

I-710 Corridor Project

LOS ANGELES COUNTY, CALIFORNIA
District 07-LA-710 (PM 5.4/24.5)
249900 / 0700000443

Final Environmental Impact Report/ Environmental Impact Statement and Final Section 4(f) Evaluation

Volume 5

Prepared by:
State of California Department of Transportation
and the
Los Angeles County Metropolitan Transportation Authority

The environmental review, consultation, and any other actions required by applicable Federal environmental laws for this project are being, or have been, carried out by Caltrans pursuant to 23 U.S.C. 327 and the Memorandum of Understanding dated December 23, 2016, and executed by FHWA and Caltrans.

April 2024

Freeway System – Projects Relevant to the I-710 RDEIR/SDEIS Area of Interest		
Route	**Project Limits**	**Description**
I-710	At Firestone Blvd.	• Modify the southbound on-ramp
I-5	Orange County Line to I-605	• Widen by 1 HOV lane and 1 mixed flow lane in each direction (widen from 3 to 5 lanes each direction). • Reconstruct Carmenita interchange.
I-10	Westbound-Santa Anita to I-710; Eastbound I-710 to Baldwin Ave.	• Expand capacity of the I-10 HOT lane (restriping to add a second lane for HOT lane on I-10 with buffer changes)
I-10	Alameda St./Union Station to I-605	• Conversion of HOV lanes to HOT lane
I-10	I-605 to Puente Avenue	• Widen by 1 HOV lane in each direction
I-10	Puente Avenue to Citrus	• Widen by 1 HOV lane in each direction
I-10	Citrus to Route 57/71	• Widen by 1 HOV lane in each direction
I-110	182 St./Artesia Transit Center to Adams Blvd	• Conversion of HOV lanes to HOT lane
I-110	At John S. Gibson Blvd. interchange	• Extend the existing off-ramp at John S. Gibson Blvd. • Modify to a 2-lane exit and re-stripe to accommodate 1 shared through and left- turn lane and 1 exclusive right lane • Create an additional left turn lane on southbound John S. Gibson Blvd. for traffic destined to port terminals
I-405	At Wilmington Ave./223rd St.	• Add 1 lane on Wilmington Ave. northbound from 223rd St. to I-405 northbound off-ramp (widen from 3 to 4 lanes) • Construct new 2 lane northbound on-ramp from southbound Wilmington Ave. • Add 1 lane to I-405 southbound on and off ramps (widen from 2 to 3 lanes)

Freeway System – Projects Relevant to the I-710 RDEIR/SDEIS Area of Interest		
Route	**Project Limits**	**Description**
I-405	At Avalon Blvd.	• Add 1 lane in northbound direction on Avalon Blvd. under I-405 (widen from 3 to 4 lanes) • Construct new 2 lane on-ramp to southbound I-405 • Add 2 lanes to northbound off-ramp (widen from 1 to 3 lanes), 2 lanes to southbound off-ramp (widen from 1 to 3 lanes) • Construct 5 lane connector road from southbound off-ramp to Avalon Blvd. (widening from 2 to 3 lanes within existing Caltrans right of way)
I-405	Euclid Ave. to I-605, in Orange Co.	• Add 1 General Purpose (GP) Lane in Each Direction
SR-710	Valley Blvd. to California Blvd.	• Extend 710; Construct 4 GP Toll Lanes in each Direction, in Tunnel
I-605 / I-405 / SR-22	SR-22 to I-605, in Orange Co.	• Add HOV Connectors from SR-22 to I-405 • Add HOV Connectors between I-405 and I-605 • Additional HOV lane on I-405 between SR-22 and I-605 • Widen Seal Beach Blvd and add additional thru lane and on off ramp • Widen Seal Beach Blvd in each direction from Old Ranch Pkwy to St. Cloud Dr.

Freeway System – Projects Relevant to the I-710 RDEIR/SDEIS Area of Interest		
Route	**Project Limits**	**Description**
SR-22	SR-55 to I-405, in Orange Co.	• Add 1 HOV Lane in each direction

Arterial Roadway System –Projects Relevant to the I-710 RDEIR/SDEIS Area of Interest		
Route	**Project Limits**	**Description**
Ocean Boulevard/ Gerald Desmond Bridge	Gerald Desmond Bridge over entrance channel	• Replace existing 5 lane Gerald Desmond Bridge with new 6 lane bridge (3 lanes in each direction) • Construct the Terminal Island East Interchange and I-710 connector ramps
Harry S. Bridges Boulevard	Figueroa St. to Alameda St.	• Relocation/consolidation of streets, street intersections, traffic channelization and signalization • Widening will be accommodated (exact number of lanes yet to be determined)
C Street	At I-110 Fwy on/off-ramps	• Consolidate two closely spaced intersections into one (Figueroa St./C St. and Figueroa St./Harry Bridges Blvd.)
Anaheim Street	Farragut Ave. to Dominguez Channel	• Widen existing roadway from 4 to 6 lanes
Del Amo Boulevard	At I-405	• Construct new 6 lane overcrossing
Sepulveda Boulevard	Alameda St. to Eastern City Limits of Carson	• Add 1 lane in each direction (widen from 2 to 4 lanes)
Firestone Boulevard	Firestone Blvd. Bridge over the Los Angeles River	• Widen on the south side and add a lane in the eastbound direction • Retrofit the bridge for compliance with the latest seismic standards
Washington Boulevard	Commerce/Vernon city boundary (just west of Indiana St.) to I-5 Fwy at Telegraph Rd.	• Reconstruct and add 1 lane in each direction on Washington Blvd. from Commerce/Vernon city boundary at Vernon to I-5 fwy. at Telegraph Rd. (widen from 2 to 3 lanes) • Increase turn radius and medians • Upgrade traffic signals
Lakewood Boulevard	Florence to Telegraph Rd.	• Widen to provide 3 travel lanes in each direction.
Del Amo Blvd.	Normandie Ave. to New Hampshire Ave.	• Widen to provide 2 travel lanes in each direction.
Beverly Blvd.	Montebello Blvd. to west of Rea Dr.	• Widen to provide 2 travel lanes in each direction.

Arterial Roadway System –Projects Relevant to the I-710 RDEIR/SDEIS Area of Interest		
Route	**Project Limits**	**Description**
SR-91/I-605/I-405 Study Area	28 Arterial Highway Intersection Improvements	• As identified in Table A-2 (Revised 3/26/13); Arterial Highway Improvement Hot Spots Initial Projects; SR-91/I-605/I-405; Early Action Analysis

Rail / Transit System –Projects Relevant to the I-710 RDEIR/SDIES Area of Interest		
Route	**Project Limits**	**Description**
Exposition Line Light Rail Transit	7th St./Metro Station to Venice/Robertson Station	• Construct Light Rail Transit Project Phase I (Metro)
Exposition Line Light Rail Transit	Venice/Robertson Station to Santa Monica	• Construct Light Rail Transit Project Phase II (Metro)
Eastside Gold Line	Union Station to Atlantic Blvd	• Construct Light Rail Transit Project (Metro)
Gold Line Foothill Extension	Sierra Madre Villa Station to Azuza Citrus Station	• Construct Light Rail Transit Project (Metro)
Blue Line Light Rail Transit	Spot Locations	• Build a parking structure on First St. near southerly terminus of the Long Beach Blue Line in downtown Long Beach • Construct a park and ride facility in Long Beach at 3rd St. and Pacific Ave. south of the Metro Blue Line Pacific Station—include 300 to 500 parking spaces and residential/commercial development • Torrance Transit Line #6—Blue Line feeder service
Regional Connector Light Rail Transit	Alameda/1st Street to 7th Street/Metro Center	• Light Rail in tunnel allowing through movements of trains, Blue, Gold, Expo Lines
HOT Lane Bus Service	I-10 HOT Lane Corridor I-110 HOT Lane Corridor	• Implement new bus services to expand transit for I-10 and I-110 High Occupancy Toll (HOT) lanes
Crenshaw – LAX Transit Corridor	Crenshaw & Exposition Station to LAX/Aviation Station	• Construct Light Rail Transit Project (Metro)
Metrolink System (SCRRA)	Positive Train Control	• Implement Positive Train Control on 216 miles of Metrolink ROW (note: largely safety, operational improvement)
Westside Purple Line Subway Extension	Wilshire & Western Station to La Cienega	• Construct Segment 1 of Westside Purple Line Subway Extension

Traffic Systems and Operations / Intelligent Transportation Systems – I-710 RDEIR/SDEIS	
Project	**Project Limits / Description**
I-710 Communication System and Closed Circuit TV System (CCTV)	Project Limits: On **I-710** from PCH to I-405 • Install facilities for traffic monitoring system and closed circuit TV system
Advanced Traffic Management Information System (ATMIS)	Project Limits: Ports of Long Beach and Los Angeles • Implement an Advanced Transportation Management System (ATMS) and Advanced Traveler Information System (ATIS) to improve traffic operations on **I-710, I-110, and SR 47/103**.
Atlantic Avenue Signal Synchronization and Enhancement Project / TSSP	Project Limits: On **Atlantic Avenue** between Ocean Blvd. and Willow St. • Major reconstruction and minor upgrades of traffic signals along Atlantic improve traffic flow
Ocean Boulevard / Shoreline Drive Signal Synchronization and Enhancement Project / TSSP	Project Limits: On **Ocean Boulevard** between Biona Ct. and Livingston Dr.; on **Livingston Drive** between Ocean Blvd. and 2nd St.; on **Shoreline Drive** between Golden Shore and Alamitos Ave., on Alamitos Avenue between Ocean Blvd. and 6th Street • Reconstruct, upgrade and synchronize traffic signals along the corridor to reduce traffic congestion
Gateway Cities Forum – Carson Street Signal Synchronization / TSSP	Project Limits: On **Carson Street** between Long Beach Blvd. to Bloomfield Ave. • Provide time-based traffic signal synchronization and upgrades to improve the overall progression of traffic along and crossing these routes
Gateway Cities Forum Traffic Signal Corridor Projects / TSSP	Phase II: Project Limits: On **Pacific Boulevard/Long Beach Boulevard** between Florence Ave. and Willow St. • Provide time-based traffic signal synchronization and upgrades to improve the overall progression of traffic along and crossing these routes
Gateway Cities Forum Traffic Signal Corridor Projects / TSSP	Phase III: Project Limits: On **Artesia Boulevard** between Alameda Blvd. and Valley View Ave.; on **Central Avenue** between El Segundo Blvd. to Victoria St.; on **Gage Avenue** between Central Ave. to Slauson Ave.; on **Whittier Boulevard** between Paramount Blvd. to Valley Home Ave.; on **Wilmington Avenue** between Imperial Highway to Sepulveda Blvd. • Provide time-based traffic signal synchronization and upgrades to improve the overall progression of traffic along and crossing these routes

Traffic Systems and Operations / Intelligent Transportation Systems – I-710 RDEIR/SDEIS	
Project	**Project Limits / Description**
Gateway Cities Forum Traffic Signal Corridor Projects / TSSP	Phase IV: Project Limits: On **38th Street/37th Street/Bandini Boulevard** between Alameda St. and Garfield Ave.; on **Garfield Avenue** between Olympic Blvd. and Eastern Ave.; on **Studebaker Road** between Florence Ave. to Del Amo Blvd. • Provide time-based traffic signal synchronization and ITS improvements to enhance intersection operations, increase traffic mobility and relieve existing traffic congestion on surface arterials
Florence Avenue Traffic Signal Communications System	Project Limits: On **Florence Avenue** between Old River School Rd. and Fairford Ave. • Develop Ethernet based communication network
Southeast Los Angeles County - Traffic Signal Synchronization Program (TSSP)	Project Limits: **I-710/Atlantic Boulevard** Corridor; **I-5/Telegraph Road** Corridor; **Lakewood/Rosemead Boulevard & Paramount Boulevard** Corridor • Implement a real-time traffic signal synchronization system to effectively managed high traffic volumes and reduce traffic congestion • Provide additional lane capacity through minor roadway widening and peak hour parking restrictions
Gateway Cities Forum Traffic Signal Corridor Projects / TSSP	Project Limits: **I-105 Corridor ITS Project**, (arterials within the Corridor include **Firestone Blvd., Imperial Highway and Rosecrans Ave**.) • Implement a traffic signal management and control system which allows jurisdictions to respond more efficiently to traffic congestion
Gateway Cities Forum Traffic Signal Corridor Projects / TSSP	Phase V: Project Limits: On **Alameda Street** between Nadeau St. to Auto Drive South; on **Florence Avenue/Mills Avenue** from Central Ave. to Scout Ave.; on **South Street** between Atlantic Ave. to Carmenita Rd.; on **Washington Boulevard** between Atlantic Blvd. and Whittier Blvd. • Provide time-based traffic signal synchronization and ITS improvements to enhance intersection operations, increase traffic mobility and relieve existing traffic congestion on surface arterials
Gateway Cities Forum Traffic Signal Corridor Projects / TSSP	Phase VI: Design and construct multijurisdictional traffic signal synchronization, intersection operational improvements and ITS components on regional arterials in Gateway Cities Area. [RTP ID: LAF3309]

Traffic Systems and Operations / Intelligent Transportation Systems – I-710 RDEIR/SDEIS	
Project	**Project Limits / Description**
Wilmington Automated Traffic Surveillance and Control System/ Adaptive Traffic Control System (ATSAC/ATCS) Project	Project Limits: Southern portion of the City of LA, bounded by Sepulveda Blvd. on the north, the City of Long Beach on the east, Seaside Ave./Ocean Blvd. on the south, Western Ave. on the west. • Implement a real-time traffic signal synchronization system to effectively managed high traffic volumes and reduce traffic congestion at 70 signalized intersections
Harbor-Gateway Automated Traffic Surveillance and Control System/ Adaptive Traffic Control System (ATSAC/ATCS) Project	Project Limits: Southerly portion of the City of LA, bounded by Manchester Ave. on the north, Alameda St. on the east, Imperial Highway on the south, Vermont Ave. on the west • Implement a real-time traffic signal synchronization system to effectively manage high traffic volumes and reduce traffic congestion at 109 signalized intersections

1.1 IDENTIFICATION OF A PREFERRED ALTERNATIVE

An alternatives analysis was completed pursuant to the California Environmental Quality Act (CEQA) and the National Environmental Policy Act (NEPA) prior to, and during preparation of, the Recirculated Draft Environmental Impact Report/Supplemental Draft Environmental Impact Statement (RDEIR/SDEIS). CEQA requires consideration of a range of reasonable alternatives that would achieve the basic objectives of the project, but would also avoid or substantially lessen any of the significant effects of the project. NEPA also requires consideration of all reasonable alternatives, which must be discussed to a comparable level of detail. An agency's "Preferred Alternative" is the alternative that the agency believes would fulfill its statutory mission and responsibilities, giving consideration to economic, environmental, technical and other factors. The California Department of Transportation (Caltrans), as a matter of practice, generally does not identify a Preferred Alternative until after circulation of a draft environmental document wherein the public has the opportunity to provide comments on the range of proposed alternatives. CEQA Statutes and Guidelines do not address the question of a Preferred Alternative, but recent case law (*Washoe Meadows Community v. Department of Parks and Recreation* [2017]) has suggested that in the case of an agency considering a diverse range of numerous alternatives that would create different sets of impacts and require different mitigation measures, a Preferred Alternative should be identified prior to the preparation of a Draft EIR. Since the two build alternatives evaluated in the RDEIR/SDEIS for the Interstate 710 (I-710) Corridor Project are generally similar in scope, impacts, and mitigation measures, identification of a Preferred Alternative after the public circulation period is appropriate. Under NEPA, a Preferred Alternative is generally not identified until after the draft environmental document has been circulated and public comments have been taken into account.

Per the Caltrans Project Development Guidelines outlined in Chapter 12 of the Project Development Procedures Manual, the Project Development Team (PDT) determines how the alternatives are to be evaluated. The I-710 PDT is made up of representatives from Caltrans, Los Angeles County Metropolitan Transportation Authority (Metro), and the Gateway Cities Council of Governments (COG). For the I-710 Corridor Project, a Community Participation Framework, which includes the various Local Advisory Committees (LACs), Technical Advisory Committee (TAC), Corridor Advisory Committee (CAC), and Project Committee (PC) was created at the outset of the project development process to provide feedback and advice from communities and stakeholders on a recommendation for various project elements, including the eventual identification of the Preferred Alternative. The public has actively participated in this process. Recommendations on the Preferred Alternative are then forwarded to the Metro Board of Directors for their approval before submittal to Caltrans District 7 as the CEQA/NEPA Lead Agency to identify the Preferred Alternative for the Final EIR/EIS.

Evaluation factors for the alternatives analysis included whether the alternatives met the project's Purpose and Need, and the technical feasibility and affordability of the alternatives, and took into account public comments and environmental impacts related to the alternatives. These evaluation factors were drawn from the technical studies performed for the project and focused on major

technical findings that clearly differentiated the two build alternatives in order to present balanced and objective information on benefits, costs, and impacts of the build alternatives for review and discussion. This was essential because the various advisory committees and stakeholders that ultimately weighed in on a recommendation for a Preferred Alternative each had different perspectives on what factors were most important to them.

To complete the alternatives analysis process, technical analysis and public engagement conducted prior to, and during preparation of, the RDEIR/SDEIS, allowed for the consideration of the benefits and impacts of Alternative 5C and Alternative 7 relative to Alternative 1 (the No Build Alternative) and relative to existing conditions within the Corridor. Numerous presentations were made to the I-710 advisory committees, local jurisdictions, community groups, and stakeholders on key technical findings related to the project alternatives throughout 2016 and 2017 leading up to the circulation of the RDEIR/SDEIS, which took place from July to October 2017. Following the public review and comment period for the RDEIR/SDEIS, the key technical results and evaluation findings were discussed and reviewed with the I-710 advisory committees and stakeholders that comprised the I-710 community participation framework. In early 2018, these advisory committees worked to form their recommendations for a Preferred Alternative. Key public issues and concerns, the I-710 PDT technical recommendations, and feedback from the I-710 advisory committees were summarized and presented to the Metro Board of Directors at Metro's Regular Board Meeting on March 1, 2018. At that meeting, the Metro Board approved Motion 5.0 recommending Alternative 5C as the Preferred Alternative, along with two accompanying motions (Motions 5.1 and 5.2) that provided additional direction to Metro staff to guide the development of future project implementation and construction. The Metro Board's recommendation for Alternative 5C was forwarded to Caltrans, District 7, for their acceptance and concurrence in June 2018.

However, in 2021**,** Caltrans and Metro reassessed the selection of Alternative 5C as the Preferred Alternative and, due to the project's impact on the environment (including the inability to achieve project-level air quality conformity for particulate matter), comments received from the general public and agencies during the public review period of the RDEIR/SDEIS, and input from the Metro Board of Directors, selected the No Build Alternative as the Preferred Alternative.

Although both Alternative 5C and Alternative 7 would meet the Purpose and Need of the project and provide mobility benefits for travel within the I-710 Corridor, Alternative 1 (No Build Alternative) has been identified as the Preferred Alternative for following reasons:

- **Community and Public Opposition to added lanes on I-710 under Alternatives 5C and 7**. Throughout the life of the project, a robust community outreach program was implemented. This included several advisory committees that met on a regular basis, public meetings and hearings, and community briefings. Through this process, the community expressed concern related to following:
    - Number of displacements associated with the build alternatives including residences (specifically in the cities of Commerce and Compton), businesses,

homeless shelters (Bell Shelter), the Long Beach Multi-Service Center, and transitional housing.

- Construction and operational air quality and health risk impacts especially related to asthma and cancer risks to the communities and facilities (such as schools and parks) adjacent to the corridor.
- Disproportionately high and adverse effects to Environmental Justice populations related to air quality, noise, traffic, parks, construction, and displacements.
- Impacts to parks and recreational facilities such as the Julia Russ Asmus Park, Coolidge Park, Ralph C. Dills Park, Bandini Park, Maywood Park, Cesar E. Chavez Park, Dominguez Gap and DeForest Treatment Wetlands, and Parque Dos Rios.
- Impacts related to proposed peak period parking restrictions on arterials, specifically along Atlantic Ave. where businesses are reliant upon on-street parking.
- Impacts to bicycle and pedestrian facilities specifically related to the safety for pedestrians and bicyclists when crossing diverging diamond interchanges proposed throughout the project limits.
- Impacts related to noise including impacts to park use and enjoyment and impacts to sensitive receptors from heavy trucks and the inadequate mitigation provided.

- **Inability to achieve project-level conformity for particulate matter.** Alternatives 5C and 7 included a zero- and near-zero emissions truck program (the I-710 Clean Truck Program) as a project feature. Alternative 7 also included a zero- and near-zero emissions freight corridor. While project analysis showed that the zero- and near zero emissions truck program would ultimately reduce diesel trucks operating in the I-710 Corridor, extensive discussions with the EPA indicated that Alternatives 5C and 7 must be considered a project of air quality concern (POAQC) due to tire wear, brake wear, and fugitive dust as well as concerns associated with the enforceability of the zero- and near zero emissions truck program. Therefore, a hot-spot analysis was required for air quality conformity determination. Preliminary results of the hot-spot analysis indicated that the two build alternatives would not demonstrate project-level conformity requirements for particulate matter and would not successfully satisfy the requirements to demonstrate conformity to the purpose of the State Air Quality Implementation Plan (SIP).would not pass project-level conformity for particulate matter and would thus result in a violation of the Clean Air Act..
- **Change in Direction of Metro Board of Directors.** Metro has adopted new policies regarding freeway widening and has shifted the focus of their highway program toward projects that can be used by buses, carpoolers, bicycles, and pedestrians, or projects that help older and existing roads work better. Therefore, Alternatives 5C and 7 are inconsistent with the new Metro Board of Directors direction. The Metro Board of Directors expressed their opinion that widening I-710 would cause displacement and bring more

traffic, including trucks near low-income households and communities of color impacted over generations by highway investment decisions mired in a legacy of inequitable policies.

- **Caltrans' Request to move forward with the No Build Alternative.** Caltrans' letter (February 7, 2022), from Director Tavares expressed concern moving forward with the build alternatives in their current form and recommended selecting the No Build Alternative as the Preferred Alternative in response to the long-standing concern about community displacement along the I-710 Corridor. In addition, Alternatives 5C and 7 are inconsistent with current State and Federal policies such as the California Transportation Agency (CalSTA) Climate Action Plan for Transportation Infrastructure (CAPTI) that was adopted in July 2021 and whose approach is to rethink highway expansion projects.

1.2 COMMUNITY OUTREACH AND EXTENSION OF COMMENT PERIOD

As described below, public outreach conducted for the project, which includes a public comment period and public hearings, was above and beyond what is legally required or regularly performed under CEQA, NEPA, and Caltrans guidance.

The public participation framework for the project is described in more detail in Section 5.8 of the Final EIR/EIS. Since the beginning of the EIR/EIS process in 2008, several advisory committees have convened on a regular or as-needed basis to provide feedback to the I-710 Corridor Project team. These committees mirror the community participation framework of the previous I-710 Major Corridor Study and include Local Advisory Committees, a Corridor Advisory Committee, a Technical Advisory Committee, a Project Committee, and an Executive Committee.

Several Local Advisory Committees (LACs) were established in several of the corridor cities and in unincorporated East Los Angeles by the respective city councils and by the County Supervisor in the case of East Los Angeles. LACs are largely made up of representatives from impacted neighborhoods and existing neighborhood-based associations. LACs are intended to focus strictly on issues related to the I-710 Corridor, its current and future impacts on their communities, and mitigation plans to reduce those impacts, as well as advising on ways and means to enhance communication between the project and the local community.

The Corridor Advisory Committee (CAC) was established as a broad-based corridor-wide body whose membership consisted of representatives of the LACs or a member appointed by the City Council or County Supervisor for those communities that do not have an LAC, representatives from the (currently defunct) Subject Working Groups, the Chair of the Technical Advisory Committee, and up to five stakeholders to be appointed by the Project Committee. The CAC was structured to represent both community and stakeholder interests within the I-710 Corridor.

The Technical Advisory Committee (TAC) provided a technical perspective within the committee structure and consists of a staff member with relevant expertise in the technical aspects of the project appointed by the City Manager, director, or administrator of each member agency of the

Project Committee, as well as representatives of the Federal Highway Administration (FHWA), the Federal Transit Administration (FTA), and the South Coast Air Quality Management District (SCAQMD).

For a Draft EIR, CEQA requires that the public review and comment period is at least 30 days and should be no longer than 60 days except under unusual circumstances. For a Draft EIR for which a state agency is the Lead Agency or Responsible Agency, CEQA requires a 45-day public review and comment period. For a Draft EIS, NEPA requires a 45-day public review and comment period. For a Draft EIR/EIS, Caltrans requires a minimum 45-day comment period, which complies with both CEQA and NEPA.

The Recirculated Draft Environmental Document was released for public review beginning on July 21, 2017 and lasting until October 23, 2017, a 90-day comment period. Therefore, the 45-day comment period required under CEQA, NEPA, and Caltrans guidance was extended to 90 days. During public review, Caltrans received requests for an extension of the review period to 120 days. However, in 2012, a Draft EIR/EIS was previously circulated for public review and comment for a 90-day period. The public review period for the RDEIR/SDEIS was originally 45 days, but extended to 90 days to maintain consistency with the Draft EIR/EIS.

CEQA does not require formal hearings at any stage of the environmental process. NEPA requires public meetings or hearings when there may be substantial environmental controversy concerning the environmental effects of the proposed action, a substantial interest in holding the meeting, or a request for a meeting by another agency with jurisdiction over the action.

Per the Caltrans Project Development Guidelines outlined in Chapter 11 of the Project Development Procedures Manual, public hearings are required for any projects that require significant right-of-way; require substantial changes to the layout or to the function of connecting roadways or facility being improved; have a significant adverse impact on abutting real property; or have a significant environmental, economic, social, or other effect. The Caltrans Project Development Guidelines do not include a requirement for the number of hearings that must be held for a project.

During the comment period, three formal public hearings were held: (1) on August 23, 2017, in the City of Commerce; (2) on August 26, 2017, in the City of Paramount; and (3) on August 31, 2017, in the City of Long Beach. In addition to the three formal public hearings, two community briefings were held on October 18, 2017, in East Los Angeles, and on October 19, 2017, in the City of Long Beach. The public hearings and community briefings provided the opportunity for the public to comment on the project, which fulfilled requirements under CEQA, NEPA, and Caltrans guidance. No additional public hearings are required for the project.

At the formal public hearings in August 2017, Caltrans and Metro employed court reporters to transcribe oral comments provided by attendees, as well as comments dictated directly to the transcriber. The transcripts of those comments and their responses are included in this appendix.

Additionally, physical comment cards and laptops at which attendees could submit comments to Caltrans' website online were made available at the hearings.

The community briefings in October 2017 were not considered formal hearings held by Caltrans; therefore, Caltrans and Metro did not provide court reporters to transcribe comments from the public. However, in the case of the community briefing in East Los Angeles, the Office of Los Angeles County Supervisor Hilda Solis (also the entity that hosted the meeting) contracted with a court reporter to transcribe the question-and-answer session that took place during the meeting, and submitted that transcript as a formal comment letter. That transcript can be found in this appendix, as Comment IP-19. Physical comment cards and laptops at which attendees could submit comments to Caltrans' website online were also made available at the community briefings and are included in this appendix.

1.3 I-710 Clean Truck Program

Both build alternatives evaluated in the RDEIR/SDEIS, Alternative 5C and Alternative 7, included a clean truck program that would provide subsidy funding to encourage the turnover of diesel trucks operating in the I-710 Corridor to zero- and near zero-emissions (ZE/NZE) trucks. In addition, Alternative 7 also included an option, called the ZE-Only Option, which presumed that all trucks using the freight corridor were zero-emissions trucks. More information regarding the I-710 Clean Truck Program is contained in Section 2.3.2.1 of the Final EIR/EIS.

As part of the air quality analysis performed for the build alternatives and the ZE Option of Alternative 7, it was determined that the number of "clean emissions" trucks that can be delivered in the I-710 Corridor ultimately depends upon available funding levels to help subsidize the purchase and deployment of NZE and/or ZE trucks.

The analysis presented in the RDEIR/SDEIS also showed that both the ZE-Only Option and the baseline description of Alternative 7 that included both ZE and NZE trucks would reduce diesel particulate matter and the associated cancer risk, by the same degree. The ZE-Only Option would reduce nitrogen oxides (NO_X) and tailpipe particulate matter emissions to a slightly lower level than the ZE/NZE Option. It is important to note that according to the Air Quality/Health Risk Assessment (AQ/HRA), the future increases in PM_{10} and $PM_{2.5}$ are predominantly due to entrained road dust, rather than tailpipe emissions. Therefore, for PM_{10} and $PM_{2.5}$, there would be only a negligible difference between the ZE-Only Option and the ZE/NZE Option of Alternative 7.

At Metro's Regular Board Meeting on March 1, 2018, the Metro Board approved a motion to change the ZE/NZE truck technology development program evaluated in the 2017 RDEIR/SDEIS to the phased-in "Zero Emission Truck Technology Development Program." The motion included increasing the program funding target from $100 million to $200 million, as well as the provision of incentives and grants investment to help accelerate zero-emission technologies both for long-hauling trucks and for zero-emission charging or fueling infrastructure within the I-710 Corridor. In April 2020, the Metro Board of Directors programmed $50 million in Metro-controlled funds to

provide funding for the initial deployment of the I-710 Clean Truck Program and to leverage the remaining funds required for full program implementation.

As noted in Chapter 2.0, Project Alternatives, of the Final EIR/EIS, the No Build Alternative (Alternative 1) has been selected as the Preferred Alternative; hence programmatic elements of the build alternatives, such as the I-710 Clean Truck Program will not be implemented by Caltrans as the Lead Agency under CEQA and NEPA and as the owner/operator of the I-710 freeway. Prior to selection of the No Build Alternative, the description of the I-710 Clean Truck Program was being further defined to include a proposed governance structure, roles and responsibilities for program oversight, and provisions related to program enforceability for the program. However, since a build alternative has not been selected as the Preferred Alternative, the I-710 Clean Truck Program will need to be developed and implemented following a process separate from this Final EIR/EIS should Metro and its partner agencies elect to proceed with these improvements at a future date.

1.4 AIR QUALITY

1.4.1 PROJECT LEVEL PARTICULATE MATTER CONFORMITY ANALYSIS

As noted in Chapter 2.0, Project Alternatives, of this Final EIR/EIS, the No Build Alternative was chosen as the Preferred Alternative due to a number of reasons including but not limited to the inability of the build alternatives to achieve project-level conformity determination for particulate matter. Details on how this determination was made for the build alternatives are provided below.

Prior to circulation of the 2012 Draft EIR/EIS, the I-710 Corridor Project build alternatives were determined to be a POAQC requiring a hot-spot analysis because they were considered to be: (i) a new or expanded highway project that had a significant number of or significant increase in diesel vehicles, and (ii) a project affecting intersections that are at level of service (LOS) D, E, or F with a significant number of diesel vehicles, or those that will change to LOS D, E, or F because of increased traffic volumes from a significant number of diesel vehicles related to the project. This was described in Section 3.13.3.1 of the 2012 Draft EIR/EIS. Hence a particulate matter (PM) hot-spot analysis would be required to demonstrate that the build alternatives met Federal project-level air quality conformity requirements. The Draft EIR/EIS and RDEIR/SDEIS both indicated that a project-level conformity analysis would be conducted for the Preferred Alternative following public circulation and prior to approval of the Final EIR/EIS. Consistent with Caltrans and FHWA guidance, project-level air quality conformity is not required for approval of a Draft EIR/EIS and, as such, was not required to be included in the RDEIR/SDEIS. However, air quality conformity is required for project approval or funding.

Some of the build alternatives analyzed in the 2012 Draft EIR/EIS assumed that ZE/NZE trucks would be commercially deployed and therefore in use in the I-710 Corridor at the time the project would be built; however, at that point in project development, the I-710 Corridor Project did not include a ZE/NZE truck program as a programmatic element. The assumption that the project was a POAQC was carried forward in the RDEIR/SDEIS even considering that the subsidy and

deployment of ZE/NZE trucks was included as a programmatic element of Alternatives 5C and 7, which serves as a commitment that ZE/NZE trucks would be deployed in the corridor should a build alternative be approved and constructed. Subsequent to circulation of the RDEIR/SDEIS, the description of the I-710 Clean Truck Program was further defined to include a proposed governance structure, roles and responsibilities for program oversight, and provisions related to program enforceability (for more information, see Section 2.3.2.1, Common Features of the Build Alternatives, and Appendix W of this Final EIR/EIS).

While project analysis showed the I-710 Clean Truck Program would reduce diesel truck trips in the I-710 Corridor in 2035, extensive discussions with the EPA indicated that Alternatives 5C and 7 must be considered a POAQC mainly because EPA staff stated that the enforceability provisions of the I-710 Clean Truck Program were not sufficient to ensure the projected reduction in 2035 diesel truck trips. Therefore, a hot-spot analysis was required for project-level air quality conformity determination. Preliminary results of the hot-spot analysis indicated that the two build alternatives would not pass project-level conformity for particulate matter, mostly because of increases in tire wear, brake wear, and entrained road dust, and would thus prevent a project-level conformity determination needed to approve a build project.

1.4.2 Air Quality Analysis Of Interim Years

As noted in Chapter 2.0, Project Alternatives, of this Final EIR/EIS, the No Build Alternative was chosen as the Preferred Alternative. Therefore, there is no need to discuss the potential for combined construction and operational emissions to be greater during the interim years than in the buildout year 2035. The construction of the build alternatives was assumed to begin between 2022 and 2024 and to be completed by horizon year 2035. As is typical during major freeway reconstruction projects in the Los Angeles metropolitan area, the I-710 freeway would continue to operate during the construction period. Hence, the build alternatives would not exist in any of the interim years between start of construction and 2035 and a comparison of the emissions with and without the build alternative in a particular interim year would be hypothetical and misleading.

According to the preliminary construction staging analysis prepared for Alternatives 5C and 7, the build alternatives were not projected to be built and operational by 2020, 2025, or 2030. Traffic volumes are highest under the build alternatives relative to the No Build condition. Also, it has been demonstrated that 2035 is the peak PM_{10}/$PM_{2.5}$ emissions year for operational emissions in the August 2018 White Paper, *I-710 Corridor Project: Selection of Analysis Year for Quantitative Particulate Matter Hot-Spot Analyses*, which was included as Appendix B of the August 2018 particulate matter conformity submittal to the Transportation Conformity Working Group. In essence, vehicle miles travelled (VMT) would increase during this period (as noted in SCAQMD's Final 2016 Air Quality Management Plan), while fleet-turnover to the cleanest current cars and trucks would be essentially complete by 2023 (as shown in EMFAC2014 and complete implementation of the California Air Resources Board's (CARB) Truck and Bus Rule by that date).

1.4.3 LOCALIZED IMPACTS OF PROJECT CONSTRUCTION EMISSIONS

As noted in Chapter 2.0, Project Alternatives, of this Final EIR/EIS, the No Build Alternative was chosen as the Preferred Alternative. Therefore, there is no need to discuss the localized air quality and health risk impacts of project construction of the build alternatives. Even if a build alternative had been chosen as the Preferred Alternative, the detailed final design, construction, and staging plans and equipment location and timing for building that alternative would not be determined until after the Final EIR/EIS and Record of Decision (ROD) are approved. Without location-specific construction activity information, modeling of location-specific air quality impacts is not possible and assumptions about those locations and the intensity/duration of construction activity at those locations would cause any dispersion modeling results (ambient or mobile source air toxics) to be speculative and misleading. The construction emissions scenarios for the build alternatives presented in the AQ/GHG/HRA Technical Study (2017) and summarized in Section 3.24, Construction Impacts, of the RDEIR/SDEIS and this Final EIR/EIS assume full build out of Alternatives 5C and 7, which represent a conservative (i.e., worst-case scenario) emissions analysis, drawn from the construction staging scenarios, in order to identify and disclose the range of potential impacts.

1.4.4 EMISSION FACTOR ASSUMPTIONS FOR ZE/NZE TRUCKS

The basis for determining ZE/NZE emission factors is presented in Section 7 of Appendix C to the *Air Quality, Greenhouse Gas, and Health Risk Assessment Technical Study* (AQ/GHG/HRA Technical Study) (June 2017) and the associated *Addendum to the Air Quality, Greenhouse Gas, and Health Risk Assessment Technical Study* (December 2020). The emission factor and fuel type for ZE/NZE trucks were determined through discussions with the SCAQMD, the CARB, and engine manufacturers. The air quality analysis conservatively (i.e., greatest potential emission impact) assumes that all ZE/NZE trucks would be NZE. NZE trucks would be non-diesel (diesel trucks have not been able to meet CARB's optional low-NO_X standard of 0.02 grams per brake horsepower-hour [gm/bhp-hr]), thereby reducing diesel particulate matter (DPM) to zero and NO_X emissions by 90 percent compared to conventional heavy-duty trucks (conventional heavy-duty trucks include light heavy-duty trucks, medium heavy-duty trucks, and heavy heavy-duty trucks). The EMFAC vehicle classes in these categories are presented in Table C1 of the AQ/GHG/HRA Technical Study. Fuel types for these vehicles are primarily diesel, but also include gasoline and natural gas trucks. The distribution across various fuel types for each heavy-duty trucks category was derived from EMFAC2014, which was used to develop the emissions factors for these vehicles. Further, and consistent with the CARB's EMFAC2014 emission factor program, it was conservatively assumed in the AQ/GHG/HRA Technical Study that NZE trucks would not reduce any other criteria air pollutant or greenhouse gas emissions as compared to a conventional heavy-duty truck. Additionally, no emission reduction credit was taken for further tailpipe reductions for pure ZE trucks that would be a component of the NZE/ZE truck program under Alternatives 5C and the baseline description of Alternative 7. However, the ZE option of Alternative 7 did assume that all trucks within the freight corridor would be ZE.

1.5 DISPLACEMENTS AND RELOCATIONS

As stated in Section 1.1 of this appendix, Caltrans, as lead agency under CEQA and NEPA (as assigned by the FHWA, in cooperation with Metro), has identified Alternative 1 (No Build) as the Preferred Alternative. Therefore, there would be no displacements or relocations in the Study Area communities. However, the information provided below describes the analysis undertaken by Caltrans and Metro for the two build alternatives that were evaluated in the 2017 RDEIR/SEIS.

1.5.1 ANALYSIS OF TAX REVENUE LOSS

Section 3.3.2.4 of the RDEIR/SDEIS provided an analysis that estimated the annual sales tax revenue losses to city, county, and State governments as a result of the acquisition of nonresidential parcels for the build alternatives. For the Preferred Alternative (No Build), there would be no loss in annual sales tax revenue. The potential losses in sales tax revenues were estimated using total taxable sales in county unincorporated areas and the affected cities in the Study Area. The analysis of tax losses in the RDEIR/SDEIS, whether property tax losses or sales tax losses, represented a conservative scenario that presumed all businesses or residences are not able to be relocated within their existing jurisdiction.

Property taxes in the Study Area are collected by the County of Los Angeles and apportioned to the incorporated cities in the County, including the affected cities in the Study Area. Property taxes are levied on the assessed value of privately owned property (the amount levied is approximately 1 percent of the assessed property value). The data used in the analysis provided in Section 3.3.2.4 of the RDEIR/SDEIS were provided by the Office of the Los Angeles County Tax Assessor for the property tax paid for each parcel that may be potentially acquired and relocated under the build alternatives in the Study Area cities. For that analysis, the property tax revenue is the total property tax amount collected by the Los Angeles County Tax Collector for each city before it is distributed to the City and other agencies. For full property acquisitions, the total amount paid in property tax was used for the analysis. For partial property acquisitions, only the percentage of the parcel that would be acquired was used to calculate the loss in property tax revenues. For example, if one of the partial acquisitions that require relocation would acquire 2 percent of the parcel, the calculated loss of property tax revenues for that parcel would be 2 percent of the total amount paid for the property tax. Estimates of property tax loss included in the RDEIR/SDEIS represent a worst-case estimate in that it is assumed that all properties either relocate outside of their existing local jurisdiction or do not relocate at all.

Individuals, families, businesses, and others that are required to relocate are protected under Caltrans' Relocation Assistance Program (RAP), as established by Federal and State law. Its primary objective is to assist all project displacees so that they do not suffer disproportionate injury as a result of a build alternative constructed for the benefit of the public. One goal of the relocation program is that both residential and non-residential relocations would occur within the affected communities under either of the build alternatives. However, since the No Build Alternative has been selected as the Preferred Alternative, then a relocation program would not apply as there would be no displacements.

1.5.2 Analysis of Replacement Properties

For the Preferred Alternative (No Build), there would be no displacements or relocations. For disclosure purposes, an analysis of both residential and non-residential replacement properties was provided in detail in the Draft Relocation Impact Report (DRIR) and summarized in Section 3.3.2.4 of the RDEIR/SDEIS and this Final EIR/EIS for the build alternatives. Proposed replacement sites for the displaced residential and non-residential tenants were identified within the federally mandated 50-mile radius for moving expense reimbursement and primarily fell within the boundaries of the displacement cities and communities. An analysis was also provided for those businesses where relocations was determined to be more complicated including two homeless shelters, gas stations, large warehouses, self-storage facilities, a fire station, and businesses with highly specialized operations. All replacement sites would require similarly zoned land that would facilitate similar business operations. Section F of the DRIR shows the estimated displacements by build alternative and Section H shows whether adequate relocation resources existed for the identified residential and non-residential properties. A diligent search for replacement units for both residential and non-residential occupants was conducted in the areas where displacements were anticipated to occur under each of the build alternatives and the research identified multiple potential replacement sites within or in close proximity of the impacted cities. The replacement areas were found to be comparable to the areas where displacement is anticipated to take place and these replacement areas would continue to offer the same types of amenities such as: public transportation, close proximity to education, employment, retail stores, and access to highways. The relocation resources were judged to be affordable to residential displacees given the use of replacement housing payments. However, it was found that resources would be needed in terms of availability and affordability to relocate all potential displaced tenant residents. The search area for replacement residential and non-residential units included the replacement area cities, surrounding communities which make up a geographic area 12 miles wide by 19 miles long. Depending upon when the properties that would have been acquired, in the analysis, consideration was given to include utilizing construction of replacement housing under the Last Resort Program. The RDEIR/SDEIS noted that available replacement properties would be evaluated once a preferred alternative was identified. As stated above in the introductory paragraph of Section 1.6, the No Build Alternative has been identified as the Preferred Alternative. Therefore, no displacements would occur and thus no relocations are necessary.

1.5.3 Impacts to Bell Shelter and Long Beach Multi-Service Center

In response to ongoing coordination with the Study Area communities and comments received on the Draft EIR/EIS and RDEIR/SDEIS, the project team worked to redesign the project build alternatives to avoid direct impacts to both the Bell Shelter and the Multi-Service Center (MSC). However, even with the redesign of the build alternatives, direct impacts to the MSC could not be avoided under one of the build alternatives - Alternative 7. As stated above in the introductory paragraph of Section 1.6, the No Build Alternative has been identified as the Preferred Alternative. There will be no impacts to the Bell Shelter or the MSC under the Preferred Alternative.

1.6 ARTERIAL PARKING RESTRICTIONS

The Arterial Parking Restriction Program described in the RDEIR/SDEIS was proposed as a programmatic project element of the build alternatives intended to be implemented in cooperation with the affected local jurisdictions. The parking restrictions were intended to increase traffic capacity by one additional through-lane in each direction at certain locations along the corridor during peak travel hours of the day.

The parking restriction program was initially proposed as part of all build alternatives because the operational change (the parking restriction during peak periods) would not require the construction or acquisition of additional right-of-way for these arterial roadways. Impacts to parking during these peak hours were analyzed and presented in the RDEIR/SDEIS in Section 3.3.1.3. However, feedback from the public and local agencies during the public circulation period of the RDEIR/SDEIS indicated a lack of support for the parking restrictions on these arterials. In addition, as described in detail in Section 1.1 of this appendix, the No Build Alternative has been selected as the Preferred Alternative. Therefore, the Arterial Parking Restriction Program has been eliminated from further consideration.

1.7 EARLY ACTION PROJECTS

For the past several years, Metro has been working with the Gateway Cities COG and the I-710 Corridor Technical Advisory Committee to identify and prioritize projects along the I-710 Corridor that could be classified as Early Action Projects to be advanced for execution prior to approval of a Preferred Alternative for the I-710 Corridor Project. To date, Early Action Projects associated with the I-710 study area have been administered by Metro, in collaboration with Caltrans and the Gateway Cities COG, and funded via Measure R. Because of the long planning timeframe of the overall I-710 Corridor Project, identifying and implementing Early Action Projects serves to help expedite needed operational improvements within the Study Area in advance of completion of the I-710 Corridor Project EIR/EIS.

Based on guidelines adopted by the I-710 Corridor TAC, proposed improvements associated within the I-710 Corridor Study Area may qualify as Early Action Projects if they: (1) are consistent with the I-710 Corridor planning process and objectives; (2) demonstrate independent utility; and (3) require no additional permanent right-of-way to construct, therefore requiring minimal environmental clearance. As such, improvements identified as Early Action Projects are considered independent projects from the I-710 Corridor EIR/EIS and are individually subject to CEQA and NEPA and the project development process.

Potential Early Action Projects associated with the I-710 Corridor may include soundwalls, local freeway interchanges, and arterial improvements. For example, the Shoemaker Bridge Replacement Project, the Firestone Boulevard Bridge Widening Project over the Los Angeles River, and the I-710 Early Action Soundwall Program are all designated as Early Action Projects because they meet the criteria described above. The respective local agencies are responsible for nominating projects for consideration by the I-710 Corridor TAC to make funding

recommendations to the Metro Board, and for leading these projects through the project development and environmental processes once funded.

1.8 MOTION 22.1

During the 2012 public circulation period of the DEIR/DEIS, comments received from the public and agencies indicated strong support for the creation and inclusion of another alternative that retained the ZE/NZE freight corridor, but did not add general purpose lanes on I-710. The U.S. Environmental Protection Agency (USEPA), in its comment letter on the 2012 DEIR/DEIS, recommended the analysis of a build alternative that would include a zero-emission freight corridor with no widening of I-710 general purpose lanes. The Coalition for Environmental Health and Justice (CEHAJ), a coalition of organizations, associations, and community groups working to achieve environmental justice, community health, and overall quality of life in the study area, put forth a detailed and comprehensive proposal of an alternative called "Community Alternative 7" (CA-7) as a formal comment on the 2012 Draft EIR/EIS, and requested that it be analyzed as a stand-alone build alternative.

CA-7 essentially described a corridor program involving several elements, including freeway improvements (no additional general purpose lanes but addition of a mandatory zero-emission freight corridor operated by a public-private partnership), comprehensive public transit element, improvements to the Los Angeles River, a comprehensive pedestrian and bicycle element, and community benefits. The scope and scale of the CA-7 program extended far beyond the I-710 Corridor Project Purpose and Need and scope of the highway project as described in both the DEIR/DEIS and RDEIR/SDEIS. For example, Los Angeles River improvements were defined in CA-7 as "restoration of the natural river functions, including recreational trails, restored wetlands, continuous fish migration corridors, and native landscaping."[1] Although Caltrans and Metro are supportive of these objectives and their benefits for corridor residents, the Los Angeles River channel is the sole jurisdiction of the United States Army Corps of Engineers (USACE), and neither Caltrans nor Metro has the authority to implement such improvements. Similarly, the implementation of "road diets" and other traffic calming treatments on principal arterial and collector streets throughout the corridor study area — although certainly beneficial to non-motorized vehicle users — are subject to the local decision-making authority of the cities and local jurisdictions who own and operate these arterial roadways.

In parallel with the ongoing coordination and communication between CEHAJ and the I-710 Project Team, community members worked with the office of Los Angeles County Supervisor Hilda Solis to continue the effort to evaluate CA-7 as a stand-alone alternative in the RDEIR/SDEIS. As a result, the Metro Board of Directors passed Board Motion 22.1 in October

[1] CEHAJ comment letter on the 2012 DEIR/DEIS (IP-22).

2015. The full text of Motion 22.1 can be found at https://media.metro.net/projects_studies/I710/images/CAC_Presentation_2015_1029_Metro_Board_Report_Oct-2015.pdf.

Motion 22.1 split up the various components of CA-7 and instructed Metro staff, in coordination with Caltrans, Gateway Cities COG, and other partner and responsible agencies, to examine several elements of CA-7 outside, but in parallel to, the I-710 Corridor Project environmental process. These elements included, but were not limited to, the following: a zero-emission truck procurement and operations program, the addition of bus stops with access points to bicycle paths, and the goal of working with community groups to develop a Local and Targeted Hiring Policy and Project Labor Agreement for construction jobs and a First Source Hiring Policy for permanent jobs created by the I-710 Corridor Project.

Many elements of CA-7 were appropriate for the project-level EIR/EIS and were incorporated into the I-710 Corridor project analysis as a result of Motion 22.1. Alternative 7 was developed and evaluated in the RDEIR/SDEIS and most directly addressed the component of CA-7 that mandated no additional general purpose lanes on I-710 with a freight-only corridor. To address the mandatory zero-emission freight corridor, Design Option 7ZE, a zero-emission only freight corridor option, was also evaluated in the RDEIR/SDEIS. The identification of up to five new pedestrian/bicycle-only bridges crossing I-710, I-405, and/or the Los Angeles River were added to the scope of both build alternatives. Programmatic elements including enhanced transit, a Clean Truck Program, and a Community Health Benefit Program were also added as elements of the project description of Alternatives 5C and 7, to be implemented if and when a build alternative was approved and constructed. Were it not for the introduction of CA-7, it is likely that Alternative 7 would not have been designed and carried forward for study in the RDEIR/SDEIS. Table 2.2-1 in Chapter 2 of the Final EIR/EIS lists the elements of Motion 22.1 that are addressed within the I-710 Corridor project analysis and where the discussion can be found in the EIR/EIS.

1.9 ALAMEDA CORRIDOR

A number of comments received on the RDEIR/SDEIS questioned the need for improvements to I-710 if the Alameda Corridor is not currently operating at full capacity. The Alameda Corridor, which opened in 2002, is a 20-mile freight rail facility connecting the Ports of Los Angeles and Long Beach with the transcontinental rail system east of downtown Los Angeles. The Alameda Corridor is restricted to rail traffic only.

The Alameda Corridor may appear to be currently underutilized because it was designed to handle projected cargo volumes up to the year 2030 and beyond, with a capacity of about 150 trains per day. The number of trains per day using the Alameda Corridor peaked at an average of 55 trains per day in 2006, prior to the global economic recession that began in 2007. The corridor averaged about 30 trains per day in 2021, although it is important to note that average

train lengths have continued to increase in size since 2006.[2] Based on scenarios developed for the I-710 Corridor Project analysis, the Alameda Corridor is projected to reach nearly 100 trains per day by 2035. This represents approximately two-thirds of the approximately 150-train-per day corridor capacity.

According to cargo forecasts utilized in the analysis for the I-710 Corridor Project, the future horizon year forecast for cargo volume at the two Ports was projected to be nearly 41.4 million twenty-foot equivalents (TEUs) by 2035. Maximum goods movement by rail is an underlying assumption of all the alternatives analyzed in the I-710 Corridor Project EIR/EIS. For the future year (2035), the estimates showed that 40 percent of Port container traffic will be carried by rail, either on-dock (30.5 percent) where trains are loaded and formed within the marine terminals, or at near-dock/off-dock rail facilities (9.5 percent) where containers are carried by truck to rail facilities near the Ports or within the Los Angeles region.

With regard to future demand for cargo containers to be transported to and from the Ports by rail, the *Final Technical Memorandum – I-710 Railroad Goods Movement Study* (URS, February 2009) found that although the rail operators have implemented a variety of operational strategies to meet container demand from the Ports, including using longer trains with higher utilization rates, the freight railroad system alone will not be able to handle the total container demand.

The Alameda Corridor represents an important leg within the overall freight rail system that moves cargo to and from the Ports. However, there are constraints, both upstream and downstream of the Alameda Corridor, that limit the ability of the overall rail system to handle freight beyond a 40 percent share of Port container traffic in the future. While there is a clear desire to increase the percentage of on-dock rail, there is not enough physical space within the marine terminals to load and build trains to meet projected demand without further physical expansion of the Ports' footprint. The San Pedro Bay Ports have recently undertaken additional rail studies to examine ways to further maximize efficiencies of terminal operations to boost train operations to the greatest extent feasible.

The vast majority of trains that originate at the Ports and that utilize the Alameda Corridor travel east through Los Angeles, Riverside, and San Bernardino Counties. The capacities of these rail lines are also projected to be constrained in light of future cargo demand, due to numerous at-grade crossings, competition with passenger rail trains, and other downstream bottlenecks attributable to insufficient mainline trackage at certain locations within the Los Angeles Basin.

However, the primary reason why the Alameda Corridor does not serve all of the Port cargo trips within the region is because many of these trips (60 percent of the cargo in 2035) are either true local truck trips or they are transload-secondary trips. Freight rail is a less expensive mode for

[2] Alameda Corridor Transportation Authority. 2021. Corridor Train Counts. Website: https://www.acta.org/wp-content/uploads/2022/07/Train_Counts.pdf (accessed November 9, 2022).

transporting cargo containers destined for inland locations more than 550 miles from the Ports. Conversely, shorter, highly dispersed trips throughout the SCAG region (i.e., true local truck trips and transload-secondary trips) can only be served by trucks using the region's freeway and roadway network.

A true local truck trip is a truck trip from the Ports to a local warehouse or distribution center or retail store within the SCAG region. Based on the analysis conducted for the RDEIR/SDEIS, approximately 80 percent of the local Port truck trips (i.e., those trips that originate at the Ports) are destined to locations within 20 miles of the Ports; 16 percent are headed to the Inland Empire or Orange County, and the remaining 4 percent to North Los Angeles County/San Gabriel Valley or other local destinations within the region.

Transloading takes place when cargo in international containers is transferred to domestic containers at transload centers or warehousing located throughout the SCAG region. Once transloaded (at that point becoming a transload-secondary trip), cargo within domestic containers is carried by truck to other destinations within the region, or it is carried by truck to intermodal (off-dock) rail yards within the region for transport by freight rail. These secondary trips are more dispersed throughout the region, relative to true local Port truck trips. The analysis showed that, in total, 64 percent of the cargo-related transload secondary truck trips are destined to an area within 20 miles of the Ports, over 17 percent are headed to the Inland Empire or Orange County, and the remaining 19 percent travel to North Los Angeles County/the San Gabriel Valley, Ventura County, and/or Imperial County. According to analyses presented in SCAG's 2012 and 2016 Regional Transportation Plans (Goods Movement Appendices), truck patterns will only become more dispersed in the future.

The Alameda Corridor EIR (January 1993) and EIS (February 1996) forecasted that the Alameda Corridor project would help slow the future increase in truck traffic to and from the Ports, including traffic on I-710, but would not reduce the absolute number of truck trips to and from the Ports. Continued improvements to the overall freight rail network within the SCAG region, implementation of planned near-dock intermodal facilities, and additional operational efficiencies at the Ports will also help alleviate future truck traffic on I-710 in minor ways. However, projections show that continued growth within the region (population, employment, and economic activity), local demand for goods and products, patterns of cargo origin and destination points, logistics and economics associated with the movement of goods, and aging infrastructure will continue to result in serious congestion and safety issues on the I-710 freeway.

1.10 COMMUNITY HEALTH BENEFIT PROGRAM

The I-710 Corridor lies within a varied mix of land uses and facilities including the Ports of Los Angeles and Long Beach, highways and arterial roadways, heavy rail, regulatory floodway, and commercial and industrial uses (including producing oil fields), in many cases nearby or directly adjacent to residential neighborhoods. Caltrans and Metro acknowledge that the communities

residing in the I-710 Corridor currently face a unique set of issues related to the usage of the corridor for goods movement and other related and unrelated industries.

The Community Health Benefit Program was originally conceived in response to public comments received on the 2012 Draft EIR/EIS. The Coalition for Environmental Health and Justice (CEHAJ), a consortium of community and activist groups, submitted a comment letter on the Draft EIR/EIS proposing a new alternative consisting of a program of projects on and near I-710 called Community Alternative 7 (CA-7). One component of that program, Component CA7.7, proposed a collection of "Community Benefits and Enhancements" to be included within the scope of the I-710 Corridor Project. These benefits and enhancements included:

- Neighborhood Services, Facilities, and Amenities
- Existing Parks
- Linking the LA River and Parks, Greenbelts, and Connections
- Healthier Schools
- Air Filtration
- Trees and Streetscapes
- Pedestrian and Bicycle Improvements
- Pedestrian Bridges
- Traffic and Parking
- Public Art

The details of these requested benefits and enhancements can be found in Appendix S of the RDEIR/SDEIS (specifically, Comment IP-22-10). Wherever possible and appropriate to do so, elements of Component CA7.7 were incorporated into the project description of the revised build alternatives. For example, bicycle and pedestrian-only bridges spanning I-710, I-405, and/or the Los Angeles River were incorporated into the design of Alternative 5C and Alternative 7. See Section 2.3.2 of this Final EIR/EIS for more detailed information regarding these bridges. However, many of the requested elements lie outside the jurisdiction and purview of transportation agencies such as Caltrans and Metro. For example, traffic signal upgrades, traffic calming measures and on- and off-street parking solutions proposed as part of the "traffic and parking" element listed above are under the jurisdiction of the local agencies (i.e., cities and the County of Los Angeles). Therefore, many of the benefits and enhancements listed in Component CA7.7 were far beyond the scope of a project-level environmental document intended to evaluate the impacts of a freeway project, and therefore could not feasibly be incorporated into the revised build alternatives.

The description of the I-710 Community Health Benefit Program included in the build alternatives was structured to provide funding for community projects and programs that have a nexus to travel on and operation of the I-710 freeway. Specifically, the Community Health Benefit Program would provide corridor communities the opportunity to implement projects or educational outreach activities that would improve public health related to I-710 travel and goods movement. Eligible projects and outreach activities for the program would fall into the following categories:

- Air quality improvements (eligible projects may include doors and/or windows replacement, installation of air filters and HVAC, buffer parks and open space, trees and landscaping. In some cases, noise reduction may be a co-benefit of these types of projects.)

- Greenhouse gas reduction (eligible projects may include energy efficiency updates and renewable energy projects).

- Health education and screening (eligible projects may include community health screening, education and/or outreach, such as mobile clinics).

Per the description of the Community Health Benefit Program, eligible program applicants would include governmental organizations (including but not limited to corridor cities, the County of Los Angeles, and school districts), daycare centers, community health providers, senior centers, and non-profit organizations geared towards air quality or public health issues, located within or serving populations within the Study Area.

The Community Health Benefit Program was included as part of the project description of the build alternatives and was intended as an enhancement program for communities that currently live in areas impacted by operation of the I-710. The program was not intended to mitigate for impacts resulting from the build alternatives as avoidance, minimization, and/or mitigation measures proposed for Alternatives 5C and 7 are identified and discussed throughout this Final EIR/EIS according to each applicable environmental resource area.

As noted in Chapter 2.0, Project Alternatives, of the Final EIR/EIS, the No Build Alternative (Alternative 1) has been selected as the Preferred Alternative. Therefore, the programmatic elements of the build alternatives, such as the Community Health Benefit Program, will not be implemented by Caltrans as the Lead Agency under CEQA and NEPA and as the owner/operator of the I-710 freeway. Prior to selection of the No Build Alternative, the description of the Community Health Benefit Program was being further defined including information regarding administration of the program, eligible projects, and project selection criteria. However, since a build alternative has not been selected as the Preferred Alternative, the Community Health Benefit Program will need to be developed and implemented following a process separate from this Final EIR/EIS should Metro or Caltrans or one of the partner agencies elect to proceed with the delivery of this program at a future date.

September 27, 2017

Mr. Phillip Washington
Chief Executive Officer
Metro
One Gateway Plaza
Los Angeles, CA 90012

Ms. Carrie Bowen
District Director
Caltrans, District 7
100 S. Main Street, Suite 100
Los Angeles, CA 90012

Dear Mr. Washington and Ms. Bowen:

I write to express my strong support of the request by my 40th Congressional District constituents, and those of surrounding communities, to extend the recirculation period for the I-710 Corridor Project Recirculated Draft Environmental Impact Report / Supplemental Draft Environmental Impact Statement (RDEIR/SDEIS) from the current 90-day comment period to 120 days.

I am aware of the 30-day increase to the comment period from the original 60-day period. However, I am greatly concerned about the homes, businesses and other properties that would be acquired by eminent domain. The resulting impact to the potentially affected residents and owners in the City of Bell Gardens, City of Commerce and the East Los Angeles community (East LA) must be fully reviewed and discussed in a public setting. To that point, various groups in these communities have communicated their need for more time to fully review and understand the impacts of the proposed alternatives. F-1-1

Because there was no hearing in the heart of East LA, the owners of the East LA properties proposed to be taken for the various alternatives, as well as local residents who would be affected by construction overall, understandably feel they have once again been ignored by Metro and Caltrans.

It is my understanding that East LA is also concerned that the some of the options listed in the Transportation Demand Management / Transportation Systems Management (TDM/TSM) plan to convert current parking lanes into designated bus travel lanes during peak travel hours will have a negative impact for businesses on Atlantic Avenue. Further, if patrons of these businesses park on the side streets just off of Atlantic, residents and homeowners who live on *those* streets will have an even more difficult time finding parking in their own neighborhood. F-1-2

If you will recall, East LA also felt that Metro had not consulted them when evaluating all of the options being studied for the Eastside Gold Line Phase II project. Also, according to some of the members of the 710 East Los Angeles-Local Advisory Committee (ELA-LAC), they have not received a detailed briefing from Metro/Caltrans on the RDEIR/SDEIS nor the TDM/TSM options. F-1-3

Therefore, I am also requesting that a hearing be held at Humphreys Elementary School, as per their request. Given the possible construction challenges that the East LA community could face over the next 30 years and the extensions and delays afforded other projects, most notably the SR-710 with decades long delay in addressing the I-710 gap, this is the very least we can do. F-1-4

Thank you for your consideration. I look forward to a favorable response that will address the issues raised by my constituents over the length of the comment period and the need for a hearing in East Los Angeles.

Sincerely,

Lucille Roybal-Allard

LUCILLE ROYBAL-ALLARD
Member of Congress

LRA:ktc

F-1-1

Please refer to Section 1.2 of this appendix for more information regarding the extension of the public comment period.

F-1-2

The arterial parking restrictions proposed as part of the build alternatives have not been included in the design of the Preferred Alternative. Please refer to Section 1.6 of this appendix for more detailed information regarding the parking restrictions proposed as part of build alternatives.

F-1-3

Please refer to Section 1.2 of this appendix for more information regarding the outreach and coordination efforts over the life of the project development process, including the role of the various Local Advisory Committees (LAC). The East Los Angeles LAC was briefed regarding proposed Options 3A and 3B of the build alternatives on August 29, 2017. The East Los Angeles LAC was also briefed on the RDEIR/SDEIS with a focus on the benefits and impacts of the build alternatives on October 5, 2017. In addition to the meetings with the East Los Angeles LAC, a meeting was also held with the Sydney neighborhood on September 7, 2017.

The Transportation System Management/Transportation Demand Management (TSM/TDM) elements of the build alternatives are presented in Section 2.3.2.1, Common Features of the Build Alternatives, of the RDEIR/SDEIS, including the proposed transit improvements that would be provided as part of the build alternatives. This information was presented to the East Los Angeles LAC at the meeting of August 29, 2017.

F-1-4

In response to the requests for an additional public hearing, Metro and the Project Team provided support for a meeting held on October 18, 2017, at Humphreys Avenue Elementary School in East Los Angeles hosted by Los Angeles County Supervisor Hilda Solis. Although not a formal public hearing per the requirements of the Caltrans Project Development Procedures Manual, a presentation regarding the project was given, and an open question-and-answer period was held so that attendees wishing to speak were given the opportunity to do so. In addition, the office of Supervisor Solis procured a court reporter to record the question-and-answer session, and following the meeting, submitted the transcript of the meeting as a formal comment on the project. That submittal and the responses to those comments can be found as Comment IP-19 in this appendix. In addition to Supervisor Solis' office providing a court reporter, the Project Team made the RDEIR/SDEIS and full suite of technical studies available at the meeting, as well as comment cards and laptop stations at which attendees could provide comments online regarding the RDEIR/SDEIS.

16591
Los Angeles River (3.9)(4.2)(4.7)
September 12, 2017

California Department of Transportation, District 7
Division of Environmental Planning
Attn: Jason Roach
100 South Main St, MS 16-A
Los Angeles, CA 90012

Dear Mr. Roach:

I have completed my review of the I-710 Corridor Project DEIS, dated July 2017, which includes replacement/modification of bridges over the Los Angeles River, Los Angeles County, California.

The Los Angeles River, from the mouth to mile 4.7, is subject to tidal influence and is considered navigable by Coast Guard standards.

The proposed replacement of the Shoemaker Bridge (West Shoreline Dr) at mile 3.9, the Anaheim St. Bridge at mile 4.2, and the Pacific Coast Highway Bridge at mile 4.7, fall under Coast Guard jurisdiction.

The General Bridge Act of 1946 requires the approval of the location and plans of bridges prior to the start of construction (33 U.S.C. 525). The Commandant of the Coast Guard has given "Advance Approval" to the location and plans of bridges to be constructed across reaches of waterways considered navigable, but not actually navigated by other than logs, log rafts, rowboats, canoes and small motorboats. In such cases, the clearances provided for high water stages will be considered adequate to meet the reasonable needs of navigation (33 CFR 115.70). F-2-1

I have determined that the Los Angeles River, at the Shoemaker Bridge (West Shoreline Dr) at mile 3.9, the Anaheim St. Bridge at mile 4.2, and the Pacific Coast Highway Bridge at mile 4.7 replacement sites, conforms to advance approval criteria under 33 CFR 115.70.

An individual Coast Guard bridge permit will not be required for these replacement projects (COMDTINST 16590.5C). This does not relieve the applicant from complying with all applicable federal, state and local laws and associated permit requirements. This review is valid for a period of 3 years from the date of this letter. If the character of navigation changes, such that the waterway no longer meets advance approval criteria, the Coast Guard will promptly withdraw the advance approval designation for this project and notify all interested parties. F-2-2

The Los Angeles River, upstream of mile 4.7, is not considered navigable by Coast Guard standards. Under the provisions of the Coast Guard Authorization Act of 1982, the Coast Guard has determined that all proposed new/replacement bridges upstream of the Pacific Coast Highway Bridge do not require Coast Guard involvement for bridge permitting purposes.

The Coast Guard is the only federal agency authorized to issue federal permits for bridges under the General Bridge Act of 1946, as amended.

Photographs and as-built drawings (plan & elevation), of the replacement bridges on 8 1/2 x 11-inch format, are required upon completion of the construction. The drawings must indicate the elevation of the lowest hittable part of the bridge above mean high water and horizontal clearance available for navigation, pier face to pier face or abutment to abutment. F-2-3

Please notify my office at least 30 days prior to beginning and upon completion of the over-water portions of these replacement projects, so I can provide the appropriate notices to mariners.

I can be contacted by telephone at (510) 437-3516 or by email Carl.T.Hausner@uscg.mil to discuss this project.

Sincerely

C. T. HAUSNER
Chief, Bridge Section
Eleventh Coast Guard District
By direction of the District Commander

F-2-1

Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), has identified Alternative 1 (No Build) as the Preferred Alternative, which is discussed in more detail in Section 1.1 of this appendix. Therefore, approval from the U.S. Coast Guard regarding the plans for bridges within areas of U.S. Coast Guard jurisdiction will not be necessary.

F-2-2

It is acknowledged that although an individual U.S. Coast Guard bridge permit is not required for the Shoemaker Bridge, the Anaheim Street Bridge, or the Pacific Coast Highway Bridge over the Los Angeles River, the location and plans for these bridges require U.S. Coast Guard approval prior to construction. Bridges upstream of the Pacific Coast Highway Bridge do not require U.S. Coast Guard approval because the Los Angeles River above the Pacific Coast Highway Bridge is not considered navigable. This comment letter serves as the Commandment of the U.S. Coast Guard's "Advanced Approval" for these bridges and is valid for a period of three years from the date of the comment letter (September 12, 2017). Please refer to Response to Comment F-2-1 regarding the selection of the No Build Alternative as the Preferred Alternative and the need to notify the U.S. Coast Guard.

F-2-3

Please refer to Response to Comment F-2-1 regarding the selection of the No Build Alternative as the Preferred Alternative and the need to notify the U.S. Coast Guard.

IN REPLY REFER TO:
(ER 17/0352)

Filed Electronically

October 23, 2017

Ronald Kosinski, Deputy District Director
Caltrans District 7, Division of Environmental Planning
100 South Main Street, MS16A
Los Angeles, CA 90012

Subject: Supplemental Draft EIS and Section 4(f) Evaluation I-710 Corridor Project from Ocean Boulevard to State Route 60, City of Los Angeles, CA

Dear Deputy Director Kosinski;

The Department of the Interior (Department), through the U.S. Fish and Wildlife Service (Service), has reviewed the above referenced Recirculated Draft Environmental Impact Report / Supplemental Draft Environmental Impact Statement (SDEIS), dated July 2017. The primary concern and mandate for the Service is the protection of public fish and wildlife resources and their habitats. The Service has legal responsibility for the welfare of migratory birds, anadromous fish, and endangered animals and plants occurring in the United States and is also responsible for administering the Endangered Species Act of 1973 (Act), as amended (16 U.S.C. 1531 *et seq.*). The Service is a Participating Agency, as defined in 23 USC 139 Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU), for this project.

The Project is receiving Federal funding through the Federal Highway Administration (FHWA). The California Department of Transportation (Caltrans) has assumed FHWA's responsibilities under the Act in accordance with Renewed 23 U.S.C. 326 and 23 U.S.C. 327 and as described in the National Environmental Policy Act assignment Memorandum of Understanding between FHWA and Caltrans (effective October 1, 2012).

The project as proposed would increase traffic capacity on I-710 through the widening of the mainline by adding mixed-flow lanes (one in each direction) between I-405 and State Route 60 (SR-60) and adding truck bypass lanes through I-405 (Alternative 5C); or, the addition of two separate truck-only lanes in each direction between the cities of Long Beach and Commerce, adjacent to the freeway (Alternative 7). We offer the following comments to assist Caltrans in avoiding, minimizing, and providing adequate conservation to offset project-related impacts to fish and wildlife resources:

General Comments

Our main concern regarding the proposed project is its potential to impact migratory birds and their habitats, including the federally endangered California least tern (*Sternula antillarum browni*) and the federally threatened western snowy plover (*Charadrius alexandrinus nivosus*). The Los Angeles River, from its mouth to Interstate 105, and to a lesser extent to SR-60, is the premier spot in Los Angeles County for migrant shorebirds, with single day counts numbering up to 15,000 individual birds (Garrett 2008, pers. comm.). According to the U.S. Shorebird Conservation Plan (Page and Shuford 2000, page 31), "Once part of one of the largest flood plains in the United States, the Los Angeles River is now entirely channelized and operated primarily as a flood control facility by the Los Angeles Department of Water and Power and the U.S. Army Corps of Engineers. Within the intertidal portion of the river, extending inland from the mouth about 2.6 miles to the Willow Street crossing in Long Beach, are approximately 234 acres of wetlands, which provide shorebird habitat when water levels are low. Although the river upstream of Willow Street has a cement bottom, a 4-mile stretch, equivalent to about 40 acres of river channel, annually holds thousands of shorebirds during migration (L. Hays pers. comm.)."

It is unclear whether the proposed project will require the relocation of utilities into the Los Angeles River channel, as previously proposed in the 2012 DEIS, which will result in the removal of river channel, the conversion of existing concrete trapezoidal channel to vertical channel walls along part of the river, and the construction of a series of box culverts that will support utility towers. We are concerned that such modifications to the river channel could increase the velocity of flood flows, reducing sedimentation and increasing scour downstream in the sensitive wetland habitats that are used by migratory and federally endangered bird species. F-3-1

Specific Comments

Page 3.16-10: According to Table 3.16-2, build alternatives will result in impacts to 44.5 or 59.81 acres of riparian/riverine habitats (Alternatives 5C and 7, respectively). We appreciate the commitment (measure NC-1) to restore temporary impact areas and to offset the permanent impacts of the project to native habitats at a minimum 2:1 ratio. According to Table 3.16-2, the permanent indirect impacts of the project resulting from bridge and freight corridor shading will be substantial. Shading from transportation infrastructure has been documented to affect estuarine habitats by reducing the density and diversity of benthic invertebrates (Struck et al. 2004), which could affect foraging by migratory and endangered bird species. As the proposed shading impacts of the project are permanent impacts, we recommend that they be offset in accordance with measure NC-1. F-3-2

Page 3.19-33: We appreciate the incorporation of measure AS-1, which will ensure that new replacement and renovated bridges associated with the project will be designed to ensure the safety of birds flying up and down the Los Angeles River through the incorporation of bridge fencing or other structural features that will direct birds over traffic. We recommend review and approval of the final build design by the Service. F-3-3

Page 3.20-15: In reference to western snowy plover, the SDEIS states that, "occasional visitors are seen along the lower Los Angeles River" but then concludes that the species is absent from the project area. As the plover is known to use the habitat within the Los Angeles River that may be affected by the project, we recommend that this statement be revised. F-3-4

Page 3.20-16: The SDEIS states that the federally endangered least Bell's vireo (*Vireo bellii pusillus*), "Has recently been recorded at DeForest Park and the ponds south of Del Amo Ave," but then concludes that the species is absent from the project area. We recommend that this statement be revised. If the project will result in any permanent, temporary, or indirect effects to habitats known to be occupied by the vireo, we recommend that the final SDEIS be revised to address potential impacts to this species. F-3-5

Page 3.20-25: The SDEIS states that measures are being incorporated to avoid and minimize effects to the western snowy plover and states that the project is "not likely to adversely affect this species" but does not address potential impacts to the least Bell's vireo. We recommend that least Bell's vireo be added to the Environmental Consequences section. In addition, we recommend that you coordinate with the Service to determine if consultation pursuant to section 7 of the Act is needed to address potential effects to the western snowy plover and the least Bell's vireo. Through the consultation process, we will work with you to refine and memorialize conservation measures to avoid and minimize potential effects to these species. F-3-6

Please contact Colleen Draguesku of the Carlsbad Fish and Wildlife Office at 760-431-9440, extension 241 for assistance in regard to these comments and this project. If you have further questions, please call me at (415) 420-0524.

Sincerely,

Janet L Whitlock

This page intentionally left blank

F-3-1

Alternatives 5C and 7 do not require the relocation of the Los Angeles Department of Water and Power towers into the Los Angeles River as was proposed under Alternatives 6A, 6B, and 6C in the 2012 Draft EIR/EIS. As stated in Section 3.8.3.1, Alternatives 5C and 7 consist of highway improvements that would require encroachments within the 100-year floodplain of the Los Angeles River, Compton Creek, and the Rio Hondo Channel as part of the bridge and levee improvements. According to the *Flood Control Facilities Report* (2017), Alternatives 5C and 7 would not change the capacity of the Los Angeles River, Compton Creek, or the Rio Hondo Channel to carry water or result in a measurable impact to the 100-year floodplain elevation. The encroachments would not result in any adverse impacts on the natural and beneficial floodplain values, would not result in a substantial change in flood risk or damage, and would not have potential to cause interruption or termination of emergency services or emergency routes. Therefore, Alternatives 5C and 7 do not constitute a significant floodplain encroachment as defined in 23 Code of Federal Regulations (CFR) 650.105(q). Because new piers proposed as part of the build alternatives would mimic the existing pier configurations upstream and downstream, there would be no substantial effects to the water surface elevation, velocity of flood flows, sedimentation, or scour in the vicinity of the new piers.

F-3-2

As stated in Measure NC-1 in Section 3.16.4 of this Final EIR/EIS, if a build alternative is selected as the Preferred Alternative, permanent impacts to estuarine and riparian/riverine habitat would be replaced on- or off-site at a minimum 2:1 ratio with in-kind habitat. Permanent impacts to these habitat types associated with shading of areas below the bridges or elevated roads would be offset in accordance with Measure NC-1.

F-3-3

Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), has identified Alternative 1 (No Build) as the Preferred Alternative, which is discussed in more detail in Section 1.1 of this appendix. Therefore, there is no need to provide the United States Fish and Wildlife Service (USFWS) an opportunity to review and provide input on the final bridge designs.

F-3-4

The conclusion of "absent" pertains to nesting habitat and to the fact that the species was not observed during surveys conducted for the proposed project. Snowy plover records on eBird are from late July and August, the post-breeding season for the species. As suggested under the "Status Federal/State" column in Table 3.20-2 with the inclusion of "(nesting)", the occurrence of nesting sites, not necessarily occurrences during migration foraging stops, are of interest and are

tracked under the California Natural Diversity Database (CNDDB). Therefore, because there is no nesting habitat within the project area and because the species was not observed during biological surveys conducted for the proposed project, the conclusion of "absent" was made.

F-3-5

The conclusion of "absent" pertains to nesting habitat and to the fact that the species was not observed during surveys conducted for the proposed project. As suggested under the "Status Federal/State" column in Table 3.20-2 with the inclusion of "(nesting)", the occurrence of nesting sites, not necessarily occurrences during migration foraging stops, are of interest and are tracked under the CNDDB. At the time the document was written, there was only marginally suitable nesting habitat within the project area and there were no records of least Bell's vireo occurring near the project area during the species' nesting season; thus, the conclusion of "absent" was made. However, recent habitat restoration projects adjacent to the Los Angeles River have resulted in the establishment of more suitable nesting habitat for least Bell's vireo and there are several recent eBird records in which the species was observed during the breeding season within the vicinity of the project area. Although there are currently no available records of least Bell's vireo nesting in these areas, suitable habitat is expanding and improving, and it is reasonable to expect that the species may begin nesting within or adjacent to the project area in the near future. As such, the conclusion regarding presence/absence has been revised, and this Final EIR/EIS has been revised to consider potential impacts to least Bell's vireo.

F-3-6

As stated in Response to Comment F-3-5, habitat suitability for least Bell's vireo has improved within and adjacent to the project area since the document was written and the species has recently been recorded in these areas during the breeding season, though nesting has not yet been documented. As such, the Environmental Consequences section in Section 3.20 of this Final EIR/EIS has been revised to address potential impacts to least Bell's vireo, and avoidance and minimization measures have also been added to this Final EIR/EIS. Informal consultation with the USFWS was initiated by Caltrans as assigned by the FHWA pursuant to the Federal Endangered Species Act (FESA) with submittal of the Biological Assessment in November 2018. In their response letter dated May 2, 2019, the USFWS concurred on the "may affect but not likely to adversely affect" determination for least Bell's vireo, as well as for western snowy plover and California least tern. However, Caltrans, as lead agency under CEQA and NEPA (as assigned by the FHWA), in cooperation with Metro, has identified Alternative 1 (No Build) as the Preferred Alternative, which is discussed in more detail in Section 1.1 of this appendix. Therefore, there will be no impacts to least Bell's vireo, western snowy plover, and California least tern as a result of the Preferred Alternative.

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY
REGION IX
75 Hawthorne Street
San Francisco, CA 94105-3901

OCT 23 2017

Carrie Bowen, Director
California Department of Transportation – District 7
100 South Main Street, Suite 100
Los Angeles, California 90012

Subject: Supplemental Draft Environmental Impact Statement (SDEIS) for the Interstate 710 Corridor Project from Ocean Boulevard to State Route 60, Los Angeles County, California (CEQ No. 20170137)

Dear Ms. Bowen:

The U.S. Environmental Protection Agency (EPA) appreciates the opportunity to review the Supplemental Draft Environmental Impact Statement (SDEIS) for the I-710 Corridor Project. In our roles as Participating Agency, Cooperating Agency pursuant to the National Environmental Policy Act (NEPA), and former member of the Air Agency Technical Working Group (AATWG), EPA has offered technical support to Caltrans on multiple occasions, and we continue to be available to coordinate as the project progresses. We appreciated the opportunity to provide feedback to Caltrans on the prior 2012 DEIS, as well as on interim materials prepared prior to the public release of the SDEIS. Our comments included below reiterate feedback provided through letters to Caltrans following our review of the June 2017 Air Quality, Greenhouse Gas, and Health Risk Assessment Technical Study, and the July 2017 Administrative Draft of the SDEIS.

Continued coordination among local, state, and federal agencies is integral in meeting the region's freight movement needs while also delivering a project that "(improves) air quality and public health"; a stated key purpose in the I-710 expansion SDEIS. EPA is supportive of this stated purpose, and we understand the need to move freight in southern California while balancing the need to protect human health and the environment. This is particularly important in the project area, given that the South Coast Air Basin has among the worst air quality in the United States, with the highest observed ozone concentrations in the country.

EPA notes several improvements to the project since the 2012 DEIS, including removing from further consideration an alternative that would have required relocation of transmission towers encroaching on the Los Angeles River channel. The SDEIS also now includes mitigation for anticipated adverse impacts to air quality and health. EPA commends Caltrans for committing in the SDEIS to funding a Community Health Benefit Program, including sound walls and vegetation barriers. We also commend Caltrans for allocating funds for air filtration projects to reduce exposures to nearby communities, including multiple schools, from primary particulate emissions originating from the I-710 freeway and connected roadways. F-4-1

We appreciate the effort that Caltrans has put forth to address some of our previous comments, and are available to coordinate with Caltrans on the issues listed below, and expanded upon in the attachment, to be addressed in the Supplemental Final EIS (SFEIS).

Zero Emission/Near-Zero Emission Vehicle Deployment Strategy
We are encouraged by the heightened awareness of the need to deploy zero and near-zero tailpipe emission technology in the project area and we commend Caltrans for including these technologies as components of incentive programs for the project. The state has identified funding to promote zero-emission trucks through cap-and-trade resources and the Ports of Los Angeles and Long Beach are contemplating new near-zero and zero-emission mandates, where trucks will either need to meet rigorous emissions standards or be subject to different rates. If the timing of those requirements aligns with I-710 zero-emission corridor implementation, it will provide a doubly strong incentive for trucks to be upgraded quickly; avoiding port fees and gaining access to less congested highway lanes.

For the zero-emission/near-zero emission (ZE/NZE) freight corridor, as well as for the incentivized ZE/NZE program for Alternative 5C, Caltrans has confirmed that it is not yet known who will manage the ZE/NZE deployment strategy or how it will be implemented and enforced. Without such assurances, we are unable to determine if expected emission reductions associated with the proposed zero-emission feature would be fully realized. Adding lane capacity and accommodating additional conventional truck traffic (if ZE/NZE trucks are not available/deployed by build year) would result in increased emissions in a corridor that already carries tens of thousands of heavy duty diesel trucks daily. Increased emissions would likely make it more difficult for the South Coast Air Basin to attain the National Ambient Air Quality Standards. Increases in emissions from conventional diesel trucks would make it challenging to demonstrate project-level conformity. Any increases in PM2.5 or ozone in this area would be a public health concern. Without increasing ZE/NZE deployment, the proposed project may disproportionately impact low-income, minority communities, where there are existing asthma burdens and disparities for minority children. Communities are affected by other port expansion and transportation projects, in addition to the I-710 expansion; these additional impacts along this corridor would be significant, given existing community vulnerabilities and disparities. F-4-2 F-4-3

EPA fully supports ZE/NZE technology along the I-710 as an essential project component, integral to reducing potentially unacceptable emissions in the project area. It is critical that there be a defined strategy for the ZE/NZE-dependent emissions reductions assumed. EPA has rated both project alternatives as EO-2 – *"Environmental Objections – Insufficient Information"* due to the need for sufficient assurance that zero-emission technology will be deployed as described by project build year. There is a potential for significant environmental impact to air quality without a robust ZE/NZE deployment strategy in place and this can be corrected by modifying the project description to include these critical details. To resolve this issue, EPA recommends that the SFEIS include the critical components of such a strategy, including the governance structure, responsible institutions, enforceability, and funding mechanisms that would be in place to ensure that the zero-emission levels identified in the SDEIS are achieved. EPA understands that many agencies have a role to play in the planning of ZE/NZE infrastructure and deployment of these vehicles. EPA would be happy to participate in a convening that attempts to consolidate discussions in these areas, and help ensure that an achievable pathway is put in place to meet ZE/NZE commitments as proposed. F-4-4

Additional Recommendations for the SFEIS
EPA recommends that the following be incorporated into the SFEIS (see attached table for more detailed description of topics and specific recommendations):

- Updates to NEPA air quality analysis, conclusions, and mitigation presented, to the extent possible, given that a future conformity analysis has yet to quantify some air quality impacts.
- Inclusion of activities and emissions associated with the adjacent ports, as a reflection of increased freight throughput that can be accommodated by the no build and build alternatives.

- Demonstration that induced travel demand analysis and traffic impacts on nearby arterials are included in the assessment of impacts at future buildout and interim years.
- Analysis and disclosure of air quality impacts to residences, businesses, and other facilities within the 150-foot corridor that were excluded from analysis.
- Identification of the source, staging, and transportation routes required for building materials (concrete, etc.), and where/when all construction and associated impacts would be greatest.
- Clarification of construction timeline and schedule as well as a proposed construction phasing plan designed to reduce cumulative impacts to sensitive populations during construction.

Project-Level Conformity

Caltrans staff have confirmed that the SDEIS is not intended to be a hot-spot analysis for demonstration of project-level transportation conformity, and that the project-level conformity analysis and determination will occur between the SDEIS and SFEIS. We recommend disclosing the results of this critical analysis in the SFEIS, including any implications of conclusions found that may differ from information presented in the SDEIS. We reiterate our availability to work with you and the Federal Highway Administration (FHWA) on this project-level analysis, and will continue to work with you on the collaborative effort recently initiated between EPA, Caltrans, and California Division FHWA to develop tools, establish process improvements, refine technical questions, and promote research important to implementing project-level conformity requirements. F-4-5

We look forward to Caltrans and partners implementing near-zero and zero-emission strategies as part of a solution to the regional goods movement challenges that will also benefit neighboring communities along the I-710 Corridor. We greatly appreciate early coordination with your agency on this and other projects. Please continue to coordinate with EPA as the NEPA and conformity processes continue, and please send us the SFEIS when available for review. If you have any questions, please contact Connell Dunning, at 415-947-4161; dunning.connell@epa.gov, or Karina O'Connor at 775-434-8176; oconnor.karina@epa.gov.

Sincerely,

Kathleen Johnson, Director
Enforcement Division

Enclosures: Summary of EPA Rating Definitions
Detailed Comments on the SDEIS

Phil Washington, Metro

SUMMARY OF EPA RATING DEFINITIONS*

This rating system was developed as a means to summarize the U.S. Environmental Protection Agency's (EPA) level of concern with a proposed action. The ratings are a combination of alphabetical categories for evaluation of the environmental impacts of the proposal and numerical categories for evaluation of the adequacy of the Environmental Impact Statement (EIS).

ENVIRONMENTAL IMPACT OF THE ACTION

"LO" (Lack of Objections)

The EPA review has not identified any potential environmental impacts requiring substantive changes to the proposal. The review may have disclosed opportunities for application of mitigation measures that could be accomplished with no more than minor changes to the proposal.

"EC" (Environmental Concerns)

The EPA review has identified environmental impacts that should be avoided in order to fully protect the environment. Corrective measures may require changes to the preferred alternative or application of mitigation measures that can reduce the environmental impact. EPA would like to work with the lead agency to reduce these impacts.

"EO" (Environmental Objections)

The EPA review has identified significant environmental impacts that should be avoided in order to provide adequate protection for the environment. Corrective measures may require substantial changes to the preferred alternative or consideration of some other project alternative (including the no action alternative or a new alternative). EPA intends to work with the lead agency to reduce these impacts.

"EU" (Environmentally Unsatisfactory)

The EPA review has identified adverse environmental impacts that are of sufficient magnitude that they are unsatisfactory from the standpoint of public health or welfare or environmental quality. EPA intends to work with the lead agency to reduce these impacts. If the potentially unsatisfactory impacts are not corrected at the final EIS stage, this proposal will be recommended for referral to the Council on Environmental Quality (CEQ).

ADEQUACY OF THE IMPACT STATEMENT

"Category 1" (Adequate)

EPA believes the draft EIS adequately sets forth the environmental impact(s) of the preferred alternative and those of the alternatives reasonably available to the project or action. No further analysis or data collection is necessary, but the reviewer may suggest the addition of clarifying language or information.

"Category 2" (Insufficient Information)

The draft EIS does not contain sufficient information for EPA to fully assess environmental impacts that should be avoided in order to fully protect the environment, or the EPA reviewer has identified new reasonably available alternatives that are within the spectrum of alternatives analysed in the draft EIS, which could reduce the environmental impacts of the action. The identified additional information, data, analyses, or discussion should be included in the final EIS.

"Category 3" (Inadequate)

EPA does not believe that the draft EIS adequately assesses potentially significant environmental impacts of the action, or the EPA reviewer has identified new, reasonably available alternatives that are outside of the spectrum of alternatives analysed in the draft EIS, which should be analysed in order to reduce the potentially significant environmental impacts. EPA believes that the identified additional information, data, analyses, or discussions are of such a magnitude that they should have full public review at a draft stage. EPA does not believe that the draft EIS is adequate for the purposes of the NEPA and/or Section 309 review, and thus should be formally revised and made available for public comment in a supplemental or revised draft EIS. On the basis of the potential significant impacts involved, this proposal could be a candidate for referral to the CEQ.

*From EPA Manual 1640, Policy and Procedures for the Review of Federal Actions Impacting the Environment

EPA DETAILED COMMENT TABLE ON THE SUPPLEMENTAL DRAFT ENVIRONMENTAL IMPACT STATEMENT FOR THE I-710 SOUTH EXPANSION, LOS ANGELES, CALIFORNIA—OCTOBER 23, 2017

TOPIC	*RECOMMENDATIONS*	
Alternatives Considered – Provide more details about the Zero-Emission Deployment Strategy	Alternative 5C assumes that zero-emission/near-zero emission technology (ZE/NZE) accounts for 22% of the heavy-duty truck vehicles miles traveled (VMT) and Alternative 7 assumes 67%. The air quality benefits analyzed and disclosed are dependent upon successful zero-emission deployment at those levels. Without assurance that ZE/NZE vehicles will be deployed as described, a greater number of conventional diesel-emitting trucks may be using the corridor for all alternatives, resulting in additional impacts. • Please describe how the Zero-Emission incentive program will be phased in, how it will be funded/enforced, and who (what entity? Government agency?) will be responsible for ensuring these trucks will become part of the fleet at the levels assumed in this analysis. We note that for the future project-level conformity determination, a written commitment to this measure will be needed per 40 CFR 93.125. • Please provide more information about the annual minimum VMT requirement, and which agencies will administer and enforce the Automatic Vehicle Locator (AVL) system. Consider the San Pedro Bay Ports Technology Advancement Program (TAP) as a model of a public-private partnership to develop and evaluate zero-emission or near-zero emission drayage technologies. • Please clarify whether the EIS definition of "near-zero" is equivalent to the CARB optional low NOx standard (90% reduction in NOx emissions from current standards), or if another meaning is intended.	F-4-6 F-4-7 F-4-8
Air Quality Impacts - Comparison to 2012 versus Comparison of Alternatives to No Build in the Year 2035	The analysis of impacts in the DEIS (e.g., Figure ES-5) is weighted heavily towards an incremental comparison to a 2012 baseline. That is, rather than expressing the total emissions associated with each alternative, the SDEIS presents the differences between each alternative's emissions in year 2035 and 2012 baseline emissions. For example, page ES-2 of the Air Quality Technical Study (AQTS) states, *"Based on the qualitative analysis, regional ambient concentrations are expected to decrease in the future."* • Please clarify if the decreases are due to the I-710 project, or if they are due to overall regional air quality strategies from the South Coast Air Quality Management District's (SCAQMD) and the California Air Resources Board's State Implementation Plan measures. In addition, on pages 26-27 of the AQTS, there are references to Tables 4-4a through 4-4c, which display incremental pollutant emissions as compared to 2012 levels. This approach makes it difficult to understand how impacts differ among alternatives in 2035 once the project is operational. Furthermore, overall summary statements about these results are often made without clarifying which baseline (2012 or the alternatives) is being used to support the statement. • EPA recommends including additional conclusions throughout the document to more clearly disclose what health impacts will be in 2035 for each alternative.	F-4-9 F-4-10
Air Quality Impacts – Description of	On pages 46 and 49 of the AQTS, the document states that *"Any increase in PM2.5 and PM10 emissions are due predominantly to entrained road dust."*	F-4-11

components of emissions	• Please include a discussion of the other components of particulate emissions, such as brake and tire wear emissions. In addition, page 18 of the Appendix H/O of the AQTS states that increases in VMT are used to explain the increases of entrained road dust. However, changes in vehicle mix, especially increases in Heavy Duty trucks, can also contribute significantly to increases in entrained road dust due to the relationship between emission factors and vehicle weight. Please include this in the discussion.	F-4-11
Alternatives Considered - Include impacts of congestion on growth assumptions for ports of LA and LB	The traffic modeling used throughout the SDEIS assumes that Port of Los Angeles and Long Beach throughput are insensitive to roadway congestion. The SDEIS assumes that the only constraint on growth is the "planned capacity of the marine terminals," (p.1-18; p.17 in Travel Demand Modeling Methodology report). The assumption that port operations will continue to grow at the same rate, regardless of sufficient rail and truck infrastructure, contradicts assumptions described in the Southern California Association of Government's (SCAG) and FREIGHTWORKS Comprehensive Regional Goods Movement Plan and Implementation Strategy (CRGMPIS), which makes clear that the envisioned economic development associated with future goods movement is dependent on new multimodal infrastructure. In addition, the draft National Freight Strategic Plan states, "Where port congestion occurs, supply chains are increasingly able to react by changing supply sources, routes, and transportation modes," and the mutual influence of congestion on trade, from highways and around ports, including the ports of LA and Long Beach, is well understood. Since there is no change in port throughput between the build and no build scenarios, as described in Section 2.2.3 of the 2012 I-710 Traffic Operations Analysis Report, there is no base "No Build" scenario of port activity on which to compare an analysis of emissions and air quality impacts. • EPA recommends that Caltrans update the No Build assumptions so that the impacts reflect constraints between roadway congestion levels and port TEU throughput, consistent with both the assumptions in the CRGMPIS Final Report and with economic literature on how surface congestion affects port throughput.	F-4-12
Air Quality Technical Study - Include emissions from ports of LA and LB in Dispersion Analysis	The I-710 AQTS states that "Freeway/roadway traffic is the only source of operational emissions associated with the I-710 Corridor Project" and that data from monitors operated by the ports of LA and Long Beach were not included because the data are affected by goods movement sources. Numerous local studies, including Multiple Air Toxic Exposure Study (MATES) and studies from USC and UCLA have found that port emissions have significant air quality impacts within the project area. While the traffic modeling includes truck traffic from the ports that drive along the I-710 freeway, the truck and other emissions from equipment operating at the ports have not been included. • EPA recommends coordinating with the South Coast Air Quality Management District (SCAQMD) to determine existing and future emission estimates for the ports, and including estimated emissions in the dispersion modeling. Including information about port throughput over time, and the number of trucks on I-710 over the same period, would help provide context regarding the current conditions for NEPA analysis, and how port activities affect traffic on I-710. In Chapter 4 of the AQTS, the gridded emission plots show emissions outside of the I-710 facility. • Please explain why there are grid cells with changes around the port area and other transportation facilities if only emissions from the I-710 facility are included.	F-4-13 F-4-14

	Please provide the activity data used to predict these changes in emissions that seem to show increases around the ports.	F-4-14
	Further, for the future transportation conformity analysis, EPA's PM hot-spot guidance explicitly notes that, for projects intended to accommodate future growth in freight and goods movement, nearby ports need to be included in air quality modeling. • Please include a summary of the data trends at the ports and at the I-710 near road monitor.	F-4-15
Alternatives Considered - Air Quality Technical Study – No Build Clarification	Section 1.3.1 states that "*The projects included in this alternative are based on SCAG's [Southern California Association of Government's] 2012-2015 Regional Transportation Plan Sustainable Communities Strategy (2012 RTP)...*" In the 2012 RTP,[1] the following project is listed (RTP ID 1C0401): "*I-710 Corridor User-Fee Backed Capacity Enhancement, Widen to 5 Mixed Flow +2 Dedicated lanes for clean technology trucks (each direction) and interchange improvements, from Ocean Blvd. in Long Beach to the Intermodal Railroad yards in Commerce/Vernon.*" The SDEIS appears to rely on population, household, and employment forecasts included in the 2012 RTP/SCS." Since the RTP/SCS includes a project similar to the build alternatives in these forecasts, it appears that the current "No Build" analysis incorporates growth forecasts that assume that one of the "Build" alternatives is completed, rather than using a land-use scenario that assumed the project was not built. • Please clarify whether the "No Build" scenario assumed that the I-710 Corridor was built.	F-4-16
Air Quality – Induced Travel and Traffic Estimates	The new general purpose lanes for Alternative 5C and the 4 new additional zero-emission truck lanes for Alternative 7 will introduce new lane capacity. Adding capacity on roadways in congested urban areas induces additional trips/travel and can ultimately lead to increased congestion back to pre-project levels. Caltrans' policy brief, "Increasing Highway Capacity Unlikely to Relieve Traffic Congestion," supports this understanding.[2] This policy brief states, "*Capacity expansion leads to a net increase in VMT, not simply a shifting of VMT from one road to another.*" • Please describe how modeling and conclusions account for induced demand in Section 3.13 of the SDEIS and throughout the document.	F-4-17
	It appears that the existing and future traffic on local streets are not included in the emissions, modeling or risk assessment in the SDEIS. Rather than just shift traffic from local arterials, the expansion of I-710 may ultimately lead to increased traffic on local roads and I-710. • Please confirm whether other roads, such as the arterials that provide access to I-710, were included in the analysis. Until the quantitative PM hot-spot analysis is performed after a preferred alternative is identified, it is not possible to conclude if the greatest impacts of the project would be from the I-710 freeway itself, as opposed to I-710 interchanges with other highways or I-710 entrance/exits to local arterials.	F-4-18
Project-Level Transportation	EPA understands that, once a preferred alternative is chosen, Caltrans will initiate analysis to determine if the project meets federal requirements for project-level transportation	F-4-19

[1] Available at: http://rtpscs.scag.ca.gov/Documents/2012/final/SR/2012fRTP_ProjectList.pdf
[2] Available at: http://www.dot.ca.gov/newtech/researchreports/reports/2015/10-12-2015-NCST_Brief_InducedTravel_CS6_v3.pdf

Conformity Analysis to be completed between SDEIS and SFEIS	conformity. This future analysis quantifying particulate matter (PM) impacts could conclude that additional mitigation is warranted, or that additional impacts beyond those disclosed in the SDEIS are anticipated. • In the SFEIS, please disclose all project-level conformity related conclusions, including additional impacts to the community, if they vary from results presented in the SDEIS.	F-4-19
Air Quality Technical Study - Dispersion modeling and lack of analysis of impacts to receptors within Exclusion Zone, within 150 feet of the project	Appendix D of the AQTS indicates that the closest receptors used for the dispersion modeling were 150 feet from the edge of the proposed expansion, resulting in a modeling "exclusion zone" running the length of the project, extending from edge of the proposed roadway out 150 feet. Maximum concentrations are typically found close to the transportation facility. There are residences, businesses, and facilities where sensitive people congregate (e.g., schools, daycare facilities) located in this 150-foot "exclusion zone." It thus appears that the SDEIS did not disclose the maximum air quality impacts, which would likely occur within 150 feet of the project. • EPA recommends adding an assessment of which residences and businesses are located within the exclusion zone and what impacts they would receive. Also, please clarify if construction emissions were included in the dispersion modeling as these emissions should be included if construction lasts more than 5 years.	F-4-20
Construction – Provide an estimate of when and for how long various sections of the road will be built and quantify construction air impacts, including Interim Years.	The AQTS's analysis of construction emissions is limited to two unlikely scenarios. The AQTS shows that construction emission impacts are expected to be above the SCAQMD criteria for some pollutants if all sections are constructed simultaneously, but below if only one section is built at a time. Based on our review of the SDEIS (Table 2-3-5), construction of many roadway segments will take over 5 years, many segments could be under construction at the same time, and construction could occur at the same time as traffic impacts from I-710. • Please describe, in more detail, how construction phasing may reduce cumulative air quality, noise, and traffic disruption impacts and add phasing as an identified mitigation measure to offset impacts to the community. • Please plan to notify the schools, child care centers, and residences located near construction sites and/or along proposed truck routes about the construction schedule, phasing, staging areas, and truck routes. • For the future conformity analysis, due to the extended construction phase, please include construction emissions or document that 40 CFR 93.123(c)(5) is met by phasing construction at different sites and over time so that no one project area will experience greater than 5 years of construction. • Please quantify construction-related criteria (e.g., SCAQMD criteria) for the more likely construction of several segments together. • Please quantify construction-related Mobile Source Air Toxics (MSAT) emissions at site-specific locations along the proposed roadway, rather than as summaries across a multi-mile segment. Include changes in ambient concentration, MSAT risk, and PM2.5 mortality and morbidity, including interim project years. • Discuss the potential for combined construction and operational emissions to be greater in interim years than in the build year 2035.	F-4-21 F-4-22 F-4-23 F-4-24 F-4-25 F-4-26
Construction Impacts – Mitigation, Ensure concurrent	Page 3.24-72 identifies a mitigation measure regarding the use of scheduling to reduce cumulative impacts.	**F-4-27**

construction of other projects does not disrupt air impact reduction measures	• EPA recommends that this mitigation measure also reflect the need to coordinate so that concurrently constructed segments do not result in adverse air quality impacts during construction. We recommend the measure be revised to state: ""*CON-CUM-1: Prior to completion of Plans, Specifications, and Estimates for construction, Caltrans shall consult with the lead agencies of other major projects within two miles of the I-710 Corridor Project to ensure that the construction plans are coordinated and do not result in conflicts regarding construction staging areas, roadway closures, ~~or~~ detour routes,* ***or commitments to reduce cumulative air quality impacts****."*	F-4-27
Construction Impacts – Mitigation, Best Available Control Technologies	It appears that the analysis of construction impacts assumed exclusive use of Tier 4 engines for all construction equipment. EPA appreciates this goal, and all Best Available Control Technology (BACT) commitments outlined in Chapter 3. We encourage the demonstration and deployment of heavy-duty technologies that at least meet the latest EPA emission performance standards for the relevant equipment categories (e.g., plug-in hybrid-electric, battery-electric, fuel cell electric, etc.) and exceed the standards whenever possible. We note that it will be challenging to require Tier 4 engines be used exclusively for the entire construction window for project. • Please confirm that Caltrans will require all Tier 4 construction equipment for the entirety of the construction of the project. If not intended to be a requirement, then please revise the analysis and conclusions to provide a range of likely emissions that would be anticipated from a scenario where this goal is not achieved.	F-4-28
Construction Material – Concrete and transport	• Identify the source of required concrete, borrow pits, processing pits, and transportation routes of construction debris/materials along with associated impacts (noise, air, impacts from creating concrete, transporting concrete, etc.) and describe how those impacts will be reduced.	F-4-29
Environmental Justice – Summary Maps	The environmental justice analysis concludes that "disproportionately high and adverse impacts have been identified for air quality (construction and operation), noise, traffic, community cohesion, visual resources, and land use." • Please include a summary map which shows the locations of the disproportionately high and adverse impacts for resource areas. Such a map would be helpful in prioritizing the Mitigation Measure C-7. Please identify which, if any, street to cul-de-sac conversions are included as potential disproportionate high adverse impacts.	F-4-30
Air Quality -MSATs and Health Impacts Descriptions	On page 3.13-30, EPA appreciates that Caltrans places importance on the role that mobile source air toxics analysis plays when attempting to characterize the impacts of a project of this magnitude and complexity. • Please revise the summary on p. 3.13-30 (and in the AQTS) to reflect that MSAT tools and analysis, such as page 3.13-33 and Section 2.3, can be used to illuminate the health risk associated with different project alternatives, for both the public and decision makers. The documented methods, guidelines, and recommendations for conducting human health risk assessments and handling uncertainty prepared by the CalEPA, the California Air Pollution Control Officers Association (CAPCOA), and SCAQMD are useful references.	F-4-31
Air Quality Technical Study –	Page ES-3 of the Air Quality Technical Study states, "PM mortality/morbidity is lower along freeway except a few locations in 2035 Alternative 7." This does not appear to be an accurate conclusion, considering the findings in the NEPA analysis, which show increases	F-4-32

PM Mortality/Morbidity	in PM across all study areas. This would lead to an increase in the PM mortality/morbidity health risk. • We suggest rephrasing this statement as follows: "In some scenarios, PM health risks are expected to decrease across the air basin. This project may result in small increases in PM-related health risks and a lessening of the overall expected decrease in health risks in the study area."	F-4-32
Near Roadway Health Effects - Mitigation	EPA appreciates that Caltrans identified schools, daycares, and other facilities with sensitive populations within 0.5 mile of the I-710 mainline and interchange improvements. We support Caltrans' commitment to installing vegetative and sound barriers, as well as new or upgraded heating, ventilation, and air conditioning (HVAC) systems, where needed at 42 separate schools.	F-4-33
	• If there is an opportunity for additional mitigation, EPA recommends that Caltrans commit to supporting the purchase of additional HVAC improvements, such as replacing filters and conducting ongoing maintenance of filtration and HVAC systems, to ensure they remain effective.	
	• Consider offering temporary vegetative barriers and air filtration and/or HVAC system upgrades to schools, daycares, and other facilities with sensitive populations that will likely be impacted by lengthy construction activities such as ingress/egress of vehicles and staging areas. Identify additional licensed childcare facilities, daycares, and other facilities such as family child care homes in Section 3.3, Figures 3.3-4 through 3.3-9.	F-4-34
	EPA commends Caltrans for proposing the I-710 Community Health Benefit Program, which would offer grants to support activities to improve air quality and public health related to I-710 travel and goods movement. We offer the following information sources for Caltrans to consider when determining recipients:	
	• Consider supporting mitigation measures that specifically address childhood asthma. Literature supports a growing understanding of traffic-related air pollution impacts to children and asthma[3] and, results from the Children's Health Study conducted in Southern California indicate childhood exposure to air pollution can affect lung function and development with possible lifelong effects.[4][5] The LA County Health Survey indicates thousands of children in the region have asthma and minority and low-income children are disproportionately burdened by asthma.[5] The Coordinated Federal Action Plan to Reduce Racial and Ethnic Asthma Disparities can be used to inform strategies and potential activities.[6] • Consider supporting projects that specifically provide education to pregnant women about reducing prenatal exposure to air pollution. Prenatal exposures to air pollution can influence birth outcomes and child development. Potential project	F-4-35

	partners could include hospitals, health clinics, birthing centers, and community organizations who employ community health promoters, or *promotores de salud.*	F-4-35
Impacts to LA River and Waters	• Page 2-96 states that "Application for Clean Water Act [CWA] 404/408 permit will occur after the Record of Decision [ROD]." EPA recommends that Caltrans not wait until after the ROD to initiate CWA Section 404 and 408 permitting because this may result in project delay. EPA recommends synchronizing the permitting and NEPA process as much as possible and including 1) a description of how Waters of the United States were avoided and 2) a 404(b)1 Alternatives Analysis (if required) in the SFEIS. We are available to assist with coordination if needed.	F-4-36
	• Given the high estimates of indirect impacts presented, please describe the anticipated effects that highway shading may have on ecosystem functioning of vegetated areas.	F-4-37
	• Please provide in the document the depiction of the location (at a finer scale) and design of proposed typical structures that will be constructed in and around aquatic resources, including the Los Angeles River and other waterways. Describe how these levees, bridge columns, and bioswales were located and designed to maximize environmental benefit and reduce impacts to hydrologic flows and water quality.	F-4-38
	• Describe how the proposed project is consistent with the goals and objectives of plans for Los Angeles River restoration.	F-4-39

This page intentionally left blank

F-4-1

Caltrans is appreciative of the noted commendations and would like to point out that the revised set of alternatives evaluated in the RDEIR/SDEIS were conceptualized and developed as a direct response to public and agency comments received on the 2012 Draft EIR/EIS, including those received from the United States Environmental Protection Agency (EPA).

F-4-2

Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), has identified Alternative 1 (No Build) as the Preferred Alternative. Since a build alternative has not been selected as the Preferred Alternative, programmatic elements such as the Zero Emission/Near Zero Emission (ZE/NZE) Truck Technology Deployment Program (now known as the I-710 Clean Truck Program) will not be implemented by Caltrans as the Lead Agency under CEQA and NEPA and as the owner/operator of the I-710 freeway. Prior to selection of the No Build Alternative as the Preferred Alternative, the I-710 Clean Truck Program was being further defined to include a proposed governance structure, roles and responsibilities for program oversight, and provisions related to program enforceability (for more information, see Section 2.3.2.1, Common Features of the Build Alternatives, and Appendix W of this Final EIR/EIS). Please refer to Section 1.1 of this appendix for further discussion on the identification of the Preferred Alternative.

The air quality analysis for the build alternatives in the RDEIR/SDEIS conservatively (i.e., the smallest potential emission reduction benefits) assumed that all ZE/NZE trucks included in the I-710 Clean Truck Program element of the build alternatives would be NZE. NZE trucks would be non-diesel (as diesel trucks have not yet been able to meet the California Air Resource Board's (CARB) optional low-nitrogen oxide (NO_X) standard of 0.02 grams per brake horsepower-hour (gm/bhp-hr), thereby reducing diesel particulate matter (DPM) to zero and NO_X emissions by 90 percent compared to conventional heavy-duty trucks. Consistent with the CARB's EMFAC2014 emission factor program, it was conservatively assumed in the air quality analysis that NZE trucks will not reduce any other criteria air pollutant or greenhouse gas emissions as compared to a conventional heavy-duty truck. Additionally, no credit was taken for further tailpipe reductions for pure ZE trucks.

It should be noted that the air quality analysis demonstrated that NO_X emissions decreased approximately 83 percent to 86 percent in all project study areas (I-710, Area of Interest, and the South Coast Air Basin [Basin]) from 2012 to 2035. As discussed in the *Air Quality, Greenhouse Gas, and Health Risk Assessment Technical Study* (AQ/GHG/HRA Technical Study) (June 2017) and the associated *Addendum to the Air Quality, Greenhouse Gas, and Health Risk Assessment Technical Study* (December 2020), reductions in exhaust-related criteria air pollutant emissions (including NO_X), greenhouse gas emissions, and DPM emissions are primarily driven by CARB's

Truck and Bus Regulation and the Ports' (collectively, the Port of Los Angeles and the Port of Long Beach) Clean Trucks Program, and therefore, are expected to occur for the 2035 build alternatives as compared to the 2012 Baseline even without the implementation of the I-710 Clean Truck Program.

F-4-3

As stated in Response to Comment F-4-2, exhaust-related criteria air pollutant emissions, greenhouse gas emissions, and DPM emissions are expected to reduce for all 2035 build alternatives as compared to the 2012 Baseline, irrespective of the I-710 Clean Truck Program implementation. In addition to evaluation of project-related emissions, the ambient air quality impacts of the build alternatives were compared to the relevant National Ambient Air Quality Standards (NAAQS). These impacts are presented in Tables 4-6a and 4-6b of the AQ/GHG/HRA Technical Study (2017) and Tables 3.13-15 and 3.13-16 of both the RDEIR/SDEIS and this Final EIR/EIS. The results show that the NAAQS for carbon monoxide (CO) and nitrogen dioxide (NO_2) would be met with the build alternatives in 2035. Since the region is in non-attainment/ maintenance for particulate matter less than 2.5 microns in diameter ($PM_{2.5}$) and particulate matter less than ten microns in diameter (PM_{10}) NAAQS, the PM impacts of the build alternatives were compared to the South Coast Air Quality Management District (SCAQMD) significance criteria. Although PM_{10} increased in all study areas and increases in the Basin were higher than the SCAQMD's significance thresholds (because although tailpipe PM_{10} decreased, brake/tire wear and entrained road dust increased as vehicle miles travelled [VMT] increased), $PM_{2.5}$ emissions decreased for all study areas. In addition, the AQ/GHG/HRA Technical Study showed that the incremental cancer and non-cancer impacts of the 2035 build alternatives decrease when compared to the 2012 Baseline. These results are primarily driven by reductions in DPM emissions associated with CARB's Truck and Bus Regulation and the Ports' Clean Trucks Program and are expected to occur even without the I-710 Clean Truck Program implementation. To better understand how these potential air quality and health risk impacts might impact low-income, minority communities, an environmental justice analysis was conducted using the results from the air quality analysis. Details on the environmental justice analysis were presented in Section 3.3.3 of the RDEIR/SDEIS, and mitigation for disproportionate impacts to environmental justice communities were outlined in Section 3.3.3.7. Other Port and development projects that may contribute to cumulative impacts to communities near I-710 were discussed in more detail in Section 3.24 of the RDEIR/SDEIS. Please refer to Section 1.4.1 of this appendix, Project Level Particulate Matter Conformity Analysis, for further discussion.

F-4-4

As stated in Response to Comment F-4-2, the No Build Alternative has been selected as the Preferred Alternative. Since a build alternative has not been selected as the Preferred Alternative, programmatic elements such as the ZE/NZE Truck Technology Deployment Program (now known as the I-710 Clean Truck Program) will not be implemented by Caltrans as the Lead Agency under

CEQA and NEPA and as the owner/operator of the I-710 freeway. Prior to selection of the No Build Alternative as the Preferred Alternative, the I-710 Clean Truck Program was being further defined to include a proposed governance structure, roles and responsibilities for program oversight, and provisions related to program enforceability (for more information, see Section 2.3.2.1, Common Features of the Build Alternatives, and Appendix W of this Final EIR/EIS).

F-4-5

As stated in Response to Comment F-4-2, the No Build Alternative has been selected as the Preferred Alternative due to a number of reasons including but not limited to the inability of the build alternatives to achieve project-level conformity determination for particulate matter. Details on how this determination was made for the build alternatives are provided below.

Prior to the circulation of the Draft EIR/EIS in 2012, the build alternatives under consideration at that time were considered to be a "Project of Air Quality Concern" (POAQC), meaning that a particulate matter (PM) hot-spot analysis would be required to demonstrate that the build alternatives met federal project-level air quality conformity requirements. The Draft EIR/EIS and RDEIR/SDEIS both indicated that a project-level conformity analysis would be conducted for the Preferred Alternative following public circulation and prior to approval of the Final EIR/EIS. Consistent with Caltrans and FHWA guidance, project-level air quality conformity is not required for approval of a Draft EIR/EIS and, as such, was not required to be included in the RDEIR/SDEIS. However, air quality conformity is required for project approval or funding. Prior to circulation of the 2012 Draft EIR/EIS, the I-710 Corridor Project build alternatives were determined to be a POAQC requiring a hot spot analysis because they were considered to be: (i) a new or expanded highway project that had a significant number of or significant increase in diesel vehicles, and (ii) a project affecting intersections that are at level of service (LOS) D, E, or F with a significant number of diesel vehicles, or those that will change to LOS D, E, or F because of increased traffic volumes from a significant number of diesel vehicles related to the project. This was described in Section 3.13.3.1 of the 2012 Draft EIR/EIS.

Some of the build alternatives analyzed in the 2012 Draft EIR/EIS assumed that ZE/NZE trucks would be commercially deployed and therefore in use in the corridor at the time the project would be built; however, at that point in project development the I-710 Corridor Project did not include a ZE/NZE truck program as a programmatic element. The assumption that the project was a POAQC was carried forward in the RDEIR/SDEIS even considering that the subsidy and deployment of ZE/NZE trucks was included as a programmatic element of Alternatives 5C and 7, which serves as a commitment that ZE/NZE trucks would be deployed in the corridor should the project be approved and constructed. Subsequent to circulation of the RDEIR/SDEIS, the description of the I-710 Clean Truck Program was further defined to include a proposed governance structure, roles and responsibilities for program oversight, and provisions related to program enforceability (for more information, see Section 2.3.2.1, Common Features of the Build Alternatives, and Appendix W of this Final EIR/EIS).

While project analysis showed the I-710 Clean Truck Program would reduce diesel truck trips in the I-710 Corridor in 2035, extensive discussions with EPA indicated that Alternatives 5C and 7 must be considered POAQCs mainly because EPA staff stated that the enforceability provisions of the I-710 Corridor Clean Truck program were not sufficient to ensure the projected reduction in 2035 diesel truck trips. Therefore, a hotspot analysis was required for project-level air quality conformity determination. Preliminary results of the hotspot analysis indicated that the two build alternatives would not pass project-level conformity for particulate matter, mostly because of increases in tire wear, brake wear, and entrained road dust, and would thus prevent a project-level conformity determination needed to approve a build project. Please refer to Section 1.4.1 of this appendix, Project Level Particulate Matter Conformity Analysis, for further discussion.

F-4-6

Please refer to Response to Comment F-4-4 regarding the I-710 Clean Truck Program, and to Common Response 1.4.4, Emission Factor Assumptions for ZE/NZE Trucks, for further discussion.

F-4-7

The San Pedro Bay Ports Technology Advancement Program was utilized as a model in drafting the basis for the existing Automatic Vehicle Locator (AVL) description in Section 2.3.2.1 of Chapter 2.0, Project Alternatives, of the RDEIR/SDEIS. Additional details regarding the I-710 Clean Truck Program can be found in Appendix W, I-710 Clean Truck Program Description. As stated in Response to Comment F-4-2, the No Build Alternative has been selected as the Preferred Alternative; hence programmatic elements of the build alternatives, such as the I-710 Clean Truck Program, will not be implemented by Caltrans as the Lead Agency under CEQA and NEPA and as the owner/operator of the I-710 freeway. Prior to selection of the No Build Alternative, the description of the I-710 Clean Truck Program was further defined to include a proposed governance structure, roles and responsibilities for program oversight, and provisions related to program enforceability (for more information, see Section 2.3.2.1, Common Features of the Build Alternatives, and Appendix W of this Final EIR/EIS).

F-4-8

Yes, the EIS definition of "near zero" is consistent with the CARB standard. As stated in Chapter 7 of Appendix C of the Air Quality/Health Risk Assessment (February 2017), "the analysis conservatively assumed that all criteria air pollutant (except for NO_X) and greenhouse gas emission factors of ZE/NZE trucks were equal to that of a conventional heavy-duty truck. Based on a year-long discussion with SCAQMD and CARB that culminated in a March 20, 2015 meeting, the NO_X emission factors of the ZE/NZE trucks were reduced by a factor of 90 percent as compared to the conventional heavy-duty trucks (i.e., equivalent to 0.02 g/bhp-hr NO_X emission rate). This approach is consistent with other SCAQMD public statements. It is conservative because the presence of ZE (as opposed to NZE) trucks would further reduce emissions." In addition, Section 2.3.2.1 of the RDEIR/SDEIS stated, "In order to qualify for funding, trucks must meet minimum requirements for emissions standards as well as travel within the I-710 Corridor. Heavy-duty trucks must meet minimum requirements for ZE/NZE standards by being certified by CARB at or below the optional low-oxides of nitrogen (NO_X) standard of 0.02 grams per brake horsepower-hour of oxides of nitrogen (g/bhp-hr NO_X) and/or meeting CARB and/or SCAQMD ZE technology definitions. The air quality analysis presumes that no ZE/NZE truck would be diesel powered." Please refer to Section 1.4.4 of this appendix, Emission Factor Assumptions for ZE/NZE Trucks, for more information.

F-4-9

The analyses presented in the AQ/GHG/HRA Technical Study (2017) and the RDEIR/SDEIS includes incremental comparisons of the future (2035) project alternatives to the 2012 Baseline as required by CEQA. The project analysis for the build alternatives does not take credit for the large reductions that have been achieved due to State and Federal rules and regulations. Instead, the AQ/GHG/HRA Technical Study discusses the CARB's Truck and Bus Regulation, the Pavley Standard, and the Ports' Clean Trucks Program as the primarily drivers for the reductions in emissions seen in the 2035 project alternatives as compared to 2012 Baseline. Further, the analyses also present incremental comparisons of the 2035 build alternatives to the 2035 No Build Alternative for NEPA, which would exclude any reductions from State and Federal rules and regulations. The NEPA analysis can be used as a basis for comparing the build alternatives without taking account for reductions achieved due to State and Federal rules and regulations.

F-4-10

This comment states the Tables 4-4a through 4-4c of the AQ/GHG/HRA Technical Study (2017) only compares the incremental criteria pollutant emissions of the build alternatives to 2012 Baseline conditions. The comment further states that the report should also compare the pollutant emissions and health risk the build alternatives to the 2035 No Build Alternative conditions. It is accurate that Tables 4-4a through 4-4c compare the build alternatives to the Baseline condition. However, comparisons of the build alternatives against the future year (2035) No Build Alternative

(Alternative 1) are also made throughout the AQ/GHG/HRA Technical Study. This discussion most notably takes place in Chapter 5 of this study. Specifically, Table 5-2b displays incremental criteria air pollutant emissions for the 2035 build alternatives as compared to the 2035 No Build Alternative (Alternative 1). In addition, Tables 3.13-12 and 3.13-13 in the RDEIR/SDEIS and this Final EIR/EIS present incremental Mobile Source Air Toxics (MSATs) and criteria air pollutant emissions for the project build alternatives as compared to the 2035 No Build Alternative, allowing the reader to assess the relative impacts of the build alternatives independent of emission changes from fleet turnover to the vehicles/engines meeting the best regulatory standards.

Section ES.6.1, Section 4.3.4, and Section 5.5 of the AQ/GHG/HRA Technical Study discuss the results of the health risk assessment of the project alternatives. Further, Section ES.9 and Section 4.5 for the AQ/GHG/HRA Technical Study present a qualitative discussion of PM mortality and morbidity. These results disclose the incremental impacts of the future (2035) project alternatives as compared to 2012 Baseline as well as the incremental impacts of the 2035 build alternatives as compared to the 2035 No Build Alternative. In addition to the results presented in the AQ/GHG/HRA Technical Study, the RDEIR/SDEIS and this Final EIR/EIS presents a summary of these health impact findings in Section 3.13.3.4. Thus, health impacts of the build alternatives compared to the No Build Alternative are disclosed throughout the document.

F-4-11

Figure ES-5 in the AQ/GHG/HRA Technical Study (2017) presents the contribution of entrained road dust, tire wear and brake wear, and exhaust emissions to total $PM_{2.5}$ and total PM_{10} emissions of the project alternatives. Section 4.3.1 (2nd and 3rd paragraph on p. 26) of the AQ/GHG/HRA Technical Study provides additional context for these emissions. In addition, a detailed discussion of the methodology used to calculate particulate emission factors, including those from entrained road dust, is presented in Appendix C of the AQ/GHG/HRA Technical Study. As stated in Section 2.2 of Appendix C, the entrained road dust emission factors were estimated separately for each analyzed traffic link based on the vehicle mix generated by the I-710 Traffic Model on that link. As shown in Equations 1 and 2 in Section 2.2 of Appendix C of the AQ/GHG/HRA Technical Study, these entrained road dust emission factors are a function of the average vehicle weight, hence the analyses presented in the RDEIR/SDEIS and this Final EIR/EIS do account for potential changes in entrained road dust emissions resulting from changes in vehicle mix.

F-4-12

The No Build Alternative assumptions on 20-foot equivalent unit (TEU) throughput and Port activity utilized in the I-710 travel demand forecast model are a product of the factors, methods, and approach used by the San Pedro Bay Ports to develop their unconstrained and constrained cargo forecasts. This information provided by the Ports was utilized by the Southern California Association of Governments (SCAG) in the development of their regional travel demand forecast

model – specifically the 2012 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) travel demand forecast model on which the I-710 travel demand forecast model is based. For the San Pedro Bay Ports, the major factors which influence these cargo forecasts include: projected U.S. Gross Domestic Product, competitiveness of the San Pedro Bay Ports relative to other ports (e.g., Atlantic, Gulf, and British Colombian), and the physical and operational capacity of the marine terminals.

F-4-13

As described in Response to Comment F-4-12, the I-710 Corridor Project is not expected to change or influence levels of operational activities at the Ports. However, Metro and Caltrans are coordinating with the Ports to assist them in their efforts to help improve regional air quality. The emissions from the equipment operating at the Ports do not need to be included in the air quality analyses for the I-710 Corridor Project. This is consistent with NEPA direction to Federal agencies under 40 CFR 1508.25, when planning projects, to conduct environmental review in order to consider the potential impacts on the environment by their proposed actions. Because activities at the Ports are not connected actions or otherwise dependent on the I-710 Corridor Project for implementation, they were not evaluated in the I-710 Corridor Project RDEIR/SDEIS. Effects of future growth in Port activity on the I-710 freeway and the roadway network in the Basin as well as projected shifts in traffic associated with the I-710 Corridor Project's build alternatives on air quality are analyzed in the RDEIR/SDEIS and this Final EIR/EIS.

F-4-14

The gridded mass emission plots (Figures 4-1a through 4-2c and 4-5a through 4-5c in the AQ/GHG/HRA Technical Study [2017]) were prepared using the emissions calculated from the I-710 Traffic Model output. The I-710 Traffic Model is based on the 2012 SCAG Regional Transportation Plan Travel Demand Model and includes traffic links and data for the full roadway network. In essence, the gridded mass emission plots demonstrate how the various I-710 alternatives along with future projects included in the SCAG RTP future baseline network for 2035 affect traffic and emissions in the region. As discussed in Section 4.3 of the AQ/GHG/HRA Technical Study, the changes seen in the Port areas are a result of future goods movement projects such as the proposed Southern California International Gateway (SCIG) project. The traffic activity data and emission estimates used to prepare the gridded emission plots were provided in Microsoft Access databases on hard drives that were delivered to three EPA offices (Nevada City, California; Ann Arbor, Michigan; San Francisco, California) in July 2017 shortly after the release of the RDEIR/SDEIS. Per the EPA's request, an additional hard drive was delivered to a fourth EPA office (Research Triangle Park, North Carolina) in early August 2017.

F-4-15

The I-710 Corridor Project is not predicted to change or influence levels of operational activity at the Ports. The 2035 build alternative and No Build Alternative for the I-710 traffic analysis assume

maximum cargo throughput capacity consistent with 2012 RTP's regional projections for goods movement for year 2035. Accordingly, the traffic and air quality analyses presented for the I-710 2035 build alternative and No Build Alternative in the I-710 RDEIR/SDEIS include effects of the future growth in Port activity on the I-710 freeway and the roadway network in the Basin. The traffic and air quality analyses also capture projected shifts in traffic on I-710 and on the overall roadway network (i.e., route choice) in response to the improvements to I-710 proposed under Alternatives 5C and 7.

Background monitoring data trends at Port of Long Beach (POLB) Superblock and I-710 Near Road Monitor are presented in the table below. These monitors were not used in the modelling analysis as they are located in close proximity to emission sources and thereby are not representative of ambient air.

Ambient Air Quality Monitoring Data Recorded at the POLB Superblock and I-710 Near-Roadway Monitoring Stations

F-4-16

The I-710 travel demand forecast model is based on the regional 2012 RTP forecast model. The 2012/2035 RTP/SCS evaluated a "No Project" future baseline scenario in addition to a "Plan" scenario. The I-710 No Build Alternative utilized the "No Project" future baseline scenario from the 2012 RTP that does not include the I-710 Corridor Project build alternatives. The 2012 RTP "No Project" future baseline scenario includes future funded and committed projects, such as those listed in the 2011 Federal Transportation Improvement Program (FTIP), while the "Plan" scenario incorporates those transportation projects identified in the Constrained Plan. The I-710 Corridor Project build alternatives (RTP ID No. 1C0401) appears in the "Plan" Alternative. It is important to note that within the Gateway Cities Council of Governments sub-region (which encompasses the I-710 Corridor Project Study Area) population, household, and employment forecasts used for the 2012 RTP/SCS are the same for the RTP/SCS "No Project" and "Plan Alternatives" (refer to Table 3.10-10 on p. 3.10-12 in SCAG's Program EIR for the 2012 RTP/SCS: http://rtpscs.scag.ca.gov/Documents/peir/2012/draft/2012dPEIR_3_10_PopulationHousingand Employment.pdf).

F-4-17

The cited paper is authored by the National Center for Sustainable Transportation (NCST), a consortium of universities engaged in research, education, and engagement programs. Caltrans is one of several agencies that provide funding for NCST. Both the NCST and the Caltrans' Division of Research and Innovation are involved in a wide variety of transportation-related research that incorporate many diverse perspectives and provide analytical, statistical, social, and environmental information to the decision-making process. It is important to note that the publication of research briefs on Caltrans' website does not signify the adoption of that research as policy. According to FHWA, increases in highway capacity do not invariably result in net increases in traffic. The issue of induced demand is very complex, involving various travel behavior responses, residential and business location decisions, and other factors that influence regional population and economic growth. While some of these responses may represent new trips, much of the observed increase in traffic comes from trips that were already being made before the increase in highway capacity, or reflect predictable behavior that is accounted for in

travel demand forecasts (FHWA 2017).[1] Accordingly, Caltrans' guidance on this topic of induced demand maintains that each project should be evaluated on a case-by-case basis.

"Induced travel" is characterized as the additional demand for travel that occurs as a result of a decrease in the generalized cost of travel, including both travel-time and out-of-pocket costs. I-710 is part of a highly congested metropolitan roadway network and is located within an urbanized area, which is essentially built out. Given the high levels of congestion in the peak periods, the I-710 travel demand forecast model is particularly sensitive to changes in travel times. The proposed improvements included in the build alternatives improve speeds and reduce travel times on I-710, which in turn attracts more traffic to the facility relative to the No Build condition. The predicted shifts in traffic are accounted for in the analysis presented in Sections 3.5 and 3.13 of the I-710 RDEIR/SDEIS and this Final EIR/EIS for both Alternatives 5C and 7. For further detail on the effects of traffic on the arterial system, please refer to the I-710 Intersection Traffic Impact Analysis Report (March 2017).

F-4-18

The air quality analyses presented in Section 3.13 of this Final EIR/EIS report findings for various geographic areas including: the I-710 Corridor; the Area of Interest; and the Basin (refer to Figure 1-2 of the AQ/GHG/HRA Technical Study [2017] for a depiction of these areas). Changes in traffic on the local roadway network attributable to the build alternatives are accounted for in the reporting for the Area of Interest and the Basin study areas, while results for the I-710 Corridor focus on the I-710 freeway (Alternative 5C and Alternative 7) and the freight corridor (Alternative 7 only.)

When viewing traffic for the build alternatives relative to the No Build Alternative, traffic changes are greatest on the I-710 Corridor with differences on the arterial system and other roadways being much more diffused and muted. Emissions from existing and future traffic on local arterials located within the Area of Interest are presented in the gridded mass emission plots presented in Figures 4-1a through 4-2c of the AQ/GHG/HRA Technical Study. These figures (right panels of Figures 4-1b and 4-1c) show that incremental $PM_{2.5}$ and PM_{10} emissions on local roads are primarily less than 1 pound per day when comparing Alternative 5C and Alternative 7 to 2035 Alternative 1 (the No Build Alternative). Based on the mass emissions analysis within the Area of Interest (gridded emission plots), the greatest $PM_{2.5}$ and PM_{10} impacts of the build alternatives are anticipated to occur on the I-710 freeway and the freight corridor. As a consequence, the air dispersion and health risk modeling focused on the I-710 Corridor.

F-4-19

Please refer to Response to Comment F-4-5 and Section 1.4.1 of this appendix, Project Level Particulate Matter Conformity Analysis, for more information and a discussion of project-level conformity.

F-4-20

The EPA and FHWA require air dispersion modeling only for project-level CO and, in some cases, PM hot-spot analyses. As stated in Section 5.3 of Appendix G of the AQ/GHG/HRA Technical Study (2017), the nearest receptors in the CO hot-spot analysis were placed at a distance of 3 meters from the edge of the adjacent roadways. The air quality analysis, which includes dispersion modeling of NO_2, CO, PM_{10}, $PM_{2.5}$, and MSAT emissions to evaluate ambient air quality impacts and health risk impacts, provides more detailed information and further in-depth analyses than other environmental documents typically prepared by Caltrans. As stated in Chapter 8 in Appendix D of the AQ/GHG/HRA Technical Study, the closest receptor used in the dispersion modeling is 50 meters (approximately 164 feet) from the edge of the Alternative 5C mainline footprint. Receptors at this distance are fully consistent with (and in many cases, closer than) recent analyses of Port, railyard and other transportation projects in southern California. In addition, EPA guidance on dispersion modeling calls for an "exclusion zone" in certain types of modeling, such as was done for the air quality analysis for the I-710 Corridor Project. Results of the dispersion modelling and the AQ/GHG/HRA Technical Study are in line with the emission calculations, and show no exceedances in the CO or NO_2 NAAQS, a reduction in health risk, or increases in PM concentrations at some receptors.

F-4-21

Metro and Caltrans do not expect the duration of construction activities for any of the build alternatives to be greater than five years at any single site. According to the preliminary construction staging analysis conducted for the build alternatives, it is likely that construction would take place in different segments within the 19-mile corridor simultaneously in order to construct the full project. The analysis presented in the AQ/GHG/HRA Technical Study (2017) evaluates potential emissions associated with the highest traffic levels in the corridor upon project completion of the build alternatives (year 2035) as well as the construction emissions impacts of constructing the full corridor. As is typical during major freeway reconstruction projects in the Los Angeles metropolitan area, the I-710 would continue to operate during the construction period. During project design and prior to construction, detailed transportation management plans would be developed to identify specific detour routes; provide public outreach and noticing during construction, and to help minimize construction impacts to the surrounding communities. However, Caltrans, as lead agency under CEQA and NEPA (as assigned by FHWA), in cooperation with Metro, has identified Alternative 1 (No Build) as the Preferred Alternative, which

is discussed in more detail in Section 1.1 of this appendix. Therefore, construction phasing to reduce cumulative impacts is no longer necessary.

F-4-22

As stated in Response to Comment F-4-21, the No Build Alternative has been selected as the Preferred Alternative. Therefore, notification of construction to schools, childcare centers, and residences located near construction sites and/or along proposed truck routes would no longer be necessary.

F-4-23

As shown in Table 2.3-5 in the RDEIR/SDEIS and this Final EIR/EIS, the most complex area in terms of construction activity and duration is located within Segment 2. A more detailed examination of the preliminary construction staging analysis within this broad area confirms that construction of the various sequential elements would be occurring at different locations and that no individual site would be affected by construction-related activities for longer than five years.

F-4-24

As stated in Response to Comment F-4-2, the No Build Alternative has been selected as the Preferred Alternative. However, Section 4.3 of the AQ/GHG/HRA Technical Study (2017) calculates criteria air pollutant and greenhouse gas emissions for a "worst-case" scenario that assumed, among other things, that construction of the build alternatives would occur simultaneously in the seven sections of the 19-mile long freeway (refer to the AQ/GHG/HRA Technical Study, Appendix B, Exhibit 2, showing overlapping construction on several segments together). Peak daily emissions associated with a single freeway section were also analyzed. These emissions were compared to the SCAQMD significance criteria as shown in Tables 4-3a and 4-3b of the AQ/GHG/HRA Technical Study. Further details on methodology are provided in Appendix B of the AQ/GHG/HRA Technical Study.

F-4-25

Detailed final design, construction, and staging plans and equipment location and timing are generally not determined until after the Final EIR/EIS and Record of Decision (ROD) are approved. Without location-specific construction activity information, modeling of location-specific air quality impacts is not possible and assumptions about those locations and the intensity/duration of construction activity at those locations would cause any dispersion modeling results (ambient or mobile source air toxics) to be speculative and misleading. The construction emissions scenarios presented in the AQ/GHG/HRA Technical Study (2017) and summarized in Section 3.24, Construction Impacts, of the RDEIR/SDEIS and this Final EIR/EIS assume full build out of the respective alternatives, which represent a conservative (i.e., worst-case scenario) emissions analysis, drawn from the construction staging scenarios, in order to identify and

disclose the range of potential impacts. Please refer to Section 1.4.3 of this appendix, Localized Impacts of Project Construction Emissions, for further discussion.

F-4-26

This comment requests that the RDEIR/SDEIS discuss the potential for combined construction and operational emissions to be greater in interim years than in horizon year 2035. The construction of the build alternatives was assumed to begin between 2022 and 2024 and be completed by horizon year 2035. As is typical during major freeway reconstruction projects in the Los Angeles metropolitan area, the I-710 would continue to operate during the construction period. Hence, the build alternatives would not exist in any of the interim years between start of construction and 2035 that are referred to in this comment and a comparison of the emissions with and without the build alternative in a particular interim year would be hypothetical and misleading. However, as stated in Response to Comment F-4-21, the No Build Alternative has been selected as the Preferred Alternative. Therefore, the potential for the combined construction and operational emissions to be greater in interim years than in the horizon year 2035 does not need to be analyzed. Please refer to Section 1.4.2 of this appendix, Air Quality Analysis of Interim Years, for further discussion.

F-4-27

This comment requests that Measure CON-CUM-1 in Section 3.24, Construction Impacts, of the RDEIR/SDEIS, be revised to include a brief discussion of the coordination of commitments to reduce cumulative air quality impacts. As stated in Response to Comment F-4-21, the No Build Alternative has been selected as the Preferred Alternative. Therefore, the suggested revision to Measure CON-CUM-1 is no longer necessary and has not been made in this Final EIR/EIS.

F-4-28

As requested, the AQ/GHG/HRA Technical Study (2017) does present "a range of likely emissions." (Refer to Tables 4-3a and 4-3b in the AQ/GHG/HRA Technical Study.) Construction emissions are presented for a baseline compliance scenario and an All-Best Available Control Technology (All-BACT) scenario. The baseline compliance scenario assumes there is "no mitigation" for off-road construction equipment (i.e., all construction equipment is assumed to be compliant with CARB's In-Use Off-Road Diesel-Fueled Fleets Regulation). The All-BACT scenario assumes that all off-road emissions will meet EPA Tier 4 final engine standards for off-road equipment.

Measure CON-AQ-15 only indicates that "Construction equipment during project construction will meet equivalent emissions performance to that of USEPA Tier 4 standards and CARB requirements for non-road engines, depending on the agency…" Measure CON-AQ-15 is included as a written commitment in the Environmental Commitments Record (ECR) of this Final

EIR/EIS, and as such, should be considered a requirement for construction of the build alternatives.

F-4-29

For a project of this size, this level of detail associated with building material delivery routes is produced during final design, when available funding for construction has been identified, and a construction schedule for the project has been determined. A preliminary construction staging analysis has been performed in order to demonstrate that the build alternatives can feasibly be constructed. The construction emissions scenarios presented in the AQ/GHG/HRA Technical Report (2017) assume a conservative (i.e., worst-case) emissions analysis, drawn from the construction staging scenarios, in order to identify and disclose the range of potential impacts.

The construction emissions estimated for the build alternatives are based on levels and intensity of construction activities assumed in the "worst-case" analysis scenario developed for the full 19-mile I-710 Corridor. This construction emissions analysis presented in the AQ/GHG/HRA Technical Study (2017) already incorporates the quantities and durations of operating construction equipment on site, as well as projected VMT of the construction material/debris haul trucks, in the estimates produced for the build alternatives. Specific construction staging areas, including routes into and out of the staging/storage areas, sources of required concrete, borrow pits, processing pits, and transportation routes, have not been identified at this stage of project design of the build alternatives, and likely would not be known in detail until final design. In the right-of-way analysis conducted for the RDEIR/SDEIS and this Final EIR/EIS, temporary construction easements for the build alternatives were determined in a manner that anticipated the need for construction staging in addition to space that would be required for construction activities. However, as stated in Response to Comment F-4-21, the No Build Alternative has been selected as the Preferred Alternative and the proposed build alternatives would not be constructed.

F-4-30

The conclusion of a disproportionately high and adverse impact to environmental justice communities, before additional mitigation, was made based on several different sets of data for different resource areas, both qualitative and quantitative. Environmental justice impact area maps are provided for air quality in Section 3.3 of this Final EIR/EIS because of the importance of that particular resource area within this I-710 Corridor relative to the project purpose. However, because of the generally discrete and easily described nature of disproportionate noise impacts and relocations, accompanying maps were not produced as it was determined they would add little value to the analysis. The four discrete locations of environmental justice impacts related to noise are provided in a bullet point list in Section 3.3.3.5. In addition, because the visual impact analysis undertaken for the project alternatives is representative in nature, a map determining the specific spatial areas of impact cannot be reliably produced. Therefore, because the requested

map would incorporate both spatial and non-spatial data and conclusions, and the possibility for misinterpretation of the data would be high, the requested map is not provided in this Final EIR/EIS. A more detailed assessment of impacts related to cul-de-sacs was included in the Community Impact Assessment; overall, the change in access due to conversions to cul-de-sacs would be minor and not represent an adverse impact.

F-4-31

The MSATs discussion in Section 3.13, Air Quality, of this Final EIR/EIS, was revised to include the following sentence: "MSAT tools and analysis can be used to illuminate, for both the public and decision-makers, the health risks associated with different project alternatives."

F-4-32

Caltrans respectfully disagrees that rephrasing of the text cited in the comment is required. This sentence from the executive summary of the AQ/GHG/HRA Technical Study (2017) is referring to the comparison of $PM_{2.5}$ emissions and concentration of the future (2035) alternatives to the 2012 Baseline. As stated in the comment, there are increases in PM_{10} emissions across all study areas; however, Section 4.5 of the AQ/GHG/HRA Technical Study states that a PM mortality and morbidity evaluation was performed based on a comparative analysis of total $PM_{2.5}$ emissions and not PM_{10} emissions. The air quality analysis demonstrated that $PM_{2.5}$ emissions show a decrease for the 2035 build alternatives as compared to the 2012 Baseline. Near-freeway $PM_{2.5}$ concentrations show a decrease for the 2035 build alternatives as compared to the 2012 Baseline at most locations except at a few locations for Alternative 7.

F-4-33

Measures AQ-2 (detailed in Section 3.13.4) and C-8 (detailed in Section 3.3.3.7) of this Final EIR/EIS, provide for the installation of filtration or heating, ventilation, and air conditioning (HVAC) units for sensitive receptors. These measures do not provide for ongoing maintenance of filtration units, as Caltrans and Metro do not have an appropriate mechanism for ongoing provision of funds or materials. Maintenance would ultimately be the responsibility of the filtration recipient.

F-4-34

As stated in Response to Comment F-4-2, the No Build Alternative has been selected as the Preferred Alternative and therefore, the proposed build alternatives will not be constructed. Hence, impacts from lengthy construction activities will not occur, and mitigation measures to reduce these impacts are not applicable.

F-4-35

As stated in Response to Comment F-4-2, the No Build Alternative has been selected as the Preferred Alternative; hence programmatic elements of the build alternatives, such as the

Community Health Benefit Program, will not be implemented by Caltrans as the Lead Agency under CEQA and NEPA and as the owner/operator of the I-710 freeway. A summary of potential elements of a Community Health Benefit Program discussed after the circulation of the RDEIR/SDEIS can be found in Section 2.3.2.1 of this Final EIR/EIS. The projects specifically noted by the commenter, including measures to address childhood asthma and prenatal exposure to air pollution would qualify as projects and actions that would have been considered when determining funding awards for the Community Health Benefit Program under the build alternatives. Please also refer to Section 1.10 of this appendix for more detailed information regarding the Community Health Benefit Program.

F-4-36

Caltrans appreciates the offer of assistance from EPA for coordination on the required 404/408 permits under the federal Clean Water Act. However, as stated in Response to Comment F-4-21, the No Build Alternative has been selected as the Preferred Alternative. Therefore, 404/408 permits would no longer be necessary. In addition, no 404(b)(1) Alternatives Analysis is required. However, a description of how the waters of the United States were avoided has been added in Section 3.17.3.1, Wetlands, of this Final EIR/EIS, as part of the Least Environmentally Damaging Practicable Alternative discussion.

F-4-37

As discussed in Section 3.16.3.1, Permanent Impacts, of the RDEIR/SDEIS and in this Final EIR/EIS, impacts associated with shading were considered indirect permanent impacts and were assumed in areas where shading from a bridge or the elevated freight corridor in Alternative 7 was identified. A discussion of indirect permanent impacts to estuarine and riparian/riverine habitats associated with shading is provided in Section 3.16.3.1, and measures to offset permanent impacts as a result of the build alternatives are provided in Section 3.16.4.

F-4-38

Section 3.8.3 of the RDEIR/SDEIS and this Final EIR/EIS include a detailed discussion of the project design features associated with the build alternatives that would result in transverse encroachments of the Los Angeles River 100-year floodplain for the build alternatives. The preliminary design approach of the structures in the floodplain maintains existing hydrologic performance by placing new columns in place of, or aligned with, existing columns for the build alternatives. All proposed modifications would preserve existing hydrologic flows and structural integrity of the Los Angeles River channel and its levees. Siting of bioswales and other permanent storm water treatment devices within existing and proposed State right-of-way under the build alternatives follow Caltrans' *Stormwater Quality Handbooks - Project Planning and Design Guide* (July 2017) and are identified in the *Storm Water Data Report* (SWDR) (January 2017). These facilities would improve water quality and would have no effect on hydrologic flows in the Los

Angeles River. As stated in Response to Comment F-4-21, the No Build Alternative has been selected as the Preferred Alternative and construction of the build alternatives would not occur.

As discussed in Section 3.8.3.1 of the RDEIR/SDEIS and this Final EIR/EIS, the build alternatives would not change the capacity of the Los Angeles River, Compton Creek, and/or the Rio Hondo Channel to carry water and would not result in a measurable impact to the 100-year floodplain elevation. The encroachments would not result in any adverse impacts on the natural and beneficial floodplain values.

F-4-39

A discussion of the build alternatives, including their consistency with the goals and objectives of plans for the Los Angeles River restoration, has been added to Section 3.1, Land Use, in this Final EIR/EIS.

Mr. Ronald Kosinski
Caltrans District 7
Division of Environmental Planning
100 South Main Street, MS 16A
Los Angeles, CA 90012

Dear Mr. Kosinski:

I am submitting comments on the I-710 Corridor Project Recirculated Draft Environmental Impact Report / Supplemental Draft Environmental Impact Statement (RDEIR/SDEIS).

As you know, I raised several issues and concerns in my previous letter dated September 27th on behalf of my constituents, including:

- the impact of the proposed acquisition of homes, businesses and properties in the cities of Bell, Bell Gardens, Commerce and the East Los Angeles community (East LA);
- the negative impact the plan to convert current parking lanes into designated bus travel lanes during peak travel hours will have on businesses on Atlantic Boulevard;
- the shortage of parking for residents and homeowners who live on the streets adjacent to Atlantic Boulevard; and
- the likely problematic traffic impacts at several intersections around the I-710 during construction and after the project is completed.

In addition to this short list, Supervisor Solis will be submitting a comprehensive list of specific issues, concerns and mitigations that was compiled by the I-710 Community Advisory Committee and the staffs of the supervisor's and my offices. While that list does not include everything that needs to be addressed, I believe it is a good start.

One item on this list is a request for a more complete traffic study. While the Caltrans traffic study gives us data for streets in close proximity to the I-710, it does not include the surrounding streets and intersections, such as Atlantic Boulevard and Whittier

F-5-1

Boulevard, or major and minor thoroughfares that are used daily by drivers, pedestrians and cyclists to travel through and around the area.

A critical reason a broader study is needed is if the traffic patterns and freeway transitions from the I-710 between the 60 freeway and the I-5 are limited, as proposed in the RDEIR/SDEIS, cars and trucks will be forced to exit the I-710, or possibly the I-5 freeway, and travel east and/or north on local streets. An expanded study is needed to establish a baseline from which to work for the entire region, not just one for traffic to, and along, the I-710 freeway. The results from the requested expanded study will greatly help Metro, the Los Angeles County Department of Public Works, and the community develop a more comprehensive and effective traffic plan, especially during construction when options will be very limited. F-5-1

Another aspect of the proposed alternatives that needs to be carefully studied is the closure of the Olympic / Whittier off- and on-ramp included in design options 3A and 3B. If this ramp is closed, more local streets would become major thoroughfares as drivers travel to and from other entrances and exits and traffic could be negatively impacted on the freeway as well as on local streets. F-5-2

In regards to the eminent domain process, when the time comes to purchase the properties, I respectfully ask that, the residents and business owners, regardless of immigration status, are fully educated about their options with sufficient time for their review and consultation. While I know it may take many years and the project may go through additional rounds of environmental reviews, the property owners and residents have a right to be properly informed and have their questions answered about the status of their homes and businesses. F-5-3

I also ask that residents be apprised of their rights when it comes to being affected by construction, and that their immigration status not be an issue should they need to file a complaint. F-5-4

Another issue of concern is the schedule of construction projects, mitigations and community improvements/beautifications. On behalf of the communities at the northern end of the project, I am requesting that the smaller mitigation projects be addressed early on, in preparation for the future construction issues they will face. As it stands, the Caltrans traffic study shows that the design options, when completed, could worsen air quality and traffic in East LA. Therefore, it is essential that as many potential problems as possible are addressed before construction begins. F-5-5

In the city of Bell, I would ask that all available steps be taken to preserve the Bell Shelter property. The organizations on the site have been there for many decades, taking in and serving homeless individuals, who are often not welcome anywhere else. As you may know, the organizations, Shelter Partnership and the Salvation Army, acquired the property through the McKinney-Vento Act, and have spent funds to develop the site. Unfortunately, our homeless population continues to grow, and I am F-5-6

concerned that the loss of property will hamper the Bell Shelter's long range plans to provide shelter and services to a greater number of homeless individuals and families. F-5-6

It has also been brought to my attention that the Los Angeles County Department of Health Services could play a critical role in this project, not only during construction, but also in the evaluation of the mitigations and the project overall. I understand they did this for a construction project in Venice. Their services would be most helpful in providing decision-makers and the community with a Health Impact Assessment (HIA). The HIA and their input would be helpful in assessing the requested mitigations before, during and after the project is completed, especially as it pertains to dust, noise, pollution and traffic issues. F-5-7

I am also requesting that Caltrans and Metro adopt Metro's best practices and lessons learned from previous mass transit and construction projects. I encourage Caltrans and Metro to follow Motion 22.1 that was offered by Supervisor Solis and adopted by the Metro Board on October 22, 2015 to the greatest extent possible. While some of the items may increase the cost of the project, in the long run, they may be the best options to improve air quality and protect the health of the impacted communities as well as improve truck travel safety for all involved. Further, given that there are no "best" or even "good" options, it has been suggested that perhaps some sort of hybrid alternative be developed. F-5-8

Thank you, in advance, for your consideration. If you have questions, please feel free to contact Cindy Muro or Kim Tachiki-Chin in my District Office at (323) 721-8790.

Sincerely,

Lucille Roybal-Allard

F-5-1

In support of the RDEIR/SDEIS, two traffic technical reports were prepared, which are available to the public on Caltrans' website (located at http://www.dot.ca.gov/d7/env-docs/docs/710corr-eir/). One of these reports, the *Intersection Traffic Impact Analysis Report* (March 2017), presents information on the major arterials within the I-710 Study Area, including Atlantic Blvd. and Whittier Blvd., as well as over 180 local intersections that have the potential to be impacted by the build alternatives.

In the RDEIR/SDEIS, two design options were examined that would modify local access to the I-710 freeway in the East Los Angeles area. Design Options 3A and 3B would limit access to I-710 in the northbound direction from the Olympic Blvd. on-ramp and would shift the ramp termini from I-710 in the southbound direction from Eastern Ave. to Whittier Blvd. The information included in both the *Traffic Operations Analysis Report* (March 2017) and the *Intersection Traffic Impact Analysis Report* (March 2017) evaluated the effect that these modifications would have on 24 intersections examined in the local traffic circulation network in East Los Angeles, which is surrounded by I-5, I-710, and SR-60.

These effects, along with concerns regarding various other environmental resource areas, were considered along with public comments on the alternatives and design options evaluated in the RDEIR/SDEIS. As a consequence, Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), has identified Alternative 1 (No Build) as the Preferred Alternative. Therefore, the programmatic project feature that would restrict on-street parking on local arterials such as Atlantic Blvd. and Garfield Ave. has also been eliminated from further consideration for the proposed project. For more information on the identification of the Preferred Alternative, please see Section 1.1 of this appendix.

F-5-2

Caltrans and Metro acknowledge concerns about the traffic and circulation impacts of Design Options 3A and 3B; however, it is important to note that these design options have been removed from further consideration for this project. Please refer to Response to Comment F-5-1 for more information. Additionally, to provide clarification as to the scope of the design options, Design Options 3A and 3B would have relocated the Olympic Blvd./Whittier Blvd. on- and off-ramps in the southbound direction of I-710, and not closed them. In the northbound direction of I-710, vehicles from the Olympic Blvd. on-ramp would have been restricted from accessing I-710, but direct access would still have been provided to the freeway system from this Olympic Blvd. on-ramp to the SR-60 connectors in lieu of I-710.

F-5-3

The commenter's request related to residents and business owners that, regardless of their immigration status, they be educated about their options and allowed sufficient time for review and consultation during the acquisition process, is acknowledged and noted in the public record. As stated in Response to Comment F-5-1, the No Build Alternative has been selected as the Preferred Alternative, and no relocations will be necessary.

F-5-4

Please refer to Response to Comment F-5-3 regarding the relocation of residents.

F-5-5

Please refer to Section 1.1 of this appendix for a more detailed discussion of the identification of a Preferred Alternative, including the disposition of Design Options 3A and 3B. These Design Options within East Los Angeles have not been included in the Preferred Alternative. As the No Build has been selected as the Preferred Alternative, additional information related to construction schedule and staging is not necessary.

F-5-6

The commenter's opposition to the displacement of the Salvation Army Bell Shelter is acknowledged and included in the project record. The No Build Alternative has been identified as the Preferred Alternative, and it will not result in the permanent displacement of the Bell Shelter.

F-5-7

A Health Impact Assessment (HIA) a systematic process that: uses data sources and analytical methods; considers input from stakeholders; determines potential effects of a proposed policy, program or project across other sectors on health; and provides recommendations to monitor and manage potential effects from a project. An HIA was not conducted for the project. Neither FHWA nor Caltrans currently has an approved methodology addressing the health impacts of freeways, and these types of assessments are an emerging practice in the transportation sector in the United States. The preparation of an Air Quality/Health Risk Assessment for the I-710 Corridor Project was an effort to respond to the requests of the I-710 Corridor communities to study health-related impacts, while also ensuring the empirical analyses performed in support of the EIR/EIS process are factual and based on sound scientific, analytical, and/or engineering judgment. The Los Angeles County Department of Health Services has been invited to comment on project-related public documents. Please refer to Section 1.2 of this appendix and Chapter 5.0, Comments and Coordination, of this Final EIR/EIS for more detailed information regarding community participation and public involvement on the I-710 Corridor Project.

F-5-8

The build alternatives incorporate elements of Motion 22.1 per the Metro Board of Directors. Table 2.2-1 in Chapter 2.0, Project Alternatives, provides the locations of Motion 22.1-related discussion that was provided in the RDEIR/SDEIS as well as this Final EIR/EIS. Please refer to Section 1.1 of this appendix for more detailed information regarding the identification of the Preferred Alternative.

RE: I-710 Corridor Project (PM 5.4-29.5, EA 249900)
Coastal Commission Staff Comments on Recirculated Draft EIR (SCH 2008081042)

Mr. Kosinski:

Thank you for the invitation to comment on the Recirculated Draft Environmental Impact Report (RDEIR) for the I-710 Corridor Project (Project). A portion of the Project is within the Coastal Zone and constitutes development, so a coastal development permit(s) will be required following the CEQA review period. This letter provides direction on the coastal development permit process and the Coastal Act issues the project may raise.

As generally depicted in Figure 3.1-2 of the RDEIR, the portion of the Project south of Anaheim Boulevard and adjacent to the west bank of the Los Angeles River is within an area of the Port of Long Beach where the Coastal Commission has certified a Port Master Plan; thus the standard of review for a coastal development permit in that area is the policies of the Long Beach Port Master Plan. Pursuant to Coastal Act Section 30715, the Project is an appealable category of development: "roads or highways which are not principally for internal circulation within the port boundaries." The Port of Long Beach may process a coastal development permit for the portion of Project within its jurisdiction, which could be appealed to the Coastal Commission.

Figure 3.1-2 identifies the portion of the City of Long Beach within the Coastal Zone to the east of the Los Angeles River, but incorrectly identifies the entire area (light blue) as Long Beach Local Coastal Program Jurisdiction. In fact, only the approximate area between Ocean Boulevard and Seaside Way is subject to the Long Beach Local Coastal Program. In that area, the City of Long Beach may process a coastal development permit for the Project, which could be appealed to the Coastal Commission. The area on filled tidelands generally south of Seaside Way (including a portion of the west bank of the Los Angeles River south of Ocean Boulevard adjacent to Shoreline Drive) is within the Coastal Commission's area of original permit jurisdiction, where a coastal development permit from the Coastal Commission is required. S-1-1

The RDEIR identifies Permits and/or Approvals Needed in Table 2.5-1. The table indicates that a Coastal Zone Management Act consistency determination from the California Coastal Commission is needed 90 days prior to issuance of the ROD; it indicates that a Harbor Development Permit (Level II) for consistency determination from the Port of Long Beach is needed 90 days prior to issuance of the

ROD; and it indicates that a Coastal Development Permit application for consistency determination will be submitted to the City of Long Beach after identification of a preferred alternative but prior to the ROD.

Note that Coastal Act Section 30601.3 authorizes the Coastal Commission to process a consolidated coastal development permit application when the applicant, the local government(s), and the Coastal Commission all agree to do so. As an alternative to separate coastal permits subject to different standards of review in multiple jurisdictions, the consolidated coastal permit is subject to review and approval only by the Coastal Commission; the Coastal Act is the standard of review for the entire project, with relevant Local Coastal Program or Port Master Plan providing guidance.

Following the selection of a project alternative, Caltrans may submit a coastal development permit application with each local agency and the Coastal Commission, or it may initiate a discussion regarding the feasibility and potential benefits of a consolidated coastal development permit. Based on the Concept Plans in RDEIR Appendix O, pages 3-5, the majority of the project within the Coastal Zone appears to be within the Port of Long Beach jurisdiction, with local street improvements within the City of Long Beach Local Coastal Program jurisdiction. Coastal development permits issued by those governments would be appealable to the Coastal Commission. It is not clear whether portions of any Project alternatives are within the Coastal Commission's area of original permit jurisdiction. Coastal Commission staff will be available to assist Caltrans staff with boundary determinations once a project alternative is selected and more detailed design plans are prepared. S-1-2

The following are general comments on Coastal Act issues relevant to the Project and relevant to the ongoing collaboration between Caltrans and the Coastal Commission:

Page 3.17-4 of the RDEIR states: "there are no California Coast Commission jurisdictional wetlands within the portion of the BSA located in the Coastal Zone." Please note that the Golden Shore Marine Biological Preserve, along the west bank of the Los Angeles River south of Shoreline Drive, is a wetland and should be preserved consistent with Coastal Act Section 30230. Based on the Concept Plans in RDEIR Appendix O, page 3, the wetland appears to be outside the project limits, so no direct impacts are anticipated, but Caltrans and its contractors should implement construction best management practices to ensure that indirect impacts to water quality and biological productivity are avoided. S-1-3

Section 3.9 of the RDEIR provides the regulatory setting and mitigation measures for Water Quality and Stormwater Runoff. 3.9. Section 3.91 should identify the coastal development permit process as one of the permitting requirements. Coastal Act Section 30231 states: "the biological productivity and the quality of coastal waters, streams, wetlands, estuaries, and lakes appropriate to maintain optimum populations of marine organisms and for the protection of human health shall be maintained and, where feasible, restored through, among other means, minimizing adverse effects of waste water discharges and entrainment, controlling runoff, preventing depletion of ground water supplies and substantial interference with surface waterflow, encouraging waste water reclamation, maintaining natural vegetation buffer areas that protect riparian habitats, and minimizing alteration of natural streams." S-1-4

Through the coastal development permit process, the Coastal Commission and local governments have previously required new Projects to incorporate construction and post-construction best management practices to avoid discharges of debris and pollutants into coastal water bodies. Relevant to the subject Project is Los Angeles River, a portion of which is within the Coastal Zone and the remainder of which transmits water, debris, and pollutants into Queensway Bay and the Pacific Ocean. S-1-4

Coastal Commission staff concurs with Metro Board of Motion 22.1: "Consistent with the Regional Water Quality Control Boards and their Municipal Separate Storm Sewer System permits, identify suitable locations within the State's right of way to implement additional storm water Best Management Practices (BMPs) and enhance the water quality for the Los Angeles River and its tributaries... Incorporate into the project design, avoidance and minimization measures to reduce the level of impacts to the Los Angeles River's riverbanks, trails, pocket parks, open space, wetlands, and native landscaping within the project area."

Page 3.9-20 of the RDEIR indicates that Alternatives 5 and 7 would increase impervious surface area the most substantially, while other alternatives would have lesser increases in surface area but would also incorporate lesser mitigation measures. Under Alternative 7, "proposed treatment BMPs include 36 bioswales, 30 infiltration basins, 12 media filters, and one wet basin, as well as eight gross solids removal devices where feasible. BMPs for the project would be designed to treat low flows from more regular storms, and BMPs would be sized according to the Caltrans permit requirement for BMPs to treat the 85th percentile 24-hour storm events. The BMPs would treat 78.3 percent of on-site runoff from the total impervious surface areas within the project area, which would be an improvement over the existing condition. After implementation of BMPs, Alternative 7 is not anticipated to further degrade the water quality of any receiving waters."

Please note that under the Coastal Act, the standard of review is not whether a project further degrades the environment compared to the existing condition, but whether adverse impacts to water quality and biological productivity are avoided. Thus, the Project should maximize treatment BMPs and minimize impervious surface runoff. Could the Project be designed to capture and treat more than 78% of runoff from impervious surface areas? Could additional treatment BMPs and native landscaping be installed to maximize water quality improvements? S-1-5

Page 4.4 of the RDEIR notes that the City of Long Beach requires that trees located within the Coastal Zone not be removed during the nesting season and that pre-construction surveys be conducted one week prior to construction activities. The western snowy plover and black-crowned night heron are referenced as potential species in the biological study area and have been observed within the Long Beach Coastal Zone. Coastal Commission staff agree with Caltrans commitments to minimize removal of native trees and survey for nesting birds within the Long Beach Coastal Zone prior to tree removal. S-1-6

Page 3.1-50 of the RDEIR states: Access to the Coastal Zone in the vicinity of the I-710 Corridor Project improvements is facilitated by the existing I-710 mainline, State Route 47 (SR-47), and Ocean Blvd. However, public accessibility to the coast is relatively limited because the area is fully developed and the areas west of I-710 are active goods movement areas within the POLB and the POLA. However, the public can gain access to the coast east of I-710 via the public parks and marinas/boat launches located

in downtown Long Beach, and south of the proposed improvements by foot, vehicle, or bicycle using a network of roads and pathways.

One of the primary tenets of the Coastal Act is to preserve and enhance public access to and along the coast, which requires an interconnected and multi-modal transportation system. The highway, local streets, busways, bicycle facilities, and pedestrian accessways identified in the RDEIR should all be designed to maximize access and connections to the Los Angeles River and the Long Beach Downtown Shoreline District near the project terminus at Ocean Boulevard and Shoreline Drive. Specifically, access to LA River pedestrian and bike path should be improved in the vicinity of Ocean Boulevard, Santa Cruz Park, and Cesar E. Chavez Park. Caltrans should also work with the Long Beach Department of Transportation to consolidate the vehicular transition to Shoreline Drive in a manner that reduces unsafe speeds and maximizes available park space in the Coastal Zone adjacent to Golden Shore. S-1-7

Finally, the project design should be informed by the initiatives within the 2017 Plan for Improved Agency Partnering between Caltrans and the California Coastal Commission. Among the initiatives are collaborating on the California Coastal Trail, which may pass along the LA River pedestrian and bike path and a portion of Ocean Boulevard within the Project area. The final plans should provide space for the trail and maximize connections consistent with the guidance above. Final plans should also incorporate context sensitive, see-through bridge and guardrail designs to enhance visual resources in the Coastal Zone, consistent with Initiative 4 and the designs selected by the Coastal Commission's Road's Edge Subcommittee in collaboration with Caltrans staff. Finally, the final plans should provide for Native Species and Invasives Control in Landscaping Plans, consistent with Initiative 9. S-1-8

Please note that the comments provided herein are preliminary in nature. More specific comments may be appropriate as the project develops. Coastal Commission staff requests notification of any future activity associated with this project or related projects. Thank you for the opportunity to comment on the Recirculated Draft EIR. Please contact me at 562-590-5071 with any questions.

Sincerely,

ZRehm

Zach Rehm
Senior Transportation Program Analyst

Cc: Steve Hudson, South Coast District Director - Los Angeles Area
Tami Grove, Statewide Development and Transportation Program Manager

S-1-1

Figure 3.1-2 of the RDEIR/SDEIS was revised in this Final EIR/EIS to correctly depict the Long Beach Local Coastal Program jurisdiction between Ocean Blvd. and Seaside Way.

S-1-2

The information provided in this comment on the coastal development permit application process is acknowledged and noted in the project record. As discussed in Section 3.1.2.1, in the "Coastal Zone" subsection, the proposed build alternative improvements would only occur in the Port of Long Beach Master Plan and the City of Long Beach Local Coastal Program jurisdictions. As discussed in Response to Comment S-1-1, Figure 3.1-2 was revised to correctly depict the areas of jurisdiction.

S-1-3

The commenter is correct in indicating that the Golden Shore Marine Biological Preserve is outside of the project limits. However, Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), has identified Alternative 1 (No Build) as the Preferred Alternative, which is discussed in more detail in Section 1.1 of this appendix. Therefore, there is no need to implement Best Management Practices (BMPs) for short- and long-term impacts related to water quality.

S-1-4

The coastal development permit process as one of the permitting requirements is outlined in Table 2.5-1, Permits and/or Approvals Needed, in Chapter 2.0, Project Alternatives, of the RDEIR/SDEIS and this Final EIR/EIS. After circulation of the RDEIR/SDEIS, subsequent coordination with California Coastal Commission staff occurred in April 2018, and it was determined that, if a build alternative was selected as the Preferred Alternative, a Coastal Development Permit application and Coastal Zone Management Act (CZMA) Consistency Determination would be submitted following certification of the EIR and when the appropriate level of plan detail was available. However, as stated in Response to Comment S-1-3, the No Build Alternative has been selected as the Preferred Alternative. Therefore, a Coastal Development Permit is no longer necessary.

S-1-5

As stated in Section 3.9.3.1 of the RDEIR/SDEIS and this Final EIR/EIS, the proposed BMPs for the build alternatives would treat 74 percent of on-site runoff from the total post-project impervious surface areas within the project area, which would be an improvement over the existing condition. After implementation of BMPs, the build alternatives are not anticipated to further degrade the

water quality of any receiving waters. However, as stated in Response to Comment S-1-3, the No Build Alternative has been selected as the Preferred Alternative. Therefore, BMPs are no longer necessary.

S-1-6

The commenter's support of the build alternatives' commitments to minimize removal of native trees and conduct pre-construction nesting bird surveys within the Long Beach Coastal Zone is acknowledged and included in the project record.

S-1-7

As discussed in Section 2.2.2.1 of the RDEIR/SDEIS and this Final EIR/EIS, the Metro Board of Directors passed Board Motion 22.1 in October 2015 that directed Metro and Caltrans to study, as a part of the I-710 Corridor build alternatives, "upgrades to the existing Los Angeles River Bike Path consisting of safety, landscaping, hardscape, lighting and access enhancements, and fix stations including to locations between Ocean Blvd. [Long Beach] and its northern terminus at Slauson Ave. [Vernon] [*sic*]". As stated in Response to Comment S-1-3, the No Build Alternative has been selected as the Preferred Alternative. However, on April 27, 2017, the Metro Board amended Motion 22.1 to advance the Los Angeles River Bike Path upgrades sooner and as a separate project; therefore, there is no discussion of this element in this Final EIR/EIS. Also, please note that the reconfiguration of Shoreline Dr, in the vicinity of Cesar E. Chavez Park as it approaches Ocean Blvd. has been incorporated into the Shoemaker Bridge Project. To that end, Caltrans has been working with the City of Long Beach on the reconfiguration of Shoreline Dr, so as to maximize available and accessible park space in and around Cesar E. Chavez Park.

S-1-8

The information provided in this comment regarding the incorporation of context-sensitive design in order to enhance visual resources is appreciated. However, as stated in Response to Comment S-1-3, the No Build Alternative has been selected as the Preferred Alternative. Therefore, context-sensitive designs for the build alternatives and measures to control invasive species are no longer necessary.

CALIFORNIA
AIR RESOURCES BOARD

Mary D. Nichols, Chair
Matthew Rodriquez, CalEPA Secretary
Edmund G. Brown Jr., Governor

October 23, 2017

Ms. Carrie Bowen
District 7 Director
California Department of Transportation
100 South Main Street, MS16A
Los Angeles, California 90012

Dear Ms. Bowen:

Thank you for the opportunity for the California Air Resources Board (CARB) staff to provide comments to the California Department of Transportation (Caltrans) on the Recirculated Draft Environmental Impact Report Environmental Impact Statement (RDEIR/EIS) and Section 4(f) Evaluation for the I-710 Corridor Project (Project).

In July 2015, Governor Brown issued Executive Order B-32-15, which provides a vision for California's transition to a more efficient, more economically competitive, and less polluting freight transport system. This transition of California's freight transport system is essential to supporting the State's economic development in coming decades while reducing harmful pollution in California communities. The Executive Order identified targets for State agencies to advance these objectives, including deploying over 100,000 freight vehicles and equipment capable of zero emission operation by 2030.

As partners with Caltrans on the Governor's 2016 California Sustainable Freight Action Plan (Plan), CARB staff sees the I-710 project as a proving ground to realize the Plan's vision to transport freight in California on a modern, safe, efficient, and resilient system by "zero emission equipment everywhere feasible, and near-zero emission equipment powered by clean, low-carbon renewable fuels everywhere else." We are optimistic that the decisions Caltrans will make on this major project to include dedicated, zero emission truck lanes will provide landmark leadership to achieve our mutual mobility, environmental, and economic goals, consistent with the Plan and State law.

The Clean Energy and Pollution Act of 2015 Senate Bill (SB) 350 (de León, Chapter 547, Statutes of 2015) established as a State priority the reduction of greenhouse gases through clean energy policies, including widespread transportation electrification, for the benefit of all Californians. Zero emission truck lanes will help transform the State's transportation sector to support widespread electrification. S-2-1

Furthermore, the State of California has recently placed additional emphasis on protecting local communities from the harmful effects of air pollution through the passage of Assembly Bill (AB) 617 (Garcia, Chapter 136, Statutes of 2017). S-2-2

AB 617 is the most significant piece of air quality legislation in decades and highlights the need for further emission reductions in communities with high exposure burdens, like those along the I-710 Corridor. S-2-2

We strongly support the project Alternative 7 Design ZE (Alternative 7ZE) that includes four truck-only lanes, a clean freight corridor that restricts usage to zero emission trucks, and an automated vehicle control system to steer, brake, and accelerate trucks (allowing for platooning). Dedicated truck lanes create opportunities to adapt to changing technology options with access and pricing approaches that support the transition to a more efficient, zero emission corridor. S-2-3

These actions are essential to achieve air quality and climate targets, including the increased truck activity on I-710 due to better system performance and the resulting induced demand. Emissions from mobile sources, especially heavy-duty diesel trucks like those traveling the I-710 Corridor are the largest contributor to regional air pollution and the largest impediment to attainment of air quality standards for ozone and fine particulate matter in the South Coast Air Basin. Even with broad deployment of 2010 and newer trucks as required by CARB regulations, the region will need substantial additional emission reductions to attain national ambient air quality standards and protect roadside communities.

CARB staff commends Caltrans for including the zero and near-zero emission freight corridor option and for the commitment to improve air quality and public health as a project objective. For the RDEIR/EIS to provide public transparency on the potential air quality and health impacts of the project, a few elements need to be updated (please see the attached comments for further details).

- The health risk and air quality analysis was prepared with the assumption that two major near-dock rail projects would be approved and fully operational by 2035. These projects are the proposed Southern California International Gateway (SCIG) and the Intermodal Container Transfer Facility (ICTF) Modernization Plan. Given their current status, the health risk and air quality results should be revised to reflect the higher anticipated I-710 truck traffic levels without the projects. S-2-4

- The health risk and air quality results also do not include an analysis of peak emissions from the overlap of construction and operations. These analyses should be revised to reflect the impacts during the peak emissions year. S-2-5

We appreciate the opportunity to comment on the RDEIR/EIS, and CARB staff is available to provide assistance to Caltrans on vehicle technologies, emission reduction

strategies, or other issues, as needed. Please include CARB on your State Clearinghouse list of selected State agencies that will receive the Final EIR/EIS as part of the comment period.

If you have any questions, please call me at (916) 445-4383 or have your staff contact Richard Boyd, Chief, Risk Reduction Branch, at (916) 322-8285 or via email at Richard.Boyd@arb.ca.gov.

Sincerely,

Richard W. Corey

California Air Resources Board Staff Comments and Recommendations on I-170 Corridor Project Recirculated Draft Environmental Impact Report/ Supplemental Draft Impact Statement

Project Description

The California Department of Transportation (Caltrans), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), the Gateway Cities Council of Governments, the Southern California Association of Governments, the Ports of Los Angeles and Long Beach, and the Interstate 5 Joint Powers Authority proposes to improve Interstate 710 (I-710) in Los Angeles County between Ocean Boulevard and State Route 60 (SR-60).

I-710 is a major north-south interstate freeway connecting the City of Long Beach to central Los Angeles and beyond. I-710 is a significant freight artery for the region and serves as the principal transportation connection for road-borne cargo between the Ports of Los Angeles and Long Beach, located at the southern end of I-710 and the BNSF and Union Pacific intermodal rail yards in the Cities of Commerce and Vernon, as well as intermodal warehouses along I-710. The existing I-710 mainline generally consists of eight general-purpose lanes north of Interstate 405 (I-405) and six general-purpose lanes south of I-405.

The study area includes the portion of I-710 from Ocean Boulevard in Long Beach to SR-60, a distance of approximately 18 miles. The study area extends one mile east and west of I-710 mainline at I-405, State Route 91, Interstate 105, and I-5 interchanges.

The existing I-710 freeway has elevated levels of health risks related to high levels of diesel particulate emissions, traffic congestion, high accident rates, and outdated design roadway features that create operational problems. To address these issues, Caltrans previously released a Draft Environmental Impact Report in 2012; however, due to extensive comments received, Caltrans developed and analyzed a new set of alternatives (5C and 7) in the Recirculated Draft Environmental Impact Report Supplemental Draft Impact Statement (RDEIR/EIS) released July 2017. The new alternatives are:

- Alternative 5C: Modernize I-710 Freeway: This alternative includes widening I-710 and adding two mixed-flow lanes, two truck by-pass lanes, widening bridges, adding bike lanes, arterial system improvements (modify freeway access, shift centerline), incorporating traffic demand management and Intelligent Traffic System (congestion relief signal upgrades, traffic calming), and focused improvements (structural, visual, irrigation, barriers).

- Alternative 7: I-710 Modernization and Added Near-Zero/ Zero Emission (NZ/ZE) Freight Corridor (Freight Corridor): Includes all of 5C, but rather than adding mixed-flow lanes and the truck by-pass lanes, Alternative 7 includes four NZ/ZE truck-only lanes and an automated vehicle control system feature that will steer, brake, and accelerate trucks allowing for platooning. Design Option 7ZE would restrict the Freight Corridor to only allow access to zero emission trucks beginning 2035.

Air Quality, Greenhouse Gas, and Health Risk Assessment (HRA) Technical Study

Results of the RDEIR/EIS indicate that projected I-710 operational emissions, in general, decline between now and 2035 as adopted clean vehicle and fuels regulations cut emissions faster than growth in vehicle miles traveled (VMT) increases emissions. This is true for the 2035 No Project or No Build scenario, as well as the two I-710 Project alternatives. However, the Alternative 7ZE results in the lowest emissions and health risk in 2035.

Preferred Alternative Recommendation

As indicated in our letter, we support Alternative 7 Design Option ZE (Alternative 7ZE) as the Preferred Alternative. By creating this dedicated freight corridor, the Project will support technology to transition to zero emission operation in highly impacted communities. It will also establish the foundation for a longer zero emission freight corridor connecting the seaports, rail yards, and inland distribution centers.

Adoption of zero emission technologies is critical to protect the health of communities near the Project study area. The restriction of use to ZE/NZE trucks on the freight corridor as part of Alternative 7 rather than conventional diesel trucks will help reduce oxides of nitrogen (NOx) emissions to help attain national ambient air quality standards in the South Coast Air Basin, cut toxic diesel particulate matter (diesel PM) to protect community health, and reduce greenhouse gases (GHG) to combat climate change. S-2-6

Comments

Air Quality, Greenhouse Gas, and Health Risk Assessment (HRA) Technical Study

1) Truck volumes: The proposed SCIG and ICTF Modernization projects to expand near-dock rail capacity are included in the port growth assumptions that were approved for use in traffic forecasting for port trucks and the baseline scenario developed for the RDEIR/EIS (page 1-31). These two intermodal projects would shift volumes of containers from truck to rail; but there is no certainty that these projects will be completed. S-2-7

The RDEIR/EIS appropriately identifies port truck volume projections both with and without these near-dock rail projects. Without these projects, the RDEIR/EIS indicates there would be an additional 5,800-8,500 truck trips per day on the I-710. However, the HRA and air quality analysis were conducted assuming that these two intermodal projects are operational in 2035. Table 38 in the Traffic Demand Methodology Technical Memorandum (June 2017) indicates port truck volumes without the SCIG and ICTF projects would increase, ranging from 14 to 134 percent, along various segments of I-710. Caltrans should update the HRA and air quality analyses to capture the emissions and health impacts from this higher truck activity. S-2-7

2) Appendix E, Section 2, Hazard Identification, Page E-2: Operational emissions were used to estimate potential health risk impacts. The analysis should be updated to include any overlapping operational and construction emissions that produce the peak estimated emission and risk levels. S-2-8

3) Appendix C, Section 1, Introduction, Page C-1: The air quality and health risk analyses used 2012 as a baseline as compared to 2035 build alternatives. Caltrans should include analyses for interim years 2023 and 2030 for combined operational and construction emissions, including the peak year recommended in Item 2, above. S-2-9

4) Figure ES-7: Figure ES-7 presents the maximum modeled cancer risk for Project alternatives and baselines. Caltrans should include additional tables showing detail on the individual Mobile Source Air Toxics that contribute to the risk. Presenting the maximum risk by individual toxic compound will provide the public with a more comprehensive understanding of the Project. S-2-10

Freight Corridor Facility

CARB would welcome the opportunity to work with Caltrans to define how the Freight Corridor will be managed under Alternative 7 to maximize fuel efficiency and emission reductions across the corridor, as well as to incentivize ZE/NZE technology. The standards that define NZE on the corridor can be updated periodically to reflect and support the current state of commercialized technology. Additionally, the infrastructure installed to manage the facility should be flexible enough to support real-time management and periodic standard updates (e.g., infrastructure similar to high-occupancy toll lanes using radio frequency identification technology). S-2-11

Mitigation Measures

Pursuant to the California Environmental Quality Act (CEQA), (see Cal. Pub. Resources Code § 21081; Title 14 CCR § 15126.2) to be adequate, mitigation measures should be specific, feasible actions that will reduce or avoid significant adverse environmental impacts, and must be enforceable and measurable. For each of the mitigation measures, the lead agency should identify measurable performance standards by which the success of the mitigation can be determined, as well as the relevant methods for monitoring that success.

1) CON-AQ-15 indicates that construction equipment used will meet U.S. EPA Tier 4 emission standards and CARB's requirements for off-road engines, depending on the responsible agency that administers the construction contract and availability of equipment. If Metro administers the construction contract, then Metro's Green Construction Policy would be utilized. Based on the elements of this policy, it is less stringent than using equipment that meets U.S. EPA Tier 4 emission standards. To achieve the greatest reductions in diesel emissions from off-road equipment, we recommend that Caltrans expand this mitigation to require that all off-road construction equipment greater than 25 horsepower used on the Project site meets U.S. EPA Tier 4 emission standards, regardless of who administers the contract. S-2-12

Given construction is scheduled to start in 2020 and Tier 4 equipment became available as early as 2008 for some horsepower categories, with the rest being made available in the 2012 timeframe, it is technically feasible to require that all Tier 4 equipment be used. To increase the enforceability of this mitigation, we recommend that Caltrans require the responsible agency administering the construction contract enter into contractual agreements with construction companies capable of meeting this requirement. S-2-13

2) CON-AQ-16 indicates Caltrans will instruct the construction contractor to comply with CARB's anti-idling rule, which prohibits diesel truck idling in excess of five minutes. Given that Project construction is estimated to last seven years, Caltrans can eliminate excess emissions by requiring that the contractors limit idling by diesel on-road construction trucks and off-road equipment to three minutes. S-2-14

3) CON-AQ-17 indicates that on-road heavy-duty trucks must meet 2007 or cleaner standards, and comply with State regulations during construction activities. CARB already requires trucks fleets to transition to 2010 or later emission standards by 2023 or earlier. At a minimum, on-road trucks over 14,000 pounds should meet 2010 or newer engine standards. For additional, feasible mitigation, we recommend that Caltrans offer extra points in the competitive scoring process to bidders with trucks that: are zero emission, certified to any of CARB's optional low NOx standards, or qualify for CARB's Hybrid Truck and Bus Voucher Incentive Project. S-2-15

S-2-1

Caltrans and Metro thank the commenter for this input. Please refer to Section 1.1 of this appendix for a discussion on the identification of the Preferred Alternative, and Section 1.3 of this appendix for additional discussion of zero emission (ZE) options.

S-2-2

The information provided on Assembly Bill 617 is acknowledged and included in the project record. As discussed in Section 1.2.2 in Chapter 1.0, Proposed Project, of the RDEIR/SDEIS and this Final EIR/EIS, one purpose of the project is to improve air quality and public health. Although the Preferred Alternative (Alternative 1, No Build) does not meet the purpose of the I-710 Corridor Project, the air quality analysis conducted for the proposed project found that other projects assumed in the No Build condition would provide some mobility and air quality benefits. In addition, all of the alternatives, when compared to the 2012 Baseline, including the No Build Alternative, would decrease the regional traffic greenhouse gas (GHG) emissions by approximately 13,000,000 metric tons of carbon dioxide equivalent (CO_2e) per year (25 percent from 2012 levels).

S-2-3

The commenter's support for Alternative 7 and the Alternative 7- Zero Emissions Design Option (Alternative 7-ZE Option) is acknowledged and included in the project record. Please refer to Section 1.1 of this appendix for a discussion on the identification of the Preferred Alternative.

S-2-4

At the time of the commencement of technical studies, including detailed traffic forecasting, in support of the I-710 Corridor Project RDEIR/SDEIS, the Project Team reviewed the status of the Southern California International Gateway (SCIG) and Intermodal Container Transfer Facility (ICTF) projects and came to the conclusion that they were reasonably foreseeable projects, and in order to represent a likely future scenario, should be included in the No Build Alternative scenario. Additionally, the SCIG and ICTF projects are reasonably foreseeable future projects included in the future No Build Alternative (2035) for the I-710 Project and the Future Year (2035) Baseline for Southern California Association of Governments' (SCAG) 2012 Regional Transportation Plan as well as SCAG's 2016 Regional Transportation Plan. In January 2018, the California Courts of Appeal ruled that the Port of Los Angeles and the BNSF were in compliance with the majority of CEQA requirements in the SCIG Final EIR, with the exception of the air quality analysis of ambient air concentrations and associated cumulative impacts of such pollutant concentrations. The Court further ordered that work on the project be suspended until such time that these deficiencies are addressed. However, Caltrans maintains, due to the information

provided above, that there is sufficient evidence and rationale for retaining the SCIG project in the No Build Alternative scenario.

According to the meeting minutes for the December 6, 2017, meeting of the ICTF Joint Powers Authority (JPA),[1] development of the Draft EIR for the ICTF Expansion and Modernization Project has begun but is currently on hold due to changes in schedules and other necessary updates. It is unknown when the process will be re-initiated.

A Sensitivity Test was conducted that removed the SCIG and ICTF Expansion Projects from the I-710 Corridor traffic model to evaluate the effects on the I-710 Corridor transportation travel patterns. These sensitivity tests are provided in the *I-710 Corridor Project RDEIR/SDEIS Travel Demand Modeling Methodology Technical Memorandum* (June 2017). In summary, viewed from daily conditions for total vehicles, removal of the SCIG and ICTF expansion projects from the No Build Alternative scenario resulted in only a slightly overall change in the total number of vehicles, with additional trucks using I-710 displacing some autos.

S-2-5

This comment requests that the health risk and air quality analysis include peak emissions from the overlap of construction and operation. Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), has identified Alternative 1 (No Build) as the Preferred Alternative, which is discussed in more detail in Section 1.1 of this appendix. Therefore, an analysis of peak emissions from the overlap of construction and operations of the build alternatives is not necessary. However, the construction emissions scenarios presented in Section 3.24, Construction Impacts, of the RDEIR/SDEIS and this Final EIR/EIS assume consecutive construction of all freeway sections, which represents a conservative (i.e., worst-case scenario) emissions analysis, drawn from the construction staging scenarios, in order to identify and disclose the range of potential impacts. Please refer to Section 1.4.2 of this appendix, Air Quality Analysis of Interim Years, for further discussion.

S-2-6

Caltrans and Metro thank the City for their input. The City's support of Alternative 7 is acknowledged and included in the project record. While Alternative 7, including the exclusive ZE option for the proposed freight corridor, would reduce nitrogen oxides (NO_X), diesel particulate matter (DPM), and GHG emissions within the Study Area, Alternative 1, the No Build Alternative,

[1] Intermodal Container Transfer Facility - Joint Powers Authority. 2017. Special Meeting of the Governing Board of the Intermodal Container Transfer Facility Joint Powers Authority Minutes, December 6, 2017. Website: http://www.ictf-jpa.org/pdf/12-06-17/ (accessed March 21, 2017).

has been identified as the Preferred Alternative due to project-related impacts associated with the build alternatives as well as other concerns. Please refer to Section 1.1 of this appendix for a discussion on the identification of the Preferred Alternative.

S-2-7

Please refer to Response to Comment S-2-4 regarding inclusion of the SCIG and ICTF projects in the Health Risk Assessment (HRA) and air quality analyses.

S-2-8

Please refer to Response to Comment S-2-5, Section 1.4.2 of this appendix, Air Quality Analysis of Interim Years, and Section 1.4.3 of this appendix, Localized Impacts of Project Construction Emissions, for further discussion.

S-2-9

This comment states that the air quality analysis should include a comparison of the build alternative emissions to future interim years 2023 and 2030 as well as year 2035. The analysis assumed construction of the build alternatives to begin in 2022 and be completed by the horizon year 2035. Hence, the build alternatives would not exist in any of the interim years (2023 or 2030) that are referred to in this comment and a comparison of the emissions with and without the build alternative in a particular interim year would be hypothetical and misleading. However, the *Air Quality, Greenhouse Gas, and Health Risk Assessment Technical Study* (AQ/GHG/HRA Technical Study) (June 2017) and the associated *Addendum to the Air Quality, Greenhouse Gas, and Health Risk Assessment Technical Study* (December 2020) present incremental comparisons of the emissions from the 2035 build alternatives to the 2035 No Build Alternative, which would exclude any reductions from State and Federal rules and regulations. Specifically, Table 5-2b in the AQ/GHG/HRA Technical Study presented the incremental changes in volatile organic compounds (VOC), nitrogen oxides (NO_X), CO, PM_{10}, $PM_{2.5}$, and sulfur oxides (SO_X) emission estimates for the 2035 build alternatives as compared to the 2035 No Build Alternative.

Also, it has been demonstrated that 2035 is the peak PM_{10}/$PM_{2.5}$ emissions year for operational emissions in the August 2018 White Paper, *I-710 Corridor Project: Considerations Regarding the Planning Assumptions Used for the Air Quality Conformity Analysis*, which was included as Appendix B of the August 2018 PM conformity submittal to the Transportation Conformity Working Group. In essence, vehicle miles travelled (VMT) would increase during this period (as noted in SCAQMD's Final 2016 Air Quality Management Plan), while fleet-turnover to the cleanest current cars and trucks would be essentially complete by 2023 (as shown in EMFAC2014 and complete implementation of the California Air Resources Board's (CARB) Truck and Bus Rule by that date). Please refer to Section 3.13.3.2 of this Final EIR/EIS for an updated discussion of project-level conformity.

As stated in Response to Comment S-2-5, the No Build Alternative has been selected as the Preferred Alternative. Therefore, a comparison of the build alternative emissions to future interim years 2023 and 2030 as well as year 2035 would no longer be necessary. Please refer to Common Response 1.4.2, Air Quality Analysis of Interim Years, for further discussion.

S-2-10

DPM is the main driver for cancer risk. As requested in the comment, individual mobile source air toxic (MSAT) contributions to the cancer risks presented in Figure ES-7 are presented in the table below. DPM contributes to 90 percent or more of the maximum-modelled cancer risk in each alternative. Acrolein is not shown, as there are no cancer risk impacts from acrolein. In all cases, the 2035 build alternatives show decreases in total cancer risk for each individual MSAT when compared to both the 2035 No Build Alternative scenario and the 2012 Baseline.

Mobile Source Air Toxic Contributions

	2012 Baseline	2035 No Build	2035 Alternative 5C	2035 Alternative 7
Total CR (in one million)	**1,420.62**	**57.34**	**45.02**	**30.33**
from DPM	1,396.70	51.71	40.82	29.53
from Benzene	12.81	2.84	2.03	0.29
from POM	5.77	1.82	1.37	0.19
from 1,3-Butadiene	3.30	0.60	0.47	0.07
from Formaldehyde	1.03	0.19	0.18	0.24
from Naphthalene	1.00	0.18	0.14	0.02

CR = cancer risk
DPM = diesel particulate matter
POM = polycyclic organic matter

S-2-11

Caltrans and Metro appreciate CARB's offer to work with the agencies regarding zero emission/near zero emission (ZE/NZE) technology incentivization. As discussed in more detail in Section 1.1 of this appendix, the No Build Alternative has been identified as the Preferred Alternative. However, as discussed in Section 2.3.2.3 in Chapter 2.0, Project Alternatives, of the RDEIR/SDEIS and this Final EIR/EIS, because the future technology cannot be predicted with certainty, Alternative 7 was analyzed in the RDEIR/SDEIS as "technology neutral" so that it would be able to accommodate at least one type of ZE heavy-duty truck that is in commercial mass production before the final design phase of project development. Because construction was several years away at the time of analysis, the selection of a specific technology would have been premature. The truck program included in both Alternatives 5C and 7 was analyzed as technology neutral so that no potential future technologies were precluded.

S-2-12

Measure CON-AQ-15 was drafted in a manner that ensures it is both enforceable and consistent with Caltrans' and Metro's contract bid requirements and procedures, given that it is not currently known at this time which agency may eventually administer the construction contract for the build alternatives. Therefore, some flexibility was retained accordingly in the wording of the measure. It is important to note that some, but not all, Tier 4 equipment is commercially available at the present time, and it is currently unknown if and when all Tier 4 equipment necessary to construct the build alternatives may be available in the future. By the time it was anticipated that construction of the build alternatives would be anticipated to begin, the Best Available Control Technology (BACT) compliance schedule for CARB In-Use Off-Road Diesel-Fueled Fleets Regulation indicates that only 10 percent of "large fleets" will consist of BACT equipment.[2]

For those reasons, in addition to the fact that the No Build Alternative has been identified as the Preferred Alternative, the text of the measure has not been revised.

S-2-13

Please refer to Response to Comment S-2-12 regarding the use of Tier 4 equipment during construction.

S-2-14

Caltrans and Metro thank the commenter for the suggestion and acknowledge that further reductions in diesel idling time will help to further minimize construction emissions. However, as stated in Response to Comment S-2-5, the No Build Alternative has been selected as the Preferred Alternative and no construction will occur. Therefore, the language in Measure CON-AQ-16 in this Final EIR/EIS retains a limit of five minutes.

S-2-15

It is important to note that Caltrans' contract bid procedures require construction contracts over a certain monetary amount be awarded to the lowest responsive and responsible bidder. Because only certain construction fleets are able to meet this requirement, there is concern that the field of potential bidders could be narrowed in a manner not consistent with legal requirements. Therefore, this suggestion has not been incorporated into the bid scoring process at this time. In addition, as stated in Response to Comment S-2-5, the No Build Alternative has been selected as the Preferred Alternative and Caltrans will not be putting out a bid for the project.

Mr. Jason Roach
Senior Environmental Planner
California Department of Transportation
100 South Main Street, MS-16A
Los Angeles, CA 94274-0001

RE: Recirculated Draft Environmental Impact Report (RDEIR) / Supplemental Draft Environmental Impact Statement (SDEIS) for the I-710 Corridor Project

Dear Mr. Roach,

The California Transportation Commission (Commission), as a Responsible Agency, received the RDEIR / SDEIS prepared by the California Department of Transportation (Caltrans) for the I-710 Corridor Project. The project would construct roadway improvements to address congestion and safety issues on a portion of Interstate 710 beginning at Ocean Boulevard in Long Beach and teminating at State Route 60. The project is funded through the Project Approval and Environmental phase only and is not fully funded. A total of $1.31 billion has been identifed and earmarked through local Measure R and M funds.

The Commission has no comments with respect to the project purpose and need, the alternatives studied, the impacts evaluated, and the evaluation methods used. The Commission should be notified as soon as the environmental process is finalized since project funds cannot be allocated for project design, right of way or construction until the final environmental document is complete. Once the final environmental process is complete, the Commission will consider the environmental impacts in determining whether to approve the project for future consideration of funding. S-3-1

Upon completion of the California Environmental Quality Act process, prior to the Commission's action to approve the project for future consideration of funding, the Commission expects the lead S-3-2

and/or implementing agency to provide written assurance whether the selected alternative identified in the final environmental document is, or is not consistent with, the project programmed by the Commission and included in the appropriate Regional Transportation Plan. In the absence of such assurance of consistency, it may be assumed that the project is not consistent and Commission staff will base its recommendations to the Commission on that fact. The Commission may deny funding to a project which is no longer eligible for funding due to scope modifications or other reasons. S-3-2

The Commission also encourages Caltrans and its partners to ensure early communication with the Commission in the event it is anticipated that the Commission will be requested to provide authorization to develop and operate high-occupancy toll lanes or other toll facilities, including the administration and operation of a value pricing program and exclusive or preferential lane facilities in accordance with California Streets and Highways Code Section 149.7. S-3-3

If you have any questions, please contact Jose Oseguera, Assistant Deputy Director, at (916) 653-2094.

Sincerely,

Susan Bransen

SUSAN BRANSEN
Executive Director

c: Phil Stolarski, Chief (Division of Environmental Analysis), California Department of Transportation

S-3-1

Caltrans acknowledges that the California Transportation Commission (CTC) has no comments on the RDEIR/SDEIS itself, and is prepared to receive notice once the Final EIR/EIS is complete.

S-3-2

After the circulation process for the RDEIR/SDEIS, Caltrans and Metro worked with the Southern California Association of Governments (SCAG) to amend the Project Description as listed in the Regional Transportation Plan (RTP) to be consistent with one of the build alternatives - Alternative 5C. The description of Alternative 5C was included in SCAG's RTP/Sustainable Communities Strategy (SCS) Amendment No. 3, adopted by SCAG on September 6, 2018, and the project listings were updated in Appendix I of this Final EIR/EIS accordingly. However, since that time, Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), has identified Alternative 1 (No Build) as the Preferred Alternative. Please refer to Section 1.1 of this appendix for more detail. Moving forward, Metro will continue to work with SCAG to ensure that the future modifications to the RTP and Federal Transportation Improvement Program (FTIP) reflect the No Build Alternative (Alternative 1) as opposed to Alternative 5C.

S-3-3

As stated in Response to Comment S-3-2, the No Build Alternative has been selected as the Preferred Alternative. Therefore, high-occupancy toll lanes or other tolling facilities, including a value-pricing program and exclusive lane facilities, are not under consideration for this Final EIR/EIS.

Los Angeles, CA 90012

Comment Letter – Interstate 710 Corridor Project Recirculated DEIR/Supplemental DEIS

Dear Mr. Kosinski

Like the California Department of Transportation,the Los Angeles River Upper Reach 2 Watershed Management Area (LAR UR2 WMA) Cities of Bell, Bell Gardens, Commerce, Cudahy, Huntington Park, Maywood, Vernon, and Los Angeles County Flood Control District (LACFCD) are Municipal Separate Storm Sewer System (MS4) National Pollutant Discharge Elimination System (NPDES) Permittees regulated by the Los Angeles Region Water Quality Control Board (LARWQCB) and State Water Resources Control Board (SWRCB). Along with other stakeholders, our agencies are charged with improving water quality and supporting the attainment of LARWQCB Basin Plan identified beneficial uses in the Los Angeles River Watershed. The LAR UR2 WMA appreciates this opportunity to provide regional water quality protection related comments that resulted from our review of the Interstate 710 (I-710) Corridor Project Recirculated Draft Environmental Report/Supplemental Draft Environmental Impact Statement (RDEIR/SDEIS). The I-710 is the principal truck transportation corridor for goods leaving the Ports of Long Beach and Los Angeles, for the intermodal Rail Yardslocatedin the LAR UR2 WMA Cities of Vernon and Commerce, as well as interstate commerce routes accessing the entire southwestern United States.

The Caltrans MS4 Permit, amended as Order 2015-0036-EXEC, regulates ongoing agency activities and discharges, while Part E.2.d.2) directs that projects creating one, or more, acres of new impervious surfaces utilize post-construction treatments that "infiltrate, harvest and reuse, and/or evapotranspire the storm water runoff". The I-710 Corridor project would also be regulated under the state Construction General Permit (CGP) amended as SWRCB Order 2012-0006-DWQ on July 17, 2012.Attachments E, K, and L, to the January 2017 I-710 Storm Water Data Report (SWDR), indicate that the preferred project alternatives 5C and 7 would disturb up to 300 acres within the LAR UR2 WMA Cities of Bell, Commerce, and Vernon, for which Caltrans identified $15 million in required mitigations. While generally supportive of Alternatives 5c and 7, the LAR UR2 WMA municipalities may separately provide additional specific comments regarding various project aspects that directly impact each of ouragencies.

I-710 Corridor Project Direct Discharges to LAR UR2 WMA MS4Permit Conveyances

As shown in **Table 1** and **Table 2** abstracted from Attachment E to the SWDR, Caltrans drainage areas 5-C, 5-F, and 5-Hdischarge untreated to LAR UR2 WMA streets rather than to Caltrans pump stations or outlets. Caltrans should propose,one to three acre, Green or LID Street Design Pollution Prevention (DPP) mitigation measures for these areas, or provide mitigation funding to the LAR UR2 WMA cities. R-1-1

Table 1 I-710 Alternative 5C Drainage Subarea BMP Summary, within the LAR UR2 WMA

Drainage Subarea Characteristics				Alternative 5C Treatment Device Tributary Acres with per Acre and Subarea Costs

5-F/Gage Av	1.3	1.3					
5-G/P21	24.2	17.8	5.3		5.3		$519,000
5-H/Slauson	2.5	2.5					
5-I//O29	37.7	28.0	28.0		28.0		$2,744,000
6-A/O30	8.3	7.6	7.6	7.2	0.4	5.6	$1,392,000
6-B/O30	53.1	36.7	36.7	36.7			$2,697,000
6-C/O31	29.2	24.7	24.7	24.7			$1,815,000
6-D/O31	1.9	1.9	1.9	1.9			$140,000
7-A/O33	11.0	7.8	7.8	7.8			$573,000
7-B/O32	7.9	7.5	7.5	7.5			$551,000
7-C/P22	31.3	16.1	16.1	16.1			$1,183,000
Totals	**297**	**208.5**	**181.5**	**101.9**	**66.6**	**18.6**	**$16,749,000**

R-1-1

Based on the Caltrans estimate of $73,500 to $147,000 per tributary acre, the 6.5 acres of resurfacedpavement would warrant mitigation payments of between $550,000 and $1.1 million for the direct impacts of this unmitigated runoff, which might otherwise be attributed to the LAR UR2 WMA. R-1-1

Caltrans Drainage Areas,Within the LAR UR2 WMA, Having No DPPs

In addition to drainage areas 5-C, 5-F, and 5-H, discussed in the prior paragraph, **Table 1** demonstrates that alternative 5C proposes no DPPs for drainage areas 5-A, 5-E, 5-G, and 6-D, while **Table 2** shows that alternative 7 proposes no DPPs for drainage area 5-A. For alternative 5c and 7 respectively, these areas represent up to an additional 40.6, and 9.4, acres of unmitigated project related land disturbance. As required by the Caltrans MS4 Permit, DPPs should be provided for these areas or mitigation provided within the LAR UR2 WMA. Again using the DPP cost factors provided by Caltrans, the mitigation impact fees resulting from alternative 5c are estimated to be$3 to $6 million. The mitigation associated with the alternative 7drainage areas, without DPPs,rangesfrom $700,000 to $1.4 million. R-1-2

Potential Cooperative Water Quality Protection Project Opportunities

As shown in **Table 1**, drainage areas 4-S, 5-B, and 5-D are proposed to include $4.66 million worth of DPPs, while **Table 2** also adds drainage areas 5-E and 5-G increasing the proposed total DPP cost for these five drainage areas to $5.6 million. While DPPs are identified for each of these drainage areas, the proposed treatment systems are bioswalesor media filters, which, unlike infiltration based systems,produce runoff, pollutants, and must be frequently maintained to remain effective. With the exception of 5-D, that drains first to a DPP and then to Florence Avenue, these drainage areas are all proposed to be serviced by pump stations which may provide alternative water conveyance opportunities.

Based on the April 2017 LAR UR2 WMA Feasibility Study, which found soils with high infiltration rates in the southern portion of the City of Bell Gardens, the LAR UR2 WMA is currently planning to begin design and construction of a large cistern under John Anson Ford Park along the Rio Hondo. During the next WMP update,which is currently scheduled for the year 2020, a similar facility may be proposed for Asmus Park. This location is immediately adjacent to drainage areas 5-A and could be enlarged to accommodate flows from one or more of these five drainage areas proposed to be serviced with DPPs.

Caltrans and the LAR UR2 WMA should hold open the optionfor direct flows from proposed pump stations P17, P18, P19, P20, and P21 to the Asmus Park Cistern Concept Project. If federal funds could be used to support the mitigation effort this would greatly benefit the LAR UR2 WMA by providing matching funds against potentialState Proposition 1 Storm Water Implementation Grant support, while Caltrans would benefit through reduced runoff and pollutant discharge loads that clearly support the infiltration objectives of their MS4 Permit Part E.2.d.2). Finally, infiltration would preserve regional ground water in the upper aquifer, which supplies water for industrial and agricultural uses. R-1-3

Conclusion

Our review of the I-710 Corridor DEIR/SDEISindicates there are several areas within LAR UR2 WMA where MS4 discharges and receiving water quality would likely be impacted by the proposed project and have yet to be adequately mitigated. Furthermore, as amended in the Caltrans MS4 Permit, the mitigation opportunities within the LAR UR2 WMA should be applicable as TMDL Credit Units (CUs).We hope these R-1-4

comments will be considered ascollaborative opportunities to benefit both Caltrans and the LAR UR2 WMAPermittees while contributing to our shared regional water quality objectives. Should you have any questions about the content of this comment letter, or the implementation status of the various LAR UR2 WMA water quality projects, please feel free to email me at gnila@ci.commerce.ca.us or call to (323) 722-4805 extension 2839. R-1-4

Respectfully submitted,

Gina Nila, LAR UR2 WMA Permittee Chair
Deputy Director of Public Works, City of Commerce

R-1-1

It should be noted that subareas 5C, 5F, and 5H are not Caltrans' drainage areas, as suggested by the commenter. These drainage areas are under local jurisdiction. As discussed in Section 3.9.4 of the RDEIR/SDEIS, the build alternatives would comply with Caltrans provisions identified in the National Pollutant Discharge Elimination System (NPDES) Permit, Statewide Stormwater Permit and Waste Discharge Requirements (WDRs) Order No. 2012-0006-DWQ, NPDES No. CAS000002, or subsequent permit of the Construction General Permit (CGP). Additionally, Measure WQ-1 would be implemented, requiring that Caltrans consult with the jurisdictions where discharges of runoff from (I-710 to local jurisdictions' streets and/or stormwater drainage systems would occur. However, Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), has identified Alternative 1 (No Build) as the Preferred Alternative. Please refer to Section 1.1 of this appendix for more detail. Therefore, pollution prevention mitigation measures are not necessary.

R-1-2

In the analysis for the build alternatives, Table 1 and Table 2 address permanent treatment Best Management Practices (BMPs) only and do not address Design Pollution Prevention (DPP) BMPs. Because details are limited, DPP BMPs are estimated as a percentage of construction. These estimates are calculated separately and follow Tables 1 and 2 in the report. It should also be noted that the I-710 Corridor Project *Storm Water Data Report* (SWDR) (January 2017) summarizes the stormwater quality issues and design decisions made regarding project compliance with Caltrans' NPDES Permit. The SWDR is initiated in the Project Initiation Document (PID) phase, refined during the Project Approval/Environmental Document (PA/ED) phase, and finalized during final design and the Plans, Specifications, and Estimates (PS&E) phase. The SWDR level of detail at the PID and PA/ED phases is often limited, as is the case for this project, and based on the available information developed for the build alternatives (which, should be noted, is preliminary). The 2017 SWDR, which was circulated along with the RDEIR/SDEIS, also supports the design and cost information provided in the Project Report for the build alternatives. The SWDR is not typically signed until after the environmental document is approved, as the SWDR needs to reflect the identification of the Preferred Alternative. However, as stated in Response to Comment R-1-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, an updated SWDR will not be necessary.

R-1-3

Please refer to Response to Comment R-1-2 regarding DPP BMPs.

R-1-4

Please refer to Response to Comment R-1-2 regarding DPP BMPs.

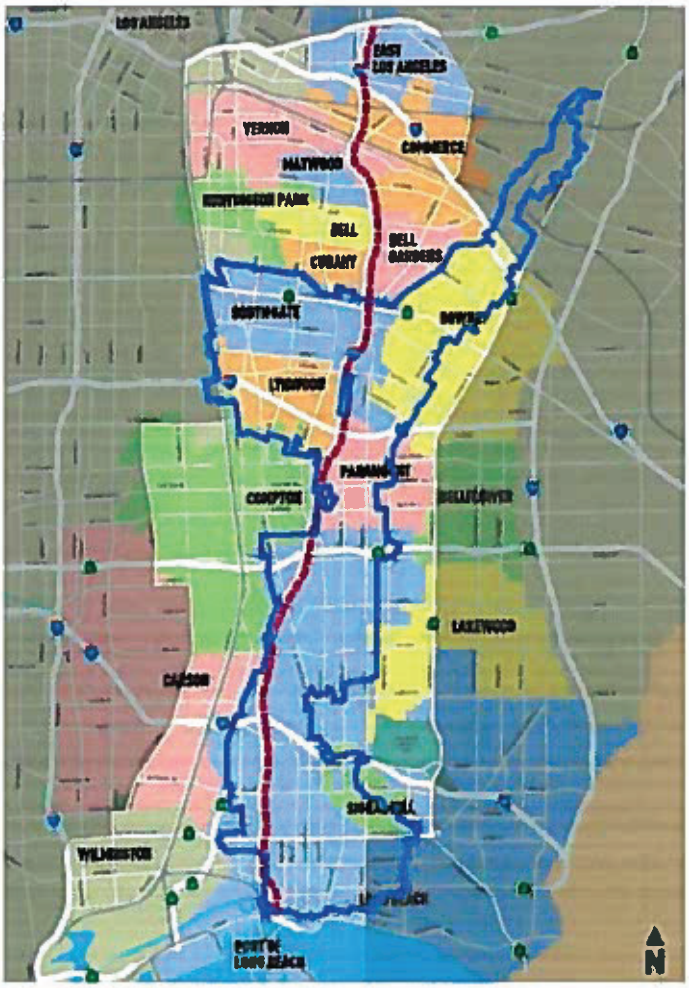
Los Angeles, CA 90012

Subject: Comments on the 710 Corridor RDEIR/SDIES

Dear Mr. Kosinki:



The Lower Los Angeles River (LLAR) Watershed Management Group (WMG) is comprised of eight public agencies and is tasked with working to improve the quality of urban and stormwater runoff in the Los Angeles River as part of the Municipal Separate Storm Sewer System (MS4) Permit issued by the Regional Water Quality Control Board, Los Angeles Region. As such, we appreciate the opportunity to comment on the RDEIR/SDIES. After reviewing the documents, we see many areas where the efforts of the LLAR WMG and Cal Trans can complement each other. Due to the narrow scope of the LLAR WMG's activities as compared to the overall scope of the 710 Corridor project, our comments are limited at this time to cooperative water quality aspects. Although the RDEIR/SDIES is several hundred pages in length, it is understandably short on specifics regarding stormwater treatment this early in the 710 Corridor project development. Nonetheless, several important considerations and potential opportunities can be drawn from a review of the document.

As background, in early 2016, the LLAR WMG developed a preliminary feasibility study that screened over 200 sites within the LLAR for potential suitability as regional water quality treatment projects. From this initial list, fourteen "top-tier" sites were selected for additional investigation. Beginning in mid-2016, geotechnical analyses and early-stage conceptual designs of these sites began. Three of these top-tier sites have already received funding (including funding from Cal Trans) or commitments to fund and are in varying stages of development.

As will be evident from the map on the following page, the LLAR and the 710 Corridor are geographically linked, and the RDEIR/SDIES should be expanded to address the opportunities for cooperation between Cal Trans and the agencies comprising the LLAR WMG.

Our comments at this time are:

1) The areas of the LLAR and 710 Corridor project overlap (LLAR boundary shown in blue).

2) The LLAR is under MS4 Permit R4-2012-175. In 2015, the Regional Board approved the LLAR Watershed Management Program (WMP), which identifies stormwater treatment needs.
3) Cal Trans is under the statewide MS4 Permit 2012-0011-DWQ, as amended. The RDEIR/SDIES (page 3-1-19) indicates that Cal Trans is directed to work with the local stormwater agencies to implement the WMPs.
4) While the RDEIR/SDIES appears to indicate that Cal Trans cooperation is limited "to those sections of the WMPs related to the TMDLs," in actuality, this is not an impediment to cooperation. The Reasonable Assurance Analysis portion of the LLAR WMP identified TMDL pollutants as the critical factor in determining treatment needs.

R-2-1

5) The approved LLAR WMP calls for the LLAR WMG to spend an estimated $300 million over the next decade(s) to achieve water quality goals.
6) From a review of the RDEIR/SDIES, it is clear that Cal Trans is likely to expend a similar amount as part of the 710 Corridor project.

R-2-2

7) Although Cal Trans' projects would be constructed later, it is important to coordinate activities now. Page 3-9-19 indicates that "no adverse impacts to water quality due to operation of the proposed improvements are anticipated." However, if the LLAR WMG constructs stormwater treatment systems based on volume estimates under current conditions and Cal Trans constructs duplicative treatment systems several years later, the LLAR WMG's would likely be treating runoff that has already been partially cleaned.

R-2-3

8) The LLAR WMP and subsequent project development documents have identified priority projects, each potentially receiving flows from varying percentages from Cal Trans right-of-ways (not necessarily from just the 710 freeway). These projects should be given serious consideration within the document. Since the goal of the two MS4 permits is ultimately cleaner waterbodies, and since compliance will ultimately be measured within the river, any project within the corridor, even if not receiving significant flows directly from Cal Trans, would have a benefit to all (analogous to a cap-and-trade scenario).

R-2-4

9) Finally, it would seem appropriate for Cal Trans to consider working as early as possible with the LLAR WMG to implement treatment systems to:
    a. Ensure design would be adequate for any potential additional flows,
    b. Fast-track construction of the treatment systems so these systems are already in place and functioning when the 710 project is ultimately completed, and
    c. Help Cal Trans and the LLAR WMG with their respected MS4 Permit compliance.

R-2-5

Thank you for your consideration of these comments. Please contact myself or John Hunter, the LLAR WMG's consultant, at (562) 802-7880 ext. 225 if you have any comments or questions.

Thank you,

Gladis Deras, Chair, Lower Los Angeles River Watershed
Senior Engineer, City of South Gate
(323) 563-9576

Cc: LLAR

This letter does not reflect the comments of any individual city or agency

This page intentionally left blank

R-2-1

Caltrans acknowledges that the California State Water Resources Control Board (SWRCB) Order No. 2012-0022-DWQ (Caltrans' MS4 permit) provides for coordination with local municipalities. The referenced text is not intended to indicate that any impediments to coordination exist, but rather that the Caltrans permit does not include a Watershed Management Program compliance approach, but its Total Maximum Daily Load (TMDL) provisions do require cooperation with agencies subject to the same TMDLs. However, Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), has identified Alternative 1 (No Build) as the Preferred Alternative. Please refer to Section 1.1 of this appendix for more detail. Therefore, additional coordination between Caltrans and the SWRCB regarding the I-710 Corridor Project is no longer necessary.

R-2-2

This comment states that the Lower Los Angeles River Watershed Management Group will spend an estimated $300 million to achieve water quality goals and that Caltrans is likely to spend a similar amount as part of the I-710 Corridor Project. As stated in Response to Comment R-2-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there is no cost associated with Best Management Practices (BMPs).

R-2-3

As stated in Response to Comment R-2-1, the No Build Alternative has been selected as the Preferred Alternative and therefore further coordination between Caltrans and the Regional Water Quality Control Board (RWQCB) is no longer necessary for this project.

R-2-4

The commenter raises a good point regarding the goals of the MS4 permits, and Caltrans concurs with the commenter regarding the ultimate goals of the permits. However, it is important to note that the scope of the RDEIR/SDEIS and this Final EIR/EIS is limited to evaluation of the environmental impacts of implementation of the proposed project. However, as indicated in Response to Comment R-2-1, the No Build Alternative has been selected as the Preferred Alternative and further coordination for this project is no longer necessary.

R-2-5

Caltrans cannot make commitments regarding the fast-tracking of specific treatment systems that may be implemented as part of the I-710 Corridor Project or speak to the specific outcomes of future coordination at this time, but as indicated in Response to Comment R-2-1, the No Build Alternative has been selected as the Preferred Alternative and further coordination regarding treatment systems is no longer necessary.

Recirculated Draft Environmental Impact Report/Supplemental Draft Environmental Impact Statement (RDEIR/SDEIS) for the Interstate 710 (I-710) Corridor Project (SCH No.: 2008081042)

The South Coast Air Quality Management District (SCAQMD) staff appreciates the opportunity to comment on the above-mentioned document for the I-710 Corridor Project (Proposed Project). The Proposed Project would modernize and increase capacity of the I-710 between Ocean Boulevard and State Route 60, a distance of approximately 18 miles. This is a key freight corridor connecting the ports to railyards and warehouses, and is important for the economic vitality of our region. At the same time, truck traffic on the corridor is a significant source of air pollution impacting the health of local communities and the region as a whole.

SCAQMD staff commends the Lead Agency for making improvement of air quality and public health an objective of the Proposed Project, and for including a dedicated Zero Emission/Near Zero Emission (ZE/NZE) freight corridor as one of the build alternatives for analysis in the RDEIR/SDEIS. SCAQMD supports efforts to integrate various inter-agency planning and funding opportunities to deliver air quality and public health benefits with accountable milestones. An effective and inclusive implementation process can also help avoid potential project delays due to litigation.

The SCAQMD has a long history working with the Caltrans to ensure that the Proposed Project facilitates the implementation and deployment of the lowest emission technologies. SCAQMD staff provided comments on the 2012 Draft EIR/SEIS[1] and the 2015 Air Quality Protocol[2]. However, some previous comments remain to be outstanding concerns. SCAQMD staff's comments on the RDEIR/SDEIS are set forth in the attachment. SCAQMD staff seeks a RDEIR/SDEIS which fully describes the Proposed Project's air quality impacts, feasible mitigation measures, enforceability, and accountability which supports effective action by the Lead Agency to meet the Project's objectives to improve air quality and public health. The following is a summary of key comments.

Need for Zero Emission Freight Corridor. The region's air quality has improved with reductions in the total number of days that the South Coast Air Basin (Basin) experiences ozone and PM2.5

[1] South Coast Air Quality Management District. 2012. http://www.aqmd.gov/docs/default-source/ceqa/comment-letters/2012/october/i-710-corridor-october-2012.pdf
[2] South Coast Air Quality Management District. 2015 http://www.aqmd.gov/docs/default-source/ceqa/comment-letters/2015/november/other710.pdf

particulate levels exceeding state and federal ambient air quality standards. Despite this progress, however, the region still has the most polluted air in the country, with substantial health impacts, including thousands of premature deaths per year. Mobile sources are the major contributor to the ozone and PM2.5 levels in this region. Heavy-duty diesel trucks are the largest source of nitrogen oxides (NOx) emissions—which react in atmosphere to form ozone and particulates—and are one of the major sources of directly emitted PM2.5. Diesel-powered equipment such as trucks traveling the I-710 corridor also contribute to significant local cancer risks. Additionally, the SCAQMD's Multiple Air Toxics Exposure Study (MATES) IV, completed in May 2015, concluded that the largest contributor to cancer risk from air pollution is diesel particulate matter emissions, and that the areas around the I-710 study area are significantly impacted with some of the highest risks from air pollution in the region with a maximum simulated cancer risk of 1,057 in a million[3]. The build alternatives would result in near-roadway incremental emissions concentrations in a few areas very near the I-710 corridor. When the health impacts from the Proposed Project are added to those existing impacts, the affected communities will face an even greater exposure to air pollution and bear a disproportionate burden of increasing health risks. R-3-1

Looking forward, emissions from new trucks are lower than emissions from older model years, but even with broad deployment of relatively new trucks, the region will need substantial additional emission reductions to attain the National Ambient Air Quality Standards (NAAQS). These needed reductions are particularly challenging because they are beyond the benefits of adopted rules and programs, and because the reductions already assume broad deployment of new trucks meeting the latest emission standards. On March 3, 2017, the SCAQMD's Governing Board adopted the 2016 Air Quality Management Plan (2016 AQMP)[4], which was later approved by the California Air Resources Board on March 23, 2017. Built upon the progress in implementing the 2007 and 2012 AQMPs, the 2016 AQMP provides a regional perspective on air quality and the challenges facing the South Coast Air Basin. The most significant air quality challenge in the Basin is to achieve an additional 45 percent reduction in nitrogen oxide (NOx) emissions in 2023 and an additional 55 percent NOx reduction beyond 2031 levels for ozone attainment.

To accommodate growth and to achieve the emission reductions needed to comply with federal standards, the region will need to transition to the use of zero and near-zero emission technologies, particularly for trucks. The Proposed Project plays an important role in facilitating this transition. A variety of zero and near-zero emission technologies using on-road vehicles and fixed guideways are technically feasible, and the RDEIR/SDEIS includes zero and near-zero emission trucks in Project build alternatives. Several types of zero and near-zero emission trucks are beginning to be deployed or expected to be feasible within the timeframe of the I-710 Project. Ensuring deployment of such technologies will require collaborative efforts to establish requirements or incentives for their use, particularly on key transport corridors, and to create needed infrastructure for charging and fueling vehicles powered by electricity, fuel cells or hybrid technologies with zero emission capability (e.g. natural gas/electric hybrids). As a key truck corridor connecting to the region and nation, the I-710 Project can and should be part of the solution. In short, deploying zero emission trucks on the I-710 will allow the corridor to accommodate economic growth, R-3-2

[3] South Coast Air Quality Management District. May 2015. *Multiple Air Toxics Exposure Study in the South Coast Air Basin*. Accessed at: http://www.aqmd.gov/docs/default-source/air-quality/air-toxic-studies/mates-iv/mates-iv-final-draft-report-4-1-15.pdf.

address local health risks, contribute to regional air quality attainment, and serve other policies such as energy security and climate. R-3-2

Specificity of Zero-Emission Freight Corridor Component. In order to successfully implement a zero-emission freight corridor component to the Proposed Project, it is important that the Lead Agency provide specificities regarding the schedule and process for development, construction, deployment, selection, and implementation of the zero-emission truck technology in the Final EIR/SEIS. SCAQMD staff recommends that the following elements be incorporated in the Final EIR/SEIS. Details regarding zero emission technologies are included in Attachment A.

1. Establish a schedule for key actions to develop and deploy zero-emission technologies. The schedule should be consistent with the timelines and goals of the 2016 AQMP. R-3-3
2. Determine zero-emission truck technology or technologies and any needed infrastructure before construction begins.
3. Develop requirements or incentives to ensure zero-emission freight corridor will be utilized.
4. Establish an I-710 implementation steering committee to provide guidance on the development and implementation of the zero-emission freight corridor.

Additional Comments on the RDEIR/SDEIS. SCAQMD staff has reviewed the air quality and health risk analyses in the DREIR/DSEIS, and has concerns about the CEQA baseline, air quality assumptions, criteria pollutant calculations, mitigation measures, and the modeling parameters and meteorological data. By using a 2012 CEQA baseline and assuming the approval of the BNSF Railroad Southern California International Gateway (SCIG) near-dock intermodal yard and the expansion of the UP Railroad near-dock intermodal Container Transfer Facility (ICTF) projects, the Lead Agency may have substantially underestimated the Proposed Project's potential significant adverse air quality and health impacts. Based on the SCAQMD staff's calculations, the Proposed Project would exceed SCAQMD's regional air quality CEQA significance thresholds for operation[5]. Therefore, the Lead Agency should consider additional mitigation measures to reduce those impacts to the maximum extent feasible. SCAQMD staff has included recommended mitigation measures that are capable of reducing significant adverse operational air quality impacts as guidance to the Lead Agency and should be incorporated into the Final EIR/SEIS. Details are included in Attachment B. R-3-4 R-3-5

Thank you for the opportunity to provide comments on the RDEIR/SDEIS. We look forward to working with the Lead Agency to address the comments raised herein and any other questions that may arise. Please feel free to call me at (909) 396-2706, if you have questions or wish to discuss our comments.

Sincerely,

Michael Krause

Michael Krause, Manager
Planning, Rule Development & Area Sources

ATTACHMENT A

ZERO EMISSION TRUCK TECHNOLOGIES

Overview

Zero emission trucks, including heavy-duty trucks, are developing rapidly with some of the technologies ready for near-term deployments. Zero emission trucks can be powered by grid electricity stored in a battery, by electricity produced onboard the vehicle through a fuel cell, or by "wayside" electricity from outside sources such as overhead catenary wires, as is currently used for light rail and some transit buses. All such technologies eliminate fuel combustion and utilize electric drive as the means to achieve zero emissions and higher system efficiency compared to conventional fossil fuel combustion technologies. Hybrid electric trucks with all-electric range (AER) can provide zero emission operations in certain corridors and flexibility to travel extended distances powered by fossil or renewable fuels (e.g. natural gas) or hydrogen for fuel cells. In collaboration with regional stakeholders and partners as well as leveraging funding support from both federal and state agencies, SCAQMD has been supporting a number of projects, as described below, to develop and demonstrate zero emission cargo transport technologies to promote and accelerate its market acceptance and deployment.

Overhead Catenary Truck Project

Project Description

Siemens Mobility is working with Volvo to integrate a pantograph system into a Class 8 heavy duty trucks. Siemens has designed and provided an adaptable pantograph system that will allow seamless connection and detachment from the catenary power source, while the vehicle is mobile. A catenary track of approximately one mile segment has been installed along Alameda Street in the city of Carson, extending north to south from E. Lomita Blvd to the Dominguez Channel. Corresponding with the operational range of the pantograph, two parallel catenary wires are installed above the roadway one mile in each direction. The connection to the grid occurs at the middle of the system where a power supply has been placed.

In addition to the Volvo truck, TransPower also developed and delivered two drayage trucks with catenary accessibility. The first truck is an existing vehicle that utilizes a battery electric drive system and has been converted to operate on the catenary system. The second truck is a CNG-hybrid truck that incorporates TransPower electric drive system on a major OEM chassis. TransPower has integrated pantographs and associated components into both vehicles. Specifically, they modified one truck currently being built with their electric drive system to operate on catenary power. The current electric truck has two 150 kW motors and 700 Ah battery pack (modified truck will have a 300 Ah battery pack). Integrating the pantograph system enabled the truck to operate on wayside power while also recharging the batteries. The second truck is new truck with a CNG hybrid drive system architecture that enables the vehicle to operate in three modes –battery-only, catenary and CNG to extend the operating range. The battery-only mode will allow the truck to have a short AER to operate without the engine for short durations while the CNG hybrid allows the truck to have regional applicability as well.

Cost
The incremental cost of the catenary battery electric truck over 8.9 L natural gas truck is approximately $250,000. This is based on limited production, however, and full production is anticipated to result in reduced costs.

Timeline and Commercialization
The project vehicles and infrastructure has been developed and is currently undergoing a 6-month demonstration with completion date by Q4 2017. Based on the project outcome, a Phase 2 demonstration with a longer track and subsequent commercialization may be considered.

TransPower Catenary Truck on the OCS Track

Volvo Catenary Truck

2012 DOE Zero Emission Cargo Transport Demonstration Project (ZECT I)

Project Description
With an award of approximately $4.2 million from the DOE in 2012, SCAQMD has contracted two local EV integrators, TransPower and US Hybrid, to develop and demonstrate a total of 11 zero emission capable heavy-duty drayage trucks, based on four different architectures, consisting of two battery electric vehicles and two plug-in hybrid electric drivetrains with AER capability. These trucks are deployed in real world drayage operations with fleet partners operating at the Ports of Los Angeles and Long Beach for demonstration up to two years. Vehicle performance and operational data is being collected and analyzed by National Renewable Laboratory (NREL) to evaluate both technical feasibility and market viability of the technologies to support drayage operations. The four demonstration technologies are summarized as follows:

Battery Electric Trucks (BETs)

a. TransPower developed four Class 8 BETs on International Prostar chassis, incorporating improvements and lessons learned from the operation of their prototype, ElecTruck. The drive system is powered by a dual motor unit, rated at 300 kW and the trucks are equipped with an innovative Inverter-Charger Unit (ICU) that combines the function of both vehicle inverter and battery charger. TransPower has installed an automated manual transmission with proprietary software to control the transmission shift mechanism, enabling operation

in multiple gears to maximize vehicle efficiency. The battery pack can provide 215 kWh of energy to support 70-100 miles in operating range and can be fully recharged within 3 hours. These trucks have been in revenue service, meeting the daily duty cycle needs of the trucking companies.

b. US Hybrid also developed two BETs on International Prostar chassis. Each vehicle is equipped with a 320kW traction motor, powered by a 240 kWh battery pack with lithium-ion cells for highly efficient and reliable performance, capable of 70-100 miles of operating range per charge. A 60 kW on-board charger is capable of fully recharging the truck within 3-4 hours. These trucks have also been in revenue service with local fleet operators.

Plug-In Hybrid Electric Trucks (PHETs)

c. Two Class 8 PHETs are being developed by TransPower with a targeted operating range of 150-200 miles, including 30-40 all-electric miles. The hybrid technology is based on the ElecTruck™ system TransPower has developed for their BETs, augmented with a CNG auxiliary power unit for extended range and power. TransPower is utilizing commercially available and widely used components, including Ford 3.7L CNG engine-generator, to ensure that these trucks are cost-competitive and well-positioned for commercialization. As in their BETs, these trucks are equipped with a 300 kW traction motor with an automated transmission. A 115 kWh battery pack on-board will support zero emission operations when traveling through the communities around the Ports that are heavily impacted by diesel traffic and activities.

d. US Hybrid is also developing three Class 8 PHETs for demonstration in this project. US Hybrid converted exiting LNG trucks with 8.9L ISLG engine into PHETs with all-electric range capability. The hybrid system is designed to provide comparable power and torque to those from larger Cummins 12L engines to support a full range of drayage operations. The trucks are capable of providing a combined power of 600 HP between the LNG engine and a 223 kW traction motor, with a targeted operating range of 250 miles, including 30-40 miles in all-electric range. Two of these trucks are currently deployed in drayage service with local fleet operators.

Cost

The incremental cost of the BETs over a natural gas truck is approximately $200,000, and the incremental cost of the PHETs is estimated to be around $250,000. These estimates are based on limited productions, and the costs are expected to be substantially reduced in larger volume production.

Timeline and Commercialization

Seven of the 11 demonstration trucks are currently in deployment with participating fleets at the Ports. The remaining trucks are expected to be deployed soon and the overall project will be completed by Q3 2018. Overseas truck OEMs have commercial products that are already eligible for incentive funding from the state, such as the HVIP, and other truck OEMs are anticipating commercialization pathways by 2019.

TransPower BETs

US Hybrid PHET

US Hybrid BET

2014 DOE Zero Emission Cargo Transport Demonstration Project (ZECT II)

Project Description

In August 2014, the SCAQMD received an award of approximately $9.7 million from the DOE to develop and demonstrate seven zero emission drayage trucks in real world drayage operations at the Ports of Los Angeles and Long Beach. Six of them will be of fuel cell range extended electric trucks and the remaining truck will be built on a hybrid electric drive platform using a CNG auxiliary power unit as described below:

Fuel Cell Range Extended Trucks (FCREs)

a. Under project management by Center for Transportation and Environment, Kenworth and BAE Systems are developing a battery electric truck with hydrogen fuel cell range extender. This project will leverage the expertise of BAE Systems to test their hybrid electric fuel cell propulsion system, currently used for transit buses, in drayage applications. The power output of the electric drivetrain is comparable to currently used

Class 8 truck engines power output. AC traction motors will be mounted one on each rear drive axle and the electric drivetrain in the architecture is set up to be fully redundant. The vehicle will operate primarily from the batteries, engaging the fuel cell system only when the batteries reach a specified state of charge. BAE anticipates that the 30 kg of hydrogen (25 kg usable) will provide approximately 110 to 120 miles of range between re-fueling.

b. Hydrogenics will develop a hydrogen fuel cell drayage truck powered by their latest advanced fuel cell drive technology (Celerity Plus fuel cell power system) and Siemens' ELFA electric drivetrain, customized for heavy duty vehicle applications. The proposed fuel cell drayage truck is designed to be capable of delivering over 150 miles of zero emission operation with 10-15 minutes fast refueling of hydrogen. The fuel cell drivetrain will be customized, tested and optimized for port applications.

c. TransPower will develop two battery electric trucks with hydrogen fuel cell range extenders. The fuel cell range extender project is to use TransPower's proven ElecTruck™ drive system as a foundation and add fuel cells provided by Hydrogenics, one of the world's leading suppliers of hydrogen fuel cells. The Proposed Project will result in the manufacturing and deployment of two demonstration trucks, one with a 30 kW fuel cell and one with a 60 kW fuel cell, enabling a direct comparison of both variants. The higher power output of the 60 kW systems is expected to be better suited for trucks carrying heavy loads over longer distances that might exceed the average power capacity of the 30 kW systems. The system will store 25-30 kg of hydrogen onboard based on an estimated 7.37 miles per kg fuel economy. TransPower's system also includes a bi-directional J1772-compliant charger that can recharge the vehicle batteries or provide power export.

d. U.S. Hybrid will develop two battery electric trucks with an onboard hydrogen fuel cell generator. U.S. Hybrid has been involved with fuel cell-powered vehicles for several years (including cargo vans, transit/shuttle buses and heavy-duty military vehicles) and believes the technology and product has reached maturity beyond feasibility and is ready for commercial demonstration deployment. The truck is powered by a lithium-ion battery with an 80 kW hydrogen fuel cell generator in charge sustaining mode, eliminating the need for charging. The fuel cell power plant is sized to sustain continuous operation based on average power demand for drayage applications. As a result, the battery size is significantly reduced, as is the required charging infrastructure. The proposed technology will provide a 150-200 mile range between refueling. Each truck will carry approximately 20 kg of hydrogen storage at 350 bar with an estimated fueling time of less than 10 minutes.

The fuel cell Class 8 trucks are expected to initiate demonstration at local trucking fleets over the next 3-18 months.

Plug-In Hybrid Electric Trucks (PHETs)

e. Under project management by Gas Technology Institute, Kenworth and BAE Systems will develop a PHET with a CNG range extender. The proposed technology is capable of providing a well-balanced blend of all electric and CNG-based hybrid operations. The electric drivetrain will be based on BAE Systems HybriDrive® Series (HDS) propulsion system hardware. The electric drivetrain will be capable of combined propulsion power

output of 320 kW (430 hp) continuous using two AC traction motors. The power output of the electric drivetrain is comparable to currently used Class 8 truck engines power output. The truck will be designed to provide an operating range of 150 miles with 30 all-electric miles.

Cost

The incremental cost of the FCREs and the PHET over 8.9 L natural gas truck is estimated to be $250,000 or higher. These estimates are based on limited productions, and the costs will be substantially reduced in full production, and state incentives funds are anticipated for the trucks and associated refueling infrastructure.

Timeline and Commercialization

The demonstration phase of this project is expected to start by Q1 2018 with at least two trucks, one each from TransPower and US Hybrid. The project is set be completed by Q3 2019 and the commercialization of these truck technologies can be expected after 2019.

CARB Zero Emission Drayage Truck Demonstration Project

Project Description

SCAQMD received an award of approximately $23.6 million to develop and demonstrate zero emission drayage trucks under CARB's Low Carbon Transportation Greenhouse Gas Reduction Fund Investments Program in 2016. The project is to develop a total of 44 Class 8 drayage trucks based on a portfolio of most commercially promising zero- and near-zero emission truck technologies for statewide demonstrations, across a variety of real world drayage applications in and around the Ports of Long Beach, Los Angeles, Oakland, Stockton and San Diego, in collaboration with four other air districts: BAAQMD, Sacramento Metropolitan AQMD, SJVAPCD and SDAPCD. The SCAQMD has contracted with three major U.S. OEMs and an international OEM, with necessary resources and networks to support future commercialization efforts, to develop and demonstrate four different types of battery and hybrid electric drayage truck technologies in this project, including: two battery electric platforms (BYD and Peterbilt), and two plug-in hybrid electric platforms (Kenworth and Volvo) as summarized below:

Battery Electric Trucks (BETs)

a. BYD, a global company with over $9 billion in revenue and 180,000 employees, will develop 25 battery electric drayage trucks for demonstration with multiple fleet partners across the state. The BET is optimized to serve near-dock and short regional drayage routes with a range of 70-100 miles, supported by 207 kWh batteries on board. The truck is designed to provide similar operating experience compared to equivalent diesel and CNG trucks with matching or exceeding power and torque, powered by two 180 kW traction motors. BYD will utilize 80 kW on-board charger to fully recharge the truck within 3-4 hours. These trucks are already eligible for incentive funds under CARB's HVIP.

b. Peterbilt, in partnership with TransPower, will develop 12 BETs in this project, building on a platform developed under the DOE ZECT I project, incorporating lessons learned from ongoing demonstrations to further refine and optimize the electric drive system. Eight trucks will be designed to provide 80 to 100 miles in range, powered by a 215 kWh

battery pack to support near-dock drayage operations, and four longer range BETs will incorporate a new battery design that allows for 120 to 150 miles of operation per charge with a 311 kWh battery pack at the same system weight with similar volume as the 215 kWh battery pack. These longer range BETs will be well suited for regional drayage routes such as from port terminals to Inland Empire and from the Port of Oakland to Sacramento and the San Joaquin Valley.

Plug-In Hybrid Electric Trucks (PHETs)

c. Kenworth expands its partnership with the BAE Systems to develop four PHETs with natural gas range extenders, leveraging the prototype development under the DOE-funded ZECT II project. These vehicles will target longer regional drayage routes. The team will continue refining the hybrid drivetrain to provide a system that can operate in a zero emissions (all-electric) mode and in a conventional hybrid electric mode to meet customer range needs and flexibility. The powertrain includes a 200 kW genset using a recently-certified 8.9L NZ CNG engine and two AC traction motors that produce 320kW (430 hp) continuous, with comparable power output to what is typically found in Class 8 truck engines. The hybrid system will be designed for an operating range of 250 miles with approximately 30-40 miles of all-electric range to operate in zero emissions mode in sensitive areas and disadvantaged communities.

d. Volvo will build on the success of past projects to develop three commercially attractive, highly-flexible hybrid trucks, with all-electric mode capability for zero emission operations in the most heavily emissions-impacted communities. Volvo offers a unique approach to system-focused hybrid powertrain improvements, utilizing a suite of innovative technologies such as energy and emission optimized driveline controls; aerodynamics and weight improvements; vehicle energy management and driver coaching systems optimized for port drayage operation; and a complete suite of NOx reduction technologies, including engine and exhaust after-treatment innovations. Furthermore, Volvo, in partnership with Metro and UC Riverside, will also integrate ITS connectivity solutions, such as vehicle-to-infrastructure and vehicle-to-vehicle communication technologies, to improve dynamic speed harmonization and reduce idling, for better fuel economy and reduced emissions.

Cost

The incremental cost of the BETs over 8.9 L natural gas truck ranges from $150,000 to $200,000. No estimate is available for the Kenworth or Volvo PHETs. As noted earlier, the cost estimates are based on limited production, and the costs are expected to be substantially reduced once these trucks reach a full-production phase.

Timeline and Commercialization

The demonstration phase of this project is expected to start by Q4 2017 with BYD trucks and the rest to follow over time throughout 2018 and 2019. This project is set be completed by Q2 2020 and the commercialization of these truck technologies can start as early as 2019 for BYD trucks with the rest taking place in the 2020-2021 timeframe.

BYD Prototype Drayage Truck

Volvo PHET

CEC Sustainable Freight Transportation Project

Project Description

SCAQMD recently received a $10 million award from the CEC under the Alternative and Renewable Fuel and Vehicle Technology Program to develop and demonstrate zero and near-zero emission freight transportation technologies. One of the awarded technologies is electric drayage trucks, to be built on the PowerDrive™ platforms developed by Efficient Drivetrains, Inc., (EDI), a global leader and innovator of advanced, high-efficiency electric drivetrains and vehicle control software.

Under project management by Velocity Vehicle Group, this project is to develop and demonstrate four electric drayage trucks, consisting of one BET and three PHETs, with EDI serving as the technical lead and vehicle integrator, and Freightliner providing necessary engineering resources and expertise in vehicle design and glider manufacturing. Both battery electric and hybrid electric drive platforms will be designed to meet end-user fleet requirements. The platforms will be also designed so that it can be easily integrated by post-production truck modification service companies and serviced by Freightliner dealerships. Based on the proposed technical concept, the BET will be capable of 100 miles in operating range and the PHETs will utilize Cummins 8.9L natural gas engine as a range extender to provide 250 miles in operating range per fueling with up to 35 miles in all-electric range.

Cost

Cost estimates are not available for these trucks but it is expected to be in line with other similar technologies, and the costs are expected to be substantially reduced once these trucks reach a wide-scale deployment and full-production phase.

Timeline and Commercialization

This project is to be completed by Q4 2020 and the commercialization of these truck technologies can be expected in the 2021-2022 timeframe.

ATTACHMENT B

ADDITIONAL COMMENTS ON THE RDEIR/SDEIS

SCAQMD Staff's Summary of Project Description

The California Department of Transportation (Caltrans), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), the Gateway Cities Council of Governments (Gateway Cities COG), the Southern California Association of Governments (SCAG), the Ports of Los Angeles and Long Beach, and the Interstate 5 Joint Powers Authority (I-5 JPA) proposes to improve 19 miles of Interstate 710 (I-710) in Los Angeles County between Ocean Boulevard in the City of Long Beach and State Route 60 (SR-60) in East Los Angeles (Proposed Project). The alternatives evaluated in the Recirculated Draft Environmental Impact Report/Supplemental Draft Environmental Impact State (RDEIR/SDEIS) include Alternative 1 (No Build Alternative) and two build alternatives: Alternative 5C (I-710 Widening and Modernization) and Alternative 7 [I-710 Modernization plus a Zero-/Near Zero-Emission (ZE/NZE) Freight Corridor]. Alternative 7 also includes an advanced technology feature that allows groups of six to eight trucks to travel in platoon in order to increase the capacity of the freight corridor[6]. Option 7ZE is only applicable to Alternative 7 and restricts use of the freight corridor exclusively to ZE trucks[7]. The programmatic elements of the Proposed Project include ZE/NZE emission truck technology deployment program, expanded transit services, and community health and benefit program. It should be noted that the alternatives that were analyzed in the RDEIR/SDEIS represent the future scenarios for the I-710 Corridor. If Alternative 1 (No Build Alternative) is selected as the preferred alternative, the existing I-710 Corridor will maintain its current configuration. If one of the build alternatives is selected as the preferred alternative, the anticipated build-out year is 2035.

SCAQMD Staff's Summary of Air Quality and Health Risk Assessment (HRA) Analyses

In the air quality analyses, the Lead Agency found that air toxics are substantially lower (95 percent or more) for the build alternatives when compared to the 2012 emissions, and the reductions are due to the turnover to diesel trucks that meet the EPA standards and deployment of ZE/NZE emission trucks[8]. Each of the build alternatives would result in lower emissions from NOx, CO, PM2.5, and VOC when compared to the 2012 baseline emissions, while PM10 and SO2 would increase for Alternative 7 in 2035. When each of the build alternatives is compared to the future "No Build Alternative," emissions from CO, PM10, PM2.5, and SO2 would increase, with the greatest increases under Alternative 7, but NOx emissions would be lower[9]. Due to increased traffic, both build alternatives result in greater near-road 24-hour PM10 impacts for several receptors located along the I-710 corridor[10] and a greater number of impacted receptors located near the corridor. The build alternatives have lower cancer risks and operational exhaust emissions, when compared to the 2012 baseline risks. The Maximum Incremental Cancer Risk (MICR) for the build alternatives were found to be less than SCAQMD's CEQA threshold of 10 in a million[11]. Reductions in cancer risks and exhaust emissions are primarily due to improved

[11] *Ibid.* Air Quality, Greenhouse Gas, and Health Risk Assessment Technical Study. Table 4-9a.

vehicle technology resulting from the implementation of federal, state, and local regulations and programs.

After a review of the air quality and health risk analyses and supporting technical documents of the build alternatives (Alternative 5C and Alternative 7) in the RDEIR/SDEIS, SCAQMD staff has comments as follows. Pursuant to Public Resources Code Section 21092.5 and CEQA Guidelines Section 15088, SCAQMD staff requests that the Lead Agency provide SCAQMD with written responses to all comments contained herein prior to the certification of the Final EIR/SEIS.

Integrate CEQA Review with Related NEPA Environmental Review

1. The Lead Agency did not perform a project-level air quality conformity determination under the Clean Air Act for each of the build alternatives (Alternative 5C and Alternative 7) as part of the air quality analysis in the RDEIR/SDEIS. SCAQMD staff understands that while a conformity determination will be completed before the certification of the Final EIR/SEIS, this will not be subject to the same level of public review as the RDEIR/SDEIS. The public is not afforded the opportunity to participate in the review of the project-level air quality conformity determination in the same manner as the RDEIR/SDEIS. One of the fundamental CEQA policies requires integrating CEQA's requirements with other legally required planning and environmental review procedures such as the project-level conformity review under the Clean Air Act so as to have them run concurrently to the maximum extent feasible (Public Resources Code Section 21003(a) and CEQA Guidelines Sections 15006(i), 15080, and 15124(d)(1)(c)). The purpose of an integrated review process is to ensure that the environmental document will meet the needs of all the agencies which will use it (CEQA Guideline Section 15006(g)). Therefore, the Lead Agency should integrate the CEQA review for the Proposed Project as much as possible with the project-level air quality conformity determination, which serves as substantial evidence to support the finding that the Proposed Project would not conflict with or obstruct the implementation of the Air Quality Management Plan/State Implementation Plan[12]. R-3-6 R-3-7

CEQA Baseline

2. The Lead Agency chose a CEQA baseline year of 2012 for determining the air quality impacts from criteria pollutants for each alternative[13]. The 2012 baseline is held constant (i.e. using emission rates from 2012) and compared to future year 2035 (i.e. using emission rates from future year)[14]. This approach of using a comparison between the build alternatives' air quality impacts in future years (using emission rates from 2035) and a 2012 baseline (using emission rates from 2012) improperly credits the build alternatives with emission reductions that will occur due to adopted state and federal rules and regulations, since these rules and regulations are expected to improve air quality, even in the absence of Alternative 5C or Alternative 7 as the Proposed Project. For example, the California Air Resources Board's (CARB) current regulation for trucks and buses will provide significant near-term and long term reductions in NOx emissions from trucks and buses, at 124 tons per day for 2014 and 98 tons per day for R-3-8

[12] *Ibid.* Section 4.2.2.2, *Air Quality (CEQA Checklist Questions III.A and III.E)*. Page 4-14.
[13] *Ibid.* Executive Summary. Page 4.
[14] *Ibid.* Section 3.13, *Air Quality*. Pages 3.13-25 to 47. Section 4.2.4.1 *(CEQA Checklist Questions III.B, III.C, and III.D)*. Page 4-48 to 54.

2023[15]. The analysis in the RDEIR/SDEIS masks the potentially significant emission increases from the Proposed Project by taking credit for large emission reductions that have been achieved due to state and federal rules and regulations. The RDEIR/SDEIS should be revised to include a realistic baseline which accurately reflects the improvements in air quality that will occur, independent of the preferred alternative selected as the Proposed Project. R-3-8

In *Neighbors for Smart Rail v. Exposition Metro Line Construction (2013) 57 Cal.4th 439*, the California Supreme Court held that using a future baseline is proper in some cases. The purpose of CEQA is to disclose environmental impacts of the alternatives to the public and decision makers in order to provide them with the actual changes to the environment from the activities involved in each alternative. By taking credit for future emission reductions from existing air quality rules and regulations, the Lead Agency may have substantially underestimated the true impacts attributable to the Proposed Project's activities for VOCs, NOx, CO, PM10, PM2.5, and SOx emissions. Therefore, SCAQMD staff recommends that the Lead Agency revise the air quality analysis to include a comparison between the emissions in future interim year 2020, year 2025, year 2030, and year 2035 with Alternative 5C and the emissions in the same interim years without Alternative 5C, and use this comparison to determine the level of significance for Alternative 5C. Similarly, SCAQMD staff recommends that the Lead Agency revise the air quality analysis to include a comparison between the emissions in future interim year 2020, year 2025, year 2030, and year 2035 with Alternative 7 and the emissions in the same interim years without Alternative 7, and use this comparison to determine the level of significance for Alternative 7. R-3-9

SCAQMD's Air Quality CEQA Thresholds of Significance

3. While CEQA permits a Lead Agency to apply a qualitative threshold to determine the level of significance, the Lead Agency may not apply a threshold of significance in a manner that precludes consideration of substantial evidence demonstrating that there may be a significant effect on the environment. Evaluation of air quality impacts, unlike some other impact areas, easily lends itself to quantification. Not only does quantification make it easier for the public and decision-makers to understand the breadth and depth of the potential air quality impacts, but it also facilitates the identification of mitigation measures required to reduce any significant adverse air quality impacts. SCAQMD's CEQA thresholds of significance for air quality provide a clear quantitative benchmark to determine the significance of a project's air quality impacts. Therefore, for most projects within SCAQMD's jurisdiction, SCAQMD's air quality CEQA significance thresholds for construction and operation [16] are used to determine the level of significance of a project's air quality impacts.

The Lead Agency quantified the Proposed Project's construction emissions from criteria pollutants for Alternative 5C and Alternative 7 but did not compare those emissions to SCAQMD's air quality CEQA significance thresholds to determine the level of significance. The Lead Agency stated in the RDEIR/SDEIS that the California Department of Transportation (Caltrans) has not adopted any of SCAQMD's significance thresholds and that R-3-10

[15] California Air Resources Board. July 14, 2017. Trucks and Bus Regulation: On-Road Heavy-Duty Diesel Vehicles (In-Use) Regulation. Accessed at: https://www.arb.ca.gov/msprog/onrdiesel/onrdiesel.htm, and https://www.arb.ca.gov/msprog/onrdiesel/documents/truckrulehealth.pdf.

[16] South Coast Air Quality Management District. March 2015. *SCAQMD Air Quality Significance Thresholds*. Accessed at: http://www.aqmd.gov/docs/default-source/ceqa/handbook/scaqmd-air-quality-significance-thresholds.pdf.

SCAQMD's significance thresholds is presented for information only[17]. The Lead Agency compared the emission results to the 2012 baseline to determine whether the emissions from the build alternatives would be higher or lower than the baseline without determining significance. SCAQMD staff recommends that the Lead Agency compare each build alternative's construction and operational emissions to SCAQMD's regional and localized air quality CEQA significance thresholds in the Final EIR/SEIS to determine the level of significance. Using SCAQMD's CEQA significance thresholds would clearly identify whether an alternative would result in significant air quality impacts, disclose the magnitude of the impacts, facilitate the identification of feasible mitigation measures, and evaluate the level of impacts before and after mitigation measures. R-3-10

Air quality and HRA Analyses Assumption

4. One of the key assumptions for the air quality and HRA analyses was the BNSF Railroad Southern California International Gateway (SCIG) near-dock intermodal yard and the expansion of the UP Railroad near-dock intermodal Container Transfer Facility (ICTF) projects[18]. The RDEIR/SDEIS stated that those projects "are now considered reasonably foreseeable," and assumed that the SCIG project would effectively eliminate approximately 95 percent of the truck trips from using I-710[19]. The Final EIR for the SCIG project was certified by the Los Angeles Board of Harbor Commissioners in March 2013 but was later vacated by the Contra Costa County Superior Court in 2016. The Proposed Project's air quality and HRA impacts were calculated based on the reduction of truck trips due to the SCIG project. Therefore, this may have substantially underestimated the Project Project's air quality impacts. In order to disclose a worst-case impact scenario for the Proposed Project, SCAQMD staff recommends that the Lead Agency revise the air quality and HRA analyses based on the number of truck trips without the SCIG project in the Final EIR/SEIS. R-3-11

Air Quality Analysis

Interim Milestone Years

5. The air quality analysis years for the RDEIR/SDEIS included only two analysis years: 2012 and 2035. By 2035, the Proposed Project is assumed fully built if any one of the build alternatives (Alternative 5C or Alternative 7) is selected as a preferred alternative with funding, and vehicle and truck fleets would meet the most stringent emission standards currently required. Although the Proposed Project may not be at peak capacity in earlier years, it is possible that due to higher emission rates of vehicles and trucks in earlier years that peak daily emissions may occur before 2035. The overall emission rates of vehicles and trucks are higher in earlier years as more stringent emission standards have not been fully implemented and fleets have not fully turned over. Therefore, SCAQMD staff recommends that the Lead Agency include interim milestone years (i.e., year 2020, year 2025, year 2030, and year 2035) in the Air Quality analysis to ensure the peak daily emissions are identified and adequately disclosed in the Final EIR/SEIS. R-3-12

[17] RDEIR/SDEIS. Pages ES-28, ES-33, 3.3-139, 3.24-4.
[18] *Ibid.* Page 1-31.
[19] *Ibid.* Page 2-3.

Overlapping Construction and Operational Impacts

6. Based on a review of the project description, SCAQMD staff found that staging of construction activities would be required for the Proposed Project. Funding, right-of-way certification, maintenance of traffic, and contractor innovation are all variables that drive the timing, priority, and scope of staged construction[20]. Under these circumstances, one or multiple segments of the I-710 corridor may be under construction while other segments are in operation. When the overlapping construction and operation activities are anticipated, the Final EIR/SEIS should identify the overlapping years, combine construction emissions with operational emissions, and compare the combined emissions to SCAQMD's air quality CEQA operational thresholds to determine the level of significance. R-3-13

Construction

7. Section S.5.3.2 – Relocations and Real Property Acquisition states that the build alternatives would result in the relocation of residential and nonresidential properties. Emissions generated from demolition and new construction of the acquired properties are not included in the emissions estimates for construction. Since relocation is foreseeable, SCAQMD staff recommends that the Lead Agency include those emissions in the Final EIR/SEIS. R-3-14

8. The Lead Agency included aggregate crushing and processing equipment in the construction emission estimates, which only accounted for the emissions from the diesel internal combustion engines. Aggregate crushing and processing release particulate matter separate from the internal combustion engine. By not including the emissions from aggregate crushing and processing, the RDEIR/SDEIS has likely underestimated air quality impacts from construction. Furthermore, if SCAQMD permits are required for the equipment, SCAQMD should be listed as a responsible agency and will rely on the analysis in the Final EIR/SEIS for permit issuance. SCAQMD staff recommends including aggregate processing emissions into the construction emission estimates[21]. R-3-15

Localized Criteria Pollutant Analysis

9. The RDEIR/SDEIS did not evaluate potential localized air quality impacts that could result from construction of the Proposed Project. A localized air quality analysis would quantify potential air quality impacts that would occur near the Proposed Project during construction. This analysis is important for the Proposed Project because of the long duration and extent of construction activities, as well as the proximity of receptors to the Proposed Project. Therefore, SCAQMD staff recommends that the Lead Agency revise the air quality analysis to include an assessment of potential localized air quality impacts[22]. R-3-16

---

[20] *Ibid.* Page 2-87.

[21] U.S. Environmental Protection Agency. AP 42, Fifth Edition Compilation of Air Pollutant Emission Factors, Volume 1: Stationary Point and Area Sources: https://www.epa.gov/air-emissions-factors-and-quantification/ap-42-compilation-air-emission-factors.

[22] The Localized Significance Threshold (LST) methodology and Mass Rate LST Look Up Table is available at: http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/localized-significance-thresholds.

Cumulative Air Quality Impacts Analysis

10. The Proposed Project is cumulative in nature both geographically and temporally. However, the RDEIR/SDEIS did not analyze potential air quality impacts from indirect or secondary effects as a result of induced growth, induced changes in the pattern of land use, population, and transportation improvements. Additionally, the RDEIR/SDEIS did not analyze potential air quality impacts from construction or operation of the Proposed Project on the rest of transportation network within and in the vicinity of the study area (e.g., I-5, I-105, I-405, SR-91, PCH 1) if one of the build alternatives is selected. For example, during construction of Alternative 7, there might be detours of vehicles and trucks to other transportation facilities. Therefore, SCAQMD staff recommends that the Lead Agency include a comprehensive assessment of the Proposed Project's potential cumulative air quality impacts in the Final EIR/SEIS. R-3-17

Air Dispersion Modeling Parameters

11. The dispersion modeling analysis for the Proposed Project included constructed portions of the I-710 mainline. Because the Proposed Project has the potential to significantly alter traffic patterns in the adjacent communities, especially diesel truck traffic patterns, the dispersion modeling analysis should be expanded beyond the I-710 mainline, including major arterials, key roadway segments in the vicinity of the Proposed Project. At a minimum, the arterials and roadways that may have substantial volumes of diesel truck traffic greater than 5,000 trucks/day should be included, as well as those roadways that will transverse through or adjacent to residential neighborhoods. R-3-18

12. In the air dispersion modeling, the Lead Agency used the non-default option "FASTALL". SCAQMD staff recommends using the default regulatory options or providing justification for using the non-default FASTALL option. R-3-19

Meteorological Data

13. In the AERMOD Modeling Files provided by the Lead Agency, it stated that the POLB station was created by using surface measurements obtained from Scripps Pier monitoring station (KLGB,WMO 722970)[23]. KLGB is monitoring station code for the Long Beach Airport monitoring station, not the Scripps Pier monitoring station. SCAMQD staff recommends clarifying the statement. R-3-20

14. In Section 5 of the Air Quality, Greenhouse Gas, and Health Risk Assessment Technical Study, the Lead Agency stated that "as multiple stations were selected to identify the meteorological profile of the AOI, the selected meteorological data can be considered as on-site data. As a result, only one year of data was used for air dispersion modeling." SCAQMD staff does not agree that the use of multiple meteorological stations constitutes these stations as on-site stations to justify that only one year of meteorological data is required. The U.S. EPA recommends five years of meteorological data, or at least one year of site-specific data for the purposes of air dispersion modeling. Consecutive years from the most recent, readily available R-3-21

[23] I710 Drive 2\AERMOD Modeling Files\AERMOD_Inputs_and_Outputs\aermet - README.TXT

five-year period are preferred[24]. Therefore, SCAQMD staff recommends that the Lead Agency update the modeling using the latest five years of available meteorological data. R-3-21

Methodology for Determining Morbidity and Mortality Impacts

15. Mortality is a measure of the number of deaths in a population, scaled to the size of that population, per unit time. Morbidity refers to the number of individuals who have contracted a disease during a given time period (the incidence rate) or the number who currently have that disease (the prevalence rate), scaled to the size of the population. On page 3.13-52 of the RDEIR/SDEIS, the Lead Agency described the qualitative methodology that was used to perform the mortality and morbidity analysis. By using total PM2.5 as a surrogate for localized primary PM-related morbidity and mortality health risks, the RDEIR/SDEIS found that mortality and morbidity health risks are expected to decrease based on future lower PM2.5 levels. SCAQMD staff recommends that the Lead Agency quantify the morbidity and mortality heath impacts and revise the PM mortality analysis and use the methods described in California Air Resources Board's 2010 guidance document[25]. R-3-22

Mitigation Measures

Deferred Analysis on Mitigation Measures

16. In the RDEIR/SDEIS, the Lead Agency proposed three air quality mitigation measures during operation of the Proposed Project. However, SCAQMD staff found that the discussion on mitigation measures was substantively lacking. First, on Page 4-50 of the RDEIR/SDEIS, the Lead Agency stated that "the only feasible additional mitigation measure that would further reduce emissions to levels below the SCAQMD thresholds would be to severely limit the total daily construction activity"[26]. The Lead Agency stated that if daily construction activities were limited, there would likely be extended construction period and increased construction costs[27]. However, there was no discussion in the Air Quality Section about how many more construction days or increased costs incurred if daily construction activities were to be limited due to significant air quality impacts. Second, there was no quantitative or qualitative analysis on the air quality impacts after incorporating the programmatic elements such as ZE/NZE trucks funding and Community Health Benefit Grant Program, which were used as substantial evidence to support the finding that air quality and public health in the corridor would be improved[28]. Third, on Page 4-54, the Lead Agency stated that localized increases in mobile source air toxics emissions were the result of increased total traffic volumes for which further mitigation of these emissions was not technically feasible because Caltrans does not control the emission characteristics of vehicles using the freeway. However, the Lead Agency has not demonstrated any evidence in the RDEIR/SDEIS to show any technical infeasibility. R-3-23 R-3-24 R-3-25

[26] *Ibid.* Page 4-50.

[27] *Ibid.* Page 4-51.

[28] *Ibid.* Page 3.13-55.

CEQA requires that all feasible mitigation measures that go beyond what is required by law be utilized to minimize or eliminate any significant impacts. CEQA recognizes that a mitigation may require the cooperation of other agencies (e.g., CARB, EPA), and this does not make mitigation not feasible. Although the Lead Agency does not need to make determinations about authorities of other agencies in the RDEIR/SDEIS, it should consider and discuss potential mitigation measures and their ramifications on the air quality impacts, with and without mitigation measures, and if the ramifications on the air quality impacts would be different among the alternatives. Technological capacities, regulatory limitations, and jurisdictional boundaries are factors relevant to the "feasibility" of mitigation measures, which could be central to selecting a preferred alternative for the Proposed Project. Therefore, the formulation of mitigation measures should not be deferred to a later time or made the responsibility of other agencies.

Limits of Air Monitoring Stations: Mitigation Measure (MM) AQ-1

17. Mitigation Measure AQ-1 proposes to provide SCAQMD with funding for the design and construction of four new air quality monitoring stations within the I-710 Corridor. The new stations will monitor meteorology and criteria pollutant concentrations. Pursuant to CEQA Guidelines Section 15126.4, mitigation measures are those capable of minimizing or reducing significant adverse impacts. Monitoring and collecting air quality data should not be considered a mitigation measure since the air monitoring stations do no mitigate or reduce any impacts. Therefore, SCAQMD staff recommends that the Lead Agency revise MM AQ-1 by providing additional information on how the monitoring station data will be used to reduce the Proposed Project's significant air quality impacts. R-3-26

Limits to Enhanced Filtration Units: Mitigation Measure (MM) AQ-2

18. The Lead Agency proposes to install enhanced filtration units to schools within 0.25 miles of I-710 that are currently lacking air filtration systems (MM AQ-2)[29]. Strategies available to reduce exposure, including, but are not limited to, building filtration systems, sounds walls, vegetation barriers, etc. Because of the potential adverse health risks involved with siting residences near a freeway, it is essential that any proposed strategy must be carefully evaluated before implementation. When enhanced filtration units are proposed, the Lead Agency should consider the limitations of the enhanced filtration. For example, in a study that SCAQMD conducted to investigate filters[30], costs were expected to range from $120 to $240 per year to replace each filter. In addition, because the filters would not have any effectiveness unless the HVAC system is running, there may be increased energy costs. It is typically assumed that the filters operate 100 percent of the time while residents are indoors, and it does not account for the times when residents have their windows or doors open or are outside in common areas. These filters also have no ability to filter out any toxic gases from vehicle exhaust. The presumed effectiveness and feasibility of any filtration units should therefore be evaluated in R-3-27

[29] *Ibid.* Page 3.13-56.

[30] This study evaluated filters rated MERV 13+ while the proposed mitigation calls for less effective MERV 12 or better filters. Accessed at: http://www.aqmd.gov/docs/default-source/ceqa/handbook/aqmdpilotstudyfinalreport.pdf. Please also see the 2012 Peer Review Journal article by SCAQMD staff. Accessed at: http://d7.iqair.com/sites/default/files/pdf/Polidori-et-al-2012.pdf.

greater detail prior to assuming that they will sufficiently alleviate near roadway exposures. Further, since filtration units must be maintained and replaced on a regular basis, the Lead Agency should provide additional details on the maintenance and replacement method, schedule, and/or responsible implementing agency to ensure that MM AQ-2 is enforceable throughout the lifetime of the Proposed Project. R-3-27

Recommended Changes to MM AQ-2

19. As described above, MM AQ-2 is limited to providing enhanced filtration units to schools within 0.25 mile of I-710. Sensitive receptors are people that have an increased sensitivity to air pollution or environmental contaminants. Sensitive receptors include schools, parks and playgrounds, daycare centers, nursing homes, hospitals, and residential dwelling units. Therefore, SCAQMD staff recommends revising MM AQ-2 to include all of the sensitive receptors within 0.25 mile of I-710 as follows.

AQ-2 To further reduce exposure of children and other people to near roadway emissions, air filtration systems shall be provided for any of the following schools and sensitive receptors, including daycare centers, nursing homes, hospitals, and residential dwelling units within 0.25 mile of I-710 that currently lack adequate air filtration systems. As stated in the California Air Resources Board (ARB) *Technical Advisory* (April 2017), high-efficiency filters in ventilation systems can remove from 50 to 99 percent of the particles in the air. Determination of adequate air filtration systems ~~will~~ shall be addressed during coordination with the respective school districts or administrations and sensitive receptor facilities based on current building codes as well as guidelines set forth by the United States Environmental Protection Agency (EPA) and the SCAQMD before certification of the Final EIR/SEIS. R-3-28

Recommended Changes to MM CON-AQ-15

20. The Proposed Project's construction emissions were modeled based on the assumption that all construction equipment will meet U.S. EPA Tier 4 emission standards. To ensure that the requirement of Tier 4 off-road construction equipment is enforced during construction, and to be consistent with the air quality modeling assumption, SCAQMD staff recommends incorporating the following revision to construction mitigation measure CON-AQ-15[31]:

CON-AQ-15 (see Section 3.24.4.13):

~~Dependent upon the responsible agency that administers the construction contract,~~ ~~e~~Construction equipment greater than 50 bhp ~~may~~ shall meet equivalent emissions performance to that of United States Environmental Protection Agency (EPA) Tier 4 standards and California Air Resources Board (ARB) requirements for non-road engines~~, if such construction equipment is available~~. All construction equipment shall be outfitted with best available control technology (BACT) devices certified by ARB. A copy of each unit's certified tier specification, BACT documentation, and ARB or SCAQMD operating permit shall be provided at the time of R-3-29

[31] *Ibid.* Page 4-86.

mobilization of each applicable unit of equipment. Contractor(s) should keep records to be able to demonstrate compliance with this mitigation measure. Metro's Green Construction Policy would be utilized ~~if Metro administers the construction contract~~. R-3-29

Recommended Changes to MM CON-AQ-17

21. CEQA requires that all feasible mitigation measures that go beyond what is required by law be utilized to minimize or eliminate any significant impacts. It is expected that all trucks and buses would need to be replaced and that all will have 2010 model year engines or equivalent emissions by year 2023[32]. Since 2010 model year trucks are expected to be available during the implementation of the Proposed Project (build-out year is 2035), SCAQMD staff recommends that the Lead Agency revise MM Con-AQ-17 in the Final EIR/SEIS. R-3-30

CON-AQ-17 (see Section 3.24.4.13):

On-road, heavy-duty trucks that meet the ARB's ~~2007~~ 2010 or cleaner certification standards for on-road diesel engines, and compliance with State on-road regulations.

New Mitigation Measure: MM AQ-4 – Performance Standards-Based Technology Review

22. The build 2035 alternatives include ZE/NZE truck technology deployment program, and Alternative 7 includes an additional platooning technology. Technology is transforming transportation. As it continues to advance, the Lead Agency should take this opportunity to develop a pathway to ensure the deployment of the lowest emission technologies possible in the life of the Proposed Project. To facilitate the deployment, SCAQMD staff recommends that the Lead Agency assess equipment availability, equipment fleet mixtures, and best available emissions control devices every two years beginning two years after the Proposed Project is approved, and specify performance standards for the technology assessment. R-3-31

Other Enforceable Mitigation Measures

23. As described in Comments 4 to 10, the Proposed Project's true air quality impacts may have been substantially underestimated and would exceed SCAQMD's air quality CEQA significance thresholds, resulting in significant and unavoidable air quality impacts, had the Lead Agency used a proper CEQA baseline and truck trips assumption to calculate emissions. Moreover, the Proposed Project is an important project and provides the necessary infrastructure to support the region's movement towards zero-emission technology. The Lead Agency should use the Proposed Project as an opportunity to take more aggressive actions to accelerate zero-emission technologies (see Attachment A: Zero Emission Truck Technologies). To ensure successful implementation of the strategies, SCAQMD staff recommends that the Lead Agency use a performance based standard and an enforceable ZE/NZE implementation plan be included as part of the Final EIR/SEIS. The implementation R-3-32

[32] California Air Resources Board. August 19, 2014. Accessed at: https://www.arb.ca.gov/msprog/onrdiesel/documents/FSRegSum.pdf.

plan should include schedules, criteria for setting and assessing progress, and the process for evaluating the effectiveness of ZE technologies that should support the air quality attainment goals and attainment timelines of the 2016 Air Quality Management Plan. R-3-32

SCAQMD Permits

24. The Lead Agency intends to use portable cement manufacturing, aggregate crushing, and screening equipment for approximately 10 years. Article 5 and Section 2450 to 2465 of Title 13, California Code of Regulation establishes a statewide program for the registration and regulation of portable engines and equipment units (Portable Equipment Registration Program – PERP). In the event that the engine or equipment unit that will be used for the Proposed Project do not meet the definition of portable engine or equipment unit, the Lead Agency would be required to obtain SCAQMD permits for aggregate equipment and operations. R-3-33

Compliance with SCAQMD Rules

25. The Final EIR/SEIS should include a discussion on how the Proposed Project will comply with the following SCAQMD Rules:

- Rule 201 – Permit to Construct – The Lead Agency should obtain written authorization for the construction/installation of any equipment that may cause or control air contaminants. If there are permit questions concerning the aggregate processing equipment, they can be directed to SCAQMD Engineering and Compliance staff at (909) 396-2315. SCAQMD should be identified as a responsible agency in the Final EIR/SEIS. R-3-34

- Rule 203 – Permit to Operate – The Lead Agency should obtain a written permit to operate. If there are permit questions concerning the aggregate processing equipment, they can be directed to Engineering and Compliance Staff at (909) 396-2315. The SCAQMD should be identified as a responsible agency under CEQA. R-3-35

- Rule 1157 – PM10 Emission Reduction From Aggregate and Related Operations – The Lead Agency should discuss and provide additional details on how the project will comply with Rule 1157. R-3-36

- Rule 403(e) – Large Operations – The Proposed Project is a large operation (50 acres or more of disturbed surface area; or daily earth-moving operations of 3,850 cubic yards or more on three days in any year) in the South Coast Air Basin. The Lead Agency is required to comply with SCAQMD Rule 403(e) – Additional Requirements for Large Operations[33]. The requirements may include, but are not limited to, Large Operation Notification (Form 403 N), appropriate signage, additional dust control measures, and employment of a dust control supervisor that has successfully completed the Dust Control in the South Coast Air Basin training class[34]. R-3-37

[33] *Ibid.* Rule 403. Last amended June 3, 2005. Accessed at: http://www.aqmd.gov/docs/default-source/rule-book/rule-iv/rule-403.pdf.

[34] SCAQMD Compliance and Enforcement Staff's contact information for Rule 403(e) Large Operations is (909) 396-2608 or by e-mail at dustcontrol@aqmd.gov.

This page intentionally left blank

R-3-1

As discussed in Section 1.2.2 in Chapter 1.0, Proposed Project, of the RDEIR/SDEIS and this Final EIR/EIS, one of the purposes of the project is to improve air quality and public health. As discussed in Section 3.13, Air Quality, in the RDEIR/SDEIS and this Final EIR/EIS, all build alternatives would generally improve air quality and reduce public health risk. Along I-710, air quality would be improved and public health risk would be reduced at most locations, but there are a few near-roadway locations where there would be an increase in certain emissions but no increase in cancer risk compared to the 2012 Baseline.

When compared to the 2035 No Build Alternative, both build alternatives would reduce cancer risk at most locations; however, a small increase in cancer risk would occur at some locations within 100 meters of I-710. For Alternative 5C, the maximum increase in risk would be approximately three in one million. The primary location of the increased risk for Alternative 5C is along a small portion of I-710 just south of SR-60. For Alternative 7, the increase in risk would be less than one in one million.

Measures AQ-2 and AQ-3 are proposed to reduce exposure to emissions at near-roadway locations for the build alternatives. Measure AQ-2 provides for the installation of filters on the ventilation systems of schools near I-710. Measure AQ-3 provides for the installation of solid barriers where soundwalls are not proposed and installation of vegetation to disperse pollution and reduce pollutant concentrations downwind. Additionally, the build alternatives include programmatic components to help improve air quality and public health along the I-710 Corridor. The I-710 Corridor Community Health Benefit Program is a programmatic component of the build alternatives and would take the form of a grant program structured to provide corridor communities the opportunity to implement projects or outreach activities that would improve air quality and public health related to I-710 travel and goods movement. However, Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), has identified Alternative 1 (No Build) as the Preferred Alternative. Please refer to Section 1.1 of this appendix for more detail. Please refer to Section 1.10 of this appendix for more information regarding the Community Health Benefit Program.

R-3-2

South Coast Air Quality Management District's (SCAQMD) support of a zero emission (ZE) corridor is noted. As stated in Response to Comment R-3-1, the No Build Alternative has been selected as the Preferred Alternative; hence programmatic elements of the build alternatives, such as the I-710 Clean Truck Program, will not be implemented by Caltrans as the Lead Agency under CEQA and NEPA and as the owner/operator of the I-710 freeway. Prior to selection of the No Build Alternative, the description of the I-710 Clean Truck Program was being further defined to include a proposed governance structure, roles and responsibilities for program oversight, and

provisions related to program enforceability (for more information, see Section 2.3.2.1, Common Features of the Build Alternatives, and Appendix W of this Final EIR/EIS).

R-3-3

The comments provided here have been utilized in the continued development of the I-710 Clean Truck Program (also referred to in the RDEIR/SDEIS as the I-710 Corridor Project Zero Emission/Near Zero Emission Truck Technology Deployment Program), which had been further refined for the build alternatives. Those details are provided in Section 2.3.2.1 and Appendix W of this Final EIR/EIS. It is important to note that the No Build Alternative has been selected as the Preferred Alternative; hence programmatic elements of the build alternatives, such as the I-710 Clean Truck Program, will not be implemented by Caltrans as the Lead Agency under CEQA and NEPA and as the owner/operator of the I-710 freeway.

R-3-4

This comment summarizes concerns detailed in later comments. Please refer to Responses to Comments R-3-8 and R-3-9 regarding the CEQA baseline, Response to Comment R-3-11 regarding the air quality assumptions, Responses to Comments R-3-18 and R-3-19 regarding modeling parameters, Responses to Comments R-3-12 through R-3-17 regarding criteria pollutant calculations, Responses to Comments R-3-23 through R-3-32 regarding air quality mitigation measures, and Responses to Comments R-3-20 and R-3-21 for a discussion of meteorological data.

The BNSF Railroad Southern California International Gateway (SCIG) and UP Railroad near-dock intermodal Container Transfer Facility (CTF) projects are appropriate to include in the 2035 No Build Alternative, as these projects were included in the 2012 Regional Transportation Plan traffic model, as documented in the RDEIR/SDEIS and this Final EIR/EIS (Section 1.2.1.4).

R-3-5

It is important to note that while the SCAQMD CEQA significance thresholds were included for informational purposes, Caltrans as a matter of practice does not utilize defined CEQA thresholds in determining the significance of an impact. Because the significance of an effect may vary depending on the environmental setting and context, set rules for determining significance in every case have not been established. Because Caltrans has statewide jurisdiction and the setting for projects varies so extensively throughout the State, Caltrans has not and has no intention to develop thresholds for significance for CEQA. The determination of significance is left to the internal Project Development Team, which includes environmental staff and specialists. The specific measures suggested by SCAQMD staff are provided later in the letter and are coded as Responses to Comments R-3-31 and R-3-32. Please refer to those responses to comments for further information.

R-3-6

As stated in Response to Comment R-3-1, the No Build Alternative has been selected as the Preferred Alternative due to a number of reasons, including but not limited to, the inability of the build alternatives to achieve project-level particulate matter conformity determination. Details on how project-level particulate matter conformity was analyzed for the build alternatives are provided in Response to Comment F-4-5.

R-3-7

The project-level carbon monoxide (CO) conformity analysis is included in Section 3.13, Air Quality, of the RDEIR/SDEIS and this Final EIR/EIS. Consistent with Caltrans and FHWA guidance, project-level air quality conformity is not required for approval of a Draft EIR/EIS and is not required to be included in the RDEIR/SDEIS. However, a project-level air quality conformity determination is required for project approval or funding for the build alternatives. Please refer to Response to Comment R-3-6, Section 1.4.1, Project Level Particulate Matter Conformity Analysis (of this appendix), and Section 3.13.3.2 of this Final EIR/EIS for updated information related to the project-level conformity analysis.

R-3-8

The analyses presented in the *Air Quality, Greenhouse Gas, and Health Risk Assessment Technical Study* (AQ/GHG/HRA Technical Study) (June 2017), and the associated *Addendum to the Air Quality, Greenhouse Gas, and Health Risk Assessment Technical Study* (December 2020), include incremental comparisons of the future (2035) project alternatives to the 2012 Baseline as required by CEQA. The re-analysis for the RDEIR/SDEIS began in 2013, so a 2012 CEQA baseline year was chosen, consistent with CEQA guidance. Selection of the CEQA baseline for the air quality analysis was discussed in the February 2017 *Air Quality, Greenhouse Gas, and Health Risk Revised Protocol* (Protocol), which was included as Appendix A of the AQ/GHG/HRA Technical Study. A draft of this Protocol was distributed to the Agency Air Technical Working Group (including SCAQMD) for review in October 2015. The build alternatives do not take credit for the large reductions that have been achieved due to State and Federal rules and regulations. Instead, the AQ/GHG/HRA Technical Study discusses the California Air Resources Board's (CARB) Truck and Bus Regulation, the Pavley Standard, and the Ports' Clean Trucks Program as the primary drivers for the reductions in emissions seen in the 2035 project alternatives as compared to the 2012 Baseline (refer to Sections ES.5.1, ES.5.2, ES.6.1, and Sections 4.3.1, 4.3.3, and 5.2 of the AQ/GHG/HRA Technical Study). Further, the analyses also present incremental comparisons of the 2035 build alternatives to the 2035 No Build Alternative for NEPA, which would exclude any reductions from State and Federal rules and regulations. The NEPA analysis can be used as a basis for comparing the build alternatives without taking account for reductions achieved due to State and Federal rules and regulations.

R-3-9

This comment recommends that the air quality analysis include a comparison of the build alternative emissions to future interim years 2020, 2025, and 2030 as well as year 2035. As stated in Response to Comment R-3-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, a comparison of the build alternative emissions to future interim years 2020, 2025, and 2030, as well as year 2035, would no longer be necessary. However, the analysis included in the RDEIR/SDEIS assumed construction of the build alternatives to begin in 2022 and be completed by the horizon year 2035. Hence, the build alternatives would not exist in any of the interim years (2020, 2025, or 2030) that are referred to in this comment and a comparison of the emissions with and without the build alternative in a particular interim year would be hypothetical and misleading However, as stated in Response to Comment R-3-8, the AQ/GHG/HRA Technical Study does present incremental comparisons of the emissions from the 2035 build alternatives to the 2035 No Build Alternative, which would exclude any reductions from State and Federal rules and regulations. Specifically, Table 5-2b presented the incremental changes in volatile organic compounds (VOC), nitrogen oxides (NO_X), CO, PM_{10}, $PM_{2.5}$, and sulfur oxides (SO_X) emission estimates for the 2035 build alternatives as compared to the 2035 No Build Alternative.

According to the preliminary construction staging analysis prepared for the proposed project, the build alternatives were not projected to be built and operational by 2020, 2025, or 2030. Traffic volumes are highest under the build alternatives relative to the No Build condition. At the time of the analysis it was too speculative to take credit for these benefits prior to year 2035 when full deployment must be assured. In addition, it has been demonstrated that 2035 is the peak PM_{10}/$PM_{2.5}$ emissions year for operational emissions in the August 2018 White Paper, *I-710 Corridor Project: Selection of Analysis Year for Quantitative Particulate Matter Hot-Spot Analyses*, which was included as Appendix B of the August 2018 PM conformity submittal to the Transportation Conformity Working Group. In essence, vehicle miles travelled (VMT) would increase during this period (as noted in SCAQMD's Final 2016 Air Quality Management Plan), while fleet-turnover to the cleanest current cars and trucks would be essentially complete by 2023 (as shown in EMFAC2014 and complete implementation of the CARB Truck and Bus Rule by that date).

Please refer to Section 1.4.2 of this appendix, Air Quality Analysis of Interim Years, for further discussion, and to Section 3.13.3.2 of this Final EIR/EIS for an updated discussion of project-level conformity.

R-3-10

Please refer to Response to Comment R-3-5 for more information on CEQA significance criteria. The air quality analysis for CEQA was provided in Chapter 4.0, CEQA Evaluation, of the RDEIR/SDEIS and this Final EIR/EIS. As discussed in Chapter 4.0, while Caltrans has not adopted them, the SCAQMD CEQA significance thresholds were provided in the CEQA analysis for informational purposes.

R-3-11

It is true that the Final EIR prepared for the SCIG project was vacated by the Contra Costa County Superior Court in 2016, prior to the circulation of the RDEIR/SDEIS, and this fact is acknowledged in the RDEIR/SDEIS. However, the technical analyses supporting the RDEIR/SDEIS, including traffic forecasting, began in 2014. Because of the lead time necessary for the complex traffic modeling efforts undertaken on the I-710 Corridor Project, it was not possible to revise the No Build Alternative scenario and re-run the model, and all subsequent analyses that depended on the traffic model, and still meet the schedule established for the project. Moreover, on January 12, 2018, the California Courts of Appeal ruled that the Port of Los Angeles and BNSF were in compliance with the majority of CEQA requirements, with the exception of the air quality analysis of ambient air concentrations and associated cumulative impacts of such pollutant concentrations and identified ways to resolve the one remaining CEQA issue (i.e., re-analysis of modeled PM concentrations at a certain location). On April 11, 2018, the California Supreme Court denied a petition to review the Court of Appeal's January 2018 decision. Caltrans maintains, due to the information provided above, that there is sufficient evidence and rationale for retaining the SCIG project in the No Build Alternative scenario.

A Sensitivity Test was conducted that removed the SCIG and ICTF Expansion Projects from the I-710 Corridor traffic model to evaluate the effects on the I-710 Corridor transportation travel patterns. These sensitivity tests are provided in the *I-710 Corridor Project RDEIR/SDEIS Travel Demand Modeling Methodology Technical Memorandum* (June 2017). In summary, viewed from daily conditions for total vehicles, removal of the SCIG and ICTF expansion projects from the No Build scenario resulted in only a slight overall change in the total number of vehicles, with additional trucks using I-710 displacing some autos.

R-3-12

Please refer to Response to Comment R-3-9 regarding the inclusion of interim milestone years in the air quality analysis and to Section 1.4.2 of this appendix, Air Quality Analysis of Interim Years, for further discussion

R-3-13

This comment requests that the RDEIR/SDEIS discuss the potential for combined construction and operational emissions to be greater during construction than in buildout year 2035. As stated in Response to Comment R-3-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there is no need to discuss the potential for combined construction and operational emissions to be greater during construction than in the buildout year 2035. It should be noted that the construction emissions scenarios presented in Section 3.24, Construction Impacts, of the RDEIR/SDEIS assumes consecutive construction of all freeway sections, which represents a conservative (i.e., worst-case scenario) emissions analysis, drawn from the construction staging scenarios, in order to identify and disclose the range of potential impacts. Please refer to Section 1.4.2 of this appendix, Air Quality Analysis of Interim Years, for further discussion

R-3-14

Emissions were calculated for the construction project area based on the right-of-way footprint of the build alternatives in acres. The Road Construction Emissions Model does include site preparation activities such as grubbing/land clearing, grading/excavation, and drainage/utilities/ sub-grade installation, although explicit aboveground demolition activities are not included. Based on the level of construction activity, emissions generated from demolition of acquired properties would be a small fraction of the emissions generated from the construction of the build alternatives. In addition, the air quality construction measures included in Section 3.24.4.13 of this Final EIR/EIS would apply to the demolition of structures acquired for construction of the build alternatives, as that is considered a construction activity.

R-3-15

The modeling methodology for construction emissions was described in the Protocol, which was included as Appendix A of the AQ/GHG/HRA Technical Study (June 2017). A draft of this Protocol was distributed to the Agency Air Technical Working Group (including SCAQMD) for review in October 2015. As described in the Protocol, construction emissions were calculated using the I-710 Construction Emissions Model, which is a modified version of the Sacramento Metropolitan Air Quality Management District (SMAQMD) Road Construction Emissions Model (RCEM) version 8.1.0. This model includes a conservative fugitive dust emission factor of 20 pounds of PM_{10}/acre/day. This emission factor was developed using methodology developed for the

SCAQMD by the Midwest Research Institute and consultation with CARB and is meant to be used when only the construction area and duration of construction are known. Detailed final design and construction plans would not be determined until after the Final EIR/EIS is approved. Since, as stated in Response to Comment R-3-1, the No Build Alternative has been selected as the Preferred Alternative, details regarding project-specific equipment, location, and timing information on construction activities is not necessary.

In addition, as the No Build Alternative has been selected as the Preferred Alternative, applicable and relevant SCAQMD permits are not necessary and have not been added to Table 2.5-1, Permits and/or Approvals Needed, of this Final EIR/EIS.

R-3-16

As stated in Response to Comment R-3-1, the No Build Alternative has been selected as the Preferred Alternative and, therefore, location-specific construction activity information and modeling of location-specific impacts is not necessary.

However, a preliminary construction staging analysis has been performed in order to demonstrate that the build alternatives could feasibly be constructed. The construction emissions scenarios presented in the AQ/GHG/HRA Technical Study (2017) and Section 3.24.3.13 of the RDEIR/SDEIS and this Final EIR/EIS assumed a conservative (i.e., worst-case scenario) emissions analysis, drawn from the construction staging scenarios, in order to identify and disclose the range of potential impacts. In addition, several air quality construction minimization measures are proposed for the build alternatives and are outlined in Section 3.24.4.13 of this Final EIR/EIS. Please refer to Section 1.4.3 of this appendix, Localized Impacts of Project Construction Emissions, for further discussion

R-3-17

This comment states that the air quality analysis should consider factors such as growth, changes in land use, population, transportation improvements, changes to the transportation network and detours during construction. The vehicle emissions in the air quality section of the RDEIR/SDEIS were estimated using travel demand modeling data for 2035. The I-710 travel demand forecast model is based on the regional 2012 Regional Transportation Plan (RTP) forecast model. In addition, the 2012/2035 RTP/Sustainable Communities Strategy (SCS) considers population, household, and employment forecasts. As such, the traffic modeling and the air quality modeling considered cumulative factors such as population and employment growth that would occur between 2012 and 2035. An analysis of the potential for project-related growth associated with the build alternatives was provided in Section 3.2, Growth, of the RDEIR/SDEIS and this Final EIR/EIS. This analysis concluded that there are no reasonably foreseeable project-related growth impacts that would occur under the build alternatives.

The 2012/2035 RTP/SCS also include future funded and committed transportation projects. In 2013, the assumptions related to goods movement within the Southern California Association of Governments' (SCAG) region were further developed and updated to more closely align with the changed economic conditions, drawing on the Updated Cargo Forecast (2009), the 2012 RTP Travel Demand Forecast Model (2012), the San Pedro Bay Ports estimates of marine terminal capacity (2013), Port Cargo market shares (2013), and Truck Trip distribution (2013). The *Model Input Data and Key Assumptions Technical Memorandum for Goods Movement* (May 2013) was then reviewed and discussed by the I-710 Technical Advisory Committee and the Port growth assumptions were approved for use in traffic forecasting performed in support of the RDEIR/SDEIS. The 2035 traffic data that are used as the basis for the air quality analysis include all future funded and committed projects, such as those listed in the above. Hence, the operational air quality also considers all future funded and committed projects, and therefore, considers cumulative factors such as land use changes and transportation improvements.

In addition, the I-710 is part of a highly congested metropolitan roadway network and is located within an urbanized area that is essentially built out. Given the high levels of congestion in the peak periods, the I-710 travel demand forecast model is particularly sensitive to changes in travel times. The proposed improvements included in the build alternatives improve speeds and reduce travel times on I-710, which in turn attracts more traffic to the facility relative to the No Build Alternative condition. The predicted shifts in traffic are accounted for in the operational traffic analysis. Therefore, changes to the transportation network are accounted for in the operational air quality analysis.

As stated in Response to Comment R-3-1, the No Build Alternative has been selected as the Preferred Alternative and therefore a detailed transportation management plan will not be necessary to identify specific detour routes; provide public outreach and noticing during construction, and help minimize construction impacts to the surrounding communities.

R-3-18

Air quality analyses presented in Section 3.13, Air Quality, of the RDEIR/SDEIS reports findings for various geographic areas including the I-710 Corridor; the I-710 Area of Interest; and the South Coast Air Basin (Basin) (refer to Figure 1-2 of the I-710 AQ/GHG/HRA Technical Study [2017] for a depiction of these areas). Changes in traffic on the local roadway network attributable to the build alternatives are taken into account in the reporting for the Area of Interest and the Basin study areas, while results for the I-710 Corridor focus on the I-710 freeway (Alternative 5C and Alternative 7) and the freight corridor (Alternative 7 only).

When viewing traffic for the build alternatives relative to the No Build Alternative, traffic volume changes are greatest on the I-710 Corridor with differences on the arterial system and other roadways being much more diffused and muted. These patterns are discernable by viewing and comparing Figures 4-3 and 4-4 in the *Traffic Operations Analysis Report* (March 2017) to

Figures 5-1 and 5-2 of the *Intersection Traffic Impact Analysis Report* (March 2017). Emissions from existing and future traffic on local arterials located within the Area of Interest are presented in the gridded mass emission plots presented in Figures 4-1a through 4-1c, Figure 4-2a through 4-2c, and Figures 4-5a through 4-5c in Appendix Q of the RDEIR/SDEIS and this Final EIR/EIS. These figures show that emissions of NO_X, PM_{10}, $PM_{2.5}$, and diesel particulate matter (DPM) generally decrease through the Area of Interest (including nearby freeways, arterials, and local roads) for the 2035 build alternatives as compared to the 2012 Baseline and the 2035 No Build Alternative, except for some locations along the I-710 freeway for PM_{10} and $PM_{2.5}$. Based on the mass emissions analysis within the Area of Interest (gridded emission plots), the greatest $PM_{2.5}$ and PM_{10} impacts of the build alternatives are anticipated to occur on the I-710 freeway and freight corridor. As a consequence, the air dispersion and health risk modeling appropriately focused on the I-710 Corridor.

R-3-19

This comment suggests that the air dispersion modeling be conducted using default regulatory options or that justification be provided about why the non-default FASTALL option was used. The modeling methodology was described in the Protocol, which was included as Appendix A of the AQ/GHG/HRA Technical Study (June 2017). A draft of this Protocol was distributed to the Agency Air Technical Working Group (including SCAQMD) for review in October 2015. As described in the Protocol, AERMOD was run using the non-default FASTALL option due to the expansive size of the project and the number of volume sources and model runs required (summarized in the table below). Modeling without the FASTALL option takes over six times longer, with run times potentially over 100 days per model run. The FASTALL option helps optimize the runtime for volume sources based on an alternative implementation of the horizontal meander algorithm.

Volume Sources and AERMOD Model Runs Using Non-Default FASTALL Option

Project Alternative	Meteorological Zone				Total Number of Volume Sources
	Coastal	Transition	Inland	Downtown	
PM Model Runs (64 runs)					
2012 Baseline	4,628	3,296	2,496	2,336	12,756
2035 No Build	4,620	3,304	2,500	2,320	12,744
2035 Alternative 5C	5,105	4,950	2,204	2,872	15,131
2035 Alternative 7	8,108	9,406	6,351	5,237	29,102
Model Runs Excluding PM (160 runs)					
2012 Baseline	2,314	1,648	1,248	1,168	6,378
2035 No Build	2,310	1,652	1,250	1,160	6,372
2035 Alternative 5C	2,531	2,302	1,102	1,436	7,371
2035 Alternative 7	3,568	3,680	2,529	2,315	12,092

PM = particulate matter

R-3-20

The AERMOD Modeling Files incorrectly stated that the Port of Long Beach (POLB) station was created using surface measurements obtained from Scripps Pier but included the correct modeling station identification (KLGB, WMO 722970). The POLB station was created by using surface measurements obtained from the Long Beach Airport monitoring station (KLGB, WMO 722970).

R-3-21

A sphere of influence analysis was performed to determine the most appropriate meteorological stations to represent the meteorological conditions encountered along the I-710 freeway for the purposes of air dispersion modeling. Details of this analysis are provided in Appendix D of the *2012 Air Quality/Health Risk Assessment Technical Study* released as part of the Draft EIR/EIS. The United States Environmental Protection Agency (EPA) and Office of Environmental Health Hazard Assessment typically recommend using a minimum of one year of on-site surface meteorological data or five years of representative surface meteorological data from a nearby site. The meteorological stations identified in the sphere of influence analyses are the Port of Long Beach Inner Harbor (POLB), North Long Beach (LGBH), Lynwood (LYNN), and Los Angeles North Main Street (CELA). As multiple stations were selected to identify the meteorological conditions, these meteorological stations were considered as site-specific and, therefore, only one year of meteorological data was needed.

As noted in the Protocol, which was included as Appendix A of the AQ/GHG/HRA Technical Study (June 2017), the Compton (CMPT) station was also reviewed for potential use as a replacement of the LYNN station (which shut down after 2009) in an attempt to use the most recent meteorological data. A draft of this Protocol was distributed to the Agency Air Technical Working Group (including SCAQMD) for review in October 2015. However, at the time of the analysis, review of SCAQMD AERMOD-Ready Data showed that the only common calendar year of data available across all these meteorological stations was 2009 (see table below). Since the LYNN station was still operational in 2009, LYNN data were used to maintain consistency with the sphere of influence analyses. At the time of the analysis, SCAQMD did not have five consecutive years (or even three consecutive years) of meteorological data available for these stations.

Meteorological Data Availability

Meteorological Station	Source	Are Meteorological Data Available?						
		2006	2007	2008	2009	2010	2011	2012
POLB	POLB	Y	Y	Y	Y	Y	Y	Y
LGBH	SCAQMD	Y	Y	Y	Y	N	Y	N
LYNN	SCAQMD	Y	Y	N	Y	N	N	N
CMPT	SCAQMD	N	N	N	Y	Y	N	Y
CELA	SCAQMD	Y	Y	N	Y	Y	Y	N

CELA = Los Angeles North Main Street
CMPT = Compton
LGBH = North Long Beach
LYNN = Lynwood
POLB = Port of Long Beach Inner Harbor
SCAQMD = South Coast Air Quality Management District

R-3-22

As discussed in Section 3.13.3.4, Public Health Considerations, although the CARB's model has been used on other projects to quantitatively assess project-specific incremental levels of public mortality and morbidity, such calculations are subject to significant uncertainty in the input data. Sources of uncertainty include emission estimates, representativeness of the meteorological data, air dispersion modeling algorithms, toxicity factors, population exposure estimates, concentration-response functions, baseline rates of mortality and morbidity (which are typically countywide, not for the specific PM impact area) that are entered into concentration response functions, and the occurrence of additional not-quantified adverse health effects. The nature of PM as a complex mixture of various pollutants, as well as the confounding health effects of pollutants such as SO_2, NO_2, CO, and O_3 that tend to co-occur with PM in ambient air, greatly increases the complexity of deriving accurate PM concentration-response functions. Health risk estimates derived in the presence of significant uncertainty tend to rely on very conservative assumptions that may greatly overestimate the potential adverse health effects. As stated by CARB in a 2006 study of DPM exposure from ports and goods movement in California, "Risk assessment has various uncertainties in the methodology and is therefore deliberately designed so that risks are not under predicted. Risk assessment is thus best understood as a tool for comparing risks from various sources, usually for purposes of prioritizing risk reduction, and not as literal prediction of the community incidence of disease from exposure."

Therefore, the analysis of PM mortality and morbidity conducted for the I-710 Corridor Project was a qualitative assessment based on comparative analysis of total $PM_{2.5}$ emissions for the various alternatives, given that other components of the model equations should be similar for the different project alternatives and are subject to the uncertainties listed above. Any quantitative estimate of the health risk or PM mortality/morbidity impacts would be speculative, inaccurate, and misleading.

R-3-23

As discussed on p. 4-51 in Section 4.2.4.1 of the RDEIR/SDEIS and this Final EIR/EIS, the construction schedule would have to be extended by more than five times in order to limit the daily construction activities to achieve emissions levels below the SCAQMD thresholds. Extending the construction schedule to this extent would more than double the total project costs for the build alternatives, due to the loss of economies of scale during construction and by accommodating the extended schedule overall.

R-3-24

ZE/NZE truck funding under the I-710 Clean Truck Program for both of the build alternatives was considered and incorporated into the air quality analysis in the RDEIR/SDEIS. The air quality benefits of the Community Health Benefit Program could not be quantified as this was defined as a programmatic feature of the build alternatives and would operate as a grant program to fund local and community projects per the description provided in Chapter 2 of the Final EIR/EIS. The benefits of the Community Health Benefit Program were, therefore, not taken into account in the air quality analysis. However, it is important to note that the No Build Alternative has been selected as the Preferred Alternative. The No Build Alternative does not include the I-710 Clean Truck Program or the Community Health Benefit Program. Also, please refer to Response to Comment R-3-1.

R-3-25

The EPA, CARB, and SCAQMD have the authority to enact regulations on emissions from vehicles operating in California. As stated on p. 5-54 of the RDEIR/SDEIS and this Final EIR/EIS, Caltrans and Metro do not have authority to regulate vehicle emissions. The build alternatives incorporated feasible mitigation to reduce Mobile Source Air Toxics (MSATs); however, the RDEIR/SDEIS and this Final EIR/EIS concluded that the long-term MSAT impacts of the build alternatives would remain significant and unavoidable at several near-roadway locations.

R-3-26

It is Caltrans' standard practice to include avoidance and minimization measures, in addition to mitigation measures, in their environmental document. It is stated on p. 3.13-56 in Section 3.13.4 of the RDEIR/SDEIS and this Final EIR/EIS that Measure AQ-1 is not intended to reduce either exposure or concentrations related to the build alternatives; however, it is intended to provide additional and better air quality data within the I-710 Corridor area so that the effects of future projects and mitigation measures can be better quantified.

R-3-27

Caltrans and Metro appreciate this information from SCAQMD regarding the implementation and limitations of filtration units. However, as stated in Response to Comment R-3-1, the No Build Alternative has been selected as the Preferred Alternative and therefore provision of air filtration units is no longer necessary. It should be noted that enhanced filtration units reduce indoor exposure to particulates, but the analysis provided in the RDEIR/SDEIS and this Final EIR/EIS for the build alternatives does not assume or rely upon any specific reduction effectiveness measures or on non-PM reductions. The measure does not provide for ongoing maintenance of filtration units, as Caltrans and Metro do not have an appropriate mechanism for ongoing provision of funds or materials. Maintenance would ultimately be the responsibility of the filtration recipient. In response to this and other comments, Measure AQ-2 has also been revised to indicate that coordination would occur to ensure that filtration systems would be in place prior to the start of construction (should a build alternative be selected as the Preferred Alternative).

R-3-28

As stated in Response to Comment R-3-1, the No Build Alternative has been selected as the Preferred Alternative and, therefore, it is not necessary to expand the scope of Measure AQ-2 to include “sensitive receptors” as defined in the AQ/GHG/HRA Technical Study and Section 3.3.3 of the RDEIR/SDEIS within 0.25 mile of I-710. This includes the following facilities: adult residential, daycare, healthcare, mental healthcare, nursing homes, and senior centers in addition to schools. In addition, it is also unnecessary to update this measure to indicate that coordination will occur to ensure that the systems will be in place prior to the start of construction.

R-3-29

Measure CON-AQ-15 was drafted in a manner that ensures it is both enforceable and consistent with Caltrans’ and Metro’s contract bid requirements and procedures, given that it is not currently known at this time which agency may eventually administer the construction contract for the build alternatives. Therefore, some flexibility was retained accordingly in the wording of the measure. It is important to note that some, but not all Tier 4 equipment is commercially available at the present time, and it is currently unknown if and when all Tier 4 equipment necessary to construct the build alternatives may be available in the future. By the time it was anticipated that construction of the build alternatives would be anticipated to begin, the Best Available Control Technology (BACT) compliance schedule for CARB’s 2014 *In-Use Off-Road Diesel-Fueled Fleets Regulation* indicates that only 10 percent of “large fleets” will consist of BACT equipment.[1]

[1] California Air Resources Board. 2014. *In-Use Off-Road Diesel Vehicle Regulation.* Revised August 2014. Website: https://www.arb.ca.gov/msprog/ordiesel/faq/bactfaq.pdf (accessed October 3, 2018).

For those reasons, in addition to the fact that the No Build Alternative has been identified as the Preferred Alternative, the text of the measure has not been revised.

R-3-30

Caltrans and Metro appreciate the specific suggestions provided by SCAQMD regarding Measure CON-AQ-17. However, as stated in Response to Comment R-3-1, the No Build Alternative has been selected as the Preferred Alternative and therefore it is not necessary to update this measure .

R-3-31

Prior to selection of the No Build Alternative as the Preferred Alternative, the I-710 Clean Truck Program was being further defined to include a proposed governance structure, roles and responsibilities for program oversight, and provisions related to program enforceability (for more information, see Section 2.3.2.1, Common Features of the Build Alternatives, and Appendix W of this Final EIR/EIS). Please refer to Section 1.1 of this appendix for further discussion on the identification of the Preferred Alternative.

R-3-32

Please also refer to Response to Comment R-3-31. In addition, as stated in Response to Comment R-3-1, the No Build Alternative has been selected as the Preferred Alternative and, therefore, there is no need for continued coordination between the Project Team and SCAQMD on performance-based standards and an enforceable implementation plan.

R-3-33

As stated in Response to Comment R-3-1, the No Build Alternative has been selected as the Preferred Alternative and, therefore, Table 2.5-1, Permits and/or Approvals Needed, was not revised in this Final EIR/EIS to include SCAQMD Rule 201 Permit to Construct, Rule 203 Permit to Operation, and Rule 1157 PM_{10} Emission Reductions from Aggregate and Related Operations.

R-3-34

As stated in Response to Comment R-3-1, the No Build Alternative has been selected as the Preferred Alternative and, therefore, Table 2.5-1, Permits and/or Approvals Needed, was not revised in this Final EIR/EIS to include SCAQMD Rule 201 Permit to Construct in the event that the cement manufacturing, aggregate crushing, and screening equipment do not meet the definition of portable engine or equipment use per Article 5 and Sections 2450–2465 of Title 13 of the California Code of Regulations (CCR).

R-3-35

As stated in Response to Comment R-3-1, the No Build Alternative has been selected as the Preferred Alternative and, therefore, Table 2.5-1, Permits and/or Approvals Needed, was not revised in this Final EIR/EIS to include SCAQMD Rule 203 Permit to Operate in the event that the portable manufacturing, aggregate crushing, and screening equipment do not meet the definition of portable engine or equipment use per Article 5 and Sections 2450–2465 of Title 13 of the CCR.

R-3-36

As stated in Response to Comment R-3-1, the No Build Alternative has been selected as the Preferred Alternative and, therefore, Table 2.5-1, Permits and/or Approvals Needed, was not revised in this Final EIR/EIS to include SCAQMD Rule 1157, PM_{10} Emission Reductions from Aggregate and Related Operations.

R-3-37

As stated in Response to Comment R-3-1, the No Build Alternative has been selected as the Preferred Alternative and, therefore, no construction would occur and the build alternatives would not need to comply with SCAQMD Rule 403, including compliance with Section (e), because the project would not disturb more than 50 acres.

This page intentionally left blank

City of
LYNWOOD

August 16, 2017

Mr. Ronald Kosinski
Caltrans District 7
Division of Environmental Planning
100 South Main Street, MS 16A
Los Angeles, CA 90012

RE: I-710 Recirculated Draft Environmental Impact Report/Supplemental Draft Environmental Impact Statement

Dear Mr. Kosinski:

We are writing to respectfully request that the California Department of Transportation extend the comment period for the Recirculated Draft Environmental Impact Report/Supplemental Draft Environmental Impact Statement (RDEIR/SDEIS) for the Interstate 710 (I-710) Corridor Project to 120 days. Comments are currently due by September 22, 2017. Granting this request would allow the comment period to go through November 19, 2017.

Several reasons support extending the comment period:

- City of Lynwood and partner community organizations are diligently working to review the RDEIR/SDEIS but additional time will be necessary to fully evaluate the document.
- City of Lynwood and technicians, as well as partnering community groups, need additional time to consult with experts to fully understand the findings. L-1-1
- City of Lynwood will require further time to fully update our residents regarding the analysis of this study and potential impacts/changes to our city
- Extending the comment period will allow for the City of Lynwood, as well as other stakeholders to be more informed about the project, and thus more fully engaged in the CEQA and NEPA processes.

Thank you in advance for your consideration, and kindly request that you respond to our extension request as soon as possible.

Sincerely,

Maria Santillan-Beas
Mayor

RE: I-710 Recirculated Draft Environmental Impact Report/Supplemental Draft Environmental Impact Statement

Dear Mr. Kosinski:

We are writing to respectfully request that the California Department of Transportation extend the comment period for the Recirculated Draft Environmental Impact Report/Supplemental Draft Environmental Impact Statement (RDEIR/SDEIS) for the Interstate 710 (I-710) Corridor Project to 120 days. Comments are currently due by September 22, 2017. Granting this request would allow the comment period to go through November 19th, 2017.

Several reasons support extending the comment period:

- Commerce and partner community organizations are diligently working to review the RDEIR/SDEIS but additional time will be necessary to fully evaluate the document.
- Commerce and technicians, as well as partnering community groups, need additional time to consult with experts to fully understand the findings.
- Commerce will require further time to fully update our residents regarding the analysis of this study and potential impacts/changes to our city
- Extending the comment period will allow for the Commerce, as well as other stakeholders to be more informed about the project, and thus more fully engaged in the CEQA and NEPA processes.

L-2-1

Thank you in advance for your consideration. We kindly ask that you respond to our extension request as soon as possible.

Sincerely,

Oralia Y. Rebollo
Mayor

RE: I-710 Recirculated Draft Environmental Impact Report/Supplemental Draft Environmental Impact Statement

Dear Mr. Kosinski:

We are writing to respectfully request that the California Department of Transportation extend the comment period for the Recirculated Draft Environmental Impact Report/Supplemental Draft Environmental Impact Statement (RDEIR/SDEIS) for the Interstate 710 (I-710) Corridor Project to 120 days. Comments are currently due by September 22, 2017. Granting this request would extend the comment period to November 19, 2017.

L-3-1

Several reasons support extending the comment period:

- City of Bell and partner community organizations are diligently working to review the RDEIR/SDEIS but additional time will be necessary to fully evaluate the document.
- City of Bell and technicians, as well as partnering community groups, need additional time to consult with experts to fully understand the findings.
- City of Bell will require further time to fully update our residents regarding the analysis of this study and potential impacts/changes to our city
- Extending the comment period will allow for the City of Lynwood, as well as other stakeholders to be more informed about the project, and thus more fully engaged in the CEQA and NEPA processes.

Thank you in advance for your consideration.

We kindly request that you respond to our extension request as soon as possible.

Sincerely,

Fidencio Joel Gallardo,
City of Bell

COUNTY OF LOS ANGELES
AIRPORT LAND USE COMMISSION

August 23, 2017

California Department of Transportation
District 7, Division of Environmental Planning
100 S. Main Street, MS 16A
Los Angeles, CA 90012
Attention: Ronald Kosinski RK

SUBJECT: ALUC REFERRAL CASE NO. RPPL2017009037
NOTICE OF AVAILABILITY OF RECIRCULATED DRAFT ENVIRONMENTAL IMPACT REPORT AND SUPPLEMENTAL DRAFT ENVIRONMENTAL IMPACT STATEMENT – I-710 CORRIDOR PROJECT

Dear Ronald Kosinski,

Thank you for the opportunity to comment on the above referenced project. Staff of the Los Angeles County Airport Land Use Commission (ALUC) has reviewed the submitted document and has the following comments:

> The proposed project is not located within an Airport Influence Area of any airport in Los Angeles County. Therefore, the proposed project is not subject to L.A. County ALUC review in accordance with Section 21676 of the California Public Utilities Code. L-4-1

If you have any questions regarding this matter, please contact Alyson Stewart at (213) 974-6432 or via email at astewart@planning.lacounty.gov, between 7:30 am and 5:30 PM, Monday through Thursday. Our office is closed on Fridays.

Sincerely,

DEPARTMENT OF REGIONAL PLANNING
Dennis Slavin, Acting Director

E. Bruce Durbin

Bruce Durbin, Supervising Regional Planner
Ordinance Studies Section

BD:as

This page intentionally left blank

L-4-1

Caltrans and Metro acknowledge that the build alternatives are not subject to Los Angeles County Airport Land Use Commission review and thanks the commenter for providing this information.

Lena Gonzalez
Councilwoman, First District
City of Long Beach

August 31, 2017

RE: I-710 Recirculated Draft Environmental Impact Report/Supplemental Draft Environmental Impact Statement

Dear Mr. Dougherty and Ms. Bowen,

I request that the California Department of Transportation extend the comment period for the Recirculated Draft Environmental Impact Report/Supplemental Draft Environmental Impact Statement (RDEIR/SDEIS) for the Interstate 710 (I-710) Corridor Project to 120 days. Comments are currently due by September 22, 2017. Granting this request would allow the comment period for this national significant project to extend through November 21, 2017.

The RDEIR/SDEIS, including appendices, represents thousands of pages of highly technical data and analyses that require additional time for thorough evaluation. Extending the comment period will allow stakeholders, including our constituents, to become better informed about the project, and thus more fully engaged in the CEQA and NEPA processes. This engagement is at the heart of CEQA and NEPA's public comment processes, and could provide improvements to the project's current design, additional or revised mitigations, and other information that will help ensure the project serves as a model for transportation projects in the 21st century. L-5-1

Moreover, the current comment period for the I-710 RDEIR/SDEIS overlaps with at least two other high-profile proposals — the draft Clean Air Action Plan (CAAP) and the Draft Supplemental Environmental Impact Report for the China Shipping Container Terminal Project due on Sept 21, 2017. The current deadline places an undue burden on members of the public wishing to engage fully in these processes.

Robust public participation is critical to ensuring a full review of this nationally significant project. Accordingly, we appreciate your consideration of request this extension request.

Sincerely,

LENA GONZALEZ
Councilwoman, First District
City of Long Beach

333 West Ocean Boulevard • Long Beach, California 90802
Phone 562-570-6919 • Fax 562-570-6590
district1@longbeach.gov

GRACE ROBINSON HYDE
Chief Engineer and General Manager

September 22, 2017

Ref. Doc. No.: 4229244

Mr. Ronald Kosinski
Division of Environmental Planning
Caltrans District 7
100 South Main Street, MS 16A
Los Angeles, CA 90012

Dear Mr. Kosinski:

RDEIR Response for the I-710 Corridor Project

The Sanitation Districts of Los Angeles County (Districts) received a Recirculated Draft Environmental Impact Report (RDEIR) for the subject project on July 25, 2017. We offer the following comments:

1. Once the project reaches the preliminary design stage, please forward the project's design plans and specifications, which should incorporate the Districts' existing sewerage facilities and include details of any proposed modification, relocation or adjustment of the Districts' facilities that may be necessary to accommodate the project, to the attention of Mr. Michael Tatalovich, the Districts' Sewer Design Section Head, at the address shown above. The Districts will review the plans and specifications to provide Caltrans with detailed comments on the project's impacts to Districts' facilities. L-6-1

2. The latest I-710 Corridor project document evaluates the impacts and potential impacts of Alternatives 1, 5C, and 7. Alternative 1 is the no-build alternative which would have no impact on the Districts' Long Beach Main Pumping Plant (LBMPP) or its influent sewers. Alternatives 5C and 7 (and their various options) would have significant impacts to the LBMPP. These alternatives require relocation of the emergency generator, surge tank, discharge manifold, influent and discharge piping, and all associated electrical and instrumentation systems. The analysis of the impacts is discussed in Section 3.4, *Utility/Emergency Services*, of the document. The first paragraph of this section states that the information is based on the *South End Utility Study*. Comments on specific sections of this study follow.

3. Section 5.1.1.3 of the *South End Utility Study* discusses proposed mitigation for potential impacts to LBMPP. Exhibits 4A and 4B in Appendix 3, and Exhibit E2A present potential mitigation for the impacts of Alternatives 5C and 7, respectively, in a very conceptual nature. Extensive analysis of the influent and effluent wastewater hydraulics and electrical power distribution system would be required during design to confirm system performance. In addition, Exhibits 4A and 4B appear to show the proposed off-ramps encroaching into the area required for maintenance and operation of the existing wet well and/or the relocated surge tank. Further L-6-2

Recycled Paper

analysis and details are required to ensure that existing facilities that will remain after the proposed mitigation is not negatively impacted and that proposed facilities have adequate access. Prior to the start of design, the I-710 Corridor project proponents should initiate discussions with the Districts regarding these issues. L-6-2

4. Section 5.1.1.4 of the *South End Utility Study* acknowledges that the "old" LBMPP is a backup to the "new" LBMPP, and as such, will also require relocation/demolition for Alternatives 5C and 7. The "new" LBMPP is presently undergoing commissioning and startup. Prior to the start of design, the I-710 Corridor project proponents should initiate discussions with the Districts regarding the timing and requirements for the relocation of the "old" LBMPP. L-6-3

5. Section 5.1.1.4 of the *South End Utility Study* states that design and construction of impacted facilities at the LBMPP "may take up to 2 years". The Districts believes that design, construction, commissioning, and startup may take 5 to 7 years, before demolition of any existing facilities could begin. L-6-4

If you have any questions, please contact the undersigned at (562) 908-4288, extension 2717.

Very truly yours,

Adriana Raza
Customer Service Specialist
Facilities Planning Department

AR:ar

cc: B. Henry
M. Tatalovich

L-6-1

Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), has identified Alternative 1 (No Build) as the Preferred Alternative. Please refer to Section 1.1 of this appendix for more detail. Therefore, further coordination between Caltrans and the Sanitation Districts of Los Angeles County regarding potential impacts to Districts' facilities is no longer necessary.

L-6-2

As stated in Response to Comment L-6-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, coordination between Caltrans,Metro, and the County Sanitation Districts of Los Angeles County during final design regarding potential mitigation for the Long Beach Main Pumping Plant (LBMPP) and potential impacts to existing facilities is no longer necessary.

L-6-3

As stated in Response to Comment L-6-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, coordination between Caltrans, Metro, and the County Sanitation Districts of Los Angeles County during final design regarding relocation requirements of the LBMPP is no longer necessary.

L-6-4

It is acknowledged that the County Sanitation Districts of Los Angeles County believes that design, construction, commissioning, and startup of impacted facilities of the LBMPP may take five to seven years, not up to two years as mentioned in the RDEIR/SDEIS.

Subject: Comments Regarding Recirculated Draft Environmental Impact Report/Supplemental Draft Environmental Impact Statement for the I-710 Corridor Project

To whom it may concern,

We submit the below request and recommendation regarding the Subject I-710 Corridor Project. We will appreciate your consideration and response.

1. In recognition that commercial interests benefit most significantly from the I 710 freight corridor, we request that you consider that the Project should be funded primarily through the commercial interests which benefit most directly such as through container and shipping fees. The I 710 Freeway in the Project area largely serves commercial freight transport to and from the Ports of Los Angeles and Long Beach, experiences great degradation from the high volume of commercial heavy-duty vehicle traffic, and must be built to accommodate the freight related commercial traffic. The public cannot reasonably be expected to pay the significant portion for goods transport, especially in consideration of the significant costs to public health already borne by the people living and working in proximity of the Project area. L-7-1
2. Implement the Alternative 7 with Option 7ZE to include only Zero Emission technology and exclude Near Zero Emission technology for the following three reasons:
    a. The required zero emission technologies are most likely to be reasonably feasible and implementable before project completion. Several public and private agencies are invested intensely in implementing zero emission technologies, as demonstrated by the Cities of Long Beach and Los Angeles. Further the Gateway Cities COG and Metro concluded in the year 2013 “I-710 Project Zero-Emission Truck Commercialization Study” that zero-emission capable drayage trucks can be developed, demonstrated, validated, and moved into production by a 2025 target timeline, within seven years of the Project’s planned Final EIR. L-7-2
    b. The Option 7ZE, with significant improvements in freight transport, related technologies, and emission reductions resulting in great economic and public health benefits, will drive monumental economies of scale that will improve Southern California transportation systems and motivate other industries towards advancing technologies, such as may become implemented in the San Pedro Bay Clean Air Action Plan only if Option 7ZE is realized.

c. The technologies and methods implemented will require significant economic investment certain to greatly influence short and long term budget planning and to substantially enhance our quality of life for generations. A shorter-term investment in near zero emission technology will reduce the perceived benefits and return from a longer term and more significant investment in zero emission technology. Indeed, Port of Los Angeles tenants such as China Shipping refused to invest in newly available advanced emission reduction equipment because of recent expenditures on inferior, but previously available emission reduction equipment. Simply establishing the Zero Emission standard rather than a mix of Near Zero will provide stability in long term financial decision making and short term budgetary considerations.

L-7-2

Please feel free to contact us should you have any questions.

Anna Erneholm
Chair of the Environment and Sustainability Committee
Coastal San Pedro Neighborhood Council
cspnclive@gmail.com

This letter was approved by the CSPNC Board at the September 18, 2017 meeting.

L-7-1

Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), has identified Alternative 1 (No Build) as the Preferred Alternative. Please refer to Section 1.1 of this appendix for more detail. Therefore, funding is no longer needed for the build alternatives.

L-7-2

Caltrans and Metro thank the commenter for providing their input. The commenter's support of Alternative 7 and ZE technology is acknowledged and included in the project record. Please refer to Section 1.1 of this appendix for a discussion on the identification of the Preferred Alternative, and Section 1.3 of this appendix for additional discussion of ZE options.

Re: CITY OF COMMERCE COMMENTS ON THE I-710 CORRIDOR PROJECT RECIRCULATED DRAFT ENVIRONMENTAL IMPACT REPORT/SUPPLEMENTAL DRAFT ENVIRONMENTAL IMPACT STATEMENT – SECTION 4(f) AND 6(f) EVAULATION

Dear Mr. Kosinski:

The City of Commerce (City) has received a letter from Caltrans (dated July 18, 2017) regarding the potential temporary impacts at Bandini Park/Batres Community Center and appreciates the collaboration and cooperation with Caltrans throughout the environmental process for the I-710 Corridor Project RDEIR/SDEIS and Section 4(f) and 6(f) Evaluation. Bandini Park/Batres Community Center is a publicly owned park located at 4725 Astor Avenue in the City of Commerce, and is subject to protection under the requirements of Section 4(f). Bandini Park, is one of only four neighborhood parks in the City of Commerce.

The City has reviewed the Draft Section 4(f) Evaluation and is concerned with the proposed *de minimis* determination for the permanent use and temporary occupancy of a portion of Bandini Park/Batres Community Center. The City appreciates the inclusion of Mitigation Measure PR-16 which addresses permanent access to the easement area at Bandini Park; however, there is no mitigation measure included to address the effects of the permanent aerial easement as well as the temporary impacts to this City resource. The City would like to express continued concern about the potential temporary impacts to this important Section 4(f) resource in our community. L-8-1

Section 23 CFR 774.13(d) provides the conditions under which "temporary occupancies of land...are so minimal as to not constitute a use within the meaning of Section 4(f)." If all of the conditions in Section 774.13(d) are met, the temporary occupancy does not constitute a use. If

2535 Commerce Way • Commerce, California 90040 • (323) 722-4805 • FAX (323) 726-6231 • www.ci.commerce.ca.us

one or more of the conditions for the exception cannot be met, then the Section 4(f) property is considered used by the project even though the duration of onsite activities is temporary.

According to 23 CFR 774.13(d), temporary occupancies of land that are so minimal as to not constitute a use within the meaning of Section 4(f), the following conditions must be satisfied:

(1) Duration must be temporary, *i.e.*, less than the time needed for construction of the project, and there should be no change in ownership of the land;

(2) Scope of the work must be minor, *i.e.*, both the nature and the magnitude of the changes to the Section 4(f) property are minimal;

(3) There are no anticipated permanent adverse physical impacts, nor will there be interference with the protected activities, features, or attributes of the property, on either a temporary or permanent basis;

(4) The land being used must be fully restored, *i.e.*, the property must be returned to a condition which is at least as good as that which existed prior to the project; and

(5) There must be documented agreement of the official(s) with jurisdiction over the Section 4(f) resource regarding the above conditions.

The City believes that according to 23 CFR 774.13(d)(3), temporary construction activities will interfere with the protected activities, features, or attributes of the property on a temporary basis. Bandini Park is an important resource to the community and any permanent change to access and/or temporary disruption to the amenities provided to the community will have a negative impact to the community.

The park offers outdoor activities, such as organized youth sports in basketball, flag football, soccer, softball, volleyball, picnic shelters, playgrounds and a children's wading pool. Due to the limited number of public park facilities in the City of Commerce, any impact, temporary or permanent, to a recreational resource would constitute an impact to the community. L-8-2

A permanent easement and temporary occupancy is anticipated as a part of both Alternative 5C and 7. Caltrans would require a 0.10-acre permanent aerial easement at this park for the land area under the proposed elevated structure to allow for access, inspections, maintenance, and other purposes. A 0.11-acre temporary easement for construction staging, materials storage, parking of construction equipment and worker vehicles, and other similar activities is also required. The City would like to request a site visit with Caltrans to better understand the project components and potential impacts of Alternative 5C and 7 to the park. L-8-3

Although Caltrans indicates that impacts to Bandini Park/Batres Community Center would be temporary, any kind of work in the area will impact the activities at the baseball field and basketball courts at the west end of the park. The park is open for public recreation year-round L-8-4

and there are organized youth sports that utilize Bandini Park/Batres Community Center. The impact analysis notes that temporary closures of portions of the park would occur during construction to protect the safety of park visitors and project construction workers. As noted in the previous comment letter, the City would like to request additional information such as construction schedule and time frame/duration for construction activities in this area. L-8-4

Caltrans indicates that the closed area would be returned to public use in the same or better condition as when the area was closed off to public access. Would there be any mature vegetation or tree removal required in this area? L-8-5

Noise and Vibration: Bandini Park (Site #NB-44M2) is located between Washington Boulevard and the rail-yard to the north in the city of Commerce. Freeway traffic noise impacts have been predicted to occur under both Alternatives 5C and 7 at this park. Noise abatement has been considered for this area in the form of a soundwall. However, during construction of the elevated structure and prior to construction of the recommended soundwall, noise and vibration during construction can substantially impair the sports field related to noise and vibration impacts. The City requests Caltrans to consider noise abatement or other feasible mitigation during construction. L-8-6

To reiterate, we respectfully disagree with the proposed *de minimis* determination for the permanent use and temporary occupancy of a portion of Bandini Park/Batres Community Center and request further evaluation of this determination. Please direct any questions and coordination efforts to Maryam Babaki at (323) 722-4805 Ext. 2337 or Matt Marquez at (323) 722-4805 Ext. 2349. L-8-7

Sincerely,

Fernando Mendoza

Interim City Administrator

This page intentionally left blank

L-8-1

As required under Section 4(f) of the United States Department of Transportation Act, Caltrans has coordinated with the City of Commerce regarding the proposed *de minimis* impact determination and temporary occupancy exception for Bandini Park under the build alternatives. This coordination has included a discussion of measures that would minimize harm to the property, which would include design refinements of the build alternatives that would minimize the permanent aerial easement and Temporary Construction Easement (TCE) area at Bandini Park, or would avoid the TCE in the park if feasible. Based on the coordination that has taken place with the City to date, the need for the TCE within Bandini Park has been avoided in the design of the build alternatives. However, Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), has identified Alternative 1 (No Build) as the Preferred Alternative. Please refer to Section 1.1 of this appendix for more detail.

L-8-2

The Preferred Alternative does not result in a temporary occupancy or use of Bandini Park. Please refer to Response to Comment L-8-1 for further details.

L-8-3

The Preferred Alternative does not result in a temporary occupancy or use of Bandini Park. Please refer to Response to Comment L-8-1 for further details.

L-8-4

The Preferred Alternative does not result in a temporary occupancy or use of Bandini Park. Please refer to Response to Comment L-8-1 for further details.

L-8-5

The Preferred Alternative does not result in a temporary occupancy or use of Bandini Park. Please refer to Response to Comment L-8-1 for further details.

L-8-6

As discussed in Section 3.14.12 of the RDEIR/SDEIS, noise abatement criteria (NAC) were used to determine when a traffic noise impact would result from the build alternatives requiring noise abatement in the form of a soundwall. Noise abatement requirements are specific to long-term traffic noise impacts, and are not required for short-term construction noise impacts.

As discussed in Section 3.24.3.14 of the RDEIR/SDEIS, during construction of the build alternatives, noise from construction activities may occasionally dominate the noise environment in the immediate project area. Should a build alternative be selected as the Preferred Alternative, construction noise would be regulated by Caltrans Standard Specifications, Section 14-8.02, “Noise Control.” These requirements state that noise levels generated during construction would be controlled and monitored and not to exceed 86 A-weighted decibels (dBA) maximum sound level (L_{max}) at 50 feet from the job site between the hours of 9:00 p.m. to 6:00 a.m.

No adverse noise impacts from construction of the build alternatives would be anticipated because construction would be conducted in accordance with the Caltrans standard specifications and would be short-term, intermittent, and the local noise environment would continue to be dominated by local traffic noise. Because short-term construction noise impacts would be minimized through compliance with Caltrans standard specifications, no mitigation measures are required for the build alternatives. However, as stated in Response to Comment L-8-1, the No Build Alternative has been selected as the Preferred Alternative and construction of the build alternatives will not occur.

L-8-7

The Preferred Alternative does not result in a temporary occupancy or use of Bandini Park. Please refer to Response to Comment L-8-1 for further details.

COUNTY OF LOS ANGELES

DEPARTMENT OF PUBLIC WORKS

"To Enrich Lives Through Effective and Caring Service"

MARK PESTRELLA, Director

900 SOUTH FREMONT AVENUE
ALHAMBRA, CALIFORNIA 91803-1331
Telephone: (626) 458-5100

REFER TO FILE: LD-4

Mr. Ronald Kosinski
Division of Environmental Planning
Department of Transportation, District 7
100 South Main Street, MS-16A
Los Angeles, CA 90012

Dear Mr. Kosinski:

DOMINGUEZ GAP AND DEFOREST TREATMENT WETLANDS IMPACTS (DGDTW) INTERSTATE 710 CORRIDOR PROJECT

Thank you for reaching out to the Los Angeles County Department of Public Works (Public Works) regarding possible impacts to improvements within the County's jurisdiction. This is in response to your letter dated July 19, 2017 (copy enclosed), outlining the I-710 project impacts on the DGDTW.

The following Public Works comments are for your consideration:

1. General Permits:

   1.1. Work within the Los Angeles County Flood Control District (LACFCD) right of way or County road right of way may require a LACFCD or County road permit, respectively. L-9-1

   1.2. Storage of construction materials within LACFCD right of way or County road right of way is prohibited unless explicitly permitted. L-9-2

   1.3. Any proposed alternative routes or detours for the trails that are anticipated to be closed for the implementation of the proposed project may require a LACFCD or County road permit depending on the proposal. A preliminary site plan depicting the proposed alternative routes or detours shall be submitted to Public Works' Land Development Division, Encroachment Permits L-9-3

and Inspection Section, to assess if a permit and corresponding traffic/pedestrian/detour control plans will be required. If so, an approved traffic/pedestrian/detour control plan will be required prior to any permit issuance. Review and approval of traffic/pedestrian/detour control plans will be coordinated through Land Development Division's Encroachment Permits and Inspection Section. Permit fees may be required. L-9-3

For County road permit information or if you have any questions, please contact Mr. Juan Sarda at (626) 458-4921 or jsarda@dpw.lacounty.gov.

2. Dominguez Gap West Basin

2.1. General

2.1.1. For RDEIR/SDEIS Alternative 7, the basin will be reduced from 13.3 acres to 9.54 acres. Given the proposed reduction of size of the west basin and the lower percolation rates as a result of the retaining wall foundation, it is very likely that the basin will no longer serve as an effective groundwater recharge facility. Caltrans/Metro should provide land of equal or greater value that provides effective groundwater recharge to replace the net loss of 3.76 acres to the LACFCD and replace any additional loss of groundwater recharge capability due to the proposed basin design features such as the retaining wall foundation. This shall be included as a mitigation in the RDEIR/SDEIS for Alternative 7. L-9-4

2.1.2. The southern basin belongs to the City of Long Beach and is not considered part of the Dominguez West Basin. L-9-5

2.2. Basin Design Considerations for Alternative 7

2.2.1. Provide an access road to the bottom of the basin. L-9-6

2.2.2. Vandalism (graffiti) will be a concern with a 40-foot-high retaining wall. Mitigations and maintenance should be addressed in the environmental documents. L-9-7

2.2.3. Replace any basin level recorder and accompanying flow recorder impacted by construction. L-9-8

2.2.4. Existing storm drain outflow pipes connected to the Long Beach basin would need to be relocated to outfall elsewhere. Direct storm drain flows are generally not permitted into spreading grounds. L-9-9

2.2.5. For the proposed basin, the relative narrowness of the southern portion and the proposed retaining wall for the proposed freight corridor and LA River channel would make the facility difficult to maintain. Caltrans/Metro should provide an alternative to provide adequate maintenance access for the water conservation basin. L-9-10

3. DeForest Market Street Basin

3.1. There is an existing conduit connection under North Long Beach Boulevard that connects the northern and southern DeForest basins. Storm flows are ultimately directed to the Market Street Pump Station, which discharges to the Los Angeles River. The proposed reconstruction and construction staging should ensure that storm flows can still pass from the north basin to the south basin. If storm flows are restricted from passing, the northern basins have no other outlet and could potentially flood the adjacent neighborhoods to the east. Additionally, the area taken up by the staging could potentially reduce the available storage provided by the existing basins. L-9-11

Please provide more detailed plans and/or drawings to define the Temporary Construction Easement (TCE) for reconstructing North Long Beach Boulevard. The TCE plan should avoid the impacts stated above and/or provide analysis showing the flood capacity of the basin is maintained during storms. L-9-12

3.2. Public Works needs vehicular access to the Market Street Pump Station at all times via the Los Angeles River east side maintenance access road between Long Beach Boulevard and Del Amo Boulevard. The RDEIR/SDEIS should disclose how access will be maintained. L-9-13

If you have any questions regarding comments 2 and 3 above, please contact Mr. Ryan Butler at (626) 458-4331 or rbutler@dpw.lacounty.gov.

If you have any other questions or require additional information, please contact Mr. Toan Duong of Land Development Division at (626) 458-4910 or duong@dpw.lacounty.gov.

Very truly yours,

MARK PESTRELLA
Director of Public Works

Making Conservation a California Way of Life.

July 19, 2017

Mark Pestrella, Director
Los Angeles County Department of Public Works
900 South Fremont Avenue
Alhambra, CA 91803

Dear Mr. Pestrella,

This letter is regarding the proposed impacts on the Dominguez Gap and DeForest Treatment Wetlands as a result of the Interstate 710 (I-710) Corridor Project (project). Under Section 4(f) of the United States Department of Transportation Act of 1966, these properties are considered a Section 4(f) resource. The project would require the permanent incorporation and temporary removal of land from the West Basin, and an expanded aerial easement and a temporary construction easement (TCE) on the DeForest Market Street Basin.

The project proposes to construct improvements from Ocean Boulevard in the City of Long Beach to State Route 60 (SR-60) in the City of Los Angeles. A Draft Environmental Impact Report/Environmental Impact Statement (EIR/EIS) was prepared for the project in 2012, which included the analysis of four build alternatives. Subsequent to public circulation of the Draft EIR/EIS, in response to new information and comments received from the public, a revised set of build alternatives were developed. The revised build alternatives under consideration include Alternative 5C (Modernize the I-710 Freeway) and Alternative 7 (Add Clean-Emission Freight Corridor [Truck-Only Lanes] Along I-710). A No Build Alternative is also under consideration.

As shown on **Figure 1**, Alternative 7 would require the removal of the entire West Basin (13.3 acres). However, only 5.4 acres along the western edge of the existing basin would be permanently incorporated into the transportation facility. The remaining 7.9 acres of the basin would be restored in the same location following construction. The temporary removal and restoration of this 7.9-acre area would constitute a temporary occupancy of this portion of the basin.

An additional 1.64 acres outside of the existing basin would also be added to the restored basin area, for a total basin area of 9.54 acres. Therefore, Alternative 7 would result in an overall net loss of 3.76 acres of the existing basin area, which would constitute a permanent use of this portion of the basin. Recreational trails around the basin would be restored following construction.

While the basin would be reduced in size from 13.3 acres to 9.54 acres, the new basin would serve a similar function as the existing basin, and recreational activities would still be available on the property. Temporary closures of the recreational trails around the basin would be required during construction. However, because the recreational trails around the basin would be restored following construction, the permanent use and temporary occupancy of a portion of the basin is not expected to adversely affect the activities, features, and attributes that qualify the resource for protection under Section 4(f).

The build alternatives would require the construction of a wider bridge over the DeForest Market Street Basin at North Long Beach Boulevard, requiring an expanded bridge and aerial easement that is 0.95 acre wider than the existing bridge and easement. The proposed bridge and aerial easement would not be substantially wider than the existing bridge and easement, and would therefore not be expected to result in substantial visual impacts. The wider aerial easement would not interfere with any of the activities, features, or attributes of any recreational activities beneath the bridge, and would not result in any proximity impacts that would substantially impair the resource. Therefore, the wider aerial easement would not constitute a use under Section 4(f).

The build alternatives would require 0.95 acre of the DeForest Market Street Basin for a TCE during project construction, which would constitute a temporary occupancy of a portion of the basin. The TCE area would be required to construct the wider bridge over the basin at North Long Beach Boulevard, and to restore a maintenance access road to Del Amo Boulevard. The basin would be used for construction staging, materials storage, parking of construction equipment and worker vehicles, light grading, and other similar activities. The construction activities in the TCE area would not result in any permanent adverse physical impacts in that area, and the temporary occupancy would not interfere with the protected activities, features, or attributes of that portion of the basin on a temporary or permanent basis. The area used for the TCE would be returned to the Los Angeles County Department of Public Works (LACDPW) in a condition which as at least as good as that which existed prior to the project. Because impacts in the basin would be temporary, the temporary occupancy of a portion of the basin is not expected to adversely affect the activities, features, and attributes that qualify the basin for protection under Section 4(f).

With implementation of mitigation measures, the permanent use and temporary occupancy of a portion of the Dominguez Gap and DeForest Treatment Wetlands would not adversely affect the activities, features, and attributes of the 4(f) resource. Therefore, Caltrans intends to make a *de minimis* determination for the permanent use and temporary occupancy of a portion of the Dominguez Gap and DeForest Treatment Wetlands.

Caltrans is initiating consultation and coordination with your agency to determine use and ensure that all reasonable measures to minimize harm have been considered. In addition, because Caltrans intends to make a *de minimis* determination for the permanent use and temporary occupancy of a portion of the Dominguez Gap and DeForest Treatment Wetlands, Caltrans is seeking your written concurrence that the project would not adversely affect the activities, features, and attributes that qualify the properties for protection under Section 4(f).

The revised build alternatives, Alternative 5C and Alternative 7, have been evaluated in a joint Recirculated Draft Environmental Impact Report/Supplemental Draft Environmental Impact Statement (RDEIR/SDEIS). The RDEIR/SDEIS, which includes the Section 4(f) evaluation, will be circulated for a 60-day public review period. The United States Department of Transportation Act mandates a minimum of 45 days for receipt of comments regarding Section 4(f) impacts. If comments are not received from your agency by October 9, 2017, a lack of objection may be assumed and the process may proceed to a final evaluation.

The Section 4(f) Evaluation is found in Appendix B of the RDEIR/SDEIS and may be viewed on July 21, 2017 at the following website:

http://www.dot.ca.gov/d7/env-docs/

If you should have any questions or would like to arrange a meeting to discuss further, please contact Jason Roach of my staff at (213) 897-0357 or jason.roach@dot.ca.gov.

Sincerely,

RON KOSINSKI
Deputy District Director, Division of Environmental Planning
Caltrans District 7

enclosures

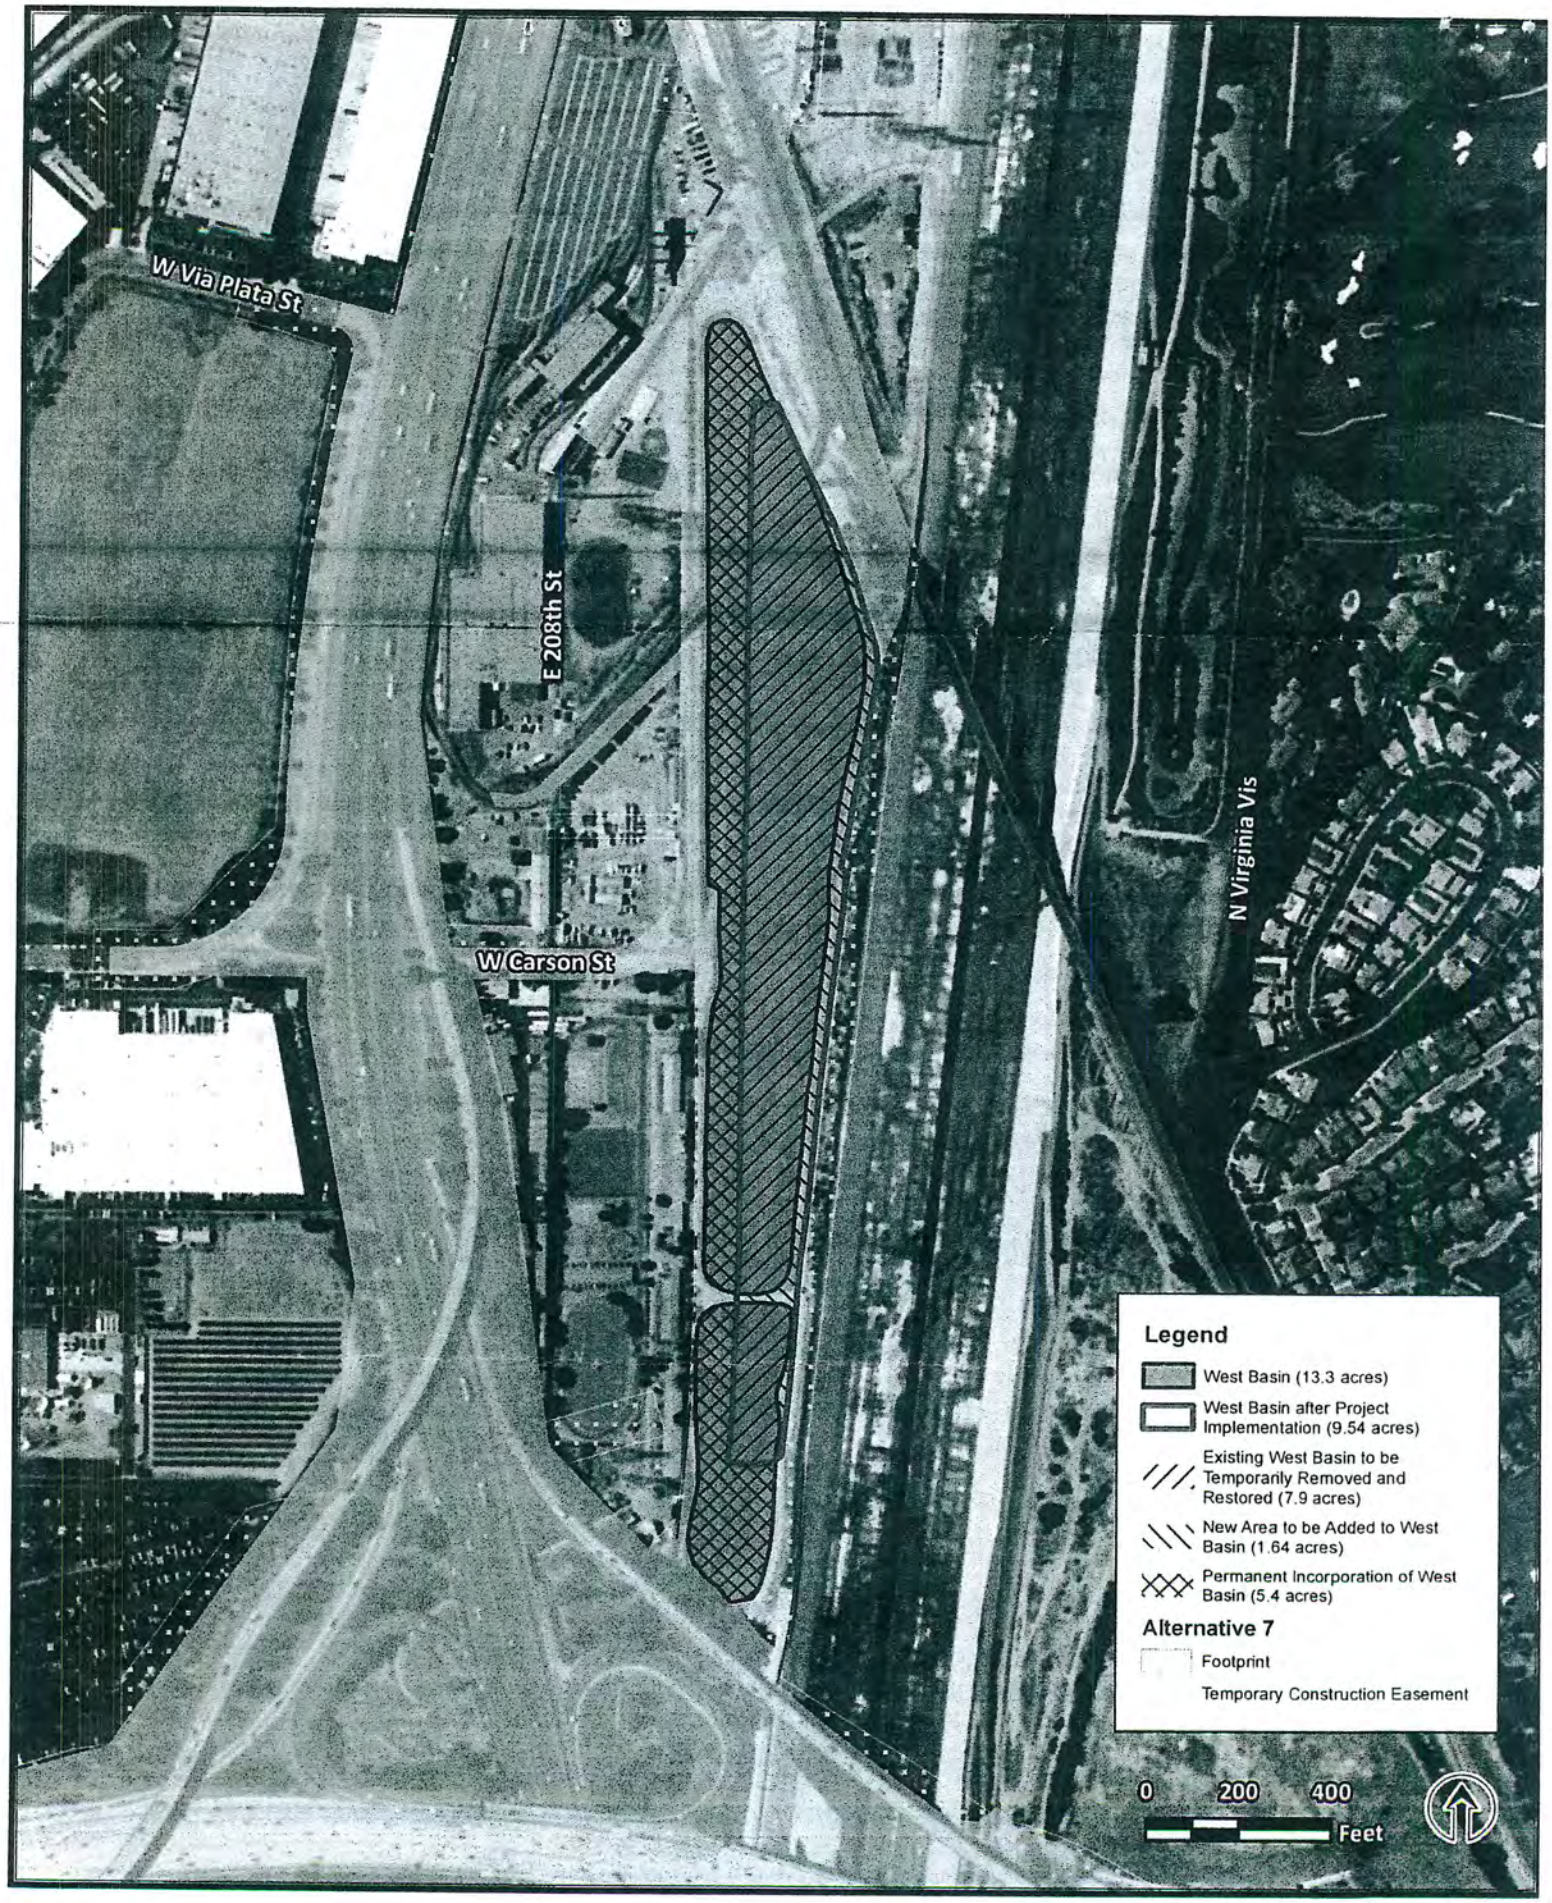

FIGURE 1. Impacts on the Dominguez Gap Wetlands West Basin (ALTERNATIVE 7)

L-9-1

Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), has identified Alternative 1 (No Build) as the Preferred Alternative. Please refer to Section 1.1 of this appendix for more detail. Therefore, an encroachment permit from the Los Angeles County Flood Control District is not necessary.

L-9-2

As discussed in Response to Comment L-9-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, encroachment permits from the Los Angeles County Flood Control District and County of Los Angeles are not necessary.

L-9-3

As discussed in Response to Comment L-9-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, , approval of encroachment permits and street construction permits, street closures and rerouting, freeway agreements, and associated improvements in the public right-of-way are not required from the County of Los Angeles.

L-9-4

LADPW's concern regarding the impacts of Alternative 7 to the Dominguez Gap West Basin is acknowledged. However, the No Build Alternative has been identified as the Preferred Alternative and will not result in impacts to the Dominguez Gap West Basin.

L-9-5

It is acknowledged that the southern basin belongs to the City of Long Beach and is not considered part of the Dominguez Gap West Basin.

L-9-6

Please refer to Response to Comment L-9-4 regarding impacts to the Dominguez Gap West Basin.

L-9-7

Please refer to Response to Comment L-9-4 regarding impacts to the Dominguez Gap West Basin.

L-9-8

Please refer to Response to Comment L-9-4 regarding impacts to the Dominguez Gap West Basin.

L-9-9

Please refer to Response to Comment L-9-4 regarding impacts to the Dominguez Gap West Basin.

L-9-10

Please refer to Response to Comment L-9-4 regarding impacts to the Dominguez Gap West Basin.

L-9-11

As discussed in Response to Comment L-9-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there will be no impact to the DeForest Market Street Basin as a result of construction or construction staging.

L-9-12

As discussed in Response to Comment L-9-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, more detailed plans to define the TCE for reconstructing North Long Beach Boulevard will not need to be provided to LADPW.

L-9-13

As discussed in Response to Comment L-9-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there will be no impact to vehicular access to the Market Street Pump Station via the Los Angeles River east side maintenance access road between Long Beach Boulevard and Del Amo Boulevard.

COUNTY OF LOS ANGELES

DEPARTMENT OF PUBLIC WORKS

"To Enrich Lives Through Effective and Caring Service"

MARK PESTRELLA, Director

900 SOUTH FREMONT AVENUE
ALHAMBRA, CALIFORNIA 91803-1331
Telephone: (626) 458-5100
http://dpw.lacounty.gov

ADDRESS ALL CORRESPONDENCE TO:
P.O. BOX 1460
ALHAMBRA, CALIFORNIA 91802-1460

October 5, 2017

IN REPLY PLEASE
REFER TO FILE: LD-4

Mr. Ronald Kosinski
Division of Environmental Planning
Department of Transportation, District 7
100 South Main Street, MS-16A
Los Angeles, CA 90012

Dear Mr. Kosinski:

LOS ANGELES RIVER AND RIO HONDO (LARIO) TRAILS
INTERSTATE 710 CORRIDOR PROJECT

Thank you for reaching out to the Los Angeles County Department of Public Works (Public Works) regarding possible impacts to improvements within the County's jurisdiction. This is in response to your letter dated July 19, 2017 (copy enclosed), outlining the I-710 project impacts on LARIO trails.

The following Public Works comments are for your consideration:

1. General Permits:

   1.1. Work within the Los Angeles County Flood Control District (LACFCD) right of way or County road right of way may require a LACFCD or Public Works Road permit, respectively. L-10-1

   1.2. Storage of construction materials within LACFCD right of way or County road right of way is prohibited unless explicitly permitted. L-10-2

   1.3. Any proposed alternative routes or detours for the trails that are anticipated to be closed for the implementation of the proposed project may require a LACFCD or County road permit depending on the proposal. A preliminary site plan depicting the proposed alternative routes or detours shall be submitted to Public Works' Land Development Division, Encroachment Permits L-10-3

and Inspection Section, to assess if a permit and corresponding traffic/pedestrian/detour control plans will be required. If so, an approved traffic/pedestrian/detour control plan will be required prior to any permit issuance. Review and approval of traffic/pedestrian/detour control plans will also be coordinated through Land Development Division's Encroachment Permits and Inspection Section. Permit fees may be required. L-10-3

For County road permit information or if you have any questions, please contact Mr. Juan Sarda at (626) 458-4921 or jsarda@dpw.lacounty.gov.

2. LARIO Trails

2.1. During construction, all trails along LARIO Channel shall remain open to Public Works maintenance personnel and provide necessary vehicular access to the channels for flood control operation and maintenance. Please provide a detailed access plan to Public Works and include construction alternatives that provide access along these trails in the Recirculated Environmental Impact Report. L-10-4

If you have any questions regarding comment 2 above, please contact Mr. Ryan Butler at (626) 458-4331 or rbutler@dpw.lacounty.gov.

If you have any other questions or require additional information, please contact Mr. Toan Duong of Land Development Division at (626) 458-4910 or duong@dpw.lacounty.gov.

Very truly yours,

MARK PESTRELLA
Director of Public Works

ANTHONY E. NYIVIH
Assistant Deputy Director
Land Development Division

Making Conservation a California Way of Life.

July 19, 2017

Mark Pestrella, Director
Los Angeles County Department of Public Works
900 South Fremont Avenue
Alhambra, CA 91803

Dear Mr. Pestrella,

This letter is regarding the proposed impacts on the Los Angeles River and Rio Hondo Trails (LARIO Trail) as a result of the Interstate 710 (I-710) Corridor Project (project). Under Section 4(f) of the United States Department of Transportation Act of 1966, this park property is considered a Section 4(f) resource. The project would require temporary closures of portions of the trails during construction.

The project proposes to construct improvements from Ocean Boulevard in the City of Long Beach to State Route 60 (SR-60) in the City of Los Angeles. A Draft Environmental Impact Report/Environmental Impact Statement (EIR/EIS) was prepared for the project in 2012, which included the analysis of four build alternatives. Subsequent to public circulation of the Draft EIR/EIS, in response to new information and comments received from the public, a revised set of build alternatives were developed. The revised build alternatives under consideration include Alternative 5C (Modernize the I-710 Freeway) and Alternative 7 (Add Clean-Emission Freight Corridor [Truck-Only Lanes] Along I-710). A No Build Alternative is also under consideration.

As shown in **Figure 1**, the build alternatives would be constructed in proximity to the LARIO Trail, and would require short-term, temporary closures of trail crossings at I-710 and local streets during construction, which would constitute the temporary occupancy of a portion of the trail. There are numerous trail crossings in the study area, starting from East Ocean Boulevard in the south to Slauson Avenue in the north, and the temporary closures would occur along several local streets in between these southern and northern limits. These closures would be temporary and may range from a few days to several months in duration, depending on the project construction activities at a given trail crossing. Alternative/detour routes for the trails would be provided whenever a closure is needed.

The segments of the LARIO Trail at the affected crossings of I-710 and the local streets would be returned to their original condition and/or incorporate enhancements at the completion of construction, and would be reopened to public use. Because impacts on the trails would be temporary during construction, and measures

to minimize harm to the trail would be implemented, the temporary occupancy of a portion of the trail is not expected to adversely affect the activities, features, and attributes that qualify the trail for protection under Section 4(f).

With implementation of mitigation measures, the temporary occupancy of a portion of the LARIO Trail would not adversely affect the activities, features, and attributes of the 4(f) resource. Therefore, Caltrans intends to make a *de minimis* determination for the temporary occupancy of a portion of the LARIO Trail.

Caltrans is initiating consultation and coordination with your agency to determine use and ensure that all reasonable measures to minimize harm have been considered. In addition, because Caltrans intends to make a *de minimis* determination for the temporary occupancy of a portion of the LARIO Trail, Caltrans is seeking your written concurrence that the project would not adversely affect the activities, features, and attributes that qualify the property for protection under Section 4(f).

The revised build alternatives, Alternative 5C and Alternative 7, have been evaluated in a joint Recirculated Draft Environmental Impact Report/Supplemental Draft Environmental Impact Statement (RDEIR/SDEIS). The RDEIR/SDEIS, which includes the Section 4(f) evaluation, will be circulated for a 60-day public review period. The United States Department of Transportation Act mandates a minimum of 45 days for receipt of comments regarding Section 4(f) impacts. If comments are not received from your agency by October 9, 2017, a lack of objection may be assumed and the process may proceed to a final evaluation.

The Section 4(f) Evaluation is found in Appendix B of the RDEIR/SDEIS and may be viewed on July 21, 2017 at the following website:

http://www.dot.ca.gov/d7/env-docs/

If you should have any questions or would like to arrange a meeting to discuss further, please contact Jason Roach of my staff at (213) 897-0357 or jason.roach@dot.ca.gov.

Sincerely,

RON KOSINSKI
Deputy District Director, Division of Environmental Planning
Caltrans District 7

Subject: I-710 Corridor Project Feedback

From: Jane Hauptman
Organization: City of Los Angeles Department of Water and Power
Phone: (213) 367 - 0968
Mailing Address: 111 N. Hope Street, Room 1044 City, State: Los Angeles
Zip: 90012
Comment/Question:

The Los Angeles Department of Water and Power (LADWP) appreciates the opportunity to review the Administrative Draft RDEIR/SDEIS for the I-710 Corridor Project. LADWP, the nation's largest municipal utility, provides power and water to more than four million residents and businesses in the City of Los Angeles. Our mission is to provide safe, reliable, affordable services in an environmentally sustainable manner.

The I-710 Corridor Project Administrative RDEIR/SDEIS and associated technical studies were received via email from LSA on behalf of the Metro Projects Director on March 29th, 2017. The following excerpts were provided for LADWP review:
Chapter 2, Alternatives
Chapter 3.1, Land Use
Chapter 3.4, Utilities and Emergency Services Chapter 3.6, Visual Chapter 3.12, Hazardous Waste Draft Relocation Impact Report North, Central, and South Utility Studies

The project extends along the I-710 corridor from East Los Angeles (60 Freeway) to the Port of Long Beach. Most of LADWP's Power System input has previously been incorporated into the above documents. Please see the following for additional items to address:

Chapter 2, Alternatives

1) Page 2-16, Table 2.3.1, Local Interchange….,

General Comment: There are a number of road widenings and various proposed crossings across the LA River that may impact LADWP. Plans will need to be submitted and reviewed on a case-by-case basis. L-11-1

Location, B-30. Firestone Blvd. (City of South Gate)
- Reconstruction of Firestone Blvd. interchange, including entrance and exit ramps.
- Reconstruction of Firestone Blvd., including the freeway overcrossing and bridge over the Los Angeles River, between Rayo Ave., and National Ave.

Comments: LADWP access to patrol roads and towers on the north and south side of Firestone Ave. shall remain accessible at all times during construction. Per Figure 2.3.6, B30-Firestone Blvd, LADWP's access north of Firestone Blvd. appears to be affected/blocked by proposed southbound off ramp. Towers H105 and H106 are not accessible from the far north due to a railroad trestle. This issue needs to be addressed. L-11-2

Location, B-31. Florence Ave. (City of Bell)
- Reconstruction of Florence Ave., including the freeway overcrossing and bridge over the Los Angeles River, between Walker Ave. and Eastern Ave.

Comment: LADWP access to patrol roads and towers on the north and south side of Florence Ave. shall remain accessible at all times during construction. L-11-3

Location, B-32. Clara St. (City of Bell Gardens and City of Cudahy)

- Reconstruction of the Clara St. overcrossing to accommodate wider freeway section.

Comment: LADWP access to patrol roads and towers on the north and south side of Clara St. shall remain accessible at all times during construction. L-11-4

Location, B-36. Atlantic/Bandini Blvds (City of Bell and City of Vernon).(City of Bell)

- Reconstruction and realignment of Atlantic Blvd. between the Los Angeles River and the 26th St. overcrossing.

Comment: LADWP access to patrol roads and towers on the north and south side of Atlantic Blvd. east of Los Angeles River shall remain accessible at all times during construction. L-11-5

2) Page 2-18,

- Reconstruction of LAJ Railway Laguna Line underpass at I-710, in Bell and Vernon to accommodate the wider freeway, and an approximate one mile long section of adjacent rail displaced be freeway widening.

Comment: It is unclear exactly where this underground crossing and one mile long section of adjacent rail displaced is located. The undercrossing south of Atlantic Blvd. and one mile of displaced tracks could affect LADWP. Clarification will be required. L-11-6

3) Page 2-53, Table 2.3.3, Local Interchange….,

No. 5C-6. Slauson Ave.

- Reconstruction of Slauson Ave. Atlantic Blvd. between the Los Angeles River and the 26th St. overcrossing.

Comment: LADWP access to patrol roads and towers on the north and south side of Slauson Ave. east of Los Angeles River shall remain accessible at all times during construction. On Figure 2.3-6, per Figure 5C6-Slauson Ave, LADWP access to the north and south of Slauson Ave appears to be affected/blocked by proposed reconstruction. This issue needs to be addressed. L-11-7

North Utility Study

North Segment, I-710 Final Draft Preliminary Strategies Report Volume 1 9-13-2016

4.3.2 Description of Major LADWP Facilities within Project Corridor

1) Page 30, Conflict N2102. A set of two circuit 230 kV 287 kV transmission lines…"

Comment:

There are two (2) 287 kV LADWP lines. See reference to Drawings below. Tables and other references to these lines should be updated throughout. L-11-8

4.4.2 Description of Major MWD Facilities within Project Corridor

1) Page 44, Conflict No. 3201, "….temporary construction easement would be needed from LADWP for construction access and activities within their existing transmission corridor."

Comments:

a) There is a conceptual approval by LADWP for a City of South Gate park at this location, known as RMC Urban Orchard Development (P-100774). L-11-9

b) The temporary construction easement request will require adequate time for review and comments. Drawings MWD construction and construction access will require LADWP review and approval. Formal access routes should be documented for future use. L-11-10

2) Page 44. The undergrounding of SCE lines via directional boring under LADWP transmission line right of ways should be subject to LADWP review and approval. L-11-11

North Segment, I-710 Final Draft Preliminary Strategies Report Volume 2 9-13-2016

1) Major Utility Crossing Matrix –Build Alternative 5C, 7 Conflict No. 2102

Comment:

There are two (2) 287 kV LADWP lines. See reference to Drawings below. Tables and other references to these lines should be updated throughout. L-11-12

2) Drawings U-06 and U-07

Comments

a) Towers 262-D1 easterly thru 261-D6, replace 230 kV with 287 kV. At Tower 262-D1, only a single 230 kV 287 kV shown is line. Same with Tower 261-D6. Between towers there are 2 lines shown. The presentation varies. SCE shows 1 line between towers. The “proposed red tower and lines” shown on U-06 and U-07 have not been approved by LADWP.

b) The northern overhead line (Laguna-Velasco 230 kV) between Tower M2 T3 and Tower H-103 is from SCE right of way to LADWP Tower H-103. The “proposed red tower and lines” shown on U-06 and U-07 have not been approved by LADWP. L-11-13

c) The proposed Southern Ave. loop crosses into LADWP right of way. L-11-14

Central Utility Study

Appendix F2-Utility Plans Alt7

1) Drawing U-39 Set

Comment:

The LADWP overhead transmission line is shown as: (10905) DWP 287 kV Pwr. This north-south transmission line is 230 kV L-11-15

2) Page 44, reference to directional boring

Comment:

The undergrounding of SCE lines via directional boring should be subject to LADWP review and approval. L-11-16

For any questions regarding the above comments, please contact Ms. Jane Hauptman of my staff at (213) 367-0968 or at jane.hauptman@ladwp.com.

*You received this message because Jane Hauptman submitted feedback regarding the I-710 Corridor Project.

Regards,

System Administrator

L-11-1

Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), has identified Alternative 1 (No Build) as the Preferred Alternative. Please refer to Section 1.1 of this appendix for more detail. Therefore, it is not necessary for Caltrans and Metro to submit final design plans to the City of Los Angeles Department of Water and Power.

L-11-2

Should a build alternative be selected as the Preferred Alternative, with implementation of Measure US&E-2 in Section 3.4.3 of the RDEIR/SDEIS, potential conflicts of the build alternatives related to maintenance access would be resolved in consultation with the LADWP. However, as stated in Response to Comment L-11-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, the patrol road on the north and south sides of Firestone Boulevard will not be blocked.

L-11-3

Please refer to Response to Comment L-11-2 regarding LADWP access to patrol roads and towers.

L-11-4

Please refer to Response to Comment L-11-2 regarding LADWP access to patrol roads and towers.

L-11-5

Please refer to Response to Comment L-11-2 regarding LADWP access to patrol roads and towers.

L-11-6

The reconstruction of the LAJ Railway Laguna Line and associated rail relocation under the Alternative 5C could be found on sheet 20 of 23 of Appendix O-1, Concept Plans, of the RDEIR/SDEIS. Please also refer to Response to Comment L-11-1 regarding the need to submit final design plans to the City of Los Angeles Department of Water and Power.

L-11-7

Please refer to Response to Comment L-11-2 regarding LADWP access to patrol roads and towers.

L-11-8

Section 3.4.2.2 of the RDEIR/SDEIS includes the correct information regarding Conflict N2102, stating that this conflict involves “a set of two circuit 287.5-kilovolt overhead lines (N2102) crossing I-710 just south of Firestone Ave…” Although the utility studies prepared in support of the RDEIR/SDEIS will not be updated at this time, as stated in Response to Comment L-11-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, it is not necessary for this information to be reconfirmed and updated in detailed design plans as the design progresses.

L-11-9

The South Gate Urban Orchard is listed as Project ID No. LD-90 in Table 3.25-1 in Section 3.25.3 of the RDEIR/SDEIS, and Caltrans and Metro have been coordinating with the City of South Gate regarding this proposed facility. As discussed in Section 3.4.2.2, an MWDSC 79-inch water line (N3201) located within the existing electrical transmission corridor, which crosses I-710 south of Firestone Avenue, within the City of South Gate, is located under the proposed Alternative 7 footprint. It would not be within direct physical conflict with the proposed improvements under Alternative 5C, and, should Alternative 5C be selected as the Preferred Alternative, would be protected in place .

L-11-10

Please refer to Response to Comment L-11-2 regarding LADWP access to patrol roads and towers.

L-11-11

As stated in Response to Comment L-11-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, it is no longer necessary for Caltrans and Metro to coordinate with LADWP regarding any undergrounding of SCE lines via directional boring under LADWP transmission line right-of-way.

L-11-12

Please refer to Response to Comment L-11-8 regarding conflicts with major utilities.

L-11-13

Please refer to Response to Comment L-11-8 regarding conflicts with major utilities.

L-11-14

Please refer to Response to Comment L-11-8 regarding conflicts with major utilities.

L-11-15

Please refer to Response to Comment L-11-8 regarding conflicts with major utilities.

L-11-16

Please refer to Response to Comment L-11-11 regarding the need for LADWP review and approval.

This page intentionally left blank

City of Long Beach
Working Together to Serve

Memorandum

L-12

Date: October 9, 2017

To: Ron Kosinski, Deputy Director, Environmental Planning Division, Caltrans District 7

From: Marie Knight, Director, Department of Parks, Recreation and Marine

Subject: Comments on Proposed Impacts on Cesar E. Chavez Park, Drake/Chavez Greenbelt, Coolidge Park, Los Cerritos Park, Cressa Park and Wrigley Greenbelt from Interstate 710 Corridor Project

On July 27, the City of Long Beach received correspondence from Caltrans, who is currently evaluating alternatives for the Interstate 710 Corridor Project (Project). In this letter, Caltrans identified the Cesar E. Chavez Park and the Drake/Chavez Greenbelt as Section 4(f) resources that are managed by the Department of Parks, Recreation and Marine (PRM) that would be permanently impacted by the proposed 710 Realignment Project alternatives. There are significant land use, operational, and programmatic impacts. The City's comments on these impacts are outlined below.

Overall Comments

1. In 2002, the Long Beach City Council adopted Ordinance No. C-7826, which is incorporated into the City Municipal Code Section 21.35.205, requiring: "*Any conversion of park land must be replaced on amenity for amenity basis on at least a two to one (2:1) ratio. One (1) acre of replacement land shall be located in the park service area where the land was converted and an additional acre of replacement land shall be located in a park service area needing park land as determined by the recreation commission."* This would require a 2:1 replacement of publicly-accessible parkland for the acres lost, with at least 50 percent to be located in the surrounding park service area. This applies to all permanent park impacts resulting from the I710 Project. L-12-1
2. Removal and addition of park area shall require a design of the entire consistent with adopted City plans and codes, with input from the community, to determine the site layout, park amenities, buffer between the park and freeway, parking, ADA access, fencing, signage, neighborhood connection, etc. L-12-2
3. Many affected park parcels were acquired or improved using County, State and/or Federal grant funds. These grants carry requirements for a duration (20 years to perpetuity) that improvements or property are available to the community. Replacement of these amenities to the satisfaction of the City and grant agencies shall be required, should affected property or amenities become permanently removed. The proposed realignment impacts these properties. Any resulting replacement or other financial burden required by the grant agencies for the taking of park property for freeway use shall be mitigated at no cost or impact to the City. L-12-3
4. All permanent impacts shall require approval from the Long Beach Parks and Recreation Commission. Approval must be secured prior to final design. L-12-4

5. A City maintenance fund shall be established with funding deposited by Caltrans prior to the completion of construction. The account shall be available to the City Department of Parks, Recreation and Marine to address unforeseen maintenance issues at each affected park site due to temporary or permanent construction impacts that become apparent after construction is complete. L-12-5

Cesar E. Chavez Park Comments

1. Permanent Impacts
   1.1. The proposed realignment would move the freeway so that it is entirely west of Chavez Park. The Department is supportive of the proposed realignment, which would result in neighborhood access to existing acres of parkland not currently accessible to the public. However, in order to achieve the realignment, the freeway would require the permanent reincorporation of 2.90 acres of land from Chavez Park. In this instance, the City's municipal code would apply. In 2002, the City of Long Beach City Council adopted Ordinance No. C-7826, which is incorporated into the City Municipal Code Section 21.35.205, requires: 'Any conversion of park land must be replaced on amenity for amenity basis on at least a two to one (2:1) ratio. One (1) acre of replacement land shall be located in the park service area where the land was converted and an additional acre of replacement land shall be located in a park service area needing park land as determined by the recreation commission.' This would require a 2:1 replacement of publicly-accessible parkland for the acres lost, with at least half in the surrounding park service area of Chavez Park. L-12-6
   1.2. The proposed realignment would also impact planned linkages between Drake Park and Cesar Chavez Park. These linkage areas are currently impacted by overhead Caltrans structures. The realignment would change the locations of the structures, created impaired visibility into areas under the bridge. L-12-7
   1.3. The proposed realignment would remove park area where it exists and add park area where today there is none. This shall require a design of the new park consistent with adopted City plans and codes, with input from the community, to determine the layout of park amenities, the buffer between the park and the freeway, parking, ADA access, fencing, signage, connection to the LA River bike trail, etc. The proposed realignment also renders the existing irrigation system (including the existing irrigation lines, valves and controls, and point of connection) unusable. The irrigation system shall be replaced in its entirety, including irrigation controls that connect to the City's central irrigation system, per the required standards to the satisfaction of the Director of the Department of Parks, Recreation and Marine. L-12-8
   1.4. Many of the park parcels were acquired or improved using County, State and/or Federal grant funds. These grants carry requirements including a designated duration (20 years to perpetuity) that improvements or property are available to the community. Replacement of these amenities to the satisfaction of the City and grant agencies shall be required, should L-12-9

affected property or amenities become permanently removed. The proposed realignment impacts these properties. Any required replacement or other financial burden required by the grant agencies for the taking of park property for freeway use shall be mitigated by Caltrans, at no cost to the City. L-12-9

1.5. The realignment proposes to eliminate basketball courts that serve Cesar E. Chavez Elementary School. Any elimination of these courts shall require the replacement of these courts adjacent to the school they serve. L-12-10

2. Temporary Impacts
   2.1. A construction staging and contractor parking and access plan shall be provided and approved prior to the start of construction at the satisfaction of the Director of Parks, Recreation and Marine. L-12-11
   2.2. At no time during construction shall construction activities impact park programs, services, or budgeted revenue. If budgeted revenue is lost as a result of construction activities, it shall be provided for by Caltrans. L-12-12
   2.3. A construction equipment access plan shall be reviewed and approved by the Department of Parks, Recreation and Marine prior to the start of construction activities. Damage to underground irrigation infrastructure shall be mitigated by placement of plywood in all areas of heavy equipment ingress/egress. L-12-13
   2.4. All areas of construction shall be appropriately secured. The contractor is responsible for monitoring the site, and shall be responsible for any damage to the site caused by vandalism, and shall be responsible for any homeless clean-up and removal costs as a result of homeless activity at the site. L-12-14
   2.5. The contractor/developer shall notify the Department of Parks, Recreation and Marine 72 hours prior to the start of work. Notification shall be directed to the Superintendent of Park Maintenance. L-12-15
   2.6. If Department staff are called to the site to respond to a site issue caused by the contractor (i.e. hitting a main line, marking irrigation infrastructure, causing a significant water leak, damaged irrigation infrastructure, etc.), the contractor shall reimburse the Department for all staff time spent addressing the site issues. L-12-16
   2.7. At the conclusion of construction, the site shall be returned to the same condition in which it was found. This shall include, but is not limited to, replacement of plant material, removal of weeds, removal of trash, regrading and compacting sites. L-12-17
   2.8. Temporary basketball courts to serve Cesar E. Chavez Elementary School shall be provided adjacent to the school during construction. L-12-18
   2.9. Irrigation shall be required during construction to ensure the health of all landscaping. A temporary water meter shall be installed and all associated costs shall be paid by the contractor. L-12-19
   2.10. All other Department Parks Standard Conditions of Approval/Park Development Requirements shall apply. L-12-20

Drake/Chavez Greenbelt Comments

1. Permanent Impacts
   1.1. Certain areas shown on the map as remaining parkland are not accurately reflected because 1) it is not parkland; 2) it is not functional as parkland (is the location of a building); or 3) it does not belong to the City and likely serves another purpose for the County. There are also open space areas not listed as parkland that are affected permanently that shall remain. The map shall be revised to reflect accurate acres of remaining parkland. L-12-21
   1.2. The 3.77 acres depicted as parkland permanently used by Alternative 5C/7 is the location of a grant-required wetland. A previous State acquisition grant requires the City to provide for 4 acres of wetland in this area and thus, is not available for development for another purpose. This is also the location of the Caltrans-funded Long Beach MUST project, which also includes grant funding and associated requirements from the San Gabriel and Lower Los Angeles Rivers and Mountains Conservancy. L-12-22

2. Temporary Impacts
   2.1. A construction staging and contractor parking and access plan shall be provided and approved prior to the start of construction at the satisfaction of the Director of Parks, Recreation and Marine. L-12-23
   2.2. At no time during construction shall construction activities impact park programs, services, or budgeted revenue. If budgeted revenue is lost as a result of construction activities, it shall be provided for by Caltrans. L-12-24
   2.3. A construction equipment access plan shall be reviewed and approved by the Department of Parks, Recreation and Marine. Damage to underground irrigation infrastructure shall be mitigated by placement of plywood in all areas of heavy equipment ingress/egress. L-12-25
   2.4. All areas of construction shall be appropriately secured. The contractor is responsible for monitoring the site, and shall be responsible for any damage to the site caused by vandalism, and shall be responsible for any homeless clean-up and removal costs as a result of homeless activity at the site. L-12-26
   2.5. The contractor/developer shall notify the Department of Parks, Recreation and Marine 72 hours prior to the start of work. Notification shall be directed to the Superintendent of Park Maintenance. L-12-27
   2.6. If Department staff are called to the site to respond to a site issue caused by the contractor (i.e. hitting a main line, marking irrigation infrastructure, causing a significant water leak, damaged irrigation infrastructure, etc.), the contractor shall reimburse the Department for all staff time spent addressing the site issues. L-12-28
   2.7. At the conclusion of construction, the site shall be returned to the same condition in which it was found. This shall include, but is not limited to, replacement of plant material, removal of weeds, removal of trash, regrading and compacting sites. L-12-29

2.8. Irrigation shall be required during construction to ensure the health of all landscaping. A temporary water meter shall be installed and all associated costs shall be paid by the contractor. L-12-30

2.9. All other Department Parks Standard Conditions of Approval/Park Development Requirements shall apply. L-12-31

Coolidge Park Comments

1. Temporary Impacts
   1.1. Coolidge Park is the only park available to the community in north Long Beach, east of the I710 and shall remain open and operational during construction and shall not have a temporary easement placed on it. L-12-32
   1.2. The eastern edge of the park shall be protected from any construction impacts and have adequate fencing to separate the park activities from construction activities. L-12-33
   1.3. The park shall not be available for access to the freeway for construction activities. Any necessary access shall be located elsewhere, away from the park. L-12-34
   1.4. All other Department Parks Standard Conditions of Approval/Park Development Requirements shall apply. L-12-35

Los Cerritos Park Comments

1. Temporary Impacts
   1.1. Los Cerritos Park shall remain open and operational during construction and shall not have a temporary easement placed on it. L-12-36
   1.2. The western edge of the park shall be protected from any construction impacts and have adequate fencing to separate the park activities from construction activities. L-12-37
   1.3. The park shall not be available for access to the freeway for construction activities. Any necessary access shall be located elsewhere, away from the park. L-12-38
   1.4. All other Department Parks Standard Conditions of Approval/Park Development Requirements shall apply. L-12-39

Cressa Park Comments

1. Temporary Impacts
   1.1. There are no issues with the proposed temporary easement at the southern end of Cressa Park. L-12-40
   1.2. The contractor/developer shall notify the Department of Parks, Recreation and Marine 72 hours prior to the start of work. Notification shall be directed to the Superintendent of Park Maintenance. L-12-41
   1.3. If Department staff are called to the site to respond to a site issue caused by the contractor (i.e. hitting a main line, marking irrigation infrastructure, causing a significant water leak, damaged irrigation infrastructure, etc.), the contractor shall reimburse the Department for all staff time spent addressing the site issues. L-12-42

1.4. At the conclusion of construction, the site shall be returned to the same condition in which it was found. This shall include, but is not limited to, replacement of plant material, removal of weeds, removal of trash, regrading and compacting sites. L-12-43

1.5. All other Department Parks Standard Conditions of Approval/Park Development Requirements shall apply. L-12-44

Wrigley Greenbelt Comments

1. Temporary Impacts
   1.1. The northern and southern areas in Wrigley Greenbelt depicted as parkland temporarily used by Alternative 5C/7 is the location of a grant-funded greenbelt project to begin construction in 2018. Temporary impacts, trail connections and displacement of these amenities shall not be allowed. Any required replacement or other financial burden required by the grant agencies for the taking of park property for freeway use shall be mitigated by Caltrans, at no cost to the City. L-12-45

   1.2. The contractor/ shall notify the Department of Parks, Recreation and Marine 72 hours prior to the start of work. Notification shall be directed to the Superintendent of Park Maintenance. L-12-46

   1.3. If Department staff are called to the site to respond to a site issue caused by the contractor (i.e. hitting a main line, marking irrigation infrastructure, causing a significant water leak, damaged irrigation infrastructure, etc.), the contractor shall reimburse the Department for all staff time spent addressing the site issues. L-12-47

   1.4. At the conclusion of construction, the site shall be returned to the same condition in which it was found. This shall include, but is not limited to, replacement of plant material, removal of weeds, removal of trash, regrading and compacting sites. L-12-48

   1.5. All other Department Parks Standard Conditions of Approval/Park Development Requirements shall apply. L-12-49

Long Beach Parks Standard Conditions of Approval/Park Development Requirements

1. Standard Conditions of Approval: This is not an exhaustive list of all conditions, but a sampling of those that will likely apply in all cases to each park property. The City of Long Beach reserves the right to apply all park standard conditions and park development requirements during design and plan check.
   1.1. All permanent impacts shall require approval from the Long Beach Parks and Recreation Commission. Approval must be secured prior to final design.

   1.2. The Department of Parks, Recreation and Marine shall be routed design and construction plans for plan check. Plans, at each stage of plan check, shall be routed to the Department of Parks, Recreation and Marine. Address plans to Park Development Officer, 2760 Studebaker Road, Long Beach, CA 90815. L-12-50

1.3. Any park or beach improvements found to be damaged as a result of construction activities related to the project shall be replaced to the satisfaction of the Director of Parks, Recreation and Marine.

1.4. Prior to certificate of completion/occupancy, the following shall be formally submitted to the Department of Parks, Recreation and Marine:

1.4.1. Final as-built plans (two printed copies, one electronic PDF, and one cad file).

1.4.2. Property documentation, including but not limited to, site survey, recorded deed, final map, soils report (one electronic PDF).

1.4.3. Operations and Maintenance Manual and warranty information for all site features (one printed and one electronic PDF).

1.5. Address all documents to Park Development Officer, 2760 Studebaker Road, Long Beach, CA 90815.

L-12-50

1.6. Prior to tree planting, and installation landscaping and irrigation system, the developer shall contact the City Park Landscape Maintenance Superintendent in the Department of Parks, Recreation and Marine, at (562) 570-4879. Department staff will inspect and accept all tree and plant specimens placed prior to planting.

L-12-51

2. Landscaping & Irrigation

2.1. The irrigation control system shall be designed to City standard and connected to the City's central irrigation control system, and use Department standard irrigation products, values and pumps.

L-12-52

2.2. The landscaping design sheet shall show specific location of each plant and coverage area, and planting distance from adjacent plants.

2.3. The irrigation design sheet shall show, in addition to main lines, specific location of each lateral/drip line, valves, wires back to controllers, drip systems, headers, etc.

L-12-53

2.4. The plant palette shall be subject to Director of Parks, Recreation and Marine's review and approval prior to the issuance of a building permit.

L-12-54

2.5. Prior to tree planting, and installation landscaping and irrigation system, the developer shall contact the City Park Landscape Maintenance Superintendent in the Department of Parks, Recreation and Marine, at (562) 570-4879. Department staff will inspect and accept all tree and plant specimens placed prior to planting.

L-12-55

2.6. Prior to final inspection, the developer shall contact the City Park Landscape Maintenance Superintendent in the Department of Parks, Recreation and Marine, at (562) 570-4879, following all tree planting, landscaping, and irrigation system installation. Department staff will perform a final inspection, identify any items for a contractor punch list and will accept all tree planting, landscaping, and irrigation system placed in the park.

L-12-56

2.7. Irrigation lines shall be located in advance of accessing the area.

L-12-57

2.8. Selected trees shall not drop fruit or be susceptible to disease. All trees shall comply with State and local water restrictions and water efficiency codes.

L-12-58

2.9. All trees shall have bubblers rings and shall be mulched to diameter of 3-ft from the trunk. Mulch shall not be in contact with the tree trunk or root crown. All dead, diseased and dying trees shall be removed. L-12-59

2.10. All landscape-related piping under concrete shall be sleeved. Sand bedding of the mainline shall be installed. L-12-60

Marie Knight
City of Long Beach Department of Parks, Recreation and Marine
2760 Studebaker Road
Long Beach, CA 90815

Dear Ms. Knight,

This letter is regarding the proposed impacts on Cesar E. Chavez Park and the Drake/Chavez Greenbelt as a result of the Interstate 710 (I-710) Corridor Project (project). Under Section 4(f) of the United States Department of Transportation Act of 1966, these park properties are considered Section 4(f) resources. The project would require the permanent incorporation of land and temporary construction easements (TCE) in both of these park properties, as well as removal and replacement of the basketball courts and temporary closures in Cesar E. Chavez Park.

The project proposes to construct improvements from Ocean Boulevard in the City of Long Beach to State Route 60 (SR-60) in the City of Los Angeles. A Draft Environmental Impact Report/Environmental Impact Statement (EIR/EIS) was prepared for the project in 2012, which included the analysis of four build alternatives. Subsequent to public circulation of the Draft EIR/EIS, in response to new information and comments received from the public, a revised set of build alternatives were developed. The revised build alternatives under consideration include Alternative 5C (Modernize the I-710 Freeway) and Alternative 7 (Add Clean-Emission Freight Corridor [Truck-Only Lanes] Along I-710). A No Build Alternative is also under consideration.

As shown in **Figure 1**, the build alternatives would include relocating the existing Shoreline Drive to the west side of the park, requiring the permanent incorporation of 2.90 acres of land from Cesar E. Chavez Park, which would constitute a permanent use of a portion of the park. However, by relocating the existing Shoreline Drive that goes through the park, the build alternatives would result in a net increase of 2.99 acres in available park land, creating a contiguous and more accessible park area. The build alternatives would also require removal of the basketball courts west of Cesar Chavez Elementary School during construction of the project, which would constitute a permanent use of a portion of the park. However, the basketball courts would be replaced following construction. Because the project would result in a net benefit to the park by adding 2.99 acres of park land, and measures to minimize harm to the park would be implemented, the permanent use of a portion of the park is not expected to adversely affect the activities, features, and attributes that qualify this park for protection under Section 4(f).

As shown in **Figure 2**, the build alternatives would require permanent incorporation of a portion (approximately 3.77 acres) of the planned linkage between Drake Park and Cesar E. Chavez Park, which would constitute a permanent use of a portion of the greenbelt. While this portion of the Drake/Chavez Greenbelt would be incorporated into the project, the majority of land in the Draft Master Plan for the Drake/Chavez Greenbelt Project is outside of the limits of the project (approximately 46.23 acres would remain after project implementation). Furthermore, the proposed structures on the property are aerial structures that would not affect the continuity of the planned linkage. Therefore, the permanent use of a portion of the greenbelt is not expected to adversely affect the activities, features, and attributes that qualify the greenbelt for protection under Section 4(f).

As shown in **Figure 3**, a TCE of approximately 21.9 acres in Cesar E. Chavez Park would be required during construction of the build alternatives, which would constitute a temporary occupancy of a portion of the park (only 19 acres would be exclusively required for the TCE because 2.90 acres of the TCE area would be permanently incorporated). In addition, portions of Cesar E. Chavez Park may be temporarily closed to public access to protect the safety of park users and project construction workers, which would constitute a temporary occupancy of a portion of the park. A TCE of approximately 3.26 acres on the Drake/Chavez Greenbelt would also be required during construction of the build alternatives, which would constitute the temporary occupancy of a portion of the park.

The TCE areas in the park and greenbelt would be used for construction staging, materials storage, parking of construction equipment and worker vehicles, and other similar activities. The TCE area in Cesar E. Chavez Park includes a detour road of 0.41 acre, which would be graded and paved to allow temporary access during construction of realigned Broadway.

The temporary occupancy of approximately 19 acres in the southern portion of Cesar E. Chavez Park for a TCE during construction of the build alternatives would likely result in the removal of all or nearly all of the existing vegetation on that parcel, including mature trees and shrubs, and grass. Caltrans policy and practice are to return all areas disturbed temporarily during construction, including areas used for TCEs, to a condition as good as or better than prior to the temporary disturbance of those areas. Therefore, the construction activities in the TCE would not result in any permanent adverse physical impacts in that area, and the temporary occupancy would not interfere with the protected activities, features, or attributes of that portion of the park on a temporary or permanent basis.

With implementation of mitigation measures, the permanent use and temporary occupancy of a portion of Cesar E. Chavez Park and the Drake/Chavez Greenbelt would not adversely affect the activities, features, and attributes of the 4(f) resources. Therefore, Caltrans intends to make a *de minimis* determination for the permanent use and temporary occupancy of a portion of Cesar E. Chavez Park and the Drake/Chavez Greenbelt.

Caltrans is initiating consultation and coordination with your agency to determine use and ensure that all reasonable measures to minimize harm have been considered. In addition, because Caltrans intends to make a *de minimis* determination for the permanent use and temporary occupancy of a portion of Cesar E. Chavez Park and the Drake/Chavez Greenbelt, Caltrans is seeking your written concurrence that the project would

not adversely affect the activities, features, and attributes that qualify the properties for protection under Section 4(f).

The revised build alternatives, Alternative 5C and Alternative 7, have been evaluated in a joint Recirculated Draft Environmental Impact Report/Supplemental Draft Environmental Impact Statement (RDEIR/SDEIS). The RDEIR/SDEIS, which includes the Section 4(f) evaluation, will be circulated for a 60-day public review period. The United States Department of Transportation Act mandates a minimum of 45 days for receipt of comments regarding Section 4(f) impacts. If comments are not received from your agency by October 9, 2017, a lack of objection may be assumed and the process may proceed to a final evaluation. A copy of the letter notifying the Long Beach Unified School District of this coordination, as it is relevant to the Joint Use Agreement at Cesar E. Chavez Park, has been enclosed here.

The Section 4(f) Evaluation is found in Appendix B of the RDEIR/SDEIS and may be viewed on July 21, 2017 at the following website:

http://www.dot.ca.gov/d7/env-docs/

If you should have any questions or would like to arrange a meeting to discuss further, please contact Jason Roach of my staff at (213) 897-0357 or jason.roach@dot.ca.gov.

Sincerely,

RON KOSINSKI

Making Conservation a California Way of Life.

July 19, 2017

Marie Knight
City of Long Beach Department of Parks, Recreation and Marine
2760 Studebaker Road
Long Beach, CA 90815

Dear Ms. Knight,

This letter is regarding the proposed impacts on Coolidge Park, Los Cerritos Park, Cressa Park, and Wrigley Greenbelt as a result of the Interstate 710 (I-710) Corridor Project (project). Under Section 4(f) of the United States Department of Transportation Act of 1966, these park properties are considered Section 4(f) resources. The project would require temporary construction easements (TCE) on each of these park properties.

The project proposes to construct improvements from Ocean Boulevard in the City of Long Beach to State Route 60 (SR-60) in the City of Los Angeles. A Draft Environmental Impact Report/Environmental Impact Statement (EIR/EIS) was prepared for the project in 2012, which included the analysis of four build alternatives. Subsequent to public circulation of the Draft EIR/EIS, in response to new information and comments received from the public, a revised set of build alternatives were developed. The revised build alternatives under consideration include Alternative 5C (Modernize the I-710 Freeway) and Alternative 7 (Add Clean-Emission Freight Corridor [Truck-Only Lanes] Along I-710). A No Build Alternative is also under consideration.

As shown in **Figure 1**, the build alternatives would require the following TCEs, which would be considered a temporary occupancy of a portion of the parks:

- Approximately 0.60 acre along the eastern edge of Coolidge Park;
- Approximately 0.06 acre along the western edge of the southern portion of Los Cerritos Park; and
- Approximately 0.05 acre in the southern portion of Cressa Park.

In addition, as shown in **Figure 2**, Alternative 5C would require a TCE of 1.23 acre on the Wrigley Greenbelt at West Wardlow Road, 29th Street, and 27th Street during construction; and Alternative 7 would require a TCE on 0.75 acre in these same locations during construction, which would be considered a temporary occupancy of a portion of the greenbelt. Alternative 5C also includes adding a graded path within the greenbelt at Spring Street to connect to a pedestrian/bicycle overcrossing. Under Alternative 5C, the pedestrian/bicycle

connection would be an enhancement to the Wrigley Greenbelt. In addition, because the graded path would be used for recreation purposes and not transportation purposes, no portion of the greenbelt would be permanently incorporated into the transportation facility.

For the purposes of Section 4(f), these types of temporary occupancies would not constitute a use if five conditions listed in 23 Code of Federal Regulation (CFR) 774.13(d) would be met. Those conditions would be met for Coolidge Park, Los Cerritos Park, Cressa Park, and the Wrigley Greenbelt, as follows:

- The duration of construction in the area of the TCEs is temporary (a maximum of two years) and would be less than the total time needed to construct the entire project (approximately 10 years or more). There would be no change in the ownership of the land in the portion of the properties used as TCEs during construction of the build alternatives.
- The scope of work in the portions of the properties used as the TCEs would be minor. The properties would be used for construction staging, materials storage, parking of construction equipment and worker vehicles, and other similar activities. No grading or other substantial construction activities would take place in the portions of the properties to be used for TCEs.
- The construction activities in the TCEs would not result in any permanent adverse physical impacts in that area and would not interfere with the protected activities, features, or attributes of that portion of the properties on a temporary or permanent basis. Recreational uses in the remaining portions of the properties outside the TCE areas would continue to be available during construction. Detours would be provided around the TCE area in the Wrigley Greenbelt to ensure that connectivity along the greenbelt is not substantially affected. Therefore, the protected activities, features, or attributes of the properties would not be substantially affected during construction.
- The areas used for TCEs would be returned to the Long Beach Department of Parks, Recreation, and Marine in condition as good as or better than prior to the use of that area for a TCE.
- There must be documented agreement of the official(s) with jurisdiction over the Section 4(f) resource regarding the above conditions.

The five conditions listed in 23 CFR 774.13(d) would be met for the proposed TCEs for each of these park properties; therefore, these temporary occupancies would not constitute a use.

Caltrans is initiating consultation and coordination with your agency to determine use and ensure that all reasonable measures to minimize harm have been considered. In addition, because Caltrans intends to apply the temporary occupancy exception, Caltrans is seeking your written concurrence that the exception for temporary occupancies in 23 CFR 774.13(d) is applicable to the parks.

The revised build alternatives, Alternative 5C and Alternative 7, have been evaluated in a joint Recirculated Draft Environmental Impact Report/Supplemental Draft Environmental Impact Statement (RDEIR/SDEIS). The RDEIR/SDEIS, which includes the Section 4(f) evaluation, will be circulated for a 60-day public review period. The United States Department of Transportation Act mandates a minimum of 45 days for receipt of

comments regarding Section 4(f) impacts. If comments are not received from your agency by October 9, 2017, a lack of objection may be assumed and the process may proceed to a final evaluation.

The Section 4(f) Evaluation is found in Appendix B of the RDEIR/SDEIS and may be viewed on July 21, 2017 at the following website:

http://www.dot.ca.gov/d7/env-docs/

If you should have any questions or would like to arrange a meeting to discuss further, please contact Jason Roach of my staff at (213) 897-0357 or jason.roach@dot.ca.gov.

L-12-1

The Draft Section 4(f) Evaluation was completed in compliance with Section 4(f) of the United States Department of Transportation Act. While avoidance, minimization, mitigation, or enhancement measures are considered under Section 4(f), compliance with Ordinance No. C-78226 is not required under Section 4(f). As indicated in the comment, Ordinance No. C-78226 was incorporated into the Long Beach Municipal Code Section 21.35.205, requiring that conversion of park land be replaced at a 2:1 ratio. Title 21 of the Long Beach Municipal Code is Zoning, and Section 21.10.030, Scope, of the Code states that "to the extent provided by State or Federal law or regulation, the Zoning Regulations shall apply to all development including development by the City of Long Beach or use of property within the City, whether public or private, tidal or submerged, except the following excluded properties: A) Roadways. When dedicated as public freeways, streets, or alleys, the Zoning Regulations shall only apply to issues of dedications, improvements, reservations, signage, parkway landscaping, street trees and curb cut locations…" Therefore, the code requiring 2:1 replacement of park land is not applicable to the I-710 Corridor project. However, Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), has identified Alternative 1 (No Build) as the Preferred Alternative. Please refer to Section 1.1 of this appendix for more detail. Therefore, there will be no impacts to the activities, features, and attributes of Cesar E. Chavez Park as a result of the Preferred Alternative.

L-12-2

Cesar E. Chavez Park is the only Section 4(f) resource where the build alternatives would require the removal or addition of park area. However, as stated in Response to Comment L-12-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there will be no impacts to the Cesar E. Chavez Park as a result of the Preferred Alternative and input from the community to determine the site layout, park amenities, buffer between the park and freeway, parking, ADA access, fencing, signage, neighborhood connection, etc. would on longer be necessary.

L-12-3

Please refer to Response to Comment L-12-2 regarding impacts to Cesar E. Chavez Park.

L-12-4

Please refer to Response to Comment L-12-2 regarding impacts to Cesar E. Chavez Park.

L-12-5

Caltrans requires that all projects incorporate current construction standards into project design. However, as stated in Response to Comment L-12-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, a City maintenance fund would not be required to address unforeseen maintenance issues for the Preferred Alternative.

L-12-6

Please refer to Response to Comment L-12-1 regarding impacts to Cesar E. Chavez Park.

L-12-7

As stated in Response to Comment L-12-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there is no need to ensure that the Preferred Alternative is consist with the Drake/Chavez Greenbelt project, and that design refinements are considered, in consultation with the City of Long Beach, near the planned linkages between Drake Park and Cesar E. Chavez Park to minimize impacts on the visibility into areas under overhead Caltrans structures.

L-12-8

As stated in Response to Comment L-12-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there is no need to ensure that the Preferred Alternative is consist with the City of Long Beach Adopted Plans, Codes, Standard Conditions of Approval, and Park Development, or to state that any necessary irrigation improvements would be incorporated into the design for review and approval by the Director of the Department of Parks, Recreation and Marine.

L-12-9

As stated in Response to Comment L-12-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there is no need to ensure that the Preferred Alternative is consistent with grant agency requirements at no cost or impact to the City of Long Beach.

L-12-10

In Section 5.2 of the Draft Section 4(f) Evaluation in the RDEIR/SDEIS and in this Final EIR/EIS, should a build alternative be selected as the Preferred Alternative, Measure PR-12 would require replacement of the basketball courts in a location accessible to Cesar E. Chavez Elementary School and park visitors. However, as stated in Response to Comment L-12-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there are no impacts to the basketball courts at Cesar E. Chavez Park.

L-12-11

As stated in Response to Comment L-12-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, a construction staging and contractor parking and access plan does not need to be provided and approved by the Director of Parks, Recreation, and Marine.

L-12-12

As stated in Response to Comment L-12-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there would be no disruption to park programs, services, or budgeted revenue.

L-12-13

As stated in Response to Comment L-12-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there would be no damage to underground irrigation infrastructure during construction.

L-12-14

As stated in Response to Comment L-12-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, securing and monitoring of the construction site, as well as repairing damage caused by vandalism and addressing homeless clean-up and removal costs from homeless activity at the site will not be required.

L-12-15

As stated in Response to Comment L-12-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, notification to the Department of Parks, Recreation and Marine 72 hours prior to the start of construction work will not be required.

L-12-16

Please refer to Response to Comment L-12-5 regarding unforeseen maintenance issues during construction.

L-12-17

As stated in Response to Comment L-12-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, restoration of TCE areas will not be necessary.

L-12-18

As stated in Response to Comment L-12-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, coordination with LBUSD will no longer be necessary regarding the construction of temporary basketball courts to serve Cesar E. Chavez Elementary School during construction.

L-12-19

As stated in Response to Comment L-12-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, irrigation during construction to ensure the health of landscaping, and installation of a temporary water meter will not be required.

L-12-20

As stated in Response to Comment L-12-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, consistency with the City of Long Beach Standard Conditions of Approval and Park Development Requirements will not be required.

L-12-21

The map of the Drake/Chavez Greenbelt was created using a map of the proposed greenbelt from the *Long Beach RiverLink Plan* (February 2007, Long Beach Department of Parks, Recreation and Marine), which was the most recent map that was publicly available at the time the Draft Section 4(f) Evaluation was written. The map includes the entire 50-acre greenbelt as proposed in the Draft Master Plan.

Recreational resources protected under Section 4(f) include both current and planned publicly-owned parks and recreational areas that are shown in a master plan. Because the entire 50-acre site is shown as a recreational area in the Draft Master Plan, all of the land within the resource boundaries, including open space, buildings, and land currently owned by the County, are considered to be a part of the recreational resource under Section 4(f). According to the City of Long Beach website (http://www.longbeach.gov/pw/projects/lbmust/), a portion of the greenbelt to the south of the Shoemaker Bridge is now included within the Long Beach Municipal Urban Stormwater Treatment (LB-MUST) facility.

Based on the most currently available information on the City's website, the Drake Chavez Greenbelt and Artificial Turf Sports Field, located on an 8.7-acre portion of the 50-acre greenbelt, had a grand opening on January 20, 2018 (http://www.longbeach.gov/district1/news/drake-chavez-greenbelt-and-artificial-turf-field-grand-opening/). The following text has been added to Section 5.1 of Appendix B, Section 4(f)/6(f):

An 8.7-acre portion of the Drake/Chavez Greenbelt opened in January 20, 2018, and includes a striped artificial turf soccer field, large grass multi-use areas, landscaped open space, a pedestrian walking trail, and on-site parking spaces. This 8.7-acre portion of the greenbelt is outside the limits of the build alternatives, and no activities, features, or attributes of this area would be affected by the build alternatives.

The following revisions have been made to Section 6.5 of Appendix B, Section 4(f)/6(f):

Drake/Chavez Soccer Fields and Greenbelt Project: In ~~April 2016~~ January 2018, the City of Long Beach ~~Council approved~~ opened new soccer fields adjacent to Drake Park (Drake/Chavez Soccer Fields and Greenbelt Project), which are located on a 8.7-acre portion of the 50-acre Drake/Chavez Greenbelt shown in the *Long Beach RiverLink Plan* (City of Long Beach, 2007). The ~~proposed~~ soccer fields are outside the limits for the project, and no activities, features, or attributes would be affected by the project. There would be no changes to accessibility, and there would be no impacts related to vegetation or wildlife, as no vegetation removal or habitat disturbance would result from the build alternatives. Visual, noise, and air quality impacts would not result in substantial impairment because no severe proximity impacts at the soccer fields/greenbelt are identified in the EIR/EIS.

L-12-22

The proposed structures under the build alternatives on the Drake/Chavez Greenbelt are aerial structures that would allow for wetlands or other City of Long Beach facilities to remain beneath the structures. Therefore, the build alternatives would not conflict with the State acquisition grant requiring the City of Long Beach to provide for four acres of wetlands in this area, and the build alternatives would also be compatible with the Long Beach MUST project. While the aerial structures could require that footings be placed directly within the wetlands, should a build alternative be selected as the Preferred Alternative, these direct impact areas would be minimized to the extent feasible to ensure the build alternatives do not substantially affect the wetland areas, if these wetlands are present at the time of construction of either of the build alternatives. The aerial structures over the wetlands proposed under the build alternatives could create some shading during daylight hours; however, the shading over the wetlands would last for only a portion of the day, and this shading would likely not substantially affect the functioning of the wetlands for water quality purposes or to support wildlife. Should a build alternative be selected as the Preferred Alternative, consultation with resource agencies, permits, and mitigation may be required under the federal Clean Water Act and/or Fish and Game Code if direct or indirect impacts on these wetlands would result from the build alternatives. If the wetlands are not present at the time of construction, the build alternatives would not preclude the later implementation of the wetlands because the wetlands could be located beneath the aerial structures in the remaining area not occupied by the proposed footings. As stated

previously, because the direct impact area required for the footings would be minimized to the extent feasible, the build alternatives would not result in substantial impacts to the grant-required wetland area. However, as stated in Response to Comment L-12-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there will be no impacts to the grant-required wetland area.

L-12-23

As stated in Response to Comment L-12-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, a construction staging and equipment access plan, and contractor parking and access plan would not be required prior to the start of construction of either build alternative in the Drake/Chavez Greenbelt.

L-12-24

As stated in Response to Comment L-12-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, City of Long Beach approvals of temporary closures in the Drake/Chavez Greenbelt to ensure that the build alternatives would not disrupt park programs, services, or budgeted revenue are not required.

L-12-25

As stated in Response to Comment L-12-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, a construction staging and equipment access plan, and contractor parking and access plan would not be required prior to the start of construction of either build alternative; and appropriate measures, such as the placement of plywood in all areas of heavy equipment ingress/egress, are not necessary to prevent damage to underground irrigation infrastructure during construction of either build alternative.

L-12-26

As stated in Response to Comment L-12-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, securing and monitoring of the construction site, as well as repairing damage caused by vandalism and addressing homeless clean-up and removal costs from homeless activity at the site is not required.

L-12-27

As stated in Response to Comment L-12-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, notification of the Department of Parks, Recreation and Marine 72 hours prior to the start of construction work is not required.

L-12-28

Please refer to Response to Comment L-12-5 regarding unforeseen maintenance issues during construction.

L-12-29

As stated in Response to Comment L-12-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, restoration of the TCE area to include, but not be limited to, replacement of plant material, removal of weeds, removal of trash, regrading and compacting of the TCE area is not required.

L-12-30

As stated in Response to Comment L-12-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, irrigation during construction to ensure the health of landscaping, and installation of a temporary water meter to be installed and paid for by the construction contractor is not required.

L-12-31

As stated in Response to Comment L-12-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, consistency with the City of Long Beach Standard Conditions of Approval and Park Development Requirements is not required.

L-12-32

As required under Section 4(f) of the United States Department of Transportation Act, Caltrans has coordinated with the City of Long Beach through the preliminary design process regarding the proposed TCE at Coolidge Park. This coordination has included a discussion of measures to minimize harm to the property, which may include, but not be limited to, design refinements of the build alternatives to minimize the TCE area in the park, or to avoid the TCE in the park if feasible. As a result of this consultation, the need for a TCE at Coolidge Park was reevaluated and subsequently avoided as part of the build alternatives. As stated in Response to Comment L-12-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, Coolidge Park will not be impacted.

L-12-33

As stated in Response to Comment L-12-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, the eastern edge of Coolidge Park will not be impacted by construction and adequate fencing to separate the park activities from construction activities will not be necessary.

L-12-34

Please refer to Response to Comment L-12-33 regarding impacts to Coolidge Park.

L-12-35

As stated in Response to Comment L-12-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, consistency with the City of Long Beach Standard Conditions of Approval and Park Development Requirements is not required.

L-12-36

As required under Section 4(f) of the United States Department of Transportation Act, Caltrans has coordinated with the City of Long Beach regarding the TCE proposed under the build alternatives at Los Cerritos Park. This coordination has included a discussion of measures to minimize harm to the property, which included, but were not limited to, design refinements of the build alternatives to minimize the TCE area in the park, or to avoid the TCE in the park if feasible. As a result of this consultation, the need for a TCE for the build alternatives within Los Cerritos Park has been reevaluated and subsequently avoided. As stated in Response to Comment L-12-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, Los Cerritos Park will not be impacted.

L-12-37

As stated in Response to Comment L-12-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, the western edge of Los Cerritos Park will not be impacted by any construction impacts and fencing to separate the park activities from construction activities would not be necessary.

L-12-38

As stated in Response to Comment L-12-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, Los Cerritos Park will not be impacted by any access needs to the freeway for construction activities related to the build alternatives.

L-12-39

As stated in Response to Comment L-12-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, consistency with the City of Long Beach Standard Conditions of Approval and Park Development Requirements is not necessary.

L-12-40

The City of Long Beach states that no issues have been identified with the proposed TCE at the southern end of Cressa Park. However, during consultation with the City in 2019, the City raised objections to the TCE necessary for the build alternatives within Cressa Park. As a result of that consultation, the need for the TCE within Cressa Park was reevaluated and subsequently avoided as part of the design of the build alternatives. As stated in Response to Comment L-12-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there is no impacts from TCEs within Cressa Park as part of the No Build Alternative.

L-12-41

As discussed in the Response to Comment L-12-40, the need for a TCE within Cressa Park is not necessary. Also, please refer to Response to Comment L-12-33 regarding notification to the Department of Parks, Recreation, and Marine 72 hours before construction.

L-12-42

Please refer to Response to Comment L-12-5 regarding unforeseen maintenance issues during construction.

L-12-43

Please refer to Response to Comment L-12-40 regarding the replacement of disturbed sites post-construction.

L-12-44

As stated in Response to Comment L-12-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, consistency with the City of Long Beach Standard Conditions of Approval and Park Development Requirements is not required.

L-12-45

As required under Section 4(f) of the United States Department of Transportation Act, Caltrans has coordinated with the City of Long Beach regarding the TCE at Wrigley Greenbelt proposed under the build alternatives. This coordination has included a discussion of measures to minimize harm to the property, which included, but were not limited to, design refinements of the build alternatives to minimize the TCE area in the park, or to avoid the TCE in the park if feasible. As a result of this consultation, the need for a TCE within Wrigley Greenbelt has been reevaluated and subsequently avoided as part of the design of the build alternatives. As stated in Response to Comment L-12-1, the No Build Alternative has been selected as the Preferred

Alternative. Therefore, there are no impacts from TCEs within the Wrigley Greenbelt as part of the No Build Alternative.

L-12-46

As stated in Response to Comment L-12-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, the Wrigley Greenbelt will not be impacted, and the Department of Parks, Recreation and Marine will not need to be notified 72 hours prior to the start of work.

L-12-47

As discussed in Response to Comment L-12-45, the TCE at Wrigley Greenbelt is not necessary.

L-12-48

Please refer to Response to Comment L-12-45 regarding the replacement of disturbed sites post-construction.

L-12-49

As stated in Response to Comment L-12-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, consistency with the City of Long Beach Standard Conditions of Approval and Park Development Requirements is not necessary.

L-12-50

As stated in Response to Comment L-12-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, consistency with the City of Long Beach Standard Conditions of Approval and Park Development Requirements for all affected parks and recreation facilities is not necessary.

L-12-51

Please refer to Response to Comment L-12-50 regarding consistency with the City of Long Beach Standard Conditions of Approval and Park Development Requirements.

L-12-52

Please refer to Response to Comment L-12-50 regarding consistency with the City of Long Beach Standard Conditions of Approval and Park Development Requirements.

L-12-53

Please refer to Response to Comment L-12-50 regarding consistency with the City of Long Beach Standard Conditions of Approval and Park Development Requirements.

L-12-54

Please refer to Response to Comment L-12-50 regarding consistency with the City of Long Beach Standard Conditions of Approval and Park Development Requirements.

L-12-55

Please refer to Response to Comment L-12-50 regarding consistency with the City of Long Beach Standard Conditions of Approval and Park Development Requirements.

L-12-56

Please refer to Response to Comment L-12-50 regarding consistency with the City of Long Beach Standard Conditions of Approval and Park Development Requirements.

L-12-57

Please refer to Response to Comment L-12-50 regarding consistency with the City of Long Beach Standard Conditions of Approval and Park Development Requirements.

L-12-58

Please refer to Response to Comment L-12-50 regarding consistency with the City of Long Beach Standard Conditions of Approval and Park Development Requirements.

L-12-59

Please refer to Response to Comment L-12-50 regarding consistency with the City of Long Beach Standard Conditions of Approval and Park Development Requirements.

OFFICE OF THE SHERIFF

COUNTY OF LOS ANGELES

HALL OF JUSTICE

JIM MCDONNELL, SHERIFF

October 12, 2017

Mr. Ronald Kosinski, Deputy District Director
Caltrans District 7, Division of Environmental Planning
100 South Main Street, MS 16A
Los Angeles, California 90012

Dear Mr. Kosinski:

REVIEW COMMENTS
NOTICE OF AVAILABILITY OF RECIRCULATED DRAFT ENVIRONMENTAL IMPACT REPORT/SUPPLEMENTAL DRAFT ENVIRONMENTAL IMPACT STATEMENT (RDEIR/SDEIS) FOR THE INTERSTATE 710 CORRIDOR PROJECT (07-LA-710, PM 5.4/24.5)

Thank you for inviting the Los Angeles County Sheriff's Department (Department) to review and comment on the Recirculated Draft Environmental Impact Report/Supplemental Draft Environmental Impact Statement (RDEIR/SDEIR), dated September 11, 2017, for the Interstate 710 Freeway Project, as referred to the I-710 Corridor Project (Project). The RDEIR/SDEIR provides changes, updates, and developed and revised build alternatives based on the feedback received during the 2012 Draft Environmental Impact Report/Environmental Impact Statement circulation period. The proposed Project will construct improvements to the I-710 Corridor, from Ocean Boulevard in Long Beach to State Route 60, a distance of approximately 19 miles. These improvements include, but are not limited to, widening of the I-710 mainline by adding mixed-flow lanes, truck bypass lanes, and a "Modernization Plus Zero/Near Zero Emission Freight Corridor."

Within the Project Study Area (RDEIR/SDEIR, Figure 1.1-2), the Department serves the cities of Carson, Commerce, Compton, East Los Angeles, Lakewood, Lynwood, Maywood, Cudahy, and Paramount. According to the RDEIR/SDEIR, the proposed Project is not expected to significantly impact the Department's operations or resources because the proposed Project would not result in increased population, and none of the Department's Sheriff Stations are located within 0.5 miles of the Project Study Area. The Department does not dispute this conclusion. However, emergency access for Department personnel, vehicles, and equipment must be maintained through the Project L-13-1

site during all phases of construction activities. As discussed in the RDEIR/RDEIS, a Transportation Management Plan (TMP) shall be prepared for the proposed Project to address short-term traffic impacts during construction of the Project. The TMP shall be reviewed by the Department and other agencies that provide emergency response services to the Project site and vicinity (see Mitigation Measure CON-TR-1, Section 3.24.4.5). The TMP should then be implemented during the construction activities to reduce construction-related emergency access impacts to a level of insignificance. L-13-1

In addition, the Department's Transit Services Bureau (TSB) has the policing responsibility for the Los Angeles County Metropolitan Transportation Authority (Metro), and shares jurisdiction in the Project Study Area for transit-related crimes only. TSB patrols the Metro Blue Line, Metro Green Line, and Metro Gold Line, as well as local and rapid buses that run through some or most of the Project Study Area. Accordingly, TSB reviewed the RDEIR/SDEIR and authored the attached comments (see correspondence, dated October 10, 2017, from Captain Jennifer L. Bateman). L-13-2

Should you have any questions regarding this matter, please contact me at (323) 526-5657, or your staff may contact Ms. Maynora Castro at (323) 526-5578.

Sincerely,

JIM McDONNELL, SHERIFF

Tracey Jue, Director
Facilities Planning Bureau

761551N52A – SH-AD (3/16)

COUNTY OF LOS ANGELES

SHERIFF'S DEPARTMENT

"A Tradition of Service Since 1850"

DATE: October 10, 2017

OFFICE CORRESPONDENCE FILE NO:

FROM: JENNIFER L. BATEMAN, CAPTAIN
TRANSIT SERVICES BUREAU

TO: TRACEY JUE, DIRECTOR
FACILITIES PLANNING BUREAU

SUBJECT: REVIEW COMMENTS ON THE RECIRCULATED DRAFT ENVIRONMENTAL IMPACT REPORT/SUPPLEMENTAL DRAFT ENVIRONMENTAL IMPACT STATEMENT FOR THE INTERSTATE 710 CORRIDOR (I-710 FREEWAY) PROJECT

The Los Angeles County Sheriff's Department (Department), Transit Services Bureau (TSB), reviewed the Recirculated Draft Environmental Impact Report/Supplemental Draft Environmental Impact Statement (RDEIR/SDEIR) dated September 11, 2017, for the Interstate 710 Freeway Project, referred to as I-710 Corridor Project (Project). The RDEIR/SDEIR is an update from the Draft Environmental Impact Report/Environmental Impact Statement circulated in 2012. The proposed Project will construct improvements to the I-710 from Ocean Boulevard in Long Beach to State Route 60, a distance of approximately 19 miles. These improvements include, but not limited to, widening of I-710 mainline by adding mixed-flow lanes, Truck bypass lanes, and modernization plus a Zero-/Near Zero-Emission Freight Corridor.

Within the Project Study Area (RDEIR/SDEIR, Figure 1.1-2), the Department serves the Cities of Carson, Commerce, Compton, East Los Angeles, Lakewood, Lynwood, Maywood, Cudahy, and Paramount. TSB has the policing responsibility for the Los Angeles County Metropolitan Transportation Authority (Metro) and shares jurisdiction in these areas for transit-related crimes only. TSB patrols the Blue Line, Green Line, and Gold Line (RDEIR/SDEIR, Figure 1.1-6), as well as the local and rapid buses that run through some or most of the Project Study Area.

According to the RDEIR/SDEIS, the proposed Project is not expected to significantly impact the Department Stations' operations or resources because none of the Stations are within 0.5 miles of the Project Study Area and the proposed Project would not result in increased population because the proposed Project would not construct new housing or businesses (RDEIR/SDEIS, S.5.4, page 13). The Department and TSB do not dispute this conclusion. However, there are transit improvements provided as part of the proposed Project (RDEIR/SDEIS pages 2-26 to 2-33). The transit improvements discussed in the RDEIE/SDEIS include the creation of three (3) new high-

L-13-3

frequency Express Bus and Rapid transit routes serving the 1-710 Corridor. It also include increase in service frequency for the Blue Line (estimated increase of 50 trains daily) and the Green Line (estimated increase of 48 trains daily). Accordingly, there will be a potential increase in the transit riding population within the Project Study Area.

TSB is responsible for providing contracted law enforcement services to Metro. The expansion of transit services, as part of the mobility solution, will most likely be a factor in the future negotiations for contracted services, as transit line stations requires some level of law enforcement support by both sworn and civilian staff assigned to TSB. TSB will continue to monitor and will work together with Metro to reevaluate and assess if the current staff and support services are adequate. At an appropriate time, a determination will be made as to what exact level of TSB patrol staffing will be required. L-13-3

TSB has no further comment to submit at this time. Thank you for including the Department and TSB in the environmental review process for the proposed Project. We look forward to providing additional input as the development process moves forward. Should you have any questions of the Department regarding this matter, please feel free to contract me at (323) 563-5082, or Lt. Chris Mouat at (323) 563-5075.

JLB:CJM:cjm

L-13-1

Caltrans and Metro understand the importance of maintaining emergency access during construction activities. Measure CON-TR-1 described in Section 3.24.4.5 was included to mitigate for impacts related to the build alternatives and specified that should a build alternative be selected as the Preferred Alternative, Caltrans and Metro would work in cooperation with the Los Angeles County Sheriff's Department and other emergency service providers to ensure that construction activities would not impede emergency response access and services. However, Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), has identified Alternative 1 (No Build) as the Preferred Alternative. Please refer to Section 1.1 of this appendix for more detail. Therefore, there is no construction and emergency access will not be impeded.

L-13-2

This comment provides information on the Los Angeles County Sheriff's Department Transit Services Bureau's (TSB) responsibility for patrolling the Metro Blue Line, Green Line, and Gold Line. The comment does not include any substantive comments or questions about the RDEIR/SDEIS and no further response is required. This comment has been made available to decision makers for their consideration.

L-13-3

It is acknowledged that an increase in transit ridership would potentially increase the need for law enforcement services for Metro facilities. However, as stated in Response to Comment L-13-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there will not be an increase in need for law enforcement services for Metro facilities as a part of the Preferred Alternative.

Los Angeles, CA 90012

Re: City of Vernon's Written Comments on the I-710 Corridor Project Recirculated Draft Environmental Impact Report/Supplemental Draft Environmental Impact Statement (RDEIR/SDEIS)

Dear Mr. Kosinski:

The City of Vernon appreciates the opportunity to review and provide written comments on the Recirculated Draft Environmental Impact Report/Supplemental Draft Environmental Impact Statement (RDEIR/SDEIS) for the Interstate 710 (I-710) Corridor Project, dated July 2017. This letter represents the official comments from the City of Vernon.

The technical review and comments provided herein focus on the subject matters pertaining to Vernon and are limited to that portion of the project study area within or adjacent to Vernon's city limits (primarily from Slauson Avenue to Washington Boulevard). The review comments are associated with the following sections of the RDEIR/SDEIS:

- Section 2.3 Project Alternatives (including supplementary conceptual plans provided to the City)
- Section 3.3 Community Impacts
- Section 3.5 Traffic and Transportation/Pedestrian and Bicycle Facilities
- Section 3.6 Visual/Aesthetics
- Section 3.24 Construction Impacts
- Appendix O Concept plans

The City of Vernon recognizes the regional significance and fully supports the I-710 Corridor Project. The City thanks Caltrans and Metro in advance for their attention to the City's technical review comments on the I-710 Corridor Project RDEIR/SDEIS and looks forward to working with Caltrans and Metro towards a successful completion of the project. If you have any questions regarding this letter, please contact Brandon Araujo at 323.583.8811, Ext. 237 or baraujo@ci.vernon.ca.us.

Sincerely,

Daniel Wall
Director of Public Works

DW/ba

BACKGROUND

The I-710 Corridor Project is being undertaken by the Department of Transportation (Caltrans) as the lead agency, in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro) as the sponsoring agency. The purpose of the project is to modernize a 19-mile segment of the I-710 corridor from Ocean Boulevard in Long Beach to State Route 60 (SR-60) in Los Angeles, address projected growth and traffic demand, improve air quality and public health, and enhance traffic safety. A No-Build and two build alternatives are being considered in the RDEIR/SDEIS, as briefly described below:

- Alternative 1 (No-Build) would maintain the existing lane and interchange configuration with no additional improvements to be provided, other than those projects that are already funded and/or committed to be constructed by or before the planning horizon year 2035.
- Alternative 5C (Modernize the I-710 Freeway) would add up to one general purpose (GP) lane in each direction of I-710 between Anaheim Street in Long Beach and Olympic Boulevard in east Los Angeles.
- Alternative 7 (Add Clean-Emission Freight Corridor along I-710) would add two controlled-access truck lanes in each direction of I-710 from Anaheim Street in Long Beach to Washington Boulevard in Commerce.

The I-710/Atlantic Boulevard/Bandini Boulevard interchange is located within the City of Vernon and is proposed to be reconfigured as part of the project. Major construction components proposed at this interchange under both build alternatives include:

- Removal of existing SB ramps and replacement with an exit ramp to Bandini Boulevard, a one-way street connection between Bandini Boulevard and Atlantic Boulevard, and an entrance ramp from Atlantic Boulevard;
- Removal of existing NB ramps and replacement with an exit ramp that splits into two separate alignments (one to Bandini Boulevard and the other to Atlantic Boulevard) and an entrance ramp from Bandini Boulevard that splits into two alignments (one connecting with NB I-710 and the other connecting with a Collector-Distributor road to I-5);
- Reconstruction and realignment of Atlantic Boulevard between the Los Angeles River and the 26th Street overcrossing;
- Reconstruction of Bandini Boulevard between Ayers Avenue and Pennington Way/26th Street; and
- Under Alternative 7, the proposed freight corridor would generally begin just north of the Atlantic Boulevard/Bandini Boulevard interchange (in the SB direction) and end (in the NB direction) within the Atlantic Boulevard/Bandini Boulevard interchange.

The build alternatives include three design variations which are called Option 1A, 2A, and 3A for Alternative 5C and Option 1B, 2B, and 3B for Alternative 7. Only Design Option 1A/1B are within Vernon's city limits. Design Option 1A/1B would modify the proposed freeway, ramp, connector, and/or freight corridor alignments between the Atlantic Boulevard/Bandini Boulevard and the Washington Boulevard interchanges to reduce impacts to BNSF operations at the Hobart intermodal rail yard.

SECTON 2.3 PROJECT ALTERNATIVES

Comment 1 – I-710/Slauson Avenue Interchange

The current project design analyzed in the RDEIR/SDEIS does not include a new I-710 interchange at Slauson Avenue under Alternative 5C. Under Alternative 7, a partial interchange consisting of a NB off-ramp and a SB on-ramp would be provided at Slauson Avenue for the freight corridor. Construction of a full I-710 interchange at Slauson Avenue was previously proposed under Alternatives 6A/6B/6C in the 2012 Draft Environmental Impact Report/Environmental Impact Statement (DEIR/EIS) and was strongly supported by the City of Vernon.

The City again would like to express support for construction of a full I-710 interchange at Slauson Avenue in both build alternatives under consideration. A new interchange at Slauson Avenue would provide a much-needed alternative access route to the residential communities west of I-710 and industrial areas east of I-710 and will also improve traffic and transportation system in and around the Gateway Cities area.

In addition, the City supports a new interchange at Slauson Avenue as it would help relieve traffic impacts during construction. Construction of the Atlantic Boulevard/Bandini Boulevard interchange would impact the traffic and transportation system in and around the City of Vernon. Full closures and lane reductions on interchange ramps and local arterials would be unavoidable during construction. With current heavy congestion along the I-710 corridor and interchanges, the adjacent Washington Boulevard interchange is not likely to have sufficient capacity to handle additional traffic during construction. Providing a new interchange at Slauson Avenue, possibly as an Early-Action Project, will provide an additional alternative route for emergency services and traffic diversion during construction. L-14-1

Comment 2 – NB Freight Corridor Merge

This comment is applicable to Alternative 7. In Alternative 7, the 2-lane NB freight corridor would terminate at the Atlantic Boulevard/Bandini Boulevard interchange, by joining and continuing on NB I-710 with two additional lanes (5th and 6th lanes) before dropping the 6th lane near the Washington Boulevard interchange and the 5th lane at the Olympic Boulevard NB off-ramp. Downstream of the NB freight corridor merge, the Bandini Boulevard NB on-ramp also merges onto NB I-710. The City is concerned that it would be difficult for the Bandini Boulevard NB on-ramp traffic to merge with truck traffic in the 6th lane as described in the RDEIR/SDEIS and requests that the project team fully evaluate this condition. L-14-2

Comment 3 - Atlantic Boulevard NB Off-Ramp Intersection

The City believes that a traffic signal is warranted at the Atlantic Boulevard NB off-ramp intersection (Intersection #123) based on the projected traffic demand for this ramp in the horizon year 2035. In addition, the City is concerned that the proposed NB freeway exit configuration may create a confusing condition to motorists destined for NB Atlantic Boulevard as they will need to use the Bandini Boulevard NB off-ramp instead of the Atlantic Boulevard NB off-ramp. Even though signage would be provided to direct "Atlantic Blvd - North" and "Atlantic Blvd - South" traffic to separate ramps, it is potentially confusing and requires additional decision making. The City requests that the project team fully evaluate this exit ramp design, possibly considering a left turn from the Atlantic Boulevard NB off-ramp to NB Atlantic Boulevard. L-14-3

In addition, the City requests that the proposed design maintain the free right turn from the Atlantic Blvd – South NB off-ramp to WB Bandini Boulevard that exists currently. L-14-3

Comment 4 – Restricted Movements at Atlantic Boulevard/Bandini Boulevard Intersection

In general, the City does not object to the proposed design of the Atlantic Boulevard/Bandini Boulevard intersection and recognizes that certain turning movements may be prohibited. However, the City would support a design that provides a left-turn movement from WB Bandini Boulevard to the SB entrance road (currently restricted by a raised median) and a right-turn movement from EB Bandini Boulevard to SB Atlantic Boulevard (currently restricted by a tight curb return). The City requests that the project team consider allowing these turn movements which are anticipated to have very low volume and should not adversely affect the intersection operation, or evaluate additional traffic control methods (in addition to signage) that may be incorporated in the project design if these movements are to be prohibited. L-14-4

Comment 5 – Entrance Ramp Acceleration

Due to the large volume of truck traffic using the Atlantic Boulevard and Bandini Boulevard ramps, the City of Vernon supports the Caltrans Highway Design Manual Index 504.3(2)(c), advisory design standard and requests that provision of a 300-foot minimum auxiliary lane be incorporated at the Atlantic Boulevard and Bandini Boulevard entrance ramps to facilitate the acceleration before merging with the freeway mainline. L-14-5

Comment 6 – Ramp Lane Widening for Trucks

Based on the Appendix O (Concept plans) of the RDEIR/SEIS, all lanes on the Bandini Boulevard NB on-ramp appear to be 12 feet wide. Please confirm that the two outside lanes on this ramp (at the 300-foot radius curve) before splitting to two separate alignments (middle lane to I-710 and outside lane to I-5) can accommodate STAA trucks side by side. Please also evaluate the need to widen the Atlantic Boulevard NB off-ramp (at the 292-foot radius curve) to accommodate truck turning in accordance with Caltrans Highway Design Manual Index 504.3(1)(b). L-14-6

Comment 7 - Truck Turning at Intersections

Please confirm that all intersections under improvements in the City of Vernon can accommodate STAA truck turning movements, preferably with 67-foot radius template. The intersection geometrics at the following locations appear slightly narrow to accommodate large truck wheel paths (and side by side with another vehicle at dual turning locations). L-14-7

- Free right turn from WB Bandini Boulevard to NB Atlantic Boulevard
- Dual left turns from SB Atlantic Boulevard to SB on-ramp
- Dual left turns from SB Atlantic Boulevard to EB Bandini Boulevard
- Dual left turns from WB Bandini Boulevard to NB loop on-ramp
- Dual right turns from EB Bandini Boulevard to NB loop on-ramp
- Dual left turns from SB Pennington Way to EB Bandini Boulevard

Comment 8 – Corner Sight Distance

Based on the Appendix O (Concept plans) of the RDEIR/SEIS, the proposed Atlantic Boulevard NB off-ramp would intersect Atlantic Boulevard approximately 120 feet south of the Pennington Way overcrossing structure. At this intersection, the corner sight distance between the drivers on the Atlantic Boulevard NB off-ramp waiting to turn at the intersection and the approaching SB traffic may be restricted by the slope paving in front of the Pennington Way bridge abutment. Adequate corner sight distance should be provided even if the intersection is signalized in case of unanticipated conflicts/signal violations or malfunction of the signal. L-14-8

Comment 9 – Stopping Sight Distance

Based on the Appendix O (Concept plans) of the RDEIR/SEIS, the project design at the Atlantic Boulevard/Bandini Boulevard interchange includes several small curve alignments on the interchange ramps. Adequate stopping sight distance may not be obtainable at some of the curve locations (noted below) due to obstructions such as bridge railings, retaining walls, concrete barriers, and cut slopes. L-14-9

- Atlantic Boulevard NB off-ramp at the 292-foot radius curve
- Bandini Boulevard NB off-ramp at the 538-foot radius curve
- Bandini Boulevard NB on-ramp at the 300-foot radius curve

Please verify that adequate stopping sight distance is provided that these locations. If not, please propose changes to the design to ensure adequate stopping sight distance is provided.

Comment 10 – Free Right Turn from WB Bandini Boulevard to NB Atlantic Boulevard

The City requests that the project team evaluate the free right turn from WB Bandini Boulevard to NB Atlantic Boulevard and adjust the project design to provide an acceleration lane on NB Atlantic Boulevard to facilitate the merge. The City recommends shifting the alignment of Atlantic Boulevard slightly to the west to accommodate an acceleration lane on NB Atlantic Boulevard. L-14-10

Comment 11 – NB Freight Corridor Bridge Column in Alternative 7

A bridge column supporting the SB Freight Corridor structure over Atlantic Boulevard in Alternative 7 is located within the Atlantic Boulevard/SB on-ramp/SB entrance road intersection. The City requests that the project team adjust the location of this column or consider realigning the SB Freight Corridor structure slightly to the west to avoid column placement within the intersection. L-14-11

Comment 12 – Atlantic Boulevard NB Off-Ramp Bridge Column in Alternative 7

A bridge column supporting the Atlantic Boulevard NB off-ramp structure is located in the southwest corner of the Atlantic Boulevard/Bandini Boulevard intersection. The City requests that the project team adjust the location of this column to avoid potential conflict with the traffic signal pole placement for the SB Atlantic Boulevard approach (especially in Alternative 7). L-14-12

Comment 13 – Atlantic Boulevard/Bandini Boulevard UC Structure – Open Area

The City requests that the project team evaluate incorporation of closure walls to curtain off open areas under the Atlantic Boulevard/Bandini Boulevard undercrossing bridge structures, as the open areas may be prone to transient use and illegal activities. L-14-13

Comment 14 – Safety Lighting under Bridges

The City requests that the project team consider additional illumination under undercrossing bridge structures along Atlantic Boulevard and Bandini Boulevard during day and night times for vehicular as well as bicycle and pedestrian traffic. L-14-14

Comment 15 – Sight Lines to Traffic Signal Heads under Bridges

Several large structures will be constructed over Atlantic Boulevard and Bandini Boulevard, with bridge soffits potentially restricting motorists' sight lines to the traffic signal heads. The City requests that the project team evaluate and address the potential sight line restriction to traffic signal heads in the project design. L-14-15

Comment 16 – Sidewalk Width

The project design for sidewalks should take into consideration the addition space needed to accommodate utility poles, street signs, bus stops and benches, and various facilities. L-14-16

Comment 17 – Bus Stops

There are currently two Metro bus stops on Atlantic Boulevard: one on the northeast corner of the Atlantic Boulevard/Bandini Boulevard intersection and the other on the southwest corner. These bus stops will need to be relocated due to proposed reconstruction/realignment of these streets and the intersection. Relocation of these bus stop could be difficult due to right of way constraint in the northeast corner adjacent to the Preferred Freezer Services, Inc. and due to potential conflict with proposed bridge columns in the southwest corner of the intersection.

The Atlantic Boulevard/Bandini Boulevard intersection is one of the busiest intersections in the City of Vernon because of the I-710 freeway access and the proximity to the Hobart intermodal rail yard. Provisions of bus stops at this busy intersection is not ideal. The City does not believe there is a heavy usage currently served by these bus stops. In addition, the proposed interchange reconfiguration would acquire several parcels adjacent to this intersection, thus reducing the pedestrian volumes at this intersection. The City request that the project team investigate the bus use demand and consider relocating both bus stops farther away from the Atlantic Boulevard/Bandini Boulevard intersection. New locations for bus stops should include bus bays to allow a bus to stop without blocking through vehicular and bicycle lanes. L-14-17

Comment 18 – Crosswalks at Atlantic Boulevard/Bandini Boulevard Intersection

Currently, crosswalks at the Atlantic Boulevard/Bandini Boulevard intersection are provided across the south and east legs of the intersection. The City requests that that the project team evaluate the need for proposed new crosswalks across the north and west legs of this intersection in the project design. In addition, if the bus stops mentioned in Comment 17 are relocated farther away from the Atlantic Boulevard/Bandini Boulevard intersection, there would be less pedestrian traffic to warrant these additional crosswalks. L-14-18

Comment 19 – Bike Lanes

The City requests the project team evaluate providing a bike lane between the through and right-turn lanes at the following locations:

- Between the NB through and right-turn lanes on NB Atlantic Boulevard at its intersection with Bandini Boulevard.
- Between the EB through and right-turn lanes on EB Bandini Boulevard at its intersection with the NB ramps/Pennington Way intersection.
- Between WB through and right-turn lane on WB Bandini Boulevard at its intersection with Ayers Avenue.

L-14-19

Comment 20 – Modified Access Report

Due to modifications proposed at Atlantic Boulevard/Bandini Boulevard interchange in combination with the termination of the NB freight corridor in the City of Vernon, the City requests a copy of the Modified Access Report (MAR), to review the impact analysis specific to proposed access modifications in Vernon. L-14-20

SECTION 3.3 COMMUNITY IMPACT

Comment 21 – Relocation of Fire Station No. 4

The Fire Station No. 4 (4530 Bandini Boulevard) would be impacted by the project improvements and requires relocation from its current location to a new location. The need to relocate and replace the Fire Station No. 4 (4530 Bandini Boulevard) before it is demolished is a priority for the City. The City intends to nominate the relocation of Fire Station No. 4 as an Early-Action Project and requests assistance from Caltrans and Metro in the Early-Action Project nomination process. L-14-21

Comment 22 - Billboards

Several billboards along both sides of I-710 will be impacted by the interchange reconstruction, requiring replacement. Section 3.3 of the RDEIR/SDEIS includes general discussion relating to the potential relocations of billboards along the project corridor. For some instances, it may not be feasible to relocate the billboards within the same general locations due to the increased height resulting from higher roadway profiles. The City requests that they have an opportunity to assist in the evaluation of potential sites during the final design phase. L-14-22

Comment 23 – Driveways

Temporary construction easements may be required from adjacent properties to accommodate the driveway reconstruction at the following locations.

- The northerly driveway to a warehouse on NB Atlantic Boulevard between the LA Railroad Junction and the I-710 SB on-ramp.
- The driveway on EB Bandini Boulevard east of Ayers Avenue, serving FedEx.
- The driveway on 26th Street to BNSF property.

L-14-23

Comment 24 – Relocations

Page 3.25-54 of the RDEIR/SDEIS reads "As stated in the discussion of Public Health Considerations, there are residential property impacts for some design options of Alternative 7 in the cities of Commerce and Vernon, where Housing of Last Resort[3] may have to be considered for relocating the affected residential properties." This statement is repeated on Page 3.25-58 of the RDEIR/SDEIS: "Last Resort Housing may be required for relocation of residents in the Cities of Commerce and Vernon for the I-710 Corridor Project."

The above statements are in conflict with Table 3.3-12 (Relocations by City) of the RDEIR/SDEIS, which shows 0 residential relocation and 8 nonresidential relocations in the City of Vernon under Alternative 7. L-14-24

SECTION 3.5 TRAFFIC AND TRANSPORTATION/PEDESTRIAN AND BICYLE FACILITIES

Comment 25 – Traffic Volumes

Section 3.5 of the RDEIR/SDEIS includes various tables showing level of service (LOS), traffic flow density and/or volume-to-capacity ratio, and intersection delay information for a.m., mid-day, and p.m. peak hours for the freeways, ramps, and local arterials. The City requests that peak hour traffic volumes be provided in these tables as well to allow the City to fully understand the traffic demand and review the potential impacts the I-710 Project Corridor will have on the traffic and transportation system. L-14-25

Comment 26 – Peak Hour Factor

Per Section 2.4.2 of the Traffic Operations Analysis Report (AECOM, March 2017), which is a supporting document for Section 3.5 of the RDEIR/SDEIS, peak hour factor (PHF) is determined from the existing traffic counts. The City assumes that this implies that the same PHF will be used in the analysis of existing as well as future conditions.

Based on the LOS worksheet for Atlantic Boulevard/Bandini Boulevard intersection provided to the City of Vernon at the August 8, 2017 meeting with AECOM, PHF of 0.98 is used for existing condition and PHF of 0.92 is used for future condition. It is assumed that the existing PHF of 0.98 is based on the traffic count. L-14-26

The City requests a clarification or justification as to why the PHF for the future year (0.92) is different from the PHF used in the existing condition (0.98). The City is concerned that if the future PHF of 0.92 is not justified, projected traffic volumes would be underestimated and the operational LOS would be miscalculated.

Comment 27 – Impact of Increased Truck Traffic on Pavement

The City understands that per Measure CON-TR-2, damages to local street pavement due to project-related construction traffic would be addressed and that new pavement would be provided on local arterials where such roadways are directly affected by the project construction. However, there will be arterials within the City of Vernon that will not be directly affected by the project construction or constructed-related traffic, but will be affected by the projected increase in truck volumes due to the project. L-14-27

According to Table 5-1 (Alternative 1 North-South Roadway Segment Volumes) and Table 6-1 (Alternative 5C North-South Roadway Segment Volumes) of the Intersection Traffic Impact Analysis

Report (AECOM, March 2017), truck traffic along Atlantic Boulevard between Bandini Boulevard and Washington Boulevard is projected to increase by 11 percent under Alternative 5C, as compared to the volume projected for the No-Build condition. Similarly, a comparison between Table 5-2 (Alternative 1 East-West Roadway Segment Volumes) and Table 6-7 (Alternative 7 East-West Roadway Segment Volumes) of the Intersection Traffic Impact Analysis Report (AECOM, March 2017) reveals a 29 percent increase in truck traffic along Washington Boulevard between Soto Street and I-710 under Alternative 7, when compared to the volume projected for the No-Build condition.

The projected increase in the truck traffic will have a substantial impact to the existing pavement system on local streets within the City of Vernon. The City requests that the potential impact to the local street pavement system be evaluated in the appropriate section of the RDEIR/SDEIS and suitable mitigation measures, such as pavement rehabilitation or replacement, be identified as part of the I-710 Corridor Project. L-14-27

In addition, due to the significant amount of truck traffic within the City of Vernon, concrete pavement should be considered for ramp terminal intersections, as well as, along Atlantic Boulevard, Bandini Boulevard, and other impacted roadways requiring pavement rehabilitation or replacement due to increased truck traffic.

Comment 28 - 37th Street/Santa Fe Avenue Intersection Mitigation

Per Table 3.5-23 of the RDEIR/SDEIS, the 37th Street/Santa Fe Avenue intersection is one of the intersections determined to be adversely impacted by the project under both build alternatives due to increased traffic volume and delay relative to the future No-Build condition. A potential mitigation to provide an acceptable level of service (LOS) at this intersection would be to add a separate right-turn lane on the westbound approach. However, mitigation is not recommended at this intersection due to the right of way impact in the northeast quadrant of the intersection. L-14-28

While the City understands the importance of minimizing right of way acquisition of private properties and displacement of businesses, in this instance, the City feels that the need for safe and efficient transportation improvement at this intersection should be further investigated. Mitigation improvement should be pursued as part of the environmental clearance.

Comment 29 - LOS E on Atlantic Boulevard

Per Figure 5-4, Figure 6-1, and Figure 6-6 of the Intersection Traffic Impact Analysis Report (AECOM, March 2017), level of service (LOS) D or better is projected for Atlantic Boulevard between Bandini Boulevard and Washington Boulevard under the No-Build Alternative, while LOS E is projected for this roadway segment under both build alternatives in the planning horizon year 2035. However, the RDEIR/SDEIS does not identify this LOS degradation as an adverse impact and no mitigation is proposed to address the degradation of this roadway segment under the build alternatives. L-14-29

Comment 30 - Intersection Queues

Table 7-41 of the Traffic Operations Analysis Report (AECOM, March 2017) indicates that adequate storage is provided at all studied intersections in Vernon under the planning horizon year 2035 build conditions, except at the following six approaches: L-14-30

- WB Bandini Boulevard through the junction at -710 NB ramps (Alt 5C & Alt 7)

- Left-turn pocket from WB Bandini Boulevard to I-710 NB on-ramp (Alt 5C & Alt 7)
- Right-turn pocket from Atlantic Boulevard to I-710 SB on-ramp (Alt 5C & Alt 7)
- Left-turn pocket from SB Pennington Way to Bandini Boulevard (Alt 5C & Alt 7)
- Right-turn pocket from WB Bandini Boulevard to Pennington Way (Alt 5C)
- Right-turn pocket from WB Bandini Boulevard to Atlantic Boulevard (Alt 5C)

The City requests that the project team consider extending the turn pockets at each of the above left- and right-turn locations which may be accomplished with minimal or no additional impacts to right of way. In some instances, minor realignment of Atlantic Boulevard or Bandini Boulevard would allow the turn pockets to be extended without right of way impacts. The City requests the project team consider adjusting the project design to provide adequate queue storage at these locations. L-14-30

Comment 31 – Left-Turn Pocket from WB Washington Boulevard to SB Downey Road

The City requests that the project team perform an analysis of the adequacy of the left-turn pocket queue length from WB Washington Boulevard to SB Downey Road. Under Alternative 7, the project is proposed to increase vehicular traffic volumes along Washington Boulevard. Mitigation (an extra left-turn lane in the NB and SB approaches) is recommended for the Washington Boulevard/Downey Road intersection under Alternative 7. However, no improvements to the westbound left-turn pocket are proposed. Due to high truck-turning volumes at this intersection the existing westbound left-turn pocket from time to time currently experiences queue lengths into the through lanes. Additional traffic volumes, especially trucks, on Washington Boulevard will exacerbate this condition. An analysis should be conducted to determine if additional improvements are required at this intersection to mitigate this impact. L-14-31

SECTION 3.6 VISUAL/AESTHETICS

Comment 32 – Screen Wall on Elevated SB Freight Corridor

Under Alternative 7, the SB freight corridor begins just north of the Atlantic Boulevard/Bandini Boulevard interchange with an elevated structure that runs parallel the west side of I-710 and crosses over Atlantic Boulevard and Bandini Boulevard, before crossing over to the east side of I-710. In this area, the SB freight corridor would be elevated approximately 25 to 30 feet over the I-710 freeway, which would also be raised 10 to 15 feet higher than the existing freeway profile. The City requests that the project team evaluate the potential glare, light, and aesthetic impacts from the elevated freight corridor and consider screen walls on the SB freight corridor through the portion within the City of Vernon. L-14-32

SECTION 3.24 CONSTRUCTION IMPACTS

Comment 33 – Construction Impacts on Traffic and Transportation

Section 3.24.3.5 of the RDEIR/SDEIS indicates that an analysis of temporary traffic impacts during construction is provided in the Intersection Traffic Impact Analysis Report (AECOM, March 2017), including levels of service expected during construction and a general description of anticipated ramp closures during construction. However, the City could not find this discussion in the referenced report. Please provide the aforementioned report. L-14-33

Comment 34 – Ramp and Street Closures

The project construction in and near the City of Vernon is estimated to take 54 to 84 months depending on the alternative chosen. In addition, the Construction Staging Concepts report, dated May 18, 2017, reveals that there is high likelihood that all of the Atlantic Boulevard/Bandini Boulevard interchange ramps as well as sections of Atlantic Boulevard and Bandini Boulevard would need to be closed for a prolonged period, possibly ranging from 4 to 36 months.

Prolonged closure of local streets and ramps (i.e. more than 10 consecutive days) would have significant economic impacts to the businesses in the City of Vernon. The City requests that each of the closure is limited to less than 10 consecutive days and that the number of closure periods be limited to a maximum of three times within a 12-month period. Construction of temporary ramp pavement and temporary street widening should be considered where feasible to keep the street and interchange open and minimize closures during construction. L-14-34

Additionally, the City requests that Mitigation Measure CON-TR-1 on page 3.24-48, include language that any ramp closures that exceed 10 days will need a formal "Ramp Closure Study".

Comment 35 – Construction of Atlantic Boulevard/Bandini Boulevard Interchange

The response to the City's previous comment on the 2012 Draft EIR/EIS (L-14-107 in Appendix S of the RDEIR/SDEIS) indicates that if a build alternative is selected that includes improvements to the I-710/Washington Boulevard interchange as the preferred alternative, the City's request to construct the I-710/Washington Boulevard interchange before any construction begins at the I-710/Atlantic Boulevard/Bandini Boulevard interchange, will be considered in developing the construction sequencing of the project.

The City appreciates the response that consideration to improve the Washington Boulevard interchange before reconstruction of the Atlantic Boulevard/Bandini Boulevard interchange will be made in the construction staging development during the final design. To ensure that this intent is communicated to the final design project team, the City requests that a mitigation measure specifying this intent be added in the RDEIR/SDEIS. The City also requests that the mitigation measure includes the City's involvement in the construction staging development for the improvements in and near Vernon during the final design phase. L-14-35

L-14-1

Interchange improvements at the Slauson Avenue/I-710 interchange under Alternative 5C are shown in Figure 2.3-6, Sheet 7 in Section 2.3.2.2 of the RDEIR/SDEIS and in Figure 2.3-11, Sheet 7 in Section 2.3.2.3 for Alternative 7. As discussed in Table 2.3-3, under Alternative 5C, the interchange improvements would include the reconstruction of Slauson Avenue, including the freeway overcrossing from the Los Angeles River to approximately 700 feet east of the existing Los Angeles Junction Railway at-grade crossing. In addition, as discussed in Table 2.3-4, under Alternative 7, the interchange improvements would include construction of a partial interchange at Slauson Ave., including a southbound entrance ramp and a northbound exit ramp for the truck lanes and reconstruction of Slauson Ave., including the freeway overcrossing and the bridge over the Los Angeles River, from approximately 200 feet west of Alamo Ave. to approximately 700 feet east of the existing Los Angeles Junction Railway at-grade crossing Please refer to Section 1.7 of this appendix for more information on I-710 Early Action Projects.

A full service local interchange at Slauson was evaluated as part of the 2012 DEIR/EIS. Further evaluation of a full service interchange was conducted as part of the refinement of build alternatives. Due to impacts to existing infrastructure, adjacent property, and freeway operations, a new interchange at Slauson was not considered viable. The impacts under this refinement included relocation of the LA Junction Railroad and corresponding property impacts required for its relocation, additional property acquisition and business relocations in the City of Commerce along Slauson Avenue, additional property acquisition and business relocation in Bell (including the Salvation Army Homeless Shelter), and relocation of LADWP electrical transmission towers. Furthermore, the new interchange would not be compatible with proposed interchange improvements at the Atlantic Boulevard/Bandini Boulevard Interchange. These assessments, along with the proposed build alternatives, were reviewed with the City's Public Works Director, Kevin Wilson, and City Council at the Council meeting on July 21, 2015, prior to the public review period of the RDEIR/SDEIS.

L-14-2

Due to public and agency input, the Preferred Alternative has been identified as the Preferred Alternative. Please refer to Section 1.1 of this appendix for a discussion on the identification of the Preferred Alternative.

L-14-3

In accordance with the Caltrans *Highway Design Manual* (6th edition, December 2018), the build alternatives were designed to accommodate merging requirements, turning movements, sight distance, and appropriate signage, lighting, and fencing, and closure requirements to enhance safety. Several deficiencies at the existing interchange would be eliminated or minimized by the ramp configuration proposed under the build alternatives, thereby enhancing

safety. Relocation of the ramp termini away from the Atlantic Boulevard/Bandini Boulevard intersection would be fundamental to proposed safety enhancements as driver confusion would be reduced because advance guide signs would be installed which would provide sufficient time for driver decision making. However, Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), has identified Alternative 1 (No Build) as the Preferred Alternative. Therefore, left turn movements will not need to be considered at the Atlantic Boulevard northbound off-ramp intersection. Please refer to Section 1.1 of this appendix for more detail on the Preferred Alternative.

L-14-4

The traffic analysis performed for the build alternatives showed that there is no turning movement demand from WB Bandini to the SB entrance road. The same movement would be more efficiently accomplished at the Atlantic Boulevard/Bandini Boulevard intersection preceding the subject intersection. Similarly, there is no turning movement demand from EB Bandini to the SB Atlantic. The same movement would be more efficiently accomplished at the Bandini/SB Atlantic entrance road intersection preceding the subject intersection. Furthermore, larger vehicles could not safely make the suggested right turn at the Atlantic Boulevard/Bandini Boulevard intersection without adversely affecting the intersection's operation.

L-14-5

The Caltrans *Highway Design Manual* was updated after completion of the conceptual design of the build alternatives. Refinements to the build alternatives have been incorporated to address the design standard. Documentation has been prepared for nonstandard features in Alternative 5C, should the design feature not meet current standards. However, as stated in Response to Comment L-14-3, the No Build Alternative has been selected as the Preferred Alternative. Therefore, the provision of a 300-foot maximum auxiliary lane incorporated at the Atlantic Boulevard and Bandini Boulevard entrance ramps does not need to be evaluated.

L-14-6

Refinements to lane widths to accommodate truck turning have been incorporated at ramp terminal intersections, including the Bandini Boulevard northbound on-ramp and the Atlantic Boulevard northbound off-ramp, for Alternative 5C.

L-14-7

Refinements to lane widths and curb return radii to accommodate truck turning have been incorporated at ramp terminal intersections and the adjacent Atlantic Boulevard/Bandini Boulevard intersection for Alternative 5C.

L-14-8

Along with other checks, corner sight distance has been checked at all locations and refinements have been incorporated to meet standards. At locations where standards are not met in Alternative 5C, documentation has been prepared for the nonstandard features.

L-14-9

Along with other checks, stopping sight distance has been checked at all locations and refinements have been incorporated to meet standards. At locations where standards are not met in Alternative 5C, documentation has been prepared for the nonstandard features.

L-14-10

A free-right turn movement was previously evaluated and was not considered practical given the 3-lane through movement on NB Atlantic Boulevard and the greater potential for vehicle-pedestrian/bicycle conflicts. A yield-controlled movement is proposed under the build alternatives. The outermost lane on NB Atlantic Boulevard, which is forced to merge prior to the Pennington Way overcrossing, serves as an acceleration lane for right turning traffic. An additional acceleration off a free-right turn, as requested, would make merging conditions more difficult and introduce greater conflicts to bicycle travel on Atlantic Boulevard.

L-14-11

Please refer to Response to Comment L-14-2 regarding the selection of the No Build Alternative as the Preferred Alternative. Therefore, the freight corridor will not be constructed and will therefore not need to be realigned.

L-14-12

Please refer to Response to Comment L-14-2 regarding the selection of the No Build Alternative as the Preferred Alternative. Therefore, the Atlantic Blvd. NB off-ramp structure will not be constructed and will therefore not need to be realigned.

L-14-13

As stated in Response to Comment L-14-2, the No Build Alternative has been selected as the Preferred Alternative. Therefore, it is no longer necessary for Caltrans to coordinate with the City regarding design features that may be feasibly employed that discourage encampments.

L-14-14

As stated in Response to Comment L-14-2, the No Build Alternative has been selected as the Preferred Alternative. Therefore, additional illumination under undercrossing bridge structures along Atlantic Boulevard and Bandini Boulevard does not need to be evaluated.

L-14-15

Sight lines and sight distances are design elements governed by Caltrans' *Highway Design Manual*, which establishes uniform policies and procedures to carry out its State highway design functions. As stated in Response to Comment L-14-2, the No Build Alternative has been selected as the Preferred Alternative. Therefore, specific design elements such as this will not need to be evaluated.

L-14-16

The design for sidewalks under the build alternatives took into consideration the additional space needed to accommodate utility poles, street signs, bus stops, benches, and various facilities as required by current design standards.

L-14-17

The proposed design of the build alternatives would help eliminate turning conflicts at the Atlantic Boulevard/Bandini Boulevard intersection by relocating existing I-710 ramp ingress and egress locations further away from this very busy intersection. For the Metro bus stop in the southbound direction of Atlantic Boulevard, at the southwest corner of Atlantic Boulevard/Bandini Boulevard, the need for a free right from Bandini Boulevard has been eliminated and sight distances would be improved relative to existing conditions for this far side stop. The Metro bus stop in the northbound direction of Atlantic Boulevard, at the northeast corner of Atlantic Boulevard/Bandini Boulevard, would need to be relocated by the build alternatives approximately 100 feet to a location just north of the gated driveway to the Preferred Freezer Services business. Under the proposed design, there would be sufficient space within the public street right-of-way within the curve of the lane drop to accommodate this stop. However, as stated in Response to Comment L-14-2, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there will be no impacts to these bus stops.

L-14-18

Caltrans' Complete Intersections: A Guide to Reconstructing Intersections and Interchanges for Bicyclists and Pedestrians (Caltrans 2010) has been used during the design process of the build alternatives. As discussed in Section 3.5.3.2 of the RDEIR/SDEIS and in this Final EIR/EIS, because sidewalks would be improved under the build alternatives, bikeways and trails would be maintained, and bicycle and pedestrian connectivity would be enhanced, the build

alternatives would improve conditions for pedestrian and bicycle travel. In addition, as discussed in Section 2.3 of the RDEIR/SDEIS and in this Final EIR/EIS, with respect to “Complete Streets” improvements, inclusion of pedestrian paths (sidewalks, curb ramps, and crosswalks) and sufficient outside shoulder width to accommodate Class II bikeways on local street crossings would be provided as part of local interchange modifications under the build alternatives. However, as stated in Response to Comment L-14-2, the No Build Alternative has been selected as the Preferred Alternative. Therefore, the addition of new crosswalks will no longer need to be evaluated Please also refer to Response to Comment L-14-17 regarding the transit stops at Atlantic Boulevard/Bandini Boulevard.

L-14-19

Refinements to bike lanes have been incorporated at the suggested locations in Alternative 5C.

L-14-20

A Modified Access Report (MAR) has been prepared for the build alternatives and reflects proposed modifications featured in Alternative 5C. Should Alternative 5C be selected as the Preferred Alternative, Caltrans would coordinate with the City prior to final design development to update Freeway Agreements as necessary. The Freeway Agreement would document the understanding between Caltrans and the local agency relating to the planned traffic circulation features of the proposed freeway or controlled access highway.

L-14-21

The City of Vernon’s desire for the relocation of Fire Station No. 4 to be an Early Action Project is acknowledged. As discussed in Section 3.3.1, Community Character and Cohesion, of the RDEIR/SDEIS and in this Final EIR/EIS, the build alternatives include improvements to the existing Bandini Boulevard/Atlantic Avenue interchange which would require acquisition and relocation of the City of Vernon Fire Station No. 4. However, as stated in Response to Comment L-14-2, the No Build Alternative has been selected as the Preferred Alternative. Therefore, Fire Station No. 4 will no longer need to be relocated.

L-14-22

Table 3.3-12 of this Final EIR/EIS was revised to more clearly indicate wherein billboard or cellular tower relocation would be required under the build alternatives. As shown in that revised table, Alternatives 5C and 7 would require displacement of one billboard in the City of Vernon, located on the parcel at 4651 Bandini Boulevard. However, as stated in Response to Comment L-14-2, the No Build Alternative has been selected as the Preferred Alternative. Therefore, this billboard will no longer require relocation.

L-14-23

As stated in Response to Comment L-14-2, the No Build Alternative has been selected as the Preferred Alternative. Therefore, Temporary construction easements for driveway reconstruction will are not necessary.

L-14-24

This comment regarding the inconsistent data provided in Section 3.25, Cumulative Impacts, and Table 3.3-12 in Section 3.3, Community Impacts, of the RDEIR/SDEIS is acknowledged and included in the project record. Table 3.3-12 correctly states that no residential relocations are proposed under either build alternative or Design Option within the City of Vernon. The Cumulative Impact section of the Final EIR/EIS has been revised to accurately reflect that there are no residential displacement impacts in the City of Vernon.

L-14-25

Peak hour traffic volumes are not typically shown in these summary tables in the RDEIR/SDEIS. However, this level of detail can be found in the supporting traffic technical reports prepared for the RDEIR/SDEIS, specifically the *Intersection Traffic Impact Analysis Report* (March 2017) and the *I-710 Corridor Project Traffic Operations Analysis Report* (March 2017), which are publicly available documents that are available upon request by contacting Caltrans District 7.

L-14-26

For the Atlantic Blvd/Bandini Blvd intersection (No. 74), existing peak hour factor (PHF; AM/MD/PM - 0.98/0.99/0.96) was carried over to the 2035 No Build Alternative, but a more conservative factor of 0.92 was used for the build alternatives due to the uncertainty associated with future build operations.

L-14-27

The commenter's concern regarding pavement deterioration on local streets as a result of increased traffic from the build alternatives is acknowledged and included in the project record. However, as stated in Response to Comment L-14-2, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there will not be increased traffic and pavement deterioration on local roads as a result of the build alternatives.

L-14-28

Caltrans and Metro strive to examine and develop the most appropriate avoidance, minimization and/or mitigation measures for the build alternatives, taking into consideration right-of-way constraints, safety, and feasibility in implementing any proposed mitigation. However, as stated

in Response to Comment L-14-2, the No Build Alternative has been selected as the Preferred Alternative. Therefore, adding a separate right-turn lane on the westbound approach at the 37th Street/Santa Fe Avenue intersection is no longer necessary to evaluate as a mitigation measure.

L-14-29

The roadway segment Volume/Capacity (V/C) analyses in the *Intersection Traffic Impact Analysis Report* (March 2017) provides a broad overview of how the alternatives affect traffic performance on the major north/south and east/west arterials serving the I-710 corridor. The more detailed intersection Level of Service (LOS) analysis is the appropriate methodology for evaluating the traffic impacts of the alternatives on the arterial street network, as intersections control the flow of traffic on these streets. The traffic impact thresholds focus on the study intersections as that is where the delay to motorists using the arterial network typically occurs and where the quantitative traffic analysis is most sensitive to changes in traffic flows and traffic movements associated with the proposed project. Impact methodologies and thresholds are specific to the 185 intersections that were evaluated for the Preferred Alternative throughout the arterial network and should not be applied to the roadway segments in the I-710 Study Area. The detailed discussion of intersection impact thresholds and methodologies can be found in Sections 2.2 and 7 of the *Intersection Traffic Impact Analysis Report* (March 2017) and were summarized in Section 3.5.3.1 of the RDEIR/SDEIS. The Atlantic Blvd/Bandini Blvd and Atlantic Blvd/Washington Blvd intersections were analyzed in the *Intersection Traffic Impact Analysis Report* referenced in the comment, and provide a more detailed assessment of the traffic performance on this segment of Atlantic Boulevard.

L-14-30

Impact thresholds are based on delay at the intersections, as discussed on page 3.5-91 of the RDEIR/SDEIS. For further detail, please refer to Section 7 of the *Intersection Traffic Impact Analysis Report* (March 2017). Queue lengths are not used for impact determination. However, as stated in Response to Comment L-14-2, the No Build Alternative has been selected as the Preferred Alternative. Therefore, extending the turn pockets at each of the cited left- and right-turn locations will not be examined.

L-14-31

The City of Vernon's recommendation for mitigation at Washington Boulevard/Downey Road has been acknowledged. However, the No Build Alternative has been identified as the Preferred Alternative. It should be noted that improvements at this location would be in accordance with Measure TR-1 which is only applicable to Alternative 7 only. Please refer Response to Comment L-14-30 for further information on queue lengths and impact determinations and to Section 1.1 of this appendix for a discussion on the identification of the Preferred Alternative.

L-14-32

Key Views 22 and 23, although not within the limits of the City of Vernon, are representative views for Vernon and a discussion of the environmental consequences to visual quality as a result of the elevated corridor under Alternative 7 was discussed in Section 3.6.3 of the RDEIR/SDEIS. Please note that the nature of the Visual Impact Assessment prepared in support of Section 3.6 of the RDEIR/SDEIS is not to examine every view to and from the project, but to select a comprehensive suite of representative key views. More information on the necessity of screen walls is described in Section 3.6.3.1 of the RDEIR/SDEIS, which states that “glare from vehicle headlights in the general purpose lanes and the elevated portions of the freight corridor are expected to be minimized by the construction of soundwalls and screen walls.” Per Measure VIS-9 identified in Section 3.6.4 of the RDEIR/SDEIS, "During final design, Caltrans will review with each local jurisdiction the aesthetic features and treatments [including screen walls] proposed to be incorporated in the final facility design for freeway components adjacent to each local jurisdiction, in accordance with the *I-710 Corridor Aesthetics Master Plan* described in Measure VIS-1.” However, the No Build Alternative has been identified as the Preferred Alternative. Therefore, there will be no need for screen walls.

L-14-33

A construction staging analysis provided in the *Construction Staging Concepts Report* (2017), which identifies the sequence of construction activities and ramp closures, was performed for the build alternatives as one of the supporting technical documents for the *Draft Project Report* (2017). However, the No Build Alternative has been identified as the Preferred Alternative. Therefore, defining further detail regarding traffic detours, approximate timelines for construction activities, and specifics related to ramp closures during construction will not be necessary

L-14-34

As stated in Response to Comment L-14-2, the No Build Alternative has been selected as the Preferred Alternative. Therefore, Measure CON-TR-1 of this Final EIR/EIS does not need to be revised to include the following statement: “If full ramp closures (lasting 10 days or longer) are found to be necessary during future phases of the project, a Ramp Closure Study will be performed to evaluate any potential impacts.”

L-14-35

Please refer to Section 1.7 of this appendix regarding Early Action Projects. A preliminary construction staging analysis was prepared for the *I-710 Corridor Project Draft Project Report* (2017) to evaluate the two build alternatives for feasibility and constructability. The preliminary construction staging analysis shows that the construction elements of the Atlantic-Bandini interchange would need to be sequenced with the construction stages of the Washington

Boulevard interchange due the complexity of the overall Atlantic-Bandini/Washington/I-5 segment. However, this information is preliminary. As stated in Response to Comment L-14-2, the No Build Alternative has been selected as the Preferred Alternative. Therefore, the City's suggestion regarding construction sequencing to construct improvements at the I-710/ Washington Boulevard interchange prior to reconstruction of the I-710/Atlantic Boulevard/ Bandini Boulevard interchange will no longer need to be taken under consideration in development of the detailed construction staging strategy and schedule.

SUBJECT: CITY OF HUNTINGTON PARK COMMENTS ON THE I-710 CORRIDOR PROJECT RECIRCULATED DRAFT ENVIRONMENTAL IMPACT REPORT/SUPPLEMENTAL DRAFT ENVIRONMENTAL IMPACT STATEMENT

Dear Mr. Kosinski:

The City of Huntington Park (City) is submitting this letter in response to the public release of the Recirculated Draft Environmental Impact Report/Supplemental Draft Environmental Impact Statement (RDEIR/SDEIS) and Section 4(f) Evaluation for the I-710 Corridor Project. This letter represents the official comments of the City of Huntington Park on the RDEIR/SDEIS, and as such, our review was focused on the potential project impacts that would most directly impact the City. As reflected below our review and corresponding concerns are related to growth, real property resources, traffic, and air quality.

1. Comments on the RDEIR/SDEIS

a. Growth

Table 3.3-2 of the RDEIR/SDEIS estimates that the population growth percent change between 2012 and 2035 is +12% for the City of Huntington Park. Based on this population growth estimate, if relocation housing has been identified within the City of Huntington Park as part of residential displacement inventory from the neighboring cities, then what percentage of the estimated growth would those relocations account for, in addition to or as part of the projected growth increase? L-15-1

b. Relocations

The RDEIR/SDEIS notes that the Project would not be able to relocate all displaced residents within their respective communities or within an area with reasonable proximity to their community. However, there is a contradiction as currently presented that needs attention., The analysis goes on to note that adequate resources appear to exist at the present time to relocate existing residential occupants to comparable replacement housing. This apparent contradiction warrants either correction or a higher level of discussion to clarify and address this contradiction, including specific reference to the location and comparable make-up of the supposed replacement resources. Since the City of Huntington Park is included in the Project's study area we need to understand, again with a higher level of detail, if the City of Huntington Park has been identified as a potential resource to meet the need for replacement housing? A secondary and potentially cumulative impact also warranting detailed discussion is how would the relocations from surrounding communities potentially impact the City of Huntington Park's current/projected housing supply? L-15-2

c. Traffic

i. On page 3.5-110 of the RDEIR/SDEIS, the intersection of Slauson/Boyle (#170) is listed under the City of Huntington Park, but throughout the rest of the document (and the traffic reports) this intersection is listed under the City of Vernon. This intersection spans the jurisdictional boundaries between the two cities, along a north-south split with the City of Huntington Park to the west and the City of Vernon to the east. The analysis should be updated to include this jurisdictional boundary and should be accurately reflected throughout the RDEIR/SDEIS. The analysis should also specifically discuss the needed coordination and concurrence regarding any potential modifications to this intersection. Both Cities will need to be party to and agree upon any determinations and/or proposed improvements. L-15-3

Figure 5-1 in the Traffic Impact Analysis Report (TIAR) shows No-Build volumes of 33,600/0/2000 (Auto/Port/Non-Port Trucks) on Slauson north of Atlantic. Figure 5-3 shows a change to 31,700/400/2500 with Alternative 7. However, the necessary discussion regarding the shift in traffic generation and change in volumes between these two figures has not been provided. Please provide further clarification as to why 400 Port trucks would use Slauson under Alternative 7. The shift and increase in port-related truck traffic based on the I-710 improvements should encourage Port trucks to use the freeway instead of local streets. Additionally, the analysis does not provide supporting documentation regarding the decline in the total auto traffic volumes. L-15-4

ii. The identified impacts at the two or three Huntington Park intersections are relatively minor across most of the build alternatives; however, for Alternative 7 L-15-5

there is a projected increase in delay by approximately 10 seconds for the following intersections:

- Slauson Ave./Alameda St.
- Slauson Ave./Santa Fe Ave.
- Slauson Ave./Boyle Ave. (City of Vernon or City of Huntington Park?)

L-15-5

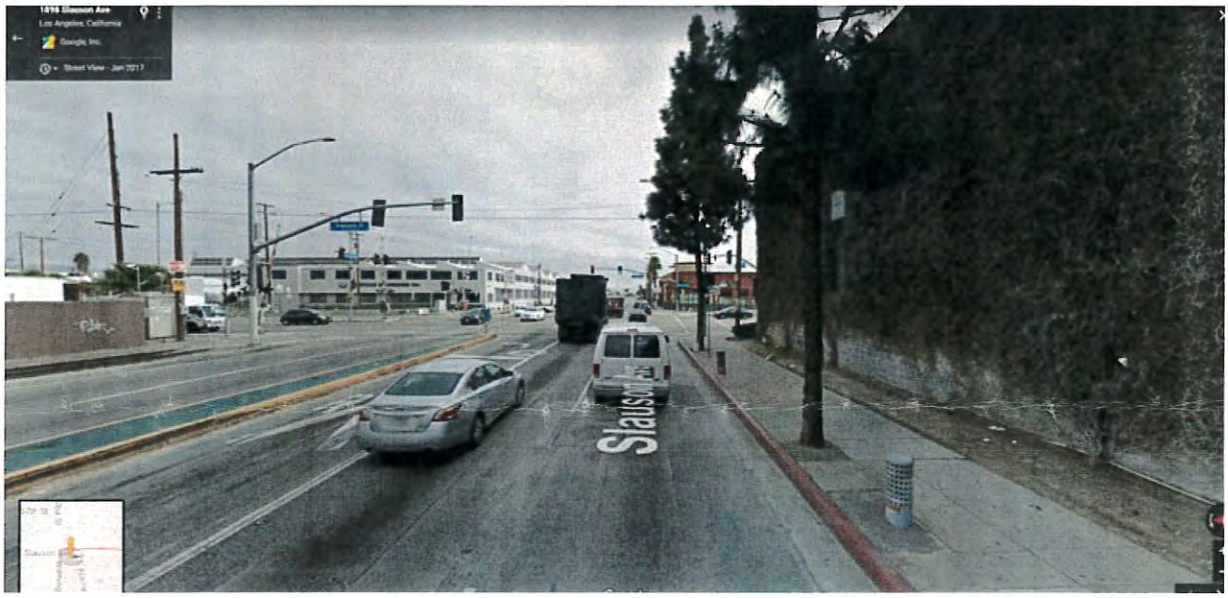
The needed analysis and explanation regarding the cause of these delays and the corresponding impacts has not been provided. If the delays are caused by an increase in traffic associated with the corridor (i.e., induced demand) or some other influencing factor, that discussion is necessary, along with potential measures to minimize impacts.?

iii. If the impacts are volume-related, they are presumably related to the increase in trucks on the City of Huntington Park streets, as noted in comment ii. Instead of geometric modifications, we recommend serious consideration of travel demand management (TDM) or other strategies be employed to keep truck traffic off City streets. While the suggested mitigation strategies appear to be effective for traffic operations at those three intersections, the additional trucks will potentially affect traffic operations, safety, and quality of life on all other intersections in the City where truck traffic will increase. The City recommends the consideration of other mitigation strategies to address this impact. L-15-6

iv. Table 6-6 in the TIAR shows high volumes on City of Huntington Park streets, and some of these volumes (especially trucks) will result in impacts. What impact criteria were used to assess these arterial volumes? Section 3.5.3 of the RDEIR/SDEIS describes changes in vehicle level of service (LOS) for freeways, arterials, and intersections, but only intersection impacts are quantified. Please provide further clarification regarding impact criteria, including quantification of impacts for freeways and arterials. L-15-7

v. Figure 6-6 in the TIAR (and other similar figures) do not show V/C ratios on Gage or Santa Fe. Consistent illustration of these ratios across the figures is needed to allow for comparative evaluation. In addition, Santa Fe, which is an intersection determined to have an impact, has this street been evaluated for arterial impacts? L-15-8

vi. Based on our review of the traffic analysis presented, it appears that impact criteria were only developed for the intersection analysis. Please clearly identify which criteria were used to evaluate the project-related changes and potential impacts to freeway and arterial LOS. It is also unclear whether the intersection impact criteria are the same for signalized and unsignalized intersections. An explanation should be provided for why they are the same or whether a different criterion was used. If a different criterion was used, an explanation supporting its use and benefit to the analysis is also needed. L-15-9



vii. The analysis as currently presented does not include an assessment of potential impacts to pedestrians and bicyclists. Per comments ii. and vi., if truck traffic will increase on local street, then these two user groups will be affected. Please provide a more comprehensive assessment of impacts to non-motorized modes. Page 3.5-106 of the RDEIR/SDEIS states that the build alternatives "will provide facilities for bicycles and pedestrians" where non-motorized traffic would be affected during construction, but without specific discussions regarding the location and make-up of these facilities for bicycles and pedestrians, the City is presuming they would be adjacent to the I-710 freeway. Additional discussion regarding these to-be provided facilities, along with any other improvements anticipated on streets away from the freeway should be provided in an updated discussion. This is of particular importance in locations within the City of Huntington Park, where traffic will increase. L-15-10

In addition, the City of Huntington Park, along with the cities of Bell, Maywood, and County of LA, have plans for the LA River pedestrian/cycling path trail adjacent to I-710. The RDEIR/SDEIS should address any modifications to the I-710 right-of-way that may potentially impact any plans to this trail, and whether the proposed trail plans would be viable and not conflict with any planned improvements for the LA River. L-15-11

viii. The analysis and documentation as presented has not presented any substantive discussion regarding safety. The potential for either positive or negative safety impacts in relation to traffic should be provided. There is limited data on the freeways in Section 3.5.2.1, but a more robust narrative is warranted and there is no discussion regarding arterials or intersections. L-15-12

ix. In the Traffic Operations Analysis Report (TOAR) (page 6-20), induced demand is mentioned: "the induced truck traffic would further increase the projected traffic demand on eastbound SR-91, causing segments that are outside of the improvement area to experience heavy congestion." Would the streets in the City of Huntington Park experience negative effects of induced demand? Please provide description of induced demand (i.e., what it is, how it was analyzed) and assessment for local streets within the City of Huntington Park. L-15-13

x. At Slauson/Alameda West, there is an identified mitigation to add a separate right-turn lane on the southbound approach. There does not appear to be sufficient right-of-way to add a right-turn lane without right-of-way impacts to the building on the northwest corner (see photo below). How would this mitigation improvement be implemented without causing secondary right-of-way/relocation impacts? L-15-14

Southbound Alameda West, approaching the Slauson intersection (looking south, from north of the intersection).

L-15-14

xi. At Slauson/Santa Fe there is an identified mitigation to add a separate right-turn lane on the northbound approach. There does not appear to be sufficient right-of-way to add a right-turn lane without right-of-way impacts to the gas stations on the southeast and southwest corners (see photo below). Again, how would this mitigation improvement be implemented without causing secondary right-of-way/relocation impacts?

L-15-15

Northbound Santa Fe, approaching the Slauson intersection (looking north, from south of the intersection).

L-15-15

xii. At Slauson/Boyle there is an identified mitigation to add a separate right-turn lane on the eastbound approach. There does not appear to be sufficient right-of-way to add a right-turn lane without right-of-way impacts to the Staples parking lot, landscaping, and sign on the southwest corner (see photo below). How would this mitigation improvement be implemented without causing secondary right-of-way/relocation impacts?

Eastbound Slauson, approaching the Boyle intersection (looking east, from west of the intersection).

L-15-16

Any proposed improvements would need to be discussed and coordinated closely with the City of Huntington Park before any proposed measures can be considered viable mitigation strategies. Specifically, any plans to widen the street or convert lanes need to be adequately assessed along with other secondary financial and logistical impacts. Additionally, the City of Huntington Park would like Caltrans to evaluate to streets that will be impacted as a result of increased traffic. Cost for repairs to streets and sidewalks, especially along Florence Avenue, should be discussed with the City.

L-15-17

d. Air Quality

i. The RDEIR/SDEIS presented the overall emission changes for different study areas (SCAB, AOI, and I-710). Localized impacts to the near-road communities along the I-710 corridor were not identified. Although the project's Air Quality,

L-15-18

Greenhouse Gases, and Health Risk Technical Study (June 2017) included figures showing emission changes and incremental criteria pollutant concentrations along I-710, it is impossible to identify the impacted locations on these figures due to the large areas the figure covers. The City requests that areas adversely impacted by the project be presented in a legible manner with enough detail both graphically and in tabular form so an informed evaluation and understanding can be obtained. This assessment and documentation should be presented separately from the regional maps to clearly show the size of the impacted areas and the level of impacts. L-15-18

In addition, it is not clear what emissions are presented in Figures 4-1a through 4-1c of the Air Quality, Greenhouse Gases, and Health Risk Technical Study. The figures appear to show emission changes for both $PM_{2.5}$ and PM_{10} in each figure. However, the table title indicates that the figure is only for $PM_{2.5}$ emissions. Within each figure, two sub-figures were labeled as PM_{10}, and the rest of the two sub-figures do not have any labels. The City requests that the figure titles and labels be revised to again clearly indicate the corresponding pollutant for each figure and to facilitate an understanding of the information/results being illustrated/presented. L-15-19

ii. Locations of potential cancer risk increases were not discussed in the RDEIR/SDEIS, other than a general discussion indicating that increased cancer risk would occur "within 110 yards of the I-710 freeway". Although figures showing cancer isopleths are included in the Air Quality, Greenhouse Gases, and Health Risk Technical Study (June 2017), it is impossible to identify the areas with increased cancer risks on these figures due to the large area the figure covers. The City requests that areas identified with increased cancer risks be presented in a legible manner with enough detail both graphically and in tabular form so an informed evaluation and understanding can be obtained. This assessment and documentation should be provided separately from the regional maps to clearly show the impacted communities and level of cancer risk increases. L-15-20

iii. Table 4.2-1 of the RDEIR/SDEIS showed that all project alternatives would have decreased cancer risks when compared to the 2012 baseline. However, the paragraph following the table on Page 4-55 concluded that the cancer risks would increase by 1 in a million for Alternative 7, and would increase by 3 in a million for Alternative 5C. The City request clarification and internal consistency on the results of the health risk assessment. L-15-21

e. **Comments on newly proposed alternatives and design options**

i. **Slauson Boulevard Interchange**: The City supports the construction of a new interchange at Slauson Boulevard. This interchange would provide additional needed access to the I-710 corridor. L-15-22

ii. **Support for Limiting Impact to Exiting State Right-of-Way**: The City appreciates Caltrans efforts to limit the impacts to the exiting right-of-way and reducing impacts in the form of property acquisition. L-15-23

iii. **Support for Zero Emission Design Options**: The City fully supports all efforts to reduce emissions within the I-710 Corridor. L-15-24

The City is committed to our continued partnership through the project development process and we look forward to working with Caltrans to resolve the aforementioned issues for this important transportation project. Please direct any questions and coordination efforts to Juan Arauz at (323) 584-6270.

Sincerely,

Sergio Infanzon
Community Development Director

L-15-1

It was not known at this time this document was prepared where specific relocation housing would be located should a build alternative be selected as the Preferred Alternative. Typically, the right-of-way acquisition process would not commence until the Final EIR/EIS and a Record of Decision for a build alternative has been approved, funding is secured, and final design is underway. Additionally, the details of relocation properties are also subject to the local real estate market conditions at the time. However, Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), has identified Alternative 1 (No Build) as the Preferred Alternative. Please refer to Section 1.1 of this appendix for more detail.

L-15-2

It should be clarified that Section 3.3.2.4, Environmental Consequences, of the RDEIR/SDEIS and this Final EIR/EIS indicates that adequate comparable replacement housing exists in general within the Study Area, with the exception of special properties such as mobile homes. In addition, no displacements are proposed under the build alternatives within the City of Huntington Park. According to the *Final Relocation Impact Report* (March 2019), Huntington Park was identified as part of the "replacement area" analyzed for available housing stock and as a basis for relocation resources should a build alternative be selected as the Preferred Alternative. However, it should be noted that Caltrans shall, wherever feasible, relocate displaced persons within their existing communities/cities. The relocation of businesses and residential properties is ultimately decided by the displacee. It should also be noted that real estate markets and availability can change drastically from the time an environmental document is prepared to the time a build alternative is constructed, and so a detailed analysis of potential relocations from surrounding communities impacting the City of Huntington Park's current and projected housing supply would be highly speculative. In addition, as stated in Response to Comment L-15-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, relocations would no longer be necessary.

L-15-3

Section 3.5 of this Final EIR/EIS has been updated to reflect that the Slauson Avenue/Boyle Avenue intersection is a shared jurisdiction between the cities of Huntington Park and Vernon. As stated in Section 3.5.4 of the RDEIR/SDEIS and this Final EIR/EIS, mitigation for impacts to local intersections by the build alternatives would be implemented by Caltrans as the lead agency in coordination with the local jurisdiction (if applicable and should a build alternative be selected as the Preferred Alternative). Therefore, should a build alternative be selected as the Preferred Alternative, any modifications to the Slauson Avenue/Boyle Avenue intersection would be coordinated with both the cities of Huntington Park and Vernon. However, as stated in

Response to Comment L-15-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, modifications to the Slauson Avenue/Boyle Avenue intersection are no longer necessary.

L-15-4

The explanation of why 400 daily port trucks are forecast to travel on Slauson Avenue west of Atlantic Boulevard in Alternative 7 compared to none under the 2035 No Build Alternative, is that the freight corridor proposed in Alternative 7 has entrance and exit ramps at Slauson Avenue. The freight corridor would attract Port (and non-Port) truck trips from other routes due to the travel time savings it would offer for a subset of truck trip origins and destinations in the I-710 Corridor. Those Port truck trips using the freight corridor that would be destined for land uses on or near Slauson Avenue west of Atlantic Avenue would likely use Slauson Avenue to get to those locations.

The decline in forecast auto volumes between Alternative 1 and Alternative 7 on Slauson Avenue west of Atlantic Avenue is a consequence of the traffic forecasting model reallocating auto trips among different roadways such that each are on the streets that would give them the quickest route to their destinations. The freight corridor under Alternative 7 would shift some truck traffic from the I-710 general purpose lanes to the freight corridor, which would free up capacity on the I-710 general purpose lanes for more auto traffic. Some of this auto traffic would shift from arterial streets, including Slauson Avenue, to the I-710 in order to take advantage of the shorter travel times that would be provided in Alternative 7 compared to the No Build Alternative.

L-15-5

The City's concern regarding the projected increase in delay under Alternative 7 at the referenced intersections is acknowledged. However, Alternative 7 has not been identified as the Preferred Alternative. Please refer to Section 1.1 of this appendix for a discussion on the identification of the Preferred Alternative. Both the Slauson Avenue/Alameda Street and Slauson Avenue/Santa Fe Avenue intersections would not be impacted by Alternative 5C. However, under future year No Build Alternative conditions, the Slauson Avenue/Boyle Avenue intersection is projected to experience LOS F in the p.m. peak hour, and Alternative 5C would add approximately six seconds of delay to this intersection in the p.m. peak hour. For those intersections that are projected to be highly congested under the future No Build Alternative (i.e., LOS E or worse), only relatively minor increases in delay are sufficient to trigger potential impacts. As a result, mitigation is proposed for Slauson Avenue/Boyle Avenue (Measure TR-1) that would improve this intersection from LOS F to LOS E in the p.m. peak hour. The proposed improvements were included in the text of Measure TR-1 (which would apply if a build alternative is selected as the Preferred Alternative), found in Section 3.5.4 of the RDEIR/SDEIS; please also refer to Appendix E in the *Intersection Traffic Impact Analysis Report* (March 2017)

for a conceptual sketch of these improvements. However, as stated in Response to Comment L-15-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, mitigation for the build alternatives will no longer be necessary at the Slauson Avenue/Boyle Avenue intersection.

L-15-6

As stated in Response to Comment L-15-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, mitigation will no longer be necessary within the City of Huntington Park. Please also refer to Response to Comment L-15-5 regarding impacts to the Slauson Ave./Alameda St., Slauson Ave./Santa Fe Ave., and Slauson Ave./Boyle Ave. intersections.

L-15-7

Truck volumes were estimated as part of the vehicle flows on major arterials and analysis calculations within the I-710 Study Area, including Huntington Park. Quantitative information on freeway Levels of Service (LOS) associated with the build alternatives on I-710 is reported in the *I-710 Corridor Project Traffic Operations Analysis Report* (March 2017). Levels of service as characterized by volume-to-capacity (VC) estimates for the major arterials for the build alternatives were quantified and are mapped in Figure 6-1 of the *Intersection Traffic Impact Analysis Report* (March 2017). Figure 6-1 shows no degradation of arterial roadway segment LOS levels for the build alternatives relative to No Build future conditions (Figure 5-4) within the City of Huntington Park. Impact thresholds focus on the study intersections, as that is where the delay to motorists using the arterial network typically occurs and where the quantitative traffic analysis is most sensitive to changes in traffic flows and traffic movements associated with the build alternatives. A detailed discussion of intersection impact thresholds and methodologies can be found in Section 2.2 of the *Intersection Traffic Impact Analysis Report* (March 2017)

L-15-8

The selection of the arterial roadway segments to include in the traffic analyses performed in support of the RDEIR/SDEIS was determined based upon the role that these major arterial roadways perform with regard to I-710 as well as the regional arterial network. Generally, contiguous north-south arterials of sufficient length that run parallel to the 19-mile I-710 Corridor, and the east-west arterials that have an interchange with I-710 were identified for evaluation, as these regionally significant facilities would be most likely to be influenced by circulation changes on I-710 generated by the build alternatives. Based on volumes reported on the approach legs for the Slauson Ave./Santa Fe Ave. intersection, there would be no appreciable change to traffic on Santa Fe Ave. within the City of Huntington Beach under the build alternatives. Please refer to Figures 5-6.f, 6-3.f, and 6-8.f in the *Intersection Traffic Impact Analysis Report* (March 2017) for detailed information. In addition, as described in Response to

Comment L-15-5, the intersection of Slauson Ave./Santa Fe Ave. would not be impacted by the build alternatives.

L-15-9

A detailed discussion of intersection impact thresholds and methodologies can be found in Section 7 of the *Intersection Traffic Impact Analysis Report* (March 2017), and summarized in Section 3.5.3.1 of the RDEIR/SDEIS. Impact thresholds focus on the study intersections, as that is where the delay to motorists using the arterial network typically occurs, and where the quantitative traffic analysis is most sensitive to changes in traffic flows and traffic movements associated with the build alternatives. While the criteria used to determine LOS for signalized intersections does differ from unsignalized intersections – please refer to Section 2.2.2.1 and Section 2.2.2.2, respectively, of the *Intersection Traffic Impact Analysis Report* (March 2017) for this detailed discussion – the impact thresholds are the same for both signalized and unsignalized intersections.

L-15-10

As discussed in Section 3.5.3.1 of the RDEIR/SDEIS and this Final EIR/EIS, the build alternatives would provide facilities for bicycles and pedestrians in locations *where local roadways are affected by the construction of the build alternatives* [italics added]. Should a build alternative be selected as the Preferred Alternative, these facilities would be designed consistent with the local General Plan Circulation Element and would comply with ADA requirements. The build alternatives would improve pedestrian facilities (sidewalks) by replacing those that would be removed as part of the build alternatives. Bike travel would also be improved under the build alternatives by providing new pavement on the arterial bridges that would be replaced over I-710 and the Los Angeles River. Class I Bikeways within the Study Area would be maintained with the proposed build alternatives.

The addition of the pedestrian and bicycle-only overcrossings under the build alternatives, proposed at locations in which gaps in freeway crossing opportunities have been identified, would also improve pedestrian and bicycle travel within the I-710 Corridor by introducing new connectivity points traversing the I-710 and the Los Angeles River (and in the case of the Pacific Place overcrossing, the I-405 and Metro Blue Line). Therefore, bicycle and pedestrian facilities provided as a result of the build alternatives would be equal to or better than the current condition.

L-15-11

As discussed in Section 3.5.3.1 of the RDEIR/SDEIS and this Final EIR/EIS, under the build alternatives, access to the Los Angeles River Trail would be maintained or upgraded as a result of modifications to trail entrances at the arterial highways that cross the trail. As discussed in

Section 3.24.3.1 of the RDEIR/SDEIS and this Final EIR/EIS, construction of the build alternatives would result in temporary impacts to pedestrian and bicyclist access points to regional and local trails and bikeways (including the Los Angeles River Trail), and short-term closures of segments of bikeways in the vicinity of new and/or modified interchanges. As discussed in Section 3.1.3.3 of the RDEIR/SDEIS and this Final EIR/EIS, should a build alternative be selected as the Preferred Alternative, Measures PR-17 through PR-20 would be implemented to minimize temporary impacts resulting from short-term changes in access to, and closures of, the Los Angeles River Trail during construction.

L-15-12

Most of the discussion related to the relative safety and operational effects of the build alternatives focus on the conceptual design of the improvements that take place on the I-710 freeway mainline, local interchanges and ramp intersections, and freeway to freeway interchanges with I-405, SR-91, I-105, and I-5. Safety and traffic issues associated with different I-710 interchange design concepts of the build alternatives are evaluated and discussed in the Intersection Control Evaluation (ICE) reports prepared in support of the Project Report. In addition, an assessment of the relative safety performance of the alternatives was developed as part of the evaluation process used to select the Preferred Alternative. This technical, evaluative information on I-710 safety and operations was presented and discussed in a public forum with the I-710 advisory committees, community groups, and key stakeholders during the period from October 2017 to January 2018. As evidenced in the traffic volume schematics for the arterial system presented in Section 6.1.2 of the *Intersection Traffic Impact Analysis Report* (March 2017), any traffic or operational effects of the build alternatives become more dispersed and muted on the arterial system as the distance from the I-710 freeway increases. Table 6-3 provides a side-by-side comparison of the relative increases and decreases in traffic operation service levels of the build alternatives relative to no build conditions for key intersections throughout the I-710 Study Area. Within the City of Huntington Park, there is no difference in LOS or the changes are so minor that safety would not be materially affected either way.

L-15-13

The reference to “induced truck traffic” within the context of this comment regarding page 6-20 of the *I-710 Corridor Project Traffic Operations Analysis Report* (March 2017) does not refer to new truck trips traveling on SR-91 created by Alternative 7 that are not forecast in the No Build Alternative. Rather, it refers to truck trips that have rerouted part or all of their trips to utilize I-710 under Alternative 7 and then connect to SR-91. This rerouting is a result of the reduction of travel time for a portion of truck trips due to the availability of the dedicated freight corridor that was proposed under Alternative 7, which includes direct truck only connector ramps to/from SR-91. The streets within the City of Huntington Park would generally see a decrease in truck traffic under either Build Alternative, as some of those trucks would reroute a greater proportion of

their trip onto the I-710 and off of City streets. This is due to Alternative 7 offering a travel time savings compared to other possible truck routes that would travel on City streets.

L-15-14

The conceptual sketches illustrating the mitigation measure (Measure TR-1) identified for the Slauson Ave./Alameda St. intersection indicate that a partial right-of-way acquisition would be needed to implement the mitigation identified under Alternative 7. This intersection was identified to be adversely impacted only under Alternative 7 and is not projected to have any impacts under Alternative 5C. As stated in Response to Comment L-15-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, Measure TR-1 is not applicable to this intersection.

L-15-15

The conceptual sketches illustrating the mitigation measure (Measure TR-1) identified for the Slauson Ave./Santa Fe Ave. intersection indicate that a partial right-of-way acquisition would be needed to implement the mitigation identified under Alternative 7. This intersection was identified to be adversely impacted only under Alternative 7 and would not have any impacts under Alternative 5C. As stated in Response to Comment L-15-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, Measure TR-1 is not applicable to this intersection.

L-15-16

The conceptual sketches illustrating the mitigation measure identified at the Slauson Ave./Boyle Ave. intersection indicate that a partial right-of-way acquisition would be necessary to implement the proposed mitigation. For reference, the conceptual sketches are included as Appendix E in the *Intersection Traffic Impact Analysis Report* (March 2017). However, As stated in Response to Comment L-15-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there would not be any impacts from the proposed mitigation.

L-15-17

Impacts to local intersections from increases in traffic were analyzed in Section 3.5, Traffic and Transportation/Pedestrian and Bicycle Facilities, of the RDEIR/SDEIS and this Final EIR/EIS. Impacted intersections are shown in Figure 3.5-8 and summarized in Table 3.5-23. As discussed in Table 3.5-23 and Measure TR-1, improvements are proposed at the impacted intersections to mitigate for impacts related to the build alternatives. As discussed in Section 3.5.4 of the RDEIR/SDEIS and this Final EIR/EIS, should a build alternative be selected as the Preferred Alternative, Caltrans would coordinate local intersection improvements with the local jurisdictions. These improvements would be funded as mitigation due to impacts related to the

build alternatives. As discussed in Measure CON-TR-2 in Section 3.24.4.5 of the RDEIR/SDEIS and this Final EIR/EIS, should a build alternative be selected as the Preferred Alternative, prior to construction, new pavement would be provided on local arterials that connect to or cross over (or under) I-710 if they are damaged or affected by construction. However, As stated in Response to Comment L-15-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there is no need to coordinate with the City of Huntington Park regarding mitigation strategies or cost for repairs to streets and sidewalks.

L-15-18

Impacts to near-roadway receptors were discussed in Section 3.13, Air Quality, and depicted on the maps in Appendix Q of the RDEIR/SDEIS and this Final EIR/EIS. As discussed in the Air Quality section and shown in Appendix Q, along I-710, air quality would be improved and public health risk would be reduced at most locations, but there are a few near-roadway locations within 100 meters of I-710 or the freight corridor (in the case of Alternative 7) where there would be an increase in certain emissions. Please refer to Figures 3.3-4 through Figure 3.3-9 in this Final EIR/EIS for larger scale contour maps of PM_{10} emissions, $PM_{2.5}$ emissions, and cancer risk for Alternatives 5C and 7.

L-15-19

Figures 4-1a through 4-1c of Appendix Q, AQ/HRA Maps, of the RDEIR/SDEIS, depicted both $PM_{2.5}$ and PM_{10} emissions. On these figures, the larger map depicts $PM_{2.5}$ emissions. The smaller inset shows PM_{10} emissions.

L-15-20

As discussed in the Air Quality, Greenhouse Gas, and Health Risk Assessment Technical Report, cancer risk would decrease in residential areas and at sensitive receptors (e.g., schools, hospitals, daycare and elder care centers, etc.) for all 2035 build alternatives when compared to the 2010 baseline, with the greatest reductions generally occurring for Alternative 7. When compared to the 2035 No Build Alternative, both build alternatives would reduce cancer risk at most locations; however, a small increase in cancer risk would occur at some locations within 100 meters of I-710. For Alternative 5C, the maximum increase in risk would be approximately three in one million. The primary location of the increased risk for Alternative 5C would be along a small portion of I-710 just south of SR-60. For Alternative 7, the increase in risk would be less than one in one million. Section 4.2.4.1 in this Final EIR/EIS was revised to include this additional clarification.

L-15-21

The discussion of cancer risk in Section 4.2.4.1 in this Final EIR/EIS was revised to clarify that cancer risk would increase at some locations for the 2035 build alternatives compared to the 2035 No Build Alternative. However, cancer risk would decrease for the 2035 build alternatives compared to the 2012 Baseline.

L-15-22

The City's support for construction of a new interchange at Slauson Blvd. is noted and included in the project record. However, As stated in Response to Comment L-15-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, construction of a new interchange at Slauson Blvd. will not occur with this project.

L-15-23

The City's support for limiting impacts to the existing state right-of-way and reducing impacts in the form of property acquisition are acknowledged and included in the project record. However, As stated in Response to Comment L-15-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there will be no impacts to the existing state right-of-way or a need to acquire property.

L-15-24

The City of Huntington Park's support of a ZE design option is acknowledged and included in the project record. Please refer to Section 1.1 of this appendix for a discussion on the identification of the Preferred Alternative and to Section 1.3 of this appendix for additional discussion of ZE options.

Los Angeles, CA 90012

SUBJECT: PROJECT NAME: I-710 Corridor Project
PROJECT LOCATION: I-710 between Ocean Blvd. and State Route 60
STATE CLEARINGHOUSE NUMBER: 2008081042

Presented below are comments submitted on behalf of the Los Angeles Unified School District (LAUSD) regarding the Recirculated Environmental Impact Report/Supplemental Draft Environmental Impact Statement for the proposed I-710 Corridor Project (Project). Due to the proximity of Humphreys Avenue Elementary School (ES), Ford Boulevard ES, Slawson Occupational Center, Ellen Ochoa Learning Center, Heliotrope Avenue ES, Marianna ES, Perez Special Education Center, Park Avenue ES, Legacy HS, Dominguez ES, and Maywood ES to the proposed Project corridor, LAUSD is concerned about the potential negative impacts of the Project on our students and staff.

Air Quality

Construction

Construction activities for the proposed Project would result in short term impacts on ambient air quality in the area surrounding the Project corridor resulting from equipment emissions and fugitive dust. To ensure that effective mitigation is applied to reduce construction air pollutant impacts on District schools, we ask that the following language be included as a mitigation measure for air quality impacts:

- If the proposed mitigation measures do not reduce air quality impacts to a level of insignificance, the Project applicant shall develop new and appropriate measures. Provisions shall be made to allow the school and or designated representative(s) to notify the Project applicant when new or more stringent measures are warranted to effectively reduce adverse air quality impacts at the affected schools.

L-16-1

Operation

Humphreys Avenue ES – Humphreys Avenue ES was identified as a sensitive receptor location that would experience increased pollutants and would be subject to an increase in cancer risk under Alternative 5C and 7. Mitigation Measure C-8 states that if Alternative 5C or 7 are selected, "upgraded or new filtration or heating, ventilation, and air conditioning (HVAC) systems will be

L-16-2

provided for" Humphreys ES. LAUSD concurs that this mitigation should be included and requests that the Mitigation Measure be revised to state that, due to the adjacency of Humphreys Avenue ES to the Project corridor, a high-performance panel filter (HP-PF) system with a Minimum Performance Reporting Value (MERV) of 16 will be provided for Humphreys Avenue ES. In addition, as the cost of the high-performance panel filters are expected to exceed the cost of the filters currently in use, the mitigation measure should stipulate that the Project would fund in perpetuity the difference in cost between the high-performance filters and the filters currently being used.

Slawson Occupational Center – Given that the Slawson Occupational Center is located adjacent to the Project corridor, LAUSD requests that mitigation be provided stipulating that a HP-PF with a MERV 16 rating be included at Slawson Occupational Center. If the current HVAC cannot accommodate MERV 16 filters, a new system or retrofits to the existing system that will allow for MERV 16 filters would be provided. In addition, as the cost of the high-performance panel filters are expected to exceed the cost of the filters currently in use, the mitigation measure should stipulate that the Project would fund in perpetuity the difference in cost between the high-performance filters and the filters currently being used. L-16-2

Additional District Schools – The Project includes Mitigation Measure AQ-2, which would require that:

> To further reduce exposure of children and other people to near roadway emissions, air filtration systems shall be provided for any of the following schools within 0.25 mile of I-710 that currently lack adequate air filtration systems. As stated in the California Air Resources Board (ARB) Technical Advisory (April 2017), high-efficiency filters in ventilation systems can remove from 50 to 99 percent of the particles in the air.

District schools within 0.25 miles of the Project corridor include Park Avenue ES, Legacy HS, Dominguez ES, Slawson Occupational Center, Ford Boulevard ES, Humphreys ES, Ellen Ochoa Learning Center, Marianna ES, and Perez Special Education Center. LAUSD requests that this mitigation measure be revised to include all the above District schools. For those schools within 0.25 mile of, but not immediately adjacent to, the Project corridor, the mitigation should stipulate that air filtration systems with a MERV 13 rating be provided and, if the existing HVAC system will not accommodate MERV 13 filters, an HVAC system that will accommodate the appropriate level of filtration would be provided. In addition, the mitigation measure should stipulate that the Project would fund in perpetuity the difference in cost between the MERV 13 rated filters and the filters currently being used. L-16-3

Noise and Vibration

LAUSD established maximum allowable noise levels to protect students and staff from noise impacts generated in terms of L_{eq}. These standards were established based on the California High Performance Schools (CHPS) noise criteria. LAUSD's exterior noise standard is 67 dBA L_{eq}, which is consistent with the exterior noise standard used in the noise analysis for the Project. LAUSD's interior noise standard is 45 dBA L_{eq}, which is more stringent than the 52 dBA Leq that was used in the DEIS/DEIR. In addition, a noise level increase of 3 dBA or more over ambient noise levels is considered significant for existing schools and would require mitigation to achieve levels within 2 dBA of pre-Project ambient level. LAUSD requests that the Project noise impacts be analyzed in accordance with LAUSD's 45 dBA L_{eq} interior noise standard and 3 dBA increase threshold. L-16-4

Construction

To ensure that effective mitigations are employed to reduce construction related noise impacts on District sites, we ask that the following language be included in the mitigation measures for noise impacts:

- If the proposed mitigation measures do not reduce noise impacts to a level of insignificance, the Project applicant shall develop new and appropriate measures. Provisions shall be made to allow the school and or designated representative(s) to notify the Project applicant when new or more stringent measures are warranted to effectively reduce adverse construction-related noise impacts at the affected schools. L-16-5

Operation

Humphreys Avenue ES – The REIR/SEIS indicates that freeway traffic noise impacts have been predicted for Humphreys Avenue ES. It is unclear whether the REIR/SEIS concludes that this is a significant and unavoidable impact; however, the lack of any proposed mitigation for this impact suggests that it is a significant and unavoidable impact. If the finding is that the noise impacts at Humphreys ES is significant and unavoidable, this should be clearly stated in the REIR/SEIS. The REIR/SEIS ruled out extending the height of the existing soundwall between Humphreys ES and the 710 from 12 feet to 16 feet because the increase in height would only provide a noise level reduction of one to two dB and would not provide the minimum required noise reduction of five dB for acoustical feasibility. L-16-6

With Alternatve 5C the difference between the build and no-build alternative would be 4.8 dB. With a 16-foot sound wall the increase would be lowered to 2.8 dB and would be less than significant. Therefore, the District requests that a 16-foot soundwall be installed between Humphreys ES and the Project corridor.

Slawson Occupational Center – As previously discussed, given that the Slawson Occupational Center is located adjacent to I-710 and given that Appendix L of the REIR/SEIS indicates that a partial portion of the Occupational Center parcel would be acquired under the Project's build alternatives, it is likely that noise impacts would occur as a result of the Project and evidence is needed to support the statement that the Project will not directly or indirectly impact the Occupational Center. In addition, concept plans in Appendix O show Project components (freight corridor feature, structure and bypass feature/structure, express lane, local feature/structure, ramps, and other improvements) crossing the Slawson Occupational Center parcel. With the Project planning new construction on the Slawson Occupational Center parcel, the District requests that a thorough analysis of the potential noise and vibration impacts of the proposed Project to the Occupational Center be conducted. L-16-7

Ford Boulevard ES – The Community Impact Assessment states that Ford Boulevard ES, "is not located adjacent to the I-710 mainline or along arterials impacted as a result of the I-710 Corridor Project build alternatives," then concludes that, "therefore, the I-710 Corridor Project build alternatives would not result in direct or indirect impacts to this school." As Ford Boulevard ES is only 300 feet from the existing I-710 corridor, the District requests that an analysis of the potential noise impacts of the proposed Project on Ford Boulevard ES be conducted. L-16-8

Traffic/Transportation

LAUSD understands that the proposed Project would have traffic impacts during construction. LAUSD's Transportation Branch **must be contacted** at (213) 580-2950 regarding the potential impact upon existing school bus routes. The Project Manager or designee will have to notify the LAUSD Transportation Branch of the expected start and ending dates for various portions of the Project that may affect traffic within nearby school areas. To ensure that effective mitigations are employed to reduce construction and operation related transportation impacts on District sites, we ask that the following language be included in the mitigation measures for traffic impacts:

- School buses must have unrestricted access to schools.
- During the construction phase, truck traffic and construction vehicles may not cause traffic delays for our transported students.
- During and after construction changed traffic patterns, lane adjustment, traffic light patterns, and altered bus stops may not affect school buses' on-time performance and passenger safety. L-16-9
- Construction trucks and other vehicles are required to stop when encountering school buses using red-flashing-lights must-stop-indicators per the California Vehicle Code.
- Contractors must install and maintain appropriate traffic controls (signs and signals) to ensure vehicular safety.
- Contractors must maintain ongoing communication with LAUSD school administrators, providing sufficient notice to forewarn children and parents when existing vehicle routes to school may be impacted.
- Parents dropping off their children must have access to the passenger loading areas.

Ford Boulevard ES – As previously discussed, Ford Boulevard ES is only 300 feet from the existing I-710 corridor; therefore, the District requests that an analysis of the potential traffic impacts of the proposed Project on Ford Boulevard ES be conducted. L-16-10

Pedestrian Safety

Construction activities that include street closures, the presence of heavy equipment, and increased truck trips to haul materials on and off the Project site can lead to safety hazards for people walking in the vicinity of the construction site. To ensure that effective mitigations are employed to reduce construction and operation related pedestrian safety impacts on District sites, we ask that the following language be included in the mitigation measures for pedestrian safety impacts:

- Contractors must maintain ongoing communication with LAUSD school administrators at all schools within 0.25-mile of the corridor or at schools beyond 0.25 miles where temporary traffic impacts were identified, providing sufficient notice to forewarn children and parents when existing pedestrian routes to school may be impacted. L-16-11
- Contractors must maintain safe and convenient pedestrian routes to all nearby schools. The District will provide School Pedestrian Route Maps upon your request, which are also available on our website at: https://achieve.lausd.net/Page/3990.
- Contractors must install and maintain appropriate traffic controls (signs and signals) to ensure pedestrian and vehicular safety.
- Haul routes are not to pass by ***any*** school, except when school is ***not*** in session.

- No staging or parking of construction-related vehicles, including worker-transport vehicles, will occur on or adjacent to a school property.
- Funding for crossing guards and/or flag person(s) at the contractor's expense is required when safety of children may be compromised by construction-related activities at impacted school crossings.
- Barriers and/or fencing must be installed to secure construction equipment and to minimize trespassing, vandalism, short-cut attractions, and attractive nuisances.
- Contractors are required to provide security patrols (at their expense) to minimize trespassing, vandalism, and short-cut attractions.

L-16-11

Ford Boulevard ES – As previously discussed, Ford Boulevard ES is only 300 feet from the existing I-710 corridor; therefore, the District requests that an analysis of the potential pedestrian safety impacts of the proposed Project on Ford Boulevard ES be conducted.

L-16-12

The District's charge is to protect the health and safety of students and staff, and the integrity of the learning environment. The comments presented above identify potential environmental impacts related to the proposed Project that must be addressed to ensure the welfare of the students attending District schools, their teachers and the staff, as well as to assuage the concerns of the parents and guardians of these students. Therefore, the measures set forth in these comments should be adopted by Caltrans as conditions of Project approval to offset unmitigated impacts on the affected school students and staff.

Thank you for your attention to this matter. If you need additional information please contact me at (213) 241-3199.

Regards,

Patrick A. Schanen, P. G.,
Environmental Health Manager
LAUSD, Office of Environmental Health & Safety

L-16-1

Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), has identified Alternative 1 (No Build) as the Preferred Alternative. Please refer to Section 1.1 of this appendix for more detail. Therefore, Measure AQ-2 in Section 3.13.4 of this Final EIR/EIS does not need to be revised to require filters on the ventilation systems of schools near I-710 ***prior*** to construction.

L-16-2

As stated in Section 3.13.4 of the RDEIS/SDEIS and this Final EIR/EIS, should a build alternative be selected as the Preferred Alternative, mitigation measure AQ-2 would require filters on the ventilation systems of schools located within 0.25 mile of the I-710 freeway that currently lack such filtration systems (including the Slawson Southeast Occupational Center). However, as stated in Response to Comment L-16-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, specifics regarding the air filtration systems to be provided to the listed facilities does not need to be determined.

L-16-3

As stated in Section 3.13.4 of the RDEIS/SDEIS and this Final EIR/EIS, should a build alternative be selected as the Preferred Alternative, Measure AQ-2 would require filters on the ventilation systems of schools located within 0.25 mile of the I-710 freeway that currently lack such filtration systems. However, Marianna Elementary School, the Perez Special Education Center, and Legacy High School are more than 0.25 mile from the improvements proposed under the build alternatives and are, therefore, not included under Measure AQ-2. Dominguez Elementary School meets the criteria and has been added to the text of Measure AQ-2. However, as stated in Response to Comment L-16-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, Measure AQ-2 will not be implemented. However, please refer to Section 1.10 of this appendix for a discussion on the Community Health Benefit Program and how it may be implemented by other agencies separate from this Final EIR/EIS.

L-16-4

It is acknowledged that LAUSD's interior noise standard of 45 dBA L_{eq} is more stringent than Caltrans 52 dBA L_{eq} and that LAUSD considered a noise increase of 3 dBA significant. CEQA requires that an EIR identify the significant environmental effects of a project (State CEQA Guidelines Section 15126), but does not promulgate specific thresholds for significance. Instead, State CEQA Guidelines Section 15064(b) states that "the determination...calls for careful judgment on the part of the public agency involved..." and that "an ironclad definition of

significant effect is not possible because the significance of an activity may vary with the setting." CEQA encourages lead agencies to develop and publish their own thresholds of significance for the purpose of determining the significant effects of their projects. Caltrans Noise Abatement Criteria (NAC) are published in the Caltrans Traffic Noise Analysis Protocol, which establishes an interior NAC of 52 dBA-L_{eq}(h) for schools. As discussed in Section 4.2.3.6, Noise, in Chapter 4.0, CEQA Evaluation, of the RDEIR/SDEIS, the Federal NAC was used as the "applicable standards of other agencies" and a 12 dBA increase in noise over existing levels is considered the "substantial permanent increase" for the CEQA analysis. None of the school interior classroom noise levels approached or exceeded the NAC of 52 dBA-L_{eq}(h) with the build alternatives. However, regardless of the noise threshold utilized, the only LAUSD school adjacent to I-710 is Humphreys Avenue Elementary School, as shown in Figure 3.3-1, Community Facilities, in Section 3.3, Community Impacts. An existing 12-foot soundwall is already in place along I-710 to reduce noise levels at Humphrey Avenue Elementary School. Therefore, utilizing the LAUSD interior noise standard would not change the findings or conclusions of the RDEIR/SDEIS regarding noise impacts.

L-16-5

Please refer to Response to Comment L-16-4. The only school in close enough proximity to be affected by noise generated by the build alternatives is Humphreys Avenue Elementary School. However, there is already an existing 12-foot soundwall in place along I-710 to reduce noise levels at Humphreys Avenue Elementary School.

L-16-6

As indicated in Section 4.2.3.6 of the Final EIR/EIS, there would be no significant and unavoidable adverse noise impacts under either Alternative 5C or Alternative 7. Per the Caltrans Traffic Noise Analysis Protocol, a noise increase is defined as "substantial" when the predicted noise levels under build conditions exceed existing noise levels by 12 dBA, which is considered the "substantial permanent increase" per CEQA Checklist question XII.C. As indicated in the comment, the predicted noise level at the referenced location exceeds the existing noise levels by 4.8 dBA. For reference, although a 5 dBA increase in noise is considered readily perceptible to the human ear[1]; the increase of 4.8 dBA is not considered significant under CEQA. Additionally, the reduction of one to two dBA that would be realized from an increase in height of the soundwall in question would not be perceptible to the human ear (a sound level change of 3 dBA is considered the level at which one perceives as "barely

[1] Federal Highway Administration. 2017. Noise. Highway Traffic Noise Analysis and Abatement Policy and Guidance. Website: https://www.fhwa.dot.gov/environMent/noise/regulations and_guidance/ polguide/polguide 02.cfm (accessed July 18, 2018).

perceptible"). Therefore, no change to the existing soundwall at this location is proposed under the build alternatives.

L-16-7

Although considered an educational facility, the Slawson Occupational Center does not meet the definition of a school as provided for in California Streets and Highways Code Section 216, which describes a school as "a public or private elementary or secondary school,[2]" or colloquially, kindergarten through 12th grade compulsory education. The Slawson Occupational Center is an adult education facility and is therefore not considered a noise-sensitive land use as defined by the Caltrans Traffic Noise Analysis Protocol. Noise-sensitive land uses include residences, active sport areas, hospitals, libraries, parks, places of worship, etc. Noise abatement is considered only where frequent human use occurs and where a lowered noise level would be of benefit. In addition, there are no defined exterior areas of frequent human use at the Occupational Center that would benefit from a lowered noise level.

L-16-8

A detailed analysis of the potential noise impacts in the area of Ford Boulevard Elementary School was contained in Section 3.14, Noise, of the RDEIR/SDEIS and this Final EIR/EIS. As is stated in Section 3.14.4.10, under the build alternatives, two 16-foot soundwalls are recommended for construction, replacing existing 12-foot soundwalls. The proposed walls would provide up to a 10 dBA noise reduction to receptors between Olympic Boulevard and Humphreys Avenue along northbound I-710, including at Ford Boulevard Elementary School. However, as stated in Response to Comment L-16-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, no soundwalls will be constructed as a part of this project.

L-16-9

As detailed in Measure CON-U&ES-1, prior to and during construction, should a build alternative be selected as the Preferred Alternative, Caltrans and the Construction Contractor would coordinate all temporary ramp closures and detour plans with local school districts and individual schools as identified by the school districts to minimize temporary delays to school bus services and to minimize effects on students who walk to school, including ensuring that pedestrian detours are safe for student use. In addition, Measure CON-TR-1 indicates that, should a build alternative be selected as the Preferred Alternative, the TMP would include public outreach, including information on current and upcoming construction activities, lane and

[2] FindLaw. For Legal Professionals. 2018. California Code, Streets and Highways Code, SHC Section 216. Website: https://codes.findlaw.com/ca/streets-and-highways-code/shc-sect-216.html (accessed July 18, 2018).

other closures, detours, and other information to assist residents, students, visitors, and business patrons to more effectively travel around and in the vicinity of active construction areas. However, as stated in Response to Comment L-16-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, temporary ramp closures and detour plans will not be necessary.

L-16-10

Per the District's request, this segment of Ford Boulevard between Olympic Boulevard and Verona Street was investigated further to better understand the long-term operational effects of the proposed project under future year (2035) traffic conditions. The overall traffic network is projected to be saturated in the future year. Both Alternative 5C and No Build Alternative traffic volumes from the I-710 travel demand forecast model for this roadway link were examined. Ford Boulevard runs directly parallel with I-710 and serves as a key role in the arterial network, providing connections to I-710, to Olympic Boulevard, and to Whittier Boulevard. When traffic queues develop on I-710, it is not unusual for freeway traffic to divert to the arterial system, seeking alternative routes to bypass the freeway congestion. The build alternatives include the addition of auxiliary lanes to a highly congested segment of I-710 between I-5 and SR-60 to help ease existing and future traffic bottlenecks. As a consequence, the I-710 travel demand forecast model projects higher daily traffic volumes on this segment of I-710 and lower traffic volumes on Ford Boulevard between Olympic Boulevard and Verona Street for the build alternatives, relative to no build traffic conditions. However, as stated in Response to Comment L-16-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, additional analyses do not need to be conducted to determine the timing of construction, to finalize construction staging plans, or to develop a Transportation Management Plan detailing anticipated traffic diversion routes for the different construction stages of the build alternatives.

L-16-11

Safety of pedestrians during construction is of the utmost importance to both Caltrans and Metro. Please refer to Response to Comment L-16-9 regarding the elements of Measures CON-U&ES-1 and CON-TR-1 that address LAUSD's request for ongoing communication with LAUSD and safe and convenient pedestrian routes, should a build alternative be selected as the Preferred Alternative. Specific haul routes and staging/parking areas, including routes into and out of the staging/storage areas, had not been identified at the time this Final EIR/EIS was prepared, and typically are not known in detail until final design. Please also refer to Response to Comment L-16-10 regarding pedestrian safety.

L-16-12

Please refer to Response to Comment L-16-11 regarding pedestrian safety.

City of Downey

October 19, 2017

Ronald Kosinski RK
Caltrans District 7
Division of Environmental Planning
100 South Main Street, MS 164
Los Angeles, CA 90012

Re: **City of Downey's Written Comments on the I-710 Corridor Project Recirculated Draft Environmental Impact Report/Supplemental Draft Environmental Impact Statement (RDEIR/SDEIS)**

Dear Mr. Kosinski:

The City of Downey appreciates the opportunity to review and provide written comments on the Recirculated Draft Environmental Impact Report/Supplemental Draft Environmental Impact Statement (RDEIR/SDEIS) for the Interstate 710 (I-710) Corridor Project, dated July 2017. This letter represents the official comments from the City of Downey.

The technical review and comments provided herewith focus on the subject matters pertaining to Downey and are limited to that portion of the project study area in vicinity of Downey (primarily the Imperial Highway, Firestone Boulevard, and Florence Avenue interchange areas). The review comments are associated with the following sections of the RDEIR/SDEIS:

- Section 2.3 Project Alternatives (including Concept Plans in Appendix O)
- Section 3.1 Land Use
- Section 3.4 Utilities and Emergency Services
- Section 3.5 Traffic and Transportation/Pedestrian and Bicycle Facilities
- Section 3.24 Construction Impacts
- Section 3.25 Cumulative Impacts

The City thanks Caltrans in advance for their attention to the City's technical review comments on the I-710 Corridor Project and looks forward to working with Caltrans and Metro on this significant project.

If you have any questions regarding this letter, please do not hesitate to contact me at 562.904.7110 or enorris@downeyca.org.

Sincerely,

Edwin J. Norris, P.E.
Deputy Director of Public Works

BACKGROUND

The I-710 Corridor Project is being undertaken by the Department of Transportation (Caltrans) as the lead agency, in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro) as the sponsoring agency. The purpose of the project is to modernize a 19-mile segment of the I-710 corridor from Ocean Boulevard in Long Beach to State Route 60 (SR-60) in East Los Angeles, address projected growth and traffic demand, as well as improve air quality and public health, and traffic safety. A No Build and two build alternatives are being considered in the RDEIR/SDEIS, as briefly described below:

- Alternative 1 (No Build) would maintain the existing lane and interchange configuration with no additional improvements to be provided, other than those projects that are already funded and/or committed to be constructed by or before the planning horizon year 2035.
- Alternative 5C (Modernize the I-710 Freeway) would add up to one general purpose (GP) lane in each direction of I-710 between Anaheim Street in Long Beach and Olympic Boulevard in East Los Angeles.
- Alternative 7 (Add Clean-Emission Freight Corridor along I-710) would add two controlled-access truck lanes in each direction of I-710 from Anaheim Street in Long Beach to Washington Boulevard in Commerce.

The I-710 freeway is within ½ mile of Downey's City limits and several interchanges along the I-710 corridor serve as accesses for Downey. Construction of the I-710 freeway and several interchanges as well as associated roadway improvements would have direct effects on the City of Downey including:

- Reconstruction of the I-710/Imperial Highway interchange from cloverleaf to diverging diamond configuration;
- Extension of Southern Avenue over I-710 and the Los Angeles River;
- Reconstruction of the I-710/Firestone Boulevard interchange (maintain two-quadrant partial cloverleaf configuration); and
- Reconstruction of the I-710/Florence Avenue interchange from cloverleaf to diverging diamond configuration.

The build alternatives include three design variations which are called Option 1A, 2A, and 3A for Alternative 5C and Option 1B, 2B, and 3B for Alternative 7. None of the design options would affect the project design in the area adjacent to Downey. For Alternative 7, Option 7ZE is also proposed to provide exclusive use of the freight corridor by zero emission trucks. This option is operational in nature and does not result in different geometric design of Alternative 7.

SECTON 2.3 PROJECT ALTERNATIVESs

Comment 1. Extension of Southern Avenue

The City is concerned about the potential traffic increase in the City of Downey due to the proposed extension of Southern Avenue, also known as Steward and Gray Road. This arterial primarily serves the City of Downey's residential communities and currently experienced high collision rates. The City requests that the environmental document includes analyses of the future traffic conditions along Stewart and Gray Road, including operational analyses for the roadway segments and key intersections along this arterial, and discloses potential impacts due to the proposed arterial extension. L-17-1

SECTION 3.1 LAND USE

Comment 2. Business Traffic

The City requests that the potential impact to business traffic within the City of Downey be evaluated in the appropriate section of the RDEIR/SDEIS and suitable mitigation measures be identified as part of the I-710 Corridor Project. L-17-2

In addition, please confirm that the traffic analyses and impact assessment performed for the I-710 Corridor Project include consideration of the potential traffic increases associated with the planned revitalization of the Rancho Los Amigos South Campus. L-17-3

SECTION 3.4 UTILITIES AND EMERGENCY SERVICES

Comment 3. Traffic Delays and Emergency Response Times

The Cumulative Resource Study Area, on pages 3.25-59 of the RDEIR/SDEIS, includes City of Downey's Fire Department and Police Department as responders. The City requests that the RDEIR/SDEIS evaluate the potential increased response times on emergency calls due to projected future traffic volume increase on several arterials within the City of Downey as well as for construction periods that are substantial. L-17-4

SECTION 3.5 TRAFFIC AND TRANSPORTATION/PEDESTRIAN AND BICYCLE FACILITIES

Comment 4. Traffic Volumes

Section 3.5 of the RDEIR/SDEIS includes various tables showing level of service (LOS), traffic flow density and/or volume-to-capacity ratio, and vehicle delay information for a.m., mid-day, and p.m. peak hours for the freeways, ramps, and local arterials. The City requests that a.m./mid-day/p.m. peak hour traffic volumes for I-710 mainline, interchange ramps, and local arterials be presented in the RDEIR/SDEIS as well. L-17-5

In addition, the City requests that traffic volume information and operational analyses be presented in the environmental document for major, primary, and secondary arterials within the City of Downey (see City's Circulation Plan 2-3 attached herewith). Some of the City's arterials are currently not analyzed, including but not limited to, Stewart and Gray Road, Old River School Road and Telegraph Road. L-17-6

Comment 5. Impact of Increased Traffic on Pavement

The projected traffic increase along various arterials will potentially increase the impact to the pavement system on local streets within the City of Downey. The City requests that the potential impact to the local street pavement system be evaluated in the appropriate section of the RDEIR/SDEIS and suitable mitigation measures, such as pavement rehabilitation or replacement identified for all affected arterials as part of the I-710 Corridor Project. L-17-7

Comment 6. Intersection Impacts

The Imperial Highway/Paramount Boulevard intersection is projected to operate at LOS F during the p.m. peak hours in 2035. The vehicle delay in Alternative 5C would be longer at 96.3 seconds, as compared to 95.5 seconds projected for the No Build Alternative. While the projected increase in vehicle delay does not meet the established threshold of 2 seconds discussed on Page 3.5-91 of the RDEIR/SDEIS, the operational degradation at this intersection is due to the project's build alternative and the City requests that mitigation be considered for this intersection. L-17-8

In addition, the City requests that additional intersections be analyzed in the environmental document including all intersections along the City's major, primary, and secondary arterials.

Comment 7. Public Transportation

The City recognizes that Table 3.25-1 (page 1569) mentions Eco Rapid, however, no potential impacts to this project are addressed in the RDEIR/SDEIS. The City requests that a discussion of potential impacts and possible mitigation measures be included. L-17-9

During construction, the project may result in increased time for Metro bus service along Imperial Highway, Firestone Boulevard, and Florence Avenue, as well as for the Downey LINK and the Downey Dial-A-Ride services. The City requests that these potential impacts be discussed in the RDEIR/SDEIS. L-17-10

During construction, bus stops in the vicinity of the proposed improvements for Imperial Highway, Firestone Boulevard, and Florence Avenue, would be temporarily relocated. The City recognizes that these impacts would be temporary and would cease after completion of any construction in the vicinity of these service routes.

SECTION 3.24 CONSTRUCTION IMPACTS

Comment 8. Construction Impacts on Traffic and Transportation

Section 3.24.3.5 of the RDEIR/SDEIS indicates the analysis provided in the Intersection Traffic Impact Analysis Report (AECOM, March 2017) discusses the levels of service expected during construction and provides a general description of anticipated ramp closures during construction. However, the City could not find this discussion in the referenced report. Please verify. L-17-11

Additionally, the City requests that:

- RDEIR/SDEIS discloses how construction closures on I-710 will increase traffic level on Interstate 5 (I-5), including the segment of the freeway that is within the Downey city limits. L-17-12
- RDEIR/SDEIS discloses how the construction of the Firestone Boulevard Bridge Widening over the Los Angeles River may impact the circulation of traffic and residents entering and exiting the City of Downey through Firestone Boulevard. L-17-13
- The upcoming Transportation Management Plan (TMP) specifically addresses all affected streets in the City of Downey due to the expected increase in traffic during construction, including TMP strategies to mitigate construction traffic impacts such as on-street parking restrictions, and signal timing changes and synchronization, should be included and discussed with the City. L-17-14

Comment 9. Ramp and Street Closures

Based on the Construction Staging Concepts report, dated May 18, 2017, which presents one possible construction concept for the I-710 Corridor Project to estimate the project duration and costs, and identify potential constructability issues and impacts, there is high likelihood that several of the I-710 interchange ramps providing access to Downey as well as portions of local arterials would need to be closed for a prolonged period, possibly up to 16 months.

Prolonged closure (i.e. more than 10 consecutive days) would have significant impacts to the residents and businesses in the City of Downey. The City requests that a mitigation measure be added to limit each of the closure to less than 10 consecutive days and that the number of closure periods be limited to a maximum of three times within a 12-month period. Construction of temporary ramp pavement and temporary street widening should be considered where feasible to keep the street and interchange open and minimize closures during construction. L-17-15

Additionally, the City requests the following:

- CON-TR-1, on page 3.24-48, includes language that any ramp closures that exceed 10 days will need a formal "Ramp Closure Study". L-17-16
- CON-TR-1, on page 3.24-48 includes language that the upcoming TMP development will include coordination with affected local agencies. L-17-17

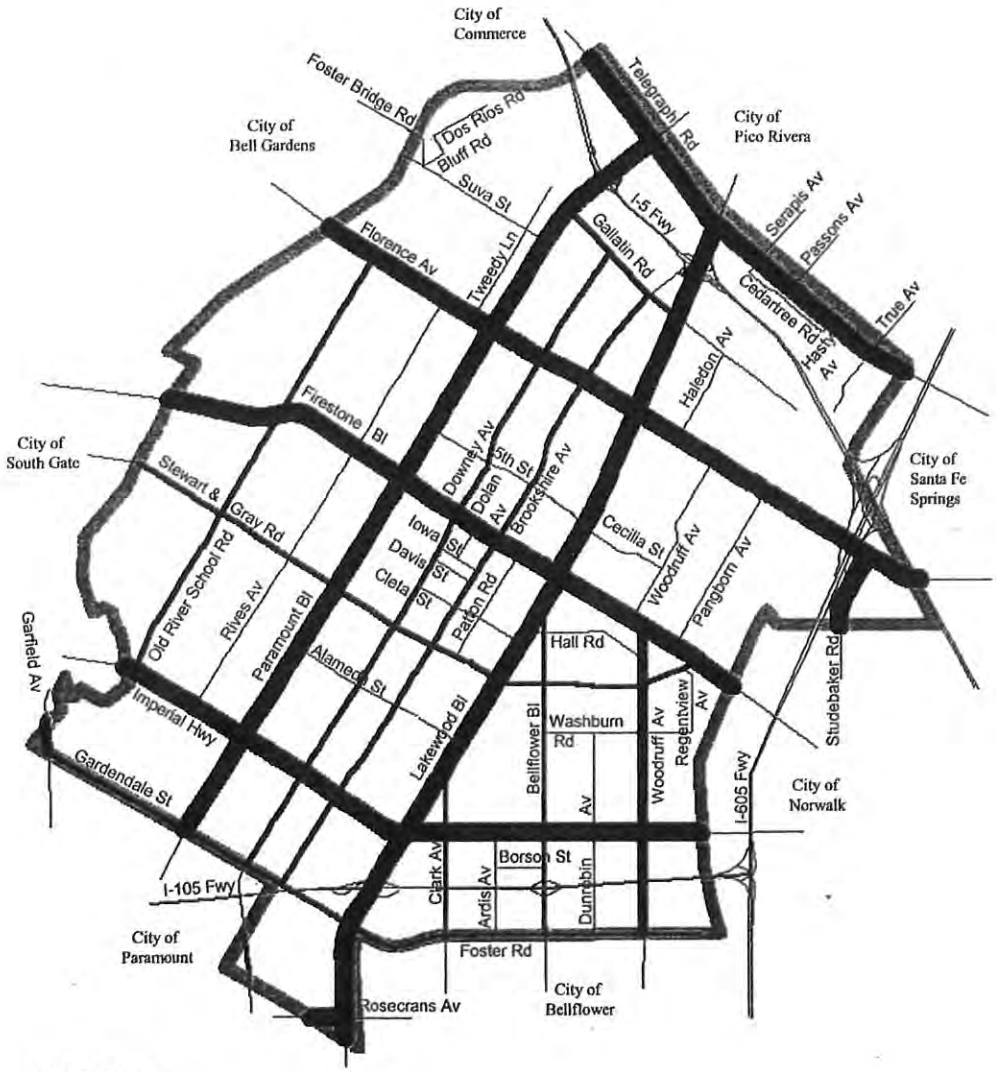
Comment 10. Construction Traffic Impacts on Pavement and Structures

The City requests that CON-TR-2 be updated to include an evaluation of all routes that may be utilized by construction traffic, and new pavement for all routes that are affected. This includes, but may not be limited to impacts on Imperial Highway, Firestone Boulevard, Stewart and Gray Road, Old River School Road, Florence Avenue and Telegraph Road in the City of Downey. L-17-18

The City also requests that funds be set aside and available to the City for pavement rehabilitation, structure rehabilitation, signal synchronization, and other mitigations required to address the construction traffic impacts. L-17-19

Comment 11. Construction Duration Discrepancy

Page 2-89 indicates that construction duration would be a minimum of 10 years. However, a footnote on page 3.24-31 states a maximum construction duration of 87.4 months (7.3 years) if all segments are constructed at the same time. Please clarify. L-17-20



SECTION 3.25 CUMULATIVE IMPACTS

Comment 12. Relocation Plan

The City recognizes that the potential closure and/or relocation of the Salvation Army shelter in the City of Bell may require the relocation of homeless people in the area, and into neighboring cities. The City requests that a plan be presented in the RDEIR/SDEIS for the relocation of the facility. L-17-21

DOWNEY VISION 2025
CHAPTER 2. CIRCULATION

FIGURE 2.1-1
CIRCULATION PLAN

ADOPTED 1-25-2005

PAGE 2 - 3

This page intentionally left blank

L-17-1

The selection of the arterial roadway segments to include in the traffic analyses performed in support of the RDEIR/SDEIS was determined based upon the role that these major arterial roadways perform with regard to I-710 as well as the regional arterial network. Generally, contiguous north-south arterials of sufficient length that run parallel to the 19-mile I-710 Corridor, and the east-west arterials that have an interchange with I-710, were identified for evaluation, as these regionally significant facilities are most likely to be influenced by circulation changes on I-710 generated by the build alternatives. While the extension of Southern Avenue over I-710 would improve the City's access to the regional transportation network, it would also likely result in increases in traffic on this east-west arterial in direct proximity to I-710. [Please refer to Figures 5-6.e and 6-3.e in the *I-710 Traffic Impact Analysis Report* (March 2017).] As a result, additional eastbound, southbound, and northbound left-turn lanes have been proposed at Southern Avenue/Garfield Avenue to facilitate turning movements from Southern Avenue (east-west arterial) to Garfield Avenue (north-south arterial), between I-710 and Garfield Avenue. Please refer to Table 7-2 in the *I-710 Traffic Impact Analysis Report*, as well as to Measure TR-1 contained in Section 3.5.4 of Section 3.5 of this Final EIR/EIS. However, Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), has identified Alternative 1 (No Build) as the Preferred Alternative. Please refer to Section 1.1 of this appendix for more detail. Therefore, additional traffic analyses will not need to be performed to better understand the shifts in circulation patterns on Stewart and Gray Road within the City of Downey.

L-17-2

Regarding land use, the City of Downey is not located directly adjacent to I-710 and is buffered by any direct physical impacts of the build alternatives by the City of South Gate. As discussed in Section 3.1 of the RDEIR/SDEIS, improvements to I-710, as well as improved interchanges with I-710 under the build alternatives, do improve regional transportation access for businesses located within the City of Downey. While the traffic analysis included in the RDEIR/SDEIS does not show any traffic impacts to intersections or arterials within the City of Downey, as stated in Response to Comment L-17-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, the traffic analysis will not need be further refined during final design. Please also refer to Response to Comment L-17-1 regarding the selection of the arterial roadway segments to include in the traffic analyses performed in support of the RDEIR/SDEIS.

L-17-3

The I-710 travel demand forecasting model is a focused subarea model for the I-710 corridor, derived from the SCAG regional travel demand forecasting model and refined and calibrated to observed traffic volumes in the I-710 Corridor. The traffic volume forecast for the year 2035 to

support the RDIER/SDEIS does not specifically include consideration of the more recent redevelopment of the Rancho Los Amigos campus, as traffic effects of this facility in particular are at a level of detail beyond the scope of the traffic analysis performed for the I-710 Corridor Project.

L-17-4

As stated in Response to Comment L-17-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, the potential increase in response times on emergency calls due to projected future traffic volumes on arterials within the City of Downey during construction of the build alternatives does not need to be analyzed further.

L-17-5

Peak-hour traffic volumes are provided in the supporting traffic technical reports prepared for the RDEIR/SDEIS, specifically the *Intersection Traffic Impact Analysis Report* (March 2017) and the *I-710 Corridor Project Traffic Operations Analysis Report* (March 2017), which are publicly available documents that can be found at: http://www.dot.ca.gov/d7/env-docs/docs/710corr-eir/. In addition, Figures 3.5-3, 3.5-4, 3.5-6, and 3.5-7 illustrate Levels of Service on the I-710 for 2012 existing conditions, the 2035 No Build Alternative, the 2035 Alternative 5C, and 2035 Alternative 7, respectively. LOS is a function of volumes to capacity.

L-17-6

The selection of arterial highway segments to include in the RDEIR/SDEIS traffic analyses was determined based upon the role that these major arterial roadways perform with regard to I-710 as well as the regional arterial system. Generally, contiguous north-south arterials of sufficient length that run parallel to the 19-mile I-710 Corridor and the east-west arterials that have an interchange with I-710 were identified for evaluation. These regionally significant arterials would be most likely to be influenced by traffic changes on I-710 as a result of the build alternatives.

L-17-7

The City's concern regarding pavement deterioration on local streets as a result of increased construction traffic from the build alternatives is acknowledged and included in the project record. However, as stated in Response to Comment L-17-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there will be no pavement deterioration on local roads due to increased construction traffic.

L-17-8

As the City notes in its comment, the increase in vehicle delay at the Imperial Hwy./Paramount Blvd. intersection does not meet the threshold to warrant mitigation. However, this intersection

may be a candidate for the Congestion Relief Program, which is a programmatic element of the build alternatives.

The main purpose of the proposed freeway improvements included under the build alternatives are to address congestion, design deficiencies, traffic operations, and safety concerns on I-710, as well as related air quality issues associated with operation of the I-710 freeway. Over 185 intersections were evaluated as part of this process to determine if the build alternatives would result in traffic impacts to the I-710 Corridor's major arterial system, and if so, to identify measures to address these impacts. The number and locations of the study intersections were identified prior to the initiation of the traffic studies performed for the RDEIR/SDEIS and were reviewed and approved by the I-710 Technical Advisory Committee.

L-17-9

Section 15126.2(a) of the State CEQA Guidelines states that "an EIR shall identify and focus on the significant environmental effects of the proposed project. In assessing the impact of a proposed project on the environment, the lead agency should normally limit its examination to changes in the existing physical conditions in the affected area as they exist at the time the notice of preparation is published, or where no notice of preparation is published, at the time environmental analysis is commenced." Section 3.25 of the RDEIR/SDEIS discusses construction of the Eco-Rapid Transit Corridor as part of the West Santa Ana Branch Corridor in a cumulative context as a reasonably foreseeable project. However, as noted in the RDEIR/SDEIS no environmental document had been prepared for this project at the time this Final EIR/EIS was prepared and as such, no information regarding environmental impacts are available at this time. Because the Eco-Rapid Transit Corridor has not been constructed and no environmental document is available, CEQA does not require analysis of impacts of the I-710 Corridor Project to this facility.

L-17-10

As noted in Section 3.24 of the RDEIR/SDEIS, during construction of the build alternatives, temporary impacts and traffic delays may occur along those routes designated as detour or alternative routes to I-710. Since detailed construction information is not available at this stage of the project, and, as stated in Response to Comment L-17-1, the No Build Alternative has been selected as the Preferred Alternative, there will no longer be potential impacts to transit services during construction of the build alternatives within the City of Downey.

L-17-11

A construction staging analysis provided in the Construction Staging Concepts report (2017), which identifies the sequence of construction activities and ramp closures for the build alternatives, was performed for the project as one of the supporting technical documents for the

Draft Project Report (2017). However, as stated in Response to Comment L-17-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, further detail, including traffic detours, approximate timelines for construction activities, and specifics related to ramp closures during construction, do not need to be prepared as part of the Traffic Management Plan (TMP) which is developed during the design phase of a project.

L-17-12

A preliminary construction staging analysis, which identifies the sequence of construction activities and ramp closures for the build alternatives, was provided in the Construction Staging Concepts Report that was prepared as one of the supporting technical documents for the *Draft Project Report* (2017). However, as stated in Response to Comment L-17-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, further detail, including specific information related to traffic detours, does not need to be prepared as part of the TMP which is developed during final design of a project.

L-17-13

A preliminary construction staging analysis was completed for the build alternatives in the Construction Staging Concepts Report that was prepared as one of the supporting technical documents for the *Draft Project Report* (2017). The construction staging analysis preliminarily identifies the sequence of construction activities and ramp closures for the build alternatives. With regard to traffic along Firestone Boulevard, traffic volumes would not be adversely affected during construction of the build alternatives. However, as stated in Response to Comment L-17-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, further detail, including traffic detours, does not need to be prepared as part of the TMP which is developed during final design of a project.

L-17-14

As stated in Response to Comment L-17-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, a Transportation Management Plan (TMP) will no longer need to be prepared prior to construction that addresses traffic delays, detour routes, public awareness, and other construction-related traffic and transportation issues. Please also refer to Responses to Comments L-17-11, L-17-12, and L-17-13.

L-17-15

As stated in Response to Comment L-17-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, Measure CON-TR-1 of this Final EIR/EIS does not need to be revised to limit full ramp closures to 10 consecutive days

L-17-16

Please refer to Response to Comment L-17-15 regarding revisions to the Transportation Management Plan.

L-17-17

Should a build alternative be selected as the Preferred Alternative, tt is Caltrans' policy to coordinate the Transportation Management Plan with the affected jurisdictions. Measure CON-TR-1 was revised to clarify this requirement.

L-17-18

The commenter's concern regarding pavement deterioration on local streets as a result of increased traffic from the build alternatives is acknowledged and included in the project record. However, as stated in Response to Comment L-17-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there will be no pavement deterioration on local roads due to increased traffic during construction of the build alternatives.

L-17-19

As detailed information regarding impacts from construction traffic related to the build alternatives (i.e., pavement rehabilitation, structure rehabilitation, and signal synchronization) is unknown at this time, a commitment to any specific funding contributions cannot be made at this time. As described in the previous responses, the No Build Alternative has been selected as the Preferred Alternative. Therefore, additional analyses do not need to be conducted to determine the timing of the construction staging, to finalize construction staging plans, or to develop a Transportation Management Plan detailing anticipated traffic diversion routes for the different construction stages of the build alternatives. It should be noted that allowances for local roadway construction impacts were accounted for in the cost estimate of the build alternatives developed for the EIR/EIS.

L-17-20

The commenter is correct. The data provided in Table 2.3-5 in Chapter 2.0, Project Alternatives, represents the best available information on the estimated construction durations of the build alternatives, while the footnote below Table 3.24-4 in Section 3.24 of the RDEIR/SDEIS is erroneous. The footnote for this table has been corrected in this Final EIR/EIS.

L-17-21

As discussed in Section 3.3.1.3 of this Final EIR/EIS, Alternative 5C would not result in the relocation of the Bell Shelter. In addition, as stated in Response to Comment L-17-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there will be no impacts to the Bell Shelter.

COUNTY OF LOS ANGELES

FIRE DEPARTMENT

1320 NORTH EASTERN AVENUE
LOS ANGELES, CALIFORNIA 90063-3294

DARYL L. OSBY
FIRE CHIEF
FORESTER & FIRE WARDEN

October 19, 2017

Ronald Kosinski, Deputy District Director
Department of Transportation
Environmental Planning
100 South Main Street
Los Angeles, CA 90012

Dear Mr. Kosinski:

NOTICE OF AVAILABILITY OF RECIRCULATED DRAFT ENVIRONMENTAL IMPACT REPORT, "710 CORRIDOR PROJECT," THE PURPOSE IS TO ACHIEVE THE FOLLOWING: IMPROVE AIR QUALITY AND PUBLIC HEALTH, IMPROVE TRAFFIC SAFETY, PROVIDE A MODERN DESIGN FOR THE I-710, ADDRESS PROJECTED TRAFFIC VOLUMES, AND ADDRESS PROJECTED GROWTH IN POPULATION, EMPLOYMENT, AND ACTIVITIES RELATED TO GOODS MOVEMENT, LOS ANGELES COUNTY, FFER 201700119

The Notice of Availability of Recirculated Draft Environmental Impact Report has been reviewed by the Planning Division, Land Development Unit, Forestry Division, and Health Hazardous Materials Division of the County of Los Angeles Fire Department.

The following are their comments:

PLANNING DIVISION:

In Section 3.4.1.1 EMERGENCY SERVICES, Fire Protection, Paragraph one, the last sentence should be corrected as follows:

"These cities and communities are part of LACFD's Consolidated Fire Protection District, Battalions 3, 7, 9, 13, and 19."

L-18-1

LAND DEVELOPMENT UNIT:

The Fire Prevention Division's Land Development Unit, has no additional comments regarding this project. The conditions that were addressed in EIR 201200096, dated July 2012, have not been changed at this time.

Should any questions arise regarding subdivision, water systems, or access, please contact the County of Los Angeles Fire Department Land Development Unit's, Inspector Nancy Rodeheffer at (323) 890-4243.

The County of Los Angeles Fire Department's Land Development Unit appreciates the opportunity to comment on this project.

FORESTRY DIVISION – OTHER ENVIRONMENTAL CONCERNS:

The statutory responsibilities of the County of Los Angeles Fire Department's Forestry Division include erosion control, watershed management, rare and endangered species, vegetation, fuel modification for Very High Fire Hazard Severity Zones or Fire Zone 4, archeological and cultural resources, and the County Oak Tree Ordinance. Potential impacts in these areas should be addressed.

The County of Los Angeles Fire Department's Forestry Division has no further comments regarding this project.

HEALTH HAZARDOUS MATERIALS DIVISION:

The Health Hazardous Materials Division of the Los Angeles County Fire Department has no requirements for the project at this time. The Cal-EPA Department of Toxic Substances Control would be the lead environmental oversight agency for this project, when applicable.

If you have any additional questions, please contact this office at (323) 890-4330.

Very truly yours,

Michael Y. Takeshita

October 20, 2017

Re: CITY OF COMMERCE COMMENTS ON THE I-710 CORRIDOR PROJECT RECIRCULATED DRAFT ENVIRONMENTAL IMPACT REPORT/SUPPLEMENTAL DRAFT ENVIRONMENTAL IMPACT STATEMENT

Dear Mr. Kosinski:

The City of Commerce (City) is submitting this letter in response to the public release of the Recirculated Draft Environmental Impact Report/Supplemental Draft Environmental Impact Statement (RDEIR/SDEIS) and Section 4(f) Evaluation for the I-710 Corridor Project. This letter represents the official comments of the City of Commerce on the RDEIR/SDEIS, and as such, it is focused on the potential project impacts that most directly affect the City. As stated by the City previously, in our letter dated September 27, 2012 in response to the Draft EIR/EIS, the City of Commerce appreciates Caltrans and its partner agencies in their attempt to find a solution to the gridlock and negative impacts on traffic safety, air quality, noise, and human health that currently exist near the I-710 corridor - impacts which are expected to increase with the projected increases in truck traffic over the next few decades.

The City strongly supports the proposed dedicated Zero Emission Freight Corridor and requests that Caltrans consider including it as a mandatory feature of the project. The City also supports a Zero Emissions Extension (ZEE) design option, which would extend this technology and the associated infrastructure beyond the freeway mainline onto the truck ramps within the City of Commerce, as close as possible to the railyards. It appears that the RDEIR/SDEIS no longer includes a ZEE design option. The City requests that Caltrans incorporate this into the final design option. L-19-1

The City acknowledges the effort that has been undertaken to further reduce right-of-way impacts as evaluated in this RDEIR/SDEIS and supports the overall regional benefit the proposed project would achieve. However, the City remains concerned that although there may be regional traffic and air quality benefits, the residents and businesses in the City of Commerce continue to be the most negatively impacted within the corridor with the greatest number of residential relocations than any other affected city. The City has a limited housing supply and the proposed project would exacerbate the existing demand for housing. The City of Commerce's 2014-2021 Housing Element Update (October 2013) sets goals to accommodate future housing. The City has extensively analyzed and identified the Housing Opportunity Overlay area within the General Plan as an appropriate area for future housing

2535 Commerce Way • Commerce, California 90040 • (323) 722-4805 • FAX (323) 726-6231 • www.ci.commerce.ca.us

development. The City would like to maintain consistency with the General Plan and existing zoning and land use designations and implement this provision in order to balance and stabilize housing availability and affordability with the impacts anticipated from the proposed project.

The City also recognizes the difficulty of any alignment in conflict with railroads and/or railyards, however, the City's expectation is for Caltrans to reconsider the disproportionate right-of-way impacts to this predominantly disadvantaged and minority community and a greater effort made to further avoid residential and business displacement. The proposed project's regional benefits are not realized in this community and as a result, the City requests additional mitigation to offset the impacts borne by this community. L-19-2

The City would like to refer to our previous letter to Caltrans, which is attached, as we continue to have concerns about the potential impacts to our residents. These concerns still include: the displacement of families, neighborhoods, and businesses; decrease in tax revenue; disruption of local traffic patterns; and increase in exposure to unhealthful levels of air pollutants, noise and extended construction though our city. The City of Commerce feels that several of our previous comments were not adequately addressed and/or reflected within the RDEIR/SDEIS as outlined below.

1. Previous comments on the Draft EIR/EIS

a. Section 3.1, Land Use

i. Comment L-19-19: Significant Community Impacts Not Disclosed

The City of Commerce appreciates the incorporation of Mitigation Measure C-1 (Uniform Relocation Assistance and Real Property Acquisitions Policies Act). The discussion in the community cohesion section recognizes that community cohesion impacts do occur at a localized level within the City of Commerce, but concludes that the project would not result in permanent impacts. The City continues to be concerned with the impact conclusion, since the City of Commerce has the greatest number of relocations with a very limited amount of available replacement housing. L-19-3

The analysis does not include detailed information such as number of apartments or rentals available within the City for those that are displaced and how impacts would be reduced below a level of significance with the lack of available housing within the City. The City requests that additional information on available stock of replacement and comparable residential housing within the City of Commerce be specifically incorporated in the Final EIR/EIS. L-19-4

b. Section 3.4, Utility/Emergency Services

i. Comment L-19-33: Unsupported Conclusions for Emergency Access and Response Times

Implementation of Design Option 3A under Alternative 5C, and Design Option 3B under Alternative 7 would have additional impacts to emergency services associated with changes in access that reduce access options and potentially increase response times on emergency calls in the City of Commerce. The RDEIR/SDEIS does not provide evidence to support the finding that potential impacts to emergency vehicles with these changes in L-19-5

access would have no effect or how they would be minimized. The City requests a more detailed analysis with regard to emergency access and emergency response times in this area. The City specifically requests a preliminary assessment and identification of proposed routing options that have been analyzed for emergency response providers. The City requests that adequate coordination with emergency responders be included as mitigation in the Environmental Commitments Record. L-19-5 L-19-6

c. Section 3.5, Traffic and Transportation/Pedestrian and Bicycle Facilities

i. Comment L-19-17: Traffic Management Plan

The City specifically requested that the City be included as a reviewing agency for the MMRP. The discussion of the TMP (Section 3.24.4.5) in the RDEIR/SDEIS is generic and brief, and does not provide the detailed discussion needed on how the TMP mitigation will be confirmed. Similarly, Comment L-19-48 requested more information regarding lane closures, even if those closures are preliminary. This level of detail and type of informative discussion will provide the framework for development of the TMP as the project move into the final design phase. L-19-7

ii. Comment L-19-37: Traffic Impact Thresholds Not Provided

The City requested that thresholds be established at a minimum for the following impact areas: vehicle traffic operations (specific to each type of facility); goods movement; transit facilities and operations; bicycle facilities and operations; pedestrian facilities and operations; safety; and construction. These areas of analysis are standard sections included in an EIR/EIS, particularly for a project of this magnitude. The project's potential impacts (beneficial or adverse) should be identified for each of these impact areas and included in Section 3.5.3 Environmental Consequences. L-19-8

iii. Comment L-19-39: Impacts to Bicycles and Pedestrians Not Addressed

Section 3.5.3 (Environmental Consequences) provides only a high-level discussion of impacts to pedestrians and bicycle facilities. The City requested that impacts upon bicycles and pedestrians, due to increased traffic volumes on arterials, be addressed and evaluated against the appropriate significance criteria. While an expanded discussion of impacts has been added to the Section 3.5.3 (page 3.5-106), there is still no discussion of impacts to pedestrians and bicycles because of an increase in traffic volumes. An analysis of how permanent changes in vehicle circulation and traffic volumes would affect pedestrians and bicycles should be included. The Project's potential impacts to non-motorized circulation and safety, associated with pedestrians and bicyclists, is needed to provide a complete analysis. L-19-9

iv. Comment L-19-41: City of Commerce Thresholds Not Considered

The City requested City-specific traffic impact thresholds of significance be used. The RDEIR/SDEIS response to comments provides an explanation as to why the HCM methodology was used, but the comment does not address LOS impact criteria. The methodology for analyzing LOS and the criteria for determining impacts are two entirely different matters. The RDEIR/SDEIS states that the impact criteria were developed L-19-10

collaboratively among Caltrans and Metro. For example, it was determined that an intersection would be impacted by the project if the intersection is projected to operate at LOS E and the increase in delay over 2035 No Build conditions is five seconds or more. The RDEIR/SDEIS should be more specific about why five seconds was selected and how this criterion compares to criteria established by the affected local jurisdictions. Lastly, the methodologies and assumptions evaluated by Caltrans and Metro in selecting the chosen metric should be provided in concert with the requested revisions. L-19-10

v. **Comment L-19-44: Full Extent of Project-Related Traffic Congestion Not Presented**

There is almost no discussion of induced demand in any of the transportation analysis. The City requested more information about induced travel effects. The Travel Demand Methodology Tech Memo is silent on this topic. Page 6-20 of the Traffic Operations Analysis Report (TOAR) notes that "the induced truck traffic would further increase the projected traffic demand on eastbound SR-91, causing segments that are outside of the improvement area to experience heavy congestion." Is that the only place induced demand is a factor? At a minimum, define induced demand, described qualitatively how it does or does not affect the forecasts, and highlight the limitations related to this issue. L-19-11

vi. **Comment L-19-47: Unapproved Future Projects Used as a Basis for Sufficient Future Rail Capacity**

The City requested clarification on the inconsistency of reasonable foreseeable future rail capacity demand associated with the SCIG and ICTF Projects. Page 2-3 of the RDEIR/SDEIS notes that these two projects are not considered reasonably foreseeable. However, later in that paragraph, it is noted that the Superior Court vacated the certification of the SCIG EIR. If the SCIG project is not in place, there will be more trips to the Hobart Yard, including traffic in and around the City of Commerce. The City requests additional clarification on the inclusion or exclusion of these two rail projects as part of the analysis. L-19-12

vii. **Comment L-19-53: Insufficient Analysis of Impacts Due to Loss of On-Street Parking**

The City requested that preparation of a detailed parking utilization study and full assessment of the loss of on-street parking be conducted. Section 3.5.5 (page 3.5-90) includes an expanded analysis of the parking restrictions and utilization and concludes that "much of the parking demand is expected to be absorbed in off-street parking areas for uses that generate the parking demand and in nearby available on-street parking areas". Please clarify which off-street and on-street parking areas, particularly in the City of Commerce, are meant to absorb the parking demand. Please also clarify whether a parking utilization study of these other areas was conducted. L-19-13

viii. **Comment L-19-54: Incorrect Assumptions Used for Signal Cycle Lengths at Study Intersections**

The City requested that the potential impact of underestimating the signal cycle lengths be fully addressed in the Final EIR/EIS. While it is recognized that the RDEIR/SDEIS analyzed 180 arterial intersections and some broad assumptions were needed, the City of Commerce specifically noted that the signal timing assumptions used for the City of L-19-14

Commerce's traffic signals (5 intersections) are likely inaccurate. The analysis should either be updated with the correct signal timing information or this discrepancy should be clearly stated in the RDEIR/SDEIS. L-19-14

ix. Comment L-19-56: Impacts to Major Intersections Not Analyzed

The City requested that the intersections of Bandini Blvd./Garfield Ave., Telegraph Rd./Garfield Ave., and Atlantic Ave./Eastern Ave. be included in the traffic analysis. Please include an analysis of these intersections in the Final EIR/EIS. L-19-15

x. Comment L-19-57: Potential Transit System Impacts Not Analyzed

Section 3.5.3 (Environmental Consequences) does not include a discussion of changes (beneficial or adverse) to transit. The City requested that an evaluation of the potential transit system impacts be included. This information should include potential changes in ridership and schedule reliability, but it is not provided in Section 3.5, Table 3.5-21 of the RDEIR/SDEIS as noted in the RDEIR/SDEIS response to comments and this information does not appear to be included elsewhere in the document. The Build alternatives would provide increased transit service, but there is no analysis of these changes. L-19-16

d. Section 3.10, Geology/Soils/Seismic/Topography

i. Comment L-19-70: Liquefaction mitigation and construction activities; associated ground settlement and vibration impacts

Regarding settlement and vibration as a result of liquefaction mitigation, Mitigation Measure CON-N-10 indicates that the contractor will be required to use alternatives for pile driving thus limiting vibrations to a negligible level. Caltrans indicates the same requirement as CON-N-9, but goes on to state that "Caltrans will conduct pre- and post-construction surveys for all structures within 100 feet of locations where pile driving will occur." CON-N-9 and CON-N-10 are not consistent with regard to whether pile driving will be conducted. Clarification is warranted to alleviate the City's concerns regarding the potential impacts due to liquefaction mitigation techniques. Additionally, Section 3.24.3.14 of the RDEIR/SDEIS indicates that pre- and post-construction surveys would be implemented for residential structures that are located 50 feet or closer from pile driving activities. This inconsistency (100 feet vs 50 feet) should also be rectified if pile driving will be conducted as part of the Project. L-19-17

e. Section 3.14, Noise

i. Comment L-19-81: Potential Noise Impacts not Evaluated or Mitigated

The City requested the addition of a mitigation measure that would establish a "Noise Community Protection Plan." The RDEIR/SDEIS states, "During construction of the project, noise from construction activities may occasionally dominate the noise environment in the immediate project area. Construction noise is regulated by Caltrans Standard L-19-18

Specifications, Section 14-8.02, "Noise Control." These requirements state that noise levels generated during construction would be controlled and monitored and not to exceed 86 dBA Lmax at 50 feet from the job site between the hours of 9:00 p.m. to 6:00 a.m."

The City of Commerce Noise Standards establish thresholds that must be considered and at a minimum, the "Noise Community Protection Plan" should be included as a mitigation measure which would include minimization measures such as temporary noise barriers, as needed, to protect sensitive receptors against excessive noise from construction activities; efficient rerouting of trucks and control of traffic activity on construction sites to reduce noise due to vehicle idling, gear shifting and accelerating under load. L-19-18

Rerouting trucks would not necessarily reduce noise levels but would transfer noise to other land use areas that may be less sensitive to noise. The "Noise Community Protection Plan" should also include a robust public relations program with the community to minimize objections to unavoidable construction impacts; provide frequent activity updates of all construction activities and schedules; and implement a construction noise and/or vibration monitoring program to further minimize nighttime construction noise impacts.

f. Section 3.13, Air Quality

i. Comment L-19-76: Potential Impacts Not Studied

The potential of increased truck queuing on local roadways in the vicinity of the rail yards in the City of Commerce should be evaluated. Increased truck queuing could result in greater vehicle emissions, which could cause additional adverse impacts on air quality and expose nearby residents and workers to increased mobile source air toxic emissions. Currently, the local streets near the rail yard already experiences issues related to truck queuing near Washington Boulevard and Atlantic Boulevard. The City requests that the impacts of trucks queuing near the rail yards in the City to be evaluated and the impacts discussed in the Final EIR/EIS. L-19-19

g. Section 3.24, Construction

i. Comment L-19-31 and L-19-86: Traffic Management Plans

In regards to construction staging areas not being identified in the Draft EIR/EIS or RDEIR/SDEIS, the City would like to request again that the staging and storage areas be identified for each alternative within the City limits. Construction will take place within the City limits and proposed construction staging and storage of equipment impacts must be identified within the Final EIR/EIS. This information should also include anticipated routes into and out of the identified staging and storage areas. L-19-20

ii. **Comment L-19-91 Noise**

The City appreciates that Caltrans will develop a Noise Community Protection Plan to avoid, minimize, and/or mitigate construction-related noise impacts. However, the development of this Plan should have been included as a mitigation measure to the RDEIR/SDEIS. This mitigation measure also needs to be included in the Environmental Commitments Record (ECR). These commitments must be recorded within the identified documents, and the early and ongoing coordination between the City and Caltrans is needed to develop the success criteria of the Noise Community Protection Plan. Please include this as a mitigation measure in the Final EIR/EIS. L-19-21

2. RECIRCULATED DRAFT ENVIRONMENTAL IMPACT REPORT/SUPPLEMENTAL DRAFT ENVIRONMENTAL IMPACT STATEMENT - ALTERNATIVES

In addition to the comments the City believes were not previously addressed, the City has reviewed the newly proposed alternatives and design options as they relate to the City of Commerce, as well as the RDEIR/SDEIS in its entirety.

a. COMMENTS ON NEWLY PROPOSED ALTERNATIVES 5C and 7 AND DESIGN OPTIONS

i. Alternative 5C

Alternative 5C proposes to widen the I-710 mainline by adding mixed-flow lanes (one in each direction) between I-405 and I-105, and between I-105 and SR-60. Truck bypass lanes are also proposed on I-710 through the I-405 interchange. This alternative will modernize the design at the I-405, SR-91, and I-5 interchanges, modernize and reconfigure most local arterial interchanges throughout the I-710 corridor, modify freeway access at various locations, and shift the I-710 centerline at various locations to reduce right-of-way impacts. In addition to improvements to the I-710 mainline and the interchanges this alternative includes: a Zero Emission/Near Zero Emission Truck Technology Deployment Program, Community Health and Benefit Program, I-710 TSM/TDM Congestion Relief Program, future provision of ramp metering, parking restrictions during peak periods, I-710 Transit Program, ITS improvements, visual and aesthetic features.

According to the RDEIR/SDEIR, Alternative 5C would result in up to 109 residential relocations and up to 165 nonresidential relocations. Of all the affected cities within the I-710 Corridor, the City of Commerce would experience the greatest number of residential relocations under Alternative 5C and 7 (including each of the design options). The City of Commerce would also experience the greatest number of non-residential relocations under Alternative 5C (Table 3.3-12 and 3.3-14 of the RDEIR/SDEIS). The number of employees and residents that would be displaced as a result of this Project would be more than that of any other community in the corridor as well as the associated loss of sales tax and property tax revenue. The City of Commerce alone would bear over 50% of the total residential L-19-22

relocations (58 of 109) for the entire project and over 25% of the total nonresidential relocations (40 of 158) which should be considered a disproportionate impact to an environmental justice community. L-19-22

	Residential	Non-residential	Emp. Displaced	Total Res. Displaced
Alternative 5C	58 of 109	40 of 158	325 of 1,050	436
Option 1A	58 of 109	39 of 157	320 of 1,045	436
Option 2A	58 of 109	40 of 161	325 of 1,105	436
Option 3A	58 of 128	40 of 165	325 of 1,050	512

ii. Alternative 5C Impacts to Washington Boulevard

This Alternative proposes the reconstruction of the Washington Blvd. interchange, including the undercrossing and all entrance and exit ramps, and construction of one-way, access controlled streets between the ramp intersections and Sheila St. Reconstruction of Washington Blvd. from west of Ayers Ave. to west of Atlantic Blvd., including access control on Washington Blvd. between ramp intersections would also be included as a part of the proposed project.

The City appreciates Caltrans' efforts to reduce impacts caused by the relocation of vital commercial and industrial properties located adjacent to this interchange. The City still requests that a detailed plan be provided showing how Caltrans will prioritize the relocations of displaced businesses within the City of Commerce and to address the associated property tax revenue loss. The comprehensive analysis efforts being conducted must take into account the potential economic and fiscal impacts, as well as the previously referenced replacement resources needed for partial and full relocations that are anticipated to occur. L-19-23

b. Alternative 7

Alternative 7 includes all the components of Alternative 5C described above, but rather than the addition of mixed-flow through lanes and truck bypass lanes, Alternative 7 includes the addition of two separate truck-only lanes in each direction (a total of four lanes, on a combination of viaduct and/or retaining wall structures and at-grade roadbeds adjacent to, or in the median of, the freeway) between the City of Long Beach and the City of Commerce, adjacent to the freeway, approximately 16 miles in length. This principal feature is referred to as a "Clean-Emission Freight Corridor." This alternative would restrict the use of the freight corridor to zero-emission/near zero-emission (ZE/NZE) trucks rather than conventionally powered diesel trucks. The ZE/NZE truck technologies consist of trucks powered by means other than diesel (e.g., natural gas, hydrogen, and/or electricity), thereby producing zero to near-zero tailpipe emissions while traveling on the freight corridor; however, no specific technology is assumed in the environmental analysis, and the ZE/NZE trucks will not be limited to one particular

technology as long as the emissions criteria are met. Please provide clarification on how the environmental analysis was conducted to determine the impacts and benefits of the proposed technology used in the analysis and if conservative assumptions were used. L-19-24

According to the RDEIR/SDEIR, Alternative 7 would result in up to 121 residential relocations and up to 206 nonresidential relocations. Of all the affected cities within the I-710 Corridor, the City of Commerce would experience the greatest number of residential relocations under Alternative 7 (including each of the design options). The City of Commerce would also experience the greatest number of residential and non-residential relocations under Alternative 7 (Table 3.3-12 and 3.3-14 of the RDEIR/SDEIS). Alternative 7 would result in the greatest impact to retail businesses. The number of employees and residents that would be displaced as a result of this Project would be more than that of any other community in the corridor as well as the associated loss of sales tax and property tax revenue. The City of Commerce alone would bear almost 50% of the total residential relocations (58 of 121) for the entire project and over 20% of the total nonresidential relocations (44 of 206) which should be considered a disproportionate impact to an environmental justice community. L-19-25

	Residential	Non-residential	Emp. Displaced	Total Res. Displaced
Alternative 7	58 of 121	44 of 206	400 of 1,346	484
Option 1B	73 of 136	44 of 206	400 of 1,346	544
Option 3B	58 of 140	44 of 213	400 of 1,366	560

i. **Washington Boulevard Interchange**: Under Alternative 7, construction of northbound and southbound ramps between the truck lanes and I-710 and between the truck lanes and Washington Blvd. would be included as part of the proposed project:

- Reconstruction of the Washington Blvd. interchange, including all entrance and exit ramps
- Construction and extension of the southbound entrance ramp from Washington Blvd. to I-710 and the freight corridor, including a separate railroad overhead
- Construction of one-way, access controlled streets between the ramp intersections and Sheila St.
- Reconstruction of Washington Blvd. from west of Ayers Ave. to west of Atlantic Blvd., including access control on Washington Blvd. between ramp intersections

The City supports and appreciates that elements of Community Alternative 7 were added to Caltrans' development of Alternative 7 for the RDEIR/SDEIS. The City also appreciates Caltrans' acknowledgement that the City would experience adverse effects to community character and cohesion as a result of the impacts to the Ayers Neighborhood, the Sydney Neighborhood, businesses, as well as community facilities. L-19-26

Permanent Population and Housing Impacts (S.6 – Summary of Significant Impacts under CEQA after Mitigation) of the Executive Summary in the RDEIR/SDEIS states: "Some of these displaced L-19-27

residences are in areas (mainly the Cities of Commerce and Compton) where there is insufficient replacement housing available. Therefore, it will not be possible to relocate all displaced residents within their community or an area within reasonable proximity to their community. For this reason, construction of replacement housing in these areas may be necessary." The City would like to see a mitigation measure added to the Environmental Commitments Record that reflects the need to construct replacement housing in the City of Commerce. L-19-27

The City would like to stress the importance of the goals of the Housing Opportunity Overlay in the Housing Element (refer to Attachment A of this letter) of the General Plan. Any residential acquisition and displacement would be inconsistent with the goals and policies outlined in these plans. It is extremely important that the displaced residents and businesses are able to relocate within the City of Commerce and the City requests that the way to address this impact is through the development of the Housing Opportunity Overlay since the availability of housing is already so limited. In addition, the majority of the City's residents are renters and if displaced, they also need to be afforded the same protection and consideration as property owners and be provided affordable replacement housing within the City of Commerce. The City would like to include ongoing coordination regarding this development as a mitigation measure for displaced residents to benefit the City residents and businesses for the impacts to the community from the proposed project.

The City would like to refer to our previous comment letter, specifically comment number L-19-11. The provisions within this comment and outlined again below must be implemented to ensure the impacts to our community would be fully mitigated:

- The provision of funding to construct one-for-one replacement housing for every dwelling unit to be removed as the result of the project, including single-family homes, townhomes, duplexes, condominiums and rental apartments. L-19-28
- Creative solutions to the siting and design of comparable replacement housing within the City of Commerce, in a manner that improves the quality of life for displaced residents.
- The provision by Caltrans, as soon as is feasible, or a clear timeline for proposed property acquisition and resident relocation, to minimize uncertainty for affected residents and allow for advanced planning.
- The provision of funds for moving expenses, and assistance with other moving-related circumstances (e.g. address changes, notification of employers for time off if needed, etc.).
- Reimbursement to residents of documented home improvement expenses incurred within the five years prior to Caltrans acquisition of properties.
- Special assistance for elderly and/or disabled residents, including but not limited to counseling.
- Funding assistance for first-time home buyers.
- Subsidies/waivers for increased property taxes associated with new residences.
- Subsidies for increased living expenses associated with new residences.
- Consideration for other marginalized populations that may be affected by relocation.

ii. **Slauson Boulevard Interchange**: As previously stated by the City, the City supports the construction of a new interchange at Slauson Boulevard. This interchange would provide additional access needed to the I-710 corridor. L-19-29

iii. **Support for Zero Emission Freight Corridor**: As previously stated in the City's comments on the Draft EIR/EIS, the City strongly supports a Zero Emissions Freight Corridor and requests that this be a mandatory project feature. L-19-30

c. Design Options 1A and 1B

These options apply to both Alternative 5C (1A) and Alternative 7 (1B) and aims to reduce impacts to the BNSF operations at the Hobart intermodal rail yard in Commerce, and would shift highway, collector-distributor road, and ramp alignments to achieve this aim without encroaching beyond State right-of-way.

However, local street circulation, highway alignment, and right-of-way requirements would differ between the two alternatives. Design Option 1B would retain the proposed interchange configuration of Alternative 7, but local street circulation, highway alignment, and right-of-way requirements would differ from those of Alternative 7. Alignments would shift generally easterly, the cul-de-sac at Ransom would be removed, the one-way street between the ramp intersection and Sheila St. would be shifted easterly, and portions of Noble St. would be realigned and reconstructed.

i. **Support for Limiting Impact to Existing State Right-of-Way**: The City appreciates Caltrans efforts to limit the impacts to the exiting right-of-way and reducing impacts in the form of property acquisitions. However, there still remains a significant amount of relocations that will be necessary and the City would like to continue to express concern over the disproportionate number of residential displacement that the City of Commerce would experience. L-19-31

d. Design Options 3A and 3B

These options apply to both Alternative 5C (3A) and Alternative 7 (3B) and aim to further improve safety and operation of the freeway by reducing weaving conflicts. In order to achieve the objective, the variation would reconfigure the SR-60, I-5, and Olympic Blvd. interchanges, and alter the freeway and local traffic circulation; however, the design options would vary between Alternative 5C and Alternative 7 in that different right-of-way limits would be required.

e. Design Option 7ZE

This design option is applicable only to Alternative 7 and restricts use of the freight corridor to exclusively ZE trucks, excluding NZE trucks. This option is operational in nature and would not represent a difference in the geometric design of Alternative 7.

i. **Support for Zero Emission Design Options**: The City fully supports all efforts to reduce emissions within the I-710 Corridor. L-19-32

3. NEW COMMENTS ON THE RDEIR/SDEIS

a. Section 3.13, Air Quality/Greenhouse Gases/Health Risk Assessment

i. The near-road air quality impacts from vehicle emissions appear to have been underestimated because the grid receptors used for the air dispersion modeling did not include receptors located within 150 feet from the roadway edge.

Section 3.13 (page 3.13-42) of the RDEIR/SDEIS indicated that the air dispersion modeling's "grid receptors now follow the freeway and begin closer to the freeway (approximately 150 feet (50 meters) away from the edge of the roadway)". According to EPA's Transportation Conformity Guidance for Quantitative Hot-spot Analyses in PM2.5 and PM10 Nonattainment and Maintenance Areas (PM Hot Spot Analysis Guidance), "the majority of emissions from a highway or transit project will occur within several meters of the ground, and concentrations are likely to be greatest in proximity of near-ground sources." Many of the residential and commercial receptors along the I-710 corridor including those in the City of Commerce are located within 150 feet from the roadway edge, and some are located as close as 50 feet from the roadway. Highest air quality impacts would likely occur at these receptors that are the closest to the vehicle emission sources. L-19-33

However, these near-road receptors were excluded from the air quality modeling of the RDEIR/SDEIS by setting up the receptor grid starting at 150 feet from the roadway. Because the air quality impacts at receptors located between the roadway edge and 150 feet from the roadway edge were not captured, the air quality results presented in the RDEIR/SDEIS do not represent the worst-case impacts.

The City requests revisions to the air quality analysis to include receptors located within 150 feet from the roadway edge following the EPA's latest PM Hot Spot Analysis Guidance on highway modeling. The Guidance suggests that "Receptors should be sited as near as five meters from a source (e.g., the edge of a traffic lane or a source in a terminal), except possibly with projects involving urban street canyons where receptors may be appropriate within 2-10 meters of a project." If additional impacts are identified, mitigation measures must be considered and included in the ECR.

ii. In addition to adding the near-road receptors, the volume source setup of the air dispersion modeling needs to be revised to ensure that the near-road receptors are not located in the volume source exclusion zone that could lead to aberrant impact results.

The vehicle emission sources were modeled as volume sources in the RDEIR/SDEIS. The project's Air Quality, Greenhouse Gases, and Health Risk Technical Study (June 2017) indicates that the receptor grid started at 150 feet from the roadway edge "to ensure that none of the receptors are within the exclusion zone of modeled volume sources". This interpretation of the "exclusion zone" adjustment is not correct. Near-road receptors should not be excluded from the modeling because these receptors are likely the ones being maximally impacted. If a receptor would be located in the exclusion zone of a volume source, L-19-34

instead of removing the receptor from the analysis, the width of the volume source should be adjusted to reduce the size of its exclusion zone, and to ensure that the near-road receptor is outside of its exclusion zone. According to Appendix J of EPA's PM Hot Spot Analysis Guidance, "when using volume sources to simulate a roadway where receptors are placed five meters from the edge of the roadway, the width of a volume source should be less than eight meters. This will ensure that no receptors fall within the receptor exclusion zone. If the width of the roadway is greater than eight meters, it is recommended that additional volume sources be defined (e.g., separate each lane of traffic), or area sources be used." L-19-34

The City requests that the receptor grid and vehicle emission source setup used in the air quality modeling should be revised to: 1) add the receptors that are located between the roadway edge to 150 feet from the roadway edge, and 2) adjust the volume source width following the EPA guidance to ensure that no receptors are located inside the volume source exclusion zones.

iii. The RDEIR/SDEIS presented the overall emission changes for different study areas (SCAB, AOI, and I-710). Localized impacts to the near-road communities along the I-710 corridor were not identified. Although the project's Air Quality, Greenhouse Gases, and Health Risk Technical Study (June 2017) included figures showing emission changes and incremental criteria pollutant concentrations along I-710, it is impossible to identify the impacted locations on these figures due to the large areas the figure covers. The City requests that areas adversely impacted by the project should be zoomed in and presented separately from the regional maps to clearly show the size of the impacted areas and the level of impacts. L-19-35

In addition, it is not clear what emissions are presented in Figures 4-1a through 4-1c of the Air Quality, Greenhouse Gases, and Health Risk Technical Study. The figures appear to show emission changes for both $PM_{2.5}$ and PM_{10} in each figure. However, the table title indicates that the figure is only for $PM_{2.5}$ emissions. Within each figure, two sub-figures were labeled as PM_{10}, and the rest of the two sub-figures do not have any labels. The City requests that the figure titles and labels should be revised to clearly indicate the corresponding pollutant for each figure. L-19-36

iv. The health risk assessment (HRA) for the RDEIR/SDEIS used the same AERMOD modeling approach as the air quality analysis. Therefore, the City's comments regarding the near-road receptor grid and volume source setup in AERMOD apply to the HRA as well. Studies of near roadway pollutant levels showed that concentrations of pollutants emitted from vehicles were highest right at the roadway and decreased substantially in the first 300-500 feet from the roadway (ARB's Status of Research on Potential Mitigation Concepts to Reduce Exposure to Nearby Traffic Pollution. 2012). Excluding receptors located closer than 150 feet from the roadway from the HRA would have resulted in underestimated health risks. The City suggests that the receptor grid and vehicle emission source setup used in the HRA should be revised to 1) add the receptors that are located between the roadway edge to 150 feet from the roadway edge, and 2) adjust the volume source width following the EPA guidance to ensure that no receptors are located inside the volume source exclusion zones. L-19-37

v. Locations of potential cancer risk increases were not discussed in the RDEIR/SDEIS, other than a general discussion indicating that increased cancer risk would occur "within 110 yards L-19-38

of the I-710 freeway". Although figures showing cancer isopleths are included in the Air Quality, Greenhouse Gases, and Health Risk Technical Study (June 2017), it is impossible to identify the areas with increased cancer risks on these figures due to the large area the figure covers. The City requests that areas identified with increased cancer risks should be zoomed in and presented separately from the regional maps to clearly show the impacted communities and level of cancer risk increases. L-19-38

vi. Table 4.2-1 of the RDEIR/SDEIS showed that all project alternatives would have decreased cancer risks when compared to the 2012 baseline. However, the paragraph following the table on Page 4-55 concluded that the cancer risks would increase by 1 in a million for Alternative 7, and would increase by 3 in a million for Alternative 5C. The City would like to request clarification and internal consistency on the results of the health risk assessment. L-19-39

b. Section 3.5, Traffic and Transportation

i. The RDEIR/SDEIS response to comments state that under NEPA, the "determination of significance is based on context and intensity." The RDEIR/SDEIS response to comments further state that "... once a decision is made regarding the need for an EIS, it is the magnitude of the impact that is evaluated, and no judgement of its individual significance is deemed important." If this is the case, the RDEIR/SDEIS should more clearly describe and define the context, level of intensity and corresponding magnitude of the Build alternatives as they relate to changes in transportation. L-19-40

ii. Section 3.5.3 (Environmental Consequences) describes changes in vehicle level of service (LOS) for freeways, arterials, and intersections. It appears that impact criteria were only developed for the intersection analysis. Please clearly identify which criteria were used to evaluate the project-related changes in freeway and arterial LOS. It is also unclear whether the intersection impact criteria are the same for signalized and un-signalized intersections. An explanation should be provided of why they are the same or whether a different criterion was used. L-19-41

iii. Section 3.5.3 (Environmental Consequences) does not include a discussion of changes (beneficial or adverse) to safety. Section 3.5.2.1 (page 3.5-2) describes the existing accident rates on the freeway segments, yet there is no analysis of how the existing accident rates would change with the Build alternatives. This analysis should be provided. L-19-42

iv. Chapter 4 of the RDEIR/SDEIS provides a discussion of potential project impacts based on CEQA Checklist Questions XVIa and XVIb. However, it is unclear why the entire transportation-related CEQA Checklist (XVIa through XVIg) was not included in Chapter 4. The entire CEQA Checklist should be addressed, or at a minimum, an explanation should be provided as to why the RDEIR/SDEIS does not address questions XVIc through XVIg. L-19-43

v. On page 3.5-2, it is noted that the 2012 and recently updated 2016 SCAG model would not yield substantially different traffic forecasts. What is the definition of "substantially different"? Can Caltrans provide some quantitative information so that others can verify this finding? The *Travel Demand Modeling Methodology* technical memorandum is silent on this topic. L-19-44

vi. In Table 3.5-1, many of the freeway segments on I-710 around the Washington and Atlantic interchange improve from LOS F from existing (2012-2013) conditions to LOS D in the No Build condition. Please provide the explanation as this result appears to be counter-intuitive. L-19-45

vii. Table 3.5-2 (page 3.5-18) has a value of 6 for density (but LOS F) for the Atlantic off-ramp/Atlantic southbound on-ramp segment for existing conditions midday. That value appears to be an error – please provide clarification. L-19-46

viii. On Page 3.5-84, it is noted that "projected vehicle throughputs....are still constrained by the bottlenecks upstream and queues extending from downstream of the Study Area along I-5." How was this determined? Neither the travel demand model nor HCM explicitly includes the analysis of queues. Will these queues be better or worse with the Build Alternatives, particularly along I-710 near the I-5 interchange? L-19-47

ix. The discussion of on-street parking effects (pages 3.5-90 and 91) is very broad. The discussion notes that "theoretically" 7,300 parking spaces will be removed. That is a very large number, but over a broad corridor. Are the observations of 30 to 40 percent occupancy over a similarly wide range of locations? Some locations have much higher occupancy – will there be impacts at those locations? Is there a specific set of criteria that were used to identify potential impacts? L-19-48

x. On page 3.5-91, there is a discussion of intersection impacts, based on LOS results. Is there a similar discussion for freeway segment impacts? L-19-49

xi. Table 3.5-23 would be more helpful if the potential benefits (reduction in delay) associated with each of the potential improvements were identified. Please provide additional detail. L-19-50

Based on the RDEIR/SDEIS, many streets and intersections would be effected during construction and operation. The City's FY 17-18 Five-Year Capital Improvement Program (CIP) includes ongoing projects that the City has planned and are underway. The City would like to propose two specific opportunities for early action that are currently in design would address and minimize some of the I-710 project impacts:

- Garfield Ave./Washington Blvd. Multi-Modal Project (ID 7/LAF5108)
- Traffic Interconnect System Upgrades (ID 38/H7-07-004)

L-19-51

Additional opportunities and relevant projects to consider to minimize traffic impacts in the City:

- Mixmaster (Eastern Ave./Telegraph Rd.)
- Intersection improvements at Washington Blvd.

c. Section 3.1, Community Impacts – Parks and Recreation Facilities

i. Bandini Park/Batres Community Center

A permanent easement and temporary occupancy is anticipated as a part of both Alternative 5C and 7. Bandini Park, is one of only four neighborhood parks in the City of Commerce and offers outdoor activities, such as organized youth sports in basketball, flag football, soccer, softball, volleyball, picnic shelters, playgrounds and a children's wading pool.

This is an important resource to the community and any permanent change to access and temporary disruption to the amenities provided to the community will have a negative impact to the community. Mitigation Measure PR-16 addresses permanent access to the easement area at Bandini Park, however, there is no mitigation measure included to address the temporary impacts to this City resource, which includes a batting cage and a walking path around the perimeter of the park. The City would like to request additional coordination to develop additional minimization measures to address the temporary impacts to Bandini Park/Batres Community Center. L-19-52

d. Section 4(f)

The City has reviewed the Draft Section 4(f) Evaluation and is concerned with the proposed *de minimis* determination for the permanent use and temporary occupancy of a portion of Bandini Park/Batres Community Center. The City submitted a formal response letter to Caltrans on September 29, 2017 regarding the proposed *de minimis* determination that the City disagrees with this determination, and would like to restate the importance of this recreational resource to the community.

i. Although Caltrans indicates that impacts would be temporary – it appears that the activities at the baseball field and basketball courts at the west end of the park would be impacted. The park is open for public recreation year round and there are organized youth sports that utilize Bandini Park/Batres Community Center. L-19-53

ii. The City would like to request additional information for the following concerns:
   a. What is the construction schedule for this area?
   b. How long would construction take in this area?
   c. When is construction anticipated (i.e. time of year)?
   d. Could the construction activities be closely coordinated with City Recreation Department staff so it would not conflict with any official City-scheduled activities as well as public use of the facilities? L-19-54
   e. Is this area one of the main access points to the park? How will Caltrans maintain access at all times?

The City believes that the impact to this Section 4(f) resource warrants mitigation in the form of an enclosed gymnasium due to the proximity of the basketball courts to the I-710 which will be underneath the proposed elevated structure. Caltrans states that the area under the proposed elevated structure is concrete and does not contain any recreational resources and is not currently used for recreation activities. Caltrans also states that the area would be further limited to the City for future use of the area. The City disagrees that this area does not contain recreational resources as this area of the park contains picnic tables and is utilized as an extension of the basketball courts. L-19-55

The City maintains that noise, air quality and health impacts to children and other users of the park could be mitigated through the provision of an enclosed gymnasium which would protect children from noise, air quality and health impacts related to both construction and operation of the proposed project. The City would like to be further engaged in ongoing coordination and development of appropriate mitigation measures for this Section 4(f) resource.

The City respectfully submits these comments and entrusts these concerns to Caltrans to consider and address. Please direct any questions and coordination efforts to Maryam Babaki at (323) 722-4805 Ext. 2337.

Sincerely,

Fernando Mendoza
Interim City Administrator

ATTACHMENT A

City of Commerce

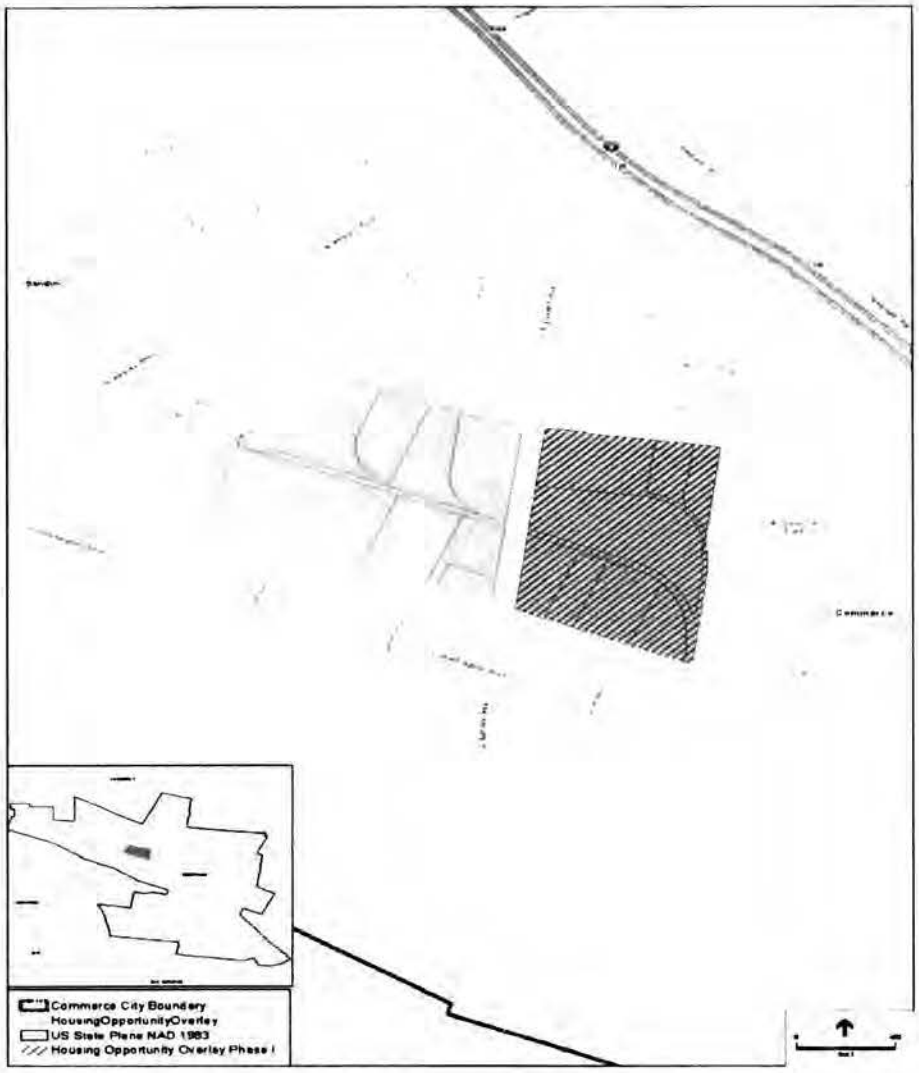
Housing Opportunity Overlay Zone

CHAPTER 19.47 - HOUSING OPPORTUNITY OVERLAY ZONE

19.47.010 - Intent and purpose.

A. The housing opportunity overlay zone (HOO) is established to facilitate the development of housing "by-right" on underutilized industrial sites. The HOO zone is intended to be applied to properties that are currently zoned heavy manufacturing (M-2) and permits discontinued manufacturing uses to recycle to residential development. The overlay zone is further intended to serve as an implementation tool of the city's housing element of the general plan by facilitating residential development on identified "housing opportunity sites."

B. The HOO has the following major objectives:



1. Create "by-right" opportunities for residential development on underutilized manufacturing sites.
2. Implement state laws that require cities to demonstrate available land capacity and zoning tools to accommodate the city's projected need for housing.
3. Provide a mix of housing types.
4. Facilitate well-designed new mixed-use development projects that combine residential and nonresidential uses (e.g., office, retail, business services, personal services, public spaces and uses, other community amenities, etc.) to promote a better balance of jobs and housing.
5. Stimulate economic development and reinvestment through regulations based upon recognized urban design principles that allow property owners to respond with flexibility to market forces.
6. Provide additional property rights while preserving existing property rights. This intent is achieved by providing additional development rights in compliance with this chapter, which property owners may exercise under certain conditions, while retaining all development rights conferred by the underlying zone to property owners in the HOO zone. Incentives and advantages include allowing a greater range and mix of uses and specifying more permissive dimensional specifications (e.g., greater floor area ratio, lot coverage ratio, and height, reduced setbacks, etc.).

(Ord. No. 656, § 4 (Exh. A), 11-19-2013)

19.47.020 - Applicability.

A. Application to Area. The HOO is an overlay zone to be used only in conjunction with an underlying heavy manufacturing (M-2) zone. The HOO area applies to approximately forty-four acres within the Rosewood Planning Area and is generally bounded by Harbor Street on the north, the Jillson Street on the south, Strong Avenue on the west and with no formal boundary on the east (eastern boundary is the Commerce Civic Center, Aquatorium and Rosewood Park), as depicted in Figure 1.

FIGURE 1: HOUSING OPPORTUNITY OVERLAY ZONE

B. Relationship Between Base Zone Standards and Overlay Zone Standards. For property within the HOO zone, the regulations in this chapter allow residential and mixed-use development as an alternative to the stand-alone industrial development allowed under the base (underlying) zone standard.

C. Base Zone Standards.

1. The provisions in this chapter shall apply to all properties within the HOO zone, but the provisions do not supersede the underlying base zone provisions until a property is developed in compliance with the provisions of this chapter. New projects may be developed in compliance with the existing underlying base zone, provided that all standards and requirements of the underlying base zone are met.

2. Regulations, development standards, and requirements in the underlying base zone shall continue to apply to those projects that are currently developed according to the existing standards.

3. For legal nonconforming uses (i.e., uses that do not comply with the provisions of the base zone), the provisions in Chapter 19.37 (Nonconforming Uses and Structures) shall apply.

D. Option to Apply HOO Zone Standards. The owner or developer of any property within the HOO zone may choose to develop in compliance with the standards and procedures in this chapter.

E. Conversion of existing nonresidential structures into a residential use may be permitted subject to a conditional use permit pursuant to Chapter 19.39, Division 7 (Conditional Use Permit).

F. After Completion of Development. Once a property is developed in compliance with the provisions of this chapter, the provisions of this chapter completely supersede the provisions of the underlying base zone. Whenever the requirements of the HOO zone impose a more or less restrictive standard than the provisions of the underlying base zone, the requirements of the HOO zone shall govern.

(Ord. No. 656, § 4 (Exh. A), 11-19-2013)

19.47.030 - Use regulations.

A. All uses in the applicable underlying zone are allowed. In addition, Table 19.11.030A identifies the uses permitted in the HOO zone.

B. Certain permitted uses and conditionally permitted uses may be subject to special conditions regarding location, operation or the design of the use. Such uses are marked in Table 19.11.030A with an asterisk (*), and the special conditions that apply are contained in Chapter 19.31 (Standards for Specific Land Uses) of this title.

C. The "notes and exceptions" column of Table 19.11.030A indicates more precisely the use regulations for specific operating characteristics. The notes and exceptions must be reviewed in conjunction with the other information for that class of use.

D. For uses or activities not specifically identified in Table 19.11.030A, the community development director shall have the authority to interpret and assign the use. The decision of the community development director can be appealed to the planning commission pursuant to Chapter 19.39, Division 4 (Appeals and Revocations) of this title.

E. Any use or activity not identified in Table 19.11.030A, or any use or activity not interpreted by the community development director, shall be prohibited.

Table 19.47.030A
Uses in Housing Opportunity Overlay Zone

Use	HOO	*Notes and Exceptions
Accessory Buildings	A	
Child Care Center	P/C*	*See Chapter 19.31 Division 8
Care Facilities (<6 persons)	P	
Child Facilities (>6 persons)	C	
Clubs, Private and Fraternities/Sororities	X	
Community Gardens	C	

Dwelling, Multi-family Attached	P	Attached multifamily dwellings could be apartments, condominium or other attached multiple family dwellings
Dwelling, Single-Family Attached	X	Attached single family dwellings could include attached townhomes, rowhouses, courtyard and/or cluster housing
Dwelling, Single-Family	X	
Dwelling, Single-Family; new construction and additions where the total floor area of all structures is greater than 2,300 square feet	X	
Emergency Shelters	X	
Greenhouses	A	
Home Occupations	P/C*	See Chapter 19.31 Division 13
Live/Work	P	See Section 19.11.080 for additional standards
Manufactured Housing	X	
Mobile Home Parks	X	
Mixed-Use Development, where residential and nonresidential uses are integrated vertically, including live/work opportunities. Nonresidential uses in vertical mixed-use projects shall be limited to: • Health and Fitness Centers; • Schools, Specialized Education and Training; • Studios, Professional; • Printing and Publishing;	P	Nonresidential uses are permitted in vertical mixed-use projects and shall be restricted to the ground floor only

• Studios—Art, Dance, Music, Photography, etc.; • Retail Trade uses that can only include: • Appliance Sales • Arts, Antiques, Collectibles, and Gifts • Convenience Stores • Furniture and Furnishings • Grocery Stores • Pet Shops • Restaurants • Retail, General Merchandise • Bank and Financial Services; • Day Care Centers; • Laundry and Dry Cleaning; • Laundromats, Self Service; • Offices; and		
Nursing/Rest Homes	C	
Parking Lots, Surface	P	
Parking Structure, Above Ground	P	Permitted if screened from views from public right-of-way and adjacent single-family residential districts

Public or Quasi-public uses of educational/recreational nature	X	
Public or Quasi-public use of religious, cultural pubic services nature	X	
Second Dwelling Unit	X	
Senior Housing	P	
Supportive Housing	P	
Swimming Pools, Private	A	
Transitional Housing	P	

NOTE: All uses are subject to performance standards as defined in Chapter 19.19.

* = See "Notes and Exceptions" column.

P = Permitted by right.

X = Not permitted.

P/C = Either permitted by right or subject to conditional use permit review, depending upon criteria contained in Chapter 19.31

C = Conditional use permit required.

(Ord. No. 656, § 4 (Exh. A), 11-19-2013)

19.47.040 - Development standards.

A. All development in the HOO zone shall conform to the development standards set forth in Table 19.11.040A.

Table 19.11.040A
Development Standards—Housing Opportunity Overlay Zone (HOO)

Development Standards	HOO	Notes
1. Maximum Density (residential uses)	40 du/ac	Maximum density for residential uses expressed as dwelling units per acre

2. Maximum Intensity (nonresidential uses)	1.0 FAR	Maximum floor area ratio (FAR) for nonresidential uses. Podium and underground parking is not counted toward floor area ratio (FAR)
3. Minimum Lot Area	None Required	
4. Minimum Dwelling Unit Size	Studio: 500 sf 1-bdrm: 600 sf 2-bdrm: 800 sf 3-bdrm: 1,000 sf	
5. Maximum Building Height	5 stories/60 ft.	Height calculated from grade
6. Distance Between Buildings (Minimum)	10 ft.	Increase of 5 ft. for every 10 ft. of height, or fraction thereof, above 25 ft.
7. Front Yard Setback	0 ft. (min); 15 ft. (max)	
8. Street Side Setback	0 ft. (min); 15 ft. (max)	
9. Interior Side Setback	5 ft. (min); No max	Minimum 10 ft. if abutting residential zone district
10. Rear Yard Setback	10 ft. (min) for residential portion, no requirement for commercial portion	Minimum 10 ft. if abutting residential zone district
11. Permitted Setback Encroachments	6 ft. into setbacks	Balconies, awning, porches, stairways and similar elements may extend up to 6 ft. into the setback. Cornices, eaves, fireplaces, similar architectural features may extend 4 ft. into the front and rear setbacks and 3 ft. in interior setbacks
12. Maximum Lot Coverage	None	
Landscape/Open Space Standards		

13. Publicly Accessible Open Space (nonresidential)	15% of net lot area	See Section 19.11.070 for additional standards
14. Private Open Space (multi-family residential)	1st floor—150 sf per unit Upper floor—100 sf per unit	See Section 19.11.060 for additional standards
15. Common Open Space (multi-family residential)	200 sf per unit	See Section 19.11.060 for additional standards
Parking Standards		
16. Surface Parking	20 ft. min. setback from front lot; 15 ft. min. setback from side lot line	
17. Garage/Tuck-Under Parking	Prohibited along front lot lines	
18. Underground/Podium Parking	Allowed beneath building footprint	
19. Above-Ground Parking Structure	Permitted if screened from views from public right-of-way and adjacent single-family residential districts	

Abbreviations: sf = square feet; ft. = feet or foot

(Ord. No. 656, § 4 (Exh. A), 11-19-2013)

19.47.050 - Frontage type standards.

A. This section provides frontage type standards for buildings in the HOO zone. Types of frontages include:

1. Live-Work/Office Fronts. A frontage that reinforces both residential and work activities that can occur in the building. The elevation of the ground floor is located at or near the grade of sidewalk to provide direct public access to the building. Entrances and windows are provided on the front of the facade to provide eyes on the street and direct sidewalk access to commercial and office uses. The front setback (if provided) may be improved with landscaping or as an extension of the public sidewalk to create a more pedestrian-friendly environment.

a. Elevation of Ground Floor. The ground floor elevation shall be located near the elevation of the sidewalk to minimize the need for external steps and external ADA ramps at public entrances.

b. Minimum Ground Floor Interior Height. Twelve feet minimum (floor-to-floor height—Commercial Ready).

c. Ground Floor Unit Entrances. All ground floor tenant spaces that have street frontage shall have entrances on a facade fronting a street. All other ground floor uses may have a common lobby entrance along the front facade or private entrances along other facades.

d. Upper Floor Unit Entrances. Entrances to upper floor units may be provided through a common lobby entrance and/or by a common entrance along a facade fronting a street.

e. Recessed Entrances. Entrances may be recessed into the facade.

f. Awnings and Marquees. Awnings or marquees may be provided over storefront windows and entrances. Awning and marquees may project up to six feet from the facade and extend over the sidewalk provided that at least eight feet of vertical clearance is provided.

g. Projecting Elements (Balconies, Roof Overhangs, Shade Structures, and Bay Windows). Projecting elements on upper floors may project four feet from the facade and project into the setback.

h. Sidewalk and Setback Treatment. The public sidewalk shall be improved with street trees with an average spacing of thirty feet on-center and pedestrian-scaled street lights (no taller than fourteen feet). If the front facade is setback from the public sidewalk, the setback shall be landscaped and/or improved as an extension of the public sidewalk.

2. Residential Fronts. A frontage that reinforces the residential character and use of the building. The elevation of the ground floor is elevated above the grade of the lot to provide privacy for residences by preventing direct views into the home from the sidewalk. Entrances and windows are provided on the front of the facade to provide eyes on the street and direct sidewalk access to the building. Stoops are allowed to project into the front setback to enhance entrances. The front setback is primarily improved with landscaping.

   a. Elevation of Ground Floor. The ground floor elevation shall be located within six feet of the ground surface of the adjacent sidewalk or walkway.

   b. Minimum Ground Floor Ceiling Height. Ten feet minimum (floor-to-floor height).

   c. Ground Floor Unit Entrances. Entrances to ground floor units that have street frontage may be provided through a common lobby entrance and/or by private entrances from the adjacent sidewalk.

   d. Upper Floor Unit Entrances. Entrances to upper floor units may be provided through a common lobby entrance and/or by a common entrance along a facade fronting a street.

   e. Recessed Entrances. Entrances may be recessed into the facade.

   f. Stoops and Front Porches. Stoops and front porches may be provided in front of building and unit entrances. Stoops and front porches may project up to six feet from the facade and project into the setback.

   g. Projecting Elements (Balconies, Roof Overhangs, Shade Structures, and Bay Windows). Projecting elements on upper floors may project four feet from the facade and project into the setback.

   h. Sidewalk and Setback Treatment. The public sidewalk shall be improved with street trees with an average spacing of thirty feet on-center and pedestrian-scaled street lights (no taller than fourteen feet). If the front facade is setback from the public sidewalk, the setback shall be landscaped (excluding stoops/front porches and paved paths to building entrances).

3. Storefronts. A frontage that reinforces the commercial character and use of the ground floor of the building. The elevation of the ground floor is located at or near the grade of sidewalk to provide direct public access into the building. Large storefronts display windows are provided on the front of the facade to encourage visual access to merchandise displays and to encourage window shopping. Awnings or marquees are provided over storefront windows and entrances. The front setback (if provided) is primarily improved as an extension of the public sidewalk to create a more pedestrian-friendly environment.

    a. Elevation of Ground Floor. The ground floor elevation shall be located near the elevation of the sidewalk to minimize the need for external steps and external ADA ramps at public entrances.

    b. Minimum Ground Floor Ceiling Height. Fifteen feet minimum (floor-to-floor height).

    c. Storefront Entrances. All ground floor tenant spaces that have street frontage shall have storefront entrances on the facade fronting a street.

    d. Lobby Entrances. Lobby entrances to upper floor uses shall be located on a facade fronting a street.

    e. Recessed Entrances. Storefront and lobby entrances may be recessed into the facade.

    f. Awnings and Marquees. Awnings or marquees are required over storefront windows and entrances. Awning and marquees may project up to six feet from the facade and extend over the sidewalk provided that at least eight feet of vertical clearance is provided.

    g. Projecting Elements (Balconies, Shade Structures, and Bay Windows). Projecting elements on upper floors may project four feet from the facade and project into the setback.

    h. Sidewalk and Setback Treatment. The public sidewalk shall be improved with street trees with an average spacing of thirty feet on-center and pedestrian-scaled street lights (no taller than fourteen feet). If the front facade is setback from the public sidewalk, the setback shall be improved as an extension of the public sidewalk.

(Ord. No. 656, § 4 (Exh. A), 11-19-2013)

19.47.060 - Open space standards.

This section provides open space standards for development within the HOO zone.

A. Usable Open Space Defined. Usable open space areas are an open area or an indoor or outdoor recreational facility which is designed and intended to be used for outdoor living and/or recreation. Usable open space shall not include any portion of parking areas, streets, driveways, sidewalks, or turnaround areas.

B. The following standards shall apply to the requirements for open space:

    1. Private Residential Open Space.

        a. For stand-alone multi-family residential projects or as part of a mixed-use development, each residential unit shall be provided with at least one area of private open space accessible directly from the living area of the unit, in the form of a fenced yard or patio, a deck or balcony at a minimum area of one hundred fifty square feet per unit for first floor units and one hundred square feet per unit for upper floors.

        b. The minimum dimension, width or depth, of a balcony shall be five feet.

    2. Common Residential Open Space.

        a. For stand-alone multi-family residential developments, each residential unit shall be provided with at least two hundred square feet of common residential open space.

b. All common open space shall be conveniently located and accessible to all dwelling units on the site.

c. Common open space areas may include landscaping, pedestrian paths, and recreational facilities.

d. In projects containing fewer than ten units, the common open space shall have a minimum width and depth of ten feet. In projects containing ten or more units, the minimum width and depth shall be twenty feet.

3. Recreational Amenities/Facilities.

a. For projects containing twenty-five or more residential units in stand-alone multi-family residential developments and as part of a mixed-use development, one common recreational amenity shall be provided for each thirty units or fraction thereof. The following listed amenities satisfy the above recreational facilities requirements. Recognizing that certain facilities serve more people than others, have a wider interest or appeal, and/or occupy more area, specified items may be counted as two amenities, as noted. In all cases, each square foot of land area devoted to a recreational amenity shall be credited as common open space on a 1:1 basis.

i. Clubhouse (two);

ii. Swimming pool (two);

iii. Tennis court (one per court);

iv. Basketball court (one per court);

v. Racquetball court (one per court);

vi. Weightlifting facility;

vii. Children's playground equipment;

viii. Sauna;

ix. Jacuzzi;

x. Day care facility (two);

xi. Other recreational amenities deemed adequate by the community development director.

(Ord. No. 656, § 4 (Exh. A), 11-19-2013)

19.47.070 - Public space amenities requirements.

A. Each project proposed within the HOO zone must include a public open space amenity, or some form of physical interface for the pedestrian. Such features may include, but not be limited to:

1. Formal Plazas. A formal plaza would be a publicly accessible open space which has a design that is influenced by classical urban planning design. A formal plaza would typically include some sort of central water fountain and/or symmetrical landscaping.

2. Urban Gardens. An urban garden can be located on the ground level, or on upper levels of a structure. Urban gardens include ornamental landscaping arranged in raised or at-grade planters or planting areas, potted plants and trees. Many times there are sculptures or other forms of public art that are included within the urban garden.

3. Covered Colonnades. Colonnades are linear in design and generous in depth. The intent is to provide a comfortably wide, covered pathway that is adjacent to the openings of a building. Sometimes the second floor of a building is utilized to create the "covered" element of the colonnade.

4. Sidewalk Dining. Sidewalk dining may occur wherever a sidewalk space is ample enough to accommodate dining furniture without impeding pedestrian access of the sidewalk. Sidewalk dining may be defined with a railing or planters, or be open and accessible.

5. Pedestrian Alleys and Walkways. A pedestrian alley or walkway is typically a "lane" that does not follow the alignment of a vehicular street, but provides a pedestrian access to either a public space or some other feature within the interior of a development. Pedestrian alleys or walkways must be designed in such a manner so as to be inviting to pedestrians. Therefore, issues such as lighting, security, line of sight, cleanliness and visual appeal are important considerations to a well designed pedestrian alley or walkway. Sometimes public art, street furniture and access to shops and public spaces are features of pedestrian alleys and walkways.

(Ord. No. 656, § 4 (Exh. A), 11-19-2013)

19.47.080 - Live-work development.

This section provides operational and compatibility standards for the development of live/work units within the HOO.

A. Allowed Uses.

1. The nonresidential component of a live/work unit shall only be a nonresidential use allowed within the HOO zone, except that certain uses are determined to be not appropriate within a residential environment and are therefore prohibited as provided in subsection (B) below.

2. The residential component of a live/work unit shall only be a residential use allowed within the HOO zone.

B. Prohibited Uses.

1. A live/work unit shall not be used for any of the following activities or similar activities as determined by the director:

a. Adult-oriented businesses;

b. Animal care or boarding;

c. Classroom instruction (e.g., art/music lessons, tutoring, and similar uses) involving five or more students at any one time;

d. Commercial food preparation activities;

e. Industrial uses;

f. Vehicle maintenance or repair (i.e., body or mechanical work, including boats and recreational vehicles), vehicle detailing and painting, upholstery, etc.;

g. Storage of flammable liquids or hazardous materials beyond that normally associated with a residential use;

h. Medical and dental offices, clinics, and laboratories (not including chiropractors or counselors/psychotherapists).

2. Activities or uses that are not compatible with residential activities or that would clearly conflict with other live/work activities or the character of the surrounding neighborhood as determined by the director; and

3. Activities or uses that would adversely affect the health or safety of live/work unit residents, because of dust, glare, heat, noise, noxious gases, odor, smoke, traffic, vibration, or other impacts, or that would be hazardous because of materials, processes, products, or wastes.

C. Site Planning and Design Standards.

1. Each live/work unit fronting a public right-of-way shall have a pedestrian-oriented frontage that allows views into the interior of the nonresidential areas of the unit.
2. Each live/work unit shall have a clearly identified, separate access from other live/work units within the structure or development. Access to individual units shall be from common access areas, parking lots, or walkways. Access to each unit shall be clearly identified to provide for emergency services.
3. The living space within the live/work unit shall be contiguous with the working space, with direct access between the two areas.

D. Operational Standards.

1. No portion of a live/work unit shall be separately sold or rented.
2. The owner or developer of a structure containing live/work units shall provide written notice to all occupants, tenants, and users that the surrounding area may be subject to higher impacts associated with nonresidential uses (e.g., noise) than exist in more predominantly residential areas. Performance standards for live/work units shall be those applicable to nonresidential uses allowed in the zone in which the live/work units are located.
3. All activities related to the "work" component of a live/work unit shall be conducted within a completely enclosed building.
4. Up to two additional persons who do not reside in the live/work unit may work in the unit.
5. Client and customer visits to live/work units are allowed.
6. Parking for each live/work unit shall be provided in compliance with Chapter 19.21 (Off-Street Parking Requirements).
7. A live/work unit shall not be converted to either entirely residential use or entirely nonresidential use.
8. A live/work use may display a window or building-mounted sign up to a maximum of five percent of the building frontage area used for commercial purposes. Signs shall not be illuminated, including neon signs.

(Ord. No. 656, § 4 (Exh. A), 11-19-2013)

19.47.090 - Mixed-use development.

This section provides operational and compatibility standards for mixed-use development within the HOO zone. Nonresidential uses are restricted to the ground floor only.

A. Operational Standards.

1. Joint Tenants and Owners Association.
    a. A joint tenants and owners association shall be formed to ensure the well-being of each tenant and owner in a mixed-use project.
    b. The association bylaws, including voting rights, shall be subject to review by the city attorney and approval by the director. The association's bylaws shall include the following:
        i. Assignment of parking spaces per each use.
        ii. Identification of maintenance responsibilities for landscaping, parking facilities, and recycling and refuse storage facilities. Noise notification procedures.
        iii. Relationship between uses regarding association representation.
        iv. Voting procedures.

v. Procedures for solving problems that may arise between the different types of uses or residents.

2. Loading and Unloading Activities. Where applicable, the covenants, conditions, and restrictions of a mixed-use project shall indicate the times when the loading and unloading of goods may occur on the street, provided that in no event shall loading or unloading take place after ten o'clock p.m. or before seven o'clock a.m. on any day of the week.

3. Noise Notification.

   a. Residents, whether owners or tenants, of a mixed-use development project shall be notified in writing before taking up residence that they will be living in an urban type of environment and that the noise levels may be higher than a typical residential area.

   b. The covenants, conditions, and restrictions of a mixed-use project shall require that the residents acknowledge their receipt of the written noise notification. Their signatures shall confirm receipt and understanding of this information

B. Fences and Walls. In addition to the regulations in Section 19.09.060 (Fences, hedges, and walls, commercial zone), fences and walls shall be subject to the following regulations:

1. Separation Wall Required. A masonry separation wall shall be constructed on all property lines adjacent to any single-family residential district. Pedestrian access points are encouraged and may be allowed subject to approval of the director. The separation wall shall be six feet in height, as measured from the highest elevation of land contiguous to the wall, except in a required front setback area and in a required exterior side setback area for a corner, reverse corner or key lot, where the wall shall be limited to thirty-six inches in height.

2. Other Fences and Walls. Fences and walls are allowed in any yard area subject to the following height regulations:

   a. Front Yard Area. In the front yard area, the height shall be limited to thirty-six inches.

   b. Street Side Yard. In street side yard areas, the height shall be limited to thirty-six inches.

   c. All Other Areas. In all other areas, the height shall be limited to six feet, as measured from the side of the fence or wall with the highest grade.

3. Location. All perimeter fences and walls shall be constructed on the property line unless a different location is permitted by the community development director. No parallel wall or fence shall be constructed less than five feet from an existing wall or fence, unless approved by the community development director.

4. Materials.

   a. Chain link fencing shall not be erected between a primary or accessory structure and a public or private street, except that chain link fencing may be used for security purposes for public utility structures and for temporary fencing needs (construction sites, special events, vacant lots, etc.).

   b. Barbed wire and concertina wire are prohibited, except at public utility structures.

C. Landscaping. Landscaping shall comply with Chapter 19.23 (Landscaping).

D. Screening and Buffering—Mechanical Equipment and Trash Facilities. Mechanical and air-conditioning equipment shall be screened and buffered in compliance with Section 19.19.100 (Mechanical equipment screening) and trash facilities shall be screened and buffered in compliance with Section 19.19.140 (Solid waste receptacles and enclosures).

E. Signs. Signs shall comply with Chapter 19.25 (Signs). In addition, in the HOO zone where both residential and nonresidential uses are allowed, the signage rights and responsibilities applicable to a particular use shall be determined as follows: residential uses shall be treated as

if they were located in the residential area where that type of use would be allowed as a matter of right, and nonresidential uses shall be treated as if they were located in a zone where that particular use would be allowed, either as a matter of right or subject to a discretionary process.

F. Sound Mitigation. Residential dwelling units shall be designed to be sound attenuated against present and future project noise. New projects or new nonresidential uses in existing projects shall provide an acoustical analysis report, by an acoustical engineer, describing the acoustical design features of the structure required to satisfy the exterior and interior noise standards.

G. Design Criteria.

1. A mixed-use development project shall be designed and constructed to:

   a. Be pedestrian in its focus by:

      i. Providing direct pedestrian linkages to adjacent public sidewalks.

      ii. Creating enhanced pedestrian connections throughout the project between residential and nonresidential uses and parking areas.

      iii. Providing enhanced pedestrian amenities throughout the project, including seating, pedestrian area lighting, special paving, public art, water features, common open space, directories, and similar items to create a pleasant pedestrian experience.

   b. Incorporating architectural design elements and materials that relate to a pedestrian scale.

   c. Locate uses in proximity to one another without large intervening parking lots so that it is convenient for people to walk between the various uses and park their vehicles only once.

   d. Create a pedestrian scale and character of development along the street by providing significant wall articulation and varying roof heights, incorporating pedestrian scale elements (e.g., doors, windows, lighting, landscaping), and locating storefronts and common open space areas (e.g., plaza, courtyard, outdoor dining) near the public sidewalk to contribute to an active street environment.

2. Consistent Use of Architectural Details and Materials. Architectural style and use of quality materials shall be compatible and consistent throughout an entire mixed-use project. However, differences in architectural details and materials may occur to differentiate between the residential and nonresidential portions of the project. The overall project design and site layout shall be one that promotes a strong pedestrian environment and active street frontage. This can be accomplished by incorporating features into the project as outlined in subsection (3) below.

3. Features.

   a. Street Level Features. Variations in the front building plane shall be incorporated through the use of varying building setbacks, variations in wall planes, and the inclusion of pedestrian amenities (e.g., plaza, courtyard, outdoor dining, landscaping). Long expanses of blank walls shall be prohibited.

   b. Pedestrian-Oriented Features. At least seventy-five percent of the building frontage facing a public street, primary pedestrian way, or parking lot shall be devoted to pedestrian-oriented features (e.g., storefronts, pedestrian entrances to nonresidential uses; transparent display windows; landscaping).

   c. Upper Level Features. Upper floor balconies, bays, and windows shall be provided whenever opportunities exist for these types of features.

   d. Entrances. When nonresidential and residential uses are located in a vertical mixed use structure, separate pedestrian entrances shall be provided for each use. The entrances for nonresidential uses shall be designed to be visually distinct from the

entrances for residential uses. Entrances to individual residential units in a vertical mixed use project shall not be allowed along a street frontage. Instead shared entrances to residential units located above the ground floor shall be from lobbies that serve multiple units.

e. Neighborhood Interface. The design of new infill development shall be sensitive to the scale and design characteristics of established structures in abutting residential neighborhoods, with the objective of achieving a harmonious transition between the new development and existing neighborhood. Consideration shall be given to factors including, but not limited to, orientation of architectural features, building articulation, and exterior building treatments.

f. Lighting. Lighting shall be incorporated along sidewalks or other pedestrian walkways, plazas, paseos, courtyards, and other common open areas to enhance the pedestrian environment and increase public safety. Lighting for nonresidential uses shall be designed, located, and shielded to ensure that they do not adversely impact the residential uses, but shall provide sufficient illumination for access and security purposes consistent with the provisions of Section 19.19.130 (Lighting).

g. Security. Projects shall be designed to minimize security risks to residents and to minimize the opportunities for vandalism and theft. This may be accomplished by:

i. Maximizing visibility to common open space areas, internal walkways, and public sidewalks. Use opportunities for natural surveillance to increase visibility.

ii. Using walkways, low fences, lighting, signage, and landscaping to clearly guide people and vehicles to and from the proper entrances.

iii. Eliminating areas of concealment, hiding places, and dead spaces.

iv. Using lighting to improve the visibility of common areas while enhancing the pedestrian environment. Lighting should not be overly bright and should provide a uniform level of light over the subject area to eliminate dark spaces.

(Ord. No. 656, § 4 (Exh. A), 11-19-2013)

19.47.100 - Outdoor dining.

This section provides standards for outdoor dining areas within the HOO zone. Outdoor dining restricted is restricted to the ground floor only.

A. Public Property. Outdoor dining on public property shall require approval of an encroachment permit by the public works director and compliance with the standards of the public works department.

B. Private Property. Outdoor dining on private property shall comply with the following standards:

1. Coordinated Design Scheme. The design and appearance of proposed improvements or furniture (e.g., tables, chairs, benches, umbrellas, planters, menu boards, etc.) to be placed in an outdoor dining area shall present a coordinated theme and shall be compatible with the appearance and design of the primary structure, as determined by the director.

2. Hours of Operation. Hours of operation for outdoor dining areas shall coincide with those of the associated indoor restaurant.

3. Property Maintenance. The operator shall maintain the outdoor dining area(s) in a neat, clean, and orderly condition at all times. This shall include all tables, benches, chairs, displays, or other related furniture. An adequate number of trash receptacles shall be provided to serve the outdoor dining area.

4. Outdoor Bar Prohibited. A bar designed and/or operated to sell or dispense any alcoholic beverages shall not be allowed in the outside dining area.

5. Location. Outdoor dining areas may be allowed to locate in required setback areas but shall not encroach into required parking areas. They may be allowed to encroach into a public right-of-way with an approved encroachment permit issued by the city engineer.

6. Noise. Amplified sound (e.g., music, television, etc.) shall not be audible beyond the lot line.

C. Review Criteria. When reviewing an application to allow outdoor dining, the review authority shall consider the relation of outdoor dining areas to sensitive noise receptors (e.g., hospitals, schools, and residential uses). Mitigation measures shall be applied to eliminate potential impacts related to glare, light, loitering, and noise.

(Ord. No. 656, § 4 (Exh. A), 11-19-2013)

19.47.110 - Driveway standards.

This section will include standards for the design (width, pavement, fire access requirements, etc.) and placement (distance from intersections, line of sight standards, etc.) of driveways within the HOO zone.

A. Access. Driveway access to a lot may be provided from a street or an adjacent property (if a shared access easement is provided). Driveways are encouraged to connect to other driveways to increase accessibility.

B. Location. Driveway access points are prohibited within fifty feet of street intersections. A minimum of three hundred feet between driveways shall be maintained.

(Ord. No. 656, § 4 (Exh. A), 11-19-2013)

19.47.120 - Signs.

A. Signage. All development within the HOO zone shall have a "sign program" as part of the project design. The sign program shall identify the location for all signage that may be located on the building, the allowable sign materials, lighting methods and sign design. In addition, temporary signs and banners will be included in the sign program, as to whether or not they are allowed, and if they are allowed, then where these signs may be located within the development project. At no time, shall the sign program allow for signage in excess of those standards within Chapter 19.25 (Signs). "Box" signs, "canister" or "can" signs are prohibited.

B. Pedestrian-oriented, non-illuminated hanging "blade" signs that either hang under a colonnade or canopy, or project from the facade of a building, shall not be counted within the sign area formula that is used to calculate the maximum amount of sign area for each building. In other words, the hanging or projecting blade sign is a "free" sign in regards to being included in calculating the maximum amount of sign area that a development or store may have. In no case shall a pedestrian-oriented, non-illuminated hanging or projecting blade sign exceed two square feet maximum per sign face, or two square feet for a double-faced blade sign.

(Ord. No. 656, § 4 (Exh. A), 11-19-2013)

19.47.130 - Other applicable regulations.

In addition to the requirements contained in Chapter 19.11, regulations contained in the following chapters of this title shall apply to development in the manufacturing zones:

Chapter 19.01: General Provisions

Chapter 19.19: Site Planning and General Development Standards

Chapter 19.21: Off-Street Parking and Loading

Chapter 19.23: Landscaping Standards

Chapter 19.25: Signs

Chapter 19.31: Standards for Specific Land Uses

Chapter 19.37: Nonconforming Uses and Structures

(Ord. No. 656, § 4 (Exh. A), 11-19-2013)

Mr. Ronald Kosinski
CALTRANS DISTRICT 7
Division of Environmental Planning
100 South Main Street, MS 164
Los Angeles, CA 90012

Re: CITY OF COMMERCE COMMENTS ON THE I-710 CORRIDOR PROJECT DRAFT EIR/EIS

Dear Mr. Kosinski:

On behalf of the City Council, the City of Commerce (City) appreciates this opportunity to review the I-710 Corridor Project Environmental Impact Report and Environmental Impact Statement (EIR/EIS), and would like to thank Caltrans for the extension of the comment period through September to allow thorough review of this important document. This letter represents the official comments of the City of Commerce on the Draft EIR/EIS, and as such, it is focused on the potential project impacts that most directly affect the resources of the City.

The City of Commerce applauds Caltrans and its partner agencies in their attempt to find a solution to the gridlock and negative impacts on traffic safety, air quality, noise, and human health that currently exist in the vicinity of the I-710 corridor – impacts which are expected to intensify with the projected increases in truck traffic over the next few decades. Goods movement through the Ports of Los Angeles and Long Beach, via the interstate highway system and rail lines, is a critical economic engine for Southern California. It is clear from the Draft EIR/EIS that the proposed I-710 Corridor Project will result in real and permanent benefits to the region, such as increased safety and level of service on the I-710 and decreased regional diesel emissions. L-19-1

However, the City continues to be concerned about the substantial costs that will be borne by our local citizenry: the displacement of families, neighborhoods, and businesses; decrease in tax revenue; disruption of local traffic patterns; and increase in exposure to unhealthful levels of air pollutants and noise, to name just a few. These impacts will clearly not be in proportion to the potential project benefits for the City of Commerce. L-19-2

The City of Commerce is unique among the 17 cities and unincorporated communities along the I-710 corridor, because it represents the terminus of the freight corridor proposed under Alternatives 6A, 6B, and 6C; is home to the Union Pacific and Burlington Northern Santa Fe rail yards, which collectively constitute the fourth largest rail yard in the nation, and therefore serve as a major "inland port"; and is the location of major freeway and arterial interchange improvements that will affect our City in a number of significant ways. For example, because the I-710 Corridor Project proposes major reconfiguration of a number of arterial interchanges, the citizens of

Commerce would experience some of the most intensive construction activity to be undertaken for this project, and for the longest period of time, including the need for construction activities to routinely occur during the nighttime hours. Following project buildout, according to the Draft EIR/EIS, the City of Commerce will be obligated to bear up to 36 percent of total corridor-wide relocations (166 properties); up to 38 percent of corridor-wide job displacement (510 jobs); up to 26 percent of corridor-wide property tax losses ($736,000); and up to 42 percent of corridor-wide sales tax losses. There are several hundred existing residential properties in Commerce that lie within 300 feet of the proposed freeway alignment and ramp improvements, and these residents will experience short-term (construction-related) and long-term (operations-related) negative health impacts as the result of project-related increases in air emissions in excess of acceptable thresholds. L-19-3

Members of our Local Advisory Committee, in conjunction with the local non-profit East Yards Communities for Environmental Justice (East Yards), have developed "Community Alternative 7" for consideration by Caltrans. East Yards plans to submit a separate comment letter containing a detailed discussion of this alternative. It is the City's understanding that Community Alternative 7 attempts to balance the predominantly regional project benefits with benefits for the largely poor and minority residential neighborhoods that will be adversely affected, and give voice to those constituents who might not otherwise be heard in the environmental review process. L-19-4

The City wholeheartedly supports our community's participation in ongoing dialogue with Caltrans, and encourages Caltrans to accept this alternative and other comment letters from Commerce's residents and business community in good faith and accord them full consideration. We believe those most affected by this project should play an integral role in the project process, and we are committed to the ultimate selection by Caltrans of a design alternative that balances the project's broad objectives with an acceptable, and even improved, quality of life for the communities that line the freeway corridor.

Our comment letter therefore incorporates the most critical concerns and questions about the proposed I-710 Corridor Project that have been communicated to the City Council by the residents, businesses, and industries for whom Commerce is home, and reiterates some of the concerns the City has expressed in previous letters to Caltrans and Metro at project milestones during Draft EIR/EIS preparation.

The City has also undertaken a comprehensive technical review of the Draft EIR/EIS, with the assistance of environmental consulting firm PCR Services, professional traffic engineers, socioeconomic consultants HR&A Advisors, and geotechnical consultants Ninyo & Moore, to identify localized impacts on City resources, since the Draft EIR/EIS necessarily evaluates impacts on a large number of affected jurisdictions and across a wide range of environmental topics, and the broad scope of the project and environmental documentation does not always permit the detailed degree of analysis necessary to identify impacts on specific neighborhoods or other resources at the local level. Our letter includes comments based on this review, categorized as follows:

1. **Proposed Alternatives and Design Options.** This section briefly summarizes proposed Alternatives 5A and 6A/B/C, and Design Options 1, 2, and 3, and provides our comments on each.

2. **Additional Technical Studies or Opportunities for Technical Study Review.** This section identifies technical studies, plans, or programs that the Draft EIR/EIS states

are planned or under preparation and that Commerce requests the opportunity to review and comment on. This section also identifies additional technical studies the City considers necessary to evaluate localized impacts in detail.

3. **Draft EIR/EIS Review Comments.** This section provides a detailed summary of the City's review comments on the Draft EIR/EIS, organized by environmental topic and focused on potential impacts to the City. This section identifies numerous instances where requests for enhancements of mitigation measures proposed in the Draft EIR/EIS or new mitigation measures not yet identified are appropriate, given the significant localized impacts predicted to occur.

4. **Community Benefits Agreement.** Based on the extent of potential impacts from the proposed I-710 Corridor Project on the quality of life and livelihoods of residents, workers, and business owners within Commerce, the City requests that Caltrans enter into a Community Benefits Agreement with the City as a means to avoid, minimize, monitor, and offset the substantial negative local financial and physical impacts.

1. Comments on Proposed Alternatives and Design Options

Having reviewed the I-710 Corridor Project Draft EIR/EIS in its entirety, Commerce has not identified a single Alternative or Design Option as superior. Below are the City's specific comments concerning the Alternatives and Design Options.

Alternatives Summary

Alternative 5A. This alternative proposes 10 general-purpose freeway lanes. The present left-side N/B I-710 connector to N/B I-5, north of Commerce, would be replaced with a new right-side connector that begins just north of (but is not accessible from) Washington Boulevard in the City of Commerce.

Alternative 6A. This Alternative proposes 10 general-purpose freeway lanes plus a four-lane dedicated freight corridor between the port complex and the rail yards in Commerce, for the exclusive use of heavy-duty trucks (assumed to be conventional diesel- or fossil-fueled trucks). The freight corridor would be both at-grade and elevated within the City of Commerce. The present left-side N/B I-710 connector to N/B I-5, north of Commerce, would be replaced with a new right-side connector that begins just north of (but is not accessible from) Washington Boulevard in the City of Commerce.

Alternative 6B. This Alternative proposes 10 general-purpose freeway lanes plus a four-lane dedicated freight corridor for the exclusive use of zero-emission trucks betwe en the port complex and the rail yards in Commerce. The freight corridor would be both at-grade and elevated within the City of Commerce. As under Alternative 6A, the present left-side N/B I-710 connector to N/B I-5, north of Commerce, would be replaced with a new right-side connector that begins just north of (but is not accessible from) Washington Boulevard in the City of Commerce.

Alternative 6C. This Alternative proposes 10 general-purpose freeway lanes plus a four-lane dedicated toll-only freight corridor for the exclusive use of zero-emission trucks between the port complex and the rail yards in Commerce, for the exclusive use of heavy-duty trucks. The

freight corridor would be both at-grade and elevated within the City of Commerce. As under Alternative 6A/B, the present left-side N/B I-710 connector to N/B I-5, north of Commerce, would be replaced with a new right-side connector that begins just north of (but is not accessible from) Washington Boulevard in the City of Commerce.

City Comments on Alternatives

Prioritizing the Relocation of Displaced Businesses within the City of Commerce. The Community Impact Assessment Technical Study provided in the Draft EIR/EIS states that Caltrans will "prioritize efforts" to relocate businesses within the same City, but no description is provided describing how Caltrans intends to ensure this. Without a detailed plan, this measure is not sufficient to mitigate the displacement-related employment impacts. The City requests that Caltrans provide a detailed plan to show specifically how it will prioritize efforts to relocate business within the City of Commerce. L-19-5

Dedicated Zero Emissions Freight Corridor and Zero Emissions Extension Option. The City strongly supports the proposed dedicated Zero Emissions Freight Corridor, and requests that this be made a mandatory feature of the project. We also support the Zero Emissions Extension (ZEE) design option, which would extend this technology and the associated infrastructure beyond the freeway mainline onto the truck ramps within the City of Commerce, as close as possible to the railyards. The Health Risk Assessment Technical Study prepared for the project demonstrates that the ZEE design option would result in substantially reduced impacts in the City of Commerce. Compared to Alternative 1 (2035 No Build), the ZEE design option would reduce emissions of criteria pollutants, including diesel particulate matter (DPM). The ZEE option would only occur under Alternatives 6B and 6C. Without the ZEE option, Alternatives 6B and 6C would expose residents and businesses in the City of Commerce to the highest cancer risk increases of any of the proposed Alternatives, compared to Alternative 1. Sensitive receptor areas such as the ABC/Ayers, Northwest, Bristow, and Bandini neighborhoods would experience significant cancer risk increases of between 10 and 100 in one million (see Figures 23 and 24 in Appendix R of the Draft EIR/EIS). Under Alternative 6B with the ZEE design option, impacts on sensitive residential areas would be eliminated, with the exception of the ABC/Ayers neighborhood, which would still experience a significant increase in cancer risk of about 10+ in one million under Alternative 6B (with the ZEE option). Under Alternative 6C with the ZEE design option, significant cancer risk increases would be eliminated at sensitive residential areas in the City of Commerce. L-19-6

Slauson Boulevard Interchange. Under all of the Alternatives, a new interchange is proposed at Slauson Boulevard, just south of the Commerce city boundary in the cities of Maywood and Bell, that would provide access to/from I-710 where none currently exists. This would improve access between these cities and the I-710 corridor. Based on the preliminary data in the Draft EIR/EIS, Commerce supports the construction of this interchange, but only in addition to retention or improvement of the critical Washington Boulevard interchange within the City of Commerce, which is essential for Commerce businesses, industry, and residents. In addition, the City is concerned about the property takes that would result from the extensive improvements proposed for this interchange. We request that Caltrans reduce or minimize the proposed take of commercial, industrial, and public property associated with this improvement. L-19-7

Community Alternative 7 (Authored by the Commerce Local Advisory Committee and East Yards Co mmunities for Environmental Justice). As noted in the introduction to this L-19-8

comment letter, the City of Commerce's Local Advisory Committee in conjunction with East Yards plans to submit a comment letter recommending an additional project alternative, Community Alternative 7, for consideration by Caltrans. While the City has not reviewed this alternative in detail, it is our preliminary understanding that it recommends minimizing impacts on public transit, improvements to the Los Angeles River, the use of zero- or low-emission construction equipment, a local hire preference, outreach to local businesses that will be affected by construction, and other strategies to avoid, minimize, or reduce impacts. The City supports these features of the Community Alternative 7 and encourages Caltrans to consider them during development of the final design alternative. L-19-8

Summary of Design Options and City Comments

Design Option 1.

This option would introduce a new mixed flow (i.e., truck and general traffic) on-ramp to the S/B I-710 at Washington Boulevard, in order to provide direct access to the I-710 possible from the UP and BNSF railyards. This ramp would loop through, and therefore require the acquisition and relocation of, the entire ABC/Ayers residential neighborhood. Two other new mixed flow ramps would be constructed at Washington Boulevard: a S/B off-ramp and a N/B on-ramp.

The new N/B on-ramp would not allow a transition to the N/B I-5 freeway; cars and trucks would instead be redirected south to the reconfigured Atlantic/Bandini Boulevard on-ramps to do so. The Atlantic/Bandini interchange with the freeway, just south of the Commerce city boundary with Vernon, would be completely reconfigured to accommodate relocation of the mainline freeway ramps east of their present location, and to allow for the terminus of one of the N/B freight corridor lanes and the beginning of one of the S/B freight corridor lanes at Bandini Boulevard.

The existing N/B off-ramp at Washington Boulevard would be removed under this Design Option, and general traffic wishing to access Washington Boulevard would be required to exit the I-710 at the reconfigured Atlantic/Bandini interchange, or at the Slauson interchange.

Elimination of the N/B Washington Boulevard off-ramp. The City is concerned that elimination of this existing off-ramp, and requiring mixed traffic to exit the I-710 freeway south of the City, at the Atlantic/Bandini off-ramp within the City of Vernon, will add to congestion on Commerce city streets and cost Commerce employees, businesses and industries, and residents valuable time. We request that Caltrans evaluate the possibility of constructing a new N/B off-ramp at Washington Boulevard. L-19-9

Impacts on the ABC/Ayers residential neighborhood. Under this Design Option, construction of the S/B Washington Boulevard on-ramp would require the acquisition and relocation of all of the residential parcels (approximately) in the ABC/Ayers neighborhood. This residential neighborhood encompasses Ayers Avenue, Bedessen Avenue, Connor Avenue, and Leonis Street.

Impacts on the Northwest residential neighborhood. Under all of the build alternatives, widening and realignment of the mainline freeway corridor would require the acquisition and relocation of residential parcels in the City's Northwest neighborhood, along Sydney Drive, Triggs Street, Dunham Street, and Eastern Avenue, southwest of the I-710/I-5 interchange.

The Draft EIR/EIS states, on page 3.3-19 of Section 3.3, Community Impacts:

> *"Impacts to community cohesion generally depend on whether a project is likely to create a barrier or disrupt connectivity of a community."*

The Draft EIR/EIS subsequently defines social cohesion on page 3.3-24:

> *"Social cohesion, including increases in social support or strengthening of social networks, is associated with decreased stress; increased assistance in emergencies; increased access to jobs, income, and job benefits; and increased access to other essential resources. Communities that become isolated or segregated lose political power, which is associated with increased exposure to crime and violence, causing both injury and stress and additional impacts to mental health (P. Simon et al. 2009).*
>
> *"...If displaced residents are required to relocate outside of their neighborhood, supportive family and community relationships can be lost both for those leaving, as well as for those remaining behind. Neighbors, friends, and family provide material as well as emotional support. Support, either perceived or provided, can buffer stressful situations, prevent damaging feelings of isolation, and contribute to a sense of self-esteem and value. (Guzman and Bhatia, 2005).*
>
> *"Residents have disclosed symptoms of stress, loss, grief, and poorer mental health following housing displacement and relocation. Certain groups, including children, the elderly, the intellectually disabled, and marginalized groups, can be particularly vulnerable to the health effects of housing displacement. (Regional Public Health, 2011). Within the I-710 Corridor, long-term residents who are elderly may require specialized relocation assistance."*

The Draft EIR/EIR goes on to state, on page 3.3-25:

> *"As discussed in more detail in Section 3.3.2.3,* ***within the cities of Commerce,*** *Bell Gardens, and Compton,* ***current market conditions indicate a lack of comparable replacement housing. While adequate comparable replacement housing appears to exist presently in neighboring cities, new replacement dwellings under Last Resort Housing may be considered for these cities as a method of providing comparable replacement housing to displaced persons who reside in areas where the replacement housing is low.*** *Last Resort Housing is being considered in response to the affected cities' request to keep housing within their cities rather than having the replacement housing be in neighboring cities."*

However, on page 3.3-26, the Draft EIR/EIS states that the proposed build alternatives would not result in adverse impacts on community cohesion in the City of Commerce, including, specifically, on the Ayers/ABC neighborhood and the Northwest neighborhood:

> *"Based on the limited extent of access changes in the Study Area, the proximity of these changes to residential and nonresidential properties, the availability of comparable properties for relocation and consideration of Last Resort Housing, and the comprehensive Relocation Assistance Program provided by Caltrans for those*

> *being relocated, the build alternatives would not result in isolation and/or segregation of residents without resources to relocate within their existing communities.* ***Therefore, the build alternatives would not result in adverse effects to public health related to social cohesion.***"

Page 5.6-9 of the Community Impacts Assessment Technical Study also notes the following:

> *"In addition, the City of Commerce, in conjunction with a private developer, plans to develop a vacant parcel located on the northeast corner of Eastern Ave. and Triggs St., and improve it with 19 detached single-family residences (DRIR 2011). The proposed project is presently in conceptual stages, but it is anticipated that the project will be completed within five years. If approved, this project could assist in providing replacement housing for residential displacements in the City of Commerce under the I-710 Corridor Project build alternatives."*

The City of Commerce understands that residential relocations in the Ayers/ABC neighborhood and the Northwest neighborhood may be necessary (and it should be noted that the Northwest neighborhood is not even addressed in the discussion of community cohesion within Section 3.3, Community Impacts, of the Draft EIR/EIS). The Draft EIR/EIS, in Section 3.3. Community Impacts, and in the Community Impact Assessment Technical Report, states that up to 110 residential displacements (i.e., units) could be necessary. This would equate to approximately 415 residents, assuming the average Commerce household size of 3.77 occupants as stated in the Draft EIR/EIS. However, this may be an understatement of the true number of potential displacements, as average household size may not be an adequate metric for accurately gauging the number of residents affected. Based on recent surveys it has conducted, the City believes that approximately 165 residential units would be displaced in the ABC/Ayers and Northwest neighborhoods, which would equate to as many as 622 residents.

Therefore, the City profoundly disagrees with the Draft EIR/EIS finding that the build alternatives would not have significant impacts with respect to social cohesion in these residential neighborhoods, as the result of relocation. The Design Options that would require relocation of the residents of these two neighborhoods would remove people, families, and extended families from homes they have occupied for decades, in some cases their entire lives; would affect a large number of elderly residents, most of whom are dependent to some degree on their neighbors for social interaction, security, and assistance with daily needs; would disproportionately affect low-income families; and would affect families with young children. The City is acutely aware, and the Draft EIR/EIS acknowledges, that adequate replacement housing does not currently exist within Commerce City limits. Relocation and dispersal to other communities of the residents of the stable and highly cohesive ABC/Ayers and Northwest neighborhoods would indisputably separate and isolate residents from one another; move them away from the essential services they are dependent on; deprive them of representation by their elected officials in the City of Commerce; could remove them from access to employment or employment opportunities; could move them away from parishes and other religious networks they are part of; and deprive them of access to a range of community services and assistance, from school to afterschool and summer enrichment programs to civic programs to transportation opportunities (including medical transportation) to opportunities for public service to their community and City. **The fact that the Draft EIR/EIS does not acknowledge this as a significant impact starkly conflicts with the very threshold criteria against which these impacts are evaluated, minimizes the human toll of relocation, and**

L-19-10

prevents the appropriate mitigation of these impacts on the affected residents. The possibility of redevelopment of the vacant parcel at the corner of Eastern Avenue and Triggs Street is speculative and should not be relied on, even in part, for a determination of a less than significant impact on community cohesion. Moreover, the possible presence of comparable housing in neighboring communities is in no way an acceptable substitute for the lives, social and civic networks, and community cohesion that residents of these two neighborhoods have built, and moreover does not reduce the magnitude of the impacts of relocation on these residents.

L-19-10

The City therefore insists that Caltrans re-evaluate Community Impacts on the ABC/Ayers and Northwest neighborhood residents in the Final EIR/EIS. We request that the Final EIR provide and document a more detailed and accurate accounting of the precise number of potential residential displacements, given the wide discrepancy between the maximum number of affected units stated in the Draft EIR (110) and the number of units surveyed by the City (165). We also respectfully request, in the strongest terms possible, that Caltrans work closely with the City of Commerce to develop Last Resort Housing for these residents within the City of Commerce and commit to the relocation of all displaced residents within the City of Commerce.

In view of the lack of comparable existing housing within the City of Commerce, the likely inadequacy of Caltrans's standard relocation stipends for potentially displaced residents, and the likely lack of sufficient financial resources on the part of those residents to afford replacement housing at current market prices, we further request that Caltrans address the following, at a minimum, for any resident relocation:

- The provision of, or the provision of funding to construct, one-for-one replacement housing for every dwelling unit to be removed as the result of the project, including single-family homes, townhomes, duplexes, condominium, and rental apartments.
- Creative solutions to the siting and design of comparable replacement housing within the City of Commerce, in a manner that improves the quality of life for displaced residents
- The provision by Caltrans, as soon as is feasible, of a clear timeline for proposed property acquisition and resident relocation, to minimize uncertainty for affected residents and allow for advance planning

L-19-11

- The provision of funds for moving expenses, and assistance with other moving-related circumstances (e.g., address changes, notification of employers for time off if needed, etc.)
- Reimbursement to residents of documented home improvement expenses incurred within the five years prior to Caltrans acquisition of properties
- Special assistance for elderly and/or disabled residents, including but not limited to counseling
- Funding assistance for first-time home buyers
- Subsidies/waivers for increased property taxes associated with new residences

- Subsidies for increased living expenses associated with new residences
- Consideration for other marginalized populations that may be affected by relocation

L-19-11

Removal of access from Washington Boulevard to I-5 N/B. The City would like to express support for the retention of the mixed-flow (truck and passenger vehicle) on-ramps to the N/B and S/B I-710 freeway at Washington Boulevard. However, the new Washington Boulevard on-ramp to the N/B I-710 proposed under this option would no longer allow a direct connection to I-5 N/B, since vehicles entering the N/B I-710 via the new Washington Boulevard on-ramp would merge with the mainline I-710 freeway at a point north of the I-710 N/B transition to I-5 N/B. This means local truck traffic and private vehicular traffic (originating in the City of Commerce as well as surrounding cities and communities) would no longer have direct access from Washington Boulevard to I-5 N/B, as they currently do. The City is aware that this is meant to address existing safety issues inherent in the present connector (i.e., the need for vehicles entering the N/B I-710 via Washington Boulevard on-ramps to cross multiple lanes of traffic in order to merge onto the N/B I-5). However, this removes a critical connection to I-5 for Commerce.

Washington Boulevard is a major east-west commercial and industrial corridor within the City, and the concentration of businesses along this corridor and in the northeast part of the City (as well as adjacent Montebello) relies on direct access to area freeways and ease of regional mobility for their existence. Commerce is also home to numerous employees and residents who require access to N/B I-5 to commute to/from other employment centers and residential communities, and Washington Boulevard is the closest major roadway to the City's civic center and its residential neighborhoods, all but two of which are concentrated in the northern part of the City. Lacking a direct connection between Washington Boulevard and I-5 N/B, local truck traffic (from industries in Commerce, Montebello, and Bell) and Commerce employee/residential traffic needing to access I-5 N/B would be required to first travel south along already congested surface streets through Commerce and Bell to access the proposed Slauson I-710 N/B on-ramp, or east across the City to the Garfield Avenue I-5 N/B on-ramp (which has a very tight on-ramp geometry that does not easily accommodate trucks). These "work-arounds" would considerably inconvenience business and industries, residents, and employees in the City, increase delay and expense, and add to surface street congestion. We request that Caltrans address this conflict in the final design option.

L-19-12

Design Option 2.

This option would continue to provide access to the N/B I-710 from Washington Boulevard, as well as access to Washington Boulevard from the S/B I-710, via two reconfigured ramps. Access to the S/B I-710 would require general traffic and freight trucks to share a new on-ramp, to be constructed west of the existing S/B onramp, and general traffic would merge with S/B off-ramp traffic accessing the Atlantic/Bandini interchange before joining the mainline I-710 freeway lanes.

Also as under Option 1, the existing N/B off-ramp at Washington Boulevard would be removed under this Design Option, and general traffic wishing to access Washington Boulevard would be required to exit the I-710 at the reconfigured Atlantic/Bandini interchange, or at the Slauson interchange.

Also as under Design Option 1, the new N/B on-ramp would not allow a transition to the N/B I-5 freeway; cars and trucks would instead be redirected south to the reconfigured Atlantic/Bandini

Boulevard on-ramps to do so. The Atlantic/Bandini interchange with the freeway, just south of the Commerce City boundary with Vernon, would be completely reconfigured.

Elevation of Washington Boulevard to accommodate proposed on-ramp. The City is concerned about the elevation of Washington Boulevard, beginning at Bewley Avenue, as it approaches the I-710. The City requests that the Final EIR contain more detailed drawings and elevations to more clearly illustrate the proposed design of this project component, as it will adversely affect, and result in some property take from, commercial businesses and industrial uses. L-19-13

Removal of access from Washington Boulevard to I-5 N/B. The City of Commerce is in favor of the retention of the mixed-flow (truck and passenger vehicle) on-ramps to the N/B and S/B I-710 freeway at Washington Boulevard. However, the new Washington Boulevard on-ramp to the N/B I-710 proposed under this option would no longer allow a direct connection to I-5 N/B, since vehicles entering the N/B I-710 via the new Washington Boulevard on-ramp would merge with the mainline I-710 freeway at a point north of the I-710 N/B transition to I-5 N/B. This means local truck traffic and private vehicular traffic (originating in the City of Commerce as well as surrounding cities and communities) would no longer have direct access from Washington Boulevard to I-5 N/B, as they currently do. The City is aware that this is meant to address existing safety issues inherent in the present connector (i.e., the need for vehicles entering the N/B I-710 via Washington Boulevard on-ramps to cross multiple lanes of traffic in order to merge onto the N/B I-5). However, this removes a critical connection to I-5 for Commerce.

Washington Boulevard is a major east-west commercial and industrial corridor within the City, and the concentration of businesses along this corridor and in the northeast part of the City (as well as adjacent Montebello) relies on direct access to area freeways and ease of regional mobility for their existence. Commerce is also home to numerous employees and residents who require access to N/B I-5 to commute to/from other employment centers and residential communities, and Washington Boulevard is the closest major roadway to the City's civic center and its residential neighborhoods, all but two of which are concentrated in the northern part of the City. Lacking a direct connection between Washington Boulevard and I-5 N/B, local truck traffic (from industries in Commerce, Montebello, and Bell) and Commerce employee/residential traffic needing to access I-5 N/B would be required to first travel south along already congested surface streets through Commerce and Bell to access the proposed Slauson I-710 N/B on-ramp, or east across the City to the Garfield Avenue I-5 N/B on-ramp (which has a very tight on-ramp geometry that does not easily accommodate trucks). These "work-arounds" would considerably inconvenience business and industries, residents, and employees in the City, increase delay and expense, and add to surface street congestion. We request that Caltrans address this conflict in the final design option. L-19-14

Design Option 3.

Also known as the base option, this Design Option 3 would construct a mixed flow S/B off-ramp and a mixed flow N/B onramp that would access/be accessed from Sheila Street (at Oak Street and Indiana Street). S/B on-ramp traffic and N/B off-ramp traffic that previously used Washington Boulevard would be redirected to the south and required to use the reconfigured Atlantic/Bandini interchange to access Washington Boulevard.

Upgrades to and use of Sheila Street. The City supports the use and/or improvement of Sheila Street for truck access to and from the UP and BNSF rail yards, since it reduces truck traffic L-19-15

and associated congestion and conflicts with general traffic on Washington Boulevard, and provides more direct access to the rail yards. Accordingly the City requests that Caltrans incorporate upgrades and/or or use of Sheila Street for truck traffic access to/from the rail yards into the alternative selected into the Final EIR. L-19-15

Zero-emission Washington Boulevard ramps. Whereas Options 1 and 2 would confine the potentially zero-emission (i.e., electrified) portion of the freight corridor to the freeway mainline and would require trucks to switch to diesel/fossil fuel power upon exiting the freeway to Washington Boulevard and while accelerating up the on-ramps, Option 3 would continue the infrastructure to support zero emissions for the length of the on- and off-ramps to Washington Boulevard. Commerce supports the zero-emission ramps and requests that Caltrans incorporate this into the final design option. L-19-16

2. ADDITIONAL TECHNICAL STUDIES/OPPORTUNITIES FOR TECHNICAL STUDY REVIEW

Based on the City's specific comments and questions concerning each of the Alternatives and Design Options listed above, the City believes that the following additional technical studies should be completed and provided to the City of Commerce for comment prior to finalizing the EIR/EIS. In addition, opportunities for review of planned or in-preparation technical studies should be provided to the City. We request that Caltrans provide review of each of the following reports, and further request that Caltrans provide a response to this comment that indicates when City input or review may be sought for each report:

Traffic Management Plans. Mitigation Measure CON-3 requires preparation of Traffic Management Plans (TMPs) to reduce impacts on fire, law enforcement, and emergency service response times. The City requests that it be identified in the Mitigation Monitoring and Reporting Program (MMRP) as a reviewing agency for the TMP(s) for project construction that will take place in or affect the City of Commerce. L-19-17

Specific Utility Relocation Plans. Mitigation Measures CON-4 and U&ES-2 require preparation of Specific Utility Relocation Plans to minimize impacts on traffic, emergency services, and disruptions to utility service. The City requests that it be identified in the MMRP as a reviewing agency for Specific Utility Relocation Plans that will take place in or affect the City of Commerce, when they become available.

Southern California Edison Bandini Substation Relocation. Under Alternative 6 A/B/C, Option 2, the Southern California Edison Bandini Substation would require relocation due to the configuration of the freeway and freight corridor ramp connections to Washington Boulevard. Although the Substation is located on the City of Vernon side of the Commerce/Vernon boundary, its relocation could result in traffic impacts or utility disruptions within the City of Commerce. The Draft EIR/EIS recommends that additional engineering and environmental studies be completed should Option 2 be selected. Although the preparation of these documents is not called out as a mitigation measure, applicable regulations such as CEQA would require their preparation. The City should be provided an opportunity to review these documents as they are prepared, and requests that it be identified in the MMRP as a reviewing agency for any mitigation measures addressing the substation's relocation when it becomes available

Comprehensive Utility Relocation Study. The Draft EIR/EIS indicates that the Comprehensive Utility Relocation Study is currently being prepared by Metro. The City of Commerce requests that it be identified in the MMRP as a reviewing agency for the Comprehensive Utility Relocation Study for the North Segments of the I-710 Corridor when it becomes available.

Final Los Angeles River Impact Report. The hydrology and floodplain analysis in the Draft EIR/EIS includes Mitigation Measure FP-1, which requires the preparation of a Final Los Angeles River Impact Report, to demonstrate that the design of the proposed project provides acceptable flood protection. While this type of mitigation is common on large-scale projects where designs are not yet finalized, the City requests that it be identified in the MMRP as a reviewing agency for the Final Los Angeles River Impact Report when it becomes available.

Water Quality and Stormwater Best Management Practices. The Project would increase impervious surface area, runoff volume, and pollutant loads, and require the replacement or extension of existing drainage systems along the I-710 corridor. Given the fact that surface water runoff from I-710 currently discharges to City of Commerce surface streets and storm drains, and will continue to do so under post-project conditions that will increase the number of trucks and passenger vehicles using the freeway and ramps accessing the rail yards, the City requests that it be consulted during the development of design development, treatment, and operational best management practices (BMPs) that address the capture and treatment of runoff, once the preferred Alternative is selected, and that it be identified as a reviewing agency in the MMRP for the BMPs. L-19-17

Air Quality Localized Construction Analysis. Construction of the Project would result in worst case daily emissions of nitrogen oxides (NOx) that are estimated to be approximately three times the CEQA threshold and particulate matter (PM) emissions approximately one half of the CEQA thresholds for a single segment. Given that a vast amount of improvements are planned at the northern terminus of the corridor, including major reconfiguration of on- and off-ramps, it is likely that the City of Commerce would experience some of the most intensive construction activity for the longest period of time. Therefore, prior to the final selection of an Alternative and design options, Caltrans should provide a focused assessment on localized construction impacts in Commerce. This focused analysis should include a discussion of potential near roadway impacts from construction based on the SCAQMD Localized Significance Threshold (LST) methodology and should identify potential sensitive receptor areas that could experience localized construction air quality impacts in excess of the standards. This assessment should include emissions from proposed rock crushing and cement plants, if plans include potentially locating these in Commerce. If significant impacts are identified, the mitigation measures should be provided. The City requests that Caltrans perform this study before the final design option is selected, and requests that it be identified in the MMRP as a reviewing agency for the localized construction analysis when it becomes available.

3. DRAFT EIR/EIS REVIEW COMMENTS

Based on a thorough review of the Draft EIR/EIS, the appendices and various technical reports, the City has identified numerous instances where the Draft EIR/EIS needs clarification to more fully disclose potential impacts to the City. With respect to a number of potentially significant impacts, the City is recommending that Caltrans perform additional analyses and/or adopt new or more stringent mitigation measures in the Final EIR/EIS. The comments are organized below by environmental topic.

Section 3.1, Land Use

General Plan Policy Compliance Not Evaluated. The only City of Commerce 2020 General Plan Element discussed in detail in the Draft EIR/EIA is the Transportation Element, in contrast to the level of detail afforded the General Plans of other jurisdictions along the I-710 corridor. The City requests that a more complete review of the various applicable General Plan Elements be provided in the Land Use section, given the physical impacts within the City of Commerce associated with the proposed Alternatives and three proposed Design Options, the affected land uses, their zoning and land use designations, adverse impacts to community cohesion from the relocation of residents of the ABC/Ayers neighborhood and Northwest neighborhood, and impacts to noise-sensitive uses. This City requests that that this review include the 2020 General Plan Community Development Element, Housing Element, Health and Safety Element, and Air Quality Element. In particular, the City requests that project compliance with the Environmental Justice policies and goals within each Element be evaluated. L-19-18

Significant Community Impacts Not Disclosed. The Community Impact Assessment prepared in support of impact analysis in Sections 3.1 (Land Use) and 3.3 (Community Impacts) concludes that the I-710 build alternatives would not result in isolation and/or segregation of residents without resources to relocate within their existing communities, even though there is a lack of replacement housing within the City of Commerce, because adequate comparable replacement housing appears to exist in neighboring cities. The City disagrees and believes the proposed alternatives would result in isolation and/or segregation of residents, because adequate housing does not exist in the City of Commerce. The dispersal of Commerce residents to other cities and communities would therefore have a significant impact on community cohesion. The City requests that the Final EIR/EIS Land Use and Community Impact sections disclose the number of housing units that would be acquired under Alternatives 6A/6B/6C and each of the Design Options, as well as a provide description of adverse impacts to community cohesion, in light of the limited amount of replacement housing available within the City of Commerce. L-19-19

Community Impacts: Consultation Needed Regarding Last Resort Housing. The residents of the ABC/Ayers neighborhood and those residents to be displaced from the Northwest neighborhood face potential relocation outside their current community, as there is insufficient replacement housing available within the City, but the Draft EIR/EIS does not acknowledge this as a significant impact that requires mitigation. Relocation of residents outside the City of Commerce is unacceptable, and the City requests that it be consulted concerning Last Resort Housing for displaced residents, prior to completion and release of the Final EIR. L-19-20

Project Compatibility with Surrounding Noise-Sensitive Land Uses Not Evaluated. Project compatibility with, and noise impacts on, parks and recreational facilities is discussed in Section 3.2 of the Draft EIR/EIS, but other incompatible or noise-sensitive uses in the study area (i.e., within ½-mile of the mainline or ramp improvements) are either not identified or construction and permanent impacts are not characterized. Land uses within the potential study area that are noise-sensitive include Bandini Park, Commerce Teen Center on Astor Avenue, Atlantic and Bristow Park Branch Libraries, Bandini Elementary School, the Dorothy Kirby Center confinement facility and several places of worship. Overhead easements and permanent access to those easements will be sought by Caltrans for the use of Bandini Park in the City of Commerce from the overhead elevated freeway structure. Other easements to be sought are not listed; the Final EIR/EIS should disclose whether others are contemplated. The City requests that project impacts on noise- L-19-21

sensitive uses in the surrounding community be fully evaluated, that mitigation for related significant impacts be considered and that disclosure of easements be fully addressed in the Final EIR/EIS. L-19-21

Section 3.2, Growth

Potential Growth Impacts Not Evaluated. The project would require the relocation of existing residents, since existing residences would be demolished to accommodate the widened right-of-way. The discussion in Section 3.2 provides little information on the potential growth impacts associated with the relocation of existing residents. If residents are relocated within the City of Commerce, the project is likely to create the need for new housing units in the City because of the limited number of existing residential units. The City requests that Caltrans evaluate potential growth impacts in detail in the Final EIR/EIS. L-19-22

Section 3.3, Community Impacts

HR&A Advisors undertook analysis of the Community Impacts analysis provided in the Draft EIR/EIS on behalf of the City of Commerce. Comments are provided below.

Draft EIR/EIS consideration of Local Advisory Committee Comments. The Community Impact Assessment provided as a Technical Study in the Draft EIR/EISS reports that, on the basis of comments from the City's I-710 Local Advisory Committee (LAC), the primary issues and concerns about the I-710 Project to the City are as follows:

- Coordination between the I-5 and I-710 improvement projects
- Minimization of impacts to areas that bring in sales tax revenue
- Minimization of impacts to the ABC/Ayers neighborhood and the Northwest neighborhood
- Minimize impacts to road access within the City

L-19-23

However, it is not clear from the record how all of the City's comments on the Notice of Preparation were addressed in the Draft EIR/EIS. The City requests that Caltrans clarify how and where in the Draft EIR/EIS these comments were addressed, and in particular, indicate what, if any, mitigation measures are provided to address these comments.

Missing fiscal and economic impacts calculation methodology. Very limited information is provided in the Draft EIR/EIS about the calculation methods used to derive the fiscal and economic impacts described in the various Economics sections of the Draft EIR/EIS. What little information is provided raises questions about its sufficiency. For example: L-19-24

- To derive an estimate of the City's potential loss of sales tax revenue from the elimination of sales tax-producing businesses, the Draft EIR/EIS calculates the average local sales tax share per business in the City and applies that figure ($8,005) to each lost business. This probably is not an accurate analysis for specific businesses

whose taxable sales and sales tax revenue deviate from this average to some unknown degree.

- To derive an estimate of the City's potential loss of property tax revenue from the acquisition and relocation of specific properties associated with each Draft EIR/EIS alternative and related design option, the Draft EIR/EIS appears to have utilized the one percent of the total assessed value of each applicable land parcel, rather than the City's share of the taxable value. This may have resulted in an overstatement of impact to the City. L-19-24

The City requests that Caltrans clarify the calculation methods used to determine the fiscal and economic impacts in Section 3.3, Community Impacts, of the Draft EIR/EIS, and in the Community Impact Assessment Technical Study prepared as part of this analysis.

Comparative fiscal and economic calculation results. Taking the fiscal and economic figures as they are presented in each of Alternative 6's design options, it is clear from the Draft EIR/EIS that the City is disproportionately adversely affected by the I-710 Project as compared with other cities along the corridor, due to the loss of sales tax revenue, property tax revenue, condemnation of residential and non-residential properties and employee displacement. For example, according to the Community Impact Assessment Technical Study provided in the Draft EIR/EIS, the City of Commerce will bear the following losses:

Sales Tax Loss

- Design Option 1 = $424,240 (42% of total corridor-wide loss or 4.0% of City's sales tax revenue)
- Design Option 2 = $384,217 (40% of total corridor-wide loss or 3.6% of City's sales tax revenue)
- Design Option 3 = $264,149 (32% of total corridor-wide loss or 2.5% of City's sales tax revenue) L-19-25

Property Tax Loss

- Design Option 1= $736,440 (26% of total corridor-wide loss)
- Design Option 2 = $613,846 (22% of total corridor-wide loss)
- Design Option 3 = $514,714 (20% of total corridor-wide loss)

Residential and Non-Residential Relocations

- Design Option 1= 166 (36% of total corridor-wide relocations)
- Design Option 2 = 89 (23% of total corridor-wide relocations)
- Design Option 3 = 66 (18% of total corridor-wide relocations)

Employee Displacement

- Design Option 1= 510 (38% of total corridor-wide relocations or 8.9% of employees currently in the City)
- Design Option 2 = 492 (37% of total corridor-wide relocations or 8.6% of employees currently in the City)
- Design Option 3 = 446 (35% of total corridor-wide relocations or 7.8% of employees currently in the City)

L-19-25

However, none of the proposed Draft EIR/EIS mitigation measures for Community Impacts indicates sensitivity to the disproportionate scale of these impacts on the City. The City requests that Caltrans consult with the City to develop measures to be incorporated into the Community Benefits Agreement discussed in Section 4 of this comment letter to comprehensively address the disproportionate impacts on the City of Commerce with respect to the loss of sales and property tax, residential and nonresidential relocation, and employee displacement

Environmental Justice. The Environmental Justice chapter of the CIS, which is a technical appendix of sorts to the Draft EIR/EIS states that there will be sales and property tax losses in addition to job displacement within the cities along the corridor. To mitigate these losses, the Community Impact Assessment suggests two actions/benefits: (1) construction jobs will be added to cities along the corridor (9,650 for the City of Commerce) which will compensate for their job losses; and (2) to mitigate the losses it will be important for Caltrans to "prioritize efforts to successfully relocate businesses within the same city." Problems with these mitigation measures are as follows:

- The Draft EIR/EIS did not provide backup calculations for how the 9,650 construction jobs in Commerce were derived, so there is no way of independently verifying its accuracy. The City requests that calculations be provided in the Final EIR showing how the number construction jobs in the City of Commerce were calculated.

L-19-26

- Even if the estimate is accurate, construction jobs are temporary, as compared with the permanent jobs lost from displaced businesses, and therefore the addition of temporary Project-related construction jobs is not an appropriate mitigation measure. The City of Commerce has the highest rate of unemployment (22 percent) of any city or community in the project study area, as stated in the Draft EIR/EIS's Community Impact Assessment Technical Study (Table 3.3-7). Accordingly, the City requests that the Final EIR acknowledge the potential loss of permanent jobs in the City as a significant impact, and appropriate mitigation to reduce this impact be developed.
- No description is provided in the Draft EIR/EIS of how Caltrans intends to "prioritize efforts" to relocate businesses within the same City. Without a detailed plan, this measure is not a sufficient measure to mitigate the displacement-related employment impacts. The City requests that Caltrans provide a detailed plan to show how it plans to prioritize efforts to relocate business within the City of Commerce.

- Lack of Attention to Indirect Economic and Fiscal Impacts. Although the Draft EIR/EIS provides very general estimates of economic and fiscal impacts to the City, it does not address, as CEQA requires, an assessment of indirect impacts resulting from certain Alternatives or design options. For example, to the extent that Design Option 3 would eliminate freeway ramps at Washington Boulevard, this may have significant adverse indirect impacts on businesses located elsewhere in the City, including the Commerce Casino, which is a major source of revenue to the City. L-19-26

Purchasing power loss. Due to the loss of households within the City, the Project will likely have a negative effect on City-wide purchasing power. This issue is not discussed in the Draft EIR/EIS or associated Appendices or Technical Studies. Purchasing power is the economic output derived from household spending in local communities at such places as grocery stores, apparel shops, drug stores, etc. Without a robust relocation program that allows for those who lose their homes to successfully relocate within the same City, the City is likely to permanently lose households. This will, in turn, reduce local purchasing power. Attachment 1 to this comment letter, a table titled Purchasing Power Loss from I-710 Relocations, shows the annual purchasing power loss under each of Alternative 6's design options. It shows that in the worst case scenario under Design Option 1, the City of Commerce will lose upwards of $897,000 in local purchasing power. With Design Options 2 and 3, local purchasing power will also be reduced, albeit by less than in Design Option 1, by $307,000 and $259,000, respectively. The City requests that Caltrans address this issue in the Final EIR/EIS and coordinate closely with the City to ensure that displaced residents are relocated within Commerce, as requested in the Community Benefits Agreement discussed in Section 4 of this comment letter. L-19-27

Population-based revenue losses. Based on an average household size of 3.77 persons per household, the City will also likely lose certain forms of federal and state funding that are based on population. For example, under Design Option 1, there is a potential loss of 110 residential units per the Draft EIR/EIS or up to 165 units based on City surveys of the number units, and at 3.77 persons per household, this translates to a population loss of between 415 and 622 persons (or between 3.3% and 4.8% of the City-wide population), assuming this does not understate the true number of displacements. Should this occur, the City will likely lose state and/or federal funds that are provided on a per capita basis. Under Design Options 2 and 3, the population loss is reduced, but still substantial at 143 persons and 121 persons, respectively, and as noted above and previously, the EIR/EIS may substantially underestimate the number of persons subject to relocation. The City requests that the number of residential units and persons subject to relocation be accurately counted and documented in the Final EIR. L-19-28

General comments. In general, other than documenting the facts regarding the fiscal and economic impacts to the cities along the corridor, the Draft EIR/EIS and its associated documents recommend only nominal mitigation measures or ways in which the various cities may be compensated for their losses. There is nothing in the Draft EIR/EIS that is specific to the City of Commerce. The City requests that Caltrans address the foregoing comments on the Draft EIR/EIS Community Impacts analysis, which request specific mitigation measures for impacts on the City of Commerce, in light of the specific and disproportionate impacts on our community. L-19-29

Section 3.4, Utility/Emergency Services

Consultation with Police and Emergency Service Providers Should Be Provided. Mitigation Measure CON-3 requires the future preparation of Traffic Management Plans (TMP) to reduce impacts on fire, law enforcement, and emergency service response times (specific TMP requirements are outlined in Mitigation Measure CON-6). In addition, Mitigation Measure CON-4 requires the future preparation of Specific Utility Relocation Plans to minimize impacts to emergency services. These mitigation measures require future coordination with fire, emergency medical, and law enforcement providers to ensure adequate emergency service response times during construction. Nevertheless, the City requests the opportunity to review and comment on the TMPs and Specific Utility Relocation Plans, if deemed necessary by the City, as they are prepared. L-19-30

Construction Staging Areas Not Identified. Mitigation Measure CON-3 does not require the TMPs to identify construction staging areas. The City requests that this be addressed in the Final EIR/EIS, especially in light of the three design options that are proposed within City limits. L-19-31

Permanent Impacts to Emergency Access Not Evaluated. Section 3.25 (Cumulative Impacts) of the Draft EIR/EIS adequately discloses and minimizes the potential cumulative impacts to utility/emergency access in accordance with the requirements of NEPA and CEQA. Under Alternative 6 A/B/C, Option 3 would reduce access to/from I-710 and Washington Boulevard, to/from I-710/Pacific Place, and to/from I-710 and Wardlow Road. The City requests that the Final EIR/EIS evaluate the permanent traffic impacts that could result from this reduction in access, particularly as they pertain to emergency vehicle access. Additional upgrades to adjacent surface streets may be required to maintain emergency response times under Option 3, and the City requests that Caltrans identify the potential need for such upgrades. L-19-32

Unsupported Conclusions for Emergency Access and Response Times. The three Design Options under Alternative 6 A/B/C have the potential to impact emergency access around Washington Boulevard. Option 1 would prevent emergency vehicle access from Washington Boulevard to northbound I-5 as well as travel on northbound I-710 between Bandini Avenue and Washington Boulevard. Similar impacts would occur under Option 2, and emergency vehicles would not be able to access northbound I-5 from Washington Boulevard. Under Option 3, the Washington Boulevard northbound and southbound ramps would be removed, and emergency vehicles would be required to use the Atlantic Boulevard/Bandini Boulevard exit to ultimately reach Washington Boulevard. While it is likely that emergency vehicles would be able to use surface streets to maintain response times, and coordination with the Los Angeles County Fire Department and Los Angeles County Sheriff's Office is required under mitigation measure CON-3, the Draft EIR/EIS does not provide evidence to support the finding that potential impacts to emergency vehicles under these access restrictions would have no effect or how they would be minimized. The City requests a more detailed analysis with regard to emergency access and emergency response times in this area. L-19-33

Minor Utility Relocations Not Evaluated. With respect to Utilities, the Draft EIR/EIS section does not specifically address minor utility impacts within the City of Commerce. While major utility relocations, such as the relocation of Los Angeles Department of Water and Power (LADWP) and Southern California Edison (SCE) transmission lines, are adequately evaluated in the Draft EIR/EIS, minor utility relocations within the City could also result in traffic impacts or disruptions to utility service. In accordance with Mitigation Measure U&ES-2, Specific Utility L-19-34

Relocation Plans would be prepared to identify and minimize these impacts. The City should requests the opportunity to review these Specific Utility Relocation Plans and associated impacts, particularly with respect to utilities that may be relocated along Slauson Avenue, Atlantic Boulevard, Bandini Boulevard, and Sheila Street. L-19-34

Recommended Engineering and Environmental Studies Not Identified As Required Mitigation Measure. As stated in the Draft EIR/EIS, the Southern California Edison Bandini Substation would require relocation under Alternative 6 A/B/C, Option 2, due to the configuration of the freeway and freight corridor ramp connections to Washington Boulevard. Although the Substation is located on the City of Vernon side of the Commerce/Vernon boundary, its relocation could result in traffic impacts or utility disruptions within Commerce. The Draft EIR/EIS recommends that additional engineering and environmental studies be completed, should Option 2 be selected. However, the preparation of these documents is not called out as a mitigation measure, and therefore implementation of this recommendation is not guaranteed or enforceable. The City requests that a mitigation measure requiring the preparation of additional engineering and environmental studies if Option 2 is selected be incorporated into the Final EIR/EIS. L-19-35

Need for Mitigation Measure Requiring Comprehensive Utility Relocation Study for the North Segments of I-710. The Comprehensive Utility Relocation Study for the North Segments of I-710, which the Draft EIR/EIS indicates is currently being prepared by Metro, is not called out as a required mitigation measure, and is therefore its preparation is not guaranteed, nor is its implementation enforceable. The City requests that a mitigation measure requiring preparation of the Comprehensive Utility Relocation Study for the North Segments of I-710 be incorporated into the Final EIR/EIS. L-19-36

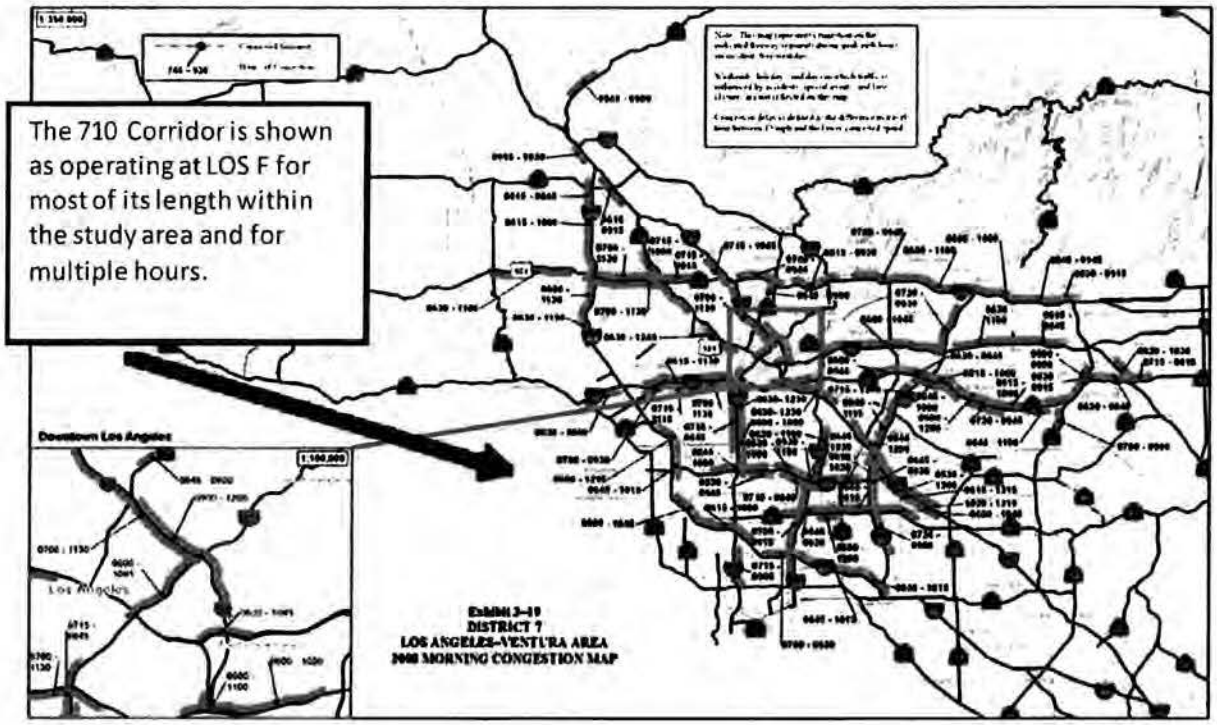
Section 3.5, Traffic and Transportation/Pedestrian and Bicycle Facilities

Traffic Impact Thresholds Not Provided. Section 3.5.1 (Regulatory Setting) describes the regulatory setting and makes no reference to transit. This section also does not contain any impact significance thresholds, which should be disclosed so reviewers understand the basis for significance determinations. The City requests that thresholds should be established at a minimum for the following impact areas: vehicle traffic operations (specific to each type of facility); goods movement; transit facilities and operations; bicycle facilities and operations; pedestrian facilities and operations; safety; and construction. L-19-37

Comparison to Baseline Conditions Not Evaluated. Section 3.5.2.2 (Page 3.5-7) states that Alternative 1 (No Build) conditions are the basis against which the build alternatives proposed for the I-710 Corridor Project were assessed. This is a useful comparison to understand how the project influences future traffic operations, but may not satisfy the requirement to assess impacts based on baseline conditions as established in recent case law. The baseline conditions for this study were established as 2008. Page 3.5-81 also states that the criteria for determining which intersections are adversely impacted are based on comparing the build alternatives to the no build alternative. The City requests that Caltrans provide an assessment of the project impacts as compared to the baseline conditions in the Final EIR/EIS. L-19-38

Impacts to Bicycles and Pedestrians Not Addressed. Section 3.5.3.1 (Page 3.5-86) contains one paragraph describing bicycle and pedestrian impacts. According to the discussion, no impacts are identified because any disruption to bicycle and pedestrian facilities will be repaired and L-19-39

old facilities will be upgraded. This discussion does not address how increases in traffic volumes on arterials will affect bicycles and pedestrians. Further, many of the proposed improvements at 42 intersections that are described in Section 2.4.1.4 and mitigation measures described in Section 3.5.4 include roadway widening to improve vehicle LOS. This widening will increase bicycle and pedestrian crossing times. This impact was not disclosed and no significance criteria were included to determine whether the impact would be significant. Impacts of mitigation measures are required to be disclosed under CEQA Section 15126.4 (D), which states, "If a mitigation measure would cause one or more significant effects in addition to those that would be caused by the project as proposed, the effects of the mitigation measure shall be discussed but in less detail than the significant effects of the project as proposed." The City requests that impacts upon bicycles and pedestrians, due to increased traffic volumes on arterials, be addressed and evaluated against the appropriate significance criteria, in the Final EIR/EIS. L-19-39



Section 3.5.3.3 Missing From Report. Section 3.5.3.3 appears to be missing from Chapter 3.5 of the Draft EIR/EIS. The sentence referring to it is on page 3.5-86: "Additionally, because no improvements would be made to the I-710 Corridor under Alternative 1, the public health benefits of reduced congestion, improved conditions for pedestrian or bicycle travel, and reduction in the number of total and fatal accidents described in Section 3.5.3.3 would not be realized." The City requests that this be resolved in the Final EIR/EIS. L-19-40

City of Commerce Thresholds Not Considered. As described on page 3.5-81, an adverse impact occurs when LOS degrades to E or F with a build alternative or when a build alternative increases intersection delay compared to the no build alternative. These significance thresholds should be included in the regulatory setting, as noted above, but should also be replaced with the LOS thresholds of each affected community. The City of Commerce General Plan (adopted January 2008, page 64) "established LOS "D" as a target LOS standard, and LOS "E" as a threshold standard." In a letter dated September 17, 2008 from the City of Commerce to Caltrans following release of the Notice of Preparation, the City requested that "In addition to applicable federal, state, and county-wide standards, project impacts must be analyzed taking into account any and all applicable standards/thresholds, including noise standards." The City requests that its stricter thresholds of significance be used to evaluate impacts in the City. L-19-41

Local Community Traffic Thresholds Not Used to Determine Impacts. As described on page 3.5-81, an adverse impact occurs when LOS degrades to E or F with a build alternative or when a build alternative increases intersection delay compared to the no build alternative. We request that these significance thresholds be included in the regulatory setting, and also request that the thresholds be replaced with the LOS thresholds of the City of Commerce, and those of other jurisdictions along the freeway corridor. The City of Commerce General Plan (adopted January 2008, page 64) "established LOS "D" as a target LOS standard, and LOS "E" as a threshold standard." In a letter dated September 17, 2008 from the City of Commerce to Caltrans following release of the Notice of Preparation, the City requested that "In addition to applicable federal, state, and county-wide standards, project impacts must be analyzed taking into account any and all applicable standards/thresholds, including noise standards." Use of the City's preferred methodology and stricter thresholds of significance may lead to the identification of additional project-related impacts and the need for additional traffic mitigation in Commerce. The City requests that Caltrans undertake additional traffic impact analysis using City of Commerce significance thresholds and include the findings in the Final EIR. L-19-42

Conflicting and Inconsistent Traffic Data Presented. The traffic operations analysis results do not match the existing conditions as reported elsewhere. Much of the study corridor is congested during peak periods according to the 2008 State Highway Congestion Monitoring Program (HICOMP), Annual Data Compilation, Caltrans 2008 (see graphic below). The Interstate 710 study corridor extends from Ocean Boulevard in Long Beach to State Route 60 (SR 60). The corridor is described in the EIR/EIS as experiencing severe congestion (see page 3.5-17), but the baseline (2008) conditions analysis (Table 3.5-1) reveals multiple freeway mainline or ramp locations operating at LOS C or D. These analysis results appear to be inconsistent with the HICOMP, which shows AM and PM peak period congestion (i.e., LOS F) for almost the entire study length of Interstate 710. The congestion extends to areas reported as operating at LOS C and D in the EIR/EIS (see AM peak period example below). The City requests that Caltrans resolve this conflict in the Final EIR/EIS.

Caltrans 2008 HiComp Report – District 7

L-19-43

One potential explanation for Draft EIR/EIS results not fully capturing the extent of congestion is due to the methodology. The traffic counts and analysis methodology followed a conventional approach for uncongested facilities. According to Section 4.1 of the I-710 Corridor Project Traffic Operations Analysis Report (TOAR), Los Angeles County Metropolitan Transportation Authority, January 2012, traffic counts were conducted for isolated peak periods (7-9 AM, 11-1 Midday, and 4-6 PM). Section 4.5.1 (page 4-34) and Section 4.5.2 (page 4-40) of the TOAR, January 2012 state that the analysis methodologies for freeways and intersections were based on the 2000 Highway Capacity Manual (2000 HCM). The 2000 HCM methods contain numerous limitations when analyzing congested conditions such as those that exist in the I-710 Corridor.

For much of the I-710 study corridor, the 7-9 AM and 4-6 PM time periods are congested, as shown in the HICOMP report. The conventional or traditional traffic counts only capture departed or served vehicles. Therefore, the counts measure throughput and do not account for unserved demand stuck in queue. Further, the 2000 HCM methods do not recognize that congestion severely reduces operational capacity. One example of this is to compare HCM 2000 capacity thresholds in Table 4-16 of the TOAR (page 4-35) with PEMS data showing actual volumes served during congested conditions. Table 4-16 shows freeway capacity ranging from 2,250 to 2,400 passenger cars per hour per lane depending on free-flow speed. The chart below shows the actual maximum throughput achieved on northbound (NB) I-710 near I-405 during the AM peak period (6-9 AM). The breakdown in freeway operations causes speeds to drop and the maximum volume served to decline below 50 percent of HCM 2000 uncongested capacity.

The HCM 2000 calculations treat capacity as an input, while in reality capacity is an output that varies depending on traffic conditions. When congestion occurs, the freeway breaks down and fewer vehicles can be served. The proposed project alternatives that add lanes to a congested freeway may not significantly relieve congestion depending on the ability of downstream portions of the freeway to accommodate increased peak period flow rates and the effect of induced travel (this topic is covered in more detail in Comment No. 5). L-19-43

One option to capture the capacity limitations from existing congestion is to use microsimulation models. This was acknowledged in one of the technical studies for the I-710 Corridor Project EIR/EIS. Appendix J of the EIR/EIS contains the Draft White Paper, Technical Memorandum – Traffic Operations Simulation Comparison, Los Angeles County Metropolitan Transportation Authority, March 31, 2010, which states the following:

> "The traffic operational analysis of the I-710 PA-ED project for various measures of effectiveness has been conducted using the HCM methodologies for freeway operations. Software packages such as HCS+ and Synchro7 have been exclusively used for this purpose. However, these software packages have their own limitations and have limited or no capability to simulate present or future freeway operations that are complex and include significant heavy duty truck (HDT) operations." L-19-43

The City requests that, at a minimum, the Final EIR/EIS should disclose the limitations of the 2000 HCM and discuss how these limitations influenced the analysis conclusions and recommendations.

Full Extent of Project-Related Traffic Congestion Not Presented. The traffic forecasts model had limited validation and the post-processing method may have resulted in an underestimate of future demand. Model validation should ideally include both static and dynamic tests. Both types of tests are recommended in the Model Validation and Reasonableness Checking Manual (FHWA, February, 1997) that was cited in the Technical Memorandum - I-710 Corridor Project EIR/EIS Travel Demand Modeling Methodology, Los Angeles County Metropolitan Transportation Authority, February 26, 2010. L-19-44

Another important issue is that the static validation for peak periods was conducted using the entire set of traffic counts without differentiating locations that are influenced by congestion. The forecasting model is a 'demand' model. As such, it is expected to produce volume estimates that closely match traffic counts on uncongested roadways. For congested locations, the demand volume

should overestimate peak period traffic counts because these counts only measure throughput and do not capture the full demand, which is stuck in queue. Figure 6 (page 27) in the Modeling Methodology Memo is one of example of the model refinements resulting in a close match to the AM peak period traffic counts. Given the severe congestion described in the EIR/EIS and noted above in the HICOMP and PEMS data, this chart should show the model volume estimates being higher than peak period traffic counts.

Without detailed dynamic validation tests, it is difficult to determine whether the forecasts for each alternative represent reasonable changes in direction and magnitude. For example, despite significant differences between No Build and Alternative 5A, total VMT increased by 0.33 percent and VHD decreased by 0.38 percent. The small VHD change may also be a concern when viewed from a cost-benefit perspective. Reducing one hour of delay costs approximately $446,550 under Alternative 5A.

The forecasts may underestimate future demand volumes because of the post-processor method and not fully accounting for induced travel effects. The post-processor added incremental traffic volume growth onto the base year traffic counts. As noted above, the peak period counts only captured vehicle throughput and not demand that was stuck in queue. As a result, the traffic volume growth was added to a 'constrained' base year traffic count and the post-processing does not account for unmet demand that exists in the base year. L-19-44

The sub-area model also has limitations related to capturing all of the induced travel effects that would be associated with a major freeway expansion in a congested corridor. The SCAG model does not contain a complete feedback system to influence trip generation or long-term land use allocation. The absence of full feedback systems to trip generation and long-term land use allocation suggests that the model's forecasts could underestimate corridor demand volumes, which could lead to the overestimation of congestion relief benefits.

While it is understood that any analytical technique will have limitations, the City requests that Caltrans provide an explanation of why the methodologies and analytical techniques used to analyze traffic operations were selected, and of their limitations.

Improved Operating Conditions Are Counterintuitive. A review of freeway mainline segment level of service in Tables 3.5-1, 3.5-2, 3.5-3 and 3.5-5 show improved operating conditions for Alternative 1 (No Build) in 2035 than for Base Year 2008. The City requests an explanation for this counterintuitive conclusion. L-19-45

Unsupported Decrease in Freeway Volumes May Cause Inconsistencies. Existing (2008) freeway volumes on I-710 shown in Table 1.2-1 show a drop of over 70,000 ADT (66,000 ADT autos plus 5,000 ADT trucks) between Rosecrans and Alondra, just south of I-105. This dip is carried forward into projected 2035 volumes at this location. No explanation is provided in Chapter 1. It appears that this data is also used in the Air Quality analysis in Section 3.18 (Tables 3.13-7 and 3.13-8). The City requests an explanation for this decrease of ADT and also requests that any potential inconsistencies caused by this data that is carried into other sections, such as Air Quality, be reconciled and noted in the Final EIR/EIS. L-19-46

Unapproved Future Projects Used as Basis for Sufficient Future Rail Capacity. Page 3.5-7 of the Draft EIR/EIS states "This alternative also assumes that goods movement to and from L-19-47

the ports make maximum utilization of existing and planned railroad capacity within the I-710 Corridor." Pages 1-36 through 1-37 state that neither the expanded Intermodal Container Transfer Facility (ICTF) nor the Southern California Intermodal Gateway (SCIG) at the Port of Los Angeles were assumed to be operational in the travel demand forecasting for the I-710 project because those projects were not yet approved when the Draft EIR/EIS analysis was conducted. This is also stated in the technical studies (page 16 of the Modeling Report, page 1-6 of the TIAR). These two major near-dock rail projects are, however, listed among the past, present and foreseeable projects listed in Table 3.25-1 and Table 3.25-2. The exclusion of these two rail projects likely results in a higher estimate of container movement along I-710 north of those two rail facilities. The City requests that this inconsistency be clarified in the Final EIR/EIS. L-19-47

Inadequate Discussion of Construction Traffic Management Plan. Only a cursory discussion of the construction-period traffic management plan is provided on pages 2-57 and 2-58. Page 2-57 states that the Transportation Management Plan (TMP) "proposes to keep all lanes open during construction, with the exception of overnight lane closures. Ramp closures will be limited to potential weekend closures and would not exceed a period of one week." Page 2-72 states that the minimum construction duration will be 8 years. Given the magnitude of the improvements proposed under each of the build alternatives, the City requests that Caltrans provide additional information about how it will be possible to keep all lanes open during construction, or disclose if this will not be possible, identify this as a significant impact, and provide appropriate mitigation. L-19-48

Available LOS Data Was Not Provided. In Tables 3.5-2 and 2.5-26, among others, no density or LOS data is presented ("N/A") for the NB I-710 to NB I-5 connector, and other locations. These locations are footnoted as "Single-lane addition/drop; HCM methodology applied for analysis." The City requests an explanation for the lack of data at these locations, especially considering the availability of the HCM methodology which allows for analysis of such locations. L-19-49

Inconsistent LOS Data. In Table 3.5-8, LOS C/D is shown for NB I-5 approaching I-710 in the AM/PM peak hours and LOS C/D/E in the midday peak hour. This data is not consistent with the accompanying text on page 3.5-31 which states that "The majority of the congestion occurs along the I-5 corridor in the vicinity of I-710 during the midday peak hour. However, field observations show severe congestion levels during both a.m. and p.m. peak hours in the 2008 existing condition." The City requests that this discrepancy be addressed. L-19-50

Unclear How Conclusions Regarding Truck Lane Capacity Was Estimated. The truck lanes are forecast to operate at or near capacity under Alternatives 6A/6B (page 3.5-57) but below capacity with tolls under Alternative 6C. It is not clear how the change in use of the truck lanes with tolls in place was estimated. The City requests that the rationale for these estimates be disclosed. L-19-51

No Differentiation Between Unmetered/Metered HOV Lanes. A description of the methodology for the ramp metering analysis is provided on page 4-44 of the TOAR. However, the analysis did not distinguish between the unmetered HOV lanes and metered SOV lanes in the ramp metering analysis. The City requests that this discrepancy be addressed. L-19-52

Insufficient Analysis of Impacts Due To Loss of On-Street Parking. Page 3.5-79 describes the proposed implementation of peak period parking restrictions along four major north-south corridors, three of which lie partly within the City of Commerce. The Draft EIR/EIS provides no analysis of the level of utilization of curb parking in these areas, nor whether the displaced L-19-53

parking demand can be accommodated elsewhere; please provide an analysis of this issue. While the loss of on-street parking is not necessarily a CEQA issue, the potential socio-economic impacts of the loss of on-street parking can be considered as impacts. In a recent traffic study for the planned "Washington Boulevard Improvement Project" in Commerce, which would widen and reconfigure Washington Boulevard to provide six through lanes (cited as Project T-24 in Table 3.25-1), a detailed utilization study of on-street parking was conducted and a full assessment of the loss of that parking was made. (The construction schedule for that project is shown in Tables 3.25-1 and 3.25-2 as "2012" but the City's current schedule puts construction of that project in 2015.) The City requests the preparation of a detailed utilization study and a full assessment of the loss of on-street parking be conducted. L-19-53

Incorrect Assumptions Used for Signal Cycle Lengths at Study Intersections. Page 4-40 of the TOAR describes the use of Synchro to implement the HCM 2000 methodology for the intersection analysis. Rather than collect signal timing plans for each study intersection from the local jurisdictions, universal assumptions were made for signal cycle lengths, such as 100 seconds for arterial intersections and 60 seconds for freeway ramp T-intersections. A review of the level of service worksheets for selected locations in Commerce shows that a cycle length of 130 to 150 seconds was assumed for the intersections with wider cross sections. The analysis also assumed that each intersection has a capacity of 1,600 vehicles per lane per hour, the ideal traffic capacity per the HCM 2000, but did not conduct saturation flow studies to support this assumption. Given the size of some intersections, these signal timing assumptions may not in every case allow for the green time that would be needed to include adequate pedestrian crossing times. This may result in the analysis underestimating vehicle delay for some locations. The City requests that this impact be fully addressed in the Final EIR/EIS. L-19-54

Discrepancies between LOS Assumptions and Existing Field Conditions. In Figure 3-3.f and Appendix B of the TIAR, several discrepancies between the intersection level of service inputs/assumptions and existing (2012) field conditions were observed that may affect the results of the analysis, as follows. The City requests that the following discrepancies be addressed in the EIR/EIS:

- Eastern Avenue & Bandini Boulevard (#75): The analysis of this intersection includes two eastbound through lanes, which is inconsistent with the existing (2012) conditions which include three eastbound through lanes. The southbound right turn lane must yield to both pedestrians and to westbound through traffic. As analyzed in the Draft EIR/EIS, this movement was coded as a permissive plus an overlap phase. The assumed signal cycle length at this location did not include enough green time to allow for minimum pedestrian crossing times. Taken together these factors could result in more delay at this intersection than is reported in the Draft EIR/EIS. L-19-55

- Washington Boulevard & Atlantic Avenue (#78): The analysis of the northbound approach to this intersection includes one left turn lane, two through lanes and one right turn lane, which is inconsistent with the existing (2012) field conditions which include one left turn lane, two through lanes and one shared through/right turn lane. The analysis also included overlapping right turn phases on all four approaches to the intersection, which is inconsistent with existing (2012) field conditions which show that no overlapping phases are present. Taken together these factors could result in more delay at this intersection than is reported in the Draft EIR/EIS.

- Washington Boulevard & Eastern Avenue (#79): The analysis included overlapping right turn phases on all four approaches to the intersection, which is inconsistent with existing (2012) field conditions which show that no overlapping phases are present. This factor could result in more delay at this intersection than is reported in the Draft EIR/EIS.

- Eastern Avenue & Slauson Avenue (#71): The analysis included overlapping right turn phases on the northbound and southbound approaches to the intersection, which is inconsistent with existing (2012) field conditions which show that these overlapping phases are not present. This factor could result in more delay at this intersection than is reported in the Draft EIR/EIS. L-19-55

- Washington Boulevard & Southbound I-710 On/Off Ramp (#126): The analysis included a protected westbound left turn phase, which is inconsistent with existing (2012) field conditions which show that this movement is permissive. This factor could result in a different delay calculation at this intersection than is reported in the Draft EIR/EIS.

- Atlantic Avenue & Bandini Boulevard/I-710 Northbound On ramp (#74): The analysis does not account for the existing (2012) westbound prohibition on right turns on red. This factor could result in a worse delay calculation at this intersection than is reported in the Draft EIR/EIS.

Impacts to Major Intersections Not Analyzed. The traffic impact analysis does not include major intersections within the City of Commerce that may be affected by the proposed project, given their proximity to the I-710/I-5 interchange: Bandini Boulevard & Garfield Avenue, Telegraph Road & Garfield Avenue and Atlantic Avenue & Eastern Avenue. The City requests that an explanation for why these locations were not analyzed, as well as providing the appropriate analysis. L-19-56

Potential Transit System Impacts Not Analyzed. There is no assessment of potential transit system impacts in Commerce, including increased transit service time or any changes to existing bus routes that would be required due to project-related roadway changes. The City requests an evaluation of these impacts in the Final EIR/EIS. L-19-57

Proposed Mitigation Measures for Intersection Impacts May Be Inadequate. The City requests that following comments pertaining to proposed mitigation measures for impacts at intersections in the City of Commerce be considered:

- Slauson Avenue & Eastern Avenue (#71): The proposed mitigation measure at this intersection is to add a second eastbound left-turn lane and a separate eastbound right-turn lane. These improvements appear reasonable, given the high volumes on these movements, even under existing (2008) conditions. These improvements would require right-of-way acquisition on both sides of Slauson Avenue. Potential secondary impacts associated with the wider cross-section on the affected approach to the intersection were not identified. It is noted that the level of service analysis of this location under Alternative 1 shows a discrepancy between the existing and future without mitigation in that it includes a separate eastbound right-turn lane and a L-19-58

separate westbound right-turn lane. This could affect the determination of project impacts, as they are assessed against Alternative 1 conditions.

- Slauson Avenue & Garfield Avenue (#73): The proposed mitigation measure at this intersection is to add a second westbound left-turn lane. This improvement appears reasonable, given the high volumes on this movement, even under existing (2008) conditions. The improvement would require right-of-way acquisition on the southeast quadrant of the intersection. Potential secondary impacts associated with the wider cross-section on the northbound approach to the intersection were not identified. L-19-58

- Garfield Avenue & Gage Avenue (#157): The proposed mitigation measure at this intersection is to add a second left-turn lane on all four approaches plus separate eastbound and westbound right-turn lanes. The improvement would require major right-of-way acquisition at the intersection and potentially building demolition. Potential secondary impacts associated with the wider cross-section on all approaches to the intersection were not identified.

Section 3.6, Visual Quality/Aesthetics

Enhanced Condition Treatment of Sound Walls Requested. Visual simulations of proposed sound wall and berm treatments in the DEIR/DEIS show a Base Condition (i.e., standard Caltrans landscaping, including groundcover and some young trees) and an Enhanced Condition ("possible aesthetic treatments" with decorative masonry wall surface treatments and more vegetation, including vines and/or more mature trees). The Draft EIR/EIS notes that Caltrans will develop final treatments in consultation with community stakeholder groups. Given the prominence of these features in the City and their proximity to residential neighborhoods and at least one recreational facility (Bandini Park), the City requests implementation of the Enhanced Condition treatment of sound walls and freeway edges/berms, within Commerce. L-19-59

Existing Low Visual Quality Should Not Rule Out Enhanced Condition Treatment. The City requests that the existing low visual quality in visually sensitive areas (e.g., due to an existing freeway sound wall or electrical lines), as identified in the Draft EIR/EIS, would not be used by Caltrans as a rationale to rule out Enhanced Condition sound wall/berm treatment, especially since existing sound walls and utilities may be relocated as part of the project. L-19-60

Input Needed for Utility Relocation Plans. The City requests the opportunity to provide input into the draft Specific Utility Relocation Plans before those are finalized and presented in the Final EIR/EIS, since those may also have aesthetic impacts on residential or other visually sensitive locations within Commerce. L-19-61

Section 3.7, Cultural Resources

Historic Bridge Inventory Survey Required. HPSR Attachment B to the Draft EIR/EIS, the Historic Property Survey Report submitted by Caltrans to the State Office of Office Historic Preservation (SHPO), lists only State Agency-designated Bridges. The City requests that Local Agency Bridges from the California Historic Bridge Inventory that are located in the City of Commerce be added, in the event that there are historic bridges within Commerce that aren't addressed. L-19-62

Potentially Eligible Local Resources Not Evaluated. The Draft EIR/EIS notes that the City of Commerce has criteria for local landmark designation, and the City was contacted during Draft EIR/EIS preparation for information on identified locally eligible and designated resources. However, inventoried properties in the Area of Potential Effect (APE) were not evaluated against local eligibility criteria; surveyed properties were evaluated only for National and California Register eligibility (see HRER Appendix B property Nos. 108-160, APE Map Reference nos. 97-149). Some of the potentially affected City of Commerce properties may be eligible individually or as part of a potential district at the local level. The City requests that Caltrans address this issue in the Final EIR/EIS. L-19-63

Section 3.8, Hydrology and Floodplain

Additional Information Regarding Traffic Impacts at Floodway Structures Needed. Floodway structures to be altered and/or replaced in Commerce under Alternative 5A include the Union Pacific crossing at Randolph Street and the Slauson Avenue crossing. No additional improvements within identified within floodways are proposed under Alternatives 6A/B/C. The improvements to the Union Pacific crossing would require construction staging in the vicinity of the crossing. The improvements at Slauson Ave may result in traffic and congestion impacts at the roadway crossing. The City requests additional information on the potential construction staging and traffic impacts at these two crossings. L-19-64

Flood Protection Evaluation Required. The analysis in the Draft EIR/EIS relies on mitigation measure FP-1, which requires the preparation of a Final Los Angeles River Impact Report, to demonstrate that the design of the proposed project provides acceptable flood protection. While this type of mitigation is common on large-scale projects where designs are not yet finalized, the City requests an opportunity to review the Final Los Angeles River Impact Report. L-19-65

No Flood Hazard Evaluation Provided. The Draft EIR/EIS does not identify any flooding concerns in the City of Commerce. Given the City's proximity to the Los Angeles River and the reliance on pumps to drain portions of the I-710 freeway, the City should raise any specific flooding concerns for areas within City boundaries in the vicinity of the freeway. Since the proposed Alternatives would increase the number of freeway lanes and, therefore, the associated impervious area, the City requests that the Draft EIR/EIS provide additional detail concerning post-project surface runoff volumes, rates, and discharge locations onto surface streets within the City, or where the City is aware of undersized, aging, or otherwise inadequate storm drain infrastructure on its arterial streets. L-19-66

Section 3.9, Water Quality and Stormwater Runoff

Consultation with City Staff Regarding BMPs Needed. Since surface water runoff from I-710 currently discharges to City of Commerce surface streets and storm drains, and will continue to do so under post-project conditions that will increase the number of trucks and passenger vehicles using the freeway and ramps accessing the rail yards, the City of Commerce requests that Caltrans consult with City staff during preparation of the final treatment BMPs that address the capture and treatment of runoff. L-19-67

Section 3.10, Geology/Soils/Seismic/Topography

Ninyo & Moore Geotechnical and Environmental Sciences Consultants undertook analysis of the geotechnical analysis provided in the Draft EIR/EIS on behalf of the City of Commerce. Comments are provided below. The complete letter report detailing Ninyo & Moore's findings is provided as Attachment 2 to this comment letter.

Geotechnical considerations. The geotechnical study for the project by URS discusses potential foundation options for bridges and retaining walls for the project. The study recommends that the selection of bridge foundation alternatives will be based on foundation loading and site-specific conditions, and the design will be based on site-specific geotechnical evaluation. Various options for retaining walls and associated foundation alternatives are presented in the geotechnical study. However, the potential impacts of the various design alternatives are not addressed in the URS report, nor are they addressed in Section 3.10 of the Draft EIR/DEIS. Construction activities for the Project corridor could pose additional impacts to properties in the City of Commerce and are addressed in the following sections.

- **Soil Erosion.** Soil erosion refers to the process by which soil or earth material is loosened or dissolved and removed from its original location. Erosion can occur by varying processes and can occur in the project area where bare soil is exposed to wind or moving water (both rainfall and surface runoff). The processes of erosion are generally a function of material type, terrain steepness, rainfall or irrigation levels, surface drainage conditions, and general land uses. Construction of the Project would result in ground surface disruption during demolition, excavation, grading, and trenching that would create the potential for erosion to occur. However, with incorporation of appropriate mitigation methods, potential soil erosion can have a less than significant impact. L-19-68

  To mitigate potential erosion at the Project site, a Storm Water Pollution Prevention Program (SWPPP) incorporating Best Management Practices (BMPs) for erosion management should be implemented prior to the start of construction. In addition, the topographic gradients at the project site are relatively gentle. The site would be covered with hardscape and landscape improvements following construction, and the impact of long-term erosion would be less than significant.

  With the implementation of BMPs incorporated in the project SWPPP during construction, water- and wind-related soil erosion can be limited and managed within construction site boundaries. Examples of these procedures could include surface drainage measures for erosion due to water, such as the use of erosion prevention mats or geofabrics, sandbags and plastic sheeting, and temporary drainage devices. Positive surface drainage should be accommodated at project construction sites to allow surface runoff to flow away from site improvements or areas susceptible to erosion. To reduce wind-related erosion, wetting of soil surfaces and/or covering exposed ground areas and soil stockpiles could be considered during construction operations, as appropriate. The use of soil tackifiers may be considered to reduce the potential for water- and wind-related soil erosion. <u>The City requests that these measures be incorporated in the project SWPPP prepared for construction that will occur in the City of Commerce.</u>

- **Groundwater and Construction Dewatering.** The Draft EIR/DEIS and the URS report provided in the Appendix indicate that the depth to groundwater along the Project corridor in the City of Commerce is more than 45 feet deep. Foundation excavations near this depth will encounter groundwater. Additionally, shallow perched groundwater may be encountered in excavations for the Project, and construction dewatering would be involved to maintain the excavations in a relatively dry condition. Lowering the groundwater results in an increase in the effective stress of soil above the groundwater and, in some cases, can result in soil settlement. Estimates of the magnitude of potential settlement related to dewatering should be made prior to site excavation, and mitigation recommendations should be implemented, as needed. The potential impacts of settlement related to construction dewatering can be made less than significant with incorporation of appropriate mitigation methods. Mitigation methods include limiting the depth of construction dewatering, installation of sheet piles and pumping from within the excavation to reduce the impacts outside the excavation, installation of monitoring wells to evaluate groundwater, monitoring adjacent areas for indications of settlement, and/or protection to settlement-sensitive structures through ground improvement or foundation underpinning (if appropriate). L-19-69

- **Liquefaction mitigation and construction activities; associated ground settlement and vibration impacts.** Typical mitigation alternatives for liquefaction include supporting structures on cast-in-place pile foundations or driven pre-cast piles that extend through the liquefiable zones into competent material. Alternatively, densification of the liquefiable soils using vibro-displacement stone columns or compaction grouting would mitigate the liquefaction hazard, and the new structures could then be supported on shallow foundation systems. From a geotechnical engineering perspective, each of these alternative methods are considered feasible, and would reduce the liquefaction hazard impact to less than significant levels.

  However, construction activities to mitigate the potential liquefaction hazard for the Project and installation of pile foundations could pose additional site impacts. Depending on the type of liquefaction hazard mitigation and pile foundations selected, construction-related vibrations could impact surrounding properties. In addition, excavations may include shoring systems, which could involve the use of driven sheet piles. The installation of driven piles or vibro-displacement stone columns for liquefaction mitigation, and installation shoring systems (such as sheet piles) involves construction vibrations, which can result in disturbance to people and/or ground settlement. L-19-70

  Sensitive receptors (people and structures) located near the Project could be impacted by vibrations and ground settlement. However, the impacts of vibrations and ground settlement to surrounding improvements due to construction activities at the project site will be reduced to less than significant levels with incorporation of mitigation techniques.

  In order to mitigate the potential impacts due to vibrations during the construction phase of the Project, sensitive receptors (people and structures) near the Project should be evaluated with regard to potential vibration-related impacts. If vibrations

would impact the receptors, mitigation techniques should be developed as part of the Final EIR and implemented at the appropriate time. Mitigation techniques to reduce the impacts of vibrations to less than significant levels include avoiding vibratory types of construction, limiting vibratory types of construction to specified distances from sensitive offsite receptors, monitoring vibration and settlement during construction, and/or protecting sensitive improvements from excessive settlement by ground stabilization or foundation underpinning.

Monitoring methods include installation of ground survey points around the outside of excavations to monitor settlement and/or placing monitoring points on nearby structures or surfaces to monitor performance of the structures. In general, acceptable levels of settlement would be ½ inch or less in non-building areas, and ¼ inch or less for building areas. If monitored movement is unacceptable to surrounding improvements during the course of construction, the work should stop and the contractor's methods should be reviewed and changes made, as appropriate; and alternative methods of settlement reduction should be implemented by the contractor. L-19-70

The City requests that the Final EIR address this issue and include these mitigation measures to reduce potential impacts in the Final EIR.

Section 3.11, Paleontology

Section 3.11 of the Draft EIR/EIS should elaborate on the various excavation activities and associated maximum depths below surface, for the different expected types of project construction. Only one excavation activity is mentioned in any detail: highway bridge excavations for pile caps up to 15 feet in depth. Without more detail about the extent and depth of excavation associated with a wider range of structures, the assessment of impacts on paleontological resources in areas of high sensitivity is inconclusive.

In the *Paleontological Resources Identification and Evaluation Report* provided in Volume I of the Technical Studies, Table B on page 26 identifies the Capistrano Formation as possessing high paleontological sensitivity, but the locales along the freeway alignment within the Area of Potential disturbance (APD) where this formation or rock unit crops out at the surface, or is subject to interception during grading and excavation, are not discussed. Without this information, impacts on paleontological resources, including within the City of Commerce, cannot be conclusively determined. L-19-71

In the *Paleontological Resources Identification and Evaluation Report* provided in Volume I of the Technical Studies, one sentence is provided to describe the pedestrian surveys conducted along the freeway alignment within the Area of Potential Disturbance (APD). Some additional detail should be provided, including some indication of whether and where any fossils were recovered, and the associated rock units.

Section 3.13, Air Quality/Greenhouse Gases

Significant Impact Not Fully Mitigated. The air quality analysis in the Draft EIR/EIS analyzed construction impacts on a regional basis for the project as a whole, and for construction of the maximum single segment. The DEIR/DEIS estimates that the entire corridor would take 8 to 15 L-19-72

years to complete, with activity in any one segment lasting up to four years. Daily emissions would, on a worst-case overlapping day, exceed thresholds for all criteria air pollutants. For the maximum single segment only NOx emissions would exceed the threshold, and are estimated to be approximately three times the applicable CEQA threshold. The Draft EIR/EIS does not contain specific mitigation measures to address the significant and unavoidable NOx impact. The City feels it is appropriate for Caltrans to adopt Metro's Green Construction Policy for this project and to modify the mitigation measures to mandate that construction contractors use the cleanest off- and on-road equipment and trucks available. The City requests that additional measures be included in the Final EIR to control or reduce NOx emissions. L-19-72

Significant Impact Not Fully Mitigated. The air quality analysis in the Draft EIR/EIS, page 3.13-55, determined that fine particulate matter (PM2.5) concentrations from operation of the proposed Project would exceed the SCAQMD Localized Significance Threshold (LST) at various areas within 50 meters of the corridor compared to the existing 2008 baseline and within 100 meters compared to Alternative 1 (2035 No Build). It is stated that the impact is primarily the result of the entrained dust modeling using the USEPA method. Nonetheless, when compared to Alternative 1, Figures 4.36, 4.37, and 4.38 in Appendix R of the Draft EIR/EIS indicate that the potential for sensitive receptors to experience high levels of PM2.5 extends into residential areas, in particular the ABC/Ayers and Northwest neighborhoods in the City of Commerce. The City requests that a mitigation measure be provided requiring Caltrans to provide a refined quantitative localized impact assessment focused on long-term operational air quality impacts to neighborhoods in the vicinity of the main roadway and relocated on- and off-ramps. Based on the localized impact assessment or real-world monitoring data (made possible through mitigation measure AQ-1), if unacceptable impacts occur, the City requests that Caltrans be responsible for long-term enhanced street sweeping, providing upgrades to residential heating, ventilation, and air conditioning (HVAC) units and air filtration systems for impacted residential receptors, and other appropriate mitigation or avoidance strategies. The City further requests that mitigation or avoidance strategies be included as part of an "Air Quality Community Protection Plan,", which is a component of the recommended Community Benefits Agreement between Commerce and Caltrans, discussed in Section 4 of this comment letter. L-19-73

Significant Impact Not Fully Mitigated. The air quality analysis in the Draft EIR/EIS analyzed construction impacts adequately on a regional basis for the project as a whole, and for the maximum single segment. The DEIR/DEIS estimates that the entire corridor would take 8 to 15 years to complete, with activity in any one segment lasting up to four years. Worst case daily emissions of NOx are estimated to be approximately three times the applicable CEQA threshold and particulate matter (PM) emissions approximately one half of the CEQA thresholds for the single segment. Given that a vast amount of improvements are planned at the northern terminus of the corridor, including major reconfiguration of on- and off-ramps, it is likely that the City of Commerce would experience some of the most intensive construction activity for the longest period of time. Therefore, a mitigation measure should be added that specifies that, prior to the final selection of an Alternative and design options, Caltrans shall be required to provide a focused assessment on localized construction impacts. This focused analysis should include a discussion of potential near roadway impacts from construction based on the SCAQMD LST methodology and should identify potential sensitive receptor areas that could experience localized construction air quality impacts in excess of the standards. This assessment should include emissions from proposed rock crushing and cement plants, if plans include potentially locating these in Commerce. In addition, Caltrans should include a requirement for an "Air Quality Community Protection Plan" L-19-74

(discussed in detail as part of a CBA below) that includes provisions to temporarily relocate impacted residents, provide upgrades to residential air filtration systems, and provide a community liaison that is available to investigate and address air quality issues in the affected community. L-19-74

Clarification Needed. In the Air Quality and Health Risk Assessments Technical Study (February 2012), on page ES-1, the second to the last bullet point states that "PM2.5-related morbidity and mortality health risks would generally decrease relative to the 2008 baseline; the exceptions would be some locations within 100 m to 300 m of the I-710 freeway and/or freight corridor, which generally would not have people present." This appears to be inconsistent with page 3.13-55 in Section 3.13, Air Quality, of the Draft EIR/EIS, which states that impacts would be limited to 50 and 100 meters compared to the existing 2008 baseline and Alternative 1, respectively. The City is therefore unsure which set of numbers are correct. Figures 4.36, 4.37, and 4.38 in the Technical Study indicate that several of the modeled receptor points are expected to experience exceedances of the SCAQMD LST for PM2.5, extending into residential areas, in particular the ABC/Ayers and Northwest neighborhoods in the City of Commerce. The final EIR/EIS should state that impacts to these neighborhoods would exceed the threshold and would be significant. The City requests that mitigation measures, such as but not limited to enhanced filtration, be required for those residences in the most severely impacted neighborhoods. L-19-75

Potential Impact Not Studied. Under Alternatives 5A, 6A, 6B, and 6C, vehicle miles traveled (and truck trips) on the I-710 would increase over Alternative 1 (No Build). However, the analysis upon which the Draft EIR/EIS relies does not discuss the potential for increased truck queuing on local roadways in the vicinity of the rail yards in the City of Commerce, which already experiences issues related to trucks queuing on the roadways in the vicinity of Washington Boulevard and Atlantic Boulevard. Increased truck queuing could result in greater diesel particulate matter emissions, which is a human carcinogen. Furthermore, because the potential increase in idling could occur on local roadways, Alternatives 6B, 6C and the Zero Emissions Extension (ZEE) option would not reduce these impacts because the catenary system would not extend to the affected roadways. The City requests that this impact be analyzed and, if warranted, appropriate mitigation measures included in the Final EIR/EIS, including but not limited to the development of an off-street dedicated truck staging yard and enhanced enforcement of current anti-idling regulations. L-19-76

Minor Error. The numbering of tables skips from 3.13-15 to 3.13-20. The City requests that this error be corrected. L-19-77

Clarification Needed. It is noted that on August 10, 2012, Caltrans issued an erratum stating that the portion of the sub-section 3.13.3.2 on "Public Health Considerations" starting with the first paragraph and continuing to the subheading "PM Mortality and Morbidity" and including Table 3.13-29 is moved to Chapter 4.0, California Environmental Quality Act Evaluation at the end of Section 4.2.4.1 "Air Quality" on page 4-41. The City requests that the CEQA analysis should also refer to and include all discussion related to impacts compared to the 2008 CEQA baseline and delete any analysis of the 2035 NEPA baseline (Alternative 1). L-19-78

Clarification Needed. On page 4-88 in Section 4.0, California Environmental Quality Act Evaluation, the following mitigation measure is proposed: "The project would incorporate the use of energy-efficient lighting, such as light-emitting diode (LED) traffic signals." The mitigation measures suggests that the project would include new and/or replacement lighting and traffic signals. It is unclear if GHG emissions from lighting and traffic signals were taken into account; please L-19-79

indicate whether this is the case. The City requests that a brief statement in the analysis should be included regarding energy consumption related to lighting and traffic signals. This information will help to inform decision makers and stakeholders of the relative benefit of the mitigation measure mentioned above. L-19-79

Clarification Needed. On page 67 in the Air Quality and Health Risk Assessments Technical Study (February 2012), Subsection 5.6, there appears to be a numerical discrepancy with the GHG emissions reported in the text and in Table 5.6 compared to the GHG emissions reported in Section 4.0, California Environmental Quality Act Evaluation (Subsection 4.3, Climate Change), Table 4.3-3a and Table 4.3-3b. The City requests that the following discrepancies be corrected:

- Page 67 of the Technical Study states that "GHG emissions for the 2035 alternatives compared to 2008 are all approximately 22,000,000 tonnes CO_2e/year higher than the existing baseline..." However, in Section 4.0, California Environmental Quality Act Evaluation (Subsection 4.3, Climate Change), the total incremental CO_2e emissions for all alternatives compared to the existing baseline, as shown in Table 4.3-3a, appear to be closer to 20,000,000 tonnes CO_2e/ycar. It is unclear which values are correct; please correct this discrepancy. L-19-80

- Table 5.6 of the Technical Study shows the total incremental CO_2e emissions for Alternatives 6A, 6B, and 6C compared to Alternative 1 (No Build) as -120,000, 600,000, and -490,000, respectively. However, Table 4.3-3b shows the total incremental CO2e emissions for Alternatives 6A, 6B, and 6C compared to Alternative 1 (No Build) as -130,000, -487,000, and -393,000, respectively. It is unclear which values are correct. These discrepancies should be corrected. This discrepancy also applies to Table ES-7 of the Technical Study; please address this as well.

Section 3.14, Noise

Potential Nighttime Noise Impacts not Evaluated or Mitigated. The Draft EIR/EIS failed to analyze construction noise impacts during the nighttime hours. Nighttime noise is especially problematic for three reasons: 1) an introduced source of noise, such as heavy duty construction equipment, is more noticeable when ambient levels are low; 2) more residents are at home in the evening and are more likely than industrial receptors to have their windows open or enjoying the outdoors, and 3) nighttime noise can cause sleep disturbances. For example, the City of Commerce Noise Standards state that exterior noise should not exceed the following limits: 55 dBA during daytime (7 am to 7pm), 50 dBA during evening (7 pm to 10 pm), and 45 dBA during nighttime (10 pm to 7 am). Nighttime construction is a normal occurrence with large infrastructure projects such as this. However, the draft EIR/EIS does not establish a threshold(s) specific to nighttime hours and fails to qualitatively or quantitatively assess potential impacts. A court case in Berkeley, California (*Berkeley Keep Jets Over the Bay Com. v. Board of Port Comrs. of Oakland, 2001*), raised concerns from interior sound exposure levels (SELs) in excess of 65 dBA, which according to the Federal Interagency Committee on Aviation noise (FICAN), would result in 5 percent of a population to be awakened. Thus, the City requests that a mitigation measure be added in the Final EIR that establishes a "Noise Community Protection Plan," that includes provisions for a community liaison that is available to investigate and address noise issues in the affected community, mandatory sound walls/blankets, and construction-period monitoring, and may include strategies such as temporary relocation of severely impacted residents, and/or providing permanent upgrades to residences (i.e., L-19-81

new window systems and other noise dampening strategies). Furthermore, we request that the Plan be incorporated into the City's requested Community Benefits Agreement between Commerce and Caltrans, which is discussed in Section 4.0 of this Comment Letter. L-19-81

Section 3.15, Energy

Section 3.15, Energy, does not include a discussion of energy consumption related to lighting traffic signals. On page 3.15-3, mitigation measure E-3 states that "[p]rior to completion of final design, Caltrans shall prepare an area lighting plan to identify lighting fixtures that are energy efficient and to identify placement of individual lighting fixtures used for roadway lighting that will provide safety lights for pedestrians and motorists." In addition, on page 4-88 in Section 4.0, California Environmental Quality Act Evaluation, the following mitigation measure is proposed: "The project would incorporate the use of energy-efficient lighting, such as light-emitting diode (LED) traffic signals." These mitigation measures suggest that the project would include new and/or replacement lighting and traffic signals, to be provided by Caltrans. A brief statement should be included in the analysis regarding energy consumption related to lighting and traffic signals. This information will help to inform decision makers and stakeholders of the relative benefit of the mitigation measures L-19-82

Sections 3.16 to 3.21, Biological Resources

CEQA Section 3.18.2 – Affected Environment. Focused surveys were conducted in 2009 for special-status plant species. Generally surveys are only valid for one year. The project surveys are three years old. It is recommended that the surveys should be repeated. L-19-83

CEQA Section 3.19.2.1 – Special-Status Animal Species Requiring Surveys. Focused surveys were conducted in 2009 for burrowing owl and special-status bat species. Generally surveys are only valid for one year. The project surveys are three years old. It is recommended that the surveys should be repeated. L-19-84

CEQA Section 3.24.1.1 – Highway Improvement Process: Pre-Construction Activities. A bullet should be added to this section as follows: "Conduct nesting bird surveys and/or any other pre-construction surveys specified in the mitigation measures, as necessary." L-19-85

Section 3.24, Construction

Mitigation Measure CON-3 – Traffic Management Plans. This mitigation measure does not require the Traffic Management Plans (TMPs) to identify construction staging areas. The City of Commerce requests that construction staging be included in Mitigation Measure CON-3 in the Final EIR/EIS, especially in light of the three Design Options that are proposed within Commerce City limits. L-19-86

4. COMMUNITY BENEFITS AGREEMENT (CBA)

In light of the disproportionate localized impacts of the project on the City of Commerce, the City of requests that Caltrans and its partner agencies in the proposed I-710 Corridor Project jointly, with the City of Commerce, execute and enter into a Community Benefits Agreement (CBA) intended to minimize to the maximum extent possible the adverse impacts of the project in City residents, commercial businesses, and industry. L-19-87

This section provides the basic framework of specific requests the City believes are warranted to be included in a CBA and intends to seek. The CBA should contain commitments to strategies, practices, goals, and targets which are expected to result in real and quantifiable reductions or avoidance of the negative impacts to Community, Traffic, Air Quality, and Noise predicted. The detailed requirements of the CBA, to be negotiated, are intended to directly benefit the most severely impacted sensitive receptors in the City of Commerce.

Community Impacts. The City requests that Caltrans work closely with the City to develop Last Resort Housing within the City of Commerce and commit to the relocation of all displaced residents within the City of Commerce.

In view of the lack of comparable existing housing within the City of Commerce, the likely inadequacy of Caltrans's standard relocation stipends for potentially displaced residents, and the likely lack of sufficient financial resources on the part of those residents to afford replacement housing at current market prices, we further request that Caltrans address the following, at a minimum, for any resident relocation:

- The provision of, or the provision of funding to, study and identify opportunities to replace in kind all residential, commercial, industrial, or other properties permanently displaced as a result of the proposed Project.

- The provision of, or the provision of funding to construct, one-for-one replacement housing for every dwelling unit to be removed as the result of the project, including single-family homes, townhomes, duplexes, condominium, and rental apartments. L-19-87

- Creative solutions to the siting and design of comparable replacement housing within the City of Commerce, in a manner that improves the quality of life for displaced residents

- The provision by Caltrans, as soon as is feasible, of a clear timeline for proposed property acquisition and resident relocation, to minimize uncertainty for affected residents and allow for advance planning

- The provision of a relocation liaison to coordinate issues with and for the citizens and business owners of Commerce.

- The provision of funds for moving expenses, and assistance with other moving-related circumstances (e.g., address changes, notification of employers for time off if needed, etc.)

- Reimbursement to residents of documented home improvement expenses incurred within the five years prior to Caltrans acquisition of properties

- Special assistance for elderly and/or disabled residents, including but not limited to counseling

- Funding assistance for first-time home buyers

- Subsidies/waivers for increased property taxes associated with new residences
- Subsidies for increased living expenses associated with new residences
- Consideration for other marginalized populations that may be affected by relocation

No description is provided in the Draft EIR/EIS of how Caltrans intends to "prioritize efforts" to relocate businesses within the same City. Without a detailed plan, this measure is not a sufficient measure to mitigate the displacement-related employment impacts. The City requests that Caltrans provide a detailed plan to show how it will prioritize efforts to relocate business within the City of Commerce and that this plan be incorporated into the Community Benefits Agreement. L-19-87

The Community Benefits Agreement should include policies to promote the impacted community and local economy by identifying purchasing, hiring and contracting opportunities; encouraging local enterprises to make bids and proposals for project contracts; prioritizing opportunities for local suppliers and vendors; and promoting the hiring of City of Commerce residents. Caltrans should develop a targeted local hiring plan to facilitate outreach to local businesses seeking contracting and procurement opportunities, as well as local residents seeking construction jobs, particularly in light of the fact that Commerce has the highest unemployment rate (22 percent) of any city or community in the project study area, as stated in the Draft EIR/EIS's Community Impact Assessment Technical Study (Table 3.3-7). The City requests that these outreach efforts are coordinated with the City to ensure that adequate opportunities for local involvement are made available for the duration of the Project's construction period.

Traffic. The City of Commerce currently experiences traffic-related impacts from truck queuing on local roadways, particularly on Washington Boulevard and Atlantic Boulevard. The freeway improvement project presents an opportunity for the City and Caltrans to work cooperatively to address the City's desire to create storage or staging yard for short-term truck parking before or after those vehicles access the UPRR or BNSF railyards. Currently this activity occurs on some City streets and leads to localized congestion, particularly on Washington Boulevard, on Atlantic Boulevard and on Sheila Street. With the projected increase in throughput at the railyards, this phenomenon is expected to increase. A staging yard should be located relatively near to the railyards and because they operate 24 hours per day, 365 days per year, it should not be located near any residences or noise-sensitive uses. One option the City has considered in the past is to widen Sheila Street. The City requests that Caltrans assist the City in identifying other potential solutions and, ultimately, contribute to the cost of what the City chooses to implement. This request is not made in connection with a specific impact identified in the draft EIR/EIS but rather is suggested as a candidate for inclusion in a Community Benefits Agreement between the City and Caltrans. L-19-88

Arterial Roadway Maintenance in Proximity to Rail Yards. In view of considerable increase in truck traffic anticipated as the result of the project on Washington Boulevard, Atlantic Boulevard, Bandini Boulevard, and possibly other City roadways such as Sheila Street, the City requests that Caltrans establish funds to assist the City with the maintenance of these roadways in perpetuity. This will benefit the rail yards, truck operators traveling between the port complex and the rail yards, City businesses and industry, and City residents and visitors. L-19-89

Air Quality. The City of Commerce would experience localized air quality-related impacts from PM2.5 to sensitive receptors within 50 meters of the corridor compared to the existing 2008 baseline and within 100 meters compared to Alternative 1 (2035 No Build). The impact is related to fugitive dust as well as exhaust emissions. Impact areas include the ABC/Ayers and Northwest neighborhoods in the City of Commerce. The City of Commerce may also be subjected to adverse localized impacts during construction, pursuant to the findings of a construction localized significance threshold analysis using the SCAQMD's LST methodology. The CBA shall provide for an Air Quality Community Protection Plan that requires Caltrans to implement short term and long-term air quality protection measures that will reduce or avoid these impacts. The air quality protection measures should include the following:

- Adopt and adhere to Metro's Green Construction Policy for this project
- Provide enhanced street sweeping for impacted streets and neighborhoods using low-emission alternative-fueled or zero-emission street sweepers;
- Provide upgrades to residential air filtration systems and thc installation of new or upgraded HVAC systems for impacted residential receptors;
- Provide funds or subsidies for increased water usage by impacted residential receptors during construction in Commerce, to allow for regular washing of outdoor surfaces, vegetation, and furnishings as a means of dust reduction
- Provide for the temporary relocation of severely impacted residents during the most intense construction activities;
- Provide a community liaison that is available to investigate and address construction-related air quality issues in the affected community;
- Other appropriate mitigation or avoidance strategies.

L-19-90

Noise. Given that construction is expected to occur during the nighttime hours and that the City of Commerce is anticipated to experience the most intense construction activity, residents within the City of Commerce would be subjected to adverse construction noise levels during the nighttime hours that would potentially cause sleep disturbances. The CBA shall provide for a Noise Community Protection Plan that requires Caltrans to implement short-term noise protection measures that will reduce or avoid these impacts. The noise protection measures shall include the following:

- Provide mandatory sound walls/blankets;
- Provide construction-period noise monitoring;
- Provide for the temporary relocation of severely impacted residents during the most intense construction activities;
- Provide permanent upgradcs to residences (i.e., new window systems and other noise dampening strategies);

L-19-91

- Provide funds or subsidies for increased water usage by impacted residential receptors during construction in Commerce, to allow for regular washing of outdoor surfaces, vegetation, and furnishings as a means of dust reduction

L-19-91

- Provide a community liaison that is available to investigate and address construction-related noise issues in the affected community;

- Other appropriate mitigation or avoidance strategies.

Recreational Improvements for Displaced Park Patrons. Project construction will take place for an extended period of time in close proximity to, and for a period of time within, Bandini Park in the northwest part of the City. The City anticipates that construction will reduce the usability of the park by sports leagues and recreational users during this time. The City therefore requests that Caltrans conduct a study of the localized impacts on parks and recreational amenities within the City, and provide funds for improvements at other parks that may be required to host more teams and events. This may include the installation of nighttime lighting if a larger number of teams are required to use the same field, the construction of new recreational amenities (playing fields, bleachers, parking, etc.) at other parks to allow for more intensive use, and other measures.

L-19-92

Graffiti/Tagging Deterrents Incorporated into Freeway Soundwall Design. In light of the potential for proposed new freeway sound walls and retaining walls to be targets for graffiti and tagging, and the associated visual impact as well as the substantial costs that are borne by cities to eliminate graffiti/tagging after the fact, the City requests that preventative features be implemented and/or measures be taken to reduce such opportunities, and that Caltrans consult with the City concerning such features or measures during the project's design stage. Preventative features and measures may include, but may not be not limited to, the planting of ivy or other vines on sound walls, the landscaping of freeway rights of way with mature trees and shrubs to prevent access to freeway sound or retaining walls, and the use of decorative masonry surface treatments on these walls, and the establishment of funds for ongoing maintenance by the City of graffiti or tagging on these walls.

L-19-93

The City sincerely appreciates this opportunity to provide comments on the Draft EIR/EIR, and looks forward to continued cooperation from Caltrans as this project progresses and the Final EIR is prepared. Please contact Alex Hamilton, Assistant Director, Community Development Department, at alexh@ci.commerce.ca.us or (323) 722-4805 ext 2330, or Jorge Rifa, City Administrator, at jrifa@ci.commerce.ca.us or (323) 722-4805, with any questions.

Sincerely,

COMMERCE CITY COUNCIL

Honorable Lilia R. Leon, Mayor of the City of Commerce

Geotechnical Review
I-710 Corridor Project

September 24, 2012
Project No. 208695001

Ms. Anne Doehne
PCR
80 South Lake Avenue, Suite 570
Pasadena, California 91101

Subject: Geotechnical Review
I-710 Corridor Project
City of Commerce, California

Dear Ms. Doehne:

In accordance with your request and authorization, we have performed a geotechnical peer review for the Interstate 710 (I-710) Corridor Project (Project) Draft Environmental Impact Report/Environmental Impact Statement (DEIR/DEIS) for the City of Commerce. The project generally involves proposed improvements to the I-710 freeway from its southerly terminus in the City of Long Beach to Interstate 60 in East Los Angeles, and includes proposed improvements within the City of Commerce. The Project corridor traverses two parts of the City of Commerce generally from Randolph Street to Slauson Avenue, and from the rail yard to Interstate 5 (I-5).

The purpose of our evaluation was to assess whether the potential geotechnical impacts of the project in the City of Commerce and proposed mitigation alternatives presented in the DEIR/DEIS have been appropriately addressed relative to California Environmental Quality Act (CEQA) and National Environmental Policy Act (NEPA) guidelines and industry standards of practice. Our evaluation has included review of geotechnical background materials, review of the referenced geotechnical study by URS, and review of the referenced sections of the DEIR/DEIS relevant to the City of Commerce.

PROJECT DESCRIPTION

The I-710 corridor project DEIR/DEIS presents several alternatives for the proposed project, Alternatives 5A, 6A, 6B and 6C. Each alternative builds on the one before it while including the

components of the previous alternatives. The general aspects of the alternatives presented in the Executive Summary and Alternatives section of the DEIR/DEIS are summarized below:

- Alternative 5A includes widening of the freeway to five general-purpose lanes in each direction, modernization of freeway and arterial interchanges, and modifications of freeway access.
- Alternative 6A adds two dedicated truck lanes in each direction, on new elevated structures and at grade depending on location.
- Alternative 6B assumes use of dedicated lanes by zero-emission trucks with automated control systems. This alternative would be built to accommodate eventual conversion to maglev.
- Alternative 6C assumes dedicated truck lanes would be toll use.

There are also three design options (Design Options 1, 2 and 3) proposed which apply to Alternatives 6A, 6B, and 6C and pertain to the portion of the I-710 between Slauson Boulevard in the City of Commerce and the I-710/I-5 interchange. The general aspects of the design options presented in the Executive Summary and Appendix O of the DEIR/DEIS are summarized below:

- Design Option 1 applies to Alternatives 6A/B/C and provides freeway access to/from Washington Boulevard via three ramp intersections.
- Design Option 2 applies to Alternatives 6A/B/C and provides freeway access to/from Washington Boulevard via two ramp intersections.
- Design Option 3 applies to Alternative 6B and relocates access to/from the freeway at Washington Boulevard. The existing ramps would be replaced with extended "freight corridor ramps" that would be built at Oak Street and Indiana Street, near the rail yards in the City of Commerce.

Based on our general understanding of the design options in the City of Commerce, structures for the Project will include at-grade roadway construction, bridges, and elevated lanes supported on pile foundations and retaining walls.

GEOTECHNICAL CONDITIONS

The following sections present a summary of the geotechnical conditions, potential impacts, significance findings and mitigation recommendations pertaining to the Project within the City of

Commerce based on our review of the referenced geotechnical study and referenced sections of the DEIR/DEIS. The documents reviewed do not specifically address potential impacts within the City of Commerce. However, generalizations are made regarding the northern end of the project corridor where the City of Commerce is located. These generalizations are included in the following sections. Where appropriate, supplemental comments are presented based on our review of referenced geotechnical background documents.

Site Geology

The geotechnical study by URS and Section 3.10 of the DEIR/DEIS indicate that the Project corridor is underlain by sandy alluvial soils containing silts, clays and gravel. The geologic map presented in Figure 2 of the URS report indicates that the Project corridor in the City of Commerce is underlain by unconsolidated alluvial floodplain deposits of silt, sand and gravel. The URS report states that the alluvial sediments underlying the Project are generally denser/harder in the northern part of the corridor (where the City of Commerce is located).

Groundwater

The URS report indicates that groundwater levels from Slauson Avenue to the north end of the Project corridor within the City of Commerce are generally more than 45 feet below the ground surface. Section 3.10 of the DEIR/DEIS generally indicates that groundwater deepens in the north part of the Project study area. The DEIR/DEIS states that groundwater levels in the Project vicinity are influenced by seasonal fluctuations, and that fluctuations in groundwater levels due to water district practices and long-term climatic conditions may lead to future changes in the water levels.

Surface Fault Rupture

Based on the information presented in the DEIR/DEIS and URS report, there are no active faults known to cross the Project corridor within the City of Commerce, and the Project corridor within the City of Commerce is not located in a State of California Earthquake Fault Zone.

Seismic Ground Shaking

The DEIR/DEIS and URS report indicate that the Project corridor will be subject to seismic shaking that could be damaging to bridges and other structures and, therefore, would influence the seismic design of the Project. The documents indicate that the Puente Hills and Upper Elysian Park blind thrust faults are located to the south and north of the City of Commerce, respectively; and are capable of generating maximum credible earthquake moment magnitudes of 7.3 and 6.4, respectively, using the Caltrans ARS online tool. The URS report indicates that the generalized peak ground acceleration from Slauson Avenue to Noakes Street in the City of Commerce ranges from 0.65 to 0.70g.

The DEIR/DEIS recommends that Projcct facilities can be designed to accommodate the expected ground accelerations through compliance with applicable building and seismic codes and, as a result, the potential for structural damage can be substantially reduced through seismic engineering design.

Liquefaction

According to Seismic Hazards Zones Maps published by the State of California (California Department of Conservation, Division of Mines and Geology [CDMG], 1999a and 1999b), the Project corridor within the City of Commerce roughly from Randolph Street to Slauson Avenue is located within an area considered susceptible to liquefaction. The maps indicate that the portion of the Project corridor from the rail yards to I-5 in the City of Commerce is not located in a State liquefaction hazard zone.

The DEIR/DEIS and URS report indicate that an approximately 0.8 mile portion of the Project corridor (roughly from the rail yards to I-5 within the City of Commerce) is not located in a State liquefaction hazard zone, and has a low potential for liquefaction. The DEIR/DEIS and URS report indicate that the portion of the Project corridor in the City of Commerce roughly from Randolph Street to Slauson Avenue is in an area considered to have a moderate potential for liquefaction.

The DEIR/DEIS states that when liquefaction occurs, the strength of soil decreases and the ability of soil to support bridge foundations are reduced; and liquefied soils can exert pressure on retaining walls, which can cause them to tilt or slide. The URS report states that the potential effects of liquefaction include reduction of vertical and lateral capacity, seismic settlement of soils and resulting downdrag loads on buried structures, additional lateral loads due to lateral spreading, instability and movement due to lateral spreading.

The DEIR/DEIS recommends that impacts to the facilities and structure due to liquefaction and seismically induced settlement can be substantially reduced based on design and construction, consistent with the recommendations of the detailed geotechnical investigations prepared during final design.

Collapsible Soils

The DEIR/DEIS and URS report indicate that it is not known whether collapsible soils are present in the Project corridor, since laboratory data were not available for the Project. However, the documents state that the Project area in not known to have collapsible soils. The URS report states that issues of bearing capacity, stability and settlement will be less in the north part of the project than in the south. The URS report recommends that site-specific laboratory testing should be performed for collapse potential during the subsurface investigation phase of the project.

Expansive Soils

The DEIR/DEIS and URS report indicate that laboratory data were not available for the Project regarding the expansion potential of site soils; however, based on data from existing bridges for sites along the Project corridor, the soils generally consist of coarse-grained materials that are not highly expansive, but some fine-grained soils susceptible to high degrees of expansion do exist. The URS report recommends that site-specific laboratory testing be performed for collapse potential during the subsurface investigation phase of the projcct.

Subsidence

Section 3.10 of the DEIR/DEIS does not address the issue of subsidence. The URS report indicates that historic subsidence was documented in areas of Long Beach at the southern end of the Project corridor, and that the subsidence was successfully arrested in the late 1960s. The URS report and our review of background information do not indicate that historic subsidence occurred in the north part of the Project corridor in the City of Commerce.

Landslides and Earthquake-Induced Slope Instability

The DEIR/DEIS indicates that with the exception of the freeway embankments and embankments and levees of the Los Angeles river, the topography of the Project corridor is relatively flat with no natural slopes. The DEIR/DEIS states that earthquake-induced slope instability in not a major factor in the design and construction of the Project, except in areas where there is a potential for liquefaction. The URS report indicates that earthquake-induced slope instability associated with liquefaction and lateral spreading is an issue in areas of moderate or high liquefaction potential and near slopes such as the Los Angeles river embankments. Based on our background review, the Project corridor is adjacent to the Los Angeles river roughly between Randolph Street and Slauson Avenue in the south part of the City of Commerce. Further, this portion of the City of Commerce is located in an area indicated in the URS report to have a moderate liquefaction potential. The URS report recommends that detailed site-specific data and analyses are needed to address this issue and should be performed during project design.

CONCLUSIONS

Our evaluation included review of published geologic and seismic data, review of the referenced URS report, and review of the referenced sections of the DEIR/DEIS document. In general, it is our opinion that these documents have appropriately addressed the primary geotechnical impacts per CEQA/NEPA guidelines. However, the potential impacts and possible mitigation recommendations of some geotechnical issues not on the CEQA checklist are not addressed in the DEIR/DEIS and URS report. Therefore, we have addressed other issues that, in our opinion, may

impact the City of Commerce and present a discussion of these issues in the following section of this report.

The primary mitigation measure included in the DEIR/DEIS (GEO-1) indicates that *"Prior to completion of final design, Caltrans will prepare a design-level geotechnical report. This report will document soil-related constraints and hazards such as slope instability, settlement, liquefaction or related secondary seismic impacts that may be present. The report shall also include: Evaluation of expansive soils and recommendations regarding construction procedures and/or design criteria to minimize the effect of these soils on development of the project; Identification of potential liquefiable areas within the project limits and recommendations for mitigation; Demonstration that the design of all proposed retaining walls is geotechnically suitable for project area soils."* Typically, site-specific geotechnical impacts and recommendations are generalized at the DEIR/DEIS stage of a project, and are addressed in detail at the design stage. Therefore, it is our opinion that this mitigation measure is an appropriate recommendation to address the potential geotechnical impacts related to construction of the project.

Based on our background review, the three design options that are proposed in the City of Commerce in the vicinity of Washington Boulevard and the I-710 (Design Options 1, 2 and 3) will be constructed within a similar geologic environment with generally similar subsurface conditions. Therefore, in our opinion, the geotechnical impacts of the proposed design options would be dependent on the type and amount of construction performed for each option, and will generally not be dependent on the location of the constructed improvements.

ADDITIONAL GEOTECHNICAL CONSIDERATIONS

Based on our review of geotechnical background information, the URS report, and the DEIR/DEIS, we have prepared the following assessment of potential impacts and mitigation methods for the Project corridor within the City of Commerce.

The geotechnical study for the project by URS discusses potential foundation options for bridges and retaining walls for the project. The study recommends that the selection of bridge foundation alternatives will be based on foundation loading and site-specific conditions, and the design will

be based on site-specific geotechnical evaluation. Various options for retaining walls and associated foundation alternatives are presented in the geotechnical study. However, the potential impacts of the various design alternatives are not addressed in the URS report, nor are they addressed in Section 3.10 of the DEIR/DEIS. Construction activities for the Project corridor could pose additional impacts to properties in the City of Commerce and are addressed in the following sections.

Soil Erosion

Soil erosion refers to the process by which soil or earth material is loosened or dissolved and removed from its original location. Erosion can occur by varying processes and can occur in the project area where bare soil is exposed to wind or moving water (both rainfall and surface runoff). The processes of erosion are generally a function of material type, terrain steepness, rainfall or irrigation levels, surface drainage conditions, and general land uses. Construction of the Project would result in ground surface disruption during demolition, excavation, grading, and trenching that would create the potential for erosion to occur. However, with incorporation of appropriate mitigation methods, potential soil erosion can have a less than significant impact.

To mitigate potential erosion at the Project site, a Storm Water Pollution Prevention Program (SWPPP) incorporating Best Management Practices (BMPs) for erosion management should be implemented prior to the start of construction. In addition, the topographic gradients at the project site are relatively gentle. The site would be covered with hardscape and landscape improvements following construction, and the impact of long-term erosion would be less than significant.

With the implementation of BMPs incorporated in the project SWPPP during construction, water- and wind-related soil erosion can be limited and managed within construction site boundaries. Examples of these procedures could include surface drainage measures for erosion due to water, such as the use of erosion prevention mats or geofabrics, sandbags and plastic sheeting, and temporary drainage devices. Positive surface drainage should be accommodated at project construction sites to allow surface runoff to flow away from site

improvements or areas susceptible to erosion. To reduce wind-related erosion, wetting of soil surfaces and/or covering exposed ground areas and soil stockpiles could be considered during construction operations, as appropriate. The use of soil tackifiers may be considered to reduce the potential for water- and wind-related soil erosion.

Groundwater and Construction Dewatering

The DEIR/DEIS and URS report indicate that the depth to groundwater along the Project corridor in the City of Commerce is more than 45 feet deep. Foundation excavations near this depth will encounter groundwater. Additionally, shallow perched groundwater may be encountered in excavations for the Project, and construction dewatering would be involved to maintain the excavations in a relatively dry condition. Lowering the groundwater results in an increase in the effective stress of soil above the groundwater and, in some cases, can result in soil settlement. Estimates of the magnitude of potential settlement related to dewatering should be made prior to site excavation, and mitigation recommendations should be implemented, as needed. The potential impacts of settlement related to construction dewatering can be made less than significant with incorporation of appropriate mitigation methods.

Mitigation methods include limiting the depth of construction dewatering, installation of sheet piles and pumping from within the excavation to reduce the impacts outside the excavation, installation of monitoring wells to evaluate groundwater, monitoring adjacent areas for indications of settlement, and/or protection to settlement-sensitive structures through ground improvement or foundation underpinning (if appropriate).

Liquefaction Mitigation and Construction Activities

Typical mitigation alternatives for liquefaction include supporting structures on cast-in-place pile foundations or driven pre-cast piles that extend through the liquefiable zones into competent material. Alternatively, densification of the liquefiable soils using vibro-displacement stone columns or compaction grouting would mitigate the liquefaction hazard, and the new structures could then be supported on shallow foundation systems. From a geotechnical en-

gineering perspective, each of these alternative methods are considered feasible, and would reduce the liquefaction hazard impact to less than significant levels.

However, construction activities to mitigate the potential liquefaction hazard for the Project and installation of pile foundations could pose additional site impacts. Depending on the type of liquefaction hazard mitigation and pile foundations selected, construction-related vibrations could impact surrounding properties. In addition, excavations may include shoring systems, which could involve the use of driven sheet piles. The installation of driven piles or vibro-displacement stone columns for liquefaction mitigation, and installation shoring systems (such as sheet piles) involves construction vibrations, which can result in disturbance to people and/or ground settlement.

Sensitive receptors (people and structures) located near the Project could be impacted by vibrations and ground settlement. However, the impacts of vibrations and ground settlement to surrounding improvements due to construction activities at the project site will be reduced to less than significant levels with incorporation of mitigation techniques.

In order to mitigate the potential impacts due to vibrations during the construction phase of the Project, sensitive receptors (people and structures) near the Project would be evaluated with regard to potential vibration-related impacts. If vibrations would impact the receptors, mitigation techniques shall be implemented at that time. Mitigation techniques to reduce the impacts of vibrations to less than significant levels include avoiding vibratory types of construction, limiting vibratory types of construction to specified distances from sensitive off-site receptors, monitoring vibration and settlement during construction, and/or protecting sensitive improvements from excessive settlement by ground stabilization or foundation underpinning.

Monitoring methods include installation of ground survey points around the outside of excavations to monitor settlement and/or placing monitoring points on nearby structures or surfaces to monitor performance of the structures. In general, acceptable levels of settlement would be ½ inch or less in non-building areas, and ¼ inch or less for building areas. If moni-

tored movement is unacceptable to surrounding improvements during the course of construction, the work shall stop and the contractor's methods shall be reviewed and changes made, as appropriate; and alternative methods of settlement reduction shall be implemented by the contractor.

Excavations

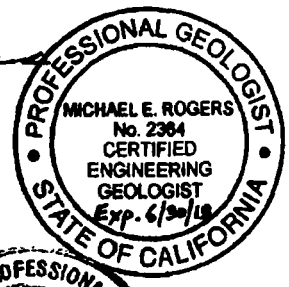
Based on our background review, we anticipate that the materials encountered in excavations for the Project in the City of Commerce will be comprised predominantly of unconsolidated alluvial soils with various amounts of silt, sand and gravel. We anticipate that excavations within the alluvial materials at the project site will be feasible with conventional grading equipment.

Unsupported steep excavations in the alluvial sediments for the Project may be susceptible to caving, which would be a safety hazard and could damage nearby improvements. Excavations for proposed Project improvements should be performed with care to reduce the potential for undermining or differential movement of pavements, adjacent utilities, hardscape, buildings and other improvements located near the excavations. Shoring will be utilized in excavations for the Project to provide adequate stability. With appropriate shoring systems incorporated during construction, excavations along the Project alignment would not result in a significant impact to surrounding improvements.

We anticipate that the Project excavations will be cordoned, fenced or covered during construction operations, such that the public will not be exposed to the impacts of excavations. Construction personnel may be exposed to the impacts of excavations, and appropriate safety measures would reduce potential impacts to site personnel. Since excavations will be filled following construction, the proposed Project would not result or expose people to impacts related to excavations after construction of the Project.

Limitations

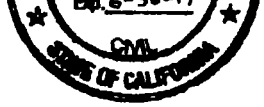
The geotechnical analyses presented in this report have been conducted in accordance with current engineering practice and the standard of care exercised by reputable geotechnical



consultants performing similar tasks in this area. No warranty, implied or expressed, is made regarding the conclusions, recommendations, and professional opinions expressed in this report. Variations may exist and conditions not observed or described in this report may be encountered. Our preliminary conclusions are based on an analysis of the referenced background information.

The purpose of this study was to evaluate geologic and geotechnical conditions within the City of Commerce to assist in evaluating the environmental impact documents for the project. A comprehensive geotechnical evaluation, including subsurface exploration and laboratory testing, should be performed prior to design and construction of the project.

We appreciate the opportunity to be of service on this project.



Respectfully submitted,

L-19-1

The California Department of Transportation (Caltrans) acknowledges the City of Commerce's comments regarding the benefits of the Interstate 710 (I-710) Corridor Project.

L-19-2

Caltrans acknowledges the City's concerns regarding the project effects on the City in proportion to the benefits of the project accrued to the City. The project effects related to property acquisition and displacements, tax revenue losses, disruptions to local traffic, and increased air emissions and noise levels are discussed in the relevant sections of the Recirculated Draft EIR/Supplemental Draft EIS (RDEIR/SDEIS). Responses to individual City comments related to the project effects are provided in Responses to Comments L-19-3 through L-19-93, below.

L-19-3

Caltrans acknowledges the City's concern regarding short- and long-term effects of air quality on near-roadway sources. Construction-related air quality emissions are discussed in Section 3.24.3.13, Air Quality, in the RDEIR/SDEIS. The emissions described in Section 3.24.3.13 and in Table 3.24-4 are based on the types of construction activities and construction periods that are representative of the effects that would occur in the City of Commerce in areas adjacent to construction activities for the I-710 Corridor Project. Single-segment construction NO_x emissions have already been identified as exceeding the SCAQMD's construction emission significance threshold. Measures to address those air quality effects are described in Section 3.24.4.13. The project construction contractors would be required to comply with those measures during project construction activities. Additionally, construction of the proposed project would follow the Caltrans and SCAQMD standard conditions for reducing fugitive dust emissions.

For long-term (operational) air quality effects, a revised set of build alternatives (Alternative 5C and Alternative 7) have been evaluated in the revised AQ/GHG/HRA. Project-funded zero-emissions/near zero-emissions (ZE/NZE) trucks along the I-710 are included in both Alternative 5C and 7, and a dedicated ZE-only freight corridor is a design option for Alternative 7. Based on the revised AQ/GHG/HRA, both build alternatives show the air quality and health benefits compared to the 2012 Baseline and 2035 No Build Alternative, particularly for NO_x and diesel particulate matter (DPM).

L-19-4

Caltrans, Metro, and the other I-710 Corridor Project funding partner agencies are extremely appreciative of the time and effort that the Coalition for Environmental Health and Justice

(CEHAJ) invested in developing the proposed Community Alternative 7 and acknowledge the City of Commerce's support of this alternative. The I-710 Corridor Project funding partner agencies share the goals described within their comments to: (1) protect community health in an already overburdened part of Los Angeles County, and, (2) identify an alternative that performs better environmentally while achieving traffic safety, enhancing goods movement, and reducing congestion. As discussed in the Responses to Comments IP-22-1 through IP-22-23 and as described in Chapter 2.0 of the RDEIR/SDEIS, many of the components of Community Alternative 7 have been integrated into Alternative 7. As further discussed in the responses to subsequent comments below, those components of Community Alternative 7 that have not been integrated into Alternative 7 are addressed in other programs and projects being undertaken by Metro and/or the Gateway Cities COG.

L-19-5

This comment requests a more detailed plan to show specifically how Caltrans will prioritize efforts to relocate businesses within the City of Commerce. The RDEIR/SDEIS includes mitigation for Caltrans to follow the Uniform Act, which includes relocating businesses (refer to Mitigation Measure C-1) within the same city as to keep jobs and tax revenues within affected cities.

L-19-6

Caltrans acknowledges the City's support of the zero emissions freight corridor and its request that it be made a mandatory feature of the project. This comment also requests that the ZEE design option (and its associated infrastructure) be extended beyond the freeway mainline onto the truck ramps within the City, as close to the rail yards as possible. A revised set of build alternatives (Alternative 5C and 7) are being carried forward in the RDEIR/SDEIS. Project-funded ZE/NZE trucks along the I-710 Corridor are a component of both Alternatives 5C and 7, and Alternative 7 includes a ZE/NZE freight corridor. Based on the revised AQ/GHG/HRA, both build alternatives show air quality and health benefits compared to the 2012 Baseline and 2035 No Build Alternative, particularly for NO_x and diesel particulate matter (DPM), compared to the No Build Alternative. $PM_{2.5}$ emissions along the I-710 are lower in all 2035 alternatives compared to the 2012 Baseline. Compared to the No Build Alternative, Alternative 7 has the greatest increase in $PM_{2.5}$ emissions (over three times greater increase than Alternative 5C). This is due to the VMT-related increases of entrained road dust and, to a lesser extent, brake/tire wear. (In 2035, exhaust emissions are a very small fraction of overall $PM_{2.5}$ traffic emissions.) Section 2.3.2.1 in the RDEIR/SDEIS describes the commercial feasibility of zero emission truck technology and includes reference to the I-710 Project Zero-Emission Truck Commercialization Study.

L-19-7

Caltrans acknowledges the City's support of the new interchange proposed at Slauson Ave. in combination with retention or improvement of the I-710/Washington Blvd. interchange. The revised build alternatives included in the RDEIR/SDEIS has revised the design at the Slauson Ave. interchange. This redesign includes reconstruction of Slauson Ave., including the freeway overcrossing from the Los Angeles River to approximately 700 feet east of the existing LAJ at-grade crossing. Alternative 7 includes a partial freight corridor-only interchange. Additionally, under Alternatives 5C and 7, the removal of the I-710/Washington Blvd. interchange has been withdrawn from further consideration. Caltrans will make every effort to avoid and/or minimize acquisition of commercial, industrial, and public property associated with improvements at the I-710/Washington Blvd. interchange.

L-19-8

Caltrans acknowledges the City's support of Community Alternative 7. Please see Response to Comment L-19-4.

L-19-9

Under the revised set of build alternatives included in the RDEIR/SDEIS, the removal of the I-710/Washington Blvd. interchange has been withdrawn from further consideration. Based on updates to the project design, improvements at the I-710/Washington Blvd. interchange include:

- Reconstruction of the interchange, including undercrossing and all entrance and exit ramps, and construction of one-way, access controlled streets between the ramp intersections and Sheila St.

- Reconstruction of the interchange from west of Ayers Ave. to west of Atlantic Blvd., including access control on Washington Blvd. between ramp intersections.

This revised design information is provided in Tables 2.3-3 and 2.3-4 of the RDEIR/SDEIS. Impacts related to this revised design are discussed in Section 3.1 (Land Use) and Section 3.3 (Community Impacts) of the RDEIR/SDEIS.

L-19-10

This information has been incorporated into Section 3.3 of the RDEIR/SDEIS and has been updated to address potential community character and cohesion impacts to the northwest neighborhood in the City of Commerce.

As stated in Section 3.3.1, the Draft EIR/EIS did in fact acknowledge the additional impacts to Commerce that would result from implementation of Alternatives 6A/B/C due to the increased right-of-way required for the four-lane freight corridor and concludes that the Alternatives 6A/B/C would result in an adverse impact to the City of Commerce community cohesion as a result of relocations. Also, Section 3.3.2.3 of the Draft EIR/EIS currently identifies a lack of comparable replacement housing within the city of Commerce and states that Last Resort Housing may be considered as a method of providing comparable replacement housing to displaced persons who reside in areas where the replacement housing is low. Refer to Section 3.3.2.3 for updated information regarding impacts, as well as Section 3.3.2.4, which describes the mitigation for relocations.

The comment also requests that Caltrans commit to the relocation of all Commerce residents within the City of Commerce. Caltrans will follow the provisions of the Uniform Act and every effort will be made to relocate residents within the affected city.

L-19-11

The comment requests Caltrans consider a list of provisions for relocations within the City of Commerce. As stated in the Section 3.3.2.3 of the RDEIR/SDEIS, Caltrans has already identified a lack of comparable replacement housing within the City of Commerce and that Last Resort Housing may be considered as a method of providing comparable replacement housing to displaced persons who reside in areas where the replacement housing is low. Refer to Section 3.3.2.3 for additional detail, as well as Section 3.3.2.4, which describes the mitigation for relocations. Please refer to Appendix D, Summary of Relocation Benefits, for a description of the assistance provided per the Uniform Relocation Act to any and all displaced persons as a result of the project.

L-19-12

Refer to Response to Comment L-19-9, above, for detailed discussion regarding the I-710/Washington Blvd. interchange and specific issues associated with that interchange.

L-19-13

Refer to Response to Comment L-19-9, above, for detailed discussion regarding the I-710/Washington Blvd. interchange and specific issues associated with that interchange.

L-19-14

Refer to Response to Comment L-19-9, above, for detailed discussion regarding the I-710/Washington Blvd. interchange and specific issues associated with that interchange.

L-19-15

Under Alternative 7, construction of one-way, access controlled streets between the Washington Blvd. ramp intersections and Sheila St. is proposed.

L-19-16

Under the proposed zero emission technology described in Section 2.3.2.1 of the RDEIR/SDEIS, trucks may continue to operate in zero emission mode even after they exit the proposed ZE/NZE freight corridor featured in Alternatives 7. The revised build alternatives and ZE/NZE truck program are both characterized as "technology neutral".

L-19-17

This comment requests additional technical studies and opportunities for the City to review those studies. Each of those requested studies is addressed below.

Transportation Management Plans. Although the Transportation Management Plan is not a technical study, the RDEIR/SDEIS has revised Measure CON-U&ES-1 (Appendix F and Section 3.24.4.4) to add coordination of all temporary ramp closures and detour plans with individual City and County Departments of Public Works, as well as emergency services providers prior to any construction in jurisdictions where there will be temporary detours or other indirect effects on local streets in those jurisdictions.

Specific Utility Relocation Plans. Although Specific Utility Relocation Plans are not technical studies, the RDEIR/SDEIS has revised Measures CON-U&ES-1 and U&ES-2 to add consultation with individual City and County Departments of Public Works regarding the Specific Utility Relocation Plans prior to any utility relocation work in those jurisdictions.

Southern California Edison Bandini Substation Relocation. Please refer to the revised Section 3.4 of the RDEIR/SDEIS for an updated discussion of utility impacts under the revised build alternatives.

Comprehensive Utility Relocation Study. As noted in Section 3.4 of the RDEIR/SDEIS, Metro has conducted three comprehensive utility relocation studies for the South, Central,

and North segments of I-710 that were used to prepare Section 3.4 of the RDEIR/SDEIS. The technical studies are available at the following link: http://www.dot.ca.gov/d7/env-docs/.

Final Los Angeles River Impact Study. Because the revised build alternatives minimized impacts to the Los Angeles River, a revised "Los Angeles River Impact Report" was not prepared; however, the referenced analysis can be found in the *Flood Control Facilities Report* (January 2017), available at the above link.

Water Quality and Stormwater Best Management Practices. Measure WQ-1 (Section 3.9.4 and Appendix F of the RDEIR/SDEIS has been updated to state that during final design, Caltrans will consult with the jurisdictions where discharges of runoff from I-710 to local jurisdictions' streets and/or storm water drainage systems will occur regarding the project design development, treatment, and operational BMPs in those local jurisdictions.

Air Quality Localized Construction Analysis. The construction phasing, daily equipment, daily haul trucks, and duration (8 to 15 years) needed to conduct the construction-related analysis of criteria pollutants and MSATs are currently unknown. Therefore, as stated in the AQ/HRA technical report and Section 4.13 of the RDEIR/SDEIS, the worst-case construction emissions were estimated using the Sacramento Metropolitan Air Quality Management District (SMAQMD) Construction Emission Model (Version 6.3.2). Any estimate of the health risk, PM mortality/morbidity, or daily construction impacts would be speculative, inaccurate, and misleading.

L-19-18

The comment requests additional review of the City of Commerce 2020 General Plan Elements and additional detail provided in Section 3.1.1 of the Draft EIR/EIS. The RDEIR/SDEIS has been updated to provide additional goals and policies of applicable General Plan Elements for the City of Commerce 2020 General Plan.

L-19-19

Sections 3.3.1 and 3.3.2 provide a discussion of community character and cohesion and relocations required within each city under the build alternatives and design options. The RDEIR/SDEIS concludes that community cohesion impacts occur at a localized level within Commerce, Bell, and Long Beach due to relocations of existing cohesive communities. In addition, Section 3.3.2.3 discusses the lack of comparable replacement housing within the cities of Commerce, Vernon, and for mobile homes specifically in Compton, and that Last Resort Housing may be considered for these cities as a method of providing comparable replacement housing to displaced persons who reside in areas where the replacement housing is low. Refer

to Section 3.3.2.3 for additional detail, as well as Section 3.3.2.4, which describes the mitigation for relocations.

L-19-20

Based on the updated CIA, the City of Commerce may require the need for Last Resort Housing. Please refer to Section 3.3.7 of the RDEIR/SDEIS for more updated information regarding relocations in the City of Commerce.

L-19-21

Sections 3.1.3 and 3.3.1 provide the evaluation of potential impacts at Bandini Park, Atlantic and Bristow Park branch libraries, Bandini Elementary School, the Dorothy Kirby Confinement Center, and places of worship located within 0.5 mile of the Study Area. However, the Commerce Teen Center, which is located outside of the Focused Study Area (i.e., more than 0.5 mile away from project improvements, which is beyond the limits of project noise impacts), was not evaluated. The evaluation provided in the Draft EIR/EIS includes discussions regarding whether the build alternatives would result in a potential direct and/or indirect impact (e.g., visual impact). Please refer to these sections for additional detail.

L-19-22

Table 3.3-10 (Section 3.3.2.3) in the RDEIR/SDEIS provides the potential number of relocations by build alternative. However, according to the revised CIA, the build alternatives will result in relocations in the City of Commerce:

It has been determined that there may be a need for Last Resort Housing within the City of Commerce. Please see Section 3.3.2 of the RDEIR/SDEIS and the revised *Relocation Impact Report* for more detailed information.

L-19-23

This comment requests an explanation of how the City's comments on the NOP were addressed in the Draft EIR/EIS. These specific requests and Caltrans' responses are as follows:

- **Coordination between I-5 and I-710 Improvement Projects:** Monthly meetings were, and will continue to be, held, involving Caltrans, Metro, the Gateway Cities COG, the I-5 Joint Powers Authority (JPA), the City of Commerce, and the County of Los Angeles on behalf of East Los Angeles to discuss the I-710 and I-5 projects and to ensure coordination of project design, consistent treatment of issues of concern to the

community, and the consistency of assumptions and technical analyses. This coordination is reflected in the project design.

- **Minimization of Impacts to Areas That Bring in Sales Tax Revenue:** To the extent possible, impacts to sales tax revenue generating uses were avoided. In cases where an impact was unavoidable, Caltrans worked to minimize the impact by acquiring small portions of property in lieu of full acquisitions. Various coordination meetings were held throughout the life of the project, including meetings with the City of Commerce, to receive City input on project design and its associated impacts. This coordination is reflected in the project design.
- **Minimization of Impacts to the ABC/Ayers Neighborhood and the Northwest Neighborhood:** Although impacts to the Ayers neighborhood have been reduced, Alternative 7 still results in impacts to this neighborhood. Please refer to Section 5.6 of the revised CIA for more detail.
- **Minimize Impacts to Road Access within the City:** Under Alternative 5C, the reconstruction of the Slauson Ave. overcrossing is proposed and would improve access for residents in the western part of the City of Commerce. In addition, the Leonis St. pedestrian undercrossing is proposed to be replaced connecting the residential areas in the Bandini-Rosini and West Planning Areas to preserve the connectivity and access to Bandini Park for residents east of the I-710 mainline. Also, the Interstate 5 (I-5) pedestrian overcrossing connecting Bristow Park in the City of Commerce to unincorporated East Los Angeles would also be maintained. Please refer to Section 5.6 of the revised CIA for more detail.

Comments received on the NOP have been incorporated in the RDEIR/SDEIS. Mitigation measures to address impacts to the City are discussed throughout Chapter 3.0, as well as in Appendix F.

L-19-24

This comment requested clarification on the methodologies used to estimate potential sales tax and property tax impacts. The economic analysis was developed through a combination of sources, which include the Taxable Sales Report from the State Board of Equalization, information provided by the Los Angeles County Auditor-Controller's and Tax Collector's Offices, labor force data from the State Employment Development Department, the 2000 Census, and the U.S. Census Bureau, 2002 Economic Census.

Property tax revenue loss was evaluated, using paid property tax data paid for the fiscal year 2008–2009, for each parcel that may be potentially acquired and relocated in the City of

Commerce. This data was provided by the Office of the Los Angeles County Tax Collector. For this analysis, the property tax revenue is the total property tax amount collected by the Los Angeles County Tax Collector for each City before it is distributed to the City and other agencies.

Sales tax revenue loss was evaluated using the average sales tax revenue that was determined by dividing the total taxable sales by the total number of businesses that operate in the City. Then percentage breakdowns were provided applying the sales tax rate for 2014 within the City of Commerce at 9.5 percent, of which 6.5 percent was distributed to the State, 1.5 percent was distributed to the local jurisdictions, and 1.5 percent was distributed to Metro.

Please refer to the revised CIA for a description of the potential sales tax revenue impacts to the City of Commerce.

L-19-25

This comment requests that Caltrans coordinate with the City to develop measures to be incorporated into a Community Benefits Agreement that includes mitigation for disproportionate impacts of potential sales tax and property tax loss to the City (also see Comment L-19-87). Please refer to Response to Comment L-19-24 for a discussion on the loss of sales tax revenue in the City of Commerce. There is no legal requirement for Caltrans to enter in to a Community Benefits Agreement with the City of Commerce or any other affected agency. Mitigation for displacements will be provided in accordance with the Uniform Act, and Caltrans and Metro will continue to work collaboratively with all affected agencies through the I-710 Corridor Project committees and the Gateway Cities COG to implement the project, if a build alternative is selected.

L-19-26

This comment requests specific information on several aspects of the Environmental Justice analysis. Responses to these issues are as follows:

- Calculations for the number of construction jobs generated in the City were derived from the American Road and Transportation Builders Association (ARTBA). ARTBA estimates every $1 billion invested in highways supports 27,823 jobs, including 9,537 on-site construction jobs, 4,324 jobs in supplier industries, and 13,962 jobs throughout the rest of the economy.
- The potential loss of permanent jobs within the City can be found in table 3.3-14 of Section 3.3.2.3 of the RDEIR/SDEIS. Caltrans strives to ensure that displaced businesses will be relocated, pursuant to the Uniform Relocation Assistance and Real

Property Acquisition Policies Act (Uniform Act) of 1970 (Public Law 91-646, 84 Stat. 1894).

- The RDEIR/SDEIS includes mitigation for Caltrans to follow the Uniform Act, which includes every effort to relocate businesses (refer to Mitigation Measure C-1) within the same city as to keep jobs and tax revenues within affected cities. Indirect impacts to communities as a result of the build alternatives are discussed in Section 3.3, Community Impacts, of the RDEIR/SDEIS. It should be noted that the removal of the I-710/Washington Blvd. interchange has been withdrawn from further consideration (as discussed in Section 2.4 of the RDEIR/SDEIS).

L-19-27

The RDEIR/SDEIS includes mitigation for Caltrans to follow the Uniform Act, which includes relocating businesses (refer to Mitigation Measure C-1) within the same city as to keep jobs and tax revenues within affected cities. There is no legal requirement for Caltrans to enter in to a Community Benefits Agreement with the City of Commerce or any other affected agency. Mitigation for displacements will be provided in accordance with the Uniform Act, and Caltrans and Metro will continue to work collaboratively with all affected agencies through the I-710 Corridor Project committees and the Gateway Cities COG to implement the project, if a build alternative is selected.

L-19-28

Section 3.3.2 of the RDEIR/SDEIS has been updated to summarize the revised *Relocation Impact Report*, which accounts for all potential relocations within the Study Area, including the City of Commerce. In addition, the number of residential units and persons that could also be displaced has also been included in Section 3.3.2.3 at the comments request. The average household size is based on the U.S. Census for each city.

L-19-29

The comment requests specific mitigation for impacts related to relocations to the City of Commerce. Please refer to Response to Comment L-19-27 regarding mitigation through the Uniform Act.

L-19-30

Measure CON-TR-1 (Section 3.24.4.5) in the RDEIR/SDEIS requires the preparation and implementation of a TMP. Measure CON-TR-1 identifies key components of the TMP. The complete TMP will be developed during final design and part of that process will be the

coordination of the TMP components, such as ramp and street closures and detours with the applicable local jurisdictions to help reduce traffic impacts in areas near the construction activities. As a result, each local jurisdiction will be provided an opportunity to work with Caltrans and the construction contractor to identify local street and lane closures and detours to minimize the effects of those activities in each community. Also, refer to Response to Comment L-19-17, above.

L-19-31

As noted in Measure CON-TR-1 (Section 3.24.4.5), the purpose of the TMP is to address short-term traffic impacts during construction. As a result, the TMP will address transportation issues (traffic, pedestrian, bicycle, emergency vehicles, rail) at all locations where project-related traffic and the construction areas would impact some or all of those transportation modes. This will include temporary street closures, temporary detours, lane reductions, etc., at locations adjacent to or in the vicinity of the construction limits. The construction staging areas are considered to be within the construction limits and, as a result, construction traffic into/out of staging areas and measures to minimize the effects of that traffic on local traffic will be considered in the TMP. As a result, no changes were made to any measures in response to this comment.

At this point in project development, it would be speculative to identify possible phasing for each of the build alternatives. Upon identification of a preferred alternative, phasing and staging concepts may be advanced to estimate construction duration, identify staging areas, identify required closures, and assess traffic access during construction.

L-19-32

This comment expresses concern about the loss of emergency access under Design Option 3 at the I-710/Washington Blvd. interchange. As discussed above in Response to Comment L-19-9, Design Option 3 has been withdrawn from further consideration.

L-19-33

This comment requests a more detailed analysis of impacts to emergency access in the City of Commerce. Please see Section 3.4.2.1 in the RDEIR/SDEIS for the updated analysis of impacts to emergency access in the City of Commerce based upon the revised design of the build alternatives.

L-19-34

Refer to Response to Comment L-19-17, above, regarding City review of the specific utility relocation areas.

L-19-35

Refer to Response to Comment L-19-17, above, which describes changes made to the RDEIR/SDEIS regarding the relocation of the SCE substation, including the addition of Measure U&ES-2.

L-19-36

The Comprehensive Utility Relocation Study is being prepared as part of the Project Report for the I-710 Corridor Project. The Project Report will be used to direct the final design of a selected project. The final design will reflect the findings and recommendations from the various studies prepared in support of and attached to the Project Report including geotechnical reports, a *Storm Water Data Report*, Initial Site Assessments, a Modified Access Report-Acceptability, Railroad Conceptual Approval, and/or Structure Advanced Planning Studies, as appropriate for a given project. The RDEIR/SDEIS is an attachment to the updated Project Report which is available upon request from Caltrans District 7. The Specific Utility Relocation Studies required in Measure U&ES-2 will address specific issues associated with the relocation of each major utility as a result of the build alternatives. As a result, a separate measure requiring the preparation of the Comprehensive Utility Relocation Study in the RDEIR/SDEIS is not needed.

L-19-37

The regulatory discussion in each subsection in Chapter 3.0, including Section 3.5, is intended to describe existing regulations that specifically address the identified parameters. There are no regulations regarding transit and, therefore, there is no discussion of transit in the regulatory setting sections in Chapter 3.0.

As described at the beginning of Chapter 4.0, California Environmental Quality Act, the proposed project is a joint project by Caltrans and the Federal Highway Administration (FHWA) and is subject to State and Federal environmental review requirements. The project environmental documentation has been prepared in compliance with the California Environmental Quality Act (CEQA) and the National Environmental Policy Act (NEPA). Caltrans is the Lead Agency for the I-710 Corridor Project under CEQA and NEPA. A primary difference between NEPA and CEQA is the way significance is determined. Under NEPA, significance is used to determine whether an EIS or some lower level of documentation will be required. NEPA requires that an EIS be prepared when the proposed Federal action (project) as a whole has the

potential to "significantly affect the quality of the human environment." The determination of significance is based on context and intensity. Some impacts determined to be significant under CEQA may not be of sufficient magnitude to be determined significant under NEPA. Under NEPA, once a decision is made regarding the need for an EIS, it is the magnitude of the impact that is evaluated, and no judgment of its individual significance is deemed important. NEPA does not require that a determination of significant impacts be stated in the environmental documents. For comparison under NEPA, Alternative 1 provides the basis for comparison of 2035 No Build conditions with the 2035 build alternatives.

CEQA requires Caltrans to identify each "significant effect on the environment" resulting from a project and ways to mitigate each significant impact. If the project may have a significant effect on any environmental resource, an EIR must be prepared. Every significant effect on the environment must be disclosed in the EIR and mitigated if feasible. In making determinations of significance under CEQA, the impacts of the build alternatives are analyzed relative to Baseline conditions which, for the I-710 Corridor Project, were the existing conditions in the I-710 Corridor Study Area when the NOP was issued in 2008. However, the revised AQ/GHG/HRA and revised traffic analyses have been updated to include 2012 as their Baseline for analysis. Information in the RDEIR/SDEIS has been updated to reflect these changes.

The analysis of project impacts under CEQA in Chapter 4.0 is based on the CEQA checklist provided in Appendix A. Caltrans has not adopted specific thresholds of significance for determining whether an impact is significant. Instead, the determination of significance is based on the context of the checklist questions.

As a result, no specific thresholds of significance under NEPA are identified in Chapter 3.0 in the RDEIR/SDEIS for the impact categories cited in this comment. However, standards such as level of service (LOS) are included as a guideline for analysis and measurement of impacts in Section 3.5. Assessment of the significance of the project effects under CEQA is provided in Chapter 4.0, based on answers to the questions in the CEQA checklist in Appendix A.

L-19-38

Please refer to Response to Comment L-19-37, above, for discussion regarding comparison of the with-project conditions under CEQA (to the 2008 existing conditions) and NEPA (to the 2035 No Build Alternative).

L-19-39

This comment requests that impacts to bicycle and pedestrians due to increased traffic volumes on arterials be addressed and evaluated against appropriate significance criteria. Please see

Section 3.5.3.1 of the RDEIR/SDEIS for an expanded discussion of impacts to existing pedestrian and bicycle facilities.

L-19-40

The discussion in Section 3.5 of the RDEIR/SDEIS has been revised in response to this comment. The reference to Section 3.5.3.3 (Traffic Accident Data) was in error. The correct reference is Section 3.5.2.1.

L-19-41

This comment requests that the City of Commerce's thresholds of significance be used for intersections in the City of Commerce. The I-710 Corridor Project analysis used the HCM 2000 methodology for impact analysis because this is the preferred methodology for Caltrans environmental impacts. Because Caltrans is the Lead Agency for this project, it was determined that the HCM methodology was the appropriate analysis technique, and the traffic analysis has since been updated to use HCM 2010. While this is inconsistent with the ICU method employed for most of the Gateway City agencies, it is a more detailed method of performing operational analysis.

L-19-42

Please refer to Response to Comment L-19-41, above, regarding the use of City of Commerce significance thresholds for intersection analysis.

L-19-43

This comment on the traffic operations analysis raises a concern regarding its consistency with the 2008 State Highway Congestion Monitoring Program (HICOMP). The I-710 Corridor Project analysis used the HCM 2000 methodology for impact analysis as it is the preferred methodology for Caltrans environmental impacts. Because Caltrans is the Lead Agency for this project, it was determined that the HCM methodology was appropriate analysis technique. While this is inconsistent with the ICU method employed for most of the Gateway City agencies, it is a more detailed method of performing operational analysis. For the updated TOAR, HCM 2010 was used. The RDEIR/SDEIS uses updated 2012-2013 traffic data to inform the analysis of existing year traffic conditions.

L-19-44

Caltrans acknowledges the City of Commerce's comment regarding the traffic forecast model. Updated model data for the alternatives have been prepared for the revised traffic reports and

the 2012 RTP model was used as the basis for projections. An explanation as to why the methodologies and analysis techniques used to analyze traffic operations were selected, as well as their limitations, have been added to the traffic reports.

L-19-45

Based on the updated traffic analysis, a comparison of LOS results between existing conditions and 2035 No Build conditions demonstrates that operations on I-710 are projected to deteriorate if improvements are not implemented to address capacity deficiencies or to amend geometric deficiencies. Tables 3.5-1, 3.5-2, 3.5-3, and 3.5-5 in the RDEIR/SDEIS have been revised based on the updated traffic reports.

L-19-46

Traffic volumes throughout the RDEIR/SDEIS have been revised based on the updated traffic reports. Please refer to Section 3.5 for updates based on the traffic analysis. Any inconsistencies between the traffic volumes have been reconciled in the RDEIR/SDEIS.

L-19-47

The Southern California International Gateway (SCIG) and Intermodal Container Transfer Facility (ICTF) facilities have been added to the revised traffic forecasting and the estimated 2035 traffic volumes on I-710 reflect the influence of these two facilities.

L-19-48

This comment requests more detail on the proposed Transportation Management Plan (TMP). Please refer to Response to Comment L-19-30 above which provides additional detail regarding the TMP.

L-19-49

All tables throughout the RDEIR/SDEIS that contain traffic information have been updated based on the revised traffic reports. In cases where "N/A" is noted, an explanation is provided as to why this information is not available.

L-19-50

Information in Section 3.5 of the RDEIR/SDEIS has been updated based on the revised traffic reports. The information in the tables and text throughout the RDEIR/SDEIS have been cross-checked for consistency.

L-19-51

This comment expresses concerns regarding truck lane capacity. The updated TOAR assumes that in the existing year as well as the future year (2035), about 80 percent of the primary truck trips (i.e., those truck trips with at least one trip end within the Ports) have destinations within 20 miles of the Ports. Approximately 14 percent of these trips are destined to the Inland Empire / Orange County and six percent to elsewhere in the SCAG region (i.e., San Gabriel Valley, north Los Angeles County, Ventura County, and Imperial County). This includes trucks carrying both loaded and unloaded (i.e., empty) containers and non-container cargo, as well as bobtail and chassis trucks. Currently port trucks operate mostly during the day shift (8:00 am to 6:00 pm) and night shift (6:00 pm to 3:00 am). Due to the increase in containerized cargo volume in 2035, approximately 20% of Port container truck movements are expected to occur during the hoot shift (3:00 am to 8:00 am), a substantial increase compared to today's operations. Once transloaded, cargo within domestic containers are carried by truck to other destinations within the SCAG region (warehouses, distribution centers, retail outlets, etc.) or it is carried by truck to intermodal (off-dock) railyards within the region for transport by freight rail. In this case, both truck trip origins and destinations are located outside the Port complex. This is called the transload-secondary market. Transload secondary truck trips are more dispersed compared to the primary container truck trips in that 64 percent of these transload secondary truck trips are destined to an area within 20-miles of the Ports, over 17 percent are headed to the Inland Empire/Orange County; and the remaining 19 percent of the transload-secondary truck trips travel to North Los Angeles County /San Gabriel Valley, Ventura County, and Imperial County.

L-19-52

In the updated TOAR, for on-ramps with an HOV preferential lane, the additional capacity provided by the HOV lane was excluded from the analysis and no discount to accounting for the HOV presence was taken from the projected peak hour volumes, thereby analyzing the worst case scenario.

L-19-53

As requested in this comment, the EIR/EIS has been updated to include more detail regarding the analysis of proposed peak-period parking restrictions (see Section 3.5.3.1 of the RDEIR/SDEIS).

L-19-54

This comment expresses concern about the assumptions made on traffic signal cycle lengths. Universal assumptions were made for signal cycle lengths, such as 100 seconds for arterial intersections and 60 seconds for freeway ramp T-intersections. Additionally, saturation flow studies were not conducted because these assumptions are sufficient for a corridor environmental document which includes 19 miles of freeway and over 180 arterial intersections.

L-19-55

This comment expresses concern about discrepancies between LOS assumptions and existing site conditions. Both the TIAR and TOAR have been revised to reflect updated design and traffic assumptions. Any discrepancies have been resolved between the intersection LOS inputs/assumptions and existing field conditions that were observed and are reflected in the revised traffic reports as well as the RDEIR/SDEIS.

L-19-56

The intersections of Bandini Blvd./Garfield Ave., Telegraph Rd./Garfield Ave., and Atlantic Ave./ Eastern Ave. were not included in the TIAR. Every effort was made to include intersections representative of the existing conditions within the corridor, but not every intersection could be feasibly included. Within the City of Commerce, the arterial intersections of Slauson Ave./Eastern Ave., Garfield Ave./Slauson Ave., Washington Blvd./Atlantic Blvd., Washington Blvd./Eastern Ave., and Garfield Ave./Washington Blvd. were included.

L-19-57

This comment expresses concern about the lack of analysis of impacts to transit service within the City of Commerce due to the proposed local street modifications. Impacts to the transit systems within the Study Area, including impacts to transit service times or changes to existing bus routes, have been added to Section 3.5,Table 3.5-21 of the RDEIR/SDEIS.

L-19-58

This comment on the intersection traffic impact analysis requests additional mitigation at the following intersections:

- Slauson Ave./Eastern Ave.

- Slauson Ave./Garfield Ave.
- Garfield Ave./Gage Ave.

The TIAR has been updated and the proposed mitigation to the referenced intersections is included in Section 3.5.4 of the RDEIR/SDEIS.

L-19-59

The City's request for the Enhanced Condition treatment for soundwalls and freeway edges/berms in the City of Commerce is noted. At this time, Caltrans cannot commit to specific aesthetic features at specific locations along the alignment. However, the following measure was added in Section 3.6.4.1 and Appendix F to ensure that each local jurisdiction is provided an opportunity to review and comment on the proposed aesthetic features on the freeway structures and facilities adjacent to that jurisdiction:

> **VIS-9** **Local Jurisdiction Review.** During final design, Caltrans will review with each local jurisdiction the aesthetic features and treatments proposed to be incorporated in the final facility design for freeway components adjacent to each local jurisdiction, in accordance with the I-710 Corridor Aesthetics Master Plan described in Measure VIS-1.

L-19-60

Although some visually sensitive areas have existing low visual quality, soundwall/berm treatment has been considered in these locations. Please see Response to Comment L-19-59 for more detail on this coordination process.

L-19-61

Refer to Response to Comment L-19-34, above, for discussion of how the utility relocations will be planned and the local jurisdictions included in the coordination meetings for the utility relocations. The relocation of utilities has been taken into consideration in the revised *Visual Impact Assessment* and is summarized in Section 3.6, Visual/Aesthetics.

L-19-62

Caltrans reviewed both the State agency and local agency bridges on the Historic Bridge Inventory as part of the resource identification process. *The Supplemental Historic Property Survey Report* for the RDEIR/SDEIS has been updated to include the local agency bridges from

the California Historic Bridge Inventory that are located in the City of Commerce in Attachment B to the *Historic Property Survey Report*.

L-19-63

The Lead Agency (Caltrans) is responsible for identifying and evaluating properties for historic significance as defined by Section 106 of the National Historic Preservation Act (36 CFR 800 et seq.), the NEPA, and CEQA. Section 106 and NEPA define a "historic property" as a property that is listed on or eligible for listing on the National Register, for which there are four criteria that are applied. CEQA defines a "historical resource" as a resource that is listed in, or determined eligible for the California Register (PRC 5024.1(c)(1-4).

Resources that are included in a local register of historical resources may be presumed to be historically significant per CEQA; however, they must be listed on a "Local Register of Historical Resources" that has been officially designated or recognized as historically significant by a local government pursuant to a local ordinance or resolution, as defined in Section 5020.1(k) of the PRC. Resources may also be presumed to be historically significant per CEQA if they have been included in a historical resource survey; however, the survey must meet the requirements of Section 5024.1(g) of the PRC. This means that the local survey must be included in the State Historic Resources Inventory, the survey and documentation must have been prepared in accordance with State Office of Historic Preservation procedures and requirements, the resources included in the survey must be given significance ratings of Categories 1 through 5 on Department of Parks and Recreation (DPR) 523 Forms, and the survey must have been conducted within the past five years.

Therefore, during the identification phase for this project, Caltrans searched all the cities located adjacent to the project corridor, including the City of Commerce, to determine if any locally significant properties meeting the criteria outlined above were present. Additionally, Caltrans sent letters to the local planning departments to inquire as to whether or not any properties have been identified as the local level, pursuant to CEQA. A letter was sent to Robert Zarrilli, Director on September 30, 2009. Alex Hamilton, Assistant Director of Community Development for the City of Commerce, responded via telephone on October 29, 2009. Mr. Hamilton indicated the City does have criteria for local landmark designation; however, there are no properties listed or designated as historic resources at this time. He indicated that the Citadel and the train station may be on State or Federal lists of significance; however, both properties are at least 0.25 mile from the I-710 Corridor. He also noted that the Hobart Yard rail tower is a known resource outside of Commerce in the vicinity of either Vernon or East Los Angeles; however, that resource is located outside of the I-710 Corridor Project APE.

Therefore, based on the information provided, no additional evaluation of locally significant properties was conducted. Further, it is up to the Lead Agency (Caltrans) to identify properties presumed to be historically significant, pursuant to the PRC; however, it does not require that lead agencies apply local criteria that are inconsistent with the California PRC for identifying properties for the purpose of CEQA. Rather, it requires that properties are evaluated against the criteria for inclusion in the California Register as outlined in PRC 5024.1(c)(1-4). No changes have been made to the RDEIR/SDEIS text in Section 3.7 as a result of this comment.

L-19-64

This comment requests more detail on project phasing. At this point in project development, it would be speculative to identify possible phasing for each of the build alternatives. Upon identification of a preferred alternative, phasing and staging concepts may be advanced to estimate construction duration, identify staging areas, identify required closures, and assess traffic access during construction.

L-19-65

As requested in this comment, the City will have an opportunity to review the *Flood Control Facilities Report* (formerly the Los Angeles River Impact Report).

L-19-66

The revised *Preliminary Hydrology Report* (AECOM, December 2016) addresses the potential effects of the build alternatives related to increased impervious surfaces and storm water runoff to local storm water drainage facilities. The technical studies in support of the RDEIR/SDEIS, including the build alternatives, are listed in Appendix H, List of Technical Studies. Copies of those technical studies will be provided to agencies and other interested parties on request to Caltrans.

L-19-67

During final design, Caltrans will coordinate the selection of final treatment BMPs with the local jurisdictions, including the City of Commerce. This commitment has been added to Mitigation Measure WQ-1 in Section 3.9.4 of the RDEIR/SDEIS.

L-19-68

As required in Measure CON-WQ-1 (Section 3.24.4.9 of the RDEIR/SDEIS), if a build alternative is selected for implementation, Caltrans will require the construction contractor to prepare and implement a Storm Water Pollution Prevention Program (SWPPP) specific to that

alternative. The SWPPP will identify specific BMPs to reduce or eliminate pollutants associated with the construction activities. Those types of construction BMPs are anticipated to include, but not be limited to, Good Housekeeping, Erosion Control, and Sediment Control BMPs. The types of BMPs cited in this comment (erosion prevention and temporary drainage devices, wetting/covering exposed soils, use of soil tackifiers) are the types of construction BMPs typically required by Caltrans. Although at this time, it is not possible to commit to including the specific BMPs cited in this comment in the project SWPPP, Caltrans will require the construction contractor to include those types of BMPs or other BMPs addressing the same impacts in the SWPPP.

L-19-69

As required in Measure GEO-1 (Section 3.10.3), if a build alternative is selected for implementation, Caltrans will prepare a design-level geotechnical report during final design. That report will address the specific design issues cited in this comment related to dewatering, if those conditions are determined to be occur and potentially affect or be affected by the selected alternative. The report will include specific required design features to address the project-related geotechnical issues associated with dewatering, if any.

L-19-70

The potential for short-term vibration impacts during construction, particularly associated with pile driving and the operation of construction equipment, is discussed in 3.24.3.14, Noise, of the RDEIR/SDEIS. Measure CON-N-10 (Section 3.24.4.14) requires alternatives to pile driving such as pre-drilling and cast-in-place to limit vibration generation. Caltrans will conduct pre- and post-construction surveys for all structures within 100 feet of locations where pile driving will occur, and compensation for damage to personal property will be provided where such damage is documented through the abovementioned surveys.

L-19-71

Because the project design is only at a 30-35 percent level of completion, specific depths of excavation for elements of the proposed project are not available at this time. More detailed analysis will be conducted during preparation of the Paleontological Mitigation Plan as outlined in Measure PAL-1, which will be prepared during final design. However, Alternative 7 involves more bridge construction work, mainly due to the separate freight corridor, than Alternative 5C and therefore requires more excavation. Therefore, Alternative 7 has a greater likelihood of impacting paleontological resources than Alternative 5C. Inclusion of the Capistrano Formation was an error and has been removed from the *Paleontological Identification Report/Paleontological Evaluation Report* and the RDEIR/SDEIS.

Text has been added to the *Paleontological Identification Report/Paleontological Evaluation Report* to state that no paleontological resources were identified during the course of the field surveys.

L-19-72

Emission control measures during construction are detailed in Mitigation Measures CON-AQ-1 through CON-AQ-17 in Section 3.24.4.13 of the RDEIR/SDEIS. A wide range of potential NO_x mitigation measures for construction (including those listed on the SCAQMD's website) were reviewed. Caltrans will consider and assess the use of Metro's Green Construction Policy as a potential mitigation measure, as well as any new potential NO_x control measures for construction that may arise before the Final EIR is certified.

L-19-73

Revisions to the AQ/GHG/HRA found that, for PM_{10} Annual Average Concentration, under both Alternatives 5C and 7, census tracts within Commerce are projected to exceed the SCAQMD criteria of 1 µg/m3. With regard to mitigation or enhancements related to air quality and health risk, Mitigation Measure AQ-2, included in the RDEIR/SDEIS (Section 3.13.4), provides for air filtration systems for any schools with 0.50 mile of I-710. In addition, both build alternatives provide for a program o for cities and community groups to apply for and obtain grant funding for health-related measures. The "Air Quality Community Protection Program" suggested in this comment would be a potential candidate for this program.

L-19-74

See Response to Comment L-19-17 regarding an assessment of localized air quality impacts during construction. With regard to mitigation or enhancements related to air quality and health risk, please refer to Response to Comment L-19-73.

L-19-75

In response to the clarification requested in this comment, the correct figures are 50 to 100 meters (AQ/HRA page 49-50) and this has been reconciled and/or updated in the RDEIR/SDEIS. Caltrans is responsible for the significance determinations and consideration of potential mitigation measures, such as those suggested by the City and will coordinate with the City of Commerce regarding these mitigation measures. With regard to mitigation or enhancements related to air quality and health risk, please refer to Response to Comment L-19-73.

L-19-76

This comment requests and analysis of the potential for increased truck queuing on local roadways in the vicinity of the rail yards in the City of Commerce. This comment also requests that if warranted, appropriate mitigation measures, including but not limited to the development of an off-street dedicated truck staging yard and enhanced enforcement of current anti-idling regulations be included in the Final EIR/EIS. Please refer to Response to Comment L-19-73.

L-19-77

To correct the error noted in this comment, the tables and their references have been renumbered in the RDEIR/SDEIS.

L-19-78

The comment requests that the discussion of air quality/global climate change in Chapter 4.0, Section 4.2.4.1, of the RDEIR/SDEIS, include a CEQA 2008 Baseline comparison analysis in addition to the 2035 NEPA Baseline comparison. This comparison to the CEQA Baseline (now 2012) has been added in Section 4.2.4.1 of the RDEIR/SDEIS.

As stated in Section 4.1 of the Draft EIR/EIS, the determinations of significance under CEQA were analyzed relative to Baseline conditions, which were the existing conditions in the I-710 Corridor at the time the NOP was issued in 2008. The comparisons to the NEPA Baseline are included in Chapter 4.0 to demonstrate that the large increase in GHG emissions is due to area growth and not the proposed project alternatives.

L-19-79

The purpose of the GHG measure listed in the comment is to ensure that the new and replacement lighting is energy-efficient. As the project would be reconstructing an existing facility, the majority of the lighting would be replacing existing inefficient lighting. Therefore, the overall energy consumption would be reduced below or remain similar to the existing conditions.

L-19-80

The discrepancies in the AQ/HRA technical report and Chapter 4.0 of the Draft EIR/EIS, as specified in the comment, have been corrected and updated in the RDEIR/SDEIS.

L-19-81

The Caltrans NSR qualitatively addresses temporary noise impacts during the construction phase of the project. This section in the NSR also addresses the potential abatement measures during the construction period. At this stage of the project, however, details are not known about the equipment that will be used for construction. However, the contractor must abide by all State, federal, and local construction noise and vibration regulations per contract. Caltrans requires contractors to prepare a noise control plan prior to beginning construction on large projects such as this one. This plan would identify not only the potential construction noise impacts, but the potential abatement measures as well. Additionally, Caltrans does have construction noise regulation which states that construction noise emanating from construction equipment/operation cannot exceed 86 dBA – L_{max} at 50 feet.

With regard to mitigation or enhancements related to noise, the proposed project also includes a Community Health Benefits Grant Program, which can be used to fund different types of improvements. The "Noise Community Protection Plan" suggested in this comment would be a potential candidate for this mitigation program.

L-19-82

The following statement has been added to Section 3.15.3.1 in the RDEIR/SDEIS regarding energy consumption related to lighting and traffic signals: "While the energy used by roadway lighting and traffic signals is very small compared to the energy used by the vehicles operating on the project roadway, it is expected that the project will place energy efficient lighting fixtures for roadway lighting. These lighting fixtures improvements will reduce the energy used by the project."

L-19-83

Focused surveys were conducted in 2015 for areas not previously surveyed as part of the revised *Natural Environment Study* and are included in the RDEIR/SDEIS.

L-19-84

Focused surveys were conducted in 2015 for areas not previously surveyed as part of the revised *Natural Environment Study* and are included in the RDEIR/SDEIS. Additionally, it is anticipated that surveys will be repeated prior to initiation of construction. Therefore, mitigation measures included in Section 3.24.4.18 of the RDEIR/SDEIS are included to conduct assessments for burrowing owl and bat surveys prior to construction. In addition, measures are included to avoid and/or minimize project effects to burrowing owls or bats if found during those surveys. The RDEIR/SDEIS includes these measures in Section 3.24.4.18 and Appendix F.

L-19-85

This measure is already included in Section 3.24.4.19 of the RDEIR/SDEIS. All other necessary pre-construction surveys have already been included as indicated in Response to Comment L-19-84.

L-19-86

Measure CON-TR-1 (Section 3.24.4.5 in the RDEIR/SDEIS) requires the preparation and implementation of a TMP during project construction. Measure CON-U&ES-1 cross-references the TMP in Measure CON-TR-1 but does not itself require the preparation of the TMP. Refer to Response to Comment L-19-31, above, which explains that the TMP will address transportation issues (traffic, pedestrian, bicycle, emergency vehicles, rail) at all locations where project-related traffic and the construction areas would impact some or all of those transportation modes, including construction staging areas.

L-19-87

This comment requests Caltrans to enter into a Community Benefits Agreement with the City of Commerce. With regard to the various mitigation measures or enhancements described in this comment, a Community Health and Benefit Program is included in Section 2.3.2.1 of the RDEIR/SDEIS and provides for a program for cities and community groups to apply for and obtain grant funding for health-related measures. The various mitigation measures or enhancements suggested in this comment would be potential candidates for this programmatic element.

L-19-88

As requested in this comment, Caltrans will coordinate with the City of Commerce regarding implementation of a storage or staging yard for short-term truck parking for those trucks accessing the BNSF or UP rail yards.

L-19-89

Caltrans will coordinate with the City of Commerce regarding the establishment of funds to assist the City with the maintenance of roadways adjacent to I-710.

L-19-90

The trucks that are travelling on the local streets in the City of Commerce are not there because of I-710, but because of the various land uses in the City; therefore, there is not a direct project

impact resulting from the I-710 Corridor Project. However, the various mitigation measures or enhancements described in this comment would be potential candidates for the community mitigation program included in the RDEIR/SDEIS (Section 3.13.4).

L-19-91

Caltrans will coordinate with the City of Commerce regarding the establishment of a Noise Community Protection Plan to avoid, minimize, and/or mitigate construction-related noise impacts. Please see Response to Comment L-19-81.

L-19-92

Temporary impacts to park patrons are discussed in Section 3.24.3.1 and avoidance, minimization, and mitigation measures for impacts to parks and recreation facilities have been added to Section 3.24.4.1. Caltrans will coordinate with the City of Commerce regarding the provision of funds for improvements to other area parks and recreational amenities. With regard to the various mitigation measures or enhancements described in this comment, a Community Health and Benefit Program is included in Section 2.3.2.1 of the RDEIR/SDEIS and provides for a program for cities and community groups to apply for and obtain grant funding for health-related measures. The various mitigation measures or enhancements suggested in this comment would be potential candidates for this programmatic element.

L-19-93

The following measure was added in Section 3.6.4.1 and Appendix F in the RDEIR/SDEIS to address potential issues associated with graffiti on facility structures and features:

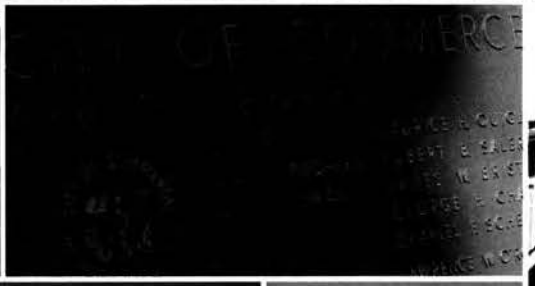
> **"VIS-12** **Graffiti Reduction, Removal, and Control.** During final design, Caltrans will include planting plans for vine planting on sound barriers and other vertical structures, planting plans for trees and shrubs in State right of way adjacent to south barriers and other vertical structures, and the use of decorative/surface treatments on sound barriers and other vertical structures in the I-710 Corridor Master Plan, to reduce the potential for graffiti and to soften the appearance of those walls, consistent with the *Highway Design Manual*, Index 902.3(5).
>
> After the construction of each sound barrier or vertical structure where vine planting is shown in the project specifications, Caltrans will require the construction contractor to install the vine planting

consistent with the project specifications and the planting requirements in the I-710 Corridor Master Plan.

Caltrans has an existing ongoing maintenance program for the control and removal of graffiti from structures and facilities within the State right of way for State highways. That program would apply to all new and modified structures in the I-710 Corridor Project build alternatives. The Caltrans program for the control and removal of graffiti is described in Chapter D1, Litter, Debris, and Graffiti (July 2006), in the Caltrans *Maintenance Manual*, Volume I (January 2011). Key program components applicable to the project features in the I-710 Corridor Project build alternatives include:

- Use of recycled paint for various structures and matching paint used to cover graffiti with the original paint color on the structure.
- Use of physical devices such as rat guards, sign hoods, razor wire, and glare screen patches to limit access to facilities targeted by taggers.
- Replacement of ground-mounted signs with signs that have protective coatings or application of protective coatings to signs.

Many local jurisdictions along the alignment of I-710 also have graffiti abatement and control programs in their Municipal Codes or other City or County requirements. Those programs apply throughout those jurisdictions and may apply to structures on public and private property. Methods used by local agencies for the removal of graffiti include power washing, gel removers, and painting."



Similar to existing conditions, Caltrans will be responsible for graffiti abatement and control on freeway facilities and structures within the State right-of-way and the local jurisdictions will be responsible for graffiti abatement and control in other public rights-of-way and on private property, consistent with each local jurisdiction's Municipal Code or other local requirements. At this time, Caltrans is not proposing the establishment of a funding program for the abatement and control of graffiti outside the State right-of-way.

THE MODEL CITY

CITY OF COMMERCE

2014-2021 Housing Element

Prepared for
City of Commerce

July 22, 2013

Alex Hamilton
Assistant Director of Community Development
City of Commerce
2535 Commerce Way
Commerce, CA 90040

Dear Mr. Hamilton:

RE: City of Commerce's 5th Cycle (2013-2021) Draft Housing Element Update

Thank you for submitting the City of Commerce's draft housing element update received for review on May 23, 2013, along with additional revisions received on July 11, 2013. Pursuant to Government Code (GC) Section 65585(b), the Department is reporting the results of the review. A telephone conversation with Sarah Walker and Alexa Washburn, the City consultants, facilitated the review.

While the draft element was found to meet the statutory requirements of State housing element law based on, among other things, Program 3.1 to complete zoning for the "Housing Opportunity Overlay Zone" to facilitate multifamily and mixed-use by-right development at minimum densities of 20 units per acre within an area totaling 24.5 acres, the Department cannot yet find the element in full compliance. This is because Commerce still needs to amend its zoning ordinance to permit year-round emergency shelter(s) without discretionary action pursuant to GC Section 65583(a)(4)(A), amended by Senate Bill 2 (Chapter 633, Statutes of 2007). Program 5.2, identified in the previous element, committed to amend the zoning ordinance to permit emergency shelters without discretionary action within one year of the adoption of the 4th cycle housing element. As noted in the current element on page 90, Program 5.2 has not been implemented.

The element will fully comply with State housing element law once the City has completed the required zoning amendment and submits the adopted element to the Department pursuant to GC Section 65585(g). To remain on an eight year planning cycle, pursuant to Senate Bill 375 (Chapter 728, Statutes of 2008), Commerce must adopt its housing element within 120 calendar days from the statutory due date of October 15, 2013 for SCAG localities. If adopted after this date, Commerce will be required to revise the housing element every four years until adopting at least two consecutive revisions by the statutory deadline (GC Section 65588(e)(4)). For additional information on housing element adoption requirements, please visit the Department's website at: http://www.hcd.ca.gov/hpd/hrc/plan/he/he_review_adoptionsteps110812.pdf.

Public Participation in the development, adoption and implementation of the housing element is essential to effective housing planning. Throughout the housing element process, the City should continue to engage the community, including organizations that represent lower-income and special needs households, by making information regularly available and considering and incorporating comments where appropriate.

The Department appreciates the hard work and dedication of Sarah Walker and Alexa Washburn in preparation of the housing element and looks forward to receiving Commerce's adopted housing element. If you have any questions or need additional technical assistance, please contact James Johnson, of our staff, at (916) 263-7426.

Sincerely,

Glen A. Campora

CITY OF COMMERCE
CALIFORNIA
INCORPORATED JANUARY 28, 1960

1. INTRODUCTION

1.1 - OVERVIEW OF HOUSING IN COMMERCE

The City of Commerce is a unique jurisdiction that presents both opportunities and barriers to affordable housing. Incorporated in 1960, the City is located six miles east of downtown Los Angeles and bordered by Bell, Bell Gardens, Downey, East Los Angeles, Montebello and Vernon. Commerce is home to 3,377 families and 1,800 businesses. The City's mix of residential areas, retail stores, business parks, manufacturing, and entertainment venues allows the city to provide high quality services for City residents while maintaining a pro-business climate. The City is primarily made up of industrial uses (more than 60% of Commerce's total land area is industrial), which presents challenges to both the identification of new sites for development and the maintenance of existing residential neighborhoods. A major challenge for the City since its incorporation has been the coexistence of industry near and among the area's existing residential neighborhoods.

Many of the original housing units constructed in the City were developed in the 1960's as work force housing for employees working at the various companies located in the City. Developed as separate communities, identified with specific names, residential areas in Commerce are islands surrounded on at least two sides by commercial and industrial uses creating a unique set of issues and opportunities. Following the City's incorporation the Commerce Community Development Commission was very active in its efforts to implement a residential relocation program to move households from older industrial districts to newer residential neighborhoods. Through these efforts, the Commission was able to relocate residents living in older households in the midst of industrial areas to homes in newly established residential neighborhoods. The older, often substandard units were then demolished and the land was then used for industrial expansion. Over time, these and similar programs have eliminated many of the land use conflicts in the City.

In addition to relocating housing units, Commerce has also aggressively established programs focused on upgrading substandard housing and replacing dilapidated units. These programs will continue to ensure that existing and future residents of the city are provided safe, sound, and decent housing. The city has also been active in promoting the redevelopment of its aging and obsolete industrial plants. Increased competition from industries abroad has had a significant impact on domestic industry, in general, and on the industrial base in the city of Commerce and neighboring cities, in particular. The City has attempted to meet this challenge through the construction of new modern business parks. New challenges that may be encountered by Commerce in the opening years of the 21st Century will be perceived as opportunities rather than as obstacles.

The unique aspects of the City that require consideration in the formulation of land use and housing policy include the following:

- The general nature and location of land uses has changed very little since the City incorporated. As such, Commerce was, and remains, predominantly industrial, providing employment for tens of thousands of persons living throughout the Los Angeles region.
- The potential for adverse land use conflicts has been lessened through past planning efforts that recognized the need to provide adequate buffers between dissimilar uses; however the introduction of new residential projects will always require an adequate assessment of on-site and surrounding land uses. In some instances there may be a need to conduct a soil analysis or other additional studies to ensure that the site is appropriate and safe for mixed use and residential development, particularly if the previous use was industrial.
- Similarly, very little vacant land remains in the City meaning that in most instances future development will involve the recycling of land that was previously occupied by older businesses or homes. While the transition from lower density residential to higher density residential may be appropriate, the transition from commercial or industrial uses to new residential may require additional abatement and mitigation to ensure the site is appropriate for housing.
- Additionally, many of the city's industries produce and store hazardous materials. The policies contained in the General Plan Community Development Element, and those included in other elements, call for residential properties to be protected from the hazards and health risks associated with industrial development.
- To accommodate the volume of commuters traveling throughout Commerce and the region, two heavily utilized freeways, Interstate 5 and Interstate 710 dissect the City. While freeways provide key access to Commerce and the greater area, they also are known to create air quality and noise impacts. Historically, the City has also had to address proposed freeway expansions that resulted in the removal of housing units and that located freeways in closer proximity to residential homes. Generally, it is not recommended for housing to be within 500 feet of a freeway to avoid health impacts for long term residents.
- The industrial land uses that surround the City's residential neighborhoods also generate significant amounts of truck traffic. During a typical weekday, the City's arterial roadways located near the residential areas (Eastern Avenue, Washington Boulevard, and Atlantic Boulevard) all experience significant truck traffic volumes almost four times the national average resulting in attendant noise and air quality impacts. As a means to protect the City's neighborhoods from the intrusion of truck traffic, regulations defining truck routes and prohibitions of on-street truck parking have been implemented. Railroads are also a critical component of the industrial districts of Commerce. Major rail yards are found in close proximity to several residential neighborhoods which also present unique challenges to the community. Several years ago, a derailment destroyed and damaged a number of homes in the Ferguson neighborhood. The City has been very proactive in petitioning the Federal Government to ensure that rail operations are conducted in a safe manner.
- In many of the City's neighborhoods, older industrial uses were located in close proximity to homes. Over the past several decades, the City has undertaken programs to acquire older lots in order to eliminate land use conflicts. Much of the infill housing constructed in the past several decades was developed in this fashion. Notable examples of these efforts include the Village development in the Rosewood Neighborhood, the Vista del Rio development in the Southeast neighborhood, and the more recent infill developments in the Northwest neighborhood.

To address these potential concerns, the City of Commerce has carefully studied the existing land uses and identified the Housing Opportunity Overlay area within the General Plan as an appropriate area to

accommodate future housing. The Housing Opportunity overlay area is the ideal location for the development of new housing including market rate and affordable units as stand-alone projects or incorporated into mixed use development. The overlay is intended to locate employment opportunities, dining, shopping, neighborhood services, and residential uses in close proximity of one another thereby reducing vehicle trips and encouraging walkability. The overlay area is ideal for the development of affordable units for residents that may need access to services, as it is close to existing residential development, City Hall, the City's transit center, the library, Rosewood Park, the City of Commerce Employment Center, the City of Commerce Aquatorium, and numerous commercial businesses. The potential constraints of housing development within the Overlay area and the City in general are further discussed in the Housing Constraints analysis.

1.2 - A History of Affordable Housing

Despite the industrial nature of the City, Commerce has historically been successful in providing affordable housing for very low-, low- and moderate-income households that is compliant with the existing zoning and General Plan land use designations. The City of Commerce, like many cities in Los Angeles County, faces the challenge of limited vacant land, which requires creative development on infill lots that may be smaller than the State's ideal site size of 5 to 10 acres. Commerce, however, through its partnerships with affordable housing developers, like TELACU and Mayans Development has produced projects on small infill lots, that through density bonuses and development incentives, meet the State's default density in order to provide a variety of affordable housing options throughout the City.

Since 1980, the City of Commerce has shown a strong commitment towards providing housing assistance to its low-income population. Over 300 units of affordable housing have been developed in Commerce in the last three decades. In the City there is a mix of both single family and multi-family housing as well as both rental and homeownership properties. There are currently three federally assisted multifamily rental complexes in Commerce with affordability covenants including: 94 units at the Rosewood Park Senior Apartments, 24 units at TELACU Gardens and 76 units at TELACU Manor. The City's most recent senior project, TELACU Manor, is a Section 202 project consisting of 76 units of rental housing for lower income seniors, developed in 1992.

In addition to the three multifamily rental projects identified, the City has worked with Mayans Development to construct affordable single-family residential developments on infill properties. Three developments known as Lanto/Pacific, Los Jardines and Jardines de Bristow have been constructed or acquired through joint developer-City efforts. The three developments contain a total of 18 single-family homes that were sold to low-income families with first time home buyer or developer price reduction assistance. Currently, all of the units are occupied by the original owners who purchased the homes. The City intends to monitor the units to ensure that if a resident vacates their home, that the City can make every effort possible to resell the unit to a new low-income qualified family.

The City of Commerce also has a number of ownership units with deed restrictions, many of which have utilized City rehabilitation programs or were rehabilitated through partnerships with local non-profits (i.e. Habitat for Humanity) in exchange for long term affordability covenants. There are at least 13 properties with affordability covenants that extend to 2023 and beyond. The majority of the housing units were assisted through the City's First Time Homebuyer Program, with two properties recently assisted through the Substantial Rehabilitation Program. The City of Commerce recognizes that their existing

affordable housing stock is a valuable resource that should be conserved, and if necessary, improved to meet habitability standards. To achieve this, the City has established a housing conservation program to monitor the continued participation of these projects that participate in the HUD Section 221 and Section 8 programs.

1.3 - PURPOSE & AUTHORITY OF ELEMENT

The City of Commerce first initiated a comprehensive general plan update, including an update of the Housing Element, in the mid-1980s. This earlier Element was subsequently updated and adopted in January 2008 pursuant to the required updates by the California Department of Housing and Community Development (HCD). Subsequently, the City updated their Housing Element again for the 2008-2014 planning period, achieving certification in April 2010.

The current Housing Element builds upon the previous elements by updating technical information and assessing the City's progress in implementing its earlier housing goals, objectives, and programs. In addition, the current Element outlines those strategies and programs that will enable the City to meet its current Regional Housing Needs Assessment (RHNA). Finally, the document serves as a critical link between housing policy and the long-range land use plan that calls for continued infill housing development as well as new opportunities for housing in areas that were previously developed as commercial or industrial uses.

Within the past several decades, the State Legislature has focused increased attention on housing-related issues in California. The State's growing population, particularly in the heavily-urbanized areas of Los Angeles County, has placed increased demands on both the existing and new housing stock. In recognition of the need for all persons to have sound, safe, and affordable housing, the State has established definitive guidelines for housing elements. The City of Commerce Housing Element fulfills the State's housing element requirements. The Element includes a technical background component identifying housing and population demographics, a housing plan with identified quantified objectives outlining the City's goals for the future and a progress report evaluating the City's past housing accomplishments.

The State Legislature understands the importance of local housing elements in implementing statewide goals for providing decent and suitable housing for all persons. The legislature also recognizes the importance of providing affordable housing to households with low- or moderate- incomes. State law makes it clear that the provision of affordable housing is the responsibility of all local governments, and using vested powers, local governments should make a conscious effort to see that there are housing opportunities for all income groups. The intent of the state housing element requirements is based on the following concerns (Section 65581):

- Local governments should recognize their responsibilities in contributing to the attainment of the State's housing goals.
- Cities and counties should prepare and implement housing elements that are coordinated with state and federal efforts in achieving the state's housing goal.
- Each local jurisdiction should participate in determining the necessary efforts required to attain the State's housing goals.

- Each local government must cooperate with other local governments to address regional housing needs.

It is evident from review of the City's historic efforts in promoting new housing, especially infill housing, that Commerce is committed to accommodating its housing need. In addition, the City has been an active participant in the regional planning efforts undertaken as a member of the Gateway Cities Council of Government and the Southern California Association of Governments (SCAG).

1.4 - SCOPE & CONTENT OF ELEMENT

State law contains very specific information concerning the content and effect of programs identified to implement the housing element. The state's housing element requirements are summarized in **Table 1-1**.

Table 1-1:
State Housing Element Requirements

Issues Requiring Analysis	Gov. Code Section	Reference in Housing Element
Analysis of employment trends.	Section 65583.a	Chapter 4, Community Profile
Projection and quantification of existing and projected housing needs for all income groups.	Section 65583.a	Chapter 4, Community Profile
Analysis and documentation of the City's housing characteristics, including cost for housing compared to ability to pay, overcrowding, and housing condition.	Section 65583.a	Chapter 4, Community Profile
An inventory of land suitable for residential development, including vacant sites and sites having redevelopment potential.	Section 65583.a	Chapter 5, Housing Resources
Analysis of existing and potential governmental constraints upon the maintenance, improvement or development of housing for all income levels.	Section 65583.a	Chapter 4, Community Profile
Analysis of existing and potential non-governmental (private sector) constraints upon maintenance, improvement or development of housing for all income levels.	Section 65583.a	Chapter 4, Community Profile
Analysis concerning the needs of the homeless.	Section 65583.a	Chapter 4, Community Profile
Analysis of special housing needs: handicapped, elderly, large families, farm workers, and female-headed households.	Section 65583.a	Chapter 4, Community Profile
Analysis of opportunities for energy conservation with respect to residential development.	Section 65583.a	Chapter 4, Community Profile

Issues Requiring Analysis	Gov. Code Section	Reference in Housing Element
Identification of Publicly-Assisted Housing Developments.	Section 65583.a	Chapter 4, Community Profile
Identification of Units at Risk of Conversion to Market Rate Housing.	Section 65583.a	Chapter 4, Community Profile
Identification of the City's goal relative to the maintenance, improvement, and development of housing.	Section 65583.a	Chapter 2, Housing Plan
Analysis of quantified objectives and policies relative to the maintenance, improvement, and development of housing.	Section 65583.b	Chapter 3, Quantified Objectives
Identification of adequate sites that will be made available through appropriate action with required public services and facilities for a variety of housing types for all income levels.	Section 65583.c(1)	Chapter 5, Housing Resources
Identification of strategies to assist in the development of adequate housing to meet the needs of low and moderate-income households.	Section 65583.c(2)	Chapter 2, Housing Plan
Identification of governmental constraints to the maintenance, improvement, and development of housing in Commerce.	Section 65583.c(3)	Chapter 4, Community Profile
Strategies to conserve and improve the condition of the existing affordable housing stock.	Section 65583.c(4)	Chapter 2, Housing Plan
Strategies to promote equal access to housing for all groups.	Section 65583.c(5)	Chapter 2, Housing Plan
Strategies to preserve the existing low-income housing stock.	Section 65583.c(6)	Chapter 2, Housing Plan
Description of the Public Participation Program in the formulation of Housing Element Goals, Policies, and Programs.	Section 65583.d	Chapter 1, Introduction
Description of the Regional Housing Needs Assessment (RHNA) prepared by the Southern California Association of Governments.	Section 65583.e	Chapter 4, Community Profile
Review of the effectiveness of the past Element, including the City's accomplishments during the previous planning period.	Section 65583.f	Chapter 6, Progress Report

1.5 - PUBLIC PARTICIPATION

California Government Code requires that local governments make a diligent effort to achieve public participation from all economic segments of the community in the development of the housing element. In the preparation of the Housing Element Update, a number of organizations and agencies that provide housing, or housing related services, were contacted. Stakeholder groups that have been identified as influential to the development of housing and the provision of services in the community are:

- Commerce Industrial Council
- Salvation Army Bell Homeless Shelter
- Fair Housing Foundation
- L.A. County Public Social Services
- Eastern Los Angeles Regional Center
- Esperanza Community Housing Corporation
- Legal Aid Foundation of LA
- WLCAC Homeless Access Center
- Shelter Partnership
- Housing Authority of LA County
- Su Casa Family Support Center
- Habitat for Humanity
- Abode Communities
- National CORE
- TELACU Development Corporation
- LINC Housing

The City held one workshop meetings prior to the submittal of this Housing Element draft to HCD for an initial review. This initial meeting with the Planning Commission took place on April 24, 2013 and was intended to provide Commissioners and the public with general information regarding the Housing Element (i.e. contents, process and information on the RHNA). A second workshop with the City Council occurred on June 4, 2013 and was streamlined to focus on Housing Element content and next steps for the update process. For both meetings the Housing Element workshop was noticed on the City's website, at City Hall, and in other public places such as the Bristow Library. Stakeholder groups were also identified and a flyer and letter invitation to the meetings was distributed several weeks before the first workshop. Informational materials for the public workshops are presented in Appendix A.

Present at the meeting were stakeholder groups specifically a representative from Southern California Rehabilitation Services, Inc. who represents the developmentally disabled in the community. Despite the City's efforts to engage the public, no public comments were made at Planning Commission meeting regarding the Housing Element. The Planning Commissioners did have questions regarding the changes in planning period length from 4 years to 8 years consistent with SB 375, clarification on SB2, and requested additional information on the RHNA allocation process.

On July 22, 2013, the State Department of Housing and Community Development issued confirmation that the Housing Element was found to be in compliance with State law. The City held another workshop with the Planning Commission on October 23, 2013 to review the final draft.

On **Month, day, year**, the Planning Commission recommended adoption of the Housing Element to City Council and on **Month, day, year**, the Housing Element was presented to the City for adoption. These meetings were noticed and open for public comment on the final Housing Element draft. After adoption, the final Housing Element was sent to the State Department of Housing and Community Development (HCD) for final State certification.

1.6 – INCORPORATION IN THE GENERAL PLAN

The Elements that comprise the Commerce General Plan are required by State law to be internally consistent. Together these Elements provide the framework for the development of facilities, services, and land uses necessary to address the needs and desires of the City's residents. To ensure that these needs are clearly addressed throughout the General Plan, the Elements must be interrelated and interdependent.

This Housing Element is most directly related to the Community Development Element, since it is the Community Development Element that designates the location and extent of residential development throughout the City. With regard to the other General Plan Elements, the following findings of conformity may be made:

- This Housing Element promotes the development of new housing in certain areas where housing does not presently exist. New housing is encouraged in the Housing Opportunity Overlay area as is consistent with the General Plan Land Use Element. This Element does not involve any land use recommendations that are inconsistent with the Community Development Element or with the other General Plan Elements.
- This Housing Element will not change the land use and/or development standards included in the Community Development Element, however a program has been recommended in the Housing Plan that allows for lot consolidation and flexibility in development standards in order to encourage infill development.
- This Housing Element does not promote or propose any land use changes requiring the instillation of any new streets or infrastructure not already anticipated in the General Plan.
- The focus of this Housing Element is to identify strategies that will be effective in conserving existing housing, while at the same time, to investigate opportunities to accommodate new infill residential development.
- Finally, this Housing Element updates important background information used in the evaluation and/or formulation of housing policy.

1.7 - FORMAT OF THE HOUSING ELEMENT

The City of Commerce Housing Element consists of six sections that together fulfill the State's housing element requirements. These sections are organized in a manner that will facilitate future updating in accordance with State law and to ensure conformity among the various elements. The Housing Element consists of the following components:

1. An **Introduction**, providing information on the Housing Element document and the City of Commerce.
2. A **Housing Plan** that addresses Commerce's identified housing needs, including housing goals, policies and programs.
3. A **Quantified Objectives** analysis to estimate the City's realistic accomplishments that will be achieved from 2014-2021.
4. A **Community Profile** providing an analysis of the City's population, an evaluation of housing need and an examination of governmental and non-governmental constraints.
5. Identification of **Housing Resources** available to encourage and facilitate housing development including the preparation of an inventory of potential housing sites in the community.
6. A **Progress Report**, proving an assessment of past housing element accomplishments.

CITY OF COMMERCE
CALIFORNIA
INCORPORATED JANUARY 28, 1960

2. HOUSING PLAN

2.1 - ISSUES & OPPORTUNITIES

Virtually all of the land area within Commerce's corporate boundaries was developed prior to the City's incorporation in 1960. Over the years, the lack of available land has presented unique challenges to the City's efforts to provide housing for its growing population. Innovative redevelopment projects and housing rehabilitation programs have led to significant improvements in both the quantity and quality of available housing. However, the average household size has held steady, placing increased pressure on the existing housing stock. Key issues related to housing that are the focus of this Housing Element are described below.

- Nearly 99% of the City of Commerce's residents live in the eleven well-defined neighborhoods that are scattered throughout the City. Most housing units in these neighborhoods were constructed before 1960, although in general the housing stock is in good condition.
- The City's distinct neighborhoods are surrounded by industrial and commercial uses leaving them impacted by the related truck traffic, freeway noise, air quality issues, and environmental justice concerns. New residential development must be strategically located and the proper environmental analyzes completed before construction occurs.
- The average household size has increased due to trends toward larger families. In 1990, the U.S. Census reported that the City's average household size was 3.7 persons. By 2000, the average household size had increased to 3.8 persons. In 2010, the average household size remained the same, at approximately 3.77 persons per household, as reported in population estimates based on the American Community Survey.
- There has been an increase in the number and percentage of elderly residents (over 65) in the City. The City's population as a whole has aged, although the median age (32.7 years) remains lower than the county median (34.8 years). Over time, the City's population (as defined by median age) will continue to increase, reflecting national trends.
- A significant number of households in Commerce are overcrowded, and the garages of some homes have been illegally converted into living quarters. The City estimates that approximately 10% of the City's housing stock may be considered for participation in rehabilitation programs.
- While housing costs in Commerce are relatively low in comparison to the region, there are a significant number of households overpaying for housing due to the lower incomes of Commerce households.
- In 2010, the City's housing inventory included 3,388 housing units. Of this total, 2,595 units (77%) are classified as single-family, 246 units (7%) are in structures containing between 2 to 4 units, and 547 units (16.0%) are located in multiple-family developments containing five or more units.

2.2 – HOUSING GOALS

For the City of Commerce the enduring objective is to facilitate and encourage housing that fulfills the diverse needs of the community. To achieve this goal the Housing Plan identifies long-term housing goals and shorter-term policies to address the identified housing needs. The goals and policies are then implemented through a series of housing programs. Programs identify specific actions the City plans to undertake toward achieving each goal and policy.

The goals, policies, and programs within the Housing Plan build upon the identified housing needs in the community, constraints confronting the City, and resources available to address the housing needs. This Plan will guide City housing policy through the 2014-2021 planning period. Commerce's housing goals, policies, and programs address the following five major areas:

1. Conservation of the City's existing housing stock;
2. Increased opportunities for affordable housing;
3. Removal of constraints to the construction of affordable housing;
4. Equal housing opportunity; and
5. Identification of adequate sites to achieve a variety and diversity of housing.

Goal 1: Conserve and enhance the quality of existing housing and residential neighborhoods in Commerce.

Continued maintenance and preservation of the existing housing stock in Commerce is crucial to ensure quality neighborhoods. Housing programs focused on the achievement of this goal include rehabilitation of single- and multi-family housing units, code enforcement, and efforts to preserve assisted housing units at risk of converting to market-rate housing. Through code enforcement, neighborhood, and home improvement programs, the City is able to maintain the condition of existing housing units.

Policy 1.1: Continue to promote, maintain, and enhance the character and identity of the City's residential neighborhoods through adequate code enforcement.

Policy 1.2: Provide financial assistance, when available, to rehabilitate dwelling units owned or occupied by seniors and low-income individuals.

Policy 1.3: Encourage property owners to rehabilitate substandard residential units and maintain their properties to the greatest extent possible.

Policy 1.4: Promote increased awareness among property owners and residents of the importance of property maintenance to long-term affordable housing.

Policy 1.5: Design new higher-density residential projects at a scale (number of units, height, etc.) that is compatible in design with adjacent residential areas.

Policy 1.6: Cooperate with non-profit housing providers in the acquisition, rehabilitation, and maintenance of older apartment complexes, single-family houses and hotel/motels to be preserved as long-term affordable housing.

Policy 1.7: Continue to monitor affordable housing developments, second units, and vacant units within the City, and work to preserve existing affordable housing in the City that is considered at risk of converting to market-level rents.

Programs

Program 1.1 - Code Enforcement

The objective of the City's Code Enforcement Program is to bring substandard units into compliance with City codes. Potential code violations are identified based on exterior windshield surveys and complaints reported to the City. The City's code enforcement officers work closely with Housing Division and Planning Division staff, as well as property owners, to identify units in need of housing assistance. To address the continuing problem of illegal units and garage conversions, code enforcement officers survey the City to identify such units. They then notify the property owner that they are in violation of City law, and enforce the necessary actions required to bring properties into compliance with City Codes. These

efforts are intended to improve the condition of housing units and maintain neighborhood character throughout the City.

When appropriate, code enforcement officers provide property owners notice of any rehabilitation loans or grants for which they may be eligible to assist in correcting code violations. Eligible residents are typically referred to the Substantial Housing Rehabilitation Program (Program 1.2), the Environmental Rehabilitation Program (Program 1.3), the Neighborhood Fix-Up Grant (Program 1.4), and the CDBG Home Preservation Grant Program (Program 1.5).

- ***Timing of Implementation:*** *Ongoing, 2014-2021*
- ***Implementation Responsibility:*** *Community Development Department*
- ***Funding Source:*** *General Fund*
- ***Objectives:*** *To maintain and improve the condition of the City's existing housing stock and promote the use of established City programs for rehabilitation and revitalization of housing units in the City. Corrections will be addressed on a case by case basis.*

Program 1.2 – Substantial Housing Rehabilitation Loan Program

The Substantial Housing Rehabilitation Program was established by the former Commerce Community Development Commission[1] in 2004. This program provides deferred loans of up to $100,000 for the rehabilitation of owner-occupied single-family homes. Generally, the Substantial Housing Rehabilitation Loan Program offers residents the opportunity to work with a general contractor to complete substantial improvements to their home. Repairs that may be financed under this program include improvements designed to remedy health and safety code violations, building code violations, and general repairs. This program facilitates funding for the substantial rehabilitation of qualifying units that will then be purchased or rented at affordable prices under long term affordability covenants. This program is often applied in conjunction with the First Time Homebuyer Program, when funds are available.

During the 2008-2014 planning period, the elimination of the Commerce Community Development Commission resulted in the loss of a permanent funding source for this program. For the 2014-2021 planning period the City will investigate new funding opportunities and administer funds as they become available. If and when a permanent funding source is identified, the City will provide information about the program at City Hall, on the City's website and in other public places to increase awareness and solicit applications.

- ***Timing of Implementation:*** *Ongoing, 2014-2021*
- ***Implementation Responsibility:*** *Housing Division*
- ***Funding Source:*** *General Fund; Additional funding sources needed.*

[1] The Commerce Community Development Commission previously functioned as the City of Commerce's redevelopment agency. Pursuant to AB 1x26 and AB 1484, all redevelopment agencies in the state have been terminated.

- ***Objectives***: *Investigate new funding opportunities and administer funds as they become available. If and when a permanent funding source is identified, the City will provide information at City Hall, on the City's website and in other public places to encourage residents to utilize the program.*

Program 1.3 - Environmental Rehabilitation Program

As the land uses in Commerce are predominantly industrial and due to the proximity of residential uses to freeways and rail lines, the former Commerce Community Development Commission established the Environmental Housing Rehabilitation Grant Program to address and mitigate when possible the negative air quality and noise impacts created by the operation of rail road yards, freeways, and heavy industrial uses within the City. The grant is available to all low- and moderate-income residents in owner-occupied dwellings within the "Ayers Residential Neighborhood" which is significantly affected by these uses. This program is structured to provide assistance up to $30,000 for improvements or repairs to homeowners throughout the City.

This program was historically funded by the Redevelopment Agency Low and Moderate Income Housing Fund ("Housing Set-Aside Funds"), however the elimination of the Commerce Community Development Commission in the previous planning period, resulted in the loss of a permanent funding source for this program. For the 2014-2021 planning period, the City will investigate new funding opportunities and administer funds as they become available. If and when a permanent funding source is identified, the City will provide information about the program at City Hall, on the City's website and in other public places to increase awareness and encourage resident applications.

- ***Timing of Implementation:*** *Ongoing, 2014-2021*
- ***Implementation Responsibility:*** *Housing Division*
- ***Funding Source:*** *General Fund; Additional funding sources needed.*
- ***Objectives:*** *Investigate new funding opportunities and administer funds as they become available. If and when a permanent funding source is identified, the City will provide information at City Hall, on the City's website and in other public places to encourage residents to utilize the program.*

Program 1.4 - Neighborhood Fix Up Grant Program

The Commerce Community Development Commission established the Neighborhood Fix-Up Grant Program to provide financial assistance to City of Commerce residents for the improvement of their homes. The Neighborhood Fix-Up Grant Program reimburses residents with grant funds up to $1,000 for the materials purchased to complete upgrades to the exterior portion of their home that is visible from the street. Over the years, the Neighborhood Fix-Up Grant Program has proven to be successful in revitalizing residential areas in the City. The program made a significant visual impact in the City's neighborhoods and has promoted unity by bringing residents together with a common goal to improve their communities. This program was historically funded by the Low and Moderate Income Housing Fund ("Housing Set-Aside Funds"), however the elimination of the Commerce Community Development Commission in the previous planning period, resulted in the loss of a permanent funding source for this

program. For the 2014-2021 planning period the City will investigate new funding opportunities, administer funds as they become available, and will also refer residents to the CDBG Home Preservation Program, when appropriate. If and when a permanent funding source is identified, the City will provide information about the program at City Hall, on the City's website and in other public places to increase awareness and encourage resident participation.

- ***Timing of Implementation:*** *Ongoing, 2014-2021*
- ***Implementation Responsibility:*** *Housing Division*
- ***Funding Source:*** *General Fund; Additional funding sources needed.*
- ***Objectives:*** *Investigate new funding opportunities and administer funds as they become available. If and when a permanent funding source is identified, the City will provide information at City Hall, on the City's website and in other public places to encourage residents to utilize the program.*

Program 1.5 - CDBG Home Preservation Grant Program

The City of Commerce as a sub grantee of the Los Angeles Community Development Commission's Federal Community Development Block Grant (CDBG) funds, has implemented the Home Preservation Grant Program. This program was established to address substandard housing conditions and to promote property maintenance by providing residential rehabilitation grants to qualified low- and moderate-income residents living in single-family owner-occupied dwellings. The Housing Division administers the program and provides funds, up to $20,000, to qualified applicants to complete improvements to their residence. The City expects to budget approximately $60,000 annually for the program.

- ***Timing of Implementation:*** *Ongoing, 2014-2021*
- ***Implementation Responsibility:*** *Housing Division*
- ***Funding Source:*** *CDBG funds*
- ***Objectives:*** *Provide $60,000 in available funding to assist approximately 3 households annually.*

Program 1.6 - Monitor and Preserve Affordable Housing

The City will inventory and gather information to establish an early warning system for publicly assisted housing units that have the potential to convert to market rate. This early warning system will include a regular and periodic review of the conversion status of all subsidized housing in the City. The City will maintain their AB 987 database to include detailed information on all subsidized units, including those that have affordability covenants. The database will indicate the expiration date of any covenant and any requirements governing reimbursement. The City will also continue to monitor at-risk developments throughout the planning period. Once the City receives notice of a potential conversion of the federally

assisted units, the Housing Division will contact the owners to ascertain what will be required to extend the participation of these projects in the HUD 221 program.

All dwelling units that receive public assistance in the City (including rehabilitation assistance and land write-down projects) shall continue to have affordable housing agreements filed with the land to ensure the long-term affordability of the units. At such time that a housing unit's affordability covenant nears expiration and the owner wishes to sell the unit at (market rate), the City will work with the seller to ensure that the affordability status is maintained.

- ***Timing of Implementation:*** *Ongoing, 2014-2021.*
- ***Implementation Responsibility:*** *Housing Division*
- ***Funding Source:*** *General Fund*
- ***Objectives:*** *The City will strive to maintain all existing affordable rental units by monitoring their affordability and contacting property owners to discuss options for long term affordability.*

Program 1.7 - Energy Efficient Design

The City will review ordinances and recommend changes, where necessary, to encourage energy efficient housing design and practices that are consistent with State regulations. The City will periodically distribute literature and post information on their website regarding energy conservation, including solar power, energy efficient insulation, and subsidies available from utility companies, and encourage homeowners and landlords to incorporate these features into construction and remodeling projects. When possible the City will encourage energy conservation devices including, but not limited to lighting, water heater treatments, and solar energy systems for all residential projects. As part of the Housing Rehabilitation Program, Environmental Rehabilitation Program, and the Neighborhood Fix-up Grant Program residents can apply for loans, if a replacement source of permanent funding is identified, to increase the energy efficiency of their home. Additionally, the Planning, Housing and Building and Safety divisions will encourage maximum utilization of Federal, State, and local government programs, such as the County of Los Angeles Home Weatherization Program, that assist homeowners in providing energy conservation measures.

- ***Timing of Implementation:*** *Ongoing, 2014-2021*
- ***Implementation Responsibility:*** *Planning, Housing and Building and Safety Divisions*
- ***Funding Source:*** *General Fund*
- ***Objectives:*** *The Housing Division will advertise the appropriate information related to this program on the City's website. In addition, the Planning Division and code enforcement personnel will refer potential applicants to the Housing Rehabilitation Program or the Neighborhood Fix-up Grant Program as potential funding sources.*

Goal 2: Provide a variety of housing types to accommodate all economic segments of the community.

Commerce strives to achieve a balanced community, with housing units available for all income segments of the population. The existing housing stock offers many affordable options throughout the City. The intent of this goal is to assist in the provision of adequate housing to meet the needs of the community, including the needs of both renter and owner households.

Policy 2.1: Provide homeownership assistance to low- and moderate-income households.

Policy 2.2: Continue to participate in State and federally sponsored programs designed to maintain housing affordability, including the Section 8 rental assistance program.

Policy 2.3: Explore opportunities for new residential development within those areas of the City occupied by vacant, obsolete commercial and industrial uses.

Policy 2.4: Continue to provide development incentives, when possible to support non-profit and for-profit organizations in their efforts to construct, acquire, and improve affordable housing.

Policy 2.5: Facilitate development of senior and low- income housing through use of financial and/or regulatory incentives.

Policy 2.6: Maintain lower densities in the Bandini-Rosini and Rosewood residential neighborhoods, while encouraging higher density residential development in the City's Southeast Planning Area.

Policy 2.7: Ensure that potential sites for residential development, located in those areas that were previously occupied by nonresidential land uses, are investigated to determine whether or not previous on-site uses present potential health risks.

Programs

Program 2.1 - First Time Homebuyer Program

In 2009, the former Commerce Community Development Commission successfully established the First Time Homebuyer Program. This Program was intended to operate in conjunction with the Substantial Housing Rehabilitation Loan, by providing residents the opportunity to apply for assistance to purchase homes acquired and rehabilitated by the City. Residents were also allowed to identify a non-City owned residence and apply for rehabilitation and financial assistance. To further homeownership opportunities the City of Commerce also partners with the Los Angeles County Housing Authority to assist Commerce residents currently on the County's Section 8 waitlist. During the 2008-2014 planning period, the elimination of the Commerce Community Development Commission resulted in the loss of a permanent funding source for this program. For the 2014-2021 planning period the City will investigate new funding opportunities and administer funds as they become available. If, and when, a permanent funding source

is identified, the City will provide information about the program at City Hall, on the City's website and in other public places to increase awareness and to encourage resident participation.

- ***Timing of Implementation:*** *Ongoing, 2014-2021 until funding is unavailable or the last participant is no longer active.*
- ***Implementation Responsibility:*** *Housing Division*
- ***Funding Source:*** *General Fund; Additional funding sources needed.*
- ***Objectives:*** *Investigate new funding opportunities and administer funds as they become available. If and when a permanent funding source is identified, the City will provide information at City Hall, on the City's website and in other public places to encourage residents to utilize the program.*

Program 2.2 - (Senior and Handicapped) Rent Subsidy Program

To augment limited Federal resources for rental assistance, the City previously utilized redevelopment set-aside monies to provide rent vouchers to seniors and handicapped residents. With the dissolution of the Commerce Community Development Commission, the City has allocated money from their General Fund to continue the program, but has reduced and limited the number of recipients. The program provides subsidies to eligible households with residents that are at least 57 years of age or are physically handicapped. The prospective applicant must also qualify as low- or very low-income. The maximum monthly subsidy for a qualified household is $200. Applicants are expected to pay a minimum of 25% of their income towards rent and the Commission will make the appropriate supplemental payments to the landlord. Landlords must agree to participate in the program and consent to a yearly inspection of the unit to insure it is up to Building and Safety standards. For the 2014-2021 planning period the City will investigate new funding opportunities and administer funds as they become available. If, and when, an additional funding source is identified, the City will provide information about the program at City Hall, on the City's website and in other public places to increase awareness and solicit additional applications.

- ***Timing of Implementation:*** *This program is ongoing and will be continued.*
- ***Implementation Responsibility:*** *Community Services Division*
- ***Funding Source:*** *General Fund*
- ***Objectives:*** *Investigate new funding opportunities and administer funds as they become available. If and when a permanent funding source is identified, the City will provide information at City Hall, on the City's website and in other public places to increase awareness and solicit additional applications.*

Program 2.3 - Los Angeles County Partnership

As a means of further leveraging housing assistance, the City will cooperate with the Los Angeles County Community Development Commission (CDC) and Los Angeles County Housing Authority to promote resident awareness and application for County run housing assistance programs. These programs include the:

- Mortgage Credit Certificate Program (MCC)
- Housing Economic Recovery Ownership (HERO) Program,
- Home Ownership Program (HOP),
- Mortgage Credit Certificate Program (MCC),
- Home Investment Partnerships Program (HOME),
- Single-family Grant Program (SFGP), and
- Single-family Rehabilitation Loan Program.

The County offers a variety of housing assistance programs that can supplement the City's current housing programs. The City has also begun to coordinate with the County to assist Commerce households currently on the County's Section 8 waitlist by referring them to the City. As the City has little control over how the County's programs are administered, the City will be responsible for providing program information on the City's website, in the City's newsletter and at City Hall.

- ***Timing of Implementation:*** *Ongoing, 2014-2021*
- ***Implementation Responsibility:*** *Housing Division*
- ***Funding Source:*** *General Fund*
- ***Objectives:*** *Increase resident awareness about housing programs offered by the County by providing information at City Hall, on the City's website and in other public places to increase awareness*

Goal 3: Minimize the impact of governmental constraints on housing production and affordability.

Market, environmental, and governmental factors pose constraints to the provision of adequate and affordable housing. These factors tend to disproportionately impact lower and moderate-income households due to their limited resources for absorbing the costs. The City is committed to removing governmental constraints that hinder the production of housing and offers a streamlined permitting process to facilitate efficient entitlement and building permit processing.

Policy 3.1: Support innovative public, private and non-profit efforts toward the development of affordable housing.

Policy 3.2: Periodically review and revise the City's development standards, if necessary, to facilitate quality housing that is affordable to all income levels.

Policy 3.3: When feasible, consider reducing, subsidizing, or deferring development fees to facilitate the provision of affordable housing.

Policy 3.4: Continue the provision of incentives, including the density bonus incentive program, which encourages developers to include affordable units in their projects.

Policy 3.5: Allow second residential units on single-family parcels as a means of providing additional infill housing opportunities.

Policy 3.6: Identify funding to be used to lower land costs of proposed projects, to ensure that affordable units are incorporated within the development.

Programs

Program 3.1 - Housing Opportunity Overlay Program

During the 2008-2014 planning period, the City established a new Housing Opportunity Overlay in the 2020 General Plan to facilitate the transition of existing non-residential uses to new residential development. The overlay designation includes a cluster of industrial properties within the Rosewood Planning Area totaling 44.3 acres. Within the identified planning area, the overlay encourages manufacturing uses to redevelop into residential uses. For the 2014-2021 planning period, the City has identified 11 parcels located east of Eastern Avenue, totaling 19.9 acres as the key opportunity area to accommodate their RHNA allocation and AB 1233 carryover. If the Phase I area is redeveloped at a minimum 20 units per acre, the City conservatively estimates that approximately298new units could be provided.

To finalize the creation of the overlay, the City has established the development process required to implement the overlay area, including the creation of development standards and design guidelines. In developing the guidelines and standards the City plans to ensure that the development of high density, multifamily, affordable housing is allowed and encouraged. The City has specifically identified the

overlay area in the Housing Resources section as appropriate to meet the City's remaining RHNA. Throughout the planning period, the City will monitor the development of parcels within the overlay area and meet with land owners to discuss potential redevelopment opportunities.

- ***Timing of Implementation:*** *The City will ensure that the program is implemented concurrent with Housing Element adoption, (by October 2013), will continuously monitor development activity in the overlay area and will contact property owners in the overlay area periodically to discuss the future of the area.*
- ***Implementation Responsibility:*** *Planning Division*
- ***Funding Source:*** *General Fund monies will be used for planning administration.*
- ***Objectives:*** *Facilitate the redevelopment of underutilized sites by identifying housing opportunity sites. Approach land owners and business operators in the overlay area to discuss the future transition of uses. Provide information to interested developers about potential residential opportunity sites.*

Program 3.2 - Atlantic Blvd. Housing Program

In the 2020 General Plan, a Mixed-Use designation along the Atlantic Boulevard corridor between the Mixmaster (on the north) and Washington Boulevard (on the south) was created. This land use designation provides for both residential development and commercial development. The permitted residential development densities range from 0 to 27 units per acre. The land use designation permits stand-alone residential and/or residential units located on the upper levels of a multi-story building containing commercial uses on the ground floor. During the 2014-2021 planning period the City will develop standards and design guidelines for the Mixed Use Overlay in the City's Zoning Ordinance. The City will maintain an inventory of opportunity sites along Atlantic Boulevard and provide information about development opportunities and the development standards established for the overlay.

- ***Timing of Implementation:*** *Ongoing 2014-2021*
- ***Implementation Responsibility:*** *Planning Division and Housing Division*
- ***Funding Source:*** *General Fund monies will be used for planning and administration.*
- ***Objectives:*** *The City will contact developers in the area to inform them of opportunity sites, the established development standards, and other pertinent information. The City may also publish information online and at City Hall about the Atlantic Boulevard Housing Program.*

Program 3.3 - Lot Consolidation Program

Parcels located in specific areas of the City within the Housing Opportunity overlay and along Atlantic Boulevard tend to be narrow and shallow in size, which can act as a constraint to the development of larger housing projects. To encourage the development of higher density residential and mixed-use projects on vacant and underutilized sites, the City offers incentives to encourage lot consolidation, including but not limited to: development standard modifications (i.e. lot size, parking, and open space requirements) streamlined processing, and assistance with development fees, when funding is available.

- ***Timing of Implementation:*** *Ongoing, 2014-2021*
- ***Implementation Responsibility:*** *Planning Division and Housing Division*
- ***Funding Source:*** *General Fund monies will be used for planning administration.*
- ***Objectives:*** *The City will notify housing developers of development incentives and opportunities for lot consolidation.*

Program 3.4 - Density Bonus Program

In 2005, the State statute was modified, requiring density bonus law to give greater density bonuses for lower income housing. In compliance with State law, housing developments proposed within the City of Commerce are eligible for a 20% density bonus if 5% percent of the units are affordable to very low-income households or if 10% of the units are affordable to lower income households. Similarly, housing developments may qualify for a 5% density bonus if 10% of the units are affordable to moderate-income families.

To further facilitate the development of additional affordable units additional bonuses are granted according to a sliding scale. For example, an additional 2.5% density bonus is granted for each additional increase of 1% very low-income units, an additional 1.5% density bonus for each additional increase in lower income units, and an additional 1% density bonus for each 1% increase in moderate-income units. No total density bonus can be greater than 35% percent. A project qualifying as a senior citizen housing development is entitled to a 20% density bonus and cannot be combined with the bonuses granted for affordable housing. In addition to offering a density bonus, the City will offer fast track processing, fee modifications, reductions in development and parking standards, and funding for off-site improvements to encourage and facilitate the development of affordable housing.

Developers granted a density bonus enter into an Affordable Housing Agreement with the City to ensure the continued affordability of these units for a minimum of 45 or 55 years. Affordable units are rented at levels that do not to exceed 30% of gross monthly income, subject to annual rent adjustments based on changes in the tenant's income. This is an existing program that will be continued. The City will evaluate its density bonus provisions as part of the Zoning Ordinance revisions that will be required to implement the General Plan. In the event it is not in conformance with current State requirements, the Density Bonus section of the City's Zoning Ordinance will be revised.

- ***Timing of Implementation:*** *Implementation will occur concurrent with Housing Element adoption. The City will administer the program throughout the planning period.*
- ***Implementation Responsibility:*** *Planning Division*
- ***Funding Source:*** *General Fund monies will be used for planning administration.*
- ***Objectives:*** *To increase the number of affordable units throughout the City in new housing developments. The Density Bonus will be emphasized in future development within the Housing Opportunity Overlay Areas.*

Program 3.5 - Streamlined Processing

The City continues to monitor permit processing times to ensure the fastest possible turnaround for applications and identify any impediments to affordable housing. Additionally, the processing time of applications for new construction or rehabilitation of housing for lower and moderate-income households and seniors will be prioritized.

- ***Timing of Implementation:*** *Ongoing, 2014-2021.*
- ***Implementation Responsibility:*** *Planning Division*
- ***Funding Source:*** *General Fund monies will be used for planning administration.*
- ***Objectives:*** *Continue to monitor permit processing times and investigate ways to streamline the process. Prioritize the review of projects that include affordable housing units.*

Program 3.6 – Incentives for Large Multi-Family Units

The City recognizes that housing priorities shift over time as housing needs change. The characteristics of the City's current housing need have been identified through the Community Profile, specifically the analysis of the special needs groups. Based on the needs analysis completed for this Housing Element, there is a need to provide affordable rental units for large families. Consequently, the City will prioritize its program activities to meet the needs of large families, as well as, other special needs groups, including extremely-low income households, and people with disabilities, including developmental disabilities. During the planning period City staff will periodically review the Zoning Ordinance to determine what incentives and/or regulations can be implemented as a means to promote the development of rental housing with three or more bedrooms. As part of the Housing Opportunity Overlay the City has also included development standards to encourage and facilitate an increased number of larger units. The requirements for mixed-use housing are applicable to both rental and owner occupied housing.

- ***Timing of Implementation:*** *Ongoing, 2014-2021*
- ***Implementation Responsibility:*** *Planning Division*
- ***Funding Source:*** *General Fund monies will be used for planning administration.*

- ***Objectives:*** *To increase the number of affordable multi-bedroom units to accommodate larger low-income families*

Program 3.7 - Residential Development Standards

On a regular basis, City staff will review the development standards for the R-1, R-2, and R-3 zones to identify standards that may constrain the development of affordable housing and housing for disabled individuals. Specifically, Staff will review requirements such as the minimum unit size, property line setbacks, parking requirements, height restrictions, etc. to ensure that they are necessary and pertinent. The City is committed to address any constraints identified in **Section 5**, *Housing Constraints,* during the update process. In the interim, Staff will on a case by case basis identify ways that standards can be relaxed if it is determined that such requirements are in any way impeding the development of affordable housing or housing for disabled residents. The City will also continue to provide fast track processing for applications related to the creation of affordable housing and will offer fee modifications for projects including affordable units that are required to apply for variations to the existing development standards.

- ***Timing of Implementation:*** *Ongoing, 2014-2021*
- ***Implementation Responsibility:*** *Planning Division*
- ***Funding Source:*** *General Fund monies will be used for planning administration.*
- ***Objectives:*** *Review development standards to identify constraints and remove or offset constraints where possible.*

Program 3.8 - Second Unit Ordinance

The City of Commerce recognizes that second units are a unique opportunity to provide affordable units in residential areas, particularly for elderly and low income residents. Consequently, the City will ensure that the second unit ordinance complies with State law and will promote the ordinance to homeowners and property managers. In many of the City's neighborhoods there are a number of second units that have been constructed, however many do not comply with planning and building requirements. The City will encourage residents that have illegally constructed a second unit on their property to bring existing illegal units into compliance with City zoning and building codes. The City may recommend that homeowners apply for assistance through existing rehabilitation programs such as the Neighborhood Fix-Up Grant Program or the CDBG Home Preservation Grant Program to modify units.

- ***Timing of Implementation:*** *The City will ensure that the ordinance is updated as required by State law concurrent with Housing Element adoption and will advertise the program throughout the planning period.*
- ***Implementation Responsibility:*** *Planning Division*
- ***Funding Source:*** *General Fund*

- ***Objectives:*** *Encourage the construction of 5 units over the planning period. To facilitate use of the ordinance the City will provide informational materials about the second unit ordinance at City Hall, on the City's website and in other public places to increase awareness.*

Program 3.9- Off Site Improvements

On a case by case basis, the City will provide opportunities for public, private and non-profit groups to develop affordable housing by constructing off-site improvements and physical infrastructure as Capital Improvement Projects. Assistance provided by the City may include traffic, street and sewer upgrades as well as other pedestrian and mobility improvements. The City will work directly with developers, on a case by case basis, to determine the feasibility of providing assistance.

- ***Timing of Implementation:*** *Ongoing, on an annual basis*
- ***Implementation Responsibility:*** *Planning Division and Housing Division*
- ***Funding Source:*** *General Fund when funds are available.*
- ***Objectives:*** *Facilitate easier development of affordable housing by allowing improvements to be negotiated.*

Program 3.10 - Water and Sewer Service Providers

In accordance with Government Code Section 65589.7 as revised in 2005, immediately following City Council adoption, the City must deliver a copy of the 2014-2021 Housing Element to all public agencies or private entities that provide water or sewer services to properties within the City of Commerce.

- ***Timing of Implementation:*** *By December 2013*
- ***Implementation Responsibility:*** *Planning Division*
- ***Funding Source:*** *General Fund*
- ***Objectives:*** *Ensure that water and sewer providers are aware of the City's intentions for residential development throughout the City.*

Program 3.11 - Flood Management

In accordance with Government Code Section 65302, as part of the current General Plan update process the City reviewed and revised the Conservation and Safety Elements to consider flood risks as they relate to future land use decisions. The Conservation Element has been updated to identify rivers, creeks, streams, flood corridors, riparian habitats, and land that may accommodate floodwater for purposes of groundwater recharge and storm water management. Additionally, the Safety Element identifies information regarding flood hazards, including, but not limited to flood hazard zones, National Flood Insurance Program maps published by FEMA, information about flood hazards, designated floodway maps, dam failure inundation maps, areas subject to inundation in the event of the failure of levees or

floodwalls, etc. as listed in Section 65302(g)(2) and establish a set of comprehensive goals, policies, and objectives for the protection of the community from the unreasonable risks of flooding. The City will continue to utilize information from the General Plan and consider flood risks in all future land use decisions.

- ***Timing of Implementation:*** *Ongoing, 2014-2021.*
- ***Implementation Responsibility:*** *Planning Division*
- ***Funding Source:*** *General Fund*
- ***Objectives:*** *Ensure that flood risks are considered when making land use decisions.*

Goal 4: Promote equal housing opportunity for all residents.

To fully meet the community's housing needs, the City must assure that housing is accessible to all residents, regardless of age, race, religion, family status, or physical disability. The City, attempts to achieve this through their reasonable accommodation ordinance and through a partnership with Los Angeles County Community Development Commission.

Policy 4.1: Continue to enforce fair housing laws prohibiting discrimination in the building, financing, selling, or renting of housing on the basis of race, ethnicity, ancestry, national origin, religion, sex, disability, age, marital status, familial status, source of income, sexual orientation, or any other arbitrary factor.

Policy 4.2: Cooperate with the Los Angeles County Fair Housing Council in the enforcement of fair housing laws and in the review of violations of applicable Federal and State fair housing laws.

Policy 4.3: Assess the social service needs of the community and provide a wide variety of social service programs to City residents.

Policy 4.4: Provide that displacement of low-income households is avoided and, where necessary, is carried out in an equitable manner.

Policy 4.5: Encourage housing construction or alteration to meet the needs of residents with special needs such as the elderly and disabled.

Programs

Program 4.1 - Reasonable Accommodation Program for Disabled

The purpose of this program is to ensure that sufficient provisions are provided by the City to facilitate a resident's request for "reasonable accommodation." This means that City Staff will ensure that the established development requirements do not place an undue burden on disabled persons living or moving into the City. For example, a household with a handicapped resident may require modifications to the housing unit to accommodate that individual. Typical modification requests include the installation of wheel chair ramps (both interior and exterior), wider doorways, and installation of wheelchair elevators in units containing multiple-levels, and the installation of handrails and modified plumbing fixtures in bathrooms. Funds from the Housing Rehabilitation Program or the CDBG Home Preservation Grant Program are available and may be used to complete the necessary improvements.

During the previous planning period, the City developed procedures for reasonable accommodation in accordance with fair housing and disability laws and amended the City's Municipal Code to provide for clear rules, policies, procedures, and fees for reasonable accommodation in order to promote equal access to housing. Policies and procedures indicate the qualifying individuals who may request a reasonable accommodation (i.e., persons with disabilities, family-members, landlords, etc.) along with any specific procedures that must be followed. The City staff also provides referrals to rehabilitation and home modification programs for qualifying residents.

- ***Timing of Implementation:*** *The City will ensure that a reasonable accommodation ordinance will be implemented concurrent with Housing Element adoption and will promote the program throughout the planning period, 2014-2021.*

- ***Implementation Responsibility:*** *Housing Division and Planning Division*

- ***Funding Source:*** *General Fund*

- ***Objectives:*** *Administer City operated programs to assist disabled households with architectural modifications to their homes and continue to implement the provisions of the Americans with Disabilities Act (ADA). Provide information in public places regarding the City's reasonable accommodation ordinance and make information on this program more widely available to residents. Referrals will be made whenever possible.*

Program 4.2 – Fair Housing Program

The City will continue to contract with the Housing Rights Center to provide residents with fair housing services using Community Development Block Grant (CDBG) funds. Fair housing services provided by the Housing Rights Center include counseling and mediation between tenants and landlords. The Housing Rights Center also conducts seminars and information activities throughout the region. The City will refer fair housing complaints to the Housing Rights Center SGVFHC as appropriate. The City will assist in program outreach through placement of fair housing program brochures in both English and Spanish at the public counter, City library, post office, and other community locations such as the City's senior center.

- ***Timing of Implementation:*** *Ongoing, 2014-2021.*

- ***Implementation Responsibility:*** *The Housing Division will cooperate with the Housing Rights Center in order to ensure that adequate information is provided to the City's residents.*

- ***Funding Source:*** *General Fund and CDBG funds.*

- ***Objectives:*** *Comply with all State and federal fair housing requirements when implementing housing programs or delivering housing-related services.*

Action 4.3 – Housing for Developmentally Disabled Persons Program

The housing needs of persons with disabilities, including persons with developmental disabilities are typically not addressed by Title 24 Regulations. The housing needs of persons with disabilities, in addition to basic affordability, range from slightly modifying existing units to requiring a varying range of supportive housing facilities. To accommodate residents with developmental disabilities the City will seek State and Federal monies, as funding becomes available, in support of housing construction and rehabilitation targeted for persons with disabilities, including developmental disabilities. Commerce will also provide regulatory incentives, such as expedited permit processing and fee waivers and deferrals, to projects targeted for persons with disabilities, including persons with developmental disabilities. To further facilitate the development of units to accommodate persons with developmental

disabilities, the City shall reach out annually to developers of supportive housing to encourage development of projects targeted for special needs groups. Finally, as housing is developed or identified, Commerce will work with the Eastern Los Angeles Regional Center to implement an outreach program informing families within the City of housing and services available for persons with developmental disabilities. Information will be made available on the City's website.

- ***Timing of Implementation**: Ongoing, 2014-2021.*
- ***Implementation Responsibility:** The Planning Division*
- ***Funding Source**: General Fund*
- ***Objective:** The City will continue to offer specific regulatory incentives throughout the planning period, when funding is available, apply for funding at least twice during the planning period to encourage development of unit specifically for persons with disabilities, will reach out annually to developers, and will initiate a cooperative outreach program with the Regional Center by 2014.*

Goal 5: Identify Adequate Sites to Achieve Housing Variety.

Meeting the housing needs of all residents of the community requires the identification of adequate sites to accommodate a variety of housing types. By capitalizing on the allowances in the Development Code and continuing to maintain an inventory of potential sites, the City will assure that adequate residentially-zoned and mixed-use sites are available to accommodate the 2014-2021 RHNA allocation.

Policy 5.1: Provide a range of residential development types in Commerce, including low density single-family homes, moderate density townhomes, higher density multi-family units, and residential/commercial mixed use in order to address the City's share of regional housing needs.

Policy 5.2: Maintain zoning regulations that permit by right, in designated zones, housing that meets temporary and short-term housing needs for individuals and families.

Policy 5.3: Provide incentives to facilitate the development of senior housing options.

Policy 5.4: Require that housing constructed expressly for low- and moderate-income households not be concentrated in any single portion of the City.

Programs

Program 5.1 - Ensure Adequate Sites to Accommodate the RHNA

For the 2014-2021 planning period, the City of Commerce has an assigned RHNA allocation of 46 units and is also responsible for accommodating 13 lower income units from the 2008-2014 planning period, in accordance with AB 1233. Consequently, the City must show resources to accommodate a total of 57 units, including 32 lower income units, 7 moderate income units, and 20 above moderate income units. As the City of Commerce has little vacant land, future housing development is likely to occur as infill development. Under this program, the City will promote the development of multifamily housing, by right at a minimum of 20 dwelling units per acre, on specific sites as identified in the Housing Resources section. For the purposes of housing element law and in accordance with Chapter 724, by-right shall mean the local government's review shall not require: a conditional use permit; planned unit development permit; or other discretionary local government review or approval that would constitute a "project" for the purposes of Division 13 (commencing with Section 21100) of the Public Resources Code. To further encourage and facilitate the development of affordable housing, the City will offer streamlined processing, fee modifications, density bonus incentives, reductions in development and parking standards, and funding, when available, for off-site improvements and any required environmental cleanup.

To ensure sufficient residential capacity to accommodate the identified regional need for lower-income households is maintained within the Housing Opportunity Overlay, the City will develop and implement a formal monitoring program. The program will track development approvals on identified sites and for those that result in a reduction of potential affordable units below the residential capacity assumed in **Table 6-6**, the City will identify and designate additional sites to rezone to ensure that no net loss occurs. This means that if any one of the identified sites is not developed in accordance with the development

requirements outlined for the overlay, an alternative site or sites must be identified and rezoned to maintain the overall affordable unit capacity.

- ***Timing of Implementation:*** *The City will ensure that the Housing Opportunity Overlay is implemented concurrent with Housing Element adoption and will provide information on development opportunities throughout the planning period, 2014-2021.*
- ***Implementation Responsibility:*** *Housing Division and Planning Division*
- ***Funding Source:*** *General Fund*
- ***Objectives:*** *Continue to provide appropriate land use designations and maintain an inventory of suitable sites for residential development. Make the vacant and underutilized residential sites inventory available to non-profit and for-profit housing developers on the City's website.*

Program 5.2 - Extremely Low-Income and Special Needs Housing

Extremely low-income households and households with special needs have limited housing options in Commerce. Housing types appropriate for these groups include: emergency shelters, transitional housing, supportive housing, and single-room occupancy (SRO) units. To accommodate this population group the City has amended the Zoning Code to allow emergency housing by right in the Heavy Industrial (M-2) zone. The M-2 zone was selected as it is the City's most prevalent land use and allows for a significant number of opportunities to facilitate the provision of emergency housing. Additionally, the City has amended the language of the residential zones to permit transitional and supportive housing, including SRO units as a residential use, subject only to those regulations that apply to other residential uses within that zone.

To assist in the development of housing to meet the needs of extremely low-, very low- and low-income households, the City offers fast track processing, development fee modifications, density bonus incentives, reductions in development and parking standards, and funding for off-site improvements. The City prioritizes funding opportunities to ensure that extremely low- and very low-income housing are given precedence and are able to easily access the financial and regulatory incentives offered by the City.

- ***Timing of Implementation:*** *The City will ensure that the Zoning Code is updated to be consistent with SB2 provisions and implemented concurrent with Housing Element adoption.*
- ***Implementation Responsibility:*** *Housing Division and Planning Division*
- ***Funding Source:*** *General Fund*
- ***Objectives:*** *Monitor available sites for the development of emergency, transitional and supportive housing.*

Program 5.3 – Alternative Housing Models

The City recognizes the changing housing needs of its population, including aging seniors in need of supportive services. To meet such needs, the City can encourage, through development incentives, the provision of more innovative housing types that may be suitable for the community, including community care facilities, supportive housing, and assisted living for seniors. Assisted living facilities are designed for elderly individuals needing assistance with activities of daily living but desiring to live as independently as possible for as long as possible. Such facilities bridge the gap between independent living and nursing homes, and offer residents help with daily activities such as eating bathing, dressing, laundry, housekeeping, and assistance with medications. Assisted living can help to meet the housing and supportive services needs of Commerce's relatively large and growing senior population.

- ***Timing of Implementation**: Ongoing, 2014-2021.*
- ***Implementation Responsibility**: Housing Division and Planning Division*
- ***Funding Source**: General Fund*
- ***Objectives**: Facilitate the development of alternative housing models suited to the community housing needs through the provision of flexible zoning regulations. Continue to provide appropriate standards to encourage development of senior housing to meet the needs of the City's growing senior population.*

CITY OF COMMERCE
CALIFORNIA
INCORPORATED JANUARY 28, 1960

Table 2-1:
Housing Plan Summary

Housing Program	Responsible Agency	Funding Source	Time Frame	Total Objective
Goal 1: Conservation of the City's existing housing stock.				
1.1 – Code Enforcement	Community Development	General Fund	Ongoing	Address violations
1.2 – Housing Rehabilitation Program	Housing	New source needed	Ongoing	Identify new funding sources
1.3 – Environmental Rehabilitation Program	Housing	New source needed	Ongoing	Identify new funding sources
1.4 – Neighborhood Fix Up Grant Program	Housing	New source needed	Ongoing	Identify new funding sources
1.5 – CDBG Home Preservation Grant Program	Housing	CDBG Funds	Ongoing	Assist 3 HH/year
1.6 – Monitor & Preserve Affordable Housing	Housing	General Fund	Ongoing	Maintain affordable units
1.7 – Energy Efficient Design	Housing/Planning	General Fund	Ongoing	Assist with energy efficiency
Goal 2: Increase affordable housing opportunities.				
2.1 – First Time Homebuyers Program	Housing	New source needed	Ongoing	Identify new funding sources
2.2– Senior Rent Subsidy Program	Housing	General Fund	Ongoing	Assist 30 HH/year
2.3 – Los Angeles County Partnership Program	Housing	General Fund	Ongoing	Advertise housing programs
Goal 3: Removal of constraints to new housing construction.				
3.1 – Housing Opportunity Overlay Program	Planning	General Fund	Ongoing	Publicize opportunities
3.2 – Atlantic Boulevard Housing Program	Housing/Planning	General Fund	Ongoing	Publicize opportunities
3.3 – Atlantic Blvd. Lot Consolidation Program	Housing/Planning	General Fund	Ongoing	Publicize opportunities
3.4 – Density Bonus Program	Planning	General Fund	Ongoing	Inform developers & residents
3.5 – Incentives for Large Multi-Family Units	Planning	General Fund	Ongoing	Inform developers & residents
3.6 – Residential Development Standards	Planning	General Fund	Ongoing	Review for constraints
3.7 – Second Unit Ordinance	Planning	General Fund	Ongoing	Provide 5 units/PP
3.8 – Off Site Improvements	Housing/Planning	General Fund	Ongoing	Easier affordable development
3.9 – Water and Sewer Providers	Planning	General Fund	Dec 2013	Provide Housing Element
Goal 4: Equal housing opportunity.				
4.1 – Reasonable Accommodation	Housing/Planning	General Fund	Ongoing	As needed basis
4.2 – Fair Housing Program	Housing	GF/RDA	Ongoing	Comply with the law

Table 2-1:
Housing Plan Summary

Housing Program	Responsible Agency	Funding Source	Time Frame	Total Objective
Goal 5: Identify adequate sites to achieve housing variety.				
5.1 – Ensure Adequate Sites to Accommodate the RHNA	Housing/Planning	General Fund	Ongoing	Accommodate RHNA
5.2 – Extremely Low-Income & Special Needs Housing	Housing/Planning	General Fund	Ongoing	Accommodate ELI HH
5.3 – Alternative Housing Models	Housing/Planning	General Fund	Ongoing	Easier affordable development

Notes:
1. HH = households, PP = planning period, ELI = Extremely Low-Income

3. QUANTIFIED OBJECTIVES

California Housing Element Law requires jurisdictions to estimate the number of affordable housing opportunities that will be created over the planning period. The quantified objectives for the 2014-2021 Housing Element presents the anticipated and potential affordable housing development for the planning period starting on January 1, 2014 and ending June 30, 2021.

It is important to note that while the goal of the quantified objective section is to show how the City will meet its remaining RHNA allocation, and based on the premise that the City intends to make every effort to achieve these goals, Commerce cannot guarantee that these needs will be met given limited financial and staff resources, and the increasing gap in affordability of housing resources and incomes. Satisfaction of the City's regional housing needs will partially depend on the cooperation of private funding sources and resources of the State, Federal and County programs that are used to support the needs of the extremely low-, very low-, low-, and moderate-income households. Additionally, outside economic forces heavily influence the housing market. State law recognizes that a locality may not be able to accommodate its regional fair share housing need.

Table 3-1 presents the City's quantified objectives in three categories: construction of new affordable units, substantial rehabilitation of substandard units and the conservation of affordable housing. New construction of affordable units focuses on the City's ability to accommodate its combined RHNA allocation (57 units) on land identified in the sites inventory. It is important to note that this subcategory assumes optimum conditions for the production of housing and does not take into account how environmental, physical, and market conditions influence the timing, type and cost of housing production in a community.

During the planning period, the City anticipates that 57 units will produced in the upcoming planning period, 24 units (3 units assisted annually) will be assisted through the CDBG Housing Preservation Program, and the affordability of 30 units will be preserved through rent subsidies offered by the City. These programs are dependent on funding availability and the City will assist households to the extent possible given the existing economic climate. In total the City anticipates that 111 units will be constructed, preserved or rehabilitated during the planning period, which is sufficient to accommodate the City's remaining RHNA allocation.

Table 3-1:
Quantified Objectives

	Extremely Low	Very Low	Low	Moderate	Above Moderate	Total
New Construction[1]	6	13	13	7	20	57
Rehabilitation[2]	--	--	12	12	--	24
Conservation/Preservation[3]	--	--	30	--	--	30
Total	**6**	**13**	**55**	**19**	**20**	**111**

Notes:
1. Construction objectives represent the City's combined RHNA need including the 2014-2021 allocation and AB 1233 carryover.
2. Rehabilitation includes units assisted through the CDBG Home Preservation Program.
3. Conservation/Preservation includes households assisted though the Senior Rental Subsidy Program

4. COMMUNITY PROFILE

4.1 – HOUSING CHARACTERISTICS IN COMMERCE

This section of the Housing Element provides an overview of the demographic, housing, and socio-economic characteristics of the City of Commerce. This section provides information on the following:

- Residential Planning Areas, providing an introduction to the residential planning areas identified in the City of Commerce;
- Population Characteristics, including population growth trends in the City, age characteristics, and ethnicity;
- Housing Unit Characteristics focuses on trends in residential development, housing unit types, and housing tenure;
- Household Characteristics provides an overview of the key socio-economic characteristics germane to housing needs;
- Employment and Economic Characteristics describes those economic and market factors relevant to the maintenance of existing housing and the need for the production of new housing in the City; and,
- Special Housing Needs Groups includes a discussion of City residents that have special housing requirements.

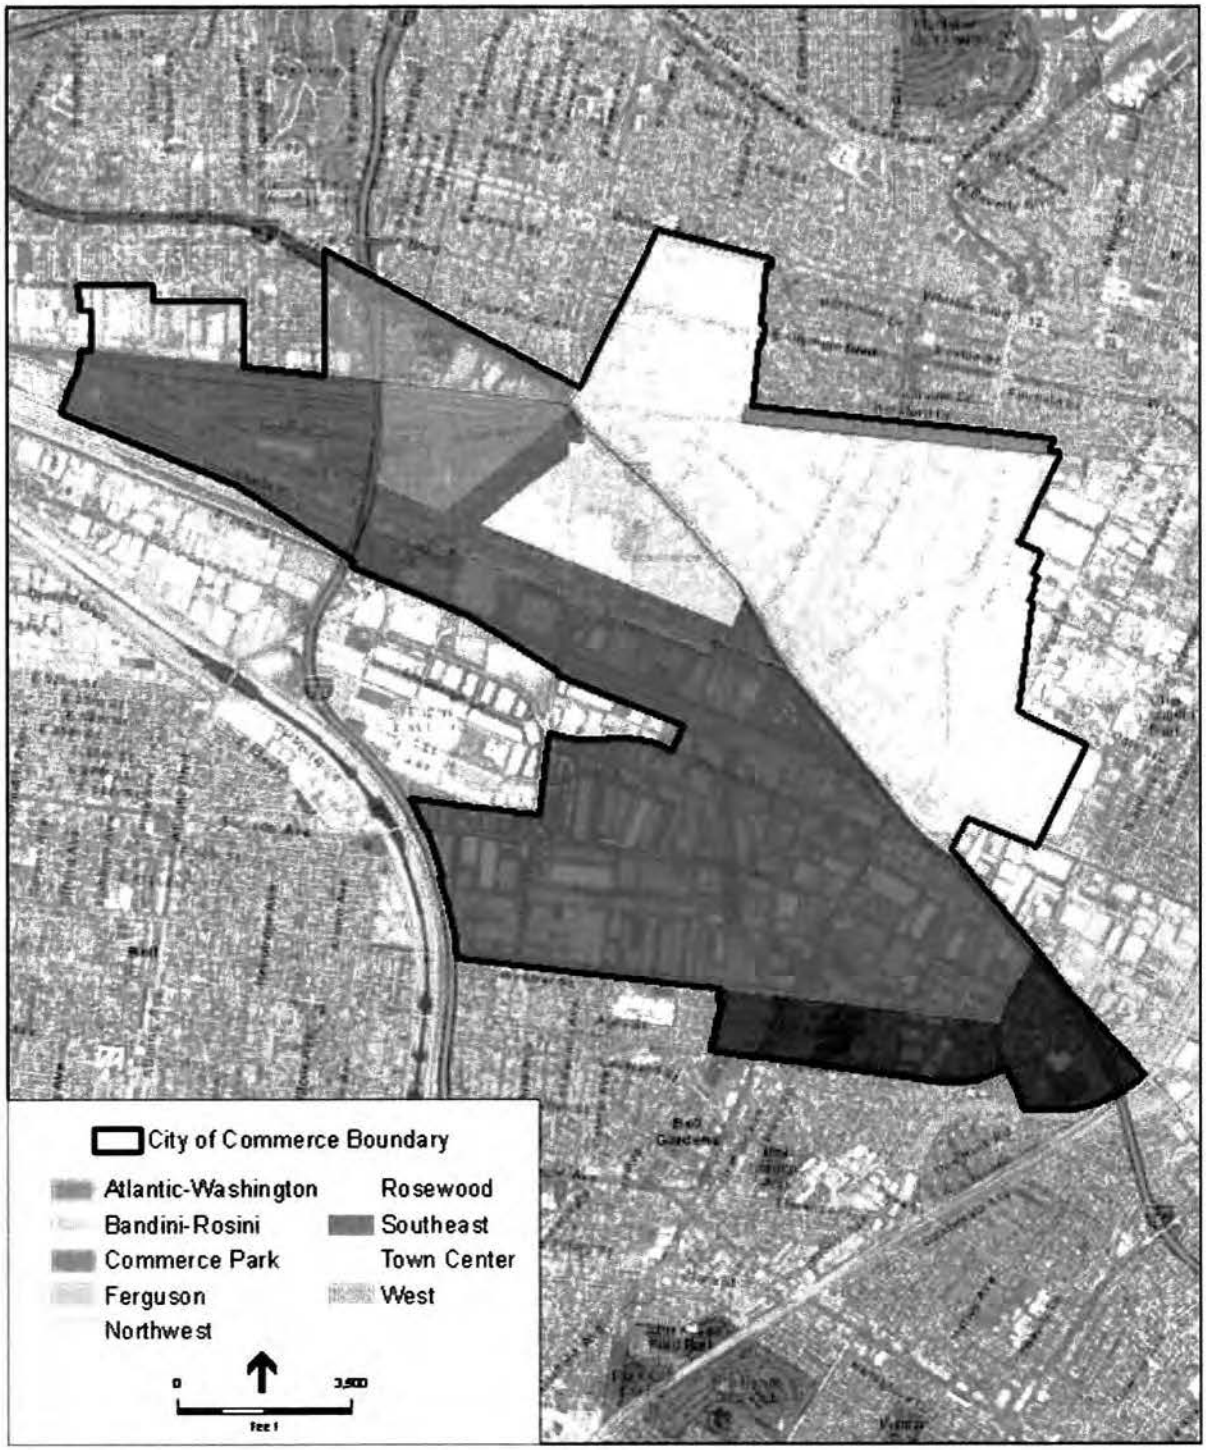
The primary source of information used in the compilation of demographic, housing, and socio-economic information for the City includes data collected by the U. S. Bureau of the Census. A number of other sources were also consulted during the preparation of this analysis, including the Federal Department of Housing and Urban Development (HUD) and the Southern California Association of Governments (SCAG). SCAG is mandated under State law to prepare population, housing, and employment projections that are to be used in the development of the region's Growth Management Plan. These projections were used in the determination of the City's Regional Housing Needs Assessment (RHNA). Finally, the City's General Plan and the Five Year Implementation Plan were also reviewed and pertinent statistical data have been included.

Periodically, HUD provides data summarizing the state of housing for jurisdictions. This report is based on US Census data and is part of the Comprehensive Housing Assessment Strategy (CHAS) Databook. **Table 4-1** summarizes the assistance needs of all households in Commerce based on the most recent CHAS data. This data is broken down by household tenure (renter/owner), household type, and "housing problems." Households with "housing problems" includes units that: 1) have physical defects (lacking complete kitchen or bathroom); 2) are overcrowded (housing units with more than one person per room); 3) have a housing cost burden exceeding 30 percent of gross income; or 4) have a severe housing cost burden exceeding 50 percent of gross income.

Table 4-1:
Housing Assistance Needs of Income Groups by Tenure 2000

Household by Type, Income & Housing Problem	Total Renters	Total Owners	Total Households[1]
Extremely Low-Income (0-30% MFI)	**525**	**185**	**710**
% with housing problems	74%	78%	75%
% with cost burden > 30%	74%	76%	75%
% with cost burden > 50%	63%	57%	61%
Very Low-Income (31-50% MFI)	**315**	**205**	**520**
% with housing problems	79%	41%	64%
% with cost burden > 30%	73%	41%	61%
% with cost burden > 50%	30%	37%	33%
Low-Income (51-80% MFI)	**330**	**440**	**770**
% with housing problems	61%	73%	68%
% with cost burden > 30%	30%	68%	52%
% with cost burden > 50%	0%	32%	18%
Moderate-Income (81-120% MFI)	**465**	**835**	**1,300**
% with housing problems	41%	39%	40%
% with cost burden > 30%	2%	26%	17%
% with cost burden > 50%	0%	2%	1%
Total Households	**1,635**	**1,665**	**3,300**
% with any housing problems	63%	53%	58%
% with cost burden > 30%	45%	44%	45%
% with cost burden > 50%	26%	20%	23%

Source: HUD CHAS Data Book, "Housing Problems Outputs for all Households", 2000.



[1] Note: The total number of households reported may not match the total shown in other tables as different data sources were utilized.

According to the CHAS Databook, nearly 58 percent of all households in the City of Commerce experienced some form of housing problem. The percentage of total households that experienced some type of housing problem was greater among renters than owners. This may reflect the fact that there are more single-family homes than multi-family units in the City. The statistics identified in **Table 4-1** indicate that housing cost is a contributing factor to housing problems, particularly for extremely low- and very low-income households. The CHAS data also indicates that throughout the City approximately 45 percent of households experience a cost burden of more than 30% while 23 percent experience a cost burden of greater than 50%. The issues and information provided in this table will be further examined in the following pages and are addressed in the City's Housing Plan in **Section 2**.

4.2 – COMMERCE PLANNING AREAS

For planning purposes, Commerce has been divided into nine planning areas, consistent with those identified in the previous general plan. The boundaries of the Planning Areas (as shown in **Figure 4-1**) were delineated using man-made features and land use characteristics. The nine identified Planning areas include:

- The Bandini-Rosini planning area is a residential neighborhood.
- The Rosewood planning area is a residential neighborhood.
- The Northwest planning area is largely residential with some industrial uses.
- The Ferguson planning area is a mixed residential neighborhood and industrial area.
- The Southeast planning area includes residential, commercial, and industrial land uses.
- The West Commerce Planning Area supports industrial and transportation uses.
- The Atlantic/Washington planning area consists of commercial uses.
- Commerce Park planning area supports commercial and industrial uses.
- The Town Center planning area is predominantly developed in industrial uses.

City of Commerce - Housing Element, 120811

Figure 4-1

City Map and Planning Areas

4.3 – RESIDENTIAL PLANNING AREAS

Of the nine Planning Areas identified in the City, six are expected to include residential development. Planning areas with residential development include: the Bandini-Rosini Planning Area; the Rosewood Planning Area; the Northwest Planning Area; the Ferguson Planning Area; the Southeast Planning Area; and the Atlantic/Washington Planning Area. As the City of Commerce has a limited amount of residentially zoned land it is important to identify these areas and the opportunities for affordable housing they provide. A brief description of each residential planning area is provided below.

4.3.1 - BANDINI-ROSINI PLANNING AREA

The Bandini-Rosini Planning Area consists almost entirely of residential development, and includes three non-contiguous neighborhoods separated by the Long Beach Freeway and the Atlantic Boulevard commercial district. Land use policy for this Planning Area calls for residential densities that correspond with the intensity and density of existing residential development. The key land use policies related to housing applicable to this Planning Area include the following:

- High-density residential development will be located in that portion of the Planning Area along Eastern Avenue and along Jillson Street east of Strong Avenue.
- Medium-density residential uses will continue to be located in those portions of the Planning Area north of Astor Avenue, east of Cowlin Avenue, and south of Nobel Street. In addition, the medium-density residential land use designation will apply to those areas located west of the Long Beach Freeway. Medium-density residential development in this neighborhood will be permitted along Ayers Avenue and Leonis Street.
- New residential development is also permitted in the central portion of the Planning Area that is currently occupied by various industrial uses. Should these industrial uses be discontinued, residential uses will be implemented.
- The remainder of the Planning Area not designated as Medium-Density Residential or High-Density Residential is designated Low-Density Residential.

4.3.2 - ROSEWOOD PLANNING AREA

The land use policy for the Rosewood Planning Area emphasizes the community's desire to retain the lower-density character of this neighborhood, while encouraging higher density residential development in the Housing Opportunity Overlay area. The land use designations that have been applied to this Planning Area reflect a desire to preserve the existing intensity of residential development. The land use policies applicable to this Planning Area include the following:

- That portion of the Planning Area adjacent to Commerce Way, Jillson Street, and the west side of Senta Avenue is designated Medium-Density Residential, which is consistent with the existing type and density of residential development.
- The balance of the Planning Area, consisting of single-family residential development, is designated Low-Density Residential, reflecting the City's policy to preserve the neighborhood's existing single-family character.

- High-Density Residential development will continue to be applicable at the corner of Eastern Avenue and Harbor Street. The general plan permits the development of housing within those properties that are presently developed and zoned for industrial uses. At such time the property owner determines industrial uses are no longer economically viable, the property will transition to residential uses).

4.3.3 - NORTHWEST PLANNING AREA

The land use plan for the Northwest Planning Area presents a considerable challenge in that there are a significant number of dilapidated, substandard, and overcrowded units located within the planning area. The City has long recognized the need for specific measures to alleviate problems related to substandard housing and conflicts between residential and non-residential land uses.

- The former Commerce Community Development Department targeted the Northwest Planning Area for housing revitalization efforts.
- For the most part, the residential portions of the Planning Area are designated Medium-Density, which corresponds with the existing development type and density.
- General Plan land use policy calls for the segregation of residential and non-residential land uses. Primary goals include the elimination of scattered residential parcels located in industrial areas and elimination of the intrusion of industrial activities in residential neighborhoods.

4.3.4 - SOUTHEAST NEIGHBORHOOD PLANNING AREA

The Southeast Neighborhood Planning Area is predominantly residential, with a mix of other land uses, including commercial, public/quasi-public, parkland, and industrial. Land use policy recognizes the potential for land use conflicts among the diverse activities located within the area. The Land Use Map reflects measures to reduce potential land use conflicts while preserving the existing residential neighborhoods. Within the Planning Area there are six smaller residential neighborhood units that are separated by transportation corridors or expanses of non-residential uses. Land use policy for the Southeast Planning Area includes the following:

- The North Slauson residential district located north of Slauson Avenue is designated as Low-Density Residential, thus encouraging retention of the existing character and density of residential development in this area.
- The South Slauson neighborhood located south of Slauson Avenue and north of the Union Pacific railroad is designated as Medium-Density Residential. This land use designation permits slightly higher densities over the life of the plan. In addition, the land use policy encourages the discontinuation of conflicting commercial uses in this neighborhood.
- The Greenwood neighborhood includes those residences south of the Union Pacific railroad line and east of Nye Avenue. The entire district is designated High-Density Residential, which will allow older dilapidated single-family units to be replaced with newer, higher-density units.
- The Greenwood neighborhood also includes the residential area south of Gage and along Kuhl Drive near Veteran's Memorial Park. The residential area also is designated for High-Density Residential, reflecting the existing and proposed higher-density development.

- The Emil neighborhood is located along Emil Avenue and Pacific Drive and the interconnecting local streets. The majority of the Emil neighborhood is designated High-Density Residential, which is consistent with the multiple-family development in the neighborhood. Exceptions include the area east of Pacific Drive, properties adjacent to Agra, and the properties located adjacent to Danielson Court, all of which are designated Low-Density Residential or Medium-Density Residential. The latter areas will continue to support the attractive single-family residential development.
- A single linear block of units, located along Darwell Avenue west of Garfield, is the last distinct residential unit located in the Southeast Neighborhood Planning Area. The Darwell Avenue district consists of single-family homes interspersed with lower-density multiple-family units, primarily duplexes. The Medium-Density Residential land use designation applicable to this area will allow for some recycling to slightly higher-density development.

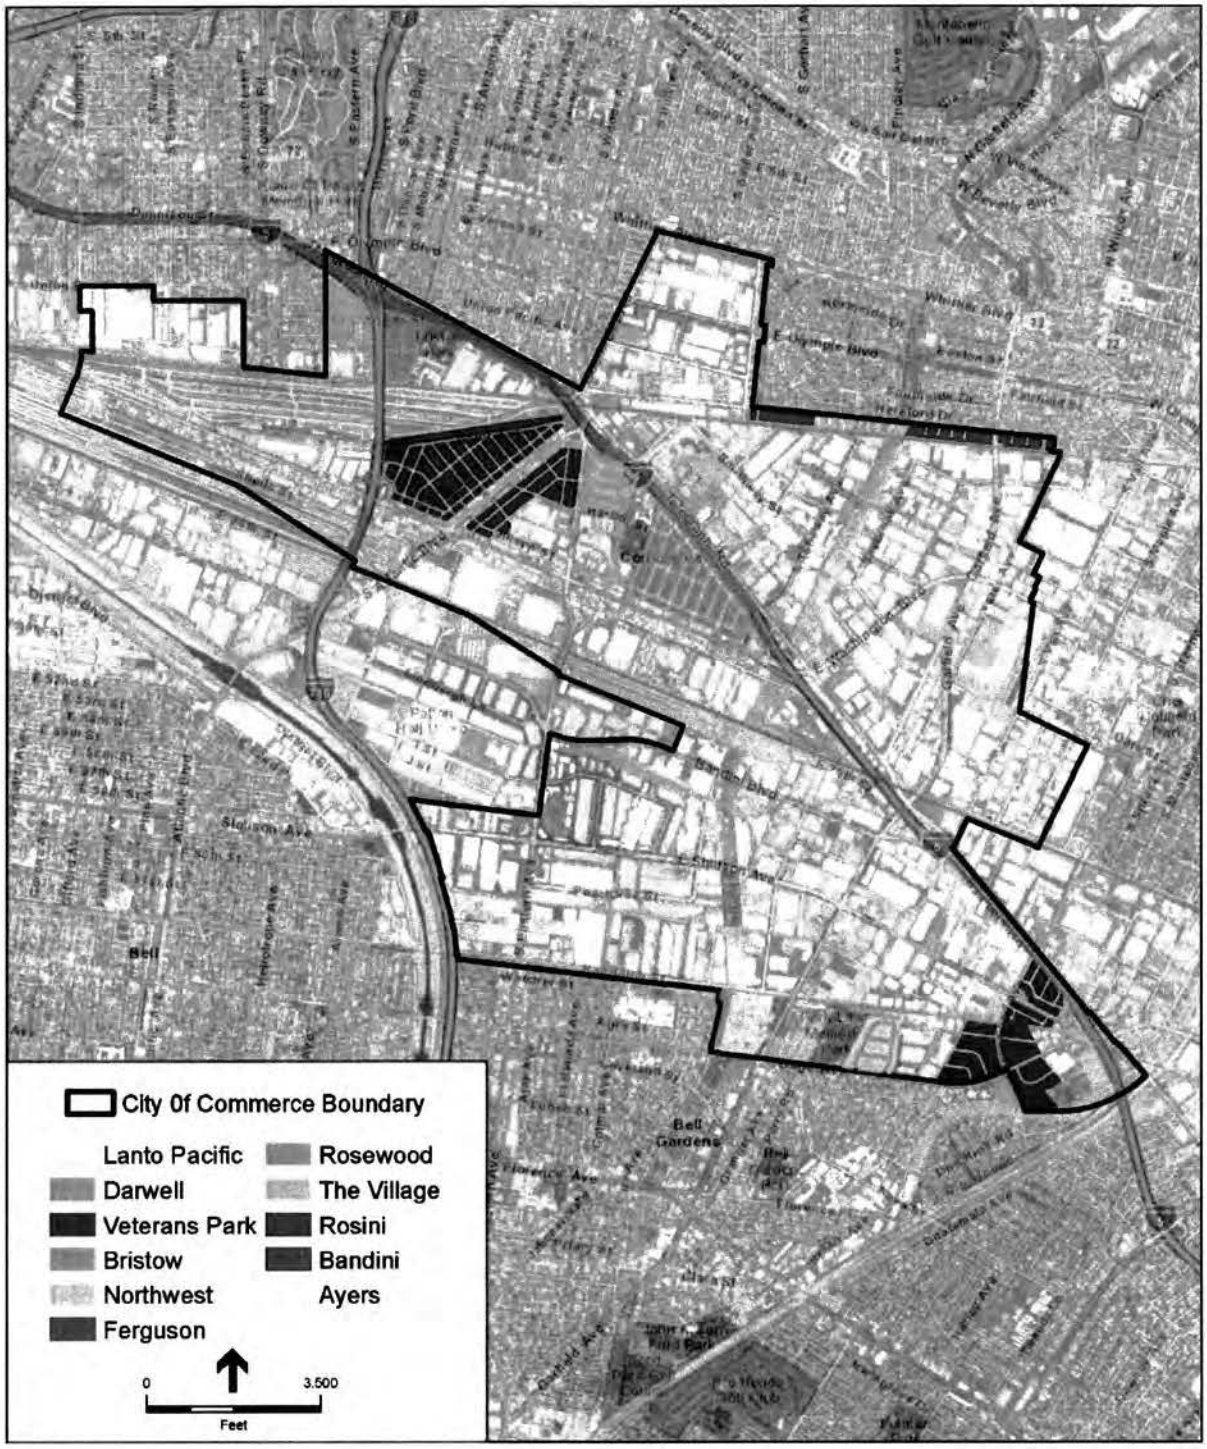
4.3.5 - Atlantic Washington Planning Area

The Atlantic Washington Planning Area consists of predominantly commercial uses, however a segment of Atlantic Boulevard located in this Planning Area has been designated as Mixed Use to promote the development of new residential uses in the area. This land use designation would permit residential development within those parcels that are currently developed as commercial. The purpose of this mixed-use designation is to promote residential and/or commercial uses as infill development.

4.3.6 - West Planning Area

Located directly west of the Atlantic Washington Planning Area, the West Planning Area is made up of predominately industrial and manufacturing uses; however a small portion of the eastern part of the Planning Area contains residential development. While the Ayers neighborhood already exists in the Planning Area, the City currently has no plans to develop any additional residential uses in the area.

4.3.7 - Ferguson Planning Area



The Ferguson Planning Area includes that portion of the City located south and adjacent to Ferguson Drive and west of Gerhart Avenue. Surrounding land uses include the Union Pacific Railroad right-of-way located immediately south of the Planning Area, and residential development opposite Ferguson Drive, located in an unincorporated portion of Los Angeles County. The land use policy for this Planning Area designates existing residentially developed properties as Low-Density Residential, and the balance of the industrial areas as Industrial. Implementation of such land use policy may result in the recycling of older residential units to new developments with lower densities.

4.4 – RESIDENTIAL NEIGHBORHOODS

In addition to dividing the City into planning areas Commerce has established identifiable residential neighborhoods. There are currently eleven residential neighborhoods:

- The Ayers neighborhood, in the northwestern portion of the City.
- The Bandini neighborhood, also in the northwestern portion of the City.
- The Bristow neighborhood, in the northern tip of the City where the I-710 meets the I-5.
- The Northwest neighborhood, in the northern tip of the City, west of the Bristow neighborhood.
- The Darwell neighborhood, located at the southwestern border of the City.
- The Ferguson neighborhood, in the northern half of the City along the railroad tracks.
- The Lanto Pacific neighborhood along the City's southern boundary.
- The Rosewood neighborhood in the center of the City adjacent to the I-5.
- The Rosini neighborhood also in the center of the City east of Atlantic Boulevard.
- The Village neighborhood in the center of the City south of Atlantic and Eastern Avenues.
- The Veterans Park neighborhood in the southern tip of the City.

The name of each neighborhood typically reflects the housing development that is included in the area. The location of each neighborhood is shown in more detail in **Figure 4-2**.

City of Commerce - Housing Element . 120811

Figure 4-2
Residential Neighborhoods

4.5 – Population Characteristics

Incorporated in 1960, the City of Commerce is a small jurisdiction encompassing 6.5 square miles in south central Los Angeles County. According to the U.S. Census, the City of Commerce had a population of 12,135 residents in 1990, and 12,568 residents by the year 2000. In the last decade, the City has generally maintained its size, with the 2010 Census reporting a population of approximately 12,823. Over the last decade, the City's population has increased by 255 residents, or 2.0 percent. Since 1970, the City's population has increased by approximately 2,188 persons, or 20.6 percent. **Table 4-2** presents population growth trends for the City of Commerce for the previous fifty years.

Table 4-2:
Population Growth Trends 1970-2011

Year	Population	Change (Number)	Change (Percent)
1970	10,635	--	--
1980	10,509	359	3.5%
1990	12,135	1,335	12.4%
2000	12,568	468	3.9%
2011	12,823	255	2.0%

Source: U. S. Bureau of the Census 1970- 2000. 2007-2011 American Community Survey 5-Year Estimates.

The City's average household size has increased over the last three decades indicating a trend towards larger families. In 1980, the U.S. Census reported the City's average household size to be 3.59 persons. By 1990, the average household size had increased to 3.7 persons, while the 2000 U.S. Census, reported the City's average household size as 3.80 persons per unit. More recently, the 2007-2011 American Community Survey estimates that the City's average household size has continued to increase above the 2000 level to 3.88 persons per household. In comparison, the average household size for the City of Commerce was higher than the average reported for Los Angeles County, which in 2011 estimated to be 2.99 persons per household.

4.5.1 – Age Composition

According to the 2007-2011 American Community Survey, 908 persons (7.1 percent) living in the City were under 5 years of age. A total of 3,525 persons (27.6 percent) were between 5 years and 19 years of age. Roughly 46 percent or 5,936 persons were between the ages of 19 and 54 and, 1,000 persons (7.8 percent were between the ages of 55 and 64 years of age. Finally, there were approximately 1,422 residents in the City over the age of 65, or roughly 11 percent. The median age for the City of Commerce is 30.3 years, which is significantly less than the national average of 37 years. Corresponding statistics for Los Angeles County indicated a median age of 34.6 years. These statistics indicate that the City's population growth was attributed to both natural increases (increased birth rates) and to in-migration. The City's population is also significantly younger overall, compared to the age of the larger regional population. **Table 4-3** shows the age distribution of the population of the City of Commerce according to the 2007-2011 American Community Survey.

Table 4-3: Age Distribution

Race/Ethnicity	Number	Percent
Preschool (0-4 years)	908	7.1%
School (5-19 years)	3,525	27.6%
Prime Working (30-54 years)	5,936	46.4%
Retirement (55-64 years)	1,000	7.8%
Senior Citizen (65+ years)	1,422	11.1%
Total	12,791	93.6

Source: 2007-2011 American Community Survey 5-Year Estimates.

4.5.2 – RACE AND ETHNICITY

The racial and ethnic composition of a community affects housing needs due to the particular household characteristics of different groups. **Table 4-4** shows the changes in the racial/ethnic composition of Commerce residents in 2010.

Table 4-4:
Race and Ethnicity: 2010

Race/Ethnicity	Number	Percent
White[1]	7,712	60.3%
African-American	272	2.1%
Asian/Pac. Islander	232	1.8%
American Indian	111	0.9%
Other	3,995	31.2%
Two or More Races	469	3.7%
Total	12,791	100.0
Hispanics [2]	12,087	94.5%

Source: 2007-2011 American Community Survey 5-Year Estimates.
1. Hispanic persons are not included.
2. Hispanics are considered an ethnicity rather than a race. Source: U. S. Census, 2010.

Between 2000 and 2010, there was a continuing shift in the racial/ethnic composition in the City of Commerce, most significantly a further increase in the number of Hispanic residents. The 2010 Census indicates that approximately 95 percent of residents living in the City identify themselves as Hispanic, an increase of 1.0 percent from 2000. Looking to **Table 4-4**, it is likely that people, classified as "White" and "Other", represent the Hispanic population in the City. The second most predominant group in the City were people of Two or More races, making up 3.7 percent of the total, followed by Black residents who comprise approximately 2 percent of the population. Generally, most racial groups experienced a slight increase as the City's population continued to grow.

4.5.3 - EMPLOYMENT CHARACTERISTICS

According to the State of California Employment Development Department (EDD), there are approximately 55,000 jobs in the City. According to SCAG projections developed for the Regional Transportation Plan, the number of jobs in Commerce is projected to increase by 2,170 jobs by the year 2020.

Of the 9,557 residents age 16 or older living in the City, there are approximately 5,379 actively working in the civilian labor force. Of this total, approximately 4,798, or 89.3 percent are employed, and 572, or 10.7 percent, are unemployed. Residents living in the City of Commerce are employed in a diverse number of industries, with the largest percentage (21 percent) of the population employed in the Educational services, and health care and social assistance sector. The 2007-2011 ACS indicates that changes have occurred in the last ten years, as the Manufacturing sector was the predominant industry in 2000. **Table 4-5** presents the number of employees by sector in 2010. Despite the changes reported over the previous decade, the Manufacturing sector is still the second highest with 15.2 percent of residents employed in related jobs.

Table 4-5: Employment by Sector

Industry Sector	Jobs	Percent
Agriculture, forestry, fishing and hunting, and mining	63	1.3%
Construction	413	8.6%
Manufacturing	730	15.2%
Educational services, and health care and social assistance	1,011	21.2%
Wholesale trade	479	10.0%
Retail trade	408	8.5%
Transportation and warehousing, and utilities	266	5.5%
Information	55	1.1%
Finance and insurance, real estate and rental leasing	199	4.1%
Professional, scientific, management, and administrative services	339	7.1%
Arts, entertainment and recreation	343	7.1%
Public administration	178	3.8%
Other professions	314	6.5%
Total (civilian employed population)	**4,798**	**100%**

Source: 2007-2011 American Community Survey 5-Year Estimates.

4.6 - HOUSEHOLD CHARACTERISTICS

To better understand and plan for future housing needs of residents living in Commerce, housing occupancy characteristics need to be identified in the City. The following is an analysis of household types and sizes, income levels, and other household characteristics that may affect access and demand for housing and housing programs.

A household is defined by the Census as all persons occupying a housing unit. Families are defined by the Census as a subset of households and include all persons living together who are related by blood, marriage, or adoption. Single households include persons living alone in housing units, but do not include persons in group quarters such as convalescent homes or dormitories. Other households include unrelated people living together, such as roommates.

4.6.1 – HOUSEHOLD SIZE

The 2007-2011 American Community Survey reports an estimated, 3,246 households living in Commerce, a slight decrease from 3,284 households identified in 2000. The distribution of households as indicated by 2007-2011 American Community Survey indicates that approximately 80 percent of all households in Commerce are families. Families headed by single parents made up 31 percent of all households, an increase from 25 percent in 2000. This special needs group will be addressed in later sections. **Table 4-6** shows the change in the number of households from 1990 to 2009.

Table 4-6:
Household Growth Trends (1990 - 2010)

Year	Households	Numerical Change	Annual Percent Change
1990	3,249	--	--
2000	3,284	35	0.11%
2010	3,246	-38	-1.1%

Source: U.S. Census 1990 Summary Tape File 1 (STF1); U.S. Census 2000 Summary File 3 (SF3); 2007-2011 American Community Survey 5-Year Estimates

Table 4-7 indicates that in 2010 the highest percentage of households in the City of Commerce (19.8%) were three-person households, a shift from four-person households which were predominant in 2000. It is important to note that almost half the households in the City in 2010 had four or more occupants and there was a significant jump in the number of six person households from 9.5 to 14.6 percent. Generally, the average household size in the City is estimated to be 4.32 occupants for owner occupied units and 3.46 occupants for renter occupied units. In comparison, Los Angeles County is reported to have an average household size of 3.18 occupants for owner occupied units and 2.81 occupants for renter occupied units. As the City experiences a high number of large households and a high average household size, it is important to ensure that larger units with an adequate number of rooms are available to accommodate the identified need.

Table 4-7: Number of Persons in Household

Number of Persons per Household	2000		2010	
	Number	Percent	Number	Percent
1 Person	508	15.5%	478	14.7%

4.6.2 – HOUSEHOLD COMPOSITION

Household composition and size are often two interrelated factors as communities with a large proportion of families with children tend to have a large average household size. Such communities have a greater need for larger units with adequate open space and recreational opportunities for children. Household size in Commerce remains higher than that of Los Angeles County. The City of Commerce average household size in 2010 was 3.88 according to the 2007-2011 American Community Survey 5-Year Estimates, as compared to the County average household size of 2.99.

To better understand types of households in Commerce, **Table 4-8** describes household size by renter and owner. Based on 2011 ACS data, it appears that among both renters and owners, there is a strong need for two and three bedroom units to accommodate the larger number of two to four person households. The Census also indicates that roughly one-third of the City's households have five or more persons. For these households, units with three or more bedrooms are best able to meet their needs.

Table 4-8: Household Size by Tenure

	Renter		Owner	
	Number	Percent	Number	Percent
1 Person	285	17.3%	193	12.1%
2 Persons	393	23.9%	242	15.1%
3 Persons	375	22.8%	268	16.7%

Average Household Size	**3.46**		**4.32**	

Source: 2007-2011 American Community Survey 5-Year Estimates

4.6.3. OVERCROWDING

The federal government defines an overcrowded household as one with more than one occupant per room, excluding bathrooms, kitchens, hallways, and porches. An overcrowded household results from either a lack of affordable housing (which forces more than one household to live together) and/or a lack of available housing units of adequate size. A household is considered to be overcrowded if there are more than 1.01 occupants per room. A household is considered to be severely overcrowded if there are more than 1.51 occupants per room.

Table 4-9: Overcrowding by Tenure

Tenure	Total Occupied Housing Units	Overcrowded Households	Percentage	Severely Overcrowded Households	Percentage
Renters	1,602	352	21.9%	76	4.7%
Owners	1,644	243	14.8%	222	13.5%
Total	3,246	595	18.3%	298	9.2%

Source: U.S. Census Bureau, 2007-2011 American Community Survey.

According to the 2007-2011 American Community Survey, 595 households, or 18 percent of all households in Commerce were overcrowded. Of this total approximately 352 were renter households, representing 59 percent of all overcrowded households and 22 percent of all renter households. In comparison, the number of owner occupied units that are classified as overcrowded was 243 households, representing 31 percent of all overcrowded households and 15 percent of all owner occupied units.

As shown in **Table 4-9**, the 2007-2011 American Community Survey also reports that approximately 298 households, or roughly 9 percent of all households in Commerce, that are considered to be severely overcrowded. Generally, the number of renter occupied units that were severely overcrowded (4.7 percent) was lower than the number of owner occupied units considered to be severely overcrowded (13.5 percent).

The incident of severe overcrowding is high in the City. In comparison in the County of Los Angeles approximately 7.1 percent of households were overcrowded and 4.8 percent of households were severely overcrowded. Overcrowding is an important housing issue for the City to monitor as overcrowded households can lead to neighborhood deterioration due to the intensive use of individual housing units leading to excessive wear and tear, and the potential cumulative overburdening of community infrastructure and service capacity. Furthermore, overcrowding in neighborhoods can lead to an overall decline in social cohesion and environmental quality. Such decline can often spread geographically and impact the quality of life and the economic value of property and the vitality of commerce within a City. The City is aware and has been told by businesses that increasing the housing stock should be a priority.

4.6.4 – HOUSEHOLD INCOME

According to the 2011 American Community Survey the median household income for Los Angeles County was $52,280. A more recent calculation completed by the Department of Housing and Urban Development (HUD) indicates that for Los Angeles County the area median income for 2012-13 was $70,100. In comparison to the County, the Census indicates that the City of Commerce experiences a lower household median income of $48,878. While Commerce still lagged the County in median household income, the City has experienced a 44 percent increase from 2000 to 2010. The income estimates for Commerce total households for the year 2000 and 2010, are found in **Table 4-10**.

Table 4-10: Household Income

Income	2000		2010	
	Households	Percent	Households	Percent
$0-$14,999	706	21.5%	459	14.1%
$15,000-$34,999	669	20.4%	750	23.1%
$35,000-$49,999	612	18.6%	458	14.1%
$50,000-$74,999	592	18.0%	596	18.4%
$75,000-$99,999	218	6.6%	485	14.9%
$100,000-$149,999	170	5.2%	338	10.4%
$150,000+	23	0.7%	160	5.0%
Total	**3,293**	**100%**	**3,246**	**100%**
Median Household Income	$34,040		$48,878	

Source: 2007-2011 American Community Survey 5-Year Estimates

The 2011 ACS indicates the median household income in the City is $48,878. This is a significant increase from the 2000 median of $34,040. In 2000, it was estimated that: over 20 percent of households earned less than $14,999 annually; this number decreased to 14 percent of households in 2010. The 2010 Census also reported that approximately 23 percent of households earned between $15,000 and $34,999 annually; 14 percent earned between $35,000 and $49,999 annually; 18 percent earned between $50,000 and $74,999 annually; and more than 30 percent of households earned above $75,000 annually. It is important to note that in addition to the increase in median household income over the last decade the percentage of households earning greater than $75,000 annually also increased substantially from 13 percent to more than 30 percent.

In identifying housing needs, State law recent established that jurisdictions must now identify and address the needs of extremely low-income (ELI) households. An ELI household is defined as any household earning less than 30% of the area median income which for Los Angeles County would equate to less than $21,030 annually. Extremely low-income families are often considered "at-risk" as they may be only one paycheck away from homelessness. According to the 2011 ACS there are approximately 900 households or 28% or the total households in the City of Commerce that earn below 30% of the Los Angeles AMI. To address the needs of Extremely Low Income households the City has determined that

half (9 units) of its very low income RHNA allocation will be dedicated to meet the needs of ELI households. Additionally, the City recently amended the Zoning Code to addresses the housing needs of extremely low income households by allowing for transitional housing, emergency housing and single room occupancy units to be constructed in identified zones by-right. The City has also created and will continue to fund the Senior Rent Subsidy Program which provides lower income senior residents with a subsidy to assist in paying their monthly rent.

4.6.5 - HOUSING OVERPAYMENT

State and Federal standards indicate that a household paying more than 30 percent of its income for housing is overpaying. Overpayment for housing can cause an imbalance on the remainder of a household's budget. The 2007-2011 American Community Survey, indicates that there were 3,246 total households paying mortgage or rent, of those households 1,587 households (49 percent) were overpaying for housing. Of these overpaying households, 676 (42 percent) were households with a mortgage, while the remaining 911 households (58 percent) were in renter-occupied units. **Table 4-11** summarizes housing overpayment statistics by tenure for the City of Commerce and also Los Angeles County based on the 2007-2011 American Community Survey Five-Year Estimates.

Table 4-11:
Summary of Housing Overpayment

Overpayment	Households	Percent	LA County Percent
Owners with mortgage	1,602[a]	--	--
Overpayment (>30% income on housing)	676	44.2%	55.1%
Occupied units paying rent	1,644	--	--
Overpayment (>30% income on housing)	911	55.4%	56.5%

Source: U.S. Census Bureau, 2007-2011 American Community Survey
Notes:
(a) The number of households represents the number of owner occupied housing units with an active mortgage, and may not match the total number of owner occupied households in the City.

4.7 – HOUSING STOCK CHARACTERISTICS

4.7.1 - HOUSING UNIT TYPES

According to the 2007-2011 American Community Survey Five-Year Estimates, there were 3,388 housing units in the City. **Table 4-12** compares the ACS estimates for the City with those of Los Angeles County.

Table 4-12:
Housing Unit Type

Unit Type	Los Angeles County		City of Commerce	
	Number	Percent	Number	Percent
Single-Family Detached	1,713,982	49.9%	2,299	67.9%
Single-Family Attached	226,826	6.5%	296	8.7%
2-4 Units	280,110	8.1%	246	7.3%
5+ Units	1,159,643	33.8%	547	16.1%
Mobile Homes/Other	57,023	1.7%	0	0.0%
Total	**3,418,698**	**100.0%**	**3,388**	**100.0%**

Source: U.S. Census Bureau, 2007-2011 American Community Survey

As shown in **Table 4-12**, 75 percent of the total housing units in the City are single family attached or detached units. Within the City an additional 7 percent of units were in structures with 2 to 4 units and 16 percent of units are in structures with 5 or more units. While manufactured units and mobile homes are permitted in the City, no such units are presently located in Commerce. In comparison to Los Angeles County, the City has a higher percentage of single family detached units and far fewer multi-family units.

4.7.2 – VACANCY RATES

The vacancy rate of a community's housing supply is a key indicator of whether an appropriate number of units are available in the City. If the vacancy rate is too high, this can have negative impacts on the community and the investment potential of a neighborhood. If the vacancy rate is too low, it may indicate that there are not enough units for any one income category to meet existing market demands, and that a portion of the population may be denied housing opportunities. The California State Department of Housing and Community Development has determined that the "healthy" vacancy rate for ownership is between 2 percent and 3 percent and 5 percent to 6 percent for rental complexes. This ensures the continued upkeep of rental properties and keeps housing costs down.

The 2007-2011 American Community Survey reported that the vacancy rate for ownership housing in the City was 3.1 percent while the rate for rental units was 0 percent. The vacancy rate for ownership housing is considered to be healthy based on the range recommended by HCD, while the rental housing vacancy rate is significantly lower than the target rate. These percentages suggest that there are few to no vacant rental housing units in the City which often results in higher rents as demand far exceeds supply.

This may be a reflection of the limited number of housing units in the City, the high jobs to housing ratio, and the desire of workers to live close to where they are employed.

4.7.3 - HOUSING CONDITION

Age is one measure of housing stock condition and a factor for determining rehabilitation or replacement need within the City. Without proper maintenance, housing units deteriorate over time. Units that are older are more likely to be in need of repairs (e.g. a new roof or plumbing). In general, houses 40 years or older are considered aged and are more likely to generate major repairs. In addition, older homes may not be built to current housing standards for fire and earthquake safety. The units of general concern are those that were constructed prior to 1969.

Majority of the City's current housing stock (67 percent) was constructed prior to 1969. The 2007-2011 ACS showed that Commerce has only 823 units that were constructed after 1980, or 24 percent of the total housing stock. **Table 4-13** provides information on the number of units constructed by decade. In addition to age, a lack in infrastructure and utilities often serves as an indicator of substandard conditions. According to the 2011 ACS, there were only 20 units lacking complete plumbing facilities, and 6 units lacking complete kitchen facilities in the City. Due to the number of units built prior to 1969, the City is aware that their rehabilitation programs and outreach to residents is crucial to update and maintain the existing housing stock.

Table 4-13: Age of Housing Stock

Age of Structure	Number	Percent
1939 or earlier	304	9.0%
1940-1949	730	21.5%
1950-1959	838	24.7%
1960-1969	400	11.8%
1970-1979	293	8.6%
1980-1989	493	14.6%
1990-1999	220	6.5%
2000 or later	110	3.2%
Total	**3,388**	**100%**

Source: U.S. Census Bureau, 2007-2011 American Community Survey

During the previous planning period, a housing condition survey was conducted to assess the magnitude of rehabilitation needs in the City. The survey identified approximately 74 units that needed rehabilitation and 10 units needing replacement. The City has successfully addressed a number of units through the Substantial Rehabilitation Program and their smaller grant programs; however there are still units in need of repairs. The City's Northwest Neighborhood contained the highest percentage of substandard and dilapidated units, with over 20% of the units in some state of disrepair. In this area the age of the housing stock is a major contributing factor to overall housing conditions in the City. In general the housing stock throughout the City is in good shape and is less than 50 years old.

Approximately 51.2% of the existing units in the City were constructed prior to 1960 with 20.9% constructed after 1980.

4.7.4 - HOUSING COSTS

This section discusses new home prices and resale costs of existing housing, as well as the average rental prices, in the City. The information provided was obtained from reliable real estate industry data sources, the 2010 Census, 2007-2011 American Community Survey (ACS) and data provided by the City.

Affordability is determined by comparing the cost of housing to the income of local households. HUD defines affordable housing costs as contract rents or mortgage payments, including taxes and insurance, but not utilities, that are equal to or less than 30 percent of the gross income of very low-, low-, and moderate-income households.

Households spending more than 30 percent of gross annual income on housing experience a housing cost burden, which occurs when housing costs increase faster than household income. When a household spends more than 30 percent of its income on housing costs, it has less disposable income for other necessities such as health care. Lower income households with a burdensome housing cost are more likely to become homeless or experience overcrowding. Homeowners with a housing cost burden have the option of selling the homes and becoming renters. Renters, however, are vulnerable and subject to constant changes in the housing market.

For purposes of determining housing affordability, the California Health and Safety Code Section 50052.5 provides the following definition of affordable housing cost based on the area median income (AMI), which is adjusted by family size and income level for each multi-family income (MFI) range.

Table 4-14:
Calculation of Affordable Housing Costs by Tenure

Income Level	Owner	Renters
Extremely Low-Income(0-30% MFI)	30% of 30% AMI	30% of 30% AMI
Very Low-Income (0-50% MFI)	30% of 50% AMI	30% of 50% AMI
Low-Income (51-80% MFI)	30% of 70% AMI	30% of 60% AMI
Moderate-Income (81-120% MFI)	35% of 110% AMI	30% of 110% AMI

Source: California Health and Safety Code Section 50052.5

In 2010, Census data indicated that for owner-occupied housing units, the majority of the monthly mortgage payments in the City were more than $2,000 a month with the median being $1,994 per month. The median monthly payments for owners increased substantially from $1,256 in 2000 to $1,994 in 2010, or approximately 60 percent. A household was considered to be overpaying for housing if more than 30% of their net "take-home" income was used for paying rent or mortgages. According to the 2007-2011 ACS, 657 households (55 percent of the total owner-occupied units with a mortgage) living in owner-occupied units paid in excess of 30 percent of their monthly income towards the mortgage. According to the 2007-2011 ACS estimates, 911 renter households (56 percent of the total renter households) paid in excess of 30% of their monthly income towards the rent.

4.7.4.A - For Sale Housing

In the City of Commerce there are approximately 3,388 occupied housing units according to the 2007-2011 American Community Survey. Of this total roughly 2,595 units were owner occupied units, the majority of which are single family detached homes. Despite the recession that occurred in 2008, home prices in the Southern California area remain some of the most expensive in the United States. Key contributors to the area's high cost for housing include the following:

- While some vacant property is available for new residential development, the majority of the new residential construction will occur on land that is presently occupied by existing development. The demolition, removal, and clean-up of these existing properties contribute to the higher cost of development.
- An earlier 1984 study prepared by the California Homebuilders Association indicates that less than 15 percent of first-time homebuyers in the State were willing to accept condominiums as a housing choice. This trend is continuing, as shown in part by the number of condominiums developed in the area since the early 1990s and continuing to the present. Thus, one of the few market devices available to counteract high land prices is burdened by the psychological attachment of the population to traditional housing stock.
- During the latter part of the 1990s, interest rates were generally low. In 2000, interest rates were raised by the Federal Reserve though they were once again lowered in the years following 2008 in response to the recession. Despite locked in low interest rates, the lack of inventory has kept housing prices high.
- In general, the cost (market-rate) for new land in the City ranges from $10/square foot up to $15/square foot. The actual construction cost for residential development ranges from $100/square foot up to $130/square foot. Real estate data was collected for the City in 2005 to determine the "asking price" of for-sale units and the asking monthly rents for rental units. The survey identified a total of 18 for-sale units and 10 rental units.

Table 4-15 compares the value of for-sale ownership housing units in the City according to the 2000 Census and 2007-2011 ACS. The median housing unit value in 2000 was approximately $219,100 in Commerce, which was slightly higher than the County median value of $170,900 in the same year. The median for Commerce increased to $366,000 in 2010, representing a 67 percent increase. **Table 4-15** generally indicates that from 2000 to 2010 home values changed considerably. The 2000 Census reported that roughly 43 percent of the houses were valued at less than $150,000, which was reduced to only 7.1 percent in 2010. In 2000 the majority of homes were valued between $150,000 and 199,999 (40 percent) while in 2010 the majority of homes were valued between $300,000 and $399,999 (56 percent). Generally, **Table 4-15** shows that home values are increasing, which may be a reflection of low vacant rates.

Table 4-15: Housing Values

Price Range	2000		2010	
	Number	Percent	Number	Percent
Less than $50,000	22	1.4%	28	1.7%
$50,000-$99,999	107	6.8%	11	0.7%
$100,000-$149,999	545	35.0%	75	4.7%
$150,000-$199,999	620	39.8%	15	0.9%
$200,000-$299,999	249	16.0%	348	21.7%

Source: Census 2000 Summary File 3 (SF 3), U.S. Census Bureau, 2007-2011 American Community Survey

Redfin, an online real estate website provides market trend overviews for jurisdictions, including detailed information on the number and price of home sales on an annual basis. In 2012, Redfin reports that there were 12 homes sold in the City of Commerce at a median sales price of $228,000. **Table 4-16** provides information about the County and home prices in surrounding cities as reported by Redfin in January 2013. For all of the jurisdictions shown, including Los Angeles County, there has generally been an increase in the home sales prices from January 2012 to January 2013. Commerce is one of the only cities in its region that experienced a decrease in the median sales price during this period of time. With regard to price per square foot, Commerce has one of the higher ratios, comparable to Pico Rivera and only slightly lower than Los Angeles County overall.

Table 4-16: Median Home Prices

Jurisdiction	Homes Sold in 2012	Median Sales Price (Jan 2013)	Percent Change (from Jan 2012)	Price per Square Foot
Commerce	12	$228,000	-3.1%	$232
Bell	18	$250,000	16.8%	$190
Downey	193	$372,000	13.9%	$215
Maywood	28	$228,000	26.4%	$215
Montebello	68	$296,000	18.6%	$202
Pico Rivera	128	$278,000	11.0%	$232
Los Angeles County	14,400	$335,000	15.6%	$244

Source: Redfin.com, Accessed March 1, 2013.

Despite the recent drop in home prices, the cost of housing in Southern California in general remains high in comparison to the nation as a whole. This is of great concern not only for low-income families who

often cannot afford a large down payment, but is increasingly impacting middle class and workforce families (i.e. teachers, firefighters etc) that are struggling to afford a decent home. While much of the region is expected to see home prices decline following the sub-prime mortgage market collapse of 2007, overall home sale prices throughout Southern California will continue to be dramatically higher than in 2000.

4.7.4.B - Rental Housing

According to the 2007-2011 American Community Survey Estimates, there were 3,388 total occupied units in Commerce. Of this total, approximately 793 units (23 percent) were renter-occupied units in buildings with 2 or more units. For renters, the median gross rent per month increased from $623 in 2000 to $893 in 2010. This increase represents a 43 percent increase over the ten year period, or 4.3 percent annually. The median gross rent dollar amount refers to the contract rent (i.e., monthly rent agreed to, or contracted for) plus the estimated average cost of utilities and fuels if paid for by the renter. In comparison to surrounding jurisdictions, the median rent paid in Commerce is the lowest in the region. **Table 4-17,** provides the median housing rental rates for Commerce and surrounding jurisdictions as reported by the 2007-2011American Community Survey.

Table 4-17:
Median Housing Rental Rates

Jurisdiction	Median Gross Rent
Commerce	**$893**
Bell	$979
Downey	$1,139
Maywood	$962
Montebello	$1,100
Pico Rivera	$1,123
County of Los Angeles	$1,117

Source: U.S. Census Bureau, 2006-2010 American Community Survey.

To further understand the rental housing market in Commerce **Table 4-18,** provides an estimate of rents based on the number of bedrooms per unit. The table indicates that the largest number of renter households pay more than $1,000 a month for rent and further illustrates that larger units are more costly which can create a housing burden for larger households.

Table 4-18:
Rents by Number of Bedrooms

Range	Studio	1 Bedroom	2 Bedroom	3 Bedroom+	Total	Total %
$0-$499	33	140	0	0	173	10.5%
$500-$749	45	152	62	62	321	19.5%
$750-$999	27	238	231	38	534	32.5%
$1000 or more	25	46	372	150	677	41.2%
No Rent	0	0	7	16	23	1.4%
Total	130	576	672	266	1,644	100%

Source: U.S. Census Bureau, 2007-2011 American Community Survey.

Finding rental information for Commerce was difficult, as the vacancy rate is reported to be close to zero in 2012. To verify the estimates reported by the Census, various internet rental listings were accessed including: Craig's List, Padmapper.com, and Southland Rental in February and March of 2013. On all three sites, no units were listed as available in the City. While the lack of rental units is a concern, new development is limited by the lack of vacant land and the numerous industrial developments in the area. To address the need for new residential development, specifically the creation of new rental units, the City has created the Housing Opportunity Overlay which is discussed in more detail in the Housing Resources section.

4.7.5 – Housing Cost and Affordability

The costs of home ownership and rent can be compared to a household's ability to pay for housing, using the 2013 HUD-established Area Median Family Income (MFI) limit for Los Angeles County of $61,900. **Table 4-19** illustrates maximum affordable mortgage payments and rents for a four-person household in Los Angeles County. Affordable housing cost is based on a maximum of 30 percent of gross household income devoted to mortgage or rental costs. These maximum affordable costs would be adjusted downward for smaller households, or upward for larger households.

Returning to **Table 4-16**, the median home price for the City of Commerce was $228,000 in 2012. Comparing this median price to **Table 4-19**, it is apparent that home prices in the City are affordable to most moderate income households, excluding single individuals. **Table 4-19** also shows that extremely low-, very low- and low-income households cannot afford the monthly mortgage payment. It is also important to note that saving up a 20 percent down payment ($45,600 for a $228,000 home) can be difficult for even a moderate income household. With regard to renters living in the City, **Table 4-17** shows that the median rent charged for housing was $893, according the 2007-2012 ACS. Comparing the median rent charged to the data provided in **Table 4-19**, to the information presented in **Table 4-17** the median rent charged in Commerce is affordable to all moderate income households and larger low income households with three or more people. Based on this information the City needs to focus on providing housing options for extremely low and very low income households.

Table 4-19:
Housing Affordability by Income Group

Income Group		AMI adjusted by size	Affordable Payment		Housing Costs		Maximum Affordable Price	
			Renter	Owner	Utilities	Taxes & Insurance	Owner	Renter

1. Property taxes and insurance based on averages for the region.
2. Calculation of affordable home sales prices based on a down payment of 20%, annual interest rate of 5%, 30-year mortgage, and monthly payment 30% of gross household income.
3. Based on 2013 Los Angeles County MFI $61,900 and 2012 HCD State Income Limits
4. Monthly affordable rent based on payments of no more than 30% of household income.

4.8 – Assisted Housing At-Risk of Conversion to Market Rate Housing

The City of Commerce has shown a strong commitment towards providing housing assistance to its low-income population. Over 300 units of affordable housing have been developed in Commerce since 1980. In the City there is a mix of both single family and multi-family housing as well as both rental and homeownership properties. There are currently three federally assisted multifamily rental complexes in Commerce with affordability covenants including: 55 units at the Rosewood Park Senior Apartments, 24 units at TELACU Gardens and 76 units at TELACU Manor. The City's most recent senior project, TELACU Manor, is a Section 202 project consisting of 76 units of rental housing for lower income seniors, developed in 1992. **Table 4-20** presents the multi-family rental complexes in the City with affordable units that receive federal funding.

Table 4-20:
Existing Affordable Units for Rent

Development Name	Very Low	Low	Moderate	Type of Assistance	Covenant Start	Covenant End

Total	**18**	**135**	**0**			

Source: City of Commerce, 2009

The City of Commerce also has a number of ownership units with deed restrictions, many of which have utilized City rehabilitation programs or were rehabilitated through partnerships with local non-profits (i.e. Habitat for Humanity) in exchange for long term affordability covenants. As shown in **Table 4-21**, there are at least 13 properties with affordability covenants that extend to 2023 and beyond. The majority of the housing units were assisted through the City's First Time Homebuyer Program, with two properties recently assisted through the Substantial Rehabilitation Program.

Source: City of Commerce, 2013.

A community's existing affordable housing stock is a valuable resource that should be conserved, and if necessary, improved to meet habitability standards. As shown in **Table 4-20** and **Table 4-21** there are three federally assisted apartment housing developments in Commerce, totaling 191 units of rental housing affordable to lower income households and 13 ownership units assisted through the First Time Home Buyer and Substantial Rehabilitation Programs.

A City housing conservation program, Monitor and Preserve Affordable Housing, Program 1.6 in the Housing Plan is specifically designed to monitor the continued participation of these projects that participate in the HUD Section 221 and Section 8 programs. The City will continue to inventory and gather information to establish an early warning system for publicly assisted housing projects that have the potential to convert to market rate. This early warning system will include a regular and periodic review of the conversion status of all subsidized housing in the City. The City has also created a database that includes the identification of all subsidized units including those that have resale covenants. Once

the City receives notice of a potential conversion of the federally assisted units, the Housing Division will contact the owners to ascertain what will be required to extend the participation of these projects in the HUD assisted programs.

In the upcoming planning period, there are no multi-family housing developments with affordable rental units at risk of conversion to market-rate. The City understands that the cost to replace at-risk developments converted to market rate rents is prohibitive. In general, the cost for new land in the City ranges from $10/square foot up to $15/square foot. The actual construction cost for residential development ranges from $100/square foot up to $130/square foot. The cost for replacing a 50-unit rental property would total roughly $6,000,000. This figure assumes that 2.3 acres of land would be required (2,000 square feet/unit) and each unit would have a total floor area of 850 square feet (two-bedrooms). The land cost would total approximately $1,250,000 while the construction cost would total approximately $5,525,000 (assuming a total floor area of 42,500 square feet). There are a number of housing providers that have been identified by the State HCD as candidate entities that could assume responsibility for at-risk units if they convert to market rate units:

- Community Development & Preservation, LLC;
- MBK Management Corporation;
- Community Rehabilitation Services, Inc;
- East Los Angeles Community Corporation
- FAME Housing Corporation;
- Los Angeles Center for Affordable Tenant Housing;
- Los Angeles Housing Partnership, Inc.;
- Los Angeles Low Income Housing Corp. (LALIH); and,
- The East Los Angeles Community Union (TELACU).

The City maintains partnerships with several of the developers identified above in order to maintain existing affordable units and create new affordable developments.

4.9 – SPECIAL HOUSING NEEDS GROUPS

Local housing elements must include an analysis of special housing needs. Special needs refer to those households that include the elderly, disabled, developmentally disabled, large families, and overcrowded households.

4.9.1 - SPECIAL NEEDS - ELDERLY

The elderly can be expected to increase as those persons between the ages of 35 and 64 grow older. Escalating housing costs, particularly in the rental market, severely impact housing affordability for the elderly, who are usually on fixed incomes. The housing needs of the elderly can be addressed through the provision of smaller units, congregate housing, and rental and rehabilitation assistance programs. The special needs of many elderly households result from their lower, fixed incomes, physical disabilities, and dependence needs. The elderly comprised 11.1% (1,422 persons) of the City's population up from 10.2% (1,281 persons) in 2000. In 2010, there were 715 households headed by seniors, aged 65 or older, a slight decrease from 981 households in 2000. The most recent Census figures indicated that 456 households had a head of household over 65 years of age in owner occupied units (29 percent of the total owner occupied units) and 263 senior headed households resided in rental units (16 percent of the total renter occupied units).

4.9.2 - DISABLED

Disabled persons have special needs when it comes to housing and many of the households in the category are occupied by elderly persons. Door frames must be wider to accommodate wheel chairs, ramps instead of stairs are needed, hand rails in bathrooms need to be installed, cabinet doors must be accessible, and light switches and other devices also need to be within easy reach. The cost for retrofitting an existing structure may be thousands of dollars and be beyond the reach of those households with lower incomes. The lack of such housing is even more pronounced when it comes to market-rate rental units. Unless such provisions are made for disabled persons during original construction, such facilities will not likely be provided in a typical rental unit. Senior housing (both owner and rental) generally has many of the features outlined above. The real constraints are associated with the housing for families and working-aged adults.

Unfortunately, data for the number of residents with a disability is not provided by the 2010 Census or the American Community Survey for the City of Commerce. This may be due to the small number of residents living in the City. The most recent 2000 Census identified a total of 732 working aged adults with physical disabilities living in the City. **Table 4-22** provides additional information on the number and type of disabled residents living in the City.

Table 4-22:
Disability Type by Age, 2000

Disability Type	16-64 Years of Age	65 Years or Over	Total	Percent
Sensory Disability	68	173	241	1.9%
Physical Disability	308	426	734	5.7%
Mental Disability	277	180	457	3.6%
Self Care Disability	113	182	295	2.3%
Go-outside-home Disability	896	386	1,282	10.0%
Employment Disability	1,083	N/A	1,083	8.4%
Total with Disability	**1,524**	**623**	**2,165**	**16.8%**

Source: U.S. Census 2000 Summary File 3 (SF3).

To estimate how the number of disabled residents may have changed since 2000, **Table 4-23** provides the number and percentage of disabled residents for the County of Los Angeles and applies those percentages to the City of Commerce to project the number of residents

Table 4-23:
Disability Type by Age, 2010

	Los Angeles County[1]		Commerce[2]	
Disability Type	**Number**	**Percent**	**Number**	**Percent**
Hearing Difficulty	232,959	2.4%	302	2.4%
Vision Difficulty	182,104	1.9%	239	1.9%
Cognitive Difficulty	347,902	3.6%	453	3.6%
Ambulatory Difficulty	513,272	5.3%	668	5.3%
Self Care Difficulty	254,139	2.6%	327	2.6%
Independent Living Difficulty	395,484	4.1%	517	4.1%
Total with a Disability	**910,294**	**9.3%**	**1,172**	**9.3%**

Notes:

1. Based on information provided by the 2007-2011 American Community Survey.
2. Estimates based on a total population of 12,603 residents and the percentages reported for Los Angeles County.

Table 4-22 shows a total of 2,165 persons 16 years and older in the City of Commerce with a disability. Based on the percentages reported for Los Angeles County by the 2010 Census, the City of Commerce would have approximately 1,172 residents living with a disability. This would represent a decrease in the number of individuals experiencing a disability from 2000 to 2010. It is difficult to compare these figures, as the classifications have changed from the 2000 to the 2010 Census, and the City of Commerce is a small jurisdiction that has unique characteristics that do not necessarily represent the County.

Under Senate Bill (SB) 520, which became effective January 1, 2002, the City is required to analyze potential and actual constraints that could affect the development, maintenance and improvement of housing for persons with disabilities. In the event that these constraints are governmental, the Element must identify those measures that will be effective in removing the constraints that may hinder the City from meeting the need for housing for persons with disabilities.

In accordance with SB 520, a review of zoning and land use, development procedures, policies, and practices, and building codes was conducted in order to identify any potential constraints that could affect the provision of housing that would be accessible to persons with disabilities. The results of this analysis are summarized below according to three general categories of potential constraints: 1. zoning and land use, 2. permits and processing procedures, and 3. building codes.

- **Zoning and Land Use.** The Zoning Ordinance does not preclude or restrict the construction of exterior ramps or other improvements (exterior or interior) for disabled persons. The City treats residential care facilities with six or fewer persons as a single-family use. These facilities are allowed by right in any zone where single-family homes are permitted under State law. The City's Zoning Ordinance also permits reduced off-street parking space requirements for seniors though no such allowance is specifically identified for persons with disabilities. A program has been added to the City's Housing Program in order to address potential constraints.
- **Permits and Processing Procedures.** There are no permit requirements for residential care facilities serving six or fewer persons. In general, no special design or permitting standards have been established for residential care facilities. The City has no occupancy standards that specifically apply to unrelated adults. Requests to retrofit homes for disabled accessibility or for reasonable accommodation are handled as any other building permit or variance application.
- **Building Code.** The City has adopted the Uniform Building Code and the most recent Los Angeles County Code which includes provisions of the Americans with Disabilities Act. One provision is that a number of the residential units in new multi-family construction of three or more apartments, or four or more condominiums, must be accessible or adaptable. The City has added no amendments to the Building Code that would place constraints on accommodation of persons with disabilities.

Based on a review of City development procedures and policies, no specific constraints were identified. The City currently considers reduced parking requirements for group care housing and streamlined review for applications that involve the retrofit of existing units to accommodate reasonable access. In summary, the City's zoning ordinance does not contain any provisions that would preclude the development of housing for handicapped persons. There are no zoning restrictions that limit the use of ramps, wider doorways, or other features desirable in such units. No additional review or development standards are required for handicapped units beyond that required for all units.

4.9.3 – DEVELOPMENTALLY DISABLED

According to Section 4512 of the California Welfare and Institutions Code a "Developmental disability" means a disability that originates before an individual attains age 18 years, continues, or can be expected to continue, indefinitely, and constitutes a substantial disability for that individual which includes mental retardation, cerebral palsy, epilepsy, and autism. This term shall also include disabling conditions found

to be closely related to mental retardation or to require treatment similar to that required for individuals with mental retardation, but shall not include other handicapping conditions that are solely physical in nature.

Many developmentally disabled persons can live and work independently within a conventional housing environment. More severely disabled individuals require a group living environment where supervision is provided. The most severely affected individuals may require an institutional environment where medical attention and physical therapy are provided. Because developmental disabilities exist before adulthood, the first issue in supportive housing for the developmentally disabled is the transition from the person's living situation as a child to an appropriate level of independence as an adult.

The State Department of Developmental Services (DDS) currently provides community based services to approximately 243,000 persons with developmental disabilities and their families through a statewide system of 21 regional centers, four developmental centers, and two community-based facilities. The Eastern Los Angeles Regional Center is one of 21 regional centers in the State of California that provides point of entry to services for people with developmental disabilities. The center is a private, non-profit community agency that contracts with local businesses to offer a wide range of services to individuals with developmental disabilities and their families.

Table 4-24 provides information from the Eastern Los Angeles Regional Center of on the number of developmentally disabled individuals in the City of Commerce. In 2012, there were approximately 92 individuals actively utilizing services at the Regional Center for a developmental disability. This is approximately 0.7 percent of the City's total population.

Table 4-24:
Developmentally Disabled Residents by Age

Zip Code Area	0-14 Years	15-22 Years	23-54 Years	55-65 Years	65+ Years	Total
90040	42	17	28	4	1	92
90091	0	0	0	0	0	0
Total	**42**	**17**	**28**	**4**	**1**	**92**

Source: South Central Los Angeles Regional Center, 2012.

To assist with any housing needs for persons with developmental disabilities, the City will implement programs to coordinate housing activities and outreach with the Eastern Los Angeles Regional Center and encourage housing providers to designate a portion of new affordable housing developments for persons with disabilities, especially persons with developmental disabilities, and pursue funding sources designated for persons with special needs and disabilities.

4.9.4 - LARGE FAMILIES

According to the HCD's definition, the term "large family" refers to a family containing five or more persons. Large family households, containing five or more persons, frequently experience a greater incidence of overcrowding due, especially in older units and rental housing. Most rental units in the City contain one or two bedrooms. In addition, landlords may be reluctant to rent smaller units to larger families. Finally, many owner occupied units are overcrowded (refer to the subsection that follows) due to extended families sharing housing as a means to reduce mortgage or rental costs. Large families are identified as a group with special housing needs based on the limited availability of adequately sized, affordable housing units. Large families are often of lower income, frequently resulting in the overcrowding of smaller dwelling units, and in turn accelerating unit deterioration. As shown in **Table 4-8** a total of 981 occupied housing units had five or more residents according to the 2007-2011 ACS. Of this total, 369 units occupied by large families were occupied by renters while 612 units were owner occupied.

All new, assisted, owner-occupied housing contains at least three bedrooms, with the majority containing 4 bedrooms. In addition, the majority of the market rate owner-occupied housing constructed during the past ten years had four or more bedrooms. In recent years, few rental units have been constructed in the City and no new rental units containing three or more bedrooms. According to the most recent census, 895 units (26.4 percent of the total housing units in the City) contained five rooms, 444 units (13.1 percent) contained six rooms, and 323 units (9.6 percent) have seven or more rooms. The City continues to address the needs of large households by prioritizing funding for projects that include large units.

4.9.5 - FEMALE HEADED HOUSEHOLDS

Single-parent households often require special consideration and assistance due to their greater need for affordable and accessible day care, health care, and other supportive services. In particular, many female-headed households with children are susceptible to having lower incomes than similar two-parent households. Single, female mothers also face social marginalization pressures that often limit their occupational choices, housing options and access to supportive services.

The 2007 - 2011 American Community Survey indicates that there are 513 female-headed households in the City of Commerce, of which 259 have children under the age of 18. These numbers account for approximately 16 percent and 8 percent, respectively, of all households in the City. In the County, there are 491,428 female - headed households with no husband present, of which 261,586 have children under the age of 18. These numbers account for approximately 22 percent and 12 percent, respectively, of all households in the County. The percentage of female-headed households within the City is lower than that of County as a whole.

4.9.6 - FARM WORKER HOUSEHOLDS

The special housing needs of many farm workers stem from their low wages and the seasonal nature of their employment. Most of Commerce residents work in the Los Angeles-Long Beach Metropolitan area in non-agricultural occupations. The 2007-2011 ACS identified 63 farm workers and other persons in forestry and fishing occupations in the City, accounting only 0.6 percent of the total employable

population in the City. This is a decrease from the 2000 Census which identified 92 farm workers, representing 0.7 percent of the total population in the City. These persons are likely to be employed in nurseries, stables, and not in traditional agricultural production. The demand for housing generated by farm workers in the City is thus estimated to be extremely low.

4.9.7 – EXTREMELY LOW-INCOME HOUSEHOLDS

According to 2005 - 2009 CHAS data generated for the City, there were approximately 520 very low-income households living in Commerce. Very low-income households are those households that earn 50 percent or less of the median family income (MFI) for the statistical region in which they are located. Extremely low-income households are those households which earn less than 30 percent of the MFI. Based on this data there are approximately 710 extremely low income households in Commerce (renters and owners). **Table 4-25**, below, includes data characterizing affordability and other housing problems in Commerce for various income groups. There are limited opportunities to address the housing needs of extremely low-income households in Commerce. However, the needs of this special needs group are taken into consideration and are generally addressed through the City's overall programs for housing affordability and by prioritizing funding and development opportunities for projects that include housing for ELI households.

Table 4-25:
Housing Problems for All Households

Household by Type, Income & Housing Problem	Renters	Owners	Total Households
Extremely Low-Income (0-30% MFI)	**525**	**185**	**710**

# with cost burden > 50%	425	334	759

SOURCE: CHAS DATA BOOK, 2005 - 2009.

4.9.8 – HOMELESS

Enumerating the homeless population is difficult due to the transient nature of the population, as well as the existence of hidden homeless or persons that move between housing situations (e.g. doubling up with another household). The Los Angeles Homeless Services Authority (LAHSA) generally reports homeless counts for Los Angeles County; however homeless counts are conducted by Service Planning Area (SPA), which include large groupings of cities. Commerce, for example, is included in the East Los Angeles SPA, which includes 22 other jurisdictions. Generally, 4,517 homeless individuals have been reported in the East Los Angeles SPA, however there is no data reported that provides a specific number of homeless living in the City.

In an effort to determine a more accurate number of homeless individuals living in the City, local homeless service providers including the Bell Shelter and the Shelter Partnership were contacted. To date, neither organization has data regarding where homeless individuals are from or the number of individuals by jurisdiction. Consequently, the City of Commerce Social Services department provides the most specific data regarding the number of homeless individuals living in the City. The Commerce Social Services department provides food, education, transportation vouchers, and other services to low income and homeless individuals year round. In the last year, the department reports that 20 individuals have been observed in the City, which may be attributed to a number of factors such as the primarily industrial nature of the City and the presence of a major homeless shelter adjacent to the City. Of the total reported, 16 individuals were located in the Veteran's and Rosewood neighborhoods and 2 individuals were each found in the Ferguson and Bristow neighborhoods.

Of the individuals identified as homeless in the City, the majority are able to reference a permanent address. If an individual is unable to provide a permanent address the Sheriff's Department acts as a referral resource to shelters in the area and in some cases will offer transport to a sub-regional facility. These shelter facilities include: the Long Beach Rescue Mission, Long Beach Salvation Army, Bell Salvation Army, Catholic Charities and Homeless Programs, Mental Health Association/Los Angeles County, and East Rancho Dominguez Community Services.

The Salvation Army operates a shelter located at East 5th Street in the City of Long Beach. The operators of this shelter report that providing temporary shelter to the homeless is the shelter's primary function. This Salvation Army shelter provides services to an average of 73 people per day. Of this number, approximately 10 percent are homeless. The Bell Shelter, located in the City of Bell, adjacent to the City of Commerce, provides transitional housing for women with dependent children. The focus of the shelter's services is to provide women who are victims of domestic violence with housing while they are making a transition to independent living. The shelter has a 24-bed capacity.

The City of Commerce is a potential source of employment for those individuals that are housed in the Bell Shelter. The MTA, Montebello Bus Lines and Commerce Transit (operated by the City) are readily available. The City's transit system consists of five routes that run within the Commerce City limits, Monday through Saturday. All transportation services offered by the department are free of charge. The City also recently amended their Zoning Code to allow emergency shelters in the Industrial Manufacturing (M-2) zone and transitional housing as a permitted uses in the residential zone districts (R-1, R-2, and R-3). To date, no applications have been submitted to the City for such uses.

Table 4-26:
Inventory of Homeless Services and Facilities in the Region

Organization	Services Provided
Salvation Army Bell Shelter 5600 Rickenbacker Rd. #2d Bell, CA 90201 (323) 262-1804	Temporary emergency housing and support services for individuals. Services include; general program referral and counseling, emergency shelter vouchers, transportation assistance, mental health services, food and clothing distribution, and rental and utility payment assistance.
Long Beach Rescue Mission 1335 Pacific Avenue Long Beach, CA 90801 (562) 591-1292	Provides shelter and a 12-month substance abuse program for men and women. Up to 120 beds are provided. The length of stay varies. Provides food services to the public.
Salvation Army 809 E. 5th St. Los Angeles, CA 90013 (213) 626-4786	Provides 286 beds for men and women for up to a stay of one year. Provides food services to the public.
Catholic Charities - Family Shelter 123 East 14th. Long Beach, CA 90813 (562) 591-1351	Provides transitional housing for homeless men, women and children. Single residents must be elderly or disabled. Stays of up to 45 days are permitted.
Mental Health Association of Los Angeles County 100 W. Broadway, Suite 5010 Long Beach, CA 90802-2310	Temporary emergency housing and support services for individuals.
East Rancho Dominguez Community Services 4513 E. Compton, Boulevard Compton, CA 90221	Multi-purpose facility designed to enhance the community with educational, social and recreational activities. Staff and non-profit agencies provide comprehensive information and referrals, case management, utility assistance, outreach, and food pantry. Emergency Food Distribution, Toy Loan, and bus tokens are provided on regular basis.
Christian Outreach Appeal 515 E. Third Street Long Beach, CA 90802 (562) 436-9877	Provides programs and informational resources for women and single mothers of jobs, training, and housing opportunities.
Catholic Charities - Family Shelter 123 East 14th. Long Beach, CA 90813 (562) 591-1351	Provides transitional housing for homeless men, women and children. Single residents must be elderly or disabled. Stays of up to 45 days are permitted.

Organization	Services Provided
Family Crisis Center Confidential Location Redondo Beach (310) 792-5900	Provides beds for up to 15 women with children under 18 who are victims of domestic violence. Shelter for adolescents at risk of becoming homeless is also provided. Services include referrals to homeless shelters and outpatient counseling. Stays of up to 6 months are permitted.
Harbor Interfaith Shelter 670 W 9th Street San Pedro, CA 90732 (310) 831-0589	Provides 20 single-bedroom units for families and children for up to 90 days. Provides food services to the public.
House of Yahweh 4430 West 147th Street Lawndale, CA 90260 (310) 675-1384	Provides transitional housing with 10 trailer units for families with children for up to 2 years. Provides food services to public.
Southern California Alcohol and Drug Programs, Inc. Angel Step Inn Address: Confidential Site Downey, CA 90239	Emergency shelter for battered, substance abusing women and women with children.
Southern California Alcohol and Drug Programs, Inc. La Casita 10603 Downey Avenue Downey, CA 90241	Provides addiction counseling and life skills education for mothers living in shelter plus care and permanent housing.
Southern California Alcohol and Drug Programs, Inc. Positive Steps 11501 Dolan Downey, CA 90241	Residential treatment for pregnant and parenting women and their children.
Southern California Alcohol and Drug Programs, Inc. Los Angeles Area 11500 Paramount Boulevard Downey, CA 90241	Alcohol/Drug addiction prevention counseling and recovery.
Transitional Living Centers 16119 Prairie Avenue Lawndale, CA 90260 (310) 542-4825	Alcohol/Drug addiction prevention counseling and recovery.

CITY OF COMMERCE
CALIFORNIA
INCORPORATED JANUARY 28, 1960

5. HOUSING CONSTRAINTS

The housing constraints section of the Housing Element analyzes barriers that may hinder the City's ability to achieve its housing objectives or to obtain the necessary resources to assist in the production, maintenance and improvement of the overall housing stock.

A number of different dynamics that include governmental, market, infrastructure, and environmental factors may constrain the provision of adequate and affordable housing in a city. Consequently, State law requires that Housing Elements analyze potential and actual governmental and non-governmental constraints to the production, maintenance, and improvement of housing for persons of all income levels and disabilities. In instances where barriers exist, State law requires the local jurisdiction to demonstrate efforts to remove, where appropriate and legally possible, governmental constraints that hinder the achievement of housing goals.

5.1 - GOVERNMENTAL CONSTRAINTS

Governmental constraints include policies, development regulations, standards, fees or other actions that impose limitations by various levels of government upon land and housing ownership and development. Local land use controls can include site improvement requirements, fees and exactions, permit processing procedures, and other factors that may constrain the maintenance, development, and improvement of housing. At the local level, government housing regulations are necessary to assure: (1) that housing is constructed and maintained in a safe manner, (2) that the density and design of housing is consistent with community standards, and (3) that adequate infrastructure to support new housing is provided. While local policies are necessary to ensure a quality housing stock, these regulations can also affect the price and availability of housing and, in particular, the availability of affordable housing. Key development standards that could add to the cost of housing development and the City's response include the following:

- The City has adopted the Los Angeles County Building Code by reference that establishes minimum construction standards. The City's existing development requirements included in the Zoning Ordinance and Building Code do not include any architectural standards that would add to the cost of new housing development. The City also relies on Los Angeles County to provide plan check services. In addition, there are no unique open space, parking, Mello-Roos fee requirements that are applicable to new developments.
- Code Enforcement site visits are typically complaint driven. The City of Commerce also maintains a number of programs that property owners may take advantage of if their unit is found to be substandard. Code Enforcement officers have been very proactive in referring residential property owners to these programs.
- All of the residential areas where the residential zoning is applicable are well served by streets and other infrastructure. No street dedications or new infrastructure is required for the typical infill development. The Housing Opportunity Overlay zone permits new residential

development within an area that is currently developed as industrial. As a result, new on-site roadways will be required to accommodate the potential housing.

- The California Energy Resources Conservation and Development Commission have developed guidelines used by building code enforcement officials to implement energy conservation regulations established by the California Energy Commission. While serving as a mitigation tool to help reduce electricity and natural gas consumption, they do add to the cost of housing. State law also authorizes school districts to collect impact fees for all new residential, commercial, and industrial construction.
- The City of Commerce Zoning Ordinance includes development standards and requirements for existing and potential development within the R-1, R-2, and R-3 zone districts. The development standards outlined in **Table 5-2** do not appear to represent a constraint to development given the amount of rehabilitation that has occurred in recent years. The minimum lot size and setback requirements are very liberal. For example, most communities in the area require between 5 to 10 feet for the side yard setbacks. This Housing Element includes a program that commits the City to a periodic review of the Zoning Ordinance to remove or modify other development standards and/or requirements that may represent a governmental constraint to housing development.

The City has established a goal within the Housing Plan to target governmental constraints that may inhibit the development of new housing in the City. Goal 3 in the Housing Plan also focuses on establishing policies and programs that will remove constraints and help facilitate affordable housing development. The City will review and, if necessary, revise the existing residential development standards as well as the density bonus provisions outlined in the City's Zoning Code.

State and Federal regulations, which are beyond local jurisdiction control, can also add to governmental constraints. Regulations related to environmental protection, building codes, and other topics have significant, often adverse, impacts on housing costs and availability. Although Federal and State agencies play a role in the imposition of governmental constraints, the actions of these agencies are, for the most part, beyond the influence of local government and are therefore not addressed in this document. Therefore this section of the Housing Element emphasizes policies and regulations that can be mitigated by the City.

5.1.1 - Land Use Controls

The Community Development Element indicates the location and extent of permitted land uses and development within the city. The following residential designations are included in the Community Development Element:

- **Low-Density Residential.** Land uses within this land use category are characterized by single-family homes and correspond to the R-1 (single-family residential) zone district.
- **Medium-Density Residential.** The medium-density residential land use category corresponds to the R-2 (light multiple-family residential) zone district. Permitted uses within this land use designation include single-family homes and duplex units.
- **High-Density Residential.** This category of land use corresponds to the R-3 (medium multiple-family residential) zone district that provides for higher-density residential development, including multiple-family residential development.

- **Mixed-Use.** This land use designation applies to the Atlantic Avenue corridor between the Mix-Master (on the north) and Washington Boulevard (on the south). This land use provides for both residential development and commercial development. A new overlay zone will be prepared for this area along with design guidelines for new development.
- **Housing Opportunity Area.** This designation applies to the Rosewood Planning Area. This land use designation permits the existing manufacturing uses to recycle to residential development should the property owner desire to do so.

Table 5-1 itemizes the land area devoted to the various land use designations that comprise the city of Commerce General Plan.

Table 5-1:
City of Commerce General Plan Land Use Designations

Land Use Designation	Land Use Description	Density Standard	Area
Low-Density Residential	Single-Family Residential Units	0-11 units/acre	151 acres
Medium-Density Residential	Single-Family & Duplex Units	12-17 units/acre	93 acres
High-Density Residential	Multiple-Family Residential Units	18-27 units/acre	74 acres
Atlantic Blvd. Mixed-Use	Mixed Use	Up to 27 units/acre	21 acres
Housing Opportunity	Residential	Up to 27 units/acre	25 acres
Total Land Area of the City			**364 acres**

Source: City of Commerce Land Use Element, 2005

5.1.2 - DEVELOPMENT STANDARDS

The City of Commerce Zoning Code establishes specific development standards, allowable uses and other limitations, and must be consistent with the community's standards as set forth in the General Plan. Zoning regulations control development by establishing requirements related to height, density, lot area, minimum unit size, yard setbacks, and minimum parking spaces. Site development standards ensure a quality living environment for all households groups in the City, including special needs groups, and low- and moderate-income households. Differences in development standards are just one factor of many that can affect the relative affordability of housing.

On a regular basis, City staff reviews the established development standards for the R-1, R-2, and R-3 zones, to ensure that the standards do not constrain the development of housing. Generally, the City's development standards outlined in **Table 5-2** are consistent with those of neighboring cities. In addition to periodically evaluating the existing residential zones in the Zoning Code update, the City established new design guidelines and development standards for the Housing Opportunity Overlay during the previous planning period. The Housing Opportunity Overlay allows for higher density residential development within parcels that are currently zoned for commercial and industrial uses. Future, potential development may include properties developed exclusively in higher density multiple-family developments.

Table 5-2:
Development Standards by Residential Zone District

	R-1	R-2	R-3
Permitted Uses	Single-family	Single-family and duplex units	Single-family, duplex units, and multiple-family (multiple-family development is permitted by right)
Density Range	0-8.7 du/acre	8.7-14.5 du/acre (for duplex units)	21.8 du/acre
Minimum Lot Area	4,000 sq. ft.	3,000 sq. ft. (duplex)	2,000 sq. ft./unit and not more than 7,500 sq. ft.
Minimum Dwelling Size	950 sq. ft.	850 sq. ft.	700 sq. ft. (1 bedroom) 850 sq. ft. (2 bedroom) 1,000 sq. ft. (3 bedroom) 1,150 sq. ft. (4-bedroom)
Maximum Building Height	Maximum 25 feet (2-story)	Maximum 25 feet (2-story)	Maximum 35 feet (3-story)
Distance Between Buildings	10 feet	10 feet	20 feet
Front Yard Setback	20 feet	20 feet	15 feet
Side Yard Setback	3 feet minimum	3 feet minimum	5 feet minimum
Rear Yard Setback	15 feet minimum	15 feet minimum	15 feet minimum
Off Street Parking	2 spaces/unit[1]	2 spaces/unit[1]	2 spaces/unit[2]
Uses Permitted	All uses permitted in R-1 zone	All uses permitted in R-1 and R-2 zones	All uses permitted in R-1, R-2, and R-3 zones

Source: City of Commerce, 2013.
Notes: 1. Enclosed parking.
2. Open Parking is permitted for R-3 developments. Parking requirements are relaxed for senior housing.

Table 5-2 summarizes various housing types and the residential zones in which they are permitted. In recent years, multiple family developments, within the R-3 zones, have utilized a variety of modifications to the existing development standards, specifically reduced setbacks and smaller yard area requirements. The City also allows developers to utilize the Planned Development (PD) overlay zone as a strategy to achieve alternative development standards. The PD process is voluntary and allows the City Staff to assist a developer in constructing a viable project on small infill lots while ensuring that the needs of residents living on the site will be met. Of the City's existing development standards for the R-3 zone, the minimum unit size, parking requirements and environmental review are most likely to be interpreted as a constraint to the development of affordable units or housing for extremely-low income residents. These requirements are discussed below.

5.1.2.A - MINIMUM UNIT SIZE

The City currently outlines a minimum square footage allowed in each residential zone. Specifically, the R-1 zone requires a minimum of 950 square feet per unit, the R-2 requires a minimum of 850 square feet per unit and the R-3 zone requires a minimum of 700 square feet for a one bedroom unit. While this requirement could be seen as a constraint to the development of housing for extremely low income residents (i.e. SRO units) the City has established this standard to ensure that a quality living environment is maintained for all residents regardless of income. Generally, this requirement is comparable or lower than the restrictions placed by surrounding jurisdictions. Furthermore, the development standards for the Housing Opportunity Overlay establish a minimum unit size requirement that is less restrictive than the residential zones.

A review of development applications during the previous planning period did not identify any development requests for smaller unit floor areas. Despite this fact, Staff will continue to monitor this stand and is committed to working with developers to reduce the unit size if the requirement becomes a constraint to the development of housing for extremely low- and low-income residents. The City has also established separate development standards for emergency and transitional housing for the benefit of extremely low-income households.

5.1.2.B - PARKING

The City's parking standards for residential developments are tailored to the vehicle ownership patterns associated with different residential uses. As such, the City currently requires garage parking for multi-family units, one garage space for a one-bedroom unit and two spaces for any unit with two or more bedrooms. This ratio is lower than many surrounding jurisdictions and garages are a common requirement in Southern California due to weather conditions and the need to limit on-street parking. While the City's parking requirements could be viewed as a constraint to the construction of multifamily affordable housing, the City offers developers the option to utilize a density bonus and is flexible with required parking requirements for specific types of residents, including the elderly. As noted above, the City recognizes that reduce parking standards are appropriate for certain types of housing and Staff is committed to working with developers to modify parking standards. To further provide flexibility with parking standards the City has established guidelines for the Housing Opportunity Overlay area that are less restrictive and offer alternatives such as shared parking, tandem parking, carports in lieu of garages, and reduced parking for senior housing or units near public transportation. Generally, a parking study for specific projects is recommended to justify reduced parking standards.

5.1.2.C - CEQA

To address potential environmental analysis constraints, which can add significant expense to a project, the City has relaxed the environmental review requirements relying on CEQA Class 32 exemptions. This has significantly streamlined the review procedures for such infill development and has reduced the costs associated with the preparation of environmental documents. As CEQA is required by the State and the City does not have the ability to modify this requirement it is not a constraint that can be addressed by the City.

5.1.3 - PROVISIONS FOR A VARIETY OF HOUSING TYPES

Housing Element Law requires jurisdictions to identify available sites in appropriate zone districts with development standards that encourage the development of a variety of housing types for all income levels, including multi-family rental housing, factory-built housing, mobile homes, emergency shelters, and transitional housing. The following paragraphs describe how the City makes provisions for these types of housing.

5.1.3.A - SECOND UNITS

City of Commerce revised its Zoning Ordinance to allow second units in all single-family residential zones in compliance with Government Code sections 65852.2 and Section 65583.1. These sections require local governments without a local second-unit ordinance or a local ordinance not in compliance with second-unit law should ministerially consider second-unit applications in accordance with State standards, as of January 1, 2003.

5.1.3. B - EMERGENCY SHELTERS AND TRANSITIONAL HOUSING

Pursuant to State law, the City permits transitional or supportive housing as a residential use, by right, subject only to the requirements of other similar residential uses in that zone. These facilities are subject to the same underlying zoning standards as other residential uses in the same residential zoning district.

Due to funding reductions and staff cutbacks, the City was unable to complete the Zoning Code amendments to address transitional housing and emergency shelters in the time specified by the 2008-2014 Housing Plan. The City has drafted an ordinance amending the Zoning Code to allow emergency shelters in the Light Manufacturing (M1) Zone, by right, without any other discretionary permit required. The City has also updated their Zoning Code to allow transitional and supportive housing, including Single Resident Occupancy (SRO) as a residential use, by right, subject only to the requirements of other residential uses in that zone. The City will take the Ordinance to City Council in 2013, in conjunction with the adoption of the 2014-2021 Housing Element.

5.1.3. C – SINGLE ROOM OCCUPANCY UNITS

Due to funding reductions and staff cutbacks the City was unable to complete the Zoning Code amendments to address SRO units in the time specified by the 2008-2014 Housing Plan. The City has drafted an ordinance amending the Zoning Code to permit SRO's in at least one non-residential zone as a permitted use and SRO's as a conditionally permitted use in appropriate residential zones. The applicable development standards are no more restrictive than standards that apply to other residential uses of the same type permitted in the same zone. The City will take the Ordinance to City Council in 2013, in conjunction with the adoption of the 2014-2021 Housing Element.

5.1.3.D – SENIOR HOUSING

The City of Commerce has previously amended its Zoning Ordinance to allow Senior Housing in all residential zones in the City. The development standards for these units differ from the requirements for conventional units in that the ordinance allows for smaller and/or efficiency units with reduced parking requirements, higher densities, and common recreation areas.

5.1.3.E - HOUSING FOR THE DISABLED

Physical disabilities can hinder access to housing units of traditional design as well as limit the ability to earn adequate income. In 2010, approximately 9.3 percent of Commerce's population was estimated to be living with a disability. This count includes age-related as well as other disabilities. Housing opportunities for the physically disabled are maximized through the provision of affordable, barrier-free housing. Special modifications include units with access ramps, wider doorways, assist bars in bathrooms, lower cabinets, and elevators. This is accomplished through the City's compliance with the Federal Americans with Disabilities Act (ADA) and the 2007 Title 24 Part 2, California Building Code regulations. In addition, the City administers a number of programs that provides financial assistance to disabled households to perform modifications such as those described above.

The Commerce Municipal Code permits residential care facilities, including facilities for the disabled (with 6 or fewer residents), by right in all residential zones in the City. For group homes with 7 or more residents, the City requires approval of a conditional use permit in all residential zones in the City. There are no facility concentration or distance requirements or similar limitations for either type of residential care facility. The applicable development standards are no more restrictive than standards that apply to other residential uses of the same type permitted in the same zone.

The City's Zoning Ordinance does not contain any provisions that would preclude the development of housing for handicapped persons or units designed to accommodate larger families. There are no restrictions that would limit the use of ramps, wider doorways, or other features that would be desirable in such units. To further assist residents with disabilities the City has established a reasonable accommodation ordinance that establishes a clear procedure for residents to apply for development modifications to accommodate a disability and refers residents to City programs that offer funding to complete proposed modifications.

Table 5-3 addresses how uses are permitted in zones that allow residential uses per the Commerce Municipal Code.

Table 5-3:
Housing Types by Residential District

Housing Type	Existing Zone Districts			Proposed Zone Districts	
	R-1	R-2	R-3	Housing Opportunity Overlay	Atlantic Blvd. Mixed Use
Single-family	P	P	P	P	N
Duplex (2 units)	N	P	P	P	N
Multiple-family	N	N	P	P	P
Mixed-Use	N	N	N	P	P
Manufactured Housing	P	P	P	P	N
Second Units	P	P	P	P	N
Care Facilities (<6 persons)	P	P	P	P	P
Care Facilities (>6 persons)	C	C	C	C	C
Senior Housing	P	P	P	P	P
Emergency Shelters[1]	C	C	C	C	C
Transitional Housing	P	P	P	P	N
Single Room Occupancy Units	N	N	P	P	N

Source: City of Commerce, 2013.
Notes: 1. Emergency shelters are permitted by right in the M-1 zone.
2. P - Permitted, N - Not permitted, C - Conditionally permitted.

The City of Commerce defines a "family" as one or more persons, related or unrelated, living together as a single integrated household in a dwelling unit.

5.1.4 - DEVELOPMENT FEES

Development fees can affect the development of affordable housing as they require the developer to spend their limited budget on fees such as school fees, plan check fees, etc. The school fees that are charged towards new residential development are a State mandate and are beyond the City's ability to control. The Montebello Unified School District (MUSD) and Los Angeles Unified School District (LAUSD) both levy a school development fee for residential construction. No other fees beyond school, development application and permit fees are applied in the City of Commerce.

Building inspection services such as plan checks and permit issuance are contracted through the County of Los Angeles. Fees charged to the developer for these services are typically less than the actual cost for review time though any increased administrative costs beyond the base fees for discretionary review are waived. The planning fees that are charged in the City do not make any distinction between rental housing and owner-occupied housing or the types of housing (single-family or multiple-family). The development fees for processing development cases in Commerce are among the lowest compared to those of the surrounding communities. As indicated previously, the City does not derive full compensation for staff hours through filing fees. This policy, whereby fees do not reflect the actual costs of performing services, results in the reduction of front-end costs to developers.

To better illustrate the development fees for residential units in the City, **Table 5-4**, generally provides the total fees charged per unit for both single family and multi-family developments.

Table 5-4:
Development Fees per Unit

Permit Fees	Single Family Residential Unit	Multi-Family (per unit)
Building Permit	1,445.00	37.70
Plan Check Fee	1,300.50	33.93
Fire Hydrant Fee	660.00	22.00
Plan Maintenance	28.90	0.75
EQ Instrumentation	30.00	1.00
Grading Pre-Inspection	0.00	0.00
Posting	0.00	0.00
Issuing Fee	0.00	0.00
Planning (incl. $5 misc)	171.46	4.39
One Stop Surcharge	56.09	1.46
System Dev Surcharge	168.26	4.40
Dwelling Unit Construction Tax	200.00	200.00
Residential Development Tax	300.00	300.00
School Fee	297.00	297.00
TOTAL	$4,657.00	$902.64

The development processing fees and school fees are largely determined by square footage, valuation and a number of other factors including the number of bedrooms, bathrooms, outlets, etc. This makes it difficult to accurately determine the average and actual fees charged to a developer. Generally the City's fees are consistent with the fees charged in the surrounding area, particularly as the permitting process is contracted through the County of Los Angeles. Consequently the development fees are not deemed to be a constraint on the development of affordable housing. In specific instances, the City previously worked with developers to modify fees however the loss of redevelopment set aside money and reductions in CDBG funds has resulted in a direct decrease in opportunities to assist with projects that include affordable housing, housing for extremely low income and disabled residents. It is important to note that the development fees have not changed since the previous planning period.

5.1.5 - DEVELOPMENT REVIEW AND PROCESSING

In addition to permit fees the processing time needed to obtain development permits and required approval can contribute to the high cost of housing. This is not the case in the City of Commerce. After completing an internal review of the City's fees and comparing them to surrounding jurisdictions, Staff has determined that the established development and permit fees are at least 15-20% lower than most surrounding jurisdictions. The City has also committed to fee modifications and will ensure fast track processing for projects that include affordable units, with priority given to projects for extremely low-income and very low-income residents.

The City of Commerce has fully implemented the provisions of AB884 and has established an expedited review process for building and construction plans through the establishment of a review committee. This committee consists of representatives from the Planning, Public Works, Engineering, and Fire Departments. The advantage of such a committee is that questions and/or problems that might surface at the Planning Commission meeting can be addressed prior to the meeting. The committee meets with the prospective applicant to discuss the project and to ascertain the nature of any issues that may arise in subsequent plant review. The effect of this review process is to provide valuable feedback to an applicant early in the planning process as a means to avoid potential delays and increased development costs related to a redesign of the development. No cost to the applicant is associated with these pre-consultation reviews. This process has expedited the Planning Commission's review of residential projects. In the past several years, residential projects that have appeared before the Planning Commission have been approved at a single hearing. In the case of the Southwest neighborhood's infill developments, multiple-projects were considered at a single hearing, thus saving time and money for the applicant.

Cases that do not involve any discretionary approvals (cases that do not require approval by the Planning Commission) may also be approved by the Review Committee. Such procedures speed up the approval process by several weeks. The Plan Check Review for new construction averages four to six weeks, which is considerably less than most surrounding cities. During the course of a development's design and planning, the City staff is available to conduct pertinent reviews and issue permits related to engineering, drainage, grading, public works, electrical, and other aspects of new developments. Even with those infill projects that require some form of discretionary review, the City has taken advantage of recent legislation that calls for smaller infill projects to be categorically exempt through the referral of a Class 32 Categorical Exemption.

Residential infill projects are handled through the City's streamlined review and entitlement process. The entire development process from land clearance through construction typically takes between six months to one year to complete, depending on the number of units. This includes the time required for plan check and construction. Land clearance and site preparation will typically require two to four weeks to complete. Actual construction will take between twelve to 24 weeks, depending on the number of units. Tract map/parcel map review (by the County) typically requires six weeks if a soils report is not required. When developments are subject to the CEQA review, a Class 32 exemption is generally provided to streamline the process.

Finally, no design review is required. A list of the cost and average processing time for each development application is provided in **Table 5-5** below.

Table 5-5:
Development Application Cost and Processing Times

APPLICATION	PRICE	AVERAGE TIME
General Plan Amendment	$1,000	6-12 months
Zone Change	$1,000	3-6 months
Zoning Ordinance Amendment	$1,000	3-6 months
Zoning Clearance Fee	$100	2 weeks
SUBDIVISIONS		
Parcel Map (4 or less lots)	$2,000	3-6 month
Tract Map (5 or more lots)	$2,000	3-6 months
Lot Line Adjustment	$750-Commercial	2-4 months
	$500-Residential	2-4 months
Lot Combination	$0	2-4 months
PLOT PLAN/SITE PLAN REVIEW		
Non-residential	$750	3-6 months
Residential	$250	2-4 months
CONDITIONAL USE PERMIT	$1,000	2-4 months
ABC and Temporary Trailer	$1,000	2-4 months
CUP MODIFICATION	$1,000	2-4 months
VARIANCE		
Non-residential	$1,000	2-4 months
Residential	$500	2-4 months
Additional Variances	$100	2-4 months
MODIFICATION OF STANDARDS		
Non-residential	$250	1-2 months
Residential	$150	1-2 months
HOME OCCUPATION PERMIT	$100	2-3 months
TEMPORARY USE PERMIT	$75	1-2 weeks
SPECIAL USE PERMIT	$75	1-2 months
TIME EXTENSIONS	$200	N/A
APPEALS OF PLANNING COMMISSION DECISION		
Non-residential	Cost of Application	1-3 months
Residential	Cost of Application	1-3 months
STREET OR ALLEY VACATION	$1,000	1-2 months
RELOCATION OF STRUCTURE	$500	2-4 months
ENVIRONMENTAL REVIEW		
EIR Review	If Services Agreement is required, Consultant's Cost Plus 20%. If not, $750	6-12 months
Categorical Exemption	$250	1-2 months
Negative Declaration	If Services Agreement is required, Consultant's Cost Plus 20%. If not, $500	3-6 months
Mitigated Negative Declaration	If Services Agreement is required, Consultant's Cost Plus 20%. If not, $500	3-6 months
ZONING VERIFICATION LETTER	$100 (per parcel)	1-2 weeks

Source: City of Commerce, 2013.

5.2 – NON-GOVERNMENTAL CONSTRAINTS

5.2.1 – CONSTRUCTION COSTS

The cost of building materials for residential construction has risen dramatically in recent years. According to the U.S. Department of Labor, the overall cost of residential construction materials rose by 2 percent between 2011 and 2012, with steel costs increasing 0.4 percent and the cost of cement increasing 1.5 percent. With the slowdown of the real estate market from 2008 until 2012, the price of construction materials has shown a significant decrease compared to the construction boom. The 2 percent increased in over all construction costs experienced over the past year is primarily due to the cost of labor.

Together, the cost of building material and construction labor are the most significant cost components of developing residential units. In the current southern California market, construction costs are estimated to account for upwards of 50 percent of the sales price of a new home. Typical construction costs for high-density apartment (20 units per acre) development run around $150,000 per unit including $10,000 per unit for structured parking. Hard construction costs for development of median-density (15 units per acre) condominiums over podium parking run approximately $200,000 per unit, including $35,000 per unit for the parking structure.

Variations in the quality of materials, type of amenities, labor costs and the quality of building materials could result in higher or lower construction costs for a new home. Pre-fabricated factory built housing, with variation on the quality of materials and amenities may also affect the final construction cost per square foot of a housing project. Furthermore, the unit volume - that is the number of units being built at one time - can change the cost of a housing project by varying the economies of scale. Generally, as the number of units under construction at one time increases, the overall costs decrease. With a greater number of units under construction, the builder is often able to benefit by making larger orders of construction materials and pay lower costs per material unit.

Density bonuses granted to a project, can also impact construction costs. Municipalities often grant density bonuses as an incentive for the builder to provide affordable units at the project site. The granting of a density bonus provides the builder with the opportunity to create more housing units and therefore more units for sale or lease than would otherwise be allowed without the bonus. Since greater units can potentially increase the economy of scale, the bonus units could potentially reduce the construction costs per unit. This type of cost reduction is of particular benefit when density bonuses are used to provide affordable housing.

As noted in the analysis provided on the units at-risk of conversion to market rate, recent appraisals completed for the City estimate that the cost of land ranges from $10/square foot up to $15/square foot. This means that land to construct a new single family home would cost approximately $50,000 to $75,000 for a 5,000 square foot lot and land for a new multifamily development would cost $450,000 per acre.

5.2.2 – LAND AVAILABILITY AND COST

There is very little vacant residential land available in the City. This is a significant constraint to the development of new housing within the City. The economy of land value and the cost of new construction can limit what a property owner can expect to achieve on an underdeveloped property. Even with an allowable 27 units per acre, as permitted by the Commerce Municipal Code, recycling and redevelopment can be difficult. As noted, in **Section 4-9**, the actual construction cost for residential development ranges from $100/square foot up to $130/square foot. This means that the cost to construct a new single family home would range from approximately $150,000 to $195,000 for a 1,500 square foot home and $100,000 to $130,000 per unit for a 1,000 square foot multifamily unit.

Chapter 6, *Housing Resources*, includes an analysis and discussion of vacant and underutilized residentially-zone parcels in the City that can accommodate new housing. Aside from the three residential zones in the City that accommodate residential development (R-1, R-2, and R-3 zones), the City has also identified opportunities in which industrial properties can be "recycled" for residential purposes, specifically through the Housing Opportunity Overlay area which will support the development of housing in a mixed-use configuration. In the City of Commerce 2020 General Plan, the Housing Opportunity Overlay area was implemented, encouraging industrial uses to recycle into mixed use, multifamily housing. During the 2008-2014 planning period, the City Council adopted specific development standards to further implement the overlay area.

5.2.3 – AVAILABILITY OF FINANCING

The availability of financing in a community depends on a number of factors, including the type of lending institutions active in the community, lending practices, rates and fees charged, laws and regulations governing financial institutions, and equal access to those institutions. Through analysis of Home Mortgage Disclosure Act (HDMA) data on the disposition of residential loan applications, an assessment can be made of the availability of residential financing within a community.

Residential lending activity in Commerce consisted of 41 applications for conventional home purchase loans in 2011, reflecting 1.2 percent of the ownership housing stock. This is a significant decrease from the 251 total applications in 2006. **Table 5-6** provides the status of home purchase loan applications in both Commerce and Los Angeles County. As illustrated by this table, the 68 percent loan approval rate in Commerce was slightly lower than the 71 percent approval rate Countywide.

Table 5-6:
Disposition of Loans

	Loans Approved[1]		Loans Denied		Loans Withdrawn/ Incomplete	
	Commerce	LA County	Commerce	LA County	Commerce	LA County
Number of Loan Applications	28	38,827	8	8,054	5	7,601
Percent of Total Applications	68%	71%	20%	15%	12%	14%

Source: Home Mortgage Disclosure Act (HMDA), Accessed 3-6-2013. Compiled by ESA.
Notes: [1] Approved loans include: loans originated and applications approved, but not accepted.

The Home Mortgage Disclosure Act (HMDA), also provides data on the total number of applications for home improvement loans in Commerce. Home improvement loans generally have lower approval rates than loans used to purchase homes. In 2011, only 17 households in the City of Commerce applied for home improvement loans. Approximately 47 percent were approved and 9 percent were denied or withdrawn, indicating a significant gap differential between those who were actually able to obtain the financing to complete home improvements and those that were not. This is where City run programs are significant to make up the gap by providing available additional assistance to the households that could not qualify for a home improvement loan, perhaps making available rehabilitation loans with special finance rates.

5.3 - Environmental Constraints

5.3.1 – Seismic Hazards

As stated in the General Plan Safety Element, the entire City - as well as most of Southern California - is located within a seismically active region that has been subject to major earthquakes in the past. There are no known faults in Commerce. However, the Whittier fault, which is in close proximity from the City of Commerce. According to the Southern California Earthquake Data Center, the maximum probable earthquake that can be generated by the Whittier Fault is a magnitude 7.2. The greatest damage from earthquakes results from ground shaking. Although ground shaking is generally most severe near quake epicenter, property not immediately adjacent to the epicenter may be subject to extreme damage due to liquefaction. The greatest potential danger is the collapse of older residential units constructed from unreinforced masonry, and explosions of petroleum and fuel lines.

5.3.2 – FLOODING

The Federal Emergency Management Agency (FEMA) publishes maps that identify areas of the City subject to flooding in the event of a major storm. These Flood Insurance Rate Maps (FIRMs) indicate areas that may be inundated in the event of a 100-year or a 500-year storm. In addition, the maps indicate the base flood elevations at selected intervals of the floodway. Commerce lies within the dam inundation area of the Garvey Reservoir in Monterey Park. Dam rupture could result in the flooding of areas between Eastern Avenue and Garfield Avenue. The Ferguson neighborhood and portions of the Rosewood neighborhood could be affected by the flooding. Areas that are designated for future residential development do not fall within the 100-year floodplain and are not subject to specialized flood construction requirements.

5.3.3 – FIRE HAZARDS

The most serious fire threat within the City is building and structure fires. Like most southern California cities on the urban fringe, the late summer fires that result from the accumulation of this brush have the potential to spread into the City proper. Since the City center is largely developed, there is less potential for fire in central City communities. Other fire hazards within the City may be associated with heavy industrial uses, older commercial and residential structures, the presence of hazardous materials, and arson.

5.3.4 – NOISE

Residential land uses are sensitive to loud noises. State noise guidelines recommend that residential development be located in areas exposed to ambient outdoor noise levels no greater than 65 A-weighted decibels (dBA). A citywide noise inventory performed in October, 2005, found that virtually all of the neighborhoods in Commerce are located in areas where noise levels exceed 65 dBA. The City's noise environment is not expected to significantly change over time since the primary factors contributing to noise - the I-5 and I-710 Freeways, the railway freight lines, the railroad yard, and local truck traffic will have a continued presence in the City.

The General Plan FEIR identifies Community Development and Health and Safety policies that are designed to protect sensitive uses (such as housing) from excessive noise impacts. First, noise sensitive land uses are generally prohibited from being sited in areas characterized by high ambient noise levels. Second, land uses that generate excessive noise levels may not permitted near sensitive land uses. Finally, the General Plan promotes measures that will reduce noise exposure through the use of site planning and construction techniques. These policies are implemented by the City through its standard environmental review process that requires preparation of noise impact studies, as necessary.
All new residential development will need to meet General Plan Noise Element and State guidelines for exterior and interior ambient noise levels. Compliance with these guidelines may require more expensive construction techniques, which may in turn increase housing costs. The industrial operations located throughout the City of Commerce produce unpleasant dusts and odors that may be irritating and harmful to residents. Moreover, some industries produce and store toxic materials.

5.3.5 – AIR QUALITY

Given the composition of land uses in the City, the 2020 General Plan establishes a set of strategies to enable industrial activities and businesses to coexist with residential uses. Specifically, a major consideration in land use decisions is an evaluation of how stationary emissions from these businesses can be mitigated so they do not impact sensitive receptors. In addition to emissions generated by local businesses the City also experiences high volumes of truck traffic and railways running through the City to accommodate goods movement. Both rail and truck traffic can generate significant amounts of particulate matter which contribute to a less than ideal environment for residential uses. Furthermore, the City of Commerce is also bisected by two freeways: Interstate 5 which runs generally in an east-west orientation and Interstate 710 which runs north-south. It is not recommended that housing be located within 500 feet of freeways to avoid long term exposure to particulate matter for long term residents. Generally, the City is aware of potential air quality impacts on future residential development and has been careful to identify opportunity areas for residential development that are less impacted than other areas of the City. It is important to understand the existing environment and conditions present in the City with regard to housing, as the options for safe and healthy sites within the City are limited based on the industrial activity established in the City.

5.3.6 – HAZARDOUS MATERIALS

As the City of Commerce is primarily made up of industrial uses, it is important to ensure that sites that are identified and developed with housing are appropriate and safe. According to the California Department of Toxic Substance Control, in 2013, no parcels within the Housing Opportunity Overlay were identified on the Hazardous Waste and Substances Site List or the State Water Resources Control Board (SWRCB) list of cleanup sites. Despite this, future housing development or redevelopment will be reviewed on a project-by-project basis as part of the City's standard environmental review process to determine, if any, site contamination and the degree of remediation required. This is consistent with the policies of the General Plan Safety Element and the findings of the General Plan FEIR. It is possible that additional analysis may be required, including a soils analysis, to ensure that sites are safe for residential development, which can add cost and time to the development process. The City of Commerce will work with developers to streamline the process and when provide funding, when possible, but it is vital that sites are properly analyzed prior to the development of housing.

6. HOUSING RESOURCES

The Housing Resources section summarizes the land, financial, and administrative resources available for the development and preservation of housing in Commerce. The analysis conducted includes an evaluation of the availability of land resources for future housing development, the City's ability to satisfy its share of the region's future housing needs, the financial resources available to support housing activities, and the administrative resources available to assist in implementing the City's housing programs and policies.

6.1 - REGIONAL HOUSING NEEDS ASSESSMENT

This section of the Housing Element compares the housing need projections developed by the State Department of Housing and Community Development (HCD) and distributed by the Southern California Association of Governments (SCAG) as part of the Regional Housing Needs Assessment (RHNA), with historic housing growth and potential housing development in the city. The SCAG housing projections were derived from population, housing, and employment figures developed by the Department of Finance as part of the earlier planning process undertaken to develop the RHNA. The authority to determine housing needs for the various income groups for cities within the region has been delegated to the Southern California Association of Governments (SCAG), pursuant to Section 65584 of the Government Code. Housing needs are categorized according to income groups. The income categories include very low, low, moderate, and above-moderate income households, and the incomes of the selected income groups are based upon percentages of the median household income for the larger Los Angeles County region:

- Very low-income households are those households whose income is less than 50% of the median household income for the greater Los Angeles area. The RHNA requires 12 very low-income units to be provided. Of these units it is assumed that 7 units will be allocated for extremely low-income households.
- Low-income households earn from 50% to 80% of the County median. The RHNA requires 7 low-income units to be provided.
- Moderate-income groups earn from 80% to 120% of the County median. The RHNA requires 7 moderate-income units to be provided.
- Above-moderate Income households earn over 120% of the County median income. The RHNA requires 20 above moderate-income units to be provided.

The 2014-2021 RHNA allocation for the City of Commerce, as determined by SCAG, is 46 units. The RHNA allocation is presented by income category in **Table 6-1** below.

Table 6-1:
RHNA 2014-2021

Income Category	Number of Units	Percent of Total
Extremely Low Income[a]	6 units	13%
Very Low	6 units	13%
Low	7 units	15%
Moderate	7 units	15%
Above Moderate	20 units	44%
Total	**46 units**	**100%**

Source: SCAG Regional Housing Needs Assessment, 2012.
(a) The regional housing need for extremely low income is assumed to be 50 percent of the City's very low income RHNA of 12 units.

6.2. AB 1233 COMPLIANCE

In January 2006, changes to Housing Element law, specifically Assembly Bill 1233, created additional incentive for jurisdictions to achieve a compliant Element. AB 1233 requires "communities that failed to comply with requirements to make available sufficient sites to meet their regional housing need in the previous planning period must, within the first year of the new planning period, zone or rezone enough sites to accommodate the RHNA not accommodated from the previous planning period."

The City of Commerce Housing Element for the 2008-2014 planning period was certified by HCD in May 2010. However, due to budget cut backs and staffing reductions, the City was unable to complete the rezoning necessary to provide adequate sites to accommodate the City's lower income RHNA. Specifically, City was unable to implement the required code amendments (as outlined in Program 3.1 of the 2008-2014 Housing Plan to implement the Housing Opportunity Overlay) within the allocated timeframe. Consequently, the City is required to plan for the current planning period of 2014-2021 as well as any unaccommodated shortfall identified from the previous (2008-2014) planning period. The 2008-2014 RHNA for Commerce is shown in **Table 6-2**.

Table 6-2:
RHNA 2008-2014

Income Category	Number of Units	Percent of Total
Very Low	15 units	23%
Low	10 units	16%
Moderate	10 units	16%
Above Moderate	29 units	45%
Total	**64 units**	**100%**

Source: SCAG Regional Housing Needs Assessment, 2006.

The two planning period allocations combined result in a final housing needs allocation as shown in **Table 6-3**. The total fair share allocation for Commerce for the combined planning periods is 110 units.

Table 6-3: Combined 2008-2014 and 2014-2021 RHNA Allocations

	Very Low	Low	Moderate	Above Moderate	Total
2008-2014 RHNA	15	10	10	29	64
2014-2021 RHNA	12	7	7	19	46
Total	**27**	**17**	**17**	**48**	**110**

As Commerce's 2008-2014 Housing Element was adopted and certified, but not fully implemented the City must evaluate two key factors to determine their exact shortfall, in compliance with AB 1233. First, as the RHNA process establishes January 1, 2006 as the baseline for growth projections for the Housing Element planning period of 2008-2014, jurisdictions may count any new units built or approved since January 1, 2006 toward their 2008-2014 RHNA allocation. This means that any units built or approved from 2006 to the present may be credited toward the City's 2008-2014 RHNA allocation of 64 units. Second, as AB 1233 focuses on units that are accommodated specifically on rezoned sites, the shortfall will primarily include lower income units that were to be accommodated on sites in the Housing Opportunity Overlay. **Table 6-4** below, presents the number of units that the City must address in their 2014-2021 sites inventory, including any shortfall from the 2008-2014 planning period.

Table 6-4: 2014-2021 RHNA with AB 1233 Shortfall

	Very Low	Low	Moderate	Above Moderate	Total
2008-2014 RHNA	15	10	10	29	64
Credits (2006-present)	0	0	0	-29	-29
Units Accommodated on Vacant Sites	-14	0	-10	0	-24
Sub-Total	**1**	**10**	**0**	**0**	**11**
2014-2021 RHNA	12	7	7	19	46
Combined RHNA Total	**13**	**17**	**7**	**19**	**57**

Source: Compiled by ESA.

As shown in **Table 6-4**, between 2006 and 2012 the City entitled, approved or developed 67 market rate units, which is more than enough to meet the City's above moderate income RHNA allocation of 29 units for the 2008-2014 planning period. No deed restricted units were constructed during the planning period.

Additionally, within the 2008-2014 Housing Element, the Housing Resources section demonstrated vacant land to accommodate the City's remaining moderate income allocation of 10 units on land zoned Light Multiple Residential (R-2) and 14 lower income units on land zoned Medium Multiple Residential (R-3). The 2008-2014 included Site One, a grouping of four vacant parcels totaling 1.44 acres zoned R-2 allowing up to 17 dwelling units per acre. At the permitted density Site One accommodated 22 moderate income units. The 2008-2014 Housing Element also included a second vacant site, Site Four that

accommodated 14 lower income units. Site Four, was comprised of four parcels located in the southern tip of the City, zoned Medium Multiple Residential (R-3). Medium Multiple Residential allows development up to 27 dwelling units per acre to be constructed. Both sites, described above, were vacant during the 2008-2014 planning period, and did not require rezoning. Consequently, as shown in **Table 6-4**, the units accommodated on Sites One and Four of the 2008-2014 Housing Element will not be carried forward.

After taking into account, the number of units constructed and the units accommodated on vacant residentially zoned land, the City must carry forward 1 very low income unit and 10 low income units. The City's combined RHNA allocation, including the 11 lower income units from the 2008-2014 planning period is 57 units.

6.3. 2014-2021 SITES INVENTORY

As shown in **Table 6-4** above, based on the requirements of AB 1233, for the 2014-2021 planning period the City must make available sites to accommodate a total of 57 units, including 13 units for very low income, 17 units for low income (a total of 30 lower income units), 7 units for moderate income, and 19 units for above moderate income. This total includes 1 very low income unit and 10 low income units which were unaccommodated and thus carried forward from the 2008-2014 planning period per AB 1233.

6.3.1 - DENSITIES TO ACCOMMODATE LOWER INCOME HOUSING

Density is a critical factor in the development of affordable housing. In theory, maintaining low densities typically increases the cost of construction per unit, while higher density development lowers the per-unit land cost and facilitates construction in an economy of scale. In addition to density bonus provisions, more intense residential development can be achieved through a number of mechanisms, including clustering of residential development and zero lot line development, subject to City development standards. Clustering of housing can produce higher densities on a portion of land while creating space for amenities, and retaining the overall density assignment of the entire property. This method is effective when portions of the property not utilized for residential development can be developed with compatible uses, such as open space/recreation, parks, schools, public facilities and supportive commercial uses.

The State Housing and Community Development Department (HCD) have deemed affordability as correlated with density. Consequently, HCD has established "default densities" that by definition are considered sufficient to provide market-based incentives for the development of housing for lower-income households. For jurisdictions with a population less than 25,000 and located within a Metropolitan Statistical Area (MSA) with a population of more than 2 million, the City is considered to be Suburban and the default density is 20 dwelling units per acre. Commerce has a population of approximately 13,000 and is within the Los Angeles MSA. Thus, HCD has determined that Commerce's default density is 20 dwelling units per acre.

Due to the level of diversity in neighborhood types, land costs, and proximity to desired destinations throughout the urbanized Los Angeles region, utilizing a specific residential density (20 units per acre as

established by State law as the default density for affordable housing production) to determine the feasibility of affordable housing is problematic. As indicated in this Housing Element, affordable housing is feasible in Commerce at the required 20 dwelling units per acre, where it may not be as feasible in more expensive parts of the urbanized County.

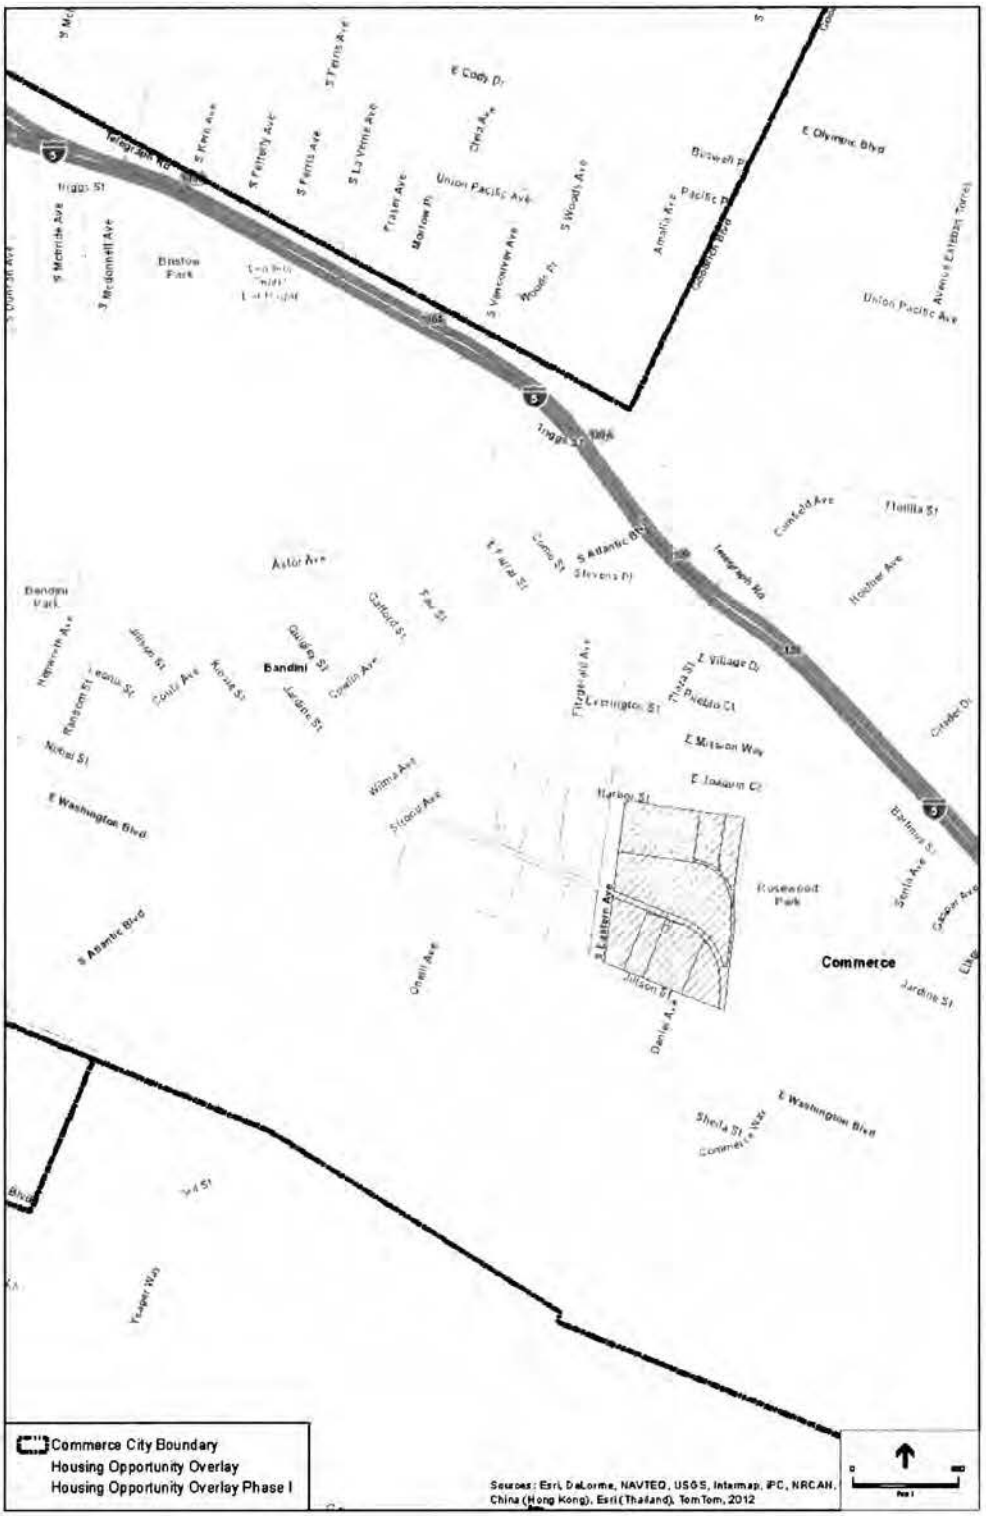
As shown in **Table 6-5**, the City of Commerce Municipal Code identifies three residential land use classifications. Additionally, the Housing Opportunity Overlay requires the development of residential uses at a minimum density of 20 dwelling units per acre. The availability of land suited to accommodate the various income levels is based upon the allowed density.

Table 6-5:
Combined 2008-2014 and 2014-2021 RHNA Allocations

Income Category	Zoning Districts	Density
Very Low Low	Housing Opportunity Overlay Medium Multiple Residential (R-3)	27 du/ac
Moderate	Light Multiple Residential (R-2)	17 du/ac
Above Moderate	Single Family Residential (R-1)	8.7 du/ac

6.3.2 – HOUSING OPPORTUNITY OVERLAY

To accommodate their 2014-2021 total RHNA allocation and AB 1233 carryover, the City has identified the Housing Opportunity overlay area to facilitate and encourage the development of residential uses. As part of the City of Commerce 2020 General Plan, the Housing Opportunity overlay was applied to a 44.3 acre area, located in the center of the City, adjacent to the Rosini, Rosewood, and The Village residential neighborhoods. The area is loosely bounded by Harbor Street on the north, Strong Avenue on the west, Jillson Street to the south, with no formal boundary on the east. Commerce City Hall and the City Aquatorium are located on the eastern side of the Overlay area. The Overlay designation includes a cluster of industrial properties totaling 44.3 acres, within the Rosewood Planning Area, that the City would like to see transition to residential and mixed use development. The Overlay area requires residential densities at a minimum 20 dwelling units per acre.



Based on the utilization and existing uses onsite, the City has identified the eastern portion of the Overlay area as most realistic to transition from industrial to residential uses during the 2014-2021 planning period. Consequently, the sites inventory for the 2014-2021 planning period, includes the parcels located Harbor Street on the north, Eastern Avenue on the west, Jillson Street to the south, with Commerce City Hall and other public facilities located to the east. This portion of the Overlay area will be called Phase I for the purposes of the Housing Element and includes approximately 19.9 acres of the total Overlay area.

To conservatively calculate unit capacity, the following assumptions were made: 1) the minimum 20 dwelling units per acre was utilized, 2) based on the existing uses onsite and given that initial projects will be in close proximity to industrial uses, 75 percent land capacity was assumed to allow for adequate buffers and onsite amenities. Given this established density and the calculation assumptions, if all 19.8 acres of the Phase I area are redeveloped, the City anticipates that approximately 298 new units could be provided. The specific parcels included in Phase I of the Housing Opportunity Overlay area are listed in **Table 6-6** and the Overlay area is shown in **Figure 6-1**.

Table 6-6:
Housing Opportunity Overlay Parcel Inventory

AIN	Acres	General Plan/Zoning	Minimum Density	Potential Capacity	Existing Use	Structure Year
6335025004	1.22	Housing Opportunity Overlay	20 du/ac	18	Packaging Manufacturer	1950
6335025005	1.77	Housing Opportunity Overlay	20 du/ac	27	Packaging Manufacturer	1952
6335025009	1.17	Housing Opportunity Overlay	20 du/ac	18	Hat Manufacturer	1955
6335025010	3.71	Housing Opportunity Overlay	20 du/ac	56	Warehouse/Office (vacant)	1951
6335025011	5.96	Housing Opportunity Overlay	20 du/ac	89	Clothing Manufacturer	1952
6335025013	0.02	Housing Opportunity Overlay	20 du/ac	1	Transportation Depot	N/A
6335025805	0.29	Housing Opportunity Overlay	20 du/ac	4	Rail Right-of-Way	1975
6335025806	0.86	Housing Opportunity Overlay	20 du/ac	13	Rail Right-of-Way	1975
6335025903	1.09	Housing Opportunity Overlay	20 du/ac	16	City Hall North Annex	1956
6335025905	1.43	Housing Opportunity Overlay	20 du/ac	21	Transportation Depot	1949
6335025906	2.36	Housing Opportunity Overlay	20 du/ac	35	Hat Manufacturer	N/A
TOTAL	**19.9**			**298**		

Figure 6-1: Housing Opportunity Overlay Area

While the City feels that the Phase I area is most likely to transition during the planning period, based on number of suite vacancies and the age and condition of the structures onsite, the City will consider redevelopment proposals for the entire Overlay area. The Housing Opportunity overlay area is the ideal location for the development of new housing including market rate and affordable units as stand-alone projects or incorporated into mixed use development. The Overlay is intended to locate employment opportunities, dining, shopping, neighborhood services, and residential uses in close proximity of one another thereby reducing vehicle trips and encouraging walkability. The Overlay area is ideal for the development of affordable units for residents that may need access to services, as it is close to existing residential development, City Hall, the City's transit center, the library, Rosewood Park, the City of Commerce Employment Center, the City of Commerce Aquatorium, and numerous commercial businesses. To further encourage and facilitate the transition of the area to residential uses, specific development standards have been developed and are included in the Housing Constraints analysis.

As the Housing Opportunity Overlay contains parcels that are developed with older industrial uses, it is important to understand the context of the area and its potential for redevelopment. Many of the existing on-site structures include older, vacant industrial buildings, as well as surface parking areas. To illustrate the existing conditions of the Overlay area, the following images have been provided of the Phase I area.

Single story, older industrial warehouse buildings are located facing Strong and Eastern Avenues. A sign in front of 2300 Eastern indicates that the space is vacant. Several other buildings in the Overlay area have signs advertising vacancies and parking lots mid-day during a work week indicate that few businesses are in operation.

Underutilized parking areas and thoroughfares can be found throughout the overlay area.

A deserted rail right-of-way runs through the overlay area. There is potential to covert the right-of-way into trails or incorporate them into the circulation plan of future projects.

As buildings sit vacant they are not properly maintained which creates blight and lowers property values.

As shown in the images above there are numerous opportunities for redevelopment within Phase I of the Housing Opportunity Overlay area. There are generally three large buildings fronting Jillson Street and three additional large structures fronting Harbor Street with one additional large manufacturing warehouse in the center of the area. These buildings are all single story, with surface parking areas and many are in need of rehabilitation. Several buildings are advertising vacancies and majority appear closed. Signs on the properties area faded or in some instances blacked out. Observation of the area revealed no pedestrian activity and limited auto access. Within the overlay area the parcels are currently disconnected from one another and there is an abandoned rail right-of-way running east-west dividing the area in half. This area is ripe for redevelopment and appropriate for residential uses, given its location and proximity to existing neighborhoods and supporting services.

6.4. SUMMARY OF AVAILABLE SITES

Table 6-3 and **Table 6-4** illustrate the City's RHNA allocation for the 2014-2021 planning period, as well as unaddressed units from the 2008-2014 planning period. Generally, the City must make available sites to accommodate a total of 57 units, including 13 units for very low income, 17 units for low income (a total of 30 lower income units), 7 units for moderate income, and 19 units for above moderate income. This total includes 1 very low income and 10 low income units which were unaccommodated per AB 1233 and thus carried forward from the 2008-2014 planning period. **Table 6-7** provides a summary of the strategies the City has identified to facilitate the development of new residential units to accommodate their combined RHNA allocation of 57 units.

Table 6-7:
Accommodation of the 2014-2021 RHNA

	Very Low	Low	Moderate	Above Moderate	Total
2008-2014 RHNA	15	10	10	29	64
Credits (2006-present)	0	0	0	-29	-29
Units Accommodated on Vacant Sites	-14	0	-10	0	-24
Sub-Total	**1**	**10**	**0**	**0**	**11**
2014-2021 RHNA	12	7	7	19	46
Combined RHNA Total	**13**	**17**	**7**	**19**	**57**
Housing Opportunity Overlay	-74	-74	-74	-76	-298
TOTAL	**0**	**0**	**0**	**0**	**(238)**

Source: Compiled by ESA.
Notes:
(a) As the Housing Opportunity Overlay requires a minimum density of 20 dwelling units per acre the units accommodated in the Overlay area have been evenly distributed across all income categories.
(b) Parentheses indicate a surplus of units.

As shown in **Table 6-7**, the City is more than able to accommodate their remaining RHNA allocation of 57 units. The City has identified the Housing Opportunity Overlay area which requires a minimum density of 20 dwelling units per acre, in accordance with AB 2348, to accommodate its remaining RHNA allocation, including their very low- and low-income units. The Overlay area can accommodate a total of 298 units, assuming a conservative 75 percent capacity. The existing conditions of the area, as shown in the images above, indicate that there are numerous underutilized parcels with vacant structures, available to facilitate and encourage development. To accommodate their RHNA and any carry over units in compliance with AB 1233, the City has identified a surplus of opportunities for all income groups.

As discussed throughout this section, the City of Commerce has been successful in providing affordable housing within their current zoning designations, which currently allows development of up to 27 units per acre. The City anticipates that with assistance from affordable housing developers such as TELACU and Mayans Development additional affordable units will be constructed within the planning period. As mentioned previously, the City in the last 30 years has been successful in creating affordable units with deed restrictions through infill opportunities and on small lots. Several of these developments are

between 20 and 30 units total and in some instances the City or the developer purchased a single-family home and established a covenant to ensure that the home remained affordable.

Allowing for a variety of units in various areas of the City at different densities is crucial to ensuring that affordable units are not concentrated in one specific area. It is also necessary to ensure that units of varying sizes, product types and styles can be developed. Based on the City's history of providing affordable units and the sites identified in Section 5.3 the City has identified many opportunities for the production of affordable housing.

6.5 – CONSTRAINTS TO HOUSING PRODUCTION

6.5.1 – PARCEL SIZE

In addition to density, the acquisition of parcels large enough to accommodate an affordable housing complex can also be challenging in the City of Commerce. In reviewing a jurisdiction's Housing Resources section, the State typically looks for properties that are between 5 and 10 acres in size. As Commerce has few vacant parcels remaining, much of the development in the City is redevelopment. This has resulted in the development of small infill projects. **Table 6-8** provides development information regarding the existing multifamily rental complexes with affordable units that occurred on small groupings of parcels up to 2 acres in size.

Table 6-8:
Density and Lot Size Calculations for Existing Multi-Family Projects

Project Name	Total Site Acreage	Approximate Density	Zoning	Number of Units
Commerce Senior Apartments Total Units = 68 units	1.94 acres	35 du/ac	R-3	68
Rosewood Park Senior Apts. Total Units = 94 units	2.12 acres	44 du/ac	R-3	94
TELACU Manor Total Units = 76 units	1.43 acres	53 du/ac	R-3	75
TELACU Gardens Total Units = 24 units	0.50 acres	48 du/ac	R-3	23
Total Average	**1.5 acres**	**45 du/ac**	**R-3**	**260**

Source: City of Commerce, 2009.

6.5.2. Environmental Constraints

Potential environmental constraints to future development of sites are addressed in Section 5, Housing Constraints. Parcels identified in the site specific Inventory were compared with all hazards maps included in the City's Safety Element; none were found to be within areas that have development restrictions due to risk of damage from disasters (such as floods, wildfires, or seismic events). The sites inventoried have a land use designation which was determined based on surrounding land uses and has already examined potential environmental constraints. Aside from the constraints mentioned above, there are no additional constraints that would impede the development of new housing units in the future on the identified sites.

6.5.3 - Infrastructure Constraints

The City's five year Capital Improvement Plan has identified expenditures of City funds used for public improvement projects, including infrastructure. The City understands that improvements can be achieved with a comprehensive approach that includes reviewing infrastructure plans for each application for discretionary approval of General Plan amendments, tentative parcel or tentative tract maps, or development proposals that includes extension of an existing street or construction of a new street. The City requires that project applications for new development be reviewed for adequate infrastructure. Applications are evaluated on a case-by-case basis to ensure there is the capacity to service new developments. Infrastructure requirements and costs are also addressed in Section 5, Housing Constraints. As the overlay area is currently developed with light manufacturing uses, the provision of infrastructure is not seen as a constraint to development of residential uses.

6.6 – Financial Resources

A variety of potential funding sources are available to finance housing activities in Commerce. Due to both the high cost of developing and preserving housing, and limitations on both the amount and uses of funds, layering of funding sources may be required for affordable housing programs and projects. **Table 6-9** lists the potential funding sources that are available for housing activities. They are divided into five categories: federal, State, county, local, and private resources.

In previous years, the primary source of funds for affordable housing activities in Commerce included HOME funds, CDBG funds as well as the Redevelopment Agency housing set-aside fund. However, on Dec. 29, 2011, the California Supreme Court ruled to uphold ABx1 26, which dissolved all redevelopment agencies (RDAs) in the State. A companion bill, ABx1 27, which would have allowed the RDAs to continue to exist, was also declared invalid by the court. The court's decision required that all RDAs within California be eliminated no later than February 1, 2012. The City of Commerce Redevelopment Agency was dissolved as of February 1, 2012 and the City was selected to be the Successor Agency responsible for all enforceable obligations owed.

Commerce previously relied on estimated redevelopment housing set-aside revenues ranging from $850,000 to $1.1 million annually to support the development of affordable housing and the

implementation of programs outlined in the Housing Plan. For the 2014-2021 planning cycle, the City is investigating new funding sources to utilize to continue administering its existing programs.

Table 6-9:
Financial Resources Available for Housing Activities

Program Name	Description	Eligible Activities
1. Federal Programs and Funding Sources		
Community Development Block Grant (CDBG)	The Community Development Block Grant (CDBG) program is a flexible program that provides communities with resources to address a wide range of unique community development needs.	Acquisition Rehabilitation Homebuyer Assistance Economic Development Homeless Assistance Public Services
Home Investment Partnership (HOME)	Commerce can apply to receive HOME funds through the County of Los Angeles. HOME funds are used to assist low income (80% AMI) households.	New Construction Acquisition Rehabilitation Homebuyer Assistance Rental Assistance
Emergency Shelter Grant (ESG) Program	Funds emergency shelters, services and transitional housing for homeless individuals and families.	Homeless Assistance Public Services
Neighborhood Stabilization Program (NSP) Funds	Provides funds to purchase abandoned and foreclosed homes and residential property.	Acquisition Homebuyer Assistance
Choice Neighborhoods Grants	Funds to address distressed neighborhoods and public and assisted projects to transform them into viable and sustainable mixed-income neighborhoods by linking housing improvements with appropriate services, schools, public assets, transportation, and access to jobs. Planning grants and implementation grants are available.	New Construction Acquisition Rehabilitation Economic Development Public Services
Section 202 Housing for Seniors	HUD provides capital advances to finance the construction, rehabilitation or acquisition with or without rehabilitation of structures that will serve as supportive housing for very low-income elderly persons, including the frail elderly, and provides rent subsidies for the projects to help make them affordable.	Acquisition Rehabilitation New Construction

Program Name	Description	Eligible Activities
Section 811 Housing for Disabled Persons	Grants to non-profit developers of supportive housing for persons with disabilities, including group homes, independent living facilities and intermediate care facilities.	Acquisition Rehabilitation New Construction Rental Assistance
Housing Opportunities for Persons with AIDS (HOPWA)	HOPWA is an entitlement grant distributed to the largest jurisdiction in each county. HOPWA funds may be used for a wide range of housing, social services, program planning, and development costs. These include, but are not limited to, the acquisition, rehabilitation, or new construction of housing units; costs for facility operations; rental assistance; and short-term payments to prevent homelessness. HOPWA funds also may be used for health care and mental health services, chemical dependency treatment, nutritional services, case management, assistance with daily living, and other supportive services.	Acquisition Rehabilitation Homebuyer Assistance Homeless Assistance Public Services Rental Assistance
Supportive Housing Program	Provides funding to develop supportive housing and services that will allow homeless persons to live as independently as possible. Grants under the Supportive Housing Program are awarded through a national competition held annually.	Homeless Assistance Public Services
Shelter Plus Care	Provides rental assistance for hard-to-serve homeless persons with disabilities in connection with supportive services funded from sources outside the program.	
2. State Programs		
Low-income Housing Tax Credit (LIHTC)	Tax credits are available to persons and corporations that invest in low-income rental housing. Proceeds from the sale are typically used to create housing. Tax credits are available between 4% and 9%.	New Construction

Program Name	Description	Eligible Activities
Building Equity and Growth in Neighborhoods (BEGIN)	Grants to cities to provide down payment assistance (up to $30,000) to low and moderate income first-time homebuyers of new homes in projects with affordability enhanced by local regulatory incentives or barrier reductions. One funding round annually through 2009.	Homebuyer Assistance
CalHome	Grants to cities and non-profit developers to offer homebuyer assistance, including down payment assistance, rehabilitation, acquisition/rehabilitation, and homebuyer counseling. Loans to developers for property acquisition, site development, predevelopment and construction period expenses for homeownership projects. One funding round annually through 2011.	Predevelopment Site development Site acquisition Rehabilitation Acquisition/Rehab Down payment assistance Mortgage financing Homebuyer counseling
Transit-Oriented Development Housing Program	Under the program, low-interest loans are available as gap financing for rental housing developments that include affordable units, and as mortgage assistance for homeownership developments. In addition, grants are available to cities, counties, and transit agencies for infrastructure improvements necessary for the development of specified housing developments, or to facilitate connections between these developments and the transit station.	Homebuyer Assistance Predevelopment Site development Infrastructure
Infill Incentive Grant Program	Funding of public infrastructure (water, sewer, traffic, parks, site clean-up, etc) to facilitate infill housing development. One funding round annually.	Regulations pending
CalHFA FHA Loan Program	Provides fixed rate FHA mortgages in Federally Designated Targeted Areas.	Homebuyer Assistance
CalHFA Homebuyer's Down payment Assistance Program	CalHFA makes below market loans to first-time homebuyers of up to 3% of sales price. Program operates through participating lenders who originate loans for CalHFA. Funds available upon request to qualified borrowers.	Homebuyer Assistance

Program Name	Description	Eligible Activities
CalHFA Mental Health Services Act Funds	Jointly administered by the California Department of Mental Health and the California Housing Finance Agency on behalf of counties, the Program offers permanent financing and capitalized operating subsidies for the development of permanent supportive housing, including both rental and shared housing, to serve persons with serious mental illness and their families who are homeless or at risk of homelessness. MHSA Housing Program funds will be allocated for the development, acquisition, construction, and/or rehabilitation of permanent supportive housing.	New Construction Acquisition Rehabilitation Homeless Assistance Public Services Rental Assistance New
CalHFA New Issue Bond Program (NIBP)	Provides affordable housing bond funding to CalHFA and other housing finance agencies. This funding allows developers to secure a source of affordable financing in the marketplace which otherwise could not be obtained.	New Construction Acquisition Rehabilitation Preservation
Golden State Acquisition Fund (GSAF)	Affordable Housing Innovation Program (AHIP): provides loans for developers through a nonprofit fund manager to provide quick acquisition financing for the development or preservation of affordable housing.	New Construction Acquisition Rehabilitation Preservation
Emergency Housing and Assistance Program Operating Facility Grants (EHAP)	Provides operating facility grants for emergency shelters, transitional housing projects, and supportive services for homeless individuals and families.	Homeless Assistance Public Services
Emergency Housing and Assistance Program Capital Development (EHAPCD)	Funds capital development activities for emergency shelters, transitional housing, and safe havens that provide shelter and supportive services for homeless individuals and families.	Homeless Assistance Public Services

Program Name	Description	Eligible Activities
Emergency Solutions Grant (ESG) Program	Funds projects that serve homeless individuals and families with supportive services, emergency shelter/transitional housing, assisting persons at risk of becoming homeless with homelessness prevention assistance, and providing permanent housing to the homeless population. The Homeless Emergency Assistance and Rapid Transition to Housing (HEARTH) Act of 2009 places new emphasis on assisting people to quickly regain stability in permanent housing after experiencing a housing crisis and/or homelessness.	Homeless Assistance Public Services
Infill Infrastructure Grant Program (IIG)	Provides grants for infrastructure construction and rehabilitation to support higher-density affordable and mixed-income housing in infill locations.	Predevelopment Site development Infrastructure
Multifamily Housing Program:	Provides funding for new construction, rehabilitation, or acquisition and rehabilitation of permanent or transitional rental housing. Projects are not eligible if construction has commenced as of the application date, or if they are receiving 9% federal low income housing tax credits. Eligible costs include the cost of child care, after-school care and social service facilities integrally linked to the assisted housing units; real property acquisition; refinancing to retain affordable rents; necessary onsite and offsite improvements; reasonable fees and consulting costs; and capitalized reserves.	Acquisition Rental Assistance Public Services Site development Infrastructure Development Fees
Predevelopment Loan Program (PDLP)	Provides predevelopment capital to finance the start of low income housing projects.	Predevelopment
3. County Programs		
Housing Choice Vouchers (formerly Section 8)	Rental assistance payments to owners of private market rate units on behalf of low-income (50% MFI) tenants.	Rental Assistance

Program Name	Description	Eligible Activities
Home Ownership Program (HOP)	The County of Los Angeles provides a secondary mortgage loans to first time homebuyers. HOP has been designed to meet the needs of low-income families and individuals who want to purchase a new home, but are unable to qualify without financial assistance.	Homebuyer Assistance
Mortgage Credit Certificate (MCC)	Federal tax credit for low- and moderate-income homebuyers who have not owned a home in the past three years. Allocation for MCC is provided by the State and administered by the County.	Homebuyer Assistance Income Tax Credit
Affordable Homeownership Program (AHOP)	The Los Angeles Community Development Commission provides first-time homebuyer assistance to low-income families and individuals to purchase newly constructed homes that were partially financed with CDC development funding.	Homebuyer Assistance
Housing Economic Recovery Ownership (HERO)	The Los Angeles County HERO program meets the needs of low, moderate and middle-income households who want to purchase a foreclosed or abandoned single family home, but are unable to qualify without financial assistance. This program provides a 0% interest loan as a secondary mortgage for the purchase of that home, down payment assistance, and rehabilitation grant opportunities.	Rehabilitation Acquisition Homebuyer Assistance
Infill Sites Rental Program (ISRP)	The ISRP is designed to provide financial assistance for acquisition and rehabilitation of foreclosed residences for affordable rental housing to low-income persons. Developers must agree to operate the housing at affordable rents for a period of 55-years.	Rehabilitation Acquisition
4. Local Programs		
Tax Exempt Housing Revenue Bond	The City can support low-income housing by holding the required TEFRA hearing prior enabling the issuance of housing mortgage revenue bonds. The bonds require the developer to lease a fixed %age of the units to low-income families at specified rental rates.	New Construction Rehabilitation Acquisition

Program Name	Description	Eligible Activities
5. Private Resources/Financing Programs		
Federal National Mortgage Association (Fannie Mae)	Fixed rate mortgages issued by private mortgage insurers; mortgages which fund the purchase and rehabilitation of a home; low down-payment mortgages for homes in underserved areas.	Homebuyer Assistance
National Housing Trust	The Green Affordable Housing Preservation Loan fund through the National Housing Trust Provides below market predevelopment and interim development loans to affordable housing developers who seek to incorporate green building techniques when rehabilitating existing affordable housing. Under the program, a portion of the loan will be forgiven when the developer demonstrates that they have incorporated practical, environmentally friendly design elements in the property's rehabilitation plan.	Predevelopment Development Loans
California Community Foundation	Provides support for general operating of existing nonprofit affordable housing developers, with the focus on supporting the development and preservation of permanent affordable housing.	New Construction Rehabilitation Acquisition
MacArthur Foundation:	Preserving Affordable Rental Housing Program is a $150 million initiative that seeks to preserve and improve affordable rental housing.	Preservation Rehabilitation Acquisition
Local banks:	Thanks to the Community Reinvestment Act of 1977, commercial banks are required to "meet the credit needs" of all the areas from which they draw deposits. They usually do this through below-market loans to both developers and qualified low-income homebuyers, and grants to community development nonprofits. Many banks have set up a separate community development division, and partner with local organizations that provide services like homeownership counseling to their borrowers. Larger banks often have a separate foundation to handle the grants.	Homebuyer Assistance

6.6.1. POTENTIAL FUTURE FUNDING SOURCES

In addition to the funding sources listed in **Table 6-9**, affordable housing advocates are working with large foundations in hopes of creating a low-interest loan fund from endowments. Housing groups are also continuing attempts to broaden infrastructure financing authority. An infrastructure financing district (IFD) may be formed pursuant to California Government Code Section 53395 et seq. (the "IFD Law"). These districts have rights to the tax increment for financing public infrastructure. This authority exists at both the state and local level, but under current law requires a vote. Another hurdle is that current IFD law prohibits IFDs within any portion of a redevelopment project area that is or has been previously created; coupled with the fact that the legislative intent of the IFD law is that IFD areas are substantially undeveloped. However, many advocates remain hopeful that IFDs may provide an opportunity to fill the redevelopment gap. Current drafts of new legislation would allow cities to create infrastructure districts without voter approval and make IFDs more user-friendly. There is also proposed legislation that, in addition to allowing for IFD formation by resolution, would require set-asides for affordable housing where an IFD is formed in a transit village development district. Certain legislation also seeks to broaden the share of property tax increment that IFDs in specified locations may collect, and seeks to address the current deficiencies in the IFD Law.

6.6.2. ADMINISTRATIVE RESOURCES

Described below are several non-profit agencies that are currently active and have completed projects in Los Angeles County. These agencies serve as resources in meeting the housing needs of the City, and are integral in implementing activities for acquisition/rehabilitation, preservation of assisted housing, and development of affordable housing. The City currently has a program within their Housing Plan to partner with affordable housing developers, including the three mentioned below.

Habitat for Humanity
Habitat is a non-profit, Christian organization that builds and repairs homes for sale to very low-income families with the help of volunteers and homeowner/partner families. Habitat homes are sold to partner families at no profit with affordable, no interest loans. The local affiliate, Habitat for Humanity, has been active in the region, rehabilitating or building new homes for families annually.

Jamboree Housing Corporation (JHC)
JHC is a non-profit developer that has developed and implemented numerous affordable housing projects throughout Southern California and the State. Jamboree has also established an in-house social services division to assist residents in maintaining self-sufficiency. "Housing with a HEART" (Helping Educate, Activate and Respond Together) now operates at most Jamboree-owned properties.

Mercy Housing California
Mercy Housing has offices in Los Angeles, San Francisco, and Sacramento. Mercy Housing serves more than 10,000 people at about 100 properties. Residents range from families to people with special needs to seniors.

6.7 - ENERGY CONSERVATION

As cities construct more housing to meet growing population demands, the consumption rate of energy becomes a significant issue. The primary uses of energy in urban areas are for transportation, lighting, water, heating and space heating and cooling. The high cost of energy demands that efforts be taken to reduce or minimize the overall level of urban consumption. In recent months, as the cost of fuel, has become increasingly more expensive, homeowners have become more aware of energy-conserving measures. The most readily available energy conservation alternatives are easily installed in new homes. As in many cities, the older homes in Commerce were constructed with minimum concern for energy conservation. However, there are numerous energy- conserving measures that can be retrofitted into existing older units that conserve the use of non-renewable fuels and save money.

There are many opportunities for conserving energy in new and existing residential units. Construction of energy efficient buildings does not lower the price of housing. However, housing with energy conservation features should result in reduced monthly occupancy costs as consumption of fuel and energy is decreased. Similarly, retrofitting existing structures with energy conserving features can result in a reduction in utility costs. Examples of energy conservation opportunities include weatherization programs and home energy audits; installation of insulation; installation or retrofitting of more efficient appliances, and mechanical or solar energy systems; and building design and orientation which incorporates energy conservation considerations. The City enforces all provisions of Title 24 of the California Administrative Code, which provides for energy conservation features in new residential construction.

Southern California Edison programs: Southern California Edison offers a variety of energy conservation services under the Low Income Energy Efficiency programs (LIEE), which help qualified homeowners and renters conserve energy and control electricity costs. Eligible customers can receive services from local community agencies and licensed contractors working with Edison. Services include weatherization, efficient lighting and cooling, refrigerator replacement, and energy education. In addition, Edison participates in the California Alternative Rates for Energy (CARE) program, which provides a 15% discount reduction on electric bills for low-income customers and the Family Electric Rate Assistance Program (FERA) that provides discounts for families with household incomes slightly exceeding the low-income energy program allowances.

Southern California Gas programs: The Southern California Gas Company offers two direct assistance programs to limited income customers: (1) a no-cost weatherization (attic insulation and water heater blankets) and (2) a no-cost furnace repair and replacement service. The Gas Company also participates in the State LIEE and CARE programs, helping low-income customers conserve energy and providing them with a discount on their gas bills.

6.6.1 - Techniques to Conserve

Many modern design methods used to reduce residential energy consumption are based on proven techniques that have been known to humans since the earliest days of collective settlement. These methods can be categorized in three ways:

1. Building design that keeps natural heat in during the winter and out in the summer. Designs aim to reduce air conditioning and heating demands. Proven building techniques in this category include:

- Orienting windows and openings of a building to follow the path of the sun, in order to minimize solar gain in the summer and maximize solar gain in the winter;
- Utilizing "thermal mass," earthen materials such as stone, brick, concrete, and tiles that absorb heat during the day and release heat at night;
- "Burying" sections of the structure in a hillside or berm to insulate the home against extremes of temperature;
- Application of window coverings, insulation, and other materials to reduce heat exchange between the interior and the exterior of the home;
- Strategic placement of openings and the use of ventilating devices that take advantage of natural air flow (particularly cool evening breezes); and
- Designing eaves and overhangs above windows to block direct summer solar gain during the summer, but allow for solar gain during the winter.

2. Building orientation that allows natural elements to maintain a comfortable interior temperature. Examples include:
   - Orienting the long axis of a building in a north-south position;
   - Minimizing the southern and western exposure of exterior surfaces; and
   - Designing the structure to admit the maximum amount of sunlight into the building and to reduce exposure to extreme weather conditions;
   - Positioning dwelling units to take advantage of natural air circulation and evening breezes.

3. Use of landscaping features to moderate interior temperatures. Such techniques include:
   - Planting of deciduous shade trees and other plants to protect the home;
   - Design including natural or artificial flowing water; and
   - Strategic placement of trees and hedges to control air flow.

In addition to natural techniques that have been used historically, a number of modern energy conversion methods have been developed and advanced in more recent years. These include:

- Implementation of solar panels and other devices to generate electricity;
- Application of solar energy to heat water;
- Employment of window glazing to repel summer heat and trap winter warmth;
- Use of weather-stripping and other insulating devices to reduce heat gain and loss; and
- Acquire energy efficient home appliances.

7. PROGRESS REPORT

The Progress Report reviews the previous Housing Element's programs, objectives, and actions that were to be implemented during the previous planning period. The City of Commerce 2008-2014 Housing Element identified five goals to be implemented during the previous planning period. Each goal has specific policies that were to be achieved in order to facilitate the construction of affordable housing and to maintain the existing affordable housing stock. Each policy has specific actions and quantified objectives that were to be implemented to accomplish the goal of the program. Each of the actions and objectives had a timeframe for completion along with a responsible agency to monitor the program.

Accomplishments that occurred during the 2008-2014 planning period are listed in the right-hand column of the table and display the progress, effectiveness, and appropriateness of the program. Pursuant to Government Code Section 65588 local governments shall review their Housing Element and evaluate the following:

1. The progress of the City or County in implementation of the housing element.
2. The effectiveness of the housing element in attainment of the community's housing goals and objectives.
3. The appropriateness of the housing goals, objectives, and policies in contributing to the attainment of the State housing goal.

Table 7-1 below provides a brief description of the housing programs outlined in the previous Element, the program's objective and the progress/appropriateness of the program. In providing the status of the program the table will indicate whether the program will be continued into the 2014-2021 planning period.

Table 7-1:
Effectiveness of Previous Housing Element Programs

Goal 1: Conserve and enhance the quality of existing housing and residential neighborhoods in Commerce.

Description of Previous Housing Element Program	Status
Program 1.1 - Code Enforcement Program. The objective of the City's Code Enforcement Program is to bring substandard housing units into compliance with City codes. Potential code violations are identified based on exterior windshield surveys and complaints reported to the City. **Objective:** To promote the use of established City programs for rehabilitation and revitalization or housing units in the City. Corrections will be addressed on a case by case basis.	**Progress and Effectiveness**: The City currently conducts windshield surveys and addresses complaints on an ongoing basis. Throughout the planning period the City addressed more than 50 violations annually including: 329 violations in 2006, 235 violations in 2007, 259 in 2008, 132 in 2009, 146 in 2010, 257 in 2011, and 263 in 2012. This is an average of 230 violations addressed per year. When appropriate code enforcement officers referred residents to the Substantial Housing Rehabilitation Loan Program, Emergency Home Repair Grant Program, Neighborhood Fix Up Grant Program, and the Environmental Rehabilitation Program. The City has successfully implemented this program. **Appropriateness**: This program is crucial to preserving the City's existing housing stock and is connected to rehabilitation programs offered by the City. The City will continue to offer this program in the upcoming planning period.

Goal 1: Conserve and enhance the quality of existing housing and residential neighborhoods in Commerce.

Description of Previous Housing Element Program	Status
Program 1.2 - Substantial Housing Rehabilitation Loan Program. The n provides deferred loans of up to $100,000 for the rehabilitation of single-family homes that are owner-occupied by low -income families. **Objective:** Assist 3 households during the planning period.	**Progress and Effectiveness**: On an annual basis the City administers loans between $50,000 and $100,000 to substantially rehabilitate units and in return property owners are required to put affordability convents in place. During the planning period the City was able to achieve their objectives and assist 3 households with substantial rehabilitation loans. In FY 2008-2009 the City administered a loan of $50,000, in FY 2010-2011 the City administered a loan of $100,000, and in FY 2011-2012 the City administered another loan of $100,000. The units assisted were rehabilitated and affordability covenants put in place to preserve the units as affordable to low income households for 45 years. Units that utilized $100,000 loans will be counted as "substantial rehab" project units towards the City's required housing allocation consistent with HCD requirements. **Appropriateness**: The Substantial Housing Rehabilitation Loan Program has historically been an important mechanism for the City to improve the existing housing stock and to increase the number of affordable units with deed restrictions. As this program was funded by the former Commerce Community Development Commission, the program moving forward will be administered based on funds available. This program will be included in the 2014-2021 Housing Element.

Goal 1: Conserve and enhance the quality of existing housing and residential neighborhoods in Commerce.

Description of Previous Housing Element Program	Status
Program 1.3 – Environmental Rehabilitation Program. The Environmental Rehabilitation Program will provide grant assistance up to $30,000 to address the negative air quality and noise impacts created by the operation of the rail road yards and freeways within the City. This program targets those households with very low- or low-incomes. **Objective:** Provide $600,000 in available RDA funding to assist 20 households over the planning period.	**Progress and Effectiveness:** The City established the Environmental Rehabilitation Program to provide grant assistance up to $30,000 to address the negative air quality and noise impacts created by the operation of the rail road yards and freeways within the City, specifically homes within the Ayers Residential Neighborhood. For the 2008-2104 planning period, the City is very close to achieving their objectives. In FY 2007-2008 the City administered one loan of $30,000 and in FY 2008-2009 the City administered 17 loans of $30,000, providing a total of $540,000 in RDA set-aside funds to 18 households between 2006 and 2012. With the dissolution of the Commerce Community Development Commission and the taking of the LMIHF in January 2012, funding for this program was suspended. **Appropriateness**: The Environmental Rehabilitation Program has historically been an important mechanism for the City to improve the existing housing stock and assist homeowners with emergency repairs that would otherwise be unaffordable. As this program was funded by the former Commerce Community Development Commission, the program moving forward will be administered based on funds available. For the upcoming planning period the City will research and apply for grant opportunities that address environmental justice to fund program activities. This program will be included in the 2014-2021 Housing Element.

Goal 1: Conserve and enhance the quality of existing housing and residential neighborhoods in Commerce.

Description of Previous Housing Element Program	Status
Program 1.4 - Neighborhood Fix Up Grant Program. The Neighborhood Fix Up Grant Program provides up to $1000 for housing repairs and alterations that are visible from the street. **Objective:** Provide $72,000 in available funding to assist 72 Households annually.	**Progress and Effectiveness:** The Neighborhood Fix Up Grant Program provides up to $1,000 for housing repairs and alterations that are visible from the street. Over time the City has seen the demand for this program increase and in response has allocated additional funding for the program. During the planning period the City increased funding from $16,500 in FY 05-06 to $72,000 in FY 08-09. The City, unfortunately did not start monitoring the households assisted through the program until 2009 however from 2009 to 2011, the City assisted 311 households, or an average of 103 households annually. While this program has been highly successful, the dissolution of the Commerce Community Development Commission, as acting RDA, in January 2012, was resulted in a direct loss of funding for this program. **Appropriateness**: The Neighborhood Fix Up Grant Program has historically been an important tool used by the City to improve existing neighborhoods and the housing stock by providing funds for exterior improvements. As this program was funded by the former Commerce Community Development Commission, the program moving forward will be administered based on funds available. It is the City's hope that as the economy improves, having a comprehensive rehabilitation program in place will allow Staff to easily begin accepting applications when funding is available. The City will also modify to focus on applying for grants and other funds to continue their efforts. This program will be included in the 2014-2021 Housing Element

Goal 1: Conserve and enhance the quality of existing housing and residential neighborhoods in Commerce.

Description of Previous Housing Element Program	Status
Program 1.5 – Emergency Home Repair Grant Program. The Emergency Home Repair Grant Program will provide emergency assistance up to $10,000 for the repair of roofs, sewers, and other emergency repairs. This program targets those households with very low- or low-incomes. These funds may only be used for emergency repairs and is not to be used for general remodeling. **Objective:** Provide $24,000 in available funding to assist 5 households annually	**Progress and Effectiveness**: The Emergency Home Repair Grant Program provides emergency assistance up to $10,000 for the repair of roofs, sewers, and other emergency repairs. From 2006-2012 the City expended $74,226.02 Emergency Repair Grant Funds to assist 8 homes. Generally, the homes assisted completed repairs that were not fully funded through the Emergency Repair Funds. Emergency Home Repair Grants were only issued to address unexpected repairs that were discovered during the Home Preservation Grant Construction process or when the Home Preservation Grant amount was exceeded. With the dissolution of the Commerce Community Development Commission and the taking of the LMIHF in January 2012, funding for this program was suspended. **Appropriateness**: The Emergency Home Repair Grant Program has been an important tool for the City to quickly address immediate housing issues, including code enforcement violations. Due to funding limitations this program will be continued into the 2014-2021 planning period under Program 1.6 and will utilize CDBG funds to assist homeowners in the City.

Goal 1: Conserve and enhance the quality of existing housing and residential neighborhoods in Commerce.

Description of Previous Housing Element Program	Status
Program 1.6 - CDBG Home Preservation Grant Program. The CDBG Home Preservation Grant Program provides $10,000 grants to eliminate substandard housing conditions and to promote property maintenance by providing residential rehabilitation grants to qualified low- and moderate-income residents living in single-family owner-occupied dwellings **Objective:** Provide $140,000 in available funding to assist approximately 15 households annually.	**Progress and Effectiveness**: Through the CDBG Home Preservation Grant Program, households can apply for grants up to $20,000 to repair of roofs, sewers, and other emergency repairs and generally eliminate substandard housing conditions and to promote property maintenance. The City of Commerce as a sub grantee of the Los Angeles Community Development Commission's Federal Community Development Block Grant (CDBG) funds was awarded $85,000 annually throughout the planning period to assist approximately 12 households per year. Between 2008 and 2012 the City administered 45 loans, 8 for $20,000 and 37 for $10,000. As the allocation of CDBG funds to jurisdictions has decreased due to the 2008 economic downturn, and the City has no control over their final allocation, they have continued to allocate the funds they are given to the fullest extent possible. **Appropriateness**: The CDBG Home Preservation Grant Program has historically been an important tool used by the City to improve existing neighborhoods and provide emergency assistance to homeowners. With the elimination of the LMIHF as a funding source, the City will likely need CDBG funds to continue providing rehabilitation services to homeowners. To simplify the rehabilitation programs offered by the City and to maximize the available CDBG funds, this program will be combined with Program 1.5. This program will be included in the 2014-2021 Housing Element.

Goal 1: Conserve and enhance the quality of existing housing and residential neighborhoods in Commerce.

Description of Previous Housing Element Program	Status
Program 1.7 - Senior Yard Maintenance Program. The Senior Yard Maintenance Program provides property maintenance (primarily landscaping services) for approximately 28 senior homeowners a year. Objective: Provide approximately $29,000 in available funding to assist 28 households annually.	**Progress and Effectiveness:** To assist senior residents in the City of Commerce with the maintenance of their properties the City established the Senior Yard Maintenance Program. The program provides landscaping services to elderly home owners that are not otherwise physically or financially able to maintain their properties. This program has played a significant role in improving the overall quality of neighborhoods in the City. When the program started more than 5 years ago there were approximately 100 households involved. Over time the City has had a reduced interest from residents and in recent years has not accepted new applicants into the program. In 2010 the number of households active in the program had been reduced to approximately 29. With the dissolution of the Commerce Community Development Commission and the taking of the LMIHF in January 2012, there is no permanent funding source for this program. **Appropriateness**: As there is no identified funding source and the City has been in the process of tapering off the program and reducing the number of residents involved over the years, this program will not be included in the 2014-2021 Housing Element. Elderly residents can still apply for loans and grants through the City's CDBG Home Preservation Grant Program as well as County programs.
Program 1.8 - Monitor and Preserve Affordable Housing. The City will inventory and gather information to establish an early warning system for publicly assisted housing projects that have the potential to convert to market rate Objective: Maintain the City's existing affordable rental units by monitoring their affordability and contacting property owners to discuss options for long term affordability.	**Progress and Effectiveness**: Commerce currently has a number of deed restricted units; however the majority of units are ownership units. The City currently has one multi-family rental property with 94 units that will not expire until 1234. The City maintains compliance with AB 987 and publishes a table annually with information on affordable units that exist in the City. **Appropriateness**: The City maintains a number of affordable units through existing deed restrictions. No rental units are at-risk of conversion to market rate during the 2014-2021 planning period. An inventory of affordable units will be kept up-to-date by Staff to monitor affordable units throughout the planning period and update the list with new deed restricted properties that are developed during the planning period. This program will be included in the 2014-2021 Housing Element.

Goal 1: Conserve and enhance the quality of existing housing and residential neighborhoods in Commerce.

Description of Previous Housing Element Program	Status
Program 1.9 - Energy Efficient Design. The City will review ordinances and recommend changes where necessary to encourage energy efficient housing design and practices that are consistent with state regulations. **Objective:** Encourage energy conservation and green building techniques and refer residents to available County programs.	**Progress and Effectiveness:** The City currently provides information on energy efficiency programs on their website and at City Hall. When appropriate, City Staff and code enforcement officers, direct residents to apply for applicable programs. Additionally, the City encourages all new development to be energy efficient and to take into consideration LEED standards. **Appropriateness:** The City recognizes the importance of encouraging energy efficient design, particularly in the design of new residential units for lower income households. The City will continue to encourage maximum utilization of Federal, State, and local government programs that assist homeowners in providing energy conservation measures. Staff will provide information on available programs and funding opportunities to residents on City website and at City Hall. This program will be included in the 2014-2021 Housing Element.

Goal 2: Provide a variety of housing types to accommodate all economic segments of the community.

Description of Previous Housing Element Program	Status
Program 2.1 - First Time Homebuyer Program. Provide down payment assistance to low and moderate income households in conjunction with the Substantial Housing Rehabilitation Loan and/or the Acquisition and Rehabilitation Program. **Objective:** Provide $300,000 in available funding to assist 3 households annually.	**Progress and Effectiveness:** This program operates in conjunction with the Substantial Housing Rehabilitation Loan and/or the Acquisition and Rehabilitation Program. In FY 2009-2010 the City reestablished the First Time Home Buyer Program and assisted four households with $150,000 to assist with the down payment in FY 2010-2011. In exchange for City assistance, an affordability covenant was put in place on each unit to preserve the units as affordable to low income households for 45 years. The City was able to achieve its objectives. **Appropriateness:** The First Time Homebuyer Program has historically been an important mechanism for the City to increase the number of affordable units with deed restrictions. As this program was funded by the former Commerce Community Development Commission, the program moving forward will be administered based on funds available. This program will be included in the 2014-2021 Housing Element.
Program 2.2 -Acquisition and Rehabilitation of Single-Family Units. In conjunction with the Housing Rehabilitation Loan Program and the First Time Homebuyer Program Staff will identify homes in need of substantial repairs, complete those repairs and sell the home to a lower income family. **Objective**: Acquire and rehabilitate existing single-family units in the City to ensure that the quality and affordability of those units is maintained.	**Progress and Effectiveness**: Throughout the planning period, the City monitors and inventories units that are in need of substantial rehabilitation and are ideal for acquisition. During the planning period, the City was able to purchase two homes, one on Jardin Street and a second on Astor Avenue. With the home on Jardin the City was able to substantially rehabilitate the unit, however the elimination of the Commerce Community Development Commission the City was unable to sell the property as part of the First Time Home Buyer Program prior to the February 1, 2012 deadline. Similarly with the property on Astor the condition of the home required that the unit be demolished and the City had developed conceptual plans for the development of a new unit that once constructed would be deed restricted for a lower income household. The City is in the process of preparing a Long Range Property Management Plan in compliance with AB 1484 that will identify all City owned assets and hopefully Staff will know the future of these two properties in the near future. Currently all activity under this program has been suspended with the loss of redevelopment as a funding source, until a new more permanent source is identified. **Appropriateness**: Due to increased home prices and a loss of redevelopment as a primary funding source, this program will not be continued into the next planning period. The City has had great success with the Substantial Housing Rehabilitation Loan and the First Time Homebuyer Program and will continue to focus their efforts on those two programs. This program will not be included in the 2014-2021 Housing Element.

Goal 2: Provide a variety of housing types to accommodate all economic segments of the community.

Description of Previous Housing Element Program	Status
Program 2.3 - Infill Housing Program. The Infill Housing Program will provide for the development of infill housing units within Commission-owned properties. **Objective**: Negotiate with Mayans the development of Sites 1 and 4 during the planning period and solicit proposals for the development of Commission owned sites.	**Progress and Effectiveness:** The Infill Housing Program was established to provide for the development of infill housing units within Commission-owned properties, including Sites 1 and 4 in the sites inventory and two sites along Atlantic Boulevard. Due to changing market conditions, the City was unable to move forward with development on Sites 1 and 4, as previously anticipated would occur in partnership with Mayans Development. Furthermore, the elimination of the Commerce Community Development Commission and the taking of the LMIHF in January 2012, have left the City's land assets frozen with no future plans for resolution. The City is in the process of preparing a Long Range Property Management Plan in compliance with AB 1484 that will identify all City owned assets and hopefully the City will know the future of these two properties in the near future. Currently all activity under this program has been suspended with the loss of redevelopment as a funding source. **Appropriateness**: With the elimination of the Commerce Community Development Commission this program is no longer appropriate to include in the 2014-2021 Housing Element. The City will continue to identify sites to accommodate their RHNA allocation and will work with affordable housing developers when appropriate to facilitate the development of new housing units on city owned land.

Goal 2: Provide a variety of housing types to accommodate all economic segments of the community.

Description of Previous Housing Element Program	Status
Program 2.4 - (Senior and Handicapped) Rent Subsidy Program. To augment limited Federal resources for rental assistance, the City utilizes redevelopment set-aside monies to provide rent vouchers to seniors and handicapped residents **Objective:** Provide $100,000 in redevelopment set aside funds to assist 40 households annually.	**Progress and Effectiveness**: To augment limited Federal resources for rental assistance, the City utilizes redevelopment set-aside monies to provide rent vouchers to seniors and handicapped residents.). Applicants are expected to pay a minimum of 25% of their income towards rent and the City will provide up to $200 in supplemental payments to the landlord. Landlords must maintain rents at or below Section 8 rental limits for Los Angeles County limits. The City only started monitoring participation in the program in 2009. From 2009 to 2012 the City expended $366,008. In April 2012, the City had approximately 37 seniors enrolled in the program and actively receiving assistance. Since April 2012, the City has not accepted new applications and in some incidences has had to reduce assistance due to the loss of redevelopment funds. **Appropriateness:** The City recognizes the importance of assisting special needs households by providing additional funding to off-set the cost of rising rents. In the wake of the Commerce Community Development Commission being eliminated the City has shifted responsibility for the program to the Community Services Division who utilizes the General Fund to continue the program. Due to funding limitations the City will continue the program with the existing participants, but will not expand the program. This program will be modified and included in the 2014-2021 Housing Element.

Goal 2: Provide a variety of housing types to accommodate all economic segments of the community.

Description of Previous Housing Element Program	Status
Program 2.5 – Los Angeles County Partnership. As a means of further leveraging housing assistance, the City will cooperate with the Los Angeles County Community Development Commission (CDC) and Los Angeles County Housing Authority to promote resident awareness and application for County run housing assistance programs. **Objective:** Increase resident awareness about housing programs offered by the County (because the City has no control over the administration of funding for these programs.	**Progress and Effectiveness:** The City currently offers information on their website and on City Hall on housing programs offered by the City, the County of Los Angeles Housing Authority, and other local housing service providers. **Appropriateness:** The County offers a variety of housing assistance programs that can supplement the City's current housing programs. Consequently, the City will continue to provide information on programs offered by the County on the City website, at City Hall, and in other public places. This program will be included in the 2014-2021 Housing Element.

Goal 3: Minimize the impact of governmental constraints on housing production and affordability.

Description of Previous Housing Element Program	Status
Program 3.1 - Housing Opportunity Overlay. Program The City recently adopted a new Housing Opportunity Overlay in the City of Commerce General Plan to facilitate the transition of existing non-residential uses to new residential development. **Objective:** Complete the Zoning Code update creating standards for the overlay area.	**Progress and Effectiveness:** The Housing Opportunity Overlay designation includes a cluster of industrial properties within the Rosewood Planning Area totaling 24.5-acres. Within the Rosewood Planning Area the overlay encourages manufacturing uses to redevelop into residential development. Due to funding reductions and staff cutbacks the City was unable to complete the Zoning Code amendments to establish development standards for the overlay, in the timeframe specified in the Housing Plan. The City has drafted an ordinance to establish development standards and design guidelines and will take the proposed ordinance to City Council for approval in conjunction with Housing Element adoption. Furthermore the City has expanded the number of Housing Opportunity Overlay sites included in the Housing Resources section to encourage the transition of the area to residential uses. **Appropriateness**: As the City will complete the required Zoning Code update to create specific standards for the Housing Opportunity Overlay prior to the end of the planning period, this program will be modified to focus on developing partnerships with land owners and monitoring the sites within the overlay area. This program will be included in the 2014-2021 Housing Element.

Goal 3: Minimize the impact of governmental constraints on housing production and affordability.

Description of Previous Housing Element Program	Status
Program 3.2 - Atlantic Blvd. Housing Program. In the 2020 General Plan a Mixed-Use designation along the Atlantic Boulevard corridor to encourage residential and commercial development. **Objective**: Complete the development standards for the Mixed Use Overlay in the Zoning Code	**Progress and Effectiveness:** As part of the 2000 General Plan, the City established a Mixed-Use designation along the Atlantic Boulevard corridor between the Mixmaster (on the north) and Washington Boulevard. Within the General Plan general standards were created to regulate density and intensity; however within the 2008-2014 Housing Element the City committed to updating the Zoning Code to establish specific development standards and design guidelines for the area. Due to funding reductions and staff cutbacks the City was unable to complete the Zoning Code amendments to establish development standards for the Mixed-Use designation, in the timeframe specified in the Housing Plan. The City has drafted an ordinance to establish development standards and design guidelines and will take the proposed ordinance to City Council for approval in conjunction with Housing Element adoption. **Appropriateness**: As the City will complete the required Zoning Code update to create specific standards to ensure consistency with the Atlantic Boulevard Mixed-Use designation prior to the end of the planning period, this program will be modified to focus on developing partnerships with land owners and monitoring the sites within the corridor. This program will be included in the 2014-2021 Housing Element.

Goal 3: Minimize the impact of governmental constraints on housing production and affordability.

Description of Previous Housing Element Program	Status
Program 3.3 - Atlantic Blvd. Lot Consolidation Program. To encourage the development of residential and mixed-use projects, the City will offer development incentives. **Objective**: During the planning period the City will contact property owners in order to purchase a property adjacent to Site Three to accommodate an affordable housing development along Atlantic Blvd.	**Progress and Effectiveness:** To allow for larger more comprehensive development projects, the City will offer development incentives and land swaps to affordable housing developers to encourage lot consolidation. For the 2008-2014 planning period, this program was specifically intended to promote development on Site 3 of the 2008-2014 Sites Inventory, by acquiring land in the immediate vicinity to develop a larger project. With the economic downturn of 2008, the City saw a decline in development generally throughout the City which in turn affected applications for affordable housing and lot consolidation. In line with the economic climate, no developers or land owners approached Staff regarding lot consolidation during the planning period. The City has historically offered development incentives for projects that include affordable units and will continue to offer these incentives for projects requiring lot consolidation actions. On a case-by-case basis the City does review projects and provides project assistance to developments that include affordable units, when funding is available. **Appropriateness**: The City recognizes the importance of offering incentives to encourage lot consolidation and will continue to provide incentives when feasible. The City will continue to provide information on this program to developers with applicable projects. While funding is limited, the City recognizes the importance of maintaining this program, which will allow Staff to easily administer funds as they become available. This program will be included in the 2014-2021 Housing Element.
Program 3.4 - Density Bonus Program. Facilitate the development of additional affordable units through a density bonus ordinance that is compliant with State law. **Objective**: The Density Bonus will be emphasized in future development within the Housing Opportunity Overlay Areas to increase the number of affordable units throughout the City in new housing developments.	**Progress and Effectiveness:** Section 19.07.150-170 of the Code of Ordinances provides for density bonuses pursuant to the provisions of State law. In late 2012, the City completed a review of the density bonus provisions and anticipates that City Council will adopt an updated ordinance in conjunction with Housing Element adoption. The updates completed ensure that the City is in compliance with State law. City staff has made the Code provisions readily available to those developers seeking a density bonus and actively supports these bonuses when they are in compliance with the State law and the Development Code. **Appropriateness:** The City recognizes the importance of offering incentives like the density bonus incentive and will continue to provide this incentive in the future. The City will continue to provide information on this program to developers with applicable projects. This program will be included in the 2014-2021 Housing Element

Goal 3: Minimize the impact of governmental constraints on housing production and affordability.

Description of Previous Housing Element Program	Status
Program 3.5 - Incentives for Large Multi-Family Units. Review the Zoning Ordinance to determine what incentives and/or regulations can be implemented as a means to promote the development of rental housing with three or more bedrooms. **Objective**: To increase the number of affordable multi-bedroom units to accommodate larger low-income families	**Progress and Effectiveness**: As the average household size has held steady over the last decade, the City has prioritized funding and incentives for developers that include large units in their projects. With the economic downturn of 2008, development activity in the City has decreased significantly and the majority of applications submitted have been for single family homes. To increase the number of affordable units in the City, the Commerce Community Development Commission has been instrumental in purchasing and/or rehabilitating larger homes with three and four bedrooms that are then deed restricted for 45 years. **Appropriateness**: Large renter households continue to be a prominent special needs group in the City, as identified in Chapter 4, Community Profile. The City will continue to provide incentives, when feasible, to encourage developers to provide units with three or more bedrooms. Specifically the City will develop language for the Housing Opportunity Overlay area to encourage the development of larger units. While funding is limited, the City recognizes the importance of maintaining this program, which will allow them to easily administer funds as they become available. This program will be included in the 2014-2021 Housing Element.

Goal 3: Minimize the impact of governmental constraints on housing production and affordability.

Description of Previous Housing Element Program	Status
Program 3.6 - Residential Development Standards. City staff will review the development standards for the R-1, R-2, and R-3 zones to identify standards that may constrain the development of affordable housing and housing for disabled individuals. **Objective**: Review development standards to identify constraints and remove or offset constraints where possible.	**Progress and Effectiveness:** On a regular basis the City reviews their development standards and also in instances where developers express concern regarding the feasibility of constructing new housing in the City. During the planning period, Staff did not receive an application for affordable housing development or housing for people with disabilities, due to the economic downturn that occurred in 2008. In general development activity decreased significantly over the planning period with the change in economic climate, with only 19 units built from 2006 to 2013. Staff has maintained their commitment to address development constraints on a project by project basis and to identify ways that standards could be modified if it is determined that such requirements were impeding the development of affordable housing or housing for disabled residents. The City also provides fast track processing for applications related to the creation of affordable housing and offers fee modifications, when funds are available, for projects including affordable units that are required to apply for variations to the existing development standards. **Appropriateness:** The City recognizes the importance of reviewing their development standards on a regular basis and seeking input from developers to identify potential constraints to the development affordable housing. The City will continue to review their standards and address any standards that may be identified in the 2014-2021 Housing Element. This program will be included in the 2014-2021 Housing Element.
Program 3.7 - Second Unit Ordinance. Provide opportunities for affordable housing through second unit development. **Objective**: Update the City's second unit ordinance to be compliant with State law. Encourage the construction of 5 units over the planning period.	**Progress and Effectiveness:** Section 19.07.090 of the Code of Ordinances provides standards addressing second units in the R-1 zone. In conjunction with Housing Element adoption, a revised version of the City's second unit ordinance was presented to the City Council for adoption. The update to the City's existing ordinance ensures that the City is compliance with State law. During the 2008-2014 planning period, the City continued to provide for second units in R-1 zones with an appropriate lot area. Since 2006, no applications for second unit developments were received by City Staff. **Appropriateness:** The City recognizes second units as an affordable housing option and will continue to allow for second units to be constructed. This program will be included in the 2014-2021 Housing Element.

Goal 3: Minimize the impact of governmental constraints on housing production and affordability.

Description of Previous Housing Element Program	Status
Program 3.8- Off Site Improvements. Provide opportunities for public, private and non-profit groups to develop affordable housing by constructing off-site improvements and physical infrastructure as Capital Improvement Projects. **Objective**: Facilitate easier development of affordable housing by allowing improvements to be negotiated.	**Progress and Effectiveness:** During the planning period, Staff did not receive an application for affordable housing development or housing for people with disabilities, due to the economic downturn that occurred in 2008. In general development activity decreased significantly over the planning period with the change in economic climate, with only 19 single family units built from 2006 to 2013. Staff has maintained their commitment to encourage housing development by constructing off-site improvements and physical infrastructure prioritizing incentives for extremely low income and special needs groups. While no applications for multifamily affordable housing development were received, the elimination of the Commerce Community Development Commission and the LMIHF has resulted in the loss of a permanent funding source for this program. **Appropriateness:** The City recognizes the importance of offering infrastructure assistance and will continue to provide incentives when feasible. The City will continue to provide information on this program to developers with applicable projects. While funding is limited, the City recognizes the importance of maintaining this program, which will allow Staff to easily administer funds as they become available. This program will be included in the 2014-2021 Housing Element.
Program 3.9 - Water and Sewer Service Providers. Ensure compliance with Government Code Section 65589.7. **Objective**: Ensure that water and sewer providers are aware of the City's intentions for residential development throughout the City.	**Progress and Effectiveness:** Following the certification and adoption of the 2008-2014 Housing Element the City submitted the final draft to the appropriate water and sewer service providers. **Appropriateness:** As required by State law, the City will submit the final 2014-2021 Housing Element to local water and sewer providers for their review and input. This program will be included in the 2014-2021 Housing Element.

Goal 4: Promote equal housing opportunity for all residents.

Description of Previous Housing Element Program	Status
Program 4.1 - Reasonable Accommodation Program for Disabled. Ensure that sufficient provisions are in place by the City to facilitate a resident's request for "reasonable accommodation." **Objective**: Develop procedures for reasonable accommodation in accordance with fair housing and disability laws.	**Progress and Effectiveness:** In conjunction with Housing Element adoption, the City Council will consider an ordinance, to establish reasonable accommodation procedures to address existing constraints to the provision of accommodations for persons with disabilities. The City is committed to assisting residents in need of reasonable accommodation and will continue to direct eligible residents to apply for applicable funds through various housing programs offered by the City, including: the CDBG Home Preservation Grant Program, the Neighborhood Fix Up Grant Program and the Environmental Rehabilitation Program. These programs allow residents to make modifications to their homes such as ramps, wider doorways, handrails etc. At least one accessibility case was completed in 2009 in which an elderly resident was able to install a hand railing at their home. The City will continue to use CDBG funds to assist residents as funds allow. **Appropriateness:** The City will effectively implement this program within the 2008-2014 planning period. Due to staffing restrictions, the timeframe was pushed back from the goal date; however, the program will be in place and advertised by the end of the planning period. For the 2014-2021 planning period the City will promote the adopted reasonable accommodation procedures on the City website and at City Hall.
Program 4.2 - Fair Housing Program. The City will continue to contract with the Housing Rights Center to provide residents with fair housing services using Community Development Block Grant (CDBG) funds. **Objective:** Comply with all State and federal fair housing requirements when implementing housing programs or delivering housing-related services.	**Progress and Effectiveness:** The Fair Housing Program is an ongoing program developed to ensure that fair housing practices are being implemented for renters. As part of the program the City maintains a referral for the Fair Housing Foundation. The Fair Housing Foundation (FHF) is a non-profit corporation formed in 1964 to promote the enforcement of fair housing laws and to encourage an atmosphere of open housing. The City currently advertises the program on the City's website and offers information on the program at City Hall. **Appropriateness:** The City will continue to be involved with the Fair Housing Council to eliminate housing discrimination and distribute information to the public about how they can report housing discrimination. This program will be included in the 2014-2021 Housing Element.

Goal 5: Identify Adequate Sites to Achieve Housing Variety.

Description of Previous Housing Element Program	Status
Program 5.1 - Ensure Adequate Sites to Accommodate Regional Fair Share of Housing Growth. Identify appropriate sites to accommodate the City's RHNA allocation. **Objective**: Provide appropriate land use designations and maintain an inventory of suitable sites for residential development	**Progress and Effectiveness:** During the previous planning period the City has maintained an inventory of sites appropriate to accommodate their RHNA allocation. The City also offers fast track processing, fee modifications, density bonus incentives, reductions in development and parking standards, and funding for off-site improvements and any required environmental clean up to further encourage the development of affordable units on identified sites. In general development activity decreased significantly during the planning period with the change in economic climate, with only 19 single family units built from 2006 to 2013. **Appropriateness:** The City maintains an inventory of available and potential residential development sites and will continue to do so for the upcoming planning period as part of Programs 3.1 and 3.2. The City utilizes this inventory to help direct interested developers to potential sites for housing. The City will continue to update the inventory throughout the 2014-2021 planning cycle, and will continue to offer development incentives whenever feasible. This program will not be included in the 2014-2021 Housing Element but the actions will be continued in conjunction with Programs 3.1 and 3.2.
Program 5.2 - Extremely Low-Income and Special Needs Housing. Ensure compliance with Senate Bill 2. **Objective:** Amend the Zoning Code to facilitate housing opportunities for extremely low-income persons by establishing definitions, performance standards, and siting regulations for single-room occupancy developments (SRO).	**Effectiveness:** Due to funding reductions and staff cutbacks the City was unable to complete the Zoning Code amendments in the time specified in the Housing Plan. In late 2012, the City drafted an ordinance amending the Zoning Code to allow emergency shelters in the Manufacturing (M-1) Zone by right without any other discretionary permit required. The City will also amend the Zoning Ordinance to allow transition and supportive housing as a residential use, subject only to the requirements of other residential uses allowed within that zone. This ordinance will be presented and adopted by the City Council in conjunction with Housing Element adoption. **Appropriateness:** As the City will complete the required rezoning to ensure that emergency and transitional housing opportunities are permitted, this program will be included in the 2014-2021 Housing Element as a program to monitor available sites.

Goal 5: Identify Adequate Sites to Achieve Housing Variety.

Description of Previous Housing Element Program	Status
Program 5.3 - Alternative Housing Models. Encourage through development incentives the provision of more innovative housing types that may be suitable for the community, including community care facilities, supportive housing, and assisted living for seniors. **Objective:** Facilitate the development of alternative housing models suited to the community housing needs through the provision of flexible zoning regulations	**Progress and Effectiveness:** To address the needs of the community and accommodate aging residents the City offers development incentives to encourage the provision of more innovative housing types that may be suitable for the community, including community care facilities, supportive housing, and assisted living for seniors. Assisted living facilities are designed for elderly individuals needing assistance with activities of daily living but desiring to live as independently as possible for as long as possible. Such facilities bridge the gap between independent living and nursing homes, and offer residents help with daily activities such as eating bathing, dressing, laundry, housekeeping, and assistance with medications. Assisted living can help to meet the housing and supportive services needs of Commerce's relatively large and growing senior population. During the planning period the City continued to provide appropriate standards to encourage development of senior housing to meet the needs of the City's growing senior population. Unfortunately, no applications for age-restricted housing were received; however this is likely reflective of the economic conditions effecting development in the City. **Appropriateness:** This program will be modified in the 2014-2021 Housing Element to focus on informing local and regional developers of the program and promoting its application.

APPENDIX A. COMMUNITY OUTREACH

This appendix contains the following materials to illustrate the City's effort to conduct quality community outreach efforts with regard to the Housing Element update process:

- Meeting flyer
- Stakeholder Letter
- Public Notice for the Housing Element meetings
- List of stakeholders contacted
- Photos of the stakeholder flyer posted at various locations around City Hall

City of Commerce Housing Element

The City of Commerce is in the process of updating the State-required Housing Element.

Please join us at the upcoming community workshops:

Planning Commission	City Council
Wednesday, April 24, 2013	Tuesday, May 7, 2013
6:30 pm	6:30 pm

The workshops will be held during regularly scheduled meetings at:

Council Chamber of Commerce City Hall
2535 Commerce Way
Commerce, CA 90040

Both workshops will discuss the following:

- Purpose and intent of the Housing Element
- Why and how often the Housing Element is updated
- The contents of the Housing Element
- The process for adoption
- Benefits of Housing Element certification

If you have any questions or would like additional information, please contact Matt Marquez at (323) 722-4805, ext. 2349, or visit the Community Development Department located in Commerce City Hall.

CITY OF COMMERCE

COMMUNITY DEVELOPMENT DEPARTMENT

April 10, 2013

Subject: Community Workshops for the City of Commerce 2014-2021 Housing Element Update

To Whom It May Concern:

The City of Commerce cordially invites you to two upcoming community workshops to discuss the 2014-2021 Housing Element update. These community events are intended to provide information to the City Council, Planning Commission and the community about the General Plan Housing Element update, and to answer any questions regarding the update process. In addition, we would like to gather input from residents, City leaders, and interested stakeholders on housing issues and concerns that should be addressed in the Housing Element update. The workshops will be held during regularly scheduled Planning Commission and City Council meetings:

Planning Commission	**City Council**
Wednesday April 24, 2013 6:30 p.m. Council Chamber of City Hall 2535 Commerce Way Commerce, CA 90040	Tuesday, May 7, 2013 6:30 p.m. Council Chamber of City Hall 2535 Commerce Way Commerce, CA 90040

The Housing Element is one component of the City's General Plan, the City's long-range plan for land use in the community. The Housing Element identifies housing specific needs in Commerce and describes the approaches the City will take to facilitate meeting those needs.

If you have questions or would like additional information, please contact Matt Marquez by telephone at (323) 722-4805 ext. 2349, or visit the Community Development Department website at http://www.ci.commerce.ca.us/.

If you cannot attend the meeting in person and would like to comment, please forward written comments to Matt Marquez in the Community Development Department, located at Commerce City Hall, 2535 Commerce Way Commerce, CA 90040.

Enclosed with this letter are flyers that provide information about the community workshop. Please distribute and post these flyers at your earliest convenience. Thank you.

Sincerely,

Alex Hamilton
Assistant Community Development Director

2535 Commerce Way • Commerce, California 90040 • (323) 722-4805 • FAX (323) 726-6231

CITY OF COMMERCE

COMMUNITY DEVELOPMENT DEPARTMENT

PUBLIC NOTICE
2014-2021 HOUSING ELEMENT UPDATE
COMMUNITY WORKSHOPS

The City of Commerce cordially invites you to two upcoming community workshops to discuss the 2014-2021 Housing Element update. These community events are intended to provide information to the City Council, Planning Commission and the community about the General Plan Housing Element update, and to answer any questions regarding the update process. In addition, City staff would like to gather input from residents, City leaders, and interested stakeholders on housing issues and concerns that should be addressed in the Housing Element update. The workshops will be held during the regularly scheduled Planning Commission and City Council meetings as follows:

Planning Commission
Wednesday April 24, 2013
6:30 p.m.

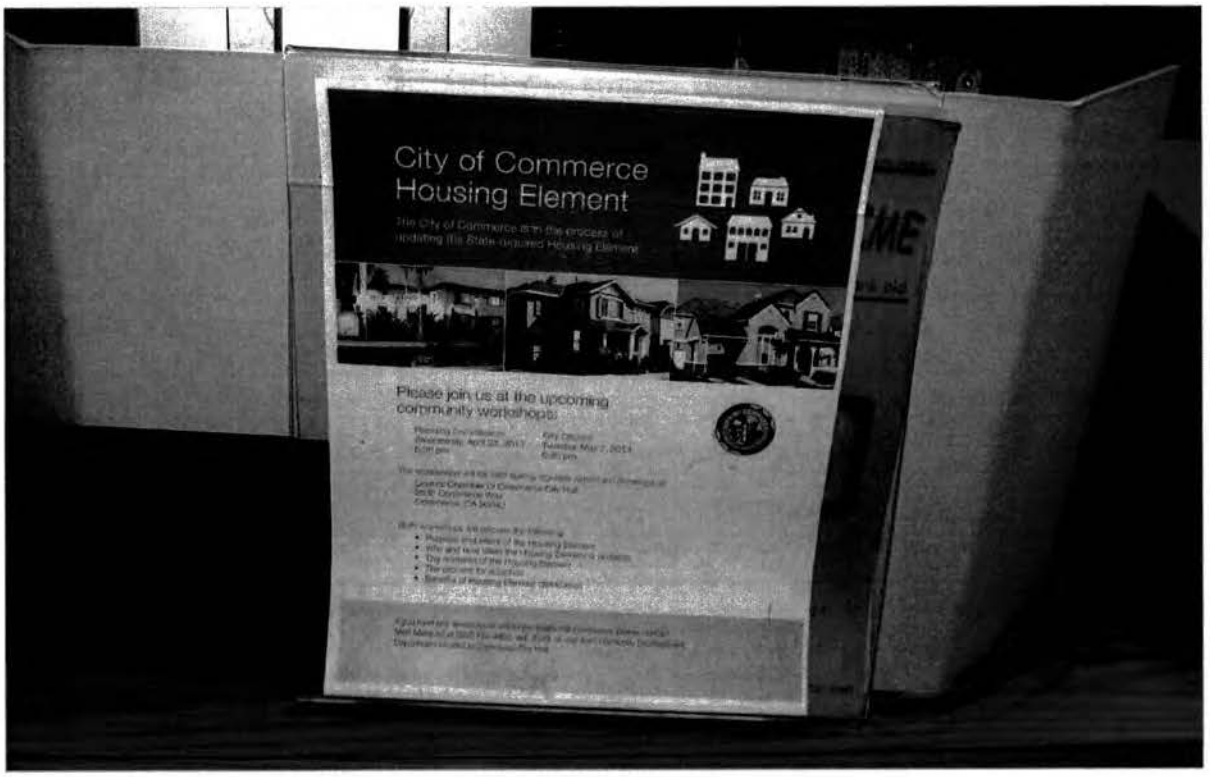
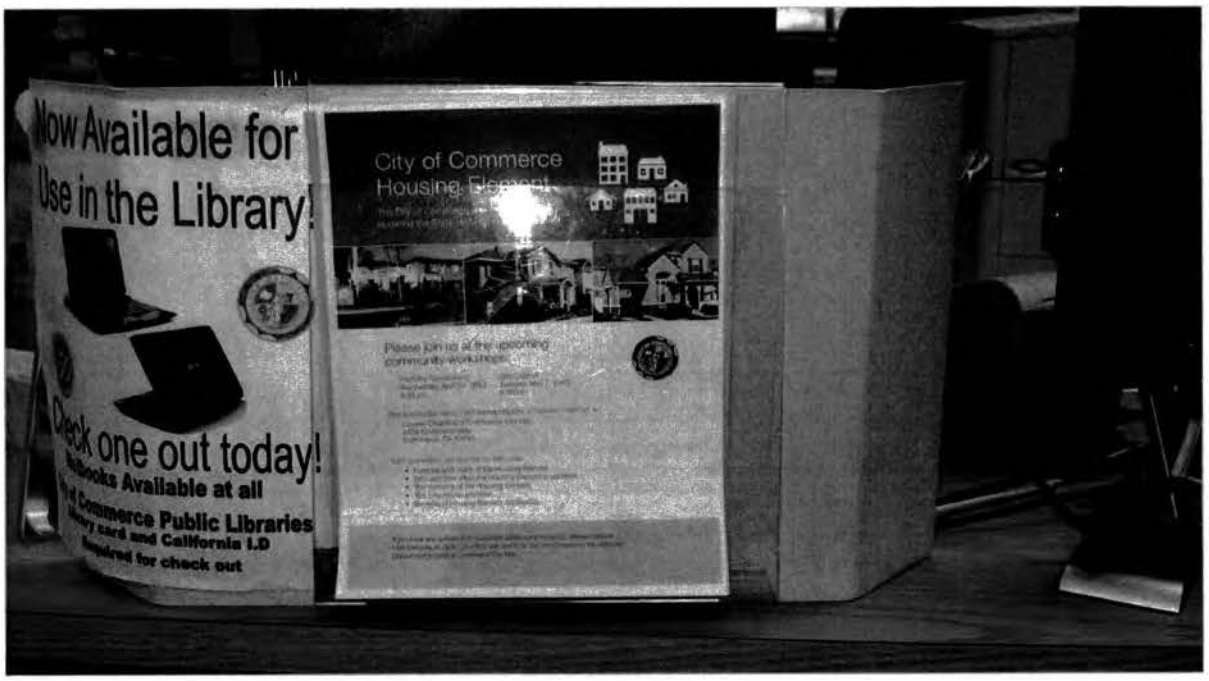
6:30 p.m.
Council Chamber of City Hall
2535 Commerce Way
Commerce, CA 90040

The Housing Element is one component of the City's General Plan, the City's long-range plan for land use in the community. The Housing Element identifies housing specific needs in Commerce and describes the approaches the City will take to facilitate meeting those needs.

If you have questions or would like additional information, please contact Matt Marquez, City Planner, by telephone at (323) 722-4805 ext. 2349, or visit the Community Development Department website at http://www.ci.commerce.ca.us/.



If you cannot attend the meeting in person and would like to comment, please forward written comments to Matt Marquez in the Community Development Department, located at Commerce City Hall, 2535 Commerce Way Commerce, CA 90040.



(Publish Commerce Comet: April 11, 2013)

L-19-1

Caltrans and Metro thank the City for providing their input. The City's support of Alternative 7 and zero emission technology is acknowledged and included in the project record. Please refer to Section 1.1 of this appendix for a discussion on the selection of the Preferred Alternative. The Zero-Emission Truck Extension Design Option evaluated in the 2012 Draft EIR/EIS briefly examined the potential for an overhead catenary electric power distribution system to/from the northern terminus of the freight corridor connector ramps and the I-710 general purpose lanes. A ZEE design option, similar to that evaluated in the 2012 Draft EIR/EIS, was not included because Alternative 7's freight corridor as proposed in the RDEIR/SDEIS is "technology neutral" in that the freight corridor needed to be flexible to accommodate one or more different types of ZE heavy-duty truck technologies that have the potential to be in commercial mass production prior to construction of Alternative 7, including technologies such as battery electric vehicles, hydrogen fueled vehicles, and ZE hybrid vehicles, that are able to travel distances of up to 200 miles before recharging/refueling and that are not reliant upon an overhead catenary electric power system. As part of the build alternatives, the I-710 Clean Truck Program (referred to in the RDEIR/SDEIS as the I-710 Corridor Project Zero Emission/Near Zero Emission Truck Technology Deployment Program) would make available (should a build alternative be selected as the Preferred Alternative) incentive funding for any heavy duty truck technology capable of achieving the ZE and NZE standards (established by CARB) for travel on I-710 in order to facilitate the deployment of 4,000 clean emissions vehicles. However, Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), has identified Alternative 1 (No Build) as the Preferred Alternative. Therefore, the I-710 Clean Truck Program will not be implemented as part of this Project**.** Please refer to Section 1.3 of this appendix for more information on the I-710 Clean Truck Program.

L-19-2

Caltrans and Metro acknowledge the City's appreciation and understanding of the significant right-of-way constraints in the I-710 Corridor and within the City of Commerce. However, as stated in Response to Comment L-19-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, right-of-way acquisition will not be necessary. It should be noted that mitigation funds for targeted improvements within environmental justice communities adjacent to the I-710, as described in more detail in Measure C-7 in Section 3.3.3.7 of this Final EIR/EIS, would have been made available to the City for use as they would deem appropriate and within the bounds of the program as outlined, if a build alternative would have been selected as the Preferred Alternative. In addition, City of Commerce residents would have benefitted from the improved air quality and mobility within the region after implementation of the build alternatives.

L-19-3

The RDEIR/SDEIS did indicate that the City of Commerce would experience a permanent impact to community cohesion under both Alternatives 5C and 7; this conclusion was outlined in Section 3.3.1.3, Environmental Consequences (Permanent Impacts). Should a build alternative be selected as the Preferred Alternative, relocations associated with impacts to community cohesion would be addressed by Measure C-1, outlined in Section 3.3.2.4, which may provide for the construction of Last Resort Housing in the event where adequate comparable replacement housing is not available. It should be clarified that Section 3.3.1.3 indicated that overall, for the balance of the cities within the Study Area, permanent impacts to community cohesion would not occur as a result of the build alternatives.

L-19-4

Although not included in the RDEIR/SDEIS itself, detailed housing stock information, including the number of single-family residential, multi-family residential, and mobile homes available at the time of preparation of the report was included in Section II.A of the *Draft Relocation Impact Report* (March 2017). Updated information based on the *Final Relocation Impact Report* (March 2019), has been added to Section 3.3.2 of the Final EIR/EIS for cities in which Last Resort Housing could potentially be utilized, including Commerce, should a build alternative be selected as the Preferred Alternative.

L-19-5

This feedback regarding the access differences between Design Options 3A and 3B and the base Alternatives 5C and 7 as presented in the RDEIR/SDEIS is appreciated. Due to public and agency input, the No Build Alternative has been identified as the Preferred Alternative.

L-19-6

Should a build alternative be selected as the Preferred Alternative, Measure CON-U&ES-1, described in Section 3.24.4.4 and included in the Environmental Commitment Record, would provide for coordination during construction of ramp closures and detour plans with fire, emergency medical, and law enforcement providers, as well as with local jurisdictions' Departments of Public Works, to minimize temporary delays in emergency response times as part of the Transportation Management Plan (TMP), including the identification of alternative routes and routes across the construction areas for emergency vehicles, developed in coordination with the affected agencies. Currently, staging strategies during construction of either of the build alternatives have not been identified, and no proposed routing options for emergency responders have been assessed at this time. As stated in Response to Comment L-19-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, more detailed information regarding construction-related closures and detours will not be provided.

L-19-7

As is stated on page F-3 of Appendix F, Environmental Commitments Record, of this Final EIR/EIS, “The ECR provided in this Appendix meets the requirements for an MMRP for the project under CEQA.” As the ECR is one component of the EIR circulated for review, cities and the general public are invited to comment on it. The discussion of the TMP in particular (included in Section 3.24.4.5 and Appendix F, the ECR, as Measure CON-TR-1) describes the objectives of and elements to be included in the TMP, as well as referencing the Caltrans TMP Guidelines, which would be used in preparing a TMP, should a build alternative be selected as the Preferred Alternative. Specific construction details regarding detour routes, closures, and other information is not available at the current level of design. As stated in Response to Comment L-19-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, a higher level of detail, and coordination with the local jurisdictions, including the City of Commerce as part of the TMP will not occur.

L-19-8

The determination of whether a project may have a significant effect on the environment calls for careful judgment and based to the extent possible on the results of field surveys and technical studies. Because the significance of an effect may vary depending on the environmental setting, set rules for determining significance in every case (“thresholds”) have not been established. Some public agencies have established thresholds of significance for CEQA. Because Caltrans has statewide jurisdiction and the setting for Caltrans’ projects varies so extensively throughout the state, Caltrans has not and has no intention to develop thresholds of significance under CEQA.

The CEQA analysis is contained in Chapter 4.0, CEQA Evaluation, of the RDEIR/SDEIS. A determination of significant impacts pursuant to CEQA for Transportation/Traffic is listed in Chapter 4.0. As detailed in Section 4.2.1.11, there would be no impact under the build alternatives for the following CEQA Checklist questions:

c) Would the project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

d) Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?

e) Would the project result in inadequate emergency access?

f) Would the project conflict with adopted policies, plans or programs regarding public transit, bicycle, or pedestrian facilities, or otherwise decrease the performance or safety of such facilities?

As detailed in Section 4.2.4.4, impacts would be significant and unavoidable under the build alternatives for the following CEQA Checklist questions:

a) Conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

b) Conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Please refer to Chapter 4.0, CEQA Evaluation, for the full CEQA analysis for Transportation/ Traffic.

L-19-9

Analysis of arterial traffic volumes at project screenlines, as well as the evaluation of the major arterial roadway segments throughout the I-710 Study Area reported in the *Intersection Traffic Impact Analysis Report* (March 2017) for the proposed project (Figure 6-2), shows that the arterial system as a whole is modestly relieved by the build alternatives relative to no build conditions. In part, this is because the proposed improvements to I-710 under the build alternatives would draw freeway traffic back onto the freeway itself, and freeway traffic would be less apt to use the arterial system as a “cut through” to avoid I-710 freeway congestion. Likewise, pedestrians and bicycles using the arterial system would also benefit. However, for crossing arterials near the interchanges, traffic volumes would increase relative to no build conditions near the ramps which feed I-710. The build alternatives include a redesign of the ramps, add or widen bicycle and pedestrian facilities through the interchange areas, and in some cases introduce traffic controls at ramp termini to help improve traffic safety for bicyclists and pedestrians. In key areas, the build alternatives would also provide new, exclusive pedestrian and bicycle overcrossings, so that some bicyclists and pedestrians could avoid using the arterials altogether to cross over I-710 and the Los Angeles River Channel. The discussion in Section 3.5.3 has been expanded in the Final EIR/EIS to provide more information on how pedestrian and bicycle safety would be improved by the various features included in the build alternatives.

L-19-10

It is Caltrans' standard practice to utilize the Highway Capacity Manual (HCM) methodology as described in Chapter 11 through Chapter 13 of the HCM (2010). Intersection Level of Service (LOS) was calculated according to analysis methodologies described in the HCM. Section 7, Project Impacts and Mitigation Measures, of the *Intersection Traffic Impact Analysis Report* (March 2017) outlined the criteria for determining impacts to arterial intersections. As lead agency for the I-710 EIR/EIS, Caltrans is responsible for establishing the traffic impact thresholds for the I-710 Project. With respect to the intersection impact analysis, the same thresholds and methodologies were uniformly applied for the intersections of all local jurisdictions that make up the I-710 Study Area for the purpose of determining impacts and for identifying mitigation. This is appropriate given that each city has their own thresholds for their own local projects, which vary from city to city. The thresholds established for the project, described in Section 3.5.3.1 of the I-710 RDEIR/SDEIS, were identified based on: an examination of future (congested) travel conditions of the arterial network within the I-710 Study Area; Caltrans' project experience with other major freeway projects in Los Angeles County similar in scope and magnitude to the I-710 Corridor Project; and consistency with intersection impact thresholds utilized in the SR-710 North Project EIR/EIS. The I-710 intersection traffic impact thresholds are very sensitive, particularly for congested intersections (i.e., those intersections projected to operate at LOS E or worse.) Because of the congested nature of the arterial system in the I-710 Study Area in the future year (2035), even very small increases in traffic volumes – in any one of the peak hours (AM, MD or PM) – trigger impacts.

L-19-11

The issue of induced travel demand is very complex, involving various travel behavior responses, residential and business location decisions, and other factors that influence regional population and economic growth. While some of these responses may represent new trips, much of the observed increase in traffic comes from trips that were already being made before the increase in highway capacity, or reflect predictable behavior that is accounted for in travel demand forecasts. Accordingly, Caltrans' guidance on this topic of induced demand maintains that each project should be evaluated case by case.

"Induced travel" is characterized as the additional demand for travel that occurs as a result of a decrease in the generalized cost of travel, including both travel-time and out-of-pocket costs. I-710 is part of a highly congested metropolitan roadway network and is located within an urbanized area which is essentially built out. Given the high levels of congestion in the peak periods, the I-710 travel demand forecast model is particularly sensitive to changes in travel times. The proposed improvements included in the build alternatives improve speeds and reduce travel times on I-710, which in turn attracts more traffic to the facility relative to the no

build condition. The predicted shifts in traffic are accounted for in the analysis presented in Sections 3.5 and 3.13 of the I-710 RDEIR/SDEIS for both Alternatives 5C and 7.

L-19-12

At the time of the commencement of technical studies, including detailed traffic forecasting, in support of the I-710 Corridor Project RDEIR/SDEIS, Caltrans reviewed the status of each of the SCIG and ICTF projects and concluded that they were reasonably foreseeable projects, and in order to represent a likely future scenario, should be included in the No Build scenario. Additionally, the Southern California International Gateway (SCIG) and Intermodal Container Transfer Facility (ICTF) are reasonably foreseeable future projects included in the future No Build Alternative (2035) for the I-710 Project and the Future Year (2035) Baseline for SCAG's 2012 Regional Transportation Plan as well as SCAG's 2016 Regional Transportation Plan. Because of the lead time necessary for the complex traffic modeling efforts on the I-710 Corridor Project, it was not possible to revise the No Build scenario and re-run the model, and all subsequent analyses that depend upon the traffic model, and still meet the schedule established for the project. In addition, in January 2018 the California Courts of Appeal ruled that the Port of Los Angeles and BNSF were in compliance with the majority of CEQA requirements in the SCIG Final EIR, with the exception of the air quality analysis of ambient air concentrations and associated cumulative impacts of such pollutant concentrations. The court further ordered that work on the project be suspended until such time that these deficiencies are addressed. However, the Caltrans maintains that, due to the information provided above, there is sufficient evidence and rationale for retaining the SCIG project in the No Build scenario.

According to the meeting minutes for the December 6, 2017 meeting of the ICTF Joint Powers Authority (JPA)[3], development of the Draft EIR for the ICTF Expansion and Modernization Project has begun but is currently on hold due to changes in schedule and other necessary updates. It is unknown when the process will be reinitiated.

A Sensitivity Test was conducted that removed the SCIG and ICTF Expansion Projects from the I-710 Corridor traffic model to evaluate the effects on the I-710 Corridor transportation travel patterns. These sensitivity tests can be reviewed in more detail in the I-710 Travel Demand Methodology Technical Memorandum (June 2017). In general, viewed from daily conditions for total vehicles, removal of the SCIG and ICTF expansion projects from the No Build scenario resulted in only a slight overall change in vehicles, with additional trucks using I-710 displacing some autos.

[3] Intermodal Container Transfer Facility - Joint Powers Authority. 2017. Special Meeting of the Governing Board of the Intermodal Container Transfer Facility Joint Powers Authority Minutes. Website: http://www.ictf-jpa.org/pdf/12-06-17/Draft%20Meeting%20Minutes%20for%20December% 206,%202017.pdf (accessed March 21, 2017).

L-19-13

Please refer to Section 1.6 of this appendix for further discussion on parking details. These restrictions have been eliminated from further consideration and are not being carried forward as a programmatic element since the No Build Alternative has been identified as the Preferred Alternative.

L-19-14

It is acknowledged that uniform cycle lengths, by type, were utilized in the traffic analysis performed for the alternatives in the RDEIR/SDEIS. The commenter is correct in that for over 180 intersections it is not practical or reasonable to obtain existing signal timing plans for each individual intersection and that basic assumptions must be used, especially when evaluating a future condition (year 2035) when future timing plans for the intersections are not yet known. These uniform assumptions allow for an objective evaluation of the relative performance and impacts of the alternatives across multiple jurisdictions at a level of detail which is applicable to the EIR/EIS. These assumptions are clearly stated in Section 2.2.2.1 of the *Intersection Traffic Impact Analysis Report* (March 2017), one of the supporting technical documents for the I-710 EIR/EIS.

L-19-15

Metro and Caltrans understand the City's desire to add additional intersections for analysis in the Final EIR/EIS. However, limitations in study resources, as well as schedule demands, require that analyses in the EIR/EIS be devoted to those intersections most likely to be impacted by the build alternatives. Nearly 200 intersections were evaluated throughout the I-710 Study Area in the RDEIR/SDEIS. The I-710 analysis intersections were originally identified with the consent and approval of the I-710 Technical Advisory Committee (TAC) in 2009. This list of I-710 analysis intersections was updated based on the findings of the 2012 I-710 Draft EIR/EIS and was appended and reaffirmed by the I-710 TAC prior to initiating work on the 2017 RDEIR/SDEIS. The three additional intersections requested by the City (Bandini Boulevard/ Garfield, Telegraph Road/Garfield Avenue, and Atlantic Avenue/Eastern Avenue) fall mainly within the influence area of I-5 as opposed to I-710.

L-19-16

An assessment of potential impacts to transit is included in Section 3.24.4.5, Traffic and Transportation/Pedestrian and Bicycle Facilities, of this Final EIR/EIS. The transit improvements described in Section 2.3.2.1 of the RDEIR/SDEIS are considered programmatic elements of the build alternatives, and as specified in that section, would not be implemented by Caltrans as the Lead Agency under CEQA and NEPA and as the owner/operator of the I-710 freeway. Extensive consultation has taken place with Metro's transit service planning department to

define the proposed transit improvements at a programmatic level for the I-710 Corridor Project EIR/EIS. It is important to note that the proposed operational transit improvements outlined would be phased in incrementally based on available funding, as well as transit demand. However, as stated in Response to Comment L-19-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, the proposed transit concepts will not be considered, evaluated, or integrated into Metro's future plans for the full transit network as a part of the I-710 Corridor Project.

L-19-17

In response to this and other comments, Measure CON-N-9 in the Final EIR/EIS has been revised to provide for continuous monitoring for residential structures within 200 feet of pile driving operations, should a build alternative be selected as the Preferred Alternative. This is partially due to the dense urbanized Study Area and proximity of residences to future construction areas. Should a build alternative be selected as the Preferred Alternative, should damage occur, operations would cease and construction methods and/or equipment would be re-evaluated. Measures in the Caltrans *Transportation and Construction Vibration Guidance Manual* (September 2013) would be implemented as necessary. However, as stated in Response to Comment L-19-1, the No Build Alternative has been selected as the Preferred Alternative and therefore Measure CON-N-9 will not be implemented.

L-19-18

The discussion provided in Section 3.24.3.14, Construction Impacts, addresses noise impacts during the construction phase of the build alternatives. However, as stated in Response to Comment L-19-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, a more detailed Noise Monitoring Plan and Noise Control Plan will not be prepared.

L-19-19

The build alternatives include I-710 ramps and connector roads targeted to more directly serving the railyards within the Cities of Commerce and Vernon. In several cases, this would relieve traffic on local roads that currently serve as collector-distributors to the railyards. Specifically, at Washington Blvd. and Atlantic Ave., traffic analysis demonstrates that delay (and thus idling) would be reduced at this intersection relative to the No Build Alternative as a result of the build alternatives (*Intersection Traffic Impact Analysis Report* [March 2017]). Further, delay at all study intersections on Washington Blvd. and Atlantic Ave. within the City of Commerce are generally improved under the build alternatives. This evidence suggests that further analysis, including queueing analysis, would not be warranted.

L-19-20

Specific construction staging areas, including routes into and out of the staging/storage areas, have not yet been identified, and are typically not known in detail until final design of a build alternative. In the right-of-way analysis conducted for the I-710 RDEIR/SDEIS, temporary construction easements for the build alternatives were determined in a manner that anticipated the need for construction staging in addition to space that would be required for construction activities. However, as stated in Response to Comment L-19-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there will not be impacts as a result of staging areas for construction.

L-19-21

Please refer to Response to Comment L-19-18 regarding the development of a Noise Community Protection Plan.

L-19-22

As disclosed in Section 3.3.2, Relocations and Real Property Acquisitions, of the RDEIR/SDEIS, the City of Commerce would experience the most residential and nonresidential relocations under Alternative 5C (over 50 percent of the residential displacements and over 25 percent of the nonresidential relocations). It is important to note that, should a build alternative be selected as the Preferred Alternative, ultimately, the displaced person(s) would make the final determination of the location of replacement property, within relocation guidelines. However, as stated in Response to Comment L-19-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there will not be any relocations.

As discussed in Section 3.3, Environmental Justice, most acquisitions as a result of the build alternatives would occur in the immediate vicinity of the I-710 freeway where the population demographics are predominantly minority and low-income. However, as stated in Response to Comment L-19-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there will not be any relocations and there would not be a disproportionate adverse impact to environmental justice populations.

L-19-23

It is important to note that the analyses of tax losses under the build alternatives included in the RDEIR/SDEIS, whether they are property tax losses or sales tax losses, represent a conservative scenario that presumes all businesses or residences would not be able to be relocated within their existing jurisdiction. However, as stated in Response to Comment L-19-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there will not

be the need to relocate residents and businesses For more information regarding relocations, please refer to Section 1.5 of this appendix.

L-19-24

Details on assumptions related to the air quality impacts related to ZE/NZE vehicles are included in Section 7 of Appendix C to the *Air Quality, Greenhouse Gas, and Health Risk Assessment Technical Study* (AQ/GHG/HRA Technical Study) (June 2017), and the associated *Addendum to the Air Quality, Greenhouse Gas, and Health Risk Assessment Technical Study* (December 2020). As stated in this section, the analysis conservatively assumes that all ZE/NZE trucks will be NZE. NZE trucks would be non-diesel (as diesel trucks have not been able to meet CARB's optional low-NO_X standard of 0.02 gm/bhp-hr), thereby reducing diesel particulate matter (DPM) to zero and NO_X emissions by 90 percent compared to conventional heavy-duty trucks. Consistent with the CARB's EMFAC2014 emission factor program, it was conservatively assumed that NZE trucks would not reduce in any other criteria air pollutant or greenhouse gas emissions as compared to a conventional heavy-duty truck; therefore, no credit was taken for further tailpipe reductions for those ZE/NZE trucks that are pure ZE.

L-19-25

Please refer to Response to Comment L-19-22 regarding residential and nonresidential relocations in the City of Commerce. The Preferred Alternative, the No Build Alternative, does not result in residential and nonresidential relocations.

L-19-26

Caltrans acknowledges the support and appreciation of the City of Commerce regarding elements of Community Alternative 7 that have been incorporated into Alternative 7, as well as the determination of adverse effects to communities in the City of Commerce as a result of the build alternatives.

L-19-27

The requested language has already been included in Measure C-1 in Section 3.3.2.4 and Appendix F, Environmental Commitments Record, of the Final EIR/EIS, which states: "While adequate comparable replacement housing appears to exist presently in neighboring cities, new replacement dwellings under Last Resort Housing may be considered for these cities as a method of providing comparable replacement housing to displaced persons who reside in areas where the replacement housing is low." The specific cities in which replacement housing stock may be currently low are not named in the measure, as the real estate market may change drastically between the time an environmental document is prepared and the time a build alternative is constructed and acquisitions are conducted (should a build alternative be selected

as the Preferred Alternative). It is important to note that, should a build alternative be selected as the Preferred Alternative, ultimately, the displaced person(s) would make the final determination of the location of replacement property, within relocation guidelines. It is also important to note that the No Build Alternative has been selected as the Preferred Alternative and therefore acquisitions are no longer necessary.

L-19-28

Caltrans and Metro acknowledge the importance of the City's Housing Opportunity Overlay in the Housing Element of the General Plan. As indicated in Measure C-1, should a build alternative be selected as the Preferred Alternative, Caltrans would cooperate with the affected jurisdictions in relocating business and residential uses within the existing communities wherever possible and feasible. Should they be displaced as a result of the build alternative, all residents, including renters, would be afforded relocation benefits in accordance with the Uniform Relocation Act as also indicated in Measure C-1. However, as stated in Response to Comment L-19-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there would not be an inconsistency with the goals and policies of the City's Housing Opportunity Overlay and Housing Element of the General Plan.

It should be noted that many of the specific points outlined by the City in this comment are already addressed by Caltrans' Relocation Assistance Program (RAP), including: provision of funds for moving expenses and general relocation assistance, including assistance for special needs, incidentals, interest rate differentials, property tax differentials, and other items. The disbursement of these funds are calculated on a case-by-case basis and are individual to each situation. In addition, the RAP provides for the provision of Last Resort Housing in the event that comparable replacement dwellings are not available. The employment of Last Resort Housing is limited in that consideration must be given to the availability of comparable housing in the program or project area, the resources available to provide comparable replacement housing, and the individual circumstances of the displaced person(s), and by a determination that Last Resort Housing is necessary for the area as a whole, a program or project cannot be advanced to completion in a timely manner without Last Resort Housing assistance, and the method selected for providing Last Resort Housing is cost-effective.

For more information on the methodologies used to analyze displacements and relocations, please refer to Section 1.5 of this appendix.

L-19-29

The City's support for construction of a new interchange at Slauson Boulevard is noted. Although reconstruction of Slauson Boulevard, including the freeway overcrossing from the Los Angeles River to approximately 700 feet east of the existing Los Angeles Junction Railway

at-grade crossing is included as part of the Alternative 5C, it is not included as part of the No Build Alternative which has been selected as the Preferred Alternative.

L-19-30

The City's support of Alternative 7 and a ZE freight corridor is acknowledged and included in the project record. Please refer to Section 1.1 of this appendix for a discussion on the identification of the Preferred Alternative.

L-19-31

Caltrans and Metro acknowledge that the City of Commerce would experience the highest amount of relocations of the I-710 Corridor area cities as a result of the build alternatives. Should a build alternative be selected as the Preferred Alternative, relocation assistance as outlined in Measure C-1 would be provided to all residents, owner or renter, which would be displaced as a result of the build alternatives. In addition, due to the disproportionate impact to environmental justice populations as a result of the build alternatives and related to community cohesion and land use, should a build alternative be selected as the Preferred Alternative, Measure C-7 would provide for funding for targeted improvements made in specific census tracts adjacent to the build alternatives containing substantial environmental justice populations. However, as stated in Response to Comment L-19-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there would not be a disproportionate number of residential displacements in the City of Commerce as a result of the build alternatives.

L-19-32

The City's support of ZE design options and efforts to reduce emissions within the I-710 Corridor is acknowledged and included in the project record. Please refer to Section 1.1 of this appendix for a discussion on the identification of the Preferred Alternative.

L-19-33

As stated in Chapter 8 in Appendix D of the AQ/GHG/HRA Technical Study, the closest receptor used in the dispersion modeling is 50 meters (approximately 164 feet) from the edge of the Alternative 5C mainline footprint. Receptors at this distance are fully consistent with (and in many cases, closer than) recent analyses of port, railyard and other transportation projects in Southern California. In addition, EPA guidance on dispersion modeling calls for an "exclusion zone" in certain types of modeling, such as was done for the air quality analysis for I-710 Corridor Project. Results of the dispersion modelling and health risk assessment are in line with the emission calculations, and show no exceedances in the CO or NO_2 National Ambient Air Quality Standards (NAAQS), a reduction in health risk, and increases in particulate matter (PM) concentrations at some receptors. The guidance referred to by the commenter is for PM "hot-

spot" analyses, not non-conformity AQ/HRA analyses, and thus is not applicable to the AQ/HRA analyses described above. Please refer to Section 3.13.3.2 of this Final EIR/EIS for updated information regarding project-level conformity analyses.

L-19-34

The AQ/HRA analyses followed SCAQMD and EPA general (not conformity hot-spot) modeling guidance, as they are not conformity analyses (CO conformity hot-spot analyses in Appendix G of the AQ/GHG/HRA Report do conform to EPA CO Hot-Spot Guidelines.) SCAQMD and EPA general modeling guidance, and indeed EPA's AERMOD modeling software, does not allow calculation of modeled concentrations within the exclusion zone as they would not be technically accurate. As noted in Response to Comment L-19-33, the AQ/HRA analyses are for CEQA and non-conformity NEPA assessments and follow the applicable guidance for such modeling (as described in the air agency-reviewed AQ/HRA Protocol in Appendix A of the AQ/GHG/HRA Report). They are not conformity hot-spot analyses and are not subject to EPA's PM hot-spot analysis guidance. Please refer to Section 3.13.3.2 of this Final EIR/EIS for updated information regarding project-level conformity analyses.

L-19-35

The commenter is stating that localized impacts to near-road communities were not analyzed and is requesting zoomed in figures of the air quality emission figures. Localized impacts to near-road receptors were analyzed in Section 3.13, Air Quality, in the RDEIR/SDEIS. The analysis contained in that section discloses that all build alternatives would generally improve air quality. However, although air quality would be improved at most locations along I-710, but there are a few near-roadway locations where there would be an increase in certain emissions. The maps included in Appendix Q of the RDEIR/SDEIS visually depict the change in emissions and the areas where emissions would increase. In addition, Figures 3.3-4, 3.3-5, 3.3-7, and 3.3-8 in Section 3.3.3, Community Impacts, of the RDEIR/SDEIS include maps at a larger scale to illustrate the change in air pollutant concentrations for PM2.5 and PM10 impacts.

L-19-36

The commenter is stating that Figures 4-1a through 4-1c in the AQ/GHG/HRA Technical Study are unclear. Figures 4-1a through 4-1c depict emission changes for both $PM_{2.5}$ and PM_{10}. The large figure depicts $PM_{2.5}$, as indicated by the main title for each figure. The sub-figures depict PM_{10}, as indicated in the label associated with the subfigures.

L-19-37

Dispersion-modeling-based HRAs are not required by the EPA, FHWA, or Caltrans for freeway projects but were completed for the I-710 Corridor Project. As noted in Responses to Comments

L-19-33 and L-19-34, the HRA analyses followed the AQ/HRA Protocol (Appendix A of the AQ/GHG/HRA Report) that was reviewed by SCAQMD, EPA and other agencies. The HRA analysis methodology is consistent with the applicable California's Office of Environmental Health Hazard Assessment (OEHHA) *Air Toxics Hot Spots Program Risk Assessment Guidelines* (note: this "hot spot" is not the same as an EPA/FHWA conformity "hot-spot") and SCAQMD's updated HRA guidance for AB2588.

L-19-38

The commenter is stating that locations of cancer risk were not discussed in the RDEIR/SDEIS and is requesting zoomed in figures of the cancer risk figures. Cancer risk was discussed in Section 4.2.4.1 of the RDEIR/SDEIS. The analysis contained in that chapter discloses that all build alternatives would generally reduce public health risk. However, although public health risk would be reduced at most locations along I-710, but there are a few near-roadway locations where there would be an increase in certain emissions. Specifically, when compared to the 2035 No Build Alternative, both build alternatives would reduce cancer risk at most locations; however, a small increase in cancer risk would occur at some locations within 100 meters of I-710. For Alternative 5C, the maximum increase in risk would be approximately three in one million. The primary location of the increased risk for Alternative 5C would occur along a small portion of I-710 just south of SR-60. For Alternative 7, the increase in risk would be less than one million.

The maps included in Appendix Q of the RDEIR/SDEIS visually depict the change in cancer risk. In addition, Figures 3.3-6 and 3.3-9 in Section 3.3.3, Community Impacts, of the RDEIR/SDEIS include maps at a larger scale to illustrate the change health risk. It should be noted that the cancer risk presented in these figures was estimated using a 30-year residential exposure scenario. Some of the areas with the small increases in cancer risk are not in residential areas, and as workers have a shorter exposure period, cancer risk would be less than the residential cancer risk results.

L-19-39

This comment is requesting clarification of Table 4.2-1 and the associated text in the RDEIR/SDEIS. Table 4.2-1 of the RDEIR/SDEIS presents the MSAT health risk for the project alternatives compared to the 2012 Baseline. All project alternatives show a decrease in cancer risk at all modeled receptors when compared to the 2012 Baseline.

The paragraph following Table 4.2-1 is referring to the incremental cancer risk impacts seen when comparing the build alternatives to the No Build Alternative in 2035. When compared to the 2035 No Build Alternative, both build alternatives would reduce cancer risk at most locations; however, a small increase in cancer risk would occur at some locations within 100 meters of I-710. For Alternative 5C, the maximum increase in risk would be approximately

three in one million. The primary location of the increased risk for Alternative 5C would occur along a small portion of I-710 just south of SR-60. For Alternative 7, the increase in risk would be less than one million.

L-19-40

As stated in the comment, the determination of significance for NEPA is based on context and intensity. For traffic, context and intensity is considered in the traffic analysis in Section 3.5, Traffic and Transportation/Pedestrian and Bicycle Facilities, of the RDEIR/SDEIS. Context is framed by the existing setting detailed in Section 3.5.2, Affected Environment of the RDEIR/SDEIS. The intensity of traffic impacts is detailed in Section 3.5.3, Environmental Consequences, of the RDEIR/SDEIS. Specifically, changes in level of service and density/volume-to-capacity (v/c) ratio are used to quantify the intensity of traffic impacts and the level of congestion on the roadways within the traffic Study Area. As discussed in Section 3.5, traffic operations within the traffic Study Area were evaluated and defined in terms of level of service (LOS), which ranges from LOS A to LOS F. LOS describes the efficiency of traffic flow and how such conditions are perceived by persons traveling in the traffic stream, and accounts for variables such as speed and travel time, freedom to maneuver, traffic interruptions, traveler comfort and convenience, and safety. LOS A indicates free traffic flow with low volumes and high speeds, resulting in low densities, while LOS F indicates traffic volumes that exceed capacity and result in forced-flow operations at low speeds, resulting in high densities. Density is defined a as the number of vehicles per mile per lane. The volume-to-capacity ratio is the ratio of the volume of traffic using the facility to the capacity of the facility. These factors are all considered together when determining the significance of impacts under NEPA.

L-19-41

Under the build alternatives, HCS analysis demonstrates that LOS would be improved for the I-710 freeway segments relative to the No Build Alternative. See Figures 5-1 and 5-2 provided in the *I-710 Corridor Project Traffic Operations Analysis Report* (March 2017). The volume-to-capacity (v/c) analysis conducted for the arterial roadway segments for the build alternatives show no major changes (i.e., only very slight improvements in the number of highly congested arterial segments) relative to the No Build Alternative. See Figure 6-2 provided in the *Intersection Traffic Impact Analysis Report* (March 2017). For the arterial network, the traffic impact analysis focused on the intersections as that is where most of the delay on the roadway network is occurring. While the methodologies used to determine LOS for signalized versus unsignalized intersections is different (Tables 2-2 and 2-3, *Intersection Traffic Impact Analysis Report* [2017]), the same intersection impact threshold criteria was uniformly applied to all (i.e., both signalized and unsignalized) intersections as stated in Section 3.5.3.1 of the I-710 RDEIR/SDEIS.

L-19-42

The information presented in Section 3.5.2.1 was provided to help characterize existing conditions on I-710. Caltrans has no accepted methodology for projecting future accident rates at this time. Actual collision data based on reporting provided by the California Highway Patrol is collected in order to understand if existing accident rates are higher on the subject route than on similar facilities within the state, and if the types of accidents that occur help to identify the types of improvements that would be most beneficial to implement. Analysis of accident rates for a future condition, after construction of the build alternatives, using the same methodology as existing accident data is not possible and would, therefore, be highly speculative in this context. Any assessment of the relative safety or operational benefits of the proposed future alternatives would need to utilize methods other than accident rates. More information on the types of accidents that occur within the I-710 Corridor can be found in Section 1.2.1.2, Capacity, Transportation Demand, and Safety, in this Final EIR/EIS.

L-19-43

Chapter 4.0, CEQA Evaluation, of the RDEIR/SDEIS was structured in a way that groups the various checklist questions together according to the response, rather than separated by resource area, as is described in more detail in Section 4.2, Discussion of Significance of Impacts. CEQA Checklist questions XVI.a and XVI.b are addressed together in Section 4.2.4.4. CEQA Checklist questions XVI.c through XVI.g are discussed previously in the CEQA chapter in Section 4.2.1.11. Therefore, all of the traffic- and transportation-related CEQA Checklist questions are included in Chapter 4.0.

L-19-44

The I-710 travel demand forecast (focus area) model is based on the 2012 RTP SCAG model, which has a future horizon analysis year of 2035. The 2016 RTP SCAG model has a future horizon analysis year of 2040. Because of the extensive amount of validation, calibration, and post-processing necessary to produce the I-710 travel demand forecasts for the Study Area, an “apples to apples” comparison between 2035 and 2040 specific to the I-710 Study Area cannot easily be made. However, based on travel information extracted from the adopted California Resources Board Emissions Factors model (EMFAC 2014), which is a single, credible source that contains both future analysis years, 2035 and 2040, vehicle miles traveled (VMT) in Los Angeles County is projected to increase by approximately 1.6 percent between 2035 and 2040.

L-19-45

For the existing condition, these freeway segments on I-710, around the Washington and Atlantic interchange, were identified as LOS F based on actual observed speed data (e.g., field reviews, travel time runs) and actual collected traffic data (PEMS), which confirms the traffic

queues that develop in this area of I-710 during the AM and PM peak hours. These oversaturated segments are identified with a footnote (refer to Footnote 6) on Table 3.5-1. For the future condition, observed data is not available, leaving only HCS methods to determine LOS, which can only identify and evaluate congestion on a segment by segment basis. Traffic queues that extend beyond more than one segment are not fully captured in the HCS operational analyses. In considering design improvements for the build alternatives for the area between Atlantic Blvd./Bandini Blvd and the I-5 interchange, the project engineers took into account both observed data and future operational analyses. As a consequence, the build alternatives would include extensive ramping, collector-distributor road systems, reconfiguration of the I-710/I-5 connectors, and additional lanes through this stretch of I-710 between Slauson Avenue and I-5.

L-19-46

The commenter is correct. This is a typographical error which has been corrected in Table 3.5-2 of the Final EIR/EIS for the existing condition, midday (MD) peak hour, for the “Atlantic Boulevard Off / Atlantic Boulevard southbound On” segment of I-710.

L-19-47

The commenter is referring to queues based on observed I-5 travel data upstream and downstream of the I-710 as noted in Table 3.5-6 under existing conditions. See those segments identified with Footnote No. 6 in Table 3.5-6. With regard to the section of I-710 approaching the I-5 interchange, please refer to Response to Comment L-19-45. The design improvements included in the build alternatives would materially improve traffic operations in this stretch of I-710 between Slauson Avenue and I-5. Under the build alternatives, much of the heavy truck traffic and weaving movements would be taken off the I-710 mainline and would be managed via a set of connector ramps and collector-distributor roads.

L-19-48

The parking analysis memorandum was included in full as Appendix D to the Community Impact Assessment (July 2017). In general, the analysis of parking demand and associated percentages was evaluated at a corridor-wide level. However, due to community input, the programmatic parking restrictions have not been carried forward as part of Alternative 5C. Please refer to Section 1.6 of this appendix for more information. In addition, it should be noted that the No Build Alternative has been selected as the Preferred Alternative, which would also not include the programmatic parking restrictions.

L-19-49

A discussion of freeway mainline LOS by segment was included in the RDEIR/SDEIS and can be seen visually on Figures 3.5-3 (existing conditions LOS), 3.5-4 (No Build Alternative LOS), 3.5-6 (Alternative 5C LOS), and 3.5-7 (Alternative 7 LOS), for a.m., p.m., and midday peak periods. In-text discussion of LOS on freeway segments for the I-710 mainline as well as portions of the crossing freeways was summarized in Section 3.5.2.2, Existing and Future No Build Traffic Conditions, and 3.5.3.1, Permanent Impacts.

L-19-50

Table 3.5-23 of the RDEIR/SDEIS provides a high-level summary of the impacted locations and recommended potential improvements and is equivalent to Table 7-12, Summary of Impacted Intersections, in the *Intersection Traffic Impact Analysis Report* (March 2017). In response to this comment, a new table (Table 3.5-24) has been added to Section 3.5 to provide more detailed information regarding intersection level of service after mitigation.

L-19-51

Please refer to Section 1.7 of this appendix for more information on the I-710 Corridor Early Action Projects . In addition, local intersection improvement projects may be eligible for funding under the ITS/TSM/Congestion Relief Program. Please refer to Section 2.3.2.1 of the Final EIR/EIS for more details regarding this program.

L-19-52

As required under Section 4(f) of the United States Department of Transportation Act (now codified in 49 U.S.C. §303 and 23 U.S.C. §138), Caltrans has consulted with the City of Commerce regarding the proposed *de minimis* impact determination and temporary occupancy exception for Bandini Park under the build alternatives. This coordination included a discussion of measures to minimize harm to the property, which included design refinements of the build alternatives to minimize the proposed permanent aerial easement and TCE area at Bandini Park, or to avoid the TCE in the park if feasible. Based on the coordination that has taken place with the City to date, the need for the TCE within Bandini Park has been avoided. In addition, as stated in Response to Comment L-19-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there is no impact to Bandini Park.

L-19-53

Please refer to Response to Comment L-19-52 regarding impacts to Bandini Park.

L-19-54

Please refer to Response to Comment L-19-52 regarding impacts to Bandini Park.

L-19-55

Please refer to Response to Comment L-19-52 regarding impacts to Bandini Park.

PUBLIC WORKS DEPARTMENT

ALL-AMERICA CITY

October 20, 2017

Ronald Kosinski
Caltrans District 7, Division of Environmental Planning
100 South Main Street, MS 164
Los Angeles, CA 90012

Re: City of Lynwood's Written Comments on the I-710 Corridor Project Recirculated Draft Environmental Impact Report/Supplemental Draft Environmental Impact Statement (RDEIR/SDEIS)

Dear Mr. Kosinski:

The City of Lynwood appreciates the opportunity to review and provide written comments on the Recirculated Draft Environmental Impact Report/Supplemental Draft Environmental Impact Statement (RDEIR/SDEIS) for the Interstate 710 (I-710) Corridor Project, dated July 2017. This letter represents the official comments from the City of Lynwood.

The technical review and comments provided herein focus on the subject matters pertaining to the City of Lynwood and are limited to that portion of the project study area within or adjacent to Lynwood's city limits (primarily from Rosecrans Avenue to Imperial Highway). The review comments are associated with the following sections of the RDEIR/SDEIS:

- Section 2.3 Project Alternatives (including Concept Plans in Appendix O)
- Section 3.3 Community Impacts
- Section 3.4 Utilities and Emergency Services
- Section 3.5 Traffic and Transportation/Pedestrian and Bicycle Facilities
- Section 3.6 Visual/Aesthetics
- Section 3.14 Noise
- Section 3.24 Construction Impacts

The City of Lynwood recognizes the regional significance and fully supports the I-710 Corridor Project. The City thanks Caltrans and Metro in advance for their attention to the City's technical review comments on the I-710 Corridor Project RDEIR/SDEIS and looks forward to working with Caltrans and Metro towards a successful completion of the project. If you have any questions regarding this letter, please do not hesitate to contact Nick Servin at 310.603.0220 or nservin@lynwood.ca.us. L-20-1

Sincerely,

Alma K. Martinez
City Manager

BACKGROUND

The I-710 Corridor Project is being undertaken by the Department of Transportation (Caltrans) as the lead agency, in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro) as the sponsoring agency. The purpose of the project is to modernize a 19-mile segment of the I-710 corridor from Ocean Boulevard in Long Beach to State Route 60 (SR-60) in Los Angeles, address projected growth and traffic demand, improve air quality and public health, and enhance traffic safety. A No Build and two build alternatives are being considered in the RDEIR/SDEIS, as briefly described below:

- Alternative 1 (No Build) would maintain the existing lane and interchange configuration with no additional improvements to be provided, other than those projects that are already funded and/or committed to be constructed by or before the planning horizon year 2035.
- Alternative 5C (I-710 Widening and Modernization) would add up to one general purpose (GP) lane in each direction of I-710 between Anaheim Street in Long Beach and Olympic Boulevard in east Los Angeles.
- Alternative 7 (I-710 Modernization plus Freight Corridor) would add two controlled-access truck lanes in each direction of I-710 from Anaheim Street in Long Beach to Washington Boulevard in Commerce.

The City of Lynwood is located on the west side of the I-710 freeway, generally where I-710 meets Interstate 105 (I-105). Construction on the I-710 freeway and interchanges as well as associated roadway improvements under both build alternatives would have direct effects on the City of Lynwood including:

- Reconfiguration of the N/S105-N710 Connector and Rosecrans Avenue NB on-ramp CD road.
- Reconfiguration of the S710/N/S105 Connector and the Martin Luther King Jr. Boulevard SB off-ramp.
- Construction of new braided ramps in the NB and SB directions between Imperial Highway ramps and the I-105 Connectors.
- Reconstruction of the I-710/Imperial Highway interchange from cloverleaf to diverging diamond configuration.
- Reconstruction of Imperial Highway including overcrossing bridge and bridge over the LA River.
- Construction of a parkway along the north side of Imperial Highway from Atlantic Avenue to the LA River.
- Termination of Wright Road on the north side of Imperial Highway.
- Reconfiguration of Wright Road (Duncan Avenue) with right-in/right-out access from/to Imperial Highway.

The build alternatives include three design variations which are called Option 1A, 2A, and 3A for Alternative 5C and Option 1B, 2B, and 3B for Alternative 7. None of the design options would affect the project design in the area adjacent to the City of Lynwood. For Alternative 7, Option 7ZE is also proposed to provide exclusive use of the freight corridor by zero emission trucks. This option is operational in nature and does not result in different geometric design of Alternative 7.

SECTON 2.3 PROJECT ALTERNATIVES

Comment 1 – Support for Alternative 5C as Preferred Alternative

Based on the ability to improve air quality and relieve traffic congestion, the City would like to express our support for implementation of Alternative 5C as the Preferred Alternative. L-20-2

Comment 2 – Wright Road/Louise Avenue Intersection

The City requests that the project team extend the proposed improvements on Wright Road to the Wright Road/Louise Avenue intersection as part of the I-710 Corridor Project. There is currently a sight distance issue at this intersection for the NB Louise Avenue traffic continuing northbound onto NB Wright Road. L-20-3

Comment 3 – Zero-Emission Incentive

Both build alternatives under consideration propose a Zero-Emission/Near Zero Emission (ZE/NZE) Truck Technology Deployment Program as a programmatic component that provides funding to subsidize the purchase of NE/NZE trucks for use within the I-710 corridor. The funding would be $100 million under Alternative 5C and $460 million under Alternative 7, and up to $1.05 billion under Design Option 7ZE. To encourage the use of ZE/NZE trucks in either of the build alternatives to provide equitable air quality improvement in the region, the City requests that the project team consider increasing the funding amount in Alternative 5C to a similar level as Alternative 7. L-20-4

Comment 4 – Access Modification at Wright Road (Duncan Avenue)

Wright Road is classified as a truck route in the City of Lynwood which connects between two other truck routes: Imperial Highway and Martin Luther King Jr. Boulevard. Due to reconfiguration of the Imperial Highway interchange, the project proposes to modify Wright Road (Duncan Avenue) at its intersection with Imperial Highway to a right-in/right-out access. The City requests that the impact to truck traffic network be analyzed in the appropriate section of the environmental document. L-20-5

SECTION 3.3 COMMUNITY IMPACT

Comment 5 – Parking Restrictions Along Atlantic Avenue and Long Beach Boulevard

Table 3.3-9 of the RDEIR/SDEIS reveals that the proposed parking restrictions during peak hours (6:00 to 9:00 a.m. and 4:00 to 7:00 p.m.) would impact up to 754 on-street parking spaces along Atlantic Avenue and Long Beach Boulevard within the City of Lynwood. The large number of on-street parking removal during peak hours in the City of Lynwood is substantial and the City believes this would have significant impacts to its residences and businesses. The City requests that the impact of the proposed parking restrictions be further analyzed in the environmental document, including identification of off-street parking areas or other on-street parking areas that may absorb the parking demand. L-20-6

Comment 6 - Vista High School HVAC System

Under Alterative 5C, Vista High School, which is adjacent to I-710, would not receive a new HVAC system to reduce the exposure of children and staff to near roadway emissions from the project, as it would under Alternative 7. *Page 3.3-151.*

The City requests that the project team consider increasing the funding amount in Alternative 5C to a similar level as Alternative 7 to receive a new HVAC system for Vista High School. L-20-7

Comment 7 – Will Rogers Elementary School HVAC System

Will Rogers Elementary School is not addressed in the list of schools within 0.25 mile from I-710, that could potentially receive a new HVAC system to mitigate air quality emissions from the project to reduce the exposure of children and staff to near roadway emissions, despite the school being 0.2 mile from I-710. *Page 3.13-56 and 3.13-57.*

The City requests that the project team include Will Rogers Elementary School and increase the funding amount in Alternative 5C to a similar level as Alternative 7 to receive a new HVAC system for Will Rogers Elementary School. L-20-8

Comment 8 – On-Street Parking Along Imperial Highway

There is currently on-street parking along both sides of Imperial Highway between Atlantic Avenue and the I-710 ramps. The City requests that on-street parking be reestablished along Imperial Highway under both build alternatives. L-20-9

Comment 9 – Property Relocations

Table 3.3-12 of the RDEIR/SDEIS reveals that two nonresidential relocations within the City of Lynwood would be required to accommodate the project under both build alternatives. However, the parcel acquisitions exhibit in Appendix L shows that full acquisition of six nonresidential properties are needed to accommodate the realignment of Imperial Highway. Please verify and update the documents as appropriate. L-20-10

Comment 10 – Right of Way at Imperial Highway/Atlantic Avenue Intersection

The City requests that the project team include a discussion in the environmental document regarding additional right of way that may be required to accommodate the proposed mitigation at the Imperial Highway/Atlantic Avenue intersection (identified in Table 3.5-23 of the RDEIR/SDEIS). L-20-11

Comment 11- Marco Antonio Firebaugh High School

Access impacts to Marco Antonio Firebaugh High School are not addressed in the report, despite the school's proximity to I-710 (0.10 mile) and the freeway exit ramp located on Martin Luther King Jr. Blvd, one block from the campus. (Table 3.3-8) *Page 3.3-41*

The City requests that access to Marco Antonio Firebaugh High School be addressed due to these improvements. L-20-12

SECTION 3.4 UTILITIES/EMERGENCY SERVICES

Comment 12 – Utility Impacts

The City recognizes that only major utilities are being evaluated as part of the environmental document for the project, while minor utilities would be investigated in the subsequent phase of the project development process. However, due to complete reconstruction of Imperial Highway, the City requests that potential impacts to overhead and underground utilities along Imperial Highway be evaluated in the environmental document. Anticipated service disruption should be identified along with mitigation/minimization measures. L-20-13

Comment 13 – Flood Control Facilities

Lynwood Retention Basin: This basin receives runoff from the local land uses including the Caltrans right of way. The basin is drained by a pump system to the LA River. The existing basin does not currently provide water quality treatment. Alternative 7 would bisect the primary basin. The capacity and functionality of the primary retention basin would be impacted, therefore the basin would need to be reconfigured or relocated elsewhere in the interchange area to remain functional. Based on the existing underground piping configuration, one possible location for a new basin would be in the northwest quadrant of the I- 105/I-710 interchange. As specified in Mitigation Measure FP-2, Caltrans will coordinate with the Los Angeles County Department of Public Works to identify a suitable location for replacement of the I-105 retention basin that will provide equal or greater capacity than the basin impacted by the freight corridor. L-20-14

The City requests that Caltrans also coordinate with City staff regarding the relocation of this basin and to further study the proposed improvements to provide water quality treatment and meet capacity purposes.

SECTION 3.5 TRAFFIC AND TRANSPORTATION/PEDESTRIAN AND BICYLE FACILITIES

Comment 14 – Traffic Volumes

Section 3.5 of the RDEIR/SDEIS includes various tables showing level of service (LOS), traffic flow density and/or volume-to-capacity ratio, and intersection delay information for a.m., mid-day, and p.m. peak hours for the freeways, ramps, and local arterials. The City requests that peak hour traffic volumes be provided in these tables as well to allow the City to fully understand the traffic demand and review the potential impacts the I-710 Project Corridor will have on the traffic and transportation system. L-20-15

Comment 15 – Impact of Increased Truck Traffic on Pavement

The projected increase in the truck traffic along Imperial Highway west of Atlantic Avenue under both build alternatives (per Tables 5-2, 6-2, and 6-7 of the Intersection Traffic Impact Analysis Report) will potentially increase the impact to the pavement system on local streets within the City of Lynwood. The City requests that the potential impact to the local street pavement system be evaluated in the appropriate section of the RDEIR/SDEIS and suitable mitigation measures, such as pavement rehabilitation or replacement identified as part of the I-710 Corridor Project. L-20-16

Comment 16 - Imperial Highway Operation

Level of service (LOS) F is projected for Imperial Highway between Long Beach Boulevard and Atlantic Avenue under both built alternatives. This roadway segment currently experience congestion during peak hours. Additional automobile and truck volumes projected along this roadway segment would exacerbate this condition. The City requests the project team investigate and incorporate additional improvements to address the degradation of this roadway segment under the build alternatives. L-20-17

Comment 17 – Imperial Highway/Atlantic Avenue Intersection Impact

Under both build alternatives, the project is predicted to increase vehicular traffic volumes along Imperial Highway and result in level of service (LOS) degradation from LOS E to LOS F at the Imperial Highway/Atlantic Avenue intersection. The queue analysis provided in the Traffic Operations Analysis Report also forecasts inadequate queue storage length for all NB and SB movements (left, through and right) as well as the EB left and right, and WB left-turn movements at this intersection. Mitigation entailing the addition of an extra left-turn lane is proposed on the EB approach at this intersection under both alternatives. However, no improvements are proposed for other approaches. Due to the additional truck volumes projected along Imperial Highway, the City requests that the project team consider additional improvements to mitigate the project impact on this intersection. L-20-18

In addition, please note that there is currently a single left-turn lane on the EB approach, which is shown to be replaced in kind (i.e. as a single left-turn lane) in the Concept Plan (Appendix O). Table 3.5-23 of the RDEIR/SDEIS indicates that an extra left-turn lane would be added on the EB approach of the Imperial Highway/Atlantic Avenue intersection, creating a triple left turn. Please verify that a triple left turn is proposed on the EB approach as stated in Table 3.5-23. L-20-19

Comment 18 – Bus Stops

There is currently a bus stop on WB Imperial Highway west of Wright Road. The City requests that the impact to this bus stop and required reconstruction/relocation be discussed in the appropriate section of the environmental document. The City also requests that the project design include bus turnouts at bus stop locations to prevent buses from blocking through traffic. L-20-20

SECTION 3.6 VISUAL/AESTHETICS

Comment 19 – Imperial Highway Bridge over LA River

In harmony with the proposed bike parkway along Imperial Highway, the City requests that the project team consider incorporating a lookout belvedere at the proposed Imperial Highway bridge over the LA River. L-20-21

Comment 20 – Sound Wall Aesthetics

The City requests that construction of any new sound walls be coordinated with City staff and members of the community for aesthetic purposes. L-20-22

Comment 21 – Landscaped Median Along Imperial Highway

The City's General Plan identifies the Imperial Highway corridor as a "landscaped boulevards" corridor with tree-line landscaped median, ornamental lighting, and decorative paving. The City requests that a discussion be included in the environmental document regarding impact and restoration of Imperial Highway landscaped median. L-20-23

SECTION 3.14 NOISE

Comment 22 – Soundwall SW-508

Per Page 3.14-28, under Alternative 5C, SW-508 (along the edge of shoulder from EB Imperial Highway transitioning onto the SB I-710 on-ramp) was found to be acoustically feasible, providing noise abatement for at least 7 residences. Per Page 3.14-66, this soundwall has not been recommended for construction due to a sight distance issue and a proposed retaining wall along the SB on-ramp from Imperial Highway is anticipated to provide some abatement for the projected noise level.

The City requests that additional analysis be performed to mitigate the sight distance issue. There appears to be extra right of way adjacent to the proposed SB on-ramp that can accommodate the soundwall set back to avoid sight distance issue. L-20-24

Comment 23 – Noise Study Report (Page 3.14-21)

The project identifies Marco Antonio Firebaugh High School as not having "exterior area of frequent human use", and therefore proposes that no noise impacts are predicted to occur at this school under either of the build alternatives, and no noise abatement will be considered, despite the school's outdoor playground and eating areas (visible on Google maps).

The project also identifies Vista High School as not having "exterior area of frequent human use", and therefore proposes that no noise impacts are predicted to occur at this school under either of the build alternatives, and no noise abatement will be considered, despite the school's outdoor playground and eating areas (visible on Google maps). L-20-25

The City requests an additional study to confirm that there are no frequent human use areas along this high school.

SECTION 3.24 CONSTRUCTION IMPACTS

Comment 24 – Ramp and Street Closures

The project construction in and near the City of Lynwood is estimated to take 48 to 72 months depending on the alternative chosen. In addition, the Construction Staging Concepts report, dated May 18, 2017, reveals that there is high likelihood that the Imperial Highway interchange ramps would need to be closed for a prolonged period, possibly up to 3 months. L-20-26

Prolonged closure of Imperial Highway and the connecting interchange ramps (i.e. more than 10 consecutive days) would have significant impacts to the residences and businesses in the City of Lynwood. This interchange is the primary access for residences and businesses in the northeast portion of the City. The City requests that each of the closure is limited to less than 10 consecutive days and that the number of closure periods be limited to a maximum of three times within a 12-month period. Construction of temporary ramp pavement and temporary street widening should be considered where feasible to keep the street and interchange open and minimize closures during construction. L-20-26

Additionally, the City requests that Measure CON-TR-1 on page 3.24-48, include language that any ramp closures exceeding 10 days need a formal "Ramp Closure Study". L-20-27

L-20-1

The City's support of the I-710 Corridor Project is acknowledged and included in the project record.

L-20-2

Caltrans and Metro thank the City for their comment. Your support for Alternative 5C as the Preferred Alternative due to the improvements to air quality and traffic congestion are acknowledged and included in the project record. However, Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), has identified Alternative 1 (No Build) as the Preferred Alternative. Please refer to Section 1.1 of this appendix for further discussion of the identification of the Preferred Alternative.

L-20-3

Project improvements related to the build alternatives in the vicinity of Wright Road are shown in Figure 2.3-6, Sheet 3 and Figure 2.3-11, Sheet 3 in Sections 2.3.2.2 and 2.3.2.3 of this Final EIR/EIS. The improvements suggested in the comment do not have a nexus to the I-710 Corridor Project improvements, and therefore have not been incorporated into the design of the build alternatives.

L-20-4

Caltrans and Metro appreciate the City's support of the I-710 Clean Truck Program (referred to in the RDEIR/SDEIS as the I-710 Corridor Project Zero Emission/Near Zero Emission Truck Technology Deployment Program). It should be noted that Metro Board Motion 5.1 changed the ZE/NZE Truck Technology Deployment Program to the phased-in Zero-Emission Truck Technology Deployment Program, which increased the program funding target from $100 million to $200 million, and include in the Program incentives and grants investment in the acceleration of ZE technology both for long-haul trucks and for freeway infrastructure. In April 2020, the Metro Board of Directors programmed $50 million in Metro-controlled funds to provide funding for the initial deployment of the I-710 Clean Truck Program and to leverage the remaining funds required for full program implementation. However, as stated in Response to Comment L-20-2, the No Build Alternative has been selected as the Preferred Alternative. Therefore, the I-710 Clean Truck Program will not be implemented as part of this Project. Please refer to Section 1.3 of this appendix for more detail on the I-710 Clean Truck Program.

L-20-5

Based on the design of the diverging diamond interchange, truck access from the City of Lynwood along Wright Rd. is maintained in both the southbound and northbound directions of I-710 under the build alternatives. With the cul-de-sac proposed under the build alternatives for Wright Rd. within the City of South Gate, some traffic would be re-routed through the Atlantic Blvd./Imperial Hwy. intersection along Atlantic Ave. and away from residential land uses along Wright Rd.. The Atlantic Ave./Imperial Hhyw. intersection was evaluated as part of the intersection impact analysis assessment conducted for the project. As shown in detail in Table 6-3 of the *Intersection Traffic Impact Analysis Report* (March 2017), the level of service at this intersection improves from LOS F under the 2035 No Build Alternative to LOS E for Alternative 5C in the p.m. peak hour. However, this intersection would experience a degradation in LOS in the a.m. peak hour. As a result, a measure to address that impact is proposed for the intersection of Atlantic Ave./Imperial Hwy. under the build alternatives. The proposed measure (Measure TR-1, in Section 3.5.4 of the RDEIR/SDEIS) would improve the LOS of this intersection to better than No Build Alternative conditions. As shown in detail in Table 7.3 of the *Intersection Traffic Impact Analysis Report* (March 2017), the Atlantic Avenue/Imperial Highway intersection would operate at LOS E or better in the a.m., mid-day, and p.m. peak hours as a result of Alternative 5C. Based on this analysis, trucks operating along designated truck routes would not be affected under the Alternative 5C.

L-20-6

Please refer to Section 1.6 of this appendix for further information regarding parking restrictions during peak hours. These restrictions have been eliminated from further consideration as the No Build Alternative has been selected as the Preferred Alternative.

L-20-7

The determination of specific schools and other facilities that would receive filtration systems under each build alternative as outlined in Measure C-8 was not determined by funding levels, but by whether or not the facility would be located within an area of pollutant increase under the build alternatives. As the increase in pollutant levels would be lesser in areas under Alternative 5C than it was under Alternative 7, fewer facilities would fall within an area of increased pollutant levels which would therefore require mitigation. Specifically, Vista High School in the City of Lynwood was identified as falling within an area of 24-hour PM_{10} impact under Alternative 7 (as seen on Figure 3.3-7, sheet 3 of 4), and would not be impacted by either $PM_{2.5}$ or PM_{10} increases under Alternative 5C (as seen on Figure 3.3-5, sheet 3 of 4, and Figure 3.3-4, sheet 3 of 4, respectively). However, the City and/or school district could be eligible for funding under the Community Health Benefit Program for the installation of filtration or HVAC systems. However, as the No Build Alternative has been selected as the Preferred Alternative, the Community Health Benefit Program will not be implemented by Caltrans as a part of the I-710

Corridor Project. Please refer to Section 1.10 of this appendix for more detail on the Community Health Benefit Program.

L-20-8

Will Rogers Elementary School was inadvertently omitted from the list of schools in Measure AQ-2, and does fall within 0.25 mile of the improvements proposed under the build alternatives. Measure AQ-2 has been revised to include Will Rogers Elementary School.

L-20-9

The current roadway design for Alternative 5C would call for removal of existing on-street parking for a small stretch of Imperial Highway, between Wright Rd. and Atlantic Blvd., to provide sufficient space for turning lanes entering and exiting the I-710 freeway, as well as for the proposed Class 1 bicycle and pedestrian facilities requested by the community. However, as stated in Response to Comment L-20-2, the No Build Alternative has been selected as the Preferred Alternative. Therefore, existing on-street parking on Imperial Highway within the City of Lynwood will not be affected.

L-20-10

As stated in Section 3.3.2.4 of the RDEIR/SDEIS, the number of parcels listed in Appendix L, Parcel Acquisitions Under Alternatives 5C and 7, may differ from those listed in Section 3.3.2.3. The difference in the number of properties affected may be a result of some parcels being either vacant, or the same business occupies multiple parcels (i.e., only one business would require relocation even though multiple parcels would be acquired for the build alternatives). The information contained in both Section 3.3.2.3 and Appendix L has been updated to reflect the Preferred Alternative (Alternative 1 – No Build).

L-20-11

As discussed in Section 3.5.4 of the RDEIR/SDEIS and this Final EIR/EIS, should a build alternative be selected as the Preferred Alternative, mitigation for impacts to local intersections by the build alternatives would be implemented by Caltrans as the lead agency in coordination with the local jurisdiction. The proposed mitigation improvements are only conceptual at the time the RDEIR/SDEIS was circulated. However, as stated in Response to Comment L-20-2, the No Build Alternative has been selected as the Preferred Alternative. Therefore, intersection mitigation will not be implemented .

L-20-12

No permanent or temporary access impacts on Marco Antonio Firebaugh High School have been identified as a result of the build alternatives, as the work proposed at the I-710/I-105 freeway to freeway interchange and proposed modifications at the Martin Luther King Jr. on- and off-ramp to and from southbound I-710 under the build alternatives would be minimal. Measure CON-TR-1 in Section 3.24.4.5 of the RDEIR/SDEIS, should a build alternative be selected as the Preferred Alternative, would require implementation of a Transportation Management Plan, which would address any temporary access impacts during construction of either of the build alternatives. However, as stated in Response to Comment L-20-2, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there will not be any modifications to the Martin Luther King Jr. on- and off-ramp to and from southbound I-710.

L-20-13

Major utilities along or near Imperial Highway (specifically, conflict C7202, which consists of one six-inch and one eight-inch underground Chevron pipeline that share a trench near the west side of the Los Angeles River) were included in Section 3.4.2.2 of the RDEIR/SDEIS. However, the City is correct in noting that generally, only major utilities were specifically evaluated within the RDEIR/SDEIS. A “major” utility was defined as those that would require significant effort to relocate in the field or those that would require substantial coordination efforts with the respective utility company or companies. However, as stated in Response to Comment L-20-2, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there will be no impacts to utilities.

L-20-14

As stated in Response to Comment L-20-2, the No Build Alternative has been selected as the Preferred Alternative. Therefore, no impacts to the Lynwood Retention Basin will occur.

L-20-15

Peak hour traffic volumes are provided in the supporting traffic technical reports prepared for the RDEIR/SDEIS, specifically the *Intersection Traffic Impact Analysis Report* (March 2017) and the *I-710 Corridor Project Traffic Operations Analysis Report* (March 2017), which are publicly available documents that can be found at: http://www.dot.ca.gov/d7/env-docs/docs/710corr-eir/.

L-20-16

The commenter’s concern regarding pavement deterioration on local streets as a result of increased traffic from the build alternatives is acknowledged and included in the project record. Based on the information provided in Tables 5-2 and 6-2 of the *Intersection Traffic Impact Analysis Report* (March 2017), the projected increase in truck traffic would not measurably

affect this section of Imperial Hwy., which is a major arterial and designated truck route within Los Angeles County. However, as stated in Response to Comment L-20-2, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there will be no additional pavement deterioration on local streets resulting from the build alternatives and additional analysis will not need to be conducted during final design to determine the timing of the construction staging, finalize construction staging plans, or develop a Transportation Management Plan (TMP) detailing anticipated traffic diversion routes for the different construction stages of the build alternatives. It should be noted that allowances for local roadway construction impacts were accounted for in the cost estimates for the build alternatives developed for the EIR/EIS.

L-20-17

As depicted on Figure 5-4 of the *Intersection Traffic Impact Analysis Report* (March 2017), this segment of Imperial Hwy. would operate at Level of Service (LOS) F under Alternative 1 (future No Build) conditions. While this LOS designation would not change as a result of the build alternatives, the intersection of Imperial Hwy./Atlantic Ave. would be impacted, and, should a build alternative be selected as the Preferred Alternative, mitigation for this intersection would be proposed (please refer to Measure TR-1 in Section 3.5.4 of the RDEIR/SDEIS and this Final EIR/EIS). Additionally, the I-710 Congestion Relief Program is a programmatic feature included as part of the build alternatives that would help address congestion on the arterial system associated with future No Build conditions, particularly directed toward intersections on the arterial system near the I-710 freeway where most of the future No Build delay (LOS E or worse) is projected to occur. The City of Lynwood is encouraged to identify project improvements along this segment of Imperial Highway that could be submitted for funding consideration under the I-710 Congestion Relief Program to help address this issue.

L-20-18

Measure TR-1 identified in Section 3.5.4 of the RDEIR/SDEIS is aimed to reduce delay at the impacted intersection from poor operating conditions (LOS E or F) under the build alternatives to the level projected under the 2035 No Build Alternative, or better. By adding an extra left-turn lane on the southbound approach as mitigation, the total delay at the intersection could be reduced to better than projected under the 2035 No Build Alternative. Therefore, no additional improvements would be required to mitigate impacts for this intersection as a result of the build alternatives. In response to this comment, a typographical error was corrected in Table 3.5-23 of this Final EIR/EIS for intersection ID no. 55 under both build alternatives, as follows: “Add an extra left-turn lane on the SB approach resulting in triple left-turn lanes.”

L-20-19

It is important to note that Table 3.5-23 in Section 3.5.3.1 of the RDEIR/SDEIS includes proposed improvements that are recommended to address impacted intersections that would occur as a result of implementation of the build alternatives. These proposed improvements are not included in the Concept Plans shown in Appendix O, as they are considered mitigation measures. Further, these improvements are currently only in conceptual stages. In addition, as stated in Response to Comment L-20-2, the No Build Alternative has been selected as the Preferred Alternative. Therefore, mitigation is not necessary.

L-20-20

As stated in Response to Comment L-20-2, the No Build Alternative has been selected as the Preferred Alternative. Therefore, the existing Metro bus stop on westbound Imperial Highway just west of Wright Road within the City of South Gate, would not be impacted during construction of the build alternatives and would not require relocation

L-20-21

As stated in Response to Comment L-20-2, the No Build Alternative has been selected as the Preferred Alternative. Therefore, a lookout belvedere along Imperial Hwy. will not be incorporated.

L-20-22

Measure VIS-9, provided in Section 3.6.4, Visual/Aesthetics, of the RDEIR/SDEIS states that, should a build alternative be selected as the Preferred Alternative, “During final design, Caltrans will review with each local jurisdiction the aesthetic features and treatments proposed to be incorporated in the final facility design for freeway components adjacent to each local jurisdiction, in accordance with the *I-710 Corridor Aesthetics Master Plan* described in Measure VIS-1." However, as stated in Response to Comment L-20-2, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there will not be any construction of soundwalls as a result of this project.

L-20-23

A discussion of restoration of landscaping was included in the project description contained in Section 2.3.2.1 of the RDEIR/SDEIS, which states: “Landscaping and irrigation systems would be provided where necessary within the corridor to provide aesthetic treatment, replacement planting, or mitigation planting for the build alternatives. Close coordination among Caltrans, Metro, various I-710 Corridor committees, and the landscape design consultant on this project has occurred to identify areas available for planting in addition to coordination with Caltrans’ Operations and Maintenance Branch to ensure consistency with their objectives and

requirements. Features included as part of the project design for the build alternatives would include drought-tolerant and native landscaping, plants that change colors with the seasons, and use of vines where space is limited. New irrigation systems would be designed to use reclaimed water (if available). In an effort to surpass the minimum tree removal-to-replacement ratio, the number of new trees, shrubs and foliage within State right-of-way would be maximized, would be drought-resistant, and would have superior biosequestration and biofiltration capabilities. An *Enhanced Water Quality Features Report* (2016) was prepared to identify potential stormwater management solutions in the corridor, along with hardscape and landscape options. The development of final landscape plans for the build alternatives would occur during later phases of design, and would maximize the number of drought-tolerant trees, shrubs, and foliage and identify additional stormwater BMP locations. In addition, a I-710 Corridor Aesthetics Master Plan (2015) was developed to guide the design of hardscape features throughout the corridor for the build alternatives, including highway design elements and themes, lighting, bridge structures, and other components. Under the No Build Alternative, this will not be implemented." As the No Build Alternative has been selected as the Preferred Alternative, the landscaping on the Imperial Highway corridor within the City of Lynwood will not be impacted by project construction.

L-20-24

Caltrans acknowledges that the soundwall in question (SW-508) is not recommended for construction due to sight distance issues. The new retaining walls that would be constructed under the build alternatives from eastbound Imperial Highway transition to the southbound I-710 on-ramp would block much of the traffic noise to the adjacent residential area. The retaining walls would provide a noise reduction of up to 7 dBA from future worst-hour noise levels, and as such, it would be difficult for SW-508 to meet the acoustical design goal of providing a 7 dBA noise reduction to at least one receptor, as is required by the Caltrans Traffic Noise Analysis Protocol. In addition, if SW-508 were constructed on a different alignment in order to avoid the sight distance issue as suggested in this comment, it would not be deemed cost-reasonable. As it was proposed, SW-508 was positioned on the edge of shoulder along eastbound Imperial Highway transitioning to the southbound I-710 on-ramp,and would cost approximately $540,000 to construct. The maximum allowable cost at that location is $560,000. Any additional widening under the build alternatives at this location to shift the alignment would exceed the maximum allowable cost, thereby deeming the wall not cost-reasonable.

L-20-25

In response to this comment, these areas were reexamined. It was determined that Marco Antonio Firebaugh High School does have exterior areas of frequent human use: a student gathering area in between the two-story classroom buildings, and the playground area along Wright Rd. Both of these areas were modeled using TNM to determine if noise impacts would

occur under the build alternatives. Under Alternative 7, the modeling results determined that the predicted worst-hour noise levels would be 59 dBA at the student gathering area, and 63 dBA at the playground area. It should be noted that each of these areas are below the 67 dBA threshold for considering noise abatement. Additionally, the predicted interior classroom noise level of 47 dBA under Alternative 7 would be below the threshold of 52 dBA. Therefore, no noise impacts would occur at this high school under either of the proposed build alternatives, and no noise abatement is considered. No similar area was identified at Vista High School.

L-20-26

A preliminary construction staging analysis for the build alternatives was provided in the Construction Staging Concepts Report, which was prepared as one of the supporting technical documents for the *Draft Project Report* (2017). The construction staging analysis preliminarily identifies the sequence of construction activities and ramp closures that would be necessary for the construction of the build alternatives. However, as stated in Response to Comment L-20-2, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there will be no effects of short and long-term ramp closures during construction

L-20-27

Please refer to Response to Comment L-20-26 regarding construction staging of the build alternatives.

AL AUSTIN II
COUNCILMEMBER, EIGHTH DISTRICT
CITY OF LONG BEACH
CITY HALL: (562) 570-6685
DISTRICT OFFICE: 570-1326

October 23, 2017

Ronald Kosinski
Caltrans District 7, Division of Environmental Planning
100 South Main Street, MS 16A
Los Angeles, CA 90012

Dear Mr. Kosinski:

The I-710 Corridor Project has been studied and discussed for the better part of two decades. Meanwhile, conditions on the I-710 are not getting any better, and the impacts on the adjacent neighborhoods continue.

The Ports of Long Beach and Los Angeles have taken significant steps to reduce harmful air emissions from the port complex. However, without improvements to the I-710 Freeway to address the serious congestion and safety issues, a major source of diesel particulate matter and other air toxins will continue unabated.

In addition, as a City Councilmember whose district is adjacent to the I-710, and as Immediate Past President of the Gateway Cities Council of Governments, I have seen the firsthand the critical role that the I-710 plays in the region's economy and our quality of life.

Easing the congestion and improving the safety on the I-710 is vital to the goods movement industry, as well as the economic vitality of Long Beach, serving as the gateway to major entertainment, tourism and jobs hubs for the region. The I-710 Corridor Project will also improve access to Uptown Long Beach neighborhoods and business corridors.

I appreciate the revisions that have been made to the project and to the project alternatives since the DEIR/DEIS was initially circulated in 2012. More has been done to address community health and benefits, and to utilize improving technology in near-zero and zero emissions. However, the City of Long Beach still has numerous technical comments and concerns submitted separately, including some that were initially raised in 2012, that I hope Caltrans will address in the Final EIR. L-21-1

It is important for this project to move forward in a timely fashion, especially given the funding sources that will be available for the project during the upcoming years. Therefore, I would like to state that I support Alternative 5C as the most responsible and prudent path to move forward for the I-710 Corridor. L-21-2

The I-710 Corridor Project Team has worked closely with the City of Long Beach throughout this process to reduce impacts (such as property acquisitions) and maximize benefits including safety, congestion relief, improvements to local streets and arterials, and providing better connections for bicycles and pedestrians.

City Hall: 333 West Ocean Boulevard, 14th Floor, Long Beach, CA 90802
District Office: 4321 Atlantic Avenue, Long Beach, CA 90807
district8@longbeach.gov

Among the reasons that Alternative 5C should be the preferred alternative:

- Alternative 5C will give the City of Long Beach an opportunity to improve traffic safety for residents and visitors to and from downtown Long Beach by providing resources to improve Shoemaker Bridge.

- Alternative 5C also requires the **least** amount of residential and property acquisitions in Long Beach, especially near the I-710/SR-91 interchange.

- There are other planning projects currently underway that will best be served by Alterntiave 5C. One such effort is the Lower LA River Revitalization Plan (LLARRP), for which I serve on the Working Group. One of the goals for the LLARRP is to improve access to the River, and increasing connections with neighborhoods to the west of the River and the 710 freeway. Two new pedestrian and bicycle bridges are planned as part of the 5C design at Spring Street and Hill Street. These will serve as important connections for communities that have been divided by the I-710 and the LA River, but they would not be feasible under Alternative 7. L-21-3

- Having the elevated truck lanes envisioned in Alternative 7, will have significant impacts on adjacent neighborhoods, including an additional visual impact.

- While the cost of the project will be a hurdle for completion in either case, the initial projected cost for Alternative 7 ($10 billion) is almost double the cost for Alternative 5C ($6 billion). If we are ever going to see the environmental, congestion and safety conditions on the 710 Freeway improve, we need to move this project forward and utilize funding that will be available to us in the near future.

Both alternatives will feature a community health and benefit program, an emphasis on zero and near-zero technology for trucks, active transportation improvements, public transit improvements consideration of public private partnerships. The Early Action Projects identified will also have more immediate impacts on the safety and quality of the 710 Corridor, thus making it more essential that the project move forward in a timely manner.

Thank you for the opportunity to comment on the RDEIR/SDEIS for the I-710 Corridor Project.

Sincerely,

Al Austin II
Councilmember, Eighth District
City of Long Beach

L-21-1

Caltrans and Metro thank the Councilmember for his appreciation regarding the revisions to the build alternatives since the circulation of the 2012 Draft EIR/EIS. The City of Long Beach provided comments on the RDEIR/SDEIS. Caltrans has addressed their comments and made revisions to the Final EIR/EIS where applicable. The comments on the RDEIR/SDEIS from the City of Long Beach and the responses can be found in this appendix as L-12 (City of Long Beach, Department of Parks, Recreation, and Marine) and L-27 (City of Long Beach, Department of Public Works).

L-21-2

The Councilmember's support for Alternative 5C as the most responsible and prudent path forward for the project is acknowledged and included in the project record. However, Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), has identified Alternative 1 (No Build) as the Preferred Alternative. Please refer to Section 1.1 of this appendix for further discussion on the identification of the Preferred Alternative.

L-21-3

The Councilmember's support for Alternative 5C and opposition to Alternative 7 is acknowledged and included in the project record.

CITY OF BELL

October 23, 2017

Mr. Ronald Kosinski RK
Caltrans District 7,
Division of Environmental Planning
100 South Main Street, MS 164
Los Angeles, CA 90012
Email: 710eir@metro.net
Esubmission: http://www.mbimedia.com/uploads/docs/surveys/LSA/I-710/

Subject: City of Bell Comments on the I-710 Corridor Project Recirculated Draft Environmental Impact Report/Environmental Impact Statement (RDEIR/RDEIS) and Section 4f Evaluation

Dear Mr. Kosinski:

The City of Bell would like to thank the State of California Department of Transportation (Caltrans) and Los Angeles County Metropolitan Transportation Authority (Metro) for the opportunity to review the Recirculated Draft Environmental Impact Report/Draft Environmental Impact Statement (RDEIR/RDEIS) for the I-710 Corridor Project. The City of Bell appreciates that Metro has taken the time to revise the project and prepare the RDEIR/RDEIS, based on comments received on the 2012 DEIR/DEIS for the Project.

In the City's September 27, 2012 comment letter on the original Draft Environmental Impact Statement/ Draft Environmental Impact Report (DEIS/DEIR) for the I-710 Corridor Project (Project), the City detailed the City's financial concerns and the fact that the City is a significantly disadvantaged community at risk for urban decay and underserved by community facilities. Those prior comments are incorporated herein by reference.[1] In that comment letter the City detailed the City's financial concerns and the fact that it was vitally important to the City's financial health that Project not place I-710 components on the City's prime developable properties.

[1] Appendix S, Letter L-17 of the RDEIR/RDEIS.

This comment letter discusses the degree to which the City's 2012 comments and concerns on the DEIS/DEIR have been addressed in the RDEIR/RDEIS. In addition, this comment letter discusses any new concerns raised by new Alternatives 5C and 7, and their variants, as analyzed in the RDEIR/RDEIS.

BACKGROUND

The City of Bell has a total land area of 2.81 square miles. The City of Bell consists of two district geographic areas that are connected by the Los Angeles River and the Long Beach Freeway (I-710): the *Central City* and the *Cheli Industrial Area*. The southerly portion of the City is commonly referred to as the *Central City,* which includes the residential neighborhoods and the local commercial districts. The Central City area is generally bounded by Randolph Street on the north and Florence Avenue on the south. Commercial development is concentrated along the City's major thoroughfares that include Florence Avenue, Gage Avenue, and Atlantic Avenue. The dominant commercial district and the source of recent development activity extend along the Atlantic Avenue corridor. The City's traditional downtown or *central business district* extends along Gage Avenue between Atlantic Avenue and Otis Avenue. Mixed commercial and residential uses are found along Florence Avenue in the southernmost portion of the City. A small industrial area is located along Salt Lake Avenue, at the western edge of the Central City. The second, northern portion of the City is located to the north of the Central City area and east of the Los Angeles River and the Long Beach Freeway. This area is largely industrial in character and is referred to as the Cheli Industrial area. The Federal government owns a large portion of the Cheli Industrial area. Land devoted to industrial uses account for approximately 390 acres or 21.7 percent of the City's total land area. These parcels have a combined area of approximately 151 acres and include properties located adjacent to the I-710 freeway and north and south of Bandini Boulevard. The properties south of Bandini Boulevard and along the I-710 Freeway were first developed during the Second World War as the Los Angeles Air Base. This area includes a National Guard facility, a Federally owned GSA land holding, and the Bell Salvation Army Shelter, which is the largest such facility west of the Mississippi River. Much of the Cheli Industrial area has undergone redevelopment in recent years with new business parks.

ISSUES OF CONCERN 2012 COMMENT LETTER

Economic Impact Analysis

In the City's prior comment letter (L-17-2), the City expressed concern regarding the loss of potential City income in the event that the project required full or partial acquisition of the following City-owned parcels on Rickenbacker Road:

- 6332-002-945,

- 6332-002-948,
- 6332-002-949,
- 6332-002-961,
- 6332-002-903, and
- 6332-002-965.

Based on the list of parcel acquisitions included as Appendix L – Parcel Acquisitions Under Alternative 5C and 7, to the RDEIR/RDEIS, it appears that neither Alternative 5C nor 7 would result in the full or partial taking of these parcels, or adjacent parcel 6332-002-962. Please confirm that these parcels would not be impacted by the Project. (Response to Comment L-17-2 only refers the reader to Section 3.3.2.3 of the RDEIR/RDEIS, but does not indicate how the City's concern over these parcels was addressed in the redesign. As a general rule it would be helpful if future responses to comments included a brief summary of how issues were resolved, rather than merely pointing the reader to large sections of the document to go looking for how a comment has been addressed.) L-22-1

If these parcels would no longer be impacted under Alternatives 5C and 7, then the City would like to thank Metro and Caltrans for addressing a major concern of the City with Alternatives 5C and 7.

Tax Revenue Loss Calculation (RDEIR/RDEIS)

Sales Tax - The RDEIR/RDEIS and Community Impact Assessment estimate that the City of Bell would experience a loss of $83,281 under Alternative 5C and $86,352 under Alternative 7. This was calculated by first calculating the average sales tax paid per businesses in the City and then applying this average figure to the number of businesses that would be relocated and potentially lost.

Does the sales tax analysis consider the short-term sales tax losses that will be experienced by traffic dependent businesses due to disruptions in traffic during Project construction, as requested in the City's 2012 comment L-17-17? As noted in Chart 4 of the City's 2012 comment letter, the loss of sales tax revenue during construction could be substantial. The RDEIR/RDEIS should address impacts revenue impacts during both construction and operation of the Project. L-22-2

Property Tax - The RDEIR/RDEIS and Community Impact Assessment estimate that the City of Bell will experience a loss of $16,835 in property taxes under Alternative 5C and $25,642 under Alternative 7 (see RDEIR/RDEIS p 3.3-71). However, the document fails to disclose how these figures were calculated. L-22-3

Please detail how this was calculated. Was this based on Bell's tax rate of 1.558% of which Bell receives 0.340413%?[2] L-22-3

It appears the RDEIR/RDEIS substantially underestimates the City's property tax loss. By way of illustration, the estimated property tax loss in the RDEIR/RDEIS is less than the calculation included in **Attachment 1** to this comment letter, which is based on the list of property acquisitions in Appendix L of the RDEIR/RDEIS. **Attachment 1** shows that the property tax loss to the City of Bell from Alternative 5C would be $146,572.84 per year from the full parcel acquisitions[3], based on the Los Angeles County Assessor's 2017 (current) Roll,[4] given the City of Bell's property tax recovery rate of 0.340413%. This amounts to a loss of approximately 1% of the City's annual property tax revenues, exclusive of any loss from partial acquisitions.[5] Please update the FEIR to provide more accurate information on the property tax impact of the proposed Project on the City of Bell for both Alternatives 5C and 7. L-22-4

In crosschecking the list of acquisitions in Appendix L against the list on pages 5.2-7 to 5.2-9 of the Community Impact Assessment technical report, there are differences in the two lists. For example, the Community Impact Assessment list shows 58 full or partial acquisitions for Alternative 5C; the Appendix L list shows 74 full and partial acquisitions. (See **Attachment 2**). Which of the two acquisition lists in the RDEIR/RDEIS is correct? Please provide an accurate list of the potential acquisitions in the City of Bell and a corresponding calculation of the property tax impacts for the two alternatives. Please revise the RDEIR/RDEIS as need to reflect the correct information. L-22-5

The RDEIR/RDEIS fails to provide any mitigation for this loss of tax revenue by the City. Decreases in the City's budget have the potential to result in physical changes to the environment over time. As a result, the Project should include mitigation for any loss of more than 1% of the property tax revenues for cities with a high environmental justice (low income minority) population. L-22-6

Need for More Detail

As noted by the City in 2012:

---

[2] http://www.cityofbell.org/?NavID=292 The City of Bell rate of .340413% reflects payment for two levy bonds, the 2007 Measure A General Obligation Bond at a rate of .152859%, and the 2005 Bell Public Finance Authority Taxable Pension Revenue Bond at a rate of .187554.

[3] A number of the full parcel acquisitions involve Building 7 of the Cheli Industrial Park. A diagram of this building is provided in **Attachment 2**.

[4] The list of parcels in **Attachment 1** is RDEIR/RDEIS Appendix L. The land, improvement and total assessed values in Attachment 1 are from parcel searches conducted at: https://portal.assessor.lacounty.gov

[5] Based on the City's 2017/18 adopted budget which shows $14,372,320 in property tax revenues.

> Public participation is integral to CEQA analysis. Courts continually emphasize the importance of public participation to the EIR: "Environmental review derives its vitality from public participation." See, e.g., Ocean View Estates Homeowners Assn., Inc. v. Montecito Water Dist., 116 Cal. App.4th 396,400 (2004); "Comments are an integral part of the final] EIR." Sutter Sensible Planning, Inc. v. Board of Supervisors, 122 Cal. App. 3d 813, 820 (1981). Public review allows citizens affected by a project's ecological implications to assist in determining the project's direction. Schoen v. Department of Forestry & Fire Protection, 58 Cal. App. 4th 566, 573-574 (1997); Save Our Peninsula Committee v. Monterey County Bd. Of Supervisors, 87 Cal. App. 4th 99,133 (2001).
>
> An EIR/EIS is an informational document and "must include detail sufficient to enable those who did not participate in its preparation to understand and to consider meaningfully the issues raised by the proposed project." Laurel Heights Improvement Assn. v. Regents of University of California, 47 Cal. 3d 376, 404- 405 (1988), Cal. Pub. Res. C.2106l. An agency's bare conclusions or opinions are continually found to be insufficient. See generally Concerned Citizens of Costa Mesa, Inc. v. 32nd Dist. Agricultural Assn., 42 Cal3d 929, 935 (1986); People v. County of Kern, 39 Cal. App. 3d 830, 841-842; Citizens for Quality Growth v. City of Mount Shasta, 198 Cal. App. 3d 433,441.

The RDEIR/RDEIS for the Project is not user-friendly because it is difficult for the reader to find community-specific information in the document to allow an understanding of how the Project will affect specific cities and populations, thus inhibiting public participation in the environmental process. The RDEIR/RDEIS is 1,817 pages in length.[6] In addition, there are 21 Appendices to the document and 28 technical studies that are listed on the Department of Transportation's website.[7] The Study Area includes the portion of the I-710 Corridor from Ocean Boulevard in Long Beach to SR-60, a distance of approximately 19 miles and includes all or portions of the Ports, the Cities of Bell, Bell Gardens, Carson, Commerce, Compton, Cudahy, Downey, Huntington Park, Lakewood, Long Beach, Lynwood, Maywood, Paramount, Signal Hill, South Gate, and Vernon, as well as unincorporated areas of Los Angeles County, including the communities of East Los Angeles, Boyle Heights, Wilmington, and San Pedro. L-22-7

---

[6] (PDF length inclusive of cover, etc) http://www.dot.ca.gov/d7/env-docs/docs/RDEIR_SDEIS%20July%202017.pdf

[7] http://www.dot.ca.gov/d7/env-docs/docs/710corr-eir/

While the complexities of preparing an environmental document for a project of this magnitude are understandable, the RDEIR/RDEIS lacks the kind of clear summary typically included in CEQA documents, and the CEQA summary table included in the document is so summary as to be meaningless when it comes to understanding the specific impacts of the Project. While the Community Impact Assessment, which is one of the technical studies for the document, does provide some city-specific information, it does not address all of the CEQA issue areas. As written, the RDEIR/RDEIS makes it difficult for local jurisdictions to get a clear picture of how their individual cities would be impacted by the project, and the reader must go to Appendix F – Environmental Commitments Record, which contains the equivalent of a Mitigation Monitoring Plan to see the complete list of mitigation measures for the project in one place. It is unlikely that the public will be able to navigate the document to find this information of concern. L-22-8

As noted on page 7 of the RDEIR/RDEIS: "some of the project's pragmatic elements would not be implemented by Caltrans as the Lead Agency under CEQA and NEPA, but would instead by implemented by Metro or other public agencies with jurisdiction over a particular element." As stated on page 5.2-1 of the Community Impact Assessment: " . . adoption of one of the I-710 Corridor Project build alternative would require the City of Bell to amend its General Plan Land Use and Circulation Elements to reflect modifications to arterials, interchange modifications, and elimination of any land uses that may need to be acquired for the I-710 Corridor Project . . " Mitigation Measure LU-1 in fact requests that local jurisdictions update their General Plans accordingly. Since a number of the local jurisdictions along the alignment will need to take discretionary actions to implement portions of the project, it is important that the document be written in a way that facilitates it use by other jurisdictions for purposes of CEQA. L-22-9

As currently written it is difficult for cities to easily find a summary of the impacts that affect their communities, the applicable mitigation measures, and the level of significance after mitigation specific to their communities. In the Final EIR/EIS, please provide city-specific CEQA-style summary tables to facilitate a clear understanding of the impacts, and associated mitigations for each city along the alignment, and the processing of any Project required discretionary approvals by local cities along the alignment. L-22-10

In the City's 2012 comment letter (L-17-3), the City requested information on the construction impacts of all build alternatives on the City. Construction impacts should be included in the requested summary table. L-22-11

Florence Avenue

In the City's 2012 comment letter (L-17-3 and L-17-4), the City requested information on the land acquisitions at the intersection of Florence Avenue and Atlantic Avenue, including detail and with justifications on the exact lane configurations. The response to this comment directs the reader to Appendix O for geometric detail at this location, and Appendix L for a list of acquisitions resulting from the build alternatives, but fails to actually provide the requested information in a manner that puts the two piece of information together (parcel acquisitions and geometrics) and explains the justifications. It appears from the RDEIR/RDEIS that the Florence Avenue/Atlantic Avenue intersection is not affected by the proposed Project. Are any improvements planned at this intersection under Alternative 5C and 7? If so, please provide the requested information. L-22-12

Northern Terminus Alignment

Land Acquisition

The City of Bell appreciates efforts to reduce Project impacts to industrial land within the City. However, According to the Community Impact Assessment and RDEIR/RDEIS, Alternative 5C would still impact 47.21 acres within the City including 20.53 acres of industrial land and Alternative 7 would impact 66.49-66.60 acres including 37.72-37.83 acres of industrial land. Does this calculation include the effect of partial acquisitions? If not, the total impact on the City may be understated. L-22-13

As noted in the City's prior comment letter, any option selected should be thoroughly investigated to reduce the total land acquisition in the City of Bell industrial area, with consideration given to keeping large, economically viable pieces of land for future development. It is important that any remaining parcels have good traffic access point. Given the level of detail provided in the RDEIR/RDEIS, it is impossible to tell the impact of partial acquisitions on the City's Industrial Area, as no tentative limits for those acquisitions have been provided. Please provide information on the limits of the partial parcel acquisitions. L-22-14

Sleepy Lagoon Monument Area

The City of Bell is in the process of planning for a monument[8] to mark the site of Sleepy Lagoon. As explained on the City's flyer for the Sleepy Lagoon

[8] For more information on the City's efforts and Sleepy Lagoon, please listen to July 27, 2017 interview on KUCR Radio (88.3 FM) on the Sleepy Lagoon Monument Project available at: http://www.cityofbell.org/Home/Components/News/News/471/50

project (see **Attachment 4**)[9], in 1940 there was an area in East Los Angeles (now City of Bell) that contained a water reservoir nicknamed "Sleepy Lagoon." It was named "Sleepy Lagoon" after a popular song by the same name made famous by Glenn Miller and also Harry James' Orchestras. "It was in this location on August 2, 1942 that a young man named Jose Gallardo Diaz was allegedly murdered." "In response to the alleged murder, the media began a campaign calling for action against "zoot suiters" which led police on August 10 to conduct a roundup of 600 Latinos who were charged with suspicion of assault, armed robbery, and related offenses; 175 were eventually held for various crimes." "Despite one medical examiner stating that the injuries were consistent with being hit by a car, 20-year-old Henry Leyvas and 24 members of what the media termed "the 38th Street gang" were arrested for allegedly murdering Díaz." The case is considered a precursor to the Zoot Suit Riots of 1943. "In October 1944, the state Court of Appeals unanimously decided the evidence was not sufficient to sustain a guilty verdict." "It reversed the 12 defendants' convictions, in the case of People v Zammora 66 Cal.App.2d 166." "The appeals court also criticized the trial judge for his bias and mishandling of the case." "The 1979 play *Zoot Suit* and the 1981 movie *Zoot Suit* are loosely based on events surrounding the murder trial. In James Ellroy's novel *The Big Nowhere*, the Sleepy Lagoon murder plays a major role in the story."[10]

It appears from the maps in Appendix L (Sheet 32 of 35 and 30 of 36), that the Sleepy Lagoon area may be impacted by partial acquisitions under Alternatives 5C and 7. Please address any impacts to this potential historic site, and the City's Sleepy Lagoon Monument Project. Please work with the City to define the limits of the acquisitions so as to avoid this site. L-22-15

Disposition of Remnant Land

In the City's 2012 comments (L-17-4, L-17-7) the City requested that as part of mitigation for impacts, any remnant land should be offered to the City as partial compensation for the Project's negative economic (and community cohesion) impacts. In response the RDEIR/RDEIS indicates, "land not used for any highway purposes may be retained within the State right-of-way for possible future use or may be designated excess property and sold to other parties. If Caltrans determines that there are remnant parcels in the City of Bell that are not needed by Caltrans for State highway improvements, the City would have the opportunity to negotiate with Caltrans to transfer that property to the City of for the City to purchase those parcels." The opportunity to purchase is not mitigation. The EIS/EIR needs to include a mitigation measure specifying that L-22-16

[9] http://www.cityofbell.org/home/showdocument?id=9489

[10] https://en.wikipedia.org/wiki/Sleepy_Lagoon_murder

any remnant parcels designated excess property shall be offered, free of charge, to the City in which they are located. This will help to partially mitigate the economic and community cohesion impacts of the project. L-22-16

Impact to Bell Homeless Shelter

While the updated project design requires a smaller footprint in this area, the Project will still impact the Bell Homeless Shelter. As explained on page 151-152 of the City's Draft General Plan:

> The Salvation Army Bell Shelter opened in January 1988. The shelter is located in a converted 40,000 square-foot hangar formerly used as a U.S. Army Air Corp depot. The facility, the only one of its kind in the State, is designed to fulfill the objectives of the 1987 Stewart B. McKinney Homeless Assistance Act, which encouraged the use of vacant Federal facilities as homeless shelters. The Shelter, now the largest homeless shelter west of the Mississippi, operates a comprehensive program that offers transitional care for up to 350 homeless men and women. Services provided at the shelter include emergency housing, transitional housing, substance abuse rehabilitation, case management, counseling, on-site health care and medical referrals, HIV/AIDS education, ESL classes, computer training, vocational assistance, job referrals, and life skills classes. The Salvation Army Bell Shelter, in collaboration with the Los Angeles County Department of Mental Health and ENKI Health and Research Systems, Inc., developed a program to provide on-site assessment and treatment for homeless clients who are mentally ill or dual diagnosed with mental illness and substance abuse. Key elements of this program include the following:
>
> - Case Management in which all client's visit a case manager on a weekly basis;
> - Supportive and transitional housing services to assist with a client's reintegration into society;
> - Individual and group counseling including psychological services provided through a collaboration with ENKI mental health services;
> - The operation of a licensed, 128-bed, drug and alcohol program where clients receive treatment in a recovery center;
> - The operation of a *Back on Track* program where clients are able to address the emotional and psychological barriers that often prevent them from escaping homelessness;
> - Working with the legal system where alternate sentencing for non-violent offenders may be considered;

- Job search assistance to help homeless clients secure meaningful employment;
- The *Homeless Veterans Reintegration Program* provides employment assistance for homeless veterans;
- On-site adult education classes, offered through the Los Angeles Unified School District, to lead to a General Education Diploma (GED), computer competency, HIV/AIDS awareness, and/or a security guard certificate; and,
- Mobile medial services are provided to all clients at the Bell Shelter, three or four times per week.

The Bell Shelter is thus a unique and important community service. According to page 3.3-144 of the RDEIR/RDEIS:

> Under Alternative 5C, the Bell Shelter facility would be avoided, but the Mark Taper Foundation Shelter Resource Bank (a nearby facility at the same street address that is owned by the Shelter Partnership and whose operations are interrelated with those of the Bell Shelter) would be partially acquired. Alternative 7 would require a partial acquisition of the Bell Shelter, and a full acquisition and relocation of . . . the Resource Bank . . . In addition, the relocation or disruption of operations at the Resource Bank would also have indirect impacts to the operations of the Bell Shelter. The RIR recognizes that relocation of any of the above facilities would be difficult and does not identify specific locations for the relocation of these facilities.

To address the impact to the Bell Shelter, the RDEIR/RDEIS includes Mitigation Measure C-4 that provides:

> During final design, and consistent with the requirements of the Uniform Act, Caltrans shall negotiate with the City of Bell to determine appropriate action and/or identify an alternative location for the Bell Shelter/Resource Bank within the general vicinity of the existing facility so as to maintain the service area and its cooperative relationship with the Bell Shelter and mitigate for the acquisition of the center. The existing center shall not be demolished until the facility has been relocated and is operational.

The RDEIR/RDEIS needs to demonstrate that mitigation is feasible and the full range of services provided by the Bell Shelter will still be provided following L-22-17

implementation of Measure C-4 [11] As quoted above, the RDEIR/RDEIS acknowledges that the: "RIR recognizes that relocation of any of the above facilities would be difficult and does not identify specific locations for the relocation of these facilities." The conclusion on page 4-45 that: "Measures C-1 through C-4 are identified to address acquisition and relocation impacts of the build alternatives. With implementation of these measures, impacts would be less than significant" is not supported by substantial evidence. In the absence of a showing that Measure C-4 is feasible, the Project would result in a significant unmitigated public service impact and additional mitigation for at-risk populations would be required. L-22-17

Noise

Why are there no locations in the City of Bell included on Table 3.14-2 Traffic Noise Level Measurements and Modeling Results? Please identify any areas within City where noise mitigation was identified as necessary, but not provided due to feasibility. L-22-18

Overall

Effectiveness of Relocation Mitigations

The response to comment L-17-11 states: As stated in Section 3.3.2.3, it is the goal of the project to relocate any impacted businesses within their existing communities; therefore losses of productive businesses would not be an irreversible effect of the proposed project."

The RDEIR/RDEIS needs to address whether and to what degree relocations of businesses within their existing communities is feasible. Given the degree to which the City of Bell is already built out and the acreage of land to be lost as a result of the Project, how many of the 27 businesses (170 employees) under Alternative 5C or 28 businesses (175 employees) under Alternative 7 that would be relocated would likely be relocated within the City? Relocations outside the City would be an irreversible effect of the proposed Project and should be identified as such. L-22-19

How will the Mitigation Measure C-1 insure that Bell businesses that are dislocated by the Project will be relocated within the City? As written, the mitigation does not include specific actions for ensuring local relocation. The L-22-20

[11] It should be noted that the 5600 Rickenbacker Road parcels (6332-002-035 and parcel 6332-002-036 which is now 6332-002-090 and 6332-002-091) have a 2017 assessed value of $7,396,030, $35,845,364 and 2,082,667 respectively. The market and social service value is clearly much higher. This further illustrates the potential difficulty of relocation.

mitigation should include specific actions that are likely to increase the likelihood of relocation within the City. How will the result of efforts to encourage local relocation be both quantifiable and verifiable? L-22-20

Parking Restrictions

As noted in City comment L-17-15:

> Parking restrictions are also proposed on Atlantic Boulevard during peak periods (6 A.M. to 9 A.M., 4 P.M., and 7 P.M.) to increase traffic capacity by one lane in each direction. . . It should be noted that imposing parking restrictions on Atlantic Boulevard during peak hours could have a significant impact on traffic-dependent businesses with a lack of off-street parking available to accommodate patrons.

The updated analysis of effects of peak-hour parking restrictions on Atlantic Boulevard is located on page 3.5-90 to 3.5.91 of RDEIR/RDEIS. According to the Community Impact Assessment (page 5.2-20) approximately 110 currently available parking spaces would be eliminated along northbound and southbound Atlantic Boulevard in the City of Bell. Page 3.5-90 of the RDEIR/RDEIS states that "Although some drivers may alter their behaviors and schedules to avoid the time-of-day parking restrictions, much of the parking demand is expected to be absorbed in off-street parking areas for uses that generate the parking demand and in nearby available on-street parking areas."

The DEIS/DEIR should provide a detailed analysis of whether there is sufficient on and off-street parking in the City of Bell in the vicinity of the Atlantic Boulevard businesses to accommodate the lost parking and identify any long-term financial impacts to businesses as well as to the City as a result of parking restrictions imposed on Atlantic Boulevard. These businesses primarily serve minorities and may be owned by minorities. To the degree that loss of parking impacts the economic viability of businesses along Atlantic Boulevard, indirect environmental impacts could occur. To the degree that impacts to businesses affect minority and low-income populations, environmental justice impacts would occur. Where the economic or social changes of a project have secondary environmental consequences, an agency must consider those consequences. (Citizens Assn. for Sensible Development of Bishop Area v. County of Inyo, (1985) I72 Cal.App.3d 151. Where there are secondary or indirect environmental consequences from a project's social or economic impacts, those impacts must be considered. Indirect environmental consequences are not necessarily insignificant solely because they are derived from economic or social changes. (Id. at 170). L-22-21

2017 RDEIR/RDEIS

Environmental Justice

According to page 3.3-144 of the RDEIR/RDEIS:

> Two social-service locations would be adversely affected by one or both of the project alternatives: the Bell Shelter, the S. Mark Taper Foundation Shelter Resource Bank, and the Long Beach Multi-Service Center. Under Alternative 5C, the Bell Shelter facility would be avoided, but the Mark Taper Foundation Shelter Resource Bank (a nearby facility at the same street address that is owned by the Shelter Partnership and whose operations are interrelated with those of the Bell Shelter) would be partially acquired. Alternative 7 would require a partial acquisition of the Bell Shelter, and a full acquisition and relocation of both the Resource Bank and the Long Beach Multi-Service Center. In addition, the relocation or disruption of operations at the Resource Bank would also have indirect impacts to the operations of the Bell Shelter. The RIR recognizes that relocation of any of the above facilities would be difficult and does not identify specific locations for the relocation of these facilities. The Bell Shelter and Resource Center are located in a census tract that exceeds the Los Angeles County average percentage for both minority and low-income, and while the Long Beach Multi-Service Center is not, both facilities serve minority and low-income residents, as well as other vulnerable and disadvantaged populations. Although these impacts would be predominantly borne by environmental justice populations, with application of standard mitigation via the Uniform Act, these impacts would not represent a disproportionate adverse impact to environmental justice communities.

As previously discussed, the RDEIR/RDEIS has not shown that mitigation Measure C-4 is feasible. The RDEIR/RDEIS has failed to provide substantial evidence that the impacts to environmental justice communities in general, and environmental justice communities within the City of Bell are mitigated to a less than significant. The potential for significant unmitigated impacts remains. L-22-22

Mitigation Measure C-7 is intended to address impacts to environmental justice populations:

> **C-7** To address disproportionate impacts to environmental justice populations with regards to air quality, traffic, visual impacts, and land use/parks and recreation, funding will be provided to local

> jurisdictions for targeted improvements that would improve air quality and public health, reduce traffic congestion, provide aesthetic/visual enhancements, and improve parks and recreation. These improvements must be made within the United States Census Bureau census tracts adjacent to the I-710 freeway that have been identified as having a high percentage of minority and/or low income populations compared to the County of Los Angeles. These targeted improvements may include, but are not limited to, air filtration systems installation or upgrade, urban art installations and community events, landscaping, traffic calming measures, pedestrian/bicycle enhancement measures, and development of pocket parks or other park space. Funding for these targeted improvements will be made in the amount of up to 1 percent of the capital construction cost for either of the build alternatives. This funding will be provided through a funding agreement between the Los Angeles County Metropolitan Transportation Authority (Metro), Caltrans, and the affected local jurisdiction upon the commencement of construction within the limits of that local jurisdiction (in the event of staged construction).

The mitigation should include a mechanism for ensuring that funding is appropriately allocated between environmental justice communities. L-22-23

Community Cohesion Impact

According to the Community Impact Analysis the proposed Project would:[12]

- **Central City** – "While the I-710 Corridor Project build alternatives ***would not directly impact the majority*** of this planning area, improvements would be made to the I-710/Florence Ave. local interchange."

- **Cheli Industrial Area** – "The I-710 Corridor Project build alternatives would modify circulation within parts of this planning area (i.e. modifications to railroad line connections and the new, realigned configuration of the Atlantic Blvd./Bandini Blvd./710 interchange). In addition, Alternatives 5C and 7 require several property acquisitions, including several industrial uses, and non-profit organizations in this planning area."

Please provide specific information on the acreage of each of these areas impacted, including the specific industrial uses and non-profit organizations impacted and the nature and magnitude of the impact. What is meant by "not L-22-24

[12] Community Impact Assessment page 5.2-2.

directly impact the majority" of the Central City planning area? How much of the planning area is actually impacted and in what way? L-22-24

According to page 11 of the RDEIR/RDEIS:

- Community Cohesion Impacts – "community cohesion impacts do occur at a localized level within the Cities of Long Beach, Bell, and Commerce due to relocations of existing cohesive communities or vital community facilities under Alternative 7. Mitigation for relocations within these communities is provided through implementation of Mitigation Measure C-1 described in Section 3.3.2.4. However, as a result of the relocations of residents . . . and businesses, and/or vital community facilities under Alternative 7, localized areas within the Cities of Long Beach, Bell, and Commerce would experience adverse impacts to community cohesion as a result of these relocations."

According to the Community Impact Assessment,[13] which is one of the many technical studies for the RDEIR/RDEIS, Alternative 5C will impact 47.21 acres within the City including:

- 20.53 acres of industrial land,
- 2.87 acres of commercial and services,
- 12 acres of transportation facilities and utilities,
- 11.60 acres of military installations
- and 0.02 acres of facilities and general office.
- Require 41 full and nine partial commercial/industrial parcel acquisitions,
- one partial residential parcel acquisition,
- one full and two partial railroad parcel acquisitions,
- one partial public parcel acquisition,
- one partial flood control parcel acquisition, and
- two partial utility parcel acquisitions.
- Option 1A would also require one partial public parcel acquisitions.
- 27 business relocations.
- An estimated 170 employees would be displaced.
- The Bell Shelter facility would be avoided, but the Mark Taper Foundation Shelter Resource Bank (a nearby facility at the same street address that is owned by the Shelter Partnership and whose operations are interrelated with those of the Bell Shelter) would be partially acquired.[14]

---

[13] Community Impact Assessment Interstate 710 Corridor Project Ocean Boulevard to State Route 60 07-LA-710-PM 5.4/24.5 EA 249900 WBS ID: 165.10.15 (Second Revised Final Report, July 2017), page 5.2-2 -5.2-19

[14] Page 3.3-144 of the RDEIS/DEIR

Alternative 7 will impact 66.49-66.60 acres including:

- 37.72-37.83 acres of industrial land,
- 2.91 acres of commercial and services,
- 13.69 acres of transportation facilities and utilities,
- 11.85 acres of military installations,
- and 0.02 acres of facilities and general office.
- Require 42 full and seven partial commercial/industrial parcel acquisitions,
- one partial residential parcel acquisition,
- two full and one partial railroad parcel acquisitions,
- two partial public parcel acquisition, and
- two partial utility parcel acquisitions.
- 28 business relocations.
- Displacement of an estimated 175 employees.
- Alternative 7 would require a partial acquisition of the Bell Shelter, and a full acquisition and relocation of the Mark Taper Foundation Shelter Resource Bank. In addition, the relocation or disruption of operations at the Resource Bank would also have indirect impacts to the operations of the Bell Shelter.

As noted on page 5.2-4 of the Community Impact Assessment, the City of Bell currently has a high degree of community cohesion. The Community Impact Assessment concludes on page 5.2-5 that Alternative 5C "would not create a barrier or disrupt connectivity of the community as a result of property acquisitions" but that the "City of Bell would experience adverse impacts to community character and cohesion as a result of relocations of businesses and vital community facilities under Alternative 7" (see page 5.2-6). Please provide a more detailed and clearer explanation for why 47.21 acres of effect doesn't result in community cohesion impact under Alternative 5C, when 66.49-66.60 acres under Alternative 7 does. The RDEIR/RDEIS should be corrected to identify both alternatives as resulting in community character and cohesion impacts and to provide clear City of Bell-specific mitigation for these impacts. L-22-25

Cost of Mitigation LU-1

Mitigation LU-1 states:

> Following approval of the Final Environmental Impact Report/Environmental Impact Statement (EIR/EIS) for the Interstate 710 (I-710) Corridor Project and filing of a Notice of Determination with the State Clearinghouse, the California Department of Transportation (Caltrans) shall request that the affected Cities and the County to amend their respective General Plans to reflect the

> final alignment, interchange locations, and modification of land use designations for properties that would be acquired for the project, during the next cycle of amendments to each local jurisdiction's General Plan Circulation and Land Use Elements. The timing of the preparation and processing of such General Plan amendments will be at the discretion of each local jurisdiction. Caltrans will also initiate amendments to existing freeway agreements with cities where the build alternatives would add or remove access to I-710 or Interstate 405 (I-405).

The City is currently in the process of updating the General Plan. The City of Bell General Plan was last updated in the mid-1990s. Updating a General Plan is a costly effort, and the Project should include provisions for assisting jurisdictions that have updated their General Plan within four years of project adoption, with the cost of updates necessitated by the proposed project. L-22-26

TRAFFIC

Several of the Tables in both the TIA and TOAR do not list intersections numbered in the 200s. Information on these intersections is provided in the associated Figures but nothing is found in the Tables. This error/omission needs to be addressed. L-22-27

CONSTRUCTION IMPACTS

The RDEIR/RDEIS need to include a more comprehensive analysis of the potential impacts to arterials during project construction and anticipated truck routes when I-710 freeway traffic is diverted to surface streets during construction. It is important that mitigation to fix arterials impacted by truck traffic during construction is sufficient to meet anticipated costs and that provisions are made for providing local jurisdictions with money to address roadway impacts. L-22-28

CEQA

Is there a summary in the document that compares the degree to which the alternatives meet the project objective identified on page 1-40? L-22-29

Table 2.5-1 should include any discretionary actions required by local jurisdictions as part of project or mitigation implementation. L-22-30

NEED TO ACCELLERATE THE PROJECT

The RDEIR/RDEIS should address the timing of the proposed project as it relates to the continued growth of port traffic. Given the growth in port traffic, the Project timeline should be accelerated. L-22-31

SUMMARY

In summary, the City of Bell is supportive of the Project goals and efforts to address regional needs that are represented by the 710 Project. We appreciate efforts to reduce impacts to the City of Bell, and will continue to work with Caltrans and Metro to further reduce impacts to the City, its residents, and environmental justice communities and to make the document more accessible to the public. L-22-32

Respectfully Submitted,

Howard W. Brown, Jr., ICMA-CM
City Manager

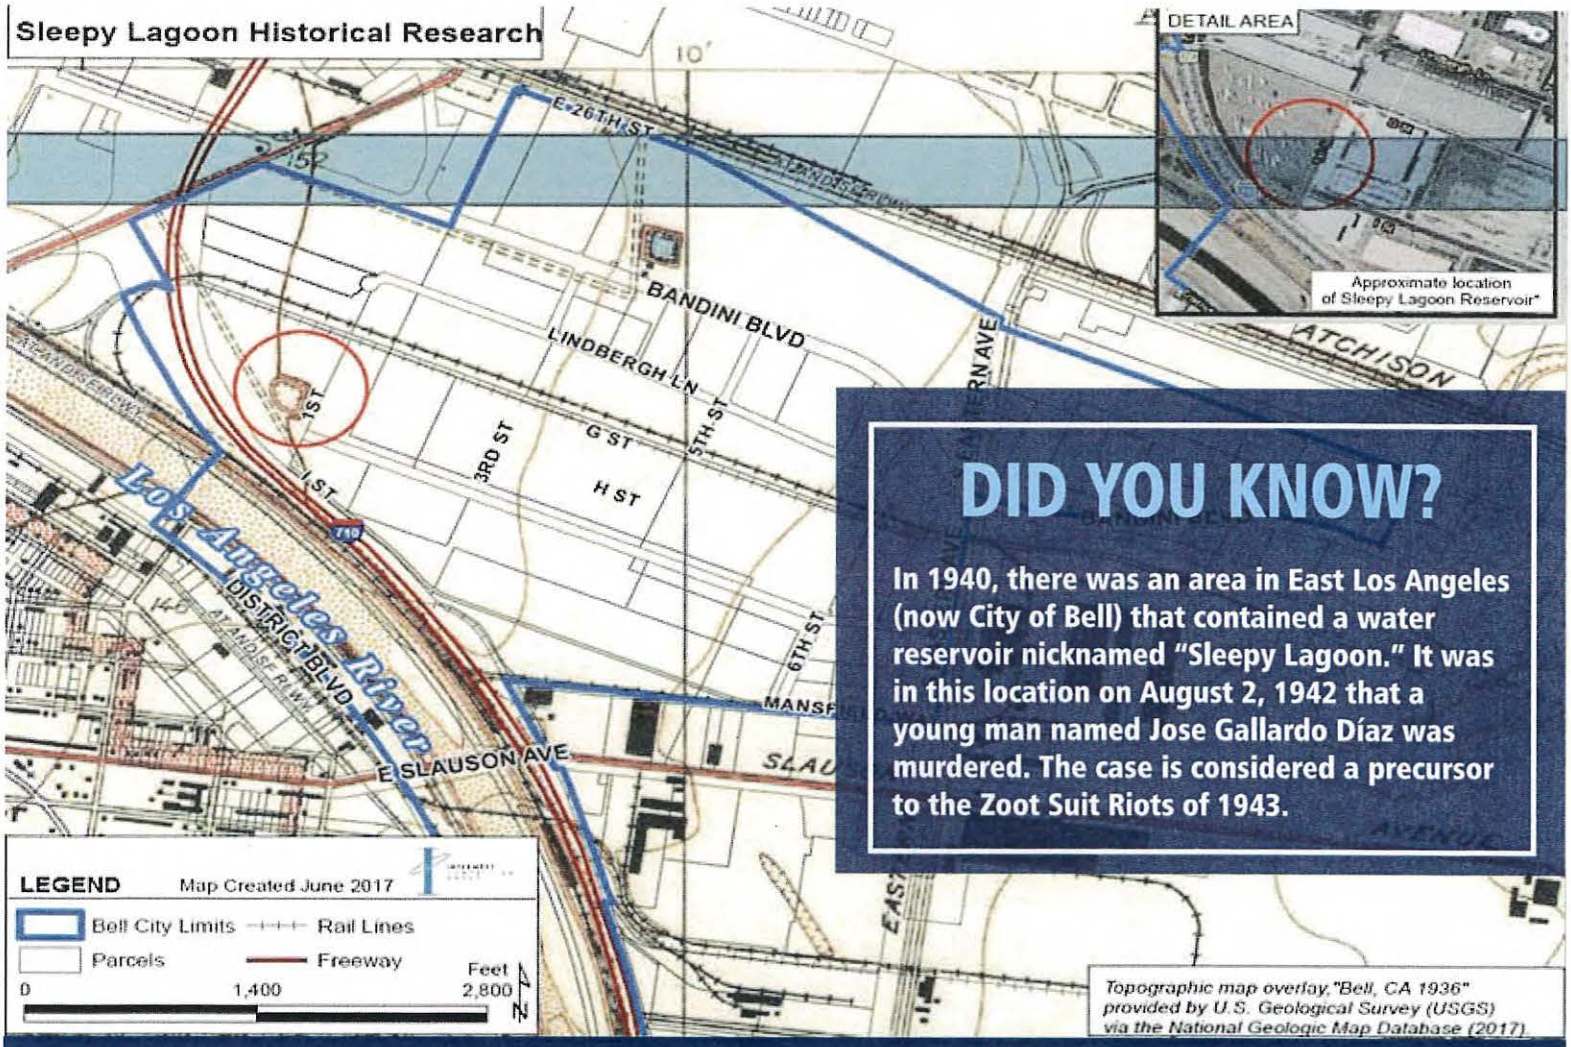
CITY OF BELL SLEEPY LAGOON MONUMENT PROJECT



CITY of BELL

SLEEPY LAGOON MONUMENT PROJECT

WE NEED YOUR INPUT!

The City of Bell wants to construct a monument commemorating the Sleepy Lagoon and is seeking public input on what the monument should look like.

Please join us at our next City Council Meeting at the Bell Community Center located at 6250 Pine Ave. on Wednesday, August 9, 2017 at 7:00pm to discuss the project

DID YOU KNOW?

In 1940, there was an area in East Los Angeles (now City of Bell) that contained a water reservoir nicknamed "Sleepy Lagoon." It was in this location on August 2, 1942 that a young man named Jose Gallardo Díaz was murdered. The case is considered a precursor to the Zoot Suit Riots of 1943.

L-22-1

Caltrans and Metro thank the City for its comment. The City's request to verify that under Alternatives 5C and 7, no full or partial acquisitions would occur to City-owned parcels 6332-002-945, 948, 949, 961, 903, and 965 is acknowledged and included in the project record. The referenced parcels are not included in Appendix L, Parcel Acquisitions Under Alternatives 5C and 7, which verifies that they are not impacted under either of the build alternatives. The No Build Alternative has been identified as the Preferred Alternative.

L-22-2

It is difficult to quantify the short-term sales tax losses for individual businesses due to construction of the build alternatives because of a number of variables that must be considered such as whether the business is dependent upon traffic passing by for sales, how access to the business would be affected (if at all), and whether sales at some businesses would be increased by patronage from construction workers during the construction period. The RDEIR/RDEIS and this Final EIR/EIS does address permanent tax revenue impacts of the build alternatives (refer to Table 3.3-15 in Section 3.3). Should a build alternative be selected as the Preferred Alternative, the preparation of a TMP (Measure CON-TR-1) prior to the start of construction would help maintain the access and visibility of local businesses along roadways temporarily impacted by construction. However, Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), has identified Alternative 1 (No Build) as the Preferred Alternative. Therefore, there will not be short-term sales tax losses or access issues due to construction within the City of Bell. Please refer to Section 1.1 of this appendix for further discussion on the identification of the Preferred Alternative.

L-22-3

The property tax losses from the build alternatives were calculated based on each city's share of the 1 percent basic property tax levy based on the assessed values in Fiscal Year 2013-14 (Bell's share of the 1 percent levy in that year was 0.053662 percent). The property tax losses were then compared against each city's total annual property tax revenue, as reported in the annual Comprehensive Annual Financial Report (CAFR) or Financial Report for Fiscal Year 2013–2014. The property tax loss analysis did not consider potential losses related to bonds or other special assessments. This likely explains the substantial disparity between the property tax losses identified in the RDEIR/SDEIS and the City of Bell's estimates. For consistency of comparison between cities within the I-710 Corridor, the property tax loss calculations have not been revised at this time.

L-22-4

Please refer to Response to Comment L-22-3 regarding property tax loss.

L-22-5

Appendix L, Parcel Acquisitions Under Alternatives 5C and 7, of the RDEIR/SDEIS provides a comprehensive list of acquisitions associated with the build alternatives. As stated in Response to Comment L-22-2, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there will be no residential or non-residential property displacements.

L-22-6

It is important to note that the analyses of tax losses associated with the build alternatives included in the RDEIR/SDEIS, whether they are property tax losses or sales tax losses, represent a conservative scenario that presumes all businesses or residences would not be able to be relocated within their existing jurisdiction. However, should a build alternative be selected as the Preferred Alternative, it is not likely that businesses and residents would be unable to relocate within their existing jurisdictions and/or neighborhoods. In addition, specific mitigation has been identified that would provide funding for targeted improvements for environmental justice communities (refer to Measure C-7 in Section 3.3.3.7 of this Final EIR/EIS for more detailed information). However, as stated in Response to Comment L-22-2, the No Build Alternative has been selected as the Preferred Alternative. Therefore, no displacements will be required, and no further mitigation is provided as requested in this comment.

L-22-7

As described later in the referenced paragraph, the Study Area includes the portion of I-710 Corridor from Ocean Boulevard in Long Beach to SR-60, a distance of approximately 19 miles. The Study Area traverses sixteen corridor cities and unincorporated areas of Los Angeles County, and is in proximity to two major port facilities. Caltrans acknowledges that the RDEIR/SDEIS contains a great deal of information and technical analysis in the document and supporting technical studies in order to meet the requirements for disclosure under CEQA and NEPA for a project of this size and magnitude. In many cases, and where it makes sense to do so in that the analysis can be segmented, impacts are presented by city (as one example, Table 3.3-12 in the RDEIR/SDEIS presents relocations by city). However, the overall structure of the RDEIR/SDEIS and the presentation of impacts by resource area are required by Caltrans. Caltrans respectfully disagrees that the organization of the RDEIR/SDEIS has inhibited public participation in the environmental process; please refer to Section 1.2 of this appendix, for more information on the structure of the public participation process throughout the development of the EIR/EIS.

L-22-8

Preceding Chapter 1.0, Proposed Project, of this RDEIR/SDEIS is the Executive Summary which provides a broad overview of the project, the project's purpose and need, project history, and a summary of project impacts and information. Section S.5 of the Executive Summary includes a summary of the environmental consequences (i.e., project impacts) and directs the reader to the applicable section of the RDEIR/SDEIS where additional information on a specific environmental topic and project impacts can be found. Where a jurisdiction-specific analysis was conducted, corresponding summary tables are provided in Section 3.1 and 3.3 of the RDEIR/SDEIS. Table 3.1-1 identifies existing land use impacts by jurisdiction; Table 3.3-9 identifies parking impacts by jurisdiction; and Table 3.3-12 identifies relocations by jurisdiction.

Much of the analysis throughout the RDEIR/SDEIS is regional in nature due to the scale of the proposed project; therefore, specific study areas were established to identify project-related impacts at a larger scale. As appropriate, and consistent with the requirements of NEPA and CEQA, the Environmental Commitments Record in Appendix F contains the full list of avoidance, minimization, and/or mitigation measures within the document. As described in Section S.5 on page 9 of the Executive Summary, the reader is guided to the environmental commitments and measures in Appendix F (Environmental Commitments Records), and also notes that the environmental commitments and measures are also listed in each topical section of Chapter 3.0, Affected Environment, Environmental Consequences, and Avoidance, Minimization, and/or Mitigation Measures. Please refer to Chapter 4.0, CEQA Evaluation, for a discussion of impact significance before and after mitigation.

L-22-9

As described above in Response to Comment L-22-8, Section S.5 of the Executive Summary includes a summary of the environmental consequences (i.e., project impacts) and directs the reader to the applicable section of the RDEIR/SDEIS where additional information on a specific environmental topic can be found. Table 3.1-1 in Section 3.1 of the RDEIR/SDEIS identifies the acreage of land use impacts by jurisdiction and Figures 2.3-4 through 2.3-12 depict the conceptual plans of the build alternatives, including key features; improvements to freeway to freeway interchanges; improvements to local arterial interchanges, crossings, and frontage road, and bridges. Please refer to Chapter 4.0, CEQA Evaluation, for a discussion of impact significance before and after mitigation. As stated in Response to Comment L-22-2, the No Build Alternative has been selected as the Preferred Alternative. Therefore, a General Plan Amendment, which requires discretionary approval by the City in its role as a Responsible Agency under CEQA, will not be necessary.

L-22-10

As described above in Response to Comment L-22-8, where a jurisdiction-specific analysis was conducted, corresponding summary tables are provided in Section 3.1 and 3.3 of the RDEIR/SDEIS. Table 3.1-1 identifies existing land use impacts by jurisdiction; Table 3.3-9 identifies parking impacts by jurisdiction; and Table 3.3-12 identifies relocations by City. Much of the analysis throughout the RDEIR/SDEIS is regional in nature due to the scale of the proposed project; therefore, specific study areas were established to identify project-related impacts at a larger scale. As stated in Response to Comment L-22-2, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there will not be a need for any future actions which require discretionary approvals by the City in its role as a Responsible Agency under CEQA.

L-22-11

Section 3.24 of the RDEIR/SDEIS and this Final EIR/EIS identifies construction impacts related to the build alternatives. Construction impacts are identified by resource type (e.g., park and recreational facilities, police and fire facilities, etc.) and are described by specific jurisdiction, where applicable. Please refer to Table 3.24-1 for temporary impacts, direct and indirect, to park and recreational facilities, and to Table 3.24-2 for temporary direct and indirect impacts to community facilities. Section 3.24.3.4 discusses construction impacts of the build alternatives to police and fire stations.

L-22-12

The commenter's concern over the response to previous letters regarding the intersection of Florence Avenue and Atlantic Avenue and the request for confirmation of any effect to this intersection under Alternatives 5C and 7 are acknowledged and included in the project record. Appendix L, Parcel Acquisitions Under Alternatives 5C and 7, of the Final EIR/EIS lists each parcel affected by Alternatives 5C and 7. However, as stated in Response to Comment L-22-2, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there will be no improvements at the intersection of Florence Avenue and Atlantic Avenue and no impacts would occur at this location.

L-22-13

Table 3.1.1 in Section 3.1.1.21 of this Final EIR/EIS includes total acreage impacts that would be affected by both full and partial acquisitions required by the build alternatives. As discussed in Measure C-1 in Section 3.3.2.5, should a build alternative be selected as the Preferred Alternative, commercial and industrial land uses subject to partial acquisitions would be evaluated during final design to determine if they could be reconfigured on site in such a manner as to enable them to remain in operation. However, as stated in Response to Comment

L-22-2, the No Build Alternative has been selected as the Preferred Alternative. Therefore, no full or partial acquisitions will be required.

L-22-14

Please refer to Response to Comment L-22-13. Please also refer to the maps contained in Appendix L, Parcel Acquisitions Under Alternatives 5C and 7, of this Final EIR/EIS.

L-22-15

The Sleepy Lagoon Monument Project includes the construction of a monument commemorating the Sleepy Lagoon. No specific plans regarding this project were publicly available at the time the RDEIR/SDEIS was prepared, and therefore, this site was not identified in the document. As detailed in Section 3.7.2.4 of the RDEIR/SDEIS and this Final EIR/EIS, records searches were conducted and information requests were submitted to local historical societies and local governments to identify historic sites within the project's area of potential effects (APE). The Sleepy Lagoon site was not identified as an historic site that would be potentially affected by the build alternatives. As stated in Response to Comment L-22-2, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there will be no impacts to the planned Sleepy Lagoon Monument Project.

L-22-16

Caltrans and Metro recognize that the City of Bell is uniquely situated in proximity to the I-710 at the Atlantic Boulevard/Bandini Boulevard interchange area, and preliminary discussions involving the City have been held to date regarding the configurations of certain parcels and how right-of-way impacts under the build alternatives could be minimized. However, as stated in Response to Comment L-22-2, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there will be no right-of-way acquisitions, excess parcels, or remnant land. Therefore, the City's request for a mitigation measure to transfer excess parcels free of charge does not need to be accommodated.

L-22-17

As stated in Response to Comment L-22-2, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there would be no impacts to the Bell Shelter or S. Mark Taper Foundation Shelter Resource Bank property.

L-22-18

In response to this and other comments related to noise, additional noise modeling has been performed along River Drive between Florence Avenue and Slauson Avenue within the City of Bell. The results of that modeling have been included in the *Supplemental Noise Study Report*

(May 2018) and included in the updated *Noise Abatement Decision Report* (NADR, May 2018) and in Section 3.14 of the Final EIR/EIS.

L-22-19

It was not known at this time of the RDEIR/SDEIS whether the guaranteed relocation of displaced persons within their existing communities and neighborhoods would be feasible at the time of right-of-way acquisition, should a build alternative be selected as the Preferred Alternative. As indicated in Measure C-1, should a build alternative be selected as the Preferred Alternative, Caltrans would strive to do so wherever possible and feasible, but as real estate markets can change drastically between the time of analysis and the time a build alternative is constructed, any such analysis would be speculative. Per the Uniform Act, only the property necessary for the build alternative would be acquired. However, as stated in Response to Comment L-22-2, the No Build Alternative has been selected as the Preferred Alternative. Therefore, no acquisitions are necessary.

L-22-20

Please refer to Response to Comment L-22-19 regarding the need for relocations as a result of the Preferred Alternative.

L-22-21

As stated in Response to Comment L-22-2, the No Build Alternative has been selected as the Preferred Alternative. Therefore, the parking restrictions proposed in the RDEIR/SDEIS are not a part of the scope of the Preferred Alternative. Therefore, no further analysis will be performed. Secondary environmental consequences, such as cumulative impacts of the project, have been considered in Section 3.25 of the document.

L-22-22

The commenter is questioning the feasibility of Mitigation Measure C-4 and the ability to relocate the S. Mark Taper Foundation Shelter Resource Bank (Resource Bank) and the Bell Shelter, should a build alternative be selected as the Preferred Alternative. Generally, should a build alternative be selected as the Preferred Alternative, many of the displaced businesses and other land use types would be able to be relocated within or near to their existing communities; however, Section 3.3.2.4 of the Final EIR/EIS goes into more detail regarding the potential difficulties should the relocation of part or all of the shelter facility be necessary. Community input regarding displacements as a result of the build alternatives, as well as the viability of displacing sensitive community resources including the Bell Shelter and Resource Bank were factors evaluated when identifying the No Build Alternative as the Preferred Alternative. Please

refer to Section 1.1 of this appendix, for more information regarding the identification of a Preferred Alternative.

L-22-23

Measure C-7 in Section 3.3.3.7 addresses disproportionate impacts from the build alternatives to environmental justice populations with regards to air quality, traffic, visual impacts, and land use/parks and recreation, and, should a build alternative be selected as the Preferred Alternative, would provide funding to local jurisdictions for targeted improvements. As is stated in the measure, the funding would be provided to the local jurisdiction through a funding agreement between Metro, Caltrans, and the local jurisdiction, upon the commencement of construction within the limits of that local jurisdiction in the event of staged construction of either of the build alternatives. The specific details of funding would be negotiated as part of that agreement. Once allocated, it would be up to each specific jurisdiction as to how they deem the funds should be appropriately allocated within their respective communities. However, as stated in Response to Comment L-22-2, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there is no need to ensure mitigation includes a mechanism for ensuring that funding is appropriately allocated between environmental justice communities.

L-22-24

Specific information regarding acquisitions associated with the build alternatives can be found in Appendix L, Parcel Acquisitions Under Alternatives 5C and 7, of this Final EIR/EIS. As the No Build Alternative has been selected as the Preferred Alternative, more clarity does not need to be provided regarding directly impacted areas.

L-22-25

An assessment of, and impacts to, community cohesion takes into account several different variables rather than simply acreage. Impacts to community cohesion are determined in part by displacements of important community facilities as well. Caltrans acknowledges that the difference in parcel acquisition acreage between Alternatives 5C and 7 is not substantial; however, the rationale as to why Alternative 5C would not result in a disruption of community cohesion whereas Alternative 7 would, is based in part on the feedback received from the general public and local organizations that the displacement of any portion of the Bell Shelter/Mark Taper Foundation Shelter Resource Bank would have substantial effects on the residents of the shelter and larger community. Generally, should a build alternative be selected as the Preferred Alternative, many of the displaced businesses and other land use types would be able to be relocated within or near to their existing communities; however, Section 3.3.2.4 of this Final EIR/EIS goes into more detail regarding the potential difficulties associated with the relocation of part or all of the shelter facility. Community input regarding displacements as a result of the build alternatives, as well as the viability of displacing sensitive community

resources including the Bell Shelter were factors evaluated when identifying the No Build Alternative as the Preferred Alternative. Please refer to Section 1.1 of this appendix, for more information regarding the identification of the Preferred Alternative.

L-22-26

Caltrans acknowledges that changes to the City of Bell General Plan could be needed as a result of the build alternatives; however, should a build alternative be selected as the Preferred Alternative, these updates could be deferred to the City's next scheduled General Plan update in accordance with State law. This is outlined in Mitigation Measure LU-1. Because these amendments could occur in the normal course of General Plan updates, Caltrans and Metro would not be required to provide compensation to local jurisdictions for General Plan updates. However, as stated in Response to Comment L-22-2, the No Build Alternative has been selected as the Preferred Alternative. Therefore, no change to the City of Bell General Plan is necessary.

L-22-27

Some of the intersections numbered in the 200s are not shown in some tables included in the *Intersection Traffic Impact Analysis Report* (March 2017) and *I-710 Corridor Project Traffic Operations Analysis Report* (March 2017) because they are new intersections that are formed by, and are exclusive to, certain build alternatives or design options. For example, intersections 230 and 231 are freight corridor ramp intersections which are relevant only to the freight corridor proposed in Alternative 7. These two intersections are not part of existing conditions, the No Build Alternative, or Alternative 5C and its associated design options. The information shown in the figures related to each table are consistent with their respective tables.

L-22-28

As stated in Response to Comment L-22-2, the No Build Alternative has been selected as the Preferred Alternative. Therefore, additional analysis does not need to be conducted during final design of either build alternative to determine the timing of the construction staging, finalize construction staging plans, or to develop a Transportation Management Plan (TMP) detailing anticipated traffic diversion routes for the different construction stages of the build alternatives. It should be noted that allowances for local roadway construction impacts were accounted for in the cost estimate of the build alternatives developed for the EIR/EIS.

L-22-29

As is stated on page 1-40 of the RDEIR/SDEIS, the project purpose statements are used as the decision factors for comparing alternatives and identifying/selecting the Preferred Alternative. A Preferred Alternative was not identified at the time of circulation of the RDEIR/SDEIS. Moreover,

the environmental impacts outlined in the RDEIR/SDEIS must be balanced with the benefits of the project. This analysis was undertaken during the Preferred Alternative identification process. Please refer to Section 1.1 of this appendix for more information on the identification of the Preferred Alternative.

L-22-30

As stated in Response to Comment L-22-2, the No Build Alternative has been selected as the Preferred Alternative. Therefore, discretionary actions required by local jurisdictions, including the City of Bell are not necessary.

L-22-31

Caltrans and Metro acknowledge the growth in Port traffic and the need for the I-710 Corridor Project build alternatives. The project was being accelerated as much as possible given that full funding for this project had not been secured at the time this Final EIR/EIS was being prepared. However, as stated in Response to Comment L-22-2, the No Build Alternative has been selected as the Preferred Alternative and therefore no funding is needed.

L-22-32

Caltrans and Metro appreciate that the City is supportive of the project goals and efforts to address the needs of the I-710 Corridor. However, as stated in Response to Comment L-22-2, the No Build Alternative has been selected as the Preferred Alternative and there will be no impacts to the City of Bell.

Cc: Brad Jensen; mbimediaadmin@gmail.com
Subject: I-710 Corridor Project Feedback

From: Chau Vu
Organization: City of Bell Gardens
Phone: 562-334-1790
Mailing Address: 7100 Garfield Ave
City, State: Bell Gardens
Zip: 92840
Comment/Question:
The following are comments on the Recirculated Draft EIR/Supplemental Draft EIS (RDEIR/SDEIS) for the I-710 Corridor Project, released on July 21, 2017.

The proposed project schedule is as follows:

- Circulate RDEIR/SDEIS for public review (Summer 2017)
- Identify Preferred Alternative (Fall 2017)
- Complete Final EIR/EIS (Winter 2018)
- Project Approval/Record of Decision (Winter 2018)

Until the "preferred alternative" is identified, it is ambiguous as to the direct impacts of the project onto the City of Bell Gardens. The current proposed and predicted impacts would be addressed according to the proposed mitigation measures. The following comments and further inquiries regarding the RDEIR/SDEIS will/should be addressed later into the EIR process and there will be further comments once the alternative is determined. L-23-1

1. Page 2-26: Arterial Parking Restriction Program
Comment: How does the restriction of parking on four arterial roadways affect land use parking availability for commercial, industrial and residential properties? Does this displacement of spaces onto off-street parking areas and on-street parking areas directly off the subject main arterials adequately address the future of increased population/increase of vehicles/drivers? L-23-2

2. Page 3.1-89 to 91: Parque Dos Rios under Alternative 5C and/or 7
Comment: What are the details of the future park and/or relocation? L-23-3

3. Last paragraph in the left column on Page 7 of Executive Summary; and Page 3.3-45 and 3.5-90
"Parking restrictions during peak periods (7:00 a.m.–9:00 a.m. and 4:00 p.m.–7:00 p.m.) on four arterial roadways: Atlantic Blvd. between Pacific Coast Hwy. and SR-60; Cherry Ave./Garfield Ave. between Pacific Coast Hwy. and SR-60; Eastern Ave. between Cherry Ave. and Atlantic Blvd.; and Long Beach Blvd. between San Antonio Dr. and Firestone Blvd." L-23-4
Comment: Eastern Avenue has a terminus at Garfield Avenue to the south, and Garfield Avenue changes to Cherry Avenue at 70th Street in the City of Long Beach. Thus, it should be corrected.

4. Table 3.3-9: Parking Impacts by Jurisdiction on Page 3.3-45
Comment: Due to the proposed parking restriction along both Eastern Avenue and Garfield Avenue within the Bell Gardens' city limit, this area would have severe parking space shortages. The shortages would include 285 impacted parking spaces and 304 spaces during peak hour only. However, no mitigation measures were proposed to resolve this L-23-5

parking shortage issue. Therefore, it is necessary to provide mitigation measures to relieve the anticipated parking shortages within the City of Bell Gardens. L-23-5

5. Table 3.5-23: Summary of Impacted Intersection on Page 3.5-98 and Page 3.5-109
Comment: One of the three (3) potential Improvements for the Florence Avenue and Eastern Avenue intersection is "Add an extra left turn lane on EB (triple left) approach". However, northbound Eastern Avenue currently has two (2) receiving lanes at the Florence Avenue intersection. To make it possible, one (1) additional receiving lane for triple receiving lanes is required. Therefore, it is necessary to include the required receiving lanes on the northbound Eastern Avenue north of Florence Avenue. L-23-6

*You received this message because Chau Vu submitted feedback regarding the I-710 Corridor Project.

Regards,
System Administrator

L-23-1

As is Caltrans' practice on environmental documents prepared for compliance with the National Environmental Policy Act (NEPA), a Preferred Alternative is typically not identified until the public has had the opportunity to review and provide comment on the environmental impacts of all proposed alternatives. The RDEIR/SDEIS presented the environmental impacts of all alternatives and design options in each resource area in order for the public and decisionmakers to be able to compare the impacts and benefits of each alternative/option. Comments provided on the RDEIR/SDEIS from the City of Bell Gardens have been responded to; please refer to the following responses.

L-23-2

Please refer to Section 1.6 of this appendix for further information regarding peak period parking restrictions. These restrictions have been eliminated from further consideration and are not being carried forward as a programmatic element as the No Build Alternative has been selected as the Preferred Alternative.

L-23-3

Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), has identified Alternative 1 (No Build) as the Preferred Alternative. Therefore, there will be no impacts to Parque Dos Rios Please refer to Section 1.1 of this appendix for further discussion on the identification of the Preferred Alternative.

L-23-4

Please refer to Response to Comment L-23-2 regarding peak period parking restrictions. Since these restrictions have been eliminated from further consideration, no change to the referenced text is needed.

L-23-5

Please refer to Response to Comment L-23-2 regarding peak period parking restrictions.

L-23-6

The conceptual sketches illustrating the mitigation measure identified for the Florence Avenue/Eastern Avenue intersection take into account the need to incorporate the additional receiving lane on northbound Eastern Avenue north of Florence Avenue. However, as stated in Response to Comment L-23-3, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there will be no impacts to the referenced intersection.

SUBJECT: CEQA CONSULTATION
I-710 Corridor Project
Recirculated Draft Environmental Impact Report/Supplemental Draft Environmental Impact Statement and Section 4(f) Evaluation (July 2017)

The Department of Public Health – Environmental Health Division has reviewed the Recirculated Draft Environmental Impact Report/Supplemental Draft Environmental Impact Statement and Section 4(f) Evaluation (RDEIR/SDEIS) for the I-710 Corridor Project.

Staff from the Department's Toxics Epidemiology Program reviewed the RDEIR/SDEIS for potential health impacts that may arise, and present the following comments concerning noise, air quality and other public health elements:

1) **Environmental Exposures**

a) The RDEIR should include a discussion on Valley Fever in the Air Quality section. Valley Fever is the common name (formally known as *Coccidioidomycosis*) for a fungal disease caused by inhalation of *Coccidioides immitis* spores that are carried in dust; it is found in parts of the southwestern United States, Mexico, and South America (LADPH 2016). In California, the highest incidence of Valley Fever occurs in the San Joaquin (Central) Valley, with over 75 percent of reported cases (CDPH 2014). In Los Angeles County or in Southern California, the fungus is

L-24-1

endemic. Overall, the Los Angeles County incidence rate for coccidiodomycosis has continued to increase over the last 10 years (please refer to the attached CDPH 2014 document, attached).

The fungus can become airborne when soil that contains *C. immitis* spores is disturbed, either by natural or anthropogenic (man-made) means, including wind, farming, and construction (excavation & grading). Valley Fever is diagnosed by a blood test, a chest x-ray, and other tests, and it is treatable with antifungal medications. Approximately 60 percent of people exposed to Valley Fever spores develop no symptoms. If symptoms develop, those individuals generally develop a mild respiratory illness with flu-like symptoms that can last a month or more. Rarely, individuals develop a severe illness such as pneumonia, meningitis, or dissemination when the fungus spreads to other parts of the body. At highest risk for exposure to Valley Fever are farmers, **construction workers**, military personnel, archaeologists, and others who are likely to engage in activities that actively **disturb soils** in areas where Valley Fever may be present. Persons at the highest risk of developing severe Valley Fever include the very young (under 5 years old); older adults (over 60 years old); immunocompromised individuals and those with diabetes; pregnant women; and certain ethnic groups, including African-Americans, Latinos, Native Americans, and Filipinos (LADPH 2016; CDPH 2014). It is believed that contributing factors may include changes in climate and rainfall patterns; **construction activities that disturb soil**; an increase in susceptible persons moving to endemic areas; and heightened awareness and diagnoses (Sondermeyer et al. 2013). L-24-1

A dust mitigation plan should be prepared and implemented to protect workers and the public from fugitive dust. Controlling fugitive dust is important to minimize exposure to the fungus. Worker protection practices should also be implemented (please refer to the attached document "Preventing Work-Related Coccidioidomycosis" sheet, CDPH 2013). L-24-2

b) One of the purposes of the I-710 S project is to improve air quality and public health. In some aspects air quality will be improved for the respective alternatives but there are nearby roadway locations and regional areas where there would be an increase in air pollutant emissions. The 2035 build alternatives show increases in near-roadway 24hour PM10 impacts for several receptors located along the I-710 freeway as compared to 2035 No Build. At least in those respects, the project fails to improve public health for all. L-24-3

The DEIR states that there are no feasible mitigation measures to reduce localized near-roadway impacts. Therefore, the Community Health Benefit Program should be implemented to provide best available technologies to reduce or minimize exposure to sensitive receptors affected by near roadway air quality impacts.

Section 3.13.4 mitigation AQ-2 measure would provide high efficiency air-filtration for the schools listed. The benefits of air filtration depend upon proper implementation of pressurization, weatherization, adequate air exchanges, and placement of the HVAC air intake. The measure L-24-4

should include a comprehensive evaluation of the building's HVAC to accommodate all the parameters listed above.

There may be other sensitive uses in the affected area such as senior-residential facilities, child care centers, and other uses that should be included in the list. Residential units are also not included and would be impacted as well. L-24-4

Section 3.13.4 mitigation AQ-3 measure would include the installation of barriers and vegetation to increase dispersion of particulate matter away from sensitive receptors nearby. The effectiveness of such a measure should be evaluated as part of a post mitigation measure. We want to ensure that the barriers are not dispersing the particulates to a location further downwind and possibly exacerbating the air quality in other locations. The selection of vegetation should take into consideration the decrease of density foliage due to seasonal changes, fire hazards associated with trees that have a high oil content, the surface area of the foliage and drought tolerance. L-24-5

c) The DEIR should provide more information or discussion on the health impacts of ultrafine particles. The decision-making body needs a better understanding of health impacts so that informative decisions can be made. Areas such as the East LA community are already impacted by multiple freeways (I-10, I-5, I-60, & I-710) transecting that community. The increase in traffic flowing from improvements made to the I-710 will flow onto adjoining freeways in East LA and will impact other areas of East LA (north of I-60 & east to Montebello) that need to be further assessed. Traditional filtration associated with ventilation system will not reduce or trap ultrafine particles. The Minimum Efficiency Reporting Value (MERV 17) is the equivalent of a HEPA filtration unit, which could remove up to 95% of UFP and would be the recommended filter for auto emissions reduction (diesel particles) within the indoor environment. ASHRAE (American Society of Heating Refrigeration Engineers) in their Guideline 24 (companion document to Standard 62.2, *Ventilation & Acceptable Air Quality in Low-Rise Residential Buildings*) recommends higher efficiency air filtration at MERV 13 or higher for residential units where high levels of ultra-fine particles are present. However, these filters and the required HVAC units are very costly. L-24-6

In regards to ultrafine particles, please see the attached document "Air Quality Recommendations for Local Jurisdictions."

d) The project will involve re-locating or removing existing businesses or other services. Do any of these businesses provide vital services to the affected communities? What would be the impact? For example, it was brought to our attention by a community member that six businesses will be taken with East Los Angeles Option 3A/3B. One of those businesses is a Dialysis Center – Davita Doctors Dialysis Center. How would the relocation of such a health care facility affect the local community? An HIA would be helpful in assessing such impacts and should be included either L-24-7

separate or part of the EIR. The decision-makers need to be fully informed about the impacts of this project to make a proper judgement. L-24-7

e) Oil and Gas facilities and their components are very common in areas on which construction is to take place. Are there any safety procedures in place for the accidental release of crude oil or other chemicals that are present at these facilities? Is there an inventory of such facilities? Underground oil and gas pipes? L-24-8

2) Noise Impacts

a) Section 3.14.3 states that "although permanent hearing loss is not predicted, since most traffic remains below 85 dBA over an eight hour period". The application of occupational exposures does not apply to sensitive or residential receptors which will be exposed to construction noise over extended time periods, especially if construction is to be conducted between the hours of 9:00 P.M. and 6:00 A.M. According to the EPA an average exposure of 70 dBA over a 24 hr. period, may result in hearing loss (EPA'74). Is hearing loss predicted in the affected areas if receptors are exposed to 70 dBA over a 24 hr. period? L-24-9

b) Construction noise impacts to the community are of a public health concern and should be fully evaluated to include mitigation measures. According to Cal-Trans standard specifications (14-8.02) sets a noise standard not to exceed 86 dBA at 50 feet from the job site between the hours of 9pm to 6 am. Applying a free-field calculation, a receptor 500 ft. away may be exposed to 66 dBA which exceeds residential night time construction noise levels in unincorporated Los Angeles County. A stricter standard especially for night time applications is recommended to minimize disturbance to nearby sensitive receptors. Night time construction should be avoided where feasible and local authorities should weigh in to evaluate and review mitigation measures to reduce noise at night. Once an alternative is chosen a specific analysis of the associated noise impacts must be evaluated to include mitigation measures. L-24-10

c) The DEIR relies on sound walls as the primary mitigation measure to reduce noise impacts on surrounding properties. Other mitigation measures in 3.14.5 were deemed not feasible. Alternative building materials such as rubberized asphalt concrete (RAC) can reduce noise levels (Sacramento County DPW-Asphalt study 1999). According to Cal-Recycle RAC lasts longer than conventional methods. This mitigation measure was not considered due to CFR regulations and funding. Did the DEIR consider tolling and or changes in port gate hours to reduce noise during peak hours? An HIA may be able to explore other measures to reduce noise impacts such as funding mechanisms and exemptions in the regulations to assist residents and other impacted sensitive receptors to improve noise insulation to affected structures, that are not within the scope of an EIR. L-24-11

d) The DEIR analyzes the noise impacts in the areas within the I-710 corridor but in communities such as East Los Angeles, the noise impacts affecting the entire community are not evaluated. As mentioned, there are multiple freeways transecting East L.A. which will be affected by the proposed changes made to the I-710; therefore, the noise study area should be expanded to the entire East L.A. community. Although this study would be beyond the scope what is required under CEQA, an HIA may include such an analysis and should be included. L-24-12

e) Zero emission trucks would not only have the benefit of improving existing air quality but would be substantially quieter than conventional freight trucks. What would be the noise impact of having zero-emission (electrical) freight trucks vs conventional combustion engine driven freight trucks or near zero (hybrid/natural gas) trucks? Would the ambient noise levels be substantially reduced? L-24-13

For questions regarding the above section, please contact Robert Vasquez or Evenor Masis of the Toxics Epidemiology Program at (213) 738-3220 or at **rvasquez@ph.lacounty.gov** and **emasis@ph.lacounty.gov**.

For any other questions regarding this report, please feel free to contact me at (626) 430-5382 or at **jbiehler@ph.lacounty.gov**.

Preventing Work-Related Coccidioidomycosis (Valley Fever)

Valley Fever is an illness that usually affects the lungs. It is caused by the fungus *Coccidioides immitis* that lives in soil in many parts of California. When soil containing the fungus is disturbed by digging, vehicles, or by the wind, the fungal spores get into the air. When people breathe the spores into their lungs, they may get Valley Fever.

Is Valley Fever a serious concern in California? YES!

Often people can be infected and not have any symptoms. In some cases, however, a serious illness can develop which can cause a previously healthy individual to miss work, have long-lasting and disabling health problems, or even result in death.

This fact sheet describes actions employers can take to prevent workers from getting Valley Fever and to respond appropriately if an employee does become ill.

➤ **In October 2007, a construction crew excavated a trench for a new water pipe. Within three weeks, 10 of 12 crew members developed coccidioidomycosis (Valley Fever), an illness with pneumonia and flu-like symptoms. Seven of the 10 had abnormal chest x-rays, four had rashes, and one had an infection that had spread beyond his lungs and affected his skin. Over the next few months, the 10 ill crew members missed at least 1660 hours of work and two workers were on disability for at least five months.**

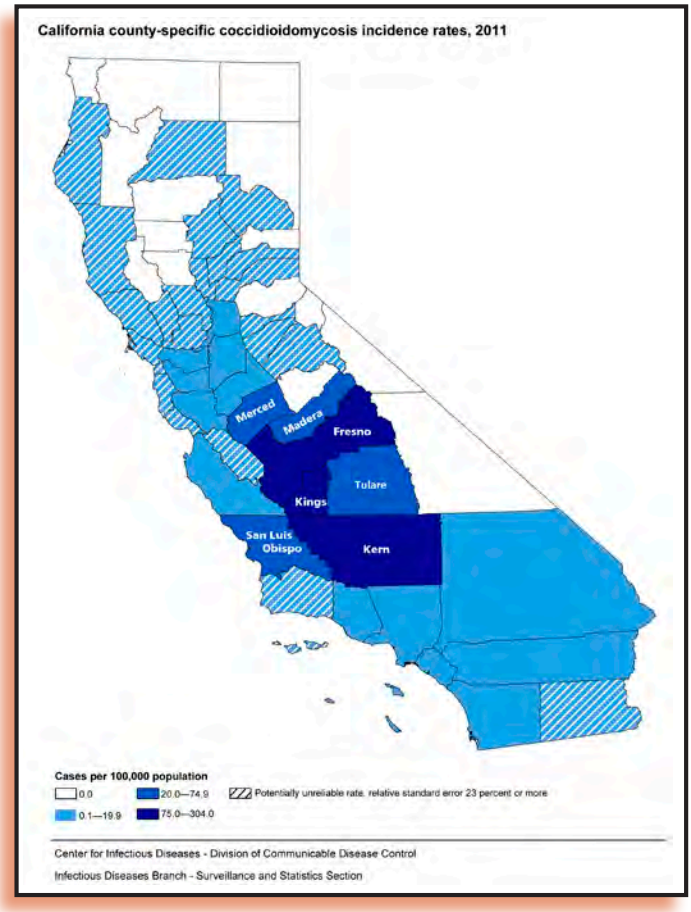
JUNE 2013

California Department of Public Health • California Department of Industrial Relations

How do workers get Valley Fever?



In California, Valley Fever is caused by the fungus *Coccidioides immitis* that lives in the top two to 12 inches of soil in many parts of the state. When soil containing this fungus is disturbed by activities such as digging, vehicles, or by the wind, the fungal spores get into the air. When people breathe the spores into their lungs, they may get Valley Fever. Fungal spores are small particles that can grow and reproduce in the body. The illness is not spread from one person to another.

How do employers know if the fungus is present in soil at their worksites?

The Valley Fever fungal spores are too small to be seen by the naked eye, and there is no reliable way to test the soil for spores before working in a particular place. Some California counties consistently have the Valley Fever fungus present in the soil. In these regions Valley Fever is considered endemic. Health departments track the number of cases of Valley Fever illness that occur. This information is used to map illness rates as seen on the figure above. Employers can contact their local health department for more information about the risk in their counties.

Where do people get Valley Fever?

Highly endemic counties, i.e., those with the highest rates of Valley Fever (more than 20 cases per 100,000 population per year), are Fresno, Kern, Kings, Madera, Merced, San Luis Obispo, and Tulare. Other counties or parts of counties also have the fungus present.

California county-specific coccidioidomycosis incidence rates, 2011

Who is at risk for Valley Fever?

Workers who disturb the soil by digging, operating earth-moving equipment, driving vehicles, or working in dusty, wind-blown areas are more likely to breathe in spores and become infected. Some occupations at higher risk for Valley Fever include:

- Construction workers, including road-building and excavation crews
- Archeologists
- Geologists
- Wildland firefighters
- Military personnel
- Workers in mining, quarrying, gas and oil extraction jobs
- Agricultural workers*

* Cultivated, irrigated soil may be less likely to contain the fungus compared to undisturbed soils.

Anyone, even healthy young people, can get Valley Fever. Once a person has had Valley Fever, their body may develop some immunity against future infections.

How does Valley Fever affect health?

- Experiments on laboratory animals indicate that a very small dose, 10 spores or fewer, may cause an infection.
- After breathing in the spores, the following can happen:
  - In about 60% of cases, symptoms are mild or not present.
  - In about 40% of cases, symptoms vary from moderate to severe. Usually symptoms are those of a flu-like illness that may last up to a month but goes away on its own. However, some people develop pneumonia (at times severe).
  - In a small proportion of cases (about 5%), disease spreads outside of the lungs causing very serious illness. Parts of the body that may be affected include the brain (meningitis), bones, joints, skin, or other organs. This is called ***disseminated Valley Fever*** (or disseminated coccidioidomycosis).
- People who are more likely to have severe or disseminated Valley Fever include those who have weakened immune systems, such as people who are HIV positive, have AIDS, cancer, or diabetes; who smoke; or who are pregnant. People of African and Filipino descent are much more likely to get disseminated disease; however, others can get disseminated disease, too.

Earth-moving equipment may stir up spores

What are signs or symptoms of Valley Fever?

When present, symptoms usually occur between seven to 21 days after breathing in spores, and can include:

- Cough
- Fever
- Chest pain
- Headache
- Muscle aches
- Rash on upper trunk or extremities
- Joint pain in the knees or ankles
- Fatigue.

Symptoms of Valley Fever can be mistaken for other diseases such as the flu (influenza) and TB (tuberculosis), so it is important for workers to obtain medical care for an accurate diagnosis and possible treatment.

Disseminated Valley Fever

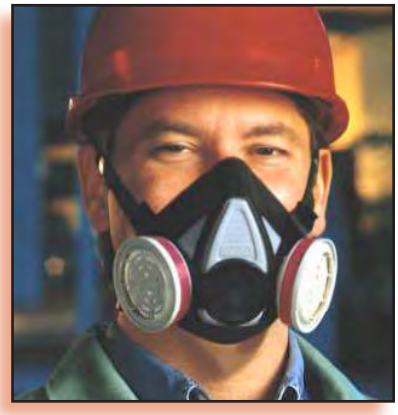
Dissemination refers to spread of infection beyond the lungs to other parts of the body. With Valley Fever this usually occurs within the first six to 12 months after the initial illness.

Signs or symptoms of disseminated Valley Fever may vary but usually consist of some combination of the following:

- Fever
- Raised skin lesions with irregular surfaces
- Lymph node swelling, especially in the neck
- Pain and swelling in one or more joints
- Recurrent, persistent, new headaches (may be mild)
- Stiff neck.

Preventing Valley Fever exposure

There is no vaccine to prevent Valley Fever. Employers can reduce worker exposure by incorporating the following elements into the company's Injury and Illness Prevention Program and project-specific health and safety plans:



1. Determine if the worksite is in an area where Valley Fever is endemic (consistently present). Check with your local health department to determine whether cases have been known to occur in the proximity of your work area. See the map on page 2 to determine whether your company will be working in an endemic county.
2. Train workers and supervisors on the location of Valley Fever endemic areas, how to recognize symptoms of illness (see page 3), and ways to minimize exposure. Encourage workers to report respiratory symptoms that last more than a week to a crew leader, foreman, or supervisor.
3. Limit workers' exposure to outdoor dust in disease-endemic areas. For example, suspend work during heavy wind or dust storms and minimize amount of soil disturbed.
4. When soil will be disturbed by heavy equipment or vehicles, wet the soil before disturbing it and continuously wet it while digging to keep dust levels down.
5. Heavy equipment, trucks, and other vehicles generate heavy dust. Provide vehicles with enclosed, air-conditioned cabs and make sure workers keep the windows closed. Heavy equipment cabs should be equipped with high efficiency particulate air (HEPA) filters. Two-way radios can be used for communication so that the windows can remain closed but allow communication with other workers.
6. Consult the local Air Pollution Control District regarding effective measures to control dust during construction. Measures may include seeding and using soil binders or paving and laying building pads as soon as possible after grading.
7. When digging a trench or fire line or performing other soil-disturbing tasks, position workers upwind when possible.
8. Place overnight camps, especially sleeping quarters and dining halls, away from sources of dust such as roadways.

PAPR with helmet (APF=1000)

Full-face respirator (APF=50)

Half-mask respirator (APF=10)

9. When exposure to dust is unavoidable, provide NIOSH-approved ***respiratory protection*** with particulate filters rated as N95, N99, N100, P100, or HEPA. Household materials such as washcloths, bandanas, and handkerchiefs do not protect workers from breathing in dust and spores.

Respirators for employees must be used within a Cal/OSHA compliant respiratory protection program that covers all respirator wearers and includes medical clearance to wear a respirator, fit testing, training, and procedures for cleaning and maintaining respirators.

Different classes of respirators provide different levels of protection according to their Assigned Protection Factor (APF) (see table below). Powered air-purifying respirators (PAPRs) have a battery-powered blower that pulls air in through filters to clean it before delivering it to the wearer's breathing zone. PAPRs will provide a high level of worker protection, with an APF of 25 or 1000 depending on the model. When PAPRs are not available, provide a well-fitted NIOSH-approved full-face or half-mask respirator with particulate filters.

Fit-tested half-mask or filtering facepiece respirators are expected to reduce exposure by 90% (still allowing about 10% faceseal leakage), which can result in an unacceptable risk of infection when digging where Valley Fever spores are present.

The table below shows the relative effectiveness of various types of respirators for particles of dust and spores.

Respiratory Protection for Reducing Dust and Spore Exposure

	Respirator Type (worn with particulate filters)	**Assigned Protection Factor (APF)**	**Expected Reduction of Exposure to Dust and Spores (%)**
	No respirator	None	0
Increasing Protection ↓	Half-mask respirator (elastomeric or filtering facepiece)	10	90
	Powered air-purifying respirator with loose-fitting face covering	25	96
	Full-face respirator	50	98
	Some powered air-purifying respirators are designed to offer higher protection (check with manufacturer)	1000	99.9

Preventing transport of spores

- **Clean tools, equipment, and vehicles with water to remove soil before transporting offsite** so that any spores present won't be re-suspended in air and inhaled at a later time.
- **Provide workers with coveralls or disposable Tyvek™ daily.** At the end of the work day, require workers to remove their work clothes at the worksite.
- **Keep street clothes and work clothes separate by providing separate lockers or other storage areas.** If possible, store work boots at the worksite; otherwise, have workers use a boot wash before getting into their vehicles.
- **Encourage workers to shower and wash their hair at the workplace** (if at a fixed location) or as soon as they get home.

What should employers do if a worker reports Valley Fever symptoms?

- If the worker disturbed soil or otherwise did dusty work in an endemic area, **the employer should send the worker to their workers' compensation health care provider or occupational medicine clinic**. The employer should provide the health care provider with the details about the dust or soil exposure. The worker should give a copy of this fact sheet to the health care provider.
- When two or more workers report symptoms that suggest Valley Fever, workers should be sent to a single medical provider or occupational medicine clinic for coordinated medical care, if possible. This can facilitate better communication between the medical provider, public health agencies, and employer.
- **Travel through endemic areas has resulted in Valley Fever cases.** When a worker who has traveled through an endemic area reports a respiratory illness that lasts more than a week, the employer should send the worker to their workers' compensation health care provider or occupational medicine clinic.
- **Complete the "Employer's Report of Occupational Injury or Illness" (Form 5020) for each occupational Valley Fever illness** which results in "lost time" or medical treatment beyond first aid.
- **List cases on the Cal/OSHA Form 300,** "Log of Work-Related Injuries and Illnesses".
- **Report immediately any serious injury, illness or death occurring in a place of employment** or in connection with any employment to the local Cal/OSHA district office. A "serious injury or illness" is defined in 8 CCR 330(h) found at **www.dir.ca.gov/title8/330.html**.

What is the treatment for Valley Fever?

Although many people with Valley Fever do not require treatment, those with symptoms should seek medical attention. When Valley Fever is suspected, doctors can order specialized tests to confirm the diagnosis. If treatment is indicated, anti-fungal medications are available. Workers who develop severe or chronic infections may need to stay in the hospital.

It is especially important for people at risk for severe disease, such as people infected with HIV or those with weakened immune systems, to be diagnosed and receive treatment as quickly as possible. People with severe infections need to be treated because advanced Valley Fever can be fatal.

Summary of Controls to Minimize Workers' Dust Exposure and Risk of Valley Fever in Endemic Areas

Type of Control	Actions
Engineering and Work Practice Controls ➤ *to control dust at the source or isolate worker from exposure.*	Minimize exposure to outdoor dust: • Suspend (stop) work in dust storms or high winds. • Minimize the amount of digging by hand. Instead, use heavy equipment with operator in an enclosed, air-conditioned, HEPA-filtered cab. Continuously wet the soil before and while digging or moving the earth. Landing zones for helicopters and areas where bulldozers, graders, or skid steers operate are examples where wetting the soil is necessary. When digging in soil is required, train workers to reduce the amount of dust inhaled by staying upwind when possible.
Administrative Controls ➤ *to increase hazard awareness and knowledge of safe work practices and select safer work practices.*	Train workers and supervisors on: • Distribution of endemic areas • Symptoms and signs, and need to report to supervisor to obtain medical evaluation • People at highest risk of serious disease • Effective controls, including proper use of equipment.
Personal Protective Equipment ➤ *to decrease quantity of fungal spores inhaled.*	Provide respirators when digging or working near earth-moving trucks or equipment: • Powered air-purifying respirator (PAPR) with high efficiency particulate air (HEPA) filter or • Full-face respirator with particulate filter or • Half-mask respirator with particulate filter and • Implement a comprehensive respirator program including medical clearance, training, fit testing, and procedures for cleaning and maintaining respirators. Provide coveralls to prevent street clothes from being contaminated with fungal spores and then taken home.
Clean up ➤ *to decrease quantity of fungal spores inhaled.*	Provide lockers and require change of clothing and shoes at worksite so workers don't take dust and spores home. Wash equipment before moving offsite.
Medical care for disease recognition and prompt, appropriate treatment.	Contract with local medical clinics • Provide prompt evaluation and care • Make sure clinic has a protocol for evaluation, follow-up, and treatment of Valley Fever Make sure in-house physician is aware of work in Valley Fever endemic areas.

Valley Fever in the general population in California (*includes individuals exposed at work*):

- In 2011, 5123 people were diagnosed with new infections.
- The number of new Valley Fever cases reported in California increased dramatically in the past few years. In 2011, there were 20% more cases compared to 2010.
- Every year, about 1,430 people are hospitalized with Valley Fever.
- About 8% (8 out of 100) of people hospitalized with Valley Fever die due to the infection.

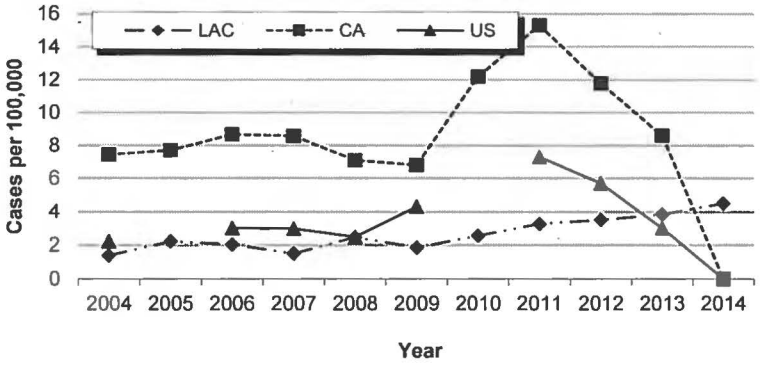
DESCRIPTION

Coccidioidomycosis, or valley fever, is a fungal disease transmitted through the inhalation of *Coccidioides immitis* spores that are carried in dust. Environmental conditions conducive to an increased occurrence of coccidioidomycosis include arid to semi-arid regions, dust storms, hot summers, warm winters, and sandy, alkaline soil. The fungus is endemic in the southwestern US and parts of Mexico and South America; Southern California is a known endemic area. Most infected people exhibit no symptoms or have mild respiratory illness, but a few individuals develop severe illness such as pneumonia, meningitis, or dissemination to other parts of the body. Among the wide range of clinical presentations, only the most severe cases are usually diagnosed and reported to the health department. Blacks, Filipinos, pregnant women, the very young (age <5 years), the elderly, and immunocompromised individuals are at higher risk for severe disease. Currently no safe and effective vaccine or drug to prevent coccidioidomycosis exists. Prevention lies mainly in dust avoidance and control (e.g., planting grass in dusty areas, putting oil on roadways, wetting down soil, air conditioning homes, wearing masks or respirators). Other options may be to warn people at high risk for severe disease not to travel to endemic areas when conditions are most dangerous for exposure.

Recovery from the disease confers lifelong immunity to reinfection, providing the rationale for development of a vaccine for prevention of symptomatic or serious forms of the disease. Increasing exposure and risk associated with construction, a growing naïve population in the endemic area, and antifungal treatments that are toxic and not uniformly effective validate the need for prevention efforts.

2014 TRENDS AND HIGHLIGHTS



- Overall, the Los Angeles County incidence rate for coccidioidomycosis has continued to increase over the last ten years. No data were available for the US in years 2005 and 2010 (Figure 1).
- Case frequency and incidence rate increased with age. The 65+ year age group had the most cases at 25% and the highest incidence rate at 9.5 cases per 100,000 (Figure 2).
- Males represented 63% of cases; females 37% (Figure 3).
- Incidence rates by race/ethnicity have remained consistent over the past five years with the exception of 2014, in which whites had the highest incidence rate of 6.6 per 100,000 and blacks the second highest incident rate of 5.3 per 100,000. This in contrast with 2010-13 when the highest incidence rates occurred among blacks (Figure 4).
- SPA 1 reported the highest incidence rate of coccidioidomycosis in LAC; at 26.2 per 100,000 this is in comparison to the next highest incidence rate in SPA 2 of 5.7 per 100,000 (Figure 5).
- In 2014, December had the most cases at 11.3%. However, there are not marked seasonal differences in rate based on data from the past 5 years, other than a modest decrease in late-winter and early-spring (Figure 6).
- There were 28 cases of disseminated coccidioidomycosis reported in LAC in 2014. SPA 1 reported the highest incidence rate at 2.5 per 100,000; this is in comparison to the next highest incidence rate of 0.4 per 100,000 in SPA 2. Males made up 70% of disseminated cases reported in SPA 1, and 89% in SPA.

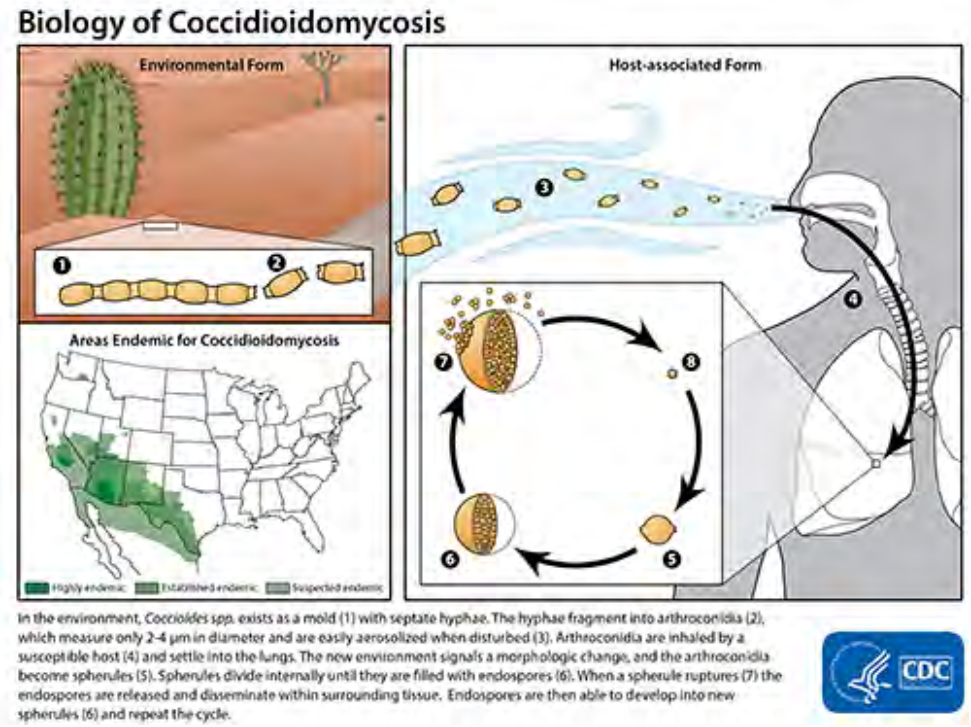
Increased Coccidioidomycosis ("Valley Fever") in Los Angeles County

Benjamin Schwartz, MD

Dawn Terashita, MD, MPH

July-August 2017



Coccidioidomycosis, commonly known as "Valley Fever," is an infection caused by inhalation of spores from the fungus *Coccidioides* that lives in dry soil and dust. The number of reported coccidioidomycosis cases have increased in Los Angeles County and in California in the past several years. In 2016, there were 714 reported cases in LA County, compared with 522 in 2015, a 37% increase. Each year since 2009, the number of reported coccidioidomycosis cases has increased annually and the total number of reports has increased 3-fold. While cases are reported from throughout the county, most cases have occurred in northern areas, specifically Antelope Valley and San Fernando Valley. Overall, the rate of coccidioidomycosis in LA County is about 7 cases per 100,000 people; among residents of Antelope Valley the rate is about 9-fold higher than elsewhere in the county. California is also seeing a significant increase in the number of cases reported statewide. The highest rate of infection in the state is in Kern County, immediately to the north of LA County (see map).

Possible reasons for the increase in disease include changes in weather and rainfall as well as persons moving into new developments in areas of higher risk. Changes in surveillance also may be contributing to increased case numbers with more cases being reported through an electronic laboratory reporting system.

Given the increase in risk of coccidioidomycosis, it is important for LA County providers to be familiar with this infection. A summary of coccidioidomycosis transmission, clinical characteristics, diagnosis, management, and prevention is presented below. For more detailed clinical guidance, please see the reference documents at the end of this article.

Transmission

Coccidioidomycosis is typically caused by the inhalation of spores from fungal species belonging to the *Coccidioides* genus from airborne dust or soil (see Biology of Coccidioidomycosis). The risk of infection is greater when the soil is disrupted such as during strong winds, dust storms, building construction, agriculture, earthquakes, and archaeological digs. It is not transmitted person-to-person.

Source: https://www.cdc.gov/fungal/diseases/coccidioidomycosis/pdf/coccidiomycosis-lifecycle508c.pdf

The fungi are endemic to the southwestern United States (i.e. Arizona, California, Nevada, New Mexico, Texas, and Utah) and parts of Central and South America. Highly endemic areas include the San Joaquin Valley in California and southern Arizona as shown in the maps below.

Areas Endemic for Coccidiodomycosis

This map is based on studies performed in the late 1940s and 1950s and also on locations of more recent outbreaks and cases. *Coccidioides* might also be found in similar areas with hot, dry climates that are not shaded on the map.

Clinical Picture

About 60% of infected people do not develop any symptoms. Among those who are symptomatic, typically beginning one to three weeks after exposure to the spores, a spectrum of symptoms and signs may occur (see box below).

Symptoms and Signs of Primary Coccidioidomycosis

- Fever
- Fatigue
- Night sweats
- Cough
- Chest pain
- Dyspnea
- Hemoptysis
- Headache
- Arthralgia
- Erythema nodosum
- Erythema multiform

Valley fever is the most common presentation and can include a self-limited flu-like illness and/or community acquired pneumonia (CAP) with fever, cough, chest pain, and headache. Systemic complaints — which include fatigue, myalagia, arthralgia, and night sweats — may last for weeks to months. Erythema nodosum and erythema multiforme also may occur. Chest radiograph findings may include diffuse pulmonary infiltrates, hilar adenopathy, and pleural effusion.

Complications are rare but can be severe. Approximately 5-10% of infections result in significant pulmonary disease and less than 1% result in extra-pulmonary disseminated disease that can involve multiple organ systems, last life-long, and lead to outcomes such as meningitis and death. Risk factors for severe or disseminated disease include immunosuppression (e.g. HIV/AIDS, TNF inhibitors, chemotherapy), diabetes mellitus, and pregnancy. In addition, some groups are at higher risk for complications including the elderly, African Americans, and persons of Filipino ethnicity.

Diagnosis

Coccidioidomycosis should be considered in any patient with a compatible clinical syndrome who resides in, works in, or has traveled to an endemic area including Antelope Valley, the north and west parts of the San Fernando Valley, Kern County, Ventura County, California's Central Valley (San Joaquin Valley), and southern Arizona. Providers should note any exposure to airborne dust or soil from the endemic areas. History should also include location and type of work as cases and outbreaks have resulted from work exposures. Prolonged illness or CAP unresponsive to antimicrobial therapy increases the likelihood of coccidioidomycosis. In endemic areas, clinicians should consider testing for coccidioidomycosis in patients who initially present with CAP (especially during seasons when other causes are less common) as an accurate diagnosis may reduce unnecessary exposure to antibiotics and facilitate appropriate counseling and possible therapy.

Serologic tests to detect IgM and IgG antibodies are used most often to diagnose coccidioidomycosis. Although cough associated with coccidioidomycosis generally is non-productive, if sputum can be obtained, direct examination of a smear with potassium hydroxide (KOH) or culture may be positive. The organism also may be identified by culture of tissue.

Treatment

There is currently no evidence that treatment of uncomplicated coccidioidal infections reduces symptom duration or prevents complications; therefore, most immunocompetent patients with mild symptoms will not require antifungal therapy. Supportive care should be provided as needed. Symptoms of prolonged fatigue can be managed by physical therapy for re-conditioning.

the California Department of Public Health.

Antifungal therapy should be started for patients with significantly debilitating illness or who are in groups at higher risk for disseminated disease or adverse outcomes: this includes persons with diabetes mellitus, who are immunocompromised, pregnant women, and the frail elderly. Per the 2016 Infectious Disease Society of America (IDSA) Clinical Practice Guideline for the Treatment of Coccidioidomycosis, treatment may be considered in demographic groups at higher risk for disseminated disease, e.g. African Americans and Filipinos. Generally, treatment is with an oral azole antifungal although in some groups amphotericin B is recommended. As detailed treatment recommendations are beyond the scope of this article, clinicians should refer to the IDSA guideline for more information. In general, primary care providers should consult with specialists if considering initiating treatment.

Prevention

There are no clearly effective interventions to prevent coccidioidomycosis for persons living or working in endemic areas. Approaches to reduce the risk of breathing in the fungal spores include staying inside with windows and doors closed when it is dusty outside, keeping car windows closed and using recirculating air conditioning while driving, and wearing an N95 mask if exposure to a high volume of dust that cannot be avoided.

Patient education materials are available from the Los Angeles County Department of Public Health (DPH). Employers who have staff with work exposures in endemic areas should maintain a comprehensive approach to minimize dust exposure including the use of respiratory protection.

Resources for preventing work-related Valley Fever are available from the Occupational Health Branch at the California Department of Public Health.

Disease Reporting

Providers in California must report coccidioidomycosis within 7 calendar days from identification (Title 17, CCR, Section 2500). For cases in LA County, reports should be submitted:

- by phone - call the Communicable Disease Reporting System at 888-397-3993, or
- by mail or fax - complete a Confidential Morbidity Report (CMR) Form available here http://www.publichealth.lacounty.gov/acd/reports/CMR-H-794.pdf and follow fax and mail instructions.

For more information or questions regarding coccidioidomycosis, call the DPH Acute Communicable Disease Control Program at 213-240-7941.

Key Messages

- Between 2015 and 2016, the number of reported coccidioidomycosis cases in Los Angeles County increased 37%. California also saw significantly more cases.
- Clinicians should consider coccidioidomycosis in any patient with a compatible clinical syndrome such as community acquired pneumonia who resides in, works in, or travels to an endemic area including parts of Los Angeles County (Antelope Valley and the west and north parts of the San Fernando Valley).

AIR QUALITY RECOMMENDATIONS FOR LOCAL JURISDICTIONS

Development of new schools, housing, and other sensitive land-uses in proximity to freeways

Studies indicate that residing near sources of traffic pollution is associated with adverse health effects such as exacerbation of asthma, onset of childhood asthma, non-asthma respiratory symptoms, impaired lung function, reduced lung development during childhood, and cardiovascular morbidity and mortality.[1] These associations are diminished with distance from the pollution source.

Given the association between traffic pollution and health, the California Air Resources Board recommends that freeways be sited at least 500 feet from residences, schools, and other sensitive land uses.[2] Other reputable research entities such as the Health Effects Institute indicate that exposure to unhealthy traffic emissions may in fact occur up to 300 to 500 meters (approximately 984 to 1640 feet). The range reported by HEI reflects the variable influence of background pollution concentrations, meteorological conditions, and season.[3]

Based on this large body of scientific evidence, the Los Angeles County Department of Public Health strongly recommends:

- A buffer of at least 500 feet should be maintained between the development of new schools, housing or other sensitive land uses and freeways. Consideration should be given to extending this minimum buffer zone based on site-specific conditions, given the fact that unhealthy traffic emissions are often present at greater distances. Exceptions to this recommended practice should be made only upon a finding by the decision-making body that the benefits of such development outweigh the public health risks.

- New schools, housing or other sensitive land uses built within 1500 feet of a freeway should adhere to current best-practice mitigation measures to reduce exposure to air pollution which may include: the use of air filtration to enhance heating, ventilation and air conditioning (HVAC) systems, and the orientation of site buildings and placement of outdoor facilities designed for moderate physical activity as far from the emission source as possible.

Development of parks and active recreational facilities in proximity to freeways

Parks and recreational facilities provide great benefits to community residents including increased levels of physical activity, improved mental health, and opportunities to strengthen social ties with neighbors.[4,5,6] However, siting parks and active recreational facilities near freeways may increase public exposure to harmful pollutants, particularly while exercising. Studies show that heavy exercise near sources of traffic pollution may have adverse health effects.[7, 8, 9] However, there are also substantial health benefits associated with exercise.[10] Therefore, DPH recommends the following cautionary approach when siting parks and active recreational facilities near freeways:

- New parks with athletic fields, courts, and other outdoor facilities designed for moderate to vigorous physical activity, should be sited at least 500 feet from a freeway. Consideration should be given to

extending this minimum buffer zone based on site-specific conditions given the fact that unhealthy traffic emissions are often present at greater distances. Exceptions to this recommended practice should be made only upon a finding by the decision-making body that the benefits of such development outweigh the public health risks.

- New parks built within 1500 feet of freeways should adhere to best-practice mitigation measures that minimize exposure to air pollution. These include the placement of athletic fields, courts, and other active outdoor facilities as far as possible from the air pollution source.

L-24-1

This comment raises the concern that people may become infected with Valley Fever when soil containing the fungus coccidioides is disturbed and subsequently inhaled by the individual. Operation of either of the build alternatives (i.e., vehicles traveling on the highway) would not disturb soil containing coccidioides. However, construction of the build alternatives would involve excavation and grading activities which would disturb soil that may contain coccidioides. However, it should be noted that the Valley Fever is more common in San Joaquin Valley than in the urban area of Los Angeles. However, Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), has identified Alternative 1 (No Build) as the Preferred Alternative. Therefore, there will be no construction and subsequently no potential for infection with Valley Fever. Please refer to Section 1.1 of this appendix for further discussion on the identification of the Preferred Alternative.

L-24-2

As discussed in Section 3.24.3.13, Air Quality, in Section 3.24, Construction Impacts, of the RDEIR/SDEIS, should a build alternative be selected as the Preferred Alternative, it would comply with the South Coast Air Quality Management District (SCAQMD) Rule 403 for fugitive dust during construction. In addition, per the Transportation Conformity Rule, the build alternatives would be required to comply with any $PM_{2.5}$ and PM_{10} control measures in the State Implementation Plan. In addition, construction activities associated with either build alternative would comply with Caltrans Standard Specifications 14.09, which include measures to control dust. These requirements are outlined in Measures CON-AQ-1 through CON-AQ-4, CON-AQ-6, CON-AQ-9 through CON-AQ-11, CON-AQ-13, CON-AQ-14, and CON-AQ-17 in Section 3.24.2.13 of the RDEIR/SDEIS. Additionally, it is Caltrans standard practice to prepare and implement a Construction Site Health and Safety Plan to protect worker health and safety, including from airborne hazards. These measures would address worker health concerns related to airborne dust including airborne fungus (Valley Fever). However, as stated in Response to Comment L-24-2, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there is no potential for construction workers to be exposed to airborne dust including airborne fungus.

L-24-3

As discussed in Section 1.2.2 in Chapter 1.0, Proposed Project, of the RDEIR/SDEIS, one of the purposes of the project is to improve air quality and public health. As discussed in Section 3.13, Air Quality, in the RDEIR/SDEIS, all build alternatives would generally improve air quality and reduce public health risk. Along I-710, air quality would be improved and public health risk would be reduced at most locations, but there are a few near-roadway locations where there would be an increase in certain emissions. Should a build alternative be selected as the

Preferred Alternative, Measures AQ-2 and AQ-3 would reduce emissions at near-roadway locations. Measure AQ-2 would require filters on the ventilation systems of schools near I-710. Measure AQ-3 would require installation of solid barriers where feasible and where soundwalls are not proposed, and installation of vegetation to disperse pollution and reduce pollutant concentrations downwind. Additionally, the build alternatives include programmatic components that would be implemented to help improve air quality and public health in the I-710 Corridor. The I-710 Corridor Community Health Benefit Program is a programmatic component of the build alternatives and would take the form of a grant program structured to provide corridor communities the opportunity to implement projects or outreach activities that would improve air quality and public-health related to I-710 travel and goods movement. Projects falling into three broad categories would be eligible and considered for funding under the program: (1) air quality improvement and/or noise reduction measures at local schools and other sensitive receptors or related sites, (2) health education, outreach, and screening, and (3) greenhouse gas (GHG) reduction through projects such as renewable power, energy efficiency, and tree-planting, etc. However, as stated in Response to Comment L-24-2, the No Build Alternative has been selected as the Preferred Alternative. Therefore, no mitigation is necessary to minimize exposure to sensitive receptors affected by near roadway air quality impacts as a result of the Preferred Alternative.

L-24-4

As stated in Response to Comment L-24-2, the No Build Alternative has been selected as the Preferred Alternative. Therefore, Measure AQ-2, will not be necessary and will not be implemented. However, it should be noted that the RDEIR/SDEIS and this Final EIR/EIS does not assume or rely upon any specific reduction effectiveness standard or on non-PM reductions. Moreover, this measure specifically refers to schools as sensitive facilities.

L-24-5

As stated in Measure AQ-3, should a build alternative be selected as the Preferred Alternative, solid barriers and vegetation could reduce PM emissions by up to 50 percent, but the RDEIR/SDEIS does not quantify emission reductions associated with these. As stated in Response to Comment L-24-2, the No Build Alternative has been selected as the Preferred Alternative. Therefore, Measure AQ-3 will not be necessary and will not be implemented.

L-24-6

Section 3.13.3.4, Public Health Considerations, of the RDEIR/SDEIS includes a subsection “Ultrafine Particulates – Qualitative Analysis” which discusses the health impacts of ultrafine particles (UFP) and the potential health impacts due to UFPs for the build alternatives. The analysis found that the public’s exposure to ultrafine particles in the vicinity of the I-710 freeway would reduce in 2035 as compared to 2012 for the build alternatives and for the No Build

Alternative. Further, the implementation of either build alternative (Alternative 5C or 7) would result in lower UFP exposure (near the I-710 freeway) as compared to the No Build Alternative. As stated in Section 3.13.4 of the RDEIS/SDEIS, should a build alternative be selected as the Preferred Alternative, Mitigation Measure AQ-2 would provide for the installation of high-efficiency filters in schools located within 0.25 mile of the I-710 freeway that currently lack such filtration systems. However, as stated in Response to Comment L-24-2, the No Build Alternative has been selected as the Preferred Alternative. Therefore, Measure AQ-2 will not be implemented.

L-24-7

Section 3.3, Community Impacts, of the RDEIR/SDEIS took into account the displacement of vital community facilities in determining the effect on community cohesion from the build alternatives. Due in part to community feedback, the No Build Alternative has been selected as the Preferred Alternative and the DaVita Doctors Dialysis Center would not be displaced. It should be noted that a Health Impact Assessment (HIA) was not prepared for the I-710 Corridor Project; however, each resource section of Chapter 3.0 of the RDEIR/SDEIS and this Final EIR/EIS includes a "Public Health Considerations" subsection in which public health pathways are identified and discussed.

L-24-8

Section 3.4.2.2 of the RDEIR/SDEIS includes information on the major underground oil and gas pipelines, and other utility facilities, that could be affected by the build alternatives. With implementation of Measure HW-6 in Section 3.12.4, should a build alternative be selected as the Preferred Alternative, a Construction Contingency Plan would be developed and implemented in the event that unidentified hazardous wastes are discovered during construction. However, as stated in Response to Comment L-24-2, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there will not be a potential for the accidental release of crude oil or other chemicals present at oil and gas facilities during construction.

L-24-9

It should be clarified that the EPA noise guidance referenced in the comment "represent averages of acoustic energy over periods of time such as 8 hours or 24 hours, and over long periods of time such as years"[4] [emphasis added]. As construction of the build alternatives

[4] U.S. Environmental Protection Agency. EPA Identifies Noise Levels Affecting Health and Welfare, press release April 2, 1974. Website: https://archive.epa.gov/epa/aboutepa/epa-identifies-noise-levels-affecting-health-and-welfare.html (accessed July 18, 2018).

would be temporary, and Caltrans would require the construction contractor to comply with the 86 dBA threshold (as well as any other applicable local ordinances and identified avoidance, minimization, and/or mitigation measures), hearing loss would not occur. However, as stated in Response to Comment L-24-2, the No Build Alternative has been selected as the Preferred Alternative. Therefore, hearing loss will not occur at sensitive receptors.

L-24-10

As stated in Response to Comment L-24-2, the No Build Alternative has been selected as the Preferred Alternative. Therefore, a more specific analysis of construction noise impacts and identification of mitigation measures is not necessary.

L-24-11

Caltrans' Noise Study Reports are based entirely on state and Federal policies as set forth in the Caltrans Traffic Noise Analysis Protocol (codified at 23 CFR 772). Funding mechanisms not addressed in 23 CFR 772 are beyond the scope of the Noise Study Report. Noise abatement measures such as rubberized asphalt concrete are not federally approved and were therefore not considered in the Noise Study Report or Noise Abatement Decision Report.

A tolling element as part of Alternative 6C was evaluated in the Draft EIR/EIS circulated for public review in 2012; however, that alternative has since been withdrawn from consideration. Changing of Port gate hours is solely the jurisdiction of the Ports of Los Angeles and Long Beach, not Metro or Caltrans.

While a health risk assessment was performed as part of the air quality analysis for the I-710 Project, the preparation of an HIA is beyond the scope of this EIR/EIS and was not considered at the time this document was prepared. However although the No Build Alternative has been selected as the Preferred Alternative, Metro has embarked on the I-710 Soundwall Program, which is currently implementing the construction of soundwalls along I-710 as early action projects. In addition, should a build alternative be selected as the Preferred Alternative, air quality improvement projects selected for funding under the I-710 Community Health Benefit Program, such as replacement and sealing of windows and doors, could also have a beneficial effect with regard to noise reduction. Please note that the No Build Alternative has been selected as the Preferred Alternative and therefore, the programmatic elements of the build alternatives, such as the Community Health Benefit Program, will not be implemented by Caltrans as the Lead Agency under CEQA and NEPA and as the owner/operator of the I-710 freeway. Prior to selection of the No Build Alternative, the description of the Community Health Benefit Program was being further defined including information regarding administration of the program, eligible projects, and project selection criteria.

L-24-12

It is important to note that the RDEIR/SDEIS analyzed the noise impacts that would occur as a result of the proposed project, in accordance with CEQA guidelines 15002(a)(1), which states that the basic purpose of CEQA is to inform decisionmakers and the public about the potential, significant environmental effects of proposed activities. In this case, the activity being analyzed is the proposed project as described in Chapter 2.0, Project Alternatives, of this Final EIR/EIS. Caltrans and Metro agree with the commenter's statement that the expanded noise study or HIA would be beyond the scope of CEQA; moreover, this type of analysis is not something that should be undertaken by a transportation agency. However, as stated in the Response to Comment L-24-11, Metro has been implementing the construction of soundwalls along I-710 as part of the I-710 Soundwall Program.

L-24-13

Per the Caltrans Technical Noise Supplement (September 2013), vehicle noise consists of four primary subsources: mechanical noise, exhaust noise (stack exhaust on heavy trucks), tire/pavement noise, and aerodynamic noise (at high speeds). Stricter EPA standards initiated in the 1970s have lowered mechanical and exhaust noise subsources. At highway speeds, tire/pavement noise affects total vehicle noise to a greater extent than all the other subsources combined. Whereas zero-emission trucks would emit less mechanical and exhaust noise, the predominant noise source, tire/pavement noise, would remain. Therefore, noise levels would not be substantially reduced if ZE/NZE trucks exclusively traveled on I-710. Additionally, there is currently no traffic noise prediction model that can separate or filter the different subsources to clearly determine the contributions of each noise subsource.

October 23, 2017

Mr. Ronald Kosinski
Division of Environmental Planning
Department of Transportation, District 7
100 South Main Street, MS-16A
Los Angeles, CA 90012

Dear Mr. Kosinski:

RECIRCULATED DRAFT ENVIRONMENTAL IMPACT REPORT (RDEIR)/ SUPPLEMENTAL DRAFT ENVIRONMENTAL IMPACT STATEMENT (SDEIS) INTERSTATE 710 (I-710) CORRIDOR PROJECT (PROJECT)

Thank you for the opportunity to review and respond to the RDEIR/SDEIS for the proposed project. The project's Draft EIR/EIS was previously circulated in June 2012. Based on additional information and public comments, a new set of build alternatives includes Alternative 1 (No Build), Alternative 5C (Modernization of I-710) and Alternative 7 (Modernization and Addition of a Clean-Emission Freight Corridor) were analyzed and included in the project's RDEIR/SDEIS.

The following comments are for your consideration:

1. Traffic

1.1. The following general comments apply to the RDEIR and the Traffic Impact Analysis (TIA):

1.1.1. Intersections with shared or 100 percent jurisdiction within unincorporated County will need to be analyzed with Intersection Capacity Utilization methodology and determine and mitigate impacts based on County of Los Angeles Department of Public Works (Public Works) guidelines for traffic impacts. L-25-1

1.1.2. Include language in the programmatic improvements in the RDEIR and TIA that any parking restrictions along Atlantic Boulevard, Garfield Avenue, and Eastern Avenue, within the unincorporated County area, will need to be reviewed and approved by Public Works and the residents/property owners on the affected roadways. L-25-2

1.1.3. Include language in the programmatic improvements in the RDEIR and TIA that any changes to timing and equipment on unincorporated County traffic signal infrastructure will need to be reviewed and approved by the Public Works. L-25-3

1.1.4. Provide Intersection Control Evaluation reports for all non-signalized study intersections or proposed local interchanges within the unincorporated County area. L-25-4

1.1.5. Incorporate the revised land uses from the East Los Angeles 3rd Street Specific Plan for the unincorporated East Los Angeles area into the traffic models for the affected unincorporated County areas. L-25-5

1.1.6. Provide conceptual plans for all mitigations within the unincorporated County area. L-25-6

1.1.7. The following unincorporated County intersection mitigations are not feasible within existing road right of way per Public Works design practices; provide alternative mitigations: L-25-7

- Third Street at Gage Avenue
- Ford Boulevard at Third Street

1.2 The following comments relate to the RDEIR:

1.2.1 Page 29 - The Traffic Management Plan to mitigate construction impacts will need to be reviewed and approved by Public Works if the Traffic Management Plan would affect unincorporated County roadways. L-25-8

1.2.2. Table 3.5-7 should be updated to reflect the following intersections as shared jurisdiction with the County of Los Angeles:

- Intersection 33 – Del Amo Boulevard at Alameda Street
- Intersection 34 – Del Amo Boulevard at Santa Fe Avenue
- Intersection 50 – Rosecrans and Atlantic Avenue
- Intersection 63/631 – Florence Avenue at Alameda Street
- Intersection 111 – I-710 southbound on/off ramp at Del Amo Boulevard
- Intersection 149 – Pacific Avenue at Florence Avenue
- Intersection 161 – Del Amo Boulevard at Susana Road
- Intersection 178 – Bandini Boulevard at Downey Road
- Intersection 210 – I-710 southbound Del Amo Boulevard and Susana Road
- Intersection 513 – SR 91 eastbound on/off ramp at Santa Fe Avenue

L-25-9

1.2.3. Table 3.5-7 should be updated to reflect the following intersections as not being shared jurisdiction with the County of Los Angeles:

- Intersection 68/681 – Slauson Avenue at Alameda Street
- Intersection 76 – Alameda Street at Washington Boulevard

L-25-10

1.3. The following comments relate to the TIA dated March 2017:

1.3.1. Figure 2-1 - Provide average daily traffic volumes and impact evaluation for the following roadway segments:

- Santa Fe Avenue between Del Amo Boulevard and Artesia Boulevard
- Alameda Street between Del Amo Boulevard and Artesia Boulevard
- Atlantic Avenue between Florence Avenue and Firestone Boulevard
- Ford Boulevard, Arizona Avenue between Whittier and Cesar Chavez Avenue
- 3rd Street between Indiana Street and Atlantic Avenue
- Indiana Street between Cesar Chavez Avenue and Olympic Boulevard

L-25-11

- Cesar Chavez between Eastern Avenue and Atlantic Avenue
- Eastern Avenue between Olympic Boulevard and Cesar Chavez Avenue
- Atlantic Avenue between Pomona Boulevard and Whittier Boulevard

L-25-11

1.3.2. Figure 2.2b – Add the following intersections to the study:

- Atlantic Avenue at Pomona Boulevard
- Atlantic Avenue at Whittier Boulevard
- Atlantic Avenue at Olympic Boulevard
- Indiana Street at Cesar E Chavez Avenue
- Downey Road at the 60 Freeway on/off ramps
- Third Street at Mednik Avenue
- Third Street at the 60 westbound on/off ramp
- Atlantic Boulevard at the 60 eastbound on/off ramp
- Atlantic Boulevard at the 60 westbound on/off ramp

L-25-12

1.3.3. Section 2.2.2.1 – Study Intersections – Signalized Intersections

Revise average cycle lengths within the unincorporated County area to be 120 seconds. L-25-13

1.4. The following comments relate to Design Options 3A/3B:

1.4.1. Provide Intersection Control Evaluation reports for all local interchanges within the unincorporated County areas directly affected by these design options. L-25-14

1.4.2. Due to the increased traffic at the Ford Boulevard at I-710 northbound on/off ramp, provide a study to determine if exclusive left- and right-turn lanes are required for the intersection. L-25-15

1.4.3. Determine left-turn queue length requirements for the new Whittier Boulevard at I-710 southbound on/off ramp and the Whittier Boulevard at Eastern Avenue left-turn queue length requirements to ensure left-turn queues do not spill over onto through movement lanes to the adjacent intersection. L-25-16

1.4.4. Determine left-turn queue length requirements for the new Olympic Boulevard at I-710 southbound on/off ramp and the Ford Boulevard at Eastern Avenue left-turn queue length requirements to ensure left-turn queues do not spill over onto through movement lanes to the adjacent intersection. L-25-17

If you have any questions regarding the traffic comments, please contact Mr. Kent Tsujii of Public Works' Land Development Division at (626) 300-4776 or ktsujii@dpw.lacounty.gov.

2. General

2.1. Alternative 7 of the REIR should include any impacts and mitigations required for the Los Angeles River Bike Trail. L-25-18

2.2. The REIR should include any impacts and mitigations required for the loss of street parking capacity along Atlantic Boulevard for any alternative that includes bus rapid transit service along Atlantic Boulevard. L-25-19

3. Please refer to the enclosed letters that outline additional project impacts to Public Works and the Los Angeles County Flood Control District at the Dominguez Gap and Deforest Treatment Wetlands and Los Angeles River and Rio Hondo Trail locations. The RDEIR/SDEIS must reflect design changes as a result of these comments.

If you have any other questions or require additional information, please contact Mr. Toan Duong of Public Works' Land Development Division at (626) 458-4910 or duong@dpw.lacounty.gov.

Very truly yours,

MARK PESTRELLA

Mr. Ronald Kosinski
Division of Environmental Planning
Department of Transportation, District 7
100 South Main Street, MS-16A
Los Angeles, CA 90012

Dear Mr. Kosinski:

DOMINGUEZ GAP AND DEFOREST TREATMENT WETLANDS IMPACTS (DGDTW) INTERSTATE 710 CORRIDOR PROJECT

Thank you for reaching out to the Los Angeles County Department of Public Works (Public Works) regarding possible impacts to improvements within the County's jurisdiction. This is in response to your letter dated July 19, 2017 (copy enclosed), outlining the I-710 project impacts on the DGDTW.

The following Public Works comments are for your consideration:

1. General Permits:

    1.1. Work within the Los Angeles County Flood Control District (LACFCD) right of way or County road right of way may require a LACFCD or County road permit, respectively.

    1.2. Storage of construction materials within LACFCD right of way or County road right of way is prohibited unless explicitly permitted.

    1.3. Any proposed alternative routes or detours for the trails that are anticipated to be closed for the implementation of the proposed project may require a LACFCD or County road permit depending on the proposal. A preliminary site plan depicting the proposed alternative routes or detours shall be submitted to Public Works' Land Development Division, Encroachment Permits

and Inspection Section, to assess if a permit and corresponding traffic/pedestrian/detour control plans will be required. If so, an approved traffic/pedestrian/detour control plan will be required prior to any permit issuance. Review and approval of traffic/pedestrian/detour control plans will be coordinated through Land Development Division's Encroachment Permits and Inspection Section. Permit fees may be required.

For County road permit information or if you have any questions, please contact Mr. Juan Sarda at (626) 458-4921 or jsarda@dpw.lacounty.gov.

2. Dominguez Gap West Basin

2.1. General

2.1.1. For RDEIR/SDEIS Alternative 7, the basin will be reduced from 13.3 acres to 9.54 acres. Given the proposed reduction of size of the west basin and the lower percolation rates as a result of the retaining wall foundation, it is very likely that the basin will no longer serve as an effective groundwater recharge facility. Caltrans/Metro should provide land of equal or greater value that provides effective groundwater recharge to replace the net loss of 3.76 acres to the LACFCD and replace any additional loss of groundwater recharge capability due to the proposed basin design features such as the retaining wall foundation. This shall be included as a mitigation in the RDEIR/SDEIS for Alternative 7.

2.1.2. The southern basin belongs to the City of Long Beach and is not considered part of the Dominguez West Basin.

2.2. Basin Design Considerations for Alternative 7

2.2.1. Provide an access road to the bottom of the basin.

2.2.2. Vandalism (graffiti) will be a concern with a 40-foot-high retaining wall. Mitigations and maintenance should be addressed in the environmental documents.

2.2.3. Replace any basin level recorder and accompanying flow recorder impacted by construction.

2.2.4. Existing storm drain outflow pipes connected to the Long Beach basin would need to be relocated to outfall elsewhere. Direct storm drain flows are generally not permitted into spreading grounds.

2.2.5. For the proposed basin, the relative narrowness of the southern portion and the proposed retaining wall for the proposed freight corridor and LA River channel would make the facility difficult to maintain. Caltrans/Metro should provide an alternative to provide adequate maintenance access for the water conservation basin.

3. DeForest Market Street Basin

3.1. There is an existing conduit connection under North Long Beach Boulevard that connects the northern and southern DeForest basins. Storm flows are ultimately directed to the Market Street Pump Station, which discharges to the Los Angeles River. The proposed reconstruction and construction staging should ensure that storm flows can still pass from the north basin to the south basin. If storm flows are restricted from passing, the northern basins have no other outlet and could potentially flood the adjacent neighborhoods to the east. Additionally, the area taken up by the staging could potentially reduce the available storage provided by the existing basins.

Please provide more detailed plans and/or drawings to define the Temporary Construction Easement (TCE) for reconstructing North Long Beach Boulevard. The TCE plan should avoid the impacts stated above and/or provide analysis showing the flood capacity of the basin is maintained during storms.

3.2. Public Works needs vehicular access to the Market Street Pump Station at all times via the Los Angeles River east side maintenance access road between Long Beach Boulevard and Del Amo Boulevard. The RDEIR/SDEIS should disclose how access will be maintained.

If you have any questions regarding comments 2 and 3 above, please contact Mr. Ryan Butler at (626) 458-4331 or rbutler@dpw.lacounty.gov.

If you have any other questions or require additional information, please contact Mr. Toan Duong of Land Development Division at (626) 458-4910 or duong@dpw.lacounty.gov.

Very truly yours,

MARK PESTRELLA
Director of Public Works

July 19, 2017

Mark Pestrella, Director
Los Angeles County Department of Public Works
900 South Fremont Avenue
Alhambra, CA 91803

Dear Mr. Pestrella,

This letter is regarding the proposed impacts on the Dominguez Gap and DeForest Treatment Wetlands as a result of the Interstate 710 (I-710) Corridor Project (project). Under Section 4(f) of the United States Department of Transportation Act of 1966, these properties are considered a Section 4(f) resource. The project would require the permanent incorporation and temporary removal of land from the West Basin, and an expanded aerial easement and a temporary construction easement (TCE) on the DeForest Market Street Basin.

The project proposes to construct improvements from Ocean Boulevard in the City of Long Beach to State Route 60 (SR-60) in the City of Los Angeles. A Draft Environmental Impact Report/Environmental Impact Statement (EIR/EIS) was prepared for the project in 2012, which included the analysis of four build alternatives. Subsequent to public circulation of the Draft EIR/EIS, in response to new information and comments received from the public, a revised set of build alternatives were developed. The revised build alternatives under consideration include Alternative 5C (Modernize the I-710 Freeway) and Alternative 7 (Add Clean-Emission Freight Corridor [Truck-Only Lanes] Along I-710). A No Build Alternative is also under consideration.

As shown on **Figure 1**, Alternative 7 would require the removal of the entire West Basin (13.3 acres). However, only 5.4 acres along the western edge of the existing basin would be permanently incorporated into the transportation facility. The remaining 7.9 acres of the basin would be restored in the same location following construction. The temporary removal and restoration of this 7.9-acre area would constitute a temporary occupancy of this portion of the basin.

An additional 1.64 acres outside of the existing basin would also be added to the restored basin area, for a total basin area of 9.54 acres. Therefore, Alternative 7 would result in an overall net loss of 3.76 acres of the existing basin area, which would constitute a permanent use of this portion of the basin. Recreational trails around the basin would be restored following construction.

While the basin would be reduced in size from 13.3 acres to 9.54 acres, the new basin would serve a similar function as the existing basin, and recreational activities would still be available on the property. Temporary closures of the recreational trails around the basin would be required during construction. However, because the recreational trails around the basin would be restored following construction, the permanent use and temporary occupancy of a portion of the basin is not expected to adversely affect the activities, features, and attributes that qualify the resource for protection under Section 4(f).

The build alternatives would require the construction of a wider bridge over the DeForest Market Street Basin at North Long Beach Boulevard, requiring an expanded bridge and aerial easement that is 0.95 acre wider than the existing bridge and easement. The proposed bridge and aerial easement would not be substantially wider than the existing bridge and easement, and would therefore not be expected to result in substantial visual impacts. The wider aerial easement would not interfere with any of the activities, features, or attributes of any recreational activities beneath the bridge, and would not result in any proximity impacts that would substantially impair the resource. Therefore, the wider aerial easement would not constitute a use under Section 4(f).

The build alternatives would require 0.95 acre of the DeForest Market Street Basin for a TCE during project construction, which would constitute a temporary occupancy of a portion of the basin. The TCE area would be required to construct the wider bridge over the basin at North Long Beach Boulevard, and to restore a maintenance access road to Del Amo Boulevard. The basin would be used for construction staging, materials storage, parking of construction equipment and worker vehicles, light grading, and other similar activities. The construction activities in the TCE area would not result in any permanent adverse physical impacts in that area, and the temporary occupancy would not interfere with the protected activities, features, or attributes of that portion of the basin on a temporary or permanent basis. The area used for the TCE would be returned to the Los Angeles County Department of Public Works (LACDPW) in a condition which as at least as good as that which existed prior to the project. Because impacts in the basin would be temporary, the temporary occupancy of a portion of the basin is not expected to adversely affect the activities, features, and attributes that qualify the basin for protection under Section 4(f).

With implementation of mitigation measures, the permanent use and temporary occupancy of a portion of the Dominguez Gap and DeForest Treatment Wetlands would not adversely affect the activities, features, and attributes of the 4(f) resource. Therefore, Caltrans intends to make a *de minimis* determination for the permanent use and temporary occupancy of a portion of the Dominguez Gap and DeForest Treatment Wetlands.

Caltrans is initiating consultation and coordination with your agency to determine use and ensure that all reasonable measures to minimize harm have been considered. In addition, because Caltrans intends to make a *de minimis* determination for the permanent use and temporary occupancy of a portion of the Dominguez Gap and DeForest Treatment Wetlands, Caltrans is seeking your written concurrence that the project would not adversely affect the activities, features, and attributes that qualify the properties for protection under Section 4(f).

The revised build alternatives, Alternative 5C and Alternative 7, have been evaluated in a joint Recirculated Draft Environmental Impact Report/Supplemental Draft Environmental Impact Statement (RDEIR/SDEIS). The RDEIR/SDEIS, which includes the Section 4(f) evaluation, will be circulated for a 60-day public review period. The United States Department of Transportation Act mandates a minimum of 45 days for receipt of comments regarding Section 4(f) impacts. If comments are not received from your agency by October 9, 2017, a lack of objection may be assumed and the process may proceed to a final evaluation.

The Section 4(f) Evaluation is found in Appendix B of the RDEIR/SDEIS and may be viewed on July 21, 2017 at the following website:

http://www.dot.ca.gov/d7/env-docs/

If you should have any questions or would like to arrange a meeting to discuss further, please contact Jason Roach of my staff at (213) 897-0357 or jason.roach@dot.ca.gov.

Sincerely,

RON KOSINSKI

Los Angeles, CA 90012

Dear Mr. Kosinski:

LOS ANGELES RIVER AND RIO HONDO (LARIO) TRAILS
INTERSTATE 710 CORRIDOR PROJECT

Thank you for reaching out to the Los Angeles County Department of Public Works (Public Works) regarding possible impacts to improvements within the County's jurisdiction. This is in response to your letter dated July 19, 2017 (copy enclosed), outlining the I-710 project impacts on LARIO trails.

The following Public Works comments are for your consideration:

1. General Permits:

    1.1. Work within the Los Angeles County Flood Control District (LACFCD) right of way or County road right of way may require a LACFCD or Public Works Road permit, respectively.

    1.2. Storage of construction materials within LACFCD right of way or County road right of way is prohibited unless explicitly permitted.

    1.3. Any proposed alternative routes or detours for the trails that are anticipated to be closed for the implementation of the proposed project may require a LACFCD or County road permit depending on the proposal. A preliminary site plan depicting the proposed alternative routes or detours shall be submitted to Public Works' Land Development Division, Encroachment Permits

and Inspection Section, to assess if a permit and corresponding traffic/pedestrian/detour control plans will be required. If so, an approved traffic/pedestrian/detour control plan will be required prior to any permit issuance. Review and approval of traffic/pedestrian/detour control plans will also be coordinated through Land Development Division's Encroachment Permits and Inspection Section. Permit fees may be required.

For County road permit information or if you have any questions, please contact Mr. Juan Sarda at (626) 458-4921 or jsarda@dpw.lacounty.gov.

2. LARIO Trails

2.1. During construction, all trails along LARIO Channel shall remain open to Public Works maintenance personnel and provide necessary vehicular access to the channels for flood control operation and maintenance. Please provide a detailed access plan to Public Works and include construction alternatives that provide access along these trails in the Recirculated Environmental Impact Report.

If you have any questions regarding comment 2 above, please contact Mr. Ryan Butler at (626) 458-4331 or rbutler@dpw.lacounty.gov.

If you have any other questions or require additional information, please contact Mr. Toan Duong of Land Development Division at (626) 458-4910 or duong@dpw.lacounty.gov.

Very truly yours,

MARK PESTRELLA

Making Conservation a California Way of Life.

July 19, 2017

Mark Pestrella, Director
Los Angeles County Department of Public Works
900 South Fremont Avenue
Alhambra, CA 91803

Dear Mr. Pestrella,

This letter is regarding the proposed impacts on the Los Angeles River and Rio Hondo Trails (LARIO Trail) as a result of the Interstate 710 (I-710) Corridor Project (project). Under Section 4(f) of the United States Department of Transportation Act of 1966, this park property is considered a Section 4(f) resource. The project would require temporary closures of portions of the trails during construction.

The project proposes to construct improvements from Ocean Boulevard in the City of Long Beach to State Route 60 (SR-60) in the City of Los Angeles. A Draft Environmental Impact Report/Environmental Impact Statement (EIR/EIS) was prepared for the project in 2012, which included the analysis of four build alternatives. Subsequent to public circulation of the Draft EIR/EIS, in response to new information and comments received from the public, a revised set of build alternatives were developed. The revised build alternatives under consideration include Alternative 5C (Modernize the I-710 Freeway) and Alternative 7 (Add Clean-Emission Freight Corridor [Truck-Only Lanes] Along I-710). A No Build Alternative is also under consideration.

As shown in **Figure 1**, the build alternatives would be constructed in proximity to the LARIO Trail, and would require short-term, temporary closures of trail crossings at I-710 and local streets during construction, which would constitute the temporary occupancy of a portion of the trail. There are numerous trail crossings in the study area, starting from East Ocean Boulevard in the south to Slauson Avenue in the north, and the temporary closures would occur along several local streets in between these southern and northern limits. These closures would be temporary and may range from a few days to several months in duration, depending on the project construction activities at a given trail crossing. Alternative/detour routes for the trails would be provided whenever a closure is needed.

The segments of the LARIO Trail at the affected crossings of I-710 and the local streets would be returned to their original condition and/or incorporate enhancements at the completion of construction, and would be reopened to public use. Because impacts on the trails would be temporary during construction, and measures

to minimize harm to the trail would be implemented, the temporary occupancy of a portion of the trail is not expected to adversely affect the activities, features, and attributes that qualify the trail for protection under Section 4(f).

With implementation of mitigation measures, the temporary occupancy of a portion of the LARIO Trail would not adversely affect the activities, features, and attributes of the 4(f) resource. Therefore, Caltrans intends to make a *de minimis* determination for the temporary occupancy of a portion of the LARIO Trail.

Caltrans is initiating consultation and coordination with your agency to determine use and ensure that all reasonable measures to minimize harm have been considered. In addition, because Caltrans intends to make a *de minimis* determination for the temporary occupancy of a portion of the LARIO Trail, Caltrans is seeking your written concurrence that the project would not adversely affect the activities, features, and attributes that qualify the property for protection under Section 4(f).

The revised build alternatives, Alternative 5C and Alternative 7, have been evaluated in a joint Recirculated Draft Environmental Impact Report/Supplemental Draft Environmental Impact Statement (RDEIR/SDEIS). The RDEIR/SDEIS, which includes the Section 4(f) evaluation, will be circulated for a 60-day public review period. The United States Department of Transportation Act mandates a minimum of 45 days for receipt of comments regarding Section 4(f) impacts. If comments are not received from your agency by October 9, 2017, a lack of objection may be assumed and the process may proceed to a final evaluation.

The Section 4(f) Evaluation is found in Appendix B of the RDEIR/SDEIS and may be viewed on July 21, 2017 at the following website:

http://www.dot.ca.gov/d7/env-docs/

If you should have any questions or would like to arrange a meeting to discuss further, please contact Jason Roach of my staff at (213) 897-0357 or jason.roach@dot.ca.gov.

Sincerely,

RON KOSINSKI

Deputy District Director, Division of Environmental Planning

Caltrans District 7

enclosure

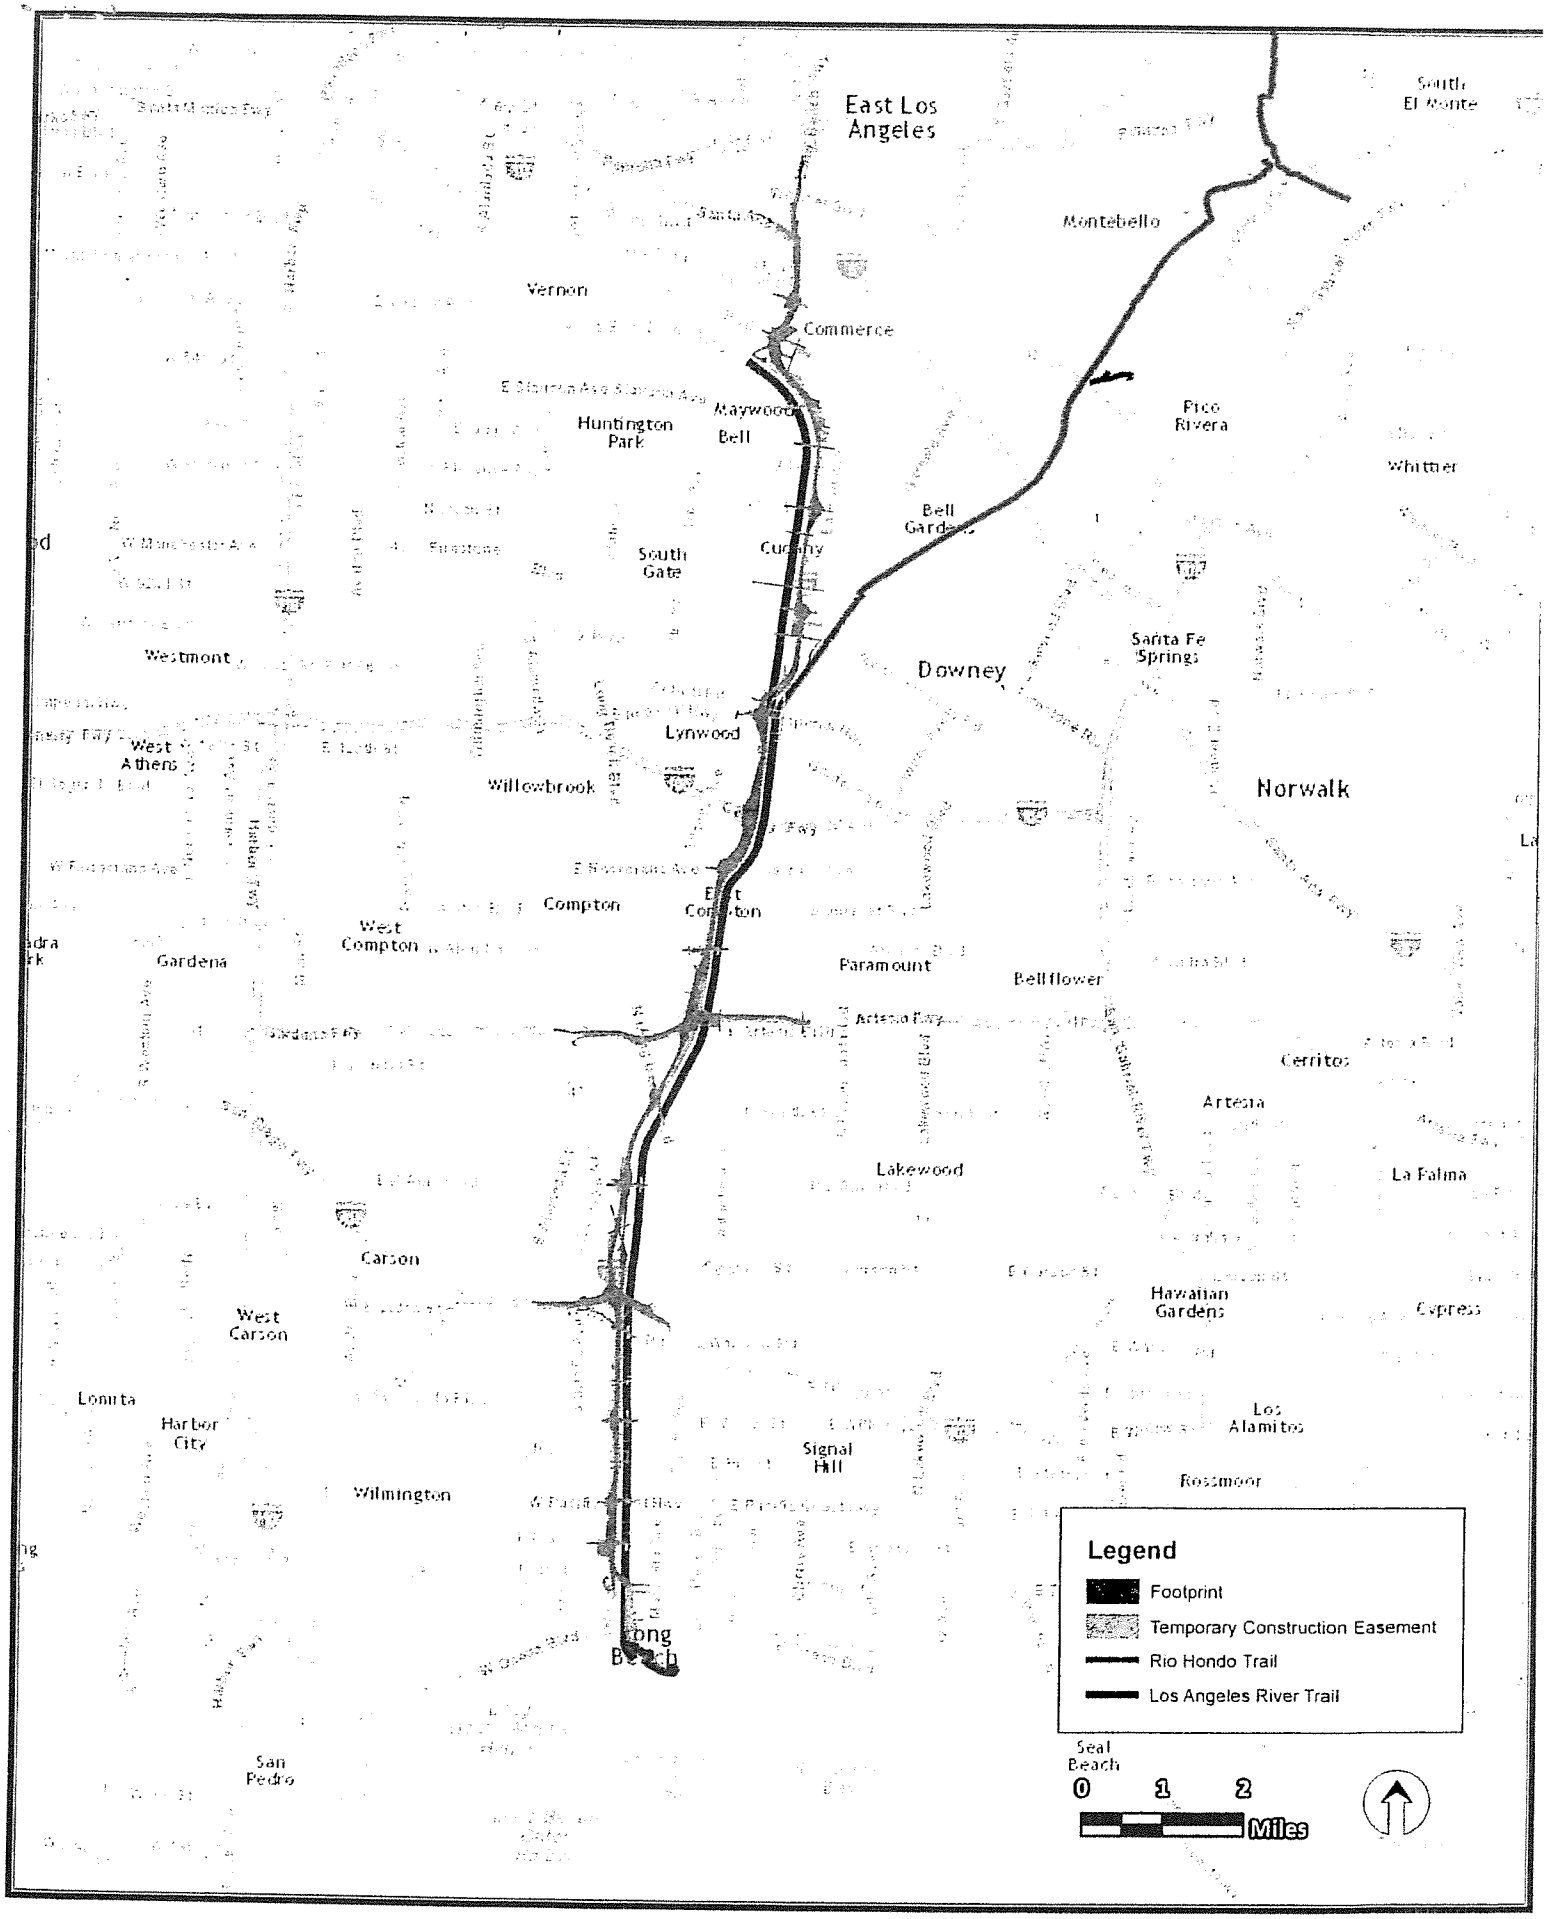

FIGURE 1. Temporary Closures of LARIO Trail
ALTERNATIVE 5C AND ALTERNATIVE 7

L-25-1

As the CEQA and NEPA lead agency, it is Caltrans' standard practice to utilize the Highway Capacity Manual (HCM) methodology as described in Chapter 11 through Chapter 13 of the Transportation Research Board's HCM 2010 to assess intersection performance. Intersection Level of Service (LOS) was calculated according to analysis methodologies described in the HCM. Section 3.5.3 of the RDEIR/SDEIS and Section 7, Project Impacts and Mitigation Measures, of the *Intersection Traffic Impact Analysis Report* (March 2017), described the criteria for determining impacts to arterial intersections. As lead agency, Caltrans is responsible for establishing the traffic impact determinations for the I-710 Corridor Project. With respect to the intersection impact analysis, the same methodology was uniformly applied for the intersections of all local jurisdictions that make up the I-710 Study Area for the purpose of determining project impacts and for identifying mitigation. This is appropriate given that each city has their own thresholds for their own local projects, which vary from city to city. The criteria established for the project, as described in Section 3.5.3.1 of the RDEIR/SDEIS and this Final EIR/EIS, were identified based on an examination of future (congested) travel conditions of the arterial network within the I-710 Study Area and Caltrans' project experience with other major freeway projects in Los Angeles County that are similar in scope and magnitude to the I-710 Corridor Project.

L-25-2

Please refer to Section 1.6, Arterial Parking Restrictions, for further discussion of parking details. Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), has identified Alternative 1 (No Build) as the Preferred Alternative. Therefore, these restrictions have been eliminated from further consideration. Please refer to Section 1.1 of this appendix for further discussion on the identification of the Preferred Alternative.

L-25-3

It is acknowledged that improvements or projects pursued under the I-710 Congestion Relief Program would be subject to the discretion of the local entity that has jurisdiction over these local roadway facilities. However, as stated in Response to Comment L-25-2, the No Build Alternative has been selected as the Preferred Alternative. Therefore, the I-710 Congestion Relief Program is no longer an element of the I-710 Corridor Project.

L-25-4

The Intersection Control Evaluation (ICE) process was conducted for all proposed local interchanges, including those within unincorporated County areas, and was part of the

geometric design development process and supporting technical documents. This information can be made available upon request.

L-25-5

The travel forecasts performed in support of the RDEIR/SDEIS were informed by the I-710 travel demand forecasting model, which was derived from the SCAG 2012 RTP/SCS regional travel demand forecasting model, and calibrated and validated for traffic in the I-710 Corridor. SCAG's 2012 RTP/SCS model utilizes population, employment, and housing socio-economic forecast data provided by the County of Los Angeles for the East Los Angeles area. Please refer to the *I-710 Corridor Project RDEIR/SDEIS Travel Demand Modeling Methodology Technical Memorandum* (June 2017) for additional detail. The I-710 travel demand forecasting model is a focused corridor-level traffic forecasting tool, and as such, at the appropriate level of detail to assess the traffic impacts at a corridor level for the environmental analyses. The development of the I-710 travel demand forecast model precedes the adoption of the East Los Angeles 3rd Street Specific Plan, which was finalized in November 2014. As stated in Response to Comment L-25-2, the No Build Alternative has been selected as the Preferred Alternative. Therefore, the traffic analyses conducted for the project does not need to be refined and the East Los Angeles 3rd Street Specific Plan, including specifics on land uses, will not be utilized as a reference document during final design.

L-25-6

Conceptual sketches illustrating the proposed mitigation measures at the impacted intersections were included as Appendix E to the *Intersection Traffic Impact Analysis Report* (March 2017). As stated in Response to Comment L-25-2, the No Build Alternative has been selected as the Preferred Alternative. Therefore, design plans for the proposed mitigation do not need to be provided to the County of Los Angeles.

L-25-7

The analyses presented in the RDEIR/SDEIS strived to develop and present the most appropriate mitigation taking into consideration right-of-way constraints, safety, and feasibility in implementing any proposed mitigations. As a key stakeholder, the Los Angeles County Department of Public Works is an important partner in the development of the overall I-710 Corridor Project. However, as stated in Response to Comment L-25-2, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there is no need for the proposed mitigation presented in the RDEIR/SDEIS.

L-25-8

Caltrans' development of a TMP document is inclusive, with the active participation of stakeholders as well as reviewing agencies such as the LACDPW. However, as stated in Response to Comment L-25-2, the No Build Alternative has been selected as the Preferred Alternative. Therefore, development of a TMP is not necessary.

L-25-9

Table 3.5-7 has been updated to reflect the referenced intersections as shared jurisdiction with the County of Los Angeles.

L-25-10

Table 3.5-7 has been updated to reflect the referenced intersections as not being shared jurisdiction with the County of Los Angeles.

L-25-11

The selection of the arterial roadway segments to include in the traffic analyses presented in the *Intersection Traffic Impact Analysis Report* (March 2017) was determined based upon the role that these major arterial roadways perform with regard to I-710 as well as the regional arterial network. Generally, contiguous north-south arterials of sufficient length that run parallel to the 19-mile I-710 Corridor, and the east-west arterials that have an interchange with I-710, were identified for evaluation as these regionally significant facilities would be most likely to show shifts in traffic volumes related to circulation changes on I-710 generated by the build alternatives.

However, the traffic impact thresholds focus on the study intersections, as that is where the delay to motorists using the arterial network typically occurs, and where the quantitative traffic analysis is most sensitive to changes in traffic flows and traffic movements associated with the build alternatives. A detailed discussion of intersection impact thresholds and methodologies can be found in Section 2.2 and Section 7 of the *Intersection Traffic Impact Analysis Report*, and was summarized in Section 3.5.3.1 of the RDEIR/SDEIS and this Final EIR/EIS. Nearly 200 intersections were evaluated throughout the I-710 Study Area in the RDEIR/SDEIS. The selected intersections were originally identified with the consent and approval of the I-710 TAC in 2009. This list of selected intersections was increased based on comments received on the Draft EIR/EIS circulated for public review in 2012, including comments from LADPW, and the list was reaffirmed by the I-710 TAC prior to initiating updated traffic forecasting and analysis work for the RDEIR/SDEIS.

L-25-12

The list of intersections that were analyzed was updated based on the findings of the Draft EIR/EIS circulated for public review in 2012, and was reaffirmed by the I-710 TAC prior to initiating work on the RDEIR/SDEIS. The main purpose of the proposed freeway improvements included in the build alternatives are to address congestion, design deficiencies, traffic operations, and safety concerns on I-710 as well as related air quality issues associated with the I-710 freeway, as discussed in detail in Section 1.2 of the RDEIR/SDEIS. Over 185 intersections were evaluated as part of this process to determine if the proposed freeway project improvements of the build alternatives would result in traffic impacts to the arterial system, and if so, to identify measures to address those impacts. Approximately 24 of these analyzed intersections are located within East Los Angeles, more than any other local jurisdiction in the I-710 Study Area, with the exception of the City of Long Beach. Nearly half of the I-710 Corridor is located in the City of Long Beach.

L-25-13

For arterial intersections, a cycle length of 100 seconds was used in the analysis. For the traffic analysis conducted in support of the RDEIR/SDEIS, different assumptions were not utilized for different local jurisdictions so as to not bias the results. The intersections were assumed to be actuated and coordinated with the adjacent intersections, and therefore a uniform cycle length of 100 seconds was used throughout the network, with the exceptions of ramp intersections.

L-25-14

As stated in Section 1.1 of this appendix, Identification of a Preferred Alternative, Design Options 3A and 3B are no longer under consideration; however, the Intersection Control Evaluation (ICE) process was conducted for all proposed local interchanges, including those within unincorporated County areas and was part of the geometric design development process and supporting documents for the build alternatives and the design options. This information can be made available upon request.

L-25-15

Please refer to Response to Comment L-25-14. In addition, based on the Synchro analysis conducted for Intersection no. 129 (I-710 northbound on- and off-ramps at Ford Boulevard), the implementation of a traffic signal and related traffic controls that are included in the build alternatives for this intersection are sufficient to raise the LOS for this intersection from LOS F (under the No Build Alternative) to an acceptable level of service (LOS D) under Alternative 5C. These detailed Synchro worksheets can be found in the Appendices of the *Intersection Traffic Impact Analysis Report* (March 2017). It should be noted that, since the No Build Alternative has

been selected as the Preferred Alternative, Intersection No. 29 would operate at LOS F and no mitigation would be provided.

L-25-16

Please refer to Response to Comment L-25-14. In addition, detailed ramp intersection queuing analysis was provided in the *I-710 Corridor Project Traffic Operations Analysis Report* (Traffic Operations Analysis Report) (March 2017). Table 7-47 of the Traffic Operations Analysis Report summarizes the queue lengths at the I-710 southbound ramps and Whittier Boulevard intersection.

L-25-17

Please refer to Response to Comment L-25-14. In addition, detailed ramp intersection queuing analysis was provided in the *I-710 Corridor Project Traffic Operations Analysis Report* (March 2017). Table 7-47 of the Traffic Operations Analysis Report summarizes the queue lengths at the I-710 southbound ramps and Olympic Boulevard/Eastern Avenue intersection.

L-25-18

Impacts and mitigation to the Los Angeles River Trail was discussed for both Alternatives 5C and 7 in Sections 3.1, Land Use, Section 3.24, Construction Impacts, and Appendix B, Section 4(f) Evaluation, of the RDEIR/SDEIS.

L-25-19

As stated in Response to Comment L-25-2, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there will be no elimination of existing on-street parking on Atlantic Boulevard to implement bus rapid transit service. Further, as discussed in Response to Comment L-25-2, arterial peak period parking restrictions are no longer proposed for the I-710 Corridor Project.

COUNTY OF LOS ANGELES
DEPARTMENT OF PARKS AND RECREATION
"Parks Make Life Better!"
John Wicker, Director Norma E. Garcia, Chief Deputy Director

October 23, 2017

Mr. Ronald J. Kosinski
Deputy District Director
California Department of Transportation
Division of Environmental Planning, Caltrans District 7
100 S. Main Street, MS 16A
Los Angeles, CA 90012

Dear Mr. Kosinski:

RECIRCULATED DRAFT ENVIRONMENTAL IMPACT REPORT (DEIR)/ SUPPLEMENTAL DRAFT ENVIRONMENTAL IMPACT STATEMENT (DEIS) AND SECTION 4(f) EVALUATION FOR THE INTERSTATE 710 CORRIDOR IMPROVEMENT PROJECT

The Department of Parks and Recreation (Department) has reviewed the I-710 Corridor Project Recirculated DEIR/Supplemental DEIS for potential impacts to the Departmental facilities including County multi-use trails. Please find below the Department's comments:

Build Alternative 5C:

- Based on the Department's review of the two build alternatives' impacts to Departmental facilities and County multi-use trails, Alternative 5C best accommodates current and future need for increased east-west connectivity in order to link communities located on either side of the I-710 Corridor and Los Angeles River. Build Alternative 5C includes five additional bike/pedestrian bridges, whereas only three are proposed for Alternative 7. While the Department recognizes the I-710 Freeway Corridor Project seeks a solution to current and future increases in vehicular and freight traffic volumes, Alternative 5C best balances these needs with demand for alternate modes of transportation and neighborhood interconnectivity. L-26-1

LA County Trails Website:

- Where most relevant/applicable in the DEIR/DEIS, include LA County Department of Parks and Recreation's Trails Website URL for reference: **www.trails.lacounty.gov**. L-26-2

Page 10, S.5.1.3 – Parks and Recreation Facilities

- Revise the second to last sentence as follows: The build alternatives would improve regional or local bikeways as well as multi-use trails (hiking, biking, equestrian) with the addition of three pedestrian/bicycle-only overcrossings under both build alternatives, and five total proposed overcrossings under Alternative 5C. L-26-3

Page 27, Traffic Circulation, Pedestrians, and Bicyclists

- Revise the last sentence as follows: In addition, construction of the build alternatives would result in temporary impacts to pedestrian and bicyclist access points to regional and local multi-use trails and bikeways (including the Los Angeles River and Rio Hondo Trails), and short-term closures of segments of bikeways in the vicinity of new and/or modified interchanges. L-26-4

Page 2-18, Pedestrian and Bike-only Bridges

- Please provide accommodations for equestrian users, in addition to pedestrian and bicyclists, on the bridges proposed to span the Los Angeles River and connect to the Los Angeles River Trail under Alternatives 5C & 7. L-26-5

Page 3.1-63, Local Multi-Use Trails

- Revise the approximate length of the Los Angeles River Trail from 9.9 miles to 9.57 miles. L-26-6

- Include the Rio Hondo River Trail (15.61 miles) in this section. L-26-7

Page 3.1-64,Table 3.1-3: Existing Parks and Recreation Facilities within 0.5 Miles of the I-710 Corridor Project Improvements

- Revise the Department's facilities as follows: L-26-8

Resource	Address	Amenities
East Rancho Dominguez ~~County~~ Park	15116 S. Atlantic Ave., City of Compton (County of Los Angeles)	East Rancho Dominguez ~~County~~ Park is a five-acre park owned and operated by the County of Los Angeles that offers a gymnasium, a large community building, tennis courts, lighted basketball courts, a picnic area with barbeque grills, and restrooms.
Los Amigos ~~Country Club~~ Golf Course	7295 Quill Dr., City of Downey (County of Los Angeles)	Los Amigos ~~Country Club~~ Golf Course is a public 18-hole golf course owned and operated by the County of Los Angeles that features 5,937 yards of golf from the longest tees for a par of 70. The facility includes a clubhouse.
Ruben F. Salazar Park	3864 Whittier Boulevard, County of Los Angeles (unincorporated East Los Angeles)	Ruben F. Salazar Park provides a baseball field, basketball courts, play area, community room, computer center, gymnasium, outdoor fitness station, picnic shelters, senior center, swimming pool, and a tennis court.
Eugene A. Obregon ~~County~~ Park	4021 East First Street, County of Los Angeles (unincorporated East Los Angeles)	Eugene A. Obregon Park provides basketball courts, ceramic rooms, community room, computer center, fitness zone, gymnasium, multi-purpose field, swimming pool and a walking path.
72nd Street Staging Area	550 72nd Street, City of Long Beach (County of Los Angeles)	The 72nd Street Arena and Park is a three acre hidden gem, adjacent to the Los Angeles River Trail that runs north to Santa Fe Dam Regional Park and south to Long Beach, ending at Lakewood boulevard near Carson Street. This multi-purpose facility includes a two-story announcer building used for viewing and judging of special events.

L-26-8

- Revise Hollydale Park as follows: Hollydale Park is a 56-acre community park built in 1976. The park is partially developed with a playground, lighted tennis courts, handball courts, softball fields with a backstop, an equestrian center, a volleyball court, open turf areas for soccer, one large picnic shelter, a parking lot, stair access to the bike path, and an ~~equestrian~~ multi-use trail along Los Angeles River. L-26-9

Page 3.1-78, Table 3.1-5: Permanent Direct and Indirect Impacts to Parks and Recreation Facilities

- Evaluate the 72nd Street Staging Area for potential direct and indirect impacts from the I-710 Corridor Project. L-26-10

Page 3.1-87, Paragraph 2

- Revise the sentence as follows: The build alternatives would not result in permanent adverse impacts to regional or local multi-use trails or bikeways. Beneficial impacts associated with the creation of bike overcrossings would be expected due to the creation of connectivity and access to local parks. L-26-11

Page 3.1-88, Park Access

- Please provide accommodations for equestrian users (in addition to pedestrian and bicyclists) on the overcrossings proposed to span the Los Angeles River and connect to the Los Angeles River Trail under Alternatives 5C & 7. L-26-12

Page 3.1-94, PR-17, PR-18, PR-19, & PR-20

- Please clarify that each measure will address impacts to both the Los Angeles River and Rio Hondo River multi-use trails and bikeways. It is important to note conditions currently exist along the Los Angeles River and Rio Hondo River Trails where the Department's multi-use trails run directly adjacent to the bikeways; where multi-use trails diverge and run parallel but separate to the bikeways; and conditions where the multi-use trails converge and combine with the bikeways, typically at undercrossings. L-26-13

Page 3.3-53, Motion 22.1

- Please provide accommodations for equestrian users (in addition to pedestrian and bicyclists) on the bridges proposed to span the Los Angeles River and connect to the Los Angeles River Trail under Alternatives 5C & 7. L-26-14

Page 3.5-50, Bicycle and Pedestrian Facilities

- Please include clarification that the Los Angeles River and Rio Hondo River multi-use trails exist independent of the Los Angeles River and Rio Hondo River bikeways. These two corridors may appear as though they are one combined trail corridor, but they are actually different and support different user groups. L-26-15

Page 3.5-106, Bicycle and Pedestrian Facilities

- Incorporate language that specifically mentions the equestrian community who utilize the Los Angeles River and Rio Hondo River multi-use trails, in addition to pedestrians and bicyclists. L-26-16

Page 3.5-107, Paragraph 3

- Revise the second sentence as follows: Bikeways and multi-use trails along the Los Angeles River will be maintained with the I-710 Corridor Project. L-26-17

Page 3.5-108

- Under the last bullet point, please provide accommodations for equestrian users (in addition to pedestrian and bicyclists) on the bridges/overcrossings. L-26-18

Page 3.17-12, Paragraph 2

- Revise the second sentence as follows: There is a multi-use ~~paved~~ recreational trail along the top of the east bank ~~both sides~~ of the Los Angeles River channel throughout the BSA. L-26-19

Page 3.24-5, Paragraph 4

- Revise the first sentence as follows: In addition, construction of either of the build alternatives would result in temporary impacts to equestrian, pedestrian and bicyclist access points to regional and local trails and bikeways (including the Los Angeles River Trail and the Rio Hondo Trail). L-26-20

Page 3.24-45, CON-PR-1, CON-PR-2, CON-PR-3, & CON-PR-4

- Please clarify that each measure will address impacts to both the Los Angeles River and Rio Hondo River multi-use trails and bikeways. There are conditions where the Department's multi-use trails run directly adjacent to the bikeways; conditions where the multi-use trails diverge and run parallel but separate to the L-26-21

bikeways; and conditions where the multi-use trails converge with the bikeways, typically at undercrossings. L-26-21

Page 3.24-48, CON-TR-1, Transportation Management Plan

- Revise the fourth bullet point as follows: Minimize detours and impacts to, and maintain connectivity for equestrians, pedestrians and bicyclists. L-26-22

Page 4-10

- Revise f) as follows: Would the project conflict with adopted policies, plans or programs regarding public transit, bicycle, equestrian or pedestrian facilities, or otherwise decrease the performance or safety of such facilities? L-26-23

In addition, a list of County multi-use trails and trail-related facilities that may be impacted by the project is provided below:

County facilities and trails potentially impacted by Alternative 5C or Alternative 7:

- Los Angeles River Trail at or near Willow Street
- Los Angeles River Trail at or near Wardlow Road
- Los Angeles River Trail at or near 405 Freeway and Pacific Place
- Los Angeles River Trail at or near West Del Amo Boulevard
- Los Angeles River Trail at or near Long Beach Boulevard
- Los Angeles River Trail at or near 91 Freeway
- Los Angeles River Trail at or near Alondra Boulevard
- Los Angeles River Trail at or near Imperial Highway
- Rio Hondo River Trail at or near Imperial Highway
- Rio Hondo River Trail at or near Garfield Avenue
- 72nd Street Staging Area

L-26-24

The Department requests that the project proponent notify the Department's Trail Planning Section a minimum of 60 days in advance of any work that may affect County multi-use trails including temporary trail closures. Construction activities affecting existing County multi-use trails may require a right-of-entry permit from this Department. At the conclusion of construction activities, County multi-use trails shall be restored to existing conditions consistent with the County of Los Angeles Trails Manual (http://file.lacounty.gov/SDSInter/dpr/208899_TrailsManual.pdf).

Thank you for including this Department in the review of this document. For further details regarding County multi-use trail requirements, please contact Ms. Michelle O'Connor, Section Head of Trails Planning Section, at (213) 351-5136 or by email at moconnor@parks.lacounty.gov, or Mr. Gabe Mason at (213) 351-5141 or by

email at gmason@parks.lacounty.gov. For inquiries on the right-of-entry permit from the Department, please contact Ms. Diane Thorne at (213) 351-5128 or by email at dthorne@parks.lacounty.gov.

Sincerely,

FOR Kathline J. King
Chief of Planning

KK:GM:JY:nr

This page intentionally left blank

L-26-1

Caltrans and Metro thank you for your comment. Your support for Alternative 5C is acknowledged and included in the project record. Please refer to Section 1.1 of this appendix for a discussion on the identification of the Preferred Alternative.

L-26-2

The Los Angeles County Department of Parks and Recreation's Trails website URL has been added as a footnote reference in Section 3.1.3.1 of this Final EIR/EIS.

L-26-3

As suggested in the comment, the cited text was revised to state that the build alternatives would improve regional or local bikeways as well as multi-use trails (hiking, biking, and equestrian) with the addition five total proposed overcrossings under Alternative 5C.

L-26-4

As suggested in the comment, the cited text was revised to state that construction of the build alternatives would result in temporary impacts to pedestrian and bicyclist access points to regional and local multi-use trails and bikeways (including the Los Angeles River and Rio Hondo Trails), and short-term closures of segments of bikeways in the vicinity of new and/or modified interchanges.

L-26-5

As discussed in Section 3.5.3.1 of the RDEIR/SDEIS, the build alternatives would provide facilities for bicycles and pedestrians in locations where local roadways are affected by construction of the build alternatives. Should a build alternative be selected as the Preferred Alternative, these facilities would be designed consistent with the local General Plan Circulation Element and would comply with ADA requirements. Equestrian use is allowed on roadways under the California Vehicle Code 21050, which states "Every person riding or driving an animal upon a highway has all of the rights and is subject to all of the duties applicable to the driver of a vehicle by this division and Division 10 (commencing with Section 20000), except those provisions which by their very nature can have no application." In general, the build alternatives would not preclude the use of roadways for equestrian use. However, it is important to note that the proposed bicycle/pedestrian-only bridges would employ enclosed, switchback ramp structures which would descend into neighborhoods on the west side of I-710 and which would be prohibitive for equestrian use, as they would not provide for separation of bicycle and equestrian use. It should also be noted that pavement requirements for bicycle travel are not

suitable for horses, as softer surfaces are required to avoid leg injuries.[5] However, Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), has identified Alternative 1 (No Build) as the Preferred Alternative. Therefore, the bicycle/pedestrian-only bridges will not be constructed and accommodations for equestrian users on the bridges that span the Los Angeles River and connect to the Los Angeles River Trail will not be included as part of the Preferred Alternative. Please refer to Section 1.1 of this appendix for further discussion on the identification of the Preferred Alternative.

L-26-6

As suggested in the comment, the approximate length of the Los Angeles River Trail was revised from 9.9 to 9.57 miles in Section 3.1 of the Final EIR/EIS.

L-26-7

As suggested in the comment, a discussion of Rio Hondo Trail was added to the Local Multi-Use Trails subsection of Section 3.1.3.1 of this Final EIR/EIS.

L-26-8

The parks and recreation facilities within Table 3.1-3 of this Final EIR/EIS have been revised as requested.

L-26-9

The description of Hollydale Park in Table 3.1-3 of this Final EIR/EIS has been revised as requested.

L-26-10

Section 3.1.3 of the Final EIR/EIS has been revised to include the 72nd Street Staging Area, as follows:

Table 3.1-3 has been revised to include the following text:

Resource	Address	Amenities
72nd Street Staging Area	550 72nd Street, City of Long Beach	The 72nd Street Staging Area is a 3-acre arena and park with a corral pen and bleacher area.

[5] Caltrans. *Highway Design Manual*, Section 1003.4.

Figure 3.1-3 has been revised to show the location of the 72nd Street Staging Area within the I-710 Focus Area. Improvements to the I-710 mainline and local arterials under the build alternatives would not result in direct impacts to the Staging Area, and the Staging Area would be separated from the I-710 mainline by the Los Angeles River and industrial land uses, which serve as a buffer that prevents indirect visual, noise, or air quality impacts on the resource. For these reasons, the 72nd Street Staging Area has not been included in Table 3.1-5 of this Final EIR/EIS.

L-26-11

As suggested in the comment, the cited text was revised to state that the build alternatives would not result in permanent adverse impacts to regional or local multi-use trails or bikeways.

L-26-12

Please refer to Response to Comment L-26-5 regarding the provision of accommodations for equestrian users (in addition to pedestrians and bicyclists).

L-26-13

As suggested in the comment, Measures PR-17 through PR-20 in Section 3.1 of this Final EIR/EIS were revised to clarify that they are applicable to the Los Angeles River and Rio Hondo River multi-use trails and bikeways (should a build alternative be selected as the Preferred Alternative).

L-26-14

Please refer to Response to Comment L-26-5 regarding the provision of accommodations for equestrian users (in addition to pedestrians and bicyclists).

L-26-15

As suggested in the comment, the Bicycle and Pedestrian Facilities section, the last subsection in Section 3.5.2.2 of this Final EIR/EIS was revised to clarify that the Los Angeles River and Rio Hondo River multi-use trails are independent of the Los Angeles River and Rio Hondo River bikeways.

L-26-16

As suggested in the comment, the Bicycle and Pedestrian Facilities subsection of Section 3.5.3.1 of this Final EIR/EIS was revised to discuss the equestrian community who utilize the Los Angeles and Rio Hondo River multi-use trails.

L-26-17

As suggested in the comment, the cited text was revised to state that bikeways and multi-use trails along the Los Angeles River would be maintained with the I-710 Corridor Project build alternatives.

L-26-18

Please refer to Response to Comment L-26-5 regarding the provision of accommodations for equestrian users (in addition to pedestrians and bicyclists).

L-26-19

As suggested in the comment, the cited text was revised to state there is a multi-use recreational trail along the top of the east bank of the Los Angeles River channel throughout the Biological Study Area (BSA).

L-26-20

As suggested in the comment, the cited text was revised to state construction of either of the build alternatives would result in temporary impacts to equestrian, pedestrian and bicyclist access points to regional and local trails and bikeways (including the Los Angeles River Trail and the Rio Hondo Trail).

L-26-21

As suggested in the comment, Measures CON-PR-1 through CON-PR-4 in Section 3.24 of this Final EIR/EIS were revised to clarify that they are applicable to the Los Angeles River and Rio Hondo River multi-use trails and bikeways (should a build alternative be selected as the Preferred Alternative).

L-26-22

As suggested in the comment, Measure CON-TR-1 in Section 3.24 of this Final EIR/EIS was revised to state that one of the objectives of the TMP would be to minimize detours and impacts to, and maintain connectivity for equestrians, pedestrians, and bicyclists (should a build alternative be selected as the Preferred Alternative).

L-26-23

Appendix G of the State CEQA Guidelines contains a checklist that is intended to encourage thoughtful assessment of impacts for each resource. CEQA allows lead agencies to use different formats; Caltrans has statewide jurisdiction and has determined that the CEQA

Checklist included as Appendix G is the State CEQA Guidelines is to be used on all Caltrans projects statewide. This checklist is also included on Caltrans' Standard Environmental Reference; the guide that is used for all Caltrans projects throughout the State. Therefore, checklist question XVI.F was not revised to add a reference to equestrians as suggested in the comment.

L-26-24

The County of Los Angeles Department of Parks and Recreation's request to be notified a minimum of 60 days in advance of any work or closures that may affect County multi-use trails, including the Los Angeles River Trail and Rio Hondo River Trail, is acknowledged and noted in the project record. However, as stated in Response to Comment L-26-5, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there will be no construction as a part of the I-710 Corridor Project and no need to notify the Department of Parks and Recreation as requested.

CITY OF LONG BEACH

DEPARTMENT OF PUBLIC WORKS

333 West Ocean Boulevard 9th Floor • Long Beach, CA 90802 • (562) 570-6383 • Fax (562) 570-6012

October 23, 2017

Mr. Ronald Kosinski
Deputy District Director
California Department of Transportation
District 7, Division of Environmental Planning
100 South Main Street, Mail Stop 16A
Los Angeles, CA 90012

Subject: I-710 Corridor Re-Circulated Draft Environmental Impact Report/ Environmental Impact Study Review Comments

Dear Mr. Kosinski:

The City of Long Beach (City) appreciates the opportunity to provide comments on the re-circulation of the Draft Environmental Impact Report/Environmental Impact Study (EIR/EIS) for the I-710 Corridor Project (Project).

The City continues to be in support of the project's primary goals of reducing congestion along the corridor, increasing safety and improving air quality while minimizing potential impacts. However, based on our review of the document, we are concerned that many goals of our existing and proposed community plans continue to not be adequately addressed. These includes the I-710 Community Livability Plan, Long Beach RiverLink, the General Plan Mobility Element and the Municipal Urban Stormwater Treatment facility (LB-MUST) which provide a framework for improvements in West Long Beach. Combined, these plans respond to the impacts of developments occurring throughout the City, especially the expansions at the Ports and related uses with the I-710 Freeway expansion, while taking into account environmental justice issues. Part of the City's engagement process with Caltrans and Metro over the last 5-years (since the last circulation in 2012) included identifying the following list of programs: L-27-1

1) Assemble, repurpose and reconfigure rights of way and utility easements for additional green space;
2) Revitalize the Los Angeles River and improve connectivity between the river and the surrounding neighborhoods;
3) Cap portions of the I-710 freeway for additional park space;
4) Improve Willow Street to accommodate a connection between the Green Line and the Blue Line at the Willow Station thereby completing the South Bay light rail loop;
5) Construct pedestrian/bicycle-only bridges across I-710 and the LA River; L-27-2
6) Deploy a "zero emission corridor" on Alameda Street;
7) Develop green infrastructure and water quality improvements; and
8) Plant more trees along the corridor, streets, and in open spaces.

These documents consist of projects that aim to expand and enhance open space, improve and protect the environment, increase mobility, implement complete street principles, improve public safety, improve stromwater runoff, promote urban forestry and encourage sustainable developments.

Herein, we have prepared comments on issues that are not satisfactorily addressed in the revised document, and continues to not meet the mark of balancing the goals of the project and the needs of the community.

- The proposed project includes permanent impacts to the existing Cesar E. Chavez Park along the eastern side of the Los Angeles River in Long Beach. It is essential that the I-710 project be consistent with the City's Cesar E. Chavez Park Integration Plan, which proposes substantial enhancements to the existing park and builds upon other proposed facilities, which include the Long Beach Municipal Urban Stormwater Treatment (MUST) Project and Shoemaker Bridge Replacement Project. The Shoemaker Bridge Replacement Project is identified as an Early Action Project within the RDEIR/SDEIS. The bridge replacement project would consist of the replacement of the Shoemaker Bridge over the Los Angeles River. Under both Build Alternatives 5C and 7, the existing Shoemaker Bridge would be demolished after construction of the new bridge. However, the build alternatives should consider leaving the existing bridge in place, to serve as beneficial use for recreational purposes and a key component of the Integration Plan. L-27-3 L-27-4

- The proposed arterial parking restrictions included under both build alternatives are unacceptable to the City of Long Beach. The proposed build alternatives would include restrictions on arterial parking along three roadways within the City of Long Beach: Atlantic Boulevard, Cherry Avenue, and Long Beach Boulevard. Little to no detail is provided regarding how such restrictions would be implemented, aside from the statement that, "The project funding partners will work collaboratively with the local jurisdictions to implement these parking restrictions as described." As noted in other areas of the RDEIR/SDEIS, the control of parking restrictions along arterial roadways outside of Caltrans right-of-way is under the jurisdiction of the City of Long Beach. Thus, the RDEIR/SDEIS makes an assumption that these restrictions could be feasibly implemented. This represents a substantial concern to the viability of the project, since this restriction of parking would result in substantial impacts to a number of communities within Long Beach. L-27-5

- The proposed project would have a substantial effect on local businesses in the City and associated impacts on the communities they serve. Within the City of Long Beach, it is estimated that between 31 to 62 nonresidential relocations would be required (depending on the build alternative). The City is concerned with the effects related to the relocation of businesses, and the impacts such relocations would have on the communities that surround them. To maintain the economic vitality and range of services provided to the communities in which they reside, every effort should be made to relocate the affected business near their existing locations, within the City of Long Beach. L-27-6

- The diverging diamond interchanges proposed for Anaheim Street, Pacific Coast Highway, Willow Street, and Del Amo Street provide features that are challenging for bicycling and pedestirans, especially the uncontrolled turn lanes and merge L-27-7

lanes that create or increase merging between bicyclists and vehicles. The RDEIR/DEIS analyzes the various interchanges in Long Beach based upon existing and future traffic volumes, but it does not analyze alternative interchange configurations and does not consider substantial differences between interchange designs in meeting the needs for bicycling in consideration of the goals of the City and the State. Interchanges must be designed with greater care at ramp terminals to provide more effective traffic controls. L-27-7

- The reconstruction of I-710 provides an opportunity to provide a shared use trail facility to meet the needs of the City's westerly neighborhoods that have been severed from the rest of the City by the 710 corridor and river channelization. A key feature is the opportunity to provide for a north/south bikeway along the west levee of the river adjacent to the freeway. This facility should be included in the project design through the Anaheim Street interchange and north to Artesia Boulevard. The facility would be comparable to the design treatments that exist along the east bank, including dip undercrossings where needed at arterial or freeway crossings and connecting roadways to both sides of the arterial. L-27-8

- The analysis of visual impacts and changes in community character as a result of the build alternatives are not adequately analyzed within the RDEIR/SDEIS. The methodology for section of the various key view locations and associated photosimulations is unclear, and key areas of visual sensitivity within the City are not accounted for. Potential impacts to recreational trail and park users was not adequately considered, in addition to key areas within the coastal portions of the City (including Ocean Boulevard). L-27-9

- The proposed Long Beach Municipal Urban Stormwater Treatment (MUST) Project is a stormwater treatment project proposed by the City that provides substantial regional water quality benefits. The MUST facility could potentially be utilized as a means of mitigating potential water quality impacts of the I-710 corridor project, and the Long Beach MUST should be considered an Early Action Project. Modernization of the storm drain system should include integrating BMPs to comply with Total Maximum Daily Loads (TMDLs), and the MUST project could assist the project in achieving these water quality mandates. L-27-10

- The analysis of potential impacts related to hazardous waste and materials has not been conducted in accordance with accepted environmental standards and does not adequately disclose potential impacts under CEQA and NEPA. The RDEIR/SDEIS notes that, "Based on a mutual agreement between the Los Angeles County Metropolitan Transportation Authority (Metro) and the California Department of Transportation (Caltrans), the ISA prepared for the project was not required to identify impacts related to site conditions." This approach is not consistent with Caltrans or ASTM standards, and deprives the City and public of the opportunity to review readily available public information pertaining to existing hazardous materials present in soils, soil gas, and groundwater within the boundaries of the project site. The hazardous materials analysis should be updated to reflect current database information, a current site visit, and appropriate L-27-11

file reviews for all on-site properties, all adjoining off-site properties (those properties that bound the project boundaries, including those separated by roads or waterways), and other adjacent off-site properties of concern. L-27-11

- The air quality analysis prepared for the project does not provide a comprehensive analysis of impacts sufficient to substantiate conclusions related to particulate matter and regional transportation conformity. Although FHWA will make the conformity determinations after the preferred alternative is identified and prior to completion of the final environmental document (FED), demonstration of regional conformity should still be conducted and included in the Draft Environmental Document (DED) for full disclosure. The lead agency should disclose to the public any new information relative to the project's conformity analysis. Therefore, the RDEIR/SDEIS must be recirculated after completion of the quantitative analysis. L-27-12

- The RDEIR/SDEIS does not properly analyze and identify funding sources for the long-term maintenance costs associated with some of the new proposed features, including but not limited to water treatment best management practices, new traffic signals, parks, new traffic ramp meters and sound wall landscaping. L-27-13

- The RDEIR/SDEIS is not clear on addressing parcels bordering the project particularly at freeway interchanges. Further analysis needs to be funded for the interchanges with the I-91 and I-405 to insure that reminant parcels are allowed to more forward with their highest and best use. L-27-14

- Caltrans is encouraged to consider a local-hiring preference on its construction workforce. While we understand this is not necessarily a CEQA/NEPA issue or mitigation, it would provide a positive economic impact in the form of jobs to the local economy. L-27-15

In addition to the overarching concerns identified above, the City provides you with specific and detailed comments regarding the RDEIR/SDEIS in the context of NEPA and CEQA. These comments have been organized by RDEIR/SDEIS section, and address the need for additional analysis or correction of numerous inadequacies.

Respectfully submitted,

Sean Crumby

Chapter 1.0 – Proposed Project

Chapter 1.0 sets forth SCAG data from both the 2012 RTP/SCS as well as the 2016 RTP/SCS, resulting in inconsistencies in data across the chapter. Data for the study area appears to be extracted from the 2012 RTP/SCS, while data for the County as a whole comes from the 2016 RTP/SCS. Since the 2016 SCAG RTP/SCS is the most recent and the projections between the two documents vary, the most recent 2016 projections should be used. L-27-16

Page 1-8, Paragraph 2. The discussion notes, "Although the full scope of the project is not currently in the FTIP and the Project Description as noted in the RTP/SCS does not match either of the currently proposed build alternatives, both the RTP and RTIP will be amended to be consistent with the preferred alternative prior to the approval of the Final EIR/EIS." The project's consistency with the FTIP and RTP/SCS is critical to demonstrating consistency with regional planning goals and policies, including the achievement of air quality conformity within the air basin. Without demonstration that the project is consistent with the FTIP and RTP/SCS, and associated consideration by the Transportation Conformity Working Group (TCWG), it is not possible to determine if the project is capable of achieving conformity. This lack of information within the public review RDEIR/SDEIS deprives the City of an opportunity to comment on the project's potential impacts, particularly the results of any air quality conformity determination by TCWG. The results of the project's conformity determination should be disclosed to the public, and the City of Long Beach and other affected agencies should have the opportunity to comment prior to any decision on the environmental document. L-27-17

Page 1-8, Paragraph 4. Section 1.2.1, Need for the I-710 Corridor Project, includes a description of factors requiring implementation of the project related to population growth, traffic, and goods movement. The writeup makes references to a number of source documents for regional demographics forecasts. The RDEIR/SDEIS notes, "According to the growth projections in the 2012 RTP/SCS, the population in the Study Area is expected to grow from 1,155,000 in 2012 to 1,272,000 in 2035, an increase of approximately 10 percent. These projections have been updated and according to growth projections adopted by SCAG in the 2016 RTP/SCS, the population of Los Angeles County is anticipated to increase from 10.2 million in 2015 to 11.5 million in 2040, an increase of approximately 13 percent. Employment in the Study Area is expected to grow from 470,000 in 2012 to 523,000 in 2035, an increase of approximately 11 percent (SCAG, 2012 RTP)." This information provides information for the study area that is based solely upon the 2012 RTP/SCS, without updated information from the 2016 RTP/SCS. While demographic information for the entirety of Los Angeles County is helpful, the latest data specific to the study area (i.e., 2016 RTP/SCS) should be provided since it is most relevant to the project area, including Long Beach. L-27-18

Page 1-13, Paragraph 2. The discussion of heavy-duty trucks notes, "Caltrans 2013 Annual Average Daily Truck Traffic on the California State Highway System (September 2014) indicates that five-axle trucks comprise at least half of all trucks on all segments of I-710, with the greatest concentrations of five-axle trucks (nearly 75 percent of all trucks) occurring at the southern end, near the Ports." The discussion should include the most current data available, to reflect existing conditions since they are subject to variability due to market and economic conditions associated with the Ports. Caltrans 2015 Average Annual Truck Traffic data is available and should be reflected in the analysis. L-27-19

Page 1-13, Paragraph 5. The description of transportation demand and growth for the study area is based upon the 2012 RTP. The 2016 RTP/SCS was adopted by SCAG in April 2016, and represents the latest and most accurate representation of demographics and future projections for growth and population for Southern California. Demographic information should be updated to reflect the 2016 RTP/SCS to reflect current statistics and projections for Long Beach. L-27-20

Page 1-18, Table 1.2-3. See comment directly above. The 2016 RTP/SCS was adopted by SCAG in April 2016, and represents the latest and most accurate representation of demographics and future projections for growth and population for Southern California. Demographic information should be updated to reflect the 2016 RTP/SCS to reflect current statistics and projections for Long Beach. L-27-21

Page 1-21, Paragraph 4. This paragraph notes, "According to data collected and reported by Caltrans over a three-year period (January 1, 2009, to December 31, 2011), the I-710 mainline experiences a fatal accident rate that is above the statewide average for freeways of this type." The beginning of this reporting period is over eight years old; updated accident data should be provided to represent current conditions along the project corridor. L-27-22

Page 1-23, Paragraph 5. The paragraph notes, "Previous data collection efforts have indicated that during late 2004 to late 2007 a high level of accidents on I-710 (ranging from 29 to 36 percent, depending on the segment) involved trucks." See comment directly above. This information was carried over from the 2012 DEIR/DEIS and is no longer current since it is over 10 years old. Updated accident data should be provided to represent current conditions along the project corridor. L-27-23 In addition, the RDEIR/SDEIS should substantiate how the causal factors of roadway geometrics, traffic volumes, and vehicle mix were determined. Mitigation should be provided for hazards, particularly under Alternative 5C (e.g., provision of a dedicated truck lane to reduce conflicts). L-27-24

Page 1-26, Paragraph 2. This section is intended to demonstrate the need for the project, and a description of pavement rehabilitation projects has been provided. However, this discussion does not discuss how pavement rehabilitation activities provide for a need for the proposed project. This should be revised and discussed. L-27-25

Page 1-32, Paragraph 3. Section 1.2.1.5, Modal Interrelationships and System Linkages, notes related planned facilities and linkages, including the I-5 Corridor Improvement Project and the Gerald Desmond Bridge Project. Although the Shoemaker Bridge Replacement Project is identified later in Chapter 1.0 as an Early Action Project, it should also be acknowledged in this section given its importance as an arterial corridor within the City of Long Beach and adjacency to the project corridor. L-27-26

Page 1-40, Section 1.2.2.1, Project Purpose. The project can also serve to provide a significant positive impact on water quality of the Los Angeles River, Compton Creek, Rio Hondo Channel. The project purpose should be expanded to implement stormwater BMPs to comply with Total Maximum Daily Loads. L-27-27

Page 1-41, Section 1.2.3, Early Action Projects. Pump stations located within the LB-MUST footprint should provide pumping of dry weather and partial stormwater flows to the LB-MUST system. This should be part of the Early Action Projects. Pump stations include: L-27-28

- 6th St. Pump Station
- Cowles Pump Station
- 19th St. Pump Station
- Willow St. Pump Station
- 27th St. Pump Station
- Dominguez Pump Station
- Caltrans Pump Station @ UP Railroad Crossing
- Caltrans Pump Station @ Long Beach Blvd.
- Gordon St. Pump Station
- North Boundary Pump Station
- Caltrans Pump Station @ SR-91 Freeway - Southbound Ramp
- Artesia Blvd. Pump Station

2012 Comments Not Adequately Addressed in the Recirculated Environmental Document

Table 1.2-1 from the 2012 DEIR/DEIS on page 1-10 should also include design capacity for the I-710 Corridor as described in the text. The reader must be quantitatively shown how traffic exceeds design capacity. L-27-29

Page 1-16 of the 2012 Draft EIR/EIS is not clear relative to the amount of container demand that is expected to be accommodated by the railroad system. This is a key data point for the assumptions in the DEIR/DEIS and should be readily available to the public within this chapter of the Draft EIR/EIS. L-27-30

The blanket statement on page 1-35 of the 2012 Draft EIR/EIS that the "I-710 Corridor will be implemented in a manner that is consistent with the programmed and planned improvements described above" (e.g., the I-5 improvements, the Gerald Desmond Bridge Project, and the I-5 Corridor Project) must be supported. L-27-31

Primary studies used to support the need for the Project and the bases for key assumptions of existing conditions are outdated. These include the I-710 Corridor Project Initial Feasibility Analysis (IFA) and the I-710 Railroad Goods Movement Study. Overall, use of these outdated studies may not provide an accurate reflection of the current and future need for the Project. L-27-32

Additional evidence is needed to show how the on-dock capacity of 23.5 percent in 2007 will reach capacity in 2035. This chapter should also provide the current capacity of the on-dock data, which is likely to have been influenced by the recent recession. The percentage of use of on-dock, near dock and off-dock intermodal facilities should also be provided along with data regarding off-dock facilities and a demonstration of how the capacities of the near dock and off-dock facilities are expected to be reached in 2035. L-27-33

Chapter 2.0 – Project Alternatives

The City of Long Beach supports the selection of Alternative 5C with Design Option 2A as the preferred alternative within the RDEIR/SDEIS. While the City is fully supportive of ZE/NZE heavy-duty truck implementation, the construction of a freight-corridor on viaduct or retaining wall structure as part of Alternative 7 would result in substantial adverse effects on the communities of Long Beach. The elevated freight corridor would become the primary visual/aesthetic feature along the I-710 corridor within Long Beach, and would result in substantial adverse visual change affecting vast portions of the City. The City of Long Beach urges Caltrans to select Alternative 5C/Design Option 2A as the preferred alternative. As noted below within the City's comments on Chapter 2.0, the scope of Alternative 5C should be enhanced to provide for funding of implementation of ZE/NZE trucks, equivalent to that proposed under Alternative 7. In addition, Design Option 2A is highly preferred since it would enhance connectivity within the southern portion of the project area between I-710, Shoreline Drive and Pacific Coast Highway. Moreover, Design Option 2A would be consistent with the City's proposed replacement of Shoemaker Drive, Long Beach Municipal Urban Stormwater Treatment (MUST) project, and other elements of the Cesar Chavez Park Integration Plan that would provide substantial benefits to the surrounding community. L-27-34

The revised document does not analyze any alternative interchange concepts. The City continues to be especially concerned that the document does not consider any interchange alternatives to diverging diamond interchanges for most Long Beach interchanges and eliminates ramp connections to Pacific Avenue at I-405 and to Wardlow Road at I-710. L-27-35

The document does not recognize the existence of Class IV Bikeways, which were recognized formally by Caltrans recently. These facilities are necessary in support of the State's goals to increase walking L-27-36

and biking as alternatives to motor vehicle travel. Also, the Long Beach Bicycle Master Plan was updated since the preparation of the original draft EIR/EIS to reflect Class IV bikeways through various interchanges. Interchange configurations that show planned Class IV bikeways need to be developed and included in the project alternatives. The provision of high quality infrastructure for pedestrians and bicycles is an essential goal for the city. L-27-36

Section 2.2.1 Revised Alternatives Development and Refinements

Page 2-6, Section 2.2.2.1, Community Alternative, Paragraph 2. The discussion describes Community Alternative 7. The discussion notes that some elements of the alternative are not appropriate for inclusion in the environmental document, one reason being that, "As the approving agency for the I-710 Corridor Project, the California Department of Transportation's (Caltrans) jurisdiction is limited to the State highway system." This perspective is inconsistent with the proposed project, since the build alternatives include components that are outside of the jurisdiction of the State highway system. For instance, the build alternatives include arterial parking restrictions on roadways outside of Caltrans' control, including Atlantic Boulevard, Cherry Avenue, and Long Beach Boulevard within the City of Long Beach. According to the RDEIR/SDEIS, "…these restrictions would result in a reduction of up to 640 parking spaces along northbound and southbound Atlantic Blvd., up to 595 parking spaces along northbound and southbound Cherry Ave., and up to 451 parking spaces along northbound and southbound Long Beach Blvd. during the peak period." The document should be consistent in its approach to facilities outside of Caltrans' jurisdiction, since the current approach is contradictory. L-27-37

Section 2.3.1 No Build Alternative (Alternative 1)

Page 2-10. The language notes, "Alternative 1 would maintain the current configuration of the existing I-710 Corridor. There would be no capacity-increasing improvements to the I-710 mainline; only approved and planned projects included in SCAG's 2012-2035 Regional Transportation Plan Sustainable Communities Strategy (RTP/SCS) and Federal Transportation Improvement Program (FTIP) are considered part of the Alternative 1." Why is the No Build Alternative based upon an outdated version of the FTP/SCS? The No Build Alternative should be based upon the current/latest forecast for regional and/or local improvements that may work towards accomplishment of the project purpose and need, in the absence of the build alternatives. L-27-38

Page 2-10, No Build Alternative. The document should include an analysis of the effect upon existing traffic conditions based upon implementation of future build alternatives. Such analysis should precede any analysis of 2035 for the build alternatives. L-27-39

Section 2.3.2 Build Alternatives

Page 2-18, Section 2.3.2.1, Pedestrian and Bike-Only Bridges. The Shoemaker Bridge Replacement Project is identified as an Early Action Project within the RDEIR/SDEIS. The bridge replacement project would consist of the replacement of the Shoemaker Bridge over the Los Angeles River. Under both Build Alternatives 5C and 7, the existing Shoemaker Bridge would be demolished after construction of the new bridge. However, the build alternatives should consider leaving the existing bridge in place, to serve as beneficial use for recreational purposes and assisting the project's compliance with the City's Park in Perpetuity Ordinance, which requires a 2:1 replacement for loss of parkland. Reuse of the existing bridge would provide a unique opportunity to create a pedestrian destination with wonderful views to the downtown, the L.A. River and the new iconic Shoemaker Bridge. It could become an extension of the park space over the river, with overlooks, seating, garden paths, educational/interpretive opportunities about the River, History of Long Beach, and Shoemaker Bridge namesake. L-27-40

Page 2-22, Section 2.3.2.1, Zero Emission/Near Zero Emission Truck Technology Deployment Program. As noted in the discussion, the I-710 Corridor Project Zero Emission/Near Zero Emission Truck Technology Deployment Program is a programmatic component of the build alternatives and would provide funding to individual owner-operators and privately owned truck fleets to subsidize the purchase of heavy-duty (Class 8) ZE/NZE trucks for use within the I-710 corridor. The City of Long Beach is highly supportive of zero emissions technology being utilized by heavy trucks along the project corridor. The funding provisions outlined within this discussion are highly geared towards Alternative 7 (i.e., $100 million of funding under Alternative 5C, $460 million under Alternative 7, and $1.05 billion under Alternative 7ZE). Funding for implementation of zero emissions trucks should be substantially enhanced under Alternative 5C. Although Alternative 5C would not include the separated freight corridor that is proposed under Alternative 7, the need for ZE/NZE improvements should not be diminished. The City of Long Beach's communities bear a significant environmental burden related to air quality pollutants along the stretch of I-710 included under the project. Funding for Alternative 5C should be increased to be equivalent to what has been identified under Alternative 7 to demonstrate the project's commitment to minimizing air quality impacts to residents within the City. L-27-41

Page 2-26, Section 2.3.2.1, Arterial Parking Restriction Program. The proposed build alternatives would include restrictions on arterial parking along three roadways within the City of Long Beach: Atlantic Boulevard, Cherry Avenue, and Long Beach Boulevard. Little to no detail is provided regarding how such restrictions would be implemented, aside from the statement that, "The project funding partners will work collaboratively with the local jurisdictions to implement these parking restrictions as described." As noted in other areas of the RDEIR/SDEIS, the control of parking restrictions along arterial roadways outside of Caltrans right-of-way is under the jurisdiction of the City of Long Beach. Thus, the RDEIR/SDEIS makes an assumption that these restrictions could be feasibly implemented. This represents a substantial concern to the viability of the project, since this restriction of parking would result in significant impacts to a number of communities within Long Beach. The RDEIR/SDEIS notes that these restrictions would result in a reduction of up to 640 parking spaces along northbound and southbound Atlantic Blvd., up to 595 parking spaces along northbound and southbound Cherry Ave., and up to 451 parking spaces along northbound and southbound Long Beach Blvd. during the peak period. The assessment of community impacts within the RDEIR/SDEIS notes "field observations have verified that the observed parking demand could be adequately absorbed in off-street parking areas for uses that generate the demand (e.g., parking lots) as well as in on-street parking areas directly off of these main arterials." This conclusion regarding parking demand and replacement parking is completely unsubstantiated. No detail or specifics regarding "field observations" is provided (e.g., were observations conducted during daytime or evening hours?). The RDEIR/SDEIS and CIA note "off-street parking", but no details of any kind are provided (quantification, location, peak hours of demand). Until this information is provided, it is impossible to determine the basis for the conclusion that adverse impacts would not occur. The loss of 1,686 parking spaces along key arterials of the City would be a significant adverse impact to business and residents in the Long Beach community. Additional detail regarding the proposed restrictions, consultation with the City of Long Beach, and measures to offset any resultant community effects is required. L-27-42

Page 2-96, Table 2.5-1. The table should include the following permits:

> CALIFORNIA STATE WATER RESOURCES CONTROL BOARD, ORDER 2012-0011-DWQ, AS AMENDED BY ORDER WQ 2014-0006-EXEC, ORDER WQ 2014-0077-DWQ, AND ORDER WQ 2015-0036-EXEC, NPDES NO. CAS000003, NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM (NPDES) STATEWIDE STORM WATER PERMIT, WASTE DISCHARGE REQUIREMENTS (WDRS), FOR STATE OF CALIFORNIA DEPARTMENT OF TRANSPORTATION L-27-43

If portable asphalt/cement batch plants are used, then include the NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM (NPDES) GENERAL PERMIT FOR STORM WATER DISCHARGES ASSOCIATED WITH INDUSTRIAL ACTIVITIES, ORDER NPDES NO. CAS000001 L-27-43

2012 Comments Not Adequately Addressed in the Recirculated Environmental Document

While the City strongly supports alternatives that include zero-emissions technology, the analysis presented includes only a brief description of various zero-emission technologies for heavy-duty trucks that are in the research and development phase and assumes that this technology would be feasible and could be economically implemented as part of the project. The City is concerned that the analysis shortchanges the concept of zero emissions technology, which would potentially diminish the perceived viability of this alternative to the decision makers and the public. The analysis should be revised to more fully describe the technology available for zero emissions technology and support the viability of zero emissions in all design alternatives as the primarily method of achieving legitimate air quality improvements. L-27-44

CEQA Guidelines Section 15126.6 also requires that the lead agency must develop and discuss alternatives to a proposed project and, from those alternatives, identify the "environmentally superior alternative." The Draft EIR/EIS does not identify an environmentally superior alternative that would minimize the significant environmental effects of the project. L-27-45

SECTION 3.1 – LAND USE

Section 3.1.1.21 – Environmental Consequences

Page 3.1-11, the discussion identifies the acreage of existing land uses by Alternative and Option that would be converted to transportation land uses. Although Table 3.1-1 provides the acreage by jurisdiction there should be a corresponding figure that identifies the properties for reference. The discussion summarizes the total land use conversions for the entire study area, but does not address the conversions by jurisdiction. A significant percentage of the overall acreage that would be impacted is located within the City of Long Beach and requires jurisdiction-specific analysis of the potential impacts. Section 3.1.1.22 merely states that amendment of each jurisdictions' General Plan would reduce long-term adverse impacts. L-27-46

In addition, since a General Plan Amendment would be required, the discussion should also address the land uses anticipated by the cities' General Plan land use designations and the impact of transitioning these land use designations to transportation land uses. Although a significant portion of the lands identified for conversion are currently vacant, some of these lands have been anticipated for development in accordance with their General Plan designations and the analysis is deficient in not identifying these planned land uses that would no longer occur if the proposed project is implemented. L-27-47

The discussion concludes "…because I-710 has been considered in the local General Plans since its construction as a freeway…the build alternatives are generally compatible with adjacent land uses." This statement is very broad and not entirely accurate. Although I-710 has been considered in local General Plans, the build alternatives would require land acquisitions that would place transportation land uses in closer proximity to land uses that may not be compatible with transportation land uses. Analysis should be provided to address this potential. L-27-48

Page 3.1-14, Table 3.1-1, under the "Grand Total for Alternative or Option" column and "Alternative 7, Option 3B" row, the total is not accurate. L-27-49

Section 3.1.2.2 – Affected Environment

Page 3.1-36, under "City of Long Beach" heading, goals and policies from the Long Beach General Plan Mobility Element, Air Quality Element, and Noise Elements are identified. The City is in the process of updating its Land Use Element, which was made available for public review in February 2017. Although this Element has not been adopted, the Land Use section should acknowledge the update and identify applicable goals and policies that would be relevant to the proposed project. L-27-50

Section 3.1.2.3 – Environmental Consequences

Page 3.1-58, first full paragraph under the "City of Long Beach General Plan" heading, provides a brief summary of the build alternatives' consistency with the Long Beach General Plan. The analysis is insufficient and the determination of consistency is unsupported. A detailed goal- and policy-specific consistency analysis is needed to support the overall conclusions. Similar to the California Coastal Act Consistency provided in Table 3.1-2, a table listing each goal and policy (previously identified on pages 3.1-36 through 3.1-40), with a corresponding analysis is needed to provide a full understanding of the build alternatives' consistency, or inconsistency, with the Long Beach General Plan. This should also include a consistency analysis with the Draft Land Use Element's applicable goals and policies, currently out for public review. L-27-51

Page 3.1-58, first full paragraph, last sentence states "The build alternatives would also result in relocation of businesses and residents in the city, which would be inconsistent with the General Plan". There is no additional discussion or analysis of this inconsistency and whether it would result in an impact. Page 3.1-62, Section 3.1.2.4, Avoidance, Minimization, and/or Mitigation Measures, states amendments to the affected cities' General Plans would be required and provides mitigation to address amendments to the General Plans to reflect the final alignment, interchange locations, and modification of land use designations for properties that would be acquired for the project. However, there is no discussion regarding the inconsistency resulting from the relocation of businesses and residents in the city. The consistency analysis is insufficient, completely ignoring the inconsistency. A detailed analysis of this inconsistency is needed as well as a determination of impacts and identification of feasible mitigation measures to reduce the potential impact. L-27-52

Page 3.1-61, second to last paragraph, the City of Long Beach LCP analysis is insufficient and the determination of consistency is unsupported. The discussion states the I-710 Corridor Project would improve an existing local arterial and therefore is a permitted use. However, the proposed improvements and their consistency with the City of Long Beach LCP are not identified or discussed. L-27-53

Page 3.1-61, last paragraph, the City of Long Beach Community Livability Plan analysis needs to include a side-by-side consistency analysis to support the conclusions, similar to the California Coastal Act Consistency provided in Table 3.1-2. L-27-54

Section 3.1.2.4 – Avoidance, Minimization, and/or Mitigation Measures

This section needs to be updated to respond to the comments identified above and resulting conclusions.

Section 3.1.3 – Parks and Recreation Facilities

The City of Long Beach Department of Parks, Recreation, and Marine has prepared comments on the RDEIR/SDEIS under separate cover. These comments relate to project impacts to parks and recreational facilities within the City, including Cesar E. Chavez Park, Drake/Chavez Greenbelt, Coolidge Park, Los Cerritos Park, Cressa Park and Wrigley Greenbelt. Refer to Attachment A, City L-27-55

of Long Beach Department of Parks, Recreation, and Marine Comments on RDEIR/SDEIS dated October 9, 2017. L-27-55

Page 3.1-81, Table 3.1-5, Permanent and Indirect Impacts to Parks and Recreation Facilities. The analysis acknowledges permanent impacts to the existing Cesar E. Chavez Park along the eastern side of the Los Angeles River in Long Beach. It is essential that the I-710 project be consistent with the City's Cesar E. Chavez Park Integration Plan, which proposes substantial enhancements to the existing park and builds upon other proposed facilities, which include the Long Beach Municipal Urban Stormwater Treatment (MUST) Project and Shoemaker Bridge Replacement Project. The concept of the Integration Plan is the contrast between historic Long Beach and the new progressive movement of the City, i.e. Willmore Historic Neighborhood and Downtown; Shoemaker Bridge Re-Use and the new iconic Shoemaker City Gateway Bridge. The Integration Plan provides for a network of bike and pedestrian trails that provide connectivity between the open space, connection to the L.A. River trail, and links to the downtown and adjacent neighborhoods. The Plan components will be compatible with the surrounding neighborhood character; create a unique and attractive destination; provide recreation opportunities; create a sense of pride and image for the International City and the most "Bike Friendly City"; refer to Figure 3.1a, *Illustrative Master Plan*, and Figure 3.1b, *Connectivity Plan*.

The Integration Plan provides a visual and physical connection between the different use areas and to the surrounding neighborhoods and downtown. The Plan identifies elements to be consistent with past project master planning efforts, and adds opportunities for other types of uses and circulation.

- The Boardwalk / Promenade are a major spine that links the downtown through Cesar Chavez Park to the Shoemaker Bridge Re-use and the LBMUST Facility.
- The relationship between Shoemaker Bridge; LBMUST Facility; and Bio-Retention Basin Area become the center of the plan with linkage to the other uses. L-27-56
- Community Gardens; Drake / Chavez Soccer Fields and Greenbelt; Drake Park; and De Forest Avenue provide for recreation amenities, venues for community activities and connection to the neighborhood.

The Integration Plan provides bicycle and pedestrian connectivity between the park areas and open space, downtown Long Beach, Los Angeles River regional trail, west side of the L.A. River and adjacent neighborhoods. The plan minimizes conflicts with significant roadways and provides for safe uninterrupted crossing and access. The plan creates a continuous green belt along the L.A. River as part of the chain of park lands to include Cesar Chavez Park; Santa Cruz Park; Golden Shore Marine Biological Reserve Park; Shoreline Aquatic Park; and Marina Greens.

- Boardwalk / Promenade
  - Pavement materials that resemble a contemporary boardwalk;
  - Flowering "botanic" gardens;
  - Palm skyline planting;
  - Architectural lighting
- Expanded Cesar E. Chavez Park
  - Sculptured earth forms;
  - Outdoor sculpture gardens;
  - Garden mazes;
  - Water wise gardens;
  - Picnic areas;
  - Open Play

- Long Beach Municipal Urban Stormwater Treatment Facility- LBMUST Facility
  - Urban Runoff Treatment Facility;
  - Education opportunities;
  - Facility to function in conjunction with the bio-retention basins systems
  - Bio-Retention Basins and Bio-Swales open channel
  - Urban runoff natural treatment systems;
  - Boardwalk access to the basins;
  - Observation and viewing areas;
- Community Gardens
  - Willmore Heritage Gardens and Gate;
  - Tower re-use for windmill;
  - Community gardens;
  - Theme playground;
  - Picnic areas
- Drake / Chavez Soccer Fields and Greenbelt
  - Soccer fields;
  - Basketball courts;
  - Handball courts;
  - Picnic areas
- Drake Park
  - Picnic shelters, arbors and gazebos architecture to be compatible with the neighborhood;
  - Splash and playground;
  - Open play;
  - Picnic areas
- Shoemaker Bridge Re-Use
  - The Shoemaker Bridge re-use provides a unique opportunity to create a pedestrian destination with wonderful views to the downtown, L.A. River and the new iconic Shoemaker Bridge.
  - Shoemaker Bridge is an example of engineering achievements of its time. It becomes an extension of the park space over the river, with overlooks, seating, garden paths, educational / interpretive opportunities about the River, History of Long Beach, and Shoemaker Bridge namesake.

L-27-56

It should be noted that this description of proposed components of the Integration Plan is considered conceptual and subject to change as the plan moves through the City's review process. It is imperative that consultation and coordination between Caltrans and the City be maintained to ensure that the Integration Plan is accommodated as the I-710 improvements move forward.

Page 3.1-81, Table 3.1-5, Permanent and Indirect Impacts to Parks and Recreation Facilities. The analysis should also consider potential impacts to grant-funded parks and recreational facilities. Grants carry requirements for park improvements that exist for 20 years to perpetuity, and can require the City to either mitigated changes or pay back the grant-administering agency (or a range of options in between). Grant agencies should be included as stakeholders and decision makers related to changes required as part of the project. L-27-57

The Section 4(f) evaluation notes that 2.9 acres of Cesar Chavez Park would be permanently incorporated into the I-710 Corridor Project, but that 5.89 acres of parkland would be added. The 5.89 acres proposed to be added by Caltrans is existing City right-of-way. As previously advised, this conflicts with the City's Park in Perpetuity Ordinance, which requires a 2:1 replacement for loss of L-27-58

parkland. This would require 5.8 acres of parkland, separate from the City right-of-way proposed to be incorporated. L-27-58

2012 Comments Not Adequately Addressed in the Recirculated Environmental Document

The Section 4(f) evaluation should also include a review of all City properties purchased for park purposes that are within the 0.5-mile study area. These include Del Amo Park. L-27-59

Parks within 0.5-mile of the I-710 Corridor Project will have direct air quality impacts and the inclusion of additional trees at these locations should be addressed as mitigation. In addition, sound walls should be included to mitigate increased noise wherever possible, especially at parks adjacent to the Project, such as at Coolidge Park and Baker Park. Coolidge Park will be heavily impacted with aesthetics, noise, and air quality impacts. It is therefore suggested that this park also receive additional landscape buffering to address these impacts. L-27-60

FIGURE
3.1b

SECTION 3.2 – GROWTH

Section 3.2.3.1 – Permanent Impacts

Page 3.2-14, first paragraph, the discussion states "[t]he build alternatives are also consistent with growth-related goals and policies of the regional and local agencies in the I-710 Corridor". However, there is no analysis or evidence to support this conclusion; nor is this analysis provided in Chapter No. 3.1, Land Use. This section further acknowledges that "[t]he improved mobility expected to be achieved as a result of the build alternatives could have a slight influence on demand for residential and nonresidential uses in the cities and communities in the Gateway Cities subregion; however, it would not be expected to be sufficient to result in the need to modify adopted General Plans to allow for greater levels of development…" Again, there is no analysis or evidence to support this conclusion. The section acknowledges that demand for residential and nonresidential uses could occur, which can influence growth in the communities. However, it then continues to claim that the build alternatives are expected to accommodate existing, approved, and planned uses and not influence the amount, timing, or location of growth in the study area. This statement is unsubstantiated. It is reasonably foreseeable that increased capacity and arterial improvements associated with the build alternatives would influence growth in the study area by making the communities more accessible. L-27-61

Page 3.2-15, first full paragraph, similar to the discussion above, the conclusion that "[t]he I-710 Corridor Project building alternatives are not expected to influence the amount, timing, or location of growth in the project area" is unsubstantiated. The analysis claims that the study area is highly developed and because of limited land there is no reasonably foreseeable project-related growth expected to result from the build alternatives. It is reasonably foreseeable that increased capacity and improved access within the study area could influence people's choices of where to work and live in the County. The lack of currently available vacant land does not preclude infill development or redevelopment of an area. L-27-62

Since the conclusion that there are no reasonably foreseeable project-related growth impacts is not accurate or substantiated, the conclusion that there would be no impacts to resources of concern is also inaccurate. Analysis is needed to address potential impacts to resources of concern associated with reasonably foreseeable growth.

Section 3.2.4 – Avoidance, Minimization, and/or Mitigation Measures

The conclusion of no adverse growth-related effects of the I-710 Corridor Project build alternatives need to be reassessed based on the comments identified above.

2012 Comments Not Adequately Addressed in the Recirculated Environmental Document

This section concludes that "there are no reasonably foreseeable project-related growth impacts under any of the I-710 Corridor Project build alternatives." However, sufficient evidence to support this conclusion is not provided within the analysis. Specifically, this section notes that "[d]ue to the lack of vacant or less developed land within the I-710 Corridor, the build alternatives would not facilitate new development by opening up access to previously undeveloped or less developed area." In addition, this section states that the Project would not induce population growth or change the pattern of land use or population density because the "build alternatives are consistent with the Regional Transportation Plan (RTP) and the goals and policies of the regional and local agencies within the I-710 Corridor." Furthermore, this section does not analyze the potential for growth as a result of the increased access and improved vehicle travel times the project proposes as it is reasonably foreseeable that these improvements would have some effect on where residents in Los Angeles County live and work, which could introduce growth. Additionally, it is reasonably foreseeable that L-27-63

increasing capacity along the I-710 Corridor would result in a corresponding increase in the amount of goods at the Ports compared to the no-build alternative. However, this section concludes that "the I-710 Corridor Project build alternatives are not expected to have a substantial effect on the demand for port cargo growth or expansion of marine terminal facilities" in part because "'[r]oadway capacity is one of numerous infrastructure considerations that can influence the level of demand for a particular port." Yet it is not reasonable to state that since the ability to move goods on the I-710 freeway is only one of the factors that can lead to growth of the goods movement system in Los Angeles that increasing the capacity would not have a growth-inducing effect. As such, this analysis does not adequately convey the potential for growth impacts associated with the project. L-27-63

Avoidance, Minimization, and/or Mitigation Measures

The conclusion of no adverse growth-related effects of the I-710 Corridor Project build alternatives need to be reassessed based on the comments above and specific to Chapter No. 3.2, Growth. Portions of the project-level analysis and conclusions are insufficient and unsupported. L-27-64

SECTION 3.3 – COMMUNITY IMPACTS

Page 3.3-1, Paragraph 4. The study area for community impacts is identified as approximately 0.5-mile from the project corridor improvements. There is no substantiation provided within the RDEIR/SDEIS regarding the methodology or rationale behind the establishment of a 0.5-mile study area. The direct and indirect effects related to the proposed project within the City of Long Beach are far-reaching, and depending on the environmental issue of concern, can reach much further than 0.5-mile from the project site. An explanation regarding the study area should be provided, including a substantiation explaining how community impacts would not extend beyond 0.5-mile from the project site. L-27-65

Page 3.3-30, Paragraph 3. The discussion of homeless facilities focuses on homeless shelters and service providers within the study area. This description does not acknowledge the substantial homeless population in the City of Long Beach, and associated encampments which are prevalent within the study area and along the I-710 corridor. Disruption of existing encampments would displace homeless populations and could create homelessness in other areas of the City. Interchange configurations should consider issues related to the homeless, such as the provision of adequate lighting and limitations on access. A detailed description related to existing conditions in this regard should be provided. In addition, the RDEIR/SDEIS should include a plan to deter homeless from camping and congregating at the constructions sites during the construction process. L-27-66

Page 3.3-45, Table 3.3-9, Parking Impacts by Jurisdiction. Table 3.3-9 notes that the project would result in the loss of 1,686 on-street parking spaces as a result of the proposed restriction of on-street parking during peak periods. The Community Impact Assessment (CIA), page 5.12-52 notes, "Under the I-710 Corridor Project build alternatives, parking restrictions during peak periods (6:00 a.m.–9:00 a.m. and 4:00 p.m.–7:00 p.m.) would be implemented on Atlantic Blvd., Cherry Ave., and Long Beach Blvd. through the City of Long Beach. These restrictions would result in a reduction of up to 640 parking spaces along northbound and southbound Atlantic Blvd., up to 595 parking spaces along northbound and southbound Cherry Ave., and up to 451 parking spaces along northbound and southbound Long Beach Blvd. during the peak period." The RDEIR/SDEIS notes "field observations have verified that the observed parking demand could be adequately absorbed in off-street parking areas for uses that generate the demand (e.g., parking lots) as well as in on-street parking areas directly off of these main arterials." The CIA notes, "sufficient off-street parking exists to adequately absorb observed demand; therefore, no adverse impacts with regards to parking would occur." This conclusion regarding community impacts related to parking demand are completely unsubstantiated. No detail or specifics regarding "field observations" is provided (e.g., were observations conducted L-27-67

during daytime or evening hours?). The RDEIR/SDEIS and CIA note "off-street parking", but no details of any kind are provided (quantification, location, peak hours of demand). Until this information is provided, it is impossible to determine the basis for the conclusion that adverse impacts would not occur. The loss of 1,686 parking spaces along key arterials of the City would be a significant adverse impact to business and residents in the Long Beach community. L-27-67

Page 3.3-65, Table 3.3-12. Table 3.3-12 of the RDEIR/SDEIS provides an overview of the number of relocations required for the project, by City. Within the City of Long Beach, it is estimated that between 31 to 62 nonresidential relocations would be required (depending on the build alternative). The relocation of nonresidential facilities is estimated to result in the relocation of anywhere between 270 to 431 employees, with a loss of up to approximately $237,130 in sales tax revenue. The City is concerned with the effects related to the relocation of businesses, and the impacts such relocations would have on the communities that surround them. While it is acknowledged that any relocations required under the project would be conducted under the Uniform Relocation Assistance and Real Property Acquisitions Policies Act of 1970, the City remains critically concerned with where these businesses would be relocated. To maintain the economic vitality and range of services provided to the communities in which they reside, every effort should be made to relocate the affected business near their existing locations, within the City of Long Beach. Many of the affected facilities within Long Beach are small business with long-standing, strong ties to the community, and their relocation to a site outside of the City would represent an adverse effect to the populations they serve. L-27-68

Page 3.3-74, Paragraph 5. Measure C-5 requires Caltrans to negotiate with the City of Long Beach to relocate the City's Multi-Service Center for Homelessness (MSC), a key homeless assistance facility within the City. The City is appreciative that Caltrans has acknowledged this concern that was noted in the City's 2012 comment letter on the DEIR/DEIS. However, the RDEIR/SDEIS lacks any analysis or mitigation related to impacts to the City's substantial homeless population, which is highly prevalent within the boundaries of the study area. Based on the results of a recent census of its homeless population in January 2017, there were 1,863 homeless people counted within the City. Implementation of the proposed project would result in the displacement of numerous homeless populations and associated encampments, placing additional burden on the City's ability to provide assistance in this regard. The RDEIR/SDEIS should consider this financial burden and consider additional facilities and services that would be required to minimize these impacts to the City's homeless population. L-27-69

Page 3.3-75, Section 3.3.3, Environmental Justice. This section lack discussion and analysis of water quality impacts as it relates to the health or environment of minority and low-income populations to the greatest extent practicable and permitted by law. L-27-70

Page 3.3-144, Paragraph 3. The methodology for selecting the Key View locations within the Visual Impact Assessment (VIA) is unclear, and does not adequately analyze potential disproportionate adverse impacts on minority and low-income populations within Long Beach. Potential impacts to recreational trail and park users throughout the I-710 corridor were not adequately considered. For example, impacts to recreation users at Santa Cruz Park, Golden Park, Cesar Chavez Park, were not addressed. Community impacts from neighborhood modifications along Fashion Avenue in Long Beach are not reflected. Based on the selected Key Views, an overall visual response score was low throughout the City of Long Beach. However, much of the project involves full takes of properties, demolition activities, and construction of new transportation facilities, which would substantially change the character of Long Beach communities. These impacts overall are underscored and, as a result, the analysis does not fully disclose the visual impacts. The City of Long Beach should be consulted on which Key View locations should be considered in the City of Long Beach to adequately analyze impacts to its sensitive communities. L-27-71

SECTION 3.4 – UTILITY/EMERGENCY SERVICES

Section 3.4.2.2, Utilities, Permanent Impacts. Overall, references to relocations of existing petroleum pipelines and oil wells should cross reference the hazardous materials section, which omits these specific improvements. These proposed improvements should also specifically be identified in Section 3.12, Hazardous Waste/Materials, and Section 3.24.3.12, Hazardous Waste/Materials as well. All utility and right-of-way research will be performed by Caltrans, and records should be provided to the City. Any abandoned lines left within the limits of the project should be removed, rather than left in place. L-27-72

Section 3.4.1.2, Utility Companies and Types of Facilities. This list is missing City Light & Power, Inc. and Covanta Long Beach Renewable Energy Corp. L-27-73

Page 3.4-38, Paragraph 2. Per the Public Utilities Commission (PUC) General Order 131-D (refer to Attachment B to this comment letter), this analysis is missing identification of significant effects as a result of relocation of existing power lines 50KV or greater. Per this General Order, there is a need for Caltrans to carefully address potential concerns when those lines might be moved closer to residences, schools, and other sensitive areas. This analysis does not disclose those sensitive areas being exposed to relocation of these lines, nor the resultant effects. L-27-74

Page 3.4-38, NEW MEASURE. A new measure should be added to public services to ensure that emergency response times are not disrupted during construction to the extent feasible; the Project Engineer shall ensure that the City of Long Beach Fire Department (LBFD) be informed of the project construction schedule, lane closures (if any), and detour plans (if any) at least 2 weeks in advance of any detour plan or lane closure being implemented throughout the construction period. L-27-75

U&ES-2. This measure should include language that clarifies that all public utility lines, pipes, and cables that are disturbed or removed to accommodate the project must be replaced or relocated within the project limits to continue to meet the needs of residents and businesses in the community. In addition, arrangements must be made to avoid disruption in utility services. If interruption in service is unavoidable, then notice must be given and proper arrangements shall be made with residents and businesses. Further, this measure should incorporate the requirements of PUC General Order 131-D. L-27-76

2012 Comments Not Adequately Addressed in the Recirculated Environmental Document

Utilities

The relocation of the oil operating area includes approximately 21 wells and associated facility equipment. The cost of the relocation will require detailed engineering to determine the exact cost, but an order of magnitude estimate is $60 million. It will take approximately three years to drill replacement wells, abandon existing wells, install associated facilities and remediate the current oil operating area. The relocation is contingent on the acquisition of property by Metro/Caltrans and the securing of the appropriate permits. It is assumed that these efforts will be the responsibility of the Project. L-27-77

If construction plans will prevent future access to abandoned wells within the current oil operating area, LBGO will request Metro/Caltrans take ownership of the wells. The transfer of ownership is a common practice when a surface owner builds a structure that prevents future access to abandoned wells. L-27-78

Caltrans must provide funding for all utilities that would need to be relocated as a result of Project construction. L-27-79

Emergency Services

The City is concerned about public safety in the event of a freeway accident. The Project should be designed to ensure there is enough room to the left of Lane #1 and to the right of Lane #5 for emergency vehicles to travel to the accident. Similar access will also need to be provided for the freight corridor. L-27-80

It is not clear whether any of the proposed options discussed will allow emergency access for first responders. All public safety agencies would need access to any incident that is unimpeded by stopped traffic in normal lanes of travel. If any of the options are chosen that create a second tier, the City of Long Beach Fire Department would need the same access on both levels. L-27-81

Access to water is also a concern. The City suggests the following depending on the ultimate freeway configuration:

1) If there were only one tier, Long Beach Fire Department would require hydrants running down the center of the freeway area that could be accessed by either northbound or southbound lanes. This would allow access to a water supply for larger incidents (e.g., truck fires) without requiring complete freeway closure in one direction in order to access a hydrant.

2) If a separated roadway or upper tier were built for larger truck traffic, the Long Beach Fire Department would need a water source (risers) on the upper tier. The Long Beach Fire Department suggests a 3" waterline and riser with a 2½" National Standard thread. They can be placed every 750 feet on the upper tier only. If a water source is not provided on the upper tier, Long Beach Fire Department would need to shut down the freeway in one direction on both levels to run a hose line across the freeway to the hydrant on the nearest residential street. For the lower tier, the Fire Department would need to ensure that use of nearby residential hydrants, if necessary, could be accommodated via access through the adjacent sound wall, with appropriate openings and signage designating the access locations. L-27-82

It is stated on page 17 of the Draft EIR/EIS that the build alternatives "would not result in increased population or demand for public services in the Study Area because they would not construct new housing or business." The City disagrees with this statement as it relates to the demand for public services. Increased lanes lead to increased traffic, and increased traffic means a larger call volume for all public safety agencies, including the Fire Department. Also, some of the alternatives create a second tier which would complicate emergency response and the ability of the Long Beach Fire Department to handle emergency situations. Some of the alternatives also offer an electrical light catenary system to support truck traffic. This high voltage electrical system would also complicate the City of Long Beach's response profile and needs further analysis. L-27-83

On page 7, under the TSM/TDM, Transit and ITS improvements, the second bullet lists peak period parking restrictions on four arterial roadways. Three of the four appear to be in Long Beach. Thus, both the Long Beach Police Department and Public Works will likely have a coordination/enforcement role. L-27-84

On page 8, under the same section, reference is made to improvements to 42 local arterial intersections, which were not listed. It is anticipated that some of these locations would be in Long Beach and will require the same coordination/enforcement actions. L-27-85

On page 14, under S.5.1.3 Parks and Recreation Facilities, the Cesar E. Chavez Park impacts are described. These modifications will potentially impact traffic and public access to the park. This same L-27-86

section describes restrictions to the Los Angeles River Trail (and Bike Path) access, which may necessitate some enforcement actions. L-27-86

Although not specifically addressed, the displacement of homeless encampments along the I-710 Corridor and Los Angeles River could result in additional calls for service as the homeless relocate to other locations in the City, or additional demands at the City's Multi-Service Center. This needs more analysis. L-27-87

Construction Impacts

Section 3.24.3.4, Utilities/Emergency Services, page 3.24-11: impacts to the numerous utilities in the Study Area are not provided. This analysis must be provided here to ensure that accurate information is disclosed to the public and decisionmakers. L-27-88

Construction of the Project will require temporary closures of freeway ramps and arterial streets. As a result, traffic will be diverted to detour routes within City limits and will create traffic impacts along the detour routes. The increase in traffic along the detour routes and coordination of ramp, freeway lanes, and arterial street closures will require additional services to be provided by the Department of Public Works, the Police Department, and the Fire Department. Capital improvements to the traffic signal system in the City will be required. In addition, such detours may potentially affect the ability of the Police Department and Fire Department to meet response time goals. As such, the City requests that Caltrans provide funding in an amount to be determined to provide City staff support and capital improvements necessary to mitigate traffic impacts along detour routes. L-27-89

SECTION 3.5 - TRAFFIC AND TRANSPORTATION/PEDESTRIAN AND BICYCLE FACILITIES

Section 3.5.2.2, Bicycle and Pedestrian Facilities, page 3.5-50. The discussion on Pedestrian and Bicycle Facilities does not reflect State and City policies to increase walking and bicycling in California. The City of Long Beach completed a full update of its Bicycle Master Plan and has incorporated the update into its general plan. The updated plan shows planned bicycle facilities that will be safer and more attractive than the improvements proposed in the RDEIR/SDEIS. These facilities include provision for Class IV bikeways on many of the roadways proposed for replacement interchanges. L-27-90

The physical requirements for a Class IV facility may be greater than for a Class II facility; however, the enhanced service provided for bicyclists and the separation provided between bicyclist and pedestrians are essential to achieve the goals of both the City and the State. The City deems that a significant impact would be unmitigated if designs to facilitate active transportation are compromised in order to serve motor vehicle volumes.

On new overpasses and structures, bikeways, and pedestrian facilities must be physically separated from roadways by a barrier rail (Type K or equivalent) or other measure that effectively prevents motor vehicles from entering the bikeway area. The width of the bikeway must be wide enough to allow a street sweeper to maintain the area, and approaches should also be planned to facilitate sweeping. Where Class IV Bikeways are planned, the sidewalk should be a separate facility and provide at least 8 feet from the edge of the bikeway to the bridge rail, and it should provide unimpeded width within the walkway that allow pedestrians to pass around posts or utility pedestals on a generally straight line. The City's Bicycle Master Plan shows Class IV Bikeways on Anaheim Street, on Pacific Coast Highway, and on Artesia Boulevard. Furthermore, other communities along the corridor may elect to upgrade bicycle infrastructure if proper amenities are provided for replacement structures. L-27-91

It should be noted that most of the existing structures that cross the freeway provide no facilities for bicycling and poorly designed narrow sidewalks that cross free flow merge ramps, creating a undesirable environment, yet persons can be seen walking and riding on all non-freeway structures. L-27-92

Section 3.5.2.2, Existing and Future No Build Traffic Conditions. This section identifies 23 intersections that are analyzed within the Shoemaker Bridge project limits (downtown Long Beach). The No Build traffic volumes are similar but not exactly the same. These discrepancies should be justified or corrected during the preparation of the final environmental document. L-27-93

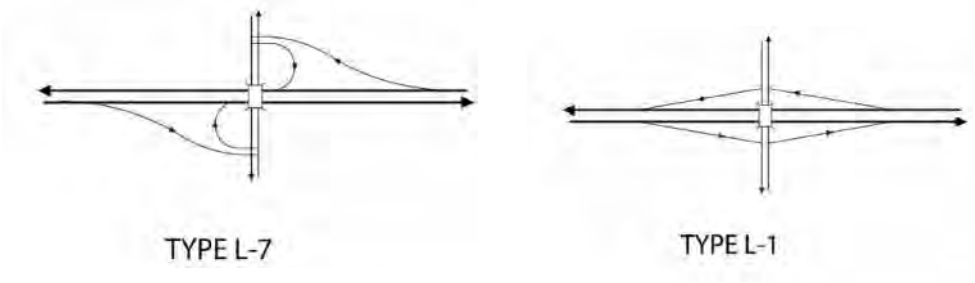
Section 3.5.3, Environmental Consequences, Page 3.5-51. Freeways: This section defines the Freeway level of service for the two build alternatives in 2035. The analysis clearly shows that Alternative 5C is the best alternative from a traffic operations standpoint. While both alternatives provide benefits to the overall corridor, Alternative 5C provides the most operational improvements to the City of Long Beach and appears to be the superior alternative. L-27-94

Page 3.5-91 – Intersections: This section identifies the traffic impacts of the two build alternatives on the intersections studies in the document in 2035. The analysis indicates that there are significant impacts (as defined in earlier sections) under Alternative 5C and 7 at is the best alternative from a traffic operations standpoint. While both alternatives provide benefits to the overall corridor, Alternative 5C and 7 in the Shoemaker Bridge study area. These impacts intersections include Anaheim/Santa Fe, Anaheim/Canal and Magnolia/Third. The Shoemaker Bridge TOAR agrees with this assessment and provides mitigation as well as modified traffic circulation at Magnolia/Third to provide operational improvements to the City of Long Beach. The FEIR should address the mitigation at these locations including the impacts of a DDI on Anaheim Street in the City of Long Beach. The proposed circulation improvements in downtown Long Beach will require coordination with the final environmental document in order to properly determine impacts. L-27-95

Page 3.5-107 – Motion 22.1 was approved by the Metro board to provide additional mitigation to I-710 improvements in the form of traffic management and pedestrian/bike improvements. The analysis should more clearly state the improvements proposed in the City of Long Beach and provide for Neighborhood Traffic Management along Anaheim Street as well as improvements to the bike and pedestrian facilities. It should also address the deficiencies of the proposed DDI interchange at Anaheim and I-710. L-27-96

Page 3.5-109 – Mitigation identified in the document includes improvements at the intersection of Anaheim Street/Santa Fe Avenue. The Shoemaker Bridge draft TOAR also identifies the need for mitigation at this intersection but we believe the improvements need to be more extensive with additional capacity to address the demand created by the closure/disconnect of 9th/10th Streets to the bridge under both the I-710 and Shoemaker Bridge project scenarios. L-27-97

General Comments Related to Traffic and Transportation/Pedestrian and Bicycle Facilities



Diverging Diamond Interchanges

The RDEIR/DEIS analyzes the various interchanges in Long Beach based upon existing and future traffic volumes, but it does not analyze alternative interchange configurations and does not consider significant differences between interchange designs in meeting the needs for bicycling in consideration of the goals of the City and the State. In particular, the diverging diamond interchanges proposed for Anaheim Street, Pacific Coast Highway, Willow Street, and Del Amo Street provide features that are challenging for bicycling, especially the uncontrolled turn lanes and merge lanes that create or increase merging between bicyclists and vehicles. The City suggests that Caltrans explore other design options that promote mobility and safety for bicyclists, as depicted in Figure 3.5a, *Pacific Coast* L-27-98

Highway Interchange Bike Trail Alternative. While the existing interchanges pose greater and more challenging merging conditions, the proposed interchanges do not address many of the conditions that will be encountered as pedestrians and bicyclists walk or ride through the interchange areas. The Caltrans Highway Design Manual, Section 502.2, recognizes these limitations and discourages high speed merges at ramps and local streets, yet features that would be created by the diverging diamond design concepts proposed.

The diverging diamond interchanges also require the provision of more through lanes on the arterial to allow for the opposing travel directions to cross each other with adequate capacity. This results in the need for six lane arterial cross sections on roadways such as Anaheim Street and Pacific Coast Highway, which currently provide four lanes as they travel across the City. There are no plans to increase these roadways to six lanes within the City, but the bikeway plan does presume that the cross sections can be repurposed to provide friendlier cross sections for pedestrians and bicyclists. Any need to provide more than the existing number of lanes on any City roadway would be considered a significant impact that can be mitigated by using a design that does not result in severe impact to private properties and businesses due to constructing the additional lanes.

We have reviewed the travel demand forecasts for both the Anaheim Street and the Pacific Coast Highway interchanges and have concluded that a much more bicycle friendly interchange design is quite feasible. The northwest and southwest quadrants for each interchange would provide a Type L-7 configuration, eliminating the need for any ramps to cross a sidewalk or bikeway located on the south side of the arterial. The northeast and southeast quadrants would provide a Type L-1 (traditional diamond) configuration that can be modified to achieve low speeds, separation of motor vehicles from pedestrians and bicyclists via traffic signal design; refer to Figure 3.5b, *Traditional Diamond Interchange*.

L-27-98

Low forecast turning movements from both interchanges to and from the south make these geometrics very feasible, while minimizing traffic across a sidewalk or bikeway along the south side of each arterial. In addition, the need to reconstruct the river overcrossings provides an opportunity to raise the elevation of the crossing roadway over the west river levee and create a full grade separation between bicyclists and traffic at or near the west levee. Finally, this recommended interchange configuration will not require six lanes east from either interchange, as these roadways enter the center city area.

The Willow Street and Del Amo interchanges have higher forecast turn volumes as indicated in the RDEIR/DEIS, including greater volumes to and from the south. The interchange configurations above may not be adequate to meet the forecast. However, the indicated volumes could likely be well served by a traditional L-9 partial-cloverleaf interchange, potentially at lower cost than the diverging diamonds proposed. These interchange configurations should be examined closely to determine their feasibility. Since arterial through volumes are not required to cross over each other, the L-9 interchange may be better suited to meet changes in through volumes from the values forecast.

I-710 Corridor Project EIR/EIS

TRADITIONAL DIAMOND INTERCHANGE

CITY OF LONG BEACH

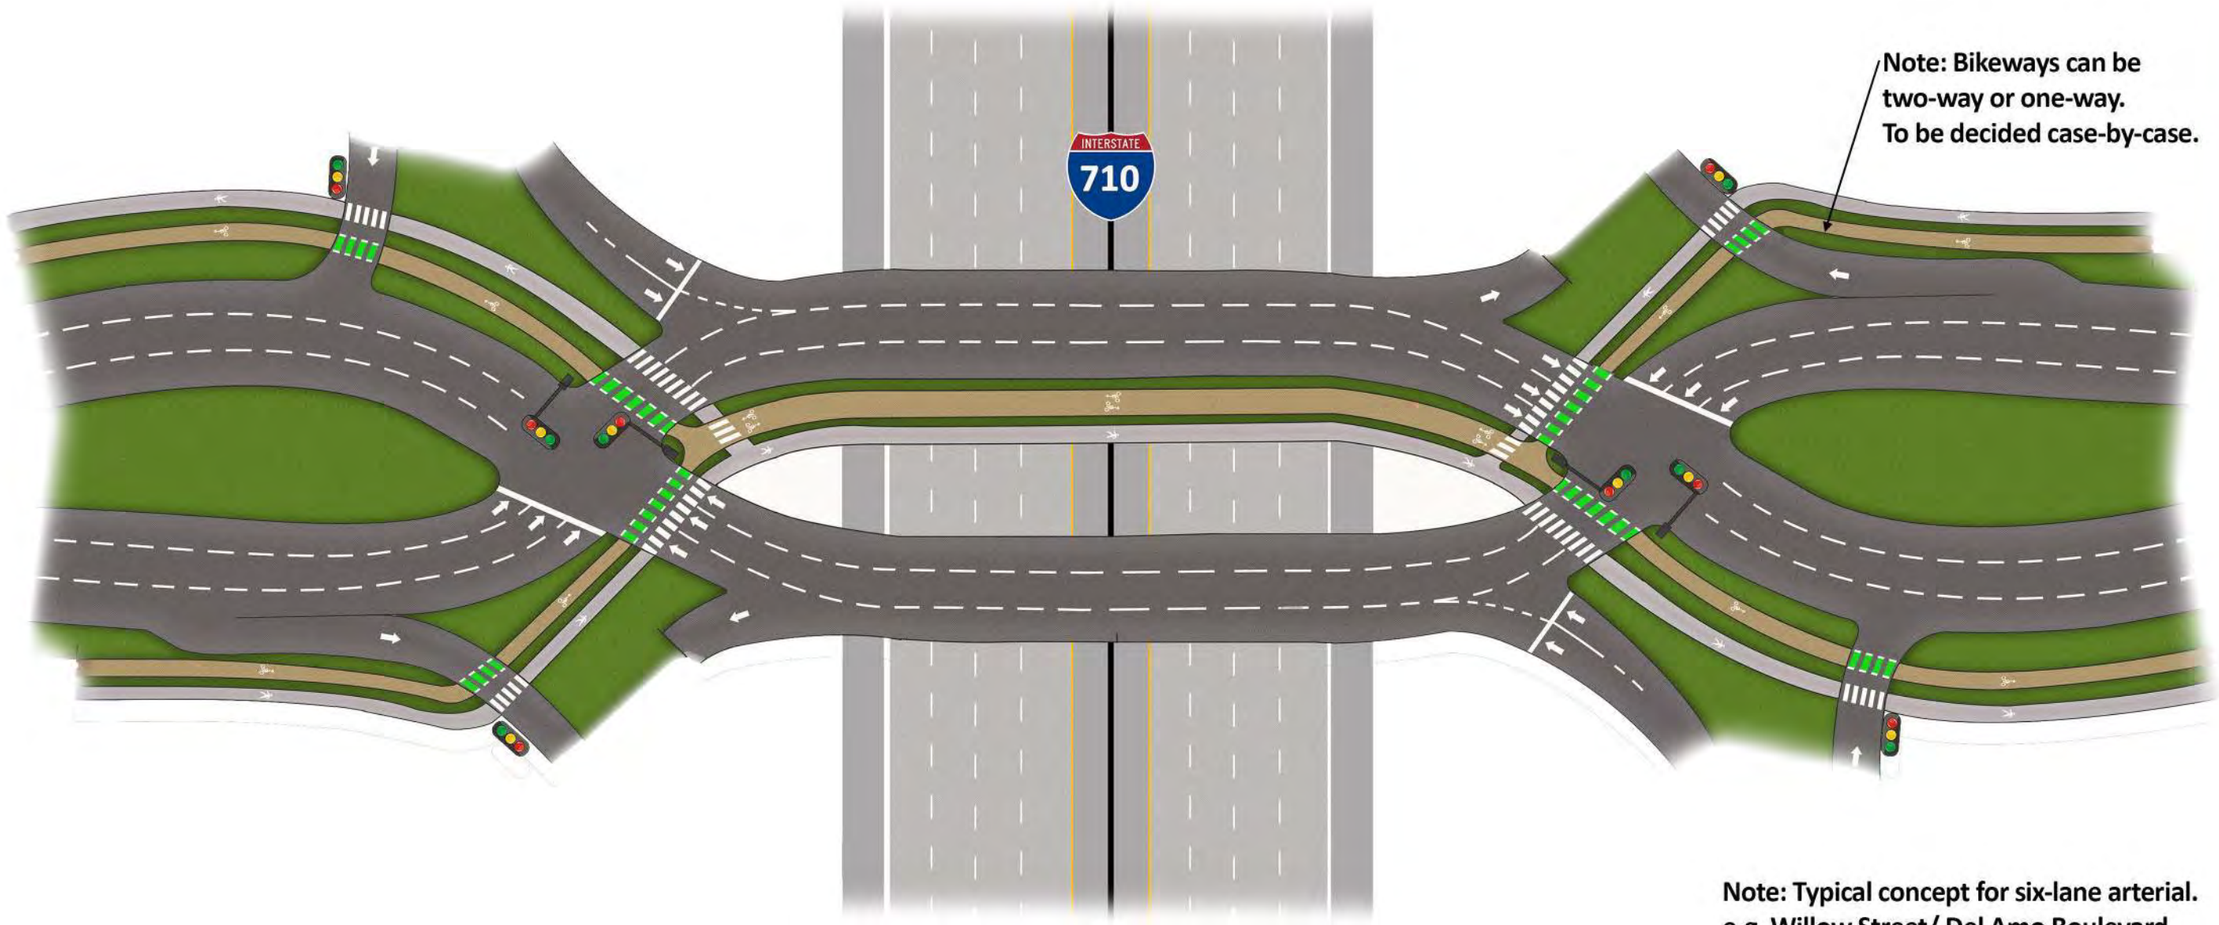
DATE 10/10/17

FIGURE 3.5b

Regardless of the final interchange type, interchanges must be designed with greater care at ramp terminals to provide more effective traffic controls. This includes traffic signal control that includes provisions for pedestrian signals across sidewalks and signalized bicycle crossings that serve Class IV bikeways, when they are located between the sidewalk and the roadway. Figure 3.5c, *Diverging Diamond Interchange*, shows a conceptual drawing for a diverging diamond that provides detail on provisions for walking and cycling that eliminates the need to look for gaps in traffic. These treatments are very common in European countries that are noted for their high-quality bicycle infrastructure and excellent traffic safety records. Long Beach has successfully emulated these strategies in our downtown area and is strongly in support of comparable facilities to link the communities west of the Los Angeles River with the rest of the city. These refinements of the diverging diamond design should be considered for each reconstructed interchange to the length of the project to minimize the need for pedestrians and bicyclists to cross freeway ramps that do not have traffic controls that create adequate gaps. L-27-98

West Bank LARIO Bikeway

The reconstruction of the 710 Freeway provides an opportunity to provide a shared use trail facility to meet the needs of the City's westerly neighborhoods that have been severed from the rest of the city by the 710 corridor and river channelization. A key feature is the opportunity to provide for a north/south bikeway along the west levee of the river adjacent to the freeway. This facility should be included in the project design through the Anaheim Street interchange and north to Artesia Boulevard. The facility would be comparable to the design treatments that exist along the east bank, including dip undercrossings where needed at arterial or freeway crossings and connecting roadways to both sides of the arterial. L-27-99



The proposed configuration for the Anaheim Street and Pacific Coast Highway interchanges would elevate these arterials above the west bank high enough to allow for the north/south bikeway to remain on the top of the levee and intersect with the east west bikeways at the elevation of the levee, grade separated from the roadway and ramps.

Pedestrian and Bicycle Overcrossings

Overcrossings have been proposed at Hill and Spring Streets. The City is in support of these valuable facilities that will unite its neighborhoods. However, the designs show structures needed to elevate the pathways over the freeway and may require acquisition of private property as they may cause shadow and privacy issues. Designs should be considered that do not require private property. Also, L-27-100
the precise crossing locations may be better suited if they are shifted to allow shallow grades from Hill Street and Spring Street to climb the levees. Grades should not exceed 5%. L-27-101

Wardlow Road Area

There is currently no connection from the LARIO to Wardlow Road since the roadway is higher than the trail and provides a grade separation. No connections are proposed in the project concept drawings. Connections should be provided on both the north and south sides of Wardlow Road so that users are not required to cross Wardlow at uncontrolled locations. L-27-102

Note: Typical concept for six-lane arterial.
e.g. Willow Street/ Del Amo Boulevard

INTERSTATE CALIFORNIA 710

Mobility. Environment. Community. Economy. Technology

I-710 Corridor Project EIR/EIS

DIVERGING DIAMOND INTERCHANGE

CITY OF LONG BEACH

DATE 10/10/17

FIGURE 3.5c

Los Cerritos Park (Bixby Knolls) Area

There are no proper connections to the LARIO between I-405 and Del Amo Street. A connection is strongly desired in the vicinity of Pacific Avenue north of I-405. Project concept plans show a connection from Los Cerritos Park over the LRT to connect Pacific Avenue with 39th Street, but it omits a direct connection to LARIO. This connection should be provided. An additional connection should also be considered further to the north, since the next connection is at Del Amo Street, over a mile away and separated by a railway corridor. L-27-103

Del Amo/Compton Creek Area

The City has previously considered a high-quality bicycle connection from the Los Angeles River Trail to the Del Amo Blue Line Station. The current connection requires users to travel along Del Amo Street across the river and through the interchange area on sidewalks of minimal width. In addition, the Compton Creek bikeway terminates at Del Amo Street on the east side of the creek, while the LRT stop is located on the west side, requiring bicyclists to travel out of the way and backtrack to reach the station.

The Compton Creek Bikeway should be extended under Del Amo Street and south to the confluence with the LA River. A new bridge would be provided over the river to connect with the east bank trail. This connection would eliminate any needed at-grade street crossings for the Compton Creek Bikeway in the vicinity. In addition, a new bridge for pedestrians and bicyclists would be provided at the LRT station north of the LRT platform, providing a direct connection from the trail to the LRT stop. This would produce a high quality low-stress pedestrian and bicycle connection to the LRT stop from the LA river that will not require any crossing of any roadway in the interchange vicinity. L-27-104

This improvement would not eliminate the need to ensure that a more bicycle friendly interchange is provided for Del Amo at I-710 using the measures described above. Del Amo Street is a highly-desired gateway to the City neighborhoods to the east, and the bicycle plan shows upgraded facilities along Del Amo to the west.

Market Street Connection to LARIO

There is currently no connection to LARIO from Del Amo to Artesia. Market Street terminates near the river levee and a connection to LARIO is feasible. Market Street is an important east/west bicycle route across the city and should be connected to the river trail on the east bank. L-27-105

Long Beach Boulevard Interchange

The existing interchange does not provide any connection to LARIO or nearby neighborhoods. The proposed interchange configuration features an L-7 configuration on the northwest and southwest quadrants. This configuration is especially well suited to provide a Class IV bicycle facility along the east side of Long Beach Boulevard that should be provided to assure utility from Victoria Street to the LARIO on the opposite side of the River. L-27-106

The west side of Long Beach Boulevard should be modified to provide for a separated Class IV bikeway to serve southbound from Victoria Street to LARIO, and the signals required for the interchange should provide control for pedestrians and bicyclists crossing the freeway ramps, as discussed previously. The City would extend this facility further to the north and south and has already established higher quality Class IV bikeways to the north.

Harding Street Connection

There is no existing connection from LARIO to Harding Street through DeForest Park. Harding Street is an important east west route for bicycling and includes a segment of the Daisy Bicycle Boulevard that is now under construction. Jordan High School is also nearby. A direct connection from the end of Harding Street to LARIO is needed. L-27-107

Artesia Boulevard Connection to LARIO

Artesia Boulevard is an important east west bicycle route. It provides post protected Class IV facilities in the interchange vicinity and over the LA River. There is no direct connection to LARIO. The project should provide direct connections to LARIO on both sides of the river via ramp structures that rise from the levees to both sides of Artesia Boulevard. L-27-108

Greenleaf Connection to LARIO

Greenleaf terminates at a local street that is separated from I-710 by a single residential home. An SCE greenbelt is located south of Greenleaf Boulevard and extends for miles to the west. A connector across I-710 would connect with the LARIO and provide an opportunity for a high-quality connection to a potential trail within the greenbelt. Early construction of the connector to LARIO would provide a connection with independent utility and further the opportunity for a major trail to the west across Compton. L-27-109

Atlantic at 710

There are no existing connectors to LARIO and none are proposed. Likewise, no direct connection to bikeway. There is an existing but unimproved connection to 72nd Street. A high-quality connection from LARIO to 72nd Street should be included in the project. L-27-110

Alondra at 710 Interchange

Bicycle lanes exist on Alondra west of Atlantic, and the roadway provides only four lanes beyond the interchange area. The proposed plan suggests the need for six lanes across the interchange because of the diverging diamond crossover design. This would likely result in elimination of the existing bicycle lanes, which is an unacceptable impact. The forecast volumes are not high enough to require 6 lanes, so the diverging diamond proposed has resulted in the impact of requiring additional travel lanes here. An alternate interchange configuration should be developed. A partial-cloverleaf would appear to meet forecast traffic volumes without requiring additional through lanes. L-27-111

Potential Improvements North of the City of Long Beach

The City of Long Beach has conducted a cursory analysis of conditions and opportunities along the 710 corridor to the north. We have identified potential improvements that would benefit pedestrians and bicyclists in these neighborhoods. Potential improvements are offered as helpful suggestions to allow the cities and communities to the north. We would defer to the judgment of the cities to the north regarding need or support for specific projects. L-27-112

Somerset Overcrossing

The existing overcrossing provides four lanes with no shoulders plus narrow sidewalks and low guardrails. It is not shown for replacement. Bicycle lanes may be feasible with a road diet treatment to the east and west. The overcrossing should be modified to provide a friendlier configuration for L-27-113

pedestrians and bicyclist. Provision of shoulders that meet Caltrans standards would be a minimum treatment and could be striped to provide bicycle lanes. L-27-113

Rosecrans at 710

The existing partial-cloverleaf configuration meets the needs of the future forecast (just as it may for many of the other interchanges). The bridge does not provide shoulders that can be used as bikeways. The proposed bridge should be adequate to provide bicycle lanes and adequate width sidewalks. The ramp configurations should be tightened so that ramp traffic is slowed while turning through signalized intersections. Also, the signals for the ramps should be modified to control traffic as it crosses the bike lanes. L-27-114

Bellflower Bikeway Greenbelt

A green belt extends for miles to the southeast from I-710 near I-105. A regional trail has already been constructed to the east, known and the Bellflower Bikeway. The project presents an opportunity to connect LARIO to Orange Avenue where it can be extended to connect with the Bellflower Bikeway. This is an important gap in regional bikeway infrastructure. L-27-115

M.L. King at 710 Freeway

There is no connection across I-710 at this time. A connection across I-710 would connect to LARIO and to Century Boulevard and the Hollydale Regional Park. Marco Antonio Firebaugh High School is nearby. This connection would likely consist of a bridge for pedestrians and bicyclists. L-27-116

Imperial Highway at I-710

The LA River Trail crosses along the south side of Imperial Hwy and doubles back to the south to go under Imperial. Another trail continues along the east levee to connect to the Rio Hondo trail. A bridge should be provided south of Imperial Highway to eliminate the need to double back to continue along the LA River Trail.

A DDI is proposed and the LA River bridge is shown to be replaced. Alternative interchange designs need to be considered, and proper connections to nearby neighborhoods should be included. L-27-117

Abbott Road

There is an existing off ramp from 710 at Abbot Road that is planned for removal. The corridor should be maintained as a bike trail to provide a direct connection from the neighborhood to the LART. L-27-118

Southern Avenue at 710

There is no existing crossing of the river or I-710. A new overcrossing and partial interchange are proposed. The crossing site should also provide a strong and friendly walk/bike connection. Southern Avenue has bike lanes to the west and a trail is located within the SCE easement to the north of Southern Avenue, beginning at Burke Ave and extending to Alameda Street (3 mi). L-27-119

Plans show a road connection from Southern to Stewart and Gray with a new loop on ramp for SB. Insure that the new road includes a bikeway with connection to the river trail, or provide a bikeway if the roadway falls out of the plan. L-27-120

Firestone at 710

This location is an existing partial-cloverleaf that was retrofitted from a full cloverleaf in the past. It is proposed to be rebuilt as a partial-cloverleaf to include the squaring of the ramps to reduce speeds. The general approach is appropriate, but consideration of physical separation between motor vehicles, bicycles and pedestrians should be considered. L-27-121

LAR at Fostoria

The project should provide a local connection to LART at Fostoria to connect to River Road so that the neighborhood can access the trail readily. L-27-122

Florence at 710

A DDI is proposed at this existing cloverleaf interchange. A partial-cloverleaf would likely meet the traffic forecast and should be evaluated closely. If a DDI is optimal, it should be modified to provide bicycle and pedestrian friendly features. L-27-123

Gage at 710

This location requires accessible connections to LART. Access is currently via non-ADA compliant stairways. L-27-124

Randolph at LART 710

LA Metro is expected to adopt an important east/west trail that will intersect with LART at Randolph and extend to the west. The wide railroad easement continues on the east side of the trail. A pedestrian/bike bridge should be provided across the river and 710 along the Randolph corridor, so that the trail can be extended further to the east in the future. L-27-125

Slauson at 710

There is no direct connection to LART from Slauson. There is a connection through Riverfront (Maywood) Park. The design should insure that this connection continues as a high-quality connection from the trail to local neighborhoods. L-27-126

710 North of Slauson

710 diverges from the LART north of Slauson. There is no parallel bikeway connection and vehicle connections are remote, due to the configuration of the arterial network and the rail yards. There is a significant existing demand for bicycle commuting from East Los Angeles to employment in Vernon and nearby areas. For many other reasons, the 710 project provides an opportunity to build a bikeway adjacent to mainline with proper treatment to achieve grade separation around ramps or appropriate intersection traffic control north to the Triggs St vicinity. Upon reaching Triggs Street, cyclists and pedestrians can connect to Arizona Ave and/or Eastern Avenue to proceed north. Both of these streets present opportunities to improve bicycle infrastructure based upon their pavement width and traffic volumes. There is an existing pedestrian overcrossing of I-5 at Arizona Street that must be replaced to meet ADA standards. Its replacement structure would be incorporated via Triggs Street. This connection would ultimately extend to connect with East Side stations along the Gold Line, and it would connect and help to serve LA Metro's LART Gap Closure project that will extend the LART to and beyond downtown Los Angeles. The potential regional significance of this connection will be substantial. L-27-127

Existing plus Project Analysis scenarios are not provided, contrary to Sunnyvale West Neighborhood Association v. City of Sunnyvale. Such analysis should precede Section 6.1.3 in the Traffic Operations Report and the results should be included in the main document. L-27-128

Section 2 no longer includes any discussion of LOS methodology. It has been relocated to Appendices summarizing traffic conditions. (Traffic Operations Report [TOR] page 2-37. L-27-129

Signalized intersections in Long Beach continue to be analyzed only using the HCM methodology, not the City LOS methodology (TOR 2-37). L-27-130

Default saturation flow rates are indicated to be reduced to 1600 vehicles per hour, however the actual analysis calculations are not provided. Only the turning movements and calculation results are provided (TOR 2-37). L-27-131

The operations report now indicate that signalized intersections have been optimized to between 60 seconds and 100 seconds. Signals should be optimized based upon actual constraints based upon the presence and length of crosswalks, provision of adequate crossing time based upon crossing width, requirements for bicyclists and other users, and adequate time to assure that left turn lanes do not block through lanes (TOR 2-37). L-27-132

Minimum pedestrian clearance intervals are not indicated in the operations report. However, the text does not acknowledge that this has been considered properly (TOR 2-37). L-27-133

It is not clear whether a peak hour factor of 1.0 was used for future year analysis. The text does not acknowledge this requirement that is contained in the Los Angeles County Congestion Management Plan (TOR2-37). L-27-134

The impacts of implementing parking restrictions or other measures to accommodate additional peak hour travel lanes has not been included. Also, in some cases this may require street reconstruction and loss of bicycle lanes. This measure should not be assumed unless it is based upon a clear city commitment, which does not exist in Long Beach (TOR 4-11). L-27-135

The questions about improvements to city intersections not committed or included in project funding has not been addressed. Improvements to city intersections must be included in project funding and impact assessment (including concurrence in project appropriateness), or they should not be assumed to be provided. It would be more appropriate to not make these assumptions and show forecasted conditions if the improvements are not made (TOR 4.11). L-27-136

The impact assessment continues to not be based upon the City's adopted criteria for city intersections (TOR 2-37). L-27-137

The provision that the City of Long Beach review, concur, and approve of City intersection improvements, in compliance with City design standards has been omitted. L-27-138

The study text indicates that the existing peak hour factor was used for exiting level of service calculations. It is not clear what factor was used for future analyses. The use of a 1.0 factor for forecasts more than 5-years into the future is acceptable (TOR 2.37). L-27-139

The operations report is not clear and conclusive about ramp metering issues. It should be clear whether on ramp lanes and storage requirements are adequate to store ramp queues for all freeway on ramps. L-27-140

It is not clear whether on ramp queues will be allowed to overflow based upon a statement of overriding consideration or how many locations may be affected. It is important to know where ramp queues may be a factor. L-27-140

The continuing existence of on and off ramps for Pacific Avenue at I-405 was noted as uncertain. The geometric drawings clearly indicate that these ramps are proposed for elimination. In addition, the ramps for Wardlow Road at I-710 are also clearly shown for elimination. The City is very concerned about the elimination of these ramps, resulting changes in local circulation, and its effect upon city intersections that will see increased traffic due to the elimination of these ramps. The impacts of these changes should be clearly noted. In addition, geometrics that preserve these connections would be strongly preferred now. L-27-141

The traffic analysis does not appear to adequately consider benefits to shifting port operations to lower traffic periods. L-27-142

The City has reviewed level of service calculations for more bicycle friendly interchanges at Pacific Coast Highway and Anaheim Street and noted that more traditional interchanges can meet existing and future needs adequately, while providing better facilities for walking and biking. L-27-143

The document does not discuss “complete streets’ type improvements for nearby arterials to reduce dependence upon motorized traffic. The City has had great success in seeing increases in walking and biking in nearby neighborhoods. These improvements should be considered for the neighborhoods along Santa Fe and along the connectors from I-710 to the neighborhoods to the east. L-27-144

The City’s concerns about loss of ramp connections to Wardlow Road and Pacific Avenue require much greater and clearer discussion. Loss of these connections will likely create or aggravate conditions at nearby interchanges and may result in backups into freeway lanes. L-27-145

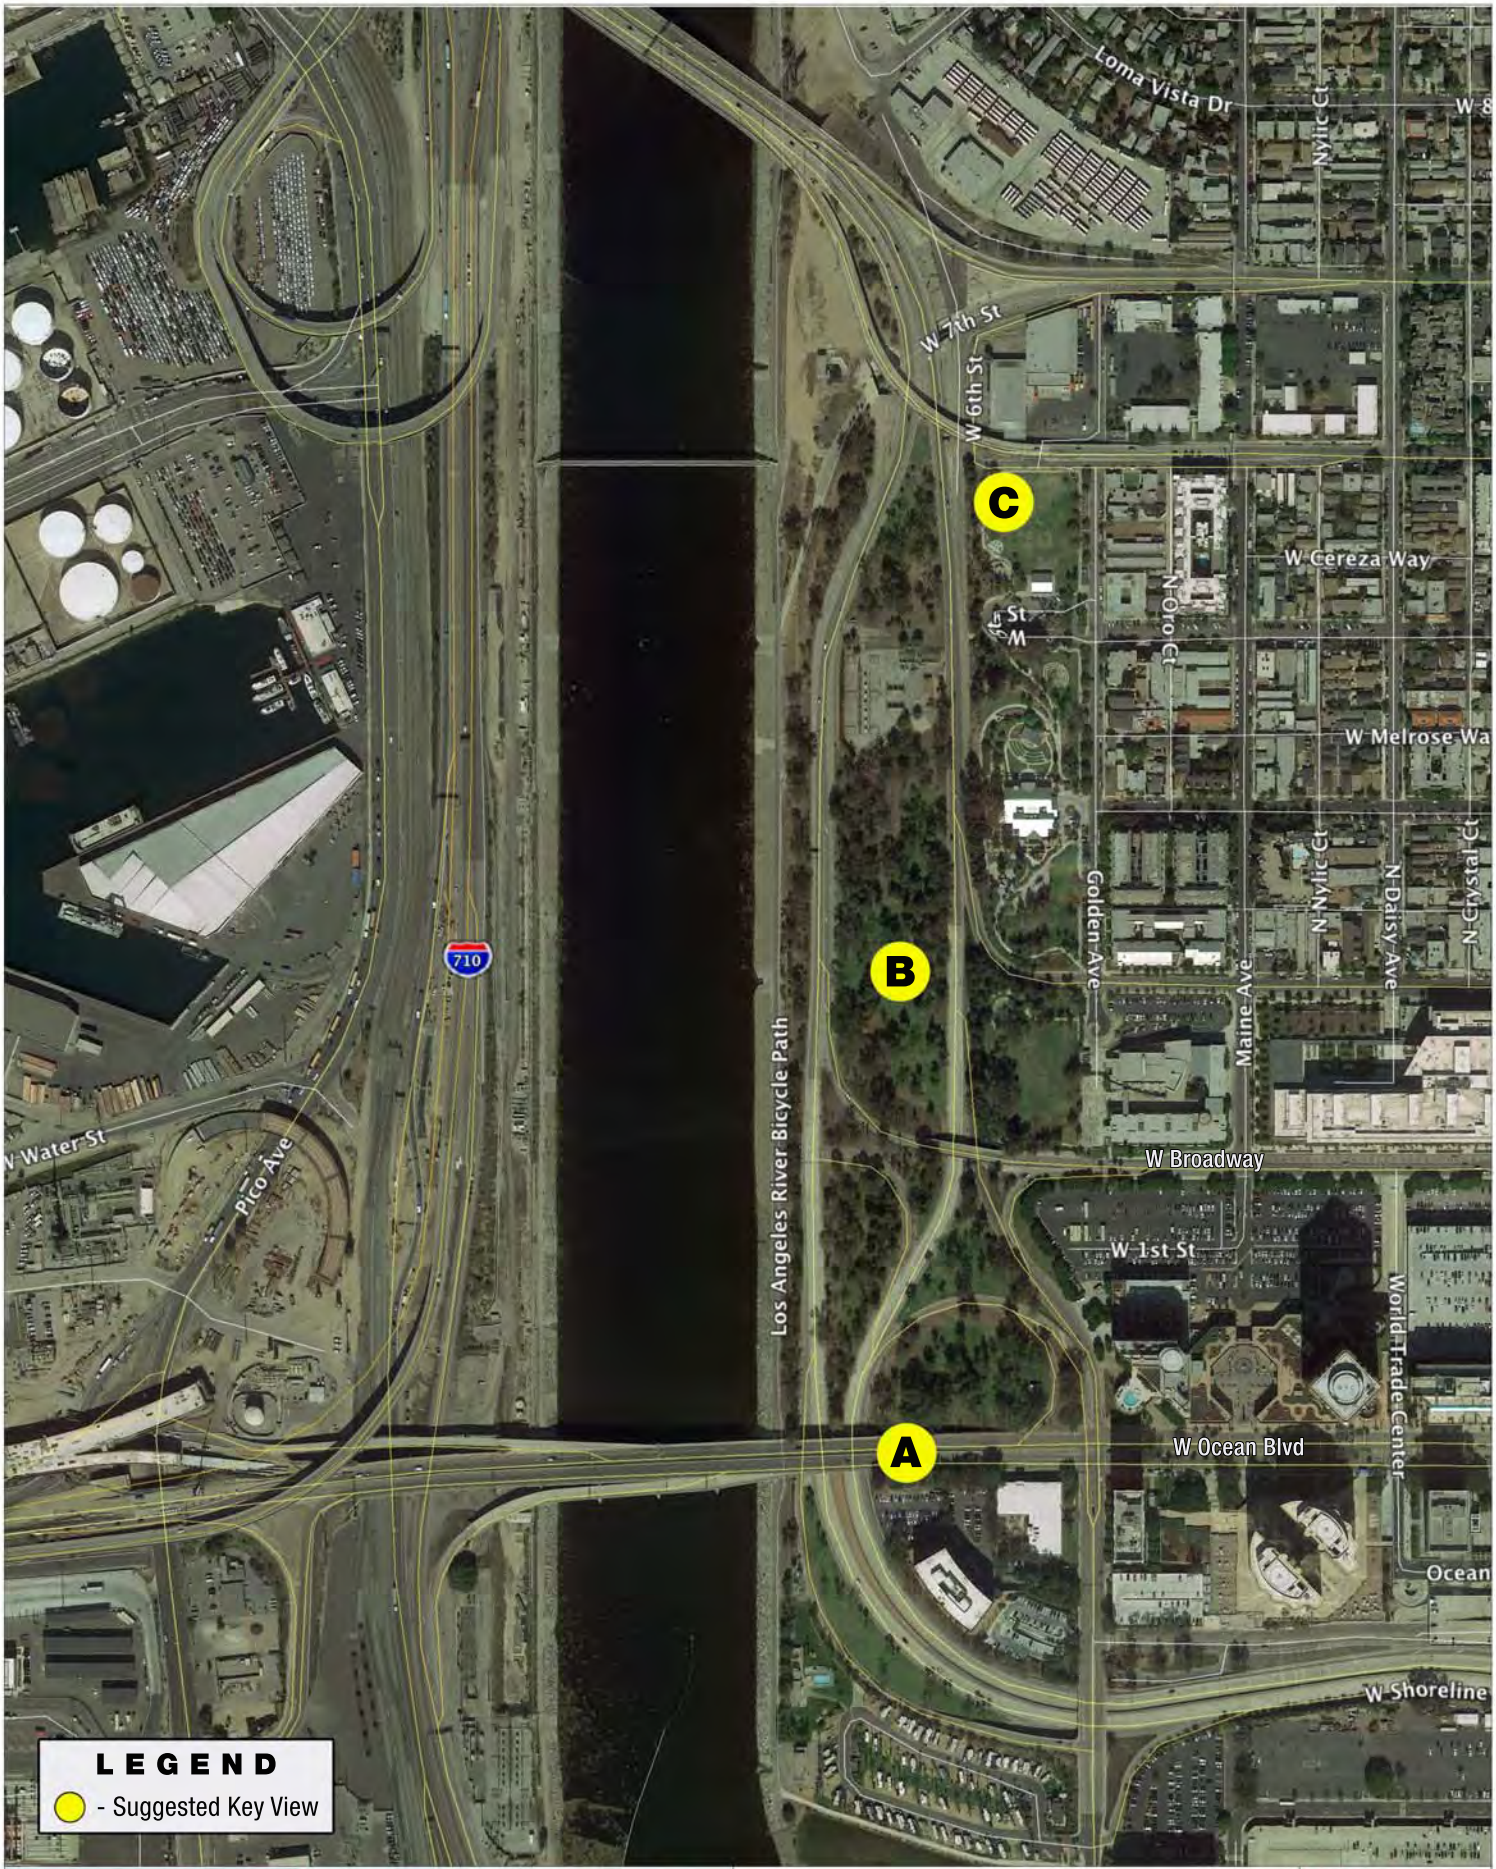
The City continues to be greatly concerned about provisions for pedestrians and bicyclists on interchanges. The exiting cloverleaf interchanges and high speed turn lanes are very poorly suited for walking or biking across the ramp terminals. Proposed interchanges, and especially diverging diamonds, continue to show high speed on and off ramps, especially to serve right turns onto or from freeway off ramps. If alternative interchange configurations are not provided, it is essential that all ramps have suitable control that will not require pedestrians to cross uncontrolled ramps or require bicyclists to merge across free turn lanes that do not require motorists to slow down. Experience with walk/bike friendly diverging diamond interchanges is not widespread due to their lack of precedent. Diverging Diamond interchanges with attempts toward walk/bike friendliness have been completed in Utah and in Alberta. Lessons learned from these examples should be applied to locations in California. L-27-146

Interchanges should reflect the philosophy noted in Caltrans publications, Deputy Directives, and Traffic Operations Policy Directives. The I-710 project reflects an opportunity to show greater sensitivity to these needs in a dense urban area that currently must use very poor facilities that discourage travel across I-710 except by motor vehicle. L-27-147

The project description is not clear or generous in the location of pedestrian and bicycle crossings and facilities. There should be a clear focus upon how these needs will be met, with consideration of Class IV facilities through interchanges. L-27-148

The City previously commented that there should be a clear and strong focus upon providing for pedestrians and bicycles, as represented by a pedestrian and bicycle master plan for the corridor. The project continues to focus upon satisfying auto and truck traffic, with brief discussion of provision of bicycle lanes and sidewalks. This token level of commitment is highly unlikely to achieve the City’s L-27-149

goal of an integrated transportation and mobility network that allows users to circulate readily and easily through and between neighborhoods along I-710 without reliance upon private motor vehicles. A specific and glaring omission is the provision of a bikeway along the west levee in Long Beach, including access to interchanges and well-suited neighborhoods, plus Class I or Class IV facilities at reconstructed interchanges that minimize or suitably control conflicts between travel modes. We have made specific comments where features of existing or planned interchanges have not been sensitive to this goal. L-27-149



SECTION 3.6 – VISUAL/AESTHETICS

Page 3.6-1, Regulatory Setting. For visual analysis, the regulatory setting is very important for understanding potential visual resources and viewer sensitivity in each local jurisdiction. This discussion should be updated to include the City of Long Beach General Plan, Local Coastal Plan Policies, as well as the State's Scenic Highways Program. L-27-150

Page 3.6-1, Section 3.6.2, Affected Environment. Refer to comments below on the Visual Impact Assessment, Section VI. Visual Environment of the Project.

Page 3.6-2, Section 3.6.2.4, Methodology. Refer to comments below on the Visual Impact Assessment, and Visual Impact Assessment, Section IV. Visual Assessment Methodology. In general, no information pertaining to the public outreach conducted to date, nor the committee input received as part of the *I-710 Corridor Aesthetic Master Plan* (CMP) process is discussed. It is important to include this information in order to properly disclose the anticipated viewer response to visual change, which would substantially affect the overall visual response scores. L-27-151

Page 3.6-2, Section 3.6.2.5, Key Views. Methodology for selecting the Key View locations was not clear. No Key View to represent potential impacts in the coastal zone, which have specific identified visual resources, was not considered. Potential impacts to recreational trail and park users was not adequately considered. For example, impacts to recreation users at Santa Cruz Park, Golden Park, Cesar Chavez Park, were not addressed. Community impacts from neighborhood modifications along Fashion Avenue in Long Beach are not reflected. Based on the selected Key Views, an overall visual response score was low throughout the City of Long Beach. However, much of the project involves full takes of properties, demolition activities, and construction of new transportation facilities, which would substantially change the character of Long Beach communities. These impacts overall are underscored and, as a result, the analysis does not fully disclose the visual impacts. The City of Long Beach should be consulted on which Key View locations should be considered in the City of Long Beach. Although it is difficult to understand the proposed project features based on the site plans provided, based on the visual sensitivity of the City of Long Beach, and proposed areas of change, the City of Long Beach recommends further Key View consideration at an additional seven locations (Key Views A through G), which are mapped on Figures 3.6a through 3.6c, *Suggested Key View Locations*, provided herein. Key Views A through C encompass proposed changes at multiple recreation facilities located in the City, as well as potential view impacts from Ocean Boulevard. Key View D reflects potential visual changes from the future City Scenic Corridor along Pacific Coast Highway. Key Views E and F represent potential visual changes from residential communities in the City. Key View G represents potential visual changes in character/quality that may be experienced by recreational users in the City (in this case, Tanaka Park). L-27-152

Overall Visual Impact Analysis. It is not clear what the major project components are that would result in the greatest visual change. No discussion of how sensitive viewers are specifically impacted by vegetation removal, increased views to hardscape features, or modification of the character of the existing communities is identified. The analysis should also discuss the project features associated with the CMP if further detail. The design guidelines should be identified, how these guidelines would reduce the resultant impacts, as well as the overall regulatory framework for enforcement. L-27-153

Page 3.6-114, Other Visual Impacts - Light, Glare, Shade, and Shadow. Refer to comments below on the Visual Impact Assessment, Section IX. Visual Impact Assessment. Light and glare considerations should also include new roadway alignments and new cul de sac features proposed in residential communities. These project features would result in new lighting from vehicle headlights that did not previously exist. These new lighting features can severely impact residential communities, depending on the configuration proposed. No mention of this is considered in the analysis. L-27-154

Page 3.6-116, Paragraph 1. It is not sufficient to compare all bridge impacts from the ratings received at just Key View 1. Consideration of existing public views toward visual resources should be considered. Whether or not new or modified bridge structures block existing views to visual resources should be considered and disclosed. L-27-155

Page 3.6-117, VIS-1, Last Paragraph. The measure VIS-1 cites the CMP as 2014, but the first paragraph of Section 3.6 cites the CMP as February 2012, and as February 2015 on pages 3.24-17 and 3.25-70. Please verify which version of the CMP document should be referenced and make consistent throughout. L-27-156

Page 3.6-117, VIS-2. This measure should also reference the tree/vegetation replacement guidelines presented in the CMP. L-27-157

Page 3.6-118, VIS-5. This measure should also reference the retaining wall design guidelines presented in the CMP. L-27-158

Page 3.6-118, VIS-6. This measure should also reference the wall design guidelines presented in the CMP. L-27-159

Page 3.6-118, VIS-7. This measure should also reference the design guidelines for lighting features presented in the CMP. L-27-160

Pages 3.6-118 and -119, VIS-8. This measure should also reference the vegetation replacement guidelines presented in the CMP. L-27-161

Visual Impact Assessment

The *Revised Draft Visual Impact Assessment Interstate 710 Corridor Project Ocean Boulevard to State Route 60* (VIA), prepared by AECOM Orange and Tatsumi Partners, Inc., dated February 2017, generally follows the guidelines outlined in the Federal Highway Administration's (FHWA) January 2015 publication *Guidelines for the Visual Impact Assessment for Highway Projects*. In this methodology, 3 main criteria were used: visual vividness, intactness and unity. All visual impact assessment work has been performed under the direction of a California-licensed landscape architect.

The VIA should also follow the California Department of Transportation (Caltrans) Standard Environmental Reference (SER) Chapter 27, *Visual & Aesthetic Review*. Per the SER Chapter 27, the level of VIA is determined using the VIA Questionnaire. The City of Long Beach has prepared a L-27-162

VIA Questionnaire for the proposed project (Attachment C, *VIA Questionnaire*, of this Comment Letter). Per the VIA Questionnaire, the VIA should follow the *Advanced/Complex VIA Annotated Outline*. The VIA Annotated Outlines have been developed to ensure that visual analyses are thorough, concise, objective, and consistent with statewide practices. L-27-162

Section III. Project Description

Prior to discussion of the Project Alternatives, a succinct description of what will be built, emphasizing the visible changes to the transportation system such as added or widened lanes, sidewalks, bike trails, or pathways; bridges removed, replaced, added, or widened; added or reconfigured intersections or interchanges; major grading; changes to access; added or removed retaining walls, noise barriers, concrete barriers, signals, signs, lighting, drainage facilities, vegetation (specific area or acres), trees (specific numbers), etc.] should be included.

Descriptions of aesthetic features that are planned for the project that the Project Development Team (PDT) has agreed are appropriate for the project scope and budget, and/or serve as contextual elements that help retain the unique character of the community and will help generate public acceptance of a project. These elements constitute "good design" and would include items such as textured noise barriers, retaining walls or paving; colored concrete or asphalt; "see-through" bridge rail; highway planting, etc. Also, this section should highlight both the beneficial features of the project as well as any measures to avoid or minimize visual impacts that were adopted early in the project development process. L-27-163

It is the understanding of the City of Long Beach, that the PDT has formed a committee of community stakeholders (including local cities, Los Angeles County, Gateway Cities Council of Governments, and Metro) and Caltrans staff to plan the visual quality of the I-710 transportation corridor. As part of this process, the Committee drafted the CMP, to be included as part of the proposed project. The CMP incorporates Caltrans policies of Context Sensitive Design Solutions; to plan, design, maintain, and operate its transportation system in a way that reflects and enhances the surrounding environment, while meeting Caltrans transportation goals and policies. A description of the CMP, including the intent, guidelines for proposed design features, and regulatory requirements associated with the CMP, should be discussed in the Project Description. L-27-164

Section IV. Visual Assessment Methodology

Preparation of the Visual Simulations. Existing condition photographs, used for the basis of the photosimulations, were taken using a Nikon D70 digital camera with a lens with the focal length of 30mm. However, in order to capture the 30mm view on the Nikon D70 digital camera, the lens must have a length of 50mm, in order to properly mimic the human eye. L-27-165

Digital Modeling. The methodology states that the specific view point for each digital model uses the architectural standard eye height of 5'7" for reference. However, the wireframe should in fact be adjusted to match the elevation of the photograph, such that it can be seemed in properly. L-27-166

Section V. Environmental Laws and Policies

This discussion should fully disclose scenic views, scenic corridors, and visual resources identified in each respective local plan that may be located in the viewshed of the project site. L-27-167

Page 21, City of Long Beach. This discussion includes the October 2002 General Plan. However, no mention of the Scenic Routes Element is discussed. Specific routes and visual resources identified in this element, that which are in the project's viewshed, should be included in this discussion. Goals L-27-168

and policies must be pulled into this discussion, as this information is important to visual resource considerations, and specifically those involving the coastal zone. L-27-168

Further, the General Plan Land Use and Urban Design Elements have since been updated in draft form February 2017. These documents, although not adopted, should be considered. Per the 2017 Urban Design Element, Ocean Boulevard remains a designated scenic route within Long Beach and is also situated within the project's viewshed. In addition, the system will be expanded to include the Los Angeles River corridor and the entire stretch of Pacific Coast Highway. These corridors are, or will become by 2030, scenic highways. To that end, these corridors and visual sensitive and should be considered specifically for architectural contributions to the overall aesthetic value of these important corridors. L-27-169

Per the 2017 Urban Design Element, vistas from high points, open locations, long corridors, and other similar places within the City include high grounds in mid-City and near Signal Hill looking toward Downtown and the coast, along rivers and channels, and natural areas among others. Consideration of these potential areas located within the project's viewshed should be considered. Per this element, wide, tree-lined streets through older neighborhoods would be considered visual resources, and also add to the visual character of a neighborhood. Other important vistas include views to the distant San Gabriel Mountains, and dramatic views from the City of Signal Hill out and over Long Beach. The policies in the 2017 Urban Design Element related to scenic routes should be included. L-27-170

Section VI. Visual Environment of the Project

The VIA is missing a description of the project location/setting in order to provide a context for determining the type and severity of changes to the existing visual environment. The project setting should discuss the project corridor, which is defined as the area of land that is visible from, adjacent to, and outside the highway right-of-way, and is determined by topography, vegetation, and viewing distance. A description of the general biogeographical or ecological region should be described. A description of the overall landscape should be included. L-27-171

The areas of the City of Long Beach are characterized as just highly industrialized/port-related industrial uses. However, in addition to these areas of the City, the project traverses through the communities of Westside and Wrigley, Bixby Knolls, and North Long Beach. Each of these communities have distinct characters, separate than that experienced near the port. L-27-172

A description as to whether or not scenic resources have been identified within the corridor should be included. The VIA should include a discussion of the project's local scenic highway designation along Ocean Boulevard, per the City of Long Beach General Plan, and if this segment includes scenic resources that which also include views to project features. L-27-173

Landscape Units. The landscape units have been divided by land use types, whereas, the first sentence of this discussion states "A landscape unit is a portion of the regional landscape and can be thought of as outdoor room that exhibits a distinct visual character. A landscape unit will often correspond to a place or district that is commonly known among local viewers." As all residential uses throughout the corridor would experience different "outdoor rooms", each with a distinct visual character, it is not reasonable to analyze the visual impacts to all residential uses together. As with residential uses, freeway users would experience different landscapes throughout the corridor and it does not seem appropriate to lump them all together. The City of Long Beach would like to be considered a distinct Landscape Unit from the rest of the project corridor, as the City has very specific visual resources that need to be considered separately from the remainder of the project corridor. L-27-174

Section VII. Visual Resources and Resource Change

This section should follow the *Advanced/Complex VIA Annotated Outline*. The concepts of form, line, color, etc., should be used to describe the visual character in the project corridor for each landscape unit (outdoor room). As discussed above, the use of land use types to describe landscape units is incorrect. The City of Long Beach should be considered its own landscape unit and the visual character should be described, including a description of the visual character of each alternative.

This section is missing the resource change discussion. The change (in terms of compatibility) of the visual character of each alternative with the existing visual character must be disclosed. Typically, for an advanced/complex level project, the visual character of the proposed project will have at least some incompatibility with the existing corridor.

L-27-175

A discussion of the changes to the visual quality of the corridor must be disclosed. Similarly, describe the visual quality of each alternative (if there are noteworthy differences between alternatives). Evaluate the change in the visual quality of each alternative (if appropriate) with the existing visual quality. Typically, for an advanced/complex level project, the visual quality of the proposed project will have a moderate to high detrimental effect to the existing corridor.

This section must summarize the changes in the visual resources for each alternative, noting in particular the changes to visual character and visual quality. Include a statement regarding overall resource change for each alternative using one of the following five levels: low, moderate-low, moderate, moderate-high, or high.

Section VIII. Viewers and Viewer Response

No viewer response rating was described for Highway Neighbors. These viewers should be rated as a high viewer response to the project. Viewer sensitivity should also consider local values of the community as a whole, based on the City of Long Beach General Plan and identified visual resources. Further, a discussion of the project's community outreach meetings, public input received, and the draft CMP should be discussed.

L-27-176

Section IX. Visual Impact Assessment

This section should follow the Advanced/Complex VIA Annotated Outline for visual impact. No discussion of impacts by visual impact assessment unit and by Alternative is provided. No description of Key View locations and which areas of the corridor they apply to are provided. Overall, the ratings need to be updated with the new guidelines. Further, the visual sensitivity needs to be re-evaluated. The Los Angeles River trail is widely used regionally and is not considered minimally traveled. Further, the sensitivity to improvements within and near the trail would be high, elevating the visual response and requiring further mitigation. Overall, the descriptions of proposed project features and resource change need to be fully developed. Consideration of new project features in each Key View need to be disclosed. Proposed project features, including the CMP, need to be disclosed. Impacts to visual resources, if applicable, need to be included. Impacts to community residents, recreational users, and institutional users as a result of removal of existing vegetation and exposure to new, relocated, or larger wall features or new bridge structures are underscored. The anticipated viewer response to these changes should be rated higher and mitigation should be deemed necessary, or otherwise explained why not.

L-27-177

A Project Impact Summary should be provided at the end of the analysis summarizing impacts per landscape unit per alternative. This section should characterize the overall visual impact of the project as low, moderate-low, moderate, moderate-high, or high. This summary should also address each of

L-27-178

the CEQA-required issue areas (scenic vistas, visual character, scenic resources along scenic highways, and light and glare) plus any potentially controversial project features such as noise barriers, tree removal, etc. A discussion of shade/shadow impacts should include a discussion of all shadow-sensitive uses that would be affected by the project should be disclosed. In addition to the narrative, consider including a table if necessary to convey the information to the reader. L-27-178

Temporary Impacts. A description of any visual impacts (by alternative if different) due to construction impacts such as night lighting, dust, temporary structures, staging areas, hauling materials, contractor yards, or detours should be included. The expected duration of construction should also be provided. L-27-179

Cumulative Impacts. The cumulative impacts, detailing if they will affect visual resources or viewers; if the visual impacts are beneficial or detrimental; and when the impacts would likely occur should be included in the VIA. The VIA should explain if the cumulative impacts would occur under all or just some of the alternatives. Specific consideration of the Shoemaker Bridge Replacement Project and the Long Beach MUST Facility, both in the City of Long Beach, within and along the I-710 Corridor, must be made. Cumulatively considerable impacts must be disclosed and whether the I-710 Corridor contributes to this impact must be disclosed. It should also be acknowledged that the proposed Long Beach MUST Facility will result in increased open space/public recreational area along the I-710 Corridor. The analysis must consider potential impacts to these facilities and whether or not the I-710 will negatively impact the future character of these areas in the City of Long Beach. L-27-180

Section X. Visual Avoidance, Minimization, and/or Mitigation Measures

The performance criteria identified as part of the CMP should be included in all applicable measures in the VIA. L-27-181

2012 Comments Not Adequately Addressed in the Recirculated Environmental Document

This section of the Draft EIR/EIS should describe any designated scenic corridors and the Project's impacts on such scenic corridors. For example, Ocean Boulevard within the City of Long Beach is designated as a scenic route by the City of Long Beach General Plan. L-27-182

This section focuses on views of the Project from specific locations adjacent to the freeway. The analysis should be supplemented with a discussion of all of the visual resources within the area (e.g., prominent landforms, historic resources, etc.) and should include an analysis of whether views of these visual resources would be obstructed by the Project. L-27-183

The public must be provided with more specificity regarding the aesthetics characteristics of the Project. In addition, the attractiveness of the new and modified sound walls must be ensured, as stated at the beginning of our letter. L-27-184

The conclusions with regard to views are highly subjective, inaccurate and/or conclusory. Reevaluation of the views should occur based on the following examples:

- The Project is a new prominent feature in key views 2 and 3. In fact, the Project is the most visible contrasting feature in key view 2 that will be viewed by residents in the vicinity of Gale Avenue and West Hill Street. Thus, the Project will result in substantial adverse visual change. In addition, the view of the enhanced conditions accentuates the visibility of the elevated freight corridor. The visual quality of view 2 is reduced by a value greater than 1.0. Similarly, the visual quality of view 3 is reduced by a value of more than 0.2. L-27-185

- As illustrated by key view 4, the Project, and the elevated freight corridor in particular, become the primary features in this view and result in substantial adverse visual change. The visual quality is reduced by more than the value of 0.7 cited in the text. L-27-186

- The Project introduces a new sound wall and elevated connector in key view 6, which will be viewed by many residents. These contrasting features do not result in a neutral impact on visual quality. L-27-187

- The removal of substantial landscaping, and the introduction of the interchange, utility poles and transmission lines in key view 7 results in much more than the 1.3 reduction in visual quality from this location cited in the text. L-27-188

- With regard to key views 11 and 12, the Project is a new highly visible feature. In addition, the introduction of the "enhanced condition" of the elevated freight corridor accentuates the visibility and contrast of the Project. The reduction in visual quality is much greater than the values of 0.4 and 0.3 provided in the text. L-27-189

The analysis of nighttime lighting is inadequate. New lighting will be introduced closer to light sensitive uses such as residential uses and lighting will also be introduced at a higher elevation along the freight corridor. No quantitative analysis is provided and the mitigation measure regarding lighting merely refers to a future lighting plan to be provided. This is inadequate to determine the impact of these new light source. L-27-190

The elevated lanes south of Willow Street would create impacts on visual blight that cannot be mitigated. The Project should be reworked to eliminate elevated lanes south of Willow Street to avoid impacts on visual blight. L-27-191

Section 2.24.3.6, Visual/Aesthetics, page 3.24-13. The analysis presented here notes that impacts to sensitive viewers would be expected. However, this analysis does not provide who or what these sensitive viewers are. This information must be provided to accurately reflect and mitigate potential impacts. L-27-192

The analysis of effects on a scenic vista provided on page 4-12 dismisses this issue by stating that there are no officially designated scenic vistas in the Project area. However, an impact of a scenic vista can occur even when a scenic vista is not officially designated. Visual resources within the project area include prominent landforms and historic resources. This section of the Draft EIR/EIS should address whether views of such resources would be affected. L-27-193

Like the analysis in Section 3.6, the analysis of potential light and glare impacts on page 4-13 is strictly qualitative with no demonstration of what potential impacts might be or how mitigation measures would reduce such impacts to less than significant levels. The proposed elevated freight corridor that will be visible to many residents may indeed result in significant light or glare impacts. L-27-194

The analysis of visual character and quality on page 4-30 is conclusory. As with the analysis provided in Section 3.6, there is no demonstration of how the introduction of a highly visible and overwhelmingly contrasting elevated freight corridor would be mitigated by the proposed mitigation measures. L-27-195

Section 4.2.4.6, Mandatory Findings of Significance, page 4-69. Based on the analysis provided in Section 3.25, cumulative Impacts, the build alternatives would also contribute to cumulative adverse impacts related to aesthetics and biological resources. As such, the conclusion presented here contradicts what is presented in the analysis of cumulative impacts. L-27-196

SECTION 3.7 – CULTURAL RESOURCES

Section 3.7.2.2 – Area of Potential Effects

Page 3.7-9, Due to the scale of the graphic, the extent of the Supplemental Area of Potential Effects is difficult to discern. Please break up the graphic onto multiple pages with match lines so the extents can be more readily identified. L-27-197

Section 3.7.2.4 – Native American Consultation

Page 3.7-15, Although the section discusses the consultation process that was undertaken with Native American contacts, no discussion was provided regarding whether the Assembly Bill (AB) 52 Tribal Consultation Procedural Requirements were met. Please provide a discussion regarding how the AB 52 process was fulfilled. L-27-198

Section 3.7.3.2 – Section 4(f) Resources

Page 3.7-27, In a letter dated November 12, 2009 from Lynette Ferenczy of the City of Long Beach to Casey Tibbet of LSA Associates, information was provided regarding potential historic resources near the proposed project. Specifically, the letter identifies the Masonic Hall at 5351-5353 Long Beach Boulevard and the Pressburg Residence located at 167 East South Street as both being landmark buildings. However, it appears that any study of these buildings has been omitted. Please identify why these structures were not evaluated. A copy of this letter can be found in Attachment F, Historical Consultation, of the *Supplemental Historic Property Survey Report* dated April 2017. L-27-199

Section 3.7.4 – Avoidance, Minimization, and/or Mitigation Measures

Page 3.7-29, the preparation of a Historic Properties Treatment Plan (HPTP) is discussed, it should be memorialized as an actual standalone measure. Furthermore, this measure should specifically identify consultation should be undertaken with the City of Long Beach Public Works Director regarding the improvements that will be required for the temporary vehicle detour in the Drake Park Historic District. L-27-200

SECTION 3.8 – HYDROLOGY AND FLOODPLAIN

Section 3.8.3.1 Permanent Impacts

Page 3.8-5, Paragraph 2. This section states that "localized channel modifications would be required to maintain the existing channel hydraulic capacity"; however, other paragraphs reference the proposed project would not change the capacity of the existing channels (see Page 3.8-17, Paragraph 3). Please clarify. L-27-201

Page 3.8-5, Paragraph 4. This section, as well as others throughout the document, references a "floodway", which is a term that is typically limited to the area within a special flood hazard area that depicts no encroachment is allowed. Unless there is a designated floodway on the FIRM, "floodway" should be replaced with "floodplain". L-27-202

Page 3.8-16, Paragraph 2 (Risk to Life and Property). This section, as well as others in the document, states it is anticipated that a CLOMR would be required. This should be expanded to describe under what conditions a CLOMR might be required. For example, FEMA would only require a CLOMR under one of two conditions: if there was a detailed study area with no floodway and there was a potential rise of greater than 1-foot associated with the proposed project; or if there was a detailed study area L-27-203

with a designated floodway and the proposed project would result in a rise greater than 0.00 feet. The LACFCD could also require a CLOMR should they feel one was warranted. This section should also be expanded to discuss the role of the U.S. Army Corps of Engineers (USACE) in this process. USACE has jurisdiction over the reaches of the LA River that were built as part of a Federal project. As such, any improvements to these reaches would require a 408 Permit. Due to the hydraulic sensitivity of the LA River, any impacts to the water surface could be considered significant by the USACE and could require mitigation. L-27-203

Page 3.8-17, Section 3.8.3.1, Permanent Impacts. A jurisdictional determination of the receiving waters (Los Angeles River, Rio Hondo and Compton Creek) listed needs be made. L-27-204

Page 3.8-18, Paragraph 1. Same comment as on Page 3.8-5, Paragraph 2. L-27-205

Page 3.8-21, Paragraph 1. This section states the levee encroachments" would not result in significant impact to the performance of levees impacted by the project." This should be expanded to reference the appropriate levee design standards and guidelines and would require a Section 408 permit from the U.S. Army Corps of Engineers. L-27-206

Page 3.8-22, Table 3.8-3. Pump stations located within the LB-MUST footprint should provide pumping of dry weather and partial stormwater flows to the LB-MUST system. These facilities should be included within Table 3.8-3 of the RDEIR/SDEIS. This should be part of the Early Action Projects. Pump stations include: L-27-207

- 6th St. Pump Station
- Cowles Pump Station
- 19th St. Pump Station
- Willow St. Pump Station
- 27th St. Pump Station
- Dominguez Pump Station
- Caltrans Pump Station @ UP Railroad Crossing
- Caltrans Pump Station @ Long Beach Blvd.
- Gordon St. Pump Station
- North Boundary Pump Station
- Caltrans Pump Station @ SR-91 Freeway - Southbound Ramp
- Artesia Blvd. Pump Station

Section 3.8.4 – Avoidance, Minimization, and/or Mitigation Measures

Page 3.8-26, Paragraph 1. This section references no work will be done within the floodplain until the Letter of Map Revision is approved. This should be changed to Conditional Letter of Map Revision and only if required. L-27-208

Page 3.8-26, Measure FP-2. There are several other TMDLs that need to be referenced including the following: L-27-209

- LA River Nitrogen and Related Effects TMDL
- LA River Watershed Bacteria TMDL
- LA River Watershed Trash TMDL
- TMDL for Toxic Pollutants in Dominguez Channel and Greater LA and Long Beach Harbors

Additionally, any replacement of the Lynwood Retention Basin and the Dominguez Gap Spreading Grounds shall meet the LARWQCB Basin Plan water quality standards. L-27-210

Preliminary On-Site Hydrology Report

Page 4, 1.0 Executive Summary of the Preliminary On-Site Hydrology Report states, "Many of the existing drainage systems also handle off-site flows (inflows to the Project) and outlet to the LA River directly or through several pump stations. Most of the pump stations have significant off-site tributary drainage areas and efforts should be made to maintain or augment the existing pump stations and associated outlets where possible." Also on Page 4 – "Offsite hydrology within the City of Long Beach was developed by referencing their storm drain master plan information. Most of the existing outlets do not require hydraulic upgrade due to the relatively minor increase in peak flow from the Project." Earlier this year (January 22 and 23, 2017), storm runoff flooded the I-710 Freeway in several locations causing the partial, if not complete, shutdown of the freeway. The storms appeared to indicate that the existing storm drain system (at least for these portions of the freeway) are deficient and in need of upgrading or replacement if future freeway shutdowns are to be avoided. The RDEIR/SDEIS appears to indicate that deficient storm drain systems may not be improved unless the project improvements conflict with their physical location or runoff from proposed improvements increase runoff significantly. The freeway acts as a barrier or dam causing ponding of storm runoff either on or off site when runoff exceeds the capacity of the facility that conveys the runoff from one side of the freeway to the other. Although the runoff from the proposed improvements may be minor, *if* the existing system is already deficient, proposed improvements may create difficulties for future upgrades of these drainage facilities. A coordinated effort should be initiated with each City to determine where existing deficient drainage systems currently exist and if proposed improvements could hinder their future upgrades. In addition, Caltrans should establish an agreement with the City so that any pump stations would capture, pretreat, and divert low flows to the Long Beach MUST facility, and include storage during rain events, where feasible. L-27-211

Page 32, Section 4.6 – Methodology and Computation Procedures of the Preliminary On-Site Hydrology Report states, "When the information was available, off-site flows were included in the evaluation at historical confluence points and pump stations." It is difficult to determine within the RDEIR/SDEIS when off-site flow information was available and utilized or not. L-27-212

Page 34, Section 5.2 – Methodology and Computation Procedures of the Preliminary On-Site Hydrology Report states, "Pump stations that are proposed to be protected in place will require evaluation for hydraulic capacity sufficient to accommodate the proposed 50-year peak Project flows. For the purpose of developing a disposition of the existing facilities, this evaluation was completed by comparing the existing on-site 50-year peak flow with the proposed onsite 50-year peak flows for the Project. *A pump station was recommended for hydraulic upgrade if there was a substantial increase in on-site peak flows*. During final design, a detailed hydraulic analysis for each pump station will be completed to address the combination of the existing off-site 50-year peak flows and the revised on-site peak flows contributing to each pump station." If the existing pump station is deficient, and no *substantial* increase in proposed improvement runoff is expected, the facility will likely be left deficient. In addition, the design occurrence frequency is a 50-year storm event; however, the Federal requirement for inclusion in the NFIP is 100-year. Each pump station facility should be checked to determine that the 100-year storm event does not cause ponding that could flood habitable structures or commercial structures. L-27-213

Page 37, 6.1 - Impacts On Existing Drainage Systems of the Preliminary On-Site Hydrology Report states, "Most off-site drainage systems that convey flows from the adjacent neighborhoods, cross the I-710 corridor, and receive on-site flows, will be replaced within the Caltrans right-of-way. *Off-site systems crossing the corridor that do not receive on-site runoff will be protected in place where possible."*

- Existing drainage systems that could be considered deficient will be protected in place and may not be improved. The I-710 Corridor Project may be the only opportunity for decades to improve some of these facilities. Caltrans should investigate the existing condition of on-site drainage pipes (via CCTV) and should line pipes that are cracked and taking on infiltration. L-27-214

- Each facility that transports runoff under the freeway or into the leveed LA River within the project area should be checked for adequacy to deliver the design discharge ultimately to the LA River. Further, an additional check should be provided to ensure that I-710 Freeway does not cause ponding during a 100-year storm event that may exceed the finished floor elevation of nearby adjacent habitable and commercial structures creating the need to delineate additional floodplains. L-27-215

- FEMA has recently undertaken the California Coastal Analysis and Mapping Project (CCAMP) to delineate new flood zones as a result of potential 100-year coastal flooding. New FIRMs are being generated as a result of the study and are just recently being made available (sometimes in preliminary form) to the public. The new FIRMs should be examined as part of the final EIR/EIS to ensure that proposed improvements are designed accounting for the new 100-year coastal floodplains if any. L-27-216

2012 Comments Not Adequately Addressed in the Recirculated Environmental Document

Section 3.8.3, Environmental Consequences: This analysis notes "construction of the improvements discussed above within the 100-year floodplain is not anticipated to substantially increase the base flood elevation. At this time, it is anticipated that a Conditional Letter of Map Revision (CLOMR) would be required. No revisions to the FEMA FIRM maps (Letter of Map Revision [LOMR]) are anticipated" with no explanation as to why a Conditional Letter of Map Revision would be required or what a Conditional Letter of Map Revision is or how it would minimize hydrology and floodplain impacts. This analysis also states "the change in floodplain elevation would be evaluated based on final design plans of the bridges and other structures where they encroach on the 100-year floodplain. The modeling results would be included in the application for a CLOMR and LOMR, if required, which would be processed through the Los Angeles County Flood Control District and FEMA." Yet this section concludes "construction of the improvements discussed above within the 100-year floodplain is not anticipated to substantially increase the base flood elevation." Such determination is not supported as the necessary studies have yet to be completed. L-27-217

There will be some loss of park space for all proposed alternatives. The Draft EIR/EIS specifically states, "the impervious increases would be minimal." This does not take into account that municipalities must actively reduce pollutants in runoff from current levels. This can be accomplished, in part, by increasing pervious areas. Maintaining pollutant discharge levels at current levels is not an acceptable option. The Draft EIR/EIS should describe mitigation measures for any existing pervious areas being converted to impervious areas. L-27-218

The Draft EIR/EIS should also show existing and proposed ground elevations contours, invert elevation, size and type of all drainage facilities. L-27-219

The structural integrity of the existing levees along the Los Angeles River should be confirmed, and potential impacts to the integrity of these levees resulting from the Project should be evaluated. L-27-220

The impact of the sound walls on the existing flood zones should be addressed. L-27-221

The City of Long Beach Department of Public Works must review the final Hydrology Study. L-27-222

The Los Angeles River Impact Study must be reviewed by the County and the USACOE. L-27-223

SECTION 3.9 – WATER QUALITY AND STORMWATER RUNOFF

Section 3.9.1.3, State Water Resources Control Board and Regional Water Quality Control Boards, page 3.9-3. Caltrans' MS4 Permit (Order No. 2012-0011-DWQ) was adopted on September 19, 2012, and became effective on July 1. The Caltrans MS4 Permit has also been amended as follows: ORDER WQ 2014-0006-EXEC; ORDER WQ 2014-0077-DWQ; and ORDER WQ 2015-0036-EXEC. These amendments should also be referenced. L-27-224

Section 3.9.3, Environmental Consequences, page 3.9-16: This section notes, "several parcels have been identified adjacent to I-710 and the Los Angeles River for relocation of the Dominguez Gap Basin." However, this section does not identify where these areas are located. This section should fully disclose all of the information and potential environmental effects as a result of the relocation of the Dominguez Gap Basin associated with the Project. L-27-225

Section No. 3.9.3.1, Permanent Impacts, Page 3.9-18, All available open space should be used to capture and detain or infiltrate stormwater. L-27-226

Section No. 3.9.3.1, Permanent Impacts, Page 3.9-18. A ten-year peak flow even is not equivalent to the 85th percentile storm. Please correct. L-27-227

Section No. 3.9.3.1, Permanent Impacts, Page 3.9-20, 2nd paragraph: Pump stations located within the LB MUST footprint should provide pumping of dry weather and partial stormwater flows to the LB MUST system. This should be part of the Early Action Projects; refer to Figure 3.9a, *Basin and Pump Station Modifications – Alternative 5C*, and Figure 3.9b, *Basin and Pump Station Modifications, Alternative 7*. L-27-228

Section No. 3.9.3.1, Permanent Impacts, Page 3.9-20, 3rd paragraph. Removing the Dominguez Gap Basin will have an effect on water quality of the LA River. Explain what will happen with the stormwater that currently enters the basin. Will it be discharged directly to the LA River? Will it be treated? L-27-229

Section No. 3.9.3.1, Permanent Impacts, Page 3.9-21, 3rd paragraph. Regarding the build alternatives, all available open space should be used to capture and detain or infiltrate stormwater; refer to Figures 3.9a and 3.9b. In addition, pump stations located within the LB-MUST footprint should provide pumping of dry weather and partial stormwater flows to the LB-MUST system. This should be part of the Early Action Projects. L-27-230

Section No. 3.9.3.1, Permanent Impacts, Page 3.9-21, last paragraph. Regarding BMPs to be utilized for both build alternatives, the stated information on its face is true but presumes the BMPs are being used as a treatment train. The current plans do not indicate treatment trains are being used everywhere. This statement is misleading and should be reworded. L-27-231

Section No. 3.9.3.2, Public Health Considerations, Page 3.9-22. The analysis notes that the build alternatives would not pose risks to public health related to hydrology and water quality. As stated previously, the receiving waters are impaired for a variety of constituents. The statement above informs the reader that the receiving waters will not be degraded. However, Caltrans is obligated to comply with its Municipal Stormwater Permit, which states the following: The effect of the Department's storm water discharges on receiving water quality is highly variable. For this reason, this Order requires the Department to implement a storm water program designed to achieve compliance with water quality standards, over time through an iterative approach. If discharges are found to be causing or contributing to an exceedance of an applicable Water Quality Standard, the Department is required to revise its BMPs (including use of additional and more effective BMPs). Additionally, the Department is obligated to comply with the Total Maximum Daily Load Requirements specified in L-27-232

Attachment IV of its Municipal Stormwater Permit. Please inform the reader of the BMPs planned for this project will result in the discharges not causing or contributing to an exceedance of an applicable Water Quality Standard and if the project will be compliant with TMDL requirements. L-27-232

Section No. 3.9.3.3, MOTION 22.1, Page 3.9-22. The BMPs noted in this section are obligatory to complying with Caltrans MS4 Permit. What additional storm water BMPs will be implemented to enhance the water quality for the Los Angeles River and its tributaries in accordance with Motion 22.1? L-27-233

Section No. 3.9.4, Avoidance, Minimization, and/or Mitigation Measures, Page 3.9-23, Measure WQ-1. All available open space should be used to capture and detain or infiltrate stormwater. Pump stations located within the LB-MUST footprint should provide pumping of dry weather and partial stormwater flows to the LB-MUST system. This should be part of the Early Action Projects. In addition, the RDEIR/SDEIS needs to add compliance with the CGP; IGP; 401 WQ Certification, 404 Permit, and any other Agency permits that will be achieved. There also needs to include a mitigation measure for removing the Dominguez Gap Basin. L-27-234

Stormwater Data Report

Page 13, 2nd paragraph. The Dominguez Gap Spreading Grounds basin has a primary purpose of providing for enhanced groundwater recharge. However, it is also effective in treating stormwater. This section should be revised accordingly. L-27-235

Page 14, 10th paragraph. Caltrans intends to install landscape along the I-710. Landscape and associated maintenance is a potential source of nutrients. Additionally, the Los Angeles River is impaired for nutrients. The TDCs should be revised to include nutrients. L-27-236

Page 16, paragraph below the table. It is recommended to provide the data that supports The Department's monitoring data depicts Caltrans discharges to be below the TMDL limits, thus no additional measures are needed to be considered for meeting the conditions of the Nitrogen TMDL. L-27-237

Page 21, 2nd bullet. When did the Department last check for dry weather flows? What frequency are dry weather flows being investigated. Do pump stations show evidence of dry weather flows? L-27-238

Page 23. A number of other BMPs should be included such as: NS-10 Vehicle and Equipment Maintenance; NS-13 Material and Equipment Use Over Water; WM-2 Material Use; WM-5 Solid Waste Management. L-27-239

Page 23, last paragraph. The Construction General Permit requires calculation of Risk Level for each Planning Watershed. The risk level determination in the SWDR identified sediment toxicity as a reason for the receiving water to be identified as high risk. Sediment toxicity is not a characteristic for the high risk receiving water (i.e., 303(d) listed as being impaired for sediment/siltation or turbidity). Accordingly, unless the receiving water has a beneficial use of cold, spawn, or migratory, the receiving water risk level is Low. This is the case for Segment 1a as defined in the SWDR. It is noted that the sediment risk factor for each segment is calculated as Low or Medium. The R-factor is the main driver, which could cause this factor to increase to High. R-factor is sensitive to the construction duration. The anticipated construction duration for each segment (which is based on project start through final stabilization), should be verified. Note that if the end date of the project is extended beyond what was originally planned, then the risk calculation must be redone. If the Risk Level changes from Risk Level 2 to 3, then the associated Construction General Permit provisions must be complied with. L-27-240

Page 24, 3rd bullet. It is noted that the sediment risk factor for each segment is calculated as Low or Medium. The R-factor is the main driver, which could cause this factor to increase to High. R-factor is sensitive to the construction duration. The anticipated construction duration for each segment (which is based on project start through final stabilization), should be verified. Note that if the end date of the project is extended beyond what was originally planned, then the risk calculation must be redone. If the Risk Level changes from Risk Level 2 to 3, then the associated Construction General Permit provisions must be complied with. L-27-241

Page 25, City of Long Beach. The section should be revised to include discussion of the City's Watershed Management Plan and the Long Beach Municipal Urban Stormwater Treatment Master Plan. L-27-242

Page 28, last paragraph Pump stations located within the LB-MUST footprint should provide pumping of dry weather and partial stormwater flows to the LB-MUST system. L-27-243

Page 32, 1st bullet. This evaluation should be conducted now and prior to the finalization of the EIR/EIS. The receiving waters are impaired for a variety of constituents. Caltrans is obligated to comply with its Municipal Stormwater Permit, which states the following:

The effect of the Department's storm water discharges on receiving water quality is highly variable. For this reason, this Order requires the Department to implement a storm water program designed to achieve compliance with water quality standards, over time through an iterative approach. If discharges are found to be causing or contributing to an exceedance of an applicable Water Quality Standard, the Department is required to revise its BMPs (including use of additional and more effective BMPs). L-27-244

Additionally, the Department is obligated to comply with the Total Maximum Daily Load Requirements specified in Attachment IV of its Municipal Stormwater Permit. Please inform the reader of the BMPs planned for this project will result in the discharges not causing or contributing to an exceedance of an applicable Water Quality Standard and if the project will be compliant with TMDL requirements.

It is critically important that Caltrans conduct this evaluation now. If the combination of biofiltration and DPP infiltration does not achieve the above-stated requirements, Caltrans will need to identify alternative solutions.

Page 32, 3rd bullet. As stated above, the TDCs should include nutrients. L-27-245

Page 32, 6th bullet. The statement provided needs to be revised to reflect the LB-MUST project. L-27-246

Attachment C - Risk Level Determination, Alternative 5C - The Construction General Permit requires calculation of Risk Level for each Planning Watershed. The risk level determination in the SWDR identified sediment toxicity as a reason for the receiving water to be identified as high risk. Sediment toxicity is not a characteristic for the high risk receiving water (i.e., 303(d) listed as being impaired for sediment/siltation or turbidity). Accordingly, unless the receiving water has a beneficial use of cold, spawn, or migratory, the receiving water risk level is Low. This is the case for Segment 1a as defined in the SWDR. It is noted that the sediment risk factor for each segment is calculated as Low or Medium. The R-factor is the main driver, which could cause this factor to increase to High. R-factor is sensitive to the construction duration. The anticipated construction duration for each segment (which is based on project start through final stabilization), should be verified. Note that if the end date of the project is extended beyond what was originally planned, then the risk calculation must be redone. If the Risk Level changes from Risk Level 2 to 3, then the associated Construction General Permit provisions must be complied with. L-27-247

Attachment D - Risk Level Determination, Alternative 7 - The Construction General Permit requires calculation of Risk Level for each Planning Watershed. The risk level determination in the SWDR identified sediment toxicity as a reason for the receiving water to be identified as high risk. Sediment toxicity is not a characteristic for the high risk receiving water (i.e., 303(d) listed as being impaired for sediment/siltation or turbidity). Accordingly, unless the receiving water has a beneficial use of cold, spawn, or migratory, the receiving water risk level is Low. This is the case for Segment 1a as defined in the SWDR. It is noted that the sediment risk factor for each segment is calculated as Low or Medium. The R-factor is the main driver, which could cause this factor to increase to High. R-factor is sensitive to the construction duration. The anticipated construction duration for each segment (which is based on project start through final stabilization), should be verified. Note that if the end date of the project is extended beyond what was originally planned, then the risk calculation must be redone. If the Risk Level changes from Risk Level 2 to 3, then the associated Construction General Permit provisions must be complied with. L-27-248

Attachment F, Checklist SW-1, Site Data Sources. The table should include the Long Beach MUST Project. L-27-249

Attachment F, Checklist SW-3, Measures for Avoiding or Reducing Potential Stormwater Impacts.

Explain why the project cannot be scheduled or phased to minimize soil-disturbing work during the rainy season? This is important and should be feasible. L-27-250

Attachment F, Treatment BMPs Checklist T-1, Part 1, Page 6. Nitrogen should be checked off as a TDC (refer to prior comments). Questions 4d and 4e should be checked "Yes". L-27-251

Attachment F, Treatment BMPs Checklist T-1, Part 1, Page 9. Dry Weather Diversion: Checklist T-1, Part 6 should be checked and included in the Storm Water Data Report. L-27-252

2012 Comments Not Adequately Addressed in the Recirculated Environmental Document

Section 3.9.3, Environmental Consequences, page 3.9-16: This section notes, "several parcels have been identified adjacent to I-710 and the Los Angeles River for relocation of the Dominguez Gap Basin." However, this section does not identify where these areas are located. This section should fully disclose all of the information and potential environmental effects as a result of the relocation of the Dominguez Gap Basin associated with the Project. L-27-253

Section 3.9.3, Environmental Consequences: This section also notes that "with the L-27-254

Table 7 on page 3-10 –The Draft EIR/EIS does not adequately discuss how the runoff from the Project will be treated and controlled in order to achieve both the interim and final targets. L-27-255

Table 7 incorrectly lists the dates of the USEPA approval for several TMDLs. These include, but are not limited to, the TMDLs for: Cadmium, Copper, Lead and Zinc which were re-approved and reaffirmed by the EPA for Reaches 1 and 2 the Los Angeles River on October 29, 2008; for Reach 1 of the San Gabriel on March 26, 2007; for Los Cerritos Channel on March 17, 2010; and the estuary (Harbor Toxics TMDL) on March 23, 2012. L-27-256

This section indicates, "the potential operational impacts (pollutants) would be addressed through the incorporation of design development BMPs, treatment BMPs, and adherence to the necessary operation and maintenance protocols identified in the Caltrans SWMP. The proposed treatment BMPs include 24 biofiltration swales, 8 infiltration basins, 22 media filters, 1 detention basin, 7 gross solids removal devices, and 1 wet basin." The City has a wide variety of concerns associated with these proposed BMPs, including the following:

Long-term effectiveness of many of these proposed BMPs has not been proven based on scientific data. Please cite specific examples associated with major transportation projects in California, or in the United States, where these proposed BMPs have been shown to remain effective in the long term. These examples should include water quality testing data (influent and effluent) for trash, heavy metals, phosphates, hydrocarbons, pathogenic bacteria and other pollutants. L-27-257

The long term funding for the maintenance of these proposed BMPs has not been properly analyzed and discussed. Funding sources should be analyzed as they relate to the ability to maintain water quality improvements.

Reuse of the "treated" urban runoff has not been properly analyzed. The State should consider a BMP to treat and reuse these flows for irrigation along the I-710 Corridor landscaping.

The cost effectiveness of low flow urban runoff treatment at the City's stormwater pump stations should be considered as an alternative, or supplement, to the proposed treatment BMPs. L-27-257

The post-construction increase in traffic that will be using local arterial streets (7th Street, 9th Street, Anaheim) will be subject to increased stop and go traffic until entering the I-710 itself. The Draft EIR/EIS should include the provisions that would be included in the Project to mitigate the increased pollutants from brake dust, tire wear and hydrocarbons that will be deposited on City-owned and operated streets. L-27-258

The City is concerned that particulates from concrete batch plants that may be located near the L.A. River, even if meeting current SCAQMD criteria, will still contribute to exceedances in the L.A. River. L-27-259

Electrical transmission lines will be relocated directly over portions of the Los Angeles River. The recirculated Draft EIR/EIS should identify if rain and condensate water dripping on the wires will significantly contribute to copper and other metal pollutants in the river. L-27-260

The Statewide Highway Characterization indicates that there are several pollutants categories (i.e. conventional, hydrocarbons, metals, microbiological, semi-volatile organics) that exceed current non-TMDL Water Quality Standards. These Water Quality Standards need to be met on a current and ongoing basis and are likely to be detected (at unknown levels) once outfall monitoring begins. The Draft EIR/EIS mentions these pollutants but does not specify immediate or long-term pollutant reduction measures. L-27-261

Several treatment BMPs are proposed (biofiltration strips and swales, infiltration basins, detention basins, media filters, etc.). The recirculated Draft EIR/EIS should contain preliminary estimates of the efficiency of each of the proposed treatment BMPs for removal of each of the anticipated pollutants and provide an analysis of how each BMP will meet TMDL compliance. L-27-262

The Draft EIR/EIS states that 83 percent of runoff from the new impervious surfaces would be treated. This implies that 17 percent of new surfaces and 100 percent of all remaining impervious surfaces will be untreated. The Draft EIR/EIS must propose mitigation measures that will result in a net decrease of (post-construction) pollutants in runoff. L-27-263

The City has been informed that 80 to 90 percent of runoff from the Project area will be treated. The Draft EIR/EIS needs to clarify if this is 80-90 percent of the total flow that will occur or does this mean that 80-90 percent of the project area will have treatment systems that may or may not have treatment capability for the larger storms. L-27-264

The City has been informed that the treatment BMPs are designed for 2 year and 10 year storms at a minimum. Municipalities are being required to treat the runoff from 85th percentile storms. The Draft EIR/EIS needs to evaluate if these two standards are equivalent. L-27-265

The Draft EIR/EIS needs to specify the operations and maintenance practices that Caltrans will follow once the treatment BMPs are installed. Under the anticipated (next) MS4 permit, municipalities are expected to be required to conduct post-construction effectiveness assessments of their treatment BMPs. The Draft EIR/EIS needs to include similar assessments to be performed by Caltrans to assure continued treatment BMP effectiveness. L-27-266

The alternatives will require significant modifications to the Dominguez Gap. The discharge point of the Dominguez Gap has been assigned to Jurisdictional Group 1, which includes the City of Long Beach and Caltrans, under the existing Los Angeles River Metals TMDL. Jurisdictional Group 1 (JG1) previously submitted a Metals TMDL implementation plan to the Regional Board on October 10, 2010. L-27-267

Under this plan, JG1, has been working with the Los Angeles County Flood Control District and is using the current assimilative capacity of Dominguez Gap as an integral part of the overall strategy to meet the first TMDL compliance point of January 2011. Any changes to Dominguez Gap have the potential for negating the current compliance of JG1 cities and Caltrans. The Draft EIR/EIS indicates, "the Dominguez Gap will retain its original recharge capacity." This statement is not equivalent to maintaining the original metals reduction capacity. The Draft EIR/EIS must contain mitigation measures for ensuring the continuous metals reduction by Dominguez Gap. L-27-267

The City has been informed that as part of this Project, numerous (22) storm water pump stations, all located along the east side of the L.A. River will be impacted. Nineteen (19) of these stations will be upgraded to accommodate the projected increased flow. These pump stations may be an integral part of the various Los Angeles River TMDL subcommittees' efforts to minimize pollutant levels in storm water dischargers to the L.A. River. The recirculated Draft EIR/EIS needs to specify how this Project will work with those entities to avoid any increased in pollutant discharges that may result from changes in the pump stations. L-27-268

The Los Angeles River Metals TMDL specifies that the wet weather sampling under the Coordinated Monitoring Plan (CMP) be initiated once a threshold of 500 cfs occurs at the Willow monitoring station. The proposed increase of 96 cfs under alternative 5A and 771 cfs under alternatives 6A/B/C could dramatically increase the number of wet-weather storms. The Draft EIR/EIS needs to address whether any of the alternatives will impact both dry-weather and wet-weather sampling procedures required under the CMP. L-27-269

Sampling stations have already been established along the embankments at locations approved by the Regional Board. The recirculated Draft EIR/EIS must indicate if these sampling stations would need to be relocated and whether the relocation would be funded by Caltrans. In addition, the Draft EIR/EIS must note if the sampling would be impacted during construction. L-27-270

The Draft EIR/EIS does not address if there will be any impact to the existing outfall monitoring that the City is required to conduct under the MS4 permit. In addition, it is likely the outfall monitoring requirements will be expanded under the next MS4 permit. The recirculated Draft EIR/EIS needs to contain provisions for working with the City to minimize impacts to the city's monitoring programs and Caltrans should provide or participate with Municipalities in water quality monitoring to show compliance with applicable TMDLs. L-27-271

It is unclear if the proposed channel structures (roadway bridges) – 24 channel structures for Alternative 5A and 33 channel structures for Alternative 6A/B/C – will discharge directly to the rivers/waterways or will be collected and directed to a treatment system. The recirculated Draft EIR/EIS needs to adequately address this issue. L-27-272

The bridges directly over the Los Angeles River are being significantly widened (Alternative 5A would create approximately 13,500 square feet of new structure within the roadway and Alternative 6A/B/C would create approximately 24,000 square feet of new structure within the roadway). The Los Angeles River, through the entire length of the proposed corridor is impaired. Alteration to or removal of any portion of the existing wetlands (regardless of the size) will have a negative impact on water quality. The recirculated Draft EIR/EIS should detail what mitigation measures are proposed for any lost wetland areas. L-27-273

The recirculated Draft EIR/EIS should include an evaluation of storm water characteristics and potential impacts prior to construction. In addition, the Draft EIR/EIS should include calculations of water quality flows and identify the discharge points. L-27-274

As part of the Project, Caltrans should develop and implement programs addressing storm water pollution issues. These programs shall comply with the latest code requirements (i.e., the latest TMDL, Clean Water Act, Coastal Zone Act and California Water Code) at the time of construction. L-27-275

Treatment BMPs should be designed such that groundwater will not be affected. L-27-276

The City requests that Caltrans develop, construct and maintain treatment control devices and BMPs within Caltrans right-of-way. In addition, all storm drain pump stations that need to be upgraded or replaced should be reviewed by the City of Long Beach. L-27-277

SECTION 3.10 – GEOLOGY/SOILS/SEISMIC/TOPOGRAPHY

2012 Comments Not Adequately Addressed in the Recirculated Environmental Document

Page 3.10-7, This section notes that "since no laboratory data is available regarding the collapsibility of soils in the area, it is not known if collapsible soils are present; however, the area is not known from existing mapping to have collapsible soils." Although the sources of this mapping are noted in Section 7.0 of the 2010 Geotechnical Final Report, they should be summarized in Section 3.10.2.1 to allow the reader to easily understand the sources of the referenced data. L-27-278

Geotechnical Final Report (January 2010)

Figures. The figures for the report are missing. Verification of the references that would be supplied in the figures could not be made. L-27-279

Appendix A. The data for Appendix A (Logs of Test Borings for Bridges Along I-710 Corridor) is missing. Verification of the references for this data could not be made without the logs. L-27-280

Per the Caltrans Standard Environmental Reference (Volume 1, Chapter 7), the qualifications of the report preparer should be noted and the report must be prepared by a California Registered Professional Geologist (PG), or a Registered Professional Engineer (PE). Please identify the qualifications of the preparer. L-27-281

SECTION. 3.12 – HAZARDOUS WASTE/MATERIALS

Page 3.12-1, Paragraph 1. This section states that "Based on a mutual agreement between the Los Angeles County Metropolitan Transportation Authority (Metro) and the California Department of Transportation (Caltrans), the ISA prepared for the project was not required to identify impacts related to site conditions." However, per Chapter 10 of the *Caltrans Standard Environmental Reference* (SER), the Phase I ISA is necessary in order to determine what activities the project would include, such as excavation, acquisition of new right of way, structure demolition or modification, etc. The remainder of this discussion goes on to state that a Preliminary Phase I ISA approach has been taken for the purposes of this analysis. However, as detailed in the comments below regarding the Phase I ISA document, this approach is not consistent with the SER, Caltrans' *Project Development Procedures Manual* (PDPM), nor the ASTM International (ASTM) E 1527-13 *Standard Practice for Environmental Site Assessments: Phase I Site Assessment Process.* This approach leaves out readily available public information pertaining to existing hazardous materials present in soils, soil gas, and groundwater within the boundaries of the project site. The Phase I ISA should be updated to reflect current database information, a current site visit, and appropriate file reviews for all on-site properties, all adjoining off-site properties (those properties that bound the project boundaries, including those separated by roads or waterways), and other adjacent off-site properties of concern. Upon update of L-27-282

the Phase I ISA, this substantial new information pertaining to hazardous materials conditions at the project site should be recirculated for public review pursuant to CEQA Guidelines Section 15088.5. L-27-282

Page 3.12-3, Section 3.12.2, Paragraph 2, Last Sentence. This sentence states that only "high" risk sites are listed in Tables 3.12-1 through 3.12-3. These tables should include "moderate" risk sites as well, since not all of the file review information, building records, other historical resources, or interviews (as bulleted on page 3.12-4) have been conducted. L-27-283

Page 3.12-4, Paragraph 1. This discussion defers future analysis of a full Phase I ISA to after selection of a preferred alternative. No specific avoidance, minimization, or mitigation measure is listed regarding this requirement, nor are there any regulatory references to what would require this additional investigation. Last, this deferral of additional research to a later date is not allowed pursuant to CEQA Guidelines Section 15126.4(a)(1)(B), which states "Formulation of mitigation measures should not be deferred until some future time. However, measures may specify performance standards which would mitigate the significant effect of the project and which may be accomplished in more than one specified way." Should additional research be conducted as a result of an updated Phase I ISA, new recommendations would be included, which would constitute new mitigation. This new report and associated new recommendations would be required to be recirculated for public review pursuant to CEQA Guidelines Section 15073.5(b)(1). If this information is not disclosed, the potential environmental impacts pertaining to hazards and hazardous materials are not being fully disclosed to the public. L-27-284

Page 3.12-6, Section 3.12.2.7. This discussion does not fully analyze potential impacts to the project site, including proposed properties for acquisition that which have potential contaminated groundwater from off-site properties. This information should be included in the analysis and a discussion of potential improvements that may involve groundwater should be fully disclosed. Measure CON-HW-3 is to general, has no performance criteria outlined, and is considered deferral of mitigation pursuant to CEQA Guidelines Section 15126.4(a)(1)(B). L-27-285

Page 3.12-7, Paragraph 5. Caltrans and the Department of Toxic Substances Control (DTSC) have entered into a Soil Management Agreement for Aerially Deposited Lead-Contaminated Soils (Agreement) effective July 1, 2016, that supersedes the prior ADL Variance. A discussion of the recent Agreement should be disclosed in the Environmental Document. L-27-286

Page 3.12-11, Section 3.12.2.8. This analysis of potential on-site landfills is insufficient. Full disclosure of potential impacts of project improvements that would disturb existing landfills should be included. Any necessary avoidance, minimization, or mitigation measures must be disclosed. L-27-287

Page 3.12-15, Section 3.12.3.1, Permanent Impacts. No discussion of the proposed hydrogen fueling station(s), discussed on page 2-21 of Section 2.3.2, has been provided. This project feature needs to be included and potential hazardous materials impacts to the surrounding area needs to be considered. L-27-288

Page 3.12-16, Paragraph 1. It is unrealistic to assume that properties proposed for right-of-way acquisition would be required to be "free of hazardous waste prior to the start of construction." At this time, no project-specific information regarding potential soils, soil gas, or groundwater contamination has been discussed. Until the existing levels of contamination can be documented, it is not yet understood what levels of cleanup can reasonably be accomplished prior to the start of construction. Further, this discussion goes on to state that project level analysis will be required later. However, no implementation mechanism for this requirement is given and, as discussed above, this type of deferral is not permitted pursuant to CEQA Guidelines Section 15126.4(a)(1)(B). L-27-289

Page 3.12-16, Paragraph 1. No discussion of potential PCB-contaminated soils from the Seabright Substation, the former release from the Santa Fe Pacific Pipeline that has resulted in soil contamination, groundwater contamination from the Former Bulk Terminal Company located at 960 De Forest Avenue and Rocket Oil Inc. located at 1701 West Anaheim Street, or known or anticipated UST locations and past dry cleaner sites that may have impacted soil, soil gas, and/or groundwater are discussed in the document. L-27-290

Page 3.12-17, Paragraph 4. This discussion references an "HW-8"; however, no HW-8 is listed on page 3.12-19. Further, in general, the Executive Summary lists measures HW-1 through HW-11, but only HW-1 through HW-7 are listed in this section. L-27-291

Page 3.12-17, Last Paragraph, Last Sentence. This discussion states that "… implementation of the build alternatives would not increase public health risks related to hazardous waste and materials in the short term and would decrease these risks in the long term as a result of the cleanup and remediation of any hazardous waste contamination on properties that would be acquired for the project." This discussed excludes consideration of proposed fueling stations. Potential long term impacts to public health should be disclosed as a result of this project feature. L-27-292

Page 3.12-18, Section 3.12.4. The following avoidance, minimization, and/or mitigation measures for the following potential impacts are not included:

The Phase I ISA suggests that there may be hazardous materials contamination at the project site and suggests the need for future Phase I ISA and sampling Site Investigation activities, yet no avoidance, minimization, or mitigation measures are recommended. The document should be revised in include appropriate minimization measures that include specific performance criteria that must be met in order to ensure that less than significant impacts result. L-27-293

The Phase I ISA discusses potential on-site oil fields and DOGGR wells; however, no mention of minimization measures required to handle potentially contaminated soils are discussed. Specific impacts from these facilities, including the Wilmington Oil Field and known DOGGR wells known to be present on-site, should be disclosed. The document should be revised in include appropriate minimization measures that include specific performance criteria that must be met in order to ensure that less than significant impacts result. L-27-294

Page 3.12-19, HW-6. There should already be an understanding of which properties potentially include underground storage tanks (USTs). There should be minimization measures included in the document that discuss known USTs that need to be removed, in addition to the potential for unknown USTs that may be encountered. The document should be revised in include appropriate minimization measures that include specific performance criteria that must be met in order to ensure that less than significant impacts result. L-27-295

Preliminary Phase I Initial Site Assessment

Section 3.12, *Hazardous Waste/Materials*, relies upon the *Preliminary Phase I Initial Site Assessment* (Phase I ISA), prepared by AECOM, dated February 2017. The Phase I ISA states that the analysis was prepared in general accordance with Chapter 10 of the SER Online Handbook and the procedures described in Caltrans' PDPM, Chapter 18, *Environmental Contamination*, of Article 3, *Policies*, dated February 28, 2006 for Initial Site Assessments. In addition, this ISA report was prepared in general accordance with Caltrans internal guidance document on ISAs, which is intended to be consistent with ASTM *Standard Practice for Environmental Site Assessments: Phase I Site Assessment Process*.

SER Chapter 10. Per Chapter 10 of the SER, the Phase I ISA should determine what activities the project would include, such as excavation, acquisition of new right of way, structure demolition or modification, etc. However, the Phase I ISA does not include a discussion of the nature of proposed excavation and what portions of the project site would require more excavation, such that groundwater may be encountered. L-27-296

Per these guidelines, the ISA should identify the potential or known hazardous materials, hazardous waste, and contamination in the project area as well as the party(ies) responsible, or potentially responsible, for hazardous waste and contamination. This information is used to evaluate alternatives, make decisions about project design, cost, scope and schedule, and used as a baseline against future claims. Although the Phase I ISA generally states that there is a potential for hazardous materials in the project site boundaries, the specific concerns are not identified. L-27-297

Per Chapter 10 of the SER, when there is regulatory oversight of a contaminated property or site, property owners and/or the entities responsible for possible contamination are required to prepare several types of documents. Also, facilities that store and use hazardous materials and those that generate, treat, store, or dispose of hazardous waste are periodically inspected and the regulatory agencies prepare inspection reports. These documents are found in the public files of the regulatory agencies and provide critical information for a project's development and delivery process. The Phase I ISA excluded review of this information, although it would provide substantial information pertaining to the likelihood of contamination within the boundaries of the subject site and is readily available for review. L-27-298

Per Chapter 10 of the SER, the ISA should be performed during the Project Initiation Documents (PID) phase of the project development process. The greater the potential risks are to the project and Caltrans the earlier the ISA should be performed. All activities must be scheduled to ensure that adequate information is available to provide remediation cost estimates and project impacts at the time of the preparation of the environmental document. As the Phase I ISA excluded multiple scope items that should have been included before publication of the public review draft Environmental Document, this requirement was clearly omitted. L-27-299

Last, property conditions can change quickly. Underground storage tanks that were intact a year ago can begin to leak. An industrial facility can have a chemical spill at any time. Previously unused properties can be sold or rented. Unused properties can attract squatters or dumping. As a result, any ISA over one (1) year old is considered out of date and must be re-evaluated and updated as needed. The Phase I ISA did not meet this SER requirement, as the Environmental Database Search was conducted in January of 2016 and the site reconnaissance was conducted in May and June of 2016. This SER requirement for the Phase I ISA was not met. The Phase I ISA should be updated accordingly and recirculated for public review. L-27-300

PDPM, Chapter 18. Per Chapter 18 of the PDPM, properties that may be obtained or utilized for a transportation project must be evaluated early in the project development process so that property conditions do not cause project delays. This conforms to Caltrans policy regarding change control, because identifying serious problems early reduces the need for project modifications later in the process. It is the project manager's responsibility to involve hazardous waste staff in the project development process as early as possible to ensure that contamination identification and remediation is addressed and completed. Every project that includes excavation, structure demolition or modification, or the purchase of new right-of-way will require a full ISA to determine if known or potential contamination (hazardous waste and or hazardous material) is present within the project limits. As discussed above, a Preliminary Phase I ISA was conducted, rather than a full Phase I ISA. This preliminary analysis does not provide the public with readily available information discussing the project's potential impacts pertaining to hazardous materials. This Phase I ISA does not fully disclose L-27-301

the project's potential impacts. Should a full Phase I ISA be prepared as part of the final Environmental Document prior to certification, this information constitutes new substantial information under CEQA, and would be required to be recirculated to the public prior to certification. L-27-301

Caltrans Internal Guidance Document on ISAs. The Phase I ISA also states that it complies with Caltrans internal guidance document on ISAs. However, since this guidance is only for projects prepared by Caltrans staff, this document is only accessible by Caltrans and is not for public distribution. Caltrans states that all others should follow the ASTM E1527 Standard Practice. L-27-302

ASTM International (ASTM) Standard Practice E 1527-13 (Standard Practice). Per the ASTM Standard Practice Section 1.1.1, *Recognized Environmental Conditions*, in defining a standard of good commercial and customary practice for conducting an environmental site assessment of a parcel of property, the goal of the processes established by this practice is to identify recognized environmental conditions (RECs). The term REC means "the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: (1) due to any release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment. De minimis conditions are not recognized environmental conditions." The Phase I ISA does not identify the professionals' opinions relative to the findings discussed in Section 6 of the Phase I ISA nor does the professional identify whether or not RECs (including conditional recognized environmental conditions [CRECs]) are present. This is a major flaw in the analysis and should be included. L-27-303

Per Section 8.2.2.1 of the ASTM Standard Practice, if the property or any of the adjoining properties is identified on one or more of the standard environmental record sources in Section 8.2.1 of the ASTM Standard Practice, pertinent regulatory files and/or records associated with the listing should be reviewed in accordance with Sections 8.1.1 through 8.1.8. The purpose of the regulatory file review is to obtain sufficient information to assist the environmental professional in determining if a REC, historical recognized environmental condition (HREC), CREC, or a de minimis condition exists at the property in connection with the listing. If, in the environmental professional 's opinion, such a review is not warranted, the environmental professional must explain within the report the justification for not conducting the regulatory file review. The Phase I ISA identifies both on-site and adjoining properties listed pursuant to ASTM Standard Practice Section 8.2.1, yet additional review of files at appropriate agencies was not conducted. This is a major flaw in the analysis. Additional review of publicly available files, including those for adjoining properties that have received case closure, would provide substantial information pertaining to the likelihood of hazardous materials within the boundaries of the project site, yet this information was not provided. L-27-304

Pursuant to ASTM Standard Practice Section 10.5.1, no Key Site Manager was identified for the Phase I ISA and pursuant to Section 11, no state and/or local government officials were interviewed to obtain information indicating RECs in connection with the project site. L-27-305

Per ASTM Standard Practice Section 12.5, the Phase I ISA should include findings for off-site properties, other than just adjoining properties. The Phase I ISA analyzed listed databases per Environmental Data Resources, Inc. (EDR) for the project site and adjoining properties. However, potential RECs as a result of adjacent off-site uses (that which are not adjoining the project site) were not specifically considered. Any off-site properties that could potentially impact groundwater underlying the project site must be included in the analysis. For example, current and past dry cleaner sites and other industrial uses that handle/store solvents, other than petroleum-related products, are known to be of high risk and can impact large areas of groundwater. The Phase I ISA should include findings regarding these off-site properties of concern, which APNs or areas of the project site that could be impacted by these plumes, and whether or not the project may involve groundwater within these areas. Should potentially contaminated groundwater be impacted by the project, L-27-306

recommendations should be included to minimize impacts to construction workers during construction of the project. Also, potential impacts to existing operating groundwater remediation/monitoring wells should be discussed, if applicable. L-27-306

Per ASTM Standard Practice Section 12.6, the Phase I ISA shall include the environmental professionals opinion(s) of the impact on the property of conditions identified in the findings section. The logic and reasoning used by the environmental professional in evaluating information collected during the course of the investigation related to such conditions shall be discussed. Frequently, items initially suspected to be a REC are subsequently determined, upon further evaluation, to not be considered a REC. The opinion shall specifically include the environmental professional's rationale for concluding that a condition is or is not currently a REC. Conditions identified by the environmental professional as RECs currently shall be listed in the conclusions section of the report. No opinions or conclusions relative to RECs have been made in the Phase I ISA. This information should be added. Per ASTM Standard Practice Section 12.8, the report shall include a conclusions section that summarizes all RECs (including controlled RECs) connected with the property. The report shall include a statement relative to whether or not RECs are present and, if present, a listing of all RECs (including CRECs) that have resulted. L-27-307

Recommendations. Recommendations for the following findings should be added: on-site oil operations/oil wells, soil sampling of potential on-site PCB-containing equipment and soil contamination from the Seabright Substation located on-site, possible encountering of on-site USTs during construction, and handling of on-site landfills. Recommendations involving further Phase I ISA analysis prior to project approval is not sufficient, as this information should already be disclosed in the Phase I ISA pursuant to SER Chapter 10, Caltrans' PDPM Chapter 18, and the ASTM Standard Practice E 1527-13. L-27-308

2012 Comments Not Adequately Addressed in the Recirculated Environmental Document

Section 3.12.3, Environmental Consequences, page 3.12-85. The analysis of temporary impacts refers the reader to Section 3.24, Construction, for a discussion of hazardous waste risks related to construction. However, Section 3.24 provides an incomplete analysis of the potential hazardous waste risks during construction. Specifically, throughout the analysis, it is noted that online agency databases did not provide complete information regarding the total sites that pose environmental concerns and as such only the sites for which information was provided were described. This analysis does not fully disclose all of the potential effects that could result during construction. Additionally, as part of the extensive consultation/coordination process required of Caltrans' projects, consultation should have been undertaken with the appropriate agencies prior to and during preparation of the Draft EIR/EIS to provide adequate information and ensure that all of the potential environmental impacts are disclosed to the public and decision makers. L-27-309

Section 3.24.3.12, Hazardous Waste/Materials. Throughout this section, it is noted that online agency databases did not provide complete information regarding the sites that pose environmental concerns and as such only the sites for which information was provided were described. As part of the preparation of this Draft EIR/EIS, consultation should have been undertaken with the appropriate agencies to provide adequate information to ensure that all of the potential environmental impacts are disclosed to the public and decision makers. This analysis must include the complete list of sites with the appropriate description and potential effects resulting from these sites. In addition, this section indicates several potential impacts resulting from contaminated groundwater, elevated levels of aerially deposited lead, asbestos, etc., and notes that further evaluations and investigations need to be conducted. However, this section does not describe what these evaluations and investigations would entail, how such investigations would minimize potential impacts to construction workers, or L-27-310

even include them as part of the mitigation measures provided in this section to reduce impacts from hazardous waste/materials. L-27-310

Prior to the removal or relocation of gas pipelines across bridge structures, testing for asbestos must be conducted and asbestos abatement provided, as necessary. These procedures must be outlined in a minimization measure to ensure adequate procedures are implemented. L-27-311

SECTION 3.13 – AIR QUALITY

The analyses contained within this section only address the Existing (2012) and horizon year (2035) traffic conditions. Hot-spot analysis in general must cover the expected highest-emission year. Normally, that is either the opening year or the horizon/design year (at least 20 years after opening). The opening year will have the highest emission factors, and the design year will have the most traffic (though lower emission factors). As emissions are on a declining trend and VMT/traffic is on an increasing trend, the highest emission year may not necessarily be in the opening year or horizon year. Therefore, it is necessary to analyze both scenarios. The Caltrans Standard Environmental Reference (SER) also states: "A basic project description documenting project design assumptions-such as future (design-year) traffic and an interim year such as open-to-traffic that are relevant to the air quality analysis". Both opening and horizon years must be included in any traffic or air quality analysis that supports the conformity determination (and the CEQA/NEPA documents as well). L-27-312

Page 3.5-2 of the RDEIR/SDEIS explains that 2035 is used as the horizon year for analysis of future conditions to maintain consistency with the date of the socioeconomic data used in the SCAG 2012–2035 RTP/SCS. However, page 3.13-14, of the RDEIR/SDEIS states that the full scope of the project is not currently in the RTP/SCS. As the project description in the RTP/SCS does not match either of the currently proposed build alternatives, the rationale for the horizon year lacks validity. Furthermore, SCAG's most recent plan is the 2016 RTP/SCS. L-27-313

Section 3.13.3 – Environmental Consequences

Page 3.13-14, Section 3.13.3.1, Regional Air Quality Conformity. This section notes that the full scope of the project is not currently in the FTIP and the Project Description as noted in the RTP/SCS does not match either of the currently proposed build alternatives. Both documents must be amended prior to FHWA approving the project. L-27-314

Page 3.13-15, Section 3.13.3.3, Permanent Impacts. The PM Hot-spot analysis included in the RDEIR/SDEIS follows the out of date qualitative guidance. All PM hot-spot analyses necessary for meeting the requirements of transportation conformity now must be quantitative. The latest guidance, *Transportation Conformity Guidance for Quantitative Hot-spot Analyses in $PM_{2.5}$ and PM_{10} Nonattainment and Maintenance Areas*, was released by the U.S. EPA in November 2015 and must be used in the RDEIR/SDEIS. In addition, the PM conformity determination has been postponed until a preferred alternative has been selected. This approach prevents the public from reviewing and commenting on the modeling and results during the public review period. In addition, the results of the qualitative analysis show a substantial increase in PM emissions along the I-710 corridor when compared to the no build conditions. Therefore, there could be impacts to the public that have not been disclosed in the RDEIR/SDEIS. L-27-315

Page 3.13-40, Table 3.13-14. Both alternatives show a large increase in PM emissions when compared to the no build conditions. Total PM_{10} emissions from Alternative 5C are projected to increase by 0.1 percent in the Basin, 0.6 percent in the Area of Interest (AOI), and 8.2 to 9.2 percent in the I-710 Area (depending on modelled and traffic data, respectively) when compared to Alternative 1. Total PM_{10} emissions from Alternative 7 are projected to increase by 0.2 percent in the Basin, 1.4 L-27-316

percent in the AOI, and 32.7 to 33.3 percent in the I-710 Area (depending on modelled and traffic data, respectively) when compared to Alternative 1. Section 176(c)(1)(B) of the Clean Air Act states that federally-supported transportation projects must not "cause or contribute to any new violation of any standard [NAAQS] in any area; increase the frequency or severity of any existing violation of any standard in any area; or delay timely attainment of any standard or any required interim emission reductions or other milestones in any area." As discussed above, increases in PM_{10} emissions could prevent the project from demonstrating conformity. L-27-316

Although FHWA will make the conformity determinations after the preferred alternative is identified and prior to completion of the final environmental document (FED), demonstration of regional conformity should still be conducted and included in the Draft Environmental Document (DED) for full disclosure. The lead agency should disclose to the public any new information relative to the projects conformity analysis. Therefore, the RDEIR/SDEIS must be recirculated after completion of the quantitative analysis. L-27-317

Page 3.13-50, Section 3.13.3.4, Public Health Considerations. The PM mortality/morbidity analysis compares the 2035 build conditions to the 2012 existing conditions. As discussed above, the project results in a large increase in PM emissions when compared to the no build conditions. The comparison among alternatives in 2035 is made in the Executive Summary and the Air Quality, Greenhouse Gas, and Health Risk Assessment, and should be disclosed in this section of the RDEIR/SDEIS. L-27-318

Page 3.13-52, Section 3.13.3.4, Public Health Considerations. The ultrafine particulate analysis compares the 2035 build conditions to the 2012 existing conditions. As discussed above, the project results in a large increase in PM emissions when compared to the no build conditions. The comparison among alternatives in 2035 is made in the Executive Summary and the Air Quality, Greenhouse Gas, and Health Risk Assessment, and should be disclosed in this section of the RDEIR/SDEIS. L-27-319

Section 3.13.4 – Avoidance, Minimization, and/or Mitigation Measures

Mitigation Measure AQ-2 requires air filtrations systems to schools within 0.25-mile of I-710. However, Mitigation Measure AQ-2 does not address on-going maintenance and replacement of filtration systems. High-efficiency filters in ventilation systems need to be replaced on a regular basis in order to remain effective. As currently written, Mitigation Measure AQ-2 is inadequate as it does not provide for the replacement of the high-efficiency filters, maintenance of the ventilation system, or the cost of the replacement of the filters. L-27-320

Mitigation Measure AQ-3 is vague and unenforceable. The mitigation measure does not identify the location or the height of the barriers and just relies on the statement: "[P]rovide solid barriers (walls) in areas where soundwalls are not currently proposed". Additionally, the second bullet of Mitigation Measure AQ-3 requires dense vegetation for pollution barriers. However, the measure does not indicate the location or type of this vegetation and does not define "dense". The California Air Resources Board Technical Advisory mentioned in the mitigation measure notes that conifers and silver birch were found to have the highest potential to improve air quality while several deciduous tree species such as oak and poplar had the greatest potential to worsen air quality when planted in large numbers. Additionally, the trees in the studies were approximately 10 meters high. It should be noted that most studies supporting the Technical Advisory were conducted on the East Coast and in Europe where vegetation types and densities differ from what is found in California. Mitigation Measure AQ-3 has no requirement for tree species, height, or density. As indicated in the Technical Advisory, the wrong tree species could actually worsen impacts and unless the trees are a certain height, the mitigation would be ineffective. Specificity, performances standards, and verification/enforcement mechanisms need to be provided for all mitigation measures. L-27-321

2012 Comments Not Adequately Addressed in the Recirculated Environmental Document

While the Project overall provides for a decrease in air emissions in the project area, "near road" emissions remain a concern. The City supports those alternatives with a "Zero Emissions" component and does not believe any design alternative is valid without a zero emissions component. L-27-322

One of the primary deficiencies in the analysis of construction air quality impacts is the lack of any analysis of localized impacts within the City of Long Beach related to criteria impacts. The SCAQMD critiqued the underlying technical methodology after participating in the Air Agency Technical Working Group. In its comments on the protocol for the Air Quality and Health Risk Assessment ("AQ/HRA Technical Study"), the SCAQMD stated that it was concerned the protocol "would not sufficiently quantify air quality impacts." SCAQMD Comments on AQHRA Protocol, at 1. Indeed, the SCAQMD stated that the AQHRA protocol should be revised to include an analysis of local criteria pollutant concentrations consistent with the SCAQMD's local significance thresholds (LSTs). Instead, the Draft EIR/EIS provided the following unsubstantiated conclusion regarding localized impacts on page 3.24-24. L-27-323

According to the SCAQMD's MATES III Study, diesel particulate matter (DPM) represents approximately 84 percent of the Basinwide cancer risk. However, the Draft EIR/EIS ignores the fact that project will emit large amounts of DPM from use of heavy-duty construction equipment and diesel haul trucks during the eight to 15 year construction duration. OEHHA recommends calculation of health risk impacts for a minimum of a 9-year exposure duration (OEHHA, 2003: The Air Toxics Hot Spots Program Guidance Manual for Preparation of Heath Risk Assessments). As proposed construction is anticipated to occur for between eight and 15 years, a health risk assessment should be conducted to evaluate potential health risk impacts during construction at sensitive land uses within the City of Long Beach. In addition, the analysis should include a calculation of risks to children in accordance with OEHHA guidelines. L-27-324

Concurrent/Interim Construction and Operational Air Quality Impacts

The Draft EIR/EIS omits consideration of emissions due to traffic disruptions caused by construction. Caltrans' Model EIR/EIS states that carbon monoxide ("CO") and PM_{10} hot spot analysis should be included if construction will last more than two years "and/or will substantially affect traffic due to detours, road closures, and temporary terminations…." Model EIR/EIS, at page 92. However, as page 3.24-23 of the Draft EIR/EIS's construction analysis states, "If construction activities were to increase traffic congestion in the area, CO and other emissions from traffic will increase slightly while those vehicles are delayed." Rather than guessing as to whether traffic disruptions will result in increased emissions during construction, the Draft EIR/EIS should perform the technical analysis to determine whether CO and other pollutant emissions will increase as a result of traffic disruptions. A review of CARB's vehicle emission factors for a light-duty gasoline automobile in Year 2012 within Los Angeles County shows a decrease from 65 miles per hour to 10 miles per hour would result in 3.6 times more ROG, 2.0 times more CO, and 1.3 times more NO_X (www.arb.ca.gov/jpub/webapp/EMFAC2011WebApp/rateSelectionPage_1.jsp). L-27-325

No interim year traffic analyses have been conducted to determine whether an interim year (increase in traffic combined with construction impacts, traffic disruptions, and vehicle emission factors that are not as favorable for the project) could potentially result in emissions that exceed 2035 emissions. The Draft EIR/EIS must provide enough information to inform the decision to remove construction impacts from the transportation conformity hot spot analysis and evaluate whether 2035 has the maximum expected emissions. L-27-326

Due to the nature of the Project and the potential for disturbed traffic flow due to detours, closures, and temporary terminations, it is also important to model the air toxics emissions along the detour routes within the City of Long Beach, as those routes might impact sensitive receptors. L-27-327

The construction analysis is deficient in that, among other things, it does not account for the following direct and indirect sources of GHG emissions: (1) Electricity to power nighttime lighting, traffic signals, etc.; (2) Vegetation changes and associated changes in carbon sequestration; (3) Water use during construction for, inter alia, dust suppression; (4) Demolition debris and construction waste disposed of in landfills; and (5) Emissions from stormwater pumps, whether direct if powered by liquid fuels or indirect if powered by electricity. L-27-328

SECTION 3.14 – NOISE

Section 3.14.2 – Affected Environment

Page 3.14-4. The calibration noise level measurements were conducted using a Type 2 sound level meter. Although permitted by Caltrans, this type of meter is less accurate than the Type 1 meters typically used. This lower accuracy can translate to the results of the noise model. L-27-329

Page 3.14-7, Table 3.14-2. Several sensitive receptors are exposed to traffic noise level increases exceeded 10 dBA when compared to the no build conditions. Section 3.14 does not show that these large increases have been abated to a more acceptable level. L-27-330

Page 3.14-7, Table 3.14-2. Large calibration factors (K-factors) were used when setting up the existing condition noise model. Section 4.4 of the Caltrans Technical Noise Supplement (TeNS) states:

> *If modeled sound levels do not match measured sound levels within ±3 dB the model parameters should be reviewed and adjusted if necessary to ensure that they accurately represent actual site conditions.*

L-27-331

K-factors exceeding 5 dBA were used. Section 3.14 does not clarify if extra noise measurements were conducted to confirm that such large correction factors are warranted.

Section 3.14.4 – Environmental Consequences

Page 3.14-17, Permanent Impacts (Groundborne Noise and Vibration impacts). The analysis states: As the proposed project will use new asphalt pavement followed with proper maintenance, there will be no potholes, bumps, expansion joints, or other discontinuities in the road surface that would generate groundborne vibration or direct or indirect noise impacts from vehicular traffic traveling on I-710." This statement may be true once the project is initially constructed. However, it does not address what the impacts would be as the roadway surface wears. I-710 serves a substantial number vehicles per day (and a relatively higher proportion of trucks when compared to other highways), which would take a toll on the roadway surface. Page 25 of the Noise Study Report also notes that due to demand and growth in the area, the future 2035 truck percentages were significantly higher than the current truck percentages. The roadway surface will not remain in its initial condition over the project lifetime and will develop potholes, bumps, and other discontinuities over time that would result in vibration impacts. The analysis does not adequately address vibration impacts. L-27-332

Traffic Noise Study Report, I-710 South (Corridor Project/Truck Lane Project), Chapter 5 (Study Methods and Procedures). The modeled future traffic volumes are provided in Appendix A, but are not disclosed or discussed in the body of the report. Section 5.3 (Traffic Noise Levels Prediction Methods) L-27-333

simply refers to schematics provided by AECOM. Traffic noise modeling typically utilize the projected traffic volumes or worst-case noise impacts that correspond to level of service (LOS) C/D for the freeway mainline. As I-710 has a higher proportion of trucks, it is assumed future projected traffic volumes were used instead. However, due to the absence of discussion in the analysis, it is not clear what assumptions were used. L-27-333

Section 3.14.5 – Noise Abatement Consideration

Page 3.14-40, Table 3.14-3. The Noise Abatement Decision Report (NADR) was prepared in 2017 but uses the 2016 reasonable allowance of $80,000 per benefitted receptor. In 2017 this allowance was increased to $92,000. This increase may result in changes to the walls determined to be reasonable. L-27-334

2012 Comments Not Adequately Addressed in the Recirculated Environmental Document

The evaluation and discussion of potential construction noise impacts is inadequate for a project of this magnitude. The discussion of construction noise impacts is limited to three pages in Section 3.24, Construction, of the Draft EIR/EIS and no supporting calculations are provided in any appendices. Specific comments are provided below.

- Construction Vibration: Page 3.24-26 of Section 3.24 of the Draft EIR/EIS states that pile driving activities may be located as close as 50 feet from existing residences and would be subject to a vibration level of 0.3 PPV. This vibration level is considered to be strongly perceptible and will have the potential to damage the older residential structures. The Draft EIR/EIS concludes no adverse temporary groundborne vibration impacts would occur with implementation of avoidance and minimization measures described in Section 3.24.4.14. Mitigation Measure CON-38 requires "A pre- and postconstruction survey will be conducted for residential structures located within 100 feet of pile driving locations to determine whether any new cracks or other damage have occurred. The proposed project will be responsible for the cost of damage to structures resulting from project construction." It should first be pointed out that the significance conclusion is incorrect as this measure only minimizes the significant and unavoidable impact and it does not result in a less than significant impact. The measure should be expanded to all structures (e.g., commercial, office, religious institutions, and schools). According to the Federal Transit Administration (FTA) Transit Noise and Vibration Assessment (FTA, May 2006), a typical-impact pile driver will generate approximately 0.644 PPV (in/sec) when measured at 25 feet. Therefore, since vibration impacts dissipate at different rates depending on the soil type and the Draft EIR/EIS provides no evidence regarding the soil types or vibration analysis, this mitigation measure must also be expanded to a minimum of 200 feet for pre- and post- surveys. In addition, this measure should be expanded to include damage to personal property. Caltrans should provide advance notice to potentially impacted areas (200 feet from proposed pile driving activities) regarding steps they should take to prevent damage (remove valuable items off shelves, etc.) to personal property. L-27-335

- Construction Noise: Page 3.24-27 of Section 3.24 of the Draft EIR/EIS indicates that equipment involved in construction is expected to generate noise levels ranging from 70 to 90 dBA at a distance of 50 feet and construction levels should not exceed 86 dBA maximum instantaneous noise level at a distance of 50 feet. This discussion needs to discuss pile driver noise levels in which noise levels would be at least 105 dBA. According to the construction noise discussion, it is concluded that construction noise impacts would be less than significant because construction would be conducted in accordance with the Caltrans Standard Specification. No discussion of what this entails is included in the discussion nor does it make it clear how it is going to reduce construction noise levels such that they are less than significant. L-27-336

- According to Section 7-1.01I, Sound Control Requirements, of the Caltrans Standard Specifications, the Contractor shall comply with all local sound control and noise level rules, regulations and ordinances and internal combustion engines shall be equipped with a muffler of a type recommended by the manufacturer. The City of Long Beach Municipal Code provides construction hour limitations (7:00 am to 7:00 pm Monday through Friday and 9:00 am to 6:00 pm on Saturday), but does not specify local sound control noise levels for construction activities. The City of Long Beach does use the following CEQA significance threshold for construction noise: A significant impact would occur if project construction activities cause the exterior ambient noise level to increase by 5 dBA or more at a noise-sensitive use, as measured at the property line of any noise-sensitive use. Therefore, the Draft EIR/EIS should implement mitigation measures to reduce project-related construction noise levels within the City of Long Beach to less than 5 dBA above ambient noise levels to support a conclusion of less than significant construction noise impacts to noise-sensitive land uses within the City of Long Beach. L-27-337

Construction Noise Mitigation Measures: Section 3.24.4.14 on page 3.24-48 of the Draft EIR/EIS provides a list of construction noise mitigation measures. However, many of the measures are not project specific nor do they provide enough specificity to evaluate whether the measures are sufficient.

- Mitigation Measures CON-30 and CON-34 require that equipment noise control be applied such that old and new equipment will meet specified noise levels. The Draft EIR/EIS does not provide any construction noise analysis and it does not specify any required reduction in noise levels. As a result, these measures are meaningless. A construction analysis must be performed that clearly demonstrates the standard in which the equipment must meet and the measures must provide a mechanism for how they will be enforced. L-27-338

- At the very least, a mitigation measure requiring a construction noise plan should be included in which a specific set of measures for certain conditions be included. The plan should also include a noise monitoring program to field verify the effectiveness of the plan to ensure that noise sensitive land uses within the City of Long Beach are not negatively impacted from this 8 to 15 year duration of construction noise. L-27-339

Noise impacts during the construction phase should be mitigated to the greatest extent possible. While there will be noise impacts from the Project, the City recommends use of state-of-the-art noise walls and other dampening/mitigating approaches for the final project.

SECTION 3.15 – ENERGY

Section 3.15.2 – Affected Environment

Page 3.15-3, Section 3.15.2. As of 2012 California only has one operational nuclear power plant. L-27-340

Section 3.15.3 – Environmental Consequences

Page 3.15-8, Table 3.15-6. This table shows that there would be a very large increase in vehicle hours traveled within the region between 2012 and 2035. For autos, the vehicle miles traveled increases by 20 percent while the vehicle miles traveled increases by 373 percent. For this to occur the average speed would have to decrease from 38.2 to 9.7 miles per hour. L-27-341

The data in Table 3.15-6 was used to calculate the results shown in Tables 3.15-8 and 3.15-10. If the data is incorrect the results will also be incorrect. L-27-342

SECTION 3.16 – NATURAL COMMUNITIES

Section 3.16.1 – Regulatory Setting

Page 3.16-1, Paragraph 3, Lines 8-10. Stated is "There are no adopted or proposed Habitat Conservation Plans or Natural Communities Conservation Plans within the I-710 Corridor Project study area; therefore, they are not applicable to the proposed project and are not discussed in this section." However, Page 3.24-43, Paragraph 1, Sentence 1, states that "The I-710 Corridor Project would have a temporary adverse effect on Coastal Pelagic Management Plan Species." Revise Section 3.6.1 accordingly. L-27-343

Section 3.16.2.2 – Land Cover Designations

Developed/Ornamental/Ruderal

Page 3.16-6, Paragraph 1, Line 6. Correct underlined scientific name spelling "tocalote (*Centauria melitensis*)," use *Centaurea*. Line 7. confirm species identification for perennial sow-thistle (*Sonchus arvensis*). Line 9. See California ground squirrel (*Spermophilus beecheyi*) scientific name, use *Otospermophilus*. L-27-344

Freshwater Emergent Marsh

Page 3.16-6, Paragraph 4, Line 2. "…much like the riparian scrub habitat described above" should read "…much like the riparian scrub habitat described below." L-27-345

Page 3.16-7, Paragraph 1, Line 6. First mention of California bulrush and cattails should be followed by scientific name, *Schoenoplectus californicus and Typha* sp., respectively, and to be removed from subsequent mentions (particularly Line 13 of Paragraph 2 under the Riparian Scrub subtitle). L-27-346

Riparian Scrub

Page 3.16-7, Paragraph 2, Last Sentence. Add the underlined to "Nonnative and/or weedy species commonly observed included…" since the common sunflower (*Helianthus annuus*) is native, but weedy. L-27-347

Section 3.16.3.1 – Permanent Impacts

Page 3.16-10, Table 3.16-2, Column 2 from the right, Row 2. Insert "Developed." Fix cell justification in Row 4. L-27-348

2012 Comments Not Adequately Addressed in the Recirculated Environmental Document

3.16.3.1 – Permanent Impacts

Page 3.16-10, Table 3.16-2. The last bullet on Page 42 of 61 of the 2012 Comment Letter was not adequately addressed; Table 3.16-2 of the RDEIR/SDEIS does not include impacts associated with Alternative 1 in relation to currently funded projects, albeit no capacity-increasing improvements to the I-710 mainline would occur under Alternative 1. L-27-349

SECTION 3.17 – WETLANDS

Section 3.17.1 – Regulatory Setting

Page 3.17-2, Paragraph 2, Line 3. Define "Department" not previously defined. L-27-350

3.17.2.3 – Jurisdictional Areas in the I-710 Corridor Biological Study Area

Pages 3.17-6 and 3.17-7, Table 3.17-1, Row 2, Column 7. Add an asterisk that lets the reader know that the "Total Section 10 Area (acres)" are inclusive of the "Total Section 404 Area (acres)" as stated on Page 3.17-5, Paragraph 2, Lines 2 and 3. L-27-351

Section 3.17.2.4 – Functions and Values

Wildlife Habitat

Page 3.17-12, Paragraph 4, Lines 6 and 7. Provide full name as provided in all other locations throughout the document, "Joint Dominguez Gap and DeForest Treatment Wetlands," for Drainage Features 3, 23, and 24. L-27-352

Aquatic Habitat

Page 3.17-13, Paragraph 1, Line 7. For consistency within subtitles, replace "provide a moderate amount of wildlife habitat" with "provide a moderate amount of habitat for aquatic species," particularly because Wildlife Habitat is discussed in the preceding subtitle. L-27-353

Section 3.17.3.1 – Permanent Impacts

Sediment Retention

Page 3.17-15, Paragraph 5, Line 6. Identify Drainage Feature 3 as "Dominguez Gap Wetlands" consistent with the rest of the document (e.g., "Features 6 and 22 (Compton Creek)"). Same for subsequent subtitles in this subsection. L-27-354

3.17.4 – Avoidance, Minimization and/or Mitigation Measures

Page 3.17-17, Paragraph 2, Lines 3-5. Add underlined words to the sentence "Compensatory mitigation for impacts to jurisdictional aquatic resources would be required in order to obtain permits from the USACE and CDFW." L-27-355

2012 Comments Not Adequately Addressed in the Recirculated Environmental Document

3.17.4 – Avoidance, Minimization, and/or Mitigation Measures

Page 3.17-17. Although the 2017 Caltrans EIR/EIS Annotated Outline (2017 Annotated Outline) Page 124 (updated from Page 112 since 2012), instructs to "…discuss compensatory measures, including location, functions, plants, cost estimates, and success criteria," the RDEIR/SDEIS states that "Final details for compensatory mitigation would be evaluated through coordination between Caltrans and the resource agencies," which would then include location(s), functions, plants, cost estimates, and success criteria. Therefore, the added discussion in this section is adequate. L-27-356

Per Page 124 of the 2017 Annotated Outline, instructions are as follows:

1) For a final environmental document, include the following information under a separate "Only Practicable Finding" subheading if the preferred alternative will impact wetlands:

    a. A reference to E.O. 11990.
    b. An explanation of why there are no practicable alternatives to the proposed action.
    c. An explanation about the inclusion of all practicable measures to minimize harm to wetlands.
    d. A concluding statement (see the sample text below):

Based on the above considerations, it is determined that there is no practicable alternative to the proposed construction in wetlands and that the proposed action includes all practicable measures to minimize harm to wetlands that may result from such use.

Per Page 123 of the 2017 Annotated Outline, Section 3.17.4, Avoidance, Minimization and/or Mitigation Measures, Page 3.17-17 should include discussions as follows: L-27-357

1) The alternatives discussion and comparison are the key component of this section of the document. Refer reader to the discussion of alternatives considered but withdrawn in Chapter 2, which describes why alternatives were withdrawn and not carried forward for analysis in the environmental document.
2) Document wetland avoidance alternatives here and in the "Alternatives" section. If the avoidance alternatives are not practicable, justify in detail how the cost, performance, socioeconomic impacts, or other factors would make these alternatives impracticable.
3) Discuss how all practicable measures to minimize harm to the affected wetland have been included in the proposed alternative(s). If a given minimization measure is not practicable, justify in detail how the cost, performance, socioeconomic impacts, or other factors would make the measure impracticable.

Page 42 of 61 of the 2012 Comment Letter mentions [brackets added] that "This section does not provide any analysis of what the impacts from altering the hydrologic regime would be. This mitigation measure [NC-1, and added measures CON-WET-1 through CON-WET-3] does not specify that the habitat replacement would reduce any impacts to the hydrologic regime. Similarly, this section does not include an analysis regarding other environmental impacts associated with alterations to the hydrologic regime or from loss of wetland habitat, such as changes in water quality and impacts to habitat for migratory birds. This section, as well as the entire Draft EIR/EIS, should provide more specificity with regard to the description of the project's effects/impacts. Finally, Section 3.9, Water Quality, page 3.9-2 notes "a discussion of the LEDPA (Least Environmentally Damaging Practicable Alternative) determination, if any, for the document is included in the Wetlands and Other Waters section (Section 3.17)." However, no such discussion is included in this section." This comment was not adequately addressed. L-27-358

Sheet 6 of Appendix R (Biological and Aquatic Resources Maps) shows impacts to the DeForest Wetlands areas within the BSA. Page 43 of 61 of the 2012 Comment Letter mentions that "The City of Long Beach is commencing construction on the DeForest wetlands area. This resource must be included as a wetland, analyzed and protected prior to and after completion of I-710 improvements. Water quality monitoring should be required to ensure that the improvements that the City makes will not be negatively impacts by this project." The first sentence of this comment was not adequately addressed. Although Section 3.24.4.9 – Water Quality mentions "The SWPPP will… develop a water L-27-359

quality monitoring and sampling plan," a specific mention to avoid impacts to the DeForest Wetlands should be incorporated to adequately address the second sentence of this comment. L-27-359

Appendix R - Biological and Aquatic Resources Maps

Several features identified as "Other Drainage Features Within Developed Areas (non-jurisdictional)" are actually "Likely Jurisdictional" to RWQCB as indicated in Table 3.17-1. "Non-jurisdictional" alone implies not jurisdictional to any agency. Revise accordingly, such as "… (RWQCB-jurisdictional only)." L-27-360

Also, for USACE jurisdiction, revise to read "USACE/RWQCB…," including for "Jurisdictional Features (includes L.A. River)." L-27-361

The red lines indicate "Continuation of Drainage Through Non-Jurisdictional Area or Outside BSA;" however, some of these lines appear going through jurisdictional features. Clarify accordingly. L-27-362

Although impacts to jurisdictional resources will be mitigated through the permitting process with the regulatory agencies, an analysis to identify areas within the BSA that could be added features to improve water quality. In Section 3.17.4, add a mitigation measure as follows:

WET-1 Added features such as bioswales, vegetative buffers, and constructed wetlands aimed at removing pollution such as sediment, suspended solids, and microscopic soil particles called colloidal suspension, dissolved solids, and turbidity shall be constructed using native species in areas adjacent to the footprint of the preferred alternative, particularly areas adjacent to off-ramp and interchange improvements designed to convey storm flows off-site. L-27-363

SECTION 3.18 – PLANT SPECIES

Section 3.18.1 – Regulatory Setting

Page 3.18-1, Paragraph 2, Lines 3 and 4. See strikethrough and underlined in the sentence ""Special-status" species are ~~selected for protection~~ given designations because they are rare and/or subject to population and habitat declines." Paragraph 3, Line 2. Remove "…USFWS candidate species…" as candidate species are protected under FESA/CESA along with endangered and threatened designations. L-27-364

Pages 3.18-2 through 3.18-12, Table 3.18-1. Update all species statuses as applicable (updated quarterly by CDFW) when finalizing the EIR/EIS. In General Habitat Description, add Blooming Period and Habit to plants where missing. Because marginally suitable habitat is present in many instances, update "Habitat Present/Absent: Absent (A) - no habitat present and no further work needed. Habitat Present (P) – habitat is, or may be present" accordingly, throughout. Provide rationale to the level provided in Table 3.19-1 for those with habitat present, such as nearest and most recent occurrences recorded by CNDDB and CNPS or otherwise. Perennial species not observed is good rationale; but, not for annuals. L-27-365

Page 3.18-4, Intermediate mariposa lily, Rationale. Stated, "BSA is outside the species'… geographic range." However, the BSA is within Los Angeles County recognized in the General Habitat Description. Cite reference to source(s) identifying specific known geographic range. L-27-366

Page 3.18-9, Davidson's bushmallow, Rationale. Stated, "No…riparian woodland…within the BSA." Should read similar to… "Although marginal riparian habitat is present within the BSA, the BSA is L-27-367

outside the species known elevation range." Same for the next entry, California muhly (i.e., stream banks and other moist sites are marginally present within the BSA). See next entry, mud nama. L-27-367

Page 3.18-10, Parish's gooseberry, Rationale. Remove "No willow swales within the BSA" since riparian scrub is present within the BSA. The rest is adequate rationale. L-27-368

Page 3.18-11, Salt Spring checkerbloom, Rationale. Estuarine habitat transitioning to freshwater marsh is brackish. Stronger rationale is suggested, such as "Believed extirpated from Los Angeles County. Not observed in marsh habitats." Greata's aster. Add "BSA is outside of species known elevation range." L-27-369

Page 3.18-12, Sonoran maiden fern, Rationale. The project site ranges from sea level to 180 feet. Remove, BSA is outside the species' known range." The rest is adequate rationale. L-27-370

Section 3.18.2.1 – Special-Status Plant Species Requiring Surveys

Page 3.18-13, Paragraph 1, Lines 1 and 2. Revise the underlined, "previously known as *Hemizonia parryi* ssp. *australis*…" Also, given additional habitat marginally present for species mentioned above, add brief discussions for those species. L-27-371

Section 3.18.3.1 – Permanent Impacts

Page 3.18-13, Paragraph 4, Lines 1-4. Mentioned are "direct permanent impacts" to southern tarplant; however, as stated on Page 3.17-13, Paragraph 5, Lines 3-5, "Indirect permanent impacts were assumed in areas where shading from a bridge or the elevated freight corridor was identified." L-27-372

Page 3.18-14, Table 3.18-2, Center Heading. Should read "Indirect Permanent Impacts," as indicated below the table in Paragraph 1, Lines 4 and 5. L-27-373

2012 Comments Not Adequately Addressed in the Recirculated Environmental Document

Page 43 of 61 of the 2012 Comment Letter mentions that "This section notes that a literature review was conducted but provides no details regarding this review." This portion of the comment was not adequately addressed. Include in Section 3.18 a summary of the discussion in Section 2.2.1 of the NES, as well as for Sections 3.19 (Wildlife) and 3.20 (Threatened and Endangered Species). L-27-374

Page 44 of 61 of the 2012 Comment Letter mentions [brackets added] that "…the mitigation measure included to reduce potential impacts, which is identified in Section 3.24, does not provide the necessary specificity required under CEQA to ensure a reduction of such impacts [from emissions, climate or microclimate changes, and fugitive dust]. Specifically, Mitigation Measure CON-61 [now CON-PS-1] does not define the vicinity or set standards for boundaries to be enforced." This portion of the comment was not adequately addressed. L-27-375

SECTION 3.19 – ANIMAL SPECIES

Section 3.19.1 – Regulatory Setting

Page 3.19-1, Paragraph 2, Lines 7 and 8. Remove "…including CDFW fully protected species…" as they are discussed in Section 3.20. Paragraph 3. Should read (underlined added), "Federal laws and regulations relevant to non-listed wildlife include the following…" Same goes for "State laws…" and include CFGC Sections 3503, 3503.5, and 3513, among others. L-27-376

Pages 3.19-5 through 3.19-25, Table 3.19-1. Update all species statuses as applicable (updated quarterly by CDFW) when finalizing the EIR/EIS. L-27-377

Pages 3.19-5 through 3.19-8. Along with discussions of extirpation, also discuss whether suitable habitat is present, and if so, the nearest and most recent occurrences recorded by CNDDB or otherwise. L-27-378

Page 3.19-12, Mountain plover, Rationale. Add the underlined, "Probably a regular winter visitor historically, but no suitable habitat remains within the BSA." L-27-379

Section 3.19.3.1 – Permanent Impacts

Other Special-Status Animal Species Not Requiring Surveys

Page 3.19-31, Paragraph 4, Line 1. "All of these species have a low to moderate regular occurrence probability…" implies that an occurrence probability analysis (low, moderate, or high) was conducted; however, only habitat presence/absence and rationale (including observations [i.e., present]) are provided in the special-status species tables (Tables 3.18-1 and 3.19-1). Revise sentence if probability of occurrence ratings is not required. L-27-380

SECTION 3.20 – THREATENED AND ENDANGERED SPECIES

Section 3.20.2 – Affected Environment

Page 3.20-2, Paragraph 2, Line 1. Revise the underlined, "On April 16, 2009, May 23, 2012, and again on June 6, 2017 the USFWS provided a list of…" L-27-381

Section 3.20.2.2 – Animal Species

Page 3.20-3, Paragraph 7. Check numbers, "…it was determined that 42 animal species or habitats that are Federally and/or State-listed…" with "Suitable habitat does not exist within the BSA for 40 of these animal species…" and "With the exception of the Southern California steelhead Distinct Population Segment (DPS), green sea turtle, western snowy plover, California least tern (CLT), California sea lion, and EFH…" L-27-382

Pages 3.20-5 through 3.20-21, Table 3.20-1. Update all species statuses as applicable (updated quarterly by CDFW) when finalizing the EIR/EIS. In General Habitat Description, add Blooming Period and Habit to plants where missing. L-27-383

Page 3.20-6, San Fernando Valley spineflower, Rationale. Replace "BSA is outside the species' range" since the BSA is within its known elevation range, with "Presumed extirpated from the Los Angeles Basin." L-27-384

Page 3.20-7, Lyon's pentachaeta, Rationale. Remove "Believed to be extirpated from the area" since it is known to occur in western Los Angeles County, and has been documented from approximately two miles west of the right-of-way north of United States Naval Station Long Beach. L-27-385

Pages 3.20-9 through 3.20-21, Table 3.20-2. Along with discussions of extirpation, also discuss whether suitable habitat is present, and if so, the nearest and most recent occurrences recorded by CNDDB or otherwise. L-27-386

Page 3.20-13, Green sea turtle, Rationale. Revise unclear sentence, "Proposed affect but is not likely to adversely affect this species with implementation project may of the Avoidance, Minimization, and Mitigation Measures." L-27-387

Page 3.20-16, Least Bell's vireo, Habitat Present or Absent. If "marginally suitable habitat for nesting remains…for nesting in the BSA," change to "P" and include in Section 3.20.2.2 a discussion of vireo as "exceptions because they may occur within the BSA" (see Page 3.20-3). Further, Page 45 of 61 of the 2012 Comment Letter mentions a "…U.S. Fish and Wildlife Service... has advised that a known population of Least Bell's vireo resides in De Forest Park…" L-27-388

2012 Comments Not Adequately Addressed in the Recirculated Environmental Document

Page 45 of 61 of the 2012 Comment Letter mentions that "Studies and/or other forms of evidence need to be provided to support the discussion in Section 3.20.2.1, Plant Species" and "Section 3.20.2.2, Animal Species..." These comments were not adequately addressed. L-27-389

Page 59 of 61 of the 2012 Comment Letter mentions that "Section 3.24.3.19, Animal Species, page 3.24-36: The essential fish habitat discussion notes that "the I-710 Corridor Project will have a temporary adverse effect on Coastal Pelagic Management Plan Species." This plan protects habitats of certain species yet this plan is not discussed anywhere in Section 3.16, Natural Communities. In fact, Section 3.16, page 3.16-2 notes that "no habitat conservation plans or natural communities conservation plans are within the I-710 Corridor Project study area and are, therefore, not applicable to the proposed project." This must be corrected and the appropriate analysis must be provided in Section 3.16." These comments were not adequately addressed." These comments were not adequately addressed. L-27-390

Page 59 of 61 of the 2012 Comment Letter mentions that "…a mitigation measure to conduct surveys for Caulerpa taxifolia (a nonnative seaweed) is provided but no description or analysis of such species possibly existing or invading the Study Area is provided. Therefore, on Page 3.24-71, add to CON-INV-1 the following: "Although it has not been reported from San Pedro Bay or the Long Beach/Los Angeles Harbor complex, site-specific surveys for this invasive will be required as part of permit conditions for any bridge work or dredging associated with the I-710 Corridor Project" (language gathered from the Estuarine Resources Environmental Assessment [Appendix F of the NES]). L-27-391

SECTION 3.23 – RELATIONSHIP BETWEEN LOCAL SHORT-TERM USES OF THE HUMAN ENVIRONMENT AND THE MAINTENANCE AND ENHANCEMENT OF LONG-TERM PRODUCTIVITY

Chapter 3.23 does not address the loss of short-term and long-term productivity that would occur within the City of Long Beach as a result of impacts to businesses that would be relocated as a result of the project. As noted in Section 3.3, Community Impacts, of the RDEIR/SDEIS, within the City of Long Beach, it is estimated that between 31 to 62 nonresidential relocations would be required (depending on the build alternative). The relocation of nonresidential facilities is estimated to result in the relocation of anywhere between 270 to 431 employees, with a loss of up to approximately $237,130 in sales tax revenue. The City is concerned with the effects related to the relocation of businesses, and the impacts such relocations would have on the communities that surround them. To maintain the economic vitality and range of services provided to the communities in which they reside, every effort should be made to relocate the affected business near their existing locations, within the City of Long Beach. These impacts to long-term productivity should be considered in this chapter. L-27-392

Chapter 3.23 does not address the short-term loss of recreational facilities that would occur as a result of the project. A substantial portion of Cesar E. Chavez park within Long Beach would be affected by L-27-393

the proposed project, and the loss of recreational opportunities during the construction process should be disclosed within this section. L-27-393

Section 3.23.2, No Build Alternative, page 3.23-2: The discussion included here is contradictory. Specifically, the second paragraph states "…Alternative 1 includes additional transportation improvements that are already funded and/or committed to be constructed by or before the planning horizon year of 2035. Therefore, there would be irretrievable commitments of resources resulting from these other transportation improvements, but not as a result of the I-710 Corridor Project." The first paragraph states "Alternative 1 would also not provide the benefits of the reduced travel times and improved efficiency for the movement of vehicles, people, and goods that would result from implementation of the I-710 Corridor Project." If this section is discussing the "irretrievable commitments of resources resulting from these other transportation improvements," why is this section not accounting for the benefits that these transportation improvements would have along the corridor? These other transportation improvements would certainly reduce travel times and result in improved efficiency for the movement of goods. This consideration must be included here. L-27-394

2012 Comments Not Adequately Addressed in the Recirculated Environmental Document

This section does not fully address all potential irreversible and irretrievable commitments of resources that would be involved with Project development. For example, this section does not include an analysis regarding consumption of water during construction, which would be consumed for dust control, concrete mixers, etc. In addition, this section also does not include an analysis of irreversible and irretrievable commitments of air quality resulting from "permanent increase in air pollutant concentrations near the I-710 Corridor" (Section 3.22, page 3.22-2), which would occur under Alternative 5A since this Alternative would only widen the freeway and not provide the zero-emission technology. Furthermore, this section does not analyze potential irreversible and irretrievable commitments of energy from electrical consumption during construction and with implementation of a catenary system or other zero-emission technology. L-27-395

SECTION 3.23 – IRREVERSIBLE AND IRRETRIEVABLE COMMITMENTS OF RESOURCES THAT WOULD BE INVOLVED IN THE PROPOSED PROJECT

Page 3.23-1, Paragraph 1. This section states that "Construction of the build alternatives involves a commitment of a range of natural, physical, human, and fiscal resources." The analysis then continues to evaluate paleontological and archaeological resources, estuarine habitat, riparian/riverine habitat, jurisdictional waters, and construction effects. No mention or analysis regarding fiscal resources committed to the project are provided, and no distinction between the build alternatives is made. L-27-396

Page 3.23-3, Paragraph 2. The analysis notes that Alternative 1 includes a range of additional transportation improvements that are already funded and/or committed to prior to the planning horizon year of 2035. The analysis notes that there would be irretrievable commitments of resources as a result of these additional improvements, but provides no supporting analysis. This lack of analysis makes it impossible to adequately compare the impacts of the build alternatives to the no build alternative. L-27-397

2012 Comments Not Adequately Addressed in the Recirculated Environmental Document

This section does not fully address all potential irreversible and irretrievable commitments of resources that would be involved with Project development. For example, this section does not include an analysis regarding consumption of water during construction, which would be consumed for dust control, concrete mixers, etc. In addition, this section also does not include an analysis of irreversible and irretrievable commitments of air quality resulting from "permanent increase in air pollutant L-27-398

concentrations near the I-710 Corridor" (Section 3.22, page 3.22-2 of 2012 EIR/EIS), which would occur under Alternative 5A since this Alternative would only widen the freeway and not provide the zero-emission technology. Furthermore, this section does not analyze potential irreversible and irretrievable commitments of energy from electrical consumption during construction and with implementation of a catenary system or other zero emission technology. L-27-398

Section 3.23.2, page 2.32-2 of 2012 EIR/EIS: The discussion included here is contradictory. Specifically, the second paragraph states "…Alternative 1 includes other transportation improvements that are already programmed and/or committed to be constructed by 2035. Therefore, there would be irretrievable commitments of resources resulting from these other transportation improvements, but not as a result of the I-710 Corridor Project." The first paragraph states "Alternative 1 would also not provide the benefits of the reduced travel times and improved efficiency for the movement of vehicles, people, and goods that would result from implementation of the I-710 Corridor Project." If this section is discussing the "irretrievable commitments of resources resulting from these other transportation improvements," why is this section not accounting for the benefits that these transportation improvements would have along the corridor? These other transportation improvements would certainly reduce travel times and result in improved efficiency for the movement of goods. This consideration must be included here. L-27-399

SECTION 3.24 – CONSTRUCTION IMPACTS

Section No. 3.24.1.1 – Highway Improvement Process

Based on Section 3.24.1.1 above construction for many of the bridge structure embankments may extend over two to three storm seasons. As stated in Sections 3.24.1.1 and 3.24.2, typical erosion control measures will be implemented along with extending existing culverts. However, there appears to be no discussion about pre-planning for a moderate or major storm event during construction. As the pictures included above suggest, the I-710 corridor is especially susceptible to flooding. Section 3.24.3.9 states that work within channel will be limited to non-flood season as much as practicable, but the storm season lasts from October to April. It is likely that bridge pier construction, and other drainage related construction, could extend into the storm season. It is recommended that the RDEIR/SDEIS require the contractor to prepare a plan on how he will conduct his construction operations during the storm season. In addition, the contractor should prepare a plan detailing how he will protect adjacent areas from the threat of flooding if he is engaged in active construction within a flood channel during the storm season especially is such activity may temporarily impact the LA River flood control levees or an adjacent pump station. The contractor's construction schedule should ensure that a local or regional drainage or pump station facility is upgraded or reconstructed first prior to the existing facility being removed to reduce the chance of flooding during a storm event. L-27-400

Section 3.24.2 – Typical Construction Impacts

The analysis notes that the construction contractor would use silt fences, hay bales, and other measures to control runoff and erosion. The measures listed are sediment control. Hay bales are not specified and are not recommended. The Storm Water Data Report identifies the minimum BMPs that will be implemented. These includes BMPs to address soil erosion as well as other potential pollutants generated during construction activities. This section should be re-written to be consistent with the Storm Water Data Report. Additionally, there is a significant potential to directly impact receiving waters because of the numerous bridge structures that would be constructed in and directly over waters. This needs to be reflected in this section. L-27-401

Section 3.24.3.9 – Water Quality and Stormwater Runoff

Page 3.24-20, 3rd paragraph. The analysis notes that Alternative 5C would have some construction over and adjacent to the local water bodies and would disturb existing channel bottom sediments. Any construction work within the channel areas would likely result in sediment resuspension and dispersal into the water column of the channels. However, work within any channels would be limited to non-flood season as much as practicable. Additionally, coordination with the National Weather Service and the USACE regarding storm and flood events would occur. A safety plan for flood events would be in place, including plans for evacuation of personnel and equipment in the event of storm flows or an anticipated storm event. Please confirm the specific period(s) in which work will be limited to non-flood season. Our wet season begins in October and ends in May. Is the recommendation to not work within the Los Angeles River in this period? L-27-402

Page 3.24-21, paragraph following the bullets. The Construction General Permit requires calculation of Risk Level for each Planning Watershed. The risk level determination in the SWDR identified sediment toxicity as a reason for the receiving water to be identified as high risk. Sediment toxicity is not a characteristic for the high risk receiving water (i.e., 303(d) listed as being impaired for sediment/siltation or turbidity). Accordingly, unless the receiving water has a beneficial use of cold, spawn, or migratory, the receiving water risk level is Low. This is the case for Segment 1a as defined in the SWDR. It is noted that the sediment risk factor for each segment is calculated as Low or Medium. The R-factor is the main driver, which could cause this factor to increase to High. R-factor is sensitive to the construction duration. The anticipated construction duration for each segment (which is based on project start through final stabilization), should be verified. Note that if the end date of the project is extended beyond what was originally planned, then the risk calculation must be redone. If the Risk Level changes from Risk Level 2 to 3, then the associated Construction General Permit provisions must be complied with. L-27-403

Page 3.24-21, 2nd paragraph following the bullets. The analysis notes that, "During construction, applicable construction site BMPs would be incorporated into the construction documents, including temporary soil stabilization, sediment and tracking control, and waste management. Groundwater removed during dewatering operations would be disposed of off-site at approved locations or treated on site and incorporated into the grading operations. These requirements are specified in the measures provided in Section 3.24.4.9, below." The statement above commits Caltrans to not treat and discharge groundwater to the storm drains and downstream receiving waters. Confirm this is Caltrans' intent. L-27-404

Section 3.24.3.4 – Utility/Emergency Services

Page 3.24-16, Paragraph 1. Specific discussion of anticipated hauling of contaminated soils to permitted landfills as a result of relocation of petroleum pipelines and oil wells should be included. L-27-405

Section No. 3.24.3.6 – Visual/Aesthetics

Page 3.24-18, Alternative 5C. Consideration of specific staging areas and proposed construction haul routes should be considered. Minimization measures ensuring that visibility of staging areas from sensitive uses is minimized to the extent feasible should be included and consideration of haul routes avoiding sensitive areas (such as residential communities) should be provided. The analysis should also clarify if nighttime construction will be necessary and include appropriate minimization measures for nighttime lighting during construction, if applicable. L-27-406

Section No. 3.24.3.8 Hydrology and Floodplain

Section 3.24.3.8, Hydrology and Floodplain. This section, as well as others in the document, states it is anticipated that a CLOMR would be required. This should be expanded to describe under what conditions a CLOMR might be required. For example, FEMA would only require a CLOMR under one of two conditions: if there was a detailed study area with no floodway and there was a potential rise of greater than 1-foot associated with the proposed project; or if there was a detailed study area with a designated floodway and the proposed project would result in a rise greater than 0.00 feet. The LACFCD could also require a CLOMR should they feel one was warranted. This section should also be expanded to discuss the role of the U.S. Army Corps of Engineers (USACE) in this process. USACE has jurisdiction over the reaches of the LA River that were built as part of a Federal project. As such, any improvements to these reaches would require a 408 Permit. Due to the hydraulic sensitivity of the LA River, any impacts to the water surface could be considered significant by the USACE and could require mitigation. L-27-407

Section 3.24.3.8, Hydrology and Floodplain discusses temporary impacts to jurisdictional waters and water quality (which should be discussed in Section 3.24.3.9, not here) and does not discuss temporary construction impacts to channel capacity or other drainage structures. As stated above, this Section should discuss that the contractor working on the project prepare a construction impact plan on drainage structures, pump stations, and channel levees when or if working during the storm season. In addition, the contractor should be directed to prepare an emergency action plan if his construction activity may impact flood control facilities during a significant storm event which includes coordination with local cities, LACFCD, USACOE, and NWS if flood warnings, evacuations, or active flood fighting are required. L-27-408

Section No. 3.24.3.10, Geology/Soils/Seismic/Topography

Page 3.24-23, Section 3.24.3.10, Geology/Soils/Seismic/Topograpy: An adequate analysis for Alternative 7 must be provided. Merely stating that temporary impacts "would be greater under Alternative 7 due to the freight corridor component" is not sufficient. A thorough analysis of potential impacts associated with geology under Alternative 7 must be provided. L-27-409

Section No. 3.24.3.12, Hazardous Waste/Materials

Page 3.24.23, Section 3.24.3.12, Hazardous Waste/Materials: This section notes that online agency file review information was only available for a portion of the identified sites that represent an concern related to hazardous materials. As part of the preparation of this RDEIR/SDEIS, consultation should have been undertaken with the appropriate agencies to provide adequate information to ensure that all of the potential environmental impacts are disclosed to the public and decisionmakers. This analysis must include the complete list of sites with the appropriate description and potential effects resulting from these sites. In addition, this section indicates several potential impacts resulting from contaminated groundwater, elevated levels of aerially deposited lead, asbestos, etc., and notes that further evaluations and investigations need to be conducted. However, this section does not describe what these evaluations and investigations would entail, how such investigations would minimize potential impacts to construction workers, or even include them as part of the mitigation measures provided in this section to reduce impacts from hazardous waste/materials. L-27-410

Section No. 3.24.3.13, Air Quality

The evaluation and discussion of potential construction air quality impacts is inadequate for a project of this magnitude. The entire discussion of construction air quality impacts is limited to approximately three pages in Section 3.24, Construction, of the RDEIR/SDEIS. In order to find any specific L-27-411

information on how these emissions were calculated or to review emissions from a specific segment the reader must uncover it where it is buried in the appendices of the AQ/HRA. The conclusions and supporting data should be discussed in detail within this section. L-27-411

Page 3.24-29, Section 3.24.3.13, Air Quality (Construction Impacts). The analysis notes that construction-related PM2.5 and PM10 emissions due to this project were not included in the hotspot analysis because construction would not occur at any one location for more than five years and construction-related emissions would be considered temporary. Although this statement is correct per 40 CFR 93.123(c)(5), localized emissions from construction should be analyzed in the CEQA analysis and mitigation measures should be identified if necessary. This analysis was also not provided in RDEIR/SDEIS Section 4.0 (CEQA). The localized impact analysis should be conducted in accordance with SCAQMD's *Localized Significance Threshold Methodology* (2008). L-27-412

Additionally, the California Office of Environmental Health Hazards Assessment (OEHHA) document, Air Toxics Hotspots Program Guidance Manual (2015), recommends assessing cancer risk to residential receptors exposed construction emissions lasting more than two months. The exposure assessment should be assumed to start in the third trimester to allow for the use of the age sensitivity factors. L-27-413

Mitigation Measure CON-AQ-15 requires the use of equipment that meets U.S. EPA Tier 4 emissions standards. However, the mitigation measure also includes caveats such as "depending on the responsible agency that administers the construction contracts and the availability of construction equipment compliant with these standards", which renders the mitigation measure unenforceable. Mitigation Measure CON-AQ-15 must be revised to provide a performance standard and enforcement/verification mechanisms. The mitigation measure needs to define how availability of Tier 4 equipment is determined. L-27-414

Section No. 3.24.3.14, Noise

Section 3.24.3.14, Noise (Construction Vibration). Page 3.24-32 notes that pile driving could occur as close as 50 feet away, exposing sensitive receptors and structures to vibration levels of 0.3 PPV, which is a "strongly perceptible" and has the potential to damage buildings and would exceed the distinctively perceptible 0.1 PPV threshold and would approach the 0.4 PPV severe annoyance threshold. L-27-415

Mitigation Measure CON-N-9 requires a pre- and post-construction survey of structures to determine whether any new cracks or other damage have occurred. The analysis does not address or mitigate vibration impacts on people. Mitigation Measure CON-N-9 does nothing to mitigate the vibration levels and only addresses building damage after the fact. If driven plies are used, Mitigation Measure CON-N-9 should include noise monitoring during construction to ensure the vibration limit (0.2 PPV in/sec) is not exceeded. If it is exceeded, construction activities should halt until a remedy is implemented to reduce the vibration levels below the limit. L-27-416

The construction noise analysis mentions that pile driving would be needed, but provides no description on the potential number of piles, duration of pile driving, or alternative methods. These details (or conservative estimates of these details) are necessary in order to adequately analyze and mitigate impacts from project construction. Mitigation measure CON-N-10 mentions the utilization of alternatives to pile driving. However, there are no details or analysis to support where this mitigation should be implemented and how much it would reduce noise and vibration impacts. L-27-417

Section 3.24.3.14, Noise (page 3.24-32). The construction noise analysis does not address whether the 86 dBA Lmax standard can be met. Figure 3.24-1 shows numerous pieces of equipment exceeding 86 dBA (including pile drivers). Also, the typical construction activities include several pieces of equipment operating simultaneously, which would result in overall construction noise levels in excess of the levels that are provided in Figure 3.24-1. The construction analysis in the DED is inadequate, and needs to be revised to identify the highest potential construction noise levels compared to the applicable standard (86 dBA Lmax). L-27-418

Section 3.24.3.14, Noise (page 3.24-60) Mitigation Measure NOI-6 does not include performance standards or timing/enforcement mechanisms. Mitigation Measure NOI-6 requires construction contractors to implement noise control measures to prevent equipment from producing noise levels in excess of "specified limits". However, the "specified limits" are not identified. It is assumed that the mitigation measure is referring to the 87 dBA Lmax limit mentioned in the analysis, but this is not clear. Specific performance standards must be provided in the mitigation measure itself. Furthermore, Mitigation Measure NOI-6 should include noise monitoring during construction to ensure the specified limits are not exceeded. If it is exceeded, construction activities should halt until a remedy is implemented to reduce the noise levels below the limit. L-27-419

Section 3.24.3.14, Noise (page 3.24-59 to page 3.24-61). The current construction noise mitigation measures (CON-N-1 through CON-N-10) are vague and unspecific and therefore, not enforceable. The mitigation measures should be revised to include performance standards and verification and timing mechanisms as required by CEQA. For example, Mitigation Measure CON-N-7 requires construction contractors to apply site restrictions to achieve noise reduction through different methods. However, no performance standard is identified. The mitigation measures must identify performance standards and enforcement/verification mechanisms. The specific measures and performance standards must be required to be written into construction contracts and specifications in order for a lead agency to be able to enforce implementation. L-27-420

Section No. 3.24.3.15 - Energy

Page 3.24-33 (Energy). The analysis identifies that construction energy consumption would represent a "small fraction" of regional energy consumption even though it would take approximately 20 trillion British thermal units (BTUs) to construct Alternative 5C and approximately 40 trillion BTUs to construct Alternative 7. The analysis should identify what increase in energy increase would be considered a significant impact, and provide additional justification that no mitigation is needed. L-27-421

Section No. 3.24.4.6 – Visual/Aesthetics

Refer to comments provided for Section No. 3.24.3.6 above. L-27-422

2012 Comments Not Adequately Addressed in the Recirculated Environmental Document

Section 3.24.1, Construction Method Approach: This section should include construction phasing, schedule and work hours. L-27-423

Section 3.24.1, Construction Method Approach: Given the level of design and known right-of-ways for each of the alternatives, this section must identify the potential locations of staging areas, and the aggregate (pavement) crushing plant. L-27-424

Section 3.24.1, Construction Method Approach: Specific details regarding construction activities must be provided. Providing statements such as "this paving could be done at night, when traffic volumes are reduced, and may take several nights" is inadequate. L-27-425

Section 3.24.3.4, Utilities/Emergency Services, page 3.24-11 of the 2012 Draft EIR/EIS: Impacts to the numerous utilities in the Study Area are also not provided. This analysis must be provided here to ensure that accurate information is disclosed to the public and decisionmakers. L-27-426

Construction of the Project will require temporary closures of freeway ramps and arterial streets. As a result, traffic will be diverted to detour routes within City limits and will create traffic impacts along the detour routes. The increase in traffic along the detour routes and coordination of ramp, freeway lanes, and arterial street closures will require additional services to be provided by the Department of Public Works, the Police Department, and the Fire Department. Capital improvements to the traffic signal system in the City will be required. In addition, such detours may potentially affect the ability of the Police Department and Fire Department to meet response time goals. As such, the City requests that Caltrans provide funding in an amount to be determined to provide City staff support and capital improvements necessary to mitigate traffic impacts along detour routes. L-27-427

Section 3.24.3.5, Traffic and Transportation/Pedestrian and Bicycle Facilities, page 3.24-12 of 2012 Draft EIR/EIS: A qualitative analysis of the potential impacts to traffic and transportation and pedestrian and bicycle facilities is not adequate. The analysis must inform the public and decisionmakers of the levels of service expected during construction and provide a specific description of anticipated ramp closures. L-27-428

It is recommended that the Caltrans Traffic Management Plan (TMP) include the necessary traffic signal upgrades/improvements along parallel streets within the City of Long Beach (i.e., Santa Fe Avenue) to help facilitate traffic movement and to ensure that the temporary construction related traffic impacts of the I-710 Corridor Project are minimized. Further yet, these improvements should be installed well in advance of the construction phase of the project. L-27-429

It is recommended that City of Long Beach staff be involved in the development of the Caltrans TMP as it pertains to detours and/or re-routes of traffic onto City of Long Beach roadways during construction of the proposed project.

It is also recommended that a detailed pavement assessment be conducted for all affected City of Long Beach streets to determine each streets pavement condition at the conclusion of project construction. If project construction causes any damage to existing pavement, street, curb, and/or gutter along the identified detour routes, Caltrans will be fully responsible for repairs. The repairs shall be completed to the satisfaction of the City of Long Beach, Department of Public Works. L-27-430

Once all truck routes have been identified during the development of the Caltrans TMP, it is recommended that a detailed pavement assessment be conducted for all affected City of Long Beach streets to determine each streets pavement condition prior to the commencement of construction.

Section 2.34.3.6, Visual/Aesthetics, page 3.24-13 of the 2012 Draft EIR/EIS: The analysis presented here notes that impacts to sensitive viewers would be expected. However, this analysis does not provide who or what these sensitive viewers are. This information must be provided to accurately reflect and mitigate potential impacts. L-27-431

During construction, a number of alternate traffic routes will be proposed. The Draft EIR/EIS does not indicate which mitigation measures will be undertaken for the additional pollutants that will be generated from the increased vehicle trips and increased pollutant loads discharged via runoff from City-operated streets into the storm drain system. This may potentially be detected as elevated L-27-432

pollutant levels in the outfall monitoring program, the ongoing Coordinated Monitoring Plans for L.A. River and Los Cerritos Channel or at the LA County mass emission station located near Wardlow. L-27-432

According to Section 7-1.01I, Sound Control Requirements, of the Caltrans Standard Specifications, the Contractor shall comply with all local sound control and noise level rules, regulations and ordinances and internal combustion engines shall be equipped with a muffler of a type recommended by the manufacturer. The City of Long Beach Municipal Code provides construction hour limitations (7:00 am to 7:00 pm Monday through Friday and 9:00 am to 6:00 pm on Saturday), but does not specify local sound control noise levels for construction activities. The City of Long Beach does use the following CEQA significance threshold for construction noise: A significant impact would occur if project construction activities cause the exterior ambient noise level to increase by 5 dBA or more at a noise-sensitive use, as measured at the property line of any noise-sensitive use. Therefore, the Draft EIR/EIS should implement mitigation measures to reduce project-related construction noise levels within the City of Long Beach to less than 5 dBA above ambient noise levels to support a conclusion of less than significant construction noise impacts to noise-sensitive land uses within the City of Long Beach. L-27-433

During construction, it is expected that a number of local arterial streets and intersections will be heavily impacted by additional traffic congestion. It is expected that the analysis will incorporate mitigation measures throughout to address the increased traffic congestion, wear and tear, and the implementation of temporary intersection improvements to relieve congestion during the construction period. L-27-434

SECTION 3.25 – CUMULATIVE IMPACTS

Table 3.25-2. Neither project (T-80 or LD-89) is listed in Table 3.25-2, "Anticipated Construction Schedule for Major Future Projects in the I-710 Corridor Study Area." These projects should be coordinated with the City of Long Beach and added to the Table. L-27-435

Section 3.25.4.1 – Land Use

Page 3.25-43, under Future and Existing Land Uses, the discussion concludes "Because I-710 has been considered in the local General Plans since its construction as a freeway…the build alternatives are generally compatible with adjacent land uses." This statement is very broad and not entirely accurate. Although I-710 has been considered in local General Plans, the build alternatives would require land acquisitions that would place transportation land uses in closer proximity to land uses that may not be compatible with transportation land uses. Analysis should be provided to address this potential and the potential for cumulative impacts. L-27-436

Page 3.25-43, under Consistency with State, Regional, and Local Plans, the discussion states the "Project is generally consistent with the adopted goals and policies in the General Plans". However, the analysis is insufficient and the determination of consistency is unsupported. A detailed goal- and policy-specific consistency analysis is needed to support the overall conclusions. In addition, there is no discussion of the Long Beach LCP, I-710 Community Livability Plan, Long Beach RiverLink Plan, Pedestrian Master Plan, Parks, Recreation and Marine Strategic Plan, and the General Plan Mobility and Open Space and Recreation Elements. L-27-437

The cumulative analysis need to be reassessed based on the comments above and specific to Chapter No. 3.1, Land Use. Portions of the project-level analysis and conclusions are insufficient and unsupported. L-27-438

Page 3.25-42, Table 3.25-2. The LB MUST Project should be included in the table. L-27-439

Section 3.25.4.2 – Growth

Page 3.25-51, first paragraph, states "…the I-710 Corridor Project build alternatives would not contribute to cumulative adverse impacts related to growth". This statement is based on unsubstantiated conclusions identified in Chapter No. 3.2, Growth. Refer to the comments specific to Chapter No. 3.2, Growth. As previously noted, it is reasonably foreseeable that increased capacity and arterial improvements associated with the build alternatives would influence growth in the study area by making the communities more accessible. This could contribute to cumulative adverse impacts related to growth. Further analysis is needed to adequately substantiate the conclusions regarding potential growth impacts and resulting cumulative impacts. L-27-440

Section 3.25.4.4 – Utility/Emergency Services

Page 3.25-65, Reasonably Foreseeable Actions. This analysis should incorporate the following future City of Long Beach projects: the Shoemaker Bridge Replacement Project and the Long Beach MUST Facility. L-27-441

Page 3.25-66, Cumulative Impacts. Particular cumulative considerations that should be made for the Shoemaker Bridge Replacement Project include potential concurrent construction schedules such that emergency access would be further exacerbated. Particular cumulative considerations that should be made for the Long Beach MUST Facility include potential project impacts on future wastewater treatment facilities that will be cited along the I-710 Corridor. L-27-442

Section 3.25.4.6 – Visual/Aesthetics

Health and Historical Context. It is not reasonable to assume that the overall visual quality of the entire I-710 Corridor is moderately low for residential areas. Further, although no officially designated State scenic roads are present within the I-710 Corridor, Ocean Boulevard is a local scenic highway. This discussion should be updated accordingly. L-27-443

Page 3.25-53, Community Character and Cohesion. It is not reasonable to state that, other than communities in Commerce, the I-710 Corridor Project build alternatives would not result in adverse impacts to community character and cohesion. As discussed throughout this comment letter, the selection of Key Views was not very representative of the communities of Long Beach, including those residential communities along Fashion Avenue in particular. L-27-444

Pages 3.25-55 and 3.25-71, Reasonably Foreseeable Actions. This list of project's should be updated to include Shoemaker Bridge Replacement Project and the Long Beach MUST Facility, both in the City of Long Beach, within and along the I-710 Corridor. Cumulatively considerable impacts must be disclosed and whether the I-710 Corridor contributes to this impact must be disclosed. It should also be acknowledged that the proposed Long Beach MUST Facility will result in increased open space/public recreational area along the I-710 Corridor. The analysis must consider potential impacts to these facilities and whether or not the I-710 will negatively impact the future character of these areas in the City of Long Beach. L-27-445

Section 3.25.4.8 - Hydrology and Floodplain

Section 3.25.4.8, Hydrology and Floodplain. This section, as well as others in the document, states it is anticipated that a CLOMR would be required. This should be expanded to describe under what conditions a CLOMR might be required. For example, FEMA would only require a CLOMR under one of two conditions: if there was a detailed study area with no floodway and there was a potential rise of greater than 1-foot associated with the proposed project; or if there was a detailed study area with a L-27-446

designated floodway and the proposed project would result in a rise greater than 0.00 feet. The LACFCD could also require a CLOMR should they feel one was warranted. This section should also be expanded to discuss the role of the U.S. Army Corps of Engineers (USACE) in this process. USACE has jurisdiction over the reaches of the LA River that were built as part of a Federal project. As such, any improvements to these reaches would require a 408 Permit. Due to the hydraulic sensitivity of the LA River, any impacts to the water surface could be considered significant by the USACE and could require mitigation. L-27-446

Section 3.25.4.8, "Hydrology and Floodplains," of the RDEIR/SDEIS (page 3.25-77) lists impacts to Compton Creek as low and states that no change in capacity by either alternative will impact the 100-year floodplain. This may not necessarily be true. Please refer to comments 15, 16 and 17 herein below. L-27-447

Section 3.25.4.9 – Water Quality and Storm Water Runoff

Page 3.25-80, 1st paragraph. As stated previously, the receiving waters are impaired for a variety of constituents. The analysis informs the reader that the receiving waters will not be degraded. However, Caltrans is obligated to comply with its Municipal Stormwater Permit, which states the following: *The effect of the Department's storm water discharges on receiving water quality is highly variable. For this reason, this Order requires the Department to implement a storm water program designed to achieve compliance with water quality standards, over time through an iterative approach. If discharges are found to be causing or contributing to an exceedance of an applicable Water Quality Standard, the Department is required to revise its BMPs (including use of additional and more effective BMPs).* Additionally, the Department is obligated to comply with the Total Maximum Daily Load Requirements specified in Attachment IV of its Municipal Stormwater Permit. Please inform the reader of the BMPs planned for this project will result in the discharges not causing or contributing to an exceedance of an applicable Water Quality Standard and if the project will be compliant with TMDL requirements. L-27-448

Page 3.25-80, 4th paragraph. The summary of cumulative impacts should be revised to reflect the water quality benefits the LB-MUST project will be providing. L-27-449

Section 3.25.4.12 - Air Quality

Page 3.25-87. The analysis makes the unsubstantiated claim that the project is expected to demonstrate conformity with all California and National Ambient Air Quality Standards. However, this statement is in direct conflict with project analysis that identifies PM_{10} and $PM_{2.5}$ increases associated with the 2035 build alternatives when compared to the 2035 No Build Alternative. Additionally, the qualitative project level particulate matter analysis confirmed that further analysis is required. L-27-450

Section 3.25.4.15 – Natural Communities

Page 3.25.93, Paragraph 5, Lines 2 and 3. Revise the underlined to be consistent with previous mentions, "The BSA is approximately 19 linear miles along the I-710 Corridor, from Ocean Blvd. to SR-60." Same for Sections 3.25.4.16 through 3.25.4.20 under Resource Study Area. L-27-451

Page 3.25.97, Paragraph 2, Lines 1 and 2. Add the underlined, "Compensatory mitigation for estuarine communities would be required to comply with Section 404 of the Clean Water Act (CWA) and Section 1600 of the California Fish and Game Code." L-27-452

Section 3.25.4.17 – Plant Species

Page 3.25-102, Paragraph 2, Lines 6 and 7. Revise "Alternatives 5C and 7 would not result in indirect permanent impacts to southern tarplant from shading" to be consistent with that previously stated on Page 3.16-9, "Alternatives 5C and 7 would result in indirect permanent impacts to southern tarplant from shading." L-27-453

Section 3.25.4.18 – Animal Species

Page 3.25-103, Paragraph 5, Lines 5 and 6. Check total number of wildlife species with the potential to occur within the vicinity of the BSA (Section 3.19.2 has 117, and Section 3.20.2.2 has 42, totaling 159). L-27-454

Section 3.25.4.19 – Threatened and Endangered Species

Page 3.25-108. With mention of critical habitat for western snowy plover, either remove or include similar statements for the other species mentioned under this heading. L-27-455

Section 3.25.4.20 – Invasive Species

Page 3.25-112. Paragraph 5, Lines 2 and 3. Add the underlined, "…and temporarily affected areas would be revegetated with native plant species…" Plantings should also be consistent with the Los Angeles River Master Plan Landscaping Guidelines and Plan Palettes (January 2004). L-27-456

APPENDIX B- SECTION 4(F) EVALUATION

As noted above, the City of Long Beach Department of Parks, Recreation, and Marine has prepared comments on the RDEIR/SDEIS under separate cover. These comments relate to project impacts to parks and recreational facilities within the City, including Cesar E. Chavez Park, Drake/Chavez Greenbelt, Coolidge Park, Los Cerritos Park, Cressa Park and Wrigley Greenbelt. Refer to Attachment A, City of Long Beach Department of Parks, Recreation, and Marine Comments on RDEIR/SDEIS dated October 9, 2017. L-27-457

Page 52, Section 5.2, Cesar E. Chavez Park and Drake/Chavez Greenbelt, Paragraph 4. This analysis documents the de minimis conclusion reached for project impacts to the existing Cesar E. Chavez Park and Drake/Chavez Greenbelt. The project would result in a permanent incorporation and temporary occupancy of the park/greenbelt, resulting in impacts to the local community in relation to recreational opportunities in the project area. It is essential that the I-710 project be consistent with the City's Cesar E. Chavez Park Integration Plan, which proposes substantial enhancements to the existing park and builds upon other proposed facilities, which include elements of the Long Beach Municipal Urban Stormwater Treatment (MUST) Project and Shoemaker Bridge Replacement Project. The concept of the Integration Plan is the contrast between historic Long Beach and the new progressive movement of the City, i.e. Willmore Historic Neighborhood and Downtown; Shoemaker Bridge Re-Use and the new iconic Shoemaker City Gateway Bridge. The Integration Plan provides for a network of bike and pedestrian trails that provide connectivity between the open space, connection to the L.A. River trail, and links to the downtown and adjacent neighborhoods. The Plan components will be compatible with the surrounding neighborhood character; create a unique and attractive destination; provide recreation opportunities; create a sense of pride and image for the International City and the most "Bike Friendly City". L-27-458

The Integration Plan provides a visual and physical connection between the different use areas and to the surrounding neighborhoods and downtown. The Plan identifies elements to be consistent with past project master planning efforts, and adds opportunities for other types of uses and circulation.

- The Boardwalk / Promenade are a major spine that links the downtown through Cesar Chavez Park to the Shoemaker Bridge Re-use and the LB MUST Facility.
- The relationship between Shoemaker Bridge; LB MUST Facility; and Bio-Retention Basin Area become the center of the plan with linkage to the other uses.
- Community Gardens; Drake / Chavez Soccer Fields and Greenbelt; Drake Park; and De Forest Avenue provide for recreation amenities, venues for community activities and connection to the neighborhood.

The Integration Plan provides bicycle and pedestrian connectivity between the park areas and open space, downtown Long Beach, Los Angeles River regional trail, west side of the L.A. River and adjacent neighborhoods. The plan minimizes conflicts with significant roadways and provides for safe uninterrupted crossing and access. The plan creates a continuous green belt along the L.A. River as part of the chain of park lands to include Cesar Chavez Park; Santa Cruz Park; Golden Shore Marine Biological Reserve Park; Shoreline Aquatic Park; and Marina Greens.

- Boardwalk / Promenade
  - Pavement materials that resemble a contemporary boardwalk;
  - Flowering “botanic” gardens;
  - Palm skyline planting;
  - Architectural lighting
- Expanded Cesar E. Chavez Park
  - Sculptured earth forms;
  - Outdoor sculpture gardens;
  - Garden mazes;
  - Water wise gardens;
  - Picnic areas;
  - Open Play
- Long Beach Municipal Urban Stormwater Treatment Facility- LBMUST Facility
  - Urban Runoff Treatment Facility;
  - Education opportunities;
  - Facility to function in conjunction with the bio-retention basins systems
- Bio-Retention Basins and Bio-Swales open channel
  - Urban runoff natural treatment systems;
  - Boardwalk access to the basins;
  - Observation and viewing areas;
- Community Gardens
  - Willmore Heritage Gardens and Gate;
  - Tower re-use for windmill;
  - Community gardens;
  - Theme playground;
  - Picnic areas
- Drake / Chavez Soccer Fields and Greenbelt
  - Soccer fields;
  - Basketball courts;
  - Handball courts;
  - Picnic areas

L-27-458

- Drake Park
  - Picnic shelters, arbors and gazebos architecture to be compatible with the neighborhood;
  - Splash and playground;
  - Open play;
  - Picnic areas
- Shoemaker Bridge Re-Use
  - The Shoemaker Bridge re-use provides a unique opportunity to create a pedestrian destination with wonderful views to the downtown, L.A. River and the new iconic Shoemaker Bridge.
  - Shoemaker Bridge is an example of engineering achievements of its time. It becomes an extension of the park space over the river, with overlooks, seating, garden paths, educational / interpretive opportunities about the River, History of Long Beach, and Shoemaker Bridge namesake.

L-27-458

It should be noted that this description of proposed components of the Integration Plan is considered conceptual and subject to change as the plan moves through the City's review process. It is imperative that consultation and coordination between Caltrans and the City be maintained to ensure that the Integration Plan is accommodated as the I-710 improvements move forward.

Page 53, Section 5.2, Cesar E. Chavez Park and Drake/Chavez Greenbelt, Paragraph 2. The evaluation notes that 2.9 acres of Cesar Chavez Park would be permanently incorporated into the I-710 Corridor Project, but that 5.89 acres of parkland would be added. The 5.89 acres proposed to be added by Caltrans is existing City right-of-way. This conflicts with the City's Park in Perpetuity Ordinance, which requires a 2:1 replacement for loss of parkland. This would require 5.8 acres of parkland, separate from the City right-of-way proposed to be incorporated. This requirement should be added to the list of measures provided on page 56 of the Section 4(f) analysis.

L-27-459

Page 53, Section 5.2, Cesar E. Chavez Park and Drake/Chavez Greenbelt, Paragraph 3. The Shoemaker Bridge Replacement Project is identified as an Early Action Project within the RDEIR/SDEIS. The bridge replacement project would consist of the replacement of the Shoemaker Bridge over the Los Angeles River. Under both Build Alternatives 5C and 7, the existing Shoemaker Bridge would be demolished after construction of the new bridge. However, the build alternatives should consider leaving the existing bridge in place, to serve as beneficial use for recreational purposes. The existing bridge is a key component of the Integration Plan described above.

L-27-460

Page 56, Paragraph 3. The analysis of potential 4(f) impacts to Cesar E. Chavez Park and the Drake/Chavez Greenbelt notes, "Consistent with the requirements of Section 4(f), Caltrans is required to consult with the agencies having jurisdiction over the Section 4(f) properties identified as potentially used by the build alternatives. Therefore, Caltrans has initiated formal consultation with the City of Long Beach, the agency that owns and operates Cesar E. Chavez Park and the Drake/Chavez Greenbelt…" It should be noted that formal written concurrence that the I-710 project will not adversely affect the activities, features, and attributes of the Section 4(f) property has not been provided by the City. As noted in the Caltrans Standard Environmental Reference and Annotated Outline, this written concurrence from the City will be necessary as part of the final environmental document. As such, the City will require that Caltrans conduct further consultation with Parks, Recreation, and Marine staff to ensure that the proposed project will be consistent with the City's Cesar E. Chavez Park Integration Plan and would not conflict with recreational elements associated with any City parks, the LB MUST project, or Shoemaker Bridge replacement.

L-27-461

Page 69, Section 6.1, Temporary Occupancy Exceptions. This section notes numerous resources within the City of Long Beach that were evaluated under the requirements of Section 4(f), but where a "use" did not occur since the project met the five conditions listed in 23 CFR 774.13(d). The resources evaluated within the City of Long Beach include the Wrigley Greenbelt, Coolidge Park, Los Cerritos Park, and Cressa Park. Under the evaluation of each of these facilities, the analysis notes, "There must be documented agreement of the official(s) with jurisdiction over the Section 4(f) resource regarding the above conditions. It is anticipated that, as part of Caltrans consultation with the Long Beach Department of Parks, Recreation and Marine, this agency would agree to the use of a portion of the park for a TCE during construction of the build alternatives." The determination of "no use" of Wrigley Greenbelt, Coolidge Park, Los Cerritos Park, and Cressa Park is predicated on the assumption that documented agreement will be provided by the City at a later date. However, no such documented agreement has been provided, and as such, it is premature to determine that "no use" would occur. The City lacks sufficient information to issue documented agreement/concurrence without more detail regarding construction impacts, TCEs, timing, and phasing. In addition, Coolidge and Los Cerritos Parks are home to community programs that would be impacted, as well as potential revenue from these programs. It is not reasonable to assume these programs would be placed on hold, or moved outside of the neighborhood they serve. Future required consultations between Caltrans and the City's Department of Parks, Recreation, and Marine would include conditions that allow services for the community to continue. L-27-462

Page 70, Section 6.1.2, Coolidge Park. The interchange and ramp improvements proposed at and along Coolidge Park would result in substantial impacts to park users. As noted in the analysis, Coolidge Park includes a baseball field, basketball courts, staff office, spray pool, and a picnic area, and is utilized heavily for recreation by the community. The proposed interchange/ramp configurations would substantially alter the visual character of the project area and result in "proximity impacts" that could potentially disrupt and alter the function of the facility as a recreational facility. The RDEIR/RDEIS includes two sentences addressing potential indirect impacts (noise, visual, air quality) effects on Coolidge Park. The impact analysis should be expanded to substantiate its conclusions. L-27-463

The City of Long Beach appreciates the opportunity to review the environmental document for the proposed project. Based on the comments provided above, it is the City's view that the RDEIR/SDEIS has considerable inadequacies that must be corrected. The RDEIR/SDEIS should include additional technical analyses to substantiate conclusions provided under CEQA and NEPA, and to adequately address the range of substantial environmental impacts the project would have upon the City of Long Beach. The City looks forward to further consultation with Caltrans regarding the proposed project.

Attachment A

City of Long Beach Department of Parks, Recreation, and Marine Comments on RDEIR/SDEIS dated October 9, 2017

City of Long Beach *Memorandum*
Working Together to Serve

Date: October 9, 2017

To: Ron Kosinski, Deputy Director, Environmental Planning Division, Caltrans District 7

From: Marie Knight, Director, Department of Parks, Recreation and Marine

Subject: Comments on Proposed Impacts on Cesar E. Chavez Park, Drake/Chavez Greenbelt, Coolidge Park, Los Cerritos Park, Cressa Park and Wrigley Greenbelt from Interstate 710 Corridor Project

On July 27, the City of Long Beach received correspondence from Caltrans, who is currently evaluating alternatives for the Interstate 710 Corridor Project (Project). In this letter, Caltrans identified the Cesar E. Chavez Park and the Drake/Chavez Greenbelt as Section 4(f) resources that are managed by the Department of Parks, Recreation and Marine (PRM) that would be permanently impacted by the proposed 710 Realignment Project alternatives. There are significant land use, operational, and programmatic impacts. The City's comments on these impacts are outlined below.

Overall Comments

1. In 2002, the Long Beach City Council adopted Ordinance No. C-7826, which is incorporated into the City Municipal Code Section 21.35.205, requiring: "*Any conversion of park land must be replaced on amenity for amenity basis on at least a two to one (2:1) ratio. One (1) acre of replacement land shall be located in the park service area where the land was converted and an additional acre of replacement land shall be located in a park service area needing park land as determined by the recreation commission."* This would require a 2:1 replacement of publicly-accessible parkland for the acres lost, with at least 50 percent to be located in the surrounding park service area. This applies to all permanent park impacts resulting from the I710 Project.
2. Removal and addition of park area shall require a design of the entire consistent with adopted City plans and codes, with input from the community, to determine the site layout, park amenities, buffer between the park and freeway, parking, ADA access, fencing, signage, neighborhood connection, etc.
3. Many affected park parcels were acquired or improved using County, State and/or Federal grant funds. These grants carry requirements for a duration (20 years to perpetuity) that improvements or property are available to the community. Replacement of these amenities to the satisfaction of the City and grant agencies shall be required, should affected property or amenities become permanently removed. The proposed realignment impacts these properties. Any resulting replacement or other financial burden required by the grant agencies for the taking of park property for freeway use shall be mitigated at no cost or impact to the City.
4. All permanent impacts shall require approval from the Long Beach Parks and Recreation Commission. Approval must be secured prior to final design.

5. A City maintenance fund shall be established with funding deposited by Caltrans prior to the completion of construction. The account shall be available to the City Department of Parks, Recreation and Marine to address unforeseen maintenance issues at each affected park site due to temporary or permanent construction impacts that become apparent after construction is complete.

Cesar E. Chavez Park Comments

1. Permanent Impacts
   1.1. The proposed realignment would move the freeway so that it is entirely west of Chavez Park. The Department is supportive of the proposed realignment, which would result in neighborhood access to existing acres of parkland not currently accessible to the public. However, in order to achieve the realignment, the freeway would require the permanent reincorporation of 2.90 acres of land from Chavez Park. In this instance, the City's municipal code would apply. In 2002, the City of Long Beach City Council adopted Ordinance No. C-7826, which is incorporated into the City Municipal Code Section 21.35.205, requires: 'Any conversion of park land must be replaced on amenity for amenity basis on at least a two to one (2:1) ratio. One (1) acre of replacement land shall be located in the park service area where the land was converted and an additional acre of replacement land shall be located in a park service area needing park land as determined by the recreation commission.' This would require a 2:1 replacement of publicly-accessible parkland for the acres lost, with at least half in the surrounding park service area of Chavez Park.
   1.2. The proposed realignment would also impact planned linkages between Drake Park and Cesar Chavez Park. These linkage areas are currently impacted by overhead Caltrans structures. The realignment would change the locations of the structures, created impaired visibility into areas under the bridge.
   1.3. The proposed realignment would remove park area where it exists and add park area where today there is none. This shall require a design of the new park consistent with adopted City plans and codes, with input from the community, to determine the layout of park amenities, the buffer between the park and the freeway, parking, ADA access, fencing, signage, connection to the LA River bike trail, etc. The proposed realignment also renders the existing irrigation system (including the existing irrigation lines, valves and controls, and point of connection) unusable. The irrigation system shall be replaced in its entirety, including irrigation controls that connect to the City's central irrigation system, per the required standards to the satisfaction of the Director of the Department of Parks, Recreation and Marine.
   1.4. Many of the park parcels were acquired or improved using County, State and/or Federal grant funds. These grants carry requirements including a designated duration (20 years to perpetuity) that improvements or property are available to the community. Replacement of these amenities to the satisfaction of the City and grant agencies shall be required, should

affected property or amenities become permanently removed. The proposed realignment impacts these properties. Any required replacement or other financial burden required by the grant agencies for the taking of park property for freeway use shall be mitigated by Caltrans, at no cost to the City.

1.5. The realignment proposes to eliminate basketball courts that serve Cesar E. Chavez Elementary School. Any elimination of these courts shall require the replacement of these courts adjacent to the school they serve.

2. Temporary Impacts
   2.1. A construction staging and contractor parking and access plan shall be provided and approved prior to the start of construction at the satisfaction of the Director of Parks, Recreation and Marine.
   2.2. At no time during construction shall construction activities impact park programs, services, or budgeted revenue. If budgeted revenue is lost as a result of construction activities, it shall be provided for by Caltrans.
   2.3. A construction equipment access plan shall be reviewed and approved by the Department of Parks, Recreation and Marine prior to the start of construction activities. Damage to underground irrigation infrastructure shall be mitigated by placement of plywood in all areas of heavy equipment ingress/egress.
   2.4. All areas of construction shall be appropriately secured. The contractor is responsible for monitoring the site, and shall be responsible for any damage to the site caused by vandalism, and shall be responsible for any homeless clean-up and removal costs as a result of homeless activity at the site.
   2.5. The contractor/developer shall notify the Department of Parks, Recreation and Marine 72 hours prior to the start of work. Notification shall be directed to the Superintendent of Park Maintenance.
   2.6. If Department staff are called to the site to respond to a site issue caused by the contractor (i.e. hitting a main line, marking irrigation infrastructure, causing a significant water leak, damaged irrigation infrastructure, etc.), the contractor shall reimburse the Department for all staff time spent addressing the site issues.
   2.7. At the conclusion of construction, the site shall be returned to the same condition in which it was found. This shall include, but is not limited to, replacement of plant material, removal of weeds, removal of trash, regrading and compacting sites.
   2.8. Temporary basketball courts to serve Cesar E. Chavez Elementary School shall be provided adjacent to the school during construction.
   2.9. Irrigation shall be required during construction to ensure the health of all landscaping. A temporary water meter shall be installed and all associated costs shall be paid by the contractor.
   2.10. All other Department Parks Standard Conditions of Approval/Park Development Requirements shall apply.

Drake/Chavez Greenbelt Comments

1. Permanent Impacts
   1.1. Certain areas shown on the map as remaining parkland are not accurately reflected because 1) it is not parkland; 2) it is not functional as parkland (is the location of a building); or 3) it does not belong to the City and likely serves another purpose for the County. There are also open space areas not listed as parkland that are affected permanently that shall remain. The map shall be revised to reflect accurate acres of remaining parkland.
   1.2. The 3.77 acres depicted as parkland permanently used by Alternative 5C/7 is the location of a grant-required wetland. A previous State acquisition grant requires the City to provide for 4 acres of wetland in this area and thus, is not available for development for another purpose. This is also the location of the Caltrans-funded Long Beach MUST project, which also includes grant funding and associated requirements from the San Gabriel and Lower Los Angeles Rivers and Mountains Conservancy.

2. Temporary Impacts
   2.1. A construction staging and contractor parking and access plan shall be provided and approved prior to the start of construction at the satisfaction of the Director of Parks, Recreation and Marine.
   2.2. At no time during construction shall construction activities impact park programs, services, or budgeted revenue. If budgeted revenue is lost as a result of construction activities, it shall be provided for by Caltrans.
   2.3. A construction equipment access plan shall be reviewed and approved by the Department of Parks, Recreation and Marine. Damage to underground irrigation infrastructure shall be mitigated by placement of plywood in all areas of heavy equipment ingress/egress.
   2.4. All areas of construction shall be appropriately secured. The contractor is responsible for monitoring the site, and shall be responsible for any damage to the site caused by vandalism, and shall be responsible for any homeless clean-up and removal costs as a result of homeless activity at the site.
   2.5. The contractor/developer shall notify the Department of Parks, Recreation and Marine 72 hours prior to the start of work. Notification shall be directed to the Superintendent of Park Maintenance.
   2.6. If Department staff are called to the site to respond to a site issue caused by the contractor (i.e. hitting a main line, marking irrigation infrastructure, causing a significant water leak, damaged irrigation infrastructure, etc.), the contractor shall reimburse the Department for all staff time spent addressing the site issues.
   2.7. At the conclusion of construction, the site shall be returned to the same condition in which it was found. This shall include, but is not limited to, replacement of plant material, removal of weeds, removal of trash, regrading and compacting sites.

2.8. Irrigation shall be required during construction to ensure the health of all landscaping. A temporary water meter shall be installed and all associated costs shall be paid by the contractor.
2.9. All other Department Parks Standard Conditions of Approval/Park Development Requirements shall apply.

Coolidge Park Comments

1. Temporary Impacts
   1.1. Coolidge Park is the only park available to the community in north Long Beach, east of the I710 and shall remain open and operational during construction and shall not have a temporary easement placed on it.
   1.2. The eastern edge of the park shall be protected from any construction impacts and have adequate fencing to separate the park activities from construction activities.
   1.3. The park shall not be available for access to the freeway for construction activities. Any necessary access shall be located elsewhere, away from the park.
   1.4. All other Department Parks Standard Conditions of Approval/Park Development Requirements shall apply.

Los Cerritos Park Comments

1. Temporary Impacts
   1.1. Los Cerritos Park shall remain open and operational during construction and shall not have a temporary easement placed on it.
   1.2. The western edge of the park shall be protected from any construction impacts and have adequate fencing to separate the park activities from construction activities.
   1.3. The park shall not be available for access to the freeway for construction activities. Any necessary access shall be located elsewhere, away from the park.
   1.4. All other Department Parks Standard Conditions of Approval/Park Development Requirements shall apply.

Cressa Park Comments

1. Temporary Impacts
   1.1. There are no issues with the proposed temporary easement at the southern end of Cressa Park.
   1.2. The contractor/developer shall notify the Department of Parks, Recreation and Marine 72 hours prior to the start of work. Notification shall be directed to the Superintendent of Park Maintenance.
   1.3. If Department staff are called to the site to respond to a site issue caused by the contractor (i.e. hitting a main line, marking irrigation infrastructure, causing a significant water leak, damaged irrigation infrastructure, etc.), the contractor shall reimburse the Department for all staff time spent addressing the site issues.

1.4. At the conclusion of construction, the site shall be returned to the same condition in which it was found. This shall include, but is not limited to, replacement of plant material, removal of weeds, removal of trash, regrading and compacting sites.
1.5. All other Department Parks Standard Conditions of Approval/Park Development Requirements shall apply.

Wrigley Greenbelt Comments

1. Temporary Impacts
   1.1. The northern and southern areas in Wrigley Greenbelt depicted as parkland temporarily used by Alternative 5C/7 is the location of a grant-funded greenbelt project to begin construction in 2018. Temporary impacts, trail connections and displacement of these amenities shall not be allowed. Any required replacement or other financial burden required by the grant agencies for the taking of park property for freeway use shall be mitigated by Caltrans, at no cost to the City.
   1.2. The contractor/ shall notify the Department of Parks, Recreation and Marine 72 hours prior to the start of work. Notification shall be directed to the Superintendent of Park Maintenance.
   1.3. If Department staff are called to the site to respond to a site issue caused by the contractor (i.e. hitting a main line, marking irrigation infrastructure, causing a significant water leak, damaged irrigation infrastructure, etc.), the contractor shall reimburse the Department for all staff time spent addressing the site issues.
   1.4. At the conclusion of construction, the site shall be returned to the same condition in which it was found. This shall include, but is not limited to, replacement of plant material, removal of weeds, removal of trash, regrading and compacting sites.
   1.5. All other Department Parks Standard Conditions of Approval/Park Development Requirements shall apply.

Long Beach Parks Standard Conditions of Approval/Park Development Requirements

1. Standard Conditions of Approval: This is not an exhaustive list of all conditions, but a sampling of those that will likely apply in all cases to each park property. The City of Long Beach reserves the right to apply all park standard conditions and park development requirements during design and plan check.
   1.1. All permanent impacts shall require approval from the Long Beach Parks and Recreation Commission. Approval must be secured prior to final design.
   1.2. The Department of Parks, Recreation and Marine shall be routed design and construction plans for plan check. Plans, at each stage of plan check, shall be routed to the Department of Parks, Recreation and Marine. Address plans to Park Development Officer, 2760 Studebaker Road, Long Beach, CA 90815.

1.3. Any park or beach improvements found to be damaged as a result of construction activities related to the project shall be replaced to the satisfaction of the Director of Parks, Recreation and Marine.
1.4. Prior to certificate of completion/occupancy, the following shall be formally submitted to the Department of Parks, Recreation and Marine:
  1.4.1. Final as-built plans (two printed copies, one electronic PDF, and one cad file).
  1.4.2. Property documentation, including but not limited to, site survey, recorded deed, final map, soils report (one electronic PDF).
  1.4.3. Operations and Maintenance Manual and warranty information for all site features (one printed and one electronic PDF).
1.5. Address all documents to Park Development Officer, 2760 Studebaker Road, Long Beach, CA 90815.
1.6. Prior to tree planting, and installation landscaping and irrigation system, the developer shall contact the City Park Landscape Maintenance Superintendent in the Department of Parks, Recreation and Marine, at (562) 570-4879. Department staff will inspect and accept all tree and plant specimens placed prior to planting.

2. Landscaping & Irrigation
  2.1. The irrigation control system shall be designed to City standard and connected to the City's central irrigation control system, and use Department standard irrigation products, values and pumps.
  2.2. The landscaping design sheet shall show specific location of each plant and coverage area, and planting distance from adjacent plants.
  2.3. The irrigation design sheet shall show, in addition to main lines, specific location of each lateral/drip line, valves, wires back to controllers, drip systems, headers, etc.
  2.4. The plant palette shall be subject to Director of Parks, Recreation and Marine's review and approval prior to the issuance of a building permit.
  2.5. Prior to tree planting, and installation landscaping and irrigation system, the developer shall contact the City Park Landscape Maintenance Superintendent in the Department of Parks, Recreation and Marine, at (562) 570-4879. Department staff will inspect and accept all tree and plant specimens placed prior to planting.
  2.6. Prior to final inspection, the developer shall contact the City Park Landscape Maintenance Superintendent in the Department of Parks, Recreation and Marine, at (562) 570-4879, following all tree planting, landscaping, and irrigation system installation. Department staff will perform a final inspection, identify any items for a contractor punch list and will accept all tree planting, landscaping, and irrigation system placed in the park.
  2.7. Irrigation lines shall be located in advance of accessing the area.
  2.8. Selected trees shall not drop fruit or be susceptible to disease. All trees shall comply with State and local water restrictions and water efficiency codes.

2.9. All trees shall have bubblers rings and shall be mulched to diameter of 3-ft from the trunk. Mulch shall not be in contact with the tree trunk or root crown. All dead, diseased and dying trees shall be removed.

2.10. All landscape-related piping under concrete shall be sleeved. Sand bedding of the mainline shall be installed.

Marie Knight
City of Long Beach Department of Parks, Recreation and Marine
2760 Studebaker Road
Long Beach, CA 90815

Dear Ms. Knight,

This letter is regarding the proposed impacts on Cesar E. Chavez Park and the Drake/Chavez Greenbelt as a result of the Interstate 710 (I-710) Corridor Project (project). Under Section 4(f) of the United States Department of Transportation Act of 1966, these park properties are considered Section 4(f) resources. The project would require the permanent incorporation of land and temporary construction easements (TCE) in both of these park properties, as well as removal and replacement of the basketball courts and temporary closures in Cesar E. Chavez Park.

The project proposes to construct improvements from Ocean Boulevard in the City of Long Beach to State Route 60 (SR-60) in the City of Los Angeles. A Draft Environmental Impact Report/Environmental Impact Statement (EIR/EIS) was prepared for the project in 2012, which included the analysis of four build alternatives. Subsequent to public circulation of the Draft EIR/EIS, in response to new information and comments received from the public, a revised set of build alternatives were developed. The revised build alternatives under consideration include Alternative 5C (Modernize the I-710 Freeway) and Alternative 7 (Add Clean-Emission Freight Corridor [Truck-Only Lanes] Along I-710). A No Build Alternative is also under consideration.

As shown in **Figure 1**, the build alternatives would include relocating the existing Shoreline Drive to the west side of the park, requiring the permanent incorporation of 2.90 acres of land from Cesar E. Chavez Park, which would constitute a permanent use of a portion of the park. However, by relocating the existing Shoreline Drive that goes through the park, the build alternatives would result in a net increase of 2.99 acres in available park land, creating a contiguous and more accessible park area. The build alternatives would also require removal of the basketball courts west of Cesar Chavez Elementary School during construction of the project, which would constitute a permanent use of a portion of the park. However, the basketball courts would be replaced following construction. Because the project would result in a net benefit to the park by adding 2.99 acres of park land, and measures to minimize harm to the park would be implemented, the permanent use of a portion of the park is not expected to adversely affect the activities, features, and attributes that qualify this park for protection under Section 4(f).

As shown in **Figure 2**, the build alternatives would require permanent incorporation of a portion (approximately 3.77 acres) of the planned linkage between Drake Park and Cesar E. Chavez Park, which would constitute a permanent use of a portion of the greenbelt. While this portion of the Drake/Chavez Greenbelt would be incorporated into the project, the majority of land in the Draft Master Plan for the Drake/Chavez Greenbelt Project is outside of the limits of the project (approximately 46.23 acres would remain after project implementation). Furthermore, the proposed structures on the property are aerial structures that would not affect the continuity of the planned linkage. Therefore, the permanent use of a portion of the greenbelt is not expected to adversely affect the activities, features, and attributes that qualify the greenbelt for protection under Section 4(f).

As shown in **Figure 3**, a TCE of approximately 21.9 acres in Cesar E. Chavez Park would be required during construction of the build alternatives, which would constitute a temporary occupancy of a portion of the park (only 19 acres would be exclusively required for the TCE because 2.90 acres of the TCE area would be permanently incorporated). In addition, portions of Cesar E. Chavez Park may be temporarily closed to public access to protect the safety of park users and project construction workers, which would constitute a temporary occupancy of a portion of the park. A TCE of approximately 3.26 acres on the Drake/Chavez Greenbelt would also be required during construction of the build alternatives, which would constitute the temporary occupancy of a portion of the park.

The TCE areas in the park and greenbelt would be used for construction staging, materials storage, parking of construction equipment and worker vehicles, and other similar activities. The TCE area in Cesar E. Chavez Park includes a detour road of 0.41 acre, which would be graded and paved to allow temporary access during construction of realigned Broadway.

The temporary occupancy of approximately 19 acres in the southern portion of Cesar E. Chavez Park for a TCE during construction of the build alternatives would likely result in the removal of all or nearly all of the existing vegetation on that parcel, including mature trees and shrubs, and grass. Caltrans policy and practice are to return all areas disturbed temporarily during construction, including areas used for TCEs, to a condition as good as or better than prior to the temporary disturbance of those areas. Therefore, the construction activities in the TCE would not result in any permanent adverse physical impacts in that area, and the temporary occupancy would not interfere with the protected activities, features, or attributes of that portion of the park on a temporary or permanent basis.

With implementation of mitigation measures, the permanent use and temporary occupancy of a portion of Cesar E. Chavez Park and the Drake/Chavez Greenbelt would not adversely affect the activities, features, and attributes of the 4(f) resources. Therefore, Caltrans intends to make a *de minimis* determination for the permanent use and temporary occupancy of a portion of Cesar E. Chavez Park and the Drake/Chavez Greenbelt.

Caltrans is initiating consultation and coordination with your agency to determine use and ensure that all reasonable measures to minimize harm have been considered. In addition, because Caltrans intends to make a *de minimis* determination for the permanent use and temporary occupancy of a portion of Cesar E. Chavez Park and the Drake/Chavez Greenbelt, Caltrans is seeking your written concurrence that the project would

not adversely affect the activities, features, and attributes that qualify the properties for protection under Section 4(f).

The revised build alternatives, Alternative 5C and Alternative 7, have been evaluated in a joint Recirculated Draft Environmental Impact Report/Supplemental Draft Environmental Impact Statement (RDEIR/SDEIS). The RDEIR/SDEIS, which includes the Section 4(f) evaluation, will be circulated for a 60-day public review period. The United States Department of Transportation Act mandates a minimum of 45 days for receipt of comments regarding Section 4(f) impacts. If comments are not received from your agency by October 9, 2017, a lack of objection may be assumed and the process may proceed to a final evaluation. A copy of the letter notifying the Long Beach Unified School District of this coordination, as it is relevant to the Joint Use Agreement at Cesar E. Chavez Park, has been enclosed here.

The Section 4(f) Evaluation is found in Appendix B of the RDEIR/SDEIS and may be viewed on July 21, 2017 at the following website:

http://www.dot.ca.gov/d7/env-docs/

If you should have any questions or would like to arrange a meeting to discuss further, please contact Jason Roach of my staff at (213) 897-0357 or jason.roach@dot.ca.gov.

Sincerely,

Making Conservation a California Way of Life.

July 19, 2017

Marie Knight
City of Long Beach Department of Parks, Recreation and Marine
2760 Studebaker Road
Long Beach, CA 90815

Dear Ms. Knight,

This letter is regarding the proposed impacts on Coolidge Park, Los Cerritos Park, Cressa Park, and Wrigley Greenbelt as a result of the Interstate 710 (I-710) Corridor Project (project). Under Section 4(f) of the United States Department of Transportation Act of 1966, these park properties are considered Section 4(f) resources. The project would require temporary construction easements (TCE) on each of these park properties.

The project proposes to construct improvements from Ocean Boulevard in the City of Long Beach to State Route 60 (SR-60) in the City of Los Angeles. A Draft Environmental Impact Report/Environmental Impact Statement (EIR/EIS) was prepared for the project in 2012, which included the analysis of four build alternatives. Subsequent to public circulation of the Draft EIR/EIS, in response to new information and comments received from the public, a revised set of build alternatives were developed. The revised build alternatives under consideration include Alternative 5C (Modernize the I-710 Freeway) and Alternative 7 (Add Clean-Emission Freight Corridor [Truck-Only Lanes] Along I-710). A No Build Alternative is also under consideration.

As shown in **Figure 1**, the build alternatives would require the following TCEs, which would be considered a temporary occupancy of a portion of the parks:

- Approximately 0.60 acre along the eastern edge of Coolidge Park;
- Approximately 0.06 acre along the western edge of the southern portion of Los Cerritos Park; and
- Approximately 0.05 acre in the southern portion of Cressa Park.

In addition, as shown in **Figure 2**, Alternative 5C would require a TCE of 1.23 acre on the Wrigley Greenbelt at West Wardlow Road, 29th Street, and 27th Street during construction; and Alternative 7 would require a TCE on 0.75 acre in these same locations during construction, which would be considered a temporary occupancy of a portion of the greenbelt. Alternative 5C also includes adding a graded path within the greenbelt at Spring Street to connect to a pedestrian/bicycle overcrossing. Under Alternative 5C, the pedestrian/bicycle

connection would be an enhancement to the Wrigley Greenbelt. In addition, because the graded path would be used for recreation purposes and not transportation purposes, no portion of the greenbelt would be permanently incorporated into the transportation facility.

For the purposes of Section 4(f), these types of temporary occupancies would not constitute a use if five conditions listed in 23 Code of Federal Regulation (CFR) 774.13(d) would be met. Those conditions would be met for Coolidge Park, Los Cerritos Park, Cressa Park, and the Wrigley Greenbelt, as follows:

- The duration of construction in the area of the TCEs is temporary (a maximum of two years) and would be less than the total time needed to construct the entire project (approximately 10 years or more). There would be no change in the ownership of the land in the portion of the properties used as TCEs during construction of the build alternatives.
- The scope of work in the portions of the properties used as the TCEs would be minor. The properties would be used for construction staging, materials storage, parking of construction equipment and worker vehicles, and other similar activities. No grading or other substantial construction activities would take place in the portions of the properties to be used for TCEs.
- The construction activities in the TCEs would not result in any permanent adverse physical impacts in that area and would not interfere with the protected activities, features, or attributes of that portion of the properties on a temporary or permanent basis. Recreational uses in the remaining portions of the properties outside the TCE areas would continue to be available during construction. Detours would be provided around the TCE area in the Wrigley Greenbelt to ensure that connectivity along the greenbelt is not substantially affected. Therefore, the protected activities, features, or attributes of the properties would not be substantially affected during construction.
- The areas used for TCEs would be returned to the Long Beach Department of Parks, Recreation, and Marine in condition as good as or better than prior to the use of that area for a TCE.
- There must be documented agreement of the official(s) with jurisdiction over the Section 4(f) resource regarding the above conditions.

The five conditions listed in 23 CFR 774.13(d) would be met for the proposed TCEs for each of these park properties; therefore, these temporary occupancies would not constitute a use.

Caltrans is initiating consultation and coordination with your agency to determine use and ensure that all reasonable measures to minimize harm have been considered. In addition, because Caltrans intends to apply the temporary occupancy exception, Caltrans is seeking your written concurrence that the exception for temporary occupancies in 23 CFR 774.13(d) is applicable to the parks.

The revised build alternatives, Alternative 5C and Alternative 7, have been evaluated in a joint Recirculated Draft Environmental Impact Report/Supplemental Draft Environmental Impact Statement (RDEIR/SDEIS). The RDEIR/SDEIS, which includes the Section 4(f) evaluation, will be circulated for a 60-day public review period. The United States Department of Transportation Act mandates a minimum of 45 days for receipt of

comments regarding Section 4(f) impacts. If comments are not received from your agency by October 9, 2017, a lack of objection may be assumed and the process may proceed to a final evaluation.

The Section 4(f) Evaluation is found in Appendix B of the RDEIR/SDEIS and may be viewed on July 21, 2017 at the following website:

http://www.dot.ca.gov/d7/env-docs/

If you should have any questions or would like to arrange a meeting to discuss further, please contact Jason Roach of my staff at (213) 897-0357 or jason.roach@dot.ca.gov.

Sincerely,

RON KOSINSKI

Attachment B

PUC General Order 131-D

State of California Business, Transportation and Housing Agency

Memorandum

To: DISTRICT DIVISION PLANNING CHIEFS Date: December 13, 1995

File No. :

From: **DEPARTMENT OF TRANSPORTATION**
ENVIRONMENTAL PROGRAM

Subject: PUC General Order 131-D

On September 28, 1995, Gene Mattocks, Chief of the Acquisition and Utilities Relocation Branch in the Right of Way and Asset Management Program, sent a memo to the District Division Chiefs for Right of Way informing them of Public Utilities Commission General Order 131-D, dated August 11, 1995. This order addresses the special permitting and environmental review requirements for major relocations of privately-owned (PUC regulated) power lines and substations operating at voltages in excess of 50KV. Relocations of power lines and/or substations operating at 50KV and above must be reviewed under CEQA at both the project planning phase and at the relocation plan approval stage so as to qualify for an exception in compliance with Section IX.B. of the General Order.

The General Order included a period, ending on December 31, 1995, during which projects would be "grandfathered" into compliance. In anticipation of the end of that period, we have developed, in consultation with the PUC, a procedure to insure that utility owners furnish the PUC staff all of the environmental information that the PUC needs for approval of the relocation of electric power and transmission lines that are over 50KV.

It is our understanding that the PUC staff is not overly concerned that transportation projects raise any unusual issues regarding the relocation of power lines, but that there is a need for Caltrans to carefully address potential concerns when those lines might be moved closer to residences, schools, and other sensitive areas.

For all projects from this date forward the environmental review and documentation needs to specifically address the location of existing 50KV, or greater, power lines; the potential relocation impacts; and a conclusion of whether a significant effect will result. As before, this is one additional area that needs to be considered as design progresses and utility relocation plans are completed.

At the time Caltrans receives the utility owner's proposed relocation plan (this follows the submittal of conflict plans to the utility owner by Caltrans District Utility Coordinator at the 65% plan completion stage) the District environmental unit needs to work together with the District Utility Coordinator to review the proposal for potential environmental impacts and to select the exception clause under PUC General Order 131-D Section III. B.1., which the District sends to the utility owner for each power line or substation operating at 50KV or greater. The exception clauses are:

a. power line facilities or substations with an in-service date occurring before January 1, 1996, which have been reported to the [Public Utilities] Commission in accordance with the Commission's decision adopting GO 131-D.

b. the replacement of existing power line facilities or supporting structures with equivalent facilities or structures.

c. the minor relocation of existing power line facilities up to 2,000 feet in length, or the intersetting of additional support structures between existing support structures.

d. the conversion of existing overhead lines to underground.

e. the placing of new or additional conductors, insulators, or their accessories on supporting structures already built.

f. power lines or substations to be relocated or constructed which have undergone environmental review pursuant to CEQA as part of a larger project, and for which the final CEQA document (Environmental Impact Report (EIR) or Negative Declaration) finds no significant unavoidable environmental impacts caused by the proposed line or substation.

g. power line facilities or substations to be located in an existing franchise, road-widening setback, easement, or public utility easement; or in a utility corridor designated, precisely mapped and officially adopted pursuant to law by federal, state, or local agencies for which a final Negative Declaration or EIR finds no significant unavoidable environmental impacts.

h. the construction of projects that are statutorily or categorically exempt pursuant to Section 15260 et seq. of the Guidelines adopted to implement the CEQA, 14 Code of California Regulations Section 15000 et seq. (CEQA Guidelines).

Section III. B. 2 states that the foregoing exemptions shall not apply when any of the conditions specified in CEQA Guidelines Section 15300.2 exist:

> a. there is reasonable possibility that the activity may impact on an environmental resource of hazardous or critical concern where designated, precisely mapped and officially adopted pursuant to law by federal, state, or local agencies; or
>
> b. the cumulative impact of successive projects of the same type in the same place, over time, is significant; or
>
> c. there is a reasonable possibility that the activity will have a significant effect on the environment due to unusual circumstances.

In addition, the District environmental unit will supply to the District Utility Coordinator one of the following:

- If the underlying project is statutorily exempt: a statement of the appropriate PRC section and information specifically supporting that the utility relocation is consistent with a statutory exemption determination that can be made by PUC.

- If the underlying project is categorically exempt: a copy of the Notice of Exemption (NOE) together with a statement specifically identifying the utility relocation being consistent with the C.E. determination.

- If the underlying project resulted in the preparation of an Negative Declaration (ND): a copy of the ND (one page) and specific excerpts from the Initial Study addressing utility relocation; a statement that the specific power line relocation has been reviewed and there are no resulting significant impacts; and a copy of the Notice of Determination (NOD) filed with OPR.

- If the underlying project resulted in an EIR: a copy of the title page; excerpts, statement and NOD as shown for ND above.

Questions on these requirements should be directed to your Headquarters Environmental Coordinator.

VIA Questionnaire

Questionnaire to Determine Visual Impact Assessment (VIA) Level

Use the following questions and subsequent score as a guide to help determine the appropriate level of VIA documentation. This questionnaire assists the VIA preparer (i.e. Landscape Architect) in estimating the probable visual impacts of a proposed project on the environment and in understanding the degree and breadth of the possible visual issues. The goal is to develop a suitable document strategy that is thorough, concise and defensible.

Enter the project name and consider each of the ten questions below. Select the response that most closely applies to the proposed project and corresponding number on the right side of the table. Points are automatically computed at the bottom of the table and the total score should be matched to one of the five groups of scores at the end of the questionnaire that include recommended levels of VIA study and associated annotated outlines (i.e., minor, moderate, advanced/complex).

This scoring system should be used as a preliminary guide and should not be used as a substitute for objective analysis on the part of the preparer. Although the total score may recommend a certain level of VIA document, circumstances associated with any one of the ten question-areas may indicate the need to elevate the VIA to a greater level of detail. For projects done by others on the State Highway System, the District Landscape Architect should be consulted when scoping the VIA level and provide concurrence on the level of analysis used.

Calculate VIA Level Score

PROJECT NAME: I-710 Corridor Project	
CHANGE TO VISUAL ENVIRONMENT	
1. Will the project result in a noticeable change in the physical characteristics of the existing environment? Consider all project components and construction impacts - both permanent and temporary, including landform changes, structures, noise barriers, vegetation removal, railing, signage, and contractor activities.	High Level of Change (3 points) ▼
2. Will the project complement or contrast with the visual character desired by the community? Evaluate the scale and extent of the project features compared to the surrounding scale of the community. Is the project likely to give an urban appearance to an existing rural or suburban community? Do you anticipate that the change will be viewed by the public as positive or negative? Research planning documents, or talk with local planners and community representatives to understand the type of visual environment local residents envision for their community.	Moderate Compatibility (2 points) ▼
3. What level of local concern is there for the types of project features (e.g., bridge structures, large excavations, sound barriers, or median planting removal) and construction impacts that are proposed? Certain project improvements can be of special interest to local citizens, causing a heightened level of public concern, and requiring a more focused visual analysis.	High Concern (3 points) ▼
4. Will the project require redesign or realignment to minimize adverse change or will mitigation, such as landscape or architectural treatment, likely be necessary? Consider the type of changes caused by the project, i.e., can undesirable views be screened or will desirable views be permanently obscured so a redesign should be considered?	Extensive Mitigation Likely (2 points) ▼

5. Will this project, when seen collectively with other projects, result in an aggregate adverse change (cumulative impacts) in overall visual quality or character? Identify any projects (both Caltrans and local) in the area that have been constructed in recent years and those currently planned for future construction. The window of time and the extent of area applicable to possible cumulative impacts should be based on a reasonable anticipation of the viewing public's perception.	Cumulative Impacts Likely to Occur Within 0-5 Years (3 points) ▼
VIEWER SENSITIVITY	
1. What is the potential that the project proposal will be controversial within the community , or opposed by any organized group? This can be researched initially by talking with Caltrans and local agency management and staff familiar with the affected community's sentiments as evidenced by past projects and/or current information.	High Potential (3 points) ▼
2. How sensitive are potential viewer-groups likely to be regarding visible changes proposed by the project? Consider among other factors the number of viewers within the group, probable viewer expectations, activities, viewing duration, and orientation. The expected viewer sensitivity level may be scoped by applying professional judgment, and by soliciting information from other Caltrans staff, local agencies and community representatives familiar with the affected community's sentiments and demonstrated concerns.	High Sensitivity (3 points) ▼
3. To what degree does the project' s aesthetic approach appear to be consistent with applicable laws, ordinances, regulations, policies or standards? Although the State is not always required to comply with local planning ordinances, these documents are critical in understanding the importance that communities place on aesthetic issues. The Caltrans Environmental Planning branch may have copies of the planning documents that pertain to the project. If not, this information can be obtained by contacting the local planning department. Also, many local and state planning documents can be found online at the California Land Use Planning Network.	Moderate Compatibility (2 points) ▼
4. Are permits going to be required by outside regulatory agencies (i.e., Federal, State, or local)? Permit requirements can have an unintended consequence on the visual environment. Anticipated permits, as well as specific permit requirements - which are defined by the permitted, may be determined by talking with the project Environmental Planner and Project Engineer. Note: coordinate with the Caltrans representative responsible for obtaining the permit prior to communicating directly with any permitting agency.	Yes (3 points) ▼
5. Will the project sponsor or public benefit from a more detailed visual analysis in order to help reach consensus on	Yes (3 points) ▼

a course of action to address potential visual impacts? Consider the proposed project features, possible visual impacts, and probable mitigation recommendations.	

Calculate Total

It is recommended that you print a copy of these calculations for the project file.

PROJECT SCORE: 27

Select An Outline Based Upon Project Score

The total score will indicate the recommended VIA level for the project. In addition to considering circumstances relating to any one of the ten questions-areas that would justify elevating the VIA level, also consider any other project factors that would have an effect on level selection.

SCORE 6-9

No noticeable visual changes to the environment are proposed and no further analysis is required. Print out a copy of this completed questionnaire for your project file or Preliminary Environmental Study (PES).

SCORE 10-14

Negligible visual changes to the environment are proposed. A brief Memorandum (see sample) addressing visual issues providing a rationale why a technical study is not required.

SCORE 15-19

Noticeable visual changes to the environment are proposed. An abbreviated VIA is appropriate in this case. The assessment would briefly describe project features, impacts and any avoidance and minimization measures. Visual simulations would be optional. Go to the Directions for using and accessing the Minor VIA Annotated Outline.

SCORE 20-24

Noticeable visual changes to the environment are proposed. A fully developed VIA is appropriate. This technical study will likely receive public review. Go to the Directions for using and accessing the Moderate VIA Annotated Outline.

SCORE 25-30

Noticeable visual changes to the environment are proposed. A fully developed VIA is appropriate that includes photo simulations. It is appropriate to alert the Project Development Team to the potential for highly adverse impacts and to consider project alternatives to avoid those impacts. Go to the Directions for using and accessing the Advanced/Complex VIA Annotated Outline.

This page intentionally left blank

L-27-1

Section 3.1, Land Use, of the RDEIR/SDEIS does address consistency with the City of Long Beach General Plan Mobility Element on page 3.1-36, and the build alternatives were generally determined to be consistent with the City's General Plan except with regard to business and residential relocations. The City of Long Beach Livability Plan is addressed on page 3.1-61 of Section 3.1 in the RDEIR/SDEIS, and the build alternatives were determined to be consistent with the Livability Plan as was described in Section 3.1.2.3 of the RDEIR/SDEIS. The build alternatives intend to address current and future health and traffic-related safety impacts to corridor users and surrounding neighborhoods, as well as provide design solutions to improve the physical environment for residents in the surrounding neighborhoods. This is consistent with the two primary goals of the Community Livability Plan (to work with corridor neighborhoods to identify and develop plans to address impacts resulting from operation of the I-710 and to develop a series of action strategies and design solutions to improve the physical environment for residents in those neighborhoods). While the Long Beach Riverlink report is not called out as a separate land use plan, there are several parks designated as Riverlink parks (refer to Table 3.1-3 in Section 3.1 of this Final EIR/EIS) thereby acknowledging the Riverlink report. The Long Beach Municipal Stormwater Treatment Facility is addressed as a cumulative project in Section 3.25, Cumulative Impacts. Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), has identified Alternative 1 (No Build) as the Preferred Alternative. Please refer to Section 1.1 of this appendix for further discussion on the identification of the Preferred Alternative. Since under the Preferred Alternative no improvements would be made within the I-710 Corridor other than the projects that are already planned and committed to be constructed by or before 2035, not improving the I-710 Corridor would be inconsistent with the City's existing and proposed community plans.

L-27-2

Caltrans and Metro acknowledge the City's goals to assemble rights-of-way for greenspace, revitalize the Los Angeles River and improve connectivity, cap portions of the freeway for park space, connect the Metro Green and Blue Lines, construct pedestrian bridges across I-710 and Los Angeles River, create a ZE corridor on Alameda Street, implement green infrastructure and water quality improvements, and plant more trees in park areas. Under the Preferred Alternative, no improvements would be made within the I-710 Corridor other than the projects that are already planned and committed to be constructed by or before 2035. Therefore, there would be no impacts to the City's stated goals.

L-27-3

As stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there will be no impacts to Cesar E. Chavez Park..

L-27-4

Caltrans and Metro acknowledge that the Shoemaker Bridge project has been identified as an Early Action Project and is currently in the preliminary design phase. Retaining the Shoemaker Bridge was not evaluated in the I-710 Corridor Project RDEIR/SDEIS because the construction of another structure within the Los Angeles River in addition to retaining an existing structure under the build alternatives may have impacts to the hydrology and natural resource habitat within the Los Angeles River.

L-27-5

Please refer to Section 1.6 of this appendix regarding arterial parking restrictions. These proposed parking restrictions have been eliminated from further consideration and are not being carried forward as a part of the No Build Alternative which has been selected as the Preferred Alternative.

L-27-6

The City's concern over the effects of the build alternatives on businesses in Long Beach is acknowledged and included in the project record. However, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there will be no impacts to businesses in the City.

L-27-7

As discussed in Section 3.5.1 of the RDEIR/SDEIS and this Final EIR/EIS, bicyclists and pedestrians are a consideration in the design of all local interchanges under the build alternatives, including diverging diamond interchange (DDI) configuration interchanges. Appropriate treatments were applied to balance vehicle, bicycle, and pedestrian use. As discussed in Section 3.5.3.2 of the RDEIR/SDEIS and this Final EIR/EIS, because sidewalks would be improved, bikeways and trails would be maintained, and bicycle and pedestrian connectivity would be enhanced, the build alternatives would improve conditions for pedestrian and bicycle travel. In addition, as discussed in Section 2.3 of the RDEIR/SDEIS and this Final EIR/EIS, with respect to "Complete Streets" improvements, the inclusion of pedestrian paths (sidewalks, curb ramps, and crosswalks) and sufficient outside shoulder width to accommodate Class II bikeways on local street crossings would be provided as part of local interchange modifications, should a build alternative be selected as the Preferred Alternative.

As compared to existing conditions, DDI interchange designs as part of the build alternatives would greatly reduce the number of unsignalized free right turns at the I-710 ramp termini. Between the two DDI intersections, only two right-turn movements would have unsignalized pedestrian/bike crossings. The crosswalks at these locations would be placed near the beginning of low-speed curves where vehicles must slow and visibility is greatest. Pedestrians would cross a single lane, with traffic approaching from one direction. Buffered bike lanes would be provided between these right-turn lanes and through travel lanes consistent with treatments identified in Caltrans' Complete Intersections Guide, a best practice employed for right-turn lanes. Vehicle speeds are lower on local streets when passing through the ramp intersections of a DDI than through other interchange types. For other interchange types, the cross street is typically designed to accommodate vehicle speeds that are 45mph or greater. For a DDI, the cross street would be designed to promote reduced and consistent speed through the ramp intersections, which are between 25mph and 35mph. Caltrans Design Information Bulletin 90 specifies this design guidance, which differs from guidance for other interchange types. FHWA maintains statistical data demonstrating that collision frequency and fatalities are lower at DDIs than other diamond type interchanges, and that vehicle speed is a significant factor in these reductions.

Challenges to pedestrian channelization and wayfinding are addressed in FHWA's DDI Infoguide (2014), which offers tested solutions implemented by various agencies across the country based on the unique requirements and constraints posed by each interchange site location. In regard to pedestrian expectations for approaching traffic, this guide suggests special pedestrian signage and/or pavement markings at the push-button, as well as a special speech message provided by the Accessible Pedestrian Signal (APS) devices for pedestrians with vision disabilities, be provided at the I-710 crossing locations. However, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there will be no construction of DDIs as a part of this project.

L-27-8

Caltrans and Metro acknowledge the need for increased connectivity within the City where it is bisected by the I-710 and the Los Angeles River. However, as the build alternatives would make modifications to an existing facility, there would not be substantial connectivity impacts that would occur as a result of the build alternatives, and therefore mitigation is not proposed. Provision of a new shared-use trail facility along the Los Angeles River levee is beyond the purview and jurisdiction of Caltrans and Metro, as the owner-operator of the Los Angeles River is the USACE, and operation of the Los Angeles River Trail falls under the jurisdiction of the Los Angeles County Department of Public Works. Therefore, these types of improvements have not been included in the design of the build alternatives.

L-27-9

Key Views 1, 5, and 9 are located within the City of Long Beach and are views from the Los Angeles River Trail and Key View 8 is located at Coolidge Park, also within the City of Long Beach. These key views are representative of parks and recreation resources. A discussion of the environmental consequences to visual quality as a result of the build alternatives is discussed in Section 3.6.3 of the RDEIR/SDEIS. Please note that the nature of the Visual Impact Assessment prepared in support of Section 3.6 of the RDEIR/SDEIS is not to examine every view to and from the build alternatives, but to select a comprehensive suite of representative key views. Potential impacts to recreational trail and park users are also assessed in Section 3.1.3, Land Use, Section 3.3 Community Impacts, and in Appendix B, Section 4(f)/6(f). Section 3.6, Visual/Aesthetics, of the RDEIR/SDEIS and this Final EIR/EIS and the *Visual Impact Assessment* (February 2017) were prepared consistent with the requirements of FHWA's guidance on visual impact assessments for highway projects; therefore, no revisions to the Visual Impact Assessment were made.

L-27-10

Please refer to Section 1.7 of this appendix for more information on Early Action Projects. Caltrans and Metro acknowledge the importance of the Long Beach MUST project to the City and appreciate that opportunities for coordination do exist between the two infrastructure projects. As stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, the Long Beach MUST facility will not need to be used for stormwater treatment and/or storage under the build alternatives.

L-27-11
