The ISA was prepared in general accordance with Caltrans' internal guidance document on ISAs, which is intended to be consistent with *American Society of Testing and Materials (ASTM) Standard Practice for Environmental Site Assessments: Phase I Site Assessment Process*, which is available to the public through ASTM. Section 3.12 of this Final EIR/EIS has been updated to clarify that additional file reviews have been conducted to supplement the online database reviews and assessments prepared for the project. Adjoining properties of potential concern are included in Table 3.12-3 of the RDEIR/SDEIS and this Final EIR/EIS.

L-27-12

Caltrans respectfully disagrees that the RDEIR/SDEIS requires recirculation once the project-level PM conformity analysis is completed. Please refer to Section 1.4 of this appendix regarding air quality and conformity. Please also refer to Section 1.3 for more information on the I-710 Clean Truck Program.

L-27-13

The purpose of the RDEIR/SDEIS is to evaluate the environmental impacts of the proposed project alternatives and propose mitigation for the build alternatives if necessary. It can be reasonably assumed that, should a build alternative be selected as the Preferred Alternative, the long term operational and maintenance costs associated with the build alternatives would come from any of several sources, including (but not limited to) the State's Highway Maintenance Program, State Highway Operations and Protection Program, and the Road Maintenance and Rehabilitation Account, and the sustained transportation funding secured under Measure M. However, this information is not germane to the assessment of environmental impacts and therefore, even if known, would not be included within a project-level EIR/EIS document. The cost estimates prepared for the build alternatives at this stage are order of magnitude estimates to make informed decisions among the alternatives and to help establish future budget estimates for programming and budgetary purposes. The capital cost estimates include robust contingencies appropriate for the current level of engineering detail. Should a build alternative be selected as the Preferred Alternative, these estimates would be further refined in the design stage of analysis. Operating and maintenance costs have been estimated for the transit elements of the build alternatives as these would be high-cost items relative to capital costs for these elements of the overall cost. On the other hand, maintenance costs for the freeway items related to the build alternatives such as ramp metering, landscaping, and drainage represent smaller, incremental costs to Caltrans's overall operating and maintenance budget. Should a build alternative be selected as the Preferred Alternative, these kinds of costs would be accounted for during Caltrans' review of these project features during the more detailed design phase and in the lifecycle cost estimates produced for during final design. However, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there are no costs associated with the I-710 Corridor Project.

L-27-14

As stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, no right-of-way acquisitions are required.

L-27-15

As stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, no construction will occur and a local hire program will not be implemented.

- L-27-16
- When the various analyses for the RDEIR/SDEIS commenced in 2012, the 2012 RTP/SCS was in effect; therefore, the planning assumptions and traffic data associated with the 2012

RTP/SCS were utilized. The 2016 RTP/SCS was approved on April 7, 2016, well after analyses in support of the RDEIR/SDEIS were underway, or in some cases, completed. In addition, the inclusion of 2016 RTP/SCS data in select locations of Chapter 1.0, Proposed Project, are included for comparative purposes, which is explained in the text. Wherever possible, the most recent data has been included where it would not be inconsistent with the underlying traffic model and planning assumptions. For example, 2016 RTP/SCS growth projections were included in Section 1.2.1.4, but it is important to note that the 2016 RTP/SCS growth projections are not materially different from those that were included in the 2012 RTP/SCS, and any conclusions drawn from that data would therefore not be different.

L-27-17

Please refer to responses to comment L-27-12 for a discussion of appropriate timing of the project-level PM conformity analysis. It is important to note that the project description that was included in the FTIP was actually far larger in scope than either of the two build alternatives under consideration in the RDEIR/SDEIS and may have had more substantial impacts related to air quality. The FTIP description of the build alternatives indicated that a ten-lane mainline from the southern terminus to SR-60 as well as four truck lanes from the southern terminus to the rail yards in the northern end of the Study Area was proposed. The RTP/SCS description did not specify the exact scope of the build alternatives. Moreover, a detailed analysis of air quality impacts in accordance with the requirements of CEQA and NEPA was included in Section 3.13 of the RDEIR/SDEIS. Caltrans procedures do not require a demonstration of transportation conformity until the final environmental document. The discussion of project-level conformity has been updated in Section 3.13.3.2 of this Final EIR/EIS, and the updated FTIP and RTP/SCS project listings have been included in Appendix I of this Final EIR/EIS. The Final EIS will be made available to the public for a minimum of 30 days prior to approval of the federal Record of Decision.

L-27-18

As is indicated in the Response to Comment L-27-16, the 2012 RTP/SCS was in effect at the time of commencement of analyses in support of the RDEIR/SDEIS; therefore, the planning assumptions associated with the 2012 RTP/SCS were used. As is stated in the referenced passage, 2016 RTP/SCS growth projections were included for reference and to illustrate that the relative difference between the 2012 and 2016 projections are not substantive. For consistency across analyses, the planning assumptions included in the 2012 RTP/SCS have been retained.

L-27-19

At the time of commencement of traffic studies, the most recent available truck traffic data was utilized. As traffic counts in support of the traffic analysis and modeling were taken in 2013, annual average truck traffic data from a similar timeframe was used, for purposes of internal consistency. Any variability in the cited truck percentages that were derived from traffic data representative of that year would not materially change this aspect of the purpose and need for the project.

L-27-20

Please refer to Response to Comment L-27-16 regarding the 2016 RTP/SCS.

L-27-21

Please refer to Response to Comment L-27-16 regarding the 2016 RTP/SCS.

L-27-22

Accident data has been evaluated and updated several times for the I-710 Corridor Project over the course of the project, using three years of complete accident data, following Caltrans procedures, and using best available information provided by Caltrans at the time the following studies were performed: the I-710 Major Corridor Study (approved in 2003 and developed during the period of 1997 to 1999), for the Draft EIR/EIS (2012) and Draft Project Report (during the period of 2004 to 2007), and for the RDEIR/SDEIS (2017) and Draft Project Report (during the period of 2009 to 2011). While some of the details have changed due to evolving traffic conditions on I-710, the fundamental findings and conclusions have remained the same with regard to the project's Purpose and Need, in that actual accident rates exceed average accident rates on several locations on I-710, particularly at the ramps and interchanges. For that reason, the accident data that was provided in Chapter 1.0, Proposed Project, of the RDEIR/SDEIS has not been updated in this Final EIR/EIS.

L-27-23

Please refer to Response to Comment L-27-22 regarding updates to traffic accident data.

L-27-24

Modernizing the design of I-710 under the build alternatives would be expected to reduce the number of total and fatal accidents, which would result in accident rates on I-710 that are more reflective of the statewide average for a similar facility. This reduction in accidents would reduce risks related to traffic safety. In response to safety concerns and other issues related to high levels of truck movements observed and predicted for the I-710 Corridor described in Section

1.2.1 of the RDEIR/SDEIS, build alternatives developed for the project included specific design features to reduce conflicts and to manage trucks traveling on and off the I-710. Specifically, the build alternatives would include buffered lanes on I-710 leading to and from Shoemaker Bridge and Shoreline Drive, truck bypass lanes on I-710 through the I-405/I-710 interchange, braided local interchange ramps through the Pacific Coast Highway and Anaheim interchanges, and collector-distributor roads through the Atlantic-Bandini, Washington, and I-5 interchanges. As discussed in Section 4.2.1.11 of the RDEIR/SDEIS and this Final EIR/EIS, should a build alternative be selected as the Preferred Alternative, the build alternatives would be designed and constructed in compliance with Caltrans *Standard Specifications* and other applicable professional, design, and construction standards. Therefore, the build alternatives presented in the RDEIR/SDEIS did not include hazardous design features. However, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, the Preferred Alternative would not improve I-710, which was designed and constructed in the 1950s, and would not result in a modernized design compared to the existing transportation facility.

L-27-25

The information related to pavement and median barriers that was included in Section 1.2.1.2 of the RDEIR/SDEIS and referenced in this comment is intended to illustrate efforts currently underway to address the non-standard or otherwise problematic features that are present on I-710. However, it is acknowledged that because these features are currently being addressed via other projects, they do not provide a need for the build alternatives, and the discussion of these elements has been updated in this Final EIR/EIS.

L-27-26

Caltrans acknowledges that there are several areas along the I-710 Corridor that provide connections to important arterial corridors for intercity and regional travel and do not intend to downplay the importance of the Shoemaker Bridge to the City; however, the subsection “Highways” is intended to describe key interstate commerce connections. The inclusion of the Gerald Desmond Bridge replacement project is discussed here as it is imperative for maintaining the connectivity of the Ports to SR-47 and I-710.

L-27-27

Caltrans acknowledges that an important component of the build alternatives are to treat runoff and improve water quality, and stormwater BMPs are proposed as part of the build alternatives. However, as a highway project, the inclusion of implementation of stormwater BMPs as a project purpose is not appropriate. Per Caltrans Environmental Management Office, “a Project’s “Need” is an identified transportation deficiency or problem, and its “Purpose” is the set of

objectives that will be met to address the transportation deficiency.[6]" Although important, the improvement of water quality of the Los Angeles River, Compton Creek and Rio Hondo Channel is not an objective that specifically addresses a transportation need. In addition, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there is no nexus to treat runoff and improve water quality by providing BMPs.

L-27-28

Please refer to Section 1.7 of this appendix for more information on the I-710 Corridor Early Action Project selection process and how to submit projects for consideration, should a build alternative be selected as the Preferred Alternative. However, it should be noted that pump stations that would be replaced or upgraded as part of the build alternatives are considered part of the build alternatives and would be constructed concurrently with other project improvements, should a build alternative be selected as the Preferred Alternative. LB MUST, as a stormwater project, wouild likely not eligible for EAP funding, which is primarily focused on transportation improvements.

L-27-29

This comment refers to information presented in the Draft EIR/EIS circulated for public review in 2012 which evaluated alternatives no longer under consideration. However, it should be noted that the previous Response to Comment correctly indicated that design capacity on the mainline is not a static number and is determined by upstream and downstream geometrics, number of lanes, demand flow rates, free flow rates, and other parameters. Attempting to provide one volume to capacity ratio for the entirety of the mainline would be misleading. Figures 1.2-2 and 1.2-3 of the RDEIR/SDEIS display the Level of Service (LOS) by segment by direction and by peak hour for the I-710 along the entire length of the I-710 Corridor for existing condition and future No Build, respectively. The LOS was determined using the *Highway Capacity Manual* (HCM) methodology for freeway LOS analysis which relates demand to design capacity. For more detail on the capacity, refer to Tables 3.5-1 and 3.5-2 of the RDEIR/SDEIS and Appendix B of the *I-710 Corridor Project Traffic Operations Analysis Report* (March 2017).

L-27-30

This comment refers to information presented in the Draft EIR/EIS circulated for public review in 2012 which evaluated alternatives no longer under consideration. However, the information that

[6] California Department of Transportation (Caltrans). Division of Environmental Analysis. Environmental Management Office (EMO). Purpose and Need. Website: http://www.dot.ca.gov/ env/emo/purpose-need.html (accessed March 29, 2018).

the commenter is referring to can be found in Section 1.2.1.5, Modal Interrelationships and System Linkages, of the RDEIR/SDEIS and in this Final EIR/EIS. The subheading “Railroads” includes more details regarding the rail network and its interface with the project, and states “taking into consideration the inland origins and destinations of the Port cargo and operational characteristics of the railroads, it was assumed that approximately 34.4 percent of the cargo growth (approximately 14.1 million annual TEUs) in 2035 could be moved directly by rail from either on-dock or off-dock intermodal terminals.” The overall amount of container demand for the San Pedro Bay Ports assumed by the I-710 Corridor Project was described on page 1-18 of the RDEIR/SDEIS. Future cargo mode shares are one of many factors that influence travel on I-710. All of these key factors, along with supporting clarifications and background information that places this information in context, are systematically described in detail in Sections 4 and 6 of the *I-710 Corridor Project RDEIR/SDEIS Travel Demand Modeling Methodology Technical Memorandum* (June 2017).

L-27-31

This comment refers to information presented in the Draft EIR/EIS circulated for public review in 2012 which evaluated alternatives no longer under consideration. However, coordination has continued to occur between Caltrans and Metro with public agencies for other nearby infrastructure projects that are being implemented. For example, the design at the southern terminus of I-710 was revised in the build alternatives evaluated in the RDEIR/SDEIS due to changes to the design of the Gerald Desmond Bridge Project. This statement was revised in Section 1.2.1.5 of the RDEIR/SDEIS to provide more information.

L-27-32

The information provided Chapter 1.0, Proposed Project, of the RDEIR/SDEIS listed numerous traffic and goods movement studies, spanning several years, which have provided historical background and context for activities associated with the San Pedro Bay Ports, cargo forecasting, freight rail, and goods movement in the I-710 Study Area. The *I-710 Corridor Project Initial Feasibility Analysis* and the *I-710 Railroad Goods Movement Study* are just two of the studies listed. All of the existing year (2012/2013) and future year (Year 2035) travel demand forecast data, including the key inputs and assumptions to the I-710 travel demand forecast model, as well as the traffic operational analysis presented in Chapter 1.0, Proposed Project, of the RDEIR/SDEIS, all relied on quantitative information that has been updated subsequent to the *I-710 Corridor Project Initial Feasibility Analysis* and the *I-710 Railroad Goods Movement Study*. These inputs and assumptions are described and reported in the *I-710 Corridor Project RDEIR/SDEIS Travel Demand Modeling Methodology Technical Memorandum* (June 2017). In a few isolated cases, where major trends or descriptions of goods movement travel markets have not appreciably changed, information from these two studies were cited.

L-27-33

The percent of on-dock rail capacity utilized in 2007 is incorrectly stated in the RDEIR/SDEIS on page 1-39. This has been revised for clarity in this Final EIR/EIS. The value of 23.5 percent represents the share of containerized cargo that was transported by on-dock rail in 2007, not the percent of the available on-dock rail capacity that was utilized. The projection of 30.5 percent of containers being transported by on-dock rail in 2035 is based on the Ports' determination of the maximum practical capacity of the existing and planned on-dock rail and supporting facilities at each Port as well as the projected total container demand and geographic market destinations of these containers. The capacity of on-dock rail at the Ports is planned to increase from 2.8 million annual container lifts in 2012 to 8.6 million lifts in 2035. Please refer to Section 6.3 of the *I-710 Corridor Project RDEIR/SDEIS Travel Demand Modeling Methodology Technical Memorandum* (June 2017) for more detail.

L-27-34

The City's support for Alternative 5C with Design Option 2A is acknowledged and included in the project record. However, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative. Please refer to Section 1.1 of this appendix for a more detailed discussion on the identification of the Preferred Alternative.

L-27-35

As part of the development of the build alternatives, multiple interchange configuration concepts were assessed in accordance with Caltrans' Interchange Design Procedure (Topic 503 of the *Highway Design Manual*) and Caltrans' Traffic Operations Policy Directive 13-02. The assessments examined existing safety and operational deficiencies at each local interchange and followed a two-step screening process in the selection of a replacement configuration. In the first step of the process, configuration types were evaluated based on whether or not they (1) failed to meet the most basic project objectives, (2) were infeasible (per State CEQA Guidelines Section 15126.6(f)(1)), or (3) were unable to avoid significant environmental impacts. Interchange configurations not meeting these criteria were eliminated from further consideration. For instance, because of their larger size, cloverleaf type configurations had significant impacts to adjacent land uses and critical infrastructure at most locations in Long Beach. These were not evaluated in the second step of the process.

Different versions of diamond configurations met the first step criteria and were considered practical at most local interchange locations in Long Beach because of their compact size. At Anaheim Street, Pacific Coast Highway, Willow Street, and Del Amo Boulevard, three types of diamond configurations were evaluated for the build alternatives: a compact diamond (Type L-1), a single point interchange (SPI; Type L-13), and a diverging diamond interchange (DDI). These configuration types were further assessed in the second step of the screening process.

Principal step 2 evaluation factors considered all users (vehicles, bicyclists, pedestrians, and transit) and measured safety, mobility, and cost benefits.

Relative to the SPI and DDI, the compact diamond configuration offered inferior safety and mobility benefits. Users of the facility would have greater exposure to conflicts and collisions, in both frequency and severity. Greater delay and queuing at the Type L-1 ramp intersections would have greater potential to adversely affect safety and operation on the local street, including its adjacent intersections, and the mainline freeway. Both the SPI and DDI would offer superior mobility benefits. Relative to the SPI, the DDI would offer superior safety benefits because of its users reduced exposure to frequent and severe collisions. The DDI would require incrementally less space and less structure than an SPI, would be easier to construct than an SPI, and would ultimately be more cost effective than an SPI. The results of these assessments and the DDI designs were reviewed with the City of Long Beach Department of Public Works during preparation of the RDEIR/SDEIS. City Engineer, Sean Crumby, and City Traffic Engineer, Eric Widstrand, attended the review on June 28, 2016.

Reconfiguration of the ramps at Pacific Avenue and I-405 and Wardlow Road and I-710 under the build alternatives was proposed to meet basic project objectives. The proposed configuration would resolve significant safety and mobility deficiencies associated with the existing configuration. The principal aspect of the proposed configuration would entail replacement of the loop connectors, and its collector-distributor (CD) roads, with direct flyover connectors. The existing CD roads would also connect to ramps servicing Wardlow Road. With the removal of the CD roads, the ramps connecting to Wardlow Road would have to be removed as well. Replacing these ramp connections on the mainline of I-710 would not be feasible due to the proximity of the I-405 connectors. Introducing ramps at these locations would adversely affect mainline safety and operation.

The freeway-to-freeway reconfiguration would also require the build alternatives to reconfigure local ramp connections along I-405 servicing Santa Fe Avenue, via Wardlow Road and Warnock Way, and remove the four ramps connecting to Pacific Place. Replacing the two Pacific Place ramp connections on the mainline of I-405 would not be feasible due to the proximity of the southbound I-405 from I-710 and the northbound exit ramp to Santa Fe Avenue. Introducing these two ramps at these locations would adversely affect mainline safety and operation. Replacing the two Pacific Place ramp connections to/from the I-710 connectors would not be viable due to significant environmental impacts, among other factors.

Service between the two freeways and Wardlow Road and Pacific Place would remain viable via the local arterial system and remaining freeway access points. Although the relatively low volume of ramp users would have to access the freeway at other locations, traffic operations at the remaining access locations would not be significantly affected. Traffic operations evaluated at intersections in the vicinity of the proposal show that level of service would be equivalent to or

better than no-build level of service. The results of these evaluations were reviewed with the City of Long Beach Department of Public Works during preparation of the RDEIR/SDEIS. City Engineer, Sean Crumby, and City Traffic Engineer, Eric Widstrand, attended the review on November 16, 2015.

L-27-36

Caltrans acknowledges that the City has updated their Bicycle Master Plan to reflect Class IV bikeways. However, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, Class IV bikeways will not be integrated into the design along some crossing arterials within the improvement limits.

L-27-37

Although Caltrans and Metro have limited jurisdiction regarding certain elements of Community Alternative 7, as described in Chapter 2.0, Project Alternatives, of the RDEIR/SDEIS, many of the components of Community Alternative 7 have been integrated into Alternative 5C and Alternative 7. As is stated in Section 2.3.2.1 of the RDEIR/SDEIS, there are programmatic elements included in both build alternatives that have a direct nexus to the I-710 Corridor Project and would help the I-710 Corridor achieve improvements in congestion, air quality, and overall community health. The Arterial Parking Restriction Program falls under this umbrella of programmatic elements. However, based in part on public and agency feedback, the No Build Alternative has been selected as the Preferred Alternative and therefore these features have been removed from further consideration.

L-27-38

The RDEIR/SDEIS used a completely updated and revalidated travel demand forecast model. Technical work in support of the RDEIR/SDEIS was initiated in 2013. The I-710 Corridor Project is a large, complex project, which requires an extensive array of detailed technical studies as well as grass roots public outreach and consensus-building process in order to obtain community feedback at several junctures through the course of the development of the revised build alternatives, design activities, and study approach. This integrated and comprehensive effort was a continuous process that extended from 2013 through to 2017. The forecasts produced for the I-710 RDEIR/RDEIS used the best travel demand forecast information available at the time that work was developed, which was SCAG's 2012–2035 Regional Transportation Plan Sustainable Communities Strategy (RTP/SCS) and FTIP. Please also refer to the Response to Comment L-27-16. The 2016 RTP/SCS was not approved by SCAG until April 2016.

L-27-39

The environmental analyses of the potential effects of the No Build and build alternatives in Chapter 3.0, Affected Environment, Environmental Consequences, and Avoidance, Minimization, and/or Mitigation Measures, include detailed descriptions of existing traffic conditions, as well as traffic conditions in the future year (2035) for the No Build and build alternatives. The analysis presented in the discussion of the future No Build Alternative demonstrates how traffic conditions would be expected to worsen in the future year without the build alternatives as compared to existing conditions. The differences between the build alternatives and the No Build Alternative in the future year show the anticipated impacts of the build alternatives. These impacts for traffic are identified and presented in Section 3.5 of the RDEIR/SDEIS and this Final EIR/EIS. For the I-710 Corridor, the build alternatives would generally improve traffic conditions on I-710 relative to No Build Alternative conditions. However, for certain intersections on the arterial roadway network, the build alternatives would result in adverse impacts. The impact analysis for the intersections in the Study Area was summarized in Section 3.5.3.1 of the RDEIR/SDEIS and was based on delay under future year conditions for the build alternatives. A measure to address impacts (Measure TR-1 included in Section 3.5.4 of the RDEIR/SDEIS) was identified for thirty intersections, which would improve these intersections to better than No Build Alternative conditions, and not recommended at two adversely impacted intersections, due to potential adverse impacts related to necessary right-of-way acquisitions.

This impact analysis and how it relates to the CEQA evaluation is addressed in Chapter 4.0, CEQA Evaluation, of the RDEIR/SDEIS. The approach utilized in the CEQA assessment followed Caltrans guidance for evaluating traffic impacts compared to existing baseline conditions, where the difference between the future build alternatives versus future No Build Alternative conditions was used as the measure of the impacts of the build alternatives, which were then compared to existing conditions. These findings and conclusions were presented in Section 4.2.4.4 of the RDEIR/SDEIS and this Final EIR/EIS.

L-27-40

Please refer to Response to Comments L-27-3 and L-27-4 regarding retaining the existing Shoemaker Bridge.

L-27-41

Caltrans and Metro appreciate the City's support of the I-710 Clean Truck Program (referred to in the RDEIR/SDEIS as the I-710 Corridor Project Zero Emission/Near Zero Emission Truck Technology Deployment Program). It should be noted that Metro Board Motion 5.1 adopted on March 1, 2018, changed the ZE/NZE Truck Technology Deployment Program to the phased-in Zero-Emission Truck Technology Deployment Program, which increased the program funding target from $100 million to $200 million, and include in the Program incentives and grants investment in the acceleration of ZE technology both for long-haul trucks and for freeway

infrastructure. In April 2020, the Metro Board of Directors programmed $50 million in Metro-controlled funds to provide funding for the initial deployment of the I-710 Clean Truck Program and to leverage the remaining funds required for full program implementation. However, since the No Build Alternative (Alternative 1) has been selected as the Preferred Alternative, programmatic elements of the build alternatives, such as the I-710 Clean Truck Program will not be implemented by Caltrans as the Lead Agency under CEQA and NEPA and as the owner/operator of the I-710 freeway.

L-27-42

Please refer to Section 1.6 of this appendix. These proposed parking restrictions have been eliminated from further consideration and are not being carried forward since the No Build Alternative has been selected as the Preferred Alternative.

L-27-43

Order 2012-0011-DWQ, the Statewide Storm Water Permit for the State of California Department of Transportation regulates the storm water discharges from Caltrans Municipal Separate Storm Sewer System. This permit was issued to Caltrans from the State Water Resources Control Board to cover all of Caltrans operations. Each individual Caltrans project is not required to obtain coverage under this permit. All Caltrans construction activities are required to comply with the Construction General Permit, should a build alternative be selected as the Preferred Alternative. The Industrial General Permit Order 2014-0057-DWQ covers operation of industrial facilities, and is not applicable to construction or operation of the I-710 facility under the build alternatives. Therefore, Order 2012-0011-DWQ or 2014-0057-DWQ would not need to be added to Table 2.5-1 of this Final EIR/EIS. It should be noted that since the No Build Alternative has been selected as the Preferred Alternative and no permits or approvals will be necessary, Table 2.5-1 has been deleted from this Final EIR/EIS.

L-27-44

This comment refers to information presented in the Draft EIR/EIS circulated for public review in 2012 which evaluated alternatives no longer under consideration. Subsequent to the circulation of the 2012 I-710 Draft EIR/EIS, Metro sponsored a study to evaluate zero emissions technologies for the I-710 Corridor in more depth. This study, entitled the *I-710 Project Zero-Emission Truck Commercialization Study*, was prepared by Calstart in 2013. The I-710 Clean Truck Program (referred to in the RDEIR/SDEIS as the I-710 Corridor Project Zero Emission/Near Zero Emission Truck Technology Deployment Program) builds upon this study effort and broadened the program to include additional technologies, such as near-zero emissions trucks, for both of the build alternatives analyzed in the RDEIR/SDEIS. It is important to note that the program is technology neutral in that any technology capable of achieving the ZE and NZE standards established by CARB would be eligible for incentive funding provided by

the program (should a build alternative be selected as the Preferred Alternative). The I-710 Clean Truck Program is an important component of the build alternatives and would be critical to achieving air quality benefits in the I-710 Corridor. However, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative. Please refer to Section 1.3 of this appendix for more details on how the I-710 Clean Truck Program may be implemented by others.

L-27-45

Consistent with State CEQA Guidelines Section 15126.6(e)(2), a discussion and identification of the Environmentally Superior Alternative has been added to Chapter 4.0, CEQA Evaluation, in the Final EIR/EIS.

L-27-46

A figure (Figure 3.1-2 in Section 3.1 of the Final EIR/EIS) illustrating the land uses impacted under each build alternative was created that shows the acreage presented in Table 3.1-1. The specific acreage that would be impacted by each build alternative for each jurisdiction or community was already included in Table 3.1-1 of the RDEIR/SDEIS. The discussion summarizes the total land use conversions of the build alternatives for the entire Study Area and references the table to provide a breakdown of the area by jurisdiction to streamline the discussion.

L-27-47

The impacts of each build alternative's proposed acquisitions on the community are analyzed in Community Impacts, Section 3.3, and the impacts of land use conversion to transportation use are briefly discussed in that section. Analysis in the land use section is limited to the present land use of those lands subject to conversion to transportation land use. Additional analysis regarding impacts to planned uses for lands would be speculative and, therefore, not included in the Final EIR/EIS.

L-27-48

Section 3.1 of the RDEIR/SDEIS supports the statement that the build alternatives would be generally compatible with land uses adjacent to the existing freeway. Approximately 68 percent of the existing rights-of-way required for Alternatives 5C and 7 consist of existing transportation, utilities, and vacant land uses. As the build alternatives would make modifications to an existing transportation facility, rather than construct a new facility, any sensitive land uses would not be substantially closer to the transportation facility than they currently are today. It is unclear from the comment what types of land uses the City considers to be incompatible with transportation land uses. Other sections of the RDEIR/SDEIS, including Section 3.13, Air Quality, and 3.14,

Noise, more specifically address impacts under each build alternative on the surrounding areas and identify sensitive receptors that may be impacted by the build alternatives.

L-27-49

The grand total of existing land use impact acreage for Alternative 7, Option 3B, was incorrectly input as 7 at the bottom of Table 3.1-1. The correct value for this area should be 751.04 acres; this has been corrected in Table 3.1-1 of this Final EIR/EIS.

L-27-50

Section 3.1, Land Use, of the RDEIR/SDEIS identified applicable goals and policies that would be relevant to the proposed project at the time the document was written. The requested update to acknowledge the City's update of its General Plan Land Use Element has been made to this Final EIR/EIS.

L-27-51

As discussed in Section 3.1.2.3 of the RDEIR/SDEIS and this Final EIR/EIS, the build alternatives are not consistent with all plans and goals within the Study Area and, should a build alternative be selected as the Preferred Alternative, would require some General Plans to be amended as a result. Since the build alternatives are inconsistent with some General Plans, should a build alternative be selected as the Preferred Alternative, Measure LU-1 would require that the General Plans be amended. Specifically, in the City of Long Beach subsection of Section 3.1.2.3 the report states "The build alternatives would also result in relocation of businesses and residents in the city, which would be inconsistent with the General Plan." However, the build alternatives are consistent with many primary components of several General Plans including community participation, improved air quality, and reduced traffic congestion. The goals and policies provided in a general plan are broad statements, and therefore broad statements of the goals and objectives of the build alternatives are used to support the consistency analysis. Consistency analysis of the City of Long Beach's draft Land Use Element was not included in the RDEIR/SDEIS because it was not finalized during the preparation of the document. In addition, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there would not be a need for a General Plan amendment. However, as stated in the Response to Comment L-27-50, the requested update has been made to the Final EIR/EIS.

L-27-52

In the subsection titled “City of Long Beach General Plan” of Section 3.1.2.3, it is disclosed that “The build alternatives would also result in relocation of businesses and residents in the city, which would be inconsistent with the General Plan.” A more detailed discussion of impacts regarding relocation of businesses and residents occurs in the Section 3.3.2, Relocations and Real Property Acquisition. While the inconsistency with the General Plan is pointed out here in Section 3.1, all measures pertaining to the relocation of businesses and residents as a result of the build alternatives can be found in Section 3.3.2.5. Additional analysis of the inconsistency with the General Plan is not warranted in this section, as the relocations of businesses and residents are addressed in Section 3.3.2, Community Impacts.

L-27-53

Section 3.1.3 of the RDEIR/SDEIS adequately identified the build alternatives as affecting an existing local arterial due to the realignment of Shoemaker Bridge, the local arterial referred to in the comment. Shoemaker Bridge carries West Shoreline Drive off of I-710 and is a major access point to downtown Long Beach from the I-710. Therefore, the discussion is accurate in stating the build alternatives are a permitted use of the arterial. In addition, the document states that “within the West Beach area, permitted uses are the existing uses” (Section 3.1.2.2). Since the existing use of the Shoemaker Bridge arterial is for transportation, then this remains a permitted use.

L-27-54

When preparing an environmental document, it is necessary to analyze only the consistency of the project with the required elements of plans and programs. In preparing the RDEIR/SDEIS, the consistency analysis focused only those plans or policies that are relevant to the I-710 Corridor Project, including the City of Long Beach Community Livability Plan. The approach for analysis of the Livability Plan is consistent with Caltrans methodologies and protocols as documented in Caltrans’ Standard Environmental Reference website (http://www.dot.ca.gov/ser/). The analysis presented in the RDEIR/SDEIS was consistent with Caltrans’ methodology, as the goals of the Livability Plan were listed individually in Section 3.1.2.2 and the potential environmental consequences and consistency analysis were discussed in Section 3.1.2.3. Because the goals in the Livability Plan are stated in broad and general terms, the consistency analysis was similarly presented in broad and general terms.

L-27-55

Caltrans and Metro thank the City for providing comprehensive comments. The letter referenced in this comment and the responses can be found in this appendix and is coded as Comment Letter L-12.

L-27-56

As discussed in the Response to Comment L-12-2, there will be no impacts to the Cesar E. Chavez Park as a result of the Preferred Alternative and input from the community to determine the site layout, park amenities, buffer between the park and freeway, parking, ADA access, fencing, signage, neighborhood connection, etc. would no longer be necessary.

L-27-57

As discussed in the Draft Section 4(f) Evaluation, no land or improvements funded with grants under the Land and Water Conservation Fund (L&WCF) would be permanently used or otherwise adversely affected by the build alternatives. Other grant agencies, such as the Watershed Conservation Authority, are being considered as the official with jurisdiction over parks and recreational facilities protected under Section 4(f) of the United States Department of Transportation Act. However, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there are no impacts to grant-funded parks and recreational facilities.

L-27-58

As discussed in the Response to Comment L-12-1, while avoidance, minimization, mitigation, or enhancement measures are considered under Section 4(f), compliance with Ordinance No. C-78226 is not required under Section 4(f). Mitigation Measures PR-10 through PR-15 were included in the Draft Section 4(f) Evaluation to ensure that the build alternatives would not adversely affect the activities, features, and attributes of Cesar E. Chavez Park, should a build alternative be selected as the Preferred Alternative. Caltrans and Metro have coordinated with the City regarding mitigation for impacts to Cesar Chavez Park resulting from the build alternatives and the City concurred with this approach June 11, 2020.

L-27-59

Del Amo Park in the City of Carson is discussed in the Draft Section 4(f) Evaluation in Section 6.2 and is listed in Table 5. Other parks in the City of Long Beach are discussed in Section 6.2 and listed in Tables 3 and 5.

Although other properties may have been purchased by the City of Long Beach for park purposes, planned parks and recreational facilities are considered Section 4(f) resources only if there is evidence of formal designation of these properties as recreational resources through inclusion in a City Master Plan. No additional properties, other than those already identified in the Draft Section 4(f) Evaluation, have been formally designated as recreational resources through inclusion in any City Master Plans that were publicly available at the time the Draft Section 4(f) Evaluation was written. Caltrans has coordinated with the City of Long Beach to

determine if additional or updated Master Plans have been made available that formally designate additional properties as recreational resources.

L-27-60

Air quality impacts on users of the parks were not identified in the technical analysis prepared for the RDEIR/SDEIS, as discussed in Section 3.1.3.2 on page 3.1-87 (“Public Health Considerations”). Section 3.1.3.2 also states that soundwalls are proposed at locations throughout the I-710 Corridor where noise levels resulting from the build alternatives would exceed Federal Noise Abatement Criteria (NAC). Should a build alternative be selected as the Preferred Alternative,, a new soundwall would replace an existing soundwall at Coolidge Park, as was discussed in Section 3.6.3.1 under “Key View 8”, as well as in Section 3.14.5.7, Noise, of the RDEIR/SDEIS. Because the new soundwall would address noise impacts at the park, landscape buffering would not be required to address noise impacts on this resource.

Noise levels at Baker Park would not exceed Federal NAC under the build alternatives, and therefore, soundwalls are not proposed in this location. Baker Park is separated from the I-710 mainline by the Los Angeles River and vacant land, which serve as a buffer that prevents indirect noise impacts on the park. Therefore, as discussed in Section 6.2 of the Draft Section 4(f) Evaluation, noise impacts from the build alternatives would not result in substantial impairment of the park because no severe proximity impacts at the park were identified in the RDEIR/SDEIS. Therefore, landscape buffering would not be required at this resource.

Section 3.1.3.2 states that visual impacts on Coolidge Park would be low under Alternative 5C and moderately low under Alternative 7. As stated in Section 3.6.4, should a build alternative be selected as the Preferred Alternative, Mitigation Measure VIS-1 would require either build alternative to incorporate the *I-710 Corridor Aesthetics Master Plan* (Aesthetics Master Plan) (February 2014), which would define aesthetic treatment measures to be incorporated into the final design of either build alternative to minimize or avoid visual impacts. Mitigation Measure VIS-4 would also require aesthetic enhancements for soundwalls in the final design of either build alternative, consistent with the Aesthetics Master Plan. Therefore, potential visual impacts at Coolidge Park, should a build alternative be selected as the Preferred Alternative, would be mitigated through consistency with the Aesthetics Master Plan, and landscape buffering would not be required to address visual impacts on this resource.

Both Baker Park and Coolidge Park are proposed to receive aesthetic treatments to the existing soundwall between the park and the SR-91 ramps as part of various packages of the Early Action Soundwall Project. Metro awarded contracts to complete the Plans, Specifications, and Estimates phase of the project in 2015. Noise abatement and other mitigation for impacts related to the I-710 Corridor Project build alternatives have been proposed commensurate with those impacts, and no further mitigation is proposed. It should be noted that, should a build alternative be selected as the Preferred Alternative, Measure AQ-3 would also provide for solid

barriers in combination with vegetation installation in order to increase dispersion of vehicular emissions and PM, to be determined in more detail during final design of either build alternative. However, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there will be no impacts to Baker or Coolidge Parks.

L-27-61

As shown in Section 3.1.2 of the RDEIR/SDEIS, growth policies for SCAG's RTP/SCS, County of Los Angeles, City of Long Beach, and the City of Los Angeles were taken into consideration. It should be clarified that Section 3.2, Growth, of the RDEIR/SDEIS, indicated that "improved mobility expected to be achieved as a result of the build alternatives could have a slight influence on demand for residential and nonresidential uses in the cities and communities in the Gateway Cities subregion…" This statement should not be interpreted as an acknowledgement that growth would unequivocally occur as a result of improved mobility along I-710 resulting from the build alternatives. It merely states that increased mobility could have a slight influence on demand for various land uses in the subregion. For illustrative purposes, that means that an improved level of service and less queuing at a particular off-ramp may entice motorists to stop at a shopping center at that location more often or during their regular commute, whereas it may have been viewed as a less convenient option before any improvements were made to the I-710 Corridor under the build alternatives. Because the build alternatives would only make improvements to an existing facility, and not provide new access to places that were previously inaccessible, coupled with the fact that the Study Area is generally built out and heavily urbanized with several barriers to growth, it is reasonable to conclude that there are no reasonably foreseeable project-related growth impacts under any of the I-710 Corridor Project build alternatives as stated on page 3.2-15 of the RDEIR/SDEIS.

L-27-62

Caltrans respectfully disagrees that the cited conclusion regarding no growth-related impacts is unsubstantiated; the conclusion takes into account all of the preceding discussion and context presented in Section 3.2.2, Affected Environment, and Section 3.2.3, Environmental Consequences. Caltrans and Metro acknowledge that the lack of currently available vacant land certainly does not preclude infill development or redevelopment, and that clarification was provided in Section 3.1.1.1, Affected Environment, of Section 3.1, Land Use, of the RDEIR/SDEIS: "Development trends among these affected cities and communities are generally similar; there is limited vacant land and new development has taken the form of redevelopment and recycling of uses." It is important to note that nowhere in the RDEIR/SDEIS was it claimed that development could not occur, simply that the lack of available vacant land and generally urbanized and built-out nature of the I-710 Corridor serves as a growth constraint. Growth constraints can take several forms, such as the lack of vacant developable land or a

physical boundary, and do not necessarily halt growth, but are only one of several factors that strongly influences where, when, and what type of development takes place. Therefore, the conclusion that there are no project-related growth impacts as a result of the build alternatives is reasonable given the scope of the I-710 Corridor Project build alternatives, the environmental context, and the constraints on growth that would occur with or without the build alternatives; therefore, no further evaluation of impacts or avoidance, minimization, and mitigation measures is required.

L-27-63

This comment refers to information presented in the Draft EIR/EIS circulated for public review in 2012 which evaluated alternatives no longer under consideration. However, many similar issues are raised in Comment L-27-62 germane to the analysis contained in the RDEIR/SDEIS and to which a response is provided, above. It should be clarified that expanding capacity on I-710 is anticipated to have no effect on Port operations and growth rates. Container growth at the Ports is anticipated, and historically has shown, to occur regardless of improvements made on I-710. The Port of Long Beach has even implemented programs encouraging graveyard shifts and “hoot gates” so that cargo can be transported via truck during off-hours like the “hoot shift” or “owl shift” generally beginning at 3:00 a.m., before the morning rush hour. One of the primary purposes of the project is to accommodate both projected traffic volumes as well as address increased traffic volumes resulting from projected growth in population, and employment and economic activities related to goods movement.

L-27-64

Caltrans respectfully disagrees that the noted conclusion needs to be reassessed and that the analysis and conclusions are insufficient and unsupported. Specific responses are provided for the comments submitted, above.

L-27-65

The Study Area for community impacts should describe the surrounding community that is generally associated with the project within which community impacts could occur. The Study Area for community impacts was deemed to be neighborhood-based in nature, and therefore the Study Area boundary of a 0.5-mile radius was chosen. This 0.5-mile radius was also utilized in the Community Impact Assessment completed in support of the RDEIR/SDEIS. Larger study areas were defined for other resource areas within the RDEIR/SDEIS that were appropriate for different types of resources, such as air quality.

L-27-66

As described in Section 3.24, Construction Impacts, should a build alternative be selected as the Preferred Alternative, installation of fencing around construction and staging areas would occur during the construction mobilization and site preparation phase , which should deter trespassing during construction. Construction sites would be closed to the public. However, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, no construction will occur and sites will not be provided for homeless to camp and congregate.

L-27-67

Please refer to Section 1.6 of this appendix. These proposed parking restrictions have been eliminated from further consideration and are not being carried forward since the No Build Alternative has been identified as the Preferred Alternative.

L-27-68

The City of Long Beach's concern about the community impacts from business displacements is acknowledged and noted in the public record. As noted in the comment, should a build alternative be selected as the Preferred Alternative, Caltrans would make every effort to relocate the affected businesses near their existing locations within the City of Long Beach if at all feasible. As discussed in the Draft Relocation Impact Report, sufficient replacement properties for the displaced businesses are located within the City of Long Beach. However, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, no community impacts from business displacements will occur.

L-27-69

As stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, the Multi-Service Center will not be displaced.

L-27-70

While water quality was not specifically discussed in regards to environmental justice in Section 3.3 of the RDEIR/SDEIS, there is a discussion of public health concerns for water quality in Section 3.9, Water Quality. This states that, should a build alternative be selected as the Preferred Alternative, water quality BMPs would be implemented to treat stormwater runoff during construction and operation of the build alternatives. As a result, the build alternatives would not be anticipated to degrade the water quality of any receiving waters. Treatment BMPs would be designed to drain and eliminate standing water; therefore, vectors (such as mosquitoes) would not be of concern. Therefore, the build alternatives would not pose risks to public health related to water quality, including for minority and low-income populations.

L-27-71

Please refer to Response to Comment L-27-9 regarding key views located within the City of Long Beach. An analysis of potential disproportionate visual impacts to minority and low-income populations was included in Section 3.3.3.5 of the RDEIR/SDEIS. It concluded that the build alternatives would have a disproportionate and adverse visual impact to environmental justice communities. However, it is important to note that the selection of Key Views was done in accordance with FHWA guidance and is intended to provide a representative sample of viewsheds for the I-710 Corridor. Additionally, all corridor cities were provided the opportunity to submit input regarding the locations of the Key Views during the development of the Visual Impact Assessment (2011) supporting the Draft EIR/EIS circulated for public review in 2012. This information was presented to the I-710 Technical Advisory Committee in 2010.

L-27-72

As discussed in Section 3.12.2.5 (Hazardous Waste/Materials, Affected Environment), numerous local and regional underground and aboveground utilities parallel and cross the I-710 and the Los Angeles River including power distribution and transmission systems, natural gas distribution and transmission pipelines, petroleum pipelines, telephone systems, cable television (CATV) systems, water distribution mains, water aqueducts, sanitary sewer mains, sewer interceptors, and city telecommunication systems. In addition, two high-voltage electrical transmission corridors (SCE and LADWP) parallel the I-710. Should a build alternative be selected as the Preferred Alternative, Measure US&E-2 in Section 3.4.3 of the RDEIR/SDEIS would require additional coordination with the City of Long Beach regarding existing utilities. Should a build alternative be selected as the Preferred Alternative, Measure HW-6 in Section 3.12.4, Hazardous Waste/Materials in the RDEIR/SDEIS and in this Final EIR/EIS would also provide for the preparation of a Construction Contingency Plan, which would include provisions for emergency response in the event that an unexpected release of hazardous substances is found. This plan would be applicable during all construction activities, including utility relocations. However, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there would not be an impact to existing petroleum pipelines and oil wells.

L-27-73

Per this comment, City Light & Power, Inc. and Covanta Long Beach Renewable Energy Corp. have been added to the list of service providers contained in Section 3.4.1.2 of this Final EIR/EIS.

L-27-74

Should a build alternative be selected as the Preferred Alternative, Measure US&E-2 in Section 3.4.3 of the RDEIR/SDEIS would require additional coordination regarding utility relocations be coordinated with the California Public Utilities Commission. As is standard Caltrans practice, the engineering plans that inform the technical analyses for the RDEIR/SDEIS are only developed to a status of approximately 25 to 35 percent of final design. It would not be recommended that any type of permit, including those necessary from CPUC for the relocation of utilities, be obtained based upon this level of design. However, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, it would not be necessary to relocate of existing power lines 50KV or greater.

L-27-75

Caltrans and Metro recognize the importance of avoiding impacts to emergency service providers during construction, and, should a build alternative be selected as the Preferred Alternative, the commitment to avoid and minimize those to the best extent practicable is included in Measure CON-U&ES-1, in Section 3.24.4.4, Construction Impacts of the RDEIR/SDEIS and this Final EIR/EIS. This commitment also relates to Measure CON-TR-1, discussed in Section 3.24.4.5, which would require the preparation of a Transportation Management Plan that would address short-term traffic impacts during construction. However, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, measures CON-U&ES-1 and CON-TR-1 will not be implemented.

L-27-76

Utilities that require relocation during construction of either build alternative would be performed in accordance with the provisions of Measure CON-U&ES-2, which would include required coordination with the utility provider, local jurisdictions, and the general public/utility customers as necessary. Major utility relocations that are within 500 feet of schools and/or require construction duration of 30 days or more would require a community meeting prior to the issuance of demolition and grading permits. However, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, no impacts to relocation or impacts to utilities are necessary.

L-27-77

Since the circulation of the Draft EIR/EIS in 2012, the project build alternatives have been revised and many of the impacts to oil operating areas within the City of Long Beach have been avoided or minimized to the greatest extent practicable. The details of the responsibility for relocation cost are preliminarily identified in their respective Utilities technical studies; however,

as cost in and of itself is not an environmental impact as defined under CEQA/NEPA, that information is not included in the EIR/EIS. However, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there will be no impacts to oil operating areas within the City of Long Beach.

L-27-78

Please refer to Response to Comment L-27-76 for information regarding utility relocations.

L-27-79

Please refer to Response to Comment L-27-76 for information regarding utility relocations.

L-27-80

This comment is referencing a comment previously submitted by the City on the 2012 Draft EIR/EIS and is relevant to alternatives no longer under consideration. As discussed in Section 2.3.2.1, both build alternatives would include the modernization of the freeway design, and would include local interchange improvements, auxiliary lane/ramp improvements, and freeway-to-freeway interchange improvements. Modernization of the freeway typically includes widening lanes and shoulders to current Caltrans standards for safety.

L-27-81

Please refer to Response to Comment L-27-80 regarding modernization of the freeway design under the build alternatives.

L-27-82

Please refer to Response to Comment L-27-80. A separate truck-only corridor is not an element of the Preferred Alternative (No Build Alternative).

L-27-83

This comment is referencing a comment previously submitted by the City on the 2012 Draft EIR/EIS and is relevant to alternatives no longer under consideration. Although part of the freight corridor under Alternative 7 would be elevated, Alternative 7 was not identified as the Preferred Alternative. Table 3.5-24 of the RDEIR/SDEIS shows that, under Alternative 5C, Vehicle Miles Traveled (VMT) and Vehicle Hours Traveled (VHT) would increase 1.8 percent and 0.4 percent, respectively, when compared to the No Build Alternative in 2035. It is important to note that these increases would not be localized to the City of Long Beach; rather, they would be corridor-wide. However, because one of the purposes of the proposed project is to increase safety and modernize aging infrastructure, it would be anticipated that fewer calls for emergency

assistance would actually occur after implementation of Alternative 5C, as existing safety hazards would be corrected. However, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there would not be an increase in population or demand for public services in the Study Area as a result of the build alternatives.

L-27-84

Please refer to Section 1.6 of this appendix. These proposed parking restrictions have been eliminated from further consideration and are not being carried since the No Build Alternative has been selected as the Preferred Alternative.

L-27-85

This comment is referencing a comment previously submitted by the City on the 2012 Draft EIR/EIS and is relevant to alternatives no longer under consideration. Improvements to the 42 arterial intersections that had previously been included as elements of the 2012 build alternatives are no longer under consideration.

L-27-86

This comment is referencing a comment previously submitted by the City on the 2012 Draft EIR/EIS and is relevant to alternatives no longer under consideration. Impacts to Cesar E. Chavez Park resulting from the revised build alternatives were presented in detail in Section 3.1, Land Use, and Appendix B, Draft Section 4(f) and 6(f) Evaluation, and include an evaluation of access impacts. It is unclear what enforcement actions are specifically referred to here, but as per the requirements set forth in Measure PR-13, should a build alternative be selected as the Preferred Alternative, coordination with the City would occur regarding closures to the Park. Should a build alternative be selected as the Preferred Alternative, closures to the Los Angeles River Trail would be coordinated with the Los Angeles County Department of Public Works, the agency with jurisdiction over the trail, as described in Measure PR-17. However, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there will be no impacts to Cesar E. Chavez Park or the Los Angeles River Trail.

L-27-87

This comment is referencing a comment previously submitted by the City on the 2012 Draft EIR/EIS and is relevant to alternatives no longer under consideration. Although it is acknowledged that the potential displacement of encampments could occur during construction activities of either build alternative, it would not be anticipated that such displacement would result in substantial new calls for service or additional demand at the City's Multi-Service

Center. Construction of either build alternative would occur in stages and would therefore not be occurring simultaneously throughout the I-710 Corridor at once. An analysis of the displacement of homeless encampments was not undertaken because of the temporary nature of those encampments, as well as the fact that the persons in question are trespassing within State right-of-way.

L-27-88

This comment is referencing a comment previously submitted by the City on the 2012 Draft EIR/EIS and is relevant to alternatives no longer under consideration. The commenter does not indicate what specifically about the response they consider inadequate or what analysis was not provided. Additional information regarding the impacts to area utilities as a result of the revised build alternatives was presented in Section 3.4, Utility and Emergency Services, of the RDEIR/SDEIS. This additional information was provided in three separate utility studies completed by Metro in 2016 (refer to studies listed in Appendix H of this Final EIR/EIS). Although the relocations associated with utility conflicts as a result of either build alternative would occur during construction, they would be permanent impacts and are therefore were not included in Section 3.24, Construction Impacts.

L-27-89

Currently at this point in project development, information regarding specific construction impacts, detour routes, vehicle amounts, and other data are not available to evaluate impacts at the level of detail requested in this comment. As indicated in Measure CON-TR-1 in Section 3.24.4.5 of the RDEIR/SDEIS and this Final EIR/EIS, should a build alternative be selected as the Preferred Alternative, a Transportation Management Plan (TMP) would be prepared prior to construction that addresses traffic delays, detour routes, public awareness, and other construction-related traffic and transportation issues. Measure CON-U&ES-1 in Section 3.24.4.4 of the RDEIR/SDEIS and this Final EIR/EIS states that ramp closures and detour routes developed as part of the TMP would be determined in coordination with local jurisdictions. At that time, when more detailed information regarding construction is known, including specific detour routes, further coordination would occur with each jurisdiction. However, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, implementation of Measure CON-TR-1 and CON-U&ES-1 will not be necessary.

L-27-90

Please refer to Response to Comment L-27-7 for more information on the inclusion of Class IV bikeways within the project design.

L-27-91

The build alternatives include provisions for Class IV bikeways in proposed local street modifications at freeway crossing locations where practical and appropriate for consistency with the City's recently updated Bicycle Master Plan. Bikeway widths would be sufficient for street sweeping. Like many recently modernized intersections throughout the City, and in conformance with current channelization design practice, the vertical elements providing separation along Class IV bikeways would be omitted at approaches to intersections to allow for vehicular turning movements. Entrances and exits to and from the freeway are major movements that would require separate turning lanes to ensure safe and efficient operation of ramp intersections at the local arterial. At these locations, Class II bikeway treatments have been incorporated in the design of the build alternatives. These provisions have been incorporated in the design concepts of the build alternatives for Anaheim Street, Pacific Coast Highway, Willow Street, Del Amo Boulevard, Long Beach Boulevard, and Artesia Boulevard within the City of Long Beach. However, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, no new bikeways or pedestrian facilities will be constructed. Please also refer to Response to Comment L-27-7 regarding DDIs.

L-27-92

This comment notes that the existing structures that cross I-710 do not have suitable facilities for bicyclists or pedestrians. As discussed in Chapter 2.0, Project Alternatives, the build alternatives include widening of existing bridges and overcrossings to accommodate bicycle and pedestrian traffic. Improvements would include ADA-compliant sidewalks and sufficient room for bicycle lanes.

L-27-93

The traffic analysis for the I-710 Corridor Project was completed prior to the analysis for the Shoemaker Bridge Project. Therefore, the Final EIR/EIS was not updated to be consistent with the No Build traffic volumes for the Shoemaker Bridge Project. Additionally, it is important to note that small differences in traffic volumes reported for specific locations are not unusual for studies completed at slightly different times due to variations in underlying data sets or traffic counts. The focus of the I-710 Corridor Project is the examination of traffic and operations on the 19-mile segment of the I-710, as well as analysis of over 190 local intersections distributed across a very large and broad study area, while the Shoemaker Bridge Project provides a much more detailed look at the local street network between Shoemaker Bridge and downtown Long Beach. What would be concerning is significant contradictions in major conclusions or findings between the two projects with regard to Existing and Future No Build travel conditions. While it is always desirable to have exact matches of traffic volume detail across different study efforts, it is not reasonable or practical to "force-fit" results. As long as each project is internally

consistent and follows accepted methods and practices that lead to logical and rational conclusions with sufficient rationale, then each project is able to stand on its own.

L-27-94

The City's support for Alternative 5C is acknowledged and included in the project record. Please refer to Section 1.1 of this appendix for a discussion on the identification of the Preferred Alternative.

L-27-95

The I-710 Corridor Project evaluated the traffic impacts of the proposed project, including the traffic effects of a DDI interchange concept for I-710 at Anaheim Street under the build alternatives. As confirmed by the commenter, the traffic analysis identified impacts at Anaheim Street/Santa Fe Avenue, Anaheim Street/Canal Avenue, and Magnolia Avenue/Third Street based on impact thresholds established for the project. Mitigation for these impacted intersections was identified in Section 3.5.4 of the RDEIR/SDEIS and in the *Intersection Traffic Impact Analysis Report* (March 2017). Refer to Table 7-5 of this report for the detailed analysis results, with and without mitigation. Recommended mitigation consisting of intersection improvements is described in Table 7-12 of the *Intersection Traffic Impact Analysis Report* and diagrams of the proposed mitigation concepts for each intersection are provided in Appendix E of this report. However, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, these mitigation concepts will not be further refined, in cooperation with the City of Long Beach, during final design.

L-27-96

The element of Motion 22.1 discussed in the comment refers to the programmatic features described in Section 2.3.2.1 of the RDEIR/SDEIS. It is important to note that these features are not considered mitigation, which is required under CEQA/NEPA to reduce, avoid, or minimize significant adverse impacts according to thresholds identified in the various analyses conducted for the EIR/EIS.

For the I-710 Corridor, the Motion 22.1 items include ITS and TSM improvements for the I-710 freeway, such as ramp metering and advanced variable message signing and information systems along the freeway. Within the City of Long Beach, pedestrian and bicycle overcrossings are proposed at selected locations. In addition, several of the DDI interchange concept designs have been modified to incorporate space for Class IV bicycle facilities in response to the City's request, which has been reflected in Chapter 2.0, Project Alternatives, of this Final EIR/EIS.

Lastly, the I-710 Congestion Relief Program was created as a programmatic feature of the project specifically to address issues associated with future congestion on major arterials and

intersections that interface with the I-710 freeway, such as Anaheim Street. The Neighborhood Traffic Management improvement identified by the City of Long Beach for Anaheim Street, as described, would align with the objectives of the I-710 Congestion Relief Program. Metro has pledged to work with the City of Long Beach to consider these types of improvements.

However, since the No Build Alternative (Alternative 1) has been selected as the Preferred Alternative; programmatic elements of the build alternatives will not be implemented by Caltrans as the Lead Agency under CEQA and NEPA and as the owner/operator of the I-710 freeway.

L-27-97

As indicated in Section 3.5.4 of the RDEIR/SDEIS and this Final EIR/EIS, the traffic analysis has identified the need for mitigation at Anaheim Street/Santa Fe Avenue within the City of Long Beach. This mitigation is described in Measure TR-1 in Section 3.5.4 of this Final EIR/EIS and in Table 7-12 of the *Intersection Traffic Impact Analysis Report* (March 2017), and mitigation concepts have been diagrammed for this intersection (and included in Appendix E of the *Intersection Traffic Impact Analysis Report*). It is understood that the City of Long Beach may be interested in a higher level of mitigation for this intersection beyond what was identified as necessary in the I-710 Corridor Project impact analysis. The analysis conducted for both the I-710 Corridor Project and the Shoemaker Bridge Project assumes that the local connectors at 9th and 10th Streets would be impacted by either projects build alternatives. However, future traffic conditions continue to evolve at this location. Additionally, in January 2018, the Port of Long Beach finalized the EIR and the Board of Harbor Commissions approved the Pier B On-Dock Rail Support Facility Project, which would impact the 9th and 10th Street connections to Shoemaker Bridge. However, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, the mitigation concepts for Anaheim Street/Santa Fe Avenue and the respective timelines and sequencing of the implementation of the Pier B Project, I-710 Corridor Project, and Shoemaker Bridge Replacement Project will not need to be more clearly developed.

L-27-98

Please refer to Response to Comment L-27-7 regarding DDIs.

L-27-99

Caltrans and Metro acknowledge the unique needs of the neighborhoods west of I-710 and the Los Angeles River within the City of Long Beach. In order to accommodate the need for increased accessibility, three pedestrian and bicycle-only bridges spanning I-710, the Los Angeles River, and/or I-405 are proposed within the City of Long Beach under the build alternatives. As the Los Angeles River levee is under the jurisdiction of the United States Army Corps of Engineers, the shared-use trail facility along the west bank of the River proposed in

this comment is not included in the design of the build alternatives. However, it should be noted that existing bridges and overcrossings that would be modified as part of the build alternatives would also be widened in order to accommodate pedestrian paths and Class II or IV bikeways on local street crossings. Furthermore, the existing Los Angeles River Trail on the eastern bank of the Los Angeles River is only approximately 650 feet from the facility proposed in the comment. In addition, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, these proposed pedestrian and bicycle-only bridges will not be provided. However, separate from the I-710 Corridor Project, Metro is currently studying several bike path projects within the I-710 Corridor, which are in preliminary phases. One, the Western Levee Bike Path, would provide a ten-mile Class 1 bike path from Pacific Coast Highway to Imperial Highway in the City of South Gate, within Los Angeles Flood Control District property on the western side of the Los Angeles River. Please refer to Response to Comment L-27-7 for further details regarding DDI design and bicycle/pedestrian movement.

L-27-100

The City of Long Beach's concern regarding residential displacements is acknowledged and noted in the public record. However, in order to locate these new pedestrian and bicycle overcrossings under the build alternatives in existing, densely populated neighborhoods, while also designing them in conformance with ADA and other standards, would make some right-of-way acquisition unavoidable. However, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, the geometric design of the build alternatives (including grades of the new pedestrian and bicycle overcrossings) will not need to be refined and no right-of-way acquisitions will be necessary.

L-27-101

Please refer to Response to Comment L-27-100 regarding the provision of overcrossings and their potential to require acquisition of private property.

L-27-102

As discussed in Section 3.5.3.1 of the RDEIR/SDEIS, the build alternatives would provide facilities for bicycles and pedestrians in locations where local roadways would be affected by the construction of the build alternatives. Please refer to Response to Comment L-27-7 for further details. The City is correct in that the feature proposed in this comment is not included in the current design plans, and, since the No Build Alternative has been selected as the Preferred Alternative, there will be no need to provide facilities for bicycles and pedestrians in locations where local roadways are affected by the construction of the build alternatives.

L-27-103

As discussed in Section 3.5.3.1 of the RDEIR/SDEIS, the build alternatives would provide facilities for bicycles and pedestrians in locations where local roadways would be affected by the construction of the build alternatives. Please refer to Response to Comment L-27-7 for further details. The feature proposed in this comment is not included in the current design plans of the build alternatives, and, since the No Build Alternative has been selected as the Preferred Alternative, there will be no need to provide facilities for bicycles and pedestrians in locations where local roadways are affected by the construction of the build alternatives.

L-27-104

As discussed in Section 3.5.3.1 of the RDEIR/SDEIS, the build alternatives would provide facilities for bicycles and pedestrians in locations where local roadways would be affected by the construction of the build alternatives. Please refer to Response to Comment L-27-7 for further details. The feature proposed in this comment is not included in the current design plans of the build alternatives, and, since the No Build Alternative has been selected as the Preferred Alternative, there will be no need to provide facilities for bicycles and pedestrians in locations where local roadways are affected by the construction of the build alternatives.

L-27-105

As discussed in Section 3.5.3.1 of the RDEIR/SDEIS, the build alternatives would provide facilities for bicycles and pedestrians in locations where local roadways would be affected by the construction of the build alternatives. Please refer to Response to Comment L-27-7 for further details. The feature proposed in this comment is not included in the current design plans of the build alternatives, and, since the No Build Alternative has been selected as the Preferred Alternative, there will be no need to provide facilities for bicycles and pedestrians in locations where local roadways are affected by the construction of the build alternatives.

L-27-106

As discussed in Section 3.5.3.1 of the RDEIR/SDEIS, the build alternatives would provide facilities for bicycles and pedestrians in locations where local roadways would be affected by the construction of the build alternatives. Please refer to Response to Comment L-27-7 for further details. The feature proposed in this comment is not included in the current design plans of the build alternatives, and, since the No Build Alternative has been selected as the Preferred Alternative, there will be no need to provide facilities for bicycles and pedestrians in locations where local roadways are affected by the construction of the build alternatives.

L-27-107

As discussed in Section 3.5.3.1 of the RDEIR/SDEIS, the build alternatives would provide facilities for bicycles and pedestrians in locations where local roadways would be affected by the construction of the build alternatives. Please refer to Response to Comment L-27-7 for further details. The feature proposed in this comment is not included in the current design plans of the build alternatives, and, since the No Build Alternative has been selected as the Preferred Alternative, there will be no need to provide facilities for bicycles and pedestrians in locations where local roadways are affected by the construction of the build alternatives.

L-27-108

As discussed in Section 3.5.3.1 of the RDEIR/SDEIS, the build alternatives would provide facilities for bicycles and pedestrians in locations where local roadways would be affected by the construction of the build alternatives. Please refer to Response to Comment L-27-7 for further details. The feature proposed in this comment is not included in the current design plans of the build alternatives, and, since the No Build Alternative has been selected as the Preferred Alternative, there will be no need to provide facilities for bicycles and pedestrians in locations where local roadways are affected by the construction of the build alternatives.

L-27-109

As discussed in Section 3.5.3.1 of the RDEIR/SDEIS, the build alternatives would provide facilities for bicycles and pedestrians in locations where local roadways would be affected by the construction of the build alternatives. Please refer to Response to Comment L-27-7 for further details. The feature proposed in this comment is not included in the current design plans of the build alternatives, and, since the No Build Alternative has been selected as the Preferred Alternative, there will be no need to provide facilities for bicycles and pedestrians in locations where local roadways are affected by the construction of the build alternatives.

L-27-110

As discussed in Section 3.5.3.1 of the RDEIR/SDEIS, the build alternatives would provide facilities for bicycles and pedestrians in locations where local roadways would be affected by the construction of the build alternatives. Please refer to Response to Comment L-27-7 for further details. The feature proposed in this comment is not included in the current design plans of the build alternatives, and, since the No Build Alternative has been selected as the Preferred Alternative, there will be no need to provide facilities for bicycles and pedestrians in locations where local roadways are affected by the construction of the build alternatives.

L-27-111

Interchange configuration assessments and the proposed DDI designs proposed as part of the build alternatives were reviewed with the respective Public Works Departments in the Cities of Paramount and Compton during preparation of the RDEIR/SDEIS. A partial cloverleaf interchange would have substantial environmental impacts at this interchange location. Provisions for bikeways along Alondra Boulevard are included in the current design of the build alternatives. Interchanges with controlled ramp intersections like those at Alondra Boulevard would require separate turning lanes for movements to and from the freeway. Partial cloverleaf, diamond, single-point and DDI configurations all would require separate turning lanes in order to accommodate the projected traffic volumes entering and exiting the freeway. The proposed six-lane section would accommodate four through-movements (two in each direction) and two turn lanes (one in each direction).

L-27-112

This comment is introductory and states that the City of Long Beach has reviewed the RDEIR/SDEIS and has identified potential improvements that would benefit pedestrians and bicycles. These suggestions are provided in Responses to Comments L-27-113 through L-27-127. The comment does not include any substantive comments or questions about the RDEIR/SDEIS and no further response is required.

L-27-113

As discussed in Section 3.5.3.1 of the RDEIR/SDEIS, the build alternatives would provide facilities for bicycles and pedestrians in locations where local roadways would be affected by the construction of the build alternatives. Please refer to Response to Comment L-27-7 for further details. The location referred to in this comment is not within the City of Long Beach and since the No Build Alternative has been selected as the Preferred Alternative, Caltrans and Metro will not need to coordinate with the local jurisdiction responsible for this location during the final design process.

L-27-114

As discussed in Section 3.5.3.1 of the RDEIR/SDEIS, the build alternatives would provide facilities for bicycles and pedestrians in locations where local roadways would be affected by the construction of the build alternatives. Please refer to Response to Comment L-27-7 for further details. The location referred to in this comment is not within the City of Long Beach and since the No Build Alternative has been selected as the Preferred Alternative, Caltrans and Metro will not need to coordinate with the local jurisdiction responsible for this location during the final design process.

L-27-115

As discussed in Section 3.5.3.1 of the RDEIR/SDEIS, the build alternatives would provide facilities for bicycles and pedestrians in locations where local roadways would be affected by the construction of the build alternatives. Please refer to Response to Comment L-27-7 for further details. The location referred to in this comment is not within the City of Long Beach and since the No Build Alternative has been selected as the Preferred Alternative, Caltrans and Metro will not need to coordinate with the local jurisdiction responsible for this location during the final design process.

L-27-116

As discussed in Section 3.5.3.1 of the RDEIR/SDEIS, the build alternatives would provide facilities for bicycles and pedestrians in locations where local roadways would be affected by the construction of the build alternatives. Please refer to Response to Comment L-27-7 for further details. The location referred to in this comment is not within the City of Long Beach and since the No Build Alternative has been selected as the Preferred Alternative, Caltrans and Metro will not need to coordinate with the local jurisdiction responsible for this location during the final design process.

L-27-117

As discussed in Section 3.5.3.1 of the RDEIR/SDEIS, the build alternatives would provide facilities for bicycles and pedestrians in locations where local roadways would be affected by the construction of the build alternatives. Please refer to Response to Comment L-27-7 for further details. The location referred to in this comment is not within the City of Long Beach and since the No Build Alternative has been selected as the Preferred Alternative, Caltrans and Metro will not need to coordinate with the local jurisdiction responsible for this location during the final design process.

L-27-118

As discussed in Section 3.5.3.1 of the RDEIR/SDEIS, the build alternatives would provide facilities for bicycles and pedestrians in locations where local roadways would be affected by the construction of the build alternatives. Please refer to Response to Comment L-27-7 for further details. The location referred to in this comment is not within the City of Long Beach and since the No Build Alternative has been selected as the Preferred Alternative, Caltrans and Metro will not need to coordinate with the local jurisdiction responsible for this location during the final design process.

L-27-119

As discussed in Section 3.5.3.1 of the RDEIR/SDEIS, the build alternatives would provide facilities for bicycles and pedestrians in locations where local roadways would be affected by the construction of the build alternatives. Please refer to Response to Comment L-27-7 for further details. The location referred to in this comment is not within the City of Long Beach and since the No Build Alternative has been selected as the Preferred Alternative, Caltrans and Metro will not need to coordinate with the local jurisdiction responsible for this location during the final design process.

L-27-120

As discussed in Section 3.5.3.1 of the RDEIR/SDEIS, the build alternatives would provide facilities for bicycles and pedestrians in locations where local roadways would be affected by the construction of the build alternatives. Please refer to Response to Comment L-27-7 for further details. The location referred to in this comment is not within the City of Long Beach and since the No Build Alternative has been selected as the Preferred Alternative, Caltrans and Metro will not need to coordinate with the local jurisdiction responsible for this location during the final design process.

L-27-121

As discussed in Section 3.5.3.1 of the RDEIR/SDEIS, the build alternatives would provide facilities for bicycles and pedestrians in locations where local roadways would be affected by the construction of the build alternatives. Please refer to Response to Comment L-27-7 for further details. The location referred to in this comment is not within the City of Long Beach and since the No Build Alternative has been selected as the Preferred Alternative, Caltrans and Metro will not need to coordinate with the local jurisdiction responsible for this location during the final design process.

L-27-122

As discussed in Section 3.5.3.1 of the RDEIR/SDEIS, the build alternatives would provide facilities for bicycles and pedestrians in locations where local roadways would be affected by the construction of the build alternatives. Please refer to Response to Comment L-27-7 for further details. The location referred to in this comment is not within the City of Long Beach and since the No Build Alternative has been selected as the Preferred Alternative, Caltrans and Metro will not need to coordinate with the local jurisdiction responsible for this location during the final design process.

L-27-123

As discussed in Section 3.5.3.1 of the RDEIR/SDEIS, the build alternatives would provide facilities for bicycles and pedestrians in locations where local roadways would be affected by the construction of the build alternatives. Please refer to Response to Comment L-27-7 for further details. The location referred to in this comment is not within the City of Long Beach and since the No Build Alternative has been selected as the Preferred Alternative, Caltrans and Metro will not need to coordinate with the local jurisdiction responsible for this location during the final design process.

L-27-124

As discussed in Section 3.5.3.1 of the RDEIR/SDEIS, the build alternatives would provide facilities for bicycles and pedestrians in locations where local roadways would be affected by the construction of the build alternatives. Please refer to Response to Comment L-27-7 for further details. The location referred to in this comment is not within the City of Long Beach and since the No Build Alternative has been selected as the Preferred Alternative, Caltrans and Metro will not need to coordinate with the local jurisdiction responsible for this location during the final design process.

L-27-125

As discussed in Section 3.5.3.1 of the RDEIR/SDEIS, the build alternatives would provide facilities for bicycles and pedestrians in locations where local roadways would be affected by the construction of the build alternatives. Please refer to Response to Comment L-27-7 for further details. The location referred to in this comment is not within the City of Long Beach and since the No Build Alternative has been selected as the Preferred Alternative, Caltrans and Metro will not need to coordinate with the local jurisdiction responsible for this location during the final design process.

L-27-126

As discussed in Section 3.5.3.1 of the RDEIR/SDEIS, the build alternatives would provide facilities for bicycles and pedestrians in locations where local roadways would be affected by the construction of the build alternatives. Please refer to Response to Comment L-27-7 for further details. The location referred to in this comment is not within the City of Long Beach and since the No Build Alternative has been selected as the Preferred Alternative, Caltrans and Metro will not need to coordinate with the local jurisdiction responsible for this location during the final design process.

L-27-127

As discussed in Section 3.5.3.1 of the RDEIR/SDEIS, the build alternatives would provide facilities for bicycles and pedestrians in locations where local roadways would be affected by the construction of the build alternatives. Please refer to Response to Comment L-27-7 for further details. The location referred to in this comment is not within the City of Long Beach and since the No Build Alternative has been selected as the Preferred Alternative, Caltrans and Metro will not need to coordinate with the local jurisdiction responsible for this location during the final design process.

L-27-128

This comment states that the RDEIR/SDEIS should include an "Existing Plus Project Analysis" to comply with CEQA. This is a correct statement for analysis under CEQA, but not NEPA. Chapter 3.0 of the Draft EIR/EIS properly analyzes the future 2035 No Build conditions under Alternative 1 with the two build alternatives. With regard to CEQA, Chapter 4.0, CEQA Evaluation, states "In making determinations of significance under CEQA, the impacts of the build alternatives are analyzed relative to baseline conditions which, for the Interstate 710 (I-710) Corridor Project, were the existing conditions in the I-710 Corridor in 2012. For comparison under NEPA, Alternative 1 provides the basis for comparison of 2035 No Build conditions with the 2035 build alternatives." Therefore, the analysis provided in Chapter 4.0 properly evaluated the build alternatives under CEQA, consistent with the Sunnyvale case. Please also refer to Response to Comment L-27-39 regarding the evaluation of traffic impacts under CEQA.

L-27-129

Section 2.4.2 on p. 2-37 of the *I-710 Corridor Project Traffic Operations Analysis Report* (March 2017) summarizes the methodology for calculating Level of Service (LOS) at signalized and unsignalized intersections. Due to the volume of pages, the worksheets for the analysis are contained in the Appendices of the report.

L-27-130

While it is true that the I-710 Corridor Project analysis used the Highway Capacity Manual (HCM) 2010 methodology for impact analysis, this is Caltrans' preferred methodology for the evaluation of environmental impacts. Because Caltrans is the Lead Agency for this project, it was determined that the HCM methodology was an appropriate analysis technique. While this is not consistent with the intersection capacity utilization (ICU) method used by most of the Gateway City agencies, it is a more detailed method of performing operational analysis. Intersection Level of Service (LOS) was calculated according to analysis methodologies described in the HCM. Section 7, Project Impacts and Mitigation Measures, of the *Intersection*

Traffic Impact Analysis Report (March 2017), outlined in detail the criteria for determining impacts to arterial intersections. This information was also summarized in Section 3.5.3.1 of the RDEIR/SDEIS. With respect to the intersection impact analysis, the same thresholds and methodology were uniformly applied for the intersections of all local jurisdictions that make up the I-710 Study Area for the purpose of determining project impacts and for identifying mitigation for the build alternatives, as necessary. This is appropriate given that each city has their own thresholds for their own local projects, which vary from city to city. The thresholds established for the project, described in Section 3.5.3.1 of the RDEIR/SDEIS, were identified based on an examination of future (congested) travel conditions of the arterial network within the I-710 Study Area and Caltrans' project experience with other major freeway projects in Los Angeles County similar in scope and magnitude to the I-710 Corridor Project.

L-27-131

The HCM 2010 reports that are provided in the appendices to the *Intersection Traffic Impact Analysis Report* (March 2017) and the *I-710 Corridor Project Traffic Operations Analysis Report* (March 2017) show the adjusted saturation flow rates for each movement at the intersections. These adjusted saturation flow rates were based on the ideal saturation flow rate of 1,600 vehicles per hour per lane (vphpl).

L-27-132

For arterial intersections, a cycle length of 100 seconds was used in the analysis to provide a consistent comparison between project alternatives across the network. The intersections were assumed to be actuated and coordinated with the adjacent intersections, and therefore a uniform cycle length of 100 seconds was used throughout the network, with the exception of ramp intersections.

L-27-133

A fully actuated and corridor optimized timing scheme was used to provide a consistent comparison between project alternatives across the network. Both a default five seconds of walk time and an 11-second flashing message of Don't Walk were used at all intersections for all scenarios.

L-27-134

For the intersections within the City of Long Beach, existing peak hour factors were carried over to all future scenarios (No Build Alternative and two build alternatives) due to the uncertainty associated with future year travel conditions and to provide a uniform basis of comparison to gauge differences across the analysis scenarios.

L-27-135

Please refer to Response to Comment L-23-2 regarding peak period parking restrictions. These restrictions have been eliminated from further consideration.

L-27-136

The City appears to be referring to the intersection improvements that would be included in the I-710 Corridor Congestion Relief Program, a programmatic feature of the build alternatives, that are described in Section 2.3.2.1 of the RDEIR/SDEIS and on page 4-7 of the *I-710 Corridor Project Traffic Operations Analysis Report* (March 2017). At this time the traffic analysis was prepared, the precise nature and specifics of the intersection improvements that would occur was not known, as these improvements were not funded and committed. Accordingly, the traffic analysis conducted for the Existing, Future No Build (Alternative 2035), and Build Alternatives (including the Preferred Alternative) did not presume these intersection improvements were already in place. It is important to note that since the No Build Alternative has been selected as the Preferred Alternative, any programmatic elements of the build alternatives would need to be implemented following a process separate from this Final EIR/EIS.

L-27-137

Please refer to Response to Comment L-27-130 regarding the use of the HCM methodology instead of the City's adopted criteria for City intersections.

L-27-138

It is important to note that there are two separate mechanisms wherein intersection improvements would be implemented within the City of Long Beach that are associated with the I-710 Corridor Project build alternatives: (1) through the I-710 Congestion Relief Program, a programmatic component of the build alternatives, and (2) as mitigation (Measure TR-1) to address impacted intersections that were identified in Section 3.5, Traffic, of the RDEIR/SDEIS (should a build alternative be selected as the Preferred Alternative).

It is acknowledged that improvements or projects pursued under the I-710 Congestion Relief Program would be subject to the discretion of the local agency with jurisdiction over the local roadway facilities. Proposals for improvements on the arterial system in Long Beach would be submitted by the City of Long Beach to Metro for consideration for funding under the program. If program funds were awarded to the City for their project(s), it would be up to the City of Long Beach to develop their project, including any needed environmental clearance, design, permitting, right-of-way acquisition (if applicable), and ultimately construction/implementation, per the guidelines of the I-710 Congestion Relief Program.

Should a build alternative be selected as the Preferred Alternative, intersection improvements implemented as mitigation would undergo a design review process in conjunction with the final design phase of either build alternative. City design standards would be a key consideration during this process. The City of Long Beach, as a project partner and key reviewing agency with jurisdiction over any mitigation improvements proposed for city roadway facilities, would be an active participant in this process and would be afforded several opportunities to review and comment as the design is developed.

However, since the No Build Alternative has been selected as the Preferred Alternative, any programmatic elements of the build alternatives, including the I-710 Congestion Relief Program, would need to be implemented following a process separate from this Final EIR/EIS.

L-27-139

For the intersections within the City of Long Beach, existing peak hour factors were carried over to all future scenarios (the No Build Alternative and two build alternatives) due to the uncertainty associated with future year travel conditions and to provide a uniform basis of comparison to gauge differences across the analysis scenarios. This provides a more conservative approach to the analysis conducted in support of the RDEIR/SDEIS. However, this information provided by the City is appreciated.

L-27-140

The detailed ramp metering analysis presented in the *I-710 Corridor Project Traffic Operations Analysis Report* (March 2017) shows the proposed design storage lengths, minimum storage required, and the required minimum metering rate for the build alternatives. The tables summarizing the results of the ramp metering analysis also disclose whether the proposed storage would be adequate to hold the on-ramp queues. However, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, queue storage lengths and specifics related to optimizing ramp metering timing will not be examined in further detail during final design of the build alternatives.

L-27-141

Please refer to Response to Comment L-27-35 regarding the various interchange configuration concepts assessed as part of the I-710 Corridor Project build alternatives.

L-27-142

The traffic analysis does consider the benefits of shifting more port operations to lower traffic periods. As described in detail in the *I-710 Corridor Project RDEIR/SDEIS Travel Demand Modeling Methodology Technical Memorandum* (June 2017), the traffic forecasts assumed an expansion of the PierPASS program which the Ports implemented in 2005 to use variable gate

fees to induce more container truck pickups during off-peak hours. The forecasts assumed a tripling of the volume of containers that would be handled during the “Hoot Shift” (3:00 a.m. – 8:00 a.m.) at the Ports.

L-27-143

Please refer to Response to Comment L-27-7 regarding pedestrian and bicycle friendly interchanges.

L-27-144

As discussed in Section 3.5.3.1 of the RDEIR/SDEIS, the build alternatives would provide facilities for bicycles and pedestrians in locations where local roadways would be affected by the construction of the build alternatives. Please refer to Response to Comment L-27-7 for further details. The improvements described by the City in this comment are beyond the jurisdiction of Caltrans to implement.

L-27-145

Please refer to Response to Comment L-27-35 regarding the various interchange configuration concepts assessed as part of the I-710 Corridor Project build alternatives.

L-27-146

Please refer to Response to Comment L-27-7 regarding pedestrian and bicycle friendly interchanges.

L-27-147

Please refer to Response to Comment L-27- regarding pedestrian and bicycle friendly interchanges.

L-27-148

Please refer to Response to Comment L-27-7 regarding pedestrian and bicycle friendly interchanges.

L-27-149

The build alternatives would add or widen bicycle and pedestrian facilities through the interchange areas, and in some cases would introduce traffic controls at ramp termini to help improve traffic safety for bicyclists and pedestrians. In key areas, the build alternatives would also provide new, exclusive pedestrian and bicycle overcrossings, so that some bicyclists and pedestrians could avoid using the arterials altogether to cross over I-710 and the Los Angeles

River Channel. The discussion in Section 3.5.3 has been expanded in the Final EIR/EIS to provide more information on how pedestrian and bicycle safety would be improved by the various features included in the build alternatives. Please refer to Response to Comment L-27-8 for information regarding the provision of a shared-use trail along the Los Angeles River levee.

L-27-150

The Regulatory Setting included in Section 3.6.1 of the EIR/EIS is standard text from Caltrans' Annotated Outline for EIR/EIS documents posted on their Standard Environmental Reference. Because this is standard text for all Caltrans' EIR/EIS documents throughout California, this section was not revised in the Final EIR/EIS.

L-27-151

Section 3.6.2.4, Methodology, of this Final EIR/EIS was updated regarding additional information pertaining to the public outreach conducted to date, committee input received as part of the Aesthetics Master Plan process.

L-27-152

Please refer to Response to Comment L-27-9 regarding key views located within the City of Long Beach.

L-27-153

Major project components of the build alternatives that would result in the greatest visual change are summarized for each key view in Section 3.6.3, Environmental Consequences, and visual simulations are provided in Figures 3.6-2 through 3.6-26.

Impacts from the build alternatives to sensitive viewers as a result of vegetation removal, increased views to hardscape features, or modification of the character of the existing communities is summarized for each key view in Section 3.6.3, Environmental Consequences, and illustrated in the visual simulations provided in Figures 3.6-2 through 3.6-26.

The commenter's request that the analysis discuss the project features associated with the Aesthetics Master Plan in further detail is respectfully rejected as the VIA was performed at the appropriate level of detail according to FHWA guidance for Visual Impact Assessments.

The commenter requests that design guidelines be identified, how these guidelines would reduce the resultant impacts, as well as the overall regulatory framework for enforcement. As discussed in Section 3.6.4, Caltrans and the FHWA require that a context-sensitive approach be taken to avoid, minimize, and/or mitigate for visual impacts for highway improvement projects. These measures constitute techniques that would most readily generate public acceptance of

the visual components of the I-710 Corridor Project build alternatives. Should a build alternative be selected as the Preferred Alternative, all visual minimization and/or mitigation would be designed and implemented consistent with the Aesthetics Master Plan per Mitigation Measure VIS-1 and in consultation with the affected local jurisdictions per Mitigation Measure VIS-9. Should a build alternative be selected as the Preferred Alternative, these measures would be enforceable commitments as documented in the Environmental Commitments Record (Appendix F of the RDEIR/SDEIS and this Final EIR/EIS). However, As stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there will be no visual impacts and no mitigation implemented.

L-27-154

Light and glare from headlights near residential neighborhoods are addressed in the Visual Section 3.6.3.1: “Should a build alternative be selected as the Preferred Alternative, glare from vehicle headlights in the general-purpose lanes and the elevated portions of the freight corridor would be minimized by the construction of soundwalls and screen walls. Since soundwalls would be installed whenever the improvements related to the build alternatives are adjacent to residential areas, these walls would block the vehicle headlight glare.” While glare from new roadway alignments and new cul de sac features are not specifically discussed, these represent a relatively small proportion of the impacts of the build alternatives. Generally, because the build alternatives propose to make modifications to an existing highway, “new” roadway alignments are not proposed, and only minor modifications to alignments would occur under the build alternatives. Within the City of Long Beach, proposed culs-de-sac would be located at Willow Street/Fashion Avenue, and several within the commercial and industrial area east of Fashion Avenue and south of Pacific Coast Highway, directly adjacent to I-710. Sensitive viewers would typically not be located at the locations of the new culs-de-sac that would be located in commercial and industrial locations. It is important to note that the majority of new light and glare impacts would have occurred under Alternative 7, which would provide a new elevated freight corridor structure with associated lighting. However, Alternative 7 was not identified as the Preferred Alternative, as it would have had greater visual impacts (among others). In addition, per Measure VIS-7 contained in Section 3.6.4 of this Final EIR/EIS, should a build alternative be selected as the Preferred Alternative, “During preparation of PS&E, a lighting plan will be prepared by Caltrans. The lighting fixtures will be designed to minimize glare on adjacent properties and into the night sky. Lighting will be shielded with nonglare hoods and focused within the I-710 Corridor Project right-of-way.”

L-27-155

Caltrans conducts visual studies using FHWA methodology as described in the publication FHWA-HI-88-054, *Visual Impact Assessment for Highway Projects.* Based on this guidance, areas can be defined as having similar visual character and analyzed accordingly. Breaking the views up into visual units is a reasonable way to address a project of this size and scope. The VIA and Section 3.6 of the RDEIR/SDEIS both disclosed pertinent information relating to changes in visual character along the I-710 Corridor. As discussed throughout the VIA and Section 3.6 of the RDEIR/SDEIS, viewer response to changes in views resulting from the build alternatives is a major criterion evaluated in the visual impact assessment.

L-27-156

Section 3.6 of this Final EIR/EIS has been revised where necessary as requested to cite the correct date of February 2014 for the Aesthetics Master Plan.

L-27-157

The Aesthetics Master Plan would not include tree/vegetation replacement guidelines; therefore, no change has been made to Measure VIS-2.

L-27-158

The referenced measure does not require revisions, as adherence to design guidelines of the Aesthetics Master Plan is included as its own measure, Measure VIS-1.

L-27-159

Please refer to Response to Comment L-27-158 regarding adherence to design guidelines of the Aesthetics Master Plan.

L-27-160

Please refer to Response to Comment L-27-158 regarding adherence to design guidelines of the Aesthetics Master Plan.

L-27-161

The Aesthetics Master Plan would not include vegetation placement guidelines; therefore, no change has been made to Measure VIS-2.

L-27-162

The VIA follows the prescribed Caltrans' VIA Annotated Outline that was in effect at the time the VIA was initiated in support of the revised build alternatives evaluated in the RDEIR/SDEIS.

L-27-163

The Visual Impact Assessment (VIA) offered a succinct project description in Section III of the document, which does outline what is proposed to be built, including the arrangement of lanes that would be added. This discussion of general features of the build alternatives is consistent with the VIA guidelines in placement and content. Further, the descriptions of the individual build alternatives within Section III of the document do address visible changes to the transportation system.

The description of each build alternative in Section III of the VIA includes a statement that the build alternatives would incorporate aesthetic enhancements that would include thematic surface treatment of structures and paved surfaces, enhanced roadside landscaping, and irrigation consistent with a corridor-wide aesthetic master plan. In addition to the freeway features described for each build alternative in Section III, the discussion of each build alternative includes a list of the overall project benefits related to transportation, air quality and health and safety. The avoidance, minimization, and/or mitigation measures are summarized in the Executive Summary and discussed in detail in Section XI.

L-27-164

Discussion of both Alternative 5C and Alternative 7 includes a reference to the *I-710 Corridor Aesthetics Master Plan* (February 2014) within Section III of the VIA document. The VIA also references the Aesthetics Master Plan regarding planned aesthetic infrastructure features on the I-710 Corridor, and advises the reader to consult the Aesthetics Master Plan for further details about aesthetic features.

L-27-165

The VIA states that the Nikon D70 digital camera with a lens with the focal length of 30mm would accurately mimic the perspective of the human eye. Caltrans respectfully disagrees that a different camera lens would improve the accuracy of the images; therefore, the key views were not rephotographed. Since the VIA guidelines do not specify which camera to use and merely states that the 50mm equivalent will need to be calculated for the camera, no changes were made to the VIA.

L-27-166

Caltrans respectfully disagrees that the “wireframe” of the digital modeling was not done at the correct height. The VIA followed Caltrans’ and FHWA guidelines, and all photo simulations are within the appropriate parameters.

L-27-167

The VIA adequately discusses regional and local visual policies following FHWA guidelines in Section V. That discussion adequately disclosed visual resources in each respective local plan that is analyzed, and did so in accordance with Caltrans and FHWA guidelines.

L-27-168

The VIA discusses the City of Long Beach General Plan adequately and in accordance with Caltrans and FHWA guidelines. Further, the discussion specifically notes that there are no State or locally designated scenic roads with the I-710 Corridor Project’s viewshed. Goal and policy consistency is included in the RDEIR/SDEIS in Section 3.1.2, Consistency with State, Regional, and Local Plans.

L-27-169

The Notice of Preparation (NOP) for the I-710 Corridor Project EIR/EIS was published in 2008. Therefore, the City of Long Beach’s General Plan Land Use and Urban Design Elements updates are not included in the analysis of this document, as they had not been initiated or were in progress at the time the NOP was published.

L-27-170

Please refer to Response to Comment L-27-169 regarding the analysis of the City of Long Beach’s General Plan Land Use and Urban Design Elements.

L-27-171

The VIA discusses the project setting in Section VI, A. Project Setting. The project setting provides the information required in both Caltrans and FHWA guidance documents.

L-27-172

The areas under analysis are broken into visual Landscape Units, which roughly correspond to land use types. The residential areas Westside and Wrigley, Bixby Knolls, and North Long Beach fall into the residential landscape unit that has been identified along the I-710 Corridor.

Therefore, while these residential areas are not individually identified, the residential landscape units within the City of Long Beach were accounted for in the analysis.

L-27-173

The VIA was prepared following Caltrans and FHWA guidance. The VIA acknowledges the County of Los Angeles General Plan policies that identify and protect scenic resources, and it specifically mentions Ocean Boulevard in the residential landscape unit. Further, per FHWA guidance, only State Scenic Highway resources are analyzed in the VIA. Therefore, the VIA follows Caltrans and FHWA guidance as it pertains to the analysis of scenic resources.

L-27-174

Per FHWA guidance, “Although a visual assessment unit is typically defined by a particular viewshed, alternative methods for defining a visual assessment unit are acceptable, such as defining it by an area of similar visual character.” Therefore, similar residential landscape units were used to define the visual assessment units prescribed by the guidance. While it is understood that each residential area might have unique features, for a project of this scope, it was reasonable to combine all the residential landscapes into a single unit for analysis.

L-27-175

Caltrans and FHWA guidance was used and tailored for the scope of the I-710 Corridor Project. Please refer to Response to Comment L-27-174 for more information on the determination and use of landscape units in the VIA. Changes in visual quality are adequately discussed in the Section IX, Subsection C, Levels of Visual Impact, of the VIA; and are specifically laid out within that subsection in Table 8.1, Existing and Proposed Visual Quality. Because of the scope of this project, a broad statement regarding each entire build alternative would be inconclusive, and therefore, each key view was instead analyzed on the “very low” to “high” visual change scale.

L-27-176

Highway Neighbors are discussed in detail in Section VIII, Subsection A, of the VIA. Several of the key views analyzed are from the perspective of potential highway neighbors. This includes, but is not limited to, Key Views 1 and 5 from the Los Angeles River Trail, Key View 5, Key View 8 from Coolidge Park, and Key Views 11 and 14 from various residential land uses along the I-710 Corridor. These represent the various “highway neighbor” categories described in Subsection A, referenced above. Per FHWA guidance, a discussion of the project’s community outreach meetings, public input received, and the draft Aesthetics Master Plan are not required to be addressed in the VIA. However, much of this information can be found in Chapter 5.0, Comments and Coordination, of the RDEIR/SDEIS and this Final EIR/EIS.

L-27-177

Caltrans and FHWA guidance was used and tailored for the scope of the I-710 Corridor Project. Key view locations are provided in map form and are further titled with appropriate descriptions and street addresses from which key view photographs were taken. Then, impacts are assessed for each key view per each build alternative, which serves as the discussion of visual change to landscape units by build alternative. The term “minimally traveled” does not appear in the VIA, and several key views come from the Los Angeles River Trail. New build alternative features are disclosed appropriately in the discussion of key views and are compliant with the guidance. The *I-710 Corridor Aesthetics Master Plan* (February 2014) is a separate document related to this project, but it is referenced in the RDEIR/SDEIS within the Visual Section (Section 3.6) in accordance with the Caltrans EIR/EIS Annotated Outline, as well as briefly referenced in the VIA itself. The VIA rating system is meant to gauge viewer response, and is compliant with FHWA guidance; further, the ratings given at each key view are appropriate and in accordance with Caltrans and FHWA guidance.

L-27-178

Caltrans and FHWA guidance was tailored for the scope of the I-710 Corridor Project. Section I, Executive Summary, contains a subsection regarding the Project Visual Impact Summary and has a table categorizing visual impact scores by build alternative. This summary characterizes the overall visual impact of the build alternatives by numerical score, which is compliant with the VIA Annotated Outline. CEQA compliance is addressed in Section V, Environmental Laws and Policies; the VIA goes on to state “The guidelines under these laws were used in this analysis to determine potential effects of the I-710 Corridor Project on the visual aesthetic environment.” Finally, shade and shadow are described in Section X of the VIA, Light, Glare, Shade and Shadow.

L-27-179

The VIA acknowledges in the executive summary that, “There will be short-term as well as long-term negative impacts with the construction of all build alternatives that would contribute adverse visual impacts to the existing views for viewers and/or user groups within the I-710 Corridor.”

L-27-180

While the FHWA VIA guidelines do advise that anticipated cumulative impacts should be described, there is no specific chapter or section for cumulative impacts within guidance for the Standard or Expanded VIA types. The approach taken by the VIA “fulfills the letter and the spirit of FHWA requirements” as it addresses estimated impacts to visual quality of the I-710 Corridor Project viewshed and takes a qualitative/aesthetic approach to visual quality loss within the

study area. The analysis of each key view addresses impacts to the full range of visual elements within each viewshed, thereby addressing the cumulative effect of the build alternatives on these visual elements. A comprehensive cumulative discussion for visual/aesthetic resources was included in Section 3.24.5.6 of the RDEIR/SDEIS.

L-27-181

The Aesthetics Master Plan is referenced appropriately in the VIA and utilized as a source in Section 3.6, Visual/Aesthetics, of the RDEIR/SDEIS. Caltrans uses “Context Sensitive Solutions”, which balance performance goals with community, aesthetic, historic and environmental values. These solutions would provide consistency and unity in the appearance and image of the route, through the application of corridor aesthetic themes. Design criteria for soundwalls would also be used, and the soundwall aesthetic and, should a build alternative be selected as the Preferred Alternative, design would receive close coordination between Caltrans and local communities throughout the life of the project. These aspects of the performance goals and design criteria for the build alternatives were incorporated into the avoidance, minimization, and/or mitigation measures identified in the VIA.

L-27-182

A discussion of designated scenic corridors has been added to Section 3.6.2, Affected Environment. The following information from the VIA will be included in Section 3.6.2: The southern portion of the I-710 Corridor Project runs through the City of Long Beach. The Open Space and Recreation Element of the City’s General Plan states that the City’s policy is to “protect and improve the community’s natural resources, amenities and scenic values.” There are no state or locally designated scenic roads within the I-710 Corridor Project’s viewshed; however, the City is working with the California Coastal Conservancy and others to rehabilitate wetland acreage in areas along the Los Angeles River, which parallels the I-710 Corridor.

L-27-183

A discussion of designated scenic vistas and scenic roads has been added to Section 3.6.2, Affected Environment. There are no state or locally designated scenic vistas or roads within the I-710 Corridor Project’s viewshed. Since it would be impractical to discuss each individual visual resource along the I-710 Corridor, the I-710 Corridor was broken up into “landscape units” which can be thought of as outdoor rooms that exhibit a distinct visual character. These landscape units included views of prominent landforms and views of historic resources from the I-710 Corridor, and the landscape units were analyzed separately in the form of key views along the I-710 Corridor.

L-27-184

Aesthetic characteristics that would be implemented as part of the build alternatives (should a build alternative be selected as the Preferred Alternative) are detailed in the Caltrans Aesthetics Master Plan, which is referenced in Section 3.6.4, Avoidance, Minimization, and/or Mitigation Measures as Measure VIS-1. Per VIS-1, elements from the Caltrans I-710 Corridor Aesthetics Master Plan would be incorporated into the final design of the if a build alternative is selected as the Preferred Alternative. The Aesthetics Master Plan has been developed in a context-sensitive design process in consultation with the affected local agencies and includes involvement of local community members as determined by the local agencies. However, as stated in Response to Comment L-2-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, elements of the I-710 Corridor Aesthetics Master Plan would not be incorporated into the final design.

L-27-185

Caltrans respectfully disagrees that visual quality of the key views in question should be rated differently. The VIA rating system is meant to gauge viewer response, and is compliant with Caltrans and FHWA-guidance; further, the ratings given at each key view are appropriate and in accordance with Caltrans and FHWA guidance.

L-27-186

Please refer to Response to Comment L-27-185 regarding the rating of the visual quality of the key views. Additionally, as discussed in Section 1.1, Identification of a Preferred Alternative, Alternative 7 is no longer under consideration as the No Build Alternative has been identified as the Preferred Alternative.

L-27-187

Please refer to Responses to Comments L-27-185 and L-27-186 regarding the rating of the visual quality of the key views.

L-27-188

Please refer to Responses to Comments L-27-185 and L-27-186 regarding the rating of the visual quality of the key views.

L-27-189

Please refer to Responses to Comments L-27-185 and L-27-186 regarding the rating of the visual quality of the key views.

L-27-190

Caltrans respectfully disagrees that the analysis of nighttime lighting is inadequate. Nighttime lighting is discussed in the Executive Summary and again in Section X, Light, Glare, Shade, and Shadow, of the VIA. The VIA discloses that, under the build alternatives, elevated night lighting would be located closer to all land uses bordering the I-710 Corridor and that some neighborhoods would experience increased night lighting, particularly under Alternative 7. It should be noted that Alternative 7 has not been identified as the Preferred Alternative.

L-27-191

Although there are measures proposed that would reduce the visual impacts of the I-710 Corridor Project build alternatives (should a build alternative be selected as the Preferred Alternative), there would still be a residual visual impact due to the introduction of reconstructed freeway-to-freeway connectors and soundwalls that cannot be fully mitigated. However, due to right-of-way constraints within the I-710 Corridor, options to rework the area south of Willow Street are limited. However, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there will be no visual impacts.

L-27-192

Clarification of sensitive viewers that may be impacted by the build alternatives has been added to Section 3.24.3.6 in this Final EIR/EIS. According to the VIA, the types of viewers considered to have a more sensitive viewer response to highway projects are highway neighbors. This viewer group involves a large number of viewers that varies from residents, students, travelers on local streets, users on bicycle trails and other recreational facilities, and employees and visitors in commercial, industrial, and transportation businesses.

L-27-193

None of the roads in the I-710 Corridor Project viewshed are designated as a State Scenic Highway. Additionally, while the County of Los Angeles has three State-designated Scenic Highways and eight County-designated Scenic Highways, none of these are within the I-710 Corridor Project's viewshed. Local scenic vistas are taken into account in Section V, Environmental Laws and Policies, and many of the local jurisdictions do not have designated scenic vistas within the I-710 Corridor viewshed. Due to the relatively flat topography within the I-710 Study Area, no scenic vistas were identified in the VIA.

L-27-194

Section X, Light, Glare, Shade, and Shadow, of the VIA deals with potential light and glare along the I-710 Corridor. Caltrans respectfully disagrees that, though qualitative, the analysis of light and glare impacts is inadequate. The analysis was done in accordance with Caltrans and

FHWA guidance regarding light and glare. The Caltrans annotated outline for VIAs calls for a discussion of “CEQA-required issue areas” including light and glare, and the VIA breaks both light and glare into separate subcategories for discussion in accordance with the annotated outline. Measure VIS-7 contained in Section 3.6.4 of this Final EIR/EIS stipulates that, should a build alternative be selected as the Preferred Alternative, “During preparation of PS&E, a lighting plan will be prepared by Caltrans. The lighting fixtures will be designed to minimize glare on adjacent properties and into the night sky. Lighting will be shielded with nonglare hoods and focused within the I-710 Corridor Project right-of-way.” Additionally, as discussed in Section 1.1 of this appendix, the No Build Alternative was identified as the Preferred Alternative. Therefore, there would be no light and glare impacts resulting from either build alternative.

L-27-195

As discussed in Section 1.1 of this appendix, the No Build Alternative has been identified as the Preferred Alternative and Alternative 7, which includes the freight corridor, has been eliminated from further consideration.

L-27-196

A discussion of cumulative adverse impacts related to aesthetics has been added to the Mandatory Findings of Significance in Chapter 4.0, CEQA Evaluation.

L-27-197

The graphic included in the RDEIR/SDEIS is for informational purposes only. For more detailed graphical data, refer to the publicly available Historic Property Survey Report, which includes a 24-page detailed Area of Potential Effects (APE) map.

L-27-198

The NOP for the Draft EIR/EIS was circulated in 2008 and therefore it is not required to follow the requirements of Assembly Bill 52. While specific reference to Assembly Bill 52 does not appear in the document, Caltrans has provided documentation of consultation with appropriate Native American tribes. Please refer to text under “Native American Consultation” in Section 3.7.2.5 of the RDEIR/SDEIS and in this Final EIR/EIS for the full list of names of representatives contacted during the course of this project. As CEQA lead agency, Caltrans consulted with California Native American tribes that were traditionally and culturally affiliated with the geographic area of the proposed project.

L-27-199

The two historical resources referenced were not included in the Historical Resources Evaluation Report because they are not located within the project’s Area of Potential Effects

(APE). The APE is the area within which an undertaking may directly or indirectly cause changes in the character or use of historic properties, should any be present. The Masonic Hall at 5351-5353 Long Beach Boulevard is located approximately .42 miles east of the APE, separated from the project by the Los Angeles River Channel and two blocks of residential development. The Pressburg Residence at 167 East South Street is located approximately 0.36 miles east of the APE, separated from the build alternatives by the Los Angeles River Channel and five blocks of residential development. These buildings will not be directly or indirectly affected by the build alternatives.

L-27-200

The Historic Properties Treatment Plan was included as an actual stand-alone measure in Section 3.24, Construction, of the RDEIR/SDEIS as Measure CON-CUL-3, and has been prepared as an appendix to the Finding of No Adverse Effect document concurred upon by SHPO on December 20, 2018. The Historic Property Treatment Plan is a guidebook that, should a build alternative be selected as the Preferred Alternative, would lay out procedures for scenarios that may be encountered as the project progresses and was developed in consultation with the State Historic Preservation Officer (SHPO).

L-27-201

As stated in Section 3.8.3.1 of the RDEIR/SDEIS, localized channel modifications would be required to maintain the existing channel hydraulic capacity under the build alternatives. Therefore, the existing channel hydraulic capacity would not change with implementation of the modifications proposed as part of the build alternatives. However, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative and localized channel modifications would not be necessary.

L-27-202

As requested in this comment, the term “floodway” was replaced with “floodplain” where applicable within this Final EIR/EIS, unless it is referencing a designated floodway identified on the Flood Insurance Rate Map (FIRM). The Los Angeles River is a regulatory floodway, which is the channel of a river or other watercourse and the adjacent land areas that must be reserved in order to discharge the base flood without cumulatively increasing the water surface elevation more than a designated height.

L-27-203

The potential necessity of a CLOMR is discussed in Section 3.8.3.1. Although no revisions to the FEMA FIRM maps are anticipated at this time, should a build alternative be selected as the Preferred Alternative, Measure FP-1 would provide for the preparation of a Final Flood Control

Facilities Report and Final Location Hydraulic Study during final design, when more detailed design plans would be available, which would assess the risk of floodplain impacts and demonstrate that the design of the build alternative provides acceptable flood protection. The level of risk was assessed in accordance with USACE authorized design discharge. The modeling results from these reports would be included in the application for a CLOMR and/or Letter of Map Revision, if required, which would be processed through the Los Angeles County Flood Control District and FEMA. However, a CLOMR and/or Letter of Map Revision will be unnecessary since the No Build Alternative has been selected as the Preferred Alternative.

In addition, acknowledgement of the need for Section 408 permits was noted in Table 2.5-1 of the RDEIR/SDEIS. Therefore, no further discussion of Section 408 permits was added to the Final EIR/EIS.

L-27-204

As stated in Section 3.8.3.1 of the RDEIR/SDEIS and this Final EIR/EIS, improvements within the 100-year floodplain proposed under Alternative 5C would result in direct, permanent impacts to the Los Angeles River, Rio Hondo and Compton Creek, which are considered potentially jurisdictional to the USACE, the California Department of Fish and Wildlife (CDFW) and the Regional Water Quality Control Board (RWQCB). Table 3.25-6 in Section 3.25.4.16 of the RDEIR/SDEIS and this Final EIR/EIS includes impacts under each build alternative to potentially jurisdictional and nonjurisdictional areas. Should a build alternative be selected as the Preferred Alternative, permits/approvals needed, and required mitigation would be coordinated with the appropriate resource agencies. However, as stated previously, these permits will not be obtained since the No Build Alternative has been selected as the Preferred Alternative.

L-27-205

Please refer to Response to Comment L-27-202 regarding the term “floodway”.

L-27-206

As shown in Table 2.5-1 of the RDEIR/SDEIS, for the build alternatives, it was anticipated that, should a build alternative be selected as the Preferred Alternative, a Section 408 permit for modification to levees would be required from the Unites States Army Corps of Engineers. However, as stated previously, the No Build Alternative has been selected as the Preferred Alternative and therefore a Section 408 permit will not be necessary. Section 3.8, Hydrology and Floodplain, of the Final EIR/EIS was revised to clarify the need for a Section 408 Permit under the build alternatives.

L-27-207

As discussed in Section 2.3.2.2 of the RDEIR/SDEIS and this Final EIR/EIS, under the build alternatives, there would be modifications to existing pump stations and new pump stations added, as shown in Figure 2.3-8. As discussed in Section 3.8.3.1 of the RDEIR/SDEIS and this Final EIR/EIS, there would be 22 existing pump stations impacted by the build alternatives. Out of the 22 locations, 18 locations would require modification including upgrading facilities to accommodate projected peak flows, relocation due to proposed improvements, or reconstruction due to freeway widening and/or profile changes. All pump stations located on the east side of the Los Angeles River would be protected-in-place during construction of either build alternative. Table 3.8-3 lists the name, location and modifications for each affected pump station. Caltrans and Metro acknowledge the importance of the Long Beach MUST project to the City and appreciate that opportunities for coordination do exist between the two infrastructure projects. As stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, the Long Beach MUST facility will not need to be used for stormwater treatment and/or storage.

L-27-208

The text in Measure FP-1 is correct as is, and no changes are required. Please also refer to Response to Comment L-27-203 regarding the need for a CLOMR and/or Letter of Map Revision.

L-27-209

Please refer to Measures WQ-1 through WQ-3 in Section 3.9.4 of the Final EIR/EIS which would also be implemented to meet water quality goals related to TMDLs should a build alternative be selected as the Preferred Alternative. However, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative and therefore implementation of these measures will not be necessary.

L-27-210

Impacts to the Lynwood Retention Basin and Dominguez Gap Spreading Grounds would only have occurred under Alternative 7. As stated in Section 3.9.1.2 of the RDEIR/SDEIS, details regarding water quality standards in a project area are contained in the applicable RWQCB Basin Plan. This section includes a description of existing state regulations that the build alternatives must comply with. However, as discussed in more detail in Section 1.1 of this appendix, the No Build Alternative has been identified as the Preferred Alternative and therefore there will be no impacts to the Lynwood Retention Basin or Dominguez Gap Spreading Grounds.

L-27-211

Caltrans and Metro acknowledge the importance of the Long Beach MUST project to the City and appreciate that opportunities for coordination do exist between the two infrastructure projects. Please refer to Response to Comment L-27-207 regarding the use of the LB MUST facility by the I-710 Corridor Project build alternatives.

Section 3.8.3.1 of the RDEIR/SDEIS stated “The build alternatives would require substantial reconstruction of the existing drainage systems including drainage inlets, storm drains, cross culverts, dikes, overside drains, concrete and earthen channels, pump stations, and detention basins. Most of the existing on-site drainage systems would be replaced with new facilities. Some existing facilities may be extended to accommodate the wider freeway.” In some segments of the build alternatives, notably the area crossing I-105, reconstruction of systems are not proposed because the highway is relatively modern and roadway modifications are minimal. However, segments through the City of Long Beach, notably where flooding has occurred, would require substantial system reconstruction as described. However, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no reconstruction of existing drainage systems.

L-27-212

Section 3.8 of the RDEIR/SDEIS was intended to inform the public of potential floodplain impacts resulting from the build alternatives, and includes avoidance, minimization, and mitigation measures as required. Additional information regarding offsite sources is not required in this section to inform the public of potential floodplain impacts. The Preliminary On-site Hydrology Report accomplished the objectives outlined in its executive summary, some of which were used to support the RDEIR/SDEIS. However, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no impact to the drainage system

L-27-213

As stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no need for replacement pump stations.

L-27-214

The repair of existing drainage systems is performed in the due course of maintenance of the overall State Highway System and is generally also funded by specific maintenance funding sources. Although some drainage systems may be protected in place under the build alternatives, the construction of the build alternatives would not preclude the regular maintenance of those systems. However, as stated in Response to Comment L-27-1, the No

Build Alternative has been selected as the Preferred Alternative and therefore, there will be no impact to existing drainage systems. It should be noted that the I-710 Corridor Project is not responsible for upgrading those systems that are to be protected in place.

L-27-215

It is important to note that the RDEIR/SDEIS is intended to disclose the impacts and avoidance, minimization, and mitigation measures of the build alternatives. Should a build alternative be selected as the Preferred Alternative, the improvements proposed under the build alternatives would be designed to engineering standards and would provide for adequate design discharge, in accordance with Caltrans guidance. Further, as discussed in Section 3.8.4 of this Final EIR/EIS, should a build alternative be selected as the Preferred Alternative, Measure FP-1 would require a Final Flood Control Facilities Report/Final Location Hydraulic Study to be prepared during final design, which would inform design features. However, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, there would be no impacts related to avoidance, minimization, and/or mitigation measures.

L-27-216

Please also refer to Response to Comment L-27-213 regarding FIRM maps. As discussed in Section 3.8.3.1 in the RDEIR/SDEIS, Alternatives 5C and 7 would consist of highway improvements that would require encroachments within the 100-year floodplain in the Los Angeles River, the Compton Creek, and the Rio Hondo Channel as part of the bridge and levee improvements and utility relocations. According to the *Flood Control Facilities Report* (2017), Alternatives 5C and 7 would not change the capacity of the Los Angeles River, Compton Creek, and the Rio Hondo Channel to carry water or result in a measurable impact to the 100-year floodplain elevation. The proposed encroachments would not result in any adverse impacts on the natural and beneficial floodplain values, would not result in a substantial change in flood risk or damage, and would not have substantial potential to cause interruption or termination of emergency services or emergency routes. Therefore, Alternatives 5C and 7 would not constitute a significant floodplain encroachment as defined in 23 CFR 650.105(q). However, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, updates to FIRM mapping at the project location will not be necessary.

L-27-217

This comment is referencing a comment previously submitted by the City on the 2012 Draft EIR/EIS and is relevant to alternatives no longer under consideration. However, please refer to Responses to Comments L-27-213 and L-27-216 regarding FIRM maps.

L-27-218

This comment is referencing a comment previously submitted by the City on the 2012 Draft EIR/EIS and is relevant to alternatives no longer under consideration. However, please note that as discussed in Section 3.9.3 of the RDEIR/SDEIS, Alternatives 5C and 7 would increase impervious surface areas, which would increase runoff volume and pollutant loads. Alternatives 5C and 7 would require replacement or extension of the existing drainage systems such as drainage inlets along the median and shoulders to accommodate the increased project flows. Impacts to water quality of receiving waters may be expected from the loading of various constituents typically associated with highway runoff. These potential operational impacts, Should a build alternative be selected as the Preferred Alternative, would be addressed through the incorporation of design pollution prevention BMPs, treatment BMPs, and adherence to the necessary operational maintenance protocols identified in the Caltrans SWMP. As described in the *Storm Water Data Report* (SWDR) (January 2017), proposed design pollution prevention BMPs would include preserving existing vegetation wherever feasible, incorporation of concentrated flow conveyance systems with velocity-reducing outlet structures, and providing slope protection with vegetation. Proposed treatment BMPs would include biofiltration swales, biofiltration strips, infiltration basins, media filters, detention basins, gross solids removal devices, and wet basins. Proposed operational maintenance BMPs would include storm drain cleaning and normal roadway and bridge maintenance, in addition to maintaining all vegetated slopes. However, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, there would be no increase in impervious surface.

L-27-219

This comment is referencing a comment previously submitted by the City on the 2012 Draft EIR/EIS and is relevant to alternatives no longer under consideration. However, brief descriptions of the existing drainage facilities in the I-710 corridor, some of which contain terrain and size descriptions, can be found in Section 3.8.2.2 of the RDEIR/SDEIS. Tables 3.8-2 and 3.8-3 in Section 3.8.3.1 list the existing facilities requiring removal and reconstruction under the build alternatives.

L-27-220

This comment is referencing a comment previously submitted by the City on the 2012 Draft EIR/EIS and is relevant to alternatives no longer under consideration. Substantial longitudinal modifications to the Los Angeles River levees are not proposed under Alternatives 5C or 7.

L-27-221

This comment is referencing a comment previously submitted by the City on the 2012 Draft EIR/EIS and is relevant to alternatives no longer under consideration. However, as stated in Section 3.8.3.1 of the RDEIR/SDEIS, all encroachments related to the build alternatives have been considered low risk by location hydraulic studies performed at 133-year flood levels. This analysis included consideration of all project features proposed as part of the build alternatives, including noise barriers.

L-27-222

As discussed in Section 3.8.4 of this Final EIR/EIS, should a build alternative be selected as the Preferred Alternative, Measure FP-1 would require a Final Flood Control Facilities Report/Final Location Hydraulic Study to be prepared during final design of the build alternatives. However, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, studies pertaining to City owned and/or maintained facilities, or potentially cooperative project features, will not be necessary.

L-27-223

This comment is referencing a comment previously submitted by the City on the 2012 Draft EIR/EIS and is relevant to alternatives no longer under consideration. Because the scope of Alternatives 5C and 7 did not include substantial longitudinal modifications to the Los Angeles River levee, a revised Los Angeles River Impact Report was not prepared in support of the RDEIR/SDEIS. In addition, since the No Build Alternative has been selected as the Preferred Alternative, coordination with the LACFCD regarding floodplain encroachments would not be necessary.

L-27-224

The referenced amendments to the Caltrans MS4 Permit have been included in Section 3.9.1.3 of this Final EIR/EIS.

L-27-225

As stated in Response to Comment L-27-210, the Dominguez Gap Basin is not impacted under the Preferred Alternative.

L-27-226

As discussed in Section 3.9.3.1 of the RDEIR/SDEIS, proposed treatment BMPs under the build alternatives would include 40 biofiltration swales, 12 media filters, 32 infiltration/detention basins, and one wet basin, as well as eight gross solids removal devices where feasible.

Although the introduction of treatment BMPs as part of the build alternatives would represent an improvement when compared to the No Build condition, as there currently are 60 Caltrans-maintained BMPs treating freeway runoff on I-710, the No Build Alternative has been selected as the Preferred Alternative and therefore, BMPs are no longer necessary.

L-27-227

In response to this comment, the following revisions have been made to the text in Section 3.9.3.1 of this Final EIR/EIS:

> BMPs would be designed to treat low flows from more regular storms. The Caltrans Permit requires that the stormwater runoff water volumes used for sizing BMPs be based on the 85th percentile, 24-hour storm event (Water Quality event). For estimating purposes, this event is roughly equivalent to ~~,and BMPs would be sized according to the results o~~ two-year peak-flow storm~~ events which are equivalent to 85th percentile storms~~.

L-27-228

Please refer to Response to Comment L-27-207 regarding impacts to pump stations.

L-27-229

Please refer to Response to Comment L-27-210 regarding impacts to the Dominguez Gap Basin.

L-27-230

Please refer to Responses to Comments L-27-207 and L-27-226 regarding impacts to pump stations and the use of the LB MUST system.

L-27-231

No references to treatment trains were included in the last paragraph on page 3.9-21 in Section 3.9.3.1 of the RDEIR/SDEIS. The statements in the referenced paragraph are not presumptive and are factual. No revisions to this Final EIR/EIS have been made in response to this comment.

L-27-232

As discussed in Section 3.9.3 of the RDEIR/SDEIS, Alternatives 5C and 7 would increase impervious surface areas, which would increase runoff volume and pollutant loads. Alternatives 5C and 7 would require replacement or extension of the existing drainage systems such as

drainage inlets along the median and shoulders to accommodate the increased flows from the build alternatives. Impacts to water quality of receiving waters may be expected from the loading of various constituents typically associated with highway runoff. Should a build alternative be selected as the Preferred Alternative, these potential operational impacts would be addressed through the incorporation of design pollution prevention BMPs, treatment BMPs, and adherence to the necessary operational maintenance protocols identified in the Caltrans SWMP. As described in the *Storm Water Data Report* (January 2017), proposed design pollution prevention BMPs would include preserving existing vegetation wherever feasible, incorporation of concentrated flow conveyance systems with velocity-reducing outlet structures, and providing slope protection with vegetation. Proposed treatment BMPs would include biofiltration swales, biofiltration strips, infiltration basins, media filters, detention basins, gross solids removal devices, and wet basins. Proposed operational maintenance BMPs would include storm drain cleaning and normal roadway and bridge maintenance, in addition to maintaining all vegetated slopes. However, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, BMPs will not be necessary.

L-27-233

Please also refer to Response to Comment L-27-232 regarding the need for BMPs.

L-27-234

Please also refer to Responses to Comments L-27-212 and L-27-232 regarding the need for BMPs. As stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, approvals from the RWQCB and USACE would not be required for Clean Water Act Section 401 and 404 Permits, respectively. Additionally, the relocation of the Dominguez Gap Spreading Grounds would not be necessary.

L-27-235

As discussed in Section 3.8.2.2 of the RDEIR/SDEIS, the Dominguez Gap Spreading Grounds, located in the northeast quadrant of the I-710/I-405 interchange, serve as recharge facilities and water quality basins.

It should be noted that comments L-27-235 through L-27-252 refer specifically to the Stormwater Drainage Report (SWDR), which was utilized during preparation of the RDEIR/SDEIS but is primarily a design document. The SWDR summarizes the stormwater quality issues and design decisions made regarding compliance of the build alternatives with Caltrans' National Pollutant Discharge Elimination System (NPDES) Permit. The SWDR is initiated in the Project Initiation Document (PID) phase, refined during the Project Approval/Environmental Document phase (the current phase of the project as of this writing), and finalized during final design and the Plans, Specifications, and Estimates (PS&E) phase

(should a build alternative be selected as the Preferred Alternative). The SWDR level of detail at the PID and PA/ED phases is often limited, as is the case for this project, and based on the available information developed for the build alternatives (which, should be noted, is preliminary). At the end of the PA/ED phase, the SWDR is intended to obtain project approval. Should a build alternative be selected as the Preferred Alternative, the SWDR would be updated to ensure consistency with the project's Water Quality Assessment Report and approved environmental document. The updates would also consider additional available information and further define costs. The SWDR available during PA/ED supports the Project Report and is not typically signed until after the environmental document is approved, as the SWDR needs to reflect the identification of the Preferred Alternative. However, since the No Build Alternative has been identified as the Preferred Alternative, The SWDR will not be updated during the PS&E phase to document the design details of BMPs incorporated into the build alternatives.

L-27-236

As discussed in Section 3.9.2.3 of the RDEIR/SDEIS, excessive nutrients (and their effects) and coliform are widespread problems in the watersheds, as well as excessive metals. The Los Angeles River Reach 1 (estuary to Carson Street) is listed as impaired for coliform bacteria, cyanide, cadmium, diazinon, trash, ammonia, dissolved copper, lead, nutrients (algae), pH, and dissolved zinc. The Los Angeles River Reach 2 (Carson Street to Figueroa Street) is listed as impaired for coliform bacteria, copper, nutrients (algae), oil, trash, ammonia, and lead. A list of expected and approved TMDLs was shown in Table 3.9-2.

L-27-237

Please refer to Responses to Comments L-27-232 and L-27-235 regarding TMDL limits.

L-27-238

Section 3.9 in the RDEIR/SDEIS and this Final EIR/EIS is intended to inform the public of potential water quality impacts from the build alternatives, and includes avoidance, minimization, and/or mitigation measures as required. Additional information regarding dry weather flows is not required in this section to inform the public of potential water quality impacts.

L-27-239

Please refer to Responses to Comments L-27-232 and L-27-235 regarding BMPs.

L-27-240

As discussed in Section 3.9.3.1 of the RDEIR/SDEIS, the cumulative risk level for the build alternatives were determined to be Risk Level 2 through the Construction General Permit (CGP) procedure. However, since the No Build Alternative has been identified as the Preferred

Alternative, it will not be necessary to confirm the risk level and update as necessary prior to completion of the PA/ED phase.

L-27-241

Please refer to Response to Comment L-27-240 regarding the cumulative risk factor for the build alternatives.

L-27-242

Section 3.9.1 of the RDEIR/SDEIS provides the appropriate regulatory setting for water quality and stormwater runoff, including federal and state regulations.

L-27-243

Please refer to Responses to Comments L-27-212 and L-27-238 regarding pump stations and the LB MUST facility.

L-27-244

Please refer to Responses to Comments L-27-232 and L-27-235 regarding stormwater discharges, the use of BMPs, and TMDL requirements.

L-27-245

Please refer to Response to Comment L-27-236 regarding TMDLs.

L-27-246

As shown in Table 3.25-1 in Section 3.25 of the RDEIR/SDEIS, the LB MUST facility project is in preliminary design and engineering stages. Pre-bidding was held on January 17, 2017, and bids were received in February 2017. According to a schedule summary provided on the website https://longbeach.gov/pw/projects/lbmust/, construction for the LB-MUST facility began in November 2021, and is scheduled to take approximately 2 years for the completion of the entire site. The project would be designed to treat diverted runoff water that would otherwise discharge into the Los Angeles River. Stormwater that enters the Los Angeles River has historically carried pollutants containing trash, bacteria, metals and hydrocarbons that have contaminated our beaches and waterways. By diverting this stormwater before it enters recreational waters, LB MUST has the potential to improve Long Beach’s recreational water quality. Please refer to Response to Comment L-27-207 for more information regarding the LB MUST project and its interface with the I-710 Corridor Project. Please also refer to Response to Comment L-27-235 regarding the SWDR.

L-27-247

Please refer to Responses to Comments L-27-235 and L-27-240 regarding risk level determination and the SWDR prepared for the build alternatives. In addition, Alternative 5C was not identified as the Preferred Alternative.

L-27-248

Please refer to Responses to Comments L-27-235 and L-27-240 regarding risk level determination and the SWDR prepared for the build alternatives. In addition, Alternative 7 was not identified as the Preferred Alternative.

L-27-249

Please refer to Responses to Comments L-27-235 and L-27-246 regarding the LB MUST project and it's interface with the I-710 Corridor Project.

L-27-250

As discussed in Section 3.9.1.3 of this Final EIR/EIS, by law, all storm water discharges associated with construction activity where clearing, grading, and excavation results in soil disturbance of at least one acre must comply with the provisions of the Construction General Permit. Please also refer to Response to Comment L-27-235 regarding the SWDR prepared for the build alternatives. Since the No Build Alternative has been selected as the Preferred Alternative, the SWDR, including checklist SW-3, will not be updated during final design.

L-27-251

Please refer to Responses to Comments L-27-235 and L-27-236 regarding treatment BMPs.

L-27-252

Please refer to Response to Comment L-27-235 regarding the SWDR prepared for the build alternatives.

L-27-253

This comment is referencing a comment previously submitted by the City on the 2012 Draft EIR/EIS and is relevant to alternatives no longer under consideration. As stated in Response to Comment L-27-210, the Dominguez Gap Basin is not impacted under the No Build Alternative which has been identified as the Preferred Alternative.

L-27-254

This comment is referencing a comment previously submitted by the City on the 2012 Draft EIR/EIS and is relevant to alternatives no longer under consideration. In addition, this comment is an incomplete sentence and does not contain enough information to warrant the provision of a response.

L-27-255

This comment is referencing a comment previously submitted by the City on the 2012 Draft EIR/EIS and is relevant to alternatives no longer under consideration. Please also refer to Response to Comment L-27-218 regarding how the runoff from the build alternatives would be treated and controlled in order to achieve both the interim and final targets.

L-27-256

This comment is referencing a comment previously submitted by the City on the 2012 Draft EIR/EIS and is relevant to alternatives no longer under consideration. However, updated expected and approved TMDLs were listed in Table 3.9-2 in Section 3.9.2.3 of the RDEIR/SDEIS.

L-27-257

This comment is referencing a comment previously submitted by the City on the 2012 Draft EIR/EIS and is relevant to alternatives no longer under consideration. However, it should be noted that, should a build alternative be selected as the Preferred Alternative, Measures WQ-1 through WQ-3 in Section 3.9.4 of the RDEIR/SDEIS would be implemented to address long-term water quality impacts from the build alternatives. However, since the No Build Alternative has been selected as the Preferred Alternative, it will not be necessary to determine the final disposition and siting of BMPs. The analysis of funding sources as they relate to the ability to maintain water quality improvements is not appropriate for inclusion into a project-level environmental document intended to identify and disclose the environmental impacts of a proposed project.

L-27-258

This comment is referencing a comment previously submitted by the City on the 2012 Draft EIR/EIS and is relevant to alternatives no longer under consideration. However, the estimated change in pollutants associated with brake dust, tire wear, and exhaust for the roadway network within the I-710 Area of Interest (AOI) that would be attributable to Alternative 5C relative to future No Build travel conditions are mapped on Figure 4-1b, “Comparison of 2035 Alternative 5C to 2035 Alternative 1, Total PM2.5 Emissions and Total PM10 Emissions” and mapped in Figure 4-1c for Alternative 7 in the *I-710 Project AQ/HRA/GHG Technical Report* (2017).

Improvements to I-710 proposed as part of the build alternatives tend to draw traffic to I-710 from other roadways such as the arterial network. Figures 4-1b and 4-1c show increases in PM2.5 and PM10 directly on I-710, but no change or slight decreases in these pollutants in the vicinity of 7th Street, 9th Street, and Anaheim within the City of Long Beach.

L-27-259

This comment is referencing a comment previously submitted by the City on the 2012 Draft EIR/EIS and is relevant to alternatives no longer under consideration. However, it should be noted that specific construction staging areas, including routes into and out of the staging/storage areas, sources of required concrete, borrow pits, processing pits, and transportation routes, have not yet been identified for the build alternatives, and would not be known in detail until final design (should a build alternative be selected as the Preferred Alternative). As the activities occurring at any concrete batch plant would be considered part of construction of the I-710 Corridor Project build alternatives, they would also be subject to all applicable avoidance, minimization, and/or mitigation measures regarding water quality outlined in Section 3.8.3 of this Final EIR/EIS. However, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, defining this level of detail during final design will not be necessary.

L-27-260

This comment is referencing a comment previously submitted by the City on the 2012 Draft EIR/EIS and is relevant to alternatives no longer under consideration. The substantial longitudinal relocation of power lines adjacent to the Los Angeles River that was proposed in the 2012 Build Alternatives is no longer proposed under Alternatives 5C and 7.

L-27-261

Please refer to Response to Comment L-27-257 regarding the use of BMPs.

L-27-262

This comment is referencing a comment previously submitted by the City on the 2012 Draft EIR/EIS and is relevant to alternatives no longer under consideration. The SWDR ascertains the feasibility and reasonability of permanent BMPs to treat an area within Caltrans' right-of-way. Please also refer to Response to Comment L-27-235 regarding the SWDR prepared for the build alternatives.

L-27-263

This comment is referencing a comment previously submitted by the City on the 2012 Draft EIR/EIS and is relevant to alternatives no longer under consideration. However, it should be

noted that to comply with its permit, Caltrans must treat the equivalent of 100 percent of new impervious surfaces. The treatment of existing and new surfaces is converted to compliance units (Cus). Because the build alternatives treat previously untreated surfaces, the build alternatives effectively "bank" Cus, and the total Cus that the build alternatives add or gain far exceed the Cus for only the new surface area. It should be noted that the treatment estimate of 83 percent was intended as a total measure of improvement in a manner that is easy for the general public to understand. However, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, it will not be necessary to treat new impervious surfaces.

L-27-264

This comment is referencing a comment previously submitted by the City on the 2012 Draft EIR/EIS and is relevant to alternatives no longer under consideration. Please also refer to Response to Comment L-27-263 for further information regarding runoff treatment percentage.

L-27-265

This comment is referencing a comment previously submitted by the City on the 2012 Draft EIR/EIS and is relevant to alternatives no longer under consideration. However, it should be noted that an EIR/EIS is not required to evaluate equivalency between different standards. The design of Caltrans' BMPs follows guidelines set forth in the Caltrans Stormwater Quality manuals and handbooks, specifically the Project Planning and Design Guide.

L-27-266

This comment is referencing a comment previously submitted by the City on the 2012 Draft EIR/EIS and is relevant to alternatives no longer under consideration. However, it should be noted that the purpose of the Draft EIR/EIS and RDEIR/SDEIS is to evaluate and disclose the environmental impacts that would occur as a result of the proposed project, and although post-construction effectiveness assessments of the system as a whole may be required under the current or a future MS4 permit for the build alternatives, that assessment is beyond the scope of an EIR/EIS analysis. As discussed in Section 3.9.1.3, Caltrans storm water discharges must meet water quality standards through implementation of permanent and temporary (construction) BMPs to the Maximum Extent Practicable, and other measures as the SWRCB determines to be necessary to meet the water quality standards.

L-27-267

Please refer to Responses to Comments L-27-210 and L-27-253 regarding impacts to the Dominguez Gap and TMDLs.

L-27-268

This comment is referencing a comment previously submitted by the City on the 2012 Draft EIR/EIS and is relevant to alternatives no longer under consideration. However, it should be noted that Measures U&ES-2 and WQ-1 in the RDEIR/SDEIS provide for coordination with local jurisdictions regarding utility relocations and water quality standards compliance should a build alternative be selected as the Preferred Alternative. However, as noted in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative.

L-27-269

This comment is referencing a comment previously submitted by the City on the 2012 Draft EIR/EIS and is relevant to alternatives no longer under consideration. However, it is acknowledged that an increase in flow volume would occur under both Alternatives 5C and 7. It is unknown how the increase in flow volume would "dramatically increase the number of wet-weather storms" as indicated in the comment. Further, it is important to note that the purpose of the Draft EIR/EIS and RDEIR/SDEIS is to evaluate and disclose the environmental impacts of the proposed project, and a change in sampling procedures required by the *I-710 Corridor Aesthetics Master Plan* (February 2014) is beyond the scope of the project.

L-27-270

This comment is referencing a comment previously submitted by the City on the 2012 Draft EIR/EIS and is relevant to alternatives no longer under consideration. The Coordinated Integrated Monitoring Program (CIMP) for the Lower Los Angeles River Watershed Monitoring Group document dated December 21, 2017 was used to confirm the latest monitoring sites pertaining to the Los Angeles River. All of the sampling sites are in the floodway. However, one of the sites includes a "mass emission station." This is the Los Angeles County Department of Public Works Gaging Station F319-R, which includes an 11x13-foot stilling well house situated on the western levee, south of Wardlow Road. The station and supporting infrastructure is proposed to be relocated up to 400 feet south of its current location under the build alternatives. This information has been added to Section 3.9.3 of this Final EIR/EIS. However, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative and there will be no need to relocate the Public Works Gaging Station F319-R.

L-27-271

This comment is referencing a comment previously submitted by the City of the 2012 Draft EIR/EIS and is relevant to alternatives no longer under consideration. However, please also refer to Response to Comment L-27-270 and Response to Comment 27-232 regarding participation with local municipalities.

L-27-272

This comment is referencing a comment previously submitted by the City on the 2012 Draft EIR/EIS and is relevant to alternatives no longer under consideration. However, it is important to note that bridges crossing the Los Angeles River are part of the local roadway system and are subject to the permit requirements of the relevant local jurisdiction. The City of Long Beach Municipal Storm Water and Urban Runoff Discharge Permit would apply to bridges that would be replaced under the build alternatives within the City of Long Beach. However, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative and there will be no permit requirements.

L-27-273

This comment is referencing a comment previously submitted by the City on the 2012 Draft EIR/EIS and is relevant to alternatives no longer under consideration. However, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative and compensatory mitigation for jurisdictional aquatic resources is no longer necessary to obtain permits from the USACE and CDFW.

L-27-274

This comment is referencing a comment previously submitted by the City of the 2012 Draft EIR/EIS and is relevant to alternatives no longer under consideration. It should be noted that the RDEIR/SDEIS is not required to include calculations of water quality flows or identify discharge points. However, this information is included in the SWDR, which was available for review during circulation and was commented on by the City of Long Beach (refer to Responses to Comments L-27-235 to L-27-252) It should also be noted that Section 3.9, Water Quality, of the RDEIR/SDEIS and the technical studies outlined in Section 3.9.2 were all prepared in accordance with Caltrans guidelines and procedures in order to assess and disclose potential environmental impacts as a result of the project.

L-27-275

This comment is referencing a comment previously submitted by the City of the 2012 Draft EIR/EIS and is relevant to alternatives no longer under consideration. However, should a build alternative be selected as the Preferred Alternative, Measures WQ-1 through WQ-3 in Section 3.9.4 of the RDEIR/SDEIS would ensure compliance with the latest code requirements at the time of circulation of the environmental document. However, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, the latest code requirements will not need to be confirmed and assessed at the time of final design and construction.

L-27-276

This comment is referencing a comment previously submitted by the City of the 2012 Draft EIR/EIS and is relevant to alternatives no longer under consideration. However, as stated in Section 3.9.3.1 of the RDEIR/SDEIS, permanent impacts to the water quality of groundwater in the vicinity of the I-710 Corridor Project would be minimal upon completion of the construction of either build alternative because there would not be any increase in the transport of pollutants into the groundwater through infiltration during the operational life of the new structures. The sediment surface of some of the affected channels is impervious, while other locations are natural bottom. Operation of the build alternatives would not change the nature or extent of these surfaces; therefore, no net gain or loss in infiltration is anticipated from operation of the build alternatives. The treatment BMPs selected as part of the build alternatives would have provided infiltration opportunities along the alignment, which would have been a positive influence to the local hydrogeology. However, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative and therefore there would be no permanent impacts to the water quality of groundwater in the vicinity of the I-710 Corridor Project.

L-27-277

This comment is referencing a comment previously submitted by the City of the 2012 Draft EIR/EIS and is relevant to alternatives no longer under consideration. However, it should be noted that the No Build Alternative has been selected as the Preferred Alternative and no BMPs will be established.

L-27-278

The sources of the mapping noted in Section 7.0 of the 2010 Geotechnical Final Report have been included in Section 3.10.2.1 as requested.

L-27-279

The figures and appendices were erroneously omitted from the *Geotechnical Final Report* (January 2010) posted on the Caltrans website; the fully compiled report is available from Caltrans upon request.

L-27-280

Please refer to Response to Comment L-27-279 regarding the *Geotechnical Final Report*.

L-27-281

The California Registered Professional Geologist (PG) or a Registered Professional Engineer (PE) has been identified in the Final Geotechnical Report, and is available from Caltrans upon request.

L-27-282

Section 3.12 of this Final EIR/EIS has been updated to clarify that additional file reviews have been conducted to supplement the online database reviews and assessments prepared for the project. The ISA was prepared in general accordance with Caltrans' internal guidance document on ISAs. The Caltrans guidance is intended to be consistent with American Society of Testing and Materials (ASTM) Standard Practice for Environmental Site Assessments: Phase I Site Assessment Process, which is available to the public through ASTM. It should also be noted that because of the similar geographic locations of the build alternatives, hazardous waste concerns were not considered to be a major differentiating factor in the comparison of the build alternatives.

L-27-283

Please refer to Response to Comment L-27-282. Sites of Potential Environmental Concern classified as high risk were listed for Alternative 5C in Table 3.12-1 and for Alternative 7 in Table 3.12-2 in Section 3.12.4 of the RDEIR/SDEIS. Sites classified as medium risk were not included in the table due to the sizable amount of data and readability. The full risk assessment for sites of potential concern is included in the *Final Preliminary Initial Site Assessment* (February 2017), available on Caltrans' website at http://www.dot.ca.gov/d7/env-docs/docs/710corr-eir/. As discussed in Section 3.12.2.7, the criteria for risk categorizations were based on land use and conditions that have the potential to produce or cause site contamination and materials that require special handling. The basis for determining each parcels risk was based upon its use, regulatory status, visual observations, and the example sites for risk analysis.

As discussed in Section 3.12.3.1, during the agency database review, 134 EDR listings were identified associated with 248 of the parcels within Alternative 5C Design Options and 133 EDR listings were identified associated with 284 of the parcels within Alternative 7 Design Options, which are summarized in Appendix P. As discussed in Section 3.12.2, because access to the individual properties and parcels was not permitted at the time of ISA preparation, and given the large amount of parcels potentially impacted by the build alternatives, only a pre-screening and risk assessment for each parcel was completed for inclusion in the RDEIR/SDEIS. Section 3.12 of this Final EIR/EIS has been updated to clarify that additional file reviews have been conducted to supplement the online database reviews and assessments prepared for the project, but consistent with the RDEIR/SDEIS, only high risk sites have been included.

L-27-284

Should a build alternative be selected as the Preferred Alternative, Measures HW-1 through HW-7 in Section 3.12.4, and CON-HW-1 through CON-HW-3 in Section 3.24.4.12 of the RDEIR/SDEIS would be implemented to substantially reduce adverse impacts related to hazardous materials and hazardous wastes during construction of the build alternatives. Additional information would be required (i.e., file review) to determine the potential impact of parcels within the two build alternatives. Sufficient evidence was not gathered or completed at every parcel to fully characterize the potential presence of hazardous materials or contaminants, as access was not permitted to conduct thorough investigations. Should a build alternative be selected as the Preferred Alternative, and if contamination is present at the parcels that cannot be mitigated, the limits of acquisition may be adjusted to avoid the residual contamination. If the limits of acquisition cannot be adjusted, minimization measures may include indemnification, reduction in price, or acquisition as highway easements instead of in fee. Please also refer to Responses to Comments L-27-282 and L-27-283.

L-27-285

In response to this comment, Measure CON-HW-3 has been refined to describe the actions that would be taken if contaminated groundwater is detected during the studies required under the measure (should a build alternative be selected as the Preferred Alternative). However, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative and therefore there will be no impact to groundwater.

L-27-286

Section 3.12.2.7 of this Final EIR/EIS has been updated to reflect the Soil Management Agreement for Aerially Deposited Lead-Contaminated Soils (Agreement) effective July 1, 2016, that supersedes the prior ADL Variance. In addition, Measure HW-3 in Section 3.12.4 of the RDEIR/SDEIS stated that, should a build alternative be selected as the Preferred Alternative, prior to soil excavation, a soil investigation for aerially deposited lead and other contaminants of concern would be conducted.

L-27-287

As discussed in Section 3.12.2.8 of the RDEIR/SDEIS and this Final EIR/EIS, all operating and most closed landfills are required to have landfill gas migration control systems and monitoring programs. Additionally, most active and many closed landfills have landfill gas capture and treatment and destruction systems. Therefore, the likelihood of methane landfill gas affecting an area beyond the landfill property is low. In addition, should a build alternative be selected as the Preferred Alternative, Measures HW-1 through HW-7 in Section 3.12.4, and CON-HW-1 through CON-HW-3 in Section 3.24.4.12 would be implemented to substantially reduce adverse impacts

related to hazardous materials and hazardous wastes during construction of the build alternatives.

As noted in Table 2.5-1 in Section 2.5 of the RDEIR/SDEIS, permits for structures or buildings within 200 feet of an active, abandoned, or idle oil or gas well, or within 1,000 feet of a landfill would be acquired from the Los Angeles Department of Water and Power (LADWP) Environmental Programs Division prior to construction of the build alternatives.

As discussed in Section 3.12.3.1 of the RDEIR/SDEIS and this Final EIR/EIS, each property of environmental concern to be acquired, should a build alternative be selected as the Preferred Alternative, would require testing in order to characterize specific soil and/or groundwater contaminants on the property, and a site-specific hazardous waste remediation plan would be developed for the appropriate removal and disposal of materials. In addition, a remediation plan and site closure plan, if required, would be implemented to clean up the site and provide for any subsequent monitoring to ensure the contamination would be remediated below regulatory thresholds. However, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative and therefore there would be no adverse impacts related to hazardous materials and hazardous wastes during construction.

L-27-288

As the I-710 Clean Truck Program (referred to in the RDEIR/SDEIS as the I-710 Corridor Project Zero Emission/Near Zero Emission Truck Technology Deployment Program) is a programmatic element of the build alternatives, the specific locations of any potential fueling stations has not been determined at the time this Final EIR/EIS was prepared; therefore, the specific environmental impacts of fueling stations are not known at this time. However, since the No Build Alternative (Alternative 1) has been selected as the Preferred Alternative, programmatic elements of the build alternatives, such as the I-710 Clean Truck Program will not be implemented by Caltrans as the Lead Agency under CEQA and NEPA and as the owner/operator of the I-710 freeway.

L-27-289

Caltrans and Metro respectfully disagree that analysis has been inappropriately deferred. Should a build alternative be selected as the Preferred Alternative, Measures HW-1 through HW-7 in Section 3.12.4, and CON-HW-1 through CON-HW-3 in Section 3.24.4.12 of the RDEIR/SDEIS would be implemented to substantially reduce adverse impacts related to hazardous materials and hazardous wastes during construction of the build alternatives. Additional information would be required (i.e., file review) to determine the potential impact of parcels within the two build alternatives. Sufficient evidence was not gathered or completed at every parcel to fully characterize the potential presence of hazardous materials or contaminants, as access was not permitted to conduct thorough investigations. Should a build alternative be

selected as the Preferred Alternative, and if contamination would be present at the parcels that cannot be mitigated, the limits of acquisition may need to be adjusted to avoid the residual contamination. If the limits of acquisition cannot be adjusted, minimization measures would include indemnification, reduction in price, or acquisition as highway easements instead of in fee. If interviews and further investigative work are conducted too soon, the information may become dated and have to be re-done to provide relevant information for the design, right-of-way acquisition, and construction phases of the project. However, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative and therefore Measures HW-1 through HW-7 in Section 3.12.4, and CON-HW-1 through CON-HW-3 will not be implemented. Please refer to Responses to Comments L-27-282, L-27-283, L-27-284, and L-27-287 regarding impacts related to hazardous waste.

L-27-290

Please refer to Responses to Comments L-27-282, L-27-283, L-27-284, and L-27-287 regarding impacts related to hazardous waste. The property located at 960 De Forest Avenue, in addition to the site of a former dry cleaning facility, was discussed in Table 3.12-3 in Section 3.12.4 of the RDEIR/SDEIS. Rocket Oil, located at 1701 West Anaheim Street, is neither a site of potential environmental concern, nor an adjoining property of potential concern, for either of the build alternatives.

L-27-291

The reference to Measures HW-1 through HW-8 in Section 3.12.3.1 of this Final EIR/EIS, as well as the Executive Summary, was corrected to be consistent with the list of measures in Section 3.12.4.

L-27-292

Please refer to Response to Comment L-27-288 regarding the I-710 Clean Truck Program (referred to in the RDEIR/SDEIS as the I-710 Corridor Project Zero Emission/Near Zero Emission Truck Technology Deployment Program).

L-27-293

Please refer to Responses to Comments L-27-282, L-27-283, L-27-284, and L-27-287 regarding impacts related to hazardous waste. It is also important to note that the measures included in Section 3.12.4 of the RDEIR/SDEIS do provide for specific performance measures, including appropriate testing, remediation, removal of contaminants, and preparation of a Construction Contingency Plan in accordance with Caltrans' Unknown Hazards Procedures for Construction, among others (should a build alternative be selected as the Preferred Alternative). However, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the

Preferred Alternative and therefore there will be impact from hazardous materials and development of appropriate minimization measures that include specific performance criteria that must be met is not necessary.

L-27-294

Please refer to Responses to Comments L-27-282, L-27-283, L-27-284, and L-27-287 regarding impacts related to hazardous waste. It is also important to note that the measures included in Section 3.12.4 of the RDEIR/SDEIS do provide for specific performance measures, including appropriate testing, remediation, removal of contaminants, and preparation of a Construction Contingency Plan in accordance with Caltrans' Unknown Hazards Procedures for Construction, among others (should a build alternative be selected as the Preferred Alternative). However, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative and therefore there will be impact from hazardous materials and development of appropriate minimization measures that include specific performance criteria that must be met is not necessary.

L-27-295

Please refer to Responses to Comments L-27-282, L-27-283, L-27-284, and L-27-287 regarding impacts related to hazardous waste. It is also important to note that the measures included in Section 3.12.4 of the RDEIR/SDEIS do provide for specific performance measures, including appropriate testing, remediation, removal of contaminants, and preparation of a Construction Contingency Plan in accordance with Caltrans' Unknown Hazards Procedures for Construction, among others (should a build alternative be selected as the Preferred Alternative). However, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative and therefore there will be impact from hazardous materials and development of appropriate minimization measures that include specific performance criteria that must be met is not necessary. Specific information regarding USTs was described in Tables 3.12-1, 3.12-2, and 3.12-3 of the RDEIR/SDEIS.

L-27-296

Section 3.24 of the RDEIR/SDEIS and this Final EIR/EIS describes the construction methods and related types of impacts considered for the build alternatives. Construction methods are the basis for assessing and qualifying the potential environmental impact from construction activities. As discussed in Section 3.24.3.9 of the RDEIR/SDEIS and this Final EIR/EIS, the construction activity that has the greatest potential to impact groundwater would involve the removal and disposal of groundwater during the excavation required for the structural foundations for I-710 under the build alternatives. However, the No Build Alternative has been selected as the Preferred Alternative and, therefore, there will be no construction activity.

L-27-297

Table 3.12-1 in Section 3.12.4 of the RDEIR/SDEIS included sites of potential environmental concern to the I-710 Corridor Project, and the rationale behind that classification, under the build alternatives. This table has been updated in this Final EIR/EIS.

L-27-298

Please refer to Responses to Comments L-27-282, L-27-283, L-27-284, and L-27-287 regarding impacts related to hazardous waste.

L-27-299

Please refer to Responses to Comments L-27-282, L-27-283, L-27-284, and L-27-287 regarding impacts related to hazardous waste.

L-27-300

Please refer to Responses to Comments L-27-282, L-27-283, L-27-284, and L-27-287 regarding impacts related to hazardous waste. It should be noted that although the RDEIR/SDEIS was based on the ISA prepared and circulated for public review, the ISA itself has no such public review requirement. Caltrans understands the implications of changing conditions and has considered these potential risks in its decision making to date and has applied commensurate project contingencies. Additional investigation will not occur during subsequent phases of project development since the No Build Alternative has been selected as the Preferred Alternative.

L-27-301

Please refer to responses to Comments L-27-282, L-27-283, L-27-284, and L-27-287 regarding impacts related to hazardous waste. As stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative and, therefore, there will be no additional environmental impacts that are currently not known.

L-27-302

The ISA was prepared in general accordance with Caltrans' internal guidance document on ISAs, which is not available to the public. The Caltrans guidance is intended to be consistent with *American Society of Testing and Materials (ASTM) Standard Practice for Environmental Site Assessments: Phase I Site Assessment Process*, which is available to the public through ASTM.

L-27-303

Please refer to Responses to Comments L-27-282, L-27-283, L-27-284, and L-27-287 regarding impacts related to hazardous waste. Caltrans and Metro respectfully disagree with the City's opinion that the analysis is flawed, as the referenced guidance is intended to be a tool rather than a mandate.

L-27-304

Please refer to Responses to Comments L-27-282, L-27-283, L-27-284, and L-27-287 regarding impacts related to hazardous waste. Section 3.12 of this Final EIR/EIS has been updated to clarify that additional file reviews have been conducted to supplement the online database reviews and assessments prepared for the project.

L-27-305

Please refer to Responses to Comments L-27-282, L-27-283, L-27-284, and L-27-287 regarding impacts related to hazardous waste. Due to the size and complexity of the build alternatives, design, right-of-way, and construction of the build alternatives would be expected to be implemented in multiple stages over several years (should a build alternative be selected as the Preferred Alternative). If interviews and further investigative work are conducted too soon, the information may become dated and have to be re-done to provide relevant information for the design, right-of-way acquisition, and construction phases of the build alternatives. However, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative and, therefore, interviews and further investigative work will not need to be conducted prior to programming these project development phases for each stage.

L-27-306

Off site adjacent properties of concern were disclosed in Table 3.12-3 of the RDEIR/SDEIS and in greater detail in the ISA. The information in Table 3.12-3 included known information regarding the presence of USTs, which may have impacts to groundwater. Should a build alternative be selected as the Preferred Alternative, Measure HW-4 in Section 3.12.4 of the RDEIR/SDEIS would specifically address the potential for contaminated groundwater.

L-27-307

Caltrans and Metro respectfully disagree with the City's opinion that the analysis is flawed, as the referenced guidance is intended to be a tool rather than a mandate. The inclusion of conclusions or recommendations concerning RECs is not required. However, recommendations for subsequent project activities for the build alternatives were made and disclosed in Section 7 of the ISA.

L-27-308

Please refer to Responses to Comments L-27-282, L-27-283, L-27-284, and L-27-287 regarding impacts related to hazardous waste. It should be noted that provisions for the handling of USTs (and other contaminants) encountered during construction of the build alternatives are included in Measure HW-6 in Section 3.12.4 of the RDEIR/SDEIS and this Final EIR/EIS. However, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative and, therefore, the suggested recommendations will not be necessary as discussed in Response to Comment L-27-305.

L-27-309

This comment is referencing a comment previously submitted by the City of the 2012 Draft EIR/EIS and is relevant to alternatives no longer under consideration. However, please refer to Responses to Comments L-27-282, L-27-283, L-27-284, and L-27-287 regarding impacts related to hazardous waste.

L-27-310

Please refer to Response to Comment L-27-309 regarding impacts related additional hazardous waste investigations.**L-27-311** This comment is referencing a comment previously submitted by the City of the 2012 Draft EIR/EIS and is relevant to alternatives no longer under consideration. However, as was discussed in Section 3.12.2.2 of the RDEIR/SDEIS and this Final EIR/EIS, the bridges, overpasses, interchanges, entrance and exit ramps, and other features of I-710 also have the potential to contain asbestos-containing material (ACM), which would also impact demolition activities related to the build alternatives. However, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative and, therefore, there would be no demolition of existing bridges, overpasses, interchanges, entrance and exit ramps, or other features of I-710 that have the potential to contain ACM or lead-based paint (LBP)

L-27-312

This comment states that the air quality section should analyze both an opening year and a horizon year (20 years after opening). As discussed in Section 3.13, Air Quality, of the

RDEIR/SDEIS and this Final EIR/EIS, 2035 was selected to represent future conditions to maintain consistency with the baseline year (2012) and horizon year (2035) used for the I-710 Traffic Model. As further detailed in Section 3.5, Traffic and Transportation/Pedestrian and Bicycle Facilities of the RDEIR/SDEIS, 2035 was used as the horizon year for future conditions to maintain consistency with the date of the socioeconomic data used in the Southern California Association of Governments' (SCAG) 2012–2035 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS). The rationale for this is that the geometric design for the build alternatives was prepared and completed between 2013 and 2015, and as such, the SCAG 2012 RTP and associated traffic forecasting model were used, which have a travel forecasting horizon year of 2035. Based on a comparative review of the key model inputs (i.e., demographics, and cargo forecasts), it was determined that the 2012 model and the recently updated 2016 model would not yield substantially different traffic forecasts, nor would they result in substantially different geometric designs. Additionally, utilizing a 20-year horizon from a projected opening year of 2033 would target a 2053 horizon year, which would be both impractical and speculative from an analytical standpoint.

Further, as discussed in Response to Comment R-3-9, it has been demonstrated that 2035 is the peak PM_{10}/$PM_{2.5}$ emissions year for operational emissions in the August 2018 White Paper "I-710 Corridor Project: Selection of Analysis Year for Quantitative PM Hot-Spot Analyses", which was Appendix B of the August 2018 PM conformity submittal to the Transportation Conformity Working Group. In essence, vehicle miles travelled (VMT) would increase during this period (as noted in the South Coast Air Quality Management District's Final 2016 Air Quality Management Plan), while fleet-turnover to the cleanest current cars and trucks would be essentially complete by 2023 (as shown in EMFAC2014 and complete implementation of the CARB Truck and Bus Rule by that date). Therefore, 2035 represents the worst-case scenario for future air quality emissions.

L-27-313

Please refer to Response to Comment L-27-16 for more information regarding the use of the 2012 RTP/SCS for planning assumptions rather than the 2016 RTP/SCS. The language provided on Page 3.13-14 of the RDEIR/SDEIS is related to specifics associated with the regional conformity process and air quality conformity requirements to include a description of the design concept and scope of the build alternatives in the conformity analysis conducted for the region. This conformity requirement does not invalidate the future year travel demand forecasts, traffic analysis, or air quality analysis prepared for the I-710 RDEIR/SDEIS, which examines both build and no build conditions. As was also stated in Section 3.13.3.1 of the RDEIR/SDEIS and this Final EIR/EIS, an update to the description of Alternative 5C was included in the RTP/SCS and FTIP. This amendment was included in the 2016 RTP/SCS Amendment No. 3 (including the 2019 Federal Transportation Improvement Program Consistency Amendment No. 19-00), adopted by SCAG on September 6, 2018. However, as

stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative and, therefore regional conformity was not obtained. Further, the discussion of project-level conformity was updated in Section 3.13.3.2 of this Final EIR/EIS.

L-27-314

Please refer to Response to Comment L-27-313 regarding the FTIP and RTP/SCS descriptions of the build alternatives.

L-27-315

Caltrans respectfully disagrees that the air quality analysis relied upon out-of-date conformity guidance. Consistent with Caltrans and FHWA guidance, project-level PM conformity analysis is not required for approval of a Draft EIR/EIS and is not required to be included in the RDEIR/SDEIS. EPA's General Conformity webpage[7] indicates that the Federal agency (in this case, Caltrans under their assumption of FHWA's responsibility under NEPA) is provided deference in determining the most appropriate way to integrate the conformity and NEPA processes, and that "it may not make sense to perform a conformity analysis for all alternatives, but only for the one actually selected." Please refer to Response to Comment L-27-12 for further discussion of the appropriate timing of the project-level PM conformity analysis. Additionally, the discussion of project-level conformity in Section 3.13.3.2 has been updated in this Final EIR/EIS.

L-27-316

The comment expresses concern that the build alternatives may not be able to demonstrate project-level PM conformity. Following the circulation of the RDEIR/SDEIS in 2017, extensive coordination occurred between Caltrans, Metro, and EPA staff related to the protocol for the particulate matter hot-spot analysis, a component of that project-level conformity analysis. Prior to circulation of the 2012 Draft EIR/EIS, the I-710 Corridor Project was determined to be a Project of Air Quality Concern (POAQC) requiring a PM hot-spot analysis because it was considered to be: (i) a new or expanded highway project that had a significant number of or significant increase in diesel vehicles, and (ii) a project affecting intersections that are at level of service (LOS) D, E or F with a significant number of diesel vehicles, or those that will change to LOS D, E or F because of increased traffic volumes from a significant number of diesel vehicles related to the build alternatives. This was described in Section 3.13.3.1 of the 2012 Draft EIR/EIS. Some of the build alternatives analyzed in the 2012 Draft EIR/EIS assumed that zero emission/near zero emission (ZE/NZE) trucks would be commercially deployed and therefore in

[7] Website: https://www.epa.gov/general-conformity/general-conformity-training-module-13-background, accessed December 13, 2018.

use in the corridor at the time a build alternative would be constructed; however, at that point in project development, the I-710 Corridor Project did not include a ZE/NZE truck program as a programmatic element. The assumption that the project was a POAQC was carried forward in the RDEIR/SDEIS even considering that the subsidy and deployment of ZE/NZE trucks was included as a programmatic element of Alternatives 5C and 7, which serves as a commitment that ZE/NZE trucks would be deployed in the corridor should a build alternative be approved and constructed. Because the build alternatives analyzed in the RDEIR/SDEIS included ZE/NZE truck deployment strategies and funding commitments approved by the Metro Board of Directors, it can be reasonably concluded that "a significant number of or significant increase in diesel vehicles" would not occur as a result of the build alternatives. Rather, it can be demonstrated that the number of diesel vehicles operating in the corridor would actually decrease as a direct result of either Alternative 5C or 7. However, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative and, therefore project-level conformity was not obtained.

L-27-317

Please refer to Responses to Comment L-27-12 and L-27-315 for a discussion of appropriate timing of the project-level PM conformity analysis. A quantitative analysis of PM emissions was conducted and disclosed in Section 3.13.3.3 of the RDEIR/SDEIS in accordance with the requirements of CEQA and NEPA. Please also refer to Response to Comment L-27-316 regarding the TCWG process.

L-27-318

As stated in Section 3.13.3.4 of the RDEIR/SDEIS and Section 4.5 of the AQ/GHG/HRA Technical Study, exhaust $PM_{2.5}$ emissions (sum of running exhaust, tire wear, brake wear, and entrained road dust) are used as a surrogate for the qualitative assessment of PM (ultrafine particle) mortality and morbidity. Comparison of the exhaust $PM_{2.5}$ emissions from the I-710 freeway, South Coast Air Basin, and I-710 "Area of Interest" for each of the build alternatives (5C and 7) as compared to the No Build Alternative (Alternative 1) in 2035 is disclosed in Section 2.5 (and not the executive summary) of the Technical Study. This information was also depicted graphically in Appendix Q of the RDEIR/SDEIS. For clarification, the following discussion from the Technical Study was added to Section 3.13.3.4 of this Final EIR/EIS:

"The near-road modeling of total PM2.5 emissions also shows that the I-710 near-roadway total PM2.5 concentrations of the 2035 No Build Alternative were about the same as both build alternatives; the exception being increases in total $PM_{2.5}$ at receptors near the freight corridor in Alternative 7. Similar to the comparisons to the 2012 Baseline, these very near-roadway increases are predominantly because of increases in entrained roadway dust (related to the assumption of an infinite silt reservoir on the roadways)."

L-27-319

Please refer to Response to Comment L-27-318 regarding exhaust $PM_{2.5}$ emissions.

L-27-320

Should a build alternative be selected as the Preferred Alternative, both measures AQ-2 (detailed in Section 3.13.4) and C-8 (detailed in Section 3.3.3.7) would provide for the installation of filtration or HVAC units for sensitive receptors. The measure would not provide for ongoing maintenance of filtration units, as Caltrans and Metro do not have an appropriate mechanism for ongoing provision of funds or materials. Maintenance would ultimately be the responsibility of the filtration recipient.

L-27-321

In response to this and other comments, Measure AQ-3 has been expanded to describe in more detail the types of vegetation that, should a build alternative be selected as the Preferred Alternative, would be utilized for the intended purpose and enforcement mechanisms used. However, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative and, therefore Measure AQ-3 will not be implemented and providing further specifics related to this measure is unnecessary.

L-27-322

The City of Long Beach's support of zero emissions and opposition to any alternative that does not include a ZE component is acknowledged and included in the project record. Please refer to Section 1.1 of this appendix for a discussion on the identification of the Preferred Alternative and Section 1.3 of this appendix for additional discussion of ZE options.

L-27-323

Detailed final design, construction, and staging plans and equipment location and timing is typically not determined until after a Final EIR/EIS is approved. Without location-specific construction activity information, modeling of location-specific air quality impacts is not possible and assumptions about those locations and the intensity/duration of construction activity at those locations would cause any dispersion modeling results (ambient or mobile source air toxics) to be speculative and misleading. However, a preliminary construction staging analysis has been performed in order to demonstrate that the build alternatives could feasibly be constructed. The construction emissions scenarios presented in the AQ/GHG/HRA Technical Study (2017) and summaries in Section 3.24, Construction Impacts, of the RDEIR/SDEIS assumed consecutive construction of all freeway sections, which represents a conservative (i.e., worst case) emissions analysis, drawn from the construction staging scenarios, in order to

identify and disclose the range of potential impacts resulting from construction of the build alternatives.

L-27-324

Please refer to Response to Comment L-27-323 regarding location-specific air quality impacts during construction.

L-27-325

This comment states that the Draft EIR/EIS omits considerations of emissions from traffic disruptions during construction. The air quality analysis was conducted consistent with Caltrans requirements. Volume 1, Chapter 11, of Caltrans' Standard Environmental Reference states that in areas subject to transportation conformity requirements, a construction impact analysis is only required if construction will last more than five years. Although the No Build Alternative has been selected as the Preferred Alternative, for purposes of the air quality analysis, it was anticipated that the duration of construction activities related to the build alternatives would not be greater than five years at any single site. Please refer to Section 3.13.3.2 of this Final EIR/EIS for an updated discussion of project-level conformity.

Further, according to the preliminary construction staging analysis, it is likely that construction of either build alternative would take place in different segments within the 19-mile corridor simultaneously in order to construct the full project. The analysis presented in the AQ/GHG/HRA Technical Study (2017) evaluates potential emissions associated with the highest traffic levels in the I-710 Corridor upon project completion (Year 2035) as well as the construction emissions impacts of constructing the full corridor under the build alternatives. It was assumed, as is typical during major freeway reconstruction projects in the Los Angeles metropolitan area, that the I-710 would continue to operate during the construction period.

In addition, as shown in Table 2.3-5 in the RDEIR/SDEIS, the most complex area in terms of construction activity and duration would be located within Segment 2 (Wardlow Road to Del Amo Boulevard). A more detailed examination of the preliminary construction staging analysis within this broad area confirmed that construction of the various sequential elements would occur at different locations and that no individual site would be affected by construction-related activities for longer than five years. However, as stated previously, the No Build Alternative has been selected as the Preferred Alternative and therefore, no construction would occur.

L-27-326

Please refer to Response to Comment L-27-312 regarding the peak construction year analysis, demonstrating that 2035 is the peak operational emission year. Also, please refer to Response to Comment L-27-325 for a discussion of construction emissions.

L-27-327

Please refer to Response to Comment L-27-325 for a discussion of emissions from traffic disruptions during construction of the build alternatives.

L-27-328

Construction emissions were calculated using the I-710 Construction Emissions Model, which is a modified version of the Sacramento Metropolitan Air Quality Management District (SMAQMD) Road Construction Emissions Model (RCEM) version 8.1.0. The results of this analysis were included in Table 3.24-4 of the RDEIR/SDEIS and in this Final EIR/EIS. Project specific information about the construction activities listed in the comment is typically not available until during the final design phase of a build alternative. However, greenhouse gas emissions from the sources listed in the comment represent a very small proportion of the overall greenhouse gas emissions expected from major construction activities, like those included in the I-710 Construction Emissions Model and presented in Table 3.24-4, and are expected to be minimal in comparison.

L-27-329

Caltrans and Metro acknowledge that Type I precision noise meters are preferred; however, they are not required for project-level environmental studies. All Type II general purpose noise meters used by Caltrans for field work on this project were calibrated annually to the American National Standards Institute (ANSI) requirements, using a third-party vendor.

L-27-330

It should be noted that most, if not all, of the receptors that show an increase in the noise level exceeding 10 dBA would be due to the removal of an existing sound wall in order to accommodate widening of the I-710 under the build alternatives. In all cases where a soundwall would be removed due to widening, it would be replaced either in-kind or taller (should a build alternative be selected as the Preferred Alternative). More details regarding abatement, including specific dBA decreases, can be found in Table 3.14-3 of Section 3.14 of this Final EIR/EIS. However, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, no sound walls will be constructed.

L-27-331

Out of the 150 measured sites, a very small number (5) showed a calibration factor exceeding 5 dBA. Because of this small number (only three percent of all measured sites) and the fact that nearby sites provide a reasonably good calibration factor, additional measurements were not conducted.

L-27-332

Extending the analysis beyond the horizon year in order to hypothesize the future roadway's pavement condition is speculative. Regular maintenance will be performed on the roadway surface as needed. Further, based on empirical data available to Caltrans, freeway traffic does not cause ground-borne vibration sufficient to cause architectural or structural damage.

L-27-333

The predicted traffic volumes utilized in the traffic and air quality analyses were also utilized in the noise analysis. More information regarding these predicted volumes can be found in Section 3.5, Traffic, of the RDEIR/SDEIS and Final EIR/EIS, as well as the *I-710 Corridor Project Traffic Operations Analysis Report* (March 2017). This information was disclosed in Section 5.3 of the *Noise Study Report* (Caltrans, May 2016), along with other highly technical methodological information that would not typically be included in an EIR/EIS, but would be available to the public in a technical report. The Traffic Noise Model is based on these predicted traffic forecasts, including the predicted truck percentages throughout the I-710 Corridor.

L-27-334

At the time of the preparation of the Noise Abatement Decision Report (NADR, approved in June 2017), $80,000 per benefited receptor was the reasonable allowance used, in accordance with the current guidance at the time. It is important to note that there is only one soundwall within the City of Long Beach (SW-405A2) that was not recommended for construction to abate noise from the build alternatives because the cost exceeded the allowance. Even using the more updated 2017 allowance of $92,000, this proposed wall would still not be considered cost-reasonable. In addition, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, no sound walls will be constructed.

L-27-335

This comment is referencing a comment previously submitted by the City on the 2012 Draft EIR/EIS and is relevant to alternatives no longer under consideration. However, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, no adverse temporary ground-borne vibration impacts would occur.

L-27-336

This comment is referencing a comment previously submitted by the City on the 2012 Draft EIR/EIS and is relevant to alternatives no longer under consideration. The discussion provided in Section 3.24.3.14, Construction Impacts, addresses noise impacts during the construction phase of the build alternatives. However, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, a more detailed

Noise Monitoring Plan and Noise Control Plan, which would further refine the potentially impacted locations and measures to address potential impacts will not be necessary and no sound walls will be constructed.

L-27-337

This comment is referencing a comment previously submitted by the City on the 2012 Draft EIR/EIS and is relevant to alternatives no longer under consideration. Please refer to Response to Comment L-27-336 regarding noise impacts during construction of the build alternatives. It is important to note that Caltrans has not adopted CEQA significance thresholds, nor is it required to adopt other agencies' thresholds.

L-27-338

Please refer to Response to Comment L-27-336 regarding noise impacts during construction of the build alternatives.

L-27-339

Please refer to Response to Comment L-27-336 regarding noise impacts during construction of the build alternatives.

L-27-340

The Energy Resources and Consumption Section discussion of Coal, Electricity, and Renewables was updated to properly describe the CEC energy assessment without specifying any power plant type.

L-27-341

The traffic input data for the energy analysis was corrected, resulting in differences between the build alternatives that show changes for Alternatives 5C and 7. The VMT and VHT data in Table 3.15-6 in this Final EIR/EIS for the entire region now show that average auto speeds, for instance, would increase from 38.2 mph in 2012 to 40.9 mph for the 2035 No Build Alternative, and to 41.0 mph for both Alternatives 5C and 7.

L-27-342

The data in Tables 3.15-6, 3.15-8 and 3.15-10 have all been updated in this Final EIR/EIS, based on the corrected traffic data input.

L-27-343

The statement in Section 3.16.1 of this Final EIR/EIS, “There are no other adopted or proposed Habitat Conservation Plans or Natural Communities Conservation Plans within the I-710 Corridor Project Study Area...” has been revised to correctly identify and provide a brief discussion of the Coastal Pelagic Management Plan.

L-27-344

The scientific name for tocalote in paragraph 4 under the Developed/Ornamental/Ruderal subtitle in Section 3.16.2.2, Land Cover Designations, in this Final EIR/EIS has been revised to *Centaurea melitensis*. Similarly, the scientific name for California ground squirrel in same paragraph has been revised to *Otospermophilus beecheyi*. The species identification for perennial sow-thistle *Sonchus arvensis* has been confirmed.

L-27-345

The first sentence under the Freshwater Emergent Marsh subtitle in Section 3.16.22, Land Cover Designations, of this Final EIR/EIS has been revised to read, “This habitat has been highly affected by the human environment, much like the riparian scrub habitat described below.”

L-27-346

Scientific names have been added for the following species referenced under the Freshwater Emergent Marsh subtitle in Section 3.16.2.2 of the Final EIR/EIS, California bulrush (*Schoenoplectus californicus*) and cattails (*Typha* sp.). Subsequent mentions of the scientific names for California bulrush and cattails (particularly under Riparian Scrub in Section 3.16.22) have been removed from the remainder of Section 3.16.

L-27-347

The last sentence of paragraph 2 under the Riparian Scrub subtitle in Section 3.16.22 of the Final EIR/EIS has been revised to read, “Nonnative and/or weedy species commonly observed included…”

L-27-348

In Table 3.16-2 of the Final EIR/EIS, the word “Developed” has been added to the cell in the second column from the right, row 2. The cell justification in Row 4 of Table 3.16.2 has also been adjusted to be consistent with the remainder of the table.

L-27-349

Please refer to the Cumulative Impacts section, Section 3.24, for more information on the impacts of other projects. Presumably, the commenter is requesting a discussion of the impacts of Alternative 1 in order to provide a side-by-side comparison of the impacts of all three alternatives. However, the impacts of Alternative 1 are limited to those associated with planned and approved projects that may happen with or without any changes to the current configuration of the I-710 Corridor. Thus, including descriptions/quantification of impacts of other planned and approved projects as Alternative 1 impacts, but not including them as part of Alternative 5C and Alternative 7 impacts would skew the comparison that is relevant to the decisions at hand for the I-710 Corridor. Furthermore, the existing information on the impacts of other planned and approved projects is not at a consistent level of detail for comparison to the I-710 design options being considered here. Finally, the impacts of those other projects have been, or will be, considered in the environmental documents for those projects on a project-by-project basis.

L-27-350

The second sentence in paragraph 5 of Section 3.17.1, Regulatory Setting, of this Final EIR/EIS has been revised to read, “Essentially, EO 11990 states that a Federal agency, such as FHWA and/or Caltrans, as assigned, cannot…”

L-27-351

In Table 3.17-1 under Section 3.17.2.3 of this Final EIR/EIS, an footnote has been added to Row 2, Column 7 and the following definition has been added to the table footnotes, “Total Section 10 Area (acres) are inclusive of Total Section 404 Area (areas).”

L-27-352

The following sentence in the second paragraph under the Wildlife Habitat subtitle in Section 3.17.2.4 of this Final EIR has been revised to read, “Wetland and riparian habitat within Drainage Features 3, 23, and 24 (Joint Dominguez Gap and DeForest Treatment Wetlands) provide wildlife habitat for mainly avian species.”

L-27-353

The last sentence in the third paragraph under the Aquatic Habitat subtitle in Section 3.17.2.4 of this Final EIR/EIS has been revised to read, “The small amount of wetland vegetation within Drainage Feature 6 and 22 (Compton Creek) provides a moderate amount of habitat for aquatic species.”

L-27-354

Where applicable within Section 3.17.3 of this Final EIR/EIS, Drainage Feature 3 has been clarified to indicate that this particular feature refers to the Dominquez Gap wetlands.

L-27-355

The second sentence in paragraph one under Section 3.17.4 of this Final EIR/EIS has been revised to read, “Compensatory mitigation for impacts to jurisdictional aquatic resources would be required in order to obtain permits from the USACE and CDFW.”

L-27-356

This comment is referencing a comment previously submitted by the City on the 2012 Draft EIR/EIS and is relevant to alternatives no longer under consideration. However, the City’s concurrence on the adequacy of the statement that the “final details for compensatory mitigation would be evaluated through coordination between Caltrans and the resource agencies,” is acknowledged and included in the project record.

L-27-357

As indicated in the comment, the requested discussion has been included in this Final EIR/EIS. A separate subheading titled “Wetlands Only Practicable Alternative Finding” can be found in Section 3.17.5 of this Final EIR/EIS and includes a discussion addressing items a through d as required in Caltrans’ Annotated Outline.

L-27-358

This comment is referencing a comment previously submitted by the City on the 2012 Draft EIR/EIS and is relevant to alternatives no longer under consideration. As indicated in Caltrans’ Annotated Outline, identification of the Least Environmentally Damaging Practicable Alternative (LEDPA) is provided in a final environmental document. Thus, Section 3.17 in this Final EIR/EIS includes a discussion of the LEDPA determination.

L-27-359

This comment is referencing a comment previously submitted by the City on the 2012 Draft EIR/EIS and is relevant to alternatives no longer under consideration. However, Section 3.17, Wetlands, in the RDEIR/SDEIS and this Final EIR/EIS discusses the Joint Dominguez Gap and DeForest Treatment Wetlands as likely being under the jurisdiction of the RWQCB. As such, the DeForest Wetlands (Drainages 23 and 24, as shown in Appendix R in the RDEIR/SDEIS and this Final EIR/EIS) are included as a wetland and are analyzed in Section 3.17, Wetlands, as well as in Section 3.16, Natural Communities, in the RDEIR/SDEIS and this Final EIR/EIS due

to the associated native habitat. Protection of the DeForest Wetlands is accounted for in Measure NC-1, described in Section 3.16, Natural Communities in this Final EIR/EIS. Should a build alternative be selected as the Preferred Alternative, this measure would be implemented to avoid and minimize, mitigate, and/or compensate impacts to jurisdictional areas and native habitat under the build alternatives. Measure NC-1 states that the California Department of Transportation (Caltrans) would prepare a Habitat Mitigation Monitoring Plan (HMMP) that would comply with all terms and conditions set forth in the permits and opinions issued by the resource agencies. Measure NC-1 also explains that, as part of the HMMP, unavoidable impacts to wetlands and natural communities, both of which the DeForest Wetlands are considered to be within the RDEIR/SDEIS and Final EIR/EIS, would be mitigated through in-kind restoration or replacement. Furthermore, the RWQCB permit would require, as general conditions of a Water Quality Certification, water quality protection measures and BMPs. Section 3.24, Construction Impacts, also specifically mentions the DeForest Wetlands under Section 3.24.3.16, Natural Communities, and since the DeForest Wetlands are presumed to be RWQCB jurisdictional, they are also incorporated under Section 3.24.3.17, Wetlands. Thus, water quality monitoring under a SWPPP, including for the DeForest Wetlands, is discussed under Section 3.24.4.16, Natural Communities (CON-NC-8) and, should a build alternative be selected as the Preferred Alternative, the need for a Water Quality Certification, which as stated above would include water quality protection measures and BMPs, from the RWQCB is identified under Section 3.24.4.17, Wetlands (CON-WET-3). The comment, therefore, was addressed through the specific mention and inclusion of the Deforest Wetlands under the Natural Communities and Wetlands sections in the RDEIR/SDEIS and this Final EIR/EIS. However, it should be noted that, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no impacts to the Joint Dominguez Gap and DeForest Treatment Wetlands.

L-27-360

The legend in the Figures provided in Appendix R have been revised the Final EIR/EIS. “Other Drainage Features Within Developed Areas (non-jurisdictional)” has been revised to read, “Other Drainage Features Within Developed Areas (RWQCB-jurisdictional only).”

L-27-361

The legend in the Figures provided in Appendix R of the Final EIR/EIS accurately implies that the “Jurisdictional Features (includes L.A. River)” are jurisdictional to all three resource agencies (USACE, RWQCB, and CDFW). The legend is already crowded and specifying that the features are jurisdictional to the USACE, RWQCB, and CDFW would be redundant.

L-27-362

This comment is referencing a comment previously submitted by the City on the 2012 Draft EIR/EIS and is relevant to alternatives no longer under consideration. The maps in question have since been comprehensively updated to reflect the revised set of build alternatives. Red lines (red crosshatching in the legend) indicate the location of permanent direct impacts.

L-27-363

This comment is referencing a comment previously submitted by the City on the 2012 Draft EIR/EIS and is relevant to alternatives no longer under consideration. The construction of both construction and treatment BMPs was provided for in Section 3.24 and 3.9, respectively, in the RDEIR/SDEIS and this Final EIR/EIS.

L-27-364

It is important to note that the Regulatory Setting text provided in Section 3.18.1 is Caltrans standard language pursuant to its 2017 EIR/EIS Annotated Outline; and therefore, the requested revisions to the text were not made in this Final EIR/EIS.

L-27-365

The species statuses provided in Table 3.18-1 have been updated in this Final EIR/EIS pursuant to California Department of Fish and Wildlife's most current listing status. Additionally, the General Habitat Descriptions have been updated in Table 3.18-1 to include the blooming period and habitat description for plant species where this was previously omitted. The Habitat Present/Absent column has also been updated where applicable in Table 3.18-1 to provide clarification and further rationale for species presence or absence within the Biological Study Area.

L-27-366

The General Habitat Description in Table 3.18-1 of this Final EIR/EIS for the intermediate mariposa lily now provides more details than were provided in the table that was commented upon in 2012. The current description states that the species' elevational range is 600 to 2,800 feet and the geographic range is in hills. Based on this description, the Rationale now states that the BSA is outside the species' elevational and geographic range. Specific sources or references are not provided for any of the species in the table; this information can be found in the NES.

L-27-367

The “Rationale” text in Table 3.18-1 of this Final EIR/EIS has been updated for the Davidson’s bushmallow and California muhly. The rationale for the mud nama is correct and has not been revised.

L-27-368

In Table 3.18-1 of this Final EIR/EIS the “Rationale” text for Parish’s gooseberry has been revised to exclude the following sentence, “No willow swales within the BSA.”

L-27-369

In Table 3.18-1 of this Final EIR/EIS, the “Rationale” text for Salt Spring checkerbloom has been revised/expanded. Additionally, the “Rationale” text for Greata’s aster has been revised to include the following text, “BSA is outside of species’ known elevation range.”

L-27-370

In Table 3.18-1 of this Final EIR/EIS the “Rationale” text for Sonoran maiden fern has been revised to exclude the following sentence, “BSA is outside the species’ known range.”

L-27-371

In paragraph one in Section 3.18.2.1 in the Final EIR/EIS, the first sentence has been revised to read, “Southern tarplant (*Centromadia parryi* ssp. *Australis*), previously known as *Hemizonia parryi* ssp. *Australis*, is a…” The species mentioned in comments above this comment include Intermediate mariposa lily, Davidson’s bushmallow, California muhly, Mud nama, Parish’s gooseberry, Salt Spring checkerbloom, Greata’s aster, and Sonoran maiden fern. The suggestions in the preceding comments regarding habitat description and rationale have been incorporated unless otherwise noted. With these updates to Table 3.18-1 in the Final EIR/EIS, the rationale for each of these species thoroughly explains why these species are considered absent from the BSA. Therefore, additional discussions for these species are not warranted.

L-27-372

There are two types of permanent impacts to southern tarplant discussed in the RDEIR/SDEIS and this Final EIR/EIS: Direct permanent impacts, resulting from the design or construction of the build alternatives, and indirect permanent impacts, resulting from shading of the build alternatives.

L-27-373

The center heading in Table 3.18-2 in the RDEIR/SDEIS and this Final EIR/EIS is correctly titled "Direct Permanent Impacts," as described in the preceding paragraph under Section 3.18.3.1 Permanent Impacts. Since shading impacts, which are discussed as indirect permanent impacts in the paragraph following Table 3.18-2, are difficult to quantify, they are not presented in Table 3.18-2.

L-27-374

This comment is referencing a comment previously submitted by the City on the 2012 Draft EIR/EIS and is relevant to alternatives no longer under consideration. However, a summary of the discussion provided in Section 2.2.1 of the Natural Environment Study with regard to the literature review conducted was added to Sections 3.18, 3.19, and 3.20 in this Final EIR/EIS.

L-27-375

This comment is referencing a comment previously submitted by the City on the 2012 Draft EIR/EIS and is relevant to alternatives no longer under consideration. Should a build alternative be selected as the Preferred Alternative, CON-61 in the Draft EIR/EIS, now CON-PS-1 in the RDEIR/SDEIS and this Final EIR/EIS, would provide for a qualified biologist to monitor construction and is considered an avoidance/minimization measure. This measure is intended to provide sufficient flexibility for future monitoring efforts related to the build alternatives and was not revised in this Final EIR/EIS.

L-27-376

Please refer to Response to Comment L-27-364 regarding Regulatory Setting text.

L-27-377

The species statuses in Table 3.19-1 in this Final EIR/EIS have been updated as applicable pursuant to the California Department of Fish and Wildlife's most current listing status.

L-27-378

The Rationale column in Table 3.19-1 provides discussions of whether suitable habitat is present for each species. Providing nearest and most recent occurrences recorded by CNDDB to the public is not permissible by CDFW, as the CNDDB license agreement states, "The CNDDB and Spotted Owl data may be shared freely between current subscribers, but should not be released to the public or non-subscribers." Furthermore, geographic occurrence information in CNDDB is not always accurate, is often too broad or general, and can be misleading to laypeople of the general public. The CNDDB license agreement states, "Data

within the CNDDB and Spotted Owl Database require biological expertise for proper analysis, interpretation, and application." Therefore, specific CNDDB occurrence information was not provided in Table 3.19-1 of this Final EIR/EIS.

L-27-379

In Table 3.19-1 in the Final EIR/EIS the "Rationale" text for Mountain plover has been revised to read, "Probably a regular winter visitor historically, but no suitable habitat remains within the BSA."

L-27-380

The statement was based on general knowledge by professional biologists. However, probability of occurrence ratings is not required and a focused analysis was not conducted. Therefore, the first sentence in the second paragraph under Other Special-Status Species Not Requiring Surveys subheading in Section 3.19.3.1 in the Final EIR/EIS has been revised accordingly to state, "All of these species are widespread in distribution and are not State or Federally listed as threatened or endangered."

L-27-381

The referenced sentence in Section 3.20.2 in this Final EIR/EIS has been further revised beyond what was included in the RDEIR/SDEIS.

L-27-382

The number of animal species referenced in Section 3.20.2.1 in this Final EIR/EIS has been corrected from 42 to 47 in the first sentence and from 40 to 43 in the second sentence of the first paragraph.

L-27-383

Please refer to Response to Comment L-27-365 regarding species statuses provided in Table 3.18-1.

L-27-384

In Table 3.20-1 in this Final EIR/EIS the "Rationale" text for San Fernando Valley spineflower has been revised to read, "Presumed extirpated from the Los Angeles Basin."

L-27-385

The CNDDB records for Lyon's pentachaeta near the Study Area are historical records (late 1800s/early 1900s) from San Pedro, Palos Verdes, and Wilmington, occurring on the Long

Beach and Torrance USGS quads. The records all state that the species is possibly extirpated from the area. Further, USFWS no longer includes this species on the official species list generated for the project, which suggests that the Service considers the species extirpated from the Study Area. Therefore, the statement “Believed to be extirpated from the area” for Lyon’s pentachaeta was not removed from Table 3.20-1 in this Final EIR/EIS.

L-27-386

The Rationale column in Table 3.20-2 provides discussions of whether suitable habitat is present for each species. Providing nearest and most recent occurrences recorded by CNDDB to the public is not permissible by CDFW, as the CNDDB license agreement states, “The CNDDB and Spotted Owl data may be shared freely between current subscribers, but should not be released to the public or non-subscribers.” Furthermore, geographic occurrence information in CNDDB is not always accurate, is often too broad or general, and can be misleading to laypeople of the general public. The CNDDB license agreement states, “Data within the CNDDB and Spotted Owl Database require biological expertise for proper analysis, interpretation, and application.” Therefore, specific CNDDB occurrence information was not provided in Table 3.20-2 of this Final EIR/EIS.

L-27-387

Table 3.20-2 of this Final EIR/EIS has been revised to reflect the “Rationale” for Green sea turtle.

L-27-388

The conclusion of “absent” pertains to nesting habitat and to the fact that the species was not observed during surveys conducted for the proposed project. As suggested under the “Status Federal/State” column in Table 3.20-2 in the RDEIR/SDEIS with the inclusion of “(nesting)”, the occurrence of nesting sites, not necessarily occurrences during migration foraging stops, are of interest and are tracked under the CNDDB. At the time that the RDEIR/SDEIS was written, there was only marginally suitable nesting habitat within the Study Area and there were no records of least Bell’s vireo occurring near the Study Area during the species’ nesting season; thus the conclusion of “absent” was made. However, recent habitat restoration projects adjacent to the Los Angeles River have resulted in the establishment of more suitable nesting habitat for the least Bell’s vireo and there are three of recent eBird records in which the species was observed during the breeding season within the vicinity of the Study Area. Although there are currently no available records of least Bell’s vireo nesting in these areas, suitable habitat is expanding and improving and it is reasonable to suspect that the species may begin nesting within or adjacent to the Study Area in the near future. As such, the conclusion regarding presence/absence has been revised and this Final EIR/EIS has been revised to consider potential impacts to the least Bell’s vireo.

L-27-389

The following text has been added to the Affected Environment section preceding the Plant and Animal Species subsections in Section 3.20.2 in this Final EIR/EIS:

“Prior to conducting the field surveys, existing documentation relevant to the Biological Study Area (BSA) was reviewed. Database records and websites reviewed included:”.

L-27-390

This comment is referencing a comment previously submitted by the City on the 2012 Draft EIR/EIS and is relevant to alternatives no longer under consideration. Please refer to Response to Comment L-27-343 regarding the discussion that has been added to Section 3.16.1 related to the Coastal Pelagic Management Plan.

L-27-391

This comment is referencing a comment previously submitted by the City on the 2012 Draft EIR/EIS and is relevant to alternatives no longer under consideration. More specific information regarding permit conditions are typically not known until the completion of final design of a build alternative. As stated in Response to Comment F-4-21, the No Build Alternative has been selected as the Preferred Alternative and therefore, no permits will be required.

L-27-392

Caltrans respectfully disagrees that Section 3.23 of the RDEIR/SDEIS should address loss of productivity within the City of Long Beach as a result of business displacements under the build alternatives. Section 3.23, Irreversible and Irretrievable Commitments of Resources, discusses the irreversible commitment of resources required to construct the build alternatives. Section 3.23 acknowledges that land acquisition represents an irreversible commitment of land to a transportation facility. However, business displacements do not represent an irreversible commitment of resources because the businesses would be relocated, should a build alternative be selected as the Preferred Alternative. Should a build alternative be selected as the Preferred Alternative, replacement properties would be identified and the businesses relocated prior to demolition of the properties in order to minimize disruptions to business operations.

The City of Long Beach’s concern about the community impacts from business displacements is acknowledged and noted in the public record. As noted in the comment and as outlined in Measure C-1, should a build alternative be selected as the Preferred Alternative, Caltrans would make every effort to relocate the affected businesses near their existing locations within the City of Long Beach if at all feasible. However, as stated in Response to Comment F-4-21, the No Build Alternative has been selected as the Preferred Alternative and therefore, relocations will not be required.

L-27-393

Section 3.23 of the RDEIR/SDEIS and this Final EIR/EIS is entitled “Irreversible and Irretrievable Commitments of Resources that would be Involved in the Proposed Project”. This section is intended to specifically address permanent impacts and losses that could result from the build alternatives. Short-term and temporary impacts are discussed in Section 3.24, Construction Impacts, and Section 3.22, Relationship Between Local Short-Term Uses of the Human Environment and the Maintenance and Enhancement of Long-Term Productivity.

Section 3.22.2.1 of the RDEIR/SDEIS and this Final EIR/EIS specifically states that the build alternatives would result in short-term losses and impacts related to disruption of recreational activities at Cesar E. Chavez Park during construction of the build alternatives. However, since the No Build Alternative has been selected as the Preferred Alternative, there will be no disruption of recreational activities at Cesar E. Chavez Park during construction.

L-27-394

The City states that the discussion provided for Alternative 1 (No Build) is contradictory. The funded and committed projects that are anticipated to be implemented under the Alternative 1 scenario would in fact result in the irreversible and irretrievable commitment of the same or similar types of resources that are identified for the build alternatives; however, the magnitude of the resources committed would not compare to that required for the build alternatives. Similarly, each of the funded and committed projects anticipated to be implemented under the Alternative 1 scenario would each have transportation-related benefits from implementation of the improvements; however, the benefits would not compare to that resulting from the build alternatives. It is important to note that there are no other projects currently proposed that are intended to wholly address the issues that the build alternatives would. Each of the funded and committed projects that are anticipated to be implemented under the Alternative 1 would also be implemented under either build alternative and does not present a differentiating factor among the build alternatives.

L-27-395

This comment is referencing a comment previously submitted by the City on the 2012 Draft EIR/EIS and is relevant to alternatives (Alternatives 5A, 6A, 6B, and 6C) no longer under consideration.

L-27-396

The City correctly notes that this section identifies that the build alternatives would involve the commitment of a range of natural, physical, human, and fiscal resources which are all considered to be irreversible and irretrievable resources. The discussion following this

statement provides additional detail on physical and natural environment resources which include paleontological resources, archaeological resources, estuarine habitat, riparian/riverine habitat, jurisdictional waters, and construction resources (e.g., fossil fuels, cement, aggregate, bituminous materials, and steel). While implementation of either of the build alternatives would involve the irreversible and irretrievable commitment of fiscal resources, the commitment of fiscal resources would not result in an effect with physical change. Effect analyzed under CEQA must be related to a physical change; therefore, no further discussion of the commitment of fiscal resources is provided in the discussion within this chapter or in Chapter 4.0, CEQA Evaluation.

L-27-397

The City correctly notes the RDEIR/SDEIS identifies that the No Build Alternative includes approved and planned projects identified in SCAG's 2012–2035 RTP/SCS and FTIP as well as current plans and projects related to good movement to and from the Ports and application of advanced technologies and programs within the I-710 Corridor. Attempting to identify the irreversible and irretrievable effects of each of the anticipated projects expected to be implemented in the No Build Scenario would be speculative for those projects for which environmental documents have not yet been prepared (refer to State CEQA Guidelines Section 15145, Speculation). Future planned projects that are assumed to be implemented under the No Build scenario would be subject to discretionary review by the approving agency at which time an analysis of the project's irreversible and irretrievable effects can be better defined and analyzed.

L-27-398

The comment is referencing a comment previously submitted by the City on the 2012 Draft EIR/EIS and is relevant to alternatives no longer under consideration. The commenter states that the section does not include an analysis of the consumption of water during construction of the build alternatives and provides examples of how water is used during construction (e.g., for dust control, concrete mixers, etc.). Water consumption during construction of the build alternatives would be temporary and would no longer be required once construction is complete; therefore, water use during construction is not considered to be an irreversible and irretrievable commitment of a resource. During operation, the build alternatives would require the use of water on a long-term basis for landscaping and irrigation systems. As detailed in Chapter 2.0, Project Alternatives, page 2-20, landscaping and irrigation systems would be provided where necessary within the I-710 Corridor to provide aesthetic treatment, replacement planting, or mitigation planting. The plant palette for landscaping would include drought-tolerant and native species to reduce the consumption of water. As further detailed within this section, new irrigation systems would be designed to use reclaimed water (if available) and the use of drought-tolerant trees, shrubs, and foliage would be maximized throughout the project corridor.

Therefore, the build alternatives include design features that would be intended to minimize the long-term consumption of water during operation.

The commenter also states that the section does not include an analysis of the irreversible and irretrievable commitments of air quality that are attributable to Alternative 5A as this alternative only includes freeway widening and does not include the zero-emission technology features. While Alternative 5A was carried forward in the 2012 environmental studies as a stand-alone alternative, it should be noted that Alternative 5A was eliminated as a feasible alternative in the RDEIR/SDEIS as described in Section 2.4 in Chapter 2.0, Project Alternatives. Alternative 5A proposed improving the I-710 mainline by widening I-710 to include ten lanes throughout the length of the I-710 Corridor (including through the freeway-to-freeway interchanges) and modernizing its design (which includes redesigns of the freeway-to-freeway and arterial interchanges). Because of the updates in traffic assumptions and data, resulting in a clearer understanding of the origin and destination of truck traffic within the Study Area, and the substantial comments received from agencies and the public concerned with potential right-of-way impacts, potential impacts to health and air quality associated with the addition of general purpose lanes, and other requests (refer to Section 2.2.1 for more information), the funding partner agencies decided to continue to build on the available information and move forward with the development of revised build alternatives that would better respond to public input and updated traffic patterns, while still meeting the project's purpose and need. Therefore, Alternative 5A has been withdrawn from consideration and was not discussed further in the RDEIR/SDEIS.

The commenter also states that the section does not include an analysis of the irreversible and irretrievable commitments of energy from electrical consumption during construction and with implementation of an overhead catenary system, which is an option to power electric propulsion trucks that would utilize the Clean-Emission Freight Corridor. Identifying the source of electricity, (and the type of fuel that creates the electricity) that would be utilized during construction and operation of either of the build alternatives to determine what commitments of resources would be required is an impossible task. Electricity is provided to various users through various means including from electricity generated at electrical generating plants that use nonrenewable resources (e.g., coal, nuclear, oil, and natural gas) as well as from electricity generated from renewable resources (e.g. solar, wind, water, biomass, and geothermal). Because the type of resources that would be consumed to generate the electricity that would be used for construction and operation of the build alternatives is unknown, this analysis was not included in the RDEIR/SDEIS. As the No Build Alternative has been selected as the Preferred Alternative, there will be no energy use beyond what is existing.

L-27-399

Please refer to Response to Comment L-27-394 regarding the benefits of the projects included in the No Build Alternative.

L-27-400

As was discussed in Section 3.9.1.3 of the RDEIR/SDEIS and this Final EIR/EIS, the Construction General Permit (Order No. 2009-009-DWQ as amended by Order No. 2012-0006-DWQ) regulates storm water discharges from construction sites which result in a Disturbed Soil Area of one acre or greater, and/or are smaller sites that are part of a larger common plan of development. By law, all storm water discharges associated with construction activity where clearing, grading, and excavation results in soil disturbance of at least one acre must comply with the provisions of the Construction General Permit. Construction activity that results in soil disturbances of less than one acre is subject to this Construction General Permit if there is potential for significant water quality impairment resulting from the activity as determined by the Regional Water Quality Control Board. Operators of regulated construction sites are required to develop storm water pollution prevention plans; to implement sediment, erosion, and pollution prevention control measures; and to obtain coverage under the Construction General Permit.

As discussed in Section 3.24.3.9 of the RDEIR/SDEIS and this Final EIR/EIS, the build alternatives would involve construction over and adjacent to the local water bodies and would disturb existing channel bottom sediments. Any construction work within the channel areas would likely result in sediment resuspension and dispersal into the water column of the channels. However, work within any channels would be limited to non-flood season as much as practicable. Additionally, should a build alternative be selected as the Preferred Alternative, coordination with the National Weather Service and the USACE regarding storm and flood events would occur. However, as stated in Response to Comment F-4-21, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no impact to local water bodies adjacent to the I-710 corridor.

L-27-401

It is important to note that the text included in Section 3.24.2 of the RDEIR/SDEIS was intended to describe typical construction impacts of the build alternatives very generally. Although sediment and erosion control are components of water quality management, more detailed information regarding water quality and stormwater runoff during construction was included in Section 3.24.3.9 of the RDEIR/SDEIS. As discussed in Section 3.24.3.9 of the RDEIR/SDEIS and this Final EIR/EIS, the construction work under the build alternatives would involve the removal of the existing structures and construction of the new highway alignments and related improvements. The construction phase of the build alternatives would have the potential to impact the present and future water quality of the receiving waters through the transport of

pollutants and mobilization of construction equipment within waterways. The primary impact locations that would have the greatest risk to water quality would be areas at or adjacent to the highway and stormwater discharge points. This would include work on structures that are located within the Los Angeles River channel. During construction, should a build alternative be selected as the Preferred Alternative, applicable construction site BMPs would be incorporated into the construction documents, including temporary soil stabilization, sediment and tracking control, and waste management. With the incorporation of the proposed site-specific BMPs during the construction phase of the build alternatives, no adverse impacts to water quality due to construction of the proposed improvements would occur.

L-27-402

As discussed in Section 3.24.4.17 of the RDEIR/SDEIS and this Final EIR/EIS, Measure CON-NC-16 states that, should a build alternative be selected as the Preferred Alternative, the operation of equipment and stockpiling of materials in storm channels, including the Los Angeles River, must be avoided during times of high flow. If such work is occurring, weather forecasts and storm predictions shall be closely monitored, and equipment and materials that could be affected by storms or other high-flow events shall be removed from the channel prior to such events. Should a build alternative be selected as the Preferred Alternative, the specifics of construction work within the Los Angeles River would also be governed by permit requirements deemed appropriate by the Army Corps of Engineers and the Los Angeles Regional Water Quality Control Board and defined when those permits are secured during the final design phase. However, as stated in Response to Comment F-4-21, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no construction over or adjacent to local water bodies.

L-27-403

Please refer to Response to Comment L-27-240 regarding the risk level determination in the SWDR.

L-27-404

Should a build alternative be selected as the Preferred Alternative, it would be Caltrans' intent to dispose of groundwater removed during dewatering operations off-site at approved locations and to not discharge groundwater to the storm drains and downstream receiving waters. As required by Measure CON-WQ-2 in Section 3.24.4.9 of the RDEIR/SDEIS, should a build alternative be selected as the Preferred Alternative, Caltrans would require the Construction Contractor to comply with the provisions of the Waste Discharge Requirements for Discharges of Groundwater from Construction and Project Dewatering to Surface Waters in Coastal Watersheds of Los Angeles and Ventura Counties, Order No. R4-2013-0095, NPDES No. CAG994004, as they relate to discharge of non-stormwater dewatering wastes for the build

alternatives, including monitoring and reporting requirements. This would include complying with the prescribed Monitoring and Reporting Program and submitting to the Los Angeles Regional Water Quality Control Board (RWQCB) a NOI at least 45 days prior to the start of non-stormwater dewatering discharge. In addition, a Notice of Termination would be submitted upon completion of dewatering discharge. However, as stated in Response to Comment F-4-21, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no dewatering required.

L-27-405

The requested information regarding construction activities associated with the build alternatives that encounter contaminated soil, whether they are discovered as a result of roadway construction or utility relocation activities, are discussed in more detail in Section 3.24.3.12, Hazardous Waste/Materials in the RDEIR/SDEIS and this Final EIR/EIS.

L-27-406

Section 3.24.4.6 of the RDEIR/SDEIS acknowledged that visual impacts associated with construction of the build alternatives would be experienced by viewers in the area, but that these impacts would be temporary and addressed by Caltrans' Standard Construction Specifications. Since specific staging areas and hauling routes have not yet been defined, any analysis would be speculative. Nighttime construction would be unavoidable as it is a standard practice to reduce mobility impacts during the day, when far more motorists are using the highways. Should a build alternative be selected as the Preferred Alternative, Measure CON-AS-13 would provide for the direction of lighting away from the Los Angeles River, adjacent parks, wetlands and vacant lands, which would also benefit adjacent residential areas. In addition, Measure CON-VIS-1 has been added to Section 3.24.4.6 in order to address visual impacts during construction of the build alternatives. However, as stated in Response to Comment F-4-21, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no visual impacts related to construction.

L-27-407

Section 3.25.4.8 of the RDEIR/SDEIS does not contain a discussion of a Conditional Letter of Map Revision (CLOMR); however, the potential necessity of a CLOMR is discussed in Section 3.8.3.1 of the RDEIR/SDEIS and this Final EIR/EIS. Please refer to Response to Comment L-27-203.

L-27-408

Because there is overlap between the discussion of impacts to jurisdictional waters and hydrology and floodplains, the referenced discussion is located accurately. More detailed

information regarding impacts to channel capacity during construction of the build alternatives is typically not known until the preparation of final design documents following the approval of a Final EIR/EIS. Should a build alternative be selected as the Preferred Alternative, that information would be coordinated with the applicable permitting agency and any commitments that result from permit conditions would be added to the Environmental Commitments Record at that time. Similarly, should a build alternative be selected as the Preferred Alternative, an emergency action plan outlining procedures to follow during a significant storm event would also be negotiated with regulatory agencies at the time of permit application.. However, as stated in Response to Comment F-4-21, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no impacts to channel capacity during construction.

L-27-409

It is important to note that although a greater number of structures would be constructed under Alternative 7 than under Alternative 5C, the improvements would occur in the same general area. Geologically speaking, there would be no difference between the temporary impacts of the build alternatives other than there would be more excavated soil, soil compaction, and potential soil erosion under Alternative 7. Therefore, the referenced discussion was not revised in this Final EIR/EIS. Also, as discussed in Section 3.10.3 of the RDEIR/SDEIS and this Final EIR/EIS, should a build alternative be selected as the Preferred Alternative, Measure GEO-1 would be implemented to address geologic hazards from the build alternatives. GEO-1 states that prior to completion of final design, the California Department of Transportation (Caltrans) would prepare a design-level geotechnical report in accordance with the *Guidelines for Preparing Geotechnical Design Reports* (Caltrans 2006). Design-level geotechnical reports would precede development of grading and/or construction plans, and they would provide detailed, site-specific design recommendations. Studies at this stage would provide specific design recommendations to mitigate geologic hazards as they relate to grading and construction of the build alternatives. However, as stated in Response to Comment F-4-21, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no excavated soil, soil compaction, or potential soil erosion.

L-27-410

As indicated in the referenced discussion in Section 3.24.3.12 of the RDEIR/SDEIS, any site listings that lack available information in the agency database reports and require additional information would be completed as part of a focused parcel-by-parcel study following the identification of the Preferred Alternative, should a build alternative be selected as the Preferred Alternative. This information from the Supplemental ISA (2018) has been added to Section 3.12.3.1 of this Final EIR/EIS. It is important to note that the rationale for the timing of these investigations is due to the large number of properties of environmental concern for both build alternatives. Should a build alternative be selected as the Preferred Alternative, the evaluations

and investigations referred to in the comment would be done prior to construction at a given site and were so outlined in Section 3.24.3.12 of the RDEIR/SDEIS. However, the avoidance, minimization, and mitigation measures outlined in Section 3.12.4 are applicable to this activity. Please also refer to Responses to Comments L-27-282, L-27-283, L-27-284, and L-27-287regarding impacts related to hazardous waste. In addition, since the No Build Alternative has been selected as the Preferred Alternative, a focused parcel-by-parcel study will not be conducted.

L-27-411

The referenced discussion is supported by a great deal of technical information and data, the locations of which are specifically referenced in the text (for example, on page 3.24-20 of the RDEIR/SDEIS, it is disclosed that “Details about the assumptions, method, and results of this “worst-case” construction scenario may be found in Appendix B of the AQ/GHG/HRA Technical Study (2017).” Important information, such as criteria pollutant mass emissions for construction of the build alternatives, were directly included in Table 3.24-4 in Section 3.24.3.13 of the RDEIR/SDEIS. However, in order to present the necessary information while also ensuring this section of the document is as reader-friendly as practicable, detailed technical information is cross-referenced to the technical study where appropriate.

L-27-412

Please refer to Responses to Comments L-27-323 and R-3-16 regarding the hot spot analysis for air quality.

L-27-413

Please refer to Responses to Comments L-27-323 and F-4-25 regarding the hot spot analysis for air quality.

L-27-414

Measure CON-AQ-15 was drafted in a manner that ensures it is both enforceable and consistent with Caltrans’ and Metro’s contract bid requirements and procedures, given that it is not currently known at this time which agency may eventually administer the construction contract for the build alternatives. Therefore, some flexibility was retained accordingly in the wording of the measure. It is important to note that some, but not all Tier 4 equipment is commercially available at the present time, and it is currently unknown if and when all Tier 4 equipment necessary to construct the build alternatives may be available in the future. Should a build alternative be selected as the Preferred Alternative, by the time construction would begin, the Best Available Control Technology (BACT) compliance schedule for CARB In-Use Off-Road

Diesel-Fueled Fleets Regulation indicates that only 10 percent of “large fleets” would consist of BACT equipment.[8]

Therefore, in order to ensure that the referenced measure is feasible and enforceable, the text of the measure has not been revised. It should also be noted that as stated in Response to Comment F-4-21, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no air quality impacts related to construction.

L-27-415

Please refer to Response to Comment L-27-335 regarding ground-borne vibration impacts. Please note there are no established state/Federal criteria for identifying vibration impacts, and more general guidelines are used to help determine whether levels would be high enough to cause annoyance or architectural/structural damage to buildings. However, as stated in Response to Comment F-4-21, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no vibration impacts.

L-27-416

Please refer to Response to Comment L-27-335 regarding ground-borne vibration impacts.

L-27-417

The construction noise analysis for the build alternatives provides the best and most detailed information that was known at the time of preparation. As stated in Response to Comment F-4-21, the No Build Alternative has been selected as the Preferred Alternative and therefore, more detailed information regarding the type, number, specific location, and construction method of piles is not necessary to define. Please refer to Response to Comment L-27-335 for vibration monitoring during construction of the build alternatives and L-27-336 for the preparation of Noise Monitoring and Noise Control Plans during final design of the build alternatives.

L-27-418

Please refer to the Response to Comment L-27-336 regarding preparation of a Noise Monitoring Plan and Noise Control Plan for the build alternatives.

[8] California Air Resources Board (CARB). 2014, Revised August 2014. Frequently Asked Questions In-Use Off-Road Diesel Vehicle Regulation. Website: https://www.arb.ca.gov/msprog/ordiesel/faq/bact faq.pdf (accessed October 3, 2018).

L-27-419

Please refer to the Response to Comment L-27-336 regarding preparation of a Noise Monitoring Plan and Noise Control Plan for the build alternatives.

L-27-420

Caltrans and Metro respectfully disagree that Measures CON-N-1 through CON-N-10 are vague and unenforceable. At the current level of engineering detail, the measures proposed are appropriately general in order to be applicable to multiple construction scenarios and activities related to the build alternatives. As stated in Response to Comment F-4-21, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no impacts related to noise during construction.

L-27-421

A more detailed description of the energy impacts of the build alternatives can be found in Section 3.15, Energy, of the RDEIR/SDEIS and this Final EIR/EIS. It is important to note that Caltrans has not adopted CEQA significance thresholds, nor is it required to adopt other agencies' thresholds. The decision of CEQA significance is made on a case-by-case basis, and significance determinations with regard to energy use can be found in Section 4.2.5 of the RDEIR/SDEIS.

L-27-422

See Response to Comment L-27-406 regarding visual impacts associated with construction of the build alternatives.

L-27-423

This comment is referencing a comment previously submitted by the City on the 2012 Draft EIR/EIS and is relevant to alternatives no longer under consideration. Requested information regarding staging, schedule, and work hours related to construction of the build alternatives are not known in detail at this time. However, should a build alternative be selected as the Preferred Alternative, general working hours would regulated by Caltrans' Standard Specifications (Section 7-1.02k(5)), all of which would be adhered to during construction. It should be noted that the No Build Alternative has been selected as the Preferred Alternative and therefore, no construction will occur.

L-27-424

Please refer Response to Comment L-27-423 for more information on construction schedules and staging related to the build alternatives. The specific locations of staging and potential crushing plant locations are not known at this time in project development.

L-27-425

Please refer to Response to Comment L-27-423 for more information on construction schedules and staging related to the build alternatives.

L-27-426

This comment is referencing a comment previously submitted by the City on the 2012 Draft EIR/EIS and is relevant to alternatives no longer under consideration. The commenter does not indicate what specifically about the response they consider inadequate or what analysis was not provided. More information regarding the impacts to area utilities as a result of the revised build alternatives was presented in Section 3.4, Utility and Emergency Services, of the RDEIR/SDEIS and this Final EIR/EIS. Although the relocations associated with utility conflicts would occur during construction of the build alternatives, they would be permanent impacts and are therefore were not included in Section 3.24, Construction Impacts.

L-27-427

This comment is referencing a comment previously submitted by the City on the 2012 Draft EIR/EIS and is relevant to alternatives no longer under consideration. The commenter does not indicate what specifically about the response they consider inadequate or what analysis was not provided. Please refer to Response to Comment L-27-89 for a similar response regarding impacts related to the build alternatives.

L-27-428

This comment is referencing a comment previously submitted by the City on the 2012 Draft EIR/EIS and is relevant to alternatives no longer under consideration. However, it should be noted that a construction staging analysis for the build alternatives was prepared in the Construction Staging Concepts Report, one of the supporting technical documents for the *Draft Project Report* (2017). The preliminary construction staging identifies the approximate sequence of construction activities and ramp closures for the build alternatives. However, the construction schedule as well as the final construction staging is typically developed during the final design of a project. However, as stated in Response to Comment F-4-21, the No Build Alternative has been selected as the Preferred Alternative and therefore, additional details such as the expected level of service during construction, the timing and duration of construction and ramp

closures, and measures to maintain pedestrian and bicycle safety during construction will no longer be necessary.

L-27-429

This comment is referencing a comment previously submitted by the City on the 2012 Draft EIR/EIS and is relevant to alternatives no longer under consideration. It is important to note that a TMP does not typically provide for permanent capital upgrades to local streets, but rather items like public information and outreach, traveler information strategies, demand management, etc. As noted above, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no impacts related to construction.

L-27-430

This comment is referencing a comment previously submitted by the City on the 2012 Draft EIR/EIS and is relevant to alternatives no longer under consideration. Please refer to Response to Comment L-27-429 regarding impacts during construction of the build alternatives.

L-27-431

This comment is referencing a comment previously submitted by the City on the 2012 Draft EIR/EIS and is relevant to alternatives no longer under consideration. Please refer to Response to Comment L-27-192 regarding visual impacts related to the build alternatives.

L-27-432

Please refer to Responses to Comments L-27-258 and L-27-400 regarding pollutants during construction of the build alternatives.

L-27-433

This comment is referencing a comment previously submitted by the City on the 2012 Draft EIR/EIS and is relevant to alternatives no longer under consideration. Please refer to Response to Comment L-27-336 regarding noise impacts during construction of the build alternatives. It is important to note that Caltrans has not adopted CEQA significance thresholds, nor is it required to adopt other agencies' thresholds.

L-27-434

Traffic-related impacts during construction of the build alternatives are considered temporary. Mitigation to address these effects, should a build alternative be selected as the Preferred Alternative, was identified in Section 3.24.4 of the RDEIR/SDEIS. However, as stated in

Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no traffic-related impacts during construction.

L-27-435

The Shoemaker Bridge Replacement Project and Long Beach MUST Project in the City of Long Beach have been added to Table 3.25-2 in this Final EIR/EIS.

L-27-436

This comment states that the discussion of land use in Section 3.25, Cumulative Impacts, of the RDEIR/SDEIS should be revised to address the potential for the build alternatives to place transportation land uses in closer proximity to land uses that may not be compatible with these uses. As discussed under the Public Health Discussion header in Section 3.1.1.21 of the RDEIR/SDEIS, existing sensitive land uses (e.g., residents, parks, and schools) directly adjacent to the I-710 are exposed to higher levels of vehicle exhaust emissions and traffic noise than occur within the overall I-710 Corridor. Improvement of air quality and reduction of public health risks are key elements of the project purpose for the proposed project, and avoidance, minimization, and mitigation measures are proposed to reduce these impacts related to the build alternatives. Therefore, Caltrans respectfully disagrees with the assertion that the analysis included in Section 3.25, Cumulative Impacts, of the RDEIR/SDEIS should be expanded to evaluate the build alternatives' compatibility with adjacent land uses as sufficient analysis has already been provided. No changes were made in this Final EIR/EIS.

L-27-437

This comment requests that Section 3.25, Cumulative Impacts of the RDEIR/SDEIS be revised to include a goal and policy specific consistency analysis to address land uses, and that specified Long Beach planning documents be included in this analysis. A detailed goal and policy-specific consistency analysis is not warranted in the Cumulative Impact section. Section 3.1.2 of the Land Use section already evaluates the proposed project's consistency with the Long Beach LCP, I-710 Community Livability Plan, and the City of Long Beach General Plan. In response to this comment, the proposed project's consistency with relevant goals and policies in the Long Beach Downtown & TOD Pedestrian Master Plan has been added to the discussion in Section 3.1.2 of this Final EIR/EIS. The Long Beach Riverlink Plan and Parks, Recreation, and Marine Strategic Plan were reviewed; however, neither plan contains goals or strategies that apply to the I-710 Corridor Project.

L-27-438

This comment requests that the analysis of cumulative land use impacts in Section 3.25, Cumulative Impacts, of the RDEIR/SDEIS be revised to address changes to the land use

discussion in Responses to Comments L-27-436 and L-27-437. Caltrans respectfully disagrees that the project-level analysis and conclusions are insufficient. The statement that “the build alternatives are generally compatible with adjacent land uses” is not overly broad for a project of this size and scope. Further, a detailed analysis of the project’s consistency with State, regional, and local planning documents is provided in Section 3.1.2, Consistency with State, Regional, and Local Plans, of the RDEIR/SDEIS. The Long Beach General Plan, the City of Long Beach LCP, and the City of Long Beach Community Livability Plan are each analyzed in Section 3.1.2 of the RDEIR/SDEIS. Additionally, destinations along the RiverLink Plan are addressed in Section 3.1.3, Parks and Recreation Facilities, of the RDEIR/SDEIS. The RDEIR/SDEIS was prepared in accordance with the Caltrans Annotated Outline.

L-27-439

Please refer to Response to Comment L-27-435 regarding the addition of the LB MUST Project in the cumulative analysis.

L-27-440

This comment requests the RDEIR/SDEIS be revised to include more analysis regarding potential growth impacts and that the cumulative impact analysis in Section 3.25, Cumulative Impacts, be updated. Caltrans respectfully disagrees that the noted statement is based on unsubstantiated conclusions in Section 3.2, Growth, of the RDEIR/SDEIS. Specific responses related to the adequacy of the analysis in Section 3.2 of the RDEIR/SDEIS are provided in Responses to Comments L-27-61, L-27-62, and L-27-63.

L-27-441

This comment requests that the list of projects identified in the discussion of reasonably foreseeable actions for utility/emergency services in Section 3.25, Cumulative Impacts, of the RDEIR/SDEIS be revised to include the Shoemaker Bridge Replacement Project and the LB MUST Project. The Shoemaker Bridge Replacement Project and LBMUST Project have been added to the discussion of reasonably foreseeable actions related to utility/emergency services.

L-27-442

Refer to Response to Comment L-27-441 regarding the addition of the Shoemaker Bridge Replacement Project and the LB MUST Project in the cumulative impacts analysis.

L-27-443

This comment appears to suggest that Section 3.25, Cumulative Impacts, of the RDEIR/SDEIS does not provide an adequate analysis of the visual quality in the I-710 Corridor and should include a discussion of Ocean Boulevard, a local scenic highway. The description of the overall

visual quality is consistent with that described in the VIA in for the Residential Landscape Unit in Section VII.B.2,

> *"For the purposes of this assessment, the distance limit to assess visual quality has been set at 0.2 miles within the study area. This distance is within a reasonable range for viewers to experience visibility to the freeway.*
>
> *Residential Landscape Unit: The overall visual quality is moderately low. Rolling hills and blue skies (weather permitting) dominate the background. Many houses that are within proximity to I-710 general purpose lanes may have a high concern about the proposed project. The vividness is low because the landscape components are low. The intactness is low because above-ground utility and power lines occupy the foreground and contribute to a low visual integrity. The visual coherence and compositional unity of the natural and built landscape as a whole is considered moderate."*

Regarding locally designated scenic highways, please refer to Response to Comment L-27-182.

L-27-444

This comment appears to suggest the key views used to analyze the build alternatives' impacts to community character and cohesion in Section 3.25, Cumulative Impacts, are not representative of the communities of Long Beach. The methodology for selecting the Key View locations was described in Section 3.6.2.4, Methodology, of the RDEIR/SDEIS and was done in accordance with FHWA's January 2015 publication *Guidelines for the Visual Impact Assessment for Highway Projects*. The purpose of the key views is to give a representative sample of visual units along the I-710 Corridor. Therefore, the RDEIR/SDEIS and this Final EIR/EIS uses key view analysis appropriately and consistent with the FHWA guidance.

L-27-445

This comment requests that the discussion of visual/aesthetics in Section 3.25, Cumulative Impacts, of the RDEIR/SDEIS be revised to include a discussion of the Shoemaker Bridge Replacement Project and LB MUST Project and related impacts. The Shoemaker Bridge Replacement Project and LB MUST Project have been added to the discussion of reasonably foreseeable actions related to visual character aesthetics.

L-27-446

Please refer to Response to Comment L-27-203 regarding the need for a CLOMR.

L-27-447

It is unclear what “Comments 15, 16, and 17 herein below” is intended to reference, and it is unclear from the comment why the commenter disagrees with the conclusions regarding Compton Creek. It is important to note that Section 3.25.4.8 of the RDEIR/SDEIS discusses cumulative impacts related to hydrology and floodplains; permanent impacts related to hydrology and floodplains as a result of the build alternatives were provided in Section 3.8 of the RDEIR/SDEIS and this Final EIR/EIS.

L-27-448

A more detailed discussion of Caltrans’ Municipal Stormwater Permit (MS4) is included in Section 3.9.1.3 of the RDEIR/SDEIS and this Final EIR/EIS. The discussion in that section indicates that the Statewide Storm Water Management Plan (SWMP) was developed by Caltrans to comply with the permit. The SWMP assigns responsibilities within Caltrans for implementing storm water management procedures and describes the minimum procedures and practices Caltrans uses to reduce pollutants in storm water and non-storm water discharges. It outlines procedures and responsibilities for protecting water quality, including the selection and implementation of BMPs. Importantly, it also indicates that, should a build alternative be selected as the Preferred Alternative, the build alternatives would be programmed to follow the guidelines and procedures outlined in the latest SWMP to address storm water runoff, which includes TMDL requirements. As indicated in the comment, should discharges be found to cause or contribute to an exceedance of an applicable water quality standard, additional or different types of BMPs would be employed. However, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, an exceedance of an applicable water quality standard would not occur and no BMPs will be required.

L-27-449

This comment requests that the discussion of water quality and storm water runoff in Section 3.25, Cumulative Impacts be revised to add a discussion of water quality benefits from the proposed LB MUST Project. A discussion of the LB MUST Project has been added.

L-27-450

This comment notes that the discussion of project conformity in the air quality analysis in Section 3.25, Cumulative Impacts, of the RDEIR/SDEIS is inconsistent with the project-level analysis. The analysis has been updated for consistency with the project-level analysis. Please refer to Section 3.13.3.2 of this Final EIR/EIS for an updated discussion of project-level conformity.

L-27-451

This comment notes that that are several references in Section 3.25, Cumulative Impacts, of the RDEIR/SDEIS that incorrectly identify the BSA as approximately 18 linear miles along the I-710 Corridor. These references have been revised to “approximately 19 linear miles” in this Final EIR/EIS.

L-27-452

This comment requests that the discussion of natural communities in Section 3.25, Cumulative Impacts, of the RDEIR/SDEIS be revised to add a statement regarding the compliance of compensatory mitigation for estuarine communities with Section 1600 of the California Fish and Game Code. The text was revised as suggested in this Final EIR/EIS.

L-27-453

This comment requests that the discussion of plant species in Section 3.25, Cumulative Impacts, of the RDEIR/SDEIS be revised to make the discussion of indirect impacts to southern tarplant consistent with Section 3.18, Plant Species. The discussion of indirect impacts in Section 3.25, Cumulative Impacts, of this Final EIR/EIS has been revised for consistency with the project-specific analysis in Section 3.18.

L-27-454

This comment requests that the discussion of animal species in Section 3.25, Cumulative Impacts, of the RDEIR/SDEIS be revised to make the discussion of the number of special status, threatened and endangered, and NMFS-regulated animal species and habitats consistent with Section 3.19, Animal Species and Section 3.20, Threatened and Endangered Species. The number of animal species has been revised for consistency with Sections 3.19 and 3.20 in this Final EIR/EIS.

L-27-455

This comment requests that the discussion of threatened and endangered animal species in Section 3.25, Cumulative Impacts, of the RDEIR/SDEIS be revised to be consistent in discussing habitat for each species. A discussion of habitat has been added for green sea turtles, California least tern, California sea lion, and essential fish habitat in this Final EIR/EIS.

L-27-456

This comment requests that the discussion of invasive species in Section 3.25, Cumulative Impacts, of the RDEIR/SDEIS be revised to clarify that temporarily affected areas under the build alternatives would be revegetated with native plant species and replanted consistent with

the Los Angeles River Master Plan Landscaping Guidelines and Plans Palettes. Section 3.25.4.20 of the RDEIR/SDEIS was revised to clarify that, should a build alternative be selected as the Preferred Alternative, revegetation would occur using native plant species and plantings would be consistent with the Los Angeles River Master Plan Landscaping Guidelines and Plant Palettes or otherwise consist of the native riparian and upland plants historically present along the Los Angeles River. Measure IS-1 in Section 3.21, Invasive Species, of the RDEIR/SDEIS was also revised to include similar language.

L-27-457

For specific responses to the City of Long Beach Department of Parks, Recreation and Marine comments, please refer to letter L-12 in this appendix.

L-27-458

As stated in the Response to Comment L-12-2, Measure PR-11 in Section 3.1.3.3 and Section 5.1 of Appendix B, Section 4(f)/6(f), has been revised in this Final EIR/EIS to ensure consistency with the Cesar E. Chavez Park Integration Plan.

L-27-459

The Draft Section 4(f) Evaluation was completed in compliance with Section 4(f) of the United States Department of Transportation Act. While avoidance, minimization, mitigation, or enhancement measures for the build alternatives are considered under Section 4(f), compliance with Ordinance No. C-78226 would not be required under Section 4(f). Please refer to Response to Comment L-12-1 which raised this same concern.

L-27-460

As discussed in the Response to Comment L-27-3, the Shoemaker Bridge Replacement Project is discussed in the RDEIR/SDEIS and this Final EIR/EIS as an Early Action Project. However, retaining the Shoemaker Bridge was not evaluated in the I-710 Corridor Project RDEIR/SDEIS because the construction of another structure within the Los Angeles River in addition to retaining an existing structure may have impacts to the hydrology and natural resource habitat within the Los Angeles River. Past coordination with the United States Army Corps of Engineers indicated that substantial modifications to the Los Angeles River and levees would not be acceptable; therefore, Caltrans has strived to avoid impacts to the Los Angeles River wherever possible. As the CEQA Lead Agency for the Shoemaker Bridge Early Action Project, the City of Long Beach is in the preliminary design phase; however, it is important to note that as part of the I-710 Corridor Project, retaining the bridge in its current location was not evaluated. As discussed in Response to Comment L-12-2, Measure PR-11 in Section 3.1.3.3 and Section 5.1

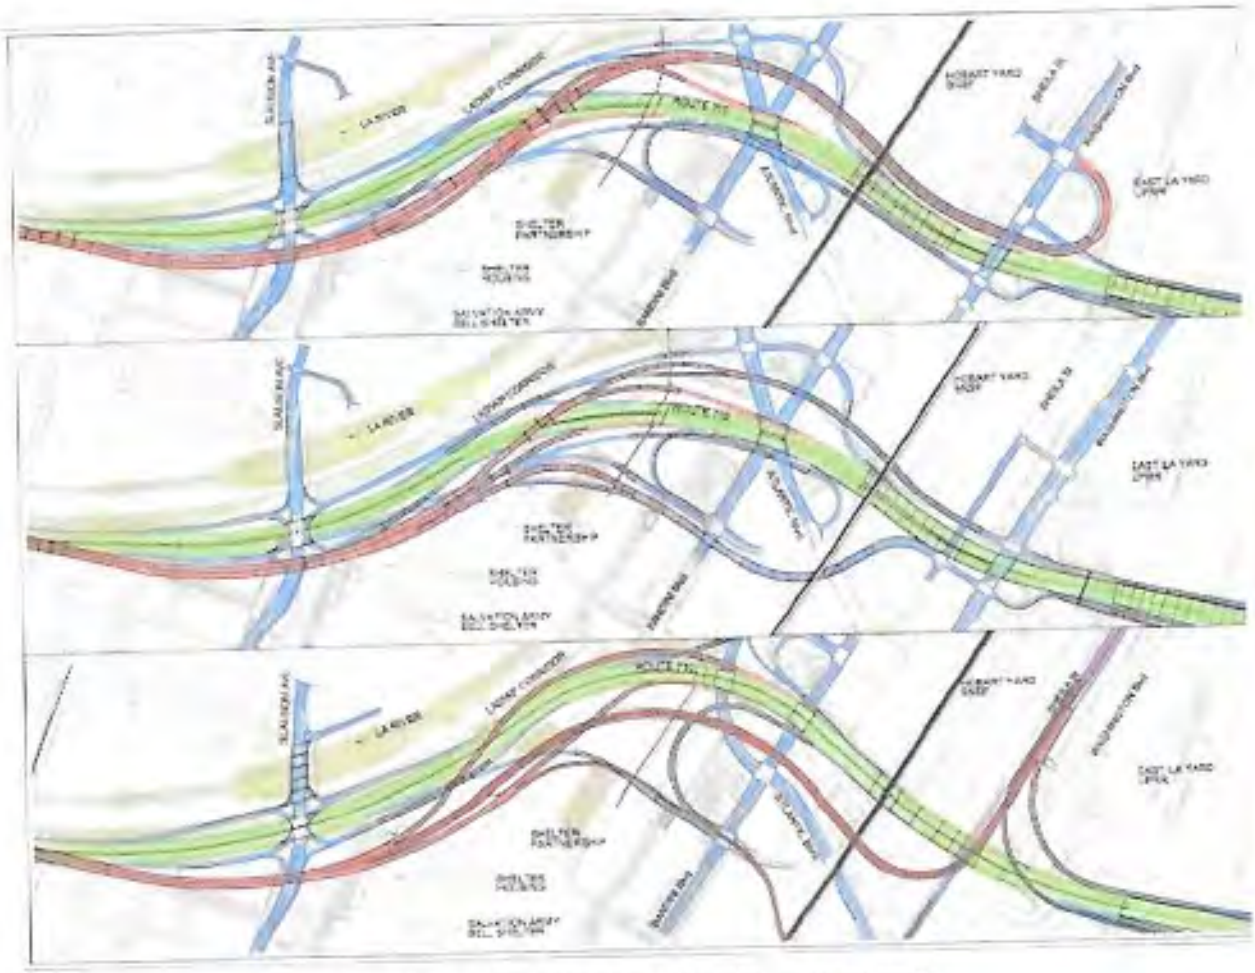
of Appendix B, Section 4(f)/6(f), has been revised in this Final EIR/EIS to ensure consistency with the Cesar E. Chavez Park Integration Plan.

L-27-461

As required under Section 4(f) of the United States Department of Transportation Act, Caltrans has coordinated with the City of Long Beach regarding the proposed *de minimis* impact determination for the build alternatives for Cesar E. Chavez Park and the Drake/Chavez Greenbelt. This coordination included a discussion of measures to minimize harm to the property, which included, but were not limited to, design refinements of the build alternatives to minimize the permanent and temporary use of land from the park. As discussed in the Response to Comment L-12-2, Measure PR-11 in Section 3.1.3.3 and Section 5.1 of Appendix B, Section 4(f)/6(f), has been revised in this Final EIR/EIS to ensure consistency with the Cesar E. Chavez Park Integration Plan, should a build alternative be selected as the Preferred Alternative. However, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no impacts to Cesar E. Chavez Park or the Drake/Chavez Greenbelt.

L-27-462

As required under Section 4(f) of the United States Department of Transportation Act, Caltrans coordinated with the City of Long Beach regarding the proposed TCEs and temporary occupancy exceptions under the build alternatives for the Wrigley Greenbelt, Coolidge Park, Los Cerritos Park, and Cressa Park. This coordination included the discussion of measures to minimize harm to the properties, which would include, but not be limited to, design refinements to minimize the TCE areas in the parks, or to avoid the TCEs in the parks if feasible. During consultation with the City in 2019, the need for TCEs and temporary occupancies for the build alternatives at Coolidge Park, Los Cerritos Park, and Cressa Park were subsequently reevaluated and deemed not necessary, and therefore avoided. This has been updated in Appendix B, Section 4(f)/6(f), of this Final EIR/EIS. In addition, as discussed in Response to Comments L-12-33 and L-12-46, Measure PR-22 and Measure PR-23 have been added to Section 3.1.3.3, and Sections 6.2 and 6.3 of Appendix B, Section 4(f)/6(f), in this Final EIR/EIS, so that in the event a build alternative be selected as the Preferred Alternative, coordination with the City of Long Beach would be required regarding construction impacts adjacent to the parks, staging, and measures that would prevent disruption of park programs because of construction activities adjacent to the parks. However, as stated in Response to Comment L-27-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no impacts to Coolidge Park, Los Cerritos Park, or Cressa Park.



L-27-463

The Draft Section 4(f) Evaluation was an appendix to the RDEIR/SDEIS, and is therefore intended to be reviewed in conjunction with the RDEIR/SDEIS. Section 6.1.2 of the Draft Section 4(f) Evaluation in the RDEIR/SDEIS referenced applicable sections of the RDEIR/SDEIS that provided detailed analyses about the impacts under each build alternative on Coolidge Park (refer to RDEIR/SDEIS Section 3.14.4, Noise; Section 3.6.3, Visual; and Section 3.13.3, Air Quality).

Noise, visual, and air quality impacts on Coolidge Park as a result of the build alternatives are also discussed in more detail in Section 3.1.3.2 of the RDEIR/SDEIS. Section 3.1.3.2 states that visual impacts on Coolidge Park would be low under Alternative 5C, and moderately low under Alternative 7. Air quality impacts from the build alternatives on users of the park were not identified in the technical analysis prepared for the RDEIR/SDEIS. In addition, soundwalls under each build alternative are proposed at locations throughout the I-710 Corridor where noise levels would exceed Federal NAC. Under the build alternatives, a new soundwall would replace an existing soundwall at Coolidge Park to address noise impacts, as discussed in Section 3.6.3.1 under “Key View 8.”

Based on the analyses provided in the RDEIR/SDEIS, the build alternatives would not result in proximity impacts after mitigation that would be so severe that the activities, features, and/or attributes that qualify Coolidge Park for protection under Section 4(f) would be substantially impaired. Caltrans has consulted with the City of Long Beach regarding Coolidge Park, and details on that consultation are located in Chapter 4 of this Final EIR/EIS. It should be noted that as a part of this consultation, the need for a TCE for the build alternatives at Coolidge Park was reevaluated and subsequently avoided. This modification is reflected in the Section 4(f) analysis included in Appendix B of this Final EIR/EIS.

Comment Letter – Interstate 710 Corridor Project Recirculated DEIR/Supplemental DEIS

Los Angeles, CA 90012

Comment Letter – Interstate 710 Corridor Project Recirculated DEIR/Supplemental DEIS

Dear Mr. Kosinski

The City of Maywood has completed the **FIRST** review of I-710 EIR/EIS. The following documents were submitted:

1. Documents: One (1) copy of the EIR/EIS Documents per disk from Ronald Kosinski.

We are delighted to provide our comments to assist in the overall I-710 improvement project. The City of Maywood strongly advocates that Alternatives 6A/B/C be reconsidered and implemented into this process. An on/off ramp for access to our City is crucial for Maywood. We desire to be an active and working participant and partner in this improvement effort. L-28-1

Please feel free to contact me or my City Engineer, Dan Garcia at (310) 968-7263 should you have any questions or need clarification on our comments.

Sincerely,

Reuben Martinez

Reuben Martinez
City Administrator

Maywood Comments on EIR/EIS Documents:

Appendix B, 2.0 Description of the Project and Alternatives - 2.4.3 Alternative 7: Add Clean-Emission Freight Corridor (Truck-Only Lanes) Along I-710 on page 25 and 26, the first darken bullet, third hollow bullet.

1. Here you mention that Slauson Avenue is a local access point for this alternative 7. Although you mention restrictions for trucks on Slauson Avenue in Appendix T, Location 3 - Slauson Ave - Existing Context starting on Page 14, 4th Paragraph last sentence where you state "Trucks on Slauson Avenue are restricted through Maywood."

2. This alternative 7 is strictly for trucks at Slauson Avenue. That doesn't' make sense. There is a truck restriction throughout Maywood, not just Slauson Avenue and does not restrict this alternative apparently from Truck Traffic. To clarify: Per Ordinance No. 03-492 trucks "... exceeding a maximum gross weight limit of three (3) tons" is restricted throughout Maywood entirely. This however is not restricted solely to Slauson Avenue. Generally, trucks use Slauson Avenue for industrial commerce for the cities of Vernon, Commerce, Bell and Maywood itself. In other words we agree that truck traffic is not an issue, yet you used this reasoning to eliminate Alternatives 6A/B/C, any options. L-28-2

3. Maywood would much rather prefer that we revisit alternative 6A/ B/C any options and implement on and off ramps at Slauson Avenue for all cars and trucks meeting Maywood's ordinance 03-492.

Appendix B, 2.0 Description of the Project and Alternatives - 2.4.3 Alternative 7: Add Clean-Emission Freight Corridor (Truck-Only Lanes) Along I-710 on page 26 the last darken bullet.

4. Please include Alternatives 6A/B/C any options for the Slauson Avenue on/off ramps when talking about reconfiguring local interchanges. You are doing this with Alternative 7 as well but Slauson Avenue is missing. L-28-3

Appendix B, 2.0 Description of the Project and Alternatives - 2.4.3 Alternative 7: Add Clean-Emission Freight Corridor (Truck-Only Lanes) Along I-710 on page 29 the last darken bullet (above Design Options)

5. On the paragraph following the first darken bullet, the Slauson Avenue Bridge should be added. Maywood agrees that bridges and overcrossings need to accommodate bicycle and pedestrian traffic. This will assist Maywood in complying with federal and state regulations and assist in qualifying for grants. For the Slauson Avenue Bridge L-28-4

overcrossing these parameters would be appropriate for Maywood and the Slauson Avenue Bridge should be added (we support Bell's efforts in reconstructing this bridge).

6. Please include the Slauson Avenue Bridge, Gage Avenue Bridge and the Florence Avenue Bridge. These bridges are being constructed by the City of Bell. L-28-4

Appendix B, 2.0 Description of the Project and Alternatives – 2.5 Design Options starting on page 29.

7. Basically, design options are satisfactory but Maywood prefers Alternative 6A/B/C any options and it should be included in this section. L-28-5

Appendix B, 3.0 Description of section 4(F) and 6(F) properties – 3.1 Section 4(F) properties on page 32.

8. The City of Maywood would like to be considered for section 4(F) properties the same as Parque Dos Rios Cesar E. Chavez Park, Drake/Chavez Greenbelt, Bandini Park/Batres Community Center, etc for its Riverfront Park. If Alternative 6A/B/C is included, that would require some widening on Slauson Avenue that impact this park. L-28-6

Appendix B, 6.0 Resources Evaluated Relative to the Requirements of Section 4(f) – Table 3: Resources Within 0.5 Mile of I-710 Corridor Project - Resources in the City of Maywood (refer to Figures 4.16-2 and 4 16-3 in the CIA for the locations of these resources) on page 81.

9. For Maywood, the following Parks/Schools/Community Center were listed: Heliotrope Avenue Elementary School, Maywood Elementary School, Maywood Park and Community Center, Maywood River Park and Pixley Park. We couldn't find Figures 4.16-2 and 4.16-3 in the documents provided. Please submit for review. L-28-7

10. Also in Appendix P, the above Parks/Schools/Community Centers were not analyzed. Please include this in your review.

Appendix F, Environmental Commitments Record – Avoidance, Minimization and Mitigation Measures - Starting on Page F-1:

11. Please include "If Alternatives 6A/B/C, any option" is considered to this section and incorporate Maywood's comments here as a PR-__. L-28-8

Appendix F, Environmental Commitments Record – Avoidance, Minimization and Mitigation Measures - Community Impacts and Relocation C-2 on Page F-10.

12. The City of Maywood would like the same consideration given to Slauson Avenue as was given to the City of Vernon on the Atlantic/Bandini interchange for this item. Assuming that you consider Alternatives 6A/B/C any options, The City of Maywood would like to improve this interchange with widening, bike and pedestrian inclusion as L-28-9

mitigation measures. This would include the bridge replacement on Slauson Avenue. L-28-9

Appendix F, Environmental Commitments Record - Avoidance, Minimization and Mitigation Measures - Community Impacts and Relocation C-4 on page F-10

13. For this Mitigation item the City of Maywood would like to incorporate Alternative 6A/B/C any options as part of this final design. L-28-10

Appendix F, Environmental Commitments Record - Avoidance, Minimization and Mitigation Measures - Community Impacts and Relocation C-7 on page F-11 and F-12.

14. The City of Maywood would like to be included as part of this disproportionate to environmental justice population analysis. It appears that Maywood was left out from this consideration. L-28-11

Appendix F, Environmental Commitments Record - Avoidance, Minimization and Mitigation Measures – Traffic and Transportation/Pedestrian and Bicycle facilities TR-1 starting on page F-15.

15. The City of Maywood is apparently missing from this analysis TR-1. The impact of the reconfiguration of Atlantic Blvd./Bandini Blvd. interchange improvement and if you consider Alternative 6A/B/C any options this would have significant impacts on Slauson Avenue and Atlantic Blvd. through Maywood. Please include Maywood in this analysis. The I-710 project will have a significant impact on our City. L-28-12

Appendix F, Environmental Commitments Record - Avoidance, Minimization and Mitigation Measures – Hydrology and Floodplains FP-1 on page F-24.

16. Upon receipt of the final approved Grading Plans the City of Maywood will issue a Maywood Grading Permit for any portion of the work that occurs within its jurisdiction. L-28-13

Appendix F, Environmental Commitments Record - Avoidance, Minimization and Mitigation Measures – Hydrology and Floodplains FP-2 on page F-24.

17. City of Maywood to participate as a member of the same Watershed Group – Los Angeles River Upper Reach 2 for any impacts to the LACFCD facilities that reside within the jurisdiction of Maywood. Please include Maywood in this analysis. L-28-14

Appendix F, Environmental Commitments Record - Avoidance, Minimization and Mitigation Measures – Water Quality and Stormwater Runoff WQ-1 on page F-25.

18. Runoff calculations will be reviewed by the City of Maywood for compliance with their current MS4 Permit requirements. MS4 Permit requirements supersede that of the L-28-15

CALTRANS. Please include Maywood in this analysis. L-28-15

Appendix F, Environmental Commitments Record - Avoidance, Minimization and Mitigation Measures – Water Quality and Stormwater Runoff WQ-2 on page F-25.

19. Upon final approval of the Low Impact Development (LIDs), a copy of the recorded Operations & Maintenance (O&M) shall be provided to the Maywood City Clerk for record purposes. L-28-16

Appendix F, Environmental Commitments Record - Avoidance, Minimization and Mitigation Measures – Air Quality AQ-2 on page F-31 and F-32.

20. Please coordinate the improvements for this item that includes Heliotrope Avenue Elementary, Maywood Elementary, etc. with the City of Maywood as part of your process in developing these reports. Please copy all of these reports to the City Administrator, City Engineer and the Director of Building and Planning. L-28-17

Appendix F, Environmental Commitments Record - Avoidance, Minimization and Mitigation Measures – Animal Species AS-1 on page F-37.

21. The City of Maywood would like to incorporate these principles for this item in the Slauson Avenue Bridge replacement being conducted by the City of Bell. L-28-18

Appendix F, Environmental Commitments Record - Avoidance, Minimization and Mitigation Measures – Construction CON-WQ-1 on page F-46.

22. A copy of the final approved General Permit shall be given to Maywood's City Clerk for record purposes. L-28-19

Appendix T, Location 3 - Slauson Ave - Existing Context start Page 14, 4th Paragraph last sentence.

23. The statement "Trucks on Slauson Avenue are restricted through Maywood." is in error. Per Ordinance No. 03-492 trucks "... exceeding a maximum gross weight limit of three (3) tons" is restricted throughout the City of Maywood entirely. This restriction, however, is not restricted solely to Slauson Avenue and in general, trucks use Slauson Avenue for industrial commerce for the cities of Vernon, Commerce, Bell and Maywood itself. This statement should not be used to discard or discount Alternatives 6A/B/C, any option which is preferred by the City of Maywood and these alternatives should be included in this analysis. For clarification, trucks may use Slauson Avenue provided they abide by Ordinance No. 03-492. L-28-20

Appendix T, Location 3 - Slauson Ave - Design Concepts - Alternative 6A/B/C (2012 DEIR/EIS) Page 14

24. Maywood favors alternatives 6A/B/C. Any of the three options would be acceptable. It appears that this effort should be further examined and reconsidered for implementation. Maywood favors conversion of this interchange into a full service interchange including four entrance and exit ramps. L-28-21

25. Your analysis here denotes that under this alternative "traffic performance was adequate during most peak periods" and the "local street system improved." This should be a preferred alternative for the entire I-710 effort overall. L-28-22

Recirculated Draft Environmental Impact Report/Supplemental Draft Environmental Impact Statement and Section 4(f) Evaluation – S.3 Proposed Project – S.3.1 Costs and Schedule on Page 5.

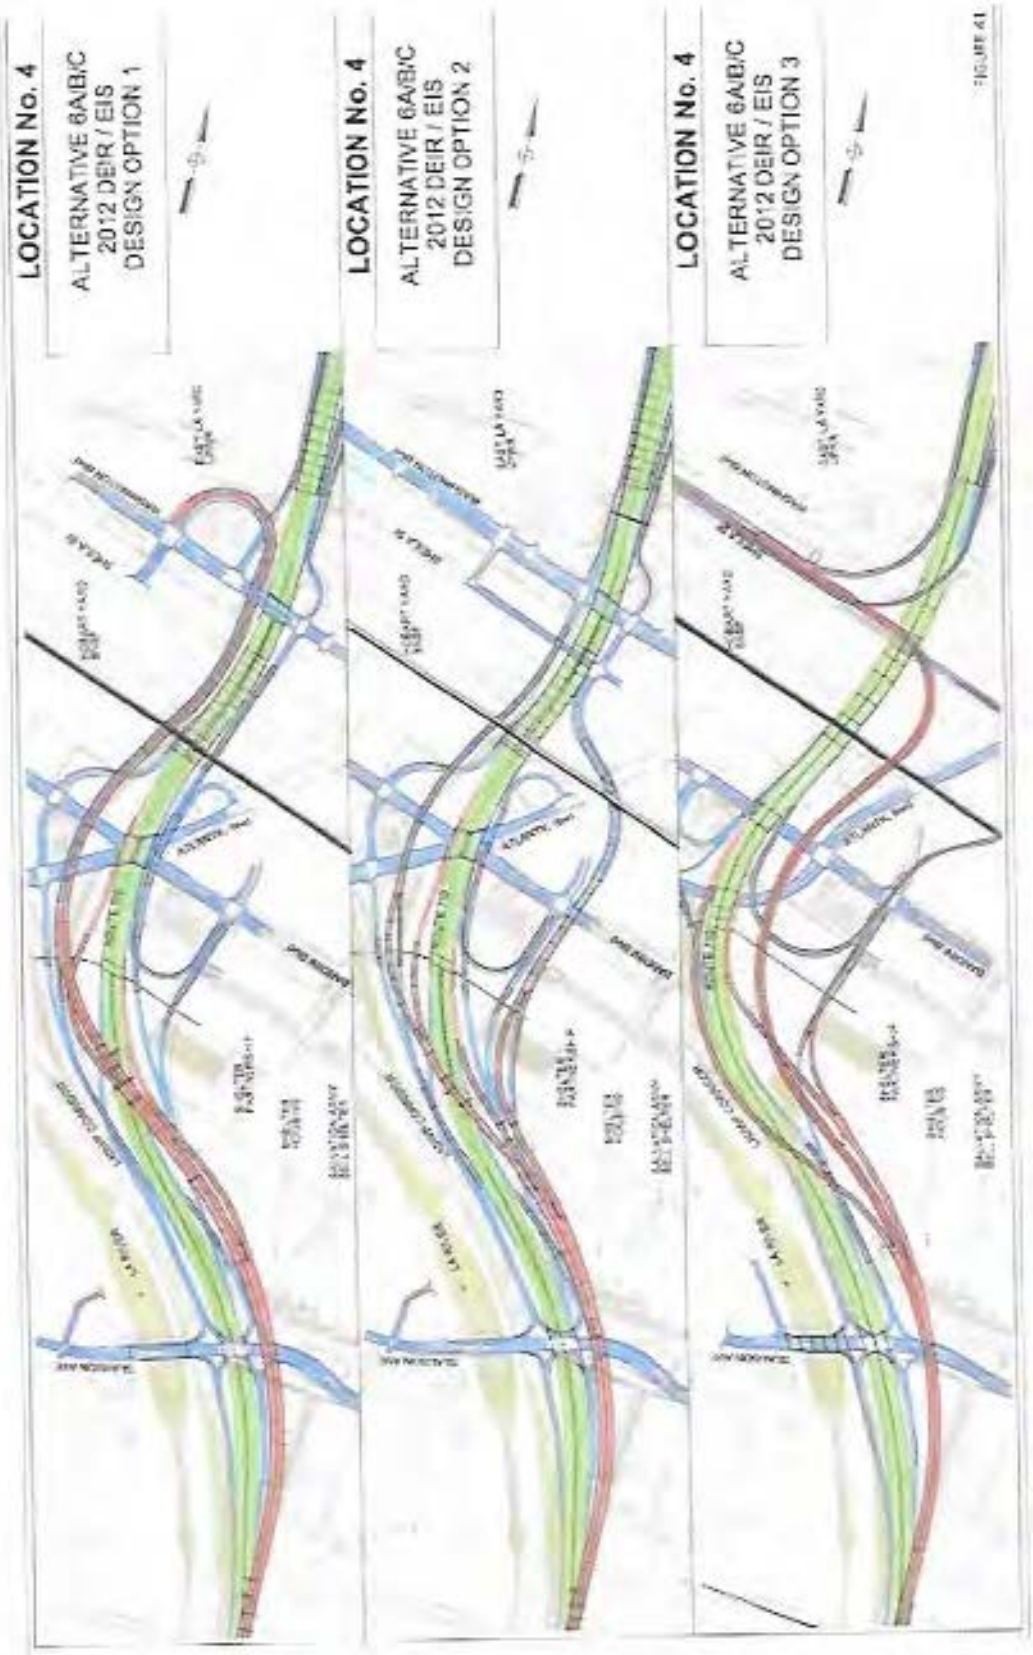
26. Please include Alternative 6A/B/C any options in Table S-1. L-28-23

Recirculated Draft Environmental Impact Report/Supplemental Draft Environmental Impact Statement and Section 4(f) Evaluation – S.3 Proposed Project – S.3.3 Alternatives on Page 6

27. Alternative 6A/B/C any options should be consider as viable alternatives. These alternatives provide on/off ramps at Slauson Avenue. They should not have been withdrawn from consideration. Reviewing these alternatives could possibly alleviate congestion at Atlantic Blvd and Bandini Blvd interchange by further studying this alternatives/options. This would also give Maywood access to the I-710 for vehicles as well as trucks. L-28-24

Recirculated Draft Environmental Impact Report/Supplemental Draft Environmental Impact Statement and Section 4(f) Evaluation – S.5 Environmental Consequences – S.5.1.3 Parks and Recreation Facilities on Page 10

28. In this paragraph, you mention permanent indirect impacts to Maywood River Front Park but do not list the impacts. Please list the impacts and submit for review.



Alternative 7 shows some direct impact to Maywood River Front Park but Alternative 5C does not. Please clarify and submit for review. L-28-25

Recirculated Draft Environmental Impact Report/Supplemental Draft Environmental Impact Statement and Section 4(f) Evaluation – S.5 Environmental Consequences – S.5.3.2 Relocations and Property Acquisition on Page 12

29. According to your statement on the build alternatives you stated that "The build alternatives will not result in any relocations in the cities/communities of" Maywood but Alternative 7 shows some real property acquisition for Maywood River Front Park. Please clarify and submit for review. L-28-26

Please contact my City Engineer Daniel R. Garcia, PE, REA, CPP at drgarcia@interwestgrp.com or (310) 968-7263 with any questions.

DESIGN OPTION 3

L-28-1

The City's support of Alternatives 6A, 6B, and 6C are acknowledged and included in the project record. Alternatives 6A, 6B, and 6C were eliminated after the conclusion of the 2012 Draft EIR/EIS public circulation period. Updates in traffic assumptions and data resulted in a clearer understanding of the origin and destination of truck traffic within the Study Area. Substantial comments were received from agencies and the public concerned with the potential right-of-way impacts and potential impacts to health and air quality associated with the addition of general purpose lanes under Alternatives 6A, 6B, and 6C. For these, and other, reasons the funding partner agencies decided to remove those alternatives from consideration and move forward with the development of revised build alternatives (Alternative 5C and Alternative 7) that better responded to public input while still meeting the project's purpose and need. Please refer to Chapter 2.0, Project Alternatives, in this Final EIR/EIS. It should be noted that Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), has identified Alternative 1 (No Build) as the Preferred Alternative. Please refer to Section 1.1 of this appendix for further discussion on the identification of the Preferred Alternative.

L-28-2

The City is referring to a new interchange at I-710 and Slauson Avenue evaluated in the RDEIR/SDEIS that would provide direct access to and from the freight corridor proposed as part of Alternative 7. The City would like to make it clear that trucks exceeding a gross weight limit of three tons are restricted throughout the City of Maywood per local ordinance.

Alternative 7 – including new freight corridor ramps at I-710 and Slauson Avenue that would exclusively serve heavy-duty trucks – was not identified as the Preferred Alternative (Alternative 1 – No Build Alternative). The process used to identify the Preferred Alternative is described in further detail in Section 1.1 of this appendix.

A full-service local interchange at Slauson Avenue was evaluated as part of the Draft EIR/EIS circulated for public review in 2012. A full-service interchange would provide all movements between northbound/southbound I-710 and eastbound/westbound Slauson Avenue. Further evaluation of a full-service interchange was conducted as part of the refinement of the build alternatives, which included Alternative 5C. Due to substantial impacts to existing infrastructure, adjacent property, and freeway operations, a new full-service interchange at Slauson Avenue was not considered viable. The impacts would include relocation of the LA Junction Railroad and corresponding property impacts required for its relocation, additional property acquisition and business relocations in the City of Commerce along Slauson Avenue, additional property acquisition and business relocation in Bell (including the Bell Shelter), and relocation of LADWP electrical transmission towers. Furthermore, a new interchange at Slauson Avenue would not be compatible with proposed interchange improvements at the Atlantic Avenue/Bandini Boulevard

interchange. The proposed modifications under the build alternatives at Atlantic Avenue/Bandini Boulevard have been refined, as compared to the build alternatives evaluated in the Draft EIR/EIS, to reduce environmental impacts as well. The proximity of the full-service interchange at Slauson Avenue, as requested by the City, to the modified interchange proposed under the build alternatives at Atlantic Avenue/Bandini Boulevard, would adversely affect freeway safety and operation on I-710. The additional impacts required to address the safety and operational effects of a new Slauson Avenue interchange would cause further environmental impacts in the vicinity of the Atlantic Avenue/Bandini Boulevard interchange. Furthermore, because reasonable and effective modifications are proposed under the build alternatives at interchanges (Atlantic Avenue/Bandini Boulevard and Florence Avenue) adjacent to Slauson Avenue, there is not sufficient justification to satisfy federal policies for new access on the federal Interstate System. These assessments, along with the proposed build alternatives, were reviewed with Maywood's City Engineer and officials prior to the circulation of the RDEIR/SDEIS in 2017.

L-28-3

Please refer to Response to Comment L-28-2 regarding the Slauson Avenue interchange.

L-28-4

It appears from the comment that the commenter is referring to the abbreviated project description contained within Appendix B of the RDEIR/SDEIS, the Section 4(f) Evaluation. It should be noted that a far more comprehensive project description could be found in Chapter 2.0, Project Alternatives, of the RDEIR/SDEIS. It should also be noted that the commenter appears to be referring to the three locations of new bicycle/pedestrian-only bridges proposed under Alternative 7. The locations of these bridges were determined by performing an analysis that first identified gaps in direct access points over I-710 (and the Los Angeles River in many cases), then evaluated the feasibility of crossings located within these gap areas. Section 2.3.2.1 of the RDEIR/SDEIS indicates that inclusion of pedestrian paths (sidewalks, curb ramps, and crosswalks) and sufficient outside shoulder width to accommodate Class II bikeways on local street crossings would be provided as part of local street modifications proposed as part of the build alternatives. However, under the Preferred Alternative (Alternative 1 – No Build), no bicycle/pedestrian bridges will be constructed.

L-28-5

Please refer to Response to Comment L-28-2 regarding Alternatives 6A/B/C.

L-28-6

Riverfront Park is included as a Section 4(f) resource in the Draft Section 4(f) Evaluation in Section 6.2 and Table 4; however, the park is listed as "Maywood River Park." Table 4 of the Draft Section 4(f) Evaluation and Section 3.1.3 of this Final EIR/EIS has been revised as follows:

Maywood River<u>front</u> Park

Alternatives 6A, 6B, and 6C were eliminated after public circulation of the 2012 Draft EIR/EIS. Alternatives 5C and 7 were carried forward for environmental review in the RDEIR/SDEIS. The impacts of Alternatives 5C and 7 on Maywood Riverfront Park are addressed in Section 6.2 of the Draft Section 4(f) Evaluation of the RDEIR/SDEIS and in the Final Section 4(f) Evaluation in this Final EIR/EIS.

L-28-7

Figures 4.16-2 and 4.16-3 from the Community Impact Assessment were not provided in the Draft Section 4(f) Evaluation in the RDEIR/SDEIS. These figure numbers referenced the Community Impact Assessment technical study as stated in the comment. However, the locations of the City of Maywood parks/schools/community center are shown in Figures 3.1-3 and 3.3-1 of the RDEIR/SDEIS and this Final EIR/EIS.

The impacts under each build alternative on City of Maywood parks/schools/community center are addressed in Section 6.2 of the Draft Section 4(f) Evaluation of the RDEIR/SDEIS and in the Final Section 4(f) Evaluation in this Final EIR/EIS. Also, the build alternatives' impacts on Maywood Riverfront Park are discussed in Tables 3.1-5 and 3.24-1 in the RDEIR/SDEIS and this Final EIR/EIS; and impacts under each build alternative on Heliotrope Avenue Elementary School and Maywood Elementary School are addressed in Tables 3.3-8 and 3.24-2 of the RDEIR/SDEIS and this Final EIR/EIS.

L-28-8

Alternatives 6A, 6B, and 6C have been removed from consideration. Please refer to Response to Comment L-28-2.

L-28-9

The referenced measure C-2, as indicated in the bold face type immediately preceding the bracketed comment, would specifically provide for the relocation of the City of Vernon Fire Station No. 4 as a direct result of the improvements under the build alternatives to the Atlantic Ave/Bandini Blvd interchange (should a build alternative be selected as the Preferred Alternative). As indicated in Table 2.3-3 of the RDEIR/SDEIS and this Final EIR/EIS, under

Alternative 5C, Slauson Avenue would be reconstructed including the freeway overcrossing from the Los Angeles River to approximately 700 feet east of the existing Los Angeles Junction Railway at-grade crossing. Also as indicated in Section 2.3.2.1 of the RDEIR/SDEIS and this Final EIR/EIS, inclusion of pedestrian paths (sidewalks, curb ramps, and crosswalks) and sufficient outside shoulder width to accommodate Class II bikeways on local street crossings would be provided as part of local street modifications associated with the build alternatives. Please also refer to Response to Comment L-28-2 regarding a new interchange at I-710 and Slauson Avenue.

L-28-10

Alternatives 6A, 6B, and 6C have been removed from consideration. Please refer to Response to Comment L-28-2 regarding a new interchange at I-710 and Slauson Avenue.

L-28-11

The City of Maywood was taken into account in the environmental justice analysis provided in Section 3.3.3, Environmental Justice, of the RDEIR/SDEIS and this Final EIR/EIS. Measure C-7 does not omit the City of Maywood as the measure refers to all affected local jurisdictions; should a build alternative be selected as the Preferred Alternative, the City of Maywood would be eligible for the funding described in Measure C-7 at the start of construction within City limits. However, as stated in Response to Comment L-28-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no impacts to environmental justice communities associated with the build alternatives.

L-28-12

The City of Maywood was included in the traffic/transportation evaluation of major arterials and study intersections conducted for the I-710 Corridor Project RDEIR/SDEIS. This evaluation revealed a slight improvement to the intersection of Slauson Avenue and Atlantic Boulevard, where the level of service (LOS) for the PM peak hour improved from LOS E, under the future No Build Alternative, to LOS D for Alternatives 5C and 7. Please refer to Tables 6-3 and 6-8 in the *Intersection Traffic Impact Analysis Report* (March 2017) for detailed information. This evaluation does take into account the reconfiguration of the Atlantic Avenue/Bandini Boulevard interchange included in the build alternatives. As shown when comparing Table 5-1 with Table 6-1 from this report, total daily volumes are projected to decrease as a result of the build alternatives on Atlantic Boulevard, between Slauson Avenue and Bandini Boulevard, by 7,000 daily vehicles as traffic shifts over to use the I-710. However, this segment of Atlantic Boulevard still exhibits congestion in 2035 under both the No Build Alternative and the build alternatives in the PM peak period. Figure 6-1 shows that Slauson Avenue would continue to operate at accepted levels of service through the City of Maywood. However, the City of Maywood may be eligible for funds intended to improve operations at congested intersection locations under the

ITS/TSM/Congestion Relief Program, outlined in more detail in Section 2.3.2.1 of this Final EIR/EIS However, since a build alternative has not been selected as the Preferred Alternative, the ITS/TSM/Congestion Relief Program programmatic element will not be implemented as part of this Project. Please refer to Responses to Comments L-28-1 and L-28-2 for further discussion on why Alternatives 6A, 6B, and 6C were eliminated from further consideration.

L-28-13

This comment suggests that a grading permit from the City of Maywood would be required to implement Measure FP-1. Should a build alternative be selected as the Preferred Alternative, construction within floodplains would require an encroachment permit from the Los Angeles County Flood Control District. However, as stated in Response to Comment L-28-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, grading permits and other approvals will not need to be obtained from the City of Maywood.

L-28-14

Caltrans acknowledges the City of Maywood's intent to participate in the Los Angeles River Upper Reach 2 Watershed Management Area. The City of Maywood was not omitted from any analysis regarding hydrology and floodplains. Please refer to Section 3.8 of this Final EIR/EIS for a detailed analysis of the project's potential impacts to hydrology and floodplains, and to letter R-1 of this appendix for responses to comments from the Los Angeles River Upper Reach 2 Watershed Management Area. As discussed in Section 3.8.4 of the RDEIR/SDEIS and this Final EIR/EIS, should a build alternative be selected as the Preferred Alternative, Measure FP-2 would require coordination with the LACFCD and affected local agencies to verify that the basin replacements would continue to meet water quality goals including those established for the Los Angeles River Metals Total Maximum Daily Load. However, as stated in Response to Comment L-28-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no impacts to hydrology and floodplains.

L-28-15

Order 2012-0011-DWQ, the Statewide Storm Water Permit for the State of California Department of Transportation regulates the storm water discharges from Caltrans Municipal Separate Storm Sewer System. This permit was issued to Caltrans from the State Water Resources Control Board to cover all of Caltrans operations. For Caltrans facilities, such as I-710, this permit supersedes the Los Angeles County MS4 permit.

L-28-16

As discussed in Response to Comment L-28-15, above, the build alternatives are subject to the requirements of the Statewide Storm Water Permit for the State of California Department of Transportation (Caltrans NPDES Permit) and not the Los Angeles County MS4 Permit. The Caltrans NPDES Permit requires preparation of a Storm Water Data Report, and not a Low Impact Development (LID) Report. BMPs are maintained by Caltrans Division of Maintenance. Caltrans Maintenance Manual is available on their website at http://www.dot.ca.gov/hq/maint/manual/maintman.htm.

L-28-17

As indicated in Measure AQ-2, should a build alternative be selected as the Preferred Alternative, the determination of adequate air filtration systems that would be provided to the listed facilities would be addressed during coordination with the respective school districts or administrations. However, as stated in Response to Comment L-28-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no nexus to implement Measure AQ-2.

L-28-18

Should a build alternative be selected as the Preferred Alternative, Measure AS-1 would be incorporated for all bridges throughout the I-710 Corridor as part of the build alternatives. Unfortunately, neither Caltrans nor Metro has the jurisdiction to incorporate this measure into the design of the Slauson Avenue Bridge Replacement being conducted by the City of Bell; therefore, it is recommended that the City of Maywood coordinate directly with the City of Bell on this project.

L-28-19

The California Construction General Permit is a statewide permit and is available on the State Water Resources Control Board's website at https://www.waterboards.ca.gov/water_issues/programs/stormwater/constpermits.shtml. Caltrans is not required to submit the Waste Discharge Identification Number to the City of Maywood. However, this information is public record and would be available on the State Water Resources Control Board's Storm Water Multiple Application and Report Tracking System if Caltrans submits the Notice of Intent for coverage under the Construction General Permit. However, as stated in Response to Comment L-28-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, a Construction General Permit will not be necessary.

L-28-20

Please refer to Response to Comment L-28-2 regarding the Slauson Avenue interchange. It should be noted that the referenced text simply states that trucks on Slauson are restricted through the City of Maywood, not disallowed. The clarification provided by the City with regards to weight limits is consistent with, albeit more detailed than, the text in Appendix T.

L-28-21

Alternatives 6A, 6B, and 6C have been removed from consideration. Please refer to Response to Comment L-28-2 regarding the Slauson Avenue interchange.

L-28-22

Appendix T, Avoidance Concepts Applicable to Alternative 7 Memorandum, evaluates right-of-way avoidance strategies at very specific locations along the I-710 Corridor under Alternative 7, in accordance with Metro Board Motion 22.1. The quotations referenced in the comment only refer to the operation of the specific avoidance concepts developed for the Bell Shelter. Please refer to Response to Comment L-28-2 for more detailed information regarding the reason for the development of these avoidance concepts. As stated in Section 1.2.2.1 of the RDEIR/SDEIS and this Final EIR/EIS, goals of the overall I-710 Corridor Project include (but are not limited to) improving traffic safety, accommodate projected traffic volumes, and modernizing the freeway design. Please also refer to Section 1.1 of this appendix for more information regarding the identification of the Preferred Alternative.

L-28-23

Alternatives 6A, 6B, and 6C have been removed from consideration. Please refer to Response to Comment L-28-2 regarding the Slauson Avenue interchange.

L-28-24

Alternatives 6A, 6B, and 6C have been removed from consideration. Please refer to Response to Comment L-28-2 regarding the Slauson Avenue interchange.

L-28-25

The project’s impacts on Maywood Riverfront Park are not discussed in detail in Section S.5.1.3 of the Executive Summary because this section is intended to be a brief summary of the project’s impacts. The project’s direct and indirect impacts are discussed in more detail in Tables 3.1-5 and 3.24-1 in the RDEIR/SDEIS and this Final EIR/EIS.

As discussed in Table 3.1-5, Alternatives 5C and 7 would not directly affect the park; however, both build alternatives would indirectly result in minimal visible changes that are classified as

low visual impacts on the park. As discussed in Table 3.24-1, the build alternatives would result in temporary impacts to access from Slauson Avenue, but, should a build alternative be selected as the Preferred Alternative, a TMP, required under Measure CON-TR-1, would minimize access impacts and provide alternate access points, if necessary. However, as stated in Response to Comment L-28-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no impacts to Maywood Riverfront Park.

L-28-26

It is unclear to where the City is referring when they indicate “real property acquisition” would be required at Maywood Riverfront Park. Table S-6 of the Executive Summary of the RDEIR/SDEIS disclosed the indirect impacts to the park, which were outlined in more detail in Table 3.1-5 of Section 3.1 of the RDEIR/SDEIS. In addition, Key View 18, shown in Figure 3.6-19 of the RDEIR/SDEIS, shows views northeast from the Los Angeles River Trail next to Maywood Riverfront Park. There is no real property acquisition required at Maywood Riverfront Park under either Alternative 5C or Alternative 7, as the park is separated from the I-710 by the Los Angeles River, and any proposed work along Slauson Avenue would not encroach into the park parcel(s). As the No Build Alternative has been selected as the Preferred Alternative, there will be no impacts to Maywood Riverfront Park.

Esubmission: http://www.mbimedia.com/uploads/docs/surveys/LSA/I-710/

Subject: City of Paramount Comments on the I-710 Corridor Project Recirculated Draft Environmental Impact Report/Environmental Impact Statement and Section 4f Evaluation

Dear Mr. Kosinski:

The City of Paramount would like to thank the State of California Department of Transportation (Caltrans) and Los Angeles County Metropolitan Transportation Authority (Metro) for the opportunity to review the Recirculated Draft Environmental Impact Report/Draft Environmental Impact Statement (RDEIR/RDEIS) for the I-710 Corridor Project (Project). Paramount is supportive of Caltrans and Metro efforts to improve the I-710 Corridor and therefore urges rejection of the No Build Alternative. Furthermore, given the projected increase in container traffic from the ports projected to occur by 2040, it is important to accelerate completion of Project, so that all components are completed by 2040. L-29-1

The City of Paramount appreciates that Metro has taken the time to revise the project and prepare the RDEIR/RDEIS, based on comments received on the 2012 DEIR/DEIS. The City of Paramount also appreciates the collaborative planning and community participation process that has taken place regarding the I-710 Corridor. We commend Caltrans and Metro for their efforts to involve affected communities and responsible agencies in the project and the EIR/EIS.

We are sensitive to the difficulties associated with the preparation of an EIR/EIS for such a complex project, spanning multiple jurisdictions. We offer the following comments on the RDEIR/RDEIS. Our comments are intended to address the environmental concerns of our City, as well as the document's usefulness as a decision-making tool under both the California Environmental Quality Act (CEQA) and the National Environmental Policy Act (NEPA). In preparing these comments we have:

1. Reviewed the document to see if revisions in the project alternatives or changes in circumstances raise any additional issues.
2. Reviewed the responses to our 2012 comments on the DEIR/DEIS to see if our concerns have been adequately addressed.

Document's Ease of Use

The Study Area includes the portion of the I-710 Corridor from Ocean Blvd. in Long Beach to SR-60, a distance of approximately 19 miles and includes all or portions of the Ports, the Cities of Bell, Bell Gardens, Carson, Commerce, Compton, Cudahy, Downey, Huntington Park, Lakewood, Long Beach, Lynwood, Maywood, Paramount, Signal Hill, South Gate, and Vernon, as well as unincorporated areas of Los Angeles County, including the communities of East Los Angeles, Boyle Heights, Wilmington, and San Pedro. As noted on page 7 of the RDEIR/RDEIS: some of the project's pragmatic elements would not be implemented by Caltrans as the Lead Agency under CEQA and NEPA, but would instead by implemented by Metro or other public agencies with jurisdiction over a particular element. As stated on page 5.16-1 of the Community Impact Assessment: " . . adoption of one of the I-710 Corridor Project build alternative would require the City of Paramount to amend its General Plan Land Use and Circulation Elements to reflect the improvements proposed for the I-710 mainline and interchanges . " Mitigation Measure LU-1 in fact requests that local jurisdictions update their General Plans accordingly. Since a number of the local jurisdictions along the alignment will need to take discretionary actions to implement portions of the project, it is important that the document be written in a way that facilitates it use by other jurisdictions for purposes of CEQA. L-29-2

The CEQA summary table included in the document is so summary as to be meaningless when it comes to understanding the specific impacts of the Project. For example the CEQA summary table (Table S-5) indicates that all noise impacts are less than significant with mitigation. However, the Community Impact Assessment, which is one of the technical studies for the Project indicates that under Alternative 7 there would be a substantial noise increase resulting in noise impacts at Ralph C. Dills Park and that noise abatement was considered in the form of a soundwall along the proposed truck lanes, however, it was determined to be acoustically not feasible. This would appear to indicate a significant unmitigated noise impact under Alternative 7 to Ralph C. Dills Park in the City of Paramount. The CEQA summary table needs to be sufficiently detailed to identify the impacts of the No Build and Project alternatives. If necessary, separate summary tables should be prepared for each Alternative. L-29-3

As currently written it is difficult for cities to easily find a summary of the impacts that affect their communities, the applicable mitigation measures, and the level of L-29-4

significance after mitigation specific to their communities. In the Final EIR/EIS, please provide city-specific CEQA-style summary tables to facilitate a clear understanding of the impacts, and associated mitigations for each city along the alignment, and the processing of any Project required discretionary approvals by local cities along the alignment. L-29-4

In reviewing the responses to the City's 2012 comments on the DEIR/DEIS we find that the comments often point to a section in the RDEIS/RDEIR as the location where the concern expressed is addressed, but sometimes fail to indicate how the concern was addressed. It would be more helpful if future responses to comments indicate how the comment has been resolved, rather than simply pointing the reader to a section of the document. This will also help to highlight Caltrans/Metro responsiveness to community concerns. L-29-5

1. COMMENTS ON THE RDEIR/RDEIS ANALYSIS OF ALTERNATIVES 5C and 7

The technical studies for the Project are not listed in the Table of Contents for the RDEIR/RDEIS. Are they considered to be part of the RDEIR/RDEIS? L-29-6

Project Description

Table 2.3-1 indicates that the Project includes the following local interchange and roadway modifications for both build:

- B-25 (Paramount and East Compton) - Modification of Rosecrans Ave. entrance and exit ramps.
- B-25 (Paramount and East Compton) - Widening of Rosecrans Ave., including the freeway overcrossing, between Gibson Ave. and the Los Angeles River.
- B- 20 (Compton) - Reconstruction of the Alondra Blvd. interchange, including conversion from one-quadrant cloverleaf interchange to diverging diamond interchange configuration, and entrance and exit ramps.
- B- 20 (Compton) - Reconstruction of Alondra Blvd., including the freeway overcrossing and bridge over the Los Angeles River, between S White Ave. and Hunsaker Ave. (Compton).

L-29-7

The description of the Alondra improvements in Table 2.3-1 (B-20) should be corrected to indicate that these improvements are also in the City of Paramount.

According to page 5.16-5 of the Community Impact Assessment: L-29-8

> Within the City of Paramount, Alternative 5C includes improvements at Alondra Blvd. and Rosecrans Ave., two major roadways that are used to travel from one part of the community to another and are familiar to residents. These improvements would either improve an arterial intersection or existing interchange with new ramps or overcrossings to accommodate the widening of the I-710 mainline or result in a new configuration of an interchange to improve circulation (refer to Section 5.16.8 for details regarding potential changes in access). In addition, Alternative 5C includes replacement of sidewalks for pedestrian access along Alondra Blvd. and Rosecrans Ave., adjacent to both the westbound and eastbound lanes within the project limits. These sidewalks would join existing sidewalks outside the project limits.

According to page 5.16-10 of the Community Impact Assessment:

> Under the I-710 Corridor Project build alternatives, sidewalks would be added along Alondra Blvd. and Rosecrans Ave. adjacent to both the westbound and eastbound lanes within the project limits and would join existing sidewalks outside the project limits. The sidewalk design will comply with Americans with Disabilities Act of 1990 (ADA) standards. Through the project limits, both Alondra Blvd. and Rosecrans Ave. feature eight-foot outside shoulders in each direction, which exceeds the minimum requirements of a Class 3 Bikeway.

Is the Community Impact Assessment description on page 5.16-5 correct or do these improvements apply to both build alternatives per Table 2.3-1? Where is the information in the RDEIR/RDEIS regarding specific Project components located within the City of Paramount and the Alondra Blvd. and Rosecrans improvements described in the Community Impact Assessment? It is difficult to tell the specifics of the Alondra Blvd. and Rosecrans Ave. improvements from Figure 2.3-6 (Sheet 3 of 7). L-29-8

Table 2.3-5 lists the construction durations for the seven segments of the Project. Will this construction occur sequentially, or will some of all of the segments be constructed concurrently? What is the total number of months for construction and when is construction anticipated to be complete? L-29-9

Page 2-88 indicates: "For each segment of the proposed project, a sequence of work was developed identifying major elements of the improvements to be constructed by stage. Maintenance of traffic assumptions, including number of lanes maintained, temporary detours, and roadway closures were identified." L-29-10

Where is this information available? When the Alondra bridge is being replaced it is important to keep one lane in each direction open for local traffic. L-29-10

Where can the list of screenwalls and sound barriers to be installed in Paramount located in the document? It does not appear from Section 3.14.5.7 that there are any soundwalls planned for the City of Paramount. Is this correct? L-29-11

Community Health Benefit Program

According to pages 2-23 to 2-24, the Project includes the Community Health Benefits Program. "The I-710 Corridor Community Health Benefit Program is a programmatic component of the build alternatives and would take the form of a grant program structured to provide corridor communities the opportunity to implement projects or outreach activities that would improve air quality and public health related to I-710 travel and goods movement." "Projects falling into three broad categories would be eligible and considered for funding under the program: (1) air quality improvement and/or noise reduction measures at local schools and other sensitive receptors or related sites, (2) air quality improvements at hospitals, medical centers, and senior facilities, as well as health education, outreach, and screening, and (3) greenhouse gas (GHG) reduction through projects such as renewable power, energy efficiency, and tree-planting, etc. More specific criteria for eligible projects would be developed by the I-710 Funding Partner agencies."

How much funding is anticipated to be allocated to this program? How will Caltrans/Metro ensure that funds are appropriately distributed among affected local jurisdictions in a way that ensure appropriate noise and air quality improvements in areas affected by I-710 traffic-related noise and emissions? How can the City of Paramount ensure that schools within 0.5 miles of the alignment will receive funding to address the air impacts of location in proximity to a major freeway under this program? Please address these same questions for Mitigation Measures C-6 and C-7 which are intended to address noise impacts and air quality, traffic, visual, land use and parks effects on environmental justice communities. L-29-12 L-29-13

Community Impact/Relocations/Acquisitions

According to the Community Impact Assessment, which is one of the technical studies for the Project:

Alternative 5C will result in:

- Partial acquisition of two commercial/industrial parcels.
- No relocations.

L-29-14

Alternative 7 will result in:

- Six full flood control parcel acquisitions and seven partial acquisitions (two commercial/industrial and five flood control parcels).
- No relocations.

However, page 5.16-7 of the Community Impact Assessment states: "as the result of the residential property acquisition under Alternative 5C, the I-710 Corridor Project build alternatives have the potential to result in a loss of property tax revenue." However no residential property acquisitions are identified in the RDEIR/RDEIS in the City. This inconsistency should be resolved and corrected in the RDEIR/RDEIS and technical study. L-29-14

Response to comment L-25-34 indicated that based on the revised build alternatives there will be no impact to the driveways at the Home Depot. Please verify that this is the case. L-29-15

Traffic

For the City of Paramount, only two (2) intersections were identified as being significantly impacted by the alternatives studied. The impacts were identified in only the Alternative 5C scenario.

- Intersection #51 – Rosecrans Avenue and Garfield Avenue
- Intersection #52 – Rosecrans Avenue and Paramount Boulevard

Mitigation Measure TR-1 (page F-18) includes:

- ROSECRANS AVE./GARFIELD AVE.: Add an extra left-turn lane on the eastbound (EB) approach. The improvement at this intersection pertains to Alternative 5C only.
- ROSECRANS AVE./PARAMOUNT BLVD.: Add an extra left-turn lane on the eastbound approach. The improvement at this intersection pertains to Alternative 5C only. L-29-16

Currently, Rosecrans Avenue provides 2 westbound and 3 eastbound lanes generally separated by a raised center median. It is unclear how the proposed mitigation measure to add an extra EB left-turn lane would be able to fit at the two impacted intersections. A major redesign of both the eastbound and westbound approaches of Rosecrans Avenue to the intersections would be necessary. The proposed mitigation measures may require the removal of the raised median and on-street parking to fit within the existing roadway width. The Final EIR/EIS needs to address the potential need for a redesign, its feasibility and any direct or indirect impacts of the mitigation.

The Project includes the implementation of peak period parking restrictions as part of Alternatives 5C and 7, to improve traffic operations on some of the congested arterial roadway segments. The parking restrictions would be 7:00 a.m. – 9:00 a.m. and 4:00 p.m. – 7:00 p.m. and implemented on:

- Atlantic Boulevard between Pacific Coast Highway and SR-60;
- Cherry Avenue/Garfield Avenue between Pacific Coast Highway and SR-60;
- Eastern Avenue between Cherry Avenue and Atlantic Boulevard; and
- Long Beach Boulevard between San Antonio Drive and Firestone Boulevard.

L-29-17

The proposed peak hour parking restrictions on Garfield Avenue will impact the City of Paramount. These restrictions will impact all the fronting uses along Garfield Avenue in Paramount. Some property owners may not be supportive of these parking restrictions especially if they have limited on-site parking.

From the analysis, we cannot confirm the City's project for the improvements along Garfield Avenue were incorporated. The City is in the process of making Garfield a 3-lane of travel in each direction with peak hour parking restriction of 7- 9 a.m. and 4-6 p.m. only.

L-29-18

From the analysis, we cannot confirm that the analysis includes the widening of Alondra Boulevard to three lanes in each direction from the I-710 to Lakewood Boulevard. Please confirm that this is included in the analysis.

L-29-19

The City would anticipate that the intersection of Alondra Blvd./Garfield Ave. would be impacted by the Project. The Traffic Impact Analysis indicates that this intersection would operate at LOS E or F under all three alternatives, but neither build alternative would impact this intersection. Please summarize the findings at this intersection regarding LOS under each of the three alternatives, in the response to this comment. Did the analysis assume City improvements at this intersection?

L-29-20

Several of the Tables in the TIA and TOAR do not list intersections numbered in the 200s. Information on these intersections is provided in the associated Figures but nothing is found in the Tables. This error/omission needs to be addressed.

L-29-21

According to page 5.16-8 of the Community Impact Assessment: "(t)here is one main area of improvement under the I-710 Corridor Project build alternatives that is within the Cities of Paramount and Compton that may impact access and circulation for residents or workers within the City of Paramount: the I-710/Alondra Blvd. interchange." According to page 5.16-10:

L-29-22

> The existing interchange configuration at Alondra Blvd. is proposed to be replaced with a diverging diamond interchange. The proposed configuration would improve traffic operations and safety over the existing interchange's tight curves, narrow lanes, and nonstandard deceleration lengths. Alondra Blvd. would be reconstructed to three through lanes in each direction between Atlantic Ave. and the second Dominguez High School entrance, east of the Los Angeles River. Because of the improvements to Alondra Blvd. and their close proximity to the interchange, Frailey Ave. and Lime Ave. in the City of Compton would require cul-de-sacs, eliminating direct access to and from Alondra Blvd. While these changes in access are not located directly within the City of Paramount (they are located adjacent to the City of Paramount within the City of Compton), the changes in access may impact residents or commuters within the City of Paramount. Drivers who access Alondra Blvd. from these roadways would be required to be redirected north to Linsley Ave. and use Atlantic Blvd. to reach Alondra Blvd.

L-29-22

Is the impact to City of Paramount drivers significant? If so, how is it being mitigated?

According to page 5.16-10 of the Community Impact Assessment:

> During construction, the project may result in increased service times for the Metro bus service in the City of Paramount, as well as for the City's Easy Rider Shuttle, the Paramount Dial-A-Ride, and the Paramount Dial-A-Taxi service. In addition, bus stops in the vicinity of the proposed improvements for Alondra Blvd. and Rosecrans Ave. would be temporarily relocated during construction. These impacts would be temporary and would cease after completion of any construction in the vicinity of these service routes.

L-29-23

How long will bus service on Alondra Blvd. and Rosecrans Ave. be relocated. What is the likely increase in service times for Metro bus service, the City's Easy Rider Shuttle, the Paramount Dial-A-Ride, and the Paramount Dial-A-Taxi? Does this constitute a significant construction impact of the Project?

How is the Eco-Rapid [1] (West Santa Ana Branch Transit Corridor) project addressed in the RDEIR/RDEIS? There appears to be only one reference to Eco Rapid in the document, on page 3.25-17. The notice of preparation of the EIS/EIR for the Eco-Rapid project was issued on June 26, 2017. Based on the current schedule, Metro now anticipates releasing the Final EIS/EIR in late 2019. How is the Eco-Rapid project included in the traffic forecasts for the Project and what assumptions were included in the analysis regarding the timing of the Eco-Rapid project? L-29-24

One of the construction impacts of the proposed project will be the impact of construction and diverted traffic on local arterials. It is very important that Caltrans/Metro provide adequate mitigation to local jurisdictions to address these impacts and that, when calculating likely impacts, the EIR/EIS consider the cost of impacts along the full length of, not only, likely construction truck routes within the corridor, but the impact of traffic diverted or detoured onto local street during construction. Please provide more information regarding how this impact is addressed in the EIR/EIS for the Project, reimbursement will be provided to local jurisdictions for roadway repair, and how the amount allocated for mitigation reimbursement has been calculated. L-29-25

Mitigation CON-TR-2 states:

> Prior to construction, an evaluation of damage to the pavement surface on local roadways that may occur due to project-related construction traffic will be completed. New pavement will be provided on local arterials that connect to or cross over (or under) I-710 where such roadways will be directly affected by project construction after project completion in the vicinity of each arterial. L-29-26

As written, Mitigation Measures CON-TR-2 does not appear to fully address this concern, as only a small segment of the lengths of roadways that may be impacted by "project-related construction traffic", are addressed by this mitigation. The wording of the mitigation should make clear that it applies to detour traffic as well as construction traffic.

Noise

Under Alternative 7, there would be a substantial noise increase (12 dB) resulting in noise impacts at Ralph C. Dills Park. Noise abatement was considered in the L-29-27

[1] For more information on Eco-Rapid, see: http://eco-rapid.org/pdf/weareplanningen.pdf , http://eco-rapid.org/Project/description.shtml , https://www.metro.net/projects/west-santa-ana/ , https://media.metro.net/projects_studies/westSantaAnaBranch/images/nop_final_signed.pdf

form of a soundwall along the proposed truck lanes, however, it was determined to be acoustically not feasible. Why was mitigation infeasible? Why is this not identified as a significant unmitigated project impact? Are there any other locations in the City where it was determined there would be a substantial noise increase resulting in noise impacts, but soundwalls or other mitigation was deemed infeasible? L-29-27

Aesthetics

Why are there no visual simulations for the City of Paramount? How is it possible to determine if there are aesthetic impacts to Paramount without simulations? L-29-28

2. PRIOR COMMENTS NOT ADEQUATELY ADDRESSED

The City's 2012 comment letter is identified in the RDEIS/RDEIR as Letter L-25 in Appendix S. Responses to these comments begin on page 589 of Appendix S. Only those comments that have not been adequately addressed are reiterated below:

Executive Summary

L-25-3 The Executive Summary does not comply with California Environmental Quality Act (CEQA) Guideline 15123(b), which requires that the summary identify "each significant effect with proposed mitigation measures." It would be helpful if the summary specified not just the impacts, but the mitigations measures included in the document to address the impacts. As currently written, the reader is required to look at the end of each section of Chapter 3 in order to obtain a listing of proposed mitigation measures. A summary table, like those typically included in an EIR which lists for each impact, the mitigation measures and level of significance after mitigation, would make review of the adequacy of the mitigation measures as well as an understanding of the comparative impacts of the Alternatives substantially easier. We understand that NEPA level analysis of the alternatives may necessitate separate summary tables for each alternative, or for groups of alternatives, but believe that the informational value of such tables is warranted, given the difficulties inherent in a reader or decision-maker understanding the comparative impacts and comparative mitigation effort required for the five alternatives addressed in the DEIR/DEIS. L-29-29

L-25-4 Please provide an estimate of the timing of the project (i.e. weeks/months for construction), key project phasing and when the project would become operational. If information, such as when the project would become operational is not available at this time, include an explanation of why the information is not currently known. L-29-30

L-25-6 Table S-3 provides only the most basic comparison of the alternatives. Statements like "project area particulate matter emissions increase compared to no project conditions" do not provide sufficient information for a meaningful understanding of the relative impacts of the alternatives. A more detailed comparison should be provided. If impacts, such as air quality emissions have been quantified, the quantifications should be included in the summary. L-29-31

2.0 Alternatives

L-25-8 Pursuant to CEQA Guidelines Section 15126.6 (e)(2) the EIR/EIS should identify the environmentally superior alternative among the alternatives, either here, or in the Executive Summary. L-29-32

L-25-9 As noted in our comments on the Executive Summary above, Table S-3 provides only the most basic comparison of the alternatives. Statements like "project area particulate matter emissions increase compared to no project conditions" do not provide sufficient information for a meaningful understanding of the relative impacts of the alternatives. A more detailed summary comparison of the alternatives should be provided in this chapter or in the Executive Summary. L-29-33

L-25-11 Please provide an estimate of the timing of the alternatives (i.e. weeks/months for construction), key phasing for each alternative and when the alternative would become operational. If information, such as when the alternative would become operational is not available at this time, include an explanation of why the information is not currently known and how the unknowns have been addressed in the analysis. This information is important when assessing the accuracy of some of the technical analysis performed for the DEIR/DEIS, such as the calculation of construction air quality impacts. The DEIR/DEIS should identify any differences in the likely construction timing or phasing of the alternatives. L-29-34

L-25-12 In addition, the timing of project components may affect potential impacts. We would recommend, for example, that street/intersection improvements be done in advance of mainline construction to reduce the impacts of mainline construction traffic on the local roadway system. In addition, we would recommend that the freight corridor be completed in advance of the general-purpose lanes so that trucks can be diverted to the freight corridor while the general purpose lane improvements are occurring, thus minimizing the disruption to car travel along the I-710. The DEIR/DEIS should address any construction timing issues with the potential to alter or reduce construction impacts and disruption and provide more complete information regarding project phasing. L-29-35

L-25-13 It would be helpful if the description of the alternatives provided information on existing capacity verse the carrying capacity of each of the alternatives, so that this information can be compared to the description of capacity needs contained in Chapter 1. L-29-36

It would be useful if this information were provided in a table comparing the three alternatives.

L-25-25 Table 2.5-3 lists the Construction duration by segment. Please make clear the assumptions used in the analysis regarding whether or not construction was assumed to be sequential, or which segments were assumed to be constructed concurrently, for each of the alternatives. Please indicate the assumed duration for construction for each of the alternatives used in the analysis. This section of the RDEIR/RDEIS needs to provide more detailed information regarding the timing of the construction components for each segment or point the reader to where that information is located in the document. More detailed project phasing, like that required for the air quality analysis, should be provided as part of the description of the alternatives. L-29-37

Chapter 4

L-25-26 Each Environmental Consequence section within this Chapter should clearly identify the impacts associated with each of the alternatives, the mitigation measures that apply to each alternative, and the level of significance after mitigation for each impact. For each issue area CEQA requires a strict baseline versus build analysis to assess whether a proposed project will have an impact. If a proposed project is determined to have a significant impact L-29-38

under CEQA, then CEQA dictates that mitigation measures must be incorporated into the project unless such measures are not feasible. L-29-38

3.1 Land Use

L-25-29 Page 37 of the City of Paramount's General Plan states that:

> Any new development or redevelopment in the city should have a Traffic Impact Analysis (TIA) conducted if the project is expected to generate more than 500 new trips per day. The TIA should be conducted in accordance with the procedures in the Los Angeles County Congestion Management Program (CMP) Guidelines for Traffic Impact Analysis, except that the impact shall be considered significant if the project related increase in the volume to capacity (v/c) ratio for intersections equals or exceeds the thresholds shown in Table 3-3. When a new project results in a significant impact, improvements to the intersection (referred to as mitigation) will be required so as to restore or reduce the v/c ratio to the operating levels that existed prior to the project's implementation.

The Traffic analysis for the I-710 only addressed intersections projected to operate at LOS E or F and, used the following criteria for determining which intersections are adversely impacted when comparing any of the I-710 Corridor Project build alternatives to the No Build conditions: L-29-39

- Degraded LOS E or F in the build alternatives (with I-710 Project); and
- Increase in intersection delay over Alternative 1 conditions.

The threshold of significance used on the I-710 Traffic Analysis is thus different than the threshold specified in the City's General Plan. Use of a threshold that is different than the threshold specified in the City's General Plan is likely to result in the under-identification and under-mitigation of intersection impacts in the City, and to create "with project" operational impacts inconsistent with the City's General Plan Circulation Element.

Would use of the City's prescribed methodology result in the identification of additional impacts within the City? L-29-39

L-25-30 Mitigation Measure LU-1 requires that:

> **LU-1** Following approval of the Final Environmental Impact Report/Environmental Impact Statement (EIR/EIS) for the Interstate 710 (I-710) Corridor Project and filing of a Notice of Determination with the State Clearinghouse, the California Department of Transportation (Caltrans) shall request that the affected Cities and the County amend their respective General Plans to reflect the final alignment, interchange locations, and modification of land use designations for properties that would be acquired for the project. Caltrans will also initiate amendments to existing freeway agreements with cities where the build alternatives would add or remove access to I-710 or Interstate 405 (I-405). L-29-40

Whether written as a request or a directive, the Project will required local jurisdictions to incur costs which may not be programmed, which could result in indirect impacts to public services if local governments are required to divert public service funds to pay for the required General Plan amendment. The mitigation measure should specify that the cost of the required General Plan amendments will be reimbursed from I-710 funds, or the potential indirect environmental impacts of this cost burden must be addressed in the DEIR/DEIS.

3.3 Community Impacts

L-25-32 As noted in Table 3.3-5, the following schools in the City are located within 0.5 mile of the I-710 mainline and interchange improvements: (1) Los Cerritos Elementary School, 14626 Gundry Ave., Paramount; (2) Keppel Elementary School, 6630 Mark Keppel St., Paramount; and (3) Zamboni Middle School, 15733 Orange Ave., Paramount. These schools are not identified as impacted in Table 3.3-8, which only identifies impacted schools, but the reason why Paramount schools within 0.5 miles of the facility are not impacted is not clear from the discussion. It would be helpful if Table 3.3-8 explained the basis of both impact and no-impact conclusions for each school. L-29-41

3.5 Traffic

L-25-42 The DEIR/DEIS needs to address the timing of street and intersection improvements. These improvements should be done in advance of mainline construction to facilitate use of local streets for detour and construction purposes.

L-29-42

While the Early Action Project nomination process allows cities to nominate improvements for early action, this should be done without requiring such action by local jurisdictions.

3.6 Visual

L-25-45 The visual/aesthetic analysis does not specifically address potential impacts to or views from the City of Paramount.

L-29-43

L-25-48 We are concerned that the project may not include adequate soundwalls and screen walls through the City of Paramount. We would request either a soundwall and/or screen wall be required along the I-710 freight corridor in and adjacent to the City of Paramount so trucks aren't visible.

L-29-44

A screen wall is required on Shoemaker bridge so trucks aren't visible. In the absence of such a screen wall, the potential for visual impacts remains.

Conclusion

We thank Caltrans and Metro for the opportunity to review the EIR for the I-710 Corridor project and look forward to continuing to work with Caltrans and Metro on this important improvement project. Should you have any questions please contact Bill Pagett, City Engineer at 562-220-2108 or bpagett@paramountcity.com.

CITY OF PARAMOUNT

Christopher S. Cash
Director of Public Works

H:\Public Works\CHRIS\LETTERS\City Paramount comment letter RDEIRRDEIS I-710_.docx

This page intentionally left blank

L-29-1

The City of Paramount's opposition to the No Build Alternative is acknowledged and included in the project record. Caltrans and Metro appreciate the City of Paramount's participation in the development of the I-710 Corridor Project build alternatives. However, Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), has identified Alternative 1 (No Build) as the Preferred Alternative. Please refer to Section 1.1 of this appendix for more information on the identification of the Preferred Alternative.

L-29-2

The RDEIR/SDEIS was written to comply with Caltrans' CEQA and NEPA standards which describe the environmental impacts of the proposed project. However, as stated in Response to Comment L-29-1, the No Build Alternative has been identified as the Preferred Alternative and there will be no need for any future General Plan updates by the City to address changes resulting from the build alternatives.

L-29-3

As described above in Response to Comment L-22-8, the Executive Summary of the Final EIR/EIS includes a summary table identifying all project-related impacts; applicable avoidance, minimization, and/or mitigation measures; and level of CEQA significance.

With respect to noise impacts described in the RDEIR/SDEIS, it is important to note that the CEQA noise analysis is completely independent of the 23 CFR 772 noise analysis, which is centered on the Federal noise abatement criteria (NAC), as described in Chapter 4.0, CEQA Evaluation. The NAC specified in Caltrans' *Traffic Noise Analysis Protocol* (Protocol) is the same as those specified in 23 CFR 772. The Protocol defines a noise increase as "substantial" when the predicted noise levels under build conditions exceed existing noise levels by 12 dBA. Several receptors within the project Study Area would experience a substantial noise increase of 12 dBA or more over existing noise levels for both build alternatives. The provision of new soundwalls under Alternatives 5C and 7, as required by Measure N-1, would mitigate project-related noise impacts along the I-710 freeway to a level below significance under CEQA. Specifically, proposed soundwall 705TL combined with other soundwalls, was determined to be acoustically feasible and would adequately reduce substantial noise impacts for this receptor. However, as stated in Response to Comment L-29-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, soundwalls will not be constructed as a part of this project.

L-29-4

As described in Response to Comment L-22-8, where a jurisdiction-specific analysis was conducted, corresponding summary tables are provided in Section 3.1 and 3.3 of the RDEIR/SDEIS. Table 3.1-1 identifies existing land use impacts by jurisdiction; Table 3.3-9 identifies parking impacts by jurisdiction; and Table 3.3-12 identifies relocations by City. Much of the analysis throughout the RDEIR/SDEIS is regional in nature due to the scale of the build alternatives; therefore, specific study areas were established to identify project-related impacts at a larger scale for each build alternative. Since the No Build Alternative has been selected as the Preferred Alternative, there is no need for permits and/or approvals from any agency and/or jurisdiction. However, the Executive Summary of the Final EIR/EIS includes a summary table identifying all project-related impacts; applicable avoidance, minimization, and mitigation measures; and level of CEQA significance.

L-29-5

Caltrans and Metro appreciate this feedback and acknowledge the amount of information presented in both the 2012 Draft EIR/EIS and the 2017 RDEIR/SDEIS. In many cases, although the analysis that was included in the Draft EIR/EIS was similar to that which was included in the RDEIR/SDEIS, the revised analysis was different enough or the comment was on a feature of the build alternatives that was no longer under consideration in the revised set of build alternatives. Therefore, many comments were essentially no longer applicable since they had been made on alternatives no longer under consideration. Caltrans has made an effort to be more specific in the responses to comments on the RDEIR/SDEIS contained in this appendix, but cross-references are still utilized where appropriate.

L-29-6

The technical studies supporting the RDEIR/SDEIS were made available for informational purposes on Caltrans' website and via Compact Disc or flash drive at six corridor-area libraries that also housed a hard copy of the RDEIR/SDEIS during the circulation period in 2017. The full list of technical studies supporting the RDEIR/SDEIS and this Final EIR/EIS is contained in Appendix H, List of Technical Studies. The analysis contained within the RDEIR/SDEIS summarizes the contents of those studies, but those studies are bound separately and not considered to be appended to the RDEIR/SDEIS itself.

L-29-7

The description of improvements under the build alternatives at Alondra Boulevard in Table 2.3-1 has been updated in this Final EIR/EIS to indicate that they are also in the City of Paramount.

L-29-8

Specific information regarding the proposed improvements to the Alondra Boulevard and Rosecrans Avenue crossings under the build alternatives can be found in Table 2.3-1 (Alondra Boulevard as B-20, Rosecrans Avenue as B-25) and shown on sheet 3 of 7 on Figure 2.3-6 of the RDEIR/SDEIS and this Final EIR/EIS. As discussed in Section 3.3.1.3 of the RDEIR/SDEIS and this Final EIR/EIS, all crossing arterials modified as a result of the build alternatives would be provided pedestrian facilities (sidewalks, curb ramps, and crosswalks) and sufficient outside shoulder width for Class II bikeways. All replaced and new sidewalks associated with the build alternatives would be designed to comply with the Americans with Disabilities Act (ADA). However, since the No Build Alternative has been selected as the Preferred Alternative, pedestrian facilities will not be provided.

L-29-9

The construction staging analysis was a conceptual analysis developed to ensure that the build alternatives could physical be constructed, that the freeway facility could continue to operate during construction, and that a logical order of construction could be defined thereby minimizing throw-away of built elements. Should a build alternative be selected as the Preferred Alternative, construction of the build alternatives would take place in sequenced construction stages or packages as funding is made available for construction. However, as stated in Response to Comment L-29-1, the No Build Alternative has been identified as the Preferred Alternative and there will be no construction.

L-29-10

Please refer to Response to Comment L-29-9 regarding construction staging for the build alternatives. The preliminary construction staging analysis for the build alternatives (which can be made available to the City upon request) shows that the Alondra Boulevard bridge would be constructed one side at a time (eastbound Alondra Boulevard, followed by westbound Alondra Boulevard) for purposes of maintenance of traffic. However, as stated in Response to Comment L-29-1, the No Build Alternative has been identified as the Preferred Alternative and therefore, closure of local roadways will not be necessary.

L-29-11

The build alternatives propose several soundwalls along I-710 in the City of Paramount between SR-91 and I-105. Please refer to sheets 20 through 22 of Figures 3.14-2 and 3.14-3 in the RDEIR/SDEIS and this Final EIR/EIS for the soundwalls proposed under Alternative 5C and Alternative 7, respectively. Screenwalls were only proposed on the freight corridor structure under Alternative 7. However, since the No Build Alternative has been selected as the Preferred Alternative, soundwalls will not be constructed as part of this project.

L-29-12

The details of the Community Health Benefit Program have been developed beyond what was included in the RDEIR/SDEIS and further details of the program are included in Section 2.3.2.1 of this Final EIR/EIS. However, since a build alternative has not been selected as the Preferred Alternative, this programmatic element will not be implemented by Caltrans as the Lead Agency under CEQA and NEPA and as the owner/operator of the I-710 freeway. Please also refer to Section 1.10 of this appendix for more information regarding the Community Health Benefit Program.

L-29-13

Should a build alternative be selected as the Preferred Alternative, Measure C-6 would address disproportionate adverse noise impacts on environmental justice communities as a result of the build alternatives. Because these are impacts that would specifically occur as a result of the build alternatives and would not address existing conditions, the locations that would receive noise abatement measures, should a build alternative be selected as the Preferred Alternative, are specifically identified in the text of measure C-6. These areas would receive noise abatement upon the commencement of construction in these particular areas. However, as stated in Response to Comment L-29-1, the No Build Alternative has been identified as the Preferred Alternative and therefore, there would be no disproportionate adverse noise impacts on environmental justice communities as a result of the build alternatives.

L-29-14

The cited statement on page 5.16-7 in the Community Impact Assessment (CIA) regarding residential property acquisition is incorrect; there are no partial or full acquisitions of residential property within the City of Paramount as a result of the build alternatives.

L-29-15

No permanent impacts to the driveways at Home Depot are proposed under either build alternative. Should a build alternative be selected as the Preferred Alternative, temporary impacts to the driveways would occur during reconstruction of the I-710/Alondra Boulevard interchange. However, as stated in Response to Comment L-29-1, the No Build Alternative has been identified as the Preferred Alternative and therefore, there would be no temporary impacts to circulation.

L-29-16

As discussed in Section 3.5.4 of the RDEIR/SDEIS and this Final EIR/EIS, should a build alternative be selected as the Preferred Alternative, mitigation for impacts to local intersections by the build alternatives would be implemented by Caltrans as the lead agency in coordination

with the local jurisdiction. The proposed mitigation improvements are only conceptual at the time of this Final EIR/EIS. Since the No Build Alternative has been selected as the Preferred Alternative, these mitigation improvements will not be implemented and do not need to be developed further in coordination with the City.

L-29-17

Please refer to Section 1.6 of this appendix for more detailed information regarding the proposed arterial parking restriction program. This program is not included in the Preferred Alternative (Alternative 1 – No Build).

L-29-18

The future year analysis (2035) conducted for the I-710 Corridor Project did not assume that the Garfield Improvement Project would be in place. The analysis conducted for the RDEIR/SDEIS was based on future, funded and committed projects identified in the SCAG Region's 2012-2035 travel demand forecast model. The future No Build network for the RDEIR/SDEIS travel demand forecasting effort for the I-710 Corridor was reaffirmed with the I-710 TAC in May 2013, prior to conducting the detailed traffic, design, and engineering studies developed in support of the RDEIR/SDEIS. Since the No Build Alternative has been selected as the Preferred Alternative, preliminary recommendations for the mitigation concepts identified for the Garfield Avenue/Rosecrans Avenue intersection in the RDEIR/SDEIS would not be implemented.

L-29-19

The traffic analysis performed in support of the RDEIR/SDEIS did not presume the widening of Alondra Boulevard to three lanes in each direction from I-710 to Lakewood Boulevard, as this arterial improvement is not yet included in the future (2035) No Build Alternative network. As of the date of this analysis (December 2018), it is acknowledged that this project is in the conceptual planning stages and has yet to achieve environmental clearance and formal project approval. Since the No Build Alternative has been selected as the Preferred Alternative, a refined traffic analysis will not be conducted during final design for the I-710 Corridor Project.

L-29-20

In response to this comment, the table provided below summarizes the delay and the LOS at the Alondra Boulevard/Garfield Avenue intersection for all three alternatives. These detailed results were also provided in Table 6-3 and Table 6-8 of the *Intersection Traffic Impact Analysis Report* (March 2017). The volumes and lane configuration at this intersection were illustrated in Figure 6-3.d and Figure 6-8.d of this report. Traffic volumes and traffic analysis performed for the RDEIR/SDEIS were changed for the future year (2035) as compared to the Draft EIR/EIS circulated for public review in 2012 as a consequence of the updated travel demand forecasts.

In addition, the build alternatives are not predicted to substantially change daily volumes on this segment of Alondra Boulevard (refer to Tables 5-2 and 6-2 in the *Intersection Traffic Impact Analysis Report* for details), as improvements to I-710 tend to attract traffic to the freeway, and thus relieve volumes on the arterial network through this area relative to the future No Build Alternative.

The traffic analysis conducted in support of the RDEIR/SDEIS did not assume the future City improvements for this intersection, as the build alternatives were still under development. In this regard, the impact analysis performed for Garfield Avenue in support of the RDEIR/SDEIS represents a worst-case future traffic condition, as the City's proposed project would improve 2035 No Build Alternative LOS at this intersection, as shown in the table below.

Delay and LOS at Alondra Boulevard and Garfield Avenue Intersection

44	Alondra Blvd/Garfield Ave Intersection	No Build (Alt 1)		Alt 5C		Alt 7	
		Delay	LOS	Delay	LOS	Delay	LOS
	AM Peak	39.0	D	42.5	D	38.7	D
	MD Peak	49.3	D	47.9	D	38.6	D
	PM Peak	72.2	E	66.1	E	68.8	E

Source: *Intersection Traffic Impact Analysis Report* (March 2017).

L-29-21

Some of the intersections numbered in the 200s are not shown in all of the tables in the *Intersection Traffic Impact Analysis Report* (March 2017) or the *I-710 Corridor Project Traffic Operations Analysis Report* (March 2017) because they are not included in some of the alternative scenarios. For example, Intersection Nos. 230 and 231 are freight corridor intersections included only in Alternative 7. These two intersections are not applicable to existing conditions, the future No Build Alternative, or Alternative 5C and its associated design options.

L-29-22

The proposed access changes under the build alternatives in the area of the I-710/Alondra Boulevard interchange has in and of itself not been determined to be a "significant impact" under CEQA. Please refer to Section 4.2.4.4 of this Final EIR/EIS for more information on significant traffic-related impacts under CEQA. Under the build alternatives, the conversion of Frailey Avenue and Lime Avenue to culs-de-sac at Alondra Boulevard would represent an access change in that drivers traveling to or from the residential neighborhood along Frailey Avenue and Lime Avenue would be required to use Atlantic Avenue and E Linsley Street. However, the proposed access change would only represent at most approximately 1,700

additional feet of travel to access Atlantic Avenue/Alondra Boulevard Additionally, circulation and congestion would generally improve for all users at the I-710/ Alondra Boulevard interchange. Drivers seeking access to Alondra Boulevard would be re-routed through the Alondra Boulevard/Atlantic Avenue intersection. This intersection was evaluated as part of the intersection impact analysis assessment conducted for the project. As shown in Table 6-3 in the *Intersection Traffic Impact Analysis Report* (March 2017), the level of service for this intersection in 2035 improves from LOS E under the No Build Alternative to LOS D under the Alternative 5C in the AM peak hour. In the MD and PM peak hours, LOS is projected to remain at LOS D. The shifts in peak hour traffic volumes for this intersection are very slight.

L-29-23

As discussed in Section 3.24.4.5 of the I-710 Corridor Project RDEIR/SDEIS and this Final EIR/EIS, should a build alternative be selected as the Preferred Alternative, a TMP would be prepared prior to construction to address potential short-term traffic impacts during construction, including impacts to existing transit services. This, and other measures, such as CON-TR-3, would reduce temporary construction impacts to local bus services to levels below significance under CEQA. However, as stated in Response to Comment L-29-1, the No Build Alternative has been identified as the Preferred Alternative and therefore, these transit impacts would not occur and a TMP will not be necessary.

L-29-24

When the travel forecasting was undertaken for the I-710 Corridor Project RDEIR/SDEIS in 2013, the West Santa Ana Branch Transit Corridor (Eco-Rapid) had not yet initiated an environmental review process. As agreed upon by the I-710 Technical Advisory Committee (TAC), the projects assumed in the RDEIR/SDEIS No Build and build alternatives needed to have been environmentally cleared by that time in order to be included in the travel demand forecasting in support of the RDEIR/SDEIS. Some exceptions were made in order to produce the most conservative, “worst-case” forecast. Therefore, this project was not assumed to be constructed and in operation by the horizon year (2035) of the travel demand forecasts. For a list of the projects assumed in the No Build Alternative, please refer to Appendix U of the RDEIR/SDEIS and this Final EIR/EIS. In March 2018, the Metro Board of Directors authorized further study of additional alternatives for the West Santa Ana Branch Transit Corridor Project, and as such, the environmental process for this project will not be completed until after the scheduled completion of this Final EIR/EIS.

L-29-25

As stated in Response to Comment L-29-1, the No Build Alternative has been identified as the Preferred Alternative and therefore, traffic will not be diverted on local arterials during construction.

L-29-26

Please refer to Response to Comment L-29-25 regarding impacts to local arterials during construction of the build alternatives.

L-29-27

The City's concern regarding the substantial noise increase resulting in noise impacts at Ralph C. Dills Park under Alternative 7 has been noted. However, Alternative 7 is no longer under consideration and the No Build Alternative has been identified as the Preferred Alternative and therefore, there will be no noise impacts at the Ralph C. Dills Park.

L-29-28

Key Views 9 and 11 are the closest key views to the City of Paramount. It is important to note that the purpose of the key views is to give a representative sample of visual landscape units along the I-710 Corridor, not provide every possible type of view at every potential jurisdiction within the I-710 Corridor. Therefore, the RDEIR/SDEIS and this Final EIR/EIS utilize selected key views appropriately consistent with FHWA's January 2015 publication *Guidelines for the Visual Impact Assessment for Highway Projects*.

L-29-29

The Executive Summary of the Final EIR/EIS includes a summary table identifying all project-related impacts; applicable avoidance, minimization, and/or mitigation measures; and level of CEQA significance.

L-29-30

As stated in Response to Comment L-29-1, the No Build Alternative has been identified as the Preferred Alternative and therefore, no construction will occur.

L-29-31

This comment was submitted on the original Draft EIR/EIS and is relevant to alternatives no longer under consideration. In general, the executive summary is meant to provide only the highest level of summary. More detailed information is available in the various EIR/EIS Chapters 3.0 and 4.0 resource area discussions, and in this case, Section 3.13, Air Quality. As there are many different pollutants and analyses comparing existing conditions with the No Build and build alternatives, providing the details in the Chapter 3.0 section and providing the plain language summary in the Executive Summary is consistent with standard practice under CEQA and NEPA.

L-29-32

Consistent with State CEQA Guidelines Section 15126.6I(2), a discussion and identification of the Environmentally Superior Alternative has been added to Chapter 4.0, CEQA Evaluation, in this Final EIR/EIS.

L-29-33

Please refer to Response to Comment L-29-31 regarding the level of detail provided in the Executive Summary.

L-29-34

As stated in Response to Comment L-29-1, the No Build Alternative has been identified as the Preferred Alternative and therefore, no construction will occur.

L-29-35

As stated in Response to Comment L-29-1, the No Build Alternative has been identified as the Preferred Alternative and therefore, no construction will occur.

L-29-36

This comment refers to information presented in the Draft EIR/EIS circulated for public review in 2012 and which evaluates alternatives no longer under consideration. It should be noted that it was decided to utilize Highway Capacity System (HCS) analysis as depicted in Figure 1.2-1 in Chapter 1.0, Proposed Project, of the RDEIR/SDEIS to illustrate the congestion problem on I-710, as this traffic operational analysis factors in design deficiencies, speeds, density and other variables that exacerbate congestion, in addition to limitations associated with insufficient lane capacity. Lane schematics have been developed for the proposed project that compares the three alternatives side by side, using a scale where these differences in lane capacity can easily be seen. These figures are provided in the supporting technical reports prepared for the project,

including in the *I-710 Corridor Project Traffic Operations Analysis Report* (March 2017), Appendix E, and in the *I-710 Draft Project Report* (2017), Attachment B.

L-29-37

This comment refers to information presented in the Draft EIR/EIS circulated for public review in 2012 and which evaluates alternatives no longer under consideration. Please refer to Response to Comment L-29-9 regarding construction duration and phasing of the build alternatives.

L-29-38

The organization of Chapter 4.0, CEQA Evaluation in both the RDEIR/SDEIS and this Final EIR/EIS, identifies and discusses “no impact” conclusions first, followed by “less than significant impact” conclusions, “significant impacts that can be mitigated to below a level of significance” conclusions, unavoidable significant impacts, and significant irreversible environmental changes. As described on page 4-1 of Chapter 4.0, “In making determinations of significance under CEQA, the impacts of the build alternatives are analyzed relative to baseline conditions which, for the Interstate 710 (I-710) Corridor Project, were the existing conditions in the I-710 Corridor in 2012,” consistent with the requirements for determining significance under CEQA. Additionally, as noted on p. 4-2, “Project impacts vary among the two build alternatives, with one alternative having greater impacts to a particular environmental factor than another. For this reason, significance under CEQA is generally discussed in terms of the alternative with the most significant adverse impact. In cases where the impacts of the alternatives vary widely, clarification is provided regarding which alternatives have the most adverse impacts to a particular environmental factor.” The responses to the CEQA Checklist questions in this chapter are summaries of information contained in Chapter 3.0 in order to provide the reader with the rationale for significance determinations; for a more detailed discussion of the nature and extent of impacts, refer to Chapter 3.0. Mitigation Measures identified for potentially significant impacts for each environmental topic area are identified in Section 4.4 of Chapter 4.0, with specific references to the locations of the Mitigation Measures in the respective sections of Chapter 3.0.

L-29-39

It is important to note that the proposed I-710 Corridor Project build alternatives are not considered “new development or redevelopment”, but are rather transportation system enhancements that redistribute existing and forecasted traffic volumes throughout the Study Area.

As the lead agency, it is Caltrans’ standard practice to utilize the Highway Capacity Manual (HCM) methodology, as described in Chapter 11 through Chapter 13 of HCM 2010, to assess intersection performance. Intersection Level of Service (LOS) was calculated according to analysis methodologies described in the HCM. Section 3.5.3.1 of the RDEIR/SDEIS and

Section 7, Project Impacts and Mitigation Measures, of the *Intersection Traffic Impact Analysis Report* (March 2017), outlined the criteria for determining impacts to arterial intersections. As lead agency under CEQA, Caltrans is responsible for establishing the traffic impact thresholds for the project. With respect to the intersection impact analysis, the same thresholds and methodology were uniformly applied for the intersections of all local jurisdictions within the I-710 Study Area for the purpose of determining the impacts of the build alternatives and for identifying measures to mitigate those impacts. This is appropriate given that each city has their own thresholds for their own local projects, which vary from city to city. The criteria for determining the impacts of the build alternatives were identified based on an examination of future (congested) travel conditions of the arterial network within the I-710 Study Area and Caltrans' project experience with other major freeway projects in Los Angeles County similar in scope and magnitude to the I-710 Corridor Project.

L-29-40

This comment refers to information presented in the Draft EIR/EIS circulated for public review in 2012 and which evaluates alternatives no longer under consideration. Measure LU-1 was revised in the RDEIR/SDEIS in response to comments to indicate that, should a build alternative be selected as the Preferred Alternative, amendments could occur in line with regular amendment cycles as required by law, and would be at the discretion of each local jurisdiction. It should be noted that local jurisdictions are under no obligation to amend their General Plans, but it is a best practice to keep them up to date. Because these amendments can occur in the normal course of General Plan updates, should a build alternative be selected as the Preferred Alternative, Caltrans and Metro do not intend to provide compensation to local jurisdictions to update their General Plans to reflect land use changes resulting from the I-710 Corridor Project. However, it should be noted that since the No Build Alternative has been selected as the Preferred Alternative, amendments to the City's General Plan will not be necessary.

L-29-41

This comment refers to information presented in the Draft EIR/EIS circulated for public review in 2012 and which evaluates alternatives no longer under consideration. Table 3.3-8 in the RDEIR/SDEIS describes "Permanent Direct and Indirect Impacts to Schools and Other Community Facilities". Since no permanent impacts to the referenced schools in the City of Paramount were identified under the build alternatives, they were not included in this table.

L-29-42

This comment refers to information presented in the Draft EIR/EIS circulated for public review in 2012 and which evaluated local intersection improvements that are no longer under consideration as part of the build alternatives. Please refer to Response to Comment L-29-9 regarding construction duration and phasing of the build alternatives.

L-29-43

This comment refers to information presented in the Draft EIR/EIS circulated for public review in 2012 and which evaluates alternatives no longer under consideration. Please refer to Response to Comment L-29-28 regarding the visual/aesthetic analysis.

L-29-44

Screenwalls on the separated freight corridor are only applicable under Alternative 7. Alternative 1 (No Build Alternative) has been identified as the Preferred Alternative; therefore, no screenwalls or sound walls on the freight corridor structure are applicable.

CITY ENGINEER

October 23, 2017

Mr. Ronald Kosinski
Caltrans District 7, Division of Environmental Planning
100 S. Main Street, MS 16A
Los Angeles, CA 90012

Subject: ***I-710 Corridor Project RDEIR/SDEIS, City of South Gate Comment Letter***

Dear Mr. Kosinski:

The City of South Gate is in receipt of the RDEIR/SDEIS for the I-710 Corridor Project that was released for circulation on July 21, 2017. The purpose of this letter is to outline the City's findings and comments pursuant to our review of the RDEIR/SDEIS.

GENERAL COMMENT

The City of South Gate welcomes initiatives that would reduce traffic congestion, improve the flow of goods, reduce vehicle related air pollution, and reduce community noise impacts. As the City is bisected by the I-710 Freeway, the proposed project would have a direct impact on the City's residents, business and property owners. While we are committed to working with Caltrans and Metro during the ongoing and planning stages of the I-710 Corridor Project, we are concerned that the proposed project may have unintended consequences related to growth inducement, cumulative impacts, dislocation, and a general degradation of the existing environment.

CHAPTER 1 – PROPOSED PROJECT

The City has worked with Caltrans, Metro, Gateway Cities COG, SCAG and the Ports to improve the I-710 as part of the Technical Advisory Committee and Project Committee. The City of South Gate residents and businesses are directly impacted by the elevated levels of traffic congestion, elevated truck volumes, increased air pollution, and exposure to toxic air contaminants. As such, the City is supportive of the proposed project's purpose to improve air quality and public health; improve traffic safety; modernize freeway design; accommodate future traffic volumes, and address the increased traffic volumes from projected growth in population, employment, and economic activities related to goods movement.

Construction of the Build Alternatives will result in major disruptions to the City, including impacts to access for residents, businesses and emergency services. The reconstruction of the Imperial Highway/I-710 interchange and the Firestone Boulevard/I-710 interchange effectively remove the major east/west arterials from circulation for the duration of their construction, creating increased traffic congestion for the duration of the construction improvements. Construction and operation of the proposed project will also result in substantial public and private property acquisitions, and subsequent financial impacts to both the City and private property owners. Our specific comments on each of these issues are detailed below.

CHAPTER 2 – PROJECT ALTERNATIVES

The Project Alternatives are described in a manner that makes them easy to understand and informative. However, it is our contention that the following items should be addressed in the RDEIR/SDEIS:

- The RDEIR/SEIS does not provide a clear description of when construction would commence. It is not until Table 3.25-2 that an anticipated start date of 2020 is provided. This information is needed to understand the extent and timing of construction related impacts. The project description should be revised to clearly indicate the anticipated construction timeline. The timeline should be given by project segment (southern, central, northern) so that the City and its affected agencies can plan and allocate resources accordingly. L-30-1

- The RDEIR/SDEIS assumes construction of the BNSF Railroad Southern California International Gateway (SCIG) near-dock intermodal yard; however, this facility may not be constructed as the EIR for the SCIG project was vacated in 2016. Freight that may have gone to the SCIG facility will likely continue to go to either the Burlington Northern Santa Fe (BNSF) Hobart rail yard or the Union Pacific (UP) East Los Angeles rail yard. We are concerned that including the SCIG facility in the travel demand model may misrepresent future traffic demand, resulting in an underestimation of future cargo related traffic that will travel through the City's study area. L-30-2

- The proposed project will result in an increase in cargo related traffic (with or without the SCIG facility be constructed) input to both the Hobart and East Los Angeles freight yards; as such, the City would like to state its preference for Design Options 1A/1B in order to reduce truck queuing at these facilities L-30-3

- Table 2.3-1 on page 2-16 of the RDEIR/SDEIS states that West Frontage Road would be extended from current northern terminus to Southern Avenue via a loop ramp; however, Figure 2.3-6 (Sheet 4 of 7), does not show the improvements to West Frontage Road that would occur under Alternative 5C. We request that the drawings be updated to show the improvements to West Frontage Road. L-30-4

- The RDEIR/SDEIS relies on the availability of ZE/NZE vehicles for the AQ/GHG analysis, as well as health risk analysis. We understand that the proposed project includes the Zero Emission/Near Zero Emission Truck Technology Deployment Program which would include funding to individual truck and fleet owners, and the deployment of up to 20 electric charging stations and up to ten hydrogen refueling stations within the corridor, and that the program would commit up to $100 million under Alternative 5C, and between $460 million to $1.050 billion under Alternative 7. However, Page 2-22 states that "zero-emission capable drayage trucks can be developed, demonstrated, validated, and moved into production by a 2025 target timeline," but there remain core issues to be addressed prior to the successful commercialization of said vehicles. The reliance of ZE/NZE technology is speculative at this time, as there is no commercial market for the production and deployment of such vehicles. Even with the increase in ZE/NZE vehicles, the proposed project would result in an increase in 24-hour averages of fine particulate matter (PM_{10}) in the City of South Gate. As such, the RDEIR/SDEIS should incorporate additional mitigation measures to ensure that AQ standards are met within the Study Area. Refer to AQ response for more detail L-30-5

CHAPTER 3 – AFFECTED ENVIRONMENT

Our comments regarding Section 3.0 are categorized according to the individual topical issues (land use, growth, community impacts, etc.). As stated previously, our comments focus on those issues that will directly affect the City of South Gate.

Chapter 3.1- Land Use

- The discussion of the environmental setting focuses on the adopted land use and development policy for the affected area. For South Gate, the discussion focuses on selected general plan land use policies included in the Mobility Element, Community Design Element, and the Healthy Community Element. While we do not disagree with the RDEIR/SDEIS selection, these and other elements also indicate that any improvements must not harm affect the community's physical or economic wellbeing, including avoiding residential displacements within the City. L-30-6

- Both Alternatives result in the acquisition of the Urban Orchard, which the City recently acquired, in order to complete the Southern Avenue extension. The City is supportive of the Southern Avenue extension and believes that completion of the extension a valid strategy to reduce traffic impacts that will result from L-30-7

implementation of the proposed project; however, the City is strongly opposed to any action that results in the loss of beneficial use and/or access to the Urban Orchard. The Urban Orchard, when completed, will be an important community asset that will provide much needed open space, community gardening, and assist the City in meeting its stormwater management goals. The RDEIR/SDEIS should be revised to evaluate potential impacts that would occur from the proposed acquisition of the Urban Orchard. The City opposes such acquisition and requests that the Urban Orchard be protected, maintained and integrated into the I-710 Corridor Project as a project feature. The City also requests that the access road providing access to and from the Thunderbird Villas and the Southern Avenue extensions be shown as an alternative that could be implemented at the City's discretion. It should also indicate that no other agency has the authority to implement the access road without City approval, in writing. The City requests that the loss of any parkland or open space in the City that would occur as a result of the proposed project be mitigated by the construction of comparable facilities elsewhere in the City prior to certification of the Final REIR and approval of the Record of Decision. L-30-7

- Parque Dos Rios would be permanently impacted by Alt 5C (3.21 acres) and Alt 7 (all 8.6 acres). Mitigation Measures PR-1 through PR-9 identify the need to identify and incorporate design refinements to minimize the permanent and temporary uses of land from Parque Dos Rios during the final design of Alternative 5C, or identify potential replacement property under either Alternative 5C or Alternative 7. We believe that impacts to Parque Dos Rios must be minimized under both Alternatives, and that replacement sites must be identified prior to certification of the Final REIR and approval of the Record of Decision. In the absence of replacement sites, the project shall provide funding to the City for installation of greenspace near the I-710 Freeway, as a mitigation measure. L-30-8

- The new vertical structures associated with the proposed project, such as the new bridge over Southern Avenue, and the proposed elevated freight corridor would attract homeless encampments to areas of the City. Caltrans must coordinate with the City of South Gate to ensure that the new structures are maintained in a manner that ensures public safety and does not increase the City's homeless population. Specific mitigation measures should be identified. L-30-9

Chapter 3.2 – Growth

- The discussion of growth impacts focuses on a general description of the regional growth projections for the region and the individual cities. This discussion of growth trends in goods movement largely repeats an earlier discussion included in the Project Description and our concerns regarding the rail yard and rail line capacity to accommodate a significant increase in rail traffic is restated here. This section also correctly details a correlation between activity and growth in the ports and increased truck traffic along the I-710 Corridor. However, this section does not address actual growth inducing impacts as required by CEQA Section 15126.2(d). The RDEIR/SDEIS must evaluate the ways that the proposed project could foster economic or population growth, or remove obstacle to population growth. Increases in the population may tax existing community service facilities, requiring construction of new facilities that could cause significant environmental effects. The RDEIR/SDEIS does mention that there may be potential growth inducing impacts on traffic, noise, air quality, and health-related impacts though it does not specifically identify those impacts that may affect the City's residents. L-30-10

Chapter 3.3 – Community Impacts

- Alternative 5C would result in the full acquisition of 10 properties, and the relocation of one apartment building with 6 residential units and 6 non-residential properties, while Alternative 7 would result in in the full acquisition of 14 properties, and the relocation of one apartment building with 6 residential units and 11 non-residential properties.

- Alternative 5C would result in the loss of $37,764 in sales tax and $2,116 in property tax and relocation of 20 employees, while Alternative 7 would result in the loss of $47,205 in sales tax and $3,487 in property tax and relocation of 30 employees.

- The City is strongly opposed to any acquisition of residential or commercial property. The project proponents should ensure that every effort must be made to eliminate or minimize property acquisitions and that Caltrans must explore alternative freeway and roadway designs that eliminate property acquisitions that would negatively impact residents and businesses in South Gate. L-30-11

- Additionally, Alternative 5C would result in 34 additional partial acquisitions and Alternative 7 would result in an additional 43 partial acquisitions. While these partial acquisitions do not result in the displacement of residential or employees, it is important that these partial acquisitions do not result in the loss of access or parking that would negatively impact commercial or industrial uses. L-30-12

- The RDEIR/SDEIS indicates that the provisions of the "Uniform Act" will be adhered to in providing just and fair compensation to affected property owners. Any resident or business acquired as a result of the proposed project must be relocated prior to construction activities commencing. Additionally, relocation of South Gate businesses and residents should occur within the City of South Gate. L-30-13

- The new vertical structures associated with the proposed project, such as the new bridge over Southern Avenue, and the proposed elevated freight corridor would attract homeless encampments to areas of the City. Caltrans must coordinate with the City of South Gate to ensure that the new structures are maintained in a manner that ensures public safety and does not increase the City's homeless population. Specific mitigation measures should be identified. L-30-14

Chapter 3.4 – Utility/Emergency Services

- The RDEIR/SDEIS does not identify Hawkins Reservoir or pumping station. The RDEIR/SDEIS should include these water resources as part of the utilities impact analysis, and determine if any impact to this important infrastructure would occur. Mitigation should be identified to ensure that local infrastructure impacts are avoided. L-30-15

Chapter 3.5 – Traffic and Transportation/Pedestrian and Bicycle Facilities

- The traffic impact analysis did not analyze all of the arterial highways and intersections in the City of South Gate. Therefore, the proposed project may not have identified all of the potential traffic impacts generated by the proposed project in the City of South Gate. L-30-16

- Both Alternatives would improve freeway operations and safety on the I-710 Corridor, but most segments between the I-105 and Florence Avenue would still operate at a Level of Service E or F during the AM and PM Peak Hours.

- Similarly, traffic volumes on Atlantic Avenue, Garfield Avenue, Imperial Highway and Firestone Boulevard are reduced, but not enough to measurably improve traffic level of service. The City of South Gate will bear a significant burden from construction of the proposed project, as project construction in the segment that would affect the City of South Gate would last for 48 months under Alternative 5C and 72 months under Alternative 7. Additionally, the City will continue to serve as an alternate route for motorists looking to by-pass the I-710. As such, the City requests that Metro carefully coordinate with the City to explore additional measures that could be incorporated into the project design in order for the City to receive maximum benefits from the I-710 project. The programmatic aspects of the I-710 Corridor Project, such as the I-710 TSM/TDM Congestion Relief Program, that would provide funding for traffic signal upgrades and coordination, safety improvements, restriping, to add turning lanes, roadway widening, and traffic calming measures, would help to provide for relief to the City relative to the lack of measurable improvements provided by implementation of the proposed project. L-30-17

- Under Alternative 5C, improvements are proposed at the following intersections due to an increase in delay resulting from the proposed project: Firestone Boulevard at Atlantic Avenue; Firestone Boulevard at Garfield Avenue; and Garfield Avenue at Southern Avenue. Under Alternative 7, improvements are proposed at Firestone Boulevard and Atlantic Avenue, and Garfield Avenue at Southern Avenue. The recommended mitigation measure for each of these intersections includes adding turning lanes; however, the RDEIR/SDEIS does not show whether additional property acquisitions would be required in order to implement the recommended mitigation measures. The RDEIR/SDEIS should provide clarification if property acquisitions are needed for these corners at these intersections; and the affected property owners should be properly notified of the potential property acquisitions. L-30-18

- Under both Alternatives, the northern portion of Wright Road is proposed to be cul-de-saced at the intersection of Imperial Highway. The City would strongly urge Caltrans to identify a new configuration for the Imperial Boulevard ramps that does not result in the creation of the cul-de-sacing of Wright Road. We understand that maintaining open access to Wright Road would result in the loss of the full benefit of the Imperial Highway ramp improvements; however, it is our contention that the impacts related to L-30-19

emergency services, residential access and the shifting of north/south traffic to St. James Avenue would negate any such benefits. L-30-19

- The RDEIR/SDEIS identified that peak hour parking prohibitions need to be implemented on Long Beach Boulevard south of Firestone Boulevard, Atlantic Avenue and Garfield Avenue during the peak periods to provide an additional travel lane. The RDEIR/SDEIS should provide alternatives for consideration in lieu of implementing the on-street parking prohibition. L-30-20

- The Southern Avenue extension over the Los Angeles River and I-710 Freeway should be constructed as an Early Action Project (EAP). The Southern Avenue extension would provide an additional connection between the east side and west side of the City and would reduce the anticipated congestion during construction work of the improvements for the I-710 Freeway/Firestone Boulevard interchange and I-710 Freeway/Imperial Highway interchange. In addition, construction of the Southern Avenue extension as an EAP will provide emergency vehicles with an additional alternative route between the east side and west side of the City. L-30-21

- The loop access from West Frontage Road (adjacent to Thunderbird Mobile Home Villas) to the proposed Southern Avenue extension should be considered as a one-way outbound access only, in order to minimize vehicular intrusion to the residential area. L-30-22

Chapter 3.6 – Visual/Aesthetics

- The use of screening shown in the images will have other impacts that are not mentioned. While screening is necessary to attenuate noise along those segments where residential neighborhoods are located in close proximity to the freeway, in other areas the screening will block the "off-site" views where freeway visibility may be desirable. For example, new commercial development near the Firestone Boulevard ramps greatly benefit from the freeway visibility. The RDEIR/SDEIS must include mitigation to ensure that there will not be a proliferation of even taller and larger signage along the freeway corridor to compensate for the loss of freeway visibility. L-30-23

- New elevated freeway lighting may adversely impact light sensitive uses in the City due to the widening of the I-710 mainline. Special care must be given during final design to ensure the light sensitive use in the City are not exposed to elevated levels of transportation related lighting from the proposed project. L-30-24

- Soundwalls, vertical columns, and other features of the proposed project could attract graffiti and vandalism. Caltrans must coordinate with the City to implement mitigation measure VIS-4 and VIS-10 which required the planting of vines, utilizing textured surfaces, and ongoing maintenance, which would serve to deter graffiti and other forms of vandalism. L-30-25

Chapter 3.7 – Cultural Resources

- Table 3.7-1 only lists one historic resource within the area of potential effect (APE) City of South Gate, the UP Railroad; however, there are several historic properties and structures within the City of South Gate that were not identified. Care should be made that impacts to these properties does not occur during construction of the proposed project. L-30-26

Chapter 3.8 – Hydrology and Floodplain

- This section accurately describes the Study Area's drainage system and potential flood hazards. FEMA flood maps indicate that the eastern portion of South Gate near the Los Angeles River and the Rio Honda drainage channel are at an elevated risk of flooding. Care must be given that development of the proposed project does not result in drainage from the I-710 running off to local streets and increasing flood risk in the City. L-30-27

Chapter 3.9 – Water Quality and Stormwater Runoff

- The increase in impervious area for Alternative 5C is 156.4 acres -- for the whole Project – which results in a total post-project impervious surface area of 913.1 acres (pre-project area of 756.7 acres). If, as anticipated, impervious area increases in South Gate, water quality may be adversely affected. To the extent the City's runoff is comingled with the I-710 runoff, the City's efforts to comply with its stormwater permit requirements may be adversely affected by the Project. L-30-28

- The increase in impervious area for Alternative 7 is 256.9 acres -- for the whole Project – which results in a total post-project impervious surface area of 1013.6 acres (pre-project area of 756.7 acres). If, as anticipated, impervious area increases in South Gate, water quality may be adversely affected. To the extent the City's runoff is comingled with the I-710 runoff, the City's efforts to comply with its stormwater permit requirements may be adversely affected by the Project. L-30-29

- The City requests site specific mitigation measures that would ensure Caltrans considers potential impact on City efforts to comply with City stormwater permit requirements. L-30-30

- The Los Angeles River Reach 2 (Carson St. to Figueroa St.) is listed as impaired for coliform bacteria, copper, nutrients (algae), oil, trash, ammonia, and lead. TMDLs must be developed for waters listed as impaired on the Section 303(d) List of Water Quality Limited Segments. The bacteria and Oil TMDLs are slated to be developed in 2019; the TMDLs for copper, nutrients (algae), trash, ammonia, and lead are shown in the RDEIR/SEIS as already having been developed and approved. Because South Gate contributes runoff to this reach of the LA River, it is important to know how the I-710 Project runoff will affect the TMDLs for this segment and what that will mean for South Gate's efforts to comply with TMDLs. L-30-31

- Proposed treatment BMPs for Alternative 5C include 40 biofiltration swales, 12 media filters, 32 infiltration/detention basin, and one wet basin, as well as eight gross solids removal devices where feasible. The introduction of treatment BMPs as part of Alternative 5C would represent an improvement when compared to the No Build condition, as there currently are 60 Caltrans-maintained BMPs treating freeway runoff on I-710. Existing BMPs within the project area will be removed as a result of the changing alignment and profile of the project.

- Proposed treatment BMPs for Alternative 7 include 36 biofiltration swales, 12 media filters, 30 infiltration/detention basin, and one wet basin, as well as eight gross solids removal devices where feasible. The introduction of treatment BMPs as part of Alternative 7 would represent an improvement when compared to the No Build condition, as there currently are 60 Caltrans-maintained BMPs treating freeway runoff on I-710. Existing BMPs within the project area will be removed as a result of the changing alignment and profile of the project.

- The RDEIR/SDEIS should delineate which construction and post construction areas of the I-710 will be discharging from what specific discharge points in South Gate, into which waterbody, and what/where treatment BMPs will be installed in South Gate. L-30-32

Chapter 3.10 – Geology/Soils/Seismic/Topography

- Given historical problems related to the ability of elevated freeway structures to withstand strong ground motion and surface rupture, we are concerned that the elevated structure and the high sound walls associated with Alternative 7 can withstand such events. While the mitigation identified is critical, additional geotechnical investigation and mitigation (including possible avoidance) may be required for those improvements. L-30-33

Chapter 3.11 – Paleontology

- Considering the amount of historical ground disturbing activities within the city of South Gate, the avoidance, minimization, and/or mitigation measures identified in section 3.11 are assumed to be sufficient.

Chapter 3.12 – Hazardous Waste/Materials

- Table 3.12-1 lists several known sites along the I-710 corridor that could be affected by the proposed project under Alternative 5C; however, Table 3.12-2 lists only one site of "Potential Concern" under Alternative 7. This discrepancy is not explained in the RDEIR/SDEIS. The RDEIR/SDEIS should be modified to show the extent of potential sites that may be impacted by both Alternatives. There are four locations in the City that are designated Cortese sites and 155 other sites that are known to be contaminated, several of which are undergoing remediation. Many of the sites are located in close proximity to the areas impacted by the I-710 project. L-30-34

Chapter 3.13 – Air Quality

- Both Alternatives 5C and 7 increase traffic on I-710 itself, resulting in an increase in total traffic related PM_{10} and $PM_{2.5}$ emissions. This would potentially increase air quality and health risk impacts near the I-710; therefore, affecting residents and other sensitive receptors in the City of South Gate. Based on this finding, the RDEIR/SEIS should include mitigation to reduce the proposed project's significant unavoidable impacts under CEQA. As shown in the RDEIR/SDEIS figures in Chapter 3.13, there are several places in the City of South Gate that would experience an increase in air pollutant emissions and health risk from the proposed project in the 2035 No Build v project Alternatives 5C and 7. L-30-35

- Thunderbird Village Mobile Home Park is a focal point of historical concern with respect to the I-710 project impacts. The RDEIR/SDEIS incudes mitigation/minimization measures that affect air pollutant dispersion and reduce the concentration of air pollutants at sensitive receptors, including Measure AQ-3 that requires solid barriers and vegetation.

- The RDEIR/SDEIS includes mitigation/minimization measures to reduce the indoor concentrations of air pollutants, including Measure AQ-2, which provided enhanced filtration systems for schools within a quarter mile. However, children who attend schools within a quarter mile of the I-710 freeway expansion areas are likely to live proximate to the schools and spend the remaining 2/3 of their day at home. There are also other sensitive receptors proximate to the freeway that would experience a significant increase in emissions compared to the 2035 No Build Alternative that would warrant minimization/avoidance measures. The RDEIR/SDEIS should amend this mitigation measure to apply to "other sensitive receptors" by establishing funding to homeowners who do not have high-efficiency ventilation systems to upgrade their systems to allow for use of high efficiency filters. The RDEIR/SDEIS should quantify how installation of the indoor air filtration system reduces indoor air concentrations of air pollutants and lowers cancer risk as the maximally affected sensitive receptor. L-30-36

- While the City acknowledges that regional air quality would improve, and localized health risks would decrease with the proposed project. For example, cancer risk within the Study Area will be reduced by approximately 90% according to their air quality models prepared for the EIR/EIS. However, since traffic congestion on the freeway within the South Gate City limits will not be improved to levels matching neighboring cities, However, the EIR/EIS acknowledges that South Gate residents air quality in South Gate c would still be disproportionally impacted by unhealthy air quality due to congestion on the I-710. The EIR/EIS identifies mitigation to reduce potential impacts, including solid and vegetation barriers; however, the City requests priority funding for the Community Health and Benefits Program, so that air quality impacts could be minimized. the residents of South Gate can receive the maximum benefits L-30-37

3.14 – Noise

- Noise impacts are accurately identified, and the implementation of new soundwalls would ensure that increased noise levels would not impact the residents of South Gate.

Chapter 3.15 – Energy

- Appendix F of the CEQA guidelines recommends inclusion of "total estimated daily vehicle trips to be generated by the project and the additional energy consumed per trip by mode." Without this information it is difficult to assess the proposed project's energy impacts as they relate to the city of South Gate. L-30-38

Chapter 3.16- Natural Communities

- The RDEIR/SDEIS indicates that the primary impacts will be related to the coastal impacts and other impacts to riparian areas. Would ask that the RDEIR/SDEIS please clarify why it is not feasible to more clearly define the compensatory mitigation details at this stage in project conceptualization. L-30-39

Chapter 3.17 – Wetlands

- The RDEIR/SDEIS indicates the importance of both the Los Angeles River and the area located at the confluence of the Rio Hondo and Los Angeles Rivers as jurisdictional waters. Would ask that the RDEIR/SDEIS please clarify why it is not feasible to more clearly define the compensatory mitigation details at this stage in project conceptualization. L-30-40

- Given the reasonably foreseeable changes to the Los Angeles River related to habitat restoration, please clarify how the proposed project would impact future wetland habitat within the city of South Gate. L-30-41

Chapter 3.18 – Plant Species

- Chapter 5.33 of the South Gate municipal code titled Tree Preservation and Protection offers protection for "Public Trees". The public tree designation applies to "any single or multi-stemmed plant normally reaching mature heights of 15 feet or more, regardless of its current level of maturity, with one-half or more of its trunk or branches on or above all public property". Any public trees that will be removed as part of the proposed project's implementation must be replaced at a one-to-one ratio L-30-42

Chapter 3.19 – Animal Species

- Since no protected species are known or suspected to be found within South Gate, we have no comments at this time.

Chapter 3.20 – Threatened and Endangered Species

- We have no comments at this time on this section other than the proposed mitigation measure should be implemented to ensure protections to protected avian species foraging in the Los Angeles River. L-30-43

Chapter 3.21 – Invasive Species

- We have no comments at this time on this section other than the proposed mitigation measure should be implemented to ensure that invasive vegetation abatement programs are implemented for the Los Angeles River. L-30-44

Chapter 22 – Relationship Between Local Short-Term-Uses of the Human Environment and the Maintenance and Enhancement of Long-Term Productivity

- The RDEIR/SDEIS on page 3.22-3 states that "the existing roads and intersections in the Study Area will operate at unacceptable levels of service into 2035 without implementation of the I-710 Corridor Project. The I-710 Corridor Project would serve to improve traffic conditions in the region. The long-term benefits to the community (through transportation improvements) will be weighed against the short-term and long-term environmental impacts of the I-710 Corridor Project." However, as previously described, most segments between the I-105 and Florence Avenue would still operate at a Level of Service E or F during the AM and PM peak hours, and traffic volumes on local arterials would also not see a measurable improvement.

- We reiterate the request that Caltrans and Metro carefully coordinate with the City to explore additional measures that could be incorporated into the project design in order for the City to receive maximum benefits from the I-710 project. The programmatic aspects of the I-710 Corridor Project, such as the I-710 TSM/TDM Congestion Relief Program, that would provide funding for traffic signal upgrades and coordination, safety improvements, and traffic calming measures, would help to provide for relief to the City relative to the lack of measurable improvements provided by implementation of the proposed project. L-30-45

Chapter 3.23 – Irreversible and Irretrievable Commitments of Resources that would be Involved in the Proposed Project.

- The loss of productive businesses that may be displaced and the attendant impacts (lost jobs, revenue, etc.) is a significant irreversible and irretrievable impact to our community. These impacts should be identified in this section and in the other relevant sections of the RDEIR/SDEIS. L-30-46

Chapter 3.24 – Construction Impacts

- The RDEIR/SDEIS does not provide a clear description of when construction would commence. It is not until Table 3.25-2 that an anticipated start date of 2020 is provided. This information is needed to understand the extent and timing of construction related impacts. The project description should be revised to clearly indicate the anticipated construction timeline. The timeline should be given by project segment (southern, central, northern) so that the City and its affected agencies can plan and allocate resources accordingly. South Gate will bear a significant burden from construction of the proposed project, as project L-30-47

construction in the segment that would affect the City of South Gate would last for 48 months under Alternative 5C and 72 months under Alternative 7. L-30-47

- Implementation of the project would require several improvements within the City boundaries. During construction there would be temporary impacts to traffic circulation due to traffic diversions resulting from temporary closures to local roadways, sidewalks and bicycle lanes, and freeway ramps. Roadway construction would require the implementation of temporary detours, additional truck traffic from haul and vendor trucks related to work and staging areas that could affect circulation in the City. L-30-48

- The proposed project could result in temporary access impacts to Los Angeles County Fire Station 54 and Station 57 that serve the City of South Gate. Mitigation Measure CON-TR-1 would be prepared to minimize impacts and provide detours. CON-TR-1 direct Caltrans to implement a transportation management plan (TMP) to maintain traffic safety and acceptable traffic flow during construction and to minimize traffic delays and detours. The City requests that Caltrans and its construction contractor coordinate with both the City and Los Angeles County Fire prior to finalizing the TMP related to these two fire stations. L-30-49

- The project is in a conceptual plan and at this level of environmental review, traffic impacts during construction were not specifically described. No construction plans and specific measures to address construction were included in the RDEIR/SDEIS The City will closely coordinate with Caltrans on the implementation of the construction plan to reduce potential impacts to land uses in the City and minimize disruptions during the construction period. L-30-50

- The RDEIR/SEIS identifies construction-related CEQA air quality impacts as a significant impact of the project. The worst-case construction scenario shows that peak daily emissions on a single segment would exceed the NOx and PM_{10} CEQA significance thresholds. The RDEIR/SDEIS includes Measures CON-AQ-1 through CON-AQ-17 to reduce air pollutant emissions generated during the construction phase. Many of the measures are largely existing regulations and/or standard Caltrans with the exception of CON-AQ-15 and CON-AQ-17, which require used of Tier 4 construction equipment and other measures that further reduce construction exhaust and construction-related fugitive dust to the extent practical. L-30-51

- Measure CON-AQ-15 requires use of construction equipment that utilizes Tier 4 engines. Use of Tier 4 equipment, especially in the early years of project implementation is not guaranteed and mitigation measure CON-AQ-15 provides flexibility since there are multiple responsible agencies associated with the improvements. If the RDEIR/SDEIS intends to require use of Tier 4, then this requirement should be specified in the construction bid so that Caltrans subcontractors are required to utilize this new construction equipment for the I-710 improvements. If Metro administers the contract, then the RDEIR/SDEIS should state whether the Metro Green Construction Policy is equally effective of reducing NOx and PM emissions associated with construction activities. If the Metro Green Construction Policy does not mandate use of Tier 4 equipment, this measure should be expanded to apply to both Caltrans and Metro subcontractors. L-30-52

- The RDEIR presents various vibration thresholds from the Caltrans Transportation- and Construction-Induced Vibration Guidance Manual (September 2013) document. There is a total of three thresholds for vibration damage and four thresholds for vibration annoyance. The next sentence states: "Both of these thresholds were used to evaluate short-term, construction-related groundborne vibration" but it is unclear what 'both' is referring to. It is requested that this paragraph be re-written to provide clarity on the two types of potential vibration impacts and the associated respective thresholds. L-30-53

- The RDEIR/SDEIS addresses pile driving impacts as the worst-case equipment item and handles potential impacts with avoidance, minimization, and/or mitigation measures (CON-N-9 and CON-N-10). However, there are other equipment items and/or processes that could potentially cause unacceptable annoyance or damage effects from construction vibration, but these are not even mentioned. For example, the RDEIR-noted FTA manual list vibratory rollers as having a reference level of 0.210 PPV at 25 feet. The FTA manual also lists a clam shovel drop as having a reference level of 0.202 PPV. These levels are double the level for "strongly perceptible" reactions (i.e., 0.1 PPV in the RDEIR/SDEIS), but there is no mention of these or any other equipment items or processes. While vibratory rollers (and other equipment) would, indeed, "generate vibration levels much lower than those of pile driving and would therefore result in lower vibration levels at adjacent receiver locations", such a statement too quickly dismisses potential construction vibration impacts and too narrowly defines the associated vibration control measures. As such, it is requested that this section be expanded to present a broader discussion of potential construction L-30-54

vibration effects (beyond the worst-case pile driving) and clarified as to the associated avoidance, minimization, and/or mitigation measures. L-30-54

Thank you for your consideration of these comments. If you have any questions, please feel free to contact Clint Herrera, P.E., Assistant City Engineer, at (323) 563-9582.

Sincerely,

Arturo Cervantes, P.E., Director of Public Works/City Engineer

CC: Michael Flad, City Manager

L-30-1

More information is known than was available for inclusion in the RDEIR/SDEIS at the time of its publication, and a descriptive construction schedule by project segment for the build alternatives has been included in Section 2.3.4.2 of this Final EIR/EIS. However, Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), has identified Alternative 1 (No Build) as the Preferred Alternative. Therefore, construction of the I-710 Corridor Project will not occur. Please refer to Section 1.1 of this appendix for further discussion on the identification of the Preferred Alternative.

L-30-2

At the time of the commencement of technical studies, including detailed traffic forecasting, in support of the I-710 Corridor Project RDEIR/SDEIS, Caltrans reviewed the status of the SCIG project and came to the conclusion that they were reasonably foreseeable projects and in order to represent a likely future scenario, should be included in the No Build scenario. Because of the lead time necessary for the complex traffic modeling efforts on the I-710 Corridor Project, it was not possible to revise the No Build scenario and re-run the model, and all subsequent analyses that depend upon the traffic model, and still meet the schedule established for the project. In addition, in January 2018 the California Courts of Appeal ruled that the Port of Los Angeles and BNSF were in compliance with the majority of CEQA requirements in the SCIG Final EIR, with the exception of the air quality analysis of ambient air concentrations and associated cumulative impacts of such pollutant concentrations. The court further ordered that work on the project be suspended until such time that these deficiencies are addressed. However, the information above provides sufficient evidence and rationale for retaining the SCIG project in the No Build scenario.

A Sensitivity Test was conducted that removed the SCIG and ICTF Expansion Projects from the I-710 Corridor traffic model to evaluate the effects on the I-710 Corridor transportation travel patterns. These sensitivity tests can be reviewed in more detail in the I-710 Travel Demand Methodology Technical Memorandum (June 2017). In general, viewed from daily conditions for total vehicles, removal of the SCIG and ICTF expansion projects from the No Build scenario resulted in only a slight overall change in vehicles, with additional trucks using I-710 displacing some autos.

L-30-3

The City’s support for Design Options 1A and 1B are acknowledged and included in the project record. Please refer to Section 1.1 of this appendix for a discussion on the identification of the Preferred Alternative.

L-30-4

Figure 2.3-6, sheet 4 of 7, has been corrected in this Final EIR/EIS to show the proposed improvements at this location under the build alternatives. The proposed Frontage Rd. loop ramp under Alternative 5C is also provided in Appendix O-1, Concept Plans, sheet 18 of 23 of the RDEIR/SDEIS and this Final EIR/EIS.

L-30-5

The air quality analysis conservatively assumed that all ZE/NZE trucks will be NZE. The California Air Resources Board (CARB) has certified NZE non-diesel engines and NZE trucks are currently commercially available. In addition, the Metro Board Motion 5.1 approved in March 1, 2018, changed the ZE/NZE Truck Technology Deployment Program to the Phased-In Zero-Emission Truck Technology Deployment Program (which increased the program funding target from $100 million to $200 million, and included in the program incentives and grants investment for the acceleration of ZE technology both for long-haul trucks and for freeway infrastructure. The Metro Board took further action in April 2020 to program $50 million in Metro-controlled funds to provide funding for the initial deployment of what is now known as the I-710 Clean Truck Program and to leverage the remaining funds required for full program implementation. Caltrans and Metro respectfully disagree that the reliance on ZE/NZE technology is speculative at this time. Although specifics of the types of technologies that may be market-ready at the time of future project implementation are not currently known, “government policies can encourage the introduction of new, cleaner and more efficient technologies through investment in research and development, technology demonstration and deployment help to support industry investment, and incentives to consumers and fleets to drive demand for those new technologies…logistics provides are investing in developing and promoting new technologies.”[9] However, as stated in Response to Comment L-30-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, the I-710 Clean Truck Program will need to be developed and implemented following a process separate from this Final EIR/EIS should Metro and its partner agencies elect to proceed with these improvements at a future date. Please refer to Section 1.3 of this appendix for more detail on the I-710 Clean Truck Program.

As discussed in Section 3.14, Air Quality, the build alternatives would increase PM_{10} emissions at near-roadway locations in the vicinity of I-710 from increases in entrained road dust, tire wear, and brake wear (which are a direct function of vehicle miles traveled) compared to the 2012 Baseline and compared to the 2035 No Build Alternative. The number of receptors near I-710 that would experience increases in PM_{10} emissions would be larger for Alternative 7 than

[9] California Air Resources Board. Sustainable Freight. Pathways to Zero and Near-Zero Emissions. 2015. April. Website: https://www.arb.ca.gov/gmp/sfti/sustainable-freight-pathways-to-zero-and-near-zero-emissions-discussion-document.pdf (accessed October 30, 2018).

for Alternative 5C due to the larger increase in traffic along the I-710 Corridor for Alternative 7. Within the City of South Gate, there would be increases in 24-hour PM10 impacts (Figures 4-4b and 4-4c of the AQ/GHG/HRA Technical Report) in locations within 150 meters of the I-710 Freeway for Alternative 5C and 500 meters of the I-710 Freeway for Alternative 7 as compared to the 2012 baseline and 2035 No Build Alternative. Besides the Zero-Emission Truck Technology Deployment Program, air quality avoidance, minimization, and mitigation measures were included in Section 3.13.4 of the RDEIR/SDEIS and this Final EIR/EIS to minimize exposure to air quality impacts associated with the build alternatives, should a build alternative be selected as the Preferred Alternative. Specifically, Measure AQ-2 would provide for the installation of filters on the ventilation systems of schools near I-710. Measure AQ-3 would provide for the installation of solid barriers where feasible and where soundwalls are not proposed, and installation of vegetation to disperse pollution and reduce pollutant concentrations downwind.

L-30-6

Caltrans and Metro acknowledge that the City does not disagree with the discussion included in Section 3.1 and similarly acknowledge that the General Plan land use policies and elements indicate that any improvements must not harm the community's physical or economic well-being, including avoiding residential displacements within the City. Any residential or business displacement that would occur as a result of the build alternatives would be addressed by Measure C-1, which would provide for relocation assistance in accordance with State and Federal procedures and regulations. In addition, should a build alternative be selected as the Preferred Alternative, the City would also benefit from the disbursal of funds under Measure C-7, which would provide for funding for targeted improvements within environmental justice communities adjacent to the I-710 freeway (described in more detail in Section 3.3.3.7 of this Final EIR/EIS). It is important to note that the conclusion in Section 3.1.2.3, Land Use, of this Final EIR/EIS states that, should a build alternative be selected as the Preferred Alternative, several regional and local agencies would need to amend their plans and/or land use maps to reflect modifications to the I-710 mainline, interchanges, arterial highways, and arterial intersections, as well as the elimination of any land uses that may need to be acquired for the build alternatives, the proposed build alternatives are generally consistent with these plans. Further, the update of these plans could be done in the course of regular General Plan updates and are at the discretion of each local jurisdiction. However, as stated in Response to Comment L-30-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, freeway agreements or General Plan amendments will not need to be amended with cities.

L-30-7

Planned parks and recreational facilities are considered Section 4(f) resources only if there is evidence of formal designation of these properties as recreational resources through inclusion in

a City or County Master Plan. The Urban Orchard has not been formally designated as a recreational resource through inclusion in any City or County Master Plans that were publicly available at the time the Draft Section 4(f) Evaluation was written.

Because the Urban Orchard is a planned facility that is not formally designated for park or recreational purposes in a City or County Master Plan, the analysis of impacts on the planned recreational uses of the property is not required under Section 4(f) of the United States Department of Transportation Act.

Metro and the City of South Gate met to discuss the relationship between the Urban Orchard and the I-710 Corridor Project in June 2017, where it was preliminarily determined that there is sufficient area to accommodate both the Urban Orchard project as well as the freeway ramp to Southern Avenue proposed under the Alternative 5C. However, since the No Build Alternative has been identified as the Preferred Alternative, the Urban Orchard will not be impacted.

L-30-8

Caltrans previously coordinated with the Watershed Conservation Authority (WCA), the owner and operator of Parque dos Rios, to find replacement sites for Parque Dos Rios during the right-of-way acquisition process should a build alternative be selected as the Preferred Alternative. However, as stated in Response to Comment L-30-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, Parque Dos Rios will not be impacted.

L-30-9

As stated in Response to Comment L-30-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, new vertical structures such as the bridge over Southern Avenue will not be constructed and homeless encampments will not be attracted to the area. In addition, because this is not considered an impact with regard to the requirements of CEQA and/or NEPA, a specific mitigation measure as requested in this comment was not added to the Final EIR/EIS.

L-30-10

The CEQA-specific discussion regarding inducement of substantial population growth in an area, either directly or indirectly, was discussed in detail in Section 4.2.2.10 in Chapter 4.0, CEQA Evaluation, of the RDEIR/SDEIS and this Final EIR/EIS. To summarize, the build alternatives intend to improve upon an existing facility, and would not provide access to previously inaccessible areas. The build alternatives themselves would not propose the construction of new homes or businesses or otherwise result in a substantial change in the location, distribution, or rate of population and housing growth within the Study Area. There

would be no impacts that would require the new construction or alteration of community facilities, the construction of which could have significant environmental effects. It is unclear what the commenter means by “potential growth inducing impacts on traffic, noise, air quality, and health-related impacts”. Section 3.2 of the RDEIR/SDEIS and this Final EIR/EIS concluded that the build alternatives themselves do not have growth-related impacts because of the reasons stated above. A more robust evaluation of impacts related to traffic, noise, and air quality was presented in Sections 3.5, 3.14, and 3.13, respectively, of the RDEIR/SDEIS, and each of those specific resource sections contained a subheading titled “Public Health Considerations” which discussed health pathways related to each resource area.

L-30-11

The City’s opposition to the acquisition of residential and commercial property is acknowledged and included in the project record. However, it should be noted that the No Build Alternative has been selected as the Preferred Alternative and will not require any acquisitions.

L-30-12

Currently, the partial acquisitions that are proposed under the build alternatives are classified as such because they do not require displacement of a building or structure and do not restrict access to a parcel in such a way that would render it unusable. However, it should be noted that the No Build Alternative has been selected as the Preferred Alternative and will not require any acquisitions.

L-30-13

Caltrans and Metro thank the commenter for providing this input regarding the guidelines of the Uniform Act and it is acknowledged and included in the project record. Please refer to Section 1.5 of this appendix for a discussion of the methodology used in the analysis of replacement properties. However, it should be noted that the No Build Alternative has been selected as the Preferred Alternative and will not require any acquisitions.

L-30-14

Please refer to Response to Comment L-30-9 regarding new vertical structures and homeless encampments.

L-30-15

The Hawkins Reservoir is located near the Firestone Boulevard/I-710 interchange. Improvements at this interchange under Alternative 5C were shown in Figure 2.3-6, Sheet 4 of 7 in Section 2.3.2.1 of the RDEIR/SDEIS and this Final EIR/EIS. As discussed in Section 3.4.2.2 of the RDEIR/SDEIS and this Final EIR/EIS, utilities in conflict with the build alternatives would

either be relocated or protected in place. Should a build alternative be selected as the Preferred Alternative, further coordination would be required with each owner to confirm the conflict and disposition strategy (i.e., whether they can be protected in place or relocated). Generally, all utility relocations would be expected to occupy new or existing fee owned or easement rights-of-way or public rights-of-way. Several strategies have been considered for utilities impacted as a result of the build alternatives. These strategies included (1) protect in place, (2) continuous aboveground relocation, and (3) continuous underground relocation. However, the Hawkins Reservoir facility located at 9021 W. Frontage Road (southwest of the Firestone Boulevard interchange) would not be impacted by the build alternatives and therefore was not discussed in Section 3.4 of the RDEIR/SDEIS or this Final EIR/EIS.

L-30-16

The selection of arterial highway segments to include in the traffic analyses performed in support of the RDEIR/SDEIS and this Final EIR/EIS was determined based upon the role that these major arterial roadways perform with regard to I-710 as well as the regional arterial system. Generally, contiguous north-south arterials of sufficient length that run parallel to the 19 mile I-710 Corridor, and the east-west arterials that have an interchange with I-710, were identified for evaluation. These regionally significant arterials would be most likely to be influenced by traffic changes on I-710 generated by the build alternatives.

The main purpose of the proposed freeway improvements included in the proposed project are to address congestion, design deficiencies, traffic operations, and safety concerns on I-710, as well as related air quality issues associated with operation of the I-710 freeway. Over 185 intersections were evaluated as part of this process to determine if the proposed freeway project improvements under the build alternatives would result in traffic impacts to the I-710 Corridor's major arterial system, and if so, to identify measures to mitigate those impacts. The number and locations of the study intersections were identified prior to the initiation of the traffic studies performed for the RDEIR/SDEIS and were reviewed and approved by the I-710 Technical Advisory Committee, which includes a representative from the City of South Gate.

L-30-17

As stated in Response to Comment L-30-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, the City will not experience any construction-related traffic impacts.

L-30-18

As discussed in Section 3.5.4 of the RDEIR/SDEIS and this Final EIR/EIS, should a build alternative be selected as the Preferred Alternative, mitigation for impacts to local intersections by the build alternatives would be implemented by Caltrans as the lead agency in coordination

with the local jurisdiction (in this case, the City of South Gate). The proposed mitigation improvements at the intersections referenced in this comment are only conceptual at this time. However, as stated in Response to Comment L-30-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, the referenced mitigation improvements will not be implemented.

L-30-19

The City's request to redesign the Imperial Highway/I-710 interchange, specifically with regards to the proposed cul-de-sac at Wright Road, is acknowledged. During development of the preliminary design of the build alternatives, relocation of the southbound exit ramp terminus from the intersection of Wright Road and Abbott Road to Imperial Highway was a key design objective to modernize of the I-710/Imperial Highway interchange. The existing isolated exit ramp to a residential neighborhood is inconsistent with modern interchange configurations where the ramps terminate at the major crossroad. To ensure adequate traffic operation at the southbound ramp termini intersection, left turns from Wright Road to Imperial Highway must be prohibited. It should be noted that the prohibition would not apply to emergency service vehicles. Residential access would be maintained from Atlantic Avenue at multiple locations using Pendleton Avenue, Abbott Road, and Tenaya Avenue. The proposed cul-de-sac at Wright Road would also divert undesirable neighborhood cut-through traffic to Atlantic Avenue, a major arterial. Modifications to the intersection at Imperial Highway and Atlantic Avenue are part of the improvements and would help address the potential traffic diversion. However, as stated in Response to Comment L-30-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, improvements to the referenced interchanges will not occur.

L-30-20

Please refer to Section 1.6 of this appendix. These arterial parking restrictions have been eliminated from further consideration and are not being carried forward as a programmatic element of Alternative 1 (No Build Alternative), the Preferred Alternative.

L-30-21

Please refer to Section 1.7 of this appendix for more information on Early Action Projects and the selection and determination process.

L-30-22

The City's request is acknowledged. During the development of preliminary design, the City expressed a desire to provide a secondary route to and from West Frontage Road. Currently, Miller Way is the only route. The loop access at the Southern Avenue freeway crossing proposed under the build alternatives would provide this secondary access. However, as stated

in Response to Comment L-30-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no access issues to and from West Frontage Road.

L-30-23

It is unclear whether the commenter is referring to soundwalls or screen walls, which were only proposed on the elevated freight corridor structure under Alternative 7. As the No Build Alternative has been identified as the Preferred Alternative, screen walls are no longer under consideration. However, it should be noted that, per the Caltrans Traffic Noise Protocol, commercial and industrial areas fall under Activity Category F, which do not have impact criteria due to a lack of sensitive receptors. Therefore, soundwalls were not proposed within commercial and industrial areas. There is no soundwall in the location referenced by the City, and no visual impacts would occur as a result of the build alternatives. Further, the height of billboards and signs adjacent to the freeway is subject to local city ordinances.

L-30-24

Although the City does not identify what is considered a “light-sensitive use”, per Measure VIS-7 contained in Section 3.6.4 of this Final EIR/EIS, should a build alternative be selected as the Preferred Alternative, “During preparation of PS&E, a lighting plan will be prepared by Caltrans. The lighting fixtures will be designed to minimize glare on adjacent properties and into the night sky. Lighting will be shielded with nonglare hoods and focused within the I-710 Corridor Project right-of-way.” It should be noted that the No Build Alternative has been identified as the Preferred Alternative, and therefore the elevated freight corridor would not be constructed.

L-30-25

As stated in Response to Comment L-30-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no new sound walls, vertical columns, or other features constructed that would attract graffiti.

L-30-26

The UP Railroad (formerly Southern Pacific Railroad) in Los Angeles and Orange Counties (Primary No. 19-186110/30-176630) and the Boulder Dam-Los Angeles 287.5-kilovolt Transmission Line (Primary No. 19-188983) are the only historic properties identified within the Area of Potential Effect (APE) that are located within the City of South Gate. The APE is the area within which an undertaking (in this case, the build alternatives) may directly or indirectly cause changes in the character or use of historic properties, should any be present. As explained in Section 3.7.2.5 of the RDEIR/SDEIS and this Final EIR/EIS, field surveys were conducted of the APE and all buildings or structures that were 45 years of age at the time of the survey were considered. In addition, Section 3.7.2.4 explains that record searches and historic

consultation were conducted to identify historic properties within the APE. While it is possible that there may be historic properties within the City of South Gate located outside of the APE, they would not be directly or indirectly affected by the build alternatives.

L-30-27

The City's comment that Section 3.8 of the RDEIR/SDEIS accurately describes the Study Area's drainage system and potential flood hazards, and that care must be given that the build alternatives do not result in drainage from the I-710 running off to local streets and increasing flood risk in the City, is acknowledged. A *Preliminary On-Site Hydrology Report* (December 2016) was prepared for the project in accordance with the Caltrans *Highway Design Manual* and the *Los Angeles County Hydrology Manual* (January 2006). The purpose of the Preliminary On-Site Hydrology Report was to evaluate changes in the on-site hydrology that would result from construction of the build alternatives and to identify modification to or augmentation of existing storm drain systems. However, as stated in Response to Comment L-30-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, a Final On-Site Hydrology Report will not need to be prepared during the final design phase to ensure that the proposed drainage improvements are designed to accommodate and convey stormwater runoff so that runoff generated from I-710 does not impact local streets or adjacent cities.

L-30-28

As discussed in Section 3.9.3.1 of the RDEIR/SDEIS and this Final EIR/EIS, Alternatives 5C and 7 would increase impervious surface areas, which would increase runoff volume and pollutant loads. Alternatives 5C and 7 would require replacement or extension of the existing drainage systems such as drainage inlets along the median and shoulders to accommodate the increased project flows. Impacts to water quality of receiving waters may be expected from the loading of various constituents typically associated with highway runoff. These potential operational impacts, should a build alternative be selected as the Preferred Alternative, would be addressed through the incorporation of design pollution prevention BMPs, treatment BMPs, and adherence to the necessary operational maintenance protocols identified in the Caltrans SWMP. As described in the *I-710 Corridor Project Storm Water Data Report* (SWDR) (January 2017), design pollution prevention BMPs proposed under the build alternatives would include preserving existing vegetation wherever feasible, incorporation of concentrated flow conveyance systems with velocity-reducing outlet structures, and providing slope protection with vegetation. Proposed treatment BMPs under the build alternatives would include biofiltration swales, biofiltration strips, infiltration basins, media filters, detention basins, gross solids removal devices, and wet basins. Proposed operational maintenance BMPs under the build alternatives would include storm drain cleaning and normal roadway and bridge maintenance, in addition to maintaining all vegetated slopes. In addition, as discussed in Section 3.9.4 of the RDEIR/SDEIS and this Final EIR/EIS, should a build alternative be selected as the Preferred Alternative,

Measures WQ-1 and WQ-2 would address long-term impacts to water quality from the build alternatives. However, as stated in Response to Comment L-30-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, there would not be a potential "comingling," handling of storm water runoff generated from City roadways and no mitigation will be necessary.

L-30-29

Please refer to Response to Comment L-30-28 regarding the handling of storm water runoff from the build alternatives. It should be noted that the No Build Alternative has been identified as the Preferred Alternative.

L-30-30

Please refer to Response to Comment L-30-28 regarding the handling of storm water runoff from the build alternatives.

L-30-31

Please refer to Response to Comment L-30-28 regarding the handling of storm water runoff from the build alternatives. In addition, as discussed in Section 3.9.3.1 of the RDEIR/SDEIS, stormwater discharges to Caltrans' municipal separate storm sewer system (MS4) are regulated through the Caltrans MS4 Permit. Although the Caltrans Stormwater Permit does not include a Watershed Management Program (WMP) compliance approach like the Los Angeles and Long Beach MS4 Permits, its TMDL provisions do require cooperation with agencies subject to the same TMDLs.

L-30-32

As discussed in Section 3.9.2.1 of the RDEIR/SDEIS and this Final EIR/EIS, the primary receiving waters for runoff from the Study Area are the Los Angeles River, Compton Creek, the Rio Hondo Channel, and the Dominguez Channel. As discussed in Section 3.9.3.1 of the RDEIR/SDEIS and this Final EIR/EIS, Alternative 5C would require replacing or extending the existing on-site drainage systems such as drainage inlets along the median and shoulders with new drainage systems that can accommodate the increased project flows. The existing drainage systems that transfer legacy runoff from the adjacent neighborhoods through the I-710 Corridor would be modified to accommodate the improvements proposed as part of Alternative 5C while still maintaining the existing hydraulic capacity required to accommodate legacy storm flows. Existing Los Angeles River drainage outlets would be maintained in their existing location whenever hydraulically feasible and when not impacted by the proposed improvements. Surface runoff would be designed to flow directly into the closest stormwater channel. Runoff from bridges would be directed to nearby drainage features via drainage inlets on the decks which

then flow through the pillars. It is important to note that the No build Alternative has been selected as the preferred Alternative and therefore, there will be no discharge into waterbodies and no BMPs will be required.

L-30-33

Measure GEO-1 set forth in Section 3.10.3 of this Final EIR/EIS, which would provide for the preparation and usage of design-level geotechnical reports prior to completion of detailed design documents, is applicable to the build alternatives. However, as stated in Response to Comment L-30-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, no elevated structures that need to withstand strong ground motion and surface rupture will not be constructed.

L-30-34

As was stated in the text on page 3.12-7 of the RDEIR/SDEIS and this Final EIR/EIS, "The sites listed in Table 3.12-2 and shown in Appendix P-2 are additional sites that were identified as high risk that would either be disturbed by full and partial acquisitions or by TCEs under Alternative 7, as identified in the ISA as properties of potential environmental concern. *The sites listed in Table 3.12-1 apply to Alternative 7 as well* [italics added]". Tables 3.13-1 and 3.12-2 in the RDEIR/SDEIS were structured in this manner to avoid duplication to the greatest extent possible and improve readability.

L-30-35

As discussed in Section 1.2.2 in Chapter 1.0, Proposed Project, of the RDEIR/SDEIS and this Final EIR/EIS, one of the purposes of the project is to improve air quality and public health. As discussed in Section 3.13, Air Quality, in the RDEIR/SDEIS, all build alternatives would generally improve air quality and reduce public health risk. Along I-710, air quality would be improved and public health risk would be reduced at most locations, but there are a few near-roadway locations where there would be an increase in certain emissions, but no increase in cancer risk when compared to the 2012 Baseline.

When compared to the 2035 No Build Alternative, both build alternatives would reduce cancer risk at most locations; however, a small increase in cancer risk compared to the 2035 No Build Alternative would occur at some locations within 100 meters of I-710. For Alternative 5C, the maximum increase in risk would be approximately three in one million. The primary location of the increased risk for Alternative 5C would occur along a small portion of I-710 just south of SR-60. For Alternative 7, the increase in risk would be less than one million. The increases in cancer risk for the build alternatives as compared to the 2035 No Build alternative would be lower than SCAQMD significance threshold. Within the City of South Gate, there would be no

increases in cancer risk (Figures 4-6b and 4-6c of the AQ/GHG/HRA Technical Report) for Alternative 5C or Alternative 7 as compared to the 2012 baseline or 2035 No Build Alternative.

For the build alternatives, Measures AQ-2 and AQ-3 are proposed to reduce emissions at near-roadway locations. Measure AQ-2 would require filters on the ventilation systems of schools near I-710. Measure AQ-3 would require installation of solid barriers where feasible and where soundwalls are not proposed, and installation of vegetation to disperse pollution and reduce pollutant concentrations downwind. However, as stated in Response to Comment L-30-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, Measures AQ-2 and AQ-3 will not be implemented. In addition, although the No Build Alternative has been selected as the Preferred Alternative, the programmatic components to help improve air quality and public health in the I-710 Corridor will not be implemented as part of this Project. Please refer to Section 1.10 of this appendix for more information regarding the Community Health Benefit Program.

L-30-36

The City's concerns about children's health is acknowledged and included in the project record. It is acknowledged that there is a potential for children who attend schools located within 0.25 mi of the I-710 Corridor to also live in the vicinity of the I-710 Corridor. Please refer to Response to Comment L-30-35 for a discussion of air quality impacts at near-road receptors.

L-30-37

Section 3.3.3 of the RDEIR/SDEIS had indicated that environmental justice populations within the I-710 Corridor would be disproportionately impacted by air quality-related impacts (among others) under the build alternatives, but did not specifically indicate that one city would be more burdened than another. However, should a build alternative be selected as the Preferred Alternative, all cities within the I-710 Corridor that contain environmental justice communities adjacent to the I-710 would receive funding for targeted improvements in accordance with Measure C-7, as described in Section 3.3.3.7 of this Final EIR/EIS. However, as stated in Response to Comment L-30-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no impacts to environmental justice communities as a result of the build alternatives. Please refer to Section 1.10 of this appendix for more information regarding the Community Health Benefit Program.

L-30-38

Table 3.5-24 in Section 3.5.3.1, Traffic and Transportation/Pedestrian and Bicycle Facilities, shows the “2035 Daily Vehicle Miles Traveled, Vehicle Hours Traveled, and Vehicle Hours of Delay Comparison” between the 2035 No Build and Build Alternatives. Table 3.15-5 in Section 3.15, Energy, of this Final EIR/EIS, shows the I-710 Corridor Project Operational Annual VMT and VHT – Study Area. Both of these tables document how the build alternatives would affect traffic volumes. Table 3.15-5 works in concert with Table 3.15-7, I-710 Corridor Project Study Area Energy Consumption – Annual, to show the annual energy consumption from the project-related vehicles under the build alternatives. The CEQA guidelines, Appendix F, Energy Conservation, indicate that a project description “may include the following items”, including the cited energy consumed per trip by mode. The EIR/EIS for the I-710 Corridor Project includes the energy consumed by all vehicle types, including all trips and modes, in summary form to facilitate the comparison of project alternatives.

L-30-39

In some cases, it is appropriate to identify a very specific compensatory habitat mitigation, especially when that mitigation is likely to be within the project boundaries. However, in the case of the I-710 Corridor, there are three major factors that make reliance on a less specific mitigation alternative more appropriate. First, the Federal agencies with responsibility for protection of waters of the United States (the U.S. Army Corps of Engineers and Environmental Protection Agency) have expressed a specific policy and regulatory preference for utilization of mitigation banks and in lieu fee programs instead of permittee-responsible mitigation, especially when those programs are available in the same watershed. The State agencies (California Department of Fish and Wildlife and Regional Water Quality Control Boards) have generally embraced this approach. Second, the proposed project is located in a watershed that is both highly developed and currently undergoing a number of planning efforts aimed at modifying the setting to create a more aesthetically pleasing and naturally functioning environment. Some of these efforts are associated with in-lieu fee programs and others could conceivably result in mitigation banks. Finally, the relatively long-time horizon for the build alternatives, combined with comparable time horizons for many of the Los Angeles River and watershed planning/modification programs, make it difficult to reliably identify specific compensatory mitigation at this time. Therefore, planning to utilize an in-lieu fee program or mitigation bank to be specifically identified nearer the time of project implementation, should a build alternative be selected as the Preferred Alternative, is the most appropriate approach. However, since the No Build Alternative has been selected as the Preferred Alternative, mitigation will not be necessary.

L-30-40

Refer to Response to Comment L-30-39 regarding specific compensatory habitat mitigation.

L-30-41

A discussion of how the build alternatives may impact future wetland habitat within the City of South Gate given the reasonably foreseeable changes to the Los Angeles River related to habitat restoration has been added to Section 3.25, Cumulative in this Final EIR/EIS.

L-30-42

The build alternatives would comply with the South Gate Municipal Code's Tree Preservation and Protection guidelines where applicable (i.e.,outside of State right-of-way). Therefore, any public trees beyond State right-of-way that would be removed as part of the implementation of the build alternatives would be replaced at a 1:1 ratio. Within State right-of-way, Caltrans is not obligated to comply with local ordinances. In response to this comment, Measure VIS-2 in Section 3.6.4 has been revised to indicate that, should a build alternative be selected as the Preferred Alternative, public trees beyond State right-of-way would be replaced in a manner that is consistent with applicable local ordinances. However, as stated in Response to Comment L-30-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no impacts to trees.

L-30-43

The measures presented in Section 3.20.4 in this Final EIR/EIS have been included in the Environmental Commitment Record for the project (Appendix F of this Final EIR/EIS) and, should a build alternative be selected as the Preferred Alternative, would ensure that avian species foraging in the Los Angeles River are not adversely impacted. However, as stated in Response to Comment L-30-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no impacts to avian species foraging in the Los Angeles River.

L-30-44

The measures presented in Section 3.21.4 in this Final EIR/EIS have been included in the Environmental Commitment Record for the project (Appendix F of this Final EIR/EIS) and, should a build alternative be selected as the Preferred Alternative, would be implemented to address invasive species concerns related to implementation of either build alternative and would ensure that an invasive vegetation abatement program is implemented. However, as stated in Response to Comment L-30-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no impact related to invasive species.

L-30-45

As stated in Response to Comment L-30-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, the programmatic elements of the build alternatives will not be implemented by Caltrans. It would be the responsibility of the applicants to submit applications in order to secure funding for projects should those elements be implemented by another agency.

L-30-46

Caltrans respectfully disagrees that Section 3.23 of the RDEIR/SDEIS and this Final EIR/EIS should address loss of productivity and jobs within the City of South Gate as a result of business displacements under the build alternatives. An analysis of the employees potentially displaced as a result of business displacements under the build alternatives was included in Section 3.3.2.4 of the RDEIR/SDEIS. It is important to note that the figures presented in this section are a "worst-case" scenario and do not account for the replacement of employees at a relocated place of business. Section 3.23, Irreversible and Irretrievable Commitments of Resources, discusses the irreversible commitment of resources that would be required to construct the build alternatives, and acknowledges that land acquisition would represent an irreversible commitment of land to a transportation facility. However, business displacements would not represent an irreversible commitment of resources because the businesses would be relocated prior to construction of either build alternative. However, as stated in Response to Comment L-30-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no loss of jobs as a result of business displacements in the City of South Gate.

L-30-47

Please refer to Response to Comment L-30-1 regarding the timing of construction of the build alternatives.

L-30-48

Caltrans and Metro acknowledge that construction of the build alternatives would result in temporary impacts to traffic circulation due to temporary detours and closures, and have proposed Measure CON-TR-1, outlined in more detail in Section 3.24.4.5 of this Final EIR/EIS, to address these temporary impacts during construction. Should a build alternative be selected as the Preferred Alternative, CON-TR-1 would require the preparation of a TMP, which would take into account the effects of the build alternatives on all travel modes including pedestrians, bicyclists, and transit users, in addition to the motoring public. However, as stated in Response to Comment L-30-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no impacts to traffic as a result of construction and a TMP will not be necessary.

L-30-49

As is stated in Section 3.24.4.4 of this Final EIR/EIS, should a build alternative be selected as the Preferred Alternative, Measure CON-U&ES-1 would provide for the coordination of all temporary ramp closures and detour plans with fire, emergency medical, and law enforcement providers, as well as with local jurisdictions' Departments of Public Works, to minimize temporary delays in emergency response times as part of the TMP, including the identification of alternative routes and routes across the construction areas for emergency vehicles, which would be developed in coordination with the affected agencies. The TMP would be developed with input from project stakeholders including the City of South Gate and LA County Fire. The TMP would specifically address short-term project construction traffic taking into consideration the effects of these activities to emergency response. Context sensitive TMP strategies, such as not allowing the contractor to close two adjacent arterial streets, requiring temporary traffic signals in the construction zone with allowances for emergency response pre-emption, and implementing a public awareness campaign to inform the travelling public on recommended alternate routes to respond to the emergency calls, would help address potential impacts during project construction of either build alternative. However, as stated in Response to Comment L-30-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no impacts to traffic as a result of construction and a TMP will not be necessary.

L-30-50

Although specific details regarding construction methods, detours, and types of equipment needed for construction of the build alternatives were not known at the time of the RDEIR/SDEIS, general measures to address construction-related impacts were included in Section 3.24, Construction, of the RDEIR/SDEIS. A general description of the highway improvement process was included in Section 3.24.1.1, which included information regarding typical construction sequences, which include traffic control during construction. More detailed information on potential traffic-related impacts during construction of the build alternatives was included in Section 3.24.3.5, and a measure to prepare and implement a Transportation Management Program prior to and during construction of the build alternatives (Measure CON-TR-1) was included in detail in Section 3.24.4.5 of the RDEIR/SDEIS. However, as stated in Response to Comment L-30-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no impacts to traffic as a result of construction and a TMP will not be necessary.

L-30-51

As discussed in Section 4.2.4.1 Air Quality of the RDEIR/SDEIS and this Final EIR/EIS, in Section 4.2.4, Unavoidable Significant Impacts of the Proposed Project, for the worst-case construction scenario, peak daily emissions for Alternatives 5C and 7 would exceed SCAQMD CEQA significance thresholds for NO_X, CO, PM_{10}, $PM_{2.5}$, and VOCs for both the Baseline Compliance Scenario and the All BACT Scenario. Although compliance with SCAQMD rules and regulations (including CON-AQ-1 through CON-AQ-17) during construction of either build alternative would reduce construction related air quality impacts from fugitive dust emissions and construction equipment emissions, air quality impacts as a result of the build alternatives during construction would remain significant and unavoidable under CEQA. However, as stated in Response to Comment L-30-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no impacts to air quality during construction.

L-30-52

Measure CON-AQ-15 was drafted in a manner that ensures it is both enforceable and consistent with Caltrans' and Metro's contract bid requirements and procedures (should a build alternative be selected as the Preferred Alternative), given that it is not currently known at this time which agency may eventually administer the construction contract for the build alternatives. Therefore, some flexibility was retained accordingly in the wording of the measure. It is important to note that some, but not all Tier 4 equipment is commercially available at the present time; however, it is currently unknown if and when all Tier 4 equipment necessary to construct the build alternatives would be available in the future. By the time construction of the build alternatives would begin (should a build alternative be selected as the Preferred Alternative), the Best Available Control Technology (BACT) compliance schedule for CARB In-Use Off-Road Diesel-Fueled Fleets Regulation indicates that only 10 percent of "large fleets" would consist of BACT equipment.[10]

Therefore, in order to ensure that the referenced measure is feasible and enforceable, the text of the measure has not been revised. It should also be noted that as stated in Response to Comment F-4-21, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no air quality impacts related to construction.

L-30-53

The text in question in Section 3.24.3.14, Noise, was revised to state that "both sets of thresholds were used to evaluate short-term, construction related ground-borne vibration."

[10] California Air Resources Board (CARB). 2014, Revised August 2014. Frequently Asked Questions In-Use Off-Road Diesel Vehicle Regulation. Website: https://www.arb.ca.gov/msprog/ordiesel/faq/bact faq.pdf (accessed October 3, 2018).

L-30-54

The discussion presented in this section and associated avoidance, minimization, and/or mitigation measures for the build alternatives was based on the best and most detailed information available at the time of preparation. In response to this and other comments, Measure CON-N-9 in this Final EIR/EIS has been revised to provide for continuous monitoring for residential structures within 200 feet of pile driving operations, should a build alternative be selected as the Preferred Alternative. Should damage occur during construction of either of the build alternatives, operations would cease and construction methods and/or equipment would be re-evaluated. Should a build alternative be selected as the Preferred Alternative, measures in the Caltrans *Transportation and Construction Vibration Guidance Manual* (September 2013) would be implemented as necessary. However, as stated in Response to Comment F-4-21, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no pile driving required.

RE: I-710 Draft Environmental Impact Report (EIR)

Dear Mr. Kosinski:

On behalf of East Los Angeles Local Advisory Committee, I am submitting comments and concerns regarding the 1-710 Draft Environmental Impact Report (EIR).

My office has facilitated numerous meetings regarding the 1-710 freeway. As you are aware, the East Los Angeles community is affected by the 1-5, 1-10, SR-60, and SR-710 freeways, which, cause intensified cumulative impacts in the community. Consequently, the residents of East Los Angeles are extremely concerned about the proposed expansion of the I-710 freeway. Enclosed are the comments made by the East Los Angeles Local Advisory Committee for your consideration.

If you require additional assistance, please do not hesitate to contact Waqas Rehman, my Senior Special Projects Deputy at (213) 974-4111.

Sincerely,

Hilda L Solis

HILDA L. SOLIS
Supervisor, First District

East Los Angeles Local Advisory Committee (ELA LAC)

I-710 Corridor Project Recirculated Draft Environmental Impact Report/Supplemental Draft Environmental Impact Statement (Rdeir/Sdeis) and Section 4(F) Evaluation

Dear Mr. Kolinski:

The East Los Angeles Local Advisory Committee (ELA LAC) has reviewed the Recirculated Draft Environmental Impact Report/Supplemental Draft Environmental Impact Statement (RDEIR/SDEIS) and Section 4(F) Evaluation for the I-710 Corridor Project and has the following comments/concerns. Please give these comments thoughtful consideration as our community has suffered the impacts of the I-710, and all the other freeways that run through it and around it, through the years.

Unless otherwise stated, all items described hereon are specific to the unincorporated County Community of East Los Angeles. Each matter described in this letter should be addressed not only upon the issue raised but also as an environmental justice issue and as a violation of CEQA and NEPA standards.

The 2017 Recirculated Draft EIR/SDEIS is deficient, it should be withdrawn, re-done and recirculated with the following items in mind:

- Design Options 3A/3B should not be included in the redrawn EIR/EIS. L-31-1
- Project proponents should abide by Motion 22.1 and study Community Alternative 7 as an alternative. L-31-2
- A Freeway Cap Design through East LA, like the 101 Park Design in Downtown LA, should be study. L-31-3
- If this project should go forward, the redrawn EIR/EIS shall include a Health Impact Assessment (HIA) study for East Los Angeles and offer mitigation measures for each one of the items in this comment letter. L-31-4
- East LA residents should be engaged during the process to provide input regarding options and/or alternatives impacting East Los Angeles prior to inclusion in the redrawn EIR/EIS. L-31-5
- We are opposed to the taking of properties and businesses in East Los Angeles. L-31-6

- The community of East Los Angeles should not have to suffer from more impacts from this project than other communities. L-31-7
- Impacts from Air Pollution, noise pollution and traffic should not be greater in East Los Angeles from the I-710 Corridor Project Build Alternatives than from the 2035 No Build Alternative. Build Alternatives should offer better air quality, reduce noise pollution and traffic in East Los Angeles if not they should not be built. L-31-8

Environmental Justice

East Los Angeles is an environmental justice community. Ninety-Seven percent of the community is Latino. The percentage of Latinos in East Los Angeles far exceeds the numbers in the study area and in the County as a whole. The number of residents living below the poverty level exceeds the number of residents living below the poverty level in the study area. East Los Angeles is one of the most impoverished areas in the study area.

2017 Recirculated Draft EIR/SDEIS Process

We feel that the time provided to review the document was insufficient given its complexity and voluminous associated technical documents. The document was once again released in the summer and did not provide sufficient time for residents to be informed and participate in the review process. This same exact comment was made in 2012, yet, it happened again. L-31-9

The I-710 Funding Partners had years to prepare this document, but only 90 days were given to residents to become aware of the project, review the 10,000 plus page document and provide comments. Many residents did not learn of the project until October 18th when Los Angeles County Supervisor Solis held a community forum in East Los Angeles. Despite repeated attempts from residents and their elected officials to obtain a full 120 comment period, Caltrans refused. L-31-10

The 2010 US Census reports that 87.6 percent of the residents of East Los Angeles speak a language other than English at home, compared to the California number of 43.6 percent, yet the vast majority of materials were provided in English. There are also many errors in the document making it difficult for East Los Angeles residents to fully understand the impacts of this project. Some of these errors include:

- Appendix L, an acquisitions page which says, "Los Angeles" instead of Unincorporated East Los Angeles when describing the properties to be acquired. L-31-11
- Appendix L also categorizes residential properties as Industrial, thus underestimating the number of homes to be acquired. L-31-12
- Throughout the document including in the Community Impact Report and Relocation Impact Report, lists 19 residential units instead of 24 as being acquired and, miscalculates the number of people to be displaced, 76 rather than 98, and it lists a 10-unit apartment building as having 5 units. L-31-13

- The Relocation Impact Report misidentifies Unincorporated East Los Angeles as the City of Los Angeles, and states that there are adequate number of replacement homes for East Los Angeles residents. L-31-14
- The Visual Impact Assessment is confusing in regards to East Los Angeles Key Views 24 and 25. The section states: "Under Alternatives 5C/7, there would be a new soundwall/retaining wall in closer proximity to the viewers, but it would be very similar to form and size to the existing soundwall." Yet, Table 8.1 and 8.2 inexplicably list different values for each. Apparently, the values for Alternative 7 are actually the values for East Los Angeles Design Options 3A/3B. L-31-15

When the document was first released, the link to the comments section was not easily found. It was not until repeated phone calls and the advocacy of East Los Angeles elected officials that the comment link was moved to a location more easily found. Additionally, the link to the main pdf was not operating properly for most of the comment period. L-31-16

Finally, people submitting comments are not able to submit pdf files online. All of this left the residents of East Los Angeles unable to fully participate in the Recirculated Draft EIR/EIS process. L-31-17

The Study Area

We feel East Los Angeles Community is placed at disadvantaged regarding the ability for residents to participate in the RDEIR/SDEIS process. The East Los Angeles Community is split in two with half of the community in the I-710 Corridor Project (South) and the other half in the SR-710 Project North. East LA is being sandwiched between both projects, both led by the same agency. We request that the entire community of East Los Angeles be included in both projects study areas and that the effects of one project be included on the other. In addition to being an environmental justice issue, this is a civil rights matter. L-31-18

There are obvious air quality, noise and traffic impacts to the area between SR-60 and the I-10, however both projects failed to study and analyze these. East Los Angeles is the only community which has the I-710 running through it, the only community directly impacted by both projects, and the only community not fully studied by either project.

Leaving a great portion of East Los Angeles, an environmental justice community that is obviously affected by the project, out of the study area is a violation of CEQA and NEPA and is simply unjust. If this is allowed, it will set up a dangerous precedent. A project which results in enormous increases in traffic, air pollution, cancer risks, health impacts to a community cannot exclude a community from the study area to avoid having to do CEQA and NEPA analysis of impacts. L-31-19

The intent of the NEPA and CEQA environmental justice laws is to protect communities like East Los Angeles, which is 97 percent Hispanic/Latino and has a one of the largest percentage of the population living below the poverty level, from impacts imparted by

projects like the I-710. Following are some excerpts from the documents, which the project is in violation of:

> The CEQA Guidelines state that the analysis of a proposed project shall discuss:
>
> "...changes induced in population distribution, population concentration, the human use of land (including commercial and residential development) ... analyze any significant environmental effects the project might cause by bringing development and people into the area affected."
>
> The Environmental Justice Section of this report states:
>
> All projects involving a Federal action (funding, permit, or land) must comply with Executive Order (EO) 12898, Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations, signed by President Clinton on February 11, 1994.

This EO directs Federal agencies to take the appropriate and necessary steps to identify and address disproportionately high and adverse effects of Federal projects on the health or environment of minority and low-income populations to the greatest extent practicable and permitted by law. This RDEIR/SDEIS does not take the appropriate and necessary steps to identify and address disproportionately high and adverse impacts of this project for the following reasons:

1) It did not complete a health impact assessment which would have identified additional impacts to the community, such as exacerbation of asthma and new cases of asthma, reduced lung function, cardiovascular heart disease, preterm birth, low birth weight and pregnancy disorders, aging of the brain, obesity, type 2 diabetes, overall burden of disease related to near roadway air pollution, increased risk of autism spectrum disorders to children born to mothers living near freeways, and increased risks to the elderly. L-31-20
2) The impacts to East Los Angeles, an environmental justice community, are disproportionate and are not adequately addressed.
3) It did not address the disproportionate impacts to low income and minority communities in a meaningful manner. L-31-21

The RDEIR/SDEIS is deficient, replete with errors, misleading to community members, and does not properly study the impacts to East Los Angeles. Additionally, each of the deficiencies violate environmental justice standards.

This RDEIR/SDEIS should be withdrawn and re-scoped incorporating meaningful input from East Los Angeles. Design Options 3A/3B should never have been included in the RDEIR/SDEIS without first being presented to the I-710 East Los Angeles Local Advisory Committee. A new corrected draft EIR/EIS without Design Options 3A/3B should be completed and recirculated for comment. L-31-22

A consolidating study of the environmental impacts from both projects to the entire community of East Los Angeles must be completed incorporating the latest information. L-31-23

A complete Health Impact Assessment (HIA) which includes all of the latest research re impacts from living near freeways should be included. This study should include a deeper look into ultrafine particulate matter. There is significant research regarding the impacts of freeways on health. Ignoring these studies is equivalent to the tobacco industry knowing that smoking kills and not disclosing that fact to consumers. L-31-24

The HIA should establish thresholds for the I-710 Corridor Improvement Project and for all future Caltrans/Metro sponsored projects through East LA. The study would establish air quality baseline standards for our community.

Community Character and Cohesion

East Los Angeles is a place where community cohesion is strong. The RDEIR/SDEIS document is somewhat right in statistics about this community. In the community impact assessment, Section 5.13.4 it states:

> Community cohesion is the degree to which residents have a sense of belonging to their neighborhood, a high level of commitment to the community, or a strong attachment to neighbors, groups, and institutions, usually as a result of continued association over time (California Department of Transportation [Caltrans] 2011).1 According to several indicators of community cohesion for the community of East Los Angeles described in Section 4.14.6, including the long tenure of many of the residents in the study area, the high degree of ethnic homogeneity, the high percentage of persons either age 65 and over or under age 19, and the large number of residents who are pedestrians (as confirmed through the finding of high percentages of transit-dependent persons), it can be concluded that there is a high degree of community cohesion in the unincorporated community of East Los Angeles.

This section states that CEQA requires:

> Alternatively, economic or social effects of a physical change may be used to determine that the physical change is a significant effect on the environment. If the physical change causes adverse economic or social effects on people, those adverse effects may be used as the basis for determining that the physical change is significant.

Design Options 3A and 3B aim to further improve safety and operation of the freeway by reducing weaving conflicts between the I-5 and SR-60. To achieve the objective, the variation would reconfigure the SR-60, I-5, and Olympic Blvd. interchanges, and alter the freeway and local traffic circulation in East LA. Design Options 3A/3B will cause significant physical change to the community and harm to residents of East Los Angeles. L-31-25

Further, other methods such as actual traffic accident data on freeway segments, on-off ramps and freeway connectors both Northbound and Southbound should have been included for comparison should have been used besides the conflict point method used to study the efficacy of Options 3A/3B. Additionally, rather than comparing the safety records of the I-710 through East Los Angeles with safety records of the State of California, County of Los Angeles should have been used for comparison. L-31-26 L-31-27

Design Options 3A/3B is deficient because it fails to meet the purpose of the project in East LA and the number one purpose throughout the corridor of improving air quality and public health and alleviating traffic congestion. Furthermore, the impacts associated with these Design Options far exceed their benefits projected. **Residents of East LA, oppose both Design Options and the taking of 24 residential properties and 7 businesses associated with this proposal**. The taking of properties on Sydney Drive and of the businesses in East Los Angeles will impact Community Cohesion. Residents will suffer both economic and social effects due to proposed displacement. The occupants of the apartment building at 626 S Sydney Drive and of other properties that would be acquired by this project on Sydney Drive are occupied by renters. Other properties that would be required are owned by residents on Sydney. Residents feel that with the four freeways running through East Los Angeles they have met their burden. They should not have to give any more property and they should not have to endure any more pollution from these projects. L-31-28

Many families on Sydney Drive have family members who also live in East Los Angeles. East Los Angeles is an environmental justice community, 97.1 percent of the population is Latino, 27.1 percent of the population have incomes below poverty level. Families with low incomes depend on extended family when money runs short. Family, and extended family is culturally important in East Los Angeles. Community members depend on their family and extended family for support. Additionally, as indicated in the East Los Angeles community profile, 42.6 percent of residents are transit dependent.

Marcia Carteret, M. Ed., states: L-31-29

> "Latinos tend to be highly group-oriented. A strong emphasis is placed on family as the major source of one's identity and protection against the hardships of life. This sense of family belonging is intense and limited to family and close friends. People who are not family or close friends are often slow to be given trust. The family model is an extended one; grandparents, aunts, cousins, and even people who are not biologically related may be considered part of the immediate family.... Financial support of the family by the individual and vice versa is important and expected." http://www.dimensionsofculture.com/2011/03/cultural-values-of-latino-patients-and-families/

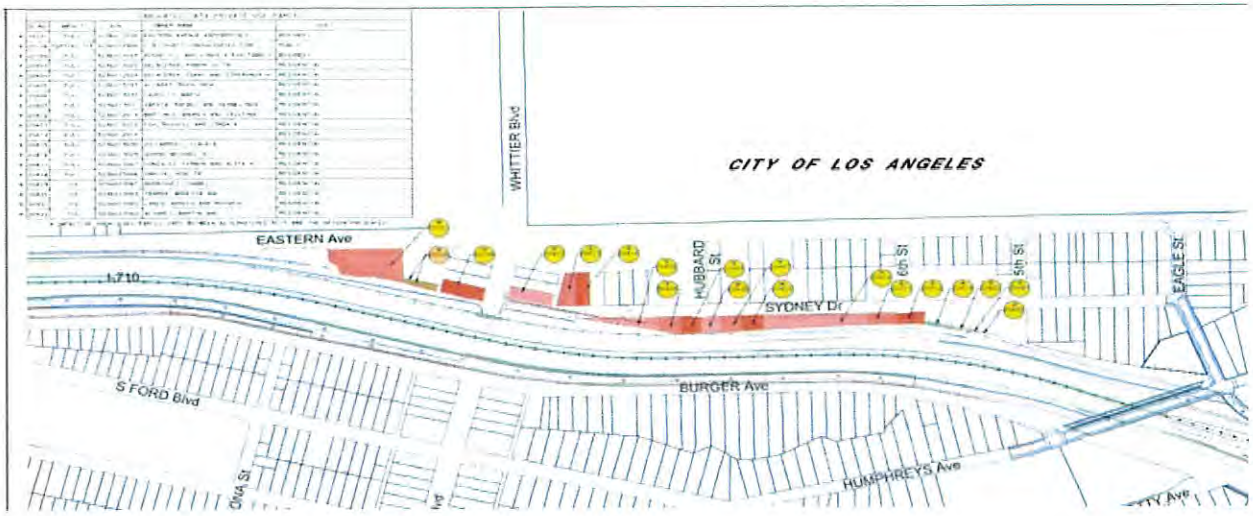
Expecting East Los Angeles residents to move from homes where they have extended networks of family to new homes far away from the support groups when they have no cars to visit those family members will hurt these community members economically,

socially and psychologically. Furthermore, many of those impacted are senior citizens whose health would be impacted by one of life's great stressors, moving. L-31-29

Los Angeles currently has a housing shortage. Rents are historically high throughout Los Angeles County. Community members will have difficulty finding properties to rent that are equal to and priced similarly to the rentals that they currently live at. Additionally, many renters who are given relocation money to move run out of the relocation money in less than a year because they are forced to pay higher rents. This has contributed to the increase in homelessness in Los Angeles County. L-31-30

As indicated in the East Los Angeles community profile, East Los Angeles has many longtime residents. The number of residents who have lived in East Los Angeles for a long period of time is greater than the County wide average. Attached are quotes from residents who would be impacted if their homes on Sydney Drive are acquired through eminent domain.

Juana Cortez, age 70 lives at 600 S Sydney Drive and has lived 35 years at her home states,



> "I am a senior citizen. My family who lives in East Los Angeles visit me and help me. At my age it would be hard and stressful for me to move to another location away from my family who provides for me both financially and emotionally. I also depend on my family for rides to the supermarket and doctor."

Relocations and Real Property Acquisition

Federal law does not allow payment for relocation benefits for undocumented Immigrants. In communities like East Los Angeles with substantial numbers of Spanish speaking immigrants, it is likely that there may be undocumented immigrants who if required to move will be severely economically impacted by this project. This will cause significant harm to this population and to the overall community of East Los Angeles. L-31-31

Additionally, the Relocation Impact Assessment is deficient in its analysis of East Los Angeles. It does not offer East Los Angeles residents the information necessary to provide comments on how this project will impact them. This is an environmental justice issue as well.

The Relocation Impact Report is totally flawed in its analysis of East Los Angeles. This puts East Los Angeles at a complete disadvantage. The Acquisitions Report, and Risk Maps list East Los Angeles homes as the City of Los Angeles. The map below is just one of the places within this document which misidentifies East Los Angeles as the City of Los Angeles. See map at below: L-31-32

The Relocation Impact Report for every community facing property acquisitions; except East Los Angeles, looks at housing sales, housing rentals, demographics, prices, and housing availability within that community. Caltrans appears to have included a generic Los Angeles category instead of studying East Los Angeles and providing detailed information on the availability of housing in East Los Angeles and how likely it would be for residents to relocate within East Los Angeles. L-31-32

If the intent was to include the City of Los Angeles as a source of housing, the report should have listed it separately, and studied East Los Angeles as an unincorporated separate community like all the other communities. It should be noted that none of the acquisitions of property occurs in the City of Los Angeles. Only 14 of the 205 properties sales listings for Los Angeles are in East Los Angeles. Almost half, 102 of the sales listings are in two zip codes in South Los Angeles (90002 and 90059). Likewise, the listings for Multi-family homes are for the City of Los Angeles not one of the 55 Multifamily homes are in East Los Angeles. A good number are near downtown 90012.

The Relocation Impact Study and the Community Impact Assessment incorrectly states that there are 19 homes that will be required when in fact the true number is 24. The apartment building at 626 S. Sydney Drive is a 10-unit building not a 5-unit building. This has resulted in the community of East Los Angeles not being fully analyzed for impacts and possible mitigation. L-31-33

Proposed Design Options 3A/3B will also impact several businesses on Whittier Blvd. Proposed displacements will hurt our community's economy as it evolves around local business sales tax revenue. Ninety-one percent of the businesses in East Los Angeles are minority owned. Eighty-one percent of the population in East Los Angeles speak a language other than Spanish at home. Businesses in East Los Angeles cater to a largely Spanish-speaking population. It will be difficult for business owners some of whom have a primary language of Spanish to find similar locations for their businesses. Additionally, East Los Angeles depends on the businesses within the community as much of the population is transit dependent. For example, the Pet Shop at the corner of Sydney and Whittier is a local resource for the community. Each weekend day the L-31-34

shop is busy with customers who walk to the store. The business for the community is irreplaceable.

The Relocation Impact Assessment is deficient in analyzing the impacts to East Los Angeles businesses and the impact to the community. It totally disregards East Los Angeles in Appendix H Commercial Listing Data and does not even attempt to locate replace properties for the businesses within East Los Angeles. Where could the Pet Shop be relocated to service the community of East Los Angeles. This business has been operating successfully within the community for many years. Where could the Dialysis Center be relocated? This is not at all addressed within the report. L-31-34

The community of East Los Angeles cannot afford to lose the jobs provided by the businesses that would be acquired. At one business alone, it is anticipated that over 20 employees would be displaced. This is unacceptable. L-31-35

The Relocation Impact Assessment does acknowledge that there is not adequate replacement housing for tenants. We believe Options 3A/3B should be removed from consideration for this reason alone. L-31-36

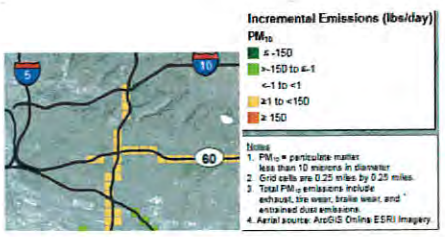
Further the Relocation Impact Assessment states that 80 percent of those facing relocation would require last resort housing assistance, we believe this number is low because of the failure to adequately study the impacts to East Los Angeles residents.

This failure to adequately analyze East Los Angeles in the Relocation Impact Report means that East Los Angeles was not identified as having a lack of comparable replacement housing and was not considered for further mitigation. Section 8.5 of the Relocations Sections states: L-31-37

> Within the Cities of Cudahy, Vernon, and Commerce, current market conditions indicate a lack of comparable replacement housing.... While adequate comparable replacement housing appears to exist presently in neighboring cities, new replacement dwellings under Last Resort Housing may be considered for these cities as a method of providing comparable replacement housing to displaced persons who reside in areas where the replacement housing is low.

Note this absence of East Los Angeles in this list.

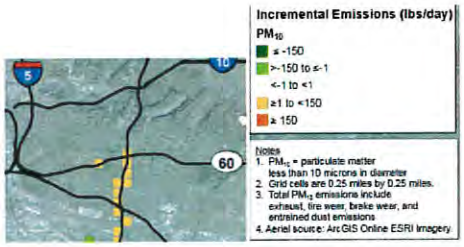
The chart below is from the replacement area report.



1. Housing stock for the study area:

Cities	A. Number of SFR		B. Number of Multi-Family		C. Number of Mobile Homes
	For Sale	For Rent	For Sale	For Rent	For Sale
Long Beach	294	61	184	50	26
Carson	35	7	22	5	12
Compton	123	2	6	4	9
Cudahy	3	0	2	0	1
Los Angeles	205	336	55	180	0
Lynwood	32	0	1	6	1
Paramount	21	1	12	7	11
South Gate	30	2	4	1	1
Bell Gardens	5	0	3	0	0
Bell	4	0	0	2	0
Commerce	1	0	1	0	0
Maywood	3	0	1	0	0
Vernon	0	0	0	0	0
TOTAL	**756**	**409**	**291**	**255**	**61**

L-31-37



AIR QUALITY/HEALTH RISKS

The current 2017 Recirculated Draft EIR/SDEIS is deficient. It does not include all of East Los Angeles yet there are impacts from the two build alternatives to all of this community. See below the PM10 pollution comparisons:

Comparison of
2035 Alternative 7 to 2035 Alternative 1
Total PM_{10} Emissions

Figure 7

Comparison of
2035 Alternative 5C to 2035 Alternative 1
Total PM_{10} Emissions

Figure 6

L-31-38

The current RDEIR/SDEIS is deficient. It does not adequately study the impacts from pollution on the residents of East Los Angeles. With this plan, there are pockets of increased cancer risk, PM10 and PM2.5 pollution with the build alternatives. It is contrary to law that the environmental justice community of East Los Angeles will face increased pollution from the build alternatives. The Air Quality, Greenhouse Gas, and Health Risk Assessment Technical Study states at ES.6.1, Page 31,:

> Both 2035 build alternatives predominantly display decreases in cancer risk with small increases within 100 meters of the I-710 when compared to the 2035

Alternative 1 (No Build). For Alternative 7, the increase in risk is less than 1 in a million. For Alternative 5C, the maximum increase in risk is approximately 3 in a million. The primary location of increased risk for Alternative 5C is along a small portion of the I-710 just south of its intersection with SR-60; the absolute risk level at this location from I-710 traffic sources is 17.4 in a million (compared to 14.2 in a million for Alternative 1 and 14.9 in million for Alternative 7).

East Los Angeles is the only community along the corridor that shows increases in incremental cancer risk. See Figure ES8. The impacts of Alternative 7 PM10 pollution is especially troubling as is the increased cancer risk to Humphreys Avenue Elementary School students and the residents around it from Alternative 5C. The impacts from this pollution is not adequately studied and does not contain sufficient data regarding health outcomes from the effects of PM10, PM2.5 and ultrafines. Further, the study of the impact from other pollutants is not adequately addressed. The increased cancer risk is unacceptable. L-31-38

We are also concerned that the Health Risk Assessment inappropriately assumed that the BNSF SCIG would be operating even though a 2016 Court Decision found that the EIR/EIS for the SCIG project violated CEQA. This has caused the emissions to be underestimated in the present I-710 EIR/EIS Health Risk Assessment. L-31-39

The Health Risk Assessment fails to measure the impacts of increased heat due to the amount of concrete from freeways within East Los Angeles and the impact of global warming and how this will impact residents in 2035 and beyond. L-31-40

A Health Risk Assessment alone is not sufficient especially for a community like East Los Angeles that has 4 major freeways running through it. Additionally, proposed Design Options 3A/3B, impact residents of East Los Angeles who reside within a triangle of freeways with the SR-60 to the North, the I-710 to the East and the I-5 to the West. Thousands of residents within this triangle live within a few hundred feet of these freeways. Some live as close as 30 feet from the I-710. Additionally, all of East Los Angeles' 126,000 plus residents live within an area which is heavily impacted by the traffic and pollution of the I-5, I-710, I-10, and SR60 freeways. This proximity requires a closer study of the pollution and impacts from the freeway on this environmental justice community. The Health Risk Assessment only addresses Cancer Risk, but Cancer Risk is not the only danger from pollution to resident's health.

The Health Risk Assessment is flawed. The DEIR/EIS should be withdrawn, redone and recirculated. Residents of East LA demand that a Health Impact Assessment (HIA) study be done before an Alternative is selected. L-31-41

A Health Impact Assessment would have identified additional impacts to the community, such as exacerbation of asthma and new cases of asthma, Reduced lung function, Cardiovascular heart disease, Preterm birth, low birth weight and pregnancy disorders, Autism, Aging of the brain, possibly obesity and Type 2 diabetes, overall burden of disease related to near roadway air pollution, increased risk of autism spectrum disorders to children born to mothers living near freeways, and increased risks to the elderly. The

East LA LAC request a Health Impact Assessment be done for the community of East Los Angeles to identify all impacts to residents by this project. L-31-41

Many studies have been completed about the impacts of air pollution on residents living near freeways. Andrea Hricko and other scientists included a listing of these studies in their comments to the SR-710. This DEIR/EIS is deficient in not including these studies when reviewing the impacts.

Additionally, the impacts from pollution is not adequately studied and does not contain sufficient data regarding health outcomes from the effects of PM10, PM2.5 and ultrafines. Cancer risk is not the only danger from pollution to resident's health.

The Health Risk Assessment is flawed. The DEIR/EIS should be withdrawn, redone and recirculated. Many of the homes in the East Los Angeles neighborhood near the I-710 freeway are less than 100 feet from the freeway. Some are as close as 30 feet from the freeway. Proposed Design Options 3A/3B would bring residents closer to the freeway, yet the impact of Ultrafines was not studied.

In the Hricko, et al comments, the following is stated about Ultrafines:

"7. Failure to include information on the health impacts of ultrafine particles (UFPs),.....

a. Ultrafine particles (UFP; aerodynamic diameter < 0.1 micrometers) are a ubiquitous exposure in the urban environment and are elevated near highways (Fuller et al, 2012; Zhu et al, 2002a; Zhu et al 2002b; Zhu et al 2006). These particles are considered especially toxic because they can enter the lung, and stay there or get into the systemic circulation. L-31-42

b. A study done by UCLA and USC researchers documented very high concentration of ultrafine particles in close proximity to the I-710 Freeway in SE Los Angeles. It found that the pollutants start to level off at about 150 meters from the freeway and are "back to background" in about 300 meters [985 feet] from the freeway during daytime dilution conditions. In fact, the impacts for ultrafine particles are 10 to 15 times further from the source than are the daytime impacts.

c. These researchers from UCLA and USC also found that at night time when winds shifted, the pollutant levels of ultrafine particles did not reach background until 300 meters from the freeway (Zhu et al, 2006).

d. Other researchers from UCLA and USC also found that at night time when winds decrease, the concentrations of ultrafine particles did not reach background until 2500 feet from the freeway (Hu et al., 2009).

e. In fact, the impacts for ultrafine particles are 10 to 15 times further from the source than are the daytime impacts.

f. Another study, by UC Davis researchers looked at a number of studies with regard to concentrations from the roadways (Karner et al, 2010). They conclude: 'In general, concentrations decay to background within a few hundred meters downwind of a road, although studies measuring pollutants solely in the evening hours indicate that higher concentrations persist beyond 500 m (1640 feet)" (citing Zhu et al, 2006). Other researchers from UCLA and USC also found that at night time when winds decrease, the concentrations of ultrafine particles did not reach background until 2500 feet from the freeway (Hu et al., 2009). L-31-42

Further in the Health Risk Assessment, no information is provided regarding Design Options 3A and 3B. Proposed Design Options 3A/3B will remove the 24 homes of almost 100 people, included is a two-story apartment building of 10 units at 626 S. Sydney. The removal of these homes will bring the freeway closer to thousands of people living in this neighborhood. The study suggests that the sound walls will act as a barrier to pollution for residents living adjacent to the wall, but the wall on Sydney will be across the street from the remaining residences, meaning that there will be no protection from the pollution. In fact, it is anticipated that the pollution will drop onto these resident's homes. The apartment building at 626 S. Sydney, because of its height, acts a barrier from noise and pollution to residents across the street from it. The impacts from the increased noise and pollution without this apartment building were not analyzed. L-31-43

The elevated auxiliary lane proposed under Design Options 3A/3B adjacent to Burger Avenue will bring the freeway closer to residents on the east side of the freeway. The HRA indicates that PM10 and PM2.5 pollution from brake wear, tire wear and entrained road dust and exhaust will increase more on the East side of the I-710 north of the I-5 and South of the SR-60; however other health risks associated with this proposal are unknown putting this community at a disadvantage. The RDEIR/SDEIS is deficient, Design Options 3A and 3B should be rejected. L-31-44

Design Options 3A/3B propose to relocate existing exit at Olympic Blvd to Whittier Blvd. A traffic study analyzing the impacts to Whittier Blvd by this proposal has not been completed. Olympic Blvd is a truck route heavily used by traffic going to and from Downtown Los Angeles. How will proposed off-ramp relocation impact traffic on Whittier Blvd and other arterials like Eastern Avenue? Will increased traffic increase pollution in East Los Angeles? L-31-45

A jogging path is due to be constructed around Calvary Cemetery which has its eastern border on Eastern Avenue. This increased traffic will conflict with the communities use of the jogging path. The increased traffic will also increase pollution and noise. L-31-46

Additionally, a small community park is being considered on current Los Angeles County property on Eagle St at the Sydney Drive intersection. L-31-47

Design Options 3A/3B will no longer allow vehicles merging from the SR-60 to access the I-5 South. These vehicles may exit on the new Whittier exit and use East Los Angeles streets to get to the I-5 freeway. They also may stay on the SR-60 freeway and exit on Atlantic Blvd. Additional cross-through traffic on the streets of East Los Angeles will increase congestion on already congested local streets, and increase pollution among other impacts. Closure of the I-5 to vehicles merging from SR-60 shall had been studied more in depth to determine these impacts. L-31-48

The intersection traffic assessment did not show increased traffic at Eagle Street and at Humphreys/3rd St. south exit; however, Eagle Street, Humphreys Avenue, and Eastern Avenue are proposed for widening in anticipation of more traffic and possibly more truck traffic. When asked about the widening, Mr. Shannon Willits of AECOM explained this was the reason for the proposed widening. When asked how many more cars would exit he said 1 to 2 a minute. That is a substantial increase for a residential community. How will increased traffic impact pollution to adjacent residents? Eagle Street experienced increased traffic when the Gold Line Project eliminated left turns from Humphreys onto 3rd Street. Residents on Eagle, Humphreys, and Eastern complain frequently about cars speeding off the freeway and through their neighborhoods. Accidents from cars speeding off the freeway frequently occur. Many of these go unreported because they are hit and run accidents and the residents do not have comprehensive insurance for the older vehicles that are parked on the streets. L-31-49

Six businesses and one cell tower will be taken with proposed Design Options 3A/3B. One of those businesses is a Dialysis Center – Davita Doctors Dialysis Center. A google search shows only four Dialysis centers in East Los Angeles. Design Options 3A/3B will then remove 25 percent of the available centers. DaVita is reported to be a large Dialysis Center with 24 stations. Additionally, East Los Angeles is a Health Professional Shortage area. The population of East Los Angeles is highly transit dependent, 42.6 percent according to Table 4.14B of the East Los Angeles profile. Which means it is more difficult for residents to travel far distances for health care. Additionally, dialysis takes a lot of time making it more difficult for residents to travel far distances. Several studies have indicated that residents living near freeways who have Diabetes often have poorer health outcomes. Additionally, end stage renal failure can be a poor outcome among diabetes patients and often necessitates dialysis. Therefore, removing one of four dialysis centers will be very impactful to the community. It is ironic, living near a freeway makes diabetes worse yet the project is suggesting that the treatment for that outcome be more difficult to obtain. The RDEIR/SDEIS fails to study how the removal of this Dialysis Center will impact the residents of East Los Angeles, therefore it is deemed deficient. L-31-50

The project should provide air quality monitoring to all sensitive receptors adjacent to the freeway, including but not limited to the following:

Ford elementary school (1112 S Ford Blvd) L-31-51

Humphreys Avenue Elementary School (500 S Humphreys Ave)
Marianna Avenue Elementary School (4215 Gleason St)
Alphonso B. Perez Special Education Center (Michigan Ave at Ford Blvd)
Brooklyn Avenue Elementary School (4620 East Cesar E Chavez Avenue)
Hilda L. Solis Learning Academy (319 N Humphreys Ave)
Eastman Avenue Elementary School (4112 E Olympic Blvd)
Winter Gardens Elementary School (1277 Clelia Ave)
Rowan Avenue Elementary School (600 S Rowan Ave)
KIIP Alumina Academy (4800 East Cesar E Chavez Avenue)
Morris K. Hamasaki Elementary School (4865 E 1st St)
Belvedere Elementary School (3724 E 1st St)
Centro Estrella (4701 East Cesar E Chavez Avenue
New Green Dot School to be built at Humphreys and Fisher
MAOF Daycare at 330 S. Ford Blvd.
Daycare Center at Gage and Union Pacific
All Daycare centers adjacent to the freeway
All Home-based Daycare centers adjacent the freeway

L-31-51

Given that East LA is one of the few communities where project's impacts to air quality is projected would be worse than "No Built" condition, the project should include green scape projects in all schools and learning centers, and planting of additional trees and landscaping on local streets adjacent and in the vicinity of I-710 to mitigate for air quality impacts

Noise Impacts

Noise exposure: Long term exposure to moderate levels of ambient noise can increase stress, hypertension, blood pressure, heart disease, sleep disturbance, hearing impairment, and, in children, can lead to learning delays.

Sources: Van Kempe EEMM, Cruise H, Oosthuizen HC, Amlin CB, Staten BAM, de Hollander AEM. (2002). The association between noise exposure and blood pressure and ischemic heart disease: A meta- analysis. Environmental Health Perspective 110:307-317.

Stansfield SA, Berglund, B, Clark C, Lopez-Barrio I, Fischer P, Airstream E, Haines MM, Head J, Hygge S, Kamp I, Berry BF, and RANCH study team. Aircraft and road traffic noise and children's cognition and health: a cross-national study. The Lancet, June 4-10,2005, Vol. 365 (9475): 1942-49

Stansfield S, Haines M, Brown B. (2000). Noise and health in the urban environment. Rev Environmental Health 15(1-2): 43-82

East Los Angeles is surrounded by four major freeways. Throughout the community noise is a problem. It disrupts sleep and makes it difficult for children to study at home. It also is a problem in East Los Angeles playgrounds. A comprehensive study on noise and the impacts it has on residents is needed for East Los Angeles.

L-31-52

If Design Options 3A/3B are built, the SR-60 interchange running adjacent to Burger Avenue will be elevated. The impacts of noise from the elevated structure to residents farther from the freeway was not adequately addressed in the RDEIR/SDEIS. The recommended sound walls do not eliminate the increased noise throughout the community from this project. 22-feet sound walls should be constructed. L-31-53

Additionally, some sound walls are not being built even though there are known increased noise levels. All sound walls studied should be built, including sound wall SW 519. L-31-54

Because there are probable future expansion plans on the I-5 freeway and possible expansion plans on the SR-60 and a planned Gold Line extension as well as the cumulative impacts from previous freeway projects through East Los Angeles all sound walls considered should be built at the maximum height to provide protection to residents from the considerable noise impacts. This includes Sound wall SW 519. L-31-55

Alternative 5C

The recommended height at the following Sound walls will not completely eliminate the increased noise for the following:

SW516 and 517: (NB Olympic to Humphreys)
The increase will be 12 d BA: A 16-ft. wall will reduce sound by 10 dBA

SW 518: (Near McD, immediately South of Cemetery)
The increase will be 8 dBA A 14-ft. wall will reduce the sound by 1 dBA
A 16-ft. wall will reduce the sound by 2 dBA

An overall study of the sound levels and noise pollution in the entire East Los Angeles community should be completed to ensure that overall sound levels in the East Los Angeles community do not increase. Current noise pollution from the I-710 should be reduced or not be increased by the project that is selected. L-31-56

Sound walls must be provided if they reduce the sound level even if the reduction is not to acceptable levels. If the sound walls do not decrease the noise to acceptable levels the noise pollution must be reduced by other means such as taller or better sound walls, landscaping, quieter road materials, soundproofing and retrofitting of all dwellings affected including but not limited to: schools, homes, public buildings, Churches and businesses.

Additionally, SW 519 (SB between Whittier BL and Humphreys) should be built. L-31-57

No sound wall is recommended for SW 518. A sound wall should be built as a jogging track which is a sensitive use will be built around the Calvary Cemetery later this year. Note: Under 5C ELA Option, the wall will be built to protect 13 receivers. It appears this is the same location. Why the variance? L-31-58

Alternative 5C, Design Option 3A

SW 516, 516A, 516B, 517: (NB Olympic to Humphreys)
The increase will be 14 dBA — A 14-ft. wall will reduce the sound by 9 dBA
A 16-ft. wall will reduce the sound by 10 dB

L-31-59

The 16-foot sound wall would provide protection to 151 homes vs 142 provided by the 14-ft. wall. This location is near Ford Elementary School. The taller 16-foot wall is requested, if a 22-ft. wall cannot be built. Students must be protected from noise.

SW 519 & 520: (SB Whittier to Humphreys)
The increase will be 11 dBA — A 14-ft. wall will reduce the sound by 8 dBA
A 16-ft. wall will reduce the sound by 8 dBA

L-31-60

The 16-foot wall is preferred if a 22-ft. wall cannot be built.

Alternative 7

SW 716 and 717
The increase will be 13 dBA — A 16-ft. wall will reduce the sound by 9 dBA

SW 718: (Near McD South of Cemetery)
The increase will be 8 dBA — A 14-ft. wall will reduce the sound by 1 dBA
A 16-ft. wall will reduce the sound by 2 Dba

L-31-61

No sound wall is recommended for SW 718. A sound wall should be built as a jogging track, which is a sensitive use, will be built around the Calvary Cemetery later this year. Note: Under 5C ELA Option, the wall will be built to protect 13 receivers. It appears this is the same location. Why the variance?

SW 719
The increase will be 10 dBA — A 14-ft. wall will reduce the sound by 1 dBA
A 16-ft. wall will reduce the sound by 1 dBA

According to the Noise Abatement Decision Report, "The Protocol establishes a process for assessing the reasonableness and feasibility of noise abatement. Before publication of the draft environmental document, a preliminary noise abatement decision is made. The preliminary noise abatement decision is based on the feasibility of evaluated abatement and the preliminary reasonableness determination. Noise abatement is considered to be acoustically feasible if it provides noise reduction of at least 5 dBA at receivers subject to noise impacts."

L-31-62

Caltrans' noise reduction design goal is that a barrier must be predicted to provide at least 7 dBA of noise reduction at one or more benefited receptors. It is unacceptable that Caltrans is demanding noise reductions greater than provided by the protocol in order to build a soundwall

For Alternative 5C - SW518 and Alternative 7 – SW718, the sound walls although meeting the protocol of 6d BA claim only one residence would benefit. Yet with the ELA Design option it is recommended as providing relief to 12 residences with 5 d BA. L-31-63

Sound wall SW-719 should be built. It benefits the sleeping quarters of Los Angeles County Firefighters. These firefighters provide an essential service and require undisturbed sleep. L-31-64

If a project is built and it's determined that a sound wall alone is not sufficient to mitigate the noise impact to equal or below than "No Built" conditions, then a combination of sound wall and property noise abatement measures should be implemented, including sound proofing for classrooms, homes, businesses and other community centers. Special consideration should be given to the sensitive receptors adjacent to the freeway: L-31-65

Ford elementary school (1112 S Ford Blvd)
Humphreys Avenue Elementary School (500 S Humphreys Ave)
Marianna Avenue Elementary School (4215 Gleason St)
Alphonso B. Perez Special Education Center (Michigan Ave at Ford Blvd)
Brooklyn Avenue Elementary School (4620 East Cesar E Chavez Avenue)
Hilda L. Solis Learning Academy (319 N Humphreys Ave)
Eastman Avenue Elementary School (4112 E Olympic Blvd)
Winter Gardens Elementary School (1277 Clelia Ave)
Rowan Avenue Elementary School (600 S Rowan Ave)
KIIP Alumina Academy (4800 East Cesar E Chavez Avenue)
Morris K. Hamasaki Elementary School (4865 E 1st St)
Belvedere Elementary School (3724 E 1st St)
Centro Estrella (4701 East Cesar E Chavez Avenue)
New Green Dot School to be built on Humphreys and Cesar Chavez
Daycare Center across from Eastman Elementary School
MAOF Daycare Center at 330 S. Ford Blvd
All Daycare centers adjacent to the I-710 freeway
All the Home Based Daycare Centers adjacent to the I-710 freeway (for example 417 S. Humphreys Avenue)

Proposed new sound walls in East LA will introduce patch work of mix match walls that would negatively impact the esthetics in the community. Existing sound walls should be retrofitted in-kind to match new walls. All sound walls through East LA should be of same height, color, texture and design. L-31-66

Proposed replacement sound wall on east side of the freeway near Humphreys Avenue, should be extended more to the north to minimize noise to Humphreys Avenue Elementary School. L-31-67

Parking Impacts

Both Build Alternatives include proposed peak hour parking restrictions along four arterial roadways, two of these through East LA; Atlantic Blvd between Pacific Coast Hwy and SR-60; and Cherry Ave/Garfield Ave between Pacific Coast Hwy and SR-60. While proposed parking-restrictions predict a 17% capacity improvement throughout the entire area, these restrictions will have a negative economic impact to local businesses in East Los Angeles which depend on-street parking availability for their patrons. It's our understanding that this proposal is one of several programmatic elements included in the Recirculated Draft Environmental Impact Report and that it will not be implemented by Caltrans as the Lead Agency of the I-710 Corridor Project. It would be up to local jurisdictions, in this case the County, to approve the proposed parking restrictions.

The parking study does not match the experience of anyone who lives in East Los Angeles. A frequent concern of residents throughout East Los Angele is that there is not enough parking. Businesses rely on on-street parking on Atlantic Blvd. for their customers. The majority of businesses traffic is during peak pm rush hour. Limiting parking during these hours would destroy these businesses. L-31-68

Members of our I-710 Local Advisory Committee have discussed parking restrictions with business owners on Atlantic which were also proposed during the SR 710 project North. Business owners where alarmed that parking might be restricted. Additionally, parishioners from St. Alphonsus were also alarmed as they use parking for services. Kipp Raices Academy located at 668 S Atlantic Blvdalso depends on street parking during morning and afternoon pickup.

In evening hours during peak traffic times is when the hunt for parking on residential streets begins. Restricting parking on Atlantic would create a nightmare for residents who live adjacent to Atlantic Blvd.

The project must replace the loss of on-street parking spaces at one to one ratio, either in the form of project build parking structures or financial contribution to the local jurisdictions topursue these. if parking were to be restricted

This committee is opposed to removing parking on Atlantic Blvd during peak hours.

Transit Projects

Both Build Alternatives include proposed Transit Improvements as one of several programmatic elements included in the Recirculated Draft Environmental Impact Report to be implemented by Metro. Only zero emission buses should be used if a Bus Rapid Transit line is implemented through East Los Angeles. This is not addressed adequately in the RDEIR/SDEIS. Pollution in East Los Angeles is a problem that causes significant health problems to residents. L-31-69

Visual Impacts

The Visual Impact Assessment states:

East Los Angeles – County of Los Angeles' General Plan 2008 Draft. East Los Angeles is an unincorporated area of Los Angeles County and therefore does not have its own General Plan. This area is governed by the laws and policies stated above in the discussion of the County of Los Angeles.

Then under County of Los Angeles the following is indicated:

County of Los Angeles – General Plan 2008 Draft. While the County of Los Angeles has three State designated Scenic Highways and eight County designated Scenic Highways, none are within the I-710 Corridor Project's viewshed. Los Angeles County recognizes the need to preserve and protect its visual and scenic resources and has adopted the following policies:

- Identify and protect scenic resources,
- Identify and protect the County's scenic highways, corridors, and routes,
- Manage development in hillside areas to protect their natural and scenic character, and
- Reduce light trespass and light pollution.

However, the County General Plan was adopted in Oct 2015 so the EIR Should not reference 2008 draft General Plan. East LA –Land use is under General Plan and also under specific plans such as

- East Los Angeles Community Plan
- East Los Angeles 3rd Street Plan
- East Los Angeles Form Based Specific Plan

L-31-70

The above plans can be located at: http://planning.lacounty.gov/plans/adopted

The visual impacts from Design Options 3A/3B are significant and unacceptable. The elevated SR-60 will loom over residents. It will change the way East Los Angeles residents feel about their community. It will become the predominant view for residents on Burger. Proposed Design Options 3A/3B should be rejected

L-31-71

The Visual Impact Assessment of East Los Angeles Options 3A/3B is flawed. The visual impact assessment does not properly assess East Los Angeles. It fails because it does not properly consider the Community Impact Assessment for East Los Angeles. East Los Angeles residents are very transit dependent – 42.6 percent, contains a large number of children compared to the rest of the county and a large senior population. Children play outside their homes. Seniors take walks and work in their gardens. Homes in East Los Angeles are largely not air-conditioned so many residents in East Los Angeles spend a great deal of time during hot periods outside their homes in their yards.

L-31-72

Key View 23 (Re Duncan In East Los Angeles)

From the diagrams and description for this view, we are unable to determine the visual impacts to residents and businesses in East Los Angeles from this structure. The assessment is deficient in this regard. However, if the structure is elevated, we believe there will be negative impacts to the residents and businesses. Mitigation for these residents and businesses would be needed if a build alternative is chosen L-31-73

Key View 24 (Burger Avenue)

The Visual Impact Assessment of East Los Angeles Options 3A/3B for Key View 24 is flawed. The failure to consider the population of East Los Angeles as indicated in the Community Impact Assessment and as indicated above is a major flaw. The analysis for Key View 24 fails to not that the majority of this location is close to Humphreys Elementary School. Because the school is so close to this location, children and their parents walk to the school at least twice a day. Under Key View 24, it states:

The most impacted viewers at this location are residents and passing motorists. Residents could be seeing the view multiple times per day as they leave and return to their homes. The duration of the view would depend upon each viewer's activity and the duration could range from a few seconds to a several hours. The overall viewer response at this location is moderately high. L-31-74

We disagree with this analysis. The Viewer Response at this location will be High (4) or Very High (5). There is no one who will only be impacted a few seconds. Even a senior who is a shut-in will be able to see the view from their windows. The view will dominate the neighborhood on Burger Avenue. Many residents will see the structure from their living room windows. For many it will be the first thing visible when they open their front doors. It will tower over resident's heads. Residents spend a great deal of time out of doors. Children play outside. The residents on Humphreys who live in two story apartments and condos will also be impact as will be residents across the freeway on Sydney. Instead of seeing the school they will see a towering concrete structure.

Additionally, we disagree with Dominance rating under Visual Character. Dominance is defined as "position, size or contrast." The rating is listed as (2). Moderately low change in visual attributes. Because of its new closer proximity to homes on Burger and its dominance in towering over the residences we believe the rating should be (5) High Level of change in visual attributes. L-31-75

Similarly, we disagree with Scale defined as "apparent size as it relates to the surroundings." The rating is listed as (4) – Moderately high change in visual attributes. We believe the correct rating should be "Very High (5) – High level of change in visual attributes." L-31-76

These changes to dominance and scale would make the correct average Visual Character Change (VCC) for East Los Angeles Design Options 3A/3B a 3.0. L-31-77

We believe the proposed visual quality for Options 3A/3B would be 5.0 and the Visual Quality Change would be 2.3. L-31-78

For the foregoing reasons we believe, the correct Resource Change would be 2.65 instead of 1.9 for Options 3A/3B. L-31-79

Additionally, we disagree with the Viewer Response assessments for Option 3A/3B. We believe that the Location is incorrect. The structure to be built on Burger Avenue will loom over residents and will become the predominant structure. Residents may even fear that the structure will fall on them during an earthquake. Yet for Location: "Relates to position of the viewer in relationship to the object being viewed. The closer the object, the more exposure" the rating is 5.0. We feel a more accurate assessment should be a 7 – Very high response from viewers based on very high viewer exposure and very high viewer sensitivity." Additionally, we believe the Quantity rating is also incorrect. Burger Avenue has a few single family residences between Whittier Blvd and Humphreys Avenue and many apartment buildings with high density. Because of the number of apartment buildings and the proximity the Humphreys Avenue elementary school and other reasons previously mentioned we believe that the quantity rating should be 7. Finally, in regards to the duration rating, "How long a viewer is able to keep an object in view." Again, we believe this should be a 7, unless of course you count when the residents close their eyes to go to sleep. Therefore, the viewer exposure average should be 7. We don't understand Viewer Sensitivity. Nonetheless, going with the given number for viewer sensitivity and using the correct number for viewer exposure the viewer response numerical rating KV 24 should be 6.25. L-31-80 L-31-81 L-31-82 L-31-83

Using our numbers for KV Option 3A/3B, we believe that the resulting Visual Impact score should be 2.65 + 6.25 = 8.9/2 = 4.45. While we agree with part of the statement for Key View 24, Resulting Visual Impact:

"The elevated roadway and soundwall under Design Option 3A/B would introduce a large mass of concrete that would drastically change the existing view within this area."

We disagree with the conclusion: L-31-84

"However, the proposed design and form of the elevated structure blends in with the existing linear form of the street. The overall visual impact for Design Option 3A/B would be moderate (3.5), and would require a moderate level of visual mitigation."

We conclude that the Overall Visual Impact for Design Option 3A/3B would be drastic and that if it were to be built it would require tremendous visual mitigation or the highest available mitigation.

Further, it is not clear from the maps if this design will impact Burger Avenue between Whittier and Mines. L-31-85

Key View 25 (Sydney Drive)

Sydney Drive at this location consists of mostly single family homes on the west side of the street. The homes will directly face the wall. The new predominant structure on the street. We believe the dominance rating should be 4 making the VCC 2.625 and the Resource Change 1.8 for Design Option 3A/3B. L-31-86

We disagree with the Viewer Response rating. We believe the quantity rating under viewer exposure is incorrect. Residents looking out their windows will see the dominating freeway wall. Many residents have front porches where they sit during the warm days that are much more frequent these days. There are many children in the neighborhood who spend afternoons outside. Parents walk their children to Humphreys Avenue Elementary School. This is a highly transit dependent neighborhood where many people walk to buses and the Gold Line. Teens walk to Griffith and Garfield or take the Gold Line. College students take the Gold Line from Third Street. Seniors garden and take walks. The correct quantity rating should be 6.0. This would make the Viewer exposure average 5.7. As indicated we don't understand the Viewer Sensitivity rating. The Overall, the Viewer Response average should be 5.6.
The overall visual impact should be at least 3.7 for Option 3A/3B. L-31-87

If Option 3A/3B is built we believe that extensive visual mitigation should be provided. L-31-88

Conclusion Both Views

Therefore, in conclusion we believe that the Visual Impact Assessment is flawed for all the reasons previously stated. Additionally, the method used for reviewing the visual changes is confusing and is difficult for a layperson to understand. Additionally the Visual Impact Assessment is a confusing mess in regards to East Los Angeles Key Views 24 and 25. The section states: "Under Alternatives 5C/7, there would be a new soundwall/retaining wall in closer proximity to the viewers, but it would be very similar to form and size to the existing soundwall." Yet, Table 8.1 and 8.2 inexplicably list different values for each. Apparently, the values for Alternative 7 are actually the values for East Los Angeles Design Options 3A/3B. The Visual Impact Assessment is deficient. L-31-89

We note that Table 8.2 lists Key View 24 in East Los Angeles as having the highest Visual Impact Evaluation Score in the entire corridor. Once again, East Los Angeles an environmental justice community is faced with the worst impact in the entire corridor. L-31-90

Traffic Impacts

Design Options 3A and 3B aim to further improve safety and operation of the freeway by reducing weaving conflicts between the I-5 and SR-60. To achieve the objective, the variation would reconfigure the SR-60, I-5, and Olympic Blvd. interchanges, and alter the freeway and local traffic circulation in East LA. However, the Traffic Study shows L-31-91

this segment of the freeway will continue to operate at Level of Service F during peak hours with these design options, therefore offering no real benefit to East Los Angeles Community.

L-31-91

Although both Build Alternatives, which include additional capacity improvements to the footprints of the I-710, are predicted to improve traffic conditions throughout most of the alignment, neither of these will improve the Level of Service in the mainline section between the I-5 and the SR-60. The additional lanes on the freeway will lead to longer bottlenecks of traffic between the I-5 and its terminus near Valley Boulevard, resulting on spillovers onto local arterials. While the traffic study evaluated the impacts to intersections immediately adjacent to the freeway, it did not examine the effects of spillovers and the capacity of the main arterials in the area. The traffic study only included 4 counting stations in East LA, 3 along Whittier Blvd and 1 on Atlantic Blvd, to determine Daily Traffic Volumes. We feel that 4 segments are not acceptable to capture traffic volumes in this community, which is centered between four freeways. The project should include a comprehensive traffic study of East LA to identify the effects of spillovers, bottlenecks, and incident response on the freeway. The study should include all intersections along all main arterials including the following:

First Street, from Indiana Street to Vancouver Avenue
Cesar Chavez Avenue from Indiana Street to Vancouver Avenue
Eastern Avenue from Medford Avenue to Telegraph Rd
Ford Blvd from Floral Drive to Telegraph Road
Olympic Blvd from Indiana Street to Montebello Blvd
3rd Street from Indiana Street to Pomona Blvd
Whittier Blvd from Indiana Street to Garfield Ave
Atlantic Blvd from SR-60 to Telegraph Road

L-31-92

The current alternatives and options introduced by Caltrans provide no real traffic relief within East Los Angeles either on the freeway or on its streets. East Los Angeles streets are currently used as cross through roadways by commuters from other jurisdictions which causes pollution and congestion within East Los Angeles. During peak hours traffic spills over from the freeways to East Los Angeles streets causing traffic delays bringing pollution and misery to East Los Angeles residents. Alternatives 5c and 7 do not improve this situation in East Los Angeles. Options 3A and 3B likewise do not improve traffic within East Los Angeles. We suggest that the current RDEIR/SDEIS be withdrawn and that other better alternatives and options be introduced which more fully incorporate Motion 22.1 and which study Community Alternative 7.

Both Build Alternatives include an I-710 Congestion Relief Program that would provide funding to local jurisdictions for traffic signal upgrades and coordination, safety improvements, traffic calming measures, and intersection improvements on the arterial street system in the Study Area. Given that under both Build Alternatives the capacity improvements to the footprints of the I-710 end south of the I-5, and bottlenecks are expected during peak hours on I-710 between I-5 and its terminus at Valley Boulevard,

L-31-93

the program should also consider including Green Scape Projects to help alleviate for air quality impacts, Pavement Rehabilitation Improvement Projects to help local jurisdictions paid for maintenance of roads adjacent to the freeway and used as cut-thought when freeway gets congested. L-31-93

Increasing capacity on the freeway does not reduce congestion on roadways. The adage "if you build it they will come" has been studied and it has been found that if you increase capacity by 10 percent driving then increases by 10 percent. See Duranton and Turner: *Duranton, Gilles, and Matthew A. Turner. 2011. "The Fundamental Law of Road Congestion: Evidence from US Cities." American Economic Review, 101(6): 2616-52.*

L-31-94

Additionally, both truck and vehicle traffic through East Los Angeles for both Alternatives increases with the increased capacity. The Vehicle Miles Traveled through East Los Angeles increases over the no build alternatives. This increased traffic will bring more pollution and noise to the community. The anticipated Levels of Service on the I-710 through East Los Angeles show that the increased capacity merely fills up the freeway providing no benefit to East Los Angeles. This is not acceptable.

Table 6. 2035 Alternative 7 Annual Average Daily Traffic Volumes
I-710 Corridor Project
Los Angeles County, California

Based on Post-Processed Traffic Data

I-710 Freeway Segment Description	AADT Volumes[2,3]					Increase in AADT Volumes[2] as Compared to 2035 Alternative 1[4]

Atlantic On to Florence Off	134,251	21,973	4,345	20%	16%	20,621	2,695

The closure of the 3rd Street Exit South as a way of reducing cross through traffic exiting on the residential streets of East Los Angeles should be studied. L-31-95

Design Options 3A/3B include widening of Eastern Avenue, Humphreys Avenue and Eagle Street. Proposed widening will make it more dangerous for pedestrians. The cars speeding off the freeway will be closer to the pedestrians and to homes. Cars coming off the freeway have hit parked vehicles, fences, and bicyclists. The last accident on Eagle St. earlier this year came within inches of hitting the fence of a home. It took out the US Mail box near the corner of Eagle and Humphreys. L-31-96

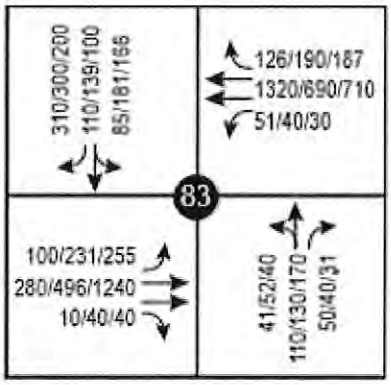
There is no sufficient room on Eagle at the condominiums to widen the street. The sidewalk is only 5.5 feet on both sides. A resident in the condo unit uses a wheel chair. There are also other residents who live in the neighborhood who use wheel chairs. The street sidewalk needs to be fully in ADA compliance.

A jogging path is due to be constructed around Calvary Cemetery which has its eastern border on Eastern Avenue. This increased traffic will conflict with the community's use of the jogging path. Widening will make it dangerous for joggers. A traffic signal should be installed at Eastern and Eagle to increase safety. L-31-97

Additionally, a small park is currently being considered for the Los Angeles County property located at Eagle on the northern intersection at Sydney Drive. L-31-98

Vehicles coming off the SR 60 Pomona Freeway will be able to exit on the new Whittier Blvd. exit but traffic from the I-710 mainline will not. Therefore, vehicles searching for L-31-99

an exit will use the 3rd Street exit increasing traffic and cross-through traffic through a residential neighborhood. L-31-99



Further, we are concerned that errors were made in analyzing truck volumes. There was a failure to consider induced demand methodologies. Additionally, there is a failure to correctly evaluate the impact of transloading thereby underestimating truck volumes on the I-710 freeway. L-31-100

Comments: Mitigation Measures Intersection Impact Analysis

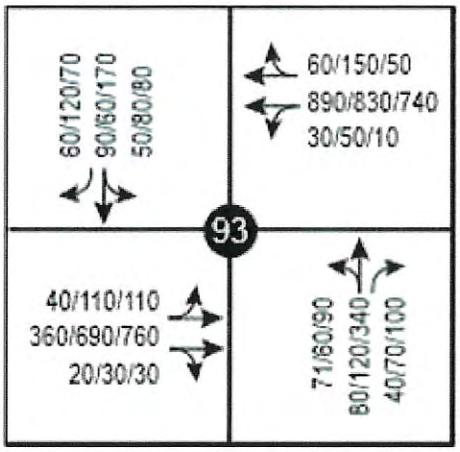
Intersection 83, Indiana and Olympic: According to the formula used mitigation is needed for Intersection 83. With Alternative 7, the delay for midday peak is expected to increase from 177.6 seconds to 293 seconds. It is suggested that adding a left-turn lane and a shared through/right-turn lane for North and Southbound approaches, delay will improve from 293 seconds to 30 seconds. This improvement seems a bit optimistic. The mid day peak volumes for southbound traffic left turning traffic is 180 vehicles, for vehicles going forward or turning right it is 439. The mid day peak volumes for Northbound left turning vehicles is much smaller only 52, whereas the right and forward bound vehicles total 170. Will having a separate left turn lane here slow traffic? This area has a lot of pedestrian traffic. L-31-101

Additionally, it seems that the majority of the mid day volume is not North and South bound but East and West bound. So are the delays due to North and Southbound traffic (Total Volume 842) or from East/West Volume (1687)? L-31-102

Finally, it appears that many of the vehicles are already going left and straight at the same time when a vehicle is making a left. Will having the left hand turn actually delay traffic? Since cars waiting to turn right when a pedestrian is crossing will block forward moving traffic which will no longer be able to go around the vehicle because they can't use the left hand lane. L-31-103

7.2 2035 Alternative 7 Mitigation Measures

Thirty (30) study intersections have been identified to be significantly impacted under Alternative 7 considering any of the three peak-hours analyzed. All impacted intersections identified under Alternative 7 have been analyzed to determine mitigation measures to improve intersection operations and delay back to the 2035 No Build (Alternative 1) conditions, which are presented below and summarized in **Table 7-8**.



- Indiana St/ Olympic Blvd (#83): Convert both the NB and SB approaches to provide a separate left-turn lane and a shared through/right-turn lane.

Intersection 93, Ford and Whittier: According to the formula used mitigation is needed. Delay for AM-Peak is expected to increase from 49.9 seconds to 64.8 seconds. Delay for Mid-Day Peak is expected to increase from 49.4 seconds to 65.6 seconds, and delay for PM-Peak is expected to decrease from 212.2 seconds to 35.8 seconds. Again, the same mitigation of having a left turn lane and a shared forward right-hand turn lane is provided with astounding results which improve the delays for all peak periods to under 19.5 seconds. The LOS is expected to go from DDF to BBB.

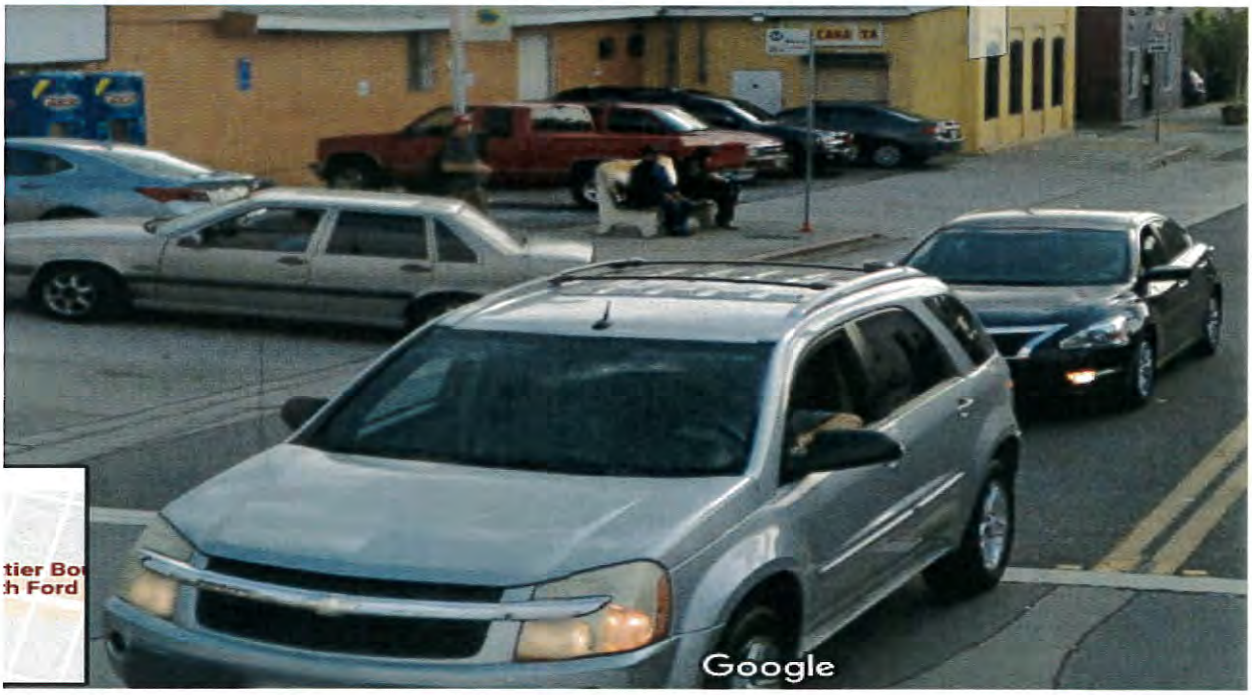
L-31-104

- Ford Blvd/ Whittier Blvd (#93): Convert both the NB and SB approaches to provide a separate left-turn lane and a shared through/right-turn lane.

Northbound on Ford Blvd. at Whittier.

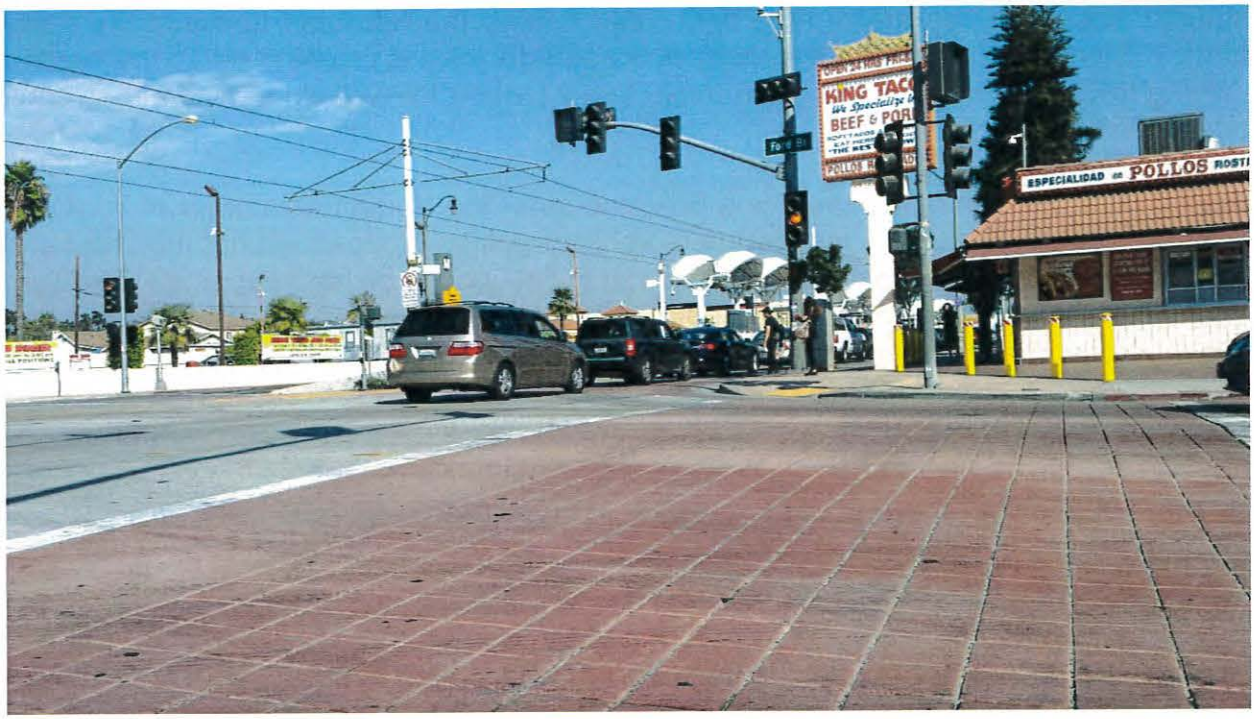
Southbound on Ford Bl. At Whittier.

Southbound on Ford at Whittier



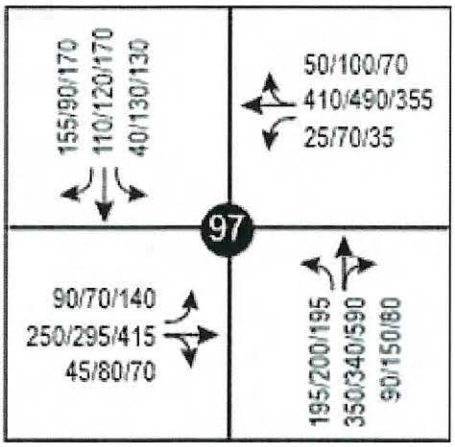
This area is a business district with a lot of pedestrian traffic. Will having a separate left turn lane here slow traffic? As can be seen in the previous photo, traffic can proceed

L-31-104



straight when vehicles are turning right. Will having the left hand turn actually delay traffic? Since cars waiting to turn right when a pedestrian is crossing will block forward moving traffic which will no longer be able to go around the vehicle because they can't use the left hand lane. L-31-104

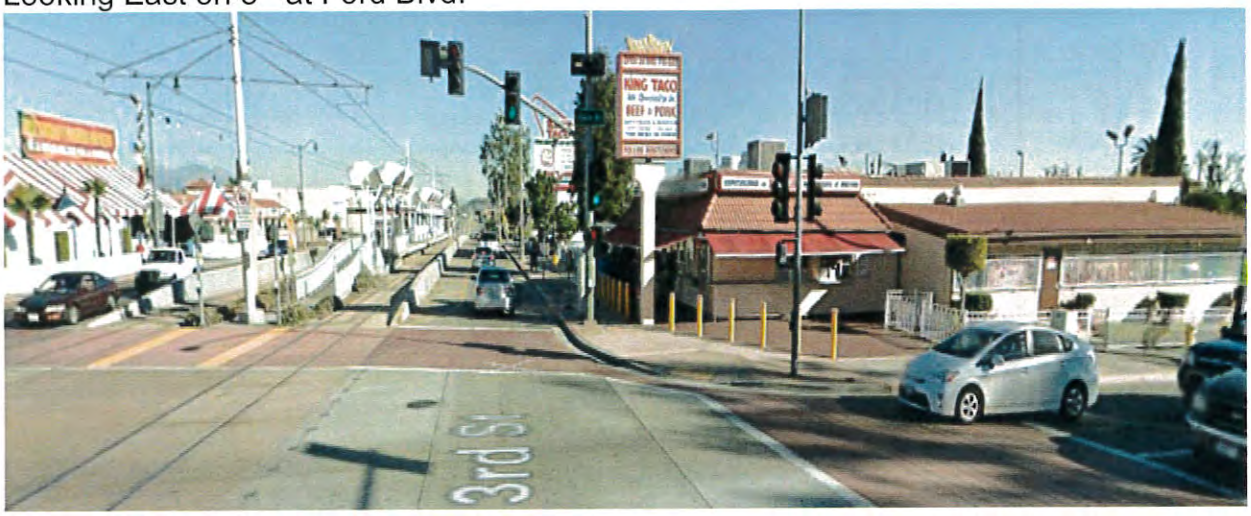
Additionally, as seen below there is a Bus stop near the South East corner of Ford and Whittier. So when a bus is stopped here vehicles will be stopped even if the Left hand turn lane is empty. If Bus lane is moved what would be the impacts? As with intersection 83, the majority of the traffic is East/West bound. So it is questionable if this mitigation measure really make that much of a difference. L-31-105 L-31-106



Intersection 97, Ford and 3rd: Mitigation is required because delay for Midday Peak is expected to increase from 44.8 to 64 seconds. This is a busy intersection with lots of pedestrians who access both buses and the Gold Line.

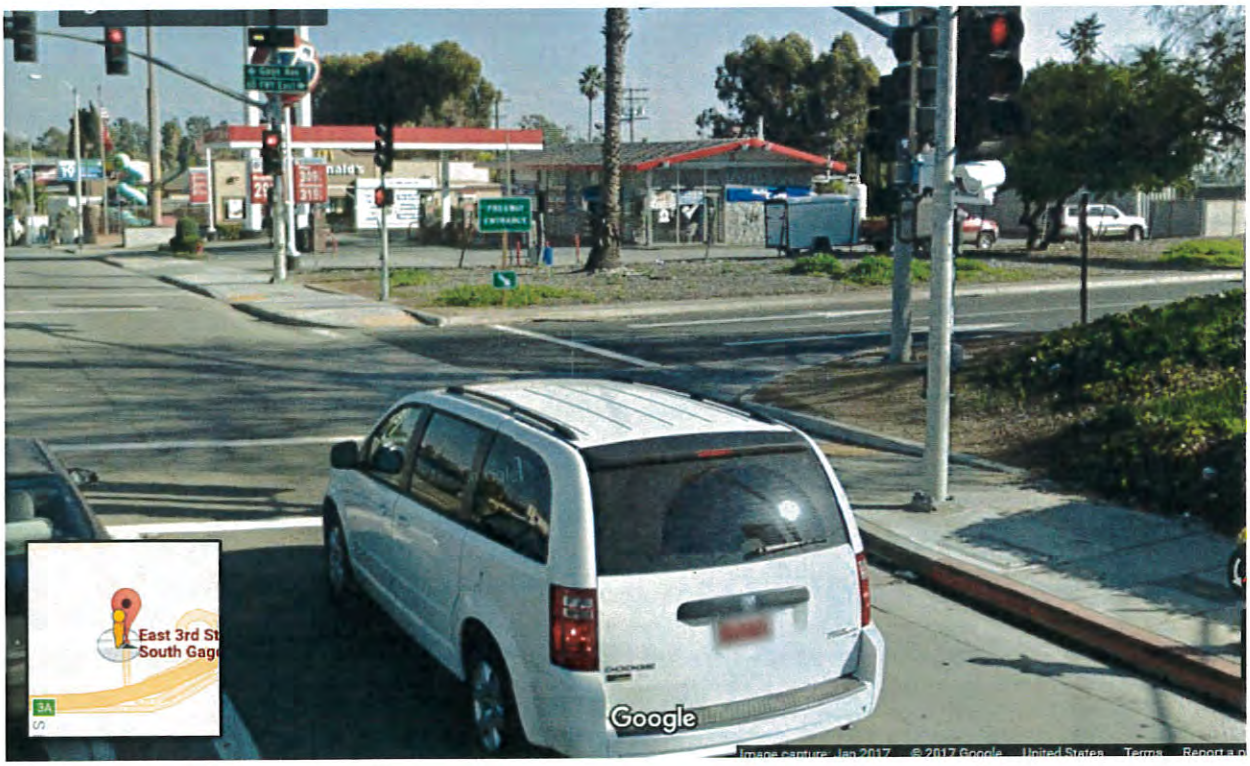
It does not appear there is sufficient space to add a right-turn lane without moving the center lane over to the other side. Additionally, if a right-turn lane was added would it help since 3rd Street is frequently packed with vehicles? Frequently traffic on Third Street backs up into the middle of the street. See photo below taken in October 2017 at 2:49 p.m. L-31-107

October 18, 2017 at 2:48 p.m. below: Third Street between Humphreys and Ford Bl.



- Ford Blvd/ 3rd St (#97): Add a separate right-turn lane on the NB approach

Looking South on Ford at 3rd Street



Looking East on 3rd at Ford Blvd.

Intersection 180, 3rd and Gage: According to the formula mitigation is needed because delay for AM peak is expected to increase from 34.6 to 57 seconds. (Grade C to E). For some reason, this intersection is listed as County instead of ELA (Unincorp). It would be nice if the designation was consistent. This is a part of ELA (Unincorp). L-31-108

See photos below: It does not appear that there is sufficient space to add a right-turn on Gage going westbound? The acquisition of property at the South/East corner of Gage is not indicated in the Acquisitions report. L-31-109

A separate right-turn lane onto the Pomona SR 60 is a good idea if Caltrans Right of way is used and sufficient sidewalk space exists to accommodate ADA pedestrians.

The Project Should Aim At Reducing Usage Of Freeway Rather Than Increasing Capacity. The Following Suggestions In Line With Motion 22.1, Encourage The Use Of Public Transportation Along The I-710 Corridor:

Incentives To Employers To Reduce Use Of The I-710

Offer incentives to Employers to offer free public transportation to employees who use the I-710 freeway including but not limited to free bus passes/metro passes.

Offer incentives to Employers to allow employees to arrive at work 10 minutes late and leave work 10 minutes early if they use public transportation.

Allow employers to sign up for a zip car like program for employees to use if there is a family emergency.

Offer incentives to employers of large companies to allow their employees to more easily transfer to locations near their work. (For example: Vons supermarket employees who live in East Los Angeles but work in Long Beach would be allowed to transfer closer more easily by putting in a request with the headquarters rather than with their store manager.) L-31-110

Offer incentives to large employers who offer flexible hours allowing their employees to commute during non-peak traffic hours. The incentives could range from bragging rights such as listing them as traffic reduction champion to providing tax incentives for any costs associated with their program.

Incentives for telecommuting.

Transportation Programs

Initiate 1st mile last mile programs all along the corridor to get public transportation commuters to their destinations.

Implement a real time Uber/Lyft like carpooling program for people to use to commute to work. In this type of program there would be no payment for the ride only for the transportation cost associated with the drive (i.e. insurance, vehicle wear and tear, gas). This way the program would not hurt taxi and UBER/Drivers. The program would do background checks for participants to ensure that sexual predators and bad drivers cannot participate. L-31-111

Offer substantially reduced cost bus passes to people who currently use the I-710.

Implement an aggressive program which would identify older large vehicles driving along the I-710 freeway and offer them a program like "replace your ride" to replace the vehicles with cleaner smaller models. Smaller vehicles take up less space on the roadway and pollute less.

http://www.replaceyourride.com/
http://www.aqmd.gov/home/library/public-information/2015-news-archives/replaceyourridepr

L-31-111

Construction Impacts

Sufficient information is not given to determine the extent of the construction impacts. The Recirculated Draft EIR/SDEIS is deficient in analyzing the impacts of the project to residents during construction. If Design Options 3A/3B are chosen, it is anticipated the noise and pollution impacts to East Los Angeles residents will be considerable. During past projects, the lights and noise effected residents' ability to sleep at night. Will the noise be above 70 dBa? Will residents experience hearing loss from sustained noise over a long period? The noise and pollution will substantially impact the health of residents. Many residents live less than 30 feet from the proposed construction areas.

L-31-112

If any project is built the construction impacts from air pollution and noise pollution must be mitigated.

Lead in soil will be kicked up during construction. This has not been adequately addressed in the Health Risk Assessment. Lead testing of areas where construction is to occur should be tested. East Los Angeles has been contaminated with lead from Exide. The impacts of lead in the soil around construction areas to East Los Angeles residents has not been adequately studied. The extent of lead contamination in the soil to the residents north of Whittier Blvd adjacent to the I-710 is not fully known. Exide testing was limited to properties south of Whittier Blvd. CHP prior to the closure of Exide had cited trucks dripping battery acid. Because of the proximity to the Exide facilities and the I-710 there could be lead contamination on properties adjacent to the freeway.

L-31-113

It is also a concern that during construction, the Los Angeles County Fire Department's ability to enter and exit its facilities may be obstructed. It does not appear that an adequate study has been made of how to deal with this. What if a natural disaster to occur? Would the Fire Department be able exit its facilities? Seconds count in dealing with health emergencies. What is the plan to make certain that these precious seconds are not lost by construction delays?

L-31-114

Cumulative Impacts

CEQA Guidelines: Section 15130(a) requires that the EIR/EIS review and analyze the cumulative impacts of a project when the project's incremental effect is "cumulatively considerable," when the new projects incremental impacts together with those of past, current and probable future projects. The focus should be on the cumulative impacts which contribute to the current project. The EIR/EIS should discuss the cumulative impacts when the projects incremental contributions are "cumulatively considerable."

Each subsequent freeway project that adds capacity adds to the noise in East Los Angeles and contributes to the misery of East Los Angeles residents in having to live with it. Cumulatively, the four freeways that run through East Los Angeles have considerable impacts. It is anticipated that a new I-5 project will be in the works shortly. Additionally, in considering the Gold Line extension along the SR 60, Caltrans commented that they did not want the Gold Line project to interfere with Caltrans ability to expand the freeway in the future. This indicates that in the future Caltrans may expand the SR60. Caltrans must mitigate to the fullest extent possible all noise and air pollution impacts in East Los Angeles, because unmitigated impacts combined with possible and probable future and past projects cumulatively combine to produce significant impacts in East Los Angeles an environmental justice community. L-31-115

The 2017 Recirculated Draft EIR/EIS is deficient, flawed and has many errors. It should be withdrawn, redone and recirculated. East Los Angeles Option 3A/3B should not be included in the redrawn EIR/EIS. Motion 22.1 elements should be meaningfully included in the redrawn EIR/EIS. The taking of homes must be minimized to the greatest extent possible all along the corridor. Community Alternative 7 should be studied in the redrawn EIR/EIS. Input from the community of East Los Angeles should be received on any East Los Angeles options before including them in the EIR/EIS. L-31-116

Possible Gold line subway Construction on Atlantic: How would I-710 project combined with the Gold Line project would impact East Los Angeles traffic, pollution and noise is not meaningfully considered. How would this project impact the Gold Line Construction project? Would traffic numbers change? What are the cumulative impacts. What are the combined construction impacts? L-31-117

The Following Should Be Included In Any New Eir/Eis:

A comprehensive Health Impact Assessment for East Los Angeles must be conducted as a part of the EIR/EIS process to fully understand the impacts to the community. Given the fact that the air quality in East LA is projected would deteriorate under both project's alternatives compared to the No Build Alternative, it is imperative that the full impacts to the community be understood. L-31-118

A comprehensive traffic study of the community that incorporates features on transit development, ADA (Americans with Disabilities Act), complete streets, first and last mile, street scape, bike facilities including bike racks and bike share programs, improved crosswalks with lighting at uncontrolled crossings to improve access for bicyclists, pedestrians and transit users, thus decreasing freeway dependency. L-31-119

Suggested Community Improvements/Mitigation Measures

A Freeway Cap Design that includes air scrubbers through East LA, similar to the 101 Park Design in Downtown LA, should be study and perceived as an Alternative for this project. We believe this is viable alternative which will offer several benefits to our community, including more green areas, green belts, businesses, affordable housing, and best of all, less pollution. Capping the freeway will reconnect our community, which L-31-120

is currently divided in half by the I-710. This alternative could be explored as a P3 (Public Private Partnership) option. L-31-120

Identification of an alternative Freeway Freight Corridor, similar to Alameda Corridor, to keep trucks out of the freeway system is recommended. L-31-121

Community Health and Benefit Program

Both Build Alternatives include a Community Health and Benefit Program, which would make funding available to local jurisdictions, school districts, day care centers, community health providers, senior centers and other non-profit, to implement projects/outreach activities targeted towards improving air quality and public health within the Study Area. Given the fact that the air quality in East LA is projected would deteriorate under both project's alternatives compared to No-Built condition, the program shall also make this funding available to resident/business located within ½ mile distance from the freeway. L-31-122

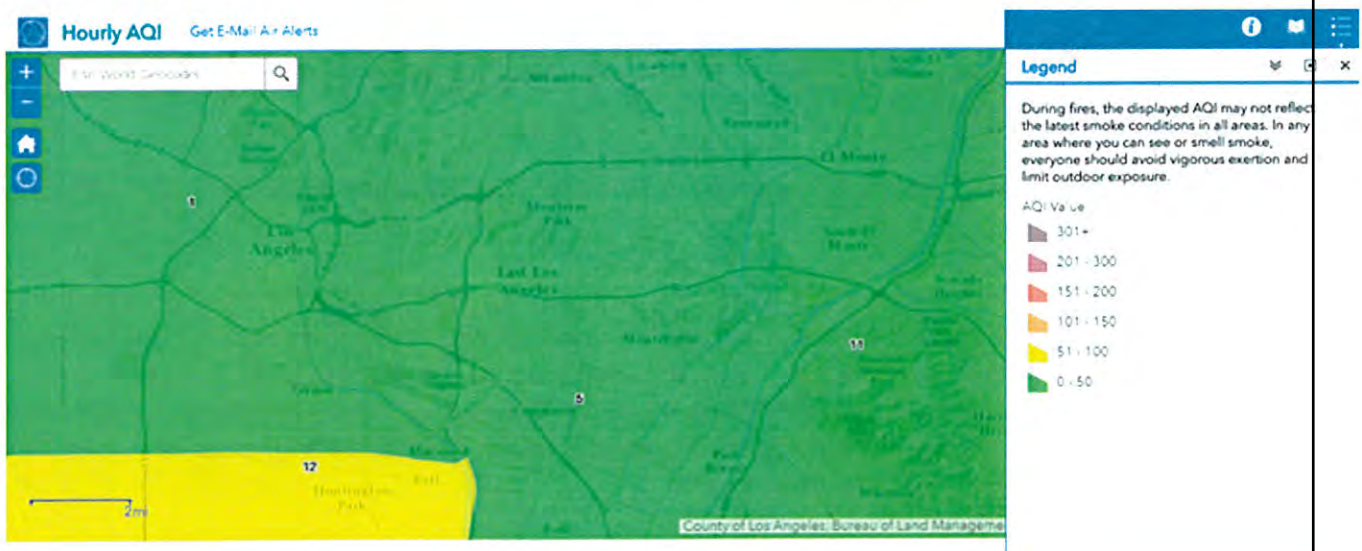
Given the fact that the air quality in East LA is projected would deteriorate under both project's alternatives compared to the No Build Alternative, it is imperative that the full impacts to the community be understood and mitigated, an ongoing Comprehensive Health Impact Assessment should continue. L-31-123

Given the fact that the air quality in East LA is projected would deteriorate under both project's alternatives compared to No-Built condition, we recommend the Community Benefit Program funds affordable Air Quality Monitors for residents in East LA.

The following mitigations and community benefits were suggested in a brainstorming session of the East Los Angeles Local Advisory Committee. We request that these components be included shall the project move forward:

- Brake, Tires, Pavement compliance standards to further reduce air quality impacts including regenerative brakes for trucks, pavement which reduces tire wear.
- Air conditioning units with air filter systems along all sensitive receptors. Proposed filtration system must include retrofitting of the building to provide adequate results. L-31-124
- Solar systems to assist property owners with additional electricity costs associated with running air conditioning units.
- Improved aesthetics including lighting/Landscaping/vegetation and water conservation projects on existing on/off ramps, freeway bridges, and adjacent Caltrans properties, (i.e. Pico Blvd & 10 fwy &210 Freeway at Euclid Av., Rancho Cucamonga)
- Fencing under freeway bridges to prevent homeless encampments.
- Placement of signage with contact information on all on/off ramps and other Caltrans properties along the freeway alignment so residents may report graffiti, illegal dumping, overgrown vegetation, trespassing, etc.
- Street Banners to promote local businesses and the community events.

- Street and pedestrian lighting (facing opposite side of freeway) to streets, sidewalks immediately adjacent to the freeway.
- Affordable Air Quality monitors at all schools within 1500 feet.
- Continuous 22-foot sound walls on both sides of freeway throughout East LA, retrofit existing walls in kind to match design, color and texture through East LA. There should be no gaps between sound walls.
- Community Benefit Programs to compensate residents and businesses for all impacts associated with proposed project during and after construction. Benefits in the form of business facade improvements, Medical Bills subsidies.
- Noise abatement measures to all properties affected by the project, including but not limited to double panel windows, sound blocking fences/green screens, sound absorbing acoustic panels, etc.
- Guarantee long term contracts for local employment.
- Local Employment Plan, Small Business Enterprise participation goals of 25% or more to stimulate community economy.
- Zero parking loss impact in East LA. If on-street parking is removed, project shall add park-ride ride structures to compensate for it.
- Pigeon prevention measures on freeway walls, overpasses, and along freeway.
- Install a signalized crosswalk at on Eastern Avenue at Eagle Street or on Eastern at 5th Streeto protect residents crossing the intersection to get to the jogging path. Many vehicles from the freeway use Eastern and Eagle.- Residents request a stop sign on bridge on Humphreys at 3rd Street South exit to protect children and residents from cars speeding off the freeway. County Public Works have determined that the bridge is Caltrans Right of Way Cars exiting the freeway do not have a clear field of vision when going straight or making a left off the 3rd St. exit south at Humphreys. L-31-124
- Study the benefits/impacts of closing I-710 3rd St Exit South at Humphreys & Eagle Street. Share results and receive input from the East Los Angeles Local Advisory Committee prior to including it in the EIR/EIS.
- Raised medians with trees and up lighting, sustainable plants on local arterials adjacent to the freeway, including Eastern Avenue and Atlantic Blvd to mitigate for pollution impacts.
- Weather Stations for Schools to provide more information (data points) to gauge pollution impacts.



Comments from East LA –Local Advisory Committee Member Ms. Martha Hernandez:

My name is Martha Hernandez, and I have been an advocate for better air quality in East Los Angeles since the 90's. I am the co-chair for the I-710 Expansion CAC for East Los Angeles. I have read your plans and proposals. I have been to several of your meetings and spoken with your engineers, consultants and representatives. I commend the work that many of you have done. However, within all these reports there is one key portion that is missing for my community. L-31-125

I had brought this up back in 2015 when Metro had plan to install another LTR. East Los Angeles does not, nor has it ever had air quality monitors installed within its boundaries. I had mentioned this prior to 2015 in previous meetings before 2000. After these meetings Metro had promised air quality monitors. However, in 2015, it came to my attention that the air quality data used to determine the air within East Los Angeles were, and are, coming from locations outside of East Los Angeles borders and even across another city. It was discovered there are only two air quality monitors near East Los Angeles based on the zip codes that make up of the area of unincorporated East LA. One is located on 1630 North Main Street, Los Angeles CA 90012, which is the Los Angeles-North Main Street air quality monitoring site. The other is located on 4144 San Gabriel River Pkwy., Pico Rivera CA 90660, which is the Pico Rivera #2 air quality monitoring site. This falls S San Gabriel for zip code 90022, while zip codes 90023 and 90063 falls under an air monitoring site located under Central LA CO. East LA do not have a monitor that reads the air quality at the center of the freeways and the heart of the East Los Angeles Interchange. Please see attached map (https://drive.google.com/open?id=16wLsjdBG-o4ML8wmvTxM3ZFbCqI&usp=sharing).

L-31-125

It is my belief that before any plans are made, a detailed study with data from air quality monitors located in East Los Angeles need to be added. For this to happen, we need these monitors installed with live data available on the arb.ca.gov and airnow.gov sites. I also believe there should be a study done on the impact of carbon emission to the residents in every street. It has recently come to my attention that Google Maps, A Sense of Aclima and the Environmental Defense Fund did such a map with the city of Oakland (https://blog.aclima.io/aclima-google-edf-map-air-quality-oakland-aad28c67859b). I have attached the article, as well as the link.

Many things that were found for Oakland are happening in East Los Angeles, and have been happening for many decades. There are higher rates of asthma and allergies. I had found a study being done of the impact of freeway emissions in pregnant women living near the freeways. The study was of pregnant women having autistic babies. Many were found to live near freeways during their pregnancy. The emissions have been linked to cancer and heart disease. There are many other diseases that have yet to be discovered. If this can impact those of us in the now, what of those yet to be born who will carry the mutated DNA. We need to stop the bleeding before we can clean the wound, and this cannot be done without all data.

I also believe that East Los Angeles not only needs monitors, but air filters integrated within the sound walls of the freeways, as well as homes in the surrounding area. Air conditioners should be placed in every home impacted by the freeway emissions with an updated electrical system to sustain it. It would be ideal if the state and/or city would sponsor a contest to create solar-powered, low-energy air conditioners that can easily be connected to the electric grid. This will reduce the use of energy during summer months, but also the cost to residents. These air conditioners will then be given to residents within a 7-mile radius at no cost to them. L-31-125

Seeing that East LA has already been greatly affected by the pollutants from the freeways, money should also be invested in creating free clinics within a 7-mile radius of the freeways for those with medical needs, including the cost of medication. This is the least that we can do for those that have unknowingly been exposed to the contaminants in the air for many decades. We also need more beneficial trees that combat the pollutants. I've noticed there are many of these lilac trees being planted that not only polluting the air with pollen, but the ground with their flowers. Several of the plants being planted around the freeways agitate asthmatics and trigger allergic reactions. I wish more study is done before planting.

I have an idea of a cargo train, which runs on a lane within the I-710 freeway, that delivers goods to ports within each city. Each city would be responsible for these ports. Trucks can drive to these ports and pick up the goods to be delivered to their destination point located within their city. This will relieve traffic on the freeways, as well as reduce the amount of accidents. This in turn reduces emissions. It will also reduce the impact and burden from East Los Angeles. This will go along with the continued expansion of the trains and subways around Los Angeles, especially West Los Angeles.

I believe we should stop before moving forward with the proposed options. We need to gather all current and important information before going forward with any plans. These changes need to not just impact the now, but future generations to come. We need to review all avenues and issues from all cities and residents to continue. From my experience and years living in Los Angeles, we haven't been rebuilding the freeways, but creating patches. We need to go one step further than the past builders, not make the same mistake of building with no thought to the future. This needs to be our legacy, but a legacy that will continue to benefit for many, many years to come. L-31-125

Thank you for the opportunity to comment:

Comments on the SR-710 DEIR/DEIS Submitted to Caltrans by Southern California Scientists and Colleagues Who Study the Health Effects of Air Pollution and Other Public Health Impacts from Transportation Infrastructure Projects and Related Traffic*

L-31-126

Mr. Garrett Damrath
Chief Environmental Planner
Caltrans District 7
Division of Environmental Planning
100 S. Main Street, MS-16A
Los Angeles, CA 90012

Submitted via website link
Hard copy and CD-Rom hand-delivered to District 7 Caltrans

Dear Mr. Damrath:

As we understand it, a DEIR/EIS is designed to help policymakers better understand the potential impacts of their decisions concerning infrastructure and other projects. As documented below, we do not believe the DEIR/DEIS effectively or successfully serves this purpose. Policymakers reading this version of the DEIR/EIS will have a very difficult time understanding what the air pollution impacts of a proposed SR-710 extension would be, particularly as it pertains to the tunnel alternative.

We respectfully submit our concerns as a group of scientists and public health experts. Some of us have been studying the health effects of air pollution in southern California individually and collectively for decades. Others are experts in public health, working to ensure that the community is adequately informed of the potential health impacts of new infrastructure projects, and that proposed infrastructure projects are designed to minimize environmental and health impacts.

Southern California has a world-class community of scientists and experts studying the health impacts of air pollution and other impacts from infrastructure projects that is unique in this field. Despite there being hundreds upon hundreds of published papers on this topic by investigators from the University of Southern California (USC), University of California, Los Angeles and Irvine (UCLA and UCI), and other investigators around the world, the DEIR is completely lacking in a discussion of the health effects of air pollution related to the alternatives, other than diffuse claims that the project will "improve air quality."

We are particularly concerned about the increased number of vehicles (and their emissions) that will chose to use a tunnel, if it is selected as an alternative, and the lack of attention in the DEIR/EIS to the increased vehicle emissions on the SR-710 north of the SR-60 Freeway up to the south tunnel portal. We are also very concerned about vehicle emissions inside the tunnel and emissions that will be "vented out" but not necessarily captured by a filter and about the lack of discussion of the health effects from portal emissions, near-roadway emissions, ultrafine particles and diesel exhaust/particulate emissions.

We are concerned about other impacts, such as noise, as described below, and of the failure of the DEIR/EIS to address environmental justice concerns in the most vulnerable communities, such as lower-income Latino communities in East Los Angeles.

Our overall evaluation of this document and its attachments leads us to conclude the following:

The DEIR/DEIS has so many deficiencies related to a lack of information on potential health impacts of the project, particularly of the Tunnel and the LRT alternatives, that we recommend that the DEIR/DEIS be redone and recirculated for review and comment.

This important determination is based upon our identification of the following deficiencies related to public health in the DEIR/EIS:

1. **Failure to describe, discuss or cite any of the dozens of studies from around the world, including many from Southern California, linking exposure to near roadway emissions with a wide range of health effects, including, as examples:**

    - **Exacerbation of asthma and new cases of asthma** (Gauderman et al. 2005; McConnell et al, 2006; McConnell et al, 2007; Jerrett et al, 2008; Perez L et al , 2012)
    - **Reduced lung function** (Gauderman et al, 2007; Urman et al, 2014)
    - **Cardiovascular heart disease** (Brook et al, 2010; Gan et al. 2010, 2011; Hoffmann et al. 2006; Kan et al. 2008)
    - **Preterm birth, low birth weight and pregnancy disorders** (Wu et al, 2009, 2011); Wilhelm et al, 2012)
    - **Autism** (Volk et al, 2011, 2013)
    - **Aging of the brain** (Chen et al, 2015)
    - **Possibly obesity and Type 2 diabetes (**Weinmayr, G et al, 2015; McConnell et al, 2015)
    - **Overall burden of disease related to near roadway air pollution** (Perez et al, 20090; Brandt et al, 2012)

2. **Failure to provide an accurate statement of the "Purpose and Need" of the Project with regard to creating a 30-mile connected truck corridor to and from the Ports, which Metro has claimed is a value of this project.**
    a. Legally, the DEIR/EIS is required to have a well-described and legitimate discussion of why the project is needed and its purpose. There is a failure in the DEIR/DEIS's purpose and need statement to acknowledge that a major reason for the tunnel alternative in this project is to move goods to and from the Ports of Los Angeles and Long Beach. Obviously, the SR-710 tunnel, when linked to the I-710 goods movement corridor, would create a 30-mile goods movement truck

corridor, yet the words "goods movement" or "freight" do not appear in the purpose and need statement.

b. Metro officials have previously stated that this, indeed, is why completing the 710 north gap closure is so valuable. Please see this 2011 statement by Douglas Failing, then executive director of highway programs for Metro: *"The 710 north gap closure between the I-10 and the I-210 would complete the natural goods corridor that was begun several decades ago."* Please find this quotation at: http://www.metro.net/news/simple_pr/metro s-highway-program-shifts-high-gear-18-new-pro/

c. Thus, the Purpose and Need of the Project, as stated, is erroneous because it fails to mention that a major purpose of the SR-710 tunnel project is to complete the "goods movement corridor" which heads north from the Ports of Los Angeles and Long Beach, between the I-10 and the I-210 Freeways. For this reason alone, the DEIR/EIS merits revision and recirculation for comments and additional opportunity for review.

3. **Failure for the DEIR/EIS to accurately inform the public and policy decision-makers about the volume and impact of heavy duty diesel big rig trucks in the tunnel – and along the lengthy approach to the tunnel's portals.**

a. The DEIR/DEIS's truck traffic estimates greatly minimize freight traffic, instead relying on a set of "FAQs" about goods movement which have no citations, admit that detailed truck studies were not performed, and are completely misleading to the public. An example is the following statement from the FAQs: *"Construction of a tunnel would not be expected to alter truck traffic destinations. Cars and trucks that are already going north (via surface streets or other freeways) may choose to take a tunnel to reduce their travel time, but no additional truck traffic will go north."* See http://media.metro.net/projects_studies/sr_710/images/sr_710_faqs_goods_movement.pdf. The public and policy makers deserve an accurate and appropriate method for estimating truck traffic in the Tunnel Alternatives – from the Ports and elsewhere – and the DEIR/DEIS should provide one. It currently does not. We request that Caltrans and Metro permanently remove this misleading set of "Frequently Asked Questions" from its web portals and websites.

b. On page 5-35 of the Air Quality Assessment, the DEIR/DEIS states *that "there is a possibility that some traffic currently utilizing other routes would be attracted to use the new facility."* This ignores the widely accepted concept of "induced demand," in which increases in traffic capacity are quickly met with increased traffic volumes whenever a new freeway is built or new lanes added. Certainly Caltrans is aware of the concept of "induced demand" when a new freeway is built. In a 2014 draft policy brief for the California Air Resources Board, two experts concluded that there is usually a growth in both vehicle miles traveled (that is there is "induced demand," as more people choose to use the new highway) and in greenhouse gas emissions after a "capacity expansion" of a highway. They argue that the "induced demand" generally offsets any reductions in greenhouse gas (GHG) emissions that would result from improved traffic flow (Handy and Boarnet, 2014. *"Given the induced travel effect, capacity expansion has limited potential as a strategy for reducing congestion*," Handy and Boarnet conclude. (See

http://www.arb.ca.gov/cc/sb375/policies/hwycapacity/highway_capacity_brief-4-21-14.pdf.

c. Truck estimates vary widely throughout the document, and these assumptions are critical to the Health Risk Assessment, the Air Quality Assessment, and other issues in the DEIR/EIS.
   i. We note that the SR-710 tunnel project would allow, for the first time, trucks to travel north from the Ports for a continuous 30 miles on the I-710 to SR-710 Freeway directly to the I-210 (and then on north to the Central Valley or east to distribution centers in Riverside and San Bernardino Counties, or other points East). But Table 5.6 on increased VMT that will occur with tunnel project in the Air Quality Assessment makes little sense. It seems to show that at the I-210 eastbound on-ramp, there would be only about 400 more vehicles a day on the on-ramp if the tunnel allowed trucks than if it did not.
   ii. Inexplicably, Table 3.5.7 on Truck Performance (see below) shows nearly identical "Vehicle Miles Traveled (VMT) for trucks in the No Build, Light Rail, and Tunnel Alternatives. How can the same VMT for trucks traveling in the "No Trucks Allowed Tunnels" occur as in tunnels that allow trucks? It is imperative to have a valid estimation of trucks in the tunnel if one is to have a valid Health Risk Assessment.

Table 1. 2035 Truck VMT with various alternatives, from the DEIR/EIS

TABLE 3.5.7:
Opening Year (2020/2025) and Horizon Year (2035) Truck Performance by Alternative

Performance Measure	No Build	TSM/TDM	BRT	LRT	Freeway Tunnel Alternative					
					Single-Bore Design Variation			Dual-Bore Design Variation		
					Toll	Toll, No Trucks	Toll, Express Bus	No Toll	No Toll, No Trucks	Toll
Opening Year 2020 (for the TSM/TDM and BRT Alternatives)										
Daily Truck VMT per Lane Mile of Freeway	2,300	2,300	2,300	N/A	N/A	N/A	N/A	N/A	N/A	N/A
Daily Truck VMT per Lane Mile of Arterials and Collectors	100	100	100	N/A	N/A	N/A	N/A	N/A	N/A	N/A
Opening Year 2025 (for the LRT and Freeway Tunnel Alternatives)										
Daily Truck VMT per Lane Mile of Freeway	2,500	N/A	N/A	2,500	2,500	2,400	2,500	2,500	2,400	2,400
Daily Truck VMT per Lane Mile of Arterials and Collectors	105	N/A	N/A	105	95	105	95	95	100	95
Horizon Year 2035 (for all Build Alternatives)										
Daily Truck VMT per Lane Mile of Freeway	2,800	2,800	2,800	2,800	2,800	2,700	2,800	2,700	2,600	2,700
Daily Truck VMT per Lane Mile of Arterials and Collectors	115	115	115	115	105	115	105	95	105	105

Source: *Transportation Technical Report* (2014).
Note: The truck-related information provided in this table refers to heavy-duty trucks as defined in the Southern California Association of Governments 2012 Regional Transportation Plan travel demand model.
N/A = Not Applicable
VMT = vehicle miles traveled

   iii. In contrast to the above, which estimates a minimal amount of trucks expected with the Tunnel Alternative, Table 4-12 shows that in 2035 there would be 25,600 trucks a day in the tunnel.

Table 2. 2035 modeled truck counts along the I-710 and in the tunnel from the DEIR/EIS

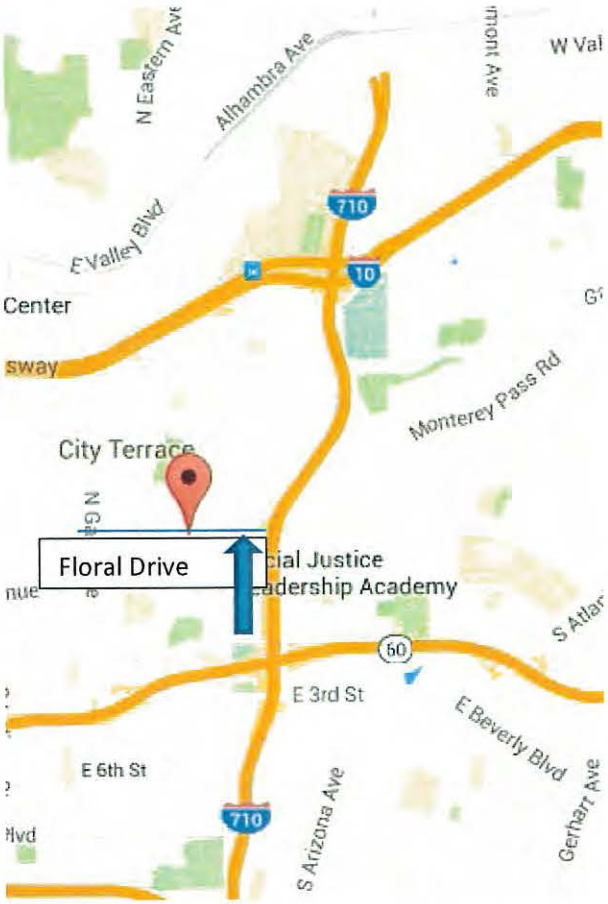

TABLE 4-12
Travel Model Comparison Summary: SR 710 North and I-710 South
SR 710 North Study, Los Angeles County, California

	SR 710 North Model (2035) [1]			I-710 South Model (2035) [1]			Comparison	
	Daily			Daily			Daily	
Location	Total	Trucks	% Trucks	Total	Trucks	% Trucks	% Diff	% Truck Diff
SR 710 Tunnel	177,600	25,600	14.4%	166,200	18,600	14.7%	-6%	-27%
I-710 North of Floral Drive	220,000	26,500	12.0%	226,900	20,300	14.7%	3%	-23%
I-710 North of Whittier Boulevard	265,800	37,000	13.9%	256,400	27,300	14.7%	-4%	-26%
I-710 North of Washington Boulevard	315,700	31,400	9.9%	274,700	30,200	14.7%	-13%	-4%
I-710 South of Imperial Highway	272,100	37,500	13.8%	249,900	36,700	14.7%	-8%	-2%

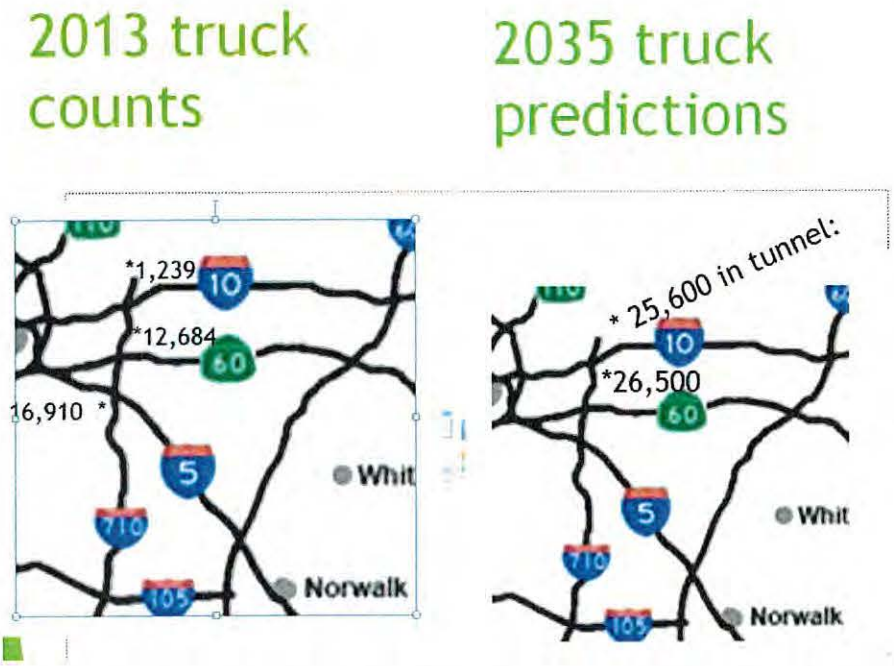
[1] The model results shown for 2035 for both SR 710 North and I-710 South include the SR 710 North tunnel and the I-710 South truck lanes. Both models assumed the SR 710 tunnel was designed as the dual-bore tunnel without a toll variation.

The above table also shows that on the I-710 north of Floral Drive there would be 26,500 trucks anticipated in 2035. Floral Drive is between the SR-60 and the I-10 Freeway. This is a clear indication that East Los Angeles will be seriously impacted by truck traffic when the tunnel opens. See map below for where Floral Drive is.

Map 1. Red mark and blue line showing east-west location of Floral Drive in East L.A. This can be matched with truck counts in Caltrans table above.

iv. The current volume of trucks that travel north of the SR-60 and north of the I-10 on the I-710 Freeway were obtained from Caltrans online truck counts and are shown below:

Map 2. Truck Counts Caltrans Data, 2013 in the study area



The above truck counts show that in 2013 there were 16,910 trucks (one way) on the I-710 north of the 5 Freeway. Some 4000 trucks exited on the SR-60. Another 11,000 trucks exited on the I-10, meaning that only 1,239 trucks were left on the I-710 when it ended in Alhambra. These data are from the following Caltrans table of truck counts:

Table 3. Caltrans truck counts along the I-710 during 2013

RTE	DIST	CNTY	POST MILE	L E G	DESCRIPTION	VEHICLE AADT TOTAL	TRUCK AADT TOTAL	TRUCK % TOT VEH	TRUCK AADT TOTAL By Axle 2	3	4	5+	% TRUCK AADT By Axle 2	3	4	5+	E 2- (1

v. When using data from the Table 4-12 in the DEIR/EIS, the following maps show how many trucks are on the I-710 today in the study area versus how many are predicted through modeling for the future, when the tunnel is open.

Map 3. Comparison of truck counts in 2013 along the I-710 Freeway and 2035 predictions if the tunnel alternative is selected.

vi.

4. **Failure to describe or discuss studies and rulings that conclude that diesel exhaust and diesel particulate are carcinogens, which is critical to understanding the potential health risks of a tunnel alternative.**
   a. We note that once constructed both the single bore tunnel and the dual bore tunnel would have "diesel PM emissions greater than or equal to the 2025 and 2035 emissions" (see page 35 of Executive Summary/DEIR/EIS).
   b. Despite the above, concerns about the health impacts of diesel exhaust and diesel PM are minimized in the DEIR/DEIS. We can locate no mention of the 1998 ruling by the California Air Resources Board naming diesel particulate as a Toxic Air Contaminant because it causes cancer, nor of the 2012 ruling by the World Health Organization's International Agency for Research on Cancer (IARC) designating "diesel exhaust as a Class I carcinogen."
   c. Page 2-17 of the HRA includes a lengthy description of OEHHA's risk assessment uncertainties in 2002, but does not include anything about OEHHA's diesel cancer risk assessment in 1998 (http://www.arb.ca.gov/toxics/dieseltac/part_b.pdf) which summarized more than 40 studies published before 1998 showing the diesel particulate causes cancer. The HRA also does not describe the new OEHHA Diesel Cancer Risk Guidelines

(proposed in 2014 and finalized in 2015). See 2014 proposal, issued before the DEIR was released and 2015 final guidance:
http://oehha.ca.gov/air/hot_spots/riskguidancedraft2014.html
http://oehha.ca.gov/air/hot_spots/hotspots2015.html.
To our knowledge, the DEIR/EIS has no discussion of the multitude of studies showing that diesel causes cancer and other health effects, summarized in the the OEHHA document cited above or more recent studies, examples of which are in the References (Zhu et al, 2002; Olsson et al, 2011; Silverman et al, 2012; Attfield et al, 2012; Bhatia et al, 2012; Silverman et al, 2014; Vermeulen et al, 2014).

d. Pages 5-25 and 5-26 of the Air Quality Assessment fail to mention action in California in 1998 that declared diesel as a Toxic Air Contaminant, with a unit risk value of cancer potency for cancer risk. But it has several pages about concerns and uncertainties expressed at the national level about diesel, from the Health Effects Institute and U.S. EPA, in an apparent attempt to downplay the health effects of diesel exhaust. For example: page 3.13-34 of the DEIR/EIS states that: "*... there is no national consensus on air dose-response values assumed to protect the public health and welfare for MSAT compounds, and in particular for diesel PM. The EPA and the Health Effects Institute have not established a basis for quantitative risk assessment of diesel PM in ambient* settings. *There is also the lack of a national consensus on an acceptable level of risk."* However, California's OEHHA and the regions South Coast AQMD have, respectively, adopted quantitative risk value and an acceptable level of risk, which the DEIR/EIS fails to acknowledge.

5. **Failure to use the most recent guidance from OEHHA in development of the Health Risk assessment for determining cancer risk from exposure to diesel exhaust; the HRA must be redone.**

   a. Although OEHHA had issued a draft of its new guidance document prior to completion of the DEIR/EIS, the Health Risk Assessment fails to include calculations for how this new guidance (now adopted) would impact the HRA. http://oehha.ca.gov/air/hot_spots/riskguidancedraft2014.html. The HRA should redone using the latest guidance document at: http://oehha.ca.gov/air/hot_spots/hotspots2015.html.

6. **The Health Risk Assessment (HRA) has many other flaws including inadequate information about the most impacted individuals.**

   a. It fails to provide all necessary background assumptions about traffic volumes and minimizes the air pollution in both the approach (above SR-60 to the I-10) to and the exit from the South Portal (impacting East L.A. and Alhambra residents). In addition, the HRA does not provide a map showing the most impacted individuals/workers/students (see Table 3-4). An informative map must be included. The HRA must be redone to address traffic approaching the South Portal, to better address the cancer risk which is currently claimed to be "zero" due to the ventilation towers (see page ES-3) which states "Due to the installation of the particulate matter control system at the tunnel ventilation system, vehicle emissions from the tunnel ventilation towers contribute minimally to the cancer risks at the MEIR and MEIW locations" (that is most impacted

resident and most impacted worker). Please provide page numbers for these calculations.

b. The Health Risk Assesment states that "the maximum student cancer risk is at Maranatha H.S. west of the SR-710 near the north portal." Did Caltrans alert this school to the increased noise and cancer risk that this project would bring to the school and its students and teachers?

c. Page 3-8 of the HRA states that "the area with cancer risk greater than 10 in one million is a narrow strip around the north and south portals and the adjacent interchange. There appears to be no analyses performed for increased cancer risks between the SR-60 and the portal of the tunnel even though there would be thousands more vehicles on the freeway when the tunnel opens. This increase in traffic on the I-710 due to the tunnel opening is completely ignored in the DEIR/EIS and its analyses for cancer risk – and for noise (see below). This is a major flaw in the HRA and the DEIR/EIS.

7. **Failure to include information on the health impacts of ultrafine particles (UFPs), the levels of exposure to passengers traveling in the tunnel, whether the UFPs would be "captured" by the particulate filters that are planned in the ventilation stacks, and how far from the portals and approach roads the ultrafine particles would travel.**

   a. Ultrafine particles (UFP; aerodynamic diameter < 0.1 micrometers) are a ubiquitous exposure in the urban environment and are elevated near highways (Fuller et al, 2012; Zhu et al, 2002a; Zhu et al 2002b; Zhu et al 2006). These particles are considered especially toxic because they can enter the lung, and stay there or get into the systemic circulation.

   b. A study done by UCLA and USC researchers documented very high concentration of ultrafine particles in close proximity to the I-710 Freeway in SE Los Angeles. It found that the pollutants start to level off at about 150 meters from the freeway and are "back to background" in about 300 meters [985 feet] from the freeway during daytime dilution conditions. See diagram below from the study *(Zhu et al, 2002)*. In fact, the impacts for ultrafine particles are 10 to 15 times further from the source than are the daytime impacts.

Figure 1. Ultrafine particle size distributions near the I-710 Freeway

Fig. 4. Ultrafine particle size distribution at different sampling locations near the 710 freeway.

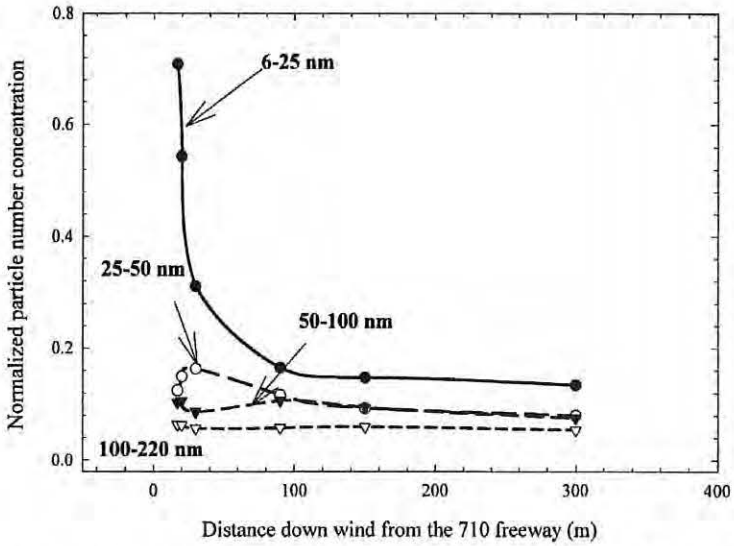

Fig. 5. Normalized particle number concentration for different size ranges as a function of distance from the 710 freeway.

c. These researchers from UCLA and USC also found that at night time when winds shifted, the pollutant levels of ultrafine particles did not reach background until 300 meters from the freeway (Zhu et al, 2006).
d. Other researchers from UCLA and USC also found that at night time when winds decrease, the concentrations of ultrafine particles did not reach background until 2500 feet from the freeway (Hu et al., 2009).
e. In fact, the impacts for ultrafine particles are 10 to 15 times further from the source than are the daytime impacts.
f. The DEIR/EIS contains no estimates on what levels of UFPs one would expect to find when driving through the enclosed environment of the tunnel, nor what ambient concentrations might be expected downwind from the ventilation stacks or portals.
g. Another study, by UC Davis researchers looked at a number of studies with regard to concentrations from the roadways (Karner et al, 2010). They conclude: *'In general, concentrations decay to background within a few hundred meters downwind of a road, although studies measuring pollutants solely in the evening hours indicate that higher concentrations persist beyond 500 m (1640 feet)"* (citing Zhu et al, 2006). Other researchers from UCLA and USC also found that at night time when winds decrease, the concentrations of ultrafine particles did not reach background until 2500 feet from the freeway (Hu et al., 2009). See graph below from Hu et al, 2009.

Figure 2. Ultrafine particles, distance from freeway

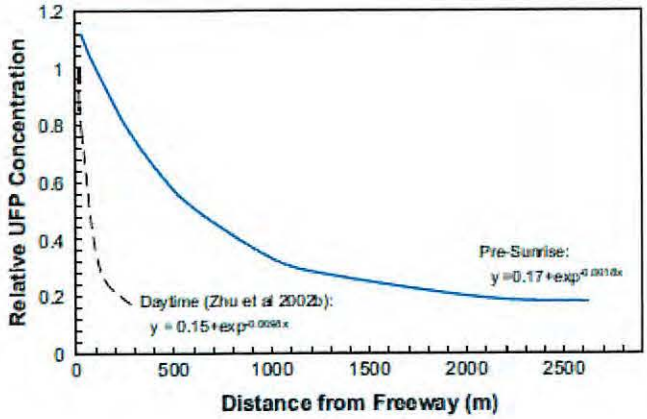

Fig. 6. Exponential fits to the downwind relative UFP concentrations with distance from the I-10 freeway during pre-sunrise hours, compared with fit to daytime data downwind of the I-405 freeway by Zhu et al. (2002b). Data were acquired continuously for pre-sunrise measurements, up to the edges of the freeway.

Also see table below from the UC Davis study which shows that many pollutants do not reach background level until 1000 meters or more (Karner et al, 2010).

Table 4. UC Davis Study summary

TABLE 1. Summary of Background Normalized Data

group	pollutant	approximate multiplier above background concentration at edge-of-road	approximate distance required to reach background concentration (m)[a]
rapid: >50% drop by 150 m	CO	21[b]	—[c]
	metal deposition	2.9	161
	UF1 particle no.	4.0	189
less rapid or gradual decay/change	benzene	2.1	280
	EC	1.7	420[d]
	NO	3.3	565[e]
	NO_2	2.9	380[f]
	NO_X	1.8	570[e]
	PM_{10}	1.3	176
	UF2 particle no.	4.8	910[e]
	VOC1	2.0	270

[a] The approximate distances were derived from an expanded version of Figure 2; the distance point at which the smoothed line reached a value of one on the *y*-axis is cited here as background. [b] Near-road CO concentrations extended outside of the range plotted in Figure 2. [c] CO concentrations did not reach background within the 285 m for which data were measured. [d] Background normalized concentrations attained an approximate minimum value of 1.1 at this distance from the road. [e] Reached background concentrations outside of the range plotted in Figure 2. [f] Background normalized concentrations attained an approximate minimum value of 1.08 at this distance from the road.

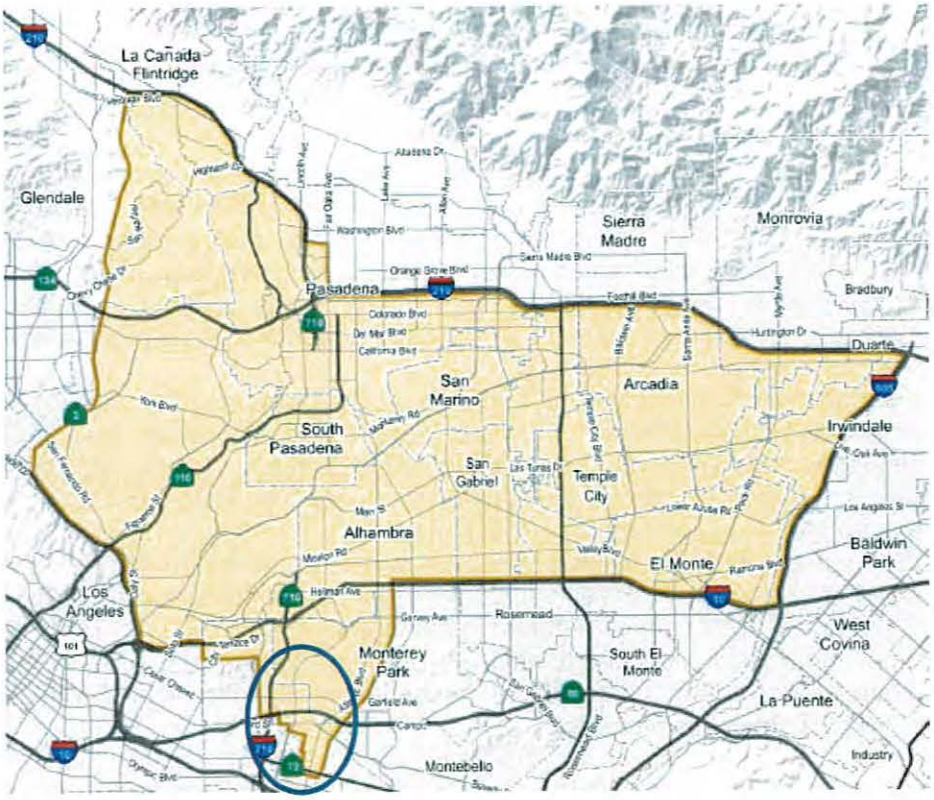
The authors concluded that *"background normalized results suggest that a range of approximately 160-400 meters [525-1312 feet] is sufficient to reach background concentrations for the majority of pollutants."*

Dozens of studies on ultrafine particles by investigators at the UCLA Particle Center directed by John Froines and by Costas Sioutas and his laboratory at USC are not included in any references or discussion in the DEIR/EIS. In fact, there are no

references to any studies on ultrafine particles, which is of great importance to the building of a tunnel alternative for the SR-710. (Examples: Delfino et al, 2005; Fanning et al, 2007; Kleinman et al, 2009; Fuller et al, 2012; Zhu et al, 2002; Zhu et al 2006)

8. **The Air Quality Assessment (the AQA) has multiple flaws and does not provide adequate information to either the public or policymakers who must select an alternative.**
    a. The AQA mentions "sensitive receptors" but fails to include a map of where all of the sensitive receptors are. Such a map must be included in a revised DEIR/DEIS. The public and policymakers cannot be expected to "imagine" where the most sensitive receptors are based on seven pages of coordinates rather than visually presenting them on a map in the DEIR/EIS.
    b. The Air Quality Assessment fails to describe operating filtration specifications of the ventilation system that will be installed in the tunnel and in the two ventilation stacks, making it nearly impossible to determine the accuracy of the claim that the stacks will remove 80% plus of the particles and gases.
    c. Air quality levels are shown in Table 3.13.1 at the South Wilson Pasadena station, but fail to show PM2.5 levels for 2013, without an explanation. Failing to include the most recent levels for a significant pollutant is not acceptable. Similar problem with Tables 4-1 and 4-2 of the air quality analysis which fail to show PM10 levels for multiple years at the Pasadena station.
    d. The assessment sometimes refers to tunnel mitigation measures as "scrubbers" and other times as "filtration devices." There is no discussion of best practices in ventilating tunnels throughout the world. Thus neither the public nor policymakers can evaluate the efficacy of the mitigation measures suggested in the context of experiences elsewhere.
    e. If a tunnel alternative is selected, there needs to be a better evaluation of what the contaminant levels and potential health risks inside the tunnel would be for those using the 4-mile tunnel. This needs to include truck estimates, based on validated truck studies (which have not been conducted according to the FAQs). A recent study (Orru et al, 2015.) estimated that there could be increased mortality due to tunnel exposures for those frequently using a proposed high volume urban tunnel in Stockholm.
    f. If a tunnel alternative is selected, there needs to be more information about the emissions and air dispersion from both portals of the tunnel and from the tunnel's ventilation stacks. The stacks are designed to primarily remove particles, not gases. Several experts have evaluated the tunnel ventilation and have submitted a separate set of comments on that topic.
    g. We request that Caltrans/Metro describe and detail the maintenance plans for how they will maintain the filtration devices as part of the tunnel air pollution control plan. This cannot be found in the DEIR/EIS.
    h. More information is needed to advise the public about details of an "exhaust duct along the entire length of the tunnel and jet fans within the tunnel." We can find no details about this technology.

9. **Failure to estimate what the pollution levels will be at the North and South Portals.**
    a. These portals are near schools and an acute care hospital and the air that rushes out from traffic will not be filtered at either portal. A voluminous medical literature has demonstrated the acute effects of particulate pollution on heart attacks, yet



there is no consideration of the potential impact on patients with heart attacks at Huntington Hospital at high risk of lethal post-infarct arrhythmias.

i. We request that if we are incorrect and the DEIR/EIS includes information about these effects, that the pages on this be made public and sent to u as commenters.

10. The DEIR/DEIS includes a faulty "study area" that fails to include impacted parts of unincorporated East Los Angeles, making this an environmental justice issue.

a. The study area is described as "approximately 100 square miles and generally bounded by I-210 on the north, I-605 on the east, I-10 on the south, and I-5 and SR 2 on the west." (See front page of DEIR/DEIR). That means that the area between the SR-60 and the I-10 adjacent to the I-710 has not been studied with regard to the Freeway Tunnel Alternatives, thus failing to recognize the immense impact on East L.A. that vehicle traffic will create as drivers travel in or out of the South Portal. (See map below). The map below shows the study area – but the part of East L.A. that is shown is only studied with regard to the LRT alternative, not for the tunnel alternative

Map 4. DEIR/EIS Study Area. *Area circled was studied in the DEIR/EIS for the Light Rail Alternative but apparently not for the tunnel alternatives.*

b. In addition, the I-710 South DEIR/EIS evaluates impacts only from the south I-710 north to the SR-60, meaning that the East L.A. stretch of the I-710 is not evaluated in *either* DEIR/DEIS. East L.A. is 97% Hispanic, and there are multiple

sensitive receptors in this area. Failure to discuss the impacts of increased emissions and traffic in East LA make this is an environmental justice issue.

Map 5. The SR-710 DEIR/EIS "study area" exclusion zone. East L.A. was studied only for the Light Rail Alternative. It was not studied for volumes of additional truck or other vehicle traffic nor for noise mitigation nor for cancer risk.

c. Table 3-1 claims that there will be a "negative" cancer risk (that is reduced) as a result of building the tunnel alternative.
d. Also Table 3-4 calculates the "incremental cancer risks" for various alternatives. For some unexplained reason no addresses near the South Portal are included (See page 3-6 of HRA). We note that the text of the HRA states that "localized

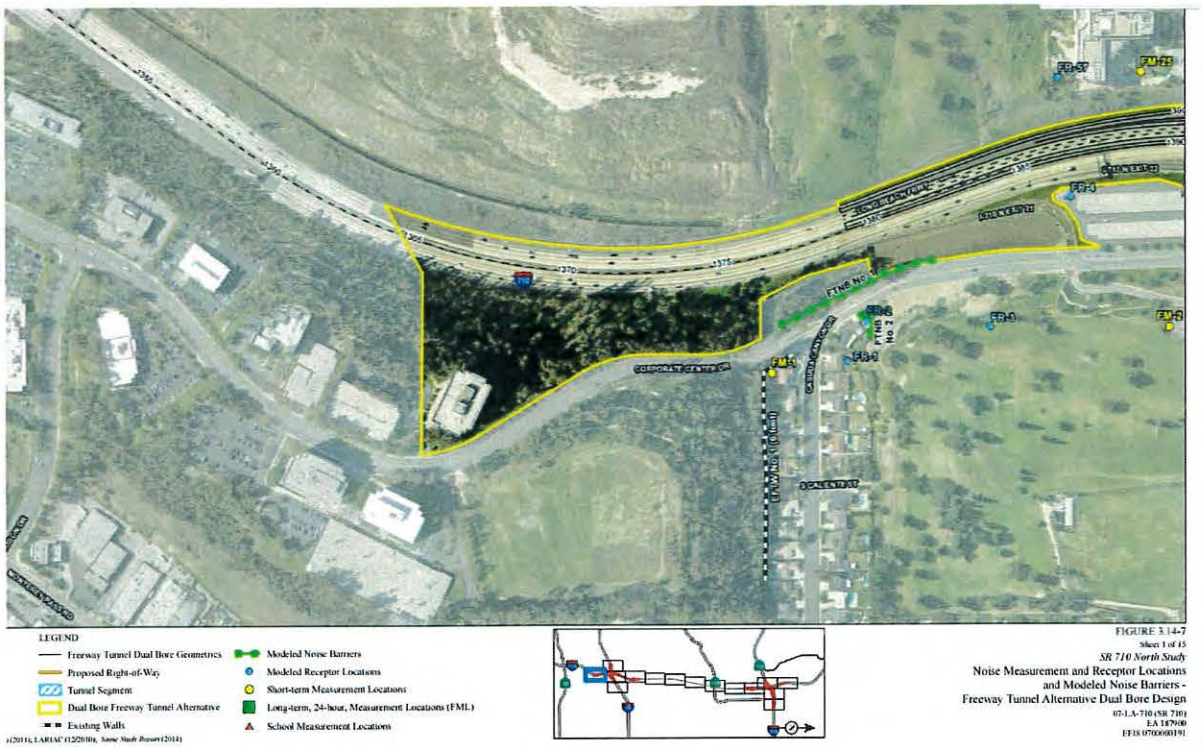
cancer risk increases occur mostly near the tunnel portal areas and extend to the nearby interchanges and highways that vehicles would use as the main routes to or from the new freeway tunnel."... "In the south, cancer risks would increase near the south portal and extend south to the SR 710/I-10 interchange."

e. In fact, the cancer risks will not stop at the SR 710/1-10 interchange; they must be evaluated for the area within the area above, extending down to the SR-60. There will be thousands more trucks traversing the I-710 between the SR-60 and the SR-710 and these impacts of adjacent communities are not considered in SR-710 DEIR/EIS
    i. If the 25,000 pages of the DEIR/EIS include information about elevated cancer risk from more traffic and more trucks on the I-710 north of SR-60, please provide the page numbers where this information appears.
    ii. Again, this area of East L.A. is not considered in the DEIR/EIS and HRA – as though it does not exist and will not be impacted. This is a serious flaw and an environmental justice issue in the DEIR/EIS and HRA. (See page 3-8 of HRA).
f. Despite claims to the contrary in the DEIR/DEIS, if a tunnel alternative is selected, there will be significantly more traffic on the existing stretch of the I-710 Freeway heading north between the SR-60 and the I-10.
    i. The DEIR/DEIS must perform an evaluation of the air pollution impacts on homes and schools on this stretch of the I-710. Currently, homes and schools in East L.A. are evaluated only for the light rail alternative. There is no analysis of noise or air pollution impacts in this area, although it will be heavily affected by truck traffic from the Ports of Los Angeles and Long Beach traveling to or from the new tunnel. This is an environmental justice issue.

11. **The DEIR identifies high risk receptors near the north portal but not near the south portal.** In Table 3-4 of the HRA, a number of higher risk receptors are identified. Although there are higher risk receptors identified near the NORTH portal, there are none identified near the SOUTH portal. In addition, there is no map showing the areas with highest risk at the South Portal. Although page 3-8 of the HRA states that cancer risks would increase near the South Portal, there is no table showing the locations where that would occur. There need to be maps of the high risk receptors at both portals.

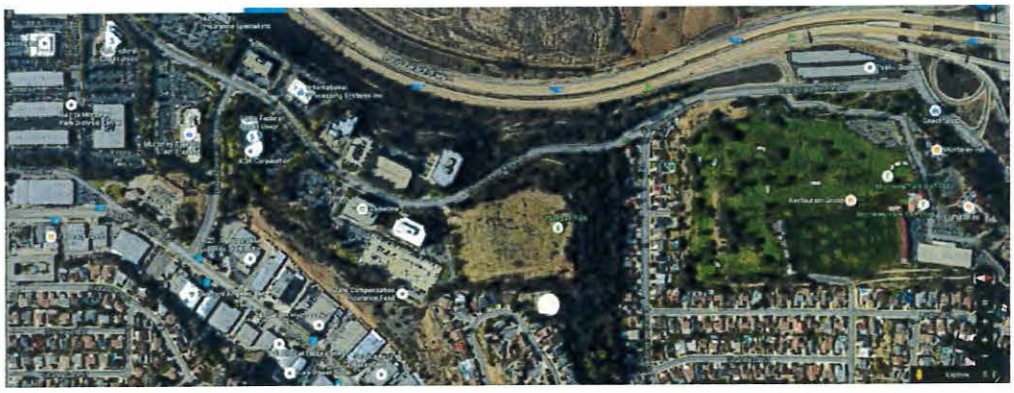
12. **The DEIR fails to look at zero emissions technology either for trucks going through the tunnel or for its Bus Rapid Transit (BRT) alternative.** Although Metro is the lead agency in the region of a collaborative on use of zero emissions technologies for transportation (see http://www.metro.net/projects/countywide-zero-emission-trucks-collaborative/), there is no discussion of requiring that trucks using the tunnel be zero emission technology nor of having truck age restrictions so that only newer trucks could use the tunnel. Although Metro has just bought five battery-electric buses for its fleet, there is no mention of using this zero emission technology for the BRT alternative, which is listed as an alternative to the tunnel.

13. **Concerns about increase noise levels from traffic entering and exiting the tunnel and increased traffic volumes along the approaches to the tunnel are minimized in the DEIR/EIS without scientifically sound analyses or even tables showing the noise measurements and analyses.**



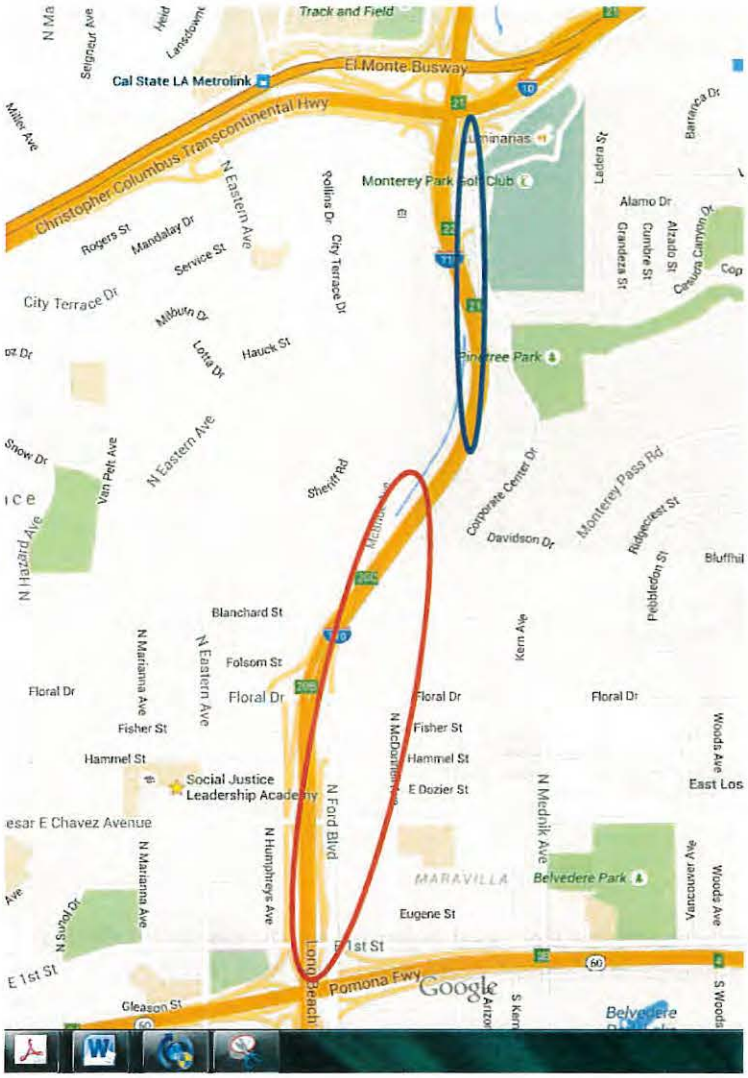
a. The Project will generate two distinct types of noise impacts: construction equipment noise and traffic noise from the cars and trucks that will travel along the routes to the tunnel and into the tunnel. The World Health Organization recognizes noise, and in particular traffic noise, as a serious public health problem.
b. Given the proposed tunnel construction and increased traffic after it opens, it is likely that the Project will result in significant noise impacts. In addition to identifying residences, the revised document should seek to identify all sensitive receptor sites including each motel and hotel, library, religious institution, hospital, nursing home, active sports area, picnic area, recreation area, playground, active sport area and park that would be potentially affected by noise from the additional traffic that will be on the I-710 Freeway between SR-60 and the approach to the tunnel, if that alternative is selected.
c. Given the serious nature of the Project's potential noise impacts, in conjunction with the effect that increased noise levels have been shown to have on public health, it is incumbent upon Caltrans through its DEIR/EIS to engage in a meticulous assessment of these potential impacts. The document's analysis of this issue, however, is subject to the same type of cursory analysis and critical omissions found in the DEIR/S overall.
a. On page 3.3-34, the Community Impact section of the DEIR/DEIS states that both Cal State LA and Marantha High School would experience permanent noise increases of 3dB if the tunnel is built. The DEIR/EIR also states that "based on a visual inspection of the exteriors of these facilities and the warm climate in the portion of Los Angeles County in which these facilities are located, the University and the high school are likely to rely on air conditioning in lieu of opening windows for ventilation; therefore the permanent noise level increases ... with the freeway tunnel alternative ... would not adversely affect their ability to serve the community." The DEIR/EIS community impacts report goes on to state that outdoor events at these two campuses would not be likely to be noise-sensitive because they "typically would produce their own noise." Noise analyses and impact determinations should not be made by "looking" at a school or site. Measurements of existing and estimated future noise impacts should be carefully considered and included in the DEIR/EIS and -- if these have not been done, they should be done and then be included in a revised and recirculated DEIR/EIS. This is a particularly egregious flaw in the DEIR/EIS: evaluating noise impacts through a "visual inspection" is simply unacceptable.

14. Noise mitigation measures are not included for the stretch of the I-710 Freeway between the SR-60 and the I-10, with the exception of noise barriers at a Golf Course and at a Park along the I-710 in this location.



a. A redone and recirculated DEIR/EIS must include noise analyses and noise mitigation measures for the stretch of the I-710 Freeway north of the SR-60 and south of the I-10, which includes East Los Angeles among other communities. This is an environmental justice issue.

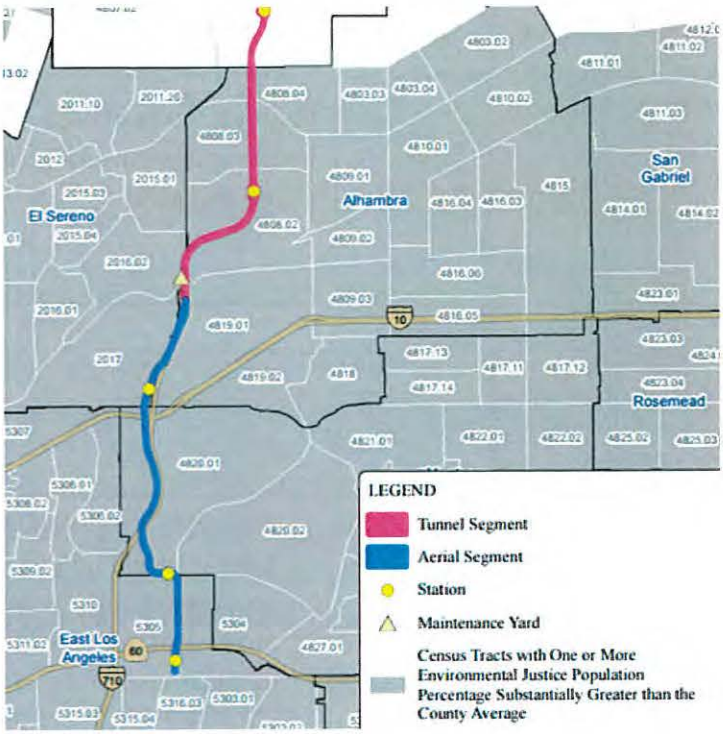
Maps 6 - 8. The noise mitigation area south of the I-10 along Corporate Center Drive, north of the SR-60, from the DEIR/EIS. *The shape includes a golf course in Monterey Park and an adjacent park both alongside Corporate Center Drive. No noise mitigation measures are described for any locations south of this location along the I-710 Freeway between the I-10 and the SR-60, despite the huge volumes of additional traffic there will be, from trucks alone, on this stretch of the Freeway as documented above:*



Map 6:

Map 7

Map 8

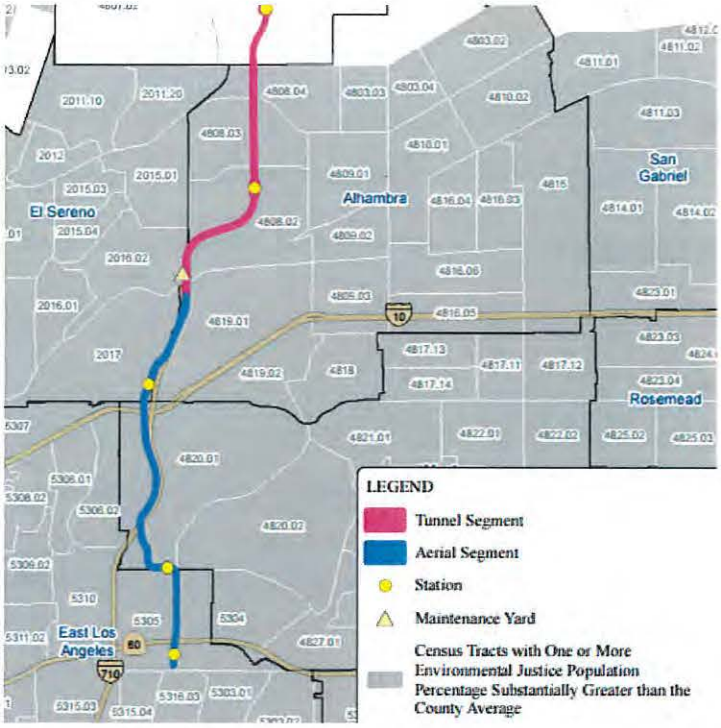


Blue oval = area of noise barrier mitigation near golf course and park

Red oval = area including East Los Angeles where no noise barriers are proposed despite the dramatic increase of truck traffic there will be in this stretch of the I-710.

15. **There are significant environmental justice issues from the various proposed alternatives, but these have been minimized by Caltrans even though various parts of East L.A. and El Sereno are documented in the DEIR/DEIS to have minority communities that would be disproportionately impacted.** Page 3.3-66/67 states that the Build Alternatives "would not cause disproportionately high and adverse effects on any minority or low-income populations under Executive Order 12898 regarding environmental justice." The graphic below shows the extent of the environmental justice population census tracts just in the area north of the SR-60 and South of the I-10 along the I-710 Freeway. An adequate I environmental justice analysis must be conducted and presented for review to the public.

Map 9.



Graphic from DEIR/EIS showing the census tracts with "environmental justice population percentage substantially greater than the county average.

10

16. **There was a clear lack of public participation and community outreach by Caltrans and Metro to East L.A. in the process of developing the Light Rail (LRT) Alternative.**
    a. This alternative appears to have been a surprise to many in East L.A., indicating a lack of community engagement by Caltrans on this alternative. There are significant environmental justice issues with the LRT alternative, such as (1) the LRT would be elevated in East L.A. but be in an underground tunnel in wealthier parts of the County, and (2) it would put an elevated rail line down a very popular street in East L.A. See map below.

Map 10. The Light Rail alternative would be "aerial" (elevated) (shown in blue below) in East L.A. and would be underground (pink) in other communities, including Pasadena.

b. Significant effects are identified in the DEIR/EIS about this alternative, which would displace numerous businesses and "adversely affect the community character and cohesion of this part of East L.A.," which we note is 97% Latino.
c. In addition, the LRT alternative would cause permanent noise level increases at the Roybal Comprehensive Center, Catholic Mission of Soledad Church, Soledad Enrichment Action, East L.A. Education Center and Casa Maravilla (East L.A.), as well as Cal State L.A. (See page 3.3-33 of the Community Impacts report).
d. Many aspects of including this alternative, the lack of community awareness about it, and selection of a location that would adversely affect community cohesion and community character, indicate insensitivities by Caltrans and Metro to the East L.A. Latino community – an environmental justice issue. If this alternative is selected, a new stand-alone DEIR/DEIS on this alternative should be developed that includes extensive consultation with the East L.A. community.

For the reasons documented above, we request that the DEIR/DEIS be redone and recirculated for public review. Thank you for your consideration of our comments.

L-31-1

Caltrans and Metro thank the commenter for providing their input. The commenter's opposition to Design Options 3A and 3B is acknowledged and included in the project record. Due to public and agency input, Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), has identified Alternative 1 (No Build) as the Preferred Alternative. Please refer to Section 1.1 of this appendix for further discussion on the identification of the Preferred Alternative.

L-31-2

Please refer to Section 1.8 of this appendix for more information regarding Motion 22.1 and Community Alternative 7.

L-31-3

It should be noted that the area in which a cap park is being developed over Route 101 is depressed below grade, which makes "capping" and enclosing the freeway structurally feasible. The I-710 freeway through East Los Angeles is at-grade. Enclosing the existing freeway with a cap design would entail a massive new structure that would likely have substantial environmental impacts, including visual, stormwater, and others. Therefore, a freeway cap in this area is infeasible.

L-31-4

The Health Impact Assessment (HIA) requested by the commenter was not conducted for the project because these types of assessments are an emerging practice in the transportation sector in the United States. Neither FHWA nor Caltrans currently has an approved methodology addressing the health impacts of freeways. Currently, State Departments of Transportation generally have not yet begun to implement HIAs or related tools for transportation planning, with some exceptions. For example, San Francisco's Department of Public Health has employed the use of HIAs in evaluating the health impacts of transportation projects. The State of Massachusetts passed a law requiring HIAs on new transportation projects, and at least one is known to be complete (the McGrath Highway Corridor HIA). In addition, Caltrans Division of Research and Innovation is actively investigating the use of HIAs for transportation planning and potential applicability to Caltrans projects.[11] However, it should also be noted that there are

[11] Caltrans Division of Research and Innovation. Preliminary Investigation. 2011. Transportation-Related Use of Health Impact Assessments and Similar Tools. August 5, 2011. Website: http://www.dot.ca.gov/research/researchreports/preliminary_investigations/docs/public_health_ preliminary_investigation_8-5-11_revised.pdf (accessed June 25, 2018).

limitations associated with the preparation and use of HIAs. According to an article published in 2000 in the British Medical Journal, "Currently there is neither an accepted gold standard nor even a simple, reliable, and evaluated method for carrying out health impact assessment" and "Several issues are unresolved in the methodology of health impact assessment…causal pathways are so complex that it is not often possible to say if an outcome will definitely be good or bad for the health of a population…The current evidence base for many health determinants is inadequate for accurately informing a process of assessment."[12] Therefore, the preparation of an Air Quality/Health Risk Assessment for the I-710 Corridor Project was an effort to respond to the requests of the I-710 Corridor communities to study health-related impacts, while also ensuring the empirical analyses performed in support of the EIR/EIS process are factual and based on sound scientific, analytical, and/or engineering judgment.

Specific impacts and proposed mitigation for the build alternatives related to air quality can be found in Section 3.13 of this Final EIR/EIS.

L-31-5

Please refer to Section 1.2 of this appendix for an overview of the community participation that has occurred to date for the project. The East Los Angeles Local Advisory Committee (LAC) has met regularly over the life of the project, and was briefed on the conceptual designs for Design Options 3A and 3B, prior to the development of the analysis of impacts included in the RDEIR/SDEIS. However, as stated in Response to Comment L-31-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, Design Option 3A is no longer under consideration.

L-31-6

The commenter's opposition to the acquisition of properties and businesses is acknowledged and included in the project record. However, as stated in Response to Comment L-31-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, no acquisition of property will be necessary.

L-31-7

As stated in Response to Comment L-31-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, the Preferred Alternative (Alternative 1 No Build) would not result in relocations and associated community impacts within unincorporated East Los Angeles.

[12] U.S. National Library of Medicine, National Institutes of Health. National Center for Biotechnology Information, Health Impact Assessment. Website: https://www.ncbi.nlm.nih.gov/pmc/articles/ PMC1118057/ (accessed June 28, 2018).

L-31-8

Specific impacts regarding air quality, noise, and traffic, as well as proposed measures to mitigate those impacts related to the build alternatives, are included in Sections 3.13, 3.14, and 3.5, respectively, in this Final EIR/EIS. Construction impacts related to the build alternatives are discussed in Section 3.24. Impacts resulting from the construction or operation of the build alternatives have been disclosed and measures proposed to address these impacts in accordance with CEQA and NEPA. It should be noted that neither CEQA nor NEPA require that existing conditions be improved upon as requested in this comment; rather the purpose of an EIR/EIS is to provide information to decision-makers regarding the consequences of a decision to approve or not approve a project. The focus of any EIR/EIS is to evaluate the potential impacts of a proposed project, evaluate alternatives, and identify feasible mitigation measures where impacts are identified.

L-31-9

Please refer to Section 1.2 of this appendix for more information regarding the public circulation period established for the project.

L-31-10

Please refer to Section 1.2 of this appendix regarding why Caltrans did not extend the public comment period beyond 90 days.

L-31-11

Because the community of East Los Angeles is an unincorporated area of Los Angeles County, the information contained in the County's parcel assessor lookup database (maps.assessor.lacounty.gov) lists addresses within unincorporated areas of the County as "Los Angeles," which was used in Appendix L, Parcel Acquisitions Under Alternatives 5C and 7, of the RDEIR/SDEIS. The entries within Appendix L have been clarified in this Final EIR/EIS to more accurately describe their location for the reader. In addition, the number of displaced units and persons under Alternative 7 has been clarified and corrected in the document where applicable.

L-31-12

It is assumed the commenter is referring to the property located at 755 S. Sydney Drive, which is shown on the Los Angeles County Assessor Portal to have an underlying land use code of 3100 (Industrial, light manufacturing). As indicated on the Existing Land Use Map (Figure 3.1-1), the portion of S. Sydney Drive in this area is classified industrial according to SCAG 2012 land use data, although residential uses may be allowed/permitted on such land use designations. This is not erroneous; rather, it may be an instance of development that is not in conformance with the underlying land use zoning, or may have secured a variance or permit in order to do so

legally. Although the No Build Alternative has been selected as the Preferred Alternative and no displacement of this parcel would occur, the parcel located at 755 S. Sydney Drive would not have been displaced under any of the I-710 build alternatives or design options either.

L-31-13

Caltrans and Metro thank the commenter for this information. The property located at 626 S. Sydney Drive in East Los Angeles was originally identified as being a five-unit property in the Draft Relocation Impact Report; however, it is acknowledged that the property contains ten units. No displacement of residents or businesses from the community of East Los Angeles will occur under the Preferred Alternative (No Build Alternative).

L-31-14

It is important to note that the No Build Alternative has been selected as the Preferred Alternative and there would be no displacements of businesses or residents within East Los Angeles as a result. However, the replacement area for the build alternatives included the displacement communities as well as adjacent cities and communities along the I-710 Corridor. The search for replacement housing was confined to this replacement area, and did not include (for example) the entire City of Los Angeles. The replacement area map included as Appendix A to the *Draft Relocation Impact Report* shows the location of potential replacement sites along the I-710 Corridor. The community of East Los Angeles was included on the replacement area map as a portion of unincorporated Los Angeles County and a number of potential replacement sites were identified within East Los Angeles. Appendix E to the *Draft Relocation Impact Report* listed specific replacement dwellings for sale and for lease and included a number of potential replacement residences within the three zip codes that comprise East Los Angeles.

L-31-15

The commenter is correct in that the VIA Tables 8.1 and 8.2 are missing an explanation/table note to explain that the values in the Alternative 7 columns for Key Views 24 and 25 represent Design Options 3A and 3B. However, Tables 3.6-1 and 3.6-2 in the Draft EIR/EIS do include notes that read "…For Key View 24 and Key View 25, Alternatives 5C and 7 have the same Proposed Visual Quality ratings, which are represented in the table under the Alternative 5C columns, and the Proposed Visual Quality ratings for Design Options 3A and 3B are represented in this table under the Alternative 7 columns.

L-31-16

When the document was initially posted on the Caltrans website, the comment link was posted near the bottom of the page, below the links to download the RDEIR/SDEIS and accompanying technical studies. After some feedback from people who were unable to locate the link, it was placed at the top of the page as well for ease of use. Caltrans and Metro did not receive any complaints from others that the link to the main PDF containing the RDEIR/SDEIS was not functioning properly. After it was posted, the link was tested to ensure that the document rendered properly.

L-31-17

Metro and Caltrans acknowledge that the comment form provided for those commenting online was not able to accept attachments, for online security and functionality purposes. However, this feedback was provided to Metro and Caltrans management teams, who allowed for this comment and attachments to be provided via email. In the future, Metro and Caltrans will look into the feasibility of accepting PDF or other forms of attachments to comments via online portal. However, Metro and Caltrans respectfully disagree that this minor limitation in functionality precluded residents of East Los Angeles to fully take part in the public review process of the RDEIR/SDEIS.

L-31-18

The Study Area was defined by the potential areas of impact that could result from the build alternatives, both directly and indirectly. Extension of the Study Area to include the entirety of a community's boundaries without regard for the actual impacts of a project would be inconsistent with Caltrans' guidance for determining the boundaries for a study area, and could exaggerate the appearance of impact analysis results in a potentially misleading way. The potential effects of the SR-710 North Project in combination with the impacts of the I-710 Corridor Project are discussed in more detail in Section 3.25, Cumulative Impacts, of this Final EIR/EIS. It is important to note that in November 2018, Caltrans approved the Final EIR/EIS for the SR-710 North Project, which identified the TSM/TDM Alternative as the Preferred Alternative. Generally, improvements included in the scope of the TSM/TDM Alternative that would occur within East Los Angeles include ITS improvements, transit refinements, and active transportation improvements, and the potential for cumulative impacts resulting from these types of improvements are minimal.

L-31-19

Although the general project Study Area as shown in Figure 1.1-2 of the RDEIR/SDEIS terminates at the SR-60, several resource-specific study areas were defined. The air quality analysis evaluates impacts to three distinct study areas: along the I-710 freeway itself, the Area

of Interest, which extends beyond the general project Study Area to north of I-10, east of I-605, west of I-110, and south into the Pacific Ocean, and the South Coast Air Basin (Basin), which encompasses Los Angeles, Orange, Riverside, and San Bernardino Counties either partially or in full. Impacts of various air quality pollutants were analyzed for each of these study areas where applicable.

Noise impacts were determined based on existing noise monitoring, projected traffic levels, horizontal and vertical alterations to the existing highway, traffic mix, topography, and other variables like ground type.

The traffic impact analysis area extended to include several dozen local intersections, some over two miles from the I-710 mainline (for example, the Garfield Avenue and Washington Boulevard intersection in the City of Commerce was analyzed for impacts and is 2.3 miles from the I-710).

An analysis of impacts of the SR-710 North Project was included in Section 3.25, Cumulative Impacts, of the RDEIR/SDEIS. Caltrans and Metro both respectfully disagree that any impacted portion of East Los Angeles, or any community with proximity to I-710, was omitted from the impact analysis and disclosure required under CEQA and NEPA.

L-31-20

Please refer to Response to Comment L-31-4 for an explanation of why an HIA was not conducted for the project. A number of analyses unique for a roadway project In California have been included in the AQ/HRA (emission impacts on non-710 roadways, near-roadway concentration impacts, near-roadway health risks (cancer risk, acute and chronic non-cancer air toxics risks), and qualitative assessments of ultrafines and PM mortality) and EIR/EIS (health risk pathways for each resource area). The quantitative AQ/GHG/HRA results are presented as emissions, concentrations, cancer risk, and health hazard indices (acute and chronic).

L-31-21

As stated in the Environmental Justice section in Section 3.3.3, Community Impacts, of the RDEIR/SDEIS and this Final EIR/EIS, the analysis concludes that there would be a disproportionate adverse effect to minority and low-income populations within the I-710 Corridor, and proposes mitigation to address the effects of the build alternatives (refer to Measures C-6 through C-8 in Section 3.3.3.7 of the RDEIR/SDEIS and this Final EIR/EIS). Should a build alternative be selected as the Preferred Alternative, the mitigation proposed would be applicable to East Los Angeles, as an environmental justice community. The commenter does not provide specificity about how impacts to East Los Angeles are not adequately addressed or how the disproportionate impacts were not addressed in a meaningful manner. Please note that a determination of disproportionate and adverse effects to environmental justice populations is not

made individually for each relevant community; rather, a project-wide determination of disproportionate adverse impacts is made. Since the No Build Alternative has been selected as the Preferred Alternative, the adverse impacts associated with environmental justice considerations for the build alternatives would not occur. However, some beneficial effects would also not occur, including improvements to air quality after construction is complete, and the provision of the "Community Health Benefit Program" that is included within each build alternative.

L-31-22

Please refer to Response to Comment L-31-5. The set of Design Options presented in the RDEIR/SDEIS were only options, and the design of the build alternatives could function independently of those options. However, as stated in Response to Comment L-31-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, recirculation of the document is unnecessary to remove alternatives or options from consideration.

L-31-23

The impacts of other planned projects that may have overlapping impact areas or might experience impacts simultaneously with the I-710 Corridor Project build alternatives were analyzed in Section 3.25, Cumulative Impacts, of the RDEIR/SDEIS. The SR-710 North Project was included in the list of cumulative projects and analyzed accordingly.

L-31-24

Please refer to Responses to Comments L-31-4 and L-31-20 for an explanation of why an HIA was not conducted for the project. An analysis of ultrafine particulates (UFPs) was done utilizing exhaust $PM_{2.5}$ as an available surrogate, and the AQ/HRA did discuss the limitations of using exhaust $PM_{2.5}$ as a surrogate for UFPs (refer to Section 4.6, Ultrafine Particles, of the AQ/HRA technical report). Specifically, "information on UFP is limited at this time and is an area of active research. For example, physical transient behaviors such as particle growth and accumulation complicate the task of elucidating UFP concentration-response functions. Also, the existing state of knowledge does not yet support the derivation of reliable UFP emission models that account for the particulate growth and accumulation phases. Dispersion modeling of UFPs would also require additional information on the rate of UFP coagulation and absorption so that concentrations can be calculated. Given the lack of information to quantify emissions, dispersion, exposure, and health response to exposure, UFP emissions from the proposed project alternatives cannot be quantified. However, a qualitative analysis was performed using

$PM_{2.5}$ exhaust emissions and exposure as a surrogate for UFP exposure to assess the incremental impacts of the project alternatives as compared to the baseline."[13]

L-31-25

Please refer to Response to Comment L-31-22 regarding Design Options 3A and 3B.

L-31-26

Actual accident data and comparisons only represent safety concerns associated with existing conditions as they are based on accident data that have been already collected and reported on I-710. These same methods cannot be utilized to forecast safety rates for a future design condition that does not yet exist. They also lack specificity with regard to specific hot spot locations. However, what can be observed is that accidents that occur on I-710 tend to cluster at the interchanges (ramps) and the merge and diverge locations where the ramps interface with the I-710 mainlines. The examination of the elimination of vehicle operational conflict points is a useful surrogate measure, which allows for an order of magnitude assessment of the relative safety benefits of different design configurations as compared to the No Build Alternative and which takes into account both roadway geometrics and projected traffic volumes under future conditions.

While Design Options 3A and 3B were predicted to eliminate existing weave and merge conflict points on I-710 between I-5 and SR-60, there were other trade-offs associated with these Design Options to consider, including increased right-of-way requirements. It is important to note that the No Build Alternative has been selected as the Preferred Alternative and therefore, Design Options 3A and 3B have not been included as part of the Preferred Alternative.

L-31-27

The comparison of actual accident rates with average accident rates on I-710 was performed in accordance with Caltrans policies and procedures, which represent the state of the practice for analytical comparisons of this type. This evaluation takes into account similarities associated with traffic volumes, roadway geometrics (e.g., type and class of roadway facility, type and class of interchange configuration), and setting (e.g., rural, suburban, urban) that allows for an "apples to apples" comparison with I-710 through East Los Angeles. Caltrans maintains a robust and comprehensive database of this information of all reported accidents by law enforcement on state roadway facilities, which is actively maintained and frequently updated. A sufficient number of data points is necessary to produce the accident rate averages, and collection and

[13] AQ/HRA, page 38.

reporting methods must be consistent, in order to have confidence in these statistical comparisons.

L-31-28

As stated in Response to Comment L-31-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, Design Options 3A and 3B have been removed from consideration. As a result, the acquisitions noted within this comment would not occur. No displacement of businesses or residences would occur in East Los Angeles under the Preferred Alternative.

L-31-29

Please refer to Response to Comment L-31-28 regarding displacements of businesses and residences in East Los Angeles as a result of the build alternatives.

L-31-30

Please refer to Response to Comment L-31-28 regarding relocations associated with the build alternatives. In addition, please note that per Caltrans' Relocation Assistance Program, eligible persons displaced as a result of a transportation project are entitled to receive relocation assistance as well as rent differential payments, if applicable.

L-31-31

As stated in Response to Comment L-31-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no displacements of undocumented persons.

L-31-32

Please refer to Response to Comment L-31-14 regarding displacements of businesses or residents within East Los Angeles as a result of the build alternatives.

L-31-33

Please refer to Response to Comment L-31-13 regarding displacements of businesses or residents within East Los Angeles as a result of the build alternatives.

L-31-34

Please refer to Response to Comment L-31-22 regarding displacements of businesses or residents within East Los Angeles as a result of the build alternatives.

L-31-35

The commenter's opposition to the loss of jobs resulting from Design Options 3A and 3B in East Los Angeles is acknowledged and included in the project record. However, as stated in Response to Comment L-31-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, Design Options 3A and 3B have been removed from consideration and no businesses within East Los Angeles would be displaced, therefore no job losses would occur.

L-31-36

Please refer to Response to Comment L-31-7 regarding displacements of businesses or residents within East Los Angeles as a result of the build alternatives. Please refer to Section 1.5 of this appendix for more information on the methodology used to locate replacement housing, should a build alternative be selected as the Preferred Alternative.

L-31-37

Please refer to Response to Comment L-31-14 regarding displacements of businesses or residents within East Los Angeles as a result of the build alternatives. Please refer to Section 1.5 of this appendix for more information on the methodology used to locate replacement housing, should a build alternative be selected as the Preferred Alternative.

L-31-38

Caltrans respectfully disagrees that the RDEIR/SDEIS is deficient. Contrary to what is stated in the comment, the RDEIR/SDEIS analyzed air quality impacts to the residents of East Los Angeles. The air quality analyses presented in Section 3.13, Air Quality, of the RDEIR/SDEIS reports findings for various geographic areas including: the I-710 Corridor; the Area of Interest; and the South Coast Air Basin (Basin). Refer to Figure 1-2 of the AQ/GHG/HRA Technical Study for a depiction of these study areas. Since East Los Angeles is located in the vicinity of the I-710 freeway, the incremental impacts of the criteria air pollutant emissions and mobile source air toxic emissions were evaluated at this location. Gridded emission maps showing these impacts for NO_X, PM_{10}, $PM_{2.5}$, and DPM in the Area of Interest, which includes East Los Angeles, are presented in Appendix Q of the RDEIR/SDEIS. Further, ambient air quality impacts and health risk impacts of the I-710 freeway on areas in the vicinity of the I-710 freeway (including East Los Angeles) were also evaluated and discussed in Section 3.13, Air Quality, of the RDEIR/SDEIS and in this Final EIR/EIS.

As discussed in Section 3.13, Air Quality, in the RDEIR/SDEIS and in this Final EIR/EIS, all build alternatives would generally improve air quality and reduce public health risk. Along I-710, air quality would be improved and public health risk would be reduced at most locations, but

there are a few near-roadway locations where there would be an increase in certain emissions but no increase in cancer risk compared to the 2012 Baseline. When compared to the 2035 No Build Alternative, both build alternatives would reduce cancer risk at most locations; however, a small increase in cancer risk would occur at some locations within 100 meters of I-710. For Alternative 5C, the maximum increase in risk would be approximately three in one million. The primary location of the increased risk for Alternative 5C is along a small portion of I-710 just south of SR-60. For Alternative 7, the increase in risk would be less than one in one million.

In addition to the information on health risk presented in the RDEIR/SDEIS, an East Los Angeles LAC meeting was held in August 2017, which included the following tabulation of health risk assessment results for the I-710 Corridor and within East Los Angeles.

Scenario	Maximum Modeled Cancer Risk*	Maximum Modeled Cancer Risk* in East Los Angeles
2012 Baseline	1,421	624
2035 Alternative 1	57	21
2035 Alternative 5C	45	18
2035 Alternative 7, 7-ZE	30	17

* Cancer risk in one million

Measures AQ-2 and AQ-3 are included as environmental commitments of the build alternatives (refer to Appendix F, Environmental Commitments Record, of this Final EIR/EIS) to reduce exposure to emissions at near-roadway locations, should a build alternative be selected as the Preferred Alternative. Should a build alternative be selected as the Preferred Alternative, Measure AQ-2 would provide for the installation of filters on the ventilation systems of schools near I-710, including Humphreys Avenue Elementary School. The air filters would remove pollutants from indoor air, where school children spend the majority of their time while at school. Should a build alternative be selected as the Preferred Alternative, Measure AQ-3 would provide for the installation of solid barriers and installation of vegetation where feasible and where soundwalls are not already proposed to disperse pollution and reduce pollutant concentrations downwind. Additionally, the build alternatives included programmatic components to help improve air quality and public health in the I-710 Corridor. Those programmatic components are outlined in more detail in Section 2.3.2.1 of this Final EIR/EIS and, since the No Build Alternative has been selected as the Preferred Alternative, are no longer a part of the I-710 Corridor Project. In addition, please refer to Section 1.10 of this appendix for more information on the Community Health Benefit Program.

In addition, the California Air Resources Board (CARB) and the South Coast Air Quality Management District (SCAQMD) are implementing programs and strategies to improve air quality near freeways. CARB is implementing several regulations such as the Truck and Bus Regulation, Pavley Standards, and Advanced Clean Cars Program to reduce emissions associated with vehicles traveling on the freeway. Besides this regulation, CARB is also in the

process of developing other regulations that target buses and heavy-duty trucks such as the Innovative Clean Transit Regulation and the Advanced Clean Trucks Regulation. The SCAQMD is also implementing several control measures under the 2016 Air Quality Management Plan to encourage the deployment of ZE/NZE technologies.

The commenter's concern regarding air quality impacts to environmental justice populations is acknowledged and included in the public record. The EIR/EIS complies with the NEPA requirement that a project must evaluate impacts to environmental justice populations and develop mitigation measures specifically to address potential disproportionately high and adverse effects to minority and/or low-income communities under the build alternatives. As discussed in Section 3.3.3, Environmental Justice, of the RDEIR/SDEIS and this Final EIR/EIS, although there are air quality benefits associated with the build alternatives, and these benefits would be experienced by the environmental justice populations that predominantly reside near the I-710 freeway, there are also near-roadway adverse impacts that would disproportionately burden environmental justice populations. Should a build alternative be selected as the Preferred Alternative, Measures AQ-2 and AQ-3, as described above in more detail, would reduce exposure of environmental justice to populations to increases in air pollutant concentrations. However, even when considering these mitigation measures in addition to the beneficial effects of the build alternatives on air quality and public health, both I-710 Corridor Project build alternatives could potentially have an adverse and disproportionate air quality impact to environmental justice populations in localized areas within the I-710 Corridor. As described in Section 3.3.3 of the RDEIR/SDEIS, Alternative 7 would have a greater impact than Alternative 5C. Measure C-7 was included in the RDEIR/SDEIS and this Final EIR/EIS to further reduce air quality impacts to environmental justice populations, should a build alternative be selected as the Preferred Alternative. Should a build alternative be selected as the Preferred Alternative, Measure C-7 would provide funding for targeted improvements that would improve air quality and public health, and include (but is not limited to) the installation or upgrade of filtration systems at environmental justice population locations along I-710. Since the No Build Alternative has been selected as the Preferred Alternative, the adverse impacts associated with environmental justice considerations for the build alternatives would not occur. However, some beneficial effects would also not occur, including improvements to air quality after construction is complete, and the provision of the "Community Health Benefit Program" that is included within each build alternative.

L-31-39

Contrary to the statement in this comment, inclusion of the BNSF Railroad Southern California International Gateway (SCIG) project is appropriate to include for the 2035 No Build Alternative, as it was a part of a collaborative process with the I-710 Technical Advisory Committee, as documented in the RDEIR/SDEIS (p. 1-31).

Regarding the 2016 court decision that found that the SCIG EIR violated CEQA, a superseding January 12, 2018 Appeals Court decision reversed most of the objections in the 2016 court decision (e.g., confirming the adequacy of the final environmental impact report regarding emissions at the Hobart railyard, greenhouse gas emissions, noise and traffic impact) and identified ways to resolve the one remaining CEQA issue (i.e., reanalysis of modeled PM concentrations at a certain location). On April 11, 2018, the California Supreme Court denied a petition to review the Court of Appeal's January 2018 decision.

L-31-40

The expansion of the I-710 freeway in East Los Angeles area would be minimal for both build alternatives compared to the existing roadway (and the entire freeway system and other paved areas in the South Coast Air Basin); hence increases in heat due to additional concrete area would be negligible in terms of incremental impacts. Section 4.3 in the RDEIR/SDEIS and this Final EIR/EIS discusses climate change in the context of the 2035 build alternatives.

L-31-41

Please refer to Response to Comment L-31-4 for more information on HIAs. In addition to specific air quality-related impacts, environmental justice-related impacts and associated mitigation for the build alternatives are addressed in Section 3.3.3 of this Final EIR/EIS.

L-31-42

Caltrans respectfully disagrees that the impacts of air pollution were not adequately studied as suggested in the comment. Sections 4.5 and 4.6 of the AQ/GHG/HRA Technical Study provide qualitative assessments for PM Mortality and Morbidity, and Ultrafine Particles (UFP) respectively. Both of these sections discuss the health impacts associated with PM emissions including UFP and cite the applicable studies mentioned in this comment as well as several other studies. These sections also qualitatively evaluate the incremental impacts of the project alternatives on PM Mortality and Morbidity, as well as health effects of UFP as compared to the project baselines. This information was summarized in Section 3.13.3.4 of the RDEIR/SDEIS.

As stated in Response to Comment L-31-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, Design Options 3A and 3B were not selected by the Metro Board to be carried forward as part of the Preferred Alternative. Regardless, as stated in Section 2.3.3.3 of the RDEIR/SDEIS, Design Options 3A and 3B extend from the north of the Washington Boulevard interchange to the SR-60 interchange, which is a distance of approximately two miles through the City of Commerce and the unincorporated areas of East Los Angeles. The traffic volumes travelling through the I-710 Corridor in Design Options 3A and 3B would be similar to those in the respective Build Alternatives 5C and 7, the only difference being that they are reconfigured differently. Thus, localized air quality and health risk impacts of

Design Options 3A and 3B would be similar or lower that the respective Alternatives 5C and 7 because (1) overall traffic levels and emissions are similar for the design options and related Alternatives 5C or 7, (2) the traffic in Design Options 3A and 3B would be spread out over a larger geographic area as compared to the Alternatives 5C and 7 (i.e., lower emissions density), and (3), freeway mainline emissions dominate local impacts.

L-31-43

Please refer to Response to Comment L-31-13 regarding displacements of businesses or residents within East Los Angeles as a result of the build alternatives.

L-31-44

The commenter's opposition to Design Options 3A and 3B are acknowledged and included in the project record. However, as stated in Response to Comment L-31-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, Design Options 3A and 3B have been removed from consideration. Please refer to Section 1.1 of this appendix for a discussion on the identification of the Preferred Alternative. Please refer to Response to Comment L-31-42 for a discussion of the air quality impacts of Design Options 3A and 3B.

L-31-45

Design Options 3A and 3B have not been carried forward as part of the Preferred Alternative.

L-31-46

Total emissions for NO_X, PM_{10}, and $PM_{2.5}$, and DPM in the entire Area of Interest as compared to the 2012 Baseline and 2035 Alternative 1 (No Build Alternative) are presented in the gridded mass emission plots (Figures 4-1a to 4-2c in Appendix Q of the RDEIR/SDEIS). The gridded emission maps show that emissions primarily decrease throughout the Area of Interest for NO_X, PM_{10}, and $PM_{2.5}$, when compared to the 2012 Baseline and 2035 Alternative 1 (No Build). Some increases are seen for $PM_{2.5}$ and PM_{10} at grid cells, which are very close to the freeway. However, these increases are less than SCAQMD Significance Criteria.

In the area near Calvary Cemetery, around which the proposed jogging path would be constructed, emissions would primarily decrease, with the exception of PM10, which would have an increase very close to the freeway. However, the increase would be less than SCAQMD Significance Criteria. In addition, air quality avoidance, minimization, and mitigation measures were included in Section 3.13.4 of the RDEIR/SDEIS and this Final EIR/EIS to minimize air quality and health risk impacts associated with the build alternatives. However, as stated in Response to Comment L-31-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no air quality impacts to the proposed jogging path beyond the existing condition and what is forecast for the 2035 No Build Alternative.

L-31-47

Total emissions for NO_X, PM_{10}, and $PM_{2.5}$, and DPM in the entire Area of Interest as compared to the 2012 Baseline and 2035 Alternative 1 (No Build Alternative) are presented in the gridded mass emission plots (Figures 4-1a to 4-2c in Appendix Q of the RDEIR/SDEIS). The gridded emission maps show that emissions primarily decrease throughout the Area of Interest for NO_X, PM_{10}, and $PM_{2.5}$, when compared to the 2012 Baseline and 2035 Alternative 1 (No Build). Some increases are seen for $PM_{2.5}$ and PM_{10} at grid cells which are very close to the freeway. However, these increases are less than SCAQMD Significance Criteria.

In the area near the proposed community park at the intersection of Eagle Street and S. Sydney Drive, emissions would primarily decrease, with the exception of PM10, which would have an increase very close to the freeway (up to 50 meters for Alternative 5C and 150 meters for Alternative 7, as compared to 2012 baseline [Figures 4-3b, 4-3c, 4-4b and 4-4c of the AQ/GHG/HRA Technical Report]). Beyond 150 meters from the I-710 freeway, no increases in PM_{10} impacts above the SCAQMD Significance Criteria would occur. In addition, air quality avoidance, minimization, and mitigation measures were included in Section 3.13.4 of the RDEIR/SDEIS and this Final EIR/EIS to minimize air quality and health risk impacts associated with the build alternatives. However, as stated in Response to Comment L-31-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no air quality impacts to the proposed community park at the intersection of Eagle Street and S. Sydney Drive beyond the existing condition and what is forecast for the 2035 No Build Alternative.

L-31-48

Design Options 3A and 3B have not been carried forward as part of the Preferred Alternative.

L-31-49

Design Options 3A and 3B have not been carried forward as part of the Preferred Alternative. Please refer to Response to Comment L-31-42 for a discussion of air quality impacts of Design Options 3A and 3B.

L-31-50

Design Options 3A and 3B have been removed from consideration based on feedback received from the community. Under the Preferred Alternative (Alternative 1 No Build), the DaVita Dialysis Center would not be displaced.

L-31-51

Should a build alternative be selected as the Preferred Alternative, Measure AQ-1, as described in Section 3.13.4 of this Final EIR/EIS, would require a funding contribution to be provided to the South Coast Air Quality Management District (SCAQMD) for the design and construction of four new air quality monitoring stations within the I-710 Corridor. The specific locations of each monitoring station would be determined in coordination with SCAQMD, as the agency tasked with regulation and monitoring of air pollution; therefore, a specific commitment to a location could not be made at the time of the RDEIR/SDEIS. However, as stated in Response to Comment L-31-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, Measure AQ-1 will not be implemented.

Please note that, should a build alternative be selected as the Preferred Alternative, Measure AQ-2 would provide installation of air filtration systems at schools located within 0.25 mile of I-710 within the Study Area that currently do not have HEPA-type air filtration systems, which includes Ford Elementary School and Humphreys Avenue Elementary School. Marianna Avenue Elementary, Alphonso B. Perez Special Education Center, Brooklyn Avenue Elementary School, and Hilda L. Solis Learning Academy are beyond the northern boundary of the Study Area and therefore were not included in the provisions of Measure AQ-2. The distance of 0.25 mile was chosen as that is where the maximum air quality impacts resulting from the build alternatives are expected to occur. However, other schools may be eligible to submit applications under a separate process for funding for filtration projects as part of the I-710 Corridor Community Health Benefit Program. Please refer to Section 1.10 of this appendix for more information on the Community Health Benefit Program.

Finally, as stated in Measure AQ-3, should a build alternative be selected as the Preferred Alternative, solid walls and vegetative barriers would be installed where feasible to increase dispersion of air pollutants and reduce air quality impacts related to the build alternatives. However, as stated in Response to Comment L-31-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, Measure AQ-3 will not be implemented.

L-31-52

It is important to note that the RDEIR/SDEIS analyzed the noise impacts that would occur as a result of the build alternatives, in accordance with CEQA guidelines 15002(a)(1), which states that the basic purpose of CEQA is to inform decisionmakers and the public about the potential, significant environmental effects of proposed activities, and NEPA requirements for “Federal Agencies to assess the environmental effects of their proposed actions prior to making decisions”[14]. In accordance with the Caltrans Traffic Noise Analysis Protocol, all freeway noise impacts that would occur as a result of the build alternatives have been disclosed, and

[14] National Environmental Policy Act (NEPA.GOV). Council on Environmental Quality. Website: https:// ceq.doe.gov/ (accessed July 19, 2018).

acoustically feasible and reasonable sound walls have been recommended for construction, should a build alternative be selected as the Preferred Alternative,. An expanded noise study for all of East Los Angeles would be beyond the scope of CEQA and NEPA requirements for the I-710 Corridor Project.

L-31-53

All impacted receptors along Burger Avenue under both build alternatives and applicable design options were addressed in accordance with the Caltrans Traffic Noise Analysis Protocol. Soundwalls SW-516, SW-516A, SW-516B, and SW-517 were all deemed reasonable and feasible and, should a build alternative be selected as the Preferred Alternative, were recommended for construction at 14 feet in height to provide up to 9 dBA noise reduction for 142 homes, as was indicated in the RDEIR/SDEIS and this Final EIR/EIS. However, as stated in Response to Comment L-31-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, Design Options 3A and 3B are no longer under consideration.

L-31-54

It is important to note that soundwalls proposed for the build alternatives are not intended to eliminate freeway traffic noise; rather, they are intended to reduce freeway traffic noise. The reason for the seeming large increase in traffic noise is because the noise levels are predicted with the existing soundwalls having been removed in order to accommodate the freeway widening under the build alternatives. Should a build alternative be selected as the Preferred Alternative, every soundwall that would be removed for freeway widening under the build alternatives would be replaced in-kind or with a taller wall, and the actual increase in noise levels would be less than indicated after those soundwalls are built. Should a build alternative be selected as the Preferred Alternative, the new soundwalls, based on the detailed information provided in Table 3.14.3 of Section 3.14, Noise, of the Final EIR/EIS, would provide a net noise reduction of 4 to 7 dBA for most areas covered by SW-516, SW-516A, SW-516B, and SW-517. Only for a small area would the noise levels increase by 1-4 dBA, which would be slightly less than a readily noticeable increase in noise levels. Wherever noise impacts have been identified for the build alternatives, abatement strategies in the form of soundwalls have been identified. Other noise reducing measures, such as quieter pavement, are currently not Federally approved for use and funding. However, as stated in Response to Comment L-31-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no soundwalls constructed as part of the I-710 Corridor Project (other than those being constructed by Metro as early action projects).

L-31-55

In accordance with the Caltrans Traffic Noise Analysis Protocol, all freeway noise impacts that would occur as a result of the build alternatives have been disclosed, and acoustically feasible and reasonable sound walls have been recommended for construction that would abate those impacts, including SW-519. Also, please refer to Response to Comment L-31-54.

L-31-56

Please refer to Response to Comment L-31-54 regarding construction of soundwalls.

L-31-57

Please refer to Response to Comment L-31-54 regarding construction of soundwalls.

L-31-58

The design of SW-518 under Design Option 3A would have a different, longer on-ramp alignment that would place the top of the proposed soundwall at a higher elevation than that of SW-518 under the Alternative 5C base option. This difference in elevation would cause the second row of homes to benefit and reach a reduction in noise of 5 dBA, thereby making SW-518 under the Design Option cost-reasonable. The Calvary Cemetery is the primary land use and without a formalized memorial gathering area, cemeteries are not considered a noise-sensitive land use according to the Caltrans Traffic Noise Analysis Protocol, and were not evaluated for impacts.

L-31-59

Please refer to the Response to Comment L-31-54 regarding construction of soundwalls.

L-31-60

Please refer to the Response to Comment L-31-54 regarding construction of soundwalls.

L-31-61

Please refer to the Response to Comment L-31-54 regarding construction of soundwalls.

L-31-62

The Caltrans Traffic Noise Analysis Protocol, which was developed in accordance with 23 CFR 772, indicates that acoustical feasibility of a soundwall is an engineering consideration in which the barrier must be predicted to provide a minimum of 5 dBA noise reduction to the impacted receptors. Reasonableness has three factors: the noise reduction design goal (must provide at

least 7 dBA reduction to one or more receptors), the cost of noise abatement, and the viewpoints of the benefited receptors. Any soundwall that is part of a Type I or Federally-funded project must be both acoustically feasible and reasonable. This is summarized in Section 3.14.1.2 of this Final EIR/EIS.

L-31-63

Similar to the response provided for comment L-31-58, the design of the walls in question and their specific elevation would provide for a greater benefit under the Design Options 3A and 3B, due to the elevated structure. Design Options 3A and 3B are no longer under consideration.

L-31-64

In accordance with State and Federal policies, all acoustically feasible and reasonable soundwalls would have been recommended for construction as part of the build alternatives. However, SW-719 was not deemed reasonable because it did not meet the acoustical design goal and is cost-prohibitive. However, as stated in Response to Comment L-31-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no soundwalls constructed as part of the I-710 Corridor Project (other than those being constructed by Metro as early action projects).

L-31-65

All schools within the Study Area have been considered for impacts, and feasible and reasonable abatement was recommended where those impacts resulting from the build alternatives have been identified. All schools listed in this comment (with the exception of Ford Elementary and Humphreys Avenue Elementary) are beyond the limits of the Study Area (e.g., north of SR-60) or far enough from the I-710 mainline that noise impacts from the build alternatives would not occur. Under the build alternatives, two 16-foot high soundwalls were recommended at Ford Elementary School that would have provided noise reduction. The existing 12-foot high soundwalls at Humphreys Avenue Elementary School currently provide traffic noise abatement, and increasing the height of these soundwalls would not provide a noticeable noise reduction. However, as stated in Response to Comment L-31-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no soundwalls constructed as part of the I-710 Corridor Project (other than those being constructed by Metro as early action projects). It should be noted that noise reduction measures at local schools and other sensitive receptors or related sites may be considered eligible projects for funding under the Community Health Benefit Program, for which school districts would be encouraged to apply as a separate process from the I-710 Corridor Project. Please refer to Section 1.10 of this appendix for more information regarding the Community Health Benefit Program.

L-31-66

Under Metro's I-710 South Early Action Soundwall Program, five miles of new soundwalls along I-710 have been identified as well as seven miles of existing walls that can be aesthetically treated to match the new walls. Soundwalls that would have been constructed as part of the I-710 Corridor Project build alternatives would have included aesthetic enhancements where feasible and in accordance with Caltrans standards and the Aesthetics Master Plan, as described in more detail in Measures VIS-1 and VIS-4 in Section 3.6.4 of this Final EIR/EIS. However, as stated in Response to Comment L-31-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no soundwalls constructed as part of the I-710 Corridor Project (other than those being constructed by Metro as early action projects).

L-31-67

Due to the location of the Humphreys Avenue Elementary School as it relates to the build alternatives, additional noise abatement is not feasible. The existing soundwalls provide sufficient noise abatement to the school, and an increase in the soundwall height from 12 feet to 16 feet would not provide a discernable noise reduction to Humphreys Avenue Elementary School.

L-31-68

Please refer to Section 1.6 of this appendix for further discussion on parking details. These restrictions have been eliminated from further consideration since Alternative 1 (No Build Alternative) has been selected as the Preferred Alternative.

L-31-69

Caltrans and Metro welcome the comment to consider only ZE buses for the Rapid Bus Transit line through East Los Angeles included in the programmatic features for the build alternatives. Metro has already moved towards cleaner buses, which operate on recycled compressed natural gas and which reduce vehicle NO_X emissions to 90 percent lower than the current EPA limit of 0.2 grams per brake horsepower-hour. In 2017, the Metro Board adopted plans to transition to a 100 percent ZE bus fleet and issued contracts for the first phase of 95 electric buses. While Metro's fleet transition plan to ZE buses is contingent on continuous advancements in electric bus technology and a drop in vehicle prices as the technology develops, under the current proposal, the phased plan would reach its target of full zero emissions by 2030 (Metro Board Report No. 50, July 27, 2017.)

L-31-70

This comment notes that the Visual Impact Assessment prepared for the RDEIR/SDEIS referenced the Draft 2008 Los Angeles County General Plan; however, Section 3.1.2.2, Affected Environment, in Section 3.1, Land Use, of the RDEIR/SEIS appropriately referenced the 2015 Los Angeles County General Plan rather than the Draft 2008 General Plan. Further, the East Los Angeles Community Plan of 1988 is in fact incorporated under East Los Angeles and, as described in Section 3.1.2.3, Environmental Consequences, of the RDEIR/SDEIS, the build alternatives were found to be consistent with several of its goals. The East Los Angeles Form-Based Code Specific Plan does not contain any goals or policies that are relevant to the I-710 Corridor Project. However, Section 3.1 of the RDEIR/SDEIS has been revised to reflect that a stated goal of the East Los Angeles 3rd Street Plan is to improve mobility and transportation choices, which is consistent with the I-710 Corridor Project build alternatives.

L-31-71

Options 3A and 3B have been removed from consideration based on feedback from the community. The visual impacts associated with the elevated structure would not occur under the Preferred Alternative (Alternative 1 No Build).

L-31-72

Caltrans respectfully disagrees that the visual impact analysis undertaken for the project is flawed. The methodology utilized to evaluate the potential impacts of the build alternatives and determine proper mitigation measures is consistent with FHWA's January 2015 publication *Guidelines for the Visual Impact Assessment for Highway Projects*. However, as stated in Response to Comment L-31-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, Design Options 3A and 3B have been removed from consideration.

L-31-73

The selection of the key view locations and methodology of the Visual Impact Assessment is consistent with CEQA and NEPA requirements. The view from Key View 23 would be the same for Alternative 5C and Alternative 7 and moderate mitigation would be required (as depicted in the visual simulations for both build alternatives), should a build alternative be selected as the Preferred Alternative.

L-31-74

It is important to note that the Visual Impact Assessment performed for the project is intended to be a representative evaluation of visual impacts under the build alternatives, as it would be infeasible to evaluate every possible change in view along a 19-mile corridor. Design Options

3A and 3B have been removed from consideration and the associated visual impacts would not occur under the Preferred Alternative (Alternative 1 No Build).

L-31-75

Caltrans and Metro thank the commenter for providing this detailed comment. Design Options 3A and 3B have been removed from consideration and the associated visual impacts would not occur under the Preferred Alternative (Alternative 1 No Build).

L-31-76

Please refer to Response to Comment L-31-75 regarding visual impacts related to Design Options 3A and 3B.

L-31-88

Please refer to Response to Comment L-31-75 regarding visual impacts related to Design Options 3A and 3B.

L-31-89

A footnote has been added to Tables 3.6-1 and 3.6-2 of this Final EIR/EIS: "For Key View 24 and Key View 25, Alternatives 5C and 7 have the same Proposed Visual Quality ratings, which are represented in the table under the Alternative 5C columns, and the Proposed Visual Quality ratings for Design Options 3A and 3B are represented in this table under the Alternative 7 columns." However, based on community feedback, Design Option 3A is no longer under consideration since the No Build Alternative has been selected as the Preferred Alternative. As Alternative 7 has not been identified as the Preferred Alternative, Design Option 3B has also been removed from consideration.

L-31-90

The score referenced in the comment is applicable to Design Options 3A and 3B. As stated previously, the No Build Alternative has been selected as the Preferred Alternative and Design Options 3A and 3B have been removed from consideration.

L-31-91

As indicated in previous responses, Design Options 3A and 3B are no longer under consideration as part of the Preferred Alternative (Alternative 1 No Build).

However, it should be noted that under the build alternatives, the Level of Service (LOS) designation on I-710 would not change. In East Los Angeles, this section of I-710 between I-5 and SR-60 would operate at LOS F under the future No Build Alternative. And, under the Preferred Alternative, this segment of I-710 would remain at LOS F in 2035. However, given the severity of traffic congestion throughout the metropolitan region, there are different gradients of LOS F that can be quantified using alternative means. VISSIM traffic modeling software was utilized as an additional analysis tool for the highway capacity analysis to examine congestion bottlenecks in key areas along the I-710 Corridor for the PM peak hour in order to help inform the design process during development of the build alternatives. This VISSIM analysis shows that the auxiliary lanes included in the design of the build alternatives on I-710 would relieve the congestion bottleneck between I-5 and SR-60 to some extent. Vehicle density would be reduced and freeway speeds would still be low, but would improve by 3 mph in the southbound direction and 12 mph in the northbound direction, under Alternative 5C relative to the No Build Alternative in this congestion hot spot location in 2035. In addition, Tables 5-1, 5-2, 5-7, 5-8provided in the *I-710 Corridor Project Traffic Operations Analysis Report* (March 2017), demonstrate that levels of service on I-710 north of SR-60 would not be affected by Alternative 5C. Tables 5-1, 5-2, 5-10, and 5-11 provided in the *I-710 Corridor Project Traffic Operations Analysis Report* (March 2017), demonstrate that levels of service on I-710 north of SR-60 under Alternative 7 would be slightly worse in the northbound direction during the PM peak hour and slightly higher in the southbound direction during the AM and midday peak hours. As stated previously, the No Build Alternative has been selected as the Preferred Alternative and, although the impacts associated with Alternative 5C and 7 would not occur, the existing and forecasted congestion for the future No Build conditions would still occur.

L-31-92

The main purpose of the proposed freeway improvements under the build alternatives, as discussed in Section 1.2 of the RDEIR/SDEIS are to address congestion, design deficiencies, traffic operations, and safety concerns on I-710 as well as related air quality issues associated with the I-710 freeway. Over 185 local intersections were evaluated as part of this process to determine if the proposed freeway project improvements under the build alternatives would

result in traffic impacts to the arterial system, and if so, to identify mitigation. The number and locations of the study intersections were identified prior to the initiation of the traffic studies performed for the I-710 EIR/EIS, and were reviewed and approved by the I-710 Technical Advisory Committee. Approximately 24 of these traffic analysis intersections are located within East Los Angeles, more than any other local jurisdiction in the I-710 Study Area, with the exception of the City of Long Beach. Nearly half of the I-710 Corridor is located in the City of Long Beach.

Additionally, the component of the build alternatives are targeted to address mobility, safety, and congestion traffic concerns on the local arterial system within the I-710 Study Area is the I-710 Congestion Relief Program. The program is structured to provide the flexibility necessary to respond to local needs and issues. Should a build alternative be selected as the Preferred Alternative, this program would provide funding directly to local jurisdictions, including the County of Los Angeles acting on behalf of the community of East Los Angeles, to set priorities for congested intersections most influenced by the freeway system within the I-710 Study Area under future No Build conditions. The County of Los Angeles, working with Metro, would play a material role in identifying the need for improvements and in developing essential, competitive projects for the area. However, as stated previously, the No Build Alternative has been selected as the Preferred Alternative and therefore, the I-710 Congestion Relief Program would not be implemented by Caltrans as the Lead Agency under CEQA and NEPA and as the owner/operator of the I-710 freeway.

L-31-93

Please refer to Response to Comment L-31-92 regarding implementation of the I-710 Congestion Relief Program

L-31-94

Increasing capacity on the freeway under the build alternatives would, to a degree, reduce congestion on roadways. The additional capacity offered by the build alternatives would improve the traffic flow on I-710 and would shift some traffic from the congested local roadways in the I-710 Corridor to I-710. The proposed modernization of the freeway design included in both Alternative 5C and 7 would also improve traffic operations and safety, which would lead to fewer accidents than under the No Build Alternative. Studies have shown that about 25 percent of freeway congestion is a result of traffic incidents, so these elements of the build alternatives would also help offset congestion levels on I-710.

The issue of whether or not additional freeway capacity reduces traffic congestion refers to the concept of “induced demand”. Induced demand is very complex, involving various travel behavior responses, residential and business location decisions, and other factors that influence regional population and economic growth. While some of these responses may represent new

trips, much of the observed increase in traffic would come from trips that were already being made before the increase in highway capacity, or would reflect predictable behavior that is accounted for in travel demand forecasts.

The traffic volumes on I-710 through East Los Angeles are forecast to increase for both build alternatives as compared to the No Build alternative. The RDEIR/SDEIS disclosed the associated air quality and noise effects of these alternatives in East Los Angeles, along with the effect of these alternatives on mobility, in Sections 3.13 and 3.14, respectively.

L-31-95

There is no existing off ramp from I-710 to 3rd Street in the southbound direction. However, there is an on-ramp from 3rd Street to southbound I-710 in East Los Angeles. The closure of this existing on ramp was not considered as part of the build alternatives as it would eliminate an important access point for East LA residents in an area that already has limited access to the freeway system within this triangular portion of East LA that is bounded by the I-5, SR-60, and I-710.

L-31-96

Two design options were assessed in the RDEIR/SDEIS that would modify local access to I-710 in the East Los Angeles area. Design Options 3A and 3B would limit access to I-710 in the northbound direction from the Olympic Boulevard on-ramp and would shift the ramp termini from I-710 in the southbound direction from Eastern Avenue to Whittier Boulevard.

The detailed information included in the *I-710 Corridor Project Traffic Operations Analysis Report* (March 2017) and the *Intersection Traffic Impact Analysis Report* (March 2017) evaluated the effects that these modifications would have on twenty-four intersections examined on the local circulation network in East Los Angeles, which is surrounded by I-5, I-710 and SR-60.

These effects, along with concerns related to various environmental impacts including right-of-way impacts, were considered along with public comments received on the alternatives and design options evaluated in the RDEIR/SDEIS. As a result, the No Build Alternative has been selected as the Preferred Alternative and therefore, Design Options 3A and 3B are no longer under consideration.

L-31-97

Concerns about the traffic and circulation impacts of Design Options 3A and 3B are acknowledged, but no longer apply since these design options are not included in the Preferred Alternative (Alternative 1 No Build). Please also refer to Response to Comment L-31-96 regarding traffic impacts of the design options included as part of the build alternatives.

L-31-98

Caltrans has reviewed the East Los Angeles Community Parks and Recreation Plan[15] (dated February 2016) and the East Los Angeles 3rd Street Specific Plan[16] (adopted November 2014) and has not been able to identify any formalized plans for a park at this location. Design Option 3A would have made a minor realignment to Eagle Street at its intersection with S. Sydney Drive; however, Design Option 3A is not a part of the Preferred Alternative (Alternative 1 No Build). Therefore, this parcel will be unaffected.

L-31-99

Concerns about the traffic and circulation impacts of Design Options 3A and 3B are acknowledged, but no longer apply since the No Build Alternative has been selected as the Preferred Alternative. Please also refer to Response to Comment L-31-96 regarding traffic impacts of the design options included as part of the build alternatives.

L-31-100

It is unclear to what the commenter is referring to regarding induced demand methodologies of truck volumes, as there is no known documentation of induced demand of heavy duty truck trips. Route shifting of heavy duty truck trips was accounted for in the I-710 travel demand forecasts. Given the high levels of congestion on I-710 in the peak periods, the I-710 travel demand forecast model is particularly sensitive to changes in travel times. The proposed improvements included in the build alternatives would improve speeds and reduce travel times on I-710, which in turn would attract more heavy duty truck traffic to the facility relative to the No Build Alternative.

---

[15] Los Angeles County Department of Parks and Recreation. 2016. East Los Angeles Community Parks and Recreation Plan. February. Website: http://file.lacounty.gov/SDSInter/dpr/240511East LACommunity Plan Reduced.pdf (accessed April 5, 2018).

[16] Los Angeles County. East Los Angeles 3rd Street Plan. Adopted November 12, 2014. Website: http://planning.lacounty.gov/assets/upl/project/ela_adopted-ela-3rdstreet-plan.pdf (accessed April 5, 2018).

The I-710 travel demand forecasting model also explicitly accounts for truck trips associated with transloading of marine cargo. Refer to Section 4.2 of the *I-710 Corridor Project RDEIR/SDEIS Travel Demand Modeling Methodology Technical Memorandum* (June 2017) for more detailed information. Transloading was also discussed in Section 1.2.1.4 of the RDEIR/SDEIS and this Final EIR/EIS.

L-31-101

During development of the build alternatives, Caltrans and Metro strived to develop and present the most appropriate avoidance, minimization, and/or mitigation measures taking into consideration right-of-way constraints, safety, and feasibility in implementing any proposed mitigation. In general, left-turning vehicles experience more delay when they are waiting for sufficient gaps in the on-coming traffic to clear the intersection, creating long queues. By providing an exclusive left-turn lane and by separating these left-turn vehicles from through traffic, these queues are made shorter, and the safety and delay for the intersection as a whole (i.e., all approaches) is improved. Therefore, the average total delay at the intersection is reduced and level of service for the intersection improves. The Synchro analysis conducted for this intersection demonstrated that this intersection would be improved by adding an exclusive left-turn lane. These detailed LOS analysis worksheets were provided in the appendices to the *Intersection Traffic Impact Analysis Report* (March 2017). In addition, the delay at this intersection under the Alternative 5C)would not be as severe as what would occur under Alternative 7, which was an additional factor considered when viewing the pre- and post-mitigation traffic analysis results.

L-31-102

The overall intersection delay as reported is a combination of the average delay for all approaches. By reducing the approach delays for the north and southbound directions, the overall intersection delay under the build alternatives would be reduced as well, since the amount of “green time” would now be optimized for all approaches. By adding an exclusive left-turn lane on the northbound and southbound approaches under the build alternatives, the total delay at the intersection could be reduced to better than what was projected under the 2035 No Build Alternative.

L-31-103

In general, left-turning vehicles experience more delay waiting for sufficient gaps in the on-coming traffic to clear the intersection. It is true that when a through lane is shared with a right-turn lane, sometimes right-turning traffic blocks through traffic while waiting for pedestrians to cross the street on a green. However, right-turning vehicles are permitted to turn right on a red signal unless they are specifically prohibited from doing so. By making legal right turns on a red signal, those vehicles would avoid pedestrians in the crosswalk, who are prohibited from

crossing on a red, and thus help clear the overall intersection by leaving more green time for through traffic.

L-31-104

Measure TR-1 proposed for the build alternatives takes into consideration right-of-way constraints, safety, and feasibility in implementing any proposed mitigation. In general, left-turning vehicles experience more delay when they are waiting for sufficient gaps in the on-coming traffic to clear the intersection, creating long queues. By providing an exclusive left-turn lane and by separating these left-turn vehicles from through traffic, these queues are made shorter, and the safety and delay for the intersection as a whole (i.e., all approaches) is improved. Therefore, the average total delay at the intersection would be reduced, and level of service for the intersection would improve. The Synchro analysis conducted for this intersection demonstrated that this intersection would be improved by adding an exclusive left-turn lane. These detailed LOS analysis worksheets are provided in the appendices to the *Intersection Traffic Impact Analysis Report* (March 2017).

L-31-105

Should a build alternative be selected as the Preferred Alternative, the proposed improvements at the referenced intersection under Measure TR-1 would improve traffic operations and reduce queues. However, as stated previously, the No Build Alternative has been selected as the Preferred Alternative and therefore, Measure TR-1 will not be implemented. In addition, there will not be any need to move the bus stop from its current location.

L-31-106

The overall intersection delay as reported is a combination of the average delay for all approaches. By reducing the approach delays for the north and southbound directions, the overall intersection delay under the build alternatives would reduce as well. Should a build alternative be selected as the Preferred Alternative, Measure TR-1 identified in the RDEIR/SDEIS would aim to reduce the impacted intersection delay from poor operating conditions (LOS E or F) under the build alternatives to the levels projected under the 2035 No Build Alternative or better. By adding an exclusive left-turn lane on the northbound and southbound approaches, the total delay at the intersection could be reduced to better than what was projected under the 2035 No Build Alternative. However, as stated previously, the No Build Alternative has been selected as the Preferred Alternative and therefore, Measure TR-1 will not be implemented.

L-31-107

It is important to note that this intersection (No. 97, Ford Boulevard/3rd Street) was identified as impacted only under Alternative 7. There was no impact identified at this intersection under Alternative 5C.

With respect to Alternative 7, the analysis conducted for this location demonstrated that the intersection would benefit with the additional northbound right-turn lane, and the conceptual sketches illustrating the mitigation measures proposed for Alternative 7 showed that there would be a partial right-of-way acquisition needed to implement this mitigation improvement. For reference, these conceptual sketches are included in the appendices to the *Intersection Traffic Impact Analysis Report* (March 2017).

L-31-108

The row in Table 3.5-7 containing intersection ID No. 180 (3rd Street/S Gage Avenue) has been updated for consistency in this Final EIR/EIS to read “East LA (unincorp)” rather than “County”. Measure TR-1 would include improvements at this intersection under the build alternatives.

L-31-109

Conceptual sketches illustrating the recommended mitigation measures under the build alternatives showed that sliver right-of-way acquisition(s) would be necessary to implement the proposed improvements at this location. The use of these commercial properties would not be affected, as they would not be displaced as a result of the acquisition. These conceptual sketches were included as Appendix E to the *Intersection Traffic Impact Analysis Report* (March 2017). However, as stated previously, the No Build Alternative has been selected as the Preferred Alternative and therefore, these mitigation measures will not be implemented.

L-31-110

Caltrans and Metro appreciate these thoughtful suggestions intended to incentivize travelers and employers to carpool or rideshare, travel during off-peak hours, and telecommute. In order to minimize travel impacts during construction, should a build alternative be selected as the Preferred Alternative, Measure CON-TR-3 would require Caltrans and Metro to work with area transit operators to implement a Transit Subsidy Program that would provide discounted transit fares in areas impacted by construction as well as performing outreach and marketing to incentivize use of transit during construction periods. However, it should be noted that this measure is intended to address impacts during construction of the build alternatives. The types of operational programs intended to exist in perpetuity as noted in the comment are beyond the jurisdiction and authority of Caltrans and Metro to implement as part of a specific project. Often, these types of programs are administered by employers. Metro’s Rideshare/Shared Mobility

Program, at https://www.metro.net/riding/rideshare/employer-programs/, should be consulted for more information and support for employers within Los Angeles County and the community of East Los Angeles. In addition, as stated previously, the No Build Alternative has been selected as the Preferred Alternative and therefore, Measure CON-TR-3 will not be implemented.

L-31-111

Please refer to Response to Comment L-31-110 regarding programs to incentivize travelers and employers to carpool or rideshare, travel during off-peak hours, and telecommute.

L-31-112

Construction impacts of the build alternatives are discussed in detail in Section 3.24, Construction Impacts of the RDEIR/SDEIS and this Final EIR/EIS. Measures to address construction-related impacts with regards to noise and air quality as a result of the build alternatives are described in more detail in Section 3.24.4.13, Air Quality, and 3.24.4.14, Noise. Moreover, since the No Build Alternative has been selected as the Preferred Alternative, Design Options 3A and 3B are no longer under consideration.

L-31-113

As discussed in Section 3.12, Hazardous Waste/Materials, of the RDEIR/SDEIS aerially deposited lead (ADL) is a byproduct of internal combustion engines burning lead containing fuels. Aerially deposited lead is deposited on the sides of roads and highways by passing cars and is often found in the soil adjacent to highways and roads. Elevated concentrations of aerially deposited lead may be present along existing roadways throughout the I-710 Study Area. Lead exists as a fraction of the dust ($PM_{2.5}$ and PM_{10}), which may be disturbed during construction activities of the build alternatives. The RDEIR/SDEIS and this Final EIR/EIS include measures to minimize dust and exposure to ADL during construction of the build alternatives. Specific construction dust mitigation measures, consistent with SCAQMD fugitive dust rules, are provided in Section 3.24.4.13 of the RDEIR/SDEIS, including, but not limited to, CON-AQ-1, CON-AQ-2, CON-AQ-6, CON-AQ-9, CON-AQ-10, CON-AQ-11, CON-AQ-14, and CON-AQ-17. In addition, as discussed in Section 3.12, Hazardous Waste/Materials, of the RDEIR/SDEIS and specified in Measure HW-3, should a build alternative be selected as the Preferred Alternative, prior to soil excavation, a soil investigation for aerially deposited lead (ADL) would be conducted. The analytical results of the soil sampling would assess the potential presence of hazardous contaminants and determine the appropriate handling of the soil and disposal of surplus materials to minimize exposure to ADL. However, as stated in Response to Comment L-31-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no exposure to ADL as a result of construction activities.

L-31-114

It is assumed that the commenter is referring to Los Angeles County Fire Station no. 3, located at 930 S. Eastern Avenue. No work is proposed to Eastern Avenue in this area under the build alternatives, although the on- and off-ramp to I-710 from Eastern Avenue would be reconfigured. Refer to Section 3.24.3.4, Utilities/Emergency Services, in this Final EIR/EIS which describes impacts to fire stations located within 0.5 mile of the improvements under the build alternatives. In addition, Measure CON-U&ES-1 states that, should a build alternative be selected as the Preferred Alternative, prior to and during construction, Caltrans and the Construction Contractor would coordinate all temporary ramp closures and detour plans with fire providers to minimize temporary delays to emergency response times as part of the Transportation Management Plan (TMP), including the identification of alternative routes and routes across the construction areas for emergency vehicles, developed in coordination with the affected agencies. However, as stated in Response to Comment L-31-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, CON-U&ES will not be implemented. In addition, the likelihood of a natural disaster occurring that may prevent access to and from a fire department or other emergency service provider facility is beyond the scope of a project-level CEQA/NEPA environmental document, and as such, was not evaluated within the RDEIR/SDEIS.

L-31-115

This comment states that cumulative noise and pollution impacts in East Los Angeles from existing, proposed, and potential future freeway projects need to be mitigated to the fullest extent possible in the RDEIR/SDEIS. Section 3.25, Cumulative, in the RDEIR/SDEIS and this Final EIR/EIS discusses a potential extension of the Gold Line along SR-60 (the Eastside Transit Corridor Phase 2 [Project T-76 in Table 3.25-1]) and a potential widening of I-5 between I-605 and I-710 in the East Los Angeles area (the I-5 Corridor Improvement Project [Project T-5 in Table 3.25-1]). As stated in Sections 3.25.4.12 and 3.25.4.13 of the RDEIR/SDEIS and this Final EIR/EIS, the I-710 Corridor Project may contribute to long-term cumulative air quality and noise impacts at receivers near the I-710 Corridor. Should a build alternative be selected as the Preferred Alternative, impacts related to air quality and noise would be mitigated to the maximum extent feasible as described in Section 3.13, Air Quality, and Section 3.14, Noise, of the RDEIR/SDEIS and this Final EIR/EIS, respectively. Although Caltrans has not currently identified any potential highway widening projects along SR-60 in East Los Angeles, Caltrans has a standing policy of evaluating proposed projects near any highway facilities to determine if they could interfere with possible future freeway projects. However, as stated in Response to Comment L-31-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no cumulative impacts related to the build alternatives.

L-31-116

Caltrans respectfully disagrees that the RDEIR/SDEIS is deficient and that it should be revised and recirculated. As stated in Response to Comment L-31-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, Design Options 3A and 3B are no longer under consideration, and it is unnecessary to revise and recirculate an environmental document to remove alternatives or options from consideration. The motion to consider a Design Option within the East Los Angeles area was made by the County representative at the Project Committee meeting in July 2014, and the East Los Angeles LAC was briefed on the Design Options prior to performing the analysis that informed the RDEIR/SDEIS in April 2015. Please refer to Table 2.2-1 in the Final EIR/EIS for a discussion of the elements of Motion 22.1 that were addressed in the RDEIR/SDEIS and their respective locations within the document. For more details on Motion 22.1 and Community Alternative 7, please refer to Section 1.8 of this appendix. Caltrans made every effort to avoid and minimize the acquisition of homes for necessary right-of-way within the I-710 Corridor; however, some displacements were found to be unavoidable in order to construct the build alternatives. However, since the No Build Alternative has been selected as the Preferred Alternative there will be no acquisitions.

L-31-117

This comment asks (1) for information about the combined impacts (traffic, pollution, and noise) for the I-710 and Gold Line projects on East Los Angeles; (2) whether the build alternatives could impact the construction of a Gold Line subway project along Atlantic Boulevard; and (3) what the cumulative impacts are for the build alternatives and the Gold Line (i.e., would traffic numbers change?). The cumulative impact analysis in Section 3.25 of the RDEIR/SDEIS and this Final EIR/EIS includes a potential extension of Metro's Gold Line (the Eastside Transit Corridor Phase 2 [Project T-76 in Table 3.25-1]) through East Los Angeles. In 2014, Metro circulated a Draft EIS/EIR for the Eastside Transit Corridor Phase 2, which evaluated two build alternatives, an LRT alignment along SR-60 to South El Monte and an LRT alignment along Washington Boulevard to Whittier. The build alternatives have since been refined to include a Washington Boulevard LRT alternative that would place the LRT in an underground segment along Atlantic Boulevard between the current Gold Line terminus station at Atlantic Boulevard/Pomona Boulevard in East Los Angeles and the Citadel Outlets in Commerce. A reinitiated Draft EIS/EIR for the Eastside Transit Corridor Phase 2 Project will update the original Draft EIS/EIR that was released in 2014 with additional environmental analysis, including an evaluation of the environmental impacts associated with a proposed subway beneath Atlantic Boulevard in East Los Angeles. The Supplemental/Recirculated Draft EIS/EIR is anticipated to be available for public review in mid-2020.

Because the Atlantic Boulevard subway contemplated as part of the Eastside Transit Corridor Phase 2 Project would operate underground, it is not expected to result in increased noise and

pollution in East Los Angeles during operation. According to the 2014 Draft EIS/EIR, the purposes of the Eastside Transit Corridor Phase 2 Project include: (1) alleviating peak-hour congestion on the roadway network by providing transit alternatives to meet increased demand; and (2) providing additional travel options, given the high travel demand connectivity constraints present in the Eastside Transit Corridor study area. Therefore, the Eastside Transit Corridor Phase 2 Project is likely to convert some passenger vehicle trips to transit trips, thereby reducing the number of vehicle trips that would otherwise be added to the local and regional roadway networks. When released in mid-2020, the Supplemental/Recirculated Draft EIS/EIR will address any changes in traffic volumes in East Los Angeles resulting from the proposed Atlantic Boulevard subway. Because the I-710 Corridor Project build alternatives are programmed into the 2016–2040 SCAG RTP/SCS adopted by the Southern California Association of Governments (SCAG), the traffic analysis in the Supplemental/Recirculated Draft EIS/EIR for the Eastside Transit Corridor Phase 2 Project will reflect a cumulative traffic analysis that incorporates the I-710 Corridor Project build alternatives.

The traffic, noise, and dust impacts related to the construction of a subway beneath Atlantic Boulevard would depend on the type of tunneling method used. The use of a tunnel boring machine (TBM) would greatly reduce impacts in comparison to a cut-and-cover tunnel, which would require excavation of a substantial amount of material and cause disruptions for the community along Atlantic Boulevard. As the specific tunnel construction method has not yet been determined, it would be premature to speculate regarding the proposed Atlantic Boulevard subway's construction impacts.

As stated in Sections 3.25.4.12 and 3.25.4.13 of the RDEIR/SDEIS and this Final EIR/EIS, the I-710 Corridor Project may contribute to long-term cumulative air quality and noise impacts at receivers near the I-710 Corridor. In addition, as stated in Section 3.25.4.5, the I-710 Corridor Project build alternatives would contribute to adverse cumulative impacts related to traffic at specific locations near the I-710 Corridor. Should a build alternative be selected as the Preferred Alternative, impacts related to traffic, pollution, and noise would be mitigated to the maximum extent possible in Section 3.5, Traffic and Transportation/Pedestrian and Bicycle Facilities, Section 3.13, Air Quality, and Section 3.14, Noise, of the RDEIR/SDEIS and this Final EIR/EIS, respectively.

The construction timeframe for the Eastside Transit Corridor Phase 2 build alternatives is tied to available funding and remains unknown. However, since the No Build Alternative has been selected as the Preferred Alternative for the I-710 Corridor Project, there will be no cumulative short-term traffic and access impacts related to the Eastside Transit Corridor Phase 2 project.

L-31-118

Please refer to Responses to Comments L-31-4, L-31-20, and L-31-23 regarding preparation of a Health Impact Assessment.

L-31-119

The purpose of the RDEIR/SDEIS prepared for the I-710 Corridor Project was to disclose to the public and decisionmakers the environmental impacts of alternatives proposed to address the purpose and need for the project. A comprehensive traffic study of East Los Angeles is beyond the scope of the environmental process under NEPA and CEQA for the I-710 Corridor Project. However, the elements of this proposed study may be covered in part by the Gateway Cities COG Strategic Transportation Plan (June 2016) and Metro's Long Range Transportation Plan (2009).

L-31-120

Please refer to Response to Comment L-31-3 regarding the feasibility of a freeway cap design.

L-31-121

A separated freight-only corridor was proposed under Alternative 7. However, Alternative 7 has not been identified as the Preferred Alternative.

L-31-122

The Community Health Benefit Program has been developed in more detail than what was presented in the RDEIR/SDEIS and further details of that program can be found in Section 2.3.2.1 of this Final EIR/EIS. As part of that description, geographic zones (both general and priority) have been established. The Program description also indicates that in making funding recommendations, "cost-effectiveness will be emphasized, with funding priority given to those proposals that benefit the most people per dollar". Additionally, there is inherent legal and logistical difficulties in ensuring funds are deployed for their intended purpose when disbursed to individual, private citizens. For example, if the Program were to allow for individual private citizens to obtain funding for installation of an air filtration system on their home, some type of deed restriction would need to be obtained on the property in question to ensure that the improvements were made. This is not feasible and may not be a prudent use of public funds. Therefore, individual private citizens and businesses are not considered eligible applicants for Community Health Benefit Program funds. However, since a build alternative has not been selected as the Preferred Alternative, this programmatic element will not be implemented by Caltrans as the Lead Agency under CEQA and NEPA and as the owner/operator of the I-710 freeway. Please refer to Section 1.10 of this appendix for more detailed information regarding the Community Health Benefit Program.

L-31-123

Please refer to Response to Comment L-31-4 and Response to Comment L-31-122 regarding preparation of an HIA. The preparation of an HIA for East Los Angeles may be a project eligible for funding under the Community Health Benefit Program that may be implemented as a separate effort.

L-31-124

Some of the suggested mitigations and enhancement measures outlined in this comment have already been included in the project description or in the proposed avoidance, minimization, and/or mitigation measures for the build alternatives. For example, HVAC/filtration systems have been proposed for impacted sensitive receptors under Measures AQ-2 and C-8. Aesthetic treatments and landscaping have been included in the project description of the build alternatives in accordance with the I-710 Aesthetics Master Plan; refer to Section 2.3.2.1 of the RDEIR/SDEIS for more information. However, since the No Build Alternative has been selected as the Preferred Alternative for the I-710 Corridor Project these mitigation measures will not be implemented. In addition, some of the projects and elements included in this comment are not under the jurisdiction of Caltrans or Metro (including crosswalk signalization off the State Highway System and planting on local arterials), and should be referred to the Los Angeles County Department of Public Works.

L-31-125

Should a build alternative be selected as the Preferred Alternative, Measure AQ-1, as described in Section 3.13.4 of this Final EIR/EIS, would requires a funding contribution to be provided to the South Coast Air Quality Management District (SCAQMD) for the design and construction of four new air quality monitoring stations within the I-710 Corridor. Air filtration/HVAC systems have been proposed, should a build alternative be selected as the Preferred Alternative, for schools and other sensitive receptors in accordance with the specifics detailed in Measures AQ-2 and C-8 (described in detail in Sections 3.13.4 and 3.3.3.7 of this Final EIR/EIS, respectively).. However, since the No Build Alternative has been selected as the Preferred Alternative for the I-710 Corridor Project Measures AQ-1, AQ-2, and C-8 will not be implemented.

The concept of each corridor city housing and maintaining a central depot for receiving Port trucks is interesting; however, truck traffic patterns are generally dictated by the economic market for the goods being transported. Caltrans and Metro cannot, and do not have the jurisdiction, to control truck movement throughout the I-710 Corridor area.

L-31-126

This information has been made part of the project record. These comments were originally submitted on the SR-710 North Project Draft EIR/EIS, which circulated for public review in 2015. Responses to these comments were made available in the Final EIR/EIS for the project and are posted on the Caltrans District 7 website at http://www.dot.ca.gov/d7/env-docs/docs/SR710NorthProject/.

Jeannine Pearce
SECOND DISTRICT
CITY OF LONG BEACH

RE: I-710 Recirculated Draft Environmental Impact Report/Supplemental Draft Environmental Impact Statement

Dear Mr. Dougherty,

We request that the California Department of Transportation extend the comment period for the Recirculated Draft Environmental Impact Report/Supplemental Draft Environmental Impact Statement (RDEIR/SDEIS) for the Interstate 710 (I-710) Corridor Project to 120 days. Comments are currently due by September 22, 2017. Granting this request would allow the comment period for this national significant project to extend through November 21, 2017.

The RDEIR/SDEIS, including appendices, represents thousands of pages of highly technical data and analyses that require additional time for thorough evaluation. Extending the comment period will allow stakeholders, including our constituents, to become better informed about the project, and thus more fully engaged in the CEQA and NEPA processes. This engagement is at the heart of CEQA and NEPA's public comment processes, and could provide improvements to the project's current design, additional or revised mitigations, and other information that will help ensure the project serves as a model for transportation projects in the 21st century. L-32-1

Moreover, the current comment period for the I-710 RDEIR/SDEIS overlaps with at least two other high-profile proposals — the draft Clean Air Action Plan (CAAP) and the Draft Supplemental Environmental Impact Report for the China Shipping Container Terminal Project due on Sept 21, 2017. The current deadline places an undue burden on members of the public wishing to engage fully in all of these processes.

Robust public participation is critical to ensuring a full review of this nationally significant project. Accordingly, we appreciate your consideration of request this extension request.

Sincerely,

Councilmember Jeannine Pearce, Second District

City of Long Beach

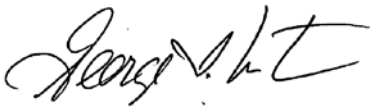
Ronald Kosinski
Caltrans District 7, Division of Environmental Planning
100 S. Main St. MS 16A
Los Angeles, CA 90012

Dear Mr. Kosinski,

On behalf of the Southern California Gas Company (SoCalGas), I am writing in support of Alternatives 5C and 7 of the I-710 Corridor Project. We support these two options because they take a balanced approach by allowing for both zero- and near-zero technologies in the proposed "Truck Technology Deployment Program" and "Clean Emission Freight Corridor." U-1-1

As you know, communities living near freeways face elevated health risks related to high levels of particulate emissions. The reason for these health impacts is heavy-duty trucks that run on diesel. More than 80 percent of the region's smog-forming emissions come from the transportation sector, and heavy-duty diesel trucks are the single biggest emitter. It is imperative that we as a region come together to do what we can to speed these trucks through the basin and prevent them from idling in traffic as they will continue to do if diesel trucks are denied access to the freight corridor.



Increasing the number of trucks with near-zero emissions engines that run on renewable natural gas is another way we can immediately improve the air quality of Southern California. That's because near-zero emissions natural gas engines deliver a 90 percent reduction in smog-forming (NOx) emissions as compared to diesel. And, those same engines, when fueled by renewable natural gas, reduce greenhouse gas emissions by 80 percent. This solution will improve our air quality as well as the health of the men, women and families living near the freeway.

SoCal Gas is not only concerned about the health of families living along the I-710. We are sensitive to those who worry how their homes and neighborhoods might be impacted by the corridor project. We urge Caltrans to mitigate any negative impacts the I-710 Corridor Project may have on those living near the freeway. U-1-2

The I-710 Corridor Project should be focused on reducing emissions – not picking winners and losers when it comes to technology. We urge continued support for Alternatives 5C and 7. Should you have any questions, please do not hesitate to contact me.

SoCalGas is the nation's largest natural gas distribution utility, delivering clean, safe and reliable energy to 21.6 million consumers. Our service territory encompasses approximately 20,000 square miles in diverse terrain throughout Central and Southern California, from Visalia to the Mexican border. We have been investing in clean transportation technologies and are delivering renewable natural gas through our pipeline system to help the state achieve its ambitious environmental goals. And we're proud that SoCalGas' innovation is fueling new possibilities in California.

Regards,

George Minter
Regional Vice President, External Affairs & Environmental Strategy
Southern California Gas Company

U-1-1

The commenter's support for Alternative 5C and Alternative 7 are acknowledged and included in the project record. Please refer to Section 1.1 of this appendix for a discussion on the identification of the Preferred Alternative.

U-1-2

Impacts to communities were analyzed in Section 3.3, Community Impacts, of the RDEIR/SDEIS. Several avoidance, minimization, and/or mitigation measures were proposed that would address potential impacts to communities, including environmental justice communities, as a result of the build alternatives within the I-710 Corridor. Please refer to Section 3.3.1.4 for a discussion of Public Health Considerations relevant to communities and neighborhoods, Section 3.3.1.6 for measures specific to impacts to community cohesion, and Section 3.3.3.7 for measures specific to impacts to environmental justice communities. However, Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), has identified Alternative 1 (No Build) as the Preferred Alternative. Therefore, there would not be any impacts to the communities and environmental justice populations within the I-710 Corridor. Please refer to Section 1.1 of this appendix for further discussion on the identification of the Preferred Alternative.

Los Angeles, California 90012

Re: Southern California Edison Company Comments on the Recirculated Draft Environmental Impact Report / Supplemental Environmental Impact Statement for the Interstate 710 Corridor Project

Dear Mr. Kosinski:

Southern California Edison Company ("SCE") appreciates the significant efforts made by the California Department of Transportation ("Caltrans"), in cooperation with the Los Angeles County Metropolitan Transportation Authority ("Metro"), the Gateway Cities Council of Governments, the Southern California Association of Governments, the Ports of Los Angeles and Long Beach ("POLA" and "POLB," respectively), and the Interstate 5 Joint Powers Authority, in proposing to improve Interstate 710 ("I-710") and the attempts to engage stakeholders throughout this process. In particular, SCE appreciates and values the years of collaboration between Caltrans, SCE, and other interested stakeholders to catalog the potential impacts of the I-710 Corridor Project ("Project") on SCE's facilities. SCE looks forward to continuing this beneficial collaboration in support of the Project's ultimate success.

SCE strongly supports the goals of the Project to: improve air quality and public safety; improve traffic safety; modernize the freeway design; address projected traffic volumes; and address projected growth in population, employment and activities related to goods movement. In furtherance of these purposes, SCE respectfully provides the following comments on the July 2017 Recirculated Draft Environmental Impact Report / Supplemental Draft Environmental Impact Statement ("RDEIR/SDEIS").

Attachment 1 to this letter provides SCE's specific comments on, and suggested edits to, the RDEIR/SDEIS. The comments made in Attachment 1 are consistent with and in addition to the comments in this letter. For ease of review and where possible, the suggestions and comments in Attachment 1 provide "redline" edits showing desired text, as well as references to the specific page number and section where that edit should be made. SCE's comments include:

- factual and technical clarifications and corrections;
- suggested language changes and comments on mitigation measures presumed applicable to SCE facilities;

- supplemental language and/or definitions in order to clarify meaning or intent; and
- additional examples and/or explanations.

Due to the sheer size of the RDEIR/SDEIS and its supporting appendices, it is unlikely that SCE captured every instance where language should be changed consistent with its comments here. To that end, SCE's comments and the specific edits implementing them are intended to provide examples of text that SCE believes should change. SCE respectfully requests Caltrans incorporate these suggested changes, as well as make additional corresponding global changes where needed for consistency and integration into the Final Recirculated Environmental Impact Report / Supplemental Environmental Impact Statement ("REIR/SEIS"). U-2-1

I. SCE SUPPORTS A CLEAN, ZERO-EMISSION FREIGHT CORRIDOR FOR THE I-710

SCE strongly supports the adoption of Alternative 7 as the preferred Project alternative. Further, SCE believes that the use of Alternative 7's dedicated freight corridor ("Freight Corridor") should be restricted to use by Zero Emission ("ZE") trucks. U-2-2

SCE is committed to the electrification of the transportation sector, as evidenced by its January 2017 Transportation Electrification ("TE") Application before the California Public Utilities Commission ("CPUC").[1] SCE's TE Application reflects a vision for accelerating transportation electrification, spanning all transportation sectors, with a particular focus on targeting pollution in disadvantaged communities that are most impacted by medium- and heavy-duty transportation.[2]

A. Alternative 7 Should be Selected Because It is the Only Alternative That Would Feasibly Accomplish the Project's Stated Goals

With respect to meeting the Project's stated purposes, Alternative 7 is clearly superior. Importantly, among all of the alternatives considered, only Alternative 7 can reasonably be expected to improve air quality and public health.[3] Further, as compared with Alternative 5C, Alternative 7 best improves traffic safety, addresses projected traffic volumes, and accommodates growth and goods movement. U-2-3

---

[1] *See* Application of Southern California Edison Company (U 338-E) for Approval of its 2017 Transportation Electrification Proposals (1/20/17) ("TE Application") at 3, incorporated herein by reference and available here: http://docs.cpuc.ca.gov/PublishedDocs/Efile/G000/M172/K519/172519265.PDF (last checked Oct. 15, 2017). Transportation Electrification ("TE") refers to the ongoing process of transforming the transportation sector from one that is primarily fueled by fossil fuels, to one that is fueled by clean electric power. *See id.*

[2] *See id.*

[3] *See* Section I.A. below.

1. Improves air quality and public health [4]

The RDEIR/SDEIS specifically finds Alternative 7 to be superior to Alternative 5C with respect to diesel particulate matter ("DPM," *i.e.*, "the greatest contributor to air-quality related cancer risk in the [SCAQMD] basin"[5]), nitrogen oxides ("NOx"), and health risks.[6] Further, the RDEIR/SDEIS's conclusion that Alternative 5C shows fewer impacts related to particulate matter ("PM"), carbon monoxide ("CO"), volatile organic compounds ("VOCs"), and sulphur dioxide ("SO2") is based on fatally flawed assumptions made in support of the air quality analyses.[7] Similarly, the PM estimates are also overstated.[8]

Alternative 5C is a lane-widening project, designed to increase the throughput volume of trucks, including conventional diesel trucks, along the I-710 corridor.[9] In contrast, the proposed Alternative 7's Freight Corridor would be limited to ZE/near-ZE ("NZE") trucks, which have emissions profiles a fraction of the diesel trucks currently used for drayage along the I-710.[10] Alternative 7 will likely also drive a significant increase in ZE/NZE trucks on the I-710, as evidenced by the increased vehicle miles travelled ("VMT") or "throughput" estimated for Alternative 7.[11] U-2-4

The air quality and associated public health benefits resulting from the replacement of diesel trucks under Alternative 7, both on the I-710 corridor and potentially in the region as a whole, should be given substantial weight. Alternative 7 would reduce air pollution and disproportionate health impacts to a significant number of disadvantaged communities ("DACs")

---

[4] *See* RDEIR/SDEIS at Executive Summary ("ES") 5 (stated purposes of Project)

[5] *See* RDEIR/SDEIS at 1-9 ("These studies show that diesel particulate matter (DPM) is the greatest contributor to air-quality related cancer risk in the South Coast Air Basin and that approximately half of the DPM is emitted by diesel trucks using the freeway and roadway systems").

[6] *See* RDEIR/SDEIS Technical Appendix, *Air Quality, Greenhouse Gas, and Health Risk Assessment Technical Study* (June 2017) ("AQ Tech Study") at ES-29 ("Compared to the 2035 Alternative 1 (No Build), Alternative 7 shows fewer impacts related to DPM, NOx, and health risks than Alternative 5C.").

[7] *See* Section III.B.1.a, below.

[8] *See* Section III.B.1.b, below.

[9] *See* RDEIR/SDEIS at ES 6-8 (describing Alternative 5C).

[10] *See* RDEIR/SDEIS at ES 6-8 (describing Alternative 7); Section III.B.1., below (referencing emissions profiles of ZE/NZE trucks).

[11] *See* RDEIR/SDEIS at 3.5-105 (Table 3.5-24, comparing VMT, vehicle hours travelled ("VHT"), and vehicle hours of delay ("VHD") of the Project's alternatives), 3.3-133 (citing increase in throughput and associated VMT), 3.3-134 (same), 3.5-83 ("vehicle throughputs are projected to increase under Alternative 7").

along the I-710. [12] These DACs along the I-710 are impacted by air pollution from transportation, and in particular, from medium- and heavy-duty transportation. Electrifying vehicles that heavily use the I-710 will help meet ground-level ozone (smog) and particulate emissions reduction requirements by curbing such emissions from medium- and heavy-duty transportation.[13] Alternative 7, with its ZE/NZE Freight Corridor, is thus the only Project Alternative that can reasonably be expected to satisfy the Project's air quality and health goals.

U-2-4

2. *Improves traffic safety* [14]

As evidenced by the RDEIR/SDEIS's findings, Alternative 7 would also enhance traffic safety to a significantly greater degree than Alternative 5C. As the RDEIR/SDEIS notes, "interaction between cars and the high volume of trucks in the traffic stream on the I-710 mainline may be contributing factors to these existing accident rates."[15] Truck-related accidents have cascading impacts on traffic safety because they form bottlenecks which "lead to additional congestion, delay, and occasionally secondary accidents on the I-710 mainline and ramps as approaching

[14] *See* RDEIR/SDEIS at ES 5 (stated purposes of Project).

[15] *See* RDEIR/SDEIS at ES-3 ("I-710 experiences elevated accident rates, exceeding the State average for similar facilities in many locations. High traffic volumes, existing freeway design, freeway congestion, and the interaction between cars and the high volume of trucks in the traffic stream on the I-710 mainline may be contributing factors to these existing accident rates"), 1-21 ("The high truck volumes may account for the severity of accidents occurring along the I-710 Corridor").

vehicles unexpectedly run into the rear ends of other vehicles."[16] Traffic safety is compromised by, among other things, "the mix of automobiles and heavy-duty trucks."[17] "Separation of trucks and general traffic would reduce the conflicts between the two and improve safety and operations on I-710."[18]

U-2-5

With its Freight Corridor, Alternative 7 effectively separates the trucks from the general traffic while Alternative 5C does not.[19] Alternative 7 is superior to Alternative 5C with respect to the Project's purpose of improving traffic safety.

3. Addresses projected traffic volumes for the 2035 horizon year[20]

Alternative 7 is superior to Alternative 5C with respect to the Project's purpose of addressing projected traffic volumes for the 2035 horizon year.

Alternative 7 would support a significantly greater degree of traffic and drayage truck throughput on the I-710 corridor.[21] As throughput increases, so does corresponding VMT.[22] In contrast, the vehicle hours of delay ("VHD") metric is punitive with larger amounts indicating longer goods movement times. With this in mind, when compared to Alternative 5C, Alternative 7 would:

U-2-6

- Increase VMT/throughput by 65 percent (215,000 miles);[23] and
- Decrease VHD by more than 53 percent (3000 hours).[24]

---

[16]*See* RDEIR/SDEIS at 1-23 ("Accidents, particularly truck-related accidents, form bottlenecks as emergency response personnel temporarily close travel lanes to respond to the accident. As a result, these incidents lead to additional congestion, delay, and occasionally secondary accidents on the I-710 mainline and ramps as approaching vehicles unexpectedly run into the rear ends of other vehicles.")

[17]*See* RDEIR/SDEIS at 1-23 ("The relatively high incidence of accidents on the I-710 mainline and ramps appears to be the result of three main factors: (1) nonstandard geometrics and design features; (2) high traffic volumes; and (3) the mix of automobiles and heavy-duty trucks.")

[18] RDEIR/SDEIS at 1-23.

[19]*See* RDEIR/SDEIS at ES 6-8 (describing Alternatives 5C and 7).

[20]*See* RDEIR/SDEIS at ES 5 (stated purposes of Project).

[21]*See* RDEIR/SDEIS at 3.5-105 (Table 3.5-24, showing Alternative 7 with most increases in VMT), 3.3-133 (citing Alternative 7's increase in throughput and associated VMT), 3.3-134 (same), 3.5-83 ("vehicle throughputs are projected to increase under Alternative 7").

[22]*See* RDEIR/SDEIS at 3.5-105 (Table 3.5-24, showing Alternative 7 with most increases in VMT), 3.3-133 (citing Alternative 7's increase in throughput and associated VMT), 3.3-134 (same), 3.5-83 ("vehicle throughputs are projected to increase under Alternative 7").

[23]*See* RDEIR/SDEIS at 3.5-105 (Table 3.5-24, VMT for no build = 22,079,000, Alt. 5C = +389,000, Alt 7 = +604,000).

[24]*See* RDEIR/SDEIS at 3.5-105 (Table 3.5-24, VHT for no build = 105,800, Alt. 5C = -3,400, Alt 7 = -6,400).

The goals of increasing throughput along the I-710 and improving the air quality in the region are, in a certain sense, at odds: as throughput/VMT increase, historically, so do air emissions. It is by limiting access to the Freight Corridor to only ZE/NZE trucks that increasing throughput becomes compatible with improving air quality and public health. Importantly therefore, the only Alternative which is likely to satisfy both goals of increased throughput and improved air quality in the region is Alternative 7. U-2-6

4. Addresses projected growth in population, employment, and activities related to goods movement [25]

The Project's purpose of addressing projected growth in population, employment, and activities related to goods movement is addressed, in large part, through Alternative 7's superiority with respect to addressing projected 2035 traffic volumes discussed above. The better the projected traffic volumes are accommodated, the better will projected growth in population, employment, and goods movement be accommodated.

Further, with respect to goods movement, only Alternative 7 includes "an automated control system that will steer, brake, and accelerate the trucks under computer control while traveling on the [Freight Corridor,…] safely allowing for trucks to travel in 'platoons' (*i.e.*, groups of six-to-eight trucks) and [thus further] increasing the capacity of the freight corridor."[26] Importantly, this increases the capacity of Alternative 7's Freight Corridor from approximately 1,200 trucks per lane per hour to 1,500.[27] With its separate Freight Corridor, Alternative 7 would also reduce accidents[28] and would likely better accommodate drayage trucks ultimately employing autonomous operation and/or other driver-assisting technologies.[29] U-2-7

Alternative 7 similarly supports approximately 56 percent more construction employment than Alternative 5C and "it is anticipated that the zero-emission/near zero-emission Freight Corridor component …would generate additional indirect employment as the technology is developed and

---

[25] *See* RDEIR/SDEIS at ES 5 (stated purposes of Project).

[26] *See* RDEIR/SDEIS at ES-8, 2-63 (same).

[27] *See* RDEIR/SDEIS at 2-63 (platooning will "increase the capacity of the freight corridor from a nominal 2,350 passenger car equivalents per lane per hour (pces/ln/hr) (approximately 1,200 trucks per lane per hour) (as would be assumed if the freight corridor were utilized by trucks without automated vehicle technology) to 3,000 pces/ln/hr (1,500 trucks/ln/hr) in Alternative 7").

[28] *See* RDEIR/SDEIS at ES-3 (interaction between trucks cars contributing to accidents), 1-21 (high truck volumes may account for the severity of accidents), 1-23 (relatively high incidence of accidents on the I-710 mainline and ramps due in part to mix of automobiles and heavy-duty trucks).

[29] *See* RDEIR/SDEIS at ES-8 (facilitation of automated control systems and "platooning"), 2-63.

eventually maintained within the I-710 Corridor."[30] Similarly, Alternative 7's Freight Corridor would likely spur the development of ZE/NZE trucks, creating other permanent employment not related to construction.[31]

In short, Alternative 7 should be Caltrans' preferred Project alternative. It is the only alternative likely to satisfy the Project's purposes. As the RDEIR/SDEIS unambiguously concludes, "[i]f port-related rail traffic and commuter demand are to be satisfied, additional mainline capacity improvements will be required. Alternative 7 would have a greater beneficial effect than Alternative 5C by providing dedicated lanes for freight movement within the I-710 Corridor."[32] U-2-7

B. The Alternative 7 "Clean Emissions" Freight Corridor Should be Limited to Zero Emission Vehicles with no Tailpipe Emissions

Consistent with "Alternative 7ZE" in the RDEIR/SDEIS, SCE believes no tailpipe pollutant emissions, including but not limited to any greenhouse gas ("GHG") emissions, from the onboard source of power should be emitted from trucks while travelling within the Freight Corridor. Hybrid ZE Vehicles (*e.g.*, ZE with NZE or diesel range extenders) should be permitted to travel within the Freight Corridor, provided the polluting source of onboard power is not engaged until outside of the Freight Corridor boundaries. SCE's position is thus (potentially) different than Option 7ZE as discussed in the RDEIR/SDEIS, which "restricts use of the freight corridor to exclusively ZE trucks, excluding NZE trucks."[33] U-2-8

Powering Alternative 7 via ZE technologies has the potential to act as a catalyst, incentivizing the development of new ZE technologies, driving innovation, increasing ZE market-share, and bringing down prices. In turn, this would further decrease air quality emissions and improve public health. Through Alternative 7, southern California has the opportunity to jumpstart this desirable cycle. The Freight Corridor should be limited to ZE vehicles ("ZEVs") to maximize health benefits and encourage market development of ZE technologies important for the satisfaction of California's GHG emissions reduction and air quality goals.[34] U-2-9

---

[30] *See* RDEIR/SDEIS at 3.3-52 (Table 3.3-10, estimated construction employment from Project alternatives, Alt. 5C appx. 99,885 and Alt. 7 appx. 179,180).

[31] *See* RDEIR/SDEIS at 3.3-52 ("…it is anticipated that the zero-emission/near zero-emission freight corridor component of Alternative 7 would generate additional indirect employment as the technology is developed and eventually maintained within the I-710 Corridor").

[32] RDEIR/SDEIS at 3.2-20.

[33] *See* RDEIR/SDEIS at ES-9. SCE notes it is unclear whether Alternative 7ZE as described in the RDEIR/SDEIS would actually exclude NZE trucks, or simply disallow tailpipe emissions.

[34] *See* Section I.C., below (discussing TE and ZEV's beneficial support for GHG emissions reduction goals); *see also* footnote 38, *infra* (summarizing California's air quality goals).

Caltrans should establish the requirements of the ZE corridor as early as possible in order to provide goods movement companies, drayage truck manufacturers, the Ports of Long Beach and Los Angeles, utilities, key stakeholders, and potential market participants sufficient time to develop and implement the infrastructure and technology supporting this ZE-only corridor. U-2-9

While not suggested by the RDEIR/SDEIS, SCE notes that the Freight Corridor should not be initially open to all vehicles, with stricter pollution control measures phased in over time in order to eventually transition to a ZE corridor. SCE believes that there is sufficient time between now and the projected opening of this Freight Corridor to traffic in 2027 to allow for necessary market transitions, innovations, and supporting infrastructure development to support a solely ZE-powered Freight Corridor.[35] U-2-10

SCE notes that the catenary system referenced by the RDEIR/SDEIS ("Catenary") is *one* alternative electric technology, among many potential technologies, which may successfully be implemented to power the envisioned ZE Freight Corridor.[36] The Catenary, including all environmental impacts associated with its potential implementation, should be studied in RDEIR/SDEIS to remain a viable option and for comparison with the other alternatives.[37] In the event that Caltrans decides to proceed with a Catenary, additional time should be included to allow for the design and construction of the supporting infrastructure. U-2-11

C. A Uniquely ZE Freight Corridor Would Support Emissions-Free Goods Movement Electrification, Providing Important Support for Achieving California's Binding and Ambitious Environmental Goals

Satisfaction of California's broad and ambitious clean energy goals[38] requires significant investment in TE and a strong commitment to enact policies that facilitate the investment. Given

---

[35] *See* RDEIR/SDEIS at 3.25-42 (projected construction schedule for Project "2020 – 2027").

[36] *See* RDEIR/SDEIS at 2-59 (brief discussion of catenary), 2-95 (same). A proven and viable technology, with historical applications in the U.S. and in other countries, preliminary feasibility studies indicate that SCE can construct the necessary power infrastructure (*e.g.*, substations, *etc.*) supporting the Catenary. While SCE believes the freight corridor should allow ZE technologies only, SCE notes that the Catenary does not envision any technology which would exclude the use of NZE vehicles on the corridor.

[37] While SCE advocates for the *description, analysis and consideration* of the Catenary in the RDEIR/SDEIS, SCE is neutral regarding the *selection* of the Catenary to support the Project's ZE freight corridor. In light of the fast changing pace of technology in the ZE space, and the considerable time that will pass before the Project's freight corridor is opened for use (approximately 10 or more years), SCE is reticent to endorse any particular ZE technology at this point in time.

[38] California's GHG reduction goals are best described in AB 32 (*Air pollution: greenhouse gases: California Global Warming Solutions Act of 2006*), SB 350 (*Clean Energy and Pollution Reduction Act of 2015*), SB 32 (*California Global Warming Solutions Act of 2006: emissions limit*), and Executive Orders S-3-05 (setting target of

the goal of reducing GHG emissions to 80 percent below 1990 levels by 2050,[39] the potential for TE to support achievement of California's climate and air quality goals is significant.

California's ability to achieve its emissions reduction targets is significantly aided by switching from fossil fuels to electrification, thus eliminating mobile source combustion of diesel, gasoline and natural gas.[40] SCE expects significant reductions in the use of natural gas will be needed to meet the state's 80 percent GHG reduction target, including uses as a vehicle fuel. Meeting California's air quality and GHG goals will be increasingly difficult (and more expensive) without significant electrification of the transportation sector.

Electricity is a low-cost fuel and the widespread production of ZEVs, and specifically ZE Class 8 trucks, is likely closer than the RDEIR/SDEIS discloses.[41] A Calstart "Commercialization Study" referenced by the RDEIR/SDEIS concludes "zero-emission capable drayage trucks can be developed, demonstrated, validated, and moved into production by a 2025 target timeline."[42] While there are issues to be addressed prior to the successful commercialization of these ZEVs,

---

statewide GHG emissions 80 percent below 1990 levels by 2050) and B-30-15 (setting target of statewide GHG emissions 40 percent below 1990 levels by 2030). Air Quality goals are summarized in the South Coast Air Quality Management District, Final 2016 Air Quality Management Plan (Mar. 2017), *available at*: http://www.aqmd.gov/home/library/clean-air-plans/air-quality-mgt-plan/final-2016-aqmp (last checked Oct. 23, 2017) at Ch. 4, p. 6 ("The most significant air quality challenge in the [South Coast] Basin, and the primary driver for the control strategy, is the need to reduce NOx emissions sufficiently to meet the upcoming ozone standard deadlines (1-hour ozone: 120 ppb by 20231 and 8-hour ozone: 80 ppb by 2024 and 75 ppb by 2032)") and the California Air Resources Board, Public Review Draft, Vision for Clean Air: A Framework for Air Quality and Climate Planning (Jun. 27, 2012), *available at*: https://www.arb.ca.gov/planning/vision/docs/vision_for_clean_air_public_review_draft.pdf (last checked Oct. 23, 2017), at 4 ("For the South Coast Air Basin, it is estimated that oxides of nitrogen, one of the key ingredients in ozone and fine particulate formation, must be reduced by around 80 percent from 2010 levels by 2023, and almost 90 percent by 2032. Similar levels of emissions reductions are likely needed in the San Joaquin Valley by 2032").

[39] *See* Executive Orders S-3-05 (setting target of statewide GHG emissions 80 percent below 1990 levels by 2050).

Scoping Plan's Mobile Source Strategy includes increasing ZEV buses, delivery and other trucks, and to put 4.2 million ZEVs on the roads.

[41] *See* CARB, *Advanced Clean Local Trucks, Second Workgroup Meeting* (Aug. 30, 2017), *available at* https://www.arb.ca.gov/msprog/actruck/mtg/170830arbpresentation.pdf (last checked Oct. 21, 2017) at 7, 8, and 11 (There are at least 11 manufacturers that currently offer zero emissions technologies on the trucks (pg. 7). CARB projected six transit agencies to have more than 3,000 zero emission buses by 2030 (pg. 8). Toyota demonstrating a fuel-cell drayage truck, Cummins announced an electric powertrain option, Siemens, Hydrogenics, and US Hybrid deploying heavy duty fuel-cell systems, and Tesla to reveal electric semi this September (pg. 11)).

[42] *See* RDEIR/SDEIS at 2-22 and 2-23 (*citing* Gateway Cities, Strategic Transportation Plan, *I-710 Project Zero-Emission Truck Commercialization Study, Final Report* (Nov. 20, 2013) ("Commercialization Study") at 6-2, *available at* http://www.calstart.org/Libraries/I-710_Project/I-710_Project_Zero-Emission_Truck_Commercialization_Study_Final_Report.sflb.ashx).

the Commercialization Study concluded ZEV hybrids (EVs with fuel cells or CNG) presented viable business cases for the I-710 as of 2013.[43] It is thus reasonable to assume the availability of such vehicles in support of a Freight Corridor estimated to be completed by 2027.

Moreover, ZEV technology has progressed significantly since this study's completion and is expected to further progress by 2027.[44] Given the long lead time for this Project, Caltrans should plan for the ZE technologies that will be, and not solely the technologies that are available today. U-2-12

D. Active Support for TE Along the I-710 is Needed Now

The I-710 Project offers an ideal opportunity for proactive, forward thinking action. Approximately 40 percent of the goods entering the U.S. are moved through southern California's ports and highways.[45] Transportation is responsible for approximately 39 percent of California's GHG emissions (and approximately 45 percent when considering upstream emissions from refineries),[46] 80 percent of nitrogen oxides (NOx), and 95 percent of DPM emissions.[47]

The 17.8 year average life for medium- and heavy-duty vehicles demands that the infrastructure must be in place now to support TE and market penetration of ZE trucks.[48] Every time a vehicle is purchased, there is an opportunity to convert a fossil-fuel-powered vehicle to a clean vehicle. If that opportunity is missed, the vehicle likely will not be converted to a clean vehicle for another decade or more.[49] Failing to push for electrification of vehicles using the I-710 Freight Corridor now would potentially (and unacceptably) delay cleaning up the I-710 corridor, as well as the South Coast Air Basin, beyond a generation.[50] U-2-13

[49] *See* TE Application Testimony at 7.

[50] *See* TE Application Testimony at 7; California Air Resources Board, *Vision for Clean Air: A Framework for Air Quality and Climate Planning* (June 2012) at 16-19, *incorporated herein by reference and available here*: http://www.arb.ca.gov/planning/vision/docs/vision_for_clean_air_public_review_draft.pdf (last checked Oct. 15, 2017) (noting that meeting the 2023 and 2031 air quality attainment deadlines requires a faster shift to zero-emission transportation than meeting the state's greenhouse gas emission reduction goals).

With only a little more than 12 years until 2030 (the year when California has committed to meet the next phase of its GHG reduction goals), the state, utilities, and other stakeholder must act now in order to achieve the GHG reduction goals.[51] Significant electrification of the transportation sector will be required to achieve these GHG goals, while also reducing local air pollution and maintaining the reliability and affordability of the electric grid.[52]

II. THE PROJECT'S IMPACTS ON SCE'S FACILITIES

SCE understands the Project proposes to expand the I-710 Freeway from the Port of Long Beach to the SR-60 Freeway. As Caltrans is aware, SCE owns and maintains critical electric transmission and subtransmission system facilities running parallel to the I-710 Freeway. The locations and design of this infrastructure have not significantly changed since SCE's September 27, 2012 comment letter regarding this same Project.

A. SCE's Existing Facilities

In particular, between the I-405 and the SR-91 Freeways, SCE has major facilities consisting of four (4) 220 kilovolt (kV) circuits and seven (7) 66 kV circuits. North of SR-91, SCE has at least three (3) 220 kV transmission lines and approximately thirty-eight (38) 66 kV subtransmission lines, twenty-five (25) 12 kV distribution lines, eighteen (18) telecommunication lines, and at least one regional substation ("Bandini"). All of these facilities either cross, run parallel to, or are located in areas likely to be impacted by the Project.

SCE's 220 kV facilities running parallel to the I-710 Freeway between the I-405 and SR-91, are considered critical infrastructure facilities by the Federal Energy Regulatory Commission ("FERC"). These 220 kV facilities are operated under the jurisdiction of the California Independent System Operator ("CAISO") and transmit electricity for ultimate delivery to approximately 85,000 customers in the greater Long Beach area, including the Gateway Cities Council of Governments cities and the Port of Long Beach. In addition, these 220 kV line facilities provide paths for power flow during abnormal electrical system events north and east of the I-710/SR-91 interchange. It is imperative from system reliability, electric system planning, and operating perspectives that SCE maintain these four (4) 220 kV circuits. U-2-14

[51] *See* TE Application Testimony at 3, 10.

[52] *See* TE Application Testimony at 3 – 25 (describing SCE's vision for TE to reduce emissions and drive innovation).

In 2012, SCE provided Caltrans and MTA a preliminary description of SCE facilities that would be impacted by the Project.[53] Since that time, SCE has engaged in significant discussions with Caltrans and its consultants to catalog the impacts of the Project on SCE's facilities and to continue the beneficial collaboration on the necessary planning and design to resolve those issues.[54] Reflecting some of those discussions, the RDEIR/SDEIS's descriptions of the Project's impacts to SCE's facilities include:

- a summary of Alternative 5C's conflicts with and impacts to SCE facilities on RDEIR/SDEIS pages 3.4-10 to 3.4-14;
- a summary of Alternative 7's conflicts with and impacts to SCE's facilities on RDEIR/SDEIS pages 3.4-23 to 3.4-31; and
- detailed descriptions of the conflicts between the Project and SCE's facilities provided in "Utility Reports" attached as technical appendices to the RDEIR/SDEIS. The Utility Reports also contain general relocation and mitigation strategies to address impacts to SCE facilities.[55]

SCE notes that these descriptions of the potential impacts on SCE's facilities are preliminary, and may not capture the entire extent of the impacts.[56] SCE looks forward to continuing to work closely with Caltrans and its consultants to refine these descriptions (to the extent necessary) through the development of the Final REIR/SEIS and Specific Utility Relocation Plan ("SURP") for SCE's relocation work (the "Relocation Work"), as discussed in Section II.B.2., below. U-2-15

[53] *See* 2012 EIR/EIS at Appx. J (Comments and Coordination).

[54] *See* RDEIR/SDEIS at ES-13 ("To address the utility relocations, Metro has conducted detailed relocation studies to help shorten the lead time necessary to implement these relocations"), 2-20 to 2-21 (describing "Major Utility Relocations").

[55] *See Final Report, Utility Impact Report, I-710 Corridor Project, Utilities Relocation Strategies Report, Central Segment* (June 2016) ("Central Segment Utility Report") at 7, 17-38 (noting coordination with SCE); *North Utility Study, Final Draft Preliminary Strategies Report* (September 13, 2016) ("North Segment Utility Report") at 37 - 61 (same); *I-710 South End Utility Study, Project Report* (November 25, 2016) ("South Segment Utility Report") at 19 – 27 (same). The South, Central, and North Segment Utility Reports are collectively referred to as the "Utility Reports" herein.

[56] *See e.g.*, RDEIR/SDEIS at 3.4-8 ("Major Utilities" addressed in the RDEIR/SDEIS are defined, in part, as including "Power lines with voltages of 50 kilovolts or greater" and thus some distribution conflicts may not be captured by the RDEIR/SDEIS's current analyses); *see also* RDEIR/SDEIS at ES-32 ("[t]he Project design is not advanced enough to determine the specific locations of some utility relocations"); Central Segment Utility Report at 8; North Segment Utility Report at 7-8.

B. Relocation of SCE Facilities

The Utility Reports are intended to "provide information, and technical guidance, and to implement strategies to develop the design in line with the need and purpose for the [Project]."[57] "The purpose of [these studies] was to understand, and evaluate the existing conditions of all underground and overhead utilities within the project limits, and to develop mitigation measures for all utilities in conflict to support developed EIR/EIS Alternative 5C, Design Option and Alternative 7."[58]

1. Environmental analyses performed and assumptions made in the RDEIR/SDEIS regarding the relocation of SCE facilities

Among other things, and as potentially relevant to SCE's facilities, the RDEIR/SDEIS assumes that:

- "[u]nder all build alternatives, utility relocations would occur prior to project construction";[59]
- "Generally, all utility relocations are expected to occupy new or existing fee owned or easement rights of way or public rights of way";[60]
- the Project's build alternatives "would not contribute to cumulative adverse impacts related to utilities…" because the cumulative projects listed in the RDEIR/SDEIS "would occur prior to highway construction";[61] and
- "[t]he relocation of existing utilities is a component of the Project Description, and the relocated utility infrastructure is included in the project footprint/disturbance limits [and that t]he effects of the utility relocation are evaluated in this RDEIR/SDEIS, including the

---

[57] *See* South Segment Utility Report at 5, 9 (utility relocation reports "supplement the EIR/EIS I-710 Corridor Study Report" and are intended to be "a comprehensive 'toolbox' that can be used as a preliminary design to develop utility relocation plans for the construction of the I-710 EIR/EIS project").

[58] *See* South Segment Utility Report at 39.

[59] *See* RDEIR/SDEIS at ES-27; South Segment Utility Report at 9 ("The majority of the mitigation measures described in this report need to be implemented before construction of the I-710 can commence.").

[60] *See* RDEIR/SDEIS at 3.4-8.

[61] *See* RDEIR/SDEIS at 3.25-66.

short-term construction effects of demolition and construction, as well as the long-term effects of operation of the new utility infrastructure."[62]

2. *Anticipated regulatory process and timeline in support of the relocation of SCE's facilities*

Consistent with the provisions of the California Environmental Quality Act ("CEQA") and CPUC General Order ("GO") 131-D, SCE intends to use the documents referenced by the Project's Final, certified and adopted REIR/SEIS, including the Utility Reports and any other relevant and available studies and/or documents, in support of any CPUC licensing required for SCE's Relocation Work.[63] The RDEIR/SDEIS generally describes Caltrans' expectations regarding the CPUC's anticipated regulatory process in support of SCE's Relocation Work on pages 2-20 through 2-21.[64] The described regulatory process suggests, and it is mutually recognized by SCE and Caltrans that additional efforts regarding the description of SCE's Relocation Work and the environmental analyses of same are required in support of any CPUC license application. U-2-16

a) Environmental analysis of SCE's Relocation Work

SCE strongly encourages Caltrans to consider the potential adverse schedule impacts that would result from the CPUC requiring additional environmental analyses of SCE's Relocation Work. Measures should be taken to minimize the potential for any such delay by completing the environmental analyses for SCE's Relocation Work prior to SCE's application for any license/permit from the CPUC. U-2-17

One option to potentially minimize such delay would be for the Final REIR/SEIS (or other document concurrently certified and relied upon by the Project approvals) to specifically

---

[62] *See* RDEIR/SDEIS at 2-20; *see also* Central Segment Utility Report at 8, Table 3.3, Table 3.4-2 (assessment and descriptions of SCE fee owned property).

[63] *See* Sept. 28, 2012 Letter from A. Barnsdale (CPUC Energy Division) to R. Kosinski (Caltrans Dist. 7) regarding *Comments on the draft EIR for the I-710 Corridor Project* (asserting, in relevant part, "The [CPUC's] discretionary authority will be required by SCE to relocate any portion of the electrical infrastructure impacted by the I-710 Corridor Project").

[64] *See* RDEIR/SDEIS at 2-20 (Caltrans anticipates the CPUC will conduct an independent review of the I-710 Corridor Project EIR/EIS; make findings required by CEQA Guidelines Section 15091 [*Findings*] for each significant effect of the Project; make the findings required by CEQA Guidelines Section 15093 [*Statement of Overriding Considerations*], if necessary; file a Notice of Determination (NOD) that states it considered the EIR/EIS as prepared by the Lead Agency; and then rely on the Project EIR/EIS for the issuance of any needed permits and approvals. Also, Public Utilities Code Section 851 [*Transfer or Encumbrance of Utility Property*] requires SCE to secure CPUC approval prior to selling, leasing, assigning or otherwise disposing or encumbering property as part of the Relocation Work.).

describe the environmental impacts resulting from any necessary relocation of SCE's facilities, including those that are subject to the licensing requirements of the CPUC per GO 131-D. This description of environmental impacts specific to SCE's Relocation Work should determine each impact category for which SCE's Relocation Work was found to be "significant" and, where appropriate, assign specific mitigation measures applicable to SCE's Relocation Work.[65] The Final REIR/SEIS should explicitly confirm that SCE's Relocation Work can be accomplished within the disturbance limits established for the Project and studied in the Final REIR/SEIS.

Further, Caltrans' final Project approvals should contain findings specific to SCE's scope of work and the impacts resulting specifically therefrom (in compliance with CEQA Guidelines section 15091 and 15093, as appropriate), independent of the findings made for the Project as a whole.[66]

These separate analyses and findings are important because, if it is not sufficiently clear to the CPUC that SCE's Relocation Work has been thoroughly evaluated *before* SCE applies for any CPUC license, the CPUC may require additional environmental evaluations be undertaken in support of SCE's Relocation Work. Because Caltrans' construction schedule assumes the utility relocations, including SCE's Relocation Work, would occur prior to the Project's construction,[67] any delays associated with SCE's licensing of its Relocation Work will negatively impact the Project's estimated construction schedule. U-2-17

In light of the importance of SCE's Relocation Work to the Project's construction schedule, SCE recommends a working group be formed in support of SCE's Relocation Work, consisting of SCE, Caltrans (and its consultants), and the CPUC (if possible). Involvement of these relevant stakeholders will limit the potential for confusion and/or scheduling surprises regarding the CPUC's permitting of SCE's Relocation Work.

---

[65] Because utility relocations are part of the Project description, SCE assumes that the impacts from its Relocation Work are a subset of the impacts that will be caused by the Project. Therefore, while certain impacts from SCE's Relocation Work may be less than the Project's, there should be no significant and unavoidable impacts associated with SCE's relocation work that are not similarly found to be significant and unavoidable for the Project as a whole.

[66] *See* CEQA Guidelines §§ 15091 (Findings), 15093 (Statement of Overriding Considerations).

[67] *See* RDEIR/SDEIS at ES-27.

b) Mitigation Measure U&ES-2 (Utilities)

SCE understands its facilities "would be relocated in accordance with specific Utility Relocation Plans [("SURPs")] described below in Measure U&ES-2."[68] Caltrans suggests that SCE's SURP would be developed after the certification of the Final REIR/SEIS.[69]

While Caltrans' intent regarding measure U&ES-2 is ambiguous,[70] SCE notes that measure U&ES-2 does not appear to be a "mitigation measure" *per se*, in that it is not clear that the provisions of SCE's SURP will reduce impacts from its Relocation Work below relevant thresholds of significance. Indeed, it is not currently clear which portions of SCE's Relocation Work may be significant and thus require mitigation. U-2-18

Mitigation plans, such as the SURPs contemplated under U&ES-2, may not improperly defer environmental analysis. Post-certification mitigation plans must lay out specific performance standards that must be satisfied in order to ensure that the environmental impacts disclosed in the environmental documents are not surpassed. Therefore, to serve as an effective mitigation plan, U&ES-2 should specifically enumerate the levels of environmental impacts the Final REIR/SEIS assumes will not be surpassed by SCE's Relocation Work. SCE has significant concerns that such an exercise would be ultimately successful given the current lack of detail regarding SCE's Relocation Work. U-2-19

SCE's preferred approach is that the environmental impacts from SCE's Relocation Work be sufficiently described in the Final REIR/SEIS or other environmental document(s) adopted by Caltrans at the time of the Project's approval.[71] Under such an approach, instead of a CEQA

---

[68] *See* RDEIR/SDEIS at 3.4-38 – 40 (Mitigation Measure U&ES-2 (Utilities) provides, in relevant part, "Utility relocations (classified as both major and minor) would be subject to preparation of Specific Utility Relocation Plans [...which] would include the following: [1] Description of existing facilities...[; 2] Description of proposed changes/demolition of existing facilities[; 3] Identification of potential conflicts... [; 4] A description of how the potential conflicts were resolved... [; 5] A description of the proposed facilities...[; 6] A work plan that describes the nature of the construction activity... [; 7] A summary of existing and planned Utility Team Coordination Meetings... [; 8] A determination whether a community meeting would be held prior to the issuance of demolition and grading permits... [; 9] ...other applicable mitigation measures described in this [RDEIR/SDEIS], for impacts related to cultural resources, visual resources, hazardous wastes, water quality, and traffic and transportation), 3.24-46 to 48 (describing mitigation measure CON-U&ES-2 (Utilities) and the Specific Utility Relocation Plans addressing temporary construction impacts).

[69] RDEIR/SDEIS at 2-20 ("Some of the relocations will be subject to the requirements of [...GO 131-D...], which will occur after certification of the I-710 Corridor Project EIR/EIS but prior to approval of utility relocation or grading plans").

[70] *See* RDEIR/SDEIS at 3.4-38 – 40 (measure U&ES-2 is listed in section 3.4.3, "Avoidance, Minimization, and/or Mitigation Measures").

[71] *See* Section II.B.2.a, *supra.*

"mitigation measure," SCE's SURP would serve as a guidance document describing the specific construction techniques that SCE will employ in order to implement its Relocation Work in accordance with the findings and determinations of the certified Final REIR/SEIS.

SCE looks forward to assisting Caltrans in developing and executing a timely approach to address the environmental impacts associated with its Relocation Work which will satisfy the requirements of the CPUC.

U-2-19

C. Estimated Costs of the Relocation of SCE Facilities

Regarding the purported costs of SCE's Relocation Work, the Utility Reports assert:

- the "North Segment" will cost SCE approximately $8,498,001 and the Project $2,844,680 for Alternative 5C,[72] and SCE approximately $11,987,555 and the Project $19,278,543 for Alternative 7;[73]
- the "Central Segment" Project (non-SCE) costs will approximate $17,436,094 for Alternative 5C[74] and approximately $36,394,469 for Alternative 7;[75] and
- the "South Segment" SCE Relocation Work costs are not broken out but are subsumed within an estimated *total* Project utility relocation cost of $195,600,000 for Alternative 5C[76] and $192,600,000 for Alternative 7.[77]

SCE understands these estimates reflect an approximate assignment of cost based on a referenced "Freeway Master Agreement" between SCE and Caltrans.[78] SCE notes that these

---

[72] *See* North Segment Utility Report at 83, 103 (total Project costs of $11,378,420 for Alternative 5C and $31,266,099 for Alternative 7).

[73] *See* North Segment Utility Report at 91, 103.

[74] *See* Central Segment Utility Report at 105.

[75] *See* Central Segment Utility Report at 106.

[76] *See* South Segment Utility Report at Ex 4-Ex-5 ($71,400,000 + $13,200,000 + $69,500,000 + $10,700,000 + $17,300,000 +$13,500,000 = $195,600,000).

[77] *See* South Segment Utility Report at Ex 4-Ex-5 ($23,200,000 + $72,300,000 + $48,700,000 + $32,100,000 + $16,300,000 = $192,600,000).

[78] *See* South Segment Utility Report at 12 (noting, with respect to the approximate assignment of Project costs, "SCE facilities operate under Freeway Master Agreement between Caltrans and SCE. The Master Contract determines liability based on the following three scenarios: [1] Caltrans/Project shall pay 100 percent of the cost of Relocations of Owners existing facilities located in a Private Right-of-Way of Owner, upon delivery by Owner to Caltrans a copy of such Private Right-of-Way concurrent with timely submission of Owner's relocation plan to Caltrans[; 2.] Owner shall pay 100 percent of the cost of Relocation of Owner's Utility Facilities originally installed within State Right-of-Way pursuant to Caltrans Encroachment permit and without benefit of a valid franchise[; or 3] In all other

costs are Caltrans' estimates, are not final, do not represent SCE's estimates of Maximum Prudent and Reasonable Cost under Public Utilities Code section 1005.5, and are subject to change in support of any licensing application for SCE's Relocation Work submitted to the CPUC. Further, all efforts supporting SCE's Relocation Work would be subject to the provisions of a Relocation Agreement to be executed between SCE and Caltrans/METRO. At a minimum, the provisions of the Relocation Agreement would establish the responsibility for Caltrans to secure for SCE equivalent fee owned property rights, non-revocable property rights, or Joint Use Agreements. SCE must be afforded a reasonable opportunity to review and approve any property rights documentation prior to their execution. Caltrans will be required to reimburse SCE for any diminished property rights. SCE also anticipates that the Relocation Agreement would ensure that any further relocation of SCE facilities would be funded by Caltrans or another third party, and that SCE's rate payers and shareholders would not be exposed to additional costs. U-2-20

III. TECHNICAL COMMENTS REGARDING THE RDEIR/SDEIS'S ENVIRONMENTAL ANALYSES

Appended hereto as Attachment 1, please find a matrix containing SCE's specific comments on the RDEIR/SDEIS, associated appendices, and supporting studies available to date. Captured within this matrix are some of the key issues which should be addressed by the Project's final environmental documents. A general summary of certain key issues is included below.

A. Alternatives

The RDEIR/SDEIS does not currently identify the preferred and/or environmentally superior project alternative, but notes that "the Final EIR/EIS…will identify the Preferred Alternative."[79] Identification of the preferred and/or environmentally superior project alternative would clarify potential Project impacts to SCE's facilities, as well as the associated environmental impacts caused by SCE's Relocation Work. U-2-21

With respect to the possible systems which may power the ZE trucks on the Freight Corridor ("Freight Corridor"),[80] SCE has performed preliminary analyses regarding the load, facility, and space requirements needed in support of an overhead catenary system. SCE has the capacity to U-2-22

---

circumstances, including but not limited to Owner's existing Utility Facilities in place pursuant to a valid franchise, statue, or non-perfected claim of prescription, the cost of Relocation of Owner's existing Utility Facilities shall be borne equally by Caltrans and Owner.")

[79] *See* RDEIR/SDEIS at ES-9.

[80] *See* RDEIR/SDEIS at 2-59 ("The power systems for these electric propulsion trucks could include, but are not limited to, road-connected wayside power (e.g., overhead catenary electric power distribution system), long-range electric battery cells, as well as ZE hybrid power sources such as a fuel-cell/electric battery Range Extender Electric Vehicle (REEV)"), 2-95 (describing catenary system as part of Alternative 6, presented in the 2012 Project DEIR/EIS).

both build the infrastructure supporting the catenary and to supply power to it. The attendant benefits associated with a catenary power system (*e.g.*, improved local air quality, effective increases in range of ZEVs utilizing the Freight Corridor, compatibility with NZE technologies, *etc.*), along with any environmental impacts associated with its supporting infrastructure, should be evaluated and considered in support of the development of the Final REIR/SEIS and selection of the preferred Project alternative. U-2-22

B. The Project's Assumptions Regarding Alternative 7 Understate its Benefits while Overstating its Environmental Impacts vis-à-vis Alternative 5C

Common sense suggests that the impacts associated with Alternative 5C would be greater than those of Alternative 7. But the RDEIR/SDEIS makes various assumptions that understate Alternative 7's environmental benefits, while overstating its environmental impacts. As a result, the environmental differences between Alternatives 5C and 7 are artificially narrowed and should be revised. U-2-23

1. Air Quality Analyses

The skewing impact of the RDEIR/SDEIS's assumptions is most clearly demonstrated in the Air Quality analyses. The *Air Quality, Greenhouse Gas, and Health Risk Assessment Technical Study* for the RDEIR/SDEIS makes a number of inaccurate assumptions that result in understated benefits to air quality and public health under Alternative 7.

The RDEIR/SDEIS makes clear that overall, the Project would convey specific regional air quality and health benefits.[81] However, with respect to certain pollutant emissions and their potential impact on populations residing near the I-710, the analyses find: U-2-24

> Alternative *[sic]* 5C and 7 show areas of increased impacts compared to the 2035 Alternative 1 (No Build). This is generally the result of increases in emissions resulting from greater capacity. Compared to the 2035 Alternative 1 (No Build), Alternative 7 shows fewer impacts related to

---

[81] *See* RDEIR/SDEIS at ES-39 ("Air Quality/Health Risk Assessment. The I-710 Corridor Project would not be implemented and the specific benefits of the I-710 Corridor Project build alternatives would not occur under Alternative 1"), 3.3-137 ("Although there are air quality benefits associated with the build alternatives (including those associated with the Community Health Benefit Program, a programmatic component of both build alternatives), and these benefits would be experienced by the environmental justice populations that predominantly reside near the I-710 freeway, there are also near-roadway adverse impacts that would disproportionately burden these populations").

> DPM, NOx and health risks than Alternative 5C. Whereas, Alternative 5C shows fewer impacts related to PM, CO, VOC, and SO2.[82]

These conclusions are predicated on the RDEIR/SDEIS's finding that Alternative 7 would effectively move more traffic and thus, would cause greater air quality emissions when compared with Alternative 5C. Simply put, as volume of traffic increases, air emissions increase. However, as explained below, this finding, coupled with questionable assumptions regarding air quality emissions, combine to inappropriately skew Alternative 7's estimated impacts. U-2-24

a) The air quality analyses assume conventional truck emissions profiles for the ZE/NZE Freight Corridor, resulting in over-estimates of NOx, CO, VOCs, SO2 and GHGs for Alternative 7

In determining the emissions factors that formed the basis for the air quality analyses of Alternatives 5C and 7, the AQ Tech Study states:

> This analysis conservatively assumed that all criteria air pollutant *[sic]* (except for NOx) and greenhouse gas emission factors of *ZE/NZE trucks were equal to that of a conventional heavy-duty truck.* … the *NOx emission factors of the ZE/NZE trucks were reduced by a factor of 90% as compared to the conventional heavy-duty trucks*…This approach is consistent with other SCAQMD public statements. It is conservative because the presence of ZE (as opposed to NZE) would further reduce emissions.[83]

U-2-25

While this paragraph makes no reference to fuel, SCE assumes the reference to "conventional heavy-duty trucks" with respect to the Project are diesel-powered, Class 8 trucks. There are various flawed assumptions here that skew the air quality analyses and present erroneous conclusions.

First, the ZE/NZE component of Alternative 7 was given no credit with respect to the estimated CO, VOCs, SO_2, $PM_{2.5}$, PM_{10}, and GHG emissions. This means that because Alternative 7

---

[82] AQ Tech Study at ES-29. "Criteria air pollutants" include Nitrogen Oxides ("NOx"), Carbon Monoxide (CO), Volatile Organic Compounds ("VOCs"), Sulphur Dioxide ("SO_2"), Particulate Matter, 2.5 microns ("$PM_{2.5}$"), and Particulate Matter, 10 microns ("PM_{10}"). *See* AQ Tech Study at ES-13 (Table ES-2, listing pollutants). DPM is "the greatest contributor to air-quality related cancer risk in the South Coast Air Basin and that approximately half of the DPM is emitted by diesel trucks using the freeway and roadway systems." *See* RDEIR/SDEIS at 1-9, 3.3-136 (decreases in cancer risks under Alternative 7 mainly due to decreases in DPM), 3.13-33 (DPM "main health risk concern").

[83] AQ Tech Study at C-27 (emphasis added), ES-16 ("…for purposes of this analysis Ramboll Environ assumed ZE/NZE trucks would be NZE with no reductions in any of the criteria air pollutants except NOx").

would effectively move more traffic, it would be penalized when compared with Alternative 5C because: (1) as the volume of traffic increases, air emissions increase; and (2) this increase in trucks was assumed to be made up of "conventional heavy-duty trucks" in lieu of ultra-low polluting ones. This assumption regarding the use of emissions profiles from conventional trucks fatally flaws the specific conclusion that Alternative 7's increased traffic flow would eclipse any reduction in SO_2 emissions resulting from the implementation of the Pavley Standard.[84] Indeed, for all criteria pollutants (save NOx, discussed below), this assumption guts the air quality benefits of Alternative 7, grossly distorting its cost/benefit analysis when compared with 5C.[85] U-2-25

Similarly, the only source of GHGs from the Project's operational phase is running exhaust.[86] The GHGs that are released by the combustion of fossil fuel in on-road vehicles include carbon dioxide ("CO_2"), methane ("CH_4"), and nitrous oxide ("N_2O"). The analysis's use of the GHG emissions profile of a conventional heavy-duty truck[87] thus fatally flaws the GHG analysis because ZEVs release no GHGs, while NZEVs generate a small fraction of the GHGs emitted by conventional diesel engines.[88] In reality, Alternative 7 does not merely "display a negligible increase in GHG emissions" as found in the RDEIR/SDEIS, [89] but rather, would drive GHG reductions considerably beyond reductions inherent in the "no build" alternative, and thus would support satisfaction of California's ambitious GHG reduction targets. U-2-26

These assumptions made by the RDEIR/SDEIS also seemingly ignore the power of Alternative 7's Freight Corridor to drive the adoption of ZE/NZE technologies and thus further reduce criteria pollutants (including NOx) and GHG emissions when compared to the lane widening proposed under Alternative 5C. U-2-27

---

[84] *See* AQ Tech Study at ES-14 ("…with the implementation of the Pavley Standard…we see decreases in SO2 emissions for all future alternatives as compared to the 2012 Baseline. For 2035 Alternative 7 alone, SO2 emissions from the I-710 freeway increase in 2035…because the increase in SO2 emissions associated with increased truck traffic on the Freight Corridor are greater than the reductions in SO2 generated by the Pavley Standard.")

[85] *See* RDEIR/SDEIS at 3.3-57 ("The success of the freight corridor depends upon its ability to remove a substantial majority of diesel trucks from the freeway lanes and deliver travel and air quality benefits relative to its projected cost").

[86] *See* AQ Tech Study at 34.

[87] AQ Tech Study at C-27 ("This analysis conservatively assumed that all criteria air pollutant (except for NOx) and greenhouse gas emission factors of ZE/NZE trucks were equal to that of a conventional heavy-duty truck").

[88] *See* CARB, EMFAC2014 Volume III - Handbook for Project-level Analyses v1.0.7 (May 20, 2015), *available at*: https://www.arb.ca.gov/msei/downloads/emfac2014/emfac2014-vol3-technical-documentation-052015.pdf (last checked Oct. 21, 2017) at 97 ("Battery-electric vehicles (BEVs) and fuel-cell vehicles (FCVs) have no tailpipe CO2 emissions."

[89] AQ Tech Study at ES-3 (no increase in GHG emissions from Alternative 7).

With specific regard to NOx, while the RDEIR/SDEIS assumed reduced NOx emissions by a factor of 90 percent, this ignores the presence of ZEVs, which emit no NOx. Thus, if the Freight Corridor is reserved solely for ZEVs, this would substantially reduce NOx (with the only NOx emissions coming from NZE vehicles and conventional diesel trucks on the I-710 freeway but not the Freight Corridor).[90] Even short of assuming a 100 percent ZEV Freight Corridor, however, the presence of ZEVs would decrease the likely NOx emissions beyond those projected by the RDEIR/SDEIS and the technical air analyses. U-2-27

Lastly, assuming ZE/NZE emissions profiles to be equivalent to "conventional heavy-duty trucks" is unnecessary. Emissions factors and methodologies are readily available to describe likely emissions from both ZE and NZE vehicles that could have been (and should be) used to compare Alternative 7's benefits vis-à-vis Alternative 5C.[91] U-2-28

b) The air quality analyses assume an "infinite silt reservoir" and fail to account for reductions in the accepted silt loading factor thus overstating Alternative 7's emissions of PM2.5 and PM10

The RDEIR/SDEIS acknowledges that increases in entrained road dust (accounted for as PM_{10}) are likely overestimated,[92] as the methodology used for estimating these emissions assumes that roadways have an infinite amount of dust (silt) and entrained road dust emissions are directly proportional to VMT. As noted above, because Alternative 7 allows for the most increase in throughput/VMT of the I-710 corridor (a key project objective), this assumed "infinite" silt U-2-29

---

[90] *See* AQ Tech Study, Appendix D, Air Dispersion Modeling, Section 7 (NZE trucks would be "alternative-fueled (*e.g.* CNG or LNG, hydrogen)"). However, the air quality analyses do not explain which emissions factors were used for the "alternative fuel" (*i.e.*, CNG, LNG, or hydrogen) or the percentages of the NZE trucks were assumed to be CNG, LNG, or hydrogen.

[91] *See e.g.*, 17 Cal. Code of Regs. 95480, *et seq.* (Low Carbon Fuel Standard) (re GHG emissions, presenting Energy Economy Ratio (gCO2e/MJ) adjusted GHG emissions for conventional, ZE, and NZE trucks); California Air Resources Board (CARB) Low Carbon Fuel Standard (LCFS) website, *available here*: https://www.arb.ca.gov/fuels/lcfs/lcfs.htm (last checked Oct. 15, 2017) (GHG emissions); Ramboll Environ, *Zero Emissions Bus Options: Analysis of 2015-2055 Fleet Costs and Emissions* (Feb. 2016), *available here*: https://media.metro.net/board/Items/2016/09_september/20160914atvcitem4.pdf (last checked Oct. 15, 2017) (NOx, PM, CH4, CO2, GHG (CO2e)); ICF International, *California Transportation Electrification Assessment, Phase 1: Final Report* (Aug. 2014; Updated Sept. 2014), *available here*: http://caletc.com/wp-content/uploads/2016/08/CalETC_TEA_Phase_1-FINAL_Updated_092014.pdf (last checked Oct. 15, 2017) (NOx); King County METRO, *Feasibility of Achieving a Carbon-Neutral or Zero-Emission Fleet* (Mar. 2017), *available here*: http://kingcounty.gov/~/media/elected/executive/constantine/news/documents/Zero_Emission_Fleet.ashx?la=en (last checked Oct. 15, 2017) (NOx, CO2, PM10).

[92] *See* AQ Tech Study at ES-14.

reservoir will tend to exaggerate Alternative 7's emissions of PM_{10} in comparison to Alternative 5C.[93]

In addition to this penalizing assumption, the California Air Resources Board ("CARB") revised the silt loading factor for freeways by approximately 25 percent.[94] This unaccounted 25 percent reduction in entrained road dust, coupled with the "infinite' silt reservoir assumption, results in overestimated of emissions of $PM_{2.5}$ and PM_{10} from Alternative 7. U-2-29

c) The defined study area fails to properly account for decreases in regional emissions and traffic, thus understating Alternative 7's benefits and potential to convert trucks to ZE/NZE technologies

The narrow geographic scope of the RDEIR/SDEIS's air quality analysis also does not capture the regional benefit of Alternative 7 to the South Coast Air Basin. As the RDEIR/SDEIS notes, railroad systems will not be able to accommodate the increase in traffic from the Ports, even if operating at maximum capacity, and thus increased truck traffic on the I-710 is inevitable.[95] Air dispersion modeling was performed using only the emissions data calculated for the I-710 mainline (and freight corridor for Alternative 7), using post-processed traffic data.[96] As such, the modeling results do not reflect changes in emissions on other nearby freeways and local arterials and roadways. Emissions on these other roadways would be expected to decrease as traffic shifts to the I-710.[97] U-2-30

---

[93] *See* AQ Tech Study at ES-14; RDEIR/SDEIS at 3.13-24 (finding decrease in exhaust PM2.5 emissions greater than the sum of the increases in tire wear, brake wear, and entrained road dust emissions but increases in entrained road dust, tire wear, and brake wear outweigh the decrease in exhaust PM10), 3.13-28 (finding Alternative 5C would increase the PM10 emissions along the I-710 freeway corridor by up to 24 percent and Alternative 7 would increase the PM10 emissions along the I-710 freeway corridor by up to 51 percent).

[94] *See* AQ Tech Study at ES-14 to ES-15.

[95] *See* RDEIR/SDEIS at 1-21 ("With regard to future demand for cargo containers to be transported to and from the Ports by rail instead of truck, the I-710 Railroad Goods Movement Study (February 2009) found that while railroads have employed a variety of operational strategies to meet increased container demand from the Ports, including longer trains with higher utilization rates, *the railroad system will not be able to handle all of the cargo demand even with the rail system operating at maximum capacity*. Therefore, any additional containers would be transported via truck, which increases travel demand by truck on I-710," emphasis added)

[96] *See* AQ Tech Study at ES-18; RDEIR/SDEIS at 3.13-29 ("The emissions analysis does show that Alternative 7 incremental near-freeway emissions along the I-710 are at least three times greater than Alternative 5C when compared to the 2035 No Build Alternative.")

[97] *See* RDEIR/SDEIS at 3.5-105 (Table 3.5-24, comparing VMT, vehicle hours travelled ("VHT"), and vehicle hours of delay ("VHD") of the Project's alternatives), 3.3-133 (citing increase in throughput and associated VMT), 3.3-134 (same), 3.5-83 ("vehicle throughputs are projected to increase under Alternative 7").

In other words, the noted increase in VMT Alternative 7 would accommodate (as compared to Alternative 5C) must be assumed to come from somewhere; VMT increases along the I-710 can be assumed to accompany VMT decreases along other regional freeways and arterials.[98] Omitting the emissions benefits produced from this shift in traffic therefore understates the positive impacts of Alternative 7, which would divert the highest volume of traffic, and further convert those trips to ZE/NZE technologies.[99]

U-2-30

d) The air emissions assumptions are not merely "conservative," but rather result in an inaccurate portrayal of the benefits and environmental impacts of Alternative 7

The RDEIR/SDEIS's characterization of the assumptions described above as merely "conservative" is erroneous.[100] These air quality assumptions do not treat Alternative 5C and 7 equally, and thus cannot be explained by a desire to present the "worst-case" scenario.

Instead, in the case at hand, where no preferred Project alternative has been selected, employing assumptions which uniformly penalize one alternative against the other (in this case, penalizing Alternative 7 vis-à-vis 5C) is not appropriate. Such a practice does not aid the public or the prospective decision-makers in making an informed selection between the alternatives. Instead, as explained above, it inappropriately presents an artificially skewed picture of the benefits, environmental consequences, and costs of Alternative 7. It is therefore detrimental to a decision-maker's deliberations regarding whether Alternative 7's likely benefits outweigh its anticipated environmental consequences and warrant its costs.

U-2-31

---

[98] *See id.*; AQ Tech Study at ES-29 (increased traffic capacity via Alternative 7), Tables C-2-4S to C-2-4C (showing CO2 emissions between 1,319 to 2,873 gram per mile (g/mi) for Heavy Heavy-Duty Trucks ("HHDT"), between 983 and 2,263 g/mi for medium-heavy duty trucks, and between 1,322 and 2,811 g/mi for port trucks in 2035, based on vehicle speed - these emissions could be mitigated if such trucks are replaced by ZE and/or NZE trucks).

[99] *See* RDEIR/SDEIS at 3.13-38 ("Both build alternatives include ZE/NZE trucks (4,000 HHDT for Alternative 5C and 18,350 [HHDT] for Alternative 7). As a result, ZE/NZE trucks account for approximately 22 percent of the HHDT VMT along the I-710, and the only trucks traveling along the freight corridor in Alternative 7 are ZE/NZE (approximately 67 percent of heavy-duty truck VMT along the I-710 main line and freight corridor)."); AQ Tech Study at Tables C-8-1A to 1C (assume 4,000 ZE/NZE trucks under Alternative 5C (24.64 percent of the total I-710 HHDT and 18,350 HHDT for Alternative 7). It is unclear how the Air Quality analysis accounts for emissions reductions from these ZE/NZE trucks. Surprisingly, Tables C-8-1A to C-8-1C appear to show Alternatives 5C and 7 as having the same criteria pollution mass emission reduction when: (1) Alternative 7 would generate 14,350 more (18,350 – 4,000 = 14,350) ZE/NZE HHDT than Alternative 5C; and (2) ZE/NZE trucks emit considerably less criteria pollution mass emissions than conventional heavy-duty trucks.

[100] *See* AQ Tech Study at ES-15 (PM2.5 and PM10 assumptions "conservative"), ES-18 (air dispersion modeling and assumed shifts in traffic "conservative"), ES-29 (criteria pollutant and GHG emissions "conservative"), C-27 ("This analysis *conservatively* assumed … It is *conservative* because the presence of ZE (as opposed to NZE) would further reduce emissions," emphasis added).

2. *Health Benefits*

With respect to the comparative health benefits of the build alternatives, in certain instances (decreases in cancer risk, for example), the RDEIR/SDEIS clearly and plainly presents Alternative 7 as the superior Project alternative.[101] In other instances however, Alternative 7's health benefits in comparison with those of Alternative 5C are more opaquely described, *e.g.*, "Under Alternative 5C, the maximum increase in risk is approximately three in one million. Under Alternative 7, that maximum increase in risk is less than one in one million."[102] Described alternatively, there is a more than 200 percent increased risk of cancer from Alternative 5C when compared with Alternative 7.

Alternative 7's benefits are also featured less prominently in the RDEIR/SDEIS's Executive Summary. While the Executive Summary makes prominent note of the alleged increase in exposure to people along the I-710 to "particulate matter (PM)-related morbidity and mortality health risks … particularly for Alternative 7," [103] the Executive Summary makes only passing reference to decreased cancer risks ("ZE/NZE trucks further reduce cancer risk for the build alternatives" [104]) and wholly fails to mention Alternative 7's documented superiority to Alternative 5C regarding the reduction of cancer health risks, as noted above.[105] U-2-32

Alternative 7's clear health benefits are obscured when not presented in the proper context or framed for clear comparison with Alternative 5C. The manner in which the data and conclusions are presented, especially in the Executive Summary, is critical to support the RDEIR/SDEIS's function as an informational document for the public and decision-makers, especially when

---

[101] RDEIR/SDEIS at 3.3-136 ("incremental decrease in cancer risk, and the greatest decreases occur under Alternative 7, mainly due to the decrease in diesel-related mobile source air toxics (MSAT) emissions (specifically diesel particulate matter [DPM], a main driver of cancer risk)…the substantial environmental justice populations in the Study Area would generally benefit from this overall reduced cancer risk").

[102] *See e.g.*, RDEIR/SDEIS at 3.3-137 ("The increases in PM10 and PM2.5 can be attributed to entrained road dust, rather than exhaust emissions (and the modeled analyses included herein are conservative). Cancer risk is lower overall, with the exceptions of some near-roadway areas that fall within the locations of environmental justice populations. Under Alternative 5C, the maximum increase in risk is approximately three in one million. Under Alternative 7, that maximum increase in risk is less than one in one million"), 4-55 ("For Alternative 7, the increase in risk is less than one in one million. For Alternative 5C, the maximum increase in risk is approximately three in one million").

[103] RDEIR/SDEIS at ES-20.

[104] RDEIR/SDEIS at ES-20.

[105] *See* RDEIR/SDEIS at 3.3-137, 4-55. As discussed in Section II.B.1.b, above, the RDEIR/SDEIS's treatment of entrained road dust artificially magnifies the assumed impacts from PM10 and PM2.5, further skewing the presentation of the comparative health benefits of Alternative 7. *See also* RDEIR/SDEIS at 3.3-137 ("The increases in PM10 and PM2.5 can be attributed to entrained road dust, rather than exhaust emissions (and the modeled analyses included herein are conservative).")

RDEIR/SDEIS alone totals more than 1,800 pages. Only when a more accurate depiction of Alternative 7's impacts are disclosed in the RDEIR/SDEIS (as opposed to assumed impacts at levels even Caltrans acknowledges to almost certainly be overstated) can the public be presented with a more accurate and reliable depiction of Alternative 7. U-2-32

3. Alternative 7's efficacy in addressing the goals of the Project penalize it in the RDEIR/SDEIS's environmental analyses

The comparison of Alternative 7 against Alternative 5C presented in the RDEIR/SDEIS would benefit from a very clear explanation of the phenomenon whereby, due to the assumptions made, Alternative 7's documented superiority in satisfying the Project's stated purposes also significantly overstates Alternative 7's estimated environmental impacts. Specifically, because Alternative 7 would significantly *improve* traffic and congestion, VMT would increase, allegedly exacerbating certain environmental impacts associated with truck traffic flows: air quality, noise, health impacts, *etc.*[106] However, as explained herein, because the beneficial ZE and NZE characteristics of the trucks travelling on Alternative 7's Freight Corridor are largely ignored by the RDEIR/SDEIS's analyses, the presentation of Alternative 7's benefits are dramatically undercut, while, at the same time, its environmental impacts are significantly overestimated. SCE suggests that these assumptions be corrected and revised in support of the analyses presented in the Final REIR/SEIS. U-2-33

4. Energy Conclusions

Another example where the RDEIR/SDEIS seems to make incorrect assumptions that minimize the positive impacts of Alternative 7 is energy consumption. First, the Energy Technical Report asserts "both Alternative 5C and Alternative 7 result in a decrease in energy consumption in both the I-710 Study Area and the entire region" when compared against the 2035 baseline.[107] This conclusion makes sense for Alternative 7; given the NZE/ZE profile required in the Freight Corridor, less gasoline and diesel would likely be consumed.[108] It is however, counterintuitive with respect to Alternative 5C. An alternative that simply increases the number of lanes available (as well as the number of vehicles travelling on said lanes) would seemingly not decrease the amount of gasoline and diesel consumed. U-2-34

---

[106] *See* Section III.B.1, above.

[107] *See* Energy Technical Report at pg. v. ("Direct energy impacts from each build alternative include reduced gasoline and diesel fuel consumption compared to the 2035 No Build Alternative (Alternative 1). The net result is that compared to the 2035 No Build Alternative, both Alternative 5C and Alternative 7 result in a decrease in energy consumption in both the I-710 Study Area and the entire region.")

[108] *See* Energy Technical Report at pg. v.

The Energy Technical Report also asserts that ZE/NZE trucks' "use of energy is not substantially changed from the traditional diesel-powered trucks" and yet, in the same paragraph, it also asserts, "[I]t is not possible to determine [ZE/NZE trucks'] effect on the overall energy demand as energy consumption factors for these advance technology trucks are currently not available."[109] First, contrary to this assertion, it is "possible to determine [ZE/NZE trucks'] effect on the overall energy demand."[110] The CARB's Low Carbon Fuel Standard ("LCFS") methodology documents the energy consumption factors from ZE/NZE trucks.[111]

U-2-34

Even assuming the assertion was accurate however, this paragraph is self-conflicting. If no conclusions can be derived from the energy consumption factors currently available for ZE/NZE trucks, then the conclusion that the energy consumption patterns of ZE/NZE trucks would be similar to traditional diesel-powered trucks is not supported by substantial evidence.[112]

Lastly, other assertions of the Energy Technical Report seem to clearly support Alternative 7:

> Without the capacity improvements proposed in the build alternatives, *congested traffic conditions* would be more prevalent throughout the Study Area and to a lesser extent, the region. *These conditions contribute to a higher energy consumption rate because vehicles use extra fuel while idling in stop-and-go traffic or moving at slow speeds through congested roadways.*[113]

U-2-35

Thus, if Alternative 7 relieves congestion, it in turn *decreases* the energy consumption rate per truck. It is therefore superior to Alternative 5C in that respect because under Alternative 7, "improvements would include ZE/NZE heavy trucks, increase average travel speeds during peak hours, remove bottlenecks, and reduce delays"[114] beyond the improvements that may come under Alternative 5C.

C. Sufficiently Robust and Enforceable Project Commitments on the Part of Metro/Caltrans are Needed to Ensure the Freight Corridor is Populated with ZE Vehicles Only

The Freight Corridor will require the dedication of funds and the potential adoption of mitigation measures to ensure that the assumed benefits of the Freight Corridor materialize. Specifically, special attention must be paid to technologies to monitor and enforce the ingress/egress of vehicles onto the Freight Corridor (*e.g.*, cameras, scanners, radio-frequency identification, billing, *etc.*). Further, ZE hybrids should be monitored to verify that the ZE technologies are engaged within the ZE corridor. The Freight Corridor should be maintained cognizant of the trends and developments in autonomous operation in order to preserve their potential compatibility with the Freight Corridor. U-2-36

D. The Potential for the Freight Corridor to be Operated by a Public/Private Partnership (PPP) Should be Studied and Considered

PPPs can provide a continued or improved level of service at reduced costs. If properly designed and implemented, PPPs can help governments to finance infrastructure investment in a more efficient way. With respect to the I-710 Corridor, a PPP may:

- relieve governments from certain investment funding;
- introduce competition;
- adopt efficient managerial practices/experience of private sector; and
- achieve greater efficiencies than traditional public services.

U-2-37

A PPP should be explored in order to maximize the effective operation of the Freight Corridor.

IV. CONCLUSION

SCE supports the Project's goals and appreciates this opportunity to provide comments on this important effort. SCE believes that Alternative 7 best accomplishes the objectives of the I-710 Corridor Project, since it allows for the greatest volume of traffic while simultaneously reducing air pollutant emissions in the region. Alternative 7 also has the opportunity to jumpstart a desirable cycle of innovation, investment, and emissions reductions that California needs. For the reasons stated above, SCE believes Alternative 7 should be designated as the environmentally superior alternative, and further suggests that the Freight Corridor associated with Alternative 7 be limited to use by ZE trucks. U-2-38

SCE is committed to continuing to work with Caltrans/Metro and other stakeholders towards successful resolution of the issues and completion of the Project. Should you have any questions, please contact me directly or you may contact Donald Johnson (Donald.Johnson@sce.com or (909) 274 - 3846) to set up a meeting with appropriate SCE personnel to discuss any of the comments contained herein.

SCE would support a modest extension of time to allow for either further consideration of Alternative 7, or to accept additional comments regarding the RDEIR/SDEIS. In the event additional opportunities are provided to submit comments regarding any environmental documents supporting the Project (*e.g.*, if the RDEIR/SDEIS comment period is extended and/or re-opened), SCE reserves the right to submit additional comments at that time as may be warranted. U-2-39

Sincerely,

Michael A. Backstrom

SCE Comment Matrix Regarding the I-710 Corridor Project RDEIR/SDEIS

Chapter/ Section(s)	Page(s)	Identified Issue/Concern/Comment	Suggested Revision
** The comments made herein are consistent with and in addition to the comments presented in SCE's cover letter.*			
Executive Summary			
S.3.3.3 - Alternative 7: I-710 Modernization Plus Freight Corridor (Zero/Near Zero-Emission Vehicles)	8	Alternative 7's efficacy in addressing the goals of the Project penalize it in the RDEIR/SDEIS's environmental analyses due to the erroneous air quality assumptions employed.	The comparison of Alternative 7 against Alternative 5C presented in the Recirculated Draft Environmental Impact Report / Supplemental Draft Environmental Impact Statement's ("RDEIR/SDEIS") Executive Summary would benefit a very clear explanation of the phenomenon whereby, due to the air quality assumptions made, Alternative 7's documented superiority in satisfying the Project's stated purposes also significantly overstate Alternative 7's estimated environmental impacts. Specifically, because Alternative 7 would significantly improve traffic and congestion, vehicle miles travelled ("VMT") would increase, allegedly exacerbating certain environmental impacts associated with truck traffic flows: air quality, noise, health impacts, etc. However, because the beneficial zero-emission ("ZE") and near zero-emission ("NZE") characteristics of the trucks travelling on Alternative 7's dedicated ZE/NZE freight corridor ("Freight Corridor") are largely ignored by the RDEIR/SDEIS's analyses, the presentation of Alternative 7's benefits are dramatically undercut, while, at the

U-2-40

Chapter/ Section(s)	Page(s)	Identified Issue/Concern/Comment	Suggested Revision	
			same time, its environmental impacts are significantly overestimated. Unless corrected in the Final Recirculated Environmental Impact Report / Supplemental Environmental Impact Statement ("REIR/SEIS"), the air quality assumptions made and their effects should be clearly and overtly disclosed in the Final REIR/SEIS's Executive Summary and sections of analysis.	U-2-40
S.4 - Joint California Environmental Quality Act/National Environmental	9	The RDEIR/SDEIS does not currently identify the preferred and/or environmentally superior project alternative, but notes that "the Final EIR/EIS…will identify the Preferred Alternative."	Identification of the preferred and/or environmentally superior project alternative would aid in clarifying potential Project impacts to SCE's facilities, as well as the associated environmental impacts caused by SCE's work to relocate its facilities to accommodate the I-710 Project ("Relocation Work").	U-2-41
2. Project Alternatives				
2.3.2.1 Common Features of the Build Alternatives, Major Utility Relocations	2-20	"Some of the project-related utility relocations will require authorization from the California Public Utilities Commission (CPUC)." While CPUC licensing is expected, such licensing will not be confirmed until the preferred Project alternative is selected and	"Some of the project-related utility relocations will likely require authorization from the California Public Utilities Commission (CPUC)."	U-2-42

Chapter/ Section(s)	Page(s)	Identified Issue/Concern/Comment	Suggested Revision	
		more is known regarding SCE's necessary scope of work.		U-2-42
2.3.2.3. Alternative 7: I-710 Modernization Plus Freight Corridor (Zero-Emission Vehicles)	2-59 (*see also* 2-95 (Alternative 6: Alternative 5 with Addition of Four Separated Freight Movement Lanes)).	The RDEIR/SDEIS makes certain references to a "catenary" as a possible system which may power the ZE trucks on the Freight Corridor.	SCE has performed preliminary analyses regarding the load, facility, and space requirements needed in support of an overhead catenary system. SCE has the capacity to both build the infrastructure supporting the catenary and to supply power to it. The attendant benefits associated with a catenary power system (*e.g.*, improved local air quality, effective increases in range of ZEVs utilizing the Freight Corridor, compatibility with NZE technologies, *etc.*), along with any environmental impacts associated with its supporting infrastructure, should be evaluated and considered in support of the development of the Final REIR/SEIS and selection of the preferred Project alternative. In the event that Caltrans decides to proceed with a Catenary, additional time should be included to allow for the design and construction of the supporting infrastructure.	U-2-43
3. Affected Environment, Environmental Consequences, and Avoidance, Minimization, and/or Mitigation Measures				
General Comments				
All environmental sections relevant to SCE's Relocation Work		Consistent with the provisions of the California Environmental Quality Act ("CEQA") and CPUC General Order ("GO")	In order to effectively rely upon these documents for SCE's CPUC license, the I-710 Project documents should describe the specific	U-2-44

Chapter/ Section(s)	Page(s)	Identified Issue/Concern/Comment	Suggested Revision
		131-D, SCE intends to use the Final REIR/SEIS, as well as any other relevant studies and/or supplemental environmental documents, potentially including but not limited to the SCE Specific Utility Relocation Plan ("SURP"), in support of any CPUC license required for SCE's Relocation Work.	environmental impacts resulting from SCE's Relocation Work, determine each impact category for which SCE's Relocation Work was found to be "significant" and, where appropriate, assign specific mitigation measures applicable to SCE's Relocation Work. These documents should explicitly confirm that the environmental impacts from SCE's Relocation Work are captured within the total disclosed environmental impacts described for the I-710 Project as a whole. If not sufficiently clear to the CPUC that SCE's Relocation Work has been thoroughly evaluated before SCE applies for any CPUC license, the CPUC may require additional environmental evaluations be undertaken in support of SCE's Relocation Work. Because Caltrans's construction schedule assumes SCE's Relocation Work would occur prior to the Project's construction, any delays associated with SCE's licensing of its Relocation Work will likely negatively impact the Project's estimated construction schedule. In light of the importance of SCE's Relocation Work to the Project's construction schedule, SCE also recommends a working group be formed consisting of SCE, Caltrans (and its

U-2-44

Chapter/ Section(s)	Page(s)	Identified Issue/Concern/Comment	Suggested Revision	
			consultants), and the CPUC (if possible) in support of the evaluations of SCE's Relocation Work.	U-2-44
3.3. Community Impacts				
3.3.3.5 Environmental Consequences, *Conclusions*	3.3-137 (*see also* 4-55 (describing cancer risks)).	"Cancer risk is lower overall, with the exceptions of some near-roadway areas that fall within the locations of environmental justice populations. Under Alternative 5C, the maximum increase in risk is approximately three in one million. Under Alternative 7, that maximum increase in risk is less than one in one million" In certain instances in the RDEIR/SDEIS, such as the text quoted above, Alternative 7's health benefits are presented with those of Alternative 5C in a way which obscures comparison. The Final REIR/SEIS should present the relative health impacts and/or benefits of Alternatives 5C and 7 in a way which allows for their effective comparison.	"Cancer risk is lower overall, with the exceptions of some near-roadway areas that fall within the locations of environmental justice populations. Under Alternative 5C, the maximum increase in risk is approximately three in one million. Under Alternative 7, that maximum increase in risk is less than one in one million. Stated alternatively, there is a more than 200% increased risk of cancer from Alternative 5C when compared with Alternative 7."	U-2-45
3.4 Utility/Emergency Services				
3.4.2.2 Utilities: Permanent Impacts, SCE Transmission	3.4-10 to 3.4-31	Descriptions of the Project's impacts to SCE's facilities include a summary of Alternative 5C's conflicts with and impacts to SCE facilities on RDEIR/SDEIS pages 3.4-10 to	Descriptions of the potential impacts on SCE's facilities are preliminary, and may not capture the entire extent of those impacts or additional property rights which may be required in	U-2-46

3.4.3 Avoidance, Minimization and/or Mitigation Measures	3.4-38 to 3.4-40	Measure U&ES-2 (Utilities) which, in general, notes that utility relocations (including SCE's Relocation Work) will be subject to Specific Utility Relocation Plans which will describe, among other things, the existing facilities, proposed changes, proposed construction activities, and any applicable mitigation measures for significant environmental impacts attendant SCE's Relocation Work.	To the extent Caltrans intends U&ES-2 to mitigate impacts from SCE's Relocation Work as may be required by CEQA, SCE notes that it is not currently clear which portions of SCE's Relocation Work may be significant and thus require mitigation. Further, mitigation plans, such as those as contemplated under U&ES-2, may not improperly defer environmental analysis. Post-certification mitigation plans	U-2-70

Chapter/ Section(s)	Page(s)	Identified Issue/Concern/Comment	Suggested Revision
			must lay out specific performance standards that must be satisfied in order to ensure that the environmental impacts disclosed in the environmental documents are not surpassed. To serve as an effective mitigation plan, U&ES-2 should specifically enumerate the levels of environmental impacts the Final REIR/SEIS assumes will not be surpassed by SCE's Relocation Work. SCE has significant concerns that such an exercise would be ultimately successful given the current lack of detail regarding SCE's Relocation Work. SCE's preferred approach is that the environmental impacts from SCE's Relocation Work be sufficiently described in the Final REIR/SEIS or other environmental document(s) adopted by Caltrans at the time of Project approval. Under such an approach, instead of a CEQA "mitigation measure," SCE's SURP would serve as a guidance document describing the specific construction techniques that SCE will employ in order to implement its Relocation Work in accordance with the findings and determinations of the certified Final REIR/SEIS.

Technical Appendices			
Air Quality, Greenhouse Gas, and Health Risk Assessment Technical Study (June 2017) ("AQ Tech Study")			

U-2-71

Chapter/ Section(s)	Page(s)	Identified Issue/Concern/Comment	Suggested Revision
General	*E.g.*, ES-15, ES-18, ES-29, C-27	ES-15 (PM2.5 and PM10 assumptions "*conservative*"); ES-18 (air dispersion modeling and assumed shifts in traffic "*conservative*"); ES-29 (criteria pollutant and GHG emissions "*conservative*"); C-27 ("This analysis *conservatively* assumed … It is *conservative* because the presence of ZE (as opposed to NZE) would further reduce emissions," emphasis added).	The AQ Tech Study and RDEIR/SDEIS's characterization of the assumptions used in the Air Quality, GHG, and Health Risk Assessment as merely "*conservative*" is erroneous. These air quality assumptions do not treat Alternative 5C and 7 equally, and thus cannot be explained by a desire to present the "worst-case" scenario. Instead, in the case at hand, where no preferred Project alternative has been selected, employing assumptions which uniformly penalize one alternative against the other (in this case, penalizing Alternative 7 vis-à-vis 5C) is not appropriate. Such a practice does not aid the public or the prospective decision-makers in making an informed selection between the alternatives. Instead, it presents an artificially skewed picture of the benefits, environmental consequences, and costs of Alternative 7. The Final REIR/SEIS should re-evaluate its findings using methodologies which accurately describe likely emissions from Alternatives 5C and 7 in order to present an accurate comparison between the two.

U-2-72

Chapter/ Section(s)	Page(s)	Identified Issue/Concern/Comment	Suggested Revision
ES.5.2 Criteria Air Pollutant Incremental Emission Impacts	ES-14 to ES-15	"Entrained road dust, tire wear, and brake wear emissions show increases in 2035 as compared to 2012 Baseline…as these emissions are directly proportional to vehicle activity (or VMT). The entrained road dust emissions were calculated using CARB's emission factors (based on USEPA's Compilation of Air Pollution Emission Factors [AP-42]) for entrained road dust from paved roads. This methodology conservatively assumes that roadways have an infinite silt reservoir, even for heavily-traveled freeways and major arterials. As a result, entrained road dust emissions are likely overestimated. *Note: After the preparation of this report, CARB revised the silt loading factor for freeways to a lower value (approximately 25 percent lower). Initial analyses indicate that this reduces freeway entrained PM2.5 and PM10 incremental emissions for all project alternatives as compared to CEQA/NEPA baselines. These reductions are not expected to alter the conclusions of this report; however, the analyses presented in this report can be considered as conservative* [emphasis in original]."	Because Alternative 7 allows for the most increase in throughput/VMT on the I-710 corridor, this assumed "infinite" silt reservoir will tend to exaggerate Alternative 7's emissions of PM2.5 and PM10 in comparison to Alternative 5C. Thus, the assertion that CARB's revised analysis would not reasonably be expected to "alter the conclusions of this report" regarding the relative benefits of Alternative 7 compared with Alternative 5C is likely inaccurate. The Final REIR/SEIS should re-evaluate its findings using the updated CARB protocols to accurately describe likely PM2.5 and PM10 emissions in order to effectively compare Alternatives 5C and 7. Further, the Final REIR/SEIS should reconsider the use of "infinite" silt reservoirs to more accurately estimate and compare likely PM2.5 and PM10 emissions from Alternatives 5C and 7.

Chapter/ Section(s)	Page(s)	Identified Issue/Concern/Comment	Suggested Revision	
ES. 6. I-710 Freeway Near-Roadway Health Risk and Air Quality Impacts	ES-18	"It's important to note that the air dispersion modeling was performed using only the emissions data calculated for the I-710 mainline (and freight corridor for Alternative 7), using post-processed traffic data. … As such, the modeling results do not reflect changes in emissions on the other nearby freeways and local arterials and roadways… Omitting the emissions benefits produced from this shift in traffic generally yields a conservative estimate of air quality and health impacts…"	The narrow geographic scope of the RDEIR/SDEIS air quality analysis does not capture the regional benefit of Alternative 7 to the South Coast Air Basin. The modeling results do not reflect changes in emissions on other nearby freeways and local arterials and roadways. Emissions on these other roadways would be expected to decrease as traffic shifts to the I-710. Omitting the emissions benefits produced from this shift in traffic understates the positive impacts of Alternative 7, which would divert the highest volume of traffic, and further convert more of the truck trips to ZE/NZE technologies. This skewed approach is inappropriate given the purpose of the RDEIR/SDEIS is largely to compare Alternatives 5C and 7 for the purpose of selecting the preferred Project alternative. The Final REIR/SEIS should re-evaluate its findings using methodologies which accurately describe likely shift in traffic patterns and increase in ZE/NZE vehicle trips Alternative 7's freight corridor would encourage in order to compare Alternatives 5C and 7.	U-2-74

Chapter/ Section(s)	Page(s)	Identified Issue/Concern/Comment	Suggested Revision	
ES.11 AQ/GHG/HRA Results Summary Overview	ES-29	"This analysis conservatively assumed that all criteria air pollutant [*sic*] (except for NOx) and greenhouse gas emission factors of ZE/NZE trucks were equal to that of a conventional heavy-duty truck. … the NOx emission factors of the ZE/NZE trucks were reduced by a factor of 90% as compared to the conventional heavy-duty trucks…This approach is consistent with other SCAQMD public statements. It is conservative because the presence of ZE (as opposed to NZE) would further reduce emissions."	There are various erroneous and unnecessary assumptions evidenced by this assumption which skew the air quality analyses and call into question the RDEIR/SDEIS's conclusions regarding the relative cost/benefits of Alternative 7 vis-à-vis Alternative 5C. Specifically, this assumption: (1) significantly over-estimates Alternative 7's emissions of criteria pollutants, including CO, VOCs, SO2, PM2.5, and PM10; (2) significantly over-estimates Alternative 7's GHG emissions; and (3) overestimates Alternative 7's NOx emissions. Because emissions factors for both ZE and NZE trucks are readily available, there is no legitimate need to use these assumptions which disproportionately penalize Alternative 7. This is especially poignant given the purpose of the RDEIR/SDEIS is largely to compare Alternatives 5C and 7 for the purpose of selecting the preferred Project alternative. The Final REIR/SEIS should re-evaluate its findings using emissions factors and methodologies which accurately describe likely emissions from ZE and NZE vehicles in order to compare Alternatives 5C and 7.	U-2-75

Chapter/ Section(s)	Page(s)	Identified Issue/Concern/Comment	Suggested Revision
Tables	Tables C-8-1A to 1C; *see also* RDEIR/SDEIS at 3.13-38.	It is unclear how the RDEIR/SEIS and AQ Tech Study calculated the emissions reductions from the ZE/NZE trucks on the Freight Corridor. Tables C-8-1A to 1C assume 4,000 ZE/NZE trucks under Alternative 5C (24.64% of the total I-710 Heavy Heavy-Duty Trucks ("HHDT")) and 18,350 HHDT for Alternative 7 (*see* RDEIR/SDEIS at 3.13-38 ("… ZE/NZE trucks account for approximately 22 percent of the heavy-duty truck VMT along the I-710, and the only trucks traveling along the freight corridor in Alternative 7 are ZE/NZE (approximately 67 percent of heavy-duty truck VMT along the I-710 main line and freight corridor")). It is unclear how the Air Quality analysis accounts for emissions reductions from these ZE/NZE trucks. Surprisingly, Tables C-8-1A to C-8-1C appear to show Alternatives 5C and 7 as having the same criteria pollution mass emission reduction when: (1) Alternative 7 would generate 14,350 more (18,350 – 4,000 = 14,350) ZE/NZE HHDT than Alternative 5C; and (2) ZE/NZE trucks emit considerably	Please correct and/or explain this apparent discrepancy.

Final Report, Utility Impact Report, I-710 Corridor Project, Utilities Relocation Strategies Report, Central Segment (June 2016) ("Central Segment Utility Report")				
Appendix F2 - Utility Plans Alt 7 Set (Drawing U-18B)	60	66kV and 220 kV lines at northern end labeled incorrectly. 	The line currently labelled as the 66 kV line is actually the 220 kV line, and the line currently labelled as the 220 kV line is actually the 66 kV line. The identification of SCE utility lines should be corrected as indicated here.	U-2-79

I-710 Corridor Project
SCE Comments to RDEIR/SDEIS*

Chapter/ Section(s)	Page(s)	Identified Issue/Concern/Comment	Suggested Revision	
3.4 Existing Utility Crossings; 4.1 SCE Summary	14 to 15, 17-38	Description of major SCE facilities within Project corridor	The descriptions of SCE facilities and property rights within and impacted by the Project corridor is subject to confirmation by SCE. While "major" facilities considered in the utility report were limited to power lines with voltages of 50 kV or greater, *all* SCE Relocation Work, including but not limited to work on lines less than 50 kV, should described within the Final REIR/SEIS as part of the Project.	U-2-80
5.2 Cost Estimate Summaries	105 - 106	Description of SCE's estimated costs/share of the total utility relocation costs for both Alternatives 5C and 7 from I-405 to North of Los Angeles River.	SCE understands these estimates reflect an approximate assignment of cost based on a referenced "Freeway Master Agreement" between SCE and Caltrans. SCE notes that these costs are Caltrans' estimates, are not final, do not represent SCE's estimates of Maximum Prudent and Reasonable Cost under Public Utilities Code section 1005.5, and are subject to change in support of any licensing application for SCE's Relocation Work submitted to the CPUC. All efforts supporting SCE's Relocation Work would be subject to the provisions of a Relocation Agreement to be executed between SCE and Caltrans.	U-2-81
5.2 Cost Estimate Summaries	106	Table summarizing individual costs for the central segment. In certain instances, the "Total Cost" equals the "Project Cost" plus	Please correct and/or explain this apparent discrepancy.	U-2-82

Chapter/ Section(s)	Page(s)	Identified Issue/Concern/Comment	Suggested Revision	
		the "Owner Cost." In others, it does not (*e.g.*, for electric facilities, the "Project Costs" are $36,394,469, and "Owner Costs" are $0, but the "Total Costs" are only $17,436,094).		U-2-82
I-710 South End Utility Study, Project Report (November 25, 2016) ("South Segment Utility Report")				
5.3.1 Southern California Edison	19-37	Description of major SCE facilities within Project corridor	The descriptions of SCE facilities and property rights within and impacted by the Project corridor is subject to confirmation by SCE. While "major" facilities considered in the utility report were limited to power lines with voltages of 50 kV or greater, *all* SCE Relocation Work, including but not limited to work on lines less than 50 kV, should described within the Final REIR/SEIS as part of the Project.	U-2-83
Utility Information Sheets	Exhibit 4-EX-5	Description of Project's estimated the total costs for both Alternatives 5C and 7 from Ocean Blvd. to I-405.	SCE understands these estimates reflect an approximate assignment of cost based on a referenced "Freeway Master Agreement" between SCE and Caltrans. SCE notes that these costs are Caltrans' estimates, are not final, do not represent SCE's estimates of Maximum Prudent and Reasonable Cost under Public Utilities Code section 1005.5, and are subject to change in support of any licensing application for SCE's Relocation Work submitted to the CPUC. All efforts supporting SCE's Relocation Work would be subject to	U-2-84

Chapter/ Section(s)	Page(s)	Identified Issue/Concern/Comment	Suggested Revision	
			the provisions of a Relocation Agreement to be executed between SCE and Caltrans.	U-2-84
Utility Information Sheets	Exhibit 4-EX-5	The utility relocation costs are not broken out by utility owner as in the North and Central Segment Utility Reports.	SCE suggests that the utility relocation costs be separately described for each utility, akin to the approach taken for the North and Central Segment Utility Reports.	U-2-85
Energy Technical Report (June 2017)				
Executive Summary; Environmental Consequences	v.	"Direct energy impacts from each build alternative include reduced gasoline and diesel fuel consumption compared to the 2035 No Build Alternative (Alternative 1). The net result is that compared to the 2035 No Build Alternative, both Alternative 5C and Alternative 7 result in a decrease in energy consumption in both the I-710 Study Area and the entire region."	This conclusion makes sense for Alternative 7; given the ZE/NZE profile required in the Freight Corridor, less gasoline and diesel would likely be consumed. It is however, counterintuitive with respect to Alternative 5C. An alternative that simply increases the number of lanes available (as well as the number of vehicles travelling on said lanes) would seemingly not decrease the amount of gasoline and diesel consumed. Please correct and/or explain this apparent discrepancy.	U-2-86

Chapter/ Section(s)	Page(s)	Identified Issue/Concern/Comment	Suggested Revision	
	32-33	"An important additional consideration for this project is the effect of ZE/NZE trucks on overall energy use. *While these trucks are designed to reduce emissions, their use of energy is not substantially changed from the traditional diesel-powered trucks.* Trucks that are electrically powered either have batteries that require charging or fuel cells that consume hydrogen. Trucks that are designated NZE are typically powered by engines similar to diesel engines but they burn a different fuel, such as natural gas. Thus, *while ZE/NZE trucks would greatly benefit air quality, it is not possible to determine their effect on the overall energy demand.* [emphasis added]"	Contrary to the assertion here, SCE understands it to be possible to determine ZE/NZE trucks' effect on overall energy demand via CARB's LCFS methodology documents and the energy consumption factors from ZE/NZE trucks therein. Further, the italicized statements in the excerpted paragraph conflict: if no conclusions can be derived from the energy consumption factors currently available for ZE/NZE trucks, then the conclusion that the energy consumption patterns of ZE/NZE trucks would be similar to traditional diesel powered trucks is not supported by substantial evidence. The Energy Technical Report included in the Final REIR/SEIS should use the appropriate CARB LCFS methodology to document overall energy demand. Further, this Report should revise the assertions in this paragraph to remove any conflicts as may be appropriate.	U-2-87

U-2-1

Caltrans is appreciative of Southern California Edison's (SCE) efforts to make specific and detailed comments on the RDEIR/SDEIS and acknowledges the size of the document. Where revisions are necessary based on comments from SCE and others, Caltrans will ensure that this Final EIR/EIS is internally consistent.

U-2-2

The commenter's support of Alternative 7 and restriction of the freight corridor to zero emission (ZE) trucks is acknowledged and included in the project record. However, Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), has identified Alternative 1 (No Build) as the Preferred Alternative. Please refer to Section 1.1 of this appendix for a discussion on the identification of the Preferred Alternative.

U-2-3

The commenter's support of Alternative 7 is acknowledged and included in the project record. An alternatives analysis was completed pursuant to CEQA and NEPA prior to, and during preparation of, the RDEIR/SDEIS. CEQA requires consideration of a range of reasonable alternatives that would achieve the basic objectives of the project, but would also avoid or substantially lessen any of the significant effects of the project. Evaluation factors for the alternatives analysis included whether the alternatives met the project's purpose and need, the technical feasibility and affordability of the alternatives, and took into account public comments and environmental impacts related to the alternatives. As stated in Response to Comment U-2-2, the No Build Alternative has been selected as the Preferred Alternative. Please refer to Section 1.1 of this appendix and to Sections 2.4 and 2.5 of Chapter 2.0 of this Final EIR/EIS for discussion of the identification of the Preferred Alternative and why Alternatives 5C and 7 were withdrawn from further consideration.

U-2-4

This comment from SCE provides an overview of more detailed comments, as cited in various footnotes to this comment. More detailed responses to comments are provided in Responses U-2-25 through U-2-28 (assumptions used in the air quality analysis) and U-2-29 (estimates of particulate matter [PM]). Please also refer to Response to Comment U-2-2 for information regarding the identification of the Preferred Alternative.

It is important to note that both build alternatives contain a programmatic element that would provide for ZE/NZE truck subsidies for use on I-710. In March 2018, the Metro Board of Directors approved Board Motion 5.1, which changed the ZE/NZE Truck Technology Deployment Program to the Phased-In Zero-Emission Truck Technology Deployment Program, which increased the

program funding target from $100 million to $200 million, and included in the Program incentives and grants investment in the acceleration of ZE technology both for long-haul trucks and freeway infrastructure. In April 2020, the Metro Board of Directors programmed $50 million in Metro-controlled funds to provide funding for the initial deployment of what is now known as the I-710 Clean Truck Program and to leverage the remaining funds required for full program implementation. However, as stated in Response to Comment U-2-2, the No Build Alternative has been selected as the Preferred Alternative and this programmatic element will no longer be under consideration by Caltrans as a part of the I-710 Corridor Project.

An analysis of impacts to environmental justice communities was undertaken in Section 3.3.3 of the RDEIR/SDEIS, and concluded that overall, air toxics generally decrease for the build alternatives as compared to the 2035 No Build Alternative. Along the I-710 freeway, with the exception of nitrogen oxides (NO_X) and diesel-related mobile source air toxics (MSATs) emissions, exhaust emissions for the build alternatives generally increase when compared to the 2035 No Build Alternative. The increases in PM_{10} and $PM_{2.5}$ can be attributed to entrained road dust, rather than exhaust emissions. Overall, Alternative 7, in part because of the greater throughput, would have a greater impact than Alternative 5C with regard to adverse and disproportionate air quality impacts to environmental justice populations. Mitigation is proposed to address these effects and was outlined in Measure C-7 in Section 3.3.3.7 of the RDEIR/SDEIS. However, since the No Build Alternative has been selected as the Preferred Alternative, mitigation will not be necessary.

U-2-5

The commenter's support of Alternative 7 due to safety concerns from vehicle/truck conflicts is acknowledged and included in the project record. Please refer to Section 1.1 of this appendix for a discussion on the identification of the Preferred Alternative.

As discussed in Section 1.2.2 in Chapter 1.0 of the RDEIR/SDEIS, one of the purposes of the project is to improve traffic safety. While Alternative 7 proposes a dedicated freight corridor, Alternative 5C also proposes improvements to address safety and operational deficiencies and to reduce vehicle and truck interactions. These improvements would include the addition of two truck bypass lanes in each direction around the I-405 freeway-to-freeway interchange, and a lane buffer in each direction between Pacific Coast Hwy. and Shoreline Dr. In addition, it is important to note that under Alternative 7, although the freight-only corridor would be open exclusively to heavy-duty trucks, trucks would not be prohibited from using the general purpose lanes on I-710, as they do today.

U-2-6

The commenter's support of Alternative 7 due to increased throughput and improved air quality is acknowledged and included in the project record. Please refer to Section 1.1 of this appendix

for a discussion on the identification of the Preferred Alternative. As discussed in Section 1.1, although not identified as the Preferred Alternative, Alternative 7 did provide a greater reduction in vehicle hours of delay as noted in this comment.

U-2-7

The commenter's preference for Alternative 7 as the Preferred Alternative has been included in the project record. It should be noted that although Alternative 7 has greater capacity than Alternative 5C, Alternative 5C in 2035 has a greater number of freeway segments operating at an acceptable level of service than does Alternative 7 in 2035. However, as stated in Response to Comment U-2-2, the No Build Alternative has been selected as the Preferred Alternative.

U-2-8

The commenter's support of Alternative 7 and recommendation that hybrid ZE vehicles should be permitted to travel within the corridor provided that the polluting source of onboard power is not engaged within the freight corridor boundaries is acknowledged and included in the project record. However, as stated in Response to Comment U-2-2, the No Build Alternative has been selected as the Preferred Alternative.

U-2-9

The commenter's support of Alternative 7 and restriction of the freight corridor to ZE vehicles is acknowledged and included in the project record. Please refer to Section 1.1 of this appendix for a discussion on the identification of the Preferred Alternative.

U-2-10

The commenter's opinion that the freight corridor should not initially be open to all vehicles and should solely be limited to ZE vehicles is acknowledged and included in the project record. As discussed in Section 2.3.2.3 in Chapter 2.0 of the RDEIR/SDEIS, Alternative 7 would restrict the use of the freight corridor to ZE/NZE trucks rather than conventionally powered diesel trucks. In addition, both build alternatives include programmatic components to help support the use of ZE/NZE technology in the I-710 Corridor. However, as noted above, the No Build Alternative has been selected as the Preferred Alternative and any programmatic elements would have to be implemented as part of a separate process. Please refer to Response to Comment U-2-4 regarding the programmatic elements of the build alternatives, including the I-710 Clean Truck Program.

U-2-11

The comment that a catenary system should be studied in the RDEIR/SDEIS and compared to other technology options has been included in the project record. The intent of the RDEIR/SDEIS

was not to define or identify a preferred technology to be utilized in the corridor at this time. As discussed in Section 2.3.2.3 in Chapter 2.0 of the RDEIR/SDEIS, because the future technology cannot be predicted with certainty, Alternative 7 is ZE "technology neutral" so that it could accommodate at least one type of ZE heavy-duty truck that is in commercial mass production before final design is completed (should Alternative 7 be selected as the Preferred Alternative). As described in Chapter 2.0 of the RDEIR/SDEIS, should Alternative 7 be selected as the Preferred Alternative, at the time of the first funding contribution for this program, if elements of the selected technology are beyond the scope of what was evaluated in this document, the appropriate re-evaluation and/or supplemental environmental documentation would be prepared in due course of project development pursuant to 23 CFR 771.129 under NEPA and Sections 15165 and 15164 of the State CEQA Guidelines. The further evaluation and development of any or all of these various technologies may be done via a Public-Private Partnership, as described in Section 2.1 of the RDEIR/SDEIS. However, as stated in Response to Comment U-2-2, the No Build Alternative has been selected as the Preferred Alternative and therefore, the freight corridor will not be constructed.

U-2-12

The commenter's suggestion that Caltrans should plan for future ZE vehicle technology is acknowledged and noted for the project record. Please refer to Response to Comment U-2-11 for a discussion of why a specific technology was not analyzed in the RDEIR/SDEIS.

U-2-13

The commenter's support of conversion to ZE trucks now is acknowledged and noted for the project record. Please refer to Section 1.1 of this appendix for a discussion on the identification of the Preferred Alternative.

U-2-14

Caltrans acknowledges the importance of the 220-kilovolt facilities running parallel to the I-710 between I-405 and SR-91 and the fact they are considered critical infrastructure facilities by the Federal Energy Regulatory Commission. The revised set of build alternatives set forth in the RDEIR/SDEIS avoided many impacts to utilities within the corridor (particularly longitudinal impacts to linear utilities) when compared to the set of build alternatives analyzed in the 2012 Draft EIR/EIS, due to feedback received from SCE and others. However, as stated in Response to Comment U-2-2, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no impacts to utilities.

U-2-15

Caltrans and Metro concur that the descriptions of potential impacts on SCE's facilities are preliminary. However, as stated in Response to Comment U-2-2, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no impacts to utilities.

U-2-16

As is standard Caltrans' practice, the engineering plans for the build alternatives that inform the technical analyses for the RDEIR/SDEIS are only developed to a status of approximately 25 to 35 percent. It would not be recommended that any type of permit be secured based on these percentage plans. These and other items were discussed at a meeting between the I-710 Corridor Project Team and SCE staff on October 18, 2017. Should a build alternative be selected as the Preferred Alternative, further environmental review be necessary once engineering plans have reached 100 percent status, the necessary analyses and re-validations would be done at that time. However, as stated in Response to Comment U-2-2, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no need to obtain permits from SCE.

U-2-17

Please refer to Response to Comment U-2-16 regarding the utilization of the RDEIR/SDEIS for California Public Utilities Commission (CPUC) permitting purposes. Caltrans and Metro agree that, should a build alternative be selected as the Preferred Alternative, a Working Group should be convened consisting of SCE, the I-710 Corridor Project Team, and the CPUC (if possible) in support of the utility work that would be ongoing during the final design of the build alternative. This and other items were discussed at a meeting between the I-710 Corridor Project Team and SCE staff on October 18, 2017. However, as stated in Response to Comment U-2-2, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be impact to utilities as a result of the I-710 Corridor Project.

U-2-18

As stated in Response to Comment U-2-2, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no impact to utilities and Measure U&ES-2 will not be required or implemented.

U-2-19

Caltrans has ensured that the environmental impacts from SCE's Relocation Work be sufficiently described in this Final EIR/EIS to the greatest extent known at the current level of design of the build alternatives. Please refer to Response to Comment U-2-18 regarding Measure U&ES-2.

U-2-20

Should a build alternative be selected as the Preferred Alternative, at the time of right-of-way acquisition, and in accordance with established Caltrans' practice and policies, a Relocation Agreement would be executed with SCE. The specific information included in that Agreement would be determined during the final design and right-of-way acquisition stage of project development. However, as stated in Response to Comment U-2-2, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no impact to utilities.

U-2-21

The commenter's request for identification of the Preferred Alternative in order to clarify potential impacts to SCE facilities is acknowledged and included in the project record. Public input is an important factor in the identification of the Preferred Alternative. After public input was received, in combination with other factors, Alternative 1 (No Build) was identified as the Preferred Alternative in the Final EIR/EIS. Please refer to Section 1.1 of this appendix for further discussion of the identification of the Preferred Alternative.

U-2-22

The commenter's suggestion that a catenary power system should be evaluated and considered in the RDEIR/SDEIS is acknowledged and noted for the project record. Please refer to Response to Comment U-2-11 for a discussion of why a specific technology was not analyzed in the RDEIR/SDEIS.

U-2-23

Caltrans respectfully disagrees that the environmental benefits of Alternative 7 are understated and, therefore, the differences between the two build alternatives are artificially narrowed. Please refer to the following responses to comments for specific examples.

U-2-24

Caltrans and Metro respectfully disagree with the commenter that flawed assumptions were used in the air quality analysis. Please refer to Responses to Comments U-2-25 through U-2-28, which address the assumptions used in the AQ/GHG/HRA Technical Study (2017) and are reflected in the RDEIR/SDEIS.

U-2-25

The basis for determining ZE/NZE emission factors is presented in Section 7 of Appendix C to the *Air Quality, Greenhouse Gas, and Health Risk Assessment Technical Study* (AQ/GHG/HRA Technical Study) (June 2017) and the associated *Addendum to the Air Quality, Greenhouse Gas, and Health Risk Assessment Technical Study* (December 2020). The emission factor and fuel type for ZE/NZE trucks was determined through discussions with the South Coast Air Quality Management District (SCAQMD), the California Air Resources Board (CARB), and engine manufacturers. The air quality analysis conservatively assumes that all ZE/NZE trucks will be NZE. NZE trucks would be non-diesel (diesel trucks have not been able to meet CARB's optional low-NO_X standard of 0.02 grams per brake horsepower-hour [gm/bhp-hr]), thereby reducing diesel particulate matter (DPM) to zero and NO_X emissions by 90 percent compared to conventional heavy-duty trucks (conventional heavy-duty trucks include light heavy-duty trucks, medium heavy-duty trucks, and heavy heavy-duty trucks. The EMFAC vehicle classes in these categories are presented in Table C1 of the AQ/GHG/HRA Technical Study. Fuel types for these vehicles are primarily diesel, but include gasoline and natural gas trucks. The distribution across various fuel types for each heavy-duty trucks category was derived from EMFAC2014, which was used to develop the emissions factors for these vehicles. Further and consistent with the CARB's EMFAC2014 emission factor program, it was conservatively assumed in the AQ/GHG/HRA Technical Study that NZE trucks would not reduce any other criteria air pollutant or greenhouse gas emissions as compared to a conventional heavy-duty truck. Additionally, no credit was taken for further tailpipe reductions for pure ZE trucks.

The AQ/GHG/HRA Technical Study also evaluates the Alternative 7-Zero Emissions Option (Alternative 7-ZE Option) in Appendix F. The Alternative 7-ZE Option has the same traffic and design features as Alternative 7, the only difference being that all ZE/NZE trucks travelling on the freight corridor in Alternative 7 were assumed to be ZE trucks in the Alternative 7-ZE Option. ZE trucks were assumed to have zero tailpipe-exhaust emissions. Therefore, the results of the air quality analysis for the Alternative 7-ZE Option do provide estimates of potential reductions in exhaust emissions of carbon monoxide (CO), volatile organic compounds (VOC), sulfur dioxide (SO_2), particulate matter less than 2.5 microns in size ($PM_{2.5}$), particulate matter less than 10 microns in size (PM_{10}), and greenhouse gas emissions associated with the proposed implementation of ZE trucks on the freight corridor. However, while there were some decreases seen in exhaust fractions of criteria air pollutants, the near-roadway incremental impacts of criteria air pollutants for Alternative 7 and the Alternative 7-ZE Option were similar. Refer to Tables F-2-1a through F-4 and Tables F-5-1 through F-5-2 in Appendix F of the AQ/GHG/HRA Technical Study for further details.

U-2-26

The analysis in the AQ/GHG/HRA Technical Study (2017) evaluates only the tailpipe or running exhaust greenhouse gas emissions from the combustion of fossil fuels and does not evaluate the lifecycle (well-to-wheel) greenhouse gas emissions. The greenhouse gas analysis is consistent with or exceeds the requirements of the Caltrans Standard Environmental Reference (SER) (available at http://www.dot.ca.gov/ser/vol1/sec3/physical/ch13energy/chap13.htm). The well-to-tank emissions can vary widely depending on technology (e.g., fuel cell, electric, or natural gas) that may be chosen by future I-710 freeway truck drivers; hence lifecycle (well-to-wheel) greenhouse gas emissions would be speculative and misleading. Chapter 4.0 of this Final EIR/EIS has been updated to provide a CEQA significance determination for greenhouse gas emissions.

U-2-27

Please refer to Response to Comment U-2-25 for details on assumptions regarding ZE/NZE emission factors. As described in Response to Comment U-2-25, the Alternative 7-ZE Option was assessed in Appendix F to the AQ/GHG/HRA Technical Study (2017), which assumed a 100 percent ZE freight corridor. The ZE truck tailpipe emission factors were assumed to be zero for all criteria air pollutants, greenhouse gases, and MSATs. The analysis found that although there were some decreases seen in exhaust fractions of criteria air pollutants, the near-roadway incremental impacts of criteria air pollutants for Alternative 7 and the Alternative 7-ZE Option were similar. Other agencies and goods movement organizations are pursuing ZE/NZE programs and goals, but there is no evidence that those programs would be positively or negatively affected by the I-710 ZE/NZE truck deployment program, should Alternative 7 be selected as the Preferred Alternative.

U-2-28

Please refer to Response to Comment U-2-25 for details on assumptions regarding ZE/NZE emission factors. As stated in Response to Comment U-2-25, the assumptions regarding ZE/NZE emission factors were developed in consultation with SCAQMD and CARB. The analysis in the AQ/GHG/HRA Technical Study (2017) does include an analysis of emissions for Alternative 7, which is conservatively analyzed with an NZE freight corridor, and the Alternative 7-ZE Option, which assumes a 100 percent ZE freight corridor.

U-2-29

As outlined in Section 2.2 of the AQ/GHG/HRA Technical Study (2017), the air quality analysis followed CARB Miscellaneous Process Methodology 7.9 for Entrained Road Travel, Paved Road Dust (available at www.arb.ca.gov/ei/ for more information), which is consistent with the United States Environmental Protection Agency's (EPA) Compilation of Air Pollutant Emission Factors

(AP-42 Chapter 13.2.1) (please refer to www.epa.gov/air-emissions-factors-and-quantification/ap-42-compilation-air-emissions-factors for more information) and was used by SCAQMD in the preparation of the 2016 Air Quality Management Plan. CARB and SCAQMD previously decoupled entrained road dust emission from vehicle miles traveled (VMT) in certain situations, but those changes were made after the Draft EIR/EIS was released in 2012 and subsequent analyses began for the RDEIR/SDEIS. This methodology assumed that roadways have an infinite amount of silt and entrained road dust emissions are directly proportional to VMT. As stated in Sections ES.2.5, ES.6.2, 4.3.1, and 5.3 of the AQ/GHG/HRA Technical Study, CARB revised the silt-loading factor for freeways to a lower value (approximately 25 percent lower) after the preparation of the AQ/GHG/HRA Technical Study. The use of the revised silt-loading factor would reduce freeway-entrained $PM_{2.5}$ and PM_{10} incremental emissions for all project alternatives as compared to the CEQA and NEPA baselines. However, these reductions would not change the overall conclusions of the AQ/GHG/HRA Technical Study.

U-2-30

Air quality analyses presented in Section 3.13, Air Quality, reports findings for various geographic areas including: the I-710 Corridor; the Area of Interest (Area of Interest); and the South Coast Air Basin (Basin) (refer to Figure 1-2 of the I-710 AQ/GHG/HRA Technical Study [2017] for a depiction of these areas). Changes in traffic on the local roadway network attributable to the build alternatives are accounted for in the reporting for the Area of Interest and the Basin study areas, while results for the I-710 Corridor focus on the I-710 freeway (Alternative 5C and Alternative 7) and freight corridor (Alternative 7 only.)

When viewing traffic for the build alternatives relative to the No Build Alternative, traffic changes would be greatest on the I-710 Corridor with differences on the arterial system and other roadways being much more diffused and muted. Emissions from existing and future traffic on local arterials located within the Area of Interest are presented in the gridded mass emission plots presented in Figures 4-1a through 4-1c, Figures 4-2a through 4-2c, and Figures 4-5a through 4-5c in Appendix Q of the RDEIR/SDEIS. These figures show that emissions of NO_X, PM_{10}, $PM_{2.5}$, and DPM would generally decrease through the Area of Interest (including nearby freeways, arterials, and local roads) for the 2035 build alternatives as compared to the 2012 Baseline and the 2035 No Build Alternative, except for some locations along the I-710 freeway for PM_{10} and $PM_{2.5}$. Based on the mass emissions analysis within the Area of Interest (gridded emission plots), the greatest $PM_{2.5}$ and PM_{10} project impacts are anticipated to occur on the I-710 freeway and freight corridor. As a consequence, the air dispersion and health risk modeling appropriately focused on the I-710 Corridor.

U-2-31

Caltrans and Metro respectfully disagree with the commenter that the emissions analysis results in an inaccurate portrayal of the impacts and benefits of Alternative 7. CEQA and NEPA analyses

are generally based on incremental comparisons between the build alternative and an environmental baseline (for CEQA) and the build alternative and a No Build Alternative (for NEPA). Therefore, the majority of the emissions and health risk analyses in the RDEIR/SDEIS are presented as incremental impacts. Alternative 5C and Alternative 7 are each compared to the environmental baseline and No Build Alternative, using consistent assumptions for each alternative. Details on the assumptions used can be found in the AQ/GHG/HRA Technical Study (2017).

U-2-32

As discussed in Section 3.13, Air Quality, in the RDEIR/SDEIS, all build alternatives would generally improve air quality and reduce public health risk. Along I-710, air quality would be improved and public health risk would be reduced at most locations, but there are a few near-roadway locations where there would be an increase in certain emissions. However, the build alternatives would increase cancer risk compared to the 2012 Baseline.

When compared to the 2035 No Build Alternative, both build alternatives would reduce cancer risk at most locations; however, a small increase in cancer risk would occur at some locations within 100 meters of I-710. For Alternative 5C, the maximum increase in risk would be approximately three in one million. The primary location of the increased risk for Alternative 5C would be along a small portion of I-710 just south of SR-60. For Alternative 7, the increase in risk would be less than one in one million.

U-2-33

As previously discussed in Response to Comment U-2-25, the assumptions used regarding ZE/NZE factors were developed in consultation with SCAQMD and CARB. The analysis presented in the AQ/GHG/HRA Technical Study (2017) and summarized in the RDEIR/SDEIS discusses the impacts that could result from Alternative 7, which is conservatively analyzed with an NZE freight corridor, and the Alternative 7-ZE Option, which assumed a 100 percent ZE freight corridor. The analysis found that although there would be some decreases seen in exhaust fractions of criteria air pollutants, the near-roadway incremental impacts of criteria air pollutants for Alternative 7 and the Alternative 7-ZE Option were similar.

U-2-34

The traffic input data for the energy analysis was corrected, resulting in differences between the build alternatives that show changes for Alternatives 5C and 7. Additionally, the Energy Technical Report has been revised to correctly analyze the energy impacts from ZE and NZE trucks based on the CARB's Low Carbon Fuel Standard (LCFS) regulations that include two factors (Energy Economy Ratio [EER] and Energy Density) that describe the relative energy consumption of electrically-powered trucks compared to diesel- and gasoline-powered trucks.

U-2-35

The Energy Technical Report revision described in Response to Comment U-2-34 correctly shows the differences in energy consumption between Alternatives 5C and 7.

U-2-36

As discussed in Section 2.3.2, Build Alternatives, in the RDEIR/SDEIS, the I-710 Clean Truck Program (referred to in the RDEIR/SDEIS as the I-710 Corridor Project Zero Emission/Near Zero Emission Truck Technology Deployment Program) is a programmatic component of the build alternatives. Should a build alternative be selected as the Preferred Alternative, this program would provide funding to individual owner-operators and privately owned truck fleets to subsidize the purchase of heavy-duty (Class 8) ZE/NZE trucks for use within the I-710 Corridor. To be eligible for ZE/NZE truck funding from this program, there would be minimum requirements for travel on I-710 (or on the proposed freight corridor, in the case of Alternative 7). The minimum commitment would be structured to reach the VMT estimates included in this EIR/EIS analysis, which are based on VMT averages per truck. The objective of the I-710 Clean Truck Program would be to produce 42.5 VMT per ZE/NZE truck per weekday, in aggregate, on average, for each deployment phase up to the total 4,000 ZE/NZE trucks. As with other truck funding programs, compliance could be assessed annually through a global positioning system (GPS)-based Automatic Vehicle Locator (AVL) or similar system that would log mileage within the I-710 Corridor limits. For a period of ten years after the funding is provided, a recipient truck that did not meet the annual minimum VMT requirement would be required to reimburse one-fifth of the program funding, or potentially up to the full program funding. If the recipient truck failed to meet the annual VMT requirement for two years, all program funding would have to be reimbursed. If the truck is sold during the ten-year period after funding is provided, the requirements would remain the same for the purchaser.

As discussed in Section 2.3.2.3 in Chapter 2.0, Project Alternatives, of the RDEIR/SDEIS, because the future technology cannot be predicted with certainty, Alternative 7 was assumed ZE “technology neutral” so that is could accommodate at least one type of ZE heavy-duty truck that is in commercial mass production before the final design would be completed (should Alternative 7 be selected as the Preferred Alternative). Because construction would be several years away, selection of specific technology for vehicles utilizing the ZE/NZE corridor is premature at the time this Final EIR/EIS was prepared. Alternative 7 was analyzed as technology neutral so that future selection of technology would not be limited. The trucks subsidized as part of the I-710 Clean Truck Program (referred to in the RDEIR/SDEIS as the I-710 Corridor Project Zero Emission/Near Zero Emission Truck Technology Deployment Program) under Alternative 5C are similarly considered “technology neutral” at this point in project development. However, as stated in Response to Comment U-2-2, the No Build Alternative has been selected as the Preferred Alternative and therefore, the I-710 Clean Truck Program will not be included as a programmatic

element of the I-710 Corridor Project and will not be implemented by Caltrans as the lead agency under CEQA and NEPA. Please refer to Response to Comment U-2-4 regarding the programmatic elements of the build alternatives, including the I-710 Clean Truck Program.

U-2-37

As discussed in Section 2.1 in Chapter 2.0, Project Alternatives, of the RDEIR/SDEIS, in addition to traditional sources of transportation funding such as Federal/State gas tax funds and local Measure R and Measure M sales tax funds, Metro also evaluated the potential applicability of a Public-Private Partnership for the I-710 Corridor Project build alternatives.

U-2-38

The commenter's support for Alternative 7 because it allows the greatest volume of traffic while reducing air pollution, and for its potential to jumpstart innovation, is acknowledged and included in the project record. Please refer to Section 1.1 of this appendix for a discussion on the identification of the Preferred Alternative.

U-2-39

Please refer to Section 1.2 of this appendix regarding the extension of the public comment period.

U-2-40

As previously discussed in Response to Comment U-2-25, the assumptions used regarding ZE/NZE emission factors were developed in consultation with SCAQMD and CARB. The analysis presented in the AQ/GHG/HRA Technical Study (2017) and summarized in the RDEIR/SDEIS discusses the impacts that could result from Alternative 7, which was conservatively analyzed with an NZE freight corridor, and the Alternative 7-ZE Option, which assumed a 100 percent ZE freight corridor. The analysis found that although there would be some decreases seen in exhaust fractions of criteria air pollutants, the near-roadway incremental impacts of criteria air pollutants for Alternative 7 and the Alternative 7-ZE Option were similar.

U-2-41

The commenter suggests that the Preferred Alternative and/or environmentally superior alternative be identified in the EIR/EIS. Under NEPA, a Preferred Alternative is generally not identified until after the draft environmental document has been circulated and public comments have been taken into account. After comparing and weighing the benefits and impacts of all of the feasible alternatives and design options, and input during the public comment period for the RDEIR/SDIES, Alternative 1 (No Build) was identified as the Preferred Alternative. A discussion of the identification of the Preferred Alternative has been added to Chapter 2.0, Project Alternatives, of the Final EIR/EIS and Section 1.1 of this appendix. In addition, consistent with

State CEQA Guidelines Section 15126.6(e)(2), a discussion and identification of the Environmentally Superior Alternative has been added to Chapter 4.0, CEQA Evaluation, in this Final EIR/EIS.

U-2-42

The edit provided within this comment to change the noted phrase in Section 2.3.2.1 has been accepted and incorporated into this Final EIR/EIS.

U-2-43

The commenter's suggestion that a catenary power system should be evaluated and considered is acknowledged and noted for the project record. Please refer to Response to Comment U-2-11 for a discussion of why the specific technology was not analyzed in the RDEIR/SDEIS.

U-2-44

Please refer to Responses to Comments U-2-16 and U-2-17 regarding the relocation of utilities.

U-2-45

The Health Risk Assessment in the RDEIR/SDEIS evaluated the build alternatives against the 2012 Baseline and the 2035 No Build Alternative (Alternative 1). The results of the build alternatives are not evaluated against each other but are used to inform the identification of the Preferred Alternative. The suggested text revision would be misleading because the higher incremental cancer risk for the build alternatives is applicable to a very small area of the Study Area, not the Study Area in its entirety. As shown in Figure ES-7 of the AQ/GHG/HRA Technical Study (2017), the maximum modeled cancer risk (risk in one million) in the 2012, the 2035 No Build, 2035 Alternative 5C and 2035 Alternative 7 would be 1421, 57, 45, and 30, respectively. The AQ/GHG/HRA Technical Study states: "For Alternative 7, the increase in risk is less than one in one million. For Alternative 5C, the maximum increase in risk is approximately three in one million. The primary location of increased risk for Alternative 5C is along a small portion of the I-710 just south of its intersection with SR-60" (ES-20). Therefore, the suggested text revision will not be implemented.

U-2-46

Please refer to Response to Comment U-2-15 regarding utility conflicts.

U-2-47

In response to this comment, the following revision has been made to Section 3.4.2.2 of this Final EIR/EIS:

> The relocation strategy proposes that the system follow the same alignment as the existing system. It ~~would~~ may be relocated underground in a casing underneath Shoemaker Bridge, and rise up aerially on new poles between the widened I-710 mainline and the Los Angeles River access road or go overhead to clear the spacing requirements. It would continue aerially to cross I-710 at 25th St., and then go west of the proposed southbound ramp to transition back to Willow St. and tie back into the existing system. This relocation would require engineered steel pole replacements of the existing poles, switch, and possible pole replacement, and possible easements, as well as multiple breaker replacements.

U-2-48

As discussed in Section 3.4.2.2 of the RDEIR/SDEIS, should a build alternative be selected as the Preferred Alternative, utilities impacted as a result of the build alternatives would be relocated in accordance with specific Utility Relocation Plans described in Measure U&ES-2. Final utility pole specifications, including selection of overhead pole type, would be determined in the specific Utility Relocation Plan and/or during final design. However, as stated in Response to Comment U-2-2, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no impact to utilities.

U-2-49

In response to this comment, the following revision has been made to Section 3.4.2.2 of this Final EIR/EIS:

> The relocation strategy consists of intercepting the line between I-710 and the Los Angeles River and undergrounding it southerly to the existing utility bridge, wherein it would tie into the bridge and cross the Los Angeles River. Undergrounding SCE subtransmission facilities may require equipment upgrades at local substations. Subtransmission structure height modifications will typically also require modifications to adjacent structures.

U-2-50

As discussed in Section 3.4.2.2 of the RDEIR/SDEIS, should a build alternative be selected as the Preferred Alternative, utilities impacted as a result of the build alternatives would be relocated in accordance with specific Utility Relocation Plans described in Measure U&ES-2. Final utility easement agreements, including utility distances, would be determined during utility coordination later in the design process and the drafting of specific Utility Relocation Plans. The following revisions have been made to Section 3.4.2.2 of the RDEIR/SDEIS:

> In order to avoid multiple costly relocations of the system, the south half of the Pacific Coast Hwy. overcrossing structure would be constructed first to allow for an underground relocation in the south half of the bridge, between Harbor Ave. west of the Los Angeles River and Golden Ave. to the east. Alternatively, taller overhead structures may be used for this relocation in the event that undergrounding would conflict with other utilities.

U-2-51

Metro and Caltrans thank the commenter for the correction. It is acknowledged that Conflict S2034 is a 12-kilovolt system. The following revisions have been made to Section 3.4.2.2 of this Final EIR/EIS:

> On joint poles with this system ~~are two~~ is one other 66-kilovolt system~~s~~ (~~S2034 and~~ S2035) and one 12-kilovolt system (S2034) that share the same impacts and would also share the relocation strategy.

U-2-52

In response to this comment, the following edit has been made to Section 3.4.2.2 of this Final EIR/EIS:

> A 30 ~~ten~~-foot easement would be needed from USACE and/or LACFCD for the portion of the line under the Los Angeles River and a 30 ~~20~~-foot easement would be needed for the portion of the line under the LADWP transmission corridor. SCE's standard requires a 30-foot easement for underground installation of 66 kV lines…"

U-2-53

As discussed in Section 3.4.2.2 of the RDEIR/SDEIS, additional right-of-way requirements at these locations would be similar to what is discussed above for the 66-kilovolt overhead lines at Southern Ave., including utility license agreements from the UP Railroad easement requests. In addition, as discussed in Section 3.4.2.2 of the RDEIR/SDEIS, should a build alternative be selected as the Preferred Alternative, utilities impacted as a result of the build alternatives would be relocated in accordance with specific Utility Relocation Plans described in Measure U&ES-2. Should a build alternative be selected as the Preferred Alternative, final utility easement agreements, including distances, would be determined during utility coordination later in the design process and the drafting of specific Utility Relocation Plans. The following revisions have been made to Section 3.4.2.2 of this Final EIR/EIS:

> Therefore, the existing lines would be rerouted over to the north side of the existing tracks and relocated underground along the north side of the existing railroad corridor, using a directional bore under I-710, the LADWP transmission corridor, and the Los

> Angeles River. Alternatively, overhead routing may be employed in the event that undergrounding was infeasible due to construction constraints. The existing overhead lines and their supports would be removed between the existing pole located at the Rayo Ave. cul-de-sac on the west to the second existing pole east of I-710 on the east. Permanent vault structures and riser poles would serve to transition the lines back overhead. Subtransmission structure height modifications will typically also require modifications to adjacent structures. Additional right-of-way requirements are similar to what is discussed above…

U-2-54

As was discussed in Section 3.4.2.2 of the RDEIR/SDEIS, should a build alternative be selected as the Preferred Alternative, right-of-way requirements would include the addition of a permanent fee take or easement within the existing parcel on the northwest corner of Florence Ave./Eastern Ave. to accommodate the proposed vault structure.

U-2-55

The following revisions have been made to Section 3.4.2.2 of this Final EIR/EIS:

> No additional right-of-way would be required. Subtransmission structure height modifications will typically also require modifications to adjacent structures.

U-2-56

The following revisions have been made to Section 3.4.2.2 of this Final EIR/EIS:

> The lines would be raised across I-710 and installed along the same alignment, not necessitating additional right-of-way. Subtransmission structure height modifications will typically also require modifications to adjacent structures.

U-2-57

The following revisions have been made to Section 3.4.2.2 of the RDEIR/SDEIS:

> Engineered steel poles would be required of this relocation and new utility easements would be necessary. Subtransmission structure height modifications will typically also require modifications to adjacent structures.

U-2-58

As discussed in Section 3.4.2.2 of the RDEIR/SDEIS, should a build alternative be selected as the Preferred Alternative, utilities impacted as a result of the build alternatives would be relocated

in accordance with specific Utility Relocation Plans described in Measure U&ES-2. Should a build alternative be selected as the Preferred Alternative, final utility easement agreements would be determined during utility coordination later in the design process and the drafting of specific Utility Relocation Plans. However, for clarity the following revisions have been made to Section 3.4.2.2 of this Final EIR/EIS:

> East of the river, the system would rise back up to a pole on DeForest Ave. just north of Hill St., and tie back into the existing system. S2028 is a 12-kilovolt system also on joint poles with S2027 and S2026 that crosses I-710 and the Los Angeles River at Hill St. West of the river, the system would be undergrounded at Hill St. just west of Gayle Ave., use a directional bore under the I-710 and Los Angeles River with S2027, and rise back up on an engineered steel pole on DeForest Ave. just north of Hill St. to tie back into the existing system. Utility easements may be required in support of this work.

U-2-59

As discussed in Section 3.4.2.2 of the RDEIR/SDEIS, should a build alternative be selected as the Preferred Alternative, utilities impacted as a result of the build alternatives would be relocated in accordance with specific Utility Relocation Plans described in Measure U&ES-2. Should a build alternative be selected as the Preferred Alternative, final utility easement agreements would be determined during utility coordination later in the design process and the drafting of specific Utility Relocation Plans. However, for clarity the following revisions have been made to Section 3.4.2.2 of this Final EIR/EIS:

> The strategy is as follows: to the west, the system would be undergrounded at Hill St./ Fashion Ave. and use a directional bore to cross I-710 and the Los Angeles River. East of the river, the system would rise back on an engineered steel pole at Hill St., just east of DeForest Ave., to tie into the existing system. Because the system is on existing poles along Hill St., the proposed relocation would not move the system any closer to existing sensitive land uses, and would partially underground the lines. Utility easements may be required in support of this work.

U-2-60

As discussed in Section 3.4.2.2 of the RDEIR/SDEIS, should a build alternative be selected as the Preferred Alternative, utilities impacted as a result of the build alternatives would be relocated in accordance with specific Utility Relocation Plans described in Measure U&ES-2. Should a build alternative be selected as the Preferred Alternative, final utility easement agreements would be determined during utility coordination later in the design process and the drafting of specific Utility Relocation Plans. However, for clarity the following revisions have been made to Section 3.4.2.2 of this Final EIR/EIS:

West of the river, a new pole west of Gale Ave. would be required. East of the river, a new pole between DeForest Ave. and San Francisco Ave. would be required as well. A 12-kilovolt aerial system (S2034) crossing I-710 and the Los Angeles River at the same location as S2033 would be impacted and relocated in a similar manner, but the new pole would be required between San Francisco Ave. and Golden Ave. The relocation would not bring the system appreciably closer to Birney Elementary School or the residential neighborhoods on the east side of the Los Angeles River. Utility easements may be required in support of this work.

U-2-61

The following revisions have been made to Section 3.4.2.2 of this Final EIR/EIS:

Underground agreements with Caltrans within the state right-of-way crossing SR-91 would be required. Subtransmission structure height modifications typically also requires modifications to adjacent structures.

U-2-62

As discussed in Section 3.4.2.2 of the RDEIR/SDEIS, should a build alternative be selected as the Preferred Alternative, utilities impacted as a result of the build alternatives would be relocated in accordance with specific Utility Relocation Plans described in Measure U&ES-2. Should a build alternative be selected as the Preferred Alternative, final utility easement agreements would be determined during utility coordination later in the design process and the drafting of specific Utility Relocation Plans. However, for clarity the following revisions have been made to Section 3.4.2.2 of this Final EIR/EIS:

The lines would be relocated easterly of I-710 within the SCE Fee Parcels, with taller poles replacing the existing poles. ~~No~~ Additional right-of-way ~~would~~ may be required in support of undergrounding the SCE facilities and/or separation from other utilities. Subtransmission structure height modifications typically also requires modifications to adjacent structures.

U-2-63

As discussed in Section 3.4.2.2 of the RDEIR/SDEIS, should a build alternative be selected as the Preferred Alternative, utilities impacted as a result of the build alternatives would be relocated in accordance with specific Utility Relocation Plans described in Measure U&ES-2. Should a build alternative be selected as the Preferred Alternative, final utility plans, including safety compliance structures, would be determined during the drafting of specific Utility Relocation Plans and/or final design. However, as stated in Response to Comment U-2-2, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no impact to utilities.

U-2-64

As discussed in Section 3.4.2.2 of the RDEIR/SDEIS, the proposed relocation discussed would be identical to that proposed under Alternative 5C. A similar edit has been made to the language describing the impacts under Alternative 5C. Please refer to Response to Comment U-2-52 regarding the 30-foot easement needed from the United States Army Corps of Engineers (USACE) and/or the Los Angeles County Flood Control District (LACFCD).

U-2-65

As discussed in Section 3.4.2.2 on page 3.4-28 of the RDEIR/SDEIS, the proposed relocation impacted by Alternative 7 would be identical to that proposed under Alternative 5C. However, the document erroneously references Alternative 5C earlier in the paragraph, instead of Alternative 7. The appropriate revision for consistency has been made in this Final EIR/EIS.

U-2-66

As discussed in Section 3.4.2.2 of the RDEIR/SDEIS, the proposed relocation discussed would be identical to that proposed under Alternative 5C. A similar edit has been made to the language describing the impacts under Alternative 5C. Please refer to Response to Comment U-2-53 regarding additional right-of-way requirements at the referenced locations.

U-2-67

The following revisions have been made to Section 3.4.2.2 of this Final EIR/EIS:

> A new 20-foot-wide underground easement from LADWP would be needed within the transmission corridor, as well as a permanent encroachment permit from Caltrans as described above. Subtransmission structure height modifications will typically also require modifications to adjacent structures.

U-2-68

The following revisions have been made to Section 3.4.2.2 of this Final EIR/EIS:

> The two sets of lines would share the undergrounding easements from USACE and/or LACFCD and LADWP as described above. Subtransmission structure height modifications will typically also require modifications to adjacent structures.

U-2-69

The following revisions have been made to Section 3.4.2.2 of this Final EIR/EIS:

Under Alternative 7, the 66-kilovolt overhead lines (N2012) crossing I-710 along the south side of the Slauson Ave. overcrossing would be directly impacted by the proposed freeway mainline and indirectly impacted due to the CPUC-mandated minimum vertical clearance requirement of 30 feet between the proposed structure deck and existing lines which cannot be met at the crossing of the freight corridor viaduct. Subtransmission structure height modifications will typically also require modifications to adjacent structures.

U-2-70

Please refer to Responses to Comments U-2-18, U-2-19, and U-2-20 regarding implementation of Measure U&ES-2.

U-2-71

Please refer to Responses to Comments U-2-18, U-2-19, and U-2-20 regarding implementation of Measure U&ES-2.

U-2-72

Caltrans and Metro respectfully disagree with the commenter that the emissions analysis results in an inaccurate portrayal of the impacts and benefits of Alternative 7. Please refer to Response to Comment U-2-31 regarding the assumptions used in the air quality analysis.

U-2-73

Please refer to Response to Comment U-2-29 regarding entrained road dust emissions. For informational purposes, the results of a revised incremental emissions analysis are presented in the table below. The table is based on the I-710 Traffic Model and shows the incremental PM emissions from the I-710 freeway for the build alternatives as compared to 2012 Baseline and 2035 No Build Alternative.

Incremental PM Emissions

		2035 Alternative 5C (lbs/day)		2035 Alternative 7 (lbs/day)	
Silt Loading	Pollutant	vs 2012 Baseline	vs 2035 No Build	vs 2012 Baseline	vs 2035 No Build
Original	PM_{10} (Total)	320	160	800	640
	$PM_{2.5}$ (Total)	-110	36	-20	130
New	PM_{10} (Total)	220	140	600	520
	$PM_{2.5}$ (Total)	-130	32	-50	110

lbs/day = pounds per day
PM = particulate matter
PM_{10} = particulate matter less than ten microns in diameter
$PM_{2.5}$ = particulate matter less than 2.5 microns in diameter

U-2-74

Please refer to Response to Comment U-2-30 regarding air dispersion modeling. The RDEIR/SDEIS includes emissions impact analyses for the South Coast Air Basin (Basin), the Area of Interest (i.e., communities along the I-710 Corridor) and the I-710 freeway.

U-2-75

Caltrans and Metro respectfully disagree with the commenter that the emissions analysis results in an inaccurate portrayal of the impacts and benefits of Alternative 7. Please refer to Responses to Comments U-2-25 and U-2-31 for a discussion of the assumptions used in the air quality analysis.

U-2-76

As discussed in Response to Comment U-2-25, the methodology used for evaluating the air quality, greenhouse gas, and health risk assessment impacts of ZE/NZE vehicles are presented in Section 7 of Appendix C to the AQ/GHG/HRA Technical Study (2017). Section 7 provides a description of how the emission factors and VMT by the ZE/NZE trucks were estimated.

Tables C-8-1A, C-8-1B, and C-8-1C of the AQ/GHG/HRA Technical Study show the incremental criteria air pollutant emissions for the future (2035) build alternatives as compared to the 2012 Baseline for the South Coast Air Basin (Basin), Area of Interest (Area of Interest), and the I-710 freeway, respectively. Although the number of ZE/NZE trucks travelling on the I-710 freeway would be larger under Alternative 7 as compared to Alternative 5C, the total number of overall vehicles would increase. Thus, emissions along the freeway may increase due to a greater number of trucks even though some of those trucks would be lower emitting for some pollutants.

Further, as discussed in Response to Comment U-2-25 and stated in Section 7 of Appendix C of the AQ/GHG/HRA Technical Study, it was conservatively assumed that all ZE/NZE trucks would be NZE in both build alternatives (Alternatives 5C and 7). NZE trucks would be non-diesel (as diesel trucks have not been able to meet CARB's optional low-NO_X standard of 0.02 gm/bhp-hr), thereby reducing DPM to zero and NO_X emissions by 90 percent compared to conventional heavy-duty trucks. All other criteria air pollutant emissions for NZE trucks are assumed to be the same as a conventional truck. Hence, NO_X would be the only criteria pollutant, that would have a greater reduction from the 2012 Baseline in Alternative 7 as compared to Alternative 5C. In addition, refer to the AQ/GHG/HRA Technical Study, provided in Appendix F, which includes the results for the Alternative 7 ZE-only option.

U-2-77

Please also refer to Response to Comment U-2-17 regarding the description of and potential impacts to SCE facilities. Caltrans and Metro acknowledge that SCE reserves the right to confirm

the descriptions of SCE facilities and coordinate with the Project Team regarding the property rights at a given location. However, as stated in Response to Comment U-2-2, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no impact to utilities.

U-2-78

Please refer to Response to Comment U-2-20 regarding SCE's estimated costs/share of the total utility relocation costs for the build alternatives.

U-2-79

At this point in the project development process, this information in Appendix F2 of the *Utility Impact Report, Central Segment* (June 2016) will not be altered; however, this correction has been acknowledged and included in the project record.

U-2-80

Please refer to Response to Comment U-2-77 regarding the description of and impacts to SCE facilities.

U-2-81

Please refer to Response to Comment U-2-20 regarding SCE's estimated costs/share of the total utility relocation costs for the build alternatives.

U-2-82

The cost discrepancies described in the comment are acknowledged. However, as stated in Response to Comment U-2-2, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no impact to utilities.

U-2-83

Please refer to Response to Comment U-2-77 regarding the description of and impacts to SCE facilities.

U-2-84

Please refer to Response to Comment U-2-20 regarding SCE's estimated costs/share of the total utility relocation costs for the build alternatives.

U-2-85

At this point in the EIR/EIS process, this information in the Utility Information Sheets of the *I-710 South End Utility Study Project Report* (November 2016) will not be altered; however, as stated

in Response to Comment U-2-2, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no impact to utilities..

U-2-86

The Energy Technical Report was revised to calculate the potential energy impacts from ZE and NZE trucks based on the CARB's LCFS regulations that include two factors (Energy Economy Ratio [EER] and Energy Density) that describe the relative energy consumption of electrically-powered trucks compared to diesel- and gasoline-powered trucks. The conclusion now also includes the following statement: "Additionally, the use of zero emission/near zero emission (ZE/NZE) trucks instead of diesel trucks for each build alternative are factored in." Table 4.2-5 show that both Alternatives 5C and 7 would result in lower operational energy consumption compared to the No Build Alternative. As stated above that table, "Alternative 5C and 7 improvements would include ZE/NZE heavy trucks, increase average travel speeds during peak hours, remove bottlenecks, and reduce delays."

U-2-87

As described in Response to Comment U-2-86, the Energy Technical Report has been revised as suggested to use the CARB's LCFS regulations and the two energy factors (Energy Economy Ratio [EER] and Energy Density) contained within.

THE METROPOLITAN WATER DISTRICT
OF SOUTHERN CALIFORNIA

Office of the General Manager

November 13, 2017 **EMAIL AND USPS**

Mr. Ronald Kosinski, Deputy District Director
Caltrans District 7, Division of Environmental Planning
100 South Main Street, MS 16A
Los Angeles, CA 90012
Email: ron_kosinski@dot.ca.gov

Dear Mr. Kosinski:

Recirculated Draft Environmental Impact Report/
Supplemental Draft Environmental Impact Statement for the I-710 Corridor Project

The Metropolitan Water District of Southern California (Metropolitan) has reviewed the Recirculated Draft Environmental Impact Report/Supplemental Draft Environmental Impact Statement (RDEIR/SDEIS) for the I-710 Corridor Project. Previously, a Draft EIR/EIS was released for public comment in 2012. Based on the comments received and new information, a new set of alternatives was developed and has been analyzed in the RDEIR/SDEIS. The alternatives studied in the RDEIR/SDEIS include Alternative 1 (No Build), Alternative 5C (Modernization of I-710 Freeway), and Alternative 7 (Modernization and Addition of a Clean-Emission Freight Corridor). All build alternatives proposed also include programmatic elements, including a zero emission/near zero emission truck deployment program, expanded transit services, and a community health benefit program. The Study Area includes the portion of the I-710 from Ocean Boulevard in Long Beach to State Route 60 (SR-60), a distance of approximately 19 miles. At the freeway-to-freeway interchanges, the Study Area extends east and west of the I-710 mainline for the Interstate 405 (I-405), SR-91, I-105, and I-5 interchanges. The project was undertaken to address the I-710 Corridor's mobility and safety needs and to explore possible solutions for transportation improvements.

Metropolitan is a public agency and regional water wholesaler. It comprises 26 member public agencies serving approximately 19 million people in portions of six counties in Southern California, including Los Angeles County.

Metropolitan responded to the Draft EIR/EIS for the project in a letter dated August 22, 2012 (enclosed). As stated in that letter, Metropolitan owns and operates several pipelines and facilities that cross or are within the Study Area (Location Map, enclosed), as follows: U-3-1

- The Middle Cross Feeder is a 72- to 78-inch welded steel pipe that runs east and west along Southern Avenue and crosses the I-710 just south of the Firestone Boulevard intersection.
- The Rio Hondo Pressure Control Structure and Power Plant is located near Miller Way and Frontage Road East, adjacent to the I-710.
- The Middle Feeder is a 79-inch welded steel pipe that runs east and west along Greenleaf Boulevard and crosses the I-710 at Greenleaf Boulevard.
- The West Coast Feeder is a 60-inch welded steel pipe that runs east and west along the I-105 and crosses the I-710 at the I-105 intersection.
- The Victoria-223rd Street Cross Feeder is a 45-inch precast concrete pipe that runs north and south along Alameda Street on the west side of the project.
- The Second Lower Feeder is a 78-inch pre-stressed pipe that runs east and west along Carson Street and crosses the I-710 at Carson Street.
- The Long Beach Lateral is a 30-inch welded steel pipe that runs east and west along Baker Street and crosses the I-710 at Baker Street.

U-3-1

Based on our review of the RDEIR/SDEIS, the project could interfere with Metropolitan's ongoing operation, maintenance and repair activities on our pipelines. Metropolitan requires unrestricted and unobstructed access to its facilities, to maintain and repair its system.

Metropolitan has previously reviewed conceptual plans for the proposed project for both Alternative 5C and 7. Both alternatives are conceptually acceptable subject to further review and approval of detail plans for bridge pile foundations, future encasements, appurtenant calculations, and site specific geotechnical analyses.

U-3-2

There are some discrepancies in the discussion of Metropolitan's pipelines under Section 3.4.2.2 Utilities, Permanent Impacts for Alternatives 5C and 7 (Page 3.4-18, Page 3.4-33). Please discuss Metropolitan's facilities in this section as follows:

1. Metropolitan's 30-inch Long Beach Lateral line crosses under the Los Angeles River, continuing in an east-west direction where the discharge structure and air-vac assembly are located both within existing and future Caltrans right of way. Under Alternative 5C, the valve would be relocated north of the existing MWDSC line and a new outlet to the Los Angeles River provided. Under Alternative 7, however, the proposed geometry would not provide sufficient room to relocate the discharge valve into LACFCD right of way. Therefore, under Alternative 7, the discharge valve would be relocated to the east side of the Los Angeles River, with an outlet to the river and power provided from Baker Street. The existing air-vac assembly would be relocated to Gale Avenue. Additional

U-3-3

Right-of-Way will be required. (See reference letters dated October 8, 2015 and November 2, 2016) U-3-3

2. Metropolitan's 78-inch pre-stressed concrete Second Lower Feeder pipeline runs in an east-west direction along Carson Street north of the I-710/I-405 interchange and is located under the proposed 5C and 7 Alternative footprints. It is not within direct physical conflict with the proposed improvements, and is to be protected in place. However, it may be necessary to extend the concrete encasement, or install another measure of permanent protection, depending upon the final geometry of the proposed improvements. (See reference letter dated April 28, 2016) U-3-4

3. Metropolitan's 73-inch welded steel Middle Feeder pipeline runs in an east-west direction along Greenleaf Boulevard north of the I-170/SR-91 interchange and is located under the proposed 5C and 7 Alternative footprints. It is not within direct physical conflict with the proposed improvements, and is to be protected in place. However, it may be necessary to extend the concrete encasement, or install another measure of permanent protection, depending upon the final geometry of the proposed improvements. (See reference letter dated April 28, 2016) U-3-5

4. Metropolitan's 61-inch welded steel West Coast Feeder pipeline runs in an east-west direction underneath the I-170/I-105 interchange and is located under the proposed Alternative 7 footprint. It is not within direct physical conflict with the proposed improvements, and is to be protected in place. However, it may be necessary to extend the concrete encasement, or install another measure of permanent protection, depending upon the final geometry of the proposed improvements. (See reference letter dated April 28, 2016) U-3-6

5. Metropolitan's 79-inch welded steel Middle Cross Feeder pipeline runs in an east-west direction underneath the I-170 within the existing electrical transmission corridor, south of Firestone Boulevard in the City of South Gate and is located under the proposed 5C and 7 Alternative footprints. It is not within direct physical conflict with the proposed improvements, and is to be protected in place. However, it may be necessary to extend the concrete encasement, or install another measure of permanent protection, depending upon the final geometry of the proposed improvements. (See reference letter dated September 30, 2015) U-3-7

In order to avoid potential conflicts with Metropolitan's facilities and rights-of-way, we require that any design plans for any activity in the area of Metropolitan's pipelines or facilities be submitted for our review and written approval. Approval of the project is contingent on Metropolitan's approval of design plans for portions of the proposed project that could impact our facilities. Any future design plans associated with this project should be submitted to the attention of Metropolitan's Substructures Team. Detailed prints of drawings of Metropolitan's U-3-8

pipelines and rights-of-way may be obtained by calling Metropolitan's Substructures Information Line at (213) 217-6564. U-3-8

Metropolitan encourages projects within its service area to include water conservation measures. While Metropolitan continues to build new supplies and develop means for more efficient use of current resources, projected population and economic growth will increase demands on the current system. Water conservation, reclaimed water use, stormwater use, and groundwater recharge programs are integral components to regional water supply planning. Metropolitan supports mitigation measures such as using water efficient fixtures, drought-tolerant landscaping, irrigation with stormwater and reclaimed water to offset any increase in water use associated with the proposed project.

We appreciate the opportunity to provide input to your planning process and we look forward to receiving future documentation and plans for this project. For further assistance, please contact Ms. Lilia I. Martínez at (213) 217-5656.

Very truly yours,

Jennifer Harriger
Team Manager, Environmental Planning Section

THE METROPOLITAN WATER DISTRICT
OF SOUTHERN CALIFORNIA

Office of the General Manager

August 22, 2012

Mr. Ron Kosinski
Deputy District Director Environmental Studies
California Department of Transportation
100 South Main Street Mail Stop 16A
Los Angeles, California 90012

Dear Mr. Kosinski:

Interstate-710 Corridor Project Draft EIR/EIS

The Metropolitan Water District of Southern California (Metropolitan) has received the I-710 Corridor Project Draft Environmental Impact Report/Environmental Impact Statement. The California Department of Transportation (Caltrans), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), the Gateway Cities Council of Governments, the Southern California Association of Governments, the Ports of Los Angeles and Long Beach, and the Interstate 5 Joint Powers Authority, are proposing to improve Interstate 710 (I-710) in Los Angeles County between Ocean Blvd. and State Route 60 (SR-60). Major features include widening I-710 up to ten general purpose lanes (five lanes in each direction), modernize and reconfigure the I-405, SR-91 and a portion of the I-5 interchanges with I-710, modernize and reconfigure most local arterial interchanges along I-710, and provision of a separated four-lane freight corridor to be used by conventional or zero-emission trucks. This letter contains Metropolitan's response to the Draft EIR/EIS as a responsible agency.

Our review of the Draft EIR/EIS indicates Metropolitan owns and operates several pipelines and facilities that cross or are adjacent to your project:

- The Middle Cross Feeder is a 72- to 78-inch welded steel pipe that runs east and west along Southern Avenue and crosses the I-710 just south of the Firestone intersection.

- The Rio Hondo Pressure Control Structure and Power Plant is located near Miller Way and Frontage Road East, adjacent to the I-710.

- The West Coast Feeder is a 60-inch welded steel pipe that runs east and west along the I-105 and crosses the I-710 at the I-105 intersection.

- The Middle Feeder is a 72-inchwelded steel pipe that runs east and west along Greenleaf Blvd and crosses the I-710 at Greenleaf Blvd.

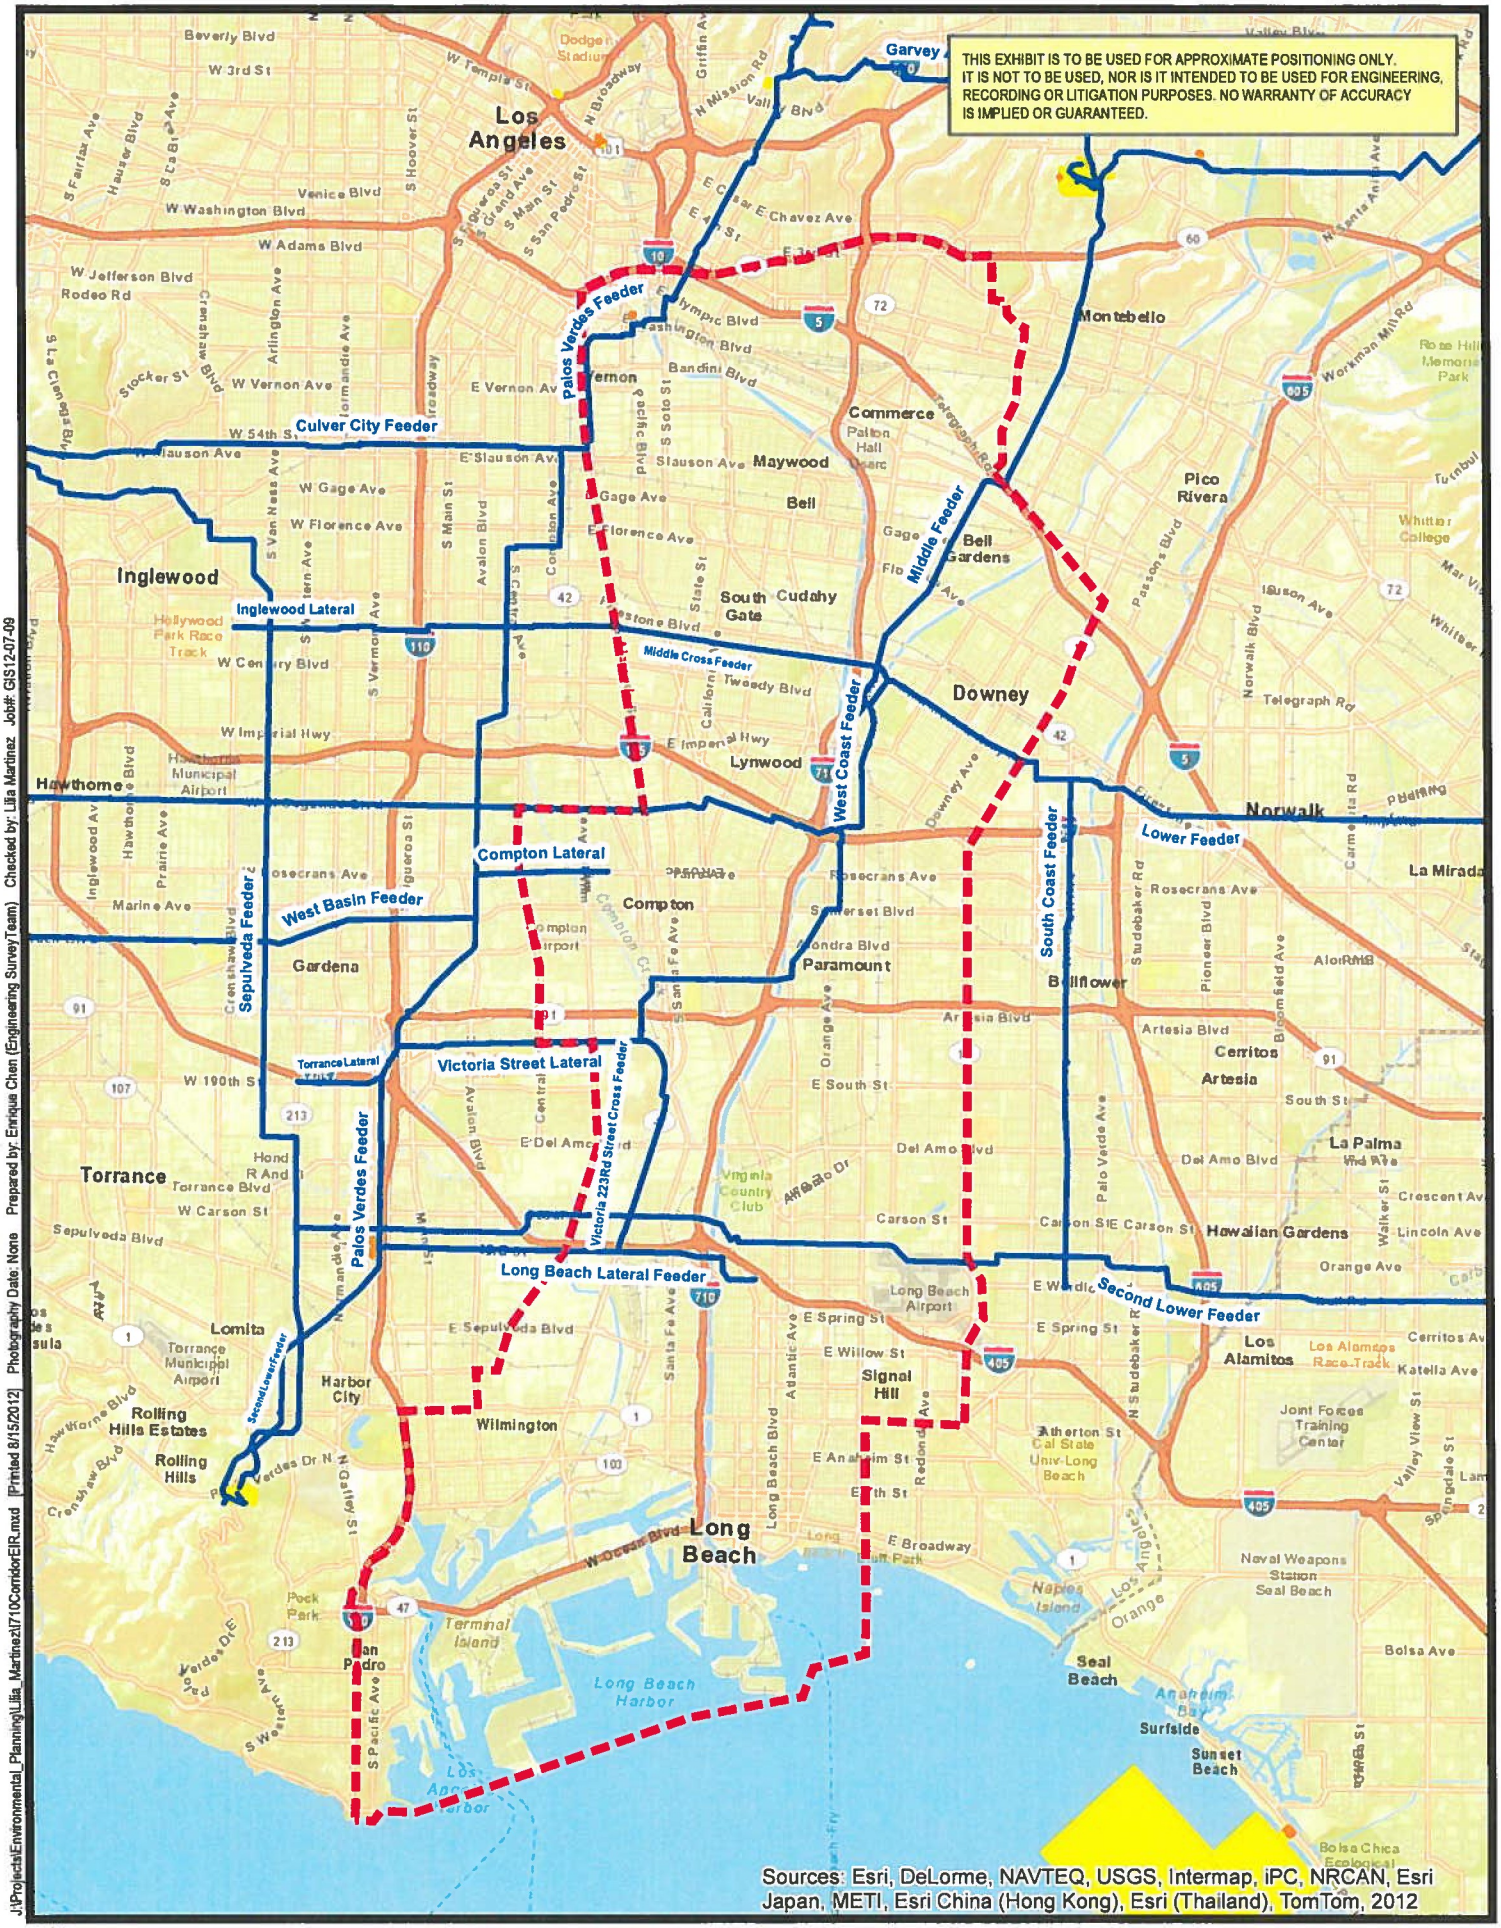
- The Second Lower Feeder is a 78-inch pre-stressed pipe that runs east and west along Carson Street and crosses the I-710 at Carson Street.

- The Long Beach Lateral is a 37-inch welded steel pipe that runs east and west along Baker Street and crosses the I-710 at Baker Street.

- The Victoria-223rd Street Cross Feeder is a 45-inch precast concrete pipe that runs north and south along Alameda Street on the west side of your project

Metropolitan is concerned with the potential impacts to the pipeline that may result from the construction and implementation of the proposed Project.

Development and redevelopment associated with the proposed Project must not restrict any of Metropolitan's day-to-day operations, and/or access to it facilities. Metropolitan must be allowed to maintain its rights-of-way and requires unobstructed access to its facilities and properties at all times in order to repair and maintain its system. Detailed prints of drawings of Metropolitan's pipelines and rights-of-way may be obtained by calling Metropolitan's Substructures Information Line at (213) 217-6564. To assist in preparing plans that are compatible with Metropolitan's facilities, easements, and properties, we have enclosed a copy of the "Guidelines for Developments in the Area of Facilities, Fee Properties, and /or easements of The Metropolitan Water District of Southern California." Please note that all submitted designs or plans must clearly identify Metropolitan's facilities and rights-of-way.



We appreciate the opportunity to provide input to your planning process. If you have any questions, please contact Mr. William Fong at (213) 217-6899.

Very truly yours,

Deirdre West
Manager, Environmental Planning Team

Guidelines for Developments in the Area of Facilities, Fee Properties, and/or Easements of The Metropolitan Water District of Southern California

1. Introduction

a. The following general guidelines should be followed for the design of proposed facilities and developments in the area of Metropolitan's facilities, fee properties, and/or easements.

b. We require that 3 copies of your tentative and final record maps, grading, paving, street improvement, landscape, storm drain, and utility plans be submitted for our review and written approval as they pertain to Metropolitan's facilities, fee properties and/or easements, prior to the commencement of any construction work.

2. Plans, Parcel and Tract Maps

The following are Metropolitan's requirements for the identification of its facilities, fee properties, and/or easements on your plans, parcel maps and tract maps:

a. Metropolitan's fee properties and/or easements and its pipelines and other facilities must be fully shown and identified as Metropolitan's on all applicable plans.

b. Metropolitan's fee properties and/or easements must be shown and identified as Metropolitan's with the official recording data on all applicable parcel and tract maps.

c. Metropolitan's fee properties and/or easements and existing survey monuments must be dimensionally tied to the parcel or tract boundaries.

d. Metropolitan's records of surveys must be referenced on the parcel and tract maps.

3. Maintenance of Access Along Metropolitan's Rights-of-Way

a. Proposed cut or fill slopes exceeding 10 percent are normally not allowed within Metropolitan's fee properties or easements. This is required to facilitate the use of construction and maintenance equipment, and provide access to its aboveground and belowground facilities.

b. We require that 16-foot-wide commercial-type driveway approaches be constructed on both sides of all streets crossing Metropolitan's rights-of-way. Openings are required in any median island. Access ramps, if necessary, must be at least 16-feet-wide. Grades of ramps are normally not allowed to exceed 10 percent. If the slope of an access ramp must exceed 10 percent due to the topography, the ramp must be paved. We require a 40-foot-long level area on the driveway approach to access ramps where the ramp meets the street. At Metropolitan's fee properties, we may require fences and gates.

c. The terms of Metropolitan's permanent easement deeds normally preclude the building or maintenance of structures of any nature or kind within its easements, to ensure safety and avoid interference with operation and maintenance of Metropolitan's pipelines or other facilities. Metropolitan must have vehicular access along the easements at all times for inspection, patrolling, and for maintenance of the pipelines and other facilities on a routine basis. We require a 20-foot-wide clear zone around all above-ground facilities for this routine access. This clear zone should slope away from our facility on a grade not to exceed 2 percent. We must also have access along the easements with construction equipment. An example of this is shown on Figure 1.

d. The footings of any proposed buildings adjacent to Metropolitan's fee properties and/or easements must not encroach into the fee property or easement or impose additional loading on Metropolitan's pipelines or other facilities therein. A typical situation is shown on Figure 2. Prints of the detail plans of the footings for any building or structure adjacent to the fee property or easement must be submitted for our review and written approval as they pertain to the pipeline or other facilities therein. Also, roof eaves of buildings adjacent to the easement or fee property must not overhang into the fee property or easement area.

e. Metropolitan's pipelines and other facilities, e.g. structures, manholes, equipment, survey monuments, etc. within its fee properties and/or easements must be protected from damage by the easement holder on Metropolitan's property or the property owner where Metropolitan has an easement, at no expense to Metropolitan. If the facility is a cathodic protection station it shall be located prior to any grading or excavation. The exact location, description and way of protection shall be shown on the related plans for the easement area.

4. Easements on Metropolitan's Property

a. We encourage the use of Metropolitan's fee rights-of-way by governmental agencies for public street and utility purposes, provided that such use does not interfere with Metropolitan's use of the property, the entire width of the property is accepted into the agency's public street system and fair market value is paid for such use of the right-of-way.

b. Please contact the Director of Metropolitan's Right of Way and Land Division, telephone (213) 250-6302, concerning easements for landscaping, street, storm drain, sewer, water or other public facilities proposed within Metropolitan's fee properties. A map and legal description of the requested easements must be submitted. Also, written evidence must be submitted that shows the city or county will accept the easement for the specific purposes into its public system. The grant of the easement will be subject to Metropolitan's rights to use its land for water pipelines and related purposes to the same extent as if such grant had not been made. There will be a charge for the easement. Please note that, if entry is required on the property prior to issuance of the easement, an entry permit must be obtained. There will also be a charge for the entry permit.

5. Landscaping

Metropolitan's landscape guidelines for its fee properties and/or easements are as follows:

a. A green belt may be allowed within Metropolitan's fee property or easement.

b. All landscape plans shall show the location and size of Metropolitan's fee property and/or easement and the location and size of Metropolitan's pipeline or other facilities therein.

c. Absolutely no trees will be allowed within 15 feet of the centerline of Metropolitan's existing or future pipelines and facilities.

d. Deep-rooted trees are prohibited within Metropolitan's fee properties and/or easements. Shallow-rooted trees are the only trees allowed. The shallow-rooted trees will not be permitted any closer than 15 feet from the centerline of the pipeline, and such trees shall not be taller than 25 feet with a root spread no greater than 20 feet in diameter at maturity. Shrubs, bushes, vines, and ground cover are permitted, but larger shrubs and bushes should not be planted directly over our pipeline. Turf is acceptable. We require submittal of landscape plans for Metropolitan's prior review and written approval. (See Figure 3).

e. The landscape plans must contain provisions for Metropolitan's vehicular access at all times along its rights-of-way to its pipelines or facilities therein. Gates capable of accepting Metropolitan's locks are required in any fences across its rights-of-way. Also, any walks or drainage facilities across its access route must be constructed to AASHTO H-20 loading standards.

f. Rights to landscape any of Metropolitan's fee properties must be acquired from its Right of Way and Land Division. Appropriate entry permits must be obtained prior to any entry on its property. There will be a charge for any entry permit or easements required.

6. Fencing

Metropolitan requires that perimeter fencing of its fee properties and facilities be constructed of universal chain link, 6 feet in height and topped with 3 strands of barbed wire angled upward and outward at a 45 degree angle or an approved equal for a total fence height of 7 feet. Suitable substitute fencing may be considered by Metropolitan. (Please see Figure 5 for details).

7. Utilities in Metropolitan's Fee Properties and/or Easements or Adjacent to Its Pipeline in Public Streets

Metropolitan's policy for the alinement of utilities permitted within its fee properties and/or easements and street rights-of-way is as follows:

a. Permanent structures, including catch basins, manholes, power poles, telephone riser boxes, etc., shall not be located within its fee properties and/or easements.

b. We request that permanent utility structures within public streets, in which Metropolitan's facilities are constructed under the Metropolitan Water District Act, be placed as far from our pipeline as possible, but not closer than 5 feet from the outside of our pipeline.

c. The installation of utilities over or under Metropolitan's pipeline(s) must be in accordance with the requirements shown on the enclosed prints of Drawings Nos. C-11632 and C-9547. Whenever possible we request a minimum of one foot clearance between Metropolitan's pipe and your facility. Temporary support of Metropolitan's pipe may also be required at undercrossings of its pipe in an open trench. The temporary support plans must be reviewed and approved by Metropolitan.

d. Lateral utility crossings of Metropolitan's pipelines must be as perpendicular to its pipeline alinement as practical. Prior to any excavation our pipeline shall be located manually and any excavation within two feet of our pipeline must be done by hand. This shall be noted on the appropriate drawings.

e. Utilities constructed longitudinally within Metropolitan's rights-of-way must be located outside the theoretical trench prism for uncovering its pipeline and must be located parallel to and as close to its rights-of-way lines as practical.

f. When piping is jacked or installed in jacked casing or tunnel under Metropolitan's pipe, there must be at least two feet of vertical clearance between the bottom of Metropolitan's pipe and the top of the jacked pipe, jacked casing or tunnel. We also require that detail drawings of the shoring for the jacking or tunneling pits be submitted for our review and approval. Provisions must be made to grout any voids around the exterior of the jacked pipe, jacked casing or tunnel. If the piping is installed in a jacked casing or tunnel the annular space between the piping and the jacked casing or tunnel must be filled with grout.

g. Overhead electrical and telephone line requirements:

1) Conductor clearances are to conform to the California State Public Utilities Commission, General Order 95, for Overhead Electrical Line Construction or at a greater clearance if required by Metropolitan. Under no circumstances shall clearance be less than 35 feet.

2) A marker must be attached to the power pole showing the ground clearance and line voltage, to help prevent damage to your facilities during maintenance or other work being done in the area.

3) Line clearance over Metropolitan's fee properties and/or easements shall be shown on the drawing to indicate the lowest point of the line under the most adverse conditions including consideration of sag, wind load, temperature change, and support type. We require that overhead lines be located at least 30 feet laterally away from all above-ground structures on the pipelines.

4) When underground electrical conduits, 120 volts or greater, are installed within Metropolitan's fee property and/or easement, the conduits must be incased in a minimum of three inches of red concrete. Where possible, above ground warning signs must also be placed at the right-of-way lines where the conduits enter and exit the right-of-way.

h. The construction of sewerlines in Metropolitan's fee properties and/or easements must conform to the California Department of Health Services Criteria for the Separation of Water Mains and Sanitary Services and the local City or County Health Code Ordinance as it relates to installation of sewers in the vicinity of pressure waterlines. The construction of sewerlines should also conform to these standards in street rights-of- way.

i. Cross sections shall be provided for all pipeline crossings showing Metropolitan's fee property and/or easement limits and the location of our pipeline(s). The exact locations of the crossing pipelines and their elevations shall be marked on as-built drawings for our information.

j. Potholing of Metropolitan's pipeline is required if the vertical clearance between a utility and Metropolitan's pipeline is indicated on the plan to be one foot or less. If the indicated clearance is between one and two feet, potholing is suggested. Metropolitan will provide a representative to assists others in locating and identifying its pipeline. Two-working days notice is requested.

k. Adequate shoring and bracing is required for the full depth of the trench when the excavation encroaches within the zone shown on Figure 4.

l. The location of utilities within Metropolitan's fee property and/or easement shall be plainly marked to help prevent damage during maintenance or other work done in the area. Detectable tape over buried utilities should be placed a minimum of 12 inches above the utility and shall conform to the following requirements:

1) Water pipeline: A two-inch blue warning tape shall be imprinted with:

"CAUTION BURIED WATER PIPELINE"

2) Gas, oil, or chemical pipeline: A two-inch yellow warning tape shall be imprinted with:

"CAUTION BURIED _____ PIPELINE"

3) Sewer or storm drain pipeline: A two-inch green warning tape shall be imprinted with:

"CAUTION BURIED _____ PIPELINE"

4) Electric, street lighting, or traffic signals conduit: A two-inch red warning tape shall be imprinted with:

"CAUTION BURIED _____ CONDUIT"

5) Telephone, or television conduit: A two-inch orange warning tape shall be imprinted with:

"CAUTION BURIED _____ CONDUIT"

m. Cathodic Protection requirements:

1) If there is a cathodic protection station for Metropolitan's pipeline in the area of the proposed work, it shall be located prior to any grading or excavation. The exact location, description and manner of protection shall be shown on all applicable plans. Please contact Metropolitan's Corrosion Engineering Section, located at Metropolitan's F. E. Weymouth Softening and Filtration Plant, 700 North Moreno Avenue, La Verne, California 91750, telephone (714) 593-7474, for the locations of Metropolitan's cathodic protection stations.

2) If an induced-current cathodic protection system is to be installed on any pipeline crossing Metropolitan's pipeline, please contact Mr. Wayne E. Risner at (714) 593-7474 or (213) 250-5085. He will review the proposed system and determine if any conflicts will arise with the existing cathodic protection systems installed by Metropolitan.

3) Within Metropolitan's rights-of-way, pipelines and carrier pipes (casings) shall be coated with an approved protective coating to conform to Metropolitan's requirements, and shall be maintained in a neat and orderly condition as directed by Metropolitan. The application and monitoring of cathodic protection on the pipeline and casing shall conform to Title 49 of the Code of Federal Regulations, Part 195.

4) If a steel carrier pipe (casing) is used:

(a) Cathodic protection shall be provided by use of a sacrificial magnesium anode (a sketch showing the cathodic protection details can be provided for the designers information).

(b) The steel carrier pipe shall be protected with a coal tar enamel coating inside and out in accordance with AWWA C203 specification.

n. All trenches shall be excavated to comply with the CAL/OSHA Construction Safety Orders, Article 6, beginning with Sections 1539 through 1547. Trench backfill shall be placed in 8-inch lifts and shall be compacted to 95 percent relative compaction (ASTM D698) across roadways and through protective dikes. Trench backfill elsewhere will be compacted to 90 percent relative compaction (ASTM D698).

o. Control cables connected with the operation of Metropolitan's system are buried within streets, its fee properties and/or easements. The locations and elevations of these cables shall be shown on the drawings. The drawings shall note that prior to any excavation in the area, the control cables shall be located and measures shall be taken by the contractor to protect the cables in place.

p. Metropolitan is a member of Underground Service Alert (USA). The contractor (excavator) shall contact USA at 1-800-422-4133 (Southern California) at least 48 hours prior to starting any excavation work. The contractor will be liable for any damage to Metropolitan's facilities as a result of the construction.

8. Paramount Right

Facilities constructed within Metropolitan's fee properties and/or easements shall be subject to the paramount right of Metropolitan to use its fee properties and/or easements for the purpose for which they were acquired. If at any time Metropolitan or its assigns should, in the exercise of their rights, find it necessary to remove any of the facilities from the fee properties and/or easements, such removal and replacement shall be at the expense of the owner of the facility.

9. Modification of Metropolitan's Facilities

When a manhole or other of Metropolitan's facilities must be modified to accommodate your construction or reconstruction, Metropolitan will modify the facilities with its forces. This should be noted on the construction plans. The estimated cost to perform this modification will be given to you and we will require a deposit for this amount before the work is performed. Once the deposit is received, we will schedule the work. Our forces will coordinate the work with your contractor. Our final billing will be based on actual cost incurred, and will include materials, construction, engineering plan review, inspection, and administrative overhead charges calculated in accordance with Metropolitan's standard accounting practices. If the cost is less than the deposit, a refund will be made; however, if the cost exceeds the deposit, an invoice will be forwarded for payment of the additional amount.

10. Drainage

a. Residential or commercial development typically increases and concentrates the peak storm water runoff as well as the total yearly storm runoff from an area, thereby increasing the requirements for storm drain facilities downstream of the development. Also, throughout the year water from landscape irrigation, car washing, and other outdoor domestic water uses flows into the storm drainage system resulting in weed abatement, insect infestation, obstructed access and other problems. Therefore, it is Metropolitan's usual practice not to approve plans that show discharge of drainage from developments onto its fee properties and/or easements.

b. If water must be carried across or discharged onto Metropolitan's fee properties and/or easements, Metropolitan will insist that plans for development provide that it be carried by closed conduit or lined open channel approved in writing by Metropolitan. Also the drainage facilities must be maintained by others, e.g., city, county, homeowners association, etc. If the development proposes changes to existing drainage features, then the developer shall make provisions to provide for replacement and these changes must be approved by Metropolitan in writing.

11. Construction Coordination

During construction, Metropolitan's field representative will make periodic inspections. We request that a stipulation be added to the plans or specifications for notification of Mr. _____ of Metropolitan's Operations Services Branch, telephone (213) 250-____, at least two working days prior to any work in the vicinity of our facilities.

12. Pipeline Loading Restrictions

a. Metropolitan's pipelines and conduits vary in structural strength, and some are not adequate for AASHTO H-20 loading. Therefore, specific loads over the specific sections of pipe or conduit must be reviewed and approved by Metropolitan. However, Metropolitan's pipelines are typically adequate for AASHTO H-20 loading provided that the cover over the pipeline is not less than four feet or the cover is not substantially increased. If the temporary cover over the pipeline during construction is between three and four feet, equipment must restricted to that which

imposes loads no greater than AASHTO H-10. If the cover is between two and three feet, equipment must be restricted to that of a Caterpillar D-4 tract-type tractor. If the cover is less than two feet, only hand equipment may be used. Also, if the contractor plans to use any equipment over Metropolitan's pipeline which will impose loads greater than AASHTO H-20, it will be necessary to submit the specifications of such equipment for our review and approval at least one week prior to its use. More restrictive requirements may apply to the loading guideline over the San Diego Pipelines 1 and 2, portions of the Orange County Feeder, and the Colorado River Aqueduct. Please contact us for loading restrictions on all of Metropolitan's pipelines and conduits.

b. The existing cover over the pipeline shall be maintained unless Metropolitan determines that proposed changes do not pose a hazard to the integrity of the pipeline or an impediment to its maintenance.

13. Blasting

a. At least 20 days prior to the start of any drilling for rock excavation blasting, or any blasting, in the vicinity of Metropolitan's facilities, a two-part preliminary conceptual plan shall be submitted to Metropolitan as follows:

b. Part 1 of the conceptual plan shall include a complete summary of proposed transportation, handling, storage, and use of explosions.

c. Part 2 shall include the proposed general concept for blasting, including controlled blasting techniques and controls of noise, fly rock, airblast, and ground vibration.

14. CEQA Requirements

a. When Environmental Documents Have Not Been Prepared

1) Regulations implementing the California Environmental Quality Act (CEQA) require that Metropolitan have an opportunity to consult with the agency or consultants preparing any environmental documentation. We are required to review and consider the environmental effects of the project as shown in the Negative Declaration or Environmental Impact Report (EIR) prepared for your project before committing Metropolitan to approve your request.

2) In order to ensure compliance with the regulations implementing CEQA where Metropolitan is not the Lead Agency, the following minimum procedures to ensure compliance with the Act have been established:

a) Metropolitan shall be timely advised of any determination that a Categorical Exemption applies to the project. The Lead Agency is to advise Metropolitan that it and other agencies participating in the project have complied with the requirements of CEQA prior to Metropolitan's participation.

b) Metropolitan is to be consulted during the preparation of the Negative Declaration or EIR.

c) Metropolitan is to review and submit any necessary comments on the Negative Declaration or draft EIR.

d) Metropolitan is to be indemnified for any costs or liability arising out of any violation of any laws or regulations including but not limited to the California Environmental Quality Act and its implementing regulations.

b. <u>When Environmental Documents Have Been Prepared</u>

If environmental documents have been prepared for your project, please furnish us a copy for our review and files in a timely manner so that we may have sufficient time to review and comment. The following steps must also be accomplished:

1) The Lead Agency is to advise Metropolitan that it and other agencies participating in the project have complied with the requirements of CEQA prior to Metropolitan's participation.

2) You must agree to indemnify Metropolitan, its officers, engineers, and agents for any costs or liability arising out of any violation of any laws or regulations including but not limited to the California Environmental Quality Act and its implementing regulations.

15. <u>Metropolitan's Plan-Review Cost</u>

a. An engineering review of your proposed facilities and developments and the preparation of a letter response

giving Metropolitan's comments, requirements and/or approval that will require 8 man-hours or less of effort is typically performed at no cost to the developer, unless a facility must be modified where Metropolitan has superior rights. If an engineering review and letter response requires more than 8 man-hours of effort by Metropolitan to determine if the proposed facility or development is compatible with its facilities, or if modifications to Metropolitan's manhole(s) or other facilities will be required, then all of Metropolitan's costs associated with the project must be paid by the developer, unless the developer has superior rights.

b. A deposit of funds will be required from the developer before Metropolitan can begin its detailed engineering plan review that will exceed 8 hours. The amount of the required deposit will be determined after a cursory review of the plans for the proposed development.

c. Metropolitan's final billing will be based on actual cost incurred, and will include engineering plan review, inspection, materials, construction, and administrative overhead charges calculated in accordance with Metropolitan's standard accounting practices. If the cost is less than the deposit, a refund will be made; however, if the cost exceeds the deposit, an invoice will be forwarded for payment of the additional amount. Additional deposits may be required if the cost of Metropolitan's review exceeds the amount of the initial deposit.

16. Caution

We advise you that Metropolitan's plan reviews and responses are based upon information available to Metropolitan which was prepared by or on behalf of Metropolitan for general record purposes only. Such information may not be sufficiently detailed or accurate for your purposes. No warranty of any kind, either express or implied, is attached to the information therein conveyed as to its accuracy, and no inference should be drawn from Metropolitan's failure to comment on any aspect of your project. You are therefore cautioned to make such surveys and other field investigations as you may deem prudent to assure yourself that any plans for your project are correct.

17. Additional Information

Should you require additional information, please contact:

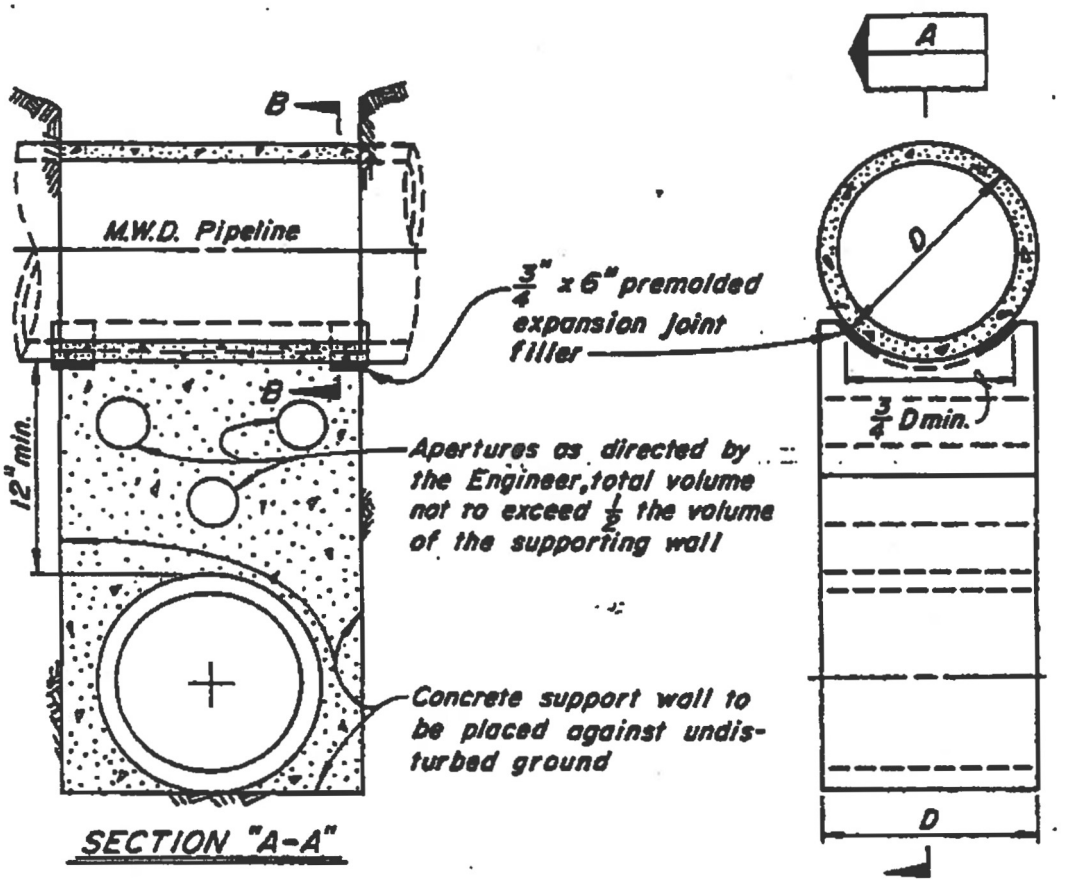
GENERAL NOTES

1. All ferrous parts and materials shall be galvanized after fabrication.
2. Adjustable tightening shall be turnbuckle or equivalent, having minimum 6" take-up.
3. Extension arms for barbed wire shall be steel, malleable iron or wrought iron and shall be attached to the top of the post with a tie wire and round head rivet. The extension arms shall carry three wires each at approximately 6" post centers in a plane approximately 45° from the vertical.
4. All gate hinges shall be heavy duty malleable iron or steel, industrial service type, 270 degree swing, of approved quality and design.
5. Secure cap to post with tie wire and round head rivet.



Use	Type	Nominal Size (Inches)	Actual O.D. (Inches)	Weight per foot (Pounds)
End, corner, slope, pull and gate posts for single gates 6 feet or less in width and double gates 12 feet or less in width for chain link fabric 72" inches or higher	Pipe	2½	2.875	3.79
End, corner, slope, pull and gate posts for single gates 6 feet or less in width and double gates 12 feet or less in width for chain link fabric less than 72 inches height	Pipe	2	2.375	2.69
Gate posts for single swing gates over 6 feet but not over 18 feet in width and double swing gates over 12 feet but not over 36 feet in width	Pipe	3½	4.000	9.1
Gate posts for single swing gates over 18 feet but not over 36 feet in width and double swing gates over 36 feet in width	Pipe	6	6.625	18.97
Gate posts for single swing gates over 18 feet in width and double swing gates over 36 feet in width	Pipe	8	8.625	24.70

April 28, 2016

Mr. Ernesto Chavez
Project Manager
LACMTA
Highway Program
One Gateway Plaza
Los Angeles, CA 90012

Dear Mr. Chaves:

Interstate 710 Utility Study — Central Segment

Thank you for your letter dated March 31, 2016, requesting Metropolitan's signature on the Preliminary Coordination Summary for District-owned water lines located within the Central Segment beginning approximately 1400 feet northerly of the Interstate 405 (I-405) interchange and extending north approximately 8 miles to the LA River Crossing Bridge for the Interstate 710 freeway (I-710) Corridor Project.

The above conceptual project will cross and impact Metropolitan's 78-inch-inside-diameter Second Lower Feeder north of the I-405 freeway, our 73-inch-inside-diameter Middle Feeder north of the State Route 91 freeway and our 61-inch-inside-diameter West

Coast Feeder at the Interchange of the I-105/I-710 freeways in the cities of Lynwood, Paramount and Long Beach of the county of Los Angeles.

Metropolitan appreciates the opportunity to meet with you and Mark Thomas & Company (MTCo) engineering staff to discuss and provide comments on this important project. As stated in your letter, we have provided our preliminary comments and requirements at the meeting held on October 27, 2015 (see meeting notes #2) and in our email dated November 16, 2015, copies attached, for this segment of the project (Alternative 5c and 7). Under Metropolitan's policies, we are unable to sign letters of intent or summary documents as you requested. However, we will continue to work with you to review plans and specifications, as they develop in the next phase of the project.

For any further correspondence with Metropolitan relating to this project, please make reference to the Substructures Job Number shown in the upper right-hand corner of the first page of this letter. Should you require any additional information, please contact Shoreh Zareh, telephone (213) 217-6530.

Very truly yours,

Kieran M. Callanan, P.E.
Manager, Substructures Team

MWD Middle Cross Feeder
Sta. 11+00 to 16+00
Substr. Job No. 2014-12-001

September 30, 2015

Mr. Ernesto Chaves
LACMTA
Highway Program
One Gateway Plaza
Los Angeles, CA 90012

Dear Mr. Chaves:

I-710 Utility Study — North Segment — Alternative 7

We received an email from Mr. Marc Cooley of HDR on August 31, 2015, submitting a plan (Exhibit 6), to accommodate the proposed widening, realignment and construction of a freight corridor as part of the I-710 Freeway project located from the Los Angeles River to State Highway 60 within various cities in the county of Los Angeles.

Subsequently, we received a revised plan (Exhibit 6) on September 18, 2015, for the above described project.

1. The locations of our 79-inch-inside-diameter Middle Cross Feeder pipeline and accompanying 15-foot-wide right-of-way, as shown on the Exhibit 6 of the revised plan, are generally in agreement with our records. However, we also request that our 15-foot-wide permanent easement and fee rights-of-way be shown and identified as Metropolitan on all pertinent sheets of your plans. Enclosed for your information and use is a copy of our Right-of-Way Map 1430-01.

2. The conceptual freight corridor bridge on columns (piles) with foundations (with a minimum of 5 feet of separation from the future encasement), and pipeline future encasement extensions, as shown on Exhibit 6 of the revised plan, is generally acceptable to Metropolitan, subject to our review and written approval of detail plans of the bridge piles for its foundations, future encasements, appurtenant calculations and related grading plans. In addition, we also request that site specific geotechnical report be submitted for our review and written approval, as addressed on our email correspondence to Mr. Marc Cooley dated September 10, 2015, copy enclosed.

3. We note that the proposed right-of-way will encroach into our fee property, as shown on your Exhibit 6 of your revised plan. Appropriate rights will need to be obtained from Metropolitan for the proposed right-of-way. Please note that granting an easement is subject to Metropolitan's Board of Directors approval.

   Please contact Jeff Wynn of our Real Property Development and Management Unit, telephone (213) 217-7659 regarding the process in obtaining the necessary permit and easement for this project.

4. All costs associated with the protections and inspection of our pipeline to accommodate this project must be borne by the project proponent. Metropolitan would consider allowing you or your contractor to perform this protection design subject to our review of the design plans and inspection of our pipeline. A utility agreement should be developed between Metropolitan and the project proponent to cover cost and responsibilities.

5. We request that a stipulation be added to all pertinent sheets of your plans or specifications to notify Kevin Johansen of our Water System Operations Group, telephone (562) 713-0348, at least two working days (Monday through Thursday) prior to starting any work in the vicinity of our facilities.

We are returning a print of Exhibit 6 of your revised plan, stamped "REVIEWED — CORRECTIONS NOTED — RESUBMITTAL REQUIRED."

For any further correspondence with Metropolitan relating to this project, please make reference to the Substructures Job Number shown in the upper right-hand corner of the

first page of this letter. Should you require any additional information, please contact Ken Chung, telephone (213) 217-7670.

Very truly yours,

Meeting Notes

Project: I-710 Utility Study, Central Segment Meeting	
Metropolitan Water District Coordination Meeting #2	
Location: Metropolitan Water District Headquarters 700 North Alameda Street Los Angeles, CA 90012-2944	Date and Time: October 27, 2015, 10:00 a.m.
Meeting Attendees: Arturo Vivar/MTCo Ann Walker/MTCo	Ben Kho/PacRIM Shohreh Zareh/MWD Ken Chung/MWD Ezequiel Montanez/MWD Mohsen Beikae/MWD
Prepared By: Ann Walker /MTCo	Date Prepared: *November 17, 2015 Revised* November 5, 2015
These notes have been prepared to the best of the writer's memory. If attendees recall differently, please contact the writer at awalker@markthomas com via email within 5 days of the prepared date above.	

1. Introductions

   Self-introductions were made.

2. I-710 Corridor Project Summary

   Arturo Vivar/MTCo, presented a brief summary of the I-710 Corridor Project and objectives discussed at the first meeting on July 9, 2015. The 2012 Draft EIR/EIS is being updated to reflect the decrease in regional traffic. The Utility Study supports the Draft Environmental Documents (EIR/EIS) being prepared by AECOM (formerly URS) and is scheduled to be finished in the summer of 2016. The Final Environmental Documents are expected to be completed in 2017.

   The goal of the Utility Study is to identify all utilities within the project area, identify utility conflicts created by the project and develop strategies to avoid major utility conflicts. The Utility Study objectives for the major utility conflicts include identifying additional right-of-way and easements needs and the costs associated with the major mitigation strategies. The responsibility of costs will be determined based on Caltrans rights and agreements.

3. Conflict Exhibit Review

   Ann Walker/MTCo presented the Central Segment utility conflict exhibits depicting the MWD utilities within the project area. Ann, MTCo, summarized the two project alternatives, Alterative 5C and Alternative 7. Both alternatives include improvements to the I-710 as well as major intersection and arterial improvements. Alternative 5C includes a truck bypass that extends from the south to Del Amo Boulevard. Alternative 7 includes a separated four lane, elevated freight corridor which parallels the I-710 and begins near the Port of Long Beach and extends northerly to the SR-60.

   Mitigation strategies for potential major utility conflicts include adjusting roadway alignment, protecting utilities in place, and/or utility relocation.

MWD provided a set of GIS maps and record drawings for each pipeline. The record drawing set included drawings that were not previously provided to MTCo.

a. Second Lower Feeder: 78-inch water main

   i. Alternative 5C
      1. Strategy: Protect-in-Place and Avoidance
      2. Proposed Mitigation:
         a. Carson St Bridge – No conflict
         b. Retaining Walls – Specify pile footings adjacent to the MWD pipeline
         c. Bridge Abutments – Relocate/Lengthen the bridge to avoid MWD pipeline
         d. NB Truck Bypass – Locate columns away from the MWD pipeline

   ii. Alternative 7
      1. Strategy: Protect-in-Place, Avoidance, and Extend Incasement
      2. Proposed Mitigation:
         a. Carson St Bridge – No conflict
         b. Retaining Walls – Specify pile footings adjacent to the MWD pipeline
         c. Extend incasement within proposed right-of-way

   iii. MWD Comments
      1. Geotechnical – See General Comments below
      2. Dominquez Gap Spreading Grounds – Incased pipe within the Spreading Grounds originally designed for scour and did not include surcharge or traffic loading. Will need to evaluate structural capacity of the existing casing within the Dominguez Gap Spreading Grounds. Most likely will need to replace or strengthen the existing casing. Alternatives to casing include a buried slab or "bridging" the Freight Corridor over the existing MWD pipeline.

b. Middle Feeder: 73-inch water main

   i. Alternative 5C
      1. Strategy: Protect-in-Place, Avoidance, and Extend Incasement
      2. Proposed Mitigation:
         a. Retaining Walls – Specify pile footings adjacent to the MWD pipeline, *manhole/tunnel structure*, and appurtenances
         b. Extend encasement within proposed right-of-way

   ii. Alternative 7
      1. Strategy: Protect-in-Place, Avoidance, and Extend Incasement
      2. Proposed Mitigation:
         a. Retaining Walls – Specify pile footings adjacent to the MWD pipeline, *manhole/tunnel structure*, and appurtenances
         b. Extend encasement within proposed right-of-way
         c. Freight Corridor – Locate columns away from the MWD pipeline

iii. MWD Comments
1. Geotechnical– See General Comments below
2. Review record drawings. Check location of existing MWD appurtenances e.g. manholes, etcetera. Identify and evaluate conflicts.

c. West Coast Feeder: 61-inch water main

MWD confirmed that there is no incasement west of the proposed Rosecrans on-ramp, beginning approximately STA 152+50.

i. Alternative 7
1. Strategy: Protect-in-Place
2. Proposed Mitigation: No Conflicts

ii. MWD Comments
1. Geotechnical– See General Comments below
2. Review record drawings. Check location of existing MWD appurtenances. Identify and evaluate conflicts. Existing manhole, air release, and vacuum valve located within existing basin, no conflict.
3. Proposed Freight Corridor located within area of the former I-710 alignment. MWD will confirm that the existing incasement was designed for traffic loading; most likely for the former I-710 alignment.
MWD Response: The existing jacked casing for the West Coast Feeder 61" WSP was designed for AASHTO H20-44 loading with the following maximum allowable cover:
Type I - 25-ft maximum cover
Type II - 40-ft maximum cover

d. General:

i. MWD Comments
1. Site specific Geotechnical Investigations required
2. Geotechnical Concerns
a. Vibration from construction activities
i. No vibration permitted within 25-feet of centerline of pipe
ii. Third Party vibration monitoring required
iii. Driven piles not permitted adjacent to MWD pipelines
b. Lateral forces from columns acting on pipeline
c. Lateral Earth Pressure
d. Differential Settlement
e. Retaining Walls – place on piles
f. Incased Pipe
i. Carrier pipe grouted to casing. Casing is structurally part of the pipe. No Sleeves.
ii. Existing incasement designed for vertical loads only. ~~The original MWD pipeline designs included an additional 20-feet to 30-feet of cover for future surcharge loads.~~

MWD Comment: Existing MWD encasements are typically designed to accommodate vertical loads such as the soil pressure and vehicle surcharge loads. The encasement are not typically designed to accommodate lateral loads or settlement.

iii. Incasement of existing pipe will require exposing the pipe. A shut down will be required for steel and prestressed pipes. ~~Reinforced Concrete Pipes may remain in service during incasement.~~
MWD Comment: A review may be conducted of the existing reinforced concrete pipes to determine if the pipeline may remain in service during the installation/modification of the incasement.

g. The integrity of the pipeline is dependent upon the confinement provided by the adjacent soils. Applies to steel and prestressed pipes.

3. Shut Downs
   a. One allowed per year per Line/Feeder
   b. Maximum duration is 7-Days
   c. Winter Season
   d. Must be scheduled 1-to-2-years in advance
4. MWD inspection of all contractor work
5. Absolute clearance from MWD pipelines is 5-feet face-to-face

- ***MTCo to review GIS maps and additional record drawings provided by MWD. Update Conflicts as needed.***
- ***MTCo to review Middle Feeder using additional record drawings provided by MWD. Check location of existing MWD appurtenances. Identify and evaluate conflicts.***
- ***Shohreh/MWD to review existing incasement of the West Coast Feeder at the proposed I-710 improvements. Confirm that the existing incasement was designed for traffic loads.***
- ***Shohreh/MWD is to review Conflict Exhibits and provide comments to MTCo prior to the next coordination meeting.***
- ***MTCo to incorporate MWD review comments prior to next coordination meeting.***
- ***MTCo to verify loads next year after Metro selects the preferred alternative.***

4. Other Impacts

R/W and easement rights – Case by Case for cost. Determination of prior rights deferred to next phase.

Costs – Need all costs. Do not need to determine cost sharing until next phase.

Assume 35% cost contingency.

- ***MTCo to prepare cost estimate for MWD review prior to next coordination meeting.***

5. Next Meeting

The next coordination meeting is tentatively scheduled for the end of November. The objective is to obtain MWD concurrence of MTCo's conflict strategy and cost estimate.

- ***MTCo to send copies of all meeting material and exhibits to MWD.***

Action Item Summary

No.	Description	Responsibility	Initially Due	Revised Due	Closed
1	Prepare meeting notes and provide copies of all MTCo meeting materials to MWD.	A.Walker/MTCo	11/05/15		11/05/15
2	Review GIS maps and additional record drawings provided by MWD. Update Conflicts as needed.	A.Walker/MTCo	11/17/15		10/29/15
3	Middle Feeder – Review additional record drawings provided by MWD. Check location of existing MWD appurtenances. Identify and evaluate conflicts.	A.Walker/MTCo	10/30/15		10/29/15
4	Review existing incasement of the West Coast Feeder at the proposed I-710 improvements. Confirm that the existing incasement was designed for traffic loads.	S. Zareh/MWD	11/10/15		11/16/15
5	Review MTCo Concept Exhibits and provide comments to MTCo prior to the next coordination meeting.	S. Zareh/MWD	11/10/15		11/16/15
6	Incorporate MWD review comments prior to next coordination meeting.	A.Walker/MTCo	11/17/15		10/29/15
7	Verify loads next year after Metro selects the preferred alternative.	A.Walker/MTCo	Fall 2016		
8	Prepare cost estimate for MWD review prior to next coordination meeting.	A.Walker/MTCo	~~11/17/15~~ *Not Required*		*N/A*

MWD Long Beach Lateral
Sta. 244+00 to 254+00
Substr. Job No. 2014-12-001

November 2, 2016

Mr. Matthew Reifer, P.E.
CH2M
Suite 700
6 Hutton Center Drive
Santa Ana, CA 92707

Dear Mr. Reifer:

Interstate 710 Corridor Project — Sound Wall (Package 3)

Thank you for your email dated October 5, 2016, submitting prints of the preliminary plans (Title Sheet, Sheets K-1 and L-2 through L-21) for the proposed sound wall from Los Angeles River to Interstate 405 Freeway and from Long Beach Boulevard to the State Route 91 freeway as part of Interstate 710 Freeway corridor project within various cities in the county of Los Angeles.

The location of Metropolitan's 37-inch-inside-diameter Long Beach Lateral pipeline in Baker Street, as shown on Sheet L-10 of your plans, is generally in agreement with our records. We request that our pipeline and our manhole structure (Insulating Section) be shown and fully identified as Metropolitan on all pertinent plans. Enclosed are prints of our Drawings A-2068, C-4552 and H-2291 for your information and use.

Metropolitan's Long Beach Lateral was constructed in 1939 within 223rd (Baker) Street right-of-way by virtue of the Metropolitan Water District Act (Act). Please note that all costs associated with the proposed sound wall including site specific geotechnical

analysis, protection and inspection of our facilities to accommodate this project must be borne by the project proponent.

In order for Metropolitan to evaluate the impact of the proposed 16-foot-high sound wall (SW-502/602, Segment 6) and its pile foundation on our pipeline, the following information must be submitted for our review and approval.

1. Detailed plans, showing the proposed sound wall and foundations in relation to our pipeline.

2. A site specific geotechnical report is required at the crossing, which must include, but not limited to, subsurface conditions, ground water, bedrock elevation, and lab testing results.

3. Subject to meeting the other restrictions the horizontal clearance between the proposed piles and the face of the pipeline must not be less than 5 feet. The induced differential settlements and seismically-induced lateral deformation as a result of the proposed piles and sound wall must be within allowable values for our pipeline.

4. Based on the Metropolitan Geotechnical Guidelines (copy enclosed) settlement analysis results along the affected reach of the pipeline must be submitted for our review.

5. The construction sequence for the proposed sound wall where it crosses our pipeline.

6. The procedures and specifications of all construction equipment to be used for removal, placement, and compaction of soil and pavement in the affected reach.

7. Metropolitan does not allow any procedures that could subject our pipeline to excessive impacts or vibratory loads. Also, Metropolitan does not allow any man-made induced vibration and vibratory equipment to be used in vibratory mode within a horizontal distance of 25 feet from the face of our pipeline.

We request that a stipulation be added to your plans and specifications to notify Kevin Johansen of our Water System Operations Group, telephone (562) 713-0348, at least two working days prior to starting any work in the vicinity of our facilities.

We are returning prints of Sheets K-1 and L-10 of the submitted preliminary plans, stamped "REVIEWED — CORRECTIONS NOTED — RESUBMITTAL REQUIRED."

For any further correspondence with Metropolitan relating to this project, please make reference to the Substructures Job Number shown in the upper right-hand corner of the first page of this letter. Should you require any additional information, please contact Shoreh Zareh, telephone (213) 217-6534.

Very truly yours,

Kieran M. Callanan, P.E.
Manager, Substructures Team

MWD Long Beach Lateral
Sta. 244+00 to 254+00
Substr. Job No. 2014-12-001

October 8, 2015

Mr. Ernesto Chaves
LACMTA
Highway Program
One Gateway Plaza
Los Angeles, CA 90012

Dear Mr. Chaves:

Interstate 710 Utility Study — South Segment

We received an email from Ms. Ania Gierach of AECOM on August 27, 2015, submitting prints of your Alternatives 5C and 7 plans (four sheets), to accommodate the proposed widening, realignment and construction of a freight corridor or truck bypass as part of the Interstate 710 Freeway project located from the Los Angeles River to State Highway 60 within various cities in the county of Los Angeles.

1. The locations of our 30- and 37-inch-inside-diameter Long Beach Lateral pipeline, manhole structures and appurtenant discharge valve and structure, as shown on Alternative 5C and 7 of the plans, are generally in agreement with our records. However, we request that our 15-foot-wide permanent easement for our Long Beach Lateral pipeline and related 10-foot-wide right-of-way (permit) for our discharge valve and structure and underground discharge pipe also be shown and identified as Metropolitan on all pertinent sheets of your plans. Enclosed for your information and use are copies of our Right-of-Way Maps 1414-02 and 1414-3A.

2. The proposed relocations of our valve structure and pressure control/blowoff structure and related underground piping to accommodate the corridor or truck bypass alternatives, as shown on Alternative 5C and 7 of your plans, appears to be feasible and acceptable to Metropolitan.

3. All costs associated with the modification design, protection, and inspection of our facilities to accommodate this project must be borne by the project proponent. Please note that general cost estimate includes Metropolitan's design, inspection, administration and any required shutdown and dewatering charges. The cost may vary, depending on the actual site conditions. The relocation must be designed and constructed in accordance with Metropolitan's standard specifications and design criteria. Metropolitan would consider allowing your contractor to perform the modification and protection subject to inspection of our facilities. A utility agreement should be developed between Metropolitan and the project proponent to cover cost and responsibilities.

4. As part of our facilities relocation, Metropolitan will require new permanent easement right-of-way for the new locations of our facilities. Please also note that Metropolitan must have unrestricted access to our pipeline facilities.

5. We request that site specific geotechnical report also be submitted for our review and written approval.

6. We request that a stipulation be added to all pertinent sheets of your plans or specifications to notify Kevin Johansen of our Water System Operations Group, telephone (562) 713-0348, at least two working days (Monday through Thursday) prior to starting any work in the vicinity of our facilities.

We are returning prints of Alternatives 5C and 7 of the plans, stamped "REVIEWED — CORRECTIONS NOTED — RESUBMITTAL REQUIRED."

For any further correspondence with Metropolitan relating to this project, please make reference to the Substructures Job Number shown in the upper right-hand corner of the first page of this letter. Should you require any additional information, please contact Ken Chung, telephone (213) 217-7670.

Very truly yours,

Shohreh Zareh, P.E.

Office of the General Manager

MWD Middle Cross Feeder
Sta. 11+00 to 16+00
Substr. Job No. 2014-12-001

September 30, 2015

Mr. Ernesto Chaves
LACMTA
Highway Program
One Gateway Plaza
Los Angeles, CA 90012

Dear Mr. Chaves:

I-710 Utility Study — North Segment — Alternative 7

We received an email from Mr. Marc Cooley of HDR on August 31, 2015, submitting a plan (Exhibit 6), to accommodate the proposed widening, realignment and construction of a freight corridor as part of the I-710 Freeway project located from the Los Angeles River to State Highway 60 within various cities in the county of Los Angeles.

Subsequently, we received a revised plan (Exhibit 6) on September 18, 2015, for the above described project.

1. The locations of our 79-inch-inside-diameter Middle Cross Feeder pipeline and accompanying 15-foot-wide right-of-way, as shown on the Exhibit 6 of the revised plan, are generally in agreement with our records. However, we also request that our 15-foot-wide permanent easement and fee rights-of-way be shown and identified as Metropolitan on all pertinent sheets of your plans. Enclosed for your information and use is a copy of our Right-of-Way Map 1430-01.

2. The conceptual freight corridor bridge on columns (piles) with foundations (with a minimum of 5 feet of separation from the future encasement), and pipeline future encasement extensions, as shown on Exhibit 6 of the revised plan, is generally acceptable to Metropolitan, subject to our review and written approval of detail plans of the bridge piles for its foundations, future encasements, appurtenant calculations and related grading plans. In addition, we also request that site specific geotechnical report be submitted for our review and written approval, as addressed on our email correspondence to Mr. Marc Cooley dated September 10, 2015, copy enclosed.

3. We note that the proposed right-of-way will encroach into our fee property, as shown on your Exhibit 6 of your revised plan. Appropriate rights will need to be obtained from Metropolitan for the proposed right-of-way. Please note that granting an easement is subject to Metropolitan's Board of Directors approval.

   Please contact Jeff Wynn of our Real Property Development and Management Unit, telephone (213) 217-7659 regarding the process in obtaining the necessary permit and easement for this project.

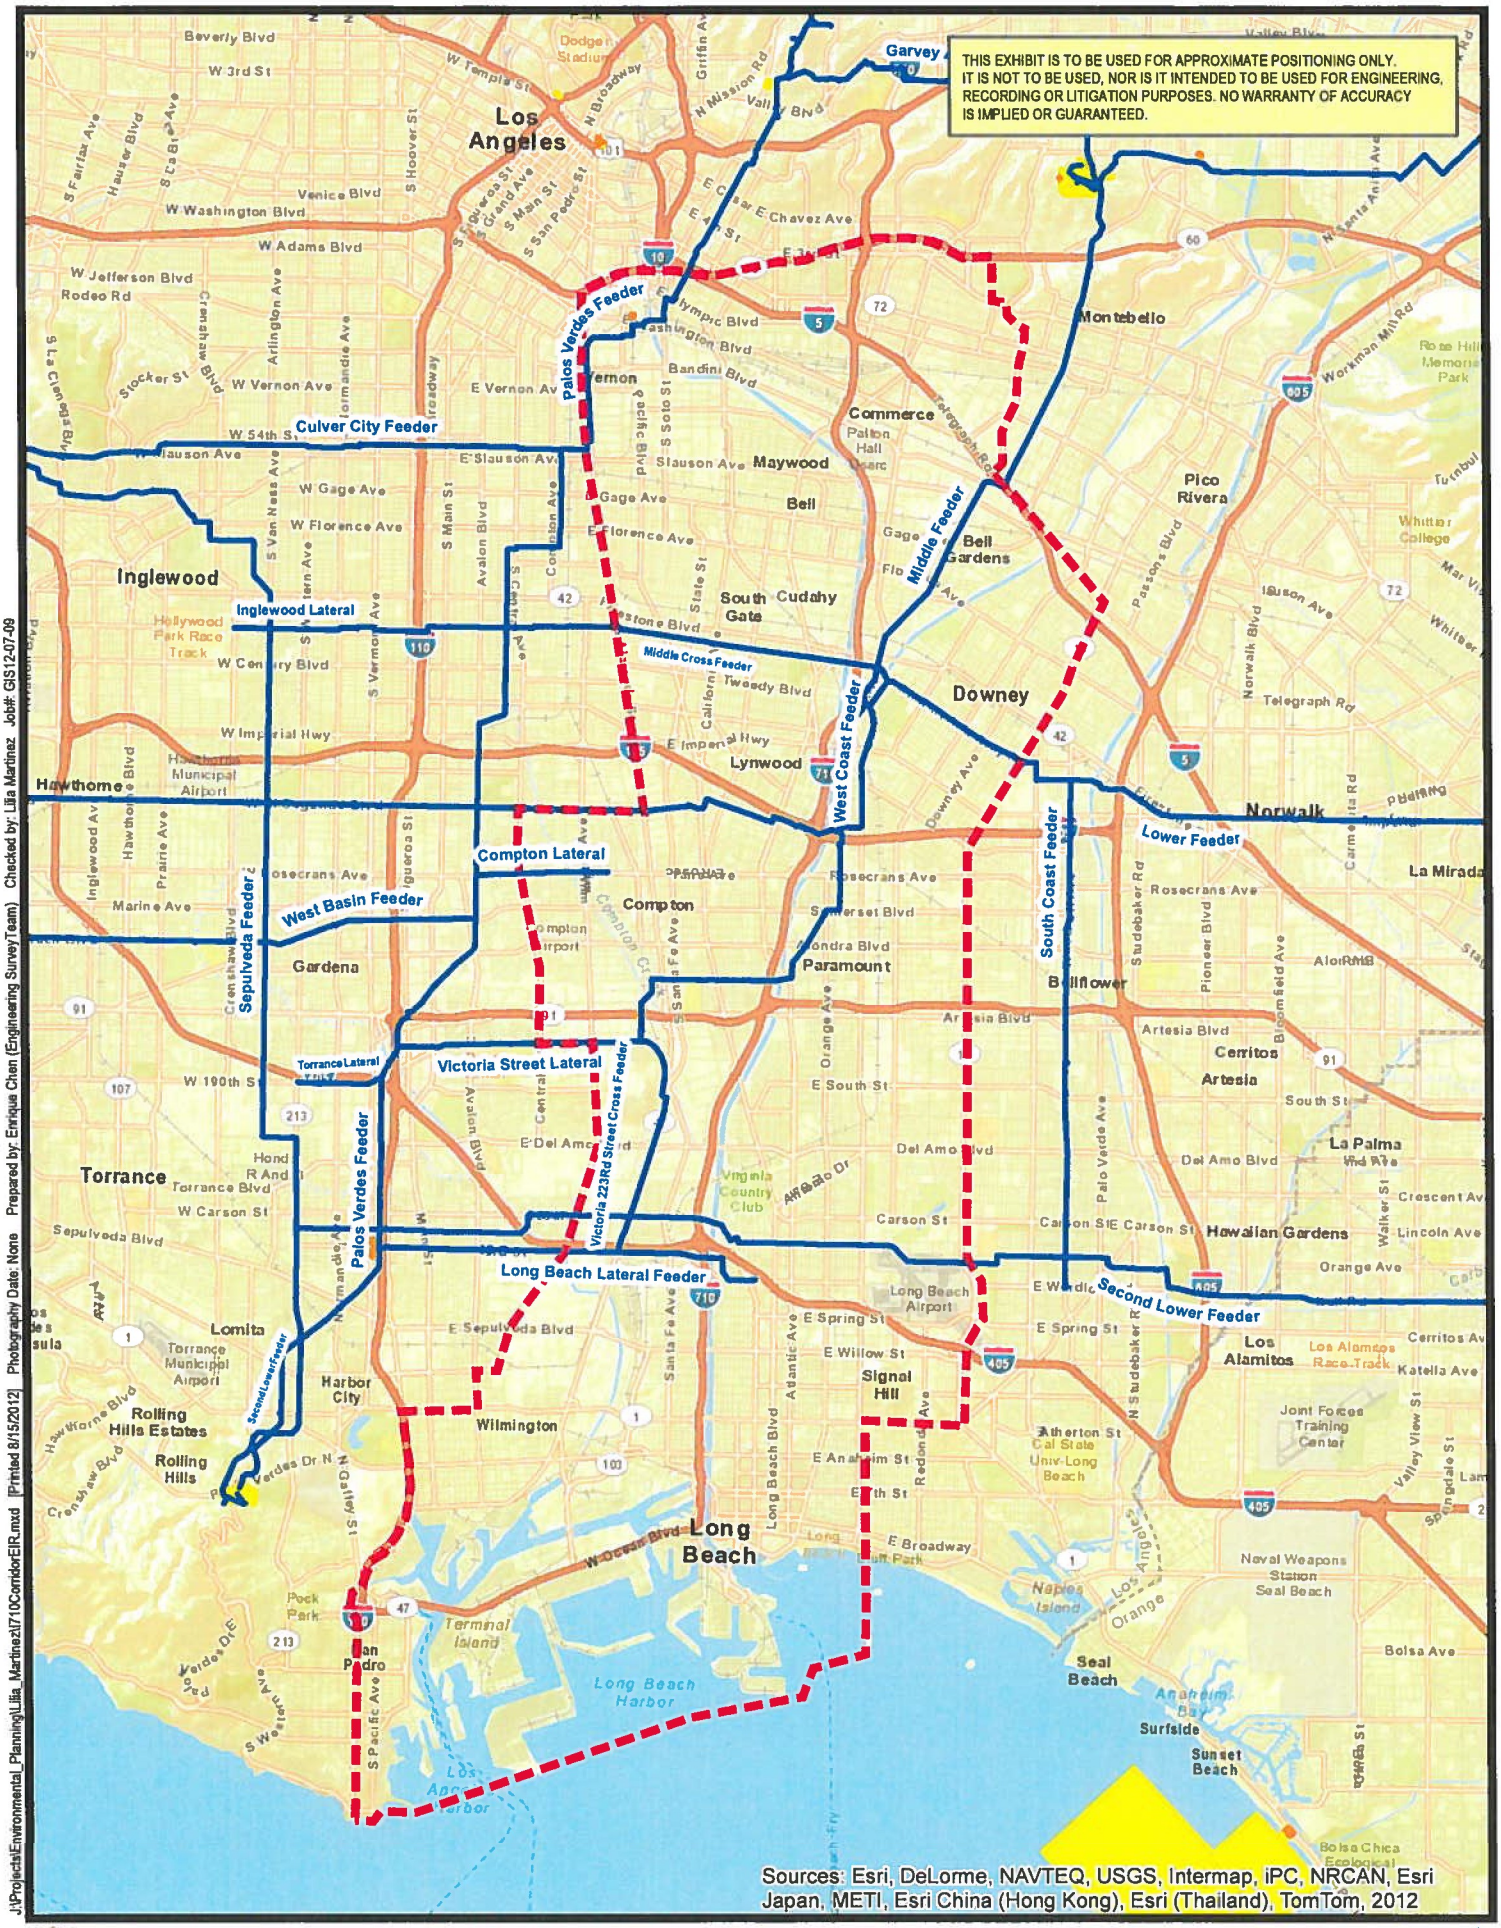
4. All costs associated with the protections and inspection of our pipeline to accommodate this project must be borne by the project proponent. Metropolitan would consider allowing you or your contractor to perform this protection design subject to our review of the design plans and inspection of our pipeline. A utility agreement should be developed between Metropolitan and the project proponent to cover cost and responsibilities.

5. We request that a stipulation be added to all pertinent sheets of your plans or specifications to notify Kevin Johansen of our Water System Operations Group, telephone (562) 713-0348, at least two working days (Monday through Thursday) prior to starting any work in the vicinity of our facilities.

We are returning a print of Exhibit 6 of your revised plan, stamped "REVIEWED — CORRECTIONS NOTED — RESUBMITTAL REQUIRED."

For any further correspondence with Metropolitan relating to this project, please make reference to the Substructures Job Number shown in the upper right-hand corner of the

first page of this letter. Should you require any additional information, please contact Ken Chung, telephone (213) 217-7670.



Very truly yours,

I-710 Corridor Project

MWD Interests

Miles
0 0.5 1 2

This page intentionally left blank

U-3-1

Caltrans and Metro acknowledge that Metropolitan Water District of Southern California's (MWDSC) facilities, as listed in the comment, could be impacted by construction of the I-710 Corridor Project build alternatives, and thank MWDSC for supplying the Location Map as an attachment to their comment submission. An analysis of potential impacts to major utilities was included in Section 3.4, Utility and Emergency Services, of the RDEIR/SDEIS. However, Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), has identified Alternative 1 (No Build) as the Preferred Alternative. Therefore, there will be no impacts to MWDSC facilities. Please refer to Section 1.1 of this appendix for further discussion on the identification of the Preferred Alternative.

U-3-2

Caltrans appreciates MWDSC's determination that both build alternatives are conceptually acceptable. However, as stated in Response to Comment U-3-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, utility relocation will not be necessary.

U-3-3

There are no apparent discrepancies associated with Conflict S3200B. As discussed in Section 3.4.2.2, Alternative 5C, of the RDEIR/SDEIS, the Conflict S3200B is an MWDSC facility north of Wardlow Rd. and south of the I-710/I-405 interchange. An existing 30-inch MWDSC line crosses under the Los Angeles River, continuing in the east-west direction where the discharge structure and air-vac assembly are located both within existing and future Caltrans right-of-way for the build alternatives. Under Alternative 5C, the valve would be relocated north of the existing MWDSC line and provide a new outlet to the Los Angeles River. Should Alternative 5C be selected as the Preferred Alternative, the existing air-vac assembly would be relocated to Gale Ave. In addition, as discussed in Section 3.4.2.2, Alternative 7, of the RDEIR/SDEIS, Conflict S3200B is an MWDSC facility north of Wardlow Rd. and south of the I-710/I-405 interchange. The impacts to this facility would be similar to that described above under Alternative 5C, but the proposed geometry under Alternative 7 would not provide sufficient room to relocate the discharge valve into Los Angeles County Flood Control District (LACFCD) right-of-way. Therefore, should Alternative 7 be selected as the Preferred Alternative, the discharge valve would be relocated to the east side of the Los Angeles River, with an outlet to the river and power provided from Baker St. The existing air-vac assembly would be relocated to Gale Ave. in the same manner as under Alternative 5C.

Additionally, as discussed in Section 3.4.2.2 of the RDEIR/SDEIS, should a build alternative be selected as the Preferred Alternative, utilities impacted as a result of the build alternatives would be relocated in accordance with specific Utility Relocation Plans described in Measure U&ES-2.

Should a build alternative be selected as the Preferred Alternative, final utility easement agreements and final right-of-way needs would be determined during utility coordination later in the design process and the drafting of specific Utility Relocation Plans. However, for clarity to Conflict S3200B at Alternative 7, the following revisions have been made to Section 3.4.2.2 of the RDEIR/SDEIS:

> Therefore, under Alternative 7, the discharge valve would be relocated to the east side of the Los Angeles River, with an outlet to the river and power provided from Baker St. The existing air-vac assembly would be relocated to Gale Ave. in the same manner as under Alternative 5C. Additional right-of-way may be required. Should Alternative 7 be selected as the Preferred Alternative, if additional right-of-way becomes necessary during final design, appropriate environmental re-evaluations will be undertaken in due course of project development pursuant to 23 CFR 771.129 under NEPA and Sections 15162 and 15164 of the State CEQA Guidelines.

U-3-4

There are no apparent discrepancies associated with MWDSC's 78-inch second lower feeder pipeline utility (Conflict C3201). As discussed in the Major Utility Crossing Matrix - Build Alternative 5C and Major Utility Crossing Matrix - Build Alternative 7 of the *I-710 South End Utility Study Project Report* (November 25, 2016), the 78-inch second lower feeder pipeline utility would be protected in place under both Alternatives 5C and 7. In addition, as generally discussed in Section 3.4.2.2 of the RDEIR/SDEIS, should a build alternative be selected as the Preferred Alternative, utilities identified to be in conflict with the build alternatives would either be relocated or protected in place. Should a build alternative be selected as the Preferred Alternative, further coordination would be required with each owner to confirm the conflict and disposition strategy (i.e., whether they can be protected in place or relocated).

While there are no apparent discrepancies, the following revisions have been made to Section 3.4.2.2 of the RDEIR/SDEIS to more clearly define the potential conflict associated with MWDSC's 78-inch second lower feeder pipeline with Alternative 5C and Alternative 7, respectively:

> **ALTERNATIVE 5C**
>
> An MWDSC 78-inch pre-stressed concrete second lower feeder pipeline (Conflict C3201) that runs in an east-west direction along Carson St. north of the I-710/I-405 interchange, is located under Alternative 5C. The facility would not be within direct physical conflict with the proposed improvements, and would be protected in place. However, it may be necessary to extend the concrete encasement, or install another measure of permanent protection.

ALTERNATIVE 7

An MWDSC 78-inch pre-stressed concrete second lower feeder pipeline (Conflict C3201) that runs in an east-west direction along Carson St. north of the I-710/I-405 interchange, is located under the proposed Alternative 7. It would not be within direct physical conflict with the proposed improvements, and would be protected in place as it would be under Alternative 5C. As in Alternative 5C, it may be necessary to extend the concrete encasement, or install another measure of permanent protection.

U-3-5

There are no apparent discrepancies associated with MWDSC's 73-inch welded steel middle feeder pipeline utility (Conflict C3202). As discussed in the Major Utility Crossing Matrix - Build Alternative 5C and Major Utility Crossing Matrix - Build Alternative 7 of the *I-710 South End Utility Study Project Report* (November 25, 2016), the 73-inch welded steel middle feeder pipeline utility would be protected in place under both Alternatives 5C and 7. In addition, as generally discussed in Section 3.4.2.2 of the RDEIR/SDEIS, should a build alternative be selected as the Preferred Alternative, utilities identified to be in conflict with the build alternatives would either be relocated or protected in place. Should a build alternative be selected as the Preferred Alternative, further coordination would be required with each owner to confirm the conflict and disposition strategy (i.e., whether they can be protected in place or relocated).

While there are no apparent discrepancies, the following revisions have been made to Section 3.4.2.2 of the RDEIR/SDEIS to more clearly define the potential conflict associated with MWDSC's 73-inch welded steel middle feeder pipeline at Alternative 5C and Alternative 7, respectively:

ALTERNATIVE 5C

An MWDSC 73-inch welded steel middle feeder pipeline (Conflict C3202) that runs in an east-west direction along Greenleaf Blvd. north of the I-710/SR-91 interchange, is located under the proposed Alternative 5C. The facility would not be within direct physical conflict with the proposed improvements under Alternative 5C, and would be protected in place. However, it may be necessary to extend the concrete encasement, or install another measure of permanent protection.

ALTERNATIVE 7

An MWDSC 73-inch welded steel middle feeder pipeline (Conflict C3202) that runs in an east-west direction along Greenleaf Blvd. north of the I-710/SR-91 interchange, is located under the proposed Alternative 7. It would not be within direct physical conflict with the proposed improvements, and would be protected

in place as it would be under Alternative 5C. As in Alternative 5C, it may be necessary to extend the concrete encasement, or install another measure of permanent protection.

U-3-6

There are no apparent discrepancies associated with MWDSC's 61-inch welded steel west coast feeder pipeline utility (Conflict C3203). As discussed in the Major Utility Crossing Matrix - Build Alternative 5C and Major Utility Crossing Matrix - Build Alternative 7 of the *I-710 South End Utility Study Project Report* (November 25, 2016), the 61-inch welded steel west coast feeder pipeline utility would only have a conflict at Alternative 7 and would be protected in place. In addition, as generally discussed in Section 3.4.2.2 of the RDEIR/SDEIS, should a build alternative be selected as the Preferred Alternative, utilities identified to be in conflict with the build alternatives would either be relocated or protected in place. Should a build alternative be selected as the Preferred Alternative, further coordination would be required with each owner to confirm the conflict and disposition strategy (i.e., whether they can be protected in place or relocated).

While there are no apparent discrepancies, the following revisions have been made to Section 3.4.2.2 of the RDEIR/SDEIS to more clearly define the potential conflict associated with MWDSC's 61-inch welded steel west coast feeder pipeline at Alternative 7:

An MWDSC 61-inch welded steel west coast feeder pipeline (Conflict C3203) that runs in an east-west direction underneath the I-710/I-105 interchange, is located under the proposed Alternative 7. It would not be within direct physical conflict with the proposed improvements, and would be protected in. As in Alternative 5C, it may be necessary to extend the concrete encasement, or install another measure of permanent protection.

U-3-7

There are no apparent discrepancies associated with Conflict N3201. As discussed in Section 3.4.2.2, Alternative 5C, of the RDEIR/SDEIS, Conflict N3201 is an MWDSC 79-inch water line located within the existing electrical transmission corridor, that crosses I-710 south of Firestone Ave. within the City of South Gate, and is located under the proposed Alternative 5C footprint. It would not be within direct physical conflict with the proposed improvements, and would be protected in place. In addition, as discussed in Section 3.4.2.2, Alternative 7, of the RDEIR/SDEIS, the Conflict N3201 located within the existing electrical transmission corridor, that crosses I-710 south of Firestone Ave., within the City of South Gate, is located under the proposed Alternative 7 footprint. It would not be within direct physical conflict with the proposed improvements, and would be protected in place as it would be under Alternative 5C. However, under Alternative 7, the concrete encasement would be extended by 110 feet to the east and 20

feet to the west of current limits. No additional permanent right-of-way requirements would be needed for the encasement extension.

Additionally, as discussed in Section 3.4.2.2 of the RDEIR/SDEIS, should a build alternative be selected as the Preferred Alternative, utilities impacted as a result of the build alternatives would be relocated in accordance with specific Utility Relocation Plans described in Measure U&ES-2. Further coordination would be required with each owner to confirm the conflict and disposition strategy, which could include concrete encasement extensions or other necessary permanent protections.

U-3-8

As stated in Response to Comment U-3-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, further coordination with each utility owner, including the MWDSC, to confirm any utility conflict and disposition strategy (i.e., whether they can be protected in place or relocated) is not necessary.

C.E.H.A.J.
coalition for environmental health and justice

July 25, 2017

Ronald Kosinski
Caltrans District 7, Division of Environmental Planning
100 South Main Street, MS 16A
Los Angeles, CA 90012

RE: I-710 Recirculated Draft Environmental Impact Report/Supplemental Draft Environmental Impact Statement

Dear Mr. Kosinski:

We are writing to respectfully request that the California Department of Transportation extend the comment period for the Recirculated Draft Environmental Impact Report/Supplemental Draft Environmental Impact Statement (RDEIR/SDEIS) for the Interstate 710 (I-710) Corridor Project to 90 days. Comments are currently due by September 22, 2017. Granting this request would allow the comment period to go through October 20, 2017. Several reasons support extending the comment period.

The Coalition for Environmental Health And Justice (CEHAJ) is diligently working to review the RDEIR/SDEIS but additional time will be necessary to fully evaluate the document. The RDEIR/SDEIS, including appendices, is well over 2600 pages. Much of this information is highly technical data. CEHAJ needs additional time to consult with experts to fully understand the findings. Extending the comment period will allow for CEHAJ as well as other stakeholders to be more informed about the project, and thus more fully engaged in the CEQA and NEPA processes. This engagement could provide improvements to the project's current design, additional or revised mitigations, and other information that is at the heart of CEQA and NEPA's public comment processes.

IP-1-1

In addition, the current comment period for the I-710 RDEIR/SDEIS overlaps with two other high-profile proposals — the draft Clean Air Action Plan (CAAP) and the Draft Supplemental Environmental Impact Report for the China Shipping Container Terminal Project due on Sept 21, 2017. CEHAJ members have been very active in the prior and current CAAP processes and will

continue to be heavily engaged and submit comments. CEHAJ members have also been very active for decades on issues related to the mitigations at the China Shipping Terminal and are currently heavily engaged in providing comments on that environmental document.

Finally, CEHAJ has a long history with this project, over a decade, and will continue to invest significant time and resources to ensure the project remains in compliance with CEQA and NEPA and serves as a model for transportation projects in the 21st century. Allowing the additional time to review the RDEIR/SDEIS will further promote these goals. IP-1-1

Thank you in advance for your consideration. We kindly request that you respond to our extension request as soon as possible.

Sincerely the below members of CEHAJ,

Ramya Sivasubramanian, Natural Resources Defense Council

Adrian Martinez, Earthjustice

Susanne Browne, Legal Aid Foundation of Los Angeles

Jaimini Parekh, Communities for a Better Environment

Sylvia Betancourt, Long Beach Alliance for Children with Asthma

Nidia Erceg, Coalition for Clean Air

T-310) 434-2300

IP-1-1

Please refer to Section 1.2 of this appendix regarding the extension of the public comment period.

Comment/Question:
On Aug 30, 2012 I had submitted comments regarding the proposed 710 widening project. I have never heard back. I just found that the Recirculated draft Environmental Impact Report was released. Again we received no notice. On review of Section 7 page 7-33 you have my contact information incorrectly noted from my letter sent as a public comment on Aug 30,2012. Someone entered the following wrong information:

BRAVO	should be as noted in letter	BAVCO
20435 S Pasadena Rd	should be as noted in letter	20435 S Susana Rd

IP-2-1

Please correct accordingly. We are a property apparently due for relocation and want to know of any upcoming meetings and events.

Thank you

*You received this message because Jim Purzycki submitted feedback regarding the I-710 Corridor Project.

This page intentionally left blank

IP-3-1

As discussed in Section 3.12.2 of the RDEIR/SDEIS, an Initial Site Assessment (ISA) was prepared for the project to determine whether construction of the build alternatives would be affected by any recorded or visible hazardous waste problems within the I-710 Corridor Project ISA Study area. The ISA included a search of government records to obtain a listing of properties or known incidents from State, Federal, or local regulatory databases for hazardous waste sites within the ISA Study Area, review of reasonably ascertainable historical information sources (aerial photographs, fire insurance maps, oil and gas maps, and topographic maps), and a site survey of the proposed right-of-way for the build alternatives to identify readily visible contamination.

Environmental Data Resources, Inc. (EDR) was subcontracted to conduct a search limited to within a one-mile radius (i.e., ASTM International [ASTM] standard) of the I-710 Corridor Project for facilities listed by regulatory agencies as potentially having environmental concerns. Additional readily accessible agency online databases were reviewed, including the California Department of Resources Recycling and Recovery (CalRecycle); Solid Waste Information System (SWIS); the California Department of Toxic Substance Control (DTSC) ENVIROSTOR database; and the State Water Resources Control Board's (SWRCB) GeoTracker database. The sites listed in Tables 3.12.1, 3.12.2, and 3.12.3 are sites identified as potentially posing potential environmental concerns. The Exide Technologies, Inc. (Exide) battery recycling facility at 2700 S Indiana St., Vernon, CA 90058 (closed since 2015) is not listed in these tables because the facility was not within nor adjacent to any of the properties that would be potentially acquired for the build alternatives. The DTSC is responsible for overseeing the cleanup of properties affected by contamination from the Exide facility. The most recent map of the cleanup area is posted on the DTSC website (https://dtsc.maps.arcgis.com/apps/webappviewer/index.html?id=d8a6b586685f46f793e39759c71be3ef; accessed January 3, 2023) and shows the status of the site assessment and cleanup of properties within the Preliminary Investigation Area for the Exide facility adjacent to I-710. None of these properties would be fully or partially acquired for the Preferred Alternative (Alternative 1 No Build).

As discussed in Section 3.12.3 of the RDEIR/SDEIS, there is potential for hazardous materials, including lead, to exist within the Study Area and be disturbed by construction on parcels fully or partially acquired or with temporary construction easements under the build alternatives. Should a build alternative be selected as the Preferred Alternative, any contamination encountered during construction and excavation activities would be properly handled, removed, remediated, and/or disposed of according to all applicable regulations. If one of the build alternatives is identified for implementation, each property of environmental concern to be acquired would require testing in order to characterize specific soil and/or groundwater contaminants on the property, and a site-specific hazardous waste remediation plan would be developed for the appropriate removal and disposal of materials. In addition, a remediation plan and site closure plan, if required, would be

implemented to clean up the site and provide for any subsequent monitoring to ensure the contamination has been remediated below regulatory thresholds. However, Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), has identified Alternative 1 (No Build) as the Preferred Alternative. Therefore, there will be no removal or disposal of materials. Please refer to Section 1.1 of this appendix for further discussion on the identification of the Preferred Alternative.

Public Counsel

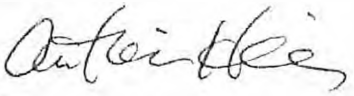
Re: Recirculated Draft Environmental Impact Report/Supplemental Draft Environmental Impact Statement Prepared for the I-710 Corridor Project

Dear Mr. Kosinski:

On behalf of The Salvation Army, Public Counsel respectfully requests a 30-day extension of the public comment period for the Recirculated Draft Environmental Impact Report/Supplemental Draft Environmental Impact Statement ("RDEIR/SDEIS") prepared for the I-710 Corridor Project (the "Project"). The Salvation Army owns parcel number 6332002036 in the City of Bell, and operates the Bell Shelter ("Bell Shelter" or the "Shelter"), which provides housing and other services to homeless individuals, on this parcel of land. The I-710 Corridor Project is likely have a substantial impact on The Salvation Army's property and client housing areas.

Public Counsel is the nation's largest pro bono public interest law firm, and has built a 40-year track record of fighting for the rights of low-income individuals, families, and nonprofit organizations. Public Counsel's Community Development Project maintains a specific focus on combatting Southern California's housing crisis by advancing affordable housing and inclusive, equitable development. We have dedicated significant time and resources to reviewing the RDEIR/SDEIS since its release on July 21, 2017. The RDEIR/SDEIS, together with its appendices, is over 2,600 pages long and highly technical in nature. Due to the unusual length and complexity of the document, additional time is necessary for our staff to adequately understand, assess, and submit informed comments on the Project. IP-5-1

In light of the staggering 23% surge in Los Angeles County's homeless population between 2016 and 2017, it is crucial that the public is given a meaningful opportunity to review the Project's potential impacts on population, housing, and community. The Bell Shelter has provided a critical service in the Los Angeles area for nearly 30 years, offering a home to thousands of homeless individuals in our community and enabling these individuals to achieve greater stability in their lives. Over the course of the last three decades, the Shelter has developed an effective service structure and valuable relationships with local partners, including government



agencies and nonprofit organizations. Any kind of displacement would have a detrimental impact on these support systems, which have enabled the Salvation Army's exceptional record of success.

IP-5-1

Public Counsel appreciates the California Department of Transportation's commitment to improving quality of life for the Los Angeles community. Extending the deadline for public comments on the RDEIR/SDEIS from September 22, 2017 to October 20, 2017 will allow us to contribute to this same purpose.

Thank you for your time and attention.

Sincerely,

Antonio Hicks, Senior Staff Attorney
Public Counsel's Community Development Project

IP-5-1

Please refer to Section 1.2 of this appendix regarding the extension of the public comment period.

Comment/Question:
Please no more lane widening. Itâ€™s proven to have marginal effects (if any) on traffic and is undoubtedly the least sustainable method of mitigating traffic, this incredibly short term bandaid, brings far more destruction than any sort of touted solution. Even DOT admits the failures of lane widening. IP-6-1

Consolidate cargo at the port so that it can travel unfettered by rail through Alameda Corridor. There is a tremendous opportunity to maximize the efficiency of land use by consolidating & reselling / redeveloping current BNSF / UP ROW. IP-6-2

IP-6-1

The current design of the I-710 freeway is unable to handle current and forecast future traffic flows that are exacerbated by the mix of autos and heavy-duty trucks entering and exiting the freeway at multiple locations up and down the 19-mile corridor. The current geometrics of the freeway contribute to operational problems such as weave conditions that sap the existing capacity of the existing through lanes on the freeway. During the development of the build alternatives, traffic operational analyses (using the Transportation Research Board's *Highway Capacity Manual* [HCM] [2010 or most current version procedures) was conducted on various conceptual designs in order to test, evaluate, and optimize the performance of various concepts, including separate lanes for trucks, auxiliary lanes, through lanes, braided on- and off-ramps, and re-positioning of freeway-to-freeway connectors. This work was reviewed at numerous phases in the design development process by Caltrans, the Federal Highway Administration (FHWA), and members of the I-710 Technical Advisory Committee, which was comprised of public works directors and city engineers of the local jurisdictions that line the I-710 Corridor. The design concept and scope for Alternative 5C represents a comprehensive reconfiguration of the I-710 Corridor, which focuses on making geometric improvements that would improve the operations of the I-710 freeway, such as auxiliary lanes, truck bypass lanes, redesign of local interchanges and freeway-to-freeway interchanges to address the spacing and sequencing of on- and off- ramps, and collector-distributor roadways to separate traffic entering and exiting the freeway from through traffic. Additional through lanes are only proposed for certain segments of the freeway in combination with the proposed geometric, operational and safety design improvements in order to optimize the performance of the overall freeway, given right-of-way constraints and the need to minimize impacts to nearby residents and businesses. The results of the traffic operational analysis for the build alternatives, along with the operational performance of the future No Build Alternative, was summarized in Section 3.5 of the RDEIR/SDEIS and presented in detail in the *I-710 Corridor Project Traffic Operations Analysis Report* (March 2017). This analysis indicates that the build alternatives would eliminate nearly all of the congestion bottlenecks on the I-710 freeway.

There are constraints that limit the ability of the overall rail system to handle more freight beyond a 40 percent share in the future. While there is a clear desire to increase the percentage of on-dock rail, there is not enough physical space within the marine terminals to load and build trains to meet projected demand without further physical expansion of the Ports. The San Pedro Bay Ports have recently undertaken additional rail studies to examine ways to further maximize efficiencies of terminal operations to boost train operations to the greatest extent feasible, with their goal of achieving 30–35 percent of total container volume being handled on-dock by 2035, consistent with the 2017 update to the Clean Air Action Plan.

IP-6-2

Please refer to Section 1.9 in this appendix for more information regarding the Alameda Corridor and how it relates to traffic on I-710. Caltrans and Metro do not have jurisdiction over land uses within the Ports (Ports of Los Angeles [POLA] and Long Beach [POLB]) or over redevelopment using BNSF or UP Railroad rights-of-way.

Re: I-710 Corridor Project
07-LA-710-PM 5.4/24.5

Dear Deputy District Director:

The proposed I-710 project will not improve traffic flow or eliminate congestion.

The project is designed to fail.

The CalTrans design builds in bottlenecks creating unsafe merging and causing congestion. IP-7-1

The CalTrans solution of adding lanes and widening freeways simply widens the footprint of the congestion.

Freeway lanes, the I-710 included, peak capacity is approximately 1,800 vehicles per lane per hour. When congestion occurs, when traffic flow breaks down, the number of vehicles past any fixed point reduces to 400-600 per hour. Add a fifth through lane to a 4 lane freeway and you increase traffic flow 400-600 vehicles per hour. IP-7-2 Add an auxiliary lane to a 4 lane freeway so traffic flow remains constant and peak capacity is maintained, and you triple traffic flow up to 6,400 vehicles per hour, 10x what adding a through lane will do.

The millions of dollars CalTrans proposes spending on the I-710 will cost the most and accomplish the least. CalTrans should spend less to accomplish more. The only significant widening, to add auxiliary lanes, IP-7-3 are bridges over the flood control channels and the bridge at the railroad yard.

For a project years in the making and years to completion, CalTrans still gets it wrong.

"Provide a safe, sustainable, integrated and efficient transportation system to enhance California's economy and livability." is printed at the bottom of your letter.

I propose that be changed: "70 years of building freeways and we still don't have a clue."

Very truly yours,

THOMAS KEISER

TK/t

IP-7-1

I-710 is part of a highly congested metropolitan roadway network and is located within the Los Angeles urbanized area, which is essentially built out. The proposed improvements included in the build alternatives, while not eliminating congestion, would improve speeds and reduce travel times on I-710, which in turn would attract more traffic to the facility relative to the No Build Alternative.

The proposed redesign of the I-710 freeway under the build alternatives would improve the geometric configuration of the freeway in order to eliminate many of the existing merge, diverge, and weave conditions that currently create congestion bottlenecks on I-710. However, Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), has identified Alternative 1 (No Build) as the Preferred Alternative. Therefore, the reduction in congestion as a result of the build alternatives will not be realized. Please refer to Section 1.1 of this appendix for further discussion on the identification of the Preferred Alternative.

IP-7-2

As discussed in detail in Chapter 1.0, Proposed Project, of the RDEIR/SDEIS, the current design of the I-710 freeway is outdated and unable to handle current and forecasted future traffic flows that are exacerbated by the mix of autos and heavy-duty trucks entering and exiting the freeway at multiple locations up and down the 19-mile corridor. The existing geometrics of the freeway contribute to operational problems such as weave conditions that sap the existing capacity of the existing through lanes on the freeway. During the development of the build alternatives, a detailed traffic operational analysis – using Highway Capacity Manual (HCM) procedures – was conducted on various conceptual designs in order to test, evaluate, and optimize the performance of various options and proposals, including separate lanes for trucks, auxiliary lanes, through lanes, braided on- and off-ramps, and re-positioning of freeway-to- freeway connectors. This work was reviewed at numerous stages in the design development process by Caltrans, FHWA, and members of the I-710 Technical Advisory Committee, which was comprised of public works directors and city engineers of the local jurisdictions that line the I-710 Corridor. The design concept and scope for the build alternatives represent a comprehensive reconfiguration of the I-710 Corridor, which focuses on making geometric improvements that would improve the operations of the I-710 freeway, such as: auxiliary lanes; truck by-pass lanes; redesign of local interchanges and freeway-to-freeway interchanges that would address the spacing and sequencing of on- and off-ramps; and collector-distributor roadways to separate traffic entering and exiting the freeway from through traffic. Through lanes are only proposed for certain segments of the freeway in combination with the proposed geometric, operational and safety design improvements in order to optimize the performance of the overall freeway given right-of-way constraints and the need to minimize impacts to nearby residents and businesses. The detailed results of the traffic

operational analysis for the build alternatives, along with the operational performance of the future No Build Alternative, is presented in the *I-710 Corridor Project Traffic Operations Analysis Report* (March 2017) and summarized in Section 3.5 of the RDEIR/SDEIS and this Final EIR/EIS.

IP-7-3

The key objective of the improvements included in the build alternatives are to improve safety and operations for the full length of the 19-mile I-710 Corridor. Please refer to Response to Comment IP-7-2 regarding the need for the build alternatives.

Subject: I-710 Corridor Project Feedback

From: Nelson Flores
Organization:
Phone: 8319157202
Mailing Address: 4423 AMBROSE AVE, 9
City, State: LOS ANGELES
Zip: 90027
Comment/Question:
Please do not widen the I-710. Widening freeways have little impact in reducing congestion on roads. The most recent widening, the I-405, has done nothing to relieve traffic and it has wasted billions of dollars. Consider creating a toll road or getting more shipments on trains that do not even go in traffic. IP-8-1

*You received this message because Nelson Flores submitted feedback regarding the I-710 Corridor Project.

System Administrator

This page intentionally left blank

IP-8-1

An option that included the tolling of trucks using the freight corridor in Alternative 7 was analyzed as part of the refinement of build alternatives early in the development of the RDEIR/SDEIS. The findings indicated that assessing a toll on trucks using the freight corridor would shift two-thirds of the truck volume out of the freight corridor and back onto the general-purpose lanes on I-710. The tolling concept was therefore removed from further consideration.

According to cargo forecasts provided by the San Pedro Bay Ports for the I-710 technical studies, the future horizon year forecast for cargo volume at the two Ports is projected to be nearly 41.4 million twenty-foot equivalents (TEUs) by 2035, compared to 14.1 million in 2012. Maximum goods movement by rail is an underlying assumption of all the alternatives analyzed in the RDEIR/SDEIS and this Final EIR/EIS.

By 2035, it is estimated that 40 percent of Port container traffic will be carried by rail, either on-dock (30.5 percent) where trains are loaded and formed within the marine terminals, or at near dock/off-dock rail facilities (9.5 percent) where containers are carried by truck to rail facilities near the Ports or within the Los Angeles region. This compares with approximately 26 percent carried by on-dock rail in 2012. While the percentage increase in on-dock rail seems small, due to the large forecast increase in total container volumes handled by the Ports, the on-dock rail container volume itself is forecast to increase over threefold.

With regard to future demand for cargo containers to be transported to and from the Ports by rail, the *Final Technical Memorandum – I-710 Railroad Goods Movement Study* (February 2009) found that although the rail operators have implemented a variety of operational strategies to meet container demand from the Ports, including using longer trains with higher utilization rates, the freight railroad system alone will not be able to handle the total container demand.

There are constraints that limit the ability of the overall rail system to handle more freight beyond a 40 percent share in the future. While there is a clear desire to increase the percentage of on-dock rail, there is not enough physical space within the marine terminals to load and build trains to meet projected demand without further physical expansion of the Ports. The San Pedro Bay Ports have recently undertaken additional rail studies to examine ways to further maximize efficiencies of terminal operations to boost train operations to the greatest extent feasible, with their goal of achieving 30–35 percent of total container volume being handled on-dock.

Comment/Question:
NOTE TO DECISION MAKERS.

This project is unnecessary as the Alameda Corridor currently operates at 25% capacity. The Alameda Corridor was constructed for the purpose of moving freight from the Ports of LA & LB and it is simply not being used.

Instead of expanding the I-710, a policy should be passed that ensures companies use the Alameda Corridor. Scrap this project and pass an Alameda Corridor usage policy.

By the Alameda Corridor Transportation Authority's own admission, they are barely meeting their debt service because the Alameda Corridor is not being used. The I-710 expansion would be a waste of taxpayer money as taxpayers already funded the underutilized Alameda Corridor. IP-9-1

Comment/Question:
As a resident to the proposed plan, I am very concern the health risk associated with the construction of these developments. I also like to know if "eminent domain" is something I need to be concern about. Would I have the option to sell my property to these developers and become compensated for all other relocation coast, inconvenience, physical/handicap hardships. In addition, I called months ago and left a message on the number that you all provided with questions and nobody returned my calls. Also be mindful of the many families with young infants, children living with asthmatic conditions due to the pollution generated by the port of Long Beach, the trucks, traffic on the freeway. Please respond to my inquires as soon as possible. thank you and have a bless day!

IP-10-1

As discussed in Section 1.2.2 in Chapter 1.0, Proposed Project, of the RDEIR/SDEIS, one of the purposes of the project is to improve air quality and public health. As discussed in Section 3.13, Air Quality, and in Chapter 4.0, CEQA Evaluation, in the RDEIR/SDEIS, all build alternatives would generally improve air quality and reduce public health risk. Along I-710, air quality would be improved and public health risk would be reduced at most locations, but there would be a few near-roadway locations where there would be an increase in certain emissions but no increase in cancer risk compared to the 2012 Baseline.

When compared to the 2035 No Build Alternative, both build alternatives would reduce cancer risk at most locations; however, a small increase in cancer risk would occur at some locations within 100 meters of I-710. For Alternative 5C, the maximum increase in risk would be approximately three in one million. The primary location of the increased risk for Alternative 5C would occur along a small portion of I-710 just south of SR-60. For Alternative 7, the increase in risk would be less than one in one million.

Should a build alternative be selected as the Preferred Alternative, Measures AQ-2 and AQ-3 would be implemented to reduce emissions at near-roadway locations. Measure AQ-2 would require filters on the ventilation systems of schools near I-710. Measure AQ-3 would provide for the installation of solid barriers where soundwalls are not proposed and the installation of vegetation to disperse pollution and reduce pollutant concentrations downwind. In addition, the build alternatives include programmatic components to help improve air quality and public health in the I-710 Corridor. The I-710 Corridor Community Health Benefit Program is a programmatic component of the build alternatives and would take the form of a grant program structured to provide corridor communities the opportunity to implement projects or outreach activities that would improve air quality and public health related to I-710 travel and goods movement. However, Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), has identified Alternative 1 (No Build) as the Preferred Alternative. Therefore, this programmatic element will not be implemented by Caltrans as the lead agency under CEQA and NEPA and as the owner/operator of the I-710 freeway. Please refer to Section 1.1 of this appendix for further discussion on the identification of the Preferred Alternative.

IP-10-2

The commenter’s concern regarding displacement of people as a result of the build alternatives is acknowledged and included in the project record. However, as stated in Response to Comment IP-10-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, no displacements will occur.

IP-10-3

Please refer to Response to Comment IP-10-1. Sensitive populations and receptors were taken into account in the air quality and environmental justice analyses prepared for the project. For more detailed information, please refer to Section 3.13, Air Quality, and Section 3.3.3, Environmental Justice, of this Final EIR/EIS.

VIA REGULAR MAIL

Mr. Ronald Kosinski
Deputy District Director, California Department of Transportation
District 7, Division of Environmental Planning
100 South Main Street, Mail Stop 16A, Los Angeles, CA 90012

Re: Comments on the I-710 Corridor Project Revised Environmental Impact Report/Environmental Impact Statement

Dear Mr. Kosinski:

California Resources Long Beach, Inc. ("CRC"), as successor in interest to Oxy Long Beach, Inc., would like to thank Caltrans and its partner agency the Los Angeles County Metropolitan Transportation Authority ("Metro") for working with CRC to revise the proposed I-710 Corridor Project (the "Project") to reduce some impacts to CRC.

While we appreciate the Project team's commitments to work with CRC, the Revised EIR/EIS – is inadequate under the California Environmental Quality Act ("CEQA") and the National Environmental Policy Act ("NEPA") and continues to impose unreasonable and unacceptable impacts to CRC as outlined below.

Our detailed comments analyzing the deficiencies of the Revised EIR/EIS are set forth in Attachment A.

Accordingly, we believe that the Revised EIR/EIS must be revised and recirculated. CRC looks forward to reviewing the next version, and to working with Caltrans, Metro, and the Project consultant team on the revised Project design that will avoid impacts to CRC's operations. IP-11-1

Very truly yours,

Adam Smith
Vice President, Regulatory Affairs

Attachment A

THE REVISED EIR/EIS DOES NOT ADEQUATELY ADDRESS THE PROJECT'S ENVIRONMENTAL IMPACTS THAT WILL ADVERSELY AFFECT CRC'S OPERATIONS AND ASSETS

CRC's primary concerns regarding the Project are the significant environmental impacts that will have severe consequences for its oil operations and assets located near the existing I-710 freeway in Long Beach. CRC operates several oil extraction facilities in the Project Area. One of these facilities is located along a thin strip of land located between the Los Angeles River to the east and the existing I-710 freeway to the west, known as the "Pico Property." CRC leases this site from the Los Angeles County Flood Control District ("LACFCD"). CRC's operations at this site stretch from around Ocean Boulevard to Anaheim Street, and its facilities include active and inactive oil wells, pumps, storage tanks, oil pipelines, and other equipment and structures. Operation and maintenance of CRC's facilities at the Pico Property, as well as ongoing construction and expansion of these facilities, requires access along the entire property for workers and heavy trucks and machinery, and frequently involves the use of drilling rigs and associated equipment temporarily placed along various points on the site. CRC, through its subsidiary Tidelands Oil Production Company, operates a second site in the area owned by the Long Beach Gas and Oil Department, commonly referred to as the "Standard Lease," that will also be impacted by the proposed Project. This site is located just north of Anaheim Street and contains a number of active and inactive wells and other structures.

CRC's operations in Long Beach are an important part of California's energy infrastructure, deliver crucial benefits to the local community, and provide high-paying jobs for many area residents. Caltrans must take all necessary measures to ensure that the I-710 Corridor Project will avoid any impacts to CRC's operations to the maximum extent feasible. Although Caltrans states that the Project build alternatives will have serious environmental impacts that will drastically limit CRC's ability to continue its operations, the Revised EIR/EIS fails to sufficiently identify those impacts or provide crucial information about how those impacts will be mitigated. IP-11-2

The Revised EIR/EIS provides insufficient information about the proposed site(s) where CRC's facilities would be relocated, provides insufficient information about how such a relocation would be accomplished, provides no information on the total cost to relocate and thereby improperly defers any analysis of the resulting environmental impacts. The extraction and transportation of CRC's oil assets is a complex operation that requires specific site conditions. Relocating CRC's facilities is not a simple matter of providing a patchwork of properties that together might add up to the amount of land affected by the Project build alternatives. The potential relocation of CRC's facilities requires careful study to ensure that operational capacity and access is maintained to ensure CRC may continue to safely operate its facilities. Given the potential cost of this relocation, Caltrans should take all feasible measures to avoid any impacts to CRC's facilities. IP-11-3

Moving CRC's operations to a new location could also have environmental impacts, which should have been studied in the Revised EIR/EIS, since they would be a direct result of the Project. CRC's current facilities are located on sites that have operated as oil fields for more than fifty IP-11-4

years, and CRC has secured and maintained all necessary permits and approvals to continue its operations at these locations. Moving CRC's operations to a new site could potentially result in different traffic impacts, land use impacts, noise impacts, and numerous other altered environmental effects, as compared to CRC's operations in its current location, that must be evaluated. Relocating CRC's existing facilities could potentially require the modification or addition of permits or governmental approvals, which is not addressed in the Revised EIR/EIS. The Revised EIR/EIS likewise fails to include any analysis of environmental construction impacts associated with relocation of CRC's facilities to a new location, which would require dozens of construction trucks and large drilling rigs to drill new wells and ensure that the wells on CRC's existing site are safely plugged and abandoned. For any relocation that will impact CRC's facilities on the Pico Property or the Long Beach Gas and Oil property required by the Project, all necessary environmental analysis and permitting must be included as part of the I-710 Corridor Project itself. IP-11-4

In total, CRC has determined that any relocation would cost in excess of $60,000,000 and the Project proponents have done an insufficient job to date mitigating the environmental and financial impacts the Project will have on CRC's assets. As a result, the Revised EIR/EIS must be revised and recirculated. IP-11-5

This page intentionally left blank

IP-11-1

Caltrans and Metro thank the commenter for providing their input. However, Caltrans and Metro both respectfully disagree that the RDEIR/SDEIS is deficient and requires revision and recirculation. In accordance with the requirements of CEQA and NEPA, the RDEIR/SDEIS sufficiently describes and discloses the potential environmental effects of the proposed action, and proposes measures to address the effects of the build alternatives. Although Caltrans makes every effort to avoid, minimize, and/or mitigate environmental impacts resulting from build alternatives, in many cases the relocation of homes, business, and/or facilities is unavoidable, particularly in a dense and highly urbanized corridor.

IP-11-2

As discussed in Section 3.4.2.2 of the RDEIR/SDEIS, several strategies have been considered for utilities impacted as a result of the build alternatives. These strategies include (1) protection in place, (2) continuous aboveground relocation, and (3) continuous underground relocation. The relocation strategy for the facilities located on the “Standard Lease” property was developed in coordination with Long Beach Gas & Oil’s Oil Operations Manager. However, Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), has identified Alternative 1 (No Build) as the Preferred Alternative. Therefore, there will be no impacts to utilities. Please refer to Section 1.1 of this appendix for further discussion on the identification of the Preferred Alternative.

IP-11-3

The South End Utility Study identifies the proposed disposition and relocation strategy for the “Tidelands” facility on the “Standard Lease” property. The study identifies the proposed location and estimated relocation costs for impacts related to the build alternatives. The corresponding right-of-way impacts under the build alternatives were identified in the RDEIR/SDEIS. A site feasibility study was conducted in cooperation with Long Beach Gas & Oil’s Oil Operations Manager.

In addition, as stated in Section 3.4.3, should a build alternative be selected as the Preferred Alternative, utilities impacted as a result of the build alternatives would be relocated in accordance with specific Utility Relocation Plans described in Measure U&ES-2. However, as stated in Response to Comment IP-4-2, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there will be no impact to the “Tidelands” facility on the “Standard Lease” property.

IP-11-4

As stated in Section 3.4.3 of this Final EIR/EIS, should a build alternative be selected as the Preferred Alternative, utilities impacted as a result of the build alternatives would be relocated in accordance with specific Utility Relocation Plans described in Measure U&ES-2. As stated in Measure U&ES-2, the Specific Utility Relocation Plans would also include other applicable mitigation measures described in the RDEIR/SDEIS, for impacts related to cultural resources, visual resources, hazardous wastes, water quality, and traffic and transportation as a result of the build alternatives.

A preliminary evaluation designed to assess the feasibility of relocation of the subsurface facilities was undertaken in October 2013 and supports the conclusions in the South End Utility Study. That evaluation focused on the abandonment of some existing wells and drilling of new wells from the new surface location. The feasibility of the drilling process included an anti-collision analysis that utilized a conic uncertainty analysis. The preliminary evaluation concluded it would be feasible to re-drill the existing wells from the proposed surface location and recommended that a gyroscopic survey of the existing wells be conducted, should a build alternative be selected as the Preferred Alternative, in order to address any areas of concern wherein the proposed well paths would intersect the uncertainty radius. In addition, production rates at the proposed relocated Standard Lease facility would be expected to maintain the rates of the existing facility. Should a build alternative be selected as the Preferred Alternative, drilling and completion of the proposed production wells would be done prior to shutting in the existing wells, therefore maintaining the net production rates. In addition, it is important to note that a net increase in production could be possible with the proposed wells, since new completion methods have been developed that could enhance production. In addition, at a minimum, new surface facilities would be designed for the current production and injection rates of the existing Standard Lease facility. The facilities would be constructed prior to drilling the proposed wells so as to not impact the timing when new production wells would be brought online. However, as stated in Response to Comment IP-4-2, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there will be no impact to utilities.

IP-11-5

Please refer to Response to Comment IP-11-2 regarding the relocation of utilities. Mitigating any potential environmental and financial impacts to California Resources Corporation’s (CRC) facilities during the Project Approval and Environmental Documentation (PA&ED) phase would be premature and any mitigation would be implemented prior to construction should a build alternative be selected as the Preferred Alternative. However, as stated in Response to Comment IP-4-2, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there will be no financial impact to CRC facilities. Please refer to Response to Comment IP-11-1 regarding recirculation of the environmental document.

9/10/17

MR. RONALD KOSINSKI RK
CALTRANS DISTRICT 7, DIVISION OF ENVIRONMENTAL PLANNING
100 SOUTH MAIN STREET, MS 16A
LOS ANGELES, CA 90012

DEAR MR. KOSINSKI,

THANK YOU FOR ALL YOUR EFFORTS AND DETAILED WORK ON THE RDEIR/SDEIS FOR THE I-710 FREEWAY. I PROPOSE THAT

METRO RAIL CONSIDERS BUILDING A RAIL LINE TO LINK THE GREEN LINE TO THE GOLD LINE. ADDITIONALLY, WHAT IF A HYBRID ALTERNATIVE WAS TO BE CONSIDERED BETWEEN ALTERNATIVE 1+5C OR 1+7? IP-12-1

TWO MAJOR RAMPS (NORTHBOUND) THAT NEED IMMEDIATE RENOVATIONS ARE I-710-IMPERIAL HIGHWAY + FLORENCE AVE; SOUTHBOUND) = FLORENCE AVENUE. IP-12-2

AGAIN, THANK YOU TO YOU + YOUR STAFF FOR ALL YOUR WORK! IP-12-3

SINCERELY,
GILMA LOPEZ

This page intentionally left blank

IP-12-1

Caltrans welcomes your comment for Metro to consider building a rail line to link the Green Line to the Gold Line. Metro is considering rail alignment options for a new rail corridor in southeast Los Angeles County that would make this connection. The Eco-Rapid Transit Project, also called the West Santa Ana Branch Transit Corridor, is currently in the environmental study stage. Information on this project may be found on Metro's website at the following URL: https://www.metro.net/projects/west-santa-ana/.

IP-12-2

The commenter's request for consideration of a hybrid alternative is acknowledged and noted in the public record. As shown in Chapter 2.0, Project Alternatives, including Section 2.5 (Alternatives Considered but Eliminated from Further Discussion) of the RDEIR/SDEIS, a reasonable range of alternatives has been evaluated over the life of the project. Factors used in determining the reasonable range of alternatives for further evaluation in the RDEIR/SDEIS included whether or not the alternatives (1) failed to meet the most basic project objectives, (2) were infeasible (per State CEQA Guidelines Section 15126.6(f)(1), or (3) were unable to avoid significant environmental impacts. The range of build alternatives was developed based on input from agencies, organizations, and the general public. A discussion of the alternatives that were considered but eliminated from further discussion for the reasons listed above were included in Section 2.5 (Alternatives Considered but Eliminated from Further Discussion) of the RDEIR/SDEIS. Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), has identified Alternative 1 (No Build) as the Preferred Alternative. Please refer to Section 1.1 of this appendix for more information regarding the identification of the Preferred Alternative.

IP-12-3

Metro and Caltrans thank the commenter for this feedback regarding the Imperial Hwy. and Florence Ave. ramps to the northbound I-710 and the Florence Ave. to southbound I-710 ramp. This feedback has been included in the project record. Under the Preferred Alternative (Alternative 1 No Build), the Imperial Hwy. and Florence Ave. interchanges with I-710 will not be improved.

Comment/Question:
Good evening, thank you for allowing us to have a platform where we can write about our concerns and our opinions. I have 2 questions/concerns regarding the 710 corridor.

1. We were told that the whole project was going to be in the billions, my concern has to do with how the money is obtained. What is the plan for raising the money and who would be the most affected by it? IP-13-1

2. My second concern has to do with how the money might be spent. We were informed that the project would move forward as the money comes in. As you know, there are schools along the corridors planed location. My question is, how are you planing on spending the money? My suggestion is to spend it first on keeping our children safe and secure. Why not spend the money first in the schools and in keeping our community healthy. Our children should always come first because if the project has a difficult time raising all the money, at least we know our children will be in a healthier environment than the one they have now. IP-13-2

IP-13-1

Please refer to Section 1.3.2 of this appendix for more information regarding transportation funding in general and potential funding sources for the I-710 Corridor Project. However, Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), has identified Alternative 1 (No Build) as the Preferred Alternative. Therefore, funding of the project is unnecessary. Please refer to Section 1.1 of this appendix for further discussion on the identification of the Preferred Alternative.

IP-13-2

Please refer to Section 1.3.3 of this appendix for more information regarding the applicability of transportation funding to other types of improvements. In addition, the Community Health Benefit Program is a programmatic component of the build alternatives that intend to make funding available for projects and outreach activities that improve air quality and public health related to I-710 travel and goods movement. However, since a build alternative has not been selected as the Preferred Alternative, this programmatic element will not be implemented by Caltrans as the lead agency under CEQA and NEPA and as the owner/operator of the I-710 freeway.

Subject: I-710 Corridor Project Feedback

From: Brian Yanity
Organization: Californians for Electric Rail
Phone: 714 519 5979
Mailing Address: 229 East Commonwealth Ave., #254 City, State: Fullerton
Zip: 92832
Comment/Question:
To whom it may concern:

I would like to express my support for Alternative 7 described in the I-710 Corridor Project RDEIR/SDEIS, with the Clean-Emission Freight Corridor. However, I would prefer the Option 7ZE, which would mandate that all trucks on the Clean-Emission Freight Corridor be zero-emissions. IP-14-1

I am pleased to see that the I-710 Corridor Project RDEIR/SDEIS discusses rail alternatives for moving freight to and from the Ports of Los Angeles and Long Beach (pages 1-38 & I-39). However, there is not enough discussion of increasing rail system capacity to meet the regionâ€™s freight movement needs, and thus reduce the amount of truck traffic on I-170. The 2009 I-710 Railroad Goods Movement Study needs to be updated as part of the I-710 Corridor Project RDEIR/SDEIS, with a goal of studying ways of aggressively shifting more freight from truck to rail. One train with double-stacked container cars can carry the equivalent of hundreds of trucks. IP-14-2

The July 2017 San Pedro Bay Ports Clean Air Action Plan update calls for expanding the use of on-dock rail by investing in improvements to the port-wide rail network, with the long-term goal of moving 50% of all cargo leaving the ports by rail, and for the continued exploration of short-haul rail. The Los Angeles region has long been a world leader in reducing emissions from port operations and transportation, and should continue this legacy by leading the way zero-emissions freight transport.

Freight rail electrification would build upon, and add value to, the large investments that the ports are making on rail infrastructure and clean technology. Used successfully all over the world for over a century, all-electric freight railroads have many advantages, and are the only proven method of zero emissions, heavy freight transport. While the up-front capital costs may be substantial, all-electric freight rail would pay for itself with significant reductions in emissions and transport energy costs.

The Alameda Corridor and the Pacific Harbor Line system around the ports could serve as a pioneering example of freight rail electrification. The Alameda Corridor is within the I-710 Study Area, and is a publically-owned rail line. It is in the public interest to reduce air pollution electrifying the trains running through populated areas. This freight rail corridor was built with enough vertical clearance for an overhead catenary wire over a double-container stacked train, along with other features designed in anticipation of future electric rail infrastructure.

Electrification of the proposed short-haul rail service between the ports and the Inland Empire, currently under study, is an opportunity for using electric locomotives though the Alameda Corridor and reducing truck traffic on the 710. All-electric locomotives dedicated to the short-haul service could go back and forth along less than 100 miles electrified track between San Pedro Bay and the Inland Empire, while conventional non-electric line-haul freight trains could continue use the same tracks.

Thank you for this opportunity to provide comment on the I-710 Corridor Project.

Best Regards,

Brian Yanity
Californians for Electric Rail
Electrical Engineer
Fullerton, CA

IP-14-1

Caltrans and Metro thank the commenter for their input. The commenter's support of Alternative 7, Option 7-ZE, is acknowledged and included in the project record. Please refer to Section 1.1 of this appendix for a discussion on the identification of the Preferred Alternative (Alternative 1 No Build).

IP-14-2

Generally, the purpose of the *I-710 Railroad Goods Movement Study* (2009) was to assess rail and intermodal facility capacity constraints, which could cause a diversion from rail to truck transport within the Los Angeles Basin, given an increase in San Pedro Bay Ports traffic. The study took into account the Alameda Corridor and other rail subdivisions in the area, as well as various railroad intermodal facilities (both existing and planned). The analysis concluded that it is difficult to say with certainty that operational strategies would be enough to meet growing demand, and freight railroads are nearing their efficient capacity in the Basin. It is important to note that the study explored current and future cargo trends and the ability of current and planned infrastructure to accommodate that cargo, rather than studying ways to divert more cargo to rail. Caltrans and Metro do not have the authority to mandate use of the Alameda Corridor or other rail and rail-related facilities. Please refer to Section 1.9 of this appendix for more information regarding the Alameda Corridor and how it relates to traffic on I-710.

Additionally, thank you for providing your perspective on electrification of freight rail. This subject is beyond the scope of the I-710 Corridor Project. With respect to electrification of freight rail, we refer you to the following publicly available study, which examined the benefits and costs of electrification in the SCAG region: *SCAG Comprehensive Regional Goods Movement Plan and Implementation Strategy – Task 8.3 Analysis of Freight Rail Electrification in the SCAG Region. Cambridge Systematics, Inc.; April 2012*.

Subject: I-710 Corridor Project Feedback

From: Anna Erneholm
Organization: Coastal San Pedro Neighborhood Council
Phone: 310-918-8650
Mailing Address: 1840 S Gaffey Street, Box 34 City, State: San Pedro
Zip: 90731
Comment/Question:

1. In recognition that commercial interests benefit most significantly from the I 710 freight corridor, we request that you consider that the Project should be funded primarily through the commercial interests which benefit most directly such as through container and shipping fees. The I 710 Freeway in the Project area largely serves commercial freight transport to and from the Ports of Los Angeles and Long Beach, experiences great degradation from the high volume of commercial heavy-duty vehicle traffic, and must be built to accommodate the freight related commercial traffic. The public cannot reasonably be expected to pay the significant portion for goods transport, especially in consideration of the significant costs to public health already borne by the people living and working in proximity of the Project area. IP-15-1

2. Implement the Alternative 7 with Option 7ZE to include only Zero Emission technology and exclude Near Zero Emission technology for the following three reasons: IP-15-2

a. The required zero emission technologies are most likely to be reasonably feasible and implementable before project completion. Several public and private agencies are invested intensely in implementing zero emission technologies, as demonstrated by the Cities of Long Beach and Los Angeles. Further the Gateway Cities COG and Metro concluded in the year 2013 "I-710 Project Zero-Emission Truck Commercialization Study" that zero-emission capable drayage trucks can be developed, demonstrated, validated, and moved into production by a 2025 target timeline, within seven years of the Project's planned Final EIR. IP-15-3

b. The Option 7ZE, with significant improvements in freight transport, related technologies, and emission reductions resulting in great economic and public health benefits, will drive monumental economies of scale that will improve Southern California transportation systems and motivate other industries towards advancing technologies, such as may become implemented in the San Pedro Bay Clean Air Action Plan only if Option 7ZE is realized. IP-15-4

c. The technologies and methods implemented will require significant economic investment certain to greatly influence short and long term budget planning and to substantially enhance our quality of life for generations. A shorter-term investment in near zero emission technology will reduce the perceived benefits and return from a longer term and more significant investment in zero emission technology. Indeed, Port of Los Angeles tenants such as China Shipping refused to invest in newly available advanced emission reduction equipment because of recent expenditures on inferior, but previously available emission reduction equipment. Simply establishing the Zero Emission standard rather than a mix of Near Zero will provide stability in long term financial decision making and short term budgetary considerations. IP-15-5

*You received this message because Anna Erneholm submitted feedback regarding the I-710 Corridor Project.

Regards,
System Administrator

This page intentionally left blank

IP-15-1

Please refer to Section 1.3 of this appendix for more information regarding transportation funding in general and potential funding sources for the I-710 Corridor Project build alternatives. However, Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), has identified Alternative 1 (No Build) as the Preferred Alternative. Therefore, funding of the project is unnecessary. Please refer to Section 1.1 of this appendix for further discussion on the identification of the Preferred Alternative.

IP-15-2

The commenter's support of Alternative 7, Option 7-ZE, is acknowledged and included in the project record. Please refer to Section 1.1 of this appendix for a discussion on the identification of the Preferred Alternative (Alternative 1 No Build).

IP-15-3

It is important to note that the implementation of NZE trucks was included as a programmatic element of both build alternatives. Although a build alternative has not been identified as the Preferred Alternative, the Metro Board of Directors issued Board Motion 5.1, which altered the Zero Emission/Near Zero Emission Truck Technology Deployment Program to the phased-in "Zero Emission Truck Technology Development Program." This program is now known as the I-710 Clean Truck Program. Included in the motion was a provision to increase the program-funding target from $100 million to $200 million and include in the Program incentives and grants investment in the acceleration of zero emission technology both for trucks and for infrastructure. The purpose of the phased in program is to deploy near zero emissions trucks in the early phases to bring immediate air quality benefits to the I-710 Corridor and at the same time continue to sponsor the development of zero emissions trucks. The ultimate goal is to achieve zero emissions under the program. However, since a build alternative has not been selected as the Preferred Alternative, this programmatic element will not be implemented by Caltrans as the lead agency under CEQA and NEPA and as the owner/operator of the I-710 freeway. Please also refer to Section 1.3 of this appendix for more information regarding zero emissions only technology within the context of the I-710 Corridor Project.

IP-15-4

While numerous studies have been conducted as well as several pilot projects, the commercial availability of zero emissions truck technologies for Class 8 heavy, heavy duty trucks at levels sufficient to meet the operational parameters (e.g., range, multiple shift operation, payload weight capacity) for trucks using I-710 is an important milestone that has yet to be fully achieved and would depend on both public and private advancements to achieve market penetration and the economic returns to scale necessary for financial feasibility for the I-710 program. For example,

CARB's Advanced Clean Truck Regulation (2020), which requires truck manufacturers to sell zero-emission trucks as an increasing percentage of their annual California sales from 2024 to 2035, is anticipated to move the market in this direction. Both Metro and Caltrans are working closely with the two Ports to coordinate efforts on the San Pedro Bay Clean Air Action Plan and the I-710 Clean Truck Program (referred to in the RDEIR/SDEIS as the I-710 Corridor Project Zero Emission/Near Zero Emission Truck Technology Deployment Program). However, since a build alternative has not been selected as the Preferred Alternative, this programmatic element will not be implemented by Caltrans as the lead agency under CEQA and NEPA and as the owner/operator of the I-710 freeway. Please also refer to Response to Comment IP-15-3 regarding the implementation of NZE trucks.

IP-15-5

In order to be effective, the I-710 Clean Truck Program (referred to in the RDEIR/SDEIS as the I-710 Corridor Project Zero Emission/Near Zero Emission Truck Technology Deployment Program) needs to be able to accommodate multiple and diverse truck travel markets. Nearly half of the heavy-duty trucks that travel on I-710 are not Port trucks. Most are operated by individual, owner-operators as opposed to large fleets operated by truck companies. As a consequence, the I-710 Truck Deployment Program is technology neutral as long as the emissions standards for eligibility under the program are met, in order to keep barriers to program entry low and to provide the flexibility necessary to serve a wide variety of heavy-duty trucks. The Phased-In Zero-Emission Truck Technology Deployment Program is structured to be implemented in phases as vehicles turn over to near-zero emissions and zero emissions. However, since a build alternative has not been selected as the Preferred Alternative, this programmatic element will not be implemented by Caltrans as the lead agency under CEQA and NEPA and as the owner/operator of the I-710 freeway. Please also refer to Response to Comment IP-15-3 regarding implementation of NZE trucks.

VIA EMAIL AND OVERNIGHT DELIVERY

Ronald Kosinski RK GAD
Deputy District Director
Caltrans District 7, Division of Environmental Planning
100 South Main Street, MS 16A
Los Angeles, CA 90012

Re: Pier B On-Dock Rail Support Facility Project

To Whom It May Concern:

I'm Daryl Phillips, owner of Phillips Steel, located at 1358 W. Anaheim Street, Long Beach, CA 90813. Phillips currently employs about 100 people in its Long Beach locations, virtually all of whom appear to be headed for unemployment if you implement either Alternative 5C or Alternative 7. While the upcoming unemployed may be able to locate other employment in other cities, your proposals appear to be punishing both local businesses and private citizens for what is likely a very small impact to the environment, and a directed attempt to enhance only particular special interests. IP-17-1

First, the environmental impact: increasing the freeway size from 4 to 6 lanes each way? Somehow, you have determined that allowing 50% greater traffic capacity will cut emissions by 50%? (Capacity will actually be increased more than 50% once your "Platoon" model is implemented.) *Zero emissions trucks* - more than 90% of our electricity comes from coal, nat gas and other CO2 emitting sources. The "clean" vehicles themselves use lead acid batteries, or more exotic batteries from lithium and other materials mined with child and other unjust labor practices. (See http://www.dailymail.co.uk/news/article-4764208/Child-miners-aged-four-living-hell-Earth.html for a recent discussion on child labor mining of Cobalt in the Congo.) Have you baked the social justice issues into your revised EIR, along with the massive drain on our energy grid and infrastructure? IP-17-2 IP-17-3

Special Interests - we have reviewed your stated goals, and attempted to reconcile these relative to the actual proposed action.

> Your goals - reduce pollution for the homeless, local residents and general public; ease traffic issues; increase volume and efficiency of transportation; increase overall safety; and upgrade existing/aged infrastructure. IP-17-4

Your solution - increase traffic flow by >/=50%; increase energy demand from coal and natural gas power plants (the single largest emitters of CO2 in this country); "platoon" trucks together to insure greater density of truck travel; altogether accommodate increased "population throughput" into and out of the city by 40%; expand the freeway footing by taking residents' property.

IP-17-4

Clearly, some of your stated goals are achievable by implementing any number of ideas, including those floated in the I-710 materials and "vetted" in your revised EIR. At the same time, it is clearly possible to eliminate one's cancer by burning the body. This is not an unintentional correlation. The problems facing our city and the Port are insidious, and spreading. However, we don't believe the proposed solutions result in the long term fix representative of the capabilities of our city leaders. In addition, it is difficult, if not impossible to determine the precise impact your proposals will have on individual property owners, residents, and others with the materials before us.

Who benefits from the current proposals? It appears that the largest beneficiary is EV technology. Maybe that is Volvo for electric trucks, Tesla for vehicles and the power companies supplying power to the charging stations. Yes, they all have great business plans and are in vogue with their "green" acceptance for now. At the same time, the burdens for these companies fall almost squarely on the backs of Long Beach residents.

IP-17-5

Suggestions: 1) Stay within the existing footprint of the I-710 and current on/off ramps with any improvements. 2) Research maglev types of transportation, or other somewhat exotic but highly feasible types of mass transit/transport systems. 3) Investigate short terms fixes for CO2 and particulate emissions such as afterburners, filters, restricted access to older diesel technology, etc. 4) Invest in police, fire, safety, and other measures to turn our crime and safety stats in the opposite direction. 5) Take a long term approach to the infrastructure issues: monorail, train, maglev, nuclear, etc. 6) Be specific as to what, who, why, and how LB citizens are to be affected by the proposed changes. To date, it is still unclear.

IP-17-6

Respectfully,

Daryl Phillips, President
Phillips Steel Company

IP-17-1

It is the policy of Caltrans in the administration of its relocation assistance program that displaced businesses and residents are “made whole” and that displaced persons shall not suffer unnecessarily as a result of programs designed to benefit the public as a whole. Businesses displaced as a result of the build alternatives may be eligible for relocation advisory services and payments. In addition, it is important to note that the analyses of employee relocations that would occur as a result of the build alternatives outlined in Section 3.3.2.4 of this Final EIR/EIS are worst-case scenarios that assume no businesses would be relocated within their original jurisdictions. However, Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), has identified Alternative 1 (No Build) as the Preferred Alternative. Therefore, there will be no displacements. Please refer to Section 1.1 of this appendix for further discussion on the identification of the Preferred Alternative.

Caltrans and Metro both respectfully disagree with the commenter’s assertion that the project intends to “enhance only particular special interests.” The goals and purposes of the project are outlined in detail in Section 1.2, Need and Purpose, of this Final EIR/EIS.

IP-17-2

The advanced technologies that would be applied to allow platooning of vehicles was proposed for the freight corridor, included in the design of Alternative 7, and evaluated in the RDEIR/SDEIS. Alternative 5C would not include platooning or a dedicated freight corridor, and would not include as much new roadway capacity when compared to Alternative 7. Alternative 5C would include added through lanes in some segments of I-710 as well as geometric operational improvements such as auxiliary lanes and extended acceleration and deceleration lanes that would improve roadway capacity on I-710. These improvements would eliminate congestion bottlenecks, improve speeds, and reduce the amount of idling vehicles on I-710, which in turn would be beneficial to air quality. However, many of the air quality benefits of the build alternatives would be attributable to the proposed I-710 Clean Truck Program, which would be an integral component of the build alternatives, should a build alternative be selected as the Preferred Alternative. These cleaner trucks would help reduce tailpipe emissions along I-710, primarily nitrogen oxides and diesel particulate matter from heavy-duty trucks. However, as stated in Response to Comment IP-17-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there will be no improvements made to I-710.

IP-17-3

The specific type of technology that would be utilized as part of the I-710 Clean Truck Program has not yet been determined. Please refer to Section 2.3.2.1 of this Final EIR/EIS for more information regarding this program. Therefore, an analysis of battery type and associated supply chain issues would be highly speculative and far beyond the scope of this EIR/EIS. In addition, it

is important to note that since a build alternative has not been selected as the Preferred Alternative, this programmatic element will not be implemented by Caltrans as the lead agency under CEQA and NEPA and as the owner/operator of the I-710 freeway.

It is also important to note that when consulted previously, Southern California Edison has confirmed that the current and planned local electrical distribution systems and power supplies would be sufficient to accommodate the energy demands, should some type of overhead catenary, ground-level power supply, or other electrical power transmission systems be used. Should battery-powered trucks be used that would require charging facilities, it is also anticipated that current and planned local electrical distribution systems and supply would be sufficient. If the I-710 Clean Truck Program were to be implemented as a part of a separate process in the future, wherein one or more ZE/NZE technologies would be selected for implementation, coordination with Southern California Edison and other utilities would occur to ensure that the selected technology or technologies are sufficiently supported by the proper energy source and infrastructure.

IP-17-4

The commenter's summary of the "stated goals" of the project is generally accurate. Specifically, and as was stated in Section 1.2 of the RDEIR/SDEIS, the purpose of the project is to: improve air quality and public health, improve traffic safety, modernize the freeway design, accommodate projected traffic volumes, and address increased traffic volumes resulting from projected growth in population, employment, and economic activities related to goods movement.

The statement that indicates that with the build alternatives, traffic flow would increase by at least 50 percent is not accurate. Please refer to Table 4-2 in the *I-710 Corridor Project Traffic Operations Analysis Report* (Traffic Operations Analysis) (March 2017) for detailed information on average daily traffic volumes for the proposed project. Comparing Figures 5-1 to 5-2 in the Traffic Operations Analysis (2017) illustrates how traffic flows and operations in the a.m., mid-day, and p.m. peak hours would be improved on the I-710 Corridor with the build alternatives, relative to future No Build conditions. In addition, the statement that energy demand from coal and natural gas power plants would be increased is also not consistent with the conclusions of the RDEIR/SDEIS. Specifically, Section 3.15, Energy, of the Final EIR/EIS, indicates that operational direct energy consumption would decrease when compared to both 2012 existing conditions and the 2035 No Build Alternative. Indirect energy consumption would increase, but the majority of that energy would be expended for construction of the build alternatives and therefore be temporary. ZE/NZE trucks traveling in "platoons" via an automated vehicle control system would only be applicable to the freight-only corridor proposed under Alternative 7, which has not been identified as the Preferred Alternative. It is not known what the commenter means by "population throughput." Finally, modernization of the existing I-710 would unfortunately require the displacement of some adjacent residents and businesses to provide standard lane and shoulder widths, adequate sight distance, and appropriate curve radii for the build alternatives.

However, as stated in Response to Comment IP-17-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, no displacements are required.

IP-17-5

As is stated in the RDEIR/SDEIS and Final EIR/EIS, and discussed in Response to Comment IP-17-3 above, the specific technology employed by the ZE/NZE trucks proposed under both build alternatives had not yet been determined at the time the RDEIR/SDEIS was circulated for public review. The improved air quality that would occur with use of the ZE/NZE vehicles within the I-710 Corridor would rightfully benefit the nearby communities and businesses that reside adjacent to the freeway. It is unclear what the commenter means by "the burdens for these companies fall almost squarely on the backs of Long Beach residents." It is acknowledged that nearly half of the I-710 Corridor Project falls within the City of Long Beach jurisdiction and, therefore, environmental impacts that occur as a result of the build alternatives would affect residents of the City. However, appropriate avoidance, minimization, and/or mitigation measures have been proposed to address these various impacts under the build alternatives.

IP-17-6

Metro and Caltrans thank the commenter for providing these suggestions. Based in part on community feedback, the No Build Alternative has been selected as the Preferred Alternative.

Alternatives 6A, 6B, and 6C, evaluated in the 2012 Draft EIR/EIS, evaluated expansion of I-710 with the addition of four separated freight-movement lanes, the design of which assumed possible future conversion (or initial construction, as feasible) of a fixed-guideway family of alternative container transport technologies, including Maglev. However, after circulation of the 2012 Draft EIR/EIS, new information regarding travel demand and truck travel patterns within the I-710 Corridor (among other things, including input from the public and affected agencies) necessitated the withdrawal of that set of alternatives. The dispersed nature of truck traffic, including the high level of transloaded traffic within the I-710 Corridor, makes fixed-guideway infrastructure generally not ideal to address travel demand within the I-710 Corridor. Also, please refer to Section 1.9 of this appendix for more information about the Alameda Corridor and how it interfaces with traffic on I-710.

Several different elements of both the project description of the build alternatives and proposed avoidance, minimization, and/or mitigation measures intend to address air quality, including particulate matter and greenhouse gases. These include the ZE/NZE trucks that would be funded by the build alternatives, filtration systems that would be installed in schools and other sensitive receptors, and solid barrier and vegetation intended to trap particulate matter, as measures to address air quality impacts as a result of the build alternatives. Restricting access to older diesel technology is not within the jurisdiction of Caltrans or Metro.

The safety improvements outlined in the project goals are intended to address traffic safety on the I-710 and adjacent roadways, rather than general crime.

During development of the I-710 Corridor Project build alternatives, an analysis was undertaken to address what was “reasonably foreseeable” in terms of accommodating Port cargo growth in the context of existing and planned infrastructure. This analysis can be found in the *I-710 Railroad Goods Movement Study* (2009). In addition, general analyses performed in support of the RDEIR/SDEIS were projected out to a horizon year of 2035 in order to adequately plan for future conditions.

Detailed information on the impacts of the proposed build alternatives was discussed in depth within the RDEIR/SDEIS and Final EIR/EIS. The commenter does not specify what specifically was unclear within the analyses. Where it was applicable, impacts were separated by city (for example, Table 3.3-12 within the RDEIR/SDEIS presented the number of relocations for each Alternative/Design Option by city).

LOS ANGELES, CA; WEDNESDAY, OCTOBER 18, 2017;

6:45 P.M.

-OOO-

THE COURT: Thank you. Well, good evening, everyone. My name is Ernesto Chavez. I'm with L.A. Metro. First and foremost, I want to thank you for coming out here today to learn more about this very important project, the I-710 project. Especially, I would like to thank our Board of Director Solis for inviting us tonight to give us an opportunity to listen to the community so I can provide your input. This is a very important project for Metro, for Caltrans and for all the other agencies that are supporting the project.

(Speaking in Spanish.)

MS. SOLIS: (In Spanish).

Thank you for all coming here this evening. I want to thank all of you for coming here tonight. I know that you could have many things to do, but this evening is special for us. We are delighted to be here in partnership with Metro, and I want to thank Ernesto.

(Speaking in Spanish.)

MS. SOLIS: And I also want to thank his staff, (unintelligible), and I also want to thank my staff. I want to thank Waqas, who's here. Some of you have met him. Javier, Joseph, Mary (in Spanish), and my staff please raise their hand. (In Spanish).

(Inaudible due to applause.)

MS. SOLIS: Javier's in the back. I see him. I also want to thank the advisory committee, the local advisory committee. We have Yolanda, Eddie, Tony, Carla, Martha, (unintelligible). We have other people that are here tonight.

(Speaking in Spanish.)

MS. SOLIS: Just briefly in English, if I could, I just want to say how happy I am to be here this evening, and I want to thank, first of all, Humphreys Elementary School for opening up their auditorium to us tonight.

Because of that --

(Inaudible due to applause.)

MS. SOLIS: Because it's not often that we get to have a forum this late in the evening here in East L.A., but I want to make very clear to you that one of my concerns is that we hear all voices of the people that are going to be impacted by a plan that has been in process for many, many years, and I have just been elected to represent this area in the last three years as a county board of supervisor, but I'm no stranger to East L.A.

I started representing this area back in 1994 as a state senator and as your congress woman and also representing the entire country as the cabinet member (in Spanish), serving with President Obama, and a lot of what I was involved in was helping to create jobs, trying to make sure that we always had a community at hand, but, now, in my capacity, I have to focus in on the jurisdiction, the people that I represent.

And I represent two million people. Just think about that, two million people. East L.A. is one -- a community. It's the size of maybe 125,000 people, but not all -- everyone is impacted by this project that we're going to be talking about tonight, the 710 South Freeway; right?

But we have many communities that I represent in the southeast like South Gate, Cudahy, Bell Gardens and the southern part of the Eastern part of Los

Angeles County, including the people that work in the ports, the People that drive the trucks, the people that live in our community and work in that industry but also make their livelihood by coming back and forth on the freeway, carrying the goods and services.

So how do we make sure that we represent all of those voices and we do it in a way that it is just, that is balanced. That to me is very important, and I'm glad that we're having this forum.

I don't get to attend all the meetings at night at every part of my district, but I wanted to make this very clear to you that we made a special example of extending the timeframe to allow for public comment because public comment by law has already been somewhat cut off, but because of my office and my efforts and my staff, we have worked very hard to say -- we wanted to extend that opportunity to you.

That's why we have an official legal individual who's going to be writing everything down, a kind of court reporter so to speak that will take down whatever's being said that will be part of the process. That report that will be given to Caltrans and to Metro. We will be able to have all that recorded.

That hasn't happened really previously so I have to tell you this is a first, and we want to make

sure that people understand that, but it isn't always often that we get to have things like that, but people understand this is something that we critically care about, and we do want to hear your voices, the people who live here, not people who come from outside that don't represent the area but people who are impacted that understand and hopefully give us an insight, and that's what I hope to gather from you this evening.

There's no doubt that this area has been impacted by traffic, by congestion, air pollution, by contaminants. We know that. Some of you here in the room have been helping us fight against Exide. Some of you have been helping us fight against air pollution, asthma and the fact that we also want to be in a place where we are safe and where people want to come and live here.

How do we do that? How do we work together and make that possible so that we can have a better life moving ahead? This is the first time, I think, in many, many years that we're in a different place now. The voters of Los Angeles voted last year to pass Measure M. How many of you voted for Measure M?

That was the transportation project that created funding, resources to help expand what we're going to talk about tonight and where we are going to go

in the future, but tonight we're talking about the freeway. We're talking about 710 South and what that means for the livelihood and for the environment and for people who have to live and work here.

But I want to also mention to you as my role not just as the county board of supervisor but also on the metro board. We passed because the voters said, yes, we want to invest in transportation. We want to make sure that we're not spending all our time on freeways. We want to make sure that we're reducing the pollutants, the smog, that people don't have to spend two hours in their car or driving in a truck from the port to Los Angeles and making sure that youngsters can get on bikes, ride bikes and have safety and protection for everyone and hopefully create new systems like new rail projects that will bring investment to our community, not just displacement because I know people are concerned about that but to make it fair so we understand each other and what that means.

Progress sometimes can be painful. I know that, but I also know we work together and we hear each other, and we can negotiate and talk. That's what this is about. That's why I believe we're here tonight, and I want to thank you all for coming here. I want to thank the advisory committee for being a part of this, our 710

project advisory committee. I want to thank Caltrans because Caltrans didn't have to do this.

Sometimes people don't always understand government entities like the state like Caltrans. Sometimes they are mistaken, and some of the times they have every right -- people have every right to say (in Spanish). I don't understand what's happening.

So what we're trying to do hopefully moving forward is allowing for people to understand and talk to each other not at each other but with each other, and that to me is very, very important. I have always been about making sure that we fight for environmental justice, that we fight for our communities to make sure that they're given equal treatment under the law because that's guaranteed through the constitution, but it depends on who's a part of making those decisions, and the decision has to be made by all of us, by our community, and that is very important for me and for all of us moving forward.

Tonight, I'm going to hear some good information, and if you leave today and you're still not clear on what it is that is being proposed, then you want to make sure that you let me know that, and you let us know because then I'm not doing my job adequately if you're not understanding that. There has to be an

opportunity to make sure it is broken down at a level you can fully understand and be able to express your opinions or your agreement or disagreement, but at this point it's about showing you what choices and opportunity you have. That's what this is about.

Nobody has decided. Hilda Solis hasn't decided one way or another what's going to happen. It's going to be based on collectively the people that live in the impacted area. That's what's most important in my mind, and I know we have some very expert people, professional individuals and people who care about what happens out here because I'm saying that that's why we are here.

So I want to leave you with that so you understand that the reason why we're here is not just because I said for them to come here, but there's also a commitment to work with my community, our community. Okay? So I want to make that really clear.

So please give everyone a round of applause who's come here this evening to make it possible for us, and I want to turn it now back to our M.C., and then I want to thank you.

This is an ongoing process.

(Speaking in Spanish.)

MR. CHAVEZ: Thank you very much supervisor for your support. What we're going to do now is I'm going to do an overview, a presentation that's a high level review. We have -- it's a very complex project as you can imagine. We have a lot of detailed information at the boards that you see in the -- on our wall. That's where we want to really get into the details of the project, but what I want to do here is give you a big picture of what the project is about and then allow enough time for us to do the comment, public comment, and then, of course, even more time to answer your detailed questions at the boards.

The I-710 project has some very important goals, and these are not very common goals in highway projects. Normally, in highway projects we only focus on improving the highway, but this project is special in the sense that our first goal is improve air quality and public health. It's been that way for the past ten years since the planning basis of the project, since the beginning because it was recognized through an extensive community participation process, through hearing the community in events like this that air quality was a major concern, perhaps even more than congestion itself, even though we deal with the congestion on a daily basis.

We, of course, want to improve traffic

safety. This freeway was built back in the 50's and 60's with some designs that would not be approved today, but nevertheless it's what we have. We know there's going to be growth, not just in the ports but also population and employment, that our region, Southern California, continues to grow and our traffic continues to grow as well.

I want to bring it down to this community. What are the goals of the project specifically here that we can see? What are the alternatives? Well, definitely air quality, reducing air pollutants through what we have at the clean emission truck program which I want to get to in a little more detail, improve traffic safety on the local streets and the arterial streets through another funding program that we have available that we will have available for the county, increase mobility to and from East L.A., provide air quality monitoring and other benefits through (unintelligible) program, which I'm going to explain in a little more detail, transit improvements overall and the bicycle and pedestrian facilities to provide those connections that perhaps today are either not there or they're not good enough in some cases.

The study area for the project is very big. As you can see, it basically goes from Long Beach where

the freeway starts all the way to the 60 Freeway over here, 19 miles of corridor, but it's really extended, the issue -- the congestion. There's a lot of congestion up and down the corridor. North of the 60, things change a little bit, but we -- this is our study area.

We -- as some of you know, this is not the first environmental document that we have produced, and we have put up for public comment. We had one in 2012, 2012, and we studied very similar alternatives than the ones I'm going to describe here, but we had up to 3,000 comments, believe it or not, in the 2012 environmental document.

There's a lot of very important comments that we felt we needed to address. We essentially revised or retooled the alternatives to address those comments, and that's why we have 5-C and 7 alternatives now generally to better address the traffic patterns in the corridor, to try to avoid -- reducing impacts to critical infrastructure like the L.A. River, for example, which has been such an important issue for southeast L.A., minimize property impacts to hommes, businesses and community facilities. Sorry. It's easier to talk this way.

We've updated our air quality analysis. We felt that we needed to develop these air quality --

sorry -- this zero emission truck program, and we had to update our air quality analysis to reflect that. We also incorporated a number of programmatic features. Programmatic just means that it's not a physical project. It's not a project that you build a program of funds that go towards purchasing, for example, air filtration systems for schools, and I'll explain that in a little bit more detail.

So the alternatives we have today are three. The first one is really doing nothing, which is something that we used to compare what would happen if we do something versus doing nothing and what the benefits or disbenefits (sic) are of the alternatives we do build.

We have Alternative 5C, which as you can see there, is approximately a 6.5 billion dollar alternative, that's billion with a "b." It's a modernization of the freeway. It would add capacity to the 710, and it would also modernize, I would say, the 710, to bring it up to today's standards and safety standards.

Alternative 7, it's different. We're not adding capacity to the freeway itself, but we're instead adding a, quote, four lanes, four additional lanes for trucks so that we can separate the cars from the trucks completely, and this freight corridor that we call it

would essentially be a freeway for trucks, and it would be only for clean emission trucks.

And these trucks would be the result of the zero emission truck program that I'm going to discuss in a little bit more detail in a second. That same program, although the Alternative 7 is labeled clean emissions, Alternative 5-C would also have the same program, and it could in that sense be labeled clean emissions because the program did apply to either one.

Just to give you a visual of what Alternative 5C looks like, what you see in green is the additional lane up and down the corridor, and what you see in blue are the interchanges up and down the corridor that improve -- every single interchange is being improved by the project, and those red lines that you see there at the bottom part of the map where the 405 and 710 intersect, those are truck bypass lanes that would help separate cars from the trucks as well just through that section.

And Alternative 7, as I've mentioned, we don't have green because we don't have another general purpose lane, another lane for the freeway, but we do have this red line that is essentially a parallel freeway for trucks, again, two lanes in each direction for trucks, for clean emission trucks that would take

truckers that want to go from Long Beach all the way up to either the 91 or up to the Commerce area and ability to go separate from the freeway in their own lanes, and that would help reduce, of course, the amount of accidents with trucks, just overall separate them. And, again, the alternative systems, the 6.5 billion, and this one is the ten billion dollar alternative.

Other elements of the alternatives, we have, as I've mentioned before, a zero emission or near zero emissions, clean emissions truck program. This would be a program that would be funded with agencies like AQMD, Air Quality Management District, or the California Air Resources Board.

These agencies provide funding for demonstrations but also turnover of truck fleets so we could provide incentives, money to help incentivize somebody to buy a cleaner truck instead of a regular diesel truck, and that would be made available with either one of these alternatives.

We also have a congestion relief program, and this is where metro could provide fundings with the county and to cities to do improvements at the local level, at the local streets, improving intersections, improving -- yeah, the interactions of the freeway and the intersections close to the freeway that would be

affected by traffic of course.

Transit improvements is something that Metro is looking at overall, restructuring or reconfiguring the entire metro system. We have some very good suggestions for our transit planning group on how to improve transit through all these study areas that we would be making that recommendation as part of this project.

We have bicycle and pedestrian facilities in connection with new ones, and I'll show you a picture of that that were actually introduced through Supervisor Solis's motion at our board, and I'll talk about that in a second.

We also have -- I want to make sure this is clear. There are some peak periods, what we call peak period parking restrictions. That's basically when you see -- on a major road you see a sign that says you can't park here between the hours of 6:00 and 9:00 and between the hours of 4:00 and 7:00 during the peak hour times primarily to provide another lane for people to travel and get more capacity to the road.

That's entirely a local decision so neither Metro nor Caltrans can really dictate that to the county in this case. So it's a recommendation that's in the -- evaluated in the -- for the project, but it's only that.

We have no power to implement that. The county's going to eventually have to decide, yes, we will do this; no, we will not do this, and there's no way anybody can really impose that, other than the county.

But it was introduced as a way to improve traffic flow specifically on Atlantic Boulevard, which of course sees a lot of traffic.

Community health and benefit program, this program would be, again, something that would be made available to implement projects and outreach activities to improve the air quality and public health. So these are grants to local jurisdictions.

School districts, for example, day care centers, community health providers. They can be used to purchase things, such as, filtration (unintelligible), filters, community health testing, partner upgrades for energy efficient and renewable energy projects.

These are just some examples, and we still have to flesh this out. It's not fully fleshed out. Between now and when we do the final E.I.R., we will have a lot more to -- for lack of a better way to say it, leave it alone on this one, but (unintelligible) Metro and Caltrans has made to include as part of the project.

We have both Alternatives 5-C and 7 actually provide for better traffic flow on the freeway

in the vicinity of East L.A. between the 60 Freeway and the 5 Freeway on the 710. That's better traffic flow compared to if we did nothing; right?

If you compare 5C and 7 to Alternative 1, which is doing nothing, we would have a lot better traffic flow, however, since we still see a lot of congestion even into the future in the area, we explored what we call a design option that would further reduce congestion in this segment, a little more than what we have with 5C and 7.

So these are what we call "design options." In our base, 5-C and 7, we can improve traffic flow without any property relocations being needed, however, for the design option to do that additional improvement, there are some relocations that would be required now.

Now, I just want to be very, very clear. Either of the base Alternatives 5C or 7 could move forward without selecting those design options. Furthermore, we are here today for input and if not -- input from the community, and if the design options are not supported, then there's no way that we would select that option if there's no local support for it. Absolutely no way, especially because we have a base alternative that does not have property impacts, and if we could select that and have to impacts. We would not

go with the design option that has impacts if there's no support for it. I just want to make that clear. This is a table showing the number of relocations that would be required for the design options.

3A and 3B relate to whether it's for Alternative 5C and Alternative 7. So you see 19 relocations on the residential side and 6 on the business side, and you see there's zero relocations required for our base alternatives, which, again, we would be compelled to select if there was no support for the design options from the local side.

Supervisor Solis back in 2015 introduced a motion at our metro board that actually included or added a lot of other elements, very important elements to the project.

For example, we added additional crossing over the freeway and in some cases over the river to the project. We also -- this zero emission -- full zero emission freight corridor was evaluated and included as part of that motion. It was a very important motion that allowed us to move forward to have the project's alternatives that we have right now.

This is perhaps the closest example to what that motion did in East L.A. because we added these alternatives -- or not alternatives. Sorry. This

feature of the project, which would be a new separated crossing for bikes and peds that would run parallel to the existing Humphreys Avenue bridge over the 710.

So this would allow people to cross the freeway in a safer manner because, now, they have a separate facility to do that and get from one side to another of the freeway. We have similar proposals up and down the corridor. This one just happens to be close to home here.

Just to wrap up my presentation, I want to give us a sense of where we are in the process and where we're going with this.

We started, believe it or not, back in 2008 with an E.I.R., E.I.S. for the project. We -- as I've mentioned before, we circulated a document back in 2012. We had a lot of comments from the community. We went back, and we revised the alternatives to in our minds improve those alternatives, minimize impacts, which is what we have today is a less impact for Alternatives 5C and 7.

We are going to close the comment period, the supervisor said, in a few days, and then we are going to come back to the communities with our recommendations on our preferred alternative.

It's a recommendation that we're going to

bring to all the communities. I failed to mention at the beginning we have very set up committees, advisory committees for the project. We have a graphic of that in one of the boards up there that we can explain, but we're going to get that recommendation, and we're going to hear the input from the communities on which alternative is preferrable, and then we're going to go to the M.T.A. board with that recommendation sometime probably in February or March of next year, 2018, is what we're hoping to do, and a final document would be prepared towards the end of next year.

Now, it may not be a surprise to you, but Metro -- nor Metro nor Caltrans has six billion or ten billion dollars to build the project. We just do not have that kind of money, even with the passage of Metro R, Measure M.

What we have for the project over the 30 year span of those measures, if you consider local, state and federal, funding is probably around $1 billion, $1.2 billion, which is obviously not enough to do the whole project.

So what we're going to have to do is figure out if it can be staged. If there are stages for the project, we can start doing so. We're going to start working on that. Once -- first, we need to figure out

what alternative to select just based on the purpose of the project, the funding, et cetera, and then, well, now that we've selected an alternative, what part can we build with the money we have?

Just to put it in context, I just want to give you a sense of, if we finish the E.I.R. as we expect by next year, we wouldn't be able to really start building anything anywhere in the corridor probably until 2023. That's just because, after this phase of the environmental process, we still have to go through final design, which takes a long time. It's a big complex project. So the earliest we could start really putting any kind of, as they say, shovels to the ground is 2023.

But, again, it's definitely not going to be the entire project because we don't have that funding. We simply just do not have it at this point in time. So we're going to have figure out staging, and we don't know at this point what that's going to be, but once we start coming up with ideas, we'll be back to the community to share those ideas with everyone.

(A pause in the proceedings.)

MR. CHAVEZ: This is just to reiterate the -- when and where you need to submit the comments. We have a way

to submit comments here today. We have a computer, also verbally through the testimony and, of course, online, and for more information, here are the websites that are available, and we will be here until we can -- until we're told to leave. We're here to answer your questions, of course, and, again, I highly emphasize we want to take your detailed questions at the boards because that will allow us the ability to show -- kind of point to the boards, and it's just much easier for us to answer that way.

And with that, I'm going to turn it over to Esmerelda.

(A pause in the proceedings.)

MS. GARCIA: If we can have the lights back up.

Thank you, Ernesto. So on your agenda, we have from 7:30 to 8:00 p.m. for comments and questions. I just want to review how we're going to manage that part of the agenda.

So we do have speaker cards. They were up front, and we can get you some more. They're at the front table.

Mark Sillings, if I can have you raise your hand. We'll be collecting them and have additional -- if you want to make a comment or ask questions, I have a

stack here all ready to go. I just want to go over a few ground rules and how we're going to be doing this.

We understand that there's quite a few people who would like to come to the mic and make comments. We have a court reporter who will be reporting your comments. We also have Andy Pendoley who will be jotting down questions and responses if you have any of those as well.

We want to be respectful of your time, and we want to make sure we get to all of the questions and comments so we want you to keep your comments at three minutes or less.

Rebecca Barrantes, please raise your hand. She will be our timekeeper so, if you're up here speaking, she will let you know when your few minutes are up. She'll be timing you; and, again, that's just to make sure we get to everyone. I know that we have quite a few people who want make a comment on the mic.

We also have members of the project team who are available to address any questions that might come up during the comment period. So they -- we will go to them to respond to those questions as they come up, and then at the end of the evening, the court reporter will submit all of the comments that are made at the mic to Caltrans as formal public comment.

As Ernesto stated, I want to just go back. We -- the end of the comment period is on October 23 so you have until then to make a comment just briefly. We want to go over how you can do that tonight.

If you don't want to speak in front of the group, you don't have to, but if you have a comment, you can go to the room just behind -- to my right, and there are copies of the environmental documents.

There are also computers where you can sit there and submit your question online, or you can write a comment in written form. We have sheets in the back. There's a box in that room where you need to drop off your comments and put it in that box. Caltrans will select the comments in the box tonight as part of the formal comments as well.

At the end of the comment period, we will go back to the open house so very similar to what you experienced as you walked in during the registration period. If you don't want to provide a written comment, the court reporter can also type your comments down. So if you want to give him your comments, he can also take that during the open house when we close the session.

So -- let's see. So with that, let's see. I think those are all the ground rules again. Just one last point. We want to get through everyone so -- again,

to be respectful of your time, but we also need to be out of the building so they can set up for school the next day. As you know, this is an elementary school so we'll be ending at 8:30, but we'll try to get through all the comments so we'll collect them here.

So with that, we will also -- there are also other members of an elected official's office so we have the field deputy for Congress woman Lucille Roybal-Allard, Cindy Munoz.

So with that, what I will do is call three people at a time. We don't necessarily need you to stand up the entire time. While you're waiting, just be ready to come to the podium to the mic, and we'll take your comments.

Again, Mark Sillings has blank speaker cards. If you want to come up to speak, just make sure you give that to him, and then Andy and Delia will be recording comments on the wall graphic.

So with that, our first set of speakers are Guadalupe Arellano, Clara Solis and Andy Padilla.

So Guadalupe Arellano.

MS. ARELLANO: I predicted I will be first; right? Here I am. My apologies.

So I'm just unclear. I think we're always going to be in a funnel effect. So given that the

IP-19-1

freeway north of us has halted and that's not going to go -- it doesn't matter how much we extend it right around this area because there will always be a funnel. Because it shuts down so congestion and air quality and the effect of it is always going to be an issue for people in this community. So that's 125,000 that Supervisor Solis referenced. IP-19-1

So the other issues that we have not addressed are the air quality that have taken place over time. So what are the trends that are happening?

We don't look at social, emotional issues that our students are affected by. We don't look at how this has been an issue over time. You look at our job rate and the men in our community and how they've been affected by all kinds of issues. IP-19-2

That sight, once you start digging up, it will overturn the dirt so we don't know how the air quality will affect us. We have private consultants that are digging, and Metro and Caltrans their result, what is the quality control for the research that's being done now? I think there's a lot of issues that would start to affect. IP-19-3

Current educational research shows that playtime is more critical right now. We don't have parks. We don't have trees. That has been cut down in IP-19-4

the 45 years that I've been in this community.

So how is this going to be (unintelligible) for us? They also won't be here in 23 years. My mom, my dogs have died of cancer and tumors. How do my dogs get cancer? I don't get it. So I don't think everybody is going to be able to live off filter systems.

A filter system is so limited. How do you -- I think the filter issue and the health quality options that are being provided show that there is ramifications to our health. You can't say we're going to offer project and fundings to support this. I mean, that's just telling us.

When he's talking about having air quality control for emissions and trucks, people don't all buy brand new trucks. They cannot afford it. Actually, the population is dropping. So if the population is dropping, how do we have so much more?

We have the 110 and the 605. We don't have any freeway that connects those three but the 5. We are all affected by the 5 Freeway. Regardless, unfortunately, I only care about this section because I live here. I will reside here. My mom's currently there. There are so many more issues that we have to tackle.

I'm talking about limited parking. That's

IP-19-4

IP-19-5

IP-19-6

IP-19-7

going to affect residents. You're going to create this in phases? So what if the funding doesn't come and we have another voter issue? How are you going to address that? So now we have a standstill of unfinished projects? IP-19-7

You know how long it took for the metro to be built, and in the meantime, we were all ticketed. We all had no parking. We were all covered with dust and silt. IP-19-8

I mean --

(Inaudible due to applause.)

MS. ARELLANO: You should give a one minute warning prior to the end.

Thank you.

(A pause in the proceedings.)

MS. GARCIA: Clara Solis, Andy Padilla followed by Pat Lara.

(A pause in the proceedings.)

MS. SILVERMAN: I am Clara Solis. I am a

(unintelligible) of Humphreys Elementary School. I saw Juan and Erica. Erica is a teacher here.

I have served on a 710 advisory committee, and our 2012 comments and through all our time, we've always said we don't want them to take any more homes or any more businesses in East Los Angeles.

East Los Angeles has four freeways running through it. We believe that this community has given enough. So we are opposed to -- I am opposed to Option 3, 3A and 3B. We've been organizing on Sydney, and I've talked to all the 24 residences. It's not 19. I've told them a number of times. There's ten apartments at 626 (unintelligible). That means there are 24 residences times 4.09. That's almost a hundred people that are going to be displaced by this project. IP-19-9

Every one of the residents we talked to represents -- have said they don't want to move. They don't want their homes taken. The people who live across the street and adjacent, they're concerned that the freeway is going to come closer.

They say right now they are happy. We took a vote at our Sydney neighborhood meeting. We asked everybody is anybody in favor of them taking their homes on Sydney? They said, no, we don't want our homes taken, and we should fight it.

The other thing that concerned me is the parking on the Atlantic. We talked to businesses in the past projects when they brought the same thing up. They wanted to take the park on Atlantic, and people said no. It's going to effect the residents who live behind the school. There's a kids' charter school. They're going to have trouble parking. The businesses won't get business, and they'll go down and (unintelligible) on Third Street. IP-19-10

(A pause in the proceedings.)

MS. SOLIS: So we are very concerned about this project and that there are bunch of errors in it. I mean, like the 19 houses, saying there's 19 residences, well, there's really 24. Like they did the study on moving people into other houses, and they put that East L.A. was the city of Los Angeles, and then the relocation houses were -- the majority of them were in two zip codes right next to Martin Luther King Hospital. IP-19-11

That isn't East L.A. You should look also at the neighborhoods along the corridor they looked at in -- within that neighborhood. Why is East L.A. always treated different than everywhere else? IP-19-12

Thank you.

(Inaudible due to applause.)

MS. GARCIA: (Unintelligible).

MR. PADILLA: Thank you very much. Thank you very much for inviting us to be here tonight. I personally am not happy at all with either one of those (unintelligible) that they have. I'm for zero actions on our street. IP-19-13

(Inaudible due to applause.)

MR. PADILLA: I live across the way from (unintelligible) where the houses are going to be knocked down. I've been living here for 55 years. My twin daughter and myself went to school here. My grandchildren went to school here. Now, my great grandchild is going to school here, and four them had asthma from the fumes coming out of the freeway. Okay?

Now, you're going to open up the freeway even more. Kids cannot play in the yard without all the fumes coming at them. Okay? I have said family members -- young lady had a dog that had cancer. I had four dogs I had to put down, and I didn't know why. Okay? Four dogs that I had to put down. I had to put them to sleep because it got so bad that even the doctors

couldn't understand.

So we (unintelligible). Another question I have is why is it that when we were trying to build a freeway going north, who has the power to stop that? Who was the one that actually fought for the people in the neighborhood and they didn't accomplish going that way?

But the poor community, minority community, let's go get them. They'll be given an extra few bucks for the house. They should be happy that they're getting (unintelligible). No. We're not happy. We're not happy one bit. IP-19-14

All my neighbors, not one neighbor is happy about having their home knocked down. They worked too hard, worked too long and too many hours to own something, and, now, you're going to come in, and you're going to give us all of this? That does nothing for us. It takes away business, and it takes away the fire department. It takes away all kinds of businesses that we depend on. Okay? Thank you. IP-19-15

I got one minute to say what I have to say. I got a whole lot. I'm going to say it, but I'm telling you right now, we are not going to support any kind of knocking down. (Unintelligible).

The last question that I have before they remove me is why is it that it's the minority community

that gets taken advantage of? Why is that I wonder? Try that at another neighborhood and see what happens. They're not going to put up with that, but we're --

(Inaudible due to applause.)

MR. PADILLA: And then we are moved from there without no say so. We are going to march. We are (unintelligible). I marched with Cesar Chavez. Okay? I'm proud of it because we accomplished a lot. Okay? This is not going to be Dodger Stadium all over again. Okay? This is not going to be Dodger Stadium again. Thank you for your time. Thank you for your time.

(A pause in the proceedings.)

MS. GARCIA: Pat Lara followed by Eddie Torres and Lourdes Caracoza.

MS. LARA: Hi. My name is Pat Lara, and I'm also against the project because of traffic congestion. I live on Eastern Avenue. If the project is approved, they're going to (unintelligible). Traffic is horrendous right now. It's horrible, traffic and noise and also pollution. So that's my concern. And, again, I'm against the project. IP-19-16

Thank you.

MS. GARCIA: Eddie Torres, Lourdes Caracoza and Yolanda Duarte.

(A pause in the proceedings.)

MS. GARCIA: Eddie Torres, Lourdes Caracoza and Yolanda Duarte.

MR. TORRES: I apologize to you because (unintelligible) to me, speaking from my heart, pushing the issue. It may be embarrassing to Caltrans. (Unintelligible). This is what I've got to say right now.

My name is Eddie Torres. I'm with the East L.A. Chamber of Commerce. I sit on the 710 local advisory committee.

Many of the members went on their own, purchased fliers, made fliers, passed them out (unintelligible). Myself represented the East L.A. Chamber of Commerce (unintelligible).

So I know my comments (unintelligible). I'm pleading. I'm begging you -- I live in (unintelligible). (Unintelligible). I'm constantly (unintelligible). I know people coughing up. (Unintelligible).

So don't -- don't speak up today for me, not for you. Speak up for your kids. If you don't want

to go up, a comment card -- speak up like I'm speaking, fill up a card that you can leave here, but please, if you need one, I'll bring one up to you. Come out to the back. We'll help you fill them out, but I'm asking you please make a comment, even if it's something that someone else said (unintelligible).

If you want to say because it's going to create more pollution, create more traffic. It's going take businesses away from us. If it's going to take parking away from us, anything you want to say, it's going to be recorded.

So don't worry about that because I hear a lot of times people say, oh, they already said that. No. Repeat it. The more you repeat it, the more you drive it home.

I'm going to repeat things, but I can't repeat (unintelligible). My name is Eddie Torres and (unintelligible).

MS. CARACOZA: Hi. I'm Lourdes Caracoza. I was born and raised here in East Los Angeles. Because I've been living here all my life, I know that, when there's these large projects, by the time they get to our part of town, the money runs out.

So when you talk about -- or they presented about stages, that just sent my alert off the charts

IP-19-17

because that just told me that by the time you get to my neighborhood, our neighborhood, there's not going to be funding, and then we're going to be back here being asked to compromise and to accept another version of this. IP-19-17

And that's scary because we all have family members that have been affected by the air pollution, family members that are no longer here, and we still have family members that are here and that are still being affected by the pollution.

And we're not seeing the benefits of what's being done to help with that. We're still dealing with Exide. That's going to be a ten year process if we're lucky, and I agree that's going to create other pollutants that aren't being studied in this study, and they're not being acknowledged as possibilities as well.

So it looks pretty -- and ideally it would be very nice, but because I've lived here all my life, we have to question the process, the project and the timeline, and they're already telling us there's no money.

I don't understand that. We're working on a project that's already telling us that there's not enough money, yet we're being told that there's going to be money to offset our businesses, our health conditions, our air quality. IP-19-18

There's so many conflictions (sic) within this process and this project that needs to be cleared up before it's brought into our neighborhood. IP-19-18

Thank you.

MS. GARCIA: Yolanda Duarte, Maria Tecas and Jeffrey Hernandez.

MS. DUARTE: Good evening. I too sit on the committee. I think I'm the baby on the committee. I'm the one that's been on the least amount of time, and yet I'm the oldest for sure and so my comments run in three categories: Good, bad and ugly.

The good is thank you very much for the opportunity to bring all of us here. Kudos for all of you who I know want to be watching the Dodgers, and thank you for coming, and so the good is thank you for the supervisor. Thank you to Metro. Thank you to Caltrans. Thank you to the supervisor for making this opportunity possible; but, second of all, so you know how the committee works, she brought all the experts to us so that we could make informed decisions. And we said we didn't want to do that until we heard from all of you. So that's the good.

Here's the bad.

In 2012, we told them no houses should be taken, in 2012. According to their words, they've IP-19-19

retooled the options to address the 2012 comments.

So, now, they're proposing to displace 20 of our residences and six businesses. So that to me is just horrendous. The worst areas on the graphs when you see them, look for the red and what they're trying to mitigate for risk, for safety, for health at both ends, our end and Long Beach, and both will not be completely cures with the option. IP-19-19

So I am totally against the design option. I think there are other options that are available. That's what they told us in 2012. So what's changed? You know, in 2012, they told us, they promised us, and I'm telling you now a lot of us were surprised to see this land with they're proposing to displace so many families.

The other issue that I have that hasn't been addressed, not in the report or within our discussions is the mitigation to our communities. I know IP-19-20 that there have been talks about Hollywood (unintelligible) Long Beach residences and businesses for the inconvenience, and our area always gets short shrifted every single time.

So when they run out of money or when it's a community that's easy to roll over, whatever our M.O. is, but whatever it is, we need to be thinking about how

we can be compensated and to let us know how they know it's going to be more safe.

How do they know it's going to be more safe when they haven't done safety -- when they're using the national averages for accidents? How do we -- what do we care about what the national average is? IP-19-21

What is it now? What is it now, and how can they do better, and can they assure us it will be better? So thank you very much. Please do -- this is rare that I ever support Eddie Torres publicly.

So just so you know, please, please don't be shy. Fill out the comment cards, and let us know what it is, even if it's just a question, but we need to know so that the committee, when we submit our report, we can actually say what you feel as well.

Thank you very much.

MS. GARCIA: Maria Tecas, Joe Hernandez, followed by Jeffrey Hernandez.

(A pause in the proceedings.)

MS. TECAS: Good afternoon. My name is Maria Tecas. I am (unintelligible). I live close by, and I'm a mother of three children.

What I want say is that, for example, right

here in (unintelligible) Boulevard, we just recently started acquiring the purchasing -- of putting more green areas. They put plants. They put trees, and we have more green, but what I am concerned about is that, if there is going to be a place where children can play. I'm concerned about the area's contamination and our community and our homes. IP-19-22

And, also, what I am concerned about is those homes that are there, what's going to happen to them? Are they going to -- the people that are there, are they going to have to move out? How do you say that? Are they going to move? How do you say that? Displacement. IP-19-23

Also, what I like to say is there's going to be a lot of displacement here in East L.A. For example, we are the voice. We are the voice here of our children. We are the voice of our children. Our children can't be present, but I am here.

I am here, and I'm going to be here on behalf of my children. For example, here in East L.A., what we also need, we also need more parks. We need areas that are green. That's what we need. IP-19-24

There is already a lot of contamination. There is a lot of pollution going on. The project -- the project is good. I do like that, but I'm also concerned IP-19-25

about the children. I am concerned about the children. IP-19-25

Again, we are the voice. We are the voice of our children, of our children. For example, over here on this area, there is a park, and we need more areas, more green areas.

Also, what I would like to see with this project -- this project seems to be good, but also what I would like to see is the funds. With these funds, are -- we need these funds, for example, the community funds to be invested in libraries, art and employment, places for training, training for females. IP-19-26

We also need the funds to avoid gangs. That's what we really should invest in and have the money, and also -- how do you say it? The expo? Yes, the expo. We also have to be involved. IP-19-27

We as a community, we have to be involved, and I really want to thank all of you that are here present and also the people that were involved with the community that were handing out fliers.

All of you guys went door to door, give out fliers, and I really do appreciate that, and I want to tell you, all of you that are here present, we all have to be involved. We all have to be volunteers.

I am a volunteer, and I participate a lot. My son -- my son is disabled, and he can't be here

present because he's small, but you know what? I am his voice. I speak on his behalf.

And, again, I want to thank all of you that are here present because you guys came, and really we all have to speak up.

Thank you very much.

MS. GARCIA: So we have a few -- quite a few speakers left.

Joe Hernandez, Jeffrey Hernandez followed by Lourdes Sanchez. Joe Hernandez. Joe Hernandez.

(No responses.)

MS. GARCIA: Jeffrey Hernandez. Is Jeffrey coming?

MR. HERNANDEZ: Yeah.

THE COURT: Okay. Perfect.

MR. HERNANDEZ: My name is Jeffrey Hernandez. My brother and I live adjacent on Humphreys. I live there 20 years myself.

I'm -- I am appreciative that we're getting the (unintelligible) of this meeting tonight. I appreciate the leadership of the supervisor and (unintelligible) others and everything (unintelligible) that happened.

However, it's frustrating that it was not

included to have it on East L.A. (unintelligible), and there's a pattern of that. IP-19-28

I'm opposed to the design option of 3A and 3B because they involve taking away homes; and, yes, we have to be considerate of the greater needs of the regional economy, but quite honestly, I think East L.A. has had its fair share of the burden. IP-19-29

It may be the case that some are viewing (unintelligible) additional work on the 710 has been posed as something wonderful, that is going to be positive. There are (unintelligible).

That (unintelligible) supporting this positive thing. Step outside. Wait for a moment while the sound around you declines, and you get to hear the rumble that we live with day in and day out.

Those freeways, there's nothing wrong with --

(Inaudible due to applause.)

MR. HERNANDEZ: And this is really about environmental justice. So I'm really (unintelligible) going to be put into consideration, that the will of the people who have to live with this is (unintelligible). That they impose these design options, and they will not be

(unintelligible).

There's no -- people shouldn't have to go (unintelligible) over and over again. What these freeways (unintelligible). It was a community just like this community, working class people, and, now, we have a community that's even more established.

45 years, 50 years, there's not a neighborhood that just should be further stepped on. So I am happy to see people speak out and filling out those comment cards. Thank you.

MS. GARCIA: Lourdes Sanchez followed by Silvia Corona and Amalia Cotto.

MS. SANCHEZ: Good evening. My name is Lourdes Sanchez, and I want to agree with a lot of the comments and suggestions that the previous speakers have made.

East L.A. is a very strong community. As you can see, we're all here tonight, and I think it's great that everyone came out and the supervisor and the Metro and Caltrans all came out and gave the community a second opportunity to extend the public comment because I think it's important. I never got to speak the first time, but this is great that we're given a second opportunity.

I just want to let you know the businesses on Atlantic Boulevard are being greatly affected if these

IP-19-30

changes are made. The air quality, traffic, and there's many schools. IP-19-30

If you increase the amount of cars coming in the morning, all that stays here throughout the day and in the evening when everybody comes home. This is a working community, and I think with the amount of traffic off the freeway, the amount of traffic in the residential street, double parked just to come here -- how many of you came walking? IP-19-31

(There was a show of hands.)

MS. SANCHEZ: That live nearby; right? Most of us, all came from around the area. Just to find parking, we had to go around a couple of times.

The amount of parking in the area is very, very limited. Now, the increase of cars going up and down Atlantic, and with the new hours restriction, it's going to worsen the air quality not only for the schools but the residents and the businesses.

If you notice, if you go down Atlantic Boulevard -- I don't know. That just came to me. If you notice a lot of the buildings have soot on them. We don't clean it out. It stays. The traffic every single day, traffic from the freeway is going to stay there. IP-19-32

The businesses -- most of the businesses -- the business we have on Atlantic Boulevard, it's a working class place. People work. This is a working community. People come, and the only time that they can come and really come and visit our business is during the hours of 4:00 to 6:00 because that's the time they come home, and they need -- that's the only time they can make it. They're not going to take time off from work to come to make -- to do business, and those hours will not work. IP-19-33

Also, the danger across the street from the schools in the morning and the air quality, it's all just going to sit. That's all what it's doing is sitting. My time is almost up, but I just want to say, you know, it's going to be very devastating and not only for the businesses. They're going to (unintelligible). Why? Because there is no business, and I just want to say one more thing. IP-19-34

It's going to be devastating not only for the businesses with the community as well so we do need some -- I'm glad that everyone came out and speak, and continue to have your voice heard.

Thank you.

MS. GARCIA: Silvia Corona, Amalia Cotto, followed by Mark Lopez.

MS. CORONA: Good afternoon to everyone. My name is

Silvia Corona. I've been here in the community for 42 years, and let me tell you guys.

My mom passed away seven years ago. She had a cancer. My granddaughter, she (unintelligible). She has a tumor in her brain, and my husband have Alzheimer. That's all (unintelligible). All (unintelligible) doing here.

I want to say what's going on with the representors (sic), the people voting? I know Hilda Solis has given (unintelligible) for everyone, but I want to see the people which voted for them.

Do they really represent this community? I don't think so. I want to see them really, really support East Los Angeles. All I want to happen here is (unintelligible) in East Los Angeles.

Let me tell you (unintelligible) Metro. They (unintelligible). I remember when they make the -- pick up the people in Soto (unintelligible). They say we supposed to be (unintelligible), and you know what (unintelligible). They make a point.

They dispose the information, and they're doing other things. It's not really, really right (unintelligible). Because we're so tired about this, and (unintelligible).

They want to keep the super. They want to

keep out all the people from there. They want (unintelligible) the people, the names of everyone, and we want to the Los Angeles School District because we go home to home, and we need to talk to that community and stand up. Okay. But that's enough. Everything that's (unintelligible) do, they want to do in Los Angeles. That's too much.

I want to work with the community organizations or whatever, but that's not right, not right, and I have 42 years living in this community, but that's enough. I'm living close to Indiana, and I don't know what's going to happen. That's a lot of people there, run through there. My mom is saying you need to make (unintelligible).

MS. GARCIA: Amalia Cotto followed by Mark Lopez.

MS. CORONA: Good night to all of you. Thank you for all of the representatives that are here. I was here -- I come -- my name is Amalia Cotto, and I come from the city of Commerce.

We have the freeways, the 710, and we have the 5, and we have the train, and we have everything right there. We see the trucks every single day, day and night.

My -- a year ago, they removed the tumor from my brain. I have two children with disabilities.

This school probably has a lot of kids with disabilities. I have -- there's a park in my neighborhood that's next to the freeway.

I have asked some of them are you going to put a wall, put another entrance from Washington to the 710? Nobody knows that. The park is on the bottom. The kids are playing right there. I have family members with disabilities. We have health problems like I told you. IP-19-35

The doctor told me that the tumor was inside of me for 30 years. We have right now problems. Stand up. I was here in 2008, and I can't believe they're telling us right now we don't have no money for the project? It's been seven years. What have they done? IP-19-36

And the other thing is is this good for our community? Is this going to make us feel good in five years? Ten years? Think about it. We have to think about what's best for our family, our kids.

The lady was right. We have to speak up for the kids who can't speak for themselves. They know the truth. They've done this study. They went to our neighborhoods. They study.

(Inaudible due to applause.)

MS. COTTO: People come first. We have to stand up because (unintelligible) trucks coming through. They're doing all this for the trucks. They've not doing it for us. They don't want to do a favor for us. So stand up together and tell them what you feel. IP-19-37

MS. GARCIA: We have quite a few speakers here. I'll collect the others that Mark has here and, actually, following Mark Lopez, Eddie -- I was going to ask Eddie -- you haven't spoken yet? Just so we can get through everyone, and we'll bring Eddie back at the end.

So then we'll have Mark Lopez followed by Juan Vazquez and Isains Hernandez.

(A pause in the proceedings.)

MR. LOPEZ: Hi. My name is Mark Lopez. I'm a resident of East L.A. My family first came to East L.A. in the 50's, and like probably many of your families here, my family's been displaced by freeways more than once in East L.A.

I'm also with East Yard Communities for Environmental Justice, and I've been involved with this project for nine years now.

You know, we heard the supervisor say you all decide. Who here right now gets to vote on this

project, raise your hand.

(No responses.)

MR. LOPEZ: Nobody; right? We don't get to decide. The community don't get to decide. This chart over here that has all the committees, the committees don't decide. The committee learned that they don't decide when they made a decision that Caltrans didn't like. Then they were told that they were recommending (unintelligible).

Multiple times we went (unintelligible) East L.A., South L.A., Long Beach (unintelligible) come up with a different plan that doesn't take our homes and doesn't take our jobs, that has mandatory zero emissions. IP-19-38

To us, that committee is made up of council members from all the cities voted multiple times to have alternative studies. Even Ernesto actually (unintelligible). You need to stop voting because Caltrans isn't going to do it. We are not going to take another vote; right?

So if they don't make a decision, and then Metro, they pass a motion that they explained here. What they didn't explain is that Caltrans isn't following the motion. There's multiple elements that are not following the motion. IP-19-39

So Metro doesn't make the decisions. Who makes the decisions? Homeboy Ron Kozinski right there. (Unintelligible). We want to talk to (unintelligible) and talk to the governor's office, and they said the local Caltrans, that's who you need to talk to, and the homeboy's not here tonight. IP-19-40

I also want to make sure to point out because nobody's brought this up yet. If your home is taken and you're undocumented, you are not receiving support to move. The federal government is not going to support you moving. You're out on the street. I want to make sure we know that; right? Under Trump right now, it's going not going to happen. We need to make sure that's clear. IP-19-41

I heard very different alternatives. There are No. 5C and 7. They're not different. 5-C, that's coming out of the last plan. Alternative 7, I only looked at my notes from 2012, and it looked like 6A and 6B. That's not new. It's given a new name, given a new number. It's the same old plans. IP-19-42

These options don't make sense. Everywhere (unintelligible). Elsewhere else they say we're not taking any more homes except for (unintelligible). I'm going to come back and finish my comments because my time is up. I don't want to take no one else's. IP-19-43

MS. GARCIA: Juan Vazquez followed by Isains Hernandez followed by Martha Hernandez.

MR. VAZQUEZ: Good evening. My name is Juan Vazquez. I'm the leader of the neighborhood watch on Sydney. I have meetings every month where we had informed our experience of what's happening on the houses being taken.

First of all, I'd like to say on Hilda Solis, if she was really interested in this, she would be here. If she really wanted to hear what the people were thinking, she would be here, not be told by one of her personnel that works for her. Okay?

Two, you know how much -- how many kids would be affected by this? As a school teacher myself, I just think someone said the future, you know, if you're seeing this right now, what are we going to be looking at in the future? IP-19-44

Now, the funds, they're not there. They keep telling us that, well, hopefully you'll vote for something. Hopefully someone would come up with a solution. Guess what? They're not there. Go to a meeting and somebody said, hey, usually when they come to East L.A. at that time, you know, the wallet is empty, and we always kind of get like short changed. IP-19-45

I've only been here five years. My wife is

not here to make it. As long as we're here, we're going to do the best that we can for our neighborhood, do the best we can for the kids that we work with, and there's no other option.

Do not take people's homes. You know, it's already very difficult where they're at. There is no homes to rent. Some people cannot afford to move. It's not as easy as just saying I'm going to get up, and I'm going to move. Okay?

So whatever it is, whatever you guys need to talk to, I don't think anyone is happy with the options of homes being taken. Thank you. IP-19-46

MS. GARCIA: Isains Hernandez, Julio Velasco followed by Martha Hernandez.

MR. HERNANDEZ: My name is Isains Hernandez, and I grew up right here on 1st and Humphreys. We moved in here in 1951, '52, right around there, and like most parents growing up at that time, their sons would always come to work and were not allowed to just hang out. So me and my brother got a job with my dad being -- that job throwing a newspaper, and we would throw the Examiner right on 3rd right across from King Taco and (unintelligible).

1962, 1961, right around there, I started seeing a lot of my neighborhood friends move out. Why were they moving? Because they were building the 710

Freeway, and they were building the 60 Freeway, and they always took our neighborhood apart.

My parents didn't get notified. Nobody (unintelligible) anything. They just came and took what they wanted and built that freeway. We lived with dust in our house for 12 years. You don't think people got sick from that? 12 years we lived with dust.

If you drive from Atlantic to right here to Humphreys, how many red lights do you see, red light tickets do you see here? We're being punished because they have a metro line right there, and who has $400 to pay for a ticket in this neighborhood? I don't. So I never drive that street anymore.

I go around First Street, and when you have (unintelligible) on Whittier Boulevard right there. Then I got a ticket there at four o'clock in the morning. A month later, I get ticket for $400. A year later, (unintelligible). Sorry. You're (unintelligible).

So not only were we disrespected, but if you (unintelligible) baseball season, you see kids there at that park. There must be about 20 teams practicing at the same time, and you can't fit any more people at that park. That's what we need here.

When I was growing up, at least we had a park. Now, there's nothing here. There's really

nothing. Actually, my mom, she's lived on that street, and hopefully they start building (unintelligible) shit that won't make her more sick. She's got Alzheimer's now so thank you.

(A pause in the proceedings.)

MS. GARCIA: (Unintelligible), Martha Hernandez and Theresa Vazquez.

Julio?

Okay. Martha.

MS. HERNANDEZ: My name is Martha Hernandez. I'm a resident of (unintelligible), and I'm the co-chair of the 710 (unintelligible). I'm working for you for 30 years for air quality, and I want to tell you a long story in short terms.

The (unintelligible) we had is (unintelligible). The reason the 710 never going to stop expanding is because the containers (unintelligible), and just like (unintelligible). You know what we like two (unintelligible). Either way, the traffic is already (unintelligible).

Every single avenue is an artery of the freeway connections. We just don't have (unintelligible) freeways. We have a network of freeways because it

(unintelligible) crossing from the 60 across to the 5 from right here in East Los Angeles. We just pass through.

(Unintelligible) pass through to take the containers to another city. I see it like this. (unintelligible) out of the box. We need to continue to have our (unintelligible) traffic and trucks.

I say myself do nothing and (unintelligible). (Unintelligible) would take all the trucks and every city has to have responsibility and have a depo so they can have (unintelligible) containers. IP-19-47

So the truck is not wandering around to every city would come to that depo. (Unintelligible) containers through whatever they needed and not (unintelligible).

(Unintelligible), and those cars, containers, you know? I have (unintelligible), and I have to tell them we're humans. Enough is enough. We are sick. I think of all the health issues. I think about working with air quality. I don't remember the first time I went to a meeting in Commerce. They were fighting for property, and I got up. And I got to them, and I told them (unintelligible) for air quality and (unintelligible).

You can buy a property. How many

(unintelligible) human beings. We go (unintelligible). Every city (unintelligible) we got on the same page. So you know we do think it's -- 710 is not going to take (unintelligible) more nice. It is. It is going to (unintelligible).

We have to think out of the box. We need a car and train, and every city needs a depo to receive containers, and the other side when you say (unintelligible). We have a depot and (unintelligible), and now the reason these things happen is because we have to get together. We have to come to these meetings.

Our families are sick. It's not going to get better. I don't (unintelligible). They wanted to start right here. If they say it's cleaner, they're lying. It's not right because when I look (unintelligible) monitors and every single freeway and every single school and in East Los Angeles is (unintelligible) for our kids. You know, we have to get together (unintelligible).

Thank you.

THE COURT: Theresa Vazquez, Bertha Gonzales and Edgar Gonzalez.

MS. VAZQUEZ: Hi name is Theresa Vazquez. I work with my husband. I work at (unintelligible) Humphreys, but my (unintelligible) neighborhood watch.

I want to thank (unintelligible) for being here, but also specifically my -- residents for coming together because we're the one that are our voices of this community. If we don't speak up, they don't do anything for us.

As my husband says, we've lived here for five years. I've been teaching here at Humphreys for 18 years, and I am invested in this community, and I work with -- I really want to speak up for the children as well as a lot of (unintelligible), especially the children that are in this community, the children that are for me dear to me here in Humphreys, but there's other schools in the area too. There are many schools.

And speaking of the pollutants that they talk about, I teach in a classroom. I can tell you I don't need to look at the research, research that finds evidence of these pollutants.

IP-19-48

One year I taught, I had eight students with asthma, eight. I had one student that went to the hospital. How can children learn if they cannot breathe?

The other thing is can they clean the area? (Unintelligible). We're right by the freeway. They are breathing -- go (unintelligible) all the way up to fifth grade. These contaminants are not (unintelligible). (Unintelligible) the kids at the middle school to the

high school in the area.

So they're breathing this, and we're saying (unintelligible) what are we looking at in terms (unintelligible) the children that are with us now when they can't even breathe or have cancer. We're going to have a very poorly (unintelligible) society.

Also, I want to speak up against having more traffic and the deconstruction and the construction in this area because it seems like the 710 was just worked on a little while ago for a long time, and then they're saying now we're going to tear it apart and (unintelligible). IP-19-49

I believe it is about money. It's not about us. It's not about our health. It's just about pushing money around and keeping people in Caltrans (unintelligible).

I also want to bring up the issue of Hilda Solis. She (unintelligible) want to hear what you guys have to say. I want to have an open honest dialogue, and then I watched her walk out. And I was so disappointed. I would not vote for her again, and I hate to say that. I had such trust in her when she was in office --

(Inaudible due to applause.)

MS. VAZQUEZ: If she wanted to hear (unintelligible) hearing all of our concerns. Thank you.

(A pause in the proceedings.)

MS. SILVERMAN: Bertha Gonzales, Edgar Gonzalez, followed Stephanie Alvarado.

MS. GONZALEZ: Good afternoon. I am here because I'd like to share my point of view. I live here in East Los Angeles, and as I'm here, I want to talk about that we have a lot of stress, and I also want to talk about the freeway, the freeways that we have around us.

What else do we have? We have the Metro, and, also, I want to talk about the crimes. I myself have been a victim of crime. You know what? They killed my husband. I live close by the 710 Freeway.

I also want to mention that my son -- my son is not doing well. He's not doing well with his mind. Also, I am sick with asthma.

I'd also like to say that where I live it's an area -- the area is closed, and right there in that area where I live, there is approximately four to five homes, and also in the area where I live, I also want to mention that there is a man. This man is taking advantage of the situation.

He has a trailer, and on top of that, he added two more trailers. Quite honestly, that is not right because this is right in front of my home. What is the end -- on top of this, he's (unintelligible) people to live there in these trailers.

Why are these people there? Are they paying rent or what? You know what? The parking, the parking is also another situation, and, you know, all this is causing me a lot of stress, and this is not right.

Also, one other thing I want to mention with regards to the trash. When I take my trash can out, what do I find in there? I find a lot of feces. Yes, feces inside the trash can. I just cannot pick up this trash can and take it inside my house.

I want to question, and I am, who's living there, besides adults that are living there in these trailers? You know who lives there? Children. Children are living there. Also, where do these people go to their -- where do they go to the bathroom? Where do they bathe? You know what? It's not right, and you know what? (Unintelligible).

This is not right. You know, this is causing me a lot of stress, and I am very upset about this. Why don't they just get a place like these people?

Why don't they just find and take these people and put them in a proper location? This is not right.

And you know what? We pay our taxes. Why don't they find funds for these people? Well, that's just all I want to say.

Thank you.

MS. GARCIA: Edgar Gonzalez followed by Stefie Alvarado and then Manuel (unintelligible).

(A pause in the proceedings.)

MR. GONZALEZ: Hi. So my name is Edgar Gonzalez, and I just want to give food for thought. If they're going to expand, things are going to happen; right?

They say that the money is the problem, and (unintelligible). Traffic is going to be problem. The city's going to grow. It's going to cost them. It's going to cost them (unintelligible) expense.

So I don't really (unintelligible). To a certain extent, I laugh because like money moves only in one direction. With the issue of this (unintelligible) cars being more smart and efficient and electric, maybe they can go like one more (unintelligible) specifically for (unintelligible) cars. IP-19-50

And (unintelligible) consideration for

what's happening here because I, like I said at the end of the day, what it is is it's all money, and it's going to cost them more (unintelligible), and they don't consider this. It's going to cost them even more so (unintelligible).

IP-19-50

MS. GARCIA: Stefie Alvarado and Brian (unintelligible). Sorry if I didn't pronounce it correctly.

Stefie Alvarado.

MS. ALVARADO: Hi, everybody. My name is Stefie Alvarado. I've been living here for like five years, and I like it. It's pretty calm. Everyone gets along, and this is really nice, and besides activities that I've (unintelligible) for years and never do anything about it; right?

(Unintelligible). That's all it is. There are people don't have money. That's how it is, but the reason why I'm here is because I noticed that I -- I don't know. I didn't hear (unintelligible).

So that in my mind should make me feel, and that's how I (unintelligible). (Unintelligible) that you see here. It was a choice. It was a choice. They're going to do (unintelligible) everything around. The decision is made already because they don't want to take a vote on it.

We could have been like -- okay. So there's people that do want it, and there's people that don't. There's some people that do want it that (unintelligible) people that don't.

Right now we're here because they didn't give us a chance to voice our opinion. Our opinion doesn't matter at all. That's what I get and what's been happening for years, but the reason why they shouldn't do this is because (unintelligible). Something has been happening I'm saying for years. It happened for years. It hasn't stopped. IP-19-51

So even making my comment right now about -- what I'm concerned about is it doesn't matter. That's my (unintelligible). It doesn't matter. It doesn't even matter because it just seems like it doesn't even matter. They just do what they want.

Even when we're saying we're going to lose our home, people (unintelligible) move out. You have to move out. It doesn't matter.

There's a bunch of kids right here, a bunch of kids. Okay. We're all adults; right? We get health risks. We get cancer, all of that. I'm not saying its fine, but we're all adults.

The children right here, they're barely living their life. My son is eight years old. He's a

(unintelligible) to be in high risk, and I have to move form this school just because we (unintelligible).

(Unintelligible) people's public transportation? That's why? For public transportation? Seriously, you're going to risk people's lives or somebody to get from their house to another location.

That's life. Life is hard. You have to go through traffic. You have to go through that.

(Inaudible due to applause.)

MS. ALVARADO: At one point, like for me to like all the way to -- I don't know -- like to -- or something like really far. People travel really far to get to places. It's unnecessary. (Unintelligible).

It's a bunch of kids (unintelligible) allergy, cancer and asthma. (Unintelligible) you know.

(Inaudible due to applause.)

MS. ALVARADO: (Unintelligible), money, power; right? The people that talk right here, the local families we're trying to make it out, trying to make it out of this.

Because it is hard when you start from the bottom. It's really hard, and then the people, they're

trying to take away where you live. You know, they're making it harder. They're making it harder, but that's why I'm here today to speak. It's not right that they don't care about your health.

You could die slowly. Believe it or not, (Unintelligible) a gun to our head real quick. (Unintelligible). I don't know why (unintelligible); right? It doesn't matter. That's what (Unintelligible). You guys are saying it doesn't matter.

I hope my comments today can make a change in your (unintelligible) in how you view things, how you see things that come (unintelligible) in a lot of situations, and I hope it changes your mind.

Have a good night.

(Inaudible due to applause.)

MS. GARCIA: (Unintelligible), and then we'll hear comments, and we're over our time in the agenda, but as we're wrapping up, you can ask questions of the project team, and the court reporter will be wrapping up so that, if you don't want to speak here but you want to make some comments, you can do that.

So here's the order of speakers:

Manuel Corval, Ryan Corval followed by

(unintelligible) Martinez -- I think might have been wanting to submit a comment. I'm not sure she's speaking -- followed by (unintelligible) Cardenas, and then we have Eddie and then Mark.

So Manuel and then Ryan. Are they in the room?

Manuel? Ryan? Ryan Corval?

(A pause in the proceedings.)

MS. GARCIA: Okay. Eddie (unintelligible)?

We have just some words, and then we'll end.

Laura Sosa, Eddie Torres and (unintelligible).

(A discussion was held off the record.)

MS. SILVERMAN: Laura Sosa followed by Eddie and then Mark.

(A pause in the proceedings.)

MS. SOSA: Hi. My name is Laura Sosa. I'm a teacher here at this school. I'm here to represent the

school and the children of the school. Not only that, but my son also attends this school as well as my other children.

My father lives within this community, and he spends weekends within the community. So what is it that we need to do? Think about it. Think about our schools. Here in the school, we have one small little playground.

Money needs to be allocated to building a playground where children can enjoy with grass. We only have cement or asphalt at this school. Investment needs to come back to our schools.

Again, we're taking and expanding the freeway, which I have no clue of. Knowing that my father is not too far away from here, gets me very upset to know that a petition -- it looks like a decision has been made, and that's very upsetting because in any other community that you have people -- how do I -- profession, they are well informed, and they have a vote. They have a say. I think our community is looked down upon and not looked up upon.

At this school we have children with asthma being my son. We work, live (unintelligible), right next to the freeway. So it would definitely affect us. IP-19-52

It would also affect us because taking

homes away from here affects my job at this school. That would mean that there would be less students here. So it affects my job.

Also, within our community there's other issues that are happening. My parents live across from the Dollar Tree. We called various times to the city to get that improved.

Now, right now, I don't know where they're doing the construction, but lo and behold, are we getting asphalt now at that parking lot? And we live right across. Children are there constantly as well as my parents who are retired.

We never got an advisory as exactly what was happening. So there's polluted air circulating at this time. This is the second week. I said, hey, what's going on? My dad goes I don't know. I don't know what they're building.

But it was upsetting to know that we are not notified. In other cities, it would be posted, posted as it was in Montebello. I've been informed. Here, we don't.

MS. GARCIA: Our last two speakers are Mark Lopez and Angelica Mirelez, and then we'll have some closing remarks and then visit with the staff, ask questions. You can give your comments to the court reporter.

(A pause in the proceedings.)

MR. LOPEZ: First of all, thank you for being patient and staying here late. So we're passing out (unintelligible). She has a clipboard. If you want to sign up, we're going to do another meeting for us to write her and send them to Caltrans and let them know how displeased we are with (unintelligible). So I am going to apologize for (unintelligible).

East L.A. Chamber of Commerce from the (unintelligible) 60 Freeway to Caltrans, all that (unintelligible) along with representatives from the local schools, (unintelligible) primarily Kim and (unintelligible) and found out that the parking that they want to take for bus lanes, Rapid buses between 7:00 and 9:00 (unintelligible) opportunities for people to use (unintelligible) schools and for the businesses. IP-19-53

In addition to that (unintelligible), they want to take peak parking hours from 4:00 to 6:00 on the west side of Atlantic Boulevard from Telegraph to the (unintelligible) Freeway, and we found out that in the document it says that there's additional parking for businesses that they could choose to subsidize their moving their cars (unintelligible). That doesn't make IP-19-54

any sense.

Also, how many people know (unintelligible) after four o'clock, raise your hand. So if people are coming home, where are those people to park? (Unintelligible). So Caltrans, Metro, their information, all dated. It's untrue. (Unintelligible).

IP-19-54

If you're trying to help, please sign up for this. We've got to get together. We've got everyone here. (Unintelligible) will have more support for this community.

(Unintelligible) good communities like Pasadena has pull. We don't. We can create something. Let's get together, and I promise I won't (unintelligible) also be (unintelligible). Let's call Channel 7, Channel 9, Channel 2. Let's start waking up the public officials, Caltrans.

We filed for an extension for the public comment period, and we were told no, but if Pasadena had asked for an extension, they would have been told yes. We're (unintelligible), and we're wanting to (unintelligible) courtesy of public comment period.

So if this makes you mad, sign it. Let's get together. Let's start doing what we can do for our common people. Our senator, she said from this night she wants to hear from you, but she doesn't hear from you,

then it's (unintelligible). It's not for me. It's what you guys need. You need to speak up. Please. God bless you. Thank you.

(A pause in the proceedings.)

THE RESPONDENT: Mark Lopez followed by Angelica Mirelez.

MR. LOPEZ: So the (unintelligible) product that he has, how quickly will we be on the freeway once they're done with the project and, apparently, they told them six to nine minutes. So is all of this really worth six to nine minutes? Seems like a pretty easy answer. Huh?

And then (unintelligible) the decision has been made, and I have to agree with that. In terms of the -- the decision's been made since at least like 2010, 2011 because Caltrans have been pushing what (unintelligible). IP-19-55

When you look at the state of California already asked Trump for money for projects. They asked for money for the 710, how are they asking for money when they don't know what they're going to do yet? It's because they know what they're going to do, unless we stop it; right? IP-19-56

They're going to do what they want to do

unless we make them do something different. (Unintelligible) only way to stop it. They don't want to do this meeting tonight.

People here tonight made that happen, the same way with the 710, they don't want to do a (unintelligible) 710 north, but the people here made that happen; right?

So we need to (unintelligible) want to do that because I guarantee you, if those Dodgers win the World Series, how many people going (unintelligible); right? We need the same amount of people coming out of the streets; right? We learn from other of our members and (unintelligible) from the 710. We're going to shut the freeway down. Is that what they need to see us do in order to take us serious; right?

Because I (unintelligible) costs millions of dollars; right? Hopefully that's not what we have to do; right? I saw there was a -- something in there called "clean emissions?" That's ridiculous.

Is a truck going to give out rainbows or what? There's no such thing as clean emissions unless it's zero emissions. Clean emissions don't exist. IP-19-57
Natural gas, no. That's emissions; right? It needs to be zero emissions, not a recommendation, not (unintelligible). It needs to be a policy.

So, again, everyone else is saying things are going get better, traffic will be better, less air pollution. Not acceptable. We don't need our homes? We're in a housing crisis. We don't need our jobs destroyed? We're in an economic crisis. IP-19-58

We don't need to eliminate homeless resources when we're in a homelessness crisis, and we need to make sure that it's zero emissions because we all know we're in a health crisis; right? IP-19-59 IP-19-60

So I want to make sure we (unintelligible) for the extending comment period to 120 days not 90 days. We shouldn't have a meeting tonight, and on Monday they close. That doesn't make any sense. We need more time to process; right? IP-19-61

And the reason why they've been fighting us for years on how to do the 710 is because if they listen to the community on the 710, they've got to listen to the community on the 5 when they extend the 5. They've got to listen us on the 60 when they expand the 60. They've got listen to us on the 605 when they expand the 605 because that's what's coming on the 710. That's what they've got planned; right? IP-19-62

Thank you.

MS. GARCIA: So Angelica Mirelez, our last speaker.

MS. MIRELEZ: Hello, everyone. My name is Angelica

Mirelez. I'm 22 years old. I'm born and raised in East L.A., and I came to Humphreys Elementary School. So I just came to speak for people who are in the middle of this. Their homes are in the way, and a bunch of their children are not even here to speak up for them.

You people that are putting this together, you guys want to build a freeway. You're going to pollute our air. You don't care about our kids. I don't know who I'm even speaking to who's in charge. You don't care about our kids. You don't care about me. IP-19-63

I work. I work full time. I go to school. Okay? I'm not pregnant. I'm not out here playing around, but the -- most of my community is because that's how we're set up to be. There's a small amount of us that are actually paying attention to this and actually care.

Nobody -- you guys know that the youth is not going to come here and speak for our older people.

(Inaudible due to applause.)

MS. MIRELEZ: You guys (unintelligible).

Nobody's gonna come out there (unintelligible) the street, ruining our streets because you guys don't let us do anything else. You want to take

up our space, to pollute our air. You don't care that our children are (unintelligible) cancer. Nobody even wants this to happen.

It's from the community. We didn't vote for this. We live here. We pay rent too. It's empty in here. I'm just shaking how mad I am because you guys take advantage of us because you know that the majority we don't even have homes. So we don't even come out of our houses to come meet you guys face to face. Okay?

So I hope that the little amount of people that came out today to have our voices heard, and whatever happens, you guys just remember that a lot of us out here that you guys are going to benefit from, we work. We work hard.

MS. GARCIA: So that was our last speaker. I want to call Javier Hernandez with his transportation deputy for Supervisor Solis's office to make closing remarks.

MR. HERNANDEZ: Good evening, everyone. I'm Javier Hernandez here with Supervisor Solis's office, transportation deputy.

So, first of all, I just want to say thank you on behalf of the supervisor. For those of you who were here a little bit earlier, you heard directly from the supervisor herself.

She has not made a decision on what

alternatives will be in this project until we hear from you guys, and that's exactly why this meeting was established to hear from you directly.

She had to leave a little bit early, of course, but our entire staff has been here, taking notes. Of course we have a court reporter here taking notes. He's been taking notes all night, and just trust that we will be carrying these -- your concerns, your ideas, your solutions back to the metro board to ensure that it is reflected in whatever is determined by the metro board.

I just want to say thank you from the bottom of our hearts for, of course, participating in tonight's event. We're, of course, becoming a little bit more aware and informed about this project that will impact your communities, and essentially helping us help you better.

So thank you very much for coming out today. We want to be mindful and be respectful of the staff (unintelligible), Humphreys Elementary school staff for opening --

(Inaudible due to applause.)

MR. HERNANDEZ: And then if you still have burning questions, by all means, as we start packing up, feel free

to stick around and ask questions, but we do have to be out of here in a timely manner. So thank you very much.

UNIDENTIFIED AUDIENCE MEMBER: One quick question to you. Do you want to keep believing that we are the ones that are going to make a decision and not these folks? The community's going to make a decision? You want me to believe we're going make it?

MR. HERNANDEZ: No. The metro board will make that decision.

(The proceedings were concluded at 8:48 p.m.)

PENALTY OF PERJURY CERTIFICATE

I, the undersigned, declare under penalty of perjury that I have read the foregoing transcript, and I have made any corrections, additions or deletions that I was desirous of making; that the foregoing is a true and correct transcript of my testimony contained therein.

EXECUTED this _____day of _____, 2017, at _____, _____.

_____

REPORTER'S CERTIFICATE

STATE OF CALIFORNIA)
) ss.
COUNTY OF LOS ANGELES)

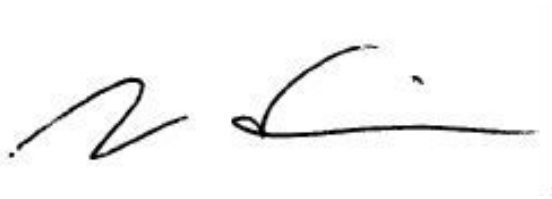
I, RONALD KIM, CSR No. 12299, Certified Shorthand Reporter for the State of California, do hereby certify;

That the deponents named in the foregoing deposition, prior to being examined, was by me first duly sworn to testify to the truth, the whole truth and nothing but the truth;

That said deposition was taken before me at the time and place therein stated and was thereafter transcribed into print under my direction and supervision, and I hereby certify the foregoing deposition is a full, true, and correct transcript of my shorthand notes so taken.

I further certify that I am not of counsel nor attorney for either of the parties hereto or in any way interested in the event of this case and that I am not related to either of the parties hereto.

WITNESS my hand this 19th day of October, 2017.



RONALD KIM, CSR No. 12299

CERTIFIED COPY CERTIFICATE

I, Ronald Kim, Certified Shorthand Reporter, No. 12299, hereby certify that the attached deposition is a correct and certified copy of the deposition of the deponent named in the foregoing deposition, taken before me at the time and place therein stated.

I declare under penalty of perjury that the foregoing is true and correct.

Executed at Covina, California, this 18th day of October, 2017.

Ronald Kim, CSR No. 12299

IP-19-1

It appears the commenter is referring to the SR-710 North Project, a separate project that is located north of the I-710 Corridor Project limits. The purpose and need of the SR-710 North Project includes completion of the regional transportation system by providing a linkage between the incomplete SR-710 freeway at Valley Blvd. in Los Angeles and the northern stub near SR-134/I-210 in Pasadena. The I-710 Corridor Project is an independent project intended to address the auto and truck traffic that travels the I-710 between the Port complex and SR-60, where nearly one-third of daily traffic is projected to exit I-710 in the 2035 No Build Alternative condition. The segment of I-710 that falls between I-5 and SR-60 is highly constrained, with land uses located close on both sides of the freeway, which limits the amount of physical improvements that can be made to I-710 through this area without right-of-way impacts. However, Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), has identified Alternative 1 (No Build) as the Preferred Alternative. Therefore, there will be no improvements made to I-710 between the Ports and SR-60. Please refer to Section 1.1 of this appendix for further discussion on the identification of the Preferred Alternative.

IP-19-2

The air quality impacts of the project have been assessed and the results presented in Section 3.13 of this Final EIR/EIS. In addition, a Health Risk Assessment has been performed in support of the project, which goes beyond Caltrans' standard practices related to the analysis of environmental impacts. The commenter is likely referring to the preparation of a Health Impact Assessment (HIA), which was not conducted for the I-710 Corridor Project. Neither the Federal Highway Administration (FHWA) nor Caltrans currently has an approved methodology addressing the health impacts of freeways, and these types of assessments are an emerging practice in the transportation sector in the United States. Currently, State Departments of Transportation generally have not yet begun to implement HIAs or related tools for transportation planning, with some exceptions. For example, San Francisco's Department of Public Health has employed the use of HIAs in evaluating the health impacts of transportation projects. The State of Massachusetts passed a law requiring HIAs on new transportation projects, and at least one is known to be complete (the McGrath Highway Corridor HIA). In addition, the Caltrans Division of Research and Innovation is actively investigating the use of HIAs for transportation planning and potential applicability to Caltrans projects.[1] However, it should also be noted that there are limitations associated with the preparation and use of HIAs. According to an article published in

[1] Caltrans Division of Research and Innovation. Preliminary Investigation. 2011. Transportation-Related Use of Health Impact Assessments and Similar Tools. August 5, 2011. Website: http://www.dot.ca.gov/research/research reports/ preliminaryinvestigations/docs/public_health_ preliminary_investigation_8-5-11_revised.pdf (accessed June 25, 2018).

2000 in the British Medical Journal, “Currently there is neither an accepted gold standard nor even a simple, reliable, and evaluated method for carrying out health impact assessment” and “Several issues are unresolved in the methodology of health impact assessment…causal pathways are so complex that it is not often possible to say if an outcome will definitely be good or bad for the health of a population…The current evidence base for many health determinants is inadequate for accurately informing a process of assessment.”[2] Hence, the preparation of an Air Quality/ Health Risk Assessment for the I-710 Corridor Project was an effort to respond to the requests of the I-710 Corridor communities to study health-related impacts, while also ensuring the empirical analyses performed in support of the EIR/EIS process were factual and based on sound scientific, analytical, and/or engineering judgment.

IP-19-3

The analyses performed in support of the I-710 Corridor Project EIR/EIS were conducted in accordance with Caltrans guidance and have undergone substantive technical specialist quality control reviews.

IP-19-4

Metro and Caltrans thank the commenter for their input. Please note, as stated in Response to Comment IP-19-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, no improvements will be made to I-710 between the Ports and SR-60. However, passive park and landscape improvements are projects that may be eligible for funding under the Community Health Benefit Program, which is included in the scope of the build alternatives but, since a No Build Alternative has been selected as the Preferred Alternative, will no longer be implemented by Caltrans as the lead agency under CEQA and NEPA. Please refer to Section 1.10 of this appendix for more detailed information on the Community Health Benefit Program.

IP-19-5

Cancer risk was discussed in Section 3.13, Air Quality, of the RDEIR/SDEIS. The analysis contained in that chapter discloses that all build alternatives would generally reduce public health risk. All project alternatives show a decrease in cancer risk at all modeled receptors when compared to the 2012 Baseline. As stated in Section 3.13 of the RDEIR/SDEIS, the build alternatives would not increase cancer risk at any areas in the vicinity of the I-710 freeway compared to 2012 Baseline. These reductions are a result of the cleaner diesel trucks as required by California Air Resources Board’s (CARB) Truck and Bus rule and implementation of the Clean Trucks Program by the Ports (Port of Los Angeles and Port of Long Beach). Both 2035 build

[2] U.S. National Library of Medicine National Institutes of Health. Health Impact Assessment. May 20, 2000. Website: https://www.ncbi.nlm.nih.gov/pmc/articles/PMC1118057/ (accessed June 28, 2018).

alternatives predominantly display decreases in cancer risk with small increases within 100 meters of the I-710 when compared to the 2035 No Build Alternative. For Alternative 5C, the maximum increase in risk would be approximately three in one million. The primary location of the increased risk for Alternative 5C would occur along a small portion of I-710 just south of SR-60. For Alternative 7, the increase in risk would be less than one million.

However, as stated in Response to Comment IP-19-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, the air quality improvements for portions of the I-710 corridor and the increase in risk for a small portion of the I-710 Corridor would not occur as a result of the build alternatives and no air quality-related mitigation measures will be implemented.

IP-19-6

As stated in Section 1.2.1.2, Capacity, Transportation Demand, and Safety, of the RDEIR/SDEIS, regional population is forecast to grow by 20 percent and the Study Area population is forecast to grow by 10 percent from 2012 to 2035. Employment will follow a similar pattern, with regional growth of 27 percent and Study Area employment growth of 11 percent. Growth will be lower in the Study Area because it is almost completely developed. Increases in population, employment, and goods movement between now and 2035 will lead to more traffic on the I-710 freeway and on the streets and roadways within the Study Area as a whole.

Implementation of CARB's implementation of the Truck and Bus Regulation and the Ports' Clean Truck Programs is expected to accelerate fleet turnover to newer and cleaner (model year 2010 and beyond) trucks by 2023. Further, the South Coast Air Quality Management District (SCAQMD) is implementing control measures as part of the 2016 Air Quality Management Plan (AQMP) that incentivizes the transition of the fleet to Zero Emissions/Near Zero Emissions (ZE/NZE). Since a build alternative has not been selected as the Preferred Alternative for the I-710 Corridor Project, the I-710 Clean Truck Program will not be implemented by Caltrans as the lead agency under CEQA and NEPA and as the owner/operator of the I-710 freeway.

IP-19-7

Please refer to Section 1.6 of this appendix for more detailed information regarding the arterial parking restrictions proposed as part of the build alternatives. As stated in Response to Comment IP-19-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, no improvements will be made to the I-710 Corridor and the arterial parking restrictions will not be implemented.

IP-19-8

Please refer to Response to Comment IP-19-7 and Section 1.6 of this appendix for more detailed information regarding the arterial parking restrictions proposed as part of the build alternatives.

IP-19-9

Caltrans and Metro thank the commenter for their input. The commenter's opposition to the displacement of residents in East Los Angeles is acknowledged and included in the project record. Alternative 1 (No Build) has been identified as the Preferred Alternative and would not require any displacements. Please refer to Section 1.1 of this appendix for a discussion on the identification of the Preferred Alternative.

IP-19-10

Please refer to Response to Comment IP-19-8 regarding the arterial parking restrictions proposed as part of the build alternatives.

IP-19-11

Caltrans and Metro thank the commenter for this information, and the agencies regret the error. It is assumed that the commenter is specifically referring to the multi-unit property located at 626 S. Sydney Dr. in East Los Angeles. This property was originally identified as being a five-unit property in the *Draft Relocation Impact Report* (March 2017) and the RDEIR/SDEIS; however, the property contains ten units. This information has been acknowledged and included in the project record. Alternative 1 (No Build) has been identified as the Preferred Alternative. Therefore, no displacement of residents or businesses from the community of East Los Angeles will occur under the Preferred Alternative.

IP-19-12

It is important to note that there would be no displacements of businesses or residents within East Los Angeles as a result of the Preferred Alternative (Alternative 1 No Build). However, it should be noted that the replacement area for the build alternatives included the displacement communities as well as adjacent cities and communities along the I-710 Corridor. The search for replacement housing was confined to this replacement area, and did not include (for example) the entire City of Los Angeles. The replacement area map included as Appendix A to the *Draft Relocation Impact Report* (March 2017) shows the location of potential replacement sites along the I-710 Corridor. The community of East Los Angeles was included on the replacement area map as a portion of unincorporated Los Angeles County and a number of potential replacement sites were identified within East Los Angeles. Appendix E to the *Draft Relocation Impact Report* listed specific replacement dwellings for sale and for lease and included a number of potential replacement residences within the three zip codes that comprise East Los Angeles. Please refer to Section 1.5 for more detail regarding the methodology used to determine replacement housing.

IP-19-13

The commenter's opposition to the build alternatives is acknowledged and included in the project record. Please refer to Section 1.1 of this appendix for a discussion on the identification of the Preferred Alternative.

IP-19-14

The commenter's opposition to displacements is acknowledged and noted in the public record. The I-710 Corridor includes communities that have a relatively high percentage of environmental justice populations (i.e., low-income and minority populations), as described in more detail in Section 3.3.3 of the RDEIR/SDEIS. Therefore, any relocations under the build alternatives, including those that are unavoidable, would affect environmental justice populations. Should a build alternative be selected as the Preferred Alternative, Measure C-7 would address environmental justice impacts by providing funding for targeted improvements that would improve air quality and public health, reduce traffic congestion, provide aesthetic/visual enhancements, and improve parks and recreation within census tracts adjacent to the I-710 that have been defined as having a high percentage of minority and/or low-income populations. However, as stated in Response to Comment IP-19-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no displacements.

IP-19-15

The commenter's opposition to displacements and concern about loss of businesses and fire stations is acknowledged and noted in the public record. Under the Preferred Alternative, no displacements of residents or businesses will occur within East Los Angeles.

IP-19-16

The commenter's opposition to the build alternatives is acknowledged and included in the project record. According to the traffic forecasting analyses performed and described in Section 3.5, Traffic, of the RDEIR/SDEIS, overall in the 2035 horizon year, traffic congestion under the build alternatives would be generally maintained or improved in the morning, midday, and evening peak periods in both directions of I-710 when compared to the future 2035 No Build Alternative. There would be degradation in level of service (LOS) with the project build alternatives at some locations, as several intersections would experience poor LOS and delay upon implementation of the build alternatives (32 intersections under the preferred Alternative 5C and 30 intersections under Alternative 7); however, should a build alternative be selected as the Preferred Alternative, mitigation in the form of traffic signal upgrades and intersection improvements would be implemented for all but two of the impacted intersections under Alternative 5C and all but four of the impacted intersections under Alternative 7. Mitigation is not proposed at these locations due to right-of-way constraints. Please refer to Section 3.5 of the Final EIR/EIS for more detailed

information as to specific locations of impacts. To address any increases in traffic noise as a result of the build alternatives, soundwalls are proposed at various locations within the I-710 Corridor, where deemed feasible and reasonable per 23 CFR 772. Please refer to Section 3.14 of the Final EIR/EIS for more detailed information on traffic noise impacts. As discussed in Section 3.13, Air Quality, in the RDEIR/SDEIS, all build alternatives would generally improve air quality and reduce public health risk. Along I-710, air quality would be improved and public health risk would be reduced at most locations, but there are a few near-roadway locations where there would be an increase in certain emissions.

IP-19-17

As stated in Response to Comment IP-19-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, there is no need for project funding or more information regarding construction staging.

IP-19-18

Should a build alternative be selected as the Preferred Alternative, Caltrans and Metro would commit to funding the Community Health Benefit Program and the I-710 Clean Truck Program (referred to in the RDEIR/SDEIS as the I-710 Corridor Project Zero Emission/Near Zero Emission Truck Technology Deployment Program) as components of any build alternative selected for implementation, and have included those programs in the Project Description of the build alternatives. However, since a build alternative has not been selected as the Preferred Alternative, these programmatic elements will not be implemented by Caltrans as the lead agency under CEQA and NEPA and as the owner/operator of the I-710 freeway. Please refer to Section 1.10 of this appendix for more information regarding the Community Health Benefit Program, and Section 2.3.2.1 of this Final EIR/EIS for more details of these programs. In addition, since the No Build Alternative has been selected as the Preferred Alternative, no funding of the I-710 Corridor Project will be necessary.

IP-19-19

The commenter’s opposition to displacements and opposition to the design options are acknowledged and noted in the public record. Design refinements of the build alternatives to minimize acquisition of property and displacements have been ongoing since the start of project development. While great effort has been made through the design review process to minimize right-of-way impacts of the build alternatives to the greatest degree feasible, some relocations would be unavoidable in implementing 19 miles of freeway modernization. However, as stated in Response to Comment IP-19-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, there is no need for right-of-way and housing and business displacements.

IP-19-20

Per Executive Order 12898, *Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations,* Federal agencies must take appropriate and necessary steps to identify and address disproportionally high and adverse effects of Federal projects on the health or environment of minority and low-income populations to the greatest extent practicable and permitted by law. Should a build alternative be selected as the Preferred Alternative, Measure C-7 in Section 3.3.3.7 in the RDEIR/SDEIS on p. 3.3-150, would be implemented to address disproportionate impacts to environmental justice populations and funding would be provided to local jurisdictions for targeted improvements. These improvements would be made within the United States Census Bureau census tracts adjacent to the I-710 freeway that have been identified as having a high percentage of minority and/or low-income populations compared to the County of Los Angeles, which would include tracts within East Los Angeles. However, as stated in Response to Comment IP-19-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no impact to environmental justice populations as a result of the build alternatives.

IP-19-21

Actual collision data based on reporting provided by the California Highway Patrol were provided in Section 1.2.1.2 of the RDEIR/SDEIS and are collected in order to understand if existing accident rates are higher on the subject route than on similar facilities within the State, and if the types of accidents that occur help to identify the types of improvements that would be most beneficial to implement. The comparison of actual accident rates on I-710 with statewide averages for facilities of this type was performed in order to help identify where accidents are currently occurring on I-710. These calculations are performed using accident data collected by law enforcement agencies on the state roadway network and maintained in databases managed by Caltrans. As seen in Tables 1.2-4 and 1.2-5 in Chapter 1.0, Proposed Project, of the RDEIR/SDEIS, State averages are used for comparison purposes. National averages are not used. This comparison of actual accident rates with statewide average accident rates is used to better understand existing travel conditions and existing accident problems on I-710. On the other hand, a safety assessment was performed using an alternative method for the future year (2035) comparison, with and without the build alternatives. This safety assessment examined issues such as the elimination of operational conflicts realized by the new freeway design, as well as proposed freeway features that separate cars and trucks in order to evaluate and compare the relative safety performance of the proposed build alternatives.

IP-19-22

The commenter’s support of park space and zero emissions is acknowledged and included in the project record. Please refer to Section 1.1 of this appendix for a discussion on the identification of the Preferred Alternative and Section 1.3 of this appendix for additional discussion of ZE

options. As stated in Response to Comment IP-19-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no impacts to play areas within the I-710 Corridor. Please note that passive park and landscape improvements may be projects eligible for funding under the Community Health Benefit Program. However, since a build alternative has not been selected as the Preferred Alternative, the Community Health Benefit Program programmatic element will not be implemented as part of this Project. Please refer to Section 1.10 of this appendix for more information on the Community Health Benefit Program.

IP-19-23

The commenter's concern regarding displacement of people as a result of the build alternatives is acknowledged and included in the project record. As stated in Response to Comment IP-19-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no displacements.

IP-19-24

Please note that the build alternatives propose Measure AQ-3, where installation of solid barriers and vegetation for pollution dispersion purposes, would be implemented during final design of the build alternatives and where feasible, should a build alternative be selected as the Preferred Alternative. However, as stated in Response to Comment IP-19-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, Measure AQ-3 will not be implemented. Additionally, passive park and landscape improvements may be projects eligible for funding under the Community Health Benefit Program. However, since a build alternative has not been selected as the Preferred Alternative, the Community Health Benefit Program programmatic element will not be implemented as part of this Project. Please refer to Section 1.10 of this appendix for more information on the Community Health Benefit Program.

IP-19-25

As discussed in Section 1.2.2 in Chapter 1.0, Proposed Project, of the RDEIR/SDEIS, one of the purposes of the project is to improve air quality and public health. As discussed in Section 3.13, Air Quality, in the RDEIR/SDEIS, all build alternatives would generally improve air quality and reduce public health risk. Along I-710, air quality would be improved and public health risk would be reduced at most locations, but there are a few near-roadway locations where there would be an increase in certain emissions.

Should a build alternative be selected as the Preferred Alternative, Measures AQ-2 and AQ-3 would be implemented to reduce emissions at near-roadway locations. Measure AQ-2 would provide for air filtration systems for schools near I-710. Measure AQ-3 would provide for the installation of solid barriers where soundwalls are not proposed and installation of vegetation to disperse pollution and reduce pollutant concentrations downwind. In addition, the build

alternatives include programmatic components to help improve air quality and public health in the I-710 Corridor. However, since a build alternative has not been selected as the Preferred Alternative, these programmatic elements will not be implemented by Caltrans as the lead agency under CEQA and NEPA and as the owner/operator of the I-710 freeway. Please refer to Section 1.10 of this appendix for more detailed information on the Community Health Benefit Program.

IP-19-26

As stated in Response to Comment IP-19-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, no funding will be necessary for the I-710 Corridor Project. It is important to note that since a build alternative has not been selected as the Preferred Alternative, programmatic elements included under the I-710 Corridor Project build alternatives, such as the Community Health Benefit Program, will not be implemented by Caltrans as the lead agency under CEQA and NEPA and as the owner/operator of the I-710 freeway. Please also refer to Section 1.10 of this appendix for more detailed information on the Community Health Benefit Program. It is acknowledged that there are many important needs within the communities that comprise the I-710 Study Area. The I-710 Corridor Project build alternatives were developed to address some, but not necessarily all, of those needs and aimed to address the transportation, freeway safety, air quality, and air quality-related human health concerns along the I-710 freeway corridor.

IP-19-27

Please refer to Response to Comment IP-19-26 regarding the applicability of transportation funds for other non-transportation uses.

IP-19-28

Please refer to Section 1.2 of this appendix for more information regarding the public hearings held for the project. In general, Commerce was selected as the location of the public hearing for the northern end of the Study Area because of the large amount of relocation impacts that occur within the City as a result of the build alternatives.

IP-19-29

The commenter's opposition to Design Options 3A and 3B are acknowledged and included in the project record. However, as stated in Response to Comment IP-19-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, Design Options 3A and 3B will not be implemented. Please refer to Section 1.1 of this appendix for a discussion on the identification of the Preferred Alternative.

IP-19-30

It is unclear what the commenter means specifically regarding effects to businesses along Atlantic Blvd. Programmatic arterial parking restrictions, including along Atlantic Blvd. between Pacific Coast Hwy. and SR-60, were originally proposed as a programmatic component of the build alternatives, but will no longer be implemented since the No Build Alternative has been selected as the Preferred Alternative. Please refer to Section 1.6 of this appendix for more detailed information regarding the proposed parking restrictions. In addition, no businesses on Atlantic Blvd. would not be displaced as a result of the Preferred Alternative.

As discussed in Section 1.2.2 in Chapter 1.0, Proposed Project, of the RDEIR/SDEIS, one of the purposes of the project is to improve air quality and public health. As discussed in Section 3.13, Air Quality, and Chapter 4.0, CEQA Evaluation, in the RDEIR/SDEIS, all build alternatives would generally improve air quality and reduce public health risk. Along I-710, air quality would be improved and public health risk would be reduced at most locations, but there are a few near-roadway locations where there would be an increase in certain emissions but no increase in cancer risk compared to the 2012 Baseline.

When compared to the 2035 No Build Alternative, both build alternatives would reduce cancer risk at most locations; however, a small increase in cancer risk would occur at some locations within 100 meters of I-710. For Alternative 5C, the maximum increase in risk would be approximately three in one million. The primary location of the increased risk for Alternative 5C would occur along a small portion of I-710 just south of SR-60. For Alternative 7, the increase in risk would be less than one in one million.

Should a build alternative be selected as the Preferred Alternative, Measures AQ-2 and AQ-3 would be implemented to reduce emissions at near-roadway locations. Measure AQ-2 would require filters on the ventilation systems of schools near I-710. Measure AQ-3 would provide for the installation of solid barriers where soundwalls are not proposed and the installation of vegetation to disperse pollution and reduce pollutant concentrations downwind. However, as stated in Response to Comment IP-19-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, Measures AQ-2 and AQ-3 will not be implemented.

IP-19-31

Forecast traffic volume increases on I-710 in East Los Angeles under both the No Build and build alternatives would be comprised of trips primarily traveling through this area, rather than destined to locations within East Los Angeles. Traffic volumes on arterial streets in the East Los Angeles area are forecast to increase on average by about 3 to 7 percent between 2012 existing conditions and the 2035 No Build Alternative, while auto traffic volume on I-710 through East Los Angeles under the No Build Alternative is forecast to decrease about one-half percent compared to 2012 existing conditions over that same time period (refer to the *Intersection Traffic Impact Analysis*

Report [March 2017]; and the *I-710 Corridor Project Traffic Operations Analysis Report* [March 2017]). This data infers that forecast increases in traffic on local streets in East Los Angeles would be a result of population and employment growth within and surrounding East Los Angeles, not as a result of proposed improvements to I-710 under the build alternatives.

IP-19-32

The commenters concern about lack of parking and air quality is acknowledged and noted in the public record. The removal of on-street parking on major arterials during peak periods under the build alternatives were detailed in Table 3.3-9 in Section 3.3, Community Impacts, of the RDEIS/SDEIS. Field observations verified that the parking demand could be adequately absorbed in off-street parking areas for uses that generate the demand (e.g., parking lots) as well as in on-street parking areas directly off these main arterials. However, the No Build Alternative has been selected as the Preferred Alternative and the programmatic parking restrictions proposed as a part of the build alternatives will not be implemented. Please refer to Section 1.6 of this appendix for more detailed information regarding the parking restrictions.

Air quality impacts were analyzed in Section 3.13, Air Quality, in the RDEIR/SDEIS. The analysis contained in that section discloses that all build alternatives would generally improve air quality. Total emissions for NO_X, PM_{10}, and $PM_{2.5}$, and DPM in the entire Area of Interest as compared to the 2012 Baseline and 2035 Alternative 1 (No Build Alternative) are presented in the gridded mass emission plots (Figures 4-1a to 4-2c in Appendix Q of the RDEIR/SDEIS). The gridded emission maps show that emissions would primarily decrease throughout the Area of Interest for NO_X, PM_{10}, and $PM_{2.5}$, when compared to the 2012 Baseline and 2035 Alternative 1 (No Build). Some increases are seen for $PM_{2.5}$ and PM_{10} at grid cells that are very close to the freeway. However, these increases would be less than SCAQMD Significance Criteria.

IP-19-33

Arterial parking restrictions, including along Atlantic Blvd. between Pacific Coast Hwy. and SR-60, were originally proposed as a programmatic component of the build alternatives. However, the No Build Alternative has been selected as the Preferred Alternative and the arterial parking restrictions proposed as a part of the build alternatives will not be implemented. Please refer to Section 1.6 of this appendix for more detailed information regarding the proposed parking restrictions.

IP-19-34

Maximum incremental impacts of particulate matter emissions and cancer risk at schools within 3 kilometers of the I-710 freeway for the build alternatives as compared to the 2012 Baseline and 2035 No Build Alternative are shown in the table below. The cancer risk estimates for schools presented in this table are conservative, as the calculations assumed residential exposure from

ages third trimester to 30 years. Since students typically attend schools from ages 5 to 18, it is likely that actual cancer risk would be lower than presented in this table below.

Further, as stated on pages 3.13-56 and 3.13-57 of the RDEIR/SDEIS, should a build alternative be selected as the Preferred Alternative, implementation of Mitigation Measure AQ-2 would result in the installation of high-efficiency filters in ventilation systems at schools located within 0.25 mile of the I-710 freeway, which would reduce indoor particulate concentrations and would further reduce cancer risks to students attending schools in the vicinity of I-710. However, since the No Build Alternative has been selected as the Preferred Alternative, Measure AQ-2 will not be implemented.

Incremental Impacts of PM and Cancer Risk

	Maximum Incremental 24-hour PM_{10} Concentration ($\mu g/m^3$)	**Maximum Incremental Annual Average PM_{10} Concentration ($\mu g/m^3$)**	**Maximum Incremental 24-hour $PM_{2.5}$ Concentration ($\mu g/m^3$)**	**Maximum Incremental Annual Average $PM_{2.5}$ Concentration ($\mu g/m^3$)**	**Maximum Incremental Cancer Risk (in one million)**
2035 Alternative 1 (No Build) Minus 2012 Baseline	1.14	0.44	0.00214	-0.0068	-7.66
2035 Alternative 5C Minus 2012 Baseline	2.15	1.10	0.10	-0.0055	-7.70
2035 Alternative 7 Minus 2012 Baseline	4.08	2.03	0.32	0.14	-7.79
2035 Alternative 5C Minus 2035 Alternative 1 (No Build)	1.45	0.68	0.33	0.15	1.15
2035 Alternative 7 Minus 2035 Alternative 1 (No Build)	3.60	1.74	0.71	0.35	-0.13

PM = particulate matter
PM_{10} = particulate matter less than ten microns in diameter
$PM_{2.5}$ = particulate matter less than 2.5 microns in diameter

IP-19-35

As shown in Section 3.14.5.10 of the RDEIR/SDEIS, a soundwall is proposed at Washington Blvd. and I-710 under the build alternatives. As discussed in Section 2.3, the build alternatives would involve modifications to local interchanges, streets, crossings, and frontage roads near I-710 to improve traffic safety, circulation, and access. Figure 2.3-6 shows the improvements that are proposed at the Washington Blvd./I-710 interchange under the build alternatives. However, as stated in Response to Comment IP-19-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, improvements will not be made to the Washington Blvd./I-710 interchange as a part of the build alternatives.

IP-19-36

As stated in Response to Comment IP-19-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, funding will not be necessary. It is important to note that generally, transportation projects are not funded until they are approved, and project approval follows the completion of the environmental document and Preferred Alternative identification process. With many projects competing for funding from the available programs every year, as well as taking into account fluctuations in revenue, potential funding opportunities and general funding landscapes are re-evaluated frequently.

IP-19-37

Metro and Caltrans acknowledge that one of the purposes of the project is to address projected growth in population, employment, and activities related to goods movement. However, other project purpose statements are to improve air quality and public health, and improve traffic safety. However, as stated in Response to Comment IP-19-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, construction of the build alternatives will not occur. For more detailed information on the Preferred Alternative identification process, please refer to Section 1.1 of this appendix.

IP-19-38

As stated in Response to Comment IP-19-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no business or residential displacements. Also, please refer to Section 1.3 of this appendix for more information regarding ZE/NZE technology.

IP-19-39

Caltrans and Metro both respectfully disagree that the I-710 Corridor Project is not abiding by the requirements set forth by Metro Board Motion 22.1. As set forth in the motion, several elements were adopted into the RDEIR/SDEIS analysis. The locations of those elements within the RDEIR/SDEIS and Final EIR/EIS are listed in Table 2.2-1 of the document. Several other elements of Motion 22.1 were intended to occur in parallel to, but separate from, the I-710 Corridor Project RDEIR/SDEIS process. Please refer to Section 1.8 in this appendix for more information on Motion 22.1.

IP-19-40

Caltrans is the lead agency under CEQA and NEPA and will ultimately approve a project on the State Highway System. Caltrans, Metro, and the various project funding partners have worked in close coordination with each other and with various stakeholders throughout project development.

IP-19-41

As stated in Response to Comment IP-19-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no business or residential displacements. It is important to note that Caltrans' Relocation Assistance Program (RAP), as established by Federal and State law, provides help to individuals, families, businesses, and others that are required to relocate as a result of a public improvement project. Its primary objective is to assist all project displacements so that they do not suffer disproportionate injury as a result of projects constructed for the benefit of the public. Federal and State laws (the Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970, as amended, also known as the Uniform Relocation Act or the Uniform Act, and California Government Code, Chapter 16, Section 7260, et seq.) require that relocation assistance be provided to any eligible person, business, farm, or nonprofit operation displaced because of the acquisition of real property by a public entity for public use.

IP-19-42

As indicated in Section 2.2.2 of the RDEIR/SDEIS, Alternative 5C and 7 were developed in response to a more comprehensive understanding of traffic patterns and behavior within the Study Area and beyond, particularly related to goods movement, changes in the status of major Port projects, changes in regional truck travel patterns, and in response to public input on the set of build alternatives evaluated in the Draft EIR/EIS released for public comment in 2012. At a very broad level, the two build alternatives evaluated in the RDEIR/SDEIS resemble their predecessors evaluated in the Draft EIR/EIS circulated for public review in 2012. However, from a more localized perspective, as viewed by the communities that line the I-710 Corridor, the geometric configuration of Alternative 5C is markedly different from Alternative 5A with different local interchange designs, changes in the mainline mixed flow lanes, locations of auxiliary lanes, modifications to the I-710/SR-91 freeway to freeway interchange design, repositioning of ramps and collector-distributor roads in the vicinity of the Atlantic Blvd./Bandini Blvd. complex, and different design options that would address congestion hot spots through East Los Angeles and would improve access to downtown Long Beach. While Alternative 7 retained a freight corridor, it eliminated general purpose through lanes from the I-710 freeway design, eliminated some freight corridor ramps to further reduce right-of-way impacts, and shifted several sections of the overall alignment, as compared to Alternatives 6A, 6B, and 6C. In addition, many of the local interchange and operational design improvements to I-710 identified for the newly designed Alternative 5C were also carried over into Alternative 7 to address existing design deficiencies and safety concerns on I-710. In the 2012 Draft EIR/EIS, Alternative 5A was evaluated as a standalone alternative, which included TSM/TDM/Transit/ITS improvements, arterial highway and congestion relief improvements, and widening of the mainline to include ten lanes throughout the length of the I-710 Corridor and modernization of the design. Alternative 5A also redesigned freeway-to-freeway and arterial interchanges. Alternative 5A differs from Alternative 5C, evaluated in the RDEIR/SDEIS circulated for public comment in 2017, in the ultimate number of lanes that would

be provided. Alternative 5C would provide for a widening of the mainline to eight general purpose lanes from Anaheim St. to I-405, and up to ten lanes from I-405 to Olympic Blvd. Alternative 5C would also provide truck bypass lanes in each direction around the I-710/I-405 interchange, and a lane buffer in each direction between Pacific Coast Highway and Shoreline Dr. that would address safety and operational deficiencies.

Alternative 6 and its variations were also evaluated in the 2012 Draft EIR/EIS and were principally composed of the addition of mainline lanes as well as the construction of a separated freight corridor structure. In contrast, in response to public and agency comments requesting the addition of a freight-only corridor without mainline widening, Alternative 7 would not include the addition of general purpose lanes to I-710.

Importantly, the suite of build alternatives evaluated in the 2012 Draft EIR/EIS also did not include the programmatic elements proposed in the RDEIR/SDEIS (the I-710 Clean Truck Program [referred to in the RDEIR/SDEIS as the I-710 Corridor Project Zero Emission/Near Zero Emission Truck Technology Deployment Program], the Community Health Benefit Program, the ITS/TSM/ Congestion Relief Program, and the Transit Program).

IP-19-43

The commenter's concern regarding displacement of people as a result of the build alternatives is acknowledged and included in the project record. As stated in Response to Comment IP-19-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no business or residential displacements.

IP-19-44

A thorough analysis of impacts to communities, including children, can be found in Section 3.3, Community Impacts, of this Final EIR/EIS. This analysis took into account the location of schools within proximity to the proposed improvements for the build alternatives and the potential impacts to those schools. In addition, schools were determined to be "sensitive receptors" taken into account in the air quality and health risk analyses. Please refer to Section 3.13, Air Quality, of this Final EIR/EIS for more detailed information.

IP-19-45

As stated in Response to Comment IP-19-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, funding is unnecessary. It is important to note that one of the key purposes of holding public meetings for the project is to solicit input from the surrounding communities in different areas along the I-710 Corridor early in the project development process. While funding devoted to making transportation improvements to I-710 in East Los Angeles would help alleviate congestion and address safety issues between I-5 and SR-60, these design options

would also involve impacts to some of the residential properties next to the freeway. It is important to identify these potential trade-offs for purposes of public discussion and consideration to help inform the selection of alternatives and/or design options.

IP-19-46

The commenter's opposition to the displacement of people as a result of the build alternatives is acknowledged and included in the project record. As stated in Response to Comment IP-19-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no business or residential displacements.

IP-19-47

The concept of each corridor city housing and maintaining a central depot for receiving Port trucks is interesting; however, truck traffic patterns are generally dictated by the economic market for the goods being transported. Caltrans and Metro cannot, and do not have the jurisdiction, to control truck movement throughout the I-710 Corridor area. The I-710 Corridor Project build alternatives aim to better accommodate travel, including truck travel, within the I-710 Corridor area.

IP-19-48

The commenter's concerns about pollution and asthma affecting the students who attend Humphrey Avenue Elementary School is acknowledged and included in the project record. As discussed in Section 1.2.2 in Chapter 1.0, Proposed Project, of the RDEIR/SDEIS, one of the purposes of the project is to improve air quality and public health. As discussed in Section 3.13, Air Quality, in the RDEIR/SDEIS, all build alternatives would generally improve air quality. Along I-710, air quality would be improved at most locations, but there are a few near-roadway locations where there would be an increase in certain emissions.

However, should a build alternative be selected as the Preferred Alternative, it would include measures to improve exposure to emissions at near-roadway locations, including Humphreys Avenue Elementary School. Measure AQ-2 would provide for the installation of filters on the ventilation systems of schools near I-710, including Humphreys Avenue Elementary School. The air filters would remove pollutants from indoor air, where school children spend the majority of their time while at school. Measure AQ-3 would provide for installation of solid barriers and vegetation where feasible along I-710 to disperse pollution and reduce pollutant concentrations. However, since the No Build Alternative has been selected as the Preferred Alternative, Measures AQ-2 and AQ-3 will not be implemented. Additionally, the I-710 Corridor Community Health Benefit Program was included as a programmatic component of the build alternatives and would have taken the form of a grant program structured to provide corridor communities the opportunity to implement projects or outreach activities that would improve air quality and public health related

to I-710 travel and goods movement. However, since a build alternative has not been selected as the Preferred Alternative, this programmatic element will not be implemented by Caltrans as the lead agency under CEQA and NEPA and as the owner/operator of the I-710 freeway. Please refer to Section 1.10 of this appendix for more information regarding the Community Health Benefit Program.

IP-19-49

The commenter is likely referring to two distinct projects that have been under construction on I-710 in recent years: the construction of a concrete median barrier that replaced a metal beam guardrail median (project cost $26 million), and the I-710 Long Life Pavement Rehabilitation Project, which is currently under construction (project cost $56 million). The installation of the concrete median barrier was necessary for safety and liability reasons and could not be deferred until the details of the Long Life Pavement Rehabilitation Project, which was not funded at the time, were known. Planning for the Long Life Pavement Rehabilitation Project began approximately one year before the median barrier project completed construction. The pavement project lowered portions of the freeway to increase bridge clearances for tall vehicles, rendering the new median too tall, and therefore, obstructing lines of sight in some areas. In those areas, the median was removed and replaced with a temporary barricade. This removal cost approximately $110,000. It was unfortunate that the two projects could not be coordinated, as Caltrans seeks to expend funding as efficiently as possible, and with as little “throw-away” work as is feasible. However, the urgent need for the median project and the unknown funding and timing of the pavement project could not be reconciled. Since the No Build Alternative has been selected as the Preferred Alternative, there will be no construction along I-710 as a part of the I-710 Corridor Project build alternatives.

IP-19-50

The commenter appears to be referring to the future efficiencies of electric vehicles as well as unanticipated costs of the I-710 Corridor Project build alternatives. The air quality and energy analyses prepared for the RDEIR/SDEIS did take into account the presence of electric autos as part of the future vehicle fleet on I-710. However, as stated in Response to Comment IP-19-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, funding is unnecessary.

IP-19-51

The Office of Supervisor Hilda Solis submitted this transcript as a formal comment and the comments herein have been responded to and included in the project record. Please refer to Section 1.2 of this appendix for more information regarding the extensive public outreach and involvement process undertaken through the life of the project. The build alternatives evaluated in the Draft EIR/EIS released for public review in 2012 were withdrawn and revised to more closely

respond to public input and comments. Caltrans and Metro are cognizant of the need to balance necessary transportation improvements with the concerns of potentially impacted communities, and have introduced mitigation measures and programmatic project elements to help address those concerns related to the build alternatives.

IP-19-52

Please refer to Response to Comment IP-19-48 the Community Health Benefit Program.

IP-19-53

Please refer to Section 1.6 of this appendix for more detailed information regarding the arterial parking restrictions proposed as part of the build alternatives. As stated in Response to Comment IP-19-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, these parking restrictions would no longer be implemented.

IP-19-54

Please refer to Response to Comment IP-19-53 regarding arterial parking restrictions.

IP-19-55

It is unclear what the commenter is referring to when they indicate that a decision has been made. A Preferred Alternative is not selected by Caltrans until circulation of the draft environmental document is complete and public comments have been received and taken into consideration. In addition, a project is not formally approved by Caltrans until the final Project Report is signed, after the approval of the Final EIR/EIS. Although the No Build Alternative has been selected as the Preferred Alternative, it is important to note that the suite of build alternatives evaluated in the RDEIR/SDEIS was revised in response to public and agency comments on the 2012 Draft EIR/EIS.

IP-19-56

The commenter may be referring to a list of key infrastructure projects submitted to the Trump administration via the National Governor's Association in February 2017 outlining the State's priority projects considered "important and transformative" and that should be considered for Federal funding. The I-710 Corridor Project was included on that list, which encompassed road, levee, bridge, port, transit, and water storage and recycling projects, among others. It should be

noted that this list only provides priority projects and no funding has been guaranteed or secured.[3] Based on preliminary cost estimates provided for the two build alternatives, it would be necessary to seek funding from multiple sources to fully fund either build alternative. As with all large projects such as I-710, it is envisioned that a long lead time would be required to obtain all of the necessary project funding should a build alternative be selected as the Preferred Alternative. For example, funding for the different elements included in the build alternatives such as transit improvements, zero emission trucks, local intersection improvements, freeway improvements, intelligent transportation systems, and goods movement-related projects rely on different funding programs and sources. While some local funding has been earmarked for the I-710 Corridor through Measure R and Measure M, funding for the entirety of either build alternative has not been programmed and committed. However, as stated in Response to Comment IP-19-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, funding will be unnecessary.

IP-19-57

The build alternatives include programmatic components to help improve air quality in the I-710 Corridor by increasing the number of ZE/NZE trucks in the I-710 Corridor. As discussed in Section 2.3.2, Build Alternatives, in the Final EIR/EIS, the I-710 Clean Truck Program (referred to in the RDEIR/SDEIS as the I-710 Corridor Project Zero Emission/Near Zero Emission Truck Technology Deployment Program) is a programmatic component of the build alternatives. This program would provide funding to individual owner-operators and privately owned truck fleets to subsidize the purchase of heavy-duty (Class 8) ZE/NZE trucks for use within the I-710 Corridor. More information regarding the program is contained in Section 2.3.2.1 of the Final EIR/EIS. At Metro's Regular Board Meeting on March 1, 2018, the Metro Board approved a motion to change the ZE/NZE truck technology development program to the phased-in "Zero Emission Truck Technology Development Program." The motion includes increasing the program funding target from $100 million to $200 million, as well as the provision of incentives and grants investment to help accelerate zero emission technologies both for long-hauling trucks and for zero emission charging or fueling infrastructure within the I-710 Corridor. A motion was also approved to develop a strategic plan that is consistent with the SCAQMD plans, which would expedite the transition from diesel freight trucks to near-zero emission vehicles as soon as possible, with a goal to transitioning to zero emission vehicles as the cleanest, most reliable technologies become available.

NZE trucks would be non-diesel and would meet CARB's optional low-NO_X standard of 0.02 gm/bhp-hr, which would lower DPM to zero and NO_X emissions by 90 percent compared to

[3] Los Angeles Times. 2017. California Submits A $100-Billion Wish List Of Infrastructure Projects To Trump For Federal Funding. February 8, 2017. Website: http://www.latimes.com/ politics/essential/la-pol-ca-essential-politics-updates-california-submits-100-billion-in-1486590025-htmlstory.html# (accessed September 21, 2018).

conventional heavy-duty trucks. ZE trucks would have even lower emissions as the tailpipe emissions of all criteria air pollutant, greenhouse gas, and mobile source air toxics would be zero. It is acknowledged that all on-road vehicles, even ZE and NZE cars and trucks, emit brake/tire wear and entrained dust emissions; therefore, by 2035, these would be the dominant mobile source particulate matter emissions in the I-710 Corridor. However, since a build alternative has not been selected as the Preferred Alternative, this programmatic element will not be implemented by Caltrans as the lead agency under CEQA and NEPA and as the owner/operator of the I-710 freeway.

In addition to the I-710 Clean Truck Program, CARB and SCAQMD are implementing programs and strategies to improve air quality near freeways. CARB is implementing several regulations such as the Truck and Bus Regulation, Pavley Standards, and Advanced Clean Cars Program to reduce emissions associated with vehicles traveling on the freeway. Besides this regulation, CARB is also in the process of developing other regulations that target buses and heavy-duty trucks such as the Innovative Clean Transit Regulation and the Advanced Clean Trucks Regulation. SCAQMD is also implementing several control measures under the 2016 Air Quality Management Plan to encourage the deployment of ZE/NZE technologies.

IP-19-58

Based on the analyses performed that were included in the RDEIR/SDEIS, air quality and traffic congestion would generally be improved with the build alternatives. Please refer to Section 3.5, Traffic, and Section 3.13, Air Quality, for more detailed information.

As stated in Response to Comment IP-19-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no displacements of business or residences.

IP-19-59

The commenter’s concern regarding the displacement or elimination of homeless services is acknowledged and included in the project record. Alternative 1 (No Build) has been identified as the Preferred Alternative and will not result in the displacement or elimination of either the Salvation Army Bell Shelter or the Long Beach Multi-Service Center.

IP-19-60

The commenter’s support of zero emissions is acknowledged and included in the project record. Please refer to Section 1.1 of this appendix for a discussion on the identification of the Preferred Alternative and Section 1.3 of this appendix for additional discussion of ZE options.

IP-19-61

Please refer to Section 1.2 of this appendix regarding the extension of the public comment period.

IP-19-62

Community input is a cornerstone of the environmental and project development processes, and because of the scope and scale of the I-710 Corridor Project, a more comprehensive public outreach framework was used. Please refer to Section 1.2 of this appendix for more detailed information on the public involvement process used for the project. The outreach framework for the I-710 Corridor Project is specific to the needs of the project, as it was a modified continuation of the outreach framework utilized on the *Major Corridor Study*, completed in 2005. Not all Caltrans projects will employ such a robust outreach framework; that decision is ultimately up to the project-specific Project Development Team. It should be noted that community feedback and comments were one of the major reasons as to why the original set of alternatives presented in the Draft EIR/EIS circulated in 2012 was withdrawn and revised.

IP-19-63

The commenter's concerns regarding air pollution and sensitive populations is acknowledged and included in the project record. As discussed in Section 3.13 of the RDEIR/SDEIS, and as shown in the maps and plots provided in Appendix Q, Air Quality/Health Risk Assessment Maps, the build alternatives would improve air quality and reduce public health risk in the Basin and the I-710 Area of Interest. Along I-710, air quality would be improved and public health risk would be reduced at most locations, but there are some near-roadway locations where there would be an increase in emissions. Alternative 5C would have the fewest areas with these near-roadway impacts. A thorough analysis of impacts to communities, including children, can be found in Section 3.3, Community Impacts, of the Final EIR/EIS. This analysis took into account the location of schools within proximity to the build alternatives and the potential impacts to those schools.

Subject: 710 Corridor Project - Need safe bicycle facilities

Dear Mr Kosinski,

I am very concerned about the "diverging diamond interchanges" that are proposed for Anaheim St, PCH, and Del Amo Ave. I live in North Long Beach just east of the LA River and north of Del Amo. Currently there is no safe way to bike or walk to the Del Amo Blue Line station. I literally risk my life when I have to bike there. I can't even get off my bike and walk it because there aren't sidewalks that connect the LA River bridge to the west side of the 710 underpass. It is horrific. Especially when I have my kids with me. IP-20-1

The proposed diverging diamond interchange with standard bike lanes is not an acceptable solution. We need a physically protected bike path to safely navigate over the LA River and under the 710 to the Del Amo Blue Line station. Families on bicycles should not just be given a 6 inch line of paint to separate our bodies from speeding 2 ton metal vehicles that are trying to access the high speed freeway as quickly as possible and whose speeds will be increased by the diverging diamond configuration. We need a physical barrier and/or grade separation. We need a safe route that is comfortable for all types of bicyclists, not just the fearless. IP-20-2

Sincerely,
Michael Sullivan

This page intentionally left blank

IP-20-1

Bicyclists and pedestrians were a consideration in the design of all local interchanges under the build alternatives, including diverging diamond interchanges, and appropriate treatments were applied to balance vehicle, bicycle, and pedestrian use. Caltrans' *Complete Intersections: A Guide to Reconstructing Intersections and Interchanges for Bicyclists and Pedestrians* (Caltrans 2010) was used during the design process of the build alternatives to date. As discussed in Section 3.5.3.2, because, under the build alternatives, sidewalks would be improved or added, bikeways and trails would be maintained, and bicycle and pedestrian connectivity would be enhanced, the I-710 Corridor build alternatives would improve conditions for pedestrian and bicycle travel, especially along Del Amo Blvd. from Compton Creek to the east side of the Los Angeles River. In addition, as discussed in Section 2.3, with respect to "Complete Streets" improvements, inclusion of pedestrian paths (sidewalks, curb ramps, and crosswalks) and sufficient outside shoulder width to accommodate bikeways on local street crossings would be provided as part of local interchange modifications under the build alternatives. In response to the City of Long Beach's General Plan update, Class IV bikeways were incorporated as part of the build alternatives in local street designs where possible, along PCH, Anaheim, and Del Amo in the vicinity of the freeway interchanges. A Class IV separated bikeway is for the exclusive use of bicycles, physically separated from motor traffic with a vertical feature. Although Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), has identified Alternative 1 (No Build) as the Preferred Alternative, this Final EIR/EIS has been updated to reflect these modifications. Please refer to Section 1.1 of this appendix for further discussion on the identification of the Preferred Alternative.

IP-20-2

As discussed in Section 3.5.3.1 of the RDEIR/SDEIS, the build alternatives would provide facilities for bicycles and pedestrians in locations where local roadways would be affected by the construction of the build alternatives. Should a build alternative be selected as the Preferred Alternative, these facilities would be designed in coordination with the affected local jurisdiction and would comply with ADA requirements. The build alternatives would improve pedestrian facilities (sidewalks) by replacing the old ones that would be removed as part of the build alternatives. Bike travel would also be improved by providing new pavement on the arterial bridges that would be replaced over I-710 and the Los Angeles River. Class I Bikeways within the Study Area would be maintained with the proposed build alternatives.

The addition of the pedestrian and bicycle-only overcrossings as part of the build alternatives, proposed at locations in which gaps in freeway crossing opportunities have been identified, would also improve pedestrian and bicycle travel within the I-710 Corridor by introducing new

connectivity points traversing the I-710 and the Los Angeles River (and in the case of the Pacific Place overcrossing, the I-405 and Metro Blue Line).

Diverging diamond interchanges decrease vehicle speeds on the crossing arterials to 20–30 mph, lessening the speed differential between bikes and vehicles. Where possible, under the build alternatives, Class IV bike lanes have been integrated into the roadway design along Del Amo Blvd. between Compton Creek and the Los Angeles River since circulation of the RDEIR/SDEIS in 2017. A Class IV separated bikeway is for the exclusive use of bicycles, physically separated from motor traffic with a vertical feature. Although Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), has identified Alternative 1 (No Build) as the Preferred Alternative, this Final EIR/EIS has been updated to reflect these modifications. As noted previously, the No Build Alternative has been selected as the Preferred Alternative and none of the bicycle and pedestrian improvements noted above will be constructed.

I have a suggestion.

Martha Hernandez

E: lavernemash@gmail.com

C: (323) 633-3419

H: (323) 863-6274

Hi,

My name is Martha Hernandez, and I have been an advocate for better air quality in East Los Angeles since the 90's. I am the co-chair for the I-710 Expansion CAC for East Los Angeles. I have read your plans and proposals. I have been to several of your meetings and spoken with your engineers, consultants and representatives. I commend the work that many of you have done. However, within all these reports there is one key portion that is missing for my community.

I had brought this up back in 2015 when Metro had plan to install another LTR. East Los Angeles does not, nor has it ever had air quality monitors installed within its boundaries. I had mentioned this prior to 2015 in previous meetings before 2000. After these meetings Metro had promised air quality monitors. However, in 2015, it came to my attention that the air quality data used to determine the air within East Los Angeles were, and are, coming from locations outside of East Los Angeles borders and even across another city. It was discovered there are only two air quality monitors near East Los Angeles based on the zip codes that make up of the area of unincorporated East LA. One is located on 1630 North Main Street, Los Angeles CA 90012, which is the Los Angeles-North Main Street air quality monitoring site. The other is located on 4144 San Gabriel River Pkwy., Pico Rivera CA 90660, which is the Pico Rivera #2 air quality monitoring site. This falls S San Gabriel for zip code 90022, while zip codes 90023 and 90063 falls under an air monitoring site located under Central LA CO. East LA do not have a monitor that reads the air quality at the center of the freeways and the heart of the East Los Angeles Interchange. Please see attached map (https://drive.google.com/open?id=16wLsjdBG-o4ML8wmvTxM3ZFbCqI&usp=sharing). IP-22-1

It is my belief that before any plans are made, a detailed study with data from air quality monitors located in East Los Angeles need to be added. For this to happen, we need these monitors installed with live data available on the arb.ca.gov and airnow.gov sites. I also believe there should be a study done on the impact of carbon emission to the residents in every street. It has recently come to my attention that Google Maps, A Sense of Aclima and the Environmental Defense Fund did such a map with the city of Oakland (https://blog.aclima.io/aclima-google-edf-map-air-quality-oakland-aad28c67859b). I have attached the article, as well as the link. IP-22-2

Many things that were found for Oakland are happening in East Los Angeles, and have been happening for many decades. There are higher rates of asthma and allergies. I had found a study being done of the impact of freeway emissions in pregnant women living near the freeways. The study was of pregnant women having autistic babies. Many were found to live near freeways during their pregnancy. The emissions have been linked to cancer and heart disease. There are many other diseases that have yet to be discovered. If this can impact those of us in the now, what of those yet to be born who will carry the mutated DNA. We need to stop the bleeding before we can clean the wound, and this cannot be done without all data. IP-22-3

I also believe that East Los Angeles not only needs monitors, but air filters integrated within the sound walls of the freeways, as well as homes in the surrounding area. Air conditioners should be placed in every home impacted by the freeway emissions with an updated electrical system to sustain it. It would be ideal if the state and/or city would sponsor a contest to create solar-powered, low-energy air conditioners that can easily be connected to the IP-22-4

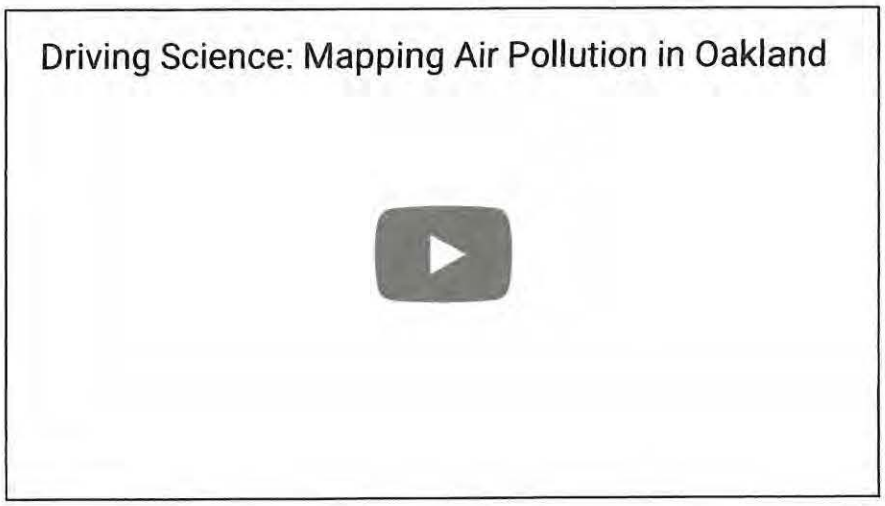
electric grid. This will reduce the use of energy during summer months, but also the cost to residents. These air conditioners will then be given to residents within a 7-mile radius at no cost to them. IP-22-4

Seeing that East LA has already been greatly affected by the pollutants from the freeways, money should also be invested in creating free clinics within a 7-mile radius of the freeways for those with medical needs, including the cost of medication. This is the least that we can do for those that have unknowingly been exposed to the contaminants in the air for many decades. We also need more beneficial trees that combat the pollutants. I've noticed there are many of these lilac trees being planted that not only polluting the air with pollen, but the ground with their flowers. Several of the plants being planted around the freeways agitate asthmatics and trigger allergic reactions. I wish more study is done before planting. IP-22-5 IP-22-6

I have an idea of a cargo train, which runs on a lane within the I-710 freeway, that delivers goods to ports within each city. Each city would be responsible for these ports. Trucks can drive to these ports and pick up the goods to be delivered to their destination point located within their city. This will relieve traffic on the freeways, as well as reduce the amount of accidents. This in turn reduces emissions. It will also reduce the impact and burden from East Los Angeles. This will go along with the continued expansion of the trains and subways around Los Angeles, especially West Los Angeles. IP-22-7

I believe we should stop before moving forward with the proposed options. We need to gather all current and important information before going forward with any plans. These changes need to not just impact the now, but future generations to come. We need to review all avenues and issues from all cities and residents to continue. From my experience and years living in Los Angeles, we haven't been rebuilding the freeways, but creating patches. We need to go one step further than the past builders, not make the same mistake of building with no thought to the future. This needs to be our legacy, but a legacy that will continue to benefit for many, many years to come.

Sincerely,



Martha Hernandez

Driving Science

Aclima, Google, and the Environmental Defense Fund map Oakland's air quality

Aclima, Google, the Environmental Defense Fund (EDF), and engineering researchers from The University of Texas at Austin (UT Austin) announce today the results of a year-long study measuring and mapping air pollution in West Oakland to better understand the hyperlocal influence air pollution has on our health and our climate. The scale and scope of air quality measurement conducted in this study is unprecedented.

Traditional air quality measurement is achieved by stationary monitors, of which Oakland has three of the 15 located throughout the Bay Area. These stations are staffed and managed by the local Bay Area Air Quality Management District. Our approach fills in the gaps of traditional air monitoring and brings a new layer of environmental intelligence to individuals, communities, and cities by making air measurement mobile and local.

In a data-driven future, the environment must be represented. Solving urban air pollution requires systemic solutions driven by sound science

and powered by big data. Thankfully, technology now makes it possible to fill in the gaps. By equipping Street View cars with Aclima's sensing platform, we've unlocked a new paradigm for understanding our environment.

The Study

For this study, two Street View cars covered 14,000 miles and collected millions of data points about black carbon, nitric oxide, and nitrogen dioxide between May 2015 and May 2016. We chose to focus on these pollutants because they are known to be harmful to human and planetary health. Empowered with this new information, we will work with city officials and our local partners to discover insights and find solutions to alleviate pollution hot spots around the city.

Our results—that urban air pollution can be highly variable over the length scale of city blocks—support the value of mobile measurement in mapping pollution at the street level. The resulting data set is one of the largest of its kind of single city streets. The work validates Aclima's mobile measurement platform as a scalable approach to increase our understanding of the processes that define air pollution in our communities.

Data visualization of Aclima mapping air quality in Oakland, CA. (Courtesy Aclima, Google)

The Problem

Aclima Chief Scientist, Melissa Lunden, stands with an Aclima-equipped Google Street View car used for the study. (Courtesy Aclima,Google)

The Solution

With this transformative technology, we hope to enable more people to join local, regional, and national dialogues on improvements to our air quality. We are already sharing the data with air quality scientists and our research partners at the U.S. Environmental Protection Agency. Our shared vision is to create a community of partners in scientific, business, governmental, and regulatory communities to apply the insights generated by Aclima's sensing platform to improve health in our communities.

Our next steps are to scale this effort and bring large-scale, ubiquitous pollution mapping to other cities. In September 2015, we made a commitment with Google to expand our mobile sensing to communities in Los Angeles, San Francisco, and the Central Valley and are measuring many more pollutants. So far, we've driven more than 80,000 miles together in California and we plan to share data and insights from that work in the coming months.

. . .

Oakland's multiple busy freeway corridors and booming industrial shipping sector in the Port of Oakland generate high levels of air pollution. The I-880 freeway, which services Oakland and the surrounding Bay Area, carries the greatest volume of truck traffic in all of California. The data collected could help shape the way cities and communities develop, adapt, and mitigate pollution.

Results of our work demonstrate how decisions about transportation, zoning, and land use can have profound impacts on air quality and quality of life for residents, workers, and commuters. Unfortunately, the effects of this air pollution are already felt among Oakland's population. In 2015, the overall rate of asthma emergency department visits for parts of East and West Oakland was two times the Alameda County rate. In Alameda County, the asthma hospitalization rate is nearly twice the state average and the third-highest in California. Today, more than a quarter of a million children suffer from asthma in Alameda County, where Oakland is located.

> *"At a time when millions of people are living in cities with poor air quality, mapping street-level pollution, block-by-block in real-time, provides an unprecedented tool for improving human and planetary health. Our sensing platform is a scalable solution to address major air quality monitoring gaps worldwide," said Melissa Lunden, Chief Scientist at Aclima.*

Supporting Information

ABSTRACT: Air pollution affects billions of people worldwide, yet ambient pollution measurements are limited for much of the world. Urban air pollution concentrations vary sharply over short distances (≪1 km) owing to unevenly distributed emission sources, dilution, and physicochemical transformations. Accordingly, even where present, conventional fixed-site pollution monitoring methods lack the spatial resolution needed to characterize heterogeneous human exposures and localized pollution hotspots. Here, we demonstrate a measurement approach to reveal urban air pollution patterns at 4−5 orders of magnitude greater spatial precision than possible with current central-site ambient monitoring. We equipped Google Street View vehicles with a fast-response pollution measurement platform and repeatedly sampled every street in a 30-km^2 area of Oakland, CA, developing the largest urban air quality data set of its type. Resulting maps of annual daytime NO, NO_2, and black carbon at 30 m-scale reveal stable, persistent pollution patterns with surprisingly sharp small-scale variability attributable to local sources, up to 5−8× within individual city blocks. Since local variation in air quality profoundly impacts public health and environmental equity, our results have important implications for how air pollution is measured and managed. If validated elsewhere, this readily scalable measurement approach could address major air quality data gaps worldwide.

1. INTRODUCTION

Air pollution is a major global risk factor for ill-health and death.[1−5] Air pollution measurements are crucial for epidemiology and air quality management, but the extent of ground-based air pollution observations is limited.[5,6] For many developing-country regions, especially in populous parts of Asia and Africa, robust air quality monitoring is largely absent.[5] Even for high-income regions, ambient monitors are generally sparsely sited. For the 60% of the U.S. census urban areas with continuous regulatory monitoring, there are a mean of ∼2−5 monitors per million people and 1000 km^2 (Supporting Information (SI) Table S1). However, primary air pollutant concentrations in cities can vary sharply over short distances (∼0.01−1 km) owing to unevenly distributed emissions sources, dilution, and physicochemical transformations.[7−10] Such gradients are not well represented with routine ambient measurements, but have important implications for exposure assessment, epidemiology, air quality management, and environmental equity.[10−13]

Advances in air pollution exposure assessment techniques over the past two decades have helped address limitations of (i) data coverage and (ii) spatial resolution that are associated with central-site ambient monitoring.[10,14] These methods include satellite remote sensing (RS), chemical transport models (CTMs), land-use regression (LUR) models, and direct personal exposure measurements.[14] Each of these approaches has distinct advantages and limitations. Satellite RS instruments and CTMs

are spatially coarse (>1−10 km resolution), and cannot characterize the fine-scale gradients (10−300 m) that drive population exposure to local emissions such as traffic. Satellites are unable to measure some pollutants of key health concern (e.g., black carbon, ultrafine particles). Dispersion models and CTMs are only as reliable as their underlying emissions inventories, and thus cannot reveal unexpected sources. Empirical and geostatistical models such as LUR and kriging can estimate concentrations at high spatial resolution.[10,14−17] However, these models provide limited temporal information, often require local training data sets to be available or collected, and struggle to predict the tails of air pollution distributions, especially where idiosyncratic local sources exist. Alternative methods to measure how air pollution concentrations vary *within* cities and neighborhoods could complement these existing techniques and fill important data gaps.[18,19]

We explore here the potential of routine mobile monitoring with fleet vehicles for measuring time-integrated concentrations at high spatial resolution. The use of vehicles for mobile air pollution sampling dates to the 1970s or earlier,[20] and has been common since the early 2000s.[10,13,21−27] However, even purpose-built "mobile labs" are rarely deployed for extended periods, and often depend on trained research staff as drivers.[28−38] As a result, few mobile monitoring data sets have sufficient repetition frequency or statistical power to precisely reveal consistent long-term spatial patterns over wide areas. We consider here an alternative approach, equipping professionally driven fleet vehicles with air quality instruments, repeatedly sampling every street of an urban area, and applying data reduction algorithms to distill stable long-term spatial patterns from time-resolved data. This approach has been implemented for public transportation vehicles along fixed routes, including trams in Karlsruhe and Zürich.[24,29] We report here on a 1 year pilot study in the San Francisco Bay Area using extensive route-free driving representative of a broad sample of city streets. In addition to testing the feasibility of this approach at scale, we explicitly aimed to "overdesign" our sampling scheme to enable quantitative characterization of trade-offs between sampling frequency and measurement precision/accuracy. (A similar oversampling approach has been tested on shorter cycling routes in the U.S. and Belgium).[15,30,31] We demonstrate that our measurement approach is capable of precisely (±10−20% of median) revealing urban pollution gradients at very fine ~30 m scales, or 10^4−10^5× greater spatial resolution than with urban-ambient monitors. Our results corroborate current understandings and also provide new insights into the spatial variability of urban air pollution.

2. MATERIALS AND METHODS

In brief, we equipped two Google Street View (SV) mapping vehicles with an Aclima environmental intelligence fast-response pollution measurement and data integration platform (Aclima, Inc., San Francisco, CA). Using these vehicles, we repeatedly measured weekday daytime concentrations of black carbon particles (BC), NO, and NO_2 over 1 year for every road within diverse residential, commercial and industrial areas of Oakland, CA. BC, NO, and NO_2 are key health relevant pollutants whose sources include vehicular traffic, shipping, industrial combustion, cooking, and heating. The large resulting data set (3×10^6 1-Hz measurements within a 30 km^2 area; 24 000 total vehicle-km on 750 road-km) is unique among mobile monitoring studies in its very high coverage density and repeat-visit frequency (average of 31 days and 200 1-Hz measurements for each 30 m of road, SI Figure S2). Through data reduction and bootstrap resampling[32] algorithms, we compute median ± standard error (SE) annual daytime concentrations for ~21 000 unique road segments. While instantaneous pollution levels vary rapidly in on-road environments, by repeatedly sampling each road and computing long-term medians, we obtained stable, precise (±10−20%) estimates of time-integrated pollution at fine 30 m spatial scales. Overall, these data reduction methods produce maps of systematic spatial variation in long-term air pollution that are robust to the stochastic temporal variability in the underlying 1-Hz data.

2.1. Measurement Platform. Two Google Street View (SV) vehicles were equipped with the Aclima Ei measurement and data acquisition platform. This platform provides data management, quality control, and visualization functions, facilitating extensive, routine measurements. In the present configuration, monitors employed were fast-response (1 Hz) laboratory-grade analyzers: BC was measured using a photoacoustic extinctiometer, NO was measured using chemiluminescence, and NO_2 was measured using cavity-attenuation phase-shift spectroscopy. The inlet system was designed to minimize self-sampling and particle sampling losses. Further details of the instrumentation design, routine calibrations, and QA/QC protocols/algorithms are provided as SI.

2.2. Study Area Description and Sampling Protocol. Sampling during the 1 year study duration emphasized three main areas within Oakland, CA: West Oakland (WO, ~10 km^2), Downtown Oakland (DT, ~5 km^2), and East Oakland (EO, ~15 km^2). WO is bounded by major interstate highways (I-880, I-980, I-580), the fifth-largest U.S. container port, and associated rail and trucking facilities. Residential blocks are interspersed with industries in this lower-income neighborhood. DT has mixed residential and commercial mid- and high-rise buildings. EO is divided between industrial and mixed-income residential areas.

We undertook mobile monitoring on weekdays from May 28, 2015 to May 14, 2016. During routine operation, cars left garages in either Mountain View, CA or San Francisco, CA at around 9:00 AM local time and drove to Oakland, CA for ~6−8 h of driving. Barring operational constraints (e.g., maintenance), two cars were operated simultaneously on each driving day.

Drivers were provided daily driving assignments consisting of polygons (~1−5 km^2) in which the driver was tasked with driving every road at least once. Drivers were instructed to drive in the normal flow of traffic. Mean speeds were ~25 km h^{-1} on surface streets and ~88 km h^{-1} on highways. Routine sampling was conducted during all seasons. Vehicles were operated without regard to weather, except during 1−2 exceptional storms that precluded safe driving. The prevailing wind direction for the study area was from the west (~85% of all study hours; median wind speed 4 m s^{-1}). A total of 2.7 M 1-Hz observations, or 800 h, on ~16 000 unique 30 m road segments were collected in core WO+DT+EO domain. Additional monitoring incorporated interstate highways linking the study areas and car maintenance garages (~300 k 1-Hz measurements on ~4500 unique 30 m road segments). Further information about the study domain and operational considerations are provided as SI, including detailed maps (Figure S1−S2).

2.3. Data Reduction. We developed a series of data reduction algorithms to convert our data set of ~3 million instantaneous observations into estimates of median annual weekday concentrations for individual 30-m road segments. First, we accounted for the possible biases of daily diurnal variation in urban-background concentrations by applying an hourly multi-

DOI: 10.1021/acs.est.7b00891
Environ. Sci. Technol. 2017, 51, 6999−7008

plicative adjustment factor to our 1-Hz mobile data based on ambient concentrations at a regulatory fixed-site monitor in WO.[15,33,50,53] This adjustment approach makes the implicit assumption that temporal patterns are spatially invariant. This common assumption is conceptually imperfect but may be acceptable for well-mixed daytime hours.[15,33,50,53] In any case, the temporal adjustment had only a minor (±10%) impact on the observed spatial patterns in long-term concentrations, likely because the numerous repeated measurements were already balanced in space and time.

Next, we employed a "snapping" procedure to assign each 1-Hz measurement to the nearest 30 m road segment on the basis of measured GPS coordinates, thereby allowing repeated measurements along the same road to be analyzed as a group.[15] We chose to use 30 m road segments for analysis after weighing considerations of spatial resolution (smaller segments show more spatial variability) and sample size (outliers and GPS errors have proportionally greater influence when data are "thinly sliced"). A virtue of this data reduction step is that it ensures that road segments with a high number of raw 1-Hz samples (e.g., owing to low average speeds) are not over-represented in our spatial analyses: regardless of the number of 1-Hz samples, a single point estimate of concentration is produced for each road segment. We restrict our analysis to include only the ~21 000 road segments in our study domain with at least 10 unique days of measurement between 8 am and 6:59 pm local time between 28 May 2015 and 18 May 2016. The typical road segment contains ~150−250 individual 1-Hz samples collected on ~20−50 distinct days. The SI provides further details on the performance of our "snapping" and temporal adjustment algorithms (see Figures S4−S5).

For each of the ~21 000 road segments, we computed distributional parameters of repeated 1-Hz observations. Similar to some recent mobile monitoring studies,[15,30] but unlike others,[28] we explicitly chose not to filter out "peak" 1-Hz concentration measurements resulting from encounters with other vehicles' exhaust plumes in assessing spatial patterns. The frequency with which plumes occur in space and time provides valuable information about the conditions that give rise to on-road concentrations.[30] We evaluated both the median and mean as metrics of central-tendency. In initial study design, we had two a priori concerns about the possible use of the mean as a reliable metric: First, that a small number of extreme outlier observations (true concentration "peaks" or rare spurious measurements) might bias our estimation of "typical" concentrations for each road segment, and second, that if we under-sampled the tails of a skewed concentration distribution, we might not obtain stable means. Also, for a log-normal or similarly skewed distribution, median is generally a more appropriate measure of central tendency than is mean. Accordingly, we chose to use median concentrations as our core estimate of central tendency for 30 m road segments, and evaluated means in sensitivity analyses.

We used a set of bootstrap resampling procedures to quantify the effect of sample-to-sample variability and sampling error on the precision of central-tendency 30 m concentration estimates. For each individual road segment, we computed the standardized error (SE) of the median and mean concentration. As a metric of precision, we consider normalized SE: the ratio of the standard error of the median (mean) concentration to the median (mean) concentration itself (SI Table S4). On average, the normalized SE of individual 30 m median (mean) concentrations was low: respectively 20% (21%), 16% (15%), and 9% (8%) for BC, NO, and NO_2. Road segment mean concentrations were well correlated with medians (mean > median owing to positive skew, $r^2 \sim 0.6-0.9$). In sum, for our sample size, central-tendency concentrations can be estimated with good precision and minimal sampling error from stochastic variability. For large groups of road segments (e.g., all residential streets), we estimate the precision of the central tendency to be within ≪1% of the normalized SE.

The SI provides further information on bootstrapping and precision calculations, comparisons between mean and median metrics, and summary tables of raw and reduced data (SI Tables S2−S3). The distributions of all ~21 000 30 m-median road segment concentrations for NO, NO_2, and BC are positively skewed, but based on a Kolmogorov−Smirnov test do not conform to a single parametric distribution (SI Figure S6).

2.4. Stability Analysis: Monte Carlo Subsampling. We utilize a subsampling analysis to investigate whether a less intensive program of repeated monitoring can reproduce the long-term pollution patterns observed from the full data set.[15,30,31] A specific question of interest here is whether there is a point of "diminishing return," beyond which additional repeat driving provides relatively little added information.

We use Monte Carlo simulation to repeatedly subsample our full data set to systematically introduce fewer days of driving for analysis. Briefly, we randomly sample without replacement $1 \leq N \leq 50$ unique drive days at each location from our full data set. Within our core domain, the mean road segment has 31 days of sampling (10% trimmed range: 17−49 days). For each value of N, we performed 250 random draws to produce 250 subsampled "maps" of 30 m median concentrations. For road segments with fewer than N days of sampling, the "subsampling" effectively includes all observations collected over the duration of our campaign. Thus, the subsampled maps converge to the result of the full data set as N approaches the total number of unique driving days for the full measurement campaign. We compute three metrics to compare the performance of each subsampled concentration map to that of our full data set. First, as a metric of precision, we computed the r^2 between each subsampled map and the corresponding full data set of 30 m median concentrations. Second, as a metric of bias, we compute the normalized root-mean-square error (normalized RMSE, or equivalently, the coefficient of variation of the RMSE, CV-RMSE) as the square root of the mean of the squared difference between each subsampled 30 m median concentration and its corresponding median from the full data set. Third, as a metric of the temporal stability of subsampled spatial patterns, we computed the intraclass correlation (ICC) of each subsampled iteration, grouped by 30 m road segments. For this application, ICC values of 0.75−1 reflect large and systematic spatial differences, with low residual temporal variability at each location (see Section S1.5). We find that spatial variability dominates the total variability in our data set, with ICC values in the range of 0.8−0.95 for all pollutants (see SI Table S5), indicating that our observed long-term spatial patterns are robust to stochastic variability among individual 1-Hz samples.

2.5. Data Mining: Spatial Patterns. We conducted two "data mining" investigations to explore the determinants of the spatial patterns that are revealed by our mobile monitoring data, specifically (i) near-highway distance-decay relationships and (ii) the effect of local, transient sources on spatial patterns.

Distance-decay relationships for pollutant concentrations near major roadways have been documented in the literature,[5,14,35] relying predominantly on experiments along carefully selected near-highway upwind-downwind transects.[35] Here, we demon-

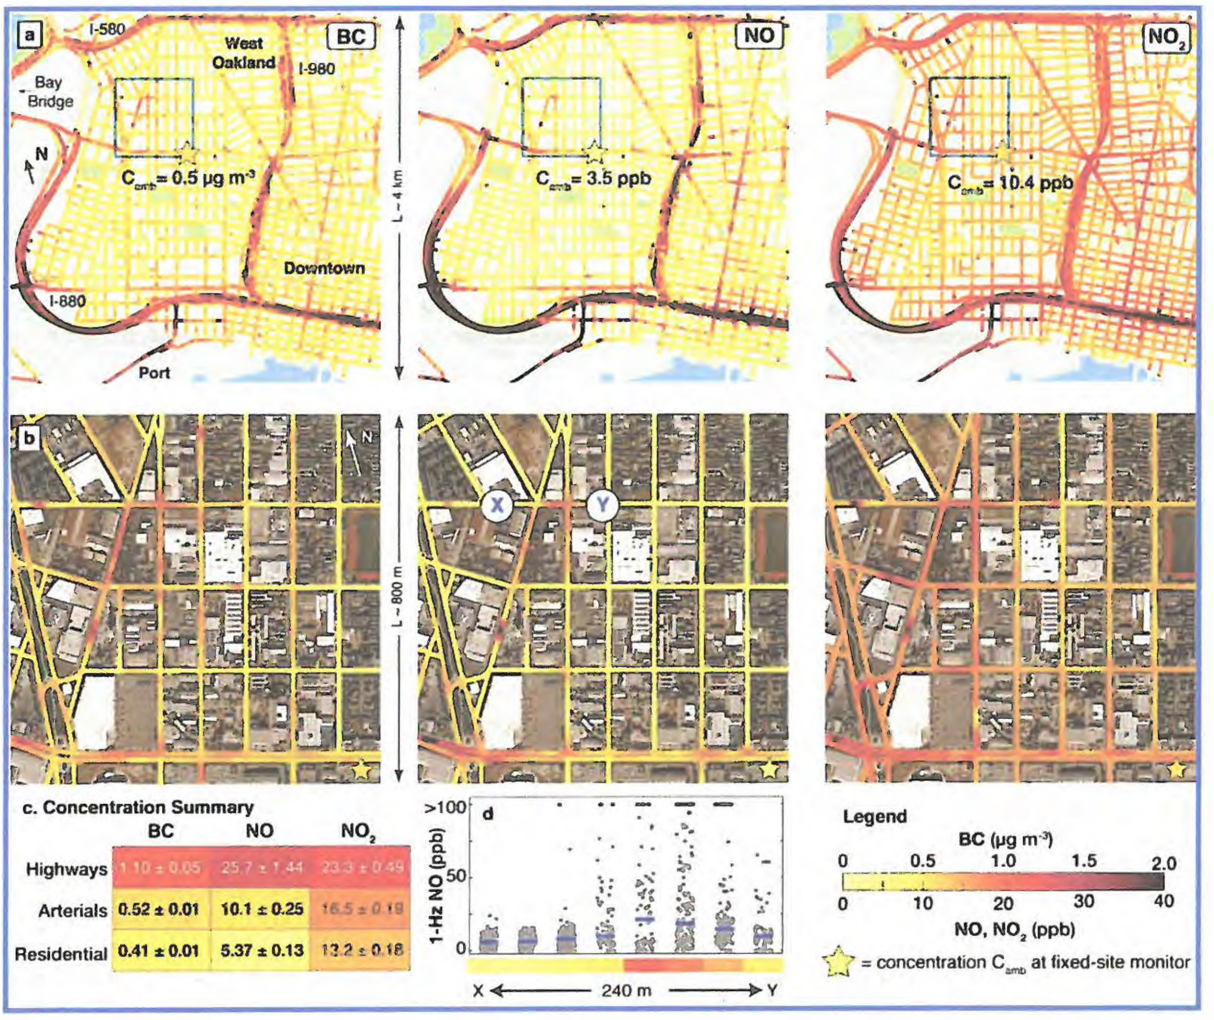

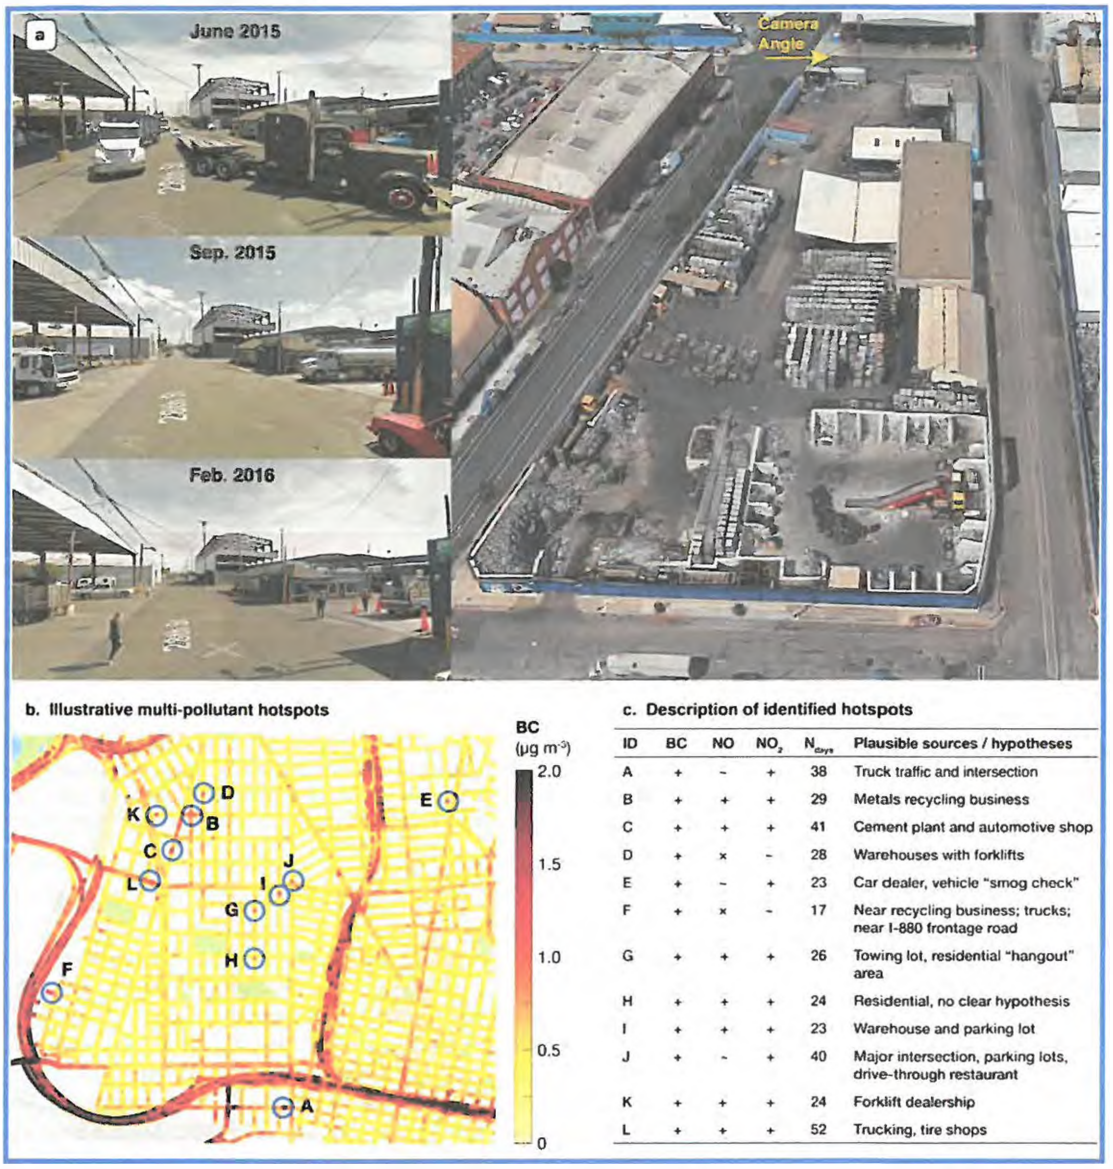

Figure 1. High-resolution mapping of time-integrated concentrations. Annual median daytime concentrations for 30 m-length road segments based on 1 year of repeated driving for a 16 km^2 domain in West Oakland [WO] and Downtown (a), and for a 0.6 km^2 industrial-residential area in WO (b). Median ± SE concentrations are tabulated by road type in c. Annual median daytime ambient concentrations C_{amb} at a regulatory fixed-site monitor in WO are plotted as shaded stars. Localized hotspots in b correspond to major intersections, industries, and businesses with truck traffic, and are interspersed with lower-income housing (see aerial image). Locations of hotspots are similar among pollutants. d, Distributions of 780 1-Hz NO measurements for a transect of eight 30 m road segments (see b, from point X to Y) to illustrate relationship between 1-Hz samples (~100 per segment over 1 year) and plotted long-term medians (colored bars, blue horizontal lines). Elevated levels near midpoint of transect are associated with operations at a metal recycler (see Figure 2). Wind rose data are provided in SI Figure S1, and show consistent westerly winds. Imagery © 2016 Google, map data © 2016 Google.

strate a "big data" approach that provides complementary information, using our full mobile data set to characterize time-averaged, isotropic (i.e., direction-independent) daytime distance-decay relationships. For every road segment within WO and DT, we computed a distance-to-nearest-highway parameter d ("spatial lag"). We bin all road segments by d, and compute the median concentration as a function of spatial lag using 50 m bins. For each pollutant we estimate a three-parameter exponential distance-decay relationship for the mean highway normalized concentration ratio as a function of spatial lag. The SI provides further detail on this fitting approach.

To investigate how localized or transient emissions sources contribute to the on-road concentrations measured by our mobile monitors, we employed a peak detection algorithm.[25,28,36,37] The basic conceptual approach uses a moving-window function to identify a localized concentration baseline, and then attributes the difference between the measured value and the baseline to short-duration concentration "peaks". We applied a 10 s moving average filter to the entire input data set to prevent spurious extreme low values in the raw data (e.g., instrument noise) from influencing the baseline determination. We established the concentration baseline for each second in this 10 s smoothed data set as the smaller of two quantities: the instantaneous value in the data set, or the p = fifth percentile concentration within a moving window of t = 120 s. By selecting the fifth percentile, the algorithm identifies a value that is representative of the cleanest local conditions, which are more influenced by the urban background than by localized sources. We chose t = 120 s to ensure that the time window was longer than the typical traffic light cycle, but short enough that the baseline concentrations on surface streets was established using measurements collected within ~1 km of each location (30 km/h for 2 min = 1 km).

L	+	+	+	52	Trucking, tire shops

Figure 2. Illustrative pollution hotspots. a. Street View and aerial imagery of the metals recycling cluster highlighted in Figure 4a–c. Frequent heavy-duty and medium-duty truck traffic is evident in repeated Street View images. b,c. Multipollutant hotspots (i.e., prominent local concentration outliers) were identified from BC, NO, and NO_2 median concentrations as described in SI. Twelve illustrative hotspots labeled A–L here, overlaid on the 30 m BC map in b for context. List in c enumerates possible emissions sources for each illustrative hotspot, with the following classification scheme for each pollutant: (+) indicates a prominent localized hotspot or cluster of roads where concentrations are sharply elevated above nearby background levels, (~) indicates a less prominent hotspot or cluster with moderately elevated levels, and (×) indicates the absence of a clearly discernible hotspot. Imagery © 2016 Google, map data © 2016 Google.

After establishing the baseline concentration, we derived the peak fraction parameter PF by computing (*i*) the mean baseline value over all repeated observations, and (ii) the mean 10s-smoothed observed concentration. Then, we compute PF as 1.0 minus the ratio of the mean baseline value to the mean observed concentration. Thus, PF is an indicator of the contribution to mean observed levels on each road segment of concentrations above the mean local baseline. While PF is inherently a semiquantitative indicator metric that is somewhat influenced by parameter choice, it usefully reveals spatial patterns in the density and magnitude of local, transient emissions sources. As a sensitivity analysis, we computed PF where the moving window period *t* was doubled to 4 min. For that analysis, overall spatial patterns in PF were nearly identical, but with an upward shift of 5–10% in PF: a longer window results in somewhat lower and more spatially homogeneous baseline concentrations.

3. RESULTS AND DISCUSSION

3.1. Spatial Patterns and Hotspots. Our mobile monitoring data set paints a vivid picture of within-urban pollution patterns, revealing remarkable and stable heterogeneity in daytime weekday pollutant concentrations (Figure 1, Figure S7). Figure 1b illustrates fine-scale variability in pollution for an indicative 0.6 km^2 industrial/residential zone in West Oakland (WO). Within this small area, time integrated 30-m median primary pollutant concentrations vary by >5× within individual

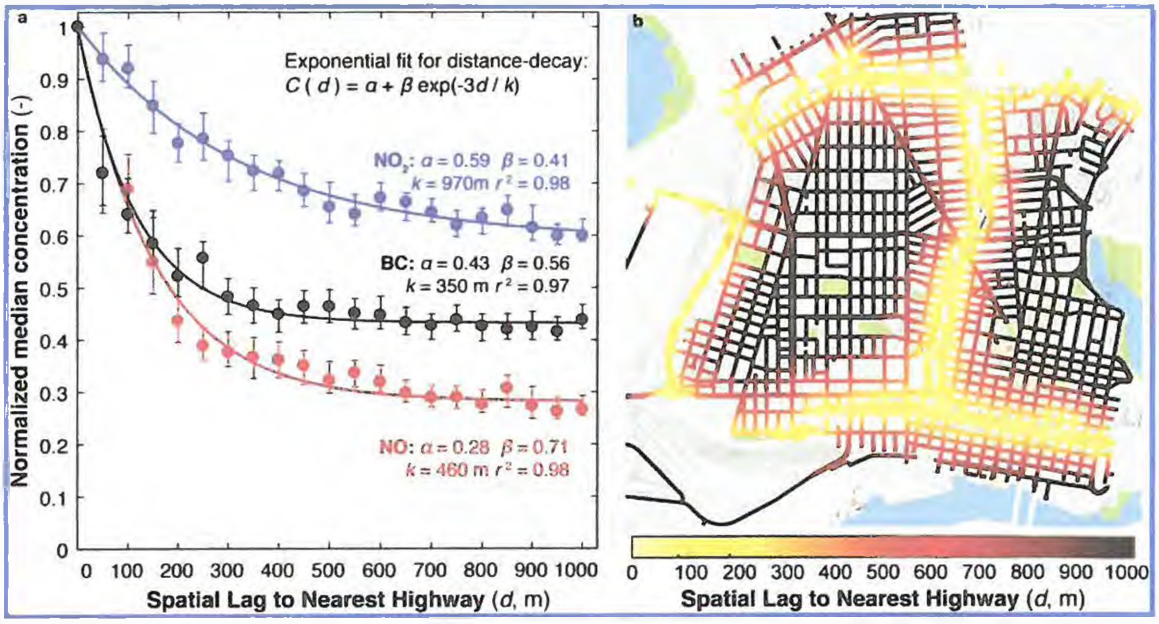

Figure 3. Decay of concentrations from major highways into city streets for WO and DT. a. Plotted points represent the ratio of median concentrations at a given distance from highways (d, "spatial lag") to median on-highway concentrations; error bars present standard error from bootstrap resampling. An unconstrained three parameter exponential model reproduces observed decay relationships with high fidelity. Here, the parameter α represents the ratio of urban-background to highway concentrations ($d \rightarrow \infty$), β represents the additional increment in pollution at near-highway conditions, and the decay parameter k governs the spatial scale of the decay process. The value of α is intermediate for BC (primary, conserved pollutant); lower for NO (consumed rapidly during daytime by reaction with O_3) and higher for NO_2 (elevated background from regional secondary photochemical conversion from NO). Data in SI demonstrate that parameter estimates are consistent among alternative fitting approaches. b. Distance-to-highway metric d for surface streets in WO and DT, computed based on the harmonic mean distance of each surface street segment to closest portion of the four major highways in the domain (see SI). Map data © 2016 Google.

city blocks, and by >8× overall, as the result of local emissions sources and traffic congestion. A surprising feature throughout our data set is the ubiquity of persistent daytime "hotspots" (length <100 m), tentatively classified as locations where concentrations of multiple pollutants exceed nearby ambient levels by 50% or more. Figure 2 presents data and plausible causes for an indicative set of hotspots based on analysis of Google Street View imagery. Examples include intersections along a major truck route, vehicle repair facilities, and industrial sites with associated truck traffic. As one indication of a localized source, most hotspots show sharp spatial "peaks" for multiple pollutants. (For the full data set, spatial patterns of 30 m-median concentrations for the three pollutants are moderately correlated, r^2: BC-NO = 0.71, NO-NO_2 = 0.57, BC-NO_2 = 0.50). The SI provides further detail on the hotspot identification scheme.

To demonstrate how hotspots consistently emerge from time-resolved data, Figure 1d shows long-term median and 1-Hz concentrations for the 240 m transect labeled X–Y in Figure 1b. Over the short length of this transect, time-integrated median NO levels rise and fall 4×. Concentrations are highest directly in front of the entrance to a metals recycling facility, where the 1-Hz distribution exhibits a large number of high NO concentrations. SV and aerial photos show a high volume of trucks and heavy equipment operating at this facility (Figure 2).

At broader spatial scales, pollutant levels differ substantially among three major road classes: highways, arterial roads, and residential streets (Figure 1). Median weekday daytime concentrations for WO and Downtown Oakland (DT) residential streets are approximately consistent with daytime observations at a regulatory fixed-site monitor in West Oakland (Figure 1c, road vs ambient: 0.41 ± 0.01 vs 0.50 $\mu g\ m^{-3}$ BC, 5.3 ± 0.11 vs 3.5 ppb NO, 13.2 ± 0.18 vs 10.4 ppb NO_2). In contrast, concentrations on busier streets and highways are substantially elevated above urban-background levels. For BC, median highway [arterial] concentrations exceed those on residential streets by a factor of 2.7 [1.3]; for NO by a factor of 4.8 [1.9]; and for NO_2 by a factor of 1.8 [1.3]. Atypically high pollutant concentrations for a given road class are evident in several areas of Figure 1, especially for NO and BC. Median concentrations on city-designated truck routes linking highways to industrial areas are 1.9–3.6× higher than on other surface streets (SI Table S6). We observe consistently higher BC and NO levels (1.5–2.0× higher) on I-880 (high truck density) than on I-580 (trucks prohibited, see SI and Figure S8).

3.2. Distance-Decay Relationships. Between the extremes of polluted freeways and cleaner residential streets, concentrations on average follow "distance-decay" relationships similar to those observed elsewhere.[3,34,35] An unconstrained three parameter exponential model, $C(d) = \alpha + \beta \exp(-3d/k)$, reproduces the concentration-distance relationship $C(d)$ with high fidelity ($r^2 \geq 0.96$, see Figure 3). Here, the isotropic parameter d reflects the distance to highways (m), the urban background parameter α represents concentrations far-from-highway ($d \rightarrow \infty$), the near-road parameter β represents the concentration increment resulting from proximity to the highway, and the decay parameter k governs the spatial scale over which concentrations relax to α. For all pollutants, estimated values of $(\alpha + \beta) \sim 1.0$, indicating that the combined contribution of the urban background and the near-highway increment approaches the levels observed on highways.

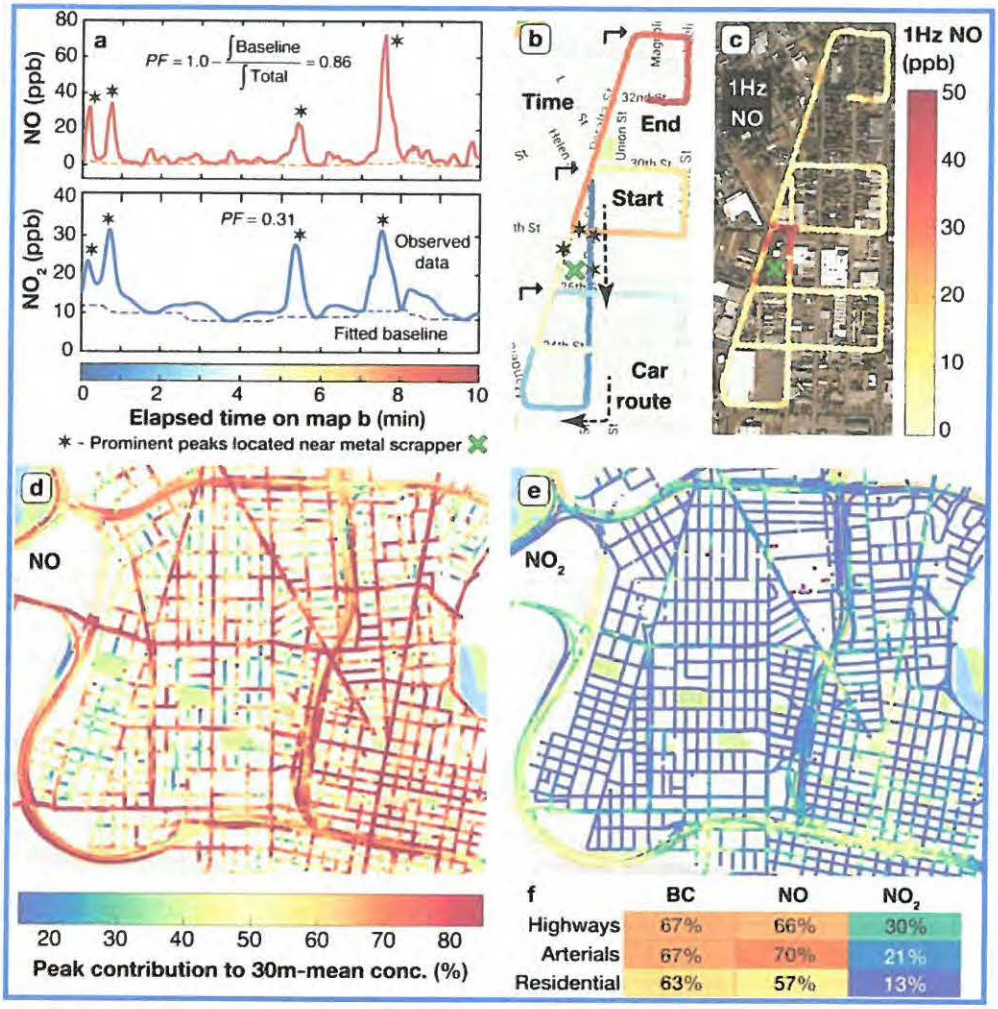

Figure 4. Identification of localized concentration peaks. a. Example 10 min time series of NO and NO_2 on afternoon of 4/22/2016. Baseline-fitting algorithm decomposes measurements (solid traces) into an ambient baseline component (dashed lines) and a high-frequency component indicative of localized pollutant sources ("peaks", difference between observation and baseline). Peak fraction PF indicates contribution of peaks to total sampled mass. PF is high for NO (low baseline, sharp peaks), and low for NO_2 (elevated ambient levels from photochemistry). Temporal progress along route indicated by blue-white-red color scale in a, and mapped in space in b. The drive route for these 10 min is a 4 km sequence of right-hand turns. As indicated by the time color scale in a and b, the starred NO peaks are spatially concentrated around a single city block with a scrap metal plant (marked × in b and c, cf. Figure 1b and Figure 2a). c, Spatial concentration profile for this example period. d,e,f. Application of peak-separation algorithm to entire data set. d,e. Blue-green-red color scale for PF quantifies fraction of mean concentration at each 30 m road segment attributable to transient peaks. f. Median PF values by road class. Imagery © 2016 Google, map data © 2016 Google.

Results in Figure 3 represent average weekday daytime decay patterns. These results reflect the average surface-street to highway concentration ratio as a function of d; as averages, they do not explore temporal differences (traffic, meteorology), the impact of wind direction, or heterogeneity among individual road segments. Interestingly, the fitted values of the parameters α and β correspond closely (within ±5%) to the results of the comprehensive meta-analysis of Karner et al. (2009).[8] Consistent with expectations about sources and atmospheric dynamics, our observed distance-decay relationships are sharpest for NO, intermediate for BC, and most shallow for NO_2. BC and NO are primary air pollutants from combustion sources. Unlike BC, NO is rapidly depleted during daylight hours by reaction with ozone ($NO + O_3 \rightarrow NO_2$, $\tau \sim 1-5$ min).[38] Because most (but not all[39,40]) daytime NO_2 is formed through secondary chemistry, spatial patterns of NO_2 tend to be more homogeneous than NO or BC. Further analysis of the robustness of our decay fitting approach and comparison with Karner et al. is provided as SI.

3.3. Localized Concentration Peaks. To further elucidate determinants of spatial patterns in air pollution, we mined the time-resolved data that underlie long-term median concentrations. The time evolution of concentrations collected by a mobile monitor reflects the superposition of (i) spatiotemporally localized concentration peaks from primary emissions and (ii) a comparatively less variable urban background condition.[28,37] Figure 4a illustrates the application of our baseline-and-peak decomposition algorithm to a 10 min excerpt from our WO mobile monitoring data. Four coincident NO and NO_2 peaks in this time series correspond in space (Figure 4b,c) to roads on the perimeter of the metals recycling facility illustrated in Figure 1b, demonstrating how spatially localized peaks are superimposed onto the urban background. For measurements at each 30 m road segment, we estimate the fractional contribution of localized

Environ. Sci. Technol. 2017, 51, 6999−7008

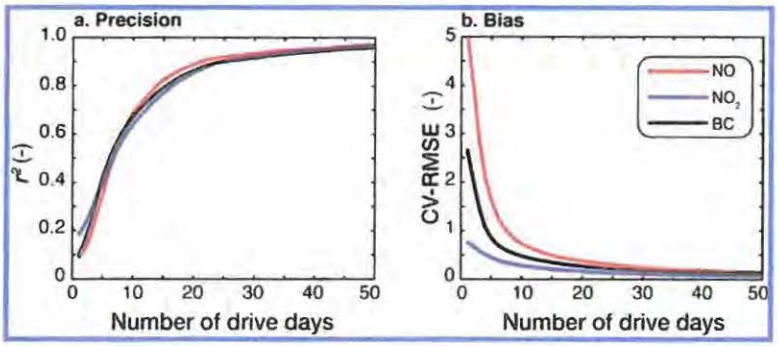

Figure 5. Scaling analysis through systematic subsampling. Using the systematic subsampling algorithm described in Section 2.4, we investigated the relationship between number of drive days and metrics of precision and bias. a. Mean subsampled r^2 as a function of 30 m-median road segment concentrations relative to the full data set, plotted as function the number of unique drive days for BC, NO, and NO_2. See SI for details of the subsampling algorithm and r^2 calculations. b. Mean subsampled coefficient of variation of root mean squared errors (CV-RMSE) versus the number of unique drive days for BC, NO, and NO_2.

sources to observed conditions ("peak fraction", PF) as 1.0 minus the ratio of the mean 30-m baseline concentration to mean 30-m observed concentration (Figure 4d–f). (Thus, at any given location, the observed 30 m median concentration is algebraically equivalent to the sum of the baseline plus peak contributions). Median values of PF are highest for NO and BC (~65%), indicating the predominant contribution of transient localized sources (e.g., traffic, industrial facilities). Spatial variations in PF values (Figure 4d) reveal that the urban background dominates NO levels on low-traffic residential streets (PF ~ 25–40%), whereas transient peaks govern concentrations on arterials (PF ~ 60–80%) and near industrial facilities. In contrast, for NO_2, PF is consistently low (~20%), reflecting the high baseline contribution from photochemistry. Future work could explore whether PF and other derived metrics (e.g., pollutant ratios) may be useful in representing the "freshness" of emissions to inform epidemiological analyses of multipollutant mixtures.

Taken in combination, our findings suggest that consistent spatial variability of air pollution exists at much finer scales than is generally detected using conventional measurements and predicted by models. Because hotspots are revealed through repeated measurement, this approach may be useful for evaluating the fine-scale performance of LUR and other models that use spatial surrogate data. We demonstrate that weekday, daytime primary pollutant levels persistently vary by a factor of 2–8× or more within neighborhoods and individual city blocks. For the median road segment, the absolute concentration difference from the single WO ambient regulatory monitor is 32% (BC), 61% (NO), and 35% (NO_2) during weekday daytime hours. Sparse monitoring networks may therefore provide an imprecise approximation and underestimate the true variability in heterogeneous population exposures.

The implications of these findings for population exposure and public health depend in part on the degree to which on-road concentrations can represent exposures. Many epidemiological studies use predicted home-address concentrations as a proxy for long-term personal exposures. These predicted home-address concentrations are often based upon models derived from roadside measurements given the ease of access to roadsides (e.g., utility poles) for monitoring. Recent research suggests that on-road concentrations can be well correlated with residential address exposures, even when on-road concentrations are higher than surrounding off-road areas owing to proximate traffic emissions.[17,41] Future work could validate the predictive power of *routine* mobile monitoring data using either residential fixed-site or personal exposure measurements.

3.4. Scaling and Future Prospects. Through systematic subsampling of our weekday daytime measurement data set, we find that 10–20 drive days (or 2–3× fewer data than collected here) are sufficient to reproduce key spatial patterns with good precision and low bias (Figure 5). The following trends hold: A small number of drive days ($N < 5$) typically results in a poor approximation of long-term spatial patterns from the full data set, with generally low precision (r^2) and high bias (CV-RMSE). However, each additional sampling day, across a year, results in a substantial improvement in r^2 and CV-RMSE. For our data set, diminishing returns for improvement in r^2 set in at ~10–20 drive days, with mean r^2 for BC and NO approaching 0.7 after 10 days of driving, and approaching 0.9 after 20–25 days of driving. Mean values of ICC (SI Figure S9) are generally high for 10 or fewer drive days, indicating that stochastic temporal variability from a small number of drive days does not obscure an overall spatially dominated pollution pattern. Similar conclusions on the number of sampling days required for convergence to stable patterns have recently been reported in studies using repeated bicycle-based BC and PM measurements.[15,30,31] Our sampling was restricted to weekday daytime conditions; in general, spatial patterns may differ at other times (nights, weekends, holidays).[42] Future work may reveal whether similar scaling considerations hold over a broader range of conditions, and in locales with less consistent meteorology than Oakland.

This study demonstrates a straightforward approach for dramatically increasing the spatial resolution with which air pollution is measured. The instrumentation costs of this technique using reference-grade monitors are perhaps comparable to those of traditional ambient monitoring. However, this routine mobile monitoring approach can provide several orders of magnitude more spatial information, albeit with lower temporal resolution. Future developments in fast-response low-cost sensor technologies could lower the costs of this approach. Moreover, in future studies, a considerably less intensive sampling scheme may provide similar results (Figure 5). Here, we employed Google SV vehicles to enable future analyses of contemporaneous 3D imagery, but other vehicle fleets (e.g., taxis, delivery vehicles, public transit) could routinely collect analogous data by repeatedly driving fixed or variable routes within a city. To facilitate scaling, our data reduction algorithms could be easily automated. Equipping ~500 such vehicles could enable high-resolution mapping of the 25 largest

DOI: 10.1021/acs.est.7b00891
Environ. Sci. Technol. 2017, 51, 6999–7008

U.S. urban areas, which in combination account for ~50% [36%] of the U.S. urban [total] population. Likewise, prior experience[12] suggests that this approach could be extended to global megacities (world's 20 largest cities have 480 M people, >10% of world urban population[43]) and to the thousands of other cities where air quality management is impaired by an absence of robust monitoring infrastructure. Future research could explore whether this approach can effectively be translated to such settings.

Routine availability of high-resolution air quality data in all major urban areas could have transformative implications for environmental management, air pollution science, epidemiology, public awareness, and policy. By highlighting localized pollution hotspots, these data may identify new opportunities for pollution control. Street-level air quality data can complement, challenge, and validate other diverse air quality data sets, including regulatory data, CTM outputs, land-use regression predictions, and remotely sensed observations. In turn, this refinement can help address exposure misclassification in epidemiological studies.[44,45] Through combination with personal GPS data on smartphone applications, rich "personal exposure analytics" become possible,[46,47] which could inform epidemiological studies and alter personal behavior, much as real-time traffic data now inform individual driving patterns. Broader societal consequences of the public awareness enabled by high-resolution pollution maps might include shifts in urban land-use decisions, regulatory actions, and in the political economy of environmental "riskscapes".

IP-22-1

As described in Section 3.13.4 of this Final EIR/EIS, the build alternatives propose Measure AQ-1, which would require a funding contribution to be provided to the South Coast Air Quality Management District (SCAQMD) for the design and construction of four new air quality monitoring stations within the I-710 Corridor, should a build alternative be selected as the Preferred Alternative. Should a build alternative be selected as the Preferred Alternative, the specific locations of each monitoring station would be determined in coordination with SCAQMD, as the agency tasked with regulation and monitoring of air pollution; therefore, a specific commitment to a location could not be made at the time the RDEIR/SDEIS was circulated. However, Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), has identified Alternative 1 (No Build) as the Preferred Alternative. Therefore, air quality impacts as a result of the build alternatives will not occur and Measure AQ-1 will not be implemented. Please refer to Section 1.1 of this appendix for further discussion on the identification of the Preferred Alternative.

IP-22-2

Please refer to Response to Comment IP-22-1 regarding air quality monitors.

IP-22-3

Caltrans and Metro thank the commenter for providing this information regarding hyperlocal air quality mapping tools. The Air Quality/Health Risk Assessment produced in support of the I-710 Corridor Project followed approved Caltrans and FHWA methodologies and procedures. The Community Health Benefit Program, included as a programmatic element under the build alternatives, has been developed further than what was included in the RDEIR/SDEIS, and a more detailed description of that program is included in Section 2.3.2.1 of this Final EIR/EIS. Community health testing, education, and/or outreach including mobile clinics are considered eligible projects for funding via the Program, and eligible applicants are encouraged to apply. However, since a build alternative has not been selected as the Preferred Alternative, this programmatic element will not be implemented by Caltrans as the lead agency under CEQA and NEPA and as the owner/operator of the I-710 freeway. Please refer to Section 1.10 of this appendix for more detailed information regarding the Community Health Benefit Program.

IP-22-4

Air filtration/HVAC systems have been proposed under the build alternatives for schools and other sensitive receptors in accordance with the specifics detailed in Measures AQ-2 and C-8 (described in detail in Sections 3.13.4 and 3.3.3.7 of this Final EIR/EIS, respectively), and would be also considered eligible projects for funding under the Community Health Benefit Program, in addition to mobile clinics, community health testing, and education. Please refer to Response to Comment IP-22-3 regarding the Community Health Benefit Program.

IP-22-5

Please refer to Response to Comment IP-22-4 regarding the Community Health Benefit Program.

IP-22-6

As stated in Response to Comment IP-22-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, no landscaping will occur.

IP-22-7

Thank you for suggesting the concept of a cargo train that would run on a lane of the I-710 freeway. Since containers move in both directions to and from the Ports along I-710, it is assumed that this concept envisions a track in each direction of the I-710. In order to the connect this proposed on-freeway cargo train to stations (ports) in each of the cities, this concept would require new train tracks to be built not only on I-710 but also to connect the proposed I-710 cargo train to each of the proposed Ports (stations) in each city along I-710. These connections would require additional land to be acquired to accommodate these connecting tracks, which would impact businesses and residential properties. Also, for safety purposes, these rail tracks would need to be separated from the auto traffic traveling on the other lanes of I-710, which would require widening of the freeway to accommodate barriers between the tracks and vehicle lanes, even if the tracks were placed on an existing lane of I-710. SCAG and the Ports have studied, and are continuing to study, a variation of your concept. They are studying the implementation of “shuttle” trains traveling over the existing railroad tracks that would carry containers from the Ports to an intermodal railyard from which trucks could then haul containers destined to distribution centers and warehouses in the Inland Empire. However, there are several obstacles to implementing this concept, including the higher cost of moving containers over relatively short distances by train versus truck and the capacity of the rail system to accommodate these additional train trips.

Subject: I-710 Corridor Project Feedback

From: James Murphy
Organization:
Phone: 3238399484
Mailing Address: 4300 Milburn Drive
City, State: Los Angeles
Zip: 90063
Comment/Question:
Haven't you been taking the land from the people who live along I-710 Corridor long enough? I remember the land that was my uncle's home before the I-710 Corridor was built, before it was the I-7 Corridor. There was plenty of land in the back of his home and for many others who had to give up a large portion of their property for this Corridor. Now you want to displace even more people? Why don't you stay out of E.L.A. and build a Corridor in your own neighborhood? IP-23-1

*You received this message because James Murphy submitted feedback regarding the I-710 Corridor Project.

Regards,
System Administrator

IP-23-1

Caltrans and Metro thank the commenter for their input. The commenter's opposition to the acquisition of property as a result of the build alternatives is acknowledged and included in the project record. Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), has identified Alternative 1 (No Build) as the Preferred Alternative. Therefore, there will be no displacements. Please refer to Section 1.1 of this appendix for further discussion on the identification of the Preferred Alternative.

Re: I-710 CORRIDOR PROJECT RECIRCULATED EIR/EIS COMMENTS

Dear Mr. Kosinski:

On behalf of the Coalition for Environmental Health and Justice and the undersigned allied organizations, we submit these comments on the I-710 corridor expansion project. As you are aware, environmental justice and environmental groups have been participating in good faith in this environmental review process for more than a decade. During that time, we have been working to make sure the nation's largest freight highway project elevates the interests of the people who live, work, and attend school in the corridor — not just the interests of the freight industry and road engineers. If CALTRANS comes into these communities, spends billions of public dollars, and does not make conditions and the quality of life better, then the agency has failed.

We remain concerned that despite our years of good faith participation, CALTRANS still views the surrounding communities as adversarial to the agency's conquest to expand this road facility. This adversarial approach makes no sense because surrounding communities have simply sought an alternative that would allow CALTRANS to achieve its goals, while providing the community with assurances that it will be protected from the negative impacts this road widening project will bring.

The current recirculated document leaves much to be desired in meeting that basic, but threshold point. First, this project should not be viewed as just a road-widening conquest to ram more containers and single-passenger automobiles through the community. As such, the alternatives presented are terrible for communities in the corridor. Second, the project must include a mandatory zero emissions corridor to address the deadly pollution crisis that comes from truck tailpipes and disproportionately impacts community health. Third, the project should be designed to eliminate the displacement of homes, businesses, homeless shelters and

transitional housing. Folks should not be penalized by this project by being removed from their homes, businesses, and losing valuable resources that have no assurance of being replaced. This is especially critical with the current housing crisis in Los Angeles County. Fourth, the project must clearly and precisely commit to concrete and sufficient community benefits that alleviate the current and forecasted harms from this project and increased goods movement expansion. Finally, the project should ensure that local and disadvantaged residents are put to work building it. Until these issues are fixed, the project remains flawed.

It is vitally important, and legally required, that the environmental review documents for this project clearly and comprehensively inform decision-makers and the public about the impacts of the proposed project. The environmental documents we reviewed do not live up to this standard of allowing truly informed decision-making. We ask that the environmental review be reevaluated to address the above issues in order to create a long-term solution to improve the environment, our economy, and most importantly the surrounding communities.

Please do not hesitate to contact Taylor Thomas at (323) 263 - 2113, or tbthomas@eycej.org if you would like to set up a meeting to discuss this matter more fully.

Sincerely,

Taylor Thomas

RE: LEGAL/TECHNICAL COMMENTS ON I-710 EXPANSION PROJECT

Dear Mr. Kosinski:

On behalf of the Coalition for Environmental Health and Justice ("CEHAJ") and its individual members, we write to provide comments on the I-710 Recirculated Draft Environmental Impact Report/Supplemental Draft Environmental Impact Statement and Section 4(f) Evaluation ("RDEIR/SDEIS"). We appreciate the opportunity to provide comments on the RDEIR/SDEIS. Given the inevitable regional and acute local impacts of the proposed project that will manifest for decades, it is especially important that the RDEIR/SDEIS, along with the original DEIR/DEIS, contain the necessary analysis to enable both the decision makers and the public to understand the significant environmental repercussions of the Project and prescribe mitigation measures to address significant impacts.

We remain concerned that Caltrans has set up this document to lead the public and decision makers to conclude that Alternative 5C is the best option. Unfortunately, Alternative 5C is the worst option that could be selected. Selecting Alternative 5C would disregard the significant input from communities that demand more of Caltrans than just paving a new lane in the corridor. Importantly, advancing a zero emission project is of paramount importance, in addition to the other important components included in Community Alternative 7 that would not be addressed in Alternative 5C. IP-24-1

Unfortunately, as described in further detail in this comment letter and accompanying technical reports, both the RDEIR/SDEIS as well as the original DEIR/DEIS fail to include the necessary analysis required under the California Environmental Quality Act ("CEQA") and the National Environmental Policy Act ("NEPA"). Because Caltrans has failed to correct many of the same IP-24-2

deficiencies that we raised in our previous comments, we incorporate those comments in their entirety here.[1] As a result of the inadequacies that persist in the RDEIR/SDEIS document and additional deficiencies this document contains, there still can be no meaningful public review of the Project. CEQA and NEPA accordingly require the California Department of Transportation ("Caltrans") to prepare and recirculate documents that will permit a complete understanding of the environmental issues at stake. IP-24-2

I. THE PROJECT DESCRIPTION IS INADEQUATE.

The RDEIR/SDEIS fails to address numerous Project features. These omissions skew the analysis of impacts and, thereby, undercut the validity of the entire document under CEQA and NEPA. Without a complete and accurate project description, neither the agencies nor the public can be assured that all of the project's environmental impacts have been revealed and mitigated. "An accurate, stable and finite project description is the *sine qua non* of an informative and legally sufficient EIR."[2] A complete project description is indispensable because "[a] curtailed or distorted project description may stultify the objectives of the reporting process."[3]

CEQA defines "project" as "the whole of an action, which has a potential for resulting in either a direct physical change in the environment, or a reasonably foreseeable indirect physical change in the environment."[4] CEQA requires "project" to be defined broadly.[5] While extensive detail is not necessary, the law mandates that the project description should include detail sufficient to ascertain the nature and general magnitude of environmental impacts.[6] Thus, a deficient project description renders the analysis of significant environmental impacts inherently unreliable. Excluding a description of elements necessary to the project and associated environmental impacts from those elements results in a "truncated project concept" that violates CEQA and mandates the conclusion that the lead agency did not proceed in a manner required by law.[7]

A. The Project Fails to Adequately Describe Project Components Required by Motion 22.1.

Motion 22.1 directed Caltrans to further investigate critical components of the project that Metro determined were necessary to the Environmental Impact Report for informed decision making on

the project. The RDEIR/SDEIS fails to comply with the requirements of Motion 22.1, thereby excluding analysis of critical components of necessary elements of the project. Thus, the RDEIR/SDEIS fails as an informational document.

For example, Motion 22.1 provided that Metro staff should work with Caltrans to "include an analysis of a Zero Emission Truck procurement and operations program (Alternative 7 only) in any Public Private Partnership analysis to be done for the Project[.]"[8] Caltrans appears to have relied on its old 2013 analysis prepared by CalStart for analyzing a ZE option.[9] The CalStart study was a truck commercialization study report, and does not analyze or develop a strategy for a Zero Emission Truck procurement and operations program.[10] The RDEIR/SDEIS fails to comply with this clear directive from Metro, to prepare a report on a Zero Emissions truck procurement policy. IP-24-3

In addition, Motion 22.1 required "Geometric design for the I-710 Freight Corridor (under Alternative 7 only) that eliminates significant impacts and displacements of homes, businesses, or community resources, such as but not limited to the Bell Shelter or Senior Centers[.]"[11] Reducing impacts of displacement from the project is not one of the project objectives. Thus, it is unclear whether the project prioritized reduction of displacement impacts. IP-24-4

Finally, Motion 22.1 required "staff to work with community based partners (community groups, faith based groups and labor) on the development of a Local and Targeted Hiring Policy and PLA for construction jobs and a First Source Hiring Policy for permanent jobs created by the project. This should be completed, at the latest, by the completion of the recirculated DEIR/DEIS."[12] Yet no local hire policy was developed as part of or concurrent with the RDEIR/SDEIS, in blatant violation of Motion 22.1. The local hire policy is critical component of ensuring the economic benefits of this project will go to local communities, which have on average higher unemployment rates, and is a therefore a critical component in assessing whether the associated project goals are met. IP-24-5

B. The Description of the ZE/NZE Program is Inadequate.

The ZE/NZE program description is fatally flawed. Though the ZE/NZE program is a critical component of the proposed project, Caltrans in general terms merely describes amounts that will be invested, but provides no details on how this proposed program will be developed. Without this detail, there cannot be a full analysis of the project's impacts. IP-24-6

[12] *Id.* at 5.

The ZE/NZE Truck Program proposes to spend either $100 million under Alternative 5C, or $460 million under Alternative 7 for ZE/NZE trucks. In Design Option 7ZE, $1.05 billion will be spent on only ZE trucks. However, regardless of how much is spent on truck procurement, and regardless of whether those funds will be used for ZE or NZE trucking, the RDEIR/SDEIS proposes to build 20 electric charging stations ($2 mil), and ten hydrogen refueling stations ($15 mil).[13] Thus, even if the ZE Option is chosen, Caltrans proposes to build hydrogen refueling stations, and fails to analyze whether additional electric charging stations will be necessary. There is fundamental disconnect between the proposed investment into truck deployment and the necessary infrastructure development to support that growth. IP-24-6

The RDEIR/SDEIS fails to look at finance options to lower the costs of the ZE Truck Program, such as using zero interest or low interest loans to incentivize truck procurement, rather than direct subsidies. Failure to consider alternative finance options makes the ZE option astronomically expensive in comparison to other project alternatives. IP-24-7

The description of the ZE/NZE truck program fails to include a timeline, making it impossible to anticipate when the environmental benefits of truck deployment will start to accrue and how long the purported benefits of solely a voluntary incentive program under Alternative 5C will be realized. Caltrans relies on an old study from 2013 to evaluate feasibility of ZE trucks, which fails to account for recent technological developments. Caltrans concludes that: "'zero-emission capable drayage trucks can be developed, demonstrated, validated, and moved into production by a 2025 target timeline,' but there remain core issues to be addressed prior to the successful commercialization of said vehicles."[14] This conclusion is at odds with existing technological advancements. Tesla will be introducing a fully electric long-haul truck with at 200-300 mile in the near future.[15] The RDEIR/SDEIS may be substantially underestimating potential benefits from this program by assuming major project benefits from a ZE/NZE option only start accruing 2025. The public is left to guess when such benefits will accrue, because no timeline is described or included in Section 2.0 of the RDEIR/SDEIS which describes the Project Alternatives. IP-24-8

C. The Project Description for Alternative 7 Fails to Adequately Describe Lane or Shoulder Widening Components.

The description of Alternative 7 fails to disclose whether lane widths will be widened, and whether shoulders will be added to the freeway. If these components are added to Alternative 7, the project may have additional undisclosed displacement and other impacts. Public comments encouraged looking at an Alternative 7 option with dedicated truck lanes, but no freeway IP-24-9

widening.[16] Yet a need for the proposed project includes improper lane widths.[17] The description of Alternative 7 fails to describe whether expansion of general purpose lanes through lane or shoulder widening will be included.[18]

IP-24-9

II. THE ALTERNATIVES ANALYSIS IS FLAWED, MISLEADING, AND UNLAWFUL.

A. The Project Alternatives Lack Details Necessary to Facilitate Comments and Informed Decision-Making.

As articulated in the prior section on the project description, the failure to fully inform on the contours of the various alternatives taints the alternatives analysis and the ability of the public to provide comments. As such, Caltrans should provide greater details on the alternatives and allow a new draft period to ensure the public is apprised of all aspects of the project.

IP-24-10

B. Rejecting Community Alternative 7 Violates NEPA and CEQA.

The RDEIR/SDEIS rejected an analysis of Community Alternative 7. Caltrans makes two arguments why it does not need to analyze Community Alternative 7 – despite acknowledging it as "a comprehensive and holistic, broad-based solution to transportation issues affecting the I-710 Corridor communities."[19] First, it argues "the California Department of Transportation's (Caltrans) jurisdiction is limited to the State Highway System."[20] Second, it argues "some elements of the CA-7 alternative are much smaller in scale than the overall I-710 Corridor Project, and implementation of these elements (such as construction of bicycle lanes or pedestrian facilities), while still subject to the California Environmental Quality Act, would likely not require the preparation of a full EIR, and could be advanced more quickly individually by the agencies with jurisdiction than if they were included in the scope of the I-710 Corridor Project."[21] Neither of these arguments are persuasive.

IP-24-11

The Council on Environmental Quality ("CEQ") has identified the alternatives analysis as the "heart" of the EIS. Accordingly, it is crucial that Caltrans identify a properly robust set of choices for expansion of the I-710.[22] An agency must "[r]igorously explore and objectively

IP-24-12

[16] *See* U.S. EPA, Comment Letter: Detailed Comments at 4 (Sep. 28, 2012); RDEIR/SDEIS at 2-2 ("Among other issues, included in those comments was support for the Project Team to consider and analyze different alternatives, including a recurring request for an alternative that would add a four-lane zero emission/near zero emission (ZE/NZE) freight corridor with no expansion of general purpose lanes on I-710.").

[17] RDEIR/SDEIS, Exec. Summary at 3 ("On the I-710 freeway mainline, nonstandard weaving distances, narrow or nonexistent shoulders, narrow lane widths, varying number of through lanes, nonuniform ramp metering, and nonstandard pavement all contribute to current operational problems.").

[22] *See* 40 C.F.R. § 1502.14.

evaluate all reasonable alternatives."[23] Realizing the importance of the alternatives analysis, the Project Committee directed the project staff to analyze Community Alternative 7. In addition, municipalities along the I-710 corridor have determined that a full analysis of Community Alternative 7 is important to fully informed decision-making on this project.

IP-24-12

Still, despite the strong support for an analysis of Community Alternative 7, Caltrans has decided it will not fully analyze Community Alternative 7.[24] This violates NEPA and CEQA.

C. Community Alternative 7 Meets the Project Objectives.

The I-710 draft EIR/EIS includes the following project objectives:

1. Improve air quality and public health;
2. Improve traffic safety;
3. Modernize design of the I-710;
4. Address projected traffic volumes; and
5. Address projected growth in population, employment and economic activity related to goods movement.

Community Alternative 7 meets all of the project objectives. First, it improves air quality and public health through advancing zero-emission freight lanes, and by proposing active transportation infrastructure and public transit as opposed to expansion of "general purpose" lanes. It also includes a mitigation program to address impacts that could result from building this project. Second, it improves traffic safety by implementing several proposals to modernize the I-710, including dedicated truck lanes, transportation demand management, and better infrastructure to ensure pedestrian and bicycling safety. Third, it modernizes the design of the I-710 by providing zero-emissions, dedicated truck lanes, in addition to safety improvements at several intersections throughout the corridor. Fourth, it addresses projected traffic volumes by providing more robust public transportation and active transportation options. This is consistent with state laws aimed at reducing greenhouse gas emissions. Finally, it addresses the growth in population, employment and economic activity related to goods movement by facilitating more transportation options beyond just driving, additional freight through adding four freight lanes, and adding additional community amenities that reduce the impacts from the heavily impactful freight industry.

Caltrans has not made any rational argument that Community Alternative 7 does not meet the project objectives. Given this, it must be studied as a reasonable alternative.

IP-24-13

[23] *Id.*; *see also* CEQA Guidelines § 15126.6(a) ("An EIR shall describe a range of reasonable alternatives to the project…which would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project, and evaluate the comparative merits of the alternatives.").
[24] RDEIR/SDEIS at 2-6.

D. Community Alternative 7 is a Reasonable Alternative within the Meaning of NEPA and CEQA.

Both CEQA and NEPA require environmental review documents to include a reasonable range of alternatives. The CEQA regulations require that an EIR must "describe a range of reasonable alternatives to the project, or to the location of the project, which would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project. . . , [and] must consider a reasonable range of potentially feasible alternatives that will foster informed decision making and public participation."[25] Indeed, "the discussion of alternatives shall focus on alternatives to the project or its location which are capable of avoiding or substantially lessening any significant effects of the project, even if these alternatives would impede to some degree the attainment of the project objectives, or would be more costly."[26] As described above, not only does Community Alternative 7 meet the project objectives, but it does so by lessening the significant effects of the project that will result from a widened freeway allowing more traffic rather than offsetting growth with active and public transit, accommodating more freight that will pollute the air and add noise impacts rather than requiring a dedicated zero-emission freight corridor, and displacing people and businesses.

IP-24-14

Further, with respect to NEPA, the CEQ has articulated that a reasonable alternative "include[s] those that are practical or feasible from the technical and economic standpoint and using common sense, rather than simply desirable from the standpoint of the applicant."[27] Here, CEHAJ provided evidence that Community Alternative 7 was practical and feasible from a technical and economic standpoint. In addition, CEHAJ used common sense to promote the elements. Community Alternative 7 met this test so well that the Project Committee determined that it is a matter of "common sense" to analyze Community Alternative 7 in the RDEIR/SDEIS. Caltrans would need to demonstrate either that Community Alternative 7 is not practical or feasible, or that the Project Committee, the Cities of Commerce, Bell, Long Beach and Huntington Park lacked "common sense" in promoting an analysis of this alternative.

Beyond the inability of Caltrans to demonstrate that the Project Committee and the cities supporting an analysis of Community Alternative 7 lacked "common sense," longstanding precedent in the United States Court of Appeals for the Ninth Circuit supports inclusion of Community Alternative 7. In particular, the Courts have determined:

IP-24-15

> An EIS will be found to be in compliance with NEPA:
>
> > when its form, content, and preparation substantially (1) provide decision-makers with an environmental disclosure sufficiently detailed to aid in the substantive decision whether to proceed with the project in the light of its environmental consequences, and (2) make available to the public, information of the proposed project's

[25] CEQA Guidelines § 15126.6(a).
[26] *Id.* § 15126.6(b).
[27] 46 Fed. Reg. 18026 (March 23, 1981).

> environmental impact and encourage public participation in the development of that information.[28]

An analysis of Community Alternative 7 is of paramount importance to meet both of these requirements. First, Community Alternative 7 helps provide the robust review necessary to help inform all stakeholders. Moreover, an expanded range of alternatives is certainly warranted for a project with an up-to $10 billion price tag, one of the most expensive road expansion projects in the nation.

Second, the public has spent significant time and resources analyzing and articulating the elements of Community Alternative 7, considering the merits of each provision of Community Alternative 7, and ultimately supporting Community Alternative 7. To not even dignify this work and careful consideration with an analysis of Community Alternative 7 in the RDEIR/SDEIS does not "encourage public participation." Rather, it diminishes the public's confidence that the I-710 EIR/EIS process truly considers the input of the impacted community, including the representative body of elected leaders that stood up to support analysis of Community Alternative 7. Those interested in participating in a truly open and technically sound process that has been promised by the agencies could become dispirited, and instead rely on other tools like protest and litigation to make sure their voices are heard. Given that Community Alternative 7 is a reasonable alternative, failure to analyze it violates state and federal laws. IP-24-15

E. Caltrans' Jurisdictional Argument is a Red Herring.

Caltrans' argument that it lacks jurisdiction over some of the components of Community Alternative 7 is inappropriate and unlawful for several reasons. First, to the extent this argument deals with the public transit enhancements of the project, LA Metro is part of the project team, so the agency that Caltrans claims has jurisdiction is deeply involved with this project. Second, Caltrans' own directives demand that the agency "develop[] integrated multimodal projects in balance with community goals, plans, and values. Addressing safety and mobility needs of bicyclists, pedestrians, and transit users in *all projects*, regardless of funding, is implicit in these objectives."[29] Third, even if promoting multimodal transportation projects is found to be somehow outside of Caltrans' jurisdiction (and the project partners are somehow not actually involved in delineating the project), that is still not a reason to exclude that analysis under NEPA and CEQA. In fact, Caltrans states "NEPA . . . clearly requires that lead agencies consider alternatives that may not be within the jurisdiction of their agency."[30] Thus, hiding behind a IP-24-16

---

[28] *Coalition for Canyon Preservation v. Bowers*, 632 F.2d 774, 781 (9th Cir. 1980) (citing *Trout Unlimited v. Morton*, 509 F.2d 1276, 1282-83 (9th Cir. 1974)).

[29] Caltrans Deputy Directive DD-64-R1, Complete Streets—Integrating the Transportation System (October 2008), *available at* http://www.dot.ca.gov/hq/tpp/offices/bike/sites_files/DD-64-R1_Signed.pdf (emphasis added).

[30] *See generally* Caltrans, Alternatives Guidance, pg. 8 (Alternatives Outside of the Agency's Jurisdiction), *available at, http://www.dot.ca.gov/ser/downloads/guidance/alternative_analyfaq.pdf*. While CALTRANS does not believe the California Environmental Quality Act requires an analysis of alternatives outside of its jurisdiction, CEHAJ disagrees. But, this matter is irrelevant because the National

jurisdictional curtain cannot shield Caltrans from assessing components it feels is not under its jurisdiction.

IP-24-16

F. Arguments About the Size of Some Components of Community Alternative 7 Makes No Sense.

Nothing in NEPA and CEQA mentions the small scale of components as a means to reject an alternative. Besides, the proposed alternatives already include components that Caltrans considers "small" such as improvements to pedestrian facilities and bike lanes. CEHAJ understands the mobility and community needs of many along the community. Sometimes this entails large pieces of infrastructure, and sometimes this entails smaller projects. As Caltrans concedes, Community Alternative 7 is more comprehensive and holistic. CEQA and NEPA do not bar agencies from engaging in more comprehensive and holistic strategies to address mobility needs. In fact, these laws are specifically designed to achieve this objective.

IP-24-17

Moreover, the fact that some pieces of Community Alternative 7 may not need to undergo environmental review misses the point. Community Alternative 7 provides a comprehensive vision and solution. The components need to proceed as a package to ensure the full benefits of this holistic solution. As such, packaging them in one project makes sense to ensure all the vital components move forward together. If parts that do not require environmental review are accomplished along the way, that does not harm the overall objective of a comprehensive solution.

IP-24-18

Because the alternatives analysis suffers serious flaws, the RDEIR/SDEIS violates CEQA and NEPA.

III. THE DISCUSSION OF LAND USE IMPACTS IS FLAWED AND INADEQUATE.

The RDEIR/SDEIS discussion of land use impacts remains inadequate. It fails to identify and adequately discuss inconsistencies with land use plans. And even when inconsistencies are identified, the document does not discuss the impacts of those inconsistencies on the environment, nor does it discuss what can be done to reduce or avoid those impacts or provide meaningful mitigation.

IP-24-19

A. The RDEIR/SDEIS Does Not Provide an Adequate Discussion of the Inconsistencies of the Project Alternatives with Land Use Plans.

To comply with CEQA guidelines, the RDEIR/SDEIS must analyze and discuss inconsistencies between the proposed project and applicable land use plans as of the time that the Notice of Preparation ("NOP") was prepared.[31] Caltrans fails to do so.

Environmental Policy Act clearly requires this analysis as conceded in CALTRANS own planning document.

[31] CEQA Guidelines § 15125(d) & (e).

The conclusion in the RDEIR/SDEIS that the build alternatives are "generally consistent" with land use plans is not supported by the evidence. In fact, Caltrans admits that adoption of any build alternative would require local and regional agencies to amend their plans to reflect changes in land use and configuration of the freeway, but fails to discuss this important inconsistency.[32]

IP-24-19

CEQA does not require a discussion of the consistencies of build alternatives with land use plans, but rather requires a discussion of the inconsistencies.[33] Here, Caltrans asserts that the build alternatives are "generally" consistent and does not adequately discuss the inconsistencies, let alone the impact of those inconsistencies on the environment. This does not comport with the law.

Caltrans incorrectly concludes that because the freeway is contemplated by some local plans, that the build alternatives are necessarily consistent with those plans. "Although the build alternatives would impact 536 to 752 acres of land currently in other uses, because I-710 has been considered in the local General Plans since its construction as a freeway in the 1950s, the build alternatives are generally compatible with adjacent land uses."[34] Perhaps the existing freeway was considered, but that does not mean that this proposed freeway project, which displaces vital community resources and housing while a number of these jurisdictions are facing a housing crisis, would be consistent.

IP-24-20

The RDEIR/SDEIS is misleading where it identifies the build alternatives as consistent with a general plan, while burying inconsistencies acknowledged later. For example, with respect to consistency with the South Gate General Plan, the RDEIR/SDEIS states that the build alternatives will "preserve residential neighborhoods in the City of South Gate by avoiding residential displacements in the city."[35] To the contrary, Table 3.1-1 shows that there will be 0.29 and 0.36 acres of residential land converted to transportation land use under alternatives 5C and 7 respectively.[36] Similarly, the City of Paramount is slated to have 0.57 acres of residential land converted to transportation land use under either build alternative and 0.9 to 1.28 acres of industrial land lost, yet the RDEIR/SDEIS states that build alternatives "would not adversely impact residences or businesses."[37] With respect to East Los Angeles, the RDEIR/SDEIS states

IP-24-21

[32] *See, e.g.,* RDEIR/SDEIS at 3.1-54 ("While adoption of any one of the build alternatives would require SCAG, the County of Los Angeles, and several other regional and local agencies to amend their plans and/or land use maps to reflect modifications to the I-710 mainline, interchanges, arterial highways, and arterial intersections, as well as the elimination of any land uses that may need to be acquired for the project, the proposed build alternatives are generally consistent with these plans. Caltrans will need to amend its existing freeway agreements with cities where the build alternatives would add or remove connections to I-710 or I-405.").

[36] *Id.* at 3.1-14.
[37] *Id.* at 3.1-14; 3.1-58.

that the build alternatives are consistent with the community plan due to their "retaining of residential areas in East Los Angeles."[38] To the contrary, Table 3.1 shows that 0.09 to 1.77 acres of residential land use will be lost as a result of the build alternatives.[39] And in the City of Bell Gardens, the RDEIR/SDEIS states that build alternatives "would not result in business displacements within the City of Bell Gardens" yet table 3.1-1 indicates 0.27 or 0.28 acres of impacts for commercial and services for 5C and 7; and 2.17 and 1.94 acres of industrial; and 1.47 and 1.02 for residential.[40]

IP-24-21

The RDEIR/SDEIS fails to identify that the build alternatives are actually inconsistent with several of the plans, incorrectly stating they are consistent:

- California Coastal Act. Goal C states "Maximize public access to and along the coast and maximize public recreational opportunities in the coastal zone consistent with sound resources conservation principles and constitutionally protected rights of private property owners."[41] The RDEIR/SDEIS states that build alternatives "would require relocation of residences and businesses . . . some of which are located in the Coastal Zone," but that because relocations would comply with the Uniform Act, the build alternatives would not result in adverse impacts.[42]

IP-24-22

- City of Bell Gardens General Plan: states consistency despite 1.02 to 1.47 acres of residential land will be converted, and preserving residential property is a stated principle of the general plan. "According to the City of Bell Garden General Plan (1995), residential land uses account for the majority of land use in Bell Gardens, and the majority of housing stock is over 50 years old. As a result, the City of Bell Gardens strives to preserve the existing residential neighborhoods while promoting new development in the industrial areas to provide employment opportunities."[43]

IP-24-23

- As currently written, the RDEIR/SDEIS fails several of the guiding principles of the 2035 County of Los Angeles General Plan. That plan promotes working to "Coordinate an equitable sharing of public and private costs associated with providing appropriate community services and infrastructure to meet growth needs."[44] A public private partnership to fund the ZE corridor would be consistent with this goal. In addition, another policy provides working to "promote programs that support a stable and well-educated workforce."[45] A local hire policy would promote this goal, but is currently lacking in the proposed projects.

IP-24-24

- For some plans, the RDEIR/SDEIS fails to acknowledge inconsistencies with local policies. For instance, as CEHAJ explained in comments on the DEIR/S, the Sustainable

IP-24-25

[45] *Id.* at 3.1-21 through 3.1-22.

Communities Strategy calls for working to "increase the efficiency of the existing transportation system" and expanding the freeway is inconsistent with this goal. IP-24-25

Finally, Table 3.1-1 Fails to provide total acres impacted for Alt. 7, Option 3B in the table.[46] IP-24-26

Moreover, Caltrans does not consider all of the relevant local and regional plans and policies that apply to the Project. For instance, the RDEIR/SDEIS fails to consider greenhouse gas elements of local plans. IP-24-27

B. The RDEIR/SDEIS Fails to Explain the Environmental Impacts of Inconsistencies with Land Use Plans.

Once inconsistencies have been identified and adequately discussed, Caltrans must discuss the impacts of those inconsistencies and what can be done to reduce or avoid those impacts.[47] Here, as discussed above, Caltrans incorrectly asserts that the build alternatives are "generally" consistent and does not discuss either the inconsistencies or the impact of those inconsistencies on the environment. Even where inconsistencies with land use plans are acknowledged, the RDEIR/SDEIS fails to analyze the environmental impacts of the inconsistencies, or as discussed in the next section to meaningfully mitigate those impacts.

For example, the RDEIR/SDEIS fails to adequately analyze the environmental impact of the following inconsistencies it identifies:

- The SCAG RCP states that build alternatives would not be consistent with "several" guiding principles and goals, but that "the build alternatives would not provide new housing or education as referenced in the RCP."[48] IP-24-28
- With respect to the SCAG RTP/SCS, the RDEIR/SDEIS states, "The build alternatives do not provide high-occupancy vehicle (HOV) gap closures or a rideshare program; therefore, the build alternatives would not be consistent with these policies in the RTP." Also, the project description does not match and the RTP would need to be amended prior to approval of the Final EIR/EIS.[49] IP-24-29
- The FTIP section acknowledges that both the RTP and RTIP will need to be amended to match the preferred alternative prior to approval of the final EIR/EIS.[50] IP-24-30
- Because "the build alternatives would result in impacts to open space and recreation land uses. Therefore, the project is not consistent with the objective" of the IRWMP. 3.1-55. IP-24-31
- With respect to the objectives of the OSHARP and OSHARTM, "The loss of recreation and open space land use associated with the build alternatives is not consistent with the objectives".[51] IP-24-32

[46] RDEIR/SDEIS at 3.1-14.
[47] CEQA Guidelines § 15125(d).
[48] RDEIR/SDEIS at 3.1-54.
[49] *Id.* at 3.1-55.
[50] *Id.*
[51] RDEIR/SDEIS at 3.1-55.

- With respect to the City of Bell General Plan, the document states: "The build alternatives would not expand public facilities in the city; however, Caltrans is working with agencies responsible for public facilities throughout the corridor to mitigate any direct impacts."[52] Despite acknowledging this inconsistency, also states that the build alternatives are consistent with the goals and policies of the General Plan. Bell General Plan Policy 10: "Expand public facilities to meet community needs and demands."[53] IP-24-33
- With respect to the City of Long Beach General Plan, "The build alternatives would also result in relocation of businesses and residents in the city, which would be inconsistent with the General Plan."[54] Confusingly, despite acknowledging this overall inconsistency, the RDEIR/SDEIS also states that build alternatives "are consistent with the adopted goals and policies in the City of Long Beach General Plan."[55] IP-24-34

Failure to analyze specific local impacts to land use is not in compliance with CEQA. For example, the City of Commerce is clear that it will oppose a project that "does not first consider the potential impacts of such facilities on the local community in which the facility will be located."[56] Yet, despite the fact that Commerce has some 280 entries in the Appendix L Parcel Acquisition table, Caltrans fails to discuss how the land use changes in the build alternatives are inconsistent with the land use plan and what impacts those inconsistencies will have. IP-24-35

The RDEIR/SDEIS does not discuss the impacts of changing land uses. The RDEIR/SDEIS acknowledges that large amounts of land will need to be converted to a different land use in order for either Project Alternative to be built. Yet Caltrans fails to describe why this significant amount of land to be converted will have a "minimal" impact on land use conversion, and furthermore fails to discuss how land use conversion will impact the environment and the people living in affected communities.[57] IP-24-36

---

[52] *Id.* at 3.1-56.
[53] *Id.* at 3.1-25.

[55] *Id.*
[56] *Id.* at 3.1-29 ("Transportation Policy 6.1: The City of Commerce will ensure that all future transportation facilities that will provide a regional benefit do not have a significant adverse impact on the community and that any such impacts are mitigated to the fullest extent possible. [...] Transportation Policy 6.2: The City of Commerce will oppose any regional public transportation improvement that does not first consider the potential impacts of such facilities on the local community in which the facility will be located.").
[57] RDEIR/SDEIS at 3.1-11 (Of the 536 to 752 acres of land that will be required for the project, "Generally, approximately 68 percent of the existing rights of way required for Alternatives 5C and 7 consist of existing transportation, utilities, and vacant land uses. Approximately 3 percent and 20 percent of existing rights of way for the build alternatives consist of existing commercial and services, and industrial uses, respectively. Additionally, approximately 3 percent of existing rights of way for the build alternatives consists of existing residential uses. Therefore, permanent impacts to land use as a result of Alternative 5C and Alternative 7 are considered minimal in terms of land use conversion.").

A total of 537 to 750+ acres of land will be converted as a result of the project. The document does not analyze what do these changes in land use mean in terms of impacts. The RDEIR/SDEIS must discuss the impacts to local housing, noise, traffic circulation, or other activities that result from changing land uses. For example, in the City of Long Beach, between 270.29 to 373.35 acres of land will be impacted by the build alternatives, including 5-6 acres of residential land.[58] The document must discuss the impacts of those land use changes. Moreover, the RDEIR/SDEIS does not discuss whether local agencies would be willing to make those changes. IP-24-37

The land use section of the RDEIR/SDEIS also fails to consider public health impacts resulting from conversion of land use. On page 3.1-15, Caltrans states that "The transportation/land use relationship is a critical one relative to public health," and "existing sensitive land uses (residences, parks, schools, etc.) directly adjacent to the I-710 are exposed to higher levels of vehicle exhaust emissions and traffic noise than occur within the overall I-710 Corridor."[59] Yet, the RDEIR/SDEIS fails to describe this relationship in any more depth or how the changes to land use will impact public health. In addition to the public health considerations related to air quality and noise and sensitive land uses, there are other health impacts, including those associated with displacement that result from reducing residential land uses in the region, that must also be analyzed. The RDEIR/SDEIS states that "Avoidance, minimization, and mitigation measures are proposed to reduce the impacts resulting from the build alternatives on existing land uses."[60] The RDEIR/SDEIS must specify what these mitigation measures are and how they will reduce impacts to public health as a result of changing land uses. IP-24-38

In addition, where the RDEIR/SDEIS adds analyses for additional plans not discussed in the DEIR/S, it nevertheless still fails to discuss the inconsistencies or their environmental impacts, or to mitigate for them. IP-24-39

C. The RDEIR/SDEIS Fails to Mitigate or Avoid Land Use Impacts.

Because Caltrans failed to identify and adequately discuss the inconsistencies and their environmental impacts, it has also failed to adequately mitigate the impacts. As explained below, Caltrans fails to provide any meaningful avoidance or mitigation efforts for impacts of the build alternatives on land use.

LU-1 is not a meaningful mitigation measure and is inadequate for both permanent impacts to land use and for issues related to inconsistency with general plans. LU-1 simply states that Caltrans will "request" that affected Cities and the County amend their General Plans "to reflect the final alignment, interchange locations, and modification of land use designations for properties that would be acquired for the project."[61] In the RDEIR/SDEIS, LU-1 was changed to clarify that the timing and processing of amendments would be at the discretion of each local jurisdiction, and that these amendments could occur "during the next cycle of amendments to IP-24-40

[58] *Id.* at 3.1-13, Table 3.1-1.
[59] *Id.* at 3.1-15.
[60] *Id.*
[61] RDEIR/SDEIS at 3.1-62.

each local jurisdiction's General Plan Circulation and Land Use Elements."[62] LU-1 also states that Caltrans will "also initiate amendments to existing freeway agreements with cities where the build alternatives would add or remove access to I-710 or Interstate 405."[63]

The proposed Caltrans request is not a mitigation measure, as it does not do anything to avoid or reduce impacts to changes in land use that occur as a result of the project. The mitigation is merely a paper exercise to achieve "consistency"; meanwhile, nothing is done to mitigate the many acres of residential land that will be converted to transportation uses. Indeed, in response to comments Caltrans acknowledges that this is not a binding mitigation measure. "Measure LU-1 was written as a request of and not a requirement on local jurisdictions such as the City of Maywood because Caltrans has no authority to require a local jurisdiction to amend its General Plan. However, in the longer term, it is to a local jurisdiction's benefit for its General Plan to reflect actual land uses such as transportation facilities."[64] IP-24-40

The RDEIR/SDEIS should analyze all feasible mitigation measures. For example, mitigation should be included to avoid or reduce changes to land use, avoid impacts to residential areas and community resources, and increase the amount of housing and access to community resources.

D. Caltrans' Response to Prior CEHAJ Comments on the DEIR/SDEIR Land Use Section is Inadequate.

CEQA § 21091 and CEQA Guideline §15088 require lead agencies to respond in writing to comments submitted by the public that raise significant environmental questions. An adequate response to comments explains why the lead agency has rejected the recommendations and objections raised in the comments and provides a good faith, reasoned analysis to support the agency's determination. The level of detail in the response should be the same as the level of detail in the comment, and conclusory statements are insufficient. Caltrans and Metro's response to CEHAJ's comment on land use is inadequate because it failed to explain the agency's basis for rejecting the recommendation or objection, provided only a general response to a specific and detailed comment, and provided only conclusory statements.

Caltrans' response to the three pages of legal comments that CEHAJ provided on the DEIR/S is a single sentence: "In response to this comment, Section 3.1.2 of the Recirculated Draft EIR/Supplemental Draft EIS has been expanded to provide more detail for the General Plan Consistency Analyses for the Study Area jurisdictions, including specific analysis of any inconsistencies."[65] Comparing section 3.1.2.3 of the DEIR/S to the RDEIR/SDEIS, it is clear that almost nothing has changed in terms of the inconsistency discussions.[66] For instance, where IP-24-41

[63] *Id.*
[64] RDEIR/SDEIS, Appendix S, Response to Comments-Local Agency Comments, L-13-24 at 168 (responding to comment from City of Maywood calling LU-1 an unfunded mandate to local agencies, and revising the measure to show that general plan updates are a state requirement.).
[65] RDEIR/SDEIS, Appendix S, Response to Comments-Interested Parties, IP-22-44 at 783-84.
[66] DEIR/S at 3.1-47 through 3.1-50.

discussing the environmental impacts to cities affected by the build alternatives, the RDEIR/SDEIS repeats exactly the same language as was in the DEIR/S.[67]

IP-24-41

The inadequacy of this response to comment violates CEQA § 21091 and CEQA Guideline § 15088 and undermines the sufficiency of the EIR as an informational document.

IV. THE RDEIR/SDEIS ANALYSIS OF THE PROJECT'S IMPACTS ON PARKS IS INADEQUATE.

The RDEIR/SDEIS identifies 72 parks and recreation facilities within half a mile of the proposed construction.[68] Yet the RDEIR/SDEIS provides only minimal assessment of the impacts from this Project to these areas. Similarly, the Draft Section 4(f) Evaluation ("4(f) Evaluation") fails to consider potentially severe impacts to enjoyment and use of parks located directly along the proposed construction. As a result of this bald analysis, these documents fail to (1) adequately analyze the impacts to these facilities, (2) identify alternatives which would avoid or limit these impacts to parks, and (3) identify sufficient measures to minimize and mitigate the impacts. This limited analysis fails to meet the requirements of NEPA, CEQA and Section 4(f) of the Department of Transportation Act ("Section 4(f)").

IP-24-42

NEPA requires an EIS to carefully assess the impacts of a proposed project and to explore "all reasonable alternatives."[69] CEQA requires that all environmental impacts of a project be analyzed, and that no project be approved "if there are feasible alternatives or feasible mitigation measures available which would substantially lessen the significant environmental effects of such projects."[70] Similarly, under Section 4(f) of the Department of Transportation Act, an agency overseeing a transportation project may not approve any project requiring the use of a significant public park, recreation area, wildlife and waterfowl refuge, or historic site, unless it determines that: (1) there is no prudent and feasible alternative to using the property, and (2) the project includes all possible planning to minimize harm to the property.[71]

A. The RDEIR/SDEIS and Section 4(f) Evaluation Fail to Adequately Analyze the Environmental Impacts that the Project Alternatives will have on Parks.

Here, the RDEIR/SDEIS and Section 4(f) evaluation fail to consider potential severe impacts to enjoyment and use of parks located directly along the proposed construction. The Section 4(f) analysis lacks evaluation of constructive uses of parks, as well as discussion of temporary occupancies, focusing exclusively on parks where the project would require a physical presence on park land. By incorrectly finding that there are no temporary or constructive uses, and only de minimis uses, Caltrans improperly evades the requirement to analyze prudent and feasible

IP-24-43

[67] *Compare* RDEIR/SDEIS at 3.1-56 to 3.1-59; *see* 3.1-58 (adding one sentence about impacts the City of Long Beach, "The build alternatives would not expose persons within the City of Long Beach to excessive noise.").

avoidance alternatives to uses of section 4(f) properties. Thus, the document also fails to identify all possible measures to avoid, limit, and/or mitigate impacts. IP-24-43

1. The RDEIR/SDEIS and Section 4(f) Analysis Fail to Consider Potential Severe Impacts to Parks.

The document fails to adequately analyze the full extent of potential severe impacts to parks, including Julia Russ Asmus Park, Coolidge Park, Dills Park, Bandini Park, Maywood Park and others.

For example, despite its proximity to the I-710, there is no discussion in the section 4(f) document about Julia Russ Asmus Park. And the RDEIR/SDEIS conclusorily states: "Improvements to the I-710 mainline and local arterials would not result in direct impacts to the park. As indicated in the Traffic Noise Study Report (Caltrans 2016) prepared for the proposed project, sound barriers were found to be feasible under the I-710 Corridor Project Build Alternatives along the east side of I-710 that could provide noise reduction to this park and surrounding land uses."[72] Such a conclusory statement does not suffice.

Similarly, with respect to Coolidge Park, while acknowledging that "because Coolidge Park is adjacent to the study area, indirect noise, visual, and air quality impacts at Coolidge Park could result from the build alternatives following construction",[73] the RDEIR/SDEIS does not discuss these impacts in section 3.1.3. It simply concludes, "Improvements to the I-710 mainline and Artesia Blvd. would not result in direct to this park; improvements would be made within the existing right of way."[74] But in so doing, it fails to adequately discuss the impacts on noise, visual, access, and air quality could have negative impacts to park use and enjoyment. Notably, the document does not address noise and visual impacts to park's picnic area. IP-24-44

With respect to both Julia Russ Asmus Park and Coolidge Park, Caltrans uses a flawed rationale for minimizing and dismissing conclusorily potential impacts. In both cases, Caltrans concludes that "Because the focus of the park is active uses that are not particularly sensitive to indirect impacts such as noise or changes in views to/from the park," the effects of the project would not substantially impair the park's activities and functions or meaningfully reduce or remove the values of the resource.[75] Further, with respect to Coolidge Park, Caltrans also relies on the limited hours of the park to determine that increased noise, air quality, and visual impacts would not impact park use.[76] In both cases, this analysis is cursory and flawed.

[72] RDEIR/SDEIS at 3.1-78, table 3.1-5.
[73] Section 4(f) Evaluation at 72.
[74] RDEIR/SDEIS at 3.1-83, table 3.1-5.
[75] RDEIR/SDEIS, Appendix S, Response to Comments-Interested Parties at 799.
[76] Section 4(f) evaluation at 72. (According to the RDEIR: "The park does not include any amenities or features (such as wildlife habitat, a campground, or outdoor amphitheater) that would be considered highly sensitive to noise, visual, or air quality impacts. In addition, the park's hours are Monday through Friday, 12:00 to 6:00 p.m.; and Saturday, 12:00 to 4:00 p.m. Based on the nature of the amenities at the park (baseball field, basketball courts, spray pool), recreational users would most likely use the park for a limited time (e.g., a few hours during

Finally, Caltrans cannot use the fact that there are existing impacts to urban parks to avoid analyzing the additional impacts of the project. For instance, the discussion of Dills Park acknowledges noise impacts, yet states that there will not be impacts because "the park is currently located adjacent to an existing transportation facility with existing traffic noise."[77] Also, under the public health considerations, Caltrans states: "VISUAL IMPACTS. As shown in Table 3.1-4, a low visual impact to Coolidge Park, would result with implementation of the I-710 Corridor Project Build Alternatives. Similar impacts are anticipated for other parks and recreation facilities located adjacent to or in proximity of the I-710 mainline and proposed freight corridor. The visual impact of the build alternatives would be low at Maywood River Park, and the visual impact at Bandini Park would be moderately low. Because these parks are within an existing urban environment, these visual impacts are not expected to reduce the public's use of parks adjacent to I-710."[78] This faulty logic would suggest that parks already experiencing visual impacts can be worsened to an infinite degree without impact on use. IP-24-45

2. The RDEIR/SDEIS and Section 4(f) Analysis Fail to Evaluate Constructive Uses of Parks.

Section 4(f) applies to both physical taking and "constructive use" of parkland.[79] "Constructive use of park land occurs when a road significantly and adversely affects park land even though the road does not physically use the park."[80] Yet the document fails to provide an adequate discussion of the constructive uses of section 4(f) properties.

The document provides only a minimal assessment of the impacts to the 72 parks and recreation facilities within a half mile of the proposed construction. The Section 4(f) evaluation determines there will be no constructive uses of parkland, even though there will be increased noise and visual impacts on numerous of the parks; and it ignores serious disruptions to use and enjoyment both temporary and permanent at many of the park. Until Caltrans undertakes sincere inquiry into the constructive uses to these parks, it has not made the "special effort" required by 4(f). IP-24-46

baseball or basketball events, or daytime hours only to use the spray pool or picnic facilities), and would not likely spend several hours from early morning to late evening at the park. Therefore, recreational users would have limited exposure to air quality, noise, and visual impacts, and these impacts would not prevent recreational users from enjoying the active recreation activities at the park.").

[77] Section 4(f) Evaluation at 76 ("Indirect noise impacts would result from the project at Dills Park; however, the park is currently located adjacent to an existing transportation facility with existing traffic noise, which currently does not interfere with the activities, features, and attributes of the park. Additional indirect noise impacts from the project are not anticipated to result in substantial impairment of the park.).

[78] RDEIR/SDEIS at 3.1-87.

[79] 23 C.F.R. § 774.17.

[80] *Sierra Club v. Dep't of Trans.*, 948 F.2d 568, 573 (9th Cir. 1991); *see also Laguna Greenbelt, Inc. v. U.S. Dep't of Transp.*, 42 F.3d 517, 533 (9th Cir. 1994).

Caltrans' discussion of constructive uses ignores discussing 4(f) protected resources in many instances. Caltrans improperly narrows its consideration of sensitive uses to "campgrounds" and "outdoor amphitheaters." Citing a 2012 FHWA Policy Paper, Caltrans contends in the response to comments that constructive use impacts "The types of impacts that may qualify as constructive use, such as increased noise levels that would substantially interfere with the use of a noise sensitive feature such as a campground or outdoor amphitheater, are addressed in 23 CFR 774.15."[81] In the RDEIR/SDEIS, Caltrans goes on to rely on the fact that there are no campgrounds or outdoor amphitheaters in many of the parks to support its conclusion that there are not constructive use impacts.[82] But the FHWA never meant this guidance to mean constructive impacts can *only* occur where there are outdoor amphitheaters and campgrounds, merely that those are examples. To the contrary, constructive impacts can and likely will occur at the many picnic areas, playgrounds, and outdoor recreation facilities that will be impacted by the project.

IP-24-46

For the parks within a half mile of the project, there are foreseeable impacts that the RDEIR/SDEIS must address yet does not. A thorough evaluation of these impacts is necessary to understand whether a constructive use occurs.

For example, the document acknowledges that there will be "short term air quality and traffic effects" yet does not discuss what those impacts will be.[83] Therefore, the idea that those undescribed impacts will be mitigated is not a meaningful promise to the public, since the impacts are not disclosed. Additionally, the assertion that noise walls and berms will mitigate those impacts does not follow – noise walls do not mitigate air quality impacts, and in any case, Caltrans has found that for several of the parks suffering from increased noise levels, sound walls are not feasible.[84]

IP-24-47

The RDEIR/SDEIS specifically fails to consider constructive uses due to noise. According to section 4(f), 23 CFR 774.15 specifically identifies as constructive use a situation in which "[t]he projected noise level increase attributable to the project substantially interferes with . . . [e]njoyment of an urban park where serenity and quiet are significant attributes."[85] For urban parks like Coolidge park, which offer restful settings in urban areas, noise impacts may substantially interfere with enjoyment of the park.

IP-24-48

[81] RDEIR/SDEIS, Appendix S, Response to Comments-Interested Parties Comments at 797; Fed. Highway Admin., Section 4(f) Policy Paper, at 7 (July 20, 2012) https://www.environment.fhwa.dot.gov/4f/4fpolicy.pdf.
[82] RDEIR/SDEIS, Appendix S, Response to Comments-Interested Parties at 797 (Caltrans also relies on fact that there are no campgrounds or outdoor amphitheaters as part of rationale that there are no constructive uses.).
[83] *Id.*
[84] *Id.* ("Other indirect impacts such as short-term air quality and traffic effects near those resources would be substantially mitigated based on measures implemented during project construction and permanent design features of the project such as noise walls and berms.").
[85] *Id.* at 64.

In addition, while the Response to Comments acknowledges that there will be effects on Table 3 parks including "noise, air quality, and visual effects" due to "both existing uses and activities . . . as well as the effects of the I-710 Corridor Project."[86] Yet the document fails to analyze to what extent the project will have impacts above the baseline conditions, and simply includes a conclusory statement that the impacts will not substantially impair the features qualifying under Section 4(f). Nowhere is this analysis in the document. IP-24-48

For its analysis of constructive impacts under the section 4(f) analysis, Caltrans simply states the following: "The properties meeting the criteria for protection under Section 4(f) were also evaluated to determine whether the build alternatives would result in the constructive use of those properties. The detailed analyses documented in the project technical reports did not identify any proximity impacts resulting from the project that would be so severe that the activities, features, or attributes that potentially qualify those properties for protection under Section 4(f) would be substantially impaired. The proximity impacts of the build alternatives in the vicinity of properties that potentially qualify for protection under Section 4(f) would not meaningfully reduce or remove the values of those resources in terms of their Section 4(f) significance. Therefore, the build alternatives were determined not to result in constructive use of any properties potentially protected under Section 4(f)."[87] Yet the section 4(f) evaluation and the RDEIR/SDEIS do not disclose the impacts identified in the technical reports, so we cannot be sure that they will not be substantial or severe. IP-24-49

Finally, the public health considerations in the parks section of RDEIR/SDEIS is also inadequate. Caltrans must consider air quality impacts on the use and enjoyment of park resources. Numerous studies demonstrate the health impacts from exercising in areas of poor air quality,[88] and this diminished use must be analyzed, addressed, and mitigated.

3. The RDEIR/SDEIS and Section 4(f) Analysis Fail to Evaluate Temporary Uses of Parks During Construction.

The discussion of impacts and mitigation measures for temporary construction impacts to parks and temporary closures of parks during construction is also inadequate. There are a number of parks that will be subject to temporary construction easements and temporary closures under the proposed project alternatives. The documents do not adequately discuss the impacts of using park space for construction staging and for temporary closures of the parks. IP-24-50

[86] *Id.* at 797.
[87] Section 4(f) Evaluation at 2-3.
[88] *See, e.g.*, CA Air Res. Bd., *Physical Activity: Health Benefits, the Role of the Built Environmental and the Impact of Air Pollution* at 38-40 (Dec. 16, 2016), https://www.arb.ca.gov/research/vprp/physical_activity_and_health_final_161216.pdf; Jason G. Su *et. al., Does exposure to air pollution in urban parks have socioeconomic, racial or ethnic gradients?* Envtl. Res. 111:319–328 (2011), http://doi.org/10.1016/j.envres.2011.01.002; M. McConnell *et al*., *A Longitudinal Cohort Study of Body Mass Index and Childhood Exposure to Secondhand Tobacco Smoke and Air Pollution: The Southern California Children's Health Study*, Envtl. Health Perspectives 123:360-6 (2015).

Merely stating that vague TMPs will be implemented and that closed or TCE areas will be returned to public use after the temporary impacts are over does not satisfy the law. Caltrans must discuss the actual impacts to use and enjoyment of the park, if even for a temporary time, and include mitigation measures to minimize those impacts. IP-24-50

Some of the temporary construction impacts do not meet the criteria as set out by 23 CFR 774.13(d).[89] For instance, the TCEs and temporary closures *would* interfere with the activities or purposes of the resource on a physical basis, making those TCEs and temporary closures a temporary occupancy that requires mitigation. IP-24-51

For the many of the projects included in the cursory constructive use analysis, Caltrans improperly concludes that "[v]isual, noise, and air quality impacts would not result in substantial impairment because no severe proximity impacts at the soccer fields/greenbelt are identified in the EIR/EIS."[90] This discussion applies to five parks – Drake/Chavez Soccer Fields and Greenbelt Project, Oregon Park, Baker Street Park, 72nd Street Staging Area, and Dills Park. These parks include facilities such as playgrounds, picnic areas, soccer fields, and tot lot. First, the reference to the analysis in the EIR/EIS is inadequate, since the document is not sufficient to adequately assess the impacts. Second, the section 4(f) evaluation cannot circularly rely on the RDEIR/SDEIS, which in turn relies on the section 4(f) evaluation. By referencing to each other, the documents attempt to get away with doing no analysis. The documents must disclose the impacts to visual, noise, and air quality impacts on parks, among other impacts. IP-24-52

The section 4(f) evaluation also states that: "For the remaining resources in Table 3, a review of the technical analyses in the EIR/EIS did not identify any project-related proximity impacts that would be so severe after mitigation as to result in substantial impairment of the activities, features, and/or attributes that qualify the properties listed in Table 3 for protection under Section 4(f). Because no severe proximity impacts have been identified in the EIR/EIS, it was determined that the build alternatives would not result in the constructive use of the resources listed in Table 3."[91] IP-24-53

[89] Section 4(f) Evaluation at 16 ("A temporary occupancy is when land is temporarily used by the project, such as for temporary construction easements (TCEs) or staging areas. A temporary occupancy would not constitute a use if the following five conditions set forth in 23 CFR § 774.13(d) can be satisfied: The duration of occupancy must be temporary, i.e., less than the time needed for construction of the project, and there should be no change in ownership of the land; · The scope of the work must be minor, i.e., both the nature and magnitude of the changes to the 4(f) resource must be minimal; · There are no anticipated permanent adverse physical impacts, nor will there be interference with the activities or purposes of the resource, on either a temporary or permanent basis; · The land being used must be fully restored, i.e., the resource must be returned to a condition which is at least as good as that which existed prior to the project, and · There must be documented agreement of the appropriate federal, state, or local officials having jurisdiction over the resource regarding the above conditions.").
[90] *Id.* at 75.
[91] *Id.*at 76-77.

4. By Failing to Find Constructive or Temporary Uses of 4(f) Properties, Caltrans Improperly Evades the Section 4(f) Requirement to Evaluate Avoidance Alternatives for Uses of Section 4(f) Resources.

Caltrans must assess prudent and feasible avoidance alternatives for the temporary and constructive uses imposed by the project. By incorrectly finding that there are no temporary or constructive uses, and only de minimis uses, Caltrans improperly evades the requirement to analyze prudent and feasible avoidance alternatives to uses of section 4(f) properties. The document cannot simply list parks surrounding the project under a blanket conclusion of no use or de minimis use; Caltrans must actually consider the impacts to these areas.[92] IP-24-54

5. The RDEIR/SDEIS Should Include Additional Information about Impacts to Parks.

Caltrans should explain why Parque Dos Rios will be non-functional under Alternative 7. Currently, the documents only state that Alternative 7 will require permanent incorporation of 3.21 acres of Parque Dos Rios, but that "because of the limited accessibility and functionality of the remnant parcel, the entire 8.6-acre park would be required by the project."[93] Why are the other 5.39 acres non-functional? Could they be redesigned to be functional? Furthermore, if they are non-functional, what will happen to those 5.39 acres if the project is built? IP-24-55

B. Caltrans Fails to Identify Alternatives that would Limit Impacts to Parks.

Until all of the environmental impacts to parks are identified and properly analyzed, Caltrans cannot meaningfully consider the range of alternatives that would avoid or reduce those impacts Section 4(f) requires the consideration of avoidance alternatives, which may include new alignments and design variations that would avoid the use of the Section 4(f) resource. IP-24-56

Section 4(f) permits use of a park only when there is no prudent and feasible alternative to using the park, and the project includes all possible planning to minimize the harm to the park.[94] Under Section 4(f), an alternative is "feasible" merely if it can be built "as a matter of sound engineering judgment."[95] An alternative is "prudent" so long as it does not unreasonably compromise the project's stated purpose and need, and does not produce certain "unacceptable," "severe," "extraordinary," "unique," or "unusual" impacts.[96] Thus, under Section 4(f), an agency approving a transportation project which uses parkland must consider all viable alternatives, even those not fully meeting the identified "needs" of the project:

[95] *Id.*; *Citizens to Pres. Overton Park, Inc. v. Volpe*, 401 U.S. 402, 411 (1971).
[96] 23 C.F.R. § 774.17 (2017).

> The mere fact that a "need" for a highway has been "established" does not prove that not to build the highway would be "imprudent" . . .. To the contrary, it must be shown that the implications of not building the highway pose an "unusual situation," are "truly unusual factors," or represent cost or community disruption reaching "extraordinary magnitudes."[97]

Whatever alternative is ultimately selected must include "all possible planning" to minimize the project's harm to used parkland.[98] "All possible planning" means all reasonable measures to minimize or mitigate harm, including design modifications or goals, provision of comparable replacement land, and monetary compensation.[99]

Caltrans has not demonstrated how it has exhausted "all possible planning" to avoid and minimize these project's impacts. For example, it has not exhausted all possible alternative design modifications of a zero-emission freight corridor, that neither increase the number of general purpose lanes nor widen lanes or shoulders, to minimize impacts to Parque Dos Rios or avoid or minimize other parkland impacts. IP-24-57

C. Caltrans Fails to Identify Sufficient Measures to Minimize and Mitigate the Impacts to Parks.

Until all constructive uses and impacts have been identified and properly analyzed, measures necessary to minimize and mitigate cannot be determined. Caltrans must consider all alternatives, including both physical and constructive, including temporary uses due to construction, and any other noise, aesthetic, or other impacts which may affect the enjoyment and use of parkland. Mitigation measures should include installation of sound barriers already found to be feasible, consideration of additional safeguards to limit noise and aesthetic interference with parks including measures to limit construction impacts), and the LID practices described in section XIV (water quality impacts) of these comments. IP-24-58

Another mitigation measure is the establishment of additional parks to serve the communities affected by the project, many of which are park poor.[100] Caltrans should require considering park equity as a component of identifying the replacement park. Currently, the mitigation measures IP-24-59

[97] *Stop H-3 Ass'n v. Dole*, 740 F.2d 1442, 1455 (9th Cir. 1984), *quoting Overton Park*, 401 U.S. at 411-13.

[100] *See, e.g.*, L.A. Cty. Dep't. of Parks & Recreation, *Los Angeles Countywide Comprehensive Park Needs Assessment* (May 9, 2016), http://file.lacounty.gov/SDSInter/dpr/245982_Attachment1-ParksNeedsAssessment_FinalReport.pdf; J. Wolch *et al.*, *Parks and Park Funding in Los Angeles: An Equity-Mapping Analysis*, Urban Geography 26(1):4–35 (2005), http://doi.org/10.2747/0272-3638.26.1.4.

include "Key considerations in identifying replacement property/properties are (1) the acreage of the replacement property/properties compared to the acres used at Parque Dos Rios, (2) whether equivalent or better recreational functionality can be provided on the replacement property/properties, and (3) whether and what connections can be provided to other recreational resources from the replacement property/properties, notably the Los Angeles River Trail."[101] Another consideration should be park equity. Caltrans should also consider the access points to the LA River for the community. Further, Caltrans should specify whether it will pay for the replacement property and describe how that will be funded. IP-24-59

The mitigation measures for physical impacts to parks should be strengthened. Caltrans should add more information in its mitigation measure for impacts to Parque Dos Rios and for replacement of the basketball court at Cesar E. Chavez Park. At Parque Dos Rios, the section (4) evaluation identifies that "there may be some interference with the protected activities, features, or attributes on a temporary basis during construction"[102] However, the mitigation measure does not address the temporary impacts during construction. Similarly, Caltrans should specify whether it will pay for the replacement of basketball court at Cesar E. Chavez park. IP-24-60

The RDEIR/SDEIS should limit the planned closures of trail crossings for the LA River and Rio Hondo Trails. Currently the section 4(f) says that the alternatives would require closures lasting from a few days to "several months" in duration.[103] A mitigation measure should specify limits on the duration of these closures, such that they do not disrupt access for longer than a specified number of days and for only the minimum period necessary. IP-24-61

Caltrans must mitigate the loss of 3.76 acres of the basin from the Dominguez Gap and DeForest Treatment Wetlands.[104] Currently, no mitigation measures for the permanent loss of these wetlands are proposed. IP-24-62

Caltrans must also do more to mitigate the removal of 7.9 acres of the West Basin during construction. Alternative 7 would require the temporary removal of 7.9 acres of the West Basin, which would be restored following construction.[105] While the mitigation states that the construction contractor will be required to return the area "to a condition as good as or better than prior to its use for construction" in consultation with the LACDPW, more can be done to specify how this area would be improved.[106] IP-24-63

Caltrans should consider additional noise mitigation where sound walls not found acoustically feasible, and discuss impacts of not abating the noise. For example, for Ralph C. Dills Park: "As indicated in the Traffic Noise Study Report (Caltrans 2016) prepared for the proposed project, under Alternative 7, there would be a substantial noise increase resulting in noise impacts. Noise IP-24-64

[106] *Id.* at 66.

abatement was considered in the form of a sound wall along the proposed truck lanes; however, it has been determined to be acoustically not feasible."[107] Additionally, the discussion of public health impacts of noise does not discuss those instances where sound walls will not be added in. IP-24-64

D. Caltrans' Response to CEHAJ Comments on the Section 4(f) Analysis is Inadequate.

CEQA § 21091 and CEQA Guideline § 15088 require lead agencies to respond in writing to comments submitted by the public that raise significant environmental questions. An adequate response to comments explains why the lead agency has rejected the recommendations and objections raised in the comments and provides a good faith, reasoned analysis to support the agency's determination. The level of detail in the response should be the same as the level of detail in the comment, and conclusory statements are insufficient. Caltrans and Metro's response to CEHAJ's comment on parks and section 4(f) is inadequate because it failed to explain the agency's basis for rejecting the recommendation or objection, provided a general response to a specific and detailed comment, and provided only conclusory statements. The section 4(f) document provides no more details about constructive uses, just a summarily stated conclusory paragraph. The inadequacy of the response to comment violates CEQA § 21091 and CEQA Guideline § 15088 and undermines the sufficiency of the EIR as an informational document. IP-24-65

E. Section 6(f) Analysis is Inadequate.

Caltrans acknowledges that the Teen and Senior Center in Cesar E. Chavez park, as well as landscaping around the center, were funded by L&WCF Act funds, making impacts to those facilities ways of potentially triggering section 6(f).[108] However, Caltrans states that "The Teen and Senior Center and the area immediately around the Teen and Senior Center would not be affected by the build alternatives. Therefore, the requirements of Section 6(f) are not triggered for Cesar E. Chavez Park."[109]

This cursory dismissal of impacts, however, fails to account for potential impacts to the facility due to construction, such as air, noise, visual impacts, and the potential ongoing impacts due to the building of an on-ramp through part of the park. The analysis fails to identify both potential temporary impacts from construction as well as permanent impacts to the facilities. In addition, as Caltrans acknowledges, there will be temporary closures of the park, presumably those closures would affect the Center. More analysis and discussion is needed here to adequately assess the impacts, identify whether section 6(f) requirements are triggered, and identify alternatives to avoid them or mitigation. IP-24-66

[109] Section 4(f) analysis at 11.

V. THE RDEIR/SDEIS ANALYSIS OF CULTURAL RESOURCE IMPACTS AND MITIGATION IS INADEQUATE.

The RDEIR/SDEIS discussion of cultural resources impacts and mitigation is inadequate. For example, the document does not adequately describe the status and results of tribal consultation. It simply states "Consultation is ongoing with three individuals/tribes who have expressed interest …. Caltrans will continue to consult with tribes as construction details are developed."[110] In the RDEIR/SDEIS and accompanying technical reports on the topic, Caltrans does little to assure the public that adequate efforts have been made to reach all interested tribes, or to describe the process, substance, or results of consultation efforts. As a result, it is impossible to determine the actual impacts identified or whether the mitigations proposed in the document for cultural resources, such as CON-CUL-2, are adequate either to arrive at a mutual agreement with consulted tribes or to actually address any impacts identified. IP-24-67

In addition, CON-CUL-3 punts further description of specific mitigations for cultural resources impacts to other future documents.[111] When a project will significantly impact cultural resources or archaeological sites, the preferred manner of mitigation is preservation in place.[112] Preservation in place involves planning construction to avoid archaeological sites and other measures that protect cultural resources. In discussing cultural resources, Caltrans failed to address preservation in place and include it as an alternative. Additionally, mitigation measures for cultural resources cannot be deferred, and leaving mitigation measures for cultural resources undefined constitutes deferred mitigation. [113] These details are needed to fully assess whether the proposed mitigations will actually address the impacts. IP-24-68

Without this information and these details, the discussion of cultural resources impacts and mitigation is inadequate and fails to comply with CEQA and NEPA.

VI. THE RDEIR/SDEIS' GROWTH INDUCEMENT ANALYSIS IS INADEQUATE.

Under the CEQA, the RDEIR/SDEIS is required to "discuss the ways in which the proposed project could foster economic or population growth, or the construction of additional housing, either directly or indirectly, in the surrounding environment."[114] Because this project is subject to NEPA review, the environmental impact report or assessment must present "a *detailed* statement setting forth . . . [t]he growth-inducing impact of the proposed project."[115] The conclusions, IP-24-69

[110] RDEIR/SDEIS at 3.7-17.

[113] Pub. Res. Code § 15126.4(a)(1)(B); *Ballona Wetlands Land Tr. v. City of L.A.*, 201 Cal. App. 4th 455 (2011).
[114] CEQA Guidelines, § 15126.2(d); see also CEQ Regulations, § 1508.8(b) (effects to be considered include "growth inducing effects and other effects related to induced changes in the pattern of land use, population density or growth rate . . . .").
[115] Pub. Res. Code, §§ 21100(b)(3) (emphasis added), 21100.1(c).

findings, and determinations made regarding the growth-inducing impacts of the project must also be supported by substantial evidence.[116] Substantial evidence excludes "[a]rgument, speculation, unsubstantiated opinion or narrative, [and] evidence which is clearly erroneous or inaccurate . . . ."[117]

In preparing the RDEIR/SDEIS, Caltrans has failed to satisfy these legal requirements to explain in detail the proposed project's growth-inducing effects and to support conclusions with adequate substantial evidence. Instead, the RDEIR/SDEIS provides general, conclusory statements and opinion without proper evidentiary support. And based on these assertions, the RDEIR/SDEIS unreasonably determines there would be "no adverse growth-related effects" from any of the I-710 Corridor Project build alternatives, and as a result, no mitigation measures are required.[118] The law requires more information and detailed analysis from public agencies. Caltrans must revise the document in order to provide the public and decisionmakers with sufficient detail to make an informed decision about this project's growth-inducement impacts and to consider potential mitigation measures. Moreover, Caltrans must also provide adequate substantial evidence to support its analysis and conclusions, as required by law. IP-24-69

A. The RDEIR/SDEIS Fails to Provide Sufficient Detail and Substantial Evidence to Support Conclusions Regarding the Availability of Vacant Land to Facilitate Population and Housing Growth.

The RDEIR/SDEIS asserts that growth in population and housing within the Study Area are unlikely to be significant because "[m]ost of the cities are close to being built out and have very limited vacant land for new development."[119] The RDEIR/SDEIS maintains this assertion throughout its growth-inducement analysis.[120] Based on this assertion, Caltrans argues that the lack of vacant land on which to build additional housing within the Study Area acts as a "physical constraint[] to growth in population and housing" and in effect would control or limit any potential growth caused by the project.[121] However, Caltrans's analysis lacks the necessary information for the public and decisionmakers to assess and confirm these assertions. IP-24-70

Caltrans does not cite to any substantial evidence in the record to support this growth-inducement determination. For instance, the RDEIR/SDEIS does not provide or cite to studies and other expert reports detailing the shortage of vacant land for new housing development or

[116] See, e.g., *Bakersfield Citizens for Local Control v. City of Bakersfield*, 124 Cal.App.4th 1184, 1198 (2004).
[117] CEQA Guidelines § 15384 (substantial evidence includes "facts, reasonable assumptions predicated upon facts, and expert opinion supported by facts.").
[118] RDEIR/SDEIS at 3.2-21
[119] *Id*. at 3.2-4.
[120] See, e.g., *Id*. at 3.2-13 ("Due to the lack of vacant or less developed land within the I-710 Corridor, the build alternatives would not facilitate new development by opening up access to previously undeveloped or less developed areas."); see also RDEIR/SDEIS at 3.2-15 ("[T]he Study Area is already highly developed, and there is limited land available for new development or redevelopment.").
[121] RDEIR/SDEIS at 3.2-4.

redevelopment. And the RDEIR/SDEIS does not provide evidence to corroborate the statement that planning efforts in cities within the Study Area are focused on the reuse of existing uses. Instead, the environmental document relies on mere opinion and broad assertions concerning the availability of vacant land in the area. However, speculation and unsubstantiated opinions are not substantial evidence to support findings.[122] As noted, the failure to cite to the evidence relied upon deprives the public and decisionmakers of the ability to test that evidence to determine its adequacy. Moreover, Caltrans' failure to provide the underlying evidence supporting its findings undermines CEQA's statutory goals to allow for informed public participation and decision-making.[123]

IP-24-70

Additionally, in reaching this conclusion, the environmental document fails to provide an adequate level of detail, as required by law, to "enable those who did not participate in its preparation to understand and to consider meaningfully the issues raised by the proposed project."[124] For example, the RDEIR/SDEIS does not provide the percentage and location of vacant land in cities in and around the Study Area. Instead, it leaves the public and decisionmakers to speculate about the actual amount and how Caltrans reached this conclusion. The RDEIR/SDEIS is required to address these deficiencies.

IP-24-71

B. The Surrounding Environment Includes Areas Beyond the Pre-Defined Study Area.

As a preliminary matter, in assessing the project's potential growth-inducing effects, Caltrans is required to detail the project's potential to "foster economic or population growth, or the construction of additional housing, either directly or indirectly, in the *surrounding environment*."[125] In other words, Caltrans must make decisionmakers aware of the project's broader direct and indirect growth-inducing effects "on areas outside of the boundaries of the project area."[126] Although the scope of what constitutes the "surrounding environment" to be considered is not expressly defined, CEQA must be "interpreted in such a manner as to afford the *fullest possible protection* to the environment within the reasonable scope of the statutory language."[127] Thus, Caltrans is required to consider a reasonable scope that includes a significant portion of the surrounding environment beyond the project area that would likely shoulder some of the project's growth effects.

IP-24-72

[122] Pub. Res. Code § 21082.2(c).
[123] *Berkeley Keep Jets Over the Bay Committee v. Board of Port Com'rs*, 91 Cal.App.4th 1344, 1355 (2001).

Napa County Bd. of Supervisors*, 91 Cal.App.4th 342, 369 (2001) ("The detail required in any particular case necessarily depends on a multitude of factors, including, but not limited to, . . . the ability to forecast the actual effects the project will have on the physical environment.").
[125] CEQA Guidelines § 15126.2(d), emphasis added.
[126] *Napa Citizens for Honest Gov't v. Napa County Bd. of Supervisors*, 91 Cal.App.4th 342, 369 (2001).
[127] CEQA Guidelines § 15003(f), emphasis added.

Contrary to CEQA's requirements, in assessing the project's growth inducing effects, the RDEIR/SDEIS constrained its review to a predetermined Study Area that excluded large portions of Los Angeles County.[128] For example, in assessing conditions and other factors that would reduce the project's potential to foster growth, the RDEIR/SDEIS confined its analysis and conclusions to these artificial boundaries, stating that "[w]ithin the *Study Area*, there are several physical constraints to growth in population and housing," "[i]n the northern part of the *Study Area*, the railroad yards and tracks also act as a constraint to growth," and "utility corridors within the *Study Area* are also a physical boundary to growth."[129] By confining the growth-impacts assessment within this artificial Study Area, Caltrans was able to ignore a significant portion of the surrounding environment near the project that would likely experience impacts from induced growth. This narrow Study Area allowed Caltrans to minimize the project's growth-inducing effects and to ultimately conclude that the project would have no significant growth impacts.[130] As a result, the RDEIR/SDEIS found that no mitigation was necessary. IP-24-72

Caltrans's constrained consideration of the "surrounding environment" is precisely what courts have rejected in other circumstances. For instance, courts have ruled against efforts to give a "project's purpose an artificially narrow definition" because doing so would allow a government agency to avoid review of certain alternatives to the proposed project.[131] Similarly, Caltrans cannot artificially constrain what constitutes the "surrounding environment" in order to help the agency avoid a robust growth-inducement analysis and to conclude that no significant growth is likely to occur and no mitigation is required. Rather, the RDEIR/SDEIS must consider the full scope of the direct and indirect impacts the surrounding area is likely to experience as a result of this project beyond the Study Area. The RDEIR/SDEIS must establish a specific, broader study area to analyze these growth effects, similar to the supplemental study areas developed for the project's health risk assessment and water quality impacts.[132] Moreover, the need to constrain review to the Study Area must be explained, if Caltrans believes growth-inducement impacts are likely to *only* occur within the general area. IP-24-73

1. A Substantial Amount of Vacant Land Exists in Parts Beyond the Study Area.

As detailed, throughout the growth analysis, Caltrans asserts that "several physical constraints to growth in population and housing" exist within the Study Area.[133] One of these main constraints is the "very limited vacant land for new development" that would control the construction of additional housing and therefore restrict population growth.[134] The RDEIR/SDEIS maintains this assertion throughout its growth analysis, asserting that because "the Study Area is already highly developed, there is limited land available for new development IP-24-74

[128] RDEIR/SDEIS at 1.
[129] *Id*. at 3.2-4, emphasis added.
[130] *Id*. at 3.2-21.
[131] *North Coast Rivers Alliance v. Kawamura*, 243 Cal.App.4th 647, 668 (2015).
[132] RDEIR/SDEIS at 1 ("Specific study areas have been established for individual analyses (e.g. health risk assessment area of interest or water quality areas.").
[133] *Id*. at 3.2-4.
[134] *Id*. at 3.2-4.

and redevelopment."[135] However, the RDEIR/SDEIS ignores other areas near the project, beyond the narrow Study Area, that would provide the necessary vacant land and other development opportunities to facilitate the reasonably foreseeable population and housing increases from the project.[136]

Although the RDEIR/SDEIS focuses on the availability of vacant land *within* the Study Area, a closer inspection of the larger surrounding environment near the project shows a substantial amount of vacant land that would facilitate increased housing development and population growth. The availability of this vacant land undermines Caltrans' assertions that housing and population growth are naturally constrained. Notably, in Los Angeles County, almost 9,000 vacant parcels of land exist with multifamily residence zoning already in place to build additional housing (see Figure 1).[137] These zoned sites have the capacity to provide between 32,000 to 72,000 housing units.

IP-24-74

[135] *Id*. at 3.2-15.
[136] *Id*. at 3.2-14 ("mobility expected to be achieved as a result of the build alternatives could have a slight influence on the demand for residential and nonresidential uses").
[137] McKinsey Global Institute, *A Tool Kit to Close California's Housing Gap: 3.5 Million Homes by 2025* (Oct. 2016), http://www.mckinsey.com/global-themes/urbanization/closing-californias-housing-gap.

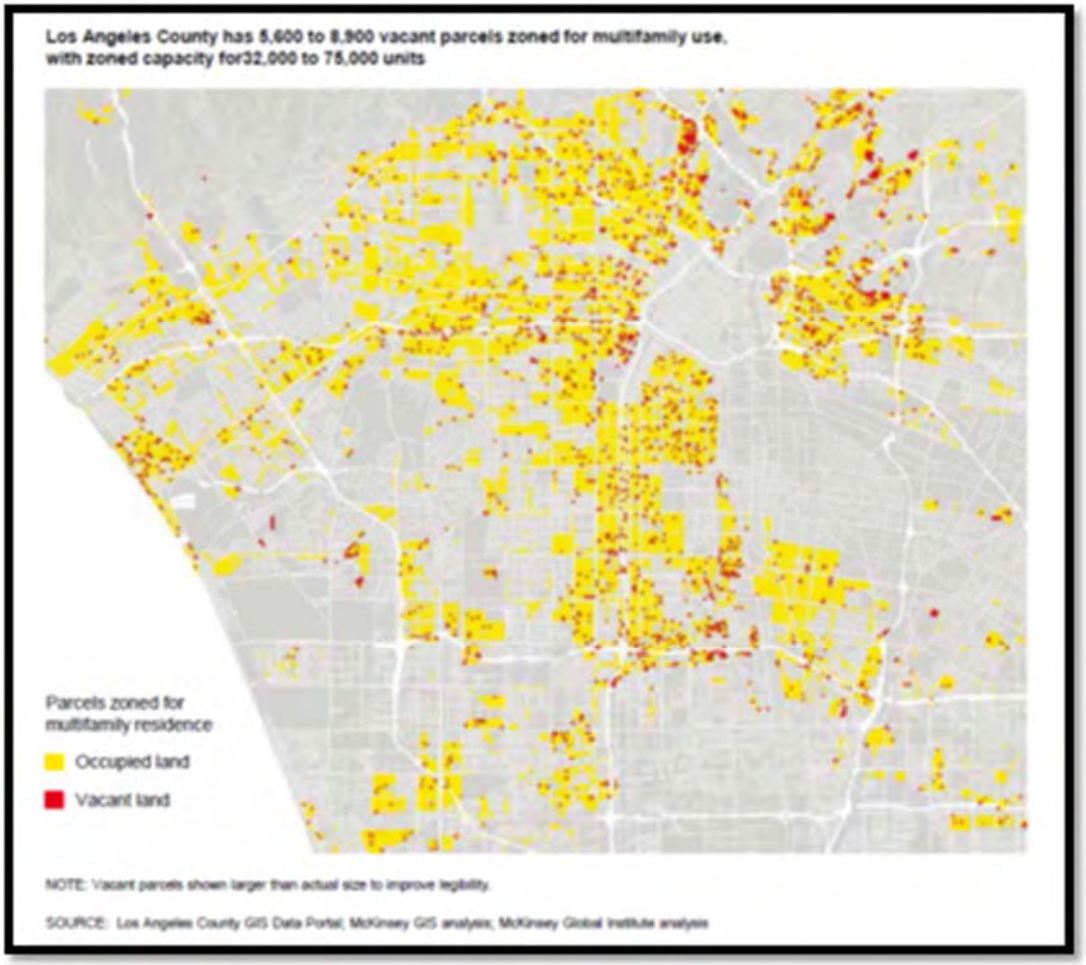

Figure 1. Vacant Parcels in Los Angeles County Zoned for Multifamily Use.

In fact, this estimate does not even account for vacant land that can be rezoned for residential use at sites both within the Study Area and in the larger surrounding areas near the project. Additionally, about 28 percent of *occupied* parcels zoned for multifamily currently utilize less than 50 percent of their capacity, and these sites have the potential to add an additional 306,000 housing units.[138]

As illustrated, available land for housing exists in the surrounding areas near the project, contradicting the RDEIR/SDEIS' assertions that the project "would not facilitate new development by opening up access to previously undeveloped or less developed areas . . . ."[139] Additionally, a significant amount of vacant land exists in areas north of the project, beyond the narrow Study Area, questioning the RDEIR/SDEIS' claim that "[i]n the northern part of the Study Area, the railroad yards and tracks also act as a constraint to growth . . . ."[140] Thus, it is

IP-24-75

[138] *Id*.
[139] RDEIR/SDEIS at 3.2-13
[140] *Id*. at 3.2-4

reasonable to expect more housing development will occur on vacant land and on already occupied land to accommodate additional population increases, driven in part by the project. IP-24-75

C. The RDEIR/SDEIS Fails to Provide Relevant Data and Information Concerning the Project's "Slight Influence" on Demand for Residential and Nonresidential Development.

This project entails the modernization of a critical piece of infrastructure in the region. Because the project will update a major freeway and improve the current level of service, one can reasonably expect this improved mobility to foster development in nearby areas. As admitted by Caltrans, "[t]he improved mobility expected to be achieved as a result of the build alternatives could have a *slight influence* on demand for residential and nonresidential uses in the cities and communities in the Gateway Cities subregion . . . ."[141] The RDEIR/SDEIS fails to actually detail the estimated amount of this "slight influence" and to explain the potential growth effects outside of the narrow Study Area. IP-24-76

Moreover, the RDEIR/SDEIS asserts the Project build alternatives "are not *expected* to influence the amount, timing, or location of growth in the Study Area."[142] Presumably, if an increased demand for residential and nonresidential development is likely to occur, one can reasonably expect such demand to also influence supply and the amount of development that occurs in the region. Once again, Caltrans fails to provide additional information and evidence in the record supporting its *expectation* that the project is unlikely to foster increased growth. IP-24-77

CEQA requires more than wishful thinking by a public agency. The public and decisionmakers are left to blindly accept as accurate the RDEIR/SDEIS' conclusions regarding growth-inducement. But speculation and unsubstantiated opinion are inadequate to support findings in an environmental review document.[143] Additional relevant information is necessary to allow for informed public participation and informed decision-making.[144] The document must be revised to provide additional detail and evidence to support these conclusions.

D. The RDEIR/SDEIS Fails to Properly Consider the Reasonably Foreseeable Significant Growth Effects from the Project's Construction, Given Its Nature and Scope

The RDEIR/SDEIS focuses largely on the potential growth effects from the project's operations at full build-out. For example, although admitting that interstate and State highways play a central role in goods movement, the RDEIR/SDEIR dismisses any increased port growth related to the project.[145] Similarly, the RDEIR/SDEIS concludes that increased vehicle mobility as a result of the project is unlikely to result in greater levels of residential and nonresidential IP-24-78

[141] *Id*. at 3.2-14 (emphasis added).
[142] *Id*.
[143] CEQA Guidelines § 15384.
[144] *Berkeley Keep Jets Over the Bay Committee v. Board of Port Com'rs*, 91 Cal.App.4th 1344, 1355 (2001).
[145] RDEIR/SDEIS at 3.2-5, 3.2-17.

development.[146] However, the environmental document provides only a cursory one-paragraph discussion of growth effects from the project's construction, claiming that growth is unlikely because construction related jobs would be filled by "the existing labor pool within the Study Area since the unemployment rate in the Study Area currently ranges from 2.8 percent to 8.1 percent."[147] This hasty analysis is inadequate.

IP-24-78

Caltrans minimizes a critical aspect of the project that is also likely to induce growth in the region: the construction of this major piece of infrastructure. The construction of this project entails substantial capital investment totaling billions of dollars for right-of-way acquisitions, utility relocation, materials, and labor.[148] A large portion of this amount will be invested in the region, and the construction of this project will require a significant labor force over an extended period of time. Indeed, infrastructure projects, such as the one proposed by Caltrans, involve not only construction workers, but also tradesmen, transportation and material hauling, in addition to other downstream job opportunities in the area.[149] In fact, an investment of just $1.3 billion dollars in infrastructure can create about *29,000* construction jobs alone, in addition to other employment opportunities in related supporting industries.[150]

IP-24-79

Yet without adequate support, the RDEIR/SDEIS speculates that local residents will likely fill these jobs due to the unemployment rate in the Study Area.[151] This assertion is pure speculation and lacks additional information. Notably, Caltrans fails to detail whether workers in the local communities have the necessary training to take-on the construction and other related jobs generated by this project. Moreover, one can reasonably expect that many workers will move into the area seeking employment opportunities created by the project. Beyond generating an increased demand for housing, the foreseeable increase in population as a result of the economic opportunities generated by this project will tax existing community service facilities and "may encourage and facilitate other activities that could significantly affect the environment . . . ."[152] Thus, the RDEIR/SDEIS fails to properly assess the direct and indirect growth effects from the construction of this project.

Indeed, the failure to adequately consider this aspect of the project also undermined the consideration of feasible mitigation measures. For example, Caltrans could have required job training programs to ensure that area workers are able to take advantage of the employment opportunities created by this project. Additionally, Caltrans could have recommended a mandatory local hiring program to reduce the potential influx of external workers into the area and instead hire local residents to help with the construction of the project. Caltrans must revise the

RDEIR/SDEIS to adequately analyze these foreseeable growth impacts from the construction of the project and to prescribe the appropriate mitigation measures. IP-24-79

VII. AN EIR MUST FULLY INFORM DECISIONS MAKERS AND THE PUBLIC OF THE ENVIRONMENTAL IMPACTS OF DISPLACEMENT AND RELOCATION. MOREOVER, AN EIR MUST CONSIDER FEASIBLE MITIGATION MEASURES TO AVOID SUCH IMPACTS.

While we commend Caltrans in its effort to analyze the Project's displacement and relocation impacts in the RDEIR/SDEIS, we also recognize that the resulting development must occur in a manner consistent with the California Environmental Quality Act and its implementing regulations. The "overriding purpose of CEQA is to ensure that agencies regulating activities that may affect the quality of the environment give primary consideration to preventing environmental damage."[153] Compliance with CEQA helps to ensure that "the long-term protection of the environment, consistent with the provision of a decent home and suitable living environment for every Californian" remains the "guiding criterion in public decisions."[154]

At the heart of CEQA is the environmental impact report (EIR).[155] It is the "primary means of achieving the Legislature's considered declaration that it is the policy of this state to 'take all action necessary to protect, rehabilitate, and enhance the environmental quality of the state.'"[156] With an EIR, the lead agency is entrusted with the responsibility of "provid[ing] public agencies and the public in general with detailed information about the effects which a proposed project is likely to have on the environment; [listing] ways in which significant effects of such a project might be minimized; and [indicating] alternatives to such a project."[157] These requirements are real and not mere technicalities:

> "As our Supreme Court has recently emphasized, 'The preparation and circulation of an EIR is more than a set of technical hurdles for agencies and developers to overcome. The EIR's function is to ensure that government officials who decide to build or approve a project do so with a full understanding of the environmental consequences and, equally important, that the public is assured those consequences have been taken into account. For the EIR to serve these goals it must present information in such a manner that the foreseeable impacts of pursuing the project can actually be understood and weighed, and the public must be given an adequate

[156] *Id*. (*citing* Pub. Res. Code § 21001, subd. (a)).
[157] Pub. Res. Code § 21061; *see* CEQA Guidelines, § 15002, subd. (a).

> opportunity to comment on that presentation before the decision to go forward is made.'"[158]

Importantly, once the impacts are identified:

> "Public Resources Code section 21081 requires a public agency to make certain specific findings attesting to its consideration of the need for the mitigation measures identified in the EIR. The findings must be supported by substantial evidence in the record. If the project has a significant effect on the environment, the agency may approve the project only upon finding that it has 'eliminated or substantially lessens significant effects on the environment where feasible' and that any unavoidable significant effects on the environment are 'acceptable due to overriding concerns …'"[159]

When an EIR fails to fully inform both decisions makers and the public of the environmental consequences of, mitigation for, and alternatives to a proposed project, and provide the public with an adequate opportunity to comment on that information, the EIR fails to comply with the letter and spirit of CEQA.

The informational benefit of an EIR is its primary function. Judicial review of an EIR is based on an abuse of discretion standard, which "is established if the agency has not proceeded in a manner required by law or if the determination or decision is not supported by substantial evidence."[160] Specifically, a "prejudicial abuse of discretion occurs 'if the failure to include relevant information precludes informed decision making and informed public participation, thereby thwarting the statutory goals of the EIR process.'"[161] To reach this conclusion, courts undergo a pragmatic analysis involving "an evaluation of whether the discussion of environmental impacts reasonably sets forth sufficient information to foster informed public participation and to enable decision makers to consider the environmental factors necessary to make a reasoned decision."[162] If the EIR does not serve as an informational document, it fails to comply with the letter and spirit of CEQA.

County of Madera* (2003) 107 Cal. App .4th 1383, 1390) ["When assessing the legal sufficiency of an EIR, the reviewing court focuses on adequacy, completeness and a good faith effort at full disclosure."].

As discussed below, the RDEIR/SDEIS fails to include sufficient information to provide meaningful review of the displacement and relocation impacts of the Project. Moreover, the RDEIR's analysis of related mitigation measures is legally insufficient. These legal deficiencies in the RDEIR/SDEIS are "so fundamentally and basically inadequate and conclusory in nature that" they fail to comply with CEQA and its implementing regulations.[163] The Draft EIR must therefore be revised and recirculated to comply with CEQA.[164]

IP-24-80

A. The RDEIR/SDEIS Fails to Accurately Describe Displacement Impacts, Relocation Impacts and Mitigation Measures for the Multi-Service Center in Long Beach, which would be displaced by Alternative 7.

Since 1997, the Multi-Service Center (MSC) has been located at 1301-1327 W. 12th Street in Long Beach. The MSC is critical to assisting the needs of homeless persons in Long Beach. Led by the Long Beach Health Department, the Multi-Service Center facility houses 12 public and private partner organizations working together to promote self-sufficiency and rebuild the lives of those experiencing homelessness. Annually, the MSC averages 26,000 client visits, making this facility the primary point of entry for persons seeking homeless services assistance in Long Beach. Services range from basic amenities of shower, laundry, mail and message center, to street outreach, van shuttle, transportation, medical care, mental health services, substance abuse treatment, HIV/AIDS services, integrated case management and housing coordination. The mission of the MSC is to provide comprehensive supportive services to promote progress towards permanent housing and self-sufficiency, by creating a community where health, safety and well-being are established.[165] The MSC recently completed a $2 million renovation in 2014, which expanded the medical clinic, classrooms and community rooms.[166]

Alternative 7 would displace the MSC.[167] Despite the proposed displacement of this vital community resource, the RDEIR/SDEIS fails to include adequate analysis of relocation impacts or feasible mitigation measures. The RDEIR/SDEIS lacks analysis regarding the critical nature of the MSC to homeless persons in the region and the land use challenges of relocating such a sensitive facility. Moreover, there is no analysis regarding the impacts to the 26,000 clients who visit the MSC each year. The RDEIR/SDEIS merely states, "relocation of this facility would require a comprehensive relocation plan and include changes to zoning and other issues that would make the move difficult. Early planning for a replacement site would be required, as well as obtaining public input for city planning commission approval for a replacement location."[168] Despite this statement, the RDEIR/SDEIS fails to identify potential sites for relocation in the City of Long Beach and it fails to mention the great likelihood of land use appeals from the Planning Commission to the City Council, which would create additional barriers to

IP-24-81

[163] *See* CEQA Guidelines, § 15088.5, subd. (a)(4).

[166] Draft Relocation Impact Report, March 2017, at p. 87.
[167] RDEIR/SDEIS at 3.3-40.
[168] RDEIR/SDEIS at 3.3-40.

relocation.[169] The RDEIR/SDEIS also fails to include any analysis regarding the local and regional impacts of displacing the MSC if Long Beach fails to approve a new site. And, the RDEIR/SDEIS does not consider mitigation measures to allow the MSC to remain in its current location. IP-24-81

The Community Impact Statement acknowledges that the MSC is in a census tract that exceeds the Los Angeles County average percentage for both minority and low-income persons and that the facility serves minority and low-income residents, as well as other vulnerable and disadvantaged populations.[170] The Community Impact Statement then goes on to make a conclusory and unsupported statement that "[a]lthough these relocation impacts would be predominantly borne by environmental justice populations… these impacts would not represent a disproportionate adverse impact to environmental justice communities.[171] This conclusory statement is contradictory to the analysis that precedes it. If displacement of the MSC will primarily impact low income communities of color, then there *will be* adverse impacts to environmental justice populations and this must be analyzed and mitigated in the RDEIR. IP-24-82

This lack of analysis and deferred analysis denies the public an opportunity to review and comment on the displacement and relocation impacts to the MSC, as well as mitigation measures, before environmental review is finalized. The RDEIR/SDEIS is inadequate because it fails to identify and analyze significant environmental effects of the proposed project on the MSC and it fails to consider feasible measures which could minimize significant adverse impacts.[172] The RDEIR/SDEIS must therefore be revised and recirculated. IP-24-83

B. The RDEIR/SDEIS Fails to Accurately Describe Displacement Impacts, Relocation Impacts and Mitigation Measures for the Bell Shelter, which would be displaced by Alternative 7.

The Bell Shelter is one of the largest homeless shelters in the country and provides shelter and meals for up to 350 individuals, emergency shelter, mental health and substance abuse treatment, prevention education, English as a second language classes, computer training, job referrals, and treatment programs."[173] Alternative 7 would require the acquisition of property and displacement of the transitional housing structures at Bell Shelter.[174]

---

[169] Members of CEHAJ have been informed in meetings with Caltrans over the past year that it is likely that relocation of the MSC would have to occur outside the City of Long Beach, as there may be no place to relocate it to in Long Beach. Despite these statements in meetings with Caltrans, the RDEIR/SDEIS includes no mention of this, nor does it examine potential sites for relocation in Long Beach or elsewhere. Relocation of the MSC outside the City of Long Beach would be devastating to the 26,000 clients who visit the MSC each year. Relocation outside the City would also have regional impacts, which have not been analyzed in the RDEIR.
[170] Second Revised Community Impact Statement, July 2017, at 6-68 & 6-69.
[171] *Id*. at 6-69.
[172] *See* CEQA Guidelines, § 15126.2, subd. (a); *id*.,§ 21061, subd. (a)(1).
[173] *See* Second Revised Final Community Impact Statement, July 2017, at 4.3-19.
[174] RDEIR/SDEIS at 3.3-32.

The displacement of Bell Shelter's transitional housing structures is proposed without analyzing the impacts this would have on the residents of this facility (and other homeless persons in the region), especially in light of our current housing crisis in Los Angeles County. The RDEIR/SDEIS also fails to analyze the availability of transitional housing in the area, identification of available and appropriate sites for relocation of such a sensitive land use, the land use challenges of relocating such a sensitive land use and potential mitigation measures to keep the Bell Shelter in its existing location. IP-24-84

The Community Impact Statement acknowledges that the Bell Shelter is in a census tract that exceeds the Los Angeles County average percentage for both minority and low-income persons and that the facility serves minority and low-income residents, as well as other vulnerable and disadvantaged populations.[175] The Community Impact Statement then goes on to make a conclusory and unsupported statement that "[a]lthough these relocation impacts would be predominantly borne by environmental justice populations… these impacts would not represent a disproportionate adverse impact to environmental justice communities.[176] This conclusory statement is contradictory to the analysis that precedes it. If displacement of the Bell Shelter would primarily impact low income communities of color, then there *will be* adverse impacts to environmental justice populations and this must be analyzed and mitigated in the RDEIR. IP-24-85

The missing and deferred analysis regarding the impacts to the Bell Shelter denies the public an opportunity to review and comment on the relocation impacts and feasible mitigation measures before the environmental documents for this Project are finalized. The RDEIR/SDEIS is inadequate because it fails to identify and analyze significant environmental effects of the proposed Project on the Bell Shelter and it fails to consider feasible measures which could minimize significant adverse impacts.[177] The RDEIR/SDEIS must therefore be revised and recirculated. IP-24-86

C. The RDEIR/SDEIS Fails to Accurately Describe Displacement Impacts, Relocation Impacts and Mitigation Measures for Homes in Commerce and Compton, which would be Displaced by the Project.

Depending upon which build version of the Project is selected (Alternative 5C or 7), the Project will include up to 140 residential displacements for approximately 560 residents.[178] The majority of these will occur in Commerce and Compton.[179] The RDEIR/SDEIS states that for the majority of the Study Area, residential displacements, given the present market conditions, do not indicate the need for the construction of replacement housing.[180] The Draft Relocation Impact report states that "[r]esearch shows that at the time of this study, adequate relocation resources exist in the project area and surrounding communities for residences."[181]

---

[175] Second Revised Community Impact Statement, July 2017, at 6-68 & 6-69.
[176] *Id*. at 6-69.
[177] *See* CEQA Guidelines, § 15126.2, subd. (a); *id*.,§ 21061, subd. (a)(1).
[178] RDEIR/SDEIS Executive Summary at 12; RDEIR/SDEIS at 3.3-63.
[179] RDEIR, Executive Summary at 32.
[180] RDEIR, Executive Summary at 12.
[181] Draft Relocation Impact Report, March 2017, at 4.

However, these conclusory statements are in direct contradiction to our current and well documented housing crisis in Los Angeles County where vacancy rates are low, rents are rapidly rising, incomes are not keeping pace with rising rents, affordable housing supply is extremely limited and displacement is rapidly happening throughout the region.[182] Moreover, the RDEIR's conclusion that adequate relocation resources exist also contradict with the analysis throughout the RDEIR, where the RDEIR/SDEIS finds that such resources are *not* available. For example, the RDEIR/SDEIS states that "[s]ome of these displaced residences are in areas (mainly the Cities of Commerce and Compton) where there is insufficient replacement housing available. Therefore, it will not be possible to relocate all displaced residents within their community or an area within reasonable proximity to their community. For this reason, the construction of replacement housing in these areas may be necessary."[183] IP-24-87

Furthermore, according to the Community Impact Statement, "the City of Commerce is primarily built out and limited vacant land is available."[184] As a result of the relocations of Commerce residents, the City of Commerce would experience adverse impacts to community character and cohesion as a result of these relocations."[185]

The RDEIR/SDEIS also acknowledges that the Study Area cities, including Commerce and Compton, are considered to be highly cohesive based on the factors of median age, ethnic homogeneity, high tenure of residents, above-average household size, high percentage of transit-dependent population and percentage of elderly residents.[186] Therefore, displacement of residents will have significant impacts on those families. Displacement and the correlating loss of social cohesion can cause increased stress, decreased access to jobs, income and job benefits, IP-24-88

[182] *See Los Angeles County Renters in Crisis: A Call for Action,* CA Housing Partnership (May 2017), http://1p08d91kd0c03rlxhmhtydpr.wpengine.netdna-cdn.com/wp-content/uploads/2017/05/Los-Angeles-County-2017.pdf; (This Report explains that Los Angeles County needs to produce 551,807 more affordable units to house residents who are currently on the edge of homelessness. Moreover, there has been a 32 percent increase in rents in the County and a 3 percent decrease in real median income since 2000. Finally, the Los Angeles County poverty rate jumps to more than 25 percent, meaning one in four Angelenos is officially poor, when local housing costs are considered.); *See also, California's Housing Crisis – It's Even Worse Than You Think*, KCET (August 2017), https://www.kcet.org/shows/socal-connected/californias-housing-crisis-its-even-worse-than-you-think; *And, Why SoCal is at a tipping point in its housing affordability crisis*, KPCC (Aug. 29, 2017), https://www.scpr.org/news/2017/08/29/75035/a-deeper-dive-into-las-housing-affordability-crisi/

[183] RDEIR, Executive Summary at 32; s*ee Also,* RDEIR/SDEIS Executive Summary at 36, which states that the Project will displace substantial numbers of existing homes and people necessitating the construction of replacement housing.

[184] Second Revised Final Community Impact Statement, July 2017, at 4.7-1.

[185] RDEIR/SDEIS at 3.3-47.

[186] RDEIR/SDEIS at 3.3-19.

psychological impacts and poor mental health.[187] "Residents have disclosed symptoms of stress, loss, grief, and poorer mental health following housing displacement and relocation.[188]

Oddly, the RDEIR/SDEIS also makes a conclusory and contradictory statement that "the build alternatives would not result in adverse effects to public health related to social cohesion." This conclusion is contradictory to the analysis and other statements in the RDEIR, as discussed above.[189]

IP-24-88

The RDEIR/SDEIS finds that adequate relocation options do not exist for the mobile homes in Compton that will be displaced.[190] The RDEIR/SDEIS states that Housing of Last Resort may have to be considered for relocating affected residential properties such as mobile homes.[191] The Draft Relocation Impact Report states that there are "no adequate relocation resources" for residential tenants or mobile homes.[192] However, the RDEIR/SDEIS provides no information about how, where or when replacement housing will be provided. And, there is no specific analysis regarding mitigating these impacts to prevent displacement.

IP-24-89

The RDEIR/SDEIS has not fully analyzed the impacts of residential displacements and relocations, it has not identified potential sites for relocation, it has not contextualized the difficulty of relocations in light of our current housing crisis and it has not analyzed feasible mitigation measures to prevent residential displacements. Finally, the RDEIR/SDEIS has not studied a version of the Project that would eliminate residential displacements.

IP-24-90

The RDEIR/SDEIS relies in a conclusory manner on the application of the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act to address displacements.[193] This reliance is problematic in many ways. First, there is no analysis regarding the difficulty of relocations in the Study Area and the likelihood of relocations in the same community. Second, if relocation to another community is likely, there is no analysis regarding the impacts this will have on displaced families. Third, we have been informed by Caltrans representatives in Sacramento that Caltrans will not provide relocation assistance to undocumented families who are displaced by the Project unless the Federal Highway Administration (FHWA) approves such relocation assistance.[194] While we strongly disagree with Caltrans's interpretation of relocation

IP-24-91

[187] RDEIR/SDEIS at 3.3-48
[188] RDEIR/SDEIS at 3.3-48.
[189] RDEIR/SDEIS at 3.3-50.
[190] RDEIR/SDEIS Executive Summary at 12.
[191] RDEIR/SDEIS at 3.3-68.
[192] Draft Relocation Impact Report, March 2017, at 30.
[193] RDEIR/SDEIS at 3.3-49.
[194] Attorneys with the Legal Aid Foundation of Los Angeles (LAFLA) have had multiple conversations with Ms. Joann Georgallis, Assistant Chief Counsel to Caltrans in Sacramento, regarding this issue. Ms. Georgallis informed LAFLA attorneys that Caltrans will not pay for relocation assistance for undocumented families who are displaced by a federally funded project unless the Federal Highway Administration (FHWA) approves the payment of relocation

laws,[195] Caltrans cannot rely on relocation assistance as a mitigation measure for undocumented families when Caltrans has informed us that undocumented families may not receive such assistance. IP-24-91

The inconsistent, deferred and lacking relocation impacts analysis in the RDEIR/SDEIS denies the public an opportunity to review and comment on relocation and displacement impacts. The RDEIR/SDEIS is also inadequate because it fails to consider feasible measures which could minimize significant adverse impacts to the homes in Commerce and Compton. The RDEIR/SDEIS must therefore be revised and recirculated. IP-24-92

D. The RDEIR/SDEIS Fails to Comply with the Requirements of Metro Motion 22.1 with Respect to Eliminating Displacement.

The RDEIR/SDEIS fails to comply with the anti-displacement requirements of Metro Motion 22.1. Motion 22.1 was developed in conjunction with community stakeholders, including CEHAJ members, to ensure that the RDEIR/SDEIS included analysis of critical Project components. Motion 22.1 requires "Geometric design for the I-710 Freight Corridor (under Alternative 7 only) that eliminates significant impacts and displacements of homes, businesses, or community resources, such as but not limited to the Bell Shelter or Senior Centers[.]" While the RDEIR/SDEIS has some right of way avoidance analysis in section 3.3-55, it is cursory at best and does not meet the informational requirements of CEQA. Moreover, the limited analysis in the RDEIR/SDEIS does not satisfy the anti-displacement requirements of Motion 22.1 because both Alternatives 5C and 7 include displacement of homes, transitional housing, homeless service facilities and other vital community resources. Accordingly, the RDEIR/SDEIS fails to comply with the requirements of Motion 22.1, thereby excluding analysis of critical components deemed necessary elements of the Project. Thus, the RDEIR/SDEIS fails as an informational document. For this reason as well, the RDEIR/SDEIS must be revised and recirculated. IP-24-93

VIII. THE RDEIR/SDEIS FAILS TO CONSIDER LOCAL AND TARGETED HIRING REQUIREMENTS AS FEASIBLE MITIGATION MEASURES. SUCH MEASURES ARE LEGALLY PERMISSIBLE AND SHOULD HAVE BEEN INCLUDED IN THE RDEIR.

An EIR must "include feasible measures which could minimize significant adverse impacts."[196] Importantly, *"[w]ith some projects, the only feasible mitigation for cumulative impacts may*

---

assistance. Ms. Georgallis also informed LAFLA attorneys that she has reached out to FHWA multiple times to discuss this issue, but she has not received a reply.

[195] When a project is funded by both state and federal funds, a displaced person is entitled to receive the maximum relocation assistance allowed under *either* state or federal law. *United Auto Workers v. Dep't of Transp.,* 20 Cal. App. 4th 1462, 1471 (1993). While federal law prohibits the payment of relocation assistance to "unlawful alien[s]", California law permits such payments. *Compare* 42 U.S.C. § 4605(a) and Cal. Gov. Code § 7260(c). Displaced families should therefore be eligible for relocation assistance pursuant to California State relocation law.

[196] *See* CEQA Guidelines § 15126.4(a)(1).

involve the adoption of ordinances or regulations rather than the imposition of conditions on a project-by-project basis."[197] Furthermore, "a public agency may use discretionary powers provided by such other law for the purpose of mitigating or avoiding a significant effect on the environment subject to the express or implied constraints or limitations that may be provided by law."[198] Clearly, "it is the policy of the state that public agencies should not approve projects as proposed if there are feasible alternatives or feasible mitigation measures available which would substantially lessen the significant environmental effects of such projects."[199]

The RDEIR/SDEIS states that a key component of the proposed Project is economic development.[200] "With regard to economic development, the Gateway Cities Sub-region experiences high levels of unemployment and poverty. In September 2016, unemployment rates in the Study Area ranged from 2.8 to 8.1 percent of the workforce within the affected communities, which in some cases is higher than Los Angeles County (5.2 percent) and State (5.5 percent) unemployment rates. Highway congestion causes delays affecting personal mobility and goods movement and results in increased economic costs."[201]

Depending upon which Project alternative is selected, the Project would create between 99,885 to 179,180 new jobs.[202] Moreover, it is anticipated that Alternative 7 would generate even more jobs as a result of ZE technology development.[203]

According to the RDEIR, the I-710 Corridor is home to a large proportion of minority and low-income populations.[204] As of the 2010 Census, the I-710 Corridor Project Study Area was 85.6 percent non-White. In contrast, Los Angeles County was 72.2 percent non-White and the State of California was 59.9 percent non-White.[205] Moreover, according to the 2010-2014 American Community Survey, 22.8 percent of I-710 Corridor residents live in households that fall below the Federal poverty threshold. Within Los Angeles County, 18.7 percent of households fall below the Federal poverty level and in California, as a whole, 15.3 percent of the households fall below the Federal poverty level.[206] Without a local and targeted hiring policy, low income residents of color who live along the Project's corridor will not benefit from the economic development opportunities created by the project. IP-24-94

Utilizing local and targeted hiring measures has the additional benefit of reducing vehicle miles traveled to work, which reduces greenhouse gas emissions. "With California's population IP-24-95

increasing and housing becoming less affordable, surface level transportation has increased as residents are commuting farther to work.[207]

The RDEIR/SDEIS fails to include any analysis regarding whether the jobs that will be created by the Project will actually benefit the low-income minority residents who reside in the impacted cities along the Project's Corridor. If job creation is not specifically targeted to local and disadvantaged residents residing in the impacted communities along the Project's Corridor, there is no basis for assuming that the jobs created will actually benefit residents of the impacted communities. Moreover, without local and targeted hiring provisions, the jobs created by the Project will result in increased traffic, as a result of increased commuters into the area. This, in turn, will have significant and additional environmental impacts on traffic, air quality and greenhouse gas emissions.

IP-24-95

In addressing air quality and traffic impacts, the South Coast Air Quality Management District (SCAQMD) encourages local hiring provisions, which support a jobs/housing balance. SCAQMD's guidance documents state that:

> "Residents in urban areas in the South Coast basin have become increasingly concerned with increased traffic congestion and the failure of the region to achieve state and federal clean air standards. The concept of 'jobs/housing balance' is based on the premise that the number of vehicle trips and vehicle miles traveled (VMT) can be reduced when sufficient jobs are available locally to balance the employment demands of the community, and when commercial services are convenient to residential areas. . . . The AQMD and the SCAG both embrace jobs/housing balance as a viable tool available to local governments to reduce air pollution."[208]

The RDEIR/SDEIS states that the majority of corridor residents work outside the cities in which they reside and they have significant commute times. Within the City of Bell, 90% of working residents work outside the City and the mean commute time is 29.4 minutes. Within the City of Bell Gardens, 89% of working residents work outside the City and the mean commute time is 28.3 minutes. Within the City of Carson, 85% of working residents work outside the City and the mean commute time is 26.2 minutes. Within the City of Commerce, 86% of working residents work outside the City and the mean commute time is 27.3 minutes. Within the City of Compton, 88% of working residents work outside the City and the mean commute time is 28.4 minutes. Within the City of Cudahy, 95% of working residents work outside the City and mean commute time is 31.7 minutes. Within the City of Downey, 82% of working residents work outside the City and mean commute time is 28.3 minutes. Within the City of Huntington Park, 87% of working residents work outside the City and mean commute time is 30.2 minutes. Within the City of Lakewood, 89% of working residents work outside the City and the mean commute

[208] SCAQMD, Guidance Document for Addressing Air Quality Issues in General Plans and Local Planning (May 2005), Chapter 2 – Air Quality Issues Regulating Land Use, p. 2-13 [available at http://www.aqmd.gov/prdas/aqguide/aqguide.html].

time is 27.9 minutes. Within the City of Long Beach, 66% of working residents work outside the City and the mean commute time is 29 minutes. Within the City of Lynwood, 90% of working residents work outside the City and the mean commute time is 29.4 minutes. Within the City of Maywood, 92% of working residents work outside the City and the mean commute time is 27.9 minutes. Within the City of Paramount, 84% of working residents work outside the City and the mean commute time is 27.1 minutes. Within the City of Signal Hill, 85% of working residents work outside the City and the mean commute time is 26.8 minutes. Within the City of South Gate, 88% of working residents work outside the City and mean commute time is 29.1 minutes.[209]

By including local and targeted hiring provisions as a mitigation measure, it would help to mitigate some of the Project's significant and unmitigated environmental impacts on air quality, greenhouse gas emissions and traffic. The RDEIR/SDEIS should include an analysis of the environmental benefits of including local and targeted hiring provisions as a feasible mitigation measure. This vital discussion of local and targeted hiring is missing from the RDEIR.[210] IP-24-96

We are aware that some of the Federal Highway Administration's (FHWA) statutes and regulations have been interpreted to limit the ability to impose local or geographic hiring requirements on FHWA funded projects.[211] However, it is unclear how much of the Project will be funded by the FHWA. Other funding sources for the Project will not include any such limitations and some funding sources (i.e., the Los Angeles County Metropolitan Transportation Authority and Department of Housing and Urban Development) would actually require local and targeted hiring requirements. IP-24-97

In order to ensure that economic opportunities created by the Project reach impacted I-710 corridor residents to the greatest extent feasible, Caltrans should segment FHWA Project funds so that other funding sources can be used to hire both local and disadvantaged residents. Best

[209] RDEIR/SDEIS at 3.1-5 – 3.1-9.

[210] The I-710 Corridor Project Health Impact Assessment (HIA), which was released in November 2011 by Human Impact Partners, recommends that local hiring be tracked to ensure that the impacted Corridor communities benefit from the Project's job creation opportunities. The HIA, at 10-22, recommends that jobs be measured and tracked, to track the proportion of local jobs in each industry that are filled by local residents. This data would allow policymakers to make informed decisions regarding strategies to enhance and stimulate local economies. The HIA also recommends that cities along the Corridor encourage businesses, through incentives, to locate in the I-710 Corridor communities. Incentives may be in the form of tax breaks, credits or may be in the form of lower loan interest rates for potential small business owners, among others. (HIA at 10-22.) Finally, the HIA recommends increased job training opportunities for residents to better prepare the workforce for the Project's employment opportunities and to reduce unemployment. (HIA at 10-23.)

[211] *See* 23 U.S.C Sec. 112 and 23 C.F.R. 635, Subpart A.

practices within this area typically require that 40% of the work hours be targeted to local residents and 10% of the work hours be targeted to disadvantaged, local residents.[212]

The RDEIR/SDEIS specifically acknowledges that construction *will be staged and segmented*. "Staging of construction would be required for all ramp reconstruction, freeway widening, and profile adjustments….The following procedures have been identified to stage construction of either build alternative: Project divided into segments; segments divided into major components…"[213] Moreover, the RDEIR/SDEIS states that funding, right-of-way certification, maintenance of traffic, and contractor innovation are all variables that drive the timing, priority, and scope of staged improvements.[214] Therefore, Caltrans can segment FHWA funds through its staged construction process so that non-FHWA funds can utilize both local and targeted hiring measures. And, FHWA funded portions of the freeway can take advantage of targeted hiring measures without geographic restrictions. IP-24-97

Importantly, even for portions of the Project that receive FHWA funds, the FHWA's statutes and regulations permit targeted hiring measures that don't discriminate geographically. Therefore, even with FHWA funding, it would be legally permissible to require that 40% of the work hours be performed by *low income residents*, irrespective of residency. Low income, targeted, hiring requirements for the Project would also advance the affirmative action and civil rights goals of Executive Order 11246. Executive Order 11246 prohibits federal contractors and subcontractors and federally-assisted construction contractors and subcontractors that generally have contracts that exceed $10,000 from discriminating in employment decisions on the basis of race, color, religion, sex, or national origin. It also requires covered contractors to take affirmative action to ensure that equal opportunity is provided in all aspects of their employment. Finally, a targeted hiring requirement would advance FHWA's own on-the-job training program, which is administered through FHWA's Office of Civil Rights, as well as Executive Order 13502. Executive Order 13502, signed by President Obama on February 6, 2009, announced that "it is the policy of the Federal Government to encourage Executive Agencies to consider requiring the use of project labor agreements in conjunction with large-scale construction projects in order to promote economy and efficiency in Federal procurement." IP-24-98

The RDEIR/SDEIS is inadequate because it fails to consider local and targeted hiring requirements as feasible mitigation measures, which would minimize significant adverse impacts.[215] The RDEIR/SDEIS must therefore be revised and recirculated. IP-24-99

Finally, the Project fails to comply with the local and targeted hiring requirements of Metro Motion 22.1. Motion 22.1 was developed in conjunction with community stakeholders to direct Caltrans to study critical components of the Project that Metro deemed necessary to include in the revised environmental documents. Motion 22.1 required "staff to work with community IP-24-100

[212] For example, *see* L.A. Cty. Metro. Auth.'s Local Hire Policy: *General Management Construction Careers Policy* (Revised January 26, 2017), https://media.metro.net/about_us/pla/images/construction_careers_policy_2017.pdf.

based partners (community groups, faith based groups and labor) on the development of a Local and Targeted Hiring Policy and PLA for construction jobs and a First Source Hiring Policy for permanent jobs created by the project. This should be completed, at the latest, by the completion of the recirculated DEIR/DEIS." Unfortunately, however, no progress has been made towards developing a Local and Targeted Hiring Policy or a First Source Hiring Policy. This is a blatant violation of Motion 22.1. This exclusion makes the Project fatally flawed as an informational document, as required by CEQA. Therefore, the RDEIR/SDEIS must be revised and recirculated. IP-24-100

IX. THE ENVIRONMENTAL JUSTICE ANALYSIS FAILS TO DISCLOSE AND ANALYZE THE TRUE IMPACTS ON THE PROJECT ON THE SURROUNDING LOW-INCOME COMMUNITIES OF COLOR.

Federal and state laws require agencies to consider environmental justice and to prohibit discrimination in their decision-making processes.

Title VI of the Civil Rights Act of 1964 and related statutes require that there be no discrimination in federally assisted programs, like Caltrans, on the basis of race, color, national origin, age, sex, or disability. Similarly, California has enacted Government Code 11135(a), which states: "No person in the State of California shall, on the basis of race, national origin, ethnic group identification, religion, age, sex, sexual orientation, color, genetic information, or disability, be unlawfully denied full and equal access to the benefits of, or be unlawfully subjected to discrimination under, any program or activity that is conducted, operated, or administered by the state or by any state agency, is funded directly by the state, or receives any financial assistance from the state." These laws prohibit Caltrans from taking actions that intentionally discriminate against any of these classes; they also prohibit Caltrans from taking actions that result in disparate impacts even if unintentional.[216]

Federal Executive Order (EO) 12898 (1994) requires Federal agencies, including the United States Department of Transportation (DOT) and FHWA, to make environmental justice part of their mission and to develop environmental justice strategies. The Presidential Memorandum accompanying the Executive Order specifically singles out NEPA, and states that "[e]ach Federal agency must provide opportunities for effective community participation in the NEPA process, including identifying potential effects and mitigation measures in consultation with affected communities and improving the accessibility of public meetings, crucial documents, and notices."[217] On August 4, 2011, the Secretary of Transportation, along with heads of other Federal agencies, signed a Memorandum of Understanding on Environmental Justice and Executive Order 12898 (EJ MOU) confirming the continued importance of identifying and addressing EJ considerations in agency programs, policies, and activities as required by E.O. 12898. DOT's internal EJ Order establishes procedures and guidance for the Department to implement E.O. 12898. "Compliance with this DOT Order is a key element in the environmental justice strategy adopted by DOT to implement the Executive Order, and can be achieved within

[216] 49 C.F.R. § 21.5(b)(2); Cal. Code Regs. Tit. 22, § 98101(i)(1).
[217] Exec. Order No. 12898 (Feb. 1994), https://www.archives.gov/files/federal-register/executive-orders/pdf/12898.pdf.

the framework of existing laws."[218] FHWA policy calls for the prevention of disproportionately high and adverse human health or environmental effects on minority and low-income populations, and calls for the collection of related data to identify any risk of discrimination in the implementation of the NEPA, among other Federal statutes.[219]

The State of California has defined "environmental justice" as: "the fair treatment of people of all races, cultures, and incomes with respect to the development, adoption, implementation, and enforcement of environmental laws, regulations, and policies."[220] Additionally, CEQA regulations define impacts or effects to be analyzed as including "ecological (such as the effects on natural resources and on the components, structures, and functioning of affected ecosystems), aesthetic, historic, cultural, economic, social, or health, whether direct, indirect, or cumulative."[221]

A. The EJ Analysis Fails to Adequately Analyze the EJ impacts in Context.

As described more fully in other sections of this letter, Caltrans has failed to adequately analyze air, noise, traffic, parks, construction, displacement, and other impacts or to adequately mitigate those impacts. Accordingly, its environmental justice analysis suffers from these same deficiencies.

In addition, though noting that surrounding populations are disproportionately low-income and Latino, the RDEIR/SDEIS does so on the basis of a comparison of the corridor's minority and low-income populations to that of the County and statewide data. For a project of national significance, such as this one, where the benefits accrue nationwide, a comparison to national demographic statistics is also relevant. Without the correct comparisons, any assessment of disproportionate impacts is also necessarily flawed. IP-24-101

Moreover, the EJ analysis requires further analysis of local conditions and sensitivity and vulnerability factors to more particularly understand and analyze how the impacts identified elsewhere in the document will be felt by the surrounding overburdened communities. While the RDEIR/SDEIS does note that the surrounding populations are disproportionately low-income and Latino, it for example fails to take into account the fact that these communities are more vulnerable to pollution impacts.[222] The EJ analysis is deficient because it fails to adequately include these factors. IP-24-102

[222] Office of Envtl. Health Hazard Assessment, *Cumulative Impacts: Building a Scientific Foundation, Exec. Summary* at ix (Dec. 2010), http://oehha.ca.gov/ej/cipa123110.html ("[A] number of studies have reported increased sensitivity to pollution, for communities with low income levels, low education levels, and other biological and social factors. This combination of

It is well established that "[t]he significance of an activity depends upon the setting."[223] Accordingly, "[a] lead agency therefore should take special care to determine whether the project will expose "sensitive receptors" to pollution...."[224] According to the California Office of the Attorney General, "[b]ecause CEQA requires that environmental impacts must be considered in context, cities and counties should pay special attention to whether a project might cause additional impacts to communities that already are affected by, or particularly vulnerable to, environmental impacts like air and water pollution."[225]

As the California EPA's Office of Environmental Health Hazard Assessment explains:

> Existing research on environmental pollutants and health risk has consistently identified socioeconomic and sensitivity factors as "effect modifiers." For example, numerous studies on the health effects of particulate air pollution have found that low socioeconomic status is associated with about a 3-fold increased risk of morbidity or mortality for a given level of particulate pollution (Samet and White, 2004). Similarly, a study of asthmatics found that their sensitivity to an air pollutant was up to 7-fold greater than non-asthmatics (Horstman et al., 1986). Low-socioeconomic status African-American mothers exposed to traffic-related air pollution were twice as likely to deliver preterm babies (Ponce et al., 2005). The young can be 10 times more sensitive to environmental carcinogen exposures than adults (OEHHA, 2009). Studies of increased risk in vulnerable populations can often be described by effect modifiers that amplify the risk.[226]

---

multiple pollutants and increased sensitivity in these communities can result in a higher cumulative pollution impact.").

[223] *Kings Cty. Farm Bureau v. City of Hanford,* 221 Cal. App .3d 692, 718 (1990) (citing CEQA Guidelines, § 15064, subd. (b)); *see also id*. at 721; CEQA Guidelines, § 15300.2(a) (noting that availability of listed CEQA exemptions "are qualified by consideration of where the project is to be located – a project that is ordinarily insignificant in its impact on the environment may in a particularly sensitive environment be significant.").

Epidemiology 162(2):140-8 (2005); J.M. Samet

Other studies confirm that young or old age, low income, and race are vulnerability factors in assessing health risk from environmental pollution.[227]

The RDEIR/SDEIS fails to include this data in its analysis, and fails to analyze how the clear demographic data showing that the surrounding communities are overburdened, low-income, and minority affects the communities' risks for adverse impacts from the project. In order to adequately analyze the impacts and risks on communities living near the proposed expansion, therefore, the RDEIR/SDEIS must first clearly identify the vulnerabilities and susceptibilities of the surrounding communities.[228] Given the likelihood that these communities also already suffer from high rates of pulmonary and cardiac diseases, cancers, pregnancy complications, adverse cognitive effects, diabetes, and other diseases with risks associated with living, working, or going to school near freeways, the RDEIR/SDEIS must also identify the existing rates and severity of these diseases—especially those that disproportionately affect low-income and minority populations—among children and the general population living at the very least within one quarter of a mile of the proposed project. IP-24-103

Once Caltrans has clearly identified these risk factors and disease rates and severity, it must then fully analyze the impacts of the project on these communities, given both the vulnerabilities and susceptibilities of the surrounding communities and known impacts of roadway pollution on the health of those nearby. Researchers have identified several methodologies for undertaking this analysis.[229] Because Caltrans has failed to describe existing conditions among the surrounding community, it has not and cannot meaningfully describe impacts and mitigation measures it can take to remediate these impacts. For each of the impacts, Caltrans must in its EJ analysis analyze all identified impacts according to the vulnerability and sensitivity factors discussed above. These deficiencies are particularly, but not exclusively, apparent in Caltrans's failure in the EJ section to adequately analyze impacts on minority and low-income populations and considering the vulnerability and other factors described above in several key areas. The analysis falls short in considering the full extent of the impacts on minority and low-income populations from residential displacement; the jobs, economic, and other impacts on minority and low-income populations from business displacement; and the traffic safety impacts on minority and low- IP-24-104

income populations from arterial "improvements" that will facilitate additional truck traffic through the communities.

IP-24-104

In addition, Caltrans must analyze the cumulative impacts in accordance with these vulnerability and sensitivity factors to adequately identify, disclose, and then mitigate the cumulative impacts. The communities surrounding the 710 corridor are already overburdened with other industrial sources of pollution, such as the Ports of LA and Long Beach, large refineries, scrap yards, chrome platers, lead smelters, and other facilities. These cumulative impacts of all of these pollution sources with the 710 project must be identified and analyzed as described above.[230]

IP-24-105

B. Caltrans' Response to Prior CEHAJ Comments on EJ Impacts is Inadequate.

CEQA § 21091 and CEQA Guideline § 15088 require lead agencies to respond in writing to comments submitted by the public that raise significant environmental questions. An adequate response to comments explains why the lead agency has rejected the recommendations and objections raised in the comments and provides a good faith, reasoned analysis to support the agency's determination. The level of detail in the response should be the same as the level of detail in the comment, and conclusory statements are insufficient. Caltrans and Metro's response to CEHAJ's comment on environmental justice analysis is inadequate because it failed to explain the agency's basis for rejecting the recommendation or objection, provided a general response to a specific and detailed comment, and provided only conclusory statements. For example, CEHAJ asks for additional analyses, including cumulative impacts, which have not been separately addressed except indirectly only for AQ/GHG/HRA through mass emission analyses. In addition, the response fails to address comments about specific additional mitigations, such as freeway lids. The inadequacy of the response to comment violates CEQA § 21091 and CEQA Guideline § 15088 and undermines the sufficiency of the EIR as an informational document.

IP-24-106

X. THE AIR QUALITY ANALYSIS IS FLAWED, INACCURATE, AND MISLEADING.

The Air Quality analysis for this project is particularly important. Even beyond CEQA and NEPA's information disclosure and mitigation requirements, this project includes an objective to "[i]mprove air quality and public health."[231] Thus, an honest assessment of air quality impacts is crucial to ensure the ultimate alternative selected achieves this vital objective. The current air

IP-24-107

[230] See Council on Envtl. Quality, Envtl. Justice Guidance Under the Nat'l Envtl. Protection Act at 9 (Dec. 10. 1997), https://www.epa.gov/communityhealth/environmental-justice-guidance-under-national-environmental-policy-act-nepa-council [hereinafter CEQA EJ Guidance under NEPA] (Directs agencies to "consider relevant public health data and industry data concerning the potential for multiple or cumulative exposure to human health or environmental hazards in the affected population and historical patterns of exposure to environmental hazards, to the extent such information is reasonably available. For example, data may suggest there are disproportionately high and adverse human health or environmental effects on a minority population, low-income population, or Indian tribe from the agency action. Agencies should consider these multiple, or cumulative effects, even if certain effects are not within the control or subject to the discretion of the agency proposing the action.").

[231] RDEIR/SDEIS at 1-40.

quality analysis, like the original air quality analysis in the Draft EIR/EIS, fails CEQA and NEPA's mandates for providing information backed by reasoned analysis. The same criticisms in that prior comment letter submitted by CEHAJ remain applicable to this Project. In addition to those flaws, the following sections outline additional flaws with the analysis. IP-24-107

A. The RDEIR/SDEIS Fails to Provide the Requisite Detail Necessary to Understand the Air Quality Implications of the Alternatives Selected.

The air quality analysis provides insufficient details to allow the public and decision-makers to understand how this project will impact air quality. Some of the analysis is delayed like the hotspot conformity analysis, and some other analysis does not provide sufficient detail about assumptions and how the agency is assessing significance. For example, throughout the analysis, the Air Quality section notes that the ZE option is "relatively similar" or other sufficiently vague terms. Because the analysis is so lacking, Caltrans needs to revise it to provide more detail and better information about the assumptions. IP-24-108

B. The 2012 Baseline Misleads Decision Makers and the Public.

The CEQA baseline selected (i.e. 2012) is not supported by the RDEIR/SDEIS and the technical documents. The Air Quality Technical Study solely provides the following basis for selecting 2012 as the project baseline:

> The CEQA Baseline represents existing, current conditions, defined to be the conditions at the time the Notice of Preparation (NOP) was released. In the Draft EIR/EIS, the CEQA Baseline represented project-specific conditions in the year 2008 (release date for the NOP). Since considerable time has passed after the release of the NOP, the CEQA Baseline year for the RDEIR/SDEIS air-related analyses will be represented by the project-specific conditions in the year 2012 (e.g., traffic on the I-710 and selected roadways in the year 2012).[232]

Neither the Air Quality Technical Report nor the RDEIR/SDEIS provide any rationale why 2012 was chosen beyond just a bald assertion that 2012 has been selected. Thus, there is not substantial evidence to support the selection of this baseline. In fact, solely using this baseline misleads the public and decision-makers. Importantly, the RDEIR/SDEIS notes that decrease in MSATs "is primarily due to improvements in vehicle technology driven by federal, state, and local regulations/programs."[233] Moreover, the Air Quality Study acknowledges that "[t]hese results indicate that a reduction in emissions due to improved vehicle technology resulting from the implementation of federal, state, and local regulations/programs such as CARB's Truck and Bus Regulation, the Pavley Standard, and the Ports' Clean Trucks Program outpaces increases in IP-24-109 IP-24-110

[232] Air Quality, Greenhouse Gas, and Health Risk Assessment Technical Study (Ramboll-Environ, June 2017) at 3 (hereinafter "Air Quality Study").
[233] Air Quality, Greenhouse Gas, and Health Risk Assessment Technical Study (Ramboll-Environ, June 2017) at ES-12 (hereinafter "Air Quality Study").

emissions resulting from increased vehicle activity in 2035."[234] The Air Quality Study further confirms that "[e]ven along the I-710, emissions of criteria and air toxic pollutants decreased in the 2035 build alternatives compared to the 2012 Baseline, as federal, state, and local air quality regulations/programs reduced emissions faster than emission increases caused by increases in VMT in 2035."[235] The analysis makes clear that this project is not responsible for the reductions in pollution in the corridor; rather it is the work of other agencies like the California Air Resources Board and the Ports of Los Angeles and Long Beach. IP-24-110

In fact, the use of the 2012 baseline for many pollutants simply shows how bad the situation in the corridor is. The scope of this project and the magnitude of this freight highway expansion means Caltrans should use a baseline that does not confuse people and take credit for the significant efforts from EPA, CARB, the Ports and other agencies to clean up dirty trucks. IP-24-111

This concern about the document being misleading is not simply hypothetical. Caltrans includes the following statement in the RDEIR/SDEIS: "the build alternatives will improve air quality and reduce public health risk in the Basin and the I-710 AOI."[236] Importantly, Caltrans seeks to make the public and decision-makers believe that this project will clean up pollution – even with clear evidence to the contrary. IP-24-112

Neither CEQA nor the CEQA Guidelines mandate "a uniform, inflexible rule" for determining a project's baseline conditions.[237] Rather, the statute empowers agencies to "employ a realistic baseline that will give the public and decision makers the most accurate picture practically possible of the project's likely impacts," and the Supreme Court has confirmed that lead agencies have the discretion and the responsibility, to "decide exactly how the existing physical conditions without the project can most realistically be measured," subject to review for support by substantial evidence.[238] Here, Caltrans employs a CEQA baseline that fails to accurately depict the significance of the Project's likely impacts. As such, it should use a baseline that allows the public and decision-makers to understand the true impact of this project on air quality. IP-24-113

C. The Assumptions in the Air Quality Analysis Are Not Supported by Substantial Evidence.

The RDEIR/SDEIS is rife with assumptions that are not justified. Here is just a subset of the issues that do not appear justified in the RDEIR/SDEIS.

- Despite having no real enforceable mitigation tied to it, the RDEIR/SDEIS assumes 22% of the trucks in the corridor under Alternative 5C will be zero or near-zero emissions. IP-24-114

[234] Air Quality Study at ES-12 & -13; *see also* RDEIR/SDEIS at 3.13-24.
[235] *Id.* at ES-28.
[236] RDEIR/SDEIS at 3.13-55.
[237] *Neighbors for Smart Rail v. Exposition Metro Line Const. Authority*, 57 Cal.4th 439, 449 (2013).
[238] *Id.*; 14 CCR § 15125(a); *Cherry Valley Pass Acres and Neighbors v. City of Beaumont*, 190 Cal.App.4th 316, 337 (holding that "without an appropriate baseline description, an adequate analysis of a project's impacts, mitigation measures, and alternatives 'becomes impossible.'").

- The analysis assumes that only non-diesel trucks will meet the "Near Zero" category for trucks. This is not substantiated. IP-24-115
- In many places, the document fails to articulate a differentiation between the emissions of the ZE alternative and the NZE alternative. IP-24-116

Given that air quality is so important to this project, the RDEIR/SDEIS should be revised.

D. The RDEIR/SDEIS Should Have Included the Quantitative Project-Level PM10/PM2.5 Analysis.

The RDEIR/DEIS notes that the quantitative hotspot analysis will be performed at selected locations in the corridor for the "preferred project."[239] The hotspot conformity analysis provides a vital tool to understand the contours of the proposed alternatives. As such, it is inappropriate to exclude it from the Draft EIR/EIS. The environmental review should be re-circulated with this analysis to allow the public to provide comments and benefit from the hotspot analysis in assessing the benefits and burdens of the various alternatives. IP-24-117

E. Air Quality Mitigation Measures Must Be Improved.

Caltrans must improve the mitigation measures for this project. While we are generally supportive of additional monitoring and air filtration at schools, these mitigation programs are vague and lack concrete details. IP-24-118

1. Construction Mitigation

Despite the long list of construction mitigation measures proposed to address air quality issues, there is little information about many of the programs and how these programs will be implemented.[240] The Construction Mitigation section needs more details to ensure that the mitigation are truly enforceable with the meaning of CEQA. The following two mitigation measures specifically need to be improved to ensure the cleanest technology available is used. IP-24-119

a. CON-AQ-15

The current language in CON-AQ-15 should be amended to more assertively require a minimum of Tier 4 construction equipment. Accordingly, we recommend deleting the phrase "depending on the responsible agency that administers the construction contract and the availability of construction equipment compliant with these standards."[241] This phrase essentially eviscerates the mitigation measure. Importantly a condition of becoming the responsible agency for this project should be committing to a minimum of Tier 4 construction equipment. IP-24-120

[239] RDEIR/SDEIS at 3.13-29.
[240] RDEIR/SDEIS at 3.24-53 to -58.
[241] RDEIR/SDEIS at 3.24-56.

b. CON-AQ-17

We appreciate Caltrans insertion of electric construction equipment into the document in CON-AQ-17.[242] However, the language is vague. Currently, any contractor will need to replace any equipment with "electric equipment whenever feasible."[243] There is no determination how this decision will be made, and how the public can ensure contractors and responsible agencies are using electrical options when available. The EIR/EIS must be improved to make clear how this mitigation measure can be enforced. IP-24-121

2. Operational Mitigation

Overall, there needs to be more details about the contours of the operational mitigation programs in the air quality analysis. For example, AQ-3 is hard to decipher. Will Caltrans require vegetative buffers throughout the corridor? Or, is this program limited in some way? The mitigation measure also does not clarify who will implement this measure and whether there will be continual funding for maintenance of the vegetative buffers. Commenters generally support vegetative buffers, and we recommend a process be developed to engage with stakeholders on the design and implementation of this type of program. IP-24-122

Finally, the RDEIR/SDEIS is woefully lacking in details about the grant program to fund near zero and zero emission trucks. The only detail on this program is contained in section 2 of the RDEIR/SDEIS.[244] As part of the project, it is unclear how this program will work and whether it will be effective. Moreover, by not identifying this part of the project as a mitigation measure, Caltrans has subverted the CEQA process.[245] In particular, it prevents the public and decision makers from assessing the efficacy of this mitigation measure to address significant impacts. For example, commenters are precluded from understanding why 105 million dollars was selected to make 22% of trucks under Alternative 5C zero emission or near zero emissions. Moreover, for alternative 5C, it is not explained how a one-time grant program will lead to the level of trucks assumed for the project analysis. Unless truck lanes are mandatory, it does not ensure that trucks meeting specific emissions standards will actually use the project, or extend once the millions of dollars are no longer available. IP-24-123

F. Caltrans' Response to CEHAJ Comments on the Air Quality Analysis is Inadequate.

CEQA § 21091 and CEQA Guideline § 15088 require lead agencies to respond in writing to comments submitted by the public that raise significant environmental questions. An adequate response to comments explains why the lead agency has rejected the recommendations and objections raised in the comments and provides a good faith, reasoned analysis to support the agency's determination. The level of detail in the response should be the same as the level of detail in the comment, and conclusory statements are insufficient. Caltrans and Metro's response to CEHAJ's comment on air quality is inadequate because it failed to explain the agency's basis IP-24-124

[242] RDEIR/SDEIS at 3.24-57.
[243] RDEIR/SDEIS at 3.24-57.
[244] RDEIR/SDEIS at 2-21 & -22.
[245] *Lotus v. Department of Transportation*, 223 Cal.App.4th 645, 658 (2014).

for rejecting the recommendation or objection, provided a general response to a specific and detailed comment, and provided only conclusory statements. Importantly, this project must include a zero emission freight corridor to ensure that growth in freight address the serious air quality issues faced by the people that live in the corridor. The inadequacy of the response to comment violates CEQA § 21091 and CEQA Guideline § 15088 and undermines the sufficiency of the EIR as an informational document. IP-24-124

XI. THE GREENHOUSE GAS ANALYSIS IS FLAWED, INADEQUATE, AND MISLEADING.

A. The Greenhouse Gas Analysis is Misleading.

The Air Quality Technical Report discloses the following assumption: "For the purpose of this analysis, ZE/NZE trucks in the build alternatives were conservatively assumed to have the same GHG emission factors as conventional trucks."[246] This approach makes no sense and seeks to obfuscate the benefits of the various build alternatives, including the zero emission option. A new draft is necessary to ensure the greenhouse gas emission impacts from this project are properly understood. IP-24-125

The Air Quality Technical Report also notes that "[b]oth 2035 build alternatives display a negligible increase in GHG emissions when compared to the 2035 Alternative 1 (No Build)."[247] But, this is misleading because the statement ignores the Alternative 7 ZE option. In the RDEIR's analysis, that alternative is more than a 1 million MT of CO2E lower than the other build alternatives – i.e. Alternative 5C and Alternative 7. The Report fails to acknowledge the deep greenhouse gas emission reductions associated with this project. IP-24-126

B. The Greenhouse Gas Analysis Fails to Identify What Baseline it is Using.

The CEQA analysis does not clarify what is the baseline for the greenhouse gas analysis. This is an important part of CEQA because the public must understand what baseline forms the conclusions developed in the analysis. IP-24-127

C. Failing to Identify a Significance Threshold Violates CEQA.

In the CEQA analysis, the RDEIR notes that "it is too speculative to make a significance determination regarding the project's direct impact and its contribution on the cumulative scale to climate change."[248] This approach violates CEQA. CEQA Guidelines make clear that lead agencies must decide "[w]hether the project emissions exceed a threshold of significance that the lead agency determines applies to the project."[249] It's clear that Caltrans cannot simply ignore this provision by failing to identify a significance threshold. IP-24-128

[246] Air Quality Study at 34.
[247] Air Quality Study at ES-3.
[248] RDEIR/SDEIS at 4-82.
[249] CEQA Guidelines § 15064.4(b)(2).

Beyond the information disclosure problems with this approach, failing to determine significance also allows Caltrans to evade its mitigation duties. By ducking the significance determination, it refers to its strategies as simply "measures," and these measures are not enforceable under CEQA. IP-24-129

Finally, by failing to identify a significance threshold, it allows the agency to overlook the deep GHG benefits of the 7ZE option as compared to the other build alternatives. The South Coast Air Quality Management District has identified 10,000 MT of CO2E as a significance threshold for projects under its jurisdiction. Alternative 7ZE exhibits dramatic reductions of greenhouse gas compared to the 2035 No Build on the order of 100 times the Air District's significance threshold. This fact is buried and glossed over in the RDEIR, which must be cured in a future draft of the EIR/EIS. IP-24-130

D. Excluding Greenhouse Gas Emission Analysis from the NEPA Analysis Violates NEPA.

The RDEIR/SDEIS does not commit that the greenhouse gas analysis from the CEQA portion of the document – even if faulty - will inform the NEPA analysis. The RDEIR/SDEIS states "[t]he CEQA analysis may be used to inform the…NEPA determination for the project."[250] The United States Court of Appeals for the Ninth Circuit has made clear that "the fact that 'climate change is largely a global phenomenon that includes actions that are outside of [the agency's] control … does not release the agency from the duty of assessing the effects of its actions on global warming within the context of other actions that also effect global warming ….' [T]he impact of greenhouse gas emissions on climate change is precisely the kind of impacts analysis that NEPA requires agencies to conduct."[251] Thus, there is no discretion under NEPA to ignore greenhouse gas emissions analysis in a NEPA analysis. The agency must assess the greenhouse gas impacts against the NEPA baseline for this project in the RDEIR/SDEIS. Moreover, the agency must look to the greenhouse gas analysis to identify which project alternative is environmentally superior. IP-24-131

E. Caltrans' Response to CEHAJ Comments on the Greenhouse Gas Analysis is Inadequate.

CEQA § 21091 and CEQA Guideline § 15088 require lead agencies to respond in writing to comments submitted by the public that raise significant environmental questions. An adequate response to comments explains why the lead agency has rejected the recommendations and objections raised in the comments and provides a good faith, reasoned analysis to support the agency's determination. The level of detail in the response should be the same as the level of detail in the comment, and conclusory statements are insufficient. Caltrans and Metro's response to CEHAJ's comment on greenhouse gas analysis is inadequate because it failed to explain the agency's basis for rejecting the recommendation or objection, provided a general response to a IP-24-132

[250] RDEIR/SDEIS at 3.13-58.

[251] *Center for Biological Diversity v. National Highway Traffic Safety Administration*, 538 F.3d 1172, 1217 (9th Cir. 2008)(requiring the National Highway Traffic Safety Administration to monetize the benefits of GHG emissions from setting fuel economy standards and requiring the agency to analyze the project's cumulative impacts on climate change).

specific and detailed comment, and provided only conclusory statements. In particular, the NEPA includes no greenhouse gas analysis in response to CEHAJ's comments, and the CEQA analysis has deep flaws. The inadequacy of the response to comment violates CEQA § 21091 and CEQA Guideline § 15088 and undermines the sufficiency of the EIR as an informational document.

IP-24-132

XII. THE ENERGY ANALYSIS IS FLAWED AND INADEQUATE.

The RDEIR/SDEIS discussion of energy impacts remains inadequate. It fails to identify and adequately discuss the true impacts from the operation and construction of this project. The current energy analysis does not comply with the requirements of CEQA and NEPA.

A. CEQA Energy Analysis Overview.

CEQA requires lead agencies to prepare or require preparation of an EIR on any project it may carry out or approve "that may have a significant effect on the environment."[252] An EIR must include a detailed statement that sets forth "[m]itigation measures proposed to minimize significant effects on the environment, including, but not limited to, measures to reduce the wasteful, inefficient and unnecessary consumption of energy."[253] The absence of such a statement, or one explaining the reasons for determining that a project will not have a significant effect on the environment, renders an EIR "fatally defective."[254] Appendix F, which is part of the CEQA Guidelines, cites to and elaborates on CEQA, section 21100, subsection (b)(3).

CEQA Guidelines provide that, "Energy conservation measures, as well as other appropriate mitigation measures, shall be discussed when relevant. Examples of energy conservation measures are provided in Appendix F."[255]

The Agency amended Appendix F in 2009 to ensure that lead agencies comply with section 21100(b)(3)'s substantive provision that they analyze energy use in their EIRS.[256] The Agency explained that the amendments were necessary because the Legislature directed the Office of Planning and Research and the Agency to develop guidelines on how to analyze and mitigate greenhouse gas ("GHG") emissions, a significant source of which results from energy use.[257] The Agency stated that, in order to reduce GHG emissions, agencies should focus on mitigation as well as project design features (as identified in Appendix F), which can reduce emissions both directly and indirectly.[258]

---

[252] CEQA § 21100(a).
[253] *Id.* at (b)(3).
[254] *People v. County of Kern,* 62 Cal.App.3d 761, 774 (1976) (citing CEQA § 21100(c)).
[255] CEQA Guidelines § 15126.4(a)(1)(C).
[256] California Natural Resources Agency (December 2009) Final Statement of Reasons for Regulatory Action, p. 71 ("Final Statement of Reasons").
[257] *Id.* at pp. 72-73.
[258] *Id.* at 46-47.

First, the 2009 amendments revised the introduction to include a cross-reference to CEQA section 21100(b)(3) and clarified that agencies need not re-analyze energy impacts in subsequent EIRs. Final Statement of Reasons, *supra*, at p. 71. Second, the amendments clarified that agencies "shall" analyze energy conservation in their EIRs, emphasizing that the duty is mandatory. Third, the Agency removed the term "lifecycle" from Appendix F because it was ambiguous. Fourth, the amendments clarified that projects can employ water use and solid waste disposal measures for energy savings. And fifth, the Agency made minor improvements to the Appendix's grammar and syntax. Several years after the Agency promulgated these amendments, two appellate court decisions ushered Appendix F into the spotlight: *California Clean Energy Committee*[259] and *City of Ukiah.*[260]

Appendix F explains that CEQA requires EIRs to include mitigation measures to reduce energy consumption in order to ensure that agencies consider energy implications in project decisions.[261] It further explains that, for many projects, energy efficiency may be more determinative than initial dollar costs when it comes to cost effectiveness.[262] However, it also allows a lead agency to consider any environmental review that has already adequately analyzed and mitigated the effects of energy productions of a particular energy source serving a project.[263]

Appendix F requires EIRs to consider "[p]otentially significant energy implications of a project" to the extent that they are applicable and relevant to that project.[264] It also enumerates various "energy impact possibilities" and "potential conservation measures" in order to illuminate the EIR preparation process.[265] It provides that these should be considered in an EIR whenever they are "applicable or relevant to the project."[266] As may be evident from its provisions, "CEQA's requirement to analyze and mitigate energy impacts of a project is substantive, and is not merely procedural."[267]

B. The Operational Energy Analysis Is Flawed.

The RDEIR/SDEIS provides insufficient information about the energy analysis to foster informed commenting. Importantly, the Energy Analysis fails to justify why assumptions about near zero emission technologies are assumed not to be diesel technologies. The RDEIR/SDEIS should also compare gasoline and diesel for the various alternatives. This will allow a more appropriate comparison of energy use amongst the alternatives, instead of just lumping all the fuels together and calculating the BTUs. Finally, it is unclear whether the agency assumed NZE and ZE trucks use no energy – gasoline or diesel – in estimating the energy use amongst the

alternatives. If so, this is massively deceptive because just assuming these vehicles will have no energy use fails from an information disclosure standpoint. IP-24-135

C. The RDEIR/SDEIS Analysis of Construction Energy Impacts is Flawed.

With no analysis about how it measured significance, the RDEIR/SDEIS concludes the following:

> Construction of any of the build alternatives would not result in adverse impacts related to energy consumption in the project Study Area or in the South Coast Air Basin compared to the No Build Alternative. No avoidance, minimization, or mitigation measures are required.[268]

CEQA and NEPA requires more than this type of bald analysis. And, this failure to properly analyze the construction energy impacts has consequences. It allows Caltrans to evade mitigation to ensure the wiser use of energy. The Energy Technical Report discloses that the majority of energy expended from construction comes from the materials used for the roads and the process of constructing the roads.[269] This is clearly an opportunity to use alternative fuels and mitigate this fuel use as Appendix F and NEPA directs. IP-24-136

The downside of Caltrans approach is clarified when instead of adopting real mitigation measures to ensure the wiser use of energy as mandatory CEQA mitigation measures, Caltrans just adopts "measures." Importantly, the RDEIR makes clear they are not in fact "mitigation measures" for CEQA purposes.[270] Caltrans does not even explain what these "measures" are and how one would ensure they are 1) effective and 2) actually implemented. Caltrans should take a look at the significant energy consumption that will occur in building this massive project and identify real mitigation measures to reduce that energy use. Measures that note the agency might use more efficient lighting, for example, does not provide the assurances that these measures will actually be implemented. IP-24-137

Because the Energy analysis is misleading and fails to examine true mitigation to ensure the wise and efficient use of energy, Caltrans should create a new analysis that cures the flaws.

XIII. THE RDEIR/SDEIS DOES NOT ADEQUATELY ADDRESS WATER QUALITY IMPACTS.

The RDEIR/SDEIS analysis of water quality impacts from construction and ongoing operation of the expanded I-710 corridor continues to be inadequate and incomplete. As such, the proposed mitigations are inadequate, and additional feasible mitigation is warranted. IP-24-138

As described in our prior letter, the RDEIR/SDEIS fails to adequately and precisely describe prospective stormwater management actions and site-specific context. Those deficiencies

[268] RDEIR/SDEIS at 3.15-15; *see also* Energy Technical Report (June 2017) at 39.
[269] Energy Technical Report at 37 [Table 4.3-1].
[270] RDEIR/SDEIS at 4-90.

continue to plague this document. For example, the final design of Best Management Practices that will be employed as construction mitigation are punted for later description.[271] Similarly, the document cursorily concludes that the proposed mitigation will account for the construction impacts, but without engaging in a fully developed discussion and analysis of the impacts that need to be mitigated. As such, the document continues to fail to provide precise locations, specific data, or detail regarding impacts or mitigation, which inhibits informed decision-making and comment by the public. Caltrans must provide significantly more information and detail on both the impacts and on the proposed mitigations in order to comply with, and serve the purposes of, CEQA and NEPA. IP-24-138

CEQA § 21091 and CEQA Guideline § 15088 require lead agencies to respond in writing to comments submitted by the public that raise significant environmental questions. An adequate response to comments explains why the lead agency has rejected the recommendations and objections raised in the comments and provides a good faith, reasoned analysis to support the agency's determination. The level of detail in the response should be the same as the level of detail in the comment, and conclusory statements are insufficient. Caltrans and Metro's response to CEHAJ's comment on stormwater issues is inadequate because it does not provide an analysis of a significant environmental question, provided a general response to a specific and detailed comment, provided only conclusory statements that were unsupported by information or fact to justify its decision that the issues raised in the comment were insignificant or would not occur. The responses and document do not adequately address how TMDLs will be met for trash and bacteria, account for impacts from construction. It is insufficient to simply rely on as of yet undetermined measures ("final design of BMPs will be analysed during PS&E")[272] to mitigate impacts that have not been fully analyzed. The inadequacy of the response to comment violates CEQA § 21091 and CEQA Guideline § 15088 and undermines the sufficiency of the EIR as an informational document. IP-24-139

XIV. THE RDEIR/SDEIS SEVERELY UNDERSTATES THE PROJECT'S NOISE IMPACTS AND FAILS TO MITIGATE THESE IMPACTS.

The RDEIR/SDEIS's analysis of noise impacts and proposed mitigation continues to be wholly inadequate.

The California Legislature has declared in CEQA that "it is the policy of the state" to "[t]ake all action necessary to provide the people of this state with . . . freedom from excessive noise."[273] Research on noise from transportation—especially heavy-duty trucks—shows significant health impacts. For instance, noise above 60 decibels ("db") has been shown to have psychological impacts, such as worsening children's mental health, concentration, and classroom behavior in

[271] RDEIR/SDEIS, Appendix S, Response to Comments-Interested Parties, IP-22-52 at 34-36, 789.
[272] RDEIR/SDEIS, Appendix S, Response to Comments-Interested Parties, IP-22-52 at 34-36; 789.
[273] Pub. Res. Code § 21001(b).

children at school.[274] (For reference, "a diesel truck 50 feet away going 50 miles per hour, may register between 80 and 90 decibels.").[275] Other studies show that chronic noise exposure, including near roadway exposure, contribute to a worsening of heart disease and higher rates of stroke, after accounting for the risks association with air pollution.[276] Traffic noise can also disturb sleep.[277]

The revised analysis continues to use standards and criteria that are unreasonable and substantially above the current recommended and local noise criteria, especially for sensitive receptors, such as schools; continues to use an unreasonable and indefensibly high threshold of significance of 12 dBA; continues to employ a methodology containing serious omissions that skewed results and failed to provide information required by CEQA and NEPA; and continues to proposes only minimal measures to lessen the severity of noise and vibration impacts and absolutely no measures to avoid them.[278] As a result, the RDEIR/SDEIS noise analysis remains inadequate under NEPA and CEQA

IP-24-140

Finally, CEQA § 21091 and CEQA Guideline § 15088 require lead agencies to respond in writing to comments submitted by the public that raise significant environmental questions. An adequate response to comments explains why the lead agency has rejected the recommendations and objections raised in the comments and provides a good faith, reasoned analysis to support the agency's determination. The level of detail in the response should be the same as the level of detail in the comment, and conclusory statements are insufficient. Caltrans and Metro's response to CEHAJ's comment on noise is inadequate because it failed to explain the agency's basis for rejecting the recommendation or objection, provided a general response to a specific and detailed

comment, and provided only conclusory statements. Caltrans has not adequately addressed any of the concerns we previously raised, nor has it provided an adequate response for its failure to do so. The inadequacy of the response to comment violates CEQA § 21091 and CEQA Guideline § 15088 and undermines the sufficiency of the EIR as an informational document. IP-24-141

XV. THE RDEIR/SDEIS FAILS TO ADEQUATELY DISCUSS AND MITIGATE CONSTRUCTION IMPACTS.

A. The Project should Incorporate the Construction Components of CA-7.

While the RDEIR/SDEIS responded to some of construction components included in CA-7, it did not address or incorporate a number of others. These additional elements that should be included are:

- Commitment to fund air mitigation ($10M per year) & accelerate mitigation for indoor air filtration and in for air filtration in schools
- Commitment to fund noise mitigation ($10M per year) & accelerate soundproofing mitigation & programs in schools; for near freeway blocks, reduce interior noise to 30 decibels or less
- Free public transit program
- Independent third-party monitor
- Conduct a health study during construction
- Funding for community outreach program ($200,000 per year)
- Job training and local hire program
- Minority business enterprise, women business enterprise and small business utilization and retention program
- Use power grid for electric motors
- Use of ZE technology where available

IP-24-142

In addition, the while the DEIR/S referenced the need to build catenary or toll systems for ZE,[279] the RDEIR/SDEIS fails to include construction plans for special structures for such a ZE alternative.

B. The RDEIR/SDEIS Contains an Inadequate Discussion of the Environmental Impacts of Construction.

The RDEIR/SDEIS fails to provide basic information about how construction on the project would proceed, making it impossible to identify potential environmental impacts. Based on this limited information about how construction would proceed, the discussion of construction impacts is extremely vague and fails to adequately identify and discuss impacts on the environment. IP-24-143

[279] DEIR at 3.24-4.

For example, the discussion of land-use impacts hints at business closures and relocations due to construction impacts, but fails to provide any more details about this potential.[280] Similarly, when discussing impacts to schools, the RDEIR/SDEIS states that there will be "temporary construction impacts" at Cesar Chavez park but does not explain what those impacts would be, or how they might impact the neighboring school. To the extent that the RDEIR/SDEIS relies on CON-TR-1 to minimize impacts to access to parks and schools, this measure is too vague to provide any information about how impacts will be reduced. IP-24-144 IP-24-145

Similarly, the RDEIR/SDEIS fails to discuss construction impacts on community resources, providing even less of a discussion than the DEIR, which had included a table listing community resources impacted by construction.[281] The only discussion is two sentences without explanation: "Additionally, temporary construction impacts would occur under each build alternative and would occur for property owners whose properties are fully acquired and require relocation. *These property owners would be temporarily impacted during the relocation process.*"[282] The document does not include a description of *how* displacement will impact people while they are relocating. IP-24-146

The discussion of how construction impacts will affect EJ communities is similarly stunted. "Lastly, construction activities would temporarily affect environmental justice populations. Temporary construction impacts would include disruption of local traffic patterns and access to residences and businesses, increased traffic congestion, and increased noise, vibration and dust. *However, construction activities would provide jobs, which would benefit local economies that include minority and low-income populations*."[283] The idea that additional jobs *may be* available for *some* members of EJ communities (although there is no guarantee of this) is irrelevant to the fact that, as the RDEIR/SDEIS acknowledges, construction will cause detrimental impacts to traffic, access to residences and businesses (including displacements) and increased noise, etc. IP-24-147

The RDEIR/SDEIS also rests on the faulty assumption that since construction will last for less than 5 years on a single segment, the emissions should not be considered permanent impacts. "According to the conceptual construction schedule used to develop the construction emissions analysis, some of the conceptual construction phases would take more than five years to complete. *However, construction would not occur at any one location for more than five years. Therefore, construction-related emissions may be considered temporary; subsequently, any construction-related PM2.5 and PM10 emissions due to this project were not included in the hot-* IP-24-148

[280] RDEIR/SDEIS at 3.24-4 through 3.24-5 ("Construction would temporarily affect nearby land uses. Temporary construction impacts would include disruption of local traffic patterns and access to residences and businesses; increased traffic congestion; and increased noise, vibration, and dust. Although some businesses could close or relocate during a prolonged construction period, this impact would be localized and would not likely result in long-term changes in land use.").
[281] DEIR at 3.24-9.
[282] RDEIR/SDEIS at 3.24-14 (emphasis added).
[283] *Id.* (emphasis added).

spot analysis."[284] Yet it is unclear from the limited detail provided whether this would in fact be the case. IP-24-148

Finally, Caltrans should provide a quantitative analysis of health impacts and much more information about construction impacts, including how and where the project will be phased in over time, construction related changes to health risks.[285] And the GHG analysis should include lifecycle GHGs of construction emissions and equipment. IP-24-149

C. Mitigation Measures for Construction Impacts are Inadequate.

In part because the analysis of existing local conditions is so inadequate, Caltrans cannot propose mitigation measures to address the clear impacts this project will have on local communities. With respect to the measures that are proposed, many of them are so undeveloped that they give no indication of whether they will actually abate any of the construction impacts. IP-24-150

For example, CON-TR-1, the Transportation Management Plan, is extremely vague and merely states the general principles that will be included in the plan, without providing specifics. For instance, it does not explain how much public information will be made available, whether or how residents will be notified of construction activities in their neighborhoods, etc. Given the lack of specifics and the fact that this TMP is undrafted, it is unclear that this measure will do anything to reduce impacts of construction. Where the RDEIR/SDEIS relies on undrafted TMPs to abate impacts for a wide range of impacts, these assertions are unsupported. IP-24-151

CON-AQ-15, which states that "dependent upon the responsible agency that administers the construction contract" the types of equipment used and associated emissions levels will vary, is not a mitigation measure since it does not actually require anything. IP-24-152

Other measures are also so broad as to be meaningless, such as those for noise proposing site restrictions and "shielding with barriers' and "educating contractors and their employees to be sensitive to noise impact problems", and unsupported assertions that construction activities will provide local jobs. The conclusion that job benefits will accrue to local EJ communities is unsupported. Additionally, assuming that this will mitigate other construction impacts to EJ communities is incorrect. IP-24-153

In this vein, CON-LU-2 is unenforceable and inadequate mitigation to address community concerns and provide information to the community. CON-LU-2 requires "one or more public information field office(s) near the construction site(s)," meaning that potentially only a single field office will be set up for the entire 710 project area. Moreover, the notice requirements are inadequate and vague. CON-LU-2 states that the field office will serve the purpose to "Notify property owners, residences, and businesses of major construction activities (e.g., utility IP-24-154

[284] *Id.* at 3.24-29 (emphasis added).
[285] RDEIR/SDEIS, Appendix S, Response to Comments-Interested Parties, IP-22-56 at 792 ("Detailed construction phasing cannot be developed at this time and thus detailed modeling would be speculative in both time and location.").

relocation/disruption, rerouting of delivery trucks) at least 14 days prior to the disruption."[286] The measure does not include provisions to notify sensitive receptors. CEHAJ has previously requested that sensitive receptors within 1000 ft of the project be notified at least 30 days before construction begins.[287] Finally, requiring vague "periodic meetings" is not sufficient to satisfy CEHAJ request for monthly meetings and does not describe where these meetings will be held, how often, or how community concerns will be incorporated into construction plans.[288] IP-24-154

D. Caltrans' Response to Prior CEHAJ Comments on the Construction Impacts of the Project are Inadequate.

CEQA § 21091 and CEQA Guideline § 15088 require lead agencies to respond in writing to comments submitted by the public that raise significant environmental questions. An adequate response to comments explains why the lead agency has rejected the recommendations and objections raised in the comments and provides a good faith, reasoned analysis to support the agency's determination. The level of detail in the response should be the same as the level of detail in the comment, and conclusory statements are insufficient. Caltrans and Metro's response to CEHAJ's comment on construction impacts is inadequate because it does not offer evidence in support of the agency's decision, failed to explain the agency's basis for rejecting the recommendation or objection, provided a general response to a specific and detailed comment, and provided only conclusory statements. IP-24-155

For example, Caltrans does not provide an explanation for why power grid is not used for mobile generators.[289] Citing to CON-AQ-8 which reduces diesel idling in sensitive areas is a different issue and does not respond to the comment. In addition, Caltrans did not respond to CEHAJ's comment to use electric cranes and forklifts where possible. In addition, the following responses were inadequate: IP-24-156

- Failure to fund requested programs because there is no specific construction schedule and therefore not possible to estimate the annual budget is besides the point; Caltrans can still commit to funding these programs without a specific construction schedule. IP-24-157
- Reliance on unfunded community benefits program is inadequate to mitigate these impacts on construction. IP-24-158
- Deflection to Metro to develop local hire policy is not in compliance with Motion 22.1. IP-24-159
- Dismissal of request to conduct a health study is not supported by substantial evidence.[290] IP-24-160
- Idea that community will benefit from construction jobs and that this will mitigate impacts is unsupported. IP-24-161

The inadequacy of the responses to comment violates CEQA § 21091 and CEQA Guideline § 15088 and undermines the sufficiency of the EIR as an informational document.

[289] *Id.* at 782-83.
[290] RDEIR/SDEIS, Appendix S, Response to Comments-Interested Parties, IP-22-21 at 774 ("Caltrans respectfully disagrees with the need for such a study . . . Another study will not will help reduce air quality and health risk impacts related to project construction.").

XVI. THE RDEIR/SDEIS CUMULATIVE IMPACTS ANALYSIS IS INADEQUATE.

The RDEIR/SDEIS's analysis of cumulative impacts is inadequate and flawed. It contains out-of-date descriptions of the status and impacts in its list of other projects, and it relies on an inadequate and flawed analysis of project impacts as described in the preceding sections.

The RDEIR/SDEIS lists in Table 3.25-1 the past, present, and foreseeable future projects for its cumulative impacts analysis.[291] But not all the entries in that table are up-to-date. For example, in line P-5, the description of the China Shipping project has an old, out-of-date description of the status, as of the date of the RDEIR/SDEIS release.[292] Without accuracy here, the cumulative analysis is faulty. IP-24-162

Further, the cumulative impacts analysis relies on the impacts identified in other sections of the document. However, because the analysis of impacts and provision of mitigation is inadequate as discussed above, the analysis of cumulative impacts based on those flawed project impact analyses is also flawed. For example, with respect to land use, the cumulative impacts analysis and its conclusion that there are no cumulative impacts is based on the notion that the project is generally consistent with local land use plans;[293] as discussed in section III (land use) above, that conclusion is unsupported and flawed. Thus, for each section discussed above with an inadequate project impact analysis, the cumulative impacts analysis is similarly inadequate and flawed. IP-24-163

XVII. THE COMMUNITY HEALTH BENEFIT PROGRAM IS INADEQUATE AS MITIGATION AND DOES NOT COMPLY WITH CEQA

The RDEIR/SDEIS acknowledges the I-710 Corridor Project will disproportionately and adversely impact minority and low-income populations who live within the project area.[294] To address these impacts, the RDEIR/SDEIS proposes additional mitigation, in the form of a Community Health Benefit Program (Program), under which communities can apply for grants to implement air quality improvement and renewable energy projects.[295] However, the RDEIR/SDEIS does not adequately explain the amount of funding, describe how projects will be funded and selected, or ensure that the projects will mitigate the project's environmental impacts. As such, the RDEIR/SDEIS' description of the Community Health Benefit Program mitigation measure is inadequate and constitutes unlawfully deferred mitigation. Caltrans must include specific performance criteria and funding commitments in the project description to ensure the Program mitigates the impacts it is designed to address. IP-24-164

[291] RDEIR/SDEIS, Table 3.25-1.
[292] *Id.* at 3.25-19, Table 3.25-1.
[293] *Id.* at 3.25-47 ("Therefore, the I-710 Corridor Project would not substantially contribute to a cumulative effect related to consistency with State, regional, and local plans because the project is generally consistent with area General Plan goals and policies....").
[294] RDEIR/SDEIS pp. 3.3-148 to 149.
[295] RDEIR/SDEIS pp. 3.3-148 to 149.

A. The Program Does Not Comply with CEQA's Requirements for Mitigation Measures.

CEQA requires proposed projects that will have significant environmental impacts to include measures to mitigate these impacts that are fully enforceable and are not deferred. The Program fails to meet these requirements.

CEQA requires mitigation measures to be "fully enforceable through permit conditions, agreements, or other legally-binding instruments. In the case of the adoption of a plan, policy, regulation, or other public project, mitigation measures can be incorporated into the plan, policy, regulation, or project design."[296] The Program is not a fully-enforceable mitigation measure. In fact, there is no guarantee that it will be adopted. It is only included as a programmatic component of the build alternatives. Therefore, it is possible for the project to be built without the implementation of this Program, which would leave the project's serious, disproportionate impacts on environmental justice communities unmitigated. Failure to mitigate significant environmental impacts violates CEQA. IP-24-165

Moreover, the Program constitutes unlawfully deferred mitigation. CEQA prohibits deferred mitigation. CEQA Guidelines § 15126.4 states, "Where several measures are available to mitigate an impact, each should be discussed and the basis for selecting a particular measure should be identified. *Formulation of mitigation measures should not be deferred until some future time.* However, measures may specify performance standards which would mitigate the significant effect of the project and which may be accomplished in more than one specified way."[297] Thus, for the Program to be a valid mitigation measure under CEQA, the RDEIR/SDEIS needs to include specific performance criteria to ensure it will mitigate the project's significant environmental impacts and make further project approvals contingent on meeting these criteria.[298] The description of the Program, as written in the RDEIR/SDEIS, is vague and does not include crucial information that is needed to ensure the Program will be implemented and that it will sufficiently mitigate the impacts it is designed to address. The Program does not include any specific funding commitments or explain how the Advisory Committee will be selected. These details are critical to ensure the success and adequacy of the Program as a mitigation measure. IP-24-166

Currently, the RDEIR/SDEIS states the Program will include yearly funding contributions adjusted for inflation over a ten-year period, commensurate with any phased construction strategy.[299] It does not specify how much money will be allocated each year. Additionally, it does not identify the sources of the funding or guarantee that the needed funds will be available. As such, the Program is not enforceable, and there is no assurance that it will implemented. Without guaranteed funding commitments, there is no way to know if the Program will be IP-24-167

[296] CEQA Guidelines § 15126.4(a)(2).
[297] CEQA Guidelines § 15126.4(a)(1)(B).
[298] *Rialto Citizens for Responsible Growth v. City of Rialto*, 208 Cal. App. 4th 899, 944 (2012); *Defend the Bay v. City of Irvine*, 119 Cal. App. 4th 1261, 1275 (2004); *Endangered Habitats League, Inc. v. Cnty of Orange*, 131 Cal. App. 4th 777, 793 (2005).
[299] RDEIR/SDEIS at 2-24.

funded or if the money allocated for the Program will actually be able to fund projects of the quality and quantity that will be needed to adequately mitigate the project's impacts. IP-24-167

The Program description also fails to adequately explain how the Advisory Committee members will be selected. The Advisory Committee will have the authority to select which projects will receive grants through the Program, and the allocation of the grant funding will determine the success of the mitigation measure. It is important that projects that address the most serious and urgent impacts on environmental justice communities are selected. One way to achieve this is by ensuring the impacted communities have voices on the Advisory Community and can choose which projects are selected. The RDEIR/SDEIS states the Advisory Committee will consist of area experts, members of the funding partner agencies, and community representatives.[300] This discussion should also include criteria for selecting members of the Advisory Committee that ensure the interests of the impacted communities will be represented. It is not enough to say community representatives will serve on the Advisory Committee without explaining who will determine what constitutes a community representative and how they will be selected. IP-24-168

B. The Program Should Be Strengthened to Ensure it Fully and Equitably Mitigates Project Impacts.

The RDEIR/SDEIS should also provide specific criteria for how to select and prioritize projects and allow for more types of projects to be funded by the Program. Currently, the RDEIR/SDEIS simply prioritizes projects that will benefit the most people per dollar and aid undefined environmental justice communities. Cost-effectiveness may be an important factor in allocating the Program's grant funding, but it is not the only factor that the Advisory Committee should consider. In addition to considering how many people a project will benefit, the Committee should consider the distributional effects of the project's impacts and select projects that address the most severe impacts.

Currently, the Program covers projects that fall under three categories: 1) air quality improvement and/or noise reduction measures at local schools; 2) air quality improvements at hospitals, medical centers, and senior facilities, as well as health education, outreach, and screening; and 3) greenhouse gas (GHG) reduction through renewable energy and tree-planting projects.[301] While these projects may be able to address the air pollution impacts caused by the project, these categories are quite narrow and only allow community members to address the new harms created by the project. The project's impacts will fall on communities that are already disproportionately impacted, which will compound present air quality issues and exacerbate existing health impacts. Limiting the Program to new harms created by the project does not address the project's contribution to cumulative air quality issues. A more comprehensive program that allows for funding of projects that fall under broader categories would allow community members to proactively address the project's impacts. IP-24-169

The Community Health Benefit Program, as described in the RDEIR/SDEIS, is inadequate and constitutes unlawfully deferred mitigation. To comply with CEQA, the Program needs to be

[300] *Id.* at 2-23.
[301] RDEIR/SDEIS at 2-23 through 2-24.

fully-enforceable through a legally-binding instrument and/or specific performance criteria need to be incorporated into the project description to ensure the Program fully and successfully mitigates the impacts it is designed to address. It should also be strengthened to ensure it provides adequate mitigation for the Project's significant impacts.

IP-24-169

XVIII. A REVISED DRAFT EIR MUST BE PREPARED AND RE-CIRCULATED.

Because of the inadequacies discussed above, the RDEIR/SDEIS cannot form the basis of a final EIR/EIS. CEQA requires preparation and recirculation of a supplemental draft "[w]hen significant new information is added to an environmental impact report" after public review and comment on the earlier draft EIR.[302] The opportunity for meaningful public review of significant new information is essential "to test, assess, and evaluate the data and make an informed judgment as to the validity of the conclusions to be drawn therefrom."[303] An agency cannot simply release a draft report "that hedges on important environmental issues while deferring a more detailed analysis to the final [EIR] that is insulated from public review."[304]

IP-24-170

In order to cure the panoply of RDEIR/SDEIS defects identified in this letter as well as the defects previously identified in the DEIR/SDEIS that persist, Caltrans must obtain substantial new information to adequately assess the proposed Project's environmental impacts, and to identify effective mitigation and alternatives capable of alleviating the Project's significant impacts. This new information will clearly necessitate recirculation. CEQA requires that the public have a meaningful opportunity to review and comment upon this significant new information in the form of a revised draft EIR.

Sincerely,

Adrian Martinez

IP-24-1

Caltrans and Metro thank the commenter for their input. The commenter's opposition to Alternative 5C and support of Alternative 7 with a zero emission freight corridor are acknowledged and included in the project record. Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), has identified Alternative 1 (No Build) as the Preferred Alternative. Please refer to Section 1.1 of this appendix for a discussion on the identification of the Preferred Alternative. Please also refer to Section 1.3 of this appendix for a discussion on the zero emission and near-zero emission truck analysis provided in the RDEIR/SDEIS.

IP-24-2

Caltrans respectfully disagrees that the RDEIR/SDEIS fails to include the necessary analysis under CEQA and NEPA and that revision and recirculation of the RDEIR/SDEIS is required. The impact analyses contained within the RDEIR/SDEIS were performed in accordance with Caltrans guidance for complying with the requirements of CEQA and NEPA (published on Caltrans' Standard Environmental Reference website at: http://www.dot.ca.gov/ser/), and in some cases, such as that of the Air Quality/Health Risk Assessment, the scope of the analysis actually surpasses that which would normally be included in a Caltrans project-level analysis.

IP-24-3

Caltrans and Metro acknowledge that the directive of Motion 22.1 states that Metro staff should work with Caltrans and partner agencies as necessary to include an analysis of a Zero Emission Truck procurement and operations program (Alternative 7 only) in any Public Private Partnership (PPP) analysis to be done for the build alternatives; however, the Motion 22.1 language clearly states that this is an action to be done "as necessary and *in parallel to the EIR/EIS process*" [italics added]. This type of analysis can and should be done in support of the deployment of said program, but has no nexus to the EIR/EIS process. The EIR/EIS process is intended to disclose and mitigate the environmental impacts of a proposed project. The procurement and operations analysis in question is not appropriate for inclusion in a project-level EIR/EIS document, but would be better suited for a funding or PPP analysis as is stated within the Motion language and which could be done at a later date should a build alternative be selected as the Preferred Alternative, and project funding be secured. Additionally, please note that Metro Board Motion 5.1 adopted on March 1, 2018, further refined the ZE/NZE Truck Technology Development Program, now known as the I-710 Clean Truck Program. Please see Section 2.3.2.1 of this Final EIR/EIS for further details. Motion 5.1 increased the funding target from $100 million to $200 million and includes incentives and grants investment in the acceleration of zero emission technology both for long-haul trucks and for freeway infrastructure. In April 2020, the Metro Board of Directors programmed $50 million in Metro-controlled funds to provide funding for the initial deployment of

the I-710 Clean Truck Program and to leverage the remaining funds required for full program implementation. However, since a build alternative has not been selected as the Preferred Alternative, this programmatic element will not be implemented by Caltrans as the lead agency under CEQA and NEPA and as the owner/operator of the I-710 freeway.

IP-24-4

Caltrans and Metro acknowledge the Motion 22.1 requirement for "Geometric design for the I-710 Freight Corridor (under Alternative 7 only) that eliminates significant impacts and displacements of homes, businesses, or community resources, such as but not limited to the Bell Shelter or Senior Centers, *and the implications of such a design on commuter and freight traffic demands; where significant impacts are unavoidable, provide documentation of the rationale and constraints*" [italics added]. That analysis was undertaken and is summarized in Section 3.3.2.3, Motion 22.1 Right of Way Avoidance Analysis, of the RDEIR/SDEIS and this Final EIR/EIS, as well as included in full in Appendix T. Based on the feedback received from community groups and members, avoidance of right-of-way acquisitions was prioritized in developing the build alternatives and design options. Reduced relocation impacts were a component of the rationale of the identification of Alternative 1 (No Build) as the Preferred Alternative.

Although reduction of right-of-way impacts was not included in the statement of objectives and purpose under CEQA nor the purpose and need statement under NEPA for the I-710 Corridor Project, Caltrans always seeks to reduce right-of-way impacts for any transportation project to the greatest extent feasible while still providing a safe project design.

IP-24-5

Because the details of such a local and targeted hiring program would be difficult, if not impossible, to develop without knowing funding amounts, source, and construction specifics (e.g., detailed construction staging and the exact types of construction occurring), should a build alternative be selected as the Preferred Alternative, this program would be completed when those construction and funding-related details become clearer. The earliest this could occur would be at the time the Initial Stage Program of Projects is developed in accordance with Metro Board Motion 5.1 adopted on March 1, 2018. However, as stated in Response to Comment IP-24-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, construction of the build alternatives will not occur, and a local hiring program will not be necessary.

IP-24-6

Caltrans and Metro both respectfully disagree that the ZE/NZE program description as included in the RDEIR/SDEIS is fatally flawed. The program was broadly described in the RDEIR/SDEIS so that it could accurately inform assumptions for the various technical analyses while also allowing the potential implementing agency or agencies some degree of flexibility. In addition, it

was important for the public to be afforded an opportunity to comment on the broad description of the program prior to finalization and the definition of specifics, should a build alternative be selected as the Preferred Alternative. The I-710 Clean Truck Program (referred to in the RDEIR/SDEIS as the I-710 Corridor Project Zero Emission/Near Zero Emission Truck Technology Deployment Program), as altered by Metro Board Motions 5.1 and 8.1, has been developed further than what was included in the RDEIR/SDEIS, and those updates have been included in Section 2.3.2.1 of this Final EIR/EIS. Because the types of trucks that would potentially be funded by the program have not been defined, and neither Caltrans nor Metro presume to dictate what the market may be at the time of program implementation (should a build alternative be selected as the Preferred Alternative), the provision of funding for up to 20 electric charging stations and/or up to ten hydrogen refueling stations was included as an additional programmatic feature of the program, as well. However, since a build alternative has not been selected as the Preferred Alternative, this programmatic element will not be implemented by Caltrans as the lead agency under CEQA and NEPA and as the owner/operator of the I-710 freeway.

IP-24-7

The I-710 Clean Truck Program (referred to in the RDEIR/SDEIS as the I-710 Corridor Project Zero Emission/Near Zero Emission Truck Technology Deployment Program) was included in the description of both build alternatives as a subsidy program that would ensure that individual owner-operators would not be precluded from participation in the program, as the subsidy program would not require the participant to provide the initial capital outlay which could be prohibitive for some individual owner-operators, even with the provision of zero interest or low interest loans as suggested in this comment. In addition, the Project Team worked closely with South Coast Air Quality Management District to develop the subsidy program as well as the number and cost of ZE/NZE trucks in order to make stable assumptions regarding fleet mix that informed the various analyses supporting the RDEIR/SDEIS.

Caltrans and Metro acknowledge that the cost for a “pure” zero emission trucks is much higher than that of an NZE truck. Please also refer to Section 1.3 of this appendix for more information regarding the ZE Only Option.

IP-24-8

As indicated in the comment, Section 2.3.2.1 of the RDEIR/SDEIS did state that zero emission capable drayage trucks can be developed, demonstrated, validated, and moved into production by a 2025 target timeline, but there remain core issues to be addressed prior to the commercialization of said vehicles. Hence, a detailed timeline for implementation cannot be determined at this time. Caltrans and Metro both respectfully disagree that this conclusion is at odds with existing technological advancements. Although Tesla may have a fully-electric long-haul truck currently in development, issues may still remain that may prevent or delay the consumer adoption process, including the pricing of the vehicle, recharging stations and the

availability and locations thereof, and/or relevant regulatory environments. The successful implementation and commercialization of a heavy-duty truck ZE/NZE technology before 2025 would not impede any I-710 Corridor Project build alternative-related benefits stemming from the ZE/NZE truck program. As described in Section 2.3.2.1 of this Final EIR/EIS, the I-710 Clean Truck Program (referred to in the RDEIR/SDEIS as the I-710 Corridor Project Zero Emission/Near Zero Emission Truck Technology Deployment Program), as altered by the Metro Board in Board Motions 5.1 and 8.1, has been developed beyond what was included in the RDEIR/SDEIS. However, since a build alternative has not been selected as the Preferred Alternative, this programmatic element will not be implemented by Caltrans as the lead agency under CEQA and NEPA and as the owner/operator of the I-710 freeway.

IP-24-9

As discussed in Section 2.3.2.3 of the RDEIR/SDEIS and this Final EIR/EIS, Alternative 7 would include all of the components of Alternative 1 (No Build Alternative), all of the components described in Section 2.3.2.1, and the addition of two separate truck-only lanes in each direction along a 16-mile section of the I-710 Corridor. As discussed in Section 2.3.2.1, both build alternatives would include the modernization of the freeway design, including local interchange improvements, auxiliary lane/ramp improvements, and freeway-to-freeway interchange improvements. Modernization of the freeway typically includes widening lanes and shoulders to comply with current Caltrans design standards for safety.

Any lane or shoulder widening proposed under either of the build alternatives was captured in the geometric footprints included in Appendix O, Concept Plans, of the RDEIR/SDEIS, and was used in performing the environmental analyses contained in the RDEIR/SDEIS. Therefore, the analyses contained within the RDEIR/SDEIS reflect the full extent of freeway improvements, including lane additions, widening, and/or shoulder widening.

IP-24-10

The commenters do not provide any specifics in their request for “greater details of the alternatives.” The project alternatives were discussed in Section 2.3 of the RDEIR/SDEIS, which specified the features common among both build alternatives, and the features that are different between the build alternatives. Figures and tables were included in Chapter 2.0, Project Alternatives, of the RDEIR/SDEIS to describe the features of the build alternatives, and Appendix O of the RDEIR/SDEIS provided concept plans showing the lane configurations for the two build alternatives. The level of detail presented in Chapter 2.0 of the RDEIR/SDEIS and this Final EIR/EIS is commensurate with the level of project engineering/design detail available at this stage of project development.

IP-24-11

Although Caltrans and Metro have limited jurisdiction regarding certain elements of the CA-7 Alternative, as described in Chapter 2.0, Project Alternatives, of the RDEIR/SDEIS, many of the components of the CA-7 Alternative were integrated into Alternative 5C and Alternative 7. Those components of the CA-7 Alternative that were not integrated into Alternative 5C and Alternative 7 were addressed in other programs and projects being undertaken by Caltrans, Metro and/or the Gateway Cities Council of Governments (Gateway Cities COG), including the I-710 Corridor Bike Path Project, led by Metro. The CA-7 Alternative can be best characterized as a program of several individual projects, one of which is improvements to the I-710 Corridor. Caltrans and Metro both respectfully disagree that NEPA and/or CEQA were violated by not analyzing as a stand-alone alternative in the RDEIR/SDEIS.

It is important to note that even if it were reasonable or feasible for Caltrans (or any agency) to package all of the individual projects submitted as part of the CA-7 Alternative program together and evaluate the impacts of all of them in one project-level environmental document, none of those individual, smaller elements could be implemented until all elements received environmental clearance in the form of project approval. Although it is acknowledged that the commenter does not consider this a persuasive argument, Caltrans and Metro do not feel that this represents a prudent use of public funds, as many elements of the program can be environmentally cleared and implemented in a far more efficient manner. Please also refer to Responses to Comments IP-24-15 and IP-24-16 for further details regarding the various components of the CA-7 Alternative.

IP-24-12

Section 2.5 of this Final EIR/EIS (formerly Section 2.4 of the RDEIR/SDEIS) contains a description of alternatives considered, but eliminated from further consideration. Section 2.2.2 of this Final EIR/EIS describes the revised build alternatives analyzed in the RDEIR/SDEIS. The *Major Corridor Study* was conducted according to SCAG's Regionally Significant Transportation Investment Study guidelines. Following the initiation of the Project Approval and Environmental Document process for the I-710 Corridor Project, an Alternatives Screening Analysis was conducted that narrowed the range of initial build alternatives based on how well they could meet the project Purpose and Need and how they performed on measures including: mobility, air quality, energy consumption, traffic safety, right-of-way, environmental impacts, and capital cost. Each of the alternatives analyzed in the Draft EIR/EIS and RDEIR/SDEIS were evaluated at a similar level of detail, as per CEQ regulations. To date, a robust alternatives analysis has been undertaken on the project.

Please refer to Response to Comment IP-24-11. Caltrans, Metro, and the other I-710 Corridor Project funding partner agencies are extremely appreciative of the time and effort that was invested in developing the proposed CA-7 Alternative. It is important to note that the Project Committee operates in an advisory capacity and its decisions do not bind Caltrans or Metro to a specific course of action.

IP-24-13

Although the CA-7 Alternative meets some of the project objectives, some features of this alternative could not be implemented by Caltrans and/or Metro due to limited jurisdiction. However, as described in Chapter 2.0, Project Alternatives, of the RDEIR/SDEIS, many of the components of the CA-7 Alternative were integrated into Alternative 5C and Alternative 7 and those components of CA-7 Alternative that were not integrated into Alternative 5C and Alternative 7 were addressed in other programs and projects being undertaken by Caltrans, Metro and/or the Gateway Cities COG. Although the CA-7 proposal was comprehensive, some elements of the alternative are not appropriate for inclusion in a transportation project-level environmental document. The CA-7 Alternative is essentially a programmatic effort aimed at implementing multi-jurisdictional projects well beyond the scope of the I-710 Corridor Project. As the approving agency for the I-710 Corridor Project, Caltrans' jurisdiction is limited to the State highway system. Additionally, some elements of the CA-7 Alternative are much smaller in scale than the overall I-710 Corridor Project, and implementation of these elements would be less impactful. Therefore, those elements (such as the construction of bicycle lanes or pedestrian facilities), while still subject to the California Environmental Quality Act (CEQA), would likely not require the preparation of a full EIR, and could be advanced more quickly individually by the agencies with jurisdiction than if they were included in the scope of the I-710 Corridor Project. For these reasons, the CA-7 Alternative was not carried forward for detailed evaluation as a stand-alone alternative in the RDEIR/SDEIS. However, the proposal of the CA-7 Alternative, coupled with the general support from the EPA and others for the evaluation of an alternative that added a ZE/NZE freight corridor without expansion of general purpose lanes, was directly responsible for the development of Alternative 7 as a stand-alone project alternative analyzed in the RDEIR/SDEIS.

IP-24-14

As shown in Chapter 2.0, Project Alternatives, including Section 2.5 (Alternatives Considered but Eliminated from Further Discussion), a reasonable range of alternatives has been evaluated over the life of the project. The CA-7 Alternative would not avoid or substantially lessen significant effects of the build alternatives as stated in this comment because the geometric design of the CA-7 Alternative provided with CEHAJ's comment letter dated September 28, 2012, on the Draft EIR/EIS does not adhere to standard engineering practices and/or Caltrans requirements. Both Alternatives 5C and 7 were designed to avoid environmental impacts as much as possible while adhering to the design standards of the Caltrans *Highway Design Manual.* In addition, as

described in Chapter 2.0, Project Alternatives, of the RDEIR/SDEIS, many of the components of the CA-7 Alternative have been integrated into Alternative 5C and Alternative 7 and those components of the CA-7 Alternative that were not integrated into Alternative 5C and Alternative 7 were addressed in other programs and projects being undertaken by Caltrans, Metro and/or the Gateway Cities COG. However, as stated in Response to Comment IP-24-1, the No Build Alternative has been selected as the Preferred Alternative and therefore none of the components of the CA-7 Alternative will be implemented.

IP-24-15

Please refer to Responses to Comments IP-24-13 and IP-24-14 for the rationale as to why CA-7 was not evaluated as a stand-alone alternative in the RDEIR/SDEIS. Additionally, the Responses to Comment IP-22 in Appendix S of the RDEIR/SDEIS provide an analysis of the components of the CA-7 Alternative. Elements of CA-7 that have been wholly or partially included in one or both build alternatives evaluated in the RDEIR/SDEIS include (1) No I-710 widening (No Additional General Purpose Lanes) (no additional general purpose lanes would be added under Alternative 7), (2) the Comprehensive Public Transit Element (a programmatic transit project component was added to both build alternatives evaluated in the RDEIR/SDEIS), (3) the Mandatory Zero-Emission Freight Corridor (Option 7ZE was evaluated in the RDEIR/SDEIS), (4) Public Private Partnership (although there is no in-depth analysis of this element, and the specifics of any funding arrangement can only be determined following approval of a project), (6) the Comprehensive Pedestrian and Bicycle Element (bicycle and pedestrian facilities that connect to the build alternatives would be upgraded at many locations; refer to Section 2.3.2.1 for more detail), and (7) Community Benefits (a Community Health and Benefit Program was added as a programmatic element of both build alternatives). However, as stated in Response to Comment IP-24-1, the No Build Alternative has been selected as the Preferred Alternative and therefore none of the components of the CA-7 Alternative will be implemented.

IP-24-16

Caltrans and Metro acknowledge that Metro is an integral member of the I-710 Corridor Project development team, and elements (both programmatic and otherwise) have been incorporated into the project description of the build alternatives that would provide for new and enhanced transit service and multi-modal connections. However, it is important to note that Caltrans is the CEQA and NEPA lead agency for the project and ultimately the agency responsible for project approval. Metro has taken the lead to implement several elements of the CA-7 Alternative and Motion 22.1 that were deemed appropriate to be pursued outside of, but in parallel to, the I-710 Corridor Project EIR/EIS. These included (in coordination with Caltrans, Gateway Cities COG, and other partner and responsible agencies) the feasibility of several Study Area elements including, but not limited to, a ZE truck procurement and operations program, addition of bus stops with access points to bicycle paths, and to work with community groups to develop a Local and

Targeted Hiring Policy and Project Labor Agreement for construction jobs and a First Source Hiring Policy for permanent jobs created by the I-710 Corridor Project, should a build alternative be selected as the Preferred Alternative.

Although Caltrans' Complete Streets directive requires that projects address the safety and mobility needs of multimodal users, it also goes on to state that a "complete street" is defined as "a transportation facility that is planned, designed, operated, and maintained to provide safe mobility for all users, including bicyclists, pedestrians, transit riders, and motorists appropriate to the function and context of the facility.[4]" Examples of Complete Streets projects that have been completed by Caltrans include a green bike lane at the on and off ramp of State Route 280 in Menlo Park, implementation of a road diet on State Route 227 in San Luis Obispo that pared down a four-lane segment to two lanes and bike lanes with medians and center turn lanes, and the addition of infrastructure such as colored crosswalks, bike lanes, and transit stops on State Route 16 in Esparto. In the design of both build alternatives, the reconstruction of overcrossings has been done in a manner that provides for sidewalks and the addition of bicycle lanes, and interchanges and ramps provide for safe pedestrian and bicycle crossing. Under the build alternatives, five new pedestrian and bicycle-only bridges would be constructed crossing over I-710, I-405 and/or the Los Angeles River, which would enhance connectivity within and between those neighborhoods. These improvements would be consistent with the suggested improvements included in Element CA-7.6, Comprehensive Pedestrian and Bicycle Element, of the CA-7 Alternative proposal.

The implementation of Complete Streets strategies should not be misconstrued as a mandate for Caltrans to implement projects on local roadways. Each of the examples of Complete Streets projects above occurred on State Routes within Caltrans' jurisdiction, and since the routes in question were not controlled-access highways like the I-710 is, the addition of bicycle lanes and/or traffic calming measures were within the ability of Caltrans to implement.

IP-24-17

CA-7 was not carried forward as a stand-alone alternative in the RDEIR/SDEIS for several reasons that are outlined in Section 2.2.2.1 of this Final EIR/EIS. It is important to note that the CA-7 Alternative is essentially a programmatic effort aimed at implementing multi-jurisdictional projects well beyond the scope of the I-710 Corridor Project. It is acknowledged that some elements of the CA-7 Alternative are much smaller in scale than the overall I-710 Corridor Project, and implementation of these elements would be less impactful. Therefore, those elements (such as the construction of bicycle lanes or pedestrian facilities), while still subject to CEQA, would

[4] Caltrans. 2008. Deputy Directive DD-64-R1. Complete Streets – Integrating the Transportation System. October. Website: http://www.dot.ca.gov/hq/tpp/offices/bike/sites_files/DD-64-R1_ Signed. pdf (accessed September 26, 2018).

likely not require the preparation of a full EIR, and could be advanced more quickly individually by the agencies with jurisdiction. It should not be inferred that the inclusion of smaller projects within the CA-7 proposal was in any way a reason that it was not evaluated as a stand-alone alternative.

IP-24-18

Due to the limited jurisdiction of Caltrans and Metro, all components of CA-7 cannot proceed as a package, as they would be a program of several separate projects. However, as stated above in Responses to Comments IP-24-11 through IP-24-17, many of the components of the CA-7 Alternative have been integrated into Alternative 5C and Alternative 7. Those components of the CA-7 Alternative that have not been integrated into Alternative 5C and Alternative 7 are addressed in other programs and projects being undertaken by Caltrans, Metro, and/or the Gateway Cities COG. Caltrans and Metro both respectfully disagree that the RDEIR/SDEIS violates CEQA and/or NEPA because CA-7 was not analyzed as a build alternative in the RDEIR/SDEIS.

IP-24-19

Caltrans maintains that the proposed build alternatives would generally be consistent with the majority of goals and policies put forth in the individual land use and general plans examined in Section 3.1. This is because the I-710 Corridor Project build alternatives would generally improve circulation, mobility, and reduce traffic congestion, which would be consistent with goals stated in the various jurisdictions' General Plans along the I-710 Corridor. Section 3.1, Land Use, of the RDEIR/SDEIS does identify where inconsistencies with local land uses would occur, and where avoidance, minimization, or mitigation would be appropriate, it is proposed for the build alternatives. Measure LU-1 in Section 3.1.2.4 of the RDEIR/SDEIS and this Final EIR/EIS is a standard measure that, should a build alternative be selected as the Preferred Alternative, would request local jurisdictions to amend their general plans and applicable land use maps to more precisely reflect the final alignment of the freeway, including designations of properties that would be acquired for the build alternatives.

In addition, in a 2017 court case (*The Highway 68 Coalition v. County of Monterey, et al. (Omni Resources LLC, Real Party in Interest)* (6th Dist. 2017) 14 Cal.App.5th 883), the Sixth District Court of Appeal held that while State CEQA Guidelines § 15125(d) requires an EIR to discuss any *inconsistencies* between a proposed project and applicable general plans, specific plans and regional plans, there is *no* requirement that an EIR analyze *consistencies* with such plans, or that the EIR itself be consistent with the relevant general plan. The analysis presented in Section 3.1 of this Final EIR/EIS is consistent with this ruling by the Sixth District Court of Appeal.

IP-24-20

The RDEIR/SDEIS adequately supports the claim that land use conversion to transportation use under the build alternatives would be fairly minimal. As is shown in Section 3.1.1.21, Land Use, approximately 68 percent of the proposed rights-of-way that would be required for Alternatives 5C and 7 would consist of existing transportation, utilities, and vacant land uses. Approximately 3 percent and 20 percent of proposed rights-of-way for the build alternatives would consist of existing commercial and services, and industrial uses, respectively. Only about 3 percent of the proposed rights-of-way for the build alternatives would consist of existing residential uses.

IP-24-21

Table 3.1, Existing Land Use Impacts by Jurisdiction, in Section 3.1, Land Use of the RDEIR/SDEIS, summarizes land acquisition and not displacements, as suggested in the comment. Specifically, Table 3.1 shows the acreage of non-transportation land use that would be converted to a transportation use under the build alternatives. Conversion on non-transportation land use to transportation use can occur without resulting in displacements if there are no residences or businesses located on the acquired land. For this reason, displacements are analyzed separately in Section 3.3.2, Relocations and Real Property Acquisition. Residential and business displacements as a result of each build alternative are summarized by City in Table 3.3-12, Relocations by City.

The commenter is accurate that the build alternatives would not avoid residential displacement within the City of South Gate, as indicated on page 3.1-59 of the RDEIR/SDEIS. The text on page 3.1-59 has been revised to delete the text indicating the build alternatives would avoid residential displacements within the City of South Gate, which is consistent with the discussion in Section 5.18.1.2 of the CIA. As shown in Table 3.3-12, Alternatives 5C and 7 would result in six residential displacements. However, although a few residential relocations would be required, the build alternatives would not be inconsistent with the objectives and policies of the City of South Gate General Plan to preserve existing neighborhoods. Specifically, Objective CD 4.1 of the City of South Gate General Plan is to “preserve the character of existing neighborhoods.” Policy P.2 of the City of South Gate General Plan states that “existing neighborhoods should be preserved and protected against potential impacts related to development, traffic, noise, air quality, and encroachment of incompatible commercial and industrial activities.” Although the build alternatives would result in residential displacements in the City of South Gate, it would impact less than one percent of the total land area designated residential in the City of South Gate. These relocations would occur along the fringes of existing transportation facilities, which would impact the edges of the neighborhood rather than the whole neighborhood. The build alternatives would not create a permanent barrier or long-term disruption in connectivity and would not divide an established community. For these reasons, the limited number of residential relocations within the

City of South Gate as a result of the build alternatives would not conflict with the policy to preserve existing residential neighborhoods.

Although the build alternatives would require acquisition of residential parcels in the City of Paramount, no residential or commercial displacements would be required as shown in Table 3.3-12 of the RDEIR/SDEIS. Therefore, the statement in the RDEIS/SDEIS that the build alternatives "would not adversely impact residences or businesses" in the City of Paramount is accurate. Additionally, in the City of Paramount, residential uses comprise 53 percent of its total acreage of 3096 acres and industrial uses comprise 27 percent of the total acreage (available at: https://paramountenvironment.org/history-of-paramount-zoning/). The build alternatives would convert less than one percent of the residential land and industrial land to transportation uses.

As shown in Table 3.3-12 of the RDEIR/SDEIS, only Design Options 3A and 3B would result in residential and business displacements; however, these design options were not selected by the Metro Board to be carried forward as part of the Preferred Alternative (Alternative 1 No Build).

The RDEIR/SDEIS accurately states that no business displacements would occur in the City of Bell Gardens (please refer to Table 3.3-12 of the RDEIR/SDEIS) as a result of the build alternatives. However, conversion of commercial and industrial land uses would be converted to transportation uses. While the build alternatives would result in impacts to commercial and industrial land uses (acreages identified in Table 3.1-1 in Section 3.1), the land use impacts would not result in displacements or relocations of businesses in the City of Bell Gardens (refer to Table 3.3-12 in Section 3.3).

It is important to note that, as stated in Response to Comment IP-24-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there will be no displacement of residences or businesses.

IP-24-22

As stated in the comment, Goal C of the Coastal Act is to "Maximize public access to and along the coast and maximize public recreational opportunities in the coastal zone consistent with sound resources conservation principles and constitutionally protected rights of private property owners." The main point of Goal C is to "Maximize public access" to and along the coast, which the build alternatives would facilitate by reducing vehicular congestion along the I-710 Corridor mainline and thereby facilitating vehicular access to the coast.

Although not mentioned in the comment, Section 30010 of the Coastal Act further states that "The Legislature hereby finds and declares that this division is not intended, and shall not be construed as authorizing the commission, port governing body, or local government acting pursuant to this division to exercise their power to grant or deny a permit in a manner which will take or damage private property for public use, without the payment of just compensation therefor. This section is

not intended to increase or decrease the rights of any owner of property under the Constitution of the State of California or the United States." As discussed in Section 3.3.2, Relocations and Real Property Access, of the RDEIR/SDEIS, should a build alternative be selected as the Preferred Alternative, all property acquisitions and relocations as a result of the build alternatives would be handled in accordance with the Uniform Act of 1970 (Public Law 91-646, 84 Stat. 1894). The Uniform Act is intended to ensure fair compensate and assistance to those who are displaced by highway right-of-way acquisitions in order to help protect the rights of private property holders. Caltrans' Relocation Assistance Program, which is based on the Uniform Act of 1970, requires that certain relocation services and payments by Caltrans be made available to eligible residents displaced by its projects. This compensation is consistent with the California Coastal Act, because it addresses the relocations occurring in the California Coastal Zone. However, as stated in Response to Comment IP-24-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, relocations will not be required.

IP-24-23

As stated in the comment, the City of Bell Garden General Plan states that "the City of Bell Gardens strives to preserve the existing residential neighborhoods while promoting new development in the industrial areas to provide employment opportunities." The intent of this policy is to steer future land development to industrial areas in order to increase employment opportunities. CEQA and NEPA require that an EIR/EIS discuss possible conflicts/inconsistencies with applicable land use plans and policies. Projects are only required to be consistent with applicable goals and polices of relevant planning document, as it would not be feasible for a project to be consistent with all goals and policies. As the I-710 Corridor Project is a transportation project, and not a land development project, this policy is not directly applicable to the project. However, the I-710 Corridor Project build alternatives would also not conflict with the policy to preserve residential neighborhoods, as suggested in the comment. Alternative 5C would require 8 residential relocations and Alternative 7 would require 4 residential relocations in the City of Bell Gardens. As a result, the City of Bell Gardens would experience a conversion of less than one percent of the total residential land uses to transportation uses under Alternative 5C and Alternative 7. These relocations would occur along the fringes of the I-710 Corridor, impacting the edges of the neighborhood rather than the whole neighborhood. The I-710 Corridor project build alternatives would not create a permanent barrier or long-term disruption in connectivity and would not divide an established community. For these reasons, the limited number of residential relocations within the City of Bell Gardens would not conflict with the policy to preserve existing residential neighborhoods.

IP-24-24

The build alternatives are generally consistent with the guiding principles in the 2035 County of Los Angeles General Plan. Specifically, the build alternatives would be consistent with the guiding

principle to “Ensure community services and infrastructure are sufficient to accommodate growth: Coordinate an equitable sharing of public and private costs associated with providing appropriate community services and infrastructure to meet growth needs.” The build alternatives would improve existing transportation facilities instead of building new freeways, would include the public during the planning process; and would improve the image of major transportation corridors. In addition, the build alternatives meet growth needs in terms of infrastructure by widening the I-710 freeway. As discussed in Section 2.2, Growth, of the RDEIR/SDEIS, the build alternatives would provide transportation infrastructure in response to existing and forecast traffic congestion due to local and regional growth that has already occurred or is planned to occur. However, provision of community services (such as schools, parks, libraries, police and fire services, and waste management) is outside the scope of a transportation project and outside the purview of Caltrans as a public transportation agency. The build alternatives would also be generally consistent with the guiding principle to “Provide the foundation for a strong and diverse economy: Protect areas that generate employment and promote programs that support a stable and well educated workforce. This will provide a foundation for a jobs-housing balance and a vital and competitive economy in the unincorporated areas.” As discussed in Section 3.3, Community Impacts, of the RDEIR/SDEIS, construction of the build alternatives would generate between an estimated 99,885 to 179,180 jobs, depending on whether a build alternative or design option is selected. These construction jobs would generate temporary employment and revenues for both the local and regional economies. However, as stated in Response to Comment IP-24-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, a local hire program will not be implemented.

IP-24-25

The Sustainable Communities Strategy (SCS) includes Transportation System Management Actions and Strategies, which includes the goal to “Work with relevant state and local transportation authorities to increase the efficiency of the existing transportation system.” As discussed in Section 2.3.2, Build Alternative, under the “TSM/TDM, Transit, and ITS” subheading in the RDEIR/SDEIS, in addition to improvements to the I-710 mainline and the interchanges, both build alternatives would also include Transportation System Management/Travel Demand Management (TSM/TDM), Transit, and Intelligent Transportation Systems (ITS) improvements. Although TSM/TDM measures alone could not satisfy the purpose and need of the I-710 Corridor Project, TSM/TDM measures have been incorporated into both build alternatives for the I-710 Corridor Project to increase the efficiency of I-710 and the local roadway network. Because the I-710 Corridor Project build alternatives would incorporate TSM/TDM, Transit, and ITS

improvement, they would not be inconsistent with the SCS Transportation System Management goal cited in the comment.

IP-24-26

The Grand Total Land Use for Alternative 7, Option 3B was incorrectly input as 7 in Table 3.1-1 of the RDEIR/SDEIS. The correct value for this area should be 751.04; this has been corrected in Section 3.1.1.21 of this Final EIR/EIS.

IP-24-27

The land use plan consistency analysis was conducted in accordance with Caltrans guidance outlined on the Standard Environmental Reference, which requires analysis of the consistency of the project with the required elements of the General Plans, which include: land use, housing, noise, circulation/transportation, public services and facilities, economic development, and conservation and open space. More detailed information regarding greenhouse gas emissions and impacts can be found in Section 4.4, Climate Change. A number of project-level greenhouse gas reduction strategies are listed in Section 4.3.7, and Measures CON-AQ-1, CON-AQ-7, CON-AQ-15, and CON-AQ-17 have been incorporated into the build alternatives and would also serve to reduce greenhouse gas emissions, should a build alternative be selected as the Preferred Alternative.

IP-24-28

The commenters misquote the RDEIR/SDEIS, which states that the “2008 RCP includes several guiding principles and goals that the build alternatives would be consistent with, including improved mobility for residents, improved air quality, and a cleaner transportation system.” The document does go on to state that the build alternatives would not provide housing or education, which are stated goals of the RCP. However, the RDEIR/SDEIS does not state that the build alternatives are inconsistent with the RCP. CEQA and NEPA require that an EIR/EIS discuss possible conflicts/inconsistencies with applicable land use plans and policies. Projects are only required to be consistent with applicable goals and polices of relevant planning document, as it would not be feasible for a project to be consistent with all goals and policies. It is acknowledged that a guiding principle of the RCP is to “promote economic vitality and new economies by providing housing, education, and job training opportunities for all people.” However, provision of housing and education is outside the scope of a transportation project and outside the purview of Caltrans as a public transportation agency. Therefore, the goal of the RCP to provide housing and education is not applicable to the I-710 Corridor Project.

IP-24-29

It is acknowledged that one of the policies of the SCAG RTP/SCS states that “high-occupancy vehicle gap closures that significantly increase transit and rideshare usage will be supported and encouraged.” While this policy encourages high-occupancy vehicle gap closures and rideshare, it is not a requirement for all projects. In addition, CEQA and NEPA require that an EIR/EIS discuss possible conflicts/inconsistencies with applicable land use plans and policies. Projects are only required to be consistent with applicable goals and polices of relevant planning document, as it would not be feasible for a project to be consistent with all goals and policies. Regardless, build alternatives that included high-occupancy vehicle lanes were considered but eliminated from further discussion for the reasons detailed in Section 2.5, Alternatives Considered but Eliminated from Further Discussion. During the 2009 Alternatives Screening Analysis, it was concluded that HOV lanes would not be utilized as much as general purpose lanes, likely due to parallel HOV facilities on both I-110 and I-605. HOV lanes were not incorporated into the build alternatives because additional general purpose lanes on I-710 are more likely to be utilized. Though the build alternatives do not provide HOV lanes, the build alternatives are not inconsistent with these policies in the RTP. While not a specific component of the build alternatives, Metro has rideshare programs available to the public, which can be utilized by motorists on I-710. Details of Metro’s rideshare program can be found at https://www.metro.net/riding/rideshare/ Section 3.1, Land Use, of this Final EIR/EIS was updated to provide further clarification on the analysis of consistency with the SCAG RTP/SCS with respect to HOV facilities.

IP-24-30

Please refer to Response to Comment IP-24-29. As stated in Response to Comment IP-24-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, an amendment to the RTP and FTIP are no longer required.

IP-24-31

The purpose of the Greater Los Angeles County Integrated Regional Water Management Plan (IRWMP) is to define a clear vision and direction for the sustainable management of water resources. The Greater Los Angeles County IRWMP is intended to improve water supply and water quality, enhance open space, recreation and habitat, and improve flood management in the Greater Los Angeles County region. It is acknowledged that an objective of the IRWMP is to “enhance open space and recreation through the increase of watershed friendly recreational space for all communities.” However, CEQA and NEPA only require that an EIR/EIS discuss possible conflicts/inconsistencies with applicable land use plans and policies. Projects are only required to be consistent with applicable goals and polices of relevant planning document, as it would not be feasible for a project to be consistent with all goals and policies. Although Alternatives 5C and 7 would impact 1.61 acres and 1.64 acres of open space and recreation land use, this is a small fraction of the 2,058-square-mile (1,317,120 acres) IRWMP planning area.

However, should a build alternative be selected as the Preferred Alternative, mitigation measures to address impacts to the watershed friendly recreational space would be implemented that would replace the affected land used in equal or better condition. Any resulting replacement or other financial burden required by the grant agencies for the acquisition of park property for freeway use would be mitigated at no cost or impact to the affected City/County. With mitigation, the build alternatives would be consistent with the goal of the IRWMP. The consistency analysis in Section 3.1, Land Use, of the RDEIR/SDEIS was updated to reflect that after mitigation, this objective would be consistent with the build alternatives.

IP-24-32

The goal of the planning process for the *Greater Los Angeles County Open Space for Habitat and Recreation Plan (Integrated Regional Water Management Plan Update –2012)* (OSHARP) (June 2012) and the Technical Memorandum for the Integrated Regional Water Management Plan for the *Greater Los Angeles County Open Space, Habitat and Recreation Technical Memorandum* (OSHARTM) (August 2006) is to provide direction for preserving, linking, restoring, and creating open space by providing a comprehensive regional framework for incorporating open space, both habitat and recreation, into water management project design features. To achieve this goal, these documents provide information to assist water managers in more effectively including open space considerations in the development of water projects, as well as information for open space managers to easily incorporate water management objectives into their projects. It is acknowledged that an objective of the OSHARP and OSHARTM is to increase open space and recreational areas. However, CEQA and NEPA only require that an EIR/EIS discuss possible conflicts/inconsistencies with applicable land use plans and policies. Projects are only required to be consistent with applicable goals and polices of relevant planning document, as it would not be feasible for a project to be consistent with all goals and policies. Although Alternative 5C and 7 would impact 1.61 acres and 1.64 acres of open space and recreation land use, this is a small fraction of the 2,058-square-mile (1,317,120 acres) OSHARP and OSHARTM planning area. However, should a build alternative be selected as the Preferred Alternative, mitigation measures to address impacts to the watershed-friendly recreational space would be implemented and would replace any park land used in equal or better condition. Any resulting replacement or other financial burden required by the grant agencies for the acquisition of park property for freeway use would be mitigated at no cost or impact to the City/County. After mitigation, the build alternatives would be consistent with the goal of the IRWMP. The consistency analysis in Section 3.1, Land Use, of the RDEIR/SDEIS was updated to reflect that, after mitigation, this objective would be consistent with the build alternatives.

P-24-33

The General Plan policy to expand public facilities to meet community needs and demands is not directly applicable to the project. Provision or expansion of public facilities (such as schools,

community facilities, places of worship, hospitals, homeless shelters, police stations, and fire stations) is outside the scope of a transportation project and outside the purview of Caltrans as a public transportation agency. However, the RDEIR/SDEIS acknowledges impacts to public facilities within the City of Bell as a result of the build alternatives. Impacts to public facilities in the City of Bell as a result of the build alternatives are discussed in Table 3.3-8 of the RDEIR/SDEIS. As summarized in Table 3.3-8 of the RDEIR/SDEIS, Alternative 7 would displace S. Mark Taper Foundation Shelter Resource Bank and the transitional housing structure on the Salvation Army's Bell Shelter. Alternative 5C and Alternative 1 (which Caltrans has identified as the Preferred Alternative) would not require relocation of the S. Mark Taper Foundation Shelter Resource Bank or Bell Shelter.

IP-24-34

Caltrans acknowledges that the following statement in the RDEIR/SDEIS is unclear: "The build alternatives are consistent with the adopted goals and policies in the City of Long Beach General Plan. The I-710 Corridor Project build alternatives would improve people and goods movement, reduce congestion, improve air quality, and include community and local agency participation. The build alternatives would not expose persons within the City of Long Beach to excessive noise. The build alternatives would also result in the relocation of businesses and residents in the City, which would be inconsistent with the General Plan." Projects are only required to be consistent with applicable goals and polices of relevant planning document, as it would not be feasible for a project to be consistent with all goals and policies. The relocations as a result of the build alternatives would not be inconsistent with any of the applicable goals and policies from the City of Long Beach General Plan (as listed in Section 3.1.2.2 of the RDEIR/SDEIS) and, therefore, the last sentence has been deleted to clarify and correct confusion with respect to the City of Long Beach General Plan.

IP-24-35

Caltrans analyzes specific impacts to land uses in Section 3.1, Land Use. However, the impacts resulting from acquisitions and relocations as a result of the build alternatives are contained within Section 3.3, Community Impacts. This is a more appropriate place for the discussion as it deals with relocations of individuals more specifically, and deals with impacts of such relocations on specific communities including the City of Commerce. Please refer to Section 3.3.2 of this Final EIR/EIS, the *Draft Relocation Impact Report* (March 2017 for more detailed information regarding relocation impacts. It is important to note that the entries contained in Appendix L, Parcel Acquisitions Under Alternatives 5C and 7, include full and partial permanent acquisitions as well as temporary construction easements, and simply stating the number of entries does not necessarily accurately characterize the impacts. It is also important to note that land use and relocation impacts differ between the build alternatives proposed in the RDEIR/SDEIS, and Alternative 5C would have generally fewer relocation and land use impacts to the City of

Commerce. Goals and policies included in the City of Commerce General Plan were listed and described in Section 3.1.2.2 of the RDEIR/SDEIS. They include General Plan Transportation Policies 1.1, 4.5, 4.11, 6.1, 6.2, and 6.3. It is acknowledged that Transportation Policy 6.2 states that the City will oppose any regional public transportation improvement that does not first consider the potential impacts of such facilities on the local community in which the facility is located; however, the potential impacts of the improvements associated with the I-710 Corridor Project build alternatives were evaluated and disclosed in the Draft EIR/EIS and the RDEIR/SDEIS prior to approval of the project. It is important to note that, as stated in Response to Comment IP-24-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, acquisitions and relocations are no longer required.

IP-24-36

The RDEIR/SDEIS acknowledges that land would need to be converted to a transportation land use in order for either build alternative to be constructed. The land that would potentially be converted would have a “minimal” impact on land use conversion because the individual city impacts would be relatively small considering the total amount of land uses within the respective cities. Additionally, as shown in Table 3.1-1, Existing Land Use Impacts by Jurisdiction, of the RDEIR/SDEIS, approximately 65 percent of the impacted land is currently transportation and utility or vacant. Section 3.1, Land Use, focuses on conversion of land uses to a different (transportation) use. The specific impacts to community facilities, residences, and businesses from these land acquisitions are detailed in Section 3.3, Community Impacts, of the RDEIR/SDEIS.

IP-24-37

Should a build alternative be selected as the Preferred Alternative, conversion of land would occur over a 19-mile stretch along I-710. As shown in Table 3.1-1, Existing Land Use Impacts by Jurisdiction, of the RDEIR/SDEIS, approximately 65 percent of the impacted land is currently transportation and utility or vacant. Additionally, the 5 to 6 acres of residential land that would be potentially converted in the City of Long Beach referenced in the comment letter is not one 5-to-6-acre block of land. Instead, this impact to residential property would be dispersed over the approximately 8-mile stretch of I-710 within the City of Long Beach. Section 3.1, Land Use, focuses on conversion of land uses to a different (transportation) use. Impacts resulting from the change in land use as a result of the build alternatives are discussed throughout the RDEIR/SDEIS. For example, housing impacts are discussed in Section 3.3.2, Relocations and Real Property Acquisition. Noise impacts are discussed in Section 3.14, Noise. Traffic impacts are discussed in Section 3.5, Traffic and Transportation/Pedestrian and Bicycle Facilities.

The RDEIR/SDEIS process is a public process in which the public, including local jurisdictions, are allowed to comment and therefore voice whether they are willing to make changes necessary to accommodate a project of this magnitude. In addition, Measure LU-1 states that Caltrans shall

request that the affected Cities and the County amend their respective General Plans to reflect the final alignment, interchange locations, and modification of land use designations for properties that would be acquired for the build alternatives. Although Caltrans cannot guarantee that local jurisdictions would amend their General Plans, should a build alternative be selected as the Preferred Alternative, it would be in the best interest of the local jurisdictions to ensure that the land uses, including any changes to I-710 as a result of the build alternatives, are reflected on their land use maps so that they can be considered in future planning efforts. However, as stated in Response to Comment IP-24-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, amendments to General Plans will not be necessary.

IP-24-38

The RDEIR/SDEIS stated that "public health was determined not to be a topic of concern for the *consistency analysis of State, regional, and local plans*" [italics added]. Public health considerations related to air quality and noise are discussed appropriately in other parts of the document. Discussion of public health considerations relative to air quality is provided in Section 3.13.3.4 of the RDEIR/SDEIS and this Final EIR/EIS, Public Health Considerations in Section 3.13, Air Quality, and public health considerations related to noise are discussed in Section 3.14.3, Public Health Considerations in Section 3.14, Noise. In addition, Section 3.3.1.4 of the RDEIR/SDEIS and this Final EIR/EIS discusses public health considerations relative to social cohesion, access to parks and schools, and jobs and economic development. Applicable avoidance, minimization, and mitigation measures that would address impacts as a result of the build alternatives can be found in each of the respective resource sections.

IP-24-39

As indicated in the comment, a discussion of the Greater Los Angeles County IRWMP, OSHARP, and Draft Final OSHARTM and the County of Los Angles Bicycle Master Plan were added to the RDEIR/SDEIS to address public comments received on the Draft EIR/EIS. However, Caltrans respectfully disagrees that the RDEIR/SDEIS failed to discuss inconsistencies with these plans. CEQA and NEPA require that an EIR/EIS discuss possible conflicts/inconsistencies with applicable land use plans and policies. Projects are only required to be consistent with applicable goals and polices of relevant planning document, as it would not be feasible for a project to be consistent with all goals and policies. The RDEIR/SDEIS discusses consistency with the applicable goals and policies only, as there is not requirement to discuss non-applicable goals and policies. Please also refer to Responses to Comments IP-24-31 and IP-24-32 for more details.

IP-24-40

Measure LU-1 is not proposed to avoid or reduce impacts related to the changing land use as a result of the build alternatives. Should a build alternative be selected as the Preferred Alternative,

this measure would address the inconsistencies that would be created in local and regional General Plans resulting from changes created by the build alternatives. The revision to Measure LU-1 made in response to comments on the 2012 Draft EIR/EIS was made to ensure clarity on the timing of any potential revisions for local jurisdictions. Although Caltrans cannot guarantee that local jurisdictions would amend their General Plans (should a build alternative be selected as the Preferred Alternative), it would be in the best interest of the local jurisdictions to ensure that the land uses, including any changes to I-710 as a result of the build alternatives, would be reflected on their land use maps so that they can be considered in future planning efforts.

Impacts resulting from the change in land use as a result of the build alternatives and appropriate avoidance, minimization, and mitigation measures are discussed throughout the RDEIR/SDEIS. Specifically, impacts to residential property and community resources are discussed in Section 3.3.2, Relocations and Real Property Acquisition.

IP-24-41

CEQA and NEPA require that an EIR/EIS discuss possible conflicts/inconsistencies with applicable land use plans and policies. Projects are only required to be consistent with applicable goals and polices of relevant planning document, as it would not be feasible for a project to be consistent with all goals and policies. The RDEIR/SDEIS discusses consistency with the applicable goals and policies only, as there is no requirement to discuss non-applicable goals and policies. Additionally, Caltrans is a State transportation agency and one of the goals of the I-710 Corridor Project build alternatives is to improve a State transportation facility. As such, Caltrans is not required to comply with goals and policies that are outside the purview of a transportation agency and outside the scope of a transportation project.

IP-24-42

Caltrans respectfully disagrees that the RDEIR/SDEIS provided a “bald analysis” of the impacts to park and recreation resources as a result of the build alternatives. As documented below, the RDEIR/SDEIS did not fail to: (1) adequately analyze the impacts to these facilities, (2) identify alternatives which would avoid or limit these impacts to parks, and (3) identify sufficient measures to minimize and mitigate the impacts. Visual, air quality, and noise impacts on parks are discussed in Section 3.1.3.2 of the RDEIR/SDEIS. Direct and indirect impacts on parks and recreational facilities are also discussed in Tables 3.1-5 (Permanent Impacts) and 3.24-1 (Temporary Impacts) of the RDEIR/SDEIS. Additional details about these impacts are also provided in Sections 3.6.3 (Visual/Aesthetics), 3.13.3 (Air Quality), and 3.14.3 (Noise). Avoidance, minimization, and/or mitigation measures to address potential impacts on parks as a result of the build alternatives are included in Sections 3.1.3.3 and 3.24.41 of the RDEIR/SDEIS.

Visual, noise, air quality, and access impacts under the build alternatives for specific parks are as follows:

Section 3.1.3.2 states that visual impacts on Coolidge Park would be low under Alternative 5C and moderately low under Alternative 7. Additional details about the analysis of visual impacts are discussed in Section 3.6.3.1.

As discussed in Section 3.1.3.2 of the RDEIR/SDEIS, soundwalls are proposed at locations throughout the I-710 Corridor where noise levels would exceed Federal Noise Abatement Criteria (NAC). As discussed in Section 3.14.5.7, Soundwalls SW-511A+B are proposed under Alternative 5C between Shull St. and Cecilia St. along northbound I-710, which would provide an eight-to-12 A-weighted decibels (dBA) noise reduction to about 20 homes in this area, as well as to Julia Russ Asmus Park. As discussed in Section 3.14.5.3, no noise impacts have been identified at Dills Park under Alternative 5C. Under the build alternatives, should a build alternative be selected as the Preferred Alternative, a new soundwall would replace an existing soundwall at Coolidge Park to address noise impacts, as discussed in Section 3.6.3.1 under “Key View 8.”

Air quality impacts on park users were not identified in the technical analysis prepared for the RDEIR/SDEIS, as discussed on page 3.1-87 in Section 3.1.3.2 (Environmental Consequences, Public Health Considerations, Air Quality).

Table 3.24-1 addresses temporary access impacts on Coolidge Park along Artesia Blvd., which would be minimized through implementation of a TMP and provision of detours. Temporary access impacts would cease following construction, should a build alternative be selected as the Preferred Alternative.

The analysis included in the RDEIR/SDEIS was conducted in compliance with the Caltrans Standard Environmental Reference (SER), a guidance document to help State and local agency staff plan, prepare, submit, and evaluate environmental documents for transportation projects in compliance with NEPA, CEQA, Section 4(f) of the United States Department of Transportation Act, and other applicable regulations.

Under Section 4(f) of the United States Department of Transportation Act, an analysis of prudent and feasible avoidance alternatives and all possible planning to minimize harm is required if the project would result in a permanent use that is not a *de minimis* impact, a temporary occupancy that is not a *de minimis* impact or that does not meet the five criteria listed under 23 CFR 774.13(d), or a constructive use.

As discussed in Section 4.1 of the Draft Section 4(f) Evaluation, the build alternatives would result in the permanent use of Parque Dos Rios. A discussion of prudent and feasible alternatives to avoid the use of Parque Dos Rios and all possible planning to minimize harm to the property is included in Sections 4.2 through 4.5 of the Draft Section 4(f) Evaluation, in compliance with Section 4(f) of the United States Department of Transportation Act.

Caltrans preliminarily determined that the uses of the parks and recreational facilities listed in Section 5.0 of the Draft Section 4(f) Evaluation would be *de minimis* impacts. Caltrans also preliminarily determined that the temporary occupancies of the parks and recreational facilities listed in Section 6.1 of the Draft Section 4(f) Evaluation would meet the temporary occupancy exception criteria in 23 CFR 774.13(d). Caltrans has coordinated with the officials with jurisdiction over these parks to obtain written concurrence on the *de minimis* impact determinations and temporary occupancy exceptions. These concurrences are included in Appendix B of this Final EIR/EIS. However, as stated in Response to Comment IP-24-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no impacts to Section 4(f) resources.

IP-24-43

The Federal Highway Administration defines a *de minimis* impact as "one that, after taking into account avoidance, minimization, mitigation and enhancement measures, results in no adverse effect to the activities, features, or attributes qualifying a park, recreation area, or refuge for protection under Section 4(f)."

Caltrans has determined that, as a result of the build alternatives, the uses of the following parks and recreational facilities listed in Section 5.0 of the Draft Section 4(f) Evaluation would be *de minimis* impacts:

- Cesar E. Chavez Park and Drake/Chavez Greenbelt: Should a build alternative be selected as the Preferred Alternative, Measures PR-10 through PR-15 would be implemented to minimize harm to this property. These measures would include incorporating park design refinements and future boundaries, replacing removed facilities, providing information regarding temporary closures, and compensating the City of Long Beach (official with jurisdiction) for implementation of these measures. With implementation of Measures PR-10 through PR-15, the build alternatives would not adversely affect the activities, features, and attributes of the Section 4(f) resource. Therefore, Caltrans determined that the build alternatives would result in a *de minimis* use impact on the property.

- Los Angeles River and Rio Hondo Trails: Should a build alternative be selected as the Preferred Alternative, Measures PR-16 through PR-19 would be implemented to minimize harm to the properties. These measures would include developing temporary closures, providing detour signage and contact information, and restoring closed areas following construction. With implementation of Measures PR-18 through PR-21, the build alternatives would not adversely affect the activities, features, and attributes of the Section 4(f) resources. Therefore, Caltrans determined that the build alternatives would result in a *de minimis* use on the properties.

- Dominguez Gap and DeForest Treatment Wetlands: Should a build alternative be selected as the Preferred Alternative, Measure PR-20 would require the construction contractor to return the area occupied by construction activities to a condition as good as or better than its condition prior to construction, and Measure PR-21 would provide for lighting installation along the portion of the Los Angeles River Bicycle Trail that travels beneath the widened Long Beach Blvd. bridge structure. With implementation of Measures PR-21 and PR-22, the build alternatives would not adversely affect the activities, features, and attributes of the Section 4(f) resource. Therefore, Caltrans determined that the build alternatives would result in a *de minimis* use on the property.

As discussed in the Executive Summary of the Draft Section 4(f) Evaluation, the properties meeting the criteria for protection under Section 4(f) were also evaluated to determine whether the build alternatives would result in the constructive use of those properties. The detailed analyses documented in the project technical reports did not identify any proximity impacts resulting from the build alternatives that would be so severe that the activities, features, or attributes that potentially qualify those properties for protection under Section 4(f) would be substantially impaired. The proximity impacts of the build alternatives in the vicinity of properties that potentially qualify for protection under Section 4(f) would not meaningfully reduce or remove the values of those resources in terms of their Section 4(f) significance. Therefore, the build alternatives were determined not to result in constructive use of any properties potentially protected under Section 4(f).

In addition, please refer to Response to Comment IP-24-42.

IP-24-44

The Federal Highway Administration (FHWA) states that constructive use on a property occurs "when the proximity impacts of a transportation project on a Section 4(f) property, even without acquisition of the property, are so great that the activities, features and attributes of the property are substantially impaired." Substantial impairment occurs only when the protected activities, features, or attributes are substantially diminished by a proposed project. As a general matter, this means that the value of the resource, in terms of its Section 4(f) purpose and significance, will be meaningfully reduced or lost. The types of impacts that may qualify as constructive use, such as increased noise levels that would substantially interfere with the use of a noise-sensitive feature, are addressed in 23 CFR 774.15. A project's proximity to a Section 4(f) property is not in itself an impact that results in constructive use.

The RDEIR/SDEIS and Draft Section 4(f) Evaluation both analyze the potential for severe impacts to parks, including Julia Russ Asmus Park, Coolidge Park, Dills Park, Bandini Park, Maywood Park, and other parks. Based on the analysis of parks not directly impacted in the RDEIR/SDEIS, no proximity impacts to the parks were identified that are so severe that the protected activities,

features, or attributes that qualify the resources for protection under Section 4(f) are “substantially impaired.”

Potential impacts as a result of the build alternatives on Julia Russ Asmus Park are described in Table 3.1-5 of the RDEIR/SDEIS. The park is also listed in Table 3 of the Draft Section 4(f) Evaluation, which includes resources within 0.5-mile of the project corridor. The Draft Section 4(f) Evaluation states that for the resources in Table 3, a review of the technical analyses in the EIR/EIS did not identify any proximity impacts as a result of the build alternatives that would be so severe after mitigation as to result in substantial impairment of the activities, features, and/or attributes that qualify the properties listed in Table 3 for protection under Section 4(f). Because no severe proximity impacts have been identified in the EIR/EIS, it was determined that the build alternatives would not result in the constructive use of the resources listed in Table 3. Therefore, the requirements for protection under Sections 4(f) and 6(f) are not triggered by the build alternatives for the resources listed in Table 3.

The discussion of noise at Julia Russ Asmus Park is not conclusory because potential noise impacts from the build alternatives were quantified, and the feasibility of soundwalls and the associated reduction in noise impacts as the result of soundwalls were also studied and quantified. As discussed in Section 3.14.5.7, Soundwalls SW-511A+B are proposed under Alternative 5C between Shull St. and Cecilia St. along northbound I-710, which would provide an eight-to-12 dBA noise reduction to about 20 homes in this area, as well as to Julia Russ Asmus Park. Therefore, with the installation of soundwalls, Alternative 5C would not generate increased noise levels that would result in the substantial impairment of the park. However, since the No Build Alternative has been selected as the Preferred Alternative, SW-511A+B will not be implemented.

Potential impacts on all land uses, including Coolidge Park, are discussed in several sections in the RDEIR/SDEIS, including Section 3.14.4 (Noise), Section 3.6.3 (Visual/Aesthetics), and Section 3.13.3 (Air Quality). According to the analysis in the RDEIR/SDEIS, should a build alternative be selected as the Preferred Alternative, a new soundwall would replace an existing soundwall at Coolidge Park to address noise impacts. The existing soundwall, fence, and trees divide the park from the I-710. Alternative 5C proposes a new soundwall and an elevated ramp. Should Alternative 5C be selected as the Preferred Alternative, the new soundwall would be very similar in size and shape to the existing soundwall. The soundwall would make the view more uniform and balanced, while the elevated ramp would be screened by the existing trees. Therefore, visual impacts on Coolidge Park as a result of Alternative 5C would be low. In addition, air quality impacts on park users were not identified in the technical analysis prepared for the RDEIR/SDEIS. Table 3.24-1 also addresses temporary access impacts on Coolidge Park along Artesia Blvd., which, should a build alternative be selected as the Preferred Alternative, would be minimized through implementation of a TMP and provision of detours. Temporary access impacts

would cease following construction. Therefore, Alternative 5C would not result in noise, visual, air quality, or access impacts that would cause substantial impairment of Coolidge Park.

While Coolidge Park and Julia Russ Asmus Park are in proximity to the proposed improvements under the build alternatives, proximity of proposed improvements to a Section 4(f) property is not in itself an impact that results in constructive use. As stated above, substantial impairment occurs only when the protected activities, features, or attributes are substantially diminished by a proposed project. A discussion of protected activities, features, or attributes at park and recreational facilities, including whether activities, features, or attributes are highly sensitive to visual, noise, or air quality impacts, is relevant to the analysis to determine if substantial impairment of these parks would result from the build alternatives. Based on the definition of "substantial impairment," no constructive uses were identified for any Section 4(f) resources under the build alternatives.

In addition, please refer to Response to Comment IP-24-42 regarding the analysis of parks and recreation resources.

IP-24-45

Please refer to Response to Comment IP-24-42 regarding the analysis of parks and recreation resources. It is important to note that the determination of impacts takes into account the existing setting and context within which impacts occur. Therefore, the determination that the visual impacts resulting from modifications to an adjacent existing freeway facility under the build alternatives within a highly urbanized area would be moderately low is a reasonable conclusion.

IP-24-46

The FHWA states that constructive use on a property occurs "when the proximity impacts of a transportation project on a Section 4(f) property, even without acquisition of the property, are so great that the activities, features and attributes of the property are substantially impaired." Substantial impairment occurs only when the protected activities, features, or attributes are substantially diminished by a proposed project. As a general matter, this means that the value of the resource, in terms of its Section 4(f) purpose and significance, will be meaningfully reduced or lost. The types of impacts that may qualify as constructive use, such as increased noise levels that would substantially interfere with the use of a noise sensitive feature, are addressed in 23 CFR 774.15. A project's proximity to a Section 4(f) property is not in itself an impact that results in constructive use.

Potential impacts on all land uses, including parks, are discussed in several sections in the RDEIR/SDEIS, including Section 3.14.4 (Noise), Section 3.6.3 (Visual), and Section 3.13.3 (Air Quality). Avoidance, minimization, and/or mitigation measures to address potential impacts on parks as a result of the build alternatives are included in Sections 3.1.3.3 and 3.24.4.1 of the

RDEIR/SDEIS. Based on the analysis of parks not directly impacted in the RDEIR/SDEIS, no proximity impacts to the parks from the build alternatives were identified that are so severe that the protected activities, features, or attributes that qualify the resources for protection under Section 4(f) are "substantially impaired." A discussion of protected activities, features, or attributes at park and recreational facilities, including whether activities, features, or attributes are highly sensitive to visual, noise, or air quality impacts, is relevant to the analysis to determine if substantial impairment of these parks would result from the build alternatives.

The analysis of proximity impacts was conducted with the knowledge that campgrounds and outdoor amphitheaters are examples of noise-sensitive uses. As shown in Table 3.14-1 of the RDEIR/SDEIS, noise abatement criteria (NAC) are assigned to different land uses depending on their sensitivity to noise. For example, the NAC for residences (67 dBA) is lower than the NAC for commercial areas (72 dBA). Table 3.14-1 includes a description of activities that fall under Activity Category C, which include: active sport areas, amphitheaters, auditoriums, campgrounds, cemeteries, daycare centers, hospitals, libraries, medical facilities, parks, picnic areas, places of worship, playgrounds, public meeting rooms, public or nonprofit institutional structures, radio studios, recording studios, recreation areas, Section 4(f) sites, schools, television studios, trails, and trail crossings. The NAC for Activity Category C is 67 dBA, which was utilized to evaluate potential noise impacts as a result of the build alternatives and determine the need for soundwalls to mitigate those potential impacts.

For all land uses, including parks, within a 0.5-mile of the project area, potential impacts are discussed in several sections of the RDEIR/SDEIS, as stated above. The detailed analyses documented in the project technical reports did not identify any proximity impacts resulting from the build alternatives that would be so severe that the activities, features, or attributes that potentially qualify those properties for protection under Section 4(f) would be substantially impaired. The proximity impacts of the build alternatives in the vicinity of properties that potentially qualify for protection under Section 4(f) would not meaningfully reduce or remove the values of those resources in terms of their Section 4(f) significance. Therefore, the build alternatives were determined not to result in constructive use of any properties potentially protected under Section 4(f).

IP-24-47

Short-term traffic impacts as a result of the build alternatives on parks are discussed in Table 3.24-1 in the RDEIR/SDEIS. Avoidance, minimization, and/or mitigation measures to address potential impacts on parks as a result of the build alternatives are included in Section 3.24.4.1. Short-term air quality impacts are discussed in Section 3.24.3.13, and avoidance, minimization, and/or mitigation measures to address potential impacts as a result of the build alternatives are included in Section 3.24.4.13. As discussed in these sections, short-term air quality impacts as a result of the build alternatives would be substantially mitigated based on measures implemented

during construction (should a build alternative be selected as the Preferred Alternative); and long-term noise impacts would be substantially mitigated based on permanent design features of the build alternatives such as noise walls and berms.

In addition, please refer to Response to Comment IP-24-42 regarding the analysis of parks and recreation facilities.

IP-24-48

Please refer to Response to Comment IP-24-42 regarding the analysis of parks and recreation facilities. Caltrans and Metro acknowledge that parks in the I-710 Corridor area offer restful settings in urban areas, but the enjoyment of these parks is not predicated on silence, as many of them exist adjacent to the existing I-710 freeway.

As discussed in Section 3.1.3.2 of the RDEIR/SDEIS, soundwalls are proposed at locations throughout the I-710 Corridor where noise levels from the build alternatives would exceed Federal Noise Abatement Criteria (NAC). As discussed in Section 3.14.5.7, Soundwalls SW-511A+B are proposed under Alternative 5C between Shull St. and Cecilia St. along northbound I-710, which, should a build alternative be selected as the Preferred Alternative, would provide an eight-to-12 dBA noise reduction to about 20 homes in this area, as well as to Julia Russ Asmus Park. Soundwalls SW-512A+B would provide a five-to-six dBA noise reduction to the residential area and Bandini Park located along northbound I-710 at the Washington Blvd. on-ramp in the City of Commerce. In the area of Coolidge Park, Soundwall SW-503A+B would benefit the residential area consisting of mostly single-family homes located between Long Beach Blvd. and Artesia Blvd. along southbound I-710 in the City of Long Beach. Should a build alternative be selected as the Preferred Alternative, both soundwalls would completely remove and replace the existing eight-foot-high soundwalls to accommodate widening under the build alternatives. These walls combined would provide a seven-to-12 dBA noise reduction to approximately 39 to 49 receptors in this area. Therefore, substantial interference with the features and attributes of the parks would not occur because the noise level increase attributable to the build alternatives would not substantially interfere with the public's enjoyment of an urban park.

IP-24-49

Please refer to Response to Comment IP-24-42 regarding the analysis of parks and recreation facilities. Specific impacts as a result of the build alternatives on parks are discussed in Section 3.1.3 and 3.24.4. Avoidance, minimization, and/or mitigation measures to address potential impacts on parks as a result of the build alternatives are included in Sections 3.1.3.3 and 3.24.4.1 of the RDEIR/SDEIS. Potential impacts as a result of the build alternatives on all land uses, including parks, are discussed in several sections in the RDEIR/SDEIS, including Section 3.14.4 (Noise), Section 3.6.3 (Visual), and Section 3.13.3 (Air Quality).

As disclosed in these sections, potential noise impacts from the build alternatives have been quantified, and the feasibility of soundwalls and associated reduction in noise impacts as the result of soundwalls have also been studied and quantified. Section 3.14.5.3 includes specific noise impacts and abatement considered at parks for impacts related to the build alternatives. Visual impacts have been assessed and evaluated, with two parks (Coolidge Park and Maywood River Park) having low visual impacts under the build alternatives; no other parks were identified as having any visual impacts from the build alternatives. Air quality impacts along the corridor have also been studied and quantified, with the project resulting in the reduction of several pollutant emissions under the 2035 project alternatives compared to the 2012 Baseline. Based on the analysis of parks not directly impacted in the RDEIR/SDEIS, no proximity impacts from the build alternatives to the parks were identified that are so severe that the protected activities, features or attributes that qualify the resources for protection under Section 4(f) are “substantially impaired.” Substantial impairment occurs only when the protected activities, features, or attributes are substantially diminished by a proposed project.

As discussed in Section 3.13.2, according to the Air Quality, Greenhouse Gas, and Health Risk Assessment (AQ/GHG/HRA) (2017), compared to the 2012 existing Baseline conditions, cancer risk would decrease at sensitive receptors, such as parks, under all 2035 project alternatives. Additionally, compared to the 2012 Baseline, vehicle exhaust emissions, including air toxics and inhalable particulate matter, and related impacts, would decrease for all 2035 project alternatives. Because of the reduction in emissions, the build alternatives would not result in poor air quality that would affect the use and enjoyment of park resources.

IP-24-50

Many of the recreational facilities that were proposed to have temporary construction easements (TCEs) under the build alternatives have been subsequently reevaluated and avoided, following coordination with the official with jurisdiction. Please refer to the revised discussion in Appendix B of this Final EIR/EIS.

IP-24-51

Many of the recreational facilities that were proposed to have temporary construction easements (TCEs) under the build alternatives have been subsequently reevaluated and avoided, following coordination with the official with jurisdiction. Please refer to the revised discussion in Appendix B of this Final EIR/EIS.

IP-24-52

Specific impacts on parks are discussed in Section 3.1.3 and 3.24.4. Avoidance, minimization, and/or mitigation measures to address potential impacts on parks as a result of the build alternatives are included in Sections 3.1.3.3 and 3.24.4.1 of the RDEIR/SDEIS. Potential impacts on all land uses, including parks, are discussed in several sections in the RDEIR/SDEIS, including Section 3.14.4 (Noise), Section 3.6.3 (Visual), and Section 3.13.3 (Air Quality). As disclosed in these sections, potential noise impacts from the build alternatives have been quantified, and the feasibility of soundwalls and associated reduction in noise impacts as the result of potential soundwalls have also been studied and quantified. Section 3.14.5.3 includes specific noise impacts and abatement considered at parks for impacts resulting from the build alternatives. Visual impacts have been assessed and evaluated, with two parks (Coolidge Park and Maywood River Park) having low visual impacts under the build alternatives; no other parks were identified as having any visual impacts from the build alternatives. Air quality impacts along the corridor have also been studied and quantified, with the project resulting in the reduction of several pollutant emissions under the 2035 project alternatives compared to the 2012 Baseline.

The 4(f) Evaluation references the detailed analyses in the RDEIR/SDEIS, as described above, to support the conclusions that visual, noise, and air quality impacts as a result of the build alternatives would not result in substantial impairment of the Drake/Chavez Soccer Fields and Greenbelt Project, Oregon Park, Baker Street Park, 72nd Street Staging Area, and Dills Park, because no severe proximity impacts at the resources are identified in the EIR/EIS. The EIR/EIS, in turn, identifies the parks as resources that are protected under Section 4(f) and that require additional analysis specific to the requirements of Section 4(f).

While both documents reference each other, the EIR/EIS includes a detailed analysis of environmental impacts to comply with the requirements of CEQA and NEPA. In contrast, the Section 4(f) Evaluation includes a detailed analysis of Section 4(f) “use” (i.e., permanent incorporation, temporary occupancy, or constructive use), to comply with Section 4(f) of the United States Department of Transportation Act. A circular analysis has not been conducted because each document has a specific purpose and includes the analysis that is relevant to a specific regulation.

In addition, please refer to Response to Comment IP-24-46 regarding the analysis of land use impacts.

IP-24-53

Please refer to the Responses to Comments IP-24-46 and IP-24-52 regarding proximity impacts of the build alternatives to Section 4(f) resources.

IP-24-54

Please refer to the Responses to Comments IP-24-42 and IP-24-43 for a discussion of the basis for the *de minimis* determinations made in the Section 4(f) Evaluation (Appendix B of the RDEIR/SDEIS and this Final EIR/EIS).

IP-24-55

As shown in Figure 4-2 in the Section 4(f) Evaluation, Alternative 7 would require the permanent use of land along almost the entire perimeter of Parque Dos Rios. Only the middle portion of the parcel would still be available for park uses following construction, should Alternative 7 be selected as the Preferred Alternative. Because this remnant parcel would be surrounded by transportation uses, the parcel would have limited accessibility and functionality. If Alternative 7 were to be constructed, Caltrans would therefore acquire the entire 8.6-acre parcel. However, the No Build Alternative has been identified as the Preferred Alternative, and the impacts to Parque dos Rios would not occur.

IP-24-56

Please refer to the Responses to Comments IP-24-42 through IP-24-55 for a discussion of how impacts to parks were analyzed in compliance with CEQA, NEPA, and the Section 4(f) statute.

IP-24-57

The commenters cite the definition of “all possible planning” as codified in 23 CFR 774.17; however, the commenters fail to note that 23 CFR 774.17(5) states that “A *de minimis* impact determination under § 774.3(b) subsumes the requirement for all possible planning to minimize harm by reducing the impacts on the Section 4(f) property to a *de minimis* level.”

The above clarification notwithstanding, it is important to note that since the initiation of the I-710 *Major Corridor Study*, which preceded the I-710 Corridor Project EIR/EIS, the planning process has considered all feasible alternatives to avoid and minimize impacts to parks while still achieving the project purpose. The build alternatives analyzed in the RDEIR/SDEIS were identified following several alternatives screening analyses, as discussed in Sections 2.4.1 and 2.4.2 of the RDEIR/SDEIS. A zero emission freight corridor that neither increases the number of general purpose lanes nor widens lanes or shoulders would not be able to accommodate projected traffic volumes, and congestion along the I-710 Corridor may worsen. Therefore, this option is not a viable project alternative because it does not meet four out of the five purposes of the project; this option would not (1) improve traffic safety, (2) modernize freeway design, (3) accommodate projected traffic volumes, and (4) address increased traffic resulting from projected growth in population; and employment, and economic activities related to goods movement.

IP-24-58

Please refer to the Responses to Comments IP-24-42 through IP-24-52 for a discussion of both direct and constructive uses to parks that were analyzed in the RDEIR/SDEIS.

IP-24-59

As required under Section 4(f) of the United States Department of Transportation Act, should a build alternative be selected as the Preferred Alternative, the replacement property/properties for Parque Dos Rios would be identified based on the ability to provide similar activities, features, and attributes of the park at its new location. The consideration of park equity is not required under the Section 4(f) statute as codified at 49 USC 303.

Should a build alternative be selected as the Preferred Alternative, all property acquisitions and relocations would be handled in accordance with the Uniform Act of 1970 (Public Law 91-646, 84 Stat. 1894). This act is intended to ensure fair compensation and assistance for those whose property is compulsorily acquired for public use under “eminent domain” law. Caltrans’ Relocation Assistance Program, which is based on the Uniform Act of 1970, requires that certain relocation services and payments by Caltrans be made available to eligible residents, businesses, and non-profit organizations displaced by its projects. Should a build alternative be selected as the Preferred Alternative, funding of replacement properties for parkland would be included in the overall funding. However, as stated in Response to Comment IP-24-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no impacts to Section 4(f) resources.

IP-24-60

Should a build alternative be selected as the Preferred Alternative, Mitigation Measure CON-TR-1 would address temporary access impacts at Parque Dos Rios (see Table 3.24-1 in the RDEIR/SDEIS). Should a build alternative be selected as the Preferred Alternative, additional mitigation measures for physical impacts on Parque Dos Rios would include Measures PR-1 through PR-9, which are listed in Section 4.4 of Appendix B; and would include design refinements to minimize impacts resulting either build alternative, a site plan for the remaining area of the park, identification of replacement property/properties, conceptual site plans for potential replacement property/properties, acquisition of replacement property/ properties, final site plan and plan installation, transfer of property ownership for Parque Dos Rios, and the return of the temporary construction easement (TCE) area in the park to a condition as good as or better than prior to its use for the TCE.

Regarding the replacement of the basketball courts at Cesar E. Chavez Park, should a build alternative be selected as from the build alternatives would be handled in accordance with the Uniform Act of 1970 (Public Law 91-646, 84 Stat. 1894), as discussed in Section 3.3.2.4 of the

RDEIR/SDEIS. This act is intended to ensure fair compensation and assistance for those whose property is compulsorily acquired for public use under “eminent domain” law. Caltrans’ Relocation Assistance Program, which is based on the Uniform Act of 1970, requires that certain relocation services and payments by Caltrans be made available to eligible residents, businesses, and non-profit organizations displaced by its projects. Measure PR-12 in Appendix B of the RDEIR/SDEIS specifically indicated that the basketball courts subject to removal under the build alternatives would be replaced no later than three months following closure of the courts, should a build alternative be selected as the Preferred Alternative. This cost would be included in the overall funding for the I-710 Corridor Project. However, as stated in Response to Comment IP-24-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no impacts to Parque Dos Rios or Cesar E. Chavez Park.

IP-24-61

A detailed construction schedule and time frame/duration for construction activities that would provide a more specific duration of any trail closures at the Los Angeles River and Rio Hondo Trails had not been developed at the time the RDEIR/SDEIS was circulated for public review, but should a build alternative be selected as the Preferred Alternative, these would be determined once the final design phase is complete. However, as stated in Response to Comment IP-24-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, trail closures at the Los Angeles River and Rio Hondo Trails will not be necessary.

IP-24-62

Impacts on wetlands and required mitigation for the build alternatives are discussed in Sections 3.17.3 and 3.17.4 in the RDEIR/SDEIS and this Final EIR/EIS.

IP-24-63

Caltrans acknowledges the impacts to the West Basin under Alternative 7; however, under Alternative 5C and Alternative 1 (the Preferred Alternative), impacts to the West Basin would not occur. No avoidance, minimization, and/or mitigation measures are necessary.

IP-24-64

As discussed in Section 3.1.3.2 of the RDEIR/SDEIS, soundwalls are proposed at locations throughout the I-710 Corridor where noise levels resulting from the build alternatives would exceed the Federal NAC. However, as stated in Response to Comment IP-24-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, these soundwalls will not be implemented.

IP-24-65

Caltrans acknowledges that the commenter feels the responses to comments on the 2012 Draft EIR/EIS provided in the RDEIR/SDEIS were inadequate, but it is important to note that, consistent with the requirements of Section 15088.5(f) of the CEQA Guidelines, Caltrans was under no legal obligation to respond to comments on the Draft EIR/EIS for inclusion in the RDEIR/SDEIS. Therefore, Caltrans respectfully disagrees that the RDEIR/SDEIS violated CEQA or undermined the sufficiency of the EIR as an informational document. Wherever possible, clarification has been provided regarding previously submitted comments, but it should also be noted that comments provided on the 2012 Draft EIR/EIS were referencing a set of alternatives no longer under evaluation.

IP-24-66

Section 6(f) of the Land and Water Conservation Fund Act (LWCFA) prohibits conversion of property acquired or developed with LWCFA grants to a non-recreation or non-parkland purpose without the approval of the Department of the Interior's (DOI) National Park Service. Section 8.0, Section 6(f) Consideration for Cesar E. Chavez Park, has been added to Appendix B of this Final EIR/EIS.

IP-24-67

In citing the concluding statement that "consultation is ongoing with three individuals/tribes who have expressed interest…." out of context, the commenter has overlooked the preceding text which does adequately describe the status and results of Caltrans efforts to contact and consult with Native American representatives. Text preceding the cited statement discusses Caltrans outreach to the Native American Heritage Commission (NAHC) in August 2008 to request both a Sacred Lands File search and a list of appropriate Native American contacts. As a result of continued outreach, in 2016, a list of 13 Native American representatives was generated and these representatives were contacted by letter. Three initial responses were received, and follow-up email correspondence ensued. Additional email outreach occurred to those who did not officially respond to the first attempts by Caltrans to contact them. Please refer to the text under "Native American Consultation" in Section 3.7.2.5 of the RDEIR/SDEIS for the full list of names of representatives contacted. Measure CON-CUL-2 is an adequate and standard mitigation measure to contact the most likely descendant in the event of finding human remains determined to be Native American in origin (should a build alternative be selected as the Preferred Alternative). In addition, further coordination and consultation has taken place with Native American representatives since the release of the RDEIR/SDEIS, and that information has been updated in Section 5.7 of this Final EIR/EIS.

IP-24-68

Where sensitive cultural resources are concerned, Caltrans has developed a project-level Programmatic Agreement and Historic Properties Treatment Plan, as described in Measure CON-CUL-3. The State Historic Preservation Officer (SHPO) and Caltrans executed the Programmatic Agreement on June 6, 2019. The Historic Properties Treatment Plan was attached to the Programmatic Agreement. Specific measures and treatment plans are described in those documents. Mitigation is also provided, under the build alternatives, in the form of Measures CON-CUL-1 and CON-CUL-2, which deal with construction related finds of cultural materials and human remains, respectively. Further, with regard to built environment resources, the build alternatives would result in a finding of No Adverse Effect under Section 106 of the National Historic Preservation Act, and under CEQA, the impacts of the build alternatives to historic resources would be less than significant. For archaeological resources, an Archaeological Sensitivity Study was prepared to assist in the determination of monitoring areas within the Area of Potential Effects, should a build alternative be selected as the Preferred Alternative. The project-level Programmatic Agreement and Historic Properties Treatment Plan set forth treatment plans should previously unknown resources be unearthed during construction, should a build alternative be selected as the Preferred Alternative. Therefore, the build alternatives would not significantly impact known cultural resources or archaeological sites under CEQA nor would the build alternatives result in adverse effects to cultural resources under Section 106 of the National Historic Preservation Act; therefore, the requirements of CEQA and NEPA have been met.

IP-24-69

Caltrans and Metro both respectfully disagree with the assertion that the growth analysis performed for the project fails to meet legal requirements and does not support its conclusions with adequate substantial evidence. The growth analysis described in detail in Section 3.2, Growth, of the Final EIR/EIS was performed in accordance with the procedures outlined in the Caltrans Standard Environmental Reference Guidance for Preparers of Growth-Related, Indirect Impact Analyses (May 2006), and cites specific data and literature in support of the conclusions made. As indicated in Section 3.2, Growth, of the Final EIR/EIS, the Gateway Cities COG Subregion as a whole has experienced population, housing, and employment growth since the early 1900s and is anticipated to continue this growth pattern through 2035. It is important to note that correlation does not imply causation. Further, the 2012 SCAG RTP “No Project” future baseline scenario includes future funded and committed projects, such as those listed in the 2011 Federal Transportation Improvement Program (FTIP), while the “Plan” scenario incorporates those transportation projects identified in the Constrained Plan. The I-710 Corridor Project build alternatives (RTP ID# 1C0401) appear in the “Plan” alternative. Within the Gateway Cities COG sub-region, which encompasses the I-710 Corridor Project Study Area, population, household, and employment forecasts used for the 2012 RTP/SCS are the same for the RTP/SCS “No

Project" and "Plan Alternatives."[5] Thus, future growth in the area is inevitable and generally consistent with local land use plans and current trends, and as the I-710 Corridor Project build alternatives are not anticipated to change the location, rate, type or amount of said growth, there are no growth-related impacts attributable to the build alternatives.

IP-24-70

More details on land use patterns, including maps indicating existing land uses and vacant land, can be found in Section 3.1, Land Use, of the Final EIR/EIS. Also, a more detailed description of development trends, including redevelopment and infill development, can be found in Section 3.1.2.2 of the Final EIR/EIS. This information was culled and summarized from local entities' general plans, as well as observation and analysis employing common-sense conclusions regarding the presence or absence of vacant land in a given area. Caltrans' Guidance for Preparers of Growth-Related, Indirect Impact Analyses states that, although there are some exceptions, generally, "the likelihood of a highway project causing growth-related impacts in an urban area is typically low because of its built-out land use pattern". Therefore, the conclusion that a lack of vacant land does act as a constraint to growth in population and housing is reasonable. Please note that the presence of a growth constraint, such as lack of vacant land or the presence of a physical boundary, is only one of several factors that strongly influences where, when, and what type of development takes place.

IP-24-71

Section 3.1, Land Use, of the RDEIR/SDEIS, provided a more comprehensive overview of the percentages of vacant land within each I-710 Corridor city, as well as maps in which the reader can view the actual land uses along the I-710 Corridor (Figure 3.1-1, Existing Land Use). In response to this comment, this Final EIR/EIS has been revised to provide for the estimated percentages of vacant land for each city and community discussed in Section 3.1.2.

IP-24-72

It should be clarified that the presence of the noted growth constraints (railroad tracks and yards in the northern portion of the Study Area and utility corridors throughout the Study Area) are not intended to define or delineate an area in which impacts would or would not occur. Rather, they were presented to provide important contextual information regarding the urbanized nature of the Study Area. Moreover, the analysis presented in Section 3.2, Growth, of the Final EIR/EIS, represents a "first-cut" analysis as described in Caltrans' Guidance for Preparers of Growth-

[5] SCAG 2012–2035 RTP/SCS, Draft PEIR, Section 3.10 Population, Housing & Employment, Table 3.10-10. Website: http://rtpscs.scag.ca.gov/documents/peir/2012/draft/2012dpeir_3_10_popul ation housingand employment.pdf (accessed October 22, 2108).

Related, Indirect Impact Analyses, wherein the potential for reasonably foreseeable growth impacts resulting from the build alternatives were assessed. Based on the attributes and characteristics of the build alternatives themselves, it was determined that no project-related growth impacts would occur. Therefore, an analysis of where growth-related impacts would occur is unnecessary. Had the results indicated that further analysis was necessary as growth impacts resulting from the build alternatives were reasonably foreseeable, that analysis would be "right-sized" and consideration as to the desirability of various areas for development would be given. Similarly, it is important to note that it is possible to dilute the effects of a single project by arbitrarily selecting a study area that is too large (e.g., that of an entire region).

IP-24-73

The characteristics of the build alternatives themselves (improvements to an existing facility), coupled with the context of the Study Area and historical growth patterns of the region, indicated that further analysis regarding growth-related effects of the build alternatives was not required. The Study Area was selected as the area for analysis because of those characteristics of the build alternatives themselves, and the fact that no new access would be provided as a result of the build alternatives. Existing access would be improved under the build alternatives, but the built-out land use patterns and general lack of vacant land of the Study Area cities and communities indicate that it is not reasonably foreseeable that growth and development patterns would change substantially. Had the first-cut analysis indicated that growth-related effects of the build alternatives were reasonably foreseeable, a more formalized geographic area for determining the magnitude and scope of those impacts would be selected as part of the growth-related impact analysis.

IP-24-74

Caltrans and Metro acknowledge that vacant parcels with appropriate zoning do exist in Los Angeles County for future development of housing. Section 3.2, Growth, of the RDEIR/SDEIS only indicated that the Study Area had very limited vacant land, not that it had none. However, it should be noted that the cited McKinsey document itself indicates that there are regulatory, political, economic, and cultural barriers to converting these potential units into actual homes. Moreover, although approximately 9,000 vacant units seems like a substantial number, there are roughly 2.3 million residential and commercial-industrial parcels within the County, according to the 2017 Annual Report from the Los Angeles County Office of the Assessor.[6] Parcel size notwithstanding, these 9,000 parcels only make up approximately 0.4 percent of all parcels within the County. In the proper context, this cannot be considered a substantial amount of vacant land.

[6] Los Angeles County Assessor. Annual Report 2017. Website: https://assessor.lacounty.gov/wp-content/uploads/2017/10/LACountyAssessor_AnnualReport_Digital.pdf (accessed July 26, 2018).

Moreover, the cited figure (Figure 1) indicates that the vacant parcels are shown larger than actual size to improve legibility.

IP-24-75

The potential for substantial amounts of land currently not zoned for residential use to be rezoned to a residential use, which is solely the jurisdiction of the local planning authority, is highly speculative. Moreover, the presence or absence of available land for housing, whether it is currently zoned as such or not, does not contradict the fact that the build alternatives "would not facilitate new development by *opening up access to previously undeveloped areas or less developed areas*" [emphasis added]. The build alternatives propose to make improvements to an existing, heavily traveled facility. They would not add a new roadway where one does not already exist, nor would it substantially change accessibility to employment, shopping, or other destinations. Moreover, in the highly urbanized Los Angeles County, and the Gateway Cities COG Subregion in particular, there are few, if any, areas that can be classified as "inaccessible" and where providing access to them would result in substantial population, employment, or housing growth.

It is unclear what the commenter is referencing in regards to the "significant amount of vacant land" north of the project area. It is very possible that some vacant lands are not suitable for development for one reason or another (e.g., preserved open space, inaccessible topography, or unstable geology). Again, the presence of vacant land does not change the fact that the project does not offer new access that was not already present.

IP-24-76

Section 3.2, Growth, of the RDEIR/SDEIS indicated that improving the mobility on I-710 under the build alternatives "could have a slight influence on demand for residential and non-residential uses in the cities and communities in the Gateway Cities COG subregion; however, it would not be expected to be sufficient to result in the need to modify adopted General Plans to allow for greater levels of development (residential and non-residential)." Los Angeles County, the Gateway Cities COG subregion, and the communities within the Gateway Cities COG subregion are projected to continue to experience some growth in population and jobs even in the jurisdictions that are relatively constrained by limited land available for development, and this growth is projected to occur with or without the projects included in the RTP/SCS, including the I-710 Corridor Project build alternatives. Those growth rates have been quantified in the RTP/SCS. Because the first-cut growth screening (done in accordance with Caltrans' Guidance for Preparers of Growth-Related, Indirect Impact Analyses) indicated that the build alternatives would only have a slight influence on growth that was already forecast for the region, further analysis to quantify that minor effect was deemed not necessary.

IP-24-77

It is important to note that the conclusion noted does not state that the “slight influence on demand for residential and non-residential uses in the cities and communities in the Gateway Cities subregion” means that demand for these uses would increase under the build alternatives; it simply states that an influence could occur. This could simply mean that the places or timing of the use could be slightly shifted. For illustrative purposes, which means that an improved level of service and less queuing at a particular off-ramp may entice motorists to stop at a shopping center at that location more often or during their regular commute, whereas it may have been viewed as a less convenient option before any improvements were made to the I-710 Corridor under the build alternatives. However, this is still consistent with the overall conclusion of the analysis, which indicates that the build alternatives are would not be expected to influence the amount, timing, or location of growth that is already expected to occur without the build alternatives.

IP-24-78

As was stated in Section 1.2.2.1 of the RDEIR/SDEIS, a central purpose of the project is to accommodate both projected general traffic volumes as well as address increased traffic volumes resulting from projected growth in population, and employment and economic activities related to goods movement. The projected growth in population and in activities related to goods movement would be expected to occur with or without the build alternatives, just as continued growth in Port throughput has occurred relatively steadily since the Port complex began development in the early 1900s.

In response to this comment, the construction growth analysis contained in Section 3.24.3.2 has been augmented to better describe the rationale as to why no additional growth-related effects related to population and housing growth would occur as a result of construction of either build alternative.

IP-24-79

In response to this and the preceding comment, the construction growth analysis contained in Section 3.24.3.2 has been augmented to better describe the rationale as to why no additional growth-related effects related to population and housing growth would occur as a result of construction of either build alternative.

As stated in Response to Comment IP-24-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, a local hire program will not be implemented.

IP-24-80

The information and mitigation measures for the build alternatives, provided in the RDEIR/SDEIS and related to relocations and displacements, comply with information required under the Caltrans

Standard Environmental References (SER) and the Caltrans' Right-of-Way Manual. Displacements that would result from the build alternatives have been identified as a significant and unavoidable impact under CEQA. As discussed in Section 3.3.2.4 of the RDEIR/SDEIS, should a build alternative be selected as the Preferred Alternative, all property acquisition and relocation would be handled in accordance with the Uniform Act of 1970 (Public Law 91-646, 84 Stat. 1894). The Uniform Act mandates that certain relocation services and payments by Caltrans be made available to eligible residents, businesses, and non-profit organizations displaced by its projects. The Uniform Act provides for uniform and equitable treatment by Federal or Federally assisted programs of persons displaced from their homes, businesses, or farms, and establishes uniform and equitable land acquisition policies. However, as stated in Response to Comment IP-24-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no displacements.

IP-24-81

The commenter's concern regarding the displacement of the Long Beach Multi-Service Center is acknowledged and included in the project record. Alternative 1 (No Build) has been identified as the Preferred Alternative and will not result in relocation of the Long Beach Multi-Service Center. Please refer to Section 1.5 of this appendix for further discussion of the Long Beach Multi-Service Center.

IP-24-82

The commenter's concerns regarding the displacement of the Long Beach Multi-Service Center is acknowledged and included in the project record. Alternative 1 (No Build) has been identified as the Preferred Alternative and would not require relocation of the Long Beach Multi-Service Center.

As discussed in Section 3.3.3, Environmental Justice, of the RDEIR/SDEIS, the demographics of the populations in the immediate vicinity of the I-710 freeway are predominantly minority and low-income; therefore, most acquisitions resulting from the build alternatives would occur in environmental justice communities. However, with the application of standard mitigation via the Uniform Act, should a build alternative be selected as the Preferred Alternative, relocated persons and businesses would be compensated fairly and provided relocation assistance, and therefore, these relocations in and of themselves would not represent a disproportionate adverse impact to environmental justice populations. Section 3.3.3, however, does acknowledge that there may be disproportionate adverse impacts to environmental justice populations with regards to community cohesion, and applicable mitigation is proposed under the build alternatives. However, as stated in Response to Comment IP-24-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no displacements.

IP-24-83

Caltrans and Metro both respectfully disagree that the RDEIR/SDEIS improperly defers analysis and requires revision and recirculation. Impacts related to the relocation of the Long Beach Multi-Service Center, and measures to reduce impacts, were considered and disclosed in the RDEIR/SDEIS. As discussed in Section 3.3.2, Relocations and Real Property Acquisition, Alternative 5C and Alternative 1 (the Preferred Alternative) would not require relocation of the Long Beach Multi-Service Center, whereas Alternative 7 would. The RDEIR/SDEIS analyzed relocation impacts under Alternative 7 and proposed measures to reduce impacts from displacement of the Long Beach Multi-Service Center. As discussed in Measure C-3, should a build alternative be selected as the Preferred Alternative, in compliance with the Uniform Act, the center would be relocated to an appropriate alternative location before the existing center would be demolished in order to reduce disruption of services. However, as stated in Response to Comment IP-24-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, the Long Beach Multi-Service Center will not be displaced.

IP-24-84

The transitional housing noted in this comment would not be displaced under the Preferred Alternative (Alternative 1 No Build). However, an analysis of the displacement impacts under both build alternatives was included in Section 3.3.2 of the RDEIR/SDEIS. That analysis acknowledged the difficulties that would be involved in the relocation of all or portions of the Bell Shelter, and appropriate mitigation measures were proposed, should a build alternative be selected as the Preferred Alternative. Please also refer to Section 1.12 of this appendix for more detailed information. As discussed in Section 3.3.2.4 of the RDEIR/SDEIS, should a build alternative be selected as the Preferred Alternative, all property acquisition and relocation would be handled in accordance with the Uniform Act of 1970 (Public Law 91-646, 84 Stat. 1894). The Uniform Act mandates that certain relocation services and payments by Caltrans be made available to eligible residents, businesses, and non-profit organizations displaced by its projects. The Uniform Act provides for uniform and equitable treatment by Federal or Federally assisted programs of persons displaced from their homes, businesses, or farms, and establishes uniform and equitable land acquisition policies.

As discussed in Section 3.3.2.1 of the RDEIR/SDEIS, Caltrans' Relocation Assistance Program (RAP) is based on the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970 (as amended) and Title 49 Code of Federal Regulations (CFR) Part 24. The purpose of the RAP is to ensure that persons displaced as a result of a transportation project are treated fairly, consistently, and equitably so that such persons would not suffer disproportionate injuries as a result of projects designed for the benefit of the public as a whole. However, as stated in Response to Comment IP-24-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, the transitional housing noted in this comment will not be displaced.

IP-24-85

Please refer to Response to Comment IP-24-82 regarding impacts to environmental justice populations.

IP-24-86

Caltrans and Metro both respectfully disagree that the RDEIR/SDEIS improperly defers analysis and requires revision and recirculation. Impacts related to the relocation of the Bell Shelter under the build alternatives, and measures to reduce those impacts, were considered and disclosed in the RDEIR/SDEIS. As discussed in Section 3.3.2, Relocations and Real Property Acquisition, Alternative 5C and Alternative 1 (which Caltrans has identified as the Preferred Alternative) would not require relocation of the Bell Shelter. Alternative 7 would require the relocation of the Bell Shelter. Although not identified as the Preferred Alternative, the RDEIR/SDEIS analyzed relocation impacts for Alternative 7 and proposed measures to reduce impacts from displacement of the Bell Shelter, should a build alternative be selected as the Preferred Alternative. As discussed in Measure C-4, should a build alternative be selected as the Preferred Alternative, in compliance with the Uniform Act, the shelter would be relocated to an appropriate alternative location before the existing center would be demolished in order to reduce disruption of services available at the center. However, as previously stated, Alternative 1 (No Build) was identified as the Preferred alternative and therefore the Bell Shelter would not require relocation.

IP-24-87

It is important to note that the conclusory statements provided are intended to be general and applicable to the build alternatives as a whole, but where caveats are necessary, they are cited. For most of the cities and communities within the project Study Area, comparable replacement housing was available at the time the *Draft Relocation Impact Report* (March 2017) was prepared. There were some specific exceptions that were appropriately disclosed. It is also important to note, should a build alternative be selected as the Preferred Alternative and, final design has been completed, and right-of-way acquisition has begun, real estate market conditions could be drastically different. The relocation impact studies intend to be representative of the most recent real estate information that is available at the time of preparation. Regardless of the market availability of comparable replacement housing, the provisions of the Uniform Act and any applicable State relocation laws and regulations would be followed, should a build alternative be selected as the Preferred Alternative. However, as stated in Response to Comment IP-24-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no displacements or relocations.

IP-24-88

The conclusion that the build alternatives would not result in adverse public health effects as a result of relocations is supported by a finding that generally, the build alternatives would not result in isolation and/or segregation of residents without resources to relocate within their existing communities. It is the isolation from their existing communities that most frequently causes symptoms of stress related to relocations. Should a build alternative be selected as the Preferred Alternative, Caltrans would commit to relocating displaced persons within their existing neighborhoods wherever possible and feasible, in accordance with Measure C-1, outlined in more detail in Section 3.3.2.5 of this Final EIR/EIS. However, as stated in Response to Comment IP-24-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no displacements or relocations.

IP-24-89

Because the specific timing of right-of-way acquisition was not known at the time the RDEIR/SDEIS was circulated for public review, and the specifics of the real estate market at a future time cannot be predicted with any reliability, the how, where and when regarding replacement housing similarly cannot be known. It would be highly speculative to identify a location for potential replacement housing purposes several years prior to actually acquiring a property. Therefore, the measures provided, should a build alternative be selected as the Preferred Alternative, would allow for flexibility in future commitments to relocate displaced persons to existing housing or last resort housing, if necessary, depending on the availability of comparable replacement housing at that specific time.

It is also important to note that the measures provided to address displacements and relocations resulting from the build alternatives do not intend to mitigate by way of preventing displacement. Unfortunately, some displacements of residents and businesses would be unavoidable in implementing 19 miles of freeway improvements under the build alternatives. Should a build alternative be selected as the Preferred Alternative, the proposed measures would intend to address, wherever possible, the disruption and impacts of relocating businesses and residents by providing relocation services and assistance, provision of payments and differentials where applicable, and other services as part of Caltrans' Relocation Assistance Program. However, as stated in Response to Comment IP-24-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no displacements or relocations.

IP-24-90

As shown in Section 3.3.2.4, Tables 3.3-11 through 3.3-14 disclose the numbers of relocations that would be required by the build alternatives. As discussed in Section 3.3.2.4, the No Build Alternative (the Preferred Alternative) would not result in property acquisitions or relocations. Section 3.3.1.5 includes a discussion of public health considerations related to social cohesion,

which includes a discussion of anxiety and other mental health symptoms that could result from housing displacements and relocations under the build alternatives. As discussed in Section 3.3.2.5, should a build alternative be selected as the Preferred Alternative, Measures C-1 through C-5 would be implemented to address impacts related to relocations and real property acquisitions. Please also refer to Response to Comment IP-24-89. It is important to note that there is no requirement for Caltrans and Metro to study a version of the build alternatives that would eliminate residential displacements. However, as noted above, the No Build Alternative was analyzed in the EIR/EIS and would not result in property acquisitions or relocations. Some displacements would be unavoidable in implementing a build alternative for 19 miles of freeway improvements. Caltrans and Metro acknowledge the Motion 22.1 requirement for "Geometric design for the I-710 Freight Corridor (under Alternative 7 only) that eliminates significant impacts and displacements of homes, businesses, or community resources, such as but not limited to the Bell Shelter or Senior Centers, *and the implications of such a design on commuter and freight traffic demands; where significant impacts are unavoidable, provide documentation of the rationale and constraints*" [italics added]. That analysis was undertaken and is summarized in Section 3.3.2.3, Motion 22.1 Right-of-Way Avoidance Analysis, of the RDEIR/SDEIS, as well as included in full in Appendix T.

IP-24-91

Please refer to Response to Comment IP-24-89 regarding displacements. In response to this comment, Measure C-1 has been revised to include relevant information regarding California Government Code 7260-7277.

IP-24-92

Caltrans and Metro both respectfully disagree that the RDEIR/SDEIS is deficient and requires revision and recirculation. In accordance with the requirements of CEQA and NEPA, the RDEIR/SDEIS sufficiently describes and discloses the potential environmental effects of the proposed action, and proposes measures to address those effects. Although Caltrans makes every effort to avoid, minimize, and/or mitigate environmental impacts resulting from the build alternatives, in many cases the relocation of homes, business, and/or facilities would be unavoidable when implementing 19 miles of freeway improvements. However, as stated in Response to Comment IP-24-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no displacements or relocations.

IP-24-93

Caltrans and Metro both respectfully disagree that the RDEIR/SDEIS fails to consider Motion 22.1 and requires revision and recirculation. The Metro Board of Directors passed Board Motion 22.1 in October 2015 that directed Metro and Caltrans to develop a geometric design for Alternative 7 that would avoid significant impacts and displacement of homes, businesses, and community

resources, such as, but not limited to, the Bell Shelter and Long Beach Multi-Service Center. It should be noted that Motion 22.1 did not provide for a similar requirement for Alternative 5C. Design refinements of the build alternatives to avoid or minimize impacts to existing land uses related to the temporary use and/or permanent acquisition of property have been ongoing since the start of project development. Please refer to Section 3.3.2.3 of this Final EIR/EIS, and Appendix T, Avoidance Concepts Applicable to Alternative 7, for more information on the development of Alternative 7 designs to avoid displacements as required in Motion 22.1. As discussed in further detail in Section 3.3 of this Final EIR/EIS, relocation impacts, including relocation of the Bell Shelter and Long Beach Multi-Service Center, would be unavoidable under Alternative 7 because of the larger footprint that would be required under this alternative, because of the separated freight corridor and the necessary space that would be required to provide adequate sight distance, curve radii, and grades for the ramps and other features associated with that new structure. The RDEIR/SDEIS does not fail to comply with the requirements of Motion 22.1 because alternatives to avoid displacements were considered, although found to be infeasible. Subsequent to public circulation of the RDEIR/SDEIS, Caltrans identified Alternative 1 (No Build) as the Preferred Alternative and therefore there will be no need to acquire right-of-way.

IP-24-94

As stated in Response to Comment IP-24-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, no construction will occur and a local hire initiative will not be implemented.

IP-24-95

Without knowing the specific funding sources from which construction funds would be drawn (should a build alternative be selected as the Preferred Alternative), it would be legally inadvisable for Metro or Caltrans to make a commitment within an EIR/EIS regarding local hire policies or procedures. However, as stated in Response to Comment IP-24-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, no construction will occur, and a local hire initiative will not be implemented.

IP-24-96

Caltrans acknowledges that minimal impacts and temporary construction impacts to air quality, greenhouse gases, and traffic resulting from the build alternatives may occur as a result of construction workers commuting to and from the project site. However, without knowing the specific funding sources from which construction funds would be drawn (should a build alternative be selected as the Preferred Alternative), it would be legally inadvisable for Metro or Caltrans to make a commitment within an EIR/EIS regarding local hire policies or procedures. However, as stated in Response to Comment IP-24-1, the No Build Alternative has been selected as the

Preferred Alternative and therefore, no construction will occur, and a local hire initiative will not be implemented.

IP-24-97

Caltrans and Metro acknowledge that there is somewhat more flexibility in local and State funding than there is in Federal funding, given the previously mentioned statutes and regulations. For example, Metro employs a Project Labor Agreement hiring goals that target local hires for projects that rely entirely on local funding. However, until the funding sources for a build alternative are known, and should a build alternative be selected as the Preferred Alternative, Caltrans and Metro cannot commit to a specific segmenting or construction strategy, and a project as large as the I-710 Corridor Project build alternatives would likely have substantial Federal funding involved. Moreover, Metro Board Motions 5.1 and 5.2 provided further direction as to the initial stages ("Early Action Program", now called the Initial Construction Stages) of construction for the build alternatives, the details of which would also need to be taken into account when developing a construction strategy. In addition, the ability of Caltrans and/or Metro to employ targeted hiring also depends on the agency administering the construction contract. Currently, there are simply not enough details known about future construction and funding of the build alternatives to make the requested commitments. It is important to note that the No Build Alternative has been selected as the Preferred Alternative and therefore, no construction will occur, and funding will be unnecessary.

IP-24-98

Similar to what is detailed in the Response to Comment IP-24-97, until the funding sources for the build alternatives would be known (should a build alternative be selected as the Preferred Alternative), it would be inappropriate for Caltrans and Metro to commit to a specific percentage or type of targeted hiring measure. The Trump Administration has reversed previous programs regarding the encouragement of innovative and flexible hiring policies and so it is difficult to foresee the legal landscape governing these regulations at the time a build alternative would approved and ready for construction (should a build alternative be selected as the Preferred Alternative). Additionally, should a build alternative be selected as the Preferred Alternative, Caltrans and Metro would continue to work with communities and interested groups through the bidding process and into construction to ensure that local communities would receive the greatest possible benefit from construction of either build alternative. However, as stated in Response to Comment IP-24-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, no construction will occur.

IP-24-99

Caltrans and Metro both respectfully disagree that the RDEIR/SDEIS is inadequate. Local and targeted hiring requirements, although a potential benefit to the construction workers who live in

communities wherein construction may occur (should a build alternative be selected as the Preferred Alternative), were not considered to be a feasible mitigation measure for two reasons: one, and as described above in previous responses, Caltrans and Metro could not commit to specific staging scenarios at the time the RDEIR/SDEIS was circulated for public review without known funding and therefore could not be relatively certain that any commitments made now regarding this issue would be fulfilled during construction of a build alternative (should a build alternative be selected as the Preferred Alternative); and two, it is unclear which impacts related to the build alternative local and targeted hiring would serve as a mitigation measure.

IP-24-100

Please note that per the language and requirements of Motion 22.1, the Local and Targeted Hiring Policy and Project Labor Agreement (PLA)/First Source Hiring Policy are intended to take place in parallel to the EIR/EIS process, not within the EIR/EIS process. Therefore, the adequacy of these separate documents has no bearing on the adequacy of the RDEIR/SDEIS.

IP-24-101

The commenter requests that the low-income and demographic information of the population be compared to national demographic statistics. The total number of Hispanic/Latino people in the U.S. in 2010 was 50,477,594 (U.S. Census Bureau). 55,199,107 is the 2012-2016 American Community Survey five-year estimate for Hispanic/Latino people in the US, or 17.3 percent of total U.S. population; 23,750,224 is the 2012-2016 American Community Survey five-year estimate for Hispanic/Latino people in the State of California, or 61.4 percent of the total California population (U.S. Census Bureau). This is compared to Los Angeles County (47.7 percent), as shown in the RDEIR/ SDEIS on p. 3.3-16. It is unclear how the determination of environmental justice populations would differ if the analysis had used nationwide demographic statistics in place of regional and State statistics. However, Caltrans and Metro maintain that the appropriate method of comparison is to regional and State statistics, in order to properly frame the analysis within the appropriate context, and respectfully disagrees that the assessment of disproportionate impacts to certain demographic groups are flawed.

IP-24-102

The environmental justice analysis was conducted in accordance with Caltrans' guidelines and procedures. The environmental justice analysis takes great care in identifying the minority and low-income populations that would be affected by both build alternatives. It then takes into account previously-identified impacts related to noise, traffic, community cohesion and relocations, visual impacts, hazardous waste, land use, and parks and recreation, makes a determination of disproportionate impacts on minority and low-income populations, and proposes mitigation for the build alternatives where appropriate. Because it is not known whether individual populations' vulnerability to pollution or other specific impacts is causal or correlative, this was

not taken into account in the analysis, as it is speculative. Therefore, the RDEIR/SDEIS does uphold Executive Order 12898 and its core principle of protecting environmental justice populations.

IP-24-103

Local medical conditions and sensitivities are difficult and costly to study and quantify, and the outcomes of the proposed health studies would be difficult to link solely to the presence of a freeway in the midst of a community when so many factors affect public health. The commenter is likely referring to a study with a similar scope as a Health Impact Assessment. A Health Impact Assessment (HIA) was not conducted for the project, as neither FHWA nor Caltrans currently has an approved methodology addressing the health impacts of freeways, and these types of assessments are an emerging practice in the transportation sector in the united States. Currently, State Departments of Transportation generally have not yet begun to implement HIAs or related tools for transportation planning, with some exceptions. For example, San Francisco's Department of Public Health has employed the use of HIAs in evaluating the health impacts of transportation projects. The State of Massachusetts passed a law requiring HIAs on new transportation projects, and at least one is known to be complete (the McGrath Highway Corridor HIA). In addition, Caltrans Division of Research and Innovation is actively investigating the use of HIAs for transportation planning and potential applicability to Caltrans projects.[7] However, it should also be noted that there are limitations associated with the preparation and use of Health Impact Assessments. According to an article published in 2000 in the British Medical Journal, "Currently there is neither an accepted gold standard nor even a simple, reliable, and evaluated method for carrying out health impact assessment" and "Several issues are unresolved in the methodology of health impact assessment…causal pathways are so complex that it is not often possible to say if an outcome will definitely be good or bad for the health of a population…The current evidence base for many health determinants is inadequate for accurately informing a process of assessment."[8] As a part of the build alternatives, Caltrans committed to setting up a Community Health Benefit program to promote public health to the extent feasible, specifically targeted at air quality and air pollution. However, since a build alternative has not been selected as the Preferred Alternative, this programmatic element will not be implemented by Caltrans as the lead agency under CEQA and NEPA and as the owner/operator of the I-710 freeway. Please

refer to Section 1.10 of this appendix for more information regarding the Community Health Benefit Program.

IP-24-104

Please also refer to Response to Comment IP-24-103 regarding the study of local medical conditions and sensitivities. Local disease rates and disease severities in relation to the build alternatives would be very difficult and costly to study. The article cited notes how difficult it is to pinpoint a single source, such as freeway pollution, as the cause of any given public health effect stating: “Differential response [to risk factors] can also flow from more complex social or physical factors or more than one interaction” (from *Expanding the Scope of Environmental Risk Assessment to Better Include Differential Vulnerability and Susceptibility*). There are multiple risk factors at play to increased incidence of any given disease in a population, such as diabetes or asthma. The potential disproportionate impacts of specific resource area to minority and low-income populations are analyzed in regard to the particular sensitivities of those populations within Section 3.3.3, Environmental Justice, of the Final EIR/EIS. This separate section ensures that the environmental justice-specific analyses remain distinct, and that several key resource areas are given special consideration with regard to environmental justice populations.

IP-24-105

This comment states that communities surrounding the I-710 Corridor are already overburdened with other industrial sources of pollution, and requests that the RDEIR/SDEIS analysis be revised to assess the cumulative impacts of these existing pollution sources in combination with the I-710 Corridor Project build alternatives. The Health and Historical Context section in Section 3.25.4.3, Community Impacts, of the RDEIR/SDEIS indicates that residents in the I-710 Corridor Study Area are affected by existing sources of air pollution. The air quality analysis in Section 3.13, Air Quality, of the RDEIR/SDEIS provides a comparison of the air quality impacts and health risks resulting from the build alternatives against the 2012 Baseline and 2035 No Build Alternative scenarios. The 2012 Baseline scenario reflects the fact that industrial sources of pollution currently exist along the I-710 Corridor. The 2035 No Build Alternative scenario reflects future conditions in which industrial pollution sources would continue to exist in the area. Because background air pollution is already captured in both scenarios, the air quality analysis in Section 3.13, Air Quality, of the RDEIR/SDEIS already represents a cumulative analysis that incorporates industrial and existing pollution sources. Refer to Responses to Comments IP-24-103 and IP-24-104 for additional information. It should also be noted that because operation and maintenance of the build alternatives would not introduce new sources of hazardous waste and materials and no new permanent impacts regarding hazardous waste and materials would not be anticipated, no adverse cumulative effects related to hazardous waste and materials would occur. Please also refer to Sections 3.25.3 and 3.12 of this Final EIR/EIS for further details.

IP-24-106

It is unclear from this comment the specific reasons why the commenter finds the previous responses to be inadequate. Please note that although Caltrans and Metro provided Responses to Comments on the Draft EIR/EIS in the RDEIR/SDEIS, they were not legally required to do so, as the entirety of the RDEIR/SDEIS was revised to evaluate the new suite of build alternatives. The environmental justice analysis contained in Section 3.3.3 of the RDEIR/SDEIS in particular has been substantially revised from what was previously included in the Draft EIR/EIS circulated for review in 2012. In addition, the cumulative analyses have been included in Section 3.25 of both the 2012 Draft EIR/EIS and the 2017 RDEIR/SDEIS. Because the I-710 freeway is an at-grade freeway, “freeway lids” are not a feasible design feature or mitigation measure, and would likely result in more impacts (such as visual impacts) than benefits.

IP-24-107

The AQ/GHG/HRA Technical Study provided a detailed description of the methodologies used to perform the air quality analyses for the proposed project in Appendices A through E. These methodologies were developed based on consultation with the Agency Air Technical Working Group (which includes SCAQMD, EPA, and CARB). As stated in Section ES.4 of the AQ/GHG/HRA Technical Study, the analysis goes beyond a typical EIR/EIS for transportation projects by (1) quantifying construction emissions for the build alternatives, (2) performing full dispersion modeling of ambient concentrations of criteria air pollutants near the I-710, (3) performing a full dispersion modeling and health risk assessment for the seven priority MSATs near the I-710, (4) evaluating (qualitative) the incremental impacts of ultrafine particulates, and (5) evaluating (qualitative) incremental particulate matter mortality and morbidity impacts.

Please refer to Responses to Comments IP-24-108 through IP-24-124 below for responses to specific comments on the air quality analysis.

IP-24-108

Caltrans and Metro both respectfully disagree that the air quality analysis provides insufficient details to allow the public and decisions-makers to understand how the build alternatives would impact air quality. Regional transportation conformity of the build alternatives was addressed in Section 3.13.3.1 of the RDEIR/SDEIS. Consistent with Caltrans and FHWA guidance, project-level air quality conformity is not required for approval of a Draft EIR/EIS and was not required to be included in the RDEIR/SDEIS. However, air quality conformity is required for project approval or funding. Some of the build alternatives analyzed in the 2012 Draft EIR/EIS assumed that ZE/NZE trucks would be commercially deployed and therefore in use in the corridor at the time the project would be built; however, at that point in project development the I-710 Corridor Project did not include a ZE/NZE truck program as a programmatic element. The assumption that the project was a project of air quality concern (POAQC) was carried forward in the RDEIR/SDEIS

even considering that the subsidy and deployment of ZE/NZE trucks was included as a programmatic element of Alternatives 5C and 7, which serves as a commitment that ZE/NZE trucks would be deployed in the corridor should a build alternative be approved and constructed. Subsequent to circulation of the RDEIR/SDEIS, the description of the I-710 Clean Truck Program was further defined to include a proposed governance structure, roles and responsibilities for program oversight, and provisions related to program enforceability (for more information, see Section 2.3.2.1, Common Features of the Build Alternatives, and Appendix W of this Final EIR/EIS).

While project analysis showed the I-710 Clean Truck Program would reduce diesel truck trips in the I-710 Corridor in 2035, extensive discussions with the EPA indicated that Alternatives 5C and 7 must be considered POAQCs mainly because EPA staff stated that the enforceability provisions of the I-710 Corridor Clean Truck program were not sufficient to ensure the projected reduction in 2035 diesel truck trips. Therefore, a hotspot analysis was required for project-level air quality conformity determination. Preliminary results of the hotspot analysis indicated that the two build alternatives would not pass project-level conformity for particulate matter, mostly because of increases in tire wear, brake wear, and entrained road dust, and would thus prevent a project-level conformity determination needed to approve a build project. Please refer to Section 1.4.1 of this appendix, Project Level Particulate Matter Conformity Analysis, for further discussion.

The AQ/GHG/HRA Technical Study also evaluated the Alternative 7-ZE Option in Appendix F. A detailed description of the methodology and results of the air quality, health risk, and greenhouse gas analysis of Alternative 7-ZE Option is also provided in Appendix F. The Alternative 7-ZE Option would have the same traffic and design features as Alternative 7, the only difference being that all ZE/NZE trucks travelling on the freight corridor in Alternative 7 would be assumed to be ZE trucks in the Alternative 7-ZE Option. ZE trucks were assumed to have zero tailpipe exhaust emissions. Therefore, the results of the air quality analysis for the Alternative 7-ZE Option provided estimates of potential reductions in exhaust emissions of CO, VOC, SO_2, $PM_{2.5}$, PM_{10} and greenhouse gas emissions associated with the implementation of ZE trucks on the freight corridor. However, while there would be some decreases seen in exhaust fractions of criteria air pollutants, the near-roadway incremental impacts of criteria air pollutants for Alternative 7 and Alternative 7-ZE Option were similar. Refer to Tables F-2-1a through F-4 and Tables F-5-1 through F-5-2 in Appendix F of the AQ/GHG/HRA Technical Study for further details.

IP-24-109

Selection of the CEQA baseline for the air quality analysis was discussed in the February 2017 Air Quality, Greenhouse Gas, and Health Risk Revised Protocol (Protocol), which was included as Appendix A of the AQ/GHG/HRA Technical Study. The CEQA baseline represents existing, current conditions, typically defined to be the conditions at the time the Notice of Preparation was released. In the Draft EIR/EIS, the CEQA baseline represented the project-specific conditions in

the year 2008 (the publication date for the NOP). However, because considerable time had based after the release of the NOP, a new CEQA baseline year (2012) was selected for the air quality analysis. The re-analysis for the RDEIR/SDEIS began in 2013, so a 2012 CEQA baseline year was chosen, consistent with State CEQA Guidelines.

IP-24-110

The AQ/GHG/HRA Technical Study discusses the CARB's Truck and Bus Regulation, the Pavley Standard, and the Ports' Clean Trucks Program as the primary drivers for the reductions in emissions seen in the 2035 project alternatives as compared to 2012 Baseline. The air quality analysis for the I-710 Corridor Project build alternatives do not presume to take credit for the large reductions in emissions; however, the analysis in the RDEIR/SDEIS does demonstrate that Alternatives 5C and 7 would provide additional NOx and DPM reductions, beyond the programs listed above.

IP-24-111

As stated in Response to Comment IP-24-110, the air quality analysis for the I-710 Corridor Project build alternatives do not presume to take credit for the large reductions in emissions that have been achieved due to State and Federal rules and regulations. Instead, the AQ/GHG/HRA Technical Study discusses the CARB's Truck and Bus Regulation, the Pavley Standard, and the Ports' Clean Trucks Program as the primary drivers for the reductions in emissions seen in the 2035 project alternatives as compared to 2012 Baseline (see Sections ES.5.1, ES.5.2, ES.6.1, 4.3.1, 4.3.3, and 5.2 of the AQ/GHG/HRA Technical Study). Further, the analyses also presents incremental comparisons of the 2035 build alternatives to the 2035 No Build Alternative for NEPA, which would exclude any reductions from State and Federal rules and regulations. The NEPA analysis can be used as a basis for comparing the build alternatives without taking account for reductions achieved due to State and Federal rules and regulations.

IP-24-112

Please also refer to Responses to Comments IP-24-110 and IP-24-111 for a discussion of emissions reductions from State and Federal rules and regulations. As stated in these responses, the air quality analysis does not take credit for emissions achieved due to State and Federal rules and regulations. Instead, the air quality analysis acknowledges CARB's Truck and Bus Regulation, the Pavley Standard, and the Ports' Clean Trucks Program as the primary drivers for the reductions in emissions seen in the 2035 project alternatives as compared to 2012 Baseline. Further, the analyses also presents incremental comparisons of the 2035 build alternatives to the 2035 No Build Alternative for NEPA, which would exclude any reductions from State and Federal rules and regulations. The NEPA analysis can be used as a basis for comparing the build alternatives without taking account for reductions achieved due to State and Federal rules and regulations.

IP-24-113

Caltrans and Metro respectfully disagree that the CEQA baseline fails to accurately depict the I-710 Corridor Project's air quality impacts. As discussed in Response to Comment IP-24-109, the CEQA baseline for the air quality analysis, including the greenhouse gas analysis, was selected as 2012. Selection of the CEQA baseline for the air quality analysis was discussed in the February 2017 Air Quality, Greenhouse Gas, and Health Risk Revised Protocol (Protocol), which was included as Appendix A of the AQ/GHG/HRA Technical Study. The CEQA baseline represents existing, current conditions, typically defined to be the conditions at the time the Notice of Preparation was released. In the Draft EIR/EIS, the CEQA baseline represented the project-specific conditions in the year 2008 (the release date for the NOP). However, because considerable time had based after the release of the NOP, a new CEQA baseline year (2012) was selected for the air quality analysis. The re-analysis for the RDEIR/SDEIS began in 2013, so a 2012 CEQA baseline year was chosen, consistent with State CEQA Guidelines. Further, as discussed in Response to Comment IP-24-111, the analyses also presents incremental comparisons of the 2035 build alternatives to the 2035 No Build Alternative for NEPA, which would exclude any reductions from State and Federal rules and regulations. The NEPA analysis can be used as a basis for comparing the build alternatives without taking account for reductions achieved due to State and Federal rules and regulations.

IP-24-114

As stated in Section 7 of Appendix C of the AQ/GHG/HRA Technical Study, the 24.64 percent in I-710 heavy-heavy-duty truck vehicle miles travelled on the I-710 for Alternative 5C was developed using a select link analysis performed through the I-710 Traffic Model. The basis for the assumption used in the analysis was that 4,000 ZE/NZE trucks would be funded through the I-710 Zero Emission Truck Technology Development Program, which has been included as a programmatic element of the description of both build alternatives. The program has been updated to the I-710 Clean Truck Program in the Final EIR/EIS. Based on 2035 travel demand projections for the dedicated freight corridor included as part of Alternative 7, it is estimated that up to 18,350 ZE/NZE vehicles would be required for Alternative 7.

Should a build alternative be selected as the Preferred Alternative, Metro and Caltrans would commit to executing the I-710 Clean Truck Program (referred to in the RDEIR/SDEIS as the I-710 Corridor Project Zero Emission/Near Zero Emission Truck Technology Deployment Program). Details of that program have been developed beyond what was included in the RDEIR/SDEIS, and have been included in Section 2.3.2.1 of this Final EIR/EIS. Coordination with SCAQMD staff has been ongoing (see Chapter 5.0, Comments and Coordination, for more detailed information). The goal of this coordination was to reach an agreement (to be documented before the ROD is issued) with SCAQMD on program details such as governance structure, administrative responsibilities, funding level commitments, and partnering arrangements, should a build

alternative be selected as the Preferred Alternative. In April 2020, the Metro Board of Directors programmed $50 million in Metro-controlled funds to provide funding for the initial deployment of the I-710 Clean Truck Program and to leverage the remaining funds required for full program implementation. However, since a build alternative has not been selected as the Preferred Alternative, this programmatic element will not be implemented by Caltrans as the lead agency under CEQA and NEPA and as the owner/operator of the I-710 freeway.

IP-24-115

The basis for determining ZE/NZE emission factors is presented in detail in Section 7 of Appendix C to the AQ/GHG/HRA Technical Study. The emission factor and fuel type for ZE/NZE trucks was determined through discussions with SCAQMD, CARB, and engine manufacturers. The air quality analysis conservatively assumed that all ZE/NZE trucks would be NZE. NZE trucks would be non-diesel (as diesel trucks have not been able to meet the California Air Resource Board's [CARB] low-NO_X standard of 0.02 gm/bhp-hr).

IP-24-116

Please also refer to Response to Comment IP-24-115 regarding the basis for determining ZE/NZE emission factors. In Alternative 5C and Alternative 7, a portion of the truck traffic was assumed to be ZE/NZE trucks. The air quality analysis conservatively assumed that all ZE/NZE trucks would be NZE, which would reduce DPM to zero and NO_X emissions by 90 percent compared to conventional heavy-duty trucks (conventional HDT include light heavy-duty trucks, medium heavy-duty trucks, and heavy heavy-duty trucks). For more information regarding the ZE-only option, please refer to Section 1.3 of this appendix.

IP-24-117

Caltrans and Metro both respectfully disagree that the RDEIR/SDEIS requires recirculation once the project-level particulate matter conformity analysis is completed. Please refer to Response to Comment IP-24-108.

IP-24-118

Some measures related to air quality have been refined in response to this and other comments. Please refer to the following Responses to Comments IP-24-119 through IP-24-123.

IP-24-119

Please refer to Responses to Comments IP-24-120 and IP-24-121 below for specific responses to mitigation measure language for Measures CON-AQ-15 (Tier 4 construction equipment) and CON-AQ-17 (alternative fuel and electric construction equipment).

IP-24-120

The build alternatives propose Measure CON-AQ-15 which was drafted in a manner that would ensure it is both enforceable and consistent with Caltrans' and Metro's contract bid requirements and procedures, given that it was not known at the time the RDEIR/SDEIS was circulated for public review which agency may eventually administer the construction contract for either build alternative, should a build alternative be selected as the Preferred Alternative. Therefore, some flexibility was retained accordingly in the wording of the measure. It is important to note that some, but not all Tier 4 equipment is commercially available at the present time, and it is currently unknown if and when all Tier 4 equipment necessary to construct a build alternative may be available in the future. Therefore, in order to ensure that the referenced measure is feasible and enforceable, the text of the measure has not been revised. However, as stated in Response to Comment IP-24-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, no construction will occur and Measure CON-AQ-15 will not be implemented.

IP-24-121

In response to this and other comments, Measure CON-AQ-17 has been refined to include more specificity where possible, adjust measures that would be more appropriate at a program level, or remove those that would not be feasibly or legally enforceable by Caltrans.

IP-24-122

In response to this and other comments, Measure AQ-3 has been revised to include more specificity regarding the timing, design, and implementation of these solid barriers and/or vegetation buffers. Please refer to the revised Measure AQ-3 included in Section 3.13.4 of this Final EIR/EIS.

IP-24-123

It is important to note that since a build alternative has not been selected as the Preferred Alternative, the I-710 Clean Truck Program, which was a programmatic element of the build alternatives, will not be implemented by Caltrans as the lead agency under CEQA and NEPA and as the owner/operator of the I-710 freeway. However, the assumptions of truck levels to be funded by the Program (should a build alternative be selected as the Preferred Alternative) were incorporated into the analyses performed in support of the RDEIR/SDEIS. Please also refer to Response to Comment IP-24-114. The funding levels that were included in the RDEIR/SDEIS provided for the program under each build alternative were determined in consultation with SCAQMD and CARB. Finally, information on the manner in which the ZE/ZNE trucks provided by the program would be required to remain within the I-710 Corridor was included in Section 2.3.2.1 of the RDEIR/SDEIS. Essentially, in order to qualify for and retain program funding, trucks would

have to meet minimum requirements for travel on the I-710 mainline each year, should a build alternative be selected as the Preferred Alternative.

IP-24-124

It is unclear from this comment the specific reasons why the commenter finds the previous responses to be inadequate. Please note that although Caltrans and Metro provided Responses to Comments on the Draft EIR/EIS in the RDEIR/SDEIS, they were not legally required to do so, as the entirety of the RDEIR/SDEIS was revised due to the new suite of build alternatives. A zero emission freight corridor option (Design Option 7-ZE) was evaluated in the RDEIR/SDEIS; however, it was not identified as part of the Preferred Alternative. Please refer to Section 1.1 of this appendix for more information about the identification of the Preferred Alternative.

IP-24-125

The basis for determining ZE/NZE emission factors is presented in detail in Section 7 of Appendix C to the AQ/GHG/HRA Technical Study. The emission factor and fuel type for ZE/NZE trucks was determined through discussions with SCAQMD, CARB, and engine manufacturers. The air quality analysis conservatively assumed that all ZE/NZE trucks would be NZE. NZE trucks would be non-diesel (diesel trucks have not been able to meet CARB's optional low-NO_X standard of 0.02 gm/bhp-hr), which would reduce DPM to zero and NO_X emissions by 90 percent compared to conventional heavy-duty trucks (conventional HDT including light heavy-duty trucks, medium heavy-duty trucks, and heavy heavy-duty trucks). Further and consistent with the CARB's EMFAC2014 emission factor program, it was conservatively assumed in the air quality analysis that NZE trucks would not reduce in any other criteria air pollutant or greenhouse gas emissions as compared to a conventional heavy-duty truck. Additionally, no credit was taken for further tailpipe reductions for pure ZE trucks.

The AQ/GHG/HRA Technical Study also evaluated the Alternative 7-ZE Option in Appendix F. The Alternative 7-ZE Option would have the same traffic and design features as Alternative 7, the only difference being that all ZE/NZE trucks travelling on the freight corridor in Alternative 7 were assumed to be ZE trucks in the Alternative 7-ZE Option. ZE trucks were assumed to have zero tailpipe exhaust emissions. Therefore, the results of the air quality analysis for the Alternative 7-ZE Option provided estimates of potential reductions in exhaust emissions of CO, VOCs, SO_2, $PM_{2.5}$, PM_{10} and greenhouse gas emissions associated with the implementation of ZE trucks on the freight corridor. However, while there would be some decreases seen in exhaust fractions of criteria air pollutants, the near-roadway incremental impacts of criteria air pollutants for Alternative 7 and Alternative 7-ZE Option would be similar. Refer to Tables F-2-1a through F-4 and Tables F-5-1 through F-5-2 in Appendix F of the AQ/GHG/HRA Technical Study for further details.

IP-24-126

The statement cited in the comment is accurate. The RDEIR/SDEIS focused on the build alternatives, Alternative 5C and Alternative 7. Both 2035 build alternatives would result in a negligible increase in greenhouse gas emissions when compared to the 2035 No Build Alternative. Specifically, when compared to the 2035 No Build Alternative, both build alternatives would reduce cancer risk at most locations; however, a small increase in cancer risk would occur at some locations within 100 meters of I-710. For Alternative 5C, the maximum increase in risk would be approximately three in one million. The primary location of the increased risk for Alternative 5C would occur along a small portion of I-710 just south of SR-60. For Alternative 7, the increase in risk would be less than one million.

An additional analysis was performed as part of the AQ/GHG/HRA Technical Study for the Alternative 7-ZE option, which included greenhouse gas emission reductions for ZE trucks. The Alternative 7-ZE Option has the same traffic and design features as Alternative 7, the only difference being that all ZE/NZE trucks travelling on the freight corridor in Alternative 7 were assumed to be ZE trucks in the Alternative 7-ZE Option. The results of the greenhouse gas emission analysis for Alternative 7-ZE are presented in Tables F-5-1 and F-5-2 in Appendix F of the AQ/GHG/HRA Technical Study. These results are reiterated in the first paragraph on p. 4-77 (Section 4.3.4.1) of the RDEIR/SDEIS, which states that the Alternative 7-ZE Option would decrease greenhouse gas emissions by approximately 1.3 million metric tonnes of CO_2e for as compared to Alternative 7.

IP-24-127

The CEQA baseline for the air quality analysis, including the greenhouse gas analysis, is 2012. Selection of the CEQA baseline for the air quality analysis was discussed in the February 2017 Air Quality, Greenhouse Gas, and Health Risk Revised Protocol (Protocol), which was included as Appendix A of the AQ/GHG/HRA Technical Study. The CEQA baseline represents existing, current conditions, typically defined to be the conditions at the time the Notice of Preparation was released. In the Draft EIR/EIS, the CEQA baseline represented the project-specific conditions in the year 2008 (the release date for the NOP). However, because considerable time had based after the release of the NOP, a new CEQA baseline year (2012) was selected for the air quality analysis. The re-analysis for the RDEIR/SDEIS began in 2013, so a 2012 CEQA baseline year was chosen, consistent with State CEQA Guidelines. In addition, the term “2012 Baseline” was used several times within Section 3.13, Air Quality, and Chapter 4.0, CEQA Evaluation, of the RDEIR/SDEIS, for clarity regarding the year used as the CEQA baseline.

IP-24-128

The discussion of greenhouse gas emissions and climate change in Chapter 4, CEQA Evaluation, has been updated to provide a CEQA significance determination for greenhouse gas emissions. It is important to note that Caltrans does not employ standardized thresholds of significance. Please refer to Response to Comment IP-24-140 for further information regarding thresholds of significance under CEQA.

IP-24-129

Please refer to Response to Comment IP-24-128 regarding CEQA significance determinations. The Environmental Commitments Record, included as Appendix F to this Final EIR/EIS, serves as the Mitigation Monitoring and Reporting Record in accordance with CEQA. Therefore, any avoidance, minimization, and/or mitigation measure listed therein, even if not considered CEQA-specific mitigation, would be enforceable under CEQA should a build alternative be selected as the Preferred Alternative.

IP-24-130

As stated in Response to Comment IP-24-126, the first paragraph on p. 4-77 (Section 4.3.4.1) of the RDEIR/SDEIS, which states that the Alternative 7-ZE Option would decrease greenhouse gas emissions by approximately 1.3 million metric tonnes of CO_2e as compared to Alternative 7. It is acknowledged that, as guidance to lead agencies, the SCAQMD has established CEQA significance criteria. However, regional significance thresholds, such as those from SCAQMD, do not apply to Caltrans projects unless adopted as a regulation. Although Caltrans has not adopted the SCAQMD's thresholds, the RDEIR/SDEIS did include discussion of the SCAQMD CEQA significance thresholds. Because CEQA thresholds are not applicable to the NEPA analysis, Section 3.13, Air Quality, presented the SCAQMD's CEQA significance criteria for information purposes only. The air quality analysis for CEQA was provided in Chapter 4.0, CEQA Evaluation, of the RDEIR/SDEIS. As discussed in Chapter 4.0 of the RDEIR/SDEIS, while Caltrans has not adopted them, the SCAQMD CEQA significance thresholds were considered in the CEQA analysis and mitigation for significant impacts as a result of the build alternatives was considered. However, the 10,000 MT CO_2e per year significance criteria cited in the comment is for industrial facilities and does not apply to transportation projects such as the I-710 Corridor Project build alternatives.

IP-24-131

Federal regulations governing reduction of greenhouse gas emissions are discussed in Section 4.4.1.1 of this Final EIR/EIS. As discussed in this section, no national standards have been established for nationwide mobile-source greenhouse gas reduction targets, nor have any regulations or legislation been enacted specifically to address climate change and greenhouse

gas emissions reduction at the project level. However, NEPA requires Federal agencies to assess the environmental effects of their proposed actions prior to making a decision on the action or project. Section 4.4.1.1 also details other Federal regulations governing reduction of greenhouse gas emissions.

Greenhouse gas emissions were analyzed in the AQ/GHG/HRA Technical Study, as well as updated in Section 4.4, Climate Change, of this Final EIR/EIS. Traffic-related greenhouse gas emissions for the NEPA analysis are presented in Table 4-10 of the AQ/GHG/HRA Technical Study and in Table 4.3-3 of this Final EIR/EIS. The percent of change between the build alternatives and 2035 Alternative 1 (No Build) would be less than 0.5 percent for all greenhouse gases.

IP-24-132

The commenter is referring to comments made on the Draft EIR/EIS circulated for review in 2012 which analyzed alternatives no longer under consideration, and requests a lifecycle greenhouse gas emissions analysis for the project. It should be noted that there is no current accepted methodology for this type of analysis, and major gaps exist in current knowledge regarding lifecycle analysis, particularly the lack of well-validated and calibrated models.[9] The greenhouse gas analysis included in Section 4.3.1 of Chapter 4.0, CEQA Evaluation, has been updated in accordance with Caltrans guidance, and a CEQA significance determination for greenhouse gas emissions has been provided in Section 4.2.2.6 of this Final EIR/EIS. Per Caltrans guidelines, although Federal laws related to climate change and greenhouse gases are presented in Section 4.3.1.1 to provide a framework for understanding the ensuing discussion and analysis, the discussion of greenhouse gas and climate change is a CEQA analysis rather than a NEPA analysis. This is because, per Section 3.13.4 of the Final EIR/EIS, at the time of preparation of this document, neither the U.S. EPA nor FHWA had issued explicit guidance or methods to conduct project-level greenhouse gas analysis, and because requirements have been set forth in California legislation and State executive orders on climate change, the issue is addressed in the CEQA discussion contained in Chapter 4.0. It should be noted that the information provided in the CEQA analysis may be used to inform the NEPA decision for the project.

IP-24-133

The Energy section of this Final EIR/EIS was completely revised to analyze the energy use from ZE and NZE trucks based on the CARB's LCFS regulations that include two factors (Energy

[9] National Center for Sustainable Transportation and the Institute of Transportation Studies. 2015. The Role of Life Cycle Assessment in Reducing Greenhouse Gas Emissions from Road Construction and Maintenance. July. Website: https://ncst.ucdavis.edu/wp-content/uploads/2014/08/07-06-2015-NCST_Reducing-GHG-in-Road-Construction-FINAL.pdf (accessed July 26, 2017).

Economy Ratio (EER) and Energy Density) to describe the relative energy consumption of electrically-powered trucks compared to diesel and gasoline powered trucks.

IP-24-134

The Energy analysis calculated the gasoline, diesel, and diesel-equivalent consumption for all build alternatives. However, instead of making three comparisons (gasoline consumption, diesel consumption, and energy consumed to power the ZE and NZE trucks), a uniform metric to represent the overall energy consumption for each build alternative was calculated by converting the fuel and energy consumption rates into British thermal units (BTUs). Thus, this total BTU energy consumption rate for each build alternative can be directly compared.

IP-24-135

Refer to Response to Comment IP-24-133 regarding energy use from ZE and NZE trucks. The energy use of ZE and NZE trucks were appropriately accounted for by using CARB's LCFS regulations that include two factors (Energy Economy Ratio (EER) and Energy Density).

IP-24-136

The energy impacts from construction of the build alternatives were included as described in Section 3.15.3.2, "As described in the *I-710 Corridor Project Revised Final Energy Technical Report* (December 2020) this analysis was conducted using the Input-Output Method. This method converts VMT, construction, and maintenance costs into energy consumption based on existing data from other road improvement projects in the United States using conversions listed in the *California Department of Transportation (Caltrans) Energy and Transportation Systems Handbook* (July 1983)." As cited, this analysis is in accordance with Caltrans' standard guidelines outlined in the Standard Environmental Reference.

IP-24-137

As described in Section 3.15.4, "As described in Sections 3.15.3.2 and 3.15.3.3, the total indirect energy impacts of the build alternatives would be negligible at the regional level. Because California's energy conservation planning actions are conducted at a regional level, and because the build alternatives' total impact to regional energy supplies would be minor, neither of the build alternatives would conflict with California's energy conservation plans as described in the CEC's 2015 Integrated Energy Policy Report." As there would be no significant impacts resulting from the build alternatives, there would be nothing to mitigate. The measures included would avoid or minimize the already less-than-significant impacts, should a build alternative be selected as the Preferred Alternative. However, in response to this comment, in order to make these measures more enforceable, the language has been altered to indicate that the plans outlined in Measures

E-1 through E-3 will be prepared *and implemented*, including incorporation into the project Plans, Specifications, and Estimates where applicable.

IP-24-138

As discussed in Section 3.9.3.1, should a build alternative be selected as the Preferred Alternative, the selection of operational BMPs would be refined during final design and would include design pollution prevention BMPs, low impact development (LID) BMPs, treatment BMPs, and maintenance BMPs. Existing Los Angeles River drainage outlets would be maintained in their existing location whenever hydraulically feasible and when not impacted by the improvements proposed under the build alternatives. Proposed treatment BMPs would include biofiltration swales, media filters, infiltration/detention basins, and wet basins, as well as gross solids removal devices where feasible. The updated locations of major drainage facilities for Alternative 5C can be found on Figure 2.3-8 in Chapter 2.0, Project Alternatives, of this Final EIR/EIS. The introduction of treatment BMPs as part of Alternative 5C would represent an improvement when compared to the No Build condition, as there currently are 60 Caltrans-maintained BMPs treating freeway runoff on I-710. However, as stated in Response to Comment IP-24-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, these BMPs will not be implemented.

As discussed in Section 3.24.3.9, the primary impact locations during construction of either build alternative with the greatest risk to water quality would be areas at or adjacent to the highway and stormwater discharge points. This would include working on structures that would be located within the Los Angeles River channel.

IP-24-139

It is unclear from this comment the specific reasons why the commenter finds the previous responses to be inadequate. Please note that although Caltrans and Metro provided Responses to Comments on the Draft EIR/EIS in the RDEIR/SDEIS, they were not legally required to do so, as the entirety of the RDEIR/SDEIS was revised due to the new suite of build alternatives. As shown in Section 3.9.2.3, Table 3.9-2 presents approved TMDLs and TMDLs being developed for water bodies affected by the build alternatives. Trash and bacterial pollutants are included in the TMDLs. As discussed in Section 3.9.4, should a build alternative be selected as the Preferred Alternative, Measures WQ-1 through WQ-3 would be implemented to address impacts related to short-term construction-related impacts on water quality. Compliance with standard requirements and permits listed in Section 3.24.4.9 would also minimize short-term, construction-related impacts on water quality resulting from the build alternatives.

IP-24-140

The noise analysis was done in accordance with State and Federal standards as described in the Caltrans Traffic Noise Analysis Protocol, which presents Caltrans policies and procedures for traffic noise studies in conformance with 23 CFR 772. This analysis is presented in Section 3.14, Noise, of this Final EIR/EIS. The CEQA analysis for noise is contained in Chapter 4.0, CEQA Evaluation. Through the course of the noise analysis, all noise-sensitive land uses were identified and taken into consideration, as described in Section 3.14.2, Affected Environment. Wherever noise impacts resulting from the build alternatives were identified, noise abatement was considered, and noise abatement that was determined to be acoustically feasible and reasonable has been recommended for implementation, should a build alternative be selected as the Preferred Alternative. Please note that as indicated in Section 4.2.3.6 of the Final EIR/EIS, because the Protocol defines a noise increase as "substantial" when the predicted noise levels under build conditions exceed existing noise levels by 12 dBA, that increase is considered the "substantial permanent increase" per CEQA Checklist question XII.C. It should be noted that for all resources, including traffic noise, Caltrans does not employ thresholds of significance, and the ultimate determination of significance under CEQA is made by the Project Development Team. Although individual cities may utilize a different criteria and possibly even a formal threshold under CEQA, Caltrans is not under a legal obligation to take those into account. However, Caltrans does require construction contractors to comply with all applicable local noise ordinances. Currently, because of the configuration and location of the build alternatives, abatement in the form of soundwalls would be the only noise abatement method that is considered feasible, reasonable, and practical, should a build alternative be selected as the Preferred Alternative. Caltrans and Metro both respectfully disagree that the noise analysis contained in the RDEIR/SDEIS is inadequate.

IP-24-141

In performing the analysis contained within the RDEIR/SDEIS as well as the 2012 Draft EIR/EIS, Caltrans has followed State and Federal requirements promulgated in the Traffic Noise Analysis Protocol. Caltrans does not have sole authority to alter analysis procedures or policy requirements, including allocation of funds for soundproofing. Additionally, the RDEIR/SDEIS evaluated a new set of build alternatives that differed, in some cases substantially, from those analyzed in the 2012 Draft EIR/EIS, and in many cases, comments made on the Draft EIR/EIS were no longer applicable as they referred to alternatives no longer under consideration. Caltrans and Metro both respectfully disagree that the EIR is insufficient.

IP-24-142

Air Mitigation

As discussed in Section 3.13 of the RDEIR/SDEIS, and as shown in the maps and plots provided in Appendix Q, the build alternatives would improve air quality and reduce public health risk in the

Basin and the I-710 Area of Interest. Along the I-710 Corridor, air quality would be improved and public health risk would be reduced at most locations, but there would be some near-roadway locations where there would be an increase in emissions. Alternative 5C would have the fewest areas with these near-roadway impacts. The near-roadway impacts would be generated by the on-road vehicles, the emissions of which would be controlled by CARB and EPA. Programmatic features to fund ZE/NZE trucks and provide a grant program to fund projects that would improve air quality and public health in the I-710 Corridor have been included in both build alternatives. Additionally, should a build alternative be selected as the Preferred Alternative, Measures AQ-2 and AQ-3 (Section 3.13.4) would commit to minimize exposure to air emissions. These measures are based upon the CARB technical advisory Strategies to Reduce Air Pollution Exposure Near High Volume Roadways (California Environmental Protection Agency/Air Resources Board, April 2017). While the timing is not specified, Measure AQ-2 (Section 3.13.4) would commit to providing air filtration systems for any schools within 0.25 mile of I-710 that currently lack adequate air filtration systems. In response to this and other comments, Measure AQ-2 has been revised to indicate that the installation of filtration systems would occur prior to the start of construction, should a build alternative be selected as the Preferred Alternative. It is important to note that since a build alternative has not been selected as the Preferred Alternative, the programmatic elements included as part of the build alternatives and Measures AQ-2 and AQ-3 will not be implemented by Caltrans as the lead agency under CEQA and NEPA and as the owner/operator of the I-710 freeway.

Noise Mitigation

Should a build alternative be selected as the Preferred Alternative, Caltrans would commit to implementing measures to address noise impacts during construction; however, because a specific construction schedule could not be identified at the time the RDEIR/SDEIS was circulated for public review, it was not possible to estimate what the annual budget would be to implement these measures. Should a build alternative be selected as the Preferred Alternative, construction would comply with all of Caltrans' standard specifications for the abatement of noise during construction. Should a build alternative be selected as the Preferred Alternative, time scheduling of activities would be implemented to minimize noise impacts on exposed areas and local activity patterns and surrounding land uses would be considered in establishing site curfews. Although the No Build Alternative has been selected as the Preferred Alternative, new construction avoidance/minimization measures regarding the preparation and implementation of construction noise monitoring/control plans for the build alternatives have been added to Section 3.24.4.14 of this Final EIR/EIS.

Free Public Transit Program

With regard to the free transit program, as stated in Measure CON-TR-1 (Section 3.24.4.5), should a build alternative be selected as the Preferred Alternative, to be consistent with the Caltrans Complete Intersections Guide: A Guide to Reconstructing Intersections and Interchanges for Bicycles and Pedestrians (2010), the TMP would consider the short-term project

effects on all travel modes including pedestrians, bicyclists, and transit users to minimize closures and the effects of temporary detours on those travelers. The TMP would include public outreach, including information on current and upcoming project construction activities, lane and other closures, detours, and other information to assist residents, students, visitors, and business patrons to more effectively travel around and in the vicinity of active construction areas. Additionally, should a build alternative be selected as the Preferred Alternative, Measure CON-TR-3 would stipulate that Caltrans and Metro would work with area transit operators to implement a Transit Subsidy Program that would provide discounted transit fares in areas impacted by construction as well as performing outreach and marketing to incentivize use of transit during construction periods. It is important to note that since a build alternative has not been selected as the Preferred Alternative, Measures CON-TR-1 and CON-TR-3 will not be implemented.

Independent Third-Party Monitor

There is no rationale for an independent third-party to monitor proposed mitigation measures beyond the agencies and entities that already would be charged with monitoring the implementation of mitigation measures (should a build alternative be selected as the Preferred Alternative), as is described in the Environmental Commitments Record (Appendix F). As on any of its construction projects, should a build alternative be selected as the Preferred Alternative, Caltrans would rigorously adhere to the mitigation commitments adopted as part of the Final EIR/EIS. However, rather than an independent third party monitor, the responsibility to monitor the implementation of these commitments would be by the Resident Engineer for the project, supported by a variety of technical specialists who have the expertise to verify compliance by the construction contractor. Each mitigation measure and the Environmental Commitments Record describe the agencies/entities that would be responsible for monitoring mitigation measure implementation.

Conduct Health Study

Numerous studies have been conducted by a variety of public health agencies and research institutions that correlate the adverse health effects that result from inhalation of DPM and other emissions, whether they come from construction or operation of a freeway. We also note that Gateway Cities COG has produced a Community Medical Needs Assessment as part of its Air Quality Action Plan (AQAP). Also, as described in more detail in Section 2.3.2, the I-710 Corridor Community Health Benefit Program is a programmatic component of the build alternatives and would take the form of a grant program structured to provide corridor communities the opportunity to implement projects or outreach activities that would improve air quality and public health related to I-710 travel and goods movement. Please refer to Section 1.14 of this appendix for more information on the Community Health Benefit Program. However, since a build alternative has not been selected as the Preferred Alternative, this programmatic element will not be implemented by Caltrans as the lead agency under CEQA and NEPA and as the owner/operator of the I-710 freeway.

Community Outreach Program

Because a specific construction schedule could not be identified at the time the RDEIR/SDEIS was circulated for public review, it was not reasonable to stipulate what the annual budget would be to implement this measure or the content of the outreach. However, should a build alternative be selected as the Preferred Alternative, Caltrans would provide for ongoing community outreach during construction. Measures CON-LU-2 (creation of public field offices during construction), CON-TR-1 (Transportation Management Plan), and CON-TR-3 (outreach and marketing to incentivize transit use during construction) would provide for outreach during construction. Please refer to Section 3.24.4 for more detail on each of these measures. However, since a build alternative has not been selected as the Preferred Alternative, Measures CON-LU-2, CON-TR-1, and CON-TR-3 will not be implemented.

Job Training and Local Hire Program

Since a build alternative has not been selected as the Preferred Alternative, no construction will occur, and a local hire program will be unnecessary.

Minority, Women, and Small Business Utilization and Retention Program

Since a build alternative has not been selected as the Preferred Alternative, no construction will occur and a Minority, Women, and Small Business Utilization and Retention Program will be unnecessary.

Use of Power Grid for Electric Motors

Should a build alternative be selected as the Preferred Alternative, construction would comply with all of Caltrans' standard specifications for construction, mandatory measures per other agency regulations (e.g., compliance with SCAQMD measures), and all construction mitigation measures identified in Section 3.24 of this Final EIR/EIS.

Use of ZE Technology where Available

Should a build alternative be selected as the Preferred Alternative, Measure CON-AQ-15 would require that construction equipment used during construction meet equivalent emissions performance to that of United States Environmental Protection Agency (EPA) Tier 4 standards and California Air Resources Board (CARB) requirements for non-road engines, depending on the responsible agency that would administer the construction contract and the availability of construction equipment compliant with these standards. Should a build alternative be selected as the Preferred Alternative, if Metro would administer the construction contract, then Metro's Green Construction Policy would be utilized.

Measure CON-AQ-15 was drafted in a manner that would ensure it would be both enforceable and consistent with Caltrans' and Metro's contract bid requirements and procedures, given that it was not known at the time the RDEIR/SDEIS was circulated for public review which agency would eventually administer the construction contract for either of the build alternatives. Therefore, some flexibility was retained accordingly in the wording of the measure. It is important to note that some,

but not all Tier 4 equipment is commercially available at the present time, and it is currently unknown if and when all Tier 4 equipment necessary to construct a build alternative would be available in the future. Therefore, in order to ensure that the referenced measure is feasible and enforceable, the text of the measure has not been revised. However, as stated in Response to Comment IP-24-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, no construction will occur and Measure CON-AQ-15 will not be implemented.

IP-24-143

A comprehensive construction staging strategy had not been developed for the build alternatives at the time the RDEIR/SDEIS was circulated for public review; although the Metro Board of Directors, in its Metro Board Motion 5.2, defined general priorities for construction of the build alternatives. However, based on its extensive experience with highway construction projects, Caltrans has made a best effort to disclose the potential and reasonably foreseeable construction impacts of the build alternatives, which are outlined in Section 3.24, Construction Impacts. Both potential impacts to the environment as well as potential impacts to the community are outlined within that section, which includes potential construction impacts from the build alternatives to each resource area also discussed in Chapter 3.0 of the RDEIR/SDEIS. In addition, the RDEIR/SDEIS outlined a general description of the highway improvement process in Section 3.24.1.1 wherein typical construction worksite characteristics, construction sequences, pre-construction activities, mobilization and site preparation, traffic control, earthwork, structures work, pavement work, and finishes were described. Section 3.24.2 outlined construction impacts typical to roadway and highway projects, and each individual resource area section outlined the construction impacts of the build alternatives specific to that resource. It is difficult to tell from the comment what the commenter specifically feels is inadequate.

IP-24-144

Specific construction details were not known at the time the RDEIR/SDEIS was circulated for public review. Specific information has been provided regarding business relocations in Section 3.3, Community Impacts. Specifically, Table 3.3-11 tabulates the non-residential (or business) relocations by build alternative. It was assumed that relocations would not occur solely as a result of construction activities of the build alternatives.

IP-24-145

There is a reference in the RDEIR/SDEIS to Appendix B, Section 4(f) Evaluation, for more information regarding Cesar E. Chavez Park and impacts to it. Appendix B states that during construction of Alternative 5C and Alternative 7, approximately 19 acres of Cesar E. Chavez Park would be required for a TCE. Temporary occupancy of 0.41 acre of land for a detour road in the park during construction of realigned Broadway would also be required. In addition, should a build alternative be selected as the Preferred Alternative, portions of Cesar E. Chavez Park may be

temporarily closed to public access to protect the safety of park users and construction workers. The closed areas would not be used for any construction activities related to either build alternative. Should a build alternative be selected as the Preferred Alternative, these closed areas would be returned to public use in the same condition as when the areas were closed off to public access, and/or would incorporate enhancements to the original design. Further, Appendix B explains that there are two half-court basketball courts in the northwest corner of Cesar E. Chavez Park, to the west of Cesar Chavez Elementary School. Through a joint use agreement between the Long Beach Unified School District and Long Beach Department of Parks, Recreation and Marine, the basketball courts are available for use by the students during school hours. The basketball courts would be impacted during construction of either build alternative, and should a build alternative be selected as the Preferred Alternative Measure PR-11, Future Boundaries and Improvements at Cesar E. Chavez Park, states that Caltrans would coordinate with the City of Long Beach on the replacement of the basketball courts that would be removed by the build alternatives in a location accessible to Cesar E. Chavez Elementary School and park visitors. Because the basketball courts are in the area used by the school, the replacement courts would be constructed no later than three months after closure of the existing courts. Because specific construction-related details, including detour routes, were not known at the time the RDEIR/SDEIS was circulated for public review, Measure CON-TR-1, as included in the RDEIR/SDEIS could not provide specificity. However, since the No Build Alternative has been selected as the Preferred Alternative, there will be no impacts to the basketball courts and Measure CON-TR-1 will not be implemented.

IP-24-146

Tables 3.24-1 and 3.24-2 of the RDEIR/SDEIS provided information regarding direct and indirect impacts to parks and recreational facilities and community facilities, respectively, under the build alternatives. In response to this comment, a discussion on how displacement would temporarily impact property owners whose properties would be fully acquired under each build alternative has been added to Section 3.24.3.3 of this Final EIR/EIS. Essentially, persons whose properties would be acquired as a result of the build alternatives would be impacted both temporarily (selecting a replacement residence and the act of moving residences) and permanently (living permanently within a different residence). However, as stated in Response to Comment IP-24-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there will be no direct or indirect impacts to parks and recreation facilities and community facilities.

IP-24-147

The fact that construction, should a build alternative be selected as the Preferred Alternative, may provide some jobs to members of environmental justice communities is considered a beneficial effect of the build alternatives, and is relevant to the discussion of construction impacts contained in Section 3.24.3.3. However, the commenter accurately states that the potential job opportunities

provided by the build alternatives was not intended to mitigate for any construction impacts resulting from the build alternatives, and this is not indicated anywhere within the RDEIR/SDEIS or this Final EIR/EIS.

IP-24-148

Should a build alternative be selected as the Preferred Alternative, Metro and Caltrans would not expect the duration of construction activities to be greater than 5 years at any single site. The definition of a single site should not be confused with the segments provided in the conceptual staging analysis. According to the preliminary construction staging analysis for the build alternatives, it is likely that construction would take place in different segments along the 19-mile I-710 Corridor simultaneously in order to construct the full project (should a build alternative be selected as the Preferred Alternative). However, the Metro Board of Directors, in its Metro Board Motion 5.2, defined general priorities for construction of the build alternatives, and specific construction staging information was not available at the time the RDEIR/SDEIS was circulated for public review. The analysis presented in the AQ/GHG/HRA Technical Study (2017) evaluated potential emissions associated with the highest traffic levels in the I-710 Corridor upon completion of the build alternatives (year 2035) as well as the construction emissions impacts of constructing the build alternatives.

As shown in Table 2.3-5 in the RDEIR/SDEIS, the most complex area in terms of construction activity and duration would be located within Segment 2. A more detailed examination of the preliminary construction staging analysis within this broad area confirms that construction of the various sequential elements of the build alternatives would be occurring at different locations and that no individual site would be affected by construction-related activities for longer than five years. However, the construction emissions scenarios presented in Section 3.24, Construction Impacts, of the RDEIR/SDEIS assumed consecutive construction of all freeway sections, which represents a conservative (i.e., worst-case scenario) emissions analysis, drawn from the construction staging scenarios, in order to identify and disclose the range of potential impacts of the build alternatives. However, as stated in Response to Comment IP-24-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there will be no air quality impacts as a result of construction.

IP-24-149

The commenter’s request to estimate construction emissions based on developed schedule and to provide a full construction HRA analysis is no longer necessary since the No Build Alternative has been selected as the Preferred Alternative. Although the No Build Alternative has been selected as the Preferred Alternative, it should be noted that there is no current accepted methodology for this type of analysis, and major gaps exist in current knowledge regarding lifecycle analysis, particularly the lack of well-validated and calibrated models. The greenhouse gas analysis included in Section 4.3.1 of Chapter 4.0, CEQA Evaluation, was updated in

accordance with Caltrans guidance, and provides a CEQA significance determination for greenhouse gas emissions. Per Caltrans guidelines, although Federal laws related to climate change and greenhouse gases are presented in Section 4.3.1.1 to provide a framework for understanding the ensuing discussion and analysis, the discussion of greenhouse gas and climate change is a CEQA analysis rather than a NEPA analysis. This is because, per Section 3.13.5 of the Final EIR/EIS, at the time of preparation of this document, neither the U.S. EPA nor FHWA has issued explicit guidance or methods to conduct project-level greenhouse gas analysis, and because requirements have been set forth in California legislation and State executive orders on climate change, the issue is addressed in the CEQA discussion contained in Chapter 4.0. It should be noted that the information provided in the CEQA analysis may be used to inform the NEPA decision for the project.

IP-24-150

It is difficult to tell from the comment what specifically regarding the proposed mitigation measures is inadequate. Caltrans and Metro both respectfully disagree that the proposed measures are inadequate. More specific responses to comments follow.

IP-24-151

Because specific construction-related details for the build alternatives, including detour routes, were not known at the time the RDEIR/SDEIS was circulated for public review, Measure CON-TR-1 could not provide the specificity requested by the commenter. However, since the No Build Alternative has been selected as the Preferred Alternative, construction will not occur and Measure CON-TR-1 will not be implemented. Although the No Build Alternative has been selected as the Preferred Alternative, it's important to note that a TMP for Caltrans projects are prepared in accordance with Caltrans' TMP Guidelines.[10] The development of a design-level TMP is an inclusive process – with the active participation of stakeholders along with local resident input – performed under the technical purview of local agencies in addition to Caltrans as the designated approving and reviewing agency for TMPs prepared for State roadway facilities. The Caltrans TMP development and approval process is rigorous, providing the necessary checks and balances to ensure that project construction activities are delivered in a safe and timely manner with the least amount of impacts to the travelling public.

[10] Caltrans. 2015. Division of Traffic Operations, Office of Traffic Management. Transportation Management Plan Guidelines. November 2015. Website: http://www.dot.ca.gov/trafficops/tm/docs/ TMP_Guidelines.pdf (accessed October 11, 2018).

IP-24-152

Should a build alternative be selected as the Preferred Alternative, Measure CON-AQ-15 would be implemented and was drafted in a manner that would ensure it would be both enforceable and consistent with Caltrans' and Metro's contract bid requirements and procedures, given that it was not known at the time the RDEIR/SDEIS was circulated for public review which agency would eventually administer the construction contract for the either build alternative (should a build alternative be selected as the Preferred Alternative). Therefore, some flexibility was retained accordingly in the wording of the measure. It is important to note that some, but not all Tier 4 equipment is commercially available at the present time, and it is currently unknown if and when all Tier 4 equipment that would be necessary to construct the build alternatives could be available in the future. Therefore, in order to ensure that the referenced measure is feasible and enforceable, the text of the measure has not been revised. However, as stated in Response to Comment IP-24-1, the No Build Alternative has been selected as the Preferred Alternative and therefore, no construction will occur and Measure CON-AQ-15 will not be implemented.

IP-24-153

Caltrans and Metro both respectfully disagree that the construction noise measures referenced in the comment are "so broad as to be meaningless." It is important to note that measures intended to address construction of the build alternatives must be applicable to all construction activities and the different areas in which construction would occur along the 19-mile project area (should a build alternative be selected as the Preferred Alternative), as well as the different types of equipment that would be used during construction. Therefore, measures were written to be relevant to all potential types of immediate environments. For example, "shielding with barriers" refers to Measure CON-N-7, which indicates that the Construction Contractor would apply site restrictions to achieve noise reduction through different methods, and continues to provide different types of methods and measures. Specifically, the measure states that "Shielding with barriers will be implemented at an early stage of a project to reduce construction equipment noise. The placement of barriers must be carefully considered to reduce limitation of site access. Barriers may be natural or man-made, such as excess land fill used as a temporary berm strategically placed to act as a barrier. They may also include the construction of soundwalls as the first order of work, if their construction will not be precluded by other construction activities, so that the walls may help to abate construction noise." Should a build alternative be selected as the Preferred Alternative, this would afford the Construction Contractor, in coordination with the Resident Engineer, flexibility in determining the best way to achieve noise abatement utilizing this strategy and given the immediate surroundings, available materials and type of abatement necessary. Similarly, "educating contractors and their employees to be sensitive to noise impact problems" refers to Measure CON-N-8, which reads in full: "The Construction Contractor(s) and their employees will be educated via a training program to be sensitive to noise impact problems and noise control methods. This may be one of the most-cost effective ways to help operators and

supervisors become more aware of the construction site conditions. The Construction Contractor will conduct a training program for equipment operators to instruct them in methods of operating their equipment to minimize environmental noise. Many training programs are presently given on the subject of job safety. This can be extended to include the impacts due to noise and methods of abatement." This measure would provide for the ability of the Contractor to tailor the training appropriately for the types of equipment that would be used by the construction workers at that specific time and place.

There is no conclusion in Section 3.24 that indicates that "job benefits will accrue to local environmental justice communities" or said job benefits "will mitigate other construction impacts to environmental justice communities." The document only concludes that "construction activities would provide jobs, *which would benefit local economies* that include minority and low-income populations" [emphasis added]. The nature of this benefit is more fully explained in Section 3.24.3.3, which states that "these construction jobs would generate temporary employment and revenues for both the local and regional economies."

IP-24-154

Caltrans and Metro both respectfully disagree with the commenter. Measure CON-LU-2 is enforceable mitigation and, should a build alternative be selected as the Preferred Alternative, would provide the public a physical location to address concerns and to request information about construction of either build alternative. It is adequate because it would allow for public access to the Caltrans process and would keep that process as transparent as possible within the communities that would be affected. While CEHAJ's specific requests cannot be met at this time, all efforts have been made to ensure that community concerns have been incorporated into the build alternatives and addressed at every level of the process thus far.

IP-24-155

It is unclear from this comment the specific reasons why the commenter finds the previous responses to be inadequate. Please note that although Caltrans and Metro provided Responses to Comments on the Draft EIR/EIS in the RDEIR/SDEIS, they were not legally required to do so, as the entirety of the RDEIR/SDEIS was revised due to the new suite of build alternatives. Regarding the response to "why power grid is not used for mobile generators", the response provided referenced Measure CON-AQ-15, which discussed emissions performance measures for construction equipment to which the build alternatives would be subject, where feasible, should a build alternative be selected as the Preferred Alternative. Electric cranes and forklifts would also be subject to these measures.

IP-24-156

Please refer to Response to Comment IP-24-152 regarding Measure CON-AQ-17.

IP-24-157

Please note that although Caltrans and Metro provided Responses to Comments on the Draft EIR/EIS in the RDEIR/SDEIS, they were not legally required to do so, as the entirety of the RDEIR/SDEIS was revised due to the new suite of build alternatives. Avoidance, minimization, and/or mitigation measures for noise abatement, air quality, and community impacts is generally based on the specific impacts that would occur as a result of the build alternatives within those resource areas; therefore, the cost estimates for those types of measures would be based on the actual cost to mitigate those impacts. However, please note that since the No Build Alternative has been selected as the Preferred Alternative, these avoidance, minimization, and/or mitigation measures will not be implemented. In addition, although the No Build Alternative has been selected as the Preferred Alternative, the Community Health Benefit Program, which was a programmatic element of the build alternatives, will no longer be implemented by Caltrans as the lead agency under CEQA and NEPA and as the owner/operator of I-710.

IP-24-158

Please note that the Community Health Benefit Program is part of the description of the build alternatives and therefore is not mitigation or a response to any impacts resulting from the build alternatives; it is a response to the community's input regarding the existing conditions within the I-710 Corridor. As noted above, since a build alternative has not been selected as the Preferred Alternative, this programmatic element will not be implemented by Caltrans as the lead agency under CEQA and NEPA and as the owner/operator of the I-710 freeway.

IP-24-159

Per the language of Motion 22.1, "Further move that the Board of Directors instruct *the Chief Executive Officer [of Metro] take the following actions, working with Caltrans and partner agencies as necessary and in parallel to the EIR/EIS process*: … Direct staff to work with community based partners (community groups, faith based groups and labor) on the development of a Local and Targeted Hiring Policy…" [emphasis added]. This clearly states that Metro, as a key project funding partner and proponent, should take the lead on the development of this policy. However, since a build alternative has not been selected as the Preferred Alternative, no construction will occur and a local hire program will be unnecessary.

IP-24-160

Please refer to Response to Comment IP-24-103 for more information on Health Impact Assessments. The preparation of an Air Quality/Health Risk Assessment for the I-710 Corridor Project was an effort to respond to the requests of the I-710 Corridor communities to study health-related impacts, while also ensuring the empirical analyses performed in support of the EIR/EIS process are factual and based on sound scientific, analytical, and/or engineering judgment.

IP-24-161

There are no measures included in the RDEIR/SDEIS that state construction jobs generated by the build alternatives would, or are intended to, offset any of the impacts created by the build alternatives. Since a build alternative has not been selected as the Preferred Alternative, no construction will occur and a local hire program will be unnecessary and therefore, a mitigation measure has not been added to the Final EIR/EIS.

IP-24-162

This comment states that that some information for projects listed in Table 3.25-1 of the RDEIR/SDEIS is out-of-date and is not accurate. The cumulative analysis reflects the information that was available when the RDEIR/SDEIS was being prepared. Caltrans has made a good faith effort to update the project descriptions and related impacts included in Table 3.25-1 where applicable.

IP-24-163

This comment suggests that the cumulative impact analysis in Section 3.25 of the RDEIR/SDEIS is flawed because the analysis of impacts and available mitigation is inadequate. Caltrans and Metro both respectfully disagree with the commenter. Aside from the specific comment related to the general consistency of the build alternatives with local land use plan, which is addressed in the response to Comment IP-24-19, this comment does not cite any specific examples of flaws or inadequacies in the analysis contained in the RDEIR/SDEIS that would cause the cumulative impacts analysis to be similarly inadequate and flawed. Instead, this comment generally refers back to “each section discussed above with an inadequate project impact analysis,” likely referring to Sections III through XV of Comment Letter IP-24, which provide more specific comments regarding the individual sections of the RDEIR/SDEIS in an effort to support the commenter’s position.

Caltrans and Metro have provided specific responses to the comments raised in Sections III through XV of Comment Letter (refer to Responses to Comments IP-24-19 through IP-24-161), which categorically refute the commenter’s assertion that the environmental analysis in the RDEIR/SDEIS is flawed and inadequate. Therefore, Caltrans and Metro both respectfully

disagree with the commenter's claim that the cumulative impacts analysis in Section 3.25 of the RDEIR/SDEIS is similarly inadequate and flawed. The impact analyses contained within the RDEIR/SDEIS were performed in accordance with Caltrans guidance, and in some cases, such as that of the Air Quality/Health Risk Assessment, the scope of the analysis actually surpasses that which would normally be included in a Caltrans project-level analysis. Similarly, the avoidance, minimization, and mitigation measures proposed sufficiently address the environmental and social impacts of the build alternatives.

IP-24-164

Caltrans and Metro acknowledge the potential disproportionate impacts that the I-710 Corridor Project build alternatives may have on environmental justice communities and the fact that additional mitigation is proposed to address these impacts. It is important to note that the determination of disproportionate and adverse impacts to environmental justice communities is made on a project-wide basis. However, the comment misrepresents the nature of this mitigation, and erroneously states that the Community Health Benefit Program is considered a mitigation measure. Measure C-7 is proposed in Section 3.3.3.7 of the RDEIR/SDEIS and states: "funding will be provided to local jurisdictions [e.g., the city and/or county in the case of unincorporated areas] for targeted improvements that would improve air quality and public health, reduce traffic congestion, provide aesthetic/visual enhancements, and improve parks and recreation. These improvements must be made within the United States Census Bureau census tracts adjacent to the I-710 freeway that have been identified as having a high percentage of minority and/or low-income populations compared to the County of Los Angeles. These targeted improvements may include, but are not limited to, air filtration systems installation or upgrade, urban art installations and community events, landscaping, traffic calming measures, pedestrian/bicycle enhancement measures, and development of pocket parks or other park space. Funding for these targeted improvements will be made in the amount of up to 1 percent of the capital construction cost for either of the build alternatives. This funding will be provided through a funding agreement between the Los Angeles County Metropolitan Transportation Authority (Metro), Caltrans, and the affected local jurisdiction upon the commencement of construction within the limits of that local jurisdiction (in the event of staged construction)." It is important to note that the funds provided as part of Measure C-7 would be distinct and separate from the Community Health Benefit Program funds. Should a build alternative be selected as the Preferred Alternative, Measure C-7 funds, as stated above, would be provided directly to the local jurisdiction for implementation of projects they see fit for the specific circumstances of their communities; Caltrans and Metro do not intend to dictate what types of the listed improvements individual communities would find most valuable. The funding level is also outlined in the measure language and provides flexibility in the event of phased or staged construction, should a build alternative be selected as the Preferred Alternative.

IP-24-165

Please also refer to Response to Comment IP-24-164 regarding disproportionate impacts to environmental justice communities. The Community Health Benefit Program is a programmatic component of the build alternatives and is not a mitigation measure. The Community Health Benefit Program has been developed beyond what was presented in the RDEIR/SDEIS; this information can be found in Section 2.3.2.1 of the Final EIR/EIS, including more information as to its implementation. As a component of the build alternatives, its implementation would be assured by its inclusion in the project description outlined in Chapter 2.0, Project Alternatives, of this Final EIR/EIS. However, since a build alternative has not been selected as the Preferred Alternative, the Community Health Benefit Program will have to be implemented as part of a separate process. Mitigation related to environmental justice impacts from the build alternatives is outlined in Measure C-7, included in Section 3.3.3.7 of the Final EIR/EIS.

IP-24-166

Please refer to Response to Comment IP-24-165 and Section 1.10 of this appendix regarding implementation of the Community Health Benefit Program. The Community Health Benefit Program is a component of the build alternatives and is not considered or intended to be a mitigation measure; therefore, mitigation has not been “unlawfully deferred.” However, since a build alternative has not been selected as the Preferred Alternative, this programmatic element will not be implemented by Caltrans as the lead agency under CEQA and NEPA and as the owner/operator of the I-710 freeway.

IP-24-167

Please also refer to Responses to Comments IP-24-164 and IP-24-165 and Section 1.10 of this appendix regarding implementation of the Community Health Benefit Program.

IP-24-168

Please also refer to Response to Comments IP-24-166 and Section 1.10 of this appendix regarding implementation of the Community Health Benefit Program.

IP-24-169

These comments have been taken into consideration during the development of the Community Health Benefit Program, which has been developed beyond what was included in the RDEIR/SDEIS. More details of the program can be found in Section 2.3.2.1 of the Final EIR/EIS. The program is not intended to mitigate for impacts resulting from the build alternatives, but rather is a community enhancement program that is a component of the build alternatives. Please also refer to Response to Comments IP-24-166 and Section 1.10 of this appendix regarding implementation of the Community Health Benefit Program.

IP-24-170

Caltrans and Metro both respectfully disagree that the RDEIR/SDEIS improperly defers analysis and requires revision and recirculation. The impact analyses contained within the RDEIR/SDEIS were performed in accordance with Caltrans guidance, and in some cases, such as that of the Air Quality/Health Risk Assessment, the scope of the analysis actually surpasses that which would normally be included in a Caltrans project-level analysis. Similarly, the avoidance, minimization, and mitigation measures proposed sufficiently address the environmental and social impacts of the build alternatives. In addition, programmatic features included in the description of the build alternatives, although not quantifiable at this time, would help to provide enhancement measures for corridor communities, should a build alternative be selected as the Preferred Alternative. However, as stated in Response to Comment IP-24-1, the No Build Alternative has been selected as the Preferred Alternative and avoidance, minimization, and/or mitigation measures proposed for the build alternatives will not be implemented.

I-710 Corridor Project EIR/EIS

Re: 710 Freeway Expansion Environmental Impact Report Study Comments

Dear CALTRANS / METRO

We as the East Los Angeles Chamber of Commerce covering all of the East L.A. unincorporated area submit these comments for the 710 freeway expansion environmental impact report study.

IP-25-1 It is obvious that traffic through East Los Angeles, ELA just as many other communities in the County of Los Angeles is out of control. However, in a community like ELA, which contains the ELA Interchange, a freeway connector which is traveled by over 580,000 vehicles per day; we the residents have become concerned over the negative impact that this many cars yields in a community. The Pollution to the air which cars create and the lack of concerns

IP-25-2 over regional needs by ELA adjacent communities, such as South Pasadena; which has been objecting to the connection of the 710 interstate for the past 45 years. Effectively preventing the interstate from completing this connection from Pasadena, North at I-210 to the South at Valley Blvd. at the I-10. The City of South Pasadena has gone so far as to close North/South streets to thru traffic and recently have gone so far as to prevent thru traffic from crossing their City through residential neighborhoods.

IP-25-3 East Los Angeles which is transected by six freeways and continues to bear the burden of the transportation needs of Los Angeles County, is now even more concerned that South Pasadena has turned down the 710 Tunnel Alternative using its political clout and intellectual arguments posed by USC professors and administrators from USC Medical School, many of whom live in South Pasadena.

Although the tunnel alternative is no longer an option it stands as an illustration of the length of environmental injustice that politicians are willing to champion. The fact stands that what is acceptable for East LA has been deemed intolerable to our neighboring communities. For example: the North/South

4716 Cesar E. Chavez Ave., Los Angeles, CA 90022
☎ Phone: (323) 263-2005
Email: info@eastlachamber.com
Visit our website: www.eastlachamber.com

IP-25-3

Connectors which link East Los Angeles with Pasadena, include Atlantic Blvd., Garfield and some of Monterey Pass Rd.; and the Monterey Pass Road transition to Mednik Avenue which, intersects at Fremont Ave are currently designated as "F" traffic conditions from Whittier Blvd. North to Huntington Drive. These two thoroughfares are vital for Metro Public Transportation systems including Red Line Busses and other Lines. Metro provides excellent service to these routes but, when you consider the daily traffic of North/South bound automobile traffic, it is obvious to observe the time delay caused by such a large volume of traffic in such a narrow and inefficient roadway system. The opening of the 710 freeway would have stood to elevate this problem. Over fifty years ago Cal Trans acquired property to complete this corridor; this land is now being considered to be resold. East Los Angeles has already been devastated by traffic congestion and bombarded by a lifetime of pollution from the freeways surround and bisect our communities. We are left to wonder how we are to consider the legitimacy and effectiveness of an I-710 Congestion Relief Program without opening the I-710 to the North. Without the completion of the I-710 there is not true Congestion nor pollutant Relief.

IP-25-4

In all options of the Report Recommendations; there is failure to consider service access and business opportunities and service by the freeway entrances and exits (for example) at the 710 North Bound entrance at Olympic Blvd. Community residents from both East Los Angeles as well as residents of Boyle Heights will be hurt by this closure. Similarly the entrance at the I-710 Eastern and Whittier exit will also hurt service to residents of the community in ELA.

IP-25-5

The study fails to mention the road expansion and construction of an I-5 and I-710 junction interchange linking the South and North Bound I-710 with the I-5. The absence of this junction is what causes East Bound traffic to exit the I-710 travel through community street and re-enter into the I-5 East Bound. North Bound connection to the I-710 already exists as does the South Bound connection.

Caltrans needs to strongly consider a North Bound connection from the I-710 to the I-5 East Bound and from the I-5 West Bound into the I-710 South Bound. From the beginning of the system in 1949 these freeway connections have been missing, providing only service to Down Town LA. This ill design has impacted the community of East Los Angeles since then.

Business, Prosperity and Community

Visit our website: www.eastlachamber.com

IP-25-5 The connection to the I-5 can alleviate the pass through design of which only affects East Los Angeles further impacting the environment by depriving North and South Bound access for residents of ELA not just trucks is using Olympic Blvd. as a deviation route.

IP-25-6 Every intersection in East Los Angeles will be greatly affected by any freeway closure either temporarily or permanently. We request traffic studies on all intersections from Indiana to Garfield to Whittier Boulevard from Indiana to Garfield on Olympic from Indiana to Mariana Street on Union Pacific every intersection from Indiana two Bradshaw every intersection between Indiana through Woods Ave on Cesar Chaves every intersection from Indiana to Woods Avenue all intersections on Floral between Eastern and Mednik Avenue.

IP-25-7 We feel it unfair for Caltrans not to have a link accepting submissions of comments of persons that wish to do so during the comment period for this environmental impact report of the I-710. For this we request that you grant an extension of time from October 23, 2017 to November 23, 2017 in order to allow planners to consider the I-710 to I-5 connection alternative and to re-open the I-710, open top open option for the I-710 from Valley Blvd. to Colorado Blvd. in order to relieve traffic on the I-710 freeway. Also every intersection in East Los Angeles will be greatly affected by any 710 North or South freeway entrance or exit closure either temporarily or permanently.

IP-25-8

IP-25-9 We request traffic studies on all intersections between Indiana to Garfield on Whittier Boulevard, between Indiana to Garfield on Olympic. Between Indiana to Mariana Street on Union Pacific. Every intersection between Indiana to Woods on 3rd Street. Every intersection between Woods to Bradshaw on Beverly. Boulevard. Every intersection on Pomona Boulevard between Woods to Margaret Avenue. Every intersection between Indiana through Woods on Cesar Chaves. Every intersection between Indiana to Woods Avenue on 1st Street. All intersections on Floral Drive between Eastern and Mednick Avenue. Also all intersections between Telegraph Road to the 60 Freeway on Atlantic Boulevard. All intersections between Union Pacific and City Terrace Drive on Eastern Avenue. Also all intersections between Olympic and Floral Drive on Ford Boulevard. All intersections between Olympic and 3rd Street on Downey Road. All intersections on Indiana between Union Pacific and Cesar Chavez Avenue.

IP-25-10 We also feel it is very unfair for Caltrans not to have a link accepting a PDF comment for persons *that want to submit during the E.I.R. comment period for this environmental impact report on the 710.* Another reason we are asking for an extension of time is that in the environmental impact report under the Alternatives of the 710 Freeway expansion. . . that would take away street parking on Atlantic Boulevard from Telegraph to the 60 freeway in East Los Angeles on the Eastside of Atlantic going Northbound from 7 a.m. to 9 a.m. or

IP-25-11 going Southbound and taking away street parking on the Westside of Atlantic Boulevard from 4 to 6 p.m. to create a lane for rapid bus lines. First of all the a.m. parking on the street is used by several schools Garfield High School, St. Alphonsus Catholic School, KIPP Elementary School, and 4th Street primary. Some teachers have to use street parking on Atlantic Boulevard when they cannot find side street parking adjacent to their schools.

Also the environmental impact report states there is parking from 4 to 6 p.m. on the side streets of Atlantic Boulevard to accommodate the business parking needs during these hours. This is incorrect, there is no available side street parking adjacent to Atlantic Boulevard. We have a need for more parking for residence as it stands now and also need to consider that many residence return home from work after 4 p.m. This is ridiculous to ignore this fact and we would only be hurting the already struggling businesses. East Los Angeles has

IP-25-12 no parking to spare for businesses. Many businesses have parking behind their stores that is taken up by the employees. Therefore, the street parking is vital to businesses being able to exist. The East Los Angeles Chamber of Commerce is adamantly opposed to any bus lanes being added and taking away street parking from Atlantic Boulevard between the 60 Freeway and Telegraph Road for any length of time to accommodate bus lanes in East Los Angeles unincorporated area. In closing we ask that all of our comment be added to the official public comments record and that we be responded to in writing.

Eddie Torres Jr.
President
East Los Angeles Chamber of Commerce

IP-25-1

Caltrans and Metro thank the commenter for their input. The commenter's concern about traffic and air quality in East Los Angeles is acknowledged and included in the project record. As discussed in Section 1.2.2 in Chapter 1.0, Proposed Project, of the RDEIR/SDEIS, the purpose of the project includes improving traffic safety, accommodating projected traffic volumes, addressing increased traffic volumes resulting from projected growth in population; and employment, and economic activities related to goods movement, and improve air quality and public health.

As discussed in Section 5.5, Traffic and Transportation/Pedestrian and Bicycle Facilities, the build alternatives would improve traffic operations along the I-710 Corridor. However, four intersections in East Los Angeles would be impacted by the build alternatives. As shown in Figure 3.5-8 in Section 3.5 of the RDEIR/SDEIS, Alternative 5C would impact the Ford Blvd./Whittier Blvd. intersection (Intersection 93). Alternative 5C Design Option 3A would impact the I-710 Northbound/Olympic Blvd. (Off), Ford Blvd./Whittier Blvd., and Ford Blvd./3rd St. intersections (Intersections 86, 97, and 180). Alternative 7 would impact the Ford Blvd./Whittier Blvd. intersection, and Ford Blvd./3rd St. intersections (Intersections 93 and 97). Alternative 7, Design Option 3B, would impact the I-710 Northbound/Olympic Blvd. (Off), Ford Blvd./Whittier Blvd, Ford Blvd./Whittier Blvd. intersection, and Ford Blvd./3rd St. intersections (Intersections 86, 93, and 97). As detailed in Table 3.5-23 and Mitigation Measure TR-1 in Section 3.5 of the RDEIR/SDEIS, improvements are proposed at these locations to mitigation for impacts resulting from the build alternatives at these intersections along Del Amo Blvd. Should a build alternative be selected as the Preferred Alternative, Mitigation Measure TR-1 would improve intersection operations and delay to a level equivalent to, or better than, what would occur under the No Build Alternative at Study Area intersections impacted by the build alternatives.

In addition, the build alternatives include programmatic components that would help improve traffic conditions on the arterial streets in the I-710 Study Area. As discussed in Section 2.3.2, Build Alternatives, in the RDEIR/SDEIS, I-710 TSM/TDM Congestion Relief Program that would provide funding for traffic signal upgrades and coordination, safety improvements, traffic calming measures, and intersection improvements on the arterial street system in the Study Area. The I-710 Corridor Project ITS/TSM/Congestion Relief Program would help address the I-710 Corridor Project goals of improving traffic safety, accommodating projected traffic volumes, and addressing increased traffic volumes resulting from projected growth in population, employment, and economic activities related to goods movement. This programmatic component of the build alternatives would provide funding to local governments to implement projects within the I-710 Corridor Project Study Area to improve operations at selected congested intersection locations on the local roadway network. However, Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), has identified Alternative 1 (No Build) as the Preferred Alternative. As a result, this programmatic element will not be implemented by

Caltrans as the lead agency under CEQA and NEPA and as the owner/operator of the I-710 freeway. Please refer to Section 1.1 of this appendix for further discussion on the identification of the Preferred Alternative.

As discussed in Section 3.13, Air Quality, in the RDEIR/SDEIS, all build alternatives would generally improve air quality and reduce public health risk. Along I-710, air quality would be improved and public health risk would be reduced at most locations, but there would be a few near-roadway locations where there would be an increase in certain emissions. The build alternatives propose Measures AQ-2 and AQ-3 to reduce emissions at near-roadway locations. Should a build alternative be selected as the Preferred Alternative, Measure AQ-2 would provide for installation of filters on the ventilation systems of schools near I-710. Measure AQ-3 would require installation of solid barriers where soundwalls would not be proposed to reduce noise impacts and installation of vegetation to disperse pollution and reduce pollutant concentrations downwind. In addition, the build alternatives include programmatic components that would help to improve air quality and public health in the I-710 Corridor. The I-710 Corridor Community Health Benefit Program is a programmatic component of the build alternatives that would take the form of a grant program structured to provide corridor communities the opportunity to implement projects or outreach activities that would improve air quality and public health related to I-710 travel and goods movement. However, this programmatic element will not be implemented by Caltrans as the lead agency under CEQA and NEPA and as the owner/operator of the I-710 freeway. Please refer to Section 1.10 of this appendix for more information regarding the Community Health Benefit Program.

IP-25-2

The SR-710 North Project is a separate project than the I-710 Corridor Project. Traffic impacts of the SR-710 North Project are discussed in the Draft EIR/EIS that was circulated for that project in 2015.

IP-25-3

Metro and Caltrans acknowledge the views held by the commenter on the importance of the SR-710 North Project and the regional transportation benefits that would be realized by closing this gap in the regional freeway network.

The I-710 Corridor Project has been examined and evaluated as its own corridor project because the travel patterns, safety and operational concerns, and congestion problems in the I-710 Corridor are separate and distinct from the SR-710 North Project. Further, each segment along the I-710 Corridor within each community is unique and must be viewed individually as well as part of the overall 19-mile corridor. It is acknowledged that East Los Angeles is highly constrained between I-5, I-710, and SR-60. Metro and Caltrans have worked closely with the East Los Angeles Local Advisory Committee to review trade-offs associated with design options for I-710 through this area, including relative travel benefits, air quality concerns, visual issues, and right-of-way

impacts. As a result of this collaborative process, Design Options 3A and 3B and peak period arterial parking restrictions have been eliminated from further consideration and, as stated in Response to Comment IP-25-1, the No Build Alternative has been selected as the Preferred Alternative. As a result, the I-710 Clean Truck Program (referred to in the RDEIR/SDEIS as the I-710 Corridor Project Zero Emission/Near Zero Emission Truck Technology Deployment Program), the Congestion Relief Program, and the Community Health Benefit Program will not be implemented by Caltrans as the lead agency under CEQA and NEPA and as the owner/operator of the I-710 freeway.

IP-25-4

As discussed in Section 3.3.1.3 of the RDEIR/SDEIS, while a number of existing routes used to travel from one part of the community to another and that are familiar to residents would be redesigned under the build alternatives to accommodate the widening of I-710 and the modernized design of the freeway interchanges, overall connectivity within these affected communities would remain intact. Where the build alternatives would result in changes in access (e.g., due to relocation of a freeway on-ramp or off-ramp), alternative routes would be available nearby to maintain existing residential and business service access and opportunities. The reconstruction of the northbound entrance and exit ramps at Olympic Blvd. and the replacement of the southbound entrance and exit ramps terminating at Eastern Ave. with ramps terminating at Whittier Blvd. were features proposed under Design Options 3A and 3B, were removed from consideration due to community feedback.

IP-25-5

As discussed in Section 2.3.2.2, Alternative 5C would modernize the freeway-to-freeway interchanges at I-5 as shown in Figure 2.3-5. At I-5, new collector-distributor roads that service local interchanges at Washington and Bandini Blvds. would be added, and ramp connection points to I-710 would be modified. The existing northbound left-hand side connector from I-710 to I-5 would be removed, as the northbound I-710 to northbound I-5 movement would be made via that collector-distributor, and the southbound connector from I-5 to I-710 would be replaced. Figure 2.3-6 shows the improvements that are proposed at the I-5/I-710 interchange under the build alternatives.

The applied alternatives development process for the build alternatives employed context sensitive design objectives. These objectives balanced impacts to existing land uses and circulation with mobility benefits. Early in the alternative development process, additional connections between I-710 and I-5 were considered, but were not justifiable. Although there would be benefits to additional connections, these were considered too limited compared to the significant adverse impacts their implementation would cause. The existing freeway and local street network, with Alternative 5C, would provide enhanced and viable connectivity between I-710 and I-5.

IP-25-6

The main purpose of the freeway improvements included in the build alternatives are to address congestion, design deficiencies, traffic operations, and safety concerns on I-710, as well as related air quality issues associated with operation of the I-710 freeway. These purposes were discussed in more detail in Section 1.2 of the RDEIR/SDEIS. Over 185 intersections were evaluated as part of the traffic analysis to determine if the build alternatives would result in traffic impacts to the arterial system, and if so, to identify appropriate measures to address those impacts. The number and locations of the study intersections were identified prior to the initiation of the traffic studies performed in support of the RDEIR/SDEIS, and were reviewed and approved by the I-710 Technical Advisory Committee. Approximately 24 of these selected intersections are located within East Los Angeles, more than any other local jurisdiction in the I-710 Study Area, with the exception of the City of Long Beach. Nearly half of the I-710 Corridor is located in the City of Long Beach.

IP-25-7

Please refer to Section 1.2 of this appendix regarding the extension of the public comment period.

IP-25-8

Please refer to Section 1.2 of this appendix for more information regarding the comment period for the RDEIR/SDEIS. The comment pertaining to the “open top open option for the I-710 from Valley Blvd. to Colorado Blvd.” is regarding the SR-710 North Project and is not part of the scope of the I-710 Corridor Project, which has a northern logical terminus of SR-60. Based on community feedback, Design Options 3A and 3B have been withdrawn from further consideration, which would have altered access to and from I-710 within the community of East Los Angeles. As was stated in Measure CON-TR-1 in Section 3.24.4.5 of the RDEIR/SDEIS, should a build alternative be selected as the Preferred Alternative, a TMP would be prepared prior to construction and would require coordination with local jurisdictions and the communities to avoid and address short-term traffic impacts, should freeway ramps need to be closed during construction.

IP-25-9

Please refer to Response to Comment IP-25-6 regarding the traffic analysis for local intersections.

IP-25-10

Caltrans and Metro accepted comments during the RDEIR/SDEIS circulation period in several ways: via the online portal, via regular mail, at public hearings via public testimony and also privately to a court reporter. The commenter is correct in that the online portal was not able to

allow for attachments to be submitted. This is due to the inability to screen attachments for potential viruses, as well as the increased chance of errors occurring.

IP-25-11

Based on community input, the parking restrictions proposed as a programmatic element of the build alternatives have not been included as part of the Preferred Alternative (Alternative 1 No Build) and are no longer under consideration.

IP-25-12

Please refer to Response to Comment IP-25-11 regarding parking restrictions.

Subject: I-710 Corridor Project Feedback

From: EZEQUIEL FLORES
Organization:
Phone: 3233021520
Mailing Address: 956 BURGER AVE
City, State: LOS ANGELES, CA
Zip: 90022
Comment/Question:
I don't agree to this expansion project,. I have put 2 dogs of mine to sleep due to cancer . this is for the pollution we have. I been a resident here in ELA for over 9 years and I am against them always making changes in our community and we never get the opportunity to vote on these new change, my daughter has ashma and she gets really sick due to the pollution this is going to make it worst for my children IP-26-1

*You received this message because EZEQUIEL FLORES submitted feedback regarding the I-710 Corridor Project.

Regards,
System Administrator

This page intentionally left blank

IP-26-1

Caltrans and Metro thank the commenter for their input. The commenter's opposition to the project is acknowledged and included in the project record. As discussed in Section 1.2.2 in Chapter 1.0, Proposed Project, of the RDEIR/SDEIS, one of the purposes of the project is to improve air quality and public health. As discussed in Section 3.13, Air Quality, in the RDEIR/SDEIS, all build alternatives would generally improve air quality and reduce public health risk Along I-710, air quality would be improved and public health risk would be reduced at most locations, but there are a few near-roadway locations where there would be an increase in certain emissions.

The build alternatives propose Measures AQ-2 and AQ-3 to reduce exposure to emissions at near-roadway locations. Should a build alternative be selected as the Preferred Alternative, Measure AQ-2 would provide for installation of filters on the ventilation systems of schools near I-710. Measure AQ-3 would provide for installation of solid barriers where soundwalls are not proposed and installation of vegetation to disperse pollutant concentrations downwind. In addition, the build alternatives include programmatic components to help improve air quality and public health in the I-710 Corridor. As discussed in Section 2.3.2, Build Alternatives, in the RDEIR/SDEIS, the I-710 Clean Truck Program (referred to in the RDEIR/SDEIS as the I-710 Corridor Project Zero Emission/Near Zero Emission Truck Technology Deployment Program) is a programmatic component of the build alternatives. Should a build alternative be selected as the Preferred Alternative, this program would provide funding to individual owner-operators and privately owned truck fleets to subsidize the purchase of heavy-duty (Class 8) zero emission/near zero emission (ZE/NZE) trucks for use within the I-710 Corridor. However, Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), has identified Alternative 1 (No Build) as the Preferred Alternative. Therefore, since a build alternative has not been selected as the Preferred Alternative, this programmatic element will not be implemented by Caltrans as the lead agency under CEQA and NEPA and as the owner/operator of the I-710 freeway. Please refer to Section 1.1 of this appendix for a discussion on the identification of the Preferred Alternative and Section 1.3 of this appendix for additional discussion of ZE options.

RE: My Comment Letter on the I-710 RDEIR/SDEIS

As a joke, I'd like to say - Where have you guys been the past few years? I am retired, and probably will not see the end of the construction of any alternative. But I am glad you are presenting us with options on doing something – I-710 needs a lot of improvements, modernization, and safety upgrades.

In 2012 I submitted a comment letter on the I-710 DEIR/DEIS. I appreciate the notice informing me that the RDEIR/SDEIS was released for public comment.

As I read the RDEIR/SDEIS Executive Summary, I'm not sure I grasped what changed to propose different build alternatives (2012 vs 2017). Are the traffic model (predictions) the main drivers of the new alternatives? IP-28-1

I am in favor of modernizing the I-710, and I want to say thank you for your continued diligence on presenting options for the I-710 (e.g. recommending build alternatives, while evaluating impacts to the neighboring communities). I would like to commend you on once again translating the Executive Summary in Spanish, I have found the translations very useful. In the last go around the Executive Summary of the DEIR/DEIS was translated to multiple languages – as a tax paying resident of Los Angeles, I interpreted the gesture to mean that Metro/Caltrans are interested in receiving public comments. The general public does not typically have the talents of an environmental scientist or an engineer. I just want to state the obvious and say the translation of materials along with preparing graphics/videos, go a long way for helping the public best understand the totality of what was evaluated. I'm sure such efforts represent less than 0.1% of your contract budget, but it will be what helps the public best understand what you are proposing. I hope that you continue to provide such information for the remainder of all phases of the project – which in turn will assist residents provide better comments. IP-28-2

I suspect that the project would find it difficult to make policy recommendations, but via the mitigations for the I-710, perhaps you can move progressive ideas forward. As I requested in my previous comment letter, when you prepare responses please do not say why my comments may not be the most practical, but rather internalize the concept and help nurture those ideas. IP-28-3

- I am greatly impressed that Metro committed to a zero-emission bus fleet by 2030. (Way to go Metro!) I also recently read that Sweden signed the Climate Act, whereby the country will reach net-zero emissions of greenhouse gases by 2045. I have also read that when cement dries/hardens a lot of CO_2 is generated and released, and that carbon sequestration can be less expensive if it is located close to the source generating the gaseous CO_2. In the spirit of this project being as environmentally friendly as possible, I propose that as a construction mitigation IP-28-4

– mobile carbon sequestration be implemented in the construction zone of the I-710, and that the I-710 or any other Caltrans projects be given the first opportunity to use the output (e.g. carbon bricks). A positive unintended consequence of this is you can probably get the construction of the I-710 to qualify as a Green Bond. IP-28-4

- If in the Cap and Trade program, 'donors of Carbon' receive portions of the Cap and Trade auction proceeds, I would request that Caltrans and or Metro do what is necessary to add the I-710 project to that list – so as to generate funding for the construction of the I-710. If the only benefit is carbon donors do not have to purchase carbon credits, then there is no need to add this project to the list. IP-28-5

Caltrans sent me CD's containing the I-710 RDEIR/SDEIS, along with a notification of the public comment period via us mail. I appreciate the gesture, but I wanted to share that I recently purchased a new computer and it does not contain a CD drive. For future distributions of Environmental Documents, Caltrans and Metro should consider sending such information via flash drives. IP-28-6

As far as the rest of my comments go, allow me to list them:

- Having a pdf of the files was more than sufficient. There was no way I was going to read the entire EIR/EIS, but there were some parts I did rely on – namely the Executive Summary. I thought it was well written and very helpful in understanding what is being proposed. IP-28-7
- I could not discern if building Alternative 5 precludes the construction of Alternative 7. That could have been made clearer in the Executive Summary. IP-28-8
- It seems that Near Zero Emission trucks provides very similar benefits to Zero Emission Trucks. If having ZE trucks is more expensive for the project, I support having NZE trucks. IP-28-9
- Can you better explain/provide more information on the Community Health and Benefit Program & the Los Angeles Gateway Freight Technology Program? IP-28-10
- As far as selecting a Preferred Alternative, I default to Caltrans to determine which build alternative will yield the highest public benefit. I do not support the No Build alternative. However, I suggest that as much investigation on utilities be performed for the Preferred Alternative, so as to minimize surprises and subsequent cost overruns during construction. IP-28-11
- I expect that there will be a lot of contaminated soil that must be treated when construction begins on the I-710. I would like to re-introduce an idea that I proposed in my I-710 DEIR/DEIS comment letter. The I-710 should create a partnership with local colleges for bioremediation of contaminated soil. The idea is to promote a program that will stimulate a green industry, and ideally provide jobs for local residents and research for students, while delivering more environmentally sustainable solutions than just moving contaminated soil to a landfill. The construction of the I-710 should take +10 years, which should be more than enough time to investigate and implement bioremediation techniques. I intended to attach my previous IP-28-12

comment letter, but the hard drive of the computer I wrote the comment letter on had to be replaced, and I lost that information.

IP-28-12

I hope you receive plenty of good comments. Keep up the good work!

Sincerely,

Aurora Huerta

Aurora Huerta

IP-28-1

A detailed description of the rationale for the new build alternatives and what changed between the 2012 Draft EIR/EIS and the 2017 RDEIR/SDEIS was contained in Section 2.2 of the RDEIR/SDEIS. To summarize, it is true that updated travel demand forecasts for the SCAG region allowed for a more comprehensive understanding of traffic patterns and behavior within the Study Area and beyond, particularly related to goods movement. Additionally, the Southern California Intermodal Gateway (SCIG) and Intermodal Container Transfer Facility (ICTF) projects at the Port complex moved forward in their respective planning processes, which would have potentially substantial impacts on Port truck traffic in the vicinity of the Ports and on I-710. More has been learned about Port cargo behaviors and their origins and destinations, particularly with regards to cargo transloading. Also, other freeway projects in the region moved forward, and the design of the I-710 Corridor Project build alternatives were changed in order to better avoid sensitive resources like the Los Angeles River and to address community and agency requests (including, but not limited to, the CA-7 Alternative).

IP-28-2

Caltrans and Metro thank the commenter for the commendation regarding the options set forth for I-710 and the provision of translated materials, and acknowledge that the volume and complexity of materials presented can be difficult to comprehend. As was done during the 2012 Draft EIR/EIS circulation period, the RDEIR/SDEIS Executive Summary was translated into Spanish, Tagalog, Vietnamese, Korean, and Khmer, and was available for download on Caltrans and Metro's websites, as well as available for review in hard copy at the public hearings.

IP-28-3

Caltrans and Metro have made their best efforts to incorporate as many innovative ideas as possible; however, please note that as transportation agencies, their respective jurisdictions are limited. In addition, Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), has identified Alternative 1 (No Build) as the Preferred Alternative. Please refer to Section 1.1 of this appendix for further discussion on the identification of the Preferred Alternative. More specific Responses to Comments follow.

IP-28-4

Caltrans and Metro appreciate these innovative suggestions. However, as stated in Response to Comment IP-28-3, the No Build Alternative has been selected as the Preferred Alternative. Therefore, a specific commitment to this suggested measure is not able to be made. However, this information has been forwarded to Metro's Environmental Compliance and Sustainability Department (ECSD). The ECSD is actively focused on minimizing the environmental, social, and

financial impacts from the planning, design, construction, operation, and maintenance of the agency's facilities and operations, among others, and is dedicated to the implementation of projects related to energy conservation, efficient water use, recycling, waste minimization, and more.

IP-28-5

As stated in Response to Comment IP-28-3, the No Build Alternative has been selected as the Preferred Alternative and therefore, funding for the build alternatives is unnecessary.

IP-28-6

Caltrans and Metro thank the commenter for providing this feedback. It is valuable to the agencies in order to continue to evolve and improve methods and manner of outreach in the future. Flash drives will be considered for future distribution of materials.

IP-28-7

Metro and Caltrans acknowledge and appreciate these comments regarding the PDF files and the Executive Summary.

IP-28-8

In general, yes. Construction of the freight corridor component of Alternative 7 would require substantial changes to the existing mainline and general purpose lanes of I-710, so that the freight corridor could fit within the existing and future right-of-way with as little disruption and displacement as is possible for a build alternative of this magnitude. The improvements made as part of Alternative 5C would add lanes and would rebuild local and freeway-to-freeway interchanges along the existing configuration of I-710 and would not require major changes to the existing alignment. Because Alternative 7 would require changes to the existing I-710 mainline that Alternative 5C would not, it can be concluded that, should Alternative 5C be selected as the Preferred Alternative, the construction of Alternative 5C would preclude construction of a freight corridor later without a large degree of "throwaway work." However, as stated in Response to Comment IP-28-3, the No Build Alternative has been selected as the Preferred Alternative and therefore, no construction will occur.

IP-28-9

The commenter is correct in that in terms of overall emissions and pollutants (including brake and tire wear, which is the predominant source of particulate matter), the benefits afforded by near zero emission (NZE) vehicles and zero emission (ZE) vehicles are very similar. Although tailpipe emissions are lowered in ZE only vehicles, tailpipe emissions are not the only source of pollutants. Caltrans and Metro acknowledge the commenters' preference as stated.

IP-28-10

The Community Health and Benefit Program is a component of the build alternatives that is intended to provide improvements to air quality and public health by supplying corridor communities with grant funding to implement projects or outreach activities. However, since a build alternative has not been selected as the Preferred Alternative, this programmatic element will not be implemented by Caltrans as the lead agency under CEQA and NEPA and as the owner/operator of the I-710 freeway. Please refer to Section 1.10 of this appendix for more information on the Community Health Benefit Program, and to Chapter 2.0, Project Alternatives, of this Final EIR/EIS for an updated description of the Program beyond what was included in the RDEIR/SDEIS.

The Los Angeles Gateway Freight Technology Program, as was indicated in Section 2.3.2.1 of the RDEIR/SDEIS, is a package of pilot projects currently being pursued and developed by Caltrans, based on a 2015 grant proposal submitted by Metro. This program encompasses the I-710 Corridor. Within the I-710 Corridor, this program would involve the promotion and implementation of technologies such as: deployment of zero/near zero emission trucks; electric charging and hydrogen fueling stations for zero emissions trucks; intelligent transportation systems and transportation systems management strategies to manage the flows of vehicles on I-710; and equipping trucks with freight advanced traveler information systems to help minimize unnecessary travel and to help avoid congestion. This program is still in the planning stages and continues to undergo development and refinement in order to better position these pilot projects for potential local, state, and federal funding.

IP-28-11

The commenter's preference of a build alternative is noted and has been included in the project record. Following public circulation of the RDEIR/SDEIS, Alternative 1 (No Build) was identified as the Preferred Alternative. Section 2.4 of this Final EIR/EIS describes the basis for how the Preferred Alternative was selected. Please also refer to Section 1.1 of this appendix for more information regarding the identification of the Preferred Alternative.

Section 3.4 of this Final EIR/EIS outlines major utility relocations that would be required as a result of the build alternatives. Utility studies were prepared in support of the RDEIR/SDEIS in coordination with major utility owners. Existing facilities have been mapped and potential dispositions under the build alternatives have been identified. The build alternatives propose Measure U&ES-2 which states that both major and minor utility relocations would be subject to the preparation and implementation of Specific Utility Relocation Plans, which would include extensive coordination with utility providers as necessary, should a build alternative be selected as the Preferred Alternative. Should a build alternative be selected as the Preferred Alternative, Utility Team Coordination Meetings would be held with all utility companies and local jurisdictions' Departments of Public Works affected. Should a build alternative be selected as the Preferred

Alternative, these meetings would occur during the final design phase and would include final design and construction staging. The meeting participants would discuss and plan a workable sequence of utility alterations so that the utility work could be coordinated and, where possible, completed in advance of highway work. However, as stated in Response to Comment IP-28-3, the No Build Alternative has been selected as the Preferred Alternative and therefore, there will be no impacts to utilities and Measure U&ES-2 would not be implemented.

IP-28-12

Please refer to Response to Comment IP-28-4 regarding the bioremediation of contaminated soil. In addition, the commenter has offered several innovative and sustainable ideas and is encouraged to contact Metro's Environmental Compliance and Sustainability Department (https://www.metro.net/projects/ecsd/), Metro's Office of Extraordinary Innovation (https://www.metro.net/projects/oei/), and Caltrans' Division of Research and Innovation (http://www.dot.ca.gov/drisi/), as many of these concepts have applicability at a program level and beyond a single project.

From: Tammy Koegle
Organization:
Phone: 562-965-7972
Mailing Address: 8044 rosecrans ave
City, State: paramount
Zip: 90723
Comment/Question:
I support Metro and Cal trans with the many upgrades that need to happen with our degrading freeways and streets but we need to make sure what we do is safe for the surrounding families and communities. When looking at all the alternatives to the ways we can do this project, I would go with Alternative 7 since it does a little of everything from making sure the clean air is taking care of with the diesel trucks to having separate lanes also, to making sure Visual/Aesthetic Features put in for each city to improve home values. Also, with that we will be able to put in wider bike routes and pedestrian lanes for people who like to run or walk their dogs. This will increase people getting out in the communities without worrying about smog or other pollution in the air from the trucks. This is a good thing that it would not impact historical places. Also water drainage areas on the freeways will get improved and storm ways will get fixed. IP-29-1

RE: SUPPORT Alternatives 5C and 7 for I-710 South Corridor

Dear Mr. Kosinski,

On behalf of BizFed, a grassroots alliance of over 160 business organizations that represent 325,000 employers with over 3 million employees in LA County, we are writing in support of Alternatives 5C and 7 of the I-710 South Corridor Project. We support these two alternatives because they both reduce traffic congestion throughout the corridor and help improve regional air quality by allowing a balanced approach for both zero-and near-zero technologies in the proposed "Truck Technology Deployment Program" and "Clean Emission Freight Corridor." IP-30-1

As you know, the I-710 is a major gateway for Southern California's goods movement sector. Increased traffic congestion on the highway negatively impacts the competitiveness of our regional goods movement sector and contributes to increased levels of pollution along the corridor, this was a major consideration that lead to BizFed to support Measure M in 2016 as members wanted highway and goods movement investments like this on the ballot.

It is imperative that we make enhancements along the corridor that speed up the flow of traffic and that we deploy cleaner vehicle truck technology to improve regional air quality and the health of the communities that live near the highway. This includes the modernization investments included in alternative 5C, the construction of a Clean Emission Freight Corridor outlined in Alternative 7, and the deployment of zero and near zero emission technologies outlined in both alternatives.

The I-710 Corridor Project should be focused on improving the flow of traffic and reducing greenhouse gas and particulate emissions in support of California's environmental goals. We urge continued support for Alternatives 5C and 7. Thank you for allowing our input on this matter. Should you have any questions, please contact Jerard Wright, BizFed Policy Manager, at (323) 919-9424.

Sincerely,

Mike Lewis

IP-30-1

Caltrans and Metro thank the commenter for their input. The commenter's support of Alternative 5C and Alternative 7 are acknowledged and included in the project record. Please refer to Section 1.1 of this appendix for a discussion on the identification of the Preferred Alternative (Alternative 1 No Build).

PLAINS ALL AMERICAN PIPELINE, L.P.

Ronald Kosinski
Deputy District Director
Caltrans District 7, Division of Environmental Planning
100 South Main Street, MS 16A
Los Angeles, CA 90012

October 23, 2017

Subject: **Comments to the I-710 Corridor Project Recirculated Draft Environmental Impact Report / Supplemental Draft Environmental Impact Statement (RDEIR/SDEIS)**

Dear Mr. Kosinski:

Plains All American Pipeline L.P. (PAALP) appreciates the opportunity to provide comments and continuing a dialogue with the I-710 Corridor Project team.

PAALP owns and operates several crude oil transportation entities in the Los Angeles (LA) basin including Plains West Coast Terminals LLC and Pacific Pipeline System LLC . The proposed I-710 corridor project will affect both of these entities which are an integral part of our overall petroleum pipeline, storage, and transfer systems. These pipelines are primarily used to transfer crude oil received from various local, in-state producers and shipping vessels into our storage terminals and subsequently distributed as feed stock to many major refineries in the LA Basin. Disrupting the ability to move volumes through our various PAALP pipeline systems, could result in adverse effects on the operations of many local refineries.

This project will have significant financial outcomes to our business. Possible customer demurrages, loss of revenue, engineering support, inspections, line identification, and excavation oversight will add significant monetary obligations to this overall project. An elaborate working relationship with the I-710 project team will be required.

The RDEIR/SDEIS addressed several specific PAALP owned pipelines affected by the various build alternatives, specifically *Section 3.4.2.2 Permanent Impacts* identifies several assets owned by Plains West Coast Terminals LLC and Pacific Pipeline System LLC. Our review of the RDEIR/SDEIS *Appendix O Concept Plans* determined there are numerous additional interferences and conflicts not identified in *Appendix O* that affect our pipeline right-of-ways. These conflicting pipeline locations are shown in Table 1. IP-31-1

According to the RDEIR/SDEIS, several newly proposed structures or pathways are in close proximity to our active and retired pipelines. Since heavy cranes, drill rigs and pile drivers will IP-31-2

be required for this project, weight bearing calculations need to be performed. Also, PAALP requests vibration studies and calculations be performed in accordance with ASME standards. These essential steps will determine if the integrity of our pipelines will be affected by the proposed construction / demolition activities. More than likely, "protect-in-place" plans will need to be developed to address these issues. IP-31-2

Development and redevelopment associated with the proposed project must not restrict any PAALP day-to-day operations, and or access to our right-of ways. PAALP must be allowed to maintain its rights-of-entry which requires unobstructed access to its easements at all times in order to repair and maintain the pipeline systems. PHMSA / State Fire Marshall regulations require access to active petroleum pipelines for emergency response to any abnormal operating conditions. IP-31-3

Detailed drawings depicting PAALP pipelines and rights-of-way may be obtained by contacting Mr. Joe Mateo at (562) 728-2368. This will assist in preparing plans that are compatible with PAALP facilities, easements, and properties. Please note that all designs or plans must clearly identify PAALP assets and rights-of-ways. IP-31-4

We appreciate the opportunity to provide input to your planning process. This letter was also submitted on-line. If you have any questions, please contact Mr. Bill Senner at (562) 728-2056.

Sincerely,

Glen Mears

IP-31-1

Caltrans and Metro thank the commenter for providing this additional information. Section 3.4.2.2 of the RDEIR/SDEIS provides a description of impacts that would occur on major regional facilities as a result of the build alternatives. The list of utilities that would be affected by the build alternatives is not intended to be exhaustive, but includes potential conflicts based on the current level of design. As discussed in Section 3.4.3 of the RDEIR/SDEIS, the build alternatives propose Measure U&ES-2 which, should a build alternative be selected as the Preferred Alternative, would require the preparation of Specific Utility Relocation Plans, outlining the description of existing facilities, proposed changes/demolition, potential conflicts that would need to be resolved, and Utility Team Coordination Meetings with all utility companies and local jurisdictions' Departments of Public Works affected by either build alternative. However, Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), has identified Alternative 1 (No Build) as the Preferred Alternative. Therefore, there will be no impacts to utilities. Please refer to Section 1.1 of this appendix for further discussion on the identification of the Preferred Alternative.

IP-31-2

As discussed in Section 3.4.3 of the RDEIR/SDEIS, the build alternatives propose Measure U&ES-2 which, should a build alternative be selected as the Preferred Alternative, would require the preparation of Specific Utility Relocation Plans, outlining the description of existing facilities, proposed changes/demolition, potential conflicts that would need to be resolved which would include potential indirect impacts to nearby pipelines or facilities that would be intended to be protected in place, and Utility Team Coordination Meetings with all utility companies and local jurisdictions' Departments of Public Works that would be affected by the build alternatives. Should a build alternative be selected as the Preferred Alternative, the meetings would occur during the final design phase and would include final design and construction staging. The meeting participants would discuss and plan a workable sequence of utility alterations so that the utility work could be coordinated and, where possible, completed in advance of highway work. However, as stated in Response to Comment IP-31-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, there will be no impacts to utilities and Measure U&ES-2 will not be implemented.

IP-31-3

Please refer to Response to Comment IP-31-3 regarding implementation of Measure U&ES-2.

IP-31-4

Please refer to Response to Comment IP-31-2 regarding implementation of Measure U&ES-2.

IP-31-5

Please refer to Response to Comment IP-31-1 regarding impacts to utilities.

Mailing Address: 956 BURGER AVENUE
City, State: LOS ANGELES
Zip: CA
Comment/Question:
I don't like this idea of them making the additional 2 lane in front of my house. I suffer with cancer and I don't understand why they are doing this, why we were not told on time. juts now. nobody is giving us the opporniuty to void on this . I don't want it . I been a resident for over 4o years and they always have make changes in our community. I don't under why we cant void on this issue. always on the low income places they always take advance and if you don't have the funds to bill this project, this only means we don't get the help need it. I don't want my street to change . I am a home owner and this affect me and my health. IP-32-1

*You received this message because RAMIRO PUGA submitted feedback regarding the I-710 Corridor Project.

System Administrator

This page intentionally left blank

IP-32-1

The commenters' opposition to the project and concerns regarding public comment, health risk, and impact on low-income populations is acknowledged and noted in the public record. Pursuant to the requirements of CEQA and NEPA, the public has been afforded several opportunities to provide input on the project prior to public circulation of the RDEIR/SDEIS. As discussed below, the public had opportunity to provide input on the project during the 30-day public circulation period of the Notice of Preparation (NOP), during the 91-day public circulation period of the Draft EIR/EIS, and during public meetings held during both public circulation periods.

The scoping process was initiated on August 15, 2018, with distribution of a Notice of Preparation (NOP) and the publication of a Notice of Intent (NOI) in the Federal Register. The NOP was circulated to agencies, groups, organizations, interested parties, and the public. The NOP notified the public that an EIR/EIS was being prepared, along with the scoping meeting locations and how to provide comments on the project. Public scoping meetings were held on September 9, 10, and 11, 2008, at Rowan Elementary School in East Los Angeles, Progress Park in the City of Paramount, and Cabrillo High School in Long Beach, respectively. Several methods of notification were used in addition to the publication of the NOP and NOI to notify the public of the scoping period and meetings: a newsletter, email, public notices (Los Angeles Times, Long Beach Press Telegram, Mundo LA, Los Angeles Eastside Sun, and Los Angeles Watts Times), and the project website. The public was afforded the opportunity to comment on the project during the 30-day circulation period of the NOP and during the public scoping meetings. Please refer to Chapter 5.0, Comments and Coordination, of the 2012 Draft EIR/EIS, for additional details on the scoping process.

The 2012 Draft EIR/EIS was made available for public comment during the 91-day public comment period, from June 29 to September 28, 2012. A Notice of completion of the Draft EIR was sent to the State Clearinghouse and posted June 27, 2012. The availability of the Draft EIS was advertised in Volume 77, Issue No. 124 of the Federal Register on June 27, 2012. Several methods were utilized to notify the public of the availability of the document. A letter was mailed to those on the distribution list included in the 2012 Draft EIR/EIS. A notice of availability of the Draft EIR/EIS with instructions on how and where to access the document and submit comments, as well as information on the public hearings, was published in the Los Angeles Times on June 29 and August 4, 2012; the Long Beach Press-Telegram on June 29 and August 3, 2012; La Opinion (Spanish-language publication) on June 29 and August 3, 2012; the Los Angeles Eastside Sun on July 7 (internet only), July 12, and August 3, 2012; and the Los Angeles Watts Times on July 5 and August 2, 2012. In addition, a postcard mailer was sent to all property owners and occupants within a 300-foot radius of the project improvements notifying them of the availability of the document and of the opportunity to review and comment. Notices were sent via email to the email addresses on file in the project database maintained by Metro. Three public hearings were held in support of the release of the Draft EIR/EIS. Locations were chosen

throughout the I-710 Corridor to maximize the potential attendance. The public hearings were held on August 7, 2012, at Progress Park in Paramount, August 8, 2012, at Silverado Park Community Center in Long Beach, and on August 9, 2012, at Rosewood Park in Commerce. The public was afforded the opportunity to comment on the project during the 91-day circulation period of the Draft EIR/EIS and during the public scoping meetings. Please refer to Chapter 5.0, Comments and Coordination, of the RDEIR/SDEIS, for additional details on public circulation of the Draft EIR/EIS.

Please refer to Section 1.2 of this appendix for more information regarding outreach and the 2017 public comment period.

As discussed in Section 1.2.2 in Chapter 1.0, Proposed Project, of the RDEIR/SDEIS, one of the purposes of the project is to improve air quality and public health. As discussed in Section 3.13, Air Quality, in the RDEIR/SDEIS, all build alternatives would generally improve air quality and reduce public health risk. Along I-710, air quality would be improved and public health risk would be reduced at most locations, but there are a few near-roadway locations where there would be an increase in certain emissions. Both build alternatives would include a soundwall to reduce freeway noise at the residences located along Burger Ave. in the City of Los Angeles. Specifically, a 16-foot-high soundwall (SW-517 under Alternative 5Cand SW-717 under Alternative 7) has been recommended to replace the existing 12-foot-high soundwall, should a build alternative be selected as the Preferred Alternative. This soundwall would begin at the on-ramp from Olympic Blvd. onto the mainline northbound I-710 and overlap with an existing 12-foot-high soundwall near Humphreys Ave. This soundwall may also help reduce pollutant concentrations downwind of the freeway. In addition, Measure AQ-3 was included in the RDEIR/SDEIS to reduce pollutants in near freeway locations resulting from the build alternatives. The build alternatives also propose Measure AQ-3 which would require installation of solid barriers where soundwalls are not proposed to reduce noise impacts, and installation of vegetation to disperse pollution and reduce pollutant concentrations downwind. In addition, the build alternatives include programmatic components to help improve air quality and public health in the I-710 Corridor. As discussed in Section 2.3.2, Build Alternatives, in the Final EIR/EIS, the I-710 Clean Truck Program (referred to in the RDEIR/SDEIS as the I-710 Corridor Project Zero Emission/Near Zero Emission Truck Technology Deployment Program) is a programmatic component of the build alternatives. Should a build alternative be selected as the Preferred Alternative, this program would provide funding to individual owner-operators and privately owned truck fleets to subsidize the purchase of heavy-duty (Class 8) ZE/NZE trucks for use within the I-710 Corridor. A Community Health Benefit Program is also proposed as a programmatic element of the build alternatives. However, Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), has identified Alternative 1 (No Build) as the Preferred Alternative. Since a build alternative has not been selected as the Preferred Alternative, these programmatic elements will

not be implemented by Caltrans as the lead agency under CEQA and NEPA and as the owner/operator of the I-710 freeway.

Please refer to Section 1.1 of this appendix for further discussion on the identification of the Preferred Alternative. Please refer to Section 1.10 of this appendix for more information on the Community Health Benefit Program.

Caltrans and Metro acknowledge the potential disproportionate impacts that the I-710 Corridor Project build alternatives may have on environmental justice communities, including low-income communities. The build alternatives propose Measure C-7 in Section 3.3.3.7 of the RDEIR/SDEIS to reduce these impacts. Should a build alternative be selected as the Preferred Alternative, Measure C-7 would specifically address disproportionate impacts to environmental justice populations with regards to air quality, traffic, visual impacts, and land use/parks and recreation resulting from the build alternatives. However, as stated above, the No Build Alternative has been selected as the Preferred Alternative and therefore, Measure C-7 will not be implemented.

Subject: I-710 Corridor Project Feedback

From: Dennis Rodriguez
Organization: Siemens Corporation
Phone: 3104034192
Mailing Address: 515 S. Flower Street #3663 City, State: Los Angeles, CA
Zip: 90071
Comment/Question:
To Whom It May Concern;

Siemens welcomes the opportunity to comment on the I-710 RDEIR/SDEIS because creating a zero emission goods movement future in the region, while focused on clean technologies that reduce emissions and combat climate change, is a strong priority for Siemens.

The I-710 RDEIR/SDEIS has missed an opportunity to investigate the electrification of the I-710 using catenary and catenary enabled trucks. This is in contravention of the Los Angeles County Metropolitan Transportation Authority's Governing motions (22.1) as well as State Bill 350. IP-33-1

The I-710 RDEIR/SDEIS states that it is not mandating a particular technology pathway or a certain type of operation. However, wayside power solutions, such as catenary, have not been investigated and, in fact, have purposefully been excluded from consideration in the name of technology neutrality [1]. IP-33-2

This exclusion of wayside power solutions, a technology option which several studies (i.e. GNA [2], UBA [3], IEA [4], ICCT [5] and others) have found to be the most cost effective way to reduce both harmful local pollutants and greenhouse gases, is a detriment to the communities impacted by the I-710. Furthermore, way-side power solutions constitute a backbone technology that is perfectly compatible with, and complementary to, other alternative fuel technologies. IP-33-3

Had the I-710 project investigated catenary electrification they would have identified that pilot projects of the technology are currently operational on public highways across the globe, as well as, within the region, on Alameda Street, in the City of Carson. IP-33-4

The CEO of a large European truck OEM thinks that trucks using such catenary systems will be a common sight within five years [6]. Germany's Chancellor Angela Merkel is promoting the technology [7], and following positive technical and economical assessments by the German Transport Ministry [8], Germany has announced three projects within the next two years on its main roads [9,10].

In alignment with the project's technology neutrality stated policy, the I-710 should only focus on those technologies which are able to support the long-term (POLA/POLB) Clean Air Action Plan (CAAP) goal towards zero-emissions, with a focus on the future deployment of alternative fuels, that are low- or zero-emitting, at the point of use and across the entire supply chain, both with regards to air pollutant and carbon dioxide (CO2) emissions, as a means to address multiple energy policy goals. According to the International Energy Agency this will be only electricity and hydrogen. IP-33-5

As POLA and POLB will also serve in an advocacy role to help reduce barriers for applicants and ensure funding awards will be targeted for priority projects in support of the CAAP goals, it is necessary to limit the funding to those technologies. According to the California Air Resources Board (CARB), the investment in bridge technologies will limit the

possibilities to be technology neutral for zero emission. Therefore Siemens argues vehemently for the I-710 project to focus on such technologies. IP-33-5

The I-710 is the busiest trucking corridor in the country. It constitutes a vital link between the San Pedro Bay ports and several nearby rail yards and warehouses. No corridor is better situated to benefit from the transition to zero emissions that a catenary system can provide, with very high efficiency, to the thousands of goods movement trucks that travel on that route. It could also be a first step to a regional network, including highway 60 to the inland empire, making zero emission trucking a reality for Los Angeles.

Siemens therefore would like to express its strong recommendation that the I-710 project include the catenary option, as it proceeds with the more detailed studies for implementation. IP-33-6

Best regards,

Dennis Rodriguez

Chief City Executive - LA/SF/SD/Pho
Siemens Corporation

*You received this message because Dennis Rodriguez submitted feedback regarding the I-710 Corridor Project.

Regards,
System Administrator

IP-33-1

Caltrans and Metro acknowledge that at time the RDEIR/SDEIS was circulated for public review, it was not known what type of ZE/NZE technology would be available in commercial mass production at the time a build alternative would be implemented (should a build alternative be selected as the Preferred Alternative). Therefore, as stated by the commenter, the analysis contained within the RDEIR/SDEIS and this Final EIR/EIS is considered "technology neutral." However, Caltrans and Metro both respectfully disagree that any opportunity for investigation has been missed. Caltrans, as lead agency under CEQA and NEPA (as assigned by the Federal Highway Administration [FHWA]), in cooperation with the Los Angeles County Metropolitan Transportation Authority (Metro), has identified Alternative 1 (No Build) as the Preferred Alternative. Therefore, ZE/NZE technology will not be implemented as part of the I-710 Corridor Project. Please refer to Section 1.1 of this appendix for further discussion on the identification of the Preferred Alternative.

It should be noted that wayside power for a catenary system was examined for the build alternatives evaluated in the Draft EIR/EIS circulated for public review in 2012. In addition to the additional visual impacts of the overhead catenary system, the evaluation also identified additional costs, infrastructure requirements, and related right-of-way concerns associated with the delivery of power from the region's electric power grid to the I-710 Corridor.

Subsequent to the Draft EIR/EIS, Metro sponsored a study on zero emissions technologies for the I-710 Corridor. The *I-710 Project Zero Emissions Commercialization Study* was completed by Calstart in 2013. At the same time, a comprehensive update of the future traffic forecasts was conducted for the I-710 Corridor, consistent with the new 2012 Regional Transportation Plan (RTP) travel demand forecast model. These studies were utilized to better understand existing and future truck travel needs and truck patterns on the I-710 Corridor. Through this work, it was discovered that I-710 does not serve a single, major drayage pattern. Trucks on I-710 serve a wide variety of trip purposes, and destination points are geographically dispersed throughout the SCAG region. Further, trucks use I-710 for only a portion of their trips and must rely on the overall arterial and freeway network to connect to their ultimate destinations.

As a consequence, the study effort for the RDEIR/SDEIS was broadened to encompass a wide range of zero and near-zero emissions vehicle technologies capable of delivering air quality benefits both on and off the I-710 Corridor that would be compatible with either of the two build alternatives (Alternatives 5C and 7). Features such as funding to support private initiatives to develop electronic charging stations and hydrogen fueling stations within the I-710 Study Area were also added to the I-710 program in recognition of the decentralized nature of truck travel on the I-710.

While the I-710 Clean Truck Program (referred to in the RDEIR/SDEIS as the I-710 Corridor Project Zero Emission/Near Zero Emission Truck Technology Deployment Program) is defined to

be technology neutral so as not to prejudge emerging zero emissions technologies, it would not preclude the future implementation of catenary and wayside power for the freight corridor alternative should a build alternative be selected as the Preferred Alternative and these technologies become commercially available and prove to be economically sustainable beyond the pilot project stage of operations. It is important to note that the I-710 Clean Truck Program is a programmatic element of the build alternatives, and the No Build Alternative has been selected as the Preferred Alternative and this programmatic element will not be implemented by Caltrans as the lead agency under CEQA and NEPA and as the owner/operator of the I-710 freeway.

IP-33-2

Caltrans and Metro both respectfully disagree that any potential technologies were purposefully excluded from consideration. Please refer to Response to Comment IP-33-1 regarding ZE/NZE technology. In addition, in Section 2.3.2.3 of the RDEIR/SDEIS, overhead catenary electric power systems are specifically mentioned as a potential power system that could be utilized for electric propulsion trucks. Although this section of the RDEIR/SDEIS is specifically discussing the freight-only corridor under Alternative 7, this information would still be applicable to the I-710 Clean Truck Program (referred to in the RDEIR/SDEIS as the I-710 Corridor Project Zero Emission/Near Zero Emission Truck Technology Deployment Program) that is a programmatic project component of the build alternatives. Please refer to Response to Comment IP-33-1 regarding implementation of the I-710 Clean Truck Program.

IP-33-3

Caltrans and Metro appreciate this information regarding catenary power systems. Please refer to Responses to Comments IP-33-1 and IP-33-2 regarding ZE/NZE technology.

IP-33-4

Please refer to Response to Comment IP-33-1 regarding electrification of the catenary system.

IP-33-5

Please refer to Response to Comment IP-33-1 for more detailed information regarding ZE/NZE technologies.

IP-33-6

The commenter’s recommendation is acknowledged and is included in the project record. Please refer to Responses to Comments IP-33-1 and IP-33-2 regarding inclusion of a catenary system as part of the build alternatives.

Re: Recirculated Draft Environmental Impact Report/Supplemental Draft Environmental Impact Statement Prepared for the I-710 Corridor Project

Dear Mr. Kosinski:

The Salvation Army submits these comments on the Recirculated Draft Environmental Impact Report/Supplemental Draft Environmental Impact Statement ("RDEIR/SDEIS") prepared for the I-710 Corridor Project (the "Project"). The Salvation Army owns parcel number 6332002036 in the City of Bell, where it operates the Bell Shelter. As proposed, Project Alternative 7 would result in significant adverse impacts to the Bell Shelter. Therefore, the Salvation Army submits that Project Alternative 5C is a superior project alternative as it minimizes the Project's effects on the Bell Shelter (and its essential community partners). IP-34-1

The Salvation Army is a California nonprofit corporation. The greater Salvation Army operates in 125 different countries, serving millions of needy and vulnerable persons throughout the world. Current programs include emergency shelters and transitional and permanent housing programs for the homeless; child care centers; low-income housing and services for senior citizens; hospitals and medical facilities; domestic violence shelters; individual and group counseling services; family reunification and missing persons services; anti-human trafficking programs; vocational training and career counseling; disaster relief; HIV/AIDS services; and drug and alcohol rehabilitation.

I. Background

A. The Salvation Army Bell Shelter

Phone: (562) 264-3672
Fax: (562) 264-3772

www.salvationarmy-socal.org

The Salvation Army Bell Shelter is located on the site of the former Cheli Air Force Base, in the City of Bell. The Shelter offers housing and services to over 480 persons on a nightly basis throughout the year. The Shelter provides crisis, bridge, and transitional housing for homeless adults in two large-scale buildings, as well as in ten three-bedroom modular homes on permanent foundations and three two- and three-bedroom mobile homes. The Shelter's services include crisis/bridge housing (three to six month stay), transitional housing (up to 24 month stay), recuperative care shelter (one to three month stay for homeless adults exiting hospitals but not yet ready for mainstream shelter or a return to the streets), and temporary independent living for homeless adults, including veterans and the formerly incarcerated, in modular and mobile homes.

In addition to temporary housing, Bell Shelter provides residents with supportive services, including a comprehensive needs assessment; an individualized case plan designed to address residents' strengths and weaknesses and assist in the transition to permanent housing and independent living in the community; a state-licensed residential drug and alcohol recovery program; job preparation and placement services; educational and vocational services; individual and group counseling provided by licensed clinicians; assistance in obtaining mainstream benefits; medical and mental health services; permanent housing assistance; and follow-up services. Bell Shelter also operates a Neurofeedback Clinic to address symptoms from PTSD, anxiety, insomnia, substance abuse relapse, and other maladies that commonly afflict persons experiencing homelessness. Over 100 adults, mostly veterans, benefit from this free, specialized service each year at Bell Shelter.

Each year, over 1,500 homeless adults receive housing and services at Bell Shelter. Roughly a third of these residents are veterans. Further resident demographic data show that:

- 41% of residents have a physical disability
- 36% of residents have a diagnosed mental illness
- 34% of residents have a drug problem
- 30% of residents have an alcohol problem
- 44% of residents have a chronic health problem
- 57% of residents have two or more physical or mental health conditions

The Property on which The Salvation Army operates the Shelter is comprised of approximately 25.321 acres of land and contains two large former warehouse structures. The Salvation Army has utilized the property continuously over the past three decades to provide services to the homeless. From 1988 to 2007, The Salvation Army leased most of the parcel from the General Services Administration. In August 2007, the U.S. Department of Health and Human Services conveyed the land and structures to The Salvation Army, under the provisions of the McKinney-Vento Act, to be used to provide services to the homeless for the next 30 years.

B. RDEIR/SDEIS Project Alternatives

The RDEIR/SDEIS presents and evaluates three revised project alternatives, which include a no build alternative and two build alternatives: Alternative 5C and Alternative 7, both involving modernization of I-710 geometric design, particularly at interchanges and access points. The primary distinguishing feature between the build alternatives is that Alternative 7 contains the additional construction of a separate four-lane freight corridor.

Both build alternatives would adversely affect the Bell Shelter. Alternative 7 requires a partial acquisition of the Bell Shelter, as well as a full acquisition and relocation of the Mark Taper Foundation Shelter Resource Bank – a nearby facility at the same street address that is owned by the Shelter Partnership and whose operations are interrelated with those of the Bell Shelter. Under Alternative 5C direct impacts to the Shelter itself are avoided, but the Resource Bank must be partially acquired. Relocation or disruption of operations at the Resource Bank would have indirect impacts to the operations of the Shelter.

II. Caltrans Must Reject Project Alternative 7 in Light of Its Significant Adverse Impacts and the Availability of a Feasible Alternative That Would Substantially Lessen Such Impacts.

The California Environmental Quality Act ("CEQA") (Pub. Resources Code, § 21000 et seq., hereafter CEQA) imposes two basic duties on government agencies: (1) the duty to fully explore, analyze, and disclose all significant environmental effects of a proposed project in an environmental impact report ("EIR") (CEQA, § 21002.1); and (2) to avoid or mitigate those significant effects by choosing a less environmentally damaging alternative project, or by identifying and recommending for adoption all feasible mitigation measures. Projects that will have significant environmental impacts cannot be approved as proposed if there are feasible alternatives or mitigation measures available that would substantially lessen the adverse effects. (CEQA, §§ 21002, 21081; Cal. Code Regs., tit. 14, §§ 15091-15094, hereafter Guidelines.)

Similarly, the National Environmental Policy Act ("NEPA") (U.S.C. § 4331 et seq.) requires any proposed major federal actions (e.g., federally funded projects) that significantly affect the environment to prepare an environmental impact statement ("EIS"), which must include the environmental impact of the proposed action, any adverse environmental effects which cannot be avoided should the proposal be implemented, and alternatives to the proposed action. (42 U.S.C., § 4332, subd. (c)(i)-(iii).) The Federal Highway Administration, in its implementation of NEPA, directs that final decisions regarding projects are to be made in the "best overall public interest" after taking into account adverse environmental impacts such as the "injurious disruption of people" and "disruption of desirable community and regional growth." (42 U.S.C., § 109, subd. (h).)

Phone: (562) 264-3672
Fax: (562) 264-3772
www.salvationarmy-socal.org

A. The RDEIR/SDEIS Improperly Concludes That Acquisition and Relocation Impacts to the Bell Shelter Would Be Less Than Significant with Implementation of the Proposed Mitigation Measures.

The RDEIR/SDEIS incorrectly concludes that, with implementation of Measures C-1 and C-4, the Project's impacts to the Bell Shelter under Alternative 7 would be less than significant. Alternative 7 would require relocation of both the Shelter and the Resource Bank. Pursuant to the Uniform Relocation Assistance and Real Property Acquisitions Policies Act ("Uniform Act"), Measure C-1 establishes relocation services and payments, to be provided by Caltrans. Measure C-4 provides: "During final design, and consistent with the requirements of the Uniform Act, Caltrans shall negotiate with the City of Bell to determine appropriate action and/or identify an alternative location for the Bell Shelter/Resource Bank within the general vicinity of the existing facility so as to maintain the service area and its cooperative relationship with the Bell Shelter and mitigate for the acquisition of the center. The existing center shall not be demolished until the facility has been relocated and is operational." IP-34-2

Based on the 2017 Relocation Impact Report ("RIR") prepared for the Project, the RDEIR/SDEIS claims that sufficient relocation properties are currently available within the Study Area – this is not true. Rather, the RIR recognizes that relocation of the Shelter and Resource Bank would be difficult and fails to identify specific locations for relocation of the facilities. In direct contradiction of the RDEIR/SDEIS, the "final conclusion" of the RIR states that "[t]here appears to be adequate replacement properties for all displaces *with exception to special needs nonresidential properties* and available affordable replacements for residential tenants."

Without identifying relocation sites, Measures C-1 and C-4 convey a misleading impression about the effectiveness of the proposed mitigation for relocation of the Shelter, thus illegally postponing a crucial determination until after Project approval. As such, they are wholly insufficient as mitigation measures for Alternative 7's impacts on the Bell Shelter.

B. Displacement of the Bell Shelter Would Further Exacerbate the Homelessness Crisis in Los Angeles County.

Los Angeles County's homeless population increased by a staggering 23% between 2016 and 2017. The sharp rise, to nearly 58,000, suggests that the pathway into homelessness continues to outpace intensifying efforts against the crisis. The magnitude and urgency of homelessness in the greater Los Angeles area necessitate that all future development prioritize against further contributing to the plight of homeless persons.

The Salvation Army has provided housing and services to homeless individuals on the Shelter parcel for nearly 30 years. Relocating the affected residents would likely cause IP-34-3

Phone: (562) 264-3672
Fax: (562) 264-3772
www.salvationarmy-socal.org

significant impacts as the City of Bell and the greater Los Angeles area absorb the needs of those displaced. The Bell Shelter is one of the largest homeless shelters in the country; finding adequate housing for the number of individuals that would be displaced would likely require the construction of several new facilities, in several different locations. IP-34-3

There are also serious questions about whether adequate relocation would even be possible, due to the Shelter's size, sources of funding, and the challenges presented in siting homeless shelters. The Bell Shelter occupies two large warehouse structures, as well as a cluster of modular homes, on the site of a former air force base. Finding an equivalently large site in the area would prove difficult, if not impossible. Additionally, the Shelter's parcel is encumbered by a variety of long-term requirements for the provision of housing and services for the homeless, which extend out as long as 2037. Should the provision of housing or services under existing contracts for services be interrupted or adversely impacted by the Project, these long-held contracts could be lost. Currently, residential housing and services are supported by approximately $8.5 million in local, state, and federal government grants and contracts for services. The Project threatens the future viability of this funding. Lastly, community opposition can present a further challenge to siting homeless shelters. This is one of the reasons for the federal policy that led to the Shelter's current location and one of the reasons why relocating the Shelter could prove difficult. All of these factors raise doubts about whether the Shelter could actually be replaced. IP-34-4

Even if sites and funding could be obtained to construct and operate facilities elsewhere, it is unclear that they would prove as successful as the Bell Shelter at combating homelessness. Residents of the Shelter experience high rates of success in transitioning out of homelessness, particularly for a population that is so difficult to serve. Over forty-five percent of low barrier/low demand crisis and bridge housing residents are placed into transitional or permanent housing upon exit, and over 50% of clients maintain or increase their income. Sixty-five percent of residents in transitional housing exit to permanent housing within two years, and nearly every client maintains or increases his or her income.

Among the reasons for the Shelter's high success rate is its location, which lacks proximity to negative influences that contribute to residents' becoming homeless. The Shelter's removed location enables residents to focus on addressing the underlying causes of their homeless condition rather than struggle to resist temptations that may otherwise trouble them. The Salvation Army has built a working relationship with the local communities and partners over many years and convenes a quarterly Local Government Task Force with representatives of neighboring communities to support collaboration and address homeless issues in the local area. The Salvation Army's property also hosts a complementary group of organizations that work collaboratively to address the needs of persons experiencing homelessness. The Project would demolish these long-standing structures and programs dedicated to helping end homelessness in Los Angeles County, further exacerbating the homelessness crisis. IP-34-5

Phone: (562) 264-3672
Fax: (562) 264-3772
www.salvationarmy-socal.org

The loss or reduction of beds at Bell Shelter would further challenge efforts to address and end homelessness in an underserved area. Homeless shelters in this area already risk overcrowding, which is considered a significant environmental effect under CEQA. (Cal. Code Regs. tit. 14, § 15064(e) ("[I]f a project would cause overcrowding of a public facility and the overcrowding causes an adverse effect on people, the overcrowding would be regarded as a significant effect.").) The impacts of Alternative 7 would only increase the risk of overcrowding, particularly if the challenges related to relocation, described above, prevent the construction of an equal number of housing accommodations for homeless individuals. IP-34-6

CEQA allows Caltrans to determine an effect's "significance" based on substantial evidence in the record, including scientific and factual data and the circumstances of the surroundings. (Guidelines, § 15064, subd. (b).) In view of the social and economic realities in the greater Los Angeles area, as well as the crucial services that the Bell Shelter provides, Caltrans should reject as infeasible Alternative 7 to avoid displacing the Bell Shelter and requiring the already overburdened homeless shelters in Los Angeles area absorb the needs of the Shelter's residents. (See *City of Del Mar v. City of San Diego* (1982) 133 Cal.App.3d 401, 417 ["[F]easibility" under CEQA encompasses 'desirability' to the extent that desirability is based on a reasonable balancing of the relevant economic, environmental, social, and technological factors."].) IP-34-7

C. Project Alternative 7 Violates Environmental Justice Requirements.

The unmitigated impacts resulting from displacement of the Bell Shelter would be predominantly borne by environmental justice populations, in violation of environmental justice requirements under Executive Order 12898, Federal Actions to Address Environmental Justice in Minority Populations and Low Income Populations, signed by President Clinton on February 11, 1994. The Executive Order requires federal agencies to identify and address "disproportionately high and adverse human health or environmental effects of [their] programs, policies, and activities on minority populations and low-income populations." (Exec. Order No. 12898, 59 Fed.Reg. 7629, 7629 (Feb. 16, 1994).) The Project receives federal funding and must comply with Executive Order 12898.

The RDEIR/SDEIS recognizes that relocation of the Shelter or the Resource Bank would be difficult and does not identify specific locations for the relocation of these facilities, which serve a population that is 76% minority and 100% low-income. Even if the Shelter could be relocated – a significant assumption – it would adversely and disproportionately impact these vulnerable individuals by disrupting their lives and interrupting vital services provided by the Shelter. The Project's adverse impact on the Shelter's population must be fully mitigated to comply with Executive Order 12898. IP-34-8

Phone: (562) 264-3672
Fax: (562) 264-3772

www.salvationarmy-socal.org

D. Relocation of the Bell Shelter Would Have Substantial Negative Impacts on Other Organizations That Provide Complementary Services.

In addition to the Bell Shelter, The Salvation Army's property hosts several organizations that provide complementary services:

- **Union Rescue Mission** utilizes space at the Shelter for storage to support its Mission facilities in downtown Los Angeles;
- **JWCH Institute** operates a 30-bed recuperative care program for homeless persons exiting hospitals who are too ill to be released to shelters or back onto the streets. The Institute has operated this program on The Salvation Army's property in Bell for more than four years and represents a direct response to the much-maligned practice of "dumping" of homeless patients on Skid Row by local hospitals;
- The **Los Angeles Homeless Services Authority** utilizes a portion of the Shelter's warehouse space to store cots, blankets, and other materials for its Winter Shelter program;
- **Help the Children** utilizes the warehouses to operate a food pantry and resource bank for nonprofit organizations serving the homeless in the United States and abroad; and
- **The Salvation Army Disaster Services Unit** uses the warehouses to store food, equipment, and emergency disaster materials for a five-county region.
- **GrowGood** provides fresh produce and opportunities through their 1.5-acre farm adjacent to the Bell Shelter. GrowGood contributes to the more than 6,000 meals served each week at the Bell Shelter. Residents of the Bell Shelter have access to GrowGood's job training program, food choice classes, and the peace and healing aspects of their garden.

IP-34-9

The Salvation Army works together with these groups to address the needs of persons experiencing homelessness. Displacement of the Shelter under Alternative 7 would have substantial negative impacts on all of these organizations, not only displacing them but also upsetting efficiencies that come from their proximity to one another.

III. Project Alternative 5C, along with Mitigation Measures, Should Be Implemented to Minimize the Project's Adverse Effects on the Bell Shelter.

The Project's significant impacts to the Bell Shelter must be fully mitigated. A finding and statement of overriding considerations would be inadequate because there is a feasible alternative available which would substantially avoid the significant adverse effects on the Shelter. (CEQA, § 21081; *Friends of Sierra Madre v. City of Sierra Madre* (2002) 25 Cal.4th 165, 185.) Pursuant to CEQA requirements, Caltrans should not approve Alternative 7 as proposed by the RDEIR/SDEIS when a feasible alternative that accomplishes the Project's goals with substantially less significant environmental impacts – i.e., Alternative 5C – is clearly available.

IP-34-10

Phone: (562) 264-3672
Fax: (562) 264-3772

www.salvationarmy-socal.org

Alternative 5C would feasibly attain the Project's objectives, but would substantially lessen the Project's significant adverse effects on the Shelter. Both build alternatives involve modernization of I-710 geometric design, in furtherance of the Project's purpose to address safety, operational, and capacity deficiencies. Yet Alternative 7 would result in the same or greater impacts than Alternative 5C in *all* of the resource areas discussed in the RDEIR/SDEIS, particularly with respect to adversely affecting the Bell Shelter. IP-34-10

A. Indirect Impacts on the Bell Shelter under Project Alternative 5C Need Mitigation.

Although Alternative 5C avoids direct impacts to the Bell Shelter parcel, it would require a partial acquisition of the Shelter Resource Bank. Relocation or disruption of operations at the Resource Bank would have indirect impacts to the operations of the Shelter. The Project's Final EIR must provide mitigation measures to avoid displacement of the Resource Bank and, in turn, mitigate the Project's impacts on the Shelter.

According to the RIR, Alternative 5C would require a partial acquisition along the western portion of the Resource Bank property. Relocation may be avoided by restructuring the building and loading zones, redesigning driveway areas, and altering traffic circulation patterns. Based on conversations with staff from the Los Angeles County Metropolitan Transit Authority ("LA Metro"), the latest designs for Alternative 5C will not result in relocation of the Resource Bank. The Project must avoid displacement in order to accommodate the cohesive relationship between the Resource Bank and the Bell Shelter. IP-34-11

B. State and Federal Law Require Analysis of and Mitigation for Adverse Impacts on the Bell Shelter's Environmental Justice Community.

Both CEQA and NEPA require analysis and disclosure of a project's potential human health effects. Under Alternative 5C, the Project has the potential for disproportionate impacts related to air quality, noise, and traffic on the environmental justice population served by the Bell Shelter. Moreover, temporary construction impacts would include disruption of local traffic patterns and access to residences and businesses, increased traffic congestions, and increased noise, vibration, and dust. The proposed I-710 freeway improvements will pass immediately adjacent to The Salvation Army's parcel, generating traffic, pollutants, and noise that will greatly affect the Shelter and its residents.

Excessive noise has serious environmental and community health impacts that are often under-appreciated or ignored. Studies of noise exposure show that noise can lead to annoyance, loss of sleep, stress-related heart health issues, and hearing loss.[1] The U.S. Environmental Protection Agency (EPA) has warned that: IP-34-12

[1] See, e.g., Babisch, et al., Traffic Noise and Risk of Myocardial Infarction, Epidemiology, Vol.16, No.1, Jan. 2005, pp. 33-40; FHA, Highway Traffic Noise in the United States, April 2000, p. 1; Griefahn et al., Disturbed

Phone: (562) 264-3672
Fax: (562) 264-3772

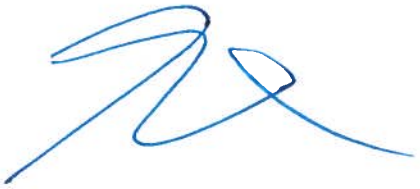
> [E]xcessive exposure to noise might be considered a health risk in that noise may contribute to the development and aggravation of stress related conditions such as high blood pressure, coronary disease, ulcers, colitis, and migraine headaches . . . Growing evidence suggests a link between noise and cardiovascular problems . . . There are also some indications that noise exposure can increase susceptibility to viral infection and toxic substances. (EPA, *Noise Effects Handbook: A Desk Reference to Health and Welfare Effects of Noise* (1981).)

Under Alternative 5C, a freeway interchange will run directly adjacent to The Salvation Army's property. The presence of the on-ramps will substantially increase the noise levels for the residents and employees of the Shelter. While the RDEIR/SDEIS notes that there will be substantial noise increases on environmental justice communities along the Project corridor, it contains no discussion of any noise increase affecting the Shelter and consequently fails to propose any mitigation measures to lessen noise impacts. Based on conversations with LA Metro staff, Project planning in the area surrounding the Bell Shelter has not included noise abatement features typically included in residential areas such as sound walls. IP-34-12

Due to the vulnerable nature of Bell Shelter residents, more than half of whom have two or more physical or mental health conditions, the Shelter is especially susceptible to being affected by excessive noise. Further mitigation that specifically addresses The Salvation Army property is necessary to help alleviate Project-related adverse impacts on the Shelter's environmental justice community.

IV. Conclusion

The Salvation Army Bell Shelter has provided a critical service in the Los Angeles area for nearly 30 years, offering a home to thousands of homeless individuals in our community, and enabling these individuals to achieve greater stability in their lives. Over this period, the Shelter has developed an effective service structure and valuable relationships with local partners, including government agencies and nonprofit organizations. This has allowed the Shelter to establish a record of success in helping a difficult-to-serve population. Displacing the Shelter will not simply require relocation—which will impact the environment in ways described above—it will also require The Salvation Army to reconstruct the structures and relationships that have enabled its success.



Sleep Patterns and Limitation of Noise, Noise and Health, Vol. 6, No. 22, Jan. – Mar. 2004, pp. 27-33; Skanberg, Adverse Health Effects in Relation to Urban Residential Soundscapes, Journal of Sound and Vibration (2002) 250(1), pp. 151-155; Clark and Stansfield, The Effect of Transportation Noise on Health and Cognitive Development: A Review of Recent Evidence, International Journal of Comparative Psychology, 2007, 20, 145-158.

Phone: (562) 264-3672
Fax: (562) 264-3772

Final approval of the I-710 Corridor Project must take into account the fact that tens of thousands of homeless individuals in the greater Los Angeles area are in desperate need of shelter. Any adverse effect on the Bell Shelter, viewed in light of the homelessness crisis, would result in uniquely significant impacts that should be mitigated by all means available. We respectfully request that Caltrans adopt Project Alternative 5C, along with measures to mitigate the Project's impact on the Shelter wherever feasible. Beyond CEQA compliance, this will ensure badly-needed protection for a vital community resource. Thank you in advance for your consideration.

IP-34-13

Sincerely,

Kyle Smith, Lt. Colonel
Divisional Commander
Southern California Division

IP-34-1

Caltrans and Metro thank the commenter for their input. The commenter's support of Alternative 5C and opposition to Alternative 7 are acknowledged and included in the project record. Please refer to Section 1.1 of this appendix for a discussion on the identification of the Preferred Alternative (Alternative 1 No Build).

IP-34-2

The commenter's concern regarding the displacement of the Salvation Army Bell Shelter is acknowledged and included in the project record. Alternative 1 (No Build) has been identified as the Preferred Alternative and will not result in the permanent displacement of Bell Shelter. Please refer to Section 1.5 of this appendix for a further discussion of the impacts to Bell Shelter.

IP-34-3

Please refer to Response to Comment IP-34-2 regarding the displacement of the Salvation Army Bell Shelter.

IP-34-4

Please refer to Response to Comment IP-34-2 regarding the displacement of the Salvation Army Bell Shelter.

IP-34-5

The commenter's concerns regarding the potential for a reduction in the effectiveness of services provided to the homeless in the event the Salvation Army Bell Shelter is relocated are acknowledged and included in the project record. Please refer to Response to Comment IP-34-2. Alternative 1 (No Build) has been identified as the Preferred Alternative, which will not displace the Bell Shelter or S. Mark Taper Foundation Shelter Resource Bank.

IP-34-6

Please refer to Response to Comment IP-34-5 regarding the potential for a reduction in the effectiveness of services provided to the homeless in the event the Salvation Army Bell Shelter would be relocated.

IP-34-7

As described in Section 2.0, Project Alternatives, of the RDEIR/SDEIS, the project purpose and need statements are used to develop a reasonable range of alternatives that must avoid or minimize environmental impacts. As described in Section 2.4, factors used in determining the reasonable range of alternatives for further evaluation in the RDEIR/SDEIS included whether or not the alternatives (1) failed to meet the most basic project objectives, (2) were infeasible (per State CEQA Guidelines Section 15126.6(f)(1), or (3) were unable to avoid significant environmental impacts.

Alternative 7 was incorporated into the project as a result of public comment during the 2012 public circulation period. Several workshops and community stakeholder meetings were also held to ensure that Alternative 7 analyzed in the RDEIR/SDEIS reflected the elements that the public desired to see with this project alternative and were also appropriate for inclusion in a project-level EIR/EIS. The Metro Board of Directors passed Board Motion 22.1 in October 2015 that directed Metro and Caltrans to study project elements, including the development of a geometric design that avoids significant impacts and displacement of homes, businesses, and community resources (which includes the Bell Shelter), as a part of the I-710 Corridor Project. In compliance with Metro Board Motion 22.1, an analysis was undertaken to examine the right-of-way impacts of Alternative 7 (which includes potential impacts to the Bell Shelter in the vicinity of Slauson Ave.), identify major impacts to homes, businesses, and/or community resources, and provide documentation of the rationale and constraints that make these impacts unavoidable. The analysis identified two avoidance concepts developed to specifically avoid relocation of or significant modifications to the Bell Shelter:

- **S1:** Shifting all of the roadway alignments westerly, while still retaining the functionality of the freight corridor and freight corridor interchange at Slauson Ave. would eliminate direct impacts to the shelter. However, this realignment would necessitate relocation of the Los Angeles Department of Water and Power (LADWP) transmission corridor west of I-710 as well as require major encroachments within the Los Angeles River. This revised alignment would result in substantial increased environmental and right-of-way impacts. Therefore, this concept was not considered viable.
- **S2:** Elimination of the truck interchange at Slauson Ave. The freight corridor ramps at Slauson Ave. would require the alignment of the freight corridor to be situated adjacent to the northbound freeway lanes. The freight corridor lanes and northbound collector-distributor road would directly affect the shelter facilities, and the realignment of the Los Angeles Junction (LAJ) railroad adjacent to the freight corridor would further impact the shelter facilities as well. Elimination of the freight corridor ramps at Slauson Ave. from the current design would reduce impacts and avoid relocation of the shelter facilities. Because there would be no ramps at Slauson Ave. in this concept, the freight corridor would be positioned in the median of the freeway, supported by a single-column viaduct structure

spanning Slauson Ave. This alignment strategy would be employed south of Slauson Ave. in the current configuration of Alternative 7. The connectors between the freight corridor and the freeway, north of Slauson Ave., were adjusted to accommodate the new freight corridor alignment. The northbound freeway lanes and northbound collector-distributor road would need to be shifted east, closer to the shelter facilities, and the LAJ railroad would need to be relocated adjacent to the northbound lanes. This scenario would not necessitate relocations associated with the shelter facilities.

However, the truck traffic that would have used the freight corridor and Slauson Ave. would be diverted to other roadways. It was anticipated that virtually all of the diverted traffic would use the mixed-flow freeway lanes instead and access the local area using interchanges at Bandini Blvd. and Florence Ave. The success of the freight corridor, and justification of its cost expenditures, would depend on its ability to remove diesel trucks from the freeway lanes. The projected number of truck traffic expected to use the freight corridor at Slauson Ave. would be approximately 9,200 per day. As a direct result of this diversion, utilization of the full length of the freight corridor would decrease and utilization of the adjacent freeway segments would increase. During peak periods, the percentage of trucks in these segments of the freight corridor would be expected to decrease as much as 15 to 17 percent, meaning that as much as 53 percent of all trucks would be using the mixed flow freeway lanes. This would reduce the distribution below the threshold criteria needed for successful use of the freight corridor for all segments during most peak periods. Because the freight corridor would be underutilized, the overall effectiveness of other freeway and local street improvements in this area would diminish markedly. The loss of access would be inconsistent with the purpose of the freight corridor and would substantially reduce the performance of Alternative 7; therefore, this concept was not considered viable.

As described above in bullet points S1 and S2, these avoidance concepts were determined not to be viable as they did not achieve the basic project objectives or avoid or minimize significant environmental impacts.

In an effort to minimize impacts to the operation of the Bell Shelter and to ensure the other area shelters would not be disrupted with a sudden influx of persons as a result of the closure of Bell Shelter, the RDEIR/SDEIS identified Measure C-4 to address these potential impacts resulting from the build alternatives. Should a build alternative be selected as the Preferred Alternative, Measure C-4 would require Caltrans to negotiate with the City of Bell to determine an appropriate action and/or identify an alternative location for the Bell Shelter and the S. Mark Taper Foundation Shelter Resource Bank within the general vicinity of the existing facility so as to maintain the service area and its cooperative relationship with the Bell Shelter and adequately mitigate for the acquisition of the facility. Should a build alternative be selected as the Preferred Alternative, the existing facility would not be demolished until the facility has been relocated and is operational. With implementation of Measure C-4, the Bell Shelter would remain operational until a new facility would be operational and could accommodate the displaced shelter residents. However, as

mentioned in previous responses, the Bell Shelter would not be displaced under Alternative 1 (No Build), which has been identified as the Preferred Alternative.

IP-34-8

Caltrans has identified Alternative 1 (No Build) as the Preferred Alternative, which would not result in displacement of the Salvation Army's Bell Shelter and medical center.

IP-34-9

Please refer to Response to Comment IP-34-5 regarding the potential for a reduction in the effectiveness of services provided to the homeless in the event the Salvation Army Bell Shelter would be relocated.

IP-34-10

Alternative 1 (No Build) has been identified as the Preferred Alternative and will not result in the displacement of Bell Shelter. Please refer to Section 1.5 of this appendix for further discussion of the impacts to Bell Shelter.

IP-34-11

Please refer to Response to Comment IP-34-5 regarding the potential for a reduction in the effectiveness of services provided to the homeless in the event the Salvation Army Bell Shelter would be relocated.

IP-34-12

A discussion of the public health considerations of noise was included in Section 3.14.3 of the RDEIR/SDEIS, and which acknowledged the several types of public health considerations related to traffic noise that have been studied over the years, including annoyance, sleep disturbance, immune effects, ergonomics, psychology, and cardiovascular disease.

In response to this comment, additional noise modeling has been performed at the referenced location. Based on the TNM modeling under existing conditions, the worst-hour noise levels at the Bell Shelter would be in the range of 66–73 dBA-L_{eq}(h). At Site #SABS-1, the worst-hour noise level would be 69 dBA-L_{eq}(h); at Site #SABS-2, the worst-hour noise level would be 71 dBA-L_{eq}(h); at Site #SABS-3, the worst-hour noise level would be 73 dBA-L_{eq}(h). Therefore, the noise increase under Alternative 5C would range from 1 to 3 dBA and would not result in a significant impact under CEQA. A new soundwall was analyzed on top of the retaining wall along the newly proposed southbound I-710 off-ramp to Atlantic Blvd./Bandini Blvd. in the City of Bell, directly adjacent to the Bell Shelter property. That barrier, SW-511D, has been found acoustically feasible and reasonable. However, as stated in Response to Comment IP-34-1, the No Build Alternative has been selected as the Preferred Alternative. Therefore, this soundwall will not be constructed.

IP-34-13

The commenter's support of Alternative 5C is acknowledged and included in the project record. However, Alternative 1 (No Build) has been identified as the Preferred Alternative.

Re: I-710 Corridor Project RDEIR/SDEIS

Dear Mr. Kosinski:

We write on behalf of Shelter Partnership, Inc. regarding the I-710 Corridor Project (the "Project") Revised Draft EIR / Supplemental Draft EIS ("RDEIR/SDEIS"). Shelter Partnership is a non-profit organization that provides support to homeless services organizations throughout Los Angeles County. As a critical part of that mission, Shelter Partnership operates the S. Mark Taper Foundation Shelter Resource Bank, a 108,000 square foot warehouse on six acres in the City of Bell.

Since the release of the original Draft EIR/EIS in 2012, Shelter Partnership has met with representatives from Metro, Caltrans, and other involved groups (the "Project Team") regarding the possibility of reducing or avoiding the Project's impacts on Shelter Partnership's operations. Shelter Partnership appreciates that the Project Team has made commitments to Shelter Partnership regarding the impact of the Project on its operations.

In particular, the Project Team has informed Shelter Partnership that Alternative 5C will not impact Shelter Partnership's S. Mark Taper Foundation Shelter Resource Bank in the City of Bell. Shelter Partnership appreciates these assurances, and looks forward to working with the Project Team going forward should Alternative 5C be selected. Should the Project proceed under one of the two build alternatives, and assuming that Alternative 5C does not impact Shelter Partnership's operation of the S. Mark Taper Foundation Shelter Resource Bank, Shelter Partnership supports Alternative 5C, rather than Alternative 7. IP-35-1

While Shelter Partnership is appreciative of the Project Team's responsiveness and commitments to work with Shelter Partnership, because the deadline for public comments to the RDEIR/SDEIS is October 23, 2017, Shelter Partnership is obligated to comment on the

document in its current form. As set forth in more detail below, the RDEIR/SDEIS contains several flaws that must be addressed before the Project can proceed.

Shelter Partnership

Shelter Partnership is a Los Angeles-based 501(c)(3) non-profit organization dedicated to collaboratively solving homelessness in Los Angeles County through policy analysis, program design, resource development, and advocacy in support of agencies and local governments that serve the homeless. In pursuit of this mission, Shelter Partnership helps to develop housing programs and supportive services for the homeless and potentially homeless. Each year, Shelter Partnership provides support and donated goods to more than 230 agencies and projects serving the homeless throughout Los Angeles County. These goods, in turn, are distributed to an estimated 100,000 homeless individuals in Los Angeles. Approximately 50% of the agencies receiving goods from Shelter Partnership serve homeless and low-income children.

In addition to distributing goods, Shelter Partnership provides a number of other services to organizations dedicated to helping the homeless. For example, Shelter Partnership is currently assisting the City and County of Los Angeles in implementing City Proposition HHH and County Measure H, programs to fund housing for the homeless and those at risk of becoming homeless, and to fund facilities that provide mental health care, addiction treatment, and other services.

In sum, Shelter Partnership plays a vital role in supporting Los Angeles' homeless population and is an important community resource.

S. Mark Taper Foundation Shelter Resource Bank

In 1989, Shelter Partnership established the S. Mark Taper Foundation Shelter Resource Bank project to distribute donated goods to homeless service agencies throughout Los Angeles County. This project provides a critical service to the Los Angeles homeless population by distributing, free of charge, items such as clothing, baby products, and personal hygiene products. To date, the project has distributed over $225 million in goods to more than 600 homeless service agencies. Indeed, in the most recent fiscal year alone, Shelter Partnership distributed $10.1 million in goods to 234 agencies. *See* Exhibit 1 (list of agencies served in 2016/2017). The primary recipients of goods from the S. Mark Taper Foundation Shelter Resource Bank are hundreds of direct homeless service providers. The S. Mark Taper Foundation Shelter Resource Bank enables these homeless service providers to focus their funds and scarce resources on direct support services for the homeless. Without Shelter Partnership's support, the agencies' ability to support local homeless populations would be compromised.

The heart of the S. Mark Taper Foundation Shelter Resource Bank is a 108,000 square foot warehouse on six acres in the City of Bell. The parcel is a former military facility. Shelter Partnership obtained the parcel by title conveyance from the United States Department of Health and Human Services in July 2007, and the United States government retains a reversionary interest in the parcel. Indeed, the conveyance entitles Shelter Partnership to occupy the property for thirty years, provided that Shelter Partnership continuously uses the property for public health purposes. For the thirty year period, Shelter Partnership may not encumber or dispose of any part of the property without the written authorization of the federal government.

The S. Mark Taper Foundation Shelter Resource Bank is in close proximity to The Salvation Army's Bell Shelter, which provides housing and services to hundreds of individuals on a nightly basis. Since 1990, the S. Mark Taper Foundation Shelter Resource Bank has provided Bell Shelter with over $2.3 million in goods for its residents, including toiletries, blankets, clothing, and furniture. The proximity of the S. Mark Taper Foundation Shelter Resource Bank to Bell Shelter benefits the missions of both organizations.

Shelter Partnership completed a $3.5 million renovation of the S. Mark Taper Foundation Shelter Resource Bank warehouse in 2009. This extensive rehabilitation was intended to ensure that the S. Mark Taper Foundation Shelter Resource Bank will thrive in its mission of serving the homeless for the next 30-50 years. Among other things, in connection with this rehabilitation, Shelter Partnership took great care to ensure that the warehouse was appropriately outfitted for receiving and distributing donations; improvements include a new roof, a new sprinkler and water system, new lighting, replacement of doors and windows, structural upgrades, and repair of the building interior and exterior.

According to the RDEIR/SDEIS, the S. Mark Taper Foundation Shelter Resource Bank would be fully acquired and displaced under Alternative 7. According to the RDEIR/SDEIS, and based on Shelter Partnership's discussions with the Project Team, Shelter Partnership understands that Alternative 5C would require a partial acquisition of the western end of the parcel, but would not impact the S. Mark Taper Foundation Shelter Resource Bank itself and would not require relocation of the business. Under the No Build Alternative, the S. Mark Taper Foundation Shelter Resource Bank would not be impacted.

Benefits of the S. Mark Taper Foundation Shelter Resource Bank's Current Location

The S. Mark Taper Foundation Shelter Resource Bank is ideally located to serve Los Angeles' homeless population. Like any warehouse facility, the S. Mark Taper Foundation Shelter Resource Bank benefits from proximity to freeways including I-710 and I-5, as easy freeway access facilitates the rapid distribution of goods from the warehouse. The S. Mark Taper Foundation Shelter Resource Bank's geographically central location in Bell also provides

operational synergies. Situated close to downtown Los Angeles, the S. Mark Taper Foundation Shelter Resource Bank is positioned to receive goods donations from businesses throughout the region. Those goods are then distributed to homeless service organizations throughout the region, many of which are close to Bell. For example, the Bell Shelter, which has received over $2.3 million in donated goods since 1990, is in close proximity to the S. Mark Taper Foundation Shelter Resource Bank.

Moreover, donors and recipients of goods are responsible for independently dropping off or picking up products at the S. Mark Taper Foundation Shelter Resource Bank. Each week, the S. Mark Taper Foundation Shelter Resource Bank receives an average of 15 shipments from donors. Annually, the S. Mark Taper Foundation Shelter Resource Bank distributes more than 750 orders to individual agencies. The S. Mark Taper Foundation Shelter Resource Bank's central location is essential to facilitate these numerous donations and distributions. It would be far more difficult for businesses and organizations to deliver or receive goods from the S. Mark Taper Foundation Shelter Resource Bank, should it be required to move further away from its primary donors and beneficiaries.

Impacts of Relocating the S. Mark Taper Foundation Shelter Resource Bank

The S. Mark Taper Foundation Shelter Resource Bank would be fully acquired and displaced under Alternative 7, and the parcel would be partially acquired under Alternative 5C. Both build alternatives could potentially force Shelter Partnership to reduce or suspend operations of the S. Mark Taper Foundation Shelter Resource Bank for a period of time. Acquisition and relocation of the S. Mark Taper Foundation Shelter Resource Bank, or suspension of its operations, would have a serious adverse impact on the homeless population of Los Angeles. Indeed, the S. Mark Taper Foundation Shelter Resource Bank serves hundreds of homeless service agencies on an annual basis—234 in 2016/2017 alone. *See* Exhibit 1 (list of agencies served during 2016/2017). These agencies count on the S. Mark Taper Foundation Shelter Resource Bank to secure critical items for the homeless, such as toiletries, clothing, and baby products. If the S. Mark Taper Foundation Shelter Resource Bank's services are disrupted as a result of construction or relocation, tens of thousands of homeless individuals throughout Los Angeles could receive significantly less material assistance from service agencies that are supported by the S. Mark Taper Foundation Shelter Resource Bank. These agencies may also have to reduce their direct services to the homeless, including case management and support services, to focus their resources on acquiring goods that were previously provided by the S. Mark Taper Foundation Shelter Resource Bank. IP-35-2

Beyond the immediate adverse impacts on the Los Angeles homeless population, acquisition of Shelter Partnership's parcel could have an adverse long-term impact on the viability of the S. Mark Taper Foundation Shelter Resource Bank project. The Project seeks to IP-35-3

expand freeway capacity specifically for freight services. Alternative 7 of the RDEIR/SDEIS includes designated truck lanes that would allow additional freight to be brought into the I-710 Corridor. As a result of increased freight being shipped through the I-710 Corridor, warehouse spaces in the region may be at a premium. Therefore, if the S. Mark Taper Foundation Shelter Resource Bank is forced to relocate, Shelter Partnership may have difficulty locating a suitable, centrally-located replacement warehouse. And as previously described, a centrally located warehouse is essential to the S. Mark Taper Foundation Shelter Resource Bank's mission. IP-35-3

In addition, relocating the S. Mark Taper Foundation Shelter Resource Bank to a less central parcel could adversely impact air quality. The S. Mark Taper Foundation Shelter Resource Bank, for example, relies on deliveries and distributions of goods by truck and car. On average, the S. Mark Taper Foundation Shelter Resource Bank receives 15 shipments per week and distributes more than 750 orders per year. Relocating to a less central warehouse could increase air pollution, as donors and recipients would be forced to drive longer distances to reach the warehouse. IP-35-4

Moreover, the S. Mark Taper Foundation Shelter Resource Bank's $3.5 million renovation included the installation of many "green" features to make the building environmentally friendly. Among the green features are a reflective cool roof, low flow toilets and faucets, motion-activated lighting throughout the warehouse, and recycled, natural or no-formaldehyde materials for the walls and ceilings. Further, the ceilings, beams, and walls of the warehouse were whitewashed with low VOC paint, and large windows running the length of the warehouse were replaced with low-E glass to maintain the abundant natural lighting. The electrical and water consumption levels of the warehouse beat state environmental standards by fifty percent. If the S. Mark Taper Foundation Shelter Resource Bank were acquired, the environmental benefits resulting from these features would be negated unless a replacement property was comparably efficient. IP-35-5

Impacts if the S. Mark Taper Foundation Shelter Resource Bank is Not Acquired

Even if the Project Alternative selected does not require acquisition of the S. Mark Taper Foundation Shelter Resource Bank parcel, construction along the I-710 Corridor could negatively impact the S. Mark Taper Foundation Shelter Resource Bank's ability to serve Los Angeles's homeless population. For example, construction along the I-710 freeway could impede access to the S. Mark Taper Foundation Shelter Resource Bank by donor or recipient organizations. Moreover, this construction could impede access to the S. Mark Taper Foundation Shelter Resource Bank by the five Shelter Partnership employees who travel to the facility on a daily basis, as well as the hundreds of deliveries and pick-ups that take place every year. IP-35-6

In addition, construction along the I-710 Corridor would also threaten air quality in the surrounding area, as well as the health of Shelter Partnership's employees. Construction along the I-710 Corridor would also increase noise levels, and would impact Shelter Partnership's employees as well as the many individuals who visit the S. Mark Taper Foundation Resource Bank each year for deliveries, pick-ups, and other reasons. IP-35-7

Moreover, even after construction is completed, Shelter Partnership understands from its meetings with the Project Team that under Alternative 5C, freeway on/off ramps will come within 25 feet of its building. The proximity of the freeway on/off ramps to Shelter Partnership's facility would likely increase the levels of pollution and noise experienced by Shelter Partnership employees and visitors to the S. Mark Taper Foundation Resource Bank. As set forth further below, if Alternative 5C is selected, Shelter Partnership requests the implementation of appropriate mitigation measures to address the effects of increased pollution and noise. IP-35-8

Inadequacies in I-710 Corridor Project RDEIR/SDEIS

1. *Alternative 5C*

The RDEIR/SDEIS is inconsistent and vague in describing the impact of Alternative 5C on the S. Mark Taper Foundation Shelter Resource Bank. In response to the initial Draft EIR/EIS released in 2012, Shelter Partnership submitted written comments highlighting the internal inconsistencies regarding Alternative 5A's impact on the S. Mark Taper Foundation Shelter Resource Bank. *See* Exhibit 2 (Sept. 28, 2012 Shelter Partnership Comment) at 7-8. In response to Shelter Partnership's September 2012 comment, the Project Team stated that "[a]s described in detail in Section 3.3.2.3 of the Recirculated Draft EIR/Supplemental Draft EIS, *the revised build alternatives have been redesigned to avoid the need to relocate the Shelter Partnership's S. Mark Taper Foundation Shelter Resource Bank in the City of Bell under at least one build alternative*." RDEIR/SDEIS Responses to Interested Party Comment IP-122-1, page 1425 (emphasis added); *see also* Exhibit 2 at 42. IP-35-9

Since the release of the RDEIR/SDEIS, Shelter Partnership has met with the Project Team to discuss the impacts of the proposed build alternatives on its property. Based on these discussions, Shelter Partnership understands that Alternative 5C would not impact or require a relocation of the S. Mark Taper Foundation Shelter Resource Bank. *See* Exhibit 3 (Oct. 5. 2017 email from E. Chaves). But the RDEIR/SDEIS is vague in describing the impact of Alternative 5C on the S. Mark Taper Foundation Shelter Resource Bank, and in several instances suggests that acquisition or reconfiguration of the warehouse structure itself would be required. For example:

- "As described in detail in Section 3.3.2.3 of the Recirculated Draft EIR/Supplemental Draft EIS, the revised build alternatives have been redesigned to avoid the need to relocate the Shelter Partnership's S. Mark Taper Foundation Shelter Resource Bank in the City of Bell under at least one build alternative. *Under Alternative 5C, a partial acquisition would occur along the western portion of the property. It is possible that redesign of the loading docks/zones, driveway areas, and traffic circulation patterns in the area could be done to avoid a relocation of the Resource Bank under Alternative 5C* and retain the interrelated nature of the Bell Shelter and the Resource Bank." RDEIR/SDEIS Responses to Interested Party Comment IP-122-1, page 1425 (emphasis added); *see also* Exhibit 2 at 42.

- "Alternative 5C would require a partial acquisition along the western portion of the property." RDEIR/SDEIS at 3.3-32.

- "Under Alternative 5C, the Bell Shelter facility would be avoided, but the *Mark Taper Foundation Shelter Resource Bank* (a nearby facility at the same street address that is owned by the Shelter Partnership and whose operations are interrelated with those of the Bell Shelter) *would be partially acquired.*" RDEIR/SDEIS at 3.3-144.

- "Alternative 5C would avoid impacts to the Bell Shelter, but would require a partial acquisition of the Shelter Resource Bank, along the western side of the property." RDEIR/SDEIS at 4-45.

IP-35-9

In recent meetings with Shelter Partnership, the Project Team clarified that the language regarding "partial acquisition" refers to a sliver along the western edge of the approximately 6 acre parcel housing the S. Mark Taper Foundation Resource Bank, and would not impact the warehouse facility. According to the Project Team, under any of the design alternatives for Alternative 5C, an on/off ramp would come within approximately 25 feet of the western corner of the warehouse, but would not impact the structure itself. *See* Exhibit 3.

Based on its discussions with the Project Team, Shelter Partnership understands that the S. Mark Taper Foundation Shelter Resource Bank would not be impacted under Alternative 5C. Based on that understanding, Shelter Partnership prefers Alternative 5C to Alternative 7, should the Project proceed with one of the build alternatives. But because of the inconsistent and vague language in the RDEIR/SDEIS itself, Shelter Partnership is obligated to submit this comment to highlight the inadequacies in the draft should Alternative 5C ultimately impact or require relocation of the S. Mark Taper Foundation Shelter Resource Bank. If Alternative 5C is ultimately designed or constructed in a manner that results in an acquisition of the warehouse, requires reconfiguration of the current structure, or otherwise impacts Shelter Partnership's

IP-35-10

operations adversely, Shelter Partnership reserves the right to challenge the adequacy of the RDEIR/SDEIS with respect to this alternative. IP-35-10

2. *Alternative 7*

In response to the initial Draft EIR/EIS in 2012, the Coalition for Environmental Health and Justice (CEHAJ) submitted a proposal known as "Community Alternative 7" or "CA-7." *See* RDEIR/SDEIS at 2-5. Community Alternative 7 included seven components: no widening of I-710 general purpose lanes; comprehensive public transit element; mandatory zero-emission freight corridor; public-private partnership operator of the freight corridor; Los Angeles River improvements; comprehensive pedestrian and bicycle element; and community benefits. *Id.* According to the RDEIR/SDEIS, "the proposal of CA-7, coupled with the general support from the EPA and others for the evaluation of an alternative that added a ZE/NZE freight corridor without expansion of general purpose lanes, was directly responsible for the development of Alternative 7 as a stand-alone project alternative under consideration in this RDEIR/SDEIS." RDEIR/SDEIS at 2-6.

The first component of Community Alternative 7—no additional general purpose lanes—made specific reference to Shelter Partnership's facility. In particular, Community Alternative 7 stated: "CA7.1 No Widening of GENERAL PURPOSE LANES. Community Alternative 7 will maintain the current configuration of the existing I-710 Corridor. Nonetheless, there would be other improvements that increase capacity to the I-710 mainline. . . . *City of Bell* specific: Community Alternative 7 will not interfere with Shelter Partnerships' facility or Bell Shelters operated by the Salvation Army." RDEIR/SDEIS Responses to Interested Party Comment IP-22-4, page 484 (emphasis in original). IP-35-11

In October 2015, the Metro Board of Directors passed Board Motion 22.1, which directed Metro and Caltrans to study certain issues as part of the Project Description. Among other things, Metro and Caltrans were directed to: "[d]evelop a geometric design for Alternative 7 that avoids significant impacts and displacement of homes, businesses, and community resources, such as but not limited to the Bell Shelter or Senior Centers, and the implications of such a design on commuter and freight traffic demands; where significant impacts are unavoidable, provide documentation of the rationale and constraints." RDEIR/SDEIS at 2-7.

Despite the stated objectives of Community Alternative 7 and Metro Board Motion 22.1, the current Alternative 7 would require a full acquisition of the S. Mark Taper Foundation Shelter Resource Bank. Moreover, while Metro Board Motion 22.1 directs Metro and Caltrans to provide documentation of the rationale and constraints if acquisition is required, the RDEIR/SDEIS provides only a cursory description of the viability of alternative plans that would

avoid Shelter Partnership's facility. RDEIR/SDEIS at 3.3-59-60. Indeed, the RDEIR/SDEIS considers only two alternative designs for Alternative 7. *Id.*

The RDEIR/SDEIS eliminates from consideration the first avoidance concept, S1, based on the fact that realignment would result in "substantial increase[s] in environmental and right of way impacts." RDEIR/SDEIS at 3.3-59. But the RDEIR/SDEIS does not specify what the increased environmental or right of way impacts are, or quantify whether or how they would surpass the anticipated environmental or right of way impacts under the current version of Alternative 7. The RDEIR/SDEIS eliminates from consideration the second avoidance concept, S2, based on the fact that it would result in underutilization of the freight corridor. RDEIR/SDEIS at 3.3-60. The RDEIR/SDEIS does not, however, detail the bases for its assumptions regarding decreased use of the freight corridor and increased usage of the mixed flow freeway lanes. IP-35-11

Because the RDEIR/SDEIS did not document the rationale and constraints requiring acquisition of the S. Mark Taper Foundation Shelter Resource Bank, it should be revised to more fully analyze these issues.

3. *The RDEIR/SDEIS Does Not Comply with the Requirements of the Uniform Act.*

According to the RDEIR/SDEIS, Alternative 7 would require a full acquisition of Shelter Partnership's property and displace the S. Mark Taper Foundation Shelter Resource Bank. *See, e.g.*, March 2017 Relocation Impact Report ("RIR") at 34 of 92. The Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970 (the "Uniform Act") mandates that certain relocation and services and payments by Caltrans be made available to eligible residents, businesses, and nonprofit organizations displaced by its projects. RDEIR/SDEIS at 3.3-67.

The RDEIR/SDEIS fails to provide adequate assurances that the proposed relocation plan complies with the requirements of the Uniform Act. The RDEIR/SDEIS states that "[w]here acquisition and relocation are unavoidable, Caltrans will follow the provisions of the Uniform Act and the 1987 Amendments as implemented by the Uniform Relocation Assistance and Real Property Acquisition Regulations for Federal and Federally Assisted Programs adopted by Caltrans, dated March 2, 1989." RDEIR/SDEIS at 3.3-73. Pursuant to regulations enacted in furtherance of the Uniform Act, "[b]efore a Federal Agency may approve any grant to, or contract, or agreement with, a State Agency under which Federal financial assistance will be made available for a project which results in real property acquisition or displacement that is subject to the Uniform Act, the State Agency must provide appropriate assurances that it will comply with the Uniform Act and this part." 49 C.F.R. § 24.4. These assurances must be provided in accordance with Section 210 of the Uniform Act. *Id.* IP-35-12

Based on these regulations, prior to final approval of the project, Caltrans must provide adequate assurances that the real property acquired in connection with the Project complies with the requirements of the Uniform Act. The RDEIR/SDEIS does not provide these assurances, and is therefore inadequate.

Under Section 210 of the Uniform Act, the acquiring agency must implement a "relocation assistance advisory program." 42 U.S.C. § 4625(b). As part of this program, the agency must "provide current and continuing information on the availability, sales prices, and rental charges of comparable replacement dwellings for displaced homeowners and tenants and suitable locations for business and farm operations." 42 U.S.C. § 4625(c)(2).

The RDEIR/SDEIS fails to meet these requirements. Nor does the RIR, authored in connection with the RDEIR/SDEIS, remedy these deficiencies. The RDEIR/SDEIS makes a blanket statement of Caltrans' intent to comply with the requirements of the Uniform Act. RDEIR/SDEIS at 3.3-73. As part of this effort, Caltrans' RIR indicates its plan to provide "Relocation Assistance Advisory Service[s]." RIR at 88. The RIR also notes that Caltrans will create a "Nonresidential Relocation Assistance Program (RAP)" to "provide[] assistance to businesses, farms and nonprofit organizations in locating suitable replacement properties[.]" *Id.* The RIR concludes that "further study would be required to investigate the specific nature of affected businesses and their relocation needs." *Id.* at 91. IP-35-12

This conclusory statement to further investigate businesses' relocation needs is insufficient to establish that the relocation needs of Shelter Partnership will be met. This deficiency is particularly critical because Alternative 7 contemplates the addition of designated freight lanes that would result in additional freight being brought into the I-710 Corridor. As a result, warehouse space in the vicinity of Shelter Partnership's current location would likely be at a premium, and relocating the S. Mark Taper Foundation Shelter Resource Bank to a nearby parcel would be more difficult.

Appendix H to the RIR likewise does not provide adequate assurances. Appendix H identifies potential relocation properties for commercial properties in the cities affected by Alternative 7. But nothing in Appendix H suggests that the properties identified are for sale, or even if for sale, what the purported purchase price would be and whether Caltrans would provide sufficient financial assistance to permit Shelter Partnership or other organizations to acquire them. Absent this data, Appendix H to the RIR does not provide adequate assurances that Caltrans will comply with the requirements of the Uniform Act in acquiring real property. As such, the RDEIR/DEIS is deficient.

4. *The Noise Study Report Fails to Analyze Sensitive Receptors.*

In 2016, Caltrans released a Traffic Noise Study Report, which evaluates potential traffic noise impacts that may result from the Project. Traffic Noise Study Report (May 16, 2016) at ii, 1. The Traffic Noise Study Report focused on noise abatement at "locations of frequent human use that would benefit from a lowered noise level" such as residences, schools, libraries, recreation and sports areas, hotels and motels. *Id.* at 23. The Traffic Noise Study Report took traffic noise readings at 149 locations and modeled at 82 sites, and based on these measurements proposed sound barriers at various locations throughout the I-710 Corridor. *Id.*

The Traffic Noise Study Report did not identify the S. Mark Taper Foundation Shelter Resource Bank as a location of frequent human use that would benefit from a lowered noise level, or a sensitive noise receptor. Traffic Noise Study Report (May 16, 2016) at 139. Accordingly, the Traffic Noise Study Report did not propose a sound wall in the vicinity of the S. Mark Taper Foundation Shelter Resource Bank. *Id.*

The omission of a proposed sound wall near the S. Mark Taper Foundation Shelter Resource Bank was in error. Five Shelter Partnership employees work at the the S. Mark Taper Foundation Shelter Resource Bank on a daily basis, and the facility receives numerous visitors each month to drop off and pick up donated goods. These individuals would benefit from a lowered noise level, and Shelter Partnership requests that the Traffic Noise Study Report and RDEIR/SDEIS be revised accordingly, including the addition of a sound wall in the vicinity of the S. Mark Taper Foundation Shelter Resource Bank. IP-35-13

5. *The RDEIR/SDEIS Includes Insufficient Analysis of Mitigation Measures*

The RDEIR/SDEIS fails to sufficiently analyze mitigation measures, including mitigation measures that would affect Shelter Partnership. If the Project proceeds with a plan that does not require acquisition of Shelter Partnership's property, Shelter Partnership requests, at a minimum, that the following mitigation measures be adopted.

- A sound wall to reduce noise levels at the S. Mark Taper Foundation Shelter Resource Bank. IP-35-14

- Steps to reduce air pollution and the consequent adverse effects on the health of S. Mark Taper Foundation Shelter Resource Bank workers during construction. This may include, among other things, installation of an air filtration system. The S. Mark Taper Foundation Shelter Resource Bank typically operates with bay doors open, and a ventilation system would allow the S. Mark Taper Foundation Shelter Resource IP-35-15

Bank to keep its doors closed to prevent dust and debris from entering the warehouse during construction. IP-35-15

- Continuous access to the S. Mark Taper Foundation Shelter Resource Bank during construction, so as not to impede Shelter Partnership's receipt or distribution of donated goods. IP-35-16

6. *The RDEIR/SDEIS Fails to Analyze the United States Government's Reversionary Interest in the Property.*

The RDEIR/SDEIS also fails to account for the United States Government's reversionary interest in Shelter Partnership's real property. *See supra* at 3. Indeed, the RDEIR/SDEIS does not mention the Department of Health and Human Services' interest in Shelter Partnership's real property at all. The Department of Health and Human Services granted the property to Shelter Partnership for a period of thirty years, on the condition that Shelter Partnership continuously use the property for public health purposes. Any acquisition of Shelter Partnership's property necessarily implicates Shelter Partnership's ability to comply with this requirement. According to the RDEIR/SDEIS, Alternative 5C requires acquisition of a portion of Shelter Partnership's parcel but would not impact the warehouse itself, and Alternative 7 requires a full acquisition of Shelter Partnership's property. Thus, to the extent the RDEIR/SDEIS analyzes the impact of either build alternative on Shelter Partnership, it must also analyze how those alternatives implicate the Department of Health and Human Services' interest in the property, and Shelter Partnership's ability to comply with the requirements of the grant from the Department of Health and Human Services. The RDEIR/SDEIS's failure to do so renders the draft inadequate. IP-35-17

Conclusion

For the reasons described above, the RDEIR/SDEIS is inadequate in several respects, and Shelter Partnership requests that it be revised and recirculated accordingly.

Sincerely,

Kristin Rose

September 28, 2012

Ronald Kosinski
Caltrans District 7, Division of Environmental Planning
100 South Main Street, MS 16A
Los Angeles, CA 90012

Dear Mr. Kosinski:

We write on behalf of Shelter Partnership, Inc. regarding inadequacies in the I-710 Corridor Project Draft EIR/EIS ("Draft EIR/EIS"). According to the Draft EIR/EIS, Shelter Partnership's S. Mark Taper Foundation Shelter Resource Bank in the City of Bell, parcel number 6332002035, would be fully acquired under Alternatives 6A/6B/6C, and ostensibly under Alternative 5A. *See infra* p. 6. Even if the project does not fully acquire the parcel, the S. Mark Taper Foundation Shelter Resource Bank will be greatly impacted from construction and operation of the expanded highway. For at least the reasons set forth below, the Draft EIR/EIS fails to satisfy CEQA's requirements for Environmental Impact Reports, and NEPA's requirements for Environmental Impact Statements. *See* Pub. Resources Code § 21100, subd. (b); Cal. Code Reg. Tit. 14, § 15126; 42 U.S.C. § 4332. Most significantly, the Draft EIR/EIS fails to take into account the community impacts that would result from acquisition of the S. Mark Taper Foundation Shelter Resource Bank. *See infra* p. 7. Accordingly, the I-710 Corridor Project should not—and cannot—move beyond the Draft EIR/EIS phase at this juncture. At a minimum, revisions to the Draft EIR/EIS are necessary to address several inadequacies pertaining to Shelter Partnership's parcel in Bell.

IP-122-1

Shelter Partnership

Shelter Partnership is a Los Angeles-based 501(c)(3) non-profit organization dedicated to alleviating, preventing, and ending homelessness. In pursuit of this mission, Shelter Partnership helps to develop short-term and transitional housing programs, affordable housing, and supportive services for the homeless and potentially homeless. Each year, Shelter Partnership provides support and donated goods to more than 200 agencies and projects serving the homeless throughout Los Angeles County. These goods, in turn, are distributed to an estimated 100,000 homeless individuals in Los Angeles. Approximately 50% of the agencies receiving goods from Shelter Partnership serve homeless and low-income children.

In addition to distributing goods, Shelter Partnership provides a number of other services to organizations dedicated to helping the homeless. For example, Shelter Partnership provides technical assistance to community-based agencies. This technical assistance takes numerous forms, including helping community-based organizations secure funding, assisting community groups to develop housing for diverse segments of the homeless population, and developing grant proposals on behalf of the City and County of Los Angeles. Over the last eighteen years, Shelter Partnership has helped secure more than $1 billion in funding for the homeless in the Los Angeles community.

Shelter Partnership is also active in the development of public policy impacting Los Angeles-area homeless populations. For example, Shelter Partnership was an active participant in the design and implementation of Los Angeles County's General Relief (GR) Reform Plan. As a result of the plan, 1,640 homeless individuals who receive General Relief at any given time receive a housing subsidy in addition to their General Relief grant. Shelter Partnership has also sought to make local government policies more proactive in addressing the housing needs of the homeless.

In sum, Shelter Partnership plays a vital role in supporting Los Angeles' homeless population and is an important community resource.

S. Mark Taper Foundation Shelter Resource Bank

In 1989, Shelter Partnership established the S. Mark Taper Foundation Shelter Resource Bank project to distribute donated goods to homeless service agencies throughout Los Angeles County. This project provides a critical service to the Los Angeles homeless population by distributing, free of charge, items such as clothing, baby products, and personal hygiene products. To date, the project has distributed over $175 million in goods to more than 400 homeless service agencies. Indeed, in the most recent fiscal year alone, Shelter Partnership distributed $8.2 million in goods to 230 agencies, and brought in $8 million in new product donations. *See* Exhibit A (list of agencies served in 2011/2012). The primary recipients of goods from the S. Mark Taper Foundation Shelter Resource Bank are hundreds of direct homeless service providers. Collectively, these organizations provide approximately 17,000 beds, and 320 short-term housing programs. The S. Mark Taper Foundation Shelter Resource Bank enables these homeless service providers to focus their funds and scarce resources on direct support services for the homeless. As demonstrated by the letters and expressions of support from several dozen of these agencies, attached as Exhibits B and C, the agencies consider the S. Mark Taper Foundation Shelter Resource Bank critical to their operations, and an important and unique project in the fight to alleviate, prevent, and end homelessness. Without Shelter

Partnership's support, the agencies' ability to support local homeless populations would be compromised.

The heart of the S. Mark Taper Foundation Shelter Resource Bank is a 108,000 square foot warehouse on nearly six acres in the City of Bell. The parcel is a former military facility. Shelter Partnership obtained the parcel by title conveyance from the United States Department of Health and Human Services in July 2007, and the United States government retains a reversionary interest in the parcel. Indeed, the conveyance entitles Shelter Partnership to occupy the property for thirty years, provided that Shelter Partnership continuously uses the property for public health purposes. For the thirty year period, Shelter Partnership may not encumber or dispose of any part of the property without the written authorization of the federal government.

The S. Mark Taper Foundation Shelter Resource Bank is immediately adjacent to The Salvation Army's Bell Shelter, which provides housing and services to hundreds of individuals on a nightly basis. Since 1990, the S. Mark Taper Foundation Shelter Resource Bank has provided Bell Shelter with over $1.3 million in goods for its residents, including toiletries, blankets, clothing, and furniture. *See* Ex. C (letter from The Salvation Army). The proximity of the S. Mark Taper Foundation Shelter Resource Bank to Bell Shelter benefits the mission of both organizations.

Shelter Partnership completed a $3.5 million renovation of the S. Mark Taper Foundation Shelter Resource Bank warehouse in 2009. This extensive rehabilitation was intended to ensure that the S. Mark Taper Foundation Shelter Resource Bank will thrive in its mission of serving the homeless for the next 30-50 years. Among other things, in connection with this rehabilitation, Shelter Partnership took great care to ensure that the warehouse was appropriately outfitted for receiving and distributing donations; improvements include a new roof, new sprinkler and water system, new lighting, replacement of doors and windows, structural upgrades, and repair of the building interior and exterior.

According to the I-710 Corridor Project Draft EIR/EIS, the S. Mark Taper Foundation Shelter Resource Bank—parcel 6332002035 in the City of Bell—would be fully acquired under Alternatives 6A, 6B, and 6C. It appears that the parcel would also be fully acquired under Alternative 5A, but the Draft EIR/EIS is internally inconsistent in this regard. *See infra* p. 6. Further, even if the parcel is not acquired, the S. Mark Taper Foundation Shelter Resource Bank will be significantly impacted by construction and operation of the expanded I-710 freeway.

Benefits of the S. Mark Taper Foundation Shelter Resource Bank's Current Location

The S. Mark Taper Foundation Shelter Resource Bank is ideally located to serve Los Angeles' homeless population. Like any warehouse facility, the S. Mark Taper Foundation Shelter Resource Bank benefits from proximity to freeways including I-710 and I-5, as easy freeway access facilitates the rapid distribution of goods from the warehouse. The S. Mark Taper Foundation Shelter Resource Bank's geographically central location in Bell also provides operational synergies. Situated close to downtown Los Angeles, the S. Mark Taper Foundation Shelter Resource Bank is positioned to receive goods donations from businesses throughout the region. Those goods are then distributed to homeless service organizations throughout the region, many of which are close to Bell. For example, the Bell Shelter, which has received over $1.3 million in donated goods since 1990, is immediately adjacent to the S. Mark Taper Foundation Shelter Resource Bank. Attached as Exhibit D is a map illustrating the locations of 229 organizations served by the S. Mark Taper Foundation Shelter Resource Bank. As Exhibit D demonstrates, the vast majority of these organizations are clustered near the S. Mark Taper Foundation Shelter Resource Bank's warehouse in Bell.

Moreover, donors and recipients of goods are responsible for independently dropping off or picking up products at the S. Mark Taper Foundation Shelter Resource Bank. Each week, the S. Mark Taper Foundation Shelter Resource Bank receives an average of 15 shipments from donors. Annually, the S. Mark Taper Foundation Shelter Resource Bank distributes more than 700 orders to individual agencies. The S. Mark Taper Foundation Shelter Resource Bank's central location is essential to facilitate these numerous donations and distributions. It would be far more difficult for businesses and organizations to deliver or receive goods from the S. Mark Taper Foundation Shelter Resource Bank, should it be required to move further away from its primary donors and beneficiaries. IP-122-2

Impacts of Relocating the S. Mark Taper Foundation Shelter Resource Bank

Under Alternatives 6A, 6B, and 6C of the Draft EIR/EIS, and potentially under Alternative 5A, the S. Mark Taper Foundation Shelter Resource Bank parcel would be fully acquired. *See infra* p. 6. Acquisition and relocation of the S. Mark Taper Foundation Shelter Resource Bank would have a serious adverse impact on the homeless population of Los Angeles. Indeed, the S. Mark Taper Foundation Shelter Resource Bank serves hundreds of homeless service agencies on an annual basis—230 in 2011/2012 alone. *See* Exhibit A (list of agencies served during 2011/2012). These agencies count on the S. Mark Taper Foundation Shelter Resource Bank to secure critical items for the homeless, such as toiletries, clothing, and baby products. If the S. Mark Taper Foundation Shelter Resource Bank's services are disrupted as a result of construction or relocation, tens of thousands of homeless individuals throughout Los IP-122-3

Angeles could receive significantly less material assistance from service agencies that are supported by the S. Mark Taper Foundation Shelter Resource Bank. These agencies may also have to reduce their direct services to the homeless, including case management and support services, to focus their resources on acquiring goods that were previously provided by the S. Mark Taper Foundation Shelter Resource Bank.

IP-122-3

Beyond the immediate adverse impacts on the Los Angeles homeless population, acquisition of Shelter Partnership's parcel could have an adverse long-term impact on the viability of the S. Mark Taper Foundation Shelter Resource Bank project. The I-710 Corridor Project seeks to expand freeway capacity specifically for freight services. Alternatives 6A, 6B, and 6C of the Draft EIR/EIS include designated truck lanes that would allow additional freight to be brought into the I-710 Corridor. As a result of increased freight being shipped through the I-710 Corridor, warehouse spaces in the region may be at a premium. Therefore, if the S. Mark Taper Foundation Shelter Resource Bank is forced to relocate, Shelter Partnership may have difficulty locating a suitable, centrally-located replacement warehouse. And as previously described, a centrally located warehouse is essential to the S. Mark Taper Foundation Shelter Resource Bank's mission.

IP-122-4

In addition, relocating the S. Mark Taper Foundation Shelter Resource Bank to a less central parcel could adversely impact air quality. The S. Mark Taper Foundation Shelter Resource Bank, for example, relies on deliveries and distributions of goods by truck and car. On average, the S. Mark Taper Foundation Shelter Resource Bank receives 15 shipments per week and distributes more than 700 orders per year. Relocating to less central warehouse could increase air pollution, as donors and recipients would be forced to drive longer distances to reach the warehouse.

IP-122-5

Moreover, the S. Mark Taper Foundation Shelter Resource Bank's recent $3.5 million renovation included the installation of many "green" features to make the building environmentally friendly. Among the green features are a reflective cool roof, low flow toilets and faucets, motion-activated lighting throughout the warehouse, and recycled, natural or no-formaldehyde materials for the walls and ceilings. Further, the ceilings, beams, and walls of the warehouse were whitewashed with low VOC paint, and large windows running the length of the warehouse were replaced with low-E glass to maintain the abundant natural lighting. The electrical and water consumption levels of the warehouse beat state environmental standards by 50%. If the S. Mark Taper Foundation Shelter Resource Bank were acquired, the environmental benefits resulting from these features would be negated unless a replacement property was comparably efficient.

IP-122-6

Impacts if the S. Mark Taper Foundation Shelter Resource Bank is Not Acquired

Even if the I-710 Corridor Project Alternative selected does not require acquisition of the S. Mark Taper Foundation Shelter Resource Bank parcel, construction along the I-710 Corridor could negatively impact the S. Mark Taper Foundation Shelter Resource Bank's ability to serve Los Angeles's homeless population. For example, construction along the I-710 freeway could impede access to the S. Mark Taper Foundation Shelter Resource Bank by donor or recipient organizations. Moreover, this construction could impede access to the S. Mark Taper Foundation Shelter Resource Bank by the five Shelter Partnership employees who travel to the facility on a daily basis. IP-122-7

In addition, construction along the I-710 Corridor would also threaten air quality in the surrounding area, as well as the health of Shelter Partnership's employees. IP-122-8

Inadequacies in I-710 Corridor Project Draft EIR/EIS

1. The Draft EIR/EIS is Self-Contradictory and Inadequate.

As a threshold matter, the Draft EIR/EIS is inadequate because it inconsistently describes the parcels that would be acquired under Alternative 5A. For example, the Parcel Acquisition Table and Maps in Appendix L to the Draft EIR/EIS set forth the parcels that would be acquired under Alternative 5A. *See* Exhibit E (excerpts from Appendix L to Draft EIR/EIS). According to Appendix L, the S. Mark Taper Foundation Shelter Resource Bank parcel, number 6332002035, would not be acquired—either in part or in full—under Alternative 5A. *See id.* at L-4, 59. But elsewhere, the Draft EIR/EIS indicates that under Alternative 5A, a freeway ramp would be built directly through the S. Mark Taper Foundation Shelter Resource Bank parcel. *See* Exhibit F (Draft EIR/EIS Chapter 2.0, Fig. 2.4-2, No. 28). IP-122-9

This inaccuracy must be analyzed and corrected. Indeed, these fundamental inconsistencies render the Draft EIR/EIS inadequate as a document that will help inform decision-making. Until the Draft EIR/EIS is revised, Shelter Partnership cannot know how its property will be affected by at least one of the I-710 Corridor Project Alternatives. And without revision, the Draft EIR/EIS will have failed in a critical respect—notifying property owners that their parcels are scheduled for acquisition. IP-122-10

Beyond this inaccuracy, the Draft EIR/EIS inadequately analyzes the placement of on and off ramps, collectors, and distributors. For example, Alternative 5A omits alternative locations for ramp placement, and does not analyze the necessity of constructing a ramp directly through a warehouse serving the local homeless population. Rather, it appears from Chapter 2.0, IP-122-11

Figure 2.4-2 (which illustrates the locations of ramps, collectors, and distributors under Alternative 5A) that the lines for these ramps were drawn without taking into account the impacts to adjacent parcels. *See* Exhibit F (Draft EIR/EIS Chapter 2.0, Fig. 2.4-2). Similarly, the Draft EIR/EIS should further analyze expansion plans under Alternatives 6A, 6B, and 6C to determine whether modifications can be made that would obviate the need for certain parcel acquisitions, including the parcel hosting the S. Mark Taper Foundation Shelter Resource Bank. IP-122-11

2. The Draft EIR/EIS Fails to Adequately Analyze Community Impacts.

In addition to inaccurately describing the acquisitions that might occur under certain proposed alternatives, the Draft EIR/EIS fails to adequately consider the community impacts associated with the proposed acquisition of the S. Mark Taper Foundation Shelter Resource Bank. Chapter 3.3 of the Draft EIR/EIS purports to analyze the community impacts of the I-710 Corridor Project Alternatives. Under the Federal Highway Administration's implementation of NEPA, final decisions regarding projects must consider "the best overall public interest" and "destruction or disruption of man-made and natural resources, aesthetic values, community cohesion and the availability of public facilities and services." 23 U.S.C. § 109(h). With respect to CEQA, the Draft EIR/EIS itself acknowledges that "[s]ince [the I-710 Corridor] project would result in physical change to the environment, it is appropriate to consider changes to community character and cohesion in assessing the significance of the project's effects." Draft EIR/EIS § 3.3.1.1.

Yet the Draft EIR/EIS omits any analysis of community impacts that would result from acquiring the S. Mark Taper Foundation Shelter Resource Bank. Table 3.3-8 of the Draft EIR/EIS describes "direct and indirect impacts to community facilities." Draft EIR/EIS § 3.3.1.3. Among the community facilities analyzed in Table 3.3-8 is the Long Beach Multi-Service Center, which provides services to the homeless. *See also* Draft EIR/EIS Chapter 3.0 at 3.3-48. Like the Long Beach Multi-Service Center, the S. Mark Taper Foundation Shelter Resource Bank is a community facility that serves Los Angeles's homeless population. At no point, however, does Chapter 3.3 of the Draft EIR/EIS consider the impacts to the S. Mark Taper Foundation Shelter Resource Bank. This omission is particularly significant given that the S. Mark Taper Foundation Shelter Resource Bank would be directly impacted under all four build alternatives. IP-122-12

Moreover, for the reasons described above, disrupting the S. Mark Taper Foundation Shelter Resource Bank's services by forcing it to relocate (or otherwise disrupting its operations through construction) would have a significant negative impact on the surrounding homeless community. As the Draft EIR/EIS contemplates acquiring other parcels providing services to

local homeless populations (including, for example, the Salvation Army's Bell Shelter), this adverse effect will be multiplied.

IP-122-12

In sum, the Draft EIR/EIS fails to analyze whether the project is in the "best overall public interest," particularly given the significant community impacts that would result from acquisition of the Resource Bank (or disruption of its operations). 23 U.S.C. § 109(h). The Draft EIR/EIS must therefore be corrected to account for these significant community impacts, and to adequately analyze whether the project is in the "best overall public interest" as required Section 109(h) of the Federal-Aid Highway Act.

3. The Draft EIR/EIS Contains Inadequate Environmental Justice Analysis.

The environmental justice analysis in the Draft EIR/EIS is also deficient. Under Executive Order 12898, *Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations*, each Federal agency "shall make achieving environmental justice part of its mission by identifying and addressing . . . disproportionately high and adverse human health or environmental effects of its programs, policies, and activities on minority populations and low-income populations." Exec. Order 12898, 59 Fed. Reg. 7,629 (Feb. 11, 1994); *see also* 42 U.S.C. § 2000d (Title VI of the 1964 Civil Rights Act). Each Federal agency must therefore identify and avoid disproportionate impacts on minority and low-income populations, to the greatest extent allowed by law. The U.S. Department of Transportation's *Order to Address Environmental Justice in Minority Populations and Low-Income Populations* likewise requires that impacts on minority and low-income populations be addressed during agency decision making. Dep't of Transp. Order 5610.2, 62 Fed. Reg. 18,377 (Apr. 15, 1997). In addition, the California Department of Transportation *Director's Policy on Environmental Justice* seeks to ensure that low-income and minority populations "are not discriminated against, treated unfairly, or made to suffer disproportionately from transportation decisions." Cal. Dep't of Transp. Director's Policy on Environmental Justice (Nov. 5, 2001); *see also* Cal. Dep't of Transp. Deputy Directive on Environmental Justice and Civil Rights in Transportation Decision-Making (Nov. 5, 2001).

IP-122-13

Despite these requirements, the Draft EIR/EIS contains no environmental justice analysis regarding impacts to the S. Mark Taper Foundation Shelter Resource Bank or the communities it serves. Should the S. Mark Taper Foundation Shelter Resource Bank be acquired (or affected by construction), low-income and minority populations would be disproportionately and adversely affected. As described above, goods from the S. Mark Taper Foundation Shelter Resource Bank are distributed to tens-of-thousands of homeless individuals per year. These distributions allow homeless service agencies to concentrate scarce resources on critical direct services to homeless populations. If distributions from the S. Mark Taper Foundation Shelter Resource Bank are

disrupted, these agencies will have diminished ability to serve local homeless populations. The Draft EIR/EIS should be revised to include environmental justice analysis regarding impacts to the S. Mark Taper Foundation Shelter Resource Bank and the low-income and minority populations it serves. IP-122-13

4. *The Draft EIR/EIS Fails to Mention the S. Mark Taper Foundation Shelter Resource Bank in its Discussion of Impacted Public Facilities.*

Because the United States government retains a continuing interest in the parcel under the conveyance, the S. Mark Taper Foundation Shelter Resource Bank is a public facility providing a public service. Under the CEQA Environmental Checklist, an Environmental Impact Report must analyze impacts on public facilities that provide public services, including the impact on "service ratios, response times or other performance objectives." *See* Draft EIR/EIS Appendix A, CEQA Checklist at 7, XIV(a). In this regard, because the Draft EIR/EIS fails to analyze the impact that relocation of the S. Mark Taper Foundation Shelter Resource Bank would have on the area homeless population, the Draft EIR/EIS does not comply with CEQA's mandate to consider impacts on public services. IP-122-14

5. *The Draft EIR/EIS Fails to Include Sufficient Analysis of Mitigation Measures.*

The Draft EIR/EIS also fails to sufficiently analyze mitigation measures, including mitigation measures that would affect Shelter Partnership. Under CEQA, each and every significant effect on the environment must be disclosed in the EIR and mitigated if feasible. *See* Draft EIR/EIS Chapter 4.0 at 4-1. If the I-710 Corridor Project moves forward, Shelter Partner requests, at a minimum, that the following mitigation measures be adopted. IP-122-15

First, measures must be taken to minimize air pollution and the consequent adverse effects on the health of S. Mark Taper Foundation Shelter Resource Bank workers during construction. This may include, among other things, installation of an air filtration system. The S. Mark Taper Foundation Shelter Resource Bank typically operates with bay doors open, and a ventilation system would allow the S. Mark Taper Foundation Shelter Resource Bank to keep its doors closed to prevent dust and debris from entering the warehouse during construction. IP-122-16

Second, Caltrans should consider alternative options for exit ramps, particularly under Alternative 5A, that would not disrupt the S. Mark Taper Foundation Shelter Resource Bank's operations. IP-122-17

Third, Caltrans should consider mitigation measures for impacts on environmental justice populations, particularly the homeless populations that would be affected by acquisition of the IP-122-18

S. Mark Taper Foundation Shelter Resource Bank. Chapter 3.3 of the Draft EIR/EIS acknowledges that "mitigation measures may be needed" regarding impacts to environmental justice populations. Draft EIR/EIS Chapter 3.3 at 3.3-53. Shelter Partnership requests that Caltrans extend its analysis of mitigation measures to address impacts on low-income and minority populations served by the S. Mark Taper Foundation Shelter Resource Bank.

IP-122-18

Conclusion

For the reasons described above, the Draft EIR/EIS is inadequate, and Shelter Partnership requests that it be revised and recirculated, with a new opportunity for public comment. Revisions to the Draft EIR/EIS should take into account the substantial adverse impacts construction and potential relocation would have on the S. Mark Taper Foundation Shelter Resource Bank and its many vulnerable constituents. Indeed, complete disclosure of the impacts to the S. Mark Taper Foundation Shelter Resource Bank and its constituents is critical to informed decision-making.

IP-122-19

Sincerely,

David I. Horowitz

Letter of Support to CalTrans:

I am concerned that all of the build alternatives for the I-710 Corridor would negatively impact Shelter Partnership's S. Mark Taper Foundation Shelter Resource Bank warehouse serving the Los Angeles County homeless population.

The donations we receive from the S. Mark Taper Foundation Shelter Resource Bank are critical to our success. If this valuable program were to be seriously disrupted or eliminated our ability to support our homeless clients would be compromised.

We encourage you to consider in your deliberations the impact of the I-710 expansion project on this most valuable regional resource.

RE: I-710 Corridor Project and DEIR/EIS Impact on the Shelter Partnership S. Mark Taper Foundation Shelter Resource Bank

Dear Mr. Koskinski:

I am writing on behalf of The Salvation Army Bell Shelter regarding the I-710 Environmental Impact Report. I am concerned that all of the build alternatives would negatively impact Shelter Partnership's S. Mark Taper Foundation Shelter Resource Bank warehouse serving the Los Angeles County homeless population.

Since 1990, our agency has been a recipient of valuable new goods from the S. Mark Taper Foundation Shelter Resource Bank. During that time, we have received $1,337,546.56 in new goods that support both our program operations and provide needed goods directly to the homeless clients we serve, at no cost to our agency. The goods have included personal care products, cleaning supplies, clothing, shoes, household goods, and so much more.

The S. Mark Taper Foundation Shelter Resource Bank donations are critical to our success. If this valuable program were to be seriously disrupted or eliminated our ability to support our homeless population would be compromised.

The Salvation Army Bell Shelter provides 300 beds of emergency shelter and transitional housing with comprehensive supportive services for homeless adults in the City of Bell, CA. We serve over 650 individuals annually with over 60% of these individuals sufficiently addressing the root causes of their homelessness that they are able to move to permanent housing upon completion of the program.

We encourage you to consider in your deliberations the impact of the I-710 expansion project on this most valuable regional resource.

Sincerely,

Steve Lytle

RE: I-710 Corridor Project and DEIR/EIS Impact on the Shelter Partnership S. Mark Taper Foundation Shelter Resource Bank

Dear Mr. Koskinski:

I am writing on behalf of Chrysalis regarding the I-710 Environmental Impact Report. I am concerned that all of the build alternatives would negatively impact Shelter Partnership's S. Mark Taper Foundation Shelter Resource Bank warehouse serving the Los Angeles County homeless population.

Since 1989 our agency has been a recipient of valuable new goods from the S. Mark Taper Foundation Shelter Resource Bank. During that time, we have received over $700,000 in new goods that support both our program operations and provide needed goods directly to the clients that we serve, at no cost to our agency. The goods have included personal care products, cleaning supplies, clothing, shoes, household goods, and so much more.

The S. Mark Taper Foundation Shelter Resource Bank donations are critical to our success. If this valuable program were to be seriously disrupted or eliminated our ability to support our homeless population would be compromised.

Our agency helps the homeless and those in poverty find and retain employment. Each year we provide services to over 3500 individuals.

We encourage you to consider in your deliberations the impact of the I-710 expansion project on this most valuable regional resource.

Sincerely,

RE: I-710 Corridor Project and DEIR/EIS Impact on the Shelter Partnership S. Mark Taper Foundation Shelter Resource Bank

Dear Mr. Koskinski:

I am writing on behalf of A Community of Friends (ACOF) regarding the I-710 Environmental Impact Report. I am concerned that all of the build alternatives would negatively impact Shelter Partnership's S. Mark Taper Foundation Shelter Resource Bank warehouse which provides services to people who are homeless in Los Angeles County.

Our agency ACOF is a nonprofit affordable housing development corporation that provides affordable housing and supportive services to formerly homeless individuals and families whose head of household also have a diagnosed mental illness. Created in 1988, ACOF currently houses over 1300 households including 500 children.

Shelter Partnership's Resource Bank is a valuable program for ACOF and many other nonprofit organizations that are involved in the goal of ending homelessness. Since 1997, our agency has been a recipient of valuable new goods from the S. Mark Taper Foundation Shelter Resource Bank, totaling over $1.1 million. The goods have included personal care products, cleaning supplies, clothing, shoes, household goods, and so much more, which is provided at no cost to the tenants living in our buildings. If this valuable program were to be seriously disrupted or eliminated due to the I-710 expansion, our ability to support our formerly homeless tenants would be compromised.

We encourage you to consider in your deliberations the impact of the I-710 expansion project on this most valuable regional resource.

Sincerely,

Dora Leong Gallo
Chief Executive Officer

Covenant House California
Opening Doors for Homeless Youth

September 12, 2012

Mr. Ronald Koskinski
Caltrans District 7, Division of Environmental Planning
100 South Main Street, MS 16A
Los Angeles, CA 90012

RE: I-710 Corridor Project and DEIR/EIS Impact on the Shelter Partnership S. Mark Taper Foundation Shelter Resource Bank

Dear Mr. Koskinski:

I am writing on behalf of Covenant House California regarding the I-710 Environmental Impact Report. I am concerned that all of the build alternatives would negatively impact Shelter Partnership's S. Mark Taper Foundation Shelter Resource Bank warehouse serving the Los Angeles County homeless population.

Since 1991, our agency has been a recipient of valuable new goods from the S. Mark Taper Foundation Shelter Resource Bank. During that time, we have received a total of $838,134 in new goods that support both our program operations and provide needed goods directly to the homeless youth that we serve, at no cost to our agency. The goods have included personal care products, cleaning supplies, clothing, shoes, household goods, and so much more.

The S. Mark Taper Foundation Shelter Resource Bank donations are critical to our success. If this valuable program were to be seriously disrupted or eliminated our ability to support our homeless population would be compromised.

Covenant House California responds to a critical service gap for nearly 4,000 individual homeless youth in Los Angeles each year, providing life saving outreach, shelter and opportunities to gain the long-term self sufficiency skills for productive citizenry. At a time of unprecedented need and scarce resources, Shelter Partnership's contributions enable our Hollywood residential campus to address the basic human needs of more than 100 homeless, transition-age youth per day, offering safe alternatives to the streets with 36,500 nights of care each year.

We encourage you to consider in your deliberations the impact of the I-710 expansion project on this most valuable regional resource.

Sincerely,

RE: I-710 Corridor Project and DEIR/EIS Impact on the Shelter Partnership S. Mark Taper Foundation Shelter Resource Bank

Dear Mr. Koskinski:

I am writing on behalf of Hollywood Community Housing Corporation (HCHC) regarding the I-710 Environmental Impact Report. I am concerned that all of the build alternatives would negatively impact Shelter Partnership's S. Mark Taper Foundation Shelter Resource Bank warehouse serving the Los Angeles County homeless population.

Since 2001, our agency has been a recipient of valuable new goods from the S. Mark Taper Foundation Shelter Resource Bank. During that time, we have received $349,150.77 in new goods that support both our program operations and provide needed goods directly to the clients that we serve, at no cost to our agency. The goods have included personal care products, cleaning supplies, clothing, shoes, household goods, and so much more.

The S. Mark Taper Foundation Shelter Resource Bank donations are critical to our success. If this valuable program were to be seriously disrupted or eliminated our ability to support our homeless population would be compromised.

For over 20 years, HCHC has been developing safe, attractive, affordable housing for households who get by on 25% to 60% of the Area Median Income. For a four-person household, this means total annual earnings between $21,350 and $51,240. The essential goods received from Shelter Partnership make an enormous difference in the lives of those who must count every penny. Today we have 22 buildings with 718 units serving approximately 1,700 people, including seniors, large families and individuals. Approximately 25% of our units are

designated for Special Needs households, this is, those who are disabled by HIV/AIDS and, in many cases, previously homeless. Our Food Pantry, through which the household goods from Shelter Partnership are distributed, serves the low-income community at large in addition to our residents. With the number of community members served by the Pantry added to our resident service population, over 2,000 individuals each year benefit from the goods we receive from Shelter Partnership.

We encourage you to consider in your deliberations the impact of the I-710 expansion project on this most valuable regional resource.

Sincerely,

William F. Harris
Executive Director

RE: I-710 Corridor Project and DEIR/EIS Impact on the Shelter Partnership S. Mark Taper Foundation Shelter Resource Bank

Dear Mr. Koskinski:

I am writing on behalf of L.A. Family Housing regarding the I-710 Environmental Impact Report. I am concerned that all of the build alternatives would negatively impact Shelter Partnership's S. Mark Taper Foundation Shelter Resource Bank warehouse serving the Los Angeles County homeless population.

Since 1989, our agency has been a recipient of valuable new goods from the S. Mark Taper Foundation Shelter Resource Bank. During that time, we have received $1,356,259 in new goods that support both our program operations and provide needed goods directly to the clients that we serve, at no cost to our agency. The goods have included personal care products, cleaning supplies, clothing, shoes, household goods, and so much more.

The S. Mark Taper Foundation Shelter Resource Bank donations are critical to our success. If this valuable program were to be seriously disrupted or eliminated our ability to support our homeless population would be compromised.

Last year, our agency helped 3,500 people transition out of homelessness and poverty through a continuum of housing enriched with supportive services including job training, mental and physical health programs, legal services, case management, child care and financial literacy programs.

We encourage you to consider in your deliberations the impact of the I-710 expansion project on this most valuable regional resource.

Sincerely,

Stephanie Klasky-Gamer

RE: I-710 Corridor Project and DEIR/EIS Impact on the Shelter Partnership S. Mark Taper Foundation Shelter Resource Bank

Dear Mr. Koskinski:

I am writing on behalf of The Los Angeles Mission regarding the I-710 Environmental Impact Report. I am concerned that all of the build alternatives would negatively impact Shelter Partnership's S. Mark Taper Foundation Shelter Resource Bank warehouse serving the Los Angeles County homeless population.

Since 1989, our agency has been a recipient of valuable new goods from the S. Mark Taper Foundation Shelter Resource Bank. During that time, we have received $1,860,012.72 in new goods that support both our program operations and provide needed goods directly to the clients that we serve, at no cost to our agency. The goods have included personal care products, cleaning supplies, clothing, shoes, household goods, and so much more.

The S. Mark Taper Foundation Shelter Resource Bank donations are critical to our success. If this valuable program were to be seriously disrupted or eliminated our ability to support our homeless population would be compromised.

Our agency exists to serve the homeless living on the streets of downtown's Skid Row and beyond. The Los Angeles Mission focuses on emergency services, drug and alcohol rehabilitation, education, employment and spiritual life. The Mission seeks to take individuals from the street to being productive citizens and relies heavily on these valuable goods while providing assistance for more than 4,500 annually.

We encourage you to consider in your deliberations the impact of the I-710 expansion project on this most valuable regional resource.

Sincerely,

Herbert L. Smith

RE: I-710 Corridor Project and DEIR/EIS Impact on the Shelter Partnership S. Mark Taper Foundation Shelter Resource Bank

Dear Mr. Koskinski:

As president and chief executive officer of Mental Health America of Los Angeles (MHA), I am writing regarding the I-710 Environmental Impact Report. We at MHA are concerned that all of the build alternatives would negatively impact Shelter Partnership's S. Mark Taper Foundation Shelter Resource Bank warehouse serving the Los Angeles County homeless population.

Our organization and the homeless adults and young adults we serve have been recipients of new goods from the Resource Bank for 22 years. During this time, we have received goods valued at more than $700,000 to provide for some of the essential needs of homeless individuals and to support our homeless assistance programs in their work, at no charge to our organization.

The S. Mark Taper Foundation Shelter Resource Bank donations are important to our success. One of our most crucial services is "outreach and engagement," when we make contact with homeless people directly on the streets and engage them in services by providing for some of their immediate needs. Because of the Resource Bank's generous support, we are able to offer items such as personal care products, clothing and shoes to help them right away and to engage them in our services that help put a permanent end to their homelessness. If the Resource Bank's work was to be disrupted or eliminated, we and the people we serve would be without this crucial community resource.

MHA has a 25-year history of service to homeless people with mental illness, many of whom also have serious health problems and substance abuse recovery needs. Last year, we served 1,134 individuals in our homeless assistance programs.

As you deliberate, we encourage you to consider the impact of the I-710 expansion project on this valuable resource that benefits so many in our community.

Sincerely,

Dave Pilon, Ph.D.

RE: I-710 Corridor Project and DEIR/EIS Impact on the Shelter Partnership S. Mark Taper Foundation Shelter Resource Bank

Dear Mr. Koskinski:

I am writing on behalf of OPCC regarding the I-710 Environmental Impact Report. I am concerned that all of the build alternatives would negatively impact Shelter Partnership's S. Mark Taper Foundation Shelter Resource Bank warehouse serving the Los Angeles County homeless population.

Since 1989, our agency has been a recipient of valuable new goods from the S. Mark Taper Foundation Shelter Resource Bank. During that time, we have received $1.5 million in new goods that support both our program operations and provide needed goods directly to the clients that we serve, at no cost to our agency. The goods have included personal care products, cleaning supplies, clothing, shoes, household goods, and so much more.

The S. Mark Taper Foundation Shelter Resource Bank donations are critical to our success. If this valuable program were to be seriously disrupted or eliminated our ability to support our homeless population would be compromised.

Our agency provides services to low-income and homeless youth, adults and families, battered women and their children, at-risk youth and people living with mental illness. Each year we provide everything from basic needs such as food, clothing, showers and laundry, to interim housing, mental and physical health care, transportation, case management, domestic violence services and permanent supportive housing to over 5,000 individuals a year.

We encourage you to consider in your deliberations the impact of the I-710 expansion project on this most valuable regional resource.

Sincerely,

RE: I-710 Corridor Project and DEIR/EIS Impact on the Shelter Partnership S. Mark Taper Foundation Shelter Resource Bank

Dear Mr. Koskinski:

I am writing on behalf of SRO Housing Corporation regarding the I-710 Environmental Impact Report. I am deeply concerned about the negative impact it may have on Shelter Partnership's S. Mark Taper Foundation Shelter Resource Bank and the low-income and homeless population we serve. Since Shelter Partnership's inception, SRO Housing Corporation has received over $1,100,000 of free goods such as personal care products, cleaning supplies, clothing, shoes, household goods, and so much more.

SRO Housing Corporation provides over 2,300 units of housing to low-income and homeless individuals in the Central City East community of downtown Los Angeles, an area more commonly known as Skid Row. This area has the largest concentration of homelessness and poverty in Los Angeles and arguably the nation. Thousands of community members depend upon the items that are received from the S. Mark Taper Foundation Shelter Resource Bank and would be negatively impacted if this program is disrupted or eliminated.

Therefore we are asking for you to take this into consideration as you deliberate the impact of the I-710 expansion project on this vital regional resource.

Sincerely,

Anita U. Nelson, MBA

RE: I-710 Corridor Project and DEIR/EIS Impact on the Shelter Partnership S. Mark Taper Foundation Shelter Resource Bank

Dear Mr. Koskinski:

I am writing on behalf of Shelter Partnership regarding the I-710 Environmental Impact Report. I am concerned that all of the build alternatives would negatively impact Shelter Partnership's S. Mark Taper Foundation Shelter Resource Bank warehouse serving the Los Angeles County homeless population.

Since July 1989, our agency has been a recipient of valuable new goods from the S. Mark Taper Foundation Shelter Resource Bank. During that time, we have received $2,495,195.07 in new goods that support both our program operations and provide needed goods directly to the clients that we serve, at no cost to our agency. The goods have included personal care products, cleaning supplies, clothing, shoes, household goods, and so much more.

The S. Mark Taper Foundation Shelter Resource Bank donations are critical to our success. If this valuable program were to be seriously disrupted or eliminated our ability to support our homeless population would be compromised.

Our agency serves those experiencing homelessness, women and children, young men and the elderly through its facilities. Programs include restoration, food and shelter designed to restore self-sufficient living.

We encourage you to consider in your deliberations the impact of the I-710 expansion project on this most valuable regional resource.
