to burrowing owl; special-status species associated with riparian/riverine and aquatic habitats;
- Pier B On-Dock Rail Support Facility – Potential impacts to migratory species associated with bridges and crevices
- Gerald Desmond Bridge Project – Potential impacts to special-status species associated with riparian/riverine and aquatic habitats and bridges and crevices
- SCIG Project – Potential impacts to special-status species associated with riparian/riverine and aquatic habitats and bridges and crevices
- I-5 Corridor Improvement Project – Potential impacts to special-status species associated with riparian/riverine and aquatic habitats and bridges and crevices

- I-5 Widening and HOV Lane Project – Potential for impacts to animal species
- California High Speed Rail – Potential for impacts to animal species
- SR-710 North Project – Potential for impacts to animal species

CUMULATIVE IMPACTS.

BURROWING OWL. Effects of the I-710 Corridor Project build alternatives to habitat for the burrowing owl would not likely threaten the continued existence of the individual(s) identified during the surveys, much less threaten the existence of the species. The environmental document for the SR-47 Expressway Project identifies temporary impacts to the burrowing owl that would be mitigated to not be adverse. Environmental documents for the Pier B On-Dock Rail Support Facility, the Gerald Desmond Bridge Project, the SR-710 North Project, the SCIG Project, and the I-5 Corridor Improvement Project did not identify impacts to the burrowing owl. The I-5 Widening and HOV Lane and California High Speed Rail projects would avoid, minimize, and/or mitigate any impacts to the burrowing owl in order to comply with CEQA and/or NEPA. Therefore, the impacts of the I-710 Corridor Project build alternatives on this species, in combination with those of reasonably foreseeable projects in the vicinity, would not be substantial.

SPECIAL-STATUS SPECIES ASSOCIATED WITH RIPARIAN/RIVERINE AND AQUATIC HABITATS. The effects of the I-710 Corridor Project build alternatives to habitat for species dependent on riparian/riverine and aquatic habitats would not likely threaten the continued existence of the populations nearby, much less threaten the existence of the species. The environmental documents for the SR-47 Expressway Project, the Gerald Desmond Bridge Project, the SCIG Project, the SR-710 North Project, and the I-5 Corridor Improvement Project identify impacts to these species but also identify avoidance, minimization, and/or mitigation measures to offset these impacts. The I-5 Widening and HOV Lane projects, California High Speed Rail, and SR-710 North Project, would avoid, minimize, and/or mitigate any impacts to habitat for species dependent on riparian/riverine and aquatic habitats in order to comply with CEQA and/or NEPA. Therefore, the impacts of the I-710 Corridor Project build alternatives, in combination with those of reasonably foreseeable projects in the vicinity, would result in incremental, cumulative effects on these species.

SPECIAL-STATUS SPECIES ASSOCIATED WITH BRIDGES AND CREVICES. The widening and modification of bridge, culvert, and overhead structures for the I-710 Corridor Project build alternatives and the projects listed above, would likely increase future potential roosting habitat if additional crevices are created within the new or modified structures. The environmental documents for the Pier B On-Dock Rail Support Facility, the Gerald Desmond Bridge Project, the SCIG Project, and the I-5 Corridor Improvement Project may have potential impacts to bats and other migratory species. The I-710 Corridor Project build

alternatives would not contribute to cumulative adverse impacts on special-status species associated with bridges and crevices.

It should also be noted that the Los Angeles River Master Plan and the RiverLink Plan would enhance the natural environment in the Study Area that may result in habitat improvements for the species listed above in this section.

AVOIDANCE, MINIMIZATION, AND MITIGATION MEASURES.

BURROWING OWL. To ensure that any burrowing owls that may occupy the site in the future are not affected by construction activities related to the build alternatives, preconstruction surveys would be required. If any of the preconstruction surveys determine that burrowing owls are present, one or more of the following measures may be required: (1) avoidance of active nests and the surrounding buffer area during construction activities; (2) passive relocation of individual owls; (3) active relocation of individual owls; and (4) preservation of on-site habitat with long-term conservation value for the owl.

SPECIAL-STATUS SPECIES ASSOCIATED WITH RIPARIAN/RIVERINE AND AQUATIC HABITATS. Because these species occupy the riparian/riverine and aquatic natural communities, avoidance and minimization efforts for special-status riparian/riverine and aquatic animal species would be the same as those described for the riparian/riverine natural communities in Section 3.25.4.15 of this Final EIR/EIS.

SPECIAL-STATUS SPECIES ASSOCIATED WITH BRIDGES AND CREVICES. For any build alternative, preconstruction surveys performed by a qualified bat biologist would be required to assess the potential for use of the project area as a maternity roost. To prevent potential effects to bridge and crevice nesting bats, all work on existing bridges with potential bat habitat conducted between December 1 and October 31 would have bat exclusion devices installed under the supervision of a qualified biologist.

The reasonably foreseeable projects with potential to affect the species listed above would include similar avoidance, minimization, and/or mitigation measures in order to comply with CEQA and/or NEPA. Therefore, adverse cumulative impacts to these species are not anticipated as a result of the I-710 Corridor Project build alternatives.

3.25.4.19 THREATENED AND ENDANGERED SPECIES

The analysis in this section is based on Sections 3.20 and 3.24.3.20 of this Final EIR/EIS and the *Natural Environment Study* (June 2017) prepared for the project.

RESOURCE STUDY AREA. The RSA for threatened and endangered species is consistent with the BSA. The BSA is approximately 19 linear miles along the I-710 Corridor, from Ocean Blvd. to SR-60. The BSA also includes a portion of major transportation corridors connecting to I-710,

including I-405, SR-91, I-105, and I-5, to accommodate for the proposed interchange improvements under the I-710 Corridor Project build alternatives. The build alternatives pass through mostly urban settings consisting of residential areas, industrial warehouses, and commercial businesses. The entire BSA is located within the Los Angeles River Watershed.

HEALTH AND HISTORICAL CONTEXT. Historically, the health of this resource has become more degraded by development over time but suitable habitat for some threatened/endangered species is present as described below.

THREATENED AND ENDANGERED PLANT SPECIES. The BSA supports suitable habitat for a few special-status plant species that are tolerant of conditions within or adjacent to an urban environment. After a thorough literature review, it was determined that a total of 14 Federally and/or State-listed as endangered or threatened plant species, or proposed or delisted endangered or threatened, have the potential to occur in or within the vicinity of the BSA. Suitable habitat does not exist within the BSA for any of these plant species.

THREATENED AND ENDANGERED ANIMAL SPECIES. The BSA supports suitable habitat for a variety of special-status wildlife species. Areas along the Los Angeles River south of the I-710/Willow St. interchange provide the most valuable habitat for shorebirds in the BSA. After a thorough literature review, it was determined that 42 animal species or habitats that are Federally and/or State-listed as endangered or threatened, candidate, or proposed or delisted endangered or threatened, regulated by the National Marine Fisheries Service (NMFS), or are considered California Fully Protected Species (CFP) species by the State of California have the potential to occur within the BSA. Potentially suitable habitat for only six of these species or habitats still exists within the BSA. There is potential for the Federally listed as endangered Southern California steelhead Distinct Population Segment (DPS), the Federally listed as threatened green turtle and western snowy plover coastal population, and the Federally and State-listed as endangered California least tern to use downstream areas of the Los Angeles River. Additionally, the California sea lion, which is not a Federally listed species or California species of special concern but is protected under the Marine Mammal Protection Act (MMPA), is occasionally found within the BSA in the lower reaches of the Los Angeles River. In addition, an area designated by the National Oceanic and Atmospheric Administration's NMFS as Essential Fish Habitat (EFH) is located within the BSA. This habitat includes those waters and substrates necessary to fish for spawning, breeding, feeding, or growth to maturity.

IMPACTS FROM THE I-710 CORRIDOR PROJECT BUILD ALTERNATIVES. Construction activities related to the build alternatives within the Los Angeles River channel would be planned carefully to prevent any disturbance of normal river processes that might affect Southern California steelhead, green turtle, western snowy plover, California least tern, California sea lion, species utilizing EFH, or other species using the river itself or the marine environment at its mouth.

Based on available data, steelhead appear to be extirpated from the BSA. Steelhead are large, highly mobile fish and would likely move out of the area if disturbed by construction activities. The riverine habitat upstream of the estuarine habitat within the BSA is primarily concrete-lined and does not provide suitable habitat for steelhead.

Any green turtles that might visit the area around the mouth of the Los Angeles River could be affected indirectly by changes in water quality originating upstream. Such changes could involve increased pollution levels, increased turbidity, or impacts on sea grasses and algae on which green turtles feed. There is no critical habitat for this species within the BSA; therefore, no critical habitat would be impacted by the build alternatives.

Based on this analysis, NMFS concurs with Caltrans that the build alternatives are not likely to adversely affect endangered Southern California steelhead or threatened East Pacific green sea turtle and designated critical habitats for these species.

The coastal population of the western snowy plover could be affected indirectly by changes in water quality generated by the build alternatives. Such changes could involve increased pollution levels, increased turbidity, or impacts on the invertebrates on which they feed. New bridge designs could result in occasional bird strikes. There is no critical habitat for this species within the BSA; therefore, no critical habitat would be impacted by the build alternatives.

California least terns could be affected indirectly by project-generated changes in water quality generated by the build alternatives. Such changes could involve increased pollution levels, increased turbidity, or impacts on the fish on which they feed. New bridge structures could result in occasional bird strikes. This species leaves California altogether for more than half of each year so that, other than potential long-term effects on fish populations, there would be no potential effects when the species is absent. No critical habitat has been designated for this species; therefore, no critical habitat would be impacted by the build alternatives.

The I-710 Corridor Project build alternatives would include the driving of piers on the following bridges over the lower Los Angeles River that could affect California sea lions: the 7th St. Bridge, Anaheim St., Pacific Coast Hwy, Hill St., and Willow St. A new bridge would be constructed over the lower Los Angeles River at 7th St., and a pedestrian bridge would be added at Hill St., while Anaheim St., Pacific Coast Hwy., and Willow St. would be expanded. Percussive forces generated during any pile-driving activities may result in injury to California sea lions within and adjacent to the BSA, where estuarine habitat exists. Once the pile driving and bridge construction are completed, bridges associated with the either build alternative would not impede the movement of California sea lions through the channel. Based on the environmental document for the SR-47 Expressway Project, an Incidental Harassment Authorization may be required for project construction effects on the California sea lion. The SR-47 Expressway Project would not be under construction at the same as either I-710 Corridor Project build alternative; therefore, these construction-related impacts would not result in a

temporary cumulative impact to the California sea lion. The environmental documents for the Pier B On-Dock Rail Support Facility, the Gerald Desmond Bridge Project, the SCIG Project, and the I-5 Corridor Improvement Project did not identify impacts to California sea lion. As the I-5 Widening and HOV Lane, California High Speed Rail, and the SR-710 North Project projects are all located far from California sea lion habitat, no impacts to this species would occur. Therefore, the I-710 Corridor Project build alternatives would not contribute to cumulative adverse impacts on California sea lion. There is no critical habitat for this species within the BSA; therefore, no critical habitat would be impacted by the build alternatives.

The designated Essential Fish Habitat within the BSA could be temporarily affected by construction activities. The I-710 Corridor Project build alternatives would not permanently impede movement of fish into and out of the Los Angeles River corridor. A temporary loss of habitat may result from construction activities; however, no permanent impacts would occur to the habitat except for a minimal loss of channel bottom where the piles would be placed. In addition, no permanent impacts would occur from dewatering activities, as dewatering materials would be removed upon completion of bridge construction. Alternatives 5C and 7 would include driving of piers/support structures in tidal waters across the Los Angeles River at the 7th St., Anaheim St., Pacific Coast Hwy., Hill St., and Willow St. crossings. Furthermore, numerous pilings would be required upstream of tidal waters in the freshwater areas of the Los Angeles River to accommodate improvements to other crossing structures. The percussive forces generated during pile-driving activities may also result in injury and death to fish within the impact area. Based on the environmental documents for the SR-47 Expressway Project and the Gerald Desmond Bridge Project, temporary impacts to fish species and their habitats would occur. However, these projects would not be under construction at the same time as either I-710 Corridor Project build alternative; therefore, these construction-related impacts would not result in temporary cumulative impacts to fish species and their habitats. As the SCIG Project, the I-5 Corridor Improvement Project, the I-5 Widening and HOV Lane Project, the California High Speed Rail Project, and the SR-710 North Project are all located far from fish species habitat, no impacts would occur. Therefore, the I-710 Corridor Project build alternatives would not contribute to cumulative adverse impacts on fish species and their habitat. The southernmost extent of the build alternatives is located within the lower reaches of the Los Angeles River in an area designated as EFH by NMFS, though it is unlikely that any species included in the Management Plans would occur within the BSA.

REASONABLY FORESEEABLE ACTIONS. Most of the lands surrounding the BSA are highly urbanized and have already been developed. Those areas not already developed have generally been preserved as city parks or restored areas. Reasonably foreseeable actions with particular relevance to threatened and endangered species include all transportation and development projects that could result in impacts to potential habitat for these species or that may result in direct impacts to these species, such as harassment or take during construction or roadkill during operation of the completed project. Those projects are:

- SR-47 Expressway Project – Potential for impacts to California sea lion, and fish; potential for Federally listed as threatened green turtle and the Federally and State-listed as endangered California least tern impacts; Similar to the I-710 Corridor Project build alternatives.
- Gerald Desmond Bridge Project – Potential for impacts to fish; potential for Federally listed as threatened green turtle and the Federally and State-listed as endangered California least tern; Similar to the I-710 Corridor Project build alternatives.
- SCIG Project – Potential for Federally listed as threatened green turtle and the Federally and State-listed as endangered California least tern; Similar to the I-710 Corridor Project build alternatives.
- California High Speed Rail – Environmental Document not available; Threatened or endangered species impacts will be avoided.
- SR-710 North Project – Potential indirect temporary impacts to listed riparian obligate bird species.

CUMULATIVE IMPACTS. As identified in the environmental documents for the SR-47 Expressway Project, the Gerald Desmond Bridge Project, and the SCIG Project, and the I-5 Corridor Improvement Project, construction activities may incrementally result in impacts similar to those described above for the I-710 Corridor Project build alternatives. However, these impacts have been identified as being strictly temporary during construction. As stated in the Final EIR/EIS for the SR-710 North Project, the LRT and Freeway Tunnel Alternative could result in indirect temporary impacts to listed riparian obligate bird species as a result of their proximity to potential nonbreeding habitat in riparian areas during construction. The SR-710 North Project Final EIR/EIS also indicates that the TSM/TDM Alternative could result in temporary indirect impacts to Townsend's big-eared bats during construction. The California High Speed Rail Project would avoid, minimize, and/or mitigate any impacts to threatened and endangered species to comply with CEQA and/or NEPA. Therefore, the impacts of the I-710 Corridor Project build alternatives, in combination with reasonably foreseeable projects in the vicinity, would result in minor incremental, cumulative effects on the green turtle and the California least tern.

It should also be noted that the Los Angeles River Master Plan and the RiverLink Plan would enhance the natural environment in the Study Area that may result in habitat suitable for threatened and endangered species.

AVOIDANCE, MINIMIZATION, AND MITIGATION MEASURES. The avoidance and minimization measures outlined in Sections 3.16, Natural Communities, and 3.24, Construction, would ensure that no noticeable changes in water conditions would occur for any build alternative. This would keep any potential effects of the proposed build alternatives on green turtles and California least terns from implementation minimal.

CALIFORNIA SEA LION. Due to the deterrent effect of construction noise, if present during construction of either build alternative, it is anticipated that most California sea lions would avoid the BSA, but it is possible that some individuals may be present in the work area at various times during construction activity. Although a Fisheries Management Plan is not required for the build alternatives based on informal Section 7 consultation that concluded in February 2019, for any build alternative, and re-initiation of consultation with NMFS occurs in the future, the plan would provide avoidance and minimization measures that would be suitable for California sea lions should they be present in the lower Los Angeles River during construction.

FISH. Acoustic monitoring, as stipulated in the *Technical Guidance for Assessment and Mitigation of the Hydroacoustic Effects of Pile Driving on Fish* (prepared and updated for Caltrans in November 2015), would be conducted during pile-driving activities of either build alternative. For any build alternative, attenuation devices would be used to bring the sound levels below the threshold levels. Construction of the I-710 Corridor Project build alternatives on dry land would not impact fish, provided that sediments and construction materials are retained on land and measures are implemented to prevent the movement of soil, concrete, and other construction materials into the river channel.

GREEN SEA TURTLE. For any build alternative, a biological monitor would be on site during pile-driving activities to minimize impacts to green sea turtles. If sea turtles are observed to be injured or killed, pile driving would cease and the CDFW and the NMFS would be contacted to determine the appropriate steps to avoid additional effects.

LEAST BELL'S VIREO. For any build alternative, biological monitoring and protocol surveys would be conducted to ensure that construction-related noise and other effects generated in the vicinity of the habitat areas would not result in disturbance to the active nest(s) or nesting behaviors. If any area is found to be occupied by an LBVI breeding territory, no work would occur within 300 feet of any habitat throughout the duration of the nesting season.

3.25.4.20 INVASIVE SPECIES

The analysis in this section is based on Sections 3.21 and 3.24.3.21 of this Final EIR/EIS and the *Natural Environment Study* (June 2017) prepared for the project.

RESOURCE STUDY AREA. The RSA for invasive species is consistent with the BSA. The BSA is approximately 19 linear miles along the I-710 Corridor, from Ocean Blvd. to SR-60. The BSA also includes a portion of the major transportation corridors connecting to I-710, including I-405, SR-91, I-105, and I-5, to accommodate for the proposed interchange improvements under the I-710 Corridor Project build alternatives. The entire BSA is located within the Los Angeles River Watershed.

HEALTH AND HISTORICAL CONTEXT. On February 3, 1999, President William J. Clinton signed Executive Order (EO) 13112, requiring Federal agencies to combat the introduction or spread of invasive species in the United States. Exotic plant species exist within the nonnative plant communities throughout the BSA, within patches of native plant communities, and in areas that have been disturbed by human uses. Exotic species are typically more numerous adjacent to roads and developed areas and frequently border the ornamental landscape. A total of 31 exotic plant species occurring on the California Invasive Plant Council (Cal-IPC) California Invasive Plant Inventory were identified within the BSA.

IMPACTS FROM THE I-710 CORRIDOR PROJECT BUILD ALTERNATIVES. Highway corridors provide opportunities for the movement of invasive species through the landscape. Construction of either I-710 Corridor Project build alternative has the potential to spread invasive species by the entering and exiting of construction equipment contaminated by invasives, the inclusion of invasive species in seed mixtures and mulch, and the improper removal and disposal of invasive species so that its seed is spread along the highway. Although no *Caulerpa taxifolia* (a nonnative seaweed) was observed in the BSA during the 2009 or 2015 biological surveys, the build alternatives could result in the spread of this species into the BSA if preventive measures are not taken. However, the potential for introduction of *Caulerpa taxifolia* into the BSA is minimized where additional shading is provided from structures such as widened bridges over the Los Angeles River. Impacts associated with Alternative 7 would be greater than impacts associated with Alternative 5C, given the larger area of disturbance associated with the freight corridor.

REASONABLY FORESEEABLE ACTIONS. The reasonably foreseeable actions would occur in the areas that are planned for development or redevelopment that are located throughout the BSA. The reasonably foreseeable actions are listed in Table 3.25-2. All projects involving construction have potential concerns regarding invasive species.

CUMULATIVE IMPACTS. Most of the lands surrounding the BSA are highly urbanized and have already been developed. Those areas not already developed have generally been preserved as city parks or restored areas. Probable future projects in the vicinity (both transportation-related and nontransportation-related) were reviewed as part of this analysis. The weed abatement program that would be implemented as part of the build alternatives, would minimize any potential contribution of the build alternatives to cumulative effects related to invasive species. Therefore, the I-710 Corridor Project build alternatives would not contribute to cumulative adverse impacts related to invasive species.

AVOIDANCE, MINIMIZATION, AND MITIGATION MEASURES. In compliance with EO 13112, for any build alternative, a weed abatement program would be developed, and temporarily affected areas would be revegetated with native plant species to help prevent the introduction or spread of invasive species. Plantings should also be consistent with the *Los Angeles River Master Plan*

Landscaping Guidelines and Plant Palettes (January 2004) or otherwise consist of the native riparian and upland plants historically present along the Los Angeles River. The weed abatement program (Measure IS-1) is discussed in greater detail in Section 3.21.4. Eradication strategies would be employed should an increase in invasive plants occur. Similar weed abatement and evaluation strategies would be implemented for reasonably foreseeable actions.

4.0 CALIFORNIA ENVIRONMENTAL QUALITY ACT EVALUATION

4.1 DETERMINING SIGNIFICANCE UNDER CEQA

The I-710 Corridor Project is a joint project by the California Department of Transportation (Caltrans) and the Federal Highway Administration (FHWA) and is subject to State and Federal environmental review requirements. Project documentation, therefore, has been prepared in compliance with both the California Environmental Quality Act (CEQA) and the National Environmental Policy Act (NEPA). FHWA's responsibility for environmental review, consultation, and any other action required in accordance with NEPA and other applicable Federal laws for this project is being, or has been, carried-out by Caltrans under its assumption of responsibility pursuant to 23 United States Code (USC) 327. Caltrans is the lead agency under CEQA and NEPA.

One of the primary differences between NEPA and CEQA is the way significance is determined. Under NEPA, significance is used to determine whether an Environmental Impact Statement (EIS) or a lower level of documentation will be required. NEPA requires that an EIS be prepared when the proposed Federal action (project) *as a whole* has the potential to "significantly affect the quality of the human environment." The determination of significance is based on context and intensity. Some impacts determined to be significant under CEQA may not be of sufficient magnitude to be determined significant under NEPA. Under NEPA, once a decision is made regarding the need for an EIS, the magnitude of the impact is evaluated, and no judgment of its individual significance is deemed important for the text. NEPA does not require that a determination of significant impacts be stated in the environmental documents.

CEQA, on the other hand, does require Caltrans to identify each "significant effect on the environment" resulting from the project and ways to mitigate each significant effect. If the project may have a significant effect on any environmental resource, then an Environmental Impact Report (EIR) must be prepared. Each and every significant effect on the environment must be disclosed in the EIR and mitigated if feasible. In addition, the CEQA Guidelines list a number of mandatory findings of significance, which also require the preparation of an EIR. There are no types of actions under NEPA that parallel the findings of mandatory significance of CEQA. This chapter discusses the effects of this project and CEQA significance.

In making determinations of significance under CEQA, the impacts of the build alternatives are analyzed relative to Baseline conditions which, for the Interstate 710 (I-710) Corridor Project, were the existing conditions in the I-710 Corridor in 2012. For comparison under NEPA, the No Build (Alternative 1 (No Build)) provides the basis for comparison of 2035 No Build conditions with the 2035 build alternatives.

Unless otherwise specified, the impacts of Alternatives 5C and 7 with the Design Options as outlined in Section 2.3.3 of this Final EIR/EIS are the same as the “base” alternatives. The No Build (Alternative 1) is not discussed below unless it's for comparison purposes.

4.2 DISCUSSION OF SIGNIFICANCE OF IMPACTS

The significance of the potential impacts of the I-710 Corridor Project build alternatives under CEQA was assessed based on the CEQA Checklist provided in Appendix A of this Final EIR/EIS and the analyses of impacts discussed in detail in Chapter 3.0, Affected Environment, Environmental Consequences, and Avoidance, Minimization, and/or Mitigation Measures, along with additional CEQA-specific analysis. The CEQA impacts of the project build alternatives are summarized in the following sections, based on the level of significance of the impacts under CEQA.

Impacts vary among the two build alternatives, with one alternative having greater impacts to a particular environmental factor than another does. For this reason, significance under CEQA is generally discussed in terms of the alternative with the most significant adverse impact. In cases where the impacts of the alternatives vary widely, clarification is provided regarding which alternatives have the most adverse impacts to a particular environmental factor. Table S-5, in the Executive Summary, provides this information in tabular format.

The following analysis is organized as follows:

- Checklist questions answered “No Impact”
- Checklist questions answered “Less Than Significant Impacts”
- Checklist questions answered “Less Than Significant Impacts with Mitigation Incorporated”
- Checklist questions answered “The Project will result in a Significant Adverse Effect”
- Checklist questions are shown in **Bold**.

4.2.1 NO IMPACTS

For the following topics, the build alternatives would have no impacts.

4.2.1.1 AESTHETICS (CEQA CHECKLIST QUESTION I.B)

b) Will the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Reference: Section 3.6

I-710 is not a designated State Scenic Highway,¹ and there are no heritage trees, historic buildings, or unique land forms that would be impacted by the build alternatives; therefore, the build alternatives would not damage scenic resources within a designated scenic corridor.

4.2.12 AGRICULTURE AND FORESTRY RESOURCES (CEQA CHECKLIST QUESTIONS II.A, II.B, II.C, II.D, AND II.E)

- a) Would the project: convert Prime Farmland, Unique Farmland, or Farmland of statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?**

Reference: Section 3.0

The Study Area does not include any designated Prime Farmland, Unique Farmland, or Farmland of Statewide Importance. Therefore, the build alternatives would not result in any temporary or permanent impacts related to designated farmlands.

The build alternatives would not result in conversion of areas currently used for agricultural production (nursery uses) to nonagricultural use.

- b) Would the project conflict with existing zoning for agricultural use, or a Williamson Act contract?**

Reference: Section 3.0

None of the lands in the Study Area is zoned for agricultural uses. Additionally, the Study Area does not include any property under Williamson Act contract. Therefore, there would be no impact.

- c) Would the project conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?**

Reference: Section 3.0

The I-710 Corridor Project Study Area does not contain any zoned forest lands or timberlands.

¹ California Department of Transportation (Caltrans). Website: http://www.dot.ca.gov/hq/LandArch/scenic_highways/index.htm (accessed March 10, 2017).

d) Would the project result in the loss of forest land or conversion of forest land to non-forest use?

Reference: Section 3.0

The I-710 Corridor Project build alternatives would not result in the loss of forest land or conversion of forest land to non-forest use, as there are no such lands within the Study Area.

e) Would the project involve other changes in the existing environment which, due to their location or nature, could result in conversion of farmland, to non-agricultural use or conversion of forest land to non-forest use?

Reference: Section 3.0

Given the lack of agricultural lands, forest lands, and timberlands in the Study Area, the build alternatives would also not involve other changes in the existing environment which, due to their location or nature, could result in a conversion of farmland to nonagricultural use or a conversion of forest land to non-forest use. Therefore, the build alternatives would not result in impacts to agriculture and forest resources.

4.2.1.3 BIOLOGICAL RESOURCES (CEQA CHECKLIST QUESTIONS IV.E AND IV.F)

e) Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Reference: Cities of Long Beach² and Los Angeles³ and County of Los Angeles⁴

The build alternatives would not conflict with any local policies or ordinances protecting biological resources. The Cities of Long Beach and Los Angeles and the County of Los Angeles are the only jurisdictions in the Study Area that have biological policies relevant to the I-710 Corridor Project. The County policy is related to the protection of native oak trees, none of which were identified within the Study Area. The Cities of Los Angeles and Long Beach have guidelines for acquiring tree removal permit compliance, for any build alternative be implemented. Additionally, the City of Long Beach requires that trees located within the Coastal Zone not be removed during the nesting season and that pre-construction surveys be conducted one week prior to construction

² City of Long Beach. City of Long Beach Municipal Code, Chapter 14.28 Trees and Shrubs, 14.28.050 – Planting or removing – Permit required. Website: https://www.municode.com/library/ca/long_beach/codes/municipal_code?nodeId=TIT14STSI_CH14.28TRSH_14.28.050PLREONRE (accessed March 10, 2017).

³ City of Los Angeles. Ordinance No. 177404 (Protected Trees. Website: https://cityplanning.lacity.org/Code_Studies/Other/ProtectedTreeOrd.pdf (accessed March 15, 2017).

⁴ County of Los Angeles. County of Los Angeles Oak Tree Ordinance. Website: <http://www.montecitohts.org/oaktreeordinance.pdf> (accessed March 10, 2017).

activities. The build alternatives would comply with all of these local policies and ordinances, and no impacts would occur.

- f) Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?**

Reference: Section 3.16.3

The Coastal Pelagic Species Fishery Management Plan (CPS FMP) has been adopted within the I-710 Corridor Project Study Area and covers six species: the northern anchovy, market squid, pacific sardine, pacific (chub) mackerel, jack mackerel, and krill. The goal of the CPS FMP is to promote efficiency and profitability in the fisheries, including the sustainability of catch, while providing adequate forage for potential predators (NOAA Fisheries, 2018). There are no other adopted or proposed Habitat Conservation Plans or Natural Communities Conservation Plans within the I-710 Corridor Project Study Area. However, the I-710 Corridor Project build alternatives would not have impacts related to any of these species covered by the CPS FMP. Therefore, the build alternatives would not result in conflicts with any biological resource habitat plans.

4.2.14 GEOLOGY AND SOILS (CEQA CHECKLIST QUESTION VI.E)

- e) Would the project have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?**

Reference: Chapter 2.0, Project Alternatives

No septic tanks or alternative wastewater disposal systems are included in the build alternatives, and soil issues related to these facilities would not be encountered. Therefore, the build alternatives would not result in impacts related to alternative wastewater disposal and soils.

4.2.15 HAZARDS AND HAZARDOUS WASTE (CEQA CHECKLIST QUESTIONS VIII.E THROUGH VIII.H)

The following two questions are addressed together.

- e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?**
- f) For a project within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?**

Reference: Section 3.1.1, Existing and Future Land Uses (see Figure 3.1-1)

The I-710 Corridor Project Study Area is not located within an airport land use plan, within two miles of an airport, or within the vicinity of a private airstrip. Therefore, the build alternatives would not result in a safety hazard to aircraft operations or persons living or working near an airport.

g) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Reference: Section 3.24.4.4

The build alternatives would not impair the implementation of, or physically interfere with, the adopted emergency response or evacuation plans of the cities in the Study Area and the County of Los Angeles. By providing a freeway that operates more efficiently, the build alternatives would have a beneficial effect on emergency response and evacuation.

For any build alternative, temporary impacts to emergency services would be addressed through preparation of the Transportation Management Plan (TMP) as required in Measure CON-TR-1, as well as the specific measures required in Measure CON-U&ES-1. Note that these measures are standard Caltrans measures applicable to such large construction projects.

h) Expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Reference: Section 3.1, Existing Land Use, as shown in Figure 3.1-1

The I-710 Corridor Project Study Area is located in developed areas and is not located within areas that are at high risk for wildland fires. As a result, the build alternatives would not result in or be affected by wildland fires.

4.2.1.6 HYDROLOGY AND WATER QUALITY (CEQA CHECKLIST QUESTIONS IX.G, IX.I, AND IX.J)

g) Would the project place housing within a 100-year flood hazard area as mapped on a Federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map?

Reference: Section 3.8.2.1; and Section 3.8.3.1

The build alternatives would improve and modify an existing transportation facility. This would not result in the placement of any housing in a 100-year flood hazard area and would not result in adverse impacts related to the placement of housing in a 100-year flood hazard area.

i) Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Reference: Section 3.8.3.1

There are no dams located in the immediate upstream area of the build alternatives whose failure could affect the project area. The build alternatives would not change the risk for people or structures to a significant risk of loss, injury, or death involving flooding, including flooding as a result of the failure of a levee or dam, and would not result in adverse impacts related to risk of loss, injury, or death involving flooding, including flooding as a result of the failure of a levee or dam.

j) Would the project [result in increased risk for] inundation by seiche, tsunami, or mudflow?

Reference: Sources from the California Department of Conservation website listed below

A seiche is an earthquake-induced wave motion in a water body such as a lake or inlet. There are no such lakes or inlets within the Study Area, and no identified risk from seiches.

A tsunami is an earthquake-induced wave motion in a sea or ocean. Tsunamis could be generated in the Pacific Ocean off the coast of Southern California and/or around the Pacific Ocean basin. The California Emergency Management Agency has prepared maps of estimated tsunami inundation areas.⁵ These maps indicate that the southern end of the Study Area, located generally south of Anaheim Blvd., could be subject to inundation in a tsunami.

However, the existing I-710 freeway is located in these same areas, and implementation of any of the build alternatives would not change the risk of inundation of the facility. In addition, the development of expanded capacity along I-710 would increase the capacity of evacuation routes when a tsunami is forecast. As such, this is a beneficial effect of the build alternatives.

Mudflows result when rainstorms inundate mountain areas, particularly after fire events. The build alternative are located over ten miles from the nearest mountain range (San Gabriel Mountains) and would not be subject to mudflows.

4.21.7 LAND USE AND PLANNING (CEQA CHECKLIST QUESTION X.C)

c) Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

Reference: Section 3.16.3

⁵ California Department of Conservation. Website: http://www.conservation.ca.gov/cgs/geologic_hazards/Tsunami/Inundation_Maps/LosAngeles/Documents/Tsunami_Inundation_LongBeach_Quad_LosAngeles.pdf (accessed March 10, 2017).

The Coastal Pelagic Species Fishery Management Plan (CPS FMP) has been adopted within the I-710 Corridor Project Study Area and covers six species: the northern anchovy, market squid, pacific sardine, pacific (chub) mackerel, jack mackerel, and krill. The goal of the CPS FMP is to promote efficiency and profitability in the fisheries, including the sustainability of catch, while providing adequate forage for potential predators (NOAA Fisheries, 2018). There are no other adopted or proposed Habitat Conservation Plans or Natural Communities Conservation Plans within the I-710 Corridor Project Study Area. However, the I-710 Corridor Project build alternatives would not have impacts related to any of these species covered by the CPS FMP. Therefore, the build alternatives would not result in impacts related to conflicts with any biological resource habitat plans.

4.2.1.8 MINERAL RESOURCES (CEQA CHECKLIST QUESTIONS XI.A AND XI.B)

The following two questions are addressed together:

- a) Would the project: result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the State?**
- b) Would the project result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?**

Reference: Section 3.1, Review of Existing Land Use Maps (see Figure 3.1-1)

There are no existing mineral resources operations in the Study Area. Therefore, the build alternatives would not have any impacts on mineral resources or mineral resource extraction operations. The build alternatives would utilize some mineral resources for project construction (e.g., concrete, asphalt, rock), but would not result in a significant depletion of the base resources. California State Department of Conservation (DOC) maps of the areas surrounding the project Study Area do not indicate any mineral extraction zones (California DOC 2001).⁶

4.2.1.9 NOISE (CEQA CHECKLIST QUESTIONS XII.E AND XII.F)

The following two questions are addressed together:

- e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?**
- f) For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?**

⁶ California Department of Conservation. 2001. Maps.

Reference: Los Angeles County Airport Land Use Plan⁷

The I-710 Corridor Project Study Area is not located within an airport land use plan or within two miles of a public or private airport. Therefore, the build alternatives would not result in the exposure of people to excessive noise related to aircraft or airport operations.

4.2.1.10 RECREATION (CEQA CHECKLIST QUESTION XV.B)

b) Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?

Reference: Section 3.1.3.2 and Section 3.24.3.1

The I-710 Corridor Project build alternatives do not include recreation facilities and would not require the expansion or construction of recreation facilities. As identified in Table 3.1-5, in Section 3.1, Land Use, several existing recreational facilities would be subject to direct and/or indirect impacts as a result of implementation of the build alternatives; however, the build alternatives would not require the construction or expansion of these affected recreational facilities that would have an adverse physical effect on the environment.

4.2.1.11 TRANSPORTATION/TRAFFIC (CEQA CHECKLIST QUESTIONS XVI.C THROUGH XVI.F)

c) Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Reference: Chapter 2; Los Angeles County Airport Land Use Plan⁸

The I-710 Corridor Project Study Area is not located within an airport land use plan or within two miles of a public or private airport facility, and the build alternatives (including the freight corridors included under Alternative 7) do not include any features that would be of sufficient height to affect airspace above the Study Area. As a result, the build alternatives would not impact air traffic patterns.

d) Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?

Reference: Chapter 2; Caltrans Highway Design Manual; and Caltrans Standard Specifications

⁷ Los Angeles County Department of Regional Planning. Website: http://planning.lacounty.gov/assets/upl/data/pd_alup.pdf.

⁸ Ibid.

The build alternatives would improve and modify an existing transportation facility. The build alternatives would not introduce any incompatible uses (e.g., farm equipment).

The build alternatives would be designed and constructed in compliance with Caltrans *Standard Specifications* and other applicable professional, design, and construction standards. As such, the build alternatives would not include hazardous design features. The build alternatives would improve I-710, which was designed and constructed in the 1950s, and would result in a modernized design compared to the existing transportation facility.

e) Would the project result in inadequate emergency access?

Reference: Section 3.24.3.4

The build alternatives would have a beneficial effect on emergency access and response, as they would improve the operation of the I-710 mainline, and impacts related to emergency access would not occur.

For any build alternative, temporary impacts to emergency services would be addressed through preparation of the TMP as required in Measure CON-TR-1, as well as the specific measures required in Measure CON-U&ES-1. Note that these measures are standard Caltrans measures applicable to such large construction projects.

f) Would the project conflict with adopted policies, plans or programs regarding public transit, bicycle, or pedestrian facilities, or otherwise decrease the performance or safety of such facilities?

Reference: Chapter 2.0, Project Alternatives, and Section 3.5.3.1

The build alternatives include changes to arterial interchanges and intersections that may affect sidewalks and bicycle lanes. The build alternatives would provide facilities for bicycles and pedestrians in locations where local streets would be affected by construction of either build alternative. For any build alternative, these facilities would be designed consistent with the respective local General Plan Circulation Element and would comply with Americans with Disabilities Act of 1990 (ADA) requirements. The build alternatives would improve pedestrian facilities (sidewalks) by replacing the existing ones that would be removed as part of the build alternatives. Bicycle travel would also be improved by providing wider shoulders and new pavement (which would provide a better riding surface) on the arterial bridges that would be replaced over I-710 and the Los Angeles River under the build alternatives. Class I Bikeways within the Study Area would be maintained with the proposed build alternatives. In addition to the widening of existing bridges and overcrossings to accommodate bicycle and pedestrian traffic, three pedestrian and bicycle-only bridges are proposed that would be constructed under both build alternatives, and an additional two (for a total of five) are proposed under Alternative 5C.

Many of the arterials crossing I-710 do not have bicycle lanes. Where segments of existing arterials are replaced, the cross sectional width of the travel way would be wide enough to allow for Class II bicycle lanes or a combination of Class II and Class IV bicycle lanes. Arterial crossing replacements at Alondra Blvd., Rosecrans Ave., Imperial Hwy., Firestone Blvd., Clara St., Florence Ave., Gage Ave., Bandini Blvd., and Washington Blvd. would have cross sections wide enough for Class II bicycle lanes and delineation. Arterial crossing replacements located in the City of Long Beach include Anaheim St., Pacific Coast Hwy., Willow St., Wardlow Rd., Del Amo Blvd., Long Beach Blvd., and Artesia Blvd. These arterial cross sections would be wide enough for Class IV bicycle lanes and delineation, except at right-turn lane locations. The cross sections at right-turn lane locations would be wide enough for Class II bicycle lanes and delineation. These cross sections are consistent with the City of Long Beach's Bicycle Master Plan (a supplement to the Mobility Element included in the City's General Plan Update). The addition of bicycle lanes on these arterial crossings would improve pedestrian safety as well, by providing greater distance and separation from the flow of vehicular traffic. Because bicycle and pedestrian facilities would be maintained or improved, the effect of the build alternatives is that travel by walking and bicycling would not substantially change as a result of the implementation of the build alternatives.

For any build alternative, Measure CON-TR-1 (Preparation of the TMP) would include measures to minimize construction impacts to bicyclists and pedestrians.

Based on these considerations, the build alternatives would not result in impacts to bicycle and pedestrian facilities.

4.2.1.12 UTILITIES AND SERVICE SYSTEMS (CEQA CHECKLIST QUESTIONS XVII.A, XVII.D, XVII.E, AND XVII.G)

a) Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Reference: Section 3.9.1

The build alternatives would not generate demand for wastewater conveyance or treatment facilities. As a result, the build alternatives would not result in significant impacts related to wastewater treatment facilities or wastewater treatment requirements.

For any build alternative, Measures WQ-1 through WQ-3 (Compliance with National Pollutant Discharge Elimination System [NPDES] Permit and Waste Discharge Requirements [WDRs]) would include the necessary procedures to ensure that either build alternative complies with stormwater and wastewater treatment requirements.

d) Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Reference: Section 3.4.2.2

While some existing water conveyance facilities may conflict with proposed structures during construction, the build alternatives would not generate a substantial demand for water supplies, and, for any build alternative, these existing impacted facilities would be relocated as needed. Some water may be needed during construction of the build alternatives and as landscaping would be planted to allow the landscaping to become established. The demand for water during construction and operation of the build alternatives would not exceed existing entitlements or require the expansion of existing water supply facilities to serve the build alternatives. Therefore, there would be no impact to water supplies.

e) Would the project result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?

Reference: Section 3.24.4.9

While some existing wastewater conveyance facilities may conflict with proposed structures during construction, the build alternatives would not result in the generation of additional wastewater. Therefore, the build alternatives would not result in exceedances of the ability of area wastewater treatment providers to accommodate either build alternative. Operation of the build alternatives would not result in impacts to wastewater utility systems.

g) Comply with Federal, State, and local statutes and regulations related to solid waste?

Reference: Section 3.24.1.1

Construction waste from the build alternatives would be limited to debris such as materials from demolished structures within the right-of-way that would be needed for the build alternatives. Operational solid waste material would be generated as part of landscape maintenance and picking up of litter along the road. All of the solid waste generated by the build alternatives would be disposed of in accordance with Federal, State, and local regulations related to recycling. Therefore, the build alternatives would not result in impacts related to Federal, State, or local statutes and regulations related to solid waste. Additionally, no solid waste facilities are located within the Study Area; therefore, no such facilities would be directly or indirectly impacted by the build alternatives.

4.2.2 LESS THAN SIGNIFICANT IMPACTS OF THE BUILD ALTERNATIVES

The following impacts resulting from the build alternatives have been determined to be less than significant.

4.2.2.1 AESTHETICS (CEQA CHECKLIST QUESTIONS I.A AND I.D)

a) Would the project have a substantial adverse effect on a scenic vista?

Reference: Section 3.6.3.1

For purposes of determining significance under CEQA, a scenic vista is defined as a viewpoint that provides expansive views of a highly valued landscape for the benefit of the general public. In addition, some scenic vistas are officially designated by public agencies, or informally designated by tourist guides. A substantial adverse effect to such a scenic vista is one that degraded the view from such a designated viewpoint.

The area surrounding the existing I-710 Corridor is essentially a flat coastal plain, with background views of local hills and mountains on days when visibility permits. The horizontal view plane is intermittently broken with electrical transmission towers, transportation facilities, and an occasional high-rise building.

No governmentally designated scenic vista has been identified within the Study Area. In addition, no specific scenic viewpoint has been identified in the Study Area.

While there are no officially designated scenic vistas in the Study Area, certain long-range views would change under the build alternatives for members of the motoring public and from users of the nearby Los Angeles River Trail. However, since these are not designated scenic vistas, and because the changes related to the build alternatives would add additional facilities typical in urbanized areas, the impacts are considered less than significant.

As described in Section 3.24.3.6, temporary visual impacts to sensitive receptors would occur under the build alternatives during the construction period and would include views of demolition of existing structures, clearing of existing vegetation, construction of the I-710 mainline widening and structures, construction vehicles, and temporary construction easements (TCEs). Construction impacts under Alternative 7 would be greater than under Alternative 5C due to construction of the elevated freight corridor. However, the construction activities would be temporary, and the adverse visual impacts related to construction would cease after completion of the build alternatives. Additionally, the impacts of vegetation clearing related to the build alternatives would gradually improve over time as landscaping matures. Temporary visual impacts related to construction of the build alternatives would be less than significant.

d) Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Reference: Section 3.6.3

As described in Section 3.6, Visual/Aesthetics, due to the expanded I-710 mainline footprint under both of the build alternatives, safety lighting and vehicle lights would be closer to surrounding land uses. As a result, viewers within the Study Area would experience increased night lighting and glare. Alternative 7 would also add safety lighting and vehicle lights associated with the freight corridor, which would not occur under Alternative 5C. However, for any build alternative, the impacts of the lighting under either of the build alternatives would be reduced by utilizing light control appliances on the safety lighting fixtures, as described in Section 3.6. Glare impacts would be minimized through construction of soundwalls and screen walls and by the distance of the viewers from the lighting source.

Based on the above, permanent light and glare impacts would be less than significant for each build alternative.

4.2.2.2 AIR QUALITY (CEQA CHECKLIST QUESTIONS III.A AND III.E)

a) Would the project: conflict with or obstruct implementation of the applicable air quality plan?

Reference: Section 3.13.3

For purposes of determining significance under CEQA, a potentially significant impact would be failure to conform to the applicable air quality plan, or obstructing implementation of such a plan.

As discussed in Section 3.13, the Study Area currently exceeds State and/or Federal standards for ozone (O_3), particulate matter less than 10 microns in size (PM_{10}), and particulate matter less than 2.5 microns in size ($PM_{2.5}$), while meeting State and/or Federal standards for carbon monoxide (CO), nitrogen dioxide (NO_2), and sulfur dioxide (SO_2).

The applicable "Air Quality Plan" is the current South Coast Air Quality Management District (SCAQMD) Air Quality Management Plan/State Implementation Plan (AQMP/SIP) that was adopted by the SCAQMD in 2012. Implementation of the SIP would bring the region into conformance with the applicable air quality standards. If a project "conforms" with the SIP, it would not conflict with or obstruct implementation of the applicable air quality plan. Project conformity with the SIP is demonstrated by:

- Inclusion of the project in the current Regional Transportation Plan (RTP)
- Detailed project-level analyses demonstrating that the project will not result in an exceedance of local standards for CO and particulates.

As noted in Section 3.13, the build alternatives are consistent with the adopted AQMP and versions are listed in both the approved 2016 RTP/Sustainable Communities Strategy (SCS), Amendment No. 3 (Project ID No. 1C0401), and the 2019 Federal Transportation Improvement Program (FTIP) (Project ID No. LA0B952, 100 percent prior years). Air quality models are used to demonstrate that the emissions resulting from the build alternatives would not contribute to the deterioration of or impede the progress of air quality goals stated in the AQMP. The air quality models for this project used project-specific data to estimate the quantity of pollutants generated from implementation of the project. The results for the No Build (Alternative 1), which has been identified as the Preferred Alternative (No Build), and the build alternatives scenarios in the horizon year were compared to the AQMP's air quality projections. Results indicated that the build alternatives would not significantly contribute to or cause deterioration of existing air quality; therefore, mitigation measures would not be required for the long-term operation of any of the build alternatives. Because the build alternatives "conform" with the SIP, they would not conflict with or obstruct the implementation of the applicable air quality plan, and potential impacts would be less than significant.

e) Create objectionable odors affecting a substantial number of people?

Reference: Section 3.24.3

Highway improvement projects do not typically produce odors that would affect off-site sensitive receptors. For any build alternative, implementation of the SCAQMD and Caltrans standard conditions, along with the measures identified in Section 3.24.4.13 of this Final EIR/EIS, would address short-term air quality impacts resulting from the build alternatives, including objectionable odors. Impacts would be less than significant.

4.22.3 BIOLOGICAL RESOURCES (CEQA CHECKLIST QUESTION IV.D)

d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Reference: Section 3.16.2.3

The I-710 Corridor has restricted wildlife movement and resulted in habitat fragmentation for many years, and the build alternatives would not have an adverse impact on wildlife movement. The build alternatives would follow the course of the existing freeway and would not increase habitat fragmentation or impede the movement of wildlife in the area. Habitat within the Los Angeles River channel and movement opportunities therein would not be affected by implementation of the build alternatives because they would essentially modify an existing transportation facility. Construction of the build alternatives could temporarily impede wildlife movement in construction areas; however, this impact would be localized to the construction area and temporary during

construction, for any build alternative. Therefore, impacts related to wildlife movement would be less than significant.

4.2.2.4 CULTURAL RESOURCES (CEQA CHECKLIST QUESTIONS V.A THROUGH V.D)

a) Cause a substantial adverse change in the significance of a historical resource as defined in §15064.5?

Reference: Section 3.7.3.1

Six resources within the Supplemental Area of Potential Effect (APE) were identified as potentially eligible for listing in the National Register of Historic Places (National Register). Please see Section 3.7 for additional discussion.

One cultural resource, Dale's Donuts in Compton, has been determined eligible for listing in the National Register in the context of architecture. This determination has been made by Caltrans in accordance with stipulation VIII.C.5.a of the Section 106 Programmatic Agreement with the State Historic Preservation Officer (SHPO). Dale's Donuts would be impacted by acquisition of part of the parking lot under the build alternatives, which is not a contributing factor to the historical significance of this property. As such, the build alternatives would not adversely affect this resource.

A segment of the Union Pacific Railroad (UP Railroad), formerly the Southern Pacific Railroad, in Los Angeles and Orange Counties (Resource No. 19-186110/30-176630) is eligible for listing in the National Register and would be impacted by the build alternatives. A portion of the segment south of Patata St. in the City of South Gate, including two bridges, that would be impacted has already been altered and does not contribute to the significance of the UP Railroad. A portion of the same segment of the UP Railroad south of Frontage Rd. in the City of South Gate would also be impacted but has been previously re-aligned and altered and therefore does not contribute to the significance of the UP Railroad. A segment of the UP Railroad south of Noakes St. (Primary No. 19-186112) includes an area in the City of Commerce and would be impacted by the build alternatives; however, this segment of rail was constructed after the period of significance for the UP Railroad and thus does not contribute to the significance of the UP Railroad. Therefore, the build alternatives would not cause a significant impact on the historic rail line because the rail line would continue to be eligible for the National Register.

The Boulder Dam-Los Angeles 287.5-kilovolt Transmission Line is eligible for listing in the National Register and would be impacted by the build alternatives. The towers on either side of I-710 would be heightened by 55 feet to make room for construction of the freight corridor under Alternative 7. This would not be required under Alternative 5C, and no impacts would occur. However, the integrity of the Transmission Line would not be reduced to the degree that it would no longer be eligible for the National Register. Therefore, the build alternatives would not cause a significant impact on the historic Transmission Line.

Drake Park Historic District was determined eligible for listing in the National Register in 1987. It had been previously designated as a local “historic landmark district” by the City of Long Beach in 1980, and expanded in 1982. In 1998, Long Beach combined the Drake Park Historic Landmark District with nearby Willmore City Historic Landmark District to form a new, larger local district called the Drake Park/Willmore City Historic Landmark District. Only the smaller Drake Park Historic District area within the larger Drake Park/Willmore City Landmark Historic District is eligible for the National Register. It is significant at the local level under Criteria A and C. No existing buildings or structures within the Drake Park Historic District would be directly affected by the construction activities along the roadways identified above for either build alternative and the construction activities would not reduce the significance, integrity, or eligibility of the historic district as a whole. Therefore, construction of the build alternatives would result in a less than significant impact to a historic resource and no mitigation would be required for any build alternative.

The Los Angeles River Flood Control Channel was assumed eligible for the National Register for the purposes of the build alternatives only. The resource comprises multiple discontinuous locations between Slauson Ave. in the City of Bell and Ocean Ave. in the City of Long Beach. Levee modifications, including demolition and replacement, and new, extended, or replaced bridge bents/pier walls in channel would be part of construction of the build alternatives; however, this would not reduce the significance, integrity, or eligibility of the channel as a whole. Therefore, construction of the build alternatives would result in a less than significant impact to a historic resource, and no mitigation is required for any build alternative.

In summary, the build alternatives have resulted in a finding of No Adverse Effect under Section 106 of the National Historic Preservation Act (NHPA). Under CEQA, the impacts of the build alternatives to historic resources would be less than significant.

b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5?

Reference: Section 3.7.3.1

As described in Section 3.7.2, no archaeological resources requiring evaluation were identified within the Supplemental APE. The archaeological survey area has been extensively disturbed by construction of the existing freeways and roads, railroads, urban development, river channel, and other infrastructure. As a result, the potential for intact archaeological resources to be present within the Study Area appears to be low.

An Archaeological Sensitivity Study (2017) was prepared subsequent to the archaeological survey study. For the Archaeological Sensitivity Study, a proximity analysis was conducted using a Geographic Information System (GIS) and used four data layers: elevation highpoints, the historic alignments of the Los Angeles River, the locations of ethnohistoric villages, and the

locations of previously recorded cultural resources identified by SCCIC records searches. Sanborn Fire Insurance Maps were also reviewed. As part of the Archaeological Sensitivity Study, settlement modeling reveals patterned human behavior and the repeated use over time of elevated landforms bordering the lower floodplain. High energy meanderings of the river channel will have erased a great deal of potential archaeological evidence. The area of direct effects (Direct APE) is considered to have very low sensitivity for the presence of buried archaeological resources within existing freeway rights-of-way (existing I-710 footprint) as any construction activities related to the build alternatives would likely be limited to within the existing engineered fill. For any build alternative, if any excavations would occur within the Direct APE outside the existing freeway footprint (i.e., within the existing rights-of-way) or if deep excavations would occur within the freeway footprint/existing rights-of-way, there would be the potential to encounter undisturbed sediments that may contain archaeological resources. In other words, excavations within native deposits below and/or outside the existing freeway alignment as part of freeway expansion related to the build alternatives would have the potential to encounter archaeological resources. Pile driving and the construction of retaining walls within previously disturbed deposits would not have the potential. At the time this document was prepared, the construction design plans were at a 30 percent level of completion; therefore, specific construction details were unknown at that time. For any build alternative, further construction details would be refined at 65 and 95 percent design review. Once specific areas of impact are defined at a 95 percent design review, areas of potential archaeological sensitivity would be reassessed.

Sensitivity study analyses identified three areas recommended for monitoring that exhibit the possibility to contain previously unrecorded archaeological resources. For any build alternative, the level and daily duration of monitoring would be dependent on several factors, including the nature of construction and the nature of the deposits observed. If previously disturbed and/or fill deposits are observed during monitoring, monitoring would not be necessary. The presence of monitors may not be necessary for the entire construction day. In total, monitoring would be recommended for 94 acres (3.6 percent) of the Direct APE at 30 percent design review. Spot checking would be recommended for 1,178 acres (45.4 percent) of the Direct APE, and no additional work would be recommended for 1,321 acres (50.9 percent) of the Direct APE. The recommendation for spot checking is based on the potential observation of native (previously undisturbed) deposits. The need for spot checking would be negated by the observation during spot checking of previously disturbed and/or fill deposits. One of the main purposes of spot checking would be to confirm the absence of native deposits. The 94 acres (3.6 percent) recommended for monitoring at this stage of design may be further reduced upon review at 65 percent and 95 percent design review for any build alternative. For any build alternative, the 1,178 acres (45.4 percent) recommended for spot checking would likely be reduced at 65 percent and 95 percent design review. Additionally, the as-builts for the areas of focused consideration (7 areas) would be examined at 65 percent design review to define, if possible, areas of prior disturbance as the result of original freeway construction. The final monitoring recommendations would be determined once the plans are developed at 65 percent and refined at 95 percent

following review by a qualified Caltrans PQS—Principal Investigator in Prehistoric or Historic Archaeology.

In a letter dated June 1, 2017, the SHPO concurred with the Supplemental HPSR and finds the analysis contained in the Archaeological Sensitivity Study to be sufficient, but concluded that Caltrans cannot fully determine how the undertaking may affect unknown historic properties in the Direct APE and advised Caltrans to move forward with a project-level Programmatic Agreement (project-level PA) for this undertaking, for any build alternative, to phase identification, evaluation, and findings of effect of unknown historic properties [pursuant to Stipulation XII.A of the Section 106 PA]. Caltrans has developed the project-level PA following the separate submittal of the Supplemental Finding of Effect document.

A Historic Properties Treatment Plan (HPTP) has also been developed by a qualified archaeologist in consultation with Caltrans PQS Principal Investigator-Prehistoric or Historic Archaeology to plan for the for the identification, evaluation, and treatment of archaeological resources should they be discovered during construction of either build alternative. The HPTP has been attached to the project-level PA, both of which would be conditions of the Supplemental Finding of Effect for the undertaking (build alternatives). Caltrans continued consultation with the SHPO on the development of the project-level PA at the time the Supplemental Finding of Effect was submitted for SHPO review. The project-level PA was submitted to SHPO on March 1, 2019. Following coordination, the project-level PA was executed between the Caltrans Division of Environmental Analysis (DEA) and SHPO on June 6, 2019. For any build alternative, in case cultural materials are discovered during construction of the build alternatives, Measure CON-CUL-1 (a standard Caltrans requirement) would require that all earthmoving activity in and around the immediate discovery area be diverted until a qualified archaeologist can assess the nature and significance of the find. In addition, Measure CON-CUL-3 states that a cultural resource monitoring area would be established prior to construction, consistent with the provisions outlined in the PA and HPTP, including any updates at 65 and 95 percent design completion, and a qualified archaeologist and a qualified Native American Monitor would monitor ground-disturbing activities within the cultural resource monitoring area. With incorporation of these measures, potential impacts related to the build alternatives would be less than significant.

d) Disturb any human remains, including those interred outside of formal cemeteries?

Reference: Section 3.7.4 and Section 3.24.4.7

No known human remains are present in the direct impact limits of the build alternatives, and there are no facts or evidence to suggest that Native American or any other human remains are buried in the Direct APE. However, for any build alternative, in the unlikely event that human remains are encountered during grading, the Los Angeles County Coroner would be notified, and standard procedures for the respectful handling of human remains during the earthmoving activities would be adhered to as described in Measure CON-CUL-2 (Caltrans Standard

Procedure). Through adherence to this standard procedure, potential impacts resulting from the build alternatives would be less than significant.

4.2.2.5 GEOLOGY AND SOILS (CEQA CHECKLIST QUESTIONS VI.A I, II, AND IV, VI.B, AND VI.D)

a) Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42?

ii) Strong seismic ground shaking?

iv) Landslides?

Reference: Section 3.10.2.6 and Section 3.24.4.10

Based on the discussion in Sections 3.10.2.6 and 3.24.4.10, the build alternatives would be subject to potential temporary and permanent impacts from faulting/seismicity and landslide soil types. The primary geologic and geotechnical constraints affecting the design and construction of the build alternatives include:

- Moderate to high ground accelerations due to the presence of nearby active faults and fault zones, including the Newport-Inglewood (Cherry Hills segment), Puente Hills, Compton, and Palos Verdes Faults.
- Fault rupture associated with the Cherry Hill segment of the Newport-Inglewood Fault Zone.
- Seismically induced settlement in areas of shallow groundwater and loose alluvial soils. Most of the Study Area is within an area identified as having the potential for liquefaction.
- Earthquake-induced slope instability in areas near slopes such as the Los Angeles River.

For any build alternative, these potential impacts would be minimized through implementation of safe construction practices and compliance with Caltrans and California Occupational Safety and Health Administration (Cal-OSHA) requirements. Additionally, preparation of a design-level geotechnical report and quality assurance/quality control plan, as specified in Measures GEO-1 and CON-GEO-1 (Caltrans standard requirement) would reduce geologic impacts. Therefore, geologic impacts to the build alternatives related to earthquakes, seismic shaking, and landslides would be less than significant.

b) Result in substantial soil erosion or the loss of topsoil?

Reference: Section 3.10.3 and Section 3.24.3.10

As discussed in Sections 3.10.3 and 3.24.3.10, during construction of the build alternatives, excavated soil would be exposed that would increase the potential for soil erosion. Additionally, during a storm event, soil erosion could occur at an accelerated rate. Either build alternative would be required to adhere to the requirements of the General Construction Permit and implement erosion and sediment control Best Management Practices (BMPs) specifically identified in a project Storm Water Pollution Prevention Plan (SWPPP) in order to keep sediment from moving off site. Impacts related to soil erosion under the build alternatives would be less than significant with compliance with these standard requirements.

d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Reference: Section 3.10.2.1 and Section 3.10.3

As discussed in Section 3.10.2.1, the on-site soils consist generally of coarse-grained materials that are not highly expansive, but some fine-grained soils susceptible to high degrees of expansion do exist. For any build alternative, required compliance with the Caltrans standard design requirements would result in these impacts being less than significant.

4.2.2.6 GREENHOUSE GAS EMISSIONS (CEQA CHECKLIST QUESTIONS VII.A AND VII.B)

a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Reference: Section 4.4.3

GHG emissions from transportation projects can be divided into those produced during operation of the project and those produced during construction. The primary GHGs produced by the transportation sector are CO₂, methane (CH₄), nitrous oxide (N₂O), and hydrofluorocarbons (HFCs). CO₂ emissions are a product of the combustion of petroleum-based products, like gasoline, in internal combustion engines. Relatively small amounts of CH₄ and N₂O are emitted during fuel combustion. In addition, a small amount of HFC emissions are included in the transportation sector.

The State CEQA Guidelines generally address GHG emissions as a cumulative impact due to the global nature of climate change (Public Resources Code, Section 21083(b)(2)). As the California Supreme Court explained, “because of the global scale of climate change, any one project’s contribution is unlikely to be significant by itself.” (*Cleveland National Forest Foundation v. San Diego Assn. of Governments* (2017) 3 Cal,5th 497, 512.) In assessing cumulative impacts, it must

be determined if a project's incremental effect is "cumulatively considerable" (CEQA Guidelines Sections 15064(h)(1) and 15130).

To make this determination, the incremental impacts of the project must be compared with the effects of past, current, and probable future projects. Although climate change is ultimately a cumulative impact, not every project that emits greenhouse gases must necessarily be found to contribute to a significant cumulative impact on the environment.

As shown in Table 4.4-2, provided later in this section, when compared to the 2012 existing Baseline, the build alternatives would decrease regional GHG emissions by approximately 13,000,000 metric tons of CO₂e per year during operation. As such, the impact would be considered less than significant.

A modified version of the Sacramento Metropolitan Air Quality Management District (SMAQMD) Road Construction Emissions Model was used to quantify the expected construction-related GHG emissions resulting from the build alternatives. As shown in Table 4.4-2 the build alternatives would result in a slight increase in GHG emissions during construction. For any build alternative, Caltrans is firmly committed to implementing measures to help reduce GHG emissions, which are outlined in Section 4.4.7. All construction contracts include Caltrans *Standard Specifications* Section 7-1.02A and Section 7-1.02C, Emissions Reduction, which require contractors to comply with all laws applicable to a build alternative and to certify they are aware of and would comply with all ARB emission reduction regulations; and Section 14-9.02, Air Pollution Control, which would require contractors to comply with all air pollution control rules, regulations, ordinances, and statutes. Certain common regulations, such as equipment idling restrictions that reduce construction vehicle emissions also help reduce GHG emissions.

b) Conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

References: Section 4.4.1 and Section 4.4.3

Section 4.4.1 provides a comprehensive discussion of federal and state level plans, policies, and regulations related to GHG emissions. As the GHG emissions with or without the build alternatives would decrease in future years when compared to the existing conditions (2012 Baseline), they would not conflict with any applicable plan, policy, or regulation adopted for the purpose of reducing GHGs. Accordingly, the impact of the build alternatives would be less than significant.

4.22.7 HAZARDS AND HAZARDOUS WASTE (CEQA CHECKLIST QUESTIONS VIII.A THROUGH VIII.C)

a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Reference: Section 3.12.3 and Section 3.24.3.12

As described in Section 3.12.3, Hazards and Hazardous Waste, operation and maintenance of the transportation facilities proposed as part of either of the build alternatives would not introduce new sources of hazardous materials or waste. For any build alternative, routine maintenance activities would be required to follow applicable regulations with respect to the handling and disposal of potentially hazardous materials.

As further described in Section 3.24.3.12, based on the findings of the records search and the site survey, the following hazardous materials may be encountered during excavation and construction activities for the build alternatives.

- Elevated concentrations of aerially deposited lead (ADL) may be present along existing roadways that would be modified by the build alternatives. For any build alternative, during grading activities, there would be the possibility for hazardous concentrations of ADL to be released into the environment and affect construction workers.
- Structures that would be removed or modified as part of the build alternatives may contain asbestos-containing materials, polychlorinated biphenyls (PCBs), and/or lead-based paint, which could be released into the environment if not properly handled and removed for disposal.
- Any transformers that would be removed or relocated during construction of the build alternatives would be considered PCB-containing, unless labeled or tested otherwise. Leaking transformers that impact adjacent soils would be a concern during construction of the build alternatives because they could affect construction workers and the environment.
- Preliminary findings regarding utilities that may be potentially impacted by the build alternatives including their relocation strategies can be found in the various Utility Impacts Reports. These utilities include petroleum pipelines that would require relocation and/or would be exposed during construction of the build alternatives. Based on the presence and contents of these pipelines, for any build alternative, it is likely that during relocation and/or construction, impacts to the subsurface may be encountered. Impacts to the subsurface encountered from these pipelines would be the responsibility of the pipeline owner.
- Yellow traffic striping and pavement-marking materials (paint, thermoplastic material, permanent tape, and temporary tape) that would be removed as part of the build alternatives may contain elevated concentrations of metals such as lead.
- Soils along the railroad tracks located near Washington Blvd., within the disturbance limits of the build alternatives, would be impacted by petroleum hydrocarbons, lead, and arsenic. For any build alternative, during grading or excavation within the railroad right-of-way, hazardous concentrations of the contaminants listed above could be released into the environment and affect construction workers.

- Previously unknown contaminants could be encountered at the properties to be acquired as part of the build alternatives.

As described in Section 3.12.3, many listed sites were identified as having the potential to pose an environmental concern within the Study Area. Considering the history and nature of activities conducted at some of the sites identified within the Study Area, contaminated groundwater may be encountered during construction of the build alternatives. Dewatering of contaminated groundwater during construction of the build alternatives could impair adjacent surface waters. As a result, for any build alternative, site investigations would be performed at all hazardous materials sites within the right-of-way of the build alternatives to determine whether hazardous materials are present on site. Hazardous material spills associated with any acquired property would be removed and remediated prior to construction of either build alternative. For any build alternative, implementation of Avoidance and Minimization Measures HW-1 through HW-7 listed in Section 3.12.4 and Avoidance and Minimization Measures CON-HW-1 through CON-HW-3 would minimize or avoid impacts related to hazardous materials and hazardous wastes during construction of either build alternative. Therefore, hazardous wastes and materials impacts associated with the build alternatives would be less than significant.

By improving the safety of I-710 through the modernized design features discussed in Chapter 2.0, operation of the build alternatives would not result in a significant permanent adverse impact related to transport or emissions of hazardous waste and materials.

b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Reference: Section 3.12.3.1

As discussed in Section 3.12, under the build alternatives, vehicles utilizing the I-710 Corridor would continue to transport hazardous substances that could spill and impact the roadway and adjacent properties or resources. However, the purpose of the I-710 Corridor Project is to improve traffic safety, which would help to minimize impacts related to hazardous waste spills under the build alternatives. In addition, transport of hazardous materials is subject to strict regulation. Caltrans, the California Highway Patrol, and local police and fire departments are trained in emergency response procedures for safely responding to accidental spills of hazardous substances on public roads, which further reduces impacts. For these reasons, operation of either of the build alternatives would not result in a significant permanent impact related to transport or upset of hazardous waste and materials.

c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Reference: Section 3.12.3.1, page 3.12-127

As discussed in the response to Checklist Question VIII.B above, the build alternatives would continue to transport hazardous substances that could spill and impact the roadway and adjacent properties or resources. However, the purpose of the I-710 Corridor Project is to improve traffic safety, which would help to minimize impacts related to hazardous waste spills under the build alternatives. In addition, transport of hazardous materials is subject to strict regulation. For these reasons, operation of either of the build alternatives would not result in a significant permanent impact within 0.25 mile of existing and proposed schools.

4.2.2.8 HYDROLOGY AND WATER QUALITY (CEQA CHECKLIST QUESTIONS IX.A THROUGH IX.F AND IX.H)

The following three questions are addressed together below:

- a) Will the project violate any water quality standards or waste discharge requirements?**
- e) Will the project create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?**
- f) Will the project otherwise substantially degrade water quality?**

Reference: Section 3.9.3 and Section 3.24.3.9

Soil disturbance and accidental spills during construction of either of the build alternatives could potentially impact water quality. For any build alternative, construction of either of the build alternatives would comply with the provisions of the NPDES General Permit for Storm Water Discharges Associated with Construction and Land Disturbance Activities (Order No. 2012-0006-DWQ, NPDES No. CAS000002), which would include implementation of Erosion and Sediment Control BMPs.

Both of the build alternatives would add new impervious surfaces, thereby increasing the amount of storm water runoff within the project limits and introducing additional water pollutant loads into the runoff in the area. The typical roadway pollutants are washed off impervious surface areas by storm water flows and then discharged to the local receiving water bodies. For any build alternative, permanent water quality impacts would be addressed in the design of either build alternative to the extent required under the Caltrans Storm Water Management Plan. Treatment BMPs, such as detention basins and bioswales, would be included in the design to address long-term water quality impacts. As discussed in Section 3.24.3.9, for temporary construction impacts related to water quality and the additional runoff associated with the added impervious areas

under the build alternatives, Minimization Measures CON-WQ-1 and CON-WQ-2 are included to address water quality issues.

The Study Area is located within the Coastal Plain of the Los Angeles Groundwater Basin and is specifically underlain by the West Coast and Central Subbasins. Groundwater has been encountered in many test borings along the alignment of the build alternatives during previous investigations for bridge construction by Caltrans and Los Angeles County. Groundwater was encountered at depths ranging from 2.2 feet below ground surface (bgs) to 113 feet bgs.

Water quality impacts during construction of either of the build alternatives would occur with the removal and disposal of groundwater that has passively seeped into the channels. Dewatered groundwater may contain high levels of total dissolved solids, salinity, or other contaminants, which could be introduced to surface waters during construction. The construction of support structures under the build alternatives would use either the cast-in-drilled-hole (CIDH) or cast-in-steel-shell (CISS) methods. In the CIDH method, a hole would be drilled, filled with slurry to prevent cave-ins, and then pumped with concrete (which displaces the slurry and is reused). The hole would be expected to passively fill with groundwater, which would be removed prior to filling with slurry and concrete. The removed groundwater would then be disposed of according to the selected method (treatment on site, treatment and disposal off site, or disposal into the local sewer system). Construction of either build alternative would not affect groundwater movement because the slurry would prevent such movement and there would not be active dewatering aside from emptying the hole prior to filling it with slurry. Because active dewatering would not be anticipated during construction, groundwater movement is not expected to be significantly impacted by the build alternatives.

With the application of these construction methods and Measures CON-WQ-1 and CON-WQ-2, the build alternatives would not violate any water quality standard and would not violate any waste discharge requirements. Impacts under the build alternatives would be less than significant.

b) Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Reference: Section 3.9.3 and Section 3.24.3.9

The build alternatives would not affect groundwater supplies since they would not use substantial amounts of water. As discussed in the response to the Checklist Question above, the build alternatives would not result in significant impacts to groundwater supplies.

The following three questions are addressed together below:

- c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?**
- d) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?**
- h) Place within a 100-year flood hazard area structures which would impede or redirect flood flows?**

Reference: Section 3.8.3.1

As discussed in Section 3.8, Hydrology and Floodplain, the build alternatives would result in transverse encroachments of the Los Angeles River and Compton Creek 100-year floodplains. With both build alternatives, one transverse encroachment of the Rio Hondo 100-year floodplain would also occur. These improvements would include widening of existing bridges, construction of new bridges, modification of existing levees, and utility relocations, which would encroach on the 100-year floodplain. As discussed in Section 3.8.3, construction of the build alternatives within the 100-year floodplain would not be anticipated to substantially increase the base flood elevations of the Los Angeles River, Compton Creek, or the Rio Hondo Channel. In addition, as discussed in detail in Section 3.8.3, the proposed 100-year floodplain encroachment resulting from the build alternatives would not result in any adverse impacts on natural and beneficial floodplain values, would not result in a substantial change in flood risk or damage, and would not have substantial potential to cause interruption or termination of emergency services or emergency routes.

Alternative 7 would result in greater permanent impacts to the 100-year floodplain compared to Alternative 5C because more improvements within the 100-year floodplain are proposed due to the freight corridor feature. The encroachments would result from construction of new columns or piers and extension of existing piers. Although Alternative 7 would result in more 100-year floodplain encroachments than Alternative 5C, permanent impacts related to emergency response, risks to life and property, incompatible floodplain development, and natural and beneficial floodplain values would be the same as those under Alternative 5C. For any build alternative, a Conditional Letter of Map Revision (CLOMR) would be required. No revisions to the Federal Emergency Management Agency (FEMA) Flood Insurance Rate Maps (FIRM) maps would be required. For any build alternative, a Final Flood Control Facilities Report/Final Location Hydraulic Study would be prepared during final design as specified in Measure FP-1. The change in floodplain elevations would be evaluated based on final design plans of the bridges and other structures where they encroach on the 100-year floodplain. The modeling results would be

included in the application for a CLOMR or an LOMR, if required, which would be processed through the Los Angeles County Flood Control District (LACFCD) and FEMA. Therefore, impacts under either of the build alternatives are considered less than significant.

4.2.2.9 LAND USE AND PLANNING (CEQA CHECKLIST QUESTIONS X.B)

b) Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Reference: Section 3.1.1.21 and Section 3.3.1.2

Based on the analysis in Section 3.1, Land Use, and Section 3.3, Community Impacts, the build alternatives would have a less than significant impact on land use for the following reasons.

With regard to overall General Plan and zoning consistency, the existing land uses in the Study Area are generally compatible with the build alternatives. I-710 has been considered in the General Plans of the County of Los Angeles and the cities in the Study Area since its construction as a freeway in the 1950s.

As discussed in Section 3.1.1.2, adoption of a build alternative would require several cities to amend their General Plan Land Use and Circulation Elements to reflect modifications to arterials, interchange modifications, and elimination of land uses that may need to be acquired. For any build alternative, this Final EIR/EIS would provide adequate environmental documentation in support of each agency's action to amend their General Plans. With the implementation of Measure LU-1 in Section 3.1.2.4, long-term adverse impacts as a result of the build alternatives would be reduced to a level below significance as a result of the Cities and the County amending their General Plans to reflect the adopted I-710 Corridor Project build alternative.

With regard to the Coastal Zone, consistency of the build alternatives with the California Coastal Act is assessed in Table 3.1-2 in Section 3.1.2.4. The analysis demonstrates that the build alternatives are consistent with the California Coastal Act.

The I-710 Corridor Project build alternatives are generally consistent with the adopted goals and policies of the General Plans because they address the main components found in the General Plan policies, including community participation, improved air quality, and reduced traffic congestion. Therefore, the build alternatives would result in a less than significant impact regarding the creation of incompatible land uses or incompatibility with land use regulations.

4.2.2.10 NOISE (CEQA CHECKLIST QUESTIONS XII.D)

d) Would the project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Reference: Section 3.24.3.14

The permanent increase in ambient noise levels in the project vicinity above levels existing without the build alternatives is addressed in response to CEQA Checklist Question XII.c in Section 4.2.3. Temporary construction noise issues related to the build alternatives are addressed in the following paragraphs.

As discussed in Section 3.24.3.14, during construction of the build alternatives, noise from construction activities may occasionally dominate the noise environment in the immediate project area. Construction noise is regulated by Caltrans *Standard Specifications*, Section 14-8.02, "Noise Control." These requirements state that noise levels generated during construction shall be controlled and monitored and a maximum noise level of 86 A-weighted decibels (dBA) would not be exceeded between the hours of 9:00 p.m. and 6:00 a.m.

Figure 3.24-1 in Section 3.24, Construction Impacts, of this Final EIR/EIS, summarizes noise levels produced by construction equipment that is commonly used on roadway construction projects. As indicated, equipment involved in construction would be expected to generate noise levels ranging from 70 to 90 dBA at a distance of 50 feet. Noise produced by construction equipment would reduce over distance at a rate of approximately six dBA per doubling of distance. Normally, construction noise levels should not exceed 86 dBA maximum instantaneous noise level (L_{max}) at a distance of 50 feet. No adverse noise impacts from construction of the build alternatives would occur because construction would be conducted in accordance with the Caltrans *Standard Specifications* and would be short term, intermittent, and dominated by local traffic noise. With compliance with the Caltrans *Standard Specifications* and implementation of Minimization Measures CON-N-1 through CON-N-11, construction noise resulting from the build alternatives would be considered less than significant.

4.2.2.11 POPULATION AND HOUSING (CEQA CHECKLIST QUESTIONS XIII.A)

- a) Would the project induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)**

Reference: Section 3.2.2, Section 3.3.1.3, and Section 3.24.3.2

The build alternatives do not propose the direct construction of new homes and businesses.

As described in Section 3.24.3.2, the build alternatives would not result in temporary or permanent impacts to the rate of population, housing, or employment growth. The additional capacity that could be provided under the build alternatives would have a positive impact on goods movement and would help achieve one component of the I-710 Corridor Project's purpose. Therefore, the I-710 Corridor Project build alternatives would result in beneficial growth-related effects relative to employment and economic activities associated with goods movement. Given the existing

constraints to growth as well as the projected growth trends described in Section 3.2, the I-710 Corridor Project build alternatives are not expected to result in a substantial change in the location, distribution, or rate of population and housing growth within the Study Area and impacts related to the build alternatives would be considered less than significant.

As described in Section 3.3, Community Impacts, the I-710 Corridor Project build alternatives would result in the acquisition of existing residential uses and the relocation of occupants of those residential uses. However, with the exception of residents with special relocation needs (e.g., low-income and minority residents), the residential relocations that would be required under the build alternatives would not require construction of replacement housing, as the construction of replacement housing is only implemented in rare cases. For any build alternative, Last Resort Housing may be required for relocation of residents with special needs, such as low-income, elderly, and handicapped residents. Additionally, for any build alternative, special assistance may be needed to relocate smaller or marginal businesses and minority businesses that need to be located next to a specific customer base. Therefore, displacement and relocation of special needs residents and businesses resulting from the build alternatives is addressed under potentially significant impacts. Section 3.3 describes that adequate housing stock currently existed within the Study Area at the time this document was prepared to meet the needs of the potential relocations, other than special needs residents and businesses.

4.2.2.12 UTILITIES AND SERVICE SYSTEMS (CEQA CHECKLIST QUESTIONS XVII.B, AND XVII.F)

b) Require or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Reference: Section 3.24.1.1

As transportation improvement, the build alternatives would not require any new water or wastewater treatment facilities or the expansion of existing facilities, as the build alternatives would not result in an increase in population and a corresponding demand for these services.

Both of the build alternatives would generate storm water runoff from the increase in impervious surfaces from the expanded transportation facility. The build alternatives include appropriate storm water drainage, collection, control, treatment, and release facilities within the proposed right-of-way of the build alternatives. As a result, impacts related to storm water drainage resulting from the build alternatives would be less than significant.

f) Be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Reference: Section 3.24.2

Construction of either of the build alternatives would generate construction waste material from demolished structures. The waste would include concrete, asphalt, vegetation, soil, rebar, and other similar materials. For any build alternative, the construction contractors would be required to divert construction waste material (by reduction, recycling, reuse, and composting) from landfills within Los Angeles County. As a result of these reduction and recycling activities, the total amount of construction waste material that would be anticipated to be disposed of in area landfills under the build alternatives would be limited and would not be expected to exceed the permitted capacity of the regional landfills.

During operation of either of the build alternatives, waste material would be generated as part of landscape maintenance and picking up of litter along the road. For any build alternative, vegetative material generated during landscape maintenance would be disposed of at a composting facility. Trash and other waste material collected along the road would be disposed at area recycling facilities and in landfills. The total amount of litter generated under the build alternatives would not be substantial, and because of the composing and recycling activities, would not be expected to exceed the permitted capacity of the regional landfills; therefore, impacts to landfills resulting from the build alternatives would be less than significant.

4.2.2.13 SIGNIFICANT IMPACTS OF THE BUILD ALTERNATIVES THAT CAN BE MITIGATED TO BELOW A LEVEL OF SIGNIFICANCE

The following impacts related to the build alternatives have been determined to be significant under CEQA. The majority of these significant impacts can be mitigated to below a level of significance. Where they cannot be mitigated, they have been identified as such, and the specific impacts that remain significant are summarized in Section 4.2.4.

4.2.2.14 AESTHETICS (CEQA CHECKLIST QUESTIONS I.C)

c) Substantially degrade the existing visual character or quality of the site and its surroundings?

Reference: Section 3.6.3, page 3.6-80

Section 3.6.3 contains an extensive analysis of the impacts resulting from the build alternatives to visual character at 25 different key views that represent typical views throughout the I-710 Corridor. As shown in that analysis, aesthetic impacts from either of the build alternatives would be low or very low at many of these viewpoints within the I-710 Corridor. However, aesthetic impacts from the build alternatives from some views in the Study Area would be higher due to the location of existing sensitive viewers (primarily residents) in close proximity to the I-710 mainline alignment. Alternative 7 would create aesthetic impacts of greater magnitude when compared to Alternative 5C in the Cities of Long Beach and South Gate because of the close proximity of the elevated freight corridor to the existing residential properties. With implementation of Measures VIS-1 through VIS-10 provided in Section 3.6.4, Visual/Aesthetics of this this Final EIR/EIS,

permanent visual impacts would be mitigated to less than significant for both of the build alternatives.

4.2.2.15 BIOLOGICAL RESOURCES (CEQA CHECKLIST QUESTIONS IV.A, IV.B, AND IV.C)

- a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or the U.S. Fish and Wildlife Service?**

Reference: Section 3.18.1.1, Section 3.19.3.1, Section 3.20.3.1, and Section 3.24.4.18

PLANT SPECIES

The only sensitive plant species identified in the Biological Study Area (BSA) was the southern tarplant. Southern tarplant was observed in three locations within the BSA during 2009 botanical surveys conducted during the blooming period for this species (May through November). The largest population consisted of approximately 9,000 plants just north of the I-710/Rosecrans Ave. interchange on the east side of I-710. Approximately 90 plants were found in sunny areas near the I-710/Atlantic Blvd. interchange, and six plants were found southeast of the I-710/ Interstate 405 (I-405) interchange.

Temporary and permanent impacts to populations of southern tarplant could result from implementation of either of the build alternatives. As proposed, the elevated structures associated with Alternative 7 would span the populations, creating some degree of permanent shade where sunny conditions currently exist. Since the southern tarplant is a sun-loving species, shading would be anticipated to result in a negative indirect impact to the portions of the populations lying below the proposed elevated structures.

As discussed in detail in Section 3.18.1.1, permanent impacts to this species cannot be avoided by the build alternatives. Alternative 5C would result in the loss of the two smaller populations of southern tarplant, and Alternative 7 would result in the loss of all three populations, including the largest population near the I-710/Rosecrans Ave. interchange. Minimization efforts are warranted to minimize disturbance to larger portions of the populations than are necessary to improve the I-710 Corridor. In order to mitigate for impacts to populations for any build alternative, it may be beneficial to relocate the affected southern tarplant populations from within the BSA to nearby protected open space areas in order to maintain these few remaining populations within the vicinity of the I-710 Corridor. Otherwise, to compensate for the loss of these populations, collection and scattering of seed in sunny areas with suitable soil and hydrologic conditions in the region, such as in areas adjacent to existing and remaining populations during the appropriate time of year, may improve the potential for populations of this species to remain stable in future years. For any build alternative, consultation with the California Department of Fish and Wildlife (CDFW) would be completed prior to any restoration effort.

For any build alternative, the Avoidance, Minimization, and Mitigation Measures outlined in Section 3.16, Natural Communities (NC-1), Section 3.18 Plant Species (PS-1), and Section 3.24, Construction Impacts (Measures CON-NC-1, CON-NC-2, CON-NC-4, CON-NC-6, CON-NC-8, CON-NC-11, CON-NC-12, CON-NC-13, CON-PS-1, and CON-INV-3), would be implemented to avoid and minimize impacts to southern tarplant. Measure NC-1 would require the preparation of a Habitat Mitigation Monitoring Plan (HMMP) that would comply with all terms and conditions set forth in the permits and opinions issued by the resource agencies, as well as annual monitoring and reporting of the success of the HMMP for a duration that would be established by resource agency permit conditions. Measure PS-1 states that the affected southern tarplant populations would be relocated from within the BSA to nearby protected open space areas in order to maintain these few remaining populations within the vicinity of the I-710 Corridor. Otherwise, to compensate for the loss of these populations, collection and scattering of seed in sunny areas with suitable soil and hydrologic conditions in the region, such as in areas adjacent to existing and remaining populations, during the appropriate time of year may improve the potential for populations of this species to remain stable in future years. For any build alternative, consultation with the CDFW would be completed prior to any restoration effort. The various measures related to potential construction impacts would also serve to reduce impacts to a less than significant level by requiring:

- The placement of highly visible barriers to prevent ground disturbance within environmentally sensitive areas (Measure CON-NC-1);
- Monitoring construction within the vicinity of estuarine and riparian/riverine habitats for the duration of the construction of either build alternative (Measure CON-NC-2);
- Development and implementation of a construction personnel education program to educate construction personnel on the environmental protection (Measure CON-NC-4);
- Prohibiting the use of toxic liquids (e.g., rodenticides, herbicides, and insecticides) in and adjacent to sensitive habitats and requiring monitoring by a qualified biologist when these toxic liquids would be used (Measure CON-NC-6);
- Preparing a construction SWPPP and soil erosion and sedimentation plan that would minimize erosion and protect water quality (Measure CON-NC-8);
- Requiring that maintenance, staging, and fueling activities be conducted in non-sensitive upland habitat areas located in strategic locations to prevent runoff and spills from entering sensitive habitats and waters of the United States (Measure CON-NC-11);
- Enforcing the proper use and disposal of oil, fuel, lead paint, antifreeze, and other toxic substances and ensuring that the storage of construction materials, equipment, debris, and waste would not occur in areas subject to tidal erosion and dispersion (Measure CON-NC-12);

- Implementation of measures to contain contaminated soils and material and removal of such soils and material to an approved disposal site (Measure CON-NC-13);
- Requiring a qualified biologist be present to monitor construction activities in the vicinity of smooth tarplant populations for the duration of construction of either build alternative to ensure compliance with all avoidance and minimization measures required to protect the species (Measure CON-PS-1); and
- Development of a weed abatement program to minimize the importation of nonnative plant material during and after construction and implementation of eradication strategies in the event an increase in invasive plant species occurs (Measure CON-INV-3).

ANIMAL SPECIES

Impacts to animal species as discussed in Section 3.19 are summarized below:

- There would be no permanent impacts to burrowing owl under any of the build alternatives because the location where burrowing owls were observed is not within the permanent project footprint of the build alternatives. Temporary impacts to burrows that could be used by the owls may result from all build alternatives. For any build alternative, implementation of the avoidance, minimization, and/or mitigation measures described in Section 3.24.4.16, Natural Communities (Measure CON-NC-1), and Section 3.24.4.19, Animal Species (Measure CON-AS-1) would ensure that temporary impacts to burrowing owl would be absent or minimal. Measure CON-NC-1 is described above in the discussion on tarplants. Measure CON-AS-1 would require monitoring by a biologist within the vicinity of burrowing owl locations (if present).
- The I-710 Corridor Project build alternatives are not expected to substantially affect long-term use of the structures by bats. There is no critical habitat for any bat species within the BSA; therefore, no critical habitat would be impacted by the build alternatives. Permanent impacts would be similar for either build alternative (Alternative 5C or 7), since the vast majority of structures housing or potentially housing bats, including the multiple bridge and culvert structures where roosting bats (including special-status bat species) and/or sign of roosting bats were observed during the focused surveys performed in 2009 and 2015, would be subject to impacts in all build alternatives. Indirect permanent issues associated with human encroachment, such as the introduction of nonnative species and trash, from either build alternative (Alternative 5C or 7) would permanently contribute to the degradation of foraging habitat (e.g., riparian/riverine vegetation) and would, therefore, result in permanent impacts to special-status bat species. Previously identified Measure NC-1 would reduce potential impacts to foraging habitat resulting from the build alternatives to a less than significant level.

Temporary impacts resulting from the build alternatives to special-status bat species would include temporary indirect disturbance (such as noise, vibration, dust, night lighting,

and human encroachment) from construction. In addition, construction of the build alternatives could temporarily impede access to roost sites (existing and future) in the crevices of bridges, culverts, and overhead structures. Only a portion of roosting habitat (existing and future) may be permanently altered by the I-710 Corridor Project build alternatives, and provision of alternative roosting habitat would serve to minimize or mitigate these impacts by avoiding net loss of roosting habitat. For any build alternative, the avoidance and minimization measures described in Section 3.24.4.19 (Measures CON-AS-6, CON-AS-7, CON-AS-8, CON-AS-9, CON-AS-10, and CON-AS-12) would ensure that temporary effects to bat species are absent or minimal from implementation of either of the build alternatives. For any build alternative, these measures would require preconstruction surveys at least one year in advance (in June or July) to determine presence or absence of bat species and potential roosting locations within the disturbance limits; installation of bat exclusion devices, between September 1 and November 30, where suitable roosting locations would be determined to be present to exclude bats from active work areas and/or humane evictions of bats if present; provision of alternate bat-roosting habitat structures prior to exclusion/eviction activities at a 1:1 ratio to ensure no net loss of roosting habitat; prohibiting tree removal or trimming during the bat maternity season (April 1–August 31); and, ensuring that removal of swallows nests, where some bats may roost, would be conducted in a manner so they would not fall to the ground and would be made available for inspection to determine they are not occupied.

- Permanent and temporary impacts to nonlisted special-status species could occur during construction of the build alternatives from temporary indirect disturbance (noise, vibration, dust, night lighting, and human encroachment) and loss of potential habitat. Impacts to these habitats are discussed in Section 3.16, Natural Communities. For any build alternative, measures described in Section 3.16, Natural Communities, and Section 3.24, Construction Impacts, would be implemented to avoid and minimize impacts to special-status animal species. Following implementation of these measures, impacts to non-listed special-status animal species from the build alternatives would be reduced to less than significant levels.
- New bridge structures, or significant changes to existing bridge structures, could result in occasional bird strikes and is considered to be a potentially significant impact of the build alternatives. The potential for bird-vehicle collisions resulting from the build alternatives cannot be quantified but is recognized as a potentially significant impact. However, for any build alternative, direct mortality is not expected with implementation of the proposed Measure AS-1 (see Section 3.19.4). With adherence to Measure AS-1, which would require that new structures be designed to ensure the safety of birds flying (e.g., provision of suitable fencing or other structures on the sides of bridges to direct birds up and out of the way of traffic), impacts from the build alternatives would be reduced to a less than significant level.

- Both build alternatives would include the construction of piers/support structures on the following bridges within the lower Los Angeles River that could affect California sea lions: the 7th St. Bridge, Anaheim St., Pacific Coast Hwy., Hill St., and Willow St. The percussive forces generated during any pile-driving activities may result in injury to California sea lions within and adjacent to the BSA, where estuarine habitat exists, as California sea lions occasionally forage within this habitat at these locations. The build alternatives may be able to drive the piles at a sound level less than the threshold that has been identified as harmful to marine mammals such as California sea lions. A sound level below 190 decibels (dB) re 1 micropascal (microPa) root-mean-square (rms) would not result in Level A harassment of pinnipeds and the onset of temporary threshold shift (TTS) in pinniped hearing (National Marine Fisheries Service [NMFS] 2003). The driving of the steel piles related to the build alternatives could exceed the Level A harassment levels if no attenuation methods are implemented. For any build alternative, use of appropriate attenuation methods during pile driving, such as bubble curtains or blocks, would be expected to reduce the sound pressure levels below the harassment level. The avoidance and minimization measures described in Section 3.9, Water Quality, for water quality protection; Section 3.16, Natural Communities, requiring the preparation of an HMMP that would comply with all terms and conditions set forth in the permits and opinions issued by the resource agencies; and Section 3.24, Construction Impacts (specifically Measures CON-TES-2, CON-TES-3, and CON-TES-4 in Section 3.24.4.20, which would require a biological monitor and minimal impact construction equipment and methods [e.g., a vibrating driver, crane, vibratory hammer, or hydraulic press] and sound level monitoring), would ensure that impacts from the build alternatives to California sea lion are less than significant. It should be noted that Alternative 5C may have a greater impact on the habitat (estuarine) within the BSA that could potentially be utilized by this species than Alternative 7. There is no critical habitat for this species within the BSA; therefore, no critical habitat would be impacted by the build alternatives.
- Both build alternatives would include construction of piers/support structures in tidal waters across the Los Angeles River at the 7th St., Anaheim St., Pacific Coast Hwy., Hill St., and Willow St. crossings. The percussive forces generated during pile-driving activities associated with the build alternatives may result in injury and death to fish within the impact area. Both the peak sound pressure level and the sound exposure level may result in damage to the auditory tissue of fishes or temporary hearing loss. Temporary hearing loss occurs at lower levels than auditory tissue damage and is dependent on the size of the fish, with smaller fish being affected at lower levels than larger fish. In addition to the direct impacts of hearing loss and auditory tissue damage, sound levels from pile driving associated with the build alternatives may also result in indirect impacts, such as the inability to avoid predators or detect prey and the inability to communicate or detect the environment. In addition to auditory tissue damage and temporary hearing loss, increased sound levels associated with pile driving related to the build alternatives may also affect

fish by causing physiological and anatomical damage. Nonauditory tissue damage may include capillary rupture in the skin, neurotrauma, eye hemorrhage, swim bladder rupture, and death of individual fish. Such impacts may be the result of single or repeated exposure to elevated sound levels. For any build alternative, the avoidance and minimization measures described in Section 3.24, Construction Impacts (specifically Measures CON-TES-1 through CON-TES-8 in Section 3.24.4.20, which would provide for the preparation of a Fisheries Management Plan if required by the NMFS, the presence of a biological monitor during pile-driving activities to monitor fish, minimal impact construction equipment and methods [e.g., a vibrating driver, crane, vibratory hammer, or hydraulic press] and sound level monitoring), would ensure that impacts to fishes resulting from the build alternatives are less than significant.

Additionally, under the build alternatives, numerous pilings would be required upstream of tidal waters in the freshwater areas of the Los Angeles River to accommodate improvements to other crossing structures. Fish moving through the river may be directly affected by bridge construction at the mouth of the Los Angeles River. While dewatering of the entire Los Angeles River would not occur, some minimal isolation of work (e.g., an air bubble curtain system or air-filled isolation casings around bridge support structures) may be required during bridge construction; this impact associated with the build alternatives would be temporary during the period of pile driving and bridge deck construction. Once the pile driving and bridge construction are complete, the bridges would not impede the movement of fish through the channel. Construction of the build alternatives on dry land would not be expected to impact fish, provided that sediments and construction materials are retained on land and measures are implemented to prevent the movement of soil, concrete, and other construction materials into the river channel. It should be noted that Alternative 5C may have a greater impact on the habitat (estuarine) within the BSA that could potentially be utilized by this species than Alternative 7. There is no critical habitat for any fish species within the BSA; therefore, no critical habitat would be impacted by the build alternatives.

- No permanent effects from the build alternatives would occur to essential fish habitat (EFH) except for a minimal permanent loss of channel bottom where the piles would be placed. During surveys conducted in October 2009, intertidal areas of riprap consisted of relatively low species diversity and included barnacles (*Balanus amphitrite* and *B. glandula*), mussels (*Mytilus galloprovincialis* and *Geukensia demissa*), a green algae (*Ulva* sp.), and filamentous red algae turf. Barnacles exist at the bridge abutments. No rooted eelgrass or kelp forests were observed in the BSA. Construction of the build alternatives would have a temporary effect on fish that inhabit the river during pile-driving operations and potential isolated dewatering activities. In addition to the injury and mortality that may result from pile driving and dewatering associated with the build alternatives, pile driving and dewatering would likely make the channel bottom in the vicinity of the bridges unsuitable for fish during these operations. This would be a

temporary loss of habitat, and no permanent impacts from the build alternatives would occur to the habitat except for a minimal loss of channel bottom where the piles would be placed. In addition, no permanent impacts would occur from dewatering activities, as dewatering materials would be removed upon completion of bridge construction.

THREATENED AND ENDANGERED SPECIES

Impacts from the build alternatives to threatened and endangered species as discussed in Section 3.20 are summarized below:

- Based on available data, southern California steelhead appears to be extirpated from the BSA. Steelhead are large highly mobile fish and would likely move out of the area if disturbed by construction activities (e.g., pile-driving) related to the build alternatives. Nonetheless, for any build alternative, in the unlikely event that steelhead are present in the BSA during construction, the mitigation measures outlined for fish in general (see the Measures noted above) should avoid and minimize potential impacts to this species. Alternative 5C may have a greater impact on the habitat (estuarine) within the BSA that could potentially be utilized by this species at this time than Alternative 7. The riverine habitat upstream of the estuarine habitat within the BSA is primarily concrete-lined and does not provide suitable habitat for steelhead. Impacts to estuarine habitat resulting from the build alternatives are discussed in Section 3.16, Natural Communities. For any build alternative, the avoidance and minimization measures described in Section 3.24, Construction Impacts (specifically Measures CON-TES-1 through CON-TES-4 in Section 3.24.4.20) would ensure that impacts to southern California steelhead are less than significant. During Section 7 consultation, NMFS concurred with Caltrans that the proposed action (the build alternatives) is not likely to adversely affect the endangered southern California steelhead designated critical habitats for this species.
- Although no green sea turtles were observed in the BSA, any green sea turtles that might visit the area around the mouth of the Los Angeles River could be affected indirectly by the build alternatives resulting from changes in water quality originating upstream. Such changes could involve increased pollution levels, increased turbidity, or impacts on the sea grasses and algae on which green sea turtles feed. However, for any build alternative, by implementing the avoidance and minimization measures outlined in Section 3.16, Natural Communities, no noticeable changes in water conditions would occur and impacts to green sea turtles would be less than significant. There is no critical habitat for this species within the BSA; therefore, no critical habitat would be impacted by the build alternatives. During Section 7 consultation, NMFS concurred with Caltrans that the proposed action (the build alternatives) is not likely to adversely affect threatened East Pacific green sea turtle and designated critical habitats for this species.
- The coastal population of western snowy plover could be affected indirectly by changes in water quality generated by the build alternatives. Such changes could involve increased

pollution levels, increased turbidity, or impacts on the invertebrates on which they feed. New bridge designs under the build alternatives could result in occasional bird strikes. However, for any build alternative, by following the avoidance and minimization measures outlined in Sections 3.16, Natural Communities, and 3.19, Animal Species, no noticeable changes in water conditions or bird strike frequency would occur and impacts would be less than significant. There is no critical habitat for this species within the BSA; therefore, no critical habitat would be impacted by the build alternatives.

Due to its larger footprint, Alternative 7 may have a greater impact on the habitats within the BSA that are utilized by this species than Alternative 5C.

- Least Bell's vireo could be impacted by noise, vibration, lighting, dust, and changes in riparian scrub habitat generated by the build alternatives within the Action Area. The small areas of riparian scrub habitat within the footprint of the build alternatives would not be expected to be occupied by the species as part of a breeding territory due to the fragmented and limited size of such areas, and the locations of these habitat areas adjacent to heavily trafficked urban land uses. Therefore, stressors related to the build alternatives on least Bell's vireo would consist of indirect effects to potentially suitable habitat areas, which would be limited to distinct portions of the Action Area that support riparian scrub habitat (e.g., Dominguez Gap and DeForest Park Wetlands, sparse riparian scrub within the Los Angeles River channel and Compton Creek). The permanent loss of riparian vegetation from the build alternatives in select areas (totaling 0.15 acre) would reduce the available foraging, dispersing, and cover habitat for least Bell's vireo in the Action Area; however, riparian habitats within the direct disturbance limits of the build alternatives already experience regular disturbance associated with existing traffic and urban land uses, and there are additional areas within the Action Area that provide for more suitable, less disturbed habitat.

Stressors associated with the build alternatives would represent limited temporary and permanent impacts to riparian habitats that were not occupied by least Bell's vireo during project surveys. Such minor effects would not appreciably diminish the value of suitable least Bell's vireo habitats in the Action Area.

- California Least Tern could be affected indirectly by changes in water quality generated by the build alternatives. Such changes could involve increased pollution levels, increased turbidity, or impacts on the fish on which they feed due to shading. New bridge designs could result in occasional bird strikes. However, for any build alternative, by following the avoidance and minimization measures outlined in Section 3.16 (Natural Communities), no noticeable changes in water conditions or bird strike frequency would occur. Furthermore, several avoidance and minimization measures identified in Sections 3.24.4.9 and 3.24.4.16 are identified to protect habitat associated with the California Least Tern and to maintain water quality for any build alternative. These measures would require a qualified biologist to be present during construction activities to monitor for special-status species.

This species is absent from California for more than half of the year. Other than potential long-term impacts on fish populations (California Least Tern's food source), there would be no potential impacts resulting from the build alternatives when the species is absent. For any build alternative, with adherence to the specified measures above, impacts would be less than significant. There is no critical habitat for this species within the BSA; therefore, no critical habitat would be impacted by the build alternatives.

For any build alternative, the HMMP (Measure NC-1) described in Section 3.16.4; Measure AS-1 described in Section 3.19.4; and Measures CON-AS-1 through CON-AS-10 described in Section 3.24.4 would reduce the impacts described above to a level below significance by imposing enforceable measures that would be incorporated into the design of either build alternative as well as the construction plans and specifications. These measures are consistent with the guidance provided in the *Technical Guidance for Assessment and Mitigation of the Hydroacoustic Effects of Pile Driving on Fish*.⁹

b) Will the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, and regulations or by the California Department of Fish and Wildlife or the U.S. Fish and Wildlife Service?

Reference: Section 3.16.3.2, page 3.16-6

For purposes of determining significance under CEQA, the build alternatives would have a substantial adverse effect if they would cause a permanent direct impact of such riparian habitat or other sensitive habitats.

As described in Section 3.16, two general natural community groups of concern were identified within the Study Area. These include estuarine habitat associated with the tidal waters of the lower three miles of the Los Angeles River and riparian/riverine habitats. The sensitive habitats are located primarily in the southern portion of the Study Area, where the Los Angeles River and associated wetlands have retained a natural state.

As described in Section 3.16, under the worst-case impact scenario, Alternatives 5C and 7 would result in direct permanent impacts to 0.18 acre or 0.11 acre, respectively, of estuarine habitat (earthen-bottom intertidal portions of the Los Angeles River) due to the construction of abutments and driving of piles, and a reduction in soft-bottom habitat as a consequence of the placement of piers and abutments. In addition to direct permanent impacts, Alternatives 5C and 7 would result

⁹ Caltrans. 2015. Division of Environmental Analysis and Environmental Engineering Hazardous Waste, Air, Noise, Paleontology Office. *Technical Guidance for Assessment and Mitigation of the Hydroacoustic Effects of Pile Driving on Fish*. November, Website: http://www.dot.ca.gov/hq/env/bio/files/bio_tech_guidance_hydroacoustic_effects_110215.pdf (accessed March 10, 2017).

in indirect permanent effects to 5.09 acres or 5.02 acres, respectively, of estuarine habitat. Indirect permanent effects would result from permanent shading associated with bridges or elevated roadways. In addition, construction of either build alternative may indirectly affect estuarine habitats permanently through enhancing the germination and proliferation of nonnative invasive plant species. Potential hydraulic effects would be associated with bridge modifications and the relocation of a segment of electrical transmission lines along the edge of the river, upstream. However, the proposed modifications under the build alternatives would mimic the existing pier configurations upstream and downstream, and there would not be substantial effects to the water surface elevation, velocity of flood flows, sedimentation, or scour in the vicinity of the new piers. Because there would be no substantial effects at the location of the modifications under the build alternatives, there would be no substantial effects to downstream locations, including the estuarine habitat.

The build alternatives would result in direct and indirect permanent impacts to riparian/riverine natural communities through disturbance and/or removal of existing vegetation. Furthermore, construction of either build alternative may indirectly affect riparian/riverine habitats permanently through shading of the areas below bridges or elevated roads and enhancing the germination and proliferation of nonnative invasive plant species. Permanent impacts to riparian/riverine habitats would be greater under Alternative 7 than under Alternative 5C. Alternative 7 would result in direct permanent effects to 10.69 acres and indirect permanent effects to 23.53 acres of riparian/riverine habitats. Alternative 5C would result in permanent direct impacts to 1.55 acres and permanent indirect impacts to 21.02 acres of riparian/riverine habitats.

The majority of the existing estuarine communities within Los Angeles County fall under the regulatory jurisdiction of the United States Army Corps of Engineers (USACE) pursuant to Section 10 of the Rivers and Harbors Act of 1899 and Section 404 of the Clean Water Act. Most of the impacts to USACE jurisdictional waters as a result of the I-710 Corridor Project build alternatives would occur to estuarine wetlands above the high tide line. Therefore, the impacts associated with the build alternatives would be primarily to waters under the jurisdiction of Section 404 and mitigation would occur under the Section 404 program. For any build alternative, the Minimization, Avoidance, and Mitigation Measure NC-1 described in Section 3.16.4 would reduce impacts from the build alternatives below a level of significance by providing for restoration and replacement of riparian habitats and sensitive natural communities.

- c) Will the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?**

Reference: Section 3.16.3.2 and Section 3.17.3.1

For purposes of determining significance under CEQA, the build alternatives would have a substantial adverse effect if they would cause a permanent direct impact of such wetlands or other sensitive habitats.

As discussed in Section 3.17, Wetlands and Other Waters, the build alternatives would result in direct and indirect impacts to USACE, Regional Water Quality Control Board (RWQCB), and CDFW jurisdictional waters. The worst-case impact scenario associated with Alternative 5C would potentially result in direct permanent impacts to approximately 1.74 acres and indirect permanent impacts to approximately 26.13 acres of USACE jurisdictional areas. In addition, Alternative 5C would potentially result in direct permanent impacts to approximately 2.13 acres and indirect permanent impacts to approximately 36.51 acres of CDFW jurisdictional areas. Furthermore, Alternative 5C would potentially result in direct permanent impacts to approximately 1.74 acres and indirect permanent impacts to approximately 26.29 acres of RWQCB jurisdictional areas.

The worst-case impact scenario associated with Alternative 7 would potentially result in direct permanent impacts to approximately 1.54 acres and indirect permanent impacts to approximately 28.56 acres of USACE jurisdictional areas. In addition, Alternative 7 would potentially result in direct permanent impacts to approximately 1.96 acres and indirect permanent impacts to approximately 42.20 acres of CDFW jurisdiction. Furthermore, Alternative 7 would potentially result in direct permanent impacts to approximately 10.80 acres and indirect permanent impacts to approximately 28.72 acres of RWQCB jurisdictional areas.

Existing or proposed wetland restoration areas identified in the BSA may be affected by the I-710 Corridor Project build alternatives. The Los Angeles County Department of Public Works identified the boundaries of County restoration areas (Rivera [December 30, 2009] and Su [January 11, 2009], personal communication). Two areas were found to overlap the limits of the BSA. The Dominguez Gap Wetlands would be impacted by the freight corridor proposed in Alternative 7. Furthermore, the BSA boundaries of all build alternatives overlap with the DeForest Treatment Wetlands, although within the BSA, none of the build alternatives are expected to permanently impact the DeForest Treatment Wetlands. However, construction within the Dominguez Gap Wetlands area would have permanent impacts.

For any build alternative, compensatory mitigation for jurisdictional waters, as specified in Section 3.16.4, Natural Communities, Avoidance, Minimization, and/or Mitigation Measures, including estuarine communities and riparian/riverine communities, would be required for USACE Section 404 and CDFW Section 1600 permitting. Typically, riparian/riverine and estuarine habitat subject to USACE and CDFW jurisdiction is mitigated at a minimum mitigation-to-impact ratio in excess of 1:1 for permanent effects and 1:1 for temporary effects, which is consistent with the USACE and CDFW policies for no net loss of riparian/riverine and estuarine habitat (e.g., wetlands). For any build alternative, compensatory mitigation may be in the form of habitat restoration and/or enhancement in on- or off-site areas where similar riparian/riverine and estuarine habitat exists,

or a monetary contribution toward an in-lieu fee program, as acceptable by the regulatory agencies. Impacts to USACE and CDFW jurisdictional waters from the build alternatives would be reduced to a less than significant level with the compensatory mitigation specified in Section 3.16.4.

4.22.16 CULTURAL RESOURCES (CEQA CHECKLIST QUESTION V.C)

c) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Reference: Section 3.11.3.1

Based on the discussion in Section 3.11.3, the Study Area crosses two deposits of Early to Late Pleistocene sediments, which are soils that have a high potential to include fossiliferous content. Therefore, it is possible that unknown paleontological resources may be disturbed during construction of the build alternatives. For any build alternative, Measure PAL-1, which would require the preparation of a Paleontological Mitigation Plan, including monitoring and resource recovery, would be included in the build alternatives to address this potential. With incorporation of this measure, potential impacts from the build alternatives would be reduced to a less than significant level.

4.22.17 GEOLOGY AND SOILS (CEQA CHECKLIST QUESTIONS VI.A.III AND VI.C)

a) Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

iii) Seismic-related ground failure, including liquefaction?

Reference: Section 3.10.2.4 and Section 3.24.3.10

Based on the discussion in Sections 3.10.2 and 3.24.3.10, both of the build alternatives would be subject to potential temporary and permanent impacts from landslides, liquefaction, and unstable soil types. The primary geologic and geotechnical constraints affecting the design and construction of the build alternatives include:

- Liquefaction and seismically induced settlement in areas of shallow groundwater and loose alluvial soils. Most of the Study Area is within an area identified as having the potential for liquefaction.
- Earthquake-induced slope instability associated with liquefaction in areas of moderate to high liquefaction potential and near slopes such as the Los Angeles River.

For any build alternative, these potential impacts would be minimized through implementation of safe construction practices and compliance with Caltrans and Cal-OSHA requirements. Additionally, for any build alternative, preparation of a design-level geotechnical report and quality

assurance/quality control plan, as specified in Measures GEO-1, and CON-GEO-1 would reduce geologic impacts. Therefore, geologic impacts to the build alternatives related to earthquakes, seismic shaking, liquefaction, landslides, and unstable soils would be less than significant with implementation of Measures GEO-1 and CON-GEO-1.

- c) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?**

Reference: Section 3.10.2.6 and Section 3.24.3.10

Most of the Study Area could be subject to subsidence and liquefaction. For any build alternative, Measures GEO-1 and CON-GEO-1, cited in Section 3.10.4 and 3.24.4.10, respectively, would require either build alternative to be developed to Caltrans' most current seismic design criteria, ensure that geotechnical/geologic recommendations are fulfilled, and would reduce impacts to a less than significant level.

4.22.18 HAZARDS AND HAZARDOUS WASTE (CEQA CHECKLIST QUESTION VIII.D)

- d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?**

Reference: Section 3.12.3.1 and Section 3.24.3.12

As described in Section 3.12 (see Tables 3.12-1, 3.12-2, 3.12-3, and 3.12-4), many listed sites were identified as having the potential to pose an environmental concern within the Study Area, including hazardous materials sites compiled pursuant to Government Code Section 65962.5. Considering the history and nature of activities conducted at some of the sites identified within the Study Area, contaminated groundwater may be encountered during construction of the build alternatives. Dewatering of contaminated groundwater during construction of either of the build alternatives could impair adjacent surface waters. As a result, for any build alternative, site investigations would be performed at all hazardous materials sites within the right-of-way of either build alternative to determine whether hazardous materials are present on site. Hazardous material spills associated with any acquired property would be removed and remediated prior to construction of either build alternative. With implementation of Measures HW-1 through HW-8 listed in Section 3.12.4 and Measures CON-HW-1 through CON-HW-3 listed in Section 3.24.4.12, impacts related to hazardous materials and hazardous wastes during construction of either build alternative and for the post- build alternative condition would be less than significant.

4.2.2.19 NOISE (CEQA CHECKLIST QUESTIONS XII.B)

The following two questions are addressed together:

- a) Would the project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?**
- c) Would the project result in a substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?**

Reference: Section 3.14

The Caltrans *Traffic Noise Analysis Protocol* (Protocol) specifies the policies, procedures, and practices to be used by agencies that sponsor new construction or reconstruction of Federal or Federal-aid highway projects. The Noise Abatement Criteria (NAC) specified in the Protocol are the same as those specified in 23 CFR 772. The FHWA NAC were established by considering: (1) hearing impairment, (2) annoyance, sleep, and task interference or disturbance, and (3) interference with speech communication. For example, the NAC for Activity Category B (Residential) establishes an exterior noise level of 67 L_{eq} (h) because this is the noise level at which hearing impairment, annoyance, sleep, and task interference or disturbance and interference with speech generally occurs. The Protocol defines a noise increase as “substantial” when the predicted noise levels under build conditions exceed existing noise levels by 12 dBA. The Protocol also states that a sound level is considered to approach an NAC level when the sound level is within one dB of the NAC identified in 23 CFR 772 (e.g., 66 dBA is considered to approach the NAC of 67 dBA, but 65 dBA is not). For this CEQA analysis, the federal NAC has been used as the “applicable standards of other agencies” referred to in Checklist question XII.A, and a 12 dBA increase in noise over existing levels is considered the “substantial permanent increase” per Checklist question XII.C.

Noise analysis for projects under CEQA centers on whether a proposed project or the proposed noise abatement would result in significant adverse environmental effects. Whether an increase in future noise level would result in a significant effect for purposes of CEQA is determined by comparing the existing noise level (or the Baseline environmental setting) to the predicted noise level with the project. The CEQA noise analysis is completely independent of the 23 CFR 772 noise analysis, which is centered on the federal noise abatement criteria. Under CEQA, the assessment entails looking at the setting of the noise impact and then how large or perceptible any noise increase would be in the given area. Key considerations include the uniqueness of the setting, the sensitive nature of the noise receptors, the magnitude of the noise increase, the number of residences affected, and the absolute noise level.

Land uses in the vicinity of the build alternatives vary and include residential, commercial, industrial, parks, recreation areas, and undeveloped land. Schools and medical facilities are

located throughout the Study Area. The existing ambient noise levels in the Study Area are between 46 and 79 dBA. As shown in Table 3.14-2 in Section 3.14, Noise, of this Final EIR/EIS, 17 receptors within the I-710 Study Area would experience a substantial noise increase of 12 dBA or more over existing noise levels for both build alternatives. Of the 17 affected receptors that would experience a substantial noise increase of 12 dBA, the greatest noise increase experienced reaches 16.6 dBA over existing conditions for Alternative 5C, and 16.9 dBA over existing conditions for Alternative 7. For any build alternative, soundwalls that are considered both reasonable and feasible would be constructed to minimize these impacts. Additionally, as part of the Early Action Soundwall Project, the Los Angeles County Metropolitan Transportation Authority (Metro) identified five miles of new soundwalls along I-710, plus an additional seven miles of existing soundwalls that can be aesthetically treated to match the new soundwalls.

For the 17 receptors that would be potentially exposed to increases in noise levels above 12 dBA, for any build alternative, the provision of new soundwalls under Alternative 5C and Alternative 7, as required by Measure N-1, would mitigate noise impacts along the I-710 freeway related to the build alternatives to a level below significance under CEQA. All proposed feasible and reasonable soundwalls included in the build alternatives would effectively attenuate noise levels at receiving receptors so that none of the receptors would experience an increase in noise levels above 12 dBA. As such, there would be no significant and unavoidable adverse noise impacts to any of the locations for either Alternative 5C or Alternative 7.

b) Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Reference: Section 3.14.4.1

For purposes of determining significance under CEQA, the Caltrans *Transportation- and Construction-Induced Vibration Guidance Manual* (September 2013) shows that the vibration damage threshold for continuous/frequent intermittent sources is 0.25 peak particle velocity (PPV) inches per second (in/sec) for historic and old buildings, 0.3 PPV in/sec for old residential structures, and 0.5 PPV in/sec for new residential structures. The same manual shows the vibration annoyance potential criteria to be barely perceptible at 0.01 PPV in/sec, distinctly perceptible at 0.04 PPV in/sec, strongly perceptible at 0.1 PPV in/sec, and severe at 0.4 PPV in/sec. Both of these criteria for damage and annoyance were used to evaluate short-term, construction-related groundborne vibration resulting from the build alternatives.

Because the rubber tires and suspension systems of trucks and other on-road vehicles provide vibration isolation, it is unusual for on-road vehicles to cause groundborne noise or vibration problems. When on-road vehicles cause effects such as rattling of windows, the source is almost always airborne noise. Groundborne vibrations are mostly associated with passenger vehicles and trucks traveling on roadways with poor conditions such as potholes, bumps, expansion joints, or other discontinuities in the road surface. Smoothing the bump or filling the pothole will usually

solve the problem. As the build alternatives would use new asphalt pavement followed with proper maintenance, there would be no potholes, bumps, expansion joints, or other discontinuities in the road surface that would generate groundborne vibration or direct or indirect noise impacts from vehicular traffic traveling on the I-710 freeway.

Vibration generated by construction equipment can result in varying degrees of ground vibration, depending on the equipment. The operation of construction equipment causes ground vibrations that spread through the ground and diminish in strength with distance. Buildings situated on soil near the active construction area respond to these vibrations, which range from imperceptible to low rumbling sounds with perceptible vibrations and slight damage at the highest vibration levels. Typically, construction-related vibrations do not reach vibration levels that would result in damage to nearby structures. However, old and fragile structures would require special consideration to avoid damage.

The build alternatives may require the use of pile drivers and other heavy-tracked construction equipment during construction. The Federal Transit Administration (FTA), in its *Transit Noise and Vibration Assessment* (FTA, May 2006), shows that a typical-impact pile driver would generate approximately 0.644 PPV in/sec when measured at 25 feet. It also shows that typical heavy-tracked construction equipment would generate approximately 0.003 to 0.089 PPV in/sec when measured at 25 feet.

Potential pile-driving activities related to the build alternatives would be located within existing channel or tidal waters and approximately 50 feet from the closest residence. The closest residence would be subject to a vibration level of 0.3 PPV in/sec. This vibration level is considered to be strongly perceptible and would have the potential to damage residential structures that are considered old, such as many of the structures that could be exposed to these vibration levels during construction activities of the build alternatives. Other construction equipment and activities associated with the build alternatives would generate vibration levels much lower than those of pile driving and heavy-tracked construction equipment and would therefore result in lower vibration levels at adjacent receiver locations. For any build alternative, with implementation of Measures CON-N-9 and CON-N-10 that would require pre-construction and post-construction surveys and alternatives to pile driving, respectively, for residential structures that are located 50 feet or closer from pile-driving activities, groundborne vibration levels generated by the build alternatives would be less than significant.

4.2.2.20 PUBLIC SERVICES (CEQA CHECKLIST QUESTION XIV.A)

- a) Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services:**

- **Fire protection?**
- **Police protection?**
- **Schools?**
- **Parks?**
- **Other public facilities?**

Reference: Section 3.3.1.3 and Section 3.4.1.1

As described in Sections 3.3 and 3.4, there are numerous public service facilities in the Study Area. The build alternatives would provide improved transportation facilities within the Study Area. As a result of improved traffic flow, the build alternatives would have beneficial effects for emergency service providers. The beneficial effects would allow fire, law enforcement, and emergency service providers to travel faster to emergency situations and move emergency equipment on the improved transportation network. The emergency service response times would be maintained or potentially improved.

Both build alternatives would require acquisition and relocation of the City of Vernon Fire Station No. 4. While a potential site for relocation of the existing fire station had not been identified at the time this document was prepared, should a build alternative be selected for any build alternative as the Preferred Alternative, Caltrans would be required to assist the City of Vernon in identifying a new site for relocation within the general vicinity of the existing station so as to maintain the existing response times and service area. In addition, the existing fire station would remain in use until the new fire station is operational.

Alternative 7 would result in direct impacts to the Multi-Service Center in the City of Long Beach. Alternative 7 would require acquisition and relocation of this facility due to the construction of freight corridor ramps at the I-710/Anaheim St. interchange. Alternative 5C would not directly or indirectly impact this facility.

Alternative 7 would also require the partial acquisition of the Salvation Army's Bell Shelter within the City of Bell and displacement of the transitional housing structures, as well as the full acquisition of the nearby S. Mark Taper Foundation Shelter Resource Bank, whose operations are interrelated to those of the Bell Shelter. Alternative 5C would avoid impacts to the Bell Shelter, but would require a partial acquisition of the Shelter Resource Bank. The acquisition would be along the western part of the property and would be limited to the area functionally used as loading docks at the far west end of the warehouse. During construction, the I-710 Corridor Project build alternatives have the potential to result in temporary impacts to access to this site along Rickenbacker Rd.; however, for any build alternative, a TMP would be prepared to minimize impacts and provide detours. These potential impacts would cease once construction of either build alternative was complete.

Measures C-1 through C-4 are identified to address acquisition and relocation impacts of the build alternatives. With implementation of these measures, impacts related to the build alternatives would be less than significant.

Direct impacts to law enforcement facilities and schools would not occur from the build alternatives. Impacts to park facilities within the Study Area are described below under Section 4.2.2.24, Recreation.

Indirect impacts from the build alternatives may occur to public facilities in the Study Area. These would include potential temporary access, noise, and aesthetic impacts that may occur during construction. Visual and noise construction impacts related to the build alternatives to the public facilities would be temporary and intermittent and would be less than significant. For any build alternative, the impact of temporary construction-related disruptions to freeway access and emergency service providers would be addressed through the TMP required by Measure CONTR-1. With implementation of this measure, potential emergency access constraints during construction of either build alternative would be less than significant.

4.2.2.21 RECREATION (CEQA CHECKLIST QUESTION XV.A)

a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Reference: Section 3.1.3 and Section 3.24.3.14

As discussed in Section 3.1.3, there are hundreds of parks and recreation facilities within the Study Area that are both publicly and privately owned. The build alternatives would also have the potential to result in direct and indirect impacts to several parks and recreation facilities, including Cesar E. Chavez Park, Parque Dos Rios, the Los Angeles River Trail, and the Rio Hondo Trail. The build alternatives would provide enhancements to Cesar E. Chavez Park in the City of Long Beach. The enhancements to this park would improve access to the park as well as provide for a larger contiguous recreation area. Construction impacts related to enhancement of this recreation facility are included in the construction analysis for the build alternatives, as discussed within this Final EIR/EIS. Several measures (PR-1 through PR-21) are identified to address potential direct and indirect impacts from the build alternatives to these recreational facilities described above. With implementation of these measures, impacts from the build alternatives to recreational facilities would be less than significant.

The build alternatives would provide improved transportation facilities within the Study Area, which may contribute to increased use of recreation facilities in the Study Area. However, the contribution of the build alternatives to increased use of recreation facilities would be very small compared to the contribution of the projected growth in the Study Area. A substantial physical deterioration of existing recreational facilities would not be expected to occur from implementation

of either build alternative. As a result, the build alternatives would result in a less than significant impact relative to increased use of existing recreation facilities.

4.2.2.2 UTILITIES AND SERVICE SYSTEMS (CEQA CHECKLIST QUESTION XVII.C)

c) Require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Reference: Section 3.8.3.1

On-site drainage systems include inlets, paved channels, and underground storm drain systems. While the proposed freeway improvements under all build alternatives may alter the location of existing pump stations and on-site flow patterns in localized areas, the confluence locations would remain in the general vicinity, and existing Los Angeles River outlets would be utilized whenever possible to minimize impacts to the river channel. The existing inflow drainage connections would be maintained and accommodated with the proposed on-site drainage systems under the build alternatives. Existing drainage patterns on the arterial streets would be maintained by utilizing existing underground drains wherever possible. Because, under the build alternatives, the existing alignment of the freeway would be shifted horizontally and/or vertically, most of the freeway pavement would be reconstructed on I-710, which would require reconstruction of most of the drainage systems. This would include both on-site systems and off-site systems within the proposed right-of-way of the build alternatives.

There are 37 existing drainage outlets impacted by the build alternatives. Of the 37 existing outlets identified, 27 would be protected in place under the build alternatives. The remaining outlets would require removal and reconstruction based on the physical impacts by the build alternatives or based on the need to increase hydraulic capacity of the outlet. Table 3.8-2 in Section, 3.8, Hydrology and Floodplain, lists the facilities requiring removal and reconstruction under the build alternatives.

There are 22 existing pump stations impacted by the build alternatives. Out of the 22 locations, 18 locations would require modification including upgrading facilities to accommodate projected peak flows, relocation due to proposed improvements of the build alternatives, or reconstruction due to freeway widening and/or profile changes under the build alternatives. For any build alternative, all pump stations located on the east side of the Los Angeles River would be protected-in-place during construction. Table 3.8-3 lists the name, location, and modifications for each pump station that would be affected by the build alternatives.

As described in Section 3.8.3.1, the build alternatives would require substantial reconstruction of the existing drainage systems including drainage inlets, storm drains, cross culverts, dikes, overside drains, concrete and earthen channels, pump stations, and detention basins. Most of the existing on-site drainage systems would be replaced with new facilities. Some existing

facilities may be extended to accommodate the wider freeway under the build alternatives. The existing Dominguez Gap Spreading Grounds located in the northeast quadrant of the I-710/I-405 interchange would not be impacted by the I-710 Corridor improvements associated with Alternative 5C, as there are no proposed improvements adjacent to the existing basin.

As discussed in Section 3.8.3.1, the Dominguez Gap Spreading Grounds/West Basin would be impacted by the freight corridor in Alternative 7. As discussed in additional detail in Measure FP-2, for any build alternative, discussions would be held with local agencies and cities for the relocation of the Dominguez Gap Spreading Grounds that could be used to mitigate for the loss in recharge areas. Measure FP-2, in Section 3.8, would require that prior to the completion of final design of Alternative 7, Caltrans would coordinate with the Los Angeles County Department of Public Works to identify suitable locations for replacement of the Interstate 105 (I-105) freeway retention basin and the Dominguez Gap Basin that would provide equal or greater capacity than the basins impacted by the freight corridor. Therefore, with implementation of Mitigation Measures FP-2, impacts associated with the construction of new basins for retention and groundwater recharge under the build alternatives would be reduced to less than significant.

4.2.2.3 MANDATORY FINDINGS OF SIGNIFICANCE (CEQA CHECKLIST QUESTION XVIII.A)

- a) Does the project have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?**

Both of the build alternatives would have the potential to degrade the environment as a result of impacts to natural communities, plant communities, and wetlands and other waters. Measures provided for these resources in Section 4.4, Mitigation Measures for Significant Impacts under CEQA, would reduce those impacts to below a level of significance.

4.2.3 UNAVOIDABLE SIGNIFICANT IMPACTS OF THE BUILD ALTERNATIVES

4.2.3.1 AIR QUALITY (CEQA CHECKLIST QUESTION III.B, III.C AND III.D)

- b) Violate any air quality standard or contribute substantially to an existing or projected air quality violation?**

Reference: Section 3.13.3

For purposes of determining significance under CEQA, the build alternatives would result in a potentially significant impact if they would result in the exceedance of Federal or State air quality standards.

Regional consistency with applicable State and Federal air quality standards is discussed in Section 3.13 and in the response to Checklist Question III.a above. Implementation of the SIP would bring the region into conformance with the applicable air quality standards. The analysis in Section 3.13 indicates that implementation of either of the build alternatives would not create a violation of applicable air quality standards.

The analyses in the *I-710 Corridor Air Quality, Greenhouse Gas, and Health Risk Assessment Technical Study* (AQ/GHG/HRA Technical Study) (June 2017), as summarized in Section 3.13, demonstrate that the build alternatives, compared to the 2012 Baseline, would generally not cause additional local exceedances for CO and particulates. However, the 8 percent to 9 percent increase in PM_{2.5} emissions along the I-710 freeway for Alternative 5C as compared to the 2035 No Build condition would fall within the range of the percent increase (5 to 26 percent) needed in the future annual average PM_{2.5} ambient concentrations to exceed the annual PM_{2.5} NAAQS. Hence, Alternative 5C may cause new violations of annual PM_{2.5} NAAQS. Additionally, Alternative 7 would increase the PM_{2.5} emissions from the I-710 freeway by 30 percent to 31 percent in 2035 when compared to the 2035 No Build condition. This increase would fall within the range of the percent of increase (5 to 34 percent) needed in the future PM_{2.5} ambient concentrations to exceed the PM_{2.5} NAAQS. As a result, the emission increases of the build alternatives may cause new violations of the 24-hour or annual PM_{2.5} NAAQS. The build alternatives may result in the violation of an air quality standard or contribute substantially to an existing or projected air quality violation; therefore, impacts resulting from the build alternatives are potentially significant and unavoidable.

c) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non- attainment under an applicable Federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Reference: Section 3.13

For purposes of determining significance under CEQA, the build alternatives would result in a potentially significant impact if, at the time of the analysis, the region was in nonattainment under applicable Federal or State ambient air quality standards and the build alternatives would contribute to such a designation.

According to the AQ/GHG/HRA Technical Study (June 2017), the Study Area would be in attainment with applicable air quality standards in design year 2035. In some cases, the build alternatives would increase the local emissions of such pollutants, although such an increase would be offset by reductions in congestion on other roadways and future background concentrations would be expected to be lower than the current background concentrations. Each of the build alternatives would result in lower NO_x (an ozone precursor), CO, PM_{2.5}, and VOC emissions when compared to the 2012 Baseline. Incremental SO₂ emissions decrease for each of the project alternatives compared to the 2012 Baseline (with the exception of Alternative 7,

which experiences an increase of one pound per day within the Study Area). The analysis in Section 3.13 demonstrates that the area would remain in attainment for most criteria pollutants. However, the overall decrease in exhaust $PM_{2.5}$ emissions for both build alternatives as compared to the 2012 Baseline would be greater than the sum of the increases in tire wear, brake wear, and entrained road dust emissions. As a result, total $PM_{2.5}$ emissions show decreases for the build alternatives when compared to the 2012 Baseline for all I-710 Corridor Project study areas. In the case of PM_{10} emissions, the increases in entrained road dust, tire wear and brake wear would far outweigh the decrease in exhaust PM_{10} . Therefore, there are increases in total PM_{10} emissions for both build alternatives when compared to the 2012 Baseline.

As such, the build alternatives may result in a cumulatively considerable increase in some criteria pollutants.

d) Expose sensitive receptors to substantial pollutant concentrations?

Reference: Section 3.13

CRITERIA AIR POLLUTANTS – CONSTRUCTION. The Study Area is in a nonattainment area for the one-hour and eight-hour ozone standards, annual and 24-hour $PM_{2.5}$ standards, and the PM_{10} 24-hour and annual CAAQS. The Study Area is in an attainment/maintenance area for the NO_2 and CO NAAQS and CAAQS and the $PM_{2.5}$ 24-hour NAAQS. As discussed in Section 3.13, peak daily construction emissions were analyzed for seven freeway segments along the 18-mile length of the improvements associated with the build alternatives. While construction for any build alternative, may or may not occur on different segments (or parts of these segments) over the same time interval, construction emissions were calculated for a “worst-case” scenario that assumed that construction would occur simultaneously in the seven segments to provide a conservative estimate of maximum peak daily emissions. Peak daily emissions associated with a single freeway segment were also analyzed. Two sets of emission estimates, one for the Baseline Compliance Scenario and the other for the All Best Available Control Technology (BACT) Scenario, were analyzed. The Baseline Compliance Scenario assumes that all construction equipment would be in compliance with ARB’s In-Use Off-Road Diesel Fueled Fleets Regulation, and the All BACT Scenario assumes that all construction equipment would meet ARB’s Tier 4-Final engine standards for off-road equipment.

The results of the analysis showed that for the worst-case construction scenario, peak daily emissions for Alternatives 5C and 7 would exceed SCAQMD CEQA significance thresholds for NO_x , CO, PM_{10} , $PM_{2.5}$, and VOCs for both the Baseline Compliance Scenario and the All BACT Scenario. Emissions of SO_x would not be exceeded under both scenarios. For a single freeway section, peak daily criteria air pollutant emission estimates for Alternatives 5C and 7 would be below SCAQMD CEQA significance criteria for all pollutants except total PM_{10} for both the Baseline Compliance and All BACT scenarios and NO_x for the Baseline Compliance Scenario

only. For any build alternative, actual construction phasing and scheduling could further reduce construction peak emissions.

For any build alternative, compliance with SCAQMD rules and regulations during construction would reduce construction-related air quality impacts from fugitive dust emissions and construction equipment emissions. In addition, the measures listed in Section 3.24.4.13 would address temporary air quality impacts resulting from the build alternatives.

While not adopting them, Caltrans has considered the SCAQMD CEQA significance thresholds in this analysis. While the measures listed in Section 3.24.4.13 reduce temporary air quality impacts related to the build alternatives, the short-term construction emissions would continue to exceed the SCAQMD's CEQA thresholds. The SCAQMD thresholds seek to limit daily emissions of pollutants from project sites. The only feasible additional mitigation measure that would further reduce emissions to levels below the SCAQMD thresholds would be to severely limit the total daily construction activity. However, such mitigation would have two additional adverse impacts:

- The construction period would be extended, thereby extending the period of local disruption from construction activities. Under a best-case scenario, using BACT technologies for construction, the build alternatives would take more than five times longer to construct.
- The costs of the build alternatives would increase due to the loss of economies of scale during construction and extended construction schedules. It is estimated that costs associated with the build alternatives would more than double.

Therefore, this additional mitigation was rejected since it would (1) create additional environmental impacts, and (2) substantially increase costs associated with the build alternatives. Therefore, the short-term impacts resulting from the build alternatives would be potentially significant and unavoidable.

CRITERIA AIR POLLUTANTS – OPERATION. Mass emissions of criteria air pollutants related to freeway/roadway traffic were calculated for the I-710 Corridor Project Study Area to determine the impact of the I-710 Corridor Project build alternatives on the surrounding area and region. The incremental regional traffic emissions of criteria pollutants for the South Coast Air Basin, the Area of Interest (AOI), and I-710 as compared to 2012 existing conditions is presented in Table 3.13-13 in Section 3.13, Air Quality. These comparisons are performed for each of the criteria pollutants and for the three project study areas (the South Coast Air Basin, the I-710 Study AOI, and the I-710, which include the freight corridor under Alternative 7). Each of the build alternatives would result in lower NO_x, CO, PM_{2.5}, and VOC emissions for all study areas when compared to 2012. NO_x, CO, and VOC emissions show decreases of 73 percent to 93 percent for the build alternatives when compared to the 2012 Baseline. These results indicate that a reduction in

emissions due to improved vehicle technology outpaces the increases in emissions resulting from increased vehicle volume in 2035.

Incremental SO₂ emissions decreased for each of the build alternatives in each study area, compared to 2012, with the exception of Alternative 7 in the I-710 Study Area, which increased by one pound per day.

Total PM₁₀ and PM_{2.5} emissions would consist of vehicle exhaust emissions, tire wear, brake wear, and entrained road dust emissions. The exhaust portion of PM emissions for all build alternatives follows a trend similar to the other criteria pollutants, showing decreases from 2012 Baseline PM₁₀ exhaust emissions. These reductions are primarily driven by cleaner heavy duty trucks in 2035 as compared to 2012 resulting from the implementation of ARB programs regulating truck and bus emissions.

The AQ/GHG/HRA Technical Study analysis identifies that the decrease in exhaust PM_{2.5} emissions for all build alternatives as compared to the 2012 Baseline would be greater than the sum of the increases in tire wear, brake wear, and entrained road dust emissions. As a result, total PM_{2.5} emissions show decreases for the build alternatives when compared to the 2012 Baseline for all I-710 Corridor Project study areas. In the case of PM₁₀ emissions, the increases in entrained road dust, tire wear and brake wear would far outweigh the decrease in exhaust PM₁₀. Therefore, the modeling results show increases in total PM₁₀ emissions for all the build alternatives when compared to the 2012 Baseline.

SO₂ emissions are formed by the conversion of fuel sulfur into SO_x during the combustion process. California already has ultra-low sulfur fuel standards in place. Therefore, there would be no significant change in the fuel sulfur content from 2012 to 2035. The analysis shows a 14 percent to 31 percent reduction in SO₂ emissions for the build alternatives as compared to the 2012 Baseline in all three I-710 Corridor Project study areas (except for Alternative 7 as compared to the 2012 Baseline on the I-710 freeway). These reductions are driven by the increased fraction of fuel efficient and electric vehicles in the light-duty fleet resulting from the implementation of the Pavley Standard. For the comparison of SO₂ emissions from the I-710 freeway for Alternative 7 to the 2012 Baseline, the increases in SO₂ emissions associated with the additional ZE/NZE trucks (assumed to be NZE for emission estimates) on the freight corridor cancels out the decreases seen in the light-duty vehicle fleet; therefore, there is no significant change in SO₂ emissions for this scenario.

Total PM_{2.5} emissions, which consist of vehicle exhaust emissions, tire wear, brake wear, and entrained road dust emissions, show mostly decreases on the freeways, arterials, and roadways in the AOI for the 2035 alternatives as compared to the 2012 Baseline. The only increases seen in these charts occur in the port areas and a portion of the I-710 north of I-10 where the proposed State Route 710 (SR-710) North Project would be located in 2035.

As shown in Table 3.13-13 in Section 3.13, while incremental emissions of NO_x, CO, VOCs, and SO_x would decrease for Alternatives 5C and 7 when compared to the 2012 Baseline, incremental emissions of PM₁₀ and PM_{2.5} for Alternatives 5C and 7 would increase when compared to the 2012 Baseline. Operational emissions of the build alternatives are attributable to vehicular emissions, which are controlled by ARB and EPA. Programmatic features to fund ZE/NZE trucks and provide a grant program to fund projects that would improve air quality and public health in the corridor are included in both build alternatives and described in Section 2.3.2.1, Common Features of the Build Alternatives.

For any build alternative, Caltrans would be committed to working with SCAQMD, ARB, and EPA to continue to develop data in the I-710 Corridor that would contribute to improved air quality planning and design in the future. As part of that commitment for any build alternative, funding would be provided for four new air quality monitoring stations within the I-710 Corridor, per Measure AQ-1. Additionally, to further reduce exposure of sensitive receptors to near roadway emissions, Caltrans would provide air filtration systems to all schools within 0.25 mile of the I-710 that currently lack air filtration systems, which is incorporated as Measure AQ-2 in Section 3.13.4. These measures would apply to both of the build alternatives. Despite the implementation of measures to address short-term and long-term air quality impacts associated with the build alternatives, impacts would remain significant and unavoidable.

MOBILE SOURCE AIR TOXICS. For purposes of determining significance under CEQA, any increase in Mobile Source Air Toxics (MSAT) concentrations at a sensitive receptor is considered significant.

The MSAT analysis provided in Section 3.13 presents MSAT incremental emissions for each of the build alternatives compared with the 2012 existing conditions (Baseline) for all study areas. This analysis focuses on the seven MSAT pollutants identified by the EPA as being the highest priority MSATs: acrolein, benzene, 1,3-butadiene, diesel particulate matter (DPM), formaldehyde, naphthalene, and polycyclic organic matter (POM). MSAT emission inventories for all project alternatives and baselines were developed for the I-710 Corridor Project study areas using the emission factors of non-criteria air pollutants in the South Coast Air Basin, I-710 Traffic Model data, and ARB and EPA speciation profiles for reactive organic gases (ROG), total organic gases (TOG), and PM_{2.5}. MSAT emission inventories for the I-710 freeway were also developed for the project alternatives and the Baseline conditions using the emission factors of non-criteria pollutants in Los Angeles County, post-processed traffic data, and ARB/EPA speciation profiles.

The existing I-710 Corridor has elevated levels of traffic congestion, elevated truck volumes, and several sensitive receptors located directly adjacent to the corridor; thus, existing MSAT emissions are already a concern in the Study Area. The analysis indicates there would be lower incremental MSAT emissions in the Study Area under the build alternatives relative to the existing Baseline conditions (2012) due to the improvement in traffic level of service (LOS) and the

reduction of delay at the intersections that would be improved by the build alternatives, as well as improvements that would result from stricter engine and fuel regulations issued by the EPA. Alternative 7 includes a separated freight corridor that is restricted to use by ZE/NZE trucks only, rather than conventionally powered trucks. Compared to 2012, reductions under Alternative 7 were approximately 1 percent greater than reductions under Alternative 5C. Both ZE/NZE trucks for Alternative 7, and ZE trucks in the ZE Design Option for Alternative 7 are assumed to be non-diesel vehicles. As a result, MSAT emissions estimates of diesel-fueled vehicles for these two build alternatives are identical and the results are identical.

While the MSAT analysis showed that there would be an overall reduction of MSAT emissions in the South Coast Air Basin and the I-710 AOI, the build alternatives would result in near-roadway incremental emissions concentrations in a few areas very near I-710 (particularly Alternative 7). Therefore, the long-term impacts of the build alternatives are potentially significant and unavoidable at these near-roadway locations.

These localized increases in emissions are the result of increased total traffic volumes on the facility. Further mitigation of these emissions is not feasible, since Caltrans does not control the emission characteristics of vehicles using the freeway. The forecast emissions take into account the planned reductions in MSAT emissions as promulgated by regulatory agencies with jurisdiction over MSAT emissions. Further reductions would require additional regulatory controls beyond the authority of Caltrans. Therefore, further mitigation by Caltrans is not technically feasible.

The build alternatives would substantially reduce the public health risk to residents in the South Coast Air Basin, the AOI, and near the I-710 freeway who are currently exposed to MSAT emissions.

As with criteria air pollutants, the greatest air toxic emission impacts occur along I-710. This occurs as the increased vehicle miles traveled (VMT) (all alternatives) and increased capacity (build alternatives) increase emissions along I-710, although improved mobility and less traffic on local roadways can decrease emissions in the larger AOI and South Coast Air Basin study areas. To address this, incremental health risk impacts (cancer risk and non-cancer acute and chronic hazard indices) resulting from emissions from the project alternatives were modeled. The MSAT emission estimates were used to calculate the incremental health risk impacts associated with traffic-related emissions on the I-710, consistent with the California Environmental Protection Agency (Cal/EPA) Office of Environmental Health Hazard Assessment (OEHHA) Air Toxics Hot Spots Program Risk Assessment guidance¹⁰ and the SCAQMD Risk Assessment Guidelines for

¹⁰ Office of Environmental Health Hazard Assessment (OEHHA). 2015. Notice of Adoption of Air Toxics Hot Spots Program Guidance Manual for the Preparation of Health Risk Assessments, March 6, 2015. Website: http://oehha.ca.gov/air/hot_spots/hotspots2015.html.

Assembly Bill (AB) 2588. DPM was used as a surrogate for calculating the cancer risk and chronic hazard index for diesel-fueled vehicles. Since DPM does not have an acute health impact, all other priority MSATs were used to estimate the acute health impacts of diesel-fueled vehicles. For non-diesel-fueled vehicles that do not emit DPM emissions, the cancer risk and hazard indices were estimated using all priority MSATs except for DPM. Because of various conservative assumptions made during the preparation of the Health Risk Assessment, it is only appropriate to use the results of the HRA to compare the relative impacts of the build alternatives.

Table 4.2-1, below, compares maximum relative health impacts between each of the project alternatives and the 2012 Baseline.

Table 4.2-1: Comparison of Incremental MSAT Health Risk Impacts for All Alternatives Compared to 2012

| Health Impact | Alt 1 vs. 2012 | Alt 5C vs. 2012 | Alt 7 vs. 2012 | SCAQMD Significance Threshold ¹ | Above Significance Criteria? |
|---|-------------------|--------------------|-------------------|--|------------------------------------|
| Cancer Risk (Risk in 1 million) | -7.26 | -7.31 | -7.40 | 10 in 1 million | No |
| Chronic Non-Cancer Hazard Index (unitless) | -0.00196 | -0.00198 | -0.00198 | 1.0 (hazard index) | No |
| Acute Non-Cancer Hazard Index (unitless) | -0.00118 | -0.00145 | -0.00174 | 1.0 (hazard index) | No |

¹ The SCAQMD significance thresholds are presented for information only.

Alt = Alternative

MSAT = Mobile Source Air Toxics

SCAQMD = South Coast Air Quality Management District

Cancer risk and non-cancer risk would decrease in residential areas and at sensitive receptors¹¹ (e.g., schools, hospitals, and daycare and elder care centers) for all build alternatives when compared to the 2012 Baseline, with the greatest reductions generally occurring in Alternative 7.

When compared to the 2035 No Build scenario, both 2035 build alternatives predominantly display decreases in cancer risk with some increases within 110 yards of the I-710 freeway. For Alternative 7, the increase in risk is less than one in one million. For Alternative 5C, the maximum increase in risk is approximately three in one million. Nearer to the northern terminus of the project in East Los Angeles, there are some small areas in which incremental cancer risk would increase up to one in one million; many of these areas are within the limits of the proposed roadway associated with the build alternatives, and human exposure would be short-lived and transitory. One sensitive receptor in the community of East Los Angeles, Humphreys Avenue Elementary School, near S. Ford Blvd. and S. Humphreys Ave., would be subject to an increase in cancer

¹¹ Receptors on the Los Angeles River were excluded from the incremental residential cancer risk assessments.

risk of up to one in one million under Alternative 5C. Please refer to Figures 3.3-6 and 3.3-9 in Section 3.3, Community Impacts, in this Final EIR/EIS, for larger-scale contour maps of cancer risk for Alternatives 5C and 7.

DESIGN OPTION 7ZE. Figures F-7-1 and F-7-2 (provided in Appendix Q of this Final EIR/EIS) show comparisons of the maximum incremental cancer risk (MICR), chronic health index (CHI), and index for acute health hazard (IAH) impacts for the ZE Design Option for Alternative 7 as compared to the 2012 Baseline and the No Build (Alternative 1). As shown in these figures, there would be little change in maximum incremental health risk impacts of Alternative 7-ZE when compared to Alternative 7.

4.232 LAND USE AND PLANNING (CEQA CHECKLIST QUESTIONS X.A)

a) Physically divide an established community?

Reference: Section 3.3

Alternative 5C would result in physical changes in the Study Area; however, the existing community character and cohesion for the affected communities would remain intact, except for one mobile home park in the City of Compton. Alternative 7 would result in impacts to community cohesion similar to those that would result from Alternative 5C; however, additional impacts to the community would result from implementation of Alternative 7 due to the increased right-of-way required for the four-lane freight corridor. The analysis in Section 3.3 discusses significant adverse effects to communities as a result of Alternative 7 that cannot be mitigated (dependent on the alternative) to a level below significance, as described below.

- Within the City of Commerce, Alternative 7 would result in adverse impacts to community character and cohesion as a result of relocations in the Ayers and Sydney neighborhoods and similar impacts would also occur under Alternative 7, Design Option 1B. Due to the shift east to accommodate construction of the four-lane freight corridor requiring additional right-of-way under Alternative 7, Design Option 1B, there would be several residential displacements within the Ayers and Sydney neighborhoods. Therefore, under Alternative 7, including Design Option 1B, adverse impacts to community character and cohesion and impacts associated with physically dividing an established community in the City of Commerce would be potentially significant and unavoidable.
- In the City of Bell, several commercial/industrial parcels and one residential parcel would be fully acquired under Alternative 7. Many of the acquired properties are vital community facilities that would need to be relocated under Alternative 7. Therefore, under Alternative 7, adverse impacts to community character and cohesion and impacts associated with physically dividing an established community in the City of Bell would be potentially significant and unavoidable. Several residential and nonresidential acquisitions

would be required with construction of Alternative 7 resulting in the relocation of existing residents, businesses, and employees.

- In the City of Long Beach, there would be adverse impacts to community character and cohesion as a result of relocations of residents, businesses, and/or vital community facilities under Alternative 7. Therefore, under Alternative 7, adverse impacts to community character and cohesion and impacts associated with physically dividing an established community in the City of Long Beach would be potentially significant and unavoidable.
- In Compton, one mobile home park located on Atlantic Ave. would be partially impacted under both build alternatives and would require the permanent relocation of five mobile homes. Mobile home communities are typically very cohesive neighborhoods; thus, the build alternatives would have an impact to community cohesion for this mobile home community in Compton. For any build alternative, Housing of Last Resort¹² may have to be considered for relocating the affected residential properties such as mobile homes. Adequate relocation resources for mobile homes in particular did not exist within the Study Area at the time this report was prepared. There are limited relocation opportunities within the Study Area for mobile homes (assuming they preferred to remain in a mobile home); therefore, this impact is considered significant and unavoidable under both build alternatives.

4.2.3.3 POPULATION AND HOUSING (CEQA CHECKLIST QUESTIONS XIII.B AND XIII.C)

The following two questions are addressed together.

- b) Would the project displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere?**
- c) Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?**

Reference: Section 3.3.1.3

¹² The Urban Redevelopment Authority (URA) requires that comparable decent, safe, and sanitary replacement housing within a person's financial means be made available before that person may be displaced. When such housing cannot be provided by using replacement housing payments, the URA provides for "housing of last resort." Housing of last resort may involve the use of replacement housing payments that exceed the URA maximum amounts. Housing of last resort may also involve the use of other methods of providing comparable decent, safe, and sanitary housing within a person's financial means. Refer to §49 CFR 24.404 and Chapter 3 of the U.S. Housing and Urban Development (HUD) Handbook 1378 for more information (Website: https://portal.hud.gov/hudportal/HUD?src=/program_offices/comm_planning/affordablehousing/training/web/relocation/lastresort, accessed February 20, 2017).

As described in Section 3.3.1.3, Community Impacts, the build alternatives would result in the acquisition of existing residential uses and the relocation of occupants of those residential uses. For any build alternative, Last Resort Housing may be required for relocation of residents with special needs, such as low-income, elderly, and handicapped residents. Additionally, for any build alternative, special assistance may be needed to relocate smaller or marginal businesses and minority businesses that need to be located next to a specific customer base. As described in Section 3.3.1.3, while adequate comparable replacement housing appeared to exist presently (at the time this report was prepared) in neighboring cities, should a build alternative be selected for any build alternative as the Preferred Alternative, new replacement dwellings under Last Resort Housing may be considered for these cities as a method of providing comparable replacement housing to displaced persons who reside in areas where the replacement housing is low. Last Resort Housing would be considered in response to the affected cities' request to keep housing within their cities rather than having the replacement housing be in neighboring cities.

Within the Study Area, Alternative 5C and the Design Options would result in a total of between 109 and 128 residential relocations and 157 and 165 nonresidential relocations. Alternative 7 and the Design Options would result in a total of between 121 and 140 residential and between 206 and 213 nonresidential displacements, depending on the design option. Under all build alternatives, the City of Commerce would experience the most residential relocations. All design options under Alternative 5C would necessitate the relocation of 58 residences within the City of Commerce, and Alternative 7 would necessitate the relocation of between 58 and 73 residences, depending on the design option. Additionally, Alternative 5C in the City of Commerce would result in 39 or 40 nonresidential relocations, depending on the design option, and Alternative 7 and the Design Options would result in 44 nonresidential relocations. The build alternatives would result in a greater impact to retail and service businesses than any other type of business. Some of these displaced residences are in areas where there is insufficient replacement housing available, such as the Ayers neighborhood in the City of Commerce and the mobile homes in the City of Compton. Therefore, for any build alternative, it may not be possible to relocate all displaced residents within their community or within an area within reasonable proximity to their community. For this reason, for any build alternative, construction of replacement housing in the Cities of Commerce and Compton may be necessary. Therefore, impacts from the build alternatives related to the displacement of existing housing and people necessitating the construction of replacement housing are potentially significant and unavoidable.

4.2.3.4 TRANSPORTATION AND TRAFFIC (CEQA CHECKLIST QUESTIONS XVI.A AND XVI.B)

The following two questions are addressed together:

- a) Conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?**
- b) Conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?**

Reference: Section 3.5.3.1

For the purposes of the CEQA traffic analysis, levels of service (LOS) were examined on I-710 to determine if the build alternatives would result in additional segments of unacceptable LOS (LOS E or worse) relative to existing travel conditions.

The build alternatives would provide additional capacity to address projected traffic volumes, improve traffic safety by removing existing design deficiencies, and provide infrastructure to address the projected growth in population, employment, and activities related to goods movement in the Study Area.

As described in the *Traffic Operations Analysis Report* (March 2017), existing traffic count data for the traffic study area were collected in spring of 2013 and 2014 as well as collected from available sources. Traffic conditions for Baseline/Existing (2012/2013) and Design Year 2035 were analyzed to determine LOS without the I-710 Corridor Project build alternatives.

In the case of the I-710 Corridor Project build alternatives, the proposed improvements would constitute a significant increase in capacity over the existing 2012/2013 Baseline condition.

Figures 4.2-1 and 4.2-2 provide a summary comparison of the existing conditions to the Year 2035 conditions with the build alternatives.

As shown in the *Traffic Operations Analysis Report* (2017), in the existing condition:

- **I-710 Northbound Direction:** 19 basic, ten weaving segments, and four merge or diverge segments currently operate at unsatisfactory LOS E or F in the existing condition.

FIGURE 4.2-1

This page intentionally left blank

- **I-710 Southbound Direction:** 26 basic, seven weaving segments, and 21–35 percent of the merge or diverge segments currently operate at unsatisfactory LOS E or F in the existing condition.

There are several deficient segments on the mainline in the existing condition. The improvements to I-710 would increase capacity under both alternatives, which would maintain or improve LOS on many of the freeway basic, weave, and merge/diverge segments under the build alternatives. As such, the build alternatives would not have adverse impacts on I-710 traffic. The roadway segment analysis is provided in the *Intersection Traffic Impact Analysis Report* (2017). The following is a summary of the roadway segments that would experience volume-to-capacity (v/c) ratios approaching or exceeding the available capacity and operating at LOS E or F with the build alternatives. Under Alternative 5C, 35 roadway segments would operate at LOS E or F. Under Alternative 7, 35 roadway segments would operate at LOS E or F.

The build alternatives would not measurably alter roadway operations within the Study Area. This is because improvements cause less I-710 traffic to be diverted onto local arterials under the I-710 Project Corridor build alternatives.

As indicated in the traffic analysis, deficiencies were present in the existing (2012/2013) condition at ramps and existing interchanges at four ramp interchanges during the p.m. peak hour. However, it should be noted that several ramp interchanges along the corridor were not analyzed under the existing (2012/2013) conditions since they were operating on low-speed cloverleaf designs that do not have controlled intersections to be analyzed.

Under build alternative conditions, all interchanges and ramps would be improved along the I-710 Corridor between Ocean Blvd./Harbor Scenic Dr. and Washington Blvd. The build alternatives would add capacity and operational efficiency as compared to existing conditions, which would lead to improved LOS and operations as well as improved safety. Additionally, Alternative 7 includes a new freight corridor interchange connection at Slauson Ave., which would be located between existing interchanges at Florence Ave. and Bandini Blvd.

An analysis of the Study Area intersections is provided in the *Intersection Traffic Impact Analysis Report* (2017). The following summary describes the 2012/2013 existing intersection operations for the a.m., midday, and p.m. peak hours. It should be noted that fewer intersections were evaluated in the midday peak hour due to the lack of available midday peak-hour traffic count volumes at many intersections. The total number of intersections with poor LOS E or F under existing conditions is shown below:

- **Morning Peak Hour:** 18 of 172 (10 percent) under existing conditions
- **Midday Peak Hour:** three of 158 (5 percent) under existing conditions
- **Evening Peak Hour:** 36 of 172 (21 percent) under existing conditions

As shown in the *Traffic Impact Analysis Report* (2017), the interchange intersection LOS under Alternatives 5C and 7 would generally improve when compared to the No Build conditions. As described in Section 3.5, implementation of the build alternatives would result in a significant project impact at 42 intersections in the Study Area. These impacted intersections are projected to operate at LOS E or F, and the intersection delay is projected to increase under the build alternatives for most affected intersections (in some cases, delay is improved although the LOS would remain deficient). To mitigate the impact of the build alternatives on these intersections, for any build alternative, Measure TR-1, as identified in Section 3.24.4.5, would be implemented. Implementation of this measure would reduce impacts to the 42 impacted intersections to a less than significant level at all but four intersections.

The LOS and/or intersection delay on the Study Area intersections would generally be maintained or improved during the peak hours in 2035 under the build alternatives compared to the No Build (Alternative 1). However, there would be degradation in LOS with the build alternatives at some locations.

Based on the arterial intersection LOS analysis, 42 Study Area intersections have been identified as being adversely impacted by the build alternatives. Intersections that would be impacted by each of the build alternatives are summarized in Section 3.5, Traffic, in Table 3.5-22. As this table shows, 32 intersections would be impacted under Alternative 5C, 30 would be impacted under Alternative 7, and 22 intersections would be impacted under both Alternatives 5C and 7. Mitigation measures to improve these impacted locations, for any build alternative, are described in Section 3.5, Traffic.

Four intersections within the Study Area would operate at unacceptable LOS (E or F) as a result of the build alternatives; however, mitigation measures have not been recommended at these intersections because mitigation would be infeasible due to right-of-way constraints and other limitations identified during coordination meetings with the staff of the affected cities. These intersections include the following: Pacific Coast Hwy./Long Beach Blvd., Willow St./Atlantic Ave., 37th St./Santa Fe Ave., and Pacific Coast Hwy./Harbor Ave.

The four intersections listed above would be adversely impacted by the build alternatives and would not meet the LOS standard of LOS D or better. Therefore, the I-710 Corridor Project build alternatives would have a potentially significant unavoidable impact on traffic at these four intersections.

4.2.3.5 MANDATORY FINDINGS OF SIGNIFICANCE (CEQA CHECKLIST QUESTION XVIII.B AND C)

The build alternatives, when combined with other cumulative projects, would contribute to cumulative impacts related to air quality, aesthetics, land use and planning, noise, population and housing, and transportation and traffic. The build alternatives would not contribute to cumulative adverse impacts related to agricultural resources, biological resources, geology and soils,

hazards and hazardous waste, hydrology and water quality, mineral resources, public services, recreation, or utilities and service systems.

The proposed build alternatives would result in unavoidable significant impacts related to air quality, land use and planning, population and housing, and transportation and traffic. Based on the analysis of potential mitigation for these impacts provided in Chapter 3.0, there is no feasible mitigation to avoid or reduce these impacts while still achieving the project goals and objectives. Therefore, the build alternatives would have direct and indirect adverse impacts on human beings that cannot be mitigated to a level below significance.

4.2.4 SIGNIFICANT IRREVERSIBLE ENVIRONMENTAL CHANGES

Section 3.22 (Relationship between Local Short-Term Uses of the Human Environment and the Maintenance and Enhancement of Long-Term Productivity) and Section 3.23 (Irreversible and Irretrievable Commitments of Resources that would be Involved in the build alternatives) describe the potential long-term commitments of resources if a build alternative is implemented. Construction of the build alternatives would result in long-term and permanent commitments of natural, physical, human, and fiscal resources. Land acquired for the build alternatives would be permanently committed to a transportation use and would no longer be available for residential, nonresidential, historical resource, or other uses. Other permanent environmental changes associated with the build alternatives would include increased noise levels, increased nighttime lighting, altered viewsheds, consumption of construction materials and energy, permanent impacts to wetlands and other natural communities, removal of residential and nonresidential uses, and the loss of a park (Parque Dos Rios) as a result of Alternative 7.

4.3 IDENTIFICATION OF THE ENVIRONMENTALLY SUPERIOR ALTERNATIVE

CEQA requires the identification of an Environmentally Superior Alternative. The *State CEQA Guidelines* Section 15126.6(e)(2) requires that if the No Project Alternative is the Environmentally Superior Alternative, then the EIR shall also identify an Environmentally Superior Alternative among the other alternatives. Table 4.3-1, below, provides, in summary format, a comparison of the level of impacts for each alternative to the I-710 Corridor Project.

The No Build (Alternative 1), which is has been identified as the Preferred Alternative, has the least impact to the environment because it would require less construction activities than the proposed project build alternatives. While the Preferred Alternative (the Alternative 1 - No Build) Alternative would lessen or avoid the impacts of the proposed project, the beneficial impacts of the proposed project build alternatives—including the provision of new overcrossings to increase connectivity—would not occur, and none of the following project objectives would be met:

- Improve air quality and public health
- Improve traffic safety

Table 4.3-1: Comparison of the Environmental Impacts of the I-710 Corridor Project to the Project Alternatives

| CEQA Environmental Topic | Alternative 5C: I-710 Widening and Modernization | Alternative 7: I-710 Widening and Modernization Plus Freight Corridor (Zero-Emission Vehicles) | No Build (Alternative 1): No Build Alternative (Preferred Alternative) |
|--|---|---|---|
| Aesthetics | Less Than Significant with Mitigation | Less Than Significant with Mitigation, but impacts are greater in magnitude | No Impact |
| Agriculture and Forestry Resources | No Impact | No Impact | No Impact |
| Air Quality | Significant and Unavoidable | Significant and Unavoidable | No Impact |
| Biological Resources | Less Than Significant with Mitigation | Less Than Significant with Mitigation, but impacts are greater in magnitude | No Impact |
| Cultural Resources | Less Than Significant | Less Than Significant | No Impact |
| Geology and Soils | Less Than Significant with Mitigation | Less Than Significant with Mitigation | No Impact |
| Global Climate Change and Greenhouse Gas Emissions | Less Than Significant | Less Than Significant | No Impact |
| Hazards and Hazardous Materials | Less Than Significant with Mitigation | Less Than Significant with Mitigation | No Impact |
| Hydrology and Water Quality | Less Than Significant with Mitigation | Less Than Significant with Mitigation, but impacts are greater in magnitude | No Impact |
| Land Use | Less Than Significant | Significant and Unavoidable | No Impact |
| Mineral Resources | No Impact | No Impact | No Impact |
| Noise | Less Than Significant with Mitigation | Less Than Significant with Mitigation | No Impact |
| Paleontological Resources | Less Than Significant with Mitigation | Less Than Significant with Mitigation | No Impact |
| Population and Housing | Significant and Unavoidable | Significant and Unavoidable, but impacts are greater in magnitude | No Impact |
| Public Services | Less Than Significant with Mitigation | Less Than Significant with Mitigation, but impacts are greater in magnitude | No Impact |
| Recreation | Less Than Significant | Less Than Significant | No Impact |
| Traffic | Significant and Unavoidable | Significant and Unavoidable | No Impact |
| Utilities and Service Systems | Less Than Significant with Mitigation | Less Than Significant with Mitigation | No Impact |
| Attainment of project objectives | Meets a majority of the project objectives. Would not meet Objectives 3 and 4, and would only partially meet Objective 1. | Meets a majority of the project objectives. Would not meet Objectives 3 and 4. | Meets none of the project objectives |

Source: Compiled by LSA (January 2019).

- Modernize freeway design
- Accommodate projected traffic volumes
- Address increased traffic volumes resulting from projected growth in population and employment, and economic activities related to goods movement

In addition, the beneficial impacts of the build alternatives in relation to response to Assembly Bill (AB) 617 will not occur under the No Build (Alternative 1). Under AB 617 (C. Garcia, Chapter 136, Statutes of 2017), CARB established the Community Air Protection Program (CAPP or Program). The Program's focus is to reduce exposure in communities most impacted by air pollution.

As described in Section 3.22, implementation of either build alternative would result in attaining short-term and long-term transportation objectives at the expense of some short-term economic impacts and some long-term social, aesthetic, and land use impacts. However, all impacts and benefits are the same for either build alternative with the exception of potential impacts related to disruption to the use of recreational amenities. Impacts identified at Parque Dos Rios would include a partial acquisition and temporary construction easement under Alternative 5C, while Alternative 7 would result in a full acquisition of this park. Additionally, Alternative 7 would require the relocation of the Compton Homing Pigeon Club which would not be required under Alternative 5C. This impact is identified under the CEQA environmental topic of Population and Housing as it relates to displacement of recreational amenities. The No Build (Alternative 1) would not result in the construction and therefore, the No Build (Alternative 1) would not provide the benefits of the reduced travel times and improved efficiency for the movement of vehicles, people, and goods that would result from implementation of either of the build alternatives

Section 3.23 identifies the following irreversible and irretrievable commitment of resources that are attributable to both build alternatives: paleontological resources, archaeological resources, estuarine habitat, riparian/riverine habitat, jurisdictional waters, and construction materials. The No Build Alternative would not result in any construction and would not result in the irreversible and irretrievable commitment of resources identified for the build alternatives.

For the purposes of this analysis, Alternative 5C is the basis upon which the assessment of environmental superiority is determined. Of the two build alternatives, With the exception of the No Build Alternative, the Environmentally Superior Alternative would be Alternative 5C, the I-710 Widening and Modernization Alternative. This alternative would have the least environmental impact when comparing the two build alternatives. Although Alternative 7 would achieve all of the project objectives identified above, due to the larger footprint associated with this alternative, some impacts would be greater in magnitude when compared to Alternative 5C. There are no impacts under Alternative 5C that are reduced in significance or reduced in magnitude when compared to Alternative 7. The Preferred Alternative (the Alternative 1 – No Build Alternative) would be less environmentally impactful than either of the Build Alternatives and is thus the Environmentally Superior Alternative of the three alternatives.

4.4 CLIMATE CHANGE

Climate change refers to long-term changes in temperature, precipitation, wind patterns, and other elements of the earth's climate system. An ever-increasing body of scientific research attributes these climatological changes to greenhouse gases (GHGs), particularly those generated from the production and use of fossil fuels.

While climate change has been a concern for several decades, the establishment of the Intergovernmental Panel on Climate Change (IPCC) by the United Nations and World Meteorological Organization in 1988, has led to increased efforts devoted to GHG emissions reduction and climate change research and policy. These efforts are primarily concerned with the emissions of GHGs related to human activity that include carbon dioxide (CO₂), methane (CH₄), nitrous oxide (N₂O), tetrafluoromethane, hexafluoroethane, sulfur hexafluoride, and various hydrofluorocarbons (HFCs). CO₂ is the most abundant GHG; and while CO₂ is a naturally occurring component of the Earth's atmosphere, fossil fuel combustion is the main source of additional, human-generated CO₂.

Two terms are typically used when discussing how the impacts of climate change are addressed: "Greenhouse Gas Mitigation" and "Adaptation." "Greenhouse Gas Mitigation" covers the activities and policies aimed at reducing GHG emissions to limit or "mitigate" the impacts of climate change. "Adaptation" on the other hand, is concerned with planning for and responding to impacts resulting from climate change (such as adjusting transportation design standards to withstand more intense storms and higher sea levels). This analysis will include a discussion of both.

4.4.1 REGULATORY SETTING

This section outlines Federal and State efforts to comprehensively reduce GHG emissions from transportation sources.

4.4.1.1 FEDERAL

To date, no national standards have been established for nationwide mobile-source GHG reduction targets, nor have any regulations or legislation been enacted specifically to address climate change and GHG emissions reduction at the project level.

The National Environmental Policy Act (NEPA) (42 USC Part 4332) requires federal agencies to assess the environmental effects of their proposed actions prior to making a decision on the action or project.

The Federal Highway Administration (FHWA) recognizes the threats that extreme weather, sea-level change, and other changes in environmental conditions pose to valuable transportation infrastructure and those who depend on it. FHWA therefore supports a sustainability approach that assesses vulnerability to climate risks and incorporates resilience into planning, asset

management, project development and design, and operations and maintenance practices.¹³ This approach encourages planning for sustainable highways by addressing climate risks while balancing environmental, economic, and social values—“the triple bottom line of sustainability.”¹⁴ Program and project elements that foster sustainability and resilience also support economic vitality and global efficiency, increase safety and mobility, enhance the environment, promote energy conservation, and improve the quality of life.

Various efforts have been promulgated at the federal level to improve fuel economy and energy efficiency to address climate change and its associated effects. The most important of these was the Energy Policy and Conservation Act of 1974 (42 USC Section 6201) and Corporate Average Fuel Economy (CAFE) Standards. This act establishes fuel economy standards for on-road motor vehicles sold in the United States. Compliance with federal fuel economy standards is determined through the CAFE program based on each manufacturer’s average fuel economy for the portion of its vehicles produced for sale in the United States.

Energy Policy Act of 2005 (109th Congress H.R.6 (2005–2006) sets forth an energy research and development program covering: (1) energy efficiency; (2) renewable energy; (3) oil and gas; (4) coal; (5) Indian energy; (6) nuclear matters and security; (7) vehicles and motor fuels, including ethanol; (8) hydrogen; (9) electricity; (10) energy tax incentives; (11) hydropower and geothermal energy; and (12) climate change technology.

U.S. EPA in conjunction with the National Highway Traffic Safety Administration (NHTSA) is responsible for setting GHG emission standards for new cars and light-duty vehicles to significantly increase the fuel economy of all new passenger cars and light trucks sold in the United States. Fuel efficiency standards directly influence GHG emissions.

4.4.12 STATE

California has been innovative and proactive in addressing GHG emissions and climate change by passing multiple Senate and Assembly bills and executive orders (EOs) including, but not limited to, the following:

Executive Order S-3-05 (June 1, 2005): The goal of this executive order is to reduce California’s GHG emissions to: (1) year 2000 levels by 2010, (2) year 1990 levels by 2020, and (3) 80 percent below year 1990 levels by 2050. This goal was further reinforced with the passage of AB 32 in 2006 and SB 32 in 2016.

¹³ Federal Highway Administration (FHWA). Sustainable Highways Initiative. Website: <https://www.fhwa.dot.gov/environment/sustainability/resilience/>.

¹⁴ FHWA. Sustainable Highways Initiative. Website: <https://www.sustainablehighways.dot.gov/overview.aspx>.

Assembly Bill 32, Chapter 488, 2006: Núñez and Pavley, The Global Warming Solutions Act of 2006: AB 32 codified the 2020 GHG emissions reduction goals as outlined in EO S-3-05, while further mandating that ARB create a scoping plan and implement rules to achieve “real, quantifiable, cost-effective reductions of greenhouse gases.” The Legislature also intended that the statewide GHG emissions limit continue in existence and be used to maintain and continue reductions in emissions of GHGs beyond 2020 (Health and Safety Code Section 38551(b)). The law requires ARB to adopt rules and regulations in an open public process to achieve the maximum technologically feasible and cost-effective GHG reductions.

Executive Order S-20-06 (October 18, 2006): This order establishes the responsibilities and roles of the Secretary of the California Environmental Protection Agency (Cal/EPA) and state agencies with regard to climate change.

Executive Order S-01-07 (January 18, 2007): This order sets forth the low carbon fuel standard (LCFS) for California. Under this EO, the carbon intensity of California’s transportation fuels is to be reduced by at least 10 percent by the year 2020. ARB re-adopted the LCFS regulation in September 2015, and the changes went into effect on January 1, 2016. The program establishes a strong framework to promote the low-carbon fuel adoption necessary to achieve the Governor’s 2030 and 2050 GHG reduction goals.

Senate Bill 375, Chapter 728, 2008, Sustainable Communities and Climate Protection: This bill requires ARB to set regional emissions reduction targets for passenger vehicles. The Metropolitan Planning Organization (MPO) for each region must then develop a "Sustainable Communities Strategy" (SCS) that integrates transportation, land-use, and housing policies to plan how it will achieve the emissions target for its region.

Senate Bill 391, Chapter 585, 2009, California Transportation Plan: This bill requires the State’s long-range transportation plan to identify strategies to address California’s climate change goals under AB 32.

Executive Order B-16-12 (March 2012) orders State entities under the direction of the Governor, including ARB, the California Energy Commission, and the Public Utilities Commission, to support the rapid commercialization of zero emission vehicles. It directs these entities to achieve various benchmarks related to zero emission vehicles.

Executive Order B-30-15 (April 2015) establishes an interim statewide GHG emission reduction target of 40 percent below 1990 levels by 2030 in order to ensure California meets its target of reducing GHG emissions to 80 percent below 1990 levels by 2050. It further orders all state agencies with jurisdiction over sources of GHG emissions to implement measures, pursuant to statutory authority, to achieve reductions of GHG emissions to meet the 2030 and 2050 GHG emissions reductions targets. It also directs ARB to update the Climate Change Scoping Plan to

express the 2030 target in terms of million metric tons of carbon dioxide equivalent (MMTCO₂e).¹⁵ Finally, it requires the Natural Resources Agency to update the state's climate adaptation strategy, *Safeguarding California*, every 3 years, and to ensure that its provisions are fully implemented.

Senate Bill 32, (SB 32) Chapter 249, 2016, codifies the GHG reduction targets established in EO B-30-15 to achieve a mid-range goal of 40 percent below 1990 levels by 2030.

Senate Bill 1386, Chapter 545, 2016, declared "it to be the policy of the state that the protection and management of natural and working lands...is an important strategy in meeting the state's greenhouse gas reduction goals, and would require all state agencies, departments, boards, and commissions to consider this policy when revising, adopting, or establishing policies, regulations, expenditures, or grant criteria relating to the protection and management of natural and working lands."

Assembly Bill 134, Chapter 254, 2017, allocates Greenhouse Gas Reduction Funds and other sources to various clean vehicle programs, demonstration/pilot projects, clean vehicle rebates and projects, and other emissions-reduction programs statewide.

Senate Bill 743, Chapter 386 (September 2013): This bill changes the metric of consideration for transportation impacts pursuant to CEQA from a focus on automobile delay to alternative methods focused on vehicle miles travelled, to promote the state's goals of reducing greenhouse gas emissions and traffic-related air pollution and promoting multimodal transportation while balancing the needs of congestion management and safety.¹⁶

Senate Bill 150, Chapter 150, 2017, Regional Transportation Plans: This bill requires ARB to prepare a report that assesses progress made by each metropolitan planning organization in meeting their established regional greenhouse gas emissions reduction targets.

¹⁵ GHGs differ in how much heat each trap in the atmosphere (global warming potential, or GWP). CO₂ is the most important GHG, so amounts of other gases are expressed relative to CO₂, using a metric called "carbon dioxide equivalent" (CO₂e). The global warming potential of CO₂ is assigned a value of 1, and the GWP of other gases is assessed as multiples of CO₂.

¹⁶ Per the Caltrans Policy on Transportation Impact Analysis and CEQA Significance Determinations for Projects on the State Highway System Memo (dated September 10, 2020), which includes the Policy Implementation Timing, "For projects initiated on or after December 28, 2018 which have reached or will reach Caltrans' Milestone 020 ("Begin Environmental") before September 15, 2020, the April 13, 2020 Implementation Timing Memorandum (VMT CEQA Significance Determinations for State Highway System Projects Implementation Timeline Memorandum) should be consulted." The project began environmental studies (i.e., Milestone 020) before December 28, 2018. Therefore, VMT-based transportation impact analysis per Section 15064.3 of the CEQA Guidelines was not required for this EIR/EIS.

Executive Order B-55-18 (September 2018) sets a new statewide goal to achieve and maintain carbon neutrality no later than 2045. This goal is in addition to existing statewide targets of reducing GHG emissions.

Executive Order N-19-19 (September 2019) advances California's climate goals in part by directing the California State Transportation Agency to leverage annual transportation spending to reverse the trend of increased fuel consumption and reduce GHG emissions from the transportation sector. It orders a focus on transportation investments near housing, managing congestion, and encouraging alternatives to driving. This EO also directs ARB to encourage automakers to produce more clean vehicles, formulate ways to help Californians purchase them, and propose strategies to increase demand for zero-emission vehicles.

4.4.2 ENVIRONMENTAL SETTING

In 2006, the Legislature passed the California Global Warming Solutions Act of 2006 (AB 32), which created a comprehensive, multi-year program to reduce GHG emissions in California. AB 32 required ARB to develop a Scoping Plan that describes the approach California will take to achieve the goal of reducing GHG emissions to 1990 levels by 2020. The Scoping Plan was first approved by ARB in 2008 and must be updated every 5 years. ARB approved the First Update to the Climate Change Scoping Plan on May 22, 2014. ARB is moving forward with a discussion draft of an updated Scoping Plan that will reflect the 2030 target established in EO B-30-15 and SB 32.

The AB 32 Scoping Plan and the subsequent updates contain the main strategies California will use to reduce GHG emissions. As part of its supporting documentation for the Draft Scoping Plan, ARB released the GHG inventory for California.¹⁷ ARB is responsible for maintaining and updating California's GHG Inventory per Health and Safety Code Section 39607.4. The associated forecast/projection is an estimate of the emissions anticipated to occur in the year 2020 if none of the foreseeable measures included in the Scoping Plan were implemented.

An emissions projection estimates future emissions based on current emissions, expected regulatory implementation, and other technological, social, economic, and behavioral patterns. The projected 2020 emissions provided in Figure 4.4-1 represent a business-as-usual (BAU) scenario assuming none of the Scoping Plan measures are implemented. The 2020 BAU emissions estimate assists ARB in demonstrating progress toward meeting the 2020 goal of 431 MMTCO₂e.¹⁸ The 2017 edition of the GHG emissions inventory (released June 2017) found total California emissions of 440.4 MMTCO₂e, showing progress towards meeting the AB 32 goals.

¹⁷ 2016 Edition of the GHG Emission Inventory Released (June 2016). Website: <https://www.arb.ca.gov/cc/inventory/data/data.htm>.

¹⁸ The revised target using Global Warming Potentials (GWP) from the IPCC Forth Assessment Report (AR4).

Figure 4.4-1: Projected 2020 Emissions

The 2020 BAU emissions projection was revisited in support of the First Update to the Scoping Plan (2014). This projection accounts for updates to the economic forecasts of fuel and energy demand as well as other factors. It also accounts for the effects of the 2008 economic recession and the projected recovery. The total emissions expected in the 2020 BAU scenario include reductions anticipated from Pavley I and the Renewable Electricity Standard (30 MMTCO₂e total). With these reductions in the Baseline, estimated 2020 statewide BAU emissions are 509 MMTCO₂e.

4.4.3 PROJECT ANALYSIS

GHG emissions for transportation projects can be divided into those produced during construction and those produced during operations.

4.4.4 LONG-TERM OPERATIONAL EMISSIONS

Four primary strategies can reduce GHG emissions from transportation sources: (1) improving the transportation system and operational efficiencies, (2) reducing travel activity), (3) transitioning to lower GHG-emitting fuels, and (4) improving vehicle technologies/efficiency. To be most effective all four strategies should be pursued concurrently.

FHWA supports these strategies to lessen climate change impacts and correlate with efforts that the state of California is undertaking to reduce GHG emissions from the transportation sector.

The highest levels of CO₂ from mobile sources such as automobiles occur at stop-and-go speeds (0–25 miles per hour) and speeds over 55 miles per hour; the most severe emissions occur from 0–25 miles per hour (see Figure 4.4-2, below). To the extent that a project relieves congestion by enhancing operations and improving travel times in high-congestion travel corridors, GHG emissions, particularly CO₂, may be reduced. The purpose of the I-710 Corridor Project is to (1) improve air quality and public health, (2) improve traffic safety, (3) modernize freeway design, (4) accommodate projected traffic volumes, and (5) address increased traffic volumes resulting from projected growth in population, employment, and economic activities related to goods movement.

Figure 4.4-2: Possible Use of Traffic Operation Strategies in Reducing On-Road CO₂ Emission¹⁹

Southern California Association of Governments (SCAG) included an SCS as part of both its 2012 and 2016 RTP/SCS. Under SB 375, the primary goal of the SCS is to provide a vision for future growth that will decrease per capita GHG emissions from automobiles and light trucks. By providing a modernized design, increased capacity, and improved interchange connections, the proposed build alternatives would help achieve the improved access and mobility goals of SCAG's 2016 RTP/SCS.

Analyses of GHG emissions were performed for the following conditions:

¹⁹ Transportation Research Board Publications. 2010. *Traffic Congestion and Greenhouse Gases*. Matthew Barth and Kanok Boriboonsomsin (TR News 268 May-June 2010). Website: <http://onlinepubs.trb.org/onlinepubs/trnews/trnews268.pdf>.

- 2012 Existing/Baseline Year
- 2035 Future Year for No Build (Alternatives 1 (No Build), 5C, and 7

An analysis of VMT and vehicle hours of delay (VHD) within the Study Area is shown in the table below. Table 4.4-1 compares the VMT and VHD for 2012 Baseline, the No Build (Alternative 1 (No Build), and the build alternatives.

Table 4.4-1: Vehicle Miles Traveled and Vehicle Hours of Delay

| | 2012 Baseline | Alternative 1 (2035 No Build) | Alternative 5C | Alternative 7 |
|------------------------|---------------|----------------------------------|----------------|---------------|
| Vehicle Miles Traveled | 20,709,520 | 22,078,747 | 22,467,694 | 22,682,844 |
| Vehicle Hours Traveled | 555,282 | 613,918 | 616,375 | 614,294 |
| Vehicle Hours of Delay | 83,454 | 105,752 | 102,387 | 99,333 |

Source: AECOM. *Traffic Operations Analysis Report* (March 2017).

As shown in Table 4.4-1, compared to both the 2012 Baseline and the No Build (Alternative 1), VMT associated with the build alternatives would increase throughout the Study Area, most likely due to the increase in capacity associated with the I-710 Corridor build alternatives. For any build alternative, as capacity is added, additional drivers may choose to use the I-710 Corridor. It should be noted that although the VMT would increase, VHD is forecast to decrease compared to the No Build (Alternative 1) throughout the Study Area, which is also likely due to the capacity improvements proposed as part of Alternatives 5C and 7. VHD associated with the build alternatives increases compared to the 2012 Baseline, likely due to anticipated population and job growth in the Study Area.

As discussed previously in Chapter 2.0, alternative travel modes were considered during the early planning studies. A separate Transportation System Management/Transportation Demand Management (TSM/TDM) alternative (Alternative 2) was considered for inclusion in the Draft EIR/EIS but withdrawn from consideration because TSM/TDM measures alone could not satisfy the purpose of and need for the I-710 Corridor Project. While Alternative 2 comprised transit, policy, Intelligent Transportation Systems (ITS) application, and operational improvements that would have a beneficial effect on mobility in the Study Area, the screening analysis demonstrated that these transportation improvements did not go far enough in resolving the worst of the congestion problems, air quality issues, design deficiencies, and safety concerns that affect motorists and residents within the overall I-710 Corridor Study Area. Instead, TSM/TDM measures were incorporated into the Reduced Set of Alternatives for the I-710 Corridor Project, as discussed in detail in Section 2.4.1.2.

4.4.4.1 QUANTITATIVE ANALYSIS

A combination of the methodologies, provided in the California Climate Action Registry's *General Reporting Protocol* (CCAR GRP), Version 3.0 (CCAR 2008), and fuel consumption/efficiency data developed using EMFAC 2014 and OFFROAD 2007 models, was used to calculate the GHG emissions associated with the project.

The total tailpipe GHG emissions in CO₂e from the 2012 Baseline condition were reported in carbon dioxide equivalents (CO₂e) and are shown in Table 4.4-2, below. CO₂e is the universal unit of measurement to indicate the global warming potential (GWP) of each of the six GHGs, expressed in terms of the GWP of one unit of CO₂. It is used to evaluate the impact of different GHGs on a common basis. Emissions of each GHG were converted to CO₂e by multiplying the CH₄ and N₂O emissions with the respective GWP. Additional details on the methodology and detailed emission calculation tables can be found in Appendix C of the AQ/GHG/HRA Technical Study (June 2017). To focus on the impact of the build alternatives, Table 4.4-2 summarize the results of the tailpipe GHG emissions for the 2012 Baseline, the 2035 No Build Alternative (Alternative 1), and the 2035 Build Alternatives (Alternatives 5C and 7).

Table 4.4-2: 2035 GHG Emissions using the I-710 Traffic Model Data as Compared to 2012 Baseline for the South Coast Air Basin

| GHG | 2012 Baseline (MT/year) | Alt. 1 – 2035 (MT/year) | Alt. 5C – 2035 (MT/year) | Alt. 7 – 2035 (MT/year) | Alt. 7-ZE – 2035 (MT/year) |
|--------------------------------|----------------------------|----------------------------|-----------------------------|----------------------------|-------------------------------|
| CH ₄ ¹ | 2,816 | 952.8 | 951.7 | 949.7 | 931.1 |
| N ₂ O ¹ | 1,467 | 675.8 | 676.2 | 676.7 | 633.0 |
| CO ₂ | 52,100,000 | 39,450,000 | 39,470,000 | 39,480,000 | 38,170,000 |
| Total (CO₂e) | 52,610,000 | 39,680,000 | 39,690,000 | 39,700,000 | 38,380,000 |

Source: Ramboll-Environ. *I-710 Corridor Air Quality, Greenhouse Gas, and Health Risk Assessment Technical Study* (June 2017).

¹ CH₄ and N₂O are converted to CO₂e using GWPs of 25, and 298, respectively. GWP values were taken from the 2007 IPCC Fourth Assessment Report and are consistent with the values used by ARB in the 2016 Edition of the *California Greenhouse Gas Emission Inventory*.

ARB = California Air Resources Board

Alt. = Alternative

CH₄ = methane

CO₂ = carbon dioxide

CO₂e = carbon dioxide equivalent: CO₂e is the universal unit of measurement to indicate the GWP of each of the six GHGs, expressed in terms of the GWP of one unit of CO₂. It is used to evaluate the impact of different GHGs on a common basis.

GHG = greenhouse gas

GWP = global warming positions

I-710 = Interstate 710

IPCC = Intergovernmental Panel on Climate Change

MT = metric tonne(s)

N₂O = nitrous oxide

All of the alternatives, when compared to the 2012 Baseline, including the No Build (Alternative 1), would decrease the regional GHG emissions by approximately 13,000,000 metric tons of CO₂e per year. When compared to the No Build conditions, the regional GHG emissions would remain approximately the same for Alternatives 5C and 7. When compared to the 2035 No Build

(Alternative 1), Alternative 5C would increase the regional GHG emissions by approximately 10,000 metric tons of CO₂e per year, and Alternative 7 would increase the regional GHG emissions by 20,000 metric tons of CO₂e per year.

DESIGN OPTION 7ZE. When compared to the 2012 Baseline condition, methane (CH₄) and nitrous oxide (N₂O) would not change appreciably in the ZE Design Option in 2035 (compared to Alternative 7 in 2035 evaluated in the AQ/GHG/HRA Technical Study [June 2017]) because trucks are an insignificant source of these emissions.²⁰ The total GHG emissions would decrease by approximately 1.3 million metric tonnes of CO₂e (tons of CO₂ equivalents) for Alternative 7 in the ZE Design Option in 2035 as compared to the original Alternative 7 in 2035 evaluated in the AQ/GHG/HRA Technical Study (June 2017). When compared to Existing Baseline 2012, 2035 Design Option 7ZE displays a decrease in total GHGs by 14.2 million metric tons of CO₂e. When compared to 2035 No Build (Alternative 1), 2035 Design Option 7ZE displays a decrease in total GHGs (approximately 3 percent), while 2035 Alternative 7 displays a negligible change.

4.4.4.2 LIMITATIONS AND UNCERTAINTIES WITH MODELING

EMFAC. Although EMFAC can calculate CO₂ emissions from mobile sources, the model does have limitations when it comes to accurately reflecting changes in CO₂ emissions due to impacts on traffic. According to the National Cooperative Highway Research Program report, *Development of a Comprehensive Modal Emission Model* (April 2008) and a 2009 University of California study,²¹ brief but rapid accelerations, such as those occurring during congestion, can contribute significantly to a vehicle's CO₂ emissions during a typical urban trip. Current emission-factor models do not distinguish the emission of such modal events (i.e., acceleration or deceleration) in the operation of a vehicle and instead estimate emissions by the average trip speed. It is difficult to model this because the frequency and rate of acceleration or deceleration at which drivers choose to operate their vehicles depends on each individual's human behavior, their reaction to other vehicles' movements around them, and their acceptable safety margins. Currently, at the time this document was being prepared, the EPA and the ARB had not approved a modal emissions model that was capable of conducting such detailed modeling. This limitation is a factor to consider when comparing the model's estimated emissions for various project alternatives against a baseline value to determine impacts.

OTHER VARIABLES. With the current understanding, project-level analysis of GHG emissions has limitations. Although a GHG analysis is included for this project, there are numerous external

²⁰ Ramboll-Environ. 2016. Appendix F – 2035 Alternative 7 Zero Emission Option. *Air Quality, Greenhouse Gas, and Health Risk Assessment Technical Study* for the I-710 Corridor Recirculated Draft Environmental Impact Report/ Supplemental Draft Environmental Impact Statement, June 2017.

²¹ Matthew Bartha, Kanok Boriboonsomsin. 2009. *Energy and emissions impacts of a freeway-based dynamic eco-driving system*. Transportation Research Part D: Transport and Environment. Volume 14, Issue 6, August 2009, Pages 400–410.

variables that could change during the design life of the build alternatives and would thus change the projected CO₂ emissions.

First, vehicle fuel economy is increasing. The EPA's annual report, "Light-Duty Automotive Technology and Fuel Economy Trends: 1975 through 2012,"²² which provides data on the fuel economy and technology characteristics of new light-duty vehicles including cars, minivans, sport utility vehicles, and pickup trucks, confirms that average fuel economy improves each year with a noticeable rate of change beginning in 2005. Corporate Average Fuel Economy (CAFE) standards remained the same between model years 1995 through 2003, subsequently increasing to higher fuel economy standards for future vehicle model years. The EPA estimates that light-duty fuel economy rose by 16 percent from 2007 to 2012. Table 4.4-3 shows the increases in required fuel economy standards for cars and trucks between Model Years 2012 and 2025, as available from the NHTSA for the 2012–2016 and 2017–2025 CAFE Standards.

Table 4.4-3: Average Required Fuel Economy (mpg)

| | 2012 | 2013 | 2014 | 2015 | 2016 | 2018 | 2020 | 2025 |
|----------------|------|------|------|------|------|-----------|-----------|-----------|
| Passenger Cars | 33.3 | 34.2 | 34.9 | 36.2 | 37.8 | 41.1–41.6 | 44.2–44.8 | 55.3–56.2 |
| Light Trucks | 25.4 | 26 | 26.6 | 27.5 | 28.8 | 29.6–30.0 | 30.6–31.2 | 39.3–40.3 |
| Combined | 29.7 | 30.5 | 31.3 | 32.6 | 34.1 | 36.1–36.5 | 38.3–38.9 | 48.7–49.7 |

Source: United States Environmental Protection Agency (2013) (Website: <http://www.epa.gov/fueleconomy/fetrends/1975-2012/420r13001.pdf>).

mpg = miles per gallon

Second, new lower emissions and zero emission vehicles will come into the market within the expected design life of the build alternatives. According to the 2013 Annual Energy Outlook (AEO2013):

“Light Duty Vehicles (LDVs) that use diesel, other alternative fuels, hybrid-electric, or all-electric systems play a significant role in meeting more stringent GHG emissions and CAFE standards over the projection period. Sales of such vehicles increase from 20 percent of all new LDV sales in 2011 to 49 percent in 2040 in the AEO2013 Reference case.”²³

The greater percentage of lower emissions and zero emission vehicles on the road in the future would reduce overall GHG emissions as compared to scenarios in which vehicle technologies and fuel efficiencies do not change.

²² EPA. Transportation, Air Pollution, and Climate Change. Website: <http://www.epa.gov/oms/fetrends.htm>.

²³ U.S. Energy Information Administration (EIA). 2013. *Annual Energy Outlook 2013 with Projections to 2040*. Website: <http://www.eia.gov/forecasts/aeo/pdf/0383.pdf>.

Third, California adopted a low-carbon transportation fuel standard in 2009 to reduce the carbon intensity of transportation fuels by 10 percent by 2020. The regulation became effective on January 12, 2010 (codified in Title 17, California Code of Regulations, Sections 95480-95490). Beginning January 1, 2011, transportation fuel producers and importers must meet specified average carbon intensity requirements for fuel in each calendar year.

4.4.4.3 LIMITATIONS AND UNCERTAINTIES WITH IMPACT ASSESSMENT

Taken from page 5-22 of the NHTSA Final EIS for model year 2017–2025 CAFE Standards (July 2012), Figure 4.4-3 illustrates how the range of uncertainties in assessing GHG impacts grows with each step of the analysis:

“Cascade of uncertainties typical in impact assessments showing the ‘uncertainty explosion’ as these ranges are multiplied to encompass a comprehensive range of future consequences, including physical, economic, social, and political impacts and policy responses.”

Figure 4.4-3 Cascade of Uncertainties

Much of the uncertainty in assessing an individual project's impact on climate change surrounds the global nature of the climate change. Even assuming that the target of meeting the 1990 levels of emissions is met, there is no regulatory or other framework in place that would allow for a ready assessment of what any modeled increase in CO₂ emissions would mean for climate change given the overall California GHG emissions inventory of approximately 430 million tons of CO₂e. This uncertainty only increases when viewed globally. The IPCC has created multiple scenarios to project potential future global GHG emissions as well as to evaluate potential changes in global temperature, other climate changes, and their effect on human and natural systems. These scenarios vary in terms of the type of economic development, the amount of overall growth, and the steps taken to reduce GHG emissions. Non-mitigation IPCC scenarios project an increase in

global GHG emissions by 9.7 up to 36.7 billion metric tons CO₂ from 2000 to 2030, which represents an increase of between 25 and 90 percent.²⁴

The assessment is further complicated by the fact that changes in GHG emissions can be difficult to attribute to a particular project because the projects often cause shifts in the locale for some type of GHG emissions, rather than causing “new” GHG emissions. It is difficult to assess the extent to which any project level increase in CO₂ emissions represents a net global increase, reduction, or no change; there are no models approved by regulatory agencies that operate at the global or even statewide scale.

The complexities and uncertainties associated with project-level impact analysis are further borne out in the recently released Final EIS completed by the NHTSA CAFE standards (October 2008). As the text quoted below shows, even when dealing with GHG emission scenarios on a national scale for the entire passenger car and light-truck fleet, the numerical differences among alternatives is very small and well within the error sensitivity of the model.

“In analyzing across the CAFE 30 alternatives, the mean change in the global mean surface temperature, as a ratio of the increase in warming between the B1 (low) to A1B (medium) scenarios, ranges from 0.5 percent to 1.1 percent. The resulting change in sea level rise (compared to the No Action Alternative) ranges, across the alternatives, from 0.04 centimeter to 0.07 centimeter. In summary, the impacts of the model year 2011–2015 CAFE alternatives on global mean surface temperature, sea level rise, and precipitation are relatively small in the context of the expected changes associated with the emission trajectories. This is due primarily to the global and multi-sectoral nature of the climate problem. Emissions of CO₂, the primary gas driving the climate effects, from the United States automobile and light truck fleet represented about 2.5 percent of total global emissions of all greenhouse gases in the year 2000 (EPA, 2008; CAIT, 2008). While a significant source, this is a still small percentage of global emissions, and the relative contribution of CO₂ emissions from the United States light vehicle fleet is expected to decline in the future, due primarily to rapid growth of emissions from developing economies (which are due in part to growth in global transportation sector emissions).” [NHTSA Draft EIS for New CAFE Standards, June 2008, pp. 3-77 to 3-78].

4.4.5 CONSTRUCTION EMISSIONS

Construction GHG emissions include emissions produced as a result of material processing, emissions produced by on-site construction equipment, and emissions arising from traffic delays

²⁴ Intergovernmental Panel on Climate Change (IPCC). February 2007. Climate Change 2007: The Physical Science Basis: Summary for Policy Makers. Website: <http://www.ipcc.ch/SPM2feb07.pdf>.

due to construction. These emissions would be produced at different levels throughout the construction phase of the build alternatives; their frequency and occurrence could be reduced through innovations in plans and specifications and by implementing better traffic management during construction phases. Calculations included in Appendix B of the AQ/GHG/HRA Technical Study (June 2017) using the I-710 Construction Emissions Model, a modified version of the Sacramento Metropolitan Air Quality Management District (SMAQMD) Road Construction Emissions Model, version 8.1.0, estimate that thirty-year amortized annual average construction GHGs are calculated to be approximately 4,700 or 7,500 metric tons per year of CO₂e for Alternatives 5C and 7, respectively. Table 4.4-4 lists the GHG emissions that would be generated in each of the construction years along with the total GHG emissions that would be generated by each of the build alternatives. Measures listed in Section 3.24.4.13 would reduce the GHG emissions generated by on-site construction equipment used for the build alternatives. In addition, with innovations such as longer pavement lives, improved traffic management plans, and changes in materials, the GHG emissions produced during construction of the build alternatives could be offset to some degree by longer intervals between maintenance and rehabilitation activities.

Table 4.4-4: Yearly Mass Emissions of CO₂e for Construction of Alternatives 5C and 7

| Year | Alternative 5C (metric tons)/year | Alternative 7 (metric tons)/year |
|--------------|--|---|
| 2021 | 1,200 | No Data |
| 2022 | 9,800 | 1,000 |
| 2023 | 17,000 | 8,300 |
| 2024 | 25,000 | 19,000 |
| 2025 | 31,000 | 30,000 |
| 2026 | 20,000 | 33,000 |
| 2027 | 16,000 | 33,000 |
| 2028 | 5,000 | 29,000 |
| 2029 | 6,900 | 22,000 |
| 2030 | 2,300 | 12,000 |
| 2031 | 4,200 | 10,000 |
| 2032 | 3,300 | 17,000 |
| 2033 | No Data | 10,000 |
| Total | 140,000 | 220,000 |

Source: Ramboll-Environ. *I-710 Corridor Air Quality, Greenhouse Gas, and Health Risk Assessment Technical Study* (June 2017).

CO₂e = carbon dioxide equivalent: CO₂e is the universal unit of measurement to indicate the global warming potential (GWP) of each of the six GHGs, expressed in terms of the GWP of one unit of CO₂. It is used to evaluate the impact of different GHGs on a common basis.

4.4.6 CEQA CONCLUSION

As discussed above, the build alternatives would result in a small decrease (less than 1 percent) in CO₂e emissions within the region in 2035 when compared to the 2035 without-project conditions. When compared to the 2012 existing Baseline, the build alternatives would decrease the regional GHG emissions by approximately 13,000,000 metric tons of CO₂e per year. The build alternatives would result in GHG emissions during construction; however, for any build alternative, project-specific GHG reduction strategies, standard specifications, and BMPs to minimize construction GHG emissions would be implemented. Because the build alternatives would reduce GHG emissions compared to the Baseline, it would not conflict with any applicable plan, policy, or regulation adopted for the purpose of reducing GHGs. Accordingly, the impact of the build alternatives would be less than significant. Caltrans is firmly committed to implementing measures to help reduce GHG emissions. These measures are outlined in the following section.

4.4.7 GREENHOUSE GAS REDUCTION STRATEGIES

4.4.7.1 STATEWIDE EFFORTS

In an effort to further the vision of California's GHG reduction targets outlined in AB 32 and SB 32, Governor Brown identified key climate change strategy pillars (concepts); see Figure 4.4-4. These pillars highlight the idea that several major areas of the California economy will need to reduce emissions to meet the 2030 GHG emissions target. These pillars are (1) reducing today's petroleum use in cars and trucks by up to 50 percent; (2) increasing from one-third to 50 percent our electricity derived from renewable sources; (3) doubling the energy efficiency savings achieved at existing buildings and making heating fuels cleaner; (4) reducing the release of methane, black carbon, and other short-lived climate pollutants; (5) managing farm and rangelands, forests, and wetlands so they can store carbon; and (6) periodically updating the state's climate adaptation strategy, *Safeguarding California*.

The transportation sector is integral to the people and economy of California. To achieve GHG emission reduction goals, it is vital that we build on our past successes in reducing criteria and toxic air pollutants from transportation and goods movement activities. GHG emission reductions will come from cleaner vehicle technologies, lower-carbon fuels, and reduction of vehicle miles traveled. One of Governor Brown's key pillars sets the ambitious goal of reducing today's petroleum use in cars and trucks by up to 50 percent by 2030.

Governor Brown called for support to manage natural and working lands, including forests, rangelands, farms, wetlands, and soils, so they can store carbon. These lands have the ability to remove carbon dioxide from the atmosphere through biological processes, and to then sequester carbon in above- and below-ground matter.

Figure 4.4-4: The Governor's Climate Change Pillars: 2030 Greenhouse Gas Reduction Goals

CALTRANS ACTIVITIES

Caltrans continues to be involved on the Governor's Climate Action Team as the ARB works to implement EOs S-3-05 and S-01-07 and help achieve the targets set forth in AB 32. EO B-30-15, issued in April 2015, and SB 32 (2016), set a new interim target to cut GHG emissions to 40 percent below 1990 levels by 2030. The following major initiatives are underway at Caltrans to help meet these targets.

CALIFORNIA TRANSPORTATION PLAN (CTP 2040)

The California Transportation Plan (CTP) is a statewide, long-range transportation plan to meet our future mobility needs and reduce GHG emissions. The CTP defines performance-based goals, policies, and strategies to achieve our collective vision for California's future statewide, integrated, multimodal transportation system. It serves as an umbrella document for all of the other statewide transportation planning documents.

SB 391 (Liu 2009) requires the CTP to meet California's climate change goals under AB 32. Accordingly, the CTP 2040 identifies the statewide transportation system needed to achieve maximum feasible GHG emission reductions while meeting the state's transportation needs. While MPOs have primary responsibility for identifying land use patterns to help reduce GHG emissions, CTP 2040 identifies additional strategies in Pricing, Transportation Alternatives, Mode Shift, and Operational Efficiency.

CALTRANS STRATEGIC MANAGEMENT PLAN

The Strategic Management Plan, released in 2015, creates a performance-based framework to preserve the environment and reduce GHG emissions, among other goals. Specific performance targets in the plan that will help to reduce GHG emissions include:

- Increasing percentage of non-auto mode share
- Reducing VMT per capita
- Reducing Caltrans' internal operational (buildings, facilities, and fuel) GHG emissions

FUNDING AND TECHNICAL ASSISTANCE PROGRAMS

In addition to developing plans and performance targets to reduce GHG emissions, Caltrans also administers several funding and technical assistance programs that have GHG reduction benefits. These include the Bicycle Transportation Program, Safe Routes to School, Transportation Enhancement Funds, and Transit Planning Grants. A more extensive description of these programs can be found in *Caltrans Activities to Address Climate Change* (2013).

Caltrans Director's Policy 30 (DP-30) Climate Change (June 22, 2012) is intended to establish a department policy that will ensure coordinated efforts to incorporate climate change into departmental decisions and activities.

Caltrans Activities to Address Climate Change (April 2013) provides a comprehensive overview of activities undertaken by Caltrans statewide to reduce GHG emissions resulting from agency operations.

PROJECT-LEVEL GHG REDUCTION STRATEGIES

Through coordination with the project development team, the following measures would be implemented in the I-710 Corridor Project build alternatives, to reduce GHG emissions and potential climate change impacts from the build alternatives:

- Caltrans and the California Highway Patrol are working with regional agencies to implement ITS to help manage the efficiency of the existing highway system. ITS is commonly referred to as electronics, communications, or information processing used singly or in combination to improve the efficiency or safety of a surface transportation system. Proposed work under the build alternatives would include the addition of updated fiber-optic communications to interconnect traffic signals along major arterial streets to provide for continuous, real-time adjustment of signal timing to improve traffic flow, as well as other technology improvements, and Transportation Management Center (TMC) upgrades and inter-ties necessary to control and monitor the ITS system.

- Transit elements, described more fully in Section 2.3.2.1, are included in the scope of both proposed build alternatives. These transit elements would include increased bus and rail service throughout the Study Area, as well as three new Metro Rapid and Express lines.
- Landscaping reduces surface warming, and through photosynthesis, decreases CO₂. Landscaping would be provided consistent with the *I-710 Corridor Aesthetics Master Plan* where necessary within the corridor to provide aesthetic treatment, replacement planting, or mitigation planting for the build alternatives. The landscape planting would help offset any potential CO₂ emissions increase. The number of new trees, shrubs, and foliage planted within Caltrans' right-of-way would be maximized, and of species that are drought resistant and have superior biosequestration and biofiltration capabilities.
- The build alternatives would incorporate the use of energy-efficient lighting, such as light-emitting diode (LED) traffic signals. LED bulbs—or balls, in the stoplight vernacular—cost \$60 to \$70 apiece but last five to six years, compared to the one-year average lifespan of the incandescent bulbs previously used. The LED balls themselves consume 10 percent of the electricity of traditional lights, which would also help reduce the CO₂ emissions resulting from the build alternatives.²⁵ For any build alternative, an area lighting plan would be prepared prior to the completion of final design (see Section 3.15.5.3 for more details).
- According to Caltrans *Standard Specifications*, idling time for lane closure during construction would be restricted to ten minutes in each direction. In addition, the contractor would comply with Title 13, California Code of Regulations §2449(d)(3), adopted by ARB on June 15, 2008. This regulation restricts idling of construction vehicles to no longer than five consecutive minutes. Compliance with this regulation would reduce harmful emissions from diesel-powered construction vehicles.
- The build alternatives would implement “Complete Streets” treatments that would promote sustainable and “livable neighborhoods” for arterials, ramp termini, and intersections improved as part of the build alternatives. Designs would be consistent with the principles outlined in Caltrans' *Main Streets, California: A Guide for Improving Community and Transportation Vitality* (2013). This would include the provision of up to five bicycle/pedestrian overcrossings in order to improve active transportation and mobility within the corridor. Improvements (including addition of turn lanes and other spot improvements) at impacted arterial intersections would also be proposed to improve traffic flow on arterials.
- Both build alternatives would include the Clean Truck Program (see Section 2.3.2.1 for more detail), which would, for any build alternative, provide funding to individual owner-

²⁵ Knoxville Business Journal. 2008. *LED Lights Pay for Themselves*. Website: <http://www.knoxnews.com/news/2008/may/19/led-traffic-lights-pay-themselves/> (accessed May 19, 2008).

operators and privately owned truck fleets to subsidize the purchase of heavy-duty ZE/NZE trucks for use within the I-710 Corridor.

- For any build alternative, a construction efficiency plan and a maintenance efficiency plan (refer to Section 3.15.5 for the specific elements of these plans) would be prepared in order to maximize and promote energy efficiency during the construction and maintenance phases of the build alternatives.
- CON-AQ-1 (see Section 3.24.4.13): The Construction Contractor would comply with Caltrans Standard Specifications, Sections 7-1.01F and 10. Section 7, "Legal Regulations and Responsibility to the Public," would address the Construction Contractor's responsibility on many items of concern, such as air pollution; protection of lakes, streams, reservoirs, and other water bodies; use of pesticides; safety; sanitation; convenience of the public; and damage or injury to any person or property as a result of any construction operation related to the build alternatives. Section 7-1.01F would specifically require compliance by the Construction Contractor with all applicable laws and regulations related to air quality, including air pollution control district and air quality management district regulations and local ordinances.
- CON-AQ-7 (see Section 3.24.4.13): The Construction Contractor would establish Environmentally Sensitive Areas (ESAs) for sensitive air receptors within which construction activities involving extended idling of diesel equipment would be prohibited to the extent feasible. In addition, for any build alternative, a strong anti-idling policy would be implemented at all construction sites as part of an air quality impact training program that would include education on potential health risks to nearby receptors and ways to reduce emissions, including no idling, use of PM filters, use of alternative fuels, etc.
- CON-AQ-15 (see Section 3.24.4.13): For any build alternative, dependent upon the responsible agency that would administer the construction contract, construction equipment may meet equivalent emissions performance to that of United States Environmental Protection Agency (EPA) Tier 4 standards and California Air Resources Board (ARB) requirements for non-road engines, if such construction equipment is available at the time either build alternative may be constructed. For any build alternative, Metro's Green Construction Policy would be utilized if Metro would administer the construction contract.
- CON-AQ-16 (see Section 3.24.4.13): Comply with ARB's anti-idling rule, which would prohibit diesel truck idling in excess of five minutes.
- In addition, depending upon the agency (i.e., Caltrans or Metro) that would administer the construction contract, legally enforceable measures intended to reduce GHG emissions from the 2016 SCAG RTP/SCS would be included in the Plans, Specifications, and Estimates package prepared for either build alternative.

4.4.8 ADAPTATION STRATEGIES

Reducing GHG emissions is only one part of an approach to addressing climate change. Climate change is expected to produce increased variability in precipitation, rising temperatures, rising sea levels, variability in storm surges and intensity, and the frequency and intensity of wildfires. Flooding and erosion can damage or wash out roads; longer periods of intense heat can buckle pavement and railroad tracks; storm surges combined with a rising sea level can inundate highways. Wildfire can directly burn facilities and indirectly cause damage when rain falls on denuded slopes that landslide after a fire. Effects will vary by location and may, in the most extreme cases, require that a facility be relocated or redesigned. Accordingly, Caltrans must consider these types of climate stressors in how highways are planned, designed, built, operated, and maintained.

4.4.8.1 FEDERAL EFFORTS

Under NEPA assignment, Caltrans is obligated to comply with all applicable federal environmental laws and FHWA NEPA regulations, policies, and guidance.

The United States Global Change Research Program (USGCRP) delivers a report to Congress and the President every four years, in accordance with the Global Change Research Act of 1990 (15 USC, Chapter 56A, Section 2921 et seq). The Fourth National Climate Assessment, published in 2018, presents the foundational science and the “human welfare, societal, and environmental elements of climate change and variability for 10 regions and 18 national topics, with particular attention paid to observed and projected risks, impacts, consideration of risk reduction, and implications under different mitigation pathways.” Chapter 12, “Transportation.” presents a key discussion of vulnerability assessments. It notes that “asset owners and operators have increasingly conducted more focused studies of particular assets that consider multiple climate hazards and scenarios in the context of asset-specific information, such as design lifetime: (USGCRP 2018).

The *U.S. DOT Policy Statement on Climate Adaptation* in June 2011 committed the federal Department of Transportation to “integrate consideration of climate change impacts and adaptation into the planning, operations, policies, and programs of the DOT in order to ensure that taxpayer resources are invested wisely and that transportation infrastructure, services and operations remain effective in current and future climate conditions.”²⁶

FHWA order 5520 (*Transportation System Preparedness and Resilience to Climate Change and Extreme Weather Events*, December 15, 2014) established FHWA policy to strive to identify the risks of climate change and extreme weather events to current and planned transportation

²⁶ FHWA. Office of Planning, Environment, & Realty. Sustainability. Website: https://www.fhwa.dot.gov/environment/sustainability/resilience/policy_and_guidance/usdot.cfm.

systems. FHWA has developed guidance and tools for transportation planning that fosters resilience to climate effects and sustainability at the federal, state, and local levels.²⁷

4.4.8.2 STATE EFFORTS

Climate change adaptation for transportation infrastructure involves long-term planning and risk management to address vulnerabilities in the transportation system. California's Fourth Climate Change Assessment (2018) is the state's effort to "translate the state of climate science into useful information for action" in a variety of sectors at both statewide and local scales. It adopts the following key terms used widely in climate change analysis and policy documents:

- *Adaptation* to climate change refers to adjustment in natural or human systems in response to actual or expected climatic stimuli or their effects, which moderates harm or exploits beneficial opportunities.
- *Adaptive capacity* is the "combination of the strengths, attributes, and resources available to an individual, community, society, or organization that can be used to prepare for and undertake actions to reduce adverse impacts, moderate harm, or exploit beneficial opportunities."
- *Exposure* is the presence of people, infrastructure, natural systems, and economic, cultural, and social resources in areas that are subject to harm.
- *Resilience* is the "capacity of any entity – an individual, a community, an organization, or a natural system – to prepare for disruptions, to recover from shocks and stresses, and to adapt and grow from a disruptive experience". Adaptation actions contribute to increasing resilience, which is a desired outcome or state of being.
- *Sensitivity* is the level to which a species, natural system, or community, government, etc., would be affected by changing climate conditions.
- *Vulnerability* is the "susceptibility to harm from exposure to stresses associated with environmental and social change and from the absence of capacity to adapt." Vulnerability can increase because of physical (built and environmental), social, political, and/or economic factor(s). These factors include, but are not limited to: ethnicity, class, sexual orientation and identification, national origin, and income inequality. Vulnerability is often defined as the combination of sensitivity and adaptive capacity as affected by the level of exposure to changing climate.

Several key state policies have guided climate change adaptation efforts to date. Recent state publications produced in response to these policies draw on these definitions.

²⁷ FHWA. Office of Planning, Environment, & Realty. Sustainability. Website: <https://www.fhwa.dot.gov/environment/sustainability/resilience/>.

Executive Order S-13-08, issued by then-governor Arnold Schwarzenegger in November 2008, focused on sea-level rise and resulted in the *California Climate Adaptation Strategy* (2009), updated in 2014 as *Safeguarding California: Reducing Climate Risk* (Safeguarding California Plan). The Safeguarding California Plan offers policy principles, and recommendations and continues to be revised and augmented with sector-specific adaptation strategies, ongoing actions, and next steps for agencies.

Executive Order S-13-08 also led to the publication of a series of sea-level rise assessment reports and associated guidance and policies. These reports formed the foundation of an interim *State of California Sea-Level Rise Interim Guidance Document* (SLR Guidance) in 2010, with instructions for how state agencies could incorporate “sea-level rise (SLR) projections into planning and decision making for projects in California” in a consistent way across agencies. The guidance was revised and augmented in 2013. *Rising Seas in California – An Update on Sea-Level Rise Science* was published in 2017, and its updated projections of sea-level rise and new understanding of processes and potential impacts in California were incorporated into the *State of California Sea-Level Rise Guidance Update* in 2018.

Executive Order B-30-15, signed in April 2015, requires state agencies to factor climate change into all planning and investment decisions. This EO recognizes that effects of climate change other than sea-level rise also threaten California’s infrastructure. At the direction of EO B-30-15, the Office of Planning and Research published *Planning and Investing for a Resilient California: A Guidebook for State Agencies* in 2017, to encourage a uniform and systematic approach. Representatives of Caltrans participated in the multi-agency, multidisciplinary technical advisory group that developed this guidance on how to integrate climate change into planning and investment.

Assembly Bill 2800 (Quirk 2016) created the multidisciplinary Climate-Safe Infrastructure Working Group, which in 2018 released its report, *Paying it Forward: The Path Toward Climate-Safe Infrastructure in California*. The report provides guidance to agencies on how to address the challenges of assessing risk in the face of inherent uncertainties still posed by the best available science on climate change. It also examines how state agencies can use infrastructure planning, design, and implementation processes to address the observed and anticipated climate change impacts.

4.4.8.3 CALTRANS ADAPTATION EFFORTS

CALTRANS VULNERABILITY ASSESSMENTS

Caltrans is conducting climate change vulnerability assessments to identify segments of the State Highway System vulnerable to climate change effects including precipitation, temperature, wildfire, storm surge, and sea-level rise. The approach to the vulnerability assessments was tailored to the practices of a transportation agency, and involves the following concepts and actions:

- *Exposure* – Identify Caltrans' assets exposed to damage or reduced service life from expected future conditions.
- *Consequence* – Determine what might occur to system assets in terms of loss of use or costs of repair.
- *Prioritization* – Develop a method for making capital programming decisions to address identified risks, including considerations of system use and/or timing of expected exposure.

The climate change data in the assessments were developed in coordination with climate change scientists and experts at federal, state, and regional organizations at the forefront of climate science. The findings of the vulnerability assessments will guide analysis of at-risk assets and development of adaptation plans to reduce the likelihood of damage to the State Highway System, allowing Caltrans to both reduce the costs of storm damage and to provide and maintain transportation that meets the needs of all Californians.

PROJECT ADAPTATION ANALYSIS

All projects that have filed a Notice of Preparation (NOP) as of the date of the EO S-13-08, and/or are programmed for construction funding through 2013, or are routine maintenance projects may, but are not required to, consider these planning guidelines.

An NOP was posted at the State Clearinghouse (SCH No. 2008081042) and circulated to public agencies and other interested parties in compliance with Section 15082 of the CEQA Guidelines on August 15, 2008. The NOP notified the public of the EIR/EIS being prepared along with the scoping meeting locations and how to provide comments on the project. Since an NOP has been filed for the I-710 Corridor Project, no further analysis is mandated. However, the project may be subject to the effects of sea level rise at the south end. Climate change impact and risk assessments for California's water resources conducted by the California Department of Water Resources utilized a sequence of models to translate global scenarios to regional and local impacts.²⁸ Sea level rise projections presented in the June 2012 National Research Council report on *Sea Level Rise for the Coasts of California, Oregon, and Washington: Past, Present, and Future*²⁹ show that projected sea level rise from a 2000 baseline south of Cape Mendocino will be up to 0.98 feet in 2030, up to 2.0 feet in 2050, and up to 5.48 feet in 2100. The anticipated design life of the build alternatives is 40 years. The limits of the build alternatives themselves would not be directly affected by the projected rises in sea level; however, traffic (particularly truck

²⁸ California Department of Water Resources, 2008. *Progress on Incorporating Climate Change into Management of California's Water Resources*. January.

²⁹ National Research Council, 2012. *Sea Level Rise for the Coasts of California, Oregon, and Washington: Past, Present, and Future*. Washington, DC: The National Academies Press. Website: doi:<https://doi.org/10.17226/13389>

trips, which are a substantial component of the purpose and need for the project) that has origins and/or destinations at the Ports of Los Angeles and Long Beach may be drastically reduced, as the Port complex would likely be inundated. It should be noted that in 2018, the State of California adopted an updated Sea Level Rise Guidance document. It is acknowledged that further coordination with the City of Long Beach Local Coastal Program for a Coastal Development Permit application and Coastal Zone Management Act Consistency Determination would occur following certification of the EIR and when the appropriate level of plan detail is available for either build alternative. At that time, further detailed analysis related to sea level rise would be performed as needed per the requirements of the permitting process. However, as stated in Chapter 2.0, the No Build (Alternative 1) has been selected/identified as the Preferred Alternative, and this coordination will not need to occur.

4.5 MITIGATION MEASURES FOR SIGNIFICANT IMPACTS UNDER CEQA

As discussed above, mitigation measures were developed to address the significant adverse impacts of the build alternatives. Those measures are listed below by environmental topic.

- **Aesthetics:** See Section 3.6.4.
- **Biological Resources:** See Sections 3.16.4; 3.19.4; and 3.21.4.
- **Hazards and Hazardous Materials:** See Section 3.12.4.
- **Land Use and Planning:** See Section 3.3.2.4.
- **Geology:** See Section 3.10.3.
- **Paleontological Resources:** See Section 3.11.4.
- **Air Quality:** See Section 3.13.4.
- **Noise:** See Section 3.14.5.
- **Population and Housing:** See Section 3.3.2.4.
- **Transportation/Traffic:** See Section 3.5.4.
- **Utilities and Service Systems:** See Section 3.4.3.
- **Construction (all topics):** See Section 3.24.4.

However, as the No Build (Alternative 1) was selected/identified as the Preferred Alternative, significant adverse impacts of the build alternatives would not occur, and the adoption of this Preferred Alternative/alternative would not require avoidance, minimization, and/or mitigation measures. Avoidance, minimization, and/or mitigation measures pertaining to the two build alternatives are retained in this Final EIR/EIS for disclosure purposes.

5.0 COMMENTS AND COORDINATION

5.1 INTRODUCTION

Early and continuing coordination with the general public and public agencies is an essential part of the environmental process. It helps planners to determine the necessary scope of environmental documentation and level of analysis required, and to identify potential impacts and mitigation measures and related environmental requirements. Agency consultation and public participation for this project have been accomplished through a variety of formal and informal methods, including an extensive multi-tiered community participation process with numerous public meetings and interagency coordination meetings. This chapter summarizes the results of the efforts by the California Department of Transportation (Caltrans), the Los Angeles County Metropolitan Transportation Authority (Metro), and the Interstate 710 (I-710) partner agencies to fully identify, address, and resolve project-related issues through early and continuing coordination.

This chapter focuses on coordination efforts since the release of the 2012 Draft Environmental Impact Report/Environmental Impact Statement (EIR/EIS). For more detailed information on scoping and other coordination efforts leading up to the 2012 public comment period, please refer to Chapter 5.0 of the I-710 Corridor Project Draft EIR/EIS.

5.2 2012 DRAFT EIR/EIS COMMENT PERIOD

5.2.1 DISTRIBUTION OF 2012 DRAFT EIR/EIS

The Draft EIR/EIS for the I-710 Corridor Project was approved on June 29, 2012. A Notice of completion of the Draft EIR was sent to the State Clearinghouse and posted June 27, 2012. The availability of the Draft EIS and Section 4(f) evaluation was advertised in Volume 77, Issue No. 124 of the Federal Register on June 27, 2012. In addition, the Draft EIR/EIS was submitted to the California Transportation Commission by Caltrans Headquarters.

Several methods were utilized to notify the public of the availability of the document. A letter, included in Appendix J of this Final EIR/EIS, Comments and Coordination, was mailed to those on the distribution list as included in the 2012 Draft EIR/EIS. A notice of availability of the Draft EIR/EIS with instructions on how and where to access the document and submit comments, as well as information on the public hearings, was published in the Los Angeles Times on June 29 and August 4, 2012; the Long Beach Press-Telegram on June 29 and August 3, 2012; La Opinion (Spanish-language publication) on June 29 and August 3, 2012; the Los Angeles Eastside Sun on July 7 (internet only), July 12, and August 3, 2012; and the Los Angeles Watts Times on July 5 and August 2, 2012. The text of the newspaper advertisements in both English and Spanish is also included in Appendix J. In addition, a postcard mailer was sent to all property owners and occupants within a 300-foot radius of the improvements proposed under

the build alternatives notifying them of the availability of the document and of the opportunity to review and comment. Notices were sent via email to the email addresses on file in the project database maintained by Metro.

The Draft EIR/EIS along with all supporting technical studies was made available for download on the Caltrans District 7 website (<http://www.dot.ca.gov/dist07>), and linked from the Metro and the Gateway Cities Council of Governments (Gateway Cities COG) websites. Electronic (CD) copies of the document were mailed via the U.S. Postal Service to the distribution list included in Chapter 7.0 of the 2012 Draft EIR/EIS. Hard copies of the Draft EIR/EIS were distributed to five corridor-area public libraries, as well as made available for review at the Caltrans District 7 office, located at 100 S. Main St., Los Angeles, CA 90012; the Dorothy Peyton Grey Transportation Library located at Metro, and at the Gateway Cities COG office located in Paramount. A total of 39 libraries throughout the Study Area received CD copies of the Draft EIR/EIS and supporting technical studies.

The Executive Summary of the Draft EIR/EIS was translated and released in Spanish, Khmer, Korean, Vietnamese, and Tagalog. They were posted online and made available in hard copy at the five libraries within the Study Area where hard copies of the Draft EIR/EIS were made available.

The public circulation period was originally scheduled to last 60 days, beginning on June 29, 2012, and ending on August 29, 2012. However, Caltrans, in coordination with the project funding partners and in response to public requests, extended the circulation end date to September 28, 2012, for a 91-day total circulation period. The Notice of Availability letter that extended the comment period until September 28, 2012, is included in Appendix J.

5.2.2 2012 DRAFT EIR/EIS PUBLIC HEARINGS

Three public hearings were held in support of the release of the Draft EIR/EIS. Locations were chosen throughout the corridor to maximize the potential attendance. The public hearings were held as follows:

- Tuesday, August 7, 2012, 6:00 p.m. to 9:00 p.m., Progress Park, Paramount
- Wednesday, August 8, 2012, 6:00 p.m. to 9:00 p.m., Silverado Park Community Center, Long Beach
- Thursday, August 9, 2012, 4:00 p.m. to 8:00 p.m., Rosewood Park, Commerce

Public hearings were held in a format that combined an “open house” style wherein attendees could view exhibits and speak with agency and consultant staff, followed by a more formal public hearing. Spanish-language and sign language translators were made available during the entirety of the meeting, as well as court reporters who transcribed the formal hearing, as well as

received and transcribed comments and testimony from attendees. Transcripts of each hearing are located in Appendix S, Response to Comments, on the Draft EIR/EIS.

Upon arrival at the hearings, attendees were asked to sign in, and were provided an array of collateral materials available in both English and Spanish, including fact sheets, frequently asked questions, comment and speaker cards, and information on property acquisitions. During the open house, attendees were encouraged to view the exhibits set up around the facility and speak to staff at hand. Stations were set up around the venues that presented information specific to several resource areas, including air quality, community impacts, geometrics, visual impacts and photo simulations, traffic, noise, and Geographic Information Systems (GIS). Stations for viewing copies of the Draft EIR/EIS, technical studies, and for providing comments were also set up.

The public hearings were attended by nearly 500 people in total; 117 signed in at the Progress Park hearing, 205 at the Silverado Park hearing, and 166 at the Rosewood Park hearing. Progress Park heard nine attendees give public testimony, and one additional comment given directly to the court reporter, including nine comment cards. Silverado Park heard 39 attendees give public testimony, with three additional speaker cards and 29 comment cards submitted, one comment submitted via the laptop station present, and 13 comments dictated to the court reporter directly. Rosewood Park heard 22 attendees give public testimony, and received 29 comment cards, with four comments submitted via laptop station, and seven comments dictated directly to the court reporter.

In addition to the formal public hearings, the public was invited to a series of three “Study Sessions.” These study sessions were informational in nature and intended to be a forum for review of the technical information contained within the Draft EIR/EIS with the Project Team (the “Project Team” refers to staff from Caltrans, Metro, the Gateway Cities COG, and project consultants working on the I-710 Corridor Project), as well as an opportunity to ask questions regarding the technical analysis, in order to submit informed comments on the project. Each of the study sessions were three hours and held at the Progress Park Community Center in Paramount. The first session focused on project design elements, aesthetics, and traffic and was held on July 19, 2012. The second session was held on August 2, 2012, and focused on air quality and health risk assessment. The third and final session was held on August 16, 2012, and focused on community impacts and noise. The public was notified of these study sessions via email to the email addresses on file in the project database maintained by Metro, as well as announcements on Metro’s I-710 Corridor Project website.

Over 20 public informational meetings were held in several locations along the I-710 Corridor between June and September 2012, at the request of local elected officials, community groups, community facilities, and others. These meetings were intended to be a “community update” and discuss with the Project Team the “highlights” of the Draft EIR/EIS, including impacts identified that were specific to the local jurisdiction or area.

5.2.3 RESPONSE TO COMMENTS ON THE DRAFT EIR/EIS

Comments were submitted via mail, e-mail, and in various ways at the public hearings. In total, nearly 3,000 individual comments were submitted on the Draft EIR/EIS. After review of the comments in March 2013, Caltrans decided to move forward with a Recirculated Draft EIR/Supplemental Draft EIS (RDEIR/SDEIS) that would analyze a refined set of build alternatives. A letter issued by Caltrans dated March 15, 2013, notifying the public of the future recirculation of the RDEIR/SDEIS was sent to those that submitted comments on the Draft EIR/EIS, and is included in Appendix J. Responses to comments received during the 2012 public circulation period are included in Appendix S to this Final EIR/EIS.

5.3 2013 STAKEHOLDER MEETINGS

Shortly after the decision to revise the set of build alternatives and prepare an RDEIR/SDEIS, the Project Team conducted a series of meetings in the spring and summer of 2013 with several stakeholders, particularly those who submitted substantive comments on the Draft EIR/EIS. Over the course of several months, the Project Team met with approximately 17 stakeholder groups to ensure that the Project Team had a comprehensive understanding of the groups' comments on the Draft EIR/EIS, to discuss any points of concern, and answer questions about the recirculation process.

5.4 COMMUNITY ALTERNATIVE 7 (CA-7) WORKSHOPS

As discussed in Section 2.2.2.1, the Coalition for Environmental Health and Justice (CEHAJ), a coalition of organizations, associations, and community groups working towards air quality, community health, and quality of life improvements for I-710 Corridor residents, submitted a comprehensive comment on the Draft EIR/EIS (see Comment No. IP-22 in Appendix S) that proposed a new alternative called "Community Alternative 7" (CA-7). Coordination between CEHAJ and the Project Team occurred regularly after the close of the comment period regarding the disposition of CA-7. Many community members requested that Caltrans include CA-7, in its entirety, as a stand-alone alternative in the RDEIR/SDEIS. Although many of the elements of CA-7 were adopted and led to the development of Alternative 7, as analyzed in this document, some others were not. Elements of CA-7 not adopted as part of Alternative 7 included improvements to the Los Angeles River, a comprehensive bicycle/pedestrian program, "Complete Streets" improvements on local arterials throughout the Study Area, a comprehensive community benefits program, including park upgrades and public art, and the commitment to a local job program during construction of the I-710 Corridor Project build alternatives (for any build alternative selected as the Preferred Alternative). Many of these elements are programmatic in nature and beyond the jurisdiction or ability of Caltrans to implement. Therefore, it would be infeasible to include them in an EIR/EIS prepared to analyze the impacts of a freeway project.

CEHAJ, Metro, Caltrans, the Gateway Cities COG, and the California State Transportation Agency (CalSTA) facilitated and attended a series of three workshops, held in December 2014

and January 2015, to discuss the elements of CA-7 and Alternative 7, and how to find a common ground between them. The workshops were intended to be fact-finding and collaborative, during which all parties involved could ask and provide clarification about CA-7 and Alternative 7. Each workshop covered different topical areas. The first workshop covered geometric design, transit elements, and pedestrian and bicycle elements. Workshop No. 2 covered revitalization of the Los Angeles River, targeted local hiring elements, and public-private partnership opportunities. The final workshop discussed financing of the build alternatives, feasibility, and mitigation opportunities.

Notable items resulting from the workshops and ongoing coordination included the I-710 Livability Initiative and Metro Board Motion 22.1. The Livability Initiative was developed by the Project Team as a conceptual framework in which some of the CA-7 programs and projects outside the purview of Caltrans could be pursued by and with the appropriate responsible jurisdictions (such as local cities or other agencies). The Gateway Cities COG has assumed responsibility to develop the framework of the Livability Initiative, including determining the structure and oversight of the program, identifying local and regional partners, developing a strategic direction, and seeking out project funding opportunities.

In order to explore other ways in which all elements of CA-7 could be pursued within the I-710 Corridor Project RDEIR/SDEIS, CEHAJ worked with the office of Los Angeles County 1st District Supervisor and Metro Board Member Hilda L. Solis. As a result, in October 2015, the Metro Board of Directors approved Motion 22.1, which tied the inclusion of some elements of CA-7 to the I-710 Corridor Project RDEIR/SDEIS, and instructed Metro to evaluate other elements in a parallel process outside of the development of the RDEIR/SDEIS. See Section 2.2.2.1 in this Final EIR/EIS for more detail on Motion 22.1.

The CA-7 proposal led to the development of Alternative 7 as analyzed in this Final EIR/EIS. Although not every element of CA-7 is implementable by Caltrans, the approving authority of this document, Caltrans adopted the elements appropriate for inclusion in a highway project into Alternative 7, including no expansion of general-purpose lanes, a zero emission/near-zero emission (ZE/NZE) freight corridor, a programmatic community and health benefit program, "Complete Streets" improvements, minimization of right-of-way acquisitions to the greatest extent possible, inclusion of transit service improvements, Intelligent Transportation Systems (ITS) and Transportation System Management (TSM) operational improvements, and the addition of pedestrian and bicycle-only crossings throughout the corridor.

5.5 2017 RDEIR/SDEIS COMMENT PERIOD

5.5.1 DISTRIBUTION OF 2017 RDEIR/SDEIS

The RDEIR/SDEIS for the I-710 Corridor Project was approved by Caltrans to circulate for public review on July 17, 2017. A Notice of Completion of the Recirculated Draft EIR was sent to the State Clearinghouse and posted on July 20, 2017. The availability of the Draft EIS and

Section 4(f) evaluation was advertised in Volume 77, Issue No. 124, of the Federal Register on July 28, 2017. In addition, the RDEIR/SDEIS was submitted to the California Transportation Commission by Caltrans Headquarters.

Several methods were utilized to notify the public of the availability of the document, similar to those utilized during the 2012 Draft EIR/EIS circulation period. A letter, included in Appendix J of this Final EIR/EIS, was mailed to those on the distribution list as included in the RDEIR/SDEIS. A notice of availability of the RDEIR/SDEIS with instructions on how and where to access the document and submit comments, as well as information on the public hearings, was published in the Los Angeles Times on July 21, July 28, and August 30, 2017; the Long Beach Press-Telegram on July 21, July 28, and August 16, 2017; the Los Angeles Watts Times on July 27 and August 17, 2017; the Los Angeles Eastside Sun on July 27 and August 17, 2017; and La Opinion (Spanish-language publication) on July 21, July 28, and August 16, 2017. The text of the newspaper advertisements in both English and Spanish is also included in Appendix J. In addition, a postcard mailer was sent to all property owners and occupants within a 500-foot radius of the improvements proposed under the build alternatives (approximately 5,100 individual postcards) notifying them of the availability of the document and of the opportunity to review and comment. Notices were sent via email to the 1,856 email addresses on file in the project database maintained by Metro on July 21, 2017, and again on August 30, 2017.

The RDEIR/SDEIS along with all supporting technical studies was made available for download on the Caltrans District 7 website (<http://www.dot.ca.gov/dist07>), and linked from the Metro and the Gateway Cities Council of Governments (Gateway Cities COG) websites. Electronic (CD) copies of the document were mailed via the U.S. Postal Service to the distribution list included in Chapter 7.0 of the RDEIR/SDEIS. Hard copies of the RDEIR/SDEIS were distributed to the same five corridor-area public libraries that had received hard copies of the Draft EIR/EIS in 2012. Hard copies of the RDEIR/SDEIS were also made available for review at the Caltrans District 7 office, located at 100 S. Main St., Los Angeles, CA 90012; the Dorothy Peyton Grey Transportation Library located at Metro, and at the Gateway Cities COG office located in Paramount. A total of 43 libraries throughout the Study Area received CD copies of the Draft EIR/EIS and supporting technical studies.

¹ A revised notice was published to update the date of the Long Beach public hearing. When published on July 21, 2017, the original notice included a Long Beach public hearing date of August 30, 2017. This was discovered to be in conflict with a planned public meeting scheduled by the Ports of Los Angeles and Long Beach regarding the Ports Clean Air Action Plan. In order to not preclude interested parties from the ability to attend both meetings, the Long Beach public hearing date was rescheduled to August 31, 2017. However, the advertisement was unable to be changed prior to publication, and the revised notices were published the following week.

The Executive Summary of the RDEIR/SDEIS was translated and released in Spanish, Khmer, Korean, Vietnamese, and Tagalog. They were posted online and made available at the public hearings. Spanish and English versions in hard copy were available at the five libraries within the Study Area where hard copies of the RDEIR/SDEIS were available.

The public circulation period was originally scheduled to last approximately 60 days, beginning on July 21, 2017, and ending on September 22, 2017. However, Caltrans, in coordination with the project funding partners and in response to public requests, extended the circulation period end date to October 23, 2017, for a 94-day total public circulation period. Advertisements of the comment period extension were published in the Los Angeles Times (September 14, 2017), the Long Beach Press-Telegram (September 16, 2017), the LA Watts Times (September 14, 2017), the LA Eastside Sun (September 21, 2017), and La Opinion (September 17, 2017). The letter sent to the officials, agencies, groups, and individuals on the Distribution List (dated September 13, 2017) that extended the comment period until October 23, 2017, is included in Appendix J.

5.5.2 2017 RDEIR/SDEIS PUBLIC HEARINGS

Similar to the public hearings held for the Draft EIR/EIS in 2012, three formal public hearings were held for the RDEIR/SDEIS, as follows:

- Wednesday, August 23, 2017, 6:00 p.m.–9:00 p.m., Commerce Senior Center, Commerce
- Saturday, August 26, 2017, 10:00 a.m.–1:00 p.m., Paramount Community Center, Paramount
- Thursday, August 31, 2017, 6:00 p.m.–9:00 p.m., Cesar E. Chavez Park Community Center, Long Beach

The hearings were again held in a combined open house/formal hearing format. Spanish-language and American Sign Language interpreters were available at all three hearings, along with an additional Khmer language interpreter present at the August 31 hearing in Long Beach, due to the large Cambodian population in the City.

Upon arrival at the hearings, attendees were asked to sign in, and were provided an array of collateral materials available in both English and Spanish, including fact sheets, frequently asked questions, and comment and speaker cards. Various stations were set up wherein attendees could view exhibits and ask questions of agency and consultant staff. These included a welcome station, an air quality station, a noise station, a traffic station, a visual impacts station, a design station, a GIS station, a Caltrans Right-of-Way information station, an environmental document station where hard copies of the RDEIR/SDEIS, executive summary, and technical studies were available for review, a comment station where attendees could submit comments on the RDEIR/SDEIS via comment card or online portal, and a kid's station with Metro coloring books and crayons.

In total, nearly 300 persons attended the three public hearings. The Commerce hearing was attended by 117 persons (110 members of the general public and seven elected officials or staff representatives), and 39 speaker cards and 11 comment cards were submitted. The Paramount hearing was attended by 37 persons (32 members of the general public and five elected officials or staff representatives), and ten speaker cards and three comment cards were submitted. The Long Beach hearing was attended by 126 persons (115 members of the general public and 11 elected officials or staff representatives), and 38 speaker cards and 19 comment cards were submitted.

The project team also provided support at a meeting facilitated by the Office of Los Angeles County Supervisor Hilda Solis, held on October 18, 2017, at Humphreys Avenue Elementary School in East Los Angeles. At that meeting, an informational presentation was given and public comments were taken by a court reporter procured by the Office of Supervisor Solis. That transcript was submitted as a comment letter on the RDEIR/SDEIS (submission IP-19 [Interested Parties] in Appendix V); however, it is important to note that this meeting was not a formal public hearing for the project. A similar community meeting was held at the EXPO Arts Center in the City of Long Beach on October 19, 2017, jointly facilitated by Long Beach City Councilmembers Al Austin (District 8), Roberto Uranga (District 7), and Rex Richardson (District 9). This meeting was also not a formal public hearing for the project. An informational presentation was given, and a public question and answer session was held. Project team staff were available at various stations around the facility to answer questions and discuss the project.

5.5.3 RESPONSE TO COMMENTS ON THE RDEIR/SDEIS

Comments were submitted via mail, email, and in various ways at the public hearings. In total, nearly 2,600 individual comments were submitted on the RDEIR/SDEIS. Responses to comments received during the RDEIR/SDEIS public circulation period in 2017 are included in Appendix V, Response to Comments on the RDEIR/SDEIS, of this Final EIR/EIS.

5.5.4 IDENTIFICATION OF THE PREFERRED ALTERNATIVE

Following the public review and comment period for the RDEIR/SDEIS, the key technical results and evaluation findings were discussed and reviewed with the I-710 advisory committees and stakeholders that comprised the I-710 community participation framework. In early 2018, these advisory committees worked to form their recommendations for a Preferred Alternative. Key public issues and concerns, the I-710 PDT technical recommendations, and feedback from the I-710 advisory committees were summarized and presented to the Metro Board of Directors at Metro's Regular Board Meeting on March 1, 2018. At that meeting, the Metro Board approved Motion 5.0 recommending Alternative 5C as the Preferred Alternative, along with two accompanying motions (Motions 5.1 and 5.2) that provided additional direction to Metro staff to guide the development of future project implementation and construction. The Metro Board's recommendation for Alternative 5C was forwarded to Caltrans, District 7, for their acceptance and concurrence in June 2018.

However, in 2021, Caltrans and Metro reassessed the selection of Alternative 5C as the Preferred Alternative and, due to the project's impact on the environment (including the inability to achieve project-level air quality conformity for particulate matter), comments received from the general public and agencies during the public review period of the RDEIR/SDEIS, and input from the Metro Board of Directors, selected the No Build (Alternative 1) as the Preferred Alternative.

Although both Alternative 5C and Alternative 7 would meet the Purpose and Need of the project and provide mobility benefits for travel within the I-710 Corridor, the No Build (Alternative 1) has been identified as the Preferred Alternative for the reasons described in Section 2.4 of this Final EIR/EIS.

5.6 23 USC 139 COORDINATION PROCESS

California participated in the "Surface Transportation Project Delivery Pilot Program" (Pilot Program) pursuant to 23 United States Code [USC] 327, for more than five years, beginning July 1, 2007, and ending September 30, 2012. With the Pilot Program, the Federal Highway Administration (FHWA) assigned, and Caltrans assumed, all of the U.S. Department of Transportation (DOT) Secretary's responsibilities under the National Environmental Policy Act (NEPA), including environmental coordination and consultation under other Federal environmental laws pertaining to the review or approval of projects under the Pilot Program. The Moving Ahead for Progress in the 21st Century Act (MAP-21) amended 23 USC 327 to establish a revised and permanent Surface Transportation Project Delivery Program.

5.6.1 COOPERATING AND/OR PARTICIPATING AGENCIES

Pursuant to the Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU) Section 6002, Caltrans sent letters to Federal agencies, inviting them to be Cooperating and/or Participating Agencies for the EIR/EIS for the proposed project, and also sent letters to non-Federal agencies that may have an interest in the project in August 2008, inviting them to be Participating Agencies. A total of 67 agencies (seven Federal, 17 State, and 43 regional/County) were asked to accept or decline Caltrans' invitation to become a Cooperating and/or Participating Agency.

SAFETEA-LU was superseded by MAP-21 in July 2012, and amendments to the environmental review process were codified at 23 USC 139. These provisions were retained in the Fixing America's Surface Transportation (FAST) Act, signed by President Obama in December 2015. The roster of Cooperating and Participating Agencies has remained the same since the initial invitations to agencies in 2008. For more details on the agency responses, please see Chapter 5.0 of the 2012 Draft EIR/EIS.

5.6.2 AGENCY INVOLVEMENT

Opportunities for involvement by the Cooperating and Participating Agencies for the I-710 Corridor Project have been provided since the circulation period of the 2012 Draft EIR/EIS.

Many of the Cooperating and Participating Agencies provided comments on the Draft EIR/EIS, and the responses to those comments are contained in Appendix S. The project Purpose and Need has remained the same since circulation of the Draft EIR/EIS. As the build alternatives have been refined, correspondence was exchanged to solicit input from the Cooperating and Participating Agencies on the build alternatives proposed for evaluation in this Final EIR/EIS and the updated *I-710 Corridor Air Quality, Greenhouse Gas, and Health Risk Assessment Technical Study* (AQ/GHG/HRA Technical Study) (June 2017) and technical methodology protocol. Copies of all correspondence since the 2012 comment period are listed below and provided in Appendix J. The following is a summary of coordination activities that have occurred since the 2012 comment period.

- On April 16, 2014, an Air Quality Agency Technical Meeting was held with the Project Team, the United States Environmental Protection Agency (EPA), the California Air Resources Board (ARB), and the South Coast Air Quality Management District (SCAQMD) to discuss the fleet mix and associated assumptions.
- On April 20, 2015, a teleconference/webinar was held with the Project Team and the EPA to provide an update on the build alternatives; the overall RDEIR/SDEIS process; CA-7 and the I-710 Livability Initiative; ongoing coordination between the Project Team, ARB, and SCAQMD; proposed programmatic air quality features of the build alternatives; development of the AQ/GHG/HRA protocol; and cost and phasing assumptions for the build alternatives.
- From April 2014 through March 2015, a series of focused meetings with the Project Team, ARB, and SCAQMD occurred to discuss in more detail the technical issues related to the air quality and health risk analyses, including (but not limited to) traffic forecasts, design of the freight corridor, 2035 baseline conditions and assumptions, and emission factors.
- On May 13, 2014, Caltrans provided a response letter to EPA questions posed as a result of the April 16 teleconference regarding fleet mix and other assumptions.
- On June 16, 2015, Caltrans submitted letters to all Cooperating and Participating Agencies requesting agency review and comment on the I-710 Corridor Project revised set of build alternatives for analysis in the RDEIR/SDEIS. Responses were received from three agencies: the EPA, the Los Angeles County Department of Public Works, and the Sanitation Districts of Los Angeles County.
- On July 15, 2015, the Los Angeles County Department of Public Works provided a response to Caltrans' June 16, 2015, letter.
- On July 27, 2015, the Sanitation Districts of Los Angeles County provided a response to Caltrans' June 16, 2015, letter.
- On July 29, 2015, the EPA provided a response to Caltrans' June 16, 2015, letter.

- On October 12, 2015, Metro distributed an invitation letter and the October 2015 draft AQ/GHG/HRA Revised Protocol to the members of the Agency Air Technical Working Group for review and comment.
- On November 13, 2015, SCAQMD provided comments on the October 2015 draft AQ/GHG/HRA Revised Protocol.
- On November 13, 2015 (letter erroneously dated November 13, 2014), the EPA provided comments on Caltrans' October 2015 draft AQ/GHG/HRA Revised Protocol.
- On February 5, 2016, Caltrans provided a partial response to comments in response to the comments received on the draft AQ/GHG/HRA Revised Protocol contained in the EPA's November 13, 2015, letter. As of the date of response, some comments pertained to issues that were still outstanding.
- On February 8, 2016, an interagency call took place between Caltrans and EPA to discuss the draft responses to comments provided on February 5, 2016.
- On April 18, 2016, the EPA provided a response to Caltrans' response to comments dated February 5, 2016.
- On May 19, 2016, Caltrans responded to the EPA's letters of November 13, 2015, and April 18, 2016, responding to comments received on the draft AQ/GHG/HRA Revised Protocol.
- On June 3, 2016, a meeting was held between the Project Team and the United States Army Corps of Engineers (USACE) on project updates, updates to technical studies, and the RDEIR/SDEIS.
- On June 16, 2016, a teleconference was held between the Project Team and the USACE on project updates, updates to technical studies, and the RDEIR/SDEIS.
- On June 27, 2016, a teleconference was held between the Project Team and the EPA to further discuss EPA's comments on the draft AQ/GHG/HRA Revised Protocol.
- On December 13, 2016, a teleconference was held between the Project Team and the EPA to discuss Caltrans' responses to EPA's comments on the draft AQ/GHG/HRA Revised Protocol.
- On March 1, 2017, a teleconference was held between the Project Team and the EPA to discuss AQ/GHG/HRA methodology, the status of the Administrative Draft RDEIR/SDEIS, and the overall project schedule.
- On March 22, 2017, Caltrans submitted the environmental justice analysis and public health consideration sections (Chapters 6 and 7, respectively) of the Community Impact Assessment (CIA) to EPA for their review and comment.

- On March 27, 2017, Caltrans submitted the body of the AQ/GHG/HRA report to EPA for their review and comment.
- On March 30, 2017, a meeting was held between the Project Team and the EPA to discuss the environmental justice and air quality analyses conducted for the CIA.

In addition, the Federal Cooperating Agencies were afforded the opportunity to review and comment on an Administrative Draft of the RDEIR/SDEIS on June 23, 2017.

Following the circulation of the RDEIR/SDEIS in 2017, regular coordination occurred with the EPA regarding the air quality project-level conformity process. A summary of coordination activities that have occurred since the 2017 circulation period is below.

- On February 16, 2018, a teleconference was held with the EPA and SCAQMD regarding the results of the particulate matter (PM) conformity test model runs.
- On May 18, 2018, Caltrans transmitted a letter to the EPA describing Alternative 5C, which was at the time identified as the Preferred Alternative, by the Project Development Team (PDT) and recommended by the Metro Board of Directors at their March 1, 2018 meeting, and describing the Initial Construction Stage Program (for more details, please refer to Section 2.4 of this Final EIR/EIS).
- On May 23, 2018, a teleconference was held with the EPA and SCAQMD to discuss the Alternative 5C, the Metro Board Motion, the protocol development for the hot-spot conformity analysis for Alternative 5C.
- On June 6, 2018, a teleconference was held with the EPA, SCAQMD, and FHWA regarding the comments EPA had submitted on the RDEIR/SDEIS and the protocol development for the hot-spot conformity analysis for Alternative 5C.
- On June 28, 2018, the Draft Quantitative PM_{2.5} and PM₁₀ Hot-Spot Analysis Protocol was provided to the EPA, SCAQMD, and FHWA for review and comment.
- On July 10, 2018, a teleconference was held with the EPA, SCAQMD, and FHWA to discuss and clarify any early questions or comments on the Draft Hot-Spot Protocol.
- On August 1, 2018, a teleconference was held with the EPA, SCAQMD, and FHWA to discuss comments on the Draft Hot-Spot Protocol, the schedule and next steps, and options for obtaining the conformity determination.
- On August 15, 2018, the Draft Quantitative PM_{2.5} and PM₁₀ Hot-Spot Analysis Protocol was provided to the TCWG for consideration during the TCWG meeting on August 28th, 2020.
- On September 5, 2018, a teleconference was held with the EPA, SCAQMD, and FHWA to discuss communications since the last teleconference on August 1, 2018, responses

to EPA's comments on the Draft Hot-Spot Protocol, the I-710 Clean Truck Program, and forecast diesel truck trip reductions on I-710.

- On September 14, 2018, a teleconference was held with the EPA, SCAQMD, and FHWA to discuss revisions to the Draft Hot-Spot Protocol and to identify the analytical information related to the I-710 Clean Truck Program that would be required to demonstrate that Alternative 5C is not a project of air quality concern.
- On December 11, 2018, a teleconference was held with the EPA, SCAQMD, and FHWA regarding the methodologies utilized to forecast ZE/NZE truck travel in the I-710 Corridor and to respond to questions on the I-710 Clean Truck Program.
- On June 9, 2020, a teleconference was held with the EPA, SCAQMD, and FHWA to provide them with an update on the status of the project, to discuss the path forward for reaching a determination that Alternative 5C is not a project of air quality concern, and to establish a timetable for continued coordination on technical issues to provide additional specifics on the features of the I-710 Clean Truck Program.
- On June 25, 2020, a teleconference was held with the EPA, SCAQMD, and FHWA to discuss key parameters of the I-710 Clean Truck Program such as milestones and phasing, requirements for program eligibility, and tracking and verification of compliance.
- On July 6, 2020, a teleconference was held with the EPA, SCAQMD, and FHWA to continue discussions on key parameters of the ZE/NZE truck program.
- On July 30, 2020, a teleconference was held with the EPA, SCAQMD, and FHWA to discuss the project team's responses to EPA's questions on the I-710 Clean Truck Program and to discuss components needed for achieving project-level air quality conformity, including the technical demonstration of diesel truck trips reductions, the detailed I-710 Clean Truck Program description, and the steering committee charter for the I-710 Clean Truck Program.
- On November 20, 2020, a teleconference was held with the EPA to hear and discuss EPA's remaining concerns on the provisions of the I-710 Clean Truck Program and achieving project-level air quality conformity.
- On March 25, 2021, Caltrans and Metro received a letter from EPA stating their technical response for the project-level transportation conformity status of the I-710 Corridor Project. This letter is included in Appendix J, Comments and Coordination.

5.7 AGENCY COORDINATION MEETINGS

The Project Team has coordinated with several agencies and public utilities, including the USACE, the Los Angeles County Flood Control District, Los Angeles City Department of Water and Power, and Southern California Edison, in order to discuss potential effects to their facilities that may be impacted by the I-710 Corridor Project build alternatives. The following is a description of other various agency coordination meetings held for the I-710 Corridor Project:

- **I-710 Funding Partner Meetings:** The I-710 Funding Partner agencies include Metro, Caltrans, the Gateway Cities COG, the Port of Los Angeles (POLA), the Port of Long Beach (POLB), the Southern California Association of Governments (SCAG), and the Interstate 5 Joint Powers Authority (I-5 JPA). These agencies have entered into a partnership agreement with Metro. Funding Partner representatives meet monthly to review project status, discuss critical issues, and develop presentations, recommendations, and responses to address the interests of the various committees.
- **Technical Advisory Committee:** The Technical Advisory Committee (TAC) provides a forum for interagency coordination with local and regional agencies. Monthly meetings are held to develop recommendations and provide technical direction to the I-710 Project Team. The TAC had substantial input on the roadway geometrics of the build alternatives. Geometrics of the build alternatives are reviewed with the TAC as a whole, as well as subgroups of TAC members representing various areas along the I-710 Corridor. In addition, individual meetings are held with affected jurisdictions to discuss specific design concerns for respective communities. The TAC has continued to meet since the end of the 2012 Draft EIR/EIS comment period. The TAC is further discussed as part of the overall community participation process in Section 5.6.4.
- **Agency Air Technical Working Group:** The Agency Air Technical Working Group (AATWG) was contacted in October 2015 to solicit feedback and comments on the draft AQ/GHG/HRA Revised Protocol. Previously, the AATWG was convened during the development of the 2012 Draft EIR/EIS to seek agency input and consensus on the technical issues, approaches, and tools for assessing air quality impacts of the build alternatives.
- **Historical Coordination:** Local historical societies and local governments were identified and invited to participate in the Section 106 process in accordance with 36 Code of Federal Regulations (CFR) Section 800.3(f)(1). Supplemental historical consultation was conducted with the groups and individuals listed below on March 4, 2016, who were first contacted regarding this project on September 30, 2009. No additional comments were received in response to this supplemental consultation (*Supplemental Historic Property Survey Report*; Attachment F).
 - Bellflower Heritage Society (16601 Civic Center Dr., Bellflower, CA 90706)
 - City of Bell Community Development Department (Clifford Graves, Interim Director, 6330 Pine Ave., Bell, CA 90201)
 - City of Bell Gardens Community Development and Planning Division (Carmen Morales, Interim Community Development Director, 7100 S. Garfield Ave., Bell Gardens, CA 90201)

- City of Bell Gardens Cultural Heritage Board (Marta Solano, 7100 S. Garfield Ave., Bell Gardens, CA 90201)
- City of Carson Planning Division (Saied Naaseh, Planning Manager, 701 E. Carson St., Carson, CA 90745)
- City of Commerce Planning Division (Matt Marquez, Deputy Director of Development Services, 2535 Commerce Wy., Commerce, CA 90040)
- City of Compton Community Development Department (Robert Delgadillo, Planning Manager, 205 S. Willowbrook Ave., Compton, CA 90220)
- City of Lynwood Development Services Department (Jonathan Colin, Director of Development Services, 11330 Bullis Rd., Lynwood, CA 90262)
- City of Monterey Park Planning Division (Michael A. Huntley, Community and Economic Development Director, 320 W. Newmark Ave., Monterey Park, CA 91754)
- City of Monterey Park Historic Heritage Commission (Harry Panagiotes, 320 W. Newmark Ave., Monterey Park, CA 91754)
- City of Paramount Community Development (Joe Perez, Community Development Director, 16400 Colorado Ave., Paramount, CA 90723)
- City of South Gate Planning Division (Alvie Betancourt, Senior Planner, 8650 California Ave., South Gate, CA 90280)
- City of Vernon Community Services Planning Division (Sergio Canales, Planning Assistant, 4305 Santa Fe Ave., Vernon, CA 90058)
- Historical Society of Long Beach (Julie Bartolotto, Executive Director, 4260 Atlantic Ave., Long Beach, CA 90807)
- Historical Society of Monterey Park (781 S. Orange Ave., Monterey Park, CA 91754)
- Historical Society of Southern California (Post Office Box 93487, Pasadena, CA 91120)
- Long Beach Heritage (Mary Kay Knottage, Executive Director, Post Office Box 92521, Long Beach, CA 90809)

- Los Angeles Conservancy (Adrian Scott Fine, Director of Advocacy, 523 W. 6th St., Ste. 826, Los Angeles, CA 90014)
- County of Los Angeles Regional Planning (Richard Bruckner, Director of Regional Planning, 320 W. Temple St., 13th Floor, Los Angeles, CA 90012)
- City of Long Beach Planning Bureau (Linda Tatum, Planning Bureau Manager, 333 W. Ocean Blvd., 4th Floor, Long Beach, CA 90802)

In addition to local historical societies and local governments, Caltrans has performed coordination with the State Historic Preservation Officer (SHPO) in accordance with its responsibilities under Section 106 of the National Historic Preservation Act. The Supplemental Finding of No Adverse Effect (SFNAE) was submitted to SHPO on November 2, 2018. Following receipt of the SFNAE, SHPO staff provided questions to Caltrans on November 27, 2018, regarding the potential contextual linkages of the bridges crossing the Los Angeles River flood control channel. Caltrans provided responses to those questions on December 3, 2018. SHPO provided concurrence on the SFNAE on December 20, 2018.

During the preparation of the SFNAE and inclusion of the Los Angeles River flood control channel as an assumed eligible resource in the SFNAE, Caltrans consulted with the USACE, as the owner of the channel, regarding the potential for effects to the resource. As a result of that coordination, the USACE was included as a signatory to the Programmatic Agreement (an attachment to the SFNAE). Caltrans requested that comments from USACE regarding the Programmatic Agreement be returned by February 25, 2019. As no comments from USACE were received, Caltrans assumed that the USACE had no objections to the Programmatic Agreement.

For more information on Section 106, please refer to Section 3.7 of this document. Correspondence with SHPO is contained in Appendix J.

- **Section 7 Consultation:** The Biological Assessment (BA) was submitted to the United States Fish and Wildlife Service (USFWS) and the National Marine Fisheries Service (NMFS, also known informally as National Oceanic and Atmospheric Administration [NOAA] Fisheries) on November 19, 2018. On February 19, 2019, NMFS concurred with Caltrans' determination that the proposed action (build alternatives) is not likely to adversely affect endangered Southern California steelhead or threatened East Pacific green sea turtle and designated critical habitats for these species. In a letter dated May 2, 2019, USFWS concurred with Caltrans' determination that the build alternatives are not likely to adversely affect the least Bell's vireo, western snowy plover, and the California least tern. An amended letter of concurrence was received on August 20, 2019, which revised the required mitigation acreage for least Bell's

vireo, following further coordination with USFWS. Please refer to Section 3.20.2 for further details regarding coordination and consultation with USFWS and NMFS.

- **Utility Coordination:** On October 18, 2017, Caltrans and Metro met with Southern California Edison (SCE) staff to discuss the draft comments SCE was preparing on the RDEIR/SDEIS. On February 7, 2018, Caltrans and Metro met again with SCE staff to discuss in more detail the comments SCE submitted on the RDEIR/SDEIS and the next steps in the project development process, including eventual permitting activities (for any build alternative selected as the Preferred Alternative).
- **Programmatic Feature Coordination:** Caltrans and Metro have engaged in continuing coordination with EPA and SCAQMD to develop specific details regarding the structure and administration of the I-710 Phased-In Zero-Emission Truck Technology Deployment Program, including a specific governance structure, responsible parties and administrating agency, enforceability details, and funding mechanisms. For any build alternative selected as the Preferred Alternative, this coordination would continue into the final design phase of either build alternative. Please refer to Section 5.6.2 for further details regarding that coordination.

For a summary of the specific details of consultation efforts related to Section 4(f) of the Department of Transportation Act of 1966, please refer to Section 8.0 of Appendix B, Section 4(f) and 6(f), of this Final EIR/EIS.

5.8 NATIVE AMERICAN COORDINATION

Coordination with Native American tribes continued from initial notification of the project during scoping in August 2008. In December 2015, four individuals were added to the contact list. Tribes, groups, and individuals were contacted via a letter sent by certified mail on January 28, 2016, and again by either follow-up email or phone call during February and March 2016, depending on whether a response to the letter was received. A summary of coordination efforts and responses received is as follows:

- Los Angeles City/County Native American Indian Community, Ron Andrade, Director; Mr. Andrade will defer to Anthony Morales.
- Gabrielino Tongva Council/Gabrielino Tongva Nation, Sam Dunlap, Tribal Secretary; no response was received.
- Ti'At Society, Cindi Alvitre; Ms. Alvitre had previously recommended having mitigation measures in place in the event of cultural resources discoveries and would like to be notified of any discoveries. No response to the January 2016 letter was received.
- Gabrielino Tongva Indians of California Tribal Council: Robert Dorame, Tribal Chair/Cultural Resources; Mr. Dorame had previously indicated he would like to be notified of any cultural resource discoveries. No response to the January 2016 letter was received.

- Tongva Ancestral Territorial Tribal Nation, John Tommy Rosas; Mr. Rosas had previously responded by email in 2008 to request full Section 106 consultation and copies of all project-related documents. He also stated his opposition to the build alternatives as having the potential to result in “many negative impacts.” Mr. Rosas responded to a follow-up email sent on March 3, 2016, to request information on “excavation areas” and “cubic yards” and also stated that his Tribe would like to monitor regardless. An email was sent on May 4, 2016, indicating that the information he had requested was unavailable at this stage of project design and asking if he had any further comments; no response was received at that time. Mr. Rosas was also contacted via email on April 19, 2017. He replied on April 19 requesting electronic copies of the two documents for review. Both documents were forwarded to him via electronic dropbox (Hightail) on April 24, 2017. Mr. Rosas also indicated that if a meeting were to be scheduled to review the results outlined in the documents, he would be unable to attend.
- Gabrielino-Tongva Tribe, Bernie Acuna; no response was received.
- Gabrieleno/Tongva San Gabriel Band of Mission Indians, Anthony Morales, Chairperson; Mr. Morales had previously responded by telephone in 2008 to state that he considers the area to be sensitive for cultural resources. He recommended monitoring by both a Native American and an archaeologist during all ground-disturbing activities associated with the build alternatives. He would also like to be notified of any cultural resource discoveries. He also responded by telephone on February 18, 2016, to state that areas in the vicinity of the Los Angeles River are very sensitive for cultural resources as there were prehistoric villages along its banks. He recommends monitoring throughout the Study Area by a Native American monitor from his group (for any build alternative selected as the Preferred Alternative).
- Gabrielino-Tongva Tribe, Linda Candelaria, Chairwoman; no response was received.
- Gabrieleno Band of Mission Indians Kizh Nation, Andrew Salas, Chairperson; Mr. Salas responded with a letter attached to an email on February 5, 2016, that stated at one time, there were hundreds of prehistoric settlements that inhabited the entire route of the proposed build alternative improvements and that have never been documented. The build alternatives run directly alongside what was once the main water resource for the Gabrieleno people and also a traditional trading route. From the map, it is evident that the build alternatives not only run directly alongside the river (Wenot) but through traditional Gabrieleno villages. This area was highly utilized by his ancestors and is considered highly sensitive. Therefore, he would like to request that one of his Tribal monitors be on site at this project, as well as archaeological monitors, during all ground disturbance (including, but not limited to, pavement removal, potholing or auguring, boring, grading, excavation and trenching) (for any build alternative selected as the Preferred Alternative). Mr. Salas was contacted again via email on April 19, 2017; however, the email address was incorrect. A telephone call was placed to his listed

number and his secretary took a message and indicated that he would return the call later. No response has been received from Mr. Salas since April 19, 2017. Upon request Caltrans will schedule a presentation of the results of the Archaeological Sensitivity Study.

- Gabrieleno/Tongva San Gabriel Band of Mission Indians, Adrian Morales, Cultural Resources Management; Mr. Morales responded via email on March 8, 2016, to request the status of the cultural resources report and the Programmatic Agreement; on May 5, 2016, a response was sent to Mr. Morales indicating that the report was being finalized, and the link to the Programmatic Agreement was provided. Mr. Anthony Morales was also contacted via email on April 19, 2017. A response was received on April 24, 2017, from Adrian Morales (Mr. Morales' son) indicating that they would like to attend a meeting if one is scheduled. Adrian Morales also requested that one hard copy of each document plus an electronic copy burned onto a CD/DVD be mailed to his address. These documents were mailed on April 25, 2017.
- Pechanga Band of Luiseno Indians, Anna Hoover, Pechanga Cultural Resources Center; Ms. Hoover responded to a follow-up email sent March 3, 2016, to state that the project is outside her Tribe's traditional territory and that they will defer to closer tribes.
- Soboba Band of Luiseno Indians, Joseph Ontiveros, Cultural Resource Director; Mr. Ontiveros responded via letter on February 25, 2016, that stated while the project does fall within the bounds of their Tribal Traditional Use Areas, they do not have specific concerns at this time. They request that appropriate consultation continue to take place. In addition, because the project is in a Traditional Use Area and there is the possibility of encountering cultural resources, they request monitoring by a qualified Native American monitor during all ground-disturbing activities associated with the build alternatives and recommend Gabrieleno Tribal Consultants who are closer to the area impacted by the build alternatives (for any build alternative selected as the Preferred Alternative).
- Consultation with the tribes and tribal representatives as described above resulted in the inclusion of the following tribes as Concurring Parties to the Programmatic Agreement (PA; an appendix to the Supplemental Finding of No Adverse Effect): the Tongva Ancestral Territorial Tribal Nation, the Gabrieleno/Tongva San Gabriel Band of Mission Indians, and the Gabrieleno Band of Mission Indians.
- The following consultation activities took place in 2017:
 - Tongva Ancestral Territorial Tribal Nation, John Tommy Rosas, Tribal Administration; Mr. Rosas was provided the Archaeological Survey Report and Archaeological Sensitivity Study in April 2017.
 - Gabrieleno/Tongva San Gabriel Band of Mission Indians, Anthony Morales, Chairperson; Mr. Morales was provided the Archaeological Survey Report and Archaeological Sensitivity Study in April 2017.

- Gabrielino/Tongva San Gabriel Band of Mission Indians, Adrian Morales, Cultural Resources Management; Mr. Morales was provided the Archaeological Survey Report and Archaeological Sensitivity Study in April 2017.
- Gabrieleño Band of Mission Indians Kizh Nation, Andrew Salas, Chairperson; Mr. Salas was contacted to confirm his continued interest in consultation.
- The following consultation activities took place in 2018:
 - Tongva Ancestral Territorial Tribal Nation, John Tommy Rosas, Tribal Administration; Mr. Rosas was provided the Draft PA for review on August 13, 2018, and provided his signature on the Draft PA also on August 13, 2018.
 - Gabrielino/Tongva San Gabriel Band of Mission Indians, Anthony Morales, Chairperson; Mr. Morales was provided the Draft PA on August 13, 2018.
 - Gabrieleño Band of Mission Indians Kizh Nation, Andrew Salas, Chairperson; Mr. Salas was reached via phone following failed email attempts. The Archaeological Survey Report, Archaeological Sensitivity Study, and Draft PA were provided to Mr. Salas for review and comment on August 13, 2018. Additional copies of the Archaeological Survey Report, Archaeological Sensitivity Study, and Draft PA were mailed, per request, on October 8, 2018. Also, per Mr. Salas' request, a telephone meeting was held on November 7, 2018. Mr. Salas will provide comments on the documents and possibly participate in a field visit in the future.
- The PA was submitted to SHPO on March 1, 2019, and SHPO executed the PA on June 6, 2019.

5.9 COMMUNITY PARTICIPATION PROCESS

Through an extensive community participation framework, community participation activities for the I-710 Corridor Project have been designed to provide various community stakeholders the opportunity to work with the technical team throughout the process. The community participation framework for the I-710 Corridor Project is modeled on the program used to complete the I-710 Major Corridor Study (MCS) and has remained the same throughout the development of the project. As discussed in the following sections, there are several Local Advisory Committees (LACs) and one active Subject Working Group (SWG) committee that made recommendations to the Corridor Advisory Committee (CAC), and both the CAC and the TAC made recommendations to the Project Committee, which in turn made recommendations to the Executive Committee.

The public was invited to attend all of the committee meetings and was given the opportunity at these meetings to comment or express any concerns relative to the project. The following sections describe the committees in more detail, the frequency of the meetings, and the general topics discussed at the meetings since the 2012 Draft EIR/EIS comment period.

In late 2018, following the circulation of the RDEIR/SDEIS, and in response to the Metro Board Motion 5.2 directive described in more detail in Section 2.4.2, an assessment of the effectiveness of the community participation framework for the I-710 Corridor Project was completed, and the framework amended. Please refer to Section 5.8.7 for further details.

5.9.1 LOCAL ADVISORY COMMITTEES

The Local Advisory Committees (LACs) represent each of the cities and unincorporated county areas along the I-710 Corridor and are comprised of representatives from each of these communities in the I-710 Corridor. There are a total of 13 LACs for the I-710 Corridor Project, and while some LACs include five to ten members, others include one or two representatives from the respective city staff. LACs have been formed in the following cities and communities: Bell, Bell Gardens, Carson, Commerce, Cudahy, East Los Angeles, Huntington Park, Lynwood, Maywood, Paramount, South Gate, and Vernon. The City of Long Beach has formed the I-710 Project Oversight Committee that serves as the City's LAC. Not all LACs have been active since the 2012 Draft EIR/EIS comment period. The following discussion describes activities undertaken by the active LACs since 2012.

The Bell Gardens LAC met once since 2012 to review project updates and conceptual plans for Alternatives 5C and 7.

The Carson LAC met four times since 2012 to review project updates, Motion 22.1 items, and geometric designs.

The Commerce LAC met seven times since 2012 to review project updates and geometric designs, and to recommend representatives to the CAC.

The East Los Angeles LAC met twice since 2012 to review project updates and refined geometrics.

The Long Beach Oversight Committee convened five times since 2012 to review project updates.

The Paramount LAC met four times since 2012 to review project updates.

The South Gate LAC met four times since 2012 to review project updates, refined geometrics, potential soundwalls proposed as part of the Early Action Soundwall project, and Motion 22.1 items.

The Vernon LAC met once since 2012 to discuss project updates, Motion 22.1 items, and geometric designs.

5.9.2 SUBJECT WORKING GROUPS

The Subject Working Groups (SWGs) were open-participation groups made up of representatives from the LACs, as well as other appointees with subject matter interest and expertise. The SWGs reviewed transportation, community design, and environmental issues in greater depth than the LACs and provided key findings and recommendations to the CAC. Only the Transportation SWG (TSWG) was active following the 2012 Draft EIR/EIS comment period; the TSWG convened once in February 2014 to review updated traffic forecasts prepared for the revised build alternatives.

5.9.3 CORRIDOR ADVISORY COMMITTEE

The Corridor Advisory Committee (CAC) was an advisory group comprised of the Chairs of each LAC and the TAC, as well as other appointees representing corridor-wide interests. The CAC also made recommendations to the Project Committee and met on a monthly basis to review topics discussed at the LAC, SWG, and TAC meetings. The CAC met several times since 2012 to review and discuss the topics including the following: general project updates, traffic forecasts, geometric concepts, ZE truck commercialization, build alternatives refinement, programmatic elements, Motion 22.1 items, and the Livability Initiative. The final CAC meeting was held in 2018.

5.9.4 TECHNICAL ADVISORY COMMITTEE

The Technical Advisory Committee (TAC) is comprised of technical experts from corridor jurisdictions, city staff, and Funding Partner agencies and advises the Project Committee on technical aspects of the I-710 Corridor Project. The TAC meets on a monthly basis and has met several times since 2012 to review, discuss, and/or make recommendations on the following topics: port cargo, traffic demand forecasts, refined alternatives, ZE truck commercialization, programmatic elements, traffic operations/design enhancements, and early action project updates.

5.9.5 PROJECT COMMITTEE

The Project Committee was made up of elected officials and Funding Partner representatives and makes recommendations to the Funding Partners and Caltrans on key assumptions and decisions in the EIR/EIS process. The Project Committee met several times since 2012 to review and discuss general project updates, early action project updates, Motion 22.1 items, the Livability Initiative, and other items. The Project Committee last met on January 31, 2017.

5.9.6 EXECUTIVE COMMITTEE

The Executive Committee was a high-level committee comprised of representatives from the Metro Board of Directors and the Funding Partner agencies, as well as the co-chairs of the Project Committee. The Executive Committee provided policy direction and final recommendations to the Metro Board of Directors to provide to Caltrans. The Executive Committee has not convened since 2012.

5.9.7 ADJUSTMENTS TO THE COMMUNITY PARTICIPATION FRAMEWORK FOLLOWING CIRCULATION OF THE RDEIR/SDEIS

In late 2018, following the circulation of the RDEIR/SDEIS and in response to the Metro Board Motion 5.2 directive described in more detail in Section 2.4.2, an assessment of the effectiveness of the community participation framework for the I-710 Corridor Project was completed by Metro staff, and the framework amended as described below.

Because the identification of the Preferred Alternative is the last major project milestone before project approval, and so that the community participation structure can be successfully advanced into the final design and construction phases of the build alternatives, a streamlining of the community participation framework used during development of the Draft EIR/EIS and RDEIR/SDEIS was warranted. The CAC, Project Committee, and Executive Committee were dissolved. The TAC, however, has and, for any build alternative selected as the Preferred Alternative, would continue to play a crucial role in the design phase of the project and development of the Initial Construction Stages, and would serve as the main venue for Metro and Caltrans, as implementing and lead agencies, to receive input from Corridor cities and the general public. The TAC would receive information from the various City Councils as well as the administering agency for the Community Health and Benefit Program (refer to Section 2.3.2.1 for more details), and would provide recommendations directly to the Metro Board of Directors.

For any build alternative selected as the Preferred Alternative, individual LACs, if desired, could continue to meet to receive updates from their TAC representative and could provide opportunities for information exchange with their respective communities. The LACs would serve as a key link between the respective City Council, the TAC, and the new Advisory Committee on Health and Livability. Should a city choose not to continue their LAC, the City Council would become the appropriate venue for communities to receive information and provide input on the project. Information would be shared between the LAC, City Council, and the Advisory Committee on Health and Livability.

The updated framework for the I-710 Corridor Community Participation Structure is shown in Figure 5-1, below.

Also, during late 2018 and early 2019, Metro held briefings with various members of the Project Committee to update them on the project's status as well as the revised community engagement structure. Project Committee representatives from the Cities of Carson, Downey and Lynwood were briefed in August 2018. The committee representative from the City of South Gate was briefed in September 2018, and the City of Cudahy's committee representative was briefed in October 2018. In January 2019, the committee representative from the City of Paramount was briefed.

6.0 LIST OF PREPARERS

This chapter lists the State and other agency personnel, including consultants, who were primarily responsible for preparing this Final Environmental Impact Report/ Environmental Impact Statement (Final EIR/EIS).

6.1 PUBLIC AGENCIES

6.1.1 CALIFORNIA DEPARTMENT OF TRANSPORTATION, DISTRICT 7

Tania Asef, District Biologist [no longer with Caltrans]

Paul Caron, Senior District Biologist

Michelle Cordi, Associate Environmental Planner

Garrett Damrath, Principal Environmental Planner

Kelly Ewing-Toledo, Supervising Environmental Planner

Caprice “Kip” Harper, Associate Environmental Planner (Archaeology)

Sean Herron, District Biologist

Ron Kosinski, Deputy District Director, Division of Environmental Planning

Jin Lee, P.E., PMP, Branch Chief, Noise & Vibration Branch

Lourdes Ortega, Senior Environmental Planner [no longer with Caltrans]

Arnold Parmar, T.E., Transportation Engineer, Noise & Vibration Branch

Jason Roach, Senior Environmental Planner

John Vassiliades, Caltrans Project Manager

Andrew Yoon, Senior Transportation Engineer, Air Quality Branch

6.1.2 LOS ANGELES COUNTY METROPOLITAN TRANSPORTATION AUTHORITY

Ernesto Chaves, Project Director

Carlos Montez, Senior Transportation Manager, Highway Programs

Lucy Olmos, Project Manager

Lourdes Ortega, Principal Transportation Planner, Highway Programs

Julio Perucho, Principal Transportation Planner, Highway Programs

John Schlenz, Highway Programs [no longer with Metro]

6.2 CONSULTANT TEAM

6.2.1 AECOM

Dave Levinsohn, Project Manager

Julie Rush, Senior Manager, Transportation Planning

Brad Slawson, Project Engineer [no longer with AECOM]

Shannon Willits, Engineering Manager [no longer with AECOM]

6.2.2 LSA ASSOCIATES, INC.

David Atwater, Senior Environmental Planner [no longer with LSA]

Andrea Bean, Environmental Planner [no longer with LSA]

Ryan Bensley, Environmental Principal

Ronald Brugger, Senior Air Quality Specialist

Meredith Canterbury, Senior GIS Specialist

Jade Dean, GIS Specialist [no longer with LSA]

Gary Dow, Associate/Graphic Designer [no longer with LSA]

Sarah Favrot, Senior Climate Change Specialist [no longer with LSA]

Bo Gould, Senior Biologist

Jacqueline Hall, Cultural Resources Manager [no longer with LSA]

Jayna Harris, Associate/Senior Environmental Planner

Ana Hernandez, Word Processor [no longer with LSA]

Amanda Johnson, Senior Environmental Planner

Lauren Johnson, Technical Editor

Patrick Kallas, Assistant Environmental Planner [no longer with LSA]

Carmen Lo, Environmental Planner [no longer with LSA]

Jason Lui, Associate/Senior Noise Specialist

Erin Martinelli, Senior Biologist [no longer with LSA]

Rob McCann, Environmental Manager [no longer with LSA]

Cayla McDonell, Assistant Environmental Planner [no longer with LSA]

7.0 DISTRIBUTION LIST

The Final Environmental Impact Report/ Environmental Impact Statement (Final EIR/EIS) and/or Notice of Availability was distributed to Federal, State, regional, local, and local agencies and elected officials, as well as Native American representatives, utility providers, and other interested parties listed on the following pages. In addition to the list provided below, all property owners/occupants within a 500-foot radius of the Interstate 710 (I-710) Corridor Project build alternatives and interested public members on the I-710 Corridor Project public mailing list were mailed a postcard informing them of the availability of the Final EIR/EIS.
