Chapter 1
Introduction

This report is provided to support the Merced County's (County) environmental review process and supply information regarding potential effects of air quality and greenhouse gas (GHG) emissions associated with the proposed Las Camas Solar Project (project). The analysis in this report evaluates the potential for short- and long-term air quality and GHG impacts associated with construction and operation of the proposed project. The report gives a description of the environmental setting for the proposed project, including existing air quality and GHG conditions, as well as applicable laws and regulations; and documents the assumptions, methodologies, and findings used to support the impact analysis. The report was prepared in accordance with the San Joaquin Valley Air Pollution Control District (SJVAPCD) *Guidance for Assessing and Mitigating Air Quality Impacts* (2015b) and *Guidance for Air Dispersion Modeling* (2022a).

1.1 Project Description

EDPR CA Solar Park III, LLC, proposes the siting, construction and long-term operation of the Las Camas Solar Park on approximately 1,741 acres west of Los Banos in Merced County, California (solar project). The solar project is a solar photovoltaic (PV) facility that would generate electricity from ground-mounted, single-axis tracking arrays and intermittently store electricity by charging and discharging lithium-ion batteries. The solar project would have a solar PV capacity of approximately 200 megawatts alternating current (MWac) and a battery storage capacity of up to 100 MWac or megawatts direct current (MWdc). The solar project would also include a 230-kilovolt (kV) transmission line (gen-tie line) running from the solar project site to Pacific Gas and Electric's (PG&E) Los Banos Substation. The line would be approximately 0.4 mile long and would convey electricity between the project and the larger electricity grid.

Transmission system improvements would also be made around the existing Los Banos Substation (PG&E substation improvements) to connect the substation to the solar project. The PG&E substation improvements include connecting the PG&E substation to the solar project's gen-tie line and installing new structures and equipment within PG&E-owned substation property. The existing substation fence would be moved outward to the south and east, on existing substation property, to accommodate the additional equipment required. The area within the modified fence would be graveled and encompass an additional approximately 450,000 square feet (10.3 acres) of existing PG&E-owned substation property.

Collectively, the solar project, gen-tie line, and PG&E substation improvements are referred to as the "proposed project" in this report. The areas comprising the 1,741-acre solar project site, gen-tie line, and PG&E substation are collectively referred to as the "project site" in this report.

Construction of the project is anticipated to begin in April 2024 and take approximately 14 months to complete. Portions of the solar project site would be graded to provide a level foundation for roads and project components. Vegetation would be cleared from the area underneath the arrays, as necessary, and the site would be graded per the County-approved

grading and drainage plan. Access roads running around and between the arrays may include crushed aggregate, if necessary, to prevent damage to existing soils, and the arrays would sit on piles that raise them above the surface, avoiding the need for additional landscaping work.

The solar project is anticipated to require 370 acre-feet (approximately 121 million gallons) of water during the entire construction period, or approximately 330,315 gallons per day; actual water consumption would depend on climatic conditions (EMKO Environmental, Inc. 2022a, 2022b). Water usage during construction would be required for soil conditioning, road maintenance, dust suppression, and other uses. Water for construction would be transported to the solar project site via 4,000-gallon water trucks. Construction water would be provided from the AKT irrigation well located adjacent to State Route (SR) 33 at the northwestern corner of AKT's Mid-Cal property, approximately 4.4 miles north of the solar project site. A total of 30,140 round trips between the well and the solar project site would be necessary. The average number of daily truck trips during the construction period to deliver water would be approximately 75 round trips, with up to 137 round trips on peak days (although this would be infrequent). Construction water trucks would access the solar project site via the SR 152/SR 33 interchange and San Luis Drive.

Following site grading and preparation, steel piles would be driven into the ground, and the solar PV tables, trackers, and panels would be installed on top of them. Trenches would be dug on site to bury the underground collection cables that would conduct the energy output from the panels to the solar inverters, storage inverters or converters, the battery storage system, and, ultimately, the solar project substation.

Remaining construction activities include installing the solar inverters and storage inverters or converters on site, installing the battery racks within the battery enclosures, constructing the solar project substation, and then constructing the high voltage generator tie line between the solar project's substation and the solar project's point of interconnection.

Construction of the PG&E substation improvements would involve the installation of new electric equipment, including new circuit breakers, bus structures, 70-kV disconnect switches, transformers, protective relaying, metering and control equipment, telemetering equipment, an electric grounding system, and underground conduits or trench systems. Construction of the PG&E substation improvements would overlap with the end phases of the solar project construction, and would take approximately eight months to complete.

The solar project and the PG&E substation improvements would require construction contractors to use Tier 4 Final engines greater than 25 horsepower for off-road equipment to reduce construction-related exhaust emissions.

After construction, the project is expected to operate for 35 years, generating approximately 593,208 megawatt-hours (MWh) of electricity per year.

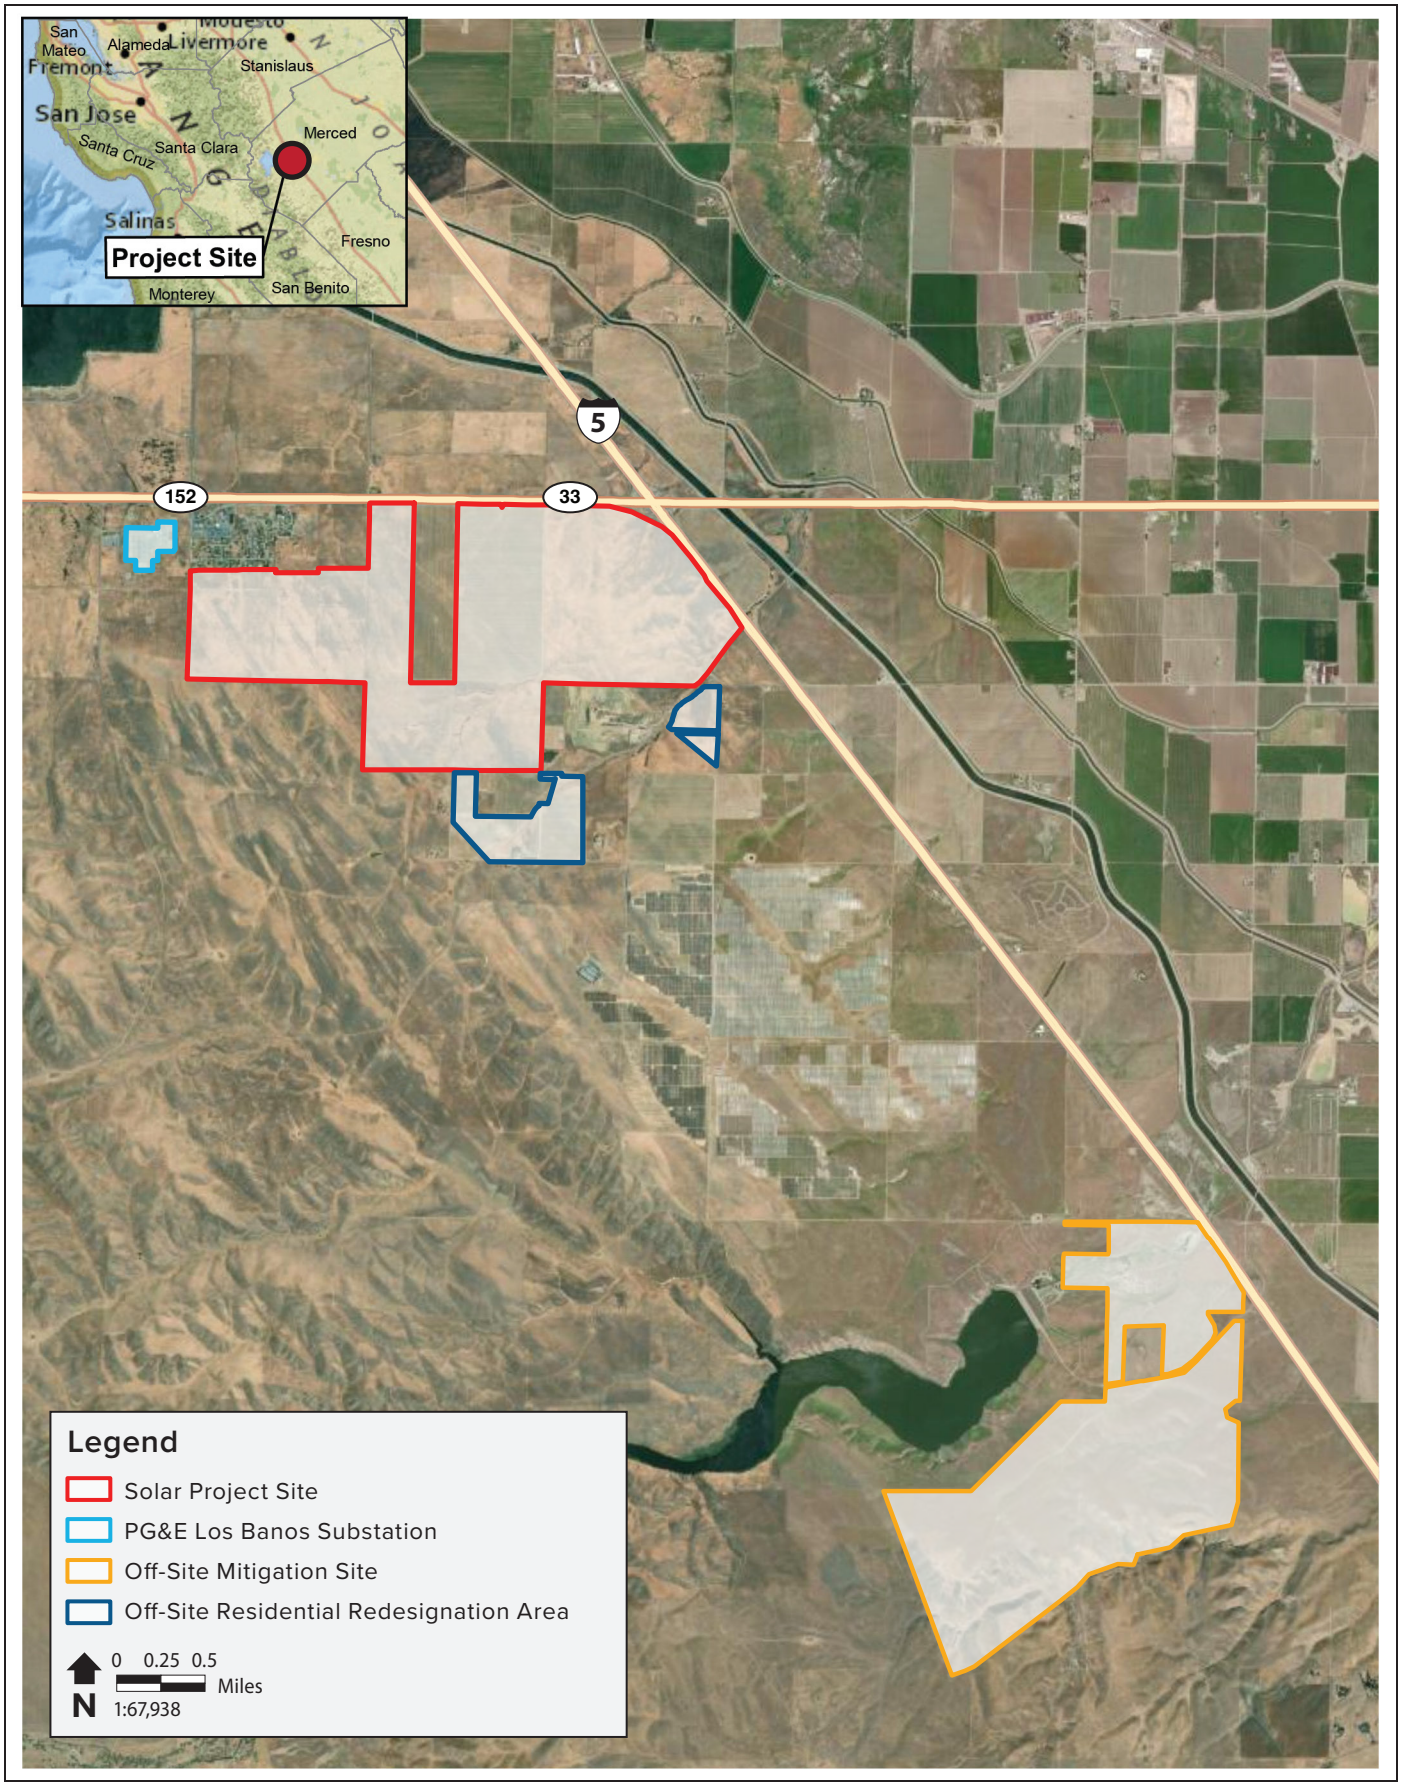

1.2 Project Location

The project site is located in an unincorporated area of Merced County, approximately 7 miles west of Los Banos, as shown in Figure 1. The project site is bounded by SR 152 on the north and Interstate (I-) 5 on the east. The proposed gen-tie line would extend approximately 0.4 mile west of the solar project site to connect with PG&E's Los Banos Substation (Figure 2).

1.3 Nearby Land Uses and Sensitive Receptors

Sensitive land uses are defined as locations where pollutant-sensitive members of the population may reside or where the presence of air pollutant emissions could adversely affect the people present. Sensitive members of the population include those who may be negatively affected by poor air quality more than others, such as children, the elderly, or the infirm. Per SJVAPCD, typical sensitive land uses include residences, hospitals, and schools (SJVAPCD 2022a). Places of employment (e.g., commercial/industrial uses) are not considered sensitive land uses because health-sensitive individuals (e.g., children and seniors) are not present.

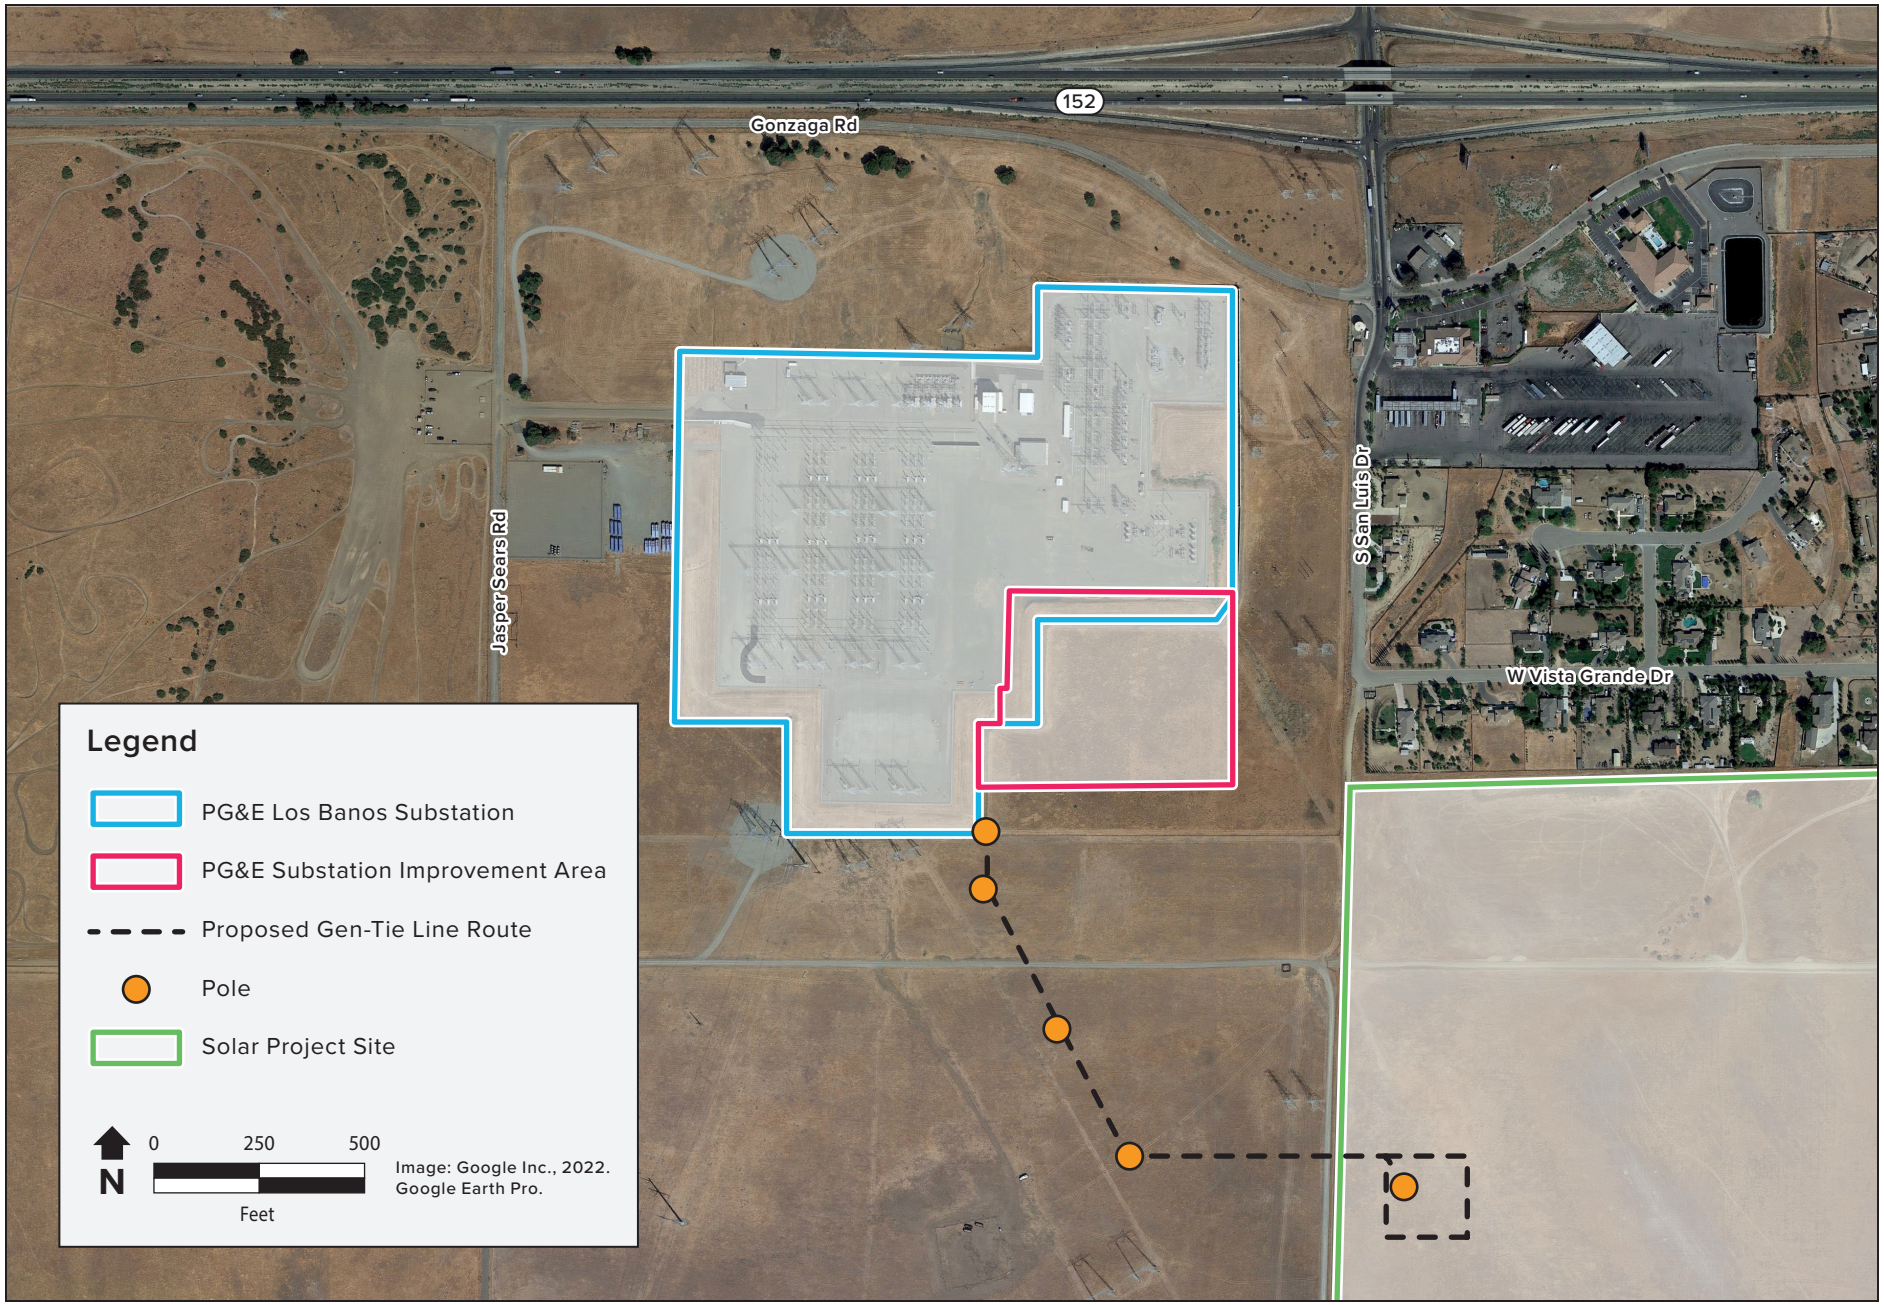

The proposed project is in an area of relatively low population density. Land uses surrounding the project site consist of mainly open-space areas, light agricultural land, low-density single-family housing, and undeveloped grazing lands. As shown in Figure 3, a small neighborhood of approximately 50 single-family residences is adjacent to the northwestern portion of the project site. A recreational vehicle park and resort, the Los Banos West/I-5 KOA, is approximately 1,000 feet north of the northwestern portion of the project site. One single-family residence is also across SR 152 from the project site's northern boundary. In addition, multiple rural residences are south of the solar project site, the closest of which is approximately 950 feet from the solar project site boundary.

Chapter 2
Air Quality

2.1 Regulatory Setting

Air quality in the project area is regulated through the efforts of various federal, state, regional, and local government agencies. These agencies work jointly and individually to improve air quality through legislation, planning, policymaking, education, and a variety of other programs. The agencies responsible for improving the air quality within the air basin are discussed below.

2.1.1 Federal

Criteria Air Pollutants

National Ambient Air Quality Standards

The U.S. Environmental Protection Agency (EPA) has been charged with implementing national air quality programs. EPA's air quality mandates draw primarily from the federal Clean Air Act (CAA), which was enacted in 1963. The most recent major amendments were made by Congress in 1990. The CAA required EPA to establish national ambient air quality standards (NAAQS) for six common air pollutants found all over the United States, referred to as *criteria air pollutants*. EPA has established primary and secondary NAAQS for the following criteria air pollutants: ozone, carbon monoxide (CO), nitrogen dioxide (NO_2), sulfur dioxide (SO_2), respirable particulate matter with an aerodynamic diameter of 10 micrometers or less (PM_{10}), fine particulate matter with an aerodynamic diameter of 2.5 micrometers or less ($PM_{2.5}$), and lead. The NAAQS are shown in Table 2-1. The primary standards protect public health, and the secondary standards protect public welfare. The CAA also required each state to prepare a State Implementation Plan (SIP) for attaining and maintaining the NAAQS. The federal CAA Amendments of 1990 (CAAA) added requirements for states with nonattainment areas to revise their SIPs to incorporate additional control measures for reducing air pollution. California's SIP is modified periodically to reflect the latest emissions inventories, planning documents, and rules and regulations of the air basins, as reported by their jurisdictional agencies. EPA is responsible for reviewing all SIPs to determine whether they conform to the mandates of the CAA and its amendments and whether implementation would achieve air quality goals. If EPA determines a SIP to be inadequate, EPA may prepare a federal implementation plan that imposes additional control measures. If an approvable SIP is not submitted or implemented within the mandated time frame, sanctions may be applied to transportation funding and stationary air pollution sources in the air basin.

Corporate Average Fuel Economy Standards for Light-Duty Passenger Vehicles

The National Highway Traffic Safety Administration (NHTSA) Corporate Average Fuel Economy (CAFE) standards require substantial improvements in fuel economy and reductions in emissions of criteria air pollutants and precursors, as well as GHGs, from all light-duty vehicles sold in the United States. On August 2, 2018, NHTSA and EPA proposed an amendment to the fuel efficiency standards for passenger cars and light trucks and established new standards for model years 2021 through 2026 that would maintain the then-current 2020 standards through 2026—this was known as the

Table 2-1 National and California Ambient Air Quality Standards

Criteria Pollutant	Average Time	California Standards	National Standards[1]	
			Primary	Secondary
Ozone	1-hour	0.09 ppm	None[2]	None[2]
	8–hour	0.070 ppm	0.070 ppm	0.070 ppm
Particulate Matter (PM_{10})	24-hour	50 μg/m³	150 μg/m³	150 μg/m³
	Annual mean	20 μg/m³	None	None
Fine Particulate Matter ($PM_{2.5}$)	24-hour	None	35 μg/m³	35 μg/m³
	Annual mean	12 μg/m³	12.0 μg/m³	15 μg/m³
Carbon Monoxide (CO)	8-hour	9.0 ppm	9 ppm	None
	1-hour	20 ppm	35 ppm	None
Nitrogen Dioxide (NO_2)	Annual mean	0.030 ppm	0.053 ppm	0.053 ppm
	1-hour	0.18 ppm	0.100 ppm	None
Sulfur Dioxide[3] (SO_2)	Annual mean	None	0.030 ppm	None
	24-hour	0.04 ppm	0.014 ppm	None
	3-hour	None	None	0.5 ppm

Hydrogen Sulfide (H_2S)	1-hour	0.03 ppm	None	None
Vinyl Chloride	24-hour	0.01 ppm	None	None

Source: California Air Resources Board (CARB) 2016.

1 National standards are divided into primary and secondary standards. *Primary standards* are intended to protect public health, whereas *secondary standards* are intended to protect public welfare and the environment.

2 The federal 1-hour standard of 12 parts per hundred million was in effect from 1979 through June 15, 2005. The revoked standard is referenced because it was employed for such a long period and is a benchmark for SIPs.

3 The annual and 24-hour NAAQS for SO_2 only apply for 1 year after designation of the new 1-hour standard to those areas that were previously in nonattainment for 24-hour and annual NAAQS.

4 CAAQS for visibility-reducing particles is defined by an extinction coefficient of 0.23 per kilometer—visibility of 10 miles or more due to particles when relative humidity is less than 70 percent (CARB 2021e).

CAAQS = California Ambient Air Quality Standards; NAAQS = National Ambient Air Quality Standards; ppm = parts per million; μg/m³ = micrograms per cubic meter.

Safer Affordable Fuel-Efficient (SAFE) *Vehicles Rule*. On September 19, 2019, NHTSA and EPA issued a final action on the One National Program Rule, which is considered Part One of the SAFE Vehicles Rule and a precursor to the proposed fuel efficiency standards. The One National Program Rule enabled NHTSA and EPA to provide nationwide uniform fuel economy and air pollutant standards by 1) clarifying that federal law preempts state and local tailpipe standards; 2) affirming NHTSA's statutory authority to set nationally applicable fuel economy standards; and 3) withdrawing California's CAA preemption waiver to set state-specific standards.

NHTSA and EPA published their decision to withdraw California's waiver and finalize the regulatory text related to the preemption on September 27, 2019 (84 *Federal Register* 51310). California, 22 other states, the District of Columbia, and two cities filed suit against Part One of the SAFE Vehicles

Rule on September 20, 2019 (*California et al. v. United States Department of Transportation et al.,* 1:19-cv-02826, U.S. District Court for the District of Columbia). On October 28, 2019, the Union of Concerned Scientists, Environmental Defense Fund, and other groups filed a protective petition for review after the federal government sought to transfer the suit to the District of Columbia (*Union of Concerned Scientists v. National Highway Traffic Safety Administration*). The lawsuit filed by California and others has been stayed, pending resolution of the petition.

NHTSA and EPA published final rules on April 30, 2020, to amend and establish national air pollutant and fuel economy standards (Part Two of the SAFE Vehicles Rule) (85 *Federal Register* 24174). The revised rule changes the national fuel economy standards for light-duty vehicles from 46.7 miles per gallon (mpg) to 40.4 mpg in future years. California, 22 other states, and the District of Columbia filed a petition for review of the final rule on May 27, 2020 (*California et al. v. United States Department of Transportation et al.*, 1:19-cv-02826, U.S. District Court for the District of Columbia).

On January 20, 2021, President Biden issued an Executive Order (EO) directing NHTSA and EPA to review the SAFE Vehicles Rule, Part One, and propose a new rule for suspending, revising, or rescinding the Rule by April 2021. The EO also requires NHTSA and EPA to propose a new rule for suspending, revising, or rescinding Part Two by July 2021.On April 22, 2021, NHTSA announced that it proposes to repeal the SAFE Vehicles Rule, Part One, allowing California the right to set its own standards (DOT 2021).

On December 12, 2021, NHTSA repealed the SAFE Vehicles Rule, Part One. On December 19, 2021, NHTSA finalized its vehicle efficiency standards rule to reach a projected industry-wide target of 40 mpg by 2026, an approximately 25 percent increase over the prior SAFE Vehicles Rule. Lastly, on March 9, 2022, EPA reinstated California's authority under the CAA to implement its own GHG emissions standards and sales mandate regarding zero-emission vehicles. This action concluded EPA's reconsideration of 2019's SAFE Vehicles Rule, Part One, by finding that actions under the previous administration, as part of SAFE-1, were decided in error; the actions are now rescinded (EPA 2022a).

Emission Standards for On-Road Heavy-Duty Vehicles

EPA has established a series of increasingly strict emission standards for new heavy-duty bus and truck engines (EPA 2023a). Emissions from heavy-duty trucks are managed by regulations and emission limits implemented at the federal, state, and local levels. In December 2000, EPA signed the Heavy-Duty Highway Rule, which reduces emissions from on-road, heavy-duty diesel trucks by establishing a series of increasingly strict emission standards for new engines. Manufacturers were required to produce new diesel vehicles that meet PM and nitrogen oxide (NO_X) emission standards beginning with model year 2007, with the phase-in period being between 2007 and 2010. The phase-in was based on a percentage-of-sales basis: 50 percent from 2007 to 2009 and 100 percent in 2010. Requirements apply to engines installed in all vehicles with a gross vehicle weight rating (GVWR) above 14,000 pounds and to some engines installed in vehicles with a GVWR between 8,500 and 14,000 pounds.

Emission Standards for Non-Road Diesel Engines

To reduce emissions from non-road diesel equipment, EPA established a series of increasingly strict emission standards for new, non-road diesel engines, also referred to as *off-road diesel engines* (EPA 2023b). Tier 1 standards were phased in on newly manufactured equipment from mode years 1996

through 2000, depending on the engine horsepower category. Tier 2 standards were phased in on newly manufactured equipment from model years 2001 through 2006. Tier 3 standards were phased in on newly manufactured equipment from model years 2006 through 2008. Tier 4 standards, which require advanced emission-control technology, were phased in from model years 2008 through 2015.

Hazardous Air Pollutants and Toxic Air Contaminants

Toxic air contaminants (TACs) or, in federal parlance, Hazardous Air Pollutants (HAPs), are a defined set of airborne pollutants that may pose a present or potential hazard to human health. A *TAC* is defined as an air pollutant that may cause or contribute to an increase in mortality or in serious illness, or that may pose a hazard to human health. TACs are usually present in minute quantities in the ambient air; however, their high toxicity or health risk may pose a threat to public health even at low concentrations.

A wide range of sources, from industrial plants to motor vehicles, emit TACs. The health effects associated with TACs are quite diverse and generally assessed locally, rather than regionally. TACs can cause long-term health effects, such as cancer, birth defects, neurological damage, asthma, bronchitis, or genetic damage, or short-term acute affects, such as eye watering, respiratory irritation (a cough), running nose, throat pain, and headaches.

For evaluation purposes, TACs are separated into carcinogens and noncarcinogens based on the nature of the physiological effects associated with exposure to the pollutant. Carcinogens are assumed to have no safe threshold below which health impacts would not occur. This contrasts with criteria air pollutants for which acceptable levels of exposure can be determined and for which the ambient standards have been established (Table 2-1). Cancer risk from TACs is expressed as excess cancer cases per million exposed individuals, typically over a lifetime of exposure.

EPA and the California Air Resources Board (CARB) regulate HAPs and TACs, respectively, through statutes and regulations that generally require the use of the maximum-available control technology or best-available control technology for air toxics to limit emissions (EPA 2023c; CARB 2023a).

2.1.2 State

Criteria Air Pollutants

CARB is the agency responsible for coordination and oversight of state and local air pollution control programs in California and for implementing the California Clean Air Act (CCAA). The CCAA required CARB to establish California Ambient Air Quality Standards (CAAQS). The CCAA established CAAQS for the same criteria air pollutants for which EPA established NAAQS, and also for sulfates, hydrogen sulfide, vinyl chloride, and visibility-reducing particulate matter. CAAQS are also summarized in Table 2-1. In most cases, CAAQS are more stringent than NAAQS. Differences in NAAQS and CAAQS are generally explained by the health-effects studies considered during the standard-setting process and the interpretation of the studies. In addition, CAAQS incorporate a margin of safety to protect sensitive individuals.

In California, EPA has delegated authority to prepare SIPs to CARB, which, in turn, has delegated that authority to individual air districts. CARB traditionally has established state air quality standards, maintaining oversight authority in air quality planning, developing programs for reducing emissions from motor vehicles, developing air emission inventories, collecting air quality and meteorological

data, and approving SIPs. The CCAA requires that all local air districts in the state endeavor to attain and maintain the CAAQS by the earliest date practical. The CCAA specifies that local air districts should focus particular attention on reducing the emissions from transportation and area-wide emission sources. The CCAA substantially adds to the authority and responsibilities of air districts. The CCAA designates air districts as lead air-quality planning agencies, requires air districts to prepare air-quality plans, and grants air districts authority to implement transportation-control measures. The CCAA also emphasizes the control of "indirect and area-wide sources" of air pollutant emissions. The CCAA gives local air-pollution control districts explicit authority to regulate indirect sources of air pollution and establish traffic-control measures.

Low-Emission Vehicle Program Regulation

CARB has established various regulations to address exhaust emissions standards for both on-road and off-road vehicles, as mentioned in the above discussion of CAFE standards for light-duty passenger vehicles.

Vehicle Efficiency and Zero-Emissions Standards

Assembly Bill (AB) 1493 (Pavley I) required CARB to develop and implement regulations to reduce automobile and light-truck GHG emissions. These stricter emissions standards were designed to apply to automobiles and light trucks, beginning with the 2009 model year. Additional strengthening of the Pavley standards (referred to previously as *Pavley II* but now referred to as the *Advanced Clean Cars* measure) was adopted in 2012 for vehicle model years 2017 through 2025. Together, the two standards are expected to increase average fuel economy to roughly 54.5 miles per gallon in 2025.

In August 2022, CARB board members voted to approve the Advanced Clean Cars II proposal, which aimed to dramatically reduce emissions from passenger cars (model years 2026 through 2035). This requires an increasing proportion of new vehicles to be zero-emission vehicles, with the goal being to have 100 percent of new vehicles sold by 2035 to be zero-emission vehicles (CARB 2022).

CARB also adopted the Advanced Clean Truck Regulation to accelerate a large-scale transition to zero-emission medium- and heavy-duty vehicles (CARB 2023b). The regulation requires zero-emission medium- and heavy-duty vehicles to make up an increasing percentage of total annual vehicle sales in California between 2024 and 2035. By 2035, zero-emission truck/chassis sales would need to amount to 55 percent of Class 2b – 3 truck sales, 75 percent of Class 4 – 8 straight truck sales, and 40 percent of truck tractor sales. By 2045, every new medium- and heavy-duty truck sold in California will be a zero-emission vehicle. Large employers, including retailers, manufacturers, brokers, and others, are required to report information about shipments and shuttle services to ensure that fleets purchase available zero-emission trucks.

Low-Carbon Fuel Standard

With EO S-01-07, Governor Schwarzenegger set forth the low-carbon fuel standard for California in 2007. Under this EO, the carbon intensity of California's transportation fuel is to be reduced by at least 20 percent by 2030.

Sierra Club v. County of Fresno

In December 2018, the California Supreme Court issued its decision in *Sierra Club v. County of Fresno (226 Cal.App.4th 704).* The case reviewed the long-term regional air-quality analysis contained in the Environmental Impact Report (EIR) for the proposed Friant Ranch development. The project is located in unincorporated Fresno County within the San Joaquin Valley Air Basin (SJVAB), an air basin designated as nonattainment with respect to NAAQS and CAAQS for both ozone and $PM_{2.5}$, and CAAQS for PM_{10} (SJVAPCD 2022). The Court ruled that the air-quality analysis failed to adequately disclose the nature and magnitude of long-term significant air-quality impacts from emissions of criteria pollutants and precursors "in sufficient detail to enable those who did not participate in its preparation to understand and consider meaningfully the issues the proposed project raises." The Court noted that the air-quality analysis, which showed that the project substantially exceeded the threshold of significance, did not provide a discussion of the foreseeable adverse effects of the project-generated emissions on Fresno County's likelihood of exceeding NAAQS and CAAQS for criteria air pollutants, nor did it explain a connection between the project's emissions and deleterious health impacts. Moreover, as noted by the Court, the EIR did not explain why it was not "scientifically possible" to determine such a connection. The Court concluded that "because the EIR as written makes it impossible for the public to translate the bare numbers provided into adverse health impacts or to understand why such translation is not possible at this time," the EIR's discussion of air-quality impacts was inadequate.

Writing as amicus curiae in Sierra Club, the SJVAPCD explained that "[t]he health impact of a particular criteria pollutant is analyzed on a regional and not a facility level based on how close the area is to complying with (attaining) the (National Ambient Air Quality Standards [NAAQS]). Accordingly, while the type of individual facility/health impact analysis that the Court of Appeal has required is a customary practice for TACs, it is not feasible to conduct a similar analysis for criteria air pollutants because currently available computer modeling tools are not equipped for this task" (SJVAPCD 2015d).

Instead, the SJVAPCD explained that it assesses a project's potential to exceed NAAQS by evaluating the project's compliance with district thresholds of significance, which are measured in mass emissions (SJVAPCD 2015d). As explained by SJVAPCD, its thresholds are based on factual, scientific data and have been set at a level that ensures that NAAQS will not be exceeded, taking into consideration all cumulative emission sources (SJVAPCD 2015d). The SJVAPCD explained that attempting to connect criteria pollutant emissions to localized health impacts will "not yield reliable information because currently available modeling tools are not well suited for this task" (SJVAPCD 2015d). Available models are only equipped to model the impact of all emissions sources on an air basin-wide or regional basis, not on a project-level basis, and "[r]unning the photochemical grid model used for predicting ozone attainment with emissions solely from one project would thus not be likely to yield valid information given the relative scale involved" (SJVAPCD 2015d).

This inability to "accurately ascertain local increases in concentration" of mass emissions and then to further link emissions with health effects is particularly true for O_3 and its precursors NO_X and ROG and VOC; O_3 is not directly emitted into the air but is instead formed as ozone precursors undergo complex chemical reactions through sunlight exposure (SJVAPCD 2015d). Given the complex nature of this process, and the fact that O_3 can be transported by wind over long distances, "a specific tonnage amount of NO_X or VOCs emitted in a particular area does not equate to a particular concentration of ozone in that area" (SJVAPCD 2015d). For this reason, the photochemical analysis for O_3 is done on a regional scale and it is inappropriate to analyze O_3 impacts at a local or project-level basis because a localized analysis would at most be speculative, and at worst be

misleading. Speculative analysis is not required by CEQA (CEQA Guidelines Section 15145; Laurel Heights Improvement Association v. Regents of the University of California 1988).

The SJVAPCD also explained that the disconnect between the tonnage of precursor pollutants and the concentration of O_3 or particulate matter formed in a particular area is especially important to understand in considering potential health effects because it is the concentration, not the tonnage, that causes health effects (SJVAPCD 2015d). The SJVAPCD explained that even if a model were developed that could accurately assess local increases in concentrations of pollutants like O_3 and particulates, it would still be "impossible, using today's models, to correlate that increase in concentration to a specific health impact" (SJVAPCD 2015d). The SJVAPCD stated that even a project with criteria pollutant emissions above its CEQA thresholds does not necessarily cause localized human health impacts as, even with relatively high levels of emissions, the SJVAPCD cannot determine "whether and to what extent emissions from an individual project directly impact human health in a particular area" (SJVAPCD 2015d). The SJVAPCD explained that this is particularly true for development projects like the project, where most of the criteria pollutants derive from mobile and area sources and not stationary sources. The South Coast Air Quality Management District (SCAQMD) also, as amicus curiae in Sierra Club, made similar points, reiterating that "an agency should not be required to perform analyses that do not produce reliable or meaningful results" (SCAQMD 2015). SCAQMD agrees that it is very difficult to quantify health impacts with regard to O_3, opining that the only possible means of successfully doing so is for a project so large that emissions would essentially amount to all regional increases (SCAQMD 2015). With regard to particulate matter, the SCAQMD noted that while the CARB has created a methodology to predict expected mortality from large amount of $PM_{2.5}$, the primary author of the methodology has reported that it "may yield unreliable results due to various uncertainties" and CARB staff has been directed by its Governing Board to reassess and improve it, which factor "also counsels against setting any hard-and-fast rule" about conducting this type of analysis (SCAQMD 2015).

This report includes qualitative discussions related to the relationship between criteria air pollutants and associated health effects.

Toxic Air Contaminants

California regulates TACs primarily through the Tanner Act (AB 1807) and the Hot Spots Act (AB 2588). The Tanner Act (AB 1807) created California's program to reduce exposure to air toxics. CARB defines *TACs* as air pollutants that may cause or contribute to an increase in mortality or an increase in serious illness or that may pose a present or potential hazard to human health. CARB has formally identified more than 200 substances and groups of substances as TACs (CARB 2022a). Direct exposure to these pollutants has been shown to cause cancer, birth defects, damage to the brain and nervous system, and respiratory disorders. The Hot Spots Act (AB 2588) supplements the AB 1807 program by requiring a statewide air-toxics inventory, notification of people exposed to a significant health risk, and facility plans to reduce these risks. The California Office of Environmental Health Hazard Assessment (OEHHA) is required to develop guidelines for health risk assessments (HRAs) under the Air Toxics Hot Spots Program. These guidelines provide the scientific basis for the values used to assess the risk of emissions exposure from facilities and new sources (OEHHA 2015).

In August 1998, CARB identified particulate emissions from diesel-fueled engines as TACs. In September 2000, CARB approved a comprehensive diesel risk-reduction plan to reduce emissions from both new and existing diesel-fueled engines and vehicles. As an ongoing process, CARB reviews air contaminants and identifies those classified as TACs. CARB also continues to establish new

programs and regulations for the control of TACs, including diesel particulate matter (DPM), as appropriate.

CARB has adopted diesel exhaust–control measures and more stringent emissions standards for various transportation-related mobile sources of emissions, including transit buses and off-road diesel equipment (e.g., tractors, generators). Over time, the replacement of older vehicles would result in a vehicle fleet that produces substantially lower levels of TACs. Mobile-source emissions of TACs (e.g., benzene, 1,3-butadiene, DPM) have been reduced significantly over the last decade and would be reduced further in California through a progression of regulatory measures (e.g., Low Emission Vehicle/Clean Fuels and Phase II reformulated gasoline regulations) and control technologies. It is expected that DPM concentrations would continue to decline. Adopted regulations are also expected to continue to reduce formaldehyde emissions emitted by cars and light-duty trucks. As emissions are reduced, it is expected that risks associated with exposure to the emissions would also be reduced.

CARB developed multiple Air Toxic Control Measures to address specific mobile- and stationary-source categories that can have an impact on the public health of communities. The measures focused on reducing public exposure to DPM and TACs from mobile sources, such as commercial trucks, buses, solid waste–collection vehicles, and cargo-handling equipment at ports. The Airborne Toxic Control Measure to Limit Diesel-Fueled Commercial Motor Vehicle Idling (California Code of Regulations [CCR] Title 13 § 2485) required heavy-duty trucks with a GVWR greater than 10,000 pounds to not idle the primary engine for more than 5 minutes at any given time or operate an auxiliary power system for more than 5 minutes within 100 feet of a restricted area.

2.1.3 Local

San Joaquin Valley Air Pollution Control District

Criteria Air Pollutants

SJVAPCD is the primary agency responsible for planning to meet NAAQS and CAAQS in the SJVAB, where the project site is located. SJVAPCD works with EPA and CARB to maintain the region's portion of the SIP for ozone and $PM_{2.5}$. The SIP is a compilation of plans and regulations that govern how the region and state would comply with the federal CAA requirements to attain and maintain the NAAQS for ozone and $PM_{2.5}$.

SJVAPCD also enforces air quality regulations, educates the public about air quality, and implements a number of programs to provide incentives for the replacement or retrofit of older diesel engines and influence land-use development in the SJVAB.

All projects are subject to adopted SJVAPCD rules and regulations in effect at the time of construction. Specific rules applicable to the project may include but are not limited to the following:

- **Rule 3135—Dust Control Plan Fee:** This rule requires applicants to submit a fee in addition to a dust-control plan. The purpose of this fee is to recover SJVAPCD's cost for reviewing such plans and conducting compliance inspections.
- **Rule 4101—Visible Emissions:** This rule prohibits emissions of visible air contaminants to the atmosphere and applies to any source operation that emits or may emit air contaminants.

- **Rule 4102—Nuisance:** This rule applies to any source operation that emits or may emit air contaminants and/or odors. If such emissions create a public nuisance, the owner/operator could be in violation and subject to enforcement action by SJVAPCD.
- **Rule 4641—Cutback, Slow Cure, and Emulsified Asphalt, Paving and Maintenance Operations:** This rule applies to the manufacture and use of the aforementioned asphalt types for paving and maintenance operations.
- **Rule 9510—Indirect Source Review:** This rule is intended to reduce or mitigate emissions of NO_X and PM_{10} from the construction- and operation-related emissions of new land-use development in the SJVAPCD. This rule requires a specific percentage reductions in estimated on-site construction and operation emissions and/or payment of a prescribed off-site mitigation fee for required reductions that cannot be met on the project site. Construction emissions of NO_X and PM_{10} exhaust must be reduced by 20 percent and 45 percent, respectively. Operational emissions of NO_X and PM_{10} must be reduced by 33.3 percent and 50 percent, respectively.
- **Regulation VIII—Fugitive Dust PM_{10} Prohibitions:** Rules 8011–8081 are designed to reduce PM_{10} emissions (predominantly dust and dirt) generated by human activity, including construction, demolition, excavation, extraction, and other earth-moving activities, bulk materials–handling storage, carryout and track-out, open areas, paved and unpaved roads, unpaved vehicle/equipment traffic areas, and agricultural sources. Compliance with Regulation VIII is mandatory, so compliance by the project proponent is assumed in this analysis. Table 2-2 contains control measures that the applicants would be required to implement during project construction activities pursuant to Rule 8021, Construction, Demolition, Excavation, Extraction, and Other Earthmoving Activities.

Table 2-2 SJVAPCD Rule 8021 Measures Applicable to the Project

Number	Measure
A.1	Pre-water site sufficient to limit visible dust emissions (VDE) to 20 percent opacity.
A.2	Phase work to reduce the amount of disturbed surface area at any one time.
B.1	Apply water or chemical/organic stabilizers/suppressants sufficient to limit VDE to 20 percent opacity; or
B.2	Construct and maintain wind barriers sufficient to limit VDE to 20 percent opacity. If using wind barriers, control measure B.1 above shall also be implemented.
B.3	Apply water or chemical/organic stabilizers/suppressants to unpaved haul/access roads and unpaved vehicle/equipment traffic areas sufficient to limit VDE to 20 percent opacity and meet the conditions of a stabilized unpaved road surface.
C.1	Restrict vehicular access to the area.
C.2	Apply water or chemical/organic stabilizers/suppressants, sufficient to comply with the conditions of a stabilized surface. If an area having 0.5 acre or more of disturbed surface area remains unused for seven or more days, the area must comply with the conditions for a stabilized surface area as defined in section 3.58 of Rule 8011.
5.3.1	An owner/operator shall limit the speed of vehicles traveling on uncontrolled unpaved access/haul roads within construction sites to a maximum of 15 miles per hour.
5.3.2	An owner/operator shall post speed limit signs that meet state and federal Department of Transportation standards at each construction site's uncontrolled unpaved access/haul road entrance. At a minimum, speed limit signs shall also be posted at least every 500 feet and shall be readable in both directions of travel along uncontrolled unpaved access/haul roads.

Number	Measure
5.4.1	Cease outdoor construction, excavation, extraction, and other earthmoving activities that disturb the soil whenever VDE exceeds 20 percent opacity. Indoor activities such as electrical, plumbing, dry wall installation, painting, and any other activity that does not cause any disturbances to the soil are not subject to this requirement.
5.4.2	Continue operation of water trucks/devices when outdoor construction excavation, extraction, and other earthmoving activities cease, unless unsafe to do so.
6.3.1	An owner/operator shall submit a Dust Control Plan to the Air Pollution Control Officer (APCO) prior to the start of any construction activity on any site that will include ten acres or more of disturbed surface area for residential developments, or five acres or more of disturbed surface area for non-residential development, or will include moving, depositing, or relocating more than 2,500 cubic yards per day of bulk materials on at least three days. Construction activities shall not commence until the APCO has approved or conditionally approved the Dust Control Plan. An owner/operator shall provide written notification to the APCO within 10 days prior to the commencement of earthmoving activities via fax or mail. The requirement to submit a dust control plan shall apply to all such activities conducted for residential and non-residential (e.g., commercial, industrial, or institutional) purposes or conducted by any governmental entity.
6.3.3	The Dust Control Plan shall describe all fugitive dust control measures to be implemented before, during, and after any dust generating activity.
6.3.4	A Dust Control Plan shall contain all the [administrative] information described in Section 6.3.6 of this rule. The APCO shall approve, disapprove, or conditionally approve the Dust Control Plan within 30 days of plan submittal. A Dust Control Plan is deemed automatically approved if, after 30 days following receipt by SJVAPCD, SJVAPCD does not provide any comments to the owner/operator regarding the Dust Control Plan.

Source: SJVAPCD Rule 8021.

If modeled construction- or operation-related emissions for a project exceed SJVAPCD's mass emission thresholds for criteria air pollutants and precursors, then SJVAPCD recommends implementing mitigation to reduce these emissions. SJVAPCD's mass emission thresholds are presented in Section 3.1.3, *State Plans, Policies, Laws, and Regulations*.

Toxic Air Contaminants

At the local level, air districts may adopt and enforce CARB control measures. Under SJVAPCD Rule 2010 (Permits Required), Rule 2201 (New and Modified Stationary Source Review), and Rule 2550 (Federally Mandated Preconstruction Review for Major Sources of Air Toxics), all stationary sources that possess the potential to emit TACs are required to obtain permits from SJVAPCD. Permits may be granted to these operations if they are constructed and operated in accordance with applicable regulations, including New Source Review standards[1] and air toxics–control measures. SJVAPCD limits emissions and public exposure to TACs through multiple programs. SJVAPCD prioritizes TAC-emitting stationary sources based on the quantity and toxicity of the TAC emissions and the proximity of the facilities to sensitive receptors.

[1] *New Source Review* is a Clean Air Act program that requires industrial facilities to install modern pollution-control equipment when they are built or when making a change that increases emissions significantly.

Odors

Although odors rarely cause any physical harm, they can be very unpleasant, leading to considerable stress among the public and often generating citizen complaints to local governments and SJVAPCD. SJVAPCD Rule 4102 (Nuisance) regulates odorous emissions.

Merced County

2030 Merced County General Plan

Relevant policies and standards from the Air Quality Element of the *2030 Merced County General Plan* are provided below (County of Merced 2013).

- **Goal AQ-11.** Reduce air pollutants and greenhouse gas emissions and anticipate adaptation due to future consequences of global and local climate change.
    - **Policy AQ-1.5: Climate Action Plan.** Prepare a Climate Action Plan that includes an inventory of 1990 and 2010 greenhouse gas emissions, determines project air quality impacts using analysis methods and significance thresholds recommended by the SJVAPC, and identify strategies to achieve State emission reduction targets.
- **Goal AQ-2.** Mitigate significant local and regional air quality impacts of projects through the CEQA [California Environmental Quality Act] process.
    - **Policy AQ-2.1: Air Quality Plan Compliance.** Require all development projects to comply with applicable regional air quality plans and policies.
    - **Policy AQ-2.2: Development Review Process.** Use the development review process to achieve measurable reductions in criteria pollutant, toxic air contaminants, and greenhouse gas emissions.
    - **Policy AQ-2.3: Cumulative Impacts.** Encourage the reduction of cumulative air quality impacts produced by projects that are not significant by themselves but result in cumulatively significant impacts in combination with other development.
    - **Policy AQ-2.4: Mitigation.** Require that local and regional air quality impacts identified during CEQA review for projects reviewed and approved by the County are consistently and fairly mitigated.
    - **Policy AQ-2.5: Innovative Mitigation Measures.** Encourage innovative mitigation measures and project redesign to reduce air quality impacts by coordinating with the San Joaquin Valley Air Pollution Control District, project applicants, and other interested parties.
    - **Policy AQ-2.7: Air District Best Performance Standards.** Require the County to use the Best Performance Standards adopted by SJVAPCD during the development review and decision-making process to ensure new projects meet the targets set by [SJVAPCD].
- **Goal AQ-6.** Improve air quality in Merced County by reducing emissions of PM_{10}, $PM_{2.5}$, and other particulates from mobile and non-mobile sources.
    - **Policy AQ-6.1: Particulate Emissions from Construction.** Support the San Joaquin Valley Air Pollution Control District's efforts to reduce particulate emissions from construction, grading, excavation, and demolition to the maximum extent feasible and consistent with State and federal regulations.

- **Policy AQ-6.2: Emissions from County Roads.** Require PM_{10} and $PM_{2.5}$ emission reductions on County-maintained roads to the maximum extent feasible and consistent with State and Federal regulations.
- **Policy AQ-6.3: Paving Materials.** Require all access roads, driveways, and parking areas serving new commercial and industrial development to be constructed with materials that minimize particulate emissions and are appropriate to the scale and intensity of use.
- **Policy AQ-6.5: Industrial Best Management Practices.** Require industrial facilities to incorporate economically feasible Best Management Practices and control technology to reduce PM_{10} and $PM_{2.5}$ emissions consistent with State and Federal regulations.
- **Policy AQ-6.8: Voluntary Emissions Reduction Agreement.** Require all project applicants, where project emissions for any criteria pollutant have been evaluated to exceed SJVAPCD significance thresholds, to consult with the SJVAPCD regarding the establishment of a Voluntary Emissions Reduction Agreement between the applicant and the SJVAPCD. Support the SJVAPCD in its efforts to fund the Emission Reduction Incentive Program.

2.2 Existing Setting

The project site is in Merced County, which is in the SJVAB. The SJVAB includes all of Fresno, Kings, Madera, Merced, Stanislaus, and Tulare counties and the valley portion of Kern County. Ambient concentrations of air pollutants are determined by the levels of emissions released by pollutant sources and the ability of the atmosphere to transport and dilute such emissions. Natural factors that affect transport and dilution include terrain, wind, atmospheric stability, and the presence of sunlight. Therefore, existing air-quality conditions in the area are determined by such natural factors as topography, meteorology, and climate, in addition to the amount of emissions released by existing air-pollutant sources, as discussed separately below (SJVAPCD 2015b).

2.2.1 Topography and Meteorology

The SJVAB comprises the southern half of California's Central Valley and is approximately 250 miles long and averages 35 miles wide. The SJVAB is bordered by the Sierra Nevada in the east, the Coast Ranges in the west, and the Tehachapi Mountains in the south. There is a slight, downward elevation gradient from Bakersfield in the southeastern end (elevation 408 feet) to sea level at the northwestern end, where the valley opens to the San Francisco Bay at the Carquinez Straits. At its northern end is the Sacramento Valley, which comprises the northern half of California's Central Valley. The bowl-shaped topography inhibits movement of pollutants out of the SJVAB.

The SJVAB is in a Mediterranean Climate Zone and influenced by a subtropical, high-pressure cell most of the year. Rainfall is sparse, occurring mainly in winter. Summers are hot and dry. Summertime maximum temperatures often exceed 100 degrees Fahrenheit (°F).

The subtropical, high-pressure cell is strongest during spring, summer, and fall and produces subsiding air, which can result in temperature inversions in the SJVAB. A temperature inversion can act like a lid, inhibiting vertical mixing of the air mass at the surface. Any emissions of pollutants can be trapped below the inversion. Most of the surrounding mountains are above the normal height of summer inversions (1,500–3,000 feet).

Wintertime high-pressure events can often last many weeks, with surface temperatures often lowering to 30–40°F. During these events, fog can be present, and inversions are extremely strong. These wintertime inversions can inhibit vertical mixing of pollutants to a few hundred feet.

Solar radiation and temperature are particularly important in the chemistry of ozone formation. The SJVAB averages more than 260 sunny days per year. Photochemical air pollution (primarily ozone) is produced by the atmospheric reaction of organic substances (e.g., volatile organic compounds [VOCs]) and oxides of nitrogen under the influence of sunlight.

2.2.2 Criteria Air Pollutants

The following provides a summary discussion of the primary and secondary criteria air pollutants of key concern. In general, *primary pollutants* are directly emitted into the atmosphere, and *secondary pollutants* are formed by chemical reactions in the atmosphere.

Ozone

Ozone, the main ingredient in urban smog, is not emitted directly into the air, but is created by chemical reactions between hydrocarbons and NO_X, both byproducts of the internal-combustion engine, in the presence of sunlight. Reactive organic gases (ROGs) are defined by CARB and include all hydrocarbons except those exempted by CARB that contribute to smog formation, whereas VOCs) are defined by EPA and include all hydrocarbons except those exempted by EPA. Generally speaking, ROGs and VOCs are similar, but not identical; although the terms are used interchangeably, ROG is used for purposes of this analysis. There are no separate NAAQS or CAAQS for ROG. Carcinogenic forms of ROGs are TACs (e.g., benzene).

ROGs consists of compounds made up primarily of hydrogen and carbon atoms. Internal combustion associated with motor vehicles is the major source of hydrocarbons. Other sources of ROGs are emissions associated with the use of paints and solvents, the application of asphalt paving, and the use of household consumer products, such as aerosols.

The two major forms of NO_X are nitric oxide (NO) and NO_2. NO is a colorless, odorless gas formed from atmospheric nitrogen and oxygen when combustion takes place under high temperatures and/or high pressure. NO_2 is an irritating, reddish-brown gas formed by the combination of NO and oxygen. In addition to serving as an integral participant in ozone formation, NO_X also directly acts as an acute respiratory irritant and increases susceptibility to respiratory pathogens.

Ozone poses a higher risk to those who already suffer from respiratory diseases (e.g., asthma), children, older adults, and people who are active outdoors. Exposure to ozone at certain concentrations can make breathing more difficult, cause shortness of breath and coughing, inflame and damage the airways, aggregate lung diseases, increase the frequency of asthma attacks, and cause chronic obstructive pulmonary disease. Studies show associations between short-term ozone exposure and nonaccidental mortality, including deaths from respiratory issues. Studies also suggest that long-term exposure to ozone may increase the risk of respiratory-related deaths (EPA 2022b). The concentration of ozone at which health effects are observed depends on an individual's sensitivity, level of exertion (i.e., breathing rate), and duration of exposure. Studies show large individual differences in the intensity of symptomatic responses, with one study finding no symptoms to the least-responsive individual after a 2-hour exposure to 400 parts per billion of ozone and a 50-percent decrement in forced airway volume in the most responsive individual. Although the results vary, evidence suggest that sensitive populations (e.g., asthmatics) may be affected on days when the 8-hour maximum ozone concentration reaches 80 parts per billion (EPA 2022c).

In addition to human health effects, ozone has been tied to crop damage, typically in the form of stunted growth, leaf discoloration, cell damage, and premature death. Ozone can also act as corrosives and oxidants, resulting in property damage, such as the degradation of rubber products and other materials.

Carbon Monoxide

CO is a colorless, odorless, and toxic gas produced by incomplete combustion of carbon substances, such as gasoline or diesel fuel. CO is considered a local pollutant because it tends to accumulate in the air locally. The primary adverse health effect associated with CO is interference with normal oxygen transfer to the blood, which may result in tissue oxygen deprivation. Exposure to CO at high concentrations can also cause fatigue, headaches, confusion, dizziness, and chest pain. There are no ecological or environmental effects for ambient CO (CARB 2019).

Particulate Matter

Particulate matter (PM) consists of finely divided solids or liquids, such as soot, dust, aerosols, fumes, and mists. Two forms of fine particulates are now recognized: respirable coarse particles with an aerodynamic diameter of 10 micrometers or less, or PM_{10}, and respirable fine particles with an aerodynamic diameter of 2.5 micrometers or less, or $PM_{2.5}$. Particulate discharge into the atmosphere results primarily from industrial, agricultural, construction, and transportation activities. However, wind on arid landscapes also contributes substantially to local particulate loading. PM is considered both a local and a regional pollutant.

Particulate pollution can be transported over long distances and may adversely affect humans, especially people who are naturally sensitive or susceptible to breathing problems (i.e., asthmatics). Numerous studies have linked PM exposure to premature death in people with preexisting heart or lung disease. Other symptoms of exposure may include nonfatal heart attacks, irregular heartbeats, aggravated asthma, decreased lung function, and increased respiratory symptoms. Depending on composition, PM_{10} and $PM_{2.5}$ can also affect water quality and acidity, deplete soil nutrients, damage sensitive forests and crops, affect ecosystem diversity, and contribute to acid rain (EPA 2022a).

Sulfur Dioxide

SO_2 is a colorless, irritating gas with a rotten egg smell, primarily formed from the combustion of fossil fuels containing sulfur. SO_2 is considered a local pollutant because it tends to accumulate in the air locally. High concentrations of SO_2 can result in temporary breathing impairment for asthmatic children and adults who are active outdoors. Short-term exposure of asthmatic individuals to elevated SO_2 levels during moderate activity may result in breathing difficulties that can be accompanied by symptoms like wheezing, chest tightness, or shortness of breath. Other effects that have been associated with longer-term exposures to high concentrations of SO_2, in conjunction with high levels of PM, include aggravation of existing cardiovascular disease, respiratory illness, and alterations in lung defenses. SO_2 also is a major precursor to $PM_{2.5}$, which is a significant health concern and a main contributor to poor visibility (see also the discussion of health effects of PM, above).

Lead

Lead is a naturally existing metal that can be a constituent of air, water, and the biosphere. Lead is considered a local pollutant because it tends to accumulative in the air locally. This highly toxic metal, used for many years in everyday products, has been found to lead to a range of health effects, from behavioral problems and learning disabilities to seizures and death (EPA 2023d). Effects on children's nervous systems are one of the primary health risk concerns from lead. When lead is present in high concentrations, children can even suffer irreversible brain damage and death. Children 6 years old and under are most at risk because their bodies are growing quickly.

Since the 1980s, lead has been phased out in gasoline, reduced in drinking water, reduced in industrial air pollution, and banned or limited in consumer products. Gasoline-powered automobile engines were a major source of airborne lead through the use of leaded fuels; however, the use of leaded fuel has been mostly phased out. Since this has occurred, the ambient lead levels have dropped dramatically.

Other Criteria Pollutants

CARB has also established CAAQS for hydrogen sulfide (H_2S), sulfates, vinyl chloride, and visibility-reducing particles. These pollutants are not addressed by federal standards. Below is a summary of these pollutants and a description of their physical properties, health and other effects, sources, and the extent of the problems.

Hydrogen sulfide emissions often are associated with geothermal activity, oil and gas production, refining, sewage treatment plants, and confined animal-feeding operations. H_2S in the atmosphere would likely oxidize into SO_2, which can lead to acid rain. At low concentrations, H_2S may cause dizziness, headaches, and irritation to the eyes, mucous membranes, and respiratory system. In high concentrations, H_2S is extremely hazardous (i.e., 800 parts per million can cause death), especially in enclosed spaces (CARB 2023c). The Occupational Safety and Health Administration (OSHA) has the primary responsibility for regulating workplace exposure to H_2S.

Sulfates are another particulate product that result from the combustion of sulfur-containing fossil fuels; however, the majority of ambient sulfates are formed in the atmosphere. When SO_2 comes in contact with oxygen, it precipitates out into sulfates. Data collected in the Mojave Desert Air Basin have demonstrated that levels of sulfates are significantly lower than the health standards. The health effects associated with SO_2 and sulfates, more commonly known as SO_X, include respiratory illnesses, decreased pulmonary-disease resistance, and aggravation of cardiovascular diseases (CARB 2023d). When acidic pollutants and particulates are also present, SO_2 tends to have an even more toxic effect. Increased PM derived from SO_2 emissions also contributes to impaired visibility. In addition to particulates, sulfur trioxide and sulfate ion are precursors to acid rain; SO_X and NO_X are the leading precursors to acid rain, which can lead to corrosion of human-made structures and cause acidification of waterbodies.

Visibility-reducing particles consist of PM generated from a variety of natural and human-made sources and vary greatly in shape, size, and chemical composition. Some haze-causing particles (e.g., windblown dust and soot) are directly emitted into the air, whereas others are formed in the air from the chemical transformation of gaseous pollutants (e.g., sulfates, nitrates, organic carbon particles), which are the major constituents of fine PM (CARB 2023e). These fine particles, caused largely by the combustion of fuel, can travel hundreds of miles and cause visibility impairment. California has been labeled unclassified for visibility—CARB has not established a method for

measuring visibility with the precision and accuracy needed to designate areas attainment or nonattainment. The proposed project is not expected to have any adverse impacts on visibility in any Class I area.

Vinyl chloride is a colorless, sweet-smelling gas at ambient temperature. Landfills, publicly owned treatment works, and polyvinyl chloride production are the major identified sources of vinyl chloride emissions in California. Polyvinyl chloride can be fabricated into several products, such as pipes, pipe fittings, and plastics. In humans, epidemiological studies of occupationally exposed workers have linked vinyl chloride exposure to development of liver angiosarcoma, a rare cancer, and have suggested a relationship between exposure and lung and brain cancers (CARB 2023f).

2.2.3 Attainment Designations

SJVAB is designated as being in nonattainment with respect to NAAQS and CAAQS for both ozone and $PM_{2.5}$ as well as the CAAQS for PM_{10} (SJVAPCD 2022).

2.2.4 Toxic Air Contaminants

DPM and naturally occurring asbestos are the TACs of primary concern in rural areas of Merced County, as discussed in greater detail below.

Diesel Particulate Matter

Diesel trucks traveling on I-5 are the predominant source of TAC emissions near the project site. As described above, DPM emitted in the exhaust of diesel-powered vehicles is designated as a TAC.

Naturally Occurring Asbestos

Asbestos is the common name for a group of naturally occurring fibrous silicate minerals that can separate into thin, but strong and durable, fibers. Naturally occurring asbestos, which was identified as a TAC by CARB in 1986, is found in many parts of California and commonly associated with serpentine soils and rocks. According to reports by the California Department of Conservation and Division of Mines and Geology (2000), naturally occurring asbestos is not likely to occur within the project vicinity.

2.2.5 Valley Fever

Coccidioidomycosis, more commonly known as *Valley Fever*, is primarily a disease of the lungs caused by the spores of the *Coccidioides immitis* fungus. The spores are found in soils, become airborne when the soil is disturbed, and are subsequently inhaled into the lungs. After the fungal spores have settled in the lungs, they change into a multicellular structure called a *spherule*. Fungal growth in the lungs occurs as the spherule grows and bursts, releasing endospores, which then develop into more spherules.

Valley Fever symptoms occur within 2 to 3 weeks of exposure. Approximately 60 percent of Valley Fever cases are mild and display flu-like symptoms or no symptoms at all. Of those who are exposed and seek medical treatment, the most common symptoms include fatigue, cough, loss of appetite, rash, headache, and joint aches. In some cases, painful red bumps may develop. These symptoms are not unique to Valley Fever and also may be caused by other illnesses. Identifying and confirming this

disease requires specific laboratory tests, such as (1) microscopic identification of the fungal spherules in infected tissue, sputum, or body fluid sample; (2) growing a culture of *Coccidioides immitis* from a tissue specimen, sputum, or body fluid; (3) detection of antibodies (i.e., serological tests specifically for Valley Fever) against the fungus in blood serum or other body fluids; and (4) administering the Valley Fever Skin Test (called *coccidioidin* or *spherulin*), which indicates prior exposure to the fungus (Valley Fever Center for Excellence 2019).

Valley Fever is not contagious. Most of those who are infected recover without treatment within 6 months and have a lifelong immunity to the fungal spores. In severe cases, such as in patients with rapid and extensive primary illnesses, those who are at risk for dissemination of disease, and those who have disseminated disease, antifungal drug therapy is used. Only 1 to 2 percent of those exposed who seek medical attention develop a disease that disseminates to other parts of the body other than the lungs. Approximately 60 percent of Valley Fever cases are mild, and no medical treatment is sought. Table 2-3 presents the various infection classifications and normal diagnostic spread as noted in recent research conducted by the Valley Fever Center for Excellence (2019).

Table 2-3 Range of Valley Fever Cases

Infection Classification	Percent of Total Diagnosed Cases
Unapparent Infections	60 percent
Mild to Moderate Infections	30 percent
Infections Resulting in Complications	5–10 percent
Fatal Infections	<1 percent

Source: Valley Fever Center for Excellence 2019.

Coccidioides immitis fungal spores are often found in the soil around rodent burrows, Native American ruins, and burial grounds. The spores become airborne when the soil is disturbed by wind, construction, farming, and other soil-disturbing activities. This type of fungus is endemic to the southwestern United States, including the San Joaquin Valley. Rates of Valley Fever cases in Merced County range from 40–99 cases per 100,000 people annually (California Department of Public Health 2021). The ecological factors that appear to be most conducive to the survival and replication of the fungal spores are high summer temperatures, mild winters, sparse rainfall, and alkaline, sandy soils. No vaccine to protect humans from Valley Fever currently exists.

2.3 Impacts and Mitigation Measures

2.3.1 Methodology

Mass Emissions

Emissions of criteria air pollutants and precursors, TACs, and odors were assessed in accordance with SJVAPCD's *Guide for Assessing and Mitigating Air Quality Impacts* (SJVAPCD 2015b). The project's emissions were compared to SJVAPCD-adopted thresholds. Emissions associated with construction and operation of the project were estimated using information about the phasing of construction activities, the types and numbers of equipment that would be used, the number of employees, and the frequency of maintenance activities during project operations, as provided by

EDPR, emission factors from the California Emissions Estimator Model (CalEEMod) Version 2020.4.0 computer program and CARB's Web-Based Mobile-Source Emission Factor Model (EMFAC2021; CARB 2021c); and equations and methodologies consistent with CalEEMod (CAPCOA 2020). Detailed model assumptions and inputs for these calculations can be found in Attachment A, *Air Quality and Greenhouse Gases Modeling Files*.

Construction Health Risk Assessment and Ambient Air Quality Analysis

The level of health risk from exposure to TACs emitted during project construction was assessed based on an HRA that was conducted in accordance with SJVAPCD guidance (SJVAPCD 2006, 2015a, 2015c), the CARB-approved American Meteorological Society/Environmental Protection Agency Regulatory Model Improvement Committee modeling system (AERMOD; EPA 2016) and California Office of Environmental Health and Hazard Assessment's Hotspots Analysis and Reporting Program, Version 2 (OEHHA 2015). The HRA was based on the level of DPM that would be emitted by heavy equipment and haul trucks during project construction, the location of off-site sensitive receptors, the possible duration of potential DPM exposure, and meteorological data from the meteorological station in Los Banos.

AERMOD (version 22112) was used to conduct the modeling. All calculation inputs for the simulations used in the DPM health risk assessment (discussed separately below) and the ambient air quality analysis are identical. AERMOD's rural dispersion option was used in the analysis, given the rural nature of the project area. In addition, the modeling used AERMAP terrain height information in the analysis.

AERMOD requires meteorological data for input into the model. The data are typically processed using AERMET and AERSURFACE, preprocessors to AERMOD. AERMET requires surface meteorological data, upper air meteorological data, and surface parameter data (supplied from AERSURFACE). CARB has meteorological datasets that have been developed for use in air quality modeling. The dataset used in this analysis was based on data derived from the Los Banos station (37.050, -120.833) for the January 1, 2004, to January 2, 2008, period. NED 1 Arc-Second (approximately 30-meter) terrain data for the project area were inputted into the model using the AERMAP tool.

Receptors were modeled using a network of discrete receptors, both at observed residential locations (for the DPM HRA) and along the fence line (for the CO ambient air quality analysis), the closest location with public access to ambient air. The closest observed residential and recreational locations were modeled using a 20- by 20-meter grid. To represent the ambient air boundary, receptors were placed along the fence line at 20-meter increments.

Emissions associated with construction equipment were treated as area polygon sources equal to the size of the project boundary. On-site construction equipment exhaust emissions were modeled with a release height of 5 meters and an initial vertical dimension of 1.4 meters, consistent with construction air dispersion modeling recommendation by the Bay Area Air Quality Management District (BAAQMD) (2012), Sacramento Metropolitan Air Quality Management District (SMAQMD) (2013), and SCAQMD (2008).

Emissions associated with truck movements near the project site would occur primarily along the following unpaved and paved roads: San Luis Drive and a short unpaved road connecting San Luis Drive to the project site. These roads were treated as line area sources to represent the travel path to and from the project site. Following EPA haul road guidance (EPA 2012b), the initial vertical dimension was set to 3.16 meters, and the release height was set to 3.4 meters, or approximately 11.15 feet.

Because construction is expected to occur during daytime hours only, only daytime meteorology was assumed. The "hour of day" function in AERMOD was used to represent 8 hours of continuous construction equipment emissions every day, 5 days a week (7:00 a.m. to 3:00 p.m.). Workers would be required to take breaks and follow the CCR Section 2485, which limits vehicle idling to no more than 5 minutes.

The approach to estimating cancer risk from long-term inhalation exposure to carcinogens requires calculating a range of potential doses and multiplying by cancer potency factors in units of inverse dose to obtain a range of cancer risks. For cancer risk, the risk for each age group is calculated using the appropriate breathing rates, age sensitivity factors, exposure duration, and cancer risks calculated for individual age groups and summed to estimate cancer risk, based on assumed exposure durations. This information and equations are provided by OEHHA in its 2015 guidance document (OEHHA 2015). Note that PM_{10} exhaust emissions are used as a surrogate for DPM, based on OEHHA guidance.

The health risk factors used in the construction assessment are representative of the 0–<2 age bin. For each modeled receptor, the modeled annual concentration from AERMOD was multiplied by the calculated factor and 1 million to obtain the cancer risk, in chances per million. Proposed project construction is assumed to last 14 months, beginning in April 2024. For the HRA, it is conservatively assumed that nearby residents may be exposed for 2 calendar years within the 0–<2 age bin, which has the highest breathing rate of any age bin.[2] The "fraction of time at home" was set at the default value of 0.85 because no schools are within the 1 in 1 million cancer risk isopleth for the project. These assumptions were input into the CARB HARP RAST tool to calculate construction-related health risks.

Calculations associated with the construction dispersion modeling and health-risk calculations for the HRA can be found in Attachment B, *Health Risk Assessment*.

Odors

The assessment of odor-related impacts is based on the types of odor sources associated with construction and operation of the project, their location relative to off-site receptors, and the likelihood of resulting in odor complaints.

Operational Health Risk Assessment

All inputs and parameters used in AERMOD for the construction HRA apply to the operational HRA, which includes emissions of DPM associated with annual solar panel cleaning. Off-road equipment and on-road vehicles would conduct the solar panel cleaning activities.

For the calculation of health risks, using CARB's HARP RAST tool, operational HRA used health risk factors associated with the 2–<16 and 16–<30 age bins. The "fraction of time at home" was set at the default values of 0.72 and 0.73 for the 2–<16 and 16–<30 age bins because no schools are within the 1 in 1 million cancer risk isopleth for the project.

Calculations associated with the operational health-risk calculations for the HRA can be found in Attachment B, *Health Risk Assessment*.

[2] An increased exposure duration of 2 years, compared to 14 months (1.2 years), increases the potential cancer risk at the nearby sensitive receptors.

2.3.2 Thresholds of Significance

In its March 2015 *Guide for Assessing and Mitigating Air Quality Impacts* (CEQA Guide), SJVAPCD provides evidence to support the development and applicability of its thresholds of significance for project-generated emissions of criteria air pollutants and precursors, which may be used at the discretion of a lead agency overseeing the environmental review of projects located within the SJVAB. As stated in the CEQA Guide, "a Lead Agency may consider thresholds of significance previously adopted or recommended by other public agencies or recommended by experts, provided the decision of the Lead Agency to adopt such thresholds is supported by substantial evidence" (SJVAPCD 2015b). CEQA-related air quality thresholds of significance are tied to achieving or maintaining attainment designations with respect to NAAQS and CAAQS for criteria air pollutants, which are scientifically substantiated, numerical concentrations considered to be protective of human health.

SJVAPCD identified numerical thresholds for construction- and operation-related emissions of criteria air pollutants and precursors that would determine whether a project's discrete emissions would result in a cumulative, regional contribution (i.e., significant) to the baseline nonattainment status of SJVAPCD. In developing thresholds of significance for individual project emissions, SJVAPCD analyzed emissions values against the SJVAPCD's offset thresholds to ozone precursors, which, when applied, prevent further deterioration of ambient air quality in the SJVAB. Thresholds for PM_{10} and $PM_{2.5}$ were adapted from the SJVAPCD's PM_{10} New Source Review offset thresholds for stationary sources (SJVAPCD 2015b). Using these parameters, SJVAPCD developed quantitative thresholds of significance for project-level CEQA evaluation that may be used to determine the extent to which a project's emissions of criteria air pollutants and precursors would contribute to the regional degradation of ambient air quality within the SJVAB.

Using federal and state guidance pertaining to TACs, in addition to the findings of several scientific studies, SJVAPCD developed cancer risk and noncancer health hazard thresholds for TAC exposure. Unlike criteria air pollutants, there is no known safe concentration of TACs with respect to cancer risk. Moreover, TAC emissions contribute to the deterioration of localized air quality and, due to the dispersion characteristics of TACs, emissions generally do not cause regional-scale air-quality impacts. SJVAPCD's thresholds are designed to ensure that a source of TACs does not contribute to a localized, significant impact on existing or new receptors.

As such, for the purpose of this project, the following thresholds of significance are used to determine if project-generated emissions would produce a significant localized and/or regional air quality impact such that human health would be adversely affected. Based on Appendix G of the State CEQA Guidelines and SJVAPCD recommendations (SJVAPCD 2015b), the project would result in a potentially significant impact on air quality if it would result in emissions of criteria air pollutants or precursors that would conflict with or obstruct air quality–planning efforts, result in a cumulatively considerable net increase of any criteria air pollutant for which the SJVAB has been designated as nonattainment with respect the applicable NAAQS or CAAQS, or expose sensitive receptors to substantial pollutant concentrations. SJVAPCD considers these criteria to be exceeded if a project's construction- or operation-related emissions would exceed its annual thresholds of 10 tons per year (tons/year) for ROG or NO_X, 100 tons/year for CO, 27 tons/year for SO_X, and/or 15 tons/year for PM_{10} or $PM_{2.5}$ (SJVAPCD 2015b). In addition, if emissions of any of these pollutants would exceed a screening criterion of 100 pounds per day (lb/day), SJVAPCD requires site-specific ambient air-quality analysis to determine whether the project would result in a localized exceedance or cumulatively considerable contribution to an exceedance of a NAAQS or CAAQS (SJVAPCD

2015b); and/or expose sensitive receptors to a substantial incremental increase in TAC emissions that exceed 20 in 1,000,000 for carcinogenic risk (i.e., the risk of contracting cancer) and/or a noncarcinogenic hazard index of 1.0 or greater (SJVAPCD 2015b).

Regarding the threshold of significance for odors, SJVAPCD's CEQA Guide states that any project with the potential to frequently expose members of the public to objectionable odors should be deemed to have a significant impact (SJVAPCD 2015b). This is mostly consistent with the odor question in CEQA Appendix G, which was revised as part of the 2019 update: "result in other emissions (such as those leading to odors) adversely affecting a substantial number of people." However, whereas the SJVAPCD CEQA Guide focuses on frequency of odor exposure, Appendix G focuses on number of people affected. To remain consistent with the 2021 CEQA Guidelines, the threshold of significance used in this analysis is based on CEQA Appendix G, which asks whether a project would result in other emissions (such as those leading to odors) adversely affecting a substantial number of people.

2.3.3 Project Impacts

Impact AQ-1: Construction-Generated Emissions of Criteria Air Pollutants and Precursors

Construction of the solar project would result in emissions of criteria air pollutants and precursors from: off-road equipment used for vegetation removal and site preparation; grading and excavation; installation of the PV system; construction of the battery-storage facility and on-site substation; and construction of the off-site connection to PG&E's existing Los Banos substation. Criteria air pollutants and precursors would also be emitted by trucks hauling equipment and materials to and from the solar project site and by worker commute trips. Fugitive PM_{10} and $PM_{2.5}$ dust emissions would also be generated by equipment and vehicles traveling on unpaved areas of the site, as well as excavation and grading activity. Fugitive-dust emissions would be primarily associated with site preparation and grading and vary as a function of soil silt content, soil moisture, wind speed, and area of disturbance. Construction of the PG&E substation improvements would generate emissions from similar activities.

Table 2-4 summarizes the estimated levels of criteria air pollutants and precursors that would be emitted during the projected 14-month construction period. These estimates are broken down by the timing of various construction phases (or the combination of construction phases that would likely overlap in timing). Phases that contribute to annual emissions in 2024 include site preparation, underground work, PV system installation, battery storage system installation, substation and gen-tie line installation, and PG&E substation modifications. Phases that contribute to annual emissions in 2025 include underground work, PV system installation, battery storage system installation, substation and gen-tie line installation, PG&E substation modifications, and testing, and commissioning, and project site restoration. Detailed modeling input and parameters, assumptions, and emissions estimates are provided in Attachment A.

Table 2-4 Annual Construction-Generated Emissions of Criteria Air Pollutants and Precursors with Tier 4 Final Engines and Regulation VIII Measures

	Projected Timing		Emissions (tons)					
Construction Phase(s)	Start	End	ROG	NO_X	CO	SO_X	PM_{10}	$PM_{2.5}$

Source: Modeling details and output provided in Attachment A.
Note: Totals may not add exactly due to rounding.
SJVAPCD = San Joaquin Valley Air Pollution Control District; ROG = reactive organic gases; age system; NO_X = oxides of nitrogen; CO = carbon monoxide; SO_X = oxides of sulfur; PM_{10} = respirable particulate matter with an aerodynamic diameter of 10 microns or less; $PM_{2.5}$ = fine particulate matter with an aerodynamic diameter of 2.5 microns or less; PV = photovoltaic.

In its *Guidance for Assessing and Mitigating Air Quality Impacts* (2015b), SJVAPCD also recommends that lead agencies and project applicants conduct a site-specific ambient air quality analysis if maximum daily emissions of any criteria air pollutants or precursors would exceed a screening criterion of 100 lb/day (SJVAPCD 2015b). The purpose of a site-specific ambient air quality analysis is to determine whether a project would result in, or contribute to, a localized exceedance of a NAAQS or CAAQS at receptors located near the emissions-generating activity. Table 2-5 summarizes the maximum daily emissions for all criteria pollutants and precursors associated with project construction. The maximum daily emissions of ROG, CO, PM_{10}, and $PM_{2.5}$ occur during the overlap of the underground work, PV system installation, battery storage system installation, substation and gen-tie line installation, and PG&E substation modifications phases. The maximum daily emissions of NO_X and SO_X occur during the overlap of the site preparation, underground work, and PV system installation phases.

Table 2-5 Maximum Daily Construction-Generated Emissions of Criteria Air Pollutants and Precursors with Tier 4 Final Engines and Regulation VIII Measures

	Projected Timing		Daily Emissions per Phase (pounds per day)					
Construction Phase	Start	End	ROG	NO_X	CO	SO_X	PM_{10}	$PM_{2.5}$
Site Preparation	4/2024	9/2024	1.8	54.5	42.2	0.5	29.2	5.9

SJVAPCD Screening Criteria			100	100	100	100	100	100
Exceeds Threshold?			**No**	**No**	**Yes**	**No**	**No**	**No**

Source: Modeling details and output provided in Attachment A.
Note: Total may not add exactly due to rounding.
SJVAPCD = San Joaquin Valley Air Pollution Control District; ROG = reactive organic gases; age system; NO_X = oxides of nitrogen; CO = carbon monoxide; SO_X = oxides of sulfur; PM_{10} = respirable particulate matter with an aerodynamic diameter of 10 microns or less; $PM_{2.5}$ = fine particulate matter with an aerodynamic diameter of 2.5 microns or less; PV = photovoltaic.

The solar project and the PG&E substation improvements would require construction contractors to use Tier 4 Final engines greater than 25 horsepower for off-road equipment to reduce construction-related exhaust emissions. The project would also be required to adhere to SJVAPCD Regulation VIII measures to reduce construction-related fugitive dust emissions. Construction-related emissions reflecting these project features and requirements are shown in Table 2-4 and Table 2-5.

As indicated in Table 2-4 and Table 2-5, construction of the project would not generate emissions in excess of SJVAPCD's adopted annual thresholds. However, emissions would exceed SJVAPCD's Ambient Air Quality Analysis (AAQA) screening-level threshold for CO. Pursuant to SJVAPCD's *Guide for Assessing and Mitigating Air Quality Impacts* (SJVAPCD 2015b), a dispersion analysis was performed to evaluate if CO concentrations would exceed CAAQS or NAAQS.

Modeled CO concentrations are summarized in Table 2-6. The increase in the CO pollutant concentration associated with project construction is added to the background concentration from the Modesto air quality monitoring station at 814 14th Street from years 2019 through 2021 to estimate the total pollutant concentration for comparison with the ambient air quality standards (EPA 2023e).

Table 2-6 Carbon Monoxide AAQA Concentration Results

	1-hour Average		8-hour Average	
CO Concentration (µg/m3)	CAAQS	NAAQS	CAAQS	NAAQS
Maximum Incremental Off-site	337	301	50	48
Background	3335	2530	2185	2070
Total Off-site	3672	2831	2235	2118
Standard (µg/m3 equivalent)	23,000	40,000	10,000	10,000

Source: Modeling output provided in Attachment A.
Note: Total may not add exactly due to rounding.
CAAQS = California Ambient Air Quality Standards; NAAQS = National Ambient Air Quality Standards; µg/m3 = micrograms (one-millionth of a gram) per cubic meter air.

As shown in Table 2-6, total maximum CO concentrations due to project construction would be less than both CAAQS and NAAQS CO standards. Therefore, the project would not result in, or contribute to, a localized exceedance of NAAQS or CAAQS. In addition, as discussed in the regulatory setting in Section 2.1.3, *Local*, all earth-disturbing activities during project construction would be required to implement the fugitive dust-control measures required by SJVAPCD Regulation VIII (e.g., watering areas of disturbed soil, limiting the speed of vehicles traveling on unpaved surfaces), which would minimize the project's contribution to localized concentrations of PM_{10} and $PM_{2.5}$.

As described in section 2.2.3, the SJVAB is designated as being in nonattainment with respect to NAAQS and CAAQS for both ozone and $PM_{2.5}$ as well as the CAAQS for PM_{10}. Certain individuals residing in areas that do not meet the ambient air quality standards, including Merced County, could be exposed to pollutant concentrations that cause or aggravate acute and/or chronic health conditions (e.g., asthmas, lost work days, premature mortality). As previously discussed, the magnitude and locations of any potential changes in ambient air quality, and thus health consequences, from these additional emissions cannot be quantified with a high level of certainty due to the dynamic and complex nature of pollutant formation and distribution (e.g., meteorology, emissions sources, sunlight exposure). However, it is known that public health will continue to be affected in Merced County so long as the region does not attain the CAAQS or NAAQS. However, since construction-related criteria pollutant emissions associated with the project would not exceed SJVAPCD significance thresholds or NAAQS or CAAQS standards, construction emissions would not be expected to contribute a significant level of air pollution such that regional air quality within the SJVAB would be degraded.

In summary, construction-generated emissions of criteria air pollutants and precursors would not exceed the applicable annual mass emission thresholds recommended by SJVAPCD (as shown in Table 2-4) and, therefore, would not result in, or contribute to, an exceedance of the NAAQS or CAAQS in the SJVAB. In addition, construction activity would not generate more than 100 lb/day of any criteria air pollutant or precursor except CO (as shown in Table 2-5). An AAQA was conducted for CO, showing that there would be no localized exceedance of CAAQS and NAAQS standards for CO. Also, the project would implement fugitive dust-control measures pursuant to SJVAPCD Regulation VIII.

Impact AQ-2: Long-Term Operational Emissions of Criteria Air Pollutants and Precursors

As part of long-term solar project operations, mobile-source emissions of criteria air pollutants and precursors would result from vehicle trips to and from the solar project site by maintenance and inspection personnel and delivery vehicles, including trucks that deliver water for periodic washing of the PV panels.

Other sources of operational emissions would include the use of maintenance equipment for washing panels and landscape maintenance equipment, such as mowers. The use of various consumer products, such as cleaning chemicals, would also generate emissions of ROGs. However, emissions levels from these sources would be nominal, given the low number of new buildings that would be part of the solar project. An on-site, 50-kilowatt, propane-fueled emergency generator would require periodic testing and maintenance, which would generate criteria air-pollutant emissions.

Table 2-7 summarizes the annual level of mobile-source emissions of criteria air pollutants and precursors associated with the solar project's first year of operation (2025). As shown in Table 2-7, annual emissions of criteria air pollutants and precursors associated with operation of the solar project would not exceed annual mass-emission thresholds recommended by SJVAPCD. Therefore, at the regional level, operational emissions of criteria air pollutants and precursors would not result in, or contribute to, an exceedance of NAAQS or CAAQS in the SJVAB.

Table 2-7 Annual Operational Emissions of Criteria Air Pollutants and Precursors

	Annual Emissions (tons per year)					
Source Category	ROG	NO_X	CO	SO_X	PM_{10}	$PM_{2.5}$

SJVAPCD Significance Thresholds	10	10	100	27	15	15
Exceeds Threshold?	**No**	**No**	**No**	**No**	**No**	**No**

Source: Modeling details and output provided in Attachment A.
Note: Total may not add exactly due to rounding.
SJVAPCD = San Joaquin Valley Air Pollution Control District; ROG = reactive organic gases; age system; NO_X = oxides of nitrogen; CO = carbon monoxide; SO_X = oxides of sulfur; PM_{10} = respirable particulate matter with an aerodynamic diameter of 10 microns or less; $PM_{2.5}$ = fine particulate matter with an aerodynamic diameter of 2.5 microns or less.

As explained under Impact AQ-1, SJVAPCD recommends that lead agencies and project applicants conduct a site-specific AAQA if a project's maximum daily emissions of any criteria air pollutant or precursors would exceed a screening criterion of 100 lb/day (SJVAPCD 2015c). Table 2-8 summarizes the maximum daily emissions of criteria air pollutants and precursors associated with operation of the solar project.

Table 2-8 Maximum Daily Operational Emissions of Criteria Air Pollutants and Precursors

	Daily Emissions (pounds per day)					
Source Category	ROG	NO_X	CO	SO_X	PM_{10}	$PM_{2.5}$
Personnel Vehicle Trips	0.1	0.2	1.1	<0.1	7.3	0.8
Water Truck Trips	0.1	4.0	1.2	<0.1	81.8	8.3
Emergency Generator	0.6	0.1	1.5	<0.1	<0.1	<0.1
Project Total	**0.8**	**4.3**	**3.9**	**<0.1**	**89.2**	**9.0**
SJVAPCD Screening Criteria	100	100	100	100	100	100
Exceeds Threshold?	**No**	**No**	**No**	**No**	**No**	**No**

Source: Modeling output provided in Attachment A.
Note: Total may not add exactly due to rounding.
SJVAPCD = San Joaquin Valley Air Pollution Control District; ROG = reactive organic gases; age system; NO_X = oxides of nitrogen; CO = carbon monoxide; SO_X = oxides of sulfur; PM_{10} = respirable particulate matter with an aerodynamic diameter of 10 microns or less; $PM_{2.5}$ = fine particulate matter with an aerodynamic diameter of 2.5 microns or less.

As shown in Table 2-8, the maximum daily emissions of all criteria pollutants and precursors associated with project operations would be less than SJVAPCD's recommended screening criterion of 100 lb/day. Therefore, a site-specific AAQA for operational emissions is not needed, and it is concluded that the project's operational emissions of criteria pollutants and precursors would not result in, or contribute, to a localized exceedance of NAAQS or CAAQS.

The PG&E substation improvements would not increase operational trips to and from the PG&E substation beyond existing conditions, nor would they introduce new emission sources.

As described in section 2.2.3, the SJVAB is designated as being in nonattainment with respect to NAAQS and CAAQS for both ozone and $PM_{2.5}$ as well as the CAAQS for PM_{10}. Certain individuals residing in areas that do not meet the ambient air quality standards, including Merced County, could be exposed to pollutant concentrations that cause or aggravate acute and/or chronic health conditions (e.g., asthmas, lost work days, premature mortality). As previously discussed, the magnitude and locations of any potential changes in ambient air quality, and thus health consequences, from these additional emissions cannot be quantified with a high level of certainty due to the dynamic and complex nature of pollutant formation and distribution (e.g., meteorology, emissions sources, sunlight exposure). However, it is known that public health will continue to be affected in Merced County so long as the region does not attain the CAAQS or NAAQS. However, since operations-related criteria pollutant emissions associated with the project would not exceed SJVAPCD significance thresholds or NAAQS or CAAQS standards, operational emissions would not be expected to contribute a significant level of air pollution such that regional air quality within the SJVAB would be degraded.

In summary, the project's operational emissions of criteria air pollutants and precursors would not exceed any annual mass emission thresholds recommended by SJVAPCD (as shown in Table 2-7) and, therefore, would not result in, or contribute to, an exceedance of NAAQS or CAAQS in the SJVAB. In addition, because project operations would not generate more than 100 lb/day of any criteria air pollutant or precursor on any day (as shown in Table 2-8), operational emissions would not result in, or contribute, to a localized exceedance of the NAAQS or CAAQS.

Decommissioning Activities

At the end of the operational life of the solar project (approximately 35 years), EDPR would decommission and remove the system and its components and return the site to existing conditions. The solar project site could then be converted to other uses in accordance with applicable land-use regulations in effect at that time. All decommissioning and restoration activities would adhere to the requirements of the appropriate governing authorities and would be conducted in accordance with all applicable federal, state, and County regulations. A collection and recycling program would be executed to dispose of the site materials.

The solar project's decommissioning activities were evaluated qualitatively because the extent of the activities and equipment amounts for decommissioning is unknown at this time. It is anticipated that decommissioning activities would be less intensive than that of project construction, the emissions of which are analyzed under Impact AQ-1. The decommissioning and site reclamation process is expected to take 12 months, which is less than the 14-month construction schedule for the project, and may be completed in multiple phases, which would reduce maximum daily emissions by spreading decommissioning activities over the entire 12-month timespan. Furthermore, the types of off-road equipment and vehicles used in the future are anticipated to be much more emission-efficient than the existing fleet due to increasingly more stringent emission-control regulations. For many future equipment and vehicle types, criteria-pollutant emissions are anticipated to be zero due to electrification of equipment and vehicles and other technological advances. Because emissions generated from decommissioning activities would be expected to be less than project construction emissions, it is expected that emissions of criteria air pollutants and precursors associated with decommissioning of the project would not exceed SJVAPCD-established annual mass-emission thresholds or daily emissions-screening criteria.

As described in section 2.2.3, the SJVAB is designated as being in nonattainment with respect to NAAQS and CAAQS for both ozone and $PM_{2.5}$ as well as the CAAQS for PM_{10}. Certain individuals residing in areas that do not meet the ambient air quality standards, including Merced County, could be exposed to pollutant concentrations that cause or aggravate acute and/or chronic health conditions (e.g., asthmas, lost work days, premature mortality). As previously discussed, the magnitude and locations of any potential changes in ambient air quality, and thus health consequences, from these additional emissions cannot be quantified with a high level of certainty due to the dynamic and complex nature of pollutant formation and distribution (e.g., meteorology, emissions sources, sunlight exposure). However, it is known that public health will continue to be affected in Merced County so long as the region does not attain the CAAQS or NAAQS. However, since decommissioning-related criteria pollutant emissions associated with the project would not exceed SJVAPCD significance thresholds or NAAQS or CAAQS standards, decommissioning emissions would not be expected to contribute a significant level of air pollution such that regional air quality within the SJVAB would be degraded. Therefore, emissions of criteria air pollutants and precursors generated during decommissioning of the project would not result in, or contribute to, an exceedance of NAAQS or CAAQS in the SJVAB, or result in localized concentrations of criteria air pollutants that exceed NAAQS or CAAQS.

Impact AQ-3: Mobile-Source Concentrations of Carbon Monoxide

Local, mobile-source CO emissions near roadway intersections are a direct function of traffic volume, speed, and delay. Transport of CO is extremely limited because CO disperses rapidly with distance from the source under normal meteorological conditions. However, under certain specific meteorological conditions, CO concentrations near congested roadways and/or intersections may reach unhealthy levels at sensitive land uses within a few hundred feet.

The local intersections around the project site, including the intersection of Billy Wright Road with SR 152/33 and the intersection of Billy Wright Road and West Pioneer Road, do not experience long queues of waiting vehicles during the peak traffic hours under existing conditions. Although up to 400 workers may travel to and from the project site during the most labor-intensive phases of project construction, the associated level of vehicle activity would not result in long periods of excessive queueing at any intersections or roadway segments within 500 feet of sensitive receptors, such as residences, schools, or childcare facilities (KD Anderson & Associates, Inc. 2022). Furthermore, as required with implementation of the project's Construction Traffic Control Plan, measures to reduce localized congestion would be implemented, as needed, including detour routes.

After the solar project is constructed, visitors to the solar project site would include up to eight daily personnel from off-site Operations and Maintenance facilities, occasional contractors, and occasional delivery vehicles. Thus, the number of vehicle trips associated with solar project operations would not result in a notable level of congestion at nearby intersections. The PG&E substation improvements would not increase operational trips to and from the PG&E substation beyond existing conditions. For these reasons, the increased level of vehicle activity on nearby roadways during both project construction and operations would not cause any operational deficiencies at any area intersections or add a substantial amount of traffic to any intersection operating at an unacceptable level of service (LOS) such that project-generated traffic would result in, or contribute to, an exceedance of the NAAQS or CAAQS for CO.

Impact AQ-4: Exposure of Sensitive Receptors to Toxic Air Contaminants and Associated Health Risk

As discussed in Section 2.1.2, *State*, DPM is classified as a carcinogenic TAC by CARB and is the primary pollutant of concern with regard to health risks to sensitive receptors during proposed project construction and operations. The operation of diesel-powered construction equipment and heavy-duty trucks could potentially expose nearby sensitive receptors to concentrations and elevated levels of health risk. Health risks from exposure to DPM are assessed quantitatively based on anticipated project emissions and the proximity of sensitive receptors to the project site, including multiple residential dwellings, as discussed in Section 1.3, *Nearby Land Uses and Sensitive Receptors*.

Table 2-9 shows the cancer risk and noncancer hazard index at the maximum affected residence based on an HRA conducted to evaluate construction and operations-related emissions of DPM. Detailed dispersion modeling and health-risk calculations are provided in Attachment B.

Table 2-9 Estimated Health Risk during Construction and Operations

Location	Cancer Risk (cases per million)	Chronic Hazard Index
Maximum Incremental Risk at Existing Receptors	0.6	0.0005
SJVAPCD Significance Thresholds	20.0	1.00

Source: Attachment B.
SJVAPCD = San Joaquin Valley Air Pollution Control District.

As shown in Table 2-9, implementation of the proposed project would not result in increased cancer risk or hazard index in excess of SJVAPCD-established significance thresholds.

Impact AQ-5. Exposure of Sensitive Receptors to Risk of Valley Fever

Construction activities that include ground disturbance can result in fugitive dust, which can cause spores of the *Coccidioides immitis* fungus to become airborne if they are present in the soil. Such activities include digging, operating earthmoving equipment, driving vehicles over dirt surfaces, or working in dusty, wind-blown areas. If inhaled by on-site construction workers or off-site receptors, these spores can cause Valley Fever, as described in Section 2.2.5, *Valley Fever*.

Given the endemic nature of the disease and the existing number of earthmoving activities in the County related to agricultural activities, grading and excavation for new land-use development, and surface-mining operations, it is not possible to attribute a specific case of Valley Fever to a specific earthmoving activity. Ground-disturbance activities represent a continual source of spores that contribute to Valley Fever cases reported each year. Construction associated with the project would result in similar localized ground disturbance activities to those that occur continually in the County.

OSHA regulates workplace safety to protect workers, including by requiring respiratory protection (29 Code of Federal Regulations § 1910.134). California, under an agreement with OSHA, operates an occupational safety and health program in accordance with Section 18 of the Occupational Safety and Health Act of 1970. The Department of Industrial Relations administers the California Occupational Safety and Health Program, commonly referred to as Cal/OSHA. Under state law, employers must "establish, implement and maintain an effective injury illness and protection plan" that includes "a system for ensuring that employees comply with safe and healthy work practices," "a system for communicating with employees in a form readily understandable by all affected employees on matters relating to occupational safety and health," "procedures for identifying and evaluating work place hazards," "a procedure to investigate occupational injury or occupational illness," "methods and/ or procedures for correcting unsafe or unhealthy conditions, work practices and work procedures," and "training and instruction" (8 CCR § 3203). Because Valley Fever infection occurs when a spore is inhaled, workers who disturb soil where fungal spores are found are most likely to breathe in spores and become infected. Accordingly, requirements for respiratory protection (29 Code of Federal Regulations § 1910.134) would be particularly applicable. California's Department of Industrial Relations enforces these laws on construction sites. Because ground disturbance in the County is ongoing, the number of cases of Valley Fever reported in the County is low each year, and independently enforceable protections of worker safety and health are in place, the risk is low that fugitive dust caused by the project would cause substantial adverse effects on human beings. However, because the potential consequences of contracting Valley Fever are high (potentially including death), this analysis conservatively concludes that solar project-generated fugitive dust could expose on-site workers and off-site receptors to spores of the *Coccidioides immitis* fungus.

Potential impacts related to Valley Fever associated with the PG&E substation improvements would be addressed through implementation of the standard PG&E Avoidance and Minimization Measures/Best Management Practices (AMM/BMPs):

- Apply water to disturbed areas and to storage stockpiles.
- Apply water in sufficient quantities to prevent dust plumes during activities such as clearing & grubbing, backfilling, trenching and other earth moving activities.
- Limit vehicle speed to 15 miles per hour.
- Load haul trucks with a freeboard (space between top of truck and load) of six inches or greater.

- Cover the top of the haul truck load.
- Clean-up track-out at least daily.
- Not generate dust in amounts that create a nuisance to wildlife or people, particularly where sensitive receptors such as schools and hospitals are located nearby or down-wind. During inactive periods (e.g. after normal working hours, weekends, and holidays), the crew shall apply water or other approved material to form a visible crust on the soil and restrict vehicle access.

In addition, the PG&E substation improvements would require a limited amount of ground disturbance and extent of area to be graded.

Recommended Measure AQ-1: Implement Additional Dust Control Measures to Reduce Exposure to the *Coccidioides Immitis* Fungus During Solar Project Construction.

In addition to implementing the dust control measured required by SJVAPCD Regulation VIII, including the dust control measures listed in Table 2-2 of this report, the solar project applicant should require its construction contractors to implement supplement measures to reduce exposure of on-site workers and off-site receptors to fugitive dust emissions that contain spores of the *Coccidioides immitis* fungus that can cause Valley Fever, including but not limited to the following:

- If wind speeds exceed 15 miles per hour or temperatures exceed 95°F for 3 consecutive days, additional dust suppression measures (such as additional water or the application of additional soil stabilizer) will be implemented prior to and immediately following ground-disturbing activities. The additional dust suppression will continue until winds are 10 miles per hour or lower and outdoor air temperatures are below 90°F for at least 2 consecutive days. The additional dust-suppression measures will be incorporated into the Final Construction Management Plan, which will be submitted to the County for review and approval prior to the issuance of any grading permit.
- Prior to any project grading activity, the primary construction contractor will prepare and implement a worker training program that describes potential health hazards associated with Valley Fever, common symptoms, proper safety procedures to minimize health hazards, and notification procedures if suspected work-related symptoms are identified during construction. The objective of the training will be to ensure that workers are aware of the dangers associated with Valley Fever and incentivize them to implement the required dust-control measures effectively to reduce the potential for their own exposure to the fugus. The worker training program will be included in the standard, in-person training for construction workers and will identify safety measures to be implemented by construction contractors during construction, including all safety measures listed here. Prior to initiating any grading, the project applicant will provide the County with copies of all educational training material for review and approval. No later than 30 days after any new employee(s) begin work, the project applicant will submit evidence to the County that each employee has acknowledged receipt of the training (e.g., sign-in sheets with a statement verifying receipt and understanding of the training).
- Thoroughly clean construction tools, equipment, and vehicles with water before they are moved off site to other work locations.

- Wheel-washing facilities with water-recycling systems will be provided at all site-egress points. Vehicles leaving the site on a daily basis will utilize wheel-washing facilities in order to reduce dust migration off the project site.
- The area immediately behind grading or trenching equipment will be sprayed with water before ground workers move into the area.
- Wherever possible, grading, and trenching work will be phased so that earthmoving equipment is working well ahead or downwind of workers on the ground.

Impact AQ-6. Exposure of Sensitive Receptors to Objectionable Odors

During construction, exhaust from construction equipment may produce discernible odors typical of most construction sites that some people may find objectionable if exposed for an extended period. Such odors could be a temporary nuisance to off-site areas close to where on-site construction activity would take place. However, these odors would dissipate with distance, and emissions-generating construction activity would not take place in any single portion of the project site for an extended period. Also, the density of land-use development areas around the project site is relatively low. Furthermore, the amount of diesel exhaust–emitting activity during operation of the project (i.e., equipment used for cleaning solar panels) would be minor and even more intermittent than odor-generating construction activity. Moreover, the project would not be one of the odor-generating project types for which SJVAPCD recommends specific set-back distances (i.e., wastewater-treatment facility, landfill, solid waste–transfer station, composting facility, refinery, chemical manufacturing, painting/coating operations, food-processing facility, feed lot, or rendering plant; CARB 2005). For these reasons, objectionable odors generated by construction and operation the project would not adversely affect a substantial number of people.

Impact AQ-7: Consistency with the Clean Air Plan

In its *Guidance for Assessing and Mitigating Air Quality Impacts* (2015b), SJVAPCD states that projects that would generate emissions of criteria air pollutants and precursors that do not exceed SJVAPCD-established mass emission thresholds would "not conflict or obstruct implementation of the District's air quality plan" (SJVAPCD 2015b). As shown under Impact AQ-1, mitigated construction-generated emissions of criteria air pollutants and precursors would not exceed the applicable annual mass emission threshold recommended by SJVAPCD (as shown in Table 2-4). Although mitigated maximum daily construction-generated emissions of CO would exceed SJVAPCD's daily threshold for requiring that a site AAQA be conducted (as shown in Table 2-5), CO concentrations are shown to be below CAAQS and NAAQS standards for CO (as shown in Table 2-6). Moreover, as shown under Impact AQ-2, operational emissions of criteria air pollutants and precursors would not exceed the applicable annual mass-emission threshold recommended by SJVAPCD (as shown in Table 2-7); and maximum daily operational emissions of criteria air pollutants and precursors would not exceed SJVAPCD's criteria for requiring that a site AAQA be conducted (as shown in Table 2-8). Therefore, emissions of criteria air pollutants and precursors generated by construction and operation of the project would not conflict with air-quality planning efforts in the SJVAB.

2.3.4 Cumulative Impacts to Air Quality

Construction and operation of the project would result in emissions of criteria air pollutants and precursors in the SJVAB, which, as explained in Section 2.2.3, *Attainment Designations*, is designated as nonattainment with respect to NAAQS and CAAQS for both ozone and $PM_{2.5}$ as well as the CAAQS for PM_{10} (SJVAPCD 2022). SJVAB experiences exceedances of these ambient air quality standards as a consequence of past and present projects.

Ozone impacts are the result of cumulative emissions from numerous sources in the region and transport from outside the region. As explained in Section 2.2.2, *Criteria Air Pollutants*, ozone is formed in chemical reactions involving NO_X, ROG, and sunlight. Only the largest individual sources emit NO_X and ROG in amounts that could have a measurable effect on ambient ozone concentrations. However, when all sources throughout the SJVAB are combined, they can result in severe ozone problems. Because the region is designated as nonattainment with respect to NAAQS and/or CAAQS for ozone, PM_{10}, and $PM_{2.5}$, emissions from cumulative development are inherently cumulative.

CEQA-related air-quality thresholds of significance are tied to achieving or maintaining attainment designations with respect to the NAAQS and CAAQS, which are scientifically substantiated, numerical concentrations of criteria air pollutants considered to be protective of human health.

SJVAPCD has established mass-emission thresholds for construction and operational emissions of criteria air pollutants and precursors to determine whether a project's discrete emissions would result in a cumulative, regional contribution (i.e., significant) to the existing nonattainment in the SJVAB. In developing mass-emission thresholds of significance to evaluate the contribution of emissions of individual projects, SJVAPCD analyzed emission values against the SJVAPCD's offset thresholds for ozone precursors, which, when applied, would prevent further deterioration of ambient air quality in the SJVAB. The mass-emission thresholds recommended by SJVAPCD for PM_{10} and $PM_{2.5}$ were adapted from the SJVAPCD's PM_{10} New Source Review offset thresholds (SJVAPCD 2015b). Using these parameters, SJVAPCD has quantitative thresholds of significance for project-level CEQA evaluation that may be used to determine the extent to which a project's emissions of criteria air pollutants and precursors would contribute to the regional degradation of ambient air quality within the SJVAB. SJVAPCD also directs lead agencies to consider the cumulative impact of multiple simultaneously proposed projects, located within the same area. If the combined impacts of such projects cause or worsen an exceedance of the concentration standards, the project would have a cumulatively significant impact.

As discussed under Impact AQ-1 and Impact AQ-2, the mass emissions of ozone precursors (i.e., ROG and NO_X), PM_{10}, and $PM_{2.5}$ associated with project construction and operation would not exceed the SJVAPCD-recommended mass-emission thresholds and, therefore, would not contribute to the nonattainment status for ozone, PM_{10}, or $PM_{2.5}$ in the SJVAB, result in greater acute or chronic health impacts compared to existing conditions, or conflict with air quality planning efforts. When evaluating the project's emissions of criteria air pollutants and precursors against SJVAPCD's thresholds of significance, it is not foreseeable that the health complications associated with exposure to ozone, PM_{10}, or $PM_{2.5}$ would be exacerbated by the project. One potential cumulative project, the Parkway Project, was identified for purposes of the CEQA analysis. The Parkway Project is an approved Development Agreement for 1,836 residential units within Santa Nella Community Specific Plan, approximately one mile north of the solar project site. Construction of the Parkway Project has not commenced. The Development Agreement expires in August 2023 with the option to extend it for another eight years. As such, it is not anticipated that the Parkway Project will be

constructed concurrently with the proposed project. Therefore, there would be no simultaneously proposed projects located within the same area as the project during project construction. Also, as explained in Impact AQ-7, the project would not conflict with clean-air planning efforts in the SJVAB.

As stated under Impact AQ-3, given that the solar project would be visited by up to eight daily maintenance and inspection personnel, and would include up to 20 parking spaces for personnel, contractors, and delivery vehicles, the project would not generate a number of vehicle trips that could cause, or contribute in any meaningful way, to traffic congestion or any operational deficiencies at any area intersections. Therefore, the project would not add a substantial amount of traffic to any congested intersection such that it, in combination with traffic generated by other reasonably foreseeable projects, would result in an exceedance of NAAQS or CAAQS for CO under future conditions. This would especially be the case because CO emissions from motor vehicles are expected to continue to decrease as emission standards improve and more electric vehicles enter the statewide fleet.

As described in Section 8.8.6 of SJVAPCD's *Guidance for Assessing and Mitigating Air Quality Impacts*, the project-level thresholds for TACs noted under Impact AQ-3 also apply as the cumulative-level thresholds for TACs. As discussed under Impact AQ-4, TAC emissions associated with construction and operation of the project would not result in a substantial increase in health-risk exposure at off-site sensitive receptors, increases in cancer risk greater than 20 in 1 million, nor a hazard index greater than 1. An HRA was conducted to examine the project's construction and operations-related TAC emissions in accordance with SJVAPCD guidance to determine the incremental increase in health-risk exposure at off-site sensitive receptors. The results of the HRA indicate that, at the point of maximum impact, the level of cancer risk would be 0.6 in 1 million, and the hazard index for long-term chronic risk would be 0.0005. These levels of health risk would not exceed SJVAPCD's incremental increase threshold for cancer risk of 20 in 1 million, nor its threshold for chronic risk (i.e., a hazard index greater than 1.0).

As discussed under Impact AQ-5, implementation of Mitigation Measure AQ-1 during project construction would minimize the potential for off-site receptors to become exposed to fugitive dust containing spores of the *Coccidioides immitis* fungus, which cause Coccidioidomycosis, more commonly known as Valley Fever. Valley Fever is a localized, rather than regional, pollutant. No other reasonably foreseeable dust-generating projects have been identified in the project vicinity.

As discussed under Impact AQ-6, emissions of odorous diesel exhaust during project construction and operations would not be generated in any specific location on the project site for an extended period (including those parts of the project site near off-site residences) and would dissipate with distance. Also, the project would not be one of the odor-generating project types for which SJVAPCD recommends specific set-back distances (i.e., wastewater-treatment facility, landfill, solid waste–transfer station, composting facility, refinery, chemical manufacturing, painting/coating operations, food-processing facility, feed lot, or rendering plant). Moreover, odor impacts are generally an issue of localized concern because it is unusual for odorous emissions from two or more separate projects to combine to result in a cumulative odor impact. No other reasonably foreseeable odor-generating projects have been identified in the project vicinity.

Chapter 3
Greenhouse Gases and Climate Change

3.1 Regulatory Setting

GHG emissions are addressed by various international, federal, state, regional, and local government agencies, as presented in greater detail below.

3.1.1 International Agreements

In 2015, the 21st session of the Conference of Parties took place in Paris, France. The session included representatives from 196 parties to the United Nations Framework Convention on Climate Change. The Paris Climate Agreement included limiting global temperature increases to well below 2 degrees Celsius (°C), establishing binding commitments so all parties make Nationally Determined Contributions (NDCs), pursuing domestic policies to achieve the NDCs, and having all countries report regularly regarding their emissions and progress made in implementing and achieving their NDCs. In April 2016, 174 states and the European Union signed the agreement, including the United States. However, on November 4, 2019, former President Donald Trump formally notified the United Nations that the United States would withdraw from the Paris Climate Agreement. The United States then entered a 1-year process for exiting the deal, which officially occurred on November 4, 2020; however, President Joseph Biden, who assumed office on January 20, 2021, submitted the United States instrument of acceptance to rejoin the agreement on his first day in office (United States White House 2021). President Biden's EO No. 14008, released on January 27, 2021, begins the process of developing the United States' NDCs and ratifying the Kigali Amendment, among other things. The Kigali Amendment is a 2016 global pact under the Montreal Protocol to phase down climate-warming hydrofluorocarbons (HFCs) over the coming decades. It will ultimately fall to the United States Senate to determine whether to move forward with Kigali ratification.

The Under2 Coalition is an international coalition of jurisdictions that signed the Global Climate Leadership Memorandum of Understanding (Under2 MOU), following former President Trump's decision to withdraw from the Paris agreement. The Under2 MOU aims to limit global warming to 2°C, limit GHGs to 80 to 95 percent below 1990 levels, and/or achieve an annual per capita emissions goal of less than 2 metric tons by 2050. The Under2 MOU has been signed or endorsed by more than 220 jurisdictions, representing 32 countries and six continents. Included among the jurisdictions is California.

3.1.2 Federal Plans, Policies, Laws, and Regulations

In *Massachusetts et al. v. Environmental Protection Agency et al.*, 549 U.S. 497 (2007), the Supreme Court of the United States ruled that carbon dioxide (CO_2) is an air pollutant as defined under the federal CAA and that EPA has the authority to regulate GHG emissions.

In 2010, EPA started to address GHG emissions from stationary sources through its New Source Review permitting program, including operating permits for "major sources" issued under Title V of the federal CAA. Most coal- and natural gas–fired electricity-generation plants are considered major sources.

As stated in Section 2.1.1, *Federal*, the CAFE standards result in reductions in GHG from light-duty vehicles, the SAFE Vehicles Rule would make these standards less stringent, and the president has issued an EO requiring NHTSA and EPA to review the SAFE Vehicles Rule. On December 12, 2021, NHTSA repealed the SAFE Vehicles Rule, Part One. On December 19, 2021, NHTSA finalized its vehicle efficiency–standards rule to reach a projected industrywide target of 40 mpg by 2026, an approximately 25 percent increase over the prior SAFE Vehicles Rule. Lastly, on March 9, 2022, EPA reinstated California's authority under the CAA to implement its own GHG-emissions standards and sales mandate regarding zero-emission vehicles. This action concluded EPA's reconsideration of 2019's SAFE Vehicles Rule, Part One, by finding that actions under the previous administration, as part of SAFE-1, were decided in error; the actions are now rescinded.

3.1.3 State Plans, Policies, Laws, and Regulations

Statewide GHG Emission Targets and the Climate Change Scoping Plan

GHG emission targets established by the state legislature include reducing statewide GHG emissions to 1990 levels by 2020 (Assembly Bill [AB] 32 of 2006) and reducing them to 40 percent below 1990 levels by 2030 (Senate Bill [SB] 32 of 2016). EO S-3-05 calls for statewide GHG emissions to be reduced to 80 percent below 1990 levels by 2050. EO B-55-18 calls for California to achieve carbon neutrality by 2045 and achieve and maintain net-negative GHG emissions thereafter. These targets are in line with the scientifically established levels needed in the United States to limit the rise in global temperature to no more than 2°C, the warming threshold at which major climate disruptions, such as super droughts and rising sea levels, are projected; these targets also pursue efforts to limit the temperature increase even further to 1.5°C (United Nations 2015).

California's 2017 Climate Change Scoping Plan (2017 Scoping Plan), prepared by CARB, outlines the main strategies California will implement to achieve the legislated GHG emission target for 2030 and "substantially advance toward our 2050 climate goals" (CARB 2017b). It identifies the reductions needed by each GHG emission sector (e.g., transportation, industry, electricity generation, agriculture, commercial and residential, pollutants with high global warming potential, recycling and waste).

In November 2022, CARB adopted the 2022 Scoping Plan Update, which identifies a technologically feasible and equity-focused pathway for the state to achieve carbon neutrality by 2045. The 2022 update outlines three alternatives for meeting the state's climate goals: two different alternatives would achieve carbon neutrality by 2035, which would require an acceleration of the 2030 and 2045 GHG goal progress. A third alternative identifies a pathway to attain carbon neutrality by 2045 (CARB 2022b).

The state has also passed more detailed legislation addressing GHG emissions associated with industrial sources, transportation, electricity generation, and energy consumption, as summarized below.

Legislation Addressing Electricity Generation

The state has passed legislation requiring the increasing use of renewables to produce electricity for consumers. California utilities are required to generate 33 percent of their electricity from renewables by 2020 (SB X1-2 of 2011), 52 percent by 2027 (California Renewables Portfolio Standard Program [RPS] [SB 100 of 2018]), 60 percent by 2030 (also SB 100 of 2018), and 100 percent by 2045 (also SB 100 of 2018).

SB 1368 of 2006 required the California Public Utilities Commission (CPUC) to establish a GHG-emission performance standard for baseload generation from investor-owned utilities by February 1, 2007. The California Energy Commission (CEC) was also required to establish a similar standard for local, publicly owned utilities by June 30, 2007. These standards cannot exceed the GHG emission rate from a baseload combined-cycle natural gas–fired plant. The standard is set at a level of GHG emissions equal to those of a combined-cycle natural-gas plant on a per-MWh basis, or 1,100 pounds of CO_2 per MWh (0.5 metric tons of carbon dioxide equivalent [$MTCO_2e$]/MWh; CPUC 2007). CPUC's recent analysis has shown an emission factor of 0.337 $MTCO_2e$/MWh for the year 2020 (CPUC 2021). The legislation further requires that all electricity provided to California, including imported electricity, must be generated from plants that meet the standards set by CPUC and CEC.

Fuel Efficiency Standards for Light-Duty Passenger Vehicles

AB 1493 of 2002 (Pavley I) required CARB to develop and implement regulations to reduce automobile and light-truck GHG emissions. These stricter emissions standards were designed to apply to automobiles and light trucks beginning with the model year 2009. Additional strengthening of the Pavley standards (referred to previously as *Pavley II* and now referred to as the *Advanced Clean Cars* measure) was adopted for vehicle model years 2017–2025 in 2012. Together, the two standards were expected to increase average fuel economy to roughly 54.5 miles per gallon in 2025.

As described in Section 2.1.1, *Federal*, in the SAFE Vehicles Rule, NHTSA and EPA proposed to amend the current fuel-efficiency standards for passenger cars and light trucks and establish new standards covering model years 2021–2026 by maintaining the current model year 2020 standards through 2026. California, 22 other states, the District of Columbia, and two cities filed suit against the proposed action on September 20, 2019 (*California et al. v. United States Department of Transportation et al.*, 1:19-cv-02826, U.S. District Court for the District of Columbia). The lawsuit requests a "permanent injunction prohibiting Defendants from implementing or relying on the Preemption Regulation," but does not stay its implementation during legal deliberations. Part One of the SAFE Vehicles Rule went into effect on November 26, 2019, and Part Two went into effect on March 30, 2020.

On January 20, 2021, the president issued an EO directing NHTSA and EPA to review the SAFE Vehicles Rule, Part One, and propose a new rule for suspending, revising, or rescinding it by April 2021. The EO also required NHTSA and EPA to propose a new rule for suspending, revising, or rescinding Part Two by July 2021.

On December 12, 2021, NHTSA repealed the SAFE Vehicles Rule, Part One. On December 19, 2021, NHTSA finalized its vehicle efficiency standards rule to reach a projected industrywide target of 40 mpg by 2026, an approximately 25-percent increase over the prior SAFE Vehicles Rule. Lastly, on March 9, 2022, EPA reinstated California's authority under the CAA to implement its own GHG-emissions standards and sales mandate regarding zero-emission vehicles. This action concluded EPA's reconsideration of 2019's SAFE Vehicles Rule, Part One, by finding that actions under the previous administration, as part of SAFE-1, were decided in error; the actions are now rescinded.

Tractor-Trailer Greenhouse Gas Regulation

In 2013 CARB approved the Tractor-Trailer Greenhouse Gas Regulation to reduce GHG emissions by requiring the use of aerodynamic tractors and trailers with low-rolling-resistance tires. The regulation applies to certain Class 8 tractors manufactured for use in California and is paralleled

with EPA and NHTSA heavy-duty truck standards. This regulation could reduce fuel consumption and GHG emissions from new heavy-duty trucks between 4 and 5 percent per year between 2014 and 2018 (EPA 2015).

Low Carbon Fuel Standard

CARB adopted the Low Carbon Fuel Standard (LCFS) in 2007 to reduce the carbon intensity of California's transportation fuels. The LCFS applies to fuels used by on-road motor vehicles and off-road vehicles, including construction equipment.

Note that the majority of the emissions benefits due to the LCFS come from the production cycle (i.e., upstream emissions) of the fuel rather than the combustion cycle (i.e., tailpipe). As a result, LCFS-related reductions are not included in this analysis of combustion-related emissions of CO_2.

Regional Land Use and Transportation Planning Requirements

In addition to regulations that address tailpipe emissions and transportation fuels, the state legislature has passed regulations to address the amount of driving by light-duty passenger vehicles. Since the passage of SB 375 in 2008, CARB requires metropolitan planning organizations (MPOs) to adopt plans showing reductions in GHG emissions from passenger cars and light trucks in their respective regions for 2020 and 2035 (CARB 2018). If regions develop integrated land use, housing, and transportation plans that meet the SB 375 targets, new projects in these regions can be relieved of certain CEQA review requirements. The Merced County Association of Governments (MCAG) serves as the MPO for Merced County, including all the cities in the County.

CEQA Requirements to Assess Vehicle Miles Travelled

Under SB 743 of 2013, the California Governor's Office of Planning and Research (OPR) proposed changes to the State CEQA Guidelines to require that CEQA transportation analyses move away from focusing on vehicle delay and LOS and instead focus on vehicle miles traveled (VMT). The intent behind SB 743 is to integrate and better balance the needs of congestion management, infill development, active transportation, and GHG-emissions reduction. These changes were adopted by the California Natural Resources Agency, resulting in the addition of Section 15064.3. In support of these changes, OPR published its *Technical Advisory on Evaluating Transportation Impacts in CEQA*, which recommends that the transportation impact of a project be based on whether the project would generate a level of VMT per capita (or VMT per employee) that is 15 percent lower than that of existing development in the region. OPR's technical advisory explains that this criterion is consistent with Section 21099 of the California Public Resources Code, which states that the criteria for determining significance must "promote the reduction in greenhouse gas emissions" (OPR 2017). This metric replaces the use of delay and LOS to measure transportation-related impacts.

Regulation for Reducing Sulfur Hexafluoride Emissions from Gas-Insulated Switchgear

In 2010, CARB adopted the Regulation for Reducing Sulfur Hexafluoride Emissions from Gas Insulated Switchgear (Section 17 CCR § 95350 *et seq.*). This regulation aims to achieve GHG reductions by reducing sulfur hexafluoride (SF_6) emissions from gas-insulated switchgear. Owners of such switchgear must not exceed a maximum allowable annual emission rate of 1.0 percent.

Owners must regularly inventory their gas-insulated switchgear equipment, measure quantities of SF_6, and maintain monitoring records for at least 3 years. Additionally, owners must report SF_6 emissions annually to CARB.

In September 2020, CARB adopted Resolution 20-28 to amend the current regulation to phase out acquisition of SF_6 in gas-insulated switchgear in stages between 2025 and 2033. Under this resolution, CARB would be developing a timeline for phasing out SF_6 equipment in California and creating incentives to encourage owners to replace SF_6 equipment. The Resolution was approved by the California Office of Administrative Law on December 30, 2021 (CARB 2022c).

3.1.4 Local

Merced County Association of Governments Regional Transportation Plan/Sustainable Communities Strategy

In 2012, MCAG adopted its Regional Transportation Plan/Sustainable Communities Strategy for Merced County (RTP/SCS; MCAG 2022). In March 2018, CARB approved updated SB 375 targets tasking MCAG to achieve a 10-percent and a 16-percent reduction in VMT per capita by 2020 and 2035, respectively (CARB 2018).

Merced County

2030 Merced County General Plan

The following policies from the General Plan are relevant to the project (CARB 2018):

- **Policy AQ-1**.1: Energy Consumption Reduction. Encourage new residential, commercial, and industrial development to reduce air quality impacts from energy consumption.
- **Policy AQ**-1.2: Business Energy Reduction Strategies. Encourage all businesses to: replace high mileage fleet vehicles with more efficient and/or alternative fuel vehicles; increase the energy efficiency of facilities; transition toward the use of renewable energy instead of non-renewable energy sources; adopt purchasing practices that promote emissions reductions and reusable materials; and increase recycling.
- **Policy AQ-1.5: Climate Action Plan.** Prepare a Climate Action Plan that includes an inventory of 1990 and 2010 greenhouse gas emissions, determines project air quality impacts using analysis methods and significance thresholds recommended by the SJVAPC, and identify strategies to achieve State emission reduction targets.
- **Policy AQ-1.7: Heat Island Effect Reduction.** Require increased tree canopy and reflective surface materials in order to reduce the heat island effect (i.e., increased temperatures due to heat radiation off paved surfaces and rooftops).
- **Policy AQ-1.8: Climate Change Adaptation.** Prepare appropriate strategies to adapt to climate change based on peer-reviewed scientific findings of the potential impacts.
- **Policy AQ-1.9: Interagency Coordination.** Coordinate with cities, regional, State, and Federal agencies and organizations to collaborate on a comprehensive approach to planning for climate change.

- **Policy AQ-1.10: Public Awareness.** Increase public awareness about climate change and encourage county residents and businesses to become involved in activities and lifestyle changes that will aid in reduction of greenhouse gas emissions.
- **Policy AQ-1.11: Truck-Related Development.** Discourage development that causes significant increases in truck traffic on roads that are not capable of accommodating truck traffic due to pavement section deficiency or other capacity limitations, unless adequate mitigation through fees or improvements in required as part of the permit approval.
- **Policy AQ-2.5: Innovative Mitigation Measures.** Encourage innovative mitigation measures and project redesign to reduce air quality impacts by coordinating with the SJVAPCD, project applicants, and other interested parties.
- **Policy AQ-2.7: Air District Best Performance Standards.** Require the County to use the Best Performance Standards adopted by SJVAPCD during the development review and decision-making process to ensure new projects meet the targets set by SJVAPCD.
- **Policy AQ-3.2: Clean Fleet Vehicles.** Require vehicle replacement practices that prioritize the replacement of older higher emission vehicles and the purchasing of the lowest emission technology vehicles, consistent with cost-effective management of the program.
- **Policy AQ-3.5: Purchasing Preferences.** Institute environmentally responsible purchasing, including giving preference to products that reduce or eliminate indirect greenhouse gas emissions and promote recycling.
- **Policy AQ-4.1: Decrease Vehicle Miles Traveled.** Require diverse, higher-density land uses (e.g., mixed-use and infill development) to decrease vehicle miles traveled.
- **Policy AQ-4.3: Public Transport Use Incentives.** Prepare incentives and programs to encourage use of public transit and decrease vehicle miles traveled.
- **Policy AQ-4.4: Transportation Alternatives.** Require employers and developers to provide employees and residents with attractive, affordable transportation alternatives, such as transit stops, van pool pick-up and drop-off locations, and biking paths/storage.
- **Policy AQ-4.5: Public Education and Awareness.** Support programs that educate the public regarding the impact of individual transportation, lifestyle, and land use decisions on air quality.
- **Policy AQ-4.6: Non-Motorized Transportation.** Encourage non-motorized transportation corridors within and between communities.

Merced County Climate Action Plan

In fall 2018, Merced County began development of a Climate Action Plan to outline a strategy for how the County will reduce its GHG emissions in accordance with statewide targets. The County had not finished preparing its Climate Action Plan at the time of preparing this EIR. Preparation has been slowed, in part, due to the COVID-19 pandemic.

San Joaquin Valley Air Pollution Control District

SJVAPCD recommends methods for analyzing project-generated GHGs in CEQA analyses and offers multiple potential GHG-reduction measures for land-use development projects. SJVAPCD developed thresholds of significance to provide a uniform scale to measure the significance of GHG emissions

from land use and stationary source projects in compliance with CEQA and AB 32 of 2006, which mandates the reduction of statewide GHG emissions to 1990 levels by 2020. SJVAPCD's goals in developing GHG thresholds include ease of implementation, use of standard analysis tools, and emissions mitigation consistent with AB 32 (2006). However, since the passage of SB 32 (2016), which mandates a statewide emissions target of 40 percent below 1990 levels by 2030, SJVAPCD has not developed new significance criteria aligned with this target.

3.2 Existing Setting

3.2.1 Physical Scientific Basis of Greenhouse Gas and Climate Change

Certain gases in the earth's atmosphere, classified as GHGs, play a critical role in determining the earth's surface temperature. Solar radiation enters the atmosphere from space. A portion of the radiation is absorbed by the earth's surface, and a smaller portion of this radiation is reflected toward space. The absorbed radiation is then emitted from the earth as low-frequency infrared radiation. The frequencies at which bodies emit radiation are proportional to temperature. The earth has a much lower temperature than the sun; therefore, the earth emits lower-frequency radiation. Most solar radiation passes through GHGs; however, infrared radiation is absorbed by these gases. As a result, radiation that otherwise would have escaped back into space is instead "trapped," resulting in a warming of the atmosphere. This phenomenon, known as the greenhouse effect, is responsible for maintaining a habitable climate on Earth.

Prominent GHGs contributing to the greenhouse effect are CO_2, methane, nitrous oxide (N_2O), HFCs, perfluorocarbons (PFCs), and SF_6. These six gases are also identified as GHGs in Section 15364.5 of the State CEQA Guidelines. Human-caused emissions of these GHGs in excess of natural ambient concentrations are found to be responsible for intensifying the greenhouse effect and leading to a trend of unnatural warming of the earth's climate, known as *global climate change* or *global warming*. It is "extremely likely" that more than half of the observed increase in global average surface temperature from 1951 to 2010 were caused by the anthropogenic increase in GHG concentrations and other anthropogenic forcing (IPCC 2014).

Since the Industrial Revolution (1760–1840), increases in fossil-fuel combustion and deforestation have exponentially increased concentrations of GHGs in the atmosphere. Rising atmospheric concentrations of GHGs in excess of natural levels enhance the greenhouse effect, which contributes to global warming of the earth's lower atmosphere. This warming induces large-scale changes in ocean-circulation patterns, precipitation patterns, global ice cover, biological distributions, and other changes to the earth's system that are collectively referred to as *climate change*.

Climate change is a global problem. GHGs are global pollutants, unlike criteria air pollutants and TACs, which are pollutants of regional and local concern. Whereas most pollutants with localized air-quality effects have relatively short atmospheric lifetimes (approximately 1 day), GHGs have long atmospheric lifetimes (1 year to several thousand years). GHGs persist in the atmosphere long enough to be dispersed around the globe. Although the lifetime of any GHG molecule depends on multiple variables and cannot be determined with any certainty, it is understood that more CO_2 is emitted into the atmosphere than is removed from the atmosphere (i.e., *sequestered*) by ocean uptake, vegetation, and other forms of sequestration. Of the total annual human-caused CO_2

emissions, approximately 55 percent are estimated to be sequestered through ocean and land uptake every year, averaged over the last 50 years, whereas the remaining 45 percent of human-caused CO_2 emissions remain stored in the atmosphere (IPCC 2013).

No single project alone would measurably contribute to an incremental change in the global average temperature or to global or local climates or microclimates. From the standpoint of CEQA, GHG impacts relative to global climate change are inherently cumulative.

3.2.2 Principal Greenhouse Gases

The GHGs listed by the Intergovernmental Panel on Climate Change (IPCC—CO_2, methane, N_2O, HFCs, PFCs, and SF_6—IPCC 2014) are discussed in this section in order of abundance in the atmosphere, and the principal characteristics surrounding these pollutants are discussed below. California law and the State CEQA Guidelines contain a similar definition of GHGs (Health and Safety Code Section 38505(g); 14 CCR 15364.5). Water vapor, the most abundant GHG, is not included in this list because its natural concentrations and fluctuations far outweigh its anthropogenic sources. Consequently, the primary GHGs of concern associated with the proposed project are CO_2, methane, N_2O, and SF_6. Note that HFCs and PFCs are not discussed because those gases would be insignificant or are primarily generated by processes that are not anticipated as part of the proposed project.

- **Carbon Dioxide (CO_2)** enters the atmosphere through the burning of fossil fuels (e.g., oil, natural gas, coal), solid waste, trees and wood products, respiration, and also as a result of other chemical reactions (e.g., manufacture of cement). CO_2 is also sequestered when it is absorbed by plants as part of the biological carbon cycle.
- **Methane (CH_4)** is emitted during the production and transport of coal, natural gas, and oil. Methane also results from livestock emanations and other agricultural practices and by the decay of organic waste in municipal solid-waste landfills.
- **Nitrous Oxide (N_2O)** is emitted during agricultural and industrial activities, as well as during combustion of fossil fuels and solid waste.
- **Sulfur Hexafluoride (SF_6)** is used in gas-insulated switchgear and is emitted from leaks.

Methods have been set forth to describe emissions of GHGs in terms of a single gas to simplify reporting and analysis. The most commonly accepted method to compare GHG emissions is the global warming potential (GWP) methodology defined by the IPCC (IPCC 2007). IPCC defines the GWP of various GHG emissions on a normalized scale that recasts all GHG emissions in terms of carbon dioxide equivalent (CO_2e), which compares the gas in question to that of the same mass of CO_2 (which has a GWP of 1, by definition). The GWP values used in this report are based on the IPCC Fourth Assessment Report and United Nations Framework Convention on Climate Change reporting guidelines and are defined in Table 3-1 (IPCC 2007). The Fourth Assessment Report GWP values are consistent with those used in CARB's 2019 California GHG inventory (CARB 2021b) and *California's 2022 Climate Change Scoping Plan* (CARB 2022b).

Table 3-1 Lifetimes, Global Warming Potentials, and Atmospheric Abundances of Select Greenhouse Gases

Gas	GWP (100 years)	Lifetime (years)[1]	Atmospheric Abundance
CO_2	1	50–200	400 ppm
CH_4	25	9–15	1,834 ppb
N_2O	298	121	328 ppb
SF_6	22,800	3,200	7.8 ppt

Sources: IPCC 2007; CARB 2022b.
[1] Defined as the half-life of the gas.
CO_2 = carbon dioxide; CH_4 = methane; GHG = greenhouse gas; GWP = global warming potential; N_2O = nitrous oxide; ppm = parts per million; ppb = parts per billion; ppt = parts per trillion; SF_6 = sulfur hexafluoride.

3.2.3 Greenhouse Gas Inventory

A *GHG inventory* is a quantification of all GHG emissions within a selected physical and/or economic boundary. GHG inventories can be performed on a large scale (e.g., for global and national entities) or on a small scale (e.g., for a particular building or person). Although many emissions processes are difficult to evaluate, several agencies have developed tools to quantify emissions from certain sources.

As discussed previously, GHG emissions are attributable in large part to human activities. The total GHG inventory for California in 2019 was 418.2 million metric tons of carbon dioxide equivalents ($MMTCO_2e$; CARB 2021a). This is nearly 13 $MMTCO_2e$ less than the 2020 target of 431 $MMTCO_2e$. Table 3-2 summarizes a breakdown of the statewide GHG inventory for California.

Table 3-2 Statewide Greenhouse Gas Emissions by Economic Sector for 2019[1]

Sector	Percent
Transportation	39.7
Industrial	21.1
Electricity generation (in state)	8.9
Electricity generation (imports)	5.2
Agriculture	7.6
Residential	6.7
Commercial	3.8
High Global Warming–Potential Pollutants	4.9
Solid Waste Generation	2.1

Sources: CARB 2021.
[1] The total emissions inventory for California in 2019 was 418.2 million metric tons of carbon dioxide equivalent.

Based on the breakdown shown in Table 3-2, the consumption of electricity in California accounts for approximately 14 percent of the state's GHG emissions.

The mix of renewable technologies related to electricity production within California is composed of wind, solar PV, solar thermal, hydroelectric, geothermal, and biomass. In 2021, California was the nation's top producer of electricity from solar, geothermal, and biomass energy. In 2021, California was the fourth-largest electricity producer in the nation, but the state was also the nation's second-largest consumer of electricity and received about 30 percent of its electricity supply from generating facilities outside of California (USEIA 2022).

3.3 Impacts and Mitigation Measures

3.3.1 Methodology

GHG emissions associated with construction and operation of the project were estimated using the same data and models used to estimate emissions of criteria air pollutants and precursors. Project-related GHG emissions were estimated using information about the phasing of construction activities, the types and numbers of equipment that would be used, and the number of employees and frequency of maintenance activities during project operations, as provided by EDPR, emission factors from CalEEMod Version 2020.4.0 computer program and EMFAC2021 (CARB 2021c), and equations and methodologies consistent with CalEEMod (CAPCOA 2020). Indirect GHG emissions generated by electricity related to water demand for dust control during construction were quantified using the anticipated volume of water consumption, associated electricity-demand factors, and emission factors for PG&E provided by CalEEMod.

The GHGs that were quantitatively estimated for the project include CO_2, methane, and N_2O. Emissions of CO_2e were calculated using the GWP of each of these pollutants, as found in CARB's 2019 California GHG inventory (CARB 2021b), which is consistent with the IPCC Fourth Assessment Report (IPCC 2007).

By generating renewable electricity for at least 35 years, the project would help California meet its RPS targets, including the state's intention of having zero-carbon and eligible renewable-energy sources supply 100 percent of the state's retail electricity consumption by 2045, as mandated by SB 100 (2018). Thus, the electricity generated by the project would replace electricity generated by fossil fuel–based sources. The associated displacement of GHGs is estimated based on the emission performance standard of 0.337 $MTCO_2e/MWh$ that was recently calculated by CPUC (2021).

Detailed model assumptions and inputs for these calculations, based on the construction assumptions provided by EDPR, can be found in Attachment A.

The project is also qualitatively evaluated for its consistency with adopted regulations, plans, and policies aimed at reducing GHG emissions. These include the CARB's 2017 and 2022 Scoping Plans (CARB 2017b, 2022b), the RPS goals, MCAG's adopted RTP/SCS (MCAG 2022), and applicable guidance from SJVAPCD.

3.3.2 Thresholds of Significance

State CEQA Guidelines Section 15064 and relevant portions of Appendix G recommend that a lead agency consider a project's consistency with relevant, adopted plans and discuss any inconsistencies with applicable regional plans, including plans to reduce GHG emissions. Under Appendix G of the State CEQA Guidelines, implementing a project would result in a cumulatively considerable contribution to climate change if it would:

- Generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment; or
- Conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs.

SJVAPCD policy provides for a tiered approach in assessing significance of project-specific GHG-emission increases. As the first tier, SJVAPCD deems that a project complying with an approved GHG emission–reduction plan or GHG-mitigation program that avoids or substantially reduces GHG emissions within the geographic area in which the project is located would be determined to have a less-than-significant individual and cumulative impact for GHG emissions. Such plans or programs must be specified in law or approved by the lead agency with jurisdiction over the affected resource and supported by a CEQA-compliant environmental review document adopted by the lead agency. Projects complying with an approved GHG emission–reduction plan or GHG-mitigation program would not be required to implement best performance standards (BPS) specified by SJVAPCD (2015b). SJVAPCD-recommended BPSs would not be applicable to the project because the project would not include any permitted stationary sources of emissions, for which SJVAPCD has established a BPS. SJVAPCD has not established a BPS for backup emergency generators, such as the one that would be used to supply electricity for cooling the project's battery-storage system during power outages (SJVAPCD 2021).

3.3.3 Impact Analysis

Impact GHG-1: Generate GHG Emissions that May Have a Significant Impact on the Environment

GHG emissions associated with the project would be generated during project construction and by operation of the project after it is built. Estimated levels of construction- and operation-related GHGs are presented below, as well as a qualitative discussion about the level of GHG emissions associated with decommissioning the project at the end of its operational life.

Construction-Generated Greenhouse Gas Emissions

Construction of the project would result in GHG emissions from off-road equipment used for vegetation removal and site preparation, grading and excavation, installation of the PV system, construction of the battery-storage facilities on-site substation, and construction of the off-site connection to PG&E's existing Los Banos substation. GHGs would also be emitted by trucks hauling equipment and materials to and from the project site and worker commute trips. Indirect GHG emissions would also be associated with water consumption used for dust control during project construction.

Table 3-3 summarizes the estimated levels of GHGs that would be emitted during the projected 14-month construction period. These estimates are broken down by the timing of various construction phases (or the combination of construction phases that would likely overlap in timing). Detailed modeling input and parameters, assumptions, and emissions estimates are provided in Attachment A.

As shown in Table 3-3, construction of the project would generate approximately 11,151 $MTCO_2e$ over the construction period.

Table 3-3 Construction-Related Greenhouse Gas Emissions

Construction Phase	GHG Emissions ($MTCO_2e$)
Site Preparation	3,793
Underground Work	2,824
PV System Installation	2,230
Battery Storage System Installation	951
Substation and Gen-Tie Line Installation	949
PG&E Substation Modifications	315
Testing and Commissioning + Project Site Restoration	55
Total[1]	**11,151**

Sources: Attachment A.
GHG = greenhouse gas; $MTCO_2e$ = metric tons of carbon dioxide equivalent; PV = photovoltaic.
[1] Emission level estimates include indirect GHG emissions associated with water consumption for dust control.

Operational Greenhouse Gas Emissions

As part of long-term solar project operations, mobile-source GHG emissions would result from vehicle trips to and from the project site by maintenance and inspection personnel and delivery vehicles, including trucks that deliver water for periodic washing of the PV panels. Indirect GHG emissions also would result from the consumption of water for the periodic washing of PV panels.

Table 3-4 summarizes the annual level of operational GHG emissions associated with the project's first year of operation. Table 3-4 also includes the level of construction-related emissions amortized over the projected 35-year operation life of the project.

Table 3-4 Annual Operational Greenhouse Gas Emissions

Source Category	Annual GHG Emissions ($MTCO_2e$/year)
Personnel Vehicle Trips	134
Water Truck Trips	20
Emergency Generator	1
Water Consumption	<1
Construction Activity (amortized)[1]	319
Total Operational Activities	**474**
Displaced Emissions	**199,911**
Net Decrease in Operational Emissions	**-199,436**

Sources: Attachment A.
GHG = greenhouse gas; $MTCO_2e$ = metric tons of carbon dioxide equivalent.
[1] Construction GHG emissions amortized over the project's 35-year lifetime.

By generating renewable electricity for at least 35 years, the project would help California meet its RPS targets, including the state's intention of having zero-carbon and eligible renewable energy sources supply 100 percent of the state's retail electricity demand by 2045, as mandated by SB 100 (2018). Thus, the renewable electricity generated by the project would replace electricity generated by fossil fuel–based sources. The associated displacement of GHGs is estimated based on the

emission performance standard of 0.337 $MTCO_2e$/MWh that was recently calculated by CPUC (2021). At this rate, given that the project would generate approximately 593,208 MWh per year, it is estimated that it would displace approximately 199,911 $MTCO_2e$/year.

As shown in Table 3-4, operation of the project would result in approximately 474 $MTCO_2e$/year, whereas the renewable electricity it produces would displace fossil fuel–based electricity, resulting in a reduction of approximately 199,911 $MTCO_2e$/year. In summary, the project would result in a net reduction of 199,436 $MTCO_2e$/year and, therefore, not generate a substantial level of GHG emissions that would contribute to climate change.

Decommissioning Activities

At the end of the operational life of the solar project (approximately 35 years), EDPR would decommission and remove the system and its components and return the site to existing conditions. The proposed project site could then be converted to other uses in accordance with applicable land-use regulations in effect at that time. All decommissioning and restoration activities would adhere to the requirements of the appropriate governing authorities and would be conducted in accordance with all applicable federal, state, and County regulations. A collection and recycling program would be executed to dispose of the site materials.

The solar project's decommissioning activities were evaluated qualitatively because the extent of the activities and equipment amounts for decommissioning is unknown at this time. It is anticipated that decommissioning activities would be less GHG-intensive than that of project construction. Due to the RPS regulation in the state, it is also anticipated that other sources of renewable electricity would supply power to the grid after the project shuts down. Because emissions generated from decommissioning activities are expected to be less than project construction emissions, it is expected that the project would result in a net decrease in GHG emissions over the long term.

Impact GHG-2: Conflict with an Applicable Plan, Policy, or Regulation Adopted for the Purpose of Reducing GHGs

Because the County has not completed and adopted a climate action plan at the time of writing this analysis, the project does not have the ability to be consistent with a local or regional plan adopted for the purpose of reducing the emissions of GHGs that is consistent with the statewide GHG target mandated by SB 32 (2016).

AB 32 and SB 32 establish statewide goals for reducing GHG emissions to 1990 levels by 2020 and 40 percent below 1990 levels by 2030, respectively. CARB adopted the AB 32 Scoping Plan as a framework for achieving AB 32 goals. The Scoping Plan outlines a series of technologically feasible and cost-effective measures to reduce statewide GHG emissions. Many of these strategies have been extended as part of the 2022 Scoping Plan to achieve SB 32 and carbon neutrality by 2045.

The 2022 Scoping Plan states that California's renewable and zero-carbon energy supply goals are key to the state's goal of achieving carbon neutrality by 2045. As explained in Section 3.1.3, *State Plans, Policies, Laws, and Regulations*, electricity generation is one of the main emission sectors addressed in CARB's 2022 Scoping Plan. SB 1020 revised California's renewable and zero-carbon energy supply goals to 90 percent by 2035, 95 percent by 2040, and 100 percent by 2045. The renewable and zero-carbon energy supply goals promote multiple objectives, including diversifying the electricity supply. Increasing the renewable energy supply toward 100 percent

zero carbon by 2045 is designed to accelerate the transformation of the electricity sector, including investment in the transmission infrastructure and system changes to allow integration of large quantities of intermittent wind and solar generation.

The proposed project would add renewable solar-generated energy to the electricity supply and, as shown in Table 3-4, result in a long-term net reduction in GHG emissions. In addition, the project would also include a 100-MW battery-storage system that would help the state's electricity supply–storage capabilities. Therefore, the proposed project would be consistent with the renewable and zero-carbon energy supply goals of the 2022 Scoping Plan.

In addition, the project would comply with CARB's Regulation for Reducing Sulfur Hexafluoride Emissions from Gas Insulated Switchgear (Section 17 CCR Section 95350, *et seq.*), thereby decreasing the mass of SF_6 that would leak from gas-insulated switchgear. Lastly, the project would be consistent with and would directly implement 2030 Merced County General Plan Policies LU-2.7: Rural Energy Production, AG-3.11: Solar and Wind Energy Production Facilities, and NR-2.4: Solar Power. For these reasons, the project would be consistent with all applicable plans, policies, and regulations adopted for the purpose of reducing GHGs, and the proposed project would help California achieve its GHG reduction goals.

3.3.4 Cumulative Greenhouse Gas Impacts

Climate change is a global problem, and GHG impacts are inherently cumulative. This is because GHGs contribute to the global phenomenon that is climate change, regardless of where they are emitted. Climate change is the result of the individual contributions of countless past, present, and future sources. Therefore, GHG impacts are inherently cumulative, and the analysis above is inclusive of cumulative impacts. As discussed under Impact GHG-1, the project would result in a long-term net reduction in GHG emissions. Moreover, as discussed under Impact GHG-2, the project would be consistent with all applicable plans, policies, and regulations adopted for the purpose of reducing GHGs, and the proposed project would help California achieve its GHG reduction goals. Therefore, the project would not result in a long-term contribution to cumulative GHG impacts.

Unmitigated Project Operational Mass Emissions (2025)

Project Operations Emissions Summary

Maximum Daily Emissions

Source Category	Days of Operation per year	Emissions (lb/day) ROG	NO_X	CO	SO_X	PM_{10} Total	$PM_{2.5}$ Total	CO_2	CH_4	N_2O
Employee Vehicle Trips	365	0.08	0.20	1.12	0.01	7.34	0.79	804.42	0.01	0.01
Emergency Generator		0.59	0.06	1.54	0.00	0.00	0.00	37.66	0.08	
Water Truck Trips	20	0.09	4.03	1.21	0.02	81.83	8.25	2107.46	0.00	0.33
Total Daily Emissions		**0.77**	**4.29**	**3.87**	**0.03**	**89.18**	**9.04**	**2949.54**	**0.09**	**0.34**
SJVAPCD AAQA Threhsolds		100	100	100	100	100	100			
Exceeds Threhsold?		**No**	**No**	**No**	**No**	**No**	**No**			

Annual Emissions

Source Category	Days of Operation per year	Annual Emissions (tons/year) ROG	NO_X	CO	SO_X	PM_{10} Total	$PM_{2.5}$ Total
Employee Vehicle Trips	365	0.02	0.04	0.20	0.00	1.34	0.14
Emergency Generator		0.01	0.00	0.04	0.00	0.00	0.00
Water Truck Trips	20	0.00	0.04	0.01	0.00	0.82	0.08
Total Annual Emissions		**0.03**	**0.08**	**0.25**	**0.00**	**2.16**	**0.23**
SJVAPCD Significance Thresholds		10	10	100	27	15	15
Exceeds Threhsold?		**No**	**No**	**No**	**No**	**No**	**No**

Annual Emissions

Source Category	Days of Operation per year	Annual Metric Tons CO_2	CH_4	N_2O	CO_2e
Employee Vehicle Trips	365	133.18	0.00	0.00	133.85
Emergency Generator		0.85	0.00	0.00	0.90
Water Truck Trips	10	19.12	0.00	0.00	20.02
Water Consumption					0.44
Amortized Construction					313.42
Total Annual Emissions		**153.15**	**0.00**	**0.01**	**468.63**
Displaced GHG Emissions					**199,911.10**
Project Net GHG Emissions					**-199,442.47**

Annual GHG Displacement

Parameter	Value
Project Annual Net Energy Generation (MWh/year)[1,2]:	593,208
GHG Displacement Factor ($MTCO_2e$/MWh)[3]	0.337
Annual Displacment of GHG Emissions ($MTCO_2e$)	**199,911**

Notes:

1) Data needs responses,V2
   Net energy generation accounts for energy consumption at night and losses. This is the amoung energy that will be sent to the grid to diplace GHG emissions associated with fossil fuel electricity
2) generation.
3) California Public Utilities Commission. 2021. R.20-05-002: Review of Climate Credits. Available: https://docs.cpuc.ca.gov/PublishedDocs/Efile/G000/M374/K795/374795423.PDF. Accessed: July 21, 2022.

Employee Vehicles-Offsite

							Running Exhaust Emission Factor (g/mile)[1]

1) Emission factors for Pickup-truck: EMFAC2021; SJVAPCD; LHDT1/LHDT2; Agg MY; 15 MPH; DSL

2) Emission factors for Bucket/Water Truck: EMFAC2021; SJVAPCD; MHDT/HHDT; Agg MY; 15 MPH; DSL

3) Accounts for all exhaust and evaporative processes

4) Onsite trip length assumes each truck will travel the total length of onsite roads which is equivalent to 10 miles.

5) Includes dust control measure of watering exposed area

PM Dust Reduction 74%
