US BROWNFIELDS: A Listing of Brownfields Sites

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

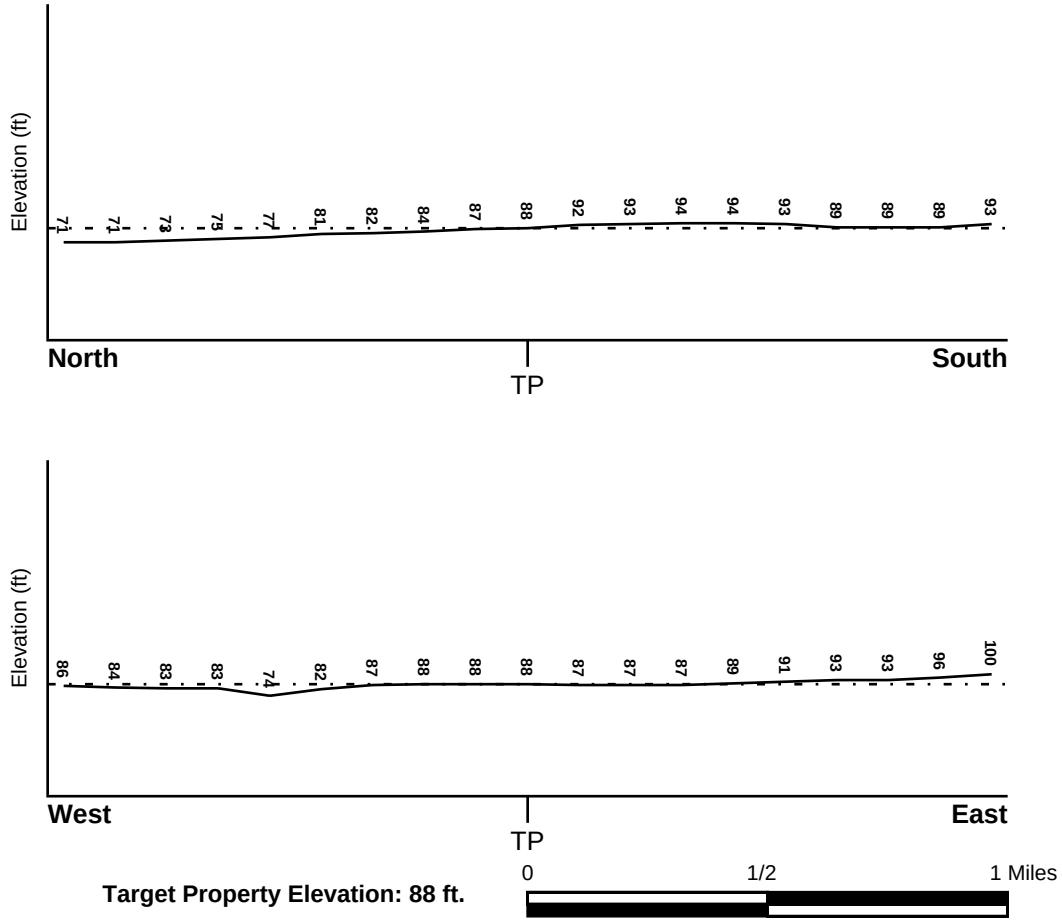
1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).



TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General North

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps. The following information is based on Soil Conservation Service STATSGO data.

Soil Component Name:	BOTELLA
Soil Surface Texture:	clay loam
Hydrologic Group:	Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.
Soil Drainage Class:	Not reported

Hydric Status: Soil does not meet the requirements for a hydric soil.

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at five year intervals.

Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1922 through 2017. This report compiles information gathered in this review by geocoding the latitude and longitude of properties identified and gathering information about properties within 660 feet of the target property.

A summary of the information obtained is provided in the text of this report.

RECORD SOURCES

EDR's Digital Archive combines historical directory listings from sources such as Cole Information and Dun & Bradstreet. These standard sources of property information complement and enhance each other to provide a more comprehensive report.

EDR is licensed to reproduce certain City Directory works by the copyright holders of those works. The purchaser of this EDR City Directory Report may include it in report(s) delivered to a customer. Reproduction of City Directories without permission of the publisher or licensed vendor may be a violation of copyright.

Toilet Room Fixtures and Accessories

Water Closet. The height is required to be a minimum of 17 inches and a maximum of 19 inches measured to the top of the seat. Flush controls are to be operable by an oscillating handle with a maximum operating force of 3 lbf or by a remote low voltage button. The handle or button is to be located so it is operable without requiring excessive body movement.*

The requirements for toilet compartments depend on the size of the water closet, so it is important to know what type one is using when designing the toilet room. There are various types available, and competitive bidding may cause later changes in the water closet used. The following table is a generalization of the typical sizes available in the commonly used types of water closets. If there is any doubt, design for the largest type that might be used.

Urinals. Provide stall-type or wall hung urinals with an elongated rim at a maximum height of 17 inches. Flush controls are to be hand operated, are to meet the same requirements as the flush controls for the water closet, and are to be no more than 44 inches above the floor. Provide a clear space 30 inches by 48 inches in front of urinals. Although not emphasized in the regulations, the accessible wall hung urinal should be the maximum elongated rim type available.*

Lavatory. Provide a clearance of at least 29 inches from the floor to the bottom of the apron with knee clearance under the front lip extending a minimum of 30 inches wide with 8 inches minimum depth at the top. Provide toe clearance at least 30 inches wide, to 9 inches above the floor and 17 inches deep from the front of the lavatory.** No height limitations are specified for the top of the lavatory, but 34 inches is recommended by the Federal Architectural and Transportation Barriers Compliance Board (ATBCB).

Provide a clear floor space 30 inches by 48 inches in front of the lavatory. The clear space may extend into knee and toe space underneath the lavatory.

Insulate or cover hot water and drain pipes under lavatories. No sharp or abrasive surfaces are allowed under lavatories.

Faucet controls and operating mechanisms are required to be operable with one hand and can not require grasping, pinching or twisting of the wrist. The force required to activate controls is not to exceed 5 lbf. Lever-operated, push-type, and electronically controlled mechanisms are examples of acceptable designs. Self-closing valves are allowed if the faucet remains open for at least 10 seconds.

Accessories. Where towel, sanitary napkin and waste receptacles and similar dispensing and disposal fixtures are provided, at least one of each type is to be located with all operable parts, including coin slots, within 40 inches from the floor.

Mount mirrors with the bottom edge no more than 40 inches from the floor.

Locate toilet tissue dispensers on the wall within 12 inches of the front edge of the toilet seat.

Re: The Church of Scientology of Los Gatos, A California Corporation
Proposed Location: 19 No 2nd St., San Jose, CA
Size of Space: Approximately 15,000 Sq. Ft.
Zoning: CG in the "Core" redevelopment area.
General Description of uses: Church administrative offices, spiritual counseling, religious classes and Sunday worship.

Dear Planner:

Our Church is in the process of purchasing a building. The building at 19 No 2nd St. fits our use. We feel the building inside and out is beautiful and we like the location. This letter is meant to give you a clear understanding of our use. I have enclosed the conditional use permit we have operated under in Campbell for the last 5 years to help further this understanding. The building is approximately 15,000 square feet and we will be the sole occupant.

The religion of Scientology is what is called an applied religious philosophy. It deals in practical applications that help individuals live a better life. We deliver one-on-one spiritual counseling to individuals. Our members train to be counselors and do course work connected with this and the administration of the Church.

The uses of our spaces are as follows:

Offices and Counseling:

This makes up the greatest percentage of space allocation. It consists of administrative offices as well as counseling offices where we deliver one-on-one spiritual counseling.

Training:

Training consists of courses that are delivered to members and staff such as The Success Through Communications Course, The Personal Efficiency Course, The Personal Values and Integrity Course, The Basic Study Manual and many other courses to help one understand and improve life.

Our courses are delivered on an individual basis, rather than a group basis. In other words, individuals start courses at any time and complete their courses at their own speed. This operating basis causes a staggered flow of public as opposed to a large influx of public all at one time.

Book Sales and Religious Artifacts:

We have an inside bookstore that takes up approximately 3% of the total space. The purpose of our bookstore is to provide religious materials for the people attending our courses and to anyone who is interested.

Occupancy and Traffic Flow

Our hours of operation are Monday through Friday, from 9:00 AM to 10:00 PM; Saturday and Sunday from 9:00 AM to 6:00 PM. The number of staff working at the Church is about 50 including part-time staff. They work staggered shifts due to our operating hours with the highest number of staff at the facility occurring between 7:00 PM and 10:00 PM, Monday through Friday. Weekends are lighter with approximately 1/2 of the staff working on Saturday and the others working on Sunday.

There are between 40 to 50 parishioners in the facility on any given night Monday through Friday. The majority of them (35 to 40) would be attending the courses described above in one of the two classrooms. The others would be meeting with a minister for spiritual counseling. Saturdays and Sundays are lighter with there being approximately 15 to 20 parishioners at the facility at any one time with the exception of Sunday Service where there may be between 30 to 40. (It is fundamental of our religious practice that we study our scripture on a daily basis. Thus our form of worship occurs everyday with the greatest attendance on weeknights rather than Sunday Services.)

There are several holidays held throughout the year that are celebrated by the religion of Scientology. Due to the number of people who attend these holiday events we rent halls at other locations as they are held in conjunction with other Churches and we wish to celebrate them together. There are 8 other Scientology Churches with in a ½ hour drive so there are far to many of us to occupy any one local Church.

Planned Improvements

There will be some tenant improvements needed to reconfigure a few of the existing walls to accommodate the new floor plan for the offices, etc. Attached is a general diagram of our future space plan along with plans of the existing space.

Included in these improvements will be a space for a sauna. Our Church has a Purification Program as one of the beginning steps to receiving counseling as it has been found that a primary barrier to clear thinking and spiritual improvement is the effects of past drugs and chemicals found in the environment. Sweating in the sauna is a part of this program which also includes exercise and nutrition. On the average, the program takes about two weeks. This is the only use for the sauna. This is not a medical program and parishioners who participate in the program receive a checkup and an okay from their MD before participating.

Two of our spiritual counseling rooms will have "assist tables" in them. In our counseling, when someone has, for example, had a baby, been ill or injured, our counselors can provide a counseling assist to aid in the recovery process. Our assists are neither massage nor medical treatment, nor are they a substitute for medical treatment. They are a complement to medical treatment and an aid to relieving the emotional shock that can occur with physical trauma. Assists can be delivered to someone sitting in a chair as well. The assist tables are occasionally used when someone prefers to lie down.

Public Welfare

This organization and its members are very active in the community. Some of the groups sponsored either by our organization or our members are: Families for a Better Community, The World Literacy Crusade, The Way to Happiness Club and The Drug Free Marshals.

The Families Group is well known in Campbell for its projects with Parks and Recs. The mural on the corner of San Tomas and Campbell Ave painted 4 years ago as a cooperative effort between the City of Campbell, the Families for a Better Community and a group of local artists stopped the tagging on this wall while creating a beautiful landmark

The Drug Free Marshals are elementary school children who educate and swear in other children and adults to Live Drug Free lives thus earning Marshal badges themselves. The Marshals have a float in the San Jose Holiday parade every year and have won a trophy every year for the last 14 years for design or community message. Several of the past winning floats can be seen on San Jose's web site.

Sincerely Yours,

Mark Warlick

PLANNING NO.: RSP03-006
DESCRIPTION: Special Use Permit to convert the ground floor of existing office and retail building into church meeting rooms and offices with a "walk-in" type-area
LOCATION: West side of North 2nd St., approximately 150 ft. northerly of E. Santa Clara St.
ADDRESS: 19 North Second St.
FOLDER #:

The San Jose Fire Department has reviewed the related plans as submitted and has the following comments and requirements.

- These comments are based on the following information:

  Largest building: 5,000 sq. ft.

  Construction Type: VN

  Occupancy Group: B/A-3

  Number of stories: 2

- Site fire flow requirement: 2,000 G.P.M.
- Average hydrant(s) spacing: 450 feet - Subject to Fire Department approval

- Comply with comments from the Building/Fire Departments at the plan review stage.

- **THE FOLLOWING CORRECTIONS SHALL APPLY TO THE SUBJECT APPLICATION:**

1. The needed fire flow noted above shall be provided from a minimum of 2 hydrants and shall be spaced apart on average 450 feet from the proposed project. Fire flow may be reduced upon construction of a four-hour wall, without openings, as per the adopted fire code. Construction of the area separation wall(s) is subject to review by the Fire Department.

2. Alter the sprinkler system as needed by new partitions, floors and ceilings. Plans and a permit application shall be submitted to the San Jose Fire Department's Bureau of Fire Prevention for review and approval before altering the system. A separate inspection will be required before the final fire inspection can be scheduled. Call (408) 277-4656 for more information.

3. The "beginning ministerial training/administration" room has over 50 occupants, which qualifies as an "A-3" occupancy. Two exits are required at minimum, half the room's diagonal on center, and doors opening in the direction of egress.

- Street numbers shall be visible day and night from the nearest street, either by means of illumination or by the use of reflective materials.

- We reserve the right to make comments at a future date.

If you have any questions regarding these items, please contact me at (408) 277-8754.

Approved 1/21/98

RESOLUTION NO. 3140

BEING A RESOLUTION OF THE PLANNING COMMISSION OF THE CITY OF CAMPBELL APPROVING A CONDITIONAL USE PERMIT TO ALLOW THE ESTABLISHMENT OF A COMMERCIAL SCHOOL ON PROPERTY LOCATED AT **2155 S. BASCOM AVENUE IN A C-2-S** (GENERAL COMMERCIAL) AND R-3-S (MULTIPLE FAMILY RESIDENTIAL) ZONING DISTRICT. APPLICATION OF THE CHURCH OF SCIENTOLOGY. FILE NO. UP 97-20.

After notification and public hearing, as specified by law, and after presentation by the Community Development Director, proponents and opponents, the hearing was closed.

After due consideration of all evidence presented, the Planning Commission did find as follows with respect to application UP 97-20:

1. Commercial schools are permitted in a C-2-S (General Commercial) Zoning District subject to approval of a Use Permit.

2. The applicant will occupy a 10,000 square foot tenant space in an existing 31,400 square foot office building; the classroom areas (including the audio/visual rooms) to be used to conduct the commercial school will be limited to a total of five (5) classrooms and a maximum of 2,200 square feet.

3. The proposed commercial school is a compatible use within the existing office building and the surrounding neighborhood.

4. The establishment of the proposed school will not entail exterior modifications to the building.

Based upon the foregoing findings of fact, the Planning Commission further finds and concludes that :

1. The proposed project is consistent with the General Plan and the City's Zoning Ordinance.

2. The proposed project as conditioned will aid in the harmonious development of the immediate area.

3. The establishment, maintenance, and/or operation of the use applied for will not be detrimental to the health, safety, peace, morals, comfort or general welfare of persons residing or working in the neighborhood of such proposed use, or be detrimental or injurious to property and improvements in the neighborhood or to the general welfare of the City.

The applicant is hereby notified, as part of this application, that he/she is required to meet the following conditions in accordance with the ordinance of the City of Campbell and the State of California. The lead department with which the applicant will work is identified on each condition where necessary. Additionally, the applicant is hereby notified that he/she is required to comply with all applicable Codes or Ordinances of the City of Campbell and the State of California that pertain to this development and are not herein specified:

COMMUNITY DEVELOPMENT DEPARTMENT

1. Approved Project: Approval is granted for a Use Permit allowing the establishment of a 10,000 square foot commercial school to be located within an existing two-story office building located at 2155 S. Bascom Avenue. The applicant shall be limited to a maximum of five (5) classrooms and 2,200 square feet of the tenant space for classroom (including audio/visual rooms) use. The project shall substantially comply with the letter dated November 25, 1997 and project plans submitted on December 5, 1997 by the Church of Scientology, except as modified by the Conditions of Approval herein.

2. Hours of Operation: Hours of operation for the Church of Scientology shall be limited to the following:

Monday through Friday	9:00 a.m. to 10:00 p.m.
Saturday and Sunday	9:00 a.m. to 6:00 p.m.

3. Building Division Requirements: The following requirements are based on classification of this project as B(office) and E-2 (educational) uses:

   A. The total occupant load is approximately 150 persons based upon the following:

Offices	16 persons
Counseling Offices	18 persons
Courserooms (including audio/visual rooms)	78 persons
Lounges:	25 persons
Library:	13 persons

   B. The applicant shall verify the existence of, or provide, one (1) hour fire-resistive construction for the main corridor of this floor; verify or provide twenty (20) minute doors in this corridor, and protection of openings per UBC 1005.7. (Note: The possible substitution of sprinklers for fire-resistive construction does not apply in this case, since it is not strictly an office use.)
   C. Final plans must be designed, stamped and signed by a licensed Architect or Engineer per UBC 106.3.

4. Use of Assist Tables and Sauna: Use of the assist tables in the counseling rooms and the sauna shall not be used for any type of "massage" uses as defined in Chapter 5.48.010 of the Campbell Municipal Code. The use of the assist tables and sauna shall substantially comply with the applicant's letters of description dated November 25, 1997 and December 3, 1997.

5. Approval Expiration: The proposed use shall be in operation and all conditions of approval specified herein must be completed within one year from the date of approval or the Use Permit shall be void.

6. Signs: Any signs proposed to be erected on site shall require approval of a Sign Permit. A Sign Permit may be granted upon complete submission of a Sign application and approval by the Community Development Department, in accordance with the City's Sign Ordinance. No sign shall be permitted until the application is approved and a permit issued.

7. Business Operation: The applicant shall operate and maintain this use in a manner which is not objectionable, offensive or incompatible with the surrounding uses and/or neighborhood. Operation of this use in violation of the Use Permit or City of Campbell standards, codes and ordinances shall be grounds for revocation of the Use Permit.

8. Exterior Modifications: No exterior modifications shall be made to the building in conjunction with the approval of this project.

9. Maintenance of sidewalks and walkways: Prior to operation of the approved use in the building, the applicant shall be required to repair and/or replace any portions of the sidewalks in the public right-of-way along S. Bascom Avenue and walkways leading to the building which are not properly maintained and are in disrepair (i.e. broken and/or cracked portions of the sidewalks and walkways, raised sidewalk and walkway areas, etc.). The applicant shall be required to obtain all necessary permits by the City, including encroachment permits by the Public Works Department, for repair and/or replacement work to be conducted.

10. Trash Enclosure: The applicant shall be required to repair and maintain the trash enclosure on-site prior to operation of the approved use in the building.

CENTRAL FIRE DISTRICT:

11. Development Review: Review of this Developmental proposal is limited to acceptability of site access and water supply as they pertain to Fire Department operations, and shall not be construed as a substitute for formal plan review to determine compliance with adopted model codes. Prior to performing any work, the applicant shall apply to the Building Department for applicable construction permits.

12. Floor Plan: At time of building permit (if needed) or prior to occupancy, the applicant shall show compliance of areas constituting public assembly areas either through construction or pre-occupancy inspections by this department with Building and Fire Code provisions for assembly uses.

13. Sprinkler Requirements: If building is already equipped with fire sprinklers, modify the existing system to accommodate proposed wall modifications.

14. Fire Department Key Box Required: Provide an approved Fire Department key box and appropriate building keys. Installations shall conform with Fire Department Standard Detail and Specification K-1. Note: This applies if the building is fire sprinklered and no such key box exists at this time.

Proposed Sign for California Coffee Ventures, LLC,
DBA Chromatic Cafe at
17 N. 2nd St, San Jose, California 95113.

The proposed sign will be 8 feet tall, 16 inches wide. It will be attached to the buildig with custom made metal brackets and screws into the cement wall. The sign is being designed and built by Ben Henderson and his metal worker who have done many of the signs downtown. The main part of the sign will be painted on wood, and will have a vintage look to it. We think the sign will enhance the Realty Building.

You can see an example of his work at 2nd Story Bakery.

The sign will not be illuminated, will be made of quality sign plywood and weight only 18 lbs.

Please let me know if there are any questions at 408-757-0061.

Sincerely,

Wendy Warren

RE: Chromatic Cafe
Assessor's Parcel Number: 467-21-028
License Type 41 – On-Sale Beer & Wine for a Bona Fide Public Eating Place, Chromatic Cafe
File No. ABCL17-101

Dear Wendy Warren:

In response to the Department of Alcoholic Beverage Control Zoning Affidavit for Property located in the City of San José, regarding the above-referenced property, the following information is being provided.

Zoning and General Plan: The property is in the DC - Downtown Primary Commercial Zoning District with an Envision San Jose 2040 General Plan Land Use/Transportation Diagram designation of Downtown.

A public eating establishment is a *permitted use* in this Zoning District. On-sale of alcohol for a bona fide public eating establishment is *permitted* at this location. All other applicable zoning regulations and permit requirements remain in effect. Alcoholic beverages may be served for consumption on the premises, as incident to the operation of a public eating establishment, which is a bona fide eating-place as defined in the Business and Professions Code Section 23038. However, the off-sale of alcoholic beverages or a drinking establishment (i.e., bar) is not a permitted use at this location. A Use Permit must be applied for and approved by the City of San José prior to allowing the off-sale of alcoholic beverages or a drinking establishment. *Outdoor seating is currently NOT permitted.*

As a point of information, in order for a business to operate between the hours of 12:00 midnight and 6:00 a.m., the owner must apply for and obtain approval of a Use Permit from the City of San José. You should be aware that the business must conform to the City's requirements for parking and signage. Any changes to the site, exterior building modifications or sign construction, expansion or change of use requires approval through a Development Permit. If you have any further questions regarding this matter, please contact me at jan.warne@sanjoseca.gov.

Best regards,

Jan Warne

FINDINGS

The Director of Planning, Building and Code Enforcement determines, concludes and finds as follows for this proposed project:

1. **Site Description and Surrounding Uses.** The subject property is located on the west side of North 2nd Street approximately 120 feet north of E. Santa Clara at 17 N. 2nd Street. The site is occupied with an identified historic building (the Realty Building) housing office spaces on the second floor and commercial spaces below. The adjacent tenants consist of a restaurant with an existing sidewalk café and a vacant retail space. The Realty building is surrounded by other taller structures with office and commercial tenants.

2. **Project Description.** This Sidewalk Cafe Permit allows outdoor seating for a public eating establishment (Chromatic Coffee) for the consumption of food and non-alcoholic beverages in the public right-of-way along North 2nd Street. A total of two (2) tables and eight (8) chairs would be placed in an approximately 68-square foot area.

3. **General Plan Conformance.** The proposed project conforms to the Envision San José 2040 General Plan Land Use/Transportation Diagram designation of Downtown, in that eating and drinking establishments are an intended use under this designation. The project also promotes the following General Plan policy:

   a. Community Design Policy CD-1.2: Install and maintain attractive, durable, and fiscally- and environmentally-sustainable urban infrastructure to promote the enjoyment of space developed for public use. Include attractive landscaping, public art, lighting, civic landmarks, sidewalk cafés, gateways, water features, interpretive/way-finding signage, farmers markets, festivals, outdoor entertainment, pocket parks, street furniture, plazas,

squares, or other amenities in spaces for public use. When resources are available, seek to enliven the public right-of-way with attractive street furniture, art, landscaping and other amenities.

The proposed Sidewalk Café is an urban infrastructure feature that promotes the enjoyment of public space. This sidewalk café will enliven the public right-of-way along North 2nd Street.

b. Community Design Policy CD-1.9: Give the greatest priority to developing high-quality pedestrian facilities in areas that will most promote transit use and bicycle and pedestrian activity. In pedestrian-oriented areas such as Downtown, Urban Villages, or along Main Streets, place commercial and mixed-use building frontages at or near the street-facing property line with entrances directly to the public sidewalk, provide high-quality pedestrian facilities that promote pedestrian activity, including adequate sidewalk dimensions for both circulation and outdoor activities related to adjacent land uses, a continuous tree canopy, and other pedestrian amenities. In these areas, strongly discourage parking areas located between the front of buildings and the street to promote a safe and attractive street facade and pedestrian access to buildings.

The proposed sidewalk café is located along a public sidewalk at the front entrance of the subject restaurant. The proposed sidewalk café helps promote a safe and attractive street facade and pedestrian access to the building.

4. **Zoning Code Compliance.** The proposed project conforms in all respects to the provisions of Title 20 of the San José Municipal Code, including the development standards of the DC Downtown Primary Commercial Zoning District.

   Under the provisions of San José Municipal Code Section 20.100.1420, a sidewalk café may be permitted upon issuance of a Sidewalk Café Permit.

5. **Environmental Review.** The environmental impacts of the project, including but not limited to noise, vibration, dust, drainage, erosion, stormwater runoff, and odor which, even if insignificant for purposes of the California Environmental Quality Act (CEQA), will not have an unacceptable negative affect on adjacent property or properties.

   - Under the provisions of Section 15301(a) of the State Guidelines for Implementation of the California Environmental Quality Act (CEQA) as stated below, this project is found to be exempt from the environmental review requirements of Title 21 of the San José Municipal Code, implementing the California Environmental Quality Act of 1970, as amended. The proposed project qualifies for this exemption because involves a minor expansion of an existing restaurant use. Therefore, the project will not have a significant adverse effect on the environment.

6. **Sidewalk Café Permit Findings.** Per Section 20.100.1450 of the San Jose Municipal Code, the director may issue a sidewalk café permit only upon first finding that issuance of the sidewalk café permit:

   a. Would not create a nuisance; and

   The proposed sidewalk café includes installation of a barrier that will contain dining activity and patrons close to the premises, preserving the function of the public right of way. Chromatic Coffee is a bona fide public eating establishment and does not operate solely as a bar.

a. Would preserve or enhance the character of the surrounding area; and

The proposed steel square tube railing will visually enhance the pedestrian experience, and is neutral enough so as not to deter from the historic architectural elements of the building.

b. Would adequately preserve and protect the convenience and safety of pedestrians, property owners, occupants, customers, residents or tenants of offices, stores, shops or dwellings in the vicinity of the premises; and

The Sidewalk Café will provide a clear divider between public and private space, which will keep patrons out of the remaining right-of-way.

c. Would not result in any significant adverse land use impacts; and

The project site is surrounded by other eating and drinking establishments. Restaurants within a block of the subject site have similar sidewalk cafes. There is sufficient space in front of the proposed location to place a sidewalk café.

d. Would comply with the Conditions & Restrictions set forth in this Part.

The Sidewalk Café shall comply with all conditions and restriction set forth in section 20.100.1450 of the San Jose Municipal Code and the conditions below.

In accordance with the findings set forth above, a Sidewalk Café Permit for said purpose specified above and subject to each and all of the conditions hereinafter set forth is hereby **approved**. The Director of Planning, Building, and Code Enforcement expressly declares that it would not have granted this Permit except upon and subject to each and all of said conditions, each and all of which conditions shall run with the land and be binding upon the owner and all subsequent owners of the subject property, and all persons who use the subject property for the use conditionally permitted hereby.

APPROVED SUBJECT TO THE FOLLOWING CONDITIONS:

1. **Acceptance of Permit.** Per Section 20.100.290(B), should the applicant fail to file a timely and valid appeal of this Permit within the applicable appeal period, such inaction by the applicant shall be deemed to constitute all of the following on behalf of the applicant:

   a. Acceptance of the Permit by the applicant; and

   b. Agreement by the applicant to be bound by, to comply with, and to do all things required of or by the applicant pursuant to all of the terms, provisions, and conditions of this permit or other approval and the provisions of Title 20 applicable to such Permit.

2. **Sewage Treatment Demand.** Chapter 15.12 of Title 15 of the San José Municipal Code requires that all land development approvals and applications for such approvals in the City of San José shall provide notice to the applicant for, or recipient of, such approval that no vested right to a Building Permit shall accrue as the result of the granting of such approval when and if the City Manager makes a determination that the cumulative sewage treatment demand of the San José-Santa Clara Water Pollution Control Plant represented by approved land uses in the area served by said Plant will cause the total sewage treatment demand to meet or exceed the capacity of San José-Santa Clara Water Pollution Control Plant to treat such sewage adequately and within the discharge standards imposed on the City by the State of California Regional Water Quality Control Board for the San Francisco Bay Region. Substantive conditions designed to decrease sanitary sewage associated with any land use approval may be imposed by the approval authority.

3. **Compliance with Local and State Laws.** The subject use shall be conducted in full compliance with all local and state laws. No part of this approval shall be construed to permit a violation of any part of the San José Municipal Code. The Permit shall be subject to revocation if the subject use is conducted in such a manner as to cause a nuisance, as defined above.

4. **Conformance to Plans.** The development of the site shall conform to the approved Sidewalk Café Permit plans entitled, "Chromatic Coffee on 2nd" date stamped **December 15, 2017**, on file with the Department of Planning, Building and Code Enforcement, and to the San José Building Code (San José Municipal Code, Title 17, Chapter 17.04), with the exception of any subsequently approved changes.

5. **Public Works.** The applicant is strongly advised to apply for any necessary Public Works permits prior to installation of the Sidewalk Café.

   a. **Maintenance**: Applicant shall be responsible to remove and replace curb, gutter, and any sidewalk damaged during construction of the proposed project.

   b. **Site Plan**: The facilities provided within the public right-of-way shall not be permanently attached to the sidewalk at any time.

   c. **American Disabilities Act (ADA).** A minimum of 4-feet clear space between the sidewalk café railing and the nearest established public facility (street light, street tree, etc) must be maintained at all times. Proposed planters, barriers, and any other elements associated with the outdoor sidewalk café cannot be bolted down to the sidewalk.

6. **Occupancy.** The permittee must comply with the building occupancy as determined by the Fire Department. The maximum number of persons allowed to occupy the sidewalk café area shall be limited to the maximum number of seats in the sidewalk café area, in accordance with the approved plans for this Permit.

7. **Outdoor Seating Furniture.** Umbrellas, tables, chairs, and other portable appurtenances shall be confined to Patio Seating Area, as shown on the approved Permit plan set.

8. **Equipment.** Equipment for the service of customers, including but not limited to, trays or carts, eating or drinking utensils, linens, and cooking appliances may not be placed or maintained on any portion of the sidewalk.

9. **Removal of Portable Appurtenances.** All umbrellas, tables, chairs and other portable appurtenances shall be removed from the area at the end of each business day, or no later than 12:00a.m.

10. **Trash Container.** At least one (1) covered outdoor trash container shall be provided in the sidewalk café, during the hours of operation and shall be maintained in a clean and sanitary condition.

12. **Obstructions.** The portion of the sidewalk area not permitted to be occupied by umbrellas, tables, chairs, and other portable appurtenances shall be kept free of obstructions at all times, so that a pedestrian through zone is maintained, at minimum, five feet in width.

13. **Tables and Chairs Required.** The sidewalk café area shall contain tables and chairs and shall operate as a café and shall not operate in a "standing only" manner in any way or in any portion of the Sidewalk Café area.

14. **Hours of Operation.** The hours of operation for the sidewalk café shall be limited to the hours of operation of the associated business. In accordance with Section 20.70.510 of the San José Municipal Code, as amended, the subject sidewalk café shall not operate between the hours of 12:00 a.m. and 6:00 a.m. unless a Conditional Use Permit is approved per 20.100.700.

15. **Amplified Music Prohibited.** No amplified sound shall be used within the sidewalk café. At no time shall any music originating from any part of the premises create a nuisance.

16. **Liability Agreement.** The Applicant shall adhere to the signed agreement, submitted to the City's Risk Manager and approved by the City Attorney, to defend, indemnify, save, and hold harmless the City and all of its officers, agents, or employees from any liability for damages resulting from any and all operations under a permit granted pursuant to San José Municipal Code Chapter 20.100 to the satisfaction of the Director of Finance.

17. **Insurance Coverage.** The permittee shall, at his or her own cost and expense, obtain and maintain in full force and effect all of the necessary insurance coverage for the full term of the Sidewalk Café Permit or any renewal thereof. The level of coverage shall be in the amount determined by the City's Risk Manager or the City Manager's designee to perform the functions of the Risk Manager.

18. **Annual Renewal of Insurance Coverage.** On or before January 15th of each calendar year, the applicant shall submit proof of insurance coverage to the City of San José Risk Manager clearly labeled with the City File No. *SC16-004* to the satisfaction of the Director of Finance.

19. **Business Tax License.** Prior to the implementation of the sidewalk café use, the applicant shall provide proof to the Director of Finance of a current Business Tax License issued by the Treasury Division of the Department of Finance.

20. **Transferability.** This permit may not be transferred or assigned.

21. **Alterations to Area.** The sidewalk shall not be painted, landscaped or altered in any way without prior written approval by the City's Director of Transportation.

22. **Easement.** The Permit does not constitute a deed or grant of an easement by the City and is revocable at any time.

24. **Restriction of Operation as a Drinking Establishment.** No Sidewalk Café may function as a Drinking Establishment as defined in Section 20.200.300 of this Title.

25. **Revocation, Suspension, Modification.** This Sidewalk Café Permit may be revoked, suspended or modified by the Planning Director, or by the Planning Commission on appeal, at any time regardless of who is the owner of the subject property or who has the right to possession thereof or who is using the same at such time, whenever, after a noticed hearing in accordance with Part 3, Chapter 20.44, Title 20 of the San José Municipal Code it finds:

2. ALL DEVICES AND EQUIPMENT INSTALLED OUTDOORS OR EXPOSED TO THE WEATHER SHALL BE OF WEATHERPROOF CONSTRUCTION.
3. ALL DEVICES SHALL BE SPECIFICATION GRADE IN COMMON AREAS. ALL SINGLE AND GANGED PLATES SHALL BE THERMOPLASTIC AND SHALL BE MATCH THE DEVICE IN COLOR. COORDINATE DEVICE COLOR WITH THE ARCHITECT PRIOR TO INSTALLATION. GANG DEVICES AT GROUP LOCATIONS UNDER A SINGLE COVER PLATE.
4. THE ELECTRICAL PLANS ARE SCHEMATIC IN NATURE AND ARE NOT INTENDED TO SHOW ALL OF THE ARCHITECTURAL DETAIL OR SPECIFICS OF ELECTRICAL CONSTRUCTION. TAKE ALL DIMENSIONS FROM THE ARCHITECTURAL DRAWINGS.
5. REFER TO THE LATEST EDITION OF THE NEC, TITLE 24, 2013 CBC AND LOCAL ORDINANCES IN EFFECT AT THE TIME OF CONSTRUCTION AS THE CONTROLLING DOCUMENTS.
6. ALL CONNECTIONS TO MECHANICAL EQUIPMENT SHALL BE MADE WITH A MINIMUM OF 24" OF WEATHERPROOF FLEXIBLE CONDUIT TO PREVENT SOUND AND VIBRATION TRANSMISSION TO THE STRUCTURE.
7. COORDINATE ALL MOTOR OVERLOADS AND/OR FUSES FURNISHED BY THIS CONTRACT WITH THE ACTUAL EQUIPMENT INSTALLED. SIZE OVERLOADS BASED ON MOTOR NAMEPLATE FULL LOAD CURRENT AND SERVICE FACTOR. FUSES FOR MOTOR AND TRANSFORMER CIRCUITS SHALL BE DUAL ELEMENT. FUSES FOR OTHER "NON–INRUSH" LOADS SHALL BE FAST ACTING. ALL FUSES SHALL BE CURRENT LIMITING CLASS RK5 OR CLASS L UNLESS OTHERWISE NOTED.
8. GROUNDING CONDUCTORS ARE GENERALLY NOT SHOWN. GROUND AND BOND ALL EQUIPMENT, RACEWAYS, MOTORS, PANELBOARDS AND SWITCHBOARDS, ETC. IN ACCORDANCE WITH NEC ARTICLE 250.
9. BONDING OF ALL INTERIOR METAL PIPING SHALL BE IN ACCORDANCE WITH ARTICLE 250–104 AS FOLLOWS:
   A. ALL INTERIOR METAL WATER PIPING SHALL BE BONDED TO ONE OR MORE GROUNDING ELECTRODES USED. THE BONDING JUMPING SHALL BE SIZED IN ACCORDANCE WITH TABLE 250–66.
   B. INTERIOR METAL PIPING THAT MAY BECOME ENERGIZED (i.e. GAS PIPING, ETC.), SHALL BE BONDED TO ONE OR MORE GROUNDING ELECTRODES USED. THE BONDING JUMPER SHALL BE SIZED IN ACCORDANCE WITH TABLE 250–66, USING THE RATING OF THE CIRCUIT THAT MAY ENERGIZE THE PIPING.
10. THE PHASE COLOR CODING OF THE INSULATION OF THE CONDUCTORS SHALL BE:

NOMINAL VOLTAGE	A	B	C	NEUTRAL	GROUND
120/240V	BLACK	RED		WHITE	GREEN

11. ALL ELECTRICAL WORK SHALL COMPLY WITH THE 2013 CALIFORNIA ELECTRICAL CODE.
12. EACH MULTIWIRE BRANCH CIRCUIT SHALL BE PROVIDED WITH A MEANS THAT WILL SIMULTANEOUSLY DISCONNECT ALL UNGROUNDED CONDUCTORS AT THE POINT WHERE THE BRANCH CIRCUIT ORIGINATES. CEC 210.4(B)
13. ALL UNGROUNDED AND GROUNDED CONDUCTORS OF EACH MULTIWIRE BRANCH CIRCUIT SHALL BE GROUPED BY WIRE TIES OR SIMILAR MEANS IN AT LEAST ONE LOCATION WITHIN THE PANELBOARD OR OTHER POINT OF ORIGINATION. CEC 210.4(D)
    a. EC TO VERIFY EXISTING GROUNDING SYSTEM. GROUND RESISTANCE SHALL BE 25 OHMS OR LESS MEASURED BY THREE–POINT METHOD.
    b. EC SHALL FIELD VERIFY THE SIZE/RATING OF ALL ELECTRICAL EQUIPMENTS AND COMPARE WITH THE DRAWINGS. ANY DISCREPANCY FOUND BETWEEN THE DRAWINGS AND ACTUAL INSTALLATION SHOULD BE IMMEDIATELY REPORTED TO THE ENGINEER UNDERSIGNED BEFORE TURNING ON THE SERVICE.
    c. EC SHALL FIELD VERIFY EXISTING FEEDER CONDUCTORS' SIZE AND INSULATION RESISTANCE. REPLACE IF NECESSARY.
    d. TEST ALL EXISTING CIRCUIT BREAKERS TO BE REUSED. EC TO MAKE SURE ALL EQUIPMENTS TO BE REUSED ARE OPERATIONAL.
    e. EC SHALL VERIFY PANELBOARD ACTUAL RATING AND LOADING SHOWN. REVISE AS REQUIRED AND SUBMIT TO THE ENGINEER BEFORE RE–ENERGIZATION.
    f. ELECTRICAL CONTRACTOR SHALL VERIFY (E) FIELD CONDITIONS PRIOR TO BID. ANY DISCREPANCIES BETWEEN DRAWINGS FOUND DURING INSTALLATION SHALL BE BROUGHT TO THE ENGINEER'S ATTENTION & SHOULD BE RESOLVED AT NO ADDITIONAL COST TO THE OWNER.
14. EACH MULTIWIRE BRANCH CIRCUIT SHALL BE PROVIDED WITH A MEANS THAT WILL SIMULTANEOUSLY DISCONNECT ALL UNGROUNDED CONDUCTORS AT THE POINT WHERE THE BRANCH CIRCUIT ORIGINATES. CEC 210.4(B)

C. Disaggregation of Electrical Circuits

☐ Each newly installed switchboard, panel, and motor control center (in both existing and newly constructed buildings) is required to be disaggregated according to the requirements of Table 130.5-B, shown on the next page.
☐ Individual branch circuits, taps or disconnects that require overcurrent protection devices rated 60A or greater.
☐ As an alternative, current transformers can be added for individual branch circuits and loads throughout the building, and a permanent measurement system can be installed. In this case, disaggregated wiring would not be required as long as the metering system allows the equivalent disaggregated measurements.
☐ Fill out a separate line for each switchboard, motor control center, panelboard and subpanel.

F. Circuit Controls for 120-Volt Receptacles

☑ Controlled 120 volt receptacles shall be provided, as required by Section 130.5(d) of the Standards.
☑ In open office areas, controlled circuit receptacles are not required if, at time of final permit, workstations are installed, and each workstation is equipped with an occupant sensing control that is permanently mounted in each workstation, and which controls a hardwired, nonresidential-rated power strip. Plug-in strips and other plug-in devices that incorporate an occupant sensor shall not be used for this exception.
☑ Receptacles that are only for the following purposes are exempt:
-Receptacles specifically for refrigerators and water dispensers in kitchenettes.
-Receptacles located a minimum of six feet above the floor that are specifically for clocks.
-Receptacles for network copiers, fax machines, A/V and data equipment other than personal computers in copy rooms.

	Field Inspector Pass	Fail
1. At least one controlled receptacle is installed within 6 feet of each uncontrolled receptacle, or split-wired duplex receptacles are installed, that have one controlled and one uncontrolled receptacle. This applies in all of the following spaces: • Private offices, open office areas • Receptions and lobbies • Conference rooms • Kitchenettes in office spaces • Copy room	☐	☐
2. Electric circuits serving controlled receptacles are equipped with automatic shut-OFF controls following the requirements prescribed in Section 130.1(c)1 through 5 (in many cases this will mean that the receptacles are connected to the same automatic shut-OFF system as the general lighting of the space).	☐	☐
3. Controlled receptacles shall have a permanent marking to differentiate them from uncontrolled receptacles.	☐	☐
4. For open office areas, controlled circuits shall be provided and marked to support installation and configuration of office furniture with receptacles that comply with Section 130.5(d) 1, 2, and 3.	☐	☐
5. For hotel and motel guest rooms at least one-half of the 120-volt receptacles in each guest room are controlled receptacles that comply with Section 130.5(d)1, 2, and 3 (see numbers 1,2 and 3 above). Electric circuits serving controlled receptacles have captive card key controls, occupancy sensing controls, or automatic controls such that, no longer than 30 minutes after the guest room has been vacated, power is switched off.	☐	☐
6. Plug-in strips and other plug-in devices that incorporate an occupant sensor are not used to comply with any of these requirements.	☐	☐

RE: 15 N 2nd Street – San Jose

Dear **M+R Engineering Consultants, Inc.**:

This is in response to your request for the Available Fault Current rating for the new electric service located at the subject address. The Available Fault Current is 18,000 amps RMS symmetrical.

The short circuit calculation was based on the following conditions:

Our secondary voltage: 120/240 volts 3 wire 1 phase.
Secondary conductor length of 55ft
Electric main switch capacity or 400 amps

Any increase on the main switch size or length of service conductor will change our calculated value and the 18,000 amps Available Fault Current is no longer valid.

If you have any questions, please call me at (408) 299-9523 or email me at TACG@pge.com.

Sincerely,

Tim Cusseaux
Project Manager

Since this form will be part of the plans, completion of this section will allow the responsible party to budget for the scope of work appropriately.

Enforcement Agency:

Systems Acceptance. Before occupancy permit is granted for a newly constructed building or space, or a new space-conditioning system serving a building or space is operated for normal use, all control devices serving the building or space shall be certified as meeting the Acceptance Requirements for Code Compliance.

Systems Acceptance. Before occupancy permit is granted. All newly installed HVAC equipment must be tested using the Acceptance Requirements. .

The NRCC-MCH-04-E form is not considered a completed form and is not to be accepted by the building department unless the correct boxes are checked. The equipment requiring testing, person performing the test (Example: HVAC installer, TAB contractor, controls contractor, PE in charge of project) and what Acceptance test must be conducted. CHAPTER 5 - NON RESIDENTIAL MANDATORY MEASURES

DIVISION 5.1 - PLANING AND DESIGN

SECTION 5.101 GENERAL

SECTION 5.101 GENERAL
5.01 PURPOSE. THE PROVISIONS OF THIS CHAPTER OUTLINE PLANNING, DESIGN AND DEVELOPMENT METHODS THAT INCLUDE ENVIRONMENTALLY RESPONSIBLE SITE SELECTION, BUILDING DESIGN, BUILDING SITING AND DEVELOPMENT TO PROTECT, RESTORE AND ENHANCE THE ENVIRONMENTAL QUALITY OF THE SITE AND RESPECT THE INTEGRITY OF ADJACENT PROPERTIES.

DIVISION 5.2 - ENERGY EFFICIENCY

SECTION 5.201 GENERAL

5.201.1 SCOPE. FOR THE PURPOSES OF MANDATORY ENERGY EFFICIENCY STANDARDS IN THIS CODE, THE CALIFORNIA ENERGY COMMISSION WILL CONTINUE TO ADOPT MANDATORY BUILDING STANDARDS.
NOTE: IT IS THE INTENT OF THIS CODE TO ENCOURAGE BUILDINGS TO ACHIEVE EXEMPLARY PERFORMANCE IN THE AREA OF ENERGY EFFICIENCY. FOR THE PURPOSES OF ENERGY EFFICIENCY STANDARDS, THE CALIFORNIA ENERGY COMMISSION BELIEVES SPECIFICALLY, A GREEN BUILDING SHOULD ACHIEVE AT LEAST A 15 PERCENT REDUCTION IN ENERGY USAGE WHEN COMPARED TO THE STATE□S MANDATORY ENERGY EFFICIENCY STANDARDS.

DIVISION 5.3 - WATER EFFICIENCY AND CONSERVATION

SECTION 5.301 GENERAL

5.301.1 SCOPE.
THE PROVISIONS OF THIS CHAPTER SHALL ESTABLISH THE MEANS OF CONSERVING WATER USED INDOORS, OUTDOORS AND IN WASTEWATER CONVEYANCE.

1. EACH PLUMBING FIXTURE AND FITTING SHALL BE MEET THE 20 PERCENT REDUCED FLOW RATE SPECIFIED IN TABLE 5.303.2.3, OR
2. A CALCULATION DEMONSTRATING A 20 PERCENT REDUCTION IN THE BUILDING "WATER USE BASELINE" AS ESTABLISHED IN TABLE 5.303.2.2 SHALL BE PROVIDED.

5.303.2 TWENTY PERCENT SAVINGS.
A SCHEDULE OF PLUMBING FIXTURES AND FIXTURE FITTINGS THAT WILL REDUCE THE OVERALL USE OF POTABLE WATER WITHIN THE BUILDING BY 20 PERCENT SHALL BE PROVIDED. THE REDUCTION SHALL BE BASED ON THE MAXIMUM ALLOWABLE WATER USE PER PLUMBING FIXTURE AND FITTINGS AS REQUIRED BY THE CALIFORNIA BUILDING STANDARDS CODE. THE 20 PERCENT REDUCTION IN POTABLE WATER USE SHALL BE DEMONSTRATED BY ONE OF THE FOLLOWING METHODS:

1. Environmental cleanup liens that are filed or recorded against the property (40 CFR 312.25).
Did a search of recorded land title records (or judicial records where appropriate, see NOTE 1 below) identify any environmental liens filed or recorded against the property under federal, tribal, state or local law?

NOTE 1: In certain jurisdictions, federal, tribal, state, or local statutes, or regulations specify that environmental liens and AULs be filed in judicial records rather than in land title records. In such cases judicial records must be searched for environmental liens and AULs.

☐ Yes ☑ No If yes, please include an explanation in the space provided below:

2. Activity and land use limitations that are in place on the property or that have been filed or recorded against the property (40 CFR 312.26(a)(1)(v) and vi).
Did a search of recorded land title records (or judicial records where appropriate, see NOTE 1 above) identify any AULs, such as engineering controls, land use restrictions or institutional controls that are in place at the property and/or have been filed or recorded against the property under federal, tribal, state or local law?

Engineering Controls are defined as physical modifications to a site or facility to reduce or eliminate the potential for exposure to hazardous substances or petroleum products in the soil or ground water on the property). Institutional Controls are defined as a legal or administrative restriction on the use of, or access to, a site or facility to 1) reduce or eliminate the potential for exposure to hazardous substances or petroleum products in the soil or ground water on the property, or 2) to prevent activities that could interfere with the effectiveness of a response action, in order to ensure maintenance of a condition of no significant risk to public health or the environment.

☐ Yes ☑ No If yes, please include an explanation in the space provided below:

3. Specialized knowledge or experience of the person seeking to qualify for the LLP (40 CFR 312.28).
Do you have any specialized knowledge or experience related to the property or nearby properties? For example, are you involved in the same line of business as the current or former occupants of the property or an adjoining property so that you would have specialized knowledge of the chemicals and processes used by this type of business?

☐ Yes ☑ No If yes, please include an explanation in the space provided below:

4. Relationship of the purchase price to the fair market value of the property if it were not contaminated (40 CFR 312.29).

Does the purchase price being paid for this property reasonably reflect the fair market value of the property?

☑ Yes ☐ No

If you conclude that there is a difference, have you considered whether the lower purchase price is because contamination is known or believed to be present at the property?

☐ Yes ☑ No

Comments:

5. Commonly known or reasonably ascertainable information about the property (40 CFR 312.30).

Are you aware of commonly known or reasonably ascertainable information about the property that would help the environmental professional to identify conditions indicative of releases or threatened releases? For example:

a. Do you know the past uses of the property?
   ☐ Yes ☑ No

b. Do you know of specific chemicals that are present or once were present at the property?
   ☐ Yes ☑ No

c. Do you know of spills or other chemical releases that have taken place at the property?
   ☐ Yes ☑ No

d. Do you know of any environmental cleanups that have taken place at the property?
   ☐ Yes ☑ No

If yes for questions above, please include an explanation in the space provided below:

6. The degree of obviousness of the presence or likely presence of contamination at the property, and the ability to detect the contamination by appropriate investigation (40 CFR 312.31).

Based on your knowledge and experience related to the property are there any obvious indicators that point to the presence or likely presence of releases at the property?

☐ Yes ☑ No If yes, please include an explanation in the space provided below:

Subject: Notification of Indoor Air Sampling Results
15 – 25 North Second Street, San Jose, California

Dear Ms. Eitel:

On November 20, 2018 and January 28, 2019, Terraphase Engineering Inc. collected indoor air samples from four locations on the 1st floor of the tenant spaces located at 15-25 North Second Street in San Jose, California ("the 15-25 North Second Street building"). The sampling was conducted as part of an on-going environmental investigation of the property located at 35 and 43 East Santa Clara Avenue in San Jose, California ("the Bassler-Haynes building"). In addition to the recent Terraphase sampling, on September 29, 2014 and September 30, 2014, All West Environmental Inc. collected indoor air samples from two locations on the 1st floor of the tenant spaces in the 15-25 North Second Street building and two non-tenant locations (basement and crawl space), as well as one outdoor ambient air sample. The analyses of these samples indicated the presence of tetrachloroethene (PCE) in indoor air at concentrations ranging from 0.31 – 5.22 micrograms per cubic meter (ug/m^3). While the presence of PCE could be related in some part to indoor sources, its presence is suspected to be mostly due to the volatilization of PCE in groundwater under the building and the subsequent migration into indoor air through the building's slab[1]. The presence of PCE in groundwater under the building is believed to be the result of historical impacts from former dry-cleaning activities in the adjacent Bassler-Haynes building.

Data Evaluation and Discussion

The indoor concentrations of PCE were below the RWQCB's conservative generic indoor air screening level[2] for commercial/industrial workers of 2.1 micrograms per cubic meter (ug/m^3), except for samples collected from 25 North Second Street[3]. This generic screening level represents a concentration at or below which PCE in indoor air can be assumed to pose no potentially significant threat to human health, including for individuals who would be considered sensitive receptors. This screening level is used to

[1] This is commonly referred to as vapor intrusion. For more information see: https://www.dtsc.ca.gov/assessingRisk/upload/Final_VIG_Oct_2011.pdf

[2] For more information see: https://www.waterboards.ca.gov/sanfranciscobay/water_issues/programs/esl.html.

[3] The November 20, 2018 sampling event was conducted during the Camp Fire in Northern California, and as a result, localized ventilation (e.g., open windows and fans), may not have been used as normal. As a result, the concentrations identified in these samples likely overestimate the concentrations that would exist in indoor air under normal occupancy conditions.

help support cleanup decisions under California EPA's and the RWQCB's site cleanup programs; however, they do not represent limits of safety for inhalation exposure. Limits such as the American Conference of Governmental Industrial Hygienists (ACGIH)'s Threshold Limit Values (TLVs)[4], are more consistent with levels that would be considered limits of safety for workers. The ACGIH TLV for PCE is 170,000 ug/m^3. The concentrations of PCE observed in indoor air are well below this occupational exposure level.

As noted above, the generic commercial/industrial screening level for PCE (2.1 ug/m^3), as calculated by the RWQCB, corresponds to an assuredly protective concentration to which a worker could be exposed for continuously over their entire working life (i.e., 8-hours/day, 250-days/year, over a 25-year period). However, Terraphase understands that the business currently occupying 25 North Second Street has not occupied the space for 25-years, but rather has been present for approximately 10 years. Assuming a 10-year exposure period, and worker exposure to the maximum concentration of PCE observed, a conservative estimate of the potential increased lifetime cancer risk workers, as a result of being exposed to PCE in indoor air, is 1 in 100,000 (+0.001%).

For context, this estimated increased risk is within the risk range (i.e., 1 to 1,000,000 to 1 in 10,000)[5] that the United States Environmental Protection Agency (EPA) believes is representative of generally acceptable levels for exposure to chemical contaminants. For additional context, according to the American Cancer Society, men and women in the United States have a risk of incurring cancer in their lifetime of 1 in 3 (33%)[6].

With regards to other health effects besides cancer, the concentrations of PCE in indoor air in 25 North Second Street are also not at levels that would not be expected to pose an increased risk to the tenants' employees.

Next Steps

In order to further evaluate the 15-25 North Second Street building, the RWQCB has requested that indoor air samples be collected from the previously unsampled tenant spaces on the 1st floor (17 North Second Street – Chromatic Coffee; 19 North Second Street, Suite 101 – Chromatic Coffee Storage Space; 21 North Second Street – Angelou's Grill) as well as two upstairs locations. Terraphase requests access to perform this sampling on a mutually agreeable date during the week of February 25, 2019.

Based on the results of previous investigations conducted at the Bassler-Haynes building, the owner and Terraphase have submitted a Remedial Action Workplan (RAP) to the RWQCB on January 7, 2019 that proposes cleanup at the Site using in-situ groundwater treatment (ISGT) and soil-vapor extraction (SVE). ISGT involves injection of reagents or chemical oxidants into groundwater or the use of thermal probes in order to accelerate the degradation of VOCs. SVE uses vacuum blowers and extraction wells to

SUBJECT: Status of Property with Respect to Vapor Intrusion at 15-25 North Second Street, San Jose, Santa Clara County

Dear Ms. Warren:

This letter explains the status of the subject property (Property) with respect to tetrachloroethene (PCE) in soil vapor and indoor air due to groundwater pollution in the vicinity. The Property consists of a two-story commercial building with tenant spaces which house a variety of businesses. You are the owner of the Property and have informed us that you are planning to sell the Property. We have previously issued you an "offsite comfort letter" addressing the presence of PCE in groundwater samples from the 35 and 43 East Santa Clara site (Site), which is next door to the Property.

The Property is located immediately down-gradient with respect to groundwater flow from the Site. The Site has a known release of PCE which has polluted soil, groundwater, soil vapor, and indoor air with pollution likely extending offsite. PCE has been detected in groundwater, soil vapor and indoor air at the Property. Phase I and Phase II Environmental Assessments were performed for the Property. There were no known uses or releases of PCE at the Property.

The presence of PCE in indoor air in the building at the Property is indicative of a vapor intrusion pathway from upgradient, contaminated groundwater and soil vapor into the overlying building. If mitigation measures are needed to prevent potential human health effects from vapor intrusion at a property due to a pollutant release from an off-site source, the Regional Water Board would require the responsible party for the pollutant release to perform the necessary mitigation.

Based on information currently available to Regional Water Board staff, we conclude that PCE pollution beneath the Property including PCE in soil vapor and indoor air is likely the result of the migration of pollutants in groundwater and soil vapor from the Site. In general, the Regional Water Board does not pursue enforcement action against a property owner whose land overlies contaminated groundwater if that contamination is solely the result of the migration of groundwater contaminants from an off-site source or sources. Accordingly, the Regional Water Board will not name current and future owners of the subject property as dischargers with

respect to groundwater pollution from upgradient sources. However, the Regional Water Board may hold such a property owner responsible for investigation or cleanup tasks if he or she refuses to provide reasonable access to an upgradient discharger attempting to investigate and cleanup off-site groundwater pollution. Additionally, if the responsible party was unable to perform the mitigation measures, the Regional Water Board may require that the offsite property owner perform the mitigation measures and the Regional Water Board may inform the County Health Department of any health risks due to vapor intrusion.

Subject: 2019 Annual Report, Bassler-Haynes Building, 35 and 43 East Santa Clara Street, San Jose, California

---

On behalf of Isis Properties, LLC, Terraphase Engineering Inc. (Terraphase) has prepared this 2019 Annual Report for the Bassler-Haynes Building located at 35 and 43 East Santa Clara Street in San Jose, California ("the Site"; Figure 1). A Remedial Action Workplan (RAP; Terraphase 2019a) was approved for the Site on September 11, 2019 by the Regional Water Quality Control Board (RWQCB) and remediation implementation is ongoing (RWQCB 2019).

The purpose of this Annual Report is to summarize current site conditions and activities performed from January 1 through December 31, 2019 and update the RWQCB on the status of the Site Cleanup Requirements No. R2-2018-0013 ("Order"; RWQCB 2018) Task C.4 (Completion of Remedial Actions) and Provision D.5 (Self-Monitoring Program).

Current Status of Site Contamination

As noted in the RAP, it appears that volatile organic compounds (VOCs) detected beneath the Site are associated with the historical operations of a dry-cleaning business that operated at the Site from approximately 1950 to 1969 (Terraphase 2019a). The current status of tetrachloroethene (PCE) concentrations in indoor air, soil-gas, and groundwater are summarized below.

Indoor Air Status Summary

Prior to submittal of the RAP, indoor air at the Site and at the adjacent 15-25 North Second Street property was shown to be impacted by PCE, both in the basement and on the first floor of the buildings (Terraphase 2019a). Additional indoor air samples were collected in 2019, on January 28, and March 5, from the second floor of 35 and 43 East Santa Clara Street (Bassler-Haynes building) and from the indoor

air in various portions of the neighboring building located at 15 - 25 North Second Street, San Jose, California. Outdoor air samples were also collected in 2019 from the roof and courtyard of the Bassler-Haynes Building. The analytical results from these sampling events are presented in Figures 2 and 3 and were detailed in Terraphase's *Summary of Indoor Air Sampling Results* (Terraphase 2019c). No additional indoor air samples from the basement were collected in 2019.

In general, 2019 results showed indoor air PCE concentrations below the cleanup level of 2.1 micrograms per cubic meter ($\mu g/m^3$) in 15, 19 (first floor Suites 101 and 102), and 21 North Second Street. The PCE concentrations in indoor air at the 17, 19 (second floor Suite 202), and 25 North Second Street tenant spaces ranged from 2.31 $\mu g/m^3$ (IA-12) to 5.22 $\mu g/m^3$ (IA-11). Note, these spaces were re-sampled on March 5, 2019, and the results in 25 North Second Street (IA-11 and IA-12) were lower than the January 19, 2019 results, with a maximum concentration of 2.65 $\mu g/m^3$.

The indoor air concentrations of PCE in concentrations on the second floor of the Bassler-Haynes building were also above the cleanup level with a detection of 27.8 $\mu g/m^3$ (IA-5; duplicate sample detection of 27.1 $\mu g/m^3$).

The PCE concentration in the outdoor air ambient air sample collected on January 28, 2019 (OA-1), located relatively close to the HVAC unit, was above the cleanup level of 2.1 $\mu g/m^3$ at a concentration of 3.09 $\mu g/m^3$. Given that this sample was located in close proximity to the HVAC unit, it is possible that the PCE concentration is reflective of exhaust from the Bassler-Haynes building HVAC system. The PCE concentration in the outdoor ambient air sample collected on March 5, 2019 (OA-2), located in the outdoor "courtyard" area in the rear of 35 and 35E East Santa Clara Street, was below the cleanup level at a concentration of 0.539 $\mu g/m^3$.

Soil-Gas and Sub-Slab Soil-Gas Status Summary

Soil-gas and sub-slab soil-gas sample locations and results are shown on Figures 4 (onsite) and 5 (offsite samples). Including data collected in 1998, 2004, 2016, and 2018, PCE has been detected onsite in soil-gas samples collected from soil-gas monitoring wells at concentrations ranging from 24.6 $\mu g/m^3$ to 6,645,309 $\mu g/m^3$ (Figure 4; Terraphase 2019a). PCE detections include concentrations exceeding the site cleanup level for PCE of 2,100 $\mu g/m^3$.

Offsite, PCE has been detected at three downgradient properties where sub-slab soil gas was sampled between 2014 and 2015, as well as in the sidewalk adjacent to 25 North Second Street and 31 North Second Street in 2018. However, offsite PCE detections have only been detected above the site cleanup level of 2,100 $\mu g/m^3$ at the adjacent property located at 15-25 North Second Street, at a concentration of 60,000 $\mu g/m^3$ (Figure 5; Terraphase 2019a). Results indicate that there is a vapor intrusion concern within the Bassler-Haynes building, and a potential vapor intrusion concern at downgradient neighboring properties.

Soil-gas impacts appear to be greatest closer to North Second Street and decrease to the east and west (Terraphase 2019b).

During a meeting with RWQCB staff on January 14, 2020, RWQCB staff indicated that further documentation regarding the delineation of soil-gas impacts is warranted from the source area. Terraphase has identified the following sources of evidence regarding the soil-gas plume area:

- Northwest (downgradient)
  - Soil-gas well SG-11 was a temporary soil-gas sample collected at 5 feet bsl in the sidewalk adjacent to 25 North Second Street. The PCE concentration at soil-gas well SG-11 was 1,490 µg/m^3 when sampled in November 2018. This concentration is below the Site cleanup level of 2,100 µg/m^3. Soil-gas well SG-11 is estimated to be approximately 80 to 120 feet downgradient of the suspected source area.
  - Soil-gas well SG-12 was a temporary soil-gas sample collected at 5 feet bsl in the sidewalk adjacent to 31 North Second Street. The PCE concentration at soil-gas well SG-11 was 160 µg/m^3 when sampled in November 2018. This concentration is below the Site cleanup level of 2,100 µg/m^3. Soil-gas well SG-11 is estimated to be approximately 165 to 215 feet downgradient of the suspected source area.
- Southwest (cross-gradient)
  - Sub-slab soil-gas sample SS-1 is located in the outdoor "courtyard area" to the north (rear) of onsite unit 35 East Santa Clara Street. The PCE concentration at sub-slab soil-gas point SS-1 was 73.9 µg/m^3 when sampled in November 2018. This concentration is below the Site cleanup level of 2,100 µg/m^3. This sample point is estimated to be approximately 25 to 60 feet cross-gradient of the suspected source area.
  - Sub-slab soil-gas sample SS-1 is located in the outdoor "courtyard area" to the north (rear) of onsite unit 35E East Santa Clara Street. The PCE concentration at sub-slab soil-gas point SS-1 was 27.9 µg/m^3 (with a duplicate sample concentration of 24.6 µg/m^3) when sampled in November 2018. This concentration is below the Site cleanup level of 2,100 µg/m^3. This sample point is estimated to be approximately 25 to 60 feet cross-gradient of the suspected source area.
- Northeast (cross-gradient) – One soil-gas and 13 sub-slab soil-gas samples were collected by Targus Associates during a 2015 evaluation of the property located at 76 East Santa Clara Street and 4 North Second Street. PCE was detected is the sub-slab soil-gas samples at concentrations ranging from 4 µg/m^3 to 409 µg/m^3, which are all below the Site cleanup level of 2,100 µg/m^3. The closest samples to the Site are SV10 and SV4, which are estimated to be approximately 100 to 125 feet from the source area.
- Southeast (upgradient) – As discussed in the *Remedial Investigation Completion Report* (Terraphase 2019b), a soil-gas well was proposed to be installed to the south of the Bassler-Haynes building, adjacent to 29-31 East Santa Clara Street. A soil-gas well was not constructed at this location due to refusal at 19 inches bsl. Due to the location of utilities, the proposed boring location could not be relocated.

Sub-slab soil-gas samples SS-1 and SS-2 are located approximately 25 and 50 feet (horizontally) from groundwater monitoring well MW-6. When last sampled in 2016, monitoring well MW-6 had a PCE

concentration of 2,400 µg/L. Given the low concentrations in the two sub-slab soil-gas samples in the courtyard (SS-1 and SS-2), it is reasonable to conclude that vapor is not traveling a substantial distance in the non-groundwater flow directions.

Groundwater Status Summary

Historical groundwater sample locations and results are shown on Figures 6 (onsite samples) and 7 (offsite samples). PCE has been detected in both the A1 (i.e., perched shallow groundwater from surface to approximately 17 feet below street level [bsl]) and the A2 (i.e., shallow groundwater at approximately 21-26 feet bsl) intervals (Terraphase 2019a).

During the most recent groundwater sampling event at the Site in 2016, PCE was detected in each of the three newly installed A1-interval groundwater monitoring wells (MW-4, MW-5, and MW-6) at concentrations ranging from 2,400 to 4,300 µg/L. The highest concentration of PCE (4,300 µg/L) is significantly lower than the previous highest result from A1 groundwater (12,000 µg/L), which was obtained from a grab sample collected from an open boring. PCE was detected in each of the three A2-interval groundwater monitoring wells at concentrations ranging from 220 to 430 µg/L. This range of PCE concentration is similar to results from previous investigations and indicates a significant attenuation of concentration with depth below grade at the Site.

The offsite extent of PCE in shallow groundwater appears to be limited to a narrow plume that extends approximately 200 feet downgradient of the Site to the northwest along North Second Street. PCE breakdown products, including TCE and cis-1,2-DCE, become more prevalent near the tail end of the plume (Figure 7).

Status of Remedial Actions – Task C.4 of the Order

As stated in Task C.4 of the Order (RWQCB 2018), completion of the tasks outlined in the RAP must be completed and documented for the Site. The RAP specified a combination of soil vapor extraction (SVE), monitored natural attenuation (MNA), in-situ groundwater treatment (ISGT), and land use controls (LUCs) as the recommended alternative to effectively mitigate potential risks to future commercial occupants from vapor intrusion, as well as remediate the groundwater and soil-gas impacts at the Site (Terraphase 2019a).

The first steps in implementing the remedial action alternative are to conduct an SVE pilot test and an ISGT pilot test. Details on the status and anticipated schedules of both tasks are presented below.

SVE Pilot Test Status

Given the shallow perched A1-zone groundwater at the Site, the SVE pilot test and full-scale SVE system will required horizontal extraction wells versus traditional vertical wells. Terraphase has submitted the Building Permit Application for the installation of a horizontal well to the City of San Jose (Attachment A). The application was accepted by the City of San Jose on January 16, 2020, and City staff indicated that the permit should be issued within two to three weeks. Once approved, Terraphase will obtain a well installation permit from Santa Clara County, and proceed with the following activities and approximate timelines, pending subcontractor availability.

- Horizontal well installation –1 week
- SVE Pilot Test –1 week
- Full-Scale SVE system design – 2 months
- Full-Scale SVE system permitting, including Bay Area Air Quality Management District, City of San Jose Building Department, Santa Clara County Groundwater – 2 months
- SVE system installation and startup – 6 weeks
- Completion Report – 2 months following system startup

ISGT Pilot Test Status

The ISGT pilot test will be conducted following the SVE pilot test, design, and full-scale SVE system implementation. It is anticipated that the ISGT pilot test will be conducted in fourth quarter 2020, with full-scale ISGT program implementation by December 31, 2021, as specified in the RAP approval letter (RWQCB 2019).

Self-Monitoring Program – Provision D.5 of the Order

As stated in Provision D.5 of the Order (RWQCB 2018), a Self-Monitoring Program shall be employed at the Site, including semi-annual groundwater monitoring of onsite wells. Terraphase requests the deferment of the Self-Monitoring Program monitoring requirement until after the ISGT system startup, which is anticipated to begin in 2021. As stated in the RAP, the recommended remediation alternative includes groundwater monitoring and reporting on a semi-annual basis at the four existing onsite wells and at two potential future downgradient monitoring wells for two years and annually thereafter for a total of eight years, following installation of the ISGT system (Terraphase 2019a).

Recommendations

Terraphase recommends the following:

- In order to provide additional lines of evidence regarding the extent of soil-gas impacts in the southwestern (cross-gradient) direction, Terraphase recommends installation of two pairs of soil-vapor probes in unit 35E East Santa Clara Street. The soil vapor probe pairs would be installed at approximately 5 feet and 10 feet below ground surface. The soil-gas wells will be installed, developed, and sampled using the methods identified in Appendix B.

- In order to more fully define the extent of groundwater impacts, Terraphase recommends installation of a groundwater monitoring well in the A1 interval in unit 35E East Santa Clara Street. In the event that drilling constraints, such as refusal with hand auguring, are encountered when attempting to install the well in 35E East Santa Clara Street, the monitoring well will be installed in the southwestern end of the courtyard. The monitoring well will be installed, developed, and sampled using the methods identified in Appendix B.

- Proceed with SVE pilot test and full-scale implementation; Submit the SVE System Implementation Report by June 30, 2020.

- Defer initiation of semi-annual groundwater monitoring until the start of the ISGT-pilot test.

- Submit 2020 Annual Report by January 30, 2021.

We request that the RWQCB provide confirmation that the semi-annual groundwater monitoring may be deferred until the start of the ISGT-pilot test (fourth quarter 2020).

Horizontal Trench Installation in Support of Environmental Remediation Piot Test

December 19, 2019

Maysoon Dahi
Senior Engineer, City of San Jose
200 E Santa Clara Street
San Jose, CA 95113

Subject: Horizontal Trench Installation in Support of Environmental Remediation Pilot Test at the Bassler-Haynes Building Located at 35 and 43 East Santa Clara Street in San Jose, California

Dear Maysoon Dahi:

On behalf of our client, Isis Properties LLC, Terraphase Engineering Inc. (Terraphase) has designed a soil vapor extraction (SVE) pilot test for the property located at 35 and 43 East Santa Clara Street in San Jose, California ("the Bassler-Haynes building" or "the Site"; Figure 1). The assessor's parcel number for the Site is 467-21-045. The Bassler-Haynes building is not currently occupied. The SVE pilot test is being performed in response to requirements of the San Francisco Bay Regional Water Quality Control Board (RWQCB).

In 2018, the RWQCB issued Site Cleanup Requirement No. R2-2018-0013 requiring a series of tasks to address potential risks to human health and the environment caused by releases of dry-cleaning solvent by a previous occupant at the Site (Attachment 1). As the first step of the remediation, the SVE pilot test will be conducted to provide site-specific data to support the full-scale SVE system design. Because of the relatively shallow groundwater table, typical SVE wells are not expected to be feasible for the Site. Therefore, Terraphase and our subcontractor Eleven Engineering Inc. (EEI) plan to install a horizontal SVE well as part of the SVE pilot test that will be conducted at the Site.

After completion of the pilot test, Terraphase will prepare the design for the full-scale SVE system, which we plan to install in early Spring 2020.

Horizontal Well Installation

The location and details of the horizontal SVE well installation are provided in Attachment 2 and Attachment 3. The horizontal SVE well installation will consist of the construction of a trench approximately 10 feet long, 5 feet deep, and 2 feet wide. A perforated pipe will be placed into the base of the trench and will be connected to a standpipe. The standpipe will be capped until the initiation of the pilot test. An additional perforated standpipe will be installed within the trench and will be used to measure vacuum and evaluate if water is being pulled into the horizontal well. The installation of the horizontal well will take approximately one week. Following installation, a pilot test using a temporary blower and granular activated carbon will be conducted.

The trench will be shored in accordance with California Department of Occupational Health and Safety (CalOSHA) standards. Shoring will be installed once the trench has been excavated to 2 feet below the top of slab to provide lateral support for the column supports. The shoring will be advanced with the trench such that there is never more than six inches of exposed soil below the bottom of the shoring.

The shoring will be installed such that there is no space between the shoring and the soil. Based on the worst-case assumption that the 3-foot by 3-foot column footings do not extend into the subsurface, the maximum horizontal load on the shoring due to the column will be less than 50 pounds per square foot (Attachment 3). The specifications from the aluminum hydraulic shores that will be used by EEI indicate that the allowable surcharge is up to 150 psf (Attachment 4). Trench spoils to be stockpiled at least five feet away from the trench. The presence of the shoring will provide protection for the structural piers between which the horizontal SVE well is located.

Additionally, given the construction date of the Bassler-Haynes building (1880s), the slab in the basement is not anticipated to be structural, and present as a means of moisture and pest control. Based on previous borings installed at the Site, the concrete slab is expected to be approximately 4-inches thick.

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
SAN FRANCISCO BAY REGION

ORDER No. R2-2018-0013

ADOPTION OF SITE CLEANUP REQUIREMENTS for:

ISIS PROPERTIES, LLC,
JAMES K. EU, AND
LING YU L. EU

for the property located at:

35 AND 43 EAST SANTA CLARA STREET
SAN JOSE, SANTA CLARA COUNTY

The California Regional Water Quality Control Board, San Francisco Bay Region (hereinafter Regional Water Board), finds that:

1. **Site Location**: The Bassler-Haynes Building, also known as the Dr. Eu Building, is located at 35 and 43 East Santa Clara Street in downtown San Jose (Site). The Site consists of two attached three-story buildings constructed in the late-1880s. Land use in this area is predominantly commercial, and the Site is bounded by streets and sidewalks on two sides and by commercial buildings on the other two sides.

2. **Site History**: Historical tenants of the Bassler-Haynes Building included several retail businesses including a jeweler, a clothing store, and a hotel. A dry cleaning operation associated with the hotel reportedly operated between 1950 and 1969 in the basement of the building. The second floor of the building is currently occupied; the basement, first floor, and third floor are unoccupied. In 1986, James K. Eu and Ling Yu L. Eu (the Eus) purchased the Site. On June 7, 2004, the Eus submitted Articles of Organization for Isis Properties, LLC, to the California Secretary of State. On September 3, 2004, the Eus submitted additional information identifying themselves as the only managers of the LLC. Isis Properties, LLC, is the current owner of the Site.

3. **Named Dischargers**: Isis Properties, LLC, is named as a discharger because it is the current owner of the property on which there is an ongoing discharge of pollutants, it has knowledge of the discharge or the activities that caused the discharge, and it has the legal ability to control the discharge. James K. Eu and Ling Yu L. Eu are named as dischargers because they owned the property during or after the time of the activity that resulted in the discharge, had knowledge of the discharge or the activities that caused the discharge, and had the legal ability to prevent the discharge. The above dischargers are collectively referred to as the "Dischargers."

   If additional information is submitted indicating that other parties caused or permitted any waste to be discharged on the Site where it entered or could have entered waters of

the State, the Regional Water Board will consider adding those parties' names to this order.

4. **Regulatory Status**: This Site is currently not subject to a Regional Water Board order.

5. **Site Hydrogeology**: Investigation of site hydrogeology has been constrained by high density development and limited by access contraints for drilling equipment. Six groundwater wells have been constructed in the basement of the Bassler-Haynes Building. The basement floor is about 6 feet below ground surface. Sediments beneath the basement include silts, sands, and clays down to an investigated depth of 26 feet below ground surface (bgs).

   A perched interval of shallow groundwater (referred to as the "A1" interval) occurs at approximately 10 feet bgs. Monitoring wells MW-4, MW-5 and MW-6 are screened between 10 and 15 feet bgs and collect groundwater samples from the A1 interval. Regional shallow groundwater (referred to as the "A2" interval) occurs at approximately 20 feet bgs. Monitoring wells MW-1, MW-2 and MW-3 are screened between 21 and 26 feet bgs and collect groundwater samples from the A2 interval.

6. **Remedial Investigation**: Site investigations were conducted in 1998, 2004, and 2016. Perchloroethene (PCE) was detected in soil, groundwater, soil vapor, and indoor air and is the primary volatile organic chemical (VOC) detected. The PCE breakdown products trichloroethene (TCE) and cis-1,2-dichloroethene (cis-1,2-DCE) were also detected in groundwater. The extent of VOC contamination has been adequately characterized in soil and groundwater but has not been adequately characterized in soil gas or indoor air, as explained below.

   Soil - PCE was detected in soil samples collected at the Site in 1998 at concentrations up to 4.1 milligrams per kilogram (mg/kg), which exceeds the environmental screening level (ESL) of 0.42 mg/kg. The extent of soil contamination has been adequately characterized.

   Groundwater - PCE has been detected in groundwater samples taken from the A1 interval at concentrations up to 4,300 micrograms per liter (µg/L), and TCE has been detected at concentrations up to 75 µg/L. PCE has been detected in groundwater samples from the A2 interval at concentrations up to 430 µg/L and TCE up to 57 µg/L. These PCE concentrations exceed the drinking water standard of 5 µg/L (U.S. EPA and California maximum contaminant level). The extent of groundwater contamination has been adequately characterized. The VOC plume is about 200 feet wide and extends about 300 feet downgradient from the Site (to the north). PCE concentrations decrease by an order of magnitude in the deeper A2 interval, but restricted access and equipment limitations did not allow confirmation of unimpacted groundwater beneath that interval.

   Soil Gas - PCE has been detected in soil gas samples at concentrations up to 2,870,000 micrograms per cubic meter (µg/$m^{3)}$, which is greater than the commercial ESL of 2,100 µg/m^3. The soil gas monitoring wells have 3 to 4-foot-long well screens that are installed

between depths of 2.5 to 7 feet below the basement floor (8.5 to 13 feet bgs). The extent of the soil gas plume is not defined toward the south, west, and north of the Site.

Indoor Air - PCE was detected in the basement indoor air at concentrations up to 18 $\mu g/m^3$, which is greater than the commercial ESL of 2.1 $\mu g/m^3$. PCE was detected at 60 $\mu g/m^3$ in an adjacent building to the northwest of the Site. The extent of indoor air exceedances over the ESL has not been defined.

7. **Risk Assessment**:

a. **Screening Levels:** A screening level evaluation was carried out to evaluate potential environmental concerns related to identified soil, soil gas, indoor air, and groundwater impacts at the Site. Chemicals evaluated in the risk assessment include PCE, TCE, cis-1,2-DCE, and vinyl chloride, the primary chemicals of concern identified at the Site.

As part of the assessment, site data were compared to ESLs compiled by Regional Water Board staff for commercial land use, the current and likely future use of the property. The presence of chemicals at concentrations above the screening levels indicates that additional evaluation of potential threats to human health and the environment is warranted. Screening levels for groundwater address the following environmental concerns: 1) drinking water impacts (toxicity and taste and odor), 2) impacts to indoor air, and 3) migration and impacts to aquatic habitats. Screening levels for soil address: 1) direct exposure, 2) leaching to groundwater and 3) nuisance issues. Screening levels for soil gas address impacts to indoor air. Chemical-specific screening levels for other human health concerns (i.e., indoor-air and direct-exposure) are based on a target excess cancer risk of $1x10^{-6}$ for carcinogens and a target Hazard Quotient of 0.2 for noncarcinogens. Groundwater screening levels for the protection of aquatic habitats are based on promulgated surface water standards (or equivalent). Soil screening levels for potential leaching concerns are intended to prevent impacts to groundwater above target groundwater goals (e.g., drinking water standards). Soil screening levels for nuisance concerns are intended to address potential odor and other aesthetic issues.

b. **Assessment Results:** Groundwater, soil, soil gas, and indoor air samples exceed the ESLs, as shown in the table below. Shaded boxes indicate media/constituent combinations where no exposure pathway exists.

c. **Conclusions:** Remedial measures need to be implemented at the Site to reduce the threat to water quality, public health, and the environment posed by the discharges of waste.

8. **Feasibility Study**: On August 4, 2017, Isis Properties, LLC, submitted a Remedial Action Plan (RAP) that evaluated the following alternatives for effectiveness, implementibilty, and cost:

    1. No action
    2. Vapor Intrusion Mitigation, Soil and Groundwater Management Plan, Monitored Natural Attenuation (MNA), Land-Use Control
    3. In-Situ Groundwater Treatment, Soil-Vapor Extraction, MNA
    4. Soil and Groundwater Removal, MNA.

9. **Remedial Action Plan**: The RAP proposed Alternative 2. On January 8, 2018, Regional Water Board staff issued a letter that rejected the RAP because Alternative 2 only includes vapor intrusion mitigation but does not include active remediation. Active remediation is needed to address the PCE concentrations in groundwater, soil gas, and indoor air at the Site.

10. **Basis for Cleanup Levels**

    a. **General**: State Water Resources Control Board (State Water Board) Resolution No. 68-16, "Statement of Policy with Respect to Maintaining High Quality of Waters in California," applies to this discharge. It requires maintenance of background levels of water quality unless a lesser water quality is consistent with maximum benefit to the people of the State, will not unreasonably affect present and anticipated beneficial

uses, and will not result in exceedance of applicable water quality objectives. This Order and its requirements are consistent with Resolution No. 68-16.

State Water Board Resolution No. 92-49, "Policies and Procedures for Investigation and Cleanup and Abatement of Discharges Under Water Code Section 13304," applies to this discharge. It directs Regional Water Boards to set cleanup levels equal to background water quality or the best water quality which is reasonable, if background levels cannot be restored. In this instance, background levels cannot be restored, based on the nature of the contamination, the limitations of available cleanup methods, and the Regional Water Board's experience with many other similarly-impacted sites. The cleanup levels established in this Order are consistent with the maximum benefit to the people of the State, will not unreasonably affect present and anticipated beneficial uses of such water, and will not result in exceedance of applicable water quality objectives. This Order and its requirements are consistent with the provisions of Resolution No. 92-49, as amended.

b. **Beneficial Uses**: The Water Quality Control Plan for the San Francisco Bay Basin (Basin Plan) is the Regional Water Board's master water quality control planning document. It designates beneficial uses and water quality objectives for waters of the State, including surface waters and groundwater. It also includes programs of implementation to achieve water quality objectives. The Basin Plan was duly adopted by the Regional Water Board and approved by the State Water Board, the Office of Administrative Law, and U.S. EPA, where required.

Regional Water Board Resolution No. 89-39, "Sources of Drinking Water," defines potential sources of drinking water to include all groundwater in the region, with limited exceptions for areas of high TDS, low yield, or naturally-high contaminant levels. Groundwater underlying and adjacent to the Site qualifies as a potential source of drinking water.

The Basin Plan designates the following potential beneficial uses of groundwater underlying and adjacent to the Site:

- o Municipal and domestic water supply
- o Industrial process supply
- o Industrial service supply
- o Agricultural water supply

At present, there is no known use of groundwater underlying the site for the above purposes.

c. **Basis for Groundwater Cleanup Levels**: The groundwater cleanup levels for the Site are based on applicable water quality objectives and are the more stringent of U.S. EPA and California primary maximum contaminant levels (MCLs). Cleanup to this level will protect beneficial uses of groundwater and will result in acceptable residual risk to humans.

d. **Basis for Soil Cleanup Levels**: The soil cleanup levels for the Site are intended to prevent leaching of contaminants to groundwater and will result in acceptable residual risk to humans. The soil sampling depth beneath the Site was limited by constaints on the equipment that could be used inside the building basement. Soil cleanup levels are included in this Order in the event that additional soil sampling finds areas of elevated PCE in vadose zone soil under the building.

e. **Basis for Soil Gas Cleanup Levels**: The soil gas cleanup levels for the Site are intended to prevent vapor intrusion into occupied buildings and will result in acceptable residual risk to humans.

f. **Basis for Indoor Air Cleanup Levels:** The indoor air cleanup levels for the Site are intended to prevent unhealthy levels of VOCs in indoor air as a result of vapor intrusion and will result in acceptable residual risk to humans.

11. **Future Changes to Cleanup Levels**: If new technical information indicates that the established cleanup levels are significantly over-protective or under-protective, the Regional Water Board will consider revising those cleanup levels.

12. **Risk Management**: The Regional Water Board considers the following human health risks to be acceptable at remediation sites: a cumulative hazard index of 1.0 or less for non-carcinogens and a cumulative excess cancer risk of 10^{-6} to 10^{-4} or less for carcinogens. The screening level evaluation for this Site found contamination-related risks in excess of these acceptable levels. Active remediation will reduce these risks over time. However, risk management measures are needed at this Site during active remediation to assure protection of human health. Risk management measures include engineering controls (such as vapor intrusion mitigation) and instititutional controls (such as deed restrictions that prohibit certain land uses).

The following risk management measures are needed at this Site:

a. A deed restriction that notifies future owners of sub-surface contamination, prohibits the use of shallow groundwater beneath the Site as a source of drinking water until cleanup levels are met, and prohibits sensitive uses of the Site such as residences and daycare centers; and

b. A risk management plan for soil that provides procedures to be followed in the event of soil disturbance due to site redevelopment or building modifications.

13. **Basis for 13304 Order**: Water Code section 13304 authorizes the Regional Water Board to issue orders requiring dischargers to cleanup and abate waste where the dischargers have caused or permitted waste to be discharged or deposited where it is or probably will be discharged into waters of the State and creates or threatens to create a condition of pollution or nuisance.

14. **Basis for 13267 Technical Reports:** Water Code section 13267 authorizes the Regional Water Board to require dischargers to provide technical or monitoring reports. The

burden of these reports, including costs, bears a reasonable relationship to the need for the report and the benefits to be obtained from the reports. Specifically, the reports required herein are necessary to ensure the protection of human health and the environment.

15. **Cost Recovery**: Pursuant to Water Code section 13304, the Dischargers are hereby notified that the Regional Water Board is entitled to, and may seek reimbursement for, all reasonable costs actually incurred by the Regional Water Board to investigate unauthorized discharges of waste and to oversee cleanup of such waste, abatement of the effects thereof, or other remedial action, required by this order.

16. **California Safe Drinking Water Policy:** It is the policy of the State of California that every human being has the right to safe, clean, affordable, and accessible water adequate for human consumption, cooking, and sanitary purposes. This Order promotes that policy by requiring discharges to meet maximum contaminant levels designed to protect human health and ensure that water is safe for domestic use.

17. **CEQA**: This action is an order to enforce the laws and regulations administered by the Regional Water Board. As such, this action is categorically exempt from the provisions of the California Environmental Quality Act (CEQA) pursuant to section 15321 of the Resources Agency Guidelines.

18. **Notification**: The Regional Water Board has notified the Dischargers and all interested agencies and persons of its intent under Water Code section 13304 to prescribe site cleanup requirements for the discharge and has provided them with an opportunity to submit their written comments.

19. **Public Hearing**: The Regional Water Board, at a public meeting, heard and considered all comments pertaining to this discharge.

IT IS HEREBY ORDERED, pursuant to sections 13304 and 13267 of the Water Code, that the Dischargers (or their agents, successors, or assigns) shall clean up and abate the effects described in the above findings as follows:

A. **PROHIBITIONS**

1. The discharge of wastes or hazardous substances in a manner that will degrade water quality or adversely affect beneficial uses of waters of the State is prohibited.

2. Further significant migration of wastes or hazardous substances through subsurface transport to waters of the State is prohibited.

3. Activities associated with the subsurface investigation and cleanup that will cause significant adverse migration of wastes or hazardous substances are prohibited.

4. **Violation Reports**: If the Dischargers violate requirements in the Site Cleanup Requirements, then the Dischargers shall notify the Regional Water Board office by telephone as soon as practicable once the Dischargers have knowledge of the violation. Regional Water Board staff may, depending on violation severity, require the Dischargers to submit a separate technical report on the violation within five working days of telephone notification.

5. **Other Reports**: The Dischargers shall notify the Regional Water Board in writing prior to any Site activities, such as construction or underground tank removal, which have the potential to cause further migration of contaminants or which would provide new opportunities for site investigation.

6. **Record Keeping**: The Dischargers or his/her agent shall retain data generated for the above reports, including lab results and QA/QC data, for a minimum of six years after origination and shall make them available to the Regional Water Board upon request.

GENERAL NOTES

1. In 2018, the San Francisco Bay Regional Water Quality Control Board issued Site Cleanup Requirement No. R2-2018-0013 requiring a series of tasks to address potential risks to human health and the environment caused by releases of dry-cleaning solvent by a previous occupant at the Site. As the first step of the remediation, the soil vapor extraction (SVE) pilot test will be conducted to provide site-specific data to support the full-scale SVE system design. Because of the relatively shallow groundwater table, typical SVE wells are not expected to be feasible for the Site. Therefore, Terraphase and our subcontractor Eleven Engineering Inc. (EEI) plan to install a horizontal SVE well as part of the SVE pilot test that will be conducted at the Site. Sheet C-1 provides the layout of the trench location for the SVE pilot test horizontal well. Sheet D-1 provides construction details of the SVE pilot test horizontal well.

Shoring Loads Due to Column Footing

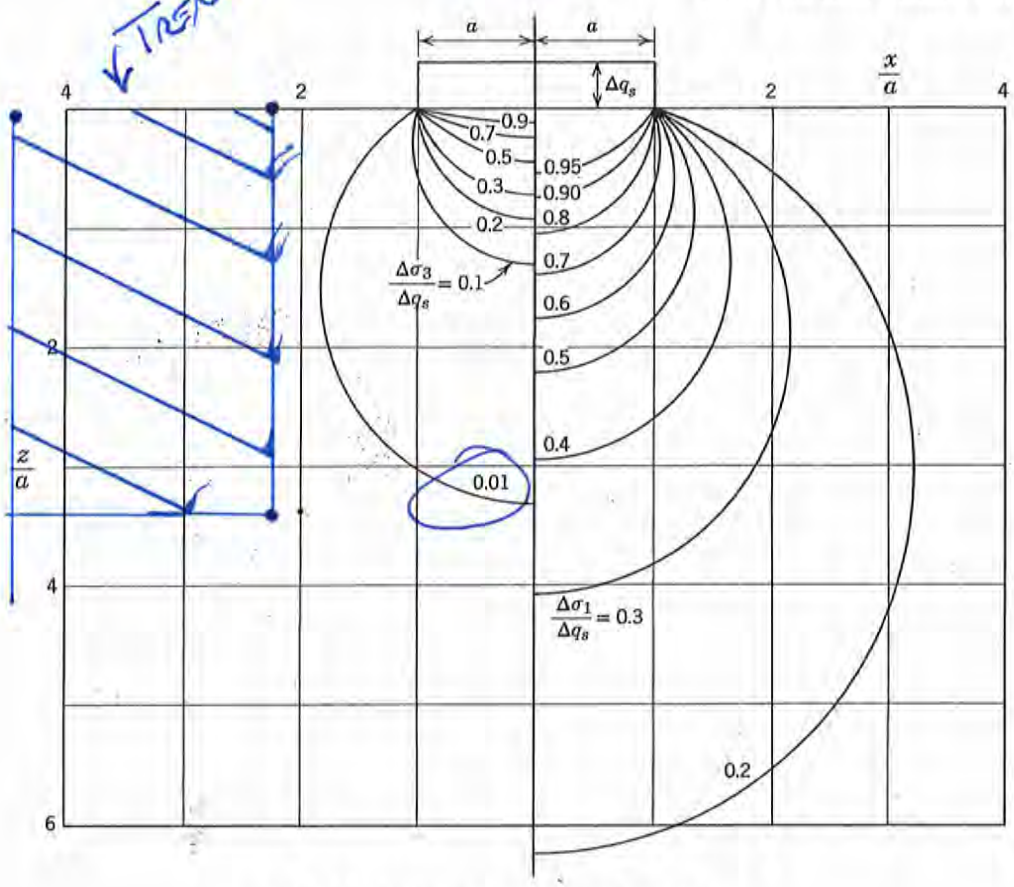

Fig. 8.7 Principal stresses under strip load.

obtain elastic stress distributions for almost any loading and boundary conditions. Charts such as those given here are useful for preliminary analysis of a problem or when the computer is not available.

Accuracy of calculated values of induced stresses. A critical question is: How accurate are the values of induced stresses as calculated from stress distribution theories? This question can be answered only by comparing calculated with actual stress increments for a number of field situations. Unfortunately, there are very few reliable sets of measured stress increments within soil masses (see Taylor, 1945 and Turnbull, Maxwell, and Ahlvin, 1961).

The relatively few good comparisons of calculated with measured stress increments indicate a surprisingly good agreement, especially in the case of vertical stresses. A great number of such comparisons are needed to establish the degree of reliability of calculated stress increments. At the present stage of knowledge, the soil engineer must continue to use stress distribution theories based on the theory of elasticity for lack of better techniques. He should realize, however, that his computed stress values may be in error by as much as $\pm 25\%$ or more.

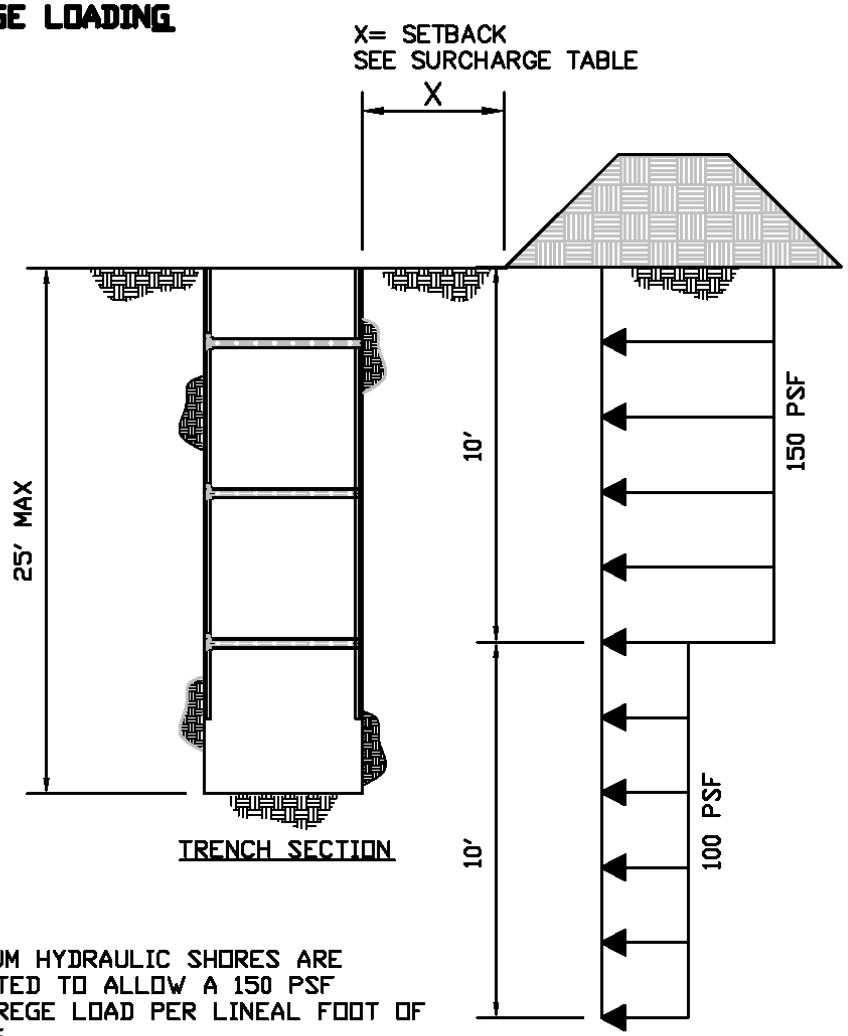
8.4 PRINCIPAL STRESSES AND MOHR CIRCLE

As in any other material, the normal stress at a point within a soil mass is generally a function of the orientation of the plane chosen to define the stress. It is meaningless to talk of *the* normal stress or *the* shear stress at a point. Thus subscripts will usually be attached to the symbols σ and τ to qualify just how this stress is defined. More generally, of course, we should talk of the *stress tensor*, which provides a complete description for the state of stress at a point. This matter is discussed in textbooks on elementary mechanics, such as Crandall and Dahl (1959). The following paragraphs will state the essential concepts and definitions.

Principal Stresses

There exist at any stressed point three orthogonal (i.e., mutually perpendicular) planes on which there are zero shear stresses. These planes are called the *principal stress planes*. The normal stresses that act on these three planes are called the *principal stresses*. The largest of these three

The columns appear to have a span of 14 feet, so each column likely supports 256 square feet of floors. Three floors at an average load of 60 psf produces a vertical bearing stress of about 5,120 pounds per square foot (q_S). 5,120 psf is also a very high allowable bearing pressure.



Assuming that the column footing is on the surface and is 3 feet by 3 feet, which is the worst case as a deeper and wider footing would have less affect on the shoring.

Hence, the maximum horizontal load on the shoring due to the column will be less than 50 psf.

Subject: Work Plan for the Installation and Sampling of Groundwater Monitoring Well and Soil-Gas Wells, Bassler-Haynes Building, 35-49 East Santa Clara Street, San Jose, California

1.0 INTRODUCTION

This Work Plan presents the objectives and proposed methods and procedures to install, develop, and sample a new groundwater monitoring well and four new soil-gas wells at the Bassler-Haynes Building, located at 35 – 43 East Santa Clara Street, San Jose, California ("the Site"). This Work Plan was prepared by Terraphase Engineering Inc. (Terraphase) on behalf of Isis Properties, LLC for submittal to the California Regional Water Quality Control Board, San Francisco Region (RWQCB). The Site background including Site setting, previous investigations, and current environmental condition of the Site are summarized in the *2019 Annual Report, Bassler-Haynes Building, 35 and 43 East Santa Clara Street, San Jose, California* (Terraphase 2020) to which this Work Plan is an appendix.

2.0 SCOPE OF WORK

The following section presents the proposed scope of work to install and sample one groundwater well and a total of four soil-gas wells at the Site. The general objective of this scope of work is to collect current, representative, and repeatable data regarding the magnitude of volatile organic compounds (VOCs) in shallow groundwater and soil-gas beneath the southwestern end of the Site to evaluate the potential for offsite contaminant migration in that direction. This objective will be met through installation and monitoring of a new groundwater monitoring well in the western corner of the Site (Figure 1) and installation and sampling of four new soil-gas wells along the southwestern perimeter of the Site in tenant space 35E East Santa Clara Street. The soil-gas wells will be installed as two well-pairs in four separate boreholes at the locations shown on Figure 2; each well pair will consist of a shallow soil-gas well (installed to a depth of 5 feet below ground surface [bgs]) and a deep soil-gas well (installed a depth of 10 feet bgs). Collected groundwater and soil-gas samples will be analyzed for VOCs.

2.1 Pre-Field Activities

Pre-field tasks will include the following, as discussed in greater detail in the *Work Plan to Conduct Further Investigation at the Bassler Haynes Building, 35 – 43 East Santa Clara Street, San Jose, California* ("the 2015 Work Plan"; Terraphase 2015), and will include:

- Obtaining boring and well permits from Santa Clara Valley Water District.
- Sample location marking.
- Notifying Underground Service Alert (USA) at least 72 hours prior to ground intrusive activities.
- Utility clearance of boring locations by a qualified private underground utility locating contractor.
- Updates to the site-specific Health and Safety Plan (HASP) to address work activities.

2.2 Soil Boring Advancement

The boring advancement and well installation work will be performed by a C-57-licensed contractor under supervision of Terraphase staff working under the direction of a California Professional Geologist as discussed in the 2015 Work Plan.

Because the soil-gas wells are to be installed within a tenant space with wood flooring/sub-floor, a hole will be cut in the wood flooring to gain access to the underlying crawl space (estimated to be approximately 4 feet deep) and subsurface. The five boring locations will be advanced to a depth of 5 feet bgs using a hand auger. For the 5-foot soil-gas well locations, the soil-gas wells will be installed in the boreholes in accordance with the procedures identified in Section 2.3. For the locations that will extend past a depth of 5 feet bgs (i.e., the 10-foot soil-gas well and the groundwater monitoring well), the borings will be advanced to the depths identified below using a portable hydraulic rig (RAMSET or equivalent).

The borings for the two 10-foot soil-gas wells will be completed using a portable hydraulic rig, if feasible. Because these wells will be installed in a tenant space which is not believed to have a concrete slab, it is possible that the portable hydraulic rig will not be able to advance the boring to 10 feet, in which case a hand auger or core auger will be used to complete the boring.

The boring for the groundwater well will be completed using a portable hydraulic rig (RAMSET or equivalent) to a total depth of approximately 21 feet below street level (bsl). The anticipated depth is based on the observed depth to groundwater (A1 interval) of approximately 15.5 feet bsl during the 2015 monitoring well installations.

A soil core will be collected nearly continuously from each borehole location. Retrieved cores will be logged for lithology in the field, and a photoionization detector (PID) will be used to screen the retrieved core for presence of VOCs. Soil samples will not be collected unless staining or other anomalies are identified.

2.3 Well Installation

The boreholes will be completed with wells to allow for collection of a representative and repeatable sample. Specific screened intervals and depths of the well will be determined in the field based on observed conditions. The anticipated construction of the proposed wells is summarized below:

Type	Groundwater Well	5-foot Soil-Gas Wells	10-foot Soil-Gas Wells
Borehole Diameter	2.25 - 3 inches	3 inches	2.25 - 3 inches
Casing Size	0.75 or 1-inch	0.75 inch	0.75 inch
Screen Slot Size	0.01 inch	0.01 inch	0.01 inch
Gravel Pack	2/12 sand	2/12 sand	2/12 sand
Screened Interval	15 – 21 feet bsl	2.5 – 5 feet bgs	5 – 10 feet bgs
Gravel Pack Interval	13 – 21 feet bsl	2 – 5 feet bgs	4 – 10 feet bgs
Dry Bentonite Interval	None proposed	1.5 – 2 feet bgs	3.5 – 4 feet bgs
Hydrated Bentonite Interval	11 – 13 feet bsl	0 – 2 feet bgs; Well completed with flush to wood sub floor well box	0 – 3.5 feet bgs; Well completed with flush to wood sub floor well box
Grout	0 – 11 feet bsl; Well completed with flush to grade well box	None proposed	None proposed

The soil-gas wells within the unoccupied tenant space will be completed with a floor box which will allow for flush mounting with the wood sub-floor. The floor box is configured with a gasket to prevent air intrusion from the crawl space below the tenant space. A cap will be placed on the groundwater monitoring well and the well will be completed using a metal well box (Christy box or similar).

2.4 Collection and Chemical Analysis of Soil-Gas and Groundwater Samples

2.4.1 Soil-Gas Samples

In accordance with Department of Toxic Substances Control (DTSC) guidance (California Environmental Protection Agency [Cal/EPA] 2015), the soil-gas wells will be allowed to equilibrate for a minimum of 48 hours after construction to account for hand auger drilling methods for the 5-foot soil-gas wells and assumed fine-grain materials.

Samples will be collected in general accordance with DTSC guidance (Cal/EPA 2015). Prior to initiating soil-gas sampling activities, an initial leak test will be conducted to assess the sample apparatus fittings. With the valves at the sample canister and soil-gas well both in the closed position, a manual purging device (i.e., gas-tight syringe with purge valve) will be connected to a tee fitting and used to apply a vacuum to the sampling apparatus of at least 100 inches of water. The valve between the tee and the

manual purging device will then be closed to observe whether the vacuum is maintained in the sampling apparatus between the soil-gas well and the sample canister over a period of at least one minute.

Prior to purging and the sample collection, a clear flexible shroud (i.e., plastic bag or similar device) will be placed around the top of the soil-gas well and the soil-gas sample apparatus. A weight will be used to seal the shroud with the ground surface. The air inside the shroud will be enriched with laboratory-grade helium to a minimum concentration of 10% by volume (measured using a portable helium detector).

Purging of the soil-gas well will be performed in accordance with DTSC guidance to remove stagnant soil gas in the soil-gas well tubing and screen prior to sample collection. A minimum of three purge volumes will be extracted prior to sampling. Soil-gas will be purged using the manual purging device (i.e., gas-tight syringe) or air pump. If water is entrained in the sampling system during purging or sampling, the sampling will be discontinued. A note will be made on the field form that the soil-gas sample was unrecoverable. Purge volumes will be calculated to include the vapor probe tip, tubing, 30% available sand porosity, and an assumed 50% porosity for the dry bentonite zone. The purged air will be checked for the presence of helium.

After the leak check is performed and the soil-gas well is purged, a sample will be collected in a summa cannister. The sample manifold will be fitted by the laboratory with a vacuum gauge and critical orifice flow regulation device sized to allow sample collection at a flow rate of approximately 100 to 200 milliliters per minute. The helium concentration inside the shroud will be measured shortly after the start of sample collection using the portable helium indicator and the measured concentration will be recorded on the field data sheet.

Soil-gas samples will be collected into laboratory-supplied summa containers, labeled, logged on chain-of-custody forms, and transported to a California certified laboratory for chemical analysis for VOCs by United State Environmental Protection Agency (USEPA) Method TO-15. The analytical results will be compared to the Site cleanup levels identified in the Cleanup Order (RWQCB 2018).

2.4.2 Groundwater Samples

The grout installed within the annular seal for the monitoring well will be allowed to cure for a minimum of 48 hours before initiating well development activities. The new groundwater monitoring point will be developed by surging and/or pumping to the extent practicable given the limited casing size (0.75 or 1-inch) and the available water column in the well, which, based on observations from previous boreholes, may be limited to less than 1 foot. Observations of indicator parameters, including pH, temperature, specific conductance, quantity, and clarity, will be recorded onto water-quality data sheets after each well volume is purged. In the event that the well recovers slowly, the well will be purged dry and then allowed to recover to approximately 80 percent of its static water level before being purged dry again.

A minimum of 24-hours after well development activities, a groundwater sample will be collected from the new groundwater monitoring well using USEPA Low-Flow (Minimal Drawdown) Ground-Water Sampling Procedures (USEPA 1996). Depth to groundwater will be measured and water-quality parameters (pH, conductivity, turbidity, oxidation reduction potential, dissolved oxygen, and temperature) will be monitored during purging.

The groundwater sample will be collected into laboratory-supplied containers (pre-preserved 40-milliliter volatile organic analysis vials) labeled, logged on chain-of-custody forms, and placed in a chilled cooler for transport to a California certified laboratory for chemical analysis for VOCs by USEPA Method 8260. The analytical results will be compared to the Site cleanup levels identified in the Cleanup Order (RWQCB 2018).

3.0 DATA ANALYSIS AND REPORTING SCHEDULE

Terraphase anticipates that the field work proposed in this Work Plan can be completed within approximately 12 weeks after receipt of approval from the RWQCB. A summary of the work completed, results, and recommendations will be included in the SVE System Implementation Report submitted by June 30, 2020.

1.0 INTRODUCTION

Terraphase Engineering Inc. (Terraphase) has prepared this Remedial Investigation Completion Report ("the Report") on behalf of Isis Properties, LLC (Isis, or Site Owner) for work conducted in or around the Bassler-Haynes building located at 35 and 43 East Santa Clara Street in San Jose, California (Figure 1; "the Site"), in response to the Regional Water Quality Control Board's (RWQCB's) Site Cleanup Requirement No. R2-2018-0013, Task 1a ("the RWQCB Order"). This Report presents the results of the remedial investigation conducted at the Site on November 20, 2018, in general accordance with the *Remedial Investigation Workplan*, *Bassler-Haynes Building, 35 and 43 East Santa Clara Street, San Jose, California* dated May 31, 2018 ("the Workplan"), which was conditionally approved by the RWQCB on September 7, 2018 (RWQCB 2018b) and revised by Terraphase on November 15, 2018 (Terraphase 2018) with verbal approval by the RWQCB Case Manager (Mr. David Barr) prior to the field implementation. The Workplan was further revised via verbal communication with Mr. Barr on November 16, 2018 in order to include two sub-slab soil gas samples in the courtyard area.

1.1 Site Description

The Site is located at the northwest corner of the intersection of East Santa Clara Street and Second Street in downtown San Jose, California (Figures 1 and 2). The Site is developed with two attached three-story buildings constructed in the late-1880s, now known as the Bassler-Haynes building. Land use in this area is predominantly commercial. The Valley Transit Authority (VTA) light rail line and North Second Street are located adjacent to and northeast of the Site, and East Santa Clara Street is located adjacent to and south of the Site. Other commercial buildings are located adjacent to and north of the Site (Figure 2).

Historical tenants of the Bassler-Haynes building included several retail businesses, including a jeweler, a clothing store, and a hotel. A dry-cleaning operation associated with the hotel reportedly released tetrachloroethene (PCE) and was located in the building's basement. The dry-cleaning operation reportedly operated between approximately 1950 and 1969 (Kennedy/Jenks 2005). A restaurant operated on the first floor in 1989 but vacated the building after a 1989 earthquake.

1.2 Site Geology and Hydrogeology

The Site is located within a broad gentle alluvial valley that slopes and drains toward San Francisco Bay to the north, and is bounded by alluvial fans and hills to the east and west (the San Jose Plain). Sediments encountered beneath the Site include alluvium deposited by distal portions of alluvial fans and consists of variable thicknesses of silts, sands, and clayey sediments to a depth of 20 feet below the basement floor (the total depth investigated beneath the Site). The basement floor is approximately 7 feet below the sidewalk elevation. Depths referenced in this document and listed on tables and figures are referenced to ground surface, defined in this document as "street level." Depths referred to as feet below ground surface (bgs) have been converted to the street-level reference point. Results of a grain size distribution analysis

conducted of four soil samples indicated the presence of silty sand and clayey sand at depths of approximately 10 to 15 feet bgs (Kennedy/Jenks 2005).

The Site is located within the Santa Clara confined zone groundwater sub-basin within the Santa Clara Valley (Todd Engineers 2010). Shallow groundwater beneath the Site is underlain by an extensive regional aquitard that acts to separate the shallow groundwater from the underlying, confined principal aquifer that supplies most of the groundwater produced from beneficial use in the area.

Typical for the area, an apparent perched interval of shallow groundwater has been encountered in soil borings intermittently at approximately 17 feet bgs. Grab groundwater samples have been collected from that depth interval. Unsaturated sediments have been encountered beneath that depth. Regional shallow groundwater has been encountered at approximately 27 feet bgs.

Groundwater in the Santa Clara sub-basin typically flows in the general direction of ground surface topography, towards the interior of the sub-basin and northerly towards San Francisco Bay. This northerly flow is confirmed with groundwater elevation data collected from a nearby underground storage tank remediation case (Chevron #9-4259, 147 East Santa Clara Street, approximately 1,000 feet northeast of the Site). Consistent with regional studies, groundwater elevation data collected from over 20 monitoring wells over several years confirmed that the direction of shallow groundwater flow is dominantly toward the northwest (generally parallel with North Second Street; Stantec 2009).

1.3 Site History

1.3.1 Summary of Previous Environmental Investigations

Several phases of environmental investigation have been conducted at the Site since 1997. The investigations performed have included the advancement of soil borings for soil and grab groundwater sampling, installation of groundwater monitoring wells, collection of soil-gas samples, and collection of indoor air samples (RUST 1998; Earth Tech 1998 & 2004; Terraphase 2016). Historical sampling locations are shown on Figures 3 through 6B.

Results from these investigations indicated the presence of PCE in soil, soil-gas, and shallow groundwater at the Site at concentrations above regulatory screening criteria (Commercial/Industrial Environmental Screening Levels; RWQCB 2016). PCE was also detected in indoor air samples collected from the Site in 2004 at concentrations above regulatory screening levels (Commercial/Industrial Environmental Screening Levels; RWQCB 2016). Trichloroethene (TCE) and cis-1,2-dichloroethene (cis-1,2-DCE), breakdown products of PCE, have also been detected in groundwater beneath the Site.

1.3.2 Summary of Offsite Investigations

Chlorinated volatile organic compounds have been detected in soil, soil-gas, groundwater, and indoor air samples collected from the following neighboring properties located to the north of the Site in the downgradient direction (AllWest 2014; Geocon 2014; Targus 2015a and 2015b; Iris 2015).

- 15-25 North Second Street, located adjacent to the Site to the northwest on Second Street;
- Planned Marshall Squares, 50, 52, 60, 66, 80, and 90 North 1st Street and 65 North Second Street, located approximately 150 feet west and northwest of the Site between North 1st Street and North Second Street;
- Silicon Valley Towers, 4 North Second Street and 75 East Santa Clara Street, located northeast of the Site across North Second Street; and
- 70 North Second Street, located north of the Site, adjacent to the Silicon Valley Towers property to the northwest.

Approximate locations of historical offsite sampling locations are illustrated on Figures 3 through 6B. Because downtown San Jose has had many industrial uses (including a printing company at an adjacent parcel and other commercial/industrial uses at these offsite properties), it is likely that offsite sources of PCE contamination exist and that the contamination found in the groundwater underlying these properties has more than one source. Additional investigation by the RWQCB or nearby site owners of other potential sources may be warranted.

1.4 Regulatory Background

On April 11, 2018, the RWQCB adopted the RWQCB Order for the Site. As stated above, this Report summarizes the findings of the investigation conducted in general accordance with the Workplan, which was been developed to address Task 1a of the RWQCB Order.

1.5 Objectives

The objectives of the investigation, designed to meet the RWQCB Order's Task 1a requirements, are as follows:

- Define the extent of the soil-gas exceeding the cleanup levels specified in the RWQCB Order to the south, west, and north of the Site.
- Define the extent of the indoor air exceeding the cleanup levels specified in the RWQCB Order within the Bassler-Haynes building.

The investigation was conducted to produce site data to assess the contamination threat to human health and the environment.

2.0 FIELD ACTIVITIES

This investigation consisted of the activities described in the following subsections. During the investigation activities, the scope of work was modified based on conditions encountered in the field. Any changes to the scope of work were made in the field by Terraphase's field staff in consultation with Terraphase's California Professional Geologist and the Project Manager and are detailed in the following sections.

2.1 Selection of Sampling Locations

2.1.1 Soil-Gas Sample Locations

Per RWQCB comments (RWQCB 2018a) on the Draft Remedial Action Workplan (Terraphase 2017), soil-gas concentrations exceeding cleanup levels have not been fully defined to the south, west, or north of the Site. Accordingly, three temporary soil-gas wells (SG-10, SG-11 and SG-12) were proposed in the Workplan to assess soil-gas conditions to the south and north of the Site. Due to subsurface refusal, only two of the proposed soil-gas wells were installed, as follows:

- Installation of soil-gas well SG-10 was proposed in the sidewalk located immediately south of the Bassler-Haynes building to delineate potential impacts to soil gas to the south. A soil-gas well was not constructed at this location due to refusal at 19 inches bgs. Due to the location of utilities, the proposed boring location could not be relocated.

- Installation of soil-gas wells SG-11 and SG-12 was proposed in the sidewalk located north of the Bassler-Haynes Building to delineate potential impacts to soil gas to the north. Two soil-gas wells, SG-11 and SG-12, were installed at the proposed locations, and samples were collected from each soil-gas well (Figure 5A).

2.1.2 Sub-Slab Soil-Gas Sample Locations

Previous soil-gas sampling activities have been conducted in the basement beneath the approximate Site addresses of 49, 43, and the central portion of 35 East Santa Clara Street. Due to the lack of a finished basement and low ceiling clearances, it was determined not to be feasible to collect samples from beneath 35E East Santa Clara Street, which includes the southwestern-most end of the Site, as proposed in the Workplan and the RWQCB verbally approved of this change in scope. In order to evaluate the soil-gas impacts to the west of the Site, the proposed two sub-slab soil-gas points were relocated and installed as follows:

- Sub-slab soil-gas locations SS-1 and SS-2 were installed within the courtyard on the western side of the Bassler-Haynes Building, as shown on Figure 5B.

This change to the scope was verbally approved by the RWQCB prior to the Workplan implementation.

2.1.3 Indoor and Outdoor Ambient Air Sample Locations

Indoor air sampling locations were selected to assess the air quality of the entire Bassler-Haynes building. Two indoor air samples were collected from each floor of the building (basement, 1st floor, 2nd floor, and 3rd floor) for a total of eight indoor air samples within the Bassler-Haynes Building. One duplicate sample was collected within the Bassler-Haynes building for quality control purposes (IA-7). The Bassler-Haynes building heating, ventilation, and air conditioning system was off during the indoor air sampling. One outdoor ambient air sample was collected from the roof of the Bassler-Haynes building (Figures 6B and 6C).

Per the RWQCB's Conditional Approval of the Workplan (RWQCB 2018b), the following offsite indoor air samples at neighboring properties were added to the scope of work:

- 25 North Second Street (Cheap Squad LLC): Two indoor air samples;
- 19 North Second Street (Vacant unit): One indoor air sample; and
- 15 North Second Street (Formula Nutrition): Two indoor air samples.

The off-site indoor air sampling locations were selected during a site reconnaissance visit with the RWQCB case manager (Mr. David Barr) on November 14, 2018.

Locations of the onsite indoor air and ambient outdoor air samples are shown on Figures 6B and 6C. Locations of the offsite indoor air samples are shown on Figure 6A.

2.2 Permits

Boring permits from Santa Clara Valley Water District were not required for the soil-gas sampling points because the borings were less than 15 feet deep and were built with flexible tubing.

In order to install soil-gas sampling points on the sidewalks surrounding the Bassler-Haynes building, Terraphase obtained a Revocable Encroachment Permit from the City of San Jose for construction within the public right-of-way (Appendix A). The work was completed under the terms of that permit and the traffic control plan generated for this work, per the requirements of the Department of Public Works.

Due to the presence of a VTA light rail line in North Second Street, Terraphase coordinated with VTA to ensure that all staff and equipment remained entirely outside of a 10-foot buffer from the light rail tracks at all times. Under these circumstances Restricted Access and Construction Access Permits were not required.

After the sampling activities were completed, Terraphase restored the sidewalks using concrete to finish the boring repair flush with surface conditions. Through communications with the City of San Jose, it was determined that a Sidewalk Repair Permit, and applicable inspections, were not required.

2.3 Health and Safety Plan

A site-specific Health and Safety Plan (HASP) was kept onsite during fieldwork activities. The HASP details the personal protective equipment (PPE) and safety measures that are required for the work. A health and safety meeting was conducted in the field before fieldwork began. Fieldwork was monitored according to the HASP to ensure that appropriate health and safety procedures were followed.

2.4 Utility Clearance

The proposed boring locations were marked with white chalk paint prior to utility clearance activities. Terraphase contacted Underground Service Alert of Northern California prior to the proposed drilling date to notify entities with underground utilities in the area of the drilling activities and verified that the relevant entities had responded before work began. In addition, Terraphase retained SubDynamic Locating Services, Inc. to further evaluate each proposed boring and sub-slab soil-gas sampling location for the presence of underground utilities.

3.0 FIELD METHODS AND PROCEDURES

Field activities included the installation of temporary soil-gas wells, sub-slab soil-gas sample points, and the collection of soil-gas, sub-slab soil-gas, indoor and outdoor ambient air samples. Locations of sampling points are shown on Figures 5A through 6C.

The sub-slab soil-gas and soil-gas sampling activities will be performed in accordance with Department of Toxic Substances Control (DTSC) and California Environmental Protection Agency (Cal/EPA) guidance (DTSC 2015; Cal/EPA 2015).

3.1 Soil-Gas Well Installation and Sampling

3.1.1 Soil-Gas Well Installation

Based on the geology, previous soil-gas investigations, and groundwater depth identified in the historical site investigations, temporary soil-gas probes were installed at each location with the probes installed at a depth of 5 feet bgs to collect soil-gas samples. The two temporary soil-gas wells (SG-11 and SG-12) were installed in general accordance with DTSC Guidelines (DTSC 2015). The soil-gas boreholes were advanced with a hand auger to a depth of 3 feet bgs. The soil-gas boreholes were advanced from 3 to 5.5 feet bgs with a direct-push technology Geoprobe rig. When the target depth was reached, the soil-gas well was constructed within the annulus of the borehole. Soil was logged in the field by Terraphase's field staff, in accordance with the Unified Soil Classification System (Appendix B).

Each temporary soil-gas location consisted of a soil-gas sampling probe tip, constructed of either a stainless-steel screen or ceramic air-stone, that was connected to ¼-inch Teflon or Teflon-lined tubing of sufficient length to extend to the ground surface with a Swagelok fitting at the end. The boring was advanced at least 6 inches deeper than the intended probe depth and filled with sand up to the depth of the probe (i.e., from approximately 5 to 5.5 feet bgs). The probe was lowered into the boring and sand was added to a depth of 6 inches above the probe. The sand pack was topped with a transition seal of approximately 12 inches of dry bentonite followed by hydrated bentonite up to ground surface. The bentonite was placed and hydrated in 6-inch lifts. The bentonite was hydrated in the annulus of the boring to further prevent bridging. A traffic cone, or similar, was placed on top of the tubing until sampling was completed to prevent damage to the temporary well.

3.1.2 Soil-Gas Well Sampling Methods

Soil-gas samples were collected a minimum of 2 hours after the installation of the soil-gas wells to allow time for equilibration of the formation disturbed during the installation activities. Soil-gas samples were not collected during or within 5 days of a significant precipitation event. A significant precipitation event is defined as greater than or equal to 1/2 inch of rainfall over a 24-hour period (DTSC 2015).

Prior to sample collection, a shut-in test was conducted on each sample train, consisting of the sample canister and sampling manifold (including an in-line filter and flow regulator) as a leak check to ensure that the sampling assembly was free from leaks before purging and sampling. Each manifold and canister were placed under a minimum vacuum of 10 inches of mercury (Hg) and sealed. Before use, each canister/manifold set was observed to ensure that the vacuum was retained for a minimum of 5 minutes prior to use.

Prior to the purging and sample collection, a clear shroud (plastic box) was placed around the top of the soil-gas well and the soil-gas sample apparatus. The air inside the shroud was enriched with helium to a minimum concentration of 10% by volume (typically between 20% and 50%), measured using a portable helium detector, as part of the leak test.

Approximately three purge volumes were extracted from each soil-gas well prior to collection of a soil-gas sample. Purge volumes were calculated to include the vapor probe tip, tubing, 30% available sand porosity, and an assumed 50% porosity for the dry bentonite zone. Soil gas was purged using a manual purging device (i.e., gas-tight syringe or handheld vacuum pump) at a rate of 100 to 200 milliliters per minute. The soil-gas probe and sampling train assembly were screened for leaks by drawing purge gas through the well. The purge gas was collected in a Tedlar bag and analyzed using a handheld helium detector. Helium was not detected or detected in very low concentrations in the purge samples. The well purge volume and associated helium concentration were recorded on the field data sheet (Appendix C).

If water was entrained in the sampling system during purging or sampling, the sampling would be discontinued; no water was observed during sampling activities.

After the shut-in test and soil-gas purging were performed, soil-gas samples were collected in 1-liter, laboratory-supplied Summa™ canisters. The initial sample canister vacuum reading indicated on the gauge was recorded on the field form. The valve was then opened on the sample canister and the start time of sample collection was recorded on the field form. The sample canister was fitted by the laboratory with a vacuum gauge and critical orifice flow regulation device sized to allow sample collection at a flow rate of approximately 100 to 200 milliliters per minute. The vacuum in the canister was monitored during sample collection and readings were recorded on the field data sheet at least once per minute. The helium concentration inside the shroud was measured continuously during sampling, and the measured concentrations was recorded on the field data sheet at least once per minute.

The sample canister valve was shut off when the vacuum gauge reached approximately 5 inches of Hg. The final vacuum was recorded on the field form. The samples were properly labeled, placed in laboratory-supplied shipping boxes, and submitted under chain-of-custody documentation to an approved analytical laboratory for chemical analysis per Section 4.0.

3.1.3 Soil-Gas Well Destruction

The two soil-gas wells (SG-11 and SG-12) were installed as temporary soil-gas wells. After sampling was completed, the tubing was removed. The three boreholes (including SG-10 where no well was installed due to refusal) were grouted, and the sidewalks were repaired with concrete, per the requirements of the Revocable Encroachment Permit, as discussed in Section 2.2.

3.2 Sub-Slab Soil-Gas Well Installation and Sampling

3.2.1 Sub-Slab Soil-Gas Well Installation

Sub-slab soil-gas sampling points were constructed with the Vapor Pin™ sampling technology. The Vapor Pin™ is a sub-slab soil-gas sampling device that eliminates the need for grout or any other adhesive (CCAI 2016). It is made of a single 3-inch piece of stainless steel, with a barb fitting on the sampling end, and it has a silicone sleeve to create a seal with the concrete slab. The barb fitting on the top of the Vapor Pin™ allows for an effective connection to sampling devices after installation. Installation was performed by drilling a small 5/8-inch-diameter hole through the concrete slab with a hammer drill, cleaning the interior of the hole, and placing the Vapor Pin™ in the hole.

After the Vapor Pin™ was installed, a silicone cap was placed on the barbed fitting at the ground surface, and a threaded metal cap was used for the surface completion.

3.2.2 Sub-Slab Soil-Gas Sampling Methods

The sub-slab soil-gas points were allowed to equilibrate without exposure to ambient air for at least two hours prior to sampling in accordance with DTSC guidance (DTSC 2015). A shut-in test, as described in Section 3.1.2, was performed prior to leak testing and sampling.

The purpose of the pre-sampling purging activities is to remove stagnant soil gas in the soil-gas well tubing and screen prior to sample collection. With the Vapor Pin™ technology, no subsurface soil-gas well tubing is involved with the sampler; therefore, no pre-sampling purge activities are required. However, a leak check was performed by extracting 30 to 60 milliliters of gas from each sub-slab soil-gas point using a gas-tight syringe and screening the collected gas in a Tedlar bag using a handheld helium detector.

At each sub-slab soil-gas sampling location, the soil-gas samples were collected using the same procedure in which soil-gas samples were collected at the soil-gas wells (see Section 3.1.2). The samples were placed in laboratory-supplied shipping boxes, properly labeled, and submitted under chain-of-custody documentation to an approved analytical laboratory for chemical analysis as discussed in Section 4.0.

3.3 Indoor Air and Outdoor Ambient Air Quality Sampling

3.3.1 Pre-Sampling Building Survey and Chemical Inventory

Prior to indoor air sample collection, a chemical inventory was conducted within each tenant space. The observation of any pertinent chemicals or materials was recorded (Appendix C).

3.3.2 Indoor and Outdoor Ambient Air Sampling Methods

Both indoor air and outdoor ambient air samples were collected within the breathing zone (3 to 5 feet above the floor) using 6-liter Summa™ canisters with a flow regulator set to collect an 8-hour time-integrated sample. The canisters were clearly labeled, and the outdoor sample canisters were secured with bicycle locks to prevent tampering. The 8-hour sample collection time for a 6-liter capacity Summa™ canister corresponds to a maximum collection flow rate of approximately 0.0125 liter per minute, which is within the DTSC and Cal/EPA guidance (DTSC 2015; Cal/EPA 2015). The Summa™ canisters and flow regulators were individually certified clean.

Summa™ canisters received from the laboratory were under vacuums of approximately 29 to 31 inches Hg. After the canisters were set up in a sample location, the protective caps were removed and an initial vacuum reading was measured and recorded to ensure that the canisters had not leaked during shipment.

The flow regulator restricts the air flow into the canister so that a time-integrated sample can be collected. Each flow regulator was used only for a single sample, and flow rate was set by the analytical laboratory. The valve on the Summa™ canister was closed once it reached 4 to 6 inches of Hg, then the flow regulator was removed. The final vacuum was measured and recorded on both the field forms and the canister laboratory label (Appendix C). After receipt of the canisters at the laboratory, the vacuum was measured again to ensure that the canisters did not leak during shipment.

The following items were recorded for each sample:

- Sample location (including figure and photograph)
- Canister identification number
- Manifold identification number
- Initial canister vacuum
- Time and date sample collection begins and ends
- Final canister vacuum

3.4 Equipment Decontamination

To prevent potential cross-contamination between sample locations, all non-disposable equipment that came in contact with soil or process residuals was decontaminated before work

was initiated at each subsequent sampling location. Equipment was decontaminated using a two-step process: (1) non-phosphate detergent wash, and (2) potable water rinse; or was decontaminated using a high-pressure steam washer. Decontamination water was collected and temporarily stored onsite as investigation-derived waste (IDW), as described below.

3.5 Investigation-Derived Waste

IDW included soil cuttings collected during investigation and sampling activities, and decontamination water. The soil cuttings generated during the boring activities are being stored in 55-gallon steel drums at the Site. Equipment wash water from equipment decontamination was also containerized in 55-gallon steel drums. The drums were sealed, labeled, and are being temporarily staged in a secure location of the Site prior to disposal. One four-point composite sample was collected from the contents of the drums for waste characterization and profiling.

Disposable PPE and sampling equipment were managed as nonhazardous solid waste. This disposable IDW was placed in plastic bags and disposed of in an industrial dumpster, the contents of which are typically disposed of in a municipal landfill.

3.6 Field Quality Assurance/Quality Control Measures

One field-duplicate sub-slab soil-gas sample was collected from one of the sub-slab soil-gas sampling points as part of the investigation, to assess variability in sample collection and laboratory analysis. The associated primary and duplicate samples consisted of two Summa canisters, sampled sequentially. Results were evaluated by calculating the relative percent difference (RPD) between associated primary and duplicate sample concentrations. The RPD for the sub-slab samples was within the acceptable limit of 50%, as specified in the DTSC Vapor Intrusion Guidance document (DTSC 2015).

One field-duplicate indoor air sample was collected as part of the investigation, to assess variability in sample collection and laboratory analysis. The associated primary and duplicate samples consisted of two separate and independent Summa canisters, placed side-by-side and operated over the same sampling period (within a few seconds). Results were evaluated by calculating the RPD between associated primary and duplicate sample concentrations. The RPD for the indoor air samples was within the acceptable limit of 50%, as specified in the DTSC Vapor Intrusion Guidance document (DTSC 2015).

Additional results of the field quality assurance/quality control assessment are included as Appendix D.

4.0 ANALYTICAL METHODS

Soil-gas, sub-slab soil-gas, indoor air, and outdoor ambient air samples collected during this investigation were submitted to Pace Analytical. Laboratory analytical reports are presented in Appendix E.

Soil-gas and sub-slab soil-gas samples were analyzed for:

- PCE, TCE, cis-1,2-DCE, and vinyl chloride (VC) with United States Environmental Protection Agency (USEPA) Method TO-15 analysis; and
- Helium by American Society for Testing and Materials method D1946.

Indoor and outdoor ambient air samples were analyzed for:

- PCE, TCE, cis-1,2-DCE, and VC with USEPA Method TO-15 Select Ion Monitoring analysis.

5.0 REMEDIAL INVESTIGATION RESULTS

5.1 Soil-Gas Investigation Results

Analytical results for the soil-gas samples are shown on Table 1 and Figure 5A. The soil-gas sample results were compared to the soil-gas cleanup levels identified in the RWQCB Order. The cleanup level for PCE is 2,100 micrograms per cubic meter (µg/m^3) and the cleanup level for TCE is 3,000 µg/m^3.

Both temporary soil-gas monitoring well samples had detections of PCE, at concentrations of 1,490 µg/m^3 (SG-11), and 160 µg/m^3 (SG-12). The sample collected from SG-11 had a detection of TCE at a concentration of 57.4 µg/m^3. The concentrations of PCE and TCE are below the soil-gas cleanup levels of 2,100 µg/m^3 and 3,000 µg/m^3, respectively. All other constituents of concern were below laboratory detection limits.

Helium was detected in both soil-gas samples at 0.244% (SG-11) and 0.211% (SG-12), which are below the 5% standard representative of a leak.

5.2 Sub-Slab Soil-Gas Investigation Results

Analytical results for the sub-slab soil-gas samples are shown on Table 1 and Figure 5B. The sub-slab soil-gas sample results were compared to the soil-gas cleanup levels identified in the RWQCB Order, as discussed in Section 5.2.

Both sub-slab soil-gas samples and the duplicate sample had detections of PCE at concentrations of 73.9 µg/m^3 (SS-1), 24.6 µg/m^3 (SS-2), and 27.9 µg/m^3 (SS-2 DUP). The concentrations of PCE are below the soil-gas cleanup levels of 2,100 µg/m^3. All other constituents of concern were below laboratory detection limits.

Helium was detected in both sub-slab soil-gas samples and the duplicate sample at 0.281% (SS-1), 0.241% (SS-2), and 0.233% (SS-2 DUP), which are below the 5% standard representative of a leak.

5.3 Indoor Air and Outdoor Ambient Air Investigation Results

Analytical results for the indoor and outdoor ambient air samples are shown on Table 2 and Figures 6A through 6C. The indoor air sample results were compared to the indoor air cleanup levels identified in the RWQCB Order. The cleanup level for PCE is 2.1 µg/m^3 and the cleanup level for TCE is 3.0 µg/m^3.

5.3.1 Onsite Indoor Air and Outdoor Ambient Air Investigation Results

All nine indoor air samples (eight primary sample locations and one duplicate sample) collected within the Bassler-Haynes Building had detections of PCE. Concentrations ranged from 3.07 µg/m^3 (IA-4) to 348 µg/m^3 (IA-1), all of which exceed the indoor air cleanup levels. The

samples with the highest PCE concentrations were collected from the basement (IA-1 and IA-2), and the third floor (IA-7 and IA-8).

TCE was detected in six of the indoor air samples (five primary sample locations and one duplicate sample) collected within the Bassler-Haynes Building, at concentrations ranging from 0.172 $\mu g/m^3$ (IA-5) to 0.525 $\mu g/m^3$ (IA-1). All TCE concentrations were below the cleanup level of 3.0 $\mu g/m^3$. TCE was detected in samples collected from the basement (IA-1 and IA-2), the second floor (IA-5), and the third floor (IA-7 and IA-8).

All other constituents of concern from samples collected within the Bassler-Haynes building were below laboratory detection limits.

The outdoor ambient air sample collected from the roof of the Bassler-Haynes Building detected PCE at a concentration of 1.11 $\mu g/m^3$ (OA-1). Other constituents of concern from the outdoor ambient air sample were below laboratory detection limits.

5.3.2 Offsite Indoor Air Investigation Results

The four indoor air samples collected from offsite neighboring properties had detections of PCE ranging in concentration from 0.4 $\mu g/m^3$ (IA-9) to 5.22 $\mu g/m^3$ (IA-11). Two of the concentrations (IA-11 and IA-12), both located within 25 North Second Street, exceed the indoor air cleanup level for PCE of 2.1 $\mu g/m^3$.

Other constituents of concern from samples collected within offsite neighboring properties were below laboratory detection limits.

6.0 CONCLUSIONS AND RECOMMENDATIONS

Results indicate that there is a vapor intrusion issue within the Bassler-Haynes building, and a potential vapor intrusion issue at downgradient neighboring properties.

In accordance with the requirements of Task 3 of the RWQCB Order, Terraphase will submit a Remedial Action Workplan (RAP) on behalf of the Site owner by January 7, 2018. The RAP will include an evaluation of remedial alternatives and a selected remedy to address vapor intrusion concerns based on the investigations performed to date.

[ ] **PRIVATE UTILITY PERMIT**

In the past, utility companies performed all of their own trench construction. However, today utility companies sometimes allow private contractors to construct the trench and install the facilities with the utility company inspecting and accepting the work. This permit is for those situations.

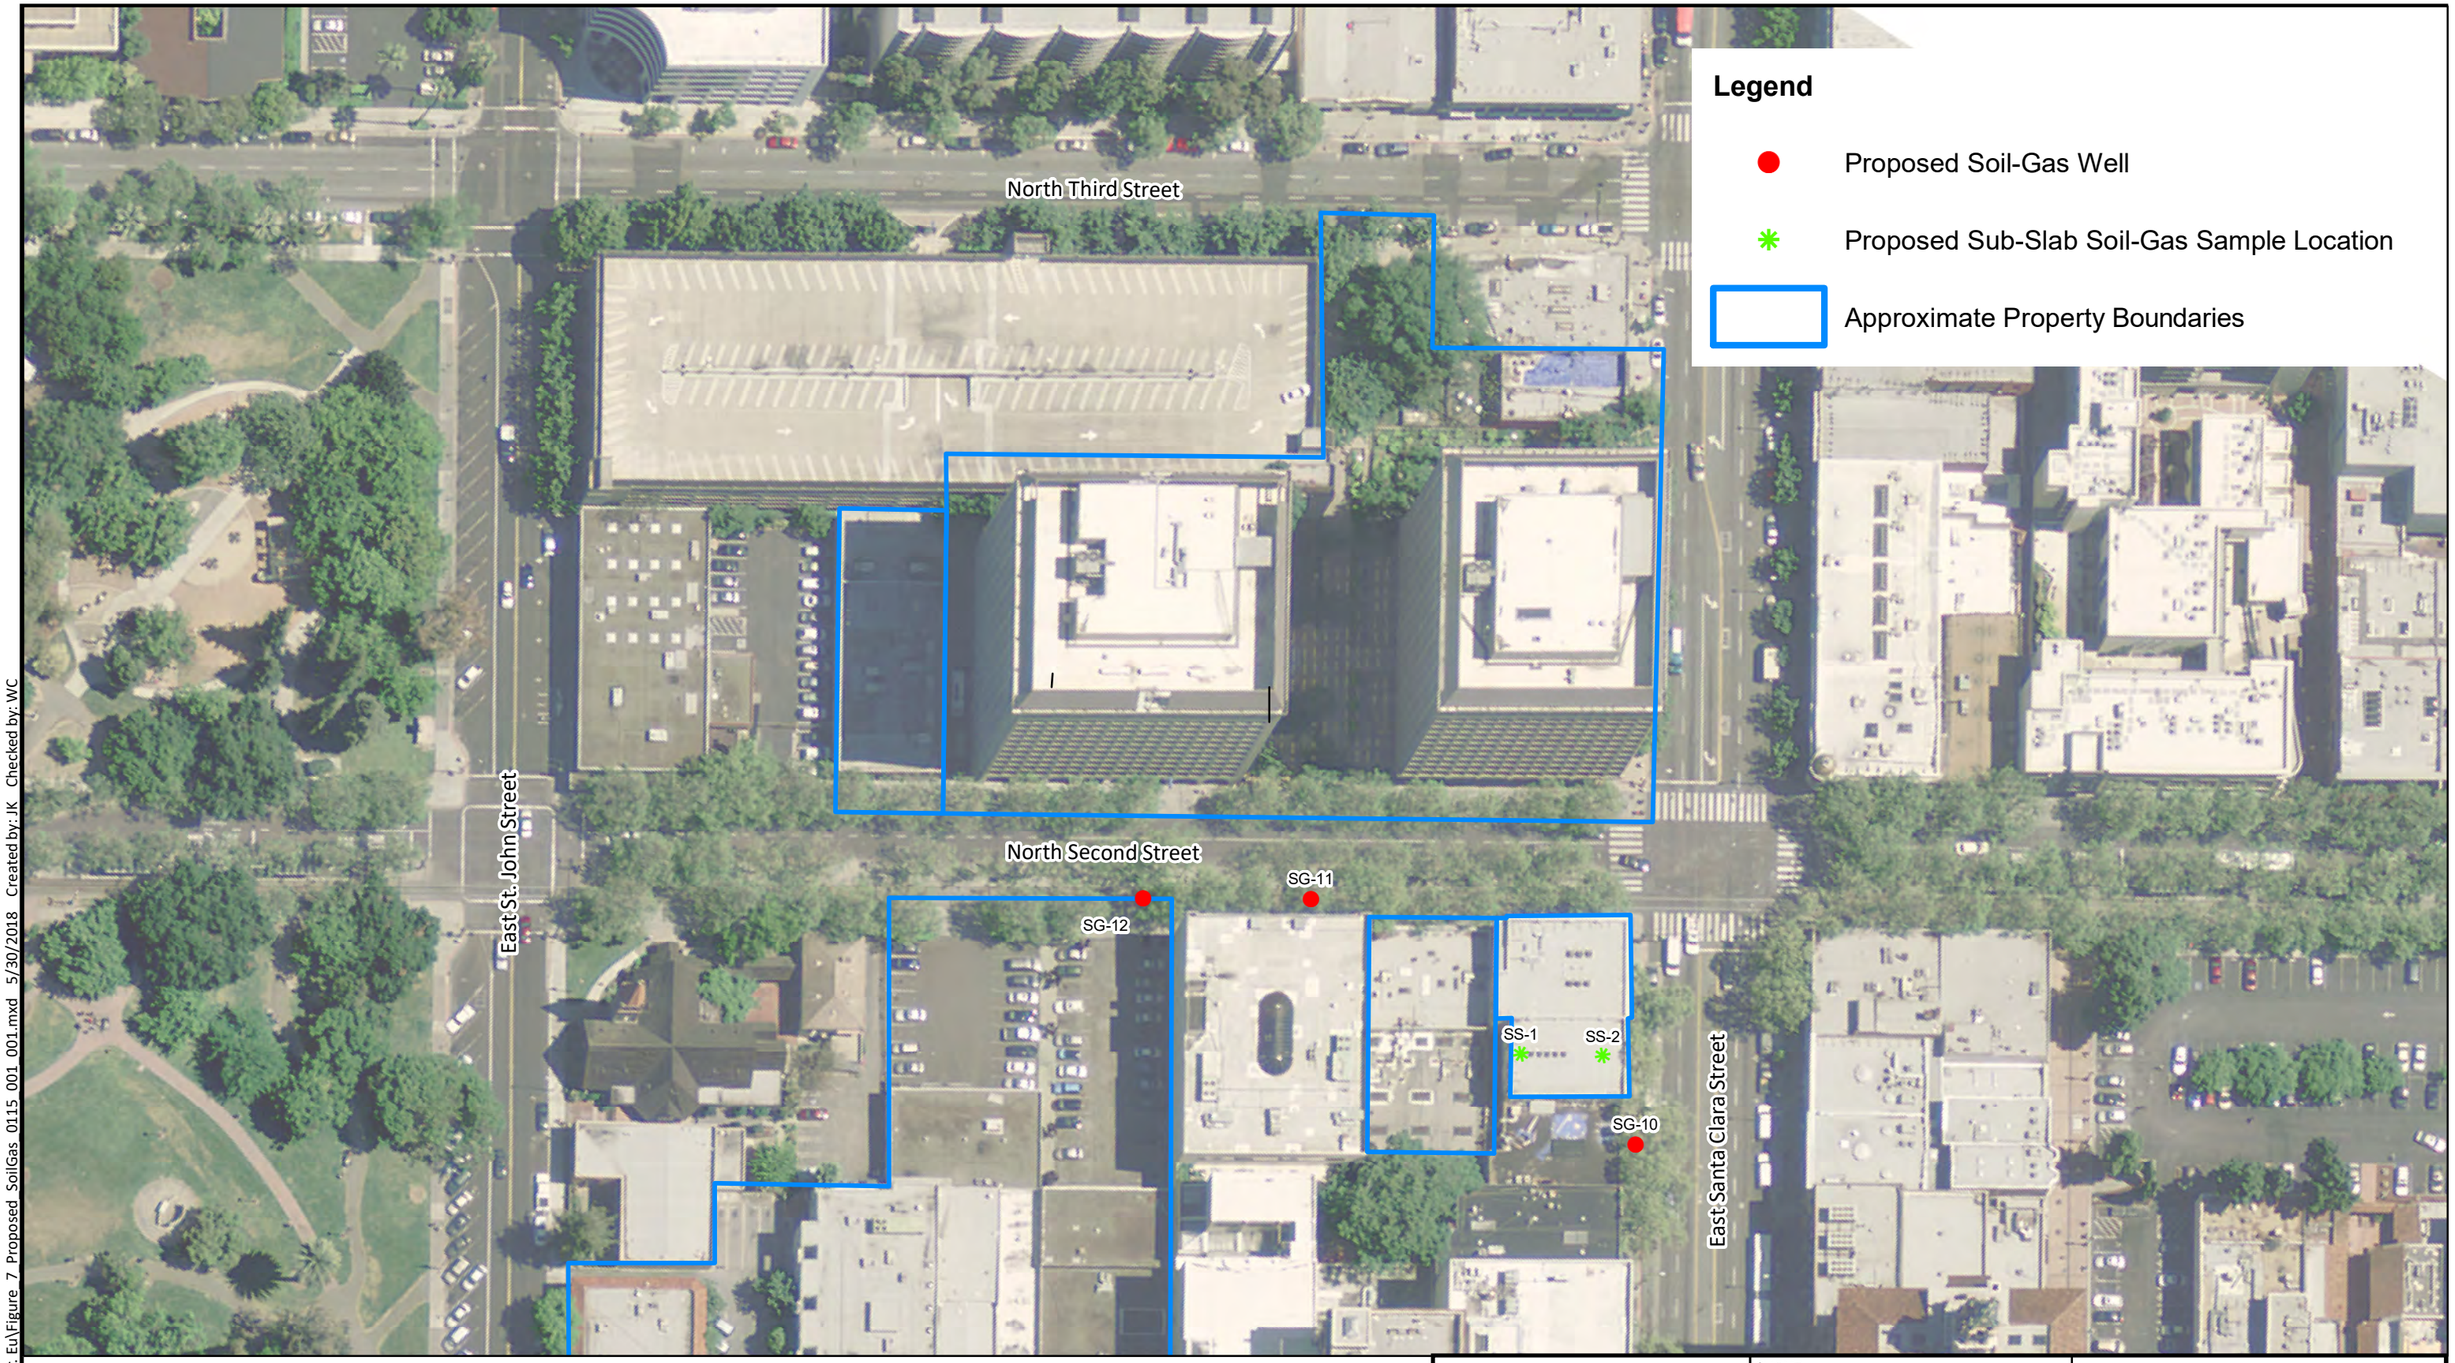
Memorandum

To: **San Jose Department of Public Works**
From: **Chris Jones,**
Date: **September 28, 2018**

Subject: **Letter of Intent – Encroachment Permit Application for work in sidewalk near intersection of E. Santa Clara St. and N. 2nd St.**



To who it may concern,

Terraphase Engineering Inc. (Terraphase) is preparing to perform a limited environmental investigation associated with the property located at 35 and 43 East Santa Clara Street (the Site). Per directives from the San Francisco Regional Water Quality Control Board (RWQCB) the scope of the investigation includes the installation of three temporary soil vapor wells (SG-10, SG-11, and SG-12) in the sidewalk to the north and east of the property under investigation as shown in the attached figure.

The temporary vapor wells will be installed by advancing a 2-inch diameter boring to a depth of 5-feet below ground surface. The work shall be completed in one day during normal business hours. No permits are required from the Santa Clara Valley Water District since the borings are less than 45-feet deep and the temporary wells will be abandoned on the same day they are installed immediately following sample collection. Furthermore, the Department of Transportation, Trees and Sidewalks Division has determined that they do not require a permit for this scope of work.

No street access will be needed to complete this work, only the portions of sidewalk immediately adjacent to the proposed vapor well locations will require delineation. The equipment used to advance the borings will be a combination of hand tools and a small drilling device mounted to a hand cart (GeoProbe 420M or similar).

The work is anticipated to take place prior to the end of October 2018. If you have any questions please contact Chris Jones (860)989-8538 or chris.jones@terraphase.com.

2: Descriptions on these logs apply only at the specific boring locations and at the time the borings were advanced. They are not warranted to be representative of subsurface conditions at other locations or times.

OVERALL ASSESSMENT

All data, as qualified, are acceptable for use.

DATA PACKAGE COMPLETENESS

The data package included the required elements: chain-of-custody, sample receipt checklist, case narrative, results and QC results.

VERIFICATION OF EDD TO HARDCOPY DATA PACKAGE

Sample results and related quality control data were not received in an electronic format.

CHAIN-OF-CUSTODY

All sample identification (ID) numbers listed on the chain-of-custody record are consistent with the sample ID reported in the EDD and hardcopy data package.

SAMPLE PRESERVATION

Sample preservation is not applicable to air samples. The lab receipt summa pressure was appropriate for all samples.

HOLDING TIMES

Samples were analyzed within the holding time.

RETENTION TIME WINDOWS

Not evaluated.

INITIAL CALIBRATION

Not evaluated.

INITIAL CALIBRATION VERIFICATION

Not evaluated.

CONTINUING CALIBRATION

Not evaluated.

METHOD BLANK ANALYSIS

No target compounds were detected in the method blank samples.

LABORATORY CONTROL SAMPLES

All percent recovery values for laboratory control samples (LCS) were within acceptable criteria established by the laboratory for the respective testing methods.

SURROGATE COMPOUND RECOVERY

All percent recovery values for surrogate compounds were within acceptable criteria established by the laboratory for the respective testing methods.

SAMPLE DUPLICATE ANALYSIS

Sample duplicate analysis was not performed for this sample batch. Precision was evaluated using the laboratory control sample analysis.

BLANK SPIKE/BLANK SPIKE DUPLICATE SAMPLE ANALYSES

Blank spike and blank spike duplicate analysis was not performed for this sample batch. Precision was evaluated using the laboratory control sample analysis.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE SAMPLE ANALYSES

FIELD DUPLICATE ANALYSES

Sample IA-7-D was collected as a field duplicate of sample IA-7. Samples were analyzed for volatile organic compounds. Tetrachloroethene was detected in the primary and duplicate samples at concentrations of 192 and 194 µg/m^3 respectively; the calculated RPD was 25.2%. Trichloroethylene was detected in the primary and duplicate samples at concentrations of 0.476 and 0.285 µg/m^3 respectively. The RPD was not calculated for Trichloroethylene since the detections were less than 1. All other calculated RPDs were within the accepted 50% limit.

Sample SS-2-D was collected as a field duplicate of sample SS-2. Samples were analyzed for volatile organic compounds. Tetrachloroethene was detected in the primary and duplicate samples at concentrations of 24.6 and 27.9 µg/m^3 respectively; the calculated RPD was 12.6%. For all detected compounds, all calculated RPDs were within the accepted 50% limit

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Abbreviations and Definitions

MDL	Method Detection Limit.
ND	Not detected at the Reporting Limit (or MDL where applicable).
RDL	Reported Detection Limit.
Rec.	Recovery.
RPD	Relative Percent Difference.
SDG	Sample Delivery Group.
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.
U	Not detected at the Reporting Limit (or MDL where applicable).
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state “ND” (Not Detected) or “BDL” (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.

1.0 INTRODUCTION AND BACKGROUND

Terraphase Engineering Inc. (Terraphase) has prepared this *Soil Vapor Extraction Pilot Test Report* ("Pilot Test Report") on behalf of Isis Properties, LLC (Isis, or "the Site Owner"). The work is planned for the Bassler-Haynes Building located at 35 and 43 East Santa Clara Street in San Jose, California ("the Site", Figure 1). This Pilot Test Report has been prepared in accordance with the remedy discussed in the *Remedial Action Workplan Bassler-Haynes Building, 35 and 43 East Santa Clara Street, San Jose, California* ("the RAP"; Terraphase 2019a) dated January 7, 2019 and approved by the San Francisco Bay Regional Water Quality Control Board (RWQCB) in their letter dated September 11, 2019 (RWQCB 2019).

Data from soil, soil gas, groundwater, and indoor air investigations indicate the presence of residual concentrations of tetrachloroethene (PCE) and breakdown products including trichloroethylene (TCE), in the shallow soils and groundwater at the Site, as outlined in the RAP. In 2018, the RWQCB issued Site Cleanup Requirement No. R2-2018-0013 requiring a series of tasks to address potential risks to human health and the environment caused by releases of dry-cleaning solvent by a previous occupant at the Site prior to its acquisition by Isis ("the RWQCB Order"; RWQCB 2018a). The RAP identified Alternative #3 consisting of the use of an in-situ groundwater treatment (ISGT) system and a soil-vapor extraction (SVE) system with operation, maintenance, and monitoring (OM&M), groundwater monitored natural attenuation, and land use controls (LUCs) as the proposed alternative.

This Pilot Test Report has been prepared as the initiation of Task 4, Completion of Remedial Action, which requires a report of completion of remedial actions. As noted in a letter from the RWQCB dated March 26, 2020 (RWQCB 2020), the RWQCB is requiring submittal of the SVE Completion Report by December 31, 2020. The SVE pilot test was conducted with the following objectives:

- Provide a basis for the design of the full-scale SVE system, including a vapor treatment system.
- Determine the zone of influence (ZOI) that can be achieved at different levels of applied vacuum at the SVE well.
- Define the relationship between extraction flow rate and applied vacuum for the SVE well.

This Pilot Test Report presents the approach, procedures, and results of the SVE pilot study conducted at the Site on June 9 and 10, 2020.

1.1 Site Description

The Site is located at the northwest corner of the intersection of East Santa Clara Street and Second Street in downtown San Jose, California (Figures 1 and 2). The Site is developed with two attached three-story buildings constructed in the late-1880s, now known as the Bassler-Haynes building. Land use in this area is predominantly commercial. The Valley Transit Authority (VTA) light rail line and North Second Street are located adjacent to and northeast of the Site, and East

Santa Clara Street is located adjacent to and south of the Site. Other commercial buildings are located adjacent to and north of the Site (Figure 2).

The Bassler-Haynes building is currently vacant. Historical tenants of the Bassler-Haynes building included several retail businesses, including a jeweler, a clothing store, and a hotel. A dry-cleaning operation associated with the hotel reportedly released PCE and was located in the building's basement. The dry-cleaning operation reportedly operated between approximately 1950 and 1969 (Kennedy/Jenks 2005). A restaurant operated on the first floor in 1989 but vacated the building after an earthquake in 1989.

A summary of previous investigations is provided in the RAP.

1.2 Site Geology and Hydrogeology

The Site is located within a broad gentle alluvial valley that slopes and drains toward San Francisco Bay to the north and is bounded by alluvial fans and hills to the east and west (the San Jose Plain). Sediments encountered beneath the Site include alluvium deposited by distal portions of alluvial fans and consists of variable thicknesses of silts, sands, and clayey sediments to a depth of 20 feet below the basement floor (the total depth investigated beneath the Site). The basement floor is approximately 7 feet below the sidewalk elevation. Depths referenced in this document and listed on tables and figures are referenced to ground surface, defined in this document as "street level." Depths referred to as feet below ground surface (bgs) have been converted to the street-level reference point. Results of a grain size distribution analysis conducted on four soil samples indicated the presence of silty sand and clayey sand at depths of approximately 10 to 15 feet bgs (Kennedy/Jenks 2005).

The Site is located within the Santa Clara confined zone groundwater sub-basin within the Santa Clara Valley (Todd Engineers 2010). Shallow groundwater beneath the Site is underlain by an extensive regional aquitard that acts to separate the shallow groundwater from the underlying, confined principal aquifer that supplies most of the groundwater produced from beneficial use in the area.

Typical for the area, an apparent perched interval of shallow groundwater has been encountered in soil borings intermittently at approximately 17 feet bgs. Grab groundwater samples have been collected from that depth interval. Unsaturated sediments have also been encountered beneath that depth. Regional shallow groundwater has been encountered at approximately 27 feet bgs.

Groundwater in the Santa Clara sub-basin typically flows in the general direction of ground surface topography, towards the interior of the sub-basin and northerly towards San Francisco Bay. This northerly flow is confirmed with groundwater elevation data collected from a nearby underground storage tank remediation case (Chevron #9-4259, 147 East Santa Clara Street, approximately 1,000 feet northeast of the Site). Consistent with regional studies, groundwater elevation data collected from over 20 monitoring wells over several years confirmed that the

direction of shallow groundwater flow is dominantly toward the northwest (generally parallel with North Second Street; Stantec 2009).

1.3 Scope of Work

The scope of work for the SVE pilot study included:

- Installation of one horizontal SVE well. The well includes an approximately 10-foot long screened zone of extraction at a depth of approximately 4.5 feet bgs (Figure 3).
- Connection of the SVE well to a skid consisting of a 10-horsepower blower, a dilution valve, and a knock-out water vessel, which discharged to two 500-pound granular activated carbon vessels (in series).
- A step test (consisting of running the blower at increasing vacuum increments) and constant rate test (consisting of operating the blower at a constant vacuum for an extended period of time).

1.4 Site Cleanup Goals

Remedial goals for chlorinated volatile organic compounds (VOCs) were developed to address the remedial action objectives (RAOs) of protecting human health from vapor intrusion. The remedial goals for the Site for this RAO are the concentrations of PCE in groundwater (in micrograms per liter or µg/L) and soil gas (in micrograms per cubic meter or $\mu g/m^3$) calculated for a potential vapor intrusion scenario and indoor air for direct exposure. The indoor air and soil-gas remedial goals are based on the cleanup levels identified in the RWQCB Order (RWQCB 2018a). The groundwater vapor intrusion levels are based on the commercial/industrial (C/I) groundwater vapor intrusion human health risk environmental screening levels (ESLs; RWQCB 2016).

Constituent	Primary Remedial Goals	Secondary Remedial Goals	
	Indoor Air Cleanup Levels ($\mu g/m^3$)	Soil-Gas Cleanup Levels ($\mu g/m^3$)	Groundwater Vapor Intrusion Levels (µg/L)
PCE	2.1	2,100	26
TCE	3.0	3,000	49
Cis-1,2-DCE	35	35,000	950
Vinyl Chloride	0.16	160	0.53

Secondary remedial goals are related to concentrations that should not result in indoor air with concentrations in excess of the primary remedial goal above. If the remediation can maintain concentrations less than the primary remedial goal, the RAO is achieved.

2.0 PRE-FIELD ACTIVITIES

The following section discusses the proposed pre-field activities associated with the completed scope of work. In general, these activities included updating project health and safety documents, obtaining any necessary permits for well installation and/or pilot test system operation, and utility clearance prior to drilling activities.

2.1 Permits

Before intrusive work was conducted at the Site, Terraphase's subcontractor Eleven Engineering Inc. obtained a Building Permit from the City of San Jose (Permit # 20-107973-CI). The permit application is provided as Appendix A and includes drawings for the horizontal SVE well. The permit was issued by the City of San Jose on February 7, 2020. A final mechanical inspection and building inspection were required for the permit. Those inspections were performed on April 20, 2020.

Terraphase contacted the Santa Clara Valley Water District (SCVWD) regarding the need to permit the horizontal SVE well. After several discussions with the SVCWD, Mr. Bill Cameron, Well Ordinance Compliance Supervisor, confirmed via email on January 28, 2020, that a well construction permit would not be required based on the construction plans provided.

Due to the temporary nature of the pilot test program, a mobile rental SVE blower assembly was used, which had a current emissions permit through the Bay Area Air Management District (BAAQMD). On March 4, 2020, Terraphase provided notification to BAAQMD air quality engineer Ms. Huiting (Lindsay) Gao of the pending SVE pilot test. Ms. Gao confirmed that the notification had been received. On June 3, 2020, Terraphase provided a follow-up notification to Ms. Gao noting that the SVE pilot test had been postponed due to the Santa Clara County Shelter in Place order but was re-scheduled to proceed on June 9 and 10, 2020.

2.2 Health and Safety Plan

The site-specific Health and Safety Plan (HASP) was revised for this work, which incorporated and addressed the health and safety concerns specific to the field procedures associated with well installation and conducting a pilot study. The HASP details the personal protective equipment that is required for the work, as well as precautions related to the novel coronavirus. Health and safety meetings were conducted in the field at the start of the project and each day before fieldwork began. Fieldwork was monitored according to the HASP to ensure that appropriate health and safety procedures were followed.

2.3 Utility Clearance

The proposed horizontal SVE well location in the basement and perimeter of the building in the street were pre-marked with white chalk paint prior to utility clearance activities. Terraphase contacted Underground Service Alert of Northern California prior the proposed start date to notify companies with underground utilities in the area of the subsurface activities. In addition,

Terraphase retained a private utility locating service, to further evaluate the proposed horizontal well location for the presence of underground utilities.

3.0 SVE PILOT TEST FIELD ACTIVITIES

The SVE pilot test (Pilot Test) field activities were conducted for the purpose of providing sufficient data to design a full-scale SVE system for remediation of the vadose zone VOC plume at the Site. This section includes:

- An overview of field activities performed on March 9-11, 2020 and June 4, 2020 (installation of horizontal SVE well) and June 9 and 10, 2020 (Pilot Test),
- Descriptions of the methods utilized in field activities,
- A detailed narrative account of field activities, and
- Quantitative and qualitative results of field activities.

3.1 Overview of Field Activities

Field activities associated with the pilot testing program at the Site consisted of the following:

- Installation of the horizontal SVE well (SVE-1).
- Baseline monitoring of VOCs in the four existing soil-vapor monitoring wells utilized for the test (SG-6 through SG-9).
- Set-up of portable SVE test system and the associated piping, blower, granular activated carbon (GAC) vessels, wellhead manifolds, sampling ports, and monitoring instrumentation.
- Operation of the SVE system test sequences.

3.2 SVE Pilot Test Program

3.2.1 Test Overview

Soil-vapor monitoring wells SG-6, SG-7, SG-8, and SG-9 were installed on May 11, 2016. The construction of these soil-vapor monitoring wells is detailed in *Results of Soil-Gas and Groundwater Sampling, Bassler-Haynes Building, 35-43 East Santa Clara Street, San Jose, California* (Terraphase 2016). The horizontal SVE well (SVE-1) was installed on March 9-11, 2020 and June 4, 2020. Construction details are discussed in the following section.

The Pilot Test was conducted between June 9 and 10, 2020. The location of the SVE well (SVE-1) and soil-vapor monitoring wells are depicted on Figure 3.

An initial round of baseline measurements was taken on all soil-vapor monitoring wells on June 9 and 10, 2020 prior to any extraction testing activities. A step test consisting of a total of five steps was conducted on June 9, 2020. A constant rate test was conducted on June 10, 2020. Details of these tests are provided below in Section 4. Copies of all field notes and forms are presented in Appendix B.

3.2.2 SVE and Monitoring Well Installations

Details on the construction of the SVE well is depicted in Figure 4. SVE-1 was installed with a 4-inch diameter casing and intended as the primary extraction well.

The construction of the soil-vapor monitoring wells is detailed in *Results of Soil-Gas and Groundwater Sampling, Bassler-Haynes Building, 35-43 East Santa Clara Street, San Jose, California* (Terraphase 2016). The soil-vapor monitoring wells were installed with 0.75-inch outer diameter casings and intended as monitoring points for the Pilot Test and as possible supplementary extraction wells for future SVE operations, if necessary. The soil-vapor monitoring wells are screened at a depth of 3 to 7 feet bgs (SG-6, SG-8, and SG-9) and 3.5 to 5.5 feet bgs (SG-7).

Copies of the vertical well completion and boring logs are presented in Appendix C.

3.2.3 Pilot Test Equipment

The SVE system setup utilized during the Pilot Test consisted of a vacuum pump 229 cubic feet per minute (CFM) blower, power supplied by the building's utilities, and two 500-lb GAC vessels in series. The blower had a water knockout device situated at the inlet to remove moisture and condensation from the vapor stream. Extracted vapors were passed through the blower and circulated through the two GAC vessels in sequence before being discharged to the atmosphere through an approximately 10-foot high temporary stack. Lengths of 2-inch-diameter flexible polyvinyl chloride (PVC) hose fitted with camlocks or boot fittings were utilized between the system components; i.e., between the extraction wellhead and the blower, between the blower and the first GAC vessel, and between the two GAC vessels. Figure 5 presents a schematic illustrating the SVE test system.

As the duration of the Pilot Test was less than five days, operation of the SVE system did not require an air quality control permit. However, the BAAQMD was notified in writing in advance of the Pilot Test.

3.2.4 Vapor Sampling

Vapor samples for field screening and/or lab analysis were collected from various points in the SVE system throughout the testing sequence.

3.2.4.1 Vapor Field Screening

The SVE horizontal well (SVE-1) and soil-vapor monitoring wells were field screened for total VOCs, oxygen, carbon dioxide, and methane at various points throughout the testing sequence. Samples from the SVE horizontal well and soil-vapor monitoring wells were collected into 1-liter Tedlar bags via wellhead sample ports and the extraction manifold using a Teflon lined vacuum pump to overcome the vacuum pressure induced by the blower. The Tedlar bag was then attached to a RAE Systems MiniRAE 2000 Photo Ionization Detector (PID) and then to a LANDTEC instruments GEM5000 gas monitor, and the readings were recorded on appropriate field forms. All connections between sample ports, pump, Tedlar bag, and instruments were

made using lengths of inert Teflon tubing. Field screening samples were also taken from sample ports located after the two GAC vessels.

Results of the field screening program are reported in parts per million by volume (ppmv) and are summarized in Tables 1 and 2.

3.2.4.2 Laboratory Sample Collection

Four soil-vapor samples in total were collected during the constant rate test. Soil-vapor samples were collected shortly after the constant rate test began and near the end of the test (after approximately four hours of operation). Influent samples were collected from a sample port located at SVE-1 and effluent samples were collected from the GAC vessel effluent sample port.

All samples were submitted to a laboratory for chemical analysis by U.S. Environmental Protection Agency (EPA) Method TO-15. Samples were collected in 1-liter Summa canisters. The Summa canisters were pre-evacuated by the laboratory to a full vacuum (approximately 30 inches of mercury [in-Hg]) prior to use in the field. For GAC effluent samples individual flow controllers for each canister were preset to a rate of approximately 150-200 milliliters of air per minute (ml/min). Flow controllers were used during sample collection, the canister was connected to the extraction GAC vessel sample port with inert Teflon tubing and Swagelok fittings, and then the canister valve was opened. After approximately 7 minutes and when the canister pressure read between 1 and 5 in-Hg, the valve was closed to keep the canister at a slight vacuum. Flow controllers were not utilized for samples collected from influent samples at SVE-1 as the vacuum at the well head was too high. Sample times and vacuum readings for each sample were recorded on the chain of custody (COC) forms provided by the laboratory.

Samples were analyzed for VOCs by EPA Method TO-15. Samples were not analyzed for methane or fixed gases in the laboratory. Samples were shipped to Pace Analytical of Mount Juliet, Tennessee. Results of the laboratory testing program are included in Table 3.

3.2.5 SVE Test Sequence

The pilot test included baseline sampling, a step test, and a constant rate test. Tables 1 and 2 detail the field measurements taken during each of the tests. Step tests and a constant rate test were conducted on SVE-1.

The step tests were designed to test the range of vacuum that can be imposed on the vadose zone through SVE-1 and to observe the resulting vapor flow rates and ZOI. The step tests were conducted by increasing the blower extraction rate by incrementally closing the fresh air inlet dilution valve on the blower assembly.

Subsequent steps in flow rate were initiated when monitoring wells achieved static pressure conditions. In the Pilot Test Work Plan, static pressure was defined as no change in the observed pressure over at least two sequential readings obtained a minimum of five minutes apart. The goal of the constant rate test was to determine the long-term ZOI for SVE-1, to collect adequate

data to allow calculation of average intrinsic air permeabilities, and to monitor the changes in VOC concentrations over time to develop an understanding of the maximum mass loading rates.

3.2.5.1 Baseline Monitoring

After equipment setup but before activating the blower, baseline monitoring was performed at the SVE well and the soil-vapor monitoring wells. Baseline monitoring was performed to establish a baseline of background static soil-vapor conditions. VOCs were measured for later comparison with measurements obtained during active tests. Samples were collected into Tedlar bags from sampling ports at each monitoring point wellhead via Teflon and silicone tubing. The Tedlar bag was then attached to the PID and 4-gas meter for field screening. Tables 1 and 2 present baseline results. Lengths of silicone tubing connected to vacuum gauges were utilized at each monitoring point to ensure that sample ports remained closed to the atmosphere between sampling events.

3.2.5.2 Step Tests

Following completion of baseline monitoring a series of flow rate step tests were performed to determine pressure-flow relationships for SVE-1. Step tests utilizing SVE-1 as the extraction well were performed on June 9, 2020. Well SVE-1 has a screen length of 10 feet and a diameter of 4 inches. The other soil-vapor monitoring wells were monitored often throughout the step tests for vacuum pressure. A summary of the flow rates and final pressure readings from each step are presented in Table 1 and Figure 6.

- During Step 1, a flow rate of 23.05 standard cubic feet per minute (SCFM) was achieved by inducing a vacuum of 20 inches of water column (in-H_2O), as measured at the well head of SVE-1. During this step, the fresh air inlet dilution valve on the blower assembly was set to 80 percent (%) open. Pressure equilibrium was achieved quickly at most wells and Step 1 was terminated after approximately 30 minutes. Pressure responses were measured at all soil-vapor monitoring wells.

- During Step 2, a flow rate of 21.25 SCFM was achieved by setting the fresh air bleed to 50% open, inducing a vacuum of 41 in-H_2O on SVE-1. Static conditions again developed rapidly (within minutes) during Step 2, but the step was continued for approximately 60 minutes to be certain conditions were static. Pressure responses were measured at all soil-vapor monitoring wells.

- During Step 3, a flow rate of 20.35 SCFM was achieved by setting the fresh air bleed to 25% open, inducing a vacuum of 70 in-H_2O on SVE-1. Static conditions again developed rapidly (within minutes) during Step 3, but the step was continued for approximately 40 minutes to be certain conditions were static. Pressure responses were measured at all soil-vapor monitoring wells.

- During Step 4, a flow rate of 23.10 SCFM was achieved by closing the fresh air bleed completely, inducing a vacuum of 95 in-H_2O on SVE-1. Static conditions were not achieved prior to observing entrained groundwater in the influent line after approximately 62 minutes. The system was shut down, and the cap was removed from the SVE-1 wellhead to

relieve any buildup of pressure. Terraphase used a water level indicator on the standpipe riser located within the SVE-1 horizontal well to check if a detectable level of water could be detected in the horizontal well. No water was indicated.

- During Step 5, a flow rate of 20.31 SCFM was achieved by setting the fresh air bleed to 25% open, inducing a vacuum of 70 in-H_2O on SVE-1. Static conditions again developed rapidly (within minutes) during Step 5, but the step was continued for approximately 120 minutes to be certain conditions were static and observe operation over a longer period. Pressure responses and flow rates were measured at all soil-vapor monitoring wells.

3.2.5.3 Constant Rate Test

The SVE-1 constant rate test was conducted in the early afternoon on June 9, 2020.The fresh air bleed was set to 25% open for the duration of the test. A flow rate of 23.9 SCFM was achieved by inducing a vacuum of 70.00 in-H_2O on SVE-1. Static conditions developed within minutes during the constant rate test. All four remaining SVE wells were utilized for pressure readings during this test, which was conducted for approximately five hours and fifteen minutes in total. The constant rate test was sufficiently long enough for all necessary measurements and samples to be successfully collected, as a steady state had been reached quickly and maintained long enough to institute multiple rounds of pressure monitoring and sample collection. A summary of flow rates, vacuum measurements, and field screened VOC concentrations during the constant rate test at SVE-1 is presented in Table 2.

Four Summa samples were collected during the constant rate test for laboratory analysis. EFFLUENT-200610-0915 and INFLUENT-200610-0920 were collected at approximately ten minutes into the constant rate test and EFFLUENT-200610-1310 and INFLUENT-200610-1345 were collected approximately four and a half hours into the constant rate test. Table 3 summarizes the analytical results of these samples.

4.0 SVE PILOT RESULTS

4.1 Baseline Monitoring

Baseline monitoring was conducted before the start of the step tests on June 9, 2020, and before the start of the constant rate tests on June 10, 2020 to establish a baseline of static soil-vapor conditions utilizing field instruments. Results of the baseline monitoring were generally on the same order of magnitude as concentrations of VOCs measured at the Site during previous soil gas investigations at the Site, with the exception of the soil-vapor well SG-7 value which was significantly higher. It should be noted that the wells were not purged prior to sampling, and therefore may be reflective of stagnant vapor build-up in the wells.

4.2 Step and Constant Rate Tests

Step and constant rate tests provided data that indicates the fine-grained sediments of the screened interval (1.5 to 5 ft bgs or approximately 8.5 to 12 feet below street level) respond relatively quickly to vacuum pressure and equilibrate to a logarithmically distributed, radial pressure field beneath the Pilot Test area (Figure 7). The response of SVE-1 to step testing is presented in Table 1 and an analysis of the ZOI of SVE-1 is presented in Section 5.2. As depicted in Figure 6, the extraction zone sediments have limited permeability and are unlikely to be capable of higher vapor flow rates than were able to be induced during the tests.

4.3 Barometric Pressure Monitoring

Real-time barometric pressures were recorded throughout the test program with a Brunton brand digital barometer. Barometric pressure did not change greatly over any period when test data was being collected. The magnitude of change in barometric pressure during each of the active SVE tests is not significant in relation to the changes in observed well vacuums. Further, no anomalous pressure response curves were found at any of the extraction or monitoring wells that could be due to atmospheric barometric pressure changes. As a result of this evaluation, no corrections were made to the well response data sets in response to changing barometric pressure.

4.4 Soil-Vapor Field Screening and Laboratory Analytical Results

Field screening were collected throughout the Pilot Test and a total of four samples were sent for laboratory analysis. Results of the field screening and laboratory analysis are presented below and are summarized in Tables 1 through 3.

4.4.1 Laboratory Analysis Results

A total of four samples were collected in 1-liter Summa canisters during the constant rate test. Influent samples were collected from SVE-1 and effluent samples were collected from the second GAC carbon vessel effluent. Samples were collected near the beginning and end (after approximately four hours) of the constant rate test. Samples were analyzed for VOCs by EPA Method TO-15.

Influent samples collected at SVE-1 had detections of 2-Propanol, PCE, TCE, and total petroleum hydrocarbons (TPH). Concentrations decreased over the constant rate test with PCE concentrations going from 3,480,000 µg/m^3 to 1,910,000 µg/m^3 and TPH concentrations going from 3,500,000 µg/m^3 to 1,910,000 µg/m^3. Effluent samples collected at the second GAC carbon effluent had detections of acetone, chloromethane, 1,4-dioxane, ethanol, 2-butanone, propene, PCE, and TCE. Concentrations of PCE increased over the constant rate test with PCE concentrations going from 2.55 µg/m^3 to 130 µg/m^3. A summary of the laboratory analytical results is presented in Table 3. Laboratory data reports are presented in Appendix D.

5.0 SVE TEST DATA, ANALYSIS, METHODS, AND RESULTS

Extensive data were collected during the Pilot Test. This section presents the data analysis methods and results from the Pilot Test and includes:

- ZOI of the extraction wells
- Expected area of remediation
- Performance of the blowers during the pilot test
- Estimated pore volume removal rate

5.1 Zone of Influence Analysis

Based on the boring logs of the four soil-vapor monitoring wells advanced for the Pilot Test (Appendix C) and observations during construction of the SVE horizontal well, lithology across the Site is substantially uniform within the top 5 to 8 feet below the basement floor that forms the active remediation zone. The material in this shallow zone is generally classified in hand sample as a dense silty sand. Groundwater has been encountered at approximately 8 feet below the basement floor.

In relatively homogeneous material, vacuum responses typically decrease logarithmically in a radial pattern relative to the distance from the vacuum source. By plotting the stabilized pressure response and radial distance of each SVE monitoring well on a semilogarithmic graph, an assessment can be made as to whether different sediment types respond similarly to pressure. If each well responds similarly to the others, relative to distance, then all data will plot on a straight line (when graphed semi-logarithmically). If the SVE monitoring wells are constructed in sediment types that respond differently to pressure, the data typically will not plot on a straight line. A measure of how well the data fit the line is made by calculating the "least squares" equation for the line. The coefficient of correlation (R^2) for each data set is an indicator of how close to perfect the data fit the line. The closer the R^2 value is to 1.0, the more perfect the fit. The theoretical maximum ZOI of an SVE well can be extrapolated from the same graph. The point where the best fit line crosses a predetermined value, 0.1 in-H_2O in this case, represents the maximum theoretical ZOI. Unlike early generations of SVE design, Terraphase does not depend on this value for well network design, only for assessing flow patterns.

Terraphase also collected air intake flow readings from the soil-vapor monitoring wellheads during Step Test 5 using rotameter gauges., Step Test 5 operated at approximately the same flow rate and vacuum as the Constant Rate Test. The air intake readings indicated 15 cubic feet per hour (CFH) at SG-7, 10 CFH at SG-8, 0.5 CFH at SG-6 and 0 CFH at SG-9. Therefore, although soil-vapor monitoring well SG-9 had observable vacuum readings of approximately 0.15 in-H_2O, the vacuum resulted in negligible air intake from the wellhead. It is possible that the reduced influence in soil-vapor well SG-9 is a result of deeper building footings located between the SVE-1 horizontal well and soil-vapor well SG-9; however, design drawings have not been provided for the building.

The pressure-distance plot for the constant rate test performed at SVE-1 is shown on Figure 7. The R^2 value for pressure response was 0.9891 (Figure 7). The R^2 value for the data is considered close to a perfect fit of 1.0. The sediment in the active remediation zone can be considered

homogeneous in its response to vacuum. Figure 8 presents an isoconcentration map of measured well pressure vacuums during the SVE-1 constant rate test. The theoretical maximum ZOI value is approximately 28 feet, which includes the location of soil-vapor well SG-9. Based on the absence of air flow at soil-vapor monitoring well SG-9, Terraphase has reduced the theoretical ZOI value to 20 feet.

5.2 Blower Performance Evaluation

The rental blower system performed adequately for conducting the Pilot Test program. The 229 SCFM rated blower allowed the test to proceed, however the blower was limited to approximately 23.1 SCFM for the induced vacuum. Based on review of the pressure-flow relationships depicted in Figure 6, it does not appear that vapor can be extracted at higher flow rates from the active remediation zone that is flow limited by soil type.

5.3 Pore Volume Removal Rate Estimates

To provide a general estimate of the length of SVE system operation that may be necessary to achieve the target remedial concentration, an estimate of the number of single well pore volumes extracted per day was made and compared to general assumptions for design (U.S. Army Corps of Engineers 1995). The following calculations were made to estimate the pore volume for an area within a 20-foot radius and, based on an extraction rate of 20 SCFM, to estimate the number of pore volumes likely to be removed by SVE per day.

Pore Volume within Influence of Area of One SVE Well:

$$(\pi)(extraction\ radius)^2(vadose\ zone\ thickness[b]) = total\ volume$$

$$(total\ soil\ volume[V_s])(air\ \ filled\ \ porosity[\theta_a]) = pore\ volume(V_p)$$

A conservative estimate for a 20-foot radius (r) is:

b = vadose zone thickness = 8 feet

π = 3.14159

V_s = total soil volume = $\pi r^2 b$ = 10,053 ft^3

θ_a = air filled porosity = 0.40 (estimated)

V_p = pore volume = 4,021 ft^3

$$Estimated\ extraction\ rate = \frac{(20\ SCFM) * \left(1440\frac{min}{day}\right)}{4021\ cf} = 7.16\ V_p/day$$

Estimated Number of Pore Volumes Removed in One Year:

$$Estimated\ extration\ rate = \left(7.16\ V_p/day\right) * \left(365\,\frac{days}{year}\right)(1\ year) = 2{,}613\ V_p$$

Based on the above assumptions, it is estimated that approximately 2,613 pore volumes can be removed by one well per year, based on the anticipated extraction rate of 20 SCFM. Given the conservative assumptions used for this calculation, this removal rate is considered reasonable and demonstrates that the design SVE trench functionally removes the necessary minimum pore volumes per day.

6.0 CONCLUSIONS AND RECOMMENDATIONS

The Pilot Test has fully demonstrated the feasibility of SVE technologies to remediate chemicals present in the vadose zone at the Site. Based on the results of the Pilot Test and area-of-remediation calculations, the design parameters for engineering a full-scale SVE system have been identified. The following parameters provide the conceptual design of the proposed system:

- The design horizontal SVE trench (SVE-1) zone-of-remediation is approximately 20 feet, which influences the portions of the Site with the historical maximum concentrations, but does not influence the entirety of the Site (Figure 7).
- Additional SVE wells are required to provide sufficient influence on the Site and neighboring properties to the northwest and southwest. A potential well configuration is shown in Figure 9.
    - Two additional large-diameter vertical SVE wells should be installed along the northwest wall of the basement to extend influence under the neighboring downgradient property located on North Second Street.
    - Three additional large diameter vertical SVE wells should be installed in the eastern portion of the basement to extend influence for tenant spaces 43 and 49.
    - At least three large-diameter vertical SVE wells should be installed in the southwestern portion of tenant space 35 East Santa Clara Street or 35E East Santa Clara Street (if feasible[1]) to influence the southwestern portion of the Site.
    - Large-diameter vertical SVE wells are proposed rather than additional horizontal SVE wells due to access limitations and physical site constraints. Mechanical excavation equipment cannot be brought into the basement; therefore, excavation of trenches must be done by hand. Soil cuttings from the basement must be transported upstairs, making large-volume soil excavations cost-prohibitive. Additionally, access to the basement space underlying tenant space 49 is provided by a small hole (approximately 2 feet by 4 feet) in a brick wall, compounding the access and equipment challenges.
- A multi-well extraction rate of approximately 200 to 250 SCFM at a vacuum pressure range of 70 to 100 in-H_2O should be used to size the blower and conveyance piping.
- VOC concentrations in the other soil-vapor monitoring wells should be monitored on an ongoing basis to evaluate the extent to which the Site is being remediated by the vapor flow in and around the SVE wells.

[1] Drilling activities along the southwestern wall of tenant space 35E East Santa Clara, as well as in the sidewalk along East Santa Clara Street, and in the courtyard have all encountered a layer of brick material in the upper 5 feet of drilling and have not been able to advance through the layer.

Prior to proceeding with design, permitting, and contracting for the full-scale SVE system, Terraphase requests RWQCB concurrence with the proposed conceptual design outlined above.

COLUMN DESCRIPTIONS

1 Depth (feet): Depth in feet below the ground surface.
2 Sample Type: Type of soil sample collected at the depth interval shown.
3 Recovered (in) / Total (in): Inches of recovery / total inches of boring tubing.
4 PID Reading (ppm): The reading from a photo-ionization detector, in parts per million. CB denotes sample reading was taken in a closed (sealed) Ziplock(TM) bag. NB denotes the reading of the sample was taken with no bag, in the opening in coring sleeve. This semi-closed space has minor influences from ambient air. OH indicates a reading taken from the open hole.
5 USCS Symbol: USCS symbol of the subsurface material.
6 Graphic Log: Graphic depiction of the subsurface material encountered.
7 Munsell Soil-Color: Color of subsurface material according to Munsell soil-color charts.
8 MATERIAL DESCRIPTION: Description of material encountered. May include consistency, moisture, color, and other descriptive text.
9 Well Log: Graphical representation of well installed upon completion of drilling and sampling.
10 REMARKS AND OTHER TESTS: Comments and observations regarding drilling or sampling made by driller or field personnel.

FIELD AND LABORATORY TEST ABBREVIATIONS

CHEM: Chemical tests to assess corrosivity
COMP: Compaction test
CONS: One-dimensional consolidation test
LL: Liquid Limit, percent
PI: Plasticity Index, percent
SA: Sieve analysis (percent passing No. 200 Sieve)
UC: Unconfined compressive strength test, Qu, in ksf
WA: Wash sieve (percent passing No. 200 Sieve)

GENERAL NOTES

1: Soil classifications are based on the Unified Soil Classification System. Descriptions and stratum lines are interpretive, and actual lithologic changes may be gradual. Field descriptions may have been modified to reflect results of lab tests.
2: Descriptions on these logs apply only at the specific boring locations and at the time the borings were advanced. They are not warranted to be representative of subsurface conditions at other locations or times.

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

Abbreviations and Definitions

MDL	Method Detection Limit.
ND	Not detected at the Reporting Limit (or MDL where applicable).
RDL	Reported Detection Limit.
Rec.	Recovery.
RPD	Relative Percent Difference.
SDG	Sample Delivery Group.
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.
U	Not detected at the Reporting Limit (or MDL where applicable).
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state “ND” (Not Detected) or “BDL” (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.

Date:	June 30, 2021	Project No.:	0115.001.013
Subject	June 2021 Bimonthly Status Report, Bassler-Haynes Building, 35 and 43 East Santa Clara Street, San Jose, California (Geotracker # SLT2O287178)		

On behalf of Isis Properties, LLC (Isis Properties), Terraphase Engineering Inc. (Terraphase) has prepared this June 2021 Bimonthly Status Report (BSR) for the Bassler-Haynes building located at 35 and 43 East Santa Clara Street in San Jose, California ("the Site"). This BSR is submitted in accordance with the requirements of the revised *Self-Monitoring Program for Order R2-2018-0013* ("Order"; San Francisco Bay Regional Water Quality Control Board [RWQCB] 2018) dated March 2, 2020, which requires the submittal of BSRs every other month. The purpose of the BSRs is to provide an update on relevant work completed during the reporting period, including site investigation and remedial measures, and work planned for the following bimonthly period. This BSR documents the work completed in May and June 2021, and planned work for the rest of the 2021 calendar year.

Following a meeting with the RWQCB on November 11, 2020, Terraphase submitted the *Status Update and Request for No Enforcement Letter, Bassler-Haynes Building, 35 and 43 East Santa Clara Street, San Jose, California (Geotracker # SLT2O287178)* ("the No Enforcement Request"; Terraphase 2020). During the November 2020 meeting, RWQCB staff were receptive to the proposed updated deadlines for the remedial actions, however, Isis Properties is awaiting confirmation from RWQCB that the No Enforcement Request has been accepted.

A Remedial Action Workplan (RAP; Terraphase 2019) was approved for the Site on September 11, 2019, by the Regional Water Quality Control Board (RWQCB), and remediation implementation is ongoing. The remedial activities associated with the soil-vapor extraction (SVE) system and the in-situ groundwater treatment (ISGT) per Task C.4 of the Order are discussed in the following sections.

Status of Remedial Actions – Task C.4 of the Order

The RAP specified a combination of SVE, monitored natural attenuation (MNA), in-situ groundwater treatment (ISGT), and land use controls (LUCs) as the recommended alternative to effectively mitigate potential risks to future commercial occupants from vapor intrusion and to remediate the groundwater and soil-gas impacts at the Site (Terraphase 2019).

The next steps in implementing the remedial action alternative are to begin operation of the full-scale SVE system and conduct an ISGT pilot test. Details on the status and anticipated schedules of these tasks are presented below.

SVE Full-Scale System Status

The No Enforcement Request and the February and April Bimonthly Status Reports outlined the reasons for the delay in implementation of the SVE full-scale system, including COVID-19 shelter-in-place orders, the Bay Area Air Quality Management District's (BAAQMD's) air permitting timeline, resolving BAAQMD issues regarding California Environmental Quality Act (CEQA) applicability to the project, and lack of responsiveness from the City of San Jose Building Department. An updated status and schedule are provided below:

- Status of Full-Scale SVE system permitting, including BAAQMD, City of San Jose Building Department, Santa Clara County Water District is described below:
  - The BAAQMD permit application was submitted on November 23, 2020. The BAAQMD issued the Authority to Construct on March 25, 2021. On April 8, 2021, Terraphase requested a modification to the Authority to Construct letter to allow for use of four smaller granular activated carbon vessels (rather than two larger vessels) due to Site access restrictions. Terraphase is awaiting a formal response to this request, however, the BAAQMD case manager has indicated that the approach should be acceptable. Terraphase submitted a Start-up Notification on May 26, 2021 and received approval from the BAAQMD to begin operations under the Authority to Construct. Terraphase has since updated BAAQMD that the anticipated start-up date has been adjusted pending completion of City of San Jose building permit inspections. A permit to operate will be issued following review of carbon influent and effluent concentrations collected during the first week of operation.
  - Terraphase contacted the City of San Jose on September 28, November 30, December 16, and, December 29, 2020, regarding building permit application requirements. The City of San Jose was unable to provide a response other than to schedule a time to review permit documents, with the earliest appointment available on February 22, 2021. Terraphase provided draft plans during the February 22, 2021 permit review meeting and Isis Properties paid the City's invoice immediately upon receipt on February 22, 2021. Comments and approvals were provided by the City as follows:
    - Electrical: comments were received on March 3, 2021; plans were resubmitted April 5, 2021, and approved April 14, 2021.

- Major Permit Adjustment Application: the City requested an application for exterior modifications to a historic building on March 9, 2021; the application package was submitted March 17, 2021; the invoice for the permit fee was received and paid April 7, 2021, and the permit was approved April 20, 2021.
- Plumbing: comments were received on March 10, 2021; one of the requested items was the BAAQMD Authority to Construct letter, which was received on March 25, 2021 as discussed above; plumbing plans were resubmitted on April 5, 2021, and approved on April 12, 2021.
- Building/structural: comments were received on March 22, 2021, and require additional structural calculations, which Terraphase engaged a subcontractor to perform. Calculations were submitted on May 5, 2021 and approved on May 18, 2021.
- The City Permits (one issued for each parcel) required an electrical inspection, a plumbing inspection, a special inspection, and a building inspection following completion of the installation for final approval on the building permit. Inspections were conducted on June 4, 2021 (described below).

- Approved SVE well construction permits were provided by Santa Clara County Water District on February 9, 2021. Well completion reports were submitted on March 23,2021.

- Installation of SVE wells – Completed February 2021 (as described in February BSR)
- SVE system installation – Completed June 2021
  - Conveyance piping and stack installation: Conveyance piping and stack installation was completed by Eleven Engineering May 25, 2021 through June 7, 2021. Conveyance piping for the six SVE wells installed within the basement was completed with two-inch diameter suction water hose and routed to a manifold within the basement. From the manifold, four-inch diameter PVC piping was installed up the stairwell and routed to an additional manifold located in the courtyard. Conveyance piping for the three SVE wells located within the crawlspace was completed using two-inch diameter PVC. Conveyance piping for two of the wells was routed overhead to the courtyard manifold, and the other was routed along the ground supported by wooden blocks. The stack was installed on the courtyard northeast wall to a height of 20 feet above ground surface. A detailed description of the installation will be provided in the SVE Completion Report (discussed below).
  - SVE system delivery: The SVE system was delivered by Mako Industries on June 3, 2021. The SVE system includes a knock-out tank, a blower, a control panel, aftercooler, and activated carbon vessels. Following completion of system connection, the system was tested with ambient air on June 4, 2021.
  - City of San Jose Inspections: Inspections were conducted on June 4, 2021. The following comments were provided:
    - Plumbing: The plumbing inspector noted PVC conveyance piping in the courtyard must be painted or covered from sun exposure and the stack for the SVE system must be a minimum of 10 feet from the property line. These issues were not identified during the

plumbing plan review period, and the plans were approved by the department. Terraphase contacted the City regarding the requirements on June 11, 2021. The City of San Jose responded on June 17, 2021 stating that covering the courtyard PVC remained a requirement, however, the stack termination only needed to be three feet from the existing property line. Eleven Engineering was retained to paint the courtyard PVC and adjust the stack to meet the three-foot spacing requirement. Work was completed June 22, 2021.

- Special Inspection: The special inspection was completed by Bagg Engineers. The inspector tested torque of expansion anchors used in the channel above the 4-inch courtyard penetration and expansion anchors used for SVE system equipment. All expansion anchors met requirements and Bagg Engineers submitted their report to the City of San Jose.
- Electrical: The electrical inspector noted electrical conduit installed within the stairwell was not typical and required sign-off from the building inspector. The building inspector provided approval for the location of the electrical conduit. Terraphase contacted the City on June 8, 2021 to determine if an additional inspection was required or if the plans could be brought to the City Office for sign-off. The City responded on June 21, 2021 stating an additional inspection was required.
- Building: The building inspector noted fire caulking used was not sufficient for 4-inch penetrations and fire collars were required. This issue was not identified during the architectural plan reviews. Fire collars were installed by Eleven Engineering on June 7, 2021.
- Reinspection was completed on June 28, 2021 and final approval was received from all City departments.

- SVE system startup – SVE system testing is scheduled for July 8, 2021. An additional two weeks of modifications and testing are anticipated following the July 8, 2021 testing.
- Completion Report – Terraphase will submit a memorandum by July 16, 2021 detailing SVE testing activities and a full completion report will be submitted within two months of system startup.

ISGT Status

As discussed in the No Enforcement Request, Terraphase is in the process of obtaining additional information regarding the Santa Clara Valley Transportation Authority (VTA) BART extension, which will include extensive excavation and dewatering along East Santa Clara Street. Additionally, Terraphase understands that VTA plans to use the western-adjoining property located at 29 and 31 East Santa Clara Street as an access point for the new BART station. VTA communicated that this would include the installation of an approximately 50-feet deep shaft and associated dewatering. It is our current opinion that dewatering will have a substantial and possibly permanent effect on groundwater elevations at the Site.

In the No Enforcement Request, Terraphase recommended the following approach with respect to the ISGT planning (updates shown in italics):

- Inclusion of a discussion of updated information regarding VTA construction plans in the Bimonthly Status Reports.
    - *On April 16, 2021, VTA contacted Terraphase and provided a link to the VTA's* BART Silicon Valley Phase II Extension Project General Engineering Consulting Services Geotechnical Data Report *(Mott MacDonald Wong 2021) detailing geotechnical data gathered within the project area. Terraphase is in communication with the VTA engineer for additional construction details and impacts.*
- Installation of the downgradient groundwater monitoring well located on North Second Street and the proposed downgradient monitoring well identified in East Santa Clara Street, as identified in the RAP during the drilling activities associated with the SVE wells.
    - *Terraphase submitted a groundwater monitoring well installation work plan as an attachment in the April Bimonthly Status Report and received approval from the RWQCB on May 17, 2021.*
    - *Both installations on North Second Street and East Santa Clara Street require an encroachment permit. On April 14, 2021, Terraphase retained Traffic Management Inc. (TMI) to complete a traffic control plan and encroachment Permits for the work. TMI submitted the completed encroachment permit application on May 10, 2021. Permitting fees were paid on June 8, 2021. A final permit has not yet been issued.*
    - *Because the drilling is located within the write of way, the Santa Clara Valley Water District (SCVWD) requires City sign-off as the property owner. SCVWD has indicated that the permit application must be submitted with the issued encroachment permit, which will serve as documentation City's approval of the drilling work in the right of way.*
    - *Terraphase's drilling contractor has indicated that they cannot schedule the work until the encroachment permit has been issued. Terraphase proposes the following schedule from receipt of the encroachment permit from the City:*
        - *Drilling permit submittal to SCVWD – within a week of receiving the encroachment permit;*
        - *Drilling permit approval – 2 weeks following submittal to SCVWD;*
        - *Drilling – Within 3-weeks following SCVWD issuance of drilling permit, pending contractor availability;*
        - *Well development – a minimum of 72 hours following drilling;*
        - *Sampling – a minimum of 24 hours following development;*
        - *Well Completion and Monitoring Report – one month following sampling.*
- Initiation of Semiannual Groundwater Monitoring events in 2021, regardless of ISGT system status.
    - *The first groundwater monitoring even was conducted on June 9, 2021 and will be documented in the Well Completion and Monitoring Report.*
- Identification of a groundwater treatment approach and schedule by December 31, 2021.

As noted in the No Enforcement Request, Isis Properties has requested a No Enforcement Letter from the RWQCB identifying the deadline for the ISGT Completion Report submittal of December 31, 2022, with the assumption that VTA development plans will be available by December 31, 2021.

Self-Monitoring Plan

The following activities are planned in accordance with the requirements of the revised Self-Monitoring Program for Order R2-2018-0013:

- The August 2021 BSR will be submitted by August 31, 2021 and will document work completed during the reporting period and work planned for the following bimonthly period.
- The Semi-annual groundwater monitoring report will be submitted, schedule contingent on the encroachment and drilling permit issuance.
- The 2021 Annual Monitoring Report will be submitted by January 30, 2022.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

Summary of Production Wells in Vicinity: There is one inactive water supply well, Well No. 07S01E08M001, located approximately 750 feet west-southwest of the site. One abandoned well, Well No. 07S01E08L001, is located approximately 200 feet northeast of the site. Based on the groundwater flow direction (West-Southwest), the low concentrations of petroleum hydrocarbons in groundwater, and the lack of down-gradient abandoned and active water production wells in the site vicinity (only one inactive well, located approximately 750 feet away), the site is not likely to pose a threat to deeper aquifers.

Soil samples were reportedly analyzed for petroleum hydrocarbons, Total Oil and Grease (TOG), Benzene, Toluene, Ethylbenzene, and total Xylenes (BTEX), and Volatile Organic Compounds (VOCs). None of the target analytes were reported above detection limits (detection limits and analytical methods were not provided). This report was not available for review.

September 1996/January 1997 – Seven soil borings were installed as part of a Phase II ESA. Soil samples collected contained up to 0.019 ppm Benzene (EB-2), 0.015 ppm Toluene, 0.0014 ppm chloroform (EB-2), 0.0082 ppm 1,2-DCA (EB-2), and 0.0015 ppm PCE (EB-7). Groundwater samples collected from these borings contained up to 130,000 ppb TPHG (EB-2), 1,300 ppb Benzene (EB-2), 1,500 ppb Toluene (EB-2), 2,300 ppb Ethylbenzene (EB-2), 8,800 ppb total Xylenes (EB-2), 41,000 ppb TPHD (EB-2), 44 ppb PCE (EB-2), 7.6 ppb Freon 112 (EB-3), 1.0 ppb 1,2-DCA (EB-7), and 5.7 ppb MTBE (EB-7).

V. ADDITIONAL COMMENTS, DATA, ETC. (Continued)

August/September 2001 – During site construction activities the site was excavated to a depth of 10' below grade. During excavation activities, petroleum impacted soils were discovered. A soil sample was collected in the impacted soil on August 16, 2001 and analyzed for TPHG (4,300 ppm), TPHD (50,000 ppm), VOCs (ND), and MTBE (ND). The impacted soil was over-excavated from August 20 to 24, 2001 (near new sewer line) and August 31 and September 4, 2001 (near old sewer line). Confirmation samples were collected from the sidewalls and bottom of each over-excavation. TPHG (up to 2,500 ppm), TPHD (up to 1,100 ppm), Toluene (up to 16 ppm), Ethylbenzene (up to 40 ppm), and Xylenes (up to 200 ppm) were reported in the confirmation samples. All other target analytes were not present above their respective detection limits. Groundwater samples were collected from seven borings completed on August 31 and September 4, 2001. The groundwater samples contained up to 9,100 ppb TPHG (BS-9), 4,700 ppb TPHD (BS-9), 64 ppb Benzene (BS-9), 180 ppb Toluene (BS-9), 270 ppb Ethylbenzene (BS-9), and 1,700 ppb Xylenes (BS-9). MTBE was not detected.

Considerations and/or Variances:

1. Soil and groundwater contamination remain in place beneath the site.
2. The site will be covered by a building and parking garage.

Conclusion:

Review of analytical data indicates that concentrations of residual petroleum hydrocarbons in soil and groundwater are at levels below regulatory concern. The contaminant sources have been removed from the site. Excavation activities associated with development activities and over-excavation of the impacted areas have removed much of the secondary contaminant sources. The site will be covered by a building and parking structure that will minimize potential infiltration through the residual soil contamination. Residual contamination is expected to continue to decline through biodegradation and other natural processes. Therefore, the Santa Clara Valley Water District has concluded that a continuing significant threat to groundwater resources, human health, and the environment does not exist at the site and recommends that the site be closed.

2.4 Excavation Backfilling

Excavated soil was used to backfill the UST excavations. Additional soil was imported, as needed. Soil placed as backfill was done without the observation of a representative of Lowney Associates and is reportedly going to be over-excavated during grading activities.

8.0 CONCLUSIONS AND RECOMMENDATIONS

8.1 Site Historical Usage

Based on our site history review and our review of previous reports prepared for the site, the site appeared to be densely residentially and commercially

20 feet below original grade. Based on depth to water data collected at the adjacent Century Center Parking Lot site, localized ground water flow is in a westerly direction (RUST Environmental & Infrastructure, 1997). A copy of the ground water contour and flow direction diagram is presented as Figure 4. Soil and water sampling protocol and boring logs are presented in Appendix A.

2.4 Soil Sample Collection and Analyses

Soil samples collected in the vicinity of the old and new sewer lines, from the soil borings, and from the soil stockpile were analyzed for TPHg, BTEX, and MTBE (EPA Test Method 8015/8020) and TPHd (EPA Test Method 8015M) with silica gel cleanup. These analyses were selected to evaluate the extent of petroleum hydrocarbon constituents identified in the original sample (pipeline 1). Soil samples BS-4 and BS-5 were additionally analyzed for nitrates (EPA Test Method 9056), E. Coli., and coliform. These analyses were selected to evaluate the presence of a release of untreated wastewater to the soil environment from the old sewer line. Neither nitrates, E. Coli, nor coliform were detected. Analytical results for the other constituents tested are presented in Table 1. Copies of the analytical reports and chain of custody documentation are presented in Appendix B.

The preliminary remediation goals (PRGs) presented in Table 1 are risk-based concentrations developed by EPA Region 9; PRGs are for use as screening levels in determining if further evaluation is warranted, in prioritizing areas of concern, in establishing initial cleanup goals, and in estimation of potential health risks.

The PRGs are chemical concentrations that correspond to fixed levels of risk (either a cancer risk of one in one million [10^{-6}] or a non-carcinogenic hazard quotient of one, whichever occurs at a lower concentration). These levels are based on common exposure pathways, but effects of exposure to multiple contaminants and other site specific conditions are not considered. Thus, they are not intended as a substitute for a site specific health risk assessment. Chemical concentrations above the PRGs would not automatically designate the site as a health threat or trigger a response action. Exceeding a PRG, however, may suggest that further evaluation of potential risks is appropriate. This further evaluation may include additional sampling and/or the reassessment of the assumptions and routes of exposure that were used to develop the non-site specific PRGs.

ground water grab sample was additionally analyzed for methyl tertiary butyl ether (MTBE) (EPA Test Method 8020). Analytical results are shown in Table 4 and on Figure 5. Copies of the laboratory reports and chain of custody documentation are presented in Appendix D.

7.4 Soil Quality

Soil samples were analyzed from borings EB-1, EB-2 and EB-7 only, to evaluate soil quality collected in the anticipated down-gradient direction from the three abandoned USTs. One soil sample was collected from boring EB-1, near the expected base of the two abandoned USTs located beneath the South Third Street sidewalk at an approximate depth of 9½ to 10 feet, two soil samples were collected from boring EB-2, near

2.5 Ground Water Sample Collection and Analyses

To evaluate ground water quality at the site, ground water grab samples were collected from borings SS-1 through SS-6 and in a 2 foot by 3-foot pilot hole in the over-excavated area on the eastern side of the sewer pipeline alignment (BS-9-W). A discussion of sampling protocol is included in Appendix A.

The ground water samples were analyzed for TPHg, BTEX, MTBE, and TPHd. These analyses were selected to help evaluate the presence of petroleum hydrocarbon contamination in the shallow ground water. Analytical results are shown in Table 2. Copies of the laboratory reports are attached in Appendix B.

3.0 HEALTH RISK EVALUATION

Based on the low residual petroleum hydrocarbon levels remaining in soil and since the area is being covered by the new building and parking garage, the potential for significant human health risks appears low. For further confirmation, an evaluation of potential health risks was performed.

Volatilization of contaminants located in site soil and groundwater and the subsequent mass transport of these vapors into enclosed spaces constitutes a potential inhalation exposure pathway. To evaluate health risks associated with this pathway due to Proposition 65 chemicals (benzene and toluene), the Johnson and Ettinger Model (U.S. EPA 1998 Version 1.2) was used to calculate exposure point concentrations for benzene and toluene. Benzene is an identified carcinogenic compound and toluene is identified as a reproductive toxin. The model is a one–dimensional analytical solution to convective and diffusive vapor transport into enclosed air spaces and provides an attenuation coefficient that relates the vapor concentration in the indoor space to the vapor concentration at the source of contamination. Inputs to the model include chemical properties of the contaminant, saturated and unsaturated soil properties, depth of contamination, and the structural properties of the building.
